THE

# JOURNAL OF HORTICULTURE,

## COTTAGE GARDENER,

AND

## HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING BEE-KEEPING.

CONDUCTED BY

ROBERT HOGG, LL.D., F.L.S.

Established

in 1848.

VOLUME XXI. THIRD SERIES.

JULY—DECEMBER, 1890.

LONDON :

PUBLISHED FOR THE PROPRIETOR, 171, FLEET STREET.

LONDON :  
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,  
171, FLEET STREET.

## TO OUR READERS.

WHILE the year 1890 will long be remembered for its fatality in the world of horticulture, and while none can more deeply regret than we do the loss of long-esteemed familiar friends, so, conversely, few can have greater cause for thankfulness than we have, inasmuch as all the members of the staff of the JOURNAL OF HORTICULTURE, and staunch and steady contributors who shared in its production at the beginning of the year, were happily with us at its close.

The half-year's Volume to which the accompanying Index refers covers a period of great activity in the field in which our readers, more or less actively, engage, or look over interestingly. The centenary of the Chrysanthemum was celebrated by thousands with extraordinary heartiness, so much so as to suggest that the enthusiasm of cultivators and admirers of the flower must have reached its zenith. Time alone will tell whether that is so or not, but at present we are informed that the demand for new and meritorious varieties is greater than ever, which indicates that the Chrysanthemum tide is flowing still.

Hardy fruit culture and preservation have pressed their claims to attention more forcibly than ever; and although 1890 was one of the worst "Apple years" on record, yet the largest competitive exhibition of the fruit ever seen was displayed in the London Guildhall, and attended by 35,000 persons, many more failing to gain entrance to the densely packed building. In connection with that event it should be stated as a matter of public interest, not hitherto made known, that Messrs. G. Bunyard, J. Cheal, T. F. Rivers, A. H. Smee, and J. Wright have received the Freedom of the City of London—the first practical horticulturists on whom, so far as we know, this honour has been conferred.

The hardy fruit supply of the kingdom appears likely to be revolutionised, and it is most necessary that prudent action be taken in every step for ensuring the greatest possible success in cultivation. Sound guidance has been given and will be continued in our pages, by those competent to teach on this important subject.

It is due to our valued coadjutors to know that their endeavours to render the pages of the JOURNAL useful and acceptable to gardeners and amateurs are appreciated, as many letters testify. A thoroughly good and successful gardener writes:—"The JOURNAL is my favourite gardening paper, as I have long thought there is none to approach it for good, sound information on all subjects, and I hope it will always receive the support it deserves." From an amateur we receive this kindly reference:—"Thursday is always looked forward to by me, and I enjoy 'our' Journal exceedingly. It seems as if there existed a bond of friendship between all the readers and contributors, as, indeed, in a sense I really think there is. We are like members of a family, and revere the good Doctor as the head. Let me, as I belong to the East, finish in Eastern style: 'May his shadow never be less.'"

Such generous expressions and good wishes encourage and help us onwards in our work—the promotion of good gardening and good fellowship between all who engage in it, and especially between editors, writers, and readers of the JOURNAL OF HORTICULTURE.

## COLOURING GRAPES.

WHAT I advanced recently concerning colouring Peaches and Nectarines brought out several interesting and instructive facts from esteemed correspondents, and has led to my penning a few thoughts and suggestions on colouring Grapes. Perfection of colouring in Grapes is a prime condition all gardeners are, more or less, ambitious to bring about, but unfortunately many more failures than successes must be recorded every season. Plenty of growers succeed in growing fine bunches and large well-formed berries, only to fail in colouring them properly. At the present time many and anxious are the glances cast at the fast changing berries. Numerous are the reasons given for the different failures, but whether these are wide of the mark or not cannot always be decided. I shall state some of my observations, and leave others to criticise them if they will.

If asked to state what I considered the most frequent cause of non-colouring in Grapes, including white as well as black varieties, I should unhesitatingly assert that overcropping is the chief. It is in respect of the important and nerve-trying work of reducing the number of bunches on a Vine that the greatest judgment is required. There can be no fixed rule laid down, so much depending upon the local conditions. What might appear a light crop in one instance might really be too heavy in another. With everything in first class order at the roots, the proper amount of water being duly supplied and neither too soon nor too late, one condition being quite as much to be avoided as the other, then ought strong Vines to bear and finish a great weight of superior fruit. When, however, the border is largely composed of poor, loose, non-retentive soil, a heavy crop, as understood by market growers, may prove fatal to the prospect of colouring the present crop and the show of bunches next season. Even worse to deal with are Vines established in an old border with the roots nobody knows where, and there are many such, it being impossible to properly colour a heavy crop of fruit in this case.

Past experience ought to be the best if not the only guide, but previous mistakes are not always profited by. If a Vine fail to finish a dozen bunches in good style in one season, where is the sense in leaving as many, or perhaps more, in the next year? Very frequently those in charge fail to estimate the extent of their crops till the berries are past their stoning period and colouring fast. Then they sometimes start reducing the number of bunches, and if this is not a case of locking the stable after the steed has vanished, it comes perilously close to it. The best practice to pursue is to take good note of what a Vine, if an old one, has previously proved itself capable or incapable of maturing properly, and to early reduce the number of bunches accordingly. As regards young Vines, I would suggest that it is wise to undercrop.

Next to overcropping I would credit red spider with being the cause of the greatest number of failures. As it happens, however, one is very frequently the consequence of the other, overcropped Vines apparently falling the most easy prey to red spider. If all accounts are true, and judging from my own observations they most probably are, red spider is very prevalent this season, even under conditions not usually considered favourable to the increase of these insects. Those parching easterly winds in May, accompanied by bright sunshine, seem to bring everything that is

bad in their wake, red spider being one of the worst of the evils due to that cause. Once established on the Vines no amount of moisture in the atmosphere, nor even frequent syringing, will prevent their spreading, as if they cannot retain their hold on the under side of the leaves they take possession of the upper surface. Neither does sulphuring the pipes do much good unless as a preventive in the first instance, while if it is placed on something hot enough to generate extra strong fumes—and I have met with cases where sulphur has been spread over nearly red-hot bricks or a thick piece of hot iron—much more harm will be done in a few minutes to the foliage than the red spider could effect all the season. No, I hold sponging the leaves carefully and repeatedly, if need be, to be the best, and I might say the only remedy, this being commenced directly the yellow patches caused by the red spider are first seen. We use soapy water, and a little sulphur is left on the leaves by the sponge. Once let the spider get the upper hand and it is a case of good-bye to all prospects of successfully colouring the Grapes.

Too much heat and not enough air are conditions which militate seriously against perfect colouring in all black Grapes, and even Muscats would frequently be of superior quality if more air was given when they were ripening. Mr. D. Thomson, Drumlanrig, long ago advocated giving more air to Grapes when they were colouring, and I have to thank him for some of my first successes in colouring the Black Hamburgh sufficiently well to gain prizes in first class company. Many years ago Mr. Thomson advised that a little front ventilation in addition to that at the top be given during the night time, and this plan I have adopted ever since. When only the top lights are opened a short distance the circulation of air in the body of the house is altogether insufficient. What is wanted is a fairly brisk circulation or a current of air playing about the bunches constantly. A very low temperature I do not recommend, as in this case the chemical changes in the berries is incomplete, flavour and keeping qualities both suffering in consequence. In cold damp weather especially we keep the fires going, this improving the circulation and preventing undue lowness of temperature. I am not very particular as to a difference of a few degrees in the heat of a house of Grapes, and rarely heed the thermometer. If it feels comfortable on first entering, say at about 9 P.M., with a little ventilation both at the front and top, that will do. A "comfortable" heat would be from 60° to 70° according to the state of the outer atmosphere, this answering well for both early and late varieties, but even a lower temperature and good circulation of air is preferable to a stagnant atmosphere.

In connection with this part of my subject I cannot do better than to briefly detail an instructive experience, for which I have to thank Mr. T. Smith, Henbury Hill Gardens, near Bristol. This observant gardener is quite of my opinion that if Grapes "had a great deal more air passing over them than they have in most vineries, there would be fewer examples of imperfect colouring." In corroboration of this theory he describes what took place in a curiously constructed house filled with Madresfield Court, the ventilation of which is effected, as in the case of too many houses hereabouts, by means of wooden cappings running the whole length of the house. More air is also admitted by sundry holes and shutters, one of the latter opening out of an earlier house. "When," to use his own words, "the Madresfields were colouring these ventilators were always left open, and there was draught enough passing through to turn a mill. One bunch of Grapes was within 2 feet of this opening, and might frequently be seen oscillating to and fro in a most violent manner. Well, that bunch when finished was as black as a raven right up to the shank, and all the bunches situated in the direct current of air were better coloured than those on either side, the falling off in this respect being marked and gradual." Nothing I can add can convey a more impressive lesson than Mr. Smith's experience, and those who fail

to colour Madresfield Court satisfactorily, these being in a great majority, ought to try what a brisk current of air will do.

Mixed houses are the most difficult to deal with, more especially those in which Muscats are grown alongside either early or later black varieties. The Muscat of Alexandria undoubtedly requires more heat than most other Grapes throughout, or otherwise the berries may be imperfectly set or small, also failing to colour and keep satisfactorily. The best way out of the difficulty is to plant the Muscats at the warmest end of the house, less air being given at all times. In this manner a somewhat higher temperature can be kept, and if the front lights are arranged so as to open separately, currents of air, needful earlier for the black varieties, can be withheld for a time. That Muscats are best grown in a separate compartment must be admitted. If these are principally studied in mixed houses, then must the blacks suffer, and most probably be nearer red than black in colour. I have previously alluded to the plan I adopted of growing a few extra good bunches of Black Hamburgs for show purposes in a house principally devoted to Muscats. A rod was brought through from an adjoining Hamburg house, and in time it reached along the front to the whole length of the compartment. This position is always several degrees cooler than it is higher up the roof, and the bunches yet get the full benefit of the front air and fire heat, the dozen or more bunches left on invariably being heavy and fairly well coloured.

Foster's Seedling and Buckland Sweetwater succeed well in a Hamburg house, while Golden Queen, Mrs. Pearson, Trebbiano, and Calabrian Raisin may be grown to perfection in the same house as Alicante, Lady Downe's, Gros Colman, and other late black Grapes. Black varieties colour best when not unduly exposed to bright sunshine, a thin canopy of healthy foliage rather than a thicket of growth being necessary. The case is somewhat different with white varieties, but even these ought not to be too suddenly exposed to a fierce sunshine, or the berries will be discoloured. A more natural and perfect colour can be "laid on" by admitting abundance of light and air to the bunches, the leaves if necessary being tied back somewhat, and a division between the laterals of adjoining rods also made. What both black and white varieties need is plenty of time, hurrying them, as I have previously pointed out, not being at all prudent. In metal houses, the roofs of which become unbearably hot to the hands on bright summer days, a light shade may well be given, this checking excessive evaporation and consequent evils. Modern houses with very light wooden rafters and large squares of glass are also very trying to the foliage of Grapes, and in many instances might be shaded with advantage. A very thin mixture of lime and water sprayed over with a syringe answers well, and so also does fish netting drawn over. A heavy shading would be injurious, but a thin one saves the foliage of Gros Colman, Mrs. Pinee, and also other varieties less susceptible to injury, and is therefore a factor in the important colouring process.—W. IGGULDEN.

#### MAGNOLIA PARVIFLORA.

I RECEIVED this remarkable plant in 1885 from a friend in North America, who had it introduced directly from Japan. It is now a handsome young tree of a broad pyramidal shape, 6 feet high and 5 feet through. It stood out unprotected during the last three winters, and has not suffered in the least from our rather severe frosts. The tree is deciduous, and the leaves approach those of *M. conspicua* in form, but are much larger, of a more leathery texture, smoother on the upper side, and bluish-white on the under surface.

It may be considered as free flowering, our plant, now six years old, having had upwards of twenty fine flowers. Its time of flowering is much later than that of the *M. conspicua* or Yulan section. The first flowers opened here at the 15th May, they continued in succession, and some of them lasted till the 12th of June. The flower buds are produced within the young leaf buds of the spring growth, as with *Magnolia grandiflora* and *Thompsoniana*, and are not visible months before, as is the case with *M. conspicua* and its varieties. They have a roundish oval shape, as large as a pullet's egg, covered with a bright

brown membrane, which is torn open in two lobes by the opening of the flower.

When opened the first day the flower looks like a beautiful pure white Tulip of the size as figured in diagram 1. It has six to seven

FIG. 1.—MAGNOLIA PARVIFLORA. (Section.)

broad petals, perfectly imbricated, and inserted beneath the ovary and stamens. The second day the flower is more open, and appears like a large Water Lily (*Nymphaea alba*), as figured in diagram 2. From that moment a very agreeable but rather strong perfume, somewhat resembling that of the Pine Apple, is diffused, and can be noted even at some distance.

The third day the flower becomes quite open, the six or seven boat-shaped petals are spread out horizontally, and remain in a star-like position, similar to a large-flowered Clematis, as represented in diagram 3. In this state the flower is in its greatest beauty, and remains so for several days, and this peculiar shape makes it widely different from any other form of Magnolia. The large green-yellowish ovary in the middle, surrounded by a broad crown of upwards 120 dark purple stamens and the milky white petals are all remarkable, and these contrasting colours with its singular shape give to the flower a distinctive character.—CHARLES VAN GEERT, *Antwerp*.

#### THE BRITISH FRUIT GROWERS' ASSOCIATION. STRAWBERRY SHOW.

THE Committee of this Association having decided to hold a Conference upon Strawberries in connection with the Rose and Pink Show in the Royal Aquarium, Westminster, on Friday, June 27th, it was thought desirable that members should be invited to exhibit as many varieties as possible, as a show of this character would furnish additional interest to a Conference. The invitation was responded to most freely, and though no prizes were offered 160 dishes of Strawberries were staged by nineteen exhibitors, representing nine counties—namely, Kent, Surrey, Bedford, Cambridge, Hertfordshire, Hampshire, Sussex, Middlesex, and Herefordshire. Great difference was noticeable in the size and quality of the fruit, but some extremely fine specimens were included. Some had found the date of the Show too late, and for others it was too early, but it would be impossible to fix a date that would be exactly suitable for all alike. It was a subject for surprise to find that forty varieties were represented from out of doors.

The exhibitors were as follows:—Mr. T. Sharpe, The Royal Strawberry Gardens, Knowle Hill, Virginia Water, had an important and most instructive collection, comprising fifty punnets of exceedingly fine fruits of British Queen, Empress Eugénie, Marguerite, and Sir Joseph Paxton. In size and colour these were unequalled. Three plants of Marguerite loaded with fruits as taken from the ground were shown to indicate their great prolificness at Knowle; one of the boxes constructed to hold four dozen punnets; the baskets employed for gathering from the beds; and a sample of the peculiar soil were also shown by Mr. Sharpe. Fruit and plants were exhibited of a seedling raised from Princess Alice Maud at Knowle, and which is distinguished by a remarkably prolific character; the fruits small, but even and bright in

colour. It has been found useful as an early Strawberry, possessing a rather brisker flavour than the parent variety. A medal was awarded to Mr. Sharpe by the B.F.G.A. for his interesting exhibit.

Cultural commendations were accorded to the following exhibitors—Mr. C. Goldsmith, gardener to W. B. Waterlow, Esq., High Trees, Red Hill, had a box of sixty grand fruits of Sir Joseph Paxton, and one of Vicomtesse Hericart de Thury, both handsome examples. Mr. Ridgewell, Histon Road, near Cambridge, showed a collection comprising good fruits of the following, with the dates of ripening attached—Auguste Nicaise, June 11th; Unser Fritz, June 12th; Eleanor, Captain, June 20th; Sir J. Paxton, June 16th; President, June 18th; Noble, June 7th; Countess, June 20th; British Queen, June 23rd; James Veitch, June 15th; King of the Earlies, June 5th; Marguerite, June 12th; Pauline, June 11th; and Incomparable, a variety raised from Keens' Seedling, probably crossed with Goliath, and which Mr. Ridgewell describes as a useful variety which he has grown for some time. Six punnets of Sir J. Paxton, as sent to market, were also shown, with twelve punnets of Gooseberries. Mr. E. Butts, Leigham Court Gardens, Streatham, showed two dishes of Vicomtesse Hericart de Thury, excellent fruits, even, and of capital flavour. Mr. Allis, Old Warden Park Gardens, Biggleswade, exhibited two dishes of Noble and Marguerite, the fruit extremely fine in both cases. Mr. W. Bates, The Gardens, Poulett Lodge, Twickenham, showed good fruits of Lucas, President, James Veitch, Noble, and Sir Joseph Paxton. Mr. G. W. Cummins, gardener to A. H. Smee, Esq., The Grange, Wallington, sent dishes of King of the Earlies, Keens' Seedling, President, Sir J. Paxton, and Vicomtesse H. de Thury, all represented by good fruit; and Mr. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, showed dishes of James Veitch, President, Sir J. Paxton, Keens' Seedling, Noble, Vicomtesse H. de Thury, Dr. Hogg, and Sir Harry. Mr. W. Taylor, Osborn Nursery, Hampton, had three fine dishes of Grove End Scarlet, President, and Sir C. Napier.

Votes of thanks were adjudged to all exhibitors, including the following not already mentioned:—Messrs. Paul & Son, Cheshunt, for La Grosse Sucrée, President, Vicomtesse H. de Thury, Noble, A. F. Barron, Pauline, Sir J. Paxton, Commander, and King of the Earlies; Messrs. Saltmarsh & Son, Chelmsford, contributed Noble, Lucas, Commander, James Veitch, President, and Sir Joseph Paxton; Mr. J. Watkins, Hereford, showed a very interesting collection, comprising seventeen varieties, including, in addition to those already mentioned, Sharpless, Dr. Hogg, Auguste Nicaise, Comte de Paris, Stirling Castle, and the Captain; Messrs. G. Bunyard & Co., Maidstone, sent nine dishes of fine fruits; Mr. T. Laxton, Bedford, showed a large collection of his own and other varieties, with several very promising seedlings. The fruits were arranged in neat square baskets with a folding handle. Messrs. H. Cannell & Sons, Swanley, sent two peck baskets of Sir J. Paxton, gathered at Swanley and Eynsford respectively, and showing the way in which the fruits are sent to market from Kent. No packing is used, and the rim of the basket is turned inwards an inch or two, so that the baskets can be placed on the top of each other without injury to the fruit. Messrs. Cheal & Son, Crawley, also

Mr. G. Gordon, Gunnersbury, contributed specimens of *Fragaria elstior*, *F. virginiana*, *F. virginiana variegata*, *F. lucida*, *F. calycina*, and *F. vesca monophylla*, which afforded much interest.

#### THE CONFERENCE.

The Conference proceedings in St. Stephen's Hall were opened at 5 P.M. by T. Francis Rivers, Esq., who occupied the chair. The pro-

FIG. 3.—MAGNOLIA PARVIFLORA.

gramme comprised the following subjects:—"The Origin of the Cultivated Strawberry," by Mr. Shirley Hibberd; "The Culture of Garden Strawberries," by Mr. J. Wright; "The Market Culture of Strawberries," by Mr. G. Bunyard; and "Seedling Strawberries," by Mr. T. Laxton. So full a programme with the attendant discussion occupied considerable time, but when the customary votes of thanks to the readers of the papers, the Chairman, and Vice-Chairman (Messrs. Rivers and Gordon) were proposed, all expressed themselves thoroughly satisfied with the business of the day. Mr. Rivers introduced the lecturers with the following remarks.

#### OPENING ADDRESS.

IT is two years since I had the honour of presiding at the first meeting of the British Fruit Growers' Association held at the Crystal Palace, and the honour of again presiding is a privilege and a great gratification, as our continued meetings show that our work has not been fruitless. You will remember that at our first meeting we were successful in drawing public attention to the fact that a national industry was in some danger of being neglected as not being of sufficient importance to be worthy of consideration as an industry. The steady increase of population and of wealth has, however, decided this point. Although orchard fruit cannot be depended on as an annual tainty, this production is a profitable occupation when carried on with care and skill. The statistics furnished by the agricultural returns show a steady increase year by year in the number of acres devoted to fruit culture; this is a very encouraging sign. I think, however, that these returns do not apply to the increase of orchards on farms, but to the fact that professional fruit growers are enlarging their plantations. As these gentlemen would not plant without a reasonable prospect of profit we may infer that they are satisfied with the results. There is, however, another phase of the question which is purely agricultural; there is no doubt that on too many farms the orchards are not in a state of decline but of decay. I venture to think that this unhappy condition is produced not from unwillingness to plant, but from the very mistaken idea that orchard trees will last not only a man's life but that of his children and grandchildren. "It will last my time and theirs"

FIG. 2.—MAGNOLIA PARVIFLORA. (Section.)

showed fruits of Sir J. Paxton and Marguerite. Altogether Sir J. Paxton was shown by twelve exhibitors, and Noble by eleven.

Mr. J. Webber, Covent Garden Market, exhibited samples of Strawberries from Kent, Middlesex, Essex, Lyme Regis, and Southampton.

is a common saying. Still it is not quite true that orchard trees will bear fruit for an unlimited time. It may be assumed that the thirty years allotted to a generation of man may also be taken as the proper life of an orchard, and after this time trees are no longer in their prime. You can easily establish this fact by the measurement of the unproductive trunk and branches of an old tree; you will find the fruit produced at the extremity of the branches does not compensate for the space occupied by the tree both above and below ground, a large proportion of the fruit being undersized and certainly not able to compete in the markets with the fruit of younger and more vigorous trees. Now, it is part of our business to urge upon all the importance of the restoration of our farm orchards. The interests of landlord and tenant, not only of this generation but of those who are to succeed, are intimately bound up with this matter, but these interests will not be served by planting a few trees in a grass orchard and leaving them to grow without further attention. A small orchard on land carefully selected, well cultivated, and well fenced will be more profitable than a grass orchard of larger acreage planted with standard trees, and supposed to last for a hundred years. Every farmer knows the extreme difficulty of protecting trees from stock, and as he usually finds a farm in which the trees are old and rugged enough to serve as rubbing posts for cattle, he is inclined to leave things as they are. I hope and am sure that some day a thorough and beneficial change will be made in orchard planting, and that all farms will have properly cultivated fruit gardens in which orchard fruit will have its share, but no more, as the land will give annual and certain crops of Strawberries, Currants, Gooseberries, &c., which will always reward the cultivator when the Apples fail. We have now obtained in this country the best varieties of all hardy fruits; they are not surpassed by any other. This has been demonstrated by the splendid autumnal shows held at the Crystal Palace, and in a very remarkable degree, at the Apple and Pea Conference held by the Royal Horticultural Society, the invitation given by this Society was answered by noble collections of fruit from all parts, collections well worthy of the country and of the growers.

An exhibition of hardy fruit is to be held in October at the Guildhall, under the presidency of Sir James Whitehead, and although the fruit crop is not generally plentiful, there is no doubt but that this Exhibition will reward the most ardent hopes of the originator. It is, I think, the first of the exhibitions held in the City, and is designed partly to promote the growth of fruit amongst cottagers. The interest taken in this Exhibition is in every way worthy of the wealthiest city in the empire. Some centuries past the gardens of a part of this great town were famous for Strawberries. Everyone knows the story of the Strawberries of the Bishop of Ely, grown in Ely Place, Holborn. In our time these Strawberries are to be found in the streets, and I may say that the streets of London furnish Strawberries at this time which in size and flavour are equal to those in any other part of the world. The gentlemen who are to deliver lectures to-day are thoroughly well qualified for the work, and I hope that both instruction and pleasure will be gained from the information they have to give. There is still considerable improvement possible in Strawberries; for instance, all of us would like to have British Queens lasting from June to the end of July. The question of soil for Strawberries ought to be thoroughly established. Different sorts flourish best in different districts. I will not, however, detain you any longer, as these points will be thoroughly explained by the lecturers.

I desire to draw attention to the very fine collection of Strawberries exhibited by Mr. Sharpe of Virginia Water, who has evidently the right soil for Strawberries, which, combined with his own skill, has produced a collection which is deservedly worthy of the thanks of the Association, and we are also much indebted to all of the exhibitors for their very fine collections.

Before I conclude I should like to offer the thanks of the Association to our Hon. Secretary, Mr. Lewis Castle, to whose energy and skill the Association mainly owes its success. He has given very much valuable time and attention to the interests of the Society, and I shall be glad to record our thanks for his exertions.

The subject of the lectures to be given to-day must always occupy a prominent part of any fruit orchard, as well as on Strawberry farms as it can be cultivated with profit and success between rows of fruit trees, and is certain to produce a crop sufficient to compensate for the failure of the fruit on the trees. There is, I understand, an enormous increase in the importation of Strawberries from abroad; it is therefore absolutely necessary that the most careful attention should be given to the selection of proper sorts for the cultivation for sale, as it is positively certain that the best sorts will always command the highest price and

the readiest sale. I will not detain you any longer, as time presses, and I will ask Mr. Shirley Hibberd to give us the history of the Strawberry.

### THE ORIGIN OF THE CULTIVATED STRAWBERRY.

BY MR. SHIRLEY HIBBERD.

THE cultivated Strawberry of British gardens is a comparatively modern fruit, for of ancient history it has none; and consequently there are not many mysteries in connection with its origin, the clearing up of which might bring honour to the present essayist. But we have ancient Strawberries that can scarcely be said to be cultivated now, although there is something to be said for them as wholesome, agreeable fruits that have a somewhat picturesque history. Time was when the wild berry of the woods had a place in gardens, but that time has passed; our native wood Strawberry has been superseded by a more stately, and in some respects superior fruit, that obtains from us an immensity of skill and care; while as to the Strawberry of the past, it is scarcely known to any but wayside botanists and village children; and these important persons prefer the modern British Queen, when they can get it, to the freshest and ripest berry from the banks. When the Duke of Gloucester sent the Bishop of Ely to obtain for him some Strawberries from the Bishop's garden at Holborn, it was simply to get rid of him in aid of a conference with the Duke of Buckingham. But the incident has historical value, as Shakespeare derived it from Sir Thomas More's "Tragical History of Richard III.," and it tells of the esteem in which the British *Fragaria vesca* was held in the days of the last of the Plantagenets. The Strawberries were sent for on Friday, June 13th, 1483, at which time Mayster Groshede was engaged in translating into English the "Boke of Husbandry," printed by Wynkin de Worde, in which the Strawberry is not even mentioned. The Bishop of Ely's garden was one of the most important for its productions and management in the fourteenth and fifteenth centuries; and as at that time the wild wood Strawberry was alone cultivated in this country, the incident marks the esteem of our forefathers for a fruit that now obtains so little attention as, in towns at least, to be practically unknown. Thomas Tusser, writing his "Hundred Points of Good Husbandry" about 1557, gives directions for planting Strawberries, the roots of which are "growing abroad among thorns in the wood," and in his "September's Husbandry" the Strawberries remind him of other things then to be planted.

"The Gooseberry, Respis, and Roses all three,  
With Strawberries under them trimly agree."

Even so late as the time of Sir Hugh Platt, who wrote his "Garden of Eden" about the year 1606, cultivated the British Strawberry in his garden in St. Martin's Lane, London, where it was considered a better fruit than the Virginian, which at that time had been introduced, although the books give a later date for it. Sir Hugh says: "Strawberries which grow in woods prosper best in gardens," and this agrees with the Shakesperian philosophy as spoken by the mouth of another Bishop of Ely in the drama of "King Henry V.," to the effect that

"The Strawberry grows underneath the nettle,  
And wholesome berries thrive and ripen best  
Neighbour'd by fruit of baser quality."

The common explanation of the name as derived from the practice of spreading straw on the ground to keep the fruit clean is as shallow as common explanations usually are. Centuries before it became the practice to strew straw for Strawberries it was known by the same name as now. In the most ancient documents in which English names of plants occur we find the *Strea-berige*, *Straeberia-wisan*, *Strebere-wise*, and *Strabery*. It is the plant that strays by the aid of threads or wires from the parent centre to find pastures new, and in so doing strews or straws itself upon the soil, as quaintly put in an ancient song—

"And can the physitian make sicke men well,  
And can the magician a fortune devine,  
Without Lily, Germander, and Sops-in-wine?  
With Sweet-bryer  
And Bon-fire  
And Strawberry-wycer  
And Collumbine."

The above references to Shakespeare include the only occasions of his mention of the Strawberry, for the handkerchief spotted with Strawberries that Othello gave to Desdemona is so described through a misconception of the poet's, the truth being that the handkerchief was marked with three Mulberries, which was the device of the great captain's shield. It was about the time of Shakespeare, however, that the garden Strawberry of the present day may be said to have come into

being. The books are full of interest on this point. In Lyte's translation of the Herbal of Dodons, 1578, the wood Strawberry alone is mentioned as a plant that grows in shadowy woods, and deep trenches, and banks, and by highway sides. In "Gerard's Herbal," 1597, only two kinds are mentioned, and they are the wood Strawberry, *F. vesca*, and the Hautbois, *F. elatior*, described as red and white. But in Parkinson's "Paradisus," published 1629, we have, in addition to these, the Virginian Strawberry and the Bohemian, and these, so far as the chronology is concerned, may be considered the parents of our modern Strawberries.

It is of considerable importance to note that in the introduction to his chapter on Strawberries Parkinson makes a distinct declaration that "the wilde Strawberry that groweth in the woods is our garden Strawberry, but bettered by the soyle and transplanting." He then describes the red, the white, and the green forms of Alpine and Hautbois Strawberries, and evidently ranks the Virginian and the Bohemian far below them in merit, for he says "scarce can one Strawberry be seene ripe among a number of plants. I think the reason thereof to be the want of skill or industry to order it aright. For the Bohemian and all other Strawberries will not bear kindly, if you suffer them to grow with many strings, and therefore they are still cut away." That the so-called Bohemian Strawberry was an interesting novelty may be concluded from Parkinson's description of the berries as measuring "neere five inches about." He says, "Master Quester the Postmaster first brought them ouer in our country, as I understand, but I know no man so industrious in the careful planting and bringing them to perfection in that plentiful manner, as Master Vincent Sion who dwelt on the Banck side, near the old Paris garden stairs, who from seven roots, as he affirmed to me, in one yeare and a halfe, planted halfe an acre of ground with the increase from them, besides those he gave away to his friends; and with him I have seen such, and of that bignesse before mentioned."

It will be observed that Parkinson had no success with his Virginian and Bohemian Strawberries. It should not surprise us that those newcomers occasioned perplexity, for the truth must be told that in the fifteenth and sixteenth and seventeenth centuries the cultivation of this fruit was understood by very few, and the produce of the woodlands was of far more importance than that of gardens until a quite new race had been established. Mr. T. Hudson Turner, the eminent archæologist and author of "Manners and Household Expenses of England," writing on horticulture in the thirteenth and fourteenth centuries, says:—

"Strawberries and Raspberries rarely occur in early accounts, owing probably to the fact that they were not cultivated in gardens, and known only as wild fruit. Strawberries are named once in the Household Roll of the Countess of Leicester for the year 1265. The plant does not seem to have been much grown even at the end of the sixteenth century. Lawson speaks of the roots of trees being 'powdred' with Strawberries, red, white, and green. Raspberries, Barberries, and Currants he describes as grown in borders. Both fruits, being indigenous, were probably to be found plentifully in the present day in Italy and other parts of Europe."

The allusions to the fruit in poetry and the drama bear out the statement of the antiquary. We find in Ben Jonson a person saying:—

"My son hath sent you  
A pot of Strawberries gather'd in the wood  
To mingle with your cream."

Spenser had in mind the attractions of wood Strawberries, where, in the tenth canto of the sixth book of the "Faerie Queen," he takes Calidore and Corydon and Pastorell "to the green woods to gather Strawberries."

It is a question of some interest—when did the Scarlet or Virginian Strawberry first reach this country? It is named in a catalogue of Jean Robin, botanist to Louis XIII., in 1614, and in Johnson's "History of English Gardening," page 343, the date of its introduction to England is stated to be 1625, but Sir Hugh Platt possessed it in 1606. Parkinson had it in 1629, and, as already remarked, was unable to grow it, probably because the plants were allowed to run into a mat, the systematic propagation now practised being then unknown. Indeed, the author of the "Paradisus" remarks at page 528 that "Strawberries will not beare kindly if you suffer them to grow with many strings, and therefore they are still cut away." The cultivation of the Strawberry, as described by John Evelyn at page 201 of the second volume of his "Compleat Gardener," published 1693, begins with the removal of plants from the woods and the putting of two or three plants in a hole, which is made with a stick 9 or 10 inches asunder. He recognises only two

kinds, the red and the white, evidently knowing nothing of the Virginian Strawberry. It appears that the system pursued ensured a crop of fruit in the second year after planting, and that was the only crop obtained; consequently annual or biennial renewal of the beds was necessary. It may be assumed, moreover, that the best forms of the plant were not secured in the first instance, and certainly there was no haste shown in raising seedlings, nor did anyone suspect the capabilities of the plant for variation and improvement. To obtain a faithful representation of the subject in what may be termed the middle period, I turn to the sixth edition of Miller's "Gardeners' Dictionary," published 1771, where, under *Fragaria*, I find it stated that there were four kinds of Strawberries then in cultivation—the Wood Strawberry, *Fragaria vesca*; the Scarlet Strawberry, *F. virginiana*; Hautbois, *F. muricata*, "with fruits as large as a small Plum;" and the Chili or Frutilla Strawberry, *F. chiloensis*, "with a large fruit and hairy fleshy leaves." Speaking of the introduction of the Chili Strawberry Miller says, "In the year 1727 I brought a parcel of the plants to England, which were communicated to me by Mr. George Clifford of Amsterdam, who had large beds of this sort growing in his gardens at Hartecamp. The leaves of this sort are hairy, oval, and of a much thicker substance than those of any sort yet known, and fixed upon very long hairy footstalks; the runners from the plants are very large, hairy, and extend to a great length. The footstalks which sustain the flowers are very strong; the leaves of the empalement (calyx) are long and hairy. The flowers are large, and often deformed; so are the fruits also when cultivated in very strong land, in which the plants produce plenty, which are firm and well flavoured; but as it is a bad bearer in most places where it has been cultivated, so in general it has been neglected."

It is of great importance—so it appears to me—to note further what Miller says on some other points. In common with Parkinson he reports three varieties of the wood Strawberry—the red, the white, and the green, the last-named being particularly valued for its fine flavour. The scarlet Strawberry of Virginia he places high above all other sorts for earliness to ripen and every other good quality, and he adds, "it is so different from the wood Strawberry in leaf, flower, and fruit, that there need be no doubt of their being distinct species." It startles one to find Miller describing the Hautbois Strawberry, which he catalogues *F. muricata*, as originally derived from America. He speaks of its capability of producing large fruit of a globular form as the result of good cultivation, and he adds that when neglected for a year or two these superior kinds degenerate to the common Hautbois. I submit that the sample of *F. muricata* on the table kindly supplied by G. F. Wilson, Esq., F.R.S., of Weybridge, will give the reason for its name as well as an explanation of its history. It is the kind described by Parkinson on page 528 as "somewhat reddish, like unto a Strawberry, but with many small harmless prickles on them, which may be eaten and chewed in the mouth without any manner of offence." This is the prickly Strawberry of Tradescant, formerly found wild in Hampstead Wood near London, now only known as a garden curiosity. It is a variety of the Hautbois, and when Miller says he obtained it from America, we need not put that down as one of his blunders, because our wood Strawberry has certainly been found growing wild on the American continent, and Miller does not say whether he obtained it as a wildling or as a garden plant.

We have thus far only two or at the utmost three species of Strawberry before us; these we may class as the Low wood (*F. vesca*), the High wood (*F. elatior*), and the Scarlet (*F. virginiana*).

In the year 1759 at the latest, the Pine Strawberry (*Fragaria grandiflora*) was introduced. The source of this is not clearly determined, but Surinam is commonly named as its native country. There can be no objection in the nature of things to the acceptance of Surinam as the original home of the Pine Strawberry, for it should be observed that it does not take us from the American continent. Indeed there is a peculiar propriety in finding a Strawberry in Guiana, for we may suspect it to be but an Eastern form of the Chilian species; which, perhaps, is but a Southern form of the Virginian species; just as our wood Strawberry is the Western, and the Hautbois the Eastern form of the European species; and all five are probably radiations from one centre, and there cannot be a question that all will cross or breed together, as commonly happens with plants nearly related in origin and constitution.

While Miller tells us he obtained the Pine Strawberry from a friend in Amsterdam, who derived it from Surinam, Duhamel speaks positively of its having been raised from the seed of the Chili Strawberry. Both may be right, for the Dutch settled at Surinam in 1654, and on the higher lands of that tropical country many plants from cool climates prosper; and from the beginning of the world a Dutchman would have

a garden wherever he himself might be planted, and would gather treasures from all climates to furnish it. That the Pine Strawberry is closely related to the Chili is sufficiently evident to give reasonable colour to Duhamel's declaration.

(To be continued.)

## GARDEN STRAWBERRIES.

BY MR. J. WRIGHT.

"DOUBTLESS God could have made a better berry than the Strawberry, but doubtless God never did." Thus wrote a quaint old doctor many years ago. He loved Strawberries when there were no such varieties as we have now, and it may be fairly assumed if he could be with us to-day he would be in the seventh heaven of delight. He has a large heritage of lovers of the luscious berries, and though all the millions of Strawberry eaters cannot be expected to agree that it is the best of all fruits, yet no other that grows and ripens in our gardens is so popular during its period of use in June and July. It is without a doubt the prince of hardy dessert fruits of early summer, and may be grown in every garden in the land, large or small, in town or country, that is capable of producing good crops of Peas and Potatoes. The Strawberry is, indeed, a better town plant than either of the familiar kinds just mentioned, at least the varieties with broad, glossy, recurving leaves are, such as Kecns' Seedling, but those with woolly or downy foliage, and more or less cupped for catching the smuts, are best in the pure air of the country. The Strawberry, then, is a good town and suburban garden fruit, and might be grown in hundreds of small enclosures from which it is now absent; and I am not aware that so much that is good can be obtained in an equally limited space as from a well grown and heavily fruited plant of the Strawberry. As I should like the greatest possible number of persons who have the necessary means to have a few Strawberries of their own growing I direct attention to the adaptability of the plant to the smallest gardens in which fruit of any kind can be cultivated.

The Strawberry is naturally and essentially a midsummer fruit, and in the great majority of gardens the crops are over all too soon. By special effort and adequate means Strawberries can be had during every month in the year, but I am not one of those who think an all-the-year-round supply of any kind of fruit generally desirable. The appetite does not grow with what it feeds upon when it feeds continually on the same kind of fruit. It is the periodical breaks in the supply, and the change consequent thereupon, that give zest and enjoyment to that which is produced at the different periods of the year. Forced Strawberries can be had in February, March, April, and May, then comes the great natural feast in June and July. Alpines can be had in August and September, and in the last-named month second crops may be produced from early forced plants, duly cared for and planted out. These continue in October. Others of the forced plants, but later, can be made to bear second crops in pots in November, December, January, and I have seen them in February. Thus is the Strawberry chain linked round the year. But some of the links are very weak, and cost a great deal more than they are worth in producing. British gardeners, however, like to accomplish feats of skill, and the endeavour is most worthy. Give them the means, and I believe we have men in our ranks who can achieve anything that is possible in the art of cultivation.

It is not my intention to dwell on the manner in which exceptional "feats" are performed under exceptional circumstances by exceptional men, for only a few can dance on the gardening tight rope creditably, and the great majority can spend their time more usefully in other ways. I prefer, then, to dwell on the more useful aspects of Strawberry growing, with the object of eliciting information relative to the best methods of providing the best supply of fruit over the longest period in a natural way; or, in other words, we will try, if you please, to keep in view the requirements of the many rather than the fancies of the few in the production of a satisfactory supply of this much coveted and delicious fruit.

The great desire of the majority of gardeners and owners of gardens is to have a plentiful daily supply of fine well-flavoured fruit from the earliest possible date to the latest in the Strawberry season. In endeavouring to attain this object four questions arise for consideration—namely, 1, choice of varieties; 2, sites for the plantations; 3, soil and its preparation; 4, methods of cultivation.

### EARLY STRAWBERRIES.

More than thirty years ago I gathered Peas sown and grown in the open 150 miles north of London on the 25th of May. Since then at the least a dozen varieties have been introduced as a week earlier than their predecessors. If they had maintained their precocity we should have a

gain of about three months in earliness. But they did not. It is a question if more than a week has been gained in time during that period, but there has been a good gain in size and quality. How stands the case with Strawberries? I am inclined to think it is much the same. Have we gained more than a week in earliness by new varieties during the same period of time? If we have gained a week it is a good advance. I doubt if we have gained more, except perhaps with one variety. In those far past days I gathered ripe fruit of Black Prince on the 2nd day of June. Has anyone here gathered outdoor Strawberries a week before that date, and if so, where, and of what variety? But we have gained distinctly in both size and quality, and Black Prince is practically obsolete. We have made good progress therefore, and now the question that the great scattered community of Strawberry growers want answering is this, Which are the best, most reliable, and distinctly early Strawberries? Can the collective wisdom of this assembly answer that question?

If I were compelled to limit myself to one early Strawberry I should not hesitate to choose Laxton's Noble. Some person may possibly object because it is not of the highest quality. It is good enough for me to begin with, and it is good enough for a noble lord who likes Strawberries; but he likes money too, and his gardener is expected to make as much as he can by selling the best produce, supplying the house with "seconds." Several lords do this sort of thing nowadays. It seems fashionable. In the garden of the noble in question was a bed of the Noble Strawberry this year. The fruit was splendid, and the gardener thought he was going to make a little fortune by it, for he, very properly, has "commission" you know. But his lord and master showed that he liked fine Strawberries better than money, for he would not have a pound of them sold, or it would have brought him 2s. It was of no use telling him the fruit was only of second quality. It was the first and the finest, and as there was none for comparison it was the *best* at the time, and as I have said good enough to begin with, and as the richer sorts followed they would be enjoyed the more. I place Noble, then, first on *my* list as the most useful early Strawberry, and reliable in being such a good grower and bearer, even when the plants are small and the soil not rich. Noble was raised from Forman's Excelsior, and I saw fruits of it in 1886 that measured upwards of 7 inches in circumference round the shoulders.

Totally different in character is the next to be named, indeed it is of a different race, and so far as I know it is the earliest Strawberry in cultivation in this country. It is an American introduction, and has been mentioned in the press as the Crescent and Crescent Seedling; but Mr. Rivers, I believe, though I have not asked him, received it under the name of Crescent City. An award of merit was recommended for some berries of it from Messrs. Paul & Son, Cheshunt, by the Fruit Committee at the last meeting of the Royal Horticultural Society. The fruit is small but not trashy. It is very bright and of good quality. It may be described as an enlarged form of the Grove End Scarlet, and the best descendant of the old Scarlet Virginian Strawberry that has found its way to our gardens. It is a free grower at Chiswick, and produces fruit bountifully in large clusters or panicles. Mr. Barron mentions as a peculiarity of this Strawberry, which may be regarded as a merit, that the fruits hang on the plant after they are ripe longer than those of any other variety. It is essentially a garden Strawberry, and not likely to be a profitable market variety. The correct name of it is, I suspect, Crescent Seedling. It has been grown under that name in America for some years, and was raised by Mr. Parmelee of New Haven, Connecticut. This is what an American author and fruit grower, Mr. Roe, said about it in 1880—"It is a very distinct and remarkable variety, and I think will fill an important place in Strawberry culture. In productiveness on many soils it will exceed any variety with which I am acquainted. The young plants are small and the foliage is slender and delicate, but they have the power to live and multiply beyond that of any other variety I have seen. It thrives under the sun of Georgia, and cares naught for the cold of Canada; it practically extends the domain of the Strawberry over the continent, and renders the laziest man in the land who has no Strawberries without excuse." Please to remember that is what an American says, not what I say, and he figures a fruit  $1\frac{1}{2}$  inch in diameter. The variety is sure to be tried in many gardens in this country, but how it will answer time only can tell. What we know is that it is the earliest of all in the Chiswick collection.

The best in quality probably of all early Strawberries is Laxton's King of the Earlies, and in soil that suits it the plants grow and bear well. The fruits are small to medium size, or in other words, small in poor, medium-sized in good soil. It is useless for light and impoverished soil, as the plants will not grow. It may, perhaps, be described as one

of the worst varieties for bad Strawberry soil, as Noble is one of the best. They practically ripen at the same time, and nearly a week after Crescent Seedling.

One other distinctly early Strawberry may be named—Pauline, but it is exceedingly capricious. In one garden I find large fruits of it ripe with King of the Earlies; in another they are small and unshapely. It is a variety to be tried experimentally, and where it succeeds it will probably be increased, for in the best form the fruit is good in size and quality.

On warm sandy soils and sheltered positions Marguerite ripens early, and produces magnificent fruit, but is not to be relied on in cold soils and districts. I may refer to it again.

LATE STRAWBERRIES.

We will now pass to the late Strawberries, and if the best of these can be determined by experienced cultivators their verdict will be acceptable to the less experienced, who desire to extend the Strawberry season, but are in doubt as to which varieties to plant. Bear in mind that profit is not the object, but pleasure—the pleasure of gathering good dishes of fine Strawberries when the crops have been over a fortnight in a neighbour's garden. I think I never saw a clergyman so pleased as when in this position, and it was not a selfish pleasure, for he gave most of his fruit to his friends, the sick poor having the first claim to his produce. The variety was Eleanor (sometimes, I believe, called Oxonian). It is the largest late Strawberry I have grown, though I am not sure it is the best and most useful, when handsome fruits of Elton Pine are remembered at the same time, and perhaps a little later.

Frogmore Late Pine lingers long in the beds, but, like Pauline, the variety seems to have peculiar preferences, and in some gardens is of little or no value.

Waterloo is a Strawberry to plant for succeeding the midseason sorts. It is not the latest, but the largest and darkest, and the only late Strawberry I know that is wanted before it is ready. This is the Chiswick experience, and those who "take" the fruit from there anxiously wait for the great crimson purple berries of Waterloo, and wonder they are so long in coming. As pointing to a well marked distinction between early and late Strawberries, it may be stated that when the crop of Crescent Seedling was ripe this year at Chiswick the plants of Waterloo were expanding their flowers.

Loxford Hall Seedling is one of the latest, and where it succeeds one of the best. I have seen it succeed admirably, but am bound to add that I have also seen it fail disastrously.

Trial rows of Strawberries form an interesting feature in gardens, and cost little; while if a few varieties fail the knowledge gained affords abundant compensation. I know of no other method of determining the varieties which will give individual cultivators such complete and permanent satisfaction.

The varieties suggested for trial for affording the earliest and latest supplies then stand thus:—

EARLY.

- Noble.
- Crescent Seedling.
- King of the Earlies.
- Pauline.
- Marguerite.

LATE.

- Elton Pine.
- Eleanor.
- Waterloo.
- Frogmore Late Pine.
- Loxford Hall Seedling.

If I were limited to six out of the ten varieties named I should take the first three in each case; but should like them all to be tried in gardens in which they have not hitherto been grown. The best early and late sorts settled, a good and varied midseason supply is easily produced.

(To be continued.)

[The conclusion of Mr. Shirley Hibberd's and of Mr. J. Wright's papers are unavoidably held over until another issue. The publication of the admirable papers on "The Market Culture of Strawberries," by Mr. G. Bunyard, and on "Seedling Strawberries," by Mr. Thomas Laxton, must also be postponed, owing to the demand on our space this week.]

THE LATE MR. B. S. WILLIAMS.

IN our brief note last week it was impossible to give any details of the late Mr. Williams' career. We therefore take the first opportunity to furnish our readers with an outline sketch of his life. Mr. B. S. Williams was born at Hoddesdon on March 2nd, 1824, his father being a gardener, who at the age of ninety-four is still alive. After a due period of schooling Mr. Williams commenced his gardening career at the age of fourteen under his father in Mr. John Warner's garden at Hoddesdon. Leaving there after three years' service he spent some time in another garden, where he began exhibiting Pansies, with other

plants and flowers. He was also in Messrs. Paul & Sons' Nursery at Cheshunt, and then returned to Hoddesdon for a time, and was appointed gardener to Mr. C. B. Warner. In the service of this gentleman he made his name as a highly successful plant cultivator and exhibitor, excelling specially with Orchids.

In 1851 Mr. Williams contributed a series of articles to the *Gardeners' Chronicle*, entitled "Orchids for the Million," which were subsequently republished as the "Orchid Growers' Manual," a book that has obtained a large share of popularity, being now in its sixth edition. Several other books on Ferns and stove and greenhouse plants have also been published by Mr. Williams, which are familiar in many garden libraries. To Mr. Warner's fine work, "Select Orchidaceous Plants," Mr. Williams also contributed, and later still he commenced the monthly issue of the "Orchid Album," devoted entirely to coloured plates and descriptions of Orchids, eight volumes having appeared up to the present time, comprising nearly 400 plates.

Mr. Williams commenced business as a nurseryman in 1856, at the Seven Sisters Road, Holloway, in partnership with Mr. R. Parker, but afterwards removed to Upper Holloway, where the Victoria and Paradise Nurseries have gained considerable fame for the collection of choice Orchids and plants of all kinds. A short time since Mr. B. S. Williams took his son Mr. Henry Williams into partnership, who for some years has rendered his father valuable assistance in the management of a large business. Mr. Williams was a frequent visitor to the principal horticultural shows in the kingdom, both as judge and exhibitor, and his unvarying genial manner endeared him to thousands of horticulturists.

The funeral took place at Highgate Cemetery at 12 noon on Monday last, when a large number of friends assembled, nearly 400 gathering round the grave. Flowers were contributed in profusion, and ample testimony was afforded of the high respect in which the late Mr. Williams was held by all who knew him.

EVENTS OF THE WEEK.—This is the height of the Rose Show season, and the exhibitions follow rapidly for the next week or two. To-day (Thursday, July 3rd) Shows will be held at Bath, Farningham, and Norwich. On July 5th the National Rose Society's Metropolitan Exhibition will be held at the Crystal Palace, Sydenham, the great event of the Rose season. On July the 8th the Royal Horticultural Society's Fruit, Floral, and Orchid Committees meet at the Drill Hall, Westminster, at twelve noon. Shows will also take place on the same day at Winchester, Ipswich, and Gloucester. July 9th is devoted to shows at Teddington, Brighton, Diss, Ealing, and Tunbridge Wells.

— THE WEATHER IN THE METROPOLITAN DISTRICT has been generally wet and dull, relieved by comparatively few hours' sunshine. Many gardeners and farmers would now gladly welcome a change to a summer temperature and a clear atmosphere.

— AT the RICHMOND (SURREY) HORTICULTURAL SOCIETY'S SHOW last week Mrs. Ford had a floral stall for the benefit of the Gardeners' Orphan Fund. It proved a great success, realising a profit of £6 6s. 6d. for the Fund, and Mrs. Ford wishes to thank the numerous donors of flowers and the ladies who assisted her on that occasion.

— AN extremely NOVEL TABLE DECORATION was recently provided at Stafford House, the London residence of the Duke of Sutherland, and one of the most palatial mansions in the metropolis. The idea was a winter scene and snowstorm, and it was carried out in an artistic manner by the gardener, Mr. Peter Blair. At each end of the table was a large branch of tree-like proportions of the common Birch, denuded of its leaves and covered with flour, powdered glass, or plaster of Paris secured to the branches by a previous moistening with water. Around these were stems and leaves of *Arundinaria falcata*, *Cupressus*, and *Ivy*, the centre of the table being occupied with a large block of ice covered with snowclad *Ivy*. Silver plate was employed on the table, the only colour being afforded by the fruit, handsome samples of Nectarines, Peaches, Grapes, Strawberries, &c. For a summer table a cooler effect could not be produced, and when lighted up the appearance was most beautiful.

— THE same evening we inspected an example of Mr. Wills's tasteful work in FLORAL DECORATION at a mansion in South Audley Street. Roses, White Lilies, and *Hydrangea paniculata* were almost exclusively employed with Ferns, Palms, and other foliage plants, but the manner in which they were arranged in recesses on the staircase, in the windows,

on mantel-shelves, and in fire grates was faultless. Mr. Wills has given so many examples of his taste in this work that no commendation can be of much advantage to him, but the graceful combination of the flowers and plants named was something to be proud of, entirely free from formality, effective and graceful in the extreme.

— MR. W. BAYLOR HARTLAND, Cork, sends us a DAFFODIL ALBUM, containing thirty-two faithful woodcut illustrations of Daffodils, from drawings by Miss Gertrude Hartland, but no descriptions are included.

— WASHING THE STEMS OF TREES—I have long considered that too little attention has been paid to the washing and wetting the boles of trees during times of drought. I think if it was practised good results would follow.—W. T.

— BIRMINGHAM GARDENERS' ASSOCIATION.—A special meeting was held on the evening of June 24th for the purpose of an exhibition of cut herbaceous plants, and some of the well-known trade growers were asked to contribute a few specimens of the rarer and less known species and varieties. Messrs. Backhouse & Son, York, sent a select collection, amongst them *Pæonia sinensis* varieties—viz., Modesty, Whitleyi plena, and Madame Bacon, all beautiful varieties; *Campanula persicifolia alba grandiflora*, *Primula reticulata*, *Clematis evecta*, *Cypripedium spectabile*, *Lilium Washingtonianum*, *Inula glandulosa*, *Tropæolum polyphyllum*, and some handsome varieties of Spanish and herbaceous Iris, &c. Messrs. Harkness & Sons, nurserymen, Bedale, also sent a large collection. Mr. Thomas Ware, Hale Farm Nurseries, Tottenham, contributed a grand collection, including many fine Liliiums. Messrs. Richard Smith & Co., nurserymen, Worcester, sent a good group, including *Erigeron multiradiatum*, *Ligularia macrophylla*, *Spiræa Aruncus elata*, *Sidalcea candida*, *Dictamnus Fraxinella*, *Orchis foliosa*, and *Pæonia* varieties. Messrs. Hewitt and Co., the Nurseries, Solihull, sent a well set up stand of handsome flowers. Messrs. Sutton & Sons, Reading, contributed a collection of outdoor flowers, including bulbous Irises, *Spiræas*, in variety, new varieties of Sweet Peas, Shirley and Iceland Poppies, *Melica altissima*, a very distinct and handsome ornamental Grass with pale purple bracts, and some fine *Gloxinia* flowers. Mr. W. B. Child, florist, Acock Green, had a standard of herbaceous flowers well arranged. Mr. Jinks, gardener to J. E. Wilson, Esq., Wyddington, and Mr. Cryer, gardener to J. A. Kenrick, Esq., Berrow Court, also exhibited well. Hearty votes of thanks were awarded to each exhibitor, and the Exhibition will give an impetus to the further culture of herbaceous plants, as a large number of gardeners were present, and note-taking general. A general interesting discussion followed.

— HAM GREEN FAVOURITE TOMATO.—Any expression of opinion as to the value of this variety in comparison with other well-known varieties will be acceptable to myself and others. At least 250 plants of it are growing in one of the houses of Tomatoes at Mr. Henry Whateley's, Kenilworth, and for earliness and cropping it is much behind Hackwood Park, and a selected rough red variety, of which Hackwood Park is a parent, grown extensively here, and wonderful croppers.

— IXORA WESTI is not much known, but it is a great acquisition, new in colour, and a beautiful variety. The trusses are large, of a lovely cerise pink colour, and the foliage fine, and the plant has a good constitution. A good specimen of it is now in bloom in Mr. Alderman Marriott's garden at Coventry. Mr. Finch, the gardener, has a very beautiful variety of *Cattleya Mendeli* in flower, the petals and tube pure ivory white, and the labellum richly coloured.—S. H.

— LEEDS INTERNATIONAL EXHIBITION.—We have received the schedule of a "Floral and Horticultural Fête" to be held in connection with the above Exhibition, on July 22nd and two following days. Very good prizes are offered in thirty classes, and a good general display should be forthcoming. Mr. J. H. Clark, who was for many years the Secretary of the Leeds Horticultural Society, has undertaken the management of the Show. Mr. Joseph Davis is the General Manager of the permanent Exhibition.

— ALEXANDER AND WATERLOO PEACHES.—A correspondent who had trees of these varieties from Mr. Rivers says the former is a freestone, the latter more of a clingstone and much the darker in colour of the two. The fruits of Alexander that we have seen were

clingstones. Another good Peach-growing gardener regards the two varieties as practically the same. Can any of our readers reconcile the differences of opinion that appear to exist on those points?

— ROSE BLOOMS.—Mr. Frank Cant, Braiswick, Colchester, sends us a box of fine Rose blooms comprising some good varieties, but the flowers had suffered somewhat in transit.

— GARDENERS' ORPHAN FUND.—The usual monthly meeting of the Committee took place at the Caledonian Hotel on the 27th ult., Mr. John Laing presiding. The minutes of the last meeting having been read, the Hon. Secretary laid upon the table a balance-sheet of receipts and expenditure of the recent Covent Garden Floral Fête, showing a clear gain of £173 8s. 7d. A draft report of the Committee and balance-sheet for presentation at the annual general meeting was read and adopted. Several matters of detail connected with the annual meeting and dinner were completed, and a cheque for the quarter's allowances to children on the Fund, amounting to £65, was ordered to be drawn. The third annual general meeting of subscribers will take place at the Cannon Street Hotel, E.C., at 2 P.M. on the 18th inst., and the annual dinner at 5 P.M., Mr. Shirley Hibberd presiding.

FIG. 4.—DENDROBIUM WARDIANUM. BARON SCHRÖDER'S VARIETY.

— ATTENDANCES AT FLOWER SHOWS.—A correspondent writes, in answer to the inquiry if any show has an attendance in two days larger than 47,000, that at Shrewsbury Floral Fête in 1888 43,000 visitors attended the second day alone, and about 11,500 on the first day, making a total of nearly 55,000 in two days, the receipts being nearly £2800. Last year both days of the Show were unfortunately very wet, yet 45,000 visitors were present, the total receipts being nearly £2500.

— BIRDS, CATERPILLARS, AND POISON.—I observe the Americans use bisulphide of carbon as an insecticide, and Professor Cook says it is the best known. For some years the sparrows have kept the Gooseberry caterpillar down in my garden. Previously I kept them under by using a little hellebore before the eggs were deposited. I never saw a caterpillar upon a bush that I had sprinkled with the powder. The hedge sparrows exterminated the "borers." After these birds were destroyed I kept them under by tapping the bushes with a stick, then as they dropped by their silken threads I killed them. Not many years since I saw acres of pasture completely destroyed by caterpillars, which followed immediately on the season after the timber of a large wood was cut. Orchard trees and bushes may be sprayed with insecticides, but it is, I fear, impracticable to do so with trees in extensive forests. Birds must, to a great extent, be the agents in these. Prevention is the proper course if it can be attained. Killing caterpillars in many cases is killing them after the work of destruction is done. If the spraying of fruit trees with insecticides would have the same effect as the hellebore had with the Gooseberry caterpillar, then the problem would be solved, but it would be absolutely necessary to do this annually, or perhaps several times annually. Proprietors would do well to make a plantation or two suitable for the breeding and preservation of insect-eating birds near both plantations and orchards.—W. T.

— DEATH OF MR. GEORGE DEAL.—It is with deep regret that we have to announce the death of Mr. George Deal, who was for many years a prominent figure in the horticultural world. The sad event took place on the 30th ult., a few days after his fifty-sixth birthday. Mr. Deal's condition had for some time been watched with considerable anxiety, as he was seized with an apoplectic stroke on the 9th of April, and gradually declined until his death. He was connected with the firm of J. Weeks & Co. for thirty-three years, entering their service when quite young, and becoming a member of the firm twenty-two years ago. Mr. Deal enjoyed the deep respect and esteem of his partners and employes, and also of a very large circle of horticultural friends and acquaintances. He was Chairman of the Gardeners' Orphan Fund from the date of its establishment, and did invaluable work for that Institution, invariably displaying the utmost zeal, attention, and courtesy in his labours on its behalf. The deceased gentleman leaves a widow, but no children. The funeral will take place on Saturday, July 5th, the cortège leaving his residence, Wroxton Grange, Mount Park Road, Ealing, at 9.15 A.M., and journeying from the Necropolis Funeral Co.'s station, Westminster Bridge Road (near Waterloo station), at 11.45 A.M. for Woking Cemetery.

— IT is also with much regret that we have to announce the DEATH OF MR. FRANCIS DANCER, late of Little Sutton, Chiswick, which happened on the 29th ult., at 21, Gordon Road, Ealing, in the 75th year of his age. Mr. Dancer was one of the noted market gardeners of Middlesex, and was for many years a prominent figure at the meetings of the Royal Horticultural Society, of the Fruit Committee of which he was for several years a member.

— WE have heard with much pleasure that MR. RICHARD SMITH-CARINGTON, who is this year Mayor of Worcester, has become the possessor by purchase of the estate and manor of Ashby Folville in Leicestershire, the ancient seat of the original Lords Carington.

— THE BIRMINGHAM BOTANICAL GARDENS.—There is invariably something of interest to be noticed here, as cultivation receives so much attention. During a hasty run through the houses recently I noticed two large plants trained to the roof of *Cereus Macdonaldiae* with large flower buds ready to expand, but as this plant flowers only at night I did not see it in full bloom, as it expands in the evening and closes early in the morning. The flowers are of a creamy white colour, and quite 14 inches in diameter when expanded. *Hoya globulosa*, trained across the rafters in the same intermediate house, was in full bloom, a strongish grower like *H. imperialis*, with cream-coloured very fragrant flowers, and very free blooming. Several plants of a new variety of *Spiraea japonica* are in flower, the spikes or plumes being larger and denser and decidedly superior to the old *S. japonica*. Mr. Latham was not certain as to its correct name. It looks like a plain-leaved *Hoteia japonica variegata* in growth, and I am wondering if it is the *Spiraea compacta multiflora* one of the Dutch growers is offering.

— SEVERAL ORCHIDS were in flower, amongst them the very pretty small growing *Oncidium uniflorum*, pale yellow with brown markings; *Nanodes Medusæ*, a South American plant, and a cool house Orchid, with a singular flower with a broad ciliated labellum, and of a dark cinnamon colour, the plant having a squat trailing habit, and very interesting. A fine collection of *Cypripediums* is grown here, and amongst several in flower is a plant of the very fine *C. Curtisi*, a distinct species, with a large broad pouch. We rarely meet with *Crossandra undulæfolia*, an East Indian stove plant of rare beauty, with flowers very much like *Lychnis Haageana* in colour. It is closely allied to *Aphelandras*, a plant of smallish growth and easy culture. There is a good specimen of *Godwinia gigas*, a striking Aroid from Nicaragua, with a 4-foot long stalk curiously marked. A plant in bloom of the beautiful but seldom seen *Philicia buxifolia* was a welcome sight. Hardy herbaceous plants are well cared for, but I had not time to see the general collection. Against the plant houses on the borders are many beautiful species of *Cistus*, and other less hardy plants here in this part of the midlands. Amongst those now in flower *Olearia macrodonta*, with handsome strongly toothed foliage, and corymbs of small white Aster-like flowers. This plant has been in the position it now occupies for five years. Close by is a plant of *Eurybia Gunni*, a small growing shrub, with dense clusters of small Michaelmas Daisy-like white flowers.—D.

#### BATEMANNIA WALLISI.

THE Batemannies and some of their relatives have been rather neglected by Orchid growers in recent years, chiefly because they have been found difficult to manage successfully, and no one likes to be troubled with plants that have perpetually a weakly or unhealthy appearance. Perhaps the key to the successful culture of these plants is to be found in affording a plentiful supply of water during the time the plants are growing, and in shading them constantly from the sun. Under such conditions as these Batemannies flourish in several well-grown collections of Orchids, and the

FIG. 5.—BATEMANNIA WALLISI.

distinct character of the flowers renders them especially worthy of attention.

An example of a new species was shown by Messrs. F. Sander and Co., St. Albans, at a meeting of the Royal Horticultural Society's Orchid Committee on June 10th last, and a first-class certificate was awarded for it. The plant was a strong one, indicating that Batemannies, like all other Orchids, are extremely well grown at St. Albans. It had one large flower (fig. 5) 4 inches in diameter. The sepals and petals hard, thick, fleshy, with a peculiarly warted but highly polished surface. The apical half of each sepal and petal is a rich glossy brown, the base white, the petal having two dark spots in the centre. The lip is white and fringed at the base, tipped with brown, and the column is also coarsely serrated. The flower has an effective appearance.

#### DENDROBIUM WARDIANUM, BARON SCHRÖDER'S VARIETY.

Many fine varieties of *Dendrobium Wardianum* have been introduced, but that of which a flower is depicted in fig. 4 is one of the best, and in some respects the most handsome yet obtained. It was shown early in the present year, and formed one of the special attractions of the meeting.

The flowers are of great size and substance, the sepals and petals heavily tipped with intensely rich crimson; the sepals are deeply flushed with a lighter shade of crimson, but the pure white of the basal portion of the petals brings the colouring into fine relief. The lip is broad and rounded, but indented at the tip,

having two maroon blotches at the base, then yellow and white zones and a crimson tip.—L. CASTLE.

## ROYAL HORTICULTURAL SOCIETY.

JUNE 24TH.

SCIENTIFIC COMMITTEE.—Present: Dr. Masters in the chair; Mr. Wilson, Rev. C. W. Dod, Mr. McLachlan, Professor Church, Dr. Oliver, Mr. Michael, Mr. Pascoe, Dr. Müller, and Rev. G. Henslow, Hon. Secretary.

*Iris reticulata*, protection against Mildew upon.—Rev. C. W. Dod described his experiments of dusting the bulbs of this Iris with flowers of sulphur before planting them, as well as the ground where they were placed, in August, 1889. The remarkable effect was to arrest all attempts at growth, the bulbs being this year exactly in the same state as when planted. Professor Church suggested that the cause of the arrest might be due to a slow oxidation of the sulphur, producing sulphurous acid, which could be absorbed by the tissues, coupled with a consequent deprivation of oxygen necessary for the development of roots.

*Blight*.—Mr. Wilson remarked on the excessive prevalence of blight this year, *Iris Kämpferi* being for the first time attacked by thrips.

*Datura Leaves*, diseased.—Dr. Masters exhibited some leaves with small spongy-like processes by the ribs, &c. They were referred to Dr. Oliver for examination and report.

*Spanish Iris with Supernumerary Parts*.—Dr. Masters exhibited some flowers with four petals instead of three, and one with a four-celled ovary. The multiplication of parts had followed the choris or bifurcation of the fibrovascular cords of the organs in question.

*Bigenes (?) between Raspberry and Strawberry*.—Dr. Masters exhibited drawings of the flower of this remarkable plant, which Mr. Culverwell has raised. It is generally known as *Rubus Leesii*, *Bab*. The pedicel and sepals are finely setose, but it wants the epicalyx of the Strawberry. Moreover, the carpels of the hybrid are setose and not glabrous. They appear to be abortive. Prof. Babington in his *Manual of British Botany* records it as being found at Ilford Bridges, Devon, and Dunster, Som., with a reference to "A. N. H., ser. 2, ix., 124."

*Hybrid between the Black Currant and Gooseberry*.—He also showed drawings of various organs of this hybrid, also received from Mr. Culverwell. The foliage more nearly resembles that of the Gooseberry, being glabrous, except along the nerves of the under surface. The petiole, however, is glabrous and not hairy as in the Gooseberry. It has no glands as the Black Currant. The inflorescence is a many-flowered raceme, intermediate in length between the many-flowered Currant and the few-flowered Gooseberry. The flowers are larger than those of either parent, with the sepal lobes erect and not reflexed as in them. The stamens are contabescent, and the style is villous in the middle, whereas those of the parents are glabrous. The stigma or apex of the style is deeply cleft, those of the parents being sub-capitate and obscurely two-lobed.

*Laelia*, two-lipped.—Dr. Masters also showed the not uncommon production of two labella in this Orchid. It is probably due to choris.

*Antirrhinum*, with viresecent corolla.—He exhibited a specimen with the corolla in the form of a calyx, but undertook to examine it further and report upon it.

*Bigenes Orchid*.—Mr. Veitch exhibited an interesting plant called *Epiphronitis Veitchi*, being a bigene between *Epidendrum radicans*, the male parent, and *Sophronitis grandiflora*, the female. It received a first-class certificate, and was unanimously awarded a botanical certificate by the Scientific Committee.

*Caleolaria*, dying off.—Mr. Henslow showed plants which had suddenly died in his garden. They had decayed in the lower part of the stem, having the cortex split for a length of about an inch. Mr. Wilks said he was familiar with the fact, and attributed it to the plants having first suffered from drought and then being overwatered, the sap was thus unable to rise and burst the tissues. Mr. Henslow observed that this interpretation corresponded with the conditions of the case in question. It was a small crimson-flowered variety with hairy foliage. The common yellow coloured species showed no signs of injury whatever.

*Pistacia Lentiscus*, Galls on.—Mr. Henslow exhibited branches of this plant from Malta covered with flat galls formed from the metamorphoses of the leaflets, which had assumed a "leguminous" shape. It is not uncommon in the Mediterranean regions. Mr. McLachlan observed that at least four species of aphides make galls on the *Pistacia*. Mr. Dod observed that Cicero speaks of the *Lentiscus* bearing fruit thrice a year; but that this was probably to be explained by the gum being collected three times annually.

*Orange*, Pistilody of Stamens in.—Mr. Henslow showed specimens of this malformation. It was well known before, but, as Dr. Oliver observed, it appears to be rather more common than usual during the present season.

*Caprificus*, or Wild Fig.—Mr. Henslow showed fruits of the Wild Fig from Malta, used by the peasants for "caprification" or fertilisation of the autumn varieties of cultivated Figs. Unlike the latter, the Wild Fig called "Duccar," invariably grows in walls or crevices of the rocks. It produces three crops per annum, each supplying a brood of the Blastophaga. The Fig is not required for the summer or "St. John's" Fig, which ripens about the end of June, the 24th being St. John the Baptist's Day, as this Fig contains both male and

female blossoms. Mr. Henslow could find no male blossoms at all in the first or winter crop of the Duccar. It is not known whether the autumn Figs are entirely female or not, but a Maltese botanist, Signor Gatto, has undertaken to make a thorough investigation upon this and other as yet obscure points involved in the caprification in Malta, as it appears to differ in some respects in other countries.

ROSE SHOW FIXTURES, 1890.

\* In the case of Brighton and Winchester, where the Shows extend over more than one day, the date of the first day's exhibition only is given.—EDWARD MAWLEY, *Rosebank, Berkhamsted, Herts.*

### MANNERS AND CUSTOMS OF ROSES.

MR. RAILLEM'S notes on "Manners and Customs" have been very useful to me, particularly by reason of their hints as to which Teas do best as dwarfs and which as standards. I should therefore be glad to hear that he is likely to continue these notes to the end of the list of foremost Teas, but if this is not practicable, I shall feel obliged if he will be good enough to inform me whether the dwarf or the standard is the better mode of growing the following:—*Perle des Jardins*, *Princess Beatrice*, *Rubens*, *Souvenir d'Elise*, *Souvenir d'un Ami*, and *The Bride*. I grow all these, but do not succeed with them, and if you allow me to ask the question, and if Mr. Raillem will kindly reply through your columns, my indebtedness to the Journal and to these "notes" will be greatly increased.—J. B.

### ROYAL AQUARIUM, WESTMINSTER.—JUNE 27TH AND 28TH.

THE first of the more important Rose Exhibitions in and near the metropolis opened under favourable auspices at the Royal Aquarium on the above dates. The weather, after a heavy morning shower, was most pleasant, and bright anticipations were formed of the coming season when the quality of the flowers was noted. The recent rains appear to have brought on the blooms well, and collectively considered they were excellent, size and form being good, with true, fresh and lustrous colour. Many famous names were found amongst the entries. Mr. B. R. Cant, Messrs. Paul of Cheshunt, Burrell, Burch, Keynes, Williams & Co., Cooling, Prince, and Prior were representatives of the trade; and Messrs. Burnside, Pemberton, Berners, Foster-Melliar, Lindsell, and Slaughter may be instanced among the amateurs. With these names quality is usually associated, and the display on the present occasion was of a high order.

The awards of the Judges, with some notes on the individual exhibits, are appended.

### NURSERYMEN.

The principal class for forty-eight blooms, single trusses, with prizes of £6, £5, £3, and £2, proved an excellent one, the entries being numerous, and the quality of the blooms of a high character. Mr. B. R. Cant, the famous Colchester grower, was placed first for a very fine and even stand, containing several very noteworthy blooms, and all were fresh and well coloured. He showed the following varieties:—Back row: *Lady Mary Fitzwilliam*, *François Michelin*, very large and fine; *Merveille de Lyon*, *Maurice Bernardin*, *Madame Cusin*, very large but coarse; *Etienne Levet*, *Baronne de Rothschild*, *Sénateur Vaissc*, *Her Majesty*, *Mons. Triévoz*, *Marguerite de St. Amand*, *Magna Charta*, *Souvenir d'un Ami*, *John Hopper*, *Souvenir d'Elise*, splendid; and *Ulrich Brunner*, large and very richly coloured. Middle row: *Victor Verdier*, *Marie Verdier*, *Madame Ducher*, *Madame Gabriel Luizet*, *Susanne Marie Rodocanachi*, *Viscountess Folkestone*, *Dupuy Jamain*, *Madame Désir*, *A. K. Williams*, very good; *La France*, *Duke of Wellington*, *Maréchal Niel*, *Duke of Edinburgh*, *Mrs. John Laing*, beautiful; *Marie Baumann*, and *Pride of Waltham*, very fine. Front row: *Madame Hoste*, *Général Jacqueminot*, *Madame Willermoz*, *Alfred Colomb*, *Niphotos*, *Le Havre*, *Innocente Pirola*, *Madame C. Joigneaux*, *Marie Van Houtte*, splendid; *Prince Arthur*, *Catherine Mermet*, *Boieldieu*, *Cleopatra*, *Victor Hugo*, *Marie Verdier*, and a beautiful example of *Madame de Watteville*. The English Fruit and Rose Company (Cranstons), King's Acre, Hereford, were second with a good but somewhat uneven stand, the best flowers being *Le Havre*, *Ulrich Brunner*, *Etienne Levet*, *John Stuart Mill*, *Duke of Edinburgh*, and *Madame Charles*

Wood. Messrs. Paul & Son, the Old Nurseries, Cheshunt, were a good third, their flowers being fresh and finely coloured, though lacking size. Messrs. D. Prior & Son, Myland Nurseries, Colechester, were fourth, two others competing.

Messrs. Keynes, Williams & Co., Salisbury, were to the front in the class for thirty-six blooms, showing the following:—Back row: Lady Mary Fitzwilliam, François Michelin, La France, Star of Waltham, Countess of Pembroke, Madame Chas. Wood, Mrs. John Laing, Sénateur Vaisse, Madame Gabriel Luizet, Etienne Levet, Her Majesty, and Ulrich Brunner, the three last being very fine. Middle row: Constantine Tretiakoff, Niphotos, Horace Vernet, Mons. Noman, François Levet, Madame de Watteville, Heinrich Schultheis, Souvenir d'Elise, Marie Baumann, Jean Ducher, Madame C. Joigneaux, and Maréchal Niel. Front row: Catherine Mermet, Madame Alphonse Lavallée, Francisca Krüger, Alfred Colomb, Amazone, Duke of Wellington, The Bride, Comtesse d'Oxford, Comtesse de Nadaillac, Duke of Edinburgh, Souvenir d'un Ami, and A. K. Williams. Close in the rear came Messrs. Cooling & Sons, Bath, who had a capital stand, with excellent examples of Lady Mary Fitzwilliam, François Michelin, Her Majesty, Mons. Noman, and Mrs. J. Laing. Messrs. G. & W. H. Burch, Peterborough, were third with smaller but well finished flowers, and Messrs. Burrell and Co., Howe House, Cambridge, fourth, several others competing. Mr. B. R. Cant was once more successful with twenty-four trebles, an even, fresh, and finely coloured stand, comprising in the back row: Ulrich Brunner, Her Majesty, Prince Arthur, Merveille de Lyon, Baronne de Rothschild, Duke of Edinburgh, La France, Alfred Colomb, François Michelin, Lady Mary Fitzwilliam, Etienne Levet, and Mrs. John Laing. In the front: Pride of Waltham, Général Jacqueminot, Souvenir d'Elise, Victor Hugo, John Hopper, Souvenir d'un Ami, Dupuy Jamain, Marie Verdier, Innocente Pirola, A. K. Williams, Violette Bouyer, and Marie Baumann. The English Fruit and Rose Co. were placed second with a fresh and even lot, comprising only one or two faulty blooms, and many of considerable excellence. Messrs. Paul & Son, Cheshunt, were third, and Mr. C. Turner, Slough, fourth. There were eight stands in all, so that this was an extensive display.

#### AMATEURS.

Six exhibits of thirty-six blooms, single trusses, represented the amateurs in the principal class, and they showed in excellent form in nearly every instance. Mr. Jordan, gardener to the Rev. Hugh A. Berners, Harkstead Rectory, Ipswich, scored a very creditable victory, his blooms being very fresh, even, and well coloured. In the back row he had Ulrich Brunner, Madame Willermoz, Star of Waltham, Captain Christy, Mrs. J. Laing, Duke of Edinburgh, La France, A. K. Williams, Catherine Mermet, Marquise de Castellane, Her Majesty, and Madame Isaac Péreire. In the middle row, Lady Mary Fitzwilliam, Heinrich Schultheis, Anna Ollivier, Duke of Teck, Merveille de Lyon, Madame Gabriel Luizet, Dupuy Jamain, Innocente Pirola, Etienne Levet, Viscountess Folkestone, Le Havre, and Mdle. Marie Cointet. In the front row, Duke of Connaught, Comtesse de Nadaillac, Marie Finger, Gloire Lyonnaise, François Michelin, Rosieriste Jacobs, Hon. Edith Gifford, Crown Prince, Violette Bouyer, Earl of Dufferin, Madame Cusin, and Jean Soupert. Mr. Bradbury, gardener to S. P. Budd, Esq., 46, Brooklyn Road, Bath, had a fine example of Mrs. J. Laing, a beautiful Charles Lefebvre, and a splendid bloom of Le Havre amongst other noteworthy flowers in his second prize stand, which was in every respect an excellent one. Mr. N. Slaughter, Jarvis Villa, Steyning, was a good third, and Mr. R. S. West, Reigate, fourth. The Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, won with twenty-four singles, a good collection with only one or two weak flowers. The varieties were as follows:—Back row: Heinrich Schultheis, Captain Christy, Alphonse Soupert, Lady Mary Fitzwilliam, Marie Verdier, Marie Finger, Dr. Andry, and Madame Verdier. Middle row: A. K. Williams, Madame Isaac Péreire, Germaine Caillot, Etienne Levet, Pride of Waltham, Mrs. Baker, Marguerite de St. Amand, and Marquise de Castellane. Front row: Baronne de Rothschild, Rosieriste Jacobs, Charles Lefebvre, Duchesse de Vallombrosa, Countess of Rosebery (very fine), Mrs. Harry Turner, Mons. Noman, and La France. The Rev. J. H. Pemberton, Havering, Romford, had a good stand also, amongst the best flowers being Lady Mary Fitzwilliam, A. K. Williams, and Madame Lambard. Mr. E. B. Lindsell, Hitchin, was third with fresh but small flowers, and Mr. J. G. Fowler, Woodford, Essex, was fourth. Mr. E. Wilkins, Lyndhurst, Sutton, had the best twelve singles—namely, Etienne Levet, Madame Isaac Péreire, Dupuy Jamain, Comtesse d'Oxford, Countess of Rosebery, La France, La Rosière, Marquise de Castellane, Victor Verdier, Prince Arthur, Madame Gabriel Luizet, and Maurice Bernardin; Mr. H. Foster, Ashford, being second, Mr. G. P. C. Burnand third, and Mr. J. Bateman, Highgate, London, N., fourth. Mr. Lindsell was victorious with twelve triplets, showing Dupuy Jamain, Duchess of Vallombrosa, Mons. Noman, Duke of Wellington, Violette Bouyer, Mrs. J. Laing, Lady Mary Fitzwilliam, Anna Ollivier, Charles Lefebvre, A. K. Williams, Madame Gabriel Luizet, and Marquise de Castellane. Some of these were small, but they were beautifully finished, and formed a capital stand. Mr. Slaughter was second, Mr. Jordan third, and the Rev. A. Foster-Melliar fourth.

#### TEAS AND NOISETTES—NURSERYMEN.

The Tea classes formed a beautiful display in St. Stephen's Hall, though this building is not light enough for showing Roses to advantage. The class for eighteen varieties, three trusses of each, brought out some beautiful blooms, and resulted in a victory for the well known Oxford grower, Mr. George Prince, whose flowers were in the usual per-

fect condition in which he shows Teas. The varieties were as follows:—Back row: Souvenir de S. A. Prince, Souvenir d'un Ami, Souvenir d'Elise, Maréchal Niel, Innocente Pirola, Comtesse de Nadaillac, splendid bloom, best in the stand; Hon. Edith Gifford, Jean Ducher, and Cleopatra. Front row: Princess of Wales, Alba rosea, Francisca Krüger, La Princesse Véra, Catherine Mermet, The Bride, Anna Ollivier, Marie Van Houtte, and Rubens, very fine. Mr. B. R. Cant, Colechester, followed with a stand worthy of his reputation, his Rubens, Anna Ollivier, Madame Hoste, Madame de Watteville, and Madame Cusin being very fine. Messrs. D. Prior & Sons had some good flowers in their third prize stand, though they had suffered somewhat from the rain. Messrs. Keynes, Williams & Co., Salisbury, were fourth, one other competing. Eighteen single blooms brought a beautiful stand from Mr. B. R. Cant composed of the following:—Back row: Madame Bravy, Madame de Watteville, Madame Willermoz, Catherine Mermet, Souvenir d'un Ami, deeply coloured; and Souvenir d'Elise, a charming bloom. Middle row: Francisca Krüger, Maréchal Niel, Ernest Metz, Marie Van Houtte, Madame Cusin, and Niphotos. Front row:—Hon. Edith Gifford, Ethel Brownlow, Caroline Kuster, Amazone, Innocente Pirola, and Madame Lambard, the latter excellent. Mr. Prince followed closely, his best flower being a magnificent Comtesse de Nadaillac, perfect in form save for two of the base petals, and charmingly fresh. Rubens and Alba rosea were also good. Messrs. Burrell & Co. had smaller but very fresh, clean, bright flowers, Messrs. Keynes, Williams and Co. being selected from the remaining five exhibitors for fourth prize.

#### AMATEURS' TEAS.

The Rev. F. R. Burnside had a very neat stand of twelve trebles, composed of Madame Cusin, Innocente Pirola, Maréchal Niel, Jules Finger, Jean Ducher, Hon. Edith Gifford, Souvenir de Gabrielle Drevet, Marie Van Houtte, Souvenir d'un Ami, Rubens, and Madame Bravy, the majority being somewhat small, but in excellent condition. A very good stand came from Mr. Jordan (gardener to the Rev. Hugh A. Berners); indeed, they pressed Mr. Burnside very closely; Anna Ollivier, Catherine Mermet, Princess of Wales, and the Hon. Edith Gifford were amongst the best. Mr. R. Bonnett, gardener to the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, was third; and Mr. A. Slaughter, Jarvis Villa, Steyning, fourth. Twelves in single trusses brought nine charming stands, the best being a beautiful box from Mr. Jordan. The varieties were Souvenir d'Elise, Madame de Watteville (very fine), Innocente Pirola, Comtesse de Nadaillac, Princess of Wales, Anna Ollivier, Catherine Mermet, Madame Caroline Kuster, The Bride, Amazone, the Hon. Edith Gifford, and Francisca Krüger. These were all charming flowers. Excellent, too, were Mr. Burnside's second prize blooms, Comtesse de Nadaillac, Anna Ollivier, and Hon. Ethel Brownlow being the best. The Rev. A. Foster-Melliar had a capital stand, and so had Mr. E. B. Lindsell, Hitchin, who were respectively third and fourth; indeed, there was something to admire in all the boxes.

#### OPEN CLASSES.

With twelve single trusses of any yellow Rose Mr. Burnside won, showing Anna Ollivier. With three exceptions the flowers were very good, and well deserved the award. Mr. S. G. Rumsey, Wrotham, Kent, was second with the same variety, very neat and fresh; and Mr. B. R. Cant was third with Maréchal Niel. The corresponding class for whites saw Mr. B. R. Cant to the fore with Innocente Pirola. His flowers were large and fine, but showing the effects of the weather. Messrs. Keynes, Williams, & Co. were second with a clean fresh lot of Niphotos; and Mr. G. Prince third with Souvenir de S. A. Prince; a special award falling to Mr. Burnside for a neat stand of Souvenir d'Elise. Crimson were best shown by Mr. B. R. Cant, this noted grower winning well with a capital stand of A. K. Williams, deeply coloured; Messrs. D. Prior & Son were second with Ulrich Brunner, medium size, fresh, bright, and clean; and Mr. Bradbury third with the same variety. The English Fruit and Rose Co. won with twelve of any H.P., showing enormous examples of Ulrich Brunner, one of the finest lots ever exhibited, although one or two flowers were somewhat coarse; Messrs. Cooling & Sons were second with a beautiful box of Mrs. John Laing, fresh and bright; and Mr. E. Wilkins was third with Chas. Lefebvre. There were upwards of twelve in competition. The corresponding Tea class saw Mr. Prince victorious with Comtesse de Nadaillac, fresh and finely coloured; Mr. Jordan was second with Souvenir d'Elise; Mr. R. B. Cant third with the same variety; and Messrs. Keynes, Williams, and Co. received a special award for a delightful stand of Catherine Mermet.

Moss and Provence Roses had one class provided for them, and this filling well proved extremely interesting. Messrs. Paul & Son, The Old Nurseries, Cheshunt, had a charming box composed of the Moss varieties Blanche Moreau, Crested, Common, Angolina Quetier, Julie de Masant, Perpetual White and Baron de Wassenaar, with the Provence Roses Mercedes, Common and White. Mr. Prince came second, also with a breed and fresh display, and Messrs. Cooling & Sons were third.

Vases, bouquets and baskets of Roses were a beautiful display. Messrs. Perkins & Sons, Coventry, showed their usual mastery of bouquet making by their exhibit in that class and were placed first. They also won with a basket, perfectly arranged and finished. Mr. J. R. Chard, Stoke Newington, was first for epergnes. Minor prizes in these classes went to Mr. Chadwick, gardener to E. M. Nelson, Esq., Ealing, Mr. D. B. Crane, Highgate, London, N., and Mr. G. Mount, Canterbury.

Amongst noteworthy miscellaneous exhibits of Roses was a splendid display of Polyantha, single and buttonhole Roses, from Mr. C. E.

Cuthell, Dorking. A fine collection of garden Roses came from the Rev. J. H. Pemberton, and a box of cut blooms from Mr. W. Tayler, Hampton. Blooms of a beautiful new Bourbon named Mrs. Paul came from Messrs. Paul & Son, Cheshunt. The flower is large, as beautifully formed as a Camellia, and of a soft blush hue. A first-class certificate was awarded. A fine collection of blooms came from the English Rose and Fruit Company, and Mr. W. Rumsey, Joynings Nurseries, Waltham Cross, also had an extensive and varied display.

#### REIGATE SHOW.

THE annual Rose Show was held on June 23th. In spite of the late frost and inclement weather it was one of the best ever held, the best box in the Show, Mrs. Waterlow, which took the President's R.H.S. medal, containing faultless Roses, and there being a very general excellence throughout the exhibits. The President, Mr. T. B. Haywood, took the N.R.S. bronze medal with a large and exquisitely coloured Marie Baumann as the best Rose not Tea or Noisette, and the Rev. A. Foster-Melliar the bronze medal for the best Tea, Comtesse de Nadaillac. The prizetakers were as follows:—Open classes: Twenty-four varieties.—First, Mr. Frank Cant; second, Mrs. Waterlow; third, Mr. T. B. Haywood. Twelve Teas (five boxes).—First, Mrs. Waterlow; second, Mr. Frank Cant; third, Mr. B. Cant. Mr. F. Cant showed a marvellous Prince Arthur, and an almost equally fine Souvenir d'un Ami. Twenty-four varieties, members only (seven boxes).—First, Rev. A. Foster-Melliar; second, Mr. R. D. West; third, Mr. E. B. Lindsell; commended, Mr. Slaughter. Six triplets.—First, Mr. Lindsell; second, Rev. F. R. Burnside; third, Mr. Slaughter.

Twelve Teas (members).—First, Rev. A. Foster Melliar; second, Rev. F. R. Burnside; third, Mr. Lindsell. Twelve varieties (eleven boxes).—First, Mr. Wilkins; second, Rev. A. Cheales; third, Mr. Mawley. Nine Teas (eight boxes).—First, Mr. Mawley; second, Mr. Cuthell; third, Rev. A. Cheales. Four triplets (nine boxes).—First, Mr. Wilkins; second, Miss Baker; third, Mrs. F. C. Pawle. Six varieties (three boxes).—First, Mr. Graham; second, Mrs. Hatch; third, Mr. Freshfield. Six Teas (three boxes).—First, Mr. Graham; second, Mr. Freshfield; third, Mrs. Hatch.

Table decorations for six persons.—First, Mrs. Fearon, with a pleasing combination of Poppies, Grasses, and Honeysuckle; second, Miss M. E. Nichol, Irises, Copper Peach leaves, some Poppies. Rose device.—First, Miss G. Baxter. At the close of the judging the Committee, Judges, and other friends were hospitably entertained by the President at his residence at Woodhatch.

#### NATIONAL PINK SOCIETY.

JUNE 27TH.

THE first Show of the above Society was held in conjunction with the Rose Show at the Royal Aquarium on Friday last, a varied and interesting display being provided. The beautiful laced Pinks well deserve a larger share of public favour, and the dozen classes devoted to them proved that an exhibition can be obtained for moderate prizes of scarcely less interest than the Carnations and Picotees afford at a later date.

The chief class was for twenty-four blooms in not less than twelve varieties, in which Mr. C. Turner, Slough, was first for fine clean examples of the following varieties:—Boiard, Rosy Gem, Minerva, The Rector, Bertram, Hebe, Exeelsior, Modesty, Henry Hooper, Empress of India, and Eurydice. Mr. Hooper of Bath was placed second. With twelve blooms Messrs. Turner and Hooper were again the winners in the same order, the best blooms in the first stand being Boiard, Modesty, Device, The Rector, Minerva, and Empress of India. Messrs. Turner, Hooper, and J. Lakin, Oxford, were the prizewinners for six varieties, as they also were for six blooms in three varieties.

The border Pinks were good, but the competition, as in the other classes, was very limited. Mr. Hooper had the best twelve, Her Majesty, Nora, Charmer, and Oliver being noteworthy varieties. Mr. R. Dean was second. Mr. Hooper was also first for six border Pinks, Mr. Turner taking a similar place for the best bunch, one variety, with Anna Boleyn; Messrs. E. R. Johnson's and Mr. J. Thurston's prizes being also won by Mr. C. Turner and Mr. Hooper.

#### FRUIT FORCING.

FIGS.—*Early House*.—As the first crop will be all gathered more moisture will be desirable, therefore resume the syringing twice daily, damping available surfaces whenever they become dry. Thin the fruit for the second crop freely, reserving those which are nearest the base of the shoots, as they finish most satisfactorily, and do not prejudice the ripening of the points of the shoots, which, to insure a full first crop another season, must be kept well up to the light. Tie the growths to the trellis as they advance, stopping or removing such as are not required,

regulating those retained so that they may receive the beneficial effects of light and air to mature them perfectly. Do not allow the trees to suffer by want of water; those in borders of limited extent will require watering freely and frequently, affording on every occasion liquid manure, or a little artificial manure may be sprinkled on the border and washed in.

*Fruit Ripening*.—Where crops are ripening maintain a free circulation of air, enough by night as well as by day to insure evaporation from instead of moisture condensing on the fruit, as in a close atmosphere and moisture pervading the air to the same extent as when the fruit is swelling it will be poor in flavour and be seriously disfigured and spoiled by cracking, indeed Figs ripened in a stuffy atmosphere have a most unpleasant musty flavour. Although less moisture in the soil is desirable when the fruit is ripening, it must not be allowed to become parchingly dry, or the trees will suffer. If necessary afford fire heat to maintain a night temperature of 65°, and 70° to 75° by day, a gentle warmth in the pipes being necessary in dull weather in order to admitting a free circulation of air.

*Trees in Pots for Early Forcing*.—Young trees intended for starting in November to afford fruit in April and early May next year must have every opportunity of making and completing growth, the foliage not being crowded either by the plants standing too close together or the growths suffered to remain too thick. Every part must be well exposed to light, and air freely admitted, in order to a thorough solidification of the growth and the storing of as much assimilated matter as possible in the wood, which in measure determines the degree of fruitfulness and the retention of the fruit. The foliage also must be kept clean by judicious but not over-syringing, always have recourse to it early enough to allow the foliage to become dry before nightfall. Water must be given as required to the roots, affording a little stimulant—indeed liquid manure on every occasion.

VINES.—*Early Houses*.—Vines from which the Grapes have been cut must be well syringed every evening until the foliage is thoroughly cleansed of red spider and dust, afterwards recurring to it occasionally so as to keep the old foliage as long as possible in a healthy condition, for when the foliage dies early from red spider, lack of moisture at the roots, or other cause, second growth not unfrequently sets in when they ought to be going to rest. Admit air to the fullest possible extent, maintaining a moderate degree of moisture in the borders, particularly at the surface, so as to keep the roots there instead of allowing it to become dry, and so causing them to descend in quest of moisture. A moderate extension of the laterals will not do any harm, but good in keeping the sap active, and so preventing early maturity, the loss of the leaves corresponding to the pruning buds; but irregularities, and particularly gross ones, should be checked by pinching or entirely removed. Weakly Vines may be assisted to develop their buds by an application of liquid manure.

*Pot Vines for Early Forcing*.—Neglect in syringing will bring red spider, and negligences in affording water and aliment to the roots bring off the leaves prematurely, therefore syringe if necessary to keep the foliage clean and healthy, exposing it to all the light practicable, ventilating freely. Liquid manure should be given at every watering. Those that have completed their growth should now have less moisture, syringing being discontinued, and the supply of water at the roots moderate, air being freely admitted, keeping the foliage well up to the glass.

*Grapes Ripening*.—Atmospheric moisture to a fair amount is necessary, as its withdrawal causes evaporation to an extent causing the berries to shrivel, and not unfrequently before ripening perfectly, as in Muscats. Damp available surfaces occasionally, in the early stages of ripening in the morning and afternoon, diminishing it as the Grapes put on colour. Inside borders must have a thorough supply of liquid manure—a good soaking in a tepid state, to reach all parts down to the drainage. Outside borders must also be well watered if the weather be dry, mulching in each case at once with some rather dry litter—short, but without manure. This will in most cases be sufficient for perfecting the Grapes. Directly colour is noticed in the berries afford plenty of air, a little fire heat being essential to the high quality of the Grapes, insuring a circulation of warm rather dry air; but allow the temperature to fall to 65° at night, otherwise securing by artificial means a temperature of 70° to 75°, and 80° to 85° through the day for Black Hamburgs and similar varieties. Muscats should have when ripening a night temperature of 70° to 75°, falling to 65° on cold nights, 80° to 85° by day, up to 90° or 95° from sun heat. As Muscats require a longer time to ripen than other thin-skinned varieties there must not be any deficiency of moisture at the roots, as from the somewhat drier atmosphere required to impart the rich amber colour, the unique crackling flesh, and rich pleasing flavour peculiarly their own, the foliage from evaporation may suffer through insufficient supplies of matter for manufacturing into the essential cambium for sustaining the next year's growth and crop in their early stages.

*Grapes Stoning*.—Dull cold weather succeeded by bright sun is the worst possible for scorching and scalding. The best means of avoiding the former is early attention to the ventilation, and for scalding nothing that we have tried succeed so well as a gentle warmth in the pipes with a little air constantly, and free ventilation early and through the day. It is not desirable to close early at this stage, as the Grapes require time to perfect the stoning, and particular attention must be given to the ventilation, not closing early to cause a moist saturated atmosphere, but reduce it by degrees, so that the temperature and hygrometrical conditions may not be greatly fluctuating, which extended over a

period of two or three weeks, will insure immunity from scorching and scalding if not from the equally disastrous shanking. If the weather be very bright a slight shade over the roof lights is very beneficial, a double thickness of herring nets affording all the shade required.

*Grapes Swelling.*—Afford every encouragement; nothing assists so much as a genial condition of the atmosphere, which should be secured by a gentle warmth in the pipes, and sprinkling available surfaces in the morning and afternoon, particularly the latter, the border being mulched with a little short rather fresh lumpy stable manure, additions being made from time to time, so as to insure a supply of ammonia to the atmosphere and nitrogenous matter for washing into the soil each time water is required. The mulching being kept moist will aid in keeping the atmosphere moist, and a never failing attraction of the roots, but avoid a close, saturated, vitiated atmosphere, above all times in close, moist, dull weather. A little ventilation almost constantly will make all safe, but it is desirable to close the house in the afternoon, well damping at the same time, allowing the temperature to rise to 90° or 95°, and after the sun passes the west or at six o'clock, provide a little at the top of the house. It will allow of the air changing, prevent excessive deposition of moisture through the night, whereby the foliage will not be so liable to be scalded or scorched should the sun act powerfully on it whilst wet through ventilation not being given early enough to expel it; indeed, the great cause of scorching is inattention to early ventilation. A night temperature of 65° is ample, advancing early in the day to 70° to 75°, having recourse to artificial means if necessary. Increase the ventilation between 70° and 75°, allowing it to advance to 80° or 85°, between which keep through the day, and close as before stated to rise to 90° to 95°. Permit a steady growth in the laterals, it keeps the roots active, but avoid overcrowding, not allowing the laterals on any account to interfere with the principal leaves, so as to deprive them of light and air—the elaborating and storing of food in the buds at their base, those being the pruning buds. The outside borders should not be neglected where the rainfall is insufficient, and a mulching of fresh lumpy stable manure will lessen evaporation without depriving the soil of the beneficial action of air, warmth, and the moisture of dew and rain.

*CUCUMBERS.*—Attention must be given to plants in full bearing by way of thinning out the exhausted growths and foliage, laying in young bearing wood, stopping one joint beyond the fruit, and earthing the roots periodically. Copious supplies of water or liquid manure will be required about twice a week or as may be necessary, but avoid applying it too strong. Syringe at closing time, and maintain a good moisture all day long by sprinkling available surfaces as necessary, and always with tepid water, attending to it more frequently in hot weather than when dull. Do not overcrop young plants, and do not allow the fruit to hang too long, as upon attention to this depends in a measure a good and continuous supply. A few seeds may now be sown for a late summer and early autumn supply of fruit. They will germinate and the seedlings be fit to plant in about a month.

#### PLANT HOUSES.

*Cyclamen.*—Plants that are ripening their seed must not be allowed to become dry. Gather the seed daily as it ripens, and place the seed pods in a shallow box on a shelf where they can be exposed to the sun. Seedlings raised early in the year and then placed into pans and boxes will be ready for transferring into 2½-inch pots. After potting, place these close to the glass where they can enjoy a moist base and not be too shaded. Nothing is gained by trying to hurry the plants, better results will follow a dwarf sturdy growth. If kept too close the foliage is drawn up weakly, and the plants seldom do well afterwards. Plants raised last August and September that are dwarf, sturdy, and well established in 2½-inch pots should be placed without delay into 4 and 5-inch size. These will seem large for the plants at first, but by careful attention and good treatment they will soon increase in size and make bold large foliage. Be careful not to allow the plants to become dry after potting, and syringe them two or three times daily. If the structure in which they are grown runs north and south no shading will be needed. Give liberal ventilation when the sun is hot, and if the plants display signs of distress syringe them.

*Bouvardias.*—Old plants that were cut back and started in heat should be in their largest pots and then gradually hardened and placed outside. In any locality where they do well planted out place them on a sunny open border, after they have been thoroughly hardened, 1 foot or 15 inches apart, according to the size of the plants. Place those raised from roots early in the year into 5, 6, and 7-inch pots according to their size. If these plants have been well cared for they will have pushed up freely from the base. Stop any shoots that are taking the lead. Plants raised from cuttings needed for decorative purposes must be stopped when the shoots have made two joints to induce bushy little plants, these should be in 5-inch pots. Any shoots that spring from the base should be stopped just below those of a weaker nature.

*Solanums.*—Cut-back plants have commenced flowering freely. These should occupy a frame where abundance of light and air can be admitted. This will insure the fruits setting if the plants are given plenty of water at their roots, but the foliage must not be syringed. Plants raised from cuttings early will be bushy little plants in 3-inch pots. Place these in 5-inch and gradually harden them to cool airy treatment. Do not pinch them after they are potted, but allow them to flower and set their berries. Solanums do well in loam, sand, and one-seventh of manure. Pot the plants firmly.

*Cinerarias.*—The earliest plants may be placed into 5 and 6-inch pots. Arrange them in a cold frame, and do not overshadow them.

Smaller plants may be placed into 60's (3-inch), while later ones may be pricked into pans and boxes 2 inches apart. A little more seed may be sown in a cool house or frame.

*Calceolarias.*—Seed can be sown without delay. Fill a pan with light soil, fine and even on the surface, and then sow seed. Do not cover it, but water gently with a fine-rose can. Cover the pan with a square of glass, and shade until the seed germinates. When the plants are large enough prick them off into pans or boxes, and grow the plants perfectly cool in a frame with a northern aspect.

*Begonias.*—Those intended for autumn and winter flowering should be repotted as they need more root room, and grown in cold frames. Abundance of air must be admitted during the day, closing the frame early, so that the temperature will rise considerably by sun heat. Do not overshadow these plants, they will bear more sunshine than is generally given them. Begonias are frequently overshadowed. They need very little shade, and then only of the lightest nature if plenty of air is admitted when the sun is bright.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

THE flowers are advancing, but the weather does not improve. On the morning of the 26th June our thermometer registered 35° Fahr., and in lower lying places the grass was stiff and white. Only once has the thermometer been above 70°, and while I am writing at midday, June 27th, it is standing at 55°, but is rising. We are having more sunshine, but heavier downpours of rain. By the time this appears in print we shall have entered a new and the last month for Clover honey, and not a super on yet. When the barometer is high it is cold and rainy without sunshine; when low, cloudy with intervals of sunshine, but of short duration. For three days the bees, anxious to gather from the profusion of flowers, have gathered a little honey, but not more than will keep them alive. It is to be hoped there will be some favoured spots where the bees will have revelled in sunshine and plenty, but from everywhere I hear the accounts are dismal. Our own stocks and others are farther back than they were more than two months ago.

#### SWARMING.

This may be expected out of season as it was in the autumn of 1889, so provision must be made to prevent loss of swarms. There are various ways of treating hives which have swarmed at the moors, but as strength accompanies large honey gatherings, perhaps the best thing to do is to remove the old queen. After a few days examine the combs and destroy all royal cells, unless one appears to contain a queen, because many cells, although sealed, are empty. A proper cell is easily known by the extra attention which the bees pay to it. These young queens must not, however, be relied upon, as they may not become fertile. Every effort should be made now to secure the proper number of queens, so that they may be fertilised before July is out. My young queens are flying for the first time to-day. The variable seasons we have experienced enable us to understand things better than those who have been bee-keepers but a short time. Beginners should take note of all that passes, and particularly the phases of swarming; it will dispel the idea that extra room, super or nadir, will prevent swarming. Crowding is a cause, but is but one of many causes. With the rise in temperature while I am writing, the air is in a roar with drones and bees, quite delightful to see and hear, every hive being in better condition than another, and a great deal more so than might have been expected after so long a time of cold, sunless, and ungenial weather.

A very few days of similar weather will in all likelihood give us more swarms than we wish, but all will be kept off, and as far as practicable two joined together, and after young queens we shall turn our attention to creating strong hives for the Heather. In ordinary cases we would have supered some days since, but the weather will not justify the proceeding.

#### PUNIC BEES.

All our hives being nearly equal in strength, two weeks' fine-weather would enable us to test the Punic race. They have, so far as the season has gone, given us satisfaction. All we need now to prove them as to their abilities for honey gathering is settled-weather of several weeks' duration. Everything in the shape of agriculture, horticulture, and the apiary requires it. We earnestly hope July will bring a favourable change, and brighten the spirits and fill the larns and the pockets of the husbandmen.

## DRONES.

The bee-keeper should pay special attention and feed the hive containing the drones, which may be considered of a superior strain, so that they may be kept vigorous for the service of young queens.

## SURPLUS QUEENS.

"You were good enough to answer my questions last December about bee farming, and all turned out well at last, for on the 3rd of May I had a very good swarm. About four days after I found a queen bee on the landing board numbed, but not lifeless, and I took her in the house. Another bee-keeper said she must belong to the old stock, and not to the young swarm; but presently there was such an uproar with the young swarm that my friend persuaded me to put the queen with them, which I did, and they seemed quite contented. The next night but one I found her or another queen bee in the same way, apparently dead; but after being in the warmth for a time she recovered, so I put her back as before, there being just the same uproar. It is said that when bees swarm once they will swarm again about nine days after the first, but I have only yesterday had the second swarm (June 21st), though the bees commenced to lay out on May 20th. Would you also tell me when is the proper time for me to put the old stock into a new hive, as I want to do so, and how can I do it? Would it be best done a few days after the swarm, or how?—A YOUNG BEGINNER."

It appears your stock swarmed with at least two queens, possibly the old and a young one, but more probably two young ones. When either is the case the swarm is unsettled, and not unfrequently leaves the hive. Yours appear to have remained with the usual commotion on such occasions. It also appears that the queen remaining with the old stock became fertile in a few days after the issue of the first swarm, and having large quantities of unhatched brood, became quickly crowded, hence the swarm on the 21st June. Look out for after swarms issuing in about ten days or more from it. Had you sent us the queen, we would have been enabled to tell you whether she was fertile or not. Altogether your bees have just done what has been predicted in these pages for some weeks past, and more eccentricities may be expected.

I had a hive ready to swarm on the 15th May; it lingered on till about the 3rd June, when several young queens and the old ones were thrown out. It is now three weeks since that, and it only threw the first swarm on the 21st June, and the hive has been divided into four, and still many queens are piping, and upwards of fifty have already been counted; in all probability as many more remain in the hive. The weather is so unfavourable that it precludes either successful manipulation or swarming, or I should have made at least a dozen of it. No young queens hereabouts have mated yet. When there is no brood in the hive is the proper time to put the bees into a new hive. You will see from the foregoing the question cannot be answered with certainty. You might do worse than keep it as it is for another year.—A LANARKSHIRE BEE-KEEPER.

## THE BRITISH BEE-KEEPERS' EXHIBITION.

THIS Association held its annual Exhibition at Plymouth last week under the auspices of and in connection with the Royal Agricultural Society. Apiculture is recognised by "The Royal" as one of the subjects which should be prominently brought before all those connected with or interested in agriculture, and they have for several years given a handsome subscription to the British Bee-keepers' Association to assist them in providing funds for the prizes and other expenses incurred in connection with the Show.

Part of each day's programme consists of lectures on bee management, also demonstrations of bee driving, thus affording an opportunity for the visitors to see how the honey may be taken in its purity without destroying the bees, and the ease with which the various manipulations can be carried out. Mr. Green of Raynham, in Kent, one of the experts of the B.B.K.A., was in charge of the bee tent, and well did he fulfil the duties entrusted to him. His lectures were plain and practical, given in a quiet, unassuming, and instructive manner, and although a manufacturer of bee-keepers' appliances did not mention the fact or puff off his own goods as has been sometimes the case at exhibitions of this kind. Those interested were invited by Mr. Green to ask him any questions, and the replies given will, we think, practically assist those seeking information and instruction.

The greatest possible interest was shown by the thousands of visitors who thronged this Exhibition examining the hives, &c., and endeavouring to obtain information about bee-keeping when they saw with their own eyes how easily bees may be profitably managed.

There were fifteen classes in which prizes were offered, seven being for hives and appliances and eight for honey. The following is a list of the awards. The Judges were Mr. Broughton Carr, Rev. F. S. Sclater, and Mr. Walter Martin.

## HIVES, HONEY, &amp;C.

For the best collection of hives and appliances.—First, W. P. Meadows; second, Charles T. Overton. For the best observatory hive.—

First, Chas. T. Overton. For the best and most complete frame hive.—First, Chas. Redshaw, South Wigston, Leicester; second, Chas. T. Overton; third, W. P. Meadows. For the most complete and inexpensive frame hive for cottagers' use.—First, no award; second, Chas. T. Overton; third, Hutchings Bros. For the best honey extractor.—First and second, W. P. Meadows; highly commended, Turner and Sons. For the best pair of section racks.—First, W. P. Meadows; second, Chas. Redshaw; third, Chas. T. Overton. For the best feeder.—First and second, W. P. Meadows.

## HONEY.

For the best twelve sections of comb honey.—First, W. Woodley; second, Wakefield Christie-Miller; third, Rev. F. T. Scott. For the best six sections of comb honey.—First, W. Woodley; second, J. Garratt; third, W. G. Preece, jun. For the best section of comb honey.—First, J. Garratt; second, Miss M. L. Gayton; third, Capt. W. St. G. Ord. For the best exhibit of run or extracted honey.—First, J. Garratt; second, James Thorn; third, Mrs. E. J. Cox; fourth, M. Whittle. For the best exhibit of granulated honey.—First, W. Sturdy; second and third, Rev. J. Kempe. For the best and most attractive display of honey, in any form.—Second, James Thorne.

## MISCELLANEOUS.

For useful inventions introduced since 1888.—Commended, Thos. Lowth. For the most interesting and instructive exhibit of any kind connected with bee culture.—First, Rev. J. Kempe; third, Henry J. Orchard.

The competition in the hive classes was not so keen as it is sometimes, and we understand that some of the manufacturers arranged not to exhibit this year; probably the district in which the Show was held may have influenced them, being difficult and expensive to get to. Be this as it may, we think it rather a pity that they do not appear to have entered in any class, and short-sighted policy. The sending of a single hive would not have cost much, and would not need the expense of attendance of anyone at the Show. They will find others will do so and come to the front. There was nothing new among the appliances to particularise. The hives, the design, size, &c., were left entirely to the exhibitor, and most of them consisted of stock hives with standard frames, with hives of shallow frames  $5\frac{1}{2}$  deep for storifying, as is considered the simplest and best way of obtaining the largest quantity of honey by the use of the extractor. The arrangements for obtaining honey in section was much the same as usual. The season for honey is rather backward, and although some of the exhibits were of good quality, there was not the quantity staged we should have expected to have seen.

## TO CORRESPONDENTS

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Insects on Elder** (*R. F. J.*).—It is a species of aphid, which usually attacks the Elder, and we have seen the young shoots in many districts black with them.

**Flower Supports** (*N. G.*).—Both cane and bamboo stakes are neat and durable. They are sold in sizes adapted to various plants by most nurserymen, seedsmen, and dealers in horticultural requisites who advertise in our columns.

**Plants Seeding** (*B.*).—Seed-bearing is unquestionably weakening to any plant, and though this applies with less force to some than to others, yet in every case it produces an injurious effect varying only in degree. Probably in the instance you mention it would be less hurtful to the plant to ripen the seeds than to have the stems removed.

**Mignonette Dying** (*Radhurst*).—The plants are liable to collapse suddenly in some soils, and in one of the finest gardens in Britain this fragrant plant cannot be grown outdoors. Lime in the soil is essential to its well-being, but a Vine border, in which your Mignonette is "going off," ought not to be deficient in lime. It may be, however. Mignonette also likes firm soil, and that of some Vine borders is too light both for it and the Vines. Cannot you try it in another position in the garden?

Peas Withering (L. Dawes).—We cannot find any grubs or insects on the roots sent. The small tubercles on the roots of leguminous plants appear to be natural productions, and are present on the healthiest and most productive of Peas. Some Peas are attacked by a fungus on the lower part of the stems, but neither the cause of the visitation nor a remedy appears to be known. Potash in the soil is a necessity for Peas, and in its absence there cannot be healthy growth; moreover, some varieties of Peas are more prone to fail in certain soils than are others, and quite recently we noticed two rows of Peas in a similar condition to yours, while two other rows growing next to them of a different variety were as healthy and productive as could be desired.

"Lobster Plant" Leaves Spotted (F. S.).—The leaves of the Clanthus sent are somewhat discoloured by the excretion of insects, probably of aphides. In addition to the dark deposit a number of white exudations are seen on the upper surface of the leaves. These may be a result of the punctures made by the insects, or may be due to secretion by the plant; indeed the larger patches have a decided opening in the centre, as if an ooze had taken place through it. There is no fungus, and the tissue of the leaves is perfectly healthy. If we mistake not (and we have only the foliage to guide us) the plant is Clanthus puniceus, a beautiful greenhouse semi-climber, hardy against walls with southern or western exposures in the southern parts of England, and we believe in Ireland also. In the southern counties it assumes large proportions and is grand when in bloom. Although there are no insects we think the appearance is in favour of the plant having been infested with aphides. Syringe with an approved insecticide.

Mildew on Vines (A. J. L.).—You are indeed "in a fix," as you say, and are to be pitied. We cannot understand anyone going to the expense of erecting a vinery 80 feet long without providing the means of heating it. The structure is essentially incomplete, and no one has a right to expect a good and certain supply of Grapes from it. Under certain weather influences mildew is almost certain to appear, and the danger is great of its eventually destroying the crop of fruit and seriously injuring the Vines. All you can do is to maintain, as well as you can, a buoyant atmosphere, yet avoiding sharp currents. This you have probably done, and if so the mildew on the Vines is not your fault but your misfortune. We have not tried the composition you name on Vines, and if we did should proceed experimentally. We should dust every affected part with sulphur, distributing it through a muslin bag, and let it remain for three or four days. Some gardeners have had to roll the bunches in platefuls of sulphur when they could not otherwise make it adhere to the berries. They will be injured more or less in whatever way the parasite may be destroyed, but if it is allowed to increase it may ruin the crop.

Grapes Decaying (A. Z.).—We suspect the misfortune is due to the decay of some of the roots in the "very heavy clay soil." It is a question if the outside border needed water when you gave it, and we think covering such soil with green cow manure in the spring the reverse of good practice. The border ought to be covered in winter with shutters or thatched to throw off the wet, and should be exposed to the sun in spring and early summer, pointing it over very lightly yet frequently for raising the temperature of the soil; and not until the surface became very dry, with signs of cracking apparent, should we apply manure, and then it would be much less close in its nature than that you have used. Such soil as you describe needs a very large admixture of lime rubbish, coarse sand, and wood ashes, or bruised charcoal to render it suitable for the production of good Grapes; and covering the ground half an inch thick with charcoal dust in early spring would do good in two respects—absorbing heat and conveying potash to the soil. The roots of the Vines should be carefully lifted and placed in more suitable soil nearer the surface. If they are left alone, and you continue the present practice, we fear the decay of the fruit will spread year by year, though much will depend on the weather. The site must be efficiently drained.

Shading Roses under Glass (S. S.).—Probably the only reason you have had no response to your inquiry is that our Rose correspondents consider yours to be an exceptional case, due to defects of ventilation or too clear large panes of glass, as the best growers do not find it necessary to shade their houses. A house that rises to 110° is defectively ventilated, and with full ventilation, assuming it to be efficient, the temperature ought not to exceed more than 5° to 10° that of the external air. The best glass is not the best for greenhouses, and is not usually employed, thirds being as a rule the clearest that is employed for horticultural purposes. We had some Peach houses glazed with 42-oz. glass of the best quality, and we found that after May the sun's rays acted with such force as not to allow the fruit time to ripen properly, the apex being ripe two full days in advance of the base. We passed a double thickness of herring-nets over the roof lights, which insured the fruit ripening more slowly and evenly, and made a great difference in the quality also, it being more juicy and piquant in flavour. With Roses under similar glass—i.e., polished plate in large panes of several feet superficial—similar precautions were necessary to insure the blooms acquiring size, substance of petal, and durability, as without it they were thin as well as deficient in fragrance. Tiffany was used in this case, but it was too dense, and a double thickness of herring-netting subdued the strong heat and light sufficiently. Under 21-oz. and 15-oz. British sheet, thirds quality, we have rarely found it necessary to shade Roses, except when bright weather followed a dull period, when a temporary shade of the material named over the roof lights prevented the blooms opening too rapidly. Your case may be similar to those named, or you may have erred in methods of ventilation.

Centipedes (A. L.).—The specimens you send differ somewhat from the centipedes with which we are most familiar, and more closely resemble Julus complanatus than any other species that we can call to mind. We doubt if anything will be more effective in banishing them than a little petroleum well mixed in water or soapsuds. Half a wine-glassful of the oil in a gallon of water is safe for most plants, and more than twice as much has been used with many without injurious results. A few experiments will enable you to find a strength that is safe for the plants, and that will banish the abounding pests. Constant agitation is requisite or the oil will float on the water. By petroleum we mean the oil which is popularly but erroneously called paraffin, and burned in lamps.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (G. B.).—A Pavia, but the material was not sufficient to permit its determination. (K. E.).—Calycanthus floridus. (G. T. B.).—1, Solanum dulcamara. 2, Scabiosa caucasica. 3, Polemonium Richardsoni. 6, Habernaria bifolia. The others were insufficient. (E. M.).—The specimen was quite decayed when it reached us, but it seems to be a variety of Asphodelus ramosus. (J. B.).—The white flower is a variety of Centaurea cyanus, the other is a Spanish Iris, I. Xiphium, and there are white varieties of that and I. xiphioides. (J. G.).—Scilla peruviana and Cephalaria tatarica. (W. C.).—We should have been glad to have a specimen of the stem, and we can only judge the faded flower received to be that of Cereus grandiflorus.

COVENT GARDEN MARKET.—JULY 2ND.

STRAWBERRIES in heavy supply with bad trade, owing to the wet weather. All classes of goods lower.

Table with columns for fruit types, prices in s. d. format, and quantities. Includes Lemons, Oranges, Peaches, St. Michael Pines, Strawberries.

VEGETABLES.

Table with columns for vegetable types, prices in s. d. format, and quantities. Includes Artichokes, Asparagus, Beans, Beet, Brussels Sprouts, Cabbage, Carrots, Cauliflowers, Celery, Coleworts, Cucumbers, Endive, Herbs, Leeks, Lettuce, Mushrooms, Mustard & Cress, Onions, Parsley, Parsnips, Potatoes, Rhubarb, Salsafy, Scorzenera, Seakale, Shallots, Spinach, Tomatoes, Turnips.

CUT FLOWERS.

Table with columns for flower types, prices in s. d. format, and quantities. Includes Arum Lilies, Asters, Bouvardias, Carnations, Calceolaria, Cornflower, Eschscholtzia, Encharis, Forget-me-not, Gardenias, Iris, Lapageria, Gladiolus, Gypsophila, Liliium, Marguerites, Maidenhair Fern.

PLANTS IN POTS.

Table with columns for plant types, prices in s. d. format, and quantities. Includes Aralia Sieboldi, Arum Lilies, Arbor Vita, Azalea, Calceolaria, Climbing Plants, Cyclamen, Deutzia, Dracena terminalis, Epiphyllum, Erica, Euonymus, Evergreens, Ferns, Ficus elastica, Foliage plants, Fuchsia, Geraniums, Ivy, Geraniums Scarlet, Heliotrope, Hydrangea, Lily of the Valley, Lobelia, Marguerite Daisy, Mignonette, Musk, Myrtles, Nasturtiums, Palms, Pelargoniums, Rhodanthe, Roses, Saxifraga pyramidalis, Spiraea, Stocks, Tropaeolums.

Bedding Plants in variety, in boxes and pots.

LESSONS AMONG THE CROPS.

Now, while the main crops of the year are in the full flush of summer growth a walk over the farm enables one to get many a useful lesson, many a hint, for improvement in the general cultivation of the farm as well as of particular fields, if only we are able to grasp fully the meaning of the pages of Nature's book lying open before us, and to see why the condition of this crop is so flourishing, or of that crop so weak. Not in a single season is this to be done with a full degree of certainty, for it is impossible to know all about any farm till one has had it in hand for two or three years. There are, however, certain general indications which may be taken as a sufficiently safe guide upon which to base conclusions, so that by the exercise of caution one need not go far wrong.

For example, when a field of corn has a yellow tinge and slender growth a want of manure may be the cause, but this poverty of growth and sickly appearance is sometimes present in highly manured land, and then it is owing to imperfect drainage. We have seen many unsatisfactory corn fields on heavy land recently—some with vigorous deep green patches among a generally weak growth, a sure indication of poverty of soil; and others uniformly weak, either from poverty or wetness. A weak sickly appearance of corn plant is often said to arise from cold and wet, and the remark is much more significant than many of those who make it suppose, for the cold is not really an abnormally low atmospheric temperature, but is that coldness of a waterlogged soil which renders anything like luxuriant growth impossible. The stoppage of a single drain serves admirably to illustrate this; above the stoppage growth is feeble and stunted, below it growth is vigorous and entirely satisfactory. When such faults in drains occur the advantage of marking the exact position of every drain in the farm map is seen—the fault is entered in the notebook, its position shown on the map, so that subsequently, after the crop is cleared, the fault may be set right.

No indication of poverty of soil should be overlooked. If it is worth while to cultivate land at all it is certainly worth while doing it well. The position of a field often determines the manner and matter of manure application. It is notorious that much goes to the land nearest the cattle yards, and the balance of fertility can be well maintained all over the farm by means of green crops for ploughing in, sheep folding, and chemical manures. It has long been our custom to winter a lot of cattle in enclosures made specially for that purpose on different parts of a farm. By this plan much expense for labour and cartage is avoided, and the work of storing provision of food for winter near such enclosures is already in progress. Large silage stacks are being made now, a field or two of roots is sown near each yard, and a certain number of corn stacks will also be made there, Beans, Peas, Barley and Oats all being cultivated for this especial purpose. The shelter sheds erected in such enclosures are built entirely of materials obtained upon the estate, and so far as is possible upon the farm itself. They are snug, substantial and tolerably neat, but not a penny is wasted upon mere appearance; so long as thorough shelter can be had that is sufficient. We make special mention of these yards now as a word to the wise, who are looking forward and striving to economise as well as improve. In making arrangements for them do not overlook the due provision of water, and either place the yard near a stream or a pond. Many a pond have we made by turning a main drainage outfall into a hollow space deepened slightly by excavation. Recourse can be had to a water cart, but that is precisely one of the things we wish to avoid.

In our round of inspection a sharp outlook must be kept for interlopers among special sorts of corn. We procure enough seed of any new sort of promise for trial at the home farm, and for distri-

bution to off-hand farms if it proves satisfactory, and as the ears develope, every plant that is not true to name is carefully sought for and rooted up, not necessarily to be wasted, for we have no more nutritious fodder than corn in ear, and all stock eat it greedily. We had much trouble last season in the clearance of such "rogues" from our new Mountain White, or Salvator Wheat. This is a white bearded Wheat of the Rivett type, which, so far as our experience of it goes, contains a rather large per-centage of Rivett Wheat, or a sort bearing a remarkably close resemblance to it.

Old Sainfoin fields that are losing plant fast and becoming very foul are among the things we shall see requiring prompt attention, and there should be no hesitation about breaking up such exhausted layers for another crop. Among weeds there are none so difficult to eradicate as charlock, and its first appearance upon a farm should be the signal to look for it again and again, and to destroy every plant of it before it forms seed. There should be no hesitation about this, or it will soon spread over every field, to rob the soil of its precious fertility, and when once established it can hardly be got rid of again.

WORK ON THE HOME FARM.

Ensilage is becoming more simple every season, and so it ought, because silage is just a heap of herbage laden with enough of some heavy substance to press it together sufficiently to exclude air. A patent apparatus may be used, but it is a mere question of pressure, and whether we impart that pressure by chains and screws, or by bags of sand, or by the soil nearest to our hands, the result appears to be very much the same, and that is just so much wholesome nutritious food. The herbage has only to be taken to the heap or stack fresh from the scythe or mowing machine, the pressure applied at once and continuously till the silage is used, to ensure success. Very simple are these two or three points, but they must have attention, and it will not answer to attempt to make hay, and to get the herbage into a mouldy sodden condition, and then to try and turn it into silage.

Haymaking has been much delayed by the unsettled weather, and much hay has been spoiled in badly made cocks and in ricks left open without rick cloth or straw to protect them. There ought always to be a rick cloth with poles, blocks, pulley, and ropes, but for small ricks rain can be kept out by keeping the middle of the rick full, and the use of a little straw for a covering at night or during showery weather. The first crop of Clover is a heavy one, but much of the Clover hay will be of doubtful quality, and would have been much more valuable if it had been made into silage; but we are the slaves of custom, and much more inferior hay will be made before silage supercedes it, as it certainly will one day.

A dripping June has certainly ensured to us an abundant hay crop; Tares, Sainfoin, mixed seeds, Clover, yellow Suckling are also all a full crop. Lucerne is as usual excellent, and of other green crops, white Mustard, Cabbage, and Kale are all a full and vigorous plant, so well established and full of growth that hot weather can do little if any harm to them now. Of root crops, Mangold, Swedes, and early white Turnips are well established and quite safe, while the recent sowings are well up, and growing so freely that very little damage from insects is probable. The rain has helped on fallow ploughings on heavy land, especially as it has fallen with sufficient frequency to soften the harsh soil, and we may hope for plenty of hot sunshine to destroy weeds.

OUR LETTER BOX.

**Bearded Wheat (J. P. R.).**—Bearded or horned Wheat is not uncommon. It is very productive, and several of the heads contain more than four rows of grains. It is not very extensively grown, as the quality is comparatively inferior.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

22nd.—Generally overcast, but occasional sunshine.  
 23rd.—Full and threatening throughout; mist or fog at midday.  
 24th.—Showery till 10.30, then fine; bright and warm in the afternoon.  
 25th.—Bright and warm; a little cloudy in the afternoon.  
 26th.—Wet from 3 A.M. till 11.30 A.M.; showery to 3.30 P.M., then fine and bright.  
 27th.—Generally bright.  
 28th.—Bright early; spots of rain at 10.30; then cloudy and very wet from 2 P.M.  
 A showery week; the temperature continues near the average in spite of the noticeable absence of hot days, because the nights keep warm.—G. J. SYMONS.

## CITY PARKS AND GARDENS.

CONTINENTAL improvers of cities have long recognised the desirability of providing abundant open spaces for the recreation of the people, and in some cases the work has been carried out on an extensive scale. Paris may be taken as a notable example of what can be effected by following out a well considered liberal plan of city embellishment, and the advantages are manifest to every visitor. Not only have parks, gardens, and open spaces been provided in numbers, but the roads and streets themselves have been rendered quite as horticulturally attractive and equally as beneficial from a sanitary point of view. Trees and shrubs have been planted in thousands, until the city itself is like a vast garden. Many less important towns in France and Belgium have taken a lesson from Baron Haussmann's great work, and wisely included in their necessary expenditure, the provision of parks and gardens for the people.

Here in England we do not obtain State aid, and but seldom the use of civic purses for such work; it is mostly left to the munificence of private individuals, or to the few societies that have within comparatively recent years sprung into existence for that special object. In some of the larger, densely populated, provincial towns like Manchester and Newcastle-on-Tyne, the matter has received much public attention, with the result that money has been raised in various ways, tracts of land have been given or purchased and laid out in parks. The two cities named are now well provided in this way, and others could be mentioned where considerable progress is being made in the same direction.

London can also boast some extensive and well kept parks, which excite the admiration of strangers, and their importance cannot be over-estimated. Still, for so great a city, there is a deficiency of smaller open spaces just where they are most needed—namely, in the poorer and more densely populated districts, which are often widely removed from the great parks. Societies have been formed for the special purpose of acquiring land in these districts, and within the past ten or twelve years a wonderful improvement has been effected, though very much yet remains to be done. One organisation that has taken a prominent part in the work is the Kyrle Society, which commenced its career in 1877, and can already point to a creditable record of accomplished improvements. This Society owes its origin we are told, to a letter written in 1876 by Miss Miranda Hill, calling attention to the "dull commonplace lives of the poor, and suggesting that means taken to enliven and beautify these lives would be labour well spent." The Society thus started has taken a broad view of its object "to bring beauty home to the people," but of its four branches that devoted to "open spaces" is by far the most important. The support of the Duke of Edinburgh was secured as President, with the Princess Louise as Vice-President; a large and influential General Committee was formed, and sub-Committees for the different branches. During the past thirteen years many small open spaces have been secured to the public through the exertions of this Society, and their most recent acquisition is the Vauxhall Park, which was formally opened on Monday last by the Prince of Wales. Its history is briefly as follows:—

This little park of about eight acres occupies the site of the houses formerly known as the Lawn, and Carron House. The Lawn was the name given to seven houses—each possessed a long old-

fashioned garden—standing together in an enclosure, behind a refreshing strip of green sward, dotted with a few old trees. The river Effra at one time flowed in an open channel between the houses and the South Lambeth Road; and the grass and trees, from which the Lawn derives its name, probably covered the course of the stream. Carron House, named after Sir Noel Caron, Dutch Ambassador to the Court of St. James's in the early part of the nineteenth century, stood in its own grounds of considerable extent between the Lawn and the road known as Fentiman Road.

The Lawn is mainly interesting as the residence of the late Henry Fawcett from the year 1874 to the time of his death at Cambridge in November, 1884. In the southernmost house of the group, that next to Carron House, Mr. Fawcett lived during his term of office as Postmaster-General from 1880 to 1884; and here, in the autumn of 1882, he passed through the serious illness which barely spared his life, and to the effects of which his subsequent sudden death must no doubt be traced. In the long garden, which now forms part of the park, pacing up and down the gravel paths, or sitting under the trees, he was wont to discuss with his friends the various projects for ameliorating the lot of the people which he was constantly initiating, amongst which none occupied a place nearer his heart than the preservation for public use of ample commons, parks, and gardens.

When therefore in 1887 it became known that the Lawn and Carron House had come into the hands of a gentleman who viewed them as material for a thriving building speculation, it was felt to be only due to Mr. Fawcett's memory to make a determined effort to avert such a misfortune, and to put the ground to the use which he would most have approved, that of a park for the people. The Vauxhall Park Committee was formed, with Mr. Mark Beaufoy, now the member for the Kennington Division of Lambeth, as its Chairman and Treasurer, and Mr. Walter Edwards as Secretary. A working men's Committee was also constituted. An Act of Parliament was obtained, authorising the purchase by the Vestry, and power was conferred upon the Metropolitan Board of Works and other public bodies to contribute towards the purchase money. The price asked was £43,500, and the cost of obtaining the Act, and other expenses, raised the total sum required to over £45,000, without reckoning the expense of laying out the Park. The aggregate of the contributions obtainable from public bodies left over £9000 to be raised by private subscription. At a critical moment, when the time for purchase had nearly expired, the Kyrle Society threw its whole influence into the movement. Public meetings were held, at one of which the Princess Louise, Vice-President of the Kyrle Society, was present; and the Prince of Wales was pleased to meet a few representatives of the working men at Lambeth Palace, and to express his interest in the scheme. A large amount was collected through the instrumentality of the Kyrle Society; in the course of a few weeks the necessary sum was raised, and in the spring of last year the land was conveyed to the Vestry of Lambeth. It still remained to clear and lay out the land as a garden, a work entailing an expense of upwards of £2000. This expenditure was undertaken by the Kyrle Society, plans were prepared and approved by the Vestry, and the Society made itself responsible for the necessary funds. The garden has been laid out from the designs of Miss Wilkinson, by Mr. Holmes, of Hackney; and the railings and other architectural works have been executed under the superintendence of Mr. Harrison Townsend, F.R.I.B.A.

The programme on Monday, July 7th, at the opening of Vauxhall Park, when the Prince and Princess of Wales were attended by the Duke of Edinburgh, Princess Louise, and the Archbishop of Canterbury, included the presentation to the Prince of several officials who had been concerned in the scheme, amongst them being Miss F. Wilkinson and Mr. William Holmes, and the latter assisted the Prince in planting a small Plane tree as a memento of the opening ceremony.

The plan is an admirable one for a small park, as can be seen in the engraving (fig. 6, page 21), reduced from a copy of the original plan kindly supplied by Miss Wilkinson, and the work has been carried out in a satisfactory manner. The greater portion has been sown with grass, and a close green sward has been already obtained. The paths are excellent, an important point in a park of this kind; some old trees remain from the former gardens, but more shrubs are required, especially in the boundary borders.

### BLOOM ON GRAPES.

A THICK coat of bloom gives the finish to Grapes. Without it they present a polished unnatural appearance; with it intact the colour, being good, black Grapes especially, may be said to be perfection. Once it is lost it cannot be made good in any way, Nature in this case defying all attempts at imitation. This being so, it behoves all would-be successful growers, exhibitors or otherwise, to be very careful how they act, every care being taken not to rub the berries with the scissors, hand, or head at any time after they have commenced their first swelling. Syringing the foliage after the flowering period is usually fatal to the bloom, as, if it does not actually wash much of it off, it leaves a stain behind that nothing can erase or hide. All this is well-worn, oft-repeated information, but there are other agencies at work in the matter, either for good or ill, not quite so well understood. For instance, there are a few varieties rarely seen carrying a good coat of bloom, this being very marked in the case of Gros Guillaume among black, and Mrs. Pearson among white Grapes. Why the bloom should be so thin in the former case and almost absent from the berries of Mrs. Pearson is one of those things not easily accounted for. I shall not attempt it, but if any reader of the *Journal of Horticulture* can give a satisfactory explanation of this enigma I hope he will do so.

As far as the generality of varieties are concerned, it is my belief that what favours thorough ripening and colouring, the two conditions not being altogether inseparable, also promotes, in most cases, the formation of a thick coat of bloom. As I attempted to prove on page 1, a good circulation of air night and day is necessary to insure perfect colouring and ripening of Grapes, and I am also of opinion that the same conditions are equally necessary to promote the formation of bloom. When a stagnant, moist atmosphere is maintained the bloom will be very thin and unsatisfactory, abundance of fresh warm air being best calculated to create and preserve the bloom as we like to see it. At Longleat for many years past very much more air, both at top and bottom ventilators, is admitted, without lowering the temperatures more greatly than is often the case, and the thickness of bloom on the Grapes has always been most marked. Mr. W. Taylor, when at Longleat, and since, always prided himself upon the beautiful bloom his Grapes invariably carry, but whether he will endorse my theory I am not able to state.

It is possible to so treat Grapes as to have them with a good coat of bloom only to lose it in a few minutes. Nor is this all. The loss of bloom by exudation is also soon followed by the decay of the berries, and it would thus really appear that the bloom is not merely for appearance sake, but is really needed as an aid to keeping. If this is not so, what is the cause of Grapes that have lost their bloom, owing to faulty ventilation, keeping so badly? Destroy the bloom and the berries may absorb moisture through their skins; preserve it, and we have one good preventive of sudden decay. This commits me to the endosmose theory, against which I have previously argued, but we live and learn, and I fail to see why we should not recant our errors, especially if we can do any good by so doing. Too much moisture in the atmosphere undoubtedly causes cracking of the berries in some instances, and where it does not act so suddenly it yet gradually destroys the bloom, and with it, therefore, the Grape's first line of defence. From the present time onwards the greatest care ought to be taken to prevent a sudden rise in the temperature of a house of Grapes. Few gardeners probably realise how cold the berries always are, whether there is fire heat in the house or not, but if they will gather one and place it against their cheek they will then better understand how it is warm moisture so quickly condenses on them. Neglect to give sufficient air to prevent this condensation of moisture, and in a short space of time it will commence to trickle down the berries, carrying the bloom with it. Even if air is given freely just in time to prevent running, but not condensation, the bloom is yet loosened from its hold, and the moisture finds its way inwards, rapid and wholesale decay of the skins being the consequence.

Being too economical with fire heat militates greatly against Grapes ripening and keeping properly, and it follows the lower the temperatures during the night the colder the berries become. On

no account should the whole of the top ventilators be closed during the night for a house of ripe or fast ripening Grapes. If the air is admitted by means of sliding sashes (the worst form of ventilation), these necessarily have to be drawn up rather closely, in wet weather especially, but this difficulty may be obviated somewhat by having end ventilators as well as those along the front, these being set well open in warm wet weather especially. Our earliest vinery is situated in a low damp position, and the greatest difficulty is experienced in keeping the Grapes. Not being able to open the top lights sufficiently in all weathers we have had net-covered shutters for fixing in the place of the doors, these shutting out birds and admitting air freely. Even this will not prevent sudden condensation of moisture on the bunches between the top-running lights, and a very close look out has to be kept. Not only is top air given freely early on clear mornings, or not later than six o'clock at this time of year, but if the lights are partially closed during a heavy shower of rain, they have to be opened within five minutes of a partial outburst of sunshine. Contrivances in the shape of closely woven cotton or other material for excluding wasps are equally effective in preventing a good circulation of air, and if fixed this must be done in such a manner as to admit of the lights, both top and bottom, being opened if need be to their fullest extent. Any of those close nettings for ventilators and muslin bags for the bunches are simply "traps for the unwary," and, what is very much to the purpose, can be dispensed with. We each season send to a nurseryman at Yeovil for a small bottle of wasp destroyer, and this proves an infallible remedy. Let those who doubt my word try it for themselves, and then for the relief thank—W. IGGULDEN.

### BORDER CARNATIONS.

For several years border Carnations caused me considerable difficulty. One reason, no doubt, was the unsuitable nature of the soil, and I was assured by those who had known the garden for many years that it was impossible to succeed with Carnations. A few years ago I was fortunate in discovering a detail which has almost revolutionised Carnation growing here. It is a detail which is of quite as much importance in gardens where there is no difficulty in their culture as in gardens the least suitable. Instead of waiting and layering the grass for young stock until the summer is well advanced, we now layer at the earliest moment. The first week in July most of our outdoor stock is finished, and the results are these: The young growths are quite soft, and root more quickly than later in the year, the heat of the summer having no doubt an important bearing on this rapidity of root formation. The plants when well rooted are lifted and placed into the beds, and have a long autumn before them—not only to become established, but to form large plants, which produce plenty of flower stems the next year. These large plants are slightly liable to the drying processes, which were the worst matters we had to contend with; and lastly, there is no difficulty in securing plenty of "grass" from such plants much earlier in the season than it is possible to do from those planted in spring which had been layered late in the preceding year.

There is a good illustration of the difference between early planted layers of the same year and plants kept in nursery lines until spring in a series of beds we have the present season. The spring-planted Carnations produce one flower stalk, and every individual is of small growth and much later than the plants which, layered at the same time, were at once placed into their flowering quarters. Several stalks are the rule with these, and plenty of shoots ready for layering at once. Want of time at a busy season no doubt deters many from attempting to carry into practice the experience just detailed, but I do not find the work is difficult to accomplish. We have about 2000 plants, and the system of layering is to send one man with a penknife to slit down the layer and form a tongue to provide roots; no leaves are taken off, and as a rule in the light soil we have to deal with it is hardly necessary to add any open material for inducing quick root action, so that securing the layers in the ground is quickly overtaken by two men provided with a supply of cut bracken stems with which the growths are pegged down. While the soil is in a moderately damp state is the most suitable time. In cases where it is deemed necessary to apply a rooting medium nothing is better than a mixture of leaf soil and sand in equal proportions. Moisture is essential to the formation of roots, and indeed few plants suffer more severely than Carnations in a season of drought, so that a moist condition of the soil is one of not the least important items in their culture.

Blooms of the new white Carnation Mrs. Muir have been forwarded and noted. I think it is destined to hold a foremost place among not only white varieties, but among hardy flowers. My plants

have been grown in pots, but they exhibit a free-flowering habit with any quantity of "grass." It is said to be a seedling from an old border Picotee most commonly known as Redbraes, though that is a name not nearly so old as the variety. Redbraes, it may be said, is a gardener's flower. Several years ago I sent it to a well known florist, who was so disgusted with its rough marking that it was destroyed before the first blooms had time to expand. Notwithstanding, it is to-day more popular than any other sort. Along with others it seeded very freely three years ago, and I raised some good varieties for the border from it, but none so good as that of the Skye Carpenter. It is quite time, I think, that flowers of this type should be alone recognised as worthy of being introduced. The flowers are not so large as numbers, but on account of its perfect non-splitting calyx it is of the greatest value for everyday work. It is rather like Germania in general appearance, and is a good companion flower, R. H. Elliott among fancies having the same good qualities.—B.

## THE BRITISH FRUIT GROWERS' ASSOCIATION. STRAWBERRY CONFERENCE.

THE conclusion of two of the papers read at the above Conference commenced last week is given in the present issue, and the others will follow at the first opportunity.

### THE ORIGIN OF THE CULTIVATED STRAWBERRY.

BY MR. SHIRLEY HIBBERD.

(Concluded from page 6.)

AN important contribution to the history of this fruit will be found in the ninth volume of "Le Jardin Frutier du Museum," of Mr. J. Decaisne, published 1862 to 1875. The material for the article "Le Fraisier" in this work was in great part supplied by Madame Elisa de Vilmorin, but the classic work on the subject, by M. Duchesne, published 1766, has been relied on chiefly for matters lying out of the region of Madame de Vilmorin's inquiries and observations. According to this authority there are seven species of Strawberry.

The wood Strawberry, *Fragaria vesca*, is described as freely scattered over Europe, Asia, and America. It is unknown in Africa, but otherwise is a free citizen of the world. The Alpine Strawberry, *F. Alpina*, is considered by Decaisne a variety of the wood Strawberry. The variety known as *Monophylla*, the One-leaved Strawberry, of which there is an example on the table, was raised by M. Duchesne in 1761 from the wood Strawberry. It is of no special interest, as the fruit does not differ from that of the wild plant. In the year 1887 Messrs. Lovell of Driffield sent me plants of the popular Sir Joseph Paxton that had become one-leaved, but in the year following these plants produced leaves three-divided, according to the proper pattern.

The Hautbois, *F. elatior*, belongs to Central Europe. It is well known to be partially dioecious, a fact that needs to be recognised by the cultivator, and one full of interest as a feature in the biology of the genus *Fragaria*. Miller's *F. muricata*, with green fruit the size of a Plum, is a variety of the Hautbois.

The green Pine, *F. collina*, described as a native of Germany, differs from others in some trivial peculiarities of the calyx. It is a variety of the Hautbois, and has no proper claim to specific distinction.

Hagenbach's, *F. Hagenbachiana*, is probably the produce of a cross between *F. vesca* and *F. collina*; in other words, a hybrid of the wood and Hautbois Strawberries.

The Scarlet or Virginian, *F. virginiana*, is described by Decaisne as introduced to Europe in the first half of the eighteenth century, but we have the testimony of Parkinson that it was in the country in the first half of the seventeenth century, so that Decaisne may be considered in error to the extent of a century in this matter. *F. canadensis* is the Canadian form of this same Scarlet Strawberry.

The Chili, *F. chiloensis*, is reported by Decaisne as introduced to France in 1712, and he describes it as producing grand foliage and fruits that are sometimes as large as pullets' eggs. He adds that it often requires to be fertilised by other varieties of its own species. The first mention of the South American Strawberry is by M. Frezier, who, in 1716, found it at the foot of the Cordillera Mountains near Quito, and carried it home to Marseilles. The Spaniards reported that they obtained it from Mexico, and through them it may have reached Paris at a date anterior to its discovery by M. Frezier, which would perhaps justify Decaisne's date, 1712. Mr. E. P. Roe, in his admirable book on "Success with Small Fruits," says, "From Mr. W. Collett Sandars, an English antiquary, I learn that seven plants were shipped from Chili, and were kept alive during the voyage by water which M. Frezier saved from his allowance, much limited owing to a shortness of supply. He gave two of his plants to M. de Jussieu, who cultivated them in the Royal Gardens." In 1727 the Chili Strawberry was introduced to England by Miller, as cited above. He describes it as a bad bearer. Duchesne says later importations from America to England met with better success, for early in the century new varieties of *F. chiloensis*, as well as of *F. virginiana*, became quite common, both in this country and on the continent.

Decaisne adds that the varieties of the Chili Strawberry make amends for the smallness of their number by their beauty and ex-

cellence. The Pine, or Great-flowered Strawberry (*F. grandiflora*), he declares to be of unknown origin, but incontestably a garden hybrid.

Gray's *F. Grayana* and the Californian *F. lucida* are forms of *F. virginiana*. The last-named has some distinctive features of leafage, and is very decidedly dioecious, and commonly sterile.

Decaisne's seven species shrink to four when investigated, but we must not forget the diversity of opinion that prevails as to the limitations of species, and the French botanists usually lean on slender characters to make many species.

In the year, 1818, when, on August 4th, Mr. Thomas Andrew Knight, President of the Horticultural Society of London, presented his memorable paper on "The Variations of the Scarlet Strawberry," the three reputed species of American Strawberries were fully established as garden plants, but there was nothing like a collection of varieties in existence. It is particularly interesting to observe that he sets out by declaring his belief that all the American Strawberries are "varieties only of one species; for all may be made to breed together indiscriminately, and I have found that similar varieties may be obtained from the seeds of any of them; and upon the same evidence I consider the wild Strawberry of Canada, the Bath Scarlet, and the Black, and, in short, all our large Strawberries, with the exception of the Hautbois, to be varieties of the same plant." In evidence of his command of facts as the basis of criticism, he reports that he had raised 400 new varieties, "some very bad, but the greater part tolerably good, and a few, I think, excellent." He describes only eighteen varieties, in respect of which there is not much to be said. But mention should be made of No. 2, produced from the seed of White Chili and pollen of the Black Strawberry, one of the berries of which weighed 274 grains. The colour of the fruit was scarlet, the form conic, and not at all flattened or deformed."

That our garden Strawberries, after much crossing and selecting, still represent the two American species need not to be enforced, for they carry the evidence in their characters. But there are points of importance in those characters that have obtained less than their due share of attention. One of these is a tendency to a dioecious habit of flowering. A perfect flower of a Strawberry contains both stamens and stigmas after the proper fashion of a rosaceous plant. But it happens that under certain circumstances flowers containing only one set of organs are produced; those that have stamens in sufficiency to be hermaphrodite being termed staminate, and those from which the stamens are absent pistillate. This part of the subject has obtained more attention in America than with us, but English gardeners have always had to recognise the fact in the cultivation of the Hautbois. This exhibits the dioecious tendency in so striking a manner that unless a plantation is closely watched, it in time becomes barren, because the male plants overrun the females, and take their place by sheer force of superior vigour. But it is a mistake to suppose that the staminate plants are absolutely necessary when the desire of the grower is to obtain Strawberries as fruits without any regard to the vitality of the seeds that those fruits may carry. The prevailing indifference to this part of the subject is scarcely pardonable when the business in hand is the raising of new varieties; but for all the ordinary purposes of the cultivator it is certainly not of great consequence, because the varieties grown in this country and on the continent of Europe are mostly pistillate; but as they are all capable of varying in their sexual capacities, the cultivator cannot with impunity ignore the facts of Nature. Our grand British Queen is often said to be fastidious in its requirements as to soil and climate, but in all probability it occasionally proves less fruitful than its wont through becoming staminate, for plants can change their sex to suit their circumstances, as I have proved in the case of the Holly, and some other garden plants. The frequency of the staminate form, as the case is represented by American culturists, is doubtless a consequence of certain peculiarities of the American climate, for their staminate kinds appear to become pistillate when removed, and the garden varieties that still rank nearest to *F. virginiana* are with us as decidedly pistillate as any. Our wood Strawberry is pretty constant in its floral characters, having five petals and four stamens to each. But the American Strawberry in its original form often has five or six stamens to each petal; and occasionally there are seven petals and forty to forty-two stamens. On the other hand, the pistils of these staminate flowers are often incomplete or but partially developed, and there is a deficiency of fruit accordingly. The Chili species is often deficient of pollen, and, therefore, is advantageously grown with other varieties. Probably the best representative of the Virginian Strawberry now in our garden is the Crescent Seedling, an early, smallish, scarlet, sprightly flavoured fruit, that appears likely to become popular for the first supply. I have examined many flowers of this variety, and have seen no indications of the predominance of either sex; in other words, they appear to be normally hermaphrodite.

In the year 1861 I made an examination of the flowers in a collection of Strawberries that were fruited under glass, and 100 blooms each on ten different varieties, making 1000 in all, were marked. The varieties were Scarlet Nonpareil, Black Prince, Carolina Superba, Oscar, Sir Harry, Empress Eugenie, Keens' Seedling, Belle de Paris, Eleanor, and Sir Charles Napier. From the 1000 marked flowers 887 berries were gathered. Those that failed appeared to begin life with equal conditions with the rest, but were impaired by insects, damp or shrivelling; in fact, they failed through what may be termed accidental causes, and not through any want of pollen to effect fertilisation, or any absence of stigmas to receive it. This observation was reported by me in the *Gardeners' Magazine* for August 16th, 1861. But although I do not urge the cultivator to watch narrowly for staminates and pistillates, I

am certain that there are times when the subject should have more attention than it obtains; and I have noticed, and possibly you have also, a hot dry season is one of those times that certain shy bearers appear to be more fruitful when grown in close association with other sorts, as though pollen were sometimes deficient. But while we discuss the difference between European and American Strawberries in respect of this question of stamens and pistils, it will be proper to keep in mind that the Strawberries of Europe are mostly descended from the Chilian and Virginian stocks; while those of the United States are the progeny of the Virginian stock almost exclusively. And there is no shadow of whim or taste in the matter, for the South American race suit the European climates, and the North American race suit the North American climates; for in those States in which Strawberries are in the greatest demand, the winters are too cold and the summers too hot for the progeny of *Fragaria Chiliensis*. Thus the question of staminate and pistillate is simplified, for the southern plants are more distinctly hermaphrodite than the northern, and this fact accounts for our indifference to the subject of sex in this fruit.

In view of these considerations it is remarkable that Decaisne in a list of thirty-one varieties, the parentage of which he attributes to *F. virginiana*, should include such evident hybrids as Admiral Dundas, British Queen, Eleanor, Eliza, Elton Pine, Goliath, Grosse Sucrée, Jucunda, Keens' Seedling, Lucas, Marguerite, Oscar, Sir C. Napier, Sir Harry, and Wonderful. As "issues" of *F. Chiloensis* he names only Barnes' Large White and Chili Orange, both late varieties, fertile, and of good quality. He might now, perhaps, be enabled to recognise in the vigorous-habited Waterloo the influence of the South American Strawberry; but it must be confessed that in garden varieties the species have been so much mixed, that to determine in any case which of the parents predominates is well nigh impossible. That our American friends are chiefly indebted to their own wild Strawberry for the varieties they prize is admitted by all the authorities from Downing to Roe, and the fact differentiates *F. virginiana* from *F. vesca*, the first being capable of endless variation, and the second being apparently as immovable as the Britisher himself, and as incapable of quitting the groove scooped in the world for it by Nature.

But our wood Strawberry takes at least three forms, which may be designated the *vesca*, *alpina*, and *elatior* forms. In like manner the American Scarlet takes a *virginiana*, an *illinaensis*, and a *canadensis* form; while the South American appears in a *chiloensis*, a *grandiflora*, and a *Carolina* form. These several sub-species, as they may be termed, may be regarded as connecting links that establish family relationships between the several species, and in the first instance reduce the reputed six species to an actual three, and the actual three to a possible one. Should we be enabled to trace the origin of the Strawberry so far back as to unite the species, we might go a step further, and entertain the notion that, to use the terms of the evolutionists, the plant originally produced dry carpels in the way of a *Potentilla*, but adopted the ingenious device of adorning the carpels with a sweet and fragrant pulp to bribe the birds to disseminate the seeds. But you did not invite me to indulge in speculations, and I will therefore be content in having placed before you a few matters of fact that may prove serviceable in aid of practical work; for a knowledge of how a thing was made may serve as a guide to the process of improving it.

## GARDEN STRAWBERRIES.

BY MR. J. WRIGHT.

(Concluded from page 7.)

### MIDSEASON STRAWBERRIES.

SOME years ago an election of Strawberries was conducted by the late Rev. C. P. Peach. Several growers in various parts of the country voted for what they considered the best varieties. The returns showed that Sir Joseph Paxton headed the poll, but with President almost an equal first. If a poll were taken now I suspect they would maintain their positions. They are two of the most useful in cultivation. Then we have the thoroughly serviceable, hardy, and free Vicomtesse Hericart de Thury. Sir Charles Napier is a standard variety at Chiswick—perhaps the most serviceable there of the midseason sorts, but it fails in some cold soils and districts. Countess, one of Dr. Roden's varieties, is a thoroughly good Strawberry, growing well, and bearing its rich fruit in abundance. Lucas is a large handsome fruit, and the plant is vigorous and prolific. The good old Keens' Seedling is still worthy of a place in limited collections. British Queen must be grown where it will thrive, and where it will not Dr. Hogg should be tried; where both grow and bear both should be cultivated. James Veitch usually bears bountiful crops of large fruit, and is a favourite in many gardens. La Grosse Sucrée is decidedly useful, and Hammonia is perhaps not so much grown as its merits deserve as a large, solid, good flavoured variety, and not the less useful in being rather late. A dozen midseason Strawberries are named from well proved varieties, and I leave others to supplement the list. If I were to choose six from the twelve for linking the earlier with the later they would be the first six in the following list:—

- |                       |                                  |
|-----------------------|----------------------------------|
| 1. Sir Joseph Paxton. | 7. Vicomtesse Hericart de Thury. |
| 2. President.         | 8. Sir Charles Napier.           |
| 3. Countess.          | 9. La Grosse Sucrée.             |
| 4. Dr. Hogg.          | 10. Keens' Seedling.             |
| 5. James Veitch.      | 11. Lucas.                       |
| 6. Hammonia.          | 12. British Queen.               |

They are not placed in the order of merit, but the two last in each six are placed there because they connect the midseason with the late varieties. Dr. Hogg is placed in the first six because it succeeds in many gardens where British Queen fails. Vicomtesse Hericart de Thury is rather small, but if a cottager were to confine himself to just one variety, this would, perhaps, be the most serviceable. Twenty-two varieties are named, five early, twelve midseason, and five late. Reducing them to selections of twelve and ten for succession they stand thus:—

#### FIRST TWELVE.

1. Noble.
2. Crescent Seedling.
3. King of the Earlies.
4. Sir Joseph Paxton.
5. President.
6. Countess.
7. Dr. Hogg.
8. James Veitch.
9. Hammonia.
10. Elton Pine.
11. Eleanor.
12. Waterloo.

#### SECOND TEN.

1. Pauline.
2. Marguerite.
3. Vicomtesse Hericart de Thury.
4. Sir C. Napier.
5. La Grosse Sucrée.
6. Keens' Seedling.
7. Lucas.
8. British Queen.
9. Frogmore Late Pine.
10. Loxford Hall Seedling.

They are not exactly arranged in the order of ripening, but endeavour has been made to place in the first twelve those which combine the essential qualities of earliness and lateness with good size, quality, and productiveness in the majority of gardens, though there are a few sorts in the second ten that may excel in some. Still further reducing, we have two good half-dozen for succession in the following:—

#### FIRST SIX.

1. Noble.
2. Sir Joseph Paxton.
3. President.
4. Dr. Hogg.
5. Waterloo.
6. Elton Pine.

#### SECOND SIX.

1. King of the Earlies.
2. Vicomtesse Hericart de Thury.
3. Keens' Seedling.
4. Sir C. Napier.
5. British Queen.
6. Eleanor.

If I were asked to nominate the three most useful varieties for small gardens they would be Noble, Sir Joseph Paxton, and Vicomtesse Hericart de Thury.

It is open to cultivators to make better selections than the above, and I shall be very glad if they will do so.

I should like to know something about Dr. Livingstone Strawberry. A grower of it in Scotland states he has had "basketfuls of equal sized fruits of it eight and ten to a pound." I presume he does not mean eighteen. He further says, "No Strawberry will grow under trees as well as this does," and from rich new soil he "pulled 4 lbs. of fruit from each yearling plant." He has also recorded that he has had fruits of Cockcombs 4 ozs. and 1 grain each. This is Strawberry growing extraordinary, and I, for one, have still something to learn.

Of Laxton's Latest of All, A. F. Barron, Auguste Nicaise, Duchess of Edinburgh, Crown Prince, Souvenir de Kieff, Oscar, and Princess Frederick William something may perhaps be said by gardeners who have grown them. Of the first named especially it would be interesting to know if it justifies its name. Mr. Gibson of Draycot finds Princess Frederick William one of his best earlies, ripening in May, and this and the Vicomtesse are perhaps the best for yielding second crops in the autumn from plants that have been forced in spring. I have more than once found Newton Seedling my sheet-anchor during a wet Strawberry season in the fruits having remained firm when most others were rotting on the ground.

I must say a word on behalf of the very distinct, richly flavoured, and much neglected Hautbois Strawberry. Years ago it was grown in most well furnished gardens, and enjoyed by their owners. It is now almost as scarce as the delightful Frontignan Grapes. There is a variety of the Hautbois at Chiswick, more prolific than any I have seen, and richer than any other Strawberry in the garden. Mr. Laxton should cross it with Noble, combine the virtues of both, and give the world a treat.

In some of the "best families" the Grove End Scarlet or Roseberry have to be specially grown for preserving. They are planted about 9 inches apart in beds, and grow into a mass. They are forms of the Virginian Strawberry. The last named was raised near Aberdeen—a chance seedling that came up under a Rose bush—hence the combination of Rose and berry—Roseberry. For that little "tip" I am indebted to my friend Mr. Barron.

Passing to sites for plantations of Strawberries, we arrive at an important practical matter in connection with a prolonged supply of fruit. This cannot be in the best manner secured without choosing the warmest positions, such as south borders (for some at least of the first early sorts), and north borders, or the coolest available positions, for the latest varieties. I have found this method of appropriation of the greatest possible advantage, and have practically doubled the length of the Strawberry season over what it was and must be when only midseason varieties are grown in an open position, or in the same quarter of ground. Yet this is still the practice in many gardens. I have recently seen a good example of the method advocated. On a south border Noble was first gathered on the 3rd of this month, and the beds cleared and the runners layered on the 23rd. In the same garden later varieties, but not the latest, are now (June 27th) flowering on the cool north border. If all had been grown in the middle of the garden, the ripening of the early variety would have been retarded and the later advanced, thus shortening the season.

by at least a fortnight. For a steady family supply of fruit, surely adapting varieties to sites on the principle suggested is the better way.

Soil and its preparation can only be briefly referred to. Strong soil is considered by many persons to be an absolute necessity for the production of good crops of Strawberries. That is perhaps the popular view, but it is a popular fallacy. It does not matter how light the land may be, provided uniform moisture is maintained in it, and it also contains the manurial constituents that Strawberries need, for the best of crops and the finest of fruits will then be produced. Potash is the chief mineral food of the Strawberry, constituting nearly half the bulk. So it is of Peas, and if the soil is made capable of producing first-rate crops of Peas it will grow first-rate crops of Strawberries, only these require more moisture. If strong soils shrink and crack, out goes the earth moisture, and down go the leaves of the plants; then

manuring his Strawberry ground. What is the secret of the remarkable success? Moisture—regular, constant, uniform moisture. Water is not far below the surface, 2 or 3 feet perhaps, and rises to the roots in the form of vapour under the influence of the sun. If you move the dusty surface you find the moisture. It reminds of the sandy fields in Holland in which bulbs are grown, where the Dutchmen level down the elevations to bring the surface nearer to the water below. The sandy Strawberry ground has no doubt been a sea beach at some remote age, and there may have been considerable marine deposits. Be that as it may, there are grown every year some of the finest and most valuable crops of Strawberries in some of the lightest sandy soil in Britain, if soil it can be called. I have not said much about soil preparation. Heavy land must be made friable, and light land nearly let alone for Strawberries. Digging this, especially in dry weather in spring, is worse

FIG. 6.—PLAN OF VAUXHALL PARK. (See Page 17.)

all is over. Cracking rarely occurs in light soil, and if it is deep it can be kept moist by heavy mulchings applied either in the autumn or very early spring. This work is often done too late. I do not say that Strawberries cannot be grown in strong soil, for they can. I have had to grow them in soil strong enough for brick-making, but did not like it half so well as a much lighter free-working medium. Make light soil firm, keep it moist and charged with fertility, and though Strawberry plants will not grow luxuriantly they will bear fine fruit abundantly. If anyone doubts this let him go and see Mr. Sharpe's culture near Virginia Water. His field is a bed of sand—nothing but sand, and if not covered would blow away under strong wind in dry weather. I have travelled far, and visited gardens in most counties, but nowhere have I seen the equal of Mr. Sharpe's crops of Marguerite, and the splendid fruits have taken first prizes at scores of shows. I am positive I have seen 2 to 3 lbs. piled up round a plant, the trusses reaching quite beyond the small hard-looking leaves. No manure is used. When it was applied it increased the growth of leaves at the expense of the fruit, and as fruit-growing paid Mr. Sharpe better than leaf-growing he ceased

than labour wasted, and all the manure that it needs after the plants are established should be applied on the surface.

I have yet to say a little, and it can only be a little, on methods of cultivation. I am a strong believer in what I call the annual system, though it is strictly biennial, of growing Strawberries, especially the earliest crops, on south borders. Subject to certain reservations for any special purpose, let the border be practically devoted to three crops—and no three are more important—early Potatoes, Strawberries, and Peas, but chiefly the two former. After the Potatoes are cleared off level the soil, but if of a light nature do not dig it. If dry scoop out some hollows and fill them with liquid manure, more than once if needed. Have ready sturdy young Strawberry plants with bushy fibrous roots, which plant carefully and well about 15 inches apart, water them and mulch. By the autumn they will produce hard nut-like crowns, and in the spring earlier and finer fruit will be produced than from old plants. Immediately the crop is gathered clear away most of the mulching, spread a couple of inches of free soil containing much vegetable refuse, leaf mould, and wood ashes between the rows; press

down the runners in it with flat stones, and by the end of July you will have the best of young Strawberries for planting, and when they are inserted dig the parents up at once and crop the ground, if you like, with winter Spinach. In this way a stock of vigorous early Strawberry plants is maintained, very different from those from enfeebled parents. I have planted in the open early in August for two years fruiting, placing them together in triangles  $2\frac{1}{2}$  feet from row to row and a little closer in the lines, and the following season gathered 2 lbs. of fruit from each clump, but 1 lb. is nearer the average, and not a bad crop in the time. Hundreds of persons may do the same without difficulty when they once get in the way of it and have rather light and fertile soil.

For preventing the deterioration of some Strawberries in some gardens it is absolutely necessary to procure plants occasionally from vigorous stocks. In no other way could I grow the British Queen in one particular garden. Plants propagated from the home stock became weaker yearly, and so it is with others if long grown in certain soils and positions that are not naturally adapted for producing well constituted plants.

In reference to the durability or profitable period of fruitfulness of Strawberries, that is a question of soil mainly. Some soils will sustain the plants for several years, others will not. Generally speaking, perhaps, the second year's crop is the best in the majority of light soils; the third year's in soils of a more holding nature. By thinning the crowns and surface manuring, profitable crops have been afforded for seven years, and I have seen a productive Strawberry bed fifteen years old; but this is exceptional, and as a rule stout early young plants that mature quickly are the most satisfactory in gardens, and a suitable number for increasing the fullest supply of the finest fruit should be planted every year, a corresponding number that have yielded their maximum crop being chopped up immediately after fruiting.

Another practical point to bear in mind is this, a greater breadth both of the very early and very late varieties should be planted than is customary. Owners of gardens usually wish for more Strawberries than they get when the first fruits commence ripening, and gardeners cannot produce as many dishes of Strawberries late in the season as are wanted, unless they plant suitable sorts freely, for the crops of very late Strawberries are not nearly so heavy as those of midseason varieties. But I must stop.

I began with the remark of an old doctor, and will conclude with the observation of another, pertaining to the use of Strawberries, and the good effect they had on an eminent man, whose name is familiar to gardeners throughout the world. It was the custom of a physician to terminate his spring course of lectures by a Strawberry festival. "I must let the class see," he said, "that we are practical as well as theoretical. Linnæus cured his gout and protracted his life by eating Strawberries."

## HORTICULTURAL SHOWS.

### TWICKENHAM SHOW.—JULY 2ND.

THE historic district of Twickenham has been renowned for its horticultural shows for a considerable time, the present Society having this year completed its majority, but, like other societies, it has in recent years had to contend with increasing competition and occasional periods of ill-luck due to unfavourable weather. Still, under good guidance it has weathered the storms, and again last week presented numerous visitors with a pleasing display of horticultural produce and artistic floral designs. The Society is fortunate in possessing an extremely courteous and able Secretary in Mr. J. J. G. Pugh, and it has the support of a practical and thoroughly interested Committee, amongst whom Messrs. W. Bates, R. W. Freshwater, W. J. Fitzwater, Fordham, and Poupert may be specially mentioned.

The Show was held in the grounds attached to Orleans House, the residence of W. Cunard, Esq., a delightful position, and fortunately, though the weather on the previous night had been extremely unpromising, it was fairly fine the whole of Wednesday, thus inducing a large number of visitors to assemble. The competition was not very keen in the plant classes, but several exceedingly tasteful groups were contributed. The best of these in class 1, arranged in a space not exceeding 100 square feet, was from Mr. H. E. Fordham, Richmond Road, and well balanced highly tasteful display, with a background of Palms, a base of Ferns, with Cattleyas, Gloxinias, Begonias, and taller Corcopsis, Lilliums, and Tuberoses, margined with Isolepis and Pansies. It was bright without being too gay, the flowers and foliage well proportioned. Mr. J. Parsons, gardener to T. Twining, Esq., Penrhyn House, Twickenham, was a good second, his group being a trifle heavier than the first, but in all other respects it was an example of admirable arrangement. In the class for a group on 50 square feet Mr. G. Watts, gardener to H. Little, Esq., Twickenham, secured the premier award for an exquisite group in the best style—light, varied, and bright, fresh green Ferns forming the groundwork, from which arose Cattleyas, Begonias, Irises, and other flowering plants, with an edging of Sibthorpias, Caladiums, and Grasses. Mr. Parsons also won the first prize for nine stove and greenhouse plants, and Mr. Little had similar honour for six well-grown Orchids, and the same exhibitor secured honours for Zonal Pelargoniums and Tuberosus Begonias, excellent plants being staged in each case. For six table plants Mr. Gage, gardener to the Earl of Dysart, Ham House, won first with neat little specimens, but closely followed by Mr. Waite, gardener to W. P. Talbot, Esq. Gloxinias from Messrs. Hilditch and Tindale were extremely fine, both as regards the size and colour of the flowers.

Cut flowers and floral decorations occupied a large tent, and con-

stituted the special feature of the Show. Roses were fresh and good from several exhibitors; Mr. C. Warwick, gardener to J. P. Kitchen, Esq., taking first place for twenty-four blooms, and Mrs. Rust was second in the same class, Mr. J. Bateman, Upper Holloway, being third. With twelve Roses the prizes went to the same exhibitors in the order named, but in the district class for twelve Roses Mrs. Rust was first, Messrs. Kestin and Hoar being second and third respectively. In the floral decorations Miss E. L. Clarke, Twickenham, was very successful, her tasteful arrangements securing four first prizes, lightness and the avoidance of discordant colours distinguishing this lady's exhibits. Mrs. J. Vickery, Miss G. Gardner, Miss A. Müller, Mr. Fordham, and Mrs. Freshwater also contributed well to this department, the stands of flowers and the baskets of Roses constituting charming features.

Grapes, Melons, Peaches, Nectarines, and Strawberries were shown in capital condition, and the leading prizes were secured by Messrs. W. & E. Wells, Waite, W. Cunard, G. Sage, F. J. Wadham, Howell and Goody. Cucumbers, collections of vegetables, and Tomatoes were similarly good, while the cottagers' productions filled a tent, and were as usual of high merit.

### LEE, BLACKHEATH, AND LEWISHAM.

ONE of the best Exhibitions of stove and greenhouse plants held around London this season was that of the Lee, Blackheath, and Lewisham Horticultural Society, which took place on July 2nd and 3rd in the grounds of Mrs. Penn, The Cedars, Lee. It would be difficult to find better grown specimens of either flowering or foliage plants than were shown there, the former being abundantly furnished with flowers and beautifully trained, and the latter possessing foliage the picture of health and cleanliness.

Particularly fine were the specimens of *Dipladenia amabilis*, *Anthurium Andreanum*, *Clerodendron Balfourii*, and *Ixora Williamsi*, shown in the class for six stove or greenhouse plants in flower by Mr. J. Hudd, gardener to F. W. Prior, Esq., these winning the first prize. In previous years Mr. S. Reece, gardener to R. Whyte, Esq., has had the leading position in this class, but this year he had had to take a second place, his plants, though admirably grown, being, with two exceptions, scarcely so well flowered. In Mr. Reece's collection were two plants well worthy of note on account of their great size and abundance of flowers—*Erica gemmifera elegans* and *Parmentieriana*, plants rarely seen in such good form nowadays. In the next large class for six plants of ornamental foliage Mr. Hudd again came in first with some grand plants of *Croton Queen Victoria*, *Cycas revoluta*, and *Cycas undulata*, the latter being a sturdy well furnished specimen. As in the previous class, Mr. S. Reece ran a close second. In his collection a noteworthy plant was *Phyllotænium Lindeni*. The third prizewinner was Mr. J. Lambert, gardener to H. W. Segelcke, Esq. Ferns were in capital condition, the specimens being large, choice, and well furnished with healthy green fronds. Mr. Hudd won the first prize for six exotics, one of his specimens, *Davallia Mooreana*, measured fully 5 feet in diameter, and proportionately large were *Gleichenia rupestris glaucescens*, *Microlepia hirta cristata*, and *Acrophora chærophyllus*. The winner of the second prize was Mr. S. Reece. Mr. J. Lambert showed well-grown examples of *Selaginella lævigata umbrosa*, *hæmatodes*, and *cæsia* in the class for six Lycopods, for which he was awarded a first prize, Mr. J. Rhoden, gardener to C. Vavasour, Esq., coming in second with small but creditable plants. *Caladiums* formed a prominent feature in the Show. The first prize collection in the class for six embraced large and beautifully coloured specimens of *Herold*, *Bicolor splendens*, *Beethoven*, *Chantini*, &c. They were exhibited by Mr. T. Aley, gardener to R. Keisey, Esq. The second prize went to Mr. C. Nunn, gardener to J. Soames, Esq., and the third to Mr. J. Dobson. In the class for four kinds Mr. Newnham was first, and Mr. Mullens second. There was only one competitor in the class for four Heaths, Mr. S. Reece, who was deservedly awarded the first prize for large and well-flowered specimens.

Perhaps the greatest feature of all in the Show were the Gloxinias. A special prize was offered by Messrs. James Carter & Co. for the best four pots of Gloxinias in bloom, and this brought together some really grand plants. Those which were awarded the first prize were fully 2 feet in diameter, and each plant carried on an average fifty blooms—examples reflecting the highest credit on the exhibitor, Mr. R. Sholdice, gardener to R. P. Barrow, Esq. Scarcely less noteworthy were the second prize specimens shown by Mr. J. Rhoden; and those by Mr. S. Reece, which gained the third prize. There were some good specimens shown in the class for six by Messrs. Barker, Sholdice, and Rhoden, who were the respective winners in the order of their names. For a specimen plant in flower Mr. C. Nunn was first with *Stephanotis floribunda*; Mr. J. Mullens second; and Mr. Reece third. Mr. W. Jeffery occupied first place for four stove and greenhouse plants in flower, Mr. C. Nunn being second. For the same number of foliage plants the first prize was well won by Mr. Barker, the second by Mr. C. Nunn, and the third by Mr. J. Mullens. Orchids were very good. Mr. J. Barker, gardener to C. Hemmerde, Esq., was first for four specimens, these being *Cattleya Mossiæ*, *Ada aurantiaca*, *Dendrobium suavisimum*, and *Brassia verrucosa*; and Mr. Hudd second. In the class for a single specimen Mr. Hudd was first with *Dendrobium Pierardi*, and Mr. Barker second with *Cypripedium barbatum*. Fuchsias are always in good condition at this Show. The chief prizewinners were Messrs. Dobson and Hudd. Space will not permit us to enumerate in detail the other classes; we cannot therefore do more than say that the principal prizewinners in the classes for Pelargoniums were Messrs. Jeffery, Reece, Hudd, and Dobson; and for miscellaneous classes Messrs. Nunn, Sholdice, Helmer, and Payne.

Roses were very good considering the rough weather experienced previous to the Show. The first prize for forty-eight varieties, single blooms, was won by P. Burnand, Esq., Reigate, the only competitor in this class. Messrs. Bunyard & Co. were first for twenty-four, P. Burnand, Esq., and Mr. Barker being second and third. For twelve, the respective winners were Messrs. Burnand, Bateman, and Cole; and for nine, Messrs. Bateman and Barker. Messrs. Lambert, Saville, and Nunn were the three prizewinners in the class for three stands of cut flowers; Messrs. Shrubbs and Hudd for a box of cut flowers; and Messrs. Shrubbs, Cole, and Nunn for hand bouquet.

Fruit was not over-plentiful. Some creditable bunches of black and white Grapes were, however, exhibited by Messrs. Goddard and Payne, the former winning the first prize for the best three bunches of black, and the latter for the best three of white. For the best bunch of white, and the best of black, Messrs. Hudd and Payne were the chief winners. Messrs. Reece, Shrubbs, Jeffery, and Fox took the principal prizes for Strawberries and Melons, and Messrs. Fox, Payne, and Shrubbs for the collection of fruit.

Vegetables were fairly well shown, though not so numerous as they ought to have been. Mr. Fox won the chief special prize for the collection of vegetables, and Mr. Nunn was second, the produce being of good quality. Messrs. Merryweather's prize, a length of sphincter grip hose, offered for the best collection of vegetables and salad combined was won by Mr. C. Nunn. Messrs. J. Laing & Son's three prizes for the best six varieties of vegetables grown from their seeds was won by Messrs. Burgess, Rhoden, and Shrubbs. Mr. C. Nunn gained Messrs. Sharpe and Co.'s prize for the best collection of vegetable grown from their seeds. A special prize, a span-roof frame, offered by Messrs. Hayward & Co., Brockley, for the best six pots of Tomatoes in fruit, was deservedly won by Mr. Payne with well fruited examples of Golden Queen.

Besides the foregoing there was an extensive display of cottagers' and amateurs' exhibits, for which space cannot be found. Among the non-certificated groups were a fine batch of single and double Petunias, also double and single Begonias from Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Begonias, &c., from Messrs. J. Laing & Co., Forest Hill; bouquets, sprays, &c., from Messrs. Garton Bros., Blackheath. Messrs. Hayward & Co. also showed a specimen of their span-roofed greenhouses. We may add in conclusion that the silver memorial cup, offered annually to the exhibitor taking the largest number of prizes, was won by Mr. J. Hudd, gardener to F. W. Prior, Esq., and that, in spite of the showery weather, there was an excellent attendance of visitors on both days.

#### TRENTHAM SHOW.—JULY 3RD.

UNDER the presidency of the Marquis of Stafford, and with aristocratic and influential patrons, an effective Committee, and energetic Secretary, the Trentham Horticultural Society is probably destined to become known far beyond the county of Stafford. The progress it has made in three years is remarkable. Cottage gardening has long been encouraged in and around Trentham, and prizes given for gardens and exhibited produce, but three years ago Mr. P. Blair determined to provide the inhabitants of the district with something more than a cottagers' show. He started without a penny, but with quiet persevering zeal obtained subscriptions that enabled £70 to be offered in prizes. The following year the sum was increased to £130, and this year to upwards of £250. A comprehensive schedule of ninety classes was issued, half of them open to all, and the result was a thoroughly representative Exhibition attended by 10,000 persons. The tents were packed with visitors, who had the privilege of passing through the extensive pleasure grounds and gardens, and attractive as these were, also the famous Grenadiers' band, which was engaged for the occasion, it was easy to see, however, that the Roses, fruit, and other exhibits commanded the most attention. There was a great display of Roses, a splendid show of fruit, and the same may be said of vegetables, as will be conceded when it is stated that Mr. Lambert of Shrewsbury was the second prizewinner in the three collections. A marquee was also devoted to plants arranged for effect, Mr. G. Williams, Manchester, well winning first honours and a valuable special prize offered by Messrs. Doulton & Co. It was a charming arrangement of tall Crotons and Palms on raised mounds of Ferns, with a few Orchids and other flowers interspersed amongst low plants of *Adiantum gracillimum*. Mr. W. Stevens, gardener to W. Thompson, Esq., Stone, secured the second prize of £5 with an attractive group, in which Orchids preponderated. But we must pass to the other sections of the Show.

ROSES AND CUT FLOWERS.—These were staged in great numbers by many exhibitors, and though the rain had marred several of the blooms, admirable boxes were placed in competition. This, in some of the classes, was extremely keen, and the adjudicators had no light task in apportioning the awards. Notably was this the case in the class for forty-eight blooms, distinct, in which, in addition to the prize of £6, a trophy of more than twice the value was provided by Messrs. W. T. Copeland & Sons. This was secured by Mr. Frank Cant, Colchester, through only, we understood, by five points out of a possible 280. Messrs. Perkins & Sons, Coventry, were second, the stands containing many fine blooms, and Messrs. Harkness & Sons, Bedale, a close third, with very fresh clean examples, but lacking in size. The Colchester varieties were as follows:—Alfred Colomb, A. K. Williams, Baronne de Rothschild, very fine; Camille Bernardin, Charles Lamb, Charles Lefebvre, Charles Darwin, Countess of Rosebery, Crown Prince, Constantine Tretiakoff, Duc de Wellington, Duchess of Bedford, Duchesse de Morny, Duke of Edinburgh, Earl Dufferin, Etienne Levet, Etienne Dupuy, Fisher Holmes, François Michelon, Heinrich Schultheis, John

Bright, La France, Madame Eugène Verdier, Madame Gabriel Luizet, Marie Finger, Marie Verdier, Marguerite de Roman, Marie Baumann, Mary Bennett, Merveille de Lyon, Mors. Mat Baron, Mrs. Jno. Laing, Pride of Reigate, Pride of Waltham, Prince Camille de Rohan, Rosieriste Jacobs, Star of Waltham, Sultan of Zanzibar, Ulrich Brunner, Victor Hugo, very fine; Viscountess Folkestone, Madame Isaac Péreire, Catherine Mermet, Cleopatra, Francisca Kruger, Madame Lambert, Niphotos, and Souvenir d'un Ami. In the class for thirty-six blooms, distinct, the English Fruit and Rose Company (Cranston's), secured the premier position, followed by Messrs. Perkins and Frank Cant in the order named.

In the class for twenty-four triplets, distinct, a special gift by Messrs. Minton & Co. of their beautiful ware, value £10 10s., was added to the first prize, and again Mr. Frank Cant was in the ascendant, though Messrs. Dickson, Chester, and Harkness, Bedale, exhibited remarkably well for the remaining prizes.

In the corresponding class for Teas the first and third prizewinners occupied the same relative positions, Mr. H. Merryweather, Southwell, being a good second. The blooms had suffered by the wet and stormy weather, yet were excellent. The Bedale examples were fresher, but small, including a good selection. In the twelve blooms of any variety class Mr. Frank Cant was first with a magnificent stand of Mrs. John Laing; Messrs. Dickson second with clean good examples of Merveille de Lyon; and Messrs. Harkness third with La France. Messrs. Cant were the winners in the Marie Baumann class, Messrs. Dickson and Frettingham following. Many stands of blooms were exhibited by local amateurs, but they cannot be enumerated.

Messrs. Perkins & Sons had the best epergne of Roses, and divided the honours with Messrs. Jenkins & Son, Newcastle, for bouquets. Mr. Elphinstone won the first prize for cut stove and greenhouse flowers with a beautiful stand, nearly all Orchids, Messrs. Crawford & Stevens following. Messrs. Cannell, Swanley; Laing, Forest Hill; and Pearson, Chilwell, contributed splendid Begonias and Pelargoniums, for which they are respectively famed; and Mr. Barlin, Didsbury, contributed effectively to the Show.

FRUIT.—For a collection of nine dishes, distinct, the Society's first prize and a special, value £5, given by Mr. Pillsbury, brought excellent competition, the prizes being awarded in the following order:—First, Mr. E. Gilman, gardener to the Earl of Shrewsbury, Ingestrie; second, Mr. J. Goodacre, Elvaston Castle Gardens; third, Mr. J. Edmunds, Bestwood Lodge Gardens, Nottingham. The produce was excellent, but taking note of individual dishes was out of the question in the surging crowd of visitors that flocked about ten abreast along the tables. In the class of six dishes we were a little more fortunate; the competition was again keen, and the produce of high quality. Mr. Allan, gardener to Lord Suffield, Gunton Park, secured the premier position with such Gros Maroc Grapes as have seldom, if ever, been seen. The berries were quite as large as first-class examples of Gros Maroc, and nearly as round. The Vine is grafted on the Frankenthal, and the stock has evidently influenced the produce. Remarkably fine also was Foster's Seedling on the same stock. The remaining dishes were wonderfully good and well coloured. Downton Nectarine, admirable Bellegarde Peaches, a capital Golden Perfection Melon, and enormous James Veitch Strawberries. Mr. W. Elphinstone, gardener to E. M. Munday, Esq., Shipley Hall, Derby, was an excellent second with well finished Grapes and good Peaches, Nectarines, Melon, and Strawberries. Third, Mr. J. Edmunds, also with a good collection.

In the Grape classes Mr. J. Wilkes, gardener to G Meakin, Esq., Cresswell Hall, was first with large clusters. Mr. W. Elphinstone, an extremely close second, with smaller symmetrical bunches, and good and well finished berries. Mr. Bate, gardener to J. H. Harris, Esq., The Hayes, Stone, third with good examples. In the any other black variety class first honours fell to Mr. J. J. Craven, gardener to J. G. Morris, Esq., Liverpool, with large bunches and berries of Madresfield Court, Mr. Elphinstone closely following with smaller bunches superbly finished, and Mr. Allan third, both exhibiting Madresfield Court. Mr. Alsopp, gardener to Lord Hotham, Walton Hall, Hull, was first with Muscats, and Mr. Allan in the other white class with handsome Foster's Seedling. Mr. Elphinstone was first in the green or white flesh Melon class with a fine fruit of the Countess, the fifth time he has exhibited the variety, and secured as many first prizes. Mr. Allan was the leading exhibitor in the green flesh class. Other prizetakers for Melons were Messrs. Goodacre, Craven, Edmunds, and Turner. Peaches were splendidly shown, Mr. P. Blair, Trentham, securing the chief prize with grand examples of Royal George, Mr. Gilman being an exceedingly close second with superb fruits of Violette Hâtive, and Mr. Turner, gardener to B. Fitzherbert, Esq., Swynnerton, third, with a good dish of Bellegarde. In Nectarines Mr. Blair took the lead with a splendid dish of Lord Napier, Messrs. Bate and Gilman following with Violette Hâtive.

Strawberries of great size were exhibited by Messrs. Allen, Edmunds, and J. Crawford, gardener to J. Thorpe, Esq., Coddington Hall, Newark, who were adjudged the prizes in the order named, the two former showing Sir Joseph Paxton, the latter James Veitch. Mr. Wallis, Keele Hall, exhibited some seedling Strawberries, two of which were certificated, one of them being the result of a cross between Countess and British Queen, and the other between British Queen and President, and the Judges considered the combined properties of those varieties, both as regards size and quality.

VEGETABLES.—These were well and extensively staged for the prizes offered by the Society, also by Messrs. Sutton & Sons, and Messrs. Webb and Sons. Mr. Crawford, Coddington Hall, outdistanced his rivals in all

the collections, followed by such good cultivators as Messrs. Lambert, Wilks, and Ba'te, but pressure on space forbids an enumeration of varieties. Mr. Edmunds staged very fine Mushrooms for Mr. Bason's prize.

This is a mere outline report of the salient features of a really good Show, which was opened by the Duke and Duchess of Sutherland. All the officials are to be congratulated on the success they have achieved, and which should stimulate them to renewed efforts another year. The Trentham Gardens are in admirable condition throughout. Orchids superb, Grapes abundant, and Peaches and Nectarines as fine as can be imagined; indeed, every department reflects the utmost credit on Mr. P. Blair.

EVENTS OF THE WEEK.—Rose shows still continue numerous. To-day (Thursday) the Birkenhead, Woodbridge, and Worksop societies hold their annual Exhibitions. Ulverston Show takes place on July 10th, New Brighton on July 12th, and Christleton on July 15th.

— THE WEATHER IN THE METROPOLITAN DISTRICT continues of the same dull character as recorded for the past week or two, and the frequent rains are causing damage to many crops. Strawberries in particular are suffering greatly; the fruit is decaying on the ground, and that gathered is so soft it suffers considerably in transit to the markets. The crop is a larger one generally, and as a consequence the fruit is being sold at very low prices; fine looking fruits are seen in the smaller shops and on the barrows at 2d. per lb.

— GARDENING APPOINTMENT.—Mr. G. Pickers, late of Brans-ton Hall, Lincoln, has taken charge of the gardens of C. E. Shea, Esq., The Elms, Foot's Cray, Kent.

— A HIGHLY satisfactory Exhibition was held by the TEDDINGTON ROYAL HORTICULTURAL SOCIETY on Wednesday last, July 9th, in the grounds of Bushey Lodge. A comprehensive and liberal schedule was provided, and keen competition was obtained in all the principal classes, the quality of the exhibits being good, but the weather was very unfavourable.

— THE Royal Caledonian Horticultural Society loses its faithful friend, MR. JOHN STEWART, at the age of seventy-six, who for twenty-five years was Secretary to the above. His genial manner made him a host of friends, many of whom showed their respect by seeing him laid in his last resting place, the beautiful cemetery of Inveresk, near Edinburgh, on July 4th.—A. O.

— FRUIT PROSPECTS.—An extensive Clydeside fruit grower informs me that Apples will be scarce, Pears an average, and Plums under an average crop. Gooseberries are fair, and Strawberries a moderate crop. A Strawberry grown there under the name of Garibaldi has ripened again earlier this year than Vicomtesse Héricart de Thury, proving it to be a distinct variety.—W. T.

— THE ROYAL BOTANIC SOCIETY'S FLORAL FETE last week proved very successful, the weather continuing favourable until late in the evening, and there was a large attendance of visitors. The competition in the floral decoration classes was unusually keen, especially with bouquets, which afforded one of the finest displays the Society has ever had. Tables, stands of flowers, and baskets of plants were also numerous, and included some exceedingly tasteful exhibits.

— SUTTON ROSE SHOW.—We are favoured with a report of the Sutton Rose Society's Show on the eve of going to press, and can, therefore, only find space for a brief reference to the principal features. Mr. Frank Cant, Braiswick Nursery, Colchester, was victorious in the open class for thirty-six blooms, having a large, even, and fresh lot of flowers; Messrs. Paul & Son, Cheshunt, being second; and Messrs. G. & W. H. Burch of Peterborough third. Mr. Frank Cant and Mr. Prince of Oxford were placed equal first with twelve Teas, Messrs. Paul and Son following. In the amateurs' classes Mr. E. B. Lindsell, Hitchin, showing very finely, carried off the lion's share of the prizes, being first for twenty-four, twelve, and eight trebles, other prizewinners being Messrs. Slaughter, J. G. Fowler, F. Pawle, E. Wilkins, P. Burnand, C. J. Graham, and the Rev. A. Cheales. The local classes were not very well filled. The table decorations, bouquets, and sprays formed an attractive feature.

— THE LATE MR. B. S. WILLIAMS.—Much to my regret I was prevented from paying the last tribute of mourning regard to my old friend. On Thursday last I met at the Trentham Flower Show Mr. F. Sander of St. Albans, who suggested that something should be done to perpetuate our departed friend's memory, and that it should take the form of a medal similar to the Veitch medal. I quite agree with the suggestion, and shall be most happy to do all in my power to assist in carrying out this most desirable object. Mr. Williams always took a most lively interest in horticultural exhibitions, and no one contributed more to their success, and no one was more highly esteemed amongst horticulturists of all grades. The main cause of this was his naturalness. There was nothing assumed (or to use a figure of speech in common use in the present day) he put "no side on," and in this respect I think all of us may learn an important life lesson summed up in two words, "Be natural." I am not wedded to the medal idea, the money might be devoted to the Gardeners' Orphan Fund, but this, of course, is a matter of detail which the trustees appointed would determine to the satisfaction of all concerned.—BRUCE FINDLAY, *Manchester*.

— THE TOTAL RAINFALL AT CUCKFIELD, SUSSEX, for June was 2.86 inches, or 1.06 inch above the average. The heaviest fall was 0.57 on 30th, rain falling on seventeen days. Highest shade temperature 75° on 24th, lowest 42° on 28th. Mean maximum 65.1°, mean minimum 48.1°, partial shade readings 3.2° under the average. A very unsatisfactory month. Much soft fruit will be spoiled if more sunny weather does not come soon.—R. I.

— ROSES AT WINCHESTER.—At the Show of the Winchester Horticultural Society, held on Tuesday last, there was a remarkably good display of Roses, but a report of the Exhibition cannot be published in the present issue. Mr. B. R. Cant was first in the forty-eight distinct class, Mr. Frank Cant closely following, also in the Tea and Noisette classes. Messrs. Keynes, Williams & Co. staged the best twenty four H.P.'s, and Messrs. Perkins the best stand of dark Roses—A. K. Williams. Mr. Flight was a leading exhibitor in the amateurs' classes.

— THE WEATHER IN JUNE.—The past month here has been truly a dripping one. Rain has fallen frequently, yet we have had an abundance of sunshine. The month on the whole has not been marked by any extremes of temperature, which has for the most part remained very steady and even, the highest point the thermometer reached being 79° in the shade on the 24th ult.; the lowest reading was 42°, on the morning of the 2nd. Rain has fallen upon sixteen days, maximum for any twenty-four hours being 0.62, on the 13th; minimum 0.01, on the 23rd; total amount during the month, 2.71. Notwithstanding the beautiful weather we have had insects have been abundant.—E. WALLIS, *The Gardens, Hamels Park, Buntingford*.

— NURSERYMEN AND MOSQUITOES.—A well-known local newspaper of West London, the *West Middlesex Advertiser*, has published in a recent issue a letter from a much aggrieved correspondent, who complains bitterly of his sufferings from mosquitoes. He has been bitten many times, once so seriously that an eye was closed up for awhile, and he had to stop away from his business; others also in his neighbourhood have been sufferers similarly. It would not certainly have been of much use to write a letter in abuse of the insects, but the author of it thinks he has discovered the source of the grievance; it is the nursery gardens and plant houses at the west of London, more particularly at West Chelsea. The proprietors, so he says, import a great variety of exotic plants, and with these the insects so much complained of. If this persecution by the mosquitoes continues, he believes many of the inhabitants will be forced to remove, and he therefore longs for the departure of the nurserymen and their plants. I have not been as yet able to visit the spot and make personal inquiries, but do not hesitate at once to assert that the allegation appears to be absurd. Entomologists have refuted over and over again the statements concerning the occurrence of the mosquito in this country, the bites attributed to this species being really caused by one or more of our native species belonging to the same family. At certain seasons these flies, notably the common gnat, are unusually abundant, and their bite has remarkable virulence, the reason of which has not been discovered. Possibly an occasional stray mosquito reaches these shores on board some vessel, but these stragglers do not breed here. Even if colonies of mosquitoes could be imported, it would be impossible for them to be introduced with foreign plants, I should think, in the way supposed, the habits of the species being quite opposed to it. Be this insect plague what it may, I do not see how the nurserymen can be made the scapegoats.—J. R. S. C.

— THE STRAWBERRY IN MALTA.—Mr. Hibberd alludes to the wild Strawberry having been cultivated in England in the sixteenth century. It may interest your readers to know that the Maltese still grow it under the name *Frauli comuni*. It has been introduced, as also *Fragaria chiloensis*, which they call the "English Strawberry," or *Frauli inglesa*. I came across a small patch of the former species in flower in February, but it was apparently much the same as our wild form. I have not seen the fruit. No other kinds are generally cultivated.—G. HENSLOW.

— ROYAL HORTICULTURAL SOCIETY.—A Conference and Great Exhibition of Carnations and Ferns will be held in the Society's Gardens at Chiswick on July 22nd and 23rd next. The National Carnation Society offers several prizes for Carnations and Picotees, and two silver challenge cups will be awarded to amateurs by the R.H.S.—viz., one for the best collection of hardy Ferns, the other for the best collection of Filmy Ferns, grown without heat. The Conference on Carnations will begin on the 22nd inst. at 2.30 P.M., and the following papers will be read—viz., "The Carnation from a Botanical Point of View," by Mr. F. N. Williams, F.L.S.; "The Florists' Carnation and Picotee as Exhibition Flowers," by Mr. Harry Turner; "Carnations and Picotees in Towns," by Mr. Martin Rowan; "Border Carnations," by Mr. Richard Dean. On the 23rd the Conference on Ferns will open at 2 P.M., and papers will be read as follows:—"The Systematic Relations of Ferns," by Professor Bower, F.L.S.; "Hybrid Ferns," by Mr. E. J. Lowe, F.R.S.; "Plumose British Ferns," by Mr. C. T. Druery, F.L.S.; "Hardy Ferns and their Cultivation," by Mr. J. Birkenhead. Intending exhibitors are requested to communicate with Mr. Barron, Superintendent R.H.S. Gardens, Chiswick, on or before Friday, July 18th, stating the classes in which they propose exhibiting, and giving an approximate idea of the amount of space they will require.

— THE INCLEMENT WEATHER.—Saturday was one of the most boisterous and inclement July days we have had for a long while past. On Friday night a small cyclonic disturbance, which lay in the morning off the north-west of France, advanced steadily in an east-north-easterly direction along the English Channel. In many districts trees were uprooted, and considerable damage was done to fruit orchards and standing crops. In London, and over our eastern and south-eastern counties generally, the squalls occasionally reached the force of a moderate to fresh gale, the high wind being accompanied by a steady downpour of cold rain. Later in the day the depression travelled away to Holland, and the wind rapidly subsided. The weather also exhibited decided signs of improvement, but the latter change was very gradual, the air remaining raw, cold, and unpleasant throughout the remainder of the day. In London the maximum temperature was as low as 57°, or 16° below the average for July. Saturday was, in fact, with one exception the coldest July day we have had in London during the whole of the past twenty years, and at least 5° colder than in thirteen out of the twenty. The solitary exception occurred on the 11th of July, 1888, when the thermometer in London never rose above 54°, and when also the occurrence of snow was reported in many parts of the country. The aggregate amount of rain which fell during the passage of Saturday's depression was very large. At Dungeness there was a total of 1.2 inch, in London and at Yarmouth 1.4 inch, at St. Aubins, Jersey, 1.5 inch, and at Cape Grisnez 1.9 inch, while at Lynsted, near Sittingbourne, as much as 2.9 inch is said to have fallen up to Saturday morning. In the London district and some other parts of our south-eastern counties the aggregate rainfall for June was heavier than in any year since the disastrous season of 1879, and the opening days of July have certainly brought us no amelioration. The hay harvest has already been partially ruined, and unless an early change to more genial weather takes place the damage to grain crops will be simply irreparable.—(*Daily Paper*.)

### MISAPPLICATION OF FLOWERS.

COMMONLY enough it occurs that where public taste sets in favour of any one article, some injudicious friends of that article do it considerable harm by advocating its claims to an extent not warranted by its merit. Many new and useful plants have been blighted in public opinion by too much having been said in favour of them by some indiscreet admirer, whereas a true and unprejudiced narrative of their worth might have retained them an honourable place.

It may appear unkind to check the unbounded admiration of certain enthusiasts, yet it sometimes happens that by their laudations they do more harm than good; looking at only one side

of the picture they forget to point out any defect it may have, or in their zeal to advocate its cause cannot see any, and consequently thrust forward their favourite for a purpose it is not suited for, and the public being disappointed will not give it credit for what it really possesses.

Numbers of new bedding plants have after trial passed into neglect, the character given of them not being fulfilled in their growth and appearance. Perhaps one good feature in this is that old and tried good kinds are the more thought of when new ones have failed. But there are other cases in which the ardent admirers of the beautiful threaten to do harm to their cause as well as in their advocacy of new plants or varieties of them, and that is in no less a matter than the almost universal purposes to which flowers are now put—purposes which, I fear, must tend to create that indifference if not dislike to them which all interested in their culture must deplore.

Although it is next to heresy to breathe a syllable against flowers, nevertheless they are sometimes introduced where their presence can hardly be otherwise than inconvenient, if not an absolute nuisance. For instance, some kind visitor will intrude a bundle of strong-scented flowers into a sick room, or perhaps a bedroom, while the sitting and other rooms are so profusely garnished with flowers that the legitimate fittings there are disregarded. It is certainly not my purpose to say much against the dinner table being ornamented with tasteful displays of flowers, but a too great profusion must be contrary to good taste, and some of the contrivances adopted to exhibit the flowers partake so much of the toy character that I should predict that they are likely to have a very short reign. In fact, the design for this class of ornament is only yet in its infancy, and no doubt when it settles down into something like a channel that will accord itself with other things, we shall look back and wonder at the monstrosities that are now countenanced.

Not very long ago at a table of some pretensions I noticed every dish and object had flowers or foliage stuck upon it. Even the hot viands emitted their steam against fast-fading blooms of exotics, while stands for plants were scattered with a profuse hand over the centre and side tables.

Now, though this is unquestionably the age for embellishment, some discretion must be exercised in its use, for assuredly ornament too profusely employed ceases to deserve the name. Flowers, fruit, and foliage are all pleasing objects to look at, but they are not to be tolerated when out of place; and when every mantelpiece, bookshelf, table, and other such places are crowded with flowers the eye becomes tired of the monotony, and all delight in their presence is lost. Flowers are also sometimes placed where existing things tend to destroy their effect—as, for instance, where a stand of cut flowers is placed against a wall that is covered with a paper of a high-coloured floral pattern, the real contending against the sham. But let us leave this department, and, emboldened by our attack on flowers where misplaced, let us pry into another quarter where they are at the present moment exceedingly popular, and see if good taste, utility, and the other conditions that govern all prudent measures will assign them a place there.

Pardon me, ye ladies, to whom all lovers of flowers look for support and encouragement, if one of the purposes you put them to should meet with undue censure; for I confess I intend to be rather severe, and when I say I mean to attack no less a feature in your pet arrangements than the bouquets you so fondly caress I fear I am bringing a frown upon myself which I by no means invite. Perhaps I may be too much of a utilitarian, and look at things only with a view to what useful services they are likely to perform; if so, my attack on hand-bouquets must only be taken for what it is worth; but I certainly aim at something better than mere condemnation, I should like the thing reformed. Let us take an example, and an ordinary one.

For a lady of rank prepared for a ball one of the requisites of the present day is a bouquet in the shape of the shield of Achilles and nearly as large. The bouquet is made as symmetrical as if it were cast in a mould, and as stiff and formal as if it were formed of earthenware or cast iron. Its bulky proportions give quite sufficient employment to one hand to hold it; and though sometimes the courtesies of a partner may be agreeably called into play in holding it for a time, it nevertheless requires almost as much nursing as a baby. If laid on a seat it certainly may not occupy so much room as the lady herself, but will take up quite as much as her partner, and it is an endless source of concern and anxiety, and finally, perhaps, occasions some little disaster to the dress by being attached to the side for security; or perchance getting upon the floor, an accident of another kind is the result. All these things and many others are of everyday occurrence where huge hand-bouquets form portions of ladies' ball equipments; and what compensation do they offer for the discomfort? The odour of the flowers may be urged in their favour; but very often such bouquets

are made more for appearance than for the scent; in fact, that of some flowers so used is disagreeable rather than otherwise. That they are of gay colours is also urged as a recommendation, but so also are very often the dresses of the fair ones who carry them; and it rarely happens indeed that any regard is paid to the contrast between the dress and the bouquet so long as the latter is formed of rare and costly flowers.

In thus complaining of bouquets as they are formed at the present time I by no means find fault with them on all occasions. A neat bouquet, not too large and unwieldy, may be a fitting, perhaps necessary, accompaniment to a lady in a carriage or when going to a levée; but for a ball could not a few sprigs be neatly fastened to some prominent portion of a lady's dress so as not to inconvenience the wearer? The little knot in a gentleman's buttonhole affords a very good example, and looks well; and that ladies should go somewhat further is excusable enough, but the excess so often run into is inexcusable, as the discordant elements the bouquets are composed of, and the highly artificial form they assume, give them all the appearance of being made of some of the various compositions that imitations are so cleverly carried out in. Assuming flowers to be real, would not a tithe of those now used in the making of a fashionable bouquet effect the same object? and would not the effect be better?

Much more might be said against the use of flowers for purposes to which they are so incongruously applied; and beautiful as they are in most cases, I would warn their greatest admirers not to use them in too great numbers in places where they are not wanted, or where the conditions of other things seem to call for something else instead; for by so doing they disgust rather than please the discriminating eye of true taste, and instead of extending the patronage of floral display they diminish it; for, as before said, ornament too profusely applied ceases to deserve the name. Let the best friends of Flora, therefore, beware that in introducing flowers everywhere they do not sacrifice good taste. By a judicious disposal of a less quantity they alike cultivate a higher and purer taste, and perpetuate the love of floriculture.—S.

### THE LATE MR. GEORGE DEAL.

WHAT a great loss our new born institution, the Gardeners' Orphan Fund, has sustained! I can even now scarcely realise it, after having at Brookwood, on Saturday, seen the grave close over all that remains of our dear friend and leader. I was somewhat taken aback at Brookwood when scanning the numerous faces, to find I was the only member of the Committee present. I afterwards heard of the London service. We must be up and doing something worthy of the memory of our good friend, and I feel sure if it were possible to have asked him in what way we could do him honour, he would have said, "Save the little ones." Let us then have a memorial election, and thus perpetuate the memory of him whose loss we deplore.—C. H. SHARMAN.

[There appears to have been no time for concerted action with a view to the attendance of the members of the Committee at the funeral. Mr. Deal enjoyed the fullest confidence and esteem of his co-workers, and all of them deplore his loss most keenly. The suggestion made by our correspondent appears highly appropriate, for Mr. Deal was devoted to the interests of the Fund, and most anxious to afford relief to the needy orphans of gardeners, which he knew were more numerous than was generally suspected; and it is a source of regret that several candidates cannot be elected as beneficiaries of the Charity during the present year. Mr. Sharmán's suggestion is commended to the consideration of those of our readers who may desire to share in establishing a fitting memorial to a good man.]

### PENTSTEMONS.

THESE plants have been improved to a marvellous degree during the past few years, and those who grow old sorts would be astonished at the advance alike in colouring, size of flowers, and length and closeness of spike that has been effected. A pure white variety fifteen years ago was something to sigh for, and the white varieties so called which were raised and distributed, had small shapeless blooms. Now white varieties, and those almost white, are of the largest size, good form, and among the most beautiful of flowers. Mont Blanc, Madame Dieulafoy, Esmeralda, and Serenade are examples of these, and each of great beauty. Then in addition to the varieties with pure centred corollas, to which the above belong, Scotch florists worked mainly on those with throats barred or striped, the best example of which is James Cocker, a most telling variety, Mrs. Westcott being a sort with a denser

marking. But a quite distinct group has been originated on the Continent, the marking on the throat or inside of the tube being a dense mass of colour, the best, though not the largest, variety in this group being Derviche. Fairly good flowers can be raised from seed of the ordinary strain, the best seed which I know is that sold as Lemoine's strain.

The seed is sown in much the same way as Lobelia, the earlier in the year the better; pricking the seedlings out into boxes as they arrive at a size easy to handle, and in due course transplanting in April or May into the beds in which they are to flower. But good named varieties are so easily grown and increased, and the effect is so much better, that I do not care much for seedlings. It may not be generally known, but it is a fact, that Pentstemons are among the best of hardy plants for massing in beds or for bold lines in large borders, and with named varieties we can select suitable colours and be sure of the result. Indeed, except in cases where growers keep plants for producing exhibition spikes, the best way to grow these is for bedding. They are of only slight value for cut flower purposes, as they droop quickly, and then they never recover. There is a way of preserving them, and that is by cutting early in the morning, and inserting the cut end of the stalks directly into a vessel of water, which must be ready for their reception as soon as cut, but the flowers keep fresh such a short time even when so treated that it is hardly worth while taking them into account as producers of bloom for furnishing.

Cuttings are inserted as a rule at two seasons, the first in summer in a cold frame shaded, to be potted in autumn, in order to secure strong plants to begin flowering in early summer; the other about the middle of October in a cold frame kept close, which form rooted plants in the same time as Calceolarias, and are planted in the same way at latest in the beginning of April, the tips of the growths being pinched out in order to produce a plant of some five or six spikes. Though they will grow well in poor soil Pentstemons at the same time require good treatment. The summer treatment consists in placing a short stout stick to each plant, the cluster of rising spikes being secured to it with raffia, and when the spikes show signs of exhaustion they are cut off, the back growths coming forward to take their places.

The following are a few of the best sorts for growing for strictly decorative purposes. L. Kuntze, A. Daudet, M. de Cherville, Tartarin, Ch. Robin, Claude Gélée, Esmeralda, Serenade, Emile Paladilke, Miss Buck, A. Forbes, Mrs. Westcott, A. Sinclair. Where plants stand the winter, which they do in most seasons, the shoots require some thinning out in spring in the case of old plants. The good resulting from this is seen in stronger spikes and a longer continued season of flowering than when they are left to flower unthinned. These old plants 3 to 5 feet across are much superior in effect to young plants, and where they survive the winter they should be, on that account, allowed to remain for a few seasons.—N.

### ROYAL HORTICULTURAL SOCIETY.

JULY 8TH.

ROSES, hardy flowers, Lilies, and Orchids were the chief features in the floral display on Tuesday last at the Drill Hall. The show of fruit was also excellent, the Cherries and Peaches from Messrs. T. Rivers & Son, and the Strawberries from several exhibitors being uncommonly fine.

FRUIT COMMITTEE.—R. D. Blackmore, Esq., in the chair, and Messrs. P. Crowley, Harrison Weir, G. Bunyard, J. Willard, T. Saltmarsh, G. Wythes, J. Hudson, H. Balderson, F. Q. Lane, T. Francis Rivers.

Messrs. T. Rivers & Son, Sawbridgeworth, had a grand collection of Cherries, fine Peaches, Jefferson and Monarch Plums, Goldoni Nectarines. Altogether twenty-nine dishes were staged of remarkably fine fruits (silver Banksian medal). Mr. H. Ridgewell, Cambridge, sent a collection of Strawberries, and an award of merit was granted for Strawberry Incomparable, noted last week (cultural commendation). Messrs. J. Veitch & Sons sent thirty-two dishes of Strawberries, representing as many varieties (bronze medal). Mr. W. C. Leach, Messrs. Bunyard & Co., and Paul & Son, Cheshunt, also exhibited collections of Strawberries (bronze medal).

*Strawberry Auguste Boisselot* (Paul & Son).—Fruits broad and somewhat flat, light bright colour, firm, and of a brisk pleasant flavour (first-class certificate).

*Fig St. John* (Messrs. James Veitch & Sons).—An extremely early variety, said to be the earliest in cultivation, retaining its crop for a long time. The plant was the same as that shown at the Temple on May 28th. The fruit is oval, even, and of good size (first-class certificate).

*Cucumber Allan's Favourite* (Mr. W. Allan, Gunton Park

Gardens, Norwich).—A long, even, spineless Cucumber, slightly ribbed; very handsome (award of merit).

*Melon Seedling* (Major C. W. Heneage, V.C., Compton Bassett, Calne; gardener, Mr. W. A. Cook).—A large globular fruit, with deep green skin, coarsely netted, the flesh scarlet bright, and good flavour (award of merit).

*Melon Syon House Seedling* (Mr. Wythes).—An oblong Melon, scarlet flesh and yellow skin, slightly netted; flavour good (award of merit).

*Melon Highlands Hybrid* (J. F. Wilkinson, The Gardens, Highlands, Minchin).—A scarlet flesh globular Melon, beautifully netted, the flesh deep, and good flavour (award of merit).

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair, and Messrs. Shirley Hibberd, H. Herbst, J. Walker, W. C. Leach, H. B. May, T. W. Girdlestone, H. Cannell, B. Wynne, T. Baines, C. Noble, J. Frascr, C. T. Druery, W. Holmes, W. Goldring, F. Ross, G. Nicholson, and Dr. M. T. Masters.

Messrs. J. Veitch & Sons, Chelsea, contributed an interesting collection of hardy flowers, together with some choice shrubs, including *Robinia glutinosa*, *Indigofera decora* alba, *Genista capitata*, *Ptelea trifoliata aurea*, and *Stuartia Pseudo-Camellia*. Varieties of *Anthuriums* Rothschildianum and *Rhododendrons* were also shown (silver Banksian medal). Messrs. H. Cannell & Sons, Swanley, sent a collection of single and double *Tuberous Begonias* and a double scarlet *Zonal Pelargonium* named *Turtle's Surprise*, very free and of good habit (award of merit). Mr. T. S. Ware, Tottenham, had a group of *Liliums*, comprising specimens of about fifty varieties, *L. pardalinum*, *L. davuricum*, *L. elegans*, *L. martagon*, *L. Hansoni* and *L. tenuifolium* being the principal types represented (silver Banksian medal).

From Lord Rothschild, Tring Park, Tring (gardener, Mr. Hill), came a group of about seventy plants of *Carnation Germania* bearing large numbers of large, well formed, pure, soft yellow flowers. This variety is found to be one of the best yellow varieties grown at Tring, free in flowering, strong in habit, and constant. The group was margined with small Ferns and Palms at the back, and had an excellent appearance (silver-gilt Banksian medal). Mr. G. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, sent flowers of *Stuartia virginica* and *Clethra arborea*. Mr. W. C. Leach, The Gardens, Albury Park, Guildford, exhibited a group of seedling *Alstroemerias* and *Pentstemons*, comprising many varieties distinguished by rich colour. Messrs. Paul & Son, Cheshunt, exhibited nine boxes of handsome *Rose* blooms in many varieties (silver medal). Messrs. Barr & Son, King Street, Covent Garden, had a group of hardy flowers (silver medal). Mr. H. J. Jones, Lewisham, had a group of *Petunias*, *Pansies*, and *Ferns*, together with several dishes of *Tomatoes*. Mr. H. Eckford, Wem, Salop, had a stand of *Sweet Peas*, including extremely pretty varieties. Mr. J. Hall, Cambridge, sent several varieties of *Scolopendrium vulgare*, *alcicornioides* being very peculiar. From the Society's gardens came several *Babianas*, *B. rubro-cyanea* having deep purple and red centre (first-class certificate). A commendation was adjudged for some fine *Canterbury Bells* from Mr. R. Dean, Ealing.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq., in the chair, and Messrs. T. B. Haywood, J. Douglas, F. Sander, Lewis Castle, E. Hill, C. Pilcher, J. Dominy, W. Ballantine, H. M. Pollett, J. O'Brien, De B. Crawshay, and A. H. Smee.

Sir Trevor Lawrence, Bart., Burford Lodge, Dorking (gardener, Mr. W. White), showed plants of *Aganisia cyanea*, certificated as *A. cœrulea* in August, 1885, the flowers a delicate blue tint like *Vanda cœrulea*, with a peculiar brownish lip; *Bulbophyllum grandiflorum*, with large purplish reticulated flowers, and *Sarcopodium psittacoglossum*, with small yellowish red veined flowers, and a deep crimson lip.

Messrs. F. Sander & Co., St. Albans, showed plants of *Cattleya Sanderiana*, *Cypripedium Rothschildianum*, and *C. Elliottianum*; *Oncidium hastatum* var. *Ernesti*, and *Aerides expansum* *Leonixæ*, with four long racemes of flowers (cultural commendation).

#### PLANTS CERTIFICATED.

*Cypripedium hybridum Youngianum* (F. Sander & Co.).—A hybrid from *C. superbians*, crossed with *C. Roebelini*, having large flowers; the dorsal sepal white, veined with green; the petals long, drooping, broad, dotted with deep crimson, and having a few dark hairs on the margin. The lower sepal is white, with fresh green veins, the lip of soft greenish tint, and the staminode reticulated with green. A distinct and beautiful Orchid.

*Lælia grandis* (F. Sander & Co.).—The true *L. grandis*, with strong upright pseudo-bulbs, and broad leaves; the flower having light and bright brown sepals and petals of nearly equal size; the lip is deep purplish crimson in the throat, lighter towards the

margin, with veins running through to the edge (first-class certificate).

*Cattleya Mossiæ × Dowiana* var. *Empress Frederick* (Baron Schröder).—A charming hybrid with large showy fragrant flowers, the sepals and petals pure white, the lip broad, rounded, intensely rich crimson, edged white, with a deep yellow throat, dwarf in habit and free, the plant having fine flowers (first-class certificate).

*Masdevallia Schröderiana* (Baron Schröder).—An imported species which flowered last year for the first time. It has large flowers, purplish crimson, white in the centre of the lower sepals, the tails long, slender, recurving and yellow (first-class certificate).

*Zygopetalum crinito-maxillare* (Lord Rothschild).—A hybrid from the parents included in the name, the sepals and petals small, green, with many brown spots, the lip small, rounded, deep purplish blue (award of merit).

*Gloxinias* (Veitch).—*Nestor*, bright scarlet, finely formed flowers; *Gaiety*, crimson, edged white, centre dotted with crimson on light ground (award of merit).

*Zingiber D'Arceyi*.—A species from the South Sea Islands; the leaves bright green, edged white. A bold variegated plant, and free in growth (award of merit).

*Spiræa bumalda variegata* (J. Veitch & Sons).—A pretty little shrub with small narrow green and yellow leaves, and bright red flower buds (award of merit).

*Rosa polyantha The Engineer* (Mr. J. T. Gilbert, Bourne).—Flowers bright red, small, but very freely produced.

*Carnation Mrs. Sanders* (Mr. H. J. Jones).—Flowers bright yellow, of good size and shape, freely produced. Plant of good habit.

*Sweet Pea Dorothy Tennant* (Mr. H. Eckford).—Flowers pale purplish mauve. *Stanley*, red and pink, very bright.

#### THE REV. H. H. D'OMBRAIN.

NOT only will the members of the National Rose Society welcome the appearance of the portrait of the founder of the Society in what it pleases so many readers to describe as the "Rose Journal," but to persons far and wide who are interested in floriculture its presentation will be equally acceptable. It, moreover, seems fitting that the portrait should appear in an issue that contains the record of one of the great Exhibitions of the National Rose Society, and we have very great pleasure in thus introducing "D., Deal," to a much wider circle of his friends and admirers—and there are many—than those who rejoice in his personal acquaintance. We are making no disclosure in this reference, for Mr. D'Ombraïn told the readers of the Journal several years ago on his removal from Deal to another charge that, though he had changed the scene of his labours, he should not change the *nom de plume* that had then become so familiar to the readers of the pages to which he has now regularly contributed for thirty years. When we consider the great variety of subjects he has treated in that time, and especially as these naturally come round in the yearly cycle of flowers, and have to be dealt with again and again, we cannot but marvel at the wonderful sustaining power of the veteran florist. Mr. D'Ombraïn has told us he was born in 1818, yet his pen is as active and his writings are as fresh as the flowers he loves when these are in their youthful beauty.

We cannot say that Mr. D'Ombraïn was a "born florist," for born in Ebury Street, Pimlico, he could scarcely be surrounded with flowers in his earliest days, and we believe it was not until he entered on his college career in Ireland that the floral chord was touched, and this by a bed of *Ranunculuses* in a garden near Dublin. His love for flowers at that now far past time was very real and deep, and it has proved enduring. Nor were flowers alone objects of his study, for while at the University he founded the Natural History Society of Dublin, and became its Secretary. The Society numbered among its members some of the best known naturalists of Ireland, and Archbishop Whateley often attended its meetings. To this Society Mr. D'Ombraïn on leaving Dublin for the curacy of Bray presented a good collection of Irish birds.

For years he could only indulge in floriculture under difficulties. At Deal his garden was simply a slice taken off a field, and at Bray he had to grow flowers on the top of a cliff, swept by every wind that blew, yet from these unsheltered plots he derived far more pleasure than the majority of garden owners enjoy with the aid of immeasurably greater natural advantages and artificial means. But though the field of his experience was thus limited, his "sphere of influence" became great, bounded only by the limits of civilisation. Loving flowers earnestly, and finding them repay by the pleasure they gave him for his fostering care, he wished that others should share in that which made the world happier and brighter for him. Untiring industry and a facile pen accomplished to a large extent the object of his hopes, for undoubtedly "D., Deal," has by his

writings given an enormous stimulus to floriculture, and induced more persons than he can ever know to engage in the delightful pursuit of gardening. Amateurs innumerable have been encouraged by him to persevere under difficulties and succeed, and not a few gardeners have obtained useful hints from his suggestive observations.

Probably if Mr. D'Ombraïn were asked to name what he considers the most notable events in his horticultural life he would be inclined to answer—the establishment of the Horticultural Club and the founding of the National Rose Society. We think we are right in saying that the Club was the outcome of a *Journal of Horticulture* dinner, over which editors and staff enjoyed pleasant converse. The Club has been a great success, and was never so strong as it is now. It was at a meeting of persons interested in Roses held at the Club on the invitation of Mr. D'Ombraïn in December, 1876, that the National Rose Society was founded under the presidency of Canon Hole, now Dean of Rochester. It commenced under happy auspices, and is now one of the most firmly established, influential, and prosperous of the special societies which have given such an impetus to floriculture in this country. Those are important achievements, and it may be added that Mr. D'Ombraïn was the Editor of the "Floral Magazine" in its best days, from 1862 to 1873, a serial which he has happily long survived, and he has edited the popular and useful "Rosarian's Year-Book" since its commencement in 1879.

A famous divine who travelled much in furtherance of his great mission, and sojourned in many homes, was led to say, "You can never know what people are till you live with them," or words to that effect. That those who closely associate with Mr. D'Ombraïn esteem him has been twice demonstrated in the tangible form of valuable testimonials, the last of which was presented to him about a fortnight ago, as was recorded in our columns. All hope that it will remain with him, and that he will remain with us to enjoy a long and happy eventide after a long and useful life.

It is but only just to say that ardently as Mr. D'Ombraïn has been devoted to the pursuit of horticulture, it was never allowed to usurp the place due to the sacred office to which he had been called; indeed he has told us in our columns how helpful it had been to him in the cares and anxieties of a large parish. When at Deal he had built a school, and in his present sphere he has, at a time of life when many would think the work might be left to others, restored, at an expenditure of 2000 guineas, the beautiful and unique church of his parish.

#### MANNERS AND CUSTOMS.

I AM very glad to hear that my notes have been of any use to "J. B." I would gladly assist him further if I understood more clearly what he wanted to know. I certainly thought I got "to the end of the list of foremost Teas." Did he perchance not see the April numbers of the *Journal*? All the Roses he speaks of were commented on, and mention made as to whether they would probably succeed as dwarfs; but I could not and cannot say much about Princess Beatrice, T. I have had one good bloom of it this year, which I showed at the Aquarium, and I think at Reigate; but it requires heat, and will never come to any good without it. Cleopatra, T, is, I believe, one of the best Tea Roses issued for years.—W. R. RAILLEM.

#### ROSE SHOW FIXTURES, 1890.

 „ 24th.—Salterhebble (Halifax).  
 Aug. 2nd.—Ripley.

#### ROSE SHOWS.

##### THE NATIONAL ROSE SOCIETY.—JULY 5TH.

A DRENCHING rain and a storm of wind all Friday night was not the most desirable preparation for the National Society's great metropolitan gathering at the Crystal Palace on Saturday last, and the prospects at one time looked extremely gloomy. When the officials at the Palace assembled at 5.30 A.M. not an exhibit had arrived, and the array of unoccupied tables seemed likely to constitute the major portion

of the Exhibition for the day. Happily, however, a large number of rosarian exhibitors had been thoughtful enough to cut their Roses early on the Friday evening, and the flowers certainly suffered less in the boxes than they would have done on the plants. Consequently the arrivals numbered about six, and followed on rapidly, so that it was soon found the table space allotted to the Show would be fully occupied. The classes were well filled, and the quality generally far exceeded the expectations of the most sanguine.

The Show was indeed an astonishing one. The freshness of the blooms and the brightness of the colours were subjects of common remark. There were certainly rough blooms in most of the leading stands, but there were also larger average numbers of particularly fine blooms than usual, ample compensation for a little irregularity. Where, too, the stands had to be supplemented on Saturday morning the blooms showed evident signs of damage by wind and rain, the light Roses and the Teas also displaying these effects more noticeably than the Hybrid Perpetuals. Still, the general verdict was "a grand Show," and all concerned in it have ample reason to be satisfied with their 1890 Exhibition.

#### NURSERYMEN'S CLASSES.

Class 1, seventy-two varieties, distinct, single trusses. This, the great class of the Show, awakened, as usual, a very large amount of interest. When the greatest growers in the kingdom are in competition the struggle is watched closely, and on the present occasion the meeting of several old rivals added to the interest of the contest. Five stands were staged, and a total of 360 fine blooms in one class made it one of considerable effect. Victory last year, it may be remembered, rested with Messrs. Harkness & Son of Bedale, these northern growers, favoured by the hot and early season, defeating their southern rivals somewhat decisively. This year the climatic advantages were reversed. Wet and cold weather in the north kept the flowers back to such an extent that last year's winners found that they had to rely upon cut-back plants for their show flowers, the maidens not being ready, and the lack of weight, size, and substance in their stand was consequently very noticeable. The result was, as might have been anticipated, that the southern and western growers were enabled to avenge their defeat of last season most effectively, and the struggle for the valuable challenge trophy resolved itself into a remarkably close fight between Mr. Frank Cant, Braiswick, Colchester, and the English Fruit and Rose Company (Cranston's), King's Acre, Hereford, terminating eventually in a victory for Mr. Cant. He staged the following varieties, their names being given in the order in which they were placed, reading from left to right—Back row: Dupuy Jamain, La France, a beautiful flower; Etienne Levet, Her Majesty, Annie Wood, Lady Mary Fitzwilliam, Chas. Lefebvre, Pride of Waltham, A. K. Williams, lacking colour; Madame Isaac Péreire, Madame Henri Péreire, very fine indeed; Comtesse d'Oxford, Maurice Bernardin, Baronne de Rothschild, Général Jacqueminot, Marie Finger, Ella Gordon, Madame Bois, Star of Waltham, Sir Rowland Hill, Camille Bernardin, Prince Camille de Rohan, Ulrich Brunner, very fine; and Horace Vernet. Middle row: Countess of Rosebery, Victor Hugo, Catherine Mermet, Louis Van Houtte, Madame de Watteville, Earl Dufferin, Marie Verdier, Pride of Reigate, Madame Gabriel Luizet, Alfred Colomb, Heinrich Schultheis, Grand Mogul, Merveille de Lyon, a splendid bloom; Madame Norman Néruda, Mrs. John Laing, a grand flower; Crown Prince, Mons. E. Dupuy, Duke of Teck, Maréchal Niel, Marie Pernet, Madame Eugène Verdier, Dr. Andry, very fine; Captain Christy, and Sultan of Zanzibar. Front row: Prince Arthur, François Michelin, Mrs. Baker, Marie Van Houtte, Comtesse de Ludre, an exquisite flower, which attracted much attention, lustrous carmine red; Duchesse de Morny, Earl of Pembroke, Madame Lambard, beautiful; Duke of Edinburgh, Marquise de Castellane, Duke of Connaught, John Hopper, very fine; Duchess of Bedford, The Bride, a lovely example; Mrs. George Paul, Innocente Pirola, Lady Helen Stewart, Niphotos, Mons. E. Y. Teas, François Louvat, Marie Baumann, Mons. M. Baron, Chas. Lamb, and Chas. Darwin. Mr. Cant must be congratulated on the very high condition of his flowers. They were finely developed, richly coloured, smooth, bright, and pleasing in every point. Moreover, they were well finished and skilfully set up, forming, perhaps, one of the strongest stands he has ever exhibited in this great class. The English Fruit and Rose Co. were not disgraced in going down before so superb a collection as that of Mr. Frank Cant. They had a grand lot of flowers, large and very rich in colour, the following being splendid examples—Général Jacqueminot, a bloom of great merit; Ulrich Brunner, Madame Chas. Wood, Madame Gabriel Luizet, a good example of Pride of Reigate, A. K. Williams, Constantin Fretiakoff, and Madame Bravy. Mr. B. R. Cant, Colchester, also had a very fine lot of flowers, a beautiful Thos. Mills, a grand Ulrich Brunner, a splendid Mrs. Baker, and noteworthy examples of La France, A. K. Williams, Eclair, and Victor Hugo being amongst the best flowers. He was placed third. Last year's winners, Messrs. Harkness and Co., had somewhat small flowers, but they were superbly finished, and in this respect were unexcelled. Both the premier Tea and the premier Hybrid Perpetual, which are referred to later on, were found in this stand, and the fourth prize was awarded to it. It may be noted that Messrs. Harkness & Son were the only exhibitors present from the north, the weather having, presumably, been too much for other well-known growers.

Class 2, forty-eight, distinct, three trusses of each. Another important class, and with the competitors numbering four, the many cases of blooms made a brave show. Mr. B. R. Cant, Colchester, was placed first for a very fine collection of flowers, large, well coloured, and

with hardly an exception perfectly fresh. The varieties represented were as follows:—Back row: Etienne Levet, Eclair, Merveille de Lyon, very chaste; Prince Camille de Rohan, Madame Isaac Péreire, Duke of Edinburgh, Pride of Waltham, Le Havre, tarnished; Madame Gabriel Luizet, Fisher Holmes, Niphotos, Comtesse d'Oxford, La France, very fine; Duchesse de Morny, Innocente Pirola, beautiful examples; Ulrich Brunner, Her Majesty, Sénateur Vaisse, Souvenir d'un Ami, Chas. Lefebvre, Mrs. John Laing, Louis Van Houtte, Madamc

ston's), Hereford. Very bright and clean were Mr. Frank Cant's third prize flowers, viewing them generally, and Messrs. Paul & Son, Cheshunt, who were fourth, also merit a word of praise.

Class 3, forty-eight, distinct, single varieties, produced one of the best displays in the Exhibition, nine being in competition. The Cotswold Roses came to the front unmistakably, Messrs. J. Jefferies & Sons of Cirencester staging a splendid stand. The flowers were most even in all points, being of fair size, fresh, and well coloured. The varieties are

FIG. 7.—REV. H. H. D'OMBRAIN.

Watteville, and Marie Baumann. Front row: Earl Dufferin, Madame Lambard, Camille Bernardin, Baronne de Rothschild, Victor Hugo, The Bride, Alfred Colomb, Madame C. Joigneaux, Sir Rowland Hill, Comtesse de Nadaillac, Prince Arthur, Heinrich Schultheis, Duke of Wellington, Catherine Mermet, A. K. Williams, very fine; Madame Cusin, Dupuy Jamain, Marie Verdier, Maurice Bernardin, Marie Finger, Beauty of Waltham, Souvenir d'Elise, a beautiful bloom but a little tarnished; Général Jacqueminot, and François Michelin. Fine examples of Marie Baumann, Mrs. John Laing, Alfred Colomb, Lady Sheffield, Ulrich Brunner, and Comtesse d'Oxford were conspicuously good in the second prize collection of the English Fruit and Rose Company (Cran-

enumerated:—Back row: Merveille de Lyon, flown; Mons. Gabriel Tournier, Mrs. John Laing, a perfect bloom; Duke of Teck, Lady Mary Fitzwilliam, Madame Isaac Péreire, Violette Bouyer, Ulrich Brunner, small, but very graceful and rich; Magna Charta, Viscountess Folkestone, Beauty of Waltham, Madame Montet, Horace Vernct, La France, Général Jacqueminot, and François Michelin. Middle row: Victor Verdier, Madame Hippolyte Jamain, Duke of Edinburgh, very fine; Maréchal Niel, Alfred Colomb, Innocente Pirola, Prince Arthur, very good; Heinrich Schultheis, Marie Baumann, Madame Gabriel Luizet, John Stuart Mill, Niphotos, Glory of Cheshunt, Pride of Waltham, and Dingee Conard. Front row:—Prince Camille de Rohan, Chas. Lamb,

Francisca Krüger, Louis Van Houtte, Madame Eugène Verdier, Comte de Raimbaud, Marie Verdier, A. K. Williams, Ferdinand de Lesseps, Catherine Mermet, Jean Cherpin, Marie Van Houtte, Comtesse d'Oxford, Rubens, Grand Mogul, and Captain Christy. Messrs. Curtis, Sanford and Co., Devon Nurseries, Torquay, had an excellent stand, comprising admirable examples of Heinrich Schultheis, Fisher Holmes, Comtesse d'Oxford, and Alfred Dumesnil, though the latter was a little spotted. They were placed second, and following them were Messrs. D. Prior and Son, Myland Nurseries, Colchester, charming examples of Madame Cusin, A. K. Williams, and Duchesse de Morny calling for notice in their stand. The remaining prize went to Messrs. G. & W. H. Burch, Peterborough.

Class 4, twenty-four, distinct, single trusses. Eight stands were here in competition, the best coming from Mr. G. Mount, Canterbury. He had in the back row Madame Gabriel Luizet, Marie Baumann, Merveille de Lyon, Dupuy Jamain, Comtesse d'Oxford, Duke of Edinburgh, Mrs. John Laing, and Alfred Colomb, very fine. Middle row: A. K. Williams, Mdlle. Eugène Verdier, Etienne Levet, Général Jacqueminot, Her Majesty, Chas. Lefebvre, Ulrich Brunner, and Louis Van Houtte. Front row: Prince Camille de Rohan, Souvenir d'Elise, Annie Wood, Maréchal Niel, Mons. E. Y. Teas, Prince Arthur, Niphetos, and Duke of Wellington. The best flowers in Messrs. G. Bunyard & Co.'s neat second prize collection were Dr. Andry and Madame Gabriel Luizet, others being larger, but a little rough. Mr. J. Mattock, New Headington, Oxford, was third, and Mr. S. G. Rumsey, Wrotham, Kent, fourth.

Class 5, twenty-four, distinct, three trusses of each, saw Messrs. Prior and Son improve on their previous position by taking first prize. They had the following varieties in good condition:—Back row: Général Jacqueminot, Merveille de Lyon, Prince Arthur (very good), Catherine Mermet, Madame Ducher, Duchesse de Morny, A. K. Williams, Pride of Waltham, Marie Baumann, Mrs. J. Laing, Ulrich Brunner, and Lady Mary Fitzwilliam. Front row: Viscountess Folkestone, Fisher Holmes, Madame de Watteville, Louis Van Houtte, Madame Lambard, Comtesse d'Oxford, Niphetos, Dupuy Jamain, The Bride, Duke of Wellington, Prince Camille de Rohan, and Marie Verdier. These were a beautifully finished stand. Next in point of merit, and pressing closely on the first prize winners, were Messrs. Keynes, Williams, & Co., of Salisbury. The third prize went to Messrs. G. & W. H. Burch, and the fourth to Messrs. J. Jefferies & Son; nine competing in all.

The best Hybrid Perpetual exhibited by a nurseryman was pronounced to be Mrs. John Laing in Messrs. Harkness & Sons' stand of seventy-two—a lovely bloom, perfect except for the tip of one petal being somewhat tarnished. The best Tea was found in the same stand—a delightful bloom of Catherine Mermet.

#### AMATEURS' CLASSES.

Class 6, forty-eight blooms, distinct varieties, the leading class for amateurs, brought six competitors, victory falling to Mr. E. B. Lindsell, Bearton, Hitchin, who has worked his way to the front very rapidly of recent years, but although he has before shown with success at the National, we believe this was his maiden attempt for the challenge trophy, and he may be justly proud of the result. His stand was one fitted to compare with many of the best of past years, and merits for him hearty congratulations. He showed the following varieties:—Back row: Mrs. J. Laing, a superb flower; Comte de Raimbaud, also a magnificent bloom; Madame Gabriel Luizet, Le Havre, a beautiful example; Heinrich Schultheis, Beauty of Waltham, Marie Verdier, grand flower; Ulrich Brunner, La France, Duke of Edinburgh, Her Majesty, A. K. Williams, Captain Christy, Charles Lefebvre, Marquise de Castellane, and Madame Victor Verdier. Middle row: Prince Arthur, François Michelin, Duke of Wellington, Merveille de Lyon, Horace Vernet, Lady Mary Fitzwilliam, Comtesse d'Oxford, brilliantly coloured; Viscountess Folkestone, Sénateur Vaissé, Baronne de Rothschild, Susanne Marie Rodocanachi, in superb condition; Pride of Waltham, Général Jacqueminot, Comtesse de Nadaillac, very beautiful; Victor Hugo, and a charming example of Countess of Rosebery. Front row: Marie Van Houtte, Xavier Olibo, Caroline Kuster, Alfred Colomb, Madame Cusin, La Rosière, Maréchal Niel, Auguste Rigotard, Marshall P. Wilder, Duchess of Bedford, Anna Ollivier, John Stuart Mill, Niphetos, Earl Dufferin, Catherine Mermet, and Duchesse de Morny. The perfection of condition in which these flowers were shown was astonishing considering the recent troublesome weather. They were exquisite. A well-known exhibitor in the person of the Rev. J. H. Pemberton, Havering-atte-Bower, Romford, was awarded second prize. He was many points in the rear, nevertheless had a highly praiseworthy display, showing Dr. Andry, Charles Lefebvre, Madame Gabriel Luizet, Niphetos, Prince Arthur, Ulrich Brunner, Comte de Raimbaud, and Auguste Rigotard particularly well. The Rev. A. Foster-Melliard, Sproughton Rectory, Ipswich, was third with Dr. Andry, Souvenir d'Elise, Duke of Wellington, Dupuy Jamain, and François Michelin as his best flowers, the remaining award going to Mr. A. Slaughter, Jarvis Villa, Steyning.

Class 7, sixteen distinct varieties, three trusses of each, also brought six competitors, and here Mr. Lindsell, who is evidently in his very best form, tied with the Rev. J. H. Pemberton. He showed in the back row La France, A. K. Williams, Viscountess Folkestone (the only weak trio in the stand), Comtesse d'Oxford, Louis Van Houtte, Merveille de Lyon, and Beauty of Waltham; in the front, Le Havre, Heinrich Schultheis, Duke of Wellington, Mrs. J. Laing, Madame Gabriel Luizet (very beautiful), Horace Vernet, Marie Verdier, and Marie Finger. Mr. Lindsell should have won but for the faulty Viscountess Folkestone. Mr. Pemberton had the following:—Back row: Heinrich Schultheis, Madame Victor Verdier, Victor Verdier, Ulrich Brunner, Marquise de Castellane,

A. K. Williams, Countess of Rosebery, and Comtesse d'Oxford. Front row: Exposition de Brie, Etienne Levet, Lady Mary Fitzwilliam, Duke of Wellington, Beauty of Waltham, Madame Gabriel Luizet, Charles Lefebvre, and Prince Arthur. The third prize went to an old winner of high honours at the National, Mr. R. N. G. Baker, Heavitree, Devon, and the fourth to the Rev. A. Foster-Melliard.

Class 8, thirty-six distinct, single trusses, produced four stands of fair merit, the best being that from Mr. Salter, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate. They were moderate in point of size, but, with one or two exceptions, good in other respects. The varieties were as follows:—Back row: Camille Bernardin, Baronne de Rothschild, A. K. Williams, Auguste Rigotard, La France, Beauty of Waltham, Comtesse d'Oxford, Her Majesty, Louis Van Houtte, François Michelin, Madame Gabriel Luizet, and Ulrich Brunner. Middle row: Etienne Levet, Duke of Teck, Heinrich Schultheis, Mrs. John Laing, Barthélemy Joubert, Countess of Rosebery, Merveille de Lyon, Chas. Lefebvre, Pride of Waltham, Marie Baumann, Dr. Andry, and Duke of Edinburgh. Front row: Eclair, Star of Waltham, Marie Rady, Sultan of Zanzibar, Marie Verdier, Horace Vernet, Alfred Colomb, Duchess of Bedford, Duchesse de Morny, Xavier Olibo, Madame Hippolyte Jamain, and Mons. E. Y. Teas. Smaller but neat blooms from Mr. Brown, gardener to Mrs. Waterlow, Great Doods, Reigate, followed, a very clear and brightly coloured bloom of François Michelin, a well-built example of La France, a large Earl Dufferin, and a beautiful Mdlle. M. Verdier being the features of this stand. The Rev. Hugh A. Berners, Harkstead Rectory, Ipswich, was third, and Mr. W. H. Jackson, Stagsden Vicarage, Bedford, fourth.

Class 9, twelve distinct, three trusses each. There were four competitors in this class, each showing well. First, Mr. Brown, extremely bright and rich, a little damaged. The varieties were as follows:—Back row: Her Majesty (very large), Charles Lefebvre, La France, Etienne Levet, Mrs. J. Laing, Ulrich Brunner, Alfred Colomb, Merveille de Lyon, Duke of Edinburgh, Madame G. Luizet, Marie Baumann, Louis Van Houtte. The second place was taken by T. B. Haywood, Esq., for an even collection, mostly crimson varieties. The Rev. H. A. Berners was third, and Mr. W. H. Jackson fourth.

Class 10, twenty-four distinct, single trusses. Of the four exhibitors the prize was secured by J. Gurney Fowler, Esq., Glebelands, Woodford, Essex, with a beautiful even stand of medium-sized blooms. Back row: Louis Van Houtte, Her Majesty, Etienne Levet, Star of Waltham, La France (large, but damaged), Ulrich Brunner, Madame Victor Verdier, Marshal P. Wilder. Middle row: Comtesse d'Oxford, Charles Lefebvre, Madame Gabriel Luizet, Henri Lédéchaux, Marie Baumann, Comte Raimbaud, Captain Christy, E. Y. Teas. Front row: Innocente Pirola, Mrs. J. Laing, La Duchesse de Morny, Madame Lambard, Duke of Wellington, Pride of Waltham, Countess of Rosebery, Souvenir d'Elise Vardon. Mr. R. E. West, Reigate, was a close second. Mr. E. M. Bethune was third, and Mr. G. Christy, Westerham, fourth.

Class 11, eight distinct, three trusses of each, Mr. R. E. West succeeded in winning the premier award with very large blooms of François Michelin and Annie Wood, and smaller examples of Baroness Rothschild, Alfred Colomb, Duke of Edinburgh, Marie Baumann, Marie Finger, and Le Havre. Mr. G. Christy was second, these being the only two exhibitors.

Class 12, eighteen distinct, single trusses. Six competitors entered, and the quality of the blooms was good throughout, but the premier (Mr. E. Mawley, Rosebank, Berkhamsted) had remarkably fresh blooms, including several unusually fine examples; one of Ulrich Brunner secured the silver medal as the best H.P. bloom in the amateurs' classes. The varieties were Dupuy Jamain, La France, Horace Vernet, Comtesse d'Oxford, Sénateur Vaissé, Prince Arthur, Marie Finger, Dr. Andry, Marquise de Castellane, Duke of Wellington, S. M. Rodocanachi, Charles Lefebvre, Heinrich Schultheis, A. K. Williams, Etienne Levet, Madame V. Verdier, Madame G. Luizet. Miss F. Baker second; Mr. H. Foster, Aylcsford, third; and the Rev. L. Garnett fourth.

Class 13, twelve distinct, single trusses. A strong class of nine exhibitors. Mr. R. L. Knight, Bobbing Place, Sittingbourne, won the first place with fine blooms of Marie Finger, Etienne Levet, Sultan of Zanzibar, Ulrich Brunner, Général Jacqueminot, La France, Madame C. Crapellet, Marie Van Houtte, Alfred Colomb, Madame C. Verdier, A. K. Williams, Duke of Edinburgh, and Le Havre. Second, Rev. A. Cheales; third, Mr. F. T. Wollaston, Reigate; fourth, Mr. R. G. Tucker, Swanley, Kent.

Class 14, nine distinct, single trusses. Again the competition was keen, but of the eleven stands the best came from Mr. G. Moules, Hitchin, who had an even, fresh, and neat collection comprising François Michelin, Xavier Olibo, Ulrich Brunner, Camille Bernardin, Heinrich Schultheis, Duke of Wellington, Mrs. John Laing, Horace Vernet, and Marie Baumann; Mr. Ernest Wilkins, Lyndhurst, Sutton, Surrey, with large and handsome blooms, a little rough; and Mr. J. Bateman, Archway Road, followed.

Class 15, six distinct, single trusses. Mr. J. Rawlins, The Bank, Cirencester, was first amongst eleven competitors with beautiful fresh blooms of Ulrich Brunner, E. Y. Teas, La France, A. K. Williams (excellent), Dr. Andry, Madame Gabriel Luizet. Mr. C. E. Cuthell was second, having a good Madame G. Luizet. Miss E. B. Denton, Orchard Court, Stevenage, was third; and Miss Alice M. Lucas, Hitchin, fourth.

Class 16, six distinct, three trusses of each. Nine exhibitors showed in this class, Mr. Percy Burmand, Reigate, taking the lead for good examples of La France, A. K. Williams (good), Général Jacqueminot, Mrs. J. Laing, Madame Marie Verdier, and Alfred Colomb. Miss

F. Baker was second; the Rev. A. Cheales third; and Mr. J. Parker, Old Headington, Oxon, fourth.

#### EXTRA CLASSES.

These formed very interesting portions of the Show, as they included the metropolitan and suburban grown Roses. The distance allowed, however, eight and ten miles respectively, includes several good Rose districts in the south and south-west of London. Class 17, six distinct, single trusses (open only to amateurs who have never won a prize at an exhibition of the N.R.S.), M. Hodgson, Esq., Shirley Cottage, Croydon, took the first place amongst seven exhibitors, with small but neat blooms of Charles Lefebvre, Marquise de Castellane, Victor Hugo, Marie Baumann, Duke of Wellington, and Dupuy Jamain; second, Mr. J. Parker, Old Headington, having a fine Ulrich Brunner; third, Mr. W. C. Romaine, Old Windsor; fourth, Mr. Alfred Wallis, Farningham. Class 18 was for twelve distinct single trusses of Roses grown within ten miles of Charing Cross. Six competitors staged good blooms, the silver cup, which constituted the first prize, being accorded to Mr. C. J. Graham, Coombe Road, Croydon, for substantial blooms of Her Majesty, Charles Lefebvre, Madame de Watteville, Marie Baumann, Comtesse de Nadaillac, Général Jacqueminot, Baroness Rothschild, A. K. Williams, Innocente Pirola, Mrs. John Laing, and Xavier Olibo; second, Mr. J. Bateman; third, Mr. J. E. Coleby Rosenheim, Worple Road, Wimbledon, capital blooms; fourth, Mr. Hodgson.

Class 19, for six distinct single trusses of Roses grown within eight miles of Charing Cross, only brought three exhibitors. Mr. H. White, 5, Woodside Cottages, Highgate, was first, showing Earl of Dufferin, Beauty of Waltham, Madame G. Luizet, Alfred Colomb, Ulrich Brunner, Camille Bernardin, very fresh and good. Mr. W. Northover, 20, Queen's Road, Wimbledon, was second, and Mr. W. B. Faulkner, Fairholme, Worple Road, Wimbledon, third. In class 21, for six single trusses of any H.P., Mr. E. M. Bethune, Denne Park, Horsham, was first for fine blooms of Marie Baumann. Mr. A. Slaughter, Steyning, was third with Marie Baumann, very fresh and good; and Mr. Dart, Heathfield Road, Croydon, fourth for Marguerite Brassac.

#### TEAS AND NOISETTES.

Considering the season and the weather, Teas have been shown in much better condition this year than could have been expected. At the Royal Horticultural Society's meeting in the previous week there was an excellent display, and again at the Crystal Palace they were well represented. Such delicate blooms, however, invariably show the effects of the weather, and a few blooms with ragged damaged petals greatly spoil the appearance of a stand, and convey a bad impression generally.

The nurserymen's classes came first, and in that for twenty-four distinct single trusses Mr. G. Prince, Oxford, was first with fine fresh blooms of the following in the back row:—Innocente Pirola, Maréchal Niel, Niphotos, Comtesse de Nadaillac, Souvenir de Paul Neyron, Catherine Mermet, Souvenir de S. A. Prince, Souvenir d'Elise Vardon. Middle row: Rubens, Anna Ollivier, Madame Cusin, M. Furtado, Princess of Wales, The Bride, Souvenir d'un Ami, Hon. Edith Gifford. Front row: Comtesse Panisse, Marie Van Houtte, Francisca Kruger, Madame de Watteville, Madame Margottin, Alba Rosea, Amazone, and Adam. Mr. B. R. Cant was second with rather rougher blooms, and Mr. Frank Cant third for smaller but fresh examples; these being the only exhibitors.

With eighteen distinct, single trusses, there were eight competitors, the premier award being secured by Messrs. Harkness & Sons, Bedale, having medium sized but clean fresh blooms of Catherine Mermet, Niphotos, Souvenir d'un Ami, Innocente Pirola, Marie Van Houtte, Jean Ducher. Middle row: Souvenir d'Elise Vardon, Madame Cusin, Madame Hoste, Jules Finger, Devoniensis, Princess of Wales. Front row: Comtesse de Nadaillac, The Bride, Etoile de Lyon, Caroline Kuster, Anna Ollivier, Souvenir de Paul Neyron. Mr. J. Mattock, New Headington, Oxford, followed closely, a brightly coloured Souvenir de Thérèse Levet being noticeable; Messrs. J. Burrell & Co., Cambridge, were third; and Messrs. Paul & Son fourth.

Amongst seven competitors the best twelve single trusses of any Tea or Noisette, excluding Maréchal Niel, were exhibited by Mr. G. Prince, beautifully fresh bright clean blooms of Comtesse de Nadaillac. Mr. B. R. Cant was a close second with Madame de Watteville, very bright and good; Mr. J. Mattock was third for Souvenir d'un Ami; and Mr. Frank Cant fourth for Madame de Watteville.

In the class for eighteen distinct, three trusses of each, five competitors made a capital display, Mr. G. Prince leading with Souvenir d'Elise Vardon, Jean Ducher, Souvenir d'un Ami, Hon. Edith Gifford, Souvenir de S. A. Prince, Catherine Mermet, Comtesse de Nadaillac, Marie Van Houtte, Innocente Pirola, Francisca Kruger, Madame Cusin, Alba Rosea, Princess of Wales, Rubens, The Bride, Princess Beatrice, Adam, Souvenir de Paul Neyron. Mr. B. R. Cant was second, Mr. F. Cant third, and Mr. J. Mattock fourth.

The amateur classes, with the exception of class 30, were all for distinct single trusses, and the competition was fairly good in the majority.

The challenge trophy in class 26, for eighteen blooms, was won by the Rev. F. R. Burnside, Birch Vicarage, Hereford, who had excellent even blooms of—Back row: Madame Lambard, Souvenir d'Elise Vardon, Souvenir d'un Ami, The Bride, Catherine Mermet, Innocente Pirola. Middle row: Francisca Kruger, Comtesse de Nadaillac, Madame Bravy, Madame Cusin, Marie Van Houtte, Anna Ollivier. Front row: Comtesse Panisse, Rubens, Caroline Kuster, Hon. Edith Gifford, Ethel Brownlow

and Madame Hoste. Four other competitors staged good blooms, and the Rev. H. Berners, Harkstead Rectory, Ipswich, followed in the second place. The Rev. Page Roberts, Scole Rectory, Norfolk, was a good third, and the Rev. A. Foster-Melliard, Sproughton Rectory, Ipswich, was fourth.

For twelve blooms Mr. O. G. Orpen, Hillside, West Bergholt, Colchester, was first, showing Catherine Mermet, Maréchal Niel, Rubens, Comtesse de Nadaillac, Madame de Watteville, Marie Van Houtte, Souvenir d'un Ami, Caroline Kuster, Princess Beatrice, The Bride, and Madame Cusin. The second prize went to Mr. J. Brown, gardener to Mrs. Waterlow, Great Doods, Reigate, for small but fresh blooms. Mr. G. M. Bethune, Denne Park, Horsham, was third, and Mr. W. H. Jackson, Stagsden Vicarage, Bedford, fourth. (Five exhibitors). Miss Francis Baker, Holmfels, Reigate (gardener, Mr. Bridgen) had the best nine blooms, small examples of Maréchal Niel, Madame Camille, Hon. Edith Gifford, Souvenir d'un Ami, Souvenir de S. A. Prince, Francisca Kruger, Souvenir d'Elise Vardon, Caroline Kuster, Marie Van Houtte. Second, Mr. Alfred Evans, Marston; third, Rev. L. Garnett, Christleton Rectory, Chester. (Three exhibitors).

No less than fifteen competitors entered class 29, for six blooms, and Mr. E. Mawley had the satisfaction of taking the first prize for Comtesse de Nadaillac, Souvenir d'un Ami, Anna Ollivier, Innocente Pirola, Jean Ducher, and Madame Bravy, all fresh and creditable blooms. Second, Mr. C. E. Cuthell, Boxhill, Dorking. Third, Rev. F. G. Taylor, Littleton Vicarage, Evesham. Fourth, Lieut.-Col. F. Standish Hore, Rosehill, St. Asaph. In the twelve variety class (three blooms of each), the Rev. H. A. Berners led with a capital stand, small, but bright and clean, of Madame de Watteville, Innocente Pirola, Catherine Mermet, The Bride, Francisca Kruger, Hon. Edith Gifford, Comtesse de Nadaillac, Etoile de Lyon, Madame Lambard, Marie Van Houtte, Souvenir d'un Ami, Anna Ollivier. The Rev. F. R. Burnside was second, Mr. W. H. Jackson third, and S. P. Budd, Esq., Bath, fourth. (Six exhibitors).

Class 31 was for nine single trusses of Catherine Mermet, and in the leading stand from the Rev. F. R. Burnside was found the premier Tea in the amateurs' classes, a superb flower amongst many that were also very fine. (Seven exhibitors). For six single trusses of any Tea or Noisette the Rev. Alan Cheales was first with Maréchal Niel in good form, the Rev. Foster-Melliard second with Marie Van Houtte, the Rev. R. Burnside third for Anna Ollivier, and Mr. Bethune fourth with Francisca Kruger.

#### OPEN CLASSES.

The greater part of the centre transept was devoted to the eighteen classes included under this head, and they constituted an exhibition in themselves. We, however, are compelled to summarise these as briefly as possible.

For twelve trusses of any yellow Rose except Maréchal Niel, Mr. G. Prince was first with Comtesse de Nadaillac, extremely fine; second Mr. B. R. Cant for the same; and third, Mr. F. Cant, with Francisca Kruger. Five exhibitors. In the white Rose class Mr. J. Mattock was first with beautiful blooms of Rubens. Second, the English Fruit and Rose Co. for Merveille de Lyon. Equal third, Mr. B. R. Cant with Merveille de Lyon, and Keynes, Williams & Co. with the same variety; thirteen exhibiting. For crimson Roses Mr. B. R. Cant was first with Alfred Colomb; Mr. S. P. Budd second with the same; and Mr. F. Cant third for Général Jacqueminot. Eleven exhibitors. In the dark velvety crimson class Mr. B. R. Cant led with Prince Arthur; Mr. F. Cant second for Victor Hugo very good; and Messrs. Curtis, Sanford and Co. third with Prince Camille de Rohan. Six exhibitors.

Marie Baumann was shown by eight exhibitors, Messrs. G. Bunyard and Co., R. B. Cant, and F. Cant being the prizewinners in that order. In the A. K. Williams class Messrs. B. R. Cant, G. Prince, and the English Fruit and Rose Co. were the successful exhibitors; while the best stands of Lady Mary Fitzwilliam came from Messrs. D. Prior and Son, F. Cant, and H. Norton, Louth. Niphotos was shown by Messrs. B. R. Cant, Keynes, Williams & Co., and Frank Cant, who were first, second, and third respectively. Two beautiful stands of Her Majesty came from Messrs. G. Paul & Son, who had very handsome blooms; and from Mr. F. Cant, the blooms a little smaller, with outer petals damaged. Mr. G. Prince was accorded a second prize for Princess of Wales (Tea).

Sixteen entered in the class for any H.P. not named in the preceding classes. Mr. F. Cant was first with Mrs. John Laing, very handsome substantial blooms. Messrs. G. Bunyard & Co. were second for Ulrich Brunner, and the English Rose and Fruit Company third with La France of medium size.

#### NEW ROSES.

For twelve single trusses of any new Rose, Mr. G. Prince was first with Souvenir de S. A. Prince, very even and beautiful blooms. Messrs. Curtis, Sanford, & Co. were second for The Queen, and Messrs. Paul and Son third with Dowager Duchess of Marlborough. With twelve new Roses Messrs. Paul & Son were the leading exhibitors, showing Comtesse B. de Blacas, H.P., globular, pink; Ernest Metz, Tea, a soft blush fine bloom; G. Caillot, a pale pink H.P., delicate and pretty; Sir Rowland Hill, H.P., deep purplish crimson; M. Trievoz, H.P., rosy crimson; John D. Pawle, H.P., dark crimson; Mrs. James Wilson, Tea, pale sulphur; Marchioness of Lorne, H.P., very bright crimson; Lady A. Hill, H.P., peculiarly bright pink; Souvenir de S. A. Prince, Edouard Michael, and Lady Alice. Mr. B. R. Cant and Messrs. Curtis, Sanford & Co. were second and third.

In the next class for three trusses of any new Rose, either not in

commerce or not first distributed earlier than November, 1889, a ground plant of the variety to be shown, two very fine Roses were exhibited, and two gold medals were awarded, a most unusual occurrence. The varieties so honoured were the following:—

*Salamander* (W. Paul & Son).—A seedling Hybrid Perpetual, remarkable for the redness of its colour, an extremely deep yet bright crimson; something of the style of Charles Lefebvre in build and petals, the latter broad, recurving, of great substance. Evidently a grand exhibition flower. A handsome symmetrical bloom. The foliage and habit are strong, and it is said to be very constant in its characters.

*Mrs. Paul* (Paul & Son, Cheshunt).—A charming Bourbon Rose, the bloom of exquisite shape and build, the petals broad, imbricated, and recurving. A delicate pink, shading to white in the centre of the older petals. The soft colouring renders this a delightful contrast to the darker Roses.

#### GARDEN ROSES.

An admirable feature was afforded by these, and if our report had not already extended to so great a length we should have referred to them fully, but we can only note that they were exhibited in first-rate condition, and attracted a large share of attention from the visitors. For thirty-six bunches Messrs. Paul & Son were first, showing Moss Roses *Félicité Perpetué*, *Gloire de Dijon*, *Perle d'Or*, *Thoresbyana*, *White Pet*, *Rosa Mundi*, &c.; second, Messrs. G. Bunyard & Co., who had fine blooms of *Madame Plantier*; third, the English Fruit and Rose Co. (Cranston's). Mr. C. E. Cuthell was first for eighteen varieties, showing, amongst others *polyantha*, *rugosa*, *lucida*, *Ma Capucine*, *Austrian Yellow*, *macrantha*, *Hebe's Lip*, *York* and *Lancaster*, W. A. Richardson, and others; second, Rev. J. H. Pemberton, an interesting collection; third, Mr. G. Mallender. Button-hole Roses were a charming class. Mr. J. Mattock led with an admirable collection, comprising *Rubens*, W. A. Richardson, *Amazone*, *Madame Lambard*, *Ma Capucine*, *Innocente Pirola*, *Madame de Watteville*, *Marie Van Houtte*, *Anna Ollivier*. Messrs. G. Bunyard & Co., *Maidstone*, were second with very neat buds of *Homère*, *Madame Falcot*, *Souvenir de Paul Neyron*, *Madame Cusin*, *Hon. Edith Gifford*, and *Bouquet d'Or*. Third, Mr. H. Evans.

Miscellaneous exhibits were numerous, and conspicuous amongst them was a grand collection of Roses from Messrs. W. Paul & Son, Waltham Cross, who had forty baskets and twenty boxes of cut flowers, representing a large number of varieties, including the many novelties sent out by this firm. Messrs. J. Veitch & Sons, Chelsea, had ten boxes of handsome Rose blooms; Messrs. Laing & Sons, Forest Hill, had a beautiful group of Tuberous Begonia flowers, Ferns, and Asparagus; Messrs. Cannell & Sons, Swanley, showed a group of Gloxinias tastefully arranged with Ferns and Asparagus; Messrs. Cheal & Son, Crawley, showed Roses and hardy flowers; Mr. W. Tayler, Hampton, had a box of Roses; Messrs. Ryder & Son, Sale, had a new Pink, *Souvenir de Sale*, of a peculiar mauve tint; Messrs. J. Peed & Son, Mitcham Road, had a collection of Roses; Mr. C. Turner a collection of Strawberries; Mr. H. J. Jones had a collection of Tuberous Begonias, yellow Carnations, and Tomatoes; and Mr. H. Bennett, Shepperton, sent a new H.P. Rose named *Capt. Haywood*, somewhat in the style of Ulrich Brunner, but of an extremely bright red tint.

#### HEREFORD AND WEST OF ENGLAND.

THE twenty-fourth Exhibition of this, the continuously oldest Rose show in the kingdom, was held in the Shire Hall, Hereford, on Tuesday, July 1st, when, we regret to say, that as in the case of last year, unfavourable weather considerably marred its usual success. Not only did heavy showers in the morning interfere with the cutting of local exhibitors and lessen the attendance, but adverse weather for several days must have disheartened intended exhibitors from a distance and prevented them keeping up to their engagements. Then, too, the cloudy, intermittently hot and cold weather of the past fortnight has checked growth, as evidenced by the prevalence of mildew, and made the date of exhibition, which looked so exactly promising, at least a week too early—add to all these disturbing elements Colchester fixture taking place on the same day, and the wonder ceases that the Rose magnates of Colchester, Salisbury, and Slough, of Devonshire and Hertfordshire, so faithful generally to old Hereford, were on this occasion conspicuous by their absence. Mr. Harkness—a host certainly in himself—with Messrs. Jefferies and Dickson, were the only exhibitors present. Your reporter could not resist heaving a deep sigh over past triumphs, when some half-dozen seventy-twos would be staged by the premier Rose nurserymen to try conclusions with the famous King's Acre nurseries; and Baker and Jowitt among amateurs, could and did show the public how a Rose was to be grown and shown to perfection. *Tempora mutantur*, indeed! though we will not allow the truth in our case of the remaining part of the hexameter; a true rosarian never changes, at least for the worst; and we of Hereford, who do not at all intend to live on our past reputation, are already looking forward to welcoming the N.R. Society on July 8th next year, and, through our energetic Hon. Sec., Rev. F. R. Burnside, of whom we are very proud, of proving to demonstration that, in spite of occasional failures, there is life in the old Show yet.

Scant as were the exhibitors, and many and bare the gaps in the hall, still the quality of some of the boxes throughout was excellent. We seldom remember to have seen a grander seventy-twos than that staged by the English Fruit and Rose Company (too delightfully vague an improvement on "Cranston & Co."). These consisted of large, smooth, bright blooms, with no suspicion of a weak corner. The darks were especially fine in colour. There was a scarcity of Teas to give brightness, which perhaps

was the only adverse criticism that could be passed. As may be supposed this admirable collection lost nothing by being set up by Mr. Grant, the quondam successful amateur and New Company's manager.

Subjoined is a list of names we hope will not be crowded out of our Journal this specially busy week, as comparatively with other unique lists we hold this to be far the best method of instructing the public. Seventy-two varieties, single trusses, division A, nurserymen.—First prize £8, English Fruit and Rose Company, Hereford, H. P. Ulrich Brunner, grand; Marie Baumann, Madame Hippolyte Jamain, A. K. Williams, Pride of Waltham, Auguste Rigotard, François Michelin, Thomas Mills, splendid; Merveille de Lyon, Abel Carrière, superb dark; Capt. Christy, Reynolds Hole, superb dark; La France, Lady H. Stewart, fine new; Charles Lefebvre, Maréchal Niel; Beauty of Waltham, Général Castellane, Duke of Wellington, Marie Verdier, Madame C. Wood, Gabriel Luizet, Maurice Bernardin, Heinrich Schultheis, grand; Baron Bonstettin, superb dark; Madame S. Rodocanachi, a perfect bloom, but puzzling to grow like its name; Prince Arthur, Anna de Diesbach, Alfred Colomb, splendid; Marguerite de St. Amand, Tea; Rubens, Sultan of Zanzibar, fine dark; Mrs. Baker, Pride of Reigate, a toy Rose among grown ups; Xavier Olibo, Marie Coiset, pretty; Lefebvre, fine Tea; Anna Ollivier, Dr. Andre, Tea; Devoniensis, H.P.; Duke of Teck, Duchesse de Morny, fine; Countess of Oxford, Tea; Niphetos, H.P.; Louis Van Houtte, Baronne Rothschild, Mons. Benoit Comte, good new; Magna Charta, grand; E. Y. Teas, Mlle. Eugénie Verdier, Madame Desir; Mrs. Caroline S. Waites, new; Dupuy Jamain, Victor Verdier, J. S. Mills, Alphonse Soupert, dark, fine; Général Jacqueminot, perfect; Madame Eugénie Verdier, Comte Raimbaud, Mrs. John Laing, a fine acquisition; Victor Hugo, Duchess of Vallombrosa, Duke of Edinburgh, Tea; Madame Willermoze, H.P.; Rosieriste Jacobs, Princess Mary of Cambridge, Marie Rady, grand Tea; Souvenir d'un Ami, H.P.; Etienne Levat, Hybrid Tea; Grace Darling, us-ful; François Louvat. Second, £6, Messrs. Harkness and Sons, Bedale, Yorkshire.—This collection contained many excellent Tea Roses, notably a splendid bloom of *Innocente Pirola*, also *The Bride* and *Marie Van Houtte*, and *Rubens*, *Souvenir d'Elise*, and *Etoile de Lyon* were especially noticeable.

Division B, nurserymen, thirty-six varieties, single trusses.—First, £3, Messrs. J. Jefferies & Son, Cirencester. Second, £2, Messrs. Dickson (Limited), Chester. Third, £1, Mr. C. Whiting, Hereford. Twelve varieties, trebles, were carried off by the same exhibitors in the same order.

Division C, amateurs, thirty-six varieties, singles.—First, Mr. S. P. Budd, Bath, with H.P. Ulrich Brunner, François Michelin, very fine; Mrs. John Laing, Hippolyte Jamain, Marie Baumann, Marie Finger, Madame Prosper Laugier, Heinrich Schultheis, grand; Etienne Levat, Merveille de Lyon, Charles Lefebvre, Mlle. Eugénie Verdier, Queen of Queens, Prince Arthur, Tea; Devoniensis, Victor Hugo, General Castellane, fine; Marie Coiset, E. Y. Teas, Her Majesty, large and good; Charles Darwin, Princess Batrice, Le Havre, Marie Verdier, Sir Rowland Hill, new and useful; Captain Christy, Countess of Oxford, fine; Louis Van Houtte, Tea Catherine Mermet, Jean Soupert, Souvenir d'Elise, splendid; Madame Clemence Joigneux, Gabriel Luizet, smooth; Duchess of Beaufort, Madame Eugénie Verdier, Reynolds Hole. Second, Miss Bulmer. Third not awarded. Twenty-four varieties, singles.—First, R. v. F. R. Burnside.

Division D, Herefordshire amateurs, twenty-four varieties, singles.—First, £2, with silver medal (N.R.S.), J. H. Arkwright. Second, £1, J. Rankin, M.P. Third, 15s, Rev. A. Phillips.

Tea and Noisette division, nurserymen, eighteen Teas and Noisettes.—First, £2, The English Fruit and Rose Company. Second and third not awarded. Twelve Teas and Noisettes.—First, 15s., Messrs. J. Jefferies and Son. Second, 12s., not awarded. Third, Mr. C. Whiting. Twelve Teas, trebles.—First, £2, Messrs. J. Jefferies & Son. Second, The English Fruit and Rose Co. Third, 15s, not awarded.

Amateurs.—Eighteen Teas or Noisettes.—First, £2, Rev. F. R. Burnside; second, Mr. S. P. Budd; third, 15s., not awarded. Twelve Teas or Noisettes.—First, 15s., Mr. C. Williams; second and third not awarded. Twelve Teas or Noisettes, trebles.—First, £2, Mr. S. P. Budd; second, £1, Rev. F. R. Burnside; third, 15s., Mr. C. Williams.

Open classes.—Twelve singles, any dark H.P.—First, 15s., the English Fruit and Rose Co., with fine level blooms of Ulrich Brunner, and also for light H.P. with grand blooms of La France. Twelve single trusses any yellow Rose.—Mr. J. H. Arkwright, first with pretty neat blooms of *Bouquet d'Or*. Mr. Budd took the N.R.S.'s silver-gilt medal for the best H.P. in the Show with François Michelin, and R. v. F. R. Burnside a similar medal for the best Tea or Noisette with *The Bride*. The drawing-room and dinner decorations and other works of floral art were not competed for as numerous as usual, possibly from the prize list being this year considerably lessened. Rev. C. H. Bulmer and Rev. F. R. Burnside were the Judges in the nurserymen's classes, and Messrs. Grant and Harkness in the amateurs'.—THE HEREFORDSHIRE INCUMBENT.

#### COLCHESTER.—JULY 1ST.

IT certainly was high time that Colchester had an exhibition of its own. Its Roses have been well to the front in every show in England for some years, and the three Colchester professionals were first, second, and third for seventy-two at the late show at York. The nurseryman's champion trophy may possibly have changed hands before these lines are printed, and it would certainly feel at home if once more lodged in the metropolis of Roses. A good deal of trouble has been undertaken by the officials in once more reinstating the Society, and it is hoped they may be successful in establishing the Show as a regular annual fixture.

The tents were pitched in the grounds of the Holly Trees, by kind permission of J. Round, Esq., M.P., and the weather was fine, but the day before had been terrible. Half a gale of wind with driving rain, sometimes quite heavy, all day was a sad trial to those who were anxious to cut good Roses. Cones and protections were blown clean away, and it was impossible that really good blooms could be exhibited on the following morning. The weather has been very unsuitable for Tea Roses, little of hot clear sun, and constant dribbles of rain having been the portion of East Anglia for a fortnight or more.

Nobody from a distance ventured in the only open class, and for thirty-six Roses the three Colchester Rose growers held the same position which they did at York—First, Mr. B. R. Cant; second, Mr. Frank Cant; third, Messrs. Prior & Son. There were, as might be expected, no extra good Roses to be noted either in this class or throughout the Show. There were only three exhibitors in the amateurs' principal class for twenty-four, and they were placed:—First, Rev. A. Foster-Melliard, Sproughton Rectory, Ipswich, and equal second Rev. H. T. Frere of Burston Rectory, Diss, and Rev. H. A. Berners, Harkstead Rectory, Ipswich. A small but fairly good A. K. Williams in Mr. Frere's stand had the silver medal as the best amateur H.P. For twelve Roses Rev. F. Page Roberts of Scole was first, Rev. A. T. Farquharson of Gissing Rectory, Diss, second, and Mrs. Egerton Green of Knutsford third. For twelve Teas there were five pretty good stands shown, which considering the weather shows how popular this class of Roses is becoming, in East Anglia at all events. Mr. Berners was first with a good stand, getting also a silver medal for a fine Anna Ollivier as the best Tea. Mr. Roberts was second with neat but smaller blooms, among which was a good Madame Cusin. Mr. Frere was third. For six single trusses of any H.P., Mr. Foster-Melliard was first with good Marie Verdier, Mrs. Egerton Green second, and Mr. Berners third with Gabriel Luizet, which variety as usual was shown by two or three other exhibitors. For six blooms of any Tea Mr. Foster-Melliard was again well ahead with Marie Van Houtte, Mr. Orpen of West Bergholt second, and Mr. Arthur Cant third. Mr. Orpen had a silver medal for the best box of amateur Roses grown within ten miles of Colchester, but the local classes did not fill as well as they should do in such a neighbourhood.

In herbaceous flowers Messrs. Burrell of Cambridge and Saltmarsh of Chelmsford showed well in the open class, the former leading, but not by much. In the amateur class Mr. Page Roberts had not much difficulty in winning the first prize. Dinner tables, buttonhole bouquets, &c., were fairly good, but might have been better, and probably will be another year. The number of visitors was not large, but then the sight of grand and good Roses can be nothing new to the good folk of Colchester.

#### BROCKHAM.

THE Brockham Rose Association was started twenty-five years ago as a "Rose" Society, and as such it has continued, although some of its daughters have combined with Roses the exhibition of other things, horticultural and vegetarian. The result was manifest in the excellent Show (one of the best the Association has held) at Bury Hill, near Dorking, on Wednesday, July 2nd, by invitation of Robert Barclay, Esq.

Considering what the weather had been previously, and especially the drenching rain, the flowers were remarkable. They must have been preserved by a whole forest of umbrellas to bring them up to the mark as the Judges viewed them when they went round on their judicial errand. On seeing a garden near Farnham, where the Roses were thus being preserved against the Show day, a friend observed to me that she thought I had a "garden party" in an obscure corner of the kitchen garden. Another friend thought when collecting the umbrellas and parasols that I was going in for the "old clothes" line. But what did it matter? The umbrellas answered the purpose. The challenge cup was won! You can do much with old umbrellas! Rose growers and Rose show-ers live long. Witness the fact in the present Hon. Sec. of this Association. The Rev. A. Cheales is what he was when I knew him twenty-five years ago; just as enthusiastic; just as keen. He scents the battle from afar as much as he did when he showed his first box in the school-room at Brockham. He is a trifle grey ("anno Domini," as my friend J. D. Pawle, a fellow Judge, feelingly remarked, "is bound to tell as time rolls on"), but his Roses are pre-eminent, and he wins more prizes than ever.

The Committee publish each year a fascinating schedule. It is worth joining the Association to secure one (I notice, though, that there are only sixty-two members, and there might be seventy). Past successes are recorded in it; Lord Penzance tells how to get a new race of Roses; the Rev. W. Wilks' remarkable summary in the Royal Horticultural Society's Report of the Rose Conference is still more summarised. Mr. Girdlestone points out the beauties of the single Roses that he grows in his delightful garden at Sunningdale. Rosa laxa is declared by Otto Froeber to be the coming Rose stock for the future, and Mr. G. Paul teaches in masterly fashion the young idea how to exhibit and win. Surely no one asks more of a schedule than this. Where could a Rose show be more fittingly or happily held than at Bury Hill, the home of so many rare plants, of the most delightful scenery, where the Deodaras grown from the first cone that came to England are now standing in full beauty (planted in 1832), where there is the finest Pinus insignis (1840) anywhere to be seen, where Abies Morinda (Smithiana) is in its glory, where Sikkim (Himalayan) Rhododendrons are plentiful, where A. Douglassi is magnificent and the "Taxodium," Cryptomeria Lobbi, and the "Oak Cork Tree" protected from the grasping tourist who is allowed often to visit Bury Hill, and who showed his

gratitude for the privilege by carrying off the bark bit by bit, are quite at home. The estate is extensive, 3000 acres. The wealth of American plants, Rhododendrons, Azaleas, &c., is stupendous, and planted as they are everywhere, with a background of the finest Coniferæ, must in the early summer be a sight ever to be remembered. A very large sheet of water in front of the house adds to the beauty of the place, and the courtesy and hospitality of the owner complete the satisfaction of all who have in any way to do with the show. The beautiful band of the Buffs played near the house, the Rose tent being some distance further removed. The Committee and the Judges (Mr. G. Paul, Mr. J. D. Pawle, and the writer of these notes) were hospitably entertained at luncheon by Mr. Barclay, and short speeches were made in response to the health of the Judges by the "President of the commission," Mr. G. Paul, and his two assessors.

It rained heavily for a while in the afternoon, but the Company, in spite of the weather, was very large. The Exhibition tent looked most attractive as you entered it, being profusely decorated with Caladiums, Ferns, Palms, Dracænas, &c., by Mr. Appleby of the Box Hill Nurseries. He also showed magnificent Rose blooms. Close by was Mr. G. Paul's box of new Roses from the "Old" Nurseries, Cheshunt, comprising blooms of Caroline d'Arden, Scipion Cochet, John D. Paule, an improved Général Jacqueminot, easily forced, hardy as iron, resists mildew, and a brilliant mixture of crimsons; Madame Trievoz, Comte H. Rignon, Hybrid Tea; N. L'Idéal, Paul's Cheshunt Scarlet, Dowager Duchess of Marlborough, exquisite scent, new this spring; Sir Rowland Hill, violet crimson H.P.; Comtesse de Blacas, Earl of Dufferin, and above all his new Bourbon Rose, Mrs. Paul, light peach with darker centre and paler edges, a seedling from Madame Isaac Périère, and of tremendous growth. Award of merit Floral Committee R.H.S., first-class certificate Royal Botanical Society, first-class certificate Aquarium Rose Show.

There was a very close contest in the twenty-fours, which formed the first class of division A, for which there were three competitors, all showing very excellent blooms. Rev. Alan Cheales won the National Rose Society's gold medal, which was the first prize, for the following fine blooms:—Silver Queen, Duke of Edinburgh, Emilie Hausburg, La France, Star of Waltham, Xavier Olibo, François Michelon, A. K. Williams, Alfred Colomb, Madame Berard, Her Majesty, Dr. Hogg, Earl Dufferin, Maréchal Niel, Reine Maria Pia, Sophie Fropot, Pride of Waltham, Le Havre, Leopold Premier, Souvenir d'Elise Vardon, Gabriel Luizet, Marie Rady, Niphotos, and Duchesse de Caylus. Mr. C. E. Cuthell took second prize (National Rose Society's silver medal) with a good box containing Madame Eugène Verdier, Alphonse Soupert, Belle Lyonnaise, F. de Lesseps, The Baroness, Etienne Levet, Charles Lefebvre, Ulrich Brunner, Souvenir d'Elise, Dupuy Jamain, Gabriel Luizet, A. K. Williams, La France, A. Colomb, Marie Van Houtte, Mrs. J. Laing, Prince Arthur, Maréchal Niel, Madame V. Verdier, Grace Darling, Louis Van Houtte, Violet Bouyer, and Xavier Olibo. Mr. Wollaston's box only missed second prize by two points, and looked the best box of the three. The Teas are always good at Brockham. Mr. Cuthell had first prize for his twelve: Maréchal Niel, Alba Rosea, Marie Van Houtte, Souvenir d'Elise, Jules Finger, Caroline Kuster, Madame Lambard, Anna Ollivier, Rubens, Catherine Mermét, Souvenir d'un Ami, Rêve d'Or. Next came Rev. A. Cheales with a good box, in which were fine blooms of Princess of Wales, Belle Lyonnaise, and Marquis Sanima.

For six triplets of any kind Mr. Frank Wollaston came out well with Duchesse de Vallombrosa, C. Lefebvre, Duke of Wellington, Gabriel Luizet, Duke of Edinburgh, M. de Castellane, and took first prize. Mr. Cuthell took second for Baronne de Rothschild, Marquise de Castellane, Charles Lefebvre, Merveille de Lyon, Xavier Olibo, and Gabriel Luizet. The twelve of any kind brought out nine competitors, and a new exhibitor in A. Tate, Esq., who is likely to prove himself hard to beat. He was *facile princeps*, and took N.R.S.'s good medal with a very fine box containing Marie Verdier, Etienne Levet, François Michelon, Ulrich Brunner, A. K. Williams, La France, Charles Lefebvre, Merveille de Lyon, Eugène Verdier, Xavier Olibo, Madame H. Jamain, and Louis Van Houtte. Mr. C. Horne took second prize for a very neat and good box, in which Abel Carrière, Marie Baumann, Mrs. G. Paul, and Madame Isaac Périère were conspicuous. Mrs. Perkins and the Hon. H. D. Ryder took an equal third prize.

Mr. Tate won first prize for nine Teas, in which there were good blooms of Etoile de Lyon, Madame Willermoz, Madame de Watteville, C. Mermet, and Comtesse de Nadaillac. Mr. Horne took the second prize. There were four other competitors. In the class for four triplets Mr. Horne came up again with Marie Baumann, Gabriel Luizet, La France, and Charles Lefebvre, and carried off first prize; while the Hon. H. D. Ryder, with the Duke of Edinburgh, La France, Souvenir de Malmaison, and Marquise de Castellane took the second. For six of any kind Mrs. Hatch won first prize for Princess Mary of Cambridge, Dr. Andry, Duchesse de Morny, Duke of Teck, La France, and The Baroness; a very good box. For four Teas Mrs. Hatch was again to the front with Maréchal Niel, Souvenir de Paul Neyron, The Bride, and Souvenir d'un Ami. In the class for two triplets there was only one box, and in it were Sultan of Zanzibar and Comtesse de Nadaillac. Mr. Horne won first prize in members' open classes for six of any one Tea with Madame Bravy, and Mr. Cheales the second with Maréchal Niel, while a third went to Mr. Cuthell for Marie Van Houtte. In the open classes for six of the same kind (not Tea) Hon. H. D. Ryder had first prize for six fine La France; Lady Lawrence second for six almost equally fine Ulrich Brunner; and Mrs. Leopold Seymour and Mr. F. Wollaston divided third prize for La France and Gabriel Luizet respectively.

A very interesting feature of the Show was the class for garden

Roses, which was much better than it was last year. Mr. Cuthell's collection of forty-eight varieties was admirable, comprising amongst others *Rugosa alba*, *De la Grifferaie*, *Lucida plena*, *Læda*, *Gloire de Polyantha*, *White Pet*, *Red Damask*, *Paul's Red Pet*, *Mignonette*, *W. A. Richardson*, *Coruscans*, *Austrian Yellow*, *Paquerette*, *Rosa Indica*, *Ma Capucine*, *Austrian Copper*, *Fairy Rose*, *Green Rose*, *L'Idéal*, *Persian Yellow*, *Grace Darling*, *Rêve d'Or*, *Crested Moss*. Miss Barclay took second prize. For a smaller collection Mr. Tate won first prize, and Mrs. L. Seymour second, and for a still smaller collection Mrs. Hatch carried off the prize.

The show of decorations was better than usual. The one for the dinner table that secured the first prize was arranged with great taste by Miss Nesfield, a new exhibitor. It consisted of a low centrepiece of green glasses in a frame of wrought iron, and four other green glasses, all filled with *Alstroemerias*, *Ferns*, and *Copper Beech*. Miss Fuller took the second prize for a graceful arrangement of yellow *Eschscholtzia*, *Spiræa*, *Clematis erecta*, *Ferns*, and *Grass*, while a tall basket arranged by Miss Bencke with white *Pæonies*, *Ferns*, *Shirley Poppies*, white *Foxglove*, and *Asparagus* was commended. There were six entries. There was a class for arrangements in large round blue vases of a uniform pattern. First prize went to Mrs. Cuthell for single *Macrantha Rose* and *Ferns*, most tasteful; and the second to Miss Fuller for *Niphotos*, *Asparagus*, and *Ferns*. For the buttonhole bouquets in groups of three there was a rather limited competition, and some required a microscope to appreciate them. Miss D. A. Nesfield took first prize, and Miss Tritton the second.

For the best Rose in the Show there was one solitary Rose, very one-sided, set up in an Eno's fruit salt bottle, reminding one of the "good old times." It did not win. But the Judges gave the prize to the Hon. H. D. Ryder for a very beautiful bloom of *Catherine Mermet*. The Society is to be congratulated for its excellent Show on the occasion of its "silver wedding." "Enthusiasm" is the motto on the banner of the Association. That it will never grow cold is certain while the management is in the excellent hands of the present Committee.

It only remains to be said that Mr. Gray is the gardener at Bury Hill, and a very comfortable home does he occupy in the kitchen garden, three-quarters of a mile from the house, and that the Judges are much indebted to him for his courtesy and kindness in showing them the many features of great interest attached to this beautiful place, which, with the help of eleven subordinates, he keeps in excellent order.—A. B. ALEXANDER, *Shedfield Vicarage*.

#### NORWICH.—JULY 3RD.

DRENCHING rain again; what a Rose season we are having! Norwich has often been unfortunate in the matter of weather; but a society which has a strong reserve fund, and not unfrequently takes over £100 gate money in a day, can at all events bear a reverse better than weaker associations.

The Show was held in the grounds of Bracondale Woods, kindly lent for the purpose by Russel J. Colman, Esq. As might be expected from the inclemency and coldness of the weather the number of exhibits was not large, and the Rose standard low, very few specimens calling for particular notice. In the open classes, Mr. B. R. Cant of Colchester was first for forty-eight, Messrs. Burch of Peterborough second, and Mr. F. Cant third, the quality throughout being but little above that seen in the amateurs' classes. For twelve trebles Mr. B. R. Cant was first, Miss Penrice of Whitton second, and Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich, third. In the amateurs' class for thirty-six Roses the annual battle was keenly fought out between the old rivals at Norwich, Rev. H. T. Frere of Burston Rectory, Diss, and Rev. A. Foster-Melliar. The premier position was this year awarded to Mr. Frere, and he and his bevy of fair assistants were warmly congratulated on thus gaining the principal prize for Roses in East Anglia. Miss Penrice was third with a less worthy collection. In twenty-four Roses Mr. Foster-Melliar was first, having here a very good bloom of *Duchesse de Morny*. Rev. F. Page Roberts of Scole Rectory was second with a good stand, and Miss Penrice third. In twelves, Mr. Page Roberts was first, Mr. B. E. Fletcher second, Mr. T. C. Blofeld third, and Mr. W. Birkbeck fourth. In a twelve class, open only to Norfolk amateurs not employing a regular gardener, Rev. A. T. Farquharson was first, Mr. G. S. Culley second, Mr. E. N. Bunn third, and Mr. A. J. Learner fourth. This sort of class does not seem very well defined, by the way. Some of the strongest amateurs in the country employ no regular gardener, and the experienced exhibitor would always rather have a regular gardener against him than an amateur who attends to his Roses himself; and this is no disparagement of gardeners, but merely a recognition of the fact that the gardener has a hundred and one things to attend to, none of which may be neglected, while the enthusiastic amateur is a specialist, and throws everything on one side for his Roses.

In six Roses, Mrs. Ames Lyde was first, Mr. G. S. Culley second, and Mr. E. N. Bunn third. In the class for twelve Teas or Noisettes, Mr. Foster-Melliar was first, getting also the silver medal for *Souvenir d'Elise*; Mr. Page Roberts second, and Mr. Frere third. This was somewhat of a surprise. Rev. H. A. Berners' fine Teas were absent; but Mr. Foster-Melliar's were unnoticed at Colchester, where the other two were well placed, and the winner made no secret of the fact that no less than eight of his twelve Teas at Norwich, including the *Souvenir d'Elise*, were the identical blooms shown at Colchester. Truly Tea Rose showing, in such cold and wet weather, is a funny business.

For six H.P.'s of one sort, Rev. A. L. Fellowes of Beighton Rectory won with *La France*, very large and fine. One of these deservedly

gained the silver medal as the best H.P. It had opened more on one side than the other, but was perfect in itself, and as fine a bloom of the sort as is often seen. Mr. Foster-Melliar was second with *Gabriel Luizet*, and Miss Penrice third with *A. K. Williams*. For six Teas of a sort, Mr. Foster-Melliar was first with *Marie Van Houtte*, Mr. E. N. Bunn second with Hon. Edith Gifford, and Mr. Fellowes third with *Madame Bravy*. The weather cleared up in the afternoon, and the attendance was fair, £80 being taken at the gates.—W. R. RAILLEM.

#### CANTERBURY.

THE terrible day of wind and rain that was experienced all over the country on Monday gave one but little hope that the Roses at the old Cathedral city would be of their usual excellent character, and therefore one was very agreeably disappointed to find one's anticipations completely falsified by the event, for not only were the Roses numerous but excellent in colour and freshness. Some few, it is true, bore the signs of weariness, which might have been more generally looked for, but, on the whole, they were remarkably good, and taking it altogether it was the best Show I think the Society has held. The great improvement that has taken place in the local classes was most remarkable. No longer were there to be seen stands at which one could hardly help smiling; no longer were outrageous names put to flowers or duplicates to be found; and as I have watched the progress of this Society from its very birth, and have attended all its shows, I can write from experience of the past. The zealous exertions of its able Secretary, Mr. S. H. Dean, have tended to put the Society on a firmer basis, and all lovers of the Rose, especially those whose interests, like mine, are closely bound up with the dear old city, must rejoice at the continued prosperity of the Society.

In the class for eighteen (amateurs) the first prize was won by R. E. Knight, Esq., of Bobbing, near Sittingbourne, with admirable blooms of *La France*, *Eugène Verdier*, very fine; *Eugène Verdier*, *Princess of Wales*, *Duke of Edinburgh*, *Ulrich Brunner*, very fine in colour; *Etienne Levet*, *Maréchal Niel*, *Duke of Teck*, *The Bride*, *Reynolds Hole*, very fine bloom; *A. K. Williams*, *Duke of Wellington*, *Gabriel Luizet*, *Gloire Lyonnaise*, *Mrs. John Laing*, very fine; and *Louis Van Houtte*, very fine. The second prize went to Cooper Wachter, Esq., and the third to Mr. R. E. West, Reigate. In class 2; for the best twelve, Mr. Knight was again first with *Gabriel Luizet*, *Le Havre*, *La France*, *Charles Lefebvre*, *Etienne Levet*, *Baroness Rothschild*, *Captain Christy*, *Duke of Teck*, and *Général Jacqueminot*. Mr. H. Foster was second. In class 3, for twelve Teas and Noisettes, the first prize was won by the popular and most valued President of the Society, Captain Lambert, with a box containing beautiful blooms of *Alba Rosea*, *Catherine Mermet*, *Madame de Watteville*, *Souvenir d'un Ami*, *Madame Van Houtte*, *Souvenir d'Elise Vardon*, *Caroline Kuster*, *Hon. Edith Gifford*, *Madame Hippolyte Jamain*, *Comtesse de Nadaillac*, *Jules Finger*, and *Ama Ollivier*. The second prize was won by Mr. Knight.

In class 4, six varieties, four trusses of each, Mr. R. E. West was the only exhibitor. He showed a very fine lot of the following varieties:—*La France*, *Madame Victor Verdier*, *Merveille de Lyon*, *Etienne Levet*, *Baroness Rothschild*, and *Marie Rady*. In class 5, for the best twelve, the first prize, a cup value two guineas, presented by the Mayor of Canterbury, was won by Captain Martin with fine blooms of *Dr. Andry*, *Etienne Levet*, *Baroness Rothschild*, *Ulrich Brunner*, *Marquise de Castellane*, *Hon. Edith Gifford*, *Duchess of Bedford*, *Duke of Edinburgh*, *A. K. Williams*, *Prince Camille de Rohan*, *La France*, *Susanne Marie Rodocanachi*. The second went to the Rev. T. R. Buchanan. In class 6, for nine Teas and Noisettes, the first prize was won by Captain Martin with *Hon. Edith Gifford*, *Madame Berard*, *Marie Van Houtte*, *Souvenir d'un Ami*, *Madame Cusin*, *Catherine Mermet*, *Rubens*, *Souvenir de Thérèse Levet*, and *Comtesse de Nadaillac*. Miss Hawkesworth was second, and Mr. W. Stoner third. In class 7, four varieties, three trusses of each, the first prize was won by Miss Hawkesworth with *Baroness Rothschild*, *Ulrich Brunner*, *Marie Van Houtte*, and *Duke of Edinburgh*. The second prize went to Mr. Stanley. In class 8, for nine varieties, Miss Rolt took first prize with *Souvenir d'un Ami*, *Marie Baumann*, *Duke of Edinburgh*, *Marie Finger*, *Duke of Teck*, *Charles Lefebvre*. Mr. R. Smith second. In class 9 Mr. S. Collard was first, Mr. Smith second, and Mr. Rolt third. In class 10, for best six Teas of any one variety, Mr. Cooper Wachter was first with fine blooms of *Maréchal Niel*; Captain Martin second with *Anna Ollivier*, and Col. Lambert third. For the best H.P., one sort, Mr. West was first with *Baroness Rothschild*; second, Mr. Hornby with *M. Bernardin*, and Mr. Knight third with *Gabriel Luizet*. For the best Hybrid Perpetual Mr. E. Martin took the medal with *Mabel Morrison*, and for the best Tea, Mr. Knight, with *Souvenir d'Elise*.

Some fine stands were exhibited in the nurserymen's class; especially good was that shown by Mr. Frank Cant, Colchester, to which the first prize was awarded. It contained the following:—Mrs. John Laing (very fine), *Ulrich Brunner*, *Pride of Waltham* (excellent), *Duke of Edinburgh*, *Madame Isaac Pereire*, *Duke of Teck*, *Victor Hugo* (a grand bloom), *Alfred Colomb*, *Souvenir d'un Ami*, *Dupuy Jamain*, *Innocente Pirola*, *Madame Gabriel Luizet*, *Prince Camille de Rohan*, *Maréchal Niel*, *Pride of Reigate*, *Comtesse de Nadaillac*, *Sultan of Zanzibar* (a grand bloom), *Her Majesty*, *Etienne Levet*, *Merveille de Lyon*, *A. K. Williams*, *Marie Finger*, *Alfred Dumesnil* (a magnificent bloom), *Marie Baumann*, *Ulrich Brunner*, *Niphotos*, *Comte de Raimbaud*, *Paul Regnon*, *Prince Arthur*, *Souvenir d'Elise Vardon*, *Mary Bennett* (a pretty bloom), *Lady Mary Fitzwilliam*. Mr. George Mount was second; Mr. Rumsey of Wrotham third; and Messrs. Thomas

Bunyard & Co., Ashford, fourth. In the class for twelve Hybrid Perpetuals and twelve Teas Mr. Frank Cant was again first; his blooms were Mrs. John Laing, Madame de Watteville, Etienne Levet, Innocente Pirola, François Michelin, Souvenir d'Elise Vardon, Ulrich Brunner, Marie Finger, Souvenir d'un Ami, Madame Cusin, Prince Arthur, Catherine Mermet, Victor Hugo, Souvenir de S. A. Prince, Camille de Rohan, Niphotos, Pride of Reigate, Francisca Krüger, Gloire de Bourg la Reinc, Edith Brownlow, Duke of Teck, Rubens, Général Jacqueminot, and Marie Van Houtte. Mr. George Mount was second. In twelve Teas Mr. Frank Cant was again first with Madame de Watteville, Jules Finger, Niphotos, Madame Cusin, Innocente Pirola, Marie Van Houtte, Souvenir d'Elise, Comtesse de Nadaillac, Catherine Mermet, and Edith Brownlow. Mr. George Mount was second.

In the stand for a vase or epergne of Roses Mrs. H. B. Biron was first with a very beautifully arranged stand, in which her well known taste was conspicuous, and also in a very exquisite shoulder knot. There were also some very pretty arrangements of buttonhole bouquets.

The weather was again unpropitious; it had interfered with many exhibitors, amongst others with the indefatigable Secretary, the Rev. H. B. Biron. Anyone who knows his garden on a cliff can quite understand what effect a S.W. gale, combined with torrents of rain, such as we had on Monday, must have had upon it, and consequently he was completely prevented from exhibiting any of his flowers. The uncertainties of our climate are indeed very perplexing and disappointing to those who depend upon it, and certainly Rose growers are as much so as most people. We had hoped for a favourable time, but alas! it seems as if we were again to experience the misery of disappointed hopes. The wonder is that any Roses are exhibited, but the friends of the Rose at Canterbury are not easily discouraged, and the excellence of their Exhibition will encourage them to go forward.—D., Deal.

#### ELTHAM.

ALTHOUGH within only eight miles of the General Post Office Eltham is comparatively unknown, yet is it a place not only of deep interest, but of Old World character, and although there have been built a large number of villas, yet somehow or other it has not been very popular, and the old street still smacks of the olden time, and many nurseries crowd around the Palace, now called Eltham Court. Here our kings held courts and parliaments, here were entertained kings from far off Armenia; in the parks that surrounded it they hunted, and they have left in the grand banqueting hall a remnant of its former greatness, for no more beautiful specimen of perpendicular domestic architecture can be found anywhere. Eltham, too, has its modern associations. Here Vandyke lived; here, too, died Doggett the comedian, the founder of "the coat and badge" rowed for by the Thames watermen; here Mr. Blenkinsop had his celebrated stud of horses, and here at his sale Blair Athol fetched 13,000 guineas; and last, but not least, here died William Sherard the botanist, the author of "Hortus Elthamensis," and the founder of the professorship of botany at Oxford.

In the ground attached to Eltham Court, as the palace is now called, the residence of that very earnest and energetic member of the National Rose Society (Mr. Bloxam) which has often benefited by his counsels, was held the annual Rose Show on Saturday last, and I think all concerned in it may be heartily congratulated on the great improvement which has taken place in the quality and extent of the flowers exhibited. Time was when a friend used to say of it, "Mrs. — first and the rest nowhere," so great was the difference between her stand and the others shown. It is not so now. The competition was very keen, and the second and third stands contained very beautiful flowers. In the class for eighteens Mrs. Fuller, Bexley Vicarage, was first also with fine blooms of Capt. Christy, Etienne Levet, Pride of Waltham, Heinrich Schultheis, Louis Van Houtte in fine bloom, which ran François Michelin very hard for the silver medal; Mrs. John Laing, Baroness Rothschild, Abel Carrière, Maréchal Niel, Duke of Edinburgh, a finely coloured bloom; Ulrich Brunner, Marie Finger, Her Majesty, Xavier Olibo, Marie Verdier, Gabriel Luizet, Magna Charta, A. K. Williams, and Merveille de Lyon. Mr. Shea was second and Mr. R. Bloxam third. In the class for twelves Mr. Shea was first, Mr. A. Biron second, and Mr. A. Harris third. Mr. Shea's blooms were White Baroness, Queen of Queens, Her Majesty, Baroness Rothschild, Marie Finger, Comtesse d'Oxford, Marquise de Castellane, Marie Cointet, Prince Arthur, Captain Christy, Duke of Edinburgh and Duchess of Vallambrosa. In the class for four trebles Mr. Fuller was first, La France, Baroness Rothschild, Louis Van Houtte and Heinrich Schultheis. In the class for sixes Mr. Bryan was first and Mr. Shea second. The blooms in the first box were Captain Christy, Charles Lefebvre, Duke of Edinburgh, La France, Madame Isaac Pereire and Merveille de Lyon. In Teas Mr. Bloxam was first with America, Anna Ollivier, Madame Lambard, Hon. Edith Gifford, Caroline Kuster and Madame Villermoz. For six of any one sort Mrs. Fuller was first with clear, bright blooms of Gabriel Luizet.

Turning now to the other side of the tent where were staged the nurserymen's and open stands, there needed not much forecasting to say, when such growers as Mr. B. R. Cant, Mr. Frank Cant, and Messrs. Paul & Son, entered the lists, and very fine flowers were staged by these celebrated growers. Mr. Frank Cant was first in twenty-fours with La France, Merveille de Lyon, Pierre Notting, Ulrich Brunner, splendid in colour; Her Majesty, Dupuy Jamain, Lady Mary Fitzwilliam, Duke of Teck, brilliant in colour; Souvenir d'Elise Vardon, Star of Waltham, Gabriel Luizet, Duke of Wellington, Niphotos, Dr. Sewell, Mrs. John Laing, Etienne Levet, Madame Cusin, Mons. E. Y. Teas, Catherine Mermet,

Pride of Reigate, Comtesse de Nadaillac, Annie Laxton, Pride of Waltham, and A. K. Williams. Mr. B. R. Cant was second with a stand which ran the first very close. His blooms were Victor Hugo, Lady Mary Fitzwilliam, Louis Van Houtte, Mrs. John Laing, Gabriel Luizet, Ulrich Brunner, La France, Charles Lefebvre, Baroness Rothschild, François Michelin, Merveille de Lyon, Comtesse d'Oxford, Prince Arthur, Duke of Edinburgh, Magna Charta, Boieldieu, Marie Finger, Marie Verdier, Dr. Andry, Alfred Colomb, and Heinrich Schultheis.

In the class for twelve Mr. Frank Cant was again first with Etienne Levet, Marie Baumann, Duke of Wellington, Captain Christy, Catherine Mermet, Duke of Teck, Ulrich Brunner, Duke of Edinburgh, Boieldieu, Gabriel Luizet, E. Y. Teas, and Marie Van Houtte. Messrs. Geo. Bunyard & Co. of Maidstone were second with excellent blooms of Horace Vernet, Ulrich Brunner, Her Majesty, Madame Eugène Verdier, Marie Rady, Marquise de Castellane, Baroness Rothschild, Madame Victor Verdier, La France, Souvenir d'Elise, and Magna Charta. In twelve Teas Mr. Frank Cant was again first with Innocente Pirola, Souvenir d'Elise, Souvenir d'un Ami, Hon. Edith Gifford, Princess of Wales, Jean Ducher, Catherine Mermet, Marie Van Houtte, Madame de Watteville, Niphotos, Madame Cusin, and The Bride. Mr. B. R. Cant second with Niphotos, Comtesse de Nadaillac, The Bride, Catherine Mermet, Devoniensis, Madame Cusin, Rubens, Marie Van Houtte, Caroline Kuster, Souvenir d'un Ami, Innocente Pirola, and Souvenir d'Elise. The prize given by Mr. Geo. Prince for twelve Teas was won by the Rev. F. H. Gall, Madame Hoste, Princess of Wales, Madame Thérèse Levet, Comtesse de Nadaillac, Madame Van Houtte, Madame Lambard, Souvenir d'un Ami, Anna Ollivier, Maréchal Niel, Niphotos, and Hon. Edith Gifford.

The whole Exhibition was a most excellent one. The cottagers' productions were most creditable; specimens of bread-making, needlework, and other useful things were exhibited in considerable quantities, while the table decorations showed a vast improvement. They were simple and elegant instead of being coarse and crowded. The bouquets and other arrangements of flowers were in excellent taste. The only thing wrong was the weather, which was showery and unpleasant; but all connected with the Exhibition may be congratulated on the evident advance that has been made.—D., Deal.

#### HITCHIN.

THE grounds of the Priory were once more thrown open to the Hitchin Rose Society for their annual Exhibition, and a more fitting place, with its beautiful surroundings, quite close upon the old-fashioned county town, which, in spite of railroads, gas, and all other modern appliances of civilisation, still retains its quaint and picturesque character, could not possibly be. In former days Hitchin was noted both for its manufactures and its coachings. These have both departed, but reminders of them still exist. The "Star," with its grand old-fashioned garden and bowling green, where in former days the fathers of the town used to assemble, smoke their churchwardens, and drink their gin, is in itself worth a visit, while there are houses and gardens in the town which are alike admirable and suggestive of refined taste, and one may add of quiet lives, and I have never met anyone who visited the town for the first time who is not charmed with its old time character.

The Hitchin Rose Society has now been twelve years in existence, and owes its present position in great part to the energetic labours and enthusiasm of the Rev. F. H. Gall, who regards it with all the affection of a parent and the love of a rosarian. He had anticipated a very large Show this year, as growers from all parts had promised to attend, but alas! for all such hopes, the stormy rainy weather of the past week had dashed them, and although a good and effective exhibition was held, the number of exhibits fell far short of his expectations, but the quality of many of the stands was excellent, and in some cases could not easily be surpassed.

In class 1, for thirty-six distinct, nurserymen, Messrs. Paul and Son were first with Ulrich Brunner, La France, Duke of Edinburgh, Alba Rosea, Mrs. John Laing, Etienne Levet, Her Majesty, Merveille de Lyon, Prince Camille de Rohan, Pride of Waltham, Prosper Laugier, Marie Verdier, Abel Carrière, Lady Mary Fitzwilliam, Louis Van Houtte, Madame Geo. Schwartz, Sultan of Zanzibar, Marie Van Houtte, Xavier Olibo, Countess of Pembroke, Madame Victor Verdier, Queen of Queens, Mrs. Charles Wood, Princess Beatrice, Maurice Bernardin, Violette Bouyer, François Michelin, Captain Christy, Grandeur of Cheshunt, Heinrich Schultheis, Duchesse de Morny, Ollivier Delhomme, Souvenir de S. A. Prince, Lady Helen Stewart, Marie Finger, Alphonse Soupert, The Bride, Prince Arthur, and Madame Prosper Laugier. In this stand there were some very remarkable flowers. Messrs. Burrell & Co. were a good second, Messrs. Burch & Co. third, and Mr. John House fourth. In class 3, for twenty-four distinct, Mr. E. B. Lindsell was a long way ahead with a box in which there was not an imperfect flower, and blooms of many of the varieties were such as one does not often see, more in the matter of colour and substance than in size, a quality which I think is beginning to take its proper place in the estimation of Rose lovers as quite secondary to the others. The flowers were A. K. Williams, La France, Louis Van Houtte, Ulrich Brunner, La France, Duke of Edinburgh, Alba Rosea, Marquise de Castellane, Lady Mary Fitzwilliam, Charles Lefebvre (a beautifully coloured flower), Baroness Rothschild, Ulrich Brunner, Prince of Wales, Princess of Wales, Marie Baumann, Abel Carrière, Souvenir d'Elise Vardon, Prince Arthur, Gabriel Luizet, Rosieriste Jacobs, Mrs. John Laing, Dr. Andry, Duchesse de Morny, Earl of Dufferin, Prince Camille de Rohan,

Duke of Edinburgh, Countess of Rosebery, Le Havre, Grace Darling, Mrs. John Laing, Marquise de Castellane and Comte de Raimbaud.

In class for eighteen Teas and Noisettes the Rev. F. A. Burnside of Birch Vicarage, Hereford, was first with Innocente Pirola, Anna Ollivier, Madame Cusin, Comtesse de Nadaillac, Madame Bravy, Jean Ducher, Marie Van Houtte, Souvenir d'un Ami, Comtesse Panisse, Souvenir d'un Ami, The Bride, Jules Finger, Catherine Mermet, Rubens, Francisca Krüger, Niphotos, Madame de Watteville, Caroline Kuster, and Hon. Edith Gifford. The Rev. W. H. Jackson of Stagsden Vicarage was second. In class 5, for twelve Teas and Noisettes, Mr. E. B. Lindsell was first with Maréchal Niel, Madame Cusin, Comtesse de Nadaillac, Souvenir d'Elise Vardon, Marie Van Houtte, Prince of Wales, Catherine Mermet, Niphotos, Francisca Krüger, Souvenir d'un Ami. The Rev. F. R. Burnside was second, and the Rev. W. H. Jackson third. In class 6, for twelve, Mr. Tims was first with good blooms of Ulrich Brunner, Marie Verdier, Madame Hippolyte Jamain, Mrs. Baker, Caroline Kuster, La Rosière, The Bride, Dr. Andry, Rosieriste Jacobs, Etienne Lemet, and Louis Van Houtte. Mr. Moule was second, the Rev. F. H. Gall third, and Mr. Parker fourth. In class 7, for nine blooms, Miss A. Lucas was first with Captain Christy, Ulrich Brunner, La France, Duchess of Bedford, Gabriel Luizet, Dr. Andry, Duchess of Vallombrosa, Duke of Wellington, and Merveille de Lyon. Messrs. Bailey, Denton, were second, and Mr. W. and Dr. B. W. Keston fourth. In class 8, for six blooms, Mrs. A. Times was first with Ulrich Brunner, Madame Gabriel Luizet, Horace Vernet, Maurice Bernardin, A. K. Williams, and Charles Darwin. Mr. G. Preece of Sandy was second, and Mr. W. Pearn third. In class 9, for nine Teas, Mr. G. Moules was first with Madame de Watteville, Caroline Kuster, Catherine Mermet, Jean Ducher, The Bride, and Marie Van Houtte, Mrs. Tims second, Mr. Preece third, and the Rev. F. H. Gall fourth.

In class 10, for the best six of any one Rose, Mr. Lindsell was first with beautiful blooms of A. K. Williams; the Rev. W. H. Jackson second; Mrs. B. A. Denton third. In class 11, for the best six of any one kind of Tea, the Rev. W. H. Jackson was first with Marie Van Houtte, and Mr. E. B. Lindsell second with Anna Ollivier. In class 12, for those who had never won a prize, Mr. G. Prince was first with La France, Reynolds Hole, Louis Van Houtte, Lady Mary Fitzwilliam, and Madame Gabriel Luizet. The Rose Society's silver medal for the best H.P. was awarded to Mr. Lindsell for a fine bloom of Charles Lefebvre, and another for the best Tea to Rev. F. R. Burnside for Anna Ollivier, the latter and other decorations were very good. Not the least interesting feature of the Show was the exhibition of cut blooms of herbaceous plants, especially from Mr. John Burrell of Cambridge, a grand lot, consisting of large bunches of flowers.—D., Deal.

#### FRUIT FORCING.

**PINES.**—*Starting Suckers.*—Those suckers will soon be fit to take from the plants which formed the early section of summer fruiters. Necessary provision for starting them must be made at once, so that the plants may have the benefit of the undiminished solar heat in developing growth for as long a period as possible. Proper means are a fermenting bed in a low house or pit, the heat being steady at about 90° 6 inches from the surface, but a few degrees higher may be allowed at the start. The suckers should be taken from the parent plants, and then placed directly into 5 or 7-inch pots according to the size of the plants or suckers, and supply water once in order to settle the soil about them. Good fibrous loam torn up by hand without any admixture is the most suitable compost, which should be firmly embedded in the pot, and will tend to cause speedier root action and sturdier growth. For a week or ten days keep the house or pit rather moist and close, shade effectually, and admit but little air, sprinkle through a fine syringe once or twice a day according to external influences. As soon as growth takes place more ventilation with less shade is desirable, which must be proceeded with gradually until growth is well decided, and the plants are inured to the sun, when ordinary treatment should be given.

*Treatment after Rooting.*—Once the plants are started they must not be allowed to become root-bound, but the growth accelerated as far as it is consistent with sturdiness, consequently there must not be any delay in shifting into the largest pots immediately the roots have taken to the soil, and before they become matted together at the sides of the pots. The size of the pots should be in accord with the requirements of the plants. For Queens and Black Jamaicas 10-inch pots are suitable, and for other sorts 11 or 12-inch pots, using fibrous loam, but more lumpy than for suckers, adding a sprinkling of bonemeal, and to prevent worms entering the pots a handful of soot or wood ashes may be sprinkled over the drainage.

**MELONS.**—*Fruits Cracking.*—Why should the Melon and other fruit crack? Some insist on its being due to excessive moisture, others are equally confident that air moisture is the cause of the mischief. Perhaps

there is truth in both, but the greater fact remains that Melons will and do split, and we have ever found it due to cultural defects. Some varieties are more subject to it than others; the hard rinded and scarlet fleshed the most; the soft and thin rinded and white fleshed the least. Those that are troubled with cracked fruits year after year should grow more varieties, and make selection of those best suited to the location or means of culture, for though the climatic conditions may vary little in different localities, it very often is sufficient to mark the distinction between success and failure. An excess of root moisture when the fruit is full sized and should be ripening is undesirable. Air moisture also should be less when the fruit is ripening than when it is swelling, for a fruit grown in a comparatively dry atmosphere during the swelling period will require a correspondingly dry atmosphere when ripening. In houses a gentle warmth in the pipes and a free circulation of warm air constantly prevent moisture condensing on the fruit; and by cutting the stem about half through below the fruit excess of root moisture is prevented. All this might be avoided by affording more liberal supplies of moisture at the roots and a somewhat moister less freely ventilated atmosphere during the swelling of the fruit, with a slight shade for a few hours at midday from powerful sun during a prolonged period of bright dry weather.

*Scorching.*—This is not common with Melons, but we have had the sun scorch the soft thin-rind varieties after a period of dull wet weather succeeded by bright. This, of course, occurred in frames, yet we have seen it in houses. The leaf tissues, indeed all the tissues of the plant, not excepting the fruit, had become soft and watery, therefore liable to evaporate more quickly than the roots could or did supply matter for elaboration, and the foliage flagged and fruit became highly heated, having the rind scorched similiar to scalding in Grapes. There is no remedy so effectual as a little ventilation at night, increasing it early in the morning, and a slight shade from fierce sun so as to prevent the foliage flagging and the sun from heating and drawing the watery matter from the interior of the fruit to the surface to be scorched between the inner and outer skins. A few days' attention to shading during bright weather succeeding a dull will mostly be highly beneficial to swelling and ripening crops.

*Late Crops.*—Late plants should be planted without delay, especially where the means of affording artificial heat is confined to fermenting materials. Whether grown in pits or frames sufficient materials should be used to raise a bottom heat of about 90°, so as to start the plants quickly. A compost of good loam rather strong, with about a fifth of old mortar rubbish incorporated and put in firm, will secure a sturdy short-jointed growth and an early, plentiful show of fruit.

In houses as the crops are cleared the plants if exhausted should be removed, and preparations made for a fresh start at the earliest opportunity; but if the plants are in good health it is folly to root them out, as they will come into bearing much sooner than young plants, and are in every way more tractable. If the old plants have not been over-cropped, have had sufficient water at the roots, and the foliage is healthy, they are good for another crop. When the crop is cut the plants should be divested of damaged leaves, fresh growth being encouraged in place of any exhausted, which should be cut away. The surface of the bed should be loosened, removing the loose soil, then applying a couple of inches depth of fresh loam, with a sprinkling of some approved fertiliser intermixed, giving a good watering, and when fresh growth commences afford liquid manure, treating as for former crops. On the continuous system fruit will show and set freely on the laterals after a few joints of growth. Fertilise and encourage swelling, affording copious supplies of water or liquid manure to the roots, and maintain a genial condition of the atmosphere by sprinkling available surfaces two or three times a day and syringing at closing time, which should be sufficiently early to raise and maintain a temperature of 90° to 95° for some hours afterwards. The fruit will then swell to a good size, and be quite equal in quality to the best of first crop.

*Routine.*—Attend to stopping, thinning, tying, or otherwise regulating the shoots. Pressure of other work must not be allowed to interfere with this where health of plant and quality of fruit are considered, for as the foliage and fruit have means of elaborating and assimilating the crude material, so is the fruit affected favourably or otherwise. Successional plants should be earthed up as soon as the roots show at the sides of the hillocks, making the soil firm, being careful that the plants have enough water, yet, on the other hand, are not too wet. Maintain a bottom heat of 80° to 85°, and afford a moist atmosphere to growing crops, syringing freely, excepting when the fruit is setting or ripening, being careful not to let one or two fruits take the lead in swelling where more are required on a plant, but have them all as nearly as possible of one size. This is a matter not only affecting swelling, but quality. Those that receive most support not only are larger, but as a rule have thicker and richer flesh than those latest in swelling.

#### KITCHEN GARDEN.

**EARLY PEAS.**—The dull wet weather throughout June has been much against the pods filling rapidly, and the haulm has run up to an unusual height. Had we not pinched the tops out of the growths in May we would have gathered but few dishes in June, but the stopping is a sure means of inducing early maturity, and those whose early Peas are still unready should take every top off at once. The sooner they are ready and used now the better, as the second early and main crops will form and fill their pods should the weather become sunny and dry,

and there may a glut of Peas shortly. Readers often ask, "Do you consider this a good season for Peas and other crops?" and as regards the early Peas at least the reply is not the best. Some who have omitted to sow their late Peas may be encouraged to know that we are this week sowing several rows of our latest. Should the autumn prove unfavourable these may not be very remunerative, but if good they will yield freely in October and probably November.

**WINTER GREENS.**—These are not all planted out. Like many others we are deficient of space. Some large quarters of Brussels Sprouts, Savoys, and Broccoli have been put out, but not in sufficient quantities to keep up with our demand, and as the plants are inclined to become tall and to be spoiled in the seed beds, the largest will at once be drawn out and planted a few inches apart in spare corners. The planting will check them a little, they will soon assume a more sturdy form, and they will be in good order for planting out in their bearing quarters by the time early Potatoes, Turnips, and Peas are cleared off. That will be towards the end of July, which is not too late to plant out the last crops.

**PESTS.**—These have been somewhat troublesome; snails have been destructive to the young Greens, the Turnip fly on the Turnips, while some of the Savoys, Cauliflowers, &c., have lost their centres, the plants in consequence becoming "blind." Our only remedy for all is to dust the plants frequently with fresh lime or soot.

**CAULIFLOWER AND BROCCOLI FOR AUTUMN.**—These are distinct from the summer or winter varieties, and like many others we have ceased to experiment with other sorts, and now confine our culture to Veitch's Autumn Giant Cauliflower and Self-protecting Autumn Broccoli. The Cauliflower is a useful one for the end of summer, but particularly so in September and October, and all who desire a certain supply of heads at that time should place out plenty of plants at present. It takes them from three to four months to form heads, and when they once begin to "turn in," the same plants will furnish heads for six weeks or two months. The Broccoli is equally useful, as it heads with unvarying regularity in November, and when the frost is not too severe it is in season all through December, and for November and December it may always be relied on. It requires a little longer to produce flowers than the Cauliflower, but if both are planted together early in July they will follow each other in giving a supply. Both produce large heads in heavy rich soil, but medium-sized heads are often more valued, and these may be grown in light soil, with the plants at a distance of 18 inches from each other.

**CARROT AND ONION GRUB.**—Of late we have noticed Carrots and Onions a little yellow in the foliage. This is a sure indication that the grubs are beginning to attack the roots, and prompt efforts should be made to check this before they are in full possession of the crop. We have had considerable experience and annoyance in former years with this, and after trying every imaginable remedy, nothing equalled gas lime in stopping the plague and allowing the plants to resume their perfect growth. The gas lime should be sifted fine and sprinkled between the rows and over the top of the plants. We neither measure nor weigh it, but sprinkle it on at a rate we regard as safe, applying it rather thin, and repeating the application if necessary.

**TURNIPS FOR AUTUMN.**—Much of the Turnip seed sown in the spring produces plants that develop a seed stem before the roots have grown much, but this rarely occurs with autumn Turnips, and if a large quarter is sown now to give a supply in September the same will remain sound and good until well into winter. Veitch's Red Globe or Carter's Jersey Lily are excellent varieties for present sowing. The latter is one of the most handsome Turnips in cultivation and one of the best for exhibition. The soil for the present sowings must not be too sandy, but moderately well warmed. We have sown 1 lb. of seed to-day on a piece of ground just cleared of spring Spinach and Potatoes. The soil was merely forked over without adding manure, and the rows opened at 1 foot apart.

**VEGETABLE MARROWS AND RIDGE CUCUMBERS.**—These have not taken kindly to their mounds this year. The weather has been too sunless of late for them. This causes them to produce a thin flabby growth of a most unfruitful kind, and the plants intended to produce early fruits of both should either have their main shoots tied up to stakes or place some Pea stakes or latticework under them to keep them up from the damp cold ground. If dry air can reach the flowers when they are open the fruit will set, but if the flowers are under large leaves and in the shade, or exposed in such a way that the rain fills them, week after week will pass without a fruit forming. Keep the shoots freely thinned, and if the plants are later than usual, try and place a frame and light over some of them for a few weeks, to secure early fruits.

**LEEKs.**—The main crop of these should be planted out. Although of little importance now, they are extremely useful as winter vegetables, and after a severe winter they are often amongst the few crops that have survived. Then they are acceptable on the best tables. In private gardens there is often a deficiency of them, and they should be planted more extensively. Large specimens, such as are seen at shows, are not the best for standing a severe winter. Plants that some would consider small are the best, and these are of a suitable size for cooking whole. Do not, therefore, dig deep trenches for the main crop of Leeks, but apply manure to a piece of ground, dig it, and open drills 3 inches deep and 12 inches apart. Into these dibble the Leeks at a distance of 6 inches apart, and the result will be a useful crop.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

THE weather during the past week has been more wintry than ever. With the exception of Sunday, the 29th June, sunshine has never been more than of a few minutes duration. On that day the sun shone for about twelve hours, but a little east and west of us the thunder rolled and the rain poured in deluges. Rain has fallen more or less every day since the 4th of May. It is the wettest season I ever experienced, and probably the lowest temperature. On Friday, the 27th June, the temperature rose suddenly from 55° to 65° for a few minutes, then sank as suddenly to 48°, when a storm of hail came on with the strong north wind. July the 4th was dull, but more genial than since June came in. The temperature rose for about five minutes on the 1st to 70°, but at other times was between 50° and 60°. The barometer is now standing at 29.50°, but I dare not predict what the next hour will be. The Poppies and other flowers have expanded, which gives us hope that an improvement in the weather is near. These short glimpses of sunshine induce the young queens to take a flight, but the drones are not so venturesome, and are becoming rapidly fewer in number by the bees killing them. This has continued since the middle of May, and why is it? Have the bees the foreknowledge of the coming weather for weeks to come? Their conduct seems to point to this, and the same has been observed by many people and for many years; even those hives that made much weight from the Sycamores are no exception, nor whether the queens are fertile or not. We know that bees apprehend the coming storm for some days previous to it, and everything goes to prove they know what is coming for weeks together.

The wet weather is telling seriously on all crops, and without an improvement and feeding most bees will become extinct. Probably, however, it is doing good for time to come by the extermination of many moths, and caterpillars may not be so numerous as they have been. Although the mercury is low, while I write the aspect of the sky is brighter, the bees are venturing out, and if we had a little more heat and sunshine than we have had all would be benefited thereby.

#### DO BEES PAY?

We answer the question in the affirmative, but not in the sense that our contemporaries have taught, that bees will "pay" with honey selling at from 3d. to "6d. per lb.;" nor dare I support the statement that "£7 can be made on an average annually from one hive." While encouraging all who have an opportunity to keep bees, I must specially warn them against starting bee-keeping on an expensive and extensive scale. I have evidence before me of more than one who has made a good deal of money, but it has been from bee-keepers, and not from the bees. There is as much in saving as in earning, and bee-keepers as well as others might study this to their advantage. One of the first lessons is important. I give it cheerfully and gratis. Put more confidence in yourself and in your own doings than in those who pose as benefactors. By practising that you will be the gainers. One dealer and writer to the press on bee matters advises "all to keep bees." If one in a hundred were to start bee-keeping on the lines he proposes they would never get a drop of honey, or if they did it would be at an enormous expense. Ample information is given in these pages to enable anyone to start bee-keeping with little outlay at first, and but little expense after if the bee-keeper only exercises a little forethought and judgment.

#### THE SHALLOW HIVE.

The hive I have used so long, and which has been claimed by so many, is not only the best hive for every phase of bee-

keeping, but all the necessary appliances in the apiary for shallow hives can be purchased much cheaper than where larger frames are used. Extractors for shallow frames can be bought at but a few shillings, and a comb-foundation machine of the very best make, with all its requisites, can be had for less than £4. No implement gives a better return for money laid out than this one does, and when it is taken into consideration that by it nothing but native wax may be employed, the value of both it and the honey is enhanced, the last named being of greater importance to the bee-keeper than many suppose. Some manufacturers pretend to hold secrets for the manufacture of comb foundation. I do not believe it. I was the first to make public the mode of manufacture, and I am prepared to give to *bonâ fide* amateurs and readers of this Journal all the necessary information for the making of comb foundation.

#### POLLEN STORES.

Another valuable lesson afforded by seasons such as this is in regard to pollen. Hives that had large stores of pollen last autumn did not lose their bees to the same extent in spring, and I may add summer, as those that had but little. At the present time hives having young but unfertile queens are storing pollen in large quantities on every favourable occasion. Now what is that for but preparing for their future wants? and yet we are told by some to remove the pollen clogged combs!

#### FEEDING IN DRIBBLETS.

This is recommended, but nothing nearer than feeding in dribblets could be approached than the small quantities of honey that has been gathered by the bees during June and the first week of July. The result is that bees out in search of honey have been lost in thousands, and brood drawing has gone on notwithstanding to an alarming extent, just as is the case when artificial feeding has been resorted to. I know the benefit of feeding, but I also know the mischief it creates as well as anyone.

The sky is as gloomy as it was bright only half an hour ago, and a few days longer will end all hopes of the honey season for 1890, when the order of the day will be nothing but feeding; and owing to so few young queens being fertilised, the caution becomes greater as to what we shall feed. I shall do all I can to ensure fertilisation; failing that, the queens that have bred least will be the only ones kept. The most important thing to attend to when feeding is to prevent robbing.

#### ROBBING.

The best means to employ is to feed the bees at night, and give about 1 lb. at a time. When bees are fed rapidly in large quantities they become gorged, and are liable to be attacked by other hives' bees, and in that state offer no resistance, being rendered either unable or unwilling to do so. Whenever bees cease to resist invaders they should either be removed to some distance or shut up and well ventilated until they are in a fit state for defence. Robbing has been going on here ever since it was incited some weeks since by the exposure of combs containing honey. I do not approve of fumigating bees, but I stopped the robbing propensities of two hives by stupifying the bees with puff ball. This has different effects upon bees. Queens can be safely introduced, and different lots of bees joined, or site changed, by using it in a cautious and judicious manner. But I hope it will be unnecessary to use it, although I must admit that I never saw any after ill effects upon the bees when it was used in moderation.

#### YIELDS OF HONEY.

The largest yields of honey have always been gathered in July, and not unfrequently during the last two weeks of it. It may be earlier in the south, but whether we have finer and more favourable weather for honey gathering or not it will be well to keep up the feeding, so that the hives may be maintained in the greatest strength.—A LANARKSHIRE BEE-KEEPER.

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**A Peculiar Foxglove (W. W.).**—It is not unusual for the uppermost flowers to assume the bell-like form characterising those sent by you. We have had several similar examples this year. It is an instance of a normally irregular flower becoming regular in form, and is occasionally seen in other flowers having peculiar corollas.

**Eradicating Weeds in Ornamental Water (H. P.).**—The only effectual means of destroying Equisetum is to cut off the supplies on which it thrives. To let off the water and remove a portion of the roots is practically useless, as the roots penetrate to a great depth, and cannot all be removed, and at best it would be a temporary expedient. The only means likely to do any good is to cut off the growths more frequently, so as to weaken the roots. Drainage is the only effectual means of eradicating Equisetum.

**Muscat Grapes Spotted (Foreman).**—The berries are spotted through moisture remaining on them some considerable time. This may have resulted from syringing, a leaky roof, or a close moist atmosphere, and the temperature falling too low at night. This would cause water to form—it may be in unobserved particles, still sufficient to prevent transpiration, and cause the injury to the skin. This would be the more likely to occur if the sun raised the heat considerably before air was admitted to expel the moisture and allow the Grape fluids to become gradually warmed equally with the surrounding air. The moisture condensed on the berries prevents that, and the result is the spot with scorching and scalding, if not shanking later on. Admit air earlier, and maintain a genial atmosphere.

**Cauliflowers Injured (W. J.).**—Nothing will save the plants that are badly attacked. It is caused by a small white maggot, the larva of a weevil (a species of Curculio). Watering the plants with a solution of nitrate of soda at the rate of half an ounce to a gallon of water will do good, and cause fresh growth in the plants if they are not too far gone. It usually prevails where plants of the Cabbage tribe have been grown on the same ground for several seasons. If the Brassicas are much subject to it in your soil dress the ground liberally with soot and wood ashes, and in autumn or spring with lime. In bad cases the best of all preventives is gas lime fresh from the gas works, at the rate of a peck per rod, distributing it evenly, which may be facilitated by mixing it with dry soil or ashes, and allow it to remain on the surface a few days, then point it in very lightly, merely picking the surface over with a fork. It should be applied a month or six weeks before putting in the crops, and must not be used over the roots of fruit trees.

**Treatment of Old Bouvardias (S. T.).**—Old plants that have been cut back and have started into growth should have their old roots partially reduced and repotted in fibry loam, a seventh of manure, and sand. Place them in a cold frame and keep close until rooted. Stop any shoots that take the lead as they require it, in order to keep the plants bushy. After they have commenced active growth they can be grown under cool-frame treatment, or be plunged outside in their pots, or planted out in a warm sheltered position; the latter, in favourable localities, being an admirable practice. Young stock rooted early are now established in small pots, and the points of the shoots must be pinched out when three or four joints of wood have been made. Give more air than has been necessary up to the present time in order to have a firm sturdy growth. These can either be placed when ready in their flowering pots, or planted out and treated like the old stock. Those only just rooted should be grown on in pots in heat for some time yet, and if then placed in cooler quarters will make valuable plants by winter.

**American Blight on Apple Trees (W. J.).**—This is a most difficult pest to eradicate when it obtains firm possession of Apple trees. The best applications we have tried are methylated spirit and petroleum. Both are tedious processes, but they are certain. The latter we have known to clear the pest from fifty acres of trees. This was effected by boys each provided with a blacking bottle with a piece of No. 8 wire

twisted round the neck so as to form a handle similar to a frying pan, and a medium-sized half-worn clean paint brush with which to apply the petroleum wherever the pest showed itself. The brush was dipped in the petroleum, with strict orders not to let it run down the bark. It destroyed the aphid and did no harm to the trees beyond scorching the leaves and young shoots where it had been negligently applied. For larger trees in orchards we have found petroleum equally effective. Methylated spirit is too expensive to be used for any but garden trees. A clear bottle with a rather wide neck is best for holding the spirit, and if it have a handle smaller but similar to that described for the blacking bottle it is more handy. A very small brush dipped lightly in the spirit and applied to the patches of aphides runs through the nest, despite of their woolly covering, and does not injure the trees in the least. Of course care is taken not to use the spirit recklessly. The spirit should be kept well corked when not in use.

**Epiphyllums (C. R. M.).**—Cuttings should be inserted in spring in light open soil in a brisk heat, keeping moist, but avoiding watering more than to keep the soil in a moderately moist state, the cuttings being inserted around the sides of the pots, and when rooted potted off singly in 3-inch pots. If the plants have filled the pots with roots, and have made, or are making, good top growth, shift into 4½-inch pots in May or June, and by the end of July or early in August the growth will be complete. They should then have a lessened supply of water, and the sprinkling overhead be discontinued, and have a light and airy position. A warm greenhouse or cool stove gives the most suitable temperature, but the plants may be grown very well by those having in addition to a greenhouse ainery started in February or March, which from the moisture and heat will conduce to a vigorous growth, that being completed by the time the Grapes are ripening, when the plants may be removed to a light airy position in the greenhouse with water only to keep the growths fresh. The plants if kept in an intermediate house will commence flowering in November and continue until February. If they have a month to six weeks of this rest after flowering they subsequently grow much more vigorously. When growth commences the plants should be repotted, taking away as much of the old soil as possible without injuring the roots, and they may be returned to the same pots, adding fresh soil. The most suitable compost is light turfy loam, very fibrous, and chopped up moderately small, with an addition, in equal proportions, of dry cowdung, sharp or river sand, and crocks—or what is better, soft bricks broken into small pieces. The potting should be moderately firm, and the drainage thorough. When in free growth and the roots active liquid manure may be given abundantly; a peck of cowdung to 20 gallons of water answers well, or 1 peck of sheep droppings to 30 gallons of water, 1 peck of soot to 30 gallons, or 1 lb. of guano to 20 gallons of water, avoiding making the soil sodden, and leaving off the applications of manure water when the growth is complete. Useful and attractive as are plants on their own roots, those grafted on Pereskia stock (*Pereskia aculeata*) are superior both in vigour of plants and their ornamental character.

**Culture of Centropogon Lucyanus (G. II.).**—The following is the experience of a successful cultivator:—"Cuttings taken with or without a portion of the old wood attached, root readily if inserted in sandy soil and plunged in slight bottom heat and placed in a close frame or under bellglasses. As soon as the cuttings are rooted they should be placed singly into 2 or 3-inch pots, and kept in a warm house until they commence growing freely. The growths of the young plants that have been rooted seldom extend to any great length, but after a time strong vigorous shoots are produced from the base. These, if pinched well back, will cause other strong shoots to spring from the base, which should be encouraged to extend. Stopping is of little service towards producing bushy specimens, for they seldom break into more than one or two shoots again at the most. If by repeated pinching bushy specimens could be produced it would by no means add to the beauty of these plants for purposes of decoration. As soon as the small pots are full of roots the plants should be placed in others 5 or 6 inches in diameter, which are large enough for decorative purposes. The pots should be drained liberally and the soil pressed moderately firm, especially when in the last-named sizes. They are not very particular about soil, and do well in almost any mixture; but the one we have found most satisfactory is good loam, a seventh of manure, a little charcoal, and a liberal dash of coarse sand. These plants should be grown warm until they are well established in their largest pots, and then more air should be given them until they can be gradually hardened to cool frame treatment during the warmest months of the year. They can remain in this position until there is fear of the temperature falling from 55° at night, when they must have a position where that temperature can be maintained. While under cool treatment the frame in which they are grown should be closed early in the afternoon while the sun is upon it. Light shade is beneficial during very bright weather in the earlier stages of the plants' growth, but at no stage must light be excluded from them. Towards the close of the season they must have full exposure to sunshine to harden and mature their shoots. The syringe must be used freely, for these plants are subject to red spider, and liberal applications of water must be given at the root while in active growth, and weak stimulants when the pots are full of roots."

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry

wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*Foreman*).—*Dictamnus Fraxinella*. See reply above as to Grape berries. (*C. II. B.*)—The purple flower is *Campanula glomerata*. The other plant is a *Taxus*, but we cannot name so small a piece. (*W. J. B. and F. R.*)—Insufficient. (*S. T. M.*)—You had evidently packed the specimens carefully and in accordance with our directions, but the box was unfortunately smashed in transit, and only two of the specimens came safely to hand, namely, 4, *Selaginella Martensi*, and 6, *Orchis maculata*. (*W. S.*)—*Juniperus virginiana*. (*Adolescens*).—Yes; the names you send are correct. (*J. C.*)—The small Orchid was completely withered; the *Sobralia* is a highly coloured variety.

COVENT GARDEN MARKET.—JULY 9TH.

THE wet weather is seriously affecting our business, and prices are consequently much depressed.

Bedding Plants in variety, in boxes and pots.

IMPLEMENTS AT THE ROYAL.

ANOTHER of its great annual shows was held by the Royal Agricultural Society of England in the last week of June at

Plymouth, and though altogether a smaller and quieter affair than the great Show of last year at Windsor, it was decidedly a successful one, the entries both of live stock and implements being on the whole good, and the fine weather induced the west country folks to visit the Show ground in large numbers. To most of them the picturesque scenery of the three towns was too familiar to excite attention, but to the visitor from a distance the view from the horse ring was indeed a treat—the Sound, the Breakwater, the wooded heights of Mount Edgcombe, and the open sea in the distance, combined to make a picture of rare beauty, which even those who came to “do” the Show thoroughly were fain to admire.

Of implements the most remarkable in the Show were two among the dairy appliances. The direct butter extractor was first shown by the Aylesbury Dairy Company last year at Windsor, and though imperfect a silver medal was awarded for its evident merits. Since then it has been under constant trial, and so much improved that it is now a perfect and most useful implement. The principle is that of centrifugal force. The drum, kept steadily supplied by milk by a feed regulator making 6000 revolutions per minute, separates most of the milk from the cream, which having the lightest specific gravity collects near the centre, and gradually enters an inner central chamber, in which rotates a spindle at the same rate of speed, finishing the work of separation, and leaving only pure butter globules, which pass out through a spout, the skim milk flowing from the machine by another passage. All the butter is extracted from 150 gallons of milk in an hour, or about as fast as it takes an ordinary separator to extract the cream alone, and the amount of power required is the same. No warming of the milk is required before separation; the butter is absolutely pure, so, too, is the skim milk, and both separated milk and butter are quite free from any fermentative germs.

To Dr. De Laval of Sweden we are indebted for the instantaneous butter maker exhibited by the Dairy Supply Company of Museum Street, London, W.C., who tell us “All dairymen are acquainted with the well-known form of the Laval Steam Turbine Separator. To this separator the new churn is attached. It consists of a cylinder about 12 inches long and 4 inches in diameter within which a dasher revolves at about 3000 revolutions per minute, being driven by a rope belt of the same kind as is used to drive a power separator from the separator spindle. The cream on leaving the separator in the usual way passes over an ingeniously contrived refrigerator of new design, which is admirably calculated to reduce the temperature as low as possible with a very small consumption of cold water; it then enters at one end of the cylinder in the course of its passage through which the cream is churned into butter, and emerges at the other end in a granular form. The cylinder is enclosed in a water casing, so that the temperature is kept very low, the butter is consequently firm, and there is no possibility of its being overchurned. It is very free from butter milk, and therefore keeps well. The churn can be attached to any of the Laval machines.”

Either or both of these machines will be invaluable for large dairies, and especially for dairy factories. They are quick and certain in action, and will enable us to dispense with milk pans altogether, and also to avoid all manipulation of cream. The speedy introduction of such an invention into every dairy large enough to require one is most desirable, and it should mark an era in the dairy farming of this country, and the beginning of a successful competition with importers of dairy produce.

Among motors, Priestman Bros.' oil engines from eleven-horse power down to two-horse power, portable and fixed, were worthy of especial notice, as also was a three-quarter-horse power electric motor by Mr. F. M. Newton for working lathes, pumping water, &c. This last motor is a step onward, and we hope it will lead to the introduction of light portable motors for all farm requirements. The electric motor is the coming power, but it comes very slowly.

In the household and garden it has already been applied to carpet sweepers, shoe-polishers, lawn mowers, and other familiar work. We have the authority of Mr. A. E. Kennelly, Mr. Edison's chief electrician, for saying that it can be applied to every mechanical operation of the household, and it follows that its use may also extend to the farm and workshop.

Of other novel and useful dairy appliances there were hand separators shown—the Danish by the Aylesbury Dairy Company, and the Victoria by Messrs. Freeth & Pocock. The “Arch Albany” butter worker of Messrs. Bradford & Co. is a decided improvement upon the old form. The table is arched so that all moisture pressed out of the butter in the working escapes quickly. The roller is ribbed or fluted spirally in short curves, the grooves being almost at right angles to its axis, which makes more indentions in the butter, and enables any superfluous moisture to escape more readily than was possible with the old style of roller.

#### WORK ON THE HOME FARM.

Since writing our last note we have had a bad time among the hay. We began mowing with a steadily rising barometer and every sign of fine weather, but the weather soon became unsettled again, and half-made hay could not be got into cocks fast enough to render all safe before heavy rain compelled us to desist and wait for better weather. In such unsettled weather the most strenuous efforts should be made to get the hay into cocks, rather than to begin carting before we have several acres well forward. A few hours' steady rain or a wet day does little harm in comparison with a showery week. It is when the hay has to be left out so long that it becomes black and mouldy that our efforts to save it in a moderately wholesome condition prove vain. As we write our window overlooks a meadow where the hay was just ready for the cocks, when down came a pelting shower, and we had to leave it; a bright Sunday followed, drying it sufficiently to prevent its being quite spoiled by the heavy rain of this the last day of a dripping June.

Clover had to be left in swath for a week. With fair weather now it will be turned with light rakes and left for about two days, when it should be ready for carting. Clover hay requires gentle handling so as not to break the leaf, and it should be carted to the stack while it has still enough sap to produce sweating, heat, and flavour. Yellow Suckling, Sainfoin, and Lucern are all treated in a very similar manner when required for hay.

With so much rain Docks and Thistles can be got up by the roots readily, and whenever this can be done without injury to growing crops not a plant should be overlooked. We give the men and boys full liberty to make overtime at this work, and at Charlock pulling too, where that is possible. The cleaning of fallows and half fallows is much retarded by rain. A fallow over which we walked a few days ago had a lot of couch grass roots alive, and some real hot summer weather will be necessary to destroy them. Fine and warm weather is also now much wanted by the Wheat and Barley as well as other crops, and the land is certainly moist enough for the roots and green crops, and all singling of roots should be well out of hand before the winter Oats are ready for the reaper. They are a fine crop, standing erect with plenty of fine bold grain; so, too, are the spring Oats, but they are not yet sufficiently forward to enable us to form an opinion of the possible yield.

#### METEOROLOGICAL OBSERVATIONS.

CAMDEN SQUARE, LONDON.

#### REMARKS.

- 29th.—Cloudy morning, bright afternoon; heavy shower at 6.45 P.M., then fine again.  
 30th.—Very wet from 4 A.M. to noon, and occasional showers till 3 P.M., then generally bright.  
 1st.—Occasional slight sprinkles of rain early, generally bright from 10 A.M. till 0.49 P.M.; then thunder and heavy showers till 2 P.M.; afterwards fine with some sunshine.  
 2nd.—Fine and generally bright day; cloudy evening rain storm at 10.45 P.M.  
 3rd.—Cloudy and rainy morning, bright afternoon and evening.  
 4th.—A little sun early, cloudy afternoon, and occasional drizzle from 4.30 P.M.  
 5th.—Steady heavy rain from 10 P.M. on the 4th to 2 P.M. on the 5th, then fair for an hour or two, but showers in the evening.  
 A wet, cold, uncomfortable week: the temperature about that due to the middle of September, and the rainfall equal to the average in the Lake district.—G. J. SYMONS.

### THE DEMAND FOR PEACHES.

IT is questionable if the demand for this delightful fruit during the London season, or from April to July, is by any means fully appreciated by the gardening public generally. It is very well known to some of our enterprising growers of produce for market, and of late there has been a great extension of provision for increasing the supply of Peaches and Nectarines of home growth for meeting the requirements of purchasers in London and other large centres of population.

For a considerable time past large importations of French Peaches have found a ready sale in this country, but it is very certain that the Continent will not be permitted to establish a monopoly in the supply. Our neighbours across the Channel have never been able to compete with British growers in the supply of Peaches of the highest class early in the season. For Peaches and Nectarines equal to those which win first prizes in the best competition there will always be a demand, for occasions are always arising when the best that can be produced is sought for, regardless of cost. But Peaches are wanted for other purposes than supplying sensational dishes at public banquets and brilliant dinner parties. There is a general as well as a special demand, the former being enormously the greater. This is not for superior fruit regardless of price, but for the best that can be obtained by a moderate outlay. French Peaches are not the best by a very long way, but they can be procured at comparatively low prices, and therefore have a large sale. It is in competition with these that home growers find they have an opportunity, and there is every reason to believe that the demand for home-grown Peaches will increase considerably, because of their superior quality, when they can be brought within the means of the great body of consumers.

Peaches and Nectarines of medium size are in great demand in hotels and the better class of restaurants, also for large garden and other parties. A limited number of large fruits do not meet the requirements on such occasions nearly so well as does an unlimited supply of comparatively small examples, and by heavier cropping than is generally the rule in gardens these can be produced at prices that command sales, yet prove remunerative to cultivators. One of the most extraordinary crops of Peaches and Nectarines for market that has come under our notice is at Bexley Heath, grown under glass by Mr. T. Burton, horticultural builder. Instead of glass structures standing empty on his premises, he planted two or three of them with trees a dozen or more years ago. They have yielded so abundantly that there is scarcely a doubt that Peach growing has been more profitable than greenhouse building. One house is a span-roof 200 feet long, about 12 feet wide, and just high enough for the trees, which are trained to wires more than a foot from the glass, to be passed under conveniently. They are not large trees, the distance from each other being 10 or 12 feet, yet so productive are they that 3000 fruits were taken from one of them in thinning, and the crop now ripening is quite remarkable. A "fruit to each square foot of trellis" is the orthodox advice, and for growing fine fruit in private gardens is very good advice, but on many parts of the trees in question it is safe to say there are nearer ten fruits than one occupying the space indicated. Over a large area there is not more than an inch or two of space between the fruits, and in the case of many scarcely room for the insertion

of a finger between them. The wood is small and hard, and the leaves small too. But the fruits swell to a good saleable size. The most remarkable thing is that the crop is such as the trees bear regularly year after year. They have never failed, and a similar crop is expected next year.

In a wider and loftier house, very light, with what may be termed a flat roof, or only with sufficient pitch for carrying off the water satisfactorily, Peach and Nectarine trees were planted along each side of the central path about fifteen years ago, and have been allowed to assume their natural habit. They may be termed bush orchard trees, and are similar to those grown in Peach gardens in the Southern States of America. The crop is enormous; indeed, "sensational" is not an inappropriate descriptive term to apply to it. So heavily laden are the branches that they would break down but for the support afforded by cords attached to them and the roof above. The trees only make moderate growth, as may be expected, and require very little pruning. The crop keeps the growth in subjection, and the marvel is that they endure the strain year by year. If all were ripe at once a bushel could be gathered in five minutes or less. From one of these trees upwards of thirty dozens of Lord Napier Nectarines will be gathered—good saleable fruit of one of the best Nectarines in cultivation. The Downton and Elruge are bearing similar crops, some of the fruits of the latter being  $9\frac{3}{4}$  inches in circumference. Twelve hundred dozens of Peaches and Nectarines were sold by Mr. Burton last season, and in all probability the number will be considerably exceeded this year. Between three and four hundred dozens have already been sold, the prices ranging from 25s. a dozen downwards; but the earliest, and consequently the higher-priced, were grown on trees in pots, now removed to the open air.

But though the main object in view is the production of the greatest number of good saleable fruit, large specimens have been grown. The largest was staged among some others at the Colonial Exhibition a few years ago, its weight being 21 ozs., and a dozen were ordered to be sent to America. Several fruits have been gathered weighing 18 ozs. each, and twelve weighed in Covent Garden Market turned the scale at 10½ lbs. Such fruits, however, do not represent the character of the produce under the present high pressure system of cropping. This gives the samples that are most in demand during the London season for the purposes above mentioned, and Mr. Burton says his supply has never been too great for the requirements, but, on the contrary, has often been inadequate. With such crops as his there can be no doubt that the culture must be profitable even at moderate to low prices, and the lower these are the greater is the number of purchasers.

No special borders are made for the trees; the ordinary soil is merely broken up, and manure is applied on the surface. It is a sandy loam full of pebbles and rests on gravel, therefore naturally well drained, and any amount of water and liquid manure can be given without any risk of souring the soil. The trees are dug round periodically, and produce a mass of fibres within a radius of 4 or 5 feet from the stems. It goes without saying that the houses are suitable for the purpose to which they are applied, and are efficiently and quickly ventilated. The heavily cropped trees are worthy of inspection, and this is readily accorded to anyone who is interested in the cultivation of Peaches and Nectarines for home use or market purposes.

We believe Dartford is the nearest station to the Peacheries, but we had a pleasant run of forty minutes by rail from Cannon Street, through some of the Hop gardens and Strawberry and Raspberry fields of Kent to Bexley, for a call on Mr. William Marshall. Always actively engaged in something, this ardent horticulturist was found busy among flags, and—no, not jam pots—but coloured glass receptacles which had been employed the night previously in illuminating his grounds, and making a beautiful wood more beautiful still with the object of attracting visitors and securing half-crowns for a church-building fund. After a glance

at his hardy Ferns, herbaceous plants, Roses, and magnificent Water Lilies Mr. Marshall was ready for a ten-minutes drive to the Peaches. Our thanks are due to him for his good guidance, and we had the great satisfaction of learning of his willingness to accept, if required, the chairmanship of the Gardeners' Orphan Fund, now vacant through the lamented death of Mr. George Deal. In the interests of this Charity, which ought not to suffer through the calamity in question, we venture to express a hope that Mr. Marshall will be unanimously elected by the Committee to the position he is so well qualified to fill.

## FLOWER CULTURE FOR PROFIT.

### SEMI-DOUBLE ZONAL PELARGONIUMS.

OF late years, or since church decoration has reached such a high pitch, there has been a good demand for flowers bright in colour, as well as pure white, that will last fairly well in a cut state. At most of the principal festivals large quantities of semi-double Pelargoniums, or as many as can be obtained are used, and at other times there is a fairly good local demand for them, both for church decoration and other purposes for which serviceable flowers are required. These Pelargoniums, however, cannot be classed as highly profitable plants, as they have to be kept about all the year round, and require a fair amount of heat during the winter, or when most in demand to have them in flower. At the same time they are bright and effective winter flowering plants, and are very useful for house decoration, in a cut state or otherwise, the surplus flowers not needed for the purpose being marketed.

What the church decorators need are varieties either bright scarlet in colour or pure white, and they are also the best for dinner-table decoration. Mixtures will not be accepted by the former at any price. All must be of one shade of colour, and if not scarlet as near that tint as possible. The favourite variety is F. V. Raspail, and on the whole this bright scarlet form is the best that can be grown extensively for winter and spring flowering. Wonderful is too small, and Bruant, a very sturdy grower, and which produces extra fine trusses of rich scarlet flowers, is scarcely free enough. None of the whites are so free-flowering during the winter as the best of the coloured varieties, but they flower profusely early in March and up to Whitsuntide. La Cygne is perhaps the best in this section, the true *Candidissimum plenum* being also a free flowering variety of compact growth. Heroine is likewise fairly well adapted for forcing, this producing large loose trusses and extra large pips, each with a longer footstalk than often seen, being therefore one of the best for buttonhole bouquets and for "mounting" generally. Of the other shades of colour the best we have yet tried are Guillon Mangilli, rich magenta, and remarkably free; General Billot, which has a suspicious resemblance to the last named; Grand Chancellor Faidherbe, a double Henri Jacoby, Madame Thibaut, purplish pink; Madame Léon Dolby, blush white, fine truss; Mrs. Arthur Lattey, light pink; and James Vick, deep salmon.

Large, rather than medium sized to small plants, give the best results, and the preference is also given to those comparatively young. Supposing the start has to be made with newly struck plants in the spring, these ought soon to be topped, and if they are already in small pots, this being the simplest way to strike them, a shift into 5-inch pots should be given directly they are breaking afresh. Still keep them growing in gentle heat and well exposed to the full light, stopping the shoots as often as necessary in order to get a good bushy head. From 5-inch pots they ought to be shifted into 8-inch or rather larger sizes, and in which they are to flower. Clean well drained pots should be used, and a fairly rich loamy compost, with plenty of grit added, this being well rammed into the pots. During the summer sunny pits and frames are the best positions for the plants, where they must not be neglected in any way. Too often these plants are set in the open during the summer. This causes them to be sturdy it is true, but thus treated they invariably lose the best of their foliage, and although they flower abundantly when first housed, the trusses are much smaller and not so continuously produced as in the case of those kept under glass. Stopping the plants should cease in July, the aim being to secure a few uncrowded firm shoots, which will branch and flower freely through the winter.

After the Whitsuntide flowers are cut all old plants should be dried off for about a fortnight, and then cut freely back. When breaking afresh turn them out of the pots, reduce the roots considerably, and re-pot into same sizes as before. Keep in gentle heat till grow-

ing strongly, and before they become drawn transfer to frames or pits. The best of them may well be given a shift, 10-inch pots or rather larger answering well. We only stop any straggling shoots on old plants, and thin out where they are crowded. Tall plants usually flower the most freely, and if these are wanted do not prune back too hard, and also allow a few strong shoots to develop and branch. If cuttings are rooted each spring, stopped once, and shifted into 4-inch or 5-inch pots, these will succeed well on various light shelves and front stages of forcing houses, and be handy for growing into larger specimens the following season.

It is not so much in the preparation of the plants that many private gardeners fail, as in their winter treatment. In some instances there are few or no suitable houses or positions for flowering them; in others they are treated to too much heat and moisture, crowding being also a frequent cause of failure. Light forcing houses, such as are used during the season for growing Melons and Cucumbers, suit these semi-double Pelargoniums well. Such structures could usually be prepared for them late in September or early in October, and there ought to be a thorough clearance of any hotbed material and soil there may be in them, the glass and woodwork washed, and the walls whitewashed. What the plants require and must have is plenty of room and light, accompanied by a dry heat and an airy atmosphere. Set the pots on a bed of rich soil or a moist bottom of any kind, and they will quickly root through into it, causing a rank flowerless growth. Even if this contingency be prevented the moisture arising favours a sappy delicate growth, and few or no trusses are obtained when most wanted. Keep them clear of all other plants, maintain a temperature of about 50° to 55° by night, and 60° to 65° in the daytime; admit air according to the outer weather; keep the floors dry, and the plants dry also. Liquid manure to be given only when they give signs of exhaustion.

At Christmas time the scarlet and white varieties sell readily at from 2s. to 3s. per dozen trusses, little more than half that figure being given for the other shades of colour. From that time to Easter the prices range from 1s. 6d. to 1s. per dozen for all varieties; but at Easter somewhat better prices can safely be asked for the whites, and there is a fairly brisk demand for scarlets. Later on the prices have to drop to 6d. per dozen, and we have frequently been content, or rather had to be, with 4d. per dozen, better sales being made at Whitsuntide, when we get 1s. per dozen for scarlets and whites. All ours are disposed of locally, and at better prices than prevail in the London markets. I must not omit mentioning that it is possible to cut and get rid of hundreds of trusses cut from plants of Guillon Mangilli and F. V. Raspail, growing against sunny conservatory walls.—M. H.

## AUTUMN-SOWN ONIONS.

WERE it not for the bulbs obtained from the sowings of Onions made early in the autumn of the previous year, a break in the culinary supply of that wholesome though much abused vegetable would assuredly occur during the months of May, June, and the early part of July. The bulbs of the previous year's growth are then soft and disposed to push into growth, and consequently are of little value for culinary purposes, and those of the current year's raising are not large enough to supplement the supply, hence the necessity for making two sowings of the most approved varieties in July, the first about the end of the third week, and the second ten days later for succession.

Ground which had been trenched and liberally manured for the previous crop, say Peas or Cauliflowers, will be admirably adapted to the requirements of Onions, without any additional dressing of animal manure of any kind being given. As soon as the ground is cleared of the crops indicated dig it a good spit deep, breaking it fine in digging; then tread it over and make it level with a coarse rake, afterwards strewing a little fresh soot over the surface before drawing drills, running north and south, about 1 inch deep, and from 12 to 16 inches asunder. Sow the seed thinly in these, but a little thicker than would be desirable in making the spring sowing, so as to make allowance for drawing young plants from the rows for salading purposes during the autumn, as well as for any mishaps that may occur in the winter months. Return the soil to the drills, and then tread and rake in the same direction as the drills, so as to present a firm and smooth surface when finished.

As soon as the young plants appear stir the soil well between the rows with a Dutch hoe, and remove any weeds that may appear. The thinning and weeding are best done during dull showery weather. Three inches from plant to plant in the rows will be ample space for the winter months, drawing every alternate plant

early in spring for transplanting, if desired to extend the crop, in rows from 12 to 16 inches apart, and at from 6 to 12 inches from plant to plant in the rows. The latter distance should be given to plants intended for exhibition.

The only after attention necessary until the bulbs have completed their growth is to keep them free from weeds and the soil stirred between the rows occasionally with the Dutch hoe, this as much with a view to accelerate growth in the plants as to destroy seedling weeds. Guano water at the rate of a 3-inch flowerpotful of guano to 6 gallons of water, applied at the roots during the months of April and May, will tend to the production of large fine bulbs, and an occasional application of soot water at the roots will, in addition to stimulating growth, arrest, if not prevent, the attacks of the grub or Onion maggot, which frequently work great havoc among the bulbs. The best varieties to grow are the Queen, only a few rows for very early use; Early White Naples, three parts of the sowing made should consist of this excellent Onion; Giant Zittau, and Sutton's Giant Blood Red Rocca.—H. W. WARD, Longford Castle, Salisbury.

## THE BRITISH FRUIT GROWERS' ASSOCIATION.

### STRAWBERRY CONFERENCE.

(Continued from page 22.)

#### STRAWBERRIES FOR MARKET.

By MR. G. BUNYARD.

THIS crop is most extensively grown for market in the county of Kent, and I propose in the first place to give a *résumé* of the usual way they are cultivated there and then to detail the varieties. Soil and situation will come first.

The best soil is a deep stiff loam rather inclined to clay than a lighter sandy mixture, and by preference such as does not feel the summer drought to a great degree, but avoiding the chalky uplands and the sandy drifts. Strawberries seem to flourish on all other soils provided deep and clean culture is carried out and a heavy manuring is applied before the plants are put in. I have seen them grand in cool clay bottoms and in the higher flinty and pebbly soils which are common in the Crays district near Swanley.

Situation is unimportant, all that is requisite is an open space free from trees, and the larger the field the better, the aim being to reduce manual by substituting horse labour in hoeing, and such open fields are more readily kept clean than where they are bounded by woods and intersected with hedges.

It is important to have the land thoroughly clean at first, and in order to do this a crop such as Potatoes, Cauliflowers, Peas or Beans may be taken the previous years, when the ground can be kept quite free from weeds, and be frequently stirred and laid up for the action of sun, wind, and frost to purify and mellow it.

*Preparation of the Soil.*—This must be deeply cultivated; large fields may be ploughed by steam, and if both ways so much the better. In smaller ones the land may be deeply dug or trenched, being previously manured with 35 to 50 tons of manure per acre, and harrowed down two or three ways about a fortnight before planting. The cost of manure, carting, spreading, ploughing, coal, &c., will be about £15 to £20 per acre, or if dug £25 to £30.

*Planting.*—This is generally done in March, when all danger from the runners being lifted by frost is passed, and the plants are about making their rootlets, when they strike at once and soon develop fine healthy foliage; an ingenious marker with spokes on a wheel which strike the land at regular distances is used, and the planters then follow with the dibble and plant by the acre. The distance preferred in Kent is 32 inches between the rows, the plants being 16 inches apart. Care must be taken that the crowns are not buried beneath the soil, and they should be set as firmly as possible.

*Summer Cultivation.*—The first year consists in removing the runners about four times with a sharp knife, horse-hoeing to keep down the weeds, and hand-hoeing between the plants.

*Autumn Cultivation* is completed by earthing-up the plants with a mould board plough to protect the foliage, and to allow the water to drain away from the crowns; the plough is set as shallow as possible.

*Cultivation in Spring.*—The field will require horse-hoeing to level down the plough ridges in March or April when the land is dry, and after a hand-hoeing when the plants are in bloom; the fields are littered with barley straw, requiring about 2½ to 3 loads per acre (about 1½ ton) preparatory to picking.

*Cultivation First Year of Cropping.*—As soon as the crop is cleaned the straw is raked off, the runners and old dead foliage having been removed by a bagging hook; the horse hoe is used again, and every encouragement given to the plants to develop foliage and make plump crowns for the second season's crop, which is generally the best. The straw is used in the cattle yards, and thus pays for cost of removal.

*Expenses per Acre.*—Estimated roughly the cost per acre up to the time of picking may be set at nearly £50 per acre—*i.e.*, £25 per year first and second years per acre; the expenses for the rest of the series of years the crop is on the land being very much less. If five years an average of £15 to £20 per acre.

*Duration of Crop.*—About five years is considered the utmost that a profitable crop can be expected, as when the fruit becomes small the market value will not be remunerative.

*Average Yield.*—Two tons per acre is considered a fair yield, much more is occasionally taken, and rarely less.

*Price.*—This varies year by year according to the weather, a dry warm time stimulating the consumption; from £16 to £28 per ton will be a fair average. The cost of picking and packing is about 4d. to 6d. for 12 lbs., this is done by women, boys, and girls, and they are paid by the dozen or gross in punnets, and by the peck later in the season, this is included in the expenses quoted per acre.

The usual plan is to place a shed at a convenient spot for the vans to load and for the pickers to assemble, and as each set of punnets or peck basket is brought in a tin tally is given to the picker, which is turned into cash as required. Some large growers dress the Strawberry land three times a year, using soot or artificial manure, and an autumn and spring dose of farmyard dung. After the third year a mulching of manure, about 15 to 20 tons per acre, must be placed round the plants to assist them, and this might be annually repeated, as the Strawberry lands are so well cared for that one or two crops can be taken after they are ploughed up without extra manure.

The uses of Strawberries are well known. As a dessert fruit they take the first place, and as a preserve are very rich. The custom is to send all the earlier pickings for table use in punnets, and to "Plum" the rest for the jam makers when they are stripped off the stalks. As regards the consumption it increases year by year in a remarkable degree, and when the price gets low they are eagerly purchased by the working classes. In 1888 the crop was very large, and one retailer in Maidstone sold 1200 lbs. over the counter on a Saturday, when formerly you could scarcely buy a basket in the town at all; truly the luxuries of one generation are the necessities of the next.

It may be asked, What are the profits of Strawberry growing? The growers are naturally reticent in giving these particulars, but I gather from various sources that from £20 to £40 per acre may be expected where the plantations are well done and cared for, and put on the market in good condition. None but the best make top prices, and care to the little details of culture will bring an adequate reward, and at times an exceptional profit. My notes give 6000 pecks of 12 lbs. each as the largest picking at the Crays on one farm alone, while another grower is said to have 2000 acres, and picked 360 tons in one week.

As Strawberries are very perishable the plantations should be near a railway to avoid as far as possible the bruising in transit. In the great Strawberry districts picking commences as soon as daylight allows, and the earliest pickings go in special vans for Manchester, Birmingham, and the large centres of consumption, later pickings being in time for the London markets. Growers in other parts deliver to the towns daily in spring vans. This enables to put them in the market in a fresh condition. The bottom of the van should have 1 foot of straw in it to prevent jolting, and a neat light cover should be placed over them to exclude the sun and dust.

As regards sorts, in market work only those that carry well can be large grown, and in this respect none approach Sir Joseph Paxton, its fine rich colour, firm flesh, and glossy skin make it taking in appearance. It is as hardy as any kind and most productive. For an earlier crop Alice Maud or Vicomtesse H. de Thury are used in some grounds, and Sir Charles Napier for a main crop, while Elton Pine and Eleanor are favoured for a late crop. Laxton's Noble will be very much grown in a few years, its large size and freedom of crop and vigorous growth are what the growers desire. We picked fruit nearly an ounce in weight on June 13th, and no other kind can compare with it for earliness and bountiful crop. This is the early market Strawberry of the future.

The practice in other counties is slightly different; for example, in Scotland, where they are extensively grown about Aberdeen, the small early kinds, Black Prince and King of Earlies, furnish the first gatherings, and Eliza, President, and British Queen are grown, and as the rainfall there is considerable the beds will last in good order as long as eight years.

British Queen is well grown near Sandwich where the cool, deep, and rather heavy loam suits them; but, as a rule, this variety is not a paying crop as it bears sparsely, and the beds must be renewed every other year.

For preserving, Mr. Beach, the contractor for Lord Sudeley's extensive fruit farms in Gloucestershire, prefers the old Carolina Pine to any other for jam purposes; the colour is bright, and it makes a delicious whole fruit preserve. In the same district Sir Charles Napier, Stirling Castle Pine are preferred with Sir J. Paxton for punnet sale.

In the Cornish system the planting distance is only 20 by 14 inches for small growing kinds and 20 by 16 for others. Here again by deep cultivation and heavy manuring beds are sometimes retained as long as fifteen years. Possibly the rainfall keeps the plants in health and vigour, while the proximity to the sea may be advantageous. One farmer there picks an average of two tons per day, and as all are marketed with baskets this represents an enormous picking.

In conclusion I would venture to suggest a trial of more varieties, such as James Veitch for earlies, and Waterloo, Laxton's Jubilee, and Aberdeen Late for late sorts. Waterloo is of very dark colour (quite a Mulberry) but its fine appearance would in time command a sale. A grower says it sells for double the price of others at the same season. Jubilee is an enormous cropper. A plot of land should be set aside, and two or three new or fresh varieties tried every year, as both early and late Strawberries are much appreciated.

Other promising varieties are Laxton's Latest of All, a grand berry of the richest flavour; Prince Teck, an improved Paxton; and Aromatic, a finely coloured midseason fruit. The American varieties have not yet been of much service, or equal to existing sorts.

For preserving enormous crops are produced by Newton Seedling, a very strong grower. John Powell (Kitley's Goliath) and the old Elton Pine are also useful for this purpose. Crescent Seedling, from America, is the earliest, and the fruit could probably be gathered at two pickings, as it produces a very large crop of small berries, and will prove invaluable for jam to start the factory. King of the Earlyies would also make a fine whole fruit jam, and is very productive. I am of opinion that as far as culture is concerned we have reached the best possible, and the only thing I object to in our Kent field system is the late hoeing which is often given.

If the land is thoroughly cleaned and pulverised, by the time the flower trusses show and before they open it would be preferable to finish hoeing at this stage, and not delay the work until the flower is out; but the weather is a factor in all operations, and is often wet when such work would otherwise be done. The object of the final hoeing is to destroy seed weeds and to prevent evaporation. Great care is exercised in laying on the straw or the annual mulching, in May the dung is sometimes carried on by rough hand barrows to prevent the closing of the soil, as happens when wheelbarrows are used. If short stuff is at hand baskets are used. To sum up the culture in a few words—deep cultivation, heavy manuring, clean culture, and care in sorting the fruit appear to be essentials.

We appear to have reached the best market Strawberry in Sir J. Paxton, but those who have time and patience should try hybridisation, taking this as one parent. In Prince Teck we have a reputed advance on this old favourite, and earlier and later Strawberries that have the same characters as Sir J. Paxton would be valuable additions to market varieties. At this date (June 27th) several promising varieties are under trial, but must be proved before we can admit them in a list of market kinds.

### SEEDLING STRAWBERRIES.

BY MR. THOMAS LAXTON.

WHEN I was invited to read a paper on "Seedling Strawberries" at this Conference, I felt that there might be listeners who would inquire of themselves why seedling Strawberries should require to be separately treated, when the history and cultivation of the fruit is expounded by the able fruitists and writers who have kindly taken those subjects in hand; but looking at our special and most popular summer fruit as almost of an annual character, as it gives its produce from seed more rapidly than any other fruit with which I am acquainted, and to the enormous demand to suit the various tastes and requirements of consumers, I do not hesitate to lay before you a few of the simple facts and slight experiences gathered by me in a period of thirty-two years, during which I have, mostly at intervals of three or four years, continued to raise and work out a batch of seedlings, chiefly by cross-fertilisation. The annual character of the Alpine Strawberries, so much appreciated by our French neighbours, is well known, as they are ordinarily and best treated as such, coming fairly true from seed, and the produce generally finer than from runner plants. Our so-called English Strawberries, which probably contain an admixture of the blood of all the edible species, may be treated in a similar manner, and may be more quickly fruited from seed than, I believe, is generally understood. As these are now cultivated in most temperate and semi-tropical climates, and as almost every soil and situation has a peculiarity for some particular variety or varieties, it becomes necessary to provide sorts suitable for these varied climes and localities. In North America, I believe, this has been largely and systematically carried out, with the result that a more vigorous race than we have in most of our English and continental sorts has been secured, for if there be a failing in our many good quality Strawberries it is chiefly that of weak constitution. The health and vigour of most of the American varieties leads me to look to these as suitable parents to be introduced into our home stud book, for although the American sorts are not all or generally suitable for our moister climate, especially in a wet season, still their great fertility, hardiness, and vigour, combined with good size of fruit, has seemed to me just what we want on this side of the water to keep up the health standard and constitution of the western European varieties, for our cousins looking at the matter in a practical and profitable way have excelled us in the production of hardy, prolific, and large fruited varieties adapted for market and field culture. By the introduction of the American Strawberry blood we have an alliance of two distinctly acclimatised races, and I cannot but think that such an alliance is equally advantageous for our artificially produced and cultivated fruits, as it has proved for the over-civilised human race. Now following the lines adopted in America in raising seedling Strawberries, the objects which it has appeared to me that we ought to seek are:—

- 1, Constitution and moderate vigour.
- 2, Fertility.
- 3, Solidity and external firmness to adapt the fruit for transit.
- 4, Flavour and quality.
- 5, Size and appearance.

The latter points many market growers will hold as constituting the blue blood of the Strawberry, while, on the other hand, private gardeners will put quality in the foreground, as Strawberries are grown to

be eaten as well as to form captivating works of art. This adds to the necessity for providing a sufficient number and variety of sorts as may be required for the particular purpose. It has been my folly to seek the philosopher's stone, and to blend all the desired qualities in one. I need hardly say that this happy goal has not yet been attained, and the pleasure may yet be looked forward to by workers in the interesting field of seedling-Strawberry raising. But to be practical, what is most wanted now are early, main crop, and late sorts having good-sized high-flavoured fruits with a firm exterior, the colour of a bright glossy scarlet and lasting. The conical or heart-shaped form may perhaps find most favour, but the shape should be regular. The plant hardy, moderately vigorous and sturdy, and fairly productive of runners. A stout footstalk carrying about ten or twelve even and regular-sized fruits, free of but not too far from the ground. The fruits of good and distinct flavours, it not being necessary that all sorts should assimilate in this respect, variety and novelty being desirable to suit various tastes. And, lastly, if these qualities can be adapted to fruits suitable also for forcing, a material gain will be secured.

*How these Ends may be Attained.*—1, By sowing seed from naturally fertilised, large, and well shaped fruits approximating to the above standard or objects desired. Perhaps the varieties Sir Jos. Paxton, Noble, or Auguste Nicaise may supply what is wanted in the earlier sorts, and British Queen, Commander, President, Dr. Hogg, Loxford Hall, Waterloo, Latest of All, or Eleanor similar advantages for the improvement of the main and late sorts. 2, By artificially intercrossing the best English and foreign varieties.

*Modes of Operation.*—The seed may either be sown as soon as the fruit is thoroughly ripened, when it may be broken up and the pulp or flesh well washed out and separated from the seed through a fine sieve or piece of muslin, dried, and at once sown in a box of rather light soil, kept moist and in a shady situation until vegetation takes place, which will probably occur in two or three weeks. As soon as the plants are large enough to handle they may be pricked out into boxes or potted off at once into 72's and afterwards repotted from time to time or planted out as may be required, or the fruits may be dried in a sunny place and retained until the early spring following, when the seed may be rubbed or picked out and sown and treated as above.

The former method has the advantage of gaining time, and from it I have been able to obtain fruit from some of the seedlings in about fourteen months from sowing the seed. The latter mode avoids the preservation of and carrying through the winter a number of small plants and the attendant risk of loss from slugs and insects.

I prefer and adopt the former when possible, and time is important, and this I find was the mode preferred by the late Dr. Roden, well known as a successful raiser and improver of the Strawberry. When the seedling plants are strong enough I usually plant them out in rows about 1 foot to 1 foot 3 inches apart according to size and vigour, giving 2 feet 6 inches between the rows. This affords a fair opportunity for testing and securing a few runners during the first two years; for although some of the plants may flower and fruit the year following that of sowing the seed many will not, however, fruit, nor can any be satisfactorily put on further probation until the second year. Where convenient it is a good plan to put out the seedlings by the side of an open walk or path, facing south if possible, as there the plants get ample light and air and can be readily tended.

*How and What to Intercross.*—Where it is desired to intercross two distinct varieties or species the parents should be both healthy and vigorous plants, but not too vigorous, and it will be well for security and convenience that the intended seed-bearing plant should be grown in a pot. The anthers must be removed from the flower to be operated upon with a pair of small sharp-pointed scissors the day preceding the opening and full development, and early the following morning pollen of the sort required as the male parent should be applied to the pistils of the intended seed-bearing flower directly from the pollen-bearing flower, and as there is a possibility of the organs not being sufficiently ripe or developed it may be advisable to repeat the operation a few hours later; but the first access of pollen will usually suffice. When it is clear that fertilisation has taken place I pinch off all flowers and fruit not required, so as to strengthen those intended for seed. There is also an advantage in potting the plants to be worked upon, as they may be advanced or retarded for use with varieties flowering earlier or later in the open, and the operations can be more safely conducted under cover, the protection of gauze, however, being unnecessary for a many-pistilled flower like that of the Strawberry. It will be wise not to over-fertilise or apply too much pollen, as when many seeds are obtained from a fruit the whole are generally weaker than when a few well-developed seeds are secured. I have an impression also that an excess of alien pollen tends in the Strawberry to a predominance of the characters of the pollen-bearing male parent.

*As to Forthcoming Results,* it may be anticipated that as the cultivated Strawberry is a cross-bred fruit, there will be considerable variety as well as some wide breaks in the progeny from intercrossing, but generally the offspring will show characters intermediate between the parents, and with perseverance it will be possible to gain the end sought. Having practised Strawberry crossing so long, however, it is somewhat discouraging to know that Noble, probably the most remarkable break in Strawberries of recent years in this country, was obtained without artistic intervention. I surmise there are some who will like to know its actual origin—such is easily told. In 1884 I grew and sowed the seed from a large and handsome fruit of Forman's Excelsior (a fine and good shaped, firm-fleshed Strawberry on light soils). From this sowing

I obtained only five plants, one of which proved bolder than the rest, and subsequently became "Ennobled"—the remainder were not acquisitions. Now, considering that I have during the past thirty-two years from my own work of cross-breeding raised at least 10,000 seedling Strawberries, and out of these only nine have as yet been sent forth to the world, although all have had to be tried, and many after being largely cultivated for years have had ultimately to be abandoned, and that out of a small batch of five from natural fertilisation there should be one distinct gain, I feel that the work of a cross-breeder who can only point to such results is not altogether satisfactory, nor, I may feelingly add, profitable. Although Noble was only from natural, or insect, or wind, fertilisation, I am able, with some confidence, to indicate its breed, and that it contains American blood, as the fruit from which it was grown was taken from a row of Forman's Excelsior grown contiguous to one of Sharpless Seedling, a large, early, and vigorous sort, and if the foliage, habit, fruit, and periods of maturity of these two varieties be examined and considered, it will appear tolerably plain that Noble has a good deal of each of these varieties in it, and that the advantages of American blood have been secured without the agency of man. The influence and weight of Noble will, however, doubtless soon be apparent in forthcoming varieties, for by intercrossing it with all the best varieties, and reversing the crosses in most cases a large number of seedlings have been obtained and are on trial. In carrying out my own work I have found that the seed of Noble is lighter, and does not vegetate so freely as that of the varieties crossed with its pollen, and it may be that to this imperfection of seed the fertility of Noble in quantity and size of fruit may be owing. I have also introduced with success the blood of other American seedlings into my crosses, and I am a believer that in this introduction of new blood there is greater probability of further advancing our own home race of Strawberries, a field in which there is yet ample scope for progress.

### THE DISCUSSION.

IN the course of the discussion which followed a number of cultivators expressed their opinion upon the subjects dealt with in the papers read. The principal points raised are, however, given in the subjoined condensed notes:—

Mr. Albert Bath said he was unable to agree with Mr. Bunyard's estimate of the profits of Strawberry culture, and considered that £40 per acre was too high. He considered that in growing Strawberries for market rather more space should be allowed between the plants in the rows than was stated by Mr. Bunyard, and, according to his experience, the largest crop was obtained by having the plants sixteen inches apart.

Mr. Cannell expressed his opinion that both Mr. Bunyard and Mr. Bath were referring to the distances required by plants grown in ploughed land. When so grown the space was no doubt sufficient, but when the land was deeply stirred and liberally manured, they required even more room than stated by Mr. Bath. He was very glad indeed that the British Fruit Growers' Association had made arrangements for a conference on Strawberries, for their culture had now become an industry of immense importance, and more especially was this the case in the county of Kent, where there were now between 2000 and 3000 acres devoted to Strawberries, giving during the picking season employment to a whole army of men, women, and children. As showing in some degree the extent of the crop, he would mention that when at Swanley Junction in the morning he saw no less than fifteen trucks waiting to be loaded and dispatched in the course of the day to the large towns in the midland and northern counties. With reference to the soil, he agreed with Mr. Wright as to Strawberries flourishing on light soils, as proved by the abundant crops produced on the chalk in Kent.

Mr. J. Peed, in referring to the comparative merits of varieties, said that he regarded Laxton's Noble as a great gain. It was one of the most handsome Strawberries he knew; and as regards its size, he would mention that a few days previously he had gathered nine fruits, one of which turned the scale at  $1\frac{1}{4}$  oz., and the remainder weighed 12 ozs., or an average of  $1\frac{1}{2}$  oz.

Mr. Cheal, in proposing a vote of thanks to the readers of the papers, said the association had good cause to congratulate itself on having been able to obtain the co-operation of such high authorities on the respective subjects as the gentlemen who had contributed the papers.

Mr. Hammond seconded the motion, and said that he had in Essex tried for several years to grow the British Queen, but with very little success. Eventually he obtained runners of that variety from a neighbour who was very successful in its cultivation, and since had obtained excellent crops.

The motion having been unanimously adopted, the proceedings terminated with the customary vote of thanks to the Chairman.

### LEDUM PALUSTRE.

As dwarf evergreen free-flowering shrubs the Ledums are worth a place wherever peat-loving plants are grown and an American garden is provided. The Labrador Tea, *L. latifolium*, is a stronger growing shrub with broader leaves than the Marsh Ledum or Wild Rosemary, *L. palustre* (fig. 8), but the latter produces its globular heads of white flowers very freely. It will grow in damp and shaded situations where comparatively few shrubs succeed, and flowers about the same time as the hardy deciduous Azaleas. Both

the species named are from North America, and were introduced in 1762 and 1763, but there is another also occasionally named *L. canadense*, which is of dwarfer habit, and did not reach this country till 1812.

The leaves of *L. palustre* have a balsamic odour, an aromatic bitter taste, and contain, among other ingredients, volatile oil and tannin. They have been sometimes used to allay irritation in whooping cough and various cutaneous diseases. In complaints of the skin they are used both externally and internally in the form of decoction. When placed among clothes they are said to prevent the attack of moths. In Germany they are sometimes substituted for hops in the preparation of beer. An oil is obtained from the

FIG. 8.—LEDUM PALUSTRE.

leaves by distillation, which is yellow, with an intoxicating odour and a burning aromatic taste. The leaves of *L. latifolium* have an agreeable odour and taste, are esteemed pectoral and tonic, and, from being used as a substitute for tea, the plant has been called Labrador Tea. The flowers afford a great quantity of honey to the bees. The leaves of both these species infused in beer render it very heady, and cause headache, nausea, and even delirium.

### TUBEROUS BEGONIAS.

It has been satisfactorily proved during the past few years that Tuberos Begonias must take rank amongst the most useful flowering plants cultivated for purposes of conservatory and garden decoration. The plants have been tested under all conditions, and in good and bad seasons alike they have maintained their characters admirably. In pots or baskets under glass their merits are great—their flowers are large, are freely produced, and present a range of

brilliant colours, from the richest crimsons and brightest scarlets, through all the gradations of rose and pink to white on the one hand, or through orange, buff, salmon, yellow, and cream to white on the other. The simple but finely proportioned forms of the single varieties afford pleasure to some admirers, while the more solid and imposing double varieties equally satisfy others. Then, too, out of doors Tuberos Begonias have been tried as bed and border plants from the south of England to far up into Scotland, and good results have been secured in the majority of cases, varying slightly with soil and situation. They have not and will not entirely supersede Zonal Pelargoniums for bedding, but they have been found to be a valuable addition, and in some seasons a useful substitute.

Much of the greater favour extended to Tuberos Begonias is due to the improvement effected by careful crossing and selection, and Messrs. J. Laing & Sons of Forest Hill have had so large a share in this work that they may fairly claim a considerable portion of the credit. At the Stanstead Park Nurseries during a number of years close attention has been paid to these plants, and the results accomplished form a portion of the floricultural history of the past decade. Mr. John Laing never rests satisfied with moderate successes, and so he has pushed on his Begonia improvement until they have reached their present astonishing stage. The houses at the nursery named now contain an assemblage of single and double varieties that may be said to furnish a "blaze of colour," softened by the more delicate hues into a brilliantly beautiful floral display. The varieties are innumerable. Many are seedlings flowering for the first time, and not yet honoured with a title. Others are established favourites of recent years, some already having quite a formidable record of certificates awarded by judges and committees. All are good, for inferior seedlings are not tolerated, and numbers that a few years ago would have been prized as additions to the lists are now cast aside as useless.

Then outside there are twenty-three long beds, each with eight rows of seedling plants, and not far short of 1000 in every row. These are arranged in colours, two beds of each, and it is astonishing how true the plants are coming. In another week or two, with fine weather, these beds will show what can be done with the Tuberos Begonia out of doors, even in such a season as the present one. Altogether something like 200,000 seedlings are grown this year, all of which are raised early in January, and yet we find sturdy specimens bearing substantial flowers, clean, pure and bright.—H. H. M.

#### THE RAINS AND THE ROSES.

WE have showers every day, but the Roses, in some places later than usual, look wonderfully well. As a rule little wood has been made; the root action must have been ample. The foliage is broad and clean, and the blooms, if in some cases rather small, are brilliant in colour and beautiful in finish. White Roses have not gummed or stuck. Souvenir de Malmaison is superb, so also Merveille de Lyon, Gloire Lyonnaise, Madame Lacharme, Perle des Jardins. Jeanne d'Arc has not been happy, but as I said, on the whole Roses have done and are doing well, Teas included.—A. M. B., *Mid-Lincoln*.

#### ROSE SHOWS.

##### IPSWICH.—JULY 5TH.

IPSWICH possesses an ideal site for a Rose Show in the beautiful private grounds of Christchurch Park, which are always available for this and similar purposes. Many a good show has been held in a meadow from which a crop of hay has been taken, but it is often terribly wet under foot in such places; and a really fine park, with a large extent of short grass, grand old trees, ornamental water, &c., situated quite in the midst of a large town, is admirably suited to all the requirements of a flower show and summer fête; and if it does rain, as it unhappily did on this occasion, and generally does, the people of the town live so close at hand that half an hour's sun soon brings a throng to the gates.

Roses were in most cases, as might be expected, below the average standard of excellence. In the open classes Mr. B. R. Cant of Colchester was first for thirty-six, having Mrs. John Laing, A. K. Williams, and S. M. Rodocanachi among his best. Messrs. Prior of Colchester were second, some way behind, and no other exhibitor was forthcoming. For twelve trebles Mr. Cant was first again, Rev. A. Foster-Melliar of Sproughton being second, with much larger flowers, but coarse, rough, and too crowded, showing, however, fine triplets of Duchesse de Morny and Le Havre. Messrs. Prior again occupied the third place. For

twelve Teas (open) Rev. H. T. Frere of Burston Rectory, Diss, was first, having a fair specimen of The Bride; Mr. Cant second, and Messrs. Prior third. In the class for amateurs there were only two who showed thirty-six, and Rev. A. Foster-Melliar took the lead with a really fine stand, in which it would have been difficult to find a bad bloom. They were large, fresh, and of good substance, among the best being Prince Arthur, Marie Baumann, and A. K. Williams. Rev. H. A. Berners of Harkstead was second with smaller specimens. There were only three stands in the class for twenty-four, Rev. Frere leading, showing Prince Arthur and Lady Helen Stewart well. Mr. Powell of Drinkstone Park was second, and Rev. F. Page Roberts of Scole a good third. Five stands of twelve were exhibited, Rev. A. Foster-Melliar being placed first, having Prince Arthur fine again, as it has been everywhere lately, and a smooth and even Madame Eugène Verdier. Mr. Berners was second, and Rev. Page Roberts third. There was a good competition in the class for twelve Teas among the clerical Tea Rose fanciers. Rev. Page Roberts was first, having a good example (for the season) of Madame de Watteville; Rev. Foster-Melliar second, with a stout young Francisca Kruger in the corner, and Rev. H. Berners third, having Comtesse de Nadaillac and Catherine Mermet in good condition. For six Roses of one sort Rev. Foster-Melliar was first with Ulrich Brunner, large but rather rough; Mr. Powell second with Camille Bernardin, and Rev. Berners third with Her Majesty, very fine but quite unopened buds. Madame Gabriel Luizet, Souvenir d'un Ami, and Ulrich Brunner were also shown in unnoticed stands. In the class for six Roses Mr. Orpen of Colchester was first, Mr. J. E. Ransom second, and Mr. E. R. Turner third. For six Teas Mr. Orpen was first with pretty good samples, and Rev. H. Gall of Hitchin third.

A new Rose, Miss Rosa Roberts, was shown by Miss Roberts, Rose Hill, Ipswich. The colour is not attractive, being a dull mottled pink, and the blooms were small and badly shown, but one or two of them seemed to have some shape and substance, and if cultivated in a superior manner it might prove worthy of propagation.

The evening turned out fine, and some thousands paid for admission at the gates, rejoicing the heart of Rev. H. Berners, the Hon. Secretary.

##### DISS.—JULY 9TH.

THIS plucky and flourishing little Society held its Rose Show on the Lawn, by kind permission of F. Taylor, Esq., M.P. The situation is very handy, and well within the limits of the town, but it had been a hayfield, the grass was long, and, as there was a good deal of rain, the ground was very wet and locomotion between the tents unpleasant. Roses were naturally below the average, but most of the usual exhibitors turned up and made a creditable display. There were only two competitors in the open class for thirty-six Roses—Mr. B. R. Cant, of Colchester, and Rev. A. Foster-Melliar, of Sproughton. The Judges had some difficulty in coming to a decision, and called for further assistance, the result being that the amateur was awarded the first prize. A. K. Williams was the best bloom in his stand, while Mr. Cant, who followed very closely, had fine specimens of Benoit Comte and Mrs. John Laing. For the amateur classes Rev. Foster-Melliar was first for twenty-four, a very fine bloom of Le Havre gaining him the silver medal for best H.P. Rev. H. T. Frere was second and Rev. F. Page Roberts third. Rev. A. Foster-Melliar was again first in twelves, having fine specimens of Marie Baumann and A. K. Williams, Rev. Page Roberts second, and Mr. Frere third, with Horace Vernet and A. K. Williams in good condition. In the local class for twelve Rev. H. T. Farquharson of Gissing was first, Mr. W. Burrows second, and Mr. A. Bobley third. Liberal prizes were offered in the class for twelve Teas, Mr. Page Roberts taking the first prize, having a small but beautiful sample of The Bride, Rev. A. Foster-Melliar second, and Rev. Frere third. The silver medal for the best Tea was awarded to Francisca Kruger in Rev. A. Foster-Melliar's box, the same bloom having already been shown at Ipswich. He thus twice within a week took the medal with a Tea Rose bloom which had already been exhibited at a previous show. In the class for six Roses, for those employing no regular gardener, Mr. C. S. Alger was first, Mr. W. Bunn of Harleston second, and Mr. Burrows third.

A handsome prize of £3 was offered in the open class for thirty-six bunches of hardy perennials. Messrs. G. Paul & Son of Cheshunt had no difficulty in winning this, and their stand excited great admiration, but there was one little gem in the front row which drew exclamations of delight from all. This was a small bunch of Calochorti, or Californian Tulips, and one of these, venustus, was a most lovely flower, a small pure white vase or cup of most elegant shape, with a sort of peacock's-feather eye of all sorts of colours most harmoniously blended, at the base of each petal, forming the cup of the flower. This charming genus does not seem to be well known, but a good many will not forget the bloom they saw at Diss. Indeed, one enthusiastic gentleman said he must have it, for he could not live without it.

The rain came down pitilessly in the afternoon, making terrible weather for cutting thirty-six three days in succession, and the number of visitors was small, causing some anxiety to the excellent Hon. Secretary, Rev. Page Roberts, who is sure to make a thing go off well if it is to be done.

##### WOODBIDGE.—JULY 10TH.

IN no place in East Anglia is the Horticultural Society more enthusiastically supported by the people than in the small town of Woodbridge. All places of business are closed at an early hour, and the triumphal arches and general display of bunting, together with the

merry peals from the church bells, would make a casual stranger think that the Queen of the realm was coming, instead of only the queen of flowers. The Abbey grounds, which have always been available by the kind permission of R. J. Carthew, Esq., are well situated, and well suited to the occasion. Other societies may well learn of Woodbridge in general enthusiasm and unanimity, and if the Committee will not be above learning a little from other shows, and moving with the times a little more in the arrangement of the prize list now that it is affiliated to the National Rose Society, the Show will certainly improve, and perhaps attract high-class Rose growers from a distance. A due regard for not clashing with other, especially East Anglian shows, is desirable. Larger classes among Roses, with more twenty-fours and trebles and less sixes, would cover the tables better. Higher prizes should be given, even if the entry fee had to be raised; and punctuality should be enforced in the tents, as well as italicised in the rules. The Society has nobly passed through a financial crisis, and most wellwishers would suggest that a greater liberality in objects of special interest would be found to answer, even if the excessive number of general classes were curtailed. There were some present who would gladly have fastened their eyes on the *Calochortus venustus* exhibited by Mr. G. Paul at Diss the day before, and learnt something of its "manners and customs" from his representative; but there is a serious difference in the attraction afforded by 15s. and £3, and *Calochortus* had fled to more liberal climes. These criticisms are offered in a friendly spirit, and with a hope that Woodbridge Horticultural Society may flourish and prosper. It is a tradition in East Anglia that Ipswich Rose Show is always wet, and Woodbridge always fine. It was more true this year than a great many weather forecasts. There had not been a day without rain for a fortnight, and it poured the next morning; but the clerk of the weather had, as usual, set apart an extra fine day for Woodbridge, and the attendance was large, and the receipts above the record.

In the open Rose classes, Rev. A. Foster-Melliard of Sproughton took all the four first prizes. For thirty-six, Messrs. D. Prior & Son of Colchester were second, having the silver medal for best Rose in open classes for a pretty good A. K. Williams. Mr. J. Woods of Woodbridge was third with inferior blooms. For twelve Teas, Messrs. Prior were second, and Rev. H. A. Berners of Harkstead third, the blooms of all being of course indifferent in such ungenial weather. For six Teas Mr. Woods was second, and Messrs. Prior third. For six trebles of H.P.'s Rev. H. A. Berners was second, and Messrs. Prior third. In the amateur classes, Rev. Foster-Melliard was first in twelve, again getting the silver medal for *Le Havre* (not the same bloom shown at Diss) for the best Rose in the amateur classes. Mr. Berners was a very close second indeed, and Rev. H. T. Frere of Burston third. For six H.P.'s, Mr. Orpen of Colchester was first, Mr. F. Gassett second, and Mr. C. E. Green third. For six Teas, Mr. Berners was first, Mr. Orpen second, and Rev. Foster-Melliard third.

The evening fête and the display of fireworks was thoroughly successful, and the faith of the good people of the neighbourhood in a fine day for Woodbridge Rose Show is more firmly established than ever.—W. R. RAILLEM.

#### BRIGHTON.

THE Brighton and Sussex Horticultural Association's first Show of the season was held in the Royal Pavilion on Wednesday and Thursday, July 9th and 10th, and was devoted to Roses. Owing, however, to the unfavourable weather a large proportion of the entries received were unavoidably withdrawn on the day before or the morning of the Show, and competition was consequently somewhat restricted. The blooms staged were of good quality, the colours being especially bright.

Eleven open classes were provided, but we can only refer to a few of them. With forty-eight single trusses Mr. Frank Cant, Braiswick, Colchester, scored another of his numerous victories this year, and included in his box grand examples of the following varieties:—*Général Jacqueminot*, Mrs. H. Turner, *Merveille de Lyon*, *Prince Camille de Rohan*, *Pride of Reigate*, *Crown Prince*, *Marie Verdier*, *Prince Arthur*, *Marie Finger*, *Sir Rowland Hill*, *Niphotos*, *Horace Vernet*, *Earl of Pembroke*, *Madame I. Pereire*, *Dr. Andry*, *G. Caillot*, *Marie Baumann*, *Her Majesty*, *François Michelin*, *Madame Victor Verdier*, *Duchess of Leeds*, *Souvenir d'Elise Vardon*, *Duke of Edinburgh*, *The Bride*, *Duke of Teck*, Mrs. J. Laing, *Madame A. Lavallée*, *Viscountess Folkestone*, *Ulrich Brunner*, *Lady Mary Fitzwilliam*, *Docteur Dor*, *Madame Eugène Verdier*, *J. Stuart Mill*, *Captain Christy*, *Star of Waltham*, *Catherine Mermet*, *Earl of Dufferin*, *Baroness Rothschild*, *Etienne Levet*, *Madame de Watteville*, *Lady H. Stewart*, *Pride of Waltham*, *Victor Hugo*, *Lady Sheffield*, *A. K. Williams*, and *Comtesse d'Oxford*. The second place was taken by Messrs. Paul & Son, Cheshunt, who had a very even and creditable collection; Messrs. Perkins & Son, Coventry, being third.

For twenty-four varieties, three blooms of each, Mr. Frank Cant succeeded in winning the premier prize, showing similarly fine blooms to those in his forty-eight stand of the varieties named herewith:—Mrs. John Laing, *Alfred Colomb*, *Comtesse d'Oxford*, *Madame Eugénie Verdier*, *Charles Darwin*, *Niphotos*, *Madame Ducher*, *Duchesse de Morny*, *Marie Verdier*, *Lady H. Stewart*, *Général Jacqueminot*, *The Bride*, *Baroness Rothschild*, *Etienne Levet*, *Pride of Waltham*, *Marie Baumann*, *Marie Finger*, *Dr. Andry*, *A. K. Williams*, *Duchess of Leeds*, *Beauty of Waltham*, *La France*, *Heinrich Schultheis*, and *Pride of Reigate*. The second and third prizes were awarded to Messrs. Paul and Son and Messrs. Perkins & Son in the same order as the class already mentioned. In the class for twelve trusses of any Rose Mr. Frank Cant took the lead with beautiful examples of Mrs. John Laing, showing the characters of this fine variety to perfection. Messrs. Paul & Son

were second with *Her Majesty*, and Messrs. Perkins & Son third with Mrs. John Laing. Messrs. Paul & Son scored an easy victory with twelve Teas and Noisettes, showing handsome substantial clean blooms of *Niphotos*, *Catherine Mermet*, *Jules Finger*, *Maréchal Niel*, *Innocente Pirola*, *Souvenir d'un Ami*, *Marie Van Houtte*, *Francisca Kruger*, *Madame de Watteville*, *Madame Lambard*, *Madame Cusin*, and *The Bride*. With Moss and Provence Roses Messrs. Paul & Son were also first, followed by Messrs. Ewing & Co., Norwich.

In the amateurs' classes the competition was not by any means keen, still the blooms were fairly good. E. M. Bethunc, Esq., Denne Park, Horsham, and A. Slaughter, Esq., Jarvis Villa, Steyning, shared the prizes, being first and second as named with forty-eight varieties, twelve Hybrid Perpetuals, twelve Teas, and six blooms of any Rose. A beautiful basket of Roses gained the first prize for Messrs. Perkins & Sons. There were also some tasteful stands of Roses and other flowers. Mr. G. Miles, Dyke Road, had a tasteful group of Ferns, and a large group of foliage and flowering plants. Messrs. J. Cheal & Sons, Crawley, exhibited an effective collection of hardy flowers and Roses; Mr. J. F. Mould, Pewsey, contributing a group of stove and greenhouse plants.

#### WIRRAL.—JULY 10TH.

IT is now about twelve years since I propounded to the readers of the Journal the geographical puzzle as to their knowledge of where Wirral was, and it has been to me a source of great pleasure that I have been able to attend every Show that the Wirral Rose Society has held. That in those years I have seen many and great changes must be self-evident, and that the Exhibition of to-day is not like many of its predecessors is simply to say that it is twelve years old. Exhibitors have changed, secretaries have changed, the place of meeting has changed, and the seasons have changed, for unquestionably we have not the weather for Rose shows we used to have, and this season has been no exception to the long cycle of bad years that we have experienced. Yet withal, without the assistance of those southern giants who used to send the blooms, Paul, Cant, and others, and notwithstanding that the principal local exhibitor, Mr. T. B. Hall of Larkwood, has retired from the fray, there was a very good Show, and some of the blooms were of great excellence; indeed the marvel was that with all the miserable weather we have lately had Roses should have been so well exhibited. Teas were, of course, the principal sufferers, but even they were shown in great beauty. Perhaps the most interesting feature of the Show was (as far as Roses were concerned) the two new seedlings of Messrs. Dickson & Son of Newtownards, Co. Down, Ireland—*Margaret Dickson*, a lovely white flower of great substance, and the *Marchioness of Dufferin*, a beautifully flesh coloured pink flower; these were both awarded first-class certificates. I think both will keep up the well-earned reputation of the great firm, and will be found on many a winning stand. The thick leathery foliage of *Margaret Dickson* is very reliable, and will almost make it mildew proof.

In the nurserymen's class for forty-eight single blooms the English Fruit and Rose Company (late Cranston's) carried off the first prize with the following—*Marie Susanne Rodocanachi*, *Alfred Colomb*, *Merveille de Lyon*, *Camille Bernardin*, *Senateur Vaisse*, *Ulrich Brunner*, *Earl of Dufferin*, *Heinrich Schultheis*, *Queen of Queens*, *Le Havre*, *Her Majesty*, *Auguste Rigotard*, *Elie Morel*, *Mary Pochin*, a pretty bloom of a scarce Rose, indeed never seen except from this firm; *Duchess of Bedford*, *Duchesse de Morny*, *Victor Verdier*, *Earl of Pembroke*, *Madame Gabriel Luizet*, *Dingee Conard*, *John Hopper*, *A. K. Williams*, *Madame Eugène Verdier*, *Louis Van Houtte*, Mrs. John Laing, very beautiful; *Comte Raimbaud*, *Marie Verdier*, *Baroness Rothschild*, *François Michelin*, *Lady Sheffield*, *Lady Helen Stewart*, *La France*, *Beauty of Waltham*, *Madame Montet*, *Star of Waltham*, *Rubens*, *John Stuart Mill*, *Madame Victor Verdier*, *Miss Edith Gifford*, *Prince Arthur*, very fine dark flower; *Charles Lefebvre*, *Général Jacqueminot*, *Horace Vernet*, and *Sir Rowland Hill*. Messrs. Dickson & Sons of Newtownards were an excellent second, and amongst their flowers were the two seedlings already alluded to, and Miss Jeanie Dickson, a flower of a lovely soft shade of pink, and Messrs. Dickson, Chester were third.

In the class for twenty-four trebles (class 2), the English Rose and Fruit Company are again first with the following:—*Madame Eugène Verdier*, *Duke of Edinburgh*, *Heinrich Schultheis*, *John Stuart Mill*, *François Michelin*, *Ulrich Brunner*, *Merveille de Lyon*, *Camille Bernardin*, *Madame Gabriel Luizet*, Mrs. John Laing, *Lady Sheffield*, *Marie Verdier*, *Louis Van Houtte*, *Marie Susanne Rodocanachi*, *A. K. Williams*, *François Michelin*, *Ulrich Brunner*, *Le Havre*, *Baroness Rothschild*, and *Beauty of Waltham*. Beautiful as these stands were, there is no doubt that a few more Teas would have lightened up the boxes considerably. Messrs. J. Dickson & Sons were second, and Dickson, Chester, third. In class 3, for the best eighteen Teas, Mr. Geo. Prince was first with a stand which, if not quite up to his usual excellence, was yet very beautiful. It contained *Comtesse de Nadaillac*, *Souvenir de S. A. Prince*, *Madame Cusin*, *Marie Van Houtte*, *Catherine Mermet*, *Innocente Pirola*, *The Bride*, *Souvenir de Paul Neyron*, *Madame Furtado* (a beautiful colour), *Alba rosea*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Jean Ducher*, *Rubens*, *Francisca Krüger*, *Souvenir d'un Ami*, *Hon. Edith Gifford*, and *Triomphe de Rennes*, a Rose very rarely exhibited, and although at one time a great favourite, I always associate it with a certain cottage in Okeford Fitzpaine, where my dear old friend, Mr. Radclyffe, used to grow it in great perfection. Messrs. A. Dickson & Sons were second, and the English Fruit and Rose Company third.

Coming now to the amateur classes, again Mr. Lindsell "sweeps the

board," his box of thirty-six varieties easily taking first with blooms of the same excellence and finish which have characterised all his exhibits during this season. The varieties were the following:—A. K. Williams, Her Majesty, Mrs. John Laing, Duke of Wellington, Madame Victor Verdier, François Michelin, Général Jacqueminot, La France, Earl of Dufferin, Captain Christy, Beauty of Waltham, Merveille de Lyon, Madame E. Verdier, Horace Vernet, Marie Verdier, Dr. Andry, Princess of Wales, Lady Helen Stewart, Madame Gabriel Luizet, John Stuart Mill, Duchesse de Morny, Rosieriste Jacobs, Star of Waltham, Victor Hugo (very fine), Louis Van Houtte, Le Havre, Heinrich Schultheis, Charles Darwin, Comte Raimbaud, Etienne Levet, Duke of Albany, Lady Sheffield, Duchess of Bedford, and Prince Camille de Rohan.

In class 6, for twelve trebles, Mr. Lindsell was again first with fine blooms of Ulrich Brunner, La France, Merveille de Lyon, Madame Victor Verdier, Lady Sheffield, Marie Baumann, Marie Verdier, Beauty of Waltham, A. K. Williams, and Victor Hugo (very fine). In class 7, for eighteen varieties of Teas and Noisettes, the Rev. F. R. Burnside was first with beautiful blooms of Madame Cusin, Madame de Watteville, Comtesse de Nadaillac, Souvenir d'Elise, &c. In class 8, for twelve blooms of any dark Rose, the first prize was awarded to J. G. Churton, Esq., for Marie Baumann; and in class 9, for any light Rose, to the Rev. J. H. Jackson, Stagsden Rectory, Bedford, for fine blooms of La France. In class 10, for amateurs in Lancashire and Cheshire, the Rev. Lionel Garnet of Christleton Rectory, was first with an excellent stand of the following flowers:—Duchess of Bedford, Her Majesty, Dupuy Jamain, Charles Lefebvre, Madame Eugène Verdier, Louis Van Houtte, Countess of Rosebery, La France, Ulrich Brunner, Etienne Levet, Merveille de Lyon, Duchesse de Morny, Earl of Dufferin, Madame Gabriel Luizet, Comte Raimbaud, Alfred Colomb, Grace Darling, Camille Bernardin, Madame Charles Crapellet, Alfred Dumesnil, Marie Baumann, François Michelin, Lady Mary Fitzwilliam, and Prosper Laugier. In class 11, for twelve varieties, J. W. Crowther, of Oxton, was first with an excellent stand, consisting of A. K. Williams, Prince Arthur, Dupuy Jamain, La France, Duchess of Bedford, Baroness Rothschild, Xavier Olibo, Le Havre, Général Jacqueminot, and Ulrich Brunner. W. Bell, Esq., of New Brighton, was second with an excellent stand, which improved in appearance as the day advanced. D. Walker, Esq., was third. In class 12, for six varieties, R. Greenshields, Esq., was first; and in class 13, for twelve varieties of Teas, T. Gree, Esq., Allerton, was first; Rev. L. G. Garnett second. Mr. Lee's flowers were Madame Cusin, Innocente Pirola, Madame de Watteville, Jean Ducher, Caroline Kuster, Catherine Mermet, Etoile de Lyon, Alba Rosea, Comtesse de Nadaillac, Prince of Wales, Anna Ollivier, and Francisca Kruger. In class 14, for six varieties of Tea and Noisettes, R. H. Bulley, Esq., was first with Anna Ollivier, Souvenir d'un Ami, Madame Lambard, Madame de Watteville, Comtesse de Nadaillac, and Rubens.

In many of these western and northern shows the exhibition of hardy perennials forms a most interesting feature of the Show, and when such a "past master" in this most interesting class of plants as the Rev. Lionel Garnett exhibits, one is sure of a sight which gladdens one's heart to see. He had on this occasion a very grand stand comprising the following:—Phlox Lady Napier, Lilium pardalinum, Delphinium, Alstrœmeria chiliensis Alstrœmeria aurantiaca, Centaurea macrocephala, Lilium testaceum, Scabiosa caucasica, Enothera Forbesæ, English Iris, Campanula persicifolia alba, Gladiolus Charming Bride, Catananche cœrulea, Gladiolus The Bride, Galega officinalis, Campanula pelviformis, Lychis Haageana, Potentilla Dr. Andry, Campanula Hendryana, Gaillardia grandiflora, Polemonium Richardsoni, Papaver nudicaule, Centaurea dealbata, and Lychnis chalcedonica.

This is one of those Shows where Roses are sold for the benefit of hospitals, and Mrs. Oakshott presided at the Rose stall. The sale was brisk, and realised £23 for the Birkenhead Children's Hospital, many exhibitors contributing their "spares," and Mr. T. B. Hall of Larkwood a large quantity of his magnificent Roses.—D., Deal.

#### GLOUCESTERSHIRE.

"WHAT an excellent Show!" "A grand Show!" "The best provincial Show of the season!" Such were the exclamations one heard on all sides from those who had frequented most of the previous exhibitions of the year; and, as I had already seen several, I am fully able to sustain the verdict thus passed. The Corn Exchange was filled with flowers. The quality of the exhibits was remarkably good, and the competition in many of the classes very keen. It was well known how very hard had been the work undertaken by the Rev. T. Halbrow, the Secretary, and how indefatigably he had worked; and it must have been a great pleasure to him that his labours and those of his Committee had been crowned with success; for alas! in some cases we may work and toil and nothing comes of it. But when all these exertions were crowned with that most essential requisite for success, a fine day, it must have been particularly gratifying to all concerned. This, the third exhibition of the Society, was, without doubt, an improvement on its predecessors; and the Gloucestershire Rose Society would seem now to be firmly established on a firm footing. It has undoubtedly stimulated the zeal of local growers; and after all, this is, I believe, that which is the real good that comes out of these exhibitions; and when such growers for sale as the British Rose and Fruit Company, Messrs. Jefferies, Cooling and others live in neighbouring counties and exhibit, the Society may well be independent of foreign aid, although all comers would be, and are, gladly welcomed.

Although in most schedules, as in this, the class of nurserymen head

it, I fancy the amateur classes are those which excite the keener interest, for it is amateurs who throng the exhibition room or tent, and they want to know what has been done by those who occupy the same position as themselves.

The first prize for thirty-six blooms was won by E. B. Lindsell, Esq., of Hitchin, the champion amateur of the year, who worthily maintained by the character of his blooms the position he won at the National on Saturday. His stand was a remarkably fine one, the flowers being not only of good colour and substance, but also of full size, a point about the attainment of which he has expressed some doubts. His blooms consisted of Ulrich Brunner, Captain Christy, Rosieriste Jacobs, Pride of Waltham, Horace Vernet, Her Majesty, Marie Baumann, Charles Lefebvre, La France, M. Gabriel Luizet, François Michelin, Princess of Wales, Jean Verdier, Duke of Wellington, Baroness Rothschild, Alfred Colomb, Niphotos, Lady Helen Stewart, Lady Sheffield, Duchesse de Morny, Louis Van Houtte, Marie Susanne Rodocanachi, Merveille de Lyon, Dupuy Jamain, Rubens, Countess of Rosebery, Le Havre, Madame Cusin, Dr. Andry, Duchess of Bedford, Souvenir d'un Ami, Etienne Levet, Victor Hugo, E. Y. Teas and Heinrich Schultheis. The Rev. J. H. Pemberton was second, and J. P. Budd, Esq., of Bath third. In the class for twenty-four varieties there was a strong competition, fourteen boxes being put up. The first prize again fell to Mr. Lindsell, the second to the Rev. J. H. Pemberton, and the third to C. J. Palley, Esq., of Lower Eaton, Hereford. Mr. Lindsell's blooms were Horace Vernet, Mrs. John Laing, Duke of Edinburgh, Madame Gabriel Luizet, Marie Baumann, Marie Susanne Rodocanachi, Charles Lefebvre, François Michelin, Captain Christy, Heinrich Schultheis, A. Colomb, La France, Victor Hugo, Comtesse d'Oxford, Xavier Olibo, Earl of Dufferin, Fisher Holmes, Le Havre, Baroness Rothschild, E. Y. Teas, Marie Baumann, Marie Verdier, Duchess of Bedford. In the class for twelve trebles, Mr. Lindsell was again first with beautiful flowers of Marie Baumann, Duke of Wellington, Horace Vernet, Baroness Rothschild, Pride of Waltham, Louis Van Houtte, Mrs. John Laing, a beautiful triplet, Le Havre, Dr. Andry, Marie Verdier, Merveille de Lyon and A. K. Williams; the Rev. J. H. Pemberton second and Dr. Budd third. In the class for twelve varieties the first prize was taken with Marie Verdier, Victor Verdier, Charles Lefebvre, Lady Mary Fitzwilliam, Magna Charta, Ulrich Brunner, Countess of Pembroke, Madame Lambard, Beauty of Waltham, Marie Van Houtte, Exposition de Brie, and Pride of Waltham. The Rev. J. H. Pemberton was second.

In the class for eighteen Teas or Noisettes the Rev. T. R. Burnside, the champion Tea grower of the year, won the first prize with beautifully clean and perfect blooms of the following:—Madame Cusin, Comtesse de Nadaillac, Marie Van Houtte, Catherine Mermet, Innocente Pirola, Souvenir d'un Ami, Madame Bravy, Marie Van Houtte, Rubens, Anna Ollivier, Francisca Kruger, Jean Ducher, Hon. Edith Gifford, Caroline Kuster, Souvenir d'Elise, Paul Neyron, Madame de Watteville. Dr. Budd was second.

In the class for twelve Teas Mr. Burnside was again first, Dr. Budd second, and Mr. W. Narrowing of New Headington, Oxford, third. Mr. Burnside's blooms were Catherine Mermet, Innocente Pirola, Souvenir d'un Ami, Anna Ollivier, Hon. Edith Gifford, Comtesse de Nadaillac, Madame Bravy, Rubens, Princess of Wales, Caroline Kuster, Souvenir d'Elise Vardon, Francisca Kruger.

In the class for twelve varieties, trebles, Mr. Burnside was again first, Mr. Budd second, and Mr. Alex. Hill Gray third. Mr. Burnside's flowers were Hon. Edith Gifford, Catherine Mermet, Marie Van Houtte, Souvenir d'un Ami, Innocente Pirola, Anna Ollivier, Francisca Kruger, Jean Ducher, Madame Bravy, Jules Finger, Madame Cusin, and Rubens.

Amongst nurserymen the leading place was taken by the English Fruit and Rose Company (late Cranston), who were first in seventy-twos and twenty-four trebles, the second position being occupied by Messrs. Harkness & Son of Bedale, Yorkshire. Amongst the flowers in the first prize stand were grand blooms of Charles Lefebvre, Mrs. John Laing, Alfred Colomb, Marie Baumann, John Stuart Mill, Horace Vernet, Rosieriste Jacobs, Madame Gabriel Luizet, Lady Sheffield, Pride of Waltham, Madame Eugénie Verdier, Xavier Olibo, Marquise de Castellane, Marshall P. Wilder, Baroness de Rothschild, and other well known flowers. Mr. Geo. Prince took the leading place with Teas. He showed lovely blooms of Comtesse de Nadaillac, Madame Hoste, Souvenir d'Elise, Madame Watteville, Madame Cusin, Rubens, The Bride, and Francisca Kruger, &c.

Amongst the Gloucestershire nurserymen the leading place was taken by Messrs. Jefferies & Son of Cirencester, who had most excellent flowers. In twenty-four varieties they took first prize with La France, Madame Prosper Laugier, Madame Hippolyte Jamain, Duke of Teck, Mrs. John Laing, Comtesse d'Oxford, Sénateur Vaisse, Marie Verdier, Louis Van Houtte, Madame Gabriel Luizet, Horace Vernet, Madame Clemence Joigneaux, Marie Finger, Fisher Holmes, François Michelin, Marie Baumann, Ulrich Brunner, Madame Montet, and Charles Darwin. The prize for the best twelve of any one dark Rose was won by the English Fruit and Rose Company with a beautiful stand of Alfred Cooling, the most perfect blooms bright and fresh, the prize for the best twelve of any light Rose being awarded to Messrs. Harkness and Son for fine blooms of La France; Dr. Budd second; Messrs. Cooling of Bath third. There was a spirited competition amongst the Gloucestershire amateurs, and considerable improvement was noticeable in their stands, although there is still room for improvement, especially in the setting up of the flowers, which in many cases was of the most elementary character, and there is no reason why local exhibitors should be behind others in this respect. There is no magic in the art,

and they can easily see from the "foreign" stands exhibited how different the style is to what it ought to be. The silver medal for the best H.P. was won by Mr. Lindsell with A. K. Williams, and for the best Tea by Mr. Pemberton with Souvenir d'Elise.

One very pleasing feature of the Show was the tastefully arranged stall for the sale of Roses for the benefit of the hospital. A considerable sum was realised for the benefit of this excellent institution and the children's hospital.

And so must end my brief and somewhat imperfect account of the Gloucestershire Rose Society's third Show. The Society evidently shows signs of great vitality, and if it continues, as it is to be hoped it may, under the guidance of the present able and indefatigable Secretary, a long and prosperous career is before it.—D., Deal.

EVENTS OF THE WEEK.—To-day (Thursday) the National Rose Society's provincial Show will be held in Birmingham, and the Helensburgh Show will take place on the same day. Friday, July 18th, will witness a large gathering of supporters of the Gardeners' Orphan Fund at the annual meeting and dinner in the Cannon Street Hotel. As already announced, Mr. Shirley Hibberd will preside at the dinner. On Tuesday, July 22nd, National Carnation and Picotee Society's Show; and an Exhibition of Ferns will be held in the Royal Horticultural Society's Gardens, Chiswick. The Conference on Carnations will begin on the 22nd inst. at 2.30 P.M., and the following papers will be read—viz., "The Carnation from a Botanical Point of View," by Mr. F. N. Williams, F.L.S.; "The Florists' Carnation and Picotee as Exhibition Flowers," by Mr. Harry Turner; "Carnations and Picotees in Towns," by Mr. Martin Rowan; "Border Carnations," by Mr. Richard Dean. On the 23rd the Conference on Ferns will open at 2 P.M., and papers will be read as follows:—"The Systematic Relations of Ferns," by Professor Bower, F.L.S.; "Hybrid Ferns," by Mr. E. J. Lowe, F.R.S.; "Plumose British Ferns," by Mr. C. T. Drury, F.L.S.; "Hardy Ferns and their Cultivation," by Mr. J. Birkenhead. Two silver challenge cups will be awarded to amateurs by the R.H.S.—viz., one for the best collection of hardy Ferns, the other for the best collection of Filmy Ferns grown without heat. Intending exhibitors are requested to communicate with Mr. Barron, Superintendent R.H.S. Gardens, Chiswick, on or before Friday, July 18th, stating the classes in which they propose exhibiting, and giving an approximate idea of the amount of space they will require.

— THE WEATHER.—Wet and dull weather has predominated during the past week, and this record has become unpleasantly monotonous. On July 8th we read—"There was a heavy fall of snow in Scotland during Monday night, and yesterday the Grampians and Monadhliadh hills were covered as in midwinter. The rivers and streams are in high flood." Fortunately there seems to be a prospect of an improvement. Monday was a summer's day, and being, moreover, St. Swithin's day also, it will be regarded by many as a good augury. Wednesday also was a brilliant day in London.

— THE NATIONAL CHRYSANTHEMUM SOCIETY'S GENERAL COMMITTEE assembled at Anderton's Hotel, Fleet Street, on Monday evening last to receive the lady representative of the Northern Horticultural Society of Tasmania (Mrs. Thrower), who has come to England as a de'legate from the affiliated Society, to represent it at the Centenary Exhibition and Conference next November. An address was presented to Mrs. Thrower, and she responded in an admirable speech, in the course of which she referred to the stimulus that had been imparted to Chrysanthemum culture in the Antipodes by the offer of the National Society's medals as prizes. The business of the evening also included the affiliation of thirteen Societies and the election of twenty-three Fellows and members.

— THE Executive Committee of the GARDENERS' ORPHAN FUND met in the Caledonian Hotel on Monday last, Mr. John Laing presiding. The principal business was to complete the arrangements for the annual meeting and dinner at the Cannon Street Hotel on Friday next. Some discussion also took place with regard to the institution of a memorial fund in honour of the late respected Chairman

(Mr. G. Deal), and promises of substantial support have already been received. Particulars of the proposed course will be announced on Friday.

— THE NATIONAL ROSE SHOW, BIRMINGHAM.—The provincial Exhibition to day (Thursday) in the Birmingham Botanical Gardens promises to be one of the best the Society has held; the entries are numerous, and the weather is favourable for Roses.

— PORTSMOUTH SHOW.—An excellent Show of plants, fruit, and vegetables was held in the Victoria Park, Portsmouth, on Tuesday last. Mr. Cypher secured the chief prize in good competition with twelve specimen plants. Mr. Wills arranged by far the best group of plants. Mr. Inglefield, Tedworth Gardens, was first with a collection of fruit. There was close competition in nearly all the important classes.

— LEWISHAM SHOW.—We are requested to state that the first prize for forty-eight Roses was won by Messrs. G. Bunyard & Co, Maidstone, and not by Mr. Burnand, as stated in our report. The Secretary states that in the vegetable classes eighteen trays or baskets were placed in competition for the Society's and Messrs. Sutton & Sons' prizes. No doubt that was so, but there was much room for improvement in this section of the Show all the same.

— CRYSTAL PALACE ROSE SHOW.—As a member of the Committee that adjudicated upon the merits of the new Roses submitted for certificates at the above Exhibition, will you allow me to supply an omission in your report in case it has escaped notice? Together with the two Roses mentioned in your report of the Show, a first-class certificate was awarded by the National Rose Society to Messrs. A. Dickson & Sons of Newtownards, Ireland, for a new white Rose, Margaret Dickson.—JOSEPH H. PEMBERTON.

— THE WEATHER LAST MONTH.—June was a very changeable month, with only three bright days. Rain fell on fifteen days, the greatest daily fall being 0.34 on the 30th, and the total fall 1.85 inch. Barometer was highest at 9 A.M. on 15th, 30.42; lowest, 29.15 at 9 P.M. on 30th. Highest shade temperature, 75° on 25th; lowest, 37° on 1st and 8th; lowest on grass, 32° on the 1st. Mean temperature of the month, 57.78. Wind was in a westerly direction twenty-four days. The garden spring ran 20 gallons per minute on the 30th.—W. H. DIVERS, *Ketton Hall, Stamford.*

— THE WOLVERHAMPTON HORTICULTURAL EXHIBITION opened on Tuesday, the 15th inst., in the public park, and with splendid weather. The Exhibition was an extensive one, much greater than that of last year, and the "open to all" plant tent was filled with first-class specimens. Mr. Cypher of Cheltenham took the lead, and Mr. Alderman Marriott, Coventry, was a close second. The display of Roses was the best ever seen in Wolverhampton, Mr. Frank Cant taking the lead. Mr. Blair, Trentham Gardens, led in fruit. Some good Orchids were shown. We shall give a fuller report in our next issue. There was a very large attendance on the first day.

— UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The quarterly meeting of the above Society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. Nathan Cole in the chair. Seven new members were elected, making a total of fifty for the half year. The Treasurer, Mr. J. Hudson, reported that he had invested £200 in 2½ per cent. Consols since the last meeting. There is one sick member only on the funds. One member died during the quarter, and the amount standing to his credit in the ledger (£25 10s. 3½d.) was paid to his widow, Mrs. Hannah Back. A vote of condolence was accorded to Mr. H. Williams on the death of the late Mr. B. S. Williams, who was one of the oldest of the Society's honorary members. The usual business having been transacted, a vote of thanks to the Chairman ended the meeting.

— SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, FOR JUNE.—56 feet above mean sea level. Mean temperature of month, 57.1°. Maximum on the 10th, 71.7°; minimum on the 8th, 36.6°. Maximum in the sun on the 18th, 132.9°; minimum on the grass on 8th, 28.7°. Mean temperature of the air at 9 A.M., 58.8°; mean temperature of the soil 1 foot deep, 57.0°. Nights below 32° in shade none, on grass two. Total duration of sunshine in month 111 hours, or 22 per cent. of possible duration. We had two sunless days. Total rainfall, 2.11 inches. Rain fell on fifteen days. Average velocity of wind, 7.4 miles per hour; velocity exceeded 400 miles on one day, and fell short of 100 miles on nine days. Approxi-

mate averages for June:—Mean temperature, 57.1°. Rainfall, 2.26 inches. Sunshine, 157 hours. A very dull month, without any warm summer weather. The greater part of the rain fell in the last week.—JOSEPH MALLENDER.

— SALE OF LEIGHAM COURT, STREATHAM.—One of the most picturesque and best kept gardens in the metropolitan district, Leigham Court, Streatham Hill, has just been sold for £92,000, and has been purchased by a building company for the erection of small houses. The garden comprises sixty-six acres, is laid out in a most tasteful style, and has for some years been under the charge of an experienced and skilful practical gardener, Mr. E. Butts, who has kept it in admirable condition. Vineries, Peach and plant houses, a charming fernery, conservatory, with pits, &c., constitute the glass. The garden includes a fine old orchard, rosery, &c., and is stocked with choice shrubs and trees. Leigham Court has been the residence of Mrs. Treadwell for a long period, and was originally taken by the late Mr. J. Treadwell, a successful railway contractor, one of those who amassed a large fortune at the time the railway fever was at its height. Many will regret the loss of this beautiful garden.

— APPLE GROWING IN NOVA SCOTIA.—While the whole of Nova Scotia may be regarded as adapted for Apple culture, about one-half, comprising those counties fringing on the Bay of Fundy, possesses special advantages in climate and soil for fruit growing. Of this part the three counties, Hants, Kings, and Annapolis, form the pick of the province. Here is the centre of the Apple industry, covering at present a strip of country about two to two and a half miles wide on each side of the Windsor and Annapolis railway that traverses the district, some eighty miles long, which last year produced some 300,000 barrels of fruit of the first quality, worth on the spot some 650,000 dollars. Of this area only about one-thirtieth is planted, and one-sixteenth is bearing, although the one-thirtieth is rapidly approaching the bearing period; its ultimate possible yield may therefore be imagined. It is only during the last few years that Nova Scotian Apples have earned a reputation on the London market, and ever since hundreds of acres of new land have been planted annually with tens of thousands of trees.—(*American Cultivator.*)

— PROPOSED MEMORIALS TO THE LATE MR. G. DEAL AND MR. B. S. WILLIAMS.—I am pleased to see Mr. Sharman has proposed what I myself had thought of—viz., starting an Orphan Fund Memorial to our late Chairman, Mr. Deal, showing how highly his services were appreciated by those who had the pleasure of working with him in this good cause, and in doing this we must not forget it was to his far-seeing care we did not encumber our limited finances with bricks and mortar, &c., and so make it many years ere the orphan could reap the benefit intended from this scheme. Thus to our lamented friend we owe much of the successful working of the Institution. Mr. Findlay has proposed a similar testimonial to Mr. Williams as an approximate means of leaving on record to those who succeed us in the profession how such men were esteemed by those who had enjoyed many years of close friendship. I am sure, having known him long and well, nothing would be more in keeping with his life than trying to lend a helping hand to the fatherless little ones of those who have not been equally successful in life as those we now hope to memorialise. Cannot we make an effort and raise a goodly sum for this cause, thus forming a fitting sequel to two good and useful lives? I need hardly say I will help this scheme in every way that I can.—CHARLES PENNY.

— FIGUS ROXBURGHII.—Some very remarkable observations on the production of the ripe figs of *Ficus Roxburghii*, Wall., have recently been published by Dr. D. D. Cunningham, F.R.S., of the Indian Medical Service. The species is dioecious, the male receptacles or figs containing perfect male flowers with pollen, together with imperfect or atrophied female or "gall-flowers," which never produce seed; the female figs contain perfect female flowers only. Both kinds of fig are visited by the "fig insect," usually a species of *Eupristis*, for the purpose of laying its eggs in the ovary. This is effected in the "gall flowers" of the male figs; but in the female figs the efforts of the insect to deposit its eggs within the ovary are frustrated by the great thickness of the wall of the ovary. It is very rare to find more than a very few grains of pollen in the female figs; and, according to Dr. Cunningham, the embryo-sac in the female flowers retains, up to the period of the visits of the insect, the character of a uninucleate cell. The full development of the embryo in the female flowers is brought about simply by hypertrophy of the tissues, the result of the stimulation

caused by the unsuccessful attempts of the insect to pierce the wall of the ovary. If these observations are confirmed, we have here one of the most remarkable instances of parthenogenesis yet recorded in the vegetable kingdom.—(*Nature.*)

— THE PHYSIC GARDEN, CHELSEA.—It having been stated in the *British Medical Journal* and other public papers that the Apothecaries' Company are about to sell this garden, which was presented to them in 1721 by Sir Hans Sloane on condition that "it should at all times be continued a physic garden, for the manifestation of the power and wisdom and goodness of God in creation, and that the apprentices might learn to distinguish good and useful plants from hurtful ones," it is thought desirable that the earliest opportunity should be taken to call public attention to the matter. The garden, although not open to the public, can be seen by passers-by for 150 yards along the Embankment, on which side it is enclosed by a dwarf wall and railing. It still retains its original formal character, and its Cedar, which has for many years been one of the many landmarks on the river bank. Should this scheme be carried out Chelsea will lose one of its characteristic features, and another open space will be lost to the public for ever. It is suggested that some scheme might be devised in connection with the Polytechnics or City Guilds so that more persons might have the opportunity of availing themselves of the garden for the study of botany, or that it might be utilised in some other way so as to prevent its being covered with houses. The future of the garden being a matter of deep interest to the inhabitants, a meeting was arranged to be held in the Town Hall, King's Road, Chelsea, on Wednesday, at five o'clock, to elect a committee to watch the matter. The Right Hon. the Earl of Meath, Chairman of the Metropolitan Public Gardens Association, was announced to take the chair.

#### MEMORIAL TO THE LATE MR. B. S. WILLIAMS.

MR. BRUCE FINDLAY proposed last week what many have been discussing at London horticultural meetings—namely, the desirability of commemorating the late Mr. B. S. Williams in some suitable way. Mr. Alfred Outram, 7, Moore Park Road, Fulham, is also taking steps to ascertain the general opinion as to the form this should assume. A Committee meeting will be probably called at an early date to discuss the subject, as all are agreed that something must be done. The majority with whom I have conversed respecting it think that a fund should be raised, and a Williams Memorial medal and prize be offered alternately in London, Manchester, and Edinburgh, any balance remaining to be divided amongst the horticultural charities. To facilitate the work of collection it might be desirable to form committees in each of the cities named, and we know what Mr. Findlay could accomplish in Manchester alone.—LEWIS CASTLE.

#### A MANUAL OF ORCHIDACEOUS PLANTS.

PART 6 of Messrs. J. Veitch & Sons' admirable work on Orchids, chiefly occupied with the genera *Cœlogyne*, *Epidendrum*, and *Calanthe*, but also includes *Spathoglottis*, *Phaius*, *Thunia*, *Chysis*, *Pleione*, *Diacrium*, *Nanodes*, *Arundina*, *Bletia*, *Broughtonia*, and other small genera. The part contains 134 pages, with numerous illustrations, and owing to the varied character of the matter it is one the most interesting yet issued. The character of the work is well maintained, the descriptions, references, history, and culture are disposed of in a most satisfactory manner—a combination of scientific accuracy with a popular style, wherever the subject admits of free treatment, distinguishing what will always be valued as a standard book of reference upon Orchids.

As an example of the style we extract the following account of the peculiar *Nanodes Medusæ* now placed as a sub-genus under *Epidendrum*. The illustration has been kindly furnished by Messrs. Veitch & Sons, and faithfully represents the chief characters of the flowers.

#### NANODES.

*Nanodes* was founded by Lindley upon a small-flowered species introduced from Rio de Janeiro in 1829 by the Horticultural Society of London, with which Reichenbach afterwards joined the far more

curious and attractive species described below. With these may be grouped two other species inhabiting the Andes of Central and South America, one of which, *Epidendrum* (*Nanodes*) *Matthewsi*, has been in cultivation for some time past in the Royal Gardens at Kew. The type species, *N. discolor* and *N. Medusæ*, were doubtfully referred to *Epidendrum* by Bentham, to which they conform as regards the union of the lip and the column, but their stems, prostrate in the first named species and pendulous in *N. Medusæ*, furnished with fleshy glaucous leaves, impart to them a habit so

revolute margin; lip very large, adnate to the column the entire length of the latter, with which it forms a funnel-like tube, the blade sub-orbicular, concave, bifid at the apex, densely and coarsely fringed at the margin, deep vinous purple. Column terete, green spotted with dark purple.

Introduced in 1867 by Messrs. Backhouse & Son of York, from the Andes of Ecuador, although probably first discovered a short time previously by Wallis, who sent a rude sketch of the flower to M. Linden of Ghent, by whom it was communicated to the late

FIG. 9.—NANODES MEDUSÆ.

distinct from all the cultivated *Epidendra* that for horticultural purposes it is better to keep them separate.

*EPIDENDRUM* (*NANODES*) *MEDUSÆ*.—Stems tufted, quite pendulous, as thick as the little finger, 6 to 10 inches long, sheathed by the imbricating bases of the leaves; leaves fleshy, lanceolate, acute, 2 to 3 inches long, glaucous green; flowers 3 inches across vertically, solitary or in pairs, terminal, with short terete bent ovaries that are pale green spotted with purple; sepals linear-oblong, acute, keeled behind, vinous-red in the middle, green at the base and apex; petals similar but narrower, and with slightly

Professor Reichenbach. It flowered for the first time in this country in the collection of the late Mr. John Day at Tottenham, in the summer of 1868. It is one of the most singular amongst Orchids, "its stout culms, its pale, glaucous foliage, and the extraordinary appearance and lurid purple of the flower give it a most sinister aspect."

*Cultural Note.*—*Nanodes Medusæ* should be grown in the *Odontoglossum* house, and receive treatment similar to that given to the dwarf growing *Odontoglots*. Pans with ample drainage or teak baskets that can be suspended near the roof-glass should be

preferred. The compost of sphagnum moss and peat should be kept constantly moist, and the plant while growing should receive a liberal supply of water. The flowers of this Orchid are among the most persistent in the order.

#### ONCIDIUM PAPILO.

AN interesting plant is this Orchid and not very difficult to grow. A warm house or stove is required. The plant may be grown either in a pot with peat, sphagnum, or an abundant drainage, or affixed to a charred block with copper wire. In the latter case sphagnum moss only need be used, but care must be taken that it has sufficient water. Its flower is peculiar, being formed like a butterfly of a bronze and yellow hue, and the bloom, which comes singly, issues from the extreme point of the knotted spike. This continues to flower for years, and on that account must not be cut away so long as blooms are wanted or it is possessed of sufficient energy to produce them. It is a most desirable and interesting plant, and comes from Trinidad.—W. S.

#### SCALDING AND CRACKING OF GRAPES.

IT is now some two years since a discussion took place in these pages on the scalding of Grapes, Lady Downe's in particular, and in which I took a part. Possibly the subject has remained fresh in the memory of some readers; at least it has to myself, as I have been a close observer since that time. Whether scalding of Grapes is more prevalent in the north than the south, and also more difficult to combat, as stated in the Journal a week or two since, I am not in a position to prove, but to my mind it appears illogical. The view I adopted did not appear very scientific to one able correspondent, but it was so to me. These notes may be in sufficient time to help the inexperienced to combat the evil, as their Grapes may be later than ours, for these have now passed through the ordeal of stoning and have commenced colouring.

I can honestly say that we have not had a single berry of Lady Downe's scald, and, as is well known, this is the Grape above all others which is prone to become damaged in this way. During the later stage of stoning exceptional care is necessary with Lady Downe's, whereas with other varieties ordinary care is all that is required to prevent their becoming scalded. The main point to prevent scalding of Lady Downe's is to keep sufficient heat in the pipes during the night and on dull days to prevent the berries becoming cold, or at least colder than the temperature of the house. A little air must be admitted to the house both by the top and bottom ventilators during the night, to be increased early in the morning, before the sun has power to raise the temperature 5°; the ventilation must also be increased as necessary, the aim being to allow the inside temperature to rise with the outside. When the temperature of the vinery is allowed to increase rapidly before sufficient air is admitted, the air becomes overheated, and is much warmer than the berries, consequently moisture condenses on them, and scalding takes place. The ventilation must also be decreased in the afternoon as the outside temperature lowers, care being necessary so that the temperature inside the vinery does not rise above the point it stood at when the ventilation was reduced. Many gardeners are very particular about the morning ventilation, yet they close the structure in the afternoon, and allow the temperature to rise to 80° or 90°. Scalding, under these circumstances, takes place just the same as when the temperature is allowed to increase rapidly in the morning.

The reason why I have included cracking of Grapes is because the same means which will prevent scalding in Lady Downe's will also entirely prevent cracking in Madresfield Court and Black Muscat. Many schemes have been put forward as remedies for this defect in this noble Grape, such as cutting halfway through the lateral, lessening the supply of water, &c., but this is of no avail if means are not taken to prevent the action of endosmose. Our Madresfield Court Vines receive abundance of moisture at the roots either when planted out or in pots. These latter I have watered five times during the day without the least ill effects, at least these were the best finished I ever saw. I am under the impression that deficiency of moisture at the roots is often the cause of inferior colour in this noble Grape, overcropping and weak root action through a cold root run being the next.

Returning to the subject of scalding of Lady Downe's, this evil is also very much aggravated through the roots working in a cold medium. Probably a strong root has descended into a cold and crude subsoil; the ascending sap, being very cold, also has its influence on the temperature of the berries. The same influence will also cause rust and imperfect fertilisation. When moisture condenses on the edge of the foliage to much extent at night time during the spring months, and whilst there is a comfortable warmth

in the pipes, it a sure sign that a strong root or roots is affording the support, and also working in a cold medium. A single stray root is quite sufficient to act in this way, as I have proved beyond doubt. I have searched and found the root, and also stopped the evil. On warm subsoils this may not be apparent, but on clay soils it is undoubtedly the case.—A. YOUNG.

#### ZONAL PELARGONIUMS AT CHILWELL.

AMONGST the many plants of interest at the Chilwell Nurseries at present the Zonal Pelargoniums claim the most attention, and deservedly so, for the large house devoted to them is a blaze of colour. There are rich and intense shades of scarlet and deep crimson, while two approaching yellow are very conspicuous, together with many tints of salmon and shades of pink and rose intermingled with white varieties of rare excellence. The pips and trusses are fine, produced on stout footstalks, carrying the flowers well above the foliage. The plants are dwarf and in robust health.

I cannot attempt to mention all I saw, but I jotted down a few of the newest forms. Sir Percival is one of the finest whites yet introduced—a decided improvement upon Amy Amphlett, though the last mentioned is grand, and will probably become a favourite market variety. It has the character of holding its flowers a long time either on the plant or cut. Sappho, salmon rose, very distinct compact truss; Rev. F. H. Brett, vermilion scarlet pips of immense size; T. Hayes, of about the same form, but deeper in colour; Duchess of Portland, bright rosy pink, an improved Constance, very dwarf habit; Launcelot, salmon scarlet, immense truss, very distinct; Phryne, cerise, shaded plum colour, very showy, fine bold truss; Opal, certificated by R.H.S. in 1889, a beautiful shaded salmon, very fine; Souvenir de Mirande, a striking variety, should be in every collection; Golden Vesuvius, an advance on Wedding Ring, a charming variety, shows up to great advantage, and will be an acquisition for bedding purposes; M. Porier, rich carmine shaded violet, enormous trusses—this appears to be the best in this colour, award of merit R.H.S. 1889.

Some seedlings on trial in the same house arrest special attention amongst these are many varieties that will be heard more about in the future. We notice one, an advance upon Perdita; it is named Midsummer, as it was certificated and named by the R.H.S. on that day. The colour is salmon, shading to white, very dwarf and sturdy in habit. I also observed an orange variety, even brighter than Golden Vesuvius; the pips larger, in a fine truss, of dwarf habit.

Double forms of many colours were also seen, of which the most attractive are Princess Van Hainhalt, pure white, good habit, and very free, useful for market work; Goldfinder, orange, approaching yellow, very showy; Mrs. Condon, rosy cerise, of compact form; C. Darwin, rich magenta, very distinct; H. V. Raspail, scarlet, excellent; Lord Derby, bright rosy pink. Many more are worthy of mention, but the above were all I had time to note in a rather hurried visit.—VISITOR.

#### STRAWBERRY NOTES.

##### LARGE STRAWBERRIES.

AT the Maidstone Rose Show on 30th June Mr. Edwin Amies put up some remarkably fine plates of Jas. Veitch Strawberry. They were of a rich colour, clean, of a uniform flat cockscomb shape, well finished. He was awarded first prize for both twenty-four and twelve fruits, and they scaled an average of 1½ oz. each, being exactly alike. The largest berry was 7 inches round. This was a performance that any grower might be proud of, and this gentleman is an amateur, and grew them in the town. When grown like this Jas. Veitch is of good quality, and only wants a little sugar.—G. B.

##### LAXTON'S NOBLE.

MANY correspondents have given their opinions as to the forcing qualities of Laxton's Noble, but all appear to have found it to be a failure as regards forcing. I should be pleased if Mr. McIndoe of Hutton Hall could be induced to give his opinion of it, as I am told he has forced it extensively this season. The reports in the gardening papers spoke very highly of the fruits he showed at Edinburgh. He also might be able to answer Mr. Riding's question as to its travelling qualities, which would be acceptable to many readers as well as to—T. C.

##### AUGUSTE NICAISE.

THIS, I believe, as it becomes better known will be considered one of our very best early Strawberries. A few days since I inspected a long row of it fruiting with trial rows of numerous

others, new and older standard varieties, at Barkby Hall Gardens, Leicester, and the unquestionable verdict was that it was the best of them all. It is extremely fruitful on young plants. The fruit is large, brightly coloured, and of good flavour, decidedly superior in this respect to Noble. The habit of the plant is good, the foliage being plentiful, but close and compact. I was surprised not to see it mentioned in the published report of Mr. Wright's valuable paper on "Garden Strawberries," read at the British Fruit Growers' Conference. [It is "mentioned" there.—ED.]

#### THE CAPTAIN.

Amongst the same trial rows of Strawberries is a row of "Captain," which is evidently an excellent variety for light land. Mr. Lindsell, the able gardener here, considers it one of his best after several years' experience with it. It is very prolific, and the fruit are of good size and colour. The flavour is superior to Noble, but not so good as Auguste Nicaise, which is very sugary and brisk, and has a suspicion of Pine flavour. Neither is Captain quite equal to that variety in the matter of firmness. Both are much alike in point of earliness, and are four to six days later than Noble.—W.

#### SEEDLING STRAWBERRIES.

In your report of the Trentham Show an error occurs. The seedling Strawberries certificated by the Judges (Messrs. Wallis, Bannerman, and Selwood) were shown by me. No. 1, a cross between British Queen and President, will be an early Queen flavoured variety. It is early, robust, and bears freely, colour bright red. No. 2 is between British Queen and Countess, good flavour, rich dark red colour, and bears abundantly fruit of the largest size. I have two other seedlings equally promising, but owing to the wet and sunless weather I have not been able to show them in their best form. I commenced hybridising Strawberries in 1836, and have some 600 plants, the result of fourteen crosses from British Queen. The object I have in view is to raise some highly coloured Strawberries with the flavour of British Queen.—WM. ALLAN.

### HARDY PLANTS.

#### ERODIUM MACRADENIUM.

THIS is not only one of the neatest of the alpine section of this genus, but it is also one of the most profuse flowerers. Its flowering invariably commences early in June, and is continued far into the autumn months; indeed, I have had it quite as good and as full of flower in October and November as at any time of the year. A tuft of this plant is one of the prettiest objects that can adorn the drier portions of the rockery at this season of the year. The flowers are of a delicate flesh colour, and veined with purplish rose, the broader petals having a dark base. Some years ago I was acquainted with a plant bearing the name of *E. macradenum* hybridum, which was an equally beautiful plant, having no dark base as in the above, and there is yet another, though I believe very rare at present, *E. trichomanifolium*, which is a sweetly pretty and graceful gem for the rockwork. These, with various other dwarf *Erodiums*, enjoy gritty loam in sunny exposures on the rockery, and I think their neatness and generally graceful habit should commend them to all lovers of choice alpinists.

#### DIANTHUS ATRO-COCCINEUS.

A showy dark crimson variety belonging to *D. cruentus*, which this season has attained 2 feet high, the small tufted heads standing out conspicuously among many perennials at this time. Fortunately it is easily grown in any ordinary soil, and should be found in hardy plant collections more frequently. It is easily raised from seed, a source from which improvements in the way of larger heads of flowers may yet be forthcoming.

#### LYCHNIS CHALCEDONICA.

The vermilion scarlet heads of flower produced by this fine old perennial have no equal among hardy plants. It is not only the showiest of all, but it is also one of the cheapest and most easily grown. It grows more freely and produces decidedly finer heads of flowers than the double form, while a sixpenny packet of seeds will produce more than sufficient for any ordinary garden. It has been discarded by many because of its single flowers, but those who desire easily grown, showy, and vigorous perennials should not lose sight of one of the best. Given a fairly rich soil, for—by the way, while easily grown, it should be by no means starved—and it will never fail to give every satisfaction annually.

#### LYCHNIS FULGENS.

The various forms of this *Lychnis* are likewise excellent showy herbaceous perennials. They embrace a much wider range of

colour, and include shades of flesh, white, scarlet, crimson, vermilion, &c., while the size of their flowers individually also vary considerably, some of the larger being nearly 2 inches across, of neat compact habit, rarely more than 1½ to 2 feet high, they constitute highly effective plants for the second row of the border, and grow quite freely in any rich loamy soil. Not unfrequently, by reason of the small rootstock and the stems dying annually, they are taken for dead, and more than once have I been the means of saving them from being thrown out, as their place is not marked by anything when the plant is at rest, therefore the necessity of labelling in some form or other. The rootstock may be compared to a cluster of Dahlia tubers in miniature and equally fleshy and brittle. Slugs are rather fond of the young shoots as they appear through the ground in spring, and on some heavy soils these play sad havoc with the plants if the latter are not attended to in time.—J. H. E.

### ROYAL HORTICULTURAL SOCIETY.

JULY 8TH.

SCIENTIFIC COMMITTEE.—Present: Mr. McLachlan (in the chair) Mr. Blandford, Dr. Müller, Mr. Wilson, Mr. Morris, and Rev. G. Henslow (Hon. Sec.).

*Acacia Seyal, stipules*.—Mr. Henslow showed a specimen of the stipules of this Central and North African species, having globular bases, about the size of large cob-nuts, terminating with slender points, 2 inches in length. They had been perforated and inhabited in all probability by ants. A discussion arose as to the possibly hereditary character of the abnormal size of the stipules of this and other species—*e.g.*, of *A. sphaerocephala*, the "Bull's horn" Thorn (as compared with the needle-like stipules of some Australian species) even when cultivated in England and in the absence of ants. It is well known that the presence of the ants causes an increase of the growth of the stipules, although they hollow them out and consume the pith as food. It is, however, the opinion of Dr. Beccari and M. Treub, who have studied many "ant-plants," that the comparatively large size of the stipules, even before they are attacked by ants, is due to the hereditary effects of the irritations set up in previous generations of trees ("Malesia" ii., and "Ann. Jard. Bot. Buit." iii., p. 129). An interesting description of *A. sphaerocephala*, &c., is given in Belt's "Naturalist in Nicaragua," p. 218.

*Lilium Martagon, fasciated*.—Mr. Elwes sent a large fasciated stem of this species, in which this abnormality had not been previously observed. It is not uncommon in other species. It bore at least 100 flowers on the flattened stem, which was about 2 inches across.

*Oak-staves, perforated*.—Mr. Morris exhibited portions of staves of beer barrels, made in England in 1889, and shipped to Aden in March, 1890, from the Indian store department. Of a hundred barrels nearly every one was found to leak, holes having been bored into the wood by the grub of some beetle. It was referred to Mr. Blandford for examination; but in the absence of all specimens of the creature, and any details in the history of the case, as—*e.g.*, whence the beetles could be derived, it is somewhat difficult to suggest a remedy.

*Carnations attacked by Wireworm (?)*.—Samples of plants and grubs were received from R.H.S. gardens at Chiswick. It was suggested by Mr. Barron that the creature might have been introduced in the "peat moss" (employed as bedding for horses) used as manure. It appeared to be a species of *Tipula*. Mr. Blandford undertook to make a further examination. Mr. Morris and Mr. Wilks remarked that Carnations were much destroyed in a similar manner both at Kew and Shirley. Mr. Henslow remarked upon the wonderfully efficacious effect of gas lime in destroying wireworms. Thinly spread over the ground and dug-in, a plot where previously not a Cabbage could be grown in his garden has borne excellent crops for several years since.

*Gladiolus with Unsymmetrical Flowers*.—Mr. Henslow showed a spray in which the two uppermost flowers were normal, the two lower reversed in position, having the stamens and style declinate, while one flower had them situated laterally. The streaked petals corresponded with the positions of the stamens in each case. The tubes did not appear to be twisted in any way. As the style and stigmas were altered in correlation to the stamens, it would probably not affect the fertilisation by insects, the latter being simply dusted with pollen in a different part of the body from usual. Mr. Morris remarked that he had observed similar alterations in the flowers of the *Gladiolus* at Kew.

*Foliage with Foliaceous Appendages*.—Mr. Henslow exhibited specimens (1) of leaves of *Acalypha cremurus* with narrow wing-like excrescence on the ribs and veins of the upper surface. Dr. Müller has described this peculiarity as a true specific character in this plant. 2, *Aristolochia siphon*, with apparent outgrowths on the lower surface. These appeared to be due to cracks in the leaf when young; a portion of the leaf then protrudes below, when adhesion again takes place. 3, *Arum maculatum* with a foliaceous appendage at the base of the blade. 4, Several specimens of Cabbage leaves with wing-like appendages to the ribs, as well as tubular and funnel-like appendages. Mr. Henslow pointed out the similarity between these foliar excrescences and many which occur on petals, especially *Gloxinias* (exhibited), *Primroses*, *Orchids*, and in the "crested" *Cyclamen*. In all cases they appear to be due to hypertrophy, and are a means of disposing of excess of nutriment, the foliar excrescences being correlated to the chorisis or branching of the fibro-vascular cords. In a monstrous form of *Mignonette*, described by the late Professor J. S. Henslow in 1833,

the ovules partook of identically the same character as the excrescences on the Cabbage leaves—viz., cups, funnel-shaped structures and foliar expansions. Such appears to explain the origin of ovules as being the outgrowths from the hypertrophied margins (placentas) of carpellary leaves.

*Plants Exhibited.*—Sir Trevor Lawrence sent *Bulbophyllum grandiflorum* and *Sarcopodium psittacoglossum*, for which a botanical certificate was unanimously awarded. A liliaceous plant with dark coloured flowers and two new species of Lily were sent by Mr. Ware. They were forwarded to Kew to be named.

### HINTS ON FORCING STRAWBERRIES.

In some gardens Strawberries must be forced in vineries and Peach houses, whilst in others houses are specially provided. Fruit is required usually from February to June, but the great months for forced Strawberries are April and May. Varieties.—1, To start before the new year for the earliest crops, La Grosse Sucrée and Vicomtesse Hericart de Thury. 2, To start at the new year for second early crops, Auguste Nicaise and Laxton's Noble. 3, To start by the middle of February for midseason crops, Sir Joseph Paxton and Sir Charles Napier. 4, To start in early March for late crops, British Queen and Dr. Hogg. For affording a full supply for a large establishment from March to June inclusive, I find 1000 plants of Sir Joseph Paxton, and 500 of each of those named necessary. That is a minimum, as besides those strong contingents are also grown Sir Harry, President, and James Veitch.

Sir Joseph Paxton has a bad character for mildew; it always redersed us excellent service. Sir Charles Napier is considered by some too "sharp." A substitute for Sir Joseph Paxton is provided in Auguste Nicaise, and for Sir Charles Napier in Noble. Auguste Nicaise is the brighter fruit, but both crop freely, and are fair in quality.

*Selecting Runners.*—Never take a runner off a non-fruiting plant, and always select the first runners. Old runners, as a rule, are late and weak.

*Rooting Runners.*—The best methods are two—viz., 1, In 3-inch pots firmly filled with good soil, in inverted turves of about 3 inches square, and a little less depth, and when well rooted transfer to the fruiting pots. 2, Layer at once into the fruiting pots. I prefer the former plan. The pots or turves being placed in suitable position half plunged or sunk, make an indent in the centre about half an inch deep, place the base of the runner therein, secure with a peg—galvanised wire 20 gauge, cut into 3-inch lengths, doubled similar to a hair pin, are best—and supply water at once, afterwards giving careful attention to induce the runners to root quickly. If layered in the fruiting pots leave them attached to the parent plants until thoroughly established; those in small pots should be detached as soon as the pots are well filled with roots, and be placed on moist ashes in a shady place for a few days. Those layered on turves may be treated similarly, only as they do not make as much leaf growth, being harder with more fibrous roots, they may be transferred to the fruiting pots at once—that is, after they become well rooted. These invariably develop good crowns, and crop as well or better than those with a larger display of leaves.

*Pots.*—For early forcing 5-inch pots are ample; 6-inch pots are a useful size for successional or late plants. Ordinarily 7-inch pots are best for late forcing, as the plants have more time to make roots and perfect a good crown. Some growers place two plants in 8-inch pots, and three in 9-inch pots. The pots should be clean inside and out. Hard are preferable to soft pots, as the former keep clean longer.

*Compost.*—Turfy loam, rather strong and well filled with fibre, should form the staple. It should only have been laid up sufficiently long to destroy the herbage. This will be rich enough without manure unless poor, when a fifth part horse manure may be added; but rich soil only favours a luxuriant crop of leaves. Break the turf up with the hand, or chop it into pieces of an inch or two square; add to every three bushels a quart each dry wood ashes, soot, and dissolved bone (superphosphate). Have the soil moderately dry. When wet it hinders the work, forms a soapy mass, hardening afterwards into brick-like substance, shrinking from the sides of the pots.

*Potting.*—The hole in the pots must be three-quarters inch in diameter; less is useless, larger unnecessary. One large crock, so as to extend over the hole, and concave side downwards, with three or four larger pieces of a little less size to form a layer over it, and then a thin layer of small pieces, sifted so as to remove the dust, or better a thin layer of steamed half-inch bones; 1 inch to 1½ inch depth for the smaller size of pot, and 1½ inch for the larger size, is ample drainage. An oyster shell concave side down over the hole, some crushed bones (steamed) make capital drainage.

Place enough of the rough compost in the pots, and ram it firmly with a potting stick about 9 inches long, having the soil half to three-quarters of an inch below the rim.

*Situation for the Plants.*—Place them on a layer of ashes 6 to 9 inches thick, fully exposed to the sun. Shelter from winds, afforded by hedges or walls, not so near as to shade, is desirable. If the plants stand just clear it will be sufficient at first, but in about three weeks' time from potting they will require placing a foot or 18 inches apart.

*Watering.*—When the soil is becoming dry, and before the foliage flags, a thorough supply of water must be given. Examine them for this purpose frequently. Syringe the foliage in the evening of hot days. Remove all runners as soon as they show a joint. Weeds must not be tolerated; but keep the soil free from moss.

*Removing Side Crowns.*—Some varieties, especially Vicomtesse

Hericart de Thury, form side crowns, and unless they are removed the central one is weakened. Take care in removing them not to injure the central bud or damage the leaves. All varieties are the best looked over not later than the early part of September where fine fruits are desired.

*Wintering.*—By the middle of October the early varieties must be placed in pits or frames, and plunged to the rims of the pots. The lights need only be used in case of heavy rains, then tilted top and bottom, and in case of snow and frost. Whenever the temperature is about 35° outside withdraw the lights. All that is wanted is rest without heavy rains, snow, and severe frosts. Midseason plants should be plunged to the rim in ashes in a sheltered situation. In very severe weather protect them with a little dry soft straw. Late plants require similar treatment to the last named. All plants must be in their winter quarters before severe weather. Letting the roots get frozen in the pots is only courting disaster.

### TREATMENT OF FRUITING STRAWBERRIES.

*Suitable Structures.*—These should be light, well ventilated, having sufficient hot-water pipes to maintain a temperature of 70° to 75° without hard firing. They must be provided with stages or shelves to keep the plants near the glass. The foliage can hardly be too near the glass without touching it, but they will not take harm at a distance of 3 feet provided they have unobstructed light. Air is essential, and if it reach the plants below or above them it is preferable to coming directly upon them sideways. Shelves in vineries and Peach houses are not the best of places, but much can be effected by such means by removing the plants as the structures accord in temperature, &c., with the requirements of the Strawberries in their different stages. To force Strawberries well two structures are required, so that a succession can be maintained, as up to setting they do not require a high temperature, but after the fruit is fairly swelling they need a good heat with corresponding moisture, which can hardly be accorded to Peach houses and vineries without prejudice to the Peaches and Grapes.

*Preparing for Forcing.*—A clean house is necessary. The glass clear, the woodwork well cleansed or painted, the brickwork lime-washed. Plants for starting in November for the earliest crops must be in the frames early in October, and as they will be removed by the middle of November others can take their place for starting later. It is well in all cases to have the plants a month or six weeks in frames preparatory to their being introduced to artificial heat.

Remove decayed leaves, avoiding close trimming, and retain all green foliage. Rectify the drainage if defective. If worms are in the soil stop the base of the pots with clay, and soak with lime water. The worms will be expelled, and the drainage can then be put right. Wash the pots, surface dress the soil with fresh horse manure rubbed through a sieve. Turfy loam being similarly treated, with a quart of Thomson's manure added to every bushel is first rate. The plants must have room on the shelves for the expansion of their foliage without crowding.

*Temperature.*—Commence with 45° to 50° as the artificial temperature. Raise it in the course of a fortnight to 50° to 55° by artificial means, the former the night, the latter the day temperature. Let it fall 5° on cold nights, but get the heat up to the artificial day temperature by 8 A.M., or an hour after daybreak, or if cold and dull 5° less may be allowed through the day. With sun allow an advance to 60° on cloudy days, with occasional clear intervals, 65° with about as much sun as cloud alternating, and to 70° with a clear sky, in all cases closing so early as to advance 5° on temperatures indicated. When the fruit is set slightly increase the temperature, advancing 5° in the course of a week, and 5° more in the course of a fortnight, which will bring the night temperature up to 60° or 65°, and the fruit will then be advanced in swelling, and bear a much higher temperature. This stage of the fruit being reached, and the crop having to be finished in the same house, the night temperature should be kept at 65°, falling 5° on cold nights, and ruling 5° higher on warm nights, 70° to 75° by day from fire heat, and 80° to 90° through the day from sun heat. This can be continued until the fruit begins to ripen, when a temperature of 60° to 65° at night and 70° to 75° by day will be all that is necessary, admitting air more liberally. The fruit is found to have better flavour than when ripened in a hot and moist atmosphere.

*Ventilation.*—Until growth is commencing little air will be required except when the temperature reaches the day limit. Closing should be effected sufficiently early to raise the heat 5° above the maximum day temperature. Ventilate slightly at the top before nightfall, and let it remain on constantly except when the house is closed in the afternoon. This procedure is to be adopted throughout the whole of the forcing period with but two exceptions—when the plants are flowering and when the fruit is ripening. At those times a circulation of air should be maintained constantly.

*Watering.*—The plants should be attended to once a day in the early stages of growth, two or three times a day when they are in free growth and their crop swelling. After the fruit begins to ripen water should only be given to prevent the foliage flagging. All water used should be tepid, a few degrees warmer than the house.

*Syringing.*—Syringe the plants morning and afternoon up to the flowering period, the exceptions are when the weather is cold and dull and the foliage does not become fairly dry before night. A gentle even sprinkling is best. In dull weather damping available surfaces in the morning and afternoon will be sufficient. Avoid saturating the flowers, ceasing when the flowers are fully expanded. After flowering have recourse to syringing again in the morning and afternoon, discontinuing it as soon as the fruit gives the least indications of ripening. Water on

the fruit after it changes colour causes it to be spotted, and the least speck ruins a large fruit.

Liquid manure may be given every alternate watering until the fruit commences ripening, when it must be discontinued. The drainings of stables, farm or dung yards diluted with six times the bulk of water are good, but their great drawback is their uncertain strength. A peck of sheep manure to 30 gallons of water makes an excellent liquid manure, and so does cow and fowl manure. Guano 1 lb. to 20 gallons of water is handy and suitable. The liquid in all cases must equal in temperature that in which the plants are growing, and it must be kept from the foliage and fruit.

*Flowering.*—If placed in a strong heat at once the flowers may unfold, but the stamens generally turn black or shrivel, and the pistils also become black or abortive. This sometimes is a consequence of immature crowns, but it often arises from bringing on the plants too rapidly. A light sprinkling may assist in liberating the pollen, but it is best omitted. Ventilate early and freely; avoid sudden fluctuations or depressions of temperature, cold currents of air, and a moist confined atmosphere. Brush the flowers lightly on a fine day when the pollen is ripe with a camel's-hair brush, a bunch of feathers, or a plume of Pampas Grass. Air in motion will do it just as well, and a sharp gentle rapping on the lower part of the trusses is good.

*Thinning the Flowers and Fruit.*—This is a necessary and not difficult matter, as the trusses have all the best flowers at the lower part, and when the trusses have about half their flowers expanded the buds on the upper part may be removed. La Grosse Sucrée does not give half the flowers of Vicomtesse Hericart de Thury, and it would be unwise to thin the flowers of the former as much as the latter. Half a dozen fruits on La Grosse Sucrée correspond to nine or a dozen on Vicomtesse Hericart de Thury. A dozen fruit is a full crop on the former, two dozen on the latter. This, however, is not an average. Six good fruit on La Grosse Sucrée and a dozen on Vicomtesse Hericart de Thury are nearer the mark than the larger or double number, and the six or twelve may be quite as heavy as the dozen or two respectively. A dozen fruits on Auguste Nicaise or Noble will swell to a size and weigh equal to a half dozen of Sir Joseph Paxton or President. The crown or king fruit always takes the lead, and if the fruits are wanted these only should be retained.

*Supporting the Fruit.*—Forked twigs of Birch, Hazel, Hornbeam, &c., form the best supports for the fruit, cutting them into suitable lengths, the lower end pointed and thrust into the soil at such an angle and position as will best suit the trusses and support the fruit above the foliage or clear of the pot. The trusses or individual fruits have their stems placed in the fork, so that the fruit will be clear of the stick, pot, and foliage. Small stakes, and the fruit stem secured to them with string, will be found useful in the case of large fruit which is much more liable to damage than medium or small fruit.

*Gathering the Fruit.*—Morning should as far as practicable be the time of gathering Strawberries, and the fruit should be just ripe, which requires some experience and judgment with different varieties. Always gather with sufficient stem to hold the fruit by.

*Retarding the Fruit.*—At times the fruit comes on too rapidly, and it is necessary to keep it back in order to maintain the succession, or reserve it for particular occasion. It is no use, however, striving to retard the fruit before it is swelled and well advanced in colour, then much may be done by turning the fruit from the sun, or removing the plants to a north house, where plenty of air can be admitted, and with all the light possible, without sun, the fruit will ripen perfectly; indeed, sun-heated fruits when the plants lack moisture at the roots, are never so juicy as those not sun-dried, nor so pleasing in flavour. A single thickness of tiffany shading will prevent the fruit ripening so fast, the temperature being kept at 60° to 65°, and the atmosphere well ventilated. The fruit may be kept on the plants in a cool airy fruit room when it is ripe, and have the shutters down so as to admit light. In such position it will keep a few days.

*Maintaining the Succession.*—Plants introduced about the middle of November will afford fruit from the middle of February to March, and to maintain a regular succession until the open air fruit comes in plants must be introduced every three weeks up to early May. Orchard houses and fruit wall cases are invaluable for affording late supplies.

*Insects.*—Caterpillars are sometimes troublesome. They are best removed by hand-picking. Aphides attacking plants outdoors may be destroyed by watering or sprinkling them with tobacco juice diluted with six times the quantity of water. Thrips and red spider will be killed by dipping the infested leaves in a solution of softsoap, 2 ozs. to the gallon of water. A grub gets into the crown and eats out the heart bud, the plants consequently are blind. Examination of the plants in late summer will mostly be rewarded by finding the pest about the base of the crown. Aphides infest the scales of the crowns when the plants are in frames. Sprinkling with the tobacco water is the best cure. Inside the forcing structures aphides multiply rapidly on the swelling crown and infest the trusses as soon as they appear. A sharp look-out should be kept for them. Fumigate thoroughly, and repeat if necessary until the flowers are showing colour. After the fruit is set fumigation must be done very moderately and carefully, as the fruit will be so dried or injured that it will not swell freely. The tender foliage also is injured by excess of tobacco smoke. Red spider will not trouble if syringing be attended to. If it obtain a footing on the foliage sponging with soapy water is the best remedy.

*Results.*—Fruit from mid-February to mid-June certain. La Grosse Sucrée and Vicomtesse Hericart de Thury, giving fruit of half to one

ounce each, 1 oz. to 1½ oz. is the top weight of those kinds, and half a pound a fair average weight of the produce per plant. Sir Joseph Paxton and President in their finest examples reach 1½ to 2 ozs., and give as an average ¾ lb. per plant, Sir Joseph Paxton being the heavier. Sir Charles Napier will afford fruit of similar size to those last named and heavier if well thinned, and 1 lb. weight per plant, and in the same category as to size may be placed British Queen and Dr. Hogg, but a lessened weight per plant by a ¼ lb., but then the quality tells, or ought, only buyers will not see it. Auguste Nicaise and Noble reach 2 ozs. per fruit individually, and 2 lbs. per plant respectively occasionally, but a fair average for those is 1 oz. per fruit and 1 lb. per plant. Those are not sensational weights neither of individual fruit or plant, but they are such as attend good culture, and cannot be attained without high aim. Under common culture the results are about half.—G. ABBEY.

## HORTICULTURAL SHOWS.

### WINCHESTER.

THIS was held in conjunction with the Royal Counties Agricultural Show in the ancient city on the 8th inst. Taking the Exhibition all round it was considered by far the best that has been held. This was largely due to the fact that this Society is managed so well by the Committee, of which Mr. F. W. Flight is Chairman, and a thorough enthusiast in gardening, ably assisted by Mr. Chaloner Shenton, the courteous and industrious Honorary Secretary.

*ROSES.*—Considering the unfavourable state of the weather lately experienced it was surprising to see how well these were presented. They were not large, but of good form, colour, and freshness, making a great display. The principal class was for forty-eight distinct single trusses. The display was a grand one. After a close inspection the Judges awarded premier honours to Mr. Benjamin R. Cant, Colchester, the blooms being rather larger and more solid than those in the second prize stand, which, however, were rather more highly coloured. The following were the varieties:—Back row: Thomas Mills, Dupuy Jamain, especially fine; Madame Eugène Verdier, Camille Bernardin, Duchesse de Morny, Marie Baumann, Madame Isaac Pereire, Merveille de Lyon, Susanne Marie Rodocanachi, Earl of Dufferin, very fine; Madame C. Vigneaux, Annie Wood, extra; Edward Herve, Ulrich Brunner, La France, and Alfred Colomb. Middle row: Marshall P. Wilder, Her Majesty, Sultan of Zanzibar, François Michelin, Madame Prosper Laugier, Marie Verdier, Sir Rowland Hill, Earl of Pembroke, very full; Prince Camille de Rohan, Niphotos, Duke of Edinburgh, Mrs. John Laing, Général Jacqueminot, Madame Gabriel Luizet, Victor Hugo, and Baroness Rothschild. Front row: Charles Lefebvre, Le Havre, neat; Madame Bravy, Eclair, Souvenir d'un Ami, Horace Vernet, Madame de Watteville, Lady Helen Stewart, John Hopper, Beauty of Waltham, grand; Comtesse de Serenye, Maréchal Vaillant, Souvenir de la Malmaison, Prince Arthur, Souvenir d'Elise, A. K. Williams, rich. Mr. Frank Cant was an extremely close second, his most noteworthy blooms being Général Jacqueminot, Prince Arthur, Niphotos, The Bride, Mrs. J. Laing, Earl of Dufferin, and Beauty of Waltham. For twenty-four distinct trebles Mr. Frank turned the tables on his rival somewhat easily by winning with blooms especially bright in colour and of good form, although not large. Messrs. Keynes, Williams & Co., Salisbury, were third with a good collection.

For eighteen Tea or Noisette varieties the first prize was adjudged to Mr. B. R. Cant for rather small blooms of the following:—Catherine Mermet, good; Innocente Pirola, Jules Finger, Madame Margottin, Niphotos, Souvenir d'un Ami, Marie Van Houtte, Comtesse de Nadaillaz, Madame Cusin, Souvenir d'Elise, Madame Lambard, fine; Madame de Watteville, The Bride, Luciole, Madame Hoste, Francis Kruger, Devoniensis, and Maréchal Niel. Mr. Frank Cant followed, Innocente Pirola, Anna Ollivier, The Bride, and Madame Lambard being the best. Messrs. Keynes, Williams & Co., were third. The prizes went in the same order for trebles of twelve varieties of Teas or Noisettes.

In the class for twenty-four Roses, distinct, Messrs. Keynes, Williams and Co. were easily first, staging grand blooms in the following order:—Back row: La France, Madame Victor Verdier, Madame Eugène Verdier, full; Senateur Vaisse, Mrs. J. Laing, Louis Van Houtte, François Michelin, and Earl of Dufferin. Middle row: A. K. Williams, Ulrich Brunner, full and rich; Marshall Wilder, good; Catherine Mermet, Etienne Levet, Her Majesty, Madame C. Wood, and Merveille de Lyon. Front row: Marie Verdier, Beauty of Waltham, Alphonse Souper, Charles Lefebvre, Madame de Watteville, Marshall P. Wilder, The Bride, and Heinrich Schultheis. Second, Messrs. Perkins & Son, Coventry, with small but neat and fresh blooms. Mr. E. Hillier, Winchester, was a good third.

For twelve blooms of any dark variety of Hybrid Perpetual there were six entries, a stand of A. K. Williams from Messrs. Perkins and Sons being much the best, medium size, wonderfully fresh, and good in colour, with small but exquisitely coloured blooms of Prince Arthur. Mr. B. R. Cant took second honours, Messrs. Keynes being third with Ulrich Brunner. For the same number of blooms of any light variety Mr. Frank Cant secured first honours with fresh well coloured examples of Mrs. J. Laing; Mr. B. R. Cant second with Merveille de Lyon. For twelve blooms of any one variety of Tea or Noisette Mr. B. R. Cant was first with Madame de Watteville, Messrs. Keynes second with The Bride.

The following classes, not open to nurserymen, made a capital show. Some excellent blooms were staged. For twenty-four distinct three

competed. P. Burnand, Esq., Wray Park, Reigate, was first with medium sized well shaped flowers. F. W. Flight, Esq. (Mr. W. Neville, gardener), was a close second. For twelve trebles the Rev. C. Eddy, Brawby Rectory, Basingstoke, was easily first, Mr. Neville second, and Mr. R. E. West, Reigate, third. Mr. Neville easily secured leading honours for twelve Teas or Noisettes, distinct, with neat fresh blooms of medium size, also for twelve distinct Roses. Mr. Chaloner Shenton was second, both staging well.

**PLANTS.**—These were staged in moderately large numbers, and of fairly good quality. For twelve stove or greenhouse, distinct, six to be in bloom, the first prize was somewhat easily secured by Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, Southampton, with well grown healthy specimens, *Cycas revoluta*, *Croton Princess*, *Kentias Fosteriana* and *Belmoreana*, *Clerodendron Balfourianum*, and *Kalosanthes coccinea* being the most noteworthy. Mr. J. Currey, gardener to Colonel Pepper, Milford Hall, Salisbury, second. In the class for eight plants the position of these two exhibitors was reversed, both staging creditably. Ferns were well shown by Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, who took first prize. Begonias, Coleus, Geraniums, and Gloxinias were in all classes represented by meritorious specimens.

**GROUPS.**—These were amply provided for in the schedule. In the open class there were only two exhibitors, Mr. J. Currey and Mr. E. Wills, who secured the prizes in the order named. In the second class, nurserymen excluded, there were seven competitors. Mr. E. Carr, gardener to R. W. Gillett, Esq., Fair Oak Lodge, Bishopstoke, secured first honours with a bright arrangement, in which were a good number of Orchids. Mr. Thos. Lowes, gardener to F. C. Berch, Esq., Clovelly, Winchester, second; and Mr. E. Wills third. Several of these groups were much too packed, and the plants in some of them weak.

Stands of cut flowers and bouquets made a good show. For the best dressed single vase Miss Flight secured the coveted award with a light arrangement in which were several good blooms of *Cattleyas*, that imparted richness to the base. Miss J. L. Smith, The Deane, Sparsholt, was second. For a similar dressed vase, open to ladies only, Miss J. L. Smith and Miss Agnes Flight were first and second respectively, the former having a pretty arrangement of white *Marguerites* with which the pink tinted foliage of the young *Maple* shoots contrasted well. Messrs. Perkins & Sons secured leading honours with both ball and bridal bouquets, Mr. E. Hillier second. Special prizes were offered by Mr. T. S. Ware for eighteen bunches of hardy perennials; here Mr. Neville was an easy first with a well arranged stand.

**FRUIT.**—This made a good display and was generally of excellent quality. For a collection of six distinct dishes Mr. G. A. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, secured the premier position with well coloured even bunches of *Black Hamburgh* and fairly good *Muscat of Alexandria* Grapes, excellent *Royal George* Peaches, *Hero of Lockinge* Melon, and splendid *President* Strawberries. Mr. J. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, was an extremely close second. Grapes in three bunches of black were well staged by four exhibitors. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, easily secured first honours with well shaped bunches of *Black Hamburgh* (*Mill Hill*) and extra fine berries of good colour. Mr. F. Cawte, gardener to W. Cotesworth, Esq., Abbots Worthy House, Winchester, was second with the same variety in good order. He also secured the leading position in the class for three white bunches with extra fine *Foster's Seedling*, Mr. N. Molyneux closely following with good *Buckland Sweetwater*. Melons made a good show, Mr. Inglefield secured first honours with *Hero of Lockinge*, Mr. Budd second with same variety. Splendid *President* and *Sir Joseph Paxton* Strawberries were staged by Mr. Inglefield in the class for two dishes Mr. Thos. Lowes following with the last named variety, and Sir C. Napier with extra finely coloured *Royal George* Peaches. Mr. Inglefield was an easy first in the class for six fruits, Mr. Allen following.

**VEGETABLES.**—These were staged in large numbers, and of excellent quality, as many as ten exhibitors entering for the prizes given by Messrs. Sutton for six distinct kinds. Mr. J. Allen was awarded premier honours, followed by Mr. R. Lye, gardener to W. H. Kingsmill, Esq., Sydmonton Court. For the best nine Tomatoes in a special class (also provided by Messrs. Sutton) Mr. Chaloner Shenton secured the first prize with fine fruits of *Perfection*; Mr. J. Allen second; he also took first prize for Sutton's Improved *Telegraph* Cucumber in a special class for that sort. Mr. B. Ladhams, florist, Shirley, Southampton, staged (not for competition) some fine herbaceous cut flowers, which made an imposing display.

#### WIMBLEDON.

HELD in the beautiful grounds of Wimbledon House (Sir Henry Peck's), on one of the most miserable of days, the 9th inst., we fear this creditable Exhibition could not be adequately attended. The adverse weather also naturally limited the display of Roses, but surprisingly good stands were forthcoming. There was a good display of stove and greenhouse plants, some beautiful groups, excellent fruit, and splendid vegetables.

**ROSES.**—The special prizes offered for twenty-four blooms were won by J. Bateman, Esq., Rose Vale, Highgate, Mr. C. Gibson, gardener to J. Wormald, Esq., Marden Park, and Mr. Ware, gardener to G. Walters, Esq., Woodhayes, in the order named, all staging well. Mr. Bateman's blooms were wonderfully clean, firm, and fresh, though not large. His varieties comprised *Ulrich Brunner*, *Her Majesty*, A. K. Williams, *Dupuy Jamain*, *Etienne Levet*, *Madame Charles Wood*, *Madame Norman Neruda*, *Baronne de Rothschild*, *Earl of Dufferin*, *Marie Verdier*, *Beauty*

of *Waltham*, *Mrs. John Laing*, *L. Van Houtte*, *Marie Finger*, *Duke of Albany*, *Heinrich Schultheis*, *Marie Rady*, *Madame G. Luizet*, *Charles Lefebvre*, *Duke of Wellington*, *La France*, and *E. Y. Teas*. Mr. Bateman also easily won the chief prize in the amateurs' class for twelve Roses with similarly good blooms, *W. R. Faulkner, Esq.*, being second with very fresh examples, but a little too "assisted" in opening.

In another class for twelve Roses the prizes were adjudged to Mr. C. Gibson, Mr. W. R. Faulkner, and Mr. H. Alderman, gardener to G. Hatfield, Esq., Morden Hall, respectively. The varieties in the first prize stand were *Paul Neyron*, *Ulrich Brunner*, *Merveille de Lyon*, *Pauline Talabot*, *Comtesse d'Oxford*, *Marie Baumann*, *Général Jacqueminot*, *Senateur Vaisse*, *Prince Camille de Rohan*, A. K. Williams, and *Rubens*, all very fresh. Messrs. G. T. Harman, J. W. Wright, and W. R. Faulkner were the prizewinners in other classes. An extensive and excellent collection of Roses were sent by Messrs. James Veitch and Sons, not for competition, and very highly commended.

**PLANTS.**—The best specimen stove and greenhouse plants were staged by Mr. J. Bentley, gardener to Sir T. Gabriel, and he also secured the first prizes for Ferns and *Caladiums*; Mr. Ware second. Begonias were well exhibited by Messrs. Methven, Thornton, and Law, and Gloxinias by Messrs. Bradford, Bentley, and Curtis, the respective prize-winners. Mr. H. Alderman had the best ornamental foliage plants. Some very beautiful groups were arranged, notably by Mr. Ware, gardener to W. Walters, Esq., who secured the chief prize in one section, and Mr. E. Newell, gardener to Sir E. Saunders, who took the lead in the other. Mr. Ware employed *Caladium argyrites* with great effect in his undergrowth of Ferns, and Palms, *Amaryllises*, *Liliums*, and *Gladiolus* The *Bride* were pleasingly associated. *Amaryllises* were also very fine in Mr. Newell's group in which well grown Begonias, Gloxinias, and Ferns were tastefully disposed. The margins were neatly formed with *Isolepis*, *Panicum*, and *Selaginellas*, all very fresh, and no pots visible. Messrs. Law and Methven were also successful exhibitors, and their contributions would have won higher positions at many shows.

**FRUIT.**—This was generally of good average quality, and the competition close. In a collection of this dish Mr. C. Gibson just managed to "creep in first" with good *Black Hamburgh* and *Muscat of Alexandria* Grapes, *Melon*, *Cherries*, *Strawberries*, and *Peaches*; Mr. Waite, *Glenleigh*, being an extremely close second, and Mr. Alderman third. The two first-named exhibitors were placed in the same order with *black Grapes*, and Messrs. Selden and Bentley with white.

**VEGETABLES.**—There was splendid competition for the prizes offered by Messrs. Sutton & Sons and *Jas. Carter & Co.*, Messrs. Waite and Lyne being first and second in both classes, Mr. Gibson third in the former, and Mr. Coll in the latter. The Society's prizes were well won by Messrs. Law, Waite, Chandler, Bentley, first prize winners, followed by Messrs. Harman, Coll, Day, and Lyne. It is not often that finer produce is seen than was exhibited on the occasion.

Messrs. D. Thomson & Sons contributed powerfully to the Exhibition by a great assortment of hardy herbaceous flowers and beautiful baskets of flowers, bouquets, and wreaths—a most meritorious display. Messrs. J. Laing & Sons exhibited a superb group of plants and Begonias, and Mr. Peed had also an effective display.

Dr. George Walker and Mr. Lyne, the chief officials, had a smile for everybody, and it would be interesting to know how much rain would be needed to damp their ardour in the management of a show.

#### TEDDINGTON.—JULY 9TH.

THE Teddington Royal Horticultural Society succeeded in obtaining a highly satisfactory Exhibition last week in the grounds attached to the residence of F. Houghton, Esq., Park Road; but the weather could scarcely have been worse for a July day. It commenced raining about noon, and continued with deplorable persistency throughout the greater part of the day, effectually deterring the majority of intending visitors from assembling in the Show ground. Misfortunes like these occur to all societies at times, and the present season has so seriously decreased the gate receipts at many a show that their financial resources will be sadly taxed unless there is a substantial balance at command. This is too seldom the case, and it is wise where possible to make some provision for the proverbial "rainy day." Perhaps the best way is by the sale of tickets before the show day, and a few of the most prosperous societies have by this plan repeatedly saved themselves from heavy losses, or even probable bankruptcy. Another method, which is, however, open to several objections, is to prolong the time of the show to two or three days. Still, this has in some notable instances enabled the societies to avoid financial failure, and it is worth consideration. The great difficulty is where cut flowers form a large portion of the show, as by the close of the first day these are seldom worth looking at, and they would have a sorry appearance the next day. Plants and fruit, however, might always be safely left for a couple of days at this time of year, and these, with vegetables, constitute the greater portion of summer shows when the Roses are past.

Nineteen annual exhibitions have been held in Teddington, and for some years they have been distinguished by the freshness and good quality of the exhibits. There has indeed been a steady advance, and within the last ten years the improvement has been most marked. The Society has done good work in the district in promoting a love of horticulture. Considerable amateur enthusiasm has been aroused, and the support thus afforded is amply deserved. Such gentlemen as Messrs. W. Furze, W. Howard, and E. H. Douet have rendered invaluable service in the past, and the Society's future success will depend greatly upon a continuation of their exertions. A strong and practical Committee has been formed, with good workers in Messrs. Davies, Anderson, Coombs,

and others, while the duties of Honorary Secretary are performed in a most satisfactory manner by Mr. Alfred R. Simmonds, who devotes considerable time to the Society's business.

Three large tents were occupied with plants, flowers, and vegetables, the last named being very strongly represented from amateurs, gardeners, and cottagers. Near entrance of the plant tent was a grand group of Orchids from Mr. Osborn, gardener to W. Howard, Esq., The Grove, Teddington, amongst the plants shown being *Odontoglossum vexillarium*, *Cattleya Warneri*, aurea and *Sanderiana*, with *Oncidium macranthum*, and brightly flowered plants of *Epidendrum vitellinum*. The plants were in excellent health and effectively arranged. For a group of plants, Mr. Sutton, gardener to J. S. Sassoon, Esq., Ashley Park, Walton, was awarded first prize for most tasteful contributions, well furnished, light, and quite free from formality. Mr. Fordham, The Nurseries, Twickenham, was a good second, but his group was slightly too flat in the centre. In the class for a smaller group (9 feet by 6 feet), Mr. J. Reeves, Oatlands Park Gardens, was the only exhibitor, gaining first prize for an arrangement that would not have been easily surpassed. With six stove and greenhouse plants, and the same number of exotic Ferns, Mr. Reeves was also first for capital specimens. Mr. G. Watts, gardener to H. Little, Esq., Twickenham, was first for four Orchids, and secured similar honours for Tuberous Begonias, but in the latter class, Mr. Coombs, gardener to W. Fuze, Esq., Roselands, Teddington, who had smaller plants, but excellent varieties. Fine-foilage plants came from Mr. Reed, gardener to G. Pettit, Esq., Oatlands Park, and Mr. Sutton in the class for six, and the contest was a close one, being decided in favour of the former by a few points. With three fine-foilage plants, Mr. J. G. Burton, Cambridge House Gardens, Twickenham; Mr. T. Gregory, gardener to J. F. Weymouth, Esq., Bushey Nook, Teddington; and Mr. Reeves were the prizetakers. Achimenes, Caladiums, and Coleuses were represented by admirably grown plants, and the prizes went to Messrs. Gregory, Coombs, Sutton, and Piper. In this tent also were fine groups of plants from Messrs. J. Laing & Sons, Forest Hill, and Puttock & Sheppard, Kingston.

Cut flowers comprised Roses, hardy flowers, Pelargoniums, and Gloxinias; while the floral decorations comprised stands of various forms, baskets of Roses, bouquets, buttonholes, sprays, &c. In this department much taste is displayed, and several contributions were of unusual excellence. The Roses were fresh in the leading stands, and the cut flowers generally possessed much merit. The fruit was also arranged in the same tent, and comprised some creditable specimens of Grapes, Pines, Peaches, Nectarines, and Melons. Mr. Osman, gardener to J. Baker, Esq., Ottershaw Park, Mr. W. Bates, Mr. Waite, and Mr. Reed were the chief exhibitors. As already noted, vegetables were remarkably good, and the entries numerous in nearly every class.

#### TUNBRIDGE WELLS.

THE thirty-second annual Show of this Society was held in the Spa Grounds on the 9th inst. by kind permission of Mr. Dicks. The weather was very much against a financial success, rain falling incessantly throughout the afternoon and evening. Those who braved the storm were, however, rewarded with one of the finest exhibitions ever held under the auspices of this old established Society. The Committee may be commended for the liberal schedule issued, and it is unfortunate that their generosity did not meet with better support on the part of visitors. The tent in which were arranged the cut flowers and fruit proved the centre of attraction throughout in spite of the grand display of specimen plants and groups arranged by Mr. Offer of Handcross Park, Mr. S. Portnell, gardener to Sir A. Ashburton, Mr. S. Pope, gardener to J. Barrow, Esq., Langton, Mons. L. Dupond, gardener to J. Allchin, Esq., and many other well known plant growers.

In the open class for eight stove and greenhouse plants Mr. Portnell secured the first prize, second Mr. A. L. Offer, third Mr. S. Pope. In the class for four plants Mr. S. Pope secured first, Mr. A. Offer second, and Mr. Portnell third prizes. With eight ornamental foliage plants Mr. Offer came to the front, Mr. Pope second. Mr. Offer was also awarded first for eight exotic Ferns, followed by Mons. L. Dupond. For the group of Ferns Mons. L. Dupond was easily first with a splendid group. The other prizewinners for plants being Messrs. Hickmott, Allan and Wilkins. Cut Roses were well shown. In the class for forty-eight, distinct, Mr. Brown, gardener to Mrs. Waterlow, Reigate, securing premier position with a grand stand, followed by Mr. B. R. Cant, Colchester, and Messrs. G. Bunyard & Co., Maidstone. Mr. Brown also secured the National Rose Society's medal for a beautiful bloom of *Innocente Pirola*. With twelve Teas or Noisettes Mr. B. R. Cant was first, Mr. J. Brown second, and Messrs. J. Cheal & Son third.

The strongest competition was in the fruit classes, sixty bunches of Grapes being staged. Mr. J. Osman, gardener to L. J. Baker, Esq., secured the first prize for black Grapes with splendid bunches of Black Hamburgh, Mr. Pope following with large bunches but badly finished; G. Clinging third with smaller but splendid finished bunches. In the class for white Mr. J. Friend, Godstone, was a good first with splendid bunches of Foster's Seedling. Mr. J. Moorhouse was second, and Mr. F. Morris third, other successful exhibitors in the fruit classes being Messrs. Hopgood, Fennell, Dunn, Searing, Allan, Hickmott, Careless, Harvey and Friend. Mr. F. Dunn secured the premier position for vegetables. Mr. G. Newman of Bromley took the lead with bouquets, buttonholes and sprays, Mr. G. Fennell for table decorations, closely followed by Mrs. Halton and Mr. W. Searing.

The tent devoted to cottagers was well filled with remarkably fine samples of vegetables and flowers. Space will not permit to mention the

local classes, which were well filled, and reflected great credit on the gardeners in the neighbourhood.

#### EALING HORTICULTURAL SOCIETY.

THE annual Exhibition of this Society took place on July 9th, but under conditions of the most depressing character. The operations of the Society are now confined to the parish of Ealing, and though this act of contracting the sphere of operations of the Society shut out several competitors, others competed for the first time, and so tents of similar size were needed to contain the exhibits.

Groups arranged for effect are always a great feature at Ealing, and the keen competition of previous years has operated to develop a high order of artistic grouping. The best of the large groups came Mr. T. A. Gledstones, Gunnersbury Lane; Mr. Roberts, gardener to Mr. Harris, Castle Bar, second; and Mr. Vyner, gardener to R. Dawes, Esq., third. In Mr. Gledstones' group were several fine Orchids, *Cattleya superba speciosa* being in fine form, and richly coloured. The best small group came from Mr. F. Gerlach, Hanger Vale House; Mr. Edwards, gardener to W. Owen, Esq., Castle Bar, being second.

Specimen plants were not up to their usual character. Mr. C. Long, gardener to Mr. E. P. Oakshott, had the best six plants in flower; Mr. F. Hicks being second. Mr. Long had some excellent Fuchsias, the best we have seen in Ealing for years, finely grown and bloom, Lye's Charming, a dark Fuchsia, being one of the very best exhibition and decorative varieties. Mr. F. Hicks and Mr. J. Harris also had some good Fuchsias, Begonias, large flowering and bedding Pelargoniums, specimen stove and greenhouse plants, and Gloxinias were all good features.

Foliage plants and Ferns were generally of good proportions and well grown. Among them were some very fine foliaged Begonias from Mr. Thomas Nye, Castle Bar. Mr. R. Dawes had the best six foliaged plants; Mr. T. Nye being second; while Mr. F. Hicks had the best four; Mr. E. Hyde having the second best. The best six Ferns came from Mr. J. Boosey; Mr. E. Tautz was second; Mr. J. Harris having the best four Ferns or Mosses. All the plants were clean and well grown, but they did not call for special remark.

Striking out the classes for Roses open to all comers certainly operated to curtail the exhibition of the Queen of Flowers. The leading class was for eighteen blooms, the four medals of the National Rose Society being offered as prizes. The gold medal was won by Mr. E. P. Oakshott, the silver-gilt by Mr. E. Hyde, the silver by Mr. E. Tautz, and the bronze by Mr. J. Moore. There were classes for eighteen Teas and Noisettes, and for twelve and six Roses, in which the local growers acquitted themselves in a commendable manner, but the rain has disfigured not a few of the blooms. The class for twelve bunches of stove and greenhouse cut flowers brought a fine lot from Mr. T. A. Gledstones, which included the new Brazilian *Aristolochia elegans*, and a nice spray of *Bougainvillea speciosa*. Mr. Chadwick was second. Hardy herbaceous plants were shown in bunches of twelve and six, but they were small, and the subjects not so good as they might have been. Bedding Pelargoniums, Begonias, and Gloxinias, all nicely arranged in a cut state, were pleasing features, and some good Sweet Williams were shown.

Fruit is a declining feature at Ealing, in so far as Grapes, Peaches, and Nectarines are concerned. Mr. R. Dawes was first, and Mr. W. Owen was second with two bunches of black Grapes, both showing Black Hamburgh. Mr. F. Hicks had the best two bunches of white Grapes in Muscat of Alexandria; Mr. R. Dawes coming second with Foster's Seedling. Some fine Strawberries were shown. Peaches and Nectarines were confined to a very few dishes, but bush fruits were numerous and very fine.

Vegetables were numerous also, but we are bound to say the Ealing gardeners do not show these so fine as they might. Mr. Chadwick had the best six dishes, competing for the special prizes offered by Messrs. Sutton & Sons; Mr. E. P. Oakshott being second. Mr. W. Owen had the best three dishes of Potatoes; Mr. Chadwick was second. Vegetables shown by cottagers, and grown almost entirely in the Ealing Allotment Gardens, were numerous and very good. Several of the leading prizes were taken by one of the local police constables, Mr. Goldsworthy, an allotment holder, who also took the first prize for the best kept allotment garden.

Table decorations were as usual a good feature. Miss Lilian Hudson, Gunnersbury House, had the best three pieces; Mr. Chadwick was second. Mrs. Slade had the best, and Miss L. Record the second best single piece. Stands of Roses and also of wild flowers were also well shown; and buttonholes, bouquets, and sprays were all in good taste. We regret to have to add that the takings at the gates fell much short of the usual amount.

Non-competing exhibits were numerous and good. Messrs. Lee and Sons, C. Turner, J. Veitch & Sons, and Fromow & Sons were the principal exhibitors.

#### WATERFORD SUMMER SHOW.

IN exhibits and relative merits of the same the present Summer Show held on the 11th inst. was superior in most respects to any of its predecessors. I am aware the exigency of your space will only permit a condensed report, and a glance through the several sections, which numbered seventy-nine, and were divided into eight classes, as follows:—Plants in pots, cut flowers, fruit, vegetables, cottage and window gardening, children's class, bouquets, dinner table decorations, and nurserymen's classes.

Conspicuous among the plants with ornamental foliage were large specimens of *Croton D'Israeli*, *Dracena Baptisti*, *Croton Weissmanni*, finely coloured *Caladium Williamsi*, &c., from Raymond De La Poer,

Esq., Kileronagh, near Waterford (Mr. Crawford, head gardener), who had first prize; while notable in the second prize collection of W. G. D. Goff, Esq., Glenville-in-the-Suburbs, were Pandanus Veitchi and Yucca aloifolia. The prizes for magnificent specimens of exotic Ferns went exactly in the same way. Captain De La Poer's Adiantum cuneatum was the largest and healthiest I ever noticed in any collection, public or private; A. gracillimum, A. farleyense, and the Golden Gymnogramma were scarcely inferior. Mr. Goff had nearly the same varieties, very neat and healthy, but smaller. C. E. Denny, Esq., May Park, had entries in most of the classes, and got first prizes for Zonals single and double, good varieties fairly grown, Tuberous Begonias, and for single and double Petunias among plants; also for trusses of Zonals. He was a strong exhibitor among vegetables, getting first for Custard Marrows and Cucumbers, second for Turnips, same for Carrots, Onions, and Cauliflowers. Mr. Goff, already mentioned, is a strong supporter of the show, and besides the prizes for ornamental plants and Ferns, carried away first prizes for splendid Gloxinias, double Tuberous Begonias, Cockscombs, and Coleus, very large, and with the colours rich and defined. He was again to the fore for cut blooms of double Begonias, Tomatoes (Carter's Perfection), and Snowball Cauliflower. Perhaps the next most successful exhibitor was N. A. Power, Esq., Bellevue House, who got second for Gloxinias and Roses, and first for a box of La France Roses, first for single Tuberous Begonias, second for Strawberries, and first for Cherries, first for Cos Lettuce, Vegetable (Cream) Marrow, and Carrots, and second for spring Onions and garden Potatoes. Mrs. Jacob, Rockfield, got second for native Ferns, Dahlias, and first for Pansies. Mrs. Malcomson (Mr. Noonan) Ballinahill, and Villa Marina, is evidently reserving for Dunmore East, but still won prizes for Zonals in pots and Ivy-leaves and Balsams, and again for Lettuce, Carrots, and Tomatoes. William King, Esq., Mount Pleasant, though not a large exhibitor, had first for Ivy-leaved Pelargoniums, second for Coleuses, and again for double Ivy-leaves. Other notable exhibitors were R. T. Carew, Esq., for Melons, Pelargoniums, Grapes, Currants, &c.; Mark De Landre, Esq., J. H. Strangman, Esq., John N. White, Esq., John H. Snow, Esq., T. W. Anderson, Esq., Gracedieu, Robert Dobbyn, Esq., and notably the courteous Secretary, who scored in several sections. Challenge cups were offered by Messrs. Saunders, Friar's Walk Nurseries, Cork, for Tuberous Begonias and Roses. The last was not won, and John N. White, Esq., Rocklands, had the cup for Tuberous Begonias. Messrs. Carter's prize for the best basket of vegetables was won by C. E. Denny, Esq., and Messrs. Sutton's by W. G. D. Goff, Esq. The Judges were Messrs. Aberne, Lismore Castle Gardens, and your correspondent.—W. J. MURPHY.

#### HARDY FRUIT GARDEN.

**APRICOTS.**—Soaking rains have evidently done the old trees good, as most of them are swelling a fairly heavy crop of fruit, and are yet forming strong lateral growths. The latter ought not to be very severely shortened, the better plan being to leave the shoots about 4 inches long, completing the pruning next winter. The advice to lay in strong young shoots wherever there is room for them, and especially over the exposed old wood, cannot be too often given, as this will put new life into the trees, young branches also producing much the finest fruit. The fruit ought not to be much smothered by leaves and shoots, nor on the other hand unduly exposed, or otherwise it will ripen unequally, that side getting all the sunshine being ripe long before the shaded side. Lightly shaded fruits are also of a clearer yellow colour, and therefore of more value than those spotted or blotched. If glass copings are kept on the upper portion of the tree ought to be syringed frequently in order to keep down red spider, ceasing when the fruit is nearly ripe, and commencing afresh when it is cleared off.

**PEACHES AND NECTARINES.**—These are better set with fruit than was at one time thought possible, and they are at last growing healthily and strongly. Very heavy crops ought not to be left on the trees, or all the fruit will be small and most probably of poor flavour. Only sufficient young growths should be reserved to well furnish the trees with fruiting wood next season, these as much as possible being laid in from the base and points of the present fruiting branches. Surplus shoots ought not to be wholly removed, but where there are fruits at their base, should be shortened to the fourth leaf. At the same time remove any leaves that shade and prevent the colouring of the fruit, also shifting nails that are now or soon will be in contact with the fruit. Too often the latter are discovered when they cannot be removed without completing the disfigurement of the fruits they are partially embedded in.

**PEARS.**—Where early stopping with the finger and thumb and disbudding has not been resorted to, there are now numbers of strong shoots to deal with. These are in many cases sufficiently matured to prune, and their removal in some instances and shortening in others will be of benefit in various ways. Where they are very thick, or there are already good clusters of fruiting spurs formed, or in the course of formation, the greater portion of them may well be cut cleanly out, the rest,

as well as all those where the main branches are not well furnished with spurs, being cut back to a length of about 4 inches; final or hard pruning to be deferred to the winter. Lay in leading growths wherever there is room for them. At the present time they can be either straightened or given a curve, as may be desired, but later on they will become more set and difficult to deal with. Thinning out the fruits where thick ought to be delayed no longer. The larger the natural size of the fruits the thinner they should be left, and always bear in mind that fine fruits are more than double the value of inferior samples.

**PLUMS.**—In but few instances is there much need for thinning the fruits. One consequence of the lightness of crops is a superfluity of strong shoots. These if neglected will soon be blown about by strong winds, and they ought in any case to be freely thinned, those reserved to be shortened back to a length of about 4 inches. Aphid is still very bad on some of the trees least exposed to the heavy rains that have fallen, and these should be given a good washing as previously advised.

**APPLES.**—Only the miniature cordon and espalier trained trees need be pruned now. These may well be treated as advised in the case of Pears. The remarks upon thinning out the fruit of the latter also applies with equal force to Apples. Heavily cropped trees naturally cast off some fruits, but in many cases there are still far more on dwarf trees than ought to be left, and the sooner some of these are removed the better. This can best be done either with strong Grape scissors or a sharp knife in preference to the more risky method of pulling them off. Small fruits of the Codlin family may be used for pies.

**YOUNG FRUIT TREES.**—No superfluous shoots ought to be allowed to form on any kind of young fruit tree, and the leading branches should be laid in or duly staked before they get too stiff to manage properly. Winds also sometimes prove very injurious among young trees, and more especially to those newly grafted or budded. The branches from the latter are liable to twist out or off as the case may be, and ought therefore to be kept well supported by stakes. None of the side branches of any young trees should be stopped, but their over-luxuriance may be checked either by depressing them considerably, or else by the removal of some of their leaves. Strong fairly well matured leaders on espalier Pear trees may be cut back to a length of about 10 inches, and from these will spring several fresh shoots. Select three of the best placed of these, one for a leader and the other for side branches. In this manner two sets or tiers of branches are secured in one season.

**BUDDING FRUIT TREES.**—The present is a good time to bud Apricots and Cherries, Peaches, Nectarines, and Plums following. Apricots, Peaches, Nectarines, and Plums may be budded, either on trees of the same species with a view to quickly and simply improve their character, or else on the Plum stock. The Muscle Plum is the stock usually preferred, but there is no reason why other seedling Plums should not be tried. Any seedling Cherries are suitable for budding choicer sorts. This season the buds will run well, and they may be taken and inserted in the young wood of the stock in precisely the same way as Roses are budded on to the Briar. Buds may also be inserted into the young shoots on any part of fruiting trees under glass or in the open. They must, however, be taken from moderately strong shoots.

**SMALL FRUITS.**—Raspberries are growing very strongly, healthy plantations throwing up many more suckers than are required. These ought, therefore, to be freely thinned out at once. Autumn fruiterers that were duly cut down in the winter must also have their shoots freely thinned out, and this may lead to those reserved fruiting throughout their entire length. Red Currants, where very vigorous, should have their shoots thinned, and all side growth saved be shortened back considerably, in order to admit plenty of light and air to the fruit.

#### FRUIT FORCING.

**FIGS.**—*Early Forced Planted-out Trees.*—The first crop is gathered. More moisture is now desirable, therefore resume syringing the trees twice daily, and sprinkle the borders and other surfaces as advised before the fruits commenced ripening. Thin the fruits, if plentiful, freely, reserving those nearest the base of the shoots. Tie in the growths to the trellis as they advance, stopping or removing such as are not required, regulating those retained, so that they may receive the beneficial effects of light and air. Trees in borders of limited extent will require water freely and frequently, affording on every occasion some stimulating food as liquid manure from tanks duly diluted, or guano, 1 lb. to 20 gallons of water, is suitable. It contains a combination of elements, as also does liquid manure from stables, &c., and is safer than simple salts, as sulphate of ammonia, nitrate of potash, and nitrate of soda. They promote too much growth in Figs. Where crops are ripening maintain a free circulation of air, warm and rather dry, day and night. Avoid wetting the fruit, but an occasional damping in the house will benefit the foliage. Moderate moisture in the soil will meet all the requirements of ripening Figs, but it must not be overdone. Trees in pots required for early forcing must not be neglected in syringing occasionally, attending with regularity to the supply of liquid manure.

**VINES.**—*Early Forced.*—Red spider is mostly attendant on Vines, particularly when the Grapes are kept for any length of time upon the Vines after being ripe. Mixed assemblages of Vines for forcing are not good, but houses of such a size as will admit of a supply of Grapes for the establishment for a period of not more than six or eight weeks are most useful. This admits of the foliage being cleansed with the syringe

or engine, but a house having Frontignans, Sweetwater, and Hamburgh Grapes ripe in May, Muscat of Alexandria in June, and Alicante in July will, through keeping the atmosphere dry and warm in ripening the early varieties, cause red spider to increase upon the foliage of the Muscats, and the foliage of the early varieties cannot be cleansed, as syringing would cause the ripe Muscats to spot. This is a great evil in early forcing operations, and one the man is often more to blame for than the master through the in some respects laudable desire of having variety and gaining experience. Growing a motley assemblage of Vines in the manner indicated is most disastrous to present and future crops of Grapes. Where Grapes are required in April or early May to August, instead having the varieties to afford the supply in one house, we would divide it into two or three compartments, so that the respective varieties may have their proper treatment. In case of an attack of red spider no remedy is so safe as sponging the leaves with a weak solution of softsoap, 1 oz. to the gallon. It is tedious work, but taken in time is not so tedious as it at first thought appears. The pipes may be brushed over with sulphur brought to a thin cream with skim milk, heating them to 160°, but it is at best an uncertain remedy, not that it will not kill the existent insects, and repeated effect a cure, but it will spoil the tender skinned Frontignan and Muscat Grapes. Wherever sulphur is used on more than ordinarily heated surfaces it must be done with great care.

*Muscats Ripening.*—These require time and assistance from fire heat, so as to insure a night temperature of 70° to 75°, 85° to 90° by day, with abundance of air. They require a rather dry warm air, for under no other conditions will they attain to that golden hue characteristic of their unapproachable vinous rich flavour. Muscats also, of all Grapes, require plentiful supplies of water when swelling their fruit. They can hardly be overdone with water at the roots after the leaves are full sized until the Grapes are well advanced in ripening, the border having thorough drainage; therefore attend well to the watering of inside borders, and outside also in dry weather. Too much atmospheric moisture, however, is fatal to Muscats when ripening, causing them to be spotted; therefore seek by gentle warmth in the pipes and a little air constantly to prevent the deposition of moisture on the berries, surfacing the border inside, after a final watering, with a few inches thickness of dry material.

*Shanking.*—This occasions a serious deterioration of crop. Its chief cause is suspended root action at the critical period of the Grapes ripening. This may arise from a deficiency of ventilation in the early stages of growth, combined with too much moisture, inducing long-jointed growth and thin foliage, or it may be the roots are deep in an unfavourable rooting medium. To avoid shanking we must have properly prepared borders and well managed Vines, being careful to fully expose the foliage to light and air. For Vines prone to shanking avoid sudden fluctuations of temperature, particular attention being given to the ventilation, thereby securing a constant supply of nutriment, not only for the formation of starch, but that still further process of ripening, and by which it is converted into sugar. Regulate the young growths, adopting the extension rather than the restrictive system where there is room for it without crowding, keeping all gross laterals stopped so as to cause an equal flow of sap throughout the Vines, and this will do much to prevent shanking.

*Young Vines.*—Those of this year's planting should, provided the light is not too much obstructed, be allowed to grow unchecked, it being presumed that they will be cut back to the bottom of the trellis, or to three or four buds at the winter pruning. Any supernumeraries intended for next year's fruiting should be regularly stopped at a length of 7 to 8 feet, removing the laterals beyond a joint, which it is essential to keep to prevent the starting of the principal buds, preserving the old leaves, and as the wood will require thorough ripening a free circulation of air will be necessary, with fire heat if the weather be cold and wet. The border should be mulched and duly watered right up to the neck or collar, with a view to obtain and encourage the growth of adventitious roots, which are highly advantageous to a strong break the following season.

*Vines in Pots.*—Those intended for fruiting next season should by this time have completed their growth, especially those required for early forcing, which must have no more water than will prevent the foliage becoming limp, and they should be exposed to all the sun and light possible, so as to thoroughly ripen the wood and the buds. Keep the Vines free from insects, as it is very important that the leaves perform their functions. After the wood becomes brown and hard the Vines may be stood in front of a wall with a south aspect, securing the canes to the wall to prevent the foliage being damaged by wind.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### THE WEATHER.

THE bees are attempting to fly, which we used to put down as a sign of improving weather, but we dare not predict now. The temperature keeps low. At midday on July 11th the thermometer was standing at 53° Fahr., and the mean temperature for

the past week has been 49½°, the readings being taken three times daily, the highest being 66° on the 9th, but this lasted for less than five minutes. Since June came in it has not been more than twenty hours at 65°. The rainfall has been excessive. On the 5th 1 inch of rain fell in eight hours, the wind being northerly; and again between Monday night and Tuesday morning the same quantity fell. Sunshine is greatly needed, and a few weeks or even days of it would change the dismal appearance.

#### HONEY PROSPECTS.

At present the prospect of a good yield of honey is not promising, but we have not lost faith yet. The movements of the bees, together with that of the barometer and thermometer, indicate finer weather, and it is a usual occurrence after a long time of wet for the thermometer to sink to 32° during the summer months immediately before a change. But so low has the temperature been during the past week that the bees have been chilled by thousands, the ground being strewn with dead bees.

#### PREPARATIONS FOR THE HEATHER.

Swarms will be of little use, and young fertile queens we used to depend upon for keeping up the strength of the hive are this year still barren. In an ordinary season they would have been by this time at the head of populous hives. The only thing we shall have to depend upon are our winter unswarmed stocks, and these, if we do take them to the moors, will be supplied with from 6 lbs. to 10 lbs. of sugar each hive, and not extra supered, as the cold weather is sure to make the Heather late. Should the weather improve for the next two weeks young queens may mate, and some stocks may swarm. Should both occur, the swarms will be placed into full sheeted frames and fed a little, a few nuclei will be raised from the old stocks that swarmed, and the remaining combs of brood will go to strengthen the hives of the first young queens, so that they may be able to gather a surplus of Heather honey. It is, however, prospective only, and is what we wish. At present feeding is our only hope to secure a supply of honey from the Heather, or failing that stocks for another year, for without feeding few stocks will survive many days.

#### DO BEES PAY?

I have frequently alluded to this question, and have shown that bees do pay. I will therefore supplement my article of last week, page 37, and show in what manner bees pay, and the expenses incurred in bee-keeping. Many who started bee-keeping with the view of making money or an easy living, induced by the glowing accounts of the profits derived from bees by interested persons, gave them up in disgust. Then others, who happened to start bee-keeping at times more favourable for bees, took immediately to giving instructions in bee-keeping, concerning which in reality they knew very little beyond having been fortunate in securing at the outset a large yield of honey. Every pound of surplus honey gathered by the cottagers' bees ought to be of the same value to him as a pound of butter, and well-managed hives may be depended upon to give on an average annually at least 20 lbs. of honey. Frequently we have had 200 lbs. from a hive in one season, and 100 lbs. is quite a common yield when the seasons are favourable. Seasons occur, however, when the flowers yield no honey, and the bees are kept alive by feeding, meaning a loss of from 5s. to 10s. for each hive, depending upon the price of the sugar and the strength of the hive. Bees are much more cheaply fed now with good sugar at 2d. per pound than when it was from 8d. to 1s. per pound. All that can be taken into consideration, and I will endeavour to show how misleading it is to say that bees will pay with honey selling at either 3d. or 6d. per pound; the reader will have no difficulty in seeing the absurdity of the statement that £7 of profit could be made annually from any hive.

We may safely set down that £1 outlay is necessary for each hive at the commencement. The appliances all being of a perishable nature require a certain amount of outlay annually for

repair. The two outlays combined will at a very low estimated rate of interest add a penny of loss on every pound of honey realised. An equal loss will result from bad seasons, which during the past fifty years has been more than a third, and might be safely set down as 2d. loss on every pound of honey realised. Where bees have to be moved about an actual outlay of from 2d. to 3d. per pound is incurred, and this does not include the time occupied, which it will be remembered some have said cottagers ought not to count. Bee-keepers are as much entitled to be paid fully for the time employed in looking after the bees as any artizan for work done by them, and that time will at the least amount to another penny. Packages for honey will cost another penny, and if the honey to be sold is to be sent by train or other conveyance it will take from 1d. to 3d. for each pound, depending upon the distance. The foregoing are outlays the bee-keeper cannot get rid of, and amount to more than what we have been told was sufficient to make bee-keeping a paying concern. There are other incidental expenses, including loss of stock from bad seasons or foul brood, which, if the truth was told, would amount to a sum not less than any one already mentioned. We consider it not only within our province but our duty to warn bee-keepers, as well as to instruct them how to make bees pay with the least amount of trouble and expense, and it is to be hoped the foregoing will assist and enable bee-keepers to turn everything to the best account in connection with the apiary, and to rely upon his own good sense more than the erroneous statements of others, whatever their object may be.

—A LANARKSHIRE BEE-KEEPER.

### BEEES AND FRUIT TREES.

CAN "A Lanarkshire Bee-keeper," or gardeners who keep bees, give their experience of their value in fruit gardens and orchards? I have heard of bees being placed in Peach houses when the trees are flowering. Is that of substantial value in causing the fruit to set? If it is they ought to be of service in fruit gardens. Is it so, or only fanciful?—AMATEUR.

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Carnation** (*J. B. H.*).—The flowers sent indicate that the variety is a good one for borders and decorative purposes. The name Orange-man is appropriate.

**Classification of Exhibitors** (*W. Ames*).—The Secretary of the Society is the proper person to answer your second question. In respect to the first, a farm labourer is obviously not a professional gardener.

**Figs for House** (*J. A.*).—Omit Brunswick and select Brown Turkey, the best of all Figs. Negro Largo and Osborne's Prolific are good. Gingo de Mel and St. John's are excellent, good for growing under glass, forced or otherwise.

**Figs not Swelling** (*Inquirer*).—The variety may be in fault. We have two trees growing near each other, one of which casts all the fruit, the other ripening a good crop. More particulars respecting the soil and position of the tree are requisite for your case to be comprehended.

**Increasing Primula obconica** (*W. T.*).—It is best raised from seed, the plants growing more freely, and are more floriferous than those from division. The latter may be done now, keeping them in a cold frame, rather close, moist, and shaded until fresh growth takes place.

**Machines for Cider Making** (*R. C. Lee, Kulu*).—We have not seen any presses more suitable for making "cider on a small scale" than some that were exhibited at the Royal Agricultural Society's Show at Windsor by Messrs. Ch. Mayforth & Co., Frankfort, and illustrated in this Journal, the issue of August 29th last year. The London office of the firm is 16, Mincing Lane. The machines appeared to be strongly made and not liable to get out of order.

**Making a Bed of Lily of the Valley** (*X. M.*).—The best time is the autumn, as soon as the old growths have died down, or in November. They thrive in an open situation, an east or west border answering well. Their great bane is a hot and dry border, but the more light they have and better they are fed and watered during growth the finer crowns they will make, the soil being moderately firm so as to insure sturdy growth.

**Bunching Flowers for Market** (*P. N., Derby*).—In making up bunches of flowers for sale it is usual to have them of various sizes suited to requirement. These may vary from three to a dozen for Violets, just as taste prompts a large or a small buttonhole, but usually the bunches are made up in such size as can be held easily in one hand. This may in Violets mean fifty blooms, of Mignonette a dozen to fifty spikes, the same of Wallflowers, or more, and a dozen blooms of Carnations. These may be stated to be minimum numbers, one or two being given over in each bunch. The bunches bring prices according to their size, small bunches as a rule being of little use except to retailers.

**Manure for Tomatoes** (*F. S.*).—Muriate of potash and superphosphate would be best for Tomatoes. Sulphate of ammonia and nitrate of soda would encourage too much leaf-growth at the expense of the fruit. A good proportion would be two parts of superphosphate and one part muriate of potash. If you want growth, increase the superphosphate to three parts, and take one part each muriate of potash and sulphate of ammonia, which will give good results in growth without prejudicing the crops of fruit. Incorporate well together, taking the ingredients by weight.

**Carnations and Picotees Eaten by Ants and Earwigs** (*X. M.*).—The best mode of dealing with the ants is to find their nests and sprinkle those with carbolic acid diluted with twelve times the quantity of water, but it must be used where there is no vegetation; or dissolve a piece of camphor the size of a hazel nut in two quarts of boiling water, and when cool apply to the nests or places infested. It will kill the ants and not hurt the plants. For earwigs no trap is better than bean stalks cut into lengths of 6 to 9 inches, and placed about the infested plants. These will catch a great number, the traps being examined every morning, and the earwigs shaken out into a vessel containing boiling water.

**Training Apple and Pear Trees** (*F. J. B.*).—We do not know of any method of training which necessitates the "removal of all shoots in May except the terminal ones," unless it is taken to apply to the leading uprights in horizontal training, when of course two side shoots and another as leader are all that are required, the others being either rubbed off or pinched back to three or four leaves, so as to induce the formation of spurs. If the rubbing off were applied to all shoots except the terminal it would mean a tree for the most part devoid of spurs, and consequently useless. That is not the object of training, but the formation of parts fully exposed to light and air, so as to obtain fruit in profitable quantity of the highest quality. Palmette verrier training was never much practised in England, and its advantages over the horizontal are more fanciful than useful.

**Diseased Tomatoes** (*H. R. and T. S. F.*).—Judging from the diseased fruit sent, we should say your plants are affected by one of the forms of Cladosporium, which works sad havoc in very many instances for about three seasons, and then gradually becomes less troublesome. It is illustrated in our issue of February 13th of the present year. You must continue to maintain a dry atmosphere, giving fire heat whenever the weather is cold and dull. Painting the hot-water pipes with a mixture of sulphur and either milk or linseed oil, making them quite hot occasionally, has a decidedly deterrent effect upon diseases of a fungoid nature generally. Mr. Iggulden has great faith in Bentley's mildew specific, and you might give it a trial. Leaves much diseased ought to be early removed, but if old leaves are somewhat closely cleared off, a few young shoots should be permitted to grow, or otherwise there will be no foliage to maintain the plants in a fairly active state. This attack of disease will inevitably lighten the crops, but there is no reason why the plants should be wholly rooted out, especially seeing you will do no good, as far as the disease is concerned, by making a fresh start. These diseases are atmospherically spread, hence the difficulty in combating them.

**Orange Seedling—Lapageria alba** (*W. T.*).—Seedling Orange trees do not fruit under six or seven years with the most suitable treatment, and not so soon under the usual treatment, as the wood does not become sufficiently ripened to form bloom buds. If you were to give your plant more heat it would probably flower and fruit soon, but as there is no certainty of the variety it would be best grafted with an approved sort. Good turfy loam with a fourth of well rotted manure added and incorporated and a little charcoal and sand form a suitable

compost. They are best repotted in spring before they begin to grow. In order to fruit they require to be kept rather dry at the roots in winter, but it must not be such as to cause the leaves to flag, or they will fall. Excessive watering at all times must be carefully guarded against, but when growing they require copious supplies of water and liquid manure. The Lapageria for some unaccountable reason has become stationary. It may arise from improper treatment, probably unsuitable soil and insufficient supplies of water, or it may be kept too much exposed to light. It requires plenty of moisture, and light without direct sun.

**Selection of Vines for Planting (J. A.).**—For the very early house you name 1 Black Hamburgh, 2 Duke of Buccleuch, and 3 Mill Hill Hamburgh. To the first and last there is no objection, both being excellent for early forcing, but Duke of Buccleuch is liable to be spotted, and requires careful treatment. Foster's Seedling or Buckland Sweetwater are more reliable varieties. For the intermediate house you mention 1 Black Hamburgh, 2 Madresfield Court, 3 Muscat of Alexandria, and 4 Gros Colman. The latter we should omit, as it will not ripen until a month after the others, substituting Gros Maroc, and relegating Gros Colman to the late selection. Gros Maroc, though handsome, is a coarse Grape. For late you submit 1 Lady Downe's, 2 Gros Colman, 3 Gros Maroc, 4 Muscat of Alexandria or Canon Hall Muscat, and 5 Alicante. In this selection we object only to Gros Maroc, and should substitute Gros Colman for it, or Mrs. Pinee, but Gros Colman is the more satisfactory of the two where appearance and not quality is the consideration. Avoid Canon Hall. You place them in reverse order of their fitness for use. They should be 1 Alicante, 2 Muscat of Alexandria, 3 Gros Colman, 4, Lady Downe's. If you want a long keeping Grape you cannot have a better than Lady Downe's in place of Gros Maroc.

**Peach Shoots Gummy (G. II.).**—You ask, "What is the matter with the enclosed Peach leaves?" We have examined them carefully, and find nothing beyond a little scorching, which at first sight appears due to thin tissue having been acted powerfully upon by the sun. But in addition to the leaves you have very properly sent wood of the current growth. This enables us to tell you what is the matter with the trees. You say the leaves began at one end "falling off, and is rapidly going through the house." All leaves on wood similar to that before us will fall. It is badly gummy. In a length of 6 inches there is no less than fifteen brown patches, and the bark tissues destroyed down to the alburnum, which is also destroyed, therefore not permeable to fluids. In older wood the cells are choked with sedimentary matter and the supplies of sap cut off, so that the parts above the point of gumming die or are very much enfeebled. The cause is a fungus—*Coryneum Beijerinckii*—a highly contagious disease. The fungus, by its mycelium, develops a ferment, which penetrates the cells and converts their starch granules and other contents into gum. The fungus causes the exudation. This is not oxidised directly (as Liebig supposed) by the oxygen of the air, but through the intermediate agency of microbes, which multiply wherever they find an appropriate habitation. The fungus itself, according to Plowright, cannot penetrate the bark; there must be laceration or abrasion before the germ tubes can enter it. This, however, is readily effected by the punctures of insects, which—particularly ants—may be a direct means of contagion, as they are not infrequent visitors of the exudations. All the parts infested should be cut away and burned. They will perish or be very much injured, and always be uncertain, even if they survive. Therefore, remove them at once and to sound wood below the infection. Admit air freely, but maintain a good heat by day with a fair amount of ventilation, which will cause transpiration and the elaboration of the sap, hardening if not thickening the cell walls, and thus enabling the trees to better resist the fungus. Avoid a close vitiated atmosphere at any time, particularly at night. A little air constantly will secure a change of atmosphere. Cease syringing, except occasionally to cleanse the foliage. Afford no more water at the roots than is absolutely necessary to prevent the foliage flagging or becoming limp for any length of time. Avoid stimulants, particularly those that tend to exuberance of foliage, as potassie, sodie, and ammoniacal manures. What is wanted is phosphoric and sulphuric acids. Therefore use, if any, phosphatic manures, as superphosphate, *i.e.*, dissolved bones. Those measures will arrest the disease. As it is encouraged by too rich soil, and consequently over-luxuriant growth, lifting is a means of discouraging its attacks. Lift the trees in autumn, as soon as the leaves give indications of falling; and this, if done carefully, will not prejudice the next year's crop, but, on the contrary, will conduce to a good set and satisfactory stoning and finish of the fruit. If the soil is heavy and deficient in calcareous matter add a fourth to a sixth of old mortar rubbish, or a similar proportion of clay marl if the soil is light. Make the border firm, give a good watering, and mulch the surface with a little fresh short stable manure, which, through keeping the soil uniformly moist, will encourage roots to be made quickly; but avoid heavy mulching; an inch thickness is all that is required, and the lumpier it is the better.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures,

it being often difficult to separate them when the paper is damp. (*J. C.*)—A variety of *Cattleya Mendelli*. (*A.*)—The names are synonymous on the *Campanula* label; the others appear to be correct. (*W. R.*)—1, *Lilium Martagon*; 2, *L. Martagon album*.

COVENT GARDEN MARKET.—JULY 16TH.

HEAVY supplies now to hand, prices remaining unaltered with a fair business doing.

Bedding Plants in variety, in boxes and pots.

THE "ROYAL" MIDSUMMER JOURNAL.

SOUND, readable, and useful is the impression we received from a glance through the pages of the new part of the Journal of the Royal Agricultural Society, and though some of the papers

are somewhat heavy in style, better is it to err in that direction than to adopt the flippant frothy style of certain would-be popular writers of the present day. Mr. Daniel Pidgeon's paper on "The Development of Agricultural Machinery" has the place of honour, and well does he tell what good work has been done by the implement trials at the "Royal" Shows; how the Judges have made implement makers "sit up" in a way that was entirely new to them; how the prize engine, which in 1849 burned  $11\frac{1}{2}$  lbs. of coal per horse power per hour, was so wonderfully improved in 1887 as to do the same amount of work with  $1\frac{1}{2}$  lb. of coal per hour! how that which is true of steam engines is true of other implements, and how the trials have gradually become more and more thorough and exhaustive.

Professor Wrightson's "Agricultural Lessons of the Eighties" takes a hopeful view of the future of British agriculture. A brief sketch of the depression and its consequences tells how there never has been a period of greater activity of thought, of proposed alterations, of attention to agricultural matters. The decade has witnessed the stirring sight of landlords and tenants combining to grapple with difficulties caused by influences altogether outside their control. Well says the writer that "Disaster is to Englishmen the trumpet call to action," and when farmers were able to realise the gravity of their position they did not flinch from a struggle out of which they are now coming with the enlarged power which mental growth confers, and with greater ability to adopt the changes in farm management which have become inevitable. What those changes are the paper shows under separate headings, and though the learned Professor's conclusions as to the return of more favourable conditions of climate are hardly supported by the gloom and wet of the weather just now, his "lessons" cannot fail of being useful.

Admirably in keeping with the tone of Professor Wrightson's paper is that of Mr. Gilbert Murray on "Increasing the Home Production of Beef." The importance of self-supporting farms of home bred stock, of building up herds of milking cows, of pure well-selected sires, of a steady development of the stock-bearing capabilities of farms, and of thorough systematic action in every detail of farm practice is clearly set forth, and there is also a useful description of the cropping rotation followed upon a farm devoted to the production of milk and meat, with same account of the practice at Elvaston.

Dr. Fream has another paper on "The Herbage of Pastures," which, apart from any reference to the Rye Grass controversy, is really a valuable, interesting, and unique contribution to agricultural literature. Since 1888 the scope of his inquiry has widened, and it now embraces the whole of the British Isles. It proves beyond dispute that the per-centage of Rye Grass in pasture generally is high, and in some of the best pasture it is very high. The most remarkable example of this is from a field in the Vale of White Horse, near Wantage, in Berkshire, where the per-centage of *Lolium perenne* proved to be as high as 72. Mr. C. H. Eady, who manages the farm, says the area of the field is forty-six acres. Last year he says, "The last week in April I stocked it with forty-four Hereford steers and four Shire fillies. The Herefords were all fat and sold to a London dealer by the middle of July. I then drafted thirty-six other Herefords into it from inferior pasture. They were all fat, and gone by the end of August. I then stocked it with forty shorthorn heifers; twenty of these were sold fat at the end of October, the remaining twenty, being half fat, were put in the stalls about the first week in November. I then put in twenty-four Welsh runts (stores) to clear it up, and they have (February 14th), until quite recently, been doing well, when I moved them into straw yards. I have never known any artificial food of any sort given to beasts in this field." We have given Mr. Eady's statement in full as affording remarkable proof of the highly nutritious properties of Rye Grass, and this is all the more striking by the absence from this pasture of *Dactylis*, of the *Fescues*, and all the other "indispensable" permanent pasture Grasses with the exception of 2 per cent. of *Phleum pratense*.

Among other useful matter the tables of agricultural statistics are valuable for reference; and among the "notes" is one in favour of the cultivation of sugar Beet. The cultivation of Beet is simple enough, but its conversion into sugar, or rather the extraction of its saccharine matter for that purpose, in this country has hitherto proved a failure. East Anglian farmers have had a try at it, and the idle sugar factory at Lavenham in Suffolk affords tangible proof of the folly of embarking upon such an undertaking without first acquiring a practical knowledge of the process of making Beet sugar, and applying a severe test to the yield of saccharine from Beet grown under similar conditions to those which answer so well for Mangolds. Sugar Beet and Tobacco can both be grown here, but we can turn neither to profitable account, and the three notable failures in the Eighties are in making Beet sugar, Tobacco, and condensed milk by farmers.

#### WORK ON THE HOME FARM.

Another week of dripping weather renders us less hopeful of a bountiful harvest, for without fine weather now our reasonable expectations of a full corn crop can hardly be realised. We hear doleful accounts of Wheat in full bloom beaten down by wind and rain, which certainly means a light crop at best. The gales of the 4th and 5th inst. have done a serious amount of harm to corn, fruit, and hops in southern districts, the storm area which then came so slowly up the English Channel bringing torrents of rain and such terrific blasts of wind that even Potato haulm and field Beans were beaten down. Hay-making has been almost at a standstill, and it is only those who have been alert to seize every brief opportunity of a cessation of rain who have been able to open the haycocks and cart any hay to the ricks. We have so far only been caught once, and have continued to cart a lot of hay in fair condition, while storm clouds have been rolling up from the west, for this year it certainly appears to be a case of nothing venture nothing have.

Not a single stack of hay would we make in such unsettled weather were we in the position of a tenant farmer, with whom in such a season ensilage should have first place. We can conceive of the entire satisfaction—even in such a wet summer—of farmers whose cropping is intended for home consumption, who have a full head of live stock, and absolutely revel in their huge stacks of silage, the certainty of an abundant crop of roots, Cabbage, and Kale, and of a full bite on pastures late in the year. These are the men who continue prosperous, while others who stick to corn growing are on the verge of bankruptcy. Excellent silage presses can now be had for the price of a small rick cloth, so that there is really nothing to prevent every farmer from ensilage, unless it is ignorance, prejudice, or carelessness. Persistent haymakers are leaving much grass uncut till the weather clears, with the certainty of a serious loss of quality, all the earlier grasses having ripe seed, much of which has fallen.

This wet weather brings with it some risk of harm to lambs out on the soft growth of pastures, and they should be withdrawn as frequently as possible. A run for a couple of hours on pasture daily will do good rather than harm, but they will thrive best if folded on Tares and Oats forward in growth, and next on second crop Clover or Sainfoin. The ewes may be on pasture altogether, and with a full bite they will soon recover condition. All sheep must be examined narrowly for flies daily, and some Cuff's dressing applied at once when necessary.

#### REMARKS.

- 6th.—Generally overcast, but a little sun in the afternoon; spots of rain at 11 A.M.  
 7th.—Generally cloudy, with frequent showers and drizzle in the morning and evening; rain at night.  
 8th.—Wet early and drizzle till 11.30 A.M.; then fine and generally bright.  
 9th.—Cloudy, with occasional spots of rain in the morning; wet afternoon; fair evening.  
 10th.—Bright morning; frequently cloudy in afternoon; solar halo from 5 to 6 P.M.; heavy rain from 11.30 P.M. to 3 A.M. on 11th.  
 11th.—Fine early; cloudy and frequently threatening in the morning; heavy rain from noon to 1 P.M. and at 4 P.M., then fine again.  
 12th.—Cloudy and frequently threatening in morning; a little sunshine in the afternoon. Another cold and rainy week; mean temperature even lower than that of the preceding week, being  $6^{\circ}$  below the average.—G. J. SYMONS.

NOW that this admirable charity is fully and firmly established the time seems opportune for a recapitulation of the steps that were taken in its foundation, and for reporting the progress that has been made. The FUND was established on July 12th, 1887, and in the statement of accounts presented to the third annual meeting on July 18th, 1890, we find a record such as the most sanguine of its promoters could scarcely have anticipated when they were formulating a plan of action three years ago. These three years have been eventful in having shown in a remarkable manner how real is the sympathy of a large number of persons in the horticultural community with those who are struggling under adverse conditions for the maintenance of the fatherless children of gardeners, so many of whom, as experience has proved, were left helpless on the world. For aiding in the support of the practically destitute children of deceased gardeners, and rescuing them from pauperism, a sum exceeding £3000 has been raised for yielding revenue, while last year alone the payments to orphans amounted to nearly £250. Such a result, after meeting all the expenses of foundation and management, is most gratifying and encouraging. At the present time thirty children are provided for—twenty-five of these by election, four by munificent donations from the Duke of Bedford, Mr. Sherwood, and Mr. Veitch; and one by a sum raised as a fitting memorial of the late Mr. W. Wildsmith. As representing the first three years' work the above record, we think, is unparalleled in the history of charitable institutions in connection with gardening. The good that has been done and will be accomplished cannot be appreciated, but the greater this is the greater the reward to all who have shared in the endeavour to relieve human misery through the channels of this Fund.

Its present position has not been attained without effort, anxiety, and grievous associations. During the short period of its existence the charity has been deprived by death of the valuable services of four of its officials—Messrs. J. Woodbridge and C. Howe, members of the Committee; Mr. W. Wildsmith, local Secretary; and Mr. G. Deal, the first Chairman of the Committee. Mr. Deal, clear headed and good hearted, was the man for the moment, and it was largely through his instrumentality that the Fund was placed on such a sound basis in such a comparatively short time. That his name and services will be forgotten there is no cause for anxiety, and it is not unlikely that under the stimulus of those true friends of the charity, Messrs. Sherwood and Veitch, that the whole of the seven unsuccessful candidates at the recent election will become beneficiaries as Memorial children of the late Chairman. As a tribute to his worth none other could be so appropriate. If anything could lessen the grief occasioned by his death of those who were near and dear to him it is providing the means of life to seven gardeners' orphans, and if the Fund has done nothing more than that its existence would have been justified; but instead of seven it will shortly afford support to thirty-seven, whereat all in sympathy with the object must rejoice.

While it is true that "great results from little causes spring" the cause of the origin of the Gardeners' Orphan Fund was a great one—a great historical event, the fiftieth year of the reign of our Sovereign—but the first step taken that led to such an important

position as the charity now occupies was a small one—a short letter written to the gardening papers by Mr. C. Penny of Sandringham. This letter appeared in the *Journal of Horticulture* on February 10th, 1887. Various propositions had been made for commemorating the above event, but Mr. Penny proposed the establishment of an orphanage with land attached as a home and school for the orphans of gardeners. He said, "When one sees earnest hard-working gardeners struck down in the very heyday of life, leaving the children totally unprovided for, it seems time that some such scheme should be set on foot." Propositions of a similar nature were made almost simultaneously by Messrs. H. J. Clayton and J. Udale. Sympathy with the object was apparent, though there was considerable divergence of opinion on the question of procedure, and a large correspondence ensued. Observing that the main object was being obscured by a number of side issues, we gave prominence to the chief "Jubilee propositions" in a leading article on March 3rd of the same year, and in reference to a large sum of money being collected for an orphanage remarked:—

"In all probability much more good could be done with the money without a necessarily costly 'home' or building than with one;" and went on to say: "In an undertaking of the kind suggested, a question for the consideration of the projector and his supporters is the desirability of forming a central committee for deciding on a form of appeal, and drafting propositions to be submitted to gardeners and others in sympathy with the object in various parts of the country. With a complete organisation and wide concerted action there is not a doubt that a very large sum of money may be collected with the object of assisting the widows of gardeners in bringing up their children, and affording orphans a means of support and education, fitting them for their duties in life. The precise form in which this could be best done is a question that must be governed by the circumstances of the case. The object itself is so good that it would command support if placed before the public in a manner that could be devised by a committee of business men, for no individual, however able and earnest, ought to be expected to carry out a work of the magnitude suggested even with the aid, generous though it may be, of casual helpers, and it appears to us that an administrative body is necessary for carrying out, in the best manner of which it is capable, the project of which the Prince of Wales' gardener has had the honour to originate. If Mr. Penny should be fortunate in securing the patronage of his august master, the 'Popular Prince,' to this good object, its success will be assured."

That was what appeared in this Journal on the date mentioned, and though it could not be expected to secure the patronage of the Prince of Wales at the outset, which, for obvious reasons, cannot be given to new movements of a speculative character, it arrested the attention and secured the services of Mr. George Deal. He at once took a lead in the movement, and in consultation with friends the idea of a building was abandoned, an appeal made for support, and eventually a meeting was held on March 22nd in the conservatory at South Kensington to decide on future action. About thirty representative horticulturists were present, and Mr. Deal occupied the chair. The sense of the meeting was strongly against a building, and it was determined to raise a fund to be applied as subsequent meetings might direct for the assistance of gardeners' orphans. After some consultation it was decided on the proposition of Mr. J. Wright that the scheme should be entitled the GARDENERS' ORPHAN FUND. A provisional Committee was then appointed to consider the whole question, prepare rules, and report to a future meeting. The President of the Royal Horticultural Society subsequently granted the use of the Council room at Chiswick, and thus Chiswick became the headquarters of the Committee—a great advantage, with its Superintendent as Secretary. On July 12th a general meeting was held at South Kensington for receiving the report of the provisional Committee, and considering the rules at the same time presented.

This was a large and enthusiastic meeting, presided over by Sir

Julian Goldsmid, Bart., M.P., supported by Dr. Hogg (representing the Council of the Royal Horticultural Society), Dr. Masters, Messrs. Deal, Hibberd, Veitch, and others, and the Gardeners' Orphan Fund was formally established. Sir Julian Goldsmid was elected President, Mr. T. B. Haywood Treasurer, Mr. A. F. Barron Secretary, and an Executive Committee, comprising Messrs. G. Deal, P. Barr, W. Bates, H. Cannell, R. Dean, J. Douglas, W. Goldring, W. G. Head, H. Herbst, W. Holmes, W. Ingram, J. Laing, G. Nicholson, C. Penny, W. Richards, J. Roberts, W. Roupell, C. H. Sharman, J. Smith, H. Turner, H. Williams, J. Woodbridge, J. Wright, and B. Wynne.

Such is a brief outline history of the origin and establishment of the Fund that is now doing so much good. In these days of quick movement and short memories it seems desirable to collect from scattered reports and compress the salient facts on the occasion of the third and most successful anniversary, which is reported on another page. From the first the proposition met with general sympathy. A few persons hesitated to join heartily in the movement from excellent motives—the chief being a fear of weakening the Gardeners' Royal Benevolent Institution, but the Secretary of that admirable charity was not one of them, and became a supporter of the Orphan Fund in its early days. Since endeavour was made to provide for the children of adversity the institution for aged gardeners and their widows has made greater progress than ever, as also has the United Horticultural Benefit Society, which affords relief to its members during illness. We wish to see all these Societies prosper, and have, on suitable occasions, appealed strongly for the two older; at the present moment the younger is under particular consideration, and we bespeak for it the greatest possible support of the greatest possible number of gardeners and lovers of gardens. The demands of the future will be great, and while we believe there will always be affluent and generous helpers, it is most desirable that the actual workers in gardening should assist according to their means. The mites of the many not only become substantial in the aggregate, but act as direct incentives to extraneous aid. There is no truer maxim than this, "Heaven helps those who help themselves," and if every gardener in the land would do ever so little for the needy "little ones" in the gardening ranks, the more readily would the wealthy join in the noble endeavour. While it is evident the Committee of the Gardeners' Orphan Fund are anxious to give immediate relief to the fullest possible extent, they are conscious, as we are, of the extreme desirability of providing a substantial permanent fund to give stability to this much needed, excellent, and, we believe, well managed Institution.

#### ANNUAL MEETING.

THE annual meeting of subscribers to this Fund was held in the Cannon Street Hotel at 3 P.M. on Friday last, July 18th, N. N. Sherwood, Esq., one of the Vice-Presidents, in the chair. The Secretary, Mr. A. F. Barron, read the notice calling the meeting and the minutes of the last general meeting. The Committee's report, which had been printed and placed on the table, was then taken as read, and Mr. Sherwood reviewed the principal items in the cash statement, comparing them with last year's statement.

The CHAIRMAN then referred to the great loss the Fund had sustained by the death of their Chairman, Mr. George Deal, and moved a resolution to the effect that the meeting pass a vote of condolence with Mrs. Deal, which was carried unanimously. He then observed that a memorial had been proposed, and they could not think of a better mode of commemorating Mr. Deal's good work than by placing as many orphans on the Fund as possible. Some conversation had taken place between himself and Mr. H. J. Veitch, with the result that they proposed if £250 as a minimum could be raised they would place the seven unelected children on the Fund, a proposal that was received with loud cheers. After suggesting that it would be preferable if the financial year commenced in January instead of in July as at present, and that the annual dinner might also be held earlier in the

season, he concluded by moving the adoption of the report and cash statement.

Mr. H. J. VEITCH seconded the proposition, and congratulated the Committee on the favourable results of their work. It was wonderful that so much could have been effected in so short a time. He was quite willing to contribute his share to the Deal Memorial Fund as proposed by the Chairman, and he also agreed with him that it would be desirable that their year should commence in January.

The other business comprised the election of Mr. T. B. Haywood as Treasurer, Mr. J. Fraser as Auditor, Messrs. Bates, Dean, Herbst, Richards, and Wright were re-elected members of the Committee, with the addition of Messrs. G. Bunyard, J. Wills, and W. Marshall. Mr. A. F. Barron was unanimously re-elected Secretary, and Messrs. R. Dean and Ward were then appointed scrutineers of the ballot, an adjournment taking place until 4 P.M., when the following results of the election were announced and votes of thanks proposed to the various officials:—Robert James Phillips, 582; Thomas Henderson, 241; George Philip Shrubbs, 148; Henry Edmund Skeiton, 131; George Beveridge, 100; Bessie Stronach Deedman, 95; Frank Butcher, 87; Susan Elizabeth Baker, 86; Henry William Milne, 79; Arthur Lacey, 78; Alfred Henry Budd, 67; Mary Grieve, 72; Winifred Jones, 61; Evan Evans Kinch, 26; Sidney Alfred Offer, 72; Francis Thomas Pragnall, 68; and Arthur Henry Rowland, 20. The first ten having secured the highest number of votes were accordingly declared to be duly elected.

#### REPORT OF THE EXECUTIVE COMMITTEE.

The first words of the Executive Committee in presenting their third annual report to the supporters of the Gardeners' Orphan Fund must needs be an expression of profound sorrow at the loss which the Fund has sustained by the death of Mr. George Deal. Only those who have worked with him in the interests of the Charity can adequately appreciate his zeal on its behalf. His devotion to his duties as Chairman of the Committee was only equalled by his business capacity, and his genial presence will linger in the memory of all who were associated with him in striving to assist the orphans of gardeners in their heritage of adversity. He will long be remembered as a true friend and kind-hearted man; and the Committee desire to record their deep sympathy with Mrs. Deal in her great bereavement. They hope also, in due time, to be able to perpetuate his memory in a manner that in life would have secured his hearty approval.

The necessity for the institution, and its maintenance, is more fully proved by each year's experience. The first year eleven were placed on the Fund, ten by election and one in consequence of the handsome donation by Mr. Sherwood. The second year eight others were added, five by election, one by reason of a noble gift from the Duke of Bedford, and two as the result of a generous proposition made by Mr. H. J. Veitch, that he would give £100 conditionally on an equal sum being raised by other contributions, which were happily forthcoming.

On the present occasion the Committee, encouraged by the growing interest in the Fund, feel justified in recommending that ten candidates be elected, and one will be added by the Wildsmith Memorial Trustees, making a total of thirty children, who will be supported at a cost of £390 a year.

By the lamented death of Mr. W. Wildsmith of Heckfield the Charity lost one of its most active workers, and in no way could his memory be more appropriately cherished than in the manner previously indicated. His loss is mourned as a genuine gardener and a good man.

The Committee desire to record, gratefully, their thanks to His Grace the Duke of Bedford for the use—the third time—of the Flower Market in Covent Garden, also to the Lady Mayoress and Lord Mayor of London for opening the Evening Fête, by which means over £173 was added to the Fund. The services of all who contributed to its success are warmly appreciated. By the alteration of Rule XII., designed to recognise special endeavours on behalf of the Fund, thirty-four life-voters have been added, to forty of the preceding year, of the Covent Garden standholders for their valued co-operation.

For the help rendered by various friends in various ways, such as by collecting cards, money boxes, concerts, gardeners' improvement societies, flower shows, &c., earnest thanks are cordially tendered, and Mr. A. Henderson, Thoresby; Mr. J. Brown, Reigate; Mr. J. Hughes, Birmingham; Mr. D. T. Fish, Hardwicke; Mr. W. Roupell, Streatham; Mr. Cummins, Hackbridge; Mr. M. Todd, Edinburgh; and Mr. T. Turton, Maiden Erleigh, Reading, are mentioned as examples of active members who have worked effectively in aid of the Fund.

While gratified with the results achieved, and thankful that, by community of effort, thirty necessitous children have been provided for in three years, the Committee have to deplore the fact that the needs of many applicants cannot be met; a strong appeal is therefore made to all who are engaged in, or derive pleasure from horticultural pursuits, to consider the best methods by which they can support the Gardeners' Orphan Fund during the ensuing year.

The members of the Committee who retire by rotation are Messrs. W. Bates, R. Dean, H. Herbst, W. Richards, J. Wright, W. Goldring, C. Penny, and J. Roberts, and the first five being eligible are recommended for re-election. Messrs. William Marshall, Bexley; George Bunyard, Maidstone; and John Wils, South Kensington, are recommended for election, in the place of Messrs. Goldring, Penny, and Roberts, who retire.

Dated July 11th, 1890.

THE DINNER.

The third anniversary dinner of the Gardeners' Orphan Fund was held on Friday last at Cannon Street Hotel, Mr. Shirley Hibberd presiding. The company was a large one, including about 160 horticulturists and friends. After dinner

The CHAIRMAN proposed the usual loyal toasts, reminding the company that the Fund was established to commemorate the Queen's Jubilee; whilst one of its founders was Mr. Penny, the gardener to the Prince of Wales.

The CHAIRMAN, before proposing the toast of the evening, "The Gardeners' Orphan Fund," said he must ask the company's consideration for a very serious matter. Since they last met death had been busy thinning the ranks. He would not attempt to mention all who had passed away from a sphere of usefulness within the last year, but two names he must bring before them. He should be wanting in his duty and he should be wanting in respect if he did not do so. They had lost their dear old friend Mr. Benjamin Williams of Holloway—a grand old gardener. They had lost another dear friend, whose presence was wanted now—Mr. George Deal, the first Chairman of the Committee of the Fund. Death was no respecter of persons, of race, or condition. When men went in the fulness of years, and they could believe that their labours were accomplished, there was no reason why they should not feel satisfaction that the Lord had been pleased to call them to His rest. But it did trouble them; it filled them with strange thoughts when men were taken in the prime of life, in the midst of their labours, when they were stricken down at a blow. It was not for them at that moment to philosophise upon those things, but to recognise the fact that they had lost two friends and deplore their loss, remembering how good an example those friends had left for others to follow. He asked them to drink upstanding and in solemn silence to the pious memory of Mr. Benjamin Williams and Mr. George Deal.

The toast was then drunk in silence.

The CHAIRMAN then asked the company to honour the toast of the evening. He said he wished to propose to them "Success to the Gardeners' Orphan Fund." (Cheers). It was a young institution, but it was becoming established, and it had been truly successful from the first. It was not always that a thing began and went on so well. There seemed, however, to be a reasonable promise of the continuation of the present prosperity, and of its increase as time went on. He hoped to be able to prove to them before he sat down that the Institution had some reasonable prospect of becoming increasingly useful. The primary idea was to provide something for the assistance of orphans of gardeners that were unprovided for. They knew all that. It was an intimation to them that all gardeners did not make provision for those they left behind them. It was one of the blessings of this life that we never knew how long it might last, for if they did life would be intolerable. He imagined many men neglected to make provision for the future because they had not the courage to face the fact that life was uncertain, that death might come upon them at any time. They had but to make observation, or to read the papers. They saw that youth and strength gave no guarantee of length of days, and they saw that weakness and infirmity, disease, want, and misery gave no sure promise of the coming of death. There were those who

lingered out their days, appearing to die every morning, and yet living. He believed many men neglected to make provision when they might do so, not from wrecklessness or selfishness, but because they would not see clearly that because of the uncertainty of life there should be a certainty of provision for death. We all loved life too much, that was why we drank and smoked. Every man wanted thirteen pence to the shilling—(laughter)—and endeavoured to live forty-eight hours in twelve. It was the case all through, and had been from the beginning of the world. It caused the use of narcotics and all the many dodges we resorted to to dodge death. Some of them were perhaps in some degree successful. Science helped us; in fact if science did not help us we should not live as long as we do. The best story that ever was told they would find in AEsop's Fables. It was the story of the old man and Death. The old man crept along in pain and misery bearing his burden. He was weary and sick of life, and he threw down his burden and said, "Oh that Death would come!" And out of the hill close by Death popped up his head and said, "Do you want me?" And the old man said, "Sir, would you be kind enough to help me take up my burden?" (Laughter.) The old man was ready to go on plodding again. The poet Young had said, "All men think all men mortal but themselves." (Hear, hear.) It was quite certain that men in all professions and occupations made enough for themselves and their families and vanished from the scene and left the whole of their affairs in confusion. They were not supposing he was making an accusation against gardeners. He could make none. From what he knew of gardeners he was prepared to say in the face of the world, that they were a provident, thoughtful class of men—(hear, hear)—that they acted in their whole life in accordance with the teaching of their business, for the teaching of their business was always to be looking into the future. He knew of no occupation which so encouraged a man to speculate as to what the future would bring forth. He (the gardener) put seed into the ground and watched the barometer that he might be guided in his work. Every part of his work was trusting to the elements, and was in the largest sense of the world trusting to Providence. Gardeners were a provident body, and they would scarcely meet a gardener who was not a member of some club or some society or fund that had for its object provision for the future, and they would remember that gardeners had a fund of their own now formed into the United Horticultural Benefit Society, which might have been a bigger thing than it is except for some strange accident in the early days of its career, but which was now perfectly sound and prosperous, and had before it, he believed, a very good future. Now, it was worthy of notice—none knew it so well as many who were present—that the demands upon gardeners in their daily life were very many and heavy. Gardeners were brought constantly under the action of what were called the laws of hospitality. In places that were frequented by visitors gardeners were put to considerable expense, about which they said nothing. He saw much of it, so did they; but they put the best face upon things. Many costs they would incur in the daily pursuit of their duties which did not come into the daily round of their business. Consequently there were many and heavy demands upon the gardener's purse, and his love of his business led him to many expenses. They would take a man engaged in building; he went plodding on making money. A gardener went about to see exhibitions, to look at gardens, as his business was one of observation. He must be always observing, always learning, and taking the measure of the world he was in. Consequently there was much to be said in mitigation of the general charge of want of provision for the future. But where would they find amongst a body of men earning their living by labour and skill, not a few who were cast down by calamities of various kinds, and who had no opportunity to make provisions for their children. There must be a certain number of orphans, and therefore there was no exceptional case there, and they should deal with it as liberally as they could, having liberal sympathy with the children. Here was a curious case. They had, say, a list of seventeen candidates, and suppose they elected them, would they put an end to the trouble in those seventeen families? No. In every case except three in the list of seventeen there were other children unprovided for. One child was selected to put before the subscribers, but there remained others in the same family for whom, of course, provision was equally needed. The list of seventeen was in reality a list of fifty-two children in want. When he said fifty-two children in want, there might be some half dozen of them just beginning to earn a living, so that it would be seen that there was a large case to be dealt with, and not easily disposed of with a few guineas. If they took notice of one child in a family, what had they to say about the rest? Well he hoped the time would come when they would be able to say something about the rest. It had been said most properly that Mr. George Deal should be kept in remembrance in connection with the Fund by an act of special generosity on their part assembled to-night. Let them understand how the case stood. There were at the meeting to-day seventeen candidates; ten had been elected, and seven remain not elected. Mr. Sherwood spoke of giving £50, and Mr. Veitch spoke of giving £50, but the proposal had taken a better shape. It was so gratifying that he knew not in what terms to put it. Mr. Sherwood and Mr. Veitch proposed to provide for five orphans out of the seven on condition that those assembled that night provided for the other two. (Loud cheers). That was the case he had to put before them, and if they subscribed £250 as a minimum they would be enabled to place seven orphans on the fund to commemorate the services of Mr. George Deal. The Chairman then invited subscriptions towards this fund, and in the course of a few minutes announced that Messrs. Weeks of Fulham had subscribed £50, Sir Julian Goldsmid

£10 10s., Baron Schröder £10 10s., Mr. J. Wills £10 10s., Mr. Pearson £5 5s., Mr. Mitchell £5 5s., and himself £5 5s., a contribution which he subsequently doubled. He then proceeded to call attention to the balance sheet. The subscriptions for the year had amounted to £463 16s., and in addition the donations had been about the same amount. The money invested in securities was £3538, and the balance at the bank was £307. That was after having provided for all incidental expenses, and making provision for the orphans on the fund. He had always thought that a substantial reserve fund must be of considerable importance to an affair of that kind. (Hear). It gave stability in reality, and it also gave the appearance of stability to the public at large. If they had not a good reserve fund they were liable to disaster in the event of the loss of friends who had been largely supporting the institution. They were liable to disaster in the event of depression in trade or other circumstances which told upon charities, and it should be remembered that a reserve fund placed at interest produced an income for the enlargement of the Society's usefulness. The reserve fund of course should never be built up beyond reasonable proportions, which could only be judged by circumstances, but it should be the largest sum possible for a certain number of years, until the persons connected with the institution's management had felt their way. Strange things happened. They saw charities rise and fall—though, thank God, very few of them failed, they mostly prospered in this country—(hear). The Committee had always been of a careful calculating frame of mind, and had lost no opportunity of obtaining help from various quarters; and he must return thanks to the many persons who had assisted that fund by flower shows, concerts, and other entertainments. He must also return thanks to those who had taken charge of collecting boxes, and he hoped that all these various aids would be continued, for he was quite sure the money they brought in would be not a little. He hoped, before they separated, they would have seen their way to provide for seven orphans. Of the sum required only about £60 or £70 seemed wanting, and that was not a large sum for a gathering of some 150 persons to make up. In conclusion, he asked them to drink in bumpers "Success to the Gardeners' Orphan Fund."

The toast was honoured with enthusiasm, and

Mr. JOHN LAING replied in a few well chosen words, expressing the hope that the fund might go on and prosper in its object of helping the orphan.

Mr. H. J. VEITCH then proposed "Gardeners and Gardening." He said that he claimed for the Orphan Fund what Mr. Shirley Hibberd had said, that it had been a very great success from the first, and that the success was due to the gardeners of this country. If they analysed the list of donors and subscribers they would find that it was the practical gardener—in which term he included the nursery and seed trade—who had supported that excellent institution. (Hear, hear.) Therefore he thought they had every right to drink to "Gardeners and Gardening." He should like to say a word or two about what had been said with regard to Mr. Sherwood and himself. They were most anxious that something worthy of the late Mr. Deal should be done, and he was quite willing to admit that if they succeeded in putting the orphans on the fund they had succeeded in doing something. But there was also another reason, as it might enable them to make a slight alteration as regarded the date at which the annual subscriptions would be due. In consequence of the subscriptions being due at July some little confusion was caused, and if they were payable on the 1st of January he thought the money would come in a great deal better. If they could therefore assist in clearing the board of candidates for election, it would make it easier for the Committee to deal with the date at which subscriptions would be due, because there would be no election pending. That was a matter which weighed with them, though in a secondary degree. With the toast he desired to couple the name of Mr. John Wills, an honour to the gardeners of this country; a man proud to call himself a working gardener, who had worked his way up from a practical gardener to be one of the foremost decorators of his age. (Cheers.)

Mr. JOHN WILLS, in reply, said that as an old gardener nothing was more conducive to his happiness than to meet his fellow gardeners on every and any occasion. It had been a great source of pleasure to meet those who loved flowers, and he was sure the present meeting could not be more happy than it was when they came there to assist those little children who wanted support. As long as he lived it would be a source of pleasure to him to help in every way he could to support those who could not support themselves. He hoped they would see that Society increase to such an extent that they would be not only in a position to elect seven, but seventy-seven children to the benefits of the institution. (Cheers.)

Mr. ALEXANDER DEAN proposed the next toast, that of "The President, Sir Julian Goldsmid, M.P., the Vice-Presidents, the Trustees, and Auditors." He said that the Chairman had omitted the loss to the Society in the death of their dear old friend, Mr. Wildsmith, whose memory had been commemorated in a method similar to that now proposed in the case of Mr. George Deal.

Dr. MASTERS, in acknowledging the toast, said that the absence of their President was caused by indisposition, but they would be glad to hear that Sir Julian was now progressing satisfactorily. Though absent in body he was sure Sir Julian Goldsmid would be present with them in spirit. (Cheers.)

Mr. A. SMEE proposed "The Committee and Officers of the Fund," remarking that the stability of the Fund bore testimony to the exertions of those gentlemen. At present they were only a young

institution, but he hoped that before many years were past, instead of £3500 invested in the name of the Trustees, they would have at least £10,000. (Cheers). It would not be many years before they had 120 orphans on the books, and it would require a large reserve fund and a large income to meet all contingencies.

Mr. J. ASSBEE in reply said he must say that he had seldom seen any committee so solicitous for the welfare of any institution as theirs.

Mr. G. BUNYARD proposed the health of "The Local Secretaries," suggesting that gardeners in what might be called "a show place" should place a collecting box in a conspicuous position for the benefit of the fund.

Mr. TURTON replied.

Mr. B. HARDY in complimentary terms asked the company to drink the health of the Chairman.

The CHAIRMAN in responding to the toast announced that the sum required had been nearly raised, and he hoped it would be altogether before the company separated. Nothing gave him greater pleasure than to be amongst gardeners and men who loved gardening. He cast in his lot with gardening early in life, and had never regretted it for a single hour since.

The remaining toasts were "The Visitors" and "The Horticultural Press."

A most enjoyable evening was rendered still more pleasant by the excellent music contributed under Mr. Herbert Schartau by Miss Lizzie Jones, Mr. W. G. Torington, Mr. Harper Kearton and Master Charles Stewart.

## NOTES ON TOMATO CULTURE.

It would be a rather difficult matter to say anything new on growing this now popular vegetable, as the different modes of culture have been so well expressed by different growers in the Journal. However, a few lines may perhaps be of some little service to intending growers, old hands need no instruction. To test the best time to sow for good returns I have sown every month in the year, and kept the plants growing without a check, giving each series exactly the same treatment so far as general management goes. Naturally those cropping during the winter months required more attention. The result arrived at was that by sowing early in January the most satisfactory and profitable crops were produced. Soon as the seedlings were up they were placed close to the glass, and when fit to handle potted into large 60's and arranged on shelves again, thus ensuring a sturdy, short-jointed and firm growth, and I may here remark that I believe unless a solid growth is made while the plants are young a foundation is laid for the dreaded disease. Over-forcing and over-feeding in many instances cause disease wrote an eminent authority to me recently, and I feel sure he was right. By the middle of February the young Tomatoes are planted out in span-roofed houses, the borders being made of road scrapings and are firm and shallow; about three stems are allowed to each plant except those near the path, which have only one stem. I must confess to never having had as good results proportionately from plants grown on the single stem system as those grown with three. No feeding is done till the plants are fruiting freely, when they then receive some assistance about twice a week till the end of the season. As a stem exhibits signs of exhaustion a young growth is encouraged from the base to take its place, cutting out the old stem as soon as its crop is finished. By judicious feeding it is astonishing how old plants will continue growing and fruiting. At no time should a crowded growth be allowed, as it necessitates a severe thinning and cripples and otherwise injures the plant. Each young growth not required is best taken out as soon as observed, the strength is then all concentrated in the other and the fruit attains a larger size.

Watering is a very important operation. I believe that in many cases too much water is given, acting in the same way as continual moisture does on Potatoes, causing disease. Syringing the plants after they commence flowering is a practice that I dislike, as I think it predisposes the plants to the propagation of disease. A certain amount of moisture is absolutely necessary to allow the fungus to live and spread, and for that reason anything that would cause a suitable medium for the disease is best avoided as far as possible. By giving plenty of air, watering only when really necessary, maintaining a dry atmosphere, and keeping a little warmth in the pipes, have never had the plants affected by disease. Most people are aware what an important thing in the breeding of animals is selection, and the same applies to Tomatoes. By choosing good fruits from the most prolific plants a very superior strain is acquired. This I have proved over and over again. Nearly all our Tomatoes were saved from a cluster of twenty-two fruits, which weighed 11½ lbs., and the produce is very satisfactory. The variety is a cross between Trophy and Cooper's Prolific. The question is often asked, Which is the most profitable, the smooth or the corrugated variety? My experience is decidedly in favour of the latter,

as they produce double the crop of the former. I will admit that the smooth secures the highest price, but I think it is more than counterbalanced by the extra weight of the corrugated type. I question if anyone has made the growing of Tomatoes pay during the winter months, taking into consideration the firing, labour, &c. I believe the game is not worth the candle, and all the British and Continental growers are of the same opinion. It is all very well to grow them for private purposes, but growing them for market is a different matter altogether, as the cost of production has to be taken into consideration. A very satisfactory feature of Tomato growing is that the demand keeps pace with the supply.—  
S. T. WRIGHT.

### SOME AUTUMN CROCUSES.

In late autumn the garden of hardy plants stands somewhat in need of something to brighten and lighten it up. Should frost

proves that what they know by this name is *Cochicum autumnale*, familiarly known as the Autumn Crocus, but frequently as the Meadow Saffron, although even this is a misnomer.

It is easy enough for the initiated to distinguish the *Colchicum* from the *Crocus*, but the following distinctions given by Wooster in "Alpine Plants," page 59, may be of value to some of my readers. The *Crocus* has only three stamens, the *Colchicum* six. The ovary is below the flower, but in the *Colchicum* it is within it. The *Crocus* has one style and three stigmas, while the *Colchicum* has three distinct styles. I may be asked why I write of these flowers now when the garden is aglow with colour, and when all Nature seems to inculcate the necessity of making the most of the present, and of taking no thought for short dull days which we would fain forget. But after all, as gardening is the "art that doth mend Nature," we have to look forward from season to season, and now is perhaps the best month to order the dry corms, which will in two or three months produce their bright flowers to delight us

FIG. 10.—ADIANTUM BAUSEI.

keep away for longer than usual there will be no lack of Asters and Helianthus and many other tall plants, but the front of the border and the rock garden, however attractive with the greys and greens of the Saxifrages, stand in need of a bit of colouring.

It is at this time that the Crocuses and Colchicums come in to fill up the void. The Colchicums are especial favourites with me, but even the most enthusiastic among the few who grow these in any variety must admit that they cannot exclude the autumn Crocuses from the garden. Each genus has its advantages, and while less able to withstand the vicissitudes of our British autumnal storms, the Crocuses possess a delicacy and refinement somewhat lacking in the most of the Colchicums. These treasures of the garden are becoming better known, but are still rarely met with, and if we ask the majority of our gardening friends if they have autumn Crocuses, the chances are many that they have not, or, if perchance they say they do grow them, on inquiry it generally

with their beauty. Ordered and procured as soon as possible, so that they may not have become weakened by starting into growth, planted about 3 inches deep in a sunny position, well sheltered from strong winds, there will be no difficulty in growing these autumn Crocuses, and when the one or the few bulbs become a large mass, no common object of beauty will be seen in the garden.

As with the early spring species, I do not claim to have an extensive number of varieties in my little garden, and as with these I merely intend to note a few of the cheapest and most easily obtained.

One of the most valuable autumn Crocuses possessing the qualities of cheapness, hardiness, and freedom of blooming, and last, but not least, beauty, is *C. speciosus*, the "blue" autumn Crocus. This flowers in September or the beginning of October, and I can say without the slightest hesitation is one which yields to none in its attractions. The flowers are of a fine purplish blue,

the inside of the petals being striped with deep purple lines, and the beauty of the flower is much enhanced by the rich orange coloured stigmas. The species is a native of the Caucasus and Transylvania, differing but slightly from each other. The flowers are very large, and when fully expanded by the rays of the sun a clump presents a most beautiful object.

Another species less valuable, but distinct enough to have a place, is *C. nudiflorus*, the Naked-flowered Crocus, which is a native of South-western Europe, but has become abundantly naturalised in meadows near Nottingham and in other localities in central England. It has fine, pale, but bright purple long tubed flowers, with orange coloured stigmas.

A very beautiful Crocus, and one which is, in my opinion, intermediate in beauty between *C. speciosus* and *C. nudiflorus*, is *C. longiflorus*, known also as *C. odoratus*, which is, I understand, a native of Italy, and has beautiful rose-lilac flowers appearing shortly after those of *C. speciosus*. This is one of the most beautiful among the species.

*C. sativus*, the true Saffron, although at one time largely cultivated in England for profit, is comparatively rare in our gardens, a circumstance probably due to the shyness of its flowering in many places. The flowers of this are purple, and it is readily distinguished by the orange coloured stigmas hanging over one side of the flower. This should have a warm sunny position.

*C. pulchellus* is a beautiful Crocus, said to be a native of Mount Atlas and Belgrade, and the east side of the Bosphorus. This species has large bluish pearl flowers, veined with a darker colour, and with white anthers.

There are some very beautiful white or whitish coloured kinds among these autumn flowering members of the genus. *C. Boryanus* or *Boryi* is one of the finest of these. It was originally found by Bory near Navarino, but appears to be pretty widely distributed over some parts of Asia Minor, the Morea, and the Greek Islands. According to Dean Herbert *C. Ionicus* and *C. Veneris* are identical with *Boryanus*, and Mr. Wooster says *C. caspicus* of Fischer is the same. The flowers appear late in autumn, and are of a fine creamy white with orange yellow throat, the anthers white, and stigmas orange yellow. I do not find *C. Boryanus* very free flowering, but have not yet been able to give it as sunny a position as it should have. *C. ochroleucus*, creamy white and yellow, and *C. Hadriaticus*, pure white, are also very beautiful kinds, which do well here; but I regret that I have no information as to the native habitats of these fine species. There are several other autumn Crocuses in commerce which I have not yet grown, and with which I am not sufficiently acquainted to venture to write of. Some of these are *C. asturicus*, purple lilac; *C. cancellatus*, white, and purple at the base; *C. c. cilicicus* and *C. c. lilacinus*, varieties of this; *C. Clusii*, purple; *C. byzantinus*, purple; *C. serotinus*, lavender; *C. Tournefortii*, delicate rose lilac; and *C. Thomasi*, white and lavender blue.

I have purposely left until the close of these notes my favourite among all I have grown—*C. zonatus*, which has been appropriately called "exquisite," and I know no other adjective more applicable to its most beautiful rose-lilac flowers, with a fine yellow zone at the base of the inside of the petals. This species should be grown everywhere, and I feel sure none who can admire the delicate beauty of these flowers will have cause to regret adding this to his collection.

As "there's ne'er a Rose without a thorn," so there is still a shortcoming in the autumn Crocus—a yellow. There may be one which I know not of, and Nature is so prodigal of her bounties that in all probability this colour will turn up somewhere in Asia, and who knows what Stanley's Mountains of the Moon may yield to enrich our gardens? Could an autumn-flowering yellow Crocus only be added to our gains the late season garden might glow with the brilliancy our spring gardens now possess, and a fresh charm be added to that most fascinating pursuit—lardy plant growing.—S. ARNOTT.

## INSECTS OF THE FLOWER GARDEN.

(Continued from page 399, last vol.)

WE come now to consider two important though not large groups of species, which from their peculiarities seem to stand aloof from the other orders of insects, but are slightly related on one side to the beetles, and on the other to the crickets and grasshoppers. Hence, by most of our entomologists they are considered to form two small and distinct orders. Both of these are brought particularly under the notice of gardeners, owing to the majority of the insects frequenting cultivated plants and shrubs both indoors and out, flowers as well as fruit suffering from their attacks, the foliage, too, being sometimes injured. Their mode of procedure is such that killing or removing them is often a troublesome and tedious business. Trapping some of them is a plan that

has its advocates. We could hardly miss the fact that the earwig season is nearing us, since so many cottage and suburban gardens exhibit the inverted flower pots or the scooped out lobster claws designed to ensnare these insects, and which, though unsightly, do answer the purpose. As most gardeners know, the ingenuity with which earwigs discover places of concealment is remarkable. They will hide in the folds of a label or in a strip of matting. A very common trick of theirs is to lurk amongst what are termed amplexicaul leaves, or within leaves that are expanding. Many-petalled flowers also afford them special gratification. Earwigs are occasionally to be found in conservatories, and they can stand a good amount of moist (not dry) heat, but they are more abundant in garden ground. During the last few years complaints have been made of their infesting plants in the kitchen garden, this arising, I presume, from their being more numerous than formerly, so not limiting themselves to the fruit and flowers. Indeed, there were places in 1886 and 1887 that suffered from an earwig plague, the insects entering dwellings, hiding in beds, garments, &c., and regaling themselves upon various articles of food. Still they doubtless prefer flowers to anything else, and of these Roses, Pinks, Carnations, and Dahlias contain most earwigs.

In the order Dermaptera, aptly named from the soft wing-cases of the insects, which are a contrast to those of beetles, though the biting apparatus of the mouth is alike in both groups, the two species best known are the one above referred to—viz., *Forficula auricularia*, and the lesser earwig, *Labia minor*. Both Latin and English names have a significance which requires explanation, for there are still people who are afraid that earwigs may crawl into their ears, and those engaged in garden work run greater risks than other folk. Apprehensions of any serious injury from such an event are, I am convinced, needless, since the insect could not penetrate the drum of the ear. It is a thing that seldom happens. I have, on inquiry, only heard of a single instance, and then the person that was thus "earwigged" had been lying upon grass. Some have suggested that the name was originally "earwing," in allusion to the beautiful wings of the species, the foldings of which have been likened to the convolutions of the ear, but I do not see much resemblance myself. It is a curious fact that though possessed of ample wings the common earwig is very seldom noticed to use them, not even to help itself in making a jump. The forceps at the extremity of the body is chiefly used by these insects in doubling up or extending the wings, and is not of the nature of a weapon—certainly it does not secrete a poison. One entomologist, however, tells us that he observed an earwig bearing along by its forceps a small beetle; but they rarely meddle with other insects, though occasionally guilty of cannibalism if any die in a retreat where several have hidden together.

Probably one chief cause of earwigs proving so troublesome, next to their nocturnal and secluded habits, is the comparative safety they enjoy while in their early stage of growth. The larva or grub of the earwig lives either under ground or beneath stones, and in other places where it is unnoticed. What the food is we are not certain about, most likely it is of a vegetable nature. A very singular fact is that the mother earwig watches over her progeny while they are small, and guards the eggs till hatched. She has been caught in the act of removing them from one place to another. As many earwigs live through the winter months under loose bark, amongst dead leaves, &c., the destruction of them at that time will tend to reduce the spring brood. Some gardeners have killed quantities of these insects by putting about flower beds small tubes, as suggested by the late Mr. Wood, made from the hollow stems of plants, or brown paper, plugged at one end, and placed with the open end downwards, which should be examined every morning and the earwigs shaken out.

The lesser earwig, *Labia minor*, does not unfrequently fly, and parties of these insects have been seen travelling rapidly during twilight, or later, in search of a new feeding place. It is of a lighter colour, and is principally found in hotbeds or amongst manure. Only now and then does a specimen appear on a flower or within a folded leaf, and from our little knowledge of its habits we assume that it is not notably injurious to our gardens.

The Thysanoptera or tassel-winged insects, so called from the hairs which fringe their tiny wings, are terrible pests to our flowers, and their number is beyond all calculation. A single bloom may contain scores, many a one being carried from a flower to the nose of the person inhaling its perfume rather too closely. This is only a part of the annoyance they cause, for when we handle flowers, or even walk only amongst the beds, these insects manage to transfer themselves to the hands, the face, and other parts of the human body. The irritation they give to some people is most painful indeed, far worse than a straightforward bite or sting; it arises from their rapid and peculiar movements over the skin, connected also probably with the fringed wings. I have known them to drive a party of excursionists almost to the verge of

delirium on a warm July day when they were passing some of our market gardens in Kent. In this order there is only a single genus, and the *thrips* is but too familiar to every gardener, though in common talk the final "s" of the name is usually dropped. Possessed of four wings, none of the species seem to fly, but they run swiftly, and also leap by a jerk of the tail. A thrips has no jaws, it feeds itself on the juices of plants by the aid of a short sucker, feasting upon petals, and also upon leaves. These insects not merely disfigure, they frequently kill both flowers and leaves. This is partly from the effect of an exudation they throw off more poisonous to plants than the "honeydew" of the aphid tribe. It is a blackish sticky fluid, deposited in minute drops certainly, but from the quantity of it capable of clogging the pores and so stopping the vital action. *Thrips cerealium*, the species so troublesome in cornfields, is believed to have attached to its sucking apparatus tiny lancets, by which it cuts up the tissues of cereal flowers; this point, however, is not clear.

The most abundant species is *T. adonidum* (I am afraid no gardener thinks it an *Adonis*), which, small as it is, finds space to display the tints of black, white, red, and yellow. It, like the rest, passes through a larval condition, and the wings are developed gradually. When the thrips occurs in a house there is not much difficulty in exterminating it by fumigation; out of doors, owing to the wandering habits of the bulk, few precautions can be taken against them. Their vitality is remarkable, far exceeding that of a host of insects much larger and apparently much stronger.—  
ENTOMOLOGIST.

ALFRED COLOMB AND BENOÎT COMTE.

I SEE that the N.R.S. have coupled together for the future Jean Soupert and Great Mogul. This is as it should be. But I see that they have adopted the same course with Alfred Colomb and Benoît Comte. I cannot see the propriety of this, as these Roses seem to me unquestionably distinct, not only in growth and leaf, which are properly not taken into consideration, but in flower. Benoît Comte is rarely symmetrical in outline, but disfigured for the most part by a pinch in the side, and scarcely opens in its full expansion without showing an eye. Sometimes it does not show these defects, and is then an excellent Rose, but surely the colour is distinct and much brighter, and more nearly approaching to scarlet than that of Alfred Colomb; in fact, I do not overstate the case when I say that I can distinguish the difference 10 yards off. I hope it is not too late for the decision to be reconsidered. I would have sent flowers for comparison, but the terrible rains have beaten every flower into pulp.—DUCKWING.

#### NATIONAL ROSE SOCIETY, BIRMINGHAM.—JULY 17TH.

ALTHOUGH the reporting of this Exhibition will fall into other hands I could not let it pass away without writing a few short notes on what I believe (having seen them all) to have been the most successful provincial Show that the Society has ever held. Rose growing has increased to a wonderful degree since the early days of the Society, while a number of new and valuable Roses have been added to our gardens, and the strides that the cultivation of the Tea Rose has made is marvellous. In former days a few stands were all that were to be seen, while now they form quite an exhibition by themselves.

THE NUMBER OF FLOWERS SHOWN.—I am not quite certain about the exact quantity, but I know that the entries amounted to nearly 400, and owing to the two previous fine days, which were favourable to the opening of the Roses, there were much fewer withdrawals than usual. Bad weather acts most injuriously in this respect, especially amongst those who are dependant on comparatively few plants for their flowers. Wet and cold weather tells most injuriously. Even where flowers are protected it often happens that in cold weather a bloom makes no progress whatever, and when at last it does open it comes deformed or queer. A large grower can pull off the bad without any qualms of conscience. Not so the small amateur, who sees perhaps the hope of the flock gone, so that the two fine days were a great help to exhibitors, just as the wet days before the Show at the Crystal Palace caused an unusual number of withdrawals.

THE QUALITY OF THE BLOOMS.—Of this there could be no doubt. It had been said that it was a Hybrid Perpetual year, that it was too wet and cold for Teas, but Teas were shown in remarkable cleanliness and beauty, the stands of Messrs. Barnside, Page Roberts, Foster-Melliard, and others amongst the amateurs, and those of Messrs. Prince, Harkness, &c., amongst nurserymen, consisting of flowers most beautifully developed. Another matter which tended to the excellence of the flowers was that now, almost for the first time this season, maiden blooms were thrown in any quantity; the season had been so backward.

After all that they had not been in flower, but now was their turn, and some of the beautiful flowers in Mr. Pemberton's stand were evidence that at last he was able to show in his usual form. Amongst the flowers shown in great beauty were Victor Hugo, Susanne Marie Rodocanachi, Her Majesty, Marie Verdier, Earl of Dufferin, Sir Rowland Hill, Madame Charles Crapelet, Countess of Rosebery, and Duchess of Bedford, while amongst Teas a beautiful triplet of Miss Ethel Brownlow, and some grand blooms of Innocente Pirola in the amateurs' stand were very conspicuous indeed. There was hardly a good variety that was not well represented at this fine Show.

SPECIAL PRIZES.—As will be seen by the report, the challenge trophies remain in the possession of last year's victors, Messrs. Harkness & Sons of Bedale, and Rev. Joseph H. Pemberton. The stand of the former was of very great excellence, and contained amongst others some very beautiful Teas. Since the withdrawal of Mr. T. B. Hall and Mr. E. R. Whitwell from the field of contest, there are as yet no northern growers who even venture to enter the lists. It is a fact much to be regretted, as these northern exhibits added much to the interest; and while one does not grudge Mr. Pemberton his well deserved victory, yet considering that this is called the Northern Exhibition, one would have liked to have seen some good northerner carrying it off; as that was not the case, it has fallen into very worthy hands. He was run very close by Mr. Lindsell, the champion of the year, but he has fought so well and so hard that it was hardly to be expected he would "come up to the last round" quite as fresh as before. Mr. Girdlestone secured an easy victory in winning Lord Calthorpe's 10-guinea cup for Moss Roses, for he was the only exhibitor. When Lord Calthorpe intimated his intention of giving this prize remonstrances were made to him that on the 17th of July it was well-nigh impossible to obtain Moss Roses, and that the exhibits must of necessity be few and not at all worthy of the prize. However, all remonstrances were of no use; but it has fallen out as one expected. The winning stand was a very nice one, but the winner would be the first to acknowledge that it was nothing to what he could have shown a fortnight before.

The National Rose Society's gold medal was awarded with acclamation to the new seedling Rose of Messrs. Alex. Dickson & Sons of Newtownards, the beautiful white Margaret Dickson. It is a flower of very great excellence, well formed, plenty of stuff as the saying is, with well formed deep petals and the most wonderful foliage; the leaves are thick and almost leathery in substance, so that it is not likely to suffer from mildew. It is a cross between Lady Mary Fitzwilliam and Merveille de Lyon, and will in the opinion of many rosarians "put the latter's nose out of joint." I may add that, beautiful as were the three Roses exhibited, they were not to be compared in size to those on which I have already commented at Wirral. Thus three gold medals have this year been awarded for Mrs. Paul, Salamander, and Margaret Dickson, a circumstance which has never before occurred in the history of the National.

It only remains to be said that no better or more convenient place could be selected for a Rose show, that the courtesy and intelligent interest of Mr. Latham made everything pleasant for the exhibitors, and that the coolness of the day contributed to keep the flowers fresh up to the last. The Society is much indebted to the Committee and their able and indefatigable Secretary, Mr. Hugh Nettleford, for a most pleasant and successful meeting.—D., Deal.

A WONDERFUL display of good blooms, a very large attendance of leading exhibitors, fine weather, and a beautiful home for the Rose Show in the well kept Botanical Gardens, pleased everyone on Thursday last, and it was generally acknowledged to be the best provincial Exhibition the Society has held. The arrangements made by Mr. Latham and his assistants met with general approval, and there was an excellent attendance. Roses generally were of good quality, and stood well till the close of the Exhibition.

In the nurserymen's jubilee class for thirty-six blooms, single trusses, the trophy and £3 (thirteen competitors), Messrs. Harkness & Sons, Bedale, were first with superb blooms of the following:—Back row: Ulrich Brunner, Duchesse de Morny, Camille Bernardin, Mrs. J. Laing, Barthelemy Joubert, Niphotos, Marie Baumann, Captain Christy, Etienne Levet, Madame E. Verdier, Countess of Oxford, Lady Mary Fitzwilliam. Second row: Madame Gabriel Luizet, Charles Lefebvre, Souvenir d'Elise, Général Jacqueminot, La France, Alfred Colomb, Her Majesty, Marie Rady, Innocente Pirola, Horace Vernet, Catherine Mermet, J. Stuart Mill. Front row:—Star of Waltham, Madame C. Kuster, A. K. Williams, Comtesse de Nadaillac, Duke of Connaught, Madame Cusin, Le Havre, The Bride, E. Y. Teas, Princess of Wales, Madame Haussmann, and Merveille de Lyon. Second, the Cranston Nursery Company, Hereford. Third, Messrs. A. Dickson & Sons, Newtownards, Belfast. Fourth, Mr. Frank Cant, Colchester.

In class 1, seventy-two blooms, distinct (five exhibitors), Messrs. Harkness & Sons again took the first prize with very fine blooms. Back row: François Lacharme, Lady Mary Fitzwilliam, Marie Van Houtte, The Bride, Général Jacqueminot, Madame Henry Pereire, A. K. Williams, Her Majesty, Ulrich Brunner, Captain Christy, Marie Baumann, Benoît Comte, Heinrich Schultheis, Exposition de Brie, Mrs. John Laing, Madame Alphonse Lavallée, Madame Eugène Verdier, Madame A. Soupert, Baroness Rothschild, Alfred Dumesnil, La France, Lady Sheffield, Paul Neron. Second row: Madame Montet, Barthelemy Joubert, Devoniansis, Alfred Colomb, Pride of Waltham, E. Y. Teas, Innocente Pirola, Charles Lefebvre, Hippolyte Jamain, Fisher Holmes, C. Mermet,

Horace Vernet, Niphotos, Lord Macaulay, Jean Ducher, Etienne Levet, Madame Berard, Marie Rady, Souvenir d'Elise, Mrs. Jowett, Souvenir de Paul Neron, Caroline Kuster, Le Havre. Front row: Madame C. Joigneaux, Madame Cointet, Ella Gordon, Emilie Hausburg, Harrison Weir, Viscountess Folkestone, Duchesse de Morny, Francisca Kruger, Constantin Tretiakoff, Etoile de Lyon, Beauty of Waltham, Queen of Queens, Camille Bernardin, Madame Cusin, Princess Beatrice, Charles Darwin, Anna Ollivier, Duke of Connaught, Madame Bravy, Dupuy Jamain, Madame de Watteville, Duchess of Bedford, and Marie Van Houtte. Second, the Cranston Nursery Company. Third, Mr. B. R. Cant. Fourth, Messrs. Paul & Son, Cheshunt.

In class 2, thirty-six, distinct, trebles (six exhibits).—First, the Cranston Nursery Company, with a very fine lot—viz., Alfred Colomb, La France, A. K. Williams, Marie Finger, Heinrich Schultheis, Ulrich Brunner, extra fine; grand blooms of Her Majesty, Madame C. Joigneaux, unnamed; Charles Darwin, Dupuy Jamain, Earl Dufferin, Duchesse de Morny, Général Jacqueminot, in grand form; unnamed, Madame Alphonse Lavallée, Countess of Oxford, Lady Sheffield, E. Y. Teas, Jean Ducher, Marie Baumann, Silver Queen, Maurice Bernardin, Comtesse de Serenye, La Rosière, Merveille de Lyon, Duke of Wellington, Marie Verdier, Camille Bernardin, Madame Gabriel Luizet, John Stuart Mill, Baroness Rothschild, Benoit Comte, very fine; M. Etienne Levet, and Madame Charles Wood. Second, Mr. B. R. Cant. Third, Mr. George Prince, Oxford. Fourth, Messrs. Paul & Son, Cheshunt.

In class 3, thirty-six blooms, distinct (six exhibits), first, Mr. Henry Merryweather, with superb blooms—viz., Camille Bernardin, Dupuy Jamain, La France, Sénateur Vaissc, Her Majesty, Horace Vernet, François Michelin, Etienne Levet, Marie Baumann, Heinrich Schultheis, A. K. Williams, Lady Mary Fitzwilliam. Second row: Fisher Holmes, Susanne Rodocanachi, Camille Bernardin, Baroness Rothschild, Marshall P. Wilder, Viscountess Folkestone, Duke of Wellington, Countess of Rosebery, Mrs. John Laing, Gloire de Margottin (very fine), Capt. Christy, Marquise de Castellane. Front row: A. Colomb, Prince Arthur, Merveille de Lyon, Général Jacqueminot, Violette Bouyer, Madame Victor Verdier, Madame G. Luizet, Marie Rady, Marie Baumann, Marie Finger, Duke of Edinburgh. Second, Messrs. Perkins & Son, Coventry; third, Messrs. Jefferies & Son, Cirencester; fourth, Mr. Rumsey, Waltham.

In class 4, eighteen trebles (five exhibits), first, Messrs. Jefferies and Son, with La France, Comte Raimbaud, Her Majesty (very fine), Horace Vernet, Merveille de Lyon, Prince Arthur, Mrs. John Laing, Ulrich Brunner (very fine), Viscountess Folkestone, A. K. Williams, Madame Marie Verdier, Marie Baumann, Baroness Rothschild, Alfred Colomb, Captain Christy, Charles Lamb, and very fine; Marie Finger, and Countess of Oxford, very fine and richly coloured. Second, Mr. Hy. Merryweather, with very fine blooms of Countess of Rosebery, Viscountess Folkestone, Her Majesty, Ulrich Brunner, Mrs. John Laing, and others. Third, Messrs. Perkins & Sons; fourth, Mr. Rumsey.

In the amateurs' classes the following awards were made:—The jubilee prizes, for twenty-four distinct varieties, first prize, the trophy, and £3, there were nine exhibitors. The Rev. J. H. Pemberton's fine first prize blooms comprised—Front row: Ulrich Brunner, Louis Van Houtte, Magna Charta, Madame Charles Crapelet, Heinrich Schultheis, Charles Lefebvre, François Michelin, Duchess of Bedford. Second row: A. K. Williams, Lady Mary Fitzwilliam, Auguste Rigotard, Marie Van Houtte, Marie Baumann, Souvenir d'un Ami, Madame Victor Verdier, Countess of Rosebery. Back row: Madame Lambard, Exposition de Brie, Her Majesty, Lady Arthur Hill, Baroness Rothschild, Comte Raimbaud, Mrs. John Laing, and Innocente Pirola. Second, Mr. E. B. Lindsell, Hitchin; third, Rev. Hugh A. Berners; fourth, Mr. J. Pulley.

For thirty-six blooms, distinct (first prize a very handsome silver cup, value £10 10s., presented by the Right Hon. Joseph Chamberlain, M.P.) with a capital stand of Etienne Levet, A. K. Williams, Countess of Oxford, Louis Van Houtte, Magna Charta, Marie Baumann, Ulrich Brunner, Dr. Andry, Heinrich Schultheis, Devienne Lamy, Pride of Waltham, Madame Charles Crapelet. Second row: Charles Lefebvre, Grandeur of Cheshunt, Victor Hugo, jun., Baroness Rothschild, William Warden (?), Her Majesty, Duchess of Bedford, Lady Mary Fitzwilliam, Mrs. John Laing, and Susanne Rodocanachi. Front row: Marie Verdier, Auguste Rigotard, François Michelin, name lost, Caroline Kuster, Le Havre, Souvenir d'un Ami, Comtesse de Morny, Merveille de Lyon, Lady Helen Stewart (a beautifully shaded bloom), La France, and Comte Raimbaud. Second, Mr. E. B. Lindsell; third, Mr. S. P. Budd, Bath. In the class for twelve trebles the Rev. J. H. Pemberton was first, and Mr. E. B. Lindsell second.

In class 7, for twenty-four distinct varieties (first prize a silver salver, value ten guineas, presented by A. H. Griffiths, Esq.), there were ten exhibitors, and close competing. Mr. Arthur Whitton, Bedale, his best blooms Ulrich Brunner, Etienne Levet, Marie Levet, Marquise de Castellane, Innocente Pirola, Dupuy Jamain, Souvenir d'Elise Vardon, Lady Sheffield, Duke of Edinburgh, Violette Bouyer, and Prince Arthur; second, Mr. Alfred Slaughter, Steyning, Sussex; third, the Rev. A. Foster-Melliar, Sproughton Rectory, Ipswich; fourth, Mr. Wm. Boyes, Derby.

Class 8, twelve single blooms (six exhibitors).—First, Mr. Edward Mawley, Berkhamstead, with a stand of very fine blooms—namely, a grand bloom of Her Majesty, Sir Rowland Hill, La France, Marie Rady, Duke of Edinburgh, Marie Finger, E. Y. Teas, Baroness Rothschild, Ulrich Brunner, J. S. Mill, Duke of Teck, and Star of Waltham.

Second, Mr. W. Whittle, Belgrave, Leicester. Third, the Rev. C. P. Roberts, Scole Rectory. Fourth, Mr. R. Ramsden, Chadwick Manor, Knowle.

Class 9, six distinct blooms.—First, Rev. F. S. Taylor, Evesham. Second, Mr. J. Rawlins, Cirencester. Third, Mr. H. D. Edwards, Mackworth, Bexley. Fourth, Rev. F. H. Gall, Hitchin. In the local amateurs' classes for twelve blooms.—First, Mr. A. H. Griffiths, Edgbaston. Second, Mr. James Richards, Edgbaston. Third, Mr. W. C. B. Cane, Harborne. For six blooms.—First, Mr. Robert Austin, Kings Heath, Second, Mr. J. Smith, Hall Green. Third, Mr. H. Bloomer, Kings Norton.

In the class for twelve new Roses Messrs. Paul & Son, Cheshunt, were first with H.P. Jules Desponds, which promises to be an acquisition, Lady Alice, John D. Pawle, Edouard Michel, Souvenir de S. A. Prince, Marie Margot, Lady Arthur Hill, H.P. Scipion Cochet, Dowager Duchess of Marlborough and two promising Teas, Ernest Metz and Mrs. James Wilson. Second, Messrs. A. Dickson and Sons, Newtownards, their best kinds being T. W. Girdlestone, a fine variety, and Duchess of Albany, a highly coloured La France. Third, Mr. B. R. Cant.

Lord Calthorpe, who owns the greater part of the Edgbaston district, gave a handsome silver eup, value ten guineas, for a collection of Moss Roses. Three boxes were staged, Mr. T. W. Girdlestone securing the eup with a well set up good collection, the old crested Moss being prominent amongst them. Some beautiful bouquets of Roses were exhibited by ladies.

In the class for twelve Teas or Noisettes, three trusses of each, open class, there were ten exhibitors and a close competition. First, Messrs. Harkness & Sons, with a superb stand. Second, Rev. F. R. Burnside. Third, Mr. B. R. Cant. Fourth, Mr. George Prince. For eighteen Teas or Noisettes, single trusses (nurserymen), first, Mr. George Prince, with very fine blooms—viz., Catherine Mermet, Edith Gifford, Madame Cusin, Souvenir de S. A. Prince, Princess of Wales, Souvenir d'Elise Vardon, Innocente Pirola, Souvenir d'un Ami, Madame Hoste, Anna Ollivier, M. Niel, Niphotos, Rubens, Alba Rosea, Comtesse de Nadaillac, very rich in orange tint; Marie Van Houtte, very fine; The Bride and Sunset, also very fine. Second, Messrs. Harkness & Sons. Third, Mr. Frank Cant. Fourth, Mr. B. R. Cant. For twelve Teas, single (nurserymen), Mr. Henry Merryweather, with a fine stand of Catherine Mermet, Marie Van Houtte, Innocente Pirola, Madame Hoste, Francisca Kruger, Comtesse de Nadaillac, Niphotos, Caroline Kuster, Souvenir d'un Ami, Jean Ducher, and Perle des Jardins. Second, the Cranston Nursery Company. Third, Messrs. Jefferies & Son. Fourth, Mr. John Mattock, Oxford. For twelve Teas or Noisettes (amateurs), eight exhibitors, first, the Rev. F. R. Burnside, with a very fine stand of The Bride, Francisca Kruger, Innocente Pirola, Madame Cusin, Innocente Pirola, Comtesse de Nadaillac, Catherine Mermet, Souvenir d'Elise, Madame Hoste, Edith Gifford, Marie Van Houtte, Souvenir d'un Ami, and Anna Ollivier. The Tea Roses were numerous and fine generally, and were a beautiful feature of the Show. The first and second prize lot of trebles were very fine, and Mr. B. R. Cant's a superb third.

For six new Roses, first, the Rev. J. H. Pemberton. Second, the Rev. A. Foster-Melliar. For twelve single trusses of any yellow Roses (six exhibitors), first, the Cranston Nursery Company, with Marie Van Houtte, very fine. Second, Mr. George Prince, with Francisca Kruger. Third, Mr. B. R. Cant, with Madame Hoste. Twelve single trusses of any white Rose (thirteen exhibits). The Teas were very strong here, some fine stands of Merveille de Lyon standing no chance. First, the Rev. F. R. Burnside, with Innocente Pirola. Second, Messrs. D. & W. Croll, with grand blooms of Rubens. Third, Mr. B. R. Cant, with The Bride. Messrs. Harkness & Sons staged in this class a fine twelve of Lady Alice. Thirteen exhibits in this class.

Twelve single trusses of any crimson Rose (fifteen exhibits).—First, the Cranston Nursery Company, with a grand stand of Alfred Colomb. Second, Messrs. R. Mack & Son, with A. K. Williams. Third, Messrs. D. & W. Croll, with E. Y. Teas. In this class the Cranston Company had a superb twelve Ulrich Brunner. For six trusses of any one variety of H.P. and six of any one variety of Tea or Noisette there were twelve exhibits. First, Messrs. Harkness & Sons, with H.P. Horace Vernet and Tea Innocente Pirola, all very fine blooms. Second, Messrs. James Cocker & Son, Aberdeen, with wonderfully fine blooms of La France and Tea Madame Bravy. Third, the Cranston Nursery Company, with Alfred Colomb and Catherine Mermet, Tea.

The gold medal for three blooms of any new seedling Rose, not yet in commerce was well won by Messrs. A. Dickson & Sons, Newtownards, with Margaret Dickson, a lovely white flower of great substance and with thick leathery foliage. Other seedlings staged in competition for the gold medal were Mrs. Arthur Wilson, from Mr. G. Swales, Beverley; a crimson seedling from Mr. F. Cant and Bourbon Mrs. Paul; and H.P. J. B. Hayward, bright in colour, from Messrs. Paul and Son, Cheshunt.

Mr. G. B. Lindsell won the premier for best H.P., Her Majesty. Best Tea or Noisette, Innocente Pirola, by Mr. A. Whitton, Bedale.

A beautifully set up stand of Roses by Messrs. Croll of Dundee was by a great many very much admired, and shows the blooms off to so much advantage to visitors. In this arrangement the names are so easily seen. With a great many of the exhibitors naming is done hurriedly, and not very legibly, and it is difficult to see the names, and in some instances these are fastened into wires under the blooms. Perhaps some Rose exhibitor will soon invent a neat and more serviceable arrangement for showing the names more prominently, and he will get the blessings at all events of those who have to report Rose exhibitions

## NEW BRIGHTON.—JULY 12TH.

THIS Rose show was absolutely unique in its character. At many other shows—Wirral, Gloucester, &c.—stalls are presided over by ladies where Roses are sold for the benefit of some charity or other, generally for hospitals, and partly those for children. It is a pretty thought to associate the Rose with the alleviation of the sufferings of childhood, for how children love flowers, wild or cultivated, but at New Brighton the whole object of the Show is the furtherance of the Children's Hospital at Wallasey, and all the surplus, after paying expenses, is devoted to that purpose. That energetic and thorough rosarian, Mr. Bell, is the prime mover in it. He throws open his grounds, provides tennis for some, and a hearty welcome for all; and, therefore, when, as this year, it rained nearly all day, it is not merely that it is a disappointment to the organisers but a considerable loss to the hospital.

Although the Show is a small one, it always has the effect of bringing together some admirable Roses, both from amateurs and growers for sale, and this year was no exception to the rule, the leading stands in both classes being of great excellence. In the nurserymen's class for forty-eight blooms, the English Fruit and Rose Co. (Cranston's) was first with the following Roses in fine order—John Stuart Mill, La France, Alfred Colomb, Mrs. John Laing, Ulrich Brunner, Her Majesty, A. K. Williams, Lælia, Madame Victor Verdier, Lady Sheffield, Horace Vernet, Pride of Waltham, Marie Baumann, Baroness Rothschild, Madame Eugène Verdier, Sénateur Vaisse, Marquise de Castellane, Louis Van Houtte, Rubens, Beauty of Waltham E. Y. Teas, Earl of Pembroke, Marie Van Houtte, Comtesse d'Oxford, François Michelon, Prince Arthur, Viscountess Folkestone, Général Jacquemino, Merveille de Lyon, Barthélemy Joubert, Madame Gabriel Luizet, Comtesse de Serenye, Duke of Edinburgh, Duchess of Bedford, Heinrich Schultheis, Madame Charles Wood, Emilie Hausburg, Comte de Raimbaud, Camille Bernardin, Madame Alphonse Lavallée, Madlle. Eugène Verdier, Charles Lefebvre, Marie Verdier, Lady Helen Stuart, Susanne Marie Rodocanachi, Le Havre, and Etienne Levet. Messrs. Harkness & Son of Bedale were a good second, and Messrs. Merryweather of Southwell, third. In the class for twenty-four singles (amateurs), Mr. E. B. Lindsell of Beaston, Hitchin, was first with blooms of the same exquisite finish he has made us familiar with this year. They were Ulrich Brunner, La France, Alfred Colomb, A. K. Williams, François Michelon, Beauty of Waltham, Merveille de Lyon, Marie Baumann, Her Majesty, Prince Arthur, Marie Verdier, Charles Lefebvre, Horace Vernet, Alfred Colomb, Mrs. John Laing, Dr. Andry, Countess of Rosebery, Marie Baumann, Etienne Levet, Maurice Bernardin, Louis Van Houtte, Marquise de Castellane, Fisher Holmes, Earl of Dufferin, and Lady Sheffield.

In eighteens, distinct, Mr. Lindsell was again first with Ulrich Brunner, La France, Alfred Colomb, Merveille de Lyon, A. K. Williams, Captain Christy, Dr. Andry, Countess of Rosebery, Louis Van Houtte, Marie Baumann, Mrs. John Laing, Baron Rothschild, Abel Carrière, Dupuy Jamain, Lady Sheffield, and Victor Hugo; Mr. Churton was second. In the class for twelve Teas, nurserymen, Messrs. Merryweather were first, Souvenir d'un Ami, Madame Lambard, Etoile de Lyon, Catherine Mermet, Souvenir d'Elise Vardon, Souvenir de Thérèse Levet, The Bride, and Souvenir de Victor Hugo, Comtesse de Nadaillac, Anna Ollivier, Madame de Watteville, and Madame Hoste; the English Fruit and Rose Company were second. In class for twelve Teas, amateurs, Mr. Lindsell was first with Comtesse de Nadaillac, The Bride, Madame Cusin, Caroline Kuster, Niphotos, Souvenir d'Elise Vardon, Princess of Wales, Catherine Mermet, Souvenir d'un Ami, Innocente Pirola, President, Anna Ollivier. In the class for twelves, amateurs, Mr. Bulley was first, Dupuy Jamain, Ulrich Brunner, Duchesse de Morny, Baroness Rothschild, Etienne Levet, A. K. Williams, Captain Christy, Louis Van Houtte, Duke of Wellington, Le Havre, Charles Lefebvre, and Rosieriste Jacobs. In the class for six, Mr. W. Holland was first with La France, Prince Arthur, Marie Baumann, Gabriel Luizet, Ulrich Brunner, and Le Havre. In the class for the best twelve of any one Rose, the English Fruit and Rose Company was first with a beautiful stand of Alfred Colomb, little inferior, if at all, to those exhibited at Gloucester; Messrs. Harkness & Sons were second with a beautiful box of Mrs. John Laing.

There were some beautiful stands of hardy herbaceous flowers shown, Messrs. Dicksons of Chester sending a fine lot, not for competition; and Messrs. Bell gaining first for a very pretty selection. These tend to make a pleasing variety in these northern Rose shows.—D., Deal.

## SAXIFRAGA COCHLEARIS.

THIS is a graceful species belonging to the crustaceous section of the above genus, forming compact clusters of rosettes, and producing elegantly formed plumes of snowy white blossoms. Though this species may usually be regarded as a free bloomer, I think it has done far better this year than I have noticed for several seasons past, and adorned with its pure white flowers it forms one of the most beautiful of its tribe. In its general aspect, too, it is exceedingly pleasing, by reason of its delicate grace. Indeed few members of this section are better worth being grown in large masses on the rockwork than this. Few species are more easily or readily increased, for it produces offsets in considerable quantity, hence the greater wonder it is not more frequently seen in large patches. Like many others it delights in

a loamy soil freely mingled with sharp grit, or old mortar rubbish, and well decayed manure; this last is not generally recommended, but I have not the slightest doubt that the well-flowered specimen, referred to by these remarks, owes not a little of its vigour and freedom of flowering to a somewhat liberal application of manure.—J. H. E.

MEMORIAL TO THE LATE MR. B. S. WILLIAMS.—A meeting was held in the offices of the Gardeners' Royal Benevolent Institution, Parliament Street, on Monday, July 21st, to consider the proposed memorial to the late Mr. B. S. Williams of Upper Holloway. Several resolutions were passed, and particulars of the form which the memorial will take will shortly be published.

— THE WEATHER following the fine days early in the past week was distinguished by severe storms and heavy rain, which caused much damage to farm and garden crops in many districts. In the immediate neighbourhood of Swanley alone it is reported that over £1000 worth of Raspberries and other fruits have been destroyed or greatly damaged. On Thursday the rainfall was excessive. At Slough Mr. H. Turner states his gauge registered 3.68 inches, and at Bisley Mr. Gregory recorded 2½ inches in forty minutes, exceeding what was registered at Wimbledon eighteen years ago—namely, 1¾ inch in seventy-five minutes. The weather has been somewhat finer since, but is still changeable.

— THE ESSEX FIELD CLUB announce that a meeting will be held on Saturday, July 26th next, on Tyler's Common, when the northern part of Upminster parish will be visited, and the party will be received at Upminster Hall by Mr. and Mrs. G. P. Hope. The members will assemble at Harold Wood Station at 3.30 P.M., and will be under the direction of Mr. Walter Crouch, with Prof. Boulger as botanical referee. Further particulars can be had from the Hon. Sec., Mr. B. G. Cole, 7, Knighton Villas, Buckhurst Hill, Essex.

— THE DEMAND FOR PEACHES.—In our article on this subject last week Dartford was mentioned as the nearest station to Bexley Heath, where Mr. Burton grows such extraordinary crops. We were misinformed. Bexley is the nearest station, and at a little more than a mile from Mr. Burton's residence in Erith Road.

— AN EXAMPLE WORTH FOLLOWING.—There is in the city of York a Society of Old Florists, who make florists' flowers their chief consideration, and the Society has had an unbroken existence of over a hundred years. Two well-known and good old florists in the city of York, Messrs. Douglas and Cowper, are still active members, and their lives have been long ones amongst their pet flowers. "The Ancient Society of York Florists" recently held a flower service in the pretty little church of Osbaldwick, close to York, and a collection of nearly £3 was made for the benefit of the Gardeners' Royal Benevolent Institution. Every little helps, and more of such excellent helps from successful flower show societies would be gladly received by the Benevolent or Gardeners' Orphan Fund Societies.—D.

— DISSOLUTION OF PARTNERSHIP.—Messrs. John Grigor & Co., nurserymen, Forres, intimate that they have dissolved partnership, and disposed of their business to Mr. William Wiseman, who for many years has acted as their manager, and who will carry on the business under his own name and on his own responsibility. Mr. Wiseman will receive and make payment of all accounts due to or by the late firm. All cheques should be made payable and all letters should be addressed to him.

— DEATH OF MR. JOHN RALFS OF PENZANCE.—Mr. Hy. Mount, Trengwainton Gardens, Penzance, sends us the following paragraph from a local paper. "We regret to announce the death of Mr. John Ralfs, the veteran botanist, which occurred, July 14th, at his rooms at St. Clare Street. For the last two years he had been in feeble health, and of late his mental and physical infirmities had rapidly increased. For many months he had been confined to his house, and had been quite unable to engage in the pursuits to which he was at one time devoted. Mr. Ralfs was the second son of

the late Mr. Samuel Ralfe, of Munddiford, Christchurch, and was born on September 13th, 1807, near Southampton, his mother being at the time on a visit to her parents. He was educated privately at Bishops Waltham and Romsey, and, leaving school at the age of eighteen, was articled to a surgeon at Southampton. He subsequently found his way to Winchester, where he 'walked the hospital' for about two years. In 1832 he passed his final examination, and was specially commended by the presiding examiner for the intimate knowledge of the science of botany which his answers displayed. For a short time Mr. Ralfe practised as a surgeon in Shoreditch, but soon after his marriage with a Miss Newman he threw up his practice and went to reside at Torquay. After wandering from place to place for a few years he came to Penzance in 1837, and has resided here ever since. He has long been known as one of the most distinguished of English botanists, and was in constant correspondence with experts in this branch of science, not only in England, but in America and the principal European countries. He was the author of many important works, including 'The British Desmidiæ,' and 'The Flora of West Cornwall' (a manuscript work now in the Penzance Library). At the time of his death Mr. Ralfe was a member of the Penzance Library Committee, a position which he had held during the greater part of the time covered by his residence in Penzance. He was also a member of the Penzance Natural History and Antiquarian Society, the transactions of which contain not a few important papers from his pen. Last year he was elected Honorary Fellow of the Royal Microscopic Society of Great Britain. The funeral will take place on Thursday at the Penzance cemetery, leaving the house at three."

— GARDENING APPOINTMENT.—Mr. Charles Slade, late gardener to the Marquis of Hertford, Ragley Park, Alcester, Warwickshire, has succeeded Mr. Gleeson as gardener to the Duke of Newcastle, Worksop, Notts.

— DRIP FROM THE RAFTERS IN PLANT HOUSES.—In ordinary houses it is very difficult to prevent drip from the rafters falling more or less into pans and baskets suspended from the roof. A cross-bar, or even a nail used for hanging blocks or baskets upon, will convey large quantities of condensed moisture to the plants. Under these circumstances such plants as Orchids are often too wet, in fact they are kept in a constant state of saturation, and seldom flourish satisfactorily. We have been troubled a good deal during several years in this way, but have now almost rendered our houses free from drip. We had long strips of zinc cut 1½ or 2 inches wide, according to the width of the rafters, and thoroughly painted them, and then tacked them below the rafters with small copper nails. Each side was slightly bent up towards the glass, which conveyed all the moisture that fell from the roof down to the eaves. The remedy was scarcely complete until we arranged on the eaves a miniature spout to receive the water conveyed down from the rafters.—O. G.

— STRAWBERRY LAXTON'S NOBLE.—In last week's number of *Journal of Horticulture* I was asked by "T. C." to give my opinion on Laxton's Noble Strawberry. I have pleasure in saying that I find Noble far the best early forcing Strawberry I have ever tried. With us the plant is a strong, free, and robust grower, with a hardy constitution, an abundant bearer, and is remarkably free from mildew and green fly during the whole of the forcing season. We forced 300 plants last year, 1000 this year, and are at present preparing 2000 for next season. This fact will show the value we set upon the "gay deceiver." Last season our first plants were started in an early Peach house about the middle of December. These were in flower on February 8th, and the first fruit was ripe on March 4th. From that date we had Noble ripe almost daily until the end of May. Although most of the Strawberries were sent to London in the usual family garden hampers, I have no complaint as to its flavour or bad travelling. On the other hand, my employer asked me the name of the "splendid Strawberry" I had been sending. Telling him, I asked him his opinion about its flavour. The reply was, "Very good, they were much admired." In order to further test its travelling capabilities I sent a dish of it to the Edinburgh Spring Show, requesting that I might be informed as to the condition in which it arrived. The reply was "Perfect in every respect, probably the grandest dish of Strawberries ever seen in Scotland." The above quotations will suffice to show that Noble is not always a bad traveller.—J. McINDOE.

— TRILLIUM SESSILE, VAR. CALIFORNICUM.—The genus Trillium contains several attractive garden plants. Trillium grandiflorum, the large, white-flowered species of the Eastern and Northern States, is the

most beautiful of them, and when once established in a suitable position it is not excelled in beauty by any spring flowering herb. The Painted Trillium, as Trillium erythrocarpum is called on account of the bright purple-rose coloured markings which appear on the lower part of the petals, is hardly less beautiful, although the flowers are considerably smaller and much more modest than those of the better known species referred to above. Another plant of this genus, of first-rate value as a garden plant, has been brought into cultivation in recent years. It is the Pacific coast form of a widely distributed eastern species, Trillium sessile, found from Pennsylvania and Wisconsin to Florida and Alabama. The western form of this plant, known as variety californicum, is widely distributed through the northern part of California west of the Sierra Nevada, and extends into Oregon. Trillium sessile, var. californicum, is a stout plant, with broadly rhombic-ovate leaves, varying from 3 to 6 inches in length, lanceolate, acute, erect sepals, and oblong or rhombic-ovate petals, which vary in length from 1 to 4 inches. These differ in colour on different plants from purple to pure white, and at first are nearly upright, becoming reflexed above the middle when the flower is fully expanded. The form with pure white petals is the handsomest and most desirable as a garden plant. The Pacific coast Trillium, like the other species in the genus, is most satisfactory when it is planted in deep moist soil in the shade of deciduous trees; that is, where it can enjoy early in the season or during the blooming period full exposure to the light, and where later it can be protected by the leaves of the overhanging trees from the full blaze of the sun. Trilliums should be planted early in the autumn, or not later than the 1st of October, if good flowers are expected from them the following spring. They do not show, however, what they are really capable of until they have been allowed to grow undisturbed in the same spot during three or four years and have become well established. Then, if the soil in which they are planted suits them, and the situation is a favourable one, they form broad masses of immense leaves, and produce flowers of large size and surprising beauty.—(*American Garden and Forest*.)

## ABUTILONS.

THESE plants are very showy, free growing, and easily cultivated. They are alike useful for ornament in the greenhouse and conservatory, for affording flowers for cutting, and for forming beds in the outside garden. The taller varieties are seen to great advantage trained to wires under roof rafters, not having the wires further from the glass than a foot, whilst as pillar plants they are effective, their drooping bell-shaped flowers in either case being seen to singular advantage. Whether as roof or pillar plants they are best allowed to grow rather loosely, so that the side branches may droop down, and when they are becoming too numerous they may be thinned, a convenient method being to cut the flowered sprays back to a few joints from their origin, which serves the purpose of keeping the plants well home as well as affording a succession or continuance of bloom, the sprays loosely arranged in large vases having a very fine effect. Crowding, however, must be avoided, timely thinning and regulation of the growths being practised in due course and with discretion, avoiding stiffness or formality as prejudicial alike to freedom of bloom and effect.

As roof or pillar plants Abutilons are perhaps best planted out. They succeed, however, very well in pots, which must be proportionate in size to the plant required. They give much less trouble in watering when planted out than if grown in pots. In the latter they require feeding with liquid manure to maintain them in good foliage, and even then they do not attain to the freedom of growth and fulness of bloom of those planted out. A border of 2 feet width and similar depth well drained, as abundance of water and food supplies is required when they are in free growth, with a compost of equal parts fibrous loam, leaf soil, and peat, with about a sixth of drift or crystal sand put in rather firmly, so as to induce a starchy free-flowering habit, will grow these plants to perfection. Continually pouring on water is not watering but drowning, making the soil sodden and sour, to the destruction of the soft roots and small fibres, the plant becoming sickly and collapsing. Over-dryness on the other hand, if not so pernicious as overwatering, causes a check to growth, a loss very often of bloom, and always a loss of foliage, more or less detracting from the appearance of the plants. The right time to supply water is when the soil is becoming dry, and before it is so dry as to cause the foliage to become limp or flag afford a thorough supply, there being no fear of overwatering a plant when it is dry. There is danger, however, of giving a check that may bring down all or most of the flower buds if the watering is delayed too long, or water is applied at a much less temperature than that in which the plants are growing, or if over-strong manurial matter be given, which destroys the younger, softer, and more

active roots or feeders. These are matters that may not often burden the careful cultivator, but they do occur nevertheless, though the cause of disaster is not often attributed to errors of culture.

Planted-out Abutilons will flower continuously if they have a temperature of 45° to 50° assured to them, the situation being light, and care being taken to keep up a succession of flowering wood; but they are all the better for a rest in winter, the soil then being kept dry, but not so dry as to impair the vitality of the plants. If the wood shrivels it is too dry, which is not resting but starving plants to death. It is needless expecting such to break as strongly and make as vigorous growth as those that have been granted rational treatment. In February the plants may be cut back, each growth to a few joints of the old wood, and where extension is required firm well-ripened wood can be trained-in to fill it, merely cutting away their unripe points. Old worn-out wood may be

surface. The foliage and bloom will show the benefit in due course. The plants will come into flower in a few weeks, and keep on right away through the summer and autumn, if not greater part of the winter, the house of course being kept as before stated at a minimum temperature of 45° to 50°.

Abutilons also form magnificent standards. The plants should be trained up with a single and straight stem to the height required, they appearing to great advantage when on 4 feet 6 inches to 6 feet stems for conservatory, whilst plants with 2 feet stems are charming for table decoration. Pots of 8 inches diameter will hold sufficiently large plants for table, but for the larger and taller plants 12-inch pots are little enough. The plants are allowed to grow somewhat taller than the intended height of stem, so as to get solidified growth to where the heading is to take place, and then the heads are cut clean off, all laterals or side growths being rubbed off on the stem when quite young, leaving the leaves at

FIG. 11.—DAVALLIA FœNICULACEA.

displaced in a similar manner—*i.e.*, cutting out the old and laying-in the young wood. Plants that become bare at the base may be cut down, they breaking freely from the old wood. After pruning a gentle sprinkling over the foliage will encourage a speedy and regular break, and when fresh growth is made the plants, if in pots, may be repotted, picking away the soil at the sides and bottom of the ball, so as to reduce them about a third, which, if they are to be returned to the same size of pot, will admit some fresh soil at the base and sides, the roots being cut close back. Those planted out should have the soil removed from amongst the roots at some little distance from the stem, so as not to disturb the fibrous or main roots at the collar, and if in compartments the soil may be taken out at the sides, the roots cut back, and fresh soil added, in all cases making it moderately firm, for which it must be in a medium state as to moisture. Avoid soil that is very dry or very wet. Water carefully until the plants have made fresh roots, and indicate possession of the soil by pushing fresh growths freely, then water thoroughly as required, and feed with liquid manure or artificials, applied in a surface dressing of light lumpy decomposing material, such as old cowdung, which will attract the roots to the

their base, as they help in a measure to thicken the stem as it advances in height, relying on the uppermost two or three growths for the formation of the head. Stop those when they have two or three leaves, merely taking out the points of the shoots, and continue this as fresh growth is made until the plants have a dozen or more shoots, when they may be allowed to flower. This being effected by midsummer, as it will if one-year-old plants are selected, they being trained the previous year to form the stem desired, the plants will afford a fine display of bloom, and being seen on a level with the eye are very pleasing, and will keep on flowering in a suitable temperature until winter. It is desirable to give them a few weeks' rest by keeping them drier and cooler, and from the middle of February to early March they may be pruned, cutting back to well ripened wood, the weak wood being cut away, and others may be left of such length as will form symmetrical heads, two or three joints of wood being ample to leave on plants that have well-furnished heads, or when a compact head is desired. The plants may be given a little extra warmth to start them into growth, damping occasionally, and when pushing fresh growths disrooting and repotting.

Stopping may be resorted to when the growths are a few inches long, or if early flowers are wanted the plants may be allowed to flower at once; if some are treated that way, whilst others are pinched, a succession of bloom will be secured. The pinched plants, however, form the finest specimens, shifting them into large pots immediately after they push a little growth after the last stopping, and when the roots have possession of the fresh soil feeding with liquid manure. Other plants treated similarly in a cool or ordinary greenhouse will afford a fine display by August, and during the late summer and autumn months. Neat bamboo stakes to the stems will be necessary for the support of the heads.

The plants intended for table decoration must be well stopped, and must be kept in comparatively small pots and firm soil, well enriched with some fertiliser to induce a sturdy well-furnished floriferous habit. Young plants of the previous spring or autumn struck stock are suitable for this purpose, and being duly stopped will form heads quite large enough by August. They should be grown in a low-roofed house or pit where they can be accorded plenty of light. When they become old and stunted they may be discarded for young plants, but the older plants are more floriferous than young, and in every way preferable for early flowering, as young plants cannot be had with a sufficiently furnished head before summer is well advanced.

For general decorative purposes *Abutilons* may be grown in almost any shape. Pyramids may be formed by stopping the lead at about every foot of growth, and the side growths to 6 inches, keeping them from flowering each year until a good well furnished habit is attained, and then allow them to flower. It is of great importance that an equalisation of growth be attained, therefore gross irregularities must be cut away unflinchingly, seeking to apportion the vigour as far as practicable throughout all parts, having the plants as well furnished at the base as at the summit. Well grown specimens rival, if they do not excel, *Fuchsias* in picturesque loveliness.

Useful decorative plants are raised from cuttings of the growing points, choosing vigorous examples early in spring. The cuttings strike readily in a close frame stood in a Cucumber pit, if a gentle bottom heat is afforded. They may either be inserted singly in thumb pots or be placed just clear of each other around the sides of a 6-inch pot, repotting them in the latter case so soon as they are rooted, and keep them rather close until established. I prefer the single pot, and so soon as the cuttings are rooted remove them to shelves where they will be just clear of the glass. When inured to the air of the house and the pots full of roots shift into 4-inch pots, continuing in a gentle warmth and light position until established, when they may be moved to a cooler house, but keeping rather close so as not to give a severe check. A span-roofed house or pit is best, in which the plants can have a cool moist base to stand on, and where they can be near the glass without touching it. The plants must also have plenty of space sideways, and as these make very handsome decorative plants they must be given every encouragement in the shape of a little artificial manure mixed with the first and all potting compost, and a sprinkling on the surface of the pots about every ten days, just a pinch between the finger and thumb, evenly disposing it on the surface for the waterings to carry down to the roots. Shift from 4 to 6-inch pots, and if all has gone well the plants will be ready for transferring to 8-inch pots early in June, always allowing them to fill the pots with roots, but before they become matted shift into larger pots. These—viz., 8-inch pots—are the size they are set to bloom in, and the plants being grown on in a cool house in plenty of light they will branch from the base, the plants being trained with a single stem, and so be furnished to the pot, affording a fine head of bloom from at least early August right away through the autumn and winter. These plants, perhaps, afford the finest flowers of any description of plant; anywise they are fine for greenhouse or conservatory decoration in late summer and autumn, and in a light properly ventilated house, with a minimum temperature of 50°, flowers will be borne successively through the winter into the spring months.

For winter flowering I find cuttings struck early in April, grown on similar to those struck earlier, and transferred to the largest pots not later than mid-July, the most suitable, as they will be about 15 or 18 inches in height, and coming into flower by mid-September or its close, and then placed in a house with a temperature of about 50°, they will be at their best during the early autumn and winter months. In winter they must not be overwatered, and the air of the house must be buoyant, damp, especially when accompanied by cold, being fatal to the flowers.

I have tried placing the plants intended for winter flowering outdoors in summer, with the result that though a fine full habit was secured, the plants did not flower so satisfactorily as those that were grown from first to last under glass. The moisture of late summer I apprehend made the growth too soft, and not unfrequently the soil was soaked, and the roots were killed. Some,

however, manage the plants very well stood on and partially plunged in ashes during the summer months, housing at the close of September; therefore my lack of success with plants so treated may be due to inadaptability of location.

There are, perhaps, no finer plants for bedding than *Abutilons*. They may be raised for this purpose by inserting cuttings early in spring, February or March, and growing them on so as to have sturdy well-established plants in 4 or 5-inch pots, well hardened by the close of May or early June. For bedding purposes, however, it is best to strike the cuttings in gentle heat during the early part of September, repotting singly when rooted, keeping them in a house from which frost is excluded and rather dry during the winter. They may be left in the store pots over the winter, repotting in spring, but the single pot system of wintering is a long way ahead of the poverty huddling system. Transfer to 5-inch pots in spring, and if the plants have become tall cut them back to about 4 inches from the soil. This should be done and the plants allowed to start again before they are potted. Encourage growth by liberal treatment, hardening them well before planting out.

Outdoors give them a sheltered situation, as their flowers are liable to be damaged by strong winds. They look best on a gentle elevation, yet are highly effective when viewed on a level or even from a height. They require a bed of good rich light soil, deeply stirred, to grow in, and made moderately firm so as to induce flowers as well as foliage, and plant them about a foot, and not more than 18 inches, apart. The edging can be of the dwarf *A. vexillarium variegatum (igneum)*, kept in order by pinching. It is better to raise a fresh stock of plants annually than to lift and store the old ones.

Hybridisation has rendered the species almost obsolete. *Abutilon Darwini*, the parent of a great many garden hybrids, has a fine cupped form, orange with darker veinings. *A. Darwini superbum* is a fine form of the species. It is useful as a pillar plant, being of good habit. *A. insigne* has large purplish crimson flowers with dark venation, borne in axillary drooping racemes, and reflexed. *A. striatum*, orange yellow with a thick veining of deep red, is a free grower and makes a good greenhouse plant, being a continuous bloomer, requiring to be freely pinched. *A. megapotamicum*, bell shaped flowers, peculiarly beautiful, sepals dark red, petals pale yellow, stamens dark brown. Both flowers and foliage are small, it has a graceful drooping habit. *A. venosum*, flowers orange with red veins, large, bell shaped, foliage large palmate; this is a splendid species and suitable for pillars and roofs. *A. Thompsoni*, flowers yellow or orange striated, foliage small, Vine-like, mottled with yellow and dark green. It is a neat variegated plant of moderate height—namely, 3 or 4 feet, but is best in dwarf plants.

Of varieties which excel the species for decorative purposes, the following are good.

*White-flowered*.—*Boule de Neige*, pure white, the best, and fine for pillars and roofs. *Seraph*, dwarf habit, and very free flowering. Purity is also free and of good sturdy habit.

*Yellow-flowered*.—*Lemoinei*, pale yellow; and *Canary Bird*, primrose, are fine and suitable for pillar and roof work. *Miss Laura Powell* is dwarf and free, perhaps the best. *Queen of the Yellows* has also great substance of flower, lemon, flowers large. *Chrysostephanum* has bold foliage, bright yellow flowers, the stamens extending conspicuously beyond the corolla. *Golden Fleece* is a rich yellow, also *Golden Gem*, free and of dwarf habit; *Cloth of Gold* having the deepest yellow flowers and most substance.

*Orange-flowered*.—*Prince of Orange*, being a strong grower, is the best for pillars and roof work. *Striatum splendidum*, orange striped crimson; and *Eclipse*, orange with crimson and purple veins, is good in habit and floriferousness.

*Pink or Rose*.—*Princess Marie*, rosy lake; and *rosæflorum*, salmon rose veined with crimson, are suitable for pillars and roofs. *King of the Roses*, deep rose, dwarf and free. *Admiration*, light pink. *Future Fame*, deep rose, shaded crimson. *Anna Crozy*, pink, shaped lilac, veined white, very showy and dwarf.

*Red or Crimson*.—*Lustrous*, red crimson, very free and dwarf. *Brilliant*, red, free, and dwarf. *Vivid Compactum*, compact habit, flowers large, scarlet. *Mr. Irving*, deep scarlet, shaded crimson, very pleasing. *Emperor*, claret crimson, large flower, free and good.

*Purple*.—*Purpureum*, deep purple, shaded lake. *The Premier*, rosy purple, large and free. All the varieties described as dwarf are good for bedding, and of the variegated varieties *A. Darwini tessellatum*, leaves mottled with yellow; *A. vexillarium variegatum*, leaves prettily blotched yellow, the growth being close yet good, leaves small; and *A. Thompsoni* are useful for that purpose. *A. Sellowianum marmoratum*, with its large Maple-like leaves heavily blotched with bright yellow, is the most effective of all the

variegated forms, the tops of which struck and grown on in a rather warm and moist house is one of the very finest of plants for table decoration. It does not grow at all freely in a greenhouse, the atmosphere being probably too dry and variable; it requires a moist genial atmosphere and a light position.

There are many other varieties besides those named, some of the newer forms being very bright and rich in colour, with a dwarf and free floriferous habit. What we want, however, is more of the *A. venosum* type—larger blooms on sturdy compact growing plants. Plants are readily raised from seeds sown in pans filled with light soil, just covering the seeds. Keep the soil uniformly moist, placing the pans in a house with a temperature of 65° to 75°, and when the seedlings appear pot singly as soon as large enough to handle, returning them to heat for a short time, and then removing them to a greenhouse and growing on. Except for the origination of new varieties, increase by seed is not desirable.

Omission ought not to be made of the double variety of *A. Thompsoni*. It is an exact counterpart of the species, but the flowers are double, rich orange veined with crimson. It certainly is novel, and for cutting useful. Last spring I made myself sure of a double *Boule de Neige*, as I had cuttings that all threw hen and chickens—*i.e.*, several smaller flowers arranged around the central one, the stamens being transformed into narrow petals. As the plants advance they threw off the monstrosity and became normal.—G. ABBEY.

### QUESTIONS AND ANSWERS.

At the July meeting of the Sheffield Floral and Horticultural Society questions on various subjects were proposed and discussed by the members, which proved very interesting. Mr. James Simmonds presided. The first question brought forward was,

#### IS IT NECESSARY TO SYRINGE VINES?

The Chairman said that for over twenty years he had been in the habit of syringing Vines up to the time of coming into bloom, after which he discontinued it for the season, and he found it answer well.

Mr. E. D. Smith considered that in the case of Vines growing in a moderate-sized greenhouse over a mixed collection of plants it was not necessary to syringe Vines, provided the plants underneath were properly attended to, because enough moisture would be present in the atmosphere for the support of the Vines and the prevention of insect attacks.

Mr. Tranter said that in a house started in January it would be necessary to syringe Vines after the bloom had set in order to keep down red spider, and he thought it was possible to syringe the Vines with pure clear water, and the Grapes too, without the slightest injury if maintaining a strong temperature.

Mr. Simmonds said he started his house regularly in January, and he had no red spider on his Vines.

Mr. W. Collier said that opinions differed very much in regard to syringing Vines, but he thought there would be found to be as many in favour of the practice as against it. There were different kinds of houses which often required different treatment. Some would require more moisture and others less. Considering the question all round, he thought a more healthy growth was secured by syringing. Most gardeners are required to grow plants as well as Grapes in a vinery. Where it is possible to devote a house entirely to Grapes syringing might be dispensed with. Then, again, there was a difference in Vine borders. Some were outside, others were inside. Where they are outside you can more readily dispense with syringing. If rain water can be procured he was in favour of syringing Vines where plants had to be grown in a vinery, especially such plants as Azaleas, which are very subject to thrips, or where it is necessary to force Strawberries in a vinery, red spider is sure to appear. Strawberry plants are the worst to introduce into a vinery, and he was supported in this statement by Mr. Woodward, who stated the experience of a gardener who had introduced Strawberries into his vinery, and at the present time they looked as if all the leaves were scorched.

#### WHAT ARE THE BEST FERNS TO STAND IN A SUNNY WINDOW?

In answer to this question Mr. John Eadon stated that the best British Fern to stand in a sunny or any other window, provided it is kept free from dirt and properly watered, is the *Polystichum angulare* var. *proliferum*. It would stand sun better than any other British Fern if it can have plenty of water, and it is perfectly hardy. The *Scolopendrium* treated in the same manner will stand almost any amount of sun, and look well. The *Osmunda* is a large-growing plant, and it will stand sun well; but it must also have a large amount of water. Among exotic Ferns there is

nothing to equal *Pteris serrulata*. It was the best possible Fern to place in a window. He also advised growers of plants in windows, especially Ferns, to let them shape themselves to the window, and never to turn them round. This practice was sure to spoil their appearance. If Ferns are turned round and the fronds are not properly set they will grow one-sided and deformed, and if they are properly set they will not be altered at all by turning round. By keeping plants in one position they perhaps do not look so well from a room, but they have a better appearance from outside.

#### WHAT CONSTITUTES A BLOOM?

This question was answered in the following notes by Mr. Smith:—In order to show clearly what constitutes a bloom it is necessary to give a short outline of the different kinds of inflorescence. The inflorescence is the whole of the flowers which are arranged directly or indirectly upon one main flower stalk or primary axis. One of the most common forms of inflorescence is the umbel, of which there are both simple and compound forms. In the simple form the individual flowers are arranged on little pedicels or flower stalks, which all spring direct from one point at the apex of the primary axis, and give off but one flower. What we generally call trusses of bloom are perhaps more correctly called umbels of bloom. In the compound form the pedicels or little flower stalks are arranged in a similar manner, but instead of only producing each a single flower they produce a number of secondary pedicels, each of which produces a flower, and the whole of them a miniature umbel, consequently the whole inflorescence is formed of a number of these small complete umbels, constituting a compound umbel of bloom. Another common form of inflorescence is the capitulum or head, in which a great number of sessile flowers, or flowers which have no visible stalk, are collected close together upon what is known as the torus or thickened head of the main flowering stalk or peduncle. Another form is the corymb, which is similar to an umbel, but differs from it in having its pedicels springing from different levels, though the flowers themselves reach about the same height. The spike is another very common form, of which there are both simple and compound. In the simple form the flowers are set upon the peduncle or main stalk without any pedicels at all, being what is known as sessile, or sitting upon the stalk. In the compound form the flowers are borne at the end of or along little pedicels springing from the main stalk at varying distances. The raceme is also a very familiar form, and differs from the spike in having the flowers on short pedicels of equal length springing from a main axis. Another form of the raceme is known as the panicle, in which each pedicel branches again, and sometimes two and three times. It is sometimes called a compound raceme.

The cyme partakes of many variations more or less of the other forms, but the character which distinguishes it particularly from the other forms is that the main flower stalk is always terminated by a flower. Sometimes the inflorescence of a plant is mixed, the whole partaking of one form, while the individual flowers or partial inflorescence will be of another character, as in the *Chrysanthemum*.

The simplest inflorescence of all is that where a single flower terminates at the end of the peduncle or main stalk, such as in the Tulip. Next to this form is that of plants such as the Pimpernel, Violets, and Pansies, which produce single flowers from the axils of the leaves. Each of these flowers, of course, constitutes a bloom of itself, and so does any individual large bloom, whether it is borne at the termination of a single peduncle or is produced on a secondary stalk branching from the peduncle and belonging to some of those previously mentioned. It is only the smaller flowers which of themselves are so inconspicuous that require to be considered, not separately as in the case of large flowers, but under certain arrangements spoken of and understood as a bloom, the particular form of arrangement, however, being indicated by the qualifying name which each special mode of arrangement bears.

#### WHAT ARE THE CAUSES OF WARTS ON THE LEAVES OF CERTAIN VARIETIES OF VINES?

Mr. Tranter said the presence of warts on the leaves of Vines was an old grievance, and one which often old practitioners could not get to the bottom of. He had noticed other trees affected, such as the Pear and the Currant. Some Vines appear more subject to them than others; for instance, a Muscat and a Black Hamburgh growing side by side will exhibit the spectacle of warts on the leaves of the Black Hamburgh and none on the Muscat, both Vines being subject to the same treatment.

Mr. Collier had read in one of the gardening journals that warts on the leaves of Vines were an indication of insufficient attention on the part of the grower and an insufficient supply of water at the roots. Since then he had discovered one of his own

Vines with warts on the leaves, and that it was growing in a very dry part of the border, thus confirming what he had read.—E. D. S.

### SELECT CARNATIONS AND PICOTEES.

THE interesting series of papers on the Carnation by Mr. David Cooper has been mentioned to me by many, and the list of varieties mentioned on page 423 last volume much criticised, inasmuch as so many of the newer varieties that have been in all the prize stands the last two seasons are not mentioned. I may say that although I have been a very enthusiastic Carnation grower, studying to get all the newest and most frequent prizewinners, many given in the list I have not even seen or heard of. I should suggest that any who wish to have the best must certainly add the under-mentioned to their collections. I am also surprised that no list of Picotees was given. For the benefit of any who may want a collection I would recommend the list given below.

Fancy yellow ground Carnations and Picotees are now so wonderfully popular they deserve mention, and I would certainly recommend all to grow a few of the following. There are a few other new and charming varieties in the hands of Mr. Turner of Slough, but they are not yet in commerce.—ROBT. SYDENHAM.

#### CARNATIONS.

*Scarlet Flakes*.—Alisemond (Douglas), Sportsman (Hedderley), Matador (Abercrombie).

*Scarlet Bizarres*.—Admiral Curzon (Easom), Robert Houlgrave (Barlow), J. Crossland (Simonite).

*Rose Flakes*.—Sybil (Holmes), Crista-galli (Whittaker).

*Crimson Bizarres*.—J. D. Hextall (Simonite), Joseph Lakin (Dodwell), Master Fred (Hewitt).

*Purple Flakes*.—James Douglas (Simonite), Prince George of Wales, George Melville (Dodwell).

*Pink and Purple Bizarres*.—William Skirving (Gorton), Sarah Payne (Ward), John Harrison (Hewitt).

#### PICOTEES.

*Heavy Red Edge*.—Brunette (Kirtland), John Smith (Bower), Dr. Epps (Smith), Princess of Wales (Fellowes), J. B. Bryant (Ingram).

*Light Red Edge*.—Violet Douglas (Simonite), Mrs. Gorton (Simonite), Thomas William (Flowdy), Mrs. Bower (Bower).

*Heavy Purple Edge*.—Hilda (Douglas), Baroness B. Coutts (Payne), Muriel (Hewitt), Mrs. Chancellor (Turner).

*Light Purple Edge*.—Mary (Simonite), Her Majesty (Addis), Clara Penson (Wilmer), Ann Lord (Lord), Silvia (Douglas).

*Heavy Rose Edge*.—Edith Dombain (Turner), Lady Louisa (Abercrombie).

*Heavy Red Edge*.—Mrs. Payne (Fellowes), Royal Visit (Abercrombie), Lady Holmesdale (Schofield).

*Light Rose Edge*.—Ethel (Fellowes), Miss Gorton (Dodwell), Mrs. Rickardo (Fellowes), Nellie (Rudd), Mary (Douglas).

*Heavy Scarlet Edge*.—Constance Heron (Fellowes), Mrs. Rudd (Rudd), Mrs. Sharpe (Sharp).

*Light Scarlet Edge*.—Favourite (Liddington), Mrs. Geggie (Geggie).

*Fancy Yellow Grounds*.—Agnes Chambers (Douglas), Prince of Orange (Perkins), Annie Douglas (Douglas), Ada (Wallington), Almira (Douglas), Dorothy (Douglas), Terra Cotta (Douglas), Colonial Beauty (Douglas), Dodwell's Seedling 192 (Dodwell), Dodwell's Seedling 183 (Dodwell), Alfred Grey (Gyles Kilmurray), Queen of Hearts (Gyles Kilmurray), Tournament (Gyles Kilmurray), Fullbarrow Beauty (Rawson), Lemon Drop (Rawson), Dodwell's Seedling 154 (Dodwell), Dodwell's Seedling 167 (Dodwell), Theodore (Benary), Stadrath Bail (Benary).

*Selfs*.—Emma Lakin (Lakin), Mrs. Muir (Muir), The Governor (Cross), Budge (Dodwell), Glalis (Dodwell), Tom Pinch (Dodwell), Mauve Perfection (Dodwell), Cassandra (Dodwell), Mrs. V. Harcourt (Dodwell), Mrs. Logan (Dodwell), Will Trelfall (Trelfall), Dodwell's Seedling 197 (Dodwell), Germania (Benary), Mrs. R. Hole (Dickson).

### ROYAL HORTICULTURAL SOCIETY.

JULY 22ND.

THE combined attractions of the National Carnation and Picotee Society's Show, the Fern Exhibition, and the various exhibits before the Fruit, Floral, and Orchid Committees furnished a most interesting display at Chiswick on Tuesday last. Two large tents were filled with plants and flowers. The Carnations were not quite so numerous as usual, but the Ferns were in strong force; in fact, it was one of the largest and most varied Exhibitions of Ferns we have seen.

#### THE COMMITTEES.

FLORAL COMMITTEE.—From the Royal Gardens, Kew, came a collection of interesting plants, comprising *Æschynanthus speciosus*

with orange red flowers; *Solanum Seaforthianum*, having loose drooping panicles of bright mauve flowers; *Pavetta Caffra*, having small white flowers in dense clusters; the pale yellow *Hedychium flavescens*; the soft bright pink *Mesembryanthemum falciforme* was very attractive; the graceful *Sollya linearis* was noticeable; and bright orange-red flowers of *Mutisia decurrens* were much admired. Messrs. J. Veitch & Sons, Chelsea, had a box of hybrid *Rhododendrons* in many good varieties (vote of thanks). Mr. R. Dean, Ealing, sent several good seedling Pentstemons and border Carnations, for which awards of merit were granted. The Rev. W. Wilks, Shirley Vicarage, Croydon, sent plants of a small *Asplenium*, named *A. Petrarhæ*, with diminutive fronds. Mr. T. Bones, Tower House, Chiswick, showed several seedling Carnations with bright red flowers; and Mr. H. Headland, The Firs, High Street, Leyton, had a seedling Carnation named Mrs. Headland, pale yellow edged with red. Messrs. H. Cannell & Sons, Swanley, sent a stand of extremely handsome double Tuberous *Begonias* (vote of thanks), also a fine *Gloxinia* named Mrs. Stanley, white dotted with rose. Messrs. de Rothschild, Gunnersbury Park, Acton (gardener, Mr. Reynolds), had an extensive and beautiful group of Carnations, Ferns, and Palms edged with *Panicum*. Messrs. Paul & Son, Cheshunt, showed three boxes of hardy flowers in many varieties. Eleven boxes of fine Rose blooms were also shown from Cheshunt, wonderfully fresh and good for the season.

ORCHID COMMITTEE.—Messrs. B. S. Williams & Son, Upper Holloway, sent a new Orchid, with tall stems, narrow leaves, and a long spike of a few small white pink dotted flowers. It was somewhat suggestive of a *Vanda*. Messrs. Sander & Co., St. Albans, showed several Orchids, for two of which awards of merit were granted. A grand plant of *Cattleya Schofieldiana* was included, sepals and petals green spotted crimson, the lip crimson dotted on white. Messrs. Pitcher and Manda, Swanley, sent *Cypripedium Hyeantum*, which was certificated April 26th, 1886, and a peculiar little *Dendrobium*, after the style of *O. crystallinum*.

FRUIT COMMITTEE.—Mr. R. Nicholas, The Gardens, Castle Hill South Molton, sent three grand Queen Pine Apples, weighing 21 lbs. The fruits were deep, well proportioned, and finely ripened (silver medal). Mr. Leach, Aibury Park, Guildford, sent large fruits of Raspberry Hornet, deep red finely formed samples of good flavour.

Messrs. Sharpe & Co. offered prizes for six varieties and three varieties of Peas. Major Heneage, Compton Bassett, and Mr. J. Watkins, Guildford, were the only exhibitors, both showing fine samples, and a first prize was awarded to each. Mr. Gibson, Thornby, Wigton, Cumberland, showed some wonderfully good Black Currants, the fruits unusually large. (Cultural commendation.)

*Melon Barkham's Seedling* (Major Heneage, Compton Bassett Gardens, Calne).—A fine globular Melon with scarlet flesh, deep, of good flavour, the skin finely netted. (First class certificate.)

#### PLANTS CERTIFICATED.

*Masdevallia Rolfeana* (F. Sander & Co.).—A new species with small flowers of a peculiar dark red, almost a chocolate tint. The points of the sepals yellow and recurving. (Award of merit.)

*Grammatophyllum multiflorum* (F. Sander & Co.).—Plant strong with stout pseudo-bulbs, and broad vigorous leaves. The raceme is over 2 feet long, with neat flowers, pale green with light brown blotches on the ovate, equal sized sepals and petals; the lip small, faintly veined with brown or white. (Award of merit.)

*Masdevallia elephanticeps* (J. Veitch & Sons).—A peculiar large flowered species, the sepals deep yellow outside, with dark crimson on the inner surface. (Botanical certificate.)

*Oncidium rhysorrhapis* (Sir Trevor Lawrence, Bart., M.P.).—A charming Orchid with drooping panicles of abundant small bright yellow flowers, the sepals palish streaked with red, the lip rounded and pure yellow.

*Epidendrum speciosum* (Sir Trevor Lawrence).—A distinct and beautiful *Epidendrum*, the sepals pale blush, the petals white acute, the lip three-lobed white, the lateral lobes are rounded, the central one narrow and acute.

*Begonia H. M. Stanley* (H. Cannell & Sons).—A grand double tuberous variety of a peculiarly glowing crimson scarlet, the flowers of great size and fine shape. (Award of merit.)

*Begonia Lafayette* (H. Cannell & Sons).—A double tuberous variety, medium size, bright scarlet, and extremely free. (Award of merit.)

*Carnation Rowena* (R. Dean).—A border variety, bright soft pink, with notched petals, very fragrant. (Award of merit.)

*Carnation Rosalind* (R. Dean).—A border variety, with good flowers, dotted with deep crimson on a light ground. (Award of merit.)

*Carnation Rebecca* (R. Dean).—A border variety of an extremely rich scarlet colour, very bright and free. (Award of merit.)

*Clematis recta flore-pleno* (Paul & Son).—Flowers double, white, star like, produced in dense clusters.

#### THE FERNS.

One large tent nearly 200 feet long with stages on each side was not sufficiently large to hold the Ferns sent in response to the invitation of the Council. Two large groups had to be accommodated in the Carnation tent, and this speaks volumes for the interest taken in the scheme. Ferns have been somewhat neglected of late years, with the exception of a few that are valued for decorative purposes, and something in the character of a large exhibition was needed to call public attention to these graceful plants again. Certainly none who visited Chiswick on

Tuesday and Wednesday but would fail to be struck with the astonishing diversity of foliage form which Ferns present. A large proportion of those shown were, too, such as could be grown with little trouble by almost every amateur. A few Ferns test the skill of experienced cultivators, but the majority are easily managed, extremely beautiful, and very useful for most ornamental purposes.

The schedule issued by the Council was as follows, exhibitors being invited to arrange their plants in these groups for convenience of examination and comparison:—British Ferns.—1, *Adiantum Capillus-Veneris* (Maidenhair) and varieties; 2, *Asplenium* (Spleenworts) and varieties; 3, *Athyrium Filix-fœmina* (Lady Fern) and varieties; 4, *Lastrea Filix-mas* (the Male Fern) and varieties; 5, *Polypodium vulgare* and varieties; 6, *Polystichum aculeatum* and *angulare* (the Shield Fern) and varieties; 7, *Scolopendrium vulgare* (the Hart's Tongue) and varieties; 8, *Blechnum Spicant* (the Hard Fern) and varieties; 9, *Hymenophyllum* and *Trichomanes radicans* (Filmy Ferns, Tunbridge Fern, Killarney Fern) and varieties; 10, Other British Ferns, *Allosorus*, *Ceterach*, *Cystopteris*, *Osmunda*, *Lastrea* (except *Filix-mas*), *Polypodium* (except *vulgare*), *Pteris*, &c. Hardy foreign Ferns and varieties. Stove and Greenhouse Ferns.—1, *Adiantum cuneatum* and varieties; 2, other *Adiantums*; 3, *Asplenium*, *Athyrium*, *Diplazium*; 4, *Blechnum*, *Lomarias*, *Doodias*, *Woodwardias*; 5, *Cheilanthes*, *Nothochlœnas*; 6, *Davallias*, *Microlepias*; 7, *Gymnogrammas*; 8, *Gleichenias*; 9, *Lasteas*, *Polystichums*, *Aspidiums*, *Cyrtomiums*, *Nephrodiums*; 10, *Pteris*, *Pellœas*, *Onychium*; 11, *Polypodiums*, *Drynariads*, *Pleopeltis*, *Niphobolus*; 12, *Hymenophyllums* and *Trichomanes* (Filmy Ferns); 13, other stove greenhouse Ferns. *Selaginellas* and *Lycopodiums*. Ferns best adapted for cultivation in rooms. Ferns best adapted for hanging baskets.

Though the exhibitors were few in numbers, these contributed so largely and such choice collections that the total display was highly satisfactory. It would be impossible this week to enumerate all that were shown, and a selection would be difficult; we therefore confine our report to brief general notes on the chief collections, fuller details of the plants represented being reserved for another issue. Two illustrations are given, however, in figs. 10 and 11, *Adiantum Eusei* (page 67), and *Davallia fœniculacea*, which was certificated some time since when shown by Messrs. B. S. Williams and Son (page 73); both are very distinct Ferns, to which we have previously referred in these pages.

Messrs. J. Veitch & Sons, Chelsea, contributed an exceedingly fine and varied collection of Ferns, comprising representatives of all the principal genera. The list of all the species and varieties included would be an extremely long one, but it may be noted that the following were the numbers.—Total about 300 species and varieties in sixty genera, the most largely shown being *Adiantums* seventy. One of the most interesting portions of the collection was that devoted to hybrid, or supposed hybrid, Ferns (125), which alone furnished ample material for study. There were also a group of *Todeas*, which included many seedlings. Of curious and interesting Ferns one hundred were staged, and of exotized crested Ferns forty forms were sent.

Mr. C. T. Drury, Fernholme, Forest Gate, E., contributed a group of beautiful hardy Ferns, nearly all forms of the British species many having been collected or raised by himself. Exceedingly beautiful were the plumose varieties of the Lady Fern, and the crispate forms of the Hart's Tongue.

Mr. H. B. May, Upper Edmonton, had a most extensive group of Ferns in all the sections, over 300 species and varieties being represented by well-grown plants, such as we are accustomed to seeing from that nursery.

A considerable portion of the tent was occupied with the grand collection of Ferns from Messrs. W. & J. Birkenhead, Sale, near Manchester, who had about 600 varieties, comprising all the best Ferns in cultivation, hardy and exotic sorts being admirably shown.

From Mr. E. J. Lowe, F.R.S., Shirenewton Hall, Chepstow, and the Zoological Gardens, Clifton, came an extraordinary collection of hardy Ferns, comprising some wonderful varieties of *Scolopendriums*, *vulgare crispum*, *Aspidiums*, *Athyriums*, *Nephrodiums*, and other Ferns.

Mr. J. A. Whittard, Rydal Mount, Streatham Hill, S.W. (gardener, Mr. H. Wright), had a choice collection of well-grown Ferns, some of the most notable plants being fine examples of *Platycerium grande*, *Gymnogramma schizophylla gloriosa*, *G. A'stoni*, *Davallia Mooreana*, *D. fijiensis plumosa*, *Adiantum farleyense*, with many other *Adiantums* and miscellaneous Ferns.

Mr. W. B. Latham, Curator Botanic Gardens, Birmingham, sent a plant of a hybrid *Dicksonia*, said to be between *D. arborescens* and *D. antarctica*, and it was named *D. Lathamii*. The fronds are stout, strong, slightly arching, very graceful, bipinnate, the pinnules bluntly notched. Fronds of a hybrid between *Alsophila excelsa* and *Cyathea princeps* were also shown by Mr. Latham.

#### THE CONFERENCES.

Conferences were held on both days, that on Tuesday being devoted to Carnations, and the programme was as follows. The proceedings commenced at 2.30 p.m. Martin R. Smith, Esq., President of the Conference, in the chair. The papers were:—"The Carnation from a Botanical Point of View," by Mr. F. N. Williams, F.L.S.; "The Florists' Carnations and Picotees as Exhibition Flowers," by Mr. Harry Turner; "Carnations and Picotees in Towns," by Mr. Martin Rowan; "Border Carnations," by Mr. Richard Dean. On Wednesday Ferns furnished the subjects for consideration, the programme being as follows. Mr. J. G. Baker, F.R.S., President of the Conference, in the chair. Papers on "The Systematic Relations of Ferns," by Professor Bower, F.L.S.; "The Cultivation of Exotic Ferns," by Mr. W. H. Gower;

"Hybrid Ferns," by Mr. E. J. Lowe, F.R.S.; "Plumose British Ferns," by Mr. C. T. Drury, F.L.S.; "Hardy Ferns and Their Cultivation," by Mr. J. Birkenhead.

#### NATIONAL CARNATION AND PICOTEE SOCIETY.

##### SOUTHERN SECTION.—JULY 22ND.

A FIRST-RATE Show, or even one of average excellence, was not looked forward to by the most sanguine Carnation lover this year. The climatic vagaries with which Rose exhibitors have had to contend have also perplexed cultivators of Carnations and Picotees, and experience taught them that the more modest their anticipations of this season's Show the less would be the likelihood of disappointment. Dull, wet, stormy weather, with brief alternations of brilliant sunshine, is the reverse of favourable for showing flowers true and clear in colour; nevertheless, as regards quality the Show was better than had been expected, especially with respect to Carnations, which were a really excellent display. Picotees were not quite so good, many of the flowers being a little spotted. The competition was not so brisk as usual, and the absence of one or two exhibitors who have shown well in former years was noted with regret. There were no special features of the Show calling for further comment other than is made in the subjoined notes of the awards.

##### CARNATIONS.

A first and pleasing duty last year was to note the increased amount of competition in the various classes. This was not fully sustained on the present occasion, but every allowance must be made for it, and it is to be hoped that another year more favourable circumstances may lead to an increased number of entries. In the principal class, that for twenty-four blooms, not less than twelve distinct varieties, two old opponents in Messrs. Douglas, gardener to Mrs. Whitbourn, Great Gearies, Ilford, and C. Turner, Royal Nurseries, Slough, with that well-known suburban amateur, Mr. M. Rowan, 36, Manor Street, Clapham, London, S.W., provided the whole of the competition, and the prizes were awarded in the order in which the names are placed. Mr. Douglas had a capital stand, comprising the following varieties:—Back row: Arthur Medhurst, Matador, Joseph Crossland, and five seedlings. Middle row: Matador, very fine; Harrison Weir, Squire Whitbourn, Alisemond, a capital bloom; Thalia, Rosamond, and two seedlings. Front row: Robt. Houlgrave, excellent; Thalia, E. Adams, John Keet (2), Alisemond, Harmony, and a seedling; the first example of John Keet being a very fine example. Mr. Turner had good flowers of Miss Erskine Wemyss, H. K. Mayor, Wm. Skirving, Hutchinson's Rose, and Squire Llewellyn. Mr. Rowan had Jas. Douglas, Thalia, Sporting Lass, John Baxton, Sarah Payne, George Melville, and Florence Nightingale in first-rate form, and altogether had a very neat, well-finished stand. There were six stands of twelve, the majority of considerable merit. Mr. Rowan's first prize box was a very beautiful one, the blooms being large, in good colour and very smooth. The varieties were Thalia, a splendid flower; Alfred, J. D. Hextall, Master Fred, Jas. Douglas, very fine; Sarah Payne, George Melville, excellent; Admiral Curzon, Edward Rowan, Gordon Lewis, Sportsman and John Buxton. Mr. Douglas' second prize stand was mainly composed of seedlings, fresh and bright, Mr. C. Phillips, 18, Hamilton Road, Reading, being third; Mr. Headland, The Firs, High Street, Leyton, fourth; Mr. G. Chaundy, William Street, Oxford, fifth; and Mr. W. J. Nicholls, 274, Kingsland Road, London, N.E., sixth. There were eleven stands of six blooms, and Mr. J. Lakin, Temple Cowley, Oxford, was placed first for James Douglas, Duchess of Fife, Squire Llewellyn, Matador, J. D. Hextall and Lovely Mary, a beautiful stand of smooth, well finished flowers. Mr. T. Anstiss, Brill, was placed second for Wm. Bacon, Mr. May, James Douglas, Robert Cannell, Robt. Houlgrave and one of Dodwell's seedlings, the latter a handsome purple flake. The third prize was taken by Mr. J. J. Keen, 15, Castle Street, Southampton, the fourth by Mr. F. Nutt, 1, Gloucester Villas, Southampton, the fifth by Mr. A. J. Sanders, gardener to the Viscountess Chewton, Bookham Lodge, Cobham, and the sixth by Mr. W. L. Walker, Dunollie, Palmerston Road, Reading.

Single specimens were numerous, and comprised some excellent blooms. In the scarlet b'zarres, Mr. Douglas was first and second with Robt. Houlgrave. Mr. Headland third and fourth with Joseph Crossland, and Mr. Phillips fifth with George. In the crimson b'zarres, Mr. Douglas was first and third with seedlings, Mr. Phillips second with J. Harland, Mr. Robt. Sydenham fourth with Harrison Weir, and Mr. Headland fifth with Duc d'Aumale. In the pink b'zarres, Mr. A. J. Sanders was first with Wm. Skirving, Mr. Douglas second and third with seedlings, Mr. Lakin fourth with Sarah Payne, and Mr. Rowan fifth with the same variety. In the purple flakes, Mr. Rowan was first with Jas. Douglas, Mr. Douglas second with a seedling, Mr. Sanders third with Jas. Douglas, Mr. Lakin fourth with Mayor of Nottingham, and Mr. Phillips fifth with Jas. Douglas. In the scarlet flakes, Mr. Douglas was first with Alisemond, Mr. Lakin second with Sportsman, Mr. Phillips third and fifth with Sportsman, and Mr. Headland fourth with Henry Cannell. In the rose flakes, Mr. Lakin was first with Lovely Mary, Mr. Douglas second with a seedling, Mr. Turner third with Thalia, Mr. Rowan fourth, and Mr. Turner fifth with the same variety.

The premier Carnation in the Show was Robert Houlgrave in Mr. Douglas's first prize stand of twenty-four.

##### PICOTEES.

As before stated, these were a little lacking in fixity of colour, and also perhaps in general smoothness, but the latter weakness was less

noticeable than the first. Mr. C. Turner won with twenty-four blooms, not less than twelve distinct varieties, having the following:—Back row: Two beautiful blooms of Lucy, two charming specimens of Madeline, and four seedlings. Middle row: Rival Purple, Nymph, Miss Flowdy, Worfred Beauty, and four seedlings. Front row: Lady Holmesdale, a capital example of Princess Dagmar; Louisa (2), John Smith, Lord Valentia, Mrs. Gorton, and a seedling. These formed an admirable stand, and were a somewhat easy first. Mr. Douglas was second, his best blooms being Her Majesty, Ethel, Constance Heron, and Miss Flowdy. No other competed. With twelve varieties the last named exhibitor scored a very meritorious victory with Her Majesty, a capital flower; Constance Heron, Liddington's Favourite, a splendid bloom; Muriel Hewett, Princess of Wales, Jessie Turner, Mrs. Sharpe, Mrs. Giggie, a charming flower; Silvia Douglas, Mrs. Chancellor, Zerlina, and Brunette. This was a very beautiful stand, the flowers being smooth and finely finished. Mr. C. Phillips, 18, Hamilton Road, Reading, had small flowers, but their smoothness and freshness secured them second prize against larger flowers. Orlando, Mrs. Sharpe, Mrs. Richards, and Favourite were, though small, charming flowers. Mr. A. J. Sanders was third with large but somewhat rough blooms; Mr. Headland fourth, and Mr. W. J. Nicholls, 274, Kingsland Road, London, N.W., fifth. There were nine stands of six blooms, amongst them some capital lots. Mr. M. Rowan had an excellent stand, and scored a creditable victory with Master Norman, Favourite, Elith D'Ombraïn, Clara Penson, Muriel, and Brunette. The two first named were excellent flowers, the third a somewhat small but charming example, and Clara Penson was also a smooth, neat flower. Mr. G. Chaundy, William Street, Oxford, was second with Amelia, Lady Holmesdale, Favourite, Clara Penson, Mrs. Lord, and a seedling, also a capital stand; Mr. J. Lakin, third; Mr. Rebbeck, fourth; Mr. J. J. Keen, fifth; and Mr. F. Nutt, sixth. Yellow grounds, in twelves, were shown by three growers, Mr. Turner winning with a beautiful stand of fresh, smooth, and well-formed flowers, the varieties being Annie Douglas (2), Janira (2), Dorothy, Almira (2), Agnes Chambers (2), and three seedlings. Mr. Douglas was second, some points behind, his best flowers being Mrs. Whitbourn and Agnes Chambers. Close up, third, came Mr. Hooper, Vine Nursery, Widcombe Hill, Bath, with some charmingly fresh blooms. There were four stands of six. Mr. G. Hooper, 7, Cambridge Place, Bath, won with a splendid stand, comprising Mrs. Little, Star of Bath, Agnes Chambers, Sparkler, Alice Brookes, and Duchess of Albany. Mr. Chaundy also had a capital stand, comprised of Alfred Grey, Nancy, Tournament, Dodwell's 167 and 192, and a seedling. Mr. F. Nutt was third.

The awards for the single specimens were as follows:—Red, heavy edge: Mr. Lakin was first with Isabel Lakin, Mr. Sanders second with Brunette, Mr. Headland third with J. B. Bryant, Mr. Douglas fourth with Princess of Wales, and fifth with Brunette. Red, light edge: Mr. Douglas was first and second with Violet Douglas, Mr. Sydenham third with Emily. Purple, heavy edge: Mr. Douglas was first and third with Mrs. Chancellor, Mr. Phillips second and fourth with Muriel, and Mr. Sanders fifth with Zerlina. Purple, light edge: Mr. Rowan was first with Clara Penson, Mr. Headland second with Pride of Leyton, Mr. Douglas third with Her Majesty and fourth with Silvia, Mr. Nicholls fifth with Pride of Leyton. Rose, heavy edge: Mr. Turner was first with Madeline, Mr. Douglas second with Mrs. Payne and third with Constance Heron, Mr. Phillips fourth with Mrs. Ricardo, and Mr. Nicholls fifth with Mrs. Sharpe. Rose, light edge: Mr. Douglas was first and second with Liddington's Favourite, Mr. Headland third with Favourite, Mr. Sydenham fourth with Mrs. Gaggie. Yellow grounds: Mr. Douglas first and third with seedlings, Mr. Turner second with Agnes Chambers, Mr. Headland fourth and fifth with seedlings.

The premier Picotee was Liddington's Favourite in Mr. Douglas' stand of twelve blooms.

MISCELLANEOUS SELFS AND FANCIES.—These were a very bright display, pleasing to the general public unversed in the niceties of bizarres, flakes, heavy edge, and light edge. There were no less than five stands of twenty-four blooms, Mr. C. Turner winning with a delightful collection of flowers, the varieties being Mary Morris (2), Anna Benary (2), Germania (2), Rose Celestial (2), Mrs. Reynolds Hole (2), Colonial Beauty, Victory (2), Duchess of Connaught, Purple Emperor, Sunset, Ruby, Terra Cotta, Lady Rose Molyneux, and several seedlings. Mr. Douglas was second with a stand largely composed of seedlings; Mr. W. Toby, 3, St. Mark's Grove, West Brompton, London, S.W., third; Mr. Hooper, Vine Nursery, Bath, fourth; and Mr. G. Hooper, Cambridge Place, Bath, fifth. There were ten stands of twelve, Mr. G. Chaundy winning with The Major, Nancy, Queen of the West, Mrs. Champness, Mrs. Reynolds Hole, Beauty (seedling), Dodwell's 476, and five other seedlings. Mr. Phillips was second, Mr. Rowan third, Mr. Anstiss fourth, Mr. Lakin fifth, and Mr. A. J. Sanders, sixth.

Specimens in pots were best shown by Mr. Turner, who won with Hutchinson's Rose, Juliette, Louisa, Sunset, Mrs. Reynolds Hole, Agnes Chambers, Victory, Almira, Purple Emperor, Favourite, and a seedling. Mr. Douglas was second, and Mr. Headland third.

First-class certificates were awarded to Mr. Douglas for Nellie Hibberd; to Mr. Turner for Sunset and Victory, all yellow grounds. First and second prizes for seedlings were also awarded to Nellie Hibberd. A first-class certificate was awarded to Mr. S. Barlow, Stakehill House, Manchester, for Pink Jas. Thurston.

An extensive collection of Carnations cut from the open ground was staged by Messrs. J. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, London, S.W., these forming a beautiful display. Mr. T. S.

Ware had several stands of Carnations and Pinks from the open borders, a free and bright collection; and Messrs. Paul & Son, The Old Nurseries, Cheshunt, also had several stands in their collection of herbaceous plants.

## HORTICULTURAL SHOWS.

PORTSMOUTH.—JULY 15TH.

THE Committee of this enterprising Society may be once more congratulated upon their efforts in providing so good an Exhibition for their patrons and the flower-loving public of this busy town as they did on the date named. An excellent Show was the result of a well arranged liberal schedule of prizes. The hard-working and courteous Honorary Secretary, Mr. F. Power, and his able assistant, Mr. B. Miller, deserve much praise for the arrangements made for exhibitors, Judges, and visitors.

Two large tents were needed to provide space for the exhibits; the centre of each was occupied with specimen stove and greenhouse plants, Ferns, &c., which gave quite a tropical appearance to the whole. Around the sides of one tent were arranged the groups for effect, which were a special feature of the Show. Plants provided the greatest display, therefore merit a first notice in this report. The principal class was that for twelve stove or greenhouse specimens, not less than half to be flowering. Mr. J. Cypher, nurseryman, Cheltenham, succeeded in obtaining the premier award by the superiority of his flowering plants, the bulk of these being of the highest order of merit. Especially noticeable were *Ixora Pilgimi*, *Erica Parmentieriana rosea superba*, *Allamanda grandiflora*, *Ixora Fraseri*, and *Ixora salicifolia*. The best specimens of foliage were *Croton Queen Victoria*, *Kentia australis*, and *Dasylirion acrotrichum*, all in rude health. Mr. Offer, gardener to Mr. J. Warren, Handcross Park, Crawley, Sussex, was a good second, especially meritorious being the well coloured *Crotons Prince of Wales*, *Andreanus*, and *princeps*. Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, Southampton, was third, having extra fine specimens of *Cycas revoluta* and *Kalosanthes coccinea*. The three collections made a grand display. For four specimens under the same conditions there was but one entry, that from Mr. C. Penford, gardener to Sir F. Fitzwygram, Bart., M.P., Leigh Park, Havant, who staged meritorious examples of *Satice profusa*, *Clerodendron Balfourianum*, *Bougainvillea glabra*, and *Anthurium crystallinum*.

For a miscellaneous collection of plants arranged for effect in a space 10 feet by 8 feet, Mr. E. Wills easily came in first with a light and tasteful arrangement of suitable plants; amongst them *Lilium longiflorum*, *Celosias*, *Orchids*, *Crotons*, and *Palms* were conspicuous, the whole neatly edged with *Panicum variegatum*. Mr. Penford was second with a rather heavy arrangement; Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, was third. Groups arranged for effect in a slightly smaller space than the above, but confined to growers in Portsea Island only, made a fine show down one side of the tent. Mr. W. Rooke, gardener to Messrs. Brickwood, Esplanade Hotel, Southsea, led the way with plants very suitable for the purpose.

The best three specimen *Palms* with stems not less than 6 feet high were staged by Mr. Offer; good examples of *Latania borbonica*, *Phoenix reclinata*, and *tenuis* of the same genus. Messrs. Penford and Wills followed with smaller plants of good health and quality. Mr. Offer easily secured leading honours for three Ferns not to exceed 5 feet in height with especially healthy examples of *Davallia polyantha*, *Cibotium Schiedeii*, and *Davallia Mooreana*. Mr. Wills was second, and Mr. Peel third, both staging well. Mr. Offer with *Cyathea dealbata* secured foremost position for one specimen Tree Fern, not less than 5 feet high, as a condition; Mr. Peel second with an exceedingly healthy plant of *Kentia Canterburyana*. Mr. Offer secured the leading position for one specimen Palm, followed by Messrs. B. & J. F. Legg, Bury Road Nurseries, Gosport, with a huge one of *Chamaerops excelsa*, Mr. Wills third with *Phoenix reclinata*. Five competed for the best specimen flowering plant, the first prize eventually falling to Mr. Cypher for *Ixora regina* with over forty trusses; Mr. Penford was second with *Cypripedium barbatum nigrum* carrying over forty blooms, and Mr. Wills third for a well-grown *Kalosanthes coccinea*. Mr. Offer had a magnificent plant of *Croton Warreni* over 7 feet in diameter, richly coloured, and was easily first for a specimen foliage plant; Mr. Penford second with *Cycas circinalis* in capital condition. The best *Tuberous Begonias* were exhibited by Mr. W. Sait, gardener to General Napier, Oaklands, Cosham; the best *Fuchsias* by Mr. J. Burridge, North End Nursery, Portsmouth; *Coleuses* by Mr. Hatch, gardener to the Victoria Park Committee, which in all sections were creditable examples. Mr. J. Burridge had some capitally grown *Cockscombs*, being dwarf, large in the comb, and especially rich in colour. *Gloxinias* by Mr. Hatch, and table plants by Mr. Wills, completed this section of the Show.

Cut flowers were not staged in great numbers, but of average good quality. For twelve bunches of hardy varieties Messrs. Legg and W. Sait were the prizewinners, showing the usual assortment in such a class. For twelve bunches of stove or greenhouse varieties, Mr. Penford and Mr. W. Peel divided the prizes in the order named. The Rev. W. Shirley, Southwick Vicarage, staged the best *Tuberous Begonias*, a good lot, in glasses. Messrs. Perkins & Son, Coventry, were distinctly ahead with both ball and bridal bouquets, with charming arrangements in their well-known style, Mr. J. Burridge following in both classes.

Fruit made an imposing display, much the largest quantity yet seen at a Portsmouth summer Exhibition, and was generally of superior quality. For six dishes, Pines excluded, Mr. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was placed first with Black Hamburgh and Muscat of Alexandria Grapes, Hero of Lockinge Melon,

Violette Hâive Peaches (richly coloured), Lord Napier Nectarine, and Brown Turkey Fig, all creditable dishes. Mr. Penford was second, fine Barrington Peaches and Hero of Lockinge Melon were his chief dishes. With Madresfield Court in splendid condition, Mr. J. Tavener, gardener to Sir A. K. Macdonald, Bart., Wolmer Lodge, Liphook, was an easy first amongst many competitors in the class for three bunches of black Grapes. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, followed with good bunches and berries of Black Hamburgh; Mr. W. Sait, third, also staging strongly. For the same number of bunches any white Grape, Mr. Inglefield led the way with Muscat of Alexandria of medium size, well coloured; Mr. N. Molyneux, second, with excellent Foster's Seedling; Mr. T. Hall, gardener to S. Montagu, Esq., M.P., South Stoneham House, Southampton, third, with Buckland Sweetwater. Mr. G. Dee, gardener to Mrs. Mills, Crescent Villa, Kingston, Portsmouth, secured first honour amongst growers in Portsca Island only for two bunches of black Grapes. The best scarlet flesh Melon was staged by Mr. Dimmick, gardener to Mrs. Young, The Limes, North End, Portsmouth; Mr. Penford following. The latter reversed his position for any green flesh Melon, followed by Mr. Inglefield, both showing creditably. Mr. Inglefield also had first honour for one dish of Peaches; Mr. Wilkin, gardener to Lady Theodore Guest, Inwood House, Henstridge. These two exhibitors reversed their positions in the class for one dish of Nectarines. Mr. Inglefield staged very fine President Strawberries in the class provided for one dish of this fruit; Messrs. Wilkins and Hall followed, the latter having fine fruits of Loxford Hall Seedling. Mr. Hall was first with Cherries.

Vegetables were a good display. For nine varieties in which two sorts of Potatoes were allowed there was brisk competition. Mr. Wilkins eventually secured the foremost position with a lot which combined all the essential points which go to make up a fine collection. Sutton's Magnum Bonum Cauliflower, Model Carrots, Perfection Tomatoes, Duke of Albany Peas, Sutton's Seedling Potatoes, extra fine, and Rousham Park Onion. Messrs. Inglefield, Molyneux and Sait followed in the order named, all staging well. Collections of vegetables were shown by residents of Portsca Island and amateurs also in the classes specially set apart for them, and made a good display, as also did the single classes for Tomatoes and Cucumbers in their respective classes.

At one end of the tent Mr. B. Ladhams, florist, Shirley, Southampton, staged a grand collection of hardy herbaceous cut flowers, which received the attention they deserved from the stream of visitors throughout the time the Show remained open.

#### WOLVERHAMPTON.

THE second annual Exhibition was held July 15th to 17th in the Public Park, which covers a very large area, and is an admirable place for a large horticultural display under canvas. The weather was bright and not too hot, and the numerous tents had an imposing effect in the pleasant surroundings of spacious open green lawns, shrubs, and flowers. The park is very extensive and admirably kept, and is most creditable to Mr. Thomas, the Superintendent.

Several spacious tents were occupied by horticultural produce; the main tent, quite 200 feet long and wide, accommodated the specimen plants entered in the various classes, and the large display of superb specimens called forth general praise. In the class for sixteen flowering and fine-foliage plants there were four exhibits. Mr. Cypher was first with grand Palms, a superb Cordyline indivisa, some excellent Crotons, a very fine Erica Parmentieriana rosea and other Ericas, a handsome Ixora Reginae, and other plants. Mr. Finch, gardener to Mr. Alderman Marriott, Coventry, was a good second, and Colonel Pepper, Salisbury, third. Mr. Cypher's first prize specimens of six stove and greenhouse plants were very fine, including grand plants of Ixora Duffi, a superb and distinct variety with large heads of rich crimson tinted flowers; a wonderful plant of Ixora salicifolia, and very fine specimens of Erica Parmentieriana rosea, Clerodendron Balfourianum, and Stephanotis floribunda. Mr. Finch was second with capital plants, including very fine Ixoras Fraseri and Williamsi and Allamanda Hendersoni. Mr. Dyer, gardener to Mrs. Marigold, Edgbaston, Birmingham, was third with some very fine specimens. Ferns, both Tree and exotic, were staged, the latter generally of medium size and well grown. Mr. Dyer taking first place for six exotics. Palms and fine-foliage plants were numerous, and so many fine specimens had a telling effect in the big tent. Mr. Cypher was first for six Tree Ferns, first for six Palms, and third for six fine-foliage plants. In the latter class Mr. Marriott was first and Mrs. Marigold second. Mr. Cypher's first prize eight Orchids consisted of large specimens of Cypripediums Curtisi, Stonei, and Lawrenceanum; Anguloa Clowesi, a large mass of Cattleya Gaskelliana, Cattleya Sanderiana, rich in colour; Lælia purpurata, and Dendrobium filiforme. Mr. Marriott had a good second prize lot, which included a fine example of Cymbidium Lowi and a good Odontoglossum Lindleyanum. Four groups were set up, the "not exceeding 400 square feet" prizes. Colonel Pepper's gardener took the first prize; Mr. Powell, gardener to G. H. Kenrick, Esq., Birmingham, second; and Mr. Fowler third. Two especially beautiful Crotons were staged; one C. Etna in Mr. Dyer's, and C. Thomsoni in Mr. Cypher's collections. In Mr. Dyer's group was a grand, massive, well coloured Croton montfordiensis.

This large tent of plants and the excellent display of cut Roses were the two great features of the Show. The cool weather brought out a large display of good sized, well-developed, and well-coloured blooms, and an excellent close competition. In the class for forty-eight blooms five lots were staged. Mr. Frank Cant, Colchester, was well ahead for first prize with beautiful even blooms of good varieties, amongst these

Ulrich Brunner, Alfred Colomb, Auguste Rigotard, Madame Henry Pereire, Madame Cusin, and Horace Vernet, Catherine Mermet, Marie Verdier, Mrs. John Laing, Madame Alphonse Lavallée, Etienne Levet, Duchesse de Morny were beautiful blooms. Second, the Cranston Nursery Company, Limited; third, Messrs. Perkins & Sons, Coventry; fourth, Messrs. Prior & Sons, Colchester. For thirty-six blooms (six exhibits), first, the Cranston Company; second, Mr. F. Cant; third, Messrs. Perkins & Sons. For twenty-four blooms (four exhibits), first, F. Cant; second, the Cranston Company; third, Messrs. Perkins & Sons. Twelve light Roses, one sort, first, Mr. F. Cant, with very beautiful bright coloured Mrs. John Laing; second, Messrs. Prior, with fine blooms of Lady Mary Fitzwilliam; third, Messrs. Perkins & Sons, with Mrs. J. Laing, pale in colour. Twelve dark Roses, one sort, first, the Cranston Company, with fine blooms of Alfred Colomb. Twelve Tea Roses, first, Cranston Company; second, Mr. F. Cant; third, Messrs. Prior & Sons. Mrs. John Laing Rose was fine generally, and Her Majesty was in good condition in some stands, Ulrich Brunner fine everywhere. Messrs. Perkins & Sons were first in the three classes for bouquets with chaste artistic arrangement; Messrs. Pope & Sons, Birmingham, second.

For twenty-four hardy herbaceous cut flowers, first, Messrs. Dicksons, Limited, Chester. The gentlemen's gardeners' county classes were well filled generally. Mrs. Marigold's gardener was first for six specimen plants and six exotic Ferns. Mr. G. H. Kenrick's gardener first for six Orchids. An excellent lot of bright well-bloomed Zonal Pelargoniums were staged, and Mr. Dyer took the first prize for a group in this section.

There was only a moderate display of fruit, and much cannot be said as to quality. For four bunches of Grapes, Mr. G. Meakin was first, and Mr. Blair, Trentham Gardens, second; also first for Peaches, with fine Royal Georges; also for Nectarines, with good Lord Napier's. For a collection of ten kinds of fruit, and for six kinds, Mr. Blair was first in both classes.

The amateur and cottagers' exhibits were extensive in their respective sections. Some excellent vegetables were staged, especially in the classes for collections, in two of which Mr. Lambert, gardener to Colonel Wingfield, Shrewsbury, took first prizes, staging in all in his usual first class style. In his collections were fine examples of Purley Park Cucumber, Sutton's Magnum Bonum, and Veitch's Autumn Giant Cauliflower, and a very fine Pea, Sutton's Mammoth Marrow.

Several honorary exhibits were staged, amongst them, from Messrs. Rd. Smith & Co., Worcester, a large group of plants, such as Liliun Harrisii, superb Gloxinias, and others, cut herbaceous blooms, and an interesting exhibit of cut shoots of rarer ornamental trees and shrubs. Messrs. Hewitt & Co., Solihull Nurseries, a group of plants, cut herbaceous plants, and very fine double and single seedling Begonias, and a handsome bridal bouquet. Messrs. Pope & Sons a large and very handsome wreath, in which a few pale tinted Cattleya blooms were mixed; and Mr. A. Brown, florist, Birmingham, a stand of florists' Pinks, in which Brown's Amy was conspicuous for its fine quality.

The Exhibition was the largest and best seen in Wolverhampton, but the genius of a Bruce Findlay was needed to govern and guide the arrangement in the tents. Whilst the judging was going on much could have been done in closing up and filling spaces, and the filling in of the prize cards was very unsatisfactory to the exhibitors, and made it difficult for visitors to see who were the prizewinners.

#### HIGHGATE.—JULY 17TH.

THE Highgate Horticultural Society is now in a most prosperous condition, such as would in fact compare favourably with many other societies of far greater pretensions, and this is largely due to the energetic and courteous Secretary, Mr. D. B. Crane, who undertook the Society's arrangements two or three years ago, and has effected an astonishing improvement in so brief a time. Much praise is also due to the Treasurer, Mr. Herbert Cutbush, who takes a great interest in the Society's welfare, and has assisted in extending its popularity. The result of last year's Show was a balance of £118 in favour of the Society, so that without taking a shilling at the gates the whole of the prize money could have been paid in full, as £200 was standing to the credit of the Society. This is a sound financial condition, and the receipts on Thursday thus constituted a balance for the next year.

The Show, which was held in a field attached to Northfield, was a good one, plants, flowers, fruits, and vegetables being all admirably represented, and a bright varied display was produced in the two large tents. Perhaps the most remarkable feature of the Highgate Show is, however, the cottagers' department, in which the competition is exceedingly keen, and the quality of the exhibits, particularly the vegetables, very high. The Baroness Burdett Coutts provides much encouragement in the shape of prizes for cottagers and children, and this has assisted greatly in creating a healthy rivalry to the advantage of the Show and the district.

The President's special prize for a group brought good competition, Mr. James Brooks, gardener to W. Reynolds, Esq., The Grove, Highgate, taking the lead with a very bright arrangement of tall Fuchsias, Liliun lancifolium, and Hydrangea paniculata, edged with Cockscombs, Gloxinias, and Torenia. Mr. J. Brittain, gardener to F. Reckett, Esq., Caen Wood, Highgate, was second, Fuchsias, Francoas, and Eucharis being the chief features. Mr. H. Eason, gardener to B. Noakes, Esq., North Hill, was third. In amateurs' class for groups Messrs. Brittain and Eason were the prizetakers.

Fuchsias were well represented by moderately sized plants, but very

freely flowered. The premier award was taken by Mr. J. Brooks for six specimens, and Mr. Eason had a similar position for four plants. Messrs. G. Quelch, gardener to W. W. Howard, Esq., Hoscote, Shepherd's Hill, E. Agate, gardener to H. Taylor, Esq., Priory House, New Southgate, secured other prizes. The best six exotic Ferns came from Mr. J. Brooks. Mr. J. Brittain was second, and Mr. Eason third; all the plants of moderate size, but fresh and healthy, Adiantums and Aspleniums being chiefly represented. Mr. Eason had the best single flowering plants, a globular specimen of *Clerodendron Balfourianum*, well flowered, and evenly trained. The best single foliage plant was a fine *Seafortia* from Mr. J. Brittain; *Caladiums* from Mr. J. Brook, *Coleuses* from Messrs. Eason, Brooks, and Quelch, and *Pelargoniums* from Mr. H. Rawson, gardener to J. H. Lloyd, Esq., Greenbank, Highgate, and Messrs. Shepherd and Eason were also notable features of the Show.

In the amateurs' class for a group of miscellaneous plants Mr. D. B. Crane, Archway, gained the President's prize with a tasteful arrangement of well grown plants, *Pelargoniums*, *Fuchsias*, *Coleuses* and *Balsams* edged with *Adiantums* and *Panicums*. For six stove and greenhouse plants Mr. Eason took the first place with neat specimens, followed by Mr. Brooks. In the class for the same number of foliage plants Mr. Eason was again first, his plants including a fine example of *Asparagus plumosus*, 5 feet high by 4 feet in diameter. Messrs. Brittain and Brooks followed. Cockscombs were grandly shown by Mr. J. Brooks, who was first in the class, followed by Mr. Agate.

Fruit was capitally shown, the principal prizes going to Messrs. B. Calvert, Reckitt, Brittain, Brooks and Agate. Grapes, Peaches, Nectarines, Strawberries, Cherries and Currants were all well represented. The Baroness Burdett Coutts' prizes for a collection of hardy fruit were won by Mr. E. Agate, gardener to A. Taylor, Esq., Priory House, Southgate, first, who had twenty-three dishes of excellent Strawberries, Currants, Gooseberries, Raspberries, Cherries and Currants, and Mr. C. Shepherd (second) with twenty-four good dishes. In another collection of fruits for cottagers and amateurs only the Baroness Burdett Coutts also offered two prizes, all the competitors being good.

Vegetables also were admirable from Messrs. Agate, Brooks, and Brittain. W. H. McLean (buttonholes). Cut flowers and floral decorations from Messrs. Brooks, Webber, and Brittain. T. L. N. Turk (hardy blooms, bouquet and stands). Roses from Messrs. Bateman and Agate were fresh and good. Pansies were also extremely good, especially those from Mr. J. Grove of Springfield Cottages, who won the first prize for twelve blooms.

Miscellaneous contributions, as usual, added materially to the Show. Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, had an especially beautiful group of Tuberous Begonias arranged with Ferns. Messrs. Wm. Cutbush & Son, Highgate, contributed a choice collection of cut Roses, comprising seven large boxes of fine blooms.

#### FRUIT FORCING.

**PEACHES AND NECTARINES.**—*Early-forced Trees.*—Those of the early varieties, such as Alexander, Waterloo, Early Beatrice, and Early Louise, or such as Hale's Early, Early Alfred, A Bec, and Royal George, which were started from early December to the new year, have been cleared of their fruit. Wood on which the fruit was borne has been removed, reserving extensions; all superfluous growths have also been cut away, so that the trees have the foliage fully exposed to light and air, influences essential to forming and perfecting the fruit buds and the thorough maturation of the wood. Syringe the trees, cleanse them of insects if necessary by the prompt application of an insecticide, and supply water, or in the case of weakly trees, liquid manure at the roots. Mulching will also tend to keep the roots active at the surface and prevent the premature ripening of the foliage. The buds will be sufficiently plumped and the wood matured to permit the roof lights being removed, which should not be further delayed, if not already done. This is a commendable practice, not the least of its advantages being the thorough moistening of the border by the autumn rains.

*Successional Houses.*—Trees started in February have the fruits ripe, and some are still ripening, the crop being later than usual on account of the somewhat cold season. The fruits, however, have swelled all the finer for the more gradual process. Royal George, Stirling Castle, a freer and finer form of Royal George, and Grosse Mignonne are not easily surpassed as midseason varieties, and Lord Napier with Elruge Nectarines are good. As the fruit is cleared off the trees cut out the wood that has borne fruit and thin the growth where too close, or where they are so close that the foliage cannot have full exposure to light and air. Cleanse the foliage by means of the syringe or engine of dust and red spider or other insect pests, if necessary using an insecticide. Keep the borders thoroughly moist, feeding trees that have carried heavy crops or are at all weakly or do not plump the bloom buds. Stop all laterals to one joint, or allow a little lateral extension if the trees have the buds in an advanced state, preventing the foliage ripening prematurely by continuing the root-action with growth. When the buds are

well formed, the fruit having been cleared from the trees, remove the roof lights. The exposure to rains and dew has an invigorating effect.

*Houses with Fruit Swelling.*—Trees started in March have the fruits swelled. They have stoned satisfactorily, as they do when the growth is not too luxuriant or improperly formed and matured. The conditions essential to a satisfactory growth and crop are three—viz., to have a border composed of rather strong loam, inclined to clay rather than sand, and preferably marly, with old mortar rubbish or chalk to afford calcareous matter, good drainage, neither too wide nor too deep borders—2 feet is plenty as regards depth, and half the width the trees have of trellis, duly watered and fed from the surface; the shoots thinly trained, no overcropping or neglect of thinning in the early stages, and a genial atmosphere so as to insure steady progressive growth. The leaves should be drawn aside, and the fruit raised by means of laths across the trellis so that the apex will be to the light. Water the borders with liquid manure, and keep the surface mulched with rather lumpy manure. Avoid a close fine surface likely to form a soapy mass, and exclude air. Ventilate early, in fact leave a little air on all night, syringing by 7 A.M., and through the early part of the day ventilate freely. When the sun loses power in the afternoon begin to reduce the ventilation and raise the temperature to 85° or 90° about 4 P.M., with a good syringing and damping, but it must be done with judgment, for when the water hangs for any length of time on the fruit during the last swelling process it is liable to damage the skin, causing it to crack, or if not that, it may give the fruit a musty flavour; therefore have the fruit dry before nightfall, and when the day is likely to be dull omit the morning syringing. Directly the fruit commences ripening cease syringing, but afford air moisture by damping available surfaces, especially the border whenever it becomes dry, ventilating rather freely in the day, and sufficiently at night to insure a circulation of air.

*Late Houses.*—In order to assist the swelling of the fruit observe the conditions laid down in the preceding paragraph. If wanted to accelerate the ripening ventilate rather freely in the early part of the day, and up to one o'clock, then keep the heat obtained by reducing the ventilation so as to secure 80° to 85°, and at about 4 P.M. close the house, syringing well, and no harm will come if the temperature rise to 90° or 95°, ventilating a little about six o'clock so as to let the pent up moisture escape, and the temperature gradually cool down. Keep the shoots tied down as they advance, allowing no more than are necessary for next year's fruiting or for furnishing the trees. Let all have space for development, the full exposure of the foliage to light and air. Keep laterals stopped to one leaf, also retain growth to attract the sap to the fruit. If there are any gross shoots which push laterals from the leaf buds cut them back to where the buds remain intact, or, if likely to derange the equilibrium of the trees, the equalisation of the sap, cut them off altogether. They only tend to promote gumming, imperfect setting, and certain casting of the fruit in stoning. Draw the leaves aside or away from the fruit, raise it from the lower side of the trellis, let it have as much light as possible, the sun acting directly on the apex. Peaches are no good unless coloured, the flavour corresponding thereto, other conditions being favourable.

*Unheated Houses or Wall Cases.*—The fruits have stoned satisfactorily, and are taking the last swelling. Where there are early varieties the fruits are ripening; the trees must not be syringed, but the trees must not lack water at the roots, and the borders should be damped, as air moisture is necessary for the health of the foliage. Afford liquid manure to trees swelling their crops, giving thorough supplies. We have found nothing surpass house sewage, but it must not be used too strong. It causes the foliage to assume a dark glossy hue, and the amount of chlorophyll in the leaves practically determines the colour and quality of the fruit. The fruits must be disposed so that they will receive light and air from all points as far as practicable by drawing the leaves aside, and raising them by means of laths across, and secured to the trellis to the front. Keep the growths thin, every shoot having space for full exposure to light and air. Syringe about 7 A.M., the house having a little ventilation constantly; increase the ventilation with the advancing temperature, contriving to have it full at 75°, or if it is desired to accelerate the ripening keep through the day at 80° to 85°, but always with ventilation, and close early to maintain the temperature, but not to raise it above 90°. Syringe again in the afternoon, about 5 P.M. Judiciously syringed there will not be any red spider, the roots being duly supplied with water and nourishment. Timely thinning increases the size of the fruits retained. It having been attended to early the fruit is a good size by the time the stoning is completed; the final thinning should be given as soon as the stoning is completed. One Peach to every square foot is ample, also for the large Nectarines. The reason Nectarines usually are smaller than Peaches is because they are not so liable to fall in stoning, and are in consequence left much closer.

#### THE FLOWER GARDEN.

*Carnations and Picotees.*—Showery weather came just in time to put new life into these, and the forwardest are opening beautifully. If not already done all should be lightly staked, several flower stems, if need be, being loosely attached to each stake. In order to have perfect blooms disbudding should be early resorted to, the largest or central bud only being left on each branch. Even these ought to be reduced in number if show blooms are desired for the July or early August exhibitions. Not a few otherwise fine blooms are apt to be disfigured by the bursting of the pod or calyx. This may be obviated by carefully and evenly splitting down the segments a little way all round, a piece of matting or thread being at the same time tied

moderately tight just below the divisions artificially or otherwise made in the calyx. Heavy rains ought to be warded off choice blooms with the aid of temporary canvas screens or other contrivances.

*Seedling Carnations and Picotees.*—These are by far the most floriferous, a good per-centage also being double flowering, while even the singles are very attractive, and much appreciated for filling vases. So very free flowering are they that it often happens no side growths are formed, and as a consequence the plants are of no service for the next season. A fresh batch of plants should therefore be raised every season, and those for flowering next summer ought now to be large enough for transferring to their final quarters. They will succeed well in mixed borders, but are most effective in beds, a sheltered and fairly warm border suiting them well. They move best out of small pots, but may be carefully transplanted from boxes and pans. It is advisable to form slightly raised beds about 6 feet wide for them, freely mixing a little fresh loam and some old Mushroom bed manure with the ordinary garden soil. Arrange the plants about 12 inches apart each way, fixing them firmly in the soil, and water occasionally in dry weather.

*Propagating Carnations and Pinks.*—It is yet too early to layer Carnations and Picotees, but both these and Pinks generally can be propagated by cuttings. No time should be lost in getting these in. In many instances these cuttings or slips would strike readily in handlights placed in a cool position, such as the foot of a north wall. All the preparation needed in this case is about 4 inches of fine loamy soil, sharp sand being freely mixed with it, and also distributed over the surface. A surer and quicker method of rooting these cuttings is to form a slight hotbed in a cool position, on this placing a shallow frame or several handlights, with a bed of sandy loamy soil for the cuttings to be inserted into. Short well-matured shoots should be selected, these being pulled off from the old plants, and after the dead or lower leaves have been removed be at once rather thickly and firmly dibbled into the soil prepared for them, and watered-in. The lights should be kept on closely, and shade afforded whenever sunshine reaches the lights, gentle waterings being given whenever the soil approaches dryness. In this manner a capital lot of serviceable plants will be ready for putting out in the autumn, these eventually producing much finer blooms than are obtained from old plantations.

*Dahlias.*—These are growing very strongly, plenty of moisture at the roots suiting them well. Being of a very brittle nature they must be early supported by stakes. As a rule one strong branching stem produces more and finer blooms than several weakly ones. If extra fine or show flowers are desired the side shoots must be early and freely thinned out, a few of the strongest of those reserved being each given a separate stake. In addition to frequently removing superfluous side shoots it is also advisable to well thin out the buds, the plant's energies being principally concentrated on a few well-formed central buds. In order to fully and evenly develop the latter keep the roots well supplied with soft water in dry weather, liquid manure being given occasionally.

*Roses from Cuttings.*—Dwarf Roses are the best in every way. They are the least liable to be killed by frosts, are the least unsightly at any time, flower earlier, and frequently the most continually. Those on their own roots are the most valuable. They cannot often be bought, but they can be raised from cuttings without much difficulty. The start might well be made now with short lengths of firm young wood, and continued, later on, with longer pieces of well-ripened shoots. The frames or handlights may be prepared exactly as recommended in the case of Carnations and Pinks, with or without bottom heat, and arranged in a cool site. Select shoots that have produced a flower, these being taken off with a thin slice or heel of old wood attached and shortened to the third or fourth joint, the lower or small leaves only be trimmed off. Do not let them flag badly or become dry before firmly fixing them in the soil, and in all other respects treat as advised for Carnations. These remarks apply to both Hybrid Perpetuals and the Teas and Noisettes, the two latter being especially to be desired on their own roots, whether for pot or open air culture, the strong suckers or shoots thrown up from their base keeping the plants in a vigorous and floriferous state.

*Rhododendrons.*—It is seldom these flower so freely as they have done this year. What was once a mass of flower is now, however, replaced by seed pods, and these ought at once to be gathered, or otherwise they will greatly weaken the shrubs. Even if they did not do this they will soon present a most unsightly appearance.

#### KITCHEN GARDEN.

**THE WEATHER AND THE CROPS.**—Whatever turn the weather may take for the better now the season must be regarded as exceptionally unfavourable for vegetables. Leaf development is about up to the average, but not so luxuriant as might be expected from the amount of moisture, and the root or fruit, as the case may be, is deficient in quantity, and still more so in quality. We have had spring Onions sown in March 14 inches in circumference by the last week in July, and now under the same treatment they are not more than 3 inches round. Peas which ought only to have been 3 feet high are 5 feet, and those supposed to attain the latter height have run up to 7 feet or 8 feet, while the produce has not extended in proportion.

**THE POTATO DISEASE.**—As might have been expected many varieties of Potatoes are becoming diseased rapidly. We have never seen early varieties so badly affected, and although the later ones are not yet "gone" to any extent, it will be surprising if all are not badly affected. Those who bought their tubers at 20s. and 30s. per ton last winter need not expect to have them again at that rate next winter.

A dry atmosphere and a dry soil are the only antidotes for the Potato disease. At the same time crops that are matured should be lifted and stored when it is dry, and the utmost care should be taken that the whole of the diseased tubers are separated from the sound ones.

**THINNING VEGETABLES.**—In dry seasons vegetables are better when not too much thinned, as a close foliage shelters the roots and retains the moisture; but at present thickly growing crops are the worst, as they are only a mass of leaves, and the smaller plants removed that all the air and light possible may be admitted to the best of the produce. This applies to all crops, and particularly to spring-sown Onions, Turnips, Carrots, and Parsnips. Where economy is rigidly considered some of these advanced thinnings may be used in the kitchen, but apart from this it would be better to pull them up and throw them away than allow them to remain to ruin the whole crop.

**TOMATOES IN THE OPEN AIR.**—These will require extra care to produce any quantity of ripe fruit. Our plants are bearing many green ones in a backward state, which will probably ripen in September. At present do not give any stimulant. Confine the plants strictly to one or two main stems, remove any large leaves that are screening the fruit, and if there are any spare frame lights place these end uppermost against the wall to slope outwards and form a temporary protection for the plants.

**PARSLEY.**—There is much truth in the proverb, "misfortunes never come singly." Our Parsley is attacked by the grub. It became yellow and drooped in a few days. We mixed one wineglassful of petroleum to a gallon of water and soaked it with this. It has undoubtedly destroyed the grub and the Parsley is improving, but it will be a long time before it attains vigour. Fortunately we had drawn a number of plants from these rows four or five weeks ago and planted them in another part of the garden, and these are quite free from maggot and healthy. There are some crops we do not approve of confining to one sowing or one plantation, and Parsley is one of them. It is a calamity to be without Parsley at any time, more especially in the winter and spring months. There is no substitute, and the utmost endeavour must be made to secure a supply. This we have invariably done by sowing a quantity of seed at the end of July or early in August in rich soil free from worms. The plants from this sowing will be dwarf and compact at the beginning of winter, and they are all the better of this, as they withstand severe weather better than huge leaves.

**CABBAGE FOR NEXT YEAR.**—One of our best crops this season was spring Cabbages. We had abundance from the 1st of April onwards. The seed that produced the first plants was sown during the first week in August, 1889. The last week in July and early in August are also times when sowing may be done in all localities, but the surest way of securing a good class of plants and meeting the variations of the season is to sow twice at the times named. The seed may be sown broadcast in beds 4 feet wide and in good soil, and sufficient should be sown to ensure surplus plants. Some do not sow seed but buy their plants, but this is not so convenient as raising the plants in each garden. The dwarf compact growing sorts are the only ones that should be grown, and only the best strain obtainable should be introduced.

#### APIARIAN NOTES.

##### THE WEATHER.

THE bees' movements on the 11th inst. did not disappoint us, although thirty-six hours passed before an improvement took place. The mean temperature of the day rose about 10° above what it had been previously, accompanied with a terrific hurricane of wind, which lasted fully two days, and doing much mischief in laying crops and unstaked flowers, and breaking the branches of trees. The 15th was breezy with some sunshine, but the temperature never rose above 60°. On the 16th, however, it rose for a short time to 75°, and was steady for a long time at 65°. The 18th was again dull with the thermometer at 60°; with a falling barometer, and idle bees, looks like much rain, which has never been absent a single day since May 4th. Only three and a half days have the bees had as honey days, two and a half in May and on the 16th July. Not one in June.

##### WEIGHING HIVES.

This I never attempted until the morning of the 16th, but not observing whether the chain rested upon the hive or the ground, prevented deciding whether 3 lbs. or 8 lbs. had been made by an average hive which weighs about 20 lbs. only. My best pure Carniolian weighed at the same time 56 lbs. These weights are for the contents of the hive only, as gross weights are misleading. All hives should have the tare marked upon them.

## PROSPECTS OF HONEY.

No time should be lost in feeding stocks short of stores, at least 10 lbs., and at the end of August the remainder necessary for winter stores. The year 1890 with many bee-keepers will be a blank so far as Clover honey is concerned, and if we had any assurance that the Heather would give a good yield we should not care, as it is most in repute, but the temperature is too low, and the lack of sunshine is against it and our hopes.

## CLOVER HONEY.

This is scarce in some districts, if the statement by a respectable honey dealer is to be relied upon. When in Glasgow on June 15th he said he had already had a consignment of a considerable quantity of this year's Clover honey, and could be supplied with all he required. I did not see it, so cannot give my verdict whether he had been deceived or not, but it is remarkable to be removing supers from hives at a time when the hills of the same county were covered with snow.

## RELIABLE INFORMATION.

In Rothesay we have a lady who has a Stewarton hive, consisting of three 9-inch body boxes on four supers full of bees and comb, the two under supers being nearly completed and full of honey—a lesson worth taking, that placing the empty super uppermost is the proper way to manage supers. Another case is that of a Renfrewshire bee-keeper, who has some heavy hives with the same number of supers also filled. The temperature at Rothesay may be higher than we experience, and the heavy hives may be partly due to the trees in the district, which the bees can gather from even while raining if the temperature be 65° and above that; below it bees seem not inclined to venture out, and the flowers may possibly not secrete honey when the temperature is lower.

## SWARMS.

Swarms in many places are scarce, and some bee-keepers have not had one. An effort should be made early before all the drones are killed to bring forward a number of young queens, because although last year's queens may live until another year, they will not be so prolific as more youthful ones, so no pains should be spared to secure them.

There is perhaps no better plan than to remove the queen regnant with a portion of the combs with bees adhering, placing it upon a new stand, and allow the majority of the bees with all the drones to remain on the old one. At the end of ten days divide into as many nuclei as desirable, and if the queen or royal cells are secured against strangers, combs from other hives with brood and young bees may be added to them, feeding all nuclei, and the stocks containing drones must not be neglected. After the young queens are laying the old queens may be disposed of according to circumstances.—A LANARKSHIRE BEE-KEEPER.

## ENGLISH AND AMERICAN METHODS.

A CORRESPONDENT of this Journal once advised me to read American journals to post me up to the times. It is well known that I have always advocated thicker and broader top bars than are generally used, which, when slides are also used, prevent "burr combs" and blackened or brooded supers. This advice was given when the Americans and their followers in this country were floundering over the difficulty. Probably the following extracts have been brought about by the influence of my pen. The editor of American *Gleanings* says:—"There are two or three matters of great moment now being discussed. The importance of thick top bars, and the doing away with burr combs and honey boards, cannot be over-estimated. Having frames suitable for out apiaries for moving and shipping is bound to come up this year, and we hope a solution of the problem may be reached."

Recognising the advisability of cheapness and handiness of hives for moving about, the editor adds, "We don't want anything that will increase the expense of the frames more than ten cents per hive." After paper packages had been tried, and announced in these pages, the Americans took the matter up. Spreading brood is denounced too, so also is the shutting in of bees at any season

"unless when in transit." Ventilation from beneath is receiving attention, and I have no doubt from the form of many American hives in the near future they will not be unlike the cheap "Lanarkshire" hive. Benton's queen cage is pronounced to be the best invented I believe, as was the candy (termed "Good's") by "A Hallamshire Bee-keeper," although many years previous to the Benton era I used similar cages.

## THE HONEY PRESSER AND MEAD.

Different sized cylinders are desirable when the presser is used for other purposes than honey. After the honey is pressed from the combs warm water should be poured over them, and the combs thoroughly macerated. Two card like instruments are suitable for this purpose. When macerated steep for twenty-four hours, then strain and pass through the presser, then the liquor is ready to be converted into mead; boil for an hour, scumming the froth as it rises, then when milkwarm add a little yeast (a few hops having been previously boiled in the liquor); stir well, and cask when fermentation has well begun; bung closely, and stand the barrel in a moderately cool dry place. The above receipt appeared before, but some may have not seen it. The wax should be extracted immediately after all the liquor is pressed out. If they lie about long after acari take possession.—A LANARKSHIRE BEE-KEEPER.

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Benefit Society (*Endymion*).**—If you send your name and address the particulars you require will be supplied by post.

**Ventilating Vineries (*E. I.*).**—The treatment you are giving your Vines is the correct one, more especially as the Grapes are beginning to colour. A little fire heat would of course be advantageous, but as you do not give it the necessity is all the greater for a circulation of air constantly, so as to prevent a close vitiated atmosphere. It will assist the Grapes in colouring, and further their quality. Continue the treatment you have proved satisfactory.

**Name of Insect (*Dyffryn, M.A.*).**—The curious insect forwarded is a specimen of *Sirex gigas*, one of the horn-tailed sawflies. The species is much more abundant some seasons than others; it occurs most frequently in the vicinity of Pine forests or plantations, in the solid wood of which the larva or grub feeds, also sometimes upon that of other trees, the Elm for instance. It has the power of producing a loud buzzing noise, and for this reason, though really harmless, it is an object of alarm in some countries, being supposed to be a stinging insect. The borer at the tail is used to pierce deeply into wood for the deposition of eggs; it is furnished with teeth, and acts in a manner similar to the centrepit of the carpenter.

**Luxuriant Growth on Young Pyramid Fruit Trees (*St. Julian Arabria*).**—Having cut out all useless growths, and shortened side shoots on main branches, you ask What you are to do with the main branches, some of which are 2 and 3 feet long? Stop them at once, merely removing a few joints of the soft growths. This will strengthen the part below, and especially the buds at the lower part of the shoots, whilst leaving the shoots a greater length than is generally desirable will afford an outlet for the overabundant sap. Any growth resulting will be from the points of the shoots, and these can be pinched at a few joints of growth, but not later than early September. At the winter pruning the branch or leading shoots may be shortened to about 15 inches of their base. The espalier trees have not pushed side shoots because the leaders were not cut back as they ought at the winter pruning. There is no remedy but after the leaves have fallen cutting back to the point, or a little lower, where you desire to originate the side branches. Trees in the luxuriant condition yours present should be lifted in autumn and the soil made firmer.

### PROGRESS.

PROFESSOR HENRY STEWART has recently in the *New York Times* called special attention to the Instantaneous Butter Maker, of which we gave a brief description in our article of July 10th. He shows how admirably it gets rid from both separated milk and the butter of all the impurities commonly found in milk—*i.e.*, the fibrine, the mucus, the scales of tissue, &c., leaving it quite pure. He also explains how, by a fortunate application of dynamics and mechanics, the dairyman's labours are reduced and made more effective with a proportionate gain and profit. His prospects are brighter than they have been for several years, for his greatest difficulty is in course of removal—that of the intricate manipulation of milk and cream, with all the adverse conditions of temperature and exacting work and oversight to contend with. There will now, he asserts, be every chance for making good butter, instead of so many chances against it. With well fed healthy cows, and the exercise of due care in the housing and milking, the making of pure butter up to a uniform standard of excellence becomes a very simple matter, and a good trade is certain to follow if only due care is taken with the salting and packing.

Vendors of this splendid implement will do well for themselves and well for farmers if they will be content with a moderate profit upon the cost of its manufacture, so as to ensure a large sale. A cheap motor has now also become a necessity for most dairies, and there will be a growing demand for it with the enlargement of farm dairies, or rather the growth of herds of dairy cows; for the new implement will enable us to dispense with milk pans and cream crocks, but it must not be forgotten that a regular supply of from 200 to 300 quarts of milk is requisite for a profitable use of the instantaneous butter maker. At many farms the entire dairy yield of milk does not amount to above a half or a third of that quantity. Butter factories are still few and far between, and the only course open to farmers generally is to curtail their Wheat crops still more, to extend the area of Oats, roots, and fodder crops, to substitute ensilage for haymaking, and to keep more cows. This would enable them to derive full benefit from the milk and butter trade, and also to materially improve their cattle business. The purchase of store cattle would then be avoided altogether. Cheap animals and cheap food, all home produce, upon which not a penny has been wasted for middleman's profits, must answer. The food would be pure, wholesome, and nourishing, and the cattle ought to be superior to most of the purchased store beasts, and they will be if due care is taken in the selection of the stud beasts.

Mention of the middleman is a reminder of the Rev. Harry Jones' efforts to bring the farmer into direct communication with the consumer of his produce. His proposal that railway companies shall furnish lists of shopkeepers in London who are willing to receive produce direct from farmers, the company collecting the money and transmitting it to the farmer, is hardly practicable. The responsibility and risk involved is precisely that for which the middleman makes the farmer pay so dear, and judging from our experience of railway rates, very much upon a par with the middleman's exorbitant commission upon sales. We shall indeed be surprised to find any railway company at all willing to pose as the farmer's friend.

The fallacy of bare fallowing to rest the land is now pretty well exploded, and extension of root culture and of green crops has probably given an impetus to bastard or half fallows. It hardly ever answers to rush into extremes, and when land is taken up in

very foul condition or becomes so through a succession of wet seasons, recourse must be had to a bare fallow. The tillages must be done with care and caution, ploughs, drag, and light harrows, crosshill and plain rollers, and even hand forks, must all be brought into use to eradicate the weeds. The work must be thorough and deliberate, and each field must be treated according to its requirements. It is mere waste to sow corn in a foul seed bed, and we could only say "serve you right" to an old tenant of a heavy land farm who recently complained that he had been obliged to plough in a field of Barley as the crop was smothered by weeds. To have land clean in the fullest sense of the term, and that is free from weeds and superfluous water, is essential to progress, whatever may be our system of cropping. We can then proceed to store the soil with fertility and to plant and sow with confidence, only we must be very sure our seed is good, true, and free from weed seeds, for we doubt not that Charlock and Poppy have first entered the soil of many a farm through the coulters of the seed drill.

### WORK ON THE HOME FARM.

St. Swithin's has passed without rain, and the indications of a change to fairer weather cause us to hope still for a tolerably full corn harvest and some good hay yet. But the rain of the past six weeks has given such vigorous growth to weeds that it will prove by no means an easy matter to have clean root fields by harvest. Early sown Mangolds were singled and the weeds were well under before the wet time set in. If subsequently weeds have grown so have the Mangolds and early Swedes, which now have the leaves meeting well across the space between the rows, and keeping down weed growth.

Two important points of practice to which managers of home farms on heavy land should now give special attention are the provision of an ample store of burnt clay and other ashes, and the turning to account the household sewage if the farm includes the park, or is near the mansion with its large staff of servants, laundry, kitchen, and stables. The supply of sewage from such an establishment is considerable, and it should on no account be wasted, but should flow through a main pipe into a tank, whence it can be removed either for distribution by a water cart and spreader on pasture, or to saturate ashes, ballast, or charcoal dust, either for ploughing in, or top-dressing pasture. Wood ashes so treated are an excellent manure for the Clovers in permanent pasture, and all really good pasture contains a large proportion of Clover, especially of the white perennial variety. Get rid of all useless banks and mounds on the farm, and turn the soil to account by burning it. In very hot dry weather the burning is easily done without coal, but in showery weather some coal is necessary.

Sheep are so profitable that the provision of plenty of food for them at all times is desirable. As the folds are removed off the Tares let the ploughs follow at once, then the harrows, roller, drill with late Turnip seed, and then a turn or two of light harrows finishes the work. There should be no delay about this, as a full crop will soon be a speculative matter from the advanced season and risk of hot dry weather. Land may also be prepared for drilling Imperial and Drumhead Cabbage early in August, or if a field cannot be spared, then get ready seed beds, and sow 1 lb. of seed per acre about the first week in August.

### METEOROLOGICAL OBSERVATIONS.

### REMARKS.

13th.—Fair, with some sunshine, but spots of rain in the evening.  
 14th.—Fine, and occasionally bright.  
 15th.—Bright and warm; the first summerlike day for two or three weeks.  
 16th.—Bright and warm morning; hazy and frequently cloudy in the afternoon.  
 17th.—Cloudy till about 4 P.M., then wet; thunder, lightning, and heavy rain in evening, the rain lasting till after midnight.  
 18th.—Wet till 6 A.M.; bright morning; generally cloudy in afternoon; wet evening and night.  
 19th.—Heavy rain at 6 A.M.; dull, with occasional drizzle in morning; afternoon and evening generally bright, but occasional slight showers.

The week has been noteworthy on account of the occurrence of one of those great rains which occur at long intervals, and when they come produce considerable damage. Although here the storm of the 17th yielded 1.671 in., more than twice that amount fell at some stations in Berkshire and Hertfordshire.—G. J. SYMONS.

## FERNS AT CHISWICK.

THE Royal Horticultural Society's Fern Exhibition and Conference in the Chiswick Garden last week provided considerable interest for the admirers of these graceful and varied plants. The exhibitors were few, but the collections staged have probably never been equalled at any society's show in this or any other country. There were from 200 to 600 distinct forms in each contribution, representing not only the best of the exotic Ferns, but also what have become even more numerous—the variations of British Ferns—which now appear to be almost endless. The schedule comprised six classes, and in the first of these for British Ferns ten groups were enumerated to include all the principal genera that have yielded variations freely either wild or under cultivation. Hardy foreign Ferns formed the next class, then there were others for stove and greenhouse Ferns, Selaginellas and Lycopodiums, "Ferns best adapted for cultivation in rooms," and "Ferns for hanging baskets." The object throughout was evidently to procure both collections and selections, but no provision was made for the tasteful arrangement of Ferns in groups as showing the special cultural value of Ferns for ornamental purposes. The large tent nearly 200 feet long had a stage at each side, and upon these the Ferns were arranged very much in the way they are too often seen in warm or cool houses in gardens, which is the least adapted for displaying the beauties of these plants to advantage. To have provided for groups of Ferns arranged for effect would have required at least another large tent.

The official lists of awards and certificates will be found on another page, but prominence must be given here to three of the collections, because they were of such an exceptional character that individually they would have formed an exhibition of importance. A silver challenge cup offered by Mr. N. N. Sherwood for the best collection of hardy Ferns and their varieties was won by Mr. E. J. Lowe for the present year, his collection being a remarkable one in all respects, and the finest series of Fern variations ever exhibited, all extremely interesting, and many exquisitely beautiful. Then a gold medal was adjudged to Messrs. J. Veitch & Sons with a representative group of stove and greenhouse Ferns in all their most distinct and graceful forms, comprising those introduced by the firm in recent years (see page 91), a group of hybrid, or supposed hybrid, Ferns, and a large collection of crested exotic Ferns, such as are now employed in decorative purposes so generally. Messrs. W. & J. Birkenhead, who have so long made a specialty of these delightful plants, were also honoured with a gold medal for their wonderful collection of choice Ferns, carefully arranged to represent nearly the whole of the classes enumerated in the Society's schedule, all fresh and neat little plants. For Mr. C. T. Druery's handsome plumose and other Ferns, and for Mr. May's extensive group of decorative Ferns, medals were also awarded, and the Royal Horticultural Society may be congratulated upon the horticultural success of their Fern Exhibition, and upon having performed a useful service in calling attention to a class of charming plants that are not so popular as their merits might be expected to render them.

Why Ferns should be neglected by amateur cultivators is difficult to understand. The majority of the most ornamental are easily grown, and they are certainly not expensive to purchase, yet

anything like a collection is rarely seen in gardens. A few Adiantums, Aspleniums, and Pterises, which are largely grown for decorative purposes, are almost the only kinds found in gardens generally, and with the exception of a very few enthusiastic amateurs like Messrs. Lowe and Druery, we have either to visit the leading nurseries or the chief botanic gardens to find Ferns adequately represented. To form an idea of the marvellous extent of variation in Ferns it is only necessary to glance through the great collection at Kew, noting the stately tree-like Cyatheas and Dicksonias, which rear their imposing crowns of fronds far above all their relatives; the graceful Adiantums, the powdered Gold and Silver Gymnogrammas, the luxuriant and elegant Davallias, the exquisitely beautiful Cheilanthes and Nothochlænas with fronded tracery, the distinct climbing Lygodiums forming long wreaths and festoons of twining fronds, the bold Aspleniums, the rugged Marattias and Angiopteris, the creeping Polypodiums, and lastly, those gems of the Fern world, the "Filmies," Trichomanes, Hymenophyllums, and Todeas, the translucent fronds of which appear in some cases frosted with crystals or glittering with liquid diamonds. These are only a few of the types that take the attention of a passing visitor to our national collection, but to those who possess a more intimate knowledge of the hundreds of species now cultivated in British gardens there are abundant other attractions of scarcely less importance; in fact nearly every individual Fern is invested with sufficient character to render it an interesting study to all who care to devote a little time to its careful examination.

There is no doubt also that from a public exhibition point of view Ferns have been comparatively neglected. Their history, structure, and culture, too, afford abundant materials for discussion at a conference, which can easily be rendered of an exceedingly interesting and important character. It is true that some societies have provided classes for specimen Ferns at the larger exhibitions, the northern societies in particular also giving encouragement to hardy Ferns, but beyond that little has been done. Two important exceptions must, however, be noticed—namely, at Brighton and Bath, where attempts have been earnestly made to do justice to this large and beautiful family of plants. At Brighton classes have been devoted to groups of Ferns arranged for effect, and the results have been satisfactory in the extreme, instructive as showing what can be accomplished with Ferns alone, and affording a refreshing contrast with the bright masses of colour furnished by Pelargoniums and other flowering plants. Compared with the conventional groups at shows these are far superior when tastefully designed, not crowded, but allowing every distinct character of frondage and habit to be distinctly seen. Much, of course, depends upon the individual taste of the competitor and the Ferns at command, but diversity of style often compensates for a restricted collection of varieties, the banking method being avoided in all cases. The Bath Society at one of their summer shows a year or two since had a large tent exclusively occupied with Ferns, British varieties largely predominating, and the late celebrated pteridologist Colonel Jones was one of the chief exhibitors. In a large experience of shows throughout this country we have never seen a more interesting or pleasing tent of plants, and it was quite refreshing to turn from the grand floral display in other portions of the grounds to the coolness and varied shades of green in the Fern tent.

With regard to the commercial value of Ferns for decorative purposes, it might be safely stated that, though as collections representing the family Ferns are neglected in private gardens, yet never in the history of horticulture have they been so extensively employed for house adornment and in floral arrangements as at the present time. It would be difficult to estimate the number of Ferns sent into the markets in the course of a year, and impossible to give even a vague idea of the quantity of cut fronds of Adiantums and other Ferns, either sent from growers in this country or imported from the continent. Suffice it that some

"market men" devote themselves almost exclusively to Ferns, and there are several growers around the metropolis who derive a substantial income from the sale of these plants alone. Wherever cut flowers are a special feature in market nurseries Ferns are grown extensively as well, and a consignment of flowers for sale would be deemed incomplete without its accompanying proportion of Fern fronds. The extension of the cut flower business has induced a corresponding increase in the demand for suitable foliage, and the result has been that a great stimulus has been given to the culture of Ferns. Of course, few species are grown for this purpose, *Adiantum cuneatum* and its variety *gracillimum* largely predominating; but amongst the importations we have several others, and it might in some cases be worth the attention of market growers whether they could not add to their stock of varieties.

The Conference arrangements furnished subjects of considerable interest to students of Fern-life, and even some who have not paid special attention to the peculiar phenomena for which these plants are remarkable found the papers sufficiently interesting or novel to retain them in the Conference tent for nearly two hours. Mr. J. G. Baker, who was to have taken the chair, was prevented doing so, and Dr. M. T. Masters very ably performed the necessary duties. Professor Bower dealt exhaustively with the systematic relations of Ferns, but this admirable paper was a little too abstruse for the general public. Mr. E. J. Lowe contributed a valuable dissertation on Hybrid Ferns, in which he referred to the extraordinary experiments he has conducted, and illustrated the success which has attended his efforts by numbers of the fine specimens included in his group. Mr. C. T. Druery discoursed about "Plumose Ferns" in his usual lucid and interesting manner, and Mr. J. Birkenhead explained the culture of hardy Ferns in a practical and useful paper. Some discussion followed the various papers, but each lecturer had so fully and clearly treated the subjects entrusted to him that there was little room for questions. The business concluded with the customary votes of thanks to the Chairman and readers, and the Fern lovers present separated with the hope that an opportunity will be afforded another year for a similar Exhibition and Conference.

### STRAWBERRIES—LEAVES VERSUS FRUIT.

ALTHOUGH much has been recently advanced in the pages of the *Journal of Horticulture* on Strawberry culture, I shall yet venture to offer a paper, the heading of which was down in my note book long before I read Mr. Wright's admirable contribution to Strawberry literature. What Mr. Bunyard has to say upon the same subject must also be treated with every respect, the writer having had great experience in all matters pertaining to fruit culture generally. At the same time I am sorry his remarks have appeared in our journal, for it is my belief they will serve to undo much of the good work that Mr. Wright had started, gardeners being somewhat apt to form hasty conclusions. Mr. Wright gives an instance of remarkable success attending the practice of manuring from the surface only, and his deductions in connection with this method of culture are undoubtedly sound, and altogether the paper ought to have proven most instructive to private gardeners. Then comes Mr. Bunyard's paper, in which he advocates digging or trenching in from 35 tons to 50 tons of manure to the acre, and this is a "floorer," at least it was thought to be such when I happened to be arguing with another gardener on the subject of manuring the ground for Strawberries. My friendly opponent after hearing what I had to say against a too free use of solid manure, quietly produced Mr. Bunyard's contribution to the Strawberry Conference, which at that time I had not read, and asked what I had to say in opposition to the experience of this expert. If I ventured to repeat all I had to urge against it as far as private gardeners are concerned, the Editor would, perhaps, think it necessary to "boil it down" considerably, but I shall endeavour to condense it somewhat.

In the first place private gardens, having been long in cultivation, are naturally richer in some forms of manure, though deficient in others—notably potash—this alone giving the plants a tendency to form far too much foliage. Added to this they are usually sheltered, often unduly so, this likewise favouring the production

of long stems and much foliage. What therefore may be sound practice in the open fields would perhaps be altogether wrong in a private garden, and of this not a few gardeners must have had ample proof this season. A superabundance of strong foliage usually results in comparatively light crops, and should the soil prove to be very loose as well as heavily manured the chances are there will be little or no fruit. Even if these overgrown plants do produce very heavy crops these are invariably late in ripening, and in bad or dull showery weather large quantities fail to ripen. Tons of fruit have spoilt on the ground in private gardens this season, but I can truthfully assert we have not had 4 lbs. of Strawberries spoilt from any cause other than what birds damaged. The reason for this is not far to seek. Our foliage is sturdy, and the clusters of fruit were thrown out well clear of it all round, and no difficulty whatever was experienced as far as ripening was concerned.

When I first commenced gardening in Essex, and in a district where Strawberries were very extensively grown for the markets, it was pointed out by a friend that not only were much heavier crops of fine fruit grown in the open fields than I should obtain in a sheltered highly cultivated garden, but it would also be found that the quality of the former was decidedly superior. Both assertions proved to be facts, and if private gardeners generally could pay a visit to the open fields while the Strawberries were at their best, a good deal of conceit would be taken out of them as it was out of me. A few years ago, it will be remembered, I argued strongly against injudicious trenching, and it was the experience gained among the market farmers that partly tended to confirm me in my prejudice in favour of firm ground for many crops. That Strawberries ought to have such there is no disputing, and it is very little manure that is needed at the outset. It is fruit, not leaves, we all ought to strive to grow, and the plants on solid and comparatively poor ground that are best calculated to give the most satisfactory results. First go the right way to promote the formation of abundance of strong trusses of bloom thrown up well above the foliage, then surface dress with special manure, or something in which potash abounds (we use wood ashes freely), and follow with a heavy mulch of strawy manure before a dry time may reasonably be anticipated. Autumn or winter mulching is a mistake, this doing more harm than good, nor should the surface be stirred with any tool other than a Dutch hoe.

A free use of manure and deep cultivation is recommended frequently for the twofold reason that ground thus treated is not so quickly affected by drought as that less expensively prepared, and it also keeps the plants in a profitable state very much longer. The question is, Which do we most often suffer from, drought or too much moisture? The latter assuredly, and this being so our method of culture ought to be adopted accordingly. Then as regards the longevity of the beds, I would ask, Why study this at all? In the majority of cases the plants rarely produce really good crops after the third year, and there is little sense in longer keeping them on the ground. We take no more pains here with Strawberries than with most other crops in the kitchen garden, and never hesitate to root them up when they have ceased to produce fine fruit in abundance. The ground intended for them is first well prepared but not trenched for early Potatoes, and these are lifted, the ground cleared of rubbish, levelled and trampled in time to plant Strawberries about the first week in August. If strong plants are put out, and these do well, a good early crop is taken from them during the first season, but if from any cause they are weakly then we pinch off the bloom, and by so doing save nets, and secure fine strong plants for the following season. Not unfrequently Tripoli Onions or salading of some kind is grown between the rows of Strawberries, and directly the latter have ripened off their last crop and yielded what runners are needed they are cut off with a spade, the ground cleared but not dug, and at once cropped with either Broccoli or Savoys. Ours is in a retentive clayey soil, but, as Mr. Wright has shown, exactly the opposite kind of root run, treated very similarly, answers surprisingly well. In order to further demonstrate what poor solid ground will do, I will briefly state our experience this season with the much despised Alice Maud, but which under field culture is yet one of the best that can be grown. In the autumn of 1888 I received sufficient runners to form two rows 26 yards long, and they were dibbled out on undug ground previously occupied by Spinach. Last year they were not allowed to fruit, this year they were, and I rather think proved eye-openers for some that saw them and knew the old variety. Every plant was completely surrounded by fruit, the largest of these weighing from 1 oz. to 1½ oz., the colour being a bright red, and the quality excellent. After we had gathered from these rows about six times I weighed all that were ripe on one of the plants carrying a fair average crop. There were twenty fruits weighing 15 ozs., and a fair average for the lot would

be  $1\frac{1}{4}$  lb. Nothing very remarkable about this weight it may be urged, but it all ripened, and what is of great importance, the crop cost next to nothing to produce.

There is yet one more point to be considered. As stated by Mr. Bunyard, the rows of Strawberries in the open fields may be about 32 inches apart, 16 inches dividing the plants in the rows. These distances answer well, though in the case of such sturdy growers as Alice Maud 2 feet between the rows is sufficient. Private gardeners often give less room than Mr. Bunyard recommends, whereas they ought really to give much more. Our plants that are to fruit one year only are put out 15 inches apart each way. Those that are to remain longer on the ground naturally require more space. Sir J. Paxton being a strong grower is planted in rows 30 inches apart, and 2 feet apart in the rows, all the rest being put out about 2 feet apart each way. According to my experience it is a wiser plan to give the clumps good room all round than to plant more thickly in the rows; but if private gardeners think this a wrong notion they will yet do well to arrange the rows nearer 3 feet than 2 feet apart, the former distance being none too much on deeply dug heavily manured ground. In conclusion, I would also add that it is the deeply cultivated loose rich ground that is most infested with slugs. This season there were fewer of the latter among our Strawberries than I ever remember seeing before, especially in a showery season.—W. IGGULDEN.

### GNATS AND MOSQUITOS.

THE real (or supposed) occurrence of mosquitos in Britain has been the subject of many a newspaper paragraph, and, like the big Gooseberry that has furnished one of our standard jokes, after occasional intervals the irrepressible insect is sure to turn up again, a theme of vexation or complaint. Reference has been made recently in these columns to an alleged abundance of the vicious flies at the West of London, and to a ridiculous notion that their appearance was explainable by the fact that they were imported to the locality with exotic plants by some nurserymen of Chelsea. On personal inquiry at the leading establishments, conducted by such men as Messrs. Bull, Veitch, and Wimsett, who of course do receive quantities of new and choice plants, I found, as might be expected, that the idea cannot be supported by the smallest fragment of fact. Obviously had the mosquitos been introduced with the plants the first to suffer from the attacks of the insects would be those who were working at the nurseries. No instances of the kind existed, and I do not believe there is any authentic case of insects noxious to human beings having been introduced to Britain by means of foreign plants imported, or at least only stragglers. As to the mosquito, all the specimens ever shown me, on the supposition that they belonged to that species, turned out to be the ordinary English gnat. If stray examples of the fly reach some of our ports, which may sometimes happen, I do not think they breed here; it is a possible thing, but very unlikely. The importation of the insect in the egg state is not more probable, because the eggs of such flies hatch speedily. At the same time, it must be acknowledged that the common gnat of our island has been exceptionally abundant this season, and its bite, from some cause or another, unusually virulent. Many women and children have been victims since March or April (for there seems to be a succession of them), not only when out taking country walks, but also when strolling or working in their own gardens. Our rougher skinned sex is less frequently attacked by them. It is all the worse that the gnats should make females their mark specially, for those that sting or bite us are of that sex; entomologists are almost agreed that the male gnat is harmless. No doubt a little watchfulness might often prevent persons from being stung when they happen to be in a place where gnats are flying about. Still this female foe is crafty; she alights gently upon the skin, inflicts the bite speedily, and it is not at first, as a rule, followed by either pain or irritation. Then, too, the insect enters bedrooms, and while people sleep attacks the face or the hands and arms if exposed, retreating unnoticed. One thing, however, is noticeable both in and out of doors, the onslaught of this vicious insect is mostly preceded by the sound of its shrill clarion, a warning to which we should attend. Some naturalist gave the species the name of *Culex pipiens*, but its trumpet note is certainly not adequately represented by the Latin "pipiens," and when the diminutive size of the insect is considered the volume of sound one can produce is surprising. It is the result of rapid vibrations of the wings, which the gnat is enabled to make by the powerful muscles lodged in the thorax. Mr. Staveley found on soaking this in turpentine, and then examining it by polarised light, that it is almost entirely muscle, bands of these crossing and recrossing each other, giving the insect the appearance of being garbed in check or turban. Owing to their strength of muscle gnats are able to perform the

feat of hovering or remaining seemingly motionless in the air, and also of keeping themselves suspended with their heads against the wind.

What we call the gnat's bite partakes of the nature of a bite and a sting, for the needle-like weapon which is thrust into the skin of the victim contains several minute lancets, which pierce the vein selected, and it then pumps the blood up the tube till satiated or driven off. Dissection has not yet revealed this object, but it is almost certain the gnat's weapon must be connected with a poison bag, a liquid being thrown into the incision to thin the blood and facilitate its flow up the tube. This must be very potent from the effects often observable when a bite happens to be inflicted in some fleshy part, such as the cheek or arm; a swelling as large as a hen's egg will sometimes rise up in the course of a few hours, attended by intense itching, and with some persons this is accompanied by feverish symptoms. After a variable period the swelling subsides, but the centre immediately round the bite hardens into a sort of core. With some people this breaks and discharges; usually it slowly disperses. I have seen the marks of gnat-bites remaining for a month. It may be well to indicate the best method of dealing with them. In the first instance there is nothing better than bathing the part freely, and if this can be done immediately the bite is perceived, the poison may be so far diluted that any after swelling is prevented, but it must be very thorough and prompt to avert this. Subsequently emollient applications may be used, such as olive oil, vaseline, or a lotion of arnica has been advised.

Now, as large numbers of gnats are yearly bred in and near gardens, the aquatic larvæ having their home in some pond, tank, or butt, which serves as a receptacle for rain-water, they should be looked after while passing through this unwinged condition, when some of them may be killed. Curious, long-bodied, flexible creatures are these gnat larvæ, with a circular moveable apparatus at the tail, by means of which they draw in air occasionally as they rise to the surface. Watching our opportunity we may skim off scores of them in the act of breathing, though they will descend speedily if they have the chance. Then again, many may be destroyed at the period they are emerging in the winged state, their extrication from the pupa or chrysalis being a matter of peril, because they may easily be drowned in coming out of the water. They manage to poise themselves till the wings are dry, lifting up their legs and using the empty case as a sort of boat, it is easy then to plunge them under before they fly off. Also the parent gnat forms her eggs into a boat-like mass as she deposits them on the water; these, though small, may be detected and removed. Some of the smaller gnats or midges are said to attack us sometimes when the weather is hot.

I should add that many supposed gnat-bites are really the effect of the insidious operations of the harvest bug, which, though called *Tetranychus autumnalis*, occurs also in the early summer, particularly amongst rows of Peas and Beans, and amongst Currants, Raspberries, &c. This bug or mite, which is akin to the detestable itch insect, transfers itself from the vegetables or shrubs to human beings who may happen to be near, and with rapid dexterity it buries itself under the skin. The irritation is very great, accompanied generally, but not always, by swelling, as with the gnat's bite. Of course the harvest bug attacks people in all parts of the body, and not merely in exposed places. It may be killed by the insertion of a fine needle, or the free rubbing in of sulphur ointment.—ENTOMOLOGIST.

### SHY-BEARING VINES: HOW TO MAKE THEM FRUITFUL.

I ENCLOSE a paper on the above subject, read by Mr. Parker of the Tyneville Vineries at the first regular monthly meeting of the Society of Jersey Gardeners. This Society has recently been formed, and its objects are the same as those of the numerous Gardeners' Mutual Improvement Associations in the mother country—England. Already about two dozen of the principal gardeners of the island have joined the Society, although there has been but one meeting. Mr. H. Elliott, F.R.H.S., has been elected Chairman of the Society.—WM. SHAVE, *Hon. Sec.*

THIS subject is full of interest and also of great importance to gardeners in general, and Jersey gardeners in particular. Here in Jersey in many instances the one object is to grow good Grapes and plenty of them, but notwithstanding that every attention is given to the Vines during the growing season we often meet with cases in which the crop of fruit is far from what it ought to be when the vigour of the Vines is taken into consideration. I have seen Vines that at pruning time have looked likely to bear a fine crop of Grapes the following season, and they undoubtedly would

have done so if they had been pruned in the right way, but the fact is in nine cases out of every ten all Vines are pruned alike whether they need it or not, and the result is a light crop of fruit year after year from Vines that are capable of bearing a full crop of Grapes, and the Vines are condemned as shy bearers; the gardener gets the order to go whether he deserves it or not. I may remark that the gardener often has not a fair chance of acquiring a knowledge of the Vines under his charge, for if he does not produce a fine crop of fruit during his first season in his situation it is seldom that he has the opportunity of trying what he can do another year. It is a well known fact that the more a man has to do with a set of Vines the better he is able to manage them. It is equally well known that when there is frequent change in the management of Vines the results are always unsatisfactory, and often disastrous. I know quite well that some varieties of Vines are considered shy bearers even by the best Grape growers, but I doubt very much if all things are conducive to good Grape growing, if any of them are such, provided they are properly treated when pruned, and otherwise well attended to. I do not wish to convey the impression that the proper pruning of Vines counts for everything in producing fine crops of fruit. When Vines have by long neglect and frequent changes in their management relapsed into a bad state, it requires something more than judicious pruning to render them fruitful again. I have had to grow Grapes under the greatest difficulties. At the same time I have had the best of opportunities of informing myself on the question of shy-bearing Vines, and the conclusions that I have arrived at are these, that if Vines make good wood each year they make good leaves, and if they make good leaves they make good buds, and having made good buds it is simply a question of proper pruning to induce them to show a good crop of fruit. My object, therefore, is to give my experience of the various ways of pruning Vines in order to make them fruitful.

Most varieties of Vines fruit freely when closely spur-pruned, provided their roots are in good borders, not too deep; but there are exceptions to this rule. Even that grand old free-bearing variety Black Hamburg when grown on the single-rod system will often fail to show a good crop of fruit when its roots are deep in the ground, though it seldom fails to fruit freely when grown on the extension system, no matter how deep its roots may be. There are other sorts that seldom fruit freely when closely spur-pruned, no matter how well they are otherwise attended to.

It will not be necessary for me to give a list of all the varieties that require special treatment at pruning time. Three examples will suffice. I will first draw attention to that well known and truly grand-looking Grape when well grown, Gros Guillaume, which is perhaps better known by many gardeners under the name of Barbarossa. This variety seldom fruits well when grown on the single rod and close spur-pruned, except when planted in an inside border not too deep. Even then the back buds often fail to show fruit in seasons following a close wet summer; therefore in order to be sure of a crop of fruit from this Vine short spur-pruning should not be relied on except in exceptional cases, but long spur-pruning should be resorted to, or, what is better still, fruit on the short rod system. The short rod system of fruiting the Vine is not so well understood or practised as it ought to be with some Vines; if it were we should hear much less about shy-bearing Vines than we do at the present time. I will describe the three ways of pruning above mentioned. In pruning on the short-spur system proper the side shoots or branches of the previous season's growth are at the time of pruning cut hard back to the last plump bud, not more than half an inch of wood being left each year. In adopting this style of pruning all Vines have a much neater appearance when dormant and at rest than when any other style of pruning is adopted; but neatness when dormant counts for very little if there is not a crop of Grapes at the right time, and in the right place too, the right place being on our own Vines.

In pruning on the long-spur system the practice is to leave three or four buds on each spur each season. Some growers, however, modify this somewhat by leaving three or four buds on half the spurs, and pruning the other half to the last plump bud; but even then this variety will sometimes fail to show a single bunch of fruit on some of the Vines, and even if it fruited well by being thus pruned the great drawback to the system is that in a few years' time the spurs get so long that they are almost unmanageable; therefore I think the short-rod system of pruning and fruiting this Vine is far preferable, as it seldom fails to fruit well when thus treated, provided that other things are conducive to good Grape growing.

The short-rod system of pruning the Vine differs from the two preceding ones materially, and at the same time I may say that it is the most certain way of securing a crop of Grapes from Vines that are at all doubtful bearers. When a Vine is taken in hand to prune on the short-rod system part of the laterals are cut off

close to the back bud in the same way as is done in short-spur pruning, but from three to five, according to the length of the main rod, of the best placed and strongest lateral shoots are left their full length, or nearly so, and are then tied to the main rod to produce the crop of fruit the following season. It is seldom that these one-year-old short rods fail to show a full crop of fruit even on Vines that are noted shy bearers, and very often they afford very fine bunches. In fact, if I was intent on producing large bunches of Grapes for exhibition, I should resort to this way of pruning even if the Vines that I had to work on were the freest bearers. When the short rods have fruited one season they are pruned hard back to the last bud nearest to the main rod, and a fresh lot are retained that have been grown from the buds that were pruned close in. When treated in this way Gros Guillaume, Golden Champion, Gros Maroc, and other noted shy-bearing Vines seldom fail to produce a fine crop of Grapes if otherwise well looked after.

When old Vines are in deep rich ground, such as we have in many parts of Jersey, they often, if at all neglected in watering in dry weather, extend their roots very deep in the subsoil. When such is the case, though they make fine leaves and good wood each year, they seldom produce fine crops of fruit if they are spur-pruned. In such cases I have generally found the long rod system by far the best for producing fine crops of fruit. It is, moreover, so simple that anyone who has any knowledge of Grape growing may adopt it. When this system is practised young canes are grown between the fruiting rods each year the full length of the rafters, and fruited the following year their full length. Many young gardeners of the present day will be disposed to think that young rods left so long would fail to break many of their buds, but such is not the case as a rule. I will give two examples from amongst many. When I took charge of the gardens at La Hougue Boîte the old Vines, through long neglect, were in as bad a state as they well could be, so I decided to get what I could off them the first year, and renew them on the long rod system. Having grown a young cane from each Vine the full length of the rafters, at pruning time I decided to leave three of them their full length, 20 feet, and prune the rest half way up the rafters. The three that were left full length broke all their buds but one, and produced 75 lbs. of good Grapes; in fact, they were the best fruit in the house. On taking charge of the vineries here I adopted the same plan as far as I could in one house to fill up some gaps, with quite as good results, other things being considered. One of the young rods grown last season, though only 17 feet long, showed this year sixty-three bunches, fifteen of which were left, and they were by far the best fruit in the house. In conclusion I may say that when young rods are run up from old Vines, if they are strong and well ripened, they will break their buds just as well as old ones the full length of the rafters, and also carry a full crop of fruit their entire length.

CALANTHES.

OF all midwinter flowering plants the Calanthes are my favourites. They may be grown during the summer in a greenhouse or cool house, but they cannot be flowered there, and unless a temperature of from 65° to 70° can be given them at the time they are producing their flower spikes they had better not be grown, as, no matter how fine the summer grown pseudo-bulbs may be, they will not flower satisfactorily in a low temperature. I proved that conclusively years ago, and at one time I was obliged to discontinue their culture for the want of heat; but that has been remedied, and they are as pleasing as ever. We need not go to extremes in culture to induce every pseudo-bulb to produce from two to four spikes from 2½ to 4 feet in length. All are charming, and for decoration, cut and uncut, they are absolutely unequalled in November, December, and the greater part of January. It takes the spikes a considerable time to open the flowers right up to the point, but the lower ones remain fresh long after the top ones are expanded, and if the plants are kept quite dry at the roots and in a dry atmosphere they will remain perfect longer than any other winter flower with which I am acquainted. They are fit associates for the best of Orchids, but they are much easier cultivated and flower with far more certainty than the majority of Orchids, and many who have neither the skill nor accommodation for them would succeed with Calanthes.

The soil should be kept moderately dry at the time the flower spikes begin to develop, and by the time these are half grown water must be entirely withheld from the roots. This will cause all the foliage to fall off, but that does not matter; indeed, it is the right process, and from then onwards no more water should be given to the roots. Sometimes when some of our pseudo-bulbs chanced to become wet from a drip from the roof after the foliage was gone the spikes have not developed so well as the totally dry ones. As soon as the flowers are over, which may be in January, the plant must be kept dry still, either by laying the pots down on their side in a dry place or shaking the plant from the soil altogether. In both cases keep the pseudo-bulbs in a temperature from 50° to 60°, but towards the end of February or early in March attend to them for another year.

I have then tried various ways, but will only state the plan that answers best. This was to place a layer of sphagnum moss in the bottom of a cutting box, place the pseudo-bulbs upright and about 2 inches apart from each other on the top of this, and then pack more moss firmly between them, but not more than half-way up the pseudo-bulb. They are then slightly watered and placed in a temperature of about 70°. The moss is merely kept moist, not saturated. In a short time the roots are emitted, and they soon push into the moss. The young growths which spring from the base soon appear after this, and when these are about 3 inches high the plants are taken from the moss and potted. I have tried them in 3-inch pots, and then transferred when ready to 6-inch or 7-inch pots. I have also potted them from the moss into the latter size, and of the two ways I prefer the last-named. One good pseudo-bulb is sufficient for a 6-inch pot, but a number may be placed into an 8-inch or 9-inch pot if desired, one-quarter filled with drainage. The potting material should consist of peat, loam, and charcoal, with a little horse droppings, the small material sifted and removed from this as much as possible, as the fleshy roots delight to penetrate a rough mixture. They will not thrive in a close, adhesive soil, and this accounts for many cases of failure amongst *Calanthes*. The material should be pressed firmly into the pots, and the pseudo-bulb must not be deeper than is sufficient to keep it quite firm. After potting, place them where the temperature is from 65° to 70°, and do not give any water until the roots are penetrating the soil. This is one of the main secrets in securing a free and luxuriant first growth. I have known fine promising bulbs to be ruined by being watered too soon after potting. They may, however, be slightly syringed, but not sufficiently to saturate the soil. When once growth has begun freely they will be benefited by the most copious supplies of water, and in July, August, and September liquid manure may be given them twice weekly with advantage. They will succeed in any warm pit in summer, and they should not be heavily shaded at any time.—J. M.

#### CYPRIPEDIUM GERMINYANUM.

A HYBRID between *C. hirsutissimum* and *C. villosum*, very distinct amongst the numerous hybrid *Cypripediums* raised during recent years. The flowers are of good and excellent shape, the petals somewhat resembling *C. hirsutissimum* in colouring; the dorsal sepal is, however, green, with bold deep brownish stripes. The lip is like that of *C. villosum* in colour. The plant was shown by Mr. H. M. Pollett and Messrs. J. Veitch & Sons at the meeting of the Royal Horticultural Society on January 11th, when certificates were awarded by the Orchid Committee.

#### OUTDOOR FIGS.

"THE fresh fruit of the Fig is very agreeable," states Dr. Hogg in his "Vegetable Kingdom," page 676, "and many varieties are cultivated in this country for that purpose. In some parts of the coast of Sussex they grow freely and bear abundant crops as standards in the open air, but they are generally grown against walls and in fruit houses." We find this tree is about as generally grown as Vines, or rather Grapes, against walls in this country. There is mostly a tree or two in gardens against walls, showing what they are capable of in leaf production, but the fruit is not given to many to eat through the scantiness or uncertainty of its crops.

There seems something wrong in our management of the Fig. Grow it does splendidly, but it seems not to produce its fruit in nine seasons of ten in a full and satisfactory crop. True there are instances of its succeeding with little or no attention, whilst in others it makes a grand display of leaves and somewhat profuse array of fruit that do not remain long enough to become fleshy. Indeed many that have or had Fig trees are little acquainted with its fruit in a fresh state as "a wholesome and agreeable" one, not to mention the nutritive value, which from forming "great part of the food of certain peoples of Africa, and even the peasantry of some parts of Italy and Spain," must be considerable. This paucity of a most desirable fruit in a generality of desserts is much to be regretted, as pectoral ailments are a peculiarity of the British climate, especially of the feebler sex, and demulcent as well as emollient properties give this fruit a peculiar fitness as a dietary in

FIG. 12.—CYPRIPEDIUM GERMINYANUM.

highly civilised communities. Apart from these considerations dishes of Figs, fresh, ripe, and bursting their skins with lusciousness, are most welcome, if for nothing less than affording variety at dessert. As they, however, are generally grown, this seems extremely uncertain of accomplishment for taking the trees, as they obtain not as many dishes of fruit (and it only takes six fruits of the larger kinds to make a full sized one) are forthcoming in a season as trees. This is mostly attributed to the climate, which seems to be invariably at fault whenever an excuse has to be made or a difficulty arises in giving a satisfactory explanation of crop failures. Climate is no doubt an important factor—indeed the first consideration in the cultivation of exotic fruits, particularly those from "sunnier climes," but it is not everything, and it is difficult to account for a tree proving sterile in one soil whilst fruitful in another.

The Fig is a fruit of undeniable wholesomeness. Ripe fresh Figs are always dear, and that is admittance of appreciation as well as a proof of scarcity. This must arise from cost or difficulty of production but in what particular respect is conjectural, as with a fair amount of means and care in culture the Fig can be produced as certainly and as profitably as any other fruit. The Fig as a hardy fruit may never become so popular and common as Apples, but there is no reason why it should not be available in a fresh state. We read that it is a native of the East—the oldest historical tree—and so conclude it is tender, much tenderer than it really is, and not only that, but set to cultivating it on preconceived notions of its roasting heat requirements and unsuitability consequently to our dull, cold, moisture-laden, murky climate. It

is not hardy, that everybody knows, as the first severe winter cuts it off the ground. This is a great drawback where it happens, one it is well to know. Protection must be given in most places for its growths in winter, in order to safety and a crop of Figs, those forgetting to come all the same in a majority of seasons in anything like remunerative quantity of the space occupied and labour entailed. There are, however, examples to the contrary. In some places Figs will grow and fruit satisfactorily without any trouble. This is rare. I have not seen a Fig tree growing luxuriantly and fruitful at the same time. This is equally true of those grown under glass as outside; indeed, I have never seen a Fig tree in the rich soil of gardens that was other than a waste of soil and space, particularly where the roots had breadth and depth of soil practically unlimited to roam in, the branches being as carefully restricted as the roots had liberty. In paved yards, as in loose fruit borders, they may be seen growing luxuriantly only to cast the incipient fruit untimely; in fact, Figs seem to produce fruit only where its order the Nettles usually do—viz., near dwellings, and in banks in which nitrates form most abundantly. These seem essential to its health, yet vigour of growth does not always culminate in fruit, but generally the reverse. Still, these nitrates appear an essential of its existence, for when grown in pots the trees become enfeebled after the nitrates formed in compost heaps and used for potting are abstracted, but in fresh turf and a decomposing bed of leaves they are sustained in healthy fruitful vigour. Figs are most fruitful when they grow stoutly, and are influenced in fertility by the soluble silica or lime in the soil. The former appears in some soils to supply plants with a substitute for lime and *vice versâ*, but apart from this Figs attain their highest degree of fruitfulness in soil of a calcareous nature. These, however, are not silicious, yet it obtains in large proportions in the disintegrated surface layer or deposit of soil over limestone and chalk. I do not know the formation on which the Fig thrives as a standard in Sussex, but wherever I have seen the Fig thriving and fruiting satisfactorily, as well as being hardy, it has been near buildings, and always where the *débris* of an old building had entered into the composition or been used as drainage, and so forming a stratum of silicious and calcareous matter. These (old mortar rubbish) form nitrate of lime when exposed to the air, and there is reason to know that bacteria form nitrate out of lime in the soil, so that this substance is obtained in one way or other by the Fig, either when planted against a wall, or more properly at the foot of a building, and in such positions the Fig always is fruitful when not subject to hard pruning, so as to cause it to make sappy growth. Limestone exerts a powerful influence on both the hardiness and fruitfulness of the Fig. In loose open rich soil, as well as in cold and wet clays, it is tender; in calcareous soils it grows harder, more firm in the wood, stouter, shorter jointed, with smaller but more leathery leaves and fruits at every joint. Marl seems to suit it well, which contains most soluble silica of any soil, and oxides of iron and alumina also, along with good percentages of phosphoric and sulphuric acids. The climatic conditions must, of course, be favourable, still soil conditions enable a plant to contend with disadvantages of climate in a remarkable degree, and in none more than the Fig. Its capriciousness in fruiting is due in a great measure to planting in soil too rich and deep, and in its not being of uniform or little fluctuating in moisture as obtains with the limestone and chalk formations, which naturally well drained are highly retentive of moisture.

What I simply wished to relate was the fruiting of the Fig as a bush or standard with no more shelter than that of a low wall, which is much overtopped in Hertfordshire. The cases that have come under my notice are only three, but there are no doubt many others in which the Fig would thrive as a standard or bush with no more protection than that of walls, such as obtains in this case in St. Albans by the low ones dividing the grounds of villa and other residences. In one instance the trees have not failed to ripen a full crop for twenty-seven years, and are scarcely pruned at all, merely having the old wood cut out, and irregular growths shortened.—G. ABBEY.

### FRUIT AT DRAYCOT MANOR.

ONCE during the summer I make an effort to visit my old friend, the gardener at Draycot, Chippenham, in each year to see his Grapes, which have been previously referred to in the *Journal of Horticulture*. Not because of the extent of the space given up to Vines am I interested, but rather in the unorthodox system of culture practised. When previously noted in these pages, it came under the heading of "Narrow Vine Borders," and at the time stimulated several correspondents to give their opinion and experience in the matter. The first border provided was only of small size—namely, 2 feet in width, and about 12 inches deep,

this carrying them over the second year. In the third year 2 feet more soil in width was added in about the same depth, drainage provided took the form of a few broken bricks in a thin layer. Soil space is still further augmented this year in about the same or less proportion.

That the provision made is satisfying to the Vines is demonstrated by their health and vigour, and the perfect finish of the Grapes, which are fitted for competition in first class company, where they figured conspicuously in some few exhibitions last year. This year's results are even more gratifying than any previous, the bunches being larger as well as berries, and the colour superb, both Black Hamburgs and Madresfield Court, with which the house is mostly occupied. A Vine of Gros Colman has medium-sized bunches, the berries promising to swell to an unusually large size. Another of the seldom seen Strawberry Grape is peculiar on account of the scent which pervades the air of the house, particularly in early morning. This has a place only by request, as it is not profitable, bunches or berries never extending beyond medium size. Mr. Gibson is an advocate of free and abundant ventilation as recently advanced by Mr. Iggulden, and this, too, earlier than is adopted by many growers, and there is no doubt but that these conditions contribute very greatly to perfect colouring as well as preventing splitting, so common with Madresfield. Not a single berry has cracked with this sort here, although it has the same amount of water as the rest, and from the moderate depth of soil it is readily understood that it is required often, or given about once a week.

Manure only in liquid form is applied, and in weak doses, a tank connected with the garden closet being drawn upon for the purpose, and no mulching is used. Although disagreeable in use there can be no doubt in the highly fertilising powers of this application, but it requires to be used cautiously. Muscats, Lady Downe's, Alnwick Seedling, and Alicante fill another house; the Alnwick, growing in a large pot, carries three perfectly set and useful bunches. Muscat of Alexandria has a rather heavy crop of nicely furnished bunches, and Lady Downe's above the average in every way.

A large house formerly used as a stove is just being completed in arrangement for Vine growing to meet the increased demand for Grapes. The permanent rods are intended to be grown under the same rules as carried out so successfully in the adjoining house; supernumerary canes are to be planted at once in a central brick pit that will be allowed to fruit at once. These are now growing in pots, and the early August planting of these will insure their partial establishment before winter arrives and the leaves fall.

The outdoor Strawberry crop has been exceedingly good, several hundredweights being disposed of beyond the home supply. King of the Earlies, Noble, and The Captain are among the varieties grown, and though much cannot be said for the quality of Princess Frederic William, it is still retained for supplying an early dish, this being two or three days earlier than Noble. Loxford Hall is a considerable favourite, fruits on yearling plants assuming enormous proportions and first-rate quality, and being firm-fleshed is a good traveller. It is the neatest grower I have seen, requiring less room than most sorts in planting. Mr. Gibson intends his future plantations of this variety to be not more than a foot apart each way. Young plants are earlier in fruiting than older ones, and when two years or three year; old they are among the best for late use. The plants I saw only a few days since were in full bearing. Red Currants and Gooseberries on walls were laden with unusually large sized clusters and berries, the former mostly of the Cherry, Grape, and Raby Castle kinds; the latter of the Red Warrington. Carter's Champion and Baldwin are the only kinds of Black Currants grown; these, unlike the old variety, do not shed their fruit directly they are ripe. The Baldwin is a most distinct grower, the leaves being much larger and pale green coloured, the berries growing very large in size. Baumforth Seedling is the favourite Raspberry, and is superior in flavour to Carter's Prolific, bearing berries quite as large if not larger, though unlike it requires staking, which is the economic feature of Carter's Prolific. Plums are a light or medium crop, also Peaches; of these latter a tree, probably Early Beatrice, ripened its first fruit the 7th of July, which clearly indicates the warm nature of the soil and surroundings. The soil is of a light sandy loam on gravel subsoil, and wall trees require watering often during sunny weather, or flagging ensues. The garden is in the highest state of fertility from the abundant applications of manure, both solid and liquid. Apple crops are very fair, but Pears somewhat thin; but this deficiency will be made up perhaps in the size of the fruits.

Tomatoes under glass are disease-stricken, and those in the open do not grow and fruit as in former years from the inclement nature of the season. This latter element, too, has proved a fertile cause for insect pests, attacks which with many fruit crops has been very troublesome and abundant. One item I have omitted in

the preparation of Strawberry runners. Instead of layering in pots or turves they are secured as early as possible, and dibbled into a prepared compost in the open on a hard bottom. They are never shaded, but watered freely and frequently, and this induces a sturdy growth, and they are easily transferred to their permanent positions either in the open or pots, and are then not in the way of, or trampled on by fruit pickers.—VISITOR.

POPULAR FERNS.

THE gold medal group of Ferns shown by Messrs. J. Veitch & Sons, Chelsea, possessed remarkable interest, not only for the number represented, but for the distinct and elegant characters possessed by the majority. A considerable proportion of those shown have been introduced by the firm, and the following list includes the Ferns obtained direct from their own collectors, raised or placed in commerce from 1862 to 1890 :—

ROYAL HORTICULTURAL SOCIETY.

JULY 22ND.

SCIENTIFIC COMMITTEE.—Present: Mr. Morris (in the chair), Professor Church, Professor H. Marshall Ward, Mr. Paseoe, Mr. Blandford, Dr. Müller, Dr. Masters, Rev. G. Henslow (Hon. Sec.), and Mr. F. R. Williams (visitor).

*Oak-staves, Perforated.*—Mr. Blandford has made an exhaustive report on the wood perforated by Trypodendron Quercus, *Eichhoff*, brought to the last meeting, which will be published in the "Kew Bulletin." It appears that the cylindrical holes run transversely through the wood, having ramifying galleries at right angles; several of the tubes were empty, others filled with debris, which might be easily ejected by the beer. He discovered one hole which had been artificially plugged, as well as others hidden by the iron bands, conclusively proving that the beetles (several specimens of which were found) must have been in the wood before it was made into casks. Mr. Morris added that he had received an independent corroboration from the officers of the Indian Store Department that the wood was unsound previous to being used for casks. A vote of thanks for his investigations was given to Mr. Blandford.

*Carnations Attacked by Tipula.*—Mr. Blandford confirmed his suspicion that it was a species of Tipula which has ruined so many Carnations during the present season.

*Nest of Weaver Bird from Paraguay.*—Prof. H. Marshall Ward exhibited a nest made of the mycelium of some fungus. It was in the sclerotoid condition formerly known as rhizomorpha. Mr. Morris observed that the Banana birds of Jamaica made a similar use of rhizomorpha. It is peculiar in being arboreal, and is found under the bark. It is common in the territories of the Argentine Republic.

*Rhizomorpha of Agaricus melleus.*—Mr. Morris exhibited a specimen of this mycelium received from Mr. F. C. Fennell of Westgate, Wakefield. It was found at a depth of 70 yards in a coal mine. It appears to be particularly destructive to props and timber made of the Spruce Fir, but not to the Larch, this proving to be the best for subterranean supports, though more expensive.

*Cherry-Laurel Fruits Poisonous to Peafowl.*—Mr. Morris recorded the fact that some peafowls at Kew had lately died, their crops being found to be full of the fruit of the common Laurel. As the pulp is harmless it was suggested that perhaps their death was due to prussic acid being developed from the kernels, though the presence of the stone appeared to negative that being the cause, otherwise it was difficult to account for it. This suggested to Mr. Morris the desirability of remarking upon the exceedingly objectionable habit of visitors throwing fragments of cigarettes to the swans and other fowl at Kew; nicotine, it need hardly be observed, being a deadly poison.

*Laburnum as a Poison.*—Dr. Müller observed that although the Laburnum appears to be exceedingly poisonous in all parts of the tree, the roots, flowers and seeds having all been known to have poisoned human beings, yet rabbits will eat the bark with impunity.

*Phylloxera at Chiswick.*—Mr. Morris called the attention of the Scientific Committee to the appearance of this disease, and invited the members to pronounce as to the treatment of it; as it is undoubtedly present in one viney in the Chiswick gardens, containing young plants from Hungary. It was first observed on a single plant at one corner, but both root and leaf galls have been found on another plant at the other end. Although the presence of the phylloxera would suggest the opportunity for a careful series of investigations and experiments, yet

it was the opinion of the Committee that it was far too serious a matter, and they were unanimous in counselling instant destruction of everything growing in the house. The following process was suggested and will be carried out at once:—1, Syringing the whole of the interior of the fabric as well as the ground and Vines with water, then to burn sulphur, the presence of the water being desirable in order to absorb the sulphurous acid gas; this process is to be repeated. 2, To burn every part of every plant as well as to calcine the soil thoroughly. 3, To remove and burn all rotten or defective wood that may be in the house; and lastly, 4, to have the whole of the woodwork well scraped and repainted. It is hoped that these suggestions will be useful and followed out elsewhere should the phylloxera appear in other gardens.

*Vines, Atrophied Foliage of.*—Mr. Morris showed specimens of a very common condition of Vines, several occurring in the house above mentioned, in which the lateral shoots were dwarfed, the leaves being only about an inch across. It has been a source of great trouble to Vine growers for many years. Dr. M. Ward undertook to examine into the cause.

*Tomatoes Diseased.*—Mr. Morris showed specimens from the gardens at Chiswick attacked by Phytophthora. As this appears to infect the Tomatoes when growing in the open, it is suggested that whenever possible they should be at once transferred indoors to a warmer and drier atmosphere, Tomatoes requiring a warmer climate than the average English summer to ripen properly. This treatment appears to invigorate them, and renders them not only less susceptible to the disease, but has been known to check the further growth of the fungus at once.

*Heteræismal Fungi.*—The following communication was received from Mr. Plowright, accompanied by specimens:—

*Puccinia Festuceæ, n. sp.*—This species occurs on *Festuca ovina* and *F. duriuscula*. The æcidiospores occur on the common Honeysuckle. After a long series of unsuccessful cultures upon various grasses and other plants, extending over a period of eight years, I was this year induced to try the effect of placing the spores of *Æcidium periclymeni* on *Festuca duriuscula* and *ovina*. In both cultures the Uredo was produced. I also succeeded in producing the *Æcidium* on *Lonicera periclymenum* from the germinating teleutospores. The last named are in shape somewhat similar to those of *P. coronata*, with which species they have previously been confounded. The material from which the *Æcidium* was produced is on the table, as well as the artificially produced uredospores and the æcidiospores from which they were produced.

*Puccinia Agrostidis, n. sp.*—The æcidiospores of this species have long been known under the name of *Æ. Aquilegiæ*. Mr. J. H. A. Jenner was kind enough last August to conduct me to a secluded spot in Abbott Wood, near Lewes, where he had for several years previously found the *Æcidium* on the wild Columbine. We carefully examined the grasses in the vicinity, and came to the conclusion that the teleutospores probably occurred on *Agrostis alba*. Material was brought home to Lynn, and from it this year the *Æcidium* was produced on *Aquilegia vulgaris*. In May of this year Mr. H. T. Soppitt conducted me to a spot on the east shore of Lake Windermere where the *Æcidium Aquilegiæ* occurs. Specimens were obtained from which both Mr. Soppitt and myself produced the uredospores on *Agrostis alba* and *vulgaris*. The material used for these cultures is on the table.

*Puccinia Digraphidis, Soppitt.*—Mr. Soppitt's discovery that the *Æcidium* on Lily of the Valley is connected with a *Puccinia* on *Phalaris arundinacea* is very interesting—the more so when we remember that this Grass is known to be the host plant of several other *Pucciniæ*—viz., *P. sessilis*, which has its æcidiospores on *Allium ursinum*, *P. Phalaridis*—which has its æcidiospores on *Arum*, *P. maculatum*, and a form of *P. coronata*—the life-history of which is at present uncertain. The Lily of the Valley, on which I produced the *Æcidium* from *P. Digraphidis*, has been growing in my garden at King's Lynn since the year 1879, and has hitherto been free from any *Æcidium*; but eight days after the germinating æcidiospores of *P. Digraphidis* were applied to it the Lily leaves began to show signs of the presence of the parasite, which in due course developed into the perfect *Æcidium*. This culture was done at the request of Mr. Soppitt, in order that his discovery of host plant bearing the teleutospores of the Lily of the Valley *Æcidium* might be confirmed by an independent observer. The *Æcidium* produced and the material used for producing it are on the table.

*Uromyces maritima, Row.*—The life history of the *Æcidium* on *Glaux maritima* was unknown until the present year. In August last Mr. Peake, jun., of Hull, was kind enough to conduct me to only known British locality for this *Æcidium*—on the banks of the Humber. From an examination of the surrounding plants I came to the conclusion that the *Æcidium* on *Glaux* was due to the *Uromyces* on *Scirpus maritimus*. A supply of the *Uromyces* was collected, and this spring applied to *Glaux maritima* in my garden at King's Lynn. In due course the æcidiospores were produced; these in turn were applied to healthy plants of *Scirpus maritimus* and the Uredo produced. The specimens used in their culture are exhibited.

*Æcidium on Black Currant Leaves.*—This fungus was found by my friend the Rev. Canon Du Port, on the Norfolk Broads, in June, 1890. Its life history is at present unknown, although I have visited the spot, and hope to be able to work it out from material collected. Whether it be the same species as occurs on Gooseberry pretty commonly in various parts of the country experimental research alone can determine.

*Melampsora vernalis on Saxifraga granulata.*—This fungus, which is doubtless the teleutospore form of the so-called *Cæoma Saxifrageæ*, was found by Mr. James Taylor of Clarkfarquhar, is also exhibited.

*Melampsora on Salix repens.*—The uredospores of this were this year produced on a plant of *S. repens*, that has been growing for three or four years in my garden, by applying to it the spores of *Cæoma Orchidis*. It is, probably a distinct and undescribed species, as no effect was produced on *S. caprea* and *viminalis* by the *Cæoma* spores. *C. Orchidis* has been the subject of many cultures made by me during the past nine years. The infecting material and the uredo produced are exhibited.

*Potato Disease.*—It would be highly desirable if some simple experiments could be conducted this year. The long-continued rains will doubtless induce the disease, and as such experiments could very easily be made it seems a pity the opportunity should be let slip. The effect of high moulding of alternate rows of some variety fairly susceptible is all that is required to show the protective influence of an efficient earth covering on the tubers; but the recent experiments in France and in America showing how powerful are the restraining influence of copper dressings applied to the foliage of the plants upon the development of the *Phytophthora* certainly ought to be tried. Now that we know the mycelium of the *Phytophthora* is localised, and that it does not extend "down the stems and along the roots," it is obvious that the spread of the disease takes place only by the enormously prodigious production of the conidia, hence it follows that any agent which can arrest this development, and also sterilise such conidia as may alight upon the healthy foliage, must have a powerful influence for good in checking the spread of the disease. The power that copper dressings have limiting the spread of the *Peronospora* on the Vine has been known in France for many years." A vote of thanks was given to Mr. Plowright for his valuable communication.

In accordance with Mr. Plowright's suggestion a sub-Committee was appointed consisting of Dr. M. T. Masters, Mr. C. B. Plowright, and Rev. G. Henslow (with power to add to their number) to carry out investigations at Chiswick upon the value of high-moulding, as well as of the use of sulphate of copper and sulphate of iron in preventing or arresting the Potato disease. Dr. Masters reminded the Committee that most valuable results were almost accidentally obtained in 1888, when of two rows most deplorably attacked by *Phytophthora* one was earthed up with but little hope of its being any use to protect the tubers. The results, however, were most astonishing, as follows\* :—"Out of fifty tubers taken from the row moulded in the ordinary way thirteen were found diseased, or 26 per cent. Out of fifty taken from the high-moulded row five only were noted as diseased, or 10 per cent. Subsequently twenty-five tubers from each row were put aside for future examination. Of the twenty-five taken from the row earthed up in the usual way thirteen were diseased and twelve sound. Of the twenty-five taken from the row earthed up in the Jensenian manner on August 10th, when the haulms of both rows appeared to be equally rotten with disease, all the tubers were sound."

EVENTS OF THE WEEK.—To-day (Thursday) the Royal Horticultural Society's Floral Committee will meet in the Chiswick Gardens at 2 P.M. On Friday, August 1st, the B. S. Williams Memorial Committee meet in the offices of the Gardeners' Benevolent Institution, 50, Parliament Street, Westminster; and the Gardeners' Orphan Fund Committee meet at the Horticultural Club, Hotel Windsor, at 6 P.M. on the same day. On Saturday, August 2nd, the Southampton Show will open, continuing until Monday night. On Tuesday, August 5th, the Leicester Summer Show will be held in the Abbey Park; and the British Fruit Growers' Association will hold a Conference in the Show ground on the same day, James Ellis, Esq., M.P., in the chair.

— THE WEATHER.—In the Metropolitan district the weather has been much more settled and favourable during the past week than we have had for some time. Many have taken advantage of the first opportunity to get in their hay. Flower beds and borders are brightening up a little, and it seems possible that a glimpse of summer may now be obtained.

— A MEETING of the BRITISH FRUIT GROWERS' ASSOCIATION was held last Thursday in the Horticultural Club room, T. Francis Rivers, Esq., in the chair. The principal business was concluding arrangements for the Conferences at Leicester, the Crystal Palace, and Brighton, on August 5th, September 5th, and September 11th respectively. It was stated that the Exhibition at Leicester is expected to be a large one, and with fine weather the attendance is always good,

\* From "Gardeners' Chronicle," Nov. 17th, 1888, page 572.

Abbey Park being a popular place of resort. At Brighton the Conference will be held in the King's room at the Royal Pavilion. A most encouraging letter was read from Sir Edwin Saunders, and that gentleman was unanimously elected a Vice-President, together with W. B. Waterlow, Esq., Dr. S. Makovski, and W. H. (Bullock) Hall, Esq. Mr. L. Castle stated with regard to the proposed holiday trip by himself and Mr. Gordon in Ireland, that a large number of letters had been received offering suggestions as to the route to be taken, much of the information indicating that fruit is successfully grown in many districts, and that the crop this year is satisfactory.

— THE NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL EXCURSION.—The annual summer outing of the above Society's members and friends, under the guidance of Mr. W. Holmes, took place on Monday last, July 28th, and over eighty assembled at Paddington Station to journey by the 10 A.M. train to Reading. Walking to Caversham Bridge, the party proceeded thence in the steam launch "Fashion" down the river to Henley, where arrangements had been made for dining. After dinner the larger portion of the party returned to the launch and had an enjoyable trip down the river to Marlow, returning to Henley for tea, and then home *via* Reading. A few of the more ardent horticulturists climbed a considerable hill on the Berks side of the Thames and visited the delightful garden at Park Place, the residence of John Noble, Esq., and where for many years the accomplished gardener, Mr. Stanton, has worked with so much success. The views over the valley of the Thames, the picturesque town of Henley, with the finely wooded Chiltern Hundreds as a background, were exquisite, and the day being clear, a long stretch of country in the direction of Reading was visible.

— By the kindness of Mr. Robert Owen a still smaller portion of the party was enabled on the return to Henley to enjoy a ride through a charming district by the way of Marlow to Maidenhead. GREENLANDS, the residence of the Right Hon. W. H. Smith, a short distance below Henley, was first visited, and there, under the guidance of the excellent gardener (Mr. Perkins), a tour of that most interesting garden was commenced. Details of all that was seen cannot be given now, but mention must be made of the exceedingly fine Grapes, especially the Muscats and Madresfield Courts. Grand bunches, colouring well, and a fine crop, indicate the kind of cultivation they receive. The last-named variety we have never seen in better condition, and "cracking" gives no trouble, plenty of water at the roots of the Vines and liberal ventilation preventing any disaster of that character. Leaving Greenlands the drive through Marlow was delightful, then along the other side of the river to Maidenhead it was equally agreeable, and the journey by road concluded with a hurried inspection of Mr. Owen's large collections of Tuberos Begonias, seedling Chrysanthemums, and other plants. A quick run to Paddington from Maidenhead completed a pleasant day's outing, which had been favoured throughout by fine weather.

— ON some of the South and West England railway lines STATION GARDENS are often rendered extremely bright, and two of the companies treat their station masters very liberally in allowing them ground for cultivating. Some take up the ornamental side of gardening and render the stations florally attractive for a good portion of the year, others by growing fruit and vegetables secure a welcome addition to their salaries. At Merton Abbey station, on the line from Ludgate Hill to Wimbledon, there is a good example of what can be accomplished in the latter direction. Mr. Young, the station master there, devotes his 40 or 50 rods of ground at the side of the line to Strawberries, Red and Black Currants, and Gooseberries, with a few vegetables and Roses, and by careful attention in his spare time he succeeds in producing remarkably good fruit. Early Strawberries in particular on a warm bank are admirably grown, and would compare favourably with the best in the market. Mr. Young is enthusiastic and evidently derives both pleasure and profit from his little garden.

— A VARIED and extremely successful Show was held by the SURREY HORTICULTURAL SOCIETY on Wednesday and Thursday last week in the grounds attached to Casino House, Herne Hill, the residence of W. G. Gover, Esq. Three tents were filled with plants, flowers, fruit and vegetables, all of good quality throughout. Some of the principal prizetakers were Mr. J. Lambert, gardener to H. W. Segelcke, Esq., Elfindale Lodge, Herne Hill; Mr. W. Monk, gardener to G. R. Higgins, Esq., Eastlands, Dulwich; Mr. J. Day, Casino Gardens; Mr. W. Clark, gardener to W. Sopper, Esq., Eversley, Herne Hill; and Mr. Fullbrook, gardener to B. B. Baker, Esq., Palace Road, Streatham. Messrs. Laing & Sons, Forest Hill, had a handsome

non-competing group, one of the most effective we have seen this season.

— THE EALING GARDENERS' ASSOCIATION.—The members of this Association spent a pleasant day at the well-known establishment of Messrs. Sutton & Sons, Reading, on Monday last, July 28th. The party, numbering about ninety, inspected the trial grounds, replete just now with interest, seed warehouses, and nurseries. Messrs. Sutton entertained the members in a hospitable manner, and the visitors returned thoroughly satisfied.

— GARDENING APPOINTMENTS.—Mr. H. Elliott, late gardener at Mulgrave Castle, Whitby, has been appointed gardener to the Rt. Hon. Lord Hillingdon, The Wildernesse, Sevenoaks, and is succeeded at Mulgrave by Mr. James Corbett. Mr. A. J. Brown, late gardener at Bear Park, Aysgarth, Yorks, has been appointed gardener and bailiff to the School of Handicraft, Chertsey, Surrey. Mr. George Groves, foreman at Rangemore Gardens, Burton-on-Trent, has been appointed gardener to General Owen Williams, Temple House, Great Marlow, Bucks.

— SELECT CARNATIONS AND PICOTEES.—In reply to Mr. Robert Sydenham (page 76) respecting my paper on the Carnation, I desire to say that from circumstances over which I had no control, I have been prevented from giving any trial to the new varieties of the past two seasons. Those named are well known as good for almost all growers of the Carnation. No list of Picotees was given, as the paper referred more particularly to Carnations.—D. COOPER.

— LANTON'S NOBLE STRAWBERRY.—I quite endorse all that Mr. McIndoe writes in favour of this variety as an early forcer. Here it succeeded splendidly, the fruits were perfect in shape, much larger and more highly coloured than those grown in the open air; in fact the fruits were phenomenal, and I was asked the question, "What is the variety?" As I had no complaints as to its flavour or its travelling qualities I conclude that these also were satisfactory. Our method of growing early Strawberries is to start them in a gentle bottom heat afforded by leaves close to the glass, where they remain until after they have flowered and set, when they are removed into a rather moist, temperate house until the fruits begin colouring, and are then finished in a dry, warm, airy greenhouse.

— ALEXANDER PEACH.—It may, perhaps, interest your readers to learn that I began gathering this variety from the open wall on the 15th of this month. Medium sized fruits, beautifully coloured, juicy and good flavoured. Hale's Early, which follows, will not be ready for quite another fortnight. I consider Alexander the best early one we have, it is a good grower and crops well.—JOHN AUSTEN, *Witley Court*

— MARIE LOUISE VIOLETS.—I herewith send you a gathering of blooms of this variety from plants now making their growth, preparatory to being lifted in October and placed in frames. We always plant out the runners early in May, and usually commence picking in August. This year, however, the plants are unusually robust; they are flowering freely, and will continue doing so right on till next May. The whole bed is now well mulched with spent Mushroom manure, and receives a thorough drenching from the garden engine twice weekly. This treatment keeps them moist at the roots, and defies our old enemy red spider.—JOHN CRAWFORD, *Coddington Hall, Newark*. [The flowers sent were delightfully fresh and fragrant, also large and full.]

— A SCOTCH correspondent writes:—"I suppose you need not be told what UNSEASONABLE AND UNGENIAL WEATHER we have had and are still experiencing. We have had only two dry days since the 4th of May, but no twenty-four hours has been dry yet. It is impossible to get weeds killed, and crops are not progressing; Strawberries are not swelling and are rotting on the ground. Bees have had only two days in June and July that they increased in weight any. At present there is no prospect whatever of any honey. On July 22nd the thermometer stood at 63°, and the wind was a perfect hurricane, with a sinking barometer. We are in great need of sunshine with a higher temperature. Unless that comes there will be no honey from the Heather either. I hope, however, for all and everything concerned the weather will improve."

— FRUIT CROPS.—The present year cannot be called a good one for fruit, with the exception that Strawberries, Red and Black Currants, and Raspberries are good in this neighbourhood; but Gooseberries only a moderate crop. Apples and Pears are almost a failure, especially the former. Many of the orchard trees and pruned bushes have only a slight sprinkling of fruit. The varieties showing the best crops of

Apples are Dutch Codlin (good), Ribston Pippin, Northern Greening, King of the Pippins, and Baldwin. Of Pears the best crops are on Jargonelle, Williams' Bon Chrétien, Lammas, Ne Plus Meuris, Beurré Rance, and Brown Beurré. Apricots and Plums are scarce; of the latter Orleans and Victoria are the best, and those are on walls. Peaches and Nectarines are a fair crop. Nuts good. There was a plentiful supply of blossom on the standard pruned bush and wall trees, particularly Apricots and late Apples; but with 16° of frost when the former were in bloom, and wet weather when the Apples were flowering, little fruit followed. The caterpillar has been prevalent amongst the Apple trees, but I have seen small birds (blackcaps) working amongst the trees, and doubtless destroying many of the pests.—A. HARDING, *Orton Hall Gardens, North Hunts.*

— KENTISH FRUIT GROWERS AND FOREIGN COMPETITION.—

It has come to the knowledge of the Kent Fruit Growers' Association that a large consignment of French Black Currants, packed in the almost purely English class of packages, the half sieve, upon which was painted in the usual way the name of a well-known London salesman, has been forwarded to London. There was nothing on the half sieve to indicate the foreign origin, and the chief of the Customs at the port of arrival was asked to detain the fruit, which he did. Upon the Customs authorities being communicated with further, they replied that hitherto it had not been found necessary to detain any similar consignment, because the packages had not been considered to bear any marks to which exception could be taken. The case has been carefully considered by the Association, and the members are unanimously of opinion that some steps should be taken to ascertain if the Customs authorities are correct in their view, as if so there can be no guarantee that the fruit so packed will not be sold by the salesmen in London or other markets as an English product. It is stated that the one consignment under notice depreciated the price of English Black Currants to the extent of £3 per ton. Mr. W. W. Berry of Selling, a large fruit grower, said that he has been informed foreign fruit so packed, and in English baskets, has been imported, but with a small strip of cardboard labelled "French fruit" slipped under the sticks on the top of the baskets, for the purpose of complying with the terms of the Merchandise Marks Act. The Association has decided to take steps to bring the matter before Parliament.

THE FERN CONFERENCE.

THE following is the official list of awards made by the Judges at the Chiswick Fern Conference, July 22nd and 23rd.

*Medals.*—Gold to Messrs. W. & J. Birkenhead, and to Messrs. J. Veitch and Sons.

Silver-gilt Flora to Mr. H. B. May, to C. T. Druery, Esq., and a silver Flora to J. A. Whallett, Esq.

*Amateurs' Competition.*—The silver challenge cup, offered by N. N. Sherwood, Esq., for the best collection of hardy Ferns, was awarded to E. J. Lowe, Esq.

There was no competition for the cup offered by D. Morris, Esq., for hardy Filmy Ferns grown without heat.

*Certificates of Merit.*—*Athyrium filix-fœmina stellatum angustatum*, A. f.-f. *percristatum* J. S. Cousins, A. f.-f. *plumosum superbum*, from C. T. Druery, Esq.

*Blechnum spicant ramo-cristatum*, B. s. *concinnum*, B. s. *plumosum* (Airey), from C. T. Druery, Esq.

*Scolopendrium vulgare* var. *crispum* (Wills), from C. T. Druery, Esq.

*Trichomanes radicans* var. *crispum cristatum*, from E. J. Lowe, Esq., F.R.S.

*Adiantum Capillus-Veneris* var. *autumnale*, from E. J. Lowe, Esq., F.R.S.

*Nephrodium paleaceum pendens*, N. p. *cristatum globosum*, from E. J. Lowe, Esq., F.R.S.

*Aspidium angulare* vars. *plumosum foliosum*, *polydactylum variegatum*, *latifolium grandiceps*, *remoto-decurrens*, *divisilobum plumosum*, *flabellipinnulum*, *decompositum frondosum*, *plumosum coronare*, *divisilobum plumosum imbricatum*; *aculeatum* var. *pulcherrimum*, var. *Abbottæ*, from E. J. Lowe, Esq.

A. a. d. p. *Baldwinii*, from J. L. Baldwin, Esq.

*Nephrodium spinulosum* var. *specabile*, from E. J. Lowe, Esq.

*Aspidium aculeatum hybridum* and *Nepos*, from E. J. Lowe, Esq.

*Scolopendrium vulgare* (*undulatum*) *Synthesina*, from E. J. Lowe, Esq.

*Aspidium angulare* (*plumosum*) *plumosissimum*, from E. J. Lowe, Esq.

*Scolopendrium vulgare undulatum muricale spirale*, S. *crispum reflexum*, S. c. *grandiceps*, S. c. *Cowburnii*, S. c. *robustum*, S. c. *augustum*, S. *variegatum aureolum*, S. v. *luminare*, S. *projectum princeps*, S. p. *capitatum*, S. *perforatum rosetta*, S. *inaequale cristatum pericallis*, S. *ramosum Alexandræ*, from E. J. Lowe, Esq.

*Asplenium filix-fœmina cruciatum columnare*, A. *calomelanos*, A. *Victoria*, A. *gracile*, A. *uncum cruciatum*, A. *cristatum magnificum*, A. *grandiceps coronare*, from E. J. Lowe, Esq.

*Todea pellucida ferulaceum*, from Messrs. J. Veitch & Sons.  
*Pteris serrulata cristata parvula*, from Messrs. J. Veitch & Sons.  
*Scolopendrium crispum fimbriatum lutescens*, S. *grandiceps fimbriatum*, S. *crispum fimbriatum cristatum*, from H. Stansfield & Co.  
*Gymnogramma chrysophylla* var. *grandiceps superba*, from Mr. H. B. May.  
*Pteris aquilina depauperatum grandiceps pendens*, from Messrs. W. & J. Birkenhead.  
*Athyrium filix-fœmina setigerum percristatum*, and A. f.-f. *Frizilliae coronare*, from Messrs. W. & J. Birkenhead.  
*Adiantum manuatum*, from Messrs. W. & J. Birkenhead.  
*Polystichum angulare* var. *pulcherrimum* (Wills), from C. T. Druery, Esq., F.L.S.  
*Lastrea montana* var. *cristata gracile*, from C. T. Druery, Esq., F.L.S.  
*Dicksonia* (hybrid) *Lathamii*, from Mr. W. B. Latham.

PACHIRA INSIGNIS.

FLOWERS of this remarkable tree were shown at one of the Royal Horticultural Society's meetings recently, and so seldom are they seen outside botanic gardens that they attracted much attention. The genus *Pachira* is a relative of the Baobab, *Adansonia*, and a member of the natural order Bombaceæ, by some ranked as a section of the Malvaceæ. There are several species natives of tropical South America, and distinguished by great size of their flowers, with dense bunches of stamens with the long filaments deep red, and forming the most conspicuous portion of the flower.

*Pachira insignis*, also known as *Carolinea insignis*, is a handsome tree with deeply divided leaves and pale red flowers, with long spreading divisions. The stamens bearing red filament and lighter, nearly white anther, contrasting well with the other portions of the flower. The tree is found in Martinique and some other West Indian islands. It also grows in the South American mainland in several districts. Under cultivation here it requires stove treatment and a spacious house to see to advantage.

Other species of *Pachira*, such as *P. alba*, are valued for their inner bark, which is converted into cordage.

THE LEICESTER ABBEY PARK.

THIS fine park, embracing about seventy acres, is formed upon the site of what was formerly known as the "Abbey Meadows," a low-lying swampy piece of land adjoining the river Soar. It was laid out by the Corporation of Leicester from designs by Messrs. W. Barron & Son, and was opened to the public on the 29th day of May, 1882, by Their Royal Highnesses the Prince and Princess of Wales, Alderman H. T. Chambers being the then Mayor of Leicester. Mr. John Burns, the able Superintendent, was appointed to the position he now holds a considerable time before the park was opened, and during the eight years which have since then elapsed each successive season has seen additional alterations and improvements effected, until at the present time it is generally said by critics, well able to give an opinion on the subject, that there is no more beautiful park in the provinces, and that in its bedding arrangements and general keeping it is quite equal, if not superior, to the London parks.

In the original formation of the park materials were obtained for raising the ground level, and for the formation of extensive mounds and sloping banks, by widening the river bed, forming thereby a fine breadth of ornamental water dotted with islands; also by the formation in the centre of the park of a lake of considerable extent. The banks and mounds were thickly planted with shrubs, which for several seasons made little progress. During the last four or five years, however, the shrubs and trees have grown most luxuriantly owing to the depth and great fertility of the soil composing the banks, insomuch that although the park is near to the principal manufacturing portion of the town, and is bounded on three sides by large factories and lofty chimneys, these are almost entirely shut out from view, and visitors to the park unacquainted with the facts might readily suppose themselves to be a considerable distance from the town. One cause for this lies in the fact that Leicester is an essentially clean town, and that the principal manufactures carried on, not being of a nature requiring the consumption of large quantities of coal, like the heavier trades of other large towns, very little smoke is made, and the shrubs and trees have the bright and clean appearance which is usually only seen in country districts.

In making our tour of the park we start from the main entrance on the Abbey Park Road, the gates of which are of wrought iron finely ornamented, those forming the carriage entrance bearing the arms and monogram of the Prince of Wales, the Borough, the Mayor, and others. On each side of this entrance are lodges in the Tudor style of architecture covered with climbers

one being occupied by the Superintendent, and the other by his principal foreman and propagator. Taking the carriage road to the right we pass on the left a broad piece of well kept lawn

raised the immense quantities of bedding plants annually used, and a fine large Chrysanthemum house capable of housing satisfactorily some 1500 plants. This house was built a few years since by

FIG. 13.—PACHIRA INSIGNIS.

devoted to lawn tennis, and on the right another smaller breadth laid out as a bowling green. Also on the right, and adjoining this bowling green, are the glass houses, pits, and frames, where are

public subscription, from designs furnished by Mr. Burns. The roof is formed of a double span, the centre supported by light columns. No staging is provided, the interior of the house being

laid out as a garden with gravel walks and beds. The roof, sides, and columns are beautifully draped and festooned with climbers, amongst which *Cobœa scandens variegata* and a number of the best varieties of *Clematis* take a leading part. In a piece of fenced in ground adjoining a fine collection of *Chrysanthemums* are being grown for filling the structure in the autumn, most of them on the cutting down principle as advocated by Mr. Orchard.

Proceeding along the carriage drive immediately past the bowling green on the right, a broad walk leads past some well kept shrubberies and herbaceous borders. Amongst many other good plants broad patches of *Campanula carpatica* and its white variety are now very beautiful. On the opposite side of the river rise the ancient walls of the Abbey grounds, with the picturesque ruins in the background. The old Abbey is famous in history as having been the last resting place of Cardinal Wolsey. Much of the historical interest might be mentioned in connection with these fine ruins, but space will not here permit. They are now, and have been for many years past, occupied by Messrs. Warner of the Abbey Nurseries, who kindly offer every facility for visitors inspecting the same; but this notwithstanding, it seems a great pity that such a place of so much antiquity and historical fame should not ere this have been acquired by the town, and its grounds incorporated with the beautiful park of which from its contiguity it appears now to naturally form a part.

Further to the right, and in the extreme north-west corner of the park, bounded by the river and the Abbey Park Road, is a new botanical garden, now in course of formation by Mr. Burns, in which is already collected many alpine, medicinal, and officinal plants, all well and distinctly labelled, with their botanical and popular names. A number of young men students of botany meet here weekly with their instructor to study from the living plants. This garden, when completed and fully planted, promises to be one of the most interesting portions of the park.

Retracing our steps to the main carriage drive we have on the left a large breadth of lawn, having an ornamental rustic band stand in the centre, which on two nights a week is occupied by the Leicester Police Band. The lawn is encircled by a broad asphalt walk, on which are placed numbers of seats, with four large rustic summer houses at the cardinal points, affording shelter in case of storms, the whole bounded by a belt of shrubberies. A walk here leads off the main drive to the left, which takes us past a very large circular bed, the principal plants used in which are *Coleus Taylor's Pet*, *Alternanthera amabilis*, *Iresine Lindeni*, *Mesembryanthemum cordifolium variegatum*, *Pachyphyton Browni*, *Spergula pilifera aurea*, *Herniaria glabra*, and *Echeverias*. Immediately behind this bed is a fine healthy English Oak, planted by H.R.H. the Princess of Wales on the occasion of opening the park. This bed and Royal tree occupy a sheltered nook of lawn bounded on three sides by high banks of shrubs, with a belt of large *Fuchsias* at its base, amongst which some fine specimens of *F. fulgens* are conspicuous. A little further along this walk some flights of rustic stone steps lead up to a large mound, on the top of which is good artificial example of ruins, surmounted by a flagstaff, and surrounded by broad asphalted walks, from which fine views of the park are obtained. At the foot of this mound, on its western side, is the lake, dotted with numerous islands, which are well furnished with suitable trees, amongst which are a very fine collection of *Willows* obtained by Mr. Burns from France. In two places rustic wooden bridges are thrown across arms of the lake, which have a pretty effect as seen from the mound.

At the farther end of the lake is another raised plateau, on which is situated the pavilion, where refreshments are dispensed and shelter provided on a similar plan and scale to those in the principal London parks. Immediately below and in front of this plateau is situated the main portion of the bedding-out display, and which, as seen from the terrace, has a very beautiful effect. Along the slope of grass leading down from the terrace to the walk below is a chain pattern of small beds planted with variegated *Pelargonium Foster's Seedling*, a capital silver variegated sort, with rosy pink flowers; *Alternanthera* and *Lobelia King of the Blues*, a charming new blue, with large white centre and very compact habit. The plainness of this scroll of small beds is relieved by four larger beds, placed at regular intervals, and planted with a fleur de lis pattern as carpet beds. On the broad lawn fronting this are about sixty large beds forming corresponding geometrical designs, on each side a broad central walk running through the same. The planting of these large beds throughout is highly effective. A very attractive combination is some large circular beds of white-edged variegated *Pelargoniums*, the bed surfaced underneath and around them with the common *Cat Mint*. All the best bedding *Pelargoniums* are used, large beds of *Henry Jacoby* being especially effective. A broad walk runs entirely round the lawn, containing this principal

geometrical design of beds, and is flanked on the side farthest away from the pavilion by a single chain of very large beds, oblongs and circles alternately, which, being planted with bold and striking colours, form a very fitting background to the main bedding display. The four large oblong beds are each planted with *Gladioli* of sorts, and have a groundwork of *Violas*, blue, white, and yellow, in lines. The six circular beds are planted in pairs. The central pair are filled with *Merveille de Lyon Rose* in fine condition. The next pair are *Lilium lancifolium*, *Hyacinthus candicans*, *Lobelia cardinalis*, and a surfacing of the old *Melindris Verbena*. The outside pair are mixed *Verbenas*. At the back of these, looking to the left from the pavilion, is another very large carpet bed, circular in shape and surrounded by the broad gravel walk. The main feature of this bed is a large Maltese cross in *Iresines Lindeni* and *Herbsti*, filled in with shields and scrolls, which are richly and effectively planted.

Again, looking to the right from the pavilion, we have a broad walk leading to the sub-tropical ground, the formation of which is one of the later works of Mr. Burns, and is so well done as to have become one of the finest and most attractive features of the park. Traversing the walk leading thereto we notice on either side grand specimens, in large tubs; of *Agave mexicana* and *A. m. variegata*. Right in the centre of this garden is a very large raised bed planted entirely with a fine collection of succulent plants, most of them legibly and distinctly named, and their grotesque shapes are a never ending source of interest and amusement to visitors. The broad borders and beds surrounding are well filled with healthy looking plants in great variety, many of them usually considered as requiring constant stove treatment. A large bed of *Cannas* in the background has for its centre a good specimen of *New Zealand Flax (Phormium tenax)* which has recently flowered on a branching stem some 10 feet in height, and is now carrying numerous large seed pods. Very striking amongst the foliage plants is a large example of *Begonia plantanifolia*, also *Phormium atro-purpureum*, *Eurya latifolia variegata*, *Jacaranda mimosæfolia*, some immense specimens of *Ficus elastica*, and many others.

At the opposite end of the flower garden from the sub-tropical grounds, in an angle formed by the junction of several main walks, is a raised triangular bed of large size, containing a large collection of rock and alpine plants, in healthy patches, most of them distinctly named, and the whole in excellent order and condition. Returning by the eastern side of the park we have long winding walks and immense breadths of well kept lawns, backed by broad belts of shrubs. It is on this side that the great summer flower show and gala is held, which mainly owing to the energy and tact of Mr. Burns, who is the Secretary and Curator, has for several years past been a great success.

Returning again to the river, which is on the opposite or western side of the park, we find a broad path running along the river bank the entire length of the park, with seats conveniently arranged at close intervals and a broad belt of lawn on each side. The side sloping down to the river's edge is very convenient for anglers, the other side is backed by an herbaceous border and belt of shrubs; an avenue of deciduous trees, *Planes*, *Limes*, and others overhangs the walk, being planted in the turf, thus forming a charming promenade nearly half a mile in length, with the old abbey walls, grounds, and ruins in the foreground across the water, to add a tinge of romance to the situation. As years roll on, and the overhanging trees become larger, this walk will be greatly appreciated by the young men and maidens of Leicester as an enjoyable promenade on which to tell over and over again the old, old story.

Adjoining to the river bank, but on the park side of the shrubbery bounding the same, is a large breadth of ground planted with *H.P. Roses*, very strong, and now producing a grand lot of flowers. All have large bold labels, the names upon which are easily read from a distance, and the rosery is therefore doubly interesting to visitors. One of the most commendable features in the management of this excellent park is the system of labelling legibly and distinctly with the botanical and popular names in most cases, and in no instance did I detect a case of misspelling, a point upon which Mr. Burns is very particular, as he says he has a horror of misspelt labels.

In conclusion, I cannot speak too highly of the excellent order and keeping of the park throughout, reflecting, as it does at every point, the ability and tact of the Superintendent, in which he appears to be ably seconded and supported by his foreman Mr. Burton. Mr. Burns has also proved himself to be not only an excellent Curator and Park Superintendent, but also a most efficient landscape artist—not only by his work in evidence in the Abbey Park, but in another public park on the other side of Leicester, which was formed and laid out entirely from his plans and under his supervision five years ago, and is called the "Spinney Hill Park," some

particulars concerning which must be reserved for a future number of the *Journal of Horticulture*.—W. K. W.

## OAKS, BEECHES, AND ELMS.

FINE old trees connect the present age with the many that have gone before it, and remain, as it were, a living chronicle of the many revolutions of society that have occurred during their growth. It is, therefore, with no ordinary interest that we ought to look on such trees, venerable alike in appearance and in the associations they call up, and we ought to regard their loss as that of old friends when accident or misfortune deprives us of them. Fortunately of late years the laudable desire to retain those emblems of the past has greatly increased, as well as the love of other objects of antiquity. There is no reason why an old work of nature should not find the same favour as does an old work of art—a remnant of masonry is certainly not more an object of just interest than an aged Oak. The latter doubtless bears the mark of time, and if in a state of decay is looked on with feelings of interest; the other is regarded with regret that the barbarous usage of a former generation should have left us so little of a pile we gaze on with admiration. But old trees and old buildings are not unusually associated together, and nothing can keep company with greater harmony than those two relics of former times; not all the wealth of the present day can give that grandeur to a building which is often afforded by the old trees by which another structure of less pretension is surrounded.

How many of the abodes of our nobility are not less remarkable for the venerable appearance of the trees in their parks than for their dwellings. Who has not often heard of, and admired too, the stately Oaks, the sombre Beeches, and magnificent Elms, with which a park is studded? and while the mind is admiring their beauties as the visitor approaches the abode of the owner, a feeling of respect is engendered for bygone generations who have left such legacies to the present one.

Fine old trees also give an importance to a place which wealth cannot command; for however cleverly constructed the machines may be which the various inventors have patented for the purpose of transplanting large trees, fine old ones are beyond their power, and if such trees were even moveable, they are not often articles on sale.

With no ordinary interest, then, ought we to regard fine old trees. Trees of unusual size are scattered far and wide, and they often enough flourish unknown almost to any but to the limited residents of the locality. Unfortunately we are all too prone to pass by such things, only noticing in a vague manner that the tree "is a remarkably fine one." We take a walk round it, and a look-up to its top, and then with some exclamation about its great size, too often bestow upon it no more thought. Candour compels me to say that such has been too often all the notice I have taken of such trees; but I often meet with objects of remarkable growth in places not having the reputation of being the best adapted for such things, and I will adopt a different course for the future, for I think a little notice of such trees now and then will be of service to the community at large. The little that I am able to report on the matter is all from personal knowledge except where otherwise stated; but, unfortunately, the information is but meagre; nevertheless it may be the means of inducing others to report more interesting objects in other localities.

### THE OAK.

Commencing with the acknowledged king of our forests, the Oak, I think I have seen at least four individual trees each asserting that dignified title. A very fine example of this tree, which to all appearance seemed likely to require some two or three centuries yet to bring it to perfection, so healthy and vigorous it seemed to be, was at Panshanger, the princely seat of Earl Cowper, in Herts. I have quite forgotten the extent of ground its umbrageous top hangs over, and a finer or healthier tree it would be difficult to find. Some very fine Oaks also adorn the noble park at Dunham Massey, the seat of the Earl of Stamford and Warrington, in Cheshire. These, however, to the best of my recollection, were more remarkable for the fine timber they contained than for any remarkable extent of top; but there were plenty of tall, fine, bold trees having a circumference of 15 feet and upwards at 5 feet from the ground; and a very large park was very heavily wooded with such trees. The soil seemed sandy, and if dry, the fall of rain in the neighbourhood, being greater than in most places, supplied the moisture, but I do not think it was deficient of that element. I was told there was a king of the forest here, but I had not the opportunity of seeing it; still the great number of fine trees astonished me. Next to the Oaks the Beeches were numerous and good, and other kinds were not wanting. Further northwards

there is some tolerably good timber in the best districts of the county of Durham; and one at Gibside contained something like eleven loads of timber some years ago. This tree was growing in a wood and was near the bottom of a slope, the soil a sort of hazel loam rather plentifully mixed with stones. It was a much less healthy tree than the one at Panshanger, but might, perhaps, contain more timber, and its top was not remarkable; in fact, some of its limbs had been broken off by high winds. I believe there are several places in Yorkshire remarkable for fine trees, but I have not visited them, and, therefore, leave their description to other hands; and Scotland has also its monarchs of the forests. An Oak at Netherwitton, in Northumberland, was once pointed out to me as good, and certainly it seemed of great size, but I forgot the particulars; and many districts doubtless would have had their fine trees at the present day had not the temptation to cut them in times gone by been so great as to tell seriously against their preservation. Even parks of established antiquity have at some period or other of their history been denuded of their ornaments by some needy or avaricious proprietor; but remarkable Oaks are of frequent occurrence, less perhaps so than Beech: the latter being a less valuable commodity in the market, there was not that inducement to cut for sale. Some fine Oak trees adorn the park of Knole, Kent, but those of Cobham in the same county are evidently of a more recent date. Everyone has heard of the fine Oaks of Windsor Park, and many other places may be cited as containing good specimens.

### THE BEECH.

Next in importance to the Oak as a park tree is the Beech, and in habit of growth it is scarcely less beautiful; in fact, it is not unlikely that if we could divest ourselves of the poetic feeling attached to the Oak as being connected with our national greatness, it is not unlikely but the Beech would be regarded as the more noble in its growth. The habits of the trees are not so much unlike: a wide expanded top, with a bole more or less branched as the position of the tree may have determined. There are, however, some fine trees in other counties. The park of Knowle contains some fine avenues of Beech, as well as groups, and single trees innumerable; some are of remarkable size, but the bulk are still in what may be called excellent timber condition. Several stages beyond this state, however, have the Beeches advanced at Lullingstone, in the same county. Some measured little short of 30 feet in circumference at 4 feet from the ground, and by their appearance they looked as if they would outlive several generations yet of the human race. A dry hilly situation with chalk underneath was their abode. Beeches are also common in many places, not the least remarkable being some places in Bedfordshire and the adjoining counties.

### THE ELM.

The Elm is a greater favourite with the farmer than with the poet, not that the farmer likes its presence any further than that the district where it grows spontaneously indicates good land. I believe the vale of the Thames contains some of the best Elm trees in the kingdom, and I have seen very good specimens in Oxfordshire. A good rich and deep soil suits this tree best, and on such a soil its growth is, perhaps, quicker than that of any tree we have, unless it be the Horse Chestnut. Elms are, however, not so long-lived trees as the Oak, Yew, Beech and others, for when decay sets in they much sooner succumb to it. We seldom see a hollow Elm, for the decay at the bottom eventually increases so as to weaken the collar, which gives way before a high wind, and down the tree comes. Unlike those trees mentioned, it does not appear that the root makes any effort to sustain the declining condition of the trunk by surrounding the remaining sound wood with bark and a fresh accession of layers. Instead of this the Elm root often decays also, or if left to a state of nature some rising suckers abstract all the nourishment. Elms furnish more suckers than most other trees, and to this, doubtless, may be attributed the shorter period of their existence as compared with these. Elms make an excellent avenue, and even as individual trees they look well; the expanded top and large sturdy limbs, striking boldly out in all directions, give the tree a noble appearance in autumn and winter. Its roots travel a long way for food, and quickly appropriate to themselves a heap of compost, mould, a flower bed, or anything tempting that comes in their way, in which case they rob their neighbours. A corn field is not unlikely to suffer from this cause. But the noble proportions of the tree entitle it to respect; for I should think that no other forest tree we have arrives at the size the Elm will do in a suitable soil. One which I know seems perfectly sound, and likely to increase in size for many years to come, is upwards of 16 feet in circumference at 5 feet from the ground, and apparently loses very little in thickness at 20 feet up.

There are several others of about the same dimensions. A good rich soil, not too shallow, suits the Elm; and its presence, like that of Nettles, often indicates a generous soil.—J. N.

#### SIMILARITY OF VARIETIES.

"DUCKWING" protests against the future coupling of Alfred Colomb and Benoît Comte. I should like to say the same of Madame Alphonse Lavallée and Marie Baumann. With me the former has been in every case a shade darker than Marie Baumann, besides being distinct in not having the colour quite so evenly distributed. But a still greater difference lies in their growth, Marie Baumann being a very moderate grower by the side of Madame Alphonse. In all these cases of identity I think amateurs who do not grow for show ought to understand that the rule about identity only applies to the bloom; otherwise I fear some useful Roses will never succeed in making their way in public estimation, owing to their similarity to some older well-known Rose with equally good blooms, but of inferior growth.—KITTIE.

#### ROSE ALFRED COLOMB AND BENOÎT COMTE.

I BEG to retract my letter about Benoît Comte and Alfred Colomb which appeared in your last issue. It was written under a mistaken impression that the two had been coupled together by the N.R.S.—DUCKWING.

#### ROSE SHOWS.

##### TIBSHELF.

THIS annual Exhibition of this Society, affiliated to the National Rose Society, was held on July 22nd in the Colliery Cricket Ground, and was very well attended, the weather being glorious. A liberal prize list brought together an excellent show of Roses, which were staged round the sides of the spacious circular marquee of former years, the centre being occupied by handsome groups of stove and greenhouse plants competing for the £10 offered by the Society. The annual fête, gala and athletic sports were held at the same time. Luncheon was provided for exhibitors in the schoolroom, and a hearty welcome was accorded to rosarians from a distance by an energetic committee. Tibshelf, no longer an unknown place in the Rose world, now ranks as one of the chief shows of the year.

In the class for seventy-two Roses Messrs. Harkness & Sons were awarded first prize, £6 and the gold medal of the National Rose Society, the best Roses in this stand being Etienne Levet, Duchess of Bedford, Mrs. J. Laing, Innocente Pirola and Charles Lefevre; Mr. H. Merryweather of Southwell being a good second. In the class for forty-eight varieties the awards were as follows. First (£4 10s.), Messrs. Harkness. Second, Mr. Merryweather. Third, Mr. J. Prior, Colchester. Fourth, Mr. W. H. Frettingham, Boston. The best blooms in the first prize collection were Marie Finger (high colour) Comte Raimbaud, Le Havre, Mrs. J. Laing, F. Kruger (fine form and of deep colour), Jean Ducher. For thirty-six single trusses—First (£4) Messrs. Harkness. Second, the Rev. J. H. Pemberton. Third, Mr. Merryweather. For twelve Teas—First, Messrs. Harkness. Second, Mr. Merryweather. Third, Mr. Prior.

In the amateurs' division the Turner Memorial prize of £10 was given in addition to the Society's own prizes to the class for eighteen varieties, single trusses. The first prize (£7) was awarded to the Rev. J. H. Pemberton. Second (£4 10s.) Mr. E. B. Lindsell, Hitchin. Third (£2 10s.) Mr. W. Boyes, Derby. Fourth, The Rev. A. Foster-Melliard. For twelve varieties, single trusses, the awards were: First, Mr. Pemberton; second, Mr. Lindsell; third (equal), Mr. Boyes and Mr. H. V. Machin, Cateford.

##### WORKSOP.

THE first annual Exhibition of this Society, which is affiliated to the N.R.S., was held on the cricket ground on Thursday, July 10th, and brought together competitors from all parts of England. Roses were of fine quality and staged in good condition. The young Society is to be congratulated on this its maiden effort.

In class 1, for forty-eight distinct, open, Mr. B. R. Cant of Colchester was first with fine substantial blooms, Messrs. Harkness & Sons, Bedale, being a close second; Mr. H. Merryweather of Southwell third. Six collections were staged. In class 2, eighteen Teas, open.—First, Messrs. Harkness & Sons; second, Mr. B. R. Cant; third, Messrs. Burch of Peterborough. In class 3, twelve of any one H.P.—First, Messrs. Harkness & Sons, with Ulrich Brunner; second, Mr. B. R. Cant, with Alfred Colomb; third, Mr. Merryweather, with Alfred Colomb. Class 5, twelve of any one white Rose.—First, Messrs. Harkness & Sons, with Souvenir d'Elise (a good stand); second, Mr. B. R. Cant, with Merveille de Lyon; third, Messrs. Burch, with Innocente Pirola. In class 6, twenty-four distinct, amateurs.—First, the Rev. J. H. Pemberton of Havering-atte-Bower; second, Mr. H. V. Machin, Cateford Hill; third, Dr. S. P. Budd, Bath. Seven collections were staged. In class 7, twelve distinct—First, Mr. H. Stewart; two entries. In class 8, twelve Teas.—First, Dr. Budd; four entries. In class 9, twelve trusses of any one Rose.—First, Mr. Machin; five entries. In class 10, twelve trusses, six

of any one H.P. and six of any one Tea.—First, Mr. A. Whitton, Bedale; six entries.

The silver medal for the best H.P. in the Show was won by the Rev. J. H. Pemberton, with Comte Raimbaud; silver medal for the best Tea going to Messrs. Harkness for Souvenir d'Elise.

#### MANCHESTER.

THE annual Exhibition of Roses took place in the gardens of the Society at Old Trafford on July 19th. The entries were unusually numerous, but the heavy rains of the two previous days must have spoiled the chances of some intending exhibitors who did not put in an appearance; still there was a remarkably good show, some very fine flowers coming from the north and some very fine Tea scented varieties were staged. The Show took place in the annexe, the light being excellent, with ample space for locomotion.

NURSEYMEN'S CLASSES.—There were seven collections of seventy-two varieties, one truss of each. Messrs. Harkness & Son, nurserymen, Bedale, were first with superb blooms, fresh, brilliantly coloured, and free from damage from rain, the leading varieties being Her Majesty, Etienne Levet, Heinrich Schultheis, Maréchal Niel, Horace Vernet, The Bride, Fisher Holmes, Lord Macaulay, Grace Darling, Elie Morel, Lady Helen Stewart, Marquise de Castellane, Etoile de Lyon, Marie Rady, Niphotos, Souvenir de Paul Neron, Princess of Wales, Camille Bernardin, Marie Finger, Madame Alphonse Lavallée, J. S. Mill, Souvenir d'un Ami, Jean Ducher, Duc de Rohan, Madame G. Luizet, Auguste Rigotard, Madame H. Jamain, a purple sport from Star of Waltham, Madame Cusin, Mrs. J. Laing, Catherine Mermet, Star of Waltham; Madame Eugène Verdier, and Innocente Pirola. The Tea scented varieties were particularly fine in this stand. Second, The English Flower and Fruit Company, Hereford, with large and striking flowers, damaged by the rain, the following particularly fine—A. K. Williams, Madame A. Lavallée, J. S. Mill, Alfred Colomb, Victor Hugo, Countess of Rosebery, Devonien-sis, Madame Isaac Pereire, a charming Bourhon variety; Fisher Holmes, Duchess of Bedford, Marie Van Houtte, Souvenir d'un Ami, Madame H. Jamain, Dupuy Jamain, Prince Arthur, Général Jacqueminot, Earl of Dufferin, Rosieriste Jacobs, Madame Berard, Mrs. Jowett, Marie Baumann, Maréchal Vaillant, Beauty of Waltham, and M. P. Wilder. Third, Mr. B. R. Cant, nurseryman, Colchester. With thirty-six varieties, three trusses of each, The English Fruit and Flower Company were first, staging excellent blooms of A. K. Williams, Lady Sheffield, Général Jacqueminot, S nature Vaisse, Alfred Colomb, J. S. Mill, Auguste Rigotard, Ulrich Brunner, Queen of Queens, M. P. Wilder, Maurice Bernardin, Prince Arthur, Her Majesty, Beauty of Waltham, Dupuy Jamain, Mons. Berard, and Duke of Edinburgh. Second, Messrs. Prior & Co., Colchester. Third, Messrs. Paul & Son, Old Nurseries, Cheshutt.

In the class for eighteen Teas and Noisettes, three blooms of each, there was keen competition, Messrs. Harkness & Sons taking first prize with some superb blooms, having in very fine condition Catherine Mermet, Innocente Pirola, Souvenir d'un Ami, Souvenir de Paul Neyron, Anna Ollivier, Madame Willermoz, Caroline Kuster, Madame Bravy, David Pradel, Marie Van Houtte, Souvenir d'Elise Vardon, Jean Ducher, Niphotos, Madame Cusin, Madame Welch, Princess of Wales, The Bride and Rubens. Second, Mr. B. R. Cant with capital blooms of Marie Van Houtte, Madame de Watteville, Ebel Brownlow, Souvenir d'un Ami, Comtesse de Nadaillac, Madame Hoste, Souvenir d'Elise, Princess of Wales, Francisca Kruger, and Luciole. Third, The English Fruit and Flower Company. Mr. B. R. Cant had the best twelve blooms of Teas and Noisettes, comprising Comtesse de Nadaillac, Madame Cusin, Madame Lambard, Madame de Watteville, Catherine Mermet, Jean Ducher, Niphotos, Souvenir d'Elise, The Bride, Souvenir d'un Ami, Innocente Pirola, and Princess of Wales. Second, Mr. H. Merryweather, nurseryman, Southwell, also with some fine blooms, Messrs. Harkness & Son being third. The best twelve blooms of any yellow Rose were some fine ones of Francisca Kruger from the Cranston Co. Mr. B. R. Cant was second with Marie Van Houtte. The best twelve blooms of any white Rose were Niphotos from Messrs. Prior & Son, Colchester. Messrs. Harkness & Son were second with Merveille de Lyon. The best twelve blooms of any crimson Rose were superb examples of Alfred Colomb from the Cranston Co. Messrs. Paul & Son were second with A. K. Williams.

The class for three bouquets of Roses brought but one exhibitor, Messrs. Perkins & Son of Coventry, who were awarded the first prize for worthy examples of artistic skill. Amateurs' Roses had classes allotted to them. The Rev. J. H. Pemberton, Romford, was first with thirty-six distinct varieties, fine blooms being staged, but showing the effects of recent storms. Very fine were Marie Baumann, Auguste Rigotard, Souvenir d'Elise, Prince Arthur, Earl of Dufferin, Alfred Colomb, Marie Finger, Madame Victor Verdier, Louis Van Houtte, Ulrich Brunner, Comte Raimbaud, Lady Mary Fitzwilliam, La France, M. P. Wilder, Marie Rady, Merveille de Lyon, Beauty of Waltham, Innocente Pirola, Sir Rowland Hill, and Horace Vernet. Second, Mr. E. B. Lindsell, Hitchin, with Dupuy Jamain, Victor Hugo, Mons. E. Y. Teas, Marie Van Houtte, Louis Van Houtte, Alfred Colomb, La France, Ulrich Brunner, Dr. Andry, Mrs. J. Laing, A. K. Williams, Francisca Kruger, Marie Baumann, and Captain Christy, all in good condition. Third, the Rev. A. Foster-Melliard, Ipswich. Rev. J. H. Pemberton also had the best twelve varieties, three trusses of each, most noticeable being Ulrich Brunner, Duke of Wellington, Merveille de Lyon, Her Majesty, Baroness Rothschild, Auguste Rigotard, and Caroline Kuster. Mr. E. B. Lindsell, who was second, had good blooms of Mons. E. Y. Teas, Comtesse de Nadaillac, Catherine Mermet, Ulrich Brunner, and Lady Mary Fitzwilliam. Third, the Rev. A. Foster-Melliard. The Rev. T. R. Burnside, Hereford, had the best twelve Teas or Noisettes,

three blooms of each, having good examples of Madame Cusin, Hon. Edith Gifford, Innocente Pirola, Comtesse de Nadaillac, Francisca Kruger, The Bride, Souvenir d'un Ami, Princess of Wales, Souvenir d'Elise, Madame Bravy, Mons. Furtado, and Catherine Mermet. The Rev. J. H. Pemberton was second, having in good form Madame Thérèse Levet, so well coloured as to supply quite a startling hue among Teas; Princess of Wales, Souvenir d'un Ami, Madame Bravy, Niphotos, and Anna Olivier. The Rev. T. R. Burnside also had the best twelve Teas, single blooms, comprising Souvenir d'Elise, Catherine Mermet, Innocente Pirola, Princess of Wales, Hon. Edith Gifford, Madame Thérèse Levet, Caroline Kuster, Niphotos, Comtesse de Nadaillac, The Bride, Rubens and Francisca Kruger. Second, Mr. E. B. Lindsell, with Caroline Kuster, Francisca Kruger, Marie Van Houtte, Anna Ollivier, Souvenir d'Elise, Catherine Mermet, and Comtesse de Nadaillac. The Rev. J. H. Pemberton was third. There was no competition in the class for twelve trusses of any yellow Rose. In that for any white the Rev. T. R. Burnside was first with a very fine lot of Innocente Pirola. Mr. C. Burgess, Plumbley Cottage, Chester, was second, and Mr. Samuel Barlow, J. P., Stakehill House, third, both with Merveille de Lyon. The best twelve blooms of any crimson Rose were Ulrich Brunner, from the Rev. J. H. Pemberton, Mr. Samuel Barlow was second with Marie Bauman. Bouquets of Roses, the best three came from Mr. George Wilkes, gardener to Miss Lord, Ashton-on-Mersey.

**DISTRICT GROWN ROSES.**—There were some classes for these grown within twenty miles of Manchester. Mr. Tatham, Wilmslow, was first with twenty-four varieties, having fairly good flowers of A. K. Williams, Captain Christy, Marie Baumann, Duc de Rohan, Prince Arthur, Ulrich Brunner, Beauty of Waltham, Alfred Colomb, La France, Madame J. Pereire, Lord Bacon, and M. P. Wilder. Second, Mr. James Brown, Heaton Nursery. Mr. Brown had the best twelve blooms. Mr. Tatham was second. Mr. C. Burgess had the best six, staging perhaps the finest bloom of Her Majesty in the Show. Mr. R. G. Burgess was second, and the latter had the best bouquet of Roses.

**EXTRA PRIZES** were awarded to Mr. Samuel Barlow for a collection of cut blooms of perennials, annuals, garden Roses, all of a fine and interesting character; and also for a large flowering spike of *Phormium tenax variegata*, which had been produced in the open ground at his Welsh residence at Llandudno; to Messrs. Dickson & Robinson, seedsmen, Manchester, for a fine lot of blooms of Carnations, hardy perennials, Roses, &c.; to Messrs. Dickson, Brown, & Tait, seedsmen, Manchester, for Roses, hardy perennials, &c., a very attractive group; to Messrs. Clibran & Son for a collection of flowers of very fine single Begonias and Clematis, also for Calceolarias in pots; to Messrs. Dickson (Limited), Chester, for fine bunches of hardy perennials, &c.; to Mr. M. Campbell, Blantyre, for a very fine and representative collection of cut flowers of Pansies, especially of Fancy varieties; and to Mr. Henry Eckford, for a collection of bunches of cut blooms of Sweet Peas.

A first-class certificate of merit was awarded to Messrs. Paul & Son for Bourbon Rose Mrs. Paul. A new H.P. named Bruce Findlay, a kind of deep shaded A. K. Williams, is of a very promising character, but was not staged in good condition.

## NATIONAL PINK SOCIETY.

### NORTHERN SECTION.

THE Pink Show, held in connection with the Manchester Rose Exhibition, was a decided success when it is considered the area of cultivation in the north as well as in the south has become very restricted of late. There were two exhibitors of twelve blooms in not less than six varieties. Mr. M. Campbell, Auchinraith Nurseries, Blantyre, was first with Modesty, very fine; Ada Louisa, Dr. Maclean, Nothing Better, a fine dark variety; Boiard, Reliance, D. Godfrey, and John Drake, with a finely formed petal. Second, Mr. Samuel Barlow, J. P., Stakehill House, Castleton, with Boiard, very fine; George Hodgkinson, Brown's Heavy Red, Mrs. Thurston, Henry Hooper, Mrs. Darke, and Rosy Morn. There were five stands of six varieties, distinct. Mr. Samuel Barlow was first with Boiard, Mrs. Darke, Brown's Heavy Red, George Hodgkinson, James Thurston, and one unnamed. Mr. T. Lord, Hole Bottom Tadnorden, was second with Boiard, Rosy Morn, Modesty, Bertram, Mrs. Darke, and Eurydice. Third, Mr. Campbell. In the class for six blooms, not less than three varieties, Mr. Samuel Barlow was first with two blooms each, Mrs. Darke and Brown's Heavy Red, Boiard, and one unnamed. Mr. F. Morton, Wolverhampton, was second with two blooms of George Hodgkinson, Boiard, Henry Hooper, Mrs. Darke, and Clipper. In the class for three blooms, one purple laced, one red laced, and one black-and-white, there was no competition. A goodly number of blooms were staged in the classes for the best purple and the best red laced Pinks. In the former class Mr. Samuel Barlow took all the prizes, being first, second, and fourth with Boiard, third with Henry Hooper, and fifth with George Hodgkinson. In the class for red laced flowers Mr. T. Lord was first and second with Bertram, and fourth with Modesty; Mr. S. Barlow third and fifth with Mrs. Darke. The premier purple laced Pink was Boiard, shown by Mr. S. Barlow; and the best red laced, Modesty, shown by Mr. Campbell.

The best collection of miscellaneous Pinks of all types came from Mr. Thomas Walkenden, Moor-side Nursery, Sale, who had an excellent collection of bunches, comprising, of laced varieties, Progress, Emmeline, and seedlings; white border Pinks, William Brownhill, Mrs. Sinkins, Fimbriata alba, and seedlings; and of coloured varieties, Souvenir de Sale, deep pink, and some good unnamed seedlings. Mr. Samuel Barlow was second with neat bunches of George Hodgkinson, Mrs. Darke,

Boiard, Mrs. Thurston, Frank Simonite, and others; the common white border Pink, Lakin's Seedlings, and mule Pink, Napoleon III.

Certificates of merit were awarded to Mr. Thomas Walkenden for Pinks Souvenir de Sale, Linley, Walkenden, white, delicately tinted with pink in the centre; Progress, white, with pink lacing; and William Brownhill, pure white; all very desirable acquisitions to the class of border Pinks.

## FINE STRAWBERRIES.

OF the two Strawberries figured one is quite new and the other not so widely known as it will be a few years hence.

COMPETITOR (fig. 14) is Mr. Laxton's latest production, one of

FIG. 14.—LAXTON'S COMPETITOR.

his largest, and he esteems it one of his best. As seen growing at Bedford early in the month it appeared to be quite as free as Noble, the fruits as large, practically as early, and better in quality. It is the result of a cross between an American Strawberry, Kerr's Prolific, and Forman's Excelsior. The fruit is high in colour, and the variety will probably be tested with Noble by many cultivators.

WATERLOO (fig. 15) is a highly distinct Strawberry, and its value is enhanced by its lateness in ripening. As seen at Chiswick, and in Mr. Smee's garden at Hackbridge, this variety may be fairly regarded as the most useful of all the late sorts. Most late Strawberries are the reverse of free bearers, but Waterloo is productive. After all others were over in both the gardens named, basketfuls of the large mulberry coloured fruits of Waterloo could be gathered in a few minutes. The fruit shown is not one of the largest, but girthed  $6\frac{1}{2}$  inches. It was grown at Chiswick, but not

FIG. 15.—WATERLOO.

weighed. Mr. Cummins has gathered from the ordinary crop, without any thinning, a fruit weighing  $2\frac{1}{2}$  ozs., and many approaching that weight.

In quality Waterloo is sweet with a sub-acid taste, and acceptable to many palates. It is better than either Eleanor or Elton Pine, more prolific than either, and the crop from one row of Waterloo would realise twice the money that could be obtained

from a row each of both, if all were cropping at their best and the fruit sold. The highest price obtained for outdoor grown Strawberries at Chiswick was half a crown a pound for fine fruits of Waterloo, smaller samples falling to 1s. 6d. Its size and extremely dark colour find favour with novelty seekers. At Hackbridge this week we observed Waterloo in full bearing, all others having ceased for some time. Noble was gathered in June, Waterloo is hoped and expected to continue till August 8th.

In habit the plant is compact, forming tufts of smallish dark leaves, which do not shade the fruit. The plants may be very well grown 18 inches apart in rows 2 feet asunder. They do not appear to produce runners very freely, and this will affect the price. Waterloo, like some other Strawberries, may not flourish in all soils, but is worth trying by all growers who desire large, dark coloured, late fruit. At Chiswick the soil is rather heavy, at Hackbridge light in texture, dark in colour, a humus like mass, and in both gardens the plants yield handsome fruit freely.

Mr. Barron informs us that this Strawberry was brought from France by Mr. James Bone, gardener to Lord Chesham, Latimers, and passed from him to Messrs. Veitch & Sons, and thence to Chiswick. It was grown in France, as might be expected, under another name, but Mr. Bone arriving home on the Waterloo anniversary commemorated the event by giving to this French Strawberry the famous Belgian name, which it will bear as long as the variety is grown in British soil.

## THE WILD FRUITS OF NEWFOUNDLAND AND LABRADOR.

(Concluded from page 514).

THE Honeysuckle family (Caprifoliaceæ) brings to our notice three genera, the *Lonicera* or Honeysuckle genus, the *Viburnum*, Arrow-wood or *Laurustinus* genus, and that of the *Sambucus* or Elder. The *Lonicera* or Honeysuckle gives us the Mountain or blue-fruited Fly Honeysuckle (*L. cœrulea*), and its variety *villosa*, and the Swamp Fly Honeysuckle (*L. oblongifolia*). Both have yellowish flowers; the berries of the former are blue, those of the latter are purple. The *Viburnum*, Arrow-wood, or *Laurustinus* has probably five species in Newfoundland, and amongst them are the Squashberry, and, I believe, our Withe-rod and White-wood berries. The others are the Sweet *Viburnum* or Sheepberry (*V. Lantago*), the Withe-rod and Naked-stalked *Viburnum* (*V. nudum*), the Few-flowered Arrow-wood (*V. pauciflorum*), and the Maple-leaved *Viburnum* or Dockmackie (*V. acerifolium*). Our Squashberry is not the High Cranberry (*Viburnum Opulus*), as at first thought, but the Few-flowered *Viburnum*. Our Withe-rod is probably the *V. nudum*; and our White Wood, whose berries are much like the Squashberry, is, perhaps, the *V. Opulus*. The *Sambucus* or Elder family gives us the panicled or red-berried Elder (*Sambucus racemosa*, variety *pubens*). The *V. Opulus* is the only one, it would seem, of these fruits which grows wild in England; it is known there as the common Guelder Rose or Water Elder.

The Madder family (Rubiaceæ) gives us the *Mitchella* or Partridgeberry genus, of which the sole species is the *M. repens*. It is remarkably distinguished by its bright red berries, formed of two flowers.

The Heath family (Rubiaceæ).—The genera or divisions of this large and important family of which we are to speak are those of the Huckleberry, Whortleberry, Creeping Snowberry, Cranberry, Partridgeberry, and Bearberry. It thus yields us a large proportion of our most common and valuable fruits. The Huckleberry or *Gaylussacia* affords us, I believe, our "black hurts" or whorts. They are of two kinds—the black or common Huckleberry (*G. resinosa*), and the dwarf Huckleberry (*G. dumosa*). The Whortleberry or *Vaccinium*.—This gives us our "hurts" or Whortleberries properly so called, and our Partridgeberry. The former are also called Blueberries or Bilberries. There are in Newfoundland five kinds of Whorts, with one variety, besides the red Whortleberry, Cowberry or Mountain Cranberry (*V. Vitis Idæa*), which is our Partridgeberry. They are the common Low Blueberry (*V. pennsylvanicum*), its variety *angustifolium*, the Blue or High Bilberry (*Vaccinium corymbosum*), Canadian Blueberry (*V. canadense*), the Mountain Blueberry (*V. uliginosum*), and the Dwarf Blueberry (*V. cœspitosum*). The last two are dwarf species, and may both be "ground hurts." The High Bilberry grows from 4 to 8 feet in height; the others are from 6 to 12 inches high, the dwarf species being still smaller. Of these the Mountain Blueberry and the Cowberry are the only ones of our Whorts found in England.

The Cranberry or *Oxycoccus*.—In very close botanical connection with the Whortleberries, so that they are, or were, sometimes grouped with them, are two others of our berries, one of which is very common and much valued by us. These are the Cranberries. Our Mashberry appears to be the common or small Cranberry of America, and the Marsh Whortleberry or Cranberry of England (*Oxycoccus vulgaris*). Our less frequent Cranberry, which bears large berries, and has its flower-stalk (or pedicels) springing from the juncture of the leaf and stem (or axillary) is the larger Cranberry (*O. macrocarpus*). Probably the latter is what is sometimes called the Bearberry and Bankberry in Fortune Bay and elsewhere. The Creeping Snowberry or *Chiogenes*.—Another delicate and much appreciated berry is claimed by the Heath

tribe, and that is the Capillaire or Maidenhairberry (*Chiogenes hispida*). It is called in other parts of North America the Mountain Boxberry, or Creeping Snowberry. The Aromatic Wintergreen or *Gualteria*. In this division we find the Checkerberry, Aromatic Wintergreen, Boxberry, or, as it called in some parts of North America, the Partridgeberry and Teaberry. About Harbor Breton it is called the Mountain Tea. The Bearberry or *Arctostaphylos*.—The red Bearberry or *Kinnikinnik* (*A. uva ursi*), and the black or alpine Bearberry (*A. alpina*) are both found here; the names indicate the colour of the berries. The former is known as the Rockberry, and possibly Foxberry and Ground Ivoryberry in Fortune Bay. Both these exist in England; and the larger English species, the Strawberry Tree (*A. unedo*) is also stated to have been identified here; but as it does not appear to be known in North America, we may conclude it is a mistake.

The Holly family (Aquifoliaceæ).—In its Mountain Holly or *Nemopanthes* we have the Canadian or Mountain Holly (*Nemopanthes canadensis*), a shrub bearing dry red berries and small greenish-white flowers, called in Fortune Bay, I believe, Brick Timber and Catberry. The Mezereum family (Thymelæaceæ).—Here we find in the Leatherwood or *Dirca* the Leatherwood or Moosewood (*D. palustris*). The Oleaster family (Elaëagnaceæ).—In *Shepherdia* we find the Canadian *Shepherdia* (*S. canadensis*). The Sandlewood family (Santalaceæ) brings us to the Bastard Toad Flax or *Commandra*, with its two species, the *C. umbellata* and *C. livida*. The Crowberry family (Empetraceæ) has two genera. The Crowberry or *Empetrum*, which affords us our so-called "Blackerry" or Heathberry or Earthberry, which is properly the common or black Crowberry (*E. nigrum*). It is common in England. A red Crowberry (*E. rubrum*), which has red berries, is found in Miquelon, Sagona, Brunet, Long Harbor, Fortune Bay, and other places westward. The Broom Crowberry or *Corema* gives us the Broom or Plymouth Crowberry (*C. Conradi*).

The Oak family (Cupuliferæ) in its Hazlenut or *Corylus* affords us our two Newfoundland nuts, the Beaked Hazel (*Corylus rostrata*) and the Wild Hazel (*C. americana*). The latter is very similar to the common English Hazel (*C. avellana*). The Sweet Gale family (Myricaceæ).—Here we have, in the Sweet Gale or *Myrica*, two plants—the Dutch Myrtle or Sweet Gale (*Myrica Gale*), and the Wax Myrtle or Bayberry (*M. cerifera*). The former is found abundantly in England.

The Pine family (Coniferæ).—Two divisions here interest us—namely, the Juniper and Yew genera. (a) The Juniper (*Juniperus*).—The Junipers of Newfoundland appear to be three in number—namely, the common Juniper (*Juniperus communis*), the red Cedar (*J. virginiana*), and the creeping Juniper (*J. sabina*, variety *procumbens*). The berries of the latter it seems are called here the "face and eye berries," from their resemblance to the human countenance. They are much in request by our "grannies" for their "sick" women. Our so-called Juniper tree belongs to a different genus of this family, and is the Tamarack or black Larch (*Larix americana*). The common Juniper is of frequent occurrence in England. It is here called Common Low or Ground Juniper, to distinguish it from the Larch, or high Juniper; and the creeping Juniper is known as "Savine." (b) The Yew or *Taxus* genus.—We have here the only North American species—namely, the ground, or American, or ground Hemlock Yew (*Taxus baccata*, var. *canadensis*). It grows in some few places in the north of England. It is probably our "Palm."

The Greenbriar family (Smilacæ).—The only genus of the order is that of the Greenbriar or *Smilax* genus. Here we have two species, which have bluish-black berries. They are the common green Briar (*Smilax rotundifolia*) and the Carrion Flower (*S. herbacea*). The medicinal Sarsaparilla (*S. sarsaparilla*), said to be found here, is not known on this side of the Atlantic.

The Lily family (Liliacæ) gives us five genera to speak of. The three-leaved Nightshade or *Trillium*, which has two species, the *T. recurvatum* and the *T. erythrocarpum*, the Smiling Wake Robin or Painted Herb or *Trillium*. The False Solomon's Seal or Smilacing, which gives us the two-leaved Solomon's Seal (*S. bifolia*) and the three-leaved Solomon's Seal (*S. trifolia*). Both these have bright red berries, and are perhaps known here as "scurvy berries," the Star-flowered Solomon's Seal or False Spikenard (*S. stellata*), with blackish berries; and the clustered Solomon's Seal (*S. racemosa*), having pale red speckled berries. The True Solomon's Seal or *Polygonatum*, in which we have only the smaller Solomon's Seal (*P. biflorum*), probably a variety *pubescens*. This has round blue or black berries. The *Clintonia* (*Clintonia*), where we have the wild Lily of the Valley (*C. borealis*), which has large yellow flowers and bright blue berries, called here "poison berries." The Twisted Stalk or *Streptopus*, in which we have the rose twisted stalk (*S. roseus*), and another species called the *S. amplexifolius*. Both have red berries.

## ROYAL AQUARIUM, WESTMINSTER.

THE Exhibition held on Tuesday and Wednesday, July 29th and 30th, was the fifth of the series under the management of Mr. W. Holmes, and it was certainly one of the best in all respects. There was a great variety of exhibits, the quality was good throughout, and the floral display was rendered brilliant by the Tuberos Begonias.

## CARNATIONS AND PICOTEES.

In quality and numbers these were far better than was expected, indeed in some points they were superior to those at the National Society's Show. We can only briefly review the classes.

With twenty-four blooms, bizarres and flakes, Mr. J. Douglas, gardener to Mrs. Whitbourn, Great Gearies, Ilford, was first, showing large bright blooms, including several seedlings and the following named varieties:—Rob Roy, Arthur Medhurst, Thalia, Alismond, Edward Adams, Matador, and Robert Houlgrave. Mr. Martin Rowan, 36, Manor Street, Clapham, was second; and Mr. C. Turner, Slough, third. Mr. M. Rowan gained first prize for twelve Carnations, distinct, fresh, bright, clean blooms of Jessica, Alfred, Sarah Payne, Rifleman, Rob Roy, Fred, Matador, G. Melville, Gordon Lewis, Robert Houlgrave, Mrs. Skirving, and Sportsman. Messrs. Douglas, Turner, and Phillips followed in that order as second, third, and fourth prizewinner. Six competitors. Amongst twelve exhibitors of six Carnations, distinct, Mr. J. F. Kew, London Road, Southend, took the lead, showing grand examples of George, Thalia, Mayor of Notts, R. Dean, and two seedlings. Messrs. Sydenham, Anstiss, and Lakin were second, third, and fourth.

Bouquets of Carnations were exhibited by eight competitors. Mr. E. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, Ealing, was first for a light and tasteful arrangement. Mr. Chard, Stoke Newington, was second, Mr. Lakin third, and Mr. Fred Hooper, Bath, fourth. A class was provided for a vase or epergne of Carnations and foliage, and several very tasteful arrangements were shown. Mr. E. Chadwick took the lead, yellow, white, and light-coloured Carnations and Picotees with grasses being chiefly employed. Mr. J. Chard was second with a tall epergne of Carnations and Grasses. Mr. J. Douglas was third, and Mr. D. B. Crane fourth.

The best twenty-four Picotees came from Mr. C. Turner, who had clean fresh blooms of Favourite, Dr. Epps, John Archer, T. B. Bryant, Madeline, Mrs. Chancellor, Lord Valentin, Mrs. Sharpe, Edith D'Ombraïn, and several seedlings. Mr. J. Douglas followed in the second place, Mr. M. Rowan was third, and Mr. F. Hooper fourth. With twelve Picotees there were eight competitors, Mr. C. Turner winning premier honours for excellent examples of Mrs. Payne, Madeline, John Smith, Mrs. Sharpe, Mrs. Gorton, Mrs. Chancellor, Favourite, and Princess of Wales, and several seedlings. Mr. J. Douglas, Mr. M. Rowan, and Mr. Headland, Leyton, were second, third, and fourth respectively. The competition was keen with six Picotees, fourteen entering. Mr. F. Hooper won the first prize for capital blooms of T. B. Bryant, Favourite, Dr. Epps, and seedlings. Mr. J. Lakin followed. Mr. Startup, Bromley, was third, and Mr. H. J. Sanders, Bookham Lodge Gardens, Cobham, was fourth.

In the class for twenty-four self or fancy Carnations and Picotees Mr. C. Turner was successful in securing the leading prize for varied, bright, and beautiful blooms of the following:—Almira, Ruby, Romulus, Mrs. R. Hole, Victory, Robert Houlgrave, Thos. Page, Dorothy, Germania, Terra Cotta, Dorothy, King of Yellows, Lord Rendlesham, and Victory. Mr. J. Douglas was second, Mr. W. Toby third, also with a good stand, and Mr. F. Hooper fourth. Mr. C. Turner had the best twelve self and fancy Carnations, showing Romulus, Lord Rendlesham, Ruby, Germania, Janira, Rose Celestial, Mrs. R. Hole, Terra Cotta, Almira, and Victory. A beautiful bright collection. Mr. M. Rowan was a good second with not quite so much variety. Mr. Chaundy, Oxford, was third, and Mr. T. Anstiss fourth. Mr. Anstiss took the lead with six self or fancy Carnations and Picotees, showing Mrs. R. Hole and several seedlings. Mr. Wm. E. Walker, Reading, was second; Mr. F. Nutt, Southampton, third; and Mr. A. J. Sanders fourth out of eleven competitors.

For six yellow self Carnations and Picotees Mr. Turner was first with Germania, Wm. Harding, and seedlings; Mr. F. Hooper followed also with seedlings. Yellow ground Picotees were shown by eight exhibitors. Mr. Turner led with six, all seedlings except Agnes Chambers; Mr. C. Phillips was second, Mr. Chaundy third, and Mr. F. Hooper fourth.

Classes were also provided for single specimens, but we failed to secure the whole of the awards.

#### TUBEROUS BEGONIAS.

The class for a group of Tuberos Begonias arranged for effect in a space of 100 square feet, with Ferns and foliage plants, excited much interest, though there were only two competitors, but it was generally understood that the contest would rest between the noted cultivators and raisers of Tuberos Begonias at Forest Hill and Swanley. The two groups staged were extremely brilliant displays of single and double varieties, but after a careful consideration the premier award was adjudged to Messrs. Laing & Sons for an effective and tastefully arranged group, the varieties of good quality, and the colours judiciously associated. Messrs. H. Cannell & Sons' group was not quite so freely arranged, and the plants were dwarfer, but included a preponderance of handsome double varieties.

In the other classes for Tuberos Begonias—namely, for six white, six pink or rose, six yellow, six crimson or scarlet, twelve doubles, and twelve singles, Messrs. Laing & Sons were the only exhibitors, securing the first prize in each with handsome specimen plants of good varieties, the six collections filling a large table at one end of the building.

#### MISCELLANEOUS.

The non-competing groups were very numerous, and added greatly to the extent and beauty of the Show.

Messrs. James Veitch & Sons, Chelsea, contributed a handsome collection of tuberos Begonia flowers, from outdoors, Begonia Worthiana being very notable for its bright scarlet flowers. Four large boxes of Carnations and Picotees were also shown by the same firm. Messrs. John Peed & Sons, Norwood Road, had two beautiful groups of Gloxinias,

effectively arranged with Adiantums (silver medal). Messrs. Dobbie and Co., Rothesay, sent a large collection of Pansy and Viola flowers.

Mr. W. Stacey, nurseryman, Dunmow, exhibited three stands of Verbenas, including fine trusses of about three dozen varieties, admirable in form and colour of flowers. Mr. H. J. Jones, Hither Green, Lewisham, had a group of well-fruited Tomato plants and several dishes of fruits representing The Conference and Peach varieties. Mr. H. W. Edwards, Stamford, also exhibited Tomato fruits. Mr. T. S. Ware, Tottenham, had first prize for a collection of Gaillardias.

Mr. C. Turner, Slough, showed eight boxes of excellent Roses. Roses were also well shown by the Rev. J. H. Pemberton, Havering, Essex, and Mr. Will Taylor, Hampton. Mr. E. F. Such, Maidenhead, contributed a capital group of hardy flowers. Messrs. D. Prior & Son, Colchester, sent seventeen boxes of Rose blooms representing many varieties. Messrs. Paul & Son, Cheshunt, sent twenty-four boxes of extremely beautiful Roses. Mr. Wm. Rumsey, Waltham Cross, had ten boxes of good Roses. Messrs. Ryder & Son, Sale, sent an extensive group of hardy flowers. Mr. C. Turner was first for a collection of eighteen bunches of Carnations and Picotees. Mr. H. Eckford, Wem, Salop, had a stand of Sweet Peas most varied in colour, soft, delicate and bright shades being numerous. Certificates were awarded for Orange Prince, Primrose, and Ignea. Messrs. J. Laing & Son had a large collection of seedling Carnations and hardy flowers arranged on stands with foliage.

Messrs. Paul & Son showed a large and varied collection of hardy flowers, very conspicuous being the bright scarlet and white double Bichon Poppy. Mr. T. S. Ware, Tottenham, had a large collection of hardy flowers. Messrs. Barr & Son, King Street, Covent Garden, also had an extensive group of hardy flowers. Messrs. Fellows & Ryder, Orpington, sent eighteen dishes of fine Tomato fruits.

Six fine Melons were shown by Mr. W. G. Gilbert. Mr. G. Mortimer, Farnham, had a certificate for a new Cucumber named Express, fine even fruits. It was obtained by a cross between Purley Park Hero and Tender and True.

## HORTICULTURAL SHOWS.

### BEDFORD AND BEDFORDSHIRE SOCIETY.

THE seventh annual Show was held at Bedford on Thursday last week, and as cut Roses are usually a material feature of the Show the clash with Birmingham considerably reduced the exhibits, the recently unsettled weather also doubtless militating against the number of the exhibits generally, for, with a few exceptions, notably in the open class for cut herbaceous and bulbous flowers, there was a considerable falling off in comparison with the shows of previous years. For forty-eight cut Roses in the open class Messrs. G. & W. H. Burch of Peterborough had the best stand, their blooms being both fine, clean, and in good colour, the bloom of Her Majesty being probably the finest Rose in the Show, the flowers also of Mdlle. Eugénie Verdier, Antoine Ducher, Merveille de Lyon, Chas. Darwin, Catherine Mermet, Etienne Levet, Marie Rady, Mrs. J. Laing, Marie Van Houtte, Innocente Pirola, Madame V. Verdier, Horace Vernet, and Niphotos were also conspicuously good and in character. Messrs. Burch took first and Messrs. J. Burrell and Co., Cambridge, second with blooms of good substance but somewhat smaller. Sir Rowland Hill, Susanne Marie Rodocanachi and Souvenir d'Elise Vardon were especially good. Mr. W. H. Frettingham, Beeston, Notts, was third, having fine flowers of Duchess of Bedford, Duke of Connaught, Duke of Teck, Jules Finger, Dupuy Jamain and Alfred Colomb. There were six exhibits altogether in this class. In the open class for twenty-four cut blooms, open to all amateurs, the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, put up a very brilliant stand, all his flowers being remarkably fresh, clean, and of good size, and as a consequence the local champion, Mr. E. B. Lindsell of Hitchin, had to succumb on this occasion, his strength being probably concentrated in the national tournament at Birmingham; however, a better stand has rarely been seen than Mr. Jackson's twenty-four, and he was deservedly placed first, his principal flowers being Ulrich Brunner, François Michelin, Marie Rady, Horace Vernet, Marie Finger, La France, Chas. Lefebvre, Marie Verdier, Dupuy Jamain, Countess of Oxford, Her Majesty, Etienne Levet, Camille Bernardin, Dr. Andry, Madame V. Verdier. For the twelve blooms in the same division Mr. Lindsell took first, Mr. G. Moules, Hitchin, second, and Mr. Jackson third.

In the Tea classes for eighteen, open to all England, Messrs. Burrell were first, Messrs. Burch second, and Mr. J. Mattock, Oxford, third. For twelve Teas, amateurs, open, Mr. Lindsell led, closely followed by Mr. G. Moules, who had Comtesse de Nadaillac and two or three other flowers of the first standard, scarcely excelled by any others in the Show. For twelve Roses, open to all amateurs, Mrs. L. E. Times, Hitchin, was first, Miss Bailey, Denton, Stevenage, second, and Mr. Moules third.

In the local class for Roses, open to amateurs, for twenty-four blooms, not less than eighteen varieties, Mr. Jackson was again first, and Mr. J. T. Green, Bletsoe, Beds, second; and for twelve blooms, Mr. C. Ellis, gardener to Mrs. Orr, Pemberly, Bedford, was first; Mr. G. Dyer, gardener to G. Repton, Esq., Odell Castle, Beds, second; and Mr. E. T. Leeds Smith, Sandy, third; and for twelve Teas Mr. Jackson was first.

In the class for thirty-six bunches of cut hardy herbaceous or bulbous flowers a very effective display was made, there being eight exhibits occupying the whole of one side of the tent, and as these were very attractively set up and massed, the class proved very attractive. Messrs. Burrell & Co. had large masses of glowing flowers, chiefly Centaureas, Lilliums, Oenotheras, Catananche, Delphiniums, &c., the old Lychnis

chalcedonica fl. pl., perhaps having never been seen to better advantage; and *Enothera speciosa*, *Campanula pelviformis*, and *Scabiosa caucasica* were very striking. Messrs. Paul & Son, Cheshunt, had a very choice but less effective display. Mr. Jas. Sheppard, Bedford, third, and Messrs. Horton & Smart, Bedford, fourth. Neither plants nor fruits were well represented, Mr. Ellis being first for a group of plants, and Mr. Day, gardener to Joshua Hawkins, Esq., Bedford, second, and Mr. Robinson, gardener to Frederick Howard, Esq., Bedford, third.

Mr. G. Allis, gardener to Major Shuttleworth, Old Warden Park, was first for Black Hamburg and Buckland Sweetwater Grapes, and Mr. Day secured a first prize for a collection of fruit, six kinds, and Mr. T. Bradshaw, Houghton Regis, had the best three varieties of Strawberries, consisting of Sir Jos. Paxton, Forman's Excelsior, and Lucas, all in fine condition. Mr. C. Musgrove, gardener to A. D. Chapman, Esq., Milton Ernest, Beds, was first for a fine collection of vegetables; Mr. Ellis second, and Mr. Herman, gardener to Griffith Jones, Esq., Goldington Bury, third. Mr. Herman also staged six well grown Zonal Pelargoniums, for which he was deservedly awarded the first place, and Mr. Musgrove for Coleus and Petunias. Mr. Sheppard contributed, not for competition, a very extensive and choice collection of plants, and Messrs. Laxton Bros., Bedford, a splendid collection of Sweet Peas, of Mr. T. Laxton's well-known strains. Cut flowers, Roses, and a large and very tastefully made wreath of light buff Roses, chiefly *Rêve d'Or*, and a magnificent crop of white flowers. Vegetables and cut flowers were well shown in the amateurs' classes, Captain Verey, Bedford, taking the lead for a collection of vegetables, and Mr. W. Kingston, Bedford, for a collection of Peas, Autocrat being especially noticeable and shown in beautiful colour and bloom. The cottagers' productions were extensive and good, filling a large tent. For the best bouquet Miss E. M. Blake, Bedford was first, and Miss Blake for three sprays and three buttonholes, Miss M. T. Godfrey, Bedford, securing first for an effective table decoration.

#### LEEDS.

A FEW years ago very large horticultural exhibitions were held in this rich and populous Yorkshire town; but year after year rain fell in torrents, and the shows were eventually washed away. Rainy days for the shows became so proverbial that on the dates being announced macintoshes and umbrellas were advertised for the occasion by enterprising tradesmen. A Show of a smaller kind was provided last week, and expressions of surprise were heard on all sides that the weather was favourable for visitors. The display consisted chiefly of Roses, cut flowers, and fruit, though interesting miscellaneous collections of plants were contributed by Messrs. Dicksons, Limited, Chester; Smith & Co., Worcester; and Featherstone, Leeds; this latter skilled decorative florist arranging the plants so artistically that the centre of the tent resembled a tropical garden. The competing exhibits were arranged on tables round the sides.

The only open class in Roses was for forty-eight varieties, and very good collections indeed were staged by five competitors. The Fruit and Flower Company, Hereford (Cranston's, Limited) secured the first prize in close competition with finer blooms than they had previously cut this year, and certainly ranking amongst the best that we have seen exhibited. The varieties comprised Alfred Colomb, Countess of Rosebery, A. K. Williams, Comtesse de Serenye, Dupuy Jamain, Lady M. Fitzwilliam, Earl of Dufferin, Madame Eugène Verdier, Devienne Lamy, Mrs. J. Laing, Général Jacqueminot, Silver Queen, Duc de Wellington, François Michelon, Marshall Wilder, Her Majesty, Lady Sheffield, François Louvat, Niphotos, Souvenir Vaisse, Souvenir d'Elise, Camille Bernardin, Queen of Queens, Marie Van Houtte, Etienne Levet, Maurice Bernardin, Comte de Nadailac, Benêt Comte, La France, Madame Cr. Wood, Maréchal Niel, Maréchal Vaillant, Thos. Mill, Baronne de Rothschild, Madame A. Lavallée, The Bride, Madame Victor Verdier, Souvenir de Paul Neyron, Mrs. Jowitt, Ulrich Brunner, Fisher Holmes, Perle des Jardins, Marie Baumann, Madame Bravy, Le Havre, Madame G. Luizet, Charles Lefebvre, and Auguste Rigotard. Nearly all of them were full, fresh, and beautiful, Lady Sheffield being perhaps the premier in the collection. Messrs. C. & W. H. Burch, Peterborough, very closely followed, and well won the second position with extremely bright young blooms, but rather small. Mr. J. House, Peterborough, was third with very good stands. Several stands were exhibited not for competition, and amongst them one of Madame George Bruant (Hybrid rugosa) from Messrs. Dicksons, and the large clusters of white flowers found many admirers.

For twelve bunches of hardy perennials the first prize was won by Messrs. Dicksons, Limited, with splendid bunches of Phlox A. Matheson; Lilioms Bloomerianum, longiflorum and testacum; Gladioli delicatissima and Prince of Wales; Delphinium ranunculiflorum, Agrostemma Wahleni; Cimicifuga racemosa, Helenium pumilum, Gaillardia grandiflora, and Carnation Mrs. Reynolds Hole. Mr. J. Riddell, gardener to the Earl of Carlisle, Castle Howard, was second with one of the best stands we have seen from a private garden. The chief prizes for bouquets were won by Messrs. Perkins & Son, Coventry.

FRUIT was well represented by several good cultivators. Mr. R. Dawes, gardener to Mr. Meynell Ingram, Temple Newsam, secured the foremost place with six dishes—namely, a Pine, Gros Colman and Foster's Seedling Grapes, Peaches, Figs, and a Melon, all excellent. Mr. W. Wallis, gardener to Sir Meysey Thompson, Bart., Kirby Hall, Leeds, was second with very good produce, and Mr. F. Hare, gardener to R. H. C. Neville, Esq., Wellingore, Lincoln, third with a creditable collection.

In the class for two bunches of black Grapes Mr. G. Anderson, gardener to A. Milnthorpe, Esq., Tower Hill, Cattal, York, outdistanced

his competitors with fine Black Hamburgs, large in bunch and berries. Mr. J. Johnson, Boston Spa, was second with smaller but well finished bunches of the same variety, and Mr. Dawes third with Madresfield Court, large berries but not ripe, and injured in transit. With two bunches of white Grapes Mr. Anderson was first with large but not quite finished Muscats, Mr. Dawes second with well finished but small Buckland Sweetwater, and Mr. Hare third with fine bunches of Foster's Seedling, but apparently scarcely ripe. In the large bunch class Mr. Dawes secured the first prize with Muscat Hamburg unthinned, weighing 3 lbs. 14 ozs. Mr. Anderson followed with Black Hamburg, weighing 3 lbs. 7 ozs., the berries large and good.

Very good Peaches were staged, the first prize for two dishes going to Mr. R. Harburn, gardener to A. Kitson, Esq., Roundhay, Leeds, varieties Royal George and Noblesse, Mr. Dawes following closely with Bellegarde and Noblesse. He was easily first with Nectarines, Stanwick Elruge and Violette Hâtive; also with Figs, Negro Largo. Mr. Riddell won the first prize for Tomatoes, with splendid fruits of Perfection; and Messrs. Quartier & Co., Fordingbridge (gardener, Mr. S. Castle) exhibited remarkably fine specimens not for competition. Mr. Riddell staged by far the best Melons, and Mr. Harburn had the best Cucumbers, Lockie's Perfection.

It should be added that the Show was held in connection with the International Exhibition in the Carlton Parade Ground. The space occupied is five acres. Articles of all kinds, useful and ornamental, are represented, and the manager, Mr. Joseph Davis, also provides high class music and entertainments for visitors. Mr. Davis was a great exhibitor of meteorological and other instruments at South Kensington a few years ago, and he is to be congratulated on this Exhibition at Leeds. The Horticultural Show was managed by Mr. J. H. Clark, many years Secretary of the Leeds Horticultural Society, and he achieved a gratifying success. The Exhibition was attended by thousands of visitors.

#### FRUIT FORCING.

VINES.—*Vines in Pots for Early Forcing.*—Those that are to be started in November should now have the wood ripe, thoroughly hardened, and the buds plump; if not, and they are later than usual, keep the house rather warmer by day, 80° to 85°, closing early, so as to raise the temperature to 90° or 95°, and open the ventilators at night. Afford water in sufficient quantity to prevent the leaves flagging, or liquid manure may be given to help them to plump the buds. The foliage cannot have too much light. Keep laterals well in check, leaving no more than are absolutely necessary to appropriate any sap that may be in excess of the leaf requirements, and so prevent the principal buds starting. When sufficiently ripened, as they are when the wood is brown and hard and the buds are prominent, they should be removed to a position outdoors in the full sun, standing on slates or boards in front of a south wall or fence, securing the canes to the face of the wall, only giving water to prevent the foliage falling prematurely, and having some waterproof material to throw the water from the pots. In this position they will rest even if the leaves are not shed. When the leaves turn yellow—give indications of falling—commence reducing the laterals; and when the leaves are all off prune, cut the laterals, cut in closely, and cut back the canes to the length required, placing them in an airy shed or cool dry place until required for forcing. Keep the soil dry at their roots, and yet it must not be allowed become dust dry, placing some dry protective material about the pots.

*Earliest Forced House.*—A dry atmosphere will now be required to thoroughly ripen the wood, but it will not be necessary to employ artificial heat. All laterals and late growths must be kept stopped and complete rest afforded, having the border cool and moderately dry. The borders inside may require water, but if they have been mulched it may not be necessary, whilst outside borders will need covering with dry straw or bracken in order to throw off heavy rains. This is absolutely necessary to insure the complete rest so essential for success with Vines long subjected to early forcing, a too moist condition of the soil tending to late growth, but there must be sufficient moisture to prevent the foliage ripening prematurely. In most cases it will be sufficient to allow a moderate extension of the laterals; and where the Vines are in an unsatisfactory condition prepare for lifting at an early date, getting fresh loam and clean drainage, so that the work can be done quickly when started. There is no danger of losing a crop. Only operate upon a part of the border at once—say the inside border one year and the outside the following. It is desirable to lift the roots and place them in fresh soil nearer the surface whilst there is foliage upon the Vines; therefore, work of this kind ought not to be delayed in the case of Vines that are to be started early in December, which will need pruning by the middle of September, or a little later in the case of lifted Vines.

*Vines not Regularly Subjected to Early Forcing.*—Vines that have not hitherto been started early will need, as soon as the crop is off, to be thoroughly cleansed by syringing or by the application of an insecticide; and if there is any doubt about ripening the wood or plumping the buds

it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Give no more water to the border than will prevent the foliage becoming limp. If the weather prove moist employ fire heat in the daytime to maintain a temperature of 70° to 75°, with moderate ventilation, and turn the heat off at night to allow the pipes to cool, increasing the ventilation so as to cause a thorough draught; and this will soon cause the wood to harden and the buds to plump, inducing rest, which for Vines that are to be started in December should be complete from the middle to the end of September. When the Vines have the wood ripe ventilate fully day and night.

*Vines Cleared of their Crops.*—Second early-forced Vines have the crops cleared; and they should have the foliage cleansed by means of the syringe or engine, and, if needful, by applying an insecticide. If there be any mealy bug or scale promptly use petroleum, a wineglassful to four gallons of water, in which 6 ozs. of softsoap and 1 oz. of soda has been dissolved, keeping the mixture thoroughly agitated whilst it is being applied to the Vines, which must be done thoroughly, wetting every part. It is best done on a calm evening, and should be repeated two or three times at intervals of a few days, and is best used at a temperature of 90° to 100°. If there are any plants they must be removed, and if the roots of the Vines are near the surface, cover the border with dry short litter to absorb the waste.

Keep the laterals fairly in check, but not closely pinched unless the Vines are very vigorous and are not ripening the wood freely, then keeping the house rather dry at night with all the air possible, and somewhat close and warm by day, will tend to promote the maturity of the wood and buds. In stopping vigorous Vines regard must be had to the principal buds, not stopping so close as to cause them to start into growth. Such Vines should be kept without water until the leaves are a little limp. Vines that, on the other hand, are not strong, having been enfeebled by continuous cropping, or other cause, should be encouraged to make growth by applying liquid manure to the border; but whatever extraneous foliage is made must not be allowed to interfere with the free access of light and air to the principal leaves, which must be kept healthy, so that they may appropriate some of the extra-food, and store it in the buds and adjacent wood. Ventilate freely day and night.

*Grapes Ripening.*—Admit air constantly, enough with a gentle warmth in the pipes to insure a circulation. In ripening most Grapes swell considerably, therefore a moderate amount of air moisture is necessary, and there must not be any deficiency of water at the roots. Give the border, if necessary, a good supply, and in the early part of the day, so that superfluous water may be dissipated before night. If the Vines are heavily cropped afford liquid manure, but not strong, and allow them plenty of time, otherwise if there be any hastening of the ripening and a deficiency of moisture or nutriment, it is likely the fruit will be defective in colour. A good rest at night in a temperature of 60° to 65° with air is a great help to Vines taxed to the utmost by weight of Grapes. A moderate air moisture will be secured by damping available surfaces occasionally, and if possible allow the laterals to extend, but overtaxed Vines rarely can cater for more than the principal leaves and Grapes.

**CUCUMBERS.**—Let the growths be thinned at least twice a week, removing exhausted growths to make room for young bearing shoots. Keep the shoots well stopped to one joint beyond the fruit, or at the fruit if the plants are vigorous and showing no signs of exhaustion. Always allow weakly plants more extension, and crop them lightly. Maintain a steady root action by necessary bottom heat and due attention to watering two or three times a week. The bottom heat should be 80° to 85°, top heat 70° at night, 75° by day, 80° to 85° with sun, closing early to increase to 90° or 95°. Syringe in the afternoon of hot days, but avoid late syringing, for the foliage should be dry by sunset, and commence ventilating early, it being important that the foliage be dry before the sun acts powerfully upon it. The autumn fruiteders should now or soon be planted on hillocks or ridges moderately firm, maintaining a moist and genial atmosphere, and they will soon show fruit in plenty.

#### PLANT HOUSES.

*Catecolarias.*—Prick off seedlings into pans 1½ or 2 inches apart, so that when they fill this space they will be ready for placing into 3-inch pots. Several successional hatches may be obtained from one sowing. Seed may still be sown where the supply of plants from the first sowing are not sufficient. Grow these plants in a cold frame with a northern aspect, at any rate where they can be shaded from the sun.

*Cinerarias.*—The earliest plants should be transferred into 5-inch pots, others into 3-inch that display signs of crowding in pans. Those still in the seed pans may be pricked off into other pans or boxes 2 inches apart. A little more seed may be sown to supply plants for flowering in small pots late in the season. Give abundance of air to these plants to induce a dwarf compact growth. Be careful not to crowd them, shade from bright sunshine, but carefully avoid over-shading them.

*Solanums.*—Where these are under glass give them abundance of air. The weather of late has been unfavourable for turning them out, but should it change they are better outside. Keep the plants growing by giving them stimulants occasionally. Seedlings that were placed into 5-inch pots some time ago and encouraged to grow should have commenced to flower freely, although they have been grown closer than cut-back plants or those raised early from cuttings. They should be carefully hardened and subjected to the same treatment as old plants.

*Salvias.*—These plants should be growing rapidly; pinch the points out of them to induce them to branch. If the stock is deficient cuttings may still be rooted of late flowering kinds, which will make useful plants by autumn. Plants in 5 and 6-inch pots for furnishing purposes are often more useful than those of a larger size. Where tall large plants can be accommodated allow them to extend and branch naturally. There is no difficulty in producing plants 5 or 6 feet high in a season provided the leader is not too closely pinched.

*Bouvardias.*—Discontinue pinching the early plants and allow them to grow naturally from the present time—that is, if large fine trusses of bloom are needed. If the plants are needed for decoration only any strong shoots that start from the base may be pinched. Our plants have still the protection of frames, but with a change of weather they may be turned out for a time to make room for those in a less forward condition. Some of the latest plants are only just being placed in their flowering pots. These should be kept under glass, and when they have taken fairly to the new soil they will be pinched for the last time. The early batches, whether kept under glass or turned out, may be given weak stimulants occasionally or artificial manure to the surface of the soil.

*Primulas.*—The earliest plants should be placed in their flowering pots. Pot them moderately deep, so that they will not shake about when in flower. Where practicable plunge the pots amongst leaves or ashes, and when they have taken to the soil raise the frames slightly so that a good circulation of air can play amongst them. This is important if sturdy plants that will flower well are required. Those for succession must be potted as they require more root room; it is a mistake to allow them to become root-bound before they are placed into larger pots. This induces the young plants to flower, which indicates that they have been seriously checked. Double varieties should be placed in 5 and 6-inch pots. Those that flowered late may be divided and potted in 3-inch pots. Each portion should now be well rooted. They will strike from cuttings, but the safest plan is to earth them up until they emit roots from the stem.

*Mignonette.*—Standards and pyramids should be extending rapidly over their trellises. All the attention needed is to remove the flowers as they appear, and regulate their shoots from time to time. Give the plants abundance of air; during the day the lights may be removed altogether. To do well they should stand on a moisture-holding base, and be carefully watered and syringed twice daily. Later plants for spring flowering should have their trellises placed to them. Seed sown in 6-inch pots should be thinned out. The plants should be 1½ inch apart. Sow a good batch of pots, and place in a cold frame until the seed germinates; the frame should be shaded with mats. To the earliest plants clear soot water may be given, but avoid strong stimulants, they do more harm than good. A little artificial manure applied to the surface is preferable.

*Heliotropes.*—Plants intended for autumn flowering—White Lady is unquestionably the best—should be placed in 6-inch pots, and stood outside on a bed of ashes in a sunny position. Standards and pyramids should have the flower trusses removed as they appear. Pinch any shoots that are taking the lead, so that the trellis is evenly covered. These plants are better outside than in.

*Stocks.*—For spring flowering in pots seed should be sown in boxes without delay. Place the boxes in frames until the seed germinates, then grow them perfectly cool, and when large enough pot them singly. The varieties of East Lothian and Intermediate are useful for this purpose. Princess Alice is a very useful Stock, and well worth sowing now for growing in pots.

*Campanula pyramidalis.*—Sow seed now in a box or pan to maintain a succession of these plants. Those sown last year at this time, and now in 6-inch pots, should be placed in 9-inch; they do well in loam, sand, and one-seventh of manure. They should stand outside. The only protection they need is a cool Peach house during the winter. The seedlings should be raised in a frame, and when large enough potted singly and watered in a cold frame.

*Celosias.*—Pot those plants that need more root room, 5 and 6-inch pots are suitable. Grow them in cold frames fully exposed to the sun, and give liberal ventilation. Nothing is gained by trying to hurry those raised from seed early in May. Plants raised later, and are only ready for breaking off or placing into pots, will require to be grown in an intermediate temperature. The faster they can be pushed on the better consistent with maintaining sturdy growth.

#### APIARIAN NOTES.

##### THE WEATHER.

ANOTHER boisterous week of unseasonable weather has passed, gloomy and stormy in the extreme, with a mean temperature of 52° Fahrenheit. The 21st was an exception, the morning's reading of the thermometer being 54° and the day temperature 70°, the most genial day of the season, and the bees worked tolerably

well for a few hours. The pure Carniolians, as well as their crosses, increased 2 lbs., while the Punic bees increased 3 lbs. in weight.

From all quarters the reports are discouraging. From one quarter a third of the colonies are dead, from another they have to feed to keep bees alive, and from a third prime swarms are casting virgin swarms, and young queens are not laying. These reports cover a very wide field. This sad state of matters is just what I predicted would take place with queens, and unless bee-keepers strain every nerve to secure young fertile queens there will be much disappointment to encounter in 1891. One sunny day would put many queens all right. It is an absurdity to say three weeks' retardation of fertilisation renders the queen sterile, that queens do not come into high laying powers for weeks after fertilisation, and that queens continue as prolific at two or three years as year-old ones.

The foregoing, combined with the experience of a very untoward season for bees, but not more so than many that I have experienced, will, it is to be hoped, instruct bee-keepers on some important points, such as to know beforehand what bees under certain circumstances will do. We have sufficient proof that where young queens have been kept there are few swarms, while in the same districts where queens were older not only have they swarmed, but have thrown virgin swarms long before they were crowded. Upon the age and fertility of the queens depends the success or non-success of the bee-keeper and his colonies.

#### PREPARING FOR THE HEATHER.

I am awaiting a reply by post as to the state of the Heather. On that reply and the weather in the next few days will I decide whether the bees go or remain at home. If the former the swarms that have young queens, and which were fertilised early, will go; all the others must remain at home. The unswarmed old stocks are in prime order, and will admit of no manipulation further than supering. Had any been weak I would have broken them up and divided their brood combs amongst the late fertilised queens, so as to gain the greatest strength and vigour with the least inclination to swarm. Unswarmed old stocks with ten days or so of fine weather, with a likelihood of a continuation, are sure to swarm, although we super beyond their wants, and will require watching; and if 1890 has not been a profitable one for bee-keepers it is to be hoped they will profit by what it has taught. I am writing this on July 25th. The same day of the month we set our bees down at the Heather last year. It did not turn out a good Heather honey year, although the bloom on the Heather never was finer. It will be remembered that the weather broke on the 7th of July, and there was not a day without rain till the first day of September, and it appears to have been but the commencement of the wet season, which we fervently hope is ended. A decided improvement has taken place; the barometer is rising slowly, and although the day is dull the thermometer is standing steady at 65°, being between 5° and 10° higher than it has been for long under similar conditions.

Before honey becomes plentiful there must be a few days of warmth and sunshine. After the honey is in the flowers there is less need of sunshine if the air be warm, and often the largest gatherings take place under a cloudy sky, but wind is unfavourable to the secretion of honey and to the flight of bees.

#### FIXED DISTANCES OF FRAMES.

Amongst the many devices of bee-keepers to alter the nature and plans of the bees that of altering the width between the frames during the season, and at all times to a little less than the bees do naturally, is one that has caused considerable discussion, which might have been avoided, because not the slightest advantage is gained by it, but the reverse. For more than a quarter of a century I have used brass nails or shoemakers' tacks as distancers in making of cheap hives, tacks being cheaper than brass nails

used for furniture. The Americans are now adopting this method, and the 1st of July "Gleanings" has an article with a drawing showing exactly what I have been doing so long, and what I have described under the heading "How to Make Cheap Hives."

Those who propose making hives for their own use should not deviate a hair's breadth from spacing their frames at 1½ inch from centre to centre, and when having them made should insist upon that distance being maintained, together with stouter top bars than are generally sent out. I may enlarge upon this question again, and as I mean to go to the moors with my bees, will watch their movements and report. I am only sorry that the weather has precluded the possibilities of a fair trial with the different races of bees in my apiary, but as the Punic gathered 1 lb. more than my best Carniolian stock on so small a gathering, augurs well that they will prove themselves the superior bee.

#### FIXING SECTIONS TO TOP BARS.

"Perhaps 'Lanarkshire Bee-keeper' will kindly inform me, at his earliest convenience, what size sections to use in the Lanarkshire hive, and where they are to be procured, one width throughout, except bottom rail? How many nails do sections require to fasten them to top bar?—J. D. L., *Northumberland*."

Sections are fastened to top bars by driving a three-eighth or half-inch fine wire nail at each end and opposite corners, or by staples, either to catch the bar and section, or they may be driven into the centre of the bar. Many people prefer the former, while others prefer the angled tins as described several years ago. There is no maker of these in this country. Numbers of people have ordered them from America. Those who have not procured them cut down common sections to the necessary requirements. I use three sizes, 2 lbs., 1½ lb., and 1 lb., 5¼ high by 6¾, 4½ and 3¾ long respectively. As our climate is so fickle, it will be obvious to all the necessity of putting no obstacle in the way of bees, the removal of the broad bottom rail is the removal of a great obstacle to bees entering supers.—A LANARKSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

Henry Norton, Louth, Lincolnshire.—*Descriptive Catalogue of Dwarf Roses.*

Armitage Brothers, High Street, Nottingham.—*Catalogue of Dutch Bulbs.*

J. E. Barnes, 9, Exchange Street, Norwich.—*Catalogue of Seeds for Autumn.*

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Figs not Swelling** (*Inquirer*).—In consequence of a peculiar confusion of addresses it is impossible for us to determine whether an answer to a letter which we have received on the above subject is required through the *Journal of Horticulture* or another medium; if through this Journal the Editor will be obliged by the name and address of the writer of the letter.

THE FARMER'S COW.

SPECIAL utility and general utility are the two points of moment which claim particular attention in making a selection of cows for stocking a farm, and local circumstances should determine if greater weight is given to one point or another, or if an equal balance is maintained between both. With a steadily downward tendency in the value of corn live stock has naturally been looked to more closely as a means of relief, and in many an instance it has failed to help the farmer in his need, more because of mismanagement than anything else. To purchase cattle at prices which preclude any possibility of profit simply because they "must" be had is ridiculous; equally ridiculous is it to breed inferior stock.

Faulty practice in this important branch of farming is doubtless owing to the fact of corn having been so profitable at one time that wherever it could be grown it has preference over everything else. Dairy farming and cattle rearing had comparatively little notice, superior practice in either being quite exceptional. Meanwhile the population went on steadily increasing, prosperity combined with the spread of information about wholesome nutritious additions to and changes of the people's dietary caused a growing demand for dairy produce, which we failed to supply. The importer saw his opportunity and seized it. Foreign produce rules the market, for farmers over the seas have made that produce so superior that it is only by bringing home produce up to a high and uniform standard of excellence that we can enter upon a competition with them with even reasonable hopes of success.

Of equal importance is the general improvement of our cattle. The exportation of select pedigree stock from this country goes steadily on, and it points in no uncertain manner to a reflux of both store and fat cattle of superior quality and in large quantities within a measurable period of time. Well will it be if we can meet it by such a general improvement in cattle, in feeding, and in the provision of food, as shall virtually give us the control of our own markets. This is no mere fanciful project; general improvement is unquestionably very possible. We ought to and could keep twice or three times the number of cattle per acre than we now do. The man who has hitherto been satisfied with £7 or £8 per acre for a crop of green fodder, ought to aspire to a return of twice that amount, simply because it is possible, and is realised under certain conditions. No longer ought we to waste our time and money upon grazing under-bred cattle, but rather turn to choice home-bred stock capable of being finished for the butcher well within the second year. Early maturity with quick and profitable returns is what we require and can have, nor ought we to rest satisfied with inferior cows. A cow giving only 10 or 12 quarts of milk daily is not worth keeping.

No doubt the model farmer's cow is an animal answering to the requirements of the Royal Agricultural Society in their class for dairy cattle of any breed. Preference is given to animals combining excellence for dairy, grazing, and stall-feeding purposes. Take for example the first-prize cow at the Preston meeting in 1885. This was "Red Cherry," a Lincolnshire shorthorn, with a very large well-shaped udder, milk veins highly developed, and capable of making a very considerable return as beef when her powers as a deep milker began to fail. The Judges said, "This is just the stamp of cow that dairymen ought to look for, combining as she does a well-developed frame, with faultless udder, and all other milking qualities. Her yield of milk, as tested in the Show

yard was 27 quarts per diem, while the quality, according to analysis by Dr. Voelcker, was a fraction over the required standard." The conditions of the competition were that cows entered should give not less than 18 quarts of milk per day, containing not less than 12 per cent. of solids (including butter fat).

Plenty of farmers require cattle solely for grazing and stall-feeding, and to them the work of selection is much easier, their choice ranging according to locality through Shorthorns, Herefords, Devons, Sussex, Galloway, Polled Angus, Red Polls, Welsh Runts, and cross breeds. More, very many more, of the latter do we wish to see, and again we say to every farmer, Breed your own cattle, and don't waste your means upon those sharp, clever middlemen who attend and virtually control every market, while you are mere puppets in their hands. Make your farms self-contained and self-supporting, and keep yourselves as free as possible from exterior influences. But pray don't shut your eyes to them, rather be on the alert for early information of all change, all progress that affects your business in any way.

WORK ON THE HOME FARM.

The farmer's brief time of leisure between haymaking and harvest has come, and he will do well to turn some part of it to account to see something of farming practice elsewhere. Before leaving home it is well to ascertain where some really good practice may be seen, and to those who as yet have not given ensilage its place upon their farm we say, Go and see as much of it as you can elsewhere, and so get the necessary feeling of confidence to adopt a process so conducive to success in stock management. Above all things listen to no method of ensilage where thorough pressure is not enforced. We have no doubt that in those rare instances where difficulty is found in getting animals to consume silage freely the fault lies in the making.

The hay generally made this season will be of inferior quality, and really choice samples will bring high prices later on. Much good hay has been made as the weather cleared after the St. Swithin's storm, but there is a preponderance of over-ripe wiry stalks among it, as it was left so late that all the earlier grasses had ripened seed and stalks. Much of the hay mown on St. Swithin's day was positively afloat after the storm on heavy land pastures, and on some low-lying land every haycock save one was swept away by the flood waters. Certainly the value of ensilage was never more apparent than it is this season.

We recently saw an Oat field sadly infested by docks, and the short ears and stunted growth of the Oats told a tale of foulness and poverty all too plainly. With soil so saturated by frequent downpours of rain it would be an easy matter to root up the docks. That would be the first step in reclaiming such a field, and our next would be to feed off the Oats with our draft ewes in folds, for such an inferior crop could be turned to no better account, the old sheep would thrive upon it, and the land would be sufficiently enriched for Cabbage, Rape, Rye Grass, Rye, winter Oats, or Wheat. Hedgerow weeds should be mown before harvest to prevent seeding, and a close search made everywhere upon the farm for docks and thistles. It is only by the timely and regular destruction of all such pests that we can hope to have a really clean farm.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

20th.—Cloudy early, bright fine day.  
 21st.—Fine with occasional sunshine.  
 22nd.—Spots of rain about 9 A.M.; bright warm day.  
 23rd.—Dull early; bright warm day.  
 24 h.—Fine and bright till 3.45 P.M.; then spots of rain, and a shower for a minute or two at 4.5 P.M. not sufficient to measure, fine night.  
 25th.—Bright and fresh throughout.  
 26th.—Misty early, with occasional showers; generally bright after 10 A.M.  
 A generally fine week of about the average temperature.—G. J. SYMONS.

## FRUIT IN THE MIDLANDS.

WHEN fruit trees are barren, or nearly so, as is the case with the majority this year in British gardens and orchards, it is perhaps only natural that the circumstance should be taken advantage of by hypochondriacs for pointing out what they conceive to be the uselessness of planting more trees. It is the way of the world, or at least the habit of several persons in it, never to be satisfied. When trees are bent to the ground with their loads of fruit, as they have been in the past, and will be again, the same objections are heard to the planting of trees, but on the ground then that there is more fruit than can be profitably sold or eaten. If persons who, we will not say thus reason, but assert themselves, were to be accepted as guides, the planting of fruit trees would cease. We are counselled not to plant on the one hand through the fear of providing too much fruit, and on the other because the trees do not bear half enough. Since such peculiar conclusions are arrived at and expressed, and as a considerable number of persons are influenced by them, it is desirable, and even necessary, to keep the question of the home fruit supply prominently before land-owners and the fruit growing public. This is what the British Fruit Growers' Association is doing, and holding some of its meetings in the provinces is a step in the right direction.

The meeting at Leicester in connection with the Horticultural Show held there this week, while adding a feature of interest to the Exhibition, will probably give an impetus to fruit culture in a great and important district. There is no better soil nor more favourable positions for increasing and improving the home fruit supply than in the midland counties. No finer grain, root, and leguminous fodder crops can be found than in the midlands; and wherever Wheat and Potatoes yield abundantly and ripen early, and where Clover and Turnips grow luxuriantly, there the finest of fruit is capable of being produced. But varieties and sites must be judiciously chosen, and cultural attention afforded to the trees for the attainment of the object. This is necessary for the production of the most familiar farm and garden crops. To these much thought is directed and labour applied, otherwise they would be complete failures. But it has not to anything approaching the same extent become the custom to cultivate fruit trees with equal care. On the contrary, the practice of planting trees and leaving them to take care of themselves has too long prevailed, and the necessity for establishing young trees long before the old have become unprofitable has not yet become recognised. But the system will have to be adopted before the British fruit supply can be regarded as satisfactory. Farmers might with as much reason rely on rickety worn-out horses for doing their work, and toothless sheep for paying the rent, as on exhausted canker-eaten trees for yielding fruit worthy of the name for home use, and for commanding attention in markets.

The fruit of the future that can alone be profitable to the grower will be the produce of young trees, or trees in the best of health, because of the nourishment they need being afforded by the soil, and with the branches exposed to the full influence of the sun. Such trees yield large, well fed, juicy, glossy, and attractive fruit, and this, moreover, can be abundantly produced in a very few years by planting trees on dwarfing stocks which feed near the surface of the soil where the food is the best, and can be so easily provided. Crowded mop-headed trees, a mere thicket of interlacing branches

and stunted growths, are essentially incapable of providing what is needed, and the crops from thousands of such trees can only be regarded as waste.

Relative to the failing fruit crops of any particular year checking the planting of trees, Mr. A. H. Pearson, in his practical essay read at the Leicester Conference, pertinently observes that Irish Potato growers have not been frightened by the disease from cultivating the crops, nor, he goes on to say, "are we going to turn our backs on fruit culture because of a few difficulties." That is fairly representative of the British characteristic of combating obstacles till they are surmounted, and it is so doing and not "turning our backs" on them that has made the nation rich and great. If the failure of a crop occasionally was to have a deterring influence, not a few persons would cease growing even grass for hay because they practically lost their crop this year through continuous wet weather. Through the same cause—violent storms—grain crops have been ruined over and over again, yet the work of sowing and reaping has continued, and will continue, in spite of occasional impediments, though the culture cannot compare with fruit growing for yielding profit over an average number of years when this is well conducted. It is not for the sale of fruit alone, however, that trees should be planted, but for affording fruit of superior quality for home use. The character of the supply for that purpose is, generally speaking, quite unsatisfactory. It is true that some of the outdoor crops must fail occasionally, as other garden and farm crops fail, but where fruit of all the useful kinds are intelligently cultivated under ordinary favourable conditions, a total failure of the whole may be said never to occur, and a thoroughly useful supply of some can be relied on, as well as can a supply of vegetables. With extra, and the reverse of extravagant, provision in the form of cheap glass structures, which so many have ample means for erecting, coupled with good management, fruit of the highest possible quality of any desired kind can be had with almost absolute certainty. Mr. Rivers refers to this in his excellent paper on stone fruits, but he does not tell half of what he has accomplished this year at Sawbridgeworth; in fact, he gives no adequate indication of either the quantity, quality, or value of the fruit that we have this year seen in his unpretending structures, and on trees in pots removed from them after the crops were safe, and plunged in the open air.

Apart, however, from this system, fruit culture ought, and no doubt will, be greatly extended; it is rare that even all varieties of Apples fail. Mr. Pearson very pointedly recommends a free and one of the most certain bearing of Apples, Duchess of Oldenburg, and thinks it will surprise his friends in the south that he should give it the post of honour in his short but useful list. We suspect those southerners who have been close observers of Apples during recent years are fully alive to the value of this Russian variety. One cultivator of great experience who has been planting trees for profit has excluded all others and is growing this alone. Mr. Rivers could give testimony of its usefulness, for he commenced sending fruit of it to market in August, and we may almost venture to state that there is not one other variety in his great collection that will be of equal value to him this year; and in a note on another page Mr. Bunyard quotes the market price of this distinct and good early Apple; and though this is 2s. a bushel less than for Irish Peach, the former is the greater bearer.

Mr. Bunyard also communicates interesting information on the influence of stocks as affecting the crop of fruit. Trees on the Crab and Paradise stocks produced ample blossom, but the difference in the crops of fruit following is remarkable and significant. He can scarcely account for this. The colder and slower moving sap of the deeper rooting stock at a critical time was possibly prejudicial. Be this as it may, the roots of the Paradise stock would be in a warmer medium during the blossoming period, and it may be expected that the supply of sap for sustaining the embryo fruit

would be more free and uniform in consequence. We have seen numbers of young dwarf trees of different kinds of fruit bearing well, while old trees surrounding them are barren.

It is only natural that a scant crop of fruit and barren trees should be disappointing to the owners of them, but trees cannot bear heavy crops always. One great grower was heard to say the rest would do his Apple trees good, and he hoped would have another and important result—namely, of starving out the codlin moth, which was becoming seriously destructive, and he thinks the pest cannot exist for a whole year without anything to eat. He intends planting more trees, especially of Duchess of Oldenburg.

## FRUIT CONFERENCE PAPERS.

THE following are two of the papers referred to above as having been read at Leicester on Tuesday last by Mr. T. Francis Rivers and Mr. A. J. Pearson. Others will appear in a future issue.

### CHERRIES AND PLUMS FOR PROFIT.

BY MR. T. FRANCIS RIVERS.

THE Cherry is, and has been always, one of our most important industrial fruits, coming into use almost as soon as the Strawberry, and remaining for some weeks after. A May Duke Cherry tree loaded with its crimson fruit is a sight beloved of boys and birds. The Norman orchardists declare that the orioles who arrive first pass the word to their followers that the Cherries are reddening in Normandy, and when the signal is given they descend in shoals on the trees. It is certain also that in many parts of England it is almost hopeless to keep a crop of fruit from these busy thieves. I know from my own experience that it is quite hopeless, and I am compelled to grow all my fruit under glass.

The tree is hardy, and will bear abundant crops of fruit very far north. In St. John's "Wild Sports of the Highlands" he speaks of the wood pigeons feeding on his plentiful crops of Cherries in Morayshire, near the Bay of Findhorn. It flourishes and fruits freely in all dry sandy soils, but does not thrive in deep rich alluvial districts. On the high and dry Epping plain, where I believe water has been sought for and not found at a depth of 800 feet, the Bigarreau and Heart Cherries thrive exceedingly; and I have also seen abundant crops of May Duke Cherries in the dry and sandy soils of Woburn Sands near Bedford. When establishing a Cherry orchard this condition of the tree should be always considered, and the knowledge will be of considerable use in winning a profit from a soil which the farmer or grazier would pass by as unsuitable for his purpose.

For practical purposes the Cherry may be divided into four classes—the Guignes or Heart Cherries, the Bigarreau, the May Duke, and the Morello. The Guignes or Heart Cherries are the earliest to ripen. The earliest large Cherry of this class is the Guigne d'Annonay, which is large, sweet, and very good, purplish black in colour, ripening in an unheated orchard house about the first week in June, and in a warm hot season the last week in May. The next in order, and in my opinion the finest of the class, is the Early Rivers. This was raised some years since from the Early Purple Guigne, a very delicious and fine Cherry, but rather too tender for out-of-doors culture in this country. Under glass the Early Rivers ripens the first week in June, and will hang in good condition until the second week in July. For some time I hesitated to recommend it for cultivation as a standard tree in orchards, but I now find that it is as hardy as the May Duke, and it produces abundant crops of fine large black fruit a fortnight before the May Duke. I can safely recommend it as one of the most profitable Cherries existing. It has lately been planted on a large scale in Kent, with the most successful results, and I am therefore, supported in this opinion by the experience of others. The Belle d'Orleans is a very early Heart Cherry, bright red and white in colour, ripening also in the beginning of June, but flowering too early to escape damage from frost. The Governor Wood is a bright yellow and red Guigne, ripening about the middle of June, very hardy and vigorous, a most abundant bearer, and a profitable market Cherry. It is a popular sort in America, from whence it was introduced in England some years since. The next in order to ripen is the Early Red Guigne, a very dark red Cherry, of large size and delicate flavour, worthy a place in a collection, but not adapted for general cultivation. The Elton, a well-known early sort, ripening before the Bigarreau. The next in order are the well known Turkey Black Heart, the Bedford Prolific, a hardy variety of the Black Tartarian, which is too tender in this country unless grown under glass or on a wall, the fruit of which will hang on the tree under glass until

August, when the Late Purple Guigne, a very fine, large, and rich Cherry, ripens, hanging through August and late into September; the Guigne de Winkler, a bright red, very juicy and sweet sort, ripens in September, and lasts well on the tree until October, closing the series of Guignes, which differ from the Bigarreau in the quality of the flesh, which is very tender, sprightly, and delicious.

The Bigarreau Cherries are perhaps better known than the Guignes, the fruit is more solid in texture, and hence better adapted for carriage. The Bigarreau Jaboulay or Early Lyons is the earliest large fruit of this series. This is a very large and fine Cherry, earlier than the May Duke by some days, requiring a wall or an orchard house. The Bigarreau de Schrecken is an early black sort of recent introduction, very hardy and good. The Early Black Bigarreau, the Early Red Bigarreau, the Bigarreau Noir de Guben, precede the White Bigarreau, and are abundantly fruitful. The White Bigarreau is the Cherry grown for the markets in Kent, the orchards being said to realise fabulous profits. The variations of this sort are the Bigarreau Monstrueuse de Mezel (when well grown the fruit of this sort is enormous), the Bigarreau Napoleon or Late Mottled Bigarreau, with numerous other synonyms, very large and late. The Emperor Francis, a recent introduction, is very late, hanging long into September under glass, this is a very large bright red sort, exceedingly handsome on the tree. The Late Black Bigarreau ripening after their light red and yellow cousins, may be described as very large, firm and rich flesh of a lustrous black. Placed in their order of ripening they consist of the Bohemian Black Bigarreau, the Bigarreau Noir de Schmidt (an enormous fruit), the Large Black Bigarreau, and the Late Black Bigarreau. The Tardive de Lich and the Belle Agathe are late sorts, lasting well into October. I have named many varieties which I do not think are generally known, but I have cultivated them all under glass, and I have thus been able to take special notice of their different habits. Those who cultivate them in an orchard house will, I am sure, find the study of the variations a source of peculiar interest, and also of great benefit to the fruit growing community, as it is only by cultivation under glass that new and possibly valuable sorts can be tested.

The Bigarreau and Guigne Cherries are of the highest value as dessert Cherries, and as the fruit is said to be entirely devoid of acidity they are a very welcome diet to the invalid, to whom the tender and delicate flesh of the Guigne is better suited than the firm and sometimes rather hard Bigarreau. The May Duke Cherry is perhaps the most popular of the tribe; at all events, we are most familiar with it. No boy ever seems to be surfeited, and can consume an indefinite quantity. There are not many varieties, but some are distinct from our old English sort—not in quality, but in the season of ripening. The Empress Eugénie is an early variation, having a maturity of some ten days earlier. The Royal Duke, the Duchesse de Palluau, the Gloire de France, the Archduke, and the Late Duke all follow in succession. If protected by netting from birds these Cherries will hang some weeks on the trees, giving a continual supply of fruit, either for the dessert or the kitchen.

There are some palates which are very well satisfied with the acid Cherries of the fourth class, which comprises the Kentish, the Flemish, and the Morello. Of these I think the Kentish and the Morello are the best. The value of the Morello is well established, as it is the Cherry for preserving either in bottles or spirits. Cherry brandy has long been a popular cordial in England. On a north wall protected with netting it will last very late into the autumn, and when black and thoroughly ripe the fruit is very refreshing and grateful. The cultivation of the Cherry in orchards is not difficult. As I have said before, it is essential to success that a dry calcareous gravel be selected, but instead of planting standard trees at 24 feet apart, of which the prospect of profit to the planter is somewhat remote, I should plant dwarf trees in rows 15 feet apart row from row and 12 feet apart tree from tree for all Guignes and Bigarreaux, and rows 12 feet apart row from row, with 9 feet plant from plant, for the May Duke and Morello. These trees are easier to manage, the fruit can be gathered without ladders, and the space between the rows can be utilised for vegetable crops or for a certain number of years by Strawberries, Gooseberries, or Currants. The trees should be pruned as little as possible, as the Guignes and Bigarreau are very impatient of pruning. My own experience is that this should be done in the autumn, superfluous shoots removed, and the summer growth thinned about the beginning of October. If severely pruned both these classes are inclined to gum, and then comes disease. The May Duke and Morello classes may be pruned in the summer and autumn without detriment, but as they are always inclined to produce fruit in quantity the trees after a certain age will not require much pruning; it will be necessary, however, when the trees are grown in rows to keep the growth as far as possible in the line of the rows.

The Montmorency Cherries are very dwarf growing kinds which merit a place in English fruit gardens; they are dwarf, easily grown, and abundantly fruitful; they are grown in large quantities near Paris, and sold in the markets very early in the summer, being used for the delicious Cherry compôtes so popular in France.

The stocks for grafting Cherries are of two kinds, the Mazzard or wild Cherry—the seedlings from this are necessary for the Bigarreau and Guigne Cherries—and the *Cerasus Mahaleb* or *Cerise de St. Lucie*, which is a good stock for the May Duke and the Morello. The advantage gained from the employment of the Mahaleb stock is that it may be planted on a poor chalk soil. It will grow freely in the most unpromising situation provided that the soil is dry. It is, of course, only an alternative, as the May Duke and Morello grow perfectly well on the wild Cherry stock. With the exception of the Governor Wood and the Early Rivers the Guigne and the Bigarreau will not grow on the Mahaleb stock, and it is useless to try it. I believe that I am right in saying that Cherry culture is not unprofitable in England, and I am certain that many districts may be utilised for the production of this very useful fruit.

Those who wish to grow and taste Cherries in perfection must grow them under glass; the fruit attains very great perfection, and is protected from rain and birds. An unheated span-roof house about 18 feet wide will give a very large supply of fruit, the trees being placed down the centre of the house, so that the sun shines on both sides of the tree. When grown in pots they can be removed at will, a convenience not obtained when the trees are planted in the soil.

About the end of July when Cherries cease to be plentiful in the markets, their place is taken by another fruit of greater economic value, and of which the cultivation in this country will some day be much more extended than it is at present. The Plum, like the Cherry, may be divided into classes, of which the principal divisions are the round fruited and oval fruited, freestone and clingstone. The earliest Plum to arrive in the market in large quantities is the Early Rivers or Early Prolific. This is a well-known and popular Plum, raised about forty years ago. Although I understand that it does not succeed everywhere, I think that in suitable localities it is one of the most profitable Plums in existence. My own orchards, on a calcareous clay, have always given me abundant crops. The Czar, a very hardy and fine Plum, closely follows the Early Rivers. These two Plums are valuable sorts, as they are abundantly fertile, and can be sent to market at a very early date, for although the foreign Plums arrive in England by the end of July, the quality is not to be compared to our own productions. The Early Orleans is also a popular market Plum, ripening with and after the Czar. The tree produces large crops, but the fruit is so liable to crack that a crop is often seriously damaged by a shower of rain.

During the month of August market Plums are plentiful; those of which I have actual experience are the Oullins Golden Gage, which I do not recommend anyone to plant. I have, I think, some 500 trees of this sort from ten to fifteen years old, and they have never yet paid the rent of the ground, the skin of the fruit being too thin for packing, and consequently it is difficult to send to market in good condition. Denniston's Superb is a most abundant bearer, and as it ripens some days before the Green Gage it commands a good price. The Belgian Purple is a large Plum of good quality, and in some places I understand it is a profitable fruit. Prince Engelbert, a large, oval, purple Plum, produces enormous crops. Sultan, a large, round, purplish red Plum, bears abundantly and always commands a good price; it is said to be one of the richest preserving Plums known. At this time we have Gisborne's, of which the Syston or Beef Plum appears to be a synonym, and the Pershore; these are followed by the Victoria, Prince of Wales, which has a bad habit of sometimes ceasing to grow; Belle de Louvain, a very large oval Plum, closely resembling the Red Magnum Bonum, but ripening some weeks earlier; Pond's Seedling, always commanding a high price; Diamond, a popular Plum in some districts; Monarch, a large and late purple Plum, which I venture to predict will some day be very largely planted; after this the Autumn Compôte and the Late Black Orleans, lasting until the second week of October.

There are some sorts which I have not named as market Plums, as I have not found them profitable in my district. These are Kirke's, which is very uncertain in its produce; Cox's Emperor, the fruit of which is produced in large clusters, and often rots on the tree, the skin being tender, like its parent the Early Orleans; Mitchelson's, a great bearer, but a very inferior Plum.

The Damsons come into bearing generally about the middle of September. The most prolific Damson that I know is the Crittenden, Cluster or Farleigh. The King of the Damsons, a sort of recent introduction, promises to be a valuable addition, as it is

very large and very prolific. The Prune or Shropshire Damson is well known and esteemed in the north.

The list of late economic Plums closes with the Bullace and the Wyedale Plums, the fruit of which will hang on the tree until late in November—a valuable quality, as it reduces the consumption of preserved fruit.

At the head of garden dessert Plums, as distinguished from market sorts, the Green Gage and its varieties undoubtedly stand. One variety of this family was introduced from France many years since, under the name of Reine Claude Diaphane, or Transparent Green Gage. When thoroughly ripe this can challenge the Green Gage for excellence; it also has the property of communicating a distinction to the seedlings derived from it. There are three which deserve a place in any garden. These are the Early Transparent Gage, the Golden Transparent Gage, and the Late Transparent Gage. Other Gage Plums of great excellence are the Bryanston, the Oullins Golden (although not an orchard Plum, it is an excellent garden Plum), the Purple, the Reine Claude du Comte Athems (a Hungarian Red Gage of excellent quality), the Guthrie's Late Gage, and the Reine Claude de Bavay. Of Plums which are not Gages, but of fine flavour and quality, we have the Stint, the Early Favourite, the De Montfort, the Yellow Impératrice, the Jefferson, Angelina Burdett, Golden Esperen, Decaisne, Grand Duke, and Coe's Golden Drop.

The small Mirabelle Plums are very pretty and productive, and should be planted in gardens, as they make a delicious preserve. I hardly think, however, they would pay for market.

The Plum does not make a lofty tree, and does not therefore require very much space. My own system, which I have found to answer very well, is that of planting dwarf trees in rows 9 feet apart and 9 feet tree from tree, the stems of the trees being a clear 4 feet to the branches. I find that trees of this size are more easily managed than standards, especially in the gathering season. Damsons, particularly the Crittenden, may be planted much nearer than Plums; in fact, 6 feet is not too great a distance, so that the trees form fruitful hedges. I should recommend the distance, however, of 9 feet between the rows. Like the Cherry, the Plum is impatient of pruning, and this should be done in the autumn about the beginning of October. A calcareous clay appears to me to be absolutely necessary to the well doing of the trees.

There is, of course, an element of uncertainty in the production of fruit out of doors in this country, but this may be made a certainty by the employment of glass. The Plum adapts itself very readily to pot cultivation under glass, and as the fruit may be removed to the outside for ripening during the summer months, a glass house may be made available for a large supply. Fruit from pots grown in suitable soil is always of excellent quality, and when ripened under glass is singularly rich and good. The fruit will hang for some time when fully ripe. The facility with which Plums may be dried has hitherto been overlooked in England, but this industry is now in the process of development, and with the assistance of improved methods we shall not hear in the future of Plums rotting on the ground from the abundance of the crop, a waste which is sinful, as the plenty of one year is usually followed by the scarcity of succeeding years. It is in the hands of those who are interested in the land to prevent this waste, and one great factor of success will be that of holding meetings to invite discussion, which will have the effect of bringing about a wider and more extended knowledge of the fruit-growing districts of our country.

## APPLES FOR THE MIDLANDS.

BY MR. A. H. PEARSON.

It is my pleasure to address you for a few moments upon the subject of "Apples for the Midlands," and in doing so I wish to look at the question from a market grower's point of view, *i.e.*, with an idea of planting for profit.

It may perhaps strike someone that the idea of planting for profit is out of place, when we look around our orchards and see the trees devastated with the caterpillar, and all prospect of fruit marred, if not blighted. Some will even go so far, I doubt not, as to say that Apple growing is a delusion and a snare, but I think there is no reason for us to accept their view. That we have all suffered loss this season, and many of us last season, is true, but I see no cause for despair; such things have happened in the past, and have passed away in due course. I have heard my father speak of a year when our Apple trees, which cover nearly 100 acres of land, had scarcely a leaf left upon them, and such a thing as a perfect leaf was hardly to be found. The whole of the trees had the appearance of being scorched, as if huge bonfires had been lighted under them, but in the course of a few days an immense flock of starlings found their way to the orchards, and in an almost incredibly short time they practically cleared off the caterpillar. It will be in the recollection of most of you that a few years ago the

Oak trees were in many parts of the country completely divested of their foliage by caterpillars, and some few died from the effects, but I never heard that any landed proprietors gave up the idea of planting Oaks in consequence, and the old Oaks to-day look as luxuriant as ever they did before their trial. The Potato disease has not yet frightened our brothers in the Green Isle from cultivating that most useful tuber, nor are we going to turn our backs upon fruit culture because of a few difficulties. It is not my business to speak to you upon the caterpillar pest, but if it were I should advise those of you who have large orchards, and especially those whose trees are large standards, to pursue a policy of masterly inactivity, and instead of purchasing Paris green, London purple, force-pumps, and other remedies, to keep your money in your pockets, protect the birds, manure the trees, and leave the issue with Nature.

It is not my purpose to take you through the dim vistas of the past, or to drag in any ancient history of the Apple, but before I can speak directly to my subject I feel it is necessary to say a word or two upon the style of planting to be adopted for profitable Apple culture in the midlands. There are, as you are fully aware, those who decry the system of planting standard Apples, and who extol the planting of bushes and pyramids, and others who just reverse things, and say Plant all standards, bushes are only fit for gardens, and they yield no profit. But is it not the truth to be found between the two rather than with either?

For those who live in districts where labour is abundant, for those who intend to give their own labour and attention to their plots of land, I believe there is no system to be compared with that of planting bushes or pyramids, and of tilling and cropping the land between with small fruits and vegetables. By this mode of culture we obtain a speedy return for capital invested, and above all we may by care and attention produce fruit of such size and quality that it shall command a ready sale at a good price, no matter what is the state of the market. My friend Mr. John Wright has so clearly set forth this system in his admirable little book, "Profitable Fruit Growing," that it will scarcely need doing again in our generation, and I shall say no more about it. On the other hand, much as I admire what our French neighbours call *petite* culture, I am fully persuaded both by reason and experience that those of us who live in districts where neither women nor children will work out of doors need not attempt it. Raspberries and Strawberries are paying crops where you have suitable labour, and superintend the work of gathering the fruit yourself, but just try the experiment of putting men at 3s. a day to the work, and where will the profits go? There will always be a large number of planters who will prefer standard trees, some market growers who will cultivate by horse power the land between the trees, using it for vegetable or for grain, and others who will plant orchards upon grass land, or lay the land down to grass after the trees are planted. To this latter class belong most of our agricultural friends, who wish to increase their home supply of Apples or to grow them for the market. Into the question of cultivated versus grass orchards I fear I may not venture further than to say this one word. Whatever merits cultivation may have when properly carried out, it has none when only half done and the land allowed to become covered with couch grass and weeds of every description. I would, therefore, advise farmers and landowners whose men are fully occupied during the summer with haymaking, root-cleaning, and harvest work, to shun cultivated orchards, and plant them in the old fashioned way upon grass, but give them a better system of treatment afterwards than has hitherto been the rule. My reason for introducing the question of standard versus pyramid trees is this. Having the fortune, or misfortune, to grow trees for sale as well as for fruit, I find the utmost difficulty to make people believe that the same varieties of Apples will not always succeed equally well in both forms. People see a bush in someone's garden bearing a profusion of fruit, and if they are about to plant an orchard they go to a nurseryman and ask for so many standard trees of that variety. It may be that although suitable for a pyramid worked on a Paradise stock, it is from its habit of growth quite unsuited for a standard tree. Let us take, as an instance, an Apple well known in this locality, the Court Pendu Plat, called in my neighbourhood Wollaton Pippin. There are few, if any Apples, which bear better in the form of a pyramid, and as the blossom expands later than that of any other variety, it escapes frost, and the tree is consequently not only an abundant but also a regular cropper; the effect is that but little wood is produced, and the tree is all fruit spurs. To plant such a variety in the form of a standard is a waste of land, as the tree can never occupy anything like the amount of space usually allotted in an orchard, and in most soils this kind is, as a standard, very short lived; even where it keeps alive it makes but little growth. We have trees in our orchards thirty or forty years old, the heads of which are not larger than a good sized Black Currant bush, and the growth of

which is so stunted and gnarled as to prevent the free flow of sap to the extremities, so that even when they bear fruit it is, from lack of proper nourishment, but small and worthless. I could name many other kinds, amongst which occur to me Potts' Seedling, Crystal Palace, Fearn's Pippin, or Clifton Nonsuch, Stirling Castle, and others. Again, there are varieties which are unsuited for standard culture because of the size of the fruit and its liability to be blown off by early autumn gales. We sell every year great numbers of Lord Suffield in the form of standards, but my experience would not lead me to plant it in that form. In making this remark I am not in the least afraid of injuring the sale of these trees; we grow them because the public will have them, and it takes a good deal of preaching both in public and in private to divert the stream of public opinion. For two generations we have inveighed against the Blenheim Orange as a standard, and to-day it is perhaps more popular than ever with small growers. Market men do not, it is true, plant it as they did, but as many trees are sold to-day as of almost any other variety. I take it that it is the especial province of the Association in whose name I speak to-day to combat all error, to make black marks against that which is bad, and to call attention to that which is good. The attendances at our conferences show that there is a new life and a spirit of inquiry abroad respecting these matters, and we may confidently hope that in the future knowledge will be more quickly disseminated and more quickly acted upon than in the past. It took thirty years to introduce Cox's Orange Pippin to the British public, and so loth was that respectable body to make a trial of anything new, that I have seen hundreds, and I think I may say thousands, of beautiful bushes of Cox's Orange stand year after year on the quarters until they ultimately reached their final repose on the fire.

I trust I have not wearied you with this rather long introduction, but I must confess I find the subject rather difficult of treatment. A bald list of names is rather tame reading, and, on the other hand, if one gives the rein to one's thoughts on so interesting a question, it is hard to say when or where to stop. Again, when I come to make my list I am confronted by another difficulty. Mr. Wright says there are 1400 varieties of Apples. It is comparatively easy to name fifty or sixty from them as being good, for that would be simply to transfer from a catalogue the list of kinds which, after three generations of trials and experience, we have selected for cultivation, but when we speak of Apples for profit we must still further reduce the list. I am thankful to say I have not had practical experience of anything like 1400 kinds, and I shall not trouble you with anything outside of those varieties which have been practically grown and fruited with us. These number about 200 kinds, most of which are at present in cultivation although some few have passed into oblivion, and more might do so with advantage.

My selection for standards will be the following:—1, Duchess of Oldenburg or Russian; 2, Warner's King; 3, New Northern Greening; 4, Bramley's Seedling; 5, Beauty of Kent; 6, Pike's Pearmain, or King of Pippins; 7, Improved Keswick; 8, Ecklinville; 9, Newton Wonder. There are other varieties with strong claims, whose voices seem to ask "Why am I left out?" but for profitable culture the number is probably sufficient. For general utility and for a succession of fruit I should if reduced to a very small number take the first three.

It will, I know, surprise my friends from the south to find Duchess of Oldenburg included at all in my list, still more that she should be placed amongst the first three. I have, however, long been of the opinion that if, as Dean Hole said of Roses, he lived in a pike (or toll bar), and had only one Rose it should be Gloire de Dijon, so I, under the same circumstances, would choose the Duchess as my sole Apple. With us in the midlands it is a heavy and regular cropper, and its size, colour and appearance always command for it a ready sale. Ripening in September it is ready for market before the foreign supply is in, and if desired it can at the expense of size be pulled before it is ripe, and finished off in the baskets. The large fruit are quite unequalled for making Apple jelly, and the small fruit may with a fairly clear conscience be sold as table fruit. Is there any Rose without a thorn? Let it be whispered that her grace is a true aristocrat, being possessed of a skin so tender that every finger mark shows in a very short time after pulling; but if left in quiet repose for two or three days these marks will disappear.

*Warner's King* is a first-rate culinary Apple; the tree is a free and vigorous grower, a good bearer, and although the fruit attains an enormous size it is not a bad one for blowing off; probably this may be accounted for by the fact that its footstalk is short and deeply inserted, so that the fruit rides on the branch.

*New Northern Greening* is so called to distinguish it from the old variety, which is so well known, and from which it is probably a seedling; it is, however, no novelty, as we have grown and fruited

it for forty years, and I find it catalogued for sale in 1846. The tree is a strong and vigorous grower, a good cropper, and as the fruit is in use from November to April it may justly claim to be one of our most useful Apples. It has the merit of being a very early bearer, young standards in the nursery being frequently covered with fruit, and for market has the advantage of weighing well. This variety, with Bramley's Seedling and Newton Wonder, should be planted at the sides of an orchard, where they would from their habit of growth protect less robust kinds from the influence of rough winds.

*Bramley's Seedling*, although only known to the public since the Apple Conference of 1883, is an Apple which has been known locally for thirty years. The tree is a very vigorous grower, of spreading habit, a constant but not an early bearer; fruit large, heavy, and handsome. Distinctly a seedling from the old Caldwell or Rymer, the fruit of which it so much resembles that when medium-sized fruits are mixed with fine fruit of that variety the best judges have been unable to distinguish the one from the other; it has, however, a better habit of growth, is a better bearer, and produces, as a rule, a finer fruit.

*Beauty of Kent* is perhaps the handsomest cooking Apple in cultivation; tree a strong and vigorous grower and a good bearer, liable to canker in some soils, or I should have given it the preference over Warner's King for the first three.

*King of Pippins* is far and away the most profitable table Apple in cultivation; in fact, so far, the only one which has proved profitable for orchard culture.

*Improved Keswick Codlin*.—This, like the New Northern Greening, seems to be unknown in the south, and does not appear in Dr. Hogg's "Fruit Manual" of 1875, although it has since been brought to his notice. This Apple possesses all the virtues of the old Keswick, with the addition that the tree is a better grower and the fruit a shade larger. Everyone knows that the Keswick may be used for cooking at almost any time from early in July to September, and no Apple will stick on the tree better when ripe than this variety. When a heavy Plum crop and Damson crop interferes with the Apple pulling we have frequently left them hanging until October. The tree attains a medium size, is an immense bearer, and will grow in almost any soil or situation.

*Ecklinville*.—An Apple of Irish origin. The tree is a fair grower, attaining medium size; fruit large, handsome, and of good culinary quality; an immense bearer.

*Newton Wonder*.—An Apple of recent introduction, sent out from Chilwell, received first-class certificate R.H.S., 1887. The tree is a vigorous grower, makes a handsome standard, and equally suitable for pyramid culture; fruit large, very regular in outline, handsome, highly coloured, and weighs very heavily. Modesty compels me to place this Apple last on the list, although I think it will prove to be worthy of a higher position. I am fully prepared for the quotation that everyone's geese are swans, and I shall not be surprised if someone asks how it is that such comparatively new Apples should be selected. My answer will be that the selection has not been made without carefully testing and weighing the merits of each, and surely it will be conceded that our old orchards need improvement in the varieties grown and the method of culture employed. The days of "Bess Pool," bearing once in seven years; Blenheim and Alexander once in five; "Bartons," bearing every year, but too small for sale when grown, are numbered, as are many others I could name; so I trust is the system of "sticking in a tree" and leaving it without further attention until death comes to its release. To those intelligent cultivators who are improving their orchards by re-grafting with improved kinds I may say that any and all of those named (except Ecklinville, of which I have had no experience in this matter) will succeed well and bear heavy crops. It is unnecessary to tell you that weak growing kinds only kill the stocks upon which they are grafted.

*Varieties for Pyramid Culture*.—1, Potts' Seedling; 2, Lord Suffield (or where that cankers Lord Grosvenor); 3, Ecklinville; 4, Frogmore Prolific; 5, Lane's Prince Albert; 6, New Northern Greening. To these half-dozen cooking Apples may be added Duchess of Oldenburg, Domino, Cox's Pomona, Cellini, Small's Admirable, New Hawthornden, Stirling Castle; and for dessert, 1, King of Pippins; 2, Margil; 3, Court Pendû Plat (already mentioned); 4, Fearn's Pippin; 5, Cox's Orange Pippin; 6, Scarlet Nonpareil; 7, Worcester Pearmain. These are all kinds easily adapted by their natural habit to pyramid culture, also early and abundant bearers. They are all so meritorious that to single any out for especial praise seems almost invidious, yet I cannot help saying that those who have not grown Potts' Seedling as a pyramid will be pleased with it. Its habit is most charming, foliage bold and distinct, and whether with fruit or without an object of

beauty. When I say without fruit I mean when fruit is not in season, for it is rare that you fail to find it carrying fruit at the proper season. It would be gilding the Rose for me to make any remarks upon Cox's Orange Pippin to-day, since it has just attained its sixtieth birthday, and is now pretty well known to the public; I will only in passing remark that it should be grown in a dwarf form, either bush, pyramid or espalier, and not as a standard. In conclusion, one word in favour of a very old friend—"Margil." In some parts of the country it goes by the familiar name of "Never-fail," and if you will plant it in a situation where it is not too much exposed to spring frost, you will find it well deserves the title.

Perhaps to those of weak digestion it has not so strong an attraction as the more tender Cox's Orange, yet to many its flavour is unequalled, and, unlike its supposed parent the Ribston, it does not canker.

## HARDY BULBOUS PLANTS.

### NARCISSI AND DAFFODILS.

A FEW words at this time, while being seasonable, may serve to act as a reminder to any who are anticipating lifting and re-planting their bulbs, while to delay longer will prove detrimental to some of the varieties. Though a great number of the Trumpet Daffodils, if not all, lose the whole of their roots annually, I am not so sure that the rule applies with equal force to some forms of the Poet's Narciss, for it matters little what day in the year you may examine a bulb, provided, of course, it is healthy and sound, you will invariably find it more or less active at the root, *i.e.*, the fibres, and this is decidedly more conspicuous in wet seasons like the present. The roots of the Poet's Narciss retain their vitality for a longer period than some others, so that it will not do to wait for the perishing of these while still left in the ground. During the summer of 1888 the double white Poet's Narciss not only retained all the old roots, but continued to push new ones also, and the same thing occurred again this year in the same variety, also with ornatus, and in a less degree with recurvus and poetarum. From a knowledge of these facts I invariably begin lifting the varieties of poeticus first, notwithstanding that they are amongst the last to flower, and of course proportionately later in attaining maturity. In all cases where possible these should be lifted with the laying down of the foliage, and particularly so in wet seasons. The month of July is an excellent one for the operation, and depending on the nature of the soil and surroundings, early or late, as the case may seem to require. As might naturally be expected, there is considerable variation in this respect in so extensive a group, having such a prolonged season of flowering, and naught but that experience which is the outcome of practice and close observance in various soils and seasons can prove of much value.

In like manner, when planting time comes the forms of *N. poeticus* should be the first planted. Indeed in all private gardens where these are grown it is much best to lift, clean, and replant with as little delay as possible, keeping the bulbs in the meantime in any dry airy shed away from hot sun. On no account should they be kept in boxes with lids—this is most certain to end disastrously—but place them in thin layers in open trays, where a free circulation of air is continually going on around them. Always endeavour to have them planted before any signs of emitting new roots appear, the first appearance of which is the white ring at the base of the bulbs immediately above the position occupied by the roots of the previous season, and this white ring gradually increases in size as the season advances till roots are emitted.

In the matter of planting I am not sure if many bulbs are not planted unnecessarily deep, for deep planting has not the slightest advantage, but the reverse. A not unusual depth to be recommended is 6, or even 9 inches; but in my opinion a far more reasonable one is 3 to 4 inches, or as forming a guide throughout the entire genus they may be planted at twice the depth of the bulbs, measured from the base to the point where the bulbs commence tapering to the neck. Deep planting, and particularly where these bulbs are grown in quantity, has the following disadvantages:—First, the greater depth you insert your bulbs the less the depth of good soil for the roots to descend into, an item of importance in shallow soils at least; secondly, deep planting necessitates far greater labour both in lifting and planting, merely in the removal of the soil; and thirdly, by shallow planting good-shaped bulbs—*i.e.*, round, plump, and short necked—are a certainty; not so, however, with deep-planted bulbs, as the following will prove to illustrate:—Some years ago I had occasion to lift some bulbs of the Tenby Daffodil, planted by a predecessor at 9 or 10 inches deep, but which when lifted were not recognisable by the

bulbs alone, and instead of the neatly formed round solid bulb one expects when taking up this kind, the whole, hardly without exception, had long tapering bulbs, most nearly allied, as far as shape is concerned, to a thin bulb of *N. maximus*. I attributed this deformity to over-deep planting, being caused probably by the weight of the soil above becoming too great. The following year when these bulbs were lifted again, and had only been covered with 3 inches of soil, they were entirely transformed into those round, solid, compact bulbs characteristic of the species under notice. Another very similar case was related to me by a gentleman who grows one of the finest collections of Daffodils in this country, but his experience was with the double forms of *N. cernuus*; these had been planted at more than ordinary depth to commence with, and had been heavily mulched, either with spent hops or manure (I forget which), in winter time, with the result that the whole had more or less disfigured bulbs—in short, they were all considerably elongated, which I imagine goes to prove that deep planting, as a rule, is anything but an advantage to the bulbs alone, apart from the extra labour entailed where large collections have a permanent home.—J. H. E.

### RED SPIDER ON VINES.

RED spider is difficult to eradicate during the current season's growth when once it has obtained a hold of the plants. Red spider is encouraged in many cases by overcrowding vineries with plants, which often results in the neglect of the borders in which the Vines are growing, and often of the Vines themselves. Vines growing in a well drained and properly prepared border require abundant supplies of water all through the season of active growth, and even in the winter the borders should not be allowed to become dry. A dry rooting medium means a check to the vigour of the plants, and all gardeners know that checks to growth of this nature invariably result in disease to some plants, and in others to the attacks of various insects. Another cause of this dreaded parasite making its appearance on Vines is deficient or unsuitable ventilation. Vines at all stages of growth require constant supplies of fresh air, and it has long been recognised as a safe rule to follow to begin early in the season, to allow a little air to be admitted at the back ventilators at night, avoiding, of course, draughts and the admission of too much during the prevalence of dry east winds. This, too, should be supplemented by timely attention to increasing the ventilation on hot bright mornings when the Vines are in full growth and very susceptible to sudden changes. Nothing is gained by having too high a temperature except in the case of some special kinds.

The management of the atmosphere of the house is very important in preventing the appearance of red spider, as unless the Vines can spread out their leaves in a moist and healthy atmosphere, so that they can absorb from abundance to meet their demands, they will certainly become liable to the speedy attacks of red spider, which lives and thrives and spreads in a dry condition of the atmosphere. Moisture is fatal to these insects, or at least to a slight attack, as has been proved in the case of Cucumbers attacked, which have been almost if not quite cleared of the pest by shutting the house close, having the pipes warm, and enveloping the plants in a steaming mist for some hours. Some gardeners have proved the disastrous effects of introducing Strawberry plants in pots into vineries, as they are sure to be attacked by the pest, which certainly will spread to the Vines despite the best attention. Growing Azaleas in vineries often induces attacks of red spider, particularly when the plants are old and root-bound.

The old remedy of applying sulphur to hot-water pipes to destroy the red spider is becoming obsolete. A better plan is the application of some of the excellent insecticides in the form of brushing or sponging the leaves infested. Fir tree oil has been found to be of great service, and a solution of it at the rate of 1 pint to 15 pints of water well mixed, will, if carefully sponged on the infested portions of the foliage, serve to destroy the pest. This may be a tedious operation in a badly infested house, but patiently persisted in, along with syringings with a weaker solution—say, about 1 pint of oil to between 30 and 40 of water—will in the end prove successful.

Some allege that the practice of syringing Vines renders them more liable to insect attacks by producing a soft and flabby growth, which having to endure the slightest unfavourable conditions soon becomes a ready prey to enemies. I am inclined to think, however, that this is an extreme of the opposite kind, and can only hold good in cases where too much attention is paid to syringing, and too little to the moisture requirement of the roots. The secret of having healthy Vines consists in maintaining an equal balance of vigour between root and branch, and this can best be done by the judicious application of food and water to the former, and of

air, heat, and moisture to the latter, with all the other necessary details of intelligent cultivation.—E. D. S.

### CLITORIA TERNATEA.

THE large family of the Leguminosæ yields us abundant useful garden plants, but those with blue flowers are not too frequent in this or any other section of the plant world. One of the best examples of a really handsome blue flowered plant is *Clitoria Ternatea*, of which a specimen is represented in fig. 16. This is seldom seen in gardens,

FIG. 16.—CLITORIA TERNATEA.

and yet the brilliant colour of its flowers ought to render it a general favourite.

It was one of the plants which was well grown at Chatsworth in Paxton's time, and he thus wrote concerning it:—

"This handsome plant was first brought beneath the notice of botanists and floriculturists as long ago as the year 1739. From that period down to the present it has been erroneously considered by many as an annual species, and slighted accordingly. Such an opinion probably had its rise in the mode of culture which has occasionally been pursued. Instead of treating it as a stove plant, it was, from the facility with which it ripens seeds, raised anew each spring as a half-hardy annual, and transferred to the open flower border; where, being unprotected on the approach of winter, it was destroyed by cold.

"From circumstances similar to the above, this plant has not been an isolated example of false notions being imbibed respecting its habits. Notwithstanding the evident bent of cultivators rather to supply a plant with too high a temperature than to suffer it to be too much

exposed, here is an instance, out of several others that we might mention, in which a contrary method has been practised. When, on the other hand, it is retained in a stove, to which a moderate amount of heat is furnished, it assumes quite another appearance. The stems, instead of perishing yearly, become shrubby at the base, the lower leaves remain through the winter without withering, and it is the upper branches alone that exhibit any signs of decay. Its natural habit is, therefore, decidedly suffruticose, and that to which it has been reduced in our gardens is simply a constrained one.

"Miller, the celebrated author of some of our first works on gardening, states that the seeds were primarily introduced to Europe from Ternate, one of the Molucca Islands; from which cause, it was originally established as a genus by Tournefort, under the name of *Ternatea*. Linnæus, however, thought it requisite to alter this, and apply the generic title it now bears. Miller again observes that there are double-flowered varieties of *C. Ternatea*, some with blue, and others with white blossoms, which will not ripen seeds with us, and these must consequently be imported from the East Indies. He adds, that seeds which he received in three different years invariably produced plants which bore double blossoms; and, as registered in the *Botanical Magazine*, 'the same happened to Commelin in two succeeding seasons, which is difficult to account for, if they are only accidental varieties of the single-flowered kind. The leaves of the double sort, as figured in the 'Hortus Amstelodamensis,' are sharp-pointed, so that perhaps what we have followed others in recording as only varieties, may be two distinct species.'"

## BASKET FERNS.

A CLASS was provided at the recent Chiswick Fern Show and Conference for basket Ferns, but in the group the distinction between Ferns for pots and those for baskets was not made very clear. A few notes on the subject may be useful.

I have tried several *Adiantums*, and amongst those I like best is *Adiantum concinnum* var. *latum*, a variety that Messrs. Veitch sent out some years ago. It is, however, a semi-deciduous Fern, losing a quantity of fronds through the winter season. It is very useful either for pots or baskets. The graceful manner in which the fronds hang over the sides of the baskets renders it a desirable acquisition for either the warm or cool stove. *A. concinnum latum* is a more robust plant than the type. The stipes are about 12 inches long, shining and black. The entire fronds are between 2 and 3 feet long, and from 12 to 15 inches broad. It grows much better in a compost of sandy fibry loam with a little leaf soil than it does in the soil generally used for Ferns. By using a stronger soil for *Adiantums* the pinnæ come much finer. The typical form is rather widely distributed, and found growing in tropical America from Mexico to the West Indies southward to Peru and Brazil.

*A. Williamsi* is better suited for baskets than pots on account of the rather slender arching stipes, and somewhat resembles *A. chilense*. The caudex is creeping, and soon travels to the side of the pots. In the event of its habit being the same in baskets, which in all probability it will, this will make one of the best of *Adiantums* for baskets. As soon as the rhizomes travel to the sides of the basket they should emit young fronds, and no doubt grow through the sides and bottom of the basket. The young fronds as they appear, and until they are fully developed, are covered with a yellow sulphur-like dust; as the fronds get matured they lose this character. This is its first season in a basket, and so far it has more than realised my expectation. It thrives well in a cool stove temperature, although it is a native of Peru, and found growing on mountains at an elevation of 12,000 feet.

*A. peruvianum* is a noble Fern, and well adapted for baskets; it is compact in habit, a very fine and well-marked species. It is by no means common in collections, and richly deserves to be more extensively grown. As the specific name implies, it is a native of Peru. I find it succeeds remarkably well in a cool stove temperature. *Asplenium cicutarium* is an extremely beautiful Fern either for pots or baskets, and in the opinion of many is the most handsome of the genus. It is a well-grown plant; the fronds attain the length of about 15 inches, and from 4 to 6 inches broad, with from ten to fifteen horizontal pinnæ on each side; the texture is rather thin, and a very pleasing bright green colour. The fronds arch gracefully over the sides of the basket, and is a great acquisition to the warm fernery. It is a native of tropical America, and delights in a warm, humid atmosphere.

*Asplenium longissimum* is a very useful Fern for baskets, in fact that is the only way in which it can be satisfactorily grown. For lofty situations this is one of the few Ferns that is really suitable. The fronds droop immediately over the sides of the

basket, and hang down to a length of 6 or 7 feet. This is one of the prolific species, forming young plants at the end of each frond. After the young plants are formed the stock can readily be increased by taking them off with a small portion of the frond, and pegging them down on a pot filled with sandy soil. It is a native of Java, Borneo, Malacca and Mauritius, and grows best in a cool stove temperature, although I have a plant in the greenhouse doing fairly well, but not so free-growing as the plants in a higher temperature.

*A. furcatum* answers well for a large basket. This is a well-known species, and common in collections; it is a rather strong-growing species. The fronds grow to a length of between 18 inches and 2 feet long, and from 4 to 6 inches broad. It is a very accommodating Fern, and answers well either in a cool stove or greenhouse temperature. *A. flaccidum* is another well-known species, and a very useful Fern; for basket work it is amongst the best natives of Australia and New Zealand, and seems quite at home in a cool temperature. In a well-grown plant the fronds grow to a length of between 2 and 3 feet, and from 4 to 8 inches broad.

*Davallias* are numerous, many of which answer better in baskets than pots. Amongst the number I have grown, and which do remarkably well, are the following:—The first, which is a great favourite with most people, and which is commonly known as the Hare's-foot Fern, *D. canariensis*, is too well known to need much said in its favour. The stout creeping rhizomes, which are densely covered with pale brown linear scales, are very suggestive of a hare's foot, from which character it has its local name. The rhizomes creep over the surface, sides and bottom of the basket, sending out at intervals its quadripinnatifid fronds, which are nearly 18 inches long and a foot broad. It is a native of the Canary Islands, N. Africa, and Madeira, and always thrives in a rather cool temperature.

*D. ciliata* is a most valuable plant for baskets, and should find a place in every collection. The rhizomes are much the same as *D. canariensis*, but not so thick, and densely covered with sharp-pointed ferruginous scales. The deeply cut lanceolate fronds grow nearly 2 feet long and from 6 to 8 inches broad. The rhizomes travel over the surface, bottom and sides of the basket; as they extend they should be pegged in close to the basket. At intervals they send out fronds which look exceedingly pretty growing in different directions. Being a native of the Philippine Islands, it requires a stove temperature.

*D. immersa* is a handsome Fern for a basket or pot work. Before the young fronds are perfectly developed they have a peculiar brown tint, and to a stranger look as though they have suffered some injury. The tripinnate fronds measure from 12 to 18 inches long and 6 to 9 inches broad, and are very useful for cutting purposes. The rhizome is wide, creeping, and peculiar in developing underneath the surface of the soil. There are several other *Davallias* that are well adapted for basket work, such as *D. charophylla*, *D. dissecta elegans*, *D. hirta cristata*, *D. Mooreana*, and *D. repens*.

For large mixed baskets the *Nephrolepis* are exceedingly useful; *N. exaltata*, *N. acuta*, *N. cordifolia*, and *N. davallioides* are all worth growing. *N. davallioides* var. *furcans* is a valuable Fern, and well deserves to be grown in a basket; the large drooping fronds furnished with pinnæ of great size and substance renders it a desirable plant in any collection.

*Polypodium pectinatum* var. *Paradisæ* makes a splendid basket Fern, and well suited for a position where a spreading plant is required. In pots it appears out of its element, for the fronds with me grow about 4 feet long, slender, and gracefully arched; the frond is cut down to the rachis into close blunt horizontal pinnæ. This variety is a much more handsome Fern than the type; it is a native of the West Indies and Mexico, and grows well in a stove temperature.

*Polypodium* (*Goniophlebium*) *subauriculatum* is amongst the most suitable of all Ferns for baskets. It requires to be suspended in a rather lofty position on account of the long pendulous fronds, which attain the length of nearly 8 feet in a well-established plant. It is a rapid-growing Fern, and when once thoroughly established soon makes a handsome specimen. It has a wide creeping rhizome covered with dull brown scales. The rhizomes often grow through the sides of the basket, in time sending out fronds. The pinnæ are about 4 inches long and three-quarters of an inch broad. It is a native of the East Indies, and widely distributed, therefore enjoys a warm stove temperature.

*Woodwardia radicans* is a well-known species, and well suited for pots or baskets. It is a strong-growing Fern, and when growing likes copious supplies of water. For the conservatory or greenhouse it is invaluable. The fronds grow from 4 to 6 feet long, and from 12 to 18 inches broad. The old fronds are prolific, producing young plants at the points. If grown in a basket it

should not be crippled for root room, using good rich soil for the occasion.—A.

**EVENTS OF THE WEEK.**—On Tuesday next the Committee meetings of the Royal Horticultural Society will be held in the Drill Hall, James Street, Westminster; and a meeting of the Williams' Memorial Fund Committee will be held at the Horticultural Club at 2 P.M. on the same day.

— **LATE COMMUNICATIONS.**—In consequence of the pressure incidental to the holiday season, several communications arrived too late for insertion in the present issue of the *Journal of Horticulture*.

— **LONDON PARKS AND GARDENS.**—We are informed that the London County Council have not appointed a Superintendent of the Parks and Gardens under their jurisdiction from any of the forty-nine applicants for the position, and that the whole question is deferred for further consideration.

— **THE GARDENERS' ORPHAN FUND.**—At a meeting of the Committee held at the Horticultural Club on Friday evening last, William Marshall, Esq., Bexley, was unanimously elected as the successor of the late Mr. George Deal. Mr. Marshall has been a member of the Council of the Royal Horticultural Society, and is the able Chairman of one of its Committees. Though free from all business engagements, Mr. Marshall is an active business man, and the Committee feel fortunate in securing his services as Chairman of the Fund during the ensuing year. The recent anniversary dinner was financially successful, and it was decided to invest the sum of £500 in consols.

— **BANK HOLIDAY IN LONDON.**—Monday last being a fine summer's day the parks, gardens, and open spaces in the metropolitan district were attended by thousands of visitors. In the beautiful park of Canon Bridges at Beddington a cottagers' flower and vegetable Show was held, mainly through the exertions of A. H. Smee, Esq., who is Chairman of the District Cottagers' Horticultural Society. Suitable amusements were also provided, and crowds of visitors attended. The prizes awarded, also for allotments and cottage gardens, were distributed by the esteemed Canon, who rejoices in seeing all his neighbours happy around him. Nearly £50 was taken for admittance to the park. It is stated that 100,000 persons visited Kew Gardens.

— **GARDENING APPOINTMENTS.**—Mr. D. Tapp, late gardener to R. S. W. Sitwell, Esq., Stainsby House, Smalley, Derby, has been appointed head gardener to Colonel Sturt, Llanvihangel Court, Abergavenny, Monmouthshire.

— **CIBOTIUM SCHIEDEI.**—In the tropical fernery at Abberley Hall, Stourport, is a large and handsome specimen of this Fern. It requires plenty of space to show its character. In the fernery mentioned it is planted out on a high rock, as if planted low its beauty would be partially lost. All the Ferns are planted out on a well arranged and artistic rockery, and which has a pleasing effect.

— **DAVALLIA BISSECTA.**—Amongst several varieties of Davallias planted in the above fernery this is the most vigorous. It covers a space of 2 or 3 square yards, and is very healthy. The rhizomes creep over the surface of the rock, and attach themselves very firmly. Moisture is abundantly applied, and which is all it has for support. This is the Fern which is largely used by florists for greenery in wreaths, &c. Those who have only grown it in pots or pans have no idea of its vigour.—J.

— **CRACKING IN MELONS.**—It is annoying after having grown a good crop of Melons to have the fruits crack just previous to the last stage of ripening. Various reasons are assigned for this defect, and also remedies to combat the evil. Too much moisture at the roots is the generally accepted cause, and to combat this cutting through the fruit-bearing lateral is recommended. Too much moisture at the roots I am not prepared to admit is the cause of the evil, as we are in the habit of applying more water to the roots than most

people, but there is far more danger in closing the ventilators early in the afternoon, and running up the temperature above the point it reached before the ventilators were closed. I have proved this in our own case, as at one time we were in want of a fruit at a certain date, and to hasten the ripening I closed the house so as to retain the sun heat, with the result of having cracked fruits the following morning. Warmth in the pipes and air as recommended by me for preventing scalding and cracking of Grapes will also prevent cracking in Melons.—A. YOUNG.

— **THE PARTIALITY OF THE RAIN.**—It seems to me, from reading the various meteorological reports from different parts of the country, that the rainfall of 1890 has been extremely variable and partial. Our first really good rain of the year was on July 17th, when we registered 1.60 inch, on the 18th we registered 0.30 inch, making nearly 2 inches in forty-eight hours. Till then the rain had not reached the depth of the roots of the early Potatoes we were digging. Our rainfall for the first six months of 1890 is as follows—viz., January 2.96 inches, February 0.72 inch, March 1.06 inch, April 1.66 inch, May 2.09 inches, June 1.66 inch.

— **I REGRET** to say that POTATO DISEASE has made its appearance in this district and seems spreading very fast, but trust we may get dry summer-like weather, which may arrest its progress. I mean to try a French remedy—viz., 1 lb. blue vitriol in ten gallons water, and 3 lbs. lime dissolved in two quarts boiling water mixed together, to be sprayed over the tops with fine-rose watering pot. Its application is easy and the materials cheap, and in common use for dressing seed Wheat.—R. MAHER, *Yattendon Court Gardens, Newbury*.

— **JULY WEATHER IN SUSSEX.**—The total rainfall at Cuckfield, Mid-Sussex, for the past month was 3.72 inches, being 1.06 inch above the average. The heaviest fall was 1.06 inch on the 4th. Rain fell on eighteen days. The highest temperature was 75° on the 23rd, lowest 42° on the 4th. Mean maximum 65.1°, mean minimum 50.1°; mean temperature 57.6°, partial shade temperature 2° under the average. Little rain fell after the 19th, and we had one fine week from that date, and things have much improved.

— **JULY WEATHER IN HERTFORDSHIRE.**—Mr. E. Wallis, The Gardens, Hamels Park, Buntingford, Herts, writes:—"The past month here has been noted for the great amount of rainfall and dull cold days, rain falling incessantly the first half of the month. The nights have been generally very cold, thermometer falling on many mornings nearly to freezing point, and tender plants, such as Iresine, have shed their leaves and become little else than bare stems. On eleven days the thermometer rose no higher than 65°, and in some days not above 60°. The highest point reached during the month was 76°, and that only upon one occasion. The total amount of rainfall for the month was 4.81 inches."

— **ROMAN HYACINTHS.**—The flowers of Roman Hyacinths are especially valuable in November and all through the darkest winter months when white and sweet-scented flowers are scarce. They are so useful for cutting for many purposes, the spikes either being used alone, or individual flowers wired and used singly in bouquets. It is necessary, in order to have flowers early, or from November onwards, that batches of bulbs be potted, according to the demand, from August to October. Early potting is practised, so that the bulbs can have a fairly long period in which to make a quantity of healthy roots, without which no bulbs intended for forcing can be expected to flower well. The earlier any kind of bulb is forced the more roots it needs to make before top growth, and then success in flowering it is better assured. Six or eight bulbs are generally potted in 5 and 6-inch pots, and where the demand for cut flowers is great, pans are employed. A moderate light compost of fibrous turf, leaf soil, sand, and manure will grow these bulbs well enough. After potting, there is no material better for plunging them in than cocoa-nut-fibre refuse, and under a quantity of this, in any cool corner, the pots should be plunged, and there remain until plenty of roots are formed and top growth is just beginning. Then bring out the pots, keeping in a subdued light for a time, afterwards giving them a light position in a greenhouse, and, when the flower spikes show, help them to develop, slowly but surely, by the aid of a little bottom heat, if required, at any particular time. This is the most necessary at the end of November onwards to the turn of the year, when the conditions to natural growth are somewhat sluggish. It is necessary, too, to plant bulbs as nearly as possible of the same size and quality in each pot, so that growth will be regular.—E. D. S.

— PROPOSED MEMORIAL OF THE LATE MR. B. S. WILLIAMS. — Interest in the proposed memorial of the late Mr. Benjamin Samuel Williams, of the Victoria and Paradise Nurseries, has acquired force since our reference to the subject a fortnight since, and the desire to participate in it appears to have greatly extended. A meeting of horticulturists is announced to be held in the Hotel Windsor, Westminster, on Tuesday next, August 12th, at 2 P.M., when probably decisive steps will be taken to give form and purpose to the proposal. A circular has been published, from which we learn that "it is proposed to establish a 'Williams' Memorial Fund,' to provide at horticultural exhibitions money prizes and certificates for the encouragement of the cultivation of stove and greenhouse plants and Orchids, these prizes and certificates to be competed for in the usual way." It is added that "To carry out the proposal a Committee is in course of formation, to include representatives of all horticultural interests associated with or related to the special sphere of activities of our late friend, who was especially distinguished as an importer, cultivator, and raiser of tender exotic plants, to which the proposed Memorial prizes would especially apply. The Committee will collect subscriptions, advise on procedure, and in all convenient ways promote the completion, with all reasonable speed, of a fund sufficient for the purposes indicated." It is desired that communications on the subject be addressed to H. J. Veitch, Esq., 544, King's Road, Chelsea, S.W.; or Shirley Hibberd, Esq., Kew, near London.

— DEATH OF MR. PATRICK BARRY. — This eminent horticulturist, a member of the firm of Ellwanger & Barry, died at his home in Rochester, N.Y., on the 22nd of June, at the age of 74. Mr. Barry was the son of a farmer, and was born near Belfast, Ireland, in 1816. He was liberally educated, and at the age of eighteen was a teacher in the National Schools. In 1836 he resigned his position and came to the United States, where he was soon engaged as a clerk by W. R. Prince, of Flushing, Long Island, a prominent firm in the nursery business. There he laid the foundation of his after success. In 1840 he went to Rochester, and the firm which existed fifty years in ever increasing vigour and fame was then formed. Mr. Barry wrote largely for agricultural and horticultural periodicals. He was the editor of the *Horticulturist* after the death of A. J. Downing, and during the period when that journal was owned by James Vick, and published in Rochester. This was in 1852, and for several years subsequent, until the publication office was transferred to Philadelphia. He was at one time the horticultural editor of the *Genesee Farmer*. In 1852 he published "The Fruit Garden," a standard work on the raising and management of fruit trees, and fruit-growing in all its various branches. A second edition, revised and enlarged, bringing the work up to the present time, was published in 1885. His greatest work, however, was the "Catalogue of the American Pomological Society," which is the accepted guide of American fruit-growers, and is high authority with fruit culturists the world over. Mr. Barry for more than thirty years was President of the Western New York Horticultural Society. He was President of the Western New York Agricultural Society and a member of the controlling Board of the New York State Agricultural Experiment Station. — (*American Agriculturist*.)

— VINE DISEASE IN CALIFORNIA. — The British Vice-Consul at Los Angeles, in California, in his last report, has some observations on the Vine and Orange pests in that region. The Vine disease now seriously menaces the existence of the viticultural industry in the vicinity of Los Angeles. At first it attacked chiefly the "mission" Vines; now, other varieties of red Vines are dying, and the white varieties are also suffering. The disease first appeared in its present dangerous form in the southern part of California, and destroyed many vineyards. Prof. Dowlen, an expert employed by the Viticultural Commission to ascertain its cause, and, if possible, discover a remedy, inclines to the opinion that it is due to a fungus. On the other hand, Mr. Wheeler, Chief Executive Officer of the Viticultural Commission, reports that he is fully convinced that the fungus found on the dead Vines is not the prime cause of their decadence, and that it attacks them only when they have been weakened by other causes. As to the *Icerya*, or "white scale," which has ravaged the Orange groves, the Vice-Consul says that a year ago many of the principal Orange growers in the vicinity of Los Angeles had abandoned their efforts to exterminate this pest, concluding that their trees must die. Fortunately, it was learned that an Australian parasite, the *Vedolia cardinalis*, had exterminated the white scale in Australia. A colony of the bugs was imported, and placed on the trees in an orchard in Los Angeles; they multiplied so

rapidly that in a few months the scale was entirely exterminated in the district; many trees, which a year ago were nearly dead, have revived and borne half a crop this season. — (*Nature*.)

— THE BIRMINGHAM GARDENERS' IMPROVEMENT SOCIETY. — We have received a descriptive report of a visit of the members of this Society to Reading ten days ago, too late for insertion, and all we can say is that the 120 members appear to have been delighted with the pleasant reception accorded them by Messrs. Sutton & Sons for inspecting their establishment and trial grounds.

— FRUIT RIPENING EARLY. — With us hardy fruit is ripening earlier, or by about a fortnight earlier than last season, and a few days in advance of the average time of commencing to gather. This must be largely due to the fact of the trees on walls generally being in flower at an exceptionally early date, many of the Pears being in flower by the first week in April, as it is very certain the weather this season has been anything but favourable to early ripening. We commenced gathering Early Moorpark from a south wall on July 25th, and the other varieties are following very closely. Plum De Montfort (a superior early dessert variety) was fit to gather July 24th, Rivers' Prolific and Morocco being ripe about the same time. Oullins Golden, Victoria, and Dry's Seedling will be ripe by the end of the first week in August, and the Green Gage is swelling fast. The earliest Pear, Doyenné d'Été, was fit to eat July 24th, and to all appearances both Jargonelle and Williams' Bon Chrétien will not be long in ripening. Beauty of Bath is our earliest Apple, and we gathered a few fruit of this July 30th; the principal portion of the crop (a good one by-the-by) will be available for dessert purposes during the first fortnight in August. Irish Peach is changing colour and will soon be ripe, while Devonshire Quarrenden will not be far behind. — W. IGGULDEN, *Somerset*.

#### APPLES—STOCK INFLUENCES.

It is not often that such a marked difference is apparent in the Crab and Paradise stocks as in the present season. We presume the surface-rooting Paradise Apple trees have not felt the effect of a wet winter so much as the deeper rooting Crab Apple, and probably from the same cause. The trees upon the Paradise were better ripened, but in appearance this ripeness is equal in both cases, as a much larger number of the maidens have started from the terminal shoot than usual, but when it comes to fruit the Paradise trees have it all their own way, although in many cases the trees on the Crab blossomed as freely as the others, but the fruits nearly all fell. In the nursery only Lord Grosvenor, Golden Spire, Grenadier, and its cousin Gold Medal and Keswick Codlin carry fruit, while nearly 200 varieties are bearing upon the Paradise stock. In special instances this is most marked; 500 Worcester Pearmain on Crab stocks are fruitless, but 500 on the Paradise, only 9 yards away, are full of fruit, though fully 75 per cent. were cut back to form pyramids; 5000 Lord Suffields on the Crab have no fruit, while 500 on the Paradise are heavily cropped; and in the maidens the following are pictures of fertility—though here again 80 per cent. were cut back (and the best fruiting wood removed)—Peter the Great, Stirling Castle, Bismarck, Baumann's Reinette, Devonshire Quarrenden, Duchess of Oldenburg, Grenadier, King of the Pippins, Manks Codlin, Scton House, Pomona, Cox's Orange, Duchess of Gloucester, Gascoyne's Scarlet, and Sturmer Pippin. Those and many others have set a fine crop. Where orchards are not required for grazing purposes evidently trees on the Paradise on the plantation style will be the trees of the future, and will soon repay for initial outlay.

The Apple crop has been most disappointing and the fruit has dropped prematurely, so that the hoped for crop will not be realised in this part of Kent. As usual there are happy exceptions, but on the other hand the trees are very vigorous, and there is much less damage by the caterpillar "genus" than for some years. It is hoped the trees will fully recover this season. Irish Peach were making 14s., and Duchess of Oldenburg Apples 12s. a bushel this week. Is it possible that Paradise trees have resisted the great frost of March 3rd better than the others? — GEORGE BUNYARD, *Maidstone*.

#### CANKER.

CANKER of Apple and other trees and plants arises from weakness, consequently inability to elaborate the matter that is essential to healthful development and continued fruitfulness. Whether the tree's energy be broken down by an unnatural rapidity of growth in its early stages, by a disproportionate growth of branches over the roots, or by the disorganisation consequent upon the roots being in an ungenial soil, they render the tree incapable of extracting nourishment to develop sufficient foliage, it being a characteristic of many a cankered tree that it has a deficiency of leaves. Excessive luxuriance also induces canker, the supply of sap is disproportioned to the elaborating functions of the leaves.

Ill-elaborated sap has its outcome in eruptions, culminating in shrinkage or decay of the affected part.

Canker, when it attacks Apple or Pear trees, marks its advent by the enlargement of the bark, whether it be of a branch or of the stem. There is invariably a swelling more pronounced in the Apple than the Pear, yet always present in those trees, and in neither case accompanied by a material discharge. Beyond the mere unnatural enlargement there is no trace or marks of disease, but the swelling increases, influenced by the favourable or unfavourable conditions under which the tree is vegetating; the alburnum dies, the bark cracks, rises in discoloured scales, and decay rapidly ensues. Small branches are soon encircled by the decay, extending through the whole alburnum and bark; moderate sized and large branches, even the stem itself, fall a prey to the evil, until ultimately the circulation of the sap is prevented, and the wood above the diseased part perishes.

In the Apple and Pear the true sap contains a considerable quantity of free acid, and in this there is, when the energy becomes impaired, a marked tendency to secrete the calcareous saline compounds, and though there is no discharge, as in the case of the Oak and Elm, there is a great destruction of wood. In the Oak and Elm, the sap of which is characterised by abounding in astringent or mucilaginous constituents, the discharge is copious, particularly in the Elm. I have seen this morbid product flow from the stem of a tree so copiously as to saturate the ground to a considerable extent around, attracting a number of wasps. On the edges of the canker in Apple trees Sir H. Davy found carbonate of lime, the bark over which the matter flows in the Elm attains the appearance of chalk, effervescing with acids. A blackish varnish-like deposit is left on the bark of the Elm, not infrequently hanging like stalactites, the matter being alkaline, and effervescent with acids. The white matter formed round the edges of the canker is composed, according to Vauquelin, of carbonate of potass, 34.2 per cent.; carbonate of lime, 5; carbonate of magnesia, 0.3; and vegetable matter, 60.5.

That the discharge is highly destructive of the wood is apparent, yet the destruction is not so great as the observer may conclude, as the amount of saline constituents in the healthy sap are largely and unnaturally increased in the diseased state. When the sap becomes vitiated—unnaturally saline—the tree becomes debilitated, and loses its power of selecting by its roots congenial nourishment. Canker, then, arises from a tendency to secrete calcareous saline compounds, due to acids prevailing over the alkalies. The remedy is easy—supply more alkali and the acid will be neutralised. Excessive moisture in soils induces succulent growth, weakness, and early decay. Draining is the prime agent by which the superabundant moisture is removed, the food of plants being destroyed by its presence, and as we remove the cause so will the roots recover their sensitiveness by the increase of temperature that follows the draining. Then it is a property of iron to sink, so by taking away the superabundant water we draw off a considerable portion of the iron. Still there are acids which have been formed, and we can only get rid of them by a neutralising agent. In this case quick (hydrate of) lime will afford what is required as a corrective. That, however, is not enough. Soils that have formed a pan must have it broken up by trenching and due exposure to the atmosphere, so as to affect their amelioration. Six tons of quicklime per acre will mostly be sufficient to correct the acidity of soils. Want of moisture in soils may be palliated by a dressing of chalk, the acids being neutralised by it in light soil, as they are by the quicklime in heavy and wet land, and in proportion as the neutralisation goes on so is the ammonia liberated from the iron. A dressing of clay marl would be even more advantageous, as its lime has the additional benefit of alumina, which with iron has the property of attracting ammonia. If the soil rest on iron gravel this must be removed, and an artificial drainage of chalk substituted, or in case of a subsoil not necessarily gravelly, but in which iron largely abounds, it may be necessary to put in concrete to prevent the roots passing into the unfavourable iron subsoil. The débris of an old building—the lime or old mortar rubbish freed of old laths—6 to 9 inches thick answer well on retentive soils, and a similar thickness of chalk where the soil is light.

Soil, however, is not everything. If the roots are deep they will send up colder and cruder food; if shallow they may afford a meagre and uncertain supply. When a few strong roots run riot in a loose rich soil the growths are gorged with sap and liable to injury by frost, resulting in canker. This can be rectified by lifting and replanting in firmer soil. The over-vigorous tree will have much wood but proportionately few leaves before lifting, afterwards not nearly so much wood but many more leaves, which means improved digestion, more perfectly elaborated sap, higher assimilation, and a greater store of ripened wood. This makes the difference between the unhealthy and healthy, between the unfruitful and fruitful, tree.

Canker may also be induced by severe or injudicious pruning. The removal of large branches late in spring is prejudicial. When recourse is had to severe pruning, especially of old trees, it should always be practised when they are in full leaf, and after the sun has passed the meridian, so that the growths retained may have the benefit of the remaining part of the year's light and warmth to mature the wood and store up food for the coming season. Late pruning is also bad, especially for luxuriant trees, as it tends to late growths, which are liable to be damaged in severe winters. Where growth is so superabundant as to necessitate severe pruning two palliatives only will avail—viz., root-pruning, or allowing the branches more space for extension. A tender variety is more subject to canker than a hardy one. That points to the necessity of selection—preserving and propagating from the most suitable. There is the question of bruises and the punctures of insects causing canker. I have never known a bruise result in canker, and though the bark may be punctured or the wood drilled by insects, no canker, so far as I have observed, could be traced thereto.—G. ABBEY.

## PARISIAN HORTICULTURE.

THE rush and bustle of the show season during the past two months have interrupted my Parisian notes, and several little chapters have yet to be written. Before, however, the present contribution reaches the hands of Journal readers I expect to be in Ireland amongst the gardens and gardeners of our sister isle. Numerous kindly invitations, a full programme, and an earnest desire to see everything worthy of record, will occupy my time there, consequently I have taken advantage of this opportunity to refer to one of the most pleasant of my Parisian excursions.

Starting from the Hôtel de Londres, near the St. Lazare station, Baron Adolphe de Rothschild's residence in the Rue Monceau was first visited to obtain the necessary permission, most readily accorded, to visit the demesne at Boulogne sur Seine, the special object of the day's journey. A short time was then spent in the charming Parc Monceau, a perfect little model of what a town park should be, and to which I hope to refer again at the first opportunity. Thence proceeding by road to the Champs Elysée, a drive by way of the Arc de Triomphe and the Place de l'Etoile was commenced of a most enjoyable character on a brilliant sunny day such as have been too rare this season.

### THE BOIS DE BOULOGNE.

The praises of this delightful resort have been frequently sung in the pages of this Journal, and no visitor familiar with our too formal London drives and parks could fail to be impressed with the scenery in the Bois. We have nothing like it in London or even in England as a public park. With regard to extent alone, I believe Richmond Park most nearly approaches it, with somewhat the advantage by a few acres, the "Bois" covering about 2000 acres. But there is no further similarity between the two parks, except that they are both well wooded, though again Richmond has the advantage in the size of its "specimen" trees, and in the "Bois" there are comparatively few of an unusual character. As a portion of an old forest it has included many fine trees, and the remains of some may still be found that in various troublous times have been destroyed, either wantonly, by accident, or for use in several ways. The "original" forest was largely composed of *Quercus sessiliflora*, the *Chêne rouvre* of the older French writers, and there are numbers of this Oak in the present "Bois," but many other trees have been largely planted, with the result that the diversity of aspect has been advantageously increased. The denseness of the tree and shrub growth has been a great help in improving the picturesque appearance of the "Bois," for judicious cutting and clearing have in some instances effected much more than could have been accomplished by planting or artificial design. It is probable, too, that still further improvement would result from an extension of the clearing process at suitable points. Observers have remarked a want of breadth as being the chief defect of the place, and this is true; but it must be remembered that the actual width of the park, if it may be so termed, is small compared with its length, and it would be difficult to secure an open space of sufficient extent to justify the wholesale sacrifice of the present occupants. In Hyde Park and Richmond Park, already mentioned, we have these grand open breezy spaces to perfection, and the breadth of the parks themselves admits of this without detracting from their general beauty.

The drives through the Bois de Boulogne are the special features, because, like the avenues and boulevards of Paris, they are spacious, tree-shaded, and well watered and kept. Extending

the whole length of the "Bois" from the Place de l'Etoile the vistas are most varied and pleasing, charming peeps of dense shaded woodland scenery, the picturesque lakes, not disfigured by unsightly buildings or bare banks, are charming in the extreme. Rustic bridges, waterfalls, and other attractions have been provided in most cases with considerable taste, and it is not difficult to understand why the Parisians throng the walks, drives, and shady retreats on Sundays and holidays.

#### A SUBURBAN CHÂTEAU.

Passing from the "Bois" the little town of Boulogne sur Seine is entered, and driving in the direction of Sèvres, Baron Adolphe de Rothschild's residence is quickly reached, and an inspection commenced of one of the most English-like gardens I had the good fortune to visit. The garden itself is in two portions, being divided by a main road exactly like Baron Schröder's garden at Egham, the ornamental part with the resi-

dition. The one in question, however, has been formed in a very short time, and never have I seen such a dense, velvety, firm and beautiful lawn produced from seed in about two months. The seed was sown on March 29th, and my visit was made in the third week in May, and no one could have desired anything better than the condition of the lawn at that time. Much careful preparation had been given to the soil previous to sowing the seed; the natural soil, which was of an unsuitable character, had been removed, and a good compost took its place. When the seed germinated it was looked after closely, and as the growth advanced water was supplied liberally, when the condition of the soil rendered it necessary, and this, with warm bright weather early in the season, helped it greatly. Frequent cutting had thickened the grass, and in all respects it was perfectly satisfactory, and considerably better than could have been anticipated in so short a time.

Surrounding the lawns are dense varied shrubberies, large

FIG. 17.—BARON ROTHSCHILD'S GARDEN AT BOULOGNE-SUR-SEINE.

dence being on one side, and the "cultural" department, the glass houses, &c., on the other. Taking the former first, and entering the principal gate from the road, a glimpse is obtained of the tasteful bijou chateau, surrounded by rustic colonnades and embowered in climbing plants, Roses with other fragrant and brightly flowered plants in profusion. Beyond this the garden slopes slightly towards the Seine, and a beautiful background is formed by the wooded heights of St. Cloud on the opposite side. This is the point of view represented in the engraving (fig. 17) prepared from a photograph taken there a short time since, and kindly forwarded for reproduction with these notes.

To detail all the attractions of the garden would far exceed my present purposes, but the special features cannot be passed unnoticed. Prominent amongst these is the lawn, and particularly so because good lawns, as we understand them in England, are too seldom seen in France. The continental summer is usually very trying for grass, and it is only by the closest attention to watering that lawns can be preserved in even a fairly green con-

dition. The one in question, however, has been formed in a very short time, and never have I seen such a dense, velvety, firm and beautiful lawn produced from seed in about two months. The seed was sown on March 29th, and my visit was made in the third week in May, and no one could have desired anything better than the condition of the lawn at that time. Much careful preparation had been given to the soil previous to sowing the seed; the natural soil, which was of an unsuitable character, had been removed, and a good compost took its place. When the seed germinated it was looked after closely, and as the growth advanced water was supplied liberally, when the condition of the soil rendered it necessary, and this, with warm bright weather early in the season, helped it greatly. Frequent cutting had thickened the grass, and in all respects it was perfectly satisfactory, and considerably better than could have been anticipated in so short a time.

Surrounding the lawns are dense varied shrubberies, large beds of Roses and Rhododendrons, the latter forming a grand bank at the river end of the garden. Fine trees are also scattered about on the lawn and near the road, Liriodendrons, Planes, Birches, Sequoia gigantea, and Tilia argentea being noticeable. The whole design of the garden indicates the most thoughtful taste; the contrast or harmony of trees, shrubs, and flowering plants has been made a careful study by Baron Rothschild, and the Baroness has also aided materially in improving the artistic effect, the experience she has gained in the extensive work at her Geneva residence having been turned to valuable service in concentrating as many garden attractions as possible in the delightful little Boulogne demesne.

Concerning the ranges of glass houses in the other department of the garden where Orchids with other plants are so well grown, I hope to say something on another occasion, because it has a bearing upon a subject of some importance, the "culture of Orchids on the Continent." This could not be adequately treated in the brief notes that would have to

suffice this week, therefore it shall be resumed when an hour's leisure affords me the opportunity of dealing with the matter.—  
LEWIS CASTLE.

### ROYAL HORTICULTURAL SOCIETY.

THE Floral Committee met at the Society's Gardens, Chiswick, on July 22nd. Present: W. Marshall, Esq., in the chair, and Messrs. Hibberd, Lowe, Drury, Walker, Herbst, Nicholson, Baines, Leach, Dean, Goldring, Paul, and Holmes. The Committee inspected the collections of Carnations, Picotees, Stocks, and Pansies growing in the Gardens, when the following awards were made. \*\*\* Equivalent to first-class certificate; \*\* to award of merit:—

Carnation	*** Juliette (R.H.S.), bright rosy purple self.
"	" Mrs. Frank Watts (Ware), white self.
Picotee	" Romco (Paul & Son).
"	" Augusta "
"	" Pica "
Carnation	" Juno " rose self.
"	" Snowdrift (Fisher, Son, & Sibray), white self.
"	" Horace (Dan), scarlet self.
"	" Maggie Laurie (Dicksons & Co.), delicate blush self.
"	" Caledonia " bright purple.
"	" The Moor (Dean), dark crimson.
"	" Rowena " bright scarlet.
Picotee	" B. J. Bryant (R.H.S.).
"	" Favourite (Turner).
Carnation	" Clown (Dodwell), yellow ground.
"	" Oxonian " salmon self.
"	** Beatrice (Fisher, Son, & Sibray), buff self.
"	" Fair Maid (Dean) blush.
Pansy	*** The Bride (Dobbie) creamy white, edged blue.
"	" Duchess of Fife " orange, edged bronze.
"	" Neptune " dark purple, top petals pale.
"	** Duchess of Sutherland (Dobbie) pale lavender.
"	" Marchioness of Tweeddale " pure white.
Stocks	*** Large Ten Week (Putz) brilliant rose.
"	" " " purple.
"	" " " white.
"	" " " sulphur yellow.
"	" Dwarf Ten Week " lilac.

### FRUIT AND VEGETABLE COMMITTEE.

Present: T. F. Rivers, Esq., in the chair, and Messrs. Cheal, Crowley, P, Veitch, Balderson, Warren, Wythes, and Hudson. The Committee inspected the collections of Peas growing in the Gardens, and made the following awards of merit:—The Daisy (James Carter & Co.) a dwarf wrinkled Marrow; Boston Hero (G. Bunyard & Co.) a tall white wrinkled Marrow; Ambassador (H. Eckford) a tall green wrinkled Marrow.

The Floral Committee, on July 31st, again inspected the collections of Carnations and Picotees, also the Pelargoniums, growing in the gardens, and made the following awards:—

Carnation	*** Mrs. Reynolds Hole (Veitch), terra cotta.
Picotee	" Grandiflora (Veitch), deep rose.
"	" Alice Ayres (Veitch-Ware), white, slightly streaked.
Carnation	" Gloire de Nancy (Veitch), white, large.
"	" Germania (Veitch-Benary), yellow.
"	" Raby Castle (Turner-Veitch), rose-pink, fine constitution.
Picotee	" Admiration (Veitch), dark purple edge.
Carnation	" Guiding Star (Ware), scarlet self.
"	" Will Threlfall (Paul), bright yellow.
"	" Edith (Fisher, Son, & Sibray), pale pink, spotted scarlet.
"	" Canary " pale yellow.
"	" Comtesse de Paris (Paul), pale blush.
"	" Penelope (Hooper), white self.
"	" Merlin (Lakin), deep crimson.
"	" Boadicea (Douglas), purple flaked.
"	" Caractacus " crimson bizarre.
"	" Feuerball (Benary), deep scarlet self.
"	" Mirakel von Zirbst (Benary), very dark crimson.
"	" Albrecht Duesser " deep rose, crimson flake.
"	" Orestes (R.H.S.), pale rose.
"	" Countess of Ellesmere (R.H.S.), pale flesh, spotted with crimson.
Picotee	" Agnes Chambers (Turner), yellow ground, lilac edge.
"	" Colonial Beauty " terra cotta, streaked.
"	" Dorothy (Turner), terra cotta.
Carnation	" Scarlet Premier (Storrie), scarlet self.
"	" Rose Celestial (Turner), rose self.
Picotee	" Atalanta (Dodwell), yellow ground.
"	" Diana (Dodwell), white self.
"	" Ariel " yellow.
"	" Andromeda (Dodwell), terra cotta flaked.
Picotee	** Grosken (Veitch), purple edge.
"	" Alfred Grey (Dodwell), yellow ground.
Carnation	" Hypatia (Paul), white self.

### Double-flowered Ivy-leaved Pelargoniums—

"	*** De Quatrefages (Lemoine), violet-magenta.
"	" Souvenir de Charles Turner, flowers of a deep pink shade.
"	" Galilee, No. 1, soft lilac.
"	" " No. 2, soft rosy pink.
"	" Madame Thibaut, deep pink.
"	" Le Printemps, rosy pink.
"	" Comtesse Horace de Choiseul, satiny rose.
"	" Gloire d'Orleans, bright pink.
Single-flowered, Ivy-leaved—	
"	*** Gem, blush white.
"	" Mrs. H. Cannell, deep mauve purple.
Zonals	*** Charles Mason (Pearson), fine scarlet, of good habit.
"	" Mons. Poirer (Lemoine), flowers of a beautiful purplish shade, of good habit of growth.
Stock, Large-flowering Ten Week—	
"	** Aurora (Putz).
Fuchsia	** Dunrobin Bedder (Melville), seedling from F. Riccartoni, a dwarf, free-flowering, bedding variety.
Mimulus	** Moschatus compactus (Putz), of dwarf, even growth, free flowering, and useful for edging purposes.

### NOTEWORTHY PLANTS.

THE "Botanical Magazine" for July contains coloured illustrations of several good plants that are worth the attention of cultivators. The plates, strangely enough, have been again bound wrongly, a mistake that has occurred rather frequently of late.

#### BIGNONIA RUGOSA.

A climbing plant with large elliptical leaves and pale yellow flowers. Sir Joseph Hooker says respecting it:—"In the absence of fruit, *Bignonia rugosa* was described as a doubtful species of the genus, and for its generic confirmation the Royal Gardens are indebted to their excellent correspondent, Dr. Ernst of Caracas, who transmitted seeds to Kew in 1872, together with the description of the fruit which is given above. Its nearest ally is probably a plant, a native of the Antilles, figured as *Macrodiscus rigescens* by Bureau in his beautiful Atlas of the flowers and fruit of the new genera into which he proposed to divide *Bignonia*, and of which the letterpress has most unfortunately never been published. As in *B. rugosa* the calyx is truncate, the corolla tubular with subequal lobes, the stamens and disc are the same, as are the fruit and seeds in all essentials. *Macrodiscus* is probably a well-founded genus. *B. rugosa* was discovered by the collector Wagener in the province of Choco, United States of Columbia, at an elevation of 4000 feet, and is described as a climber 10 feet high. In the description by Schlechtendal, and in native specimens from Dr. Ernst, there are stipular leaflets at the base of the petiole.

"The Kew plant of *B. rugosa* was raised from seeds sent, as stated above, by Dr. Ernst in 1872, and which flowered in the Palm house in October, 1889."

#### LUEDDEMANNIA PESCATOREI.

A handsome Orchid with long racemes of flowers, the sepals streaked, spotted, and suffused with red, the petals and lip yellow. It will be seen that a slightly different orthography is adopted for the generic name from that usual in gardening periodicals—*Lueddemannia*. An account of the botanical difference between this, *Peristeria*, *Cynoches*, *Acineta*, *Lacena*, and others is given, and the description concludes with the following note—"L. *Pescatorei* is a native of the mountains of Ocana, a province of New Grenada, at the mouth of the Magdalena River, where it was found at elevations of 6000 to 9000 feet by Schlim in 1848, who sent it to Linden, and it has been subsequently collected in the same country by Roezl. Specimens with the spike upwards of 3 feet long, and bearing upwards of ninety flowers, are known. The specimen here figured was sent for figuring by Mr. Moore of the Glasnevin Botanical Gardens in July, 1889, the spike being 34 inches long. The flower had a strong scent, rather like decaying Oranges."

#### ASARUM CAUDIGERUM.

A peculiar species from China with small spotted flowers, the three divisions of the flowers prolonged into whitish tails, and exactly like one of the smaller *Masdevallias*. In an illustration, if it were not for the leaves the plant might easily be mistaken for a *Masdevallia*. This is a curiosity, and as such would be worth a place in a collection, but it would be of little horticultural value.

#### MASDEVALLIA CARDERI.

One of the small flowered species, with pretty bell-like drooping flowers, white, with a red ring near the base, which is yellow, the sepaline tails being marked with red and yellow.

"Of all the genera of Orchideæ, none is so remarkable as *Masde-*

vallia for diversity in inflorescence, sepals, petals, and lip. Twenty species have been figured in the "Botanical Magazine," and not one of these resembles *M. Carderi* in the symmetrical pendulous campanulate flowers, which show scarcely any tendency to obliquity in the position of the ovary relatively to the scape. Nor are the colours common to the genus, the predominance of white in this being very exceptional. Dr. Reichenbach refers it to the group *Saccolabiatae*, in which the terminal lobe of the lip is conspicuously saccate, and to the near neighbourhood of his *M. Houtteana* (Illust. Hort. t. 2106), in which the sheaths on the scape are lanceolate and loose, the perianth much shallower and more deeply divided, and the midlobe of the lip keeled within in the middle. Mr. Rolfe has pointed out to me a nearer ally in *M. Troglodytes*, *E. Morren*, in which the midlobe is, as in *M. Carderi*, quite even within, and the perianth of which more resembles that of the latter, though more deeply divided and very differently coloured. It further differs in the flowers being pedicelled, the narrow hypochile, and the acuminate column."

#### HAKEA LAURINA.

A member of the now forsaken *Protea* family, and like many of its relatives, it is, when in flower, very handsome. The leaves are long and narrow, the flowers in scarlet balls, from which the long yellow styles project to a considerable distance.

"Unfortunately it is not one that will stand in the open air in any but the warmest parts of the British Islands, and being a native of a very dry part of Australia, even the warmer counties would probably prove too damp for it. This, however, remains to be seen, for hitherto it has been treated in England only as a greenhouse plant. In the Mediterranean regions it does well; it has flowered profusely in Italy and Sicily, first, I believe, in Palermo in 1880, and later with the Baron Ricasoli, at his residence of Casa Bianca, near Argentaria, in Sardinia. Mr. Watson informs me that under the name of the Sea Urchin it is the glory of the gardens of the Riviera, where in Mr. Hanbury's garden, Mortalo, near Mentone, he saw a plant of it, forming a shrub 10 feet high, covered with balls of flowers  $2\frac{1}{2}$  inches in diameter. The specimen here figured was flowered by M. Braves at Nice, by whom a flowering branch was sent to the Royal Gardens in 1889. It is a native of the south-west coast of Australia, where it ranges on hills from Cape Arid to King George's Sound."

#### THE CULTURE OF THE CHRYSANTHEMUM.

At a recent meeting of the Dalston Amateur Chrysanthemum Society the President (Mr. W. Holmes) delivered an instructive lecture upon "The Culture of Chrysanthemums," of which the following is the substance.

After some introductory remarks by Mr. Arthur Hill, the President proceeded to give a rough outline of the necessary operations and "time table" for the cultivation of Chrysanthemum blooms for exhibition purposes, specially applicable to Dalston and similar districts, and based his remarks upon the following carefully prepared directions:— November (at the shows), first consider and decide positively which of the sections it is preferred to grow; (at home) second, estimate exactly the number of plants you can accommodate when the time arrives for housing; December, secure a sufficient number of good clean cuttings, make them carefully, pot into a suitable light soil, and place in a cool position, when struck pot into thumbs or  $2\frac{1}{2}$ -inch pots; January, secure cuttings of those varieties that could not be obtained in December, and treat in a similar manner; February, shift all plants that may be ready into small 60's or  $3\frac{1}{2}$ -inch pots, keep close for about a week, afterwards give a moderate amount of air during daytime, specially guarding against frost, and keep the plants to a single stem; March, shift the remainder of the plants which were not ready in February, and treat in a similar manner; April, repot all the strongest plants into 32's or 6-inch pots, keep close at night for a week or ten days, and then give all the air possible; May, repot the remainder of the collection, and treat in a similar manner; June, shift the strongest plants into their flowering pots—viz., 16's or  $8\frac{1}{2}$ -inch, stake and tie securely; July, shift remainder of plants and treat in a similar manner, and arrange plants in summer quarters; August, secure suitable buds where possible, and having done so commence stimulants in very moderate proportions; September, secure buds of those varieties that could not be taken during previous month; October, house plants in greenhouse, and increase use of stimulant as buds develop into flowers; November, keep a strict watch over flowers, remove malformed or damping petals, look out for earwigs after dark,

and one or two days before the show cut and dress the blooms, stage on regular boards, and win.

Speaking to the above "directions," Mr. Holmes, in a chatty and conversational manner, said they were assembled for the purpose of disseminating such knowledge as they happened to possess of the cultivation of their pet flower, the Chrysanthemum. It was somewhat unusual that meetings in the interest of that flower should be held at a time of the year when the Queen of Summer, their favourite flower, the Rose, had so nearly reached the zenith of its beauty and perfection. The Queen of Autumn, however, was their pet flower, and out of interest for it, no less than for their earnest regard for the Society, they did not hesitate to summon a meeting at the present period of the year to discuss the best methods of producing it. If any justification were needed for holding that meeting, it would not be difficult to find plenty. In the first place, it was pretty well known that the present year was the centenary of the introduction of the flower into England. As they were probably aware, it was proposed in November next to hold larger and more extraordinary exhibitions than usual to celebrate the event, not only in London, but in most of the larger towns and suburbs around the metropolis. That being the case, they were surely justified in holding an extraordinary meeting such as the present, to enable them to pay closer attention to the cultivation of the plant, and to produce such flowers as had not hitherto been seen. If further reasons were required it was only necessary to refer to the admirable statement which had been submitted by their Chairman and the Treasurer as to the progress which the Society had made, proving how strong was the hold which it had taken upon the florists in that particular district. He was glad to say that the enthusiasm displayed with regard to that flower was not confined to that district alone, for as Secretary of the National Chrysanthemum Society he had during the past four or five months received no less than twenty applications from bodies of gentlemen in various parts of the country, who had bound themselves together, and were organising such societies as theirs.

Having mentioned one or two other features indicative of the interest and enthusiasm which was evinced in the cultivation of the plant all over the world, the speaker went on to deal *seriatim* with the "directions" above referred to, and in the first place remarked that there were now some nine or ten sections set out in the catalogues, irrespective of the many forms of Japanese. Having explained the leading characteristics of these, the President said he had no hesitation in saying that the easiest to produce good exhibition flowers was the Japanese section. They were much easier to stage, they required less dressing, and were more largely grown than any other section. There was no more fruitful source of failure in the culture of the Chrysanthemum, or indeed of any other plant, than the attempt to grow more than they had accommodation for. He had seen many collections absolutely spoiled because of overcrowding, and owing to the fact that an attempt was made to do more than the capacity of the house or ground could provide for. He strongly recommended everyone to take double the number of cuttings required in consequence of the many risks to which the plants were exposed. The extra trouble was very small compared with the distinct advantage of having a large stock to select from. They must be careful that the cutting was "clean cut," and that it was made at the bottom of one of the joints. The reason for that was that in nineteen cases out of twenty roots would come from immediately below the axil of the leaf. If they did not make their cutting immediately below that axil the result was that the portion which was left on decayed until it reached the axil and then struck off. In the process of decay, however, the probability was that the whole cutting would be lost because it had not been made in the right place or cleanly.

The soil must contain plenty of grit, and be thoroughly well drained; and the young plants should be placed in thumbs, or 2-inch pots. It was a fact which was proved by experience that cuttings placed on the edge of the pot would strike in about two-thirds of the time which would be occupied if they were placed in the centre; and this was owing to the fact that the drainage on the edge of the pot was far more complete than was the case when the cuttings were surrounded by soil. As to position they should get an ordinary handlight, and place it in the greenhouse, taking care that there was not too much moisture. Very little water was required after the cuttings were put in. One good sound watering should be given to settle the plants, and they should then be left for a week or ten days. Everything must depend upon the surrounding conditions as to what quantity of water should be administered, but generally speaking very little was required for the first fortnight. They must not dig a deeper hole than the cuttings required, and care must be taken that it touched the base of the hole, as many hundreds shrivelled up in consequence of their not doing so. Then it was not advisable to grow year after year from the same plants, but stock should be interchanged with neighbouring florists. Generally speaking cuttings should be taken in December, but in the case of many varieties it was necessary to postpone doing so until January. Cuttings should always be shifted from one pot to another as soon as the roots reached the side of the pot. The best soil to use was that containing three-fifths of good rich loam, one-fifth of grit and oyster-shells pounded, one-fifth of the ordinary rotten manure, and a quart of good clean soot to every bushel of soil, for the purpose of preventing aphids and insects generally. The cuttings should be tightly potted.

Having explained the best method of connecting the young plants with the bamboo canes, which were the best things to use for the purpose, the President went on to say that the first buds that were set were practically useless for exhibition purposes and should be discarded.

They must then decide how many shoots they would carry up, but in arriving at their decision upon that point, they must be guided by the particular variety which they were desirous of cultivating. If the plants were strong they might have four or five blooms, but on an average he carried up four and permitted them to go on until they had made about a foot of growth. They would then be able to see which of the four were the stronger, and the weaker could be taken out. In July the pots should be arranged in long rows, on either side of a long path was as good a position as they could have, or in parallel rows in some place in the garden. Next month the buds would begin to set, but if they did so in the first fortnight in August they should be pinched off.

Stimulants must not be used until the plants had begun to exhaust the soil in which they were potted. The only reason for giving them stimulants was because they were then going through a trial time, as it were, or because the food at the roots was exhausted, and they required it. He believed a mixture of cow and sheep manure was as good as they could find anywhere. They were accustomed to hear of all sorts of chemical manures, but they were rather dangerous to use, and unless they were thoroughly acquainted with their properties they would find that more harm than good was done by employing them. During this month also any amount of syringing would do a great deal of good.

With regard to September, the lecturer pointed out that there were two kinds of buds, the "crown" and the "terminal." The former generally gave fine large flowers, which took a long time to develop, whilst the other produced flowers of a brighter and better colour, and with not so large petals. Certainly the "terminal" buds made more perfect blooms, though they were not quite so large, but it was an extraordinary fact that, although they took the "crown" buds the second week in August and the "terminal" in September, the two flowers would be at perfection at one and the same time. They must be very careful to give the plants all the room they could afford, and to tie the branches so that the various blooms were set out independently. The least bruise in the bud developed into a malformed flower, and the greatest possible care should be exercised in preventing the slightest bruise of any kind. If they only drew the back of a quill over a bud they would probably find a black mark across the flower when it subsequently developed.

Watering, when the plants were under glass, should be very carefully done, and in order to keep the mildew in check a little flowers of sulphur should be used. He was of opinion that a little sulphate of ammonia did much towards helping the flowers to develop and to brighten the colours in some of those varieties in which they wanted to heighten the colour. He considered that excessive dressing, if not illegal, was at any rate an undesirable practice. He did not see how it was to be stopped, nor was it desirable to do so whilst it was conducted on something like proper principles. It commences, as far as he could judge, from the moment that the flower began to develop, and having noticed a malformed petal the grower removes it. When, however, it reached such a point (as he had known) as a man carving out the bad centre and taking that of another bloom and pinning it in its place, he must say that he was distinctly opposed to it.

Mr. T. W. Howard, in moving a very hearty vote of thanks to the President for the lecture he had delivered, proved himself to be thoroughly conversant with the subject of the Chrysanthemum, and paid a high tribute to the services rendered by Mr. Holmes to the floral world. This was seconded by Mr. G. C. Young, and carried amid great enthusiasm.

### STRAWBERRIES.

ALTHOUGH we cultivate about seventy-five varieties, we do so with a view to reduce them to twenty-five best in the future—plus the Alpines and Hautbois family; and in order to do this we have taken notes, and our Strawberry foreman has done the same. The results—which were unanimous—may interest your readers.

*Best ten for quality and flavour* :—Dr. Hogg, British Queen, John Powell, La Grosse Sucrée, Vicomtesse de Thury, Keens' Seedling, President, Trollope's Victoria, Lucas, and Countess. Many palates prefer a brisk acid flavour; therefore Sir Charles Napier, Aromatic, Kimberley, and Eleanor would come in.

*Best twelve for crop* :—Noble, Vicomtesse H. de Thury, President, Sir C. Napier, Sir J. Paxton, Aromatic, Helena Gloede, John Powell, King of the Earlies, Jubilee, Newton Seedling, Trollope's Victoria.

*Largest half-dozen* :—James Veitch, Noble, Helena Gloede, Sharpe's No. 1, Sir Joseph Paxton, and Auguste Nicaise.

These results are arrived at after a close examination through this season, and from one, two, and three-year-old beds. When a few fresh kinds and new ones under trial have had a fair chance some of the above may be superseded; but in order to make up the twenty-five varieties we must add the following, which are just outside the boundaries above :—Filbert Pine and Waterloo.

We find such close compact growers as Countess, Lucas, Dr. Hogg, Duke of Edinburgh, Jubilee, Hammonia, Frogmore Late Pine, and one sparse-foliaged variety—La Grosse Sucrée—want planting closer together than usual—say, 24 by 12 inches—otherwise the radiation of heat from the exposed soil reduces the crop; and possibly they would be better if allowed to ramble all over the bed. They are really better in three-year beds than during the second year. We think Bicton Pine (which Mr. Barron calls White Carolina) should be planted in every garden, as it is invaluable in dry summers, as its ample foliage protects

the fruit. In our opinion a good Strawberry should possess fine foliage, long footstalks, and a hardy constitution.—GEORGE BUNYARD, AND Co., *Maidst me.*

### BIRDS, INSECTS, AND FRUIT.

#### MR. HIAM'S VIEWS.

A VISIT to Mr. J. Hiam, naturalist and fruit grower, The Wren's Nest, Astwood Bank, Worcestershire, was described as follows in a recent issue of the *Evesham Journal*. Mr. Hiam's observations are suggestive and useful :—

"Mr. Hiam, who is a member of the Evesham Experimental Insects Committee, stated that the psylla was very prevalent amongst the Apple trees. He also remarked that he thought that it would be a good thing if the Experimental Committee met again before the autumn, because they had other pests to deal with besides the caterpillar, and notable amongst these were the psylla, the Apple weevil, the aphid, and others, which would require the serious consideration of the Committee. Mr. Hiam is a great believer, in the case of small and young trees which are easily accessible, of using a coating of thick limewash on the trees, so as to encase the eggs of the caterpillar, the psylla, the scale, and others, and he can show the visitor several instances where this dressing has achieved the most excellent results. He used two brushes, and painted the stems and the branches of the trees. It will be seen that this process is impracticable in the case of large plantations and old trees. Mr. Hiam, however, thinks perhaps that it might be successfully carried out by means of a hop-washing machine or a strawsonizer, supposing that the nozzle was large enough and the liquid thick enough.

"Before inspecting the orchard Mr. Hiam alluded to the good small birds did, and casually observed that at the evening meeting held some time ago at Evesham, when he gave a lecture on birds and insects, it was said that the common tom-tit did as much damage as any other bird which the gardeners were troubled with. He dissented from that view, his opinion being that they were most useful insect destroyers, and not fruit eaters. The bullfinch, on the contrary, is exceptionally fond of the bud, and not long since he shot a tom-tit and two bullfinches for the purpose of confirming or refuting his opinion. The result has been just as he foretold. The inside of the tit contained nothing but blight, while that of the bullfinch, one of which was feeding on the Plums and the other on the Gooseberries, contained the inside of the bud. Mr. Hiam is strongly of opinion that tom-tits should be preserved in the gardens. He also advocates, not the destruction, but the capture of the bullfinch. This he considers the more humane treatment, and it is also more remunerative, as bullfinches are still looked upon as song birds, and can be turned into money. They are also very easily caught at a certain time of the year, and he caught forty-two last winter.

"After some little time had been spent in examining these specimens, an inspection of the orchard was made. Mr. Hiam first drew attention to an Apple tree which was so badly blighted last year that when it was photographed there was not a leaf to be seen upon it. He placed a grease band around it, but as this was applied late it did not have quite as much effect as it should have had, and caterpillars appeared. It should be mentioned that he was unable to obtain good grease as early as he desired, and could not apply it until about the middle of November, which was at the least a month late. By that time several of the female moths had found their way up the tree, but nevertheless the grease bands proved death traps to some thousands. In this particular tree, as soon as the caterpillar made its appearance, Mr. Hiam syringed with a solution of Paris green, and the result has been most satisfactory. The foliage looks exceedingly well, and although there is no fruit, which can hardly be wondered at considering the condition of the tree last year, it looks healthy and in good form for a crop next year. By way of an experiment, Mr. Hiam left an Apple tree adjoining to take its chance, and the result is that there is no foliage at all on it. This is the same with another tree close by where no washing was resorted to. All the trees were greased at the same time. The most marked contrast in the whole of the orchard was in one large Apple tree which was greased as well as the others. Here the caterpillar also appeared, and on one side—about a third of the tree—Mr. Hiam used a wash of London purple, leaving the other two-thirds alone. On the portion which was dressed the foliage is slightly scorched, but beyond that there is no damage done and there is no sign of the caterpillar. There is also a very good show of fruit, while on the other parts of the tree there is no fruit and very little foliage. A clearer proof than this could hardly be obtained. Another tree had been dressed with Paris green, and here the foliage is practically uninjured, and the fruit is as thick as the tree can very well bear. At the end of the orchard some high Elm trees overhang the fruit trees, and Mr. Hiam says that the wind shakes the caterpillars from the Elms on to his fruit trees, and he was suffering a good deal of damage from this cause. An application of Paris green, however, soon disposed of the pest. With regard to an application of alum, Mr. Hiam said that at first he was inclined to recommend its use, as it appeared to kill the grub. As, however, the grub increased in size, it had no effect upon it, and he added that Mr. C. D. Wise was not far wrong when he said that the caterpillars liked alum. The trees on which this preparation had been used were quite devoid of foliage.

"With regard to the greasing, Mr. Hiam places the grease upon waterproof paper, and where there are any irregularities in the trunk of the tree or the bark, he fills it with a kind of cement made of lime and soot, to prevent the moths creeping under the band. On one tree he

was induced to try a solution of Hudson's dry soap, and this he thinks he must have used too strong, as the foliage was very much scorched. Nevertheless, the fruit was saved for this year at least. How the scorching of the foliage will affect next year's crop remains to be seen.

"The psylla is present in considerable quantities amongst Mr. Hiam's Apple trees, and they make their presence known by the number of Apples which have fallen off. Mr. Hiam has hit upon a method of catching this fly—that is, to get an old umbrella and grease it inside, and then to hold it near a bough, which is shaken. The flies immediately disperse in swarms, and many are captured in the grease. Mr. Hiam also showed several trees upon which there was no foliage at all last year, and upon which the leaf could not possibly look healthier. There is, of course, no fruit, but last year's blight is sufficient to account for that. Mr. Hiam is of opinion that London purple will scorch the foliage sooner than Paris green, and also that the leaf of the Keswick Codlin is more easily affected than that of other Apple trees. Several of the little homes are provided for birds in various parts of the orchard and premises, and nearly all were tenanted in the spring. In one of these—an old tea pot—no less than seven broods have been safely reared. Mr. Hiam's extensive knowledge of the habits of birds and insects made the interview most interesting and enjoyable."

## HORTICULTURAL SHOWS.

### HAYWARDS HEATH.

IN our brief notice of the first Show held by the above Society last year we expressed the opinion that from its central position, the enthusiasm of its promoters, and the generous facilities offered by the Railway Company, it would become something more than a local Show. These expectations have been fully realised on the occasion of its second annual Show, held on Wednesday last, the 30th ult. The entries were so numerous that five marquees were necessary to receive the exhibits, and even with this accommodation exhibitors came in with such a rush as to make the pre-arranged means of staging wholly inadequate to cope with them. Experience will no doubt remedy this another year, as it will also the slight want of method in supplying exhibitors' cards, &c. One or two other matters also want seeing to in the future—viz., keeping exhibitors up to time in the morning, so that the Judges may have time to finish their labours before the admission of the public, for it is extremely annoying for the latter to make their awards with a small crowd of exhibitors surrounding them. With regard to the arrangement of the exhibits they were very satisfactory, except that they were overcrowded in some instances, and it was a mistake to place large foliage plants, Ferns, and flowering plants on so high a stage in the centre of the large marquee. Large pots should never be made conspicuous by bringing them so near on a level with the eye if the occupants are to be seen to advantage.

Having pointed out these few shortcomings, let us briefly refer to a few of the best features of a highly satisfactory exhibition. There were five miscellaneous groups of plants staged, all very creditable. Mr. T. Gilbert of Springfield Nurseries, Hastings, was an easy first with a beautiful light arrangement, in which elegant Palms and Lilioms were appropriately associated with choice plants of dwarfer growth. W. Jupp, gardener to G. Boulton, Esq., Eastbourne, was second with a neat group, in which Orchids was a feature, but he was short of a few larger Palms to be on a level with his opponent. Mr. Hodges, gardener to — Gibbons, Esq., Lindfield, was third, and S. Horseroft, gardener to Mr. Potter, Ardingly, fourth with well arranged groups. For so young a Society this was felt to be an unequal contest. For a group of foliage plants Mr. Jupp was first, Mr. A. Seutt, gardener to Mrs. Jenkins, Burgess Hill, second, and Mr. Gilbert third. Mr. Jupp was also first for the collection of Ferns, Mr. J. Harnes, gardener to Miss Wyatt, Haywards Heath, second, and Mr. G. P. Wickham, gardener to Mr. J. Humphrey, Rymer, third. For a collection of fruit, flowers, and vegetables arranged for effect two exhibitors staged. Mr. G. Stringer, gardener to R. A. Biron, Esq., Cuckfield, had much the best fruit, and although the arrangement was of the simplest it was effective. The other exhibitor was Mr. C. Crosby, gardener to Mr. Cambridge, Lindfield. W. Marston, gardener to Mrs. Borrer, Bolney, was first of the collection of nine varieties of vegetables with a fine lot, conspicuous being Satisfaction Potatoes and Duke of Albany Peas. Mr. F. Godby, gardener to Dr. Withers, Moore Burgess Hill, was second. These classes were all open to the county. We must pass over the plant classes. They were much more numerous and of better quality than last year, the chief successful exhibitors being Messrs. J. Hodges, J. Mitchell, H. Townshend, P. March, G. F. Wickham, and J. Voss. Amongst cut flowers hardy herbaceous flowers and annuals were well shown, and made a fine display. The fruit staged was of very good quality, and the entries numerous, especially in hardy fruits. The chief prize-winners were Messrs. C. H. Brooks, G. J. Warren, H. Hunt, G. Jupp, W. Marston, S. Horseroft, H. Cornwells, and G. Austin.

There were thirty special prizes offered by various tradesmen, much to their credit, amongst whom were Messrs. Sutton & Sons, Messrs. J. Carter & Co., Messrs. Daniel Bros., Messrs. Grimsdick & Son, Messrs. J. Cheal & Sons, Mr. T. S. Ware, Messrs. Richard Smith & Co., Messrs. Wood & Sons, Mr. G. W. Piper, Messrs. Hooper & Co., and others. The result of this was that nearly a whole marquee was filled with interesting exhibits. A similar marquee was well filled by the trade themselves—or rather their exhibits—and the Roses there staged by the Messrs. Woolard & Sons, Mr. W. Knight, Messrs. Geo. Bunyard & Co., and the

Messrs. J. Cheal & Sons, and made a great display. Messrs. J. Laing and Sons sent some fine cut flowers of their famous Begonias, and Messrs. J. Peed & Sons showed some cut flowers of their beautiful strain of Gloxinias, neatly arranged in moss and Maidenhair Fern.

The Society had unfortunately a miserable day for their Show, a drizzling rain falling at intervals all day. The President of this promising Society is S. Cooper, Esq., and the Secretary Mr. A. Willmot.

### SOUTHAMPTON.—AUGUST 2ND.

IT is pleasurable to state that the Show to be described was superior in all departments, and the officials are to be congratulated on the success achieved. Captain Gibbs is most energetic as Chairman of the Committee, and Mr. Fudge is a most courteous and experienced Secretary.

PLANTS.—For these thirty-five classes were set apart, sufficient to bring together an excellent collection, and as the prizes were liberal the competition was good. Two very large tents were required, one being devoted entirely to the specimens, while the groups and small plants occupied the centre of another tent. The arrangements were excellent for proper inspection both by the Judges and public. There was a slight falling off in the numbers staged. Mr. Lock, who has been a constant exhibitor for some years, was missed. The principal class was for twelve stove or greenhouse specimens, half to be in bloom and the remainder foliage, for which prizes of £15, £12, and £10 were offered. Mr. Cypher, The Nurseries, Cheltenham, was easily first, showing a clean lot, the flowering plants being fresh and well bloomed, the foliage all that could be desired. *Latania borbonica* was of huge size, *Crotons Sunset* and *Thompsoni* were richly coloured, *Kentia Fosteriana* and *Cycas revoluta* were noteworthy. The best of the flowering plants were *Ixoras Pilgrimi* and *coccinea*, both profusely flowered. *Bougainvillea glabra* and *Allamanda nobilis* were also good. Mr. E. Wills, gardener to Mrs. Pearce, Bassett, Southampton, was second, a capital *Cycas revoluta* being in his group; third Mr. J. Currey, gardener to Col. Pepper, Milford Hall, Salisbury. For ten stove or greenhouse plants, competition confined to gardeners only, the same conditions applying as in the former class as to number of flowering plants, Mr. N. Blandford, gardener to Mrs. Haselfoot, West Hill, Bitterne, was an easy first. The rarely seen *Lasiandra maerantha floribunda* was well shown, with *Ixoras Duffi* and *Fraseri*, and *Allamanda Chelsoni* well flowered. Mr. W. Peel, gardener to Miss Todd, Sidford Lodge, Shirley, was second.

An open class for six specimens was also provided and produced a capital display, so keen was the competition. Mr. Cypher followed up his previous success by taking first honours with *Erica Parmenteriana* of large size, freely flowered, and good in colour. *Ixoras salicifolia* and *Regina* were also good. *Croton Queen Victoria*, rich in colour, and *Kentia australis* were the best foliage plants. Mr. Blandford was a good second, staging a magnificently flowered *Allamanda Hendersoni*, and a like specimen of *Ixora Fraseri*; Mr. J. Currey third. The best single specimen foliage plant was a healthy *Latania borbonica* from Mr. Wills, Mr. Currey being second. Mr. Blandford was first for a specimen flowering plant with *Erica æmula*, 3 feet in diameter, beautifully flowered, Mr. Mills following with *Statice profusa*, and Mr. Cypher with *Ixora coccinea*. This was a strong class. That for six stove or greenhouse Ferns brought out some good specimens, Mr. Wills leading with *Lomaria gibba platyptera*, *Nephrolepis davallioides furcans*, *Microlepia hirta cristata*, and *Adiantum cardiochlena*. Mr. Peel was second, also staging well. For the same number of hardy Ferns there was smart competition, Messrs. Blandford and Wills being first and second respectively. *Athyrium Filix-fœmina grandiceps*, *Onoclea sensibilis*, and *Adiantum pedatum* were most noteworthy.

Mr. Wills was the only exhibitor of six Fuchsias, he deservedly taking first honours with specimens 7 feet high, freely flowered, and he was also first for a single specimen. Mr. H. Innes, gardener to J. Buchan, Esq., Wilton House, Southampton, was second in the latter class. For six Begonias Mr. Wills was first with not very large plants, but very healthy and carrying fine blooms. Mr. Bushby, gardener to F. Willan, Esq., Thornhill Park, Bitterne, was second, he also staging well. Messrs. Innes and Busby took the awards for *Coleus* in six distinct varieties, the plants being remarkable for high colouring rather than large size. *Coekscombs* were magnificently staged by Mr. E. Varney, gardener to T. B. C. West, Esq., Langdown Lawn, Hythe; the plants were dwarf, carrying heads fully 8 inches wide and 15 inches long. Mr. Innes was second. Mr. B. Ladhams, florist, Shirley, staged the best *Petunias*, freely flowered, dwarf plants. Double Begonias in four varieties were best staged by Mr. Innes and Mr. Busby. Mr. Blandford staged the best double and single Zonal Pelargoniums, Mr. Wills following in each class. Gloxinias were capitally shown by Messrs. Blandford and Innes, prizes going in the order named. Mr. Wills took first honours for six *Celosias*, freely flowered, and also for six table plants. Mr. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, was second in the latter class.

For a group of miscellaneous plants arranged for effect, occupying 120 square feet, there were five competitors. Mr. Wills was a somewhat easy first. From a bed of small Maidenhair Ferns rose such plants as well-coloured *Crotons*, light and graceful Palms, *Francoa ramosa*, *Lobelia fulgens*, and *Celosias* evenly and lightly disposed, the whole neatly edged with *Panicum variegatum*. Mr. Currey was second with plants suitable for the purpose, but heavily arranged, lacking lightness and grace. Mr. Ladhams was third with an harmonious arrangement of hardy plants mainly, in conjunction with Maidenhair Ferns and Palms.

Orchids were not largely shown. The best collection was staged by Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke, comprising such plants as *Lycaste Deppei*, *Chysis aurea*, *Odontoglossum vexillarium*, *Epidendrum vitellinum majus*, and *Augoula Clowesi*. Mr. Blandford was second. The best specimen Orchid was a *Cattleya Gaskelliana* from Mr. Cypher; second, Mr. J. Evans, gardener to Lady Ashburton, Melchet Court, Romsey. Amateurs staged most creditably in the classes set apart for them.

**CUT FLOWERS.**—These made a good display in the tent with the fruit. For twenty-four Roses, distinct, Mr. S. G. Rumsey, Wrotham, Kent, was placed first with a capital lot for so late in the season, the blooms being large and richly coloured, especially *Comte de Raimbaud*, Duke of Edinburgh, Alfred Colomb, Earl of Dufferin, Madame Hoste, John S. Mill and Mrs. J. Laing. Messrs. Perkins & Sons, Coventry, were second, and Messrs. Keynes, Williams & Co., Salisbury, third. For twelve Roses, distinct, Mr. W. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, was first with good blooms, *Catherine Mermet*, *The Bride*, *Souvenir d'Elise*, and *The Hon. Edith Gifford* being good. Second, Mr. A. Pomeroy, gardener to Dr. D. Seaton, Bitterne. For twelve bunches of stove or greenhouse flowers Mr. Budd was first, staging good Orchids, *Stephanotis floribunda*, *Æchmea fulgens* and *Allamanda Hendersoni*, Mr. J. Evans second. Hardy herbaceous flowers were plentifully staged, the best lot of twelve varieties coming from Messrs. Cheal & Son, Crawley. Mr. R. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, was second, and Mr. Evans third. For twelve Carnations and Picotees, six of each, Mr. W. Clements, Ford, Salisbury, was easily first, as also for twelve Carnations in not less than six varieties, and for twelve Picotees; in all cases the flowers were fine. For twelve Dahlias, not less than eight varieties, Mr. West took leading honours, Mr. Neville being second. The best Pompon Dahlias staged in threes were from Mr. J. Evans. Second, Messrs. Cheal. For the best epergne decoration Mr. Cypher was well ahead with a good arrangement of choice flowers. Second, Miss A. Hobley. Messrs. Perkins were invincible in the classes for ball and bridal bouquets, staging in both instances in their usual style. Mr. J. R. Chard, Stoke Newington, and Messrs. Drover, Fareham Nurseries, were second in the respective classes. For six buttonhole bouquets Messrs. Perkins were first; Mr. Garner, gardener to Mrs. Braddyll, Amberwood, Christchurch, was second. Baskets of wild flowers and Grasses were a strong feature. Miss K. Golding, Winchester Road, Portswood, was first, and Miss A. Hobby second, both staging well.

**FRUIT.**—This was staged in large quantities, and with the exception of the black Grapes, which were generally rather short of colour, made a fine display, as many as 116 bunches of Grapes being staged. For six dishes of fruit, Pines excluded, there were eight competitors. After a close scrutiny the Judges awarded premier honours to Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, for a generally good collection, comprising *Madresfield Court Grapes*, medium-sized bunches and berries, well coloured; *Muscat of Alexandria*, good *Hero of Lockinge Melon*, *Moorpark Apricot*, *Sea Eagle Peaches*, extra good, and *Figue d'Or Figs*. Mr. W. H. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, was a close second; *Muscat of Alexandria*, and *Madresfield Court Grapes*, *Hero of Lockinge Melon*, and *Royal George Peaches* being his best dishes. Mr. G. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was third, also staging well. large clusters of well-coloured *Black Hamburgh Grapes* and richly-coloured *Elruge Nectarines* being conspicuous. For three bunches of black Grapes there were five competitors. Mr. Inglefield took the leading position with *Black Hamburgh*, fine in bunch, berry, and colour. Second, Mr. F. Bennett, nurseryman, Posbrook, Tichfield; third, Mr. Ward, all staging well. For three bunches of white Grapes there were six competitors. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, was distinctly first with *Muscat of Alexandria*, long shapely bunches, extra large berries, and only needing a trifle more colour to make them perfect. Mr. Inglefield was second, showing the same variety, and Mr. H. W. Ward third. For two bunches of black Grapes eight staged. Mr. J. Allen, gardener to Captain the Hon. V. Montagu, Wherwell Priory, Andover, was placed first with *Alicante*, medium sized bunches, berries, and colour. Mr. H. Innes was second with *Black Hamburgh*. Mr. Curtis, gardener to J. S. Dixon, Esq., Holly Bank, Hythe, third. Some good judges thought the latter should have been placed first. Mr. Allen also took premier honours for two bunches of white Grapes with *Muscat of Alexandria*, shapely bunches of good colour. Mr. Innes second with *Buckland Sweetwater*. Mr. Curtis third. Nine staged single bunches of black Grapes, the best coming from Mr. Inglefield, a medium sized bunch of *Black Hamburgh* well finished gaining him the award. Mr. Iggulden was second with *Madresfield Court*, well coloured; and Mr. F. Bennett third. The best single bunch of white Grapes was a perfect one in every respect of *Muscat of Alexandria* from Mr. N. Molyneux, who was first amongst seven other competitors. Mr. E. Varney was second with *Buckland Sweetwater*, large in bunch and berry; and Mr. Ward third. For one Pine Mr. J. Evans won with *Smooth Cayenne* of fair quality; Mr. Budd following.

*Scarlet-flesh Melons* were sparsely shown. The best *Blenheim Orange* was from Mr. J. Evans; second, Mr. R. Woodfine, gardener to Major Boyd, Emsworth House. *Green-flesh Melons* were more numerous staged. Mr. W. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Salisbury, was first with *Hero of Lockinge*; Mr. T. Annalls, gardener to T. C. Shenton, Esq., Twyford, Winchester, second; Mr. H. W. Ward third. For the best dish of six Peaches there were eleven

competitors, the first prize falling to Mr. J. Allen for extremely good *Barrington*; *Sea Eagle* from Mr. Iggulden, and *Royal George* from Mr. N. Molyneux being second and third respectively. For the best dish of six *Nectarines* the same number competed, Mr. J. Budd being first with capital *Elruge*; Mr. Inglefield was second, and Mr. Iggulden third. For six dishes of hardy outdoor fruit, distinct, Mr. J. Allen was easily first with extra fine *Gooseberries*, *Raspberries*, *Black and Red Currants*, and *Apricots*; second, Mr. R. West, staging well.

**VEGETABLES.**—These were a strong feature of the Show, as they always are at Southampton. Classes were provided for collections of twelve and nine varieties, two sorts of Potatoes being allowed in both classes. In the former class there were but three competitors, first honours falling to Mr. T. Wilkins, gardener to Lady Theodora Guest, Inwood House, Henstridge, Blandford, for a capital all-round lot. *Rousham Park Onion*, *Veitch's Autumn Giant Cauliflower*, *Green Globe Artichokes*, *Intermediate Carrot* (extra fine), *Sutton's Seedling Potato*, *Duchess Pea*, *Jersey Lily Turnips*, *Canadian Wonder Bean*, *Carter's Iris Round Potato*, and *Perfection Tomato* were the leading dishes. Mr. C. J. Waite, gardener to Col. The Hon. W. P. Talbot, Glenhurst, Esher, was a close second, with *Golden Rocca Onion*, *Glenhurst Favourite Tomato*, *Stourbridge Glory Kidney*, and *Chiswick Favourite Round Potatoes*, and *Ne Plus Ultra Runner Bean*. Mr. W. Pope was a good third. For nine varieties there were five competitors, Mr. Inglefield being first, staging a good lot; Mr. Allen second, and Mr. N. Molyneux third. Messrs. Suttons provided the prizes for six dishes, to include two varieties of their sending out. For these ten competed Messrs. Waite, Wilkins, and Pope taking the honours in the order named. For Messrs. Webb's prizes, Messrs. Waite and Pope were first and second respectively, with varieties similar to those named previously, all staging well.

Mr. B. Ladhams staged, "not for competition," a capital lot of cut, hardy, and herbaceous flowers, which were much admired.

#### LEICESTER SHOW AND FRUIT CONFERENCE.

TUESDAY, AUGUST 5TH.

THE annual horticultural Exhibition in the Abbey Park, Leicester, has gained the well-deserved reputation of being one of the best in England, and it invariably attracts a large muster of horticulturists and the public. The Show on Tuesday last was no exception to the rule; the weather was brilliant in the extreme, the heat being pleasantly tempered by a slight breeze, and the beautiful park, now in its best condition, was consequently thronged with thousands of visitors. Very rarely do we see such crowds of people at shows in the south of England and the metropolitan district. It is quite refreshing to find that flower shows have not lost their power of attracting the multitude, and it must be a source of intense satisfaction to all the officials to find such results repay them for their exertions. The Leicester Show is peculiar in the respect that it is entirely under the management of a Committee appointed by the Corporation, and with the help of the courteous and experienced superintendent of the park, Mr. John Burn, they have succeeded in rendering the Show first-rate from a horticultural point of view, and highly successful as a popular holiday and means of innocent recreation for the citizens of a populous town.

Four large tents were filled with exhibits, and in every case the plants, flowers, fruits, or vegetables were of praiseworthy quality. We can, however, only give a brief summary of the leading features, with the names of the prizewinners, for time did not permit much note-taking.

In the principal plant tent the chief features were the groups both competing and non-competing. Messrs. B. S. Williams & Son, Upper Holloway, London, had a grand group of fine-foliage plants, including *Sarracenas*, which were highly commended. The competing groups were bold and effective of the usual style. Messrs. Johnstone of Stoneleigh; G. Barry, gardener to H. Snow, Esq., Stoneygate; J. Mawbey, New Humberston; and J. & H. Hickling, Loughborough, were the prizetakers in the order named. Then there were classes for *Coleuses*, *Begonias*, *Zonal Pelargoniums*, *Fuchsias*, *Ferns*, and stove and greenhouse plants, which occupied considerable space, and included some admirably grown plants. The principal winners in the five first-named classes were Messrs. J. Roberts, Johnstone, Barry, Rogers, and Hassell. This tent was, however, so thronged with visitors early in the day that it was impossible to obtain details of all the exhibits.

#### CUT FLOWERS.

Division B, for cut flowers, open to all.—Immediately opposite the entrance on the centre table was an exceedingly handsome group of Orchids from Messrs. F. Sander & Co., of St. Albans. Very conspicuous were well-flowered specimens of *Cattleya aurea*, *C. Gaskelliana*, *C. Schofieldiana*, and the rare and beautiful *Sobralia xantholeuca*; a long raceme of *Renanthera Lowi* was also sent, and attracted much attention, having two distinct and differently marked kinds of flowers; *Disa grandiflora*, *Cypripedium Curtisi*, and numbers of *Odontoglossums*, *Oncidiums*, and *Dendrobiums* were also shown. The group was fringed by *Maidenhair Ferns*, and had a centre of *Bamboos*. Following on the centre table was a group of *Tuberous Begonias*, double and single cut flowers, from Mr. B. R. Davies, Yeovil, Somerset; also a remarkably fine group of these showy plants from Messrs. J. Laing & Sons, Forest Hill Nurseries, London. A stand of *Carnations* (Mrs. Reynolds Hole) from Mr. J. House, Peterborough, attracted much notice. This variety is coming into favour rapidly as useful for cutting.

For twelve bunches of stove or greenhouse cut flowers Mr. P. Blair,

Trentham Gardens, was well first with a fine stand of Orchids. Of hand bouquets there was an extensive display, Messrs. Perkins & Son of Coventry being placed first, Mr. P. Blair second, and Messrs. A. W. Smith & Co., Hawksbury, near Coventry, third. For bridal bouquets Messrs. Perkins & Son were again first; Messrs. Hewitt & Co., Birmingham, second; and Messrs. J. R. Pearson third. For a wreath of white flowers Messrs. Perkins & Son were first; Messrs. Thomson & Co., Birmingham, second; Messrs. Pearson & Sons highly commended. With twelve Zonal Pelargoniums, three trusses of each, Messrs. Pearson and Sons were well first with fine blooms shown in their usual style, excellent varieties being represented with several unnamed seedlings. Mr. Rogers, nurseryman, Belgrave, was second; and Mr. Hassell, Belgrave, third. A collection of Pansies, Pentstemons, Phlox, Pinks, &c., came from Mr. John Forbes, Hawick, N.B.

Cut Roses were shown to great advantage. For thirty-six Roses, single blooms, Messrs. Harkness & Sons, Bedale, were first with large fresh blooms. Well arranged and especially fine were Auguste Rigotard, May Quennell, Duke of Wellington, Horace Vernet, Madame Cusin, Marie Baumann, A. K. Williams, &c. The Rev. J. Pemberton, Havering, Essex, was second, and Messrs. Perkins & Son were third. For twenty-four Roses, Messrs. Harkness & Son were again first; Mr. H. Merryweather, nurseryman, Southwell, Notts, second; and the Rev. J. Pemberton third. For twelve Teas or Noisettes, Messrs. Harkness and Son were first, Messrs. James Cocker & Sons, Aberdeen, second, and Mr. H. Merryweather third. A stand of twelve very fine flowers of Her Majesty was shown by Messrs. James Cocker & Sons, also of Horace Vernet, by Messrs. Harkness; Mrs. John Laing and Chas. Lefebvre, by Messrs. Perkins & Son; and Earl of Dufferin, by Mr. H. Merryweather, who also staged twelve each of Mrs. J. Laing and Marie Baumann. The prizes offered in this class were won, first, by Messrs. Harkness with Horace Vernet; second, Messrs. Cocker, with Her Majesty, and third, Mr. H. Merryweather, with Earl of Dufferin. For twelve Roses, single blooms, grown by amateurs, first, Mr. M. Whittle, Belgrave; second, Rev. E. N. Pochin, Barkby Vicarage; and third, Mr. Thos. Battersby, Blaydon-on-Tyne. With six Roses, Mr. M. Whittle was again first, Mr. Pochin second, and Mr. S. Green third. For six Teas or Noisettes Mr. Whittle was first, and Mr. T. Battersby second.

Adjoining these was a large exhibit of cut flowers of Tuberous Begonias exhibited by Mr. Davis. For twelve Carnations Mr. W. Ward, Fuller Street, Leicester, was first; Mr. B. Simonite, Sheffield, second; and Messrs. Thomson & Co., Sparkhill Nurseries, Birmingham, third. With twelve Picotees.—First, Mr. W. Ward. Second, Messrs. Thomson. Third, Mr. B. Simonite. For Carnations, single bloom, Mr. W. Ward, was first with Robert Lord, the first exhibitor being also first for Picotee, single bloom, with Favourite, a very fine flower.

A collection of Tomatoes shown by Messrs. Hewitt & Co. of Birmingham, not for competition, was commended by the Judges. The prizes offered for twelve bunches of hardy herbaceous flowers brought a large competition, the first prize going to Messrs. Harkness and Sons, the second to Mr. Thos. Battersby, the third, Messrs. Hickling, Loughborough. For twelve bunches hardy annuals Messrs. Biddles & Co. were first, Messrs. Hickling second, and Mr. J. Cox third. A handsome collection shown by Messrs. Pearson, not for competition, was highly commended.

#### FRUIT.

In division C, fruit, open to all, the first prize for a collection of fruit, nine distinct, was awarded to Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston, Derby, for excellent produce, comprising Black Hamburg, Muscat of Alexandria, and Foster's Seedling Grapes, a Queen Pine, a fine Countess Melon, Bellegarde Peaches, Lord Napier Nectarines, Apricots, and Circassian Cherries. The Black Hamburg Grapes were well coloured, moderate sized bunches, but small in berry. The Muscats were very fine bunches; the Peaches, Nectarines, and Melon especially fine. Mr. J. Edmonds, gardener to the Duke of St. Albans, was second, and Mr. P. Blair, Trentham Gardens, third. For a collection of six dishes of fruit Mr. Goodacre was again first, showing Black Hamburg and Muscat of Alexandria Grapes, a Queen Pine, Countess Melon, Dymond Peach, and Lord Napier Nectarine, the three latter being of very high quality. Mr. P. Blair was here placed second, and Mr. J. Edmonds third. In the class for four dishes of fruit Mr. P. Blair was first, Mr. J. Edmonds second, Mr. Robert Shaw, Garendon Park, third, and Mr. C. Stacey, Manor House Cottage, Oadby, fourth. The best Pine Apple came from Mr. Goodacre, Mr. J. Edmonds being second, and Mr. P. Blair third.

For two bunches of black Grapes Mr. A. McVinish, Lockington Hall, Derby, was first with grand examples of Black Hamburgs, the best in the Show. Mr. G. Lofley, Knighton Church Road, Leicester, second, with only slightly inferior samples; Messrs. Hickling, Loughborough, third. For two bunches Muscat of Alexandria Mr. McVinish was again first with the best Muscats shown, Mr. P. Blair second, and Mr. Goodacre third. A class was provided for two bunches of any other variety of white Grapes, and Mr. P. Blair was first with grand bunches of Duke of Buccleuch; Mr. Goodacre second with Foster's Seedling, very fine; Mr. R. Shaw, Garendon Park, third.

For six Peaches, Mr. W. H. Divers, Ketton Hall Gardens, Stamford, was first with superb fruit of Crimson Galande; second, Mr. Goodacre; third, Mr. George Barry, gardener to H. Snow, Esq., Stoneysgate, Leicester. For six Nectarines Mr. Divers was again first with Lord Napier, Mr. Goodacre second, and Mr. McVinish third. Melons were numerous shown, Mr. R. Shaw being first for a green-fleshed variety, and Mr. A. W. Hainsworth first for a scarlet-fleshed variety. Mr.

McVinish was first for a dish of Cherries, and Mrs. Perry Herriek, Beau Manor, Loughborough (gardener, Mr. A. Hamsher), first for a dish of Figs.

#### VEGETABLES.

Vegetables were exceedingly well shown, Mr. Robert Shaw, Garendon Park, being first with a fine collection. For three Cauliflowers Mr. John Lambert, Onslow Hall Gardens, Shrewsbury, was well first with good samples. Turnips, Carrots, Onions, and Potatoes were all shown in fine condition, and the entries were very numerous. The same remarks also equally apply to the exhibits of Peas and Beans. Cucumbers were fine, especially the first prize brace shown by Mr. J. Goadby, 31, Watling Street, Leicester. The finest display of vegetables in the Show, however, was undoubtedly a collection of twelve varieties shown by Mr. John Lambert, Onslow Hall, Shrewsbury, all fine examples, and superbly staged. Tomatoes were numerous and good, the first prize for twelve fruits going to Mr. P. Blair for grand specimens of Hackwood Park Prolific. Currants and Gooseberries were also good. Several dishes of Waterloo Strawberry attracted much notice from their large size and fine dark colour.

A large tent was devoted to amateurs' and cottagers' productions, and the classes throughout were well filled. The quality of the exhibits, both cut flowers, fruits, and vegetables, was all that could be wished, but in the arrangement of bouquets, baskets of flowers, buttonholes, sprays, &c., there was too much formality.

#### THE CONFERENCE.

The Conference of the British Fruit Growers' Association was held in the afternoon, James Ellis, Esq., M.P., in the chair. There was a very large attendance of ladies, gentlemen, and horticulturists interested in the subjects dealt with. The meeting was most successful, the programme including admirable papers on "Cherries and Plums," by Mr. T. Francis Rivers; "Fruits for Leicestershire," by Mr. W. Ingram, Belvoir Castle Gardens; "Apples for the Midlands," by Mr. A. H. Pearson; and "Pruning," by Mr. G. Bunyard. A discussion followed to which the Chairman contributed some important observations, and the business of an exceedingly successful meeting concluded with a vote of thanks to the readers of the papers and the Chairman, which was carried by acclamation.

The members of the Association were entertained at luncheon by the Mayor and Corporation, and in being called upon to respond for the visitors, Mr. Lewis Castle, the Secretary, referred briefly to the objects in view, and the Chairman made interesting and suggestive remarks appropriate to the occasion.

#### OXFORD CARNATION AND PICOTEE UNION.

AUGUST 5TH.

To most florists the circumstances attending the formation of the Oxford Carnation and Picotee Union will be so familiar that their recapitulation is not necessary. Up to a few years ago Mr. E. S. Dodwell, its Secretary and Treasurer, had been one of the most prominent members of the National Carnation and Picotee Society, but subsequently resigned his connection with it for reasons that need not be gone into on the present occasion, having been fully treated in the past. That one so long and closely associated with the Carnation should lose his interest in the flower after severing his connection with the Society devoted to its interests was not to be expected for a moment, but some may have thought that after years of active work in promoting the interests of Carnations the veteran florist would leave the work in other hands and devote his attention to the Carnation as a home flower. Not so Mr. Dodwell. He was not tired of work, though advancing in years, and so he determined to have a society of his own. The Oxford Union has now been established five years, and according to Mr. S. Barlow, who responded to the toast of the Union at the luncheon on the afternoon of this year's exhibition, it has increased yearly in numbers. Certainly its show is a unique one. Mr. Dodwell devotes the grounds of his pleasant suburban residence at Oxford to it, and in a garden of Carnations, for such it is, the surroundings are at once beautiful and appropriate. There are Carnations and Picotees on every hand, the choicest products of every celebrated raiser, and in themselves a source of interest largely supplementing that of the show.

To turn to the latter, any consideration of it must be tempered by recollections of the season. When experienced florists cannot remember such a one, and northern growers have had scarcely a glimpse of sunshine since May, there was cause for astonishment at the excellence of the exhibition. Northern and Midland growers mustered strongly, but the honours of the day in the two largest classes fell to a London grower, Mr. M. Rowan, whose successes at Chiswick may be remembered. A strong contingent came from Birmingham, and their exhibits included at least one remarkable feature in a magnificent new scarlet bizarre Carnation, named C. H. Herbert, which is referred to further on, and which may eclipse Robert Houlgrave, just as Mr. Barlow's masterpiece has eclipsed Admiral Curzon and other famous bizarres. Mr. Dodwell also had a splendid new heavy rose-edged Picotee, which was honoured by the Judges, and named Little Phil, a distinct and lovely variety. A striking feature of the Show was the prominent manner in which yellow grounds were shown. Formerly the attention of florists was largely devoted to the white grounds, and they are not likely to lose their position as the more important section, still the yellows have gained ground rapidly, and the number of good varieties is being rapidly augmented. Most of the classes were for a small number of blooms, but nearly all were well filled. For instance, the largest class for Carnations was for

twelve blooms, and there were eight competitors, these stands forming an excellent and interesting class. A very beautiful stand came from Mr. M. Rowan, Manor Street, Clapham, London, S.W., composed of a very fine bloom of John Buxton, a good flower of Robert Houlgrave, a charming bloom of Sarah Payne, an equally good George Melville, John Whitham, Gordon Lewis, Rob Roy, Matador, Rifleman, Fred, J. D. Hextall, and a charming example of Jessica. The freshness and fulness of Mr. Rowan's flowers were very remarkable, and they were perhaps an improvement on his excellent stand at Chiswick. Mr. W. Reed, gardener to Mr. Dodwell, Stanley Road, Oxford, followed; his back row flowers—Robert Houlgrave, a seedling pink and purple bizarre, Thomas Moore and Thalia, being a very beautiful quartette. The last named was a perfect flower, and Robert Houlgrave was better than Mr. Rowan's fine bloom of the same variety. George Melville and Mrs. Matthews were also charming flowers. The third prize was won by a neat stand from Messrs. Thomson & Co., Birmingham, in which Thalia, Sarah Payne, and the new scarlet bizarre C. H. Herbert, a really grand bloom, large, finely proportioned, smooth, and well filled, somewhat resembling Robert Houlgrave, but brighter in colour, were most conspicuous. Mr. Robert Sydenham, Birmingham, had a capital stand, comprising good blooms of George Melville, Master Fred (a large, well filled example), Matador, and Gordon Lewis, and was placed fourth; Mr. G. Chaundy of Oxford was fifth (Sportsman, very good); Mr. A. R. Brown sixth; Mr. J. Walker, Thame, seventh; and Mr. H. Geggie eighth. There were thirteen stands of six blooms, and the principal prize fell to Mr. T. Lord for Biddy Malone, a finely formed flower, smooth, charmingly coloured, and very fresh, Richard Dean, Robert Lord, Harrison Weir, John Keet, and Squire Meynell. Mr. J. S. Hedderly was second with Rifleman, George Melville, Robert Houlgrave, Sportsman, a rose flake seedling, and William Skirving; and Mr. S. Barlow third with Sir Garnet, Robert Houlgrave, E. S. Dodwell, Dr. Foster, Sportsman, and J. D. Hextall, both neat stands. The fourth prize went to Mr. Joe Edwards; the fifth to Mr. W. L. Walker, Reading; the sixth to Mr. W. Bacon; the seventh to Mr. C. Phillips; the eighth to Mr. H. Startup; and the ninth to Mr. J. Lakin.

The class for twelve Picotees brought nine competitors, this forming a similarly excellent display to that in the corresponding Carnation class. Mr. M. Rowan was again successful in carrying off the principal prize, and his stand, if hardly of so high a class as the Carnations, was an unquestionably good one. The freshness and smoothness of his flowers were very much admired. His varieties were a finely developed example of Brunette, a beautiful Mrs. Payne, Duchess, Nellie, Edith D'Ombra, a capital bloom of Favourite, Mrs. Chancellor. Mrs. Dodwell, Mrs. Sharp, Clara Penson, Thomas William, and Amy Robsart. Mr. Robert Sydenham, who gains ground every year, took second place with Lady Homesdale, Dr. Epps, Mrs. Bower, Morna, Novelty, Favourite, Lady Louisa, Ann Lord, Mr. A. Chancellor, Daisy, Muriel, and a fine bloom of Ethel. This good stand did credit to Mr. Sydenham. The third prize stand of Mr. Dodwell was also a very good one, and comprised several admirable flowers, amongst them two splendid seedlings, 680 (heavy scarlet edge), and 784, a heavy rose edge, the latter a magnificent variety, smooth and refined, subsequently selected as the premier Picotee, and named Little Phil. The fourth prize went to Messrs. Thomson & Co., for a fresh smooth stand, the fifth to Mr. A. R. Brown, the sixth to Mr. G. Chaundy, the seventh to Mr. T. Anstiss, the eighth to Mr. H. Geggie, and the ninth to Mr. J. Walker. There were seventeen stands of six, a beautiful class. Mr. A. W. Jones, Birmingham, was placed first with small flowers, but fresh and well finished. The varieties were Mrs. Sharp, Muriel, Thomas William, Clara Penson, Miss Horner, and Edith D'Ombra. Mr. J. Witham was second with Zerlina, Miss Flowdy, Clara Penson, Gertrude, John Smith, and Imogen; and Mr. J. S. Hedderly third with Favourite, Muriel, John Smith, Thomas William, Zerlina, and Mrs. Sharp, the latter a beautiful flower. Mr. W. Bacon was placed fourth, Mr. Nutt fifth, Mr. Lakin sixth, Mr. J. Rebbeck seventh, Mr. W. L. Walker eighth, and Mr. J. Edwards ninth.

There were five stands of six yellow grounds, Mr. Dodwell winning with Alfred Grey, Tournament, Patricia, Queen of Hearts, Rachel, and Nancy, all beautiful blooms. Mr. Chaundy was second with Alfred Grey, Queen of Hearts, Patricia, Ursula, Rachel, and Nora. Mr. Anstiss was third; Messrs. Thomson & Co. fourth; and Mr. R. Sydenham fifth.

There were nine stands of selfs and Fancies, and Mr. Dodwell was victorious with a charming stand, comprising Gladys, The Maestro, Schlieben (Benary), Stadtrath Bail (Benary), Norah, Terra Cotta, and six seedlings; 761, a crimson self, being very rich in colour. Mr. G. Chaundy was second with a stand of seedlings; Mr. R. Sydenham third with a good stand; and Mr. A. R. Brown fourth; the remaining prizes falling to Messrs. Thomson & Co., M. Rowan, W. L. Walker, T. Anstiss, and J. Walker. There were thirteen stands of six, and Mr. Thos. Lord won with a beautiful stand. He had Thalia, Sparkler, Gladys, Mrs. Price, Tom Pinch, and a seedling yellow ground, rose flaked. Mr. F. Nutt was second with a splendid Germania, Budge, a good Joe Willett, a fine Almira, Mrs. Muir, and The Moor. Mr. S. Barlow was third; and Mr. T. Foulkes fourth; five other prizes being awarded.

Single specimens were extensively shown both in the case of Carnations and Picotees. In the rose flakes Mr. Lakin was first with Mrs. Gibson, Messrs. Thomson & Co. second with Robert Thomson and third with Thalia, Mr. Geggie fourth with a seedling, and Mr. Rowan fifth with Thalia. In the scarlet flakes Mr. Rowan was first with John Witham and second with Matador, Mr. Hedderly third with Sportsman, Mr.

Dodwell fourth with a seedling, and Mr. Chaundy fifth with Sportsman. In the purple flakes Mr. Rowan was first and second with Gordon Lewis, Mr. Sydenham third with a seedling, Mr. Geggie fourth with a seedling, and Mr. Edwards fifth with Sarah Payne. In the crimson bizarres Mr. Rowan was first and second with J. D. Hextall, Mr. Dodwell third with Joseph Lakin, Mr. Sydenham fourth with J. D. Hextall, and Mr. Hedderly fifth with Master Fred. In the scarlet bizarres Messrs. Thomson & Co. were first with C. H. Herbert, Mr. Dodwell second with Robert Lord, Mr. Chaundy third with a seedling, Mr. Dodwell fourth with Robert Houlgrave, and Mr. Rowan fifth with the same variety. In the pink and purple bizarres Mr. Lord was first with Eccentric Jack, Mr. Sydenham second with J. Harrison, Mr. Hedderly third with Wm. Skirving, Mr. Rowan fourth with Sarah Payne, and Mr. Edwards fifth with Sir Garnet Wolseley. In the yellow grounds Mr. Nutt was first with Germania, Mr. Chaundy second with the same variety, Mr. Dodwell third with Queen of Hearts and fourth with Germania, and Mr. Chaundy fifth with Queen of Hearts.

The single specimen Picotees were classed as red and its hues, broad, medium, and light edge, and purple ditto. The awards were as follows:—Broad red edge, Mr. Dodwell first and third with seedlings, Mr. Rowan second with Mrs. Sharp, and fourth with Edith D'Ombra; Mr. Sydenham fifth with Dr. Epps. Medium red edge.—Mr. Rowan first with Mrs. Payne, and second with Nellie; Mr. A. W. Jones third with Miss Horner; Mr. Dodwell fourth with Nellie, and Mr. R. Sydenham fifth with Lady Holmesdale. Light red edge.—Mr. Chaundy first with Favourite, Mr. Dodwell second with the same variety, Messrs. Thomson & Co. third with Mrs. Herbert, Mr. Jones fourth with Thos. William, and Mr. Rowan fifth with Mrs. Gorton. Broad purple edge.—Mr. Dodwell first with Amy Robsart, Mr. Sydenham second with Mrs. Chancellor, Mr. Jones third and fourth with Muriel, Mr. Geggie fifth with a seedling. Medium purple edge.—Mr. Rowan first with Muriel and third with Mary, Mr. Walker second with Muriel, Mr. A. R. Brown fourth with Juliette, and Mr. Anstiss fifth with Baroness Burdett Coutts. Light purple edge.—Mr. Sydenham first and fifth, Mr. A. W. Jones second and fourth, and Messrs. Thomson & Co. third, all with Clara Penson.

Carnations in epergnes and glasses were best shown by Mrs. G. B. Dodwell and Mr. W. Hovell, the former having a charming epergne, chiefly composed of Picotees and Maidenhair Ferns. Equal third, Mr. Wardell and Messrs. Thomson & Co. Prizes were awarded to Mr. Anstiss and Mrs. G. B. Dodwell for buttonhole bouquets of Carnations; also to Mr. Walker of Thame, prizes for bouquets going to Mrs. G. B. Dodwell, Mr. Wm. Gawn, Mr. T. Anstiss, Mr. W. Hovell, and Mr. Walker of Thame. In one or two special classes for Carnations several of the exhibitors previously named won prizes.

The premier blooms were as follows:—Bizarre and Flake Carnations, C. H. Herbert, exhibited by Messrs. Thomson & Co., a scarlet bizarre, described above; also awarded a certificate of merit. Picotees: Little Phil, exhibited by Mr. Reed, gardener to Mr. Dodwell, heavy rose edge. Fancies: Seedling 467, shown by Mr. Dodwell, buff ground, flaked with slaty mauve. Selfs: Germania, yellow, shown by Mr. F. Nutt. Yellow grounds: Patricia, shown by Mr. Dodwell, large and handsome bloom, faintly ticked with red, almost a self.

Certificates were awarded to Mr. C. Turner of Slough for the following five yellow grounds:—Countess of Jersey, Mrs. Walford, Mrs. Henwood, Romulus, and Victory; and also for the heavy rose edge Picotee The Rector; to Mr. J. Lakin, for Carnation Annie Lakin, white self; to Mr. Henry Geggie, for Mrs. Lee, white self; to Mr. J. Edwards, for Carnation Mabel, white self; and to Mr. H. Gibbs, gardener to Miss Alice de Rothschild, for Carnation Conqueror, scarlet self.

A luncheon took place in the afternoon, to which about 150 sat down. Mr. Alderman Buckell presided, and Mr. Dodwell, Mr. S. Barlow, the Rev. Mr. Ripon, Mr. Rowan, Mr. Shaw, Mr. Walker, Mr. Hewitt, and Mr. John Ball were among the speakers. The proceedings were very pleasant.

#### FRUIT FORCING.

PINES.—Prepare houses as they become vacant for re-occupation. If hot water is the agent in furnishing bottom heat, the bed, whether of tan or leaves, must be removed at least once a year, or woodlice will increase rapidly. All brickwork should be scalded and brushed with hot lime, the wood and ironwork with soap and water thoroughly cleansed, using a brush, keeping the soapy water as much as possible from the glass, which should be cleansed inside and outside with water only. If necessary, paint the wood and ironwork, the roof being made as watertight as practicable. Chambered beds, *i.e.*, the hot-water pipes covered with slate or other material, are much in advance of those surrounded or passing through beds of rubble. Those composed of the latter must be turned over and any dirt or small parts removed, to allow the heat given off by the pipes to penetrate uniformly to the bed. Provide fresh tan in other cases. If wet, turn it occasionally on fine sunny days. With hot-water pipes beneath about 3 feet depth of tan is ample; more will be needed where such aid is not provided.

Suckers started in June will soon fill their pots with roots, and must be shifted into larger pots before the roots become closely matted together. Queens may have 9 and 10-inch pots, and those of stronger growth 11-inch pots. Water immediately after potting, and plunge in a bed having a temperature of 90° to 95°. There is no greater mistake in growing Pines than crowding young plants. The plants become drawn and weakly, instead of having a sturdy base. Attend to the bottom heat of beds that have recently been disturbed by the removal of plants, not allowing the heat to exceed 95° at the base of the pots without immediately raising them, as too much heat will disastrously affect plants with fruit or those having the pots filled with roots. Examine the plants about twice a week, and maintain a moist well-ventilated atmosphere. The climatic conditions are now so favourable that Pine plants grow luxuriantly; therefore, discontinue any shading such as may have been employed for an hour or two at mid-day, when the sun was powerful. Admit air plentifully when the temperature ranges from 85° to 95°, affording to fruiting plants a night temperature of 70° to 75° and succession 65° to 70° at night. Reserve another batch of suckers on the stocks for starting at the commencement of September.

**FIGS.—Early-forced Trees in Pots.**—As soon as the second crop is cleared examine the trees, keeping them somewhat drier at the roots, and the drier condition of the atmosphere, consequent on a free circulation of air, tends to an increase of red spider and scale. Those pests are inseparable from Fig culture in heated houses. Still, the enemies steal a march whenever they get the chance, as cannot well be prevented during the ripening of the fruit; therefore, when that is cleared off the trees recourse must be had to cleansing; and as the foliage and wood are far advanced in ripening, destructive agents may be used at a strength which would not be safe earlier. If, therefore, these pests, and especially scale, have made undesirable progress, syringe the trees with some insecticide, of which there are many advertised, and all good when the instructions are strictly followed. The mixture may be kept from saturating the roots by tying a handful of dry moss round the stem and then raising a sort of pyramid of the same placed about the plants. Badly infested wood should be brushed to dislodge scale, and repeat the syringing in a few days; afterwards sponge thoroughly with tepid water. The trees will not need much further attention, but watering must be attended to, so as to prevent the foliage becoming limp, ventilating to the fullest extent day and night; but protect the trees from heavy rains, which have a tendency to keep the roots active, instead of inducing that rest so necessary for trees subjected to early forcing. Placing trees outdoors, as formerly practised, is not desirable, as the air moisture causes growth, whilst trees kept under glass have complete rest through dryness. If placed outdoors they must be in a sunny position, the pots stood on a layer of ashes, with similar material about them; and though the trees must not suffer from dryness, material must be in readiness to apply so as to throw off heavy rain, in order to prevent the soil becoming sodden. Whether kept under glass or placed outdoors they cannot have too much light and air.

**Early Forced Planted-out Fig Trees.**—Second crops ripening will need a circulation of air constantly, more, of course, by day than at night. If dull weather prevail a gentle heat in the pipes makes a great difference in the quality of the fruit, and prevents splitting. Watering at the roots must be diminished, syringing discontinued, but a moderate air moisture must be allowed for the benefit of the foliage. A light sprinkling of available surfaces will afford the needful moisture for the benefit of the foliage. If red spider is present, heat the pipes to over 140°, or so hot that the hand cannot endure the heat, and then coat them with a thin wash of sulphur and skim milk, keeping the house closed for an hour or two, then allow the pipes to cool and admit air as usual. By close gathering the fruit syringing may be resorted to, but it is a bad expedient, as a free circulation of warm rather dry air is essential to perfection in Figs, and it acts beneficially on the foliage and wood.

**Unheated Houses.**—In all but favoured locations and exceptional seasons Fig crops cannot be relied on outdoors. Glass structures for entrapping and retaining sun heat are indispensable, lean-to structures with a southern aspect are best. Success also depends on restriction. Roots allowed to ramble far and deep eat too freely, are not amenable to control. Narrow borders one-third the width of the trees are ample, well drained, and 18 inches to 2 feet deep. That depth of compost will grow more fruit than greater areas. Calcareous matter is essential. Where natural calcareous loam does not obtain, old mortar rubbish to the extent of a sixth will supply calcic matter in a useful form, or chalk may be used with an addition of one-sixth of road scrapings. Figs like lime, also grit, hence marl is a useful application, and for light soils may be used to the extent of a fourth, but it must be a clay marl. The soil must also be firm, not a caked impervious mass, but such that air and water can enter gradually: this will ensure steady supplies of nutrition, and short-jointed wood. Unobstructed light and free ventilation are principles in securing Figs of the choicest description, careful attention being given to details of culture; one of the most important is watering through a mulch of rather lumpy manure. Thin the growths so as to ensure solidified wood through the assimilation of matter elaborated in the leaves fully exposed to light. The finest fruit is had on extensions kept renewed by cutting out worn out and replacing with young. The fruit now is advanced for ripening, therefore spare no pains in freeing of red spider by syringing in the morning and early afternoon. Admit a little air early, increasing it with the sun heat, maintaining through the day a temperature of 80° to 85° with free ventilation, closing early so as to increase to 90° or 95°, and when the sun power is declining a little air may be admitted at the top of the

house, so as to allow the pent-up moisture to escape, the temperature gradually cooling. Water or liquid manure will be required once or twice a week, according to circumstances, in order to keep the soil moist and supply nutrition. Directly the fruit begins to ripen syringing must cease, water be gradually diminished at the roots, a circulation of air secured constantly, freely ventilating when favourable, and husbanding sun heat, not by closing, but by lessened opening of the ventilators, as it is a confined atmosphere that does the mischief, a little ventilation preventing the moisture condensing and the fruit cracking.

**MELONS.**—Damp and cold weather has been against frame plants: It has favoured those in houses which have been assisted with a gentle warmth in the pipes, and they are finer than usual both in thickness of flesh and quality. Late crops in frames are not setting well; they grow too luxuriantly in moist weather, and set indifferently. The growths should be kept thin, and a little air given constantly, maintaining the warmth by manure or grass mowings placed around the frame, and renewed at intervals. A quantity to create a radical change is not good, but a gentle warmth favours a good set and the swelling of the fruit. Do not neglect to fertilise the flowers daily on plants now in bloom, and go over them frequently for the removal of superfluous growths. Keep the atmosphere dry when the fruit is ripening and setting. Maintain a bottom heat of 80° to 85°; top heat 70° at night and 75° by day. In dull weather admit a little air at 75° if the day is likely to be fine, allowing the heat to rise to 80°, and keeping it through the day at 85° to 90°, closing so as to increase to 90° or 95°. A free circulation of rather dry air greatly improves the finish and flavour of Melons when ripening. If fruit be wanted very late make a last sowing now. Plants for fruiting in October should be planted at once, it being highly important that they have a light and well heated structure.

**CHERRY HOUSE.**—The buds are as plump as they need be, therefore undue excitement must be guarded against by exposing the trees to the influence of the atmosphere so far as the house will admit, which is the best means of arresting premature growth, to which the Cherry is liable when forced year after year successively. The border must not be allowed to become parchingly dry, but must have copious supplies of water; and if the trees are weak afford liquid manure. To subdue red spider give an occasional washing with the syringe or garden engine. Black aphides attack Cherry trees; keep an eye to them, and whenever they appear promptly assail them with tobacco water. Trees in pots must be regularly watered and syringed to maintain the foliage in good order, for though it may not be capable of much further effort in elaborating sap and storing food it has some, and it is necessary that the leaves perform their functions to the last.

#### KITCHEN GARDEN.

**THE FAILURE OF THE CARROT CROP.**—As the season advances the failure of the Carrot crop is more and more apparent. It is likely to prove one of the worst Carrot years on record, the grub having done great damage. Many will find themselves deficient in roots during the winter and next spring unless they try to secure another young crop. It is late for sowing in the open ground, as the roots would not attain a good size before the winter, but wherever there are spare frames some might be profitably devoted to raising late Carrots. A gentle hotbed would be advantageous. In our case we have sown seed in the long frame that is devoted to early spring Carrots, in the same soil after cleaning and stirring it. The French or Early Horn are the only kinds to sow now. Our crop sown in the open three weeks ago is well up, but the snails are troublesome, and they must be dusted with lime or soot every damp morning until the plants are large.

**PARSLEY.**—This is almost as bad as the Carrots, and immediate attention should be given to providing a young stock. Unfortunately Parsley is slow in growing, and the young plants require a long time to become ready for use, and if sown now, even with the aid of a frame, it will not be very luxuriant by November.

**LATE KIDNEY BEANS.**—We have only this week gathered the first of our dwarf Beans in the open air. They are later this year than we ever had them, and the runners have been unseen in July, but should the autumn prove fine the late crop may partially compensate for the tardy returns. As all know, the plants are exceedingly tender; they will not bear the slightest frost, and those intended for the latest crop should be sown in frames, or where frames can be placed over them. They require a soil only moderately rich, as a dwarf not over-luxuriant growth is the best for late bearing. The variety Ne plus Ultra is one of the best amongst dwarf Beans.

**SHALLOTS.**—These should be drawn from the soil and laid out on a walk or some dry place in the sun to mature before storing for the winter. They are very hardy, never being affected with grub or disease, and it is surprising that not more of the Potato Onion is grown, as they are prolific and remarkably good keepers. At present they are chiefly a cottager's vegetable, but they should be grown in all gentlemen's gardens as well. Garlic we never store, but dig it from the ground as it is required.

**HERBS.**—Now is the time to cut and dry for the winter. There is little or no art in it, but many omit to cut in time, and when the leaves begin falling from Mint it is of little use for drying. Mint, Sage, and Thyme are the leading herbs, but all others should also be secured. They may be cut while dry and placed in a cool airy shed, but do not lay them out in the sun, as this will make the dry leaves very brittle; when dried in the shade the leaves become tough and will hang on the stems for twelve months or more. When dried in a spread-out form they should be tied up in handfuls and suspended from the roof of a dry shed.

**ENDIVE AND LATE LETTUCE.**—Endive should be sown now; indeed, there is not much use in sowing after this time, as unless the plants are of a good size by October they will not grow much afterwards, and when they are full sized then they will keep in good condition until far into winter. The best way of raising Endive is to sow the seed rather thinly in drills, and when the plants are ready for transplanting sufficient should be left in the ground to form a crop, while the thinnings must be planted elsewhere. Where there are no means of protecting them they should be planted in a sheltered position, such as by the bottom of a wall or fence. The same remarks apply to Lettuces. Those raised at this time will be found to remain long in use, probably from the end of September till January, and the Cos varieties are much better for winter than the Cabbage sorts.

**MISCELLANEOUS.**—Thin young Spinach plants to 3 inches apart. Late Turnips may be thinned to 10 inches apart. Clear off all Peas that have done fruiting, and winter greens may be planted in vacant ground. It has been a season of weeds, the excessive moisture favouring their development while offering few opportunities for hoeing them up, but weeding should be resorted to rather than allow the crops to be fettered with weeds. In a dull season it is all the more necessary to admit light and air to them, and this applies as much to the surface of the soil as to the top growth.

#### PLANT HOUSES.

**Crotons.**—Plants rooted at various times and now well established in 5 to 7-inch pots, may be placed in others 2 inches larger where Crotons in that size are useful for decorative purposes. All the smaller growing varieties are better in 5 and 6-inch pots, and when they become too large in these the top may be taken off and re-rooted. After the heads have been removed side growths are freely produced, and these make capital plants in small pots, or for growing for yielding good heads. In many forms of decoration Crotons that have small leaves or are a little bare at the base may be used effectively, but they are useless for standing singly. All the Crotons that will be needed should be rooted from the present to the end of next month. Expose the plants to abundance of light, so that their foliage will colour thoroughly. Be careful not to crowd them when room is limited; it is a good plan to suspend some from the roof of the house. Pass a wire round the pot below the rim and then secure three other wires to it, or, better still, order pots with three holes just below the rim, so that the wires can be passed through. Perhaps the best method of all is to have pans below the pots and secure the wires to these.

**Stephanotis floribunda.**—If mealy bug is present, shade the house and give a thorough syringing with petroleum and water, one ounce to each gallon of water will be ample. Do not remove the shading until the oil has evaporated. Artificial heat is not indispensable for this plant, but to flower it well abundance of light and air are needed. Ventilate liberally during the day and close early, so that the temperature will rise considerably.

**Allamandas.**—Young Allamandas that have commenced flowering in 7 to 10-inch pots and trained round four or five stakes will be effective in the conservatory, but before removing them to this structure harden them carefully, and do not place them where they will be exposed to cold draughts. Allamandas in large pots which are full of roots may be top-dressed with cow manure, and supplied liberally with stimulants, or the flowers will be small and the plants will discontinue growth. Where Allamandas are growing in borders it may be necessary to thin the shoots if trained over the roof, so that they do not overshadow the plants beneath them. Plants rooted early in the year may be repotted until they are placed into 9 and 10-inch pots. A position should be selected close beneath the glass fully exposed to the sun.

**Anthurium Schertzerianum.**—Remove Anthuriums that have completed their growth to an intermediate temperature; shade them, and keep them liberally supplied with water. Any necessary repotting may be done at once, not using too much soil. The pots should be liberally drained, and the compost light and open. Rooted cuttings of *A. Andreanum* may be placed in 5 and 6-inch pots, and they will be capital for flowering during the winter. Old outdoor plants can be encouraged to grow by top-dressing them. If their shoots are crowded remove those that are not needed, and insert them in small pots in the propagating frame.

**Acalyphas.**—Young specimens growing freely in 5-inch pots will now be better in cold frames than in heat, provided they are carefully hardened and the frames are closed early in the afternoon. Root all the cuttings that are available, for whether in 3-inch pots or those of a larger size few plants are more beautiful when well grown. They are propagated easily, and grow rapidly in heat, but when once fairly started they are better in an intermediate temperature, as they do not run up so rapidly.

able at the time. I waited a month for the young queen starting to lay; at the end of that time she commenced laying drone eggs. I came to the conclusion that she was not fertilised, and the hive being troubled with robbers the bees became less every day. The majority of them were bred prior to September last. I destroyed them, and the queen was very small. I intended sending her to you for inspection, but did not manage it. I thought I would be able to get a swarm and put in the empty hive, but was disappointed, as none of my hives has swarmed.

To the Sandringham hive, which I have mentioned before, I added a box of frames the same depth as the Lanarkshire frames; the bees took to them almost immediately, and the queen started laying in them very soon. I have fitted slides between the frames; do you think two taken out at each side will be sufficient to admit the bees into the supers? It is much wider than the Lanarkshire hive; the number of bees in this hive is enormous, and had the weather been favourable I should have had some supers filled earlier. It has not been quite so cold with us as with you, but I have had to feed. This hive (Sandringham) had 22 lbs. of sugar from June 12th to July 8th. I had a longer trough fitted to the box-feeder, which I think is an improvement, as the bees have more room. I have tried the bottom feeder and like it very much. I have had a tin fountain made, but it does not work, because the screw is not right.

A neighbour of mine has a hive that swarmed several weeks ago. The week after swarming he examined it; it contained twelve queen cells. He destroyed all but one, the most forward; in a few days he looked again and found this cell empty; he concluded that the young queen had come out. He is now much disappointed to find that this queen (if there is one in the hive) has not commenced laying; is it because she has not been fertilised? There has been opportunity enough as regards the weather.

I placed a super on the Sandringham hive, and the bees are working in it well. The fields are white with Clover; if we only had warmer weather many in this neighbourhood who placed supers on in May have had to take them off and feed them. You mentioned in the Journal recently about bees turning drones out. Mine have turned a number out; it seems to be general, whether the bees have been fed or not. I have altered my sections this time, making the bottoms narrower and straight, doing away with dividers. I have propped the grate well up off the top of the frames. I have made a calico cover for one of my Lanarkshire hives; it is a failure as a waterproof. I could not have done it right; I allowed it to remain in the boiled linseed oil all night, then I squeezed it out in the morning and placed it out to dry.

Will you be kind enough to give a reply to the following? Are two slides taken out on each side of the hive referred to enough space to admit the bees to the supers?—C. R.

[Old bees seldom raise satisfactory queens. The best results are obtained from strong hives—the stronger the better—during May, June and July. The present year is an exception; many queens that were bred in May are still sterile, and may yet be fertilised. Not so, however, with those raised by bees a long time queenless; they begin to lay drone eggs early. In such cases it is advisable to give several frames of brood with young bees adhering, then good queens may be expected. You did right to enlarge the Sandringham hive. The standard hive is too small for profitable bee-keeping. You also have done right to narrow the bottom rail of section, and to do away with separators. Keep large and strong hives, and the bees will build symmetrical combs. One slide out at each side is quite sufficient to admit bees to supers. Why you have failed to secure a waterproof with calico steeped in boiled oil I cannot understand. I have some very old covers which, if made hollow and filled with water, will remain till evaporated without showing signs of damp on the under side. Steep the cloth in oil until fully saturated, then hang it up to drip, turning it occasionally, until the oil begins to set; after it is thoroughly dry repeat a second time, or lay it flat and put on the oil with a brush or a cloth.—LANARKSHIRE BEE-KEEPER.]

#### EXTRACTORS.

“WILL you be kind enough to give me advice through the *Journal of Horticulture* on extractors for extracting honey from box frames, and size of frame that will take full-sized foundation combs? I have only four hives, so do not want too expensive ones. Any information will be thankfully received.—W. P.”

[When large frames are in use extractors are bulky. Shallow frames require a much smaller extractor than large ones, and are otherwise more serviceable. As you have only four hives, and mean to increase your stock, you will not regret adopting shallow-framed hives; these may be used in combination with deeper ones. The best extractors are those that do not revolve the extracted honey while the combs are being extracted. Any of the dealers will supply you with a suitable one if you let them know particulars.

## THE BEE-KEEPER.

#### QUEENLESS HIVES.

I INTENDED writing ere this to let you know how the queenless hive was going on. I tried it again with a piece of comb containing eggs. The bees raised six queens; these I reduced to two as soon as I had seen which was the most promising. One of these came out all right, the bees drew the other. I chanced to see a bee carry it out; it was not quite matured, and the weather was very unfavour-

Comb foundation is made of different sizes, from 4 inches broad to 2 feet; therefore "full-sized foundation combs" is too vague a term to understand.—LANARKSHIRE BEE-KEEPER.]

TRADE CATALOGUES RECEIVED.

James Carter & Co. 237 and 238, High Holborn, London.—*Illustrated Catalogue of Bulbs.*  
 Alexander Dicksons & Sons, Central Avenue, Belfast.—*Illustrated Catalogue of Bulbs.*  
 Roozen Brothers, Overveen, near Haarlem, Holland.—*Autumn Catalogue of Dutch and Cape Bulbs and Plants.*  
 William Bull, 536, King's Road, Chelsea.—*Catalogue of Tuberos Rooted Plants and Bulbs.*

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Cultivation of Heaths (W. J. and R.).**—The information you require will be given in an early issue.

**Grapes Scalded (W. B. R.).**—You should have written sooner. The utmost we can do, under the circumstances, is to direct your attention to our reply to "J. W. M.," page 105, last week, and to the references there given.

**Seedling Begonias (J. Jones).**—Though your variety is not equal to the best in cultivation, it is good for decorative purposes, worthy of preservation, and as the raiser you can give it any name you choose that has not been applied to any other Begonia.

**Peas (E.A.).**—We cannot name the variety from the pods sent, nor could anyone do so with accuracy. The only reliable way of ascertaining its name is by sowing with others in a large trial collection, and determining the matter by comparison.

**Double Clarkia (James Carter & Co.).**—The flowering plant you have sent is distinctly attractive. Every flower may be described as double (for absolutely double flowers do not produce seed), and every reddish purple petal is clearly tipped with white. The plant is also dwarf and floriferous.

**Chrysanthemum Buds (H. P.).**—The buds forming now of the late varieties will probably develop blooms about the proper time, but if the buds are set of the early sorts the blooms will possibly have lost their freshness before the autumn shows. You should possess Mr. Molyneux's work and follow his teaching generally, subject to such modifications as you may perceive applicable to your case. As a rule the buds which form naturally in August afford blooms at the right time for showing, the late varieties being set early, and the early sorts set late in the month. This is the best general reply we can give to your short general question.

**Figs Unsatisfactory (Inquirer).**—The letter to which we referred was addressed to two journals, the number of one and the name of the other. It was delivered and opened at this office, but as on reading it we found you appealed by name to another paper we forwarded the letter to our contemporary. It now appears it was intended for us. If you will be good enough to state the position in which the tree is growing, also indicate its age, size, and the length and thickness of the summer growths, taking care to address your letter to the Editor of the *Journal of Horticulture*, 171, Fleet Street, the case shall have our best attention. The information requested is necessary for the preparation of a serviceable reply.

**Piping Required for Greenhouse (W. E.).**—A flow and return 4-inch pipe along the front of the house beneath the staging will give all the heat required for a greenhouse during the severest weather; but to maintain a temperature of 70° you will need six rows of piping the length of the house, and instead of its being a greenhouse it will be a warm stove. We advise a greenhouse temperature—viz., 45° to 50° by artificial means, and you will have a better supply of flowers than from a stove. Winter-flowering greenhouse plants are Camellias, Bouvardias, Tree Carnations, Cinerarias, Primulas, Cyclamen, Cytisus, Epacris, Coronilla glauca, Daphne indica alba, Acacias, Azaleas, and Abutilons. Bulbs, such as Roman and Dutch Hyacinths, Narcissus, and early Tulips are indispensable; and *Deutzia gracilis*, *Dielytra spectabilis*,

Lily of the Valley, and Roses may be forced. Chrysanthemums should be grown for early winter.

**Gall-mites on Trees (S. T.).**—It has been discovered that the Alder is infested by at least four species of the gall-mite tribe. The first you describe, showing itself by silvery patches, usually beneath the leaf, is, we presume, *Erineum Alneum*. The second scatters thickly over the leaves galls of green or yellow tints. This is *Cephaloneon pustulatum*. By the third galls are produced along the nervures, the upper showing most traces. This would be *Phytoptus Alni*, a less frequent kind. Upon the Plane or Sycamore the first gall described is very common; it is the work of *Phytoptus Aceris*, similar to that produced by its congeners that haunt the Lime and the Maple. To *Phytoptus Pruni* must be attributed the raised galls on the Plum, sometimes like purses or clubs in miniature. Continental observers describe another gall-mite of the Plum, which infests the twigs of young trees, and even occasions their death in some instances.

**Culture of Ramondia pyrenaica (C. W. M.).**—The plant you name inhabits a somewhat varied area in the Pyrenean and Piedmontese Alps, oft-times on the steep and almost perpendicular faces of the rocks. When so situated, however, it is generally where moisture is in abundance, as it is impatient of drought, preferring protection from hot sun. This, however, is of not so great moment as a plentiful supply of moisture in a well-drained position. Plant it in equal parts of peat and loam, together with a liberal addition of silver sand or grit—it delights to send its tiny fibres into moist sand—and success will invariably attend the operation. From its extremely prostrate habit of growth it is not to be recommended as a border plant, since heavy rains keep the plant almost wholly covered with earth, but on a mound above the ordinary level it may be made as equally at home as in its native habitat. It is chiefly increased from seed, though now and then some few plants throw out offsets; but to detach these with roots is a very dangerous operation, and should always be avoided. Sow the seed as soon as ripe. This will be about the middle of August, and the seedlings will appear the following spring. Do not be discouraged by the slow growth of seedlings, which is remarkable. When the seedlings are of sufficient size they may either be potted or pricked out in small colonies on the rockery. By so doing a goodly patch will soon be made.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (A. O.).—1, *Tecoma radicans*. 2, *Brugmansia suaveolens*. 3, *Mandevilla suaveolens*. (A. S.).—1, *Adiantum amabile*. 2, *Gymnogramma chryso-phylla*. 3, *Pteris umbrosa*. We have received boxes of hardy flowers, but no letters from the senders of them. These should always be placed in the boxes with the specimens.

COVENT GARDEN MARKET.—AUGUST 6TH.

BUSINESS brisk with heavy supplies, prices being somewhat lower.

BREEDING STOCK.

NEWSPAPER accounts of the vast quantities of meat imported into this country are enough to make a man "look to his going" in the breeding of live stock, and to hesitate before going very far in any particular direction. Probably the most successful man is he who altogether avoids extremes, keeps steadily on improving his stock, and gradually makes additions to it of sound useful animals, occasionally by purchase, but preferably by breeding, as he has always something coming on for a good market whenever it offers. Such a man pays little heed to popular cries for combination and co-operation, for he is so thoroughly imbued with the spirit of self-reliance and self-help that he prefers to fight for his own hand.

No pleasanter or more instructive sight is there in agriculture than a farm homestead with its full complement of breeding stock. Not merely for the farm work are horses kept there; brood mares predominate, because every mare is expected to rear its annual foal. The more valuable the mare the more profitable the foal, and there is no hesitation about the breeding, all risk of loss being covered by insurance, the only practical objection to thus breeding from every mare being the necessary cessation of the work of each of them before and after foaling, especially as this so frequently happens when there is a pressure of work in getting in the spring crops. The difficulty is more apparent than real when the breeding is managed with a view to profitable sales, as it ought to be. Not the sale of yearlings, but rather of horses broken to work, and kept steadily at it till a really good opportunity for sale offers. At the age of three years and upwards a sound well-bred horse is worth any sum from £40 to £100 or more, and at such prices a surplus horse or two to relieve the mares from overwork may be very well kept, the governing principle being to sell any horse for which a fair price can be had.

Fancy prices must be left out of the calculations of an ordinary farmer. There are certain home farms where such prices are given and received, but the purchase of breeding stock for such farms and the amount realised may be treated of subsequently as a higher branch of farming, wherein wealthy landlords do good work in the improvement of live stock, and the hundreds or thousands of pounds occasionally given by them for a single animal is a thing of the moment, an almost inevitable result of a contest of capitalists for the possession of the horse or beast of their fancy.

Let the tenant farmer improve his stock, too, by every means in his power, but what he wants to produce to keep him going is plenty of bullocks, which go off his hands well within the second year at prices ranging from £15 to £30 a-piece, and to do this he must breed and feed well and carefully. Home-bred stock and home-grown food are a tower of strength to him, the purchase of stock being altogether avoided except for the improvement of the herd, but some dry food may be purchased to advantage.

To the flock the first place among stock will be assigned by most farmers—certainly by all whose land will carry a flock in winter, both for the quick return it affords upon outlay, and for the economical and thorough manner in which it manures the land. Early maturity, first of all so admirably developed in Hampshire Downs, has come to be regarded as indispensable in all breeds, and even when prices were generally so low two or three years ago, drafts from well known flocks always brought special prices. At the present time lambs are selling wonderfully well, some select Suffolk ewe lambs reaching as high as 66s. 6d. each. These were an exceptionally fine lot, but plenty of lambs have realised from 40s. to 50s. each at the ordinary auction sales. In East Anglia the pure Black-faced Suffolk always commands a special price, superior to that of cross-bred sheep. But we have found much improvement follow the use of good Hampshire Down tups with good cross-bred ewes, the lambs proving hardy animals, always forward in condition under fair treatment.

It is of the utmost importance to have both male and female parents of the best, and a selection of tups should now be made for turning into the flock at the end of the month. With such an abundance of food on pastures the ewes are in excellent condition, but it will much assist early breeding to give them a daily run of an hour or two upon the corn stubbles, and they may be placed on early Turnips to clear and manure the land for winter corn.

WORK ON THE HOME FARM.

Our advice has been recently asked about the treatment of an old pasture on a clay farm, which was so infested with rushes as to be practically worthless, and we at once said, Pare the turf deeply, turning up 2 or 3 inches of soil with it, and burn the whole of it. Then bush drain it, the depth of the drains being from 20 to 30 inches—the latter depth preferably, if a sufficient fall can be had to the eye or outlet of each drain; the drains to be 15 feet apart. After the draining spread the burnt clay and ashes over the surface, and then break up the soil deeply with a steam cultivator; give it repeated turns with cultivator, drag harrow, rollers, and ploughs during the autumn, and finally throw it up in ridges with the double-breasted plough for the winter. On the first favourable opportunity next spring harrow down the ridges, and sow it with a mixture consisting of Perennial Rye Grass, Cocksfoot, Timothy, and Perennial White Clover, either with or without a crop of Oats. As the field is in the hands of a tenant farmer, he will probably take a crop of Oats, and there need be no undue exhaustion of the soil if he sows with the Oats a mixture of nitrate of soda and mineral superphosphate.

We give our advice here in detail because of the too common impression that a simple process of draining is sufficient to eradicate rushes. We have found it so in bog land, but heavy clay is quite another thing. We give preference to bush drains, because clay often settles so closely around drain pipes as to close the joints and prevent the entrance of water.

The weather though still unsettled has been more favourable for the corn, and harvest follows the tardy haymaking closely. Peas and winter Oats are reaped, and will be in stack before this note is printed, if the promise of bright sunshine with which August opens is fulfilled. Much of the Wheat too is changing fast to the yellow hue which betokens speedy maturity, and the sparrows are making sad havoc among the ears again, and yet no effort is made to eradicate these pests which cost the farmer so dear. Well may he exclaim, "There goes the rent!" as he sees a cloud of them spring from the corn upon his approach, only to return again when he is gone.

REMARKS.

27th.—Generally fine and bright, but slight shower about noon. [bright.  
28th.—Dull and drizzly early; short sharp shower at 9.45 A.M., then fine and generally  
29th.—Fine, but with little bright sunshine.  
30th.—Showers early; overcast day with spots of rain in the morning.  
31st.—Overcast, with occasional very slight showers.  
1st.—Frequently cloudy in morning. Hottest day this year, but max. only 79°0.  
2nd.—Generally cloudy and threatening in the morning, slight rain in afternoon, and more from 7.30 to 9 P.M.  
A generally fine week with average temperature.—G. J. SYMONS.

## NOTES ON TOMATOES.

— + —

AT this time of the year everyone has some acquaintance with Tomatoes, but they are only known to the bulk of consumers through the medium of the fruiterers' shops, and in the great majority of these there is only cheap foreign fruit, which lacks the perfection of finish, colour, flavour, and ripeness, as well as beauty of shape, which we are accustomed to see and admire in English grown produce. Shop-window Tomatoes are lacking in variety. They are practically of one size, shape, and colour. We look in vain for the rich golden yellow fruit, small and large, for the delicious plum and cherry-shaped sorts, and the large clusters of the small-fruited Currant Tomato. Then there are the smooth, large-fruited varieties, differing slightly in shape and colour, which, though often seen exposed for sale, are by no means common, at least the most shapely and handsome fruits are not. To see Tomatoes in perfection they should be inspected growing on the plants in a representative collection of varieties, such as in the Royal Horticultural Society's garden at Chiswick, or in private gardens where they are well and skilfully cultivated.

The Tomato as an outdoor plant does well in the southern parts of England in seasons when the weather is hot and dry, and when proper attention is given to the plants. But it is in the United States of America that the Tomato is said to attain its highest perfection with the least trouble or special cultivation. In that sunny and specially favoured country nobody dreams of growing Tomatoes under glass. I am informed that the seed is sown in rows in the State of Illinois, like a row of Peas, the plants thinned, and stakes driven down about 8 feet apart, to which strings are attached, and the growths trained to these, or sometimes sticks are placed to the rows in the same manner as Peas, and I believe very little further trouble is taken with them. Here in England, however, whether the plants are grown outside or under glass, we find it very necessary to follow some rules of restriction of growth, for assisting the plants to flower, set their fruit, and produce good crops of finely flavoured and well-coloured shapely specimens which, I venture to say, cannot be excelled by the Americans.

There are various ways of growing Tomatoes under glass. Planting out in borders is, however, the best where plenty of head room for the extension of the stems is available. It is surprising what a shallow depth of soil, if it is made firm, the Tomato can be grown in. I have plants growing in less than 6 inches depth of soil, about 14 inches in width, bearing good crops of fruit. The soil is held up by a double row of bricks, and is placed on a hard bottom of stone, simply the surface of a stone table above the hot-water pipes. Some addition is made to the bulk of the soil in the course of the season, but no great quantity is at any time added. Where there is unlimited room for the stems to extend, as under the roof of a span or a lean-to house, more room or depth of soil may be provided. When planting on hillocks of soil, too, the depth must be regulated by the depth of the pot from which the plant is turned out. The ball of roots requires to rest on a stratum of soil about an inch in depth, and the surface of the ball should be covered with about 2 inches, all pressed firmly round. The manner of potting Tomatoes in their fruiting pots needs but little reference, as it is generally understood and conceded that sufficient soil only is necessary to induce a vigorous and sturdy start, and to carry the plants to the development of the first bunches of bloom and the

safe setting of the fruit that should follow, after which, further support is from time to time necessary. When the plants have become established and are growing freely, the necessary pruning and training commences, and requires to be followed almost daily throughout the season. On this depends to a great extent the fruitfulness of the plants. The simplest method of training is confining each plant to a single stem, which is allowed to extend without stopping until it has filled its allotted portion of space, rubbing out or breaking off all the growths that appear in the axils of the leaves, paying particular attention to shoots which start and are liable to grow very vigorously near the leading points of the plants. A few days' inattention to this matter often necessitates surplus growth having to be cut away with the knife, instead of being rubbed off with the finger and thumb, or broken away when in a brittle condition. These little matters are worth attending to regularly, because of the ease with which they are accomplished at the proper time, and the consequent benefit to the plants.

It is not absolutely necessary in all cases to confine a plant to one stem only, though in the case of pot plants grown perpendicularly to a stake it is the best method. Under a roof two or three stems may be allowed to grow, but in the case of each stem the same attention to the timely removal of the side shoots is requisite. More fruit is often obtained in this way, but the largest and finest specimens are, as a rule, obtained from single-stemmed plants. When more than two or three stems are allowed the grower may be said to have adopted the extension system, and by this method he can manage with fewer plants. This is a very good way of growing a spring crop of the small fruited sorts. They do not require such high feeding as the others, and plants of these sooner recover from the weak and spindly condition which Tomatoes preserved through the winter and planted early in a warm position, but often a long way from the glass, frequently assume. A good breadth of extension-trained plants will give early fruit and continue a succession of flowering, setting, swelling, and ripening fruit throughout the summer, but the most constant and best attention must be given to them.

During the period of flowering plenty of air is necessary to enable the plants to develop perfect floral organs, which the best varieties invariably do, with the exception of sometimes producing a central fasciated or deformed flower. This is best removed, particularly when the fruits are wanted for exhibition purposes, as to allow it to set and develop only results in an unshapely fruit. The pollen is distributed on sunny days about noon by lightly shaking the truss of bloom or tapping the stems of the plants, and some growers syringe the plants lightly to effect the same object. It is surprising how long the fertilised blooms sometimes are in swelling the young fruit, but generally the first bunches swell rapidly, and then it may often be noticed that further bunches refuse to swell. When this is the case it is a certain sign that more support to the roots is needed, and until that is given the fruit, or rather the young bunches of embryonic fruit, will remain at a standstill, the limited amount of support the plant had at command having been utilised by the first formed bunches. At this stage there is nothing to equal a top-dressing of turfy loam and manure in which is also mixed a little soot and bonemeal, and placed on the surface when the soil is moist. It will soon attract a multitude of white fibres, the effect of which is to give a fresh impetus to the forces of the plants, and which will soon be made apparent by the enlargement of the fruit. As the rootlets extend and multiply more water will be needed, and also weak supplies of clear soot water or other liquid manure. Fresh top-dressings of the same materials may be applied with advantage from time to time as they are seen to be necessary, and in this way, together with applications of liquid and artificial manure, the plants are strengthened and good crops of fine fruit secured. I find that when planted out on hillocks of soil top-dressing is not

needed so soon, but it may depend on whether the plants are enabled to root in the subsoil below them. Care should be taken that such subsoil is of a hard nature, because if loose the prospect of fruit may be jeopardised, as the plants will have a tendency to produce long roots and large sappy stems and foliage.

The Tomato is not without enemies, and those, too, of a serious nature. Disease often works serious mischief and devastates plants wholesale when once it gains a foothold. A fungoid disease attacks the foliage and stems, and is known by the name of *Cladysporium*. As I had some experience of the ravages of this fungus a year or two back it may be interesting to give a sketch of its progress through a house of plants. My plants were attacked in the month of June, the first symptom being a small light coloured spot, which soon became a dark brown colour, and spread rapidly over the leaves, and eventually the stems. The fruit was not affected by it, but when the disease had attained a firm hold of the plants no further progress in setting fruit was possible, as the fungus absorbed all the sap. It spread its invisible mycelium in the tissues of the leaves, from which it developed slender erect filaments bearing on the tip of each the fully developed and seed-bearing spores, which when ripe and massed together presented to the unassisted eye the appearance of dark masses of brown dust, the least disturbance of air being sufficient to distribute millions. The leaves soon shrivelled and became useless until all had to be cut away, leaving only bare stems with the fruit in various stages. The first and worst attack of the disease was in 1887, followed by a less virulent one the next year, and less still in 1889. This year I have not observed it, but my treatment of the plants has been different. The disease is said to be due to atmospheric influences, and there can be no doubt that the rapid spread of the fungus may be arrested by a dry and warm atmosphere. The fungus in my case was no doubt invited by a damp and cold atmosphere during the early period of growth, when the plants were soft and no fire heat was afforded. It is at this stage and under these conditions that the fungus was able to obtain a foothold, its spread being afterwards easy, especially when the conditions it delights in continue. The probability is that had fire heat not been discontinued so soon in the season the plants would have grown sturdier and have had firmer and stronger foliage better able to resist the attacks of the fungus. I am strengthened in this idea because this year, having provided a little fire heat, particularly at night, until the beginning of July, I have not been troubled with any sign of disease, and the plants are growing well and setting fruit abundantly.

There is only one insect pest that is troublesome to the Tomato, and that is the white fly. Fumigation will destroy it, but I am trying to keep it down by the aid of the syringe, and have succeeded to a great extent. This necessitates syringing the plants, a practice which some recommend and others object to. I find the plants are not injured by syringing when it is done early enough in the day to allow of the foliage becoming dry, or nearly so, before night. Syringing should be performed either early in the morning or in the afternoon, moderately cloudy and breezy weather being the best for the purpose, because then evaporation takes place more quickly than it does in dull "muggy" weather. Soapy water may be used sometimes, but not when the sun has any power on the plants. Plenty of ventilation is at all times needed by Tomatoes, and a moderate amount should be left on the house at night. A moist, warm, insufficiently ventilated house tends to cause the fruit to crack, and certainly provides the necessary conditions for an attack of the fungoid disease.

There are numerous varieties of Tomatoes now, all claiming to be good. One of the best among the red fruited, smooth, Apple-shaped sorts is Hathaway's Excelsior. It is a free setter, and produces good bunches of fruit, which ripen to a deep red colour. Vick's Criterion is very useful, producing good bunches of egg-shaped fruits. Dedham Favourite produces large and handsome fruit. Sutton's Earliest of All is an excellent partly corrugated

variety, a moderately dwarf grower, and gives beautiful light scarlet fruit, somewhat flat and round. Hackwood Park Prolific is capable of producing some very heavy bunches, is a strong grower, but is, according to a limited experience of it, not the best of setters. The Mikado is a very distinct variety, both in the foliage and the colour of the fruit, but after setting one good bunch of fruit I find it difficult to induce it to set many more. The colour of the fruit is brick red, and the flavour and quality are not first-class. It is by no means equal to the previously mentioned varieties. Among the smaller fruited varieties, Nisbet's Victoria is one of the best. Almost every bloom appears to set well, and the fruits grow to the size of a Victoria Plum in very prolific clusters. The best of the yellow varieties I have grown is Carter's Blenheim Orange, an exceedingly good variety. Each well-ripened fruit is streaked with marks of rich red, which gives it a very attractive appearance. It is good in every respect. Next to the above is Green Gage, which produces light yellow fruit of medium size. The Perfection type of Tomatoes are among the best, and there are some recently introduced sorts, such as Ham Green Favourite and others, which are said to be very good, but which I have not yet tried.—E. D. S.

### WINTER SPINACH.

THIS is a far more important crop than many gardeners seem to be aware of. There may be establishments where there is little or no demand for it, but as far as my experience goes it is almost impossible to grow too much. During the winter it ranks as a choice vegetable, and does excellent service as such, and there can be no question about its wholesomeness or medicinal properties. Spinach Beet is sometimes grown as a substitute for it, though unfortunately this exceptionally hardy and easily grown vegetable is by no means equal to the genuine article, and some cooks will not even try to do anything with it. Winter Spinach is not generally of easy culture; in fact there are many more failures than successes with it. Those with a somewhat limited area of ground have the greatest difficulty with it, simply because they are or fancy they are unable to devote a good space to the crop. Not only ought a comparatively large piece of ground be given up to Winter Spinach, but this should be prepared at least two months in advance of sowing time. Our practice is to manure and roughly dig a breadth of rather high ground newly cleared of Broccoli, and a second turning is given during the summer. This has the effect of sweetening and well pulverising the soil, and what also is of great importance, gets rid of the greater portion of the natural enemy to the crop—viz., the grubs of the Spinach moth. Soot and lime freely stirred into the surface act as a deterrent of the grub, and also tend to promote a stronger growth.

Early Potatoes are an excellent preparation for Spinach, these leaving the ground in a sweet porous condition, and it ought to be possible in most gardens to sow it in close succession to them. It is advisable to sow a considerable breadth of ground with this crop even if the demand is successive, for the simple reason that when there are only a few short rows these are kept far too closely gathered from, even if only drawn from once a week, as it must be remembered that growth is very slow in the colder months of the year. When to sow the seed is another consideration, more depending upon this than is apparent to the careless observer. In our case if sown before August premature bolting usually results, while, on the other hand, if the sowing is deferred till late in August the plants do not attain a serviceable size before the following spring. It is the happy medium that best meets our case, and if the seed is sown during the second week in August failure rarely occurs, the plants continuing to yield good gatherings of leaves till the earliest spring sown is available. This answers our purpose far better than making two or three sowings, extending from the latter part of July till the early days of September. The ground being stirred to a good depth and finely divided, this sometimes necessitating the use of heavy hoes, shallow drills are drawn 15 inches apart, and if at all dry these are moistened prior to sowing the seed. It is unwise to sow sound seed very thickly, but as there are slugs and grubs to contend with many more seeds than of plants required are sown. If all goes on well the seedlings are early and lightly thinned out, soot and lime being frequently dusted over them if the weather favours the slugs in their depredations. Before the plants become crowded they are further reduced to about 3 inches apart, and in the course of a few days they are large enough for transplanting with a trowel in order to make good any blanks. In

thus moving them care has to be taken to preserve the tap root as much as possible, and to keep a little soil about them, as Spinach transplants rather badly. When there is no need for resorting to transplanting, about half the plants are, when of good size, drawn for use, a distance of 6 inches apart being ample for those reserved. Frequently stirring between the rows is absolutely necessary; this, in addition to promoting a stronger growth of the plants, also keeping slugs from increasing and grubs from being so plentiful and destructive. Many err in placing their rows too closely together, this rendering it almost out of the question to surface hoe occasionally. Winter Spinach is perfectly hardy, any attempt to protect it usually doing more harm than good.

The Winter or Prickly-seeded Spinach is the variety most generally sown at this time of year, but as a matter of fact it is not any hardier or better adapted for the winter crops than the summer or round-seeded form. Neither of them is equal to the Victoria and Monstrous Viroflay, and either of those ought to be sown in preference to the older and much smaller leaved varieties. One leaf of the Victoria is equal to two of the smaller forms, and it is a free-growing perfectly hardy Spinach.—W. IGGULDEN.

## LEICESTER CONFERENCE PAPER. FRUITS FOR LEICESTERSHIRE.

By Mr. WILLIAM INGRAM, Belvoir.

I APPREHEND that the object of the visit of the British Fruit Growers' Association to Leicester is twofold; in the first place to elicit information on fruit growing as it is locally practised, and the second to communicate facts on the same subject, which the extended practical experience of the members of the Society enable them to do.

Fruit trees, like other living objects in Nature, are liable to be constitutionally affected in growth and fertility by circumstances of soil, climate, latitude, elevation, and other natural causes, and as this England of ours presents in a limited space greater climatic conditions and diversity in its geological character, and therefore soil, than any other portions of Europe, it follows that to have anything like an assurance of success in fruit growing we must know the conditions of soil that exist, and the varieties of trees that have shown by their vigour, fertility, and duration the mutual adaptability that is requisite between Nature inert and vital.

Pursuing the idea that certain physical conditions are important factors, and so necessary to be considered in the cultivation of fruit trees, it may be interesting to those of our visitors unacquainted with Leicestershire to mention a few salient features in the geology of the county, and one very remarkable one is seen in the range of hills that rise north of the town, and constitute the Charnwood district. This mountain range, for such it really is, attains an elevation of a little over 900 feet, and the rocks of which it is composed, consisting of granite, syenite, slate, and sandstone, are of considerable economic value. I mention the occurrence of this interesting range because in the long period of time since its obtrusion, its waste by atmospheric causes has been considerable, and the *débris* of these hard rocks has usefully modified some of our heavy soil, and apart from the slow operations of Nature, we have in the active working of the granite quarries great resources of dust and pulverised granite rich in feldspar, which both in fertilising action and in keeping the soil open is of especial value.

A general glance at the geological map of the county of Leicester, and very little consideration of the circumstances it reveals, will be sufficient to convey the fact that it does not enjoy any special natural advantages that would constitute it a fruit growing county. It certainly does not possess the recommendations either of climate or the conditions of soil that distinguish districts pre-eminent for fruit growing like Kent or Hertfordshire, situated in the centre of England, and having a general elevation of from 300 to 500 feet above sea level over the greater part of it (the exception on altitude being the Charnwood range which I have already described), it may be inferred from the rocky character of its more elevated parts, and its general altitude, that its climate is less genial than from its latitude alone we might be led to expect. Elevation, a great extent of cold clay land and marls, both of the trias and lias, also conduce to bring about this result. Whilst I have freely commented on the physical disadvantages of the county, I may with the same degree of freedom mention the favourable circumstances resulting from the climate and soil that belongs to it. Its general cool climate has the effect of retarding the blooming of fruit trees, and this is an advantage appreciated by the practical man, when, as the great churchman who died at Leicester Abbey said, "The third day comes a frost, a

killing frost." We often hear of the destruction of the fruit-blossoms in the south-eastern counties when we are safe from the same calamity through the undeveloped condition of the buds. Although the river system of the county is of a somewhat restricted character, and there are not found the extensive valleys possessing rich river deposits such as are found contiguous to the Thames, the Trent, and the Lea, yet the materials from which these loams were derived exist in abundance, but in a concentrated form. Our granites, limes, gypsum, ironstone, and sandstone as they have been in the past so they remain still, a rich storehouse of mineral matters available for distribution by man's agency, or the slower but inevitable operations of Nature in her system of soil making. As illustrating this opinion of the innate capabilities of the land of Leicestershire, I may say that whenever fruit growing has been taken in hand and pursued with knowledge and intelligence, a considerable amount of success has been achieved. The Grapes grown by Mr. Henderson of Cole Orton had a name and a fame throughout the land. Beau Manor, shadowed by the cold rocks of Charnwood, in the skilful hands of Mr. Hamsher, has furnished fruit of great excellence. Gopsall and other places have also afforded instances to substantiate my argument, and orchards well placed and managed have suggested, rather than exhibited, what may be done in this county.

I must in this short paper deal rather in general principles than in details of culture. The influence of soils on the health of trees is pretty well, if not understood, certainly acknowledged. An unhealthy tree is at once the subject for the attacks of insects. Good cultivation, by promoting vigour, enables a tree to overcome its enemies. In a deep fertile soil, or a situation naturally adapted to the habits of fruit trees, vitality is increased and vegetable existence is prolonged. Showing how important healthy foliage is in aiding the fruitful development of the bud we have the example of the late and the present season. The blighted condition of the trees last and the preceding year was so marked that it invited discussion, and numerous remedies were suggested and tried. It is now sufficiently evident to us that the unfruitfulness of the present season is largely due to the injury sustained by the foliage of the trees last year, for no frost of sufficient severity occurred to destroy Apple, Pear, and Plum blossom. This experience suggests the importance of maintaining the foliage of a tree in health and vigour.

The two very important matters which will I hope be considered and discussed at this meeting are drainage and shelter. In a county like this it is extremely difficult to lay down any rule for the former, but stagnant water should not be allowed to exist below an orchard. Shelter is all-important. We seem to be particularly exposed to the action of high winds. The question of belts of trees and of the sorts to be employed is also worth consideration.

The selection of suitable Apples, Pears, and Plums for private gardens, as well as those cultivated exclusively for profit, is a subject that demands practical local knowledge and considerations. Those who grow for home consumption must naturally select the kinds likely to afford a supply of fruit in succession from an early to a late period; while the grower for profit will confine himself to a few well-known prolific kinds, to come in early and late, so as not to be in competition with American importations. I have prepared a list of Apples, Pears, and Plums, which I submit to the Conference.

### APPLES

Margil.	Old Golden Pippin.
Early Red Apple.	

## GOOD PEARS GROWN AT BELVOIR.

Doyenné d'Été	Bergamotte Esperen
Jargonelle	Easter Beurré
Doyenné Boussoch	Josephine de Malines
Williams' Bon Chrétien	Knight's Monarch
Bergamotte d'Automne	Beurré Rance
Beurré d'Amanlis	Beurré du Buisson
Beurré Superfin	Olivier de Serres
Marie Louise	Winter Nélis
British Queen	Beurré Hardy
Doyenné du Comice	Beurré Diel
Beurré d'Aremberg	Huyshe's Victoria
Beurré d'Anjou	Huyshe's Bergamot
Soldat d'Esperen	

## PLUMS.

Angelina Burdett	Coe's Golden Drop
Rivers' Early Prolific	Yellow Magnum Bonum
Kirke's	Impératrice
Jefferson	Victoria
Green Gage	Prince Englebert
Reine Claude de Bavay	Pond's Seedling
Purple Gage	Wine Sour
Early Orleans	

## GOOSEBERRIES.

<i>Red.</i>	<i>Yellow.</i>
Crown Bob	Golden Drop
Ironmonger	Yellow Rough
Red Champagne	<i>Green.</i>
Warrington	Greengage
Whinham's Industry	Rosebery

## CURRANTS.

Raby Castle	White Transparent
New Dutch	Black Baldwin
Red Grape	Black Naples
White Dutch	Black Lee's Prolific

## RASPBERRIES.

Carter's Prolific	Antwerp Red
-------------------	-------------

The following selection has been supplied to me by Mr. Thomas Warner of Leicester :—

## APPLES.

*Blenheim Orange.*—Does only fairly well, and never gets equal to south or south-western grown fruit.

*Bess Pool.*—A very good late Apple, but a shy bearer for the first twenty years after planting, after which it bears well every other year.

*Bramley's Seedling.*—This is a very good winter Apple, and bears well as a young tree.

*Annie Elizabeth.*—A handsome Apple, but of only second rate quality.

*Calldwell.*—One of the best late cooking Apples, very hardy.

*Keswick Codlin.*—One of the best early cookers.

*Cox's Orange Pippin.*—Early and free bearer, first-rate quality, and very good keeper.

*Duchess of Oldenburg.*—The best early cooking Apple I know, a splendid grower, and fruits regularly.

*Dumelow's Seedling.*—One of the best late cookers; free grower and good bearer.

*Greenup's Pippin.*—Handsome, good bearer and free grower; the best Apple for making jelly; always commands a good price in the market.

*Early Red Margaret.*—A very good early dessert Apple.

*Joaneting.*—Poor quality, but fruits and sells well; a decidedly profitable Apple.

*King of the Pippins.*—Good in every way.

*Lane's Prinee Albert.*—Very good, free grower and bearer.

*Lord Suffield.*—A bad grower but very fine fruit.

*Northern Greening.*—A splendid late cooking variety.

*Devonshire Quarrenden.*—Very good, free bearer.

*Ribston Pippin.*—Too good to be left out, but, in my opinion, for this locality, superseded by Cox's Orange Pippin.

*Sturmer Pippin.*—A valuable late Apple, good keeper; tree very hardy, and good bearer.

*Warner's King.*—Very large, free grower, and good bearer.

*Warner's Seedling.*—First rate quality, free grower, good and certain bearer.

## PEARS.

*Beurré d'Amanlis.*—Good bearer and first quality.

*Beurré de Capiaumont.*—Good bearer, fair quality.

*Easter Bcurré.*—A very good late variety.

*Beurré Rance.*—The best late Pear known. I ate them from standard trees the last week in May.

*Bon Chrétien.*—One of the best market Pears.

*Hessle.*—One of the best market Pears.

*Doyenné du Comice.*—Very good. Equal in flavour to any Pear I ever tasted. Grows well as a standard.

*Jargonelle.*—Very good.

*Louise Bonne of Jersey.*—Good; free bearer.

*Beurré Diel.*—Good market Pear; second quality.

*Marie Louise.*—Splendid, but an uncertain bearer.

## PLUMS.

*Bleeker's Scarlet.*—Free bearer; good.

*Damson Shropshire.*—Free bearer; very good variety.

*Diamond.*—Fine cooking variety.

*Early Prolific.*—Free bearer; good, but rather too small.

*Coe's Golden Drop.*—One of the best varieties grown.

*Early Orleans.*—Good; free bearer.

*Prinee Englebert.*—Good; free bearer.

*Reine Claude de Bavay.*—Great bearer, good quality; the best of the late Gages.

*Syston.*—Good bearer, poor quality, but a very profitable market variety.

*Victoria.*—The best bearer, good grower, and profitable as a market Plum.

## CHERRIES.

May Duke.

Bigarreau.

White Heart.

Morello.

In making out this list, Mr. Warner adds, I have confined myself to trees I know do well as standards. Of course there are many more varieties worth growing, especially for dessert purposes, which I have not named; but I think those I have enumerated all do well in Leicestershire, and are good profitable sorts.

## CYPRIPIEDUM GODEFROYÆ.

THERE is a wide variation in the foliage of this species, some plants being much darker than others. The flowers also vary considerably. Plants with dark foliage have slightly larger flowers than those with lighter leaves, but the upper sepal is not so beautifully spotted in the former as the latter, yet there are more spots on the back of the sepal than in the lighter foliaged form. The other portions of the flower are very similar. This plant thrives in well-drained pots in a mixture of peat and moss, with a little charcoal added. It delights in a warm moist atmosphere, where it is well shaded from the sun.

## CATTLEYA GASKELLIANA.

The various forms of this Cattleya make an attractive display just now, and are very effective in a shady position in the conservatory, grouped with Ferns. When used in this position be careful not to place them where cold draughts will strike upon them. These plants are not damaged in the least by being placed in rooms for a few days. The flowers last perfectly fresh much longer in the cooler and drier atmosphere of the conservatory than in the Orchid house, where blocks and baskets have to be syringed, and a moist atmosphere maintained to suit mixed collections of plants.

## CATTLEYA EL DORADO.

Where room is limited the numerous forms of this Orchid will be found to do better suspended from the roof in ordinary pots than when standing on the stage. It requires a warm moist atmosphere and plenty of water during the season of growth. The last plants with us have flowered, and they will be arranged at the lightest but coolest end of the structure, to thoroughly develop and mature the young pseudo-bulbs on which the flowers have been produced.

## LÆLIA PURPURATA.

Plants of this useful Orchid should be starting strongly into growth. Where they are fairly started place them at the coolest end of the Cattleya house, and top-dress them with living sphagnum and peat. If they need larger pots repot them at once. If the compost is in good condition do not disturb the roots, but break the pots, and any portions that cling to the roots should be placed

with them into the fresh pots. If the plants are unduly disturbed at their roots, such as is necessary when the whole of the old compost needs removal, they are certain to assume a sickly appearance. If repotted carefully they will grow without a check. The main body of the compost should consist of peat fibre used in lumps, and charcoal, with a little living sphagnum on the surface.

#### LÆLIA ANCEPS.

Weak pieces of the various forms of this Orchid are longer growing into a flowering condition than is the case with many species. Beginners would do well to start with good healthy pieces when their culture is comparatively easy, provided they do not place too much material about the roots and overwater them. Plants with strong pseudo-bulbs will show flower spikes with their new growths. Watch for slugs, which are particularly fond of them, and aphides, if any exist in the house, are certain to establish themselves upon the plants. The best method of eradication we have found is to lift the plant down and place a soft cloth round it, and then tap the plant sharply over a shallow vessel containing a weak solution of tobacco water. Any insects resting on the cloth can then be conveyed outside; sponge the growths afterwards with tobacco water.

#### DENDROBIUM BRYMERIANUM.

The pseudo-bulbs have finished lengthening out, and the plants should now be arranged at the coolest and lightest end of the structure to thoroughly ripen them. During the whole of the season these plants have given trouble by the attacks of a small yellow aphid. Lifting the plants down carefully, and dipping them in a weak solution of tobacco water, has been effective in destroying them. *D. crassinode* is turning yellow, and will be gradually exposed to full sunshine. The plants are being hardened, and will then be placed in a moderately cool house, where they can enjoy a good circulation of air, but will not be suspended nearer the glass than 2 feet. This species, during the process of ripening, will bear fully double the sunshine of *D. Wardianum*, *D. primulinum*, and others.

#### ORCHID PANS.

Some of the "patent" fancy pans that have been introduced during recent years, and said not to go green, are ten times more trouble to wash than ordinary pans and pots; in fact, they cannot be washed clean. Plain pans and pots burnt hard are the best; they are a long time before they turn green, and if not neglected are easily washed clean. Those full of various shaped holes and fancy markings on the outside cannot be washed clean, and even if the outsides are clean the holes and crocks which show through have a filthy appearance.—ORCHID GROWER.

#### WATERING.

WHERE there is an abundant water supply, with means for distributing it quickly where wanted, at no season of the year will it be found of greater usefulness than at present. Assuming that last winter was dry, and in most districts it was, and that all the rain that has since fallen has been sufficient merely for the wants of the moment, those who are in a position to apply water abundantly and cheaply should not hesitate to soak any such crops as Peas coming into bearing, Cauliflowers, Vegetable Marrows, Celery, Parsley—especially where maggot-eaten—and all such young crops as Spinach, Lettuces, Endives, and Cabbages for autumn use. Fruit trees on south exposures, such as Apricots bearing heavy crops, will be greatly helped if well watered. So will Peaches, and also young Apple trees bearing crops. Plums and Pears, which are generally wanting in fruit, will perhaps be as well without water, but over-dryness, even in such cases, is inimical to the next season's crop.

Among flowers, Carnations are greatly helped by a good soaking in dry weather; the blooms come larger, last longer, and the supply is longer continued. Gladioli, Dahlias, Phloxes, Pentstemons, Calceolarias, Lobelias, Begonias, and Chrysanthemums are other flowers which should be well supplied with water. Marguerites, Pelargoniums, Sunflowers, and Marigolds are examples of those which may be passed.

Grape Vines at this season are not uncommonly allowed to suffer on account of a stinted supply of water at the roots, and the same remark might well be applied to Peaches grown under glass. Weekly waterings are not too often for either, at least until the middle of September is past. There is no better method of keeping the trees and Vines in a clean healthy condition, and of obtaining well coloured fruit, with, of course, the unstinted ventilation which can be given at the present season.

All plants intended for winter flowering, such as Bouvardias, Pelargoniums, Chrysanthemums, and foliage plants, such as Crotons, Dracænas, &c., will also take large quantities of water with continued surfacings of manure. We have also begun to surface dress with soil Chrysanthemums which have shown signs of exhaustion. It is quite possible we may have some weeks of weather too dry for the wants of

the trees and plants mentioned above, and the application of water will be found to be of the greatest possible advantage.

When cold nights begin and much rain falls watering must cease in most cases, and indeed it is sometimes advisable to allow things to become rather dry about the end of September in order to help to secure a more profuse crop of flowers, &c., later in autumn. Just now, however, plenty of water is in demand.—B.

#### OLEARIAS.

OVER eighty species of the genus *Olearia*, one of the numerous groups of *Compositæ*, are known to botanists, but scarcely a dozen are found in gardens, and still less are generally valued for their ornamental characters. Two of the best known are *Olearia*, or *Eurybia*, *Gunniana*, and *O. Haasti*, both with abundant white flower heads of shrubby habit,

FIG. 18.—OLEARIA STELLULARIA.

and hardy in many districts, the former, from Tasmania, requiring protection in exposed positions, and being rather more tender than the New Zealand *O. Haasti*. When in flower these shrubs are exceedingly ornamental and form conspicuous objects on a rockery or in a border. Another *Olearia*, *O. stellularia*, was shown from Kew at a meeting of the Royal Horticultural Society on April 8th this year, and a spray of this form depicted in fig. 18 gives a good idea of its character. The flowers are starry in form, white, clustered towards the joints of the branches, the leaves small and closely set on the stems. The majority of the *Olearias* are natives of Australia, and the others are distributed through New Zealand and Tasmania.

#### PEAS.

THIS year has been very favourable to Peas, and having given a fair trial to several new varieties, perhaps your readers may like to know the results. Sharpe's First Early, Laxton's Earliest of All, Early William, No. 1, and Alpha composed the first batch. Earliest of All, sown ten days to a fortnight after Sharpe's First Early, beat the latter by just

three days. Where earliness is everything this Pea will be useful, but commend me to Early William. This is a great improvement upon William I., being so much dwarfer, not being more than 3 feet high; whereas William I. is apt to run considerably over 4 feet. The Early William is also very uniform in appearance, whereas I always found William I. vary very much in pods and growth. Laxton's Charmer followed; and in this we have indeed a grand acquisition. It is supposed to be from 4 feet to 5 feet high, but this year it has not stopped short at 6 feet. The pods are an intense green, and they hang in profusion the whole length of the bine. The peas are bright green and closely packed to the number of from nine to twelve in a narrow curved pod. This is an immense cropper and a poor man's Pea in all respects, there being little bulk of pod and plenty of peas. The quality also is all that can be desired. Boston Hero, on the other hand, is all pod and no peas, and not worth growing. Autocrat is a splendid Pea, a good cropper, with pods of an intense green, carrying a very heavy bloom. The peas quickly form, so that even when the pods are thin they shell out satisfactorily. The quality is good, and I can strongly recommend it. It would also be useful for exhibition. Sharpe's Queen is another good Pea, the pods being longer than those of Autocrat, but hardly of such good colour. It is of first-rate quality and a good cropper. I found it satisfactory in every respect, and it is not one of the hollow-pod monstrosities. Bliss's Everbearing was kindly sent me by Messrs. Henderson of New York, and it is a useful Pea, 2 feet high, with short thick pods filled with unusually large peas of good quality. Sharpe's Triumph, an old favourite of mine, did not turn out so well as usual, but Prince of Wales is just the Pea to have when you want to keep picking, for it is a grand cropper. This, also, is all peas and little pod. It is so well known that I need add nothing, but it so happened that I had never grown it before.

Since writing the above I have been much astonished to see that Boston Hero has obtained a first-class certificate. I enclose you a few pods of this Pea for your opinion. These are a fair sample, for I have had none better, and they will confirm, I think, my opinion of the Pea. I also send a few pods of Laxton's Charmer, but as they are now old you will not have such a good opportunity of judging the merit of this really first-class Pea.—H. S. EASTY.

[The specimens received are as our correspondent represents them. The pods of Boston Hero are very large, but not half filled; the pods of Charmer are crowded with peas.]

## GARDEN NOTES IN 1889.

### ALPINE AND HERBACEOUS PLANTS.

WHEN Queen Rosa holds her court all other things seem to fall into the background, comparatively speaking at least; and as from the end of June until the middle of July festivals in her honour are continually held, and I hold a somewhat responsible position in her court, and have to wait on her royal progress, and not only so, but to tell others about those festivals, it is no wonder that other matters connected with the garden are apparently neglected. During the time indicated many things have claimed my attention, but writing about anything else but Roses was impossible. Visions of Mr. Pemberton's or Mr. Lindsell's H.P.'s., Mr. Burnside's, or that noble army of East Anglian parsons, Teas would flit before me and hide everything else from sight. But now there is breathing time. Boxes are put away, shades and Zulu hats have disappeared from the gardens, reputations have been lost and won, one can think and write about other subjects, and I resume my notes on some of the herbaceous plants that gave me so much pleasure during last summer.

When the full blush of the early spring flowers is over, when most bulbs have died down or are rapidly doing so, there are still a few of them to interest and add vivid colouring to the garden. For this I know nothing better than the too much overlooked sections of Tulips. The Parrot varieties, quaint in form and gorgeous in colouring, with the tall brilliant flowers of Gesneriana or Duchesse de Parma, told very well for lighting up the masses of green plants, which were only just beginning to send up their flowering stems. There is another Tulip which, although exceedingly quaint, is also telling for its colouring, cornuta, and a small patch of this was noticeable at some distance. It is at that time, too, that I have found the Hyacinth so valuable for giving colour and perfume to the garden, and at so very little trouble or expense. All who grow Hyacinths in pots, it is well known, find it necessary to procure fresh bulbs each year, and the question comes, What is to be done with the old bulbs? Throw them away, say most people. It is indeed nearly useless to try to grow them successfully in pots the second year, but their capabilities for garden work were forcibly impressed upon me some years ago by seeing a very beautiful bed of them at Canterbury in an amateur's small garden in Dane John, which was entirely kept up by bulbs which had been grown in pots, and instead of being turned out had been carefully dried off, stored away, and planted. I have been in the habit for some years of taking care of my bulbs and planting them out, so that in all parts of the garden I have clumps of flowering roots, which, in their varied hues, planted without any regard to arrangement, brighten up the borders. I might, possibly, were I to take them up, take away the small bulbs and replant the larger, have finer spikes of bloom, but I prefer leaving them as they are. There is one clump in my Rose border which is the produce of one bulb, and I had this year fourteen very fine spikes on it.

On the rockery at the same time many things claim attention. There are little patches of *Gentiana verna* and *G. acaulis*, the former the most lovely of all blue flowers I think, yet often baffling the efforts of cultivators, as it has often puzzled myself. I have it now on a northerly aspect, and have allowed *Arenaria balearica* and *Mentha suaveolens* to form a sort of carpet for it to grow upon, as I have seen it on Alpine pastures, although we cannot imitate the Alpine winter which keeps them warm and dry. Then there are masses of *Aubrietia*, gay with their profusion of bloom, especially the variety I claim as a reminiscence of a pleasant visit to Belvoir many years ago. It is, however, eclipsed in beauty by the very remarkable variety which we owe to Mr. Max Leichtlin, and named after him. It is interesting as having a decided tint of crimson in it, quite distinct from the prevailing colour of the family—lilac; and it is possible that it may be the precursor of other and still more brilliant forms, but it is in itself a most lovely plant, and in large masses will be most effective. Then, too, some of the *Androsaces* are showing their pretty flowers, some of them, like *carnea*, difficult to grow; at least I rarely find it doing well with "herbaceous men." You can grow it in pots, but I confess to not having much regard for Alpines which require to be thus treated, although my dream—a dream not to be realised—is that of a well constructed rockery under glass, where all the spring gems could be cultivated, and the lights taken off during summer. In such a place we might be able to grow these plants to perfection. Some of them, such as *A. sarmentosa*, grow freely, and there is one, *A. villosa*, which is very free in flowering, and which also retains its flowers in beauty for a considerable time.

And is there a prettier flower on the rockery than the delightful dwarf Pink, *Dianthus alpinus*? Its large (1½ inch across) flowers, lying close down on its dwarf foliage, which they completely cover, make it an object of beauty not easily eclipsed. Our native and well-known Cheddar Pink, *D. cæsius*, flowered also very well with me; but pretty and sweet although it is, it cannot equal its Alpine sister in beauty. There are other kinds which I grow, and which flower about the same time—*D. fragrans* and *D. neglectus*—but I do not think that any of them equal the Alpines. I have had *D. Atkinsoni* very brilliant in colour, but evidently a biennial. I have had it several times, but after it has flowered it has disappeared. And what glowing masses of colour are made by the dwarf early Phloxes. I had some grand clumps of them this spring when, in conjunction with *Iberis corifolia* and *Aubrietia Ingrami*, they made that part of the rockery most attractive. I have never quite unravelled their nomenclature, but have them under the names of *setacea*, *purpurea*, and *Nelsoni*, and no more satisfactory plants can be placed on the rockery.

In the herbaceous border, that most beautiful and interesting class of plants, to which such great additions have been made of late years, the *Aquilegias* next begin to assume their beauty and to delight us with their varied forms. The old common Columbine of our cottage gardens is not to be despised, and this is especially to be said of the white form, which is very fine and makes a conspicuous object in the garden, but the newer varieties claim our attention especially. They are all easy of cultivation with the exception of one or two, and where a number of them are planted together the agency of bees and moths will be sufficient to produce any number of varieties; indeed this is one difficulty in their cultivation, that it is almost impossible to keep them true, and often have I been disappointed when I had taken, as I supposed, the greatest care in isolating a plant from which to save seed, to have found when the seedlings came up that they were of a very mixed character. There is one species with which I have failed, *Aquilegia glandulosa*. I had plants of it from many quarters, including Grigors of Forres, but after a year or so they departed. Can it be that this is a biennial? The species which have given most of the many varieties that abound in every garden where such plants are cultivated are *cœrulea*, *chrysantha*, *canadense*, and *Skinneri*. *A. cœrulescens* is a dwarf growing species, very beautiful in the colour of its flowers and large in size; it is earlier than most of the others, and my plants this year were very strong and healthy. *A. chrysantha* is, I think, the finest of all; its brilliant yellow flowers, its long spurs and stately growth, combine to make it a very beautiful plant. *A. californica* or *canadense* is scarlet and yellow, and it will be readily seen what capabilities there are for variation where these colours get intermixed. I wish it were possible for me in my small garden to give them more space than I do. I have a border some 12 feet long by 3 wide planted with them; there they are free to seed as they like, and the result has been a wonderfully beautiful set of seedlings of the most varied tints and habits. Most of them, indeed, are tall, partaking of the habit of *A. chrysantha*. This, by-the-by, is the easiest to keep true; it blooms until late in the season, when the other kinds are all past, and if some of the later flowers be reserved for seed purposes the plants raised from them will be pretty sure to come true.

*Inula glandulosa* is a plant whose praises I have more than once sounded in the Journal. It was very beautiful with me last year, the fine weather suiting it and many other herbaceous plants admirably. The plant is about 18 inches high. The flowers rise up to about 2½ feet. They are of a very rich yellow, the florets hanging down like golden tassels. The plant is very easy of cultivation, and can be readily increased by division of the roots. It is a good thing to cut off the flowering stems, for then the plant will be likely to send up some later blooms as mine has done this year. There is another plant somewhat like it in colour and form of flower which comes in later, but is coarser and taller, and lacks its softness; I mean *Telekia speciosa* or *Bupthalmum cordi-*

folium, a most showy looking plant and very suitable for a shrubbery or the background of a border.—D., Deal.

(To be continued.)

EVENTS OF THE WEEK.—To-day (Thursday) there will be Shows at Maidenhead, Faringdon, and Taunton; on Friday at Cheadle; on Saturday the National Co-operative Flower Show will be held at the Crystal Palace. On Wednesday, Thursday, and Friday, August 20th, 21st, and 22nd, will be held the great autumn Show at Newcastle-on-Tyne, and on the 20th and 21st the Shrewsbury Floral Fête will take place.

— THE PROPOSED FRUIT SHOW IN THE GUILDHALL, LONDON.—This Exhibition, which is being organised by the Fruiterers' Company, with the object of encouraging the culture of useful fruits in the home-steads and cottage gardens in the United Kingdom, will be held on the 6th, 7th, and 8th of October. Schedules are in the course of preparation, and classes are provided for cottagers, tenant farmers, gardeners, amateurs, and nurserymen. Prizes in the form of medals, money, and certificates will be awarded on the occasion. Sir James Whitehead, Bart. (Master of the Company), is Chairman of the Executive Committee.

— BEAUTY OF BATH APPLE.—Messrs. Cooling & Sons, Bath, send us specimens of this early dessert Apple. They inform us that fruits were quite ready for use on August 1st, and the crop a full one. The specimens are of good size for dessert, being from 2½ to 3 inches in diameter and about 2 inches deep. They are very symmetrical and handsome in appearance, being reddish crimson in colour. The flesh is tender, juicy and refreshing, rather than rich in flavour. We are told that this Apple only requires to become known to be a favourite with private as well as market growers. Such fruits as those before us would undoubtedly be acceptable on many tables and find a ready sale in markets.

— PEA CARTERS' ANTICIPATION.—Medium height Peas, as a rule, have done badly with us this season, but Anticipation is a noteworthy exception. It attained a height of about 3 feet, was very productive, and the pods were well filled with large and very sweet peas. Evidently it is a thoroughly reliable variety, and one of the best for small gardens. We find it does well grown in the market gardeners' fashion—that is to say, without stakes.—W. I.

— ASTER VEITCH'S EMPRESS.—Asters are very effective when planted in masses, especially if the heights of the respective varieties can be properly gauged. The new Empress, we find, is all that the vendors say of it—viz., dwarf, robust, and compact in habit, and also early flowering. With us the plants scarcely attain a height of 12 inches; they branch freely and produce very fine reflexed blooms. For bedding-out purposes they are particularly serviceable, and it is to be hoped that more colours will soon be added to this useful section. At present there are only crimson and white forms, the former being very effective when edged by the latter.—W. IGGULDEN.

— APPLE DUCHESS OF OLDENBURG.—For several seasons past I have taken every opportunity of writing and speaking in favour of this excellent variety. With us it rarely, if ever, fails to bear well, and this season some of the branches are weighted down to the ground with fine fruit. When ripe it is of very attractive appearance, being almost transparent and richly striped with bright red on the most exposed side. It sells readily for dessert purposes, but is somewhat acidulous in flavour, and it is as a culinary variety that it finds most favour here. The middle of September is as a rule quite late enough to keep it.—W. I., Somerset.

— THE FRUITERERS' COMPANY IN KENT.—We are informed that several representatives of this Company recently visited some of the fruit gardens in Kent, also the extensive nurseries of Mr. George Bunyard at Allington, near Maidstone, with which they were much pleased. A fruit feast followed, and was much enjoyed by the visitors.

— WILLIAMS' MEMORIAL.—A meeting was held at the rooms of the Horticultural Club, Hotel Windsor, Victoria Street, London, S.W., on Tuesday, the 12th inst., to consider the form of the proposed memorial to the late Mr. B. S. Williams. Dr. M. T. Masters occupied the chair, and there was a good attendance. Letters were read from Sir Trevor Lawrence, Bart., M.P., Baron Schröder, Mr. Thomson of Clovenfords, Sir Joseph Terry, Dr. Hogg, Mr. J. Watson, Mr. W. Robinson, Mr. Reginald Young, Mr. J. Vere Goodman, Mr. H. Perkins, Mr. Sander, Mr. W. Bull, Mr. W. Smythe, Mr. Stephen Osborne, Mr. Jas. Coombes, Mr. E. Pidsley, Mr. Bruce Findlay, Mr. Gaskell, Mr. Pyneart Van Geert, Mr. Eckford, and several other gentlemen, expressing approval of the scheme, and offering various suggestions as to the form it should take. The Chairman stated that they were all at one as to the proposal to establish a fund, and invited discussion as to the character of the scheme that should be placed before the public. Messrs. Cannell, William Paul, Pearson, H. J. Veitch, B. Wynne, Shirley Hibberd, Herbst, Outram, and other gentlemen addressed the meeting, and eventually the following resolution was proposed by Mr. Henry Cannell, seconded by Mr. H. J. Veitch, and carried unanimously:—"That this Committee desires to raise a sufficient sum to perpetuate Mr. B. S. Williams' memory by investing an amount sufficient to put a certain number of orphans on the Gardeners' Orphan Fund as Williams' Memorial Orphans, and also to give prizes in money with Williams' Memorial certificates for excellence in the cultivation of plants." A list of subscriptions was read over, and will shortly be published, while others will be invited to further the object in view.

— THE PROPOSED HALL OF HORTICULTURE.—We have pleasure in giving publicity to the following letter in furtherance of this project:—"You have, doubtless, heard of the scheme for building in London a Hall of Horticulture, with suitable premises, to form a centre for all the horticultural interests of the United Kingdom. Such central buildings, on a large scale, already exist both in France and in the United States, and have been found to be of the utmost value in promoting and advancing the gentle craft of gardening. Considering, therefore, that we English people claim to be the pioneers of horticulture, it appears little less than a public reproach that we are so far behind our neighbours on both sides of us in the lack of any central buildings. A project to supply this want was put forth a short time ago, and nearly £20,000 has been promised out of the £40,000 required. At the present moment a grand opportunity exists of acquiring a most advantageous site on the Thames Embankment, if only the remaining £20,000 can be raised to at once close with the offer, and it is in the hope that many will help us to raise this sum that I write this appeal. All that is asked is the loan of money free of interest, and the Trustees anticipate being able to begin to pay off the money lent in two years from the completion of the buildings. May I impress upon all the utmost importance of immediate action, as the offer of the site may, at any moment, fall through, and an opportunity be lost such as would probably never occur again in our lifetime. If every friend and lover of gardens would only lend the Trustees an average of £10 a piece, the thing would be done. The sums lent vary from £1 to £1000.—W. Wilks, Shirley Vicarage, Croydon."

— NATIONAL EXHIBITION OF PRESERVED AND DRIED FRUITS.—The Royal Horticultural Society being desirous of doing everything in its power to promote the extended cultivation of fruit, and having already held three Great Exhibitions of Apples and Pears, in 1883, 1885, and 1888, at which not far short of twenty thousand dishes of fruit were exhibited, and holding smaller exhibitions every fortnight throughout the year of the smaller and more perishable fruits, wishes now to draw attention to the great advance that has been made during the last quarter of a century in the preservation of fruit for winter use, and invites the co-operation of all who are interested in the subject. For convenience in comparing the different exhibits, it is proposed to divide them into the following classes:—Jams, Jellies, Syrup, Fruit Vinegar, Bottled Fruits, Fruits Preserved Whole in Syrup, Fruits in Spirits, Crystallised and Candied Fruits, and Dried Fruits. All kinds of British-grown Fruits are invited, also Colonial and Foreign-grown Fruits. The Exhibition is to be held in the Drill Hall, James Street, Westminster, on October 14th, 15th, and 16th. Medals, certificates, &c., will be granted by the Council on the recommendation of the Judges. Exhibitors are invited to send everything, as far as possible, in threes, any one of which the Council (or the Judges delegated by them) must have full right to open and taste at their discretion, the remaining two being left on exhibition. All intending exhibitors must give notice in writing to Mr. Barron, Superintendent Royal Horticultural Society's Gardens, Chis-

wick, on or before Wednesday, October 8th, stating the classes in which they intend to exhibit. Colonial and foreign exhibitors should make early arrangement, either directly or through a London agent empowered to act on their behalf. Schedules can be obtained from the Secretary of the Royal Horticultural Society, 117, Victoria Street, Westminster. We regard this as a very important exhibition, and trust it will be as extensive, diversified, and successful as the project deserves.

— MR. A. YOUNG sends the following six notes from Abberley :—  
CELOSIA PYRAMIDALIS.—Occasionally a note is seen in the gardening press of good specimens of the above being seen, and then someone follows with notes on culture. The details are carefully carried out, but the end is only failure. To secure good specimens of *Celosia pyramidalis* it is necessary to procure a good strain, and this is the secret, as then, with ordinary culture, there is no difficulty in procuring good plants.

— REPOTTING ADIANTUM CUNEATUM.—I think these are repotted oftener than is necessary, the advice generally being to repot in February, just previous to the plants starting into growth. This checks them to a considerable extent and prevents free growth. We grow a few hundreds, and the best plants are those which have not been repotted during the past three years. We have several upwards of 2 feet across in 6 and 7 inch pots, and these are very healthy and of a dark green colour. The plants are watered liberally, and have an occasional dressing of Clay's fertiliser. These plants are grown in a large and dry conservatory, where stone and marble predominate. Good fronds are useful in most establishments, the demand often being greater than the supply, so probably this brief note may be acceptable to those who have failed through constant repotting. The drainage in the first place must be free.

— DIMORPHANTHUS MANDSHURICUS.—This handsome deciduous shrub cannot be very well known, or more specimens would be seen in gardens. We have several in the grounds here, and they have a very imposing appearance; in fact, they impart rather a tropical grandeur. The foliage is very distinct and handsome.

— DEUTZIA CRENATA FL. PL.—This *Deutzia* has been very effective this season, being literally wreathed in blossom. It appears to be indifferent to soil or position, and is effective in shrubberies in the summer.

— SPIRÆA ARLÆFOLIA.—We have a very handsome specimen of this elegant *Spiræa* in bloom, in fact it is almost the same every season. It is especially adapted for planting in shrubberies. It must be very hardy, as in our case the situation is much exposed.

— RHODOCHITON VOLUBILE.—This quaint old-fashioned greenhouse climber is rarely seen nowadays, but what could be more effective at this season? We have it now in bloom, and it will continue growing and flowering until far into the autumn. Visitors always stop to admire it, and wonder what it is. There used to be a plant in the temperate house at Kew which covered a large space. It may be there now.

— AT the LEEK SHOW, to be held on September 5th and 6th, the silver medal of the Royal Horticultural Society is offered for six Orchids, and the silver medal and two bronze medals are provided for cut flowers exhibited by amateurs and cottagers.

— VERONICA SPICATA CORYMBOSA.—This hardy herbaceous plant is now in full bloom. It bears slender spikes of deep blue flowers, closely set together, and blooms from the bottom upwards. Bushy plants of it are conspicuous at a distance.—E. D. S.

— JULY WEATHER IN NOTTINGHAMSHIRE.—The following summary of meteorological observations for July at Hodsock Priory, Worksop, Notts, is sent by Mr. Joseph Mallender :—Mean temperature of the month, 59°0'. Maximum on the 13th, 74°2'; minimum on the 12th, 41°6'. Maximum in the sun, on the 26th, 134°4'; minimum on the grass, on the 12th, 34°5'. Extreme range, 32°8'. Mean temperature of the air at 9 A.M., 59°5'. Mean temperature of the soil 1 foot deep, 58°5'. Sunshine—total in the month 149 hours, or 30 per cent. of possible duration. The brightest day was the 24th, and we had no sunless days. Total rainfall, 2·12 inches. Rain fell on nineteen days. Average velocity of wind, 9·4 per hour; velocity exceeded 400 miles on two days, and fell short of 100 miles on three days. Approximate averages for July—Mean temperature, 6·12°. Sunshine, 160 hours. Rainfall, 2·36 inches. A cool, showery, and cloudy month, with an absence of any really warm weather.

— JULY RAINFALL IN HANTS.—I send you the amount of rain which fell here last month, as the amount was so much above the average of any corresponding month for years. On the 17th of the month 3·04 inches fell in twelve hours, and of this amount 1·40 inch fell in one hour and a half. The total amount for July was 4·92.—A. J. L., *Stockbridge*.

— THE WEATHER LAST MONTH.—July was a rainy month without any settled weather, and very bad for haymaking and keeping the land clean. The total rainfall was 2·65 inches, which fell on seventeen days, the greatest daily fall being 0·60 on the 2nd, when we had a heavy thunderstorm. The barometer varied much. The highest reading was 30·28 inches at 9 A.M. on the 20th; lowest 29·26 at 9 A.M. on the 1st. Highest shade temperature 75° on the 13th, 17th, and 23rd; lowest 42° on the 12th; lowest on grass 42° on the 4th, 10th, 12th, 20th, and 29th; mean temperature of the month 61·46. Wind in a westerly direction twenty-six days, the garden spring running 18 gallons per minute on the 31st.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— CLITORIA TERNATEA.—Referring to your notes on this plant in last week's Journal, I had not seen Paxton's opinion of it before, and regret to say I have not found it so easy of cultivation as he considered it to be. A gentleman who called here some three or four years since kindly gave me a few seeds of it which he had collected in India, and told me at the same time what a beautiful flower it was as seen growing out there. The seeds were sown and gave us two plants, which were grown in a stove all the time, but only produced two or three flowers, and then dwindled away. At no period of their growth did they show any vigour, and they left me with the impression that it is by no means easy to cultivate them in this country successfully. If any of your readers have good plants of it the particulars of their mode of culture would be interesting and useful. Another plant said to be remarkable for its beauty (*Antigonon leptopus*), obtained in the same way, has not flowered, and grows very weak and thin, but has managed to survive to the present time.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— THE FOLLOWING IS A GOOD SELECTION OF DAHLIAS.—  
Show Dahlias: Muriel, yellow; Mrs. William Slack, light lilac; Mrs. Dodds, deep purple; Gloire de Lyon, pure white; Flora Wyatt, light bronze; Harrison Weir, primrose yellow; Mrs. Langtry, lilac, tipped with purple; Louisa Neate, delicate pink, centre creamy white; Burgundy, deep purple; Eclipse, bright orange scarlet; John Bennett, deep yellow, tipped with scarlet; Joseph B. Service, deep yellow. Bouquet, Pompon, or Liliputian Dahlias:—Forstmeister Gschwina, crimson, shaded amber and white; Garnet, orange scarlet; Catherine, yellow; Red Gauntlet, deep red; Little Wag, light purple; Little Bride, white; A. Hubner, bronze and yellow; Rosetta, purple; Prince of Liliputians, maroon; Coquette, light bronze; Fanny Weiner, deep orange; Leila, reddish buff, tipped with white; Profusion, dark crimson; Lilac Gem, deep lilac; Rosalie, pale yellow, tipped faintly with rose; Little Bobby, crimson; Catherine Folkman, white; Iolanthe, orange; Don Juan, maroon, small and beautiful flower; Brunette, red; Pure Love, lilac rose; Golden Gem, yellow, tinted deep red. The above arranged in threes on a stand, covered with a bed of fresh green moss, are very attractive and beautiful.—E. D. S.

— FROME FLOWER SHOW.—Although scarcely so good in some respects as its predecessors, this was yet a great success, and never before has the attendance of visitors been nearly so satisfactory. Fine-foliaged plants were well shown by Mr. E. Wilcox, gardener to Mrs. Sinkins; W. Iggulden, gardener to Lord Cork; Ferns by Mr. E. Brown, gardener to Mr. C. Baily, and Mr. W. Iggulden; Fuchsias by Mr. J. Edwards, gardener to Mr. J. Knight, and Mr. W. Strugnell, gardener to Mr. A. R. Baily; groups by Mr. H. Wright, gardener to Mr. Haley, and Mr. Strugnell, the competition in these and several other plant classes being good. The principal prizewinners with cut flowers were Messrs. Iggulden, Strugnell, Wilcox, and Brown; and with Roses Messrs. Keynes, Williams & Co., Salisbury; G. Cooling & Sons, Bath; and Dr. Budd, Bath. Fruit was shown in fairly large quantities and of good quality. Mr. Iggulden took the first prize for a collection of six dishes, staging good Black Hamburgh and Muscat of Alexandria Grapes, Melon The Countess, Peach Sea Eagle, Nectarine Lord Napier, and Apricots, all good. Mr. Strugnell was a very creditable second with a very similar collection, and Mr. R. Phillips, gardener to Mr. John Baily, third. These exhibitors, and Mr. W. Bridgman, gardener to Mr. E. R. Trotman, were the principal prizewinners in the other fruit classes. A capital lot of vegetables were shown, and Tomatoes, notably Carter's Perfection,

were remarkably fine. A grand group of plants was arranged by Mr. W. Pratt, gardener to the Marquis of Bath, Longleat, not for competition, also some splendid bunches of Grapes.

— **WORTH HORTICULTURAL SOCIETY.**—On Wednesday, August 6th, one of the most brilliant days of the season, this Society held their seventh annual Show, by the kind permission of Mrs. Montefiore, in her beautifully laid out and highly kept grounds of Worth Park, Sussex. To judge from the large attendance during the afternoon this must be a highly popular institution with all classes in the neighbourhood. The exhibits were in every respect creditable to the local men who chiefly brought them together. For groups of plants Mr. J. Wilson, Crawley Down Park, Mr. A. Langridge, Hay Heath, Worth, and Mr. W. Woodfine, South Hall, Worth, were the successful exhibitors in the order named. Mr. R. Spinks was first for a collection of twenty-four bunches of cut flowers, Mr. F. Sutton being second. The latter had by far the best collection of vegetables, but by some oversight only staged nine dishes instead of ten, and was disqualified. Mr. A. Langridge was awarded first prize in this class. Mr. J. Wilson was first for eight dishes of fruit, and also first in the class for white Grapes with very fair Muscats. Chief amongst exhibits not for competition was a large bank of plants, fitting one end of the tent, kindly sent by Mrs. Montefiore, and admirably arranged by her able gardener, Mr. Glen. He also showed some very finely coloured bunches of Gros Guillaume Grapes, and splendid samples of Prince of Wales Peach. Messrs. J. Cheal and Sons had a bright lot of their single and Pompon Dahlias, and Mr. J. Willis, florist, East Grinstead, had a group of Ferns. Cottagers are encouraged here by giving good prizes and plenty of them, and they respond with a will. This Society is fortunate in having so liberal a supporter as Mrs. Montefiore, and in having Sir F. A. Montefiore as their President. Mr. A. G. Hobbs, Crawley Down, is the Honorary Secretary, and the arrangements showed that he was ably supported by a Committee of practical men.

— **THE WALKLEY (SHEFFIELD) FLORAL AND HORTICULTURAL SOCIETY.**—The fortnightly meeting held on Friday, August 1st, was rendered attractive by the fine display of flowering and foliage plants, cut blooms, Ferns, fruits, and vegetables brought together by the members for the purpose of gaining marks of merit, which at the end of the year are added together, those exhibitors receiving the highest number having the first chance of selecting from a number of valuable prizes. The record of marks on this evening was higher than on any previous occasion, one member, Mr. Barnes, gaining 117, followed by Mr. Jarvis with 75, he having hitherto held the highest position. The total number of marks received by the members was 430. Among the exhibits may be specially mentioned some beautiful plants of *Lilium auratum*; one specimen growing in a 9-inch pot had three stems about 7 feet high bearing over a dozen open and massive flowers, shown by Mr. Carlton. A handsome and shapely standard Fuchsia, with a clear stem and well-balanced head, about 3 feet through, evenly and profusely flowered, was shown by Mr. Broomhead. The variety was named Spitfire. Mr. Hague, the President, showed some splendid Roses that would have been in perfect condition but for a heavy thunderstorm that prevailed just before they were gathered. He also showed some tall and well-flowered spikes of white Phlox, and a head of bloom of the beautiful *Campanula persicifolia alba plena* (the double white Peach-leaved Bellflower). It is a beautiful and useful flower for cutting. He also showed a good collection of Carnations, Picotees, and Pansies. Mr. Taylor had a bushy specimen of *Acalypha tricolor*, a stove plant similar in appearance to a *Coleus*, but having smooth, coppery, and red coloured leaves. The Judges were Messrs. Hannah and Smith. Mr. John Turner of Attercliffe gave an interesting address, illustrated with specimens, on "Wild Plants and their Utility."

— **SHEFFIELD FLORAL AND HORTICULTURAL SOCIETY.**—At the last monthly meeting of this Society Mr. James Wrigley read an interesting paper on "A Ramble through the Rivelin Valley." Mr. John Eadon presided. Mr. Wrigley dealt with his subject chiefly from a medical botanist's point of view, but he also mentioned much of the lore and superstition connected with the plants that he treated. Time would not permit, however, of his interesting allusions to, and eloquent descriptions of, more than half of the well mounted and neatly named specimens he had brought with him to illustrate his paper. The Rivelin Valley, the nearest and one of the most interesting valleys to the town of Sheffield, is full of interest to the lover of wild plants, and both Mr. Wrigley and the Chairman bore testimony to the pleasant hours they had spent on its sunny slopes and shady woodlands, by its babbling streams, miniature lakes, and rock-bound ravines, in search of wild

plants and Ferns. At the same meeting stands of good, fresh, and bright Roses were shown by Mr. Storey and Mr. Jackson, both amateurs, and by a professional gardener. Mr. Eadon and Mr. Davy showed some select varieties of British and exotic Ferns, the former taking first honours in the British class with a splendid and perfect specimen of *Athyrium Filix-fœmina Kalothrix*, in a 6-inch pot, with superb, finely divided, arching, transparent, delicate, and shining fronds, and an *Athyrium F.-f. Frizelli ramosum*, in a 5-inch pot. This variety is remarkable for being heavily crested at the apex of the fronds, and for the peculiar friselled and contracted appearance of the pinnæ on the other parts. Mr. Davy was second with an *Athyrium F.-f. Kalothrix* and a good specimen of *Scolopendrium vulgare crispum fimbriatum*, the fronds of which were broad, healthy in colour, and fimbriated along the edges. Mr. Davy was first with exotic Ferns, showing the compact, dwarf growing Japanese *Osmunda japonica corymbifera*, and a young plant of *Phymatodes Billiardieri*. In the professional class, Mr. Collier was the only exhibitor in both classes of Ferns with *Adiantum farleyense* and *A. gracillimum*, and *Lastrea Filix-mas cristata* and *Polystichum angulare var. proliferum*.

— **THE WAKEFIELD PAXTON SOCIETY.**—At the ordinary weekly meeting of the members of the above Society, Mr. Henry Oxley, the President, in the chair, the members proceeded to appoint seven gentlemen to act on behalf of the Society as Trustees of the proposed public park, along with those selected by the donors at the recent meeting held at the Town Hall. After some discussion it was unanimously resolved that the Society's seven Trustees should be Mr. Henry Oxley, the President of the Society (through whose indefatigable efforts the scheme has been brought to a successful issue), Ald. W. H. Lee, J.P., Mr. W. H. Kingswell, Mr. J. Gerrard (Government Inspector of Mines), Mr. B. Whiteley, and Messrs. G. W. Fallas and T. Garnett (the two Hon. Secretaries to the Paxton Society). Mr. George Gill of Eastmoor, a successful florist, then opened an interesting discussion on "The Carnation and Picotee," numerous fine specimens of which sweet and favourite blooms were exhibited on the tables. Mr. Gill, who has for a great number of years been an extensive grower and successful exhibitor of Carnations and Picotees, clearly and fully explained his mode of treating the plants from the first to the last stages, and gave some very useful and valuable advice, based on long and extensive practice. His remarks were supplemented by Mr. Maddock of Loft-house, Mr. Garnett, one of the Secretaries, and others, and at the close a very hearty vote of thanks was given to Mr. Gill. At a dinner of the members Mr. David Stephenson proposed "Success to the Paxton Society," and in doing so referred to the great and good work it is doing in providing recreation grounds, promoting the public park scheme, and arranging the annual winter garden exhibition. Mr. Oxley responded, and said the Society's success was due to the fact that its members were all imbued with the desire to benefit their neighbours, and never permitted either political opinions or religious views to sow discord amongst them. He alluded to the fact that the Society had raised about £4000 in eight weeks on behalf of the proposed public park. Mr. B. Whiteley remarked that it was mainly due to their much-esteemed and very indefatigable President, Mr. H. Oxley, that the public of Wakefield would next year be in possession of a public park. He warmly thanked Mr. Oxley for his services on behalf of the Paxton Society, and hoped he would long live to reign over it.

## STRAWBERRY NOTES.

AUGUSTE NICAISE.

I NOTICE that this Strawberry is coming to the front. It is now some fifteen years since I became acquainted with it. It was grown in an orchard house for supplying the latest forced fruit, so was brought on comparatively cool. It certainly was a free cropper, and the fruit handsome in appearance, but the flavour was very indifferent.

UNSER FRITZ.

This variety was grown about the same time, and I am surprised that it is not more largely cultivated. It is very compact in growth, the fruit handsome in appearance, and the flavour excellent. It would be interesting if any gardeners who have grown it would state their opinion on its merits. I am under the impression that it is very little known. I have not grown it since I came into Worcestershire, as after trying three of our largest nurserymen I failed to obtain plants.—A. YOUNG.

SIR J. PAXTON.

No other variety of the common Strawberry I am acquainted with will give such a long succession of fruit from the same plants, and if the beds are disposed in about three positions, no other form, with the ex-

ception of Noble, need be grown, as far as we are concerned. Our first dish of Sir Joseph was gathered on June 9th from plants on a sunny raised border, and long before these were over the same variety was available in the open, the latest supply of large fruit being had from plants in a much cooler part of the garden. From the latter, and also those located on higher ground, we continued to gather presentable fruit until the end of July, and there are more still to come. It is not always possible to have such a long succession with the aid of Sir J. Paxton alone, but with us it is the last to fail in any season.—W. I. M.

I DO not know whether I shall be overstepping the mark in making a few remarks on Strawberries after we have had the benefit of the experience of the "big guns," but I am led to write a few lines through reading Mr. Iggulden's article on page 86. I entirely concur with him in the opinion that heavy manuring before planting only results in a superabundance of foliage and a light crop of fruit, which soon rots in wet weather. My soil is very heavy and sticky ("loving," we call it, for it is loth to part from you in wet weather), and I have this year and last tried a few rows which had a heavy coat of manure dug in before planting, and the results were gross foliage and little fruit, whereas in both years the crop of fruit on the plants treated otherwise was very good.

I plant out on land in good condition, but undug in autumn or spring, and in the latter case I pick off all flowers as soon as formed. No manure is given until the plants are in full flower, when they have a first dressing of artificial strong in potash, and this is not given unless we have a good rain to wash it in. Later on, when most of the fruit is formed, another dressing is given in showery weather, with the result of a heavy crop of fruit and not too much leafage. I find Sir Joseph Paxton must be planted a yard apart from row to row, for the long flower stalks hang over between the rows so far that it is hard to avoid treading upon the fruit if the rows are closer.

I was much interested in finding that Mr. Iggulden had very few slugs this year, for last year and the year previous I was so troubled with slugs that they ate nearly all my Scarlet Runners as soon as they came up, cleared off my seed bed of Brussels Sprouts, and finished by devouring any autumn planted Cabbages. This year they have done me no damage, and I have seen very few indeed, and this I attribute to the dry time in April and May, when, I think, the black-birds looked them up very closely.

Noble was my earliest Strawberry, and Oxonian my latest. To-day (August 1st) I had a good picking of the latter, and I shall certainly have one more dish. They are not planted on a north border, but with a southern aspect, so I consider it a very useful late variety. I had the plants from Mr. Gilbert, who, I believe, maintains that it is distinct from Eleanor, and I fancy he is right, although I must own I have not grown them side by side. Mr. Laxton kindly favoured me with a few plants of his Latest of All, but as they were rather weak I pinched out the trusses, so have not yet had the pleasure of fruiting them. For earliness and beauty of fruit combined with cropping qualities there is no Strawberry in the same street with Noble.—H. S. EASTY.

#### ROSE SOUVENIR DE LA MALMAISON.

THIS has long been a great favourite of mine, as I have frequently testified in the pages of the *Journal of Horticulture*, and it undoubtedly ranks among the most serviceable Roses grown. It flowers freely enough at the commencement of the season, but it is during August and up till the time severe frosts intervene that its good qualities are most apparent. The successional blooms, in addition to being very numerous, are of better form and colour than the earlier ones, and particularly durable in a cut state. It ought to be grown on its own roots, and the strong suckers thrown up branch and flower even more freely than do those of Tea Roses. By far the finest beds of the old Souvenir I have yet met with are to be seen in the pleasure grounds connected with Wilton House, near Salisbury. The plants are all on their own roots, and in the best health possible. In a few days the beds will again be in full flower, and must form an attractive feature in a generally beautiful and well kept place.—W.

#### ROSES AT THE RIPLEY (DERBY) HORTICULTURAL SHOW.

THE seventh annual Exhibition of the Ripley Co-operative Horticultural Society was held on Saturday, August 2nd. There was a good display of flowers and vegetables in the amateurs' and cottagers' classes, Stocks especially being largely and well shown. Roses formed the chief feature of the Exhibition, the quality of the blooms being very good. In the open class, for thirty-six varieties, the first prize was awarded to the Rev. J. H. Pemberton of Havering, Essex, whose best blooms were Her Majesty, Madame Joseph Desbois, Madame Eugène Verdier, Marshall P. Wilder, Horace Vernet, Prosper Laugier, Comtesse de Camondo, and Rosieriste Jacobs. Mr. H. Merryweather of Southwell was a close

second with a bright and fresh collection, Mr. Burch of Peterborough being a good third. Fourth, Mr. Frettingham of Nottingham. The other competitors in this class were Mr. Lowe of Derby and Messrs. Harkness of Bedale: the last-named was exhibiting at Liverpool on the same day. For twenty-four Roses (amateurs), the first prize was awarded to Mr. W. Boyes of Derby, whose Roses were young and of good colour. Second, the Rev. J. H. Pemberton; third, Mr. H. V. Machin of Worksop; fourth, Mr. Whittle of Leicester. For twelve Roses (local class), first, Mr. Alfred Elliott; second, Mr. S. Hawkins; third, Mr. D. Judge; and fourth, Mr. H. Hill.

#### GARDENERS' ORPHAN FUND.

##### PROPOSED MEMORIAL TO THE LATE MR. GEORGE DEAL.

AT the annual general meeting of the supporters of this Institution, held at the Cannon Street Hotel, on Friday, July 18th, it was unanimously resolved to specially commemorate the services rendered to the Fund by the late Chairman of the Executive Committee, by granting the benefits of the Fund to the seven orphan children who had that day failed to secure election.

To enable the Committee to put these seven children on the Fund the sum of £598 is required, and the Chairman (Mr. Sherwood), on behalf of Mr. Harry J. Veitch and himself, made the munificent offer that if a minimum sum of £250 was raised among the subscribers they would jointly undertake to provide the remainder.

At the annual dinner the Chairman (Mr. Shirley Hibberd) strongly urged that the most generous offer of Mr. Sherwood and Mr. Veitch should be promptly and heartily acknowledged by a special effort to raise the sum required in order to pay a graceful tribute to the memory of their late friend.

The appeal thus made was readily responded to, among other subscriptions announced being:—

The Committee acknowledge with gratitude the hearty manner in which the proposition to found a "George Deal Memorial" has been received, and heartily appeal to the many whom the Committee feel there are who would like to subscribe to this tribute of respect to the memory of Mr. Deal to send their contributions at once to the Honorary Secretary—A. F. BARRON, *Royal Horticultural Society, Chiswick.*

#### DOUBLE ANNUAL CHRYSANTHEMUMS.

OF these there have long been plenty in the varietal forms of Chrysanthemum coronarium, and a gay effect they produce in gardens, continuing growing and flowering till destroyed by frost. We have also seen semi-double varieties of C. carinatum, or tricolor, but not any equal in form and colours to specimens that have been sent to us by Messrs. Hurst & Sons, wholesale seed merchants of 152, Houndsditch. These were so striking that we have had a few of the best of them engraved, with a charming white flower for contrast. The most remarkable flower had a perfectly full crimson centre, and bright clear yellow guard florets. Several were bronzy yellow, the florets edged with red; others were in two shades of crimson. Some were white with pink centres, others lilac and rose, the imbricated ray florets being pencilled like the feathers of a bird. Some of the flowers were irregular, but others were as perfect as the best Asters or double Zinnias.

Having in view the sportive nature of the plants and the difficulty of fixing individual varieties, we understand it is intended to divide

them into two groups—bronze yellow, and lilac rose—and distribute the seed in mixture. This will afford various growers opportunities for

single forms of this fine composite are beautiful both in borders and pots, and the doubles will probably become as familiar companion plants

FIG. 19.—CHRYSANTHEMUM CARINATUM FLORE-PLENO.

selecting and improving, and if they obtain a fair per-centage equal to those figured, they will add a feature of interest to their gardens. The

as are the double varieties of Zinnias and Pyrethrums with their single progenitors.

## SALT AS A GARDEN MANURE.

SALT as a manure has long been applied to garden and farm crops. Its principal use, however, in gardens has been in the destruction of weeds, for it is well known that in large quantity it is destructive to vegetable life; hence it is employed for scattering over walks, or they are watered with a strong solution of salt, to destroy the weeds and moss appearing on them. On the other hand, in moderate quantities its application is attended with very satisfactory results; for, as remarked by Mr. Johnson in the "Science and Practice of Gardening," page 119, "The day has long passed when it was disputed whether saline bodies are promotive of vegetable growth," and the same author continues—"It is now determined that some plants will not even live without the means of procuring certain salts."

Although salt, or saline matter, enters the composition of all plants, it is evident, from the experiments made by Dr. Voelcker, that the application of a quantity of salt which proves beneficial to one kind of plant will be injurious to another. This he demonstrated by watering plants with water holding varied proportions of salt, and it is a remarkable fact that to most of the crops of the horticulturist even in very strong solutions it did not prove injurious. Even at the rate of twenty-four grains to a pint it "decidedly benefited Radishes, Onions, Lentils, and Cabbages," but "plants of *Anthoxanthum odoratum* (Sweet Vernal Grass) were killed by a solution containing twenty-four grains of salt per pint, after the lapse of one month." "Grasses are affected by salt more readily than any of the plants experimented upon." We may, therefore, conclude that salt in a certain quantity is beneficial to most vegetable crops, for we have Radishes or Raphanæ, Crambe (Seakale), Brassica, including Cauliflower, Broccoli, Borecole, and Turnips; Liliaceæ, including Onions, Leeks, and Asparagus, and, I may add, many of our most beautiful bulbous plants, and those with succulent leaves. Dr. Voelcker remarks, "Bulbous plants and plants with succulent leaves are especially benefited by the application of salt;" also Lentils, Peas, and Beans, and may we not safely conclude all the other Leguminosæ, or pod-bearers, as the Dwarf Kidney Bean and Scarlet Runner? Dr. Voelcker mentions the Thistle as being benefited by salt, and we may consider the Globe Artichoke and Cardoon to be equally so. Mr. Johnson completes the list on the authority of Saussure—viz., Beetroot, Rhubarb, Potatoes, Jerusalem Artichoke, Carrot, probably also the Parsnip and Celery, as these two belong to the same natural order, so that salt is beneficial to every kind of vegetable crop.

Of the value of salt there can be no doubt. In fact, from its application I have come to the conclusion that to the gardener it is one of the most valuable of manures. I have come to regard it as not only valuable, or, as stated by Mr. Thompson in "The Gardener's Assistant," page 121, "a necessary addition to the soil wherever marine plants, or such as naturally grow near the sea, are cultivated;" but to all, except it be Grasses; and even to these in small quantities, or less than for other plants, it is very beneficial. For some fruit trees it seems not to be so desirable as for others—for instance, the Apricot, Apple, and Cherry; but the Peach, the Pear, and the Plum are benefited by it. I need say no more respecting its value, but will proceed to its application, of which there are several modes, but I shall only name two—namely, alone and mixed with other substances.

*Salt Applied Alone.*—As a top-dressing salt may be applied to every kind of kitchen garden crop at the rate of ten bushels per acre, or half a gallon per rod. It may be given at the time of sowing, putting in, or planting the crop, but I consider it most advantageously applied when crops from seed have arrived at the thinning stage; to "put-in" crops, as Potatoes and Jerusalem Artichokes, it may be applied when they are well above ground, and before the first hoeing; to planted crops as soon as they are again rooted. Ten bushels per acre I think a sufficient quantity for a general dressing. Some crops will bear much more salt than the quantity named; for instance, Asparagus is not overdone at 1 lb. per square yard, or 43 cwt. per acre, and the best time to apply it is when the heads are appearing, and again early in May.

Cabbages may have repeated applications of salt, and so may most of the Cabbage tribe. Cabbages planted in September to stand the winter may in October be dressed, and again in March; Broccoli and Winter Greens after planting, and in October or early in November; whilst for most other members of the same family one application will be sufficient.

The value of salt as a manure may be esteemed principally from its entering into the composition of plants; but it possesses other values—one being that it is destructive to predatory vermin, such as slugs, and is found serviceable against grubs in Turnips, and club or ambury in the other representatives of the Cabbageworts. It has also another most valuable property—that of protecting plants

from injury by cold, or as it is stated in the "Science and Practice of Gardening," page 144, it protects "plants from suffering by sudden reductions of temperature by entering into their system, stimulating and rendering them more vigorous, impregnating their sap, and consequently rendering it less liable to be congealed." There can be no doubt of salt being advantageously used for plants of a succulent nature, such being liable to suffer in case of sudden reduction of temperature.

*Salt Mixed with Other Substances.*—This, I believe, is the most satisfactory method, for all soils require to be constituted of several ingredients for the production of healthy plants. Gardens long enriched with stable or farmyard manure in time become sick or worn out. Lime dressings have been advised, and are indeed very beneficial, often more so than dressings of stable manure. "When caustic lime or, as it is more commonly called, quicklime is added to a soil, it decomposes the salts of ammonia which the soil contains, driving off the ammonia, but which is absorbed and retained by the alumina in the soil. Caustic lime also promotes the rapid decay of vegetable and animal bodies in the soil"—(Science and Practice of Gardening, page 85). It has also been recommended to give dressings of fresh or maiden loam to long-cropped vegetable ground, choosing soil from a pasture, thus giving those very constituents which have been absorbed or taken up from the ground by every vegetable—viz, saline matters, and which are present in the maiden loam more than in old garden soil, because Grasses do not take up saline substances to nearly the same extent as do garden crops. Fresh soil mixed with old causes a change in the products; it gives to old soil an addition of one or other substance required by vegetable crops, for it cannot be that fresh loam is richer, as without manure it will not grow many vegetables to a fitting condition; therefore it is not in the fibres of the Grass about which so much is insisted, but in supplying those compounds of which the soil has been deprived by a continued course of vegetable crops, and those compounds are principally saline.

Lime does good, but it is known that "when salt is mixed with moist earth and lime a considerable quantity of carbonate of soda and chloride of calcium is produced, owing to the salt being partially decomposed, the chlorine of a part of the salt uniting with the lime, whilst carbonic acid supplies its place, forming carbonate of soda. This having the property of combining with silica and rendering it soluble may prove beneficial to plants by supplying them with that essential article of their food"—(Gardener's Assistant, page 121). Now, if we dress ground for Onions, one part with lime, another with salt, and a third with soot, the ground having in autumn been manured in the usual way, we find there is little, if any, difference between that limed and the part sown without the lime dressing—the produce is not materially greater; but that dressed with salt produces more than the limed part, and the parts dressed with soot more still. This would show soot to be the most fertilising of the three, but in none of these cases is the dressing so good as when the whole are mixed—that is, the lime, salt, and soot, which afford much the better crop of Onions. A bushel of lime, soot, and salt mixed and sown broadcast over the ground intended for Onions and Carrots prior to putting in the seeds is good against the maggot or grub which infests these vegetables, and is sufficiently stimulating. It is also an excellent dressing for ground in March intended to be planted with every kind of vegetable crop. It is valuable both as a manure and as a preventive and destroyer of insect pests.

Everyone knows the value of guano as a manure. It is considered to contain most, if not all, the constituents required by vegetables. I am persuaded, however, though it may be highly fertilising, that it is not so beneficial by itself as when mixed with salt, one of the inorganic elements that in guano is reckoned of very inferior value. In some guanos there is a considerable quantity of lumps, consisting for the most part of common salt (chloride of sodium). In the best samples of guano the chloride of sodium is about 3.00; of a sample consisting of hard lumps the chloride of sodium has been found as much as 49.70. Ordinary samples of Peruvian guano contain 5.00 of alkaline salts, potash, and soda. This quantity may be sufficient for cereals, but there is evidently not enough salt for kitchen garden crops, for I find crops dressed with guano alone do not produce so well as those dressed with one part salt to two parts guano, and at that rate 1 cwt. of salt to 2 cwt. of guano answers for every description of vegetable, but it should not be given in dry weather, for all the leaves upon which it falls it scalds or leaves a white blotch upon.

I may name a few of the cases in which I have found it most beneficial, though it answers well in all.

1, I had some beds of Onions, Carrots, and Parsnips on a plot of old garden ground, well trenched and in good heart. They were at a complete standstill, and grub already at work, making frequent wide gaps. They were dressed with the mixed guano and salt, about a peck to every two beds, each 4 feet wide and 40 feet long. This was previous to prospects of rain, and it fell as was anti-

culated. The grub was seen no more, the Onions, the Carrots, and Parsnips were good. Without the dressing there was no hope of a crop.

2, I had 1500 Celery plants on a plot of ground added to the garden the previous year; it is the virgin loam so much prized. The trenches were well manured. The Celery grew for a time, but afterwards came to a standstill. Guano alone was applied, but it did not improve anything but the colour of the plants; at last they were heavily dressed with the guano mixed with salt, and the Celery grew well. I had a like number of plants on old ground, and they grew well from the first, and were dressed with guano mixed with salt. I contrived to give it so as to keep it from the hearts.

3, Club, ambury, and all the grubs seemed to combine to prevent my Cabbages hearting, Cauliflowers heading, or Turnips forming. They were dressed with the guano and salt, and they reared their heads and were soon quite free of any grubs or pest of any kind.

Lastly, in a greenhouse I had some climbers in a border; they seemed to grow and flower finely up to June, when they came to a standstill. They were Passifloras and Tacsonias. Guano water, &c., had no beneficial effect, but I gave them about a peck of guano and salt broadcast over the border (30 feet by 3 feet), and then washed it out of sight with water from a hose. The effect was all that could be wished.

I am convinced that guano and salt in the proportions named will prove good for Vines, especially those that have a tendency to mildew; also for Peaches, which never do so well as near the sea or within reach of its influence. It will also be good for all plants subject to mildew. Salt and lime are the most destructive of all to fungoid life.

Ferns are speedily destroyed by guano and salt, but it is remarkable that if freestone be sprinkled with it that the stone in a few days becomes quite green from the growth of moss; hence it may be of value in newly formed rockwork.—G.

## CULTIVATION OF HEATHS.

SEVERAL correspondents have requested some information respecting Heaths, and we therefore give the following notes from an experienced cultivator, who has secured a large measure of success with these plants:—

Heaths are reputedly difficult to cultivate, but happily there are some species which will stand a greater amount of rough treatment than others, and it is always advisable for beginners to ascertain which they are, and commence operations with them. *Erica gracilis* is very useful for flowering in the autumn, winter, and spring, there being two varieties—one called *autumnalis*, the other *vernalis*. I have had the first in flower from October to February, and the latter from February till April. The flowers are small, but come in abundance, and are of a bright pink colour, and highly ornamental at a time of the year when flowers are somewhat scarce. This I have found to be of the easiest culture, and also readily propagated, as it strikes very easily from cuttings, which cannot be said of some sorts. But more of propagation presently. *E. hyemalis* is another sort that I consider easy to grow, and a very pretty kind, but it does not last in bloom so long a time as *gracilis*. I have had it regularly in bloom from November until February, so that I may consider it truly a winter-flowering sort. *E. colorans* I have usually in bloom about the same time. It lasts in bloom rather longer than *hyemalis*, is more erect in habit, and not quite so free in growth. The flowers are nearly white at first, but change to a reddish-pink when past their best. *E. mammosa pallida* I have generally had in flower late in the autumn. *E. cerinthoides* has often flowered with me in the winter. *E. Willmoreana* is a spring-flowering sort, and a very strong grower. These are what I have found to be free growers, and such as I believe are suitable to begin with, supposing anyone wished to begin cultivating Heaths. The treatment I have usually given them is very simple—merely cutting them down after flowering, and standing them out of doors in May, fully exposed to sun, wind, and rain, housing them in September, and giving them ordinary greenhouse treatment from that time until the beginning of May.

But this treatment will not do for most Heaths. *E. caffra*, for instance, is winter flowering, at least so I have found it; but it is of a more delicate constitution, and will not stand the rough treatment described. *E. mutabilis* I have in bloom the whole year round; but this also requires careful management, but the treatment of these is the same as what is necessary for what I call the choice varieties; and as I intend to give the details of my own method of treating them I will here merely remark that the time of flowering with certain varieties varies much, and that variation depends considerably on the treatment, but sometimes on the

season. *E. fastigiata*, *E. lutescens*, and *E. Vernoni* have flowered with me this season in March and April. The latter is now in full bloom, being the second flowering this season. *E. vestita coccinea* I have usually known to flower in the spring, but this season I have seen it flowering in August. This variation in the time of flowering frequently happens, but a good grower can generally keep them to the proper season. What I consider to be the better Heaths are mostly summer flowering, and are often grown for exhibition; but at present I will merely name such as are my own favourites, and what I have had to deal with.

*E. ampullacea major*, compact growing, flowers in July and August; the flowers of a light colour, changing to a reddish hue as they pass their best. This is a characteristic of several others, if not most light coloured ones. *E. Cavendishiana*.—A close compact grower of fine habit and foliage, with deep yellow flowers, which open in May and June. This is a general favourite. *E. eximia*.—One of the very best; a close compact grower, first-rate habit, and exquisite in the form and colour of its flowers, and usually lasts in bloom a long time. Flowers in June and July. *E. Hartnelli*.—Flowers about the same time as the last; flowers fine and full, not quite so full and free in habit as the above-named, but good for exhibition. *E. jasminiflora alba*.—Rather free in habit; one of the best white ones. Flowers same time as the last. *E. Massoni*.—This I like as well as any Heath grown, both from its habit of growth—the shoots always putting me in mind of the ascent of a rocket—and also on account of its fine flowers, which it produces in June and July. *E. metulæflora bicolor*.—Another favourite, which, when well grown and flowered, is second to none for beauty; but it is not quite so profuse a bloomer as some—at least, so I have found it. Flowers in June and July. *E. retorta major*.—A most profuse bloomer, of excellent habit, compact, and free, hanging over the sides of the pot, and flowering at every point. June and July. *E. tricolor rubra*.—A good sort, as it shows up the flowers well; but rather spare than otherwise in habit. *E. tricolor Wilsoni*.—Good both in flowers and habit. These flower in June, July, and August, consequently are good to grow for exhibition.

The above are known to Heath growers as good sorts, and there are others equally good; but what I have named would be a good selection though a small one, and it is always advisable to begin with a few, as before said. Those who have had little to do with this genus had better use a little caution and begin with the strong-growing *Ericas*, for after a little practice with such they will acquire a certain amount of confidence that may soon enable them to handle choicer kinds, it being a consideration that while a small plant of *gracilis* may be bought at a nursery for 1s., a plant the same size of *Massoni* would most likely cost 5s., perhaps more.

Most growers differ on several minor points of detail. Almost every Heath grower has his own peculiar ways and opinions, and I will confess that I have mine; but then nothing suits me better than to learn the exact methods of other growers, so that, if I find their ways better than mine, I gladly adopt them. My object in penning these notes is simply with the idea that others may like to learn from my practice as much as I should like to learn from theirs; I will therefore give my experience in detail, and begin first with

### SOIL.

When in the neighbourhood of London I have used a peculiar kind of peat or heath soil such as I have not seen elsewhere. This peat, with the addition of a little more silver sand than it naturally contained, made a most perfect soil for Heaths, and they were sure to thrive in it; but then this peat may not be obtainable everywhere, so that we must do what we can with the best within reach. Peat earth of some kind it must be, but the more fibry the better—just the mere turf pared off if possible; the tougher it is and the harder to chop up the better. But even fibry peat may not be at hand, and then, when it is for growing the choicer sorts of Heaths, great care is necessary, and I will just explain how I bring it into a condition that I can trust the roots of Heaths in it. I first chop it up with a spade, and then rub it through a sieve. The latter operation is not necessary, but I prefer doing it for the sake of the rougher fibre, which I consider an important ingredient in the drainage; if white moss can be obtained that will answer the purpose, and the peat need not be sifted. Whether sifted or not sand must be added; I add about a third of silver sand. If silver sand is not to be had drift sand or any other sand may be used; but it should be well washed of all earthy matter. The way I have done this is to nearly fill a pail or bucket with sand, fill up with water, stir well, pour off the water, add more, repeat the process until the water runs off clear, then dry the sand, and it is ready to be well incorporated with the peat. Peat itself without sand, or with very little, is a very unsuitable soil for putting any plant in. When wet it soon turns sour, and if it once becomes thoroughly dry it is difficult to make it properly moist again. Plenty of sand

mixed with it makes it both porous and absorbent. Any kind of well-washed sand will accomplish this object, and will do provided there is no pernicious quality in it. Silver sand, however, is best, and even if another kind of sand is used it is still advisable to mix some of this with the soil, since it is said that the Heath derives its silica from it; it therefore supplies an article of food. But, in addition to sand, I invariably mix with the peat a large quantity of broken pots. This I consider most useful, for it makes the soil still more porous and absorbent, and there is little chance of the soil becoming sour. The soil when ready for potting is about one-half peat, the other half equal portions of sand and broken pots.

#### POTTING.

This requires a little care and skill, for much of the success depends on it; indeed, so much so that I can scarcely consider a plant under control unless I know how it has been potted. In the first place the pot should be thoroughly clean, and just dry enough to show no moisture on it. If too dry it is apt to absorb the moisture from the soil. The plant about to be potted should be just nicely moist, neither more nor less so than the soil to be used in potting. The pots should be neatly drained, and this does not depend on the quantity of drainage, but on its arrangement. I generally first put a crock over the hole, convex side upwards. I quite agree that it is a good plan to place it convex side downwards in order to keep worms out of the pot, but I never like placing Heaths where worms have a chance of getting in. Round this I place pieces rather smaller, and cover with crocks broken smaller still, but not fine, over this a thin layer of peat fibre, then a little soil. It is then ready for the plant, which should be placed at the proper height, simply taking care not to bury the collar, and to leave room for water. I generally use a blunted stick to press the soil together, but take care that it is merely rendered solid and not hard.

#### WATERING.

Supplying water at the right time and in a proper manner I consider essential to the successful culture of Heaths; but then if the plants are potted with the soil and in the manner I have described, there is less chance of giving them too much or too little. The soil absorbs a certain amount of water, the rest drains away, and what the soil retains will never stagnate, for a healthy plant will gradually appropriate it; and if by chance water should be withheld until the soil becomes dry, its free open nature will soon allow it to percolate through. A Heath seldom requires water immediately after potting, and sometimes it may remain a week or two, supposing it to be in the winter, for I follow no rule as regards the time of the year in potting; but when a plant is watered for the first time after potting, it should be done thoroughly, so as to wet the mass of soil through, and this cannot very well be done without filling up the pot three or four times. This is invariably my practice, for I find that if the soil is not properly moistened at the first watering after potting, it never becomes so afterwards, and plants have often died in consequence. After this, when the plants want water, filling up once will be sufficient. A practised eye can tell at once when a plant wants water; but few good growers ever trust their eyes only, but generally ring the pot and feel the soil in addition. At the first watering after potting I generally use a fine rose, but afterwards merely pour the water on the soil from the spout of the watering-pot. During the summer, and while in flower, Heaths require a great deal of water; but in the winter, and while at rest, they may be allowed to become all but dust dry, for a Heath may appear very dry, and even flag, when a watering will cause it to expand and pick up again; but when a plant shows signs of distress from over-watering, it is mostly in a dying state, and will be hard to recover, even if that be possible. There is little fear of over-watering provided the soil is free and open, and the drainage perfect.

#### SUMMER TREATMENT.

About the beginning of May, the more hardy sorts, as *gracilis* and *Willmoreana*, may be set entirely out of doors, if the soil is free, and the drainage good, and they are placed on a good bed of ashes, on boards, or bricks, or in any way so that worms cannot get into the pots, and they will take no hurt until about Michaelmas if they are merely watered as required. But for choicer sorts no place can be better than a brick-built pit, having a good slope or pitch to prevent the possibility of drip from the glass. Draw the lights entirely off on all favourable occasions, putting them on in wet weather and on bright sunny days, and adding a slight shade, but tilt the lights at the side, and keep neither lights nor shades on longer than is necessary to protect from rain or too bright sunshine. Heaths are sometimes stood in a shady place without covering. In this case they must be turned on their sides, should heavy rains occur; but if left too long in that position they are apt to turn the points of the shoots upwards, which puts them out of shape.

In my younger days I have been called up in the middle of the night to turn down a lot of specimen Heaths, and other plants. This is no joke; and although I would rather do it now than allow favourite plants to become injured or killed, still I would rather evade the necessity of doing so, or of giving others the trouble, by putting the plants in a place where they would be safe from injury from drenching rains. In places where there are plenty of hands to run and shut up pits, frames, &c., or turn down plants, there is less chance of accident; but in most places this is not the case, and it becomes necessary to avoid such running about, which breaks into the day's work more than lookers-on would suppose. And if plants are to be kept under cover, it must be where they can have fresh air night and day, and not be overhung by other plants.

#### WINTER TREATMENT.

When housed about Michaelmas, supposing the plants to have been freely exposed, care should be taken to give them all the fresh air that can be admitted to them, for under no circumstances will they thrive and do well in a close or confined atmosphere. Keep them cool, and rather dry than otherwise, and never attempt to hurry them into growth. I should have said that after about the middle of August, the more sun the plants have the better, as this will harden the wood and induce them to flower better. In the autumn and winter mildew sometimes attacks the Heath, but rarely have I had plants troubled with it, as good drainage, a free open soil, and plenty of exposure to the air, will prevent it, and if it has made its appearance a dusting of sulphur will cure it. Heaths are also sometimes infested with scale, but this is only when they become pot-bound, or are crowded too much in the wood, or are placed too closely together. This pest is difficult to eradicate if it happen to get ahead, but strong soapy water rubbed on with a sponge or soft brush will destroy the insects. Some of the softer-wooded kinds are sometimes troubled with green fly, which is easily destroyed by fumigation. But, generally speaking, Heaths are very clean in their growth, and if kept in good condition will give the cultivator very little trouble as regards pests of any kind. This I consider a great recommendation to their cultivation.

#### TRAINING.

The training of Heaths not only requires both skill and judgment, but it is an art acquired only by practice. A well-grown and well-trained Heath is one of the most beautiful productions of the plant department that can well be conceived. To grow and train one as it should be requires no mean display of skilful handling. There should be few sticks, and those thin and tapering, and painted green to match the foliage. The bast matting should be good, and used very thin. I greatly dislike using thread, as some make a practice of doing. The shoots should be trained-in at regular distances, at the same time giving the whole plant a natural and easy appearance. But those who know how to train a Heath will not want telling, and those who do not will learn more by practice than from description. Men who have to use heavy tools can seldom train these plants well, and this is often exemplified in the specimens produced in many places, and which exhibit a countless host of sticks, and an appearance the opposite of easy or graceful. A Heath to look well should have the pot proportioned to the size of the plant, and be trained in such a manner that the eye is not attracted by the sticks.

#### PROPAGATION.

The propagation of Heaths is not generally a part of the duties of the gardener, indeed very few can spare the time necessary, or have a suitable place in which to strike these plants. Propagators of Heaths and other hardwooded plants must undergo a certain training in order to qualify them for the work, and when they become competent they generally command good wages. Propagating such plants is an art, and, according to the division of labour it should be left to those who have studied the art, and certainly those who are unacquainted with it must not suppose it is equivalent to striking cuttings of bedding-out plants. Some kinds of Heaths will take from six to nine months from the time of inserting the cuttings till these become rooted, and some hardwooded plants will take twelve months, and all this time they require daily attention in wiping the glasses and shading. I simply mention this, so that those who may be unacquainted with the process may be prepared for what they have to do should they make the attempt. I have struck various Heaths more for amusement than anything else, and in five years' time have had plants which I consider repaid all the time and attention they required. "This is a long time to wait," many will say. True, but then the time comes at last, and it must be remembered that there are propagators now engaged in striking Heaths that in three or four years' time will make small flowering plants. The process I have followed is to fill two or three pots of a suitable size about

three parts full of drainage broken rather small, then a layer of peat fibre, then a mixture of peat and silver sand, then half an inch of well-washed silver sand, the whole well watered. The cuttings are small shoots about an inch long, taken as near the collar of the plant as possible and the lower leaves stripped off. They are dibbed into the sand with a very small dibber, and a little water is allowed to drip on them to settle the sand about them. A bellglass is then put over them, and they are set in a shady part of a warm greenhouse; no sun is allowed to shine on them, and the inside of the glass is wiped every day.—F. C.

#### BUD FORMATION.

PLANTS of Chrysanthemums grown by the method most generally practised for the production of large blooms are this season forming their flower buds in a somewhat irregular manner. In a general way cuttings that were struck from the end of November until the middle of January make the first, or natural "break," from the beginning of May until the middle of June, according to the variety and the time the cuttings were inserted. Some sorts make this first break at 1 foot high, while others will not start into additional growth until the stem is 4 feet high, so variable is the manner of growth in different varieties. When what are known as "crown" buds form at the right time they invariably produce the best blooms, although they may not always be suitable for every person alike, and available just at the time required for any particular date. It is an utter impossibility to lay down rules for bud formation which will suit every person and district. Experience will teach individuals what modification is necessary from the general principles in their own case. The subject of bud selection requires more study than does any other phase in the culture of the plants.

From complaints by growers in different parts of the country of late I find there is a great disposition of plants to set their buds this season at what I will call awkward dates. The Queen family appears to be giving the greatest trouble in this respect. The cause of this premature formation of flower buds is no doubt due to the excessive heat experienced during the latter half of the month of May. On six successive days here the thermometer registered 80° and over. This great heat coming at a time when the plants were in 5½-inch pots, and many of them full of roots, would conduce to premature bud formation instead of free growth. I never remember seeing plants which have made so many flower buds nor lost so many of their bottom leaves as I have witnessed this season. This will cause some anxiety to growers regarding the selection of the best buds for their purpose in the various districts. My advice to those persons is not to be in too great a hurry to secure the buds, especially of early flowering varieties, but where the plants appear to be stunted and very much lacking vigour and freedom of growth, to apply some quick acting stimulant to push them on to the next bud. There is nothing better for the purpose than nitrate of soda, which is very quick in its effect; but if there is any doubt about a scarcity of roots in the pots, the soda should not be applied, as the stimulant would do more harm than good. There ought, however, to be scarcely any plants now lacking in root action, and if there be, the results next November cannot reasonably be expected to be very satisfactory.

There are two ways of applying nitrate of soda—in the dry state and in the form of liquid manure. If the former plan is chosen, a small portion of soil, loam, and leaves, in about equal parts, should be laid on the surface soil in the pot, pressing it down firmly. Into this the surface roots will run, and prove advantageous in receiving other supplies of stimulative food later on. On the added soil sprinkle finely ground nitrate of soda, half a teaspoonful to each plant, afterwards watering it in with clear water. The object of first placing the soil over the roots is to prevent their being killed by direct contact with the nitrate of soda. By dissolving half an ounce of nitrate in one gallon of clear water the stimulant can be safely applied by those who prefer to use it in this way. Before mixing with the water in bulk the soda should be dissolved thoroughly in a smaller portion of water, which may be warm for convenience, before adding to the bulk to be used. This stimulant will expedite the growth of both stems and leaves, and will render these plants in a better condition to receive other support later on, when the flower buds have set and are swelling evenly.

Some varieties, such as Boule d'Or and some other naturally late-flowering sorts, are forming their buds now in a regular manner. These, which require a long season of growth, must be "taken" as fast as they form, as if they were to be rejected, and the next buds waited for, the blooms in November would not only be too late but inferior in quality. Early-flowering sorts, if "taken" now, would lose much of their freshness before the time required in November; also the colour of the petals is very much paler than from later-chosen buds; and as colour in the flowers is an important point to study, in close com-

petition especially, it behoves exhibitors to obtain the best possible shades of it in the respective kinds.—E. MOLYNEUX.

#### CLASSES WANTED FOR AMATEURS.

I WRITE a few lines on what I think shows the unfairness of Chrysanthemum Show schedules to amateurs. In all the schedules I have seen the classes for cut blooms are divided into two divisions only, one "open" and the other limited to growers within a certain radius. This leaves the amateur no resource but to oppose big growers who have five or six times the number of plants that he has. If there were classes for persons who employed only one gardener, I think it would be better. I grow about a hundred Japanese for exhibition, but I cannot see a chance of getting in anywhere without going in the open classes, which I think is unfair, as I have to work all day at my trade. It is very expensive growing specimen blooms, and I for one shall have to give it up unless I can see some small chance of recouping myself.—NOVICE.

#### ALEXANDER PEACH.

I WAS very much pleased in reading Mr. J. Austen's remarks respecting this early Peach, page 93, and can fully endorse all that he says respecting it. Here we grow many Peaches and Nectarines of all the best sorts, both early and late, but do not force any, and Alexander is always ready to gather about the second week in July. It is highly coloured and good flavoured, and the tree is a heavy cropper. Alexander is earlier by a fortnight than any other Peach that I am acquainted with. It has often surprised me that it is not more frequently mentioned in gardening journals; and when looking over gentlemen's gardens I seldom, if ever, see it—at least, not in this neighbourhood. I feel sure that those who give this Peach a trial will be highly satisfied with it.—W. SHEPHERD, *Grenhurst Gardens, Capel, Dorking.*

OUR outside walls are not well furnished with Peach trees, nor does the fruit ripen so early as the position of the garden might justify us in anticipating. We shall not gather Hale's Early much before the middle of August. We are thus comparatively late with Peaches, as I saw ripe fruit of Early Beatrice in a Kentish garden on July 20th, and at Wilton House Mr. Challis was gathering fine fruit of Early Alexander at much the same time, Hale's Early and Early Beatrice being from a week to ten days later. At Witley Court, Stourport, Mr. Austen began gathering handsome fruit of Early Alexander on July 15th. Nurserymen, whether purposely or not, are in the habit of supplying Alexandra Noblesse for the Early Alexander, one being totally distinct from the other. No less than four instances of this unfortunate practice have come under my notice, and in each case great disappointment was expressed. Alexandra Noblesse is undoubtedly an improvement on the good old Noblesse, but it is far from being an early variety, and those who plant a tree under the impression that they will eventually be rewarded with richly coloured early fruit are to be condoled with in their deception.—W. I.

[We much regret to learn of the practice indicated, and trust it will cease, for the two Peaches are wholly dissimilar.]

#### THE ECONOMIC USES OF LEAVES.

EVERY part of plants and trees is more or less utilised by savage and civilised men—the roots, stems, sap, bark, fruit and seeds, and leaves. If we take the foliage, apparently the most insignificant part of the plant, how dependent are we on these for food, clothing, medicine, dyes, stains and various comforts. In tropical countries especially the domestic uses of leaves are almost innumerable.

The leaves of many Palms are largely employed for making hats. Those best known are Panama hats, made from the finely plaited fibre of the leaves of a South American Screw Pine (*Carludovicia palmata*). The tree occurs only on the slopes of the Andes. About 200,000 dozens of these hats are made in Ecuador and different States of South America, and they are distinguished from all others by consisting only of a single piece and by their lightness and flexibility; they may be rolled up and put in the pocket without injury. The plaiting of the hats is very tedious and troublesome; the coarse ones may be finished in two or three days, but the fine ones take as many months to plait. They vary in price, according to fineness and quality, from five dollars to a hundred dollars. The unexpanded fronds of *Livistonia australis*, prepared by being immersed in boiling water, are dried, and the fibre thus obtained is much valued for the manufacture of hats in Australia, which much resemble the celebrated Panama hats.

The rough leaves of the Chumico (*Curatella americana*) and of *Davilla lucida* are used for cleaning iron and polishing and scouring wood. *Curatella alata* is used in the West Indies for polishing bows, sabres, &c.; and in Brazil *C. sambaiba* serves all the purposes of sand-paper to the Indians for polishing their blow-pipes and war clubs. The leaves of *Celtis orientalis* are used for polishing horns in the East Indies.

The foliage of *Guaiacum officinale* is frequently used in the West Indies to scour and whiten floors, which it is said to do better than soap. Leaves sewn together are much used in India as substitutes for the plates and dishes of more civilised life. It is not always poverty that leads natives to use them in preference to metal or porcelain articles as caste or custom has often some influence in the matter. The

leaves principally used are those of the Egyptian Lotus; those of the Banyan by Brahmans, and the Plantain leaf.

The leaves of *Bauhinia Vahlii* are used in the construction of the curious, rude leaf-bellows in Sikkim, with which the natives of the hills smelt iron. These leaves, when sewn together, are used as plates, cups, rough tablecloths, rain-hats and caps. The leaves are heart-shaped and above a foot in breadth, and the same in length. Sewn together with twigs, they also serve for baskets for holding pepper, turmeric and ginger, and are likewise used for thatching. Under the name of "Chattahs," a kind of umbrella-hat or sun-shade is made in the East of the leaves of the *Licuala peltata* and the Talipot Palm. These Chattah hats are much worn by the ploughmen and coolies of Bengal and Assam.

The large fan-shaped leaves of the Talipot Palm are, like those of the Palmyra Palm, carried over the heads of people of rank as an umbrella, and are also used for making books and for various domestic purposes. They are also cut up into neat bracelets, worn by Santal girls in India. Those of *Vanda Roxburghii*, split, are also worn by them as anklets. Those of another species, *Borassus aethiopicus*, occur as much as 12 feet across, and serve also for the manufacture of baskets, mats, ropes, and sieves. The leaves of *Nipa fruticans* attains a height of 15 to 20 feet, presenting a very handsome appearance, resembling the fronds of huge Ferns. This graceful eastern Palm is utilised in various ways, the principal being in the manufacture of thatching for house-roofs. This manufacture is quite an industry in itself, and affords employment to many natives, chiefly women, the men simply bringing cargoes of the fronds to the women, to be stitched with split rattans, and made up. Atap roofs are the best adapted for these climates, for while the winds are never strong enough to blow them away, they afford the coolest protection against the sun of any kind of roofing known.

The leaves of the Palmyra Palm were formerly used like paper, to write books on, and to this day they are applied to this purpose in Orissa, Southern India, and Ceylon, where an iron style is employed to write upon them; in Bengal young children use them to write the alphabet lessons on. They are largely employed for making pans, bags, winnows, hats, umbrellas, and for thatching, &c. The leaf takes a dye well, and is worked up in Madras into pretty coloured patterns in baskets and mats.

The slips of Talipot and other Palm leaves are coming into European commerce for the manufacture of ornamental braids, and in the construction of straw or Leghorn hats. The fibre obtained from the base of the leaves of the Chusan Palm is used by the Chinese for making hats and coarse clothing. The sale of Palm leaves for decorative purposes in the towns of Elche and Alicante, in Spain, produces a considerable income to the towns.

Kadjan mats, manufactured out of *Nipa* leaves, are indispensable for travelling purposes; packed up in the smallest compass when not required, each mat is capable of affording sufficient cover at night for two or three persons, either in boat or forest journeys. They also form, almost exclusively, the material for side walls and divisions in houses. The young leaf unfolded and dried, under the name of Roko, forms the favourite covering for cigarettes in the Malayan Peninsula in preference to paper.

The large leaves of the Teak tree are used for plates, for packing, and for thatching. The leaves of *Cordia myxa* are employed as plates in Pegu, and to cover Burmese cheroots. In Bangalore the leaves of *Canna indica* are used by the natives in lieu of plates to serve their millet puddings and other dishes on. The leaves of the Papaw tree are employed by the negroes in washing linen as a substitute for soap. They have also the property of rendering meat wrapped in them tender, owing to the alkaloid papain which they contain, and which acts as a solvent.

For cordage and other textile purposes, numberless leaves are used, and they serve very generally for packing and wrapping up small parcels in India. In Guiana, Tibisiri fibre is obtained from the inner surface of the spiral leaves of the Ita Palm (*Mauritia flexuosa*). It is used by the Indians for making hammocks, &c. The leaves are cut before they are open, and the midrib separated by drawing each division of the leaf through the finger and thumb. After drying, the fibre is ready for use without further preparation. About a quarter of a pound may be procured from each leaf, and if the central leaf is left uninjured, no evil effect is produced on the tree. Bags or matting could be cheaply and easily made from this fibre, as well as hats similar to those known as Panama.—(*American Gardeners' Monthly*).

## ROYAL HORTICULTURAL SOCIETY.

AUGUST 12TH.

SEVERAL very interesting plants, also imposing collections of flowers and important contributions of fruit furnished the tables of the Drill Hall on this occasion, but the attendance of Fellows was small, as is usual at this season of the year, when all who can do so appear inclined to "take their holidays."

FRUIT COMMITTEE.—Present: Sir C. W. Strickland, Bart., in the chair; and Messrs. John Lee, R. D. Blackmore, Harrison Weir, T. Francis Rivers, P. Crowley, G. W. Cummins, J. Cheal, G. Bunyard, W. Warren, W. Bates, G. Wythes, H. Balderson, F. Q. Lane, A. Watkins, and J. Wright. Mr. Barron announced that it had been decided that the Melon which was certificated at the last meeting under the provisional name of Barkham's Seedling should be *Advance*. The fruit was of distinctly superior

quality, and an advance on all others which had been placed before the Committee during the season.

Fruits of *Musa paradisaica* were sent by Mr. G. Wythes, Syon House, grown on plants from suckers planted in September last. They were large and well ripened, and a cultural commendation was awarded. It was not considered to be the true species, the fruits of which are larger and more slender than those exhibited. These, however, represented admirable culture, and were in excellent condition.

Mr. A. Lancaster, Holkham, Norfolk, sent two large and handsome fruits of a very pale green flesh Melon, grown and ripened without fire heat. They weighed 13 lbs., but the want of flavour did not justify any award. Mr. James Baldwin, Otterbourne, Hampshire, sent a "seedling" Pea, evidently a form of *Ne Plus Ultra*, and not equal to the true type of that fine old variety. Mr. A. Waterman, Preston Hall Gardens, Aylesford, sent very fine pods of the "Preston Hall" Scarlet Runner. The Committee recommended that the variety be grown at Chiswick, where a trial of Runner Beans was suggested as desirable.

Mr. S. Mortimer Rowledge, Fareham, sent splendid fruits of his *Express* Cucumber, and a first class certificate was unanimously awarded. It was the opinion of the Committee that more perfect Cucumbers had never been placed before them than the specimens in question. The variety is the result of a cross between Purley Park Hero and Tender and True.

Mr. T. T. MacGregor, Great Waltham, sent a good dish of Tomatoes, also a stem bearing bunches of fruit. He had found the variety profitable for market, as are many others, and no award was made. A splendid assortment of between twenty and thirty varieties were exhibited from Chiswick, and a cultural commendation was accorded to Mr. A. F. Barron. Messrs. T. Burton & Son, Erith Road, Bexley, sent eight boxes of splendid Peaches grown on the heavily cropped trees that were referred to on page 41 in our issue of the 17th ult. The varieties were Osprey, Princess of Wales, Sea Eagle, Albatross, and others. A fruiting branch with four large fruits in a length of 9 inches was also exhibited. A silver medal was unanimously recommended for this meritorious exhibit. Mr. W. Roupell sent from his garden at Streatham dishes of Irish Peach, Mr. Gladstone, Peter the Great, and Red Joanetting Apples—a most creditable display from a suburban garden. The fruits of Mr. Gladstone were highly coloured, and very favourable opinions were expressed on the comparatively new Apple Peter the Great. A vote of thanks was accorded.

Messrs. James Veitch & Sons exhibited a remarkable collection of Gooseberries, Currants, and early Apples from their fruit grounds at Langley. There were eighty dishes of Gooseberries, including choice small dessert and large exhibition varieties; fifteen dishes of Currants, ten of Apples, and a good dish of Jargonelle Plums. The most noticeable Apples were Early Harvest, Mr. Gladstone, Oslin, very fine; Irish Peach, and Lord Suffield. A silver-gilt medal was unanimously recommended for this interesting collection. Also unanimously, a silver medal was recommended for fifty dishes of remarkably fine Gooseberries, exhibited by Messrs. Paul & Son, Cheshunt.

FLORAL COMMITTEE—Present: Messrs. W. Marshall (in the chair), Henry Cannell, George Paul, Shirley Hibberd, H. Herbst, W. Goldring, W. C. Leach, G. Nicholson, H. B. May, Chas. Jeffries, Harry Turner, Edward Mawley, Rev. H. H. D'Ombraim, Wm. Kelway, John Fraser, and Dr. M. T. Masters.

The floral section was exceptionally strong and interesting, the hall being well filled with a variety of exhibits, comprising both garden and indoor plants, also abundance of cut flowers.

*Nepenthes Burkei excellens*, exhibited by Messrs. James Veitch and Sons, Royal Exotic Nursery, Chelsea, was awarded a first-class certificate, and an award of merit was granted to the same firm for *N. B. prolifica*, also for *Hydrangea hortensis* fl. pl. *Anthurium Le Flambeau*, *A. hybrida delicata*, *Begonia Marie Louise*, *Gymnogramma schizophylla erecta*, and a collection of *Rhododendrons javanico-jasminiflorum* hybrids were also shown by Messrs. Veitch.

Mr. A. Wipf, gardener to N. Clayton, Esq., East Cliffe, Lincoln, sent three very fine plants of hybrid *Sarracenia*s, one named *S. Claytoni*, raised from *S. Drummondii* alba and *S. Chelsoni*, received an award of merit. A large plant from the reverse cross had three dozen very fine and well coloured pitchers. This plant was considered by many to be worthy of some recognition. A cultural commendation was awarded for two fine spikes of *Hedychium Gardnerianum* from Messrs. J. Carter and Co., and an award of merit for *Petunia Holborn Blue* (*Clematis* section), the flowers resembling *Clematis Jackmani*. A bronze Banksian medal was awarded to Mr. G. Wythes, gardener to the Duke of Northumberland, for a group of well flowered plants of *Campanula pyramidalis*, blue and white.

*Gladioli* were extensively shown by the great specialists, Messrs. Kelway & Son, Langport, Somerset, and their collection, comprising many very fine varieties, was greatly admired. It is not easy to make a selection amongst so many splendid hybrids, all worth growing, but the following may be noted as exceptionally fine—Lord Carnarvon, vermilion scarlet, white throat; Clarence, rich red, deeply suffused with purple; Lady Carrington, rosy lilac, flaked with carmine; Empress of Germany, creamy white, flaked crimson, very large, good form; Malcolm, blush, deeply suffused with crimson; Shakespeare, ivory white, carmine throat; Emperor of Germany, rich crimson, clear white throat, finely formed flower; Mrs. Baines, orange red; and Duke of Fife, bright crimson, white throat, well formed. Messrs. Veitch and Sons also had a collection of seedling *Gladioli*, hybrids imported from America. These lack the substance of the best English and French

hybrids, nor are the colours so well defined. One named Sensation was perhaps the best. The Rev. H. H. D'Ombraïn showed three hardy varieties.

*Dracænas*.—A collection of these plants was shown by Messrs. B. S. Williams & Son, Upper Holloway, comprising such fine kinds as *voluta*, *Lonsiæ*, *Berkleyi*, *Tellingi*, *Reali*, *indivisi variegata*, *alba marginata*, *Fraseri*, *Vicomtesse de Belval*, *superba*, *Elizabethæ*, *Massangeana*, *angustifolia*, *majestica*, *pendula*, *imperialis*, *Guilfoylei*, *terminalis alba*, and *Lindeni*.

For *Dracæna Miss Glendinning*, which has narrow arching leaves of a dull bronzy green, the edges deeply margined with bright rosy crimson, a first class certificate was awarded.

*Hardy Herbaceous Plants and Roses* came from Messrs. Paul and Son, the Old Nurseries, Cheshunt, the former comprising a beautiful box of *Phloxes*; *Spiræas callosa*, *callosa alba*, *Nobleanum*, *canadensis*, and *grandiflora*; *Prunus Pissardi*, *P. domestica aurea*; *Alnus aurea*, *Hypericum oblongifolium* (award of merit), *Hydrangea paniculata*, and various *Carnations*.

*Gloxinias* came from Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood Road, London, S.E.—a bright and graceful display of flowers, rising from a groundwork of Maidenhair Fern. The excellence of this strain has recently been commented on.

*Marigolds*.—A collection of these from Messrs. J. Veitch & Sons, Chelsea, comprising African lemon and orange, French striped and miniature Orange (African) was much admired, and a silver Banksian medal was awarded. Mr. R. Dean, 42, Rancragh Road, Ealing, also had a fine stand of Africans of a very large strain, and was awarded a vote of thanks.

*Dahlias*.—A bright, fresh, and beautiful collection of Cactus, single and bouquet varieties was the contribution of Messrs. J. Cheal & Sons, Crawley. Amongst the former, a class of growing importance for garden decoration, the claret coloured Centennial, the fine pure white Henry Patrick, and the canary yellow Honoria were very noteworthy, Mr. T. S. Ware received an award of merit for Cactus Dahlia Robert Maher, clear pale yellow, a large, well formed, very handsome flower.

*Trees and Shrubs*.—A very interesting collection in pots and baskets came from Messrs. James Veitch & Sons. It included *Sciadopitys verticillata*, *Ceanothus azureus albidus*, pure white and agreeably scented; *Abies Tsuga*, a handsome Japanese species, the young growths gracefully pendulous; *Cupressus Lawsoniana filiformis*; *Acer argutum*, described as having beautiful autumnal tints; *Abies canadensis pendula* and *Eueryphia pinnatifolia*, a dwarf bushy shrub with pure white flowers, and a brush-like profusion of stamens, illustrated in the Journal of August 26th, 1880.

First class certificates were awarded to the following in Messrs. Veitch's group:—

*Sequoia sempervirens alba spica*, the growths tipped with greenish white, giving it a very distinct appearance; and

*Tilia euclora*, described as a fine avenue tree, holding its foliage much longer than the ordinary Lime, with dark green leaves 6 to 7 inches across.

Amongst miscellaneous exhibits of flowers were a collection of Ivy-leaved Pelargoniums (cut blooms) from the Royal Horticultural Gardens, Chiswick; a box of the new double annual Chrysanthemums, illustrated on another page, from Messrs. Hurst & Sons, 152, Houndsditch, London, E.; seedling Fuchsias from Mr. A. Lye, Clyffe Hall, Market Lavington; seedling Carnations from Mr. A. Spurling, Blackheath Park; a box of a white Begonia named Octavie, closely resembling a Gardenia, from Messrs. H. Cannell & Sons, Swanley; also a box of seedling Begonias, a box of Verbenas, and pots of the fine Heliotrope Swanley Giant, from the same nurserymen; and a collection of plants and flowers—comprising *Brachycomes*, white, rose, and blue—*Arnebia cornuta*, *Torenia Bailloni*, *Tournieri*, and *White Wings*; and Carnations from the Society's Chiswick Garden.

A small collection of plants came from the Royal Gardens, Kew, for which a vote of thanks was accorded. Amongst them were cut flowers of seedling *Streptocarpus*, obtained by crossing *S. Saundersi* with *S. kewensis*, *S. Watsoni*, *S. Rexi*, &c., and flowers of *S. Watsoni*. A plant of *S. Rexi alba* was shown; also *Pentstemon puniceus*, *Stylidium graminifolium*, *Cyrtanthus Mackeni*, *Chironia pedunculata*, *C. palustris* var., and *Lobelia tupa*.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq. (in the chair), Dr. Masters, and Messrs. J. O'Brien, E. Hall, J. Dominy, H. Ballantine, H. M. Pollett, and A. H. Smee.

Messrs. F. Sander & Co. exhibited a collection of Orchids, including a fine plant of *Cattleya Gaskelliana* with twenty blooms, and three other plants of the same species representing fine varieties; also *C. Dowiana*, *C. Schofieldiana*, and *C. Wilsoni*, *Angræcum articulatum*, *Phalænopsis Micholitzii* B.C., greenish white, yellow throat; and *Masdevallia hybrida Amesiana*. Messrs. Seeger & Tropp, East Dulwich, had a charming box of thirty *Satyriums* in fine varieties—*S. carneum*, pink and white; *S. e. roseum*, pink; *S. candidum*, white; *S. erectum nitens*, red and yellow; and *S. erectum*, pale yellow, being noteworthy. A silver Banksian medal was awarded. A good plant of the beautiful *Oncidium Lancanum* with twenty blooms on a spike was sent by F. Wigan, Esq. (Mr. W. H. Young, gardener), Clare Lawn, East Sheen (vote of thanks). From Messrs. B. S. Williams & Son came the pretty *Pachystoma Thompsoniana* and a collection of *Cypripediums*, including *C. grande*, *C. tonsum*, *C. Ashburtonæ superba*, and *C. oenanthem*. Mr. D. Cullimore, gardener to Malcolm S. Cooke, Esq., Kingston Hill, sent a plant

of *Cypripedium superbiens* with three blooms, each malformed; in one were two perfect slippers; the second had a double pouch, one inside the other. Referred to Scientific Committee. He also had a fine spike of *Lælia elegans*, a good dark form. Messrs. T. & J. Rogers, Fern Bank Nurseries, Lodsworth, sent a plant under the name of *Cypripedium incurvum*, which the Committee considered identical with *C. callosum*.

First-class certificates were awarded for the following:—

*Masdevallia Lowi*, exhibited by Sydney Courtauld, Esq. (Mr. A. Wright, gardener). The plant was small.

*Saccolabium Hendersonianum*, exhibited by Major Mason, The Firs, Warwick.

*Sobralia Warszewiczii*, exhibited by Messrs. Veitch & Sons. The plant was about 2 feet high, with broad dark green leaves, purplish mauve sepals and petals, lip same colour, pale yellow in the throat; not equal in beauty to the old *S. macrantha*.

*Cypripedium H. Ballantine*.—Hybrid, *C. purpuratum*, *C. Fairrieanum*.

## NATIONAL CARNATION AND PICOTEE SOCIETY.

### NORTHERN DIVISION.

THE annual Exhibition of the above Society was held in the Botanical Gardens, Manchester, on August 9th. There was much greater competition than at last year's show, and the Birmingham growers came out very successfully, taking by far the largest share of the prizes. The new S.B. C. H. Herbert, was again shown finely by the raiser, Mr. Herbert (of Thomson & Co.), taking four out of the five prizes in the single class. In the evening the gardens were lit by the electric light, and there was a large attendance of visitors. The awards were as follows:—

Class A, twelve Carnations, all dissimilar.—First, Mr. T. Lord, Todmorden, with fine flowers, characterised by great breadth of petal, of Master Fred, James Douglas, Thalia, J. D. Hextall, Edward Adams, Richard Bealey (very fine), Unexpected, Alisemond, Tim Bobbin, William Skirving, Richard Dean, Robert Lord. Second, Messrs. Thomson and Co., Sparkhill Nurseries, Birmingham, with larger blooms but not quite so good in quality of C. H. Herbert, Robert Thomson, William Skirving, George, James Douglas, Rifleman, Alisemond, Florence Nightingale, Harrison Weir, Thalia, James Merryweather, Robert Houlgrave. Third, Mr. R. Sydenham, Bristol Road, Birmingham, with Gordon Lewis, Robert Houlgrave, Rob Roy, John Harrison, William Skirving, Matador, Sarah Payne, Florence Nightingale, Thalia, Duc d'Aumale, Alisemond, Robert Lord. Fourth, Mr. B. Simonite, Sheffield. Fifth, Mr. H. Geggie, Bury.

Class B, twelve Picotees, all dissimilar.—First, Messrs. Thomson and Co. with fine blooms of good quality of Princess of Wales, Campanini, Favourite, John Smith, Lady Louisa, Mrs. Sharp, Juliette, Mrs. Payne, Zerlina, Thomas William, Mrs. F. Ricardo, Mrs. A. Chancellor. Mr. R. Sydenham followed closely with Dr. Epps, Favourite, Mrs. Sharp, Seedling, Mrs. Gorton, Hilda, Sylvia, Morna, Mrs. A. Chancellor, Lady Holmesdale, John Smith, Ethel. Third, Mr. E. Shaw, Moston, Manchester. Fourth, Mr. Geggie. Fifth, Mr. Beswick, Middleton, Manchester, who had a very fine bloom of Ann Lord in his stand.

Class C, twelve Carnations, not less than nine dissimilar.—First, Mr. A. R. Brown, Handsworth, Birmingham, with Fanny Hudson (fine), Thalia (three blooms, very fine), Edward Rowan, Edward Adams, Alfred, Squire Whitbourn, Alisemond (two blooms), George and Tim Bobbin. Second, Mr. S. Barlow, Stakehill House, Castleton, Manchester, with Robert Houlgrave, E. S. Dodwell, Sir Garnet Wolseley, Squire Llewelyn, J. D. Hextall, Squire Meynell, Master Fred, Cristagalli, Robert Houlgrave (two blooms), William Skirving, Dan Godfrey. Third, Mr. J. Edwards, Moston, Manchester, who had a fine bloom of J. S. Hedderley in his stand. Fourth, Mr. G. Bleachley, Whitefield, Manchester. Fifth, Mr. J. Whitham, Hebden Bridge, Yorkshire.

Class D, twelve Picotees, nine at least dissimilar.—First prize, Mr. A. R. Brown, with smooth, clean blooms of Imogen, Favourite, Jessie, Campanini (two blooms), J. B. Bryant, Mrs. Sharp, Clara Penson, Lady Louisa, John Smith, Thomas William, and Morna. Second, Mr. J. Whitham, with Gertrude, Clara Penson, Brunette, Thomas William, Ann Lord, Fanny Helen, Becky Sharp, Favourite, Dr. Epps, Miss Flowdy, and John Smith. Third, Mr. J. Edwards, with Mrs. Edwards, Mrs. Gorton, Lady Louisa, Dr. Epps, Clara Penson, Favourite, Muriel, William Summers, and two seedlings. Fourth, Mr. J. Bleachley.

Class E, six Carnations, dissimilar.—First, Mr. T. Helliwell, with Sybil, Robt. Houlgrave, J. D. Hextall, Master Fred, Squire Whitbourn, Sportsman. Second, Mr. G. Thornley, Middleton, Manchester.

Class F, six Picotees, dissimilar.—First, Mr. A. W. Jones, Handsworth, Birmingham, with very clean, smooth blooms of John Smith, Muriel, Sylvia, Campanini, Mrs. Payne, and Mrs. Sharp. Second, Mr. T. Helliwell, Todmorden, with Brunette, Ann Lord, Clara Penson, Favourite, and Mrs. Niven. Third, Mr. T. Barlow. Fourth, Mr. W. Taylor, Middleton. Fifth, Mr. W. Bacon, Derby. Sixth, Mr. G. Thornley.

Twelve selfs, Fancies or Yellow Grounds.—First, Messrs. Thomson with grand blooms of Terra Cotta, Almira, Blushing Bride, Gladys, Annie Douglas, Alfred Grey, Germania, C. H. Herbert, Ruby, Dodwell's s. 167, and a seedling, a true yellow ground bizarre. Second, Mr. T. Lord with Germania, Thalia, R. Butler, Mrs. Preece, Rob Roy, Captain Cuttle, John Ball, The Bride, Mereury, and R. H. Elliott. Third, Mr. A. R. Brown with Patricia, Purple Emperor, Dodwell's s. 192, s. 191, s. 166, s. 154, s. 186, s. 609, Germania, Lady Edwards, Rose Celestial, and Terra Cotta. Fourth, Mr. J. Edwards. Six selfs, Fancies or Yellow Grounds.—First, Mr. A. W. Jones with Dodwell's s. 154,

Germania, The Bride, Alfred Grey, Agnes Chambers, and Mrs. Alfred, very fine. Second, Mr. J. Beswick. Third, Mr. W. Taylor.

Single Blooms.—Scarlet Bizarres.—First, Mr. Barlow with Robert Houlgrave. Second, third, fourth, and fifth, Thomson & Co. with C. H. Herbert. Crimson Bizarres.—First, third, and fifth, Mr. Lord with Master Fred; and fourth with Richard Bealey. Second, Mr. Thornley with Master Fred. Pink and Purple Bizarres.—First, Messrs. Thomson & Co. with Sarah Payne, second with a seedling, and fourth with Rifleman. Third, Mr. Lord with William Skirving; and fourth Mr. Helliwell with E. S. Dodwell.

Scarlet Flakes.—First, Mr. Lord with Robert Cannell. Second, Mr. Geggie with a seedling. Third, Mr. Helliwell with Sportsman. Fourth, Mr. Lord with Alisemond. Fifth, Mr. Sydenham with Alisemond. Purple Flakes.—First, Mr. Simonite with President. Second, Thomson & Co. with George Melville. Third, Mr. Sydenham with George Melville. Fourth and fifth, Mr. Lord with Jas. Douglas and Gordon Lewis. Rose Flakes.—First, Mr. Lord with Tim Bobbin, second with Thalia, and third with a seedling. Fourth, Mr. Helliwell with Sybil; and fifth, Mr. Brown, with Thalia.

PICOTEES.—Heavy Red Edge.—First, Mr. Jones, with John Smith. Second, Mr. Brown, with Mary D. Anstiss. Third, Mr. Sydenham, with Dr. Epps. Fourth, Mr. Taylor, with John Smith. Fifth, Thomson and Co., with Dr. Epps. Light Red Edge.—First, Mr. Lord, with Violet Douglas. Second, third, and fifth, Mr. Jones, and fourth, Mr. Whitham, all with Thomas William. Heavy Purple Edge.—First, third, and fourth, Mr. Jones, with Muriel. Second, Thomson and Co., with Mrs. Chancellor; and fifth, Mr. Edwards, with Zerlina. Light Purple Edge.—First and second, Mr. Jones, with Sylvia. Third and fourth, Mr. Shaw, with Clara Penson. Fifth, Mr. Sydenham, with Sylvia. Heavy Rose Edge.—First, Mr. Sydenham, and second, Mr. Brown, with Lady Louisa. Third and fifth, Thomson & Co., with Campanini and Mrs. Payne. Fourth, Mr. Jones, with Mrs. Sharp. Light Rose Edge.—First, Mr. Barlow. Third, Thomson & Co., and fourth and fifth, Mr. Shaw, with Favourite. Second, Mr. Jones, with Nellie. There were 405 single blooms in competition.

The premier Carnation was Master Fred, exhibited by Mr. T. Lord. The premier Picotee was Lady Louisa, exhibited by Mr. J. Edwards. Mr. Chas. Turner, Royal Nursery, Slough, sent down a fine exhibit of yellow grounds. The varieties were Mrs. Walford, Romulus, Mrs. Fenwood, Old Coin, Remembrance, Countess of Jersey, Victory, and Adela.

First-class certificates were awarded to Messrs. Thomson & Co. for their new S.B. C. H. Herbert; to Mr. B. Simonite for H. Pomroy C.B.; to Mr. J. Edwards for H. Rose E. Mrs. Edwards; and to Mr. C. Turner for yellow grounds Remembrance and Romulus.—A NORTHERN FLORIST.

#### HARDY FRUIT GARDEN.

BIRDS EATING FRUIT.—No sooner are the various small fruits finished than the blackbirds start eating the Apples and Pears. They seem to know exactly which are the softest or most forward, and if undisturbed will spoil the best of the fruit in a few hours. Jargonelle Pears are among the first to suffer, and Beurré d'Amanlis is another variety hard to preserve. Apples Irish Peach, Duchess of Oldenburg, Keswick Codlin, and Lord Suffield have already been attacked by birds, and those who have good crops of these, or indeed any other good Apples or Pears, will do well to net them over at once. Wall trees can be very simply covered. Pyramids, bush, and cordon trained trees will require to have a temporary framework erected over them to support the netting clear of the fruit. Especially is it necessary to net over such fine yet comparatively soft Apples as Peasgood's Nonesuch, Potts' Seedling, Queen, Cellini, Bismarck, and Blenheim Pippin. Pears are also liable to have small pieces pecked out of them by tomtits, and to ward off these either  $\frac{3}{4}$ -inch mesh netting must be used, or the ordinary netting should be doubled and hung over the trees.

GATHERING AND RIPENING PEARS.—Pears evidently like plenty of moisture at the roots, the fruit being very fine this season. Doyenné d'Été and Citron des Carmes are best gathered and eaten direct from the trees, as they soon become dry and mealy after they are picked. Jargonelle is plentiful in many gardens. This again keeps badly, and in order to lengthen the season of this delicious variety it is advisable to gather a few before the seeds are become brown, wrapping the fruit in soft paper, and placing in gentle heat to ripen. More may be gathered and similarly treated about every four days, and in this manner every fruit will be utilised. Williams' Bon Chrétien, though scarce on trees in the open, is plentiful enough against walls, and this variety a few days later on may be treated similarly to the Jargonelles. It is the only way to prolong the season, as the fruit will not keep, and Souvenir du Congrès is very little better in that respect. Beurré d'Amanlis should be watched closely, as it ripens fairly early and will not keep long. Those who have large quantities of either of the four last named, or more than are required for home consumption, ought to market the

surplus rather than risk spoiling good fruit. Only sound and not very ripe specimens should be selected for the purpose, these being wrapped separately in soft paper and carefully packed, bruised or badly scratched fruit realising but poor prices.

EARLY APPLES.—Early Apples would appear to be the most plentiful this season, this remark applying to both dessert and culinary varieties. Plums being scarce there will be a greater demand for Apples, especially good dessert sorts, and a ready market will be found for all good surplus fruit. All the early varieties, including Margaret, Early Harvest, Early Julyan, Irish Peach, Beauty of Bath, and Devonshire Quarrenden are poor keepers, and are of the best flavour when eaten directly after they part freely from the tree. Early kitchen Apples, including Carlisle and Keswick Codlins, Duchess of Oldenburg, Lord Suffield, Hawthornden, and Stirling Castle, keep much better than the dessert varieties, and in this case thinnings ought to be used and also marketed if desirable. None should be gathered and stored before the seeds have browned or they part readily from the trees. If gathered too early premature shrivelling is the result.

THINNING SHOOTS ON FRUIT TREES.—In very many cases pyramid, bush, and half-standard trees are not pruned in any way till the winter, and then far too severely. The more vigorous trees are pruned in the winter the more dense the thickets of growth made, the crops being correspondingly light. Nor is it wise to closely prune in the summer, this quite paralysing the action of old trees especially, as well as any not treated liberally at the roots. Now is a very good time to go over the trees and freely thin out the shoots, leaving a few of the best placed their entire length. These thus favoured will mature properly, and if not interfered with next winter will most probably form fruit buds throughout their entire length during next year. This treatment soon alters the character of Apple, Pear, Cherry, and Plum trees for the better, and finer fruit in greater profusion usually results. Young Raspberry canes ought where at all crowded to be freely thinned out, and the old canes may well be removed at the same time.

STRAWBERRIES.—If not already done, the beds of these ought to be cleared of rubbish, and the runners, as well as the oldest of the foliage, trimmed off the plants and burnt at the same time. Well rooted runners have been obtained in abundance without much trouble this season, and it is not yet too late to move the strongest of these with a good ball of soil and roots and replant. During dry hot weather plants newly put out ought to be watered frequently, otherwise progress will be slow. See that all are firmly fixed in the ground, a sturdy growth, which this brings about, being most to be desired. Weakly runners put out at this date rarely attain a serviceable size before wintry weather sets in, and if they are planted where they are to remain they ought not to be allowed to fruit next season. Runners taken off now and planted about 4 inches apart in beds would be available for finally planting out next season, and the bloom being kept pinched out fine clumps will be formed during the growing season. Such plants are also admirable for potting.

#### FRUIT FORCING.

PEACHES AND NECTARINES.—*Earliest Forced Houses.*—Trees started in December and early January must not lack water at the roots. When this occurs the buds often fall instead of expanding when started. Afford water or liquid manure to weakly trees as may be necessary to maintain the soil in a moist condition. Needless waterings only saturate, sour the soil, and destroy the fibrous roots. This applies to artificial watering, as rain is accompanied by a lower temperature, and no harm results provided the borders are properly drained; indeed the ammonia and nitric acid of rain have a most beneficial tendency. Allow some laterals that are green and unripe to remain as an outlet for any excess of sap. They act as a safeguard against starting the buds, and promote the activity of the roots. Early-forced trees do not as a rule make strong growth, and there is often a preponderance of fruit over wood buds, hence in pruning it is not desirable to cut back next year's bearing wood unless the shoots are of great length. Very little pruning will be needed provided disbudding has been properly attended to, and no more wood been trained in than is necessary to replace the bearing shoots of the current year, and to renew worn-out growths. If the trees are enfeebled by long subjection to early forcing, and a rest cannot be given, they will be benefited by cutting out some of the old wood, especially the long branches, but this must be done judiciously, always having an eye to a crop. Some trees are the exact opposite, and those making too vigorous, long-jointed growth, should be restrained. This is not effected by stopping, though it is useful in causing a diversion of sap from the strong to the weaker parts of the trees, thereby assisting in an equal distribution of nutriment, consequently tending to maturity of the wood and buds. Any trees which grow too vigorously must be lifted and their roots laid in firmer material nearer the surface. Those showing symptoms of weakness may have the old soil carefully removed from amongst the roots, supplying turfy loam with an admixture of equal parts of steamed bonemeal and wood ashes. A bushel to a cartload of loam is a proper quantity, well incorporated. Give a good watering both to the lifted and replanted trees. These operations require to be performed as soon as the leaves have matured, but before they fall from the trees.

*Trees Cleared of their Crops.*—Cut away the shoots that have borne fruit unless required for extension, and where the growths are too crowded they should be thinned. This will allow air and light to harden the wood by increasing elaboration and storing assimilated matter in the buds and adjacent stems. It will also allow of the foliage being kept clean and healthy through freer access of water by the syringe or

engine, also, if necessary, the more efficient application of an insecticide for cleansing the trees of red spider, brown aphides, and scale. It is essential that the foliage be kept clean and healthy as long as possible. Water must be given as is necessary at the roots, but avoid needless applications, especially where the trees are vigorous and lifting is intended. Admit air to the fullest extent, especially at night.

*Houses with Fruit Ripening.*—A free circulation of air will enhance the quality of the fruit, and water need only be given to prevent the foliage becoming limp. Secure air moisture by an occasional damping of the house for the benefit of the foliage, also fruit, which in an arid atmosphere is liable to become mealy, whilst it ripens prematurely if the trees suffer by want of water. Ants are often troublesome. They take to treacle greedily. Bits of sponge held tightly in the fingers, then dipped in the syrup and there relaxed, will absorb some, and a gentle squeeze on withdrawing will leave enough in the sponge to entice the ants. These laid in their haunts will rid any place of the active creatures by immersing the sponges occasionally, with the ants in them, in boiling water. Cleanse the sponges each time and repeat the dipping.

*Late Houses.*—Trees which have the wood thin have a better chance to ripen, and the foliage to elaborate the sap, than those with the summer growths laid in so closely as to impede air and light. Upon the assimilation of the food depends its storing in the buds and wood for the support of the blossom and embryo fruit in the ensuing season. Gross growths tend to impoverish the weaker, appropriate an undue amount of sap, and tend to gumming and unprofitableness. They must be stopped or removed. An even spread of moderately strong short-jointed wood is desirable. Ventilate the house early in the morning, allowing a good heat by day, and closing so as to increase to 85° or more, for sun heat after evaporation has been going on for some time will not do any harm if care be taken to admit a little air before nightfall, and the temperature to gradually cool down, thereby securing rest. The night and early day ventilation tends to the solidification of the growth and its ripening. Syringe to keep down red spider.

*VINES.—Early Houses.*—Though the wood may be ripe and some foliage falling, there must not be any attempt at removing it, nor to cut the laterals close in, as that may cause the principal buds to start; therefore remove the laterals by degrees, and shorten some of the long shoots, preserving, however, some growth, especially when the leaves are down, above the buds to which the Vines are to be pruned, the final pruning being deferred until the early part of next month. The old surface soil should be removed and forked from amongst the roots, taking this advantage to raise any that are deep, and laying them in fresh material near the surface. Good calcareous loam is the most suitable, with an admixture of steamed bonemeal and wood ashes; about a thirtieth part is ample, or a good handful per square yard. If the soil be light add a sixth of clayey marl, or if stiff a similar proportion of old mortar rubbish. Give a moderate watering, and the roots will push from near the collar into the soil at once, and the Vines will be in capital condition for starting when the proper time comes round. When renovating or lifting is deferred until the leaves fall the start is not nearly so satisfactory.

*Midseason Houses.*—Fire heat is necessary when the Grapes are ripening to insure a circulation of air, and make high quality and finish certain. Air moisture is essential to the full swelling of the Grapes, and will not do any harm provided the atmosphere is not close. Good feeding is necessary. A supply of liquid manure and surface mulching of rather short yet dry material, to keep down superfluous moisture, is valuable for such varieties as Madresfield Court, one of the finest midseason Grapes. A rather low night temperature will assist Vines in carrying heavy crops.

*Late Houses.*—Full supplies of nourishment should be given until the Grapes are well advanced in colouring. Most late Grapes take a long time to perfect thoroughly, and some appear ripe when they are really not so, as is proved afterwards by their shrinking. All late Grapes require ample time for ripening. They ought now to be colouring, and then with a circulation of warm, rather dry air finish well. Afford a temperature of 70° to 75° by day artificially, 80° to 90° with sun, and close sufficiently early to increase to 90° to 95°. When the sun is losing power open the top and bottom ventilators to insure a circulation of air, and increase the ventilation early in the morning. A gentle warmth should be maintained in the pipes to prevent the temperature falling below 65°.

#### PLANT HOUSES.

*Erica hyemalis.*—Do not crowd these too closely together, or the lower foliage will turn brown and eventually fall. If thoroughly hardened, these plants are better standing on a bed of ashes outside in an open sunny position. Partially plunge the pots of the front row and the plants will afford sufficient shade to the others. Be careful they do not suffer by an insufficient supply of water. Keep the material moist on which they stand, and syringe the plants in the afternoon of dry days. Where they are protected in frames it is a good plan to raise these from the ground, so that a good circulation of air can play amongst the plants. The lights should be drawn off during the day.

*Erica melanthera.*—As these flower late they will now be in active growth, and should be kept in frames for some weeks. Encourage them to make their growth by closing the frame early in the afternoon. This species is benefited by this treatment, and is not liable to be attacked by mildew. Give plenty of air during the day, syringe morning and evening in dry weather, and give liberal supplies of water. If any of these plants need repotting it should be done at once. Do not disturb the old soil further than is necessary to remove the drainage; press the soil,

peat and sand, firmly, and give water with caution for some time afterwards. A light shade over the frame during the hottest part of the day will prove beneficial.

*Azalea amœna.*—Plants that were assisted to make their growth early, and have been gradually hardened by abundance of air and exposure to light, may be stood outside. If the plants have been growing under Vines and Peaches thin tiffany should be arranged so as to shade them for a few hours during bright sunshine, or the foliage will be unduly browned by sudden exposure. Protect the front row of pots, the same as advised for Ericas. Syringe the plants freely, and do not allow them to become dry at their roots.

*Epacris.*—Those that flowered early and were assisted into growth by gentle warmth, will be sufficiently advanced for standing outside, so that air and sunshine may ripen their growths, for upon this depends whether they flower profusely or the reverse. Do not turn them out before the plants have been carefully prepared by exposing them to the sun. Plants in active growth should still remain in frames, and be pushed forward by early closing in the afternoon, and syringing at the same time. Air should be admitted freely during the day, so that their growths are sturdy and strong. A too confined atmosphere soon draws them up weakly.

*Camellias.*—When these have completed their growth syringing should be stopped for a time until the flower buds are set. Plants in vigorous growth if kept close and moist are liable to start again into growth; this can be prevented by the admission of more air, a drier atmosphere and the gradual exposure of the plants to light. The latter is most important where strong growth has been made, for if not thoroughly matured the flower buds may fall prematurely. Plants that are swelling their buds should be kept moist at the roots and syringed freely. If confined in pots or narrow borders stimulants may be given. If these plants are placed outside they must have a position where they will receive partial shade, and must be well watered, also syringed during bright warm weather.

*Primula obconica.*—The earliest plants may be placed in 5-inch pots and stood in a shady corner outside. Bright sunshine is detrimental to their well being. Later plants may be potted; they need more root room, and to be kept in frames that have a northern aspect.

*Lilium candidum.*—Where these are appreciated in pots, imported bulbs should be potted as soon as they can be received. Large bulbs may be placed singly in 6-inch pots, or three or four may be placed into 10-inch. Drain the pots liberally, and pot in a compost of good loam, one-seventh of decayed manure, and sand. The bulbs should be covered with about 1 inch of soil. Stand the pots outside or in cold frames until growth commences.

*Gladiolus The Bride.*—Where a number of bulbs have been flowered in 5-inch pots and stood outside for the past few weeks they should be placed at once into pots 2 inches larger. Remove the drainage, and pot them without disturbing their roots. Plunge the pots and just cover the rim with ashes. They can remain in this condition until October, when the corms will have commenced growth, and the plants may be removed to the greenhouse.

*Kalosanthes.*—Plants that have flowered may be cut back and placed in frames to break, when they should be repotted. Shoots that have not flowered may be rooted singly in small pots, or a number placed together in 5 and 6-inch pots. These plants, if rooted quickly and then fully exposed to light and air, will flower freely another year. If wanted only for the season following, root them singly, and then remove the point to induce them to branch. Plants cut back last season should be placed outside fully exposed to the sun to ripen, which will induce every shoot to flower freely.

*Veronica Andersoni variegata.*—Young shoots of this variety may be inserted thickly together in pots and placed in the propagating frame; they will soon root, and will be found useful in small pots for furnishing during the winter. This plant grows quickly, and for the purpose in question should not be stopped.

*Begonia manicata.*—This species, and *B. hydrocotylifolia*, which for conservatory decoration is the more useful of the two, should be placed, if not already done, into 5 and 6-inch pots, their flowering size. They do well in a mixture of loam, one-third leaf mould, one-seventh of Mushroom bed refuse and sand. Place them in cold frames, where they will be perfectly safe until the end of September. Shade them lightly from the sun.

*Begonia Ingrami.*—Place a number of plants in 5-inch pots and grow them cool. Cuttings may also be inserted singly in small pots. Strike cuttings also of *B. semperflorens*, *B. carminea*, *B. rosea*, as well as *B. nitida* and its rose coloured form.

*Euonymus latifolius variegatus.*—This is equally as ornamental in the greenhouse or conservatory during the autumn and winter as the Croton is in the stove, and plants of various sizes may be used with effect. Low standards on stems from 1 foot to 18 inches high are very useful. Cuttings of young wood should now be inserted thickly together in pans of sandy soil, well watered, and then placed in a cold frame where they can be shaded from the sun. Nearly every one will root in this position, and may be potted singly early in the year. They can be rooted in heat, but are less certain, and entail more than double the labour. By rooting a few annually there need be no deficiency of stock.

*Ivy-leaved Pelargoniums.*—Young plants intended for autumn and winter flowering that have been rooted late and are now only in 3-inch pots should be placed in 5-inch, gradually hardened, and stood outside, where they will make firm sturdy growth, and in due time flower profusely.

# THE BEE-KEEPER.

## APIARIAN NOTES.

### THE WEATHER.

A DECIDED improvement has taken place, the temperature having risen considerably. History has it that our parish is a cold one. One thing is certain—namely, that we have been in the track of storms the whole summer, and I observed that the severe gales at times covered a narrow field. Some days the temperature never rose with us above 58° Fahr. with a strong wind, a leaden sky, and not a bee ventured abroad. In the beginning of April we had several serene days, but none since; and no better proof of this, to those who were not present, is, after the summer is past, a large per-centage of young queens are still sterile.

### WEIGHING HIVES.

We have been defeated in our intention of comparing the gathering of different races of bees by colonies of great strength, but the day is fine, and bees appear to be working well. We must be careful neither to deceive others nor ourselves. A Punic stock is suspended upon a balance; it rose in weight 3 lbs. upon the 25th July, and 1 lb. on the 28th; in two "rushes" of one and a half hour 3 lbs. of bees left the hive to gather honey. Out of the 4 lbs. gathered, after evaporation 1 lb. only remained. This working for little or nothing wears out the bees in a short time, and is on a par with spring stimulative feeding, and, what is worse, the old practice revived of feeding outside with syrup.

### PREPARING FOR WINTER.

Those bee-keepers situated south of the Tweed may not have the same difficulty to contend with in the want of young fertile queens as we have. Owing to the temperature being higher in England unmated queens will be fewer in number, and where these are breeding may be encouraged longer than where the queens of last year are still regnant. Where bees are numerous enough in the hive during August, it is unnecessary and inadvisable to encourage breeding. It exhausts the queen, and often great numbers of eggs are deposited that are never hatched; and encouraging queens to lay which have done duty since January is courting failure, as queens over-bred are liable to be deposed in spring, when it is impossible to get them replaced. Queens have laid an unusually large number of eggs this season, and already I hear that many queens have been deposed. If it were not for the Heather I should at once finish up my hives for the year without further disturbance. A queen that might continue laying till swarming time by giving her the necessary repose now, runs a greater chance of being deposed in March or April, if laying now be encouraged.

### EARLY AND LATE SITUATIONS.

Our system of management is alike for all districts, and our hives suit both. Late districts are more unfavourable to tiding over hives with queens that have done much laying than earlier ones, but weaker hives may be brought up to the standard of strength at less expense than the former. In early districts it is necessary, if profit is to be expected, to go into winter quarters with strong hives and youthful queens, so that breeding may be started early and maintained till the flowers and honey appear. In fine seasons late districts have greater advantages than early ones, especially where Heather abounds, but there is more wear and tear of bee and queen life. In neither case is it advisable to keep other than fertile queens of the current year.

### YOUNG AND OLD QUEENS.

I have had queens do good service for three, four, five and even six years, but I have had too many losses of queens above a year old dying at a time they could not be replaced, or failing to fill a proper sized hive with sufficient bees to be profitable, to recommend queens a year old or upwards to be kept as stocks. I

may be compelled to keep a number of last year's queens, but I shall take care that they are neither stimulated nor kept in too large hives, so that early swarming will be encouraged. But the large sized hives I have had so long will be the only ones employed as non-swarmer. I am writing this on 1st August, the mildest day we have had this year, and a queen nine weeks old has this day become fertile, and I doubt not others will have shared the same fate, so that bee-keepers may yet have all their stocks in a normal state for 1891 and headed by young queens.—A LANARKSHIRE BEE-KEEPER.

### TRADE CATALOGUES RECEIVED.

Wm. Paul & Son, Waltham Cross.—*Catalogue of Bulbs and Winter Flowers.*

Dicksons & Co., 1, Waterloo Place, Edinburgh.—*Catalogue of Flower Roots.*

W. Cutbush & Sons, Highgate, London.—*Descriptive Catalogue of Hyacinths, Tulips, and other Bulbs.*

John Laing & Sons, Forest Hill, London, S.E.—*Descriptive Catalogue of Bulbous Roots, Fruit Trees, Roses, Begonias, &c.*

James Veitch & Sons, 544, King's Road, Chelsea, London, S.W.—*Catalogues of Hyacinths and other Bulbous Roots, and Fruits.*

Vilmorin, Andrieux, et Cie., 4, Quai de la Mégisserie, Paris.—*Catalogue of Bulbs, Flowers and Strawberries.*

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Auricula Treatise (H. S.).**—A very good treatise on the Auricula, by the Rev. F. D. Horner, Lowfields, Kirkby Lonsdale, is published, with articles on other flowers, in a small work for amateurs, but we do not remember its price nor the address of the publishers. Mr. Horner will doubtless give you the information if you write to him and enclose a stamped addressed envelope for the reply.

**Strawberries in Light Soil (C. J.).**—If the soil is made firm before planting and it is mulched with manure, and the surface further thickly covered with straw or other littery material as soon as the plants commence flowering, to keep the ground cool and moist, you may succeed in your object. Three suitable varieties for your purpose are Vicomtesse Hericart de Thury, President, and Waterloo.

**Pansies Failing (E. C.).**—It is not always the fault of the soil when Pansies "go off" in the manner you describe. Many failures are the result of too late and shallow planting. When the soil is in fault heavy applications of lime have proved beneficial, and you cannot err by using as much fresh loam as you can obtain, incorporating with it some friable cow manure and wood ashes.

**American Blight (J. R.).**—Your trees are infested with this insect. Syringe them with a strong solution of softsoap, 6 ozs. of soap being dissolved in a gallon of water, to which may be added half an ounce of petroleum. A solution of nicotine soap of the same strength will also destroy the pest. In the winter, scrub the trees with brine, applying also petroleum with a brush to those parts where the insects most abound, but not dressing the smooth bark of the trees with the oil, or it may seriously injure the trees.

**Gladioluses Dying (Medicus).**—They are, we fear, attacked by the disease that is often so destructive to these flowers. We know of no remedy, and we can only suggest that you procure healthy corms from a fresh source, and keep them separate from your own stock, and also plant them in a fresh place. The disease appears more pronounced in rich highly manured soil than in ground well worked and sweetened, but only moderately fertile in character.

**Walnut Trees not Bearing (H. T. H.).**—When free bearing trees of good varieties are desired seedlings should be grafted when young with such varieties. Seedlings are extremely variable both in respect

to the time of bearing and the character of the produce. We should be inclined to allow the sixteen-year-old trees to bear, to test the quality of the nuts. You say the heads are "bushy;" if very dense thin out some of the branches, but do not shorten those retained, dig a trench round the trees, and cut several of the roots for checking exuberant growth.

Trees for Orchard House (E. D. N).—Peaches and Nectarines potted as maidens commence bearing the second year when well managed, and improve yearly with judicious treatment. The leading fruit nurserymen specially prepare trees for growing in pots, and you had much better purchase such trees than attempt growing your own. Healthy young trees may be removed from the garden into the orchard house, and if the transplanting is carefully done early in the autumn just as the foliage commences changing, a moderate crop may be taken the following year, but everything depends on the condition of the trees and the treatment to which they are subjected.

Cropping Strong Soil (Borton).—The soil may be improved by ridging it in the autumn and breaking up the ridges two or three times during the winter when they are crusted with frost. Ashes and gritty matter of any kind should also be mixed with it in as large quantities as can be obtained, and the soil will in due time be improved considerably. Such soil generally suits Cabbages, Broccolis, Kales, Savoys, &c., well; also Beans, late Peas, Rhubarb, Strawberries, Raspberries, and bush fruits generally, but special care is needed in sowing and planting so as to enable the crops and trees to obtain a good start. This work must only be done in fine weather, the soil in contact with the seeds and roots being made as fine as possible. Soot is a good manure for such soil.

Faulty Mushrooms (S. L).—It is not all uncommon for Mushrooms to be lacking in juiciness and flavour at this period of the year; indeed they are bound to be inferior, if not grown in cool places and kept moist with the aid of damp coverings. If the beds are too dry and position too warm, they are tough and insipid, and they are also liable to become infested with maggots. Very good Mushrooms are grown on outdoor beds in shaded positions in summer, if well covered with litter, and this is frequently sprinkled, as the temperature is then lowered by the process of evaporation. July and August are the most unfavourable months for the growth of Mushrooms, and the best time for commencing their culture is clearly stated on page 104 of Wright's "Mushrooms for the Million," (sixth edition) post free from this office for 1s. 2d.

Fig Tree Unfruitful (Inquirer).—The cause of the tree casting its fruit is unquestionably imperfect fertilisation, which usually arises from a deficiency of calcic and silicious matter in the soil in a soluble state. This can be afforded in various ways, but the most effectual is the addition to the soil of old mortar rubbish, whereby nitrate of lime is afforded, and surface dressings of short rather fresh manure, which whilst affording organic matter or humus, also supplies soda. We advise a trench to be taken out half the distance from the stem that the tree has spread of branches, going so deep as to detach all roots, and remove some of the soil from amongst the roots towards the stem. Then procure fresh soil, to which add one-sixth of old mortar rubbish, and fill up the trench—good loam with the old mortar rubbish added answering very well. The roots should be disposed evenly in the material, and made firm. It may be done so soon as the leaves commence falling, following with a covering of rather littersy manure a foot farther than the roots extend outwards from the stem, and about 3 inches thick.

Red Spider on Apple Trees—Pears Spotted (D. J. A.).—Red spider is usually most prevalent on trees in dry soils and in dry seasons. Give the trees a good soaking with liquid manure, or apply a mulch of short rather lumpy material, and water thoroughly if the weather be dry. Syringe the trees with a solution of softsoap at the rate of 2 ozs. to a gallon of water, choosing a calm evening, and directing the solution against the under side of the leaves. This will destroy the acarus, but should be repeated in the course of a few days, as other generations will be hatched. The application of the soap solution should be followed within twenty-four hours by a thorough cleansing with clear water, allowing the solution, however, to become dried before applying the water. The black spots on the Pears are caused by a fungus (Cladosporium dendriticum). Fruit so infested usually cracks, and is worthless. It is generally considered that lifting and planting in fresh firmer soil with an admixture of old mortar rubbish, so as to encourage healthier growth, is the best palliative, but there is no question of the fungus causing the disease, which would probably be overcome by phosphatic manures, and might be destroyed by a weak solution of sulphate of iron, one part to ninety-nine of water, applied occasionally in the early stages of the fruit growth. That, however, is matter for experiment, and a light dressing to the soil might act beneficially. Half an ounce per square yard is a full quantity to apply, a quarter of an ounce being safer.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (Thropton).—Dictamnus Fraxinella. (J. E.).—1, Campanula fragilis; 2, Harpalium rigidum; 3, Lilium tigrinum; 4, Monarda didyma. (G. S.).—Stenactis speciosa. (Oxon).—Francoa appendiculata.

COVENT GARDEN MARKET.—AUGUST 13TH.

MARKET getting quiet; supplies of soft fruit falling off; hothouse goods lower.

FRUIT.

Table with 4 columns: Fruit name, s. d., s. d., s. d. s. d. Includes Apples, Grapes, Lemons, etc.

Table with 4 columns: Plant name, s. d., s. d., s. d. s. d. Includes Aralia Sieboldi, Geraniums, Heliotrope, etc.

PROFITABLE FORAGE PLANTS.

EVERY season has its special lessons, and among those of this year the full growth of forage plants is very remarkable, affording an opportunity as it does for a comparison of bulk of crop, which may be turned to account subsequently; for in such a wet summer we see much of what is possible in the growth of such plants, and full recognition is given to the superiority of the best, if only they are seen under cultural conditions favourable to that full development which is now possible.

Of herbage for dairy cows we have certainly nothing better than Cocksfoot. See it now among the aftermath in pasture where it predominates. How rampant and free is its tender succulent growth! How fond the cows are of it! and how quickly it springs up again and again however closely they crop it off! For the tenant farmer such a grass is invaluable, as it is certain to repay him for high cultivation, and to afford a quick return upon his outlay for

seed and the preparation of the seed bed. No grass is more suitable for heavy land. We have a magnificent crop of it now upon a clay farm in Essex, and in the deep rich Suffolk loams we have had it upwards of 4 feet high—so high, in fact, as to hide the men mowing it with scythes from view. It is as nutritious as it is vigorous, and we have no doubt that many a heavy land farmer whose dependance on corn alone brought him to bankruptcy in "the eighties," would have met hard times well enough had he had a fair proportion of his farm down in this and a few other robust sorts of grasses and Clovers.

Timothy is another good heavy land grass which has been exceedingly vigorous this season, reaching a height of nearly 4 feet in a moderately fertile pasture, and contributing very much to the bulk of our hay crop. The aftermath is good, but is decidedly inferior to that of the Cocksfoot. Under really high cultivation it should be as vigorous in this country as it is in the United States, where Mr. Martin J. Sutton tells us it has attained a height of 6 feet. It is deservedly popular with farmers in the States, and it is doubtless owing to the fact of its culture there as a special crop that our American visitors recognise it so quickly. Ignorance of the best forage plants is so general in this country that we wish it were customary to have separate fields of Cocksfoot and Timothy as well as other grasses, just as we do of Rye Grass, so that farmers might become as familiar with them as they now are with different sorts of corn.

Italian Rye Grass is sown alone, but we have met with some faulty practice in its cultivation, though indeed it answers well enough if allowed to stand only one year; but it holds plant so well in the second year that it ought always to be kept over. It is such a gross feeder that not only should it have a rich seed bed, but frequent top-dressings where sewage cannot be had for it. In the present season exceptionally heavy crops of it have been obtained by a free use of chemical manure as a top-dressing immediately after each mowing. In a dry summer very much may be done by the application of liquid manure by means of a water cart and spreader; the more thorough the watering the more bulky the crop. Top-dressings of stable sawdust saturated with urine answer well, too, and serve in a great measure to exclude drought from the soil.

To complain that this grass and others of robust growth exhaust the soil, is a tacit acknowledgment of bad husbandry. Of course they are exhaustive, but then it is our affair to keep up the supply of food in the soil for crops which afford such a splendid return upon our outlay and labour. There are such things as proportion and balance in farming, and we cannot afford to ignore them. What is the storage of the soil with fertility and the growth of a full crop but simple cause and effect? A letter from a New Zealand farmer in *Bell's Weekly Messenger* shows that Cocksfoot is in high favour with farmers in that country, where it is grown alone, especial care being taken to have it pure. To ensure this the seedlings are often transplanted, the plants being set 18 inches apart, and so vigorous is the growth that when the plants are fully grown this distance, we are told, is not by any means too great. The mass of leafy nutritious herbage from such huge plants must be enormous, and a field so treated must be a remarkable sight, and the crop exceptionally profitable.

#### WORK ON THE HOME FARM.

The change to fair summer weather which set in at the beginning of the month has brought on the corn so fast that harvest is now in full swing in the southern counties, and on the whole it bids fair to realise our estimate of a yield of general abundance. The improvement in Oat cultivation is evident in the heavy crop, which is much above the average. Much of the best corn is beaten down and twisted by wind and rain, and much care is required in using the reaper. A clean upstanding field of forward Oats has been reaped by the self-binder, but some other fields so much laid that the straw is in very unequal condition, will be mown, left unbound, and be turned once or twice before the carting, both to ripen the straw and prevent overheating in the stack.

Winter Oats are now nearly out of hand. As usual we had them carted direct from the field to the threshing machine, and the straw was

cut into chaff immediately after the threshing. The chaff fills a barn-head at each farm, a little salt was sprinkled on each layer, it was well tramp'd, and will come into use whenever it is wanted.

Light ploughs drawn by a pair of horses, and managed by stout boys, will be in constant use during harvest to turn up the stubbles as soon as the fallen corn is cleared off by pigs and sheep. Foul stubbles are numerous this summer, and the ground is soft enough to admit of the free use of broadshares to pare the surface sufficiently and cut up all weeds. Light harrows should follow at once to clear off as much of the weed growths as possible, and to mingle fallen weed seeds with the soil so as to induce speedy germination. Then when the ploughs follow the new growth of weeds is buried, and a tolerably clean seed bed ensured next spring.

Pigs out on stubbles should always have water at midday. Sows out on grass require very little other food now, but it is as well to keep a watchful eye upon them, and not allow them to become too low in condition. It is a good rule never to suffer a breeding animal of any sort to show poverty of condition, for this is an evil for which farmers have to pay eventually.

**THE HESSIAN FLY.**—Information is published by the Board of Agriculture concerning the Hessian fly now infesting Wheat and Barley plants in some parts of England and Scotland, and as to the measures calculated to prevent its spread. The puparia are of a brown colour not unlike the colour of a Horse Chestnut, and somewhat like linseed, and may be found now in the joints of Wheat and Barley plants in infested fields. Wheat and Barley stubble in infested localities should, as far as practicable, be ploughed at once after harvest, and skimm-coulters used to bury the stubble completely. Upon "seeds," the stubble should be rolled or beaten down, horse-raked, carried away, and burnt. In infested districts Wheat should be sown as late as possible, in order that the autumn brood of flies may not find plants to lay their eggs upon. Self-sown, or "volunteer" corn plants, should be cut off in, or near to, infested fields, that eggs may not be deposited upon them. Where Wheat and Barley crops are infested, after these are threshed out, whether this is done in the fields at harvest time, or in the stack yards or barns later on, all the screenings and short refuse from the screens, and particularly the fine screenings, should be burnt at once. Tail Wheat should be carefully examined and run down again if the chestnut-coloured puparia are found in it. It would be advisable not to sow winter Barley and Rye near infested fields.

**AUSTRIAN AGRICULTURE.**—In connection with the International Exhibition of Agriculture and Forestry which is being held at Vienna this summer under the patronage of the Emperor of Austria, an International Congress of Agriculturists will be held in the University Buildings from the 2nd to the 6th of next month, under the presidency of Baron Arthur von Hohenbruck, of the Austrian Ministry of Agriculture. Members of the Congress will have the opportunity of inspecting, under skilled guidance, some of the most striking agricultural establishments in the empire. Inspections are being organised of estates in Moravia, Bohemia, Lower Austria, Silesia, and Hungary, including the State Stud Farms of Kisber, Stuhlweissenbourg, and Mezohegyes. The offices of the Organising Committee are 1, Herrngasse, 13, Vienna; but copies of the programme may be had in this country on application to the Royal Agricultural Society of England, 12, Hanover Square, to be officially represented at the Congress by their Secretary and Editor, Mr. Ernest Clarke.

**POULTRY IN FRANCE.**—The following statistics have been collected for the French Department of Agriculture. The income derived by French people who rear fowls, according to octroi and market returns, is 337,100,000 francs, of which 153,500,000 francs represent the value of the flesh and 183,600,000 francs that of the eggs. The quantity sold in poultry yards is immense, as is also the number used in the homes of those who rear fowls. These figures do not find their way into statistics.

#### METEOROLOGICAL OBSERVATIONS.

#### REMARKS.

3rd.—Fine and warm; lovely evening.  
4th.—Dull morning with spots of rain; but brilliant from 11 A.M.  
5th.—Bright throughout.  
6th.—Bright and warm.  
7th.—Cloudy and dull early; fair day; some sunshine in afternoon.  
8th.—Cloudy and cool day; drizzle in evening.  
9th.—Dull and drizzly early; cloudy day, but one or two gleams of sun in afternoon.  
Pleasant summer weather except on the last two days. Temperature about 3° above the average.—G. J. SYMONS.

A FEW years ago when on a visit to Mr. Cannell he took me into a field near Swanley Station, and asked me what I thought of it for growing fruit. It resembled a gravel bed as much as anything, only able to grow weeds, and these badly, for a few alone of the deep rooting kinds, such as Decks and hard wiry-looking grasses, were to be seen, as if struggling hard for existence. It appeared as if not worth cultivating, and was not cultivated but neglected. It may be safely said that for agricultural purposes a farmer would not take such land at a rental of 5s. an acre. Mr. Cannell does not always wait for an answer to one question before he asks another. He is a busy man, and cannot always tarry for responses from persons slow of speech; and before I could answer him he continued, shifting his question from the land to its new owner, "Shouldn't you consider a man who bought this land for fruit growing crazed?" Luckily my interlocutor could not pause, and went on to say, "Philip Ladds has bought it; a remarkable man, very remarkable, he is indeed; and he has thirty tons of glass on the station platform now for vineries and Peach houses, and if you come in three years' time you will find them full of fruit. Mark my words, he will make it pay; he makes everything pay; buys the worst land, and gets the best crops; very remarkable, but it's true; come and see." "Come and see" is a familiar Swanley motto, and those who accept the invitation, and especially those who were acquainted with the district twenty years ago, and inspect the "Home of Flowers," Mr. Ladds' establishment on the field of gravel, and Mr. Wood's jam manufactory, will witness in the trio such an example of industrial enterprise in horticulture as will astonish when the old order of things are remembered. To say that a thousand pounds' worth of produce is raised and sold where only half a hundred pounds were realised before does not adequately represent the advance. It is nothing less than marvellous, and shows what can be accomplished by men of enterprise, resource, energy, judgment, and ability. Mr. Cannell's words were true. Three years after inspecting the barren, impoverished-looking field I had the pleasure of seeing tons of Tomatoes, Strawberries, and Grapes, and hundreds of tons have since been raised and sold from a site that ninety-nine out of a hundred gardeners would have regarded as worthless, and the man who was so bold as to invest in it as "crazed."

On one of my visits I asked Mr. Ladds what induced him to secure the land that looked so unpromising. I knew there must be a reason, for men who achieve brilliant successes do not act without thinking. "Well," he replied, in his quiet way, and pointing with his finger, "do you see that tree?" This was a splendid Oak standing alone and majestic—and he continued, "Do you think land with nothing in it could grow a tree like that? I know it couldn't; and it was that tree which I took as my guide. And another thing, you can't poison land like this with muck, but can feed it well and it is always sweet, and that's the sort to grow fruit in." So it has proved very conclusively. "Philip" has fed the land lavishly, and drawn from it abundantly, and without any doubt the property is worth a hundred times more than when he secured it, and I should be very much surprised to learn that it has not increased in value five hundredfold. As Mr. Cannell says, it is all "very remarkable." Here is a man who started with a basket, worked till he was the proud possessor of a barrow, then

aspired to a cart, next to a van, and now takes pride in the best hunters that money can buy—all done in a generation—and he is the same plain unassuming man he was when he started on his industrial career some thirty years ago.

We will now pass from Kent into Surrey, and glance at the progress that has been made by another busy worker in the hive of horticulture—one who came from Scotland fourteen years ago, and like the famous warrior of old, "came, saw, and conquered"—Mr. James Walker of Daffodil fame, whose new field of labour at Ham Common I have lately had the pleasure of inspecting. Mr. Walker was an amateur florist when he arrived in the south, full of zeal, but tempered with prudence and the cool sound judgment that is characteristic of the race to which he belongs. He had a desire to engage in commercial horticulture, and to this end took the wise course of closely examining what others were doing, and of becoming acquainted with the manners and customs of the trade at the great emporium, Covent Garden Market. He endeavoured to ascertain the growing taste of the public, so that he might cater the better for it, and therefore for himself. He sought out the fields of production, and eventually leased land at Whitton. He noticed the increasing demand for Daffodils, and prepared to meet it, and was not long before he was able to purchase nearly a thousand pounds' worth of bulbs in one season. The more flowers he grew—grew well, be it understood, and placed in the market in the best condition—the greater was the demand, and this he could only meet by growing them in millions and by the acre. With care and good culture his bulbs increased enormously, and from a grower of flowers for market he grew into a wholesale vendor of bulbs. Strongly convinced that hardy bulbs could be grown at home as well as abroad, he set himself to the work with quiet pertinacity, and the result is that he can now supply the Dutchmen better than the Dutchmen can supply him with certain kinds. He executes orders of 100,000 at home and abroad, and could sell Daffodil and Narcissus bulbs by the ton if required and the terms were right.

His lease approaching termination he looked about him for another field to which he might migrate. His eye fell on a farm of nearly 140 acres at Ham Common, sandy poor-looking land, wild with weeds. He satisfied himself that the impoverished and weed-infested land was deep, and that being so conceived that labour and manure could be profitably invested in it, and to secure this land paid I dare not say how much for the practically worthless crops that were in it. Very accommodating sort of land he regards it, free to work, and so deep that when the sand is pushed aside in the driest weather moisture is found, while if the rain it raineth every day it passes down freely, and there is no stagnation. Shrewd, observant, calculating, Mr. Walker has re-established himself, and has evidently faith in the future, or he would not have erected the bulb stores and splendid ranges of glass, nor planted fruit trees so extensively. He is a strong believer in bulbs and fruit, and is convinced that both can be grown at home as good in quality as can be imported, and at prices remunerative to the cultivator. He has found that Daffodils yield two crops—the flowers above ground and bulbs below, and also that they profitably occupy the land between his fruit trees; and if all these had been Lord Grosvenor Apples, as many are, they would this year have afforded him nearly 10s. worth of fruit per tree four years after planting.

But to revert to the bulbs. At the time of my visit, a fortnight ago, ten men were digging them, and had been digging for weeks. They are probably digging yet, for the work is somewhat tedious, and the extent of ground occupied considerable. You see acres of weeds—land apparently lying waste, but it is full of money—bulbs. The weeds are not considered to do harm, but rather good in shading the soil, and every time the fork is turned over, or rather every other time, out the bulbs come in clusters. The men are expert at the work and know exactly how deep to dig to turn the crust and reveal the necks of the Daffodils, and the

next action of the fork brings them out. They are spread in rather thick heaps on the roadside, and covered with pea haulm or other material to dry steadily. Of all the cheaper kinds there are cartloads, yes, and of some of the dearer, cartloads too, but the choice and rare are mostly under cover. Fancy a ton or two of Emperors on a floor of one of the sheds. There are thousands of them of huge size. In one place we find a shedful of Maximus; passing to another building we find the lower floor covered with Horsefieldi; and climbing the ladder are astonished by the flooring of Empress. Then we find floor after floor of the beautiful, and in every garden indispensable, Poeticus ornatus, the famous forcing variety that is sold in tens of thousands, and there were many tens of thousands on view. Benches in long glass ranges were filled with them drying ready for planting and packing; and so I might go on enumerating, for all sorts are there, the rarer in boxes, the more plentiful in heaps—a perfect bewildering maze of brown pear-shaped Daffodils. There appeared to be millions of them—sufficient to stock a kingdom. To the observation, "You are getting too many, Mr. Walker;" the reply came in a quiet, firm Scottish "No, no, not too many, never too many; all will be wanted—all." Yes, most assuredly, he has faith in the future of bulbs.

Faith in the future of fruit, too, or why these splendid glass ranges?—eight new span-roofs, each 180 feet long, 24 feet wide, and about 13 feet high to the ridge, the sides 4 feet, half brickwork and half moveable glass sashes. These, also the top ventilators, open in 60 feet lengths by a simple cogwheel and rod movement. All these houses are intended for Peaches and Nectarines, and for the purpose they are models of lightness with neatness and strength. The sashbars, 18 inches apart, are glazed with 21 oz. glass, no top putty, stout T-iron being used as purlines, supported by pillars for strengthening the roof. In three years' time the sight will be worth seeing, and if I am well and keep on good terms with the owner, he will, I hope, see me there again. Some of the houses are planted, and the growth the trees have made is wonderful. I have seen nothing like them since, some years ago, I saw in Sussex a lofty wall covered by Mr. Edward Luckhurst in four years, and a crowd of grand fruit from base to summit. "I shall let them go," remarked Mr. Walker, "I like to see youthful vigour; if they are not strong then what can we expect?" Mr. Luckhurst "let his trees go," and fed them with liquid manure, and the laterals from the summer's growth ripened and bore fruit abundantly of the first size and quality. So will Mr. Walker's if he does not overcrowd them. The trees were planted so that every other might, and will, be removed for furnishing the other houses, but they have outgrown anticipations, though no harm is done. Numbers of the Alexander Peach and Lord Napier Nectarine have been wisely planted, for they are the best early market sorts, and are fortunately true. All the best of Mr. Rivers' varieties are also included, and all the world does not know yet how good these are. Mr. Walker evidently intends to be in the front with Peaches and Nectarines, and there is no room for doubt that he will much more than hold his own with the French competitors in the English market. He has also hundreds of trees in pots that are bearing well, and will pay well, till the roofs of the houses are covered.

The houses for which the supernumerary Peach trees referred to are being grown are this year occupied with Tomatoes, mostly the new Chiswick variety named Conference, the finest stock, probably, in existence. As a Fellow of the Royal Horticultural Society Mr. Walker was entitled to a packet of seed, and he has made the best of it. Not only did he take care of every plant, but took a cutting from each, and then perhaps others; be that as it may, he has hundreds of plants bearing as no other Tomato of its size can bear. The fruit, like its parent, Horsford's Prelude, is borne in long bunches or racemes, the lowermost hanging down and resting on the ground, and those above overlapping. The plants are confined to one stem, and the earliest topped at 6 or 7 feet, so that the crop can be over and the houses cleared for Chrysanthemums. The

fruits are medium sized and take well in the market, because they are smooth, firm, and rich glossy scarlet in colour, with more than three or four in a pound. As sixpence a pound was the lowest return, a "few hundreds" will probably be made from the packet of seed. "No, no! Mr. Wright, don't say so" (with an emphasis on the so), is what Mr. Walker will say when he sees these lines; but I have said it, and he ought to be very proud of his work. The soil was as hard as a board, as dry as dust on the surface, and the air like that of a desert. That is the way to evade the disease in Tomatoes, as I have many times said, and Mr. Walker believes in the doctrine. I do not pretend to say the disease can be absolutely prevented, but judging from experience, I honestly believe that in nine cases out of ten when Tomato crops have been ruined under glass the calamity has been the consequence of mismanagement in forcing growth unduly by over-rich soil, too much water, and a too close and moist atmosphere.

Just a few lines only on hardy fruit. Mr. Walker has so much faith in the future of Apple growing that if he had 500 acres of land to spare he would plant it with bushes of varieties that he is proving to be profitable. He has fifteen to twenty acres planted, and the free open bush trees are most promising. In my essay I ventured to say Lord Grosvenor was likely to supersede Lord Suffield. With Mr. Walker it has outdistanced it by a very long way, the trees of the former being twice the size of the latter, and the crops five times more valuable. At the time of my visit the large but not very symmetrical fruit were realising 5s. per half bushel, and half the crop had been gathered, the fruit thinned, and certainly half a bushel remained on each tree; but Lord Suffield had only a slight sprinkling of fruit. A long row of Lanc's Prince Albert, a very compact grower, was bearing well. It is an excellent and profitable variety for bush culture, and takes up little room. Much the same may be said of Stirling Castle, which was bearing well, as it usually does, and often when many others are barren. Warner's King and the New Hawthornden were proving their usefulness, as were Yellow Ingestrie and Cox's Orange Pippin. A little known variety, Peter the Great, was bearing handsome fruit, and the free growth and free spurring character of the tree made it a favourite in the collection. Mr. Gladstone was bearing highly coloured saleable fruit, but Lady Sudeley and Worcester Pearmain were bearing sparsely, though they must be ranked amongst the best, as must King of the Pippins (Golden Winter Pearmain) for profit, though not for the highest quality. Duchess of Oldenburg was bearing fairly well, and will bear still better. It is of substantial value, and the New Northern Greening, if I remember rightly, for I took no notes, and Dumelow's Seedling were promising well for future profit. Two Apples which Mr. Walker has not planted, but I think should do so, are Domino and Bramley's Seedling, the former one of the best of the early Codlins, and the latter for storing for late use.

More might be written on the work at Ham Common, but enough is said to show that Mr. James Walker, like Mr. Ladds, is a worthy representative of industrial enterprise in horticulture, and there are others able to meet all comers in our markets. We ought to be proud of such men. They are creators of wealth, and by the employment they give provide for the needs of many who strive to make happy, if humble, homes by the labour of their hands.—J. WRIGHT.

### PRIMULA OBCONICA.

ATTENTION is not directed so often as it might appear desirable to this useful, showy, and free flowering plant. Everyone who has any demand for cut flowers is aware of its value, as a good plant in a vigorous condition will positively revel in the early spring and summer months in having its flowers freely cut, provided the plant receives plenty of water and frequent doses of weak stimulating liquid manure. It is not very particular what it is if it is only used clear, so that no sediment is left on the surface of the pot to clog up the pores of the soil. Plants treated in this manner become almost continuous bloomers far into the

winter, when young and vigorous seedlings are ready to take their place with the first flush of spring that comes with the lengthening days.

Seed of *P. obconica* may be sown almost at any time of the year, the main points in its culture being free growth, ordinary warmth and plenty of moisture, with reasonable shade in hot weather and abundance of air. New seed quickly germinates, and the seedlings grow vigorously, but old seed of this *Primula*, like that of others, is slow in germinating, and the plants produced are necessarily somewhat sluggish without the help of some brisk moist heat. Seed sown now would produce plants ready to bloom next spring. *P. obconica* does not wait until it attains a certain size before it blooms, but so soon as the plant becomes strong enough, and is producing fresh new leaves and abundance of fibrous roots, it throws up its flowering stems, though not of course so freely as when it attains to a larger size.

Four, five, and six-inch pots are suitable sizes in which to flower this *Primula*, and the compost used should be rich, free, and open. Loam, leaf soil, decayed cow manure, sand, and charcoal will form a good mixture for potting at all stages of growth. Seedlings at their first transplanting may be placed in pans instead of pots, and if not pricked out too thickly they can be lifted, when large enough, with a sufficient quantity of roots to be at once placed in 4 and 5-inch pots. It all depends then on the wish of the cultivator whether they are further potted or not. Those in 4-inch pots may be moved to 6-inch pots when they are ready, but plants in 5-inch pots make very handy flowering specimens suitable for moving into rooms or windows for decoration. Large plants are not desirable, but those with leaves overhanging the pot sides, and forming a bold and effective base from which the numerous spikes of creamy and pinky white flowers rise, are much to be preferred. This *Primula* is a free surface rooter, and when potting, the plant may be kept moderately low so as to admit of a few rich top-dressings, which will serve to encourage the rapid production of these roots, benefiting and strengthening the plant, and rendering it more floriferous. The removal, too, of seed pods and decayed flowers will materially help the prolongation of its flowering, as well as keeping the plant in a thoroughly creditable condition. Should the plants at any time get very dry, and an ordinary supply of water is not sufficient to moisten the thirsty ball of roots, immerse the pot over its rim in water for half an hour. Apply liquid manure only when the soil is in a moist state, though certainly not when very wet or sticky. The healthiest plants and those with the deepest green leaves are grown in a partially shaded position in a greenhouse. Too much sun takes away the rich green of the leaves, and causes moisture to evaporate from the soil too quickly, thereby robbing the plant of a considerable amount of support.

Seed may be saved from one or two plants specially reserved for the purpose, as it is well not to encourage a great number of flower spikes on plants selected for this purpose. The pollen should be collected from the ripe anthers of flowers on other plants with a camel's hair brush, and conveyed to the stigmas of those which are intended for seed bearing, and when sufficient pods are set and swelling remove all flowers as fast as they appear. By this means good, well-developed seed will be obtained, which when ripe and sown within a reasonable time afterwards will quickly germinate and make fine plants. Division of the roots may also be resorted to to increase the stock, and in the spring and early summer in a moist, warm atmosphere, pieces with a small quantity of roots attached soon grow into good plants, but the flowers are often smaller and sometimes less freely produced than in plants raised from good seed. Gardeners, as a rule, prefer the latter, and, as I think, the best method of keeping up a stock.

*Primula obconica* is said to be by various persons somewhat of a poisonous nature. The handling and touching of the leaves have caused, it is alleged, a very unpleasant irritability of the skin on the hands and arms, and a kind of rash has appeared, which in some cases has proved very troublesome. I have never experienced anything of the kind, nor do I know anyone who has. If it is proved by further knowledge to be possessed of this unpleasant quality, no doubt a considerable amount of the popularity this plant has now enjoyed for some years will wax and wane. If it be true, however, it may not affect everybody alike, and many may be proof against it altogether.—E. D. S.

## LEICESTER CONFERENCE PAPER.

### PRUNING IN COMMERCIAL FRUIT CULTURE.

BY MR. G. BUNYARD.

THE OBJECT OF PRUNING.—This operation is designed to assist Nature in the production of superior fruit. Reducing the quantity

of fruiting spurs and excess branches, enables the tree to concentrate its vital energy on a fewer number of buds to their better individual development. Further than this, a good pruner leaves all those buds in the best possible position to catch the sun and air with a view of obtaining not only increased size in the fruit, but to ensure that high colour which such exposure alone can produce. All growers are aware that the fruit from the inside of the tree is not so highly developed or coloured as that from the outside. Thus a careful man will operate with a view to create a natural balance between roots and top, so that each tree can produce a crop yearly, and not, as when left alone, a heavy crop every other year, which makes it require a year's rest to recover itself. I recollect a story told that the owner of a small garden had two large standard Apples that produced a heavy crop every other year, and my grandfather advised him to cut off the blossom from one at flowering time. This brought them so that he had a crop every year. This exhaustion of the tree by an over-crop is emphasised by the fact that most early fruits (whether Apples, Pears, or Plums) are as a rule more regular bearers than later kinds, because the tree has time to recover its lost power between the gathering of the crop and the fall of the leaf, when Nature's repose comes on. Evidently, therefore, it is on these lines that "rational pruning" should be done.

In dealing with this subject from a trade point of view we are naturally at once met with the cost of the operation, and it is here that we are at a disadvantage compared with the cheap labour of the continent; but I would suggest that growers should teach their sons to look after this, which is after all a most interesting operation, and I am sure they would enjoy it as I did looking after our orchard some years ago. The next point is—"How to go to work." I can remind you that in dealing with some fruits you are always on the right track as cultivators, but I want to see the system extended. Take, for example, your Red Currants and Gooseberries after pruning. A novice would at once say you had spoiled them entirely, whereas you know by experience that your berries are twice as large as when the trees are unpruned, and your Currants, too, are larger in the berry and longer in the bunch, while, in some cases, you summer-prune as well to let in the sun to ripen the wood. If this pays in the case of the small soft fruits it will also pay in the case of the harder "top" fruit, and you all know too well that it is the best samples from reputed growers which command the highest price, under-sized fruits and spotted samples really bring down the value of the entire crop. In a warm summer your fruit would be super-excellent, and in a wet or cold one, what you produced would be much finer and clearer than from neglected trees. Again, in the case of Raspberries, you cut off 2 to 4 feet of the canes, certainly to save sticking on the one hand, but you also know that you get much larger berries, and jam makers do not like Raspberries that are all seeds, as they would be if left uncut. In old neglected gardens the berries are not one-fourth the size of properly headed-back plantations. The most forcible example of the value of pruning is afforded by the Cob Nut. As pruned in Kent the tree appears a miserable object after the cutter has done his work, but as the result proves, we get a better crop, and the Nuts are far larger than those on trees not pruned; in fact, if allowed to grow as they like, the Nuts are but a trifle larger than those called Barcelonas in the shops.

Again, why is wall fruit so much finer than that from the open? Because such trees must be pruned to keep them in position, and moreover the spurs are always (in properly cared-for gardens) thinned out, and naturally all face one way to catch the sun, and have the additional benefit of the radiation of heat from the wall to assist in the ripening of the wood.

Having given you, perhaps, too much theory, I will now proceed to indicate how I would recommend the pruning to be done on young trees, say standards or half-standards. In planting, all that is necessary is to cut off any injured roots, and then to shorten back slightly the long anchor-like roots, taking care to cut in closely the tap root, or those roots that have a distinctly downward tendency. The tree should then have its head examined, the planter holding it so that he can, as it were, look it in the face on a line with the trunk. He will then see at a glance if there are more shoots than are required to form a symmetrical head, by preference three, five, or seven shoots placed at equal distances, like the spokes of a wheel. I mean if we can get seven, so much the better, but it is, for the purpose of a foundation, preferable to have even three at a regular distance between each other, than to have four or five, the balance of which is uneven. All surplus shoots can be cut clean away, and the rest not cut or tipped in any way. The following winter (in February by preference, avoiding frosty weather) this head is to be cut back rather severely, say leaving five or six eyes at the base, but cutting so that there is one bud left pointing outwards at the extremity of the cut. From this cutting a mass of shoots will issue, and in July the pruner should go over his trees and cut back

(leaving only one inch of wood) those that are in the middle of the tree, preserving at their full length all those that form a head like an inverted umbrella. The following February these are again shortened; but this time allow about 6 inches of the new wood, and continue the operation for a few years, when the trees will begin to bear on the old wood. Keep the centres of the trees thinned out, and do not allow too many shoots to encumber the tree, but cut so that all hang free and do not cross each other. Possibly, in a few more years, some of these may be cut away with advantage, and there will be stronger ones taking the lead, and provided they are in proper places, may be allowed to go ahead. I consider this severe pruning necessary at first, because some fruits (notably, Manx Codlin, Stone's, and Lord Suffield Apples), if left uncut, form a mass of fruit buds, and come into bearing, and never afterwards get beyond a mop-sized head. Some Pears and Plums have the same tendency.

In planting Plums (from the nature of their roots), if the planting is completed before Christmas, they may be pruned the first year of planting; but if done after that time it is better to allow them to wait one year. Their after attention is the same as that advised for Pears and Apples, but as they grow more freely they need not be cut back so hard, as they form a head rapidly.

In planting Cherries I strongly advise planters to let them stand the first year without cutting at all (except the roots as advised for Apples). In the following season cut them back as required, after which the less "knifing" done on them the better, merely removing the crossing boughs. As Pears have fewer roots than Apples they must not be so severely cut.

The management of bush or pyramidal trees will be the same as advised for standards, having regard to the form of tree desired, but as they are more protected from the wind, and the crop can be thinned, they may be left with longer shoots than standards. Apples upon the Paradise stock may be cut back the first season if planted early.

In soft fruits, the prevailing custom of cutting them hard the first year cannot be improved upon; but in case of late planting (say February or March) the resulting shoots are so thin and sappy that it may be best to let them stand a year to establish themselves before pruning. It is most desirable that they should be planted before December, as in that case the rootlets push and get a firm hold of the soil before winter sets in. In planting Raspberries for market, they may be shortened before planting to about 2 feet.

I now come to a more important point in pruning—namely, that of old or neglected trees, which are far too prevalent, and where faggots must be taken out to make any impression on the mass of useless wood they contain. In dealing with such examples we need to be very careful, for it is well known that large boughs sawn off Apples, Pears, Plums, and Cherries will sometimes result in decay, and in that case the tree suffers loss by heavy-laden boughs giving way at a weak spot. I am of opinion that it would be well not to cut these so close to the main stems and branches as is usually done, and that after the saw has been used the surface should be planed over or smoothed with a knife, and the edges neatly rounded with a sharp knife, so that the new bark can creep over and cover the wound.

All old orchards have trees with holes in them—the favourite nesting-places of the starling and tom-tit. The wood decays, and the woodpecker first starts the aperture by searching for its food, and other birds take the opportunity to nest where they can readily make room in the soft spongy wood. All shoots over half an inch across should be rounded in the way indicated, and I strongly recommend that this pruning should be done as soon as the fruit is gathered, as the bark makes some progress to cover the wound, the same season, and the air being dry, the wood hardens (so to speak, heals) more than in the winter; and, moreover, the shoots that are dead and leafless can at once be detected much more readily than when the leaf is off. Now that the strain of farm work is reduced by the grubbing of Hôp land, more labour is at command for this work, and I must repeat that all this severe pruning should be done in the summer or autumn. Especially should all broken and split boughs be removed from Plums where injured by an over crop. I have heard of trees being severely injured by being pruned in a heavy frost, when the men could not work on the land, but I cannot say that it is always so. In pruning these "old stagers" it is not advisable to tip the branches, as the most lively wood, which draws the sap up freely, is on the points, and they nourish the tree.

The next point which I think worth a trial on a large scale is the thinning of the spurs. I have before me a fruiting branch of the old Yorkshire Apple, the Cockpit (a free bearer but too small for profit). When the trees bear, I have half the fruit taken off, but although that makes the fruit finer, I am now thinning the

spurs so that they may be larger still, and I am persuaded that if half the spurs were taken from our old orchard trees, which is easy work with a tool like the one I am using, we should have much finer fruit, and the spurs if cut about an inch from the stem would, in some cases, throw out other spurs, which in time would enable us to prune out those left in the former cutting, and thus we should have perpetual youth on the head of an ancient body. Pears are most profuse in the way they spur, and some kinds bear so freely that they are not inaptly said to crop like ropes of Onions. In the case of Plums it is the same. The Diamond would bear more freely if half its spurs were taken out, and the Victoria under this treatment would not be so liable to break as it does from carrying such heavy crops. Jefferson again is a mass of spurs; in fact, even in winter, an expert can tell the names of leafless trees by the form of the spurs, and the style they set on the branches.

In removing what I may term surplus spurs, those found on the under sides of the branches are of little value, and if I say, negatively, that the pruner should retain all those in the best positions, and remove the rest, you will get an idea how to work. The Crittenden, or Cluster Damson, is one which makes a mass of thorny spurs, and I think these require thinning, as if left too thickly on the boughs the fruit is very small, and you will have noticed that the trees from suckers are much more inclined to thorn than those budded, which take more of the Plum nature. The King of the Pippins and Manx Codlin Apples, for example, are very fruitful trees, and I know that those who prune them on the spur system and shorten all the young growth defy the inevitable canker which affects these sorts. These close pruned trees grow marvellous fruit, which sells at a price that pays for extra labour expended. Such kinds as Court Pendû Plat and Keswick Codlin again make too many spurs.

I can scarcely leave the subject of pruning without reference to the Kentish Cob Nut, a subject which requires more cutting and pruning than any other fruit.

When received from the growers these trees have a small head upon a stem of 12 to 15 inches, and this stem is intended that the ground beneath the bush may be the more readily kept free from weeds and be dug. They are planted as received, and allowed to grow for one year, when they should be cut hard in, to make them throw out vigorous shoots from the base of the head to form the start of the future tree. This is done by annually cutting, so that the next terminal shoot is made from an under bud, which in course of time makes a tree formed like a washing basin. I note the best shaped trees have started with six to be doubled to twelve main branches. From these a set of spurs or short shoots are given off, on which the nuts are produced, and the trees should be so managed that at the end of 100 years old they should be 15 or 20 feet across the top, but not higher than 5½ feet from the ground. From the bent portion of the main boughs a number of strong yearling shoots will be given off, which in Kent are called wands. These are taken out in summer, or partially so, for packing the autumn fruit, and in winter the rest are broken out, and either sold for flower sticks or basket making, or reserved to pack soft fruit the next season. The male or catkin blossoms are produced most freely at the upper part of the trees, and should be allowed to remain long enough to fertilise the pistillate or female flowers, which are produced on the smaller boughs. When the weather is very still and warm it would pay to tap the boughs with a stick, to make this pollen fly. When winter pruning the spurs are thinned, and if need be stopped. Old wood is removed, and the stronger growths shortened and thinned, leaving the tree regularly balanced on all sides, and with free play for the air and sun among the branches, remembering that the foliage is large on pruned trees. If time permits in July or August, it is a great help to the strength of the tree to break the stronger shoots off the upper boughs with the finger and thumb (a sharp twist being all that is required), this plumps up the buds below the fracture and assists the ripening of the wood, and it is found better than cutting, as the broken surface allows some sap to exude, and this prevents the formation of a secondary growth, which would weaken the bush and be of no value to produce Nuts. In pruning (in winter), these cut ends are smoothly severed with a sharp knife. A careful pruner will proceed so that there is always abundance of fresh young wood in his examples, and when a twig shows signs of age, he cuts so that a fresh young one shall succeed it in the next year's cutting, so that worn out twigs are never seen in ancient trees. Suckers from the roots should be hoed off in growth or severed with a sharp spade, and if well rooted some may be reserved to make future plants.

In Continental works on fruit culture much stress is laid on the tools used. A few which we find useful as labour-savers are: 1, Coppin's tree pruner, avoiding the use of ladders in young trees; made from 6 to 10 feet long. 2, American lightning saw, very

easy and rapid in its work; capital for green wood. 3, Belgian secateurs for pruning. 4, Aubert's Parisian secateurs. 5, Clasp and sheath knives.

### AUTUMN FUCHSIAS.

BUSHY specimens in 5 or 6-inch pots are very attractive in the conservatory during the months of October and November. Free flowering and naturally bushy growers are those which give the greatest satisfaction, and if plants were struck late in spring, and are now growing in 3 and 4 inch pots receive frequent pinching, they will, with another shift into a size larger pot, and continuing the pinching when the shoots get long enough, grow into desirable plants, handy in size, with fine healthy foliage, and a promise of abundance of bloom. It is only the single varieties that can be recommended for these purposes; the doubles are not, as a rule, free enough in flowering at that time of the year. A cool frame on a bed of ashes is the place to grow them for the next five or six weeks, where they can be readily shaded from strong sun, and the lights removed in showery or dull weather and dewy autumn nights. Shade and moisture will keep them soft and growing, but a dry atmosphere and too much sun will bring them into flower too soon. A free, open, and rich compost composed of turfy loam, leaf soil, decayed manure and sand, with broken charcoal mixed therewith will grow them well. They may be frequently syringed in dry weather, and should at such times receive attention at least twice a day, to ascertain whether water is needed or not. They will scarcely need any kind of liquid or artificial manure until the pots are full of roots and flowers are showing, which it is desirable should be encouraged to develop, and only then weak supplies will be needed, as the demands of the plants are not so heavy and frequent as in the longer days of summer.

Any very free flowering varieties will be suitable for autumn decoration if properly prepared. Older plants that have done blooming may be encouraged to flower again by a little shortening back of the shoots, a warm close atmosphere and frequent syringing to induce fresh young growths, which, partially ripened, are sure to produce flowers, which are always welcome late in the season.—S. W.

### NOTES ON EARLY ENGLISH HORTICULTURE.

(Continued from page 479, last vol.)

JUST now the minds of Chelsea folks are exercised lest the long famous Apothecaries' or Physic Garden on the banks of the Thames, so long sacred to horticultural and botanical purposes, should have its few acres thrown into the devouring maw of the modern builder, which has swallowed hundreds of the acres about London formerly occupied as nursery or garden grounds. Let us hope many persons in other London districts will be heartily interested in the effort to keep intact this historic space, and also to utilise it, if that be possible. Some way may be found, I think, to give this small area a botanical or educational value, and thus keep in remembrance the design with which Sir Hans Sloane handed over the land to the keeping of the Apothecaries' Company. In pursuing the history of our horticulture we have reached a period when this Chelsea garden had attained a position of importance, owing to the eminence of Miller, head of the establishment from about 1722 to 1769. The renowned Linnaeus spoke in the highest terms of Miller, with whom he often corresponded, and by some foreign botanists he was styled the "Prince of Gardeners" in that century, but of course at home he was not greatly honoured, at least during his life. A large number of exotic plants had been added to this garden in the reign of Anne, when Doody was gardener, and Petiver demonstrator. The latter was an intimate of Ray, and a great collector of natural history objects generally. Many of his specimens were bought by Sir Hans Sloane, and formed part of the nucleus of the British Museum. To encourage the apothecaries in their researches after new and rare plants the Baronet presented the Company with this garden on condition of their handing in yearly fifty fresh specimens reared there to the Royal Society till the number of 3000 had been reached. Small as is the space, it contained one of the most important collections of exotic trees formed early in the eighteenth century, and even now some of these live there in their descendants. Its splendid Oriental Plane, considered to be the finest British specimen, was killed, as was supposed, by the works of the Embankment, and its famous Magnolia died some years ago. This Magnolia was an offset, it was said, of the celebrated tree planted at Exeter, which supplied plants to many gardens near and distant. Amongst its notable trees were the large examples of the Nettle Tree, the Paper Mulberry, the Salisburia, the Pistacia Terebinthus, and several species of

Pandanus. On a visit to the Gardens I was fortunate enough to see in full flower a very large and venerable example of the Styrax (*Styrax officinale*).

Phillip Miller's father was a market gardener at Deptford, and at the time he accepted the office of gardener to the establishment at Chelsea Miller had a small nursery near Newington Butts, Surrey. According to Field, the historian of this Chelsea garden, the career of Miller showed what an ordinary working gardener might do in the way of raising himself to eminence by study and perseverance, for he was apparently a self-taught man. His "Gardeners' Dictionary" proves how extensive was his theoretical and practical knowledge, and though the work was costly its sale was considerable for that period. We can quite believe on examining this book in Field's statement that horticulture is greatly indebted to Miller for his trouble in procuring and his skill in cultivating species or varieties unknown to these islands. He appears to have been the first to recommend the practice of growing the bulbs of Hyacinths, Tulips, and allied species in water, though it is probable the introducer of the method was one Martin Triewald, a Swedish gentleman, about 1728. It is likely that Miller's influence led to the formation of a society of London gardeners and nurserymen, at which discussions took place on horticultural topics. Amongst its senior members we notice the names of Fairchild, Hoxton; of Furber, original proprietor of the Kensington Nursery; Gray of Fulham, Driver of Lambeth, and Hunt of Putney. The Messrs. Hunt had a rather extensive arboretum on the bank of the Thames, sheltered by the Surrey hills. Its trees and plants were sold in 1834, and the ground cleared for building. James Lee, who afterwards started the Hammersmith Nursery, was one of the younger men in this Society. He was then working under Miller at the Apothecaries' Garden. It may be that the speedy dissolution of the Society arose from the ill success of a volume they prepared conjointly, one intended to be the first of a series, which would be given a complete and illustrated catalogue of all hardy trees, shrubs, and plants. This first part was published at a guinea and a half, with figures of fifty species drawn and coloured by Van Huysum. This, if it could have been completed, would have helped on English horticulture considerably, but it failed to obtain purchasers. The fame of Miller led to his being often consulted by the owners of extensive gardens as to arrangement of ground or methods of cultivation. Amongst his employers were the Dukes of Bedford and Richmond. Miller held his office at the Chelsea garden till 1769, and died soon after his resignation. By the joint efforts of the Botanical and Horticultural Societies of London a cenotaph to his honour was erected in the old churchyard of Chelsea in 1815, but from some strange mistake it is placed on the spot where Horsfall the printer was buried.

The society of gardeners to which Miller was secretary consisted chiefly of West London men, but it had a few members at Hoxton, Kingsland, and Mile End. In the reign of George I. very different systems were followed in the gardens or fields at the east and west of London. The market gardeners at the east raised large quantities of vegetables for the city; those at the west, with a more limited space at command, grew more choice kinds, and managed to have a rapid succession of crops. About this period the White Beet was grown extensively, the midribs and footstalks of the leaves being boiled and eaten as Asparagus. We should also have seen in the gardens what was called Lamb's Quarters (*Chenopodium bonus Henricus*); the leaves of this plant some thought equal, or superior, to Spinach. The Chive was a variety of the Onion much in demand, because the young plants were cut up for salads, and they were also put round flower beds for an edging. A plant now neglected, the Squash Melon (*Cucurbita melopepo*) had some popularity, being grown on the sides of rivulets or ditches. Our ancestors gathered the fruit unripe, boiled it, and served it on toast. Few cottage gardens were without some plants of the Pumpkin. People used to compete in trying how far the shoots could be made to run over a grassy bank. One writer on gardening thinks that the English would never have been so partial to all varieties of Cabbage as they showed themselves in the eighteenth century except for the influence of northern gardeners, and the Scotch, he adds, must have acquired their liking by contact with the German fishermen. It was usual then to grow Spinach amongst Cabbages, and a favourite plan of the gardeners was to plant Cucumbers along the rows of this vegetable in May. Quantities of Lettuces were sown in frames about June, and afterwards transplanted under glass. One singular feature of market and kitchen gardens of that time was the numerous pits, receptacles of dung and litter, to which water was freely added to excite fermentation, as it was not usual to spread at once to the land what manure was obtained from the stables and cowsheds. Gardeners then preferred to have the kitchen garden somewhat on the incline, open

toward the south, and sheltered by shrubs or trees on the other sides.—J. R. S. C.

### NOTES ON A TRIP TO ENGLAND.

I AM recently returned from what every gardener should annually have the privilege of enjoying—namely, a fortnight's holiday. It has been suggested that a few notes of what was seen on the way might interest readers of the Journal.

Having experienced one of the wettest seasons on record in this country, we were fortunate in securing a fine day for commencing our journey on July 15th. Leaving one of the principal junctions in the south of Ireland, we travelled by the G. S. and W. Railway to North Wall, departing from thence at 7 P.M., enjoying a pleasant trip of four and a half hours' duration to Holyhead. Being dark little of the scenery could be noted for the first three hours. On moonlight nights, however, the views from Holyhead to Chester are magnificent. Not until we are nearing the latter station can we see much of the surrounding country, and then the outlook is gloomy enough; a dense fog with drizzling rain, and we fear we have brought Irish weather with us. However, we reached Dorking without getting much rain, but the next day we had such a downpour as I have never before witnessed, but afterwards we had "Queen's weather" in perfection. Being in this locality we call at

#### THE ROOKERY,

The beautiful residence of G. A. Fuller, Esq. Great improvements have been carried out here during the last few years. New herbaceous borders have been formed, and planted with a capital selection of plants. The back of the borders contain a great variety of new and rare flowering shrubs. A good collection of fruit trees has also been formed. Apples, Pears, and Peaches are a slight crop; bush fruits of all kinds are very abundant, and the quality excellent. In the kitchen garden we noticed the best Onions that were seen during our travels. A large bed of Carrots had been recently attacked by the maggot. To check their depredations a dressing of soot 2 inches thick was spread over them, and well worked in with the hoe. The Carrots were at the time of our visit doing remarkably well. Peas were cropping very well, but like our own had grown out of all recognition. In the houses a miscellaneous collection of plants were being grown, such as is generally to be found in medium-sized gardens. Grapes were a heavy crop. Peaches, however, were a light crop. In a small lean-to Tomatoes were carrying a splendid crop of fruit. Here we noticed some admirably well flowered Tuberoses and Lilliums, principally auratum. Melons and Cucumbers are well grown in frames. Outside we inspected a very fine and well grown collection of Chrysanthemums, which look as if they will yield a good return later on. In front of the mansion summer bedding is carried out, and with the exception of Coleus all the plants were looking well. Great credit is due to the able head gardener, Mr. Grant, for the admirable way in which everything relating to this beautiful garden is kept. The next move is to

#### HIGHLANDS, BOLNEY, SUSSEX.

This is the residence of B. B. Hodgson, Esq., and I trust if I enlarge somewhat upon this model garden, that you and your readers will forgive me when I state that it was in this establishment I first commenced my gardening career a good many years ago, under the same talented head gardener, Mr. J. Harding, who still so ably presides over it. I find my old chief busy training some young Gooseberry bushes, the majority of which proved to be Whinham's Industry. This, Mr. Harding considers the best of all Gooseberries; it is an immense cropper, and the large red fruit are very attractive. Apples and Pears here, too, are a very light crop, all other fruit plentiful. A new orchard was made last winter and planted with the most approved varieties. The trees are doing well, and should be able to carry a light crop next year. Abundance of Apple and Pear trees were planted here by Mr. Harding's predecessor, but out of about 1000 trees I do not think there are twenty that crop well. The garden walls were all planted with diagonal cordon trees. True, they cover the wall, and that was about all that could be said for them during my sojourn there, and as far as my observations went they are no better this year. The soil is a strong clay, most difficult to work. Strawberries do splendidly in it; at the time of our visit, July 19th, there was a grand crop of Alice Maud. Noble had been very good I was informed, both on forced plants and outside. It was considered the most attractive but the worst flavoured Strawberry in existence.

No garden appears to be complete nowadays without it has a Tomato house. Since our last visit we find one has been erected here. The plants are strong and healthy, and are, moreover, carrying a marvellous crop of fruit. Adjoining this house are the Melon and Cucumber pits. Several novelties were on trial, and, judging from present appearances, will cause a sensation later on. We next enter the late vinery; this is planted entirely with Black Hamburgs. The Vines are not doing well, and the bunches are consequently small. This house has a very bad aspect, being shaded by large trees until the day is far advanced. Situated in another part of the kitchen garden is a range of three houses; the first is the early vinery, it contains one Foster's Seedling, the remainder are Black Hamburg. This Grape is the favourite here. A fine collection of Ferns is grown under the Vines, and right well they thrive under the shade thus afforded them. The centre house is an intermediate house, and contains a fine collection of various decorative plants. Some most brilliant Coleus arrest our attention. It may interest readers of the Journal to know that Mr. Harding raised The Queen Coleus here some years ago. He has now some very promising

seedlings. The remaining house is devoted to Peaches, and fine crops of fruit were ripening. Near at hand is a span-roof stove in two divisions, containing well grown flowering and foliage plants. Outside vegetables of all kinds were looking well. We were greatly taken with a plot of Sutton's Favourite Lettuce. It is the finest Lettuce I have ever seen; they are very large, solid, and crisp, and show no inclination whatever to bolt; in fact, they decay before they will bolt. Everyone should grow this Lettuce.

Passing the herbaceous borders we find the large well kept lawn judiciously planted with shrubs, trees, large clumps of Pampas Grass, Tritomas, beds of Roses, relieved here and there by a bed of summer bedding plants, while the large clumps of shrubs are margined with ribbon borders. Since our last visit a splendid conservatory has been built adjoining to and accessible from the mansion. The majority of the plants are either plunged or planted out in the borders. Everything in this structure is grown as naturally as possible; at the north end is a beautiful fernery all planted upon the natural system. In addition to the "sundry and manifold" duties of a gardener, Mr. Harding, a few years ago, took charge of the farm; the combined duties render his life a busy one. Supported by a generous employer he has converted what was formerly a commonplace garden into a veritable paradise. May he live long to enjoy the confidence he has won, and the pleasures of the gardens over which he has so creditably presided for so many years.

A naturalised Irishman may be pardoned for wishing to see some of the sights of London and its suburbs. A trip to Kew was therefore taken one day, and our impression, after an absence of eleven years, was that the plants in the houses are wonderfully improved, they have a far healthier appearance than we ever saw them in before. We were very pleased with everything we saw there except the summer bedding between the lake and the large Palm house. The wet season may have been against it, at any rate we came to the conclusion it was not such an "ilegant" affair as we were led to believe.

Another day was devoted to a trip to Forest Hill to see the famous Begonias at Messrs. Laing's. We were fortunate in securing Mr. Laing, junior, for our guide, and we are shown house after house of Begonias from the small seedlings to the famous exhibition plants familiar to all show-goers. Outside we find many thousands of seedlings planted out; some of these would give one a strong inclination to break the tenth commandment. Everything connected with this establishment is in good keeping, and does great credit to the heads of the firm.

The last day was spent in a hurried run to the Victoria and Paradise Nurseries. There we found much to admire in the Orchid department. There were thousands of plants, and not a sickly one among them. Everything is well grown, but the Orchids and magnificent Azaleas and Camellias are particularly noticeable. I made no notes of anything while away; writing from memory only, the sketch is but an incomplete one of the places visited. In conclusion, permit me to thank my guides individually and collectively for the courtesy and hospitality which each and all accorded to—HANDY ANDY.

### ROYAL HORTICULTURAL SOCIETY.

AUGUST 12TH.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters, in the chair; Mr. Veitch, Mr. McLachlan, Mr. Morris, Mr. Wilson, Rev. W. Wilks, and Rev. G. Henslow, Hon. Sec.

*Carnations and Tipula*.—With reference to the diseased Carnations, after a further and careful investigation by Mr. Blandford, he thinks that the Tipulæ were not the cause of the mischief, but "interlopers." He considers the state of the plants as more probably indicating the work of an anthomyid fly, but cannot speak positively on the point as yet.

*Bird's Nest of Rhizomorpha*.—The specimen shown at the last meeting was brought by Mr. Blandford's brother from Argentina, and exhibited by him; not by Prof. Ward, as accidentally mis-stated.

*Phylloxera*.—A report was received from Mr. Barron that the instructions of the Scientific Committee had been carried out at Chiswick with the view of the destruction of the Vines infected. Mr. McLachlan observed that when the same treatment had been followed a few years ago, it proved perfectly effectual, no trace of the disease having appeared since in the same locality.

*Distribution of Plants from Chiswick*.—To guard against the possible extension of Phylloxera, it has been determined by the Council that no plants of any kind, nor Vine cuttings, shall be issued from Chiswick for the present.

*Tomatoes Diseased*.—Specimens of the fruit attacked by Cladosporium and Phytophora were received from Chiswick. They will be forwarded to Dr. Marshall Ward for examination and report.

*Vine Shoots atrophied*.—Mr. Morris called attention to the fact that this, at present, obscure complaint is by no means uncommon. It occurs in other gardens in the neighbourhood of Chiswick, and is regarded by cultivators as very injurious indeed. If it affects the primary shoot in the early stage of growth, it apparently renders the Vine utterly barren. It is suspected as being due to some fungus. It is in the hands of Professor Ward for examination.

*Pinus Strobus, &c., Attacked by Chermes*.—Mr. Morris mentioned that trees in the arboretum at Kew are being injured by some species of Chermes. It has the habit of attacking the upper part of the trees first, and then, apparently by falling on to the lower branches, it spreads downwards. The only remedy appears to be petroleum emulsion well syringed over the trees.

*The Potato Disease.*—The following interesting communication was received from Mr. J. Wright, who records the fact that the immense advantage of high moulding was known so long as twenty-five or more years ago in Lincolnshire. He says: "I first saw it in full and systematic operation in most of the cottage gardens at Appleby, in Lincolnshire. The seed tubers were placed a yard asunder on the surface, and mounded over. When growth appeared they were mounded again, and when the haulm had a tendency to fall down, three or four of the best stems (the weakest being pulled out) were gently bent down, the early leaves not being smothered, and spread equidistantly, and then "crowned" with soil. This "crowning" was repeated at intervals till no more soil could be dug from between the mounds. The object of the cultivator was to get a peck of tubers (21 lbs. from a mound). I have had 18 lbs., 19 lbs., and 20 lbs., but never 21 lbs. I have known practically the whole of the mound crops sound when those on the level were worthless, for the results of this system were far in advance of crops on the level in "bad disease" years. With the introduction of strong upright-growing sorts the mound system fell into disuse. I have known several plants in the middle of a Potato bed tied upright to sticks and kept so, so that the early-formed leaves remain exposed to the light and air. These not only yielded more than twice the bulk of tubers of the surrounding procumbent plants, but the former were sound when dug while the latter were rotten. This was in a wet and "great disease" year. I remember once seeing water standing between the rows in a Potato field because it could not pass through the hard "sole" or "pan" made with the plough. I took a fork and broke up the pan over a rod of ground, and the water rushed away. In no other part of the field were the Potatoes worth digging. With regard to varieties, short-topped Potatoes were the favourites in former days for late or winter use and pig feeding, but the weak-stemmed and foliaged sorts were annihilated by the murrain, only the more robust and coarser surviving, and only one that could in any measure be relied on had stout woody stems that remained upright with large thick leaves. It was known as the "Old London Red." The quality, however, of the tubers was inferior, and Sutton's Red-skinned Flour-ball was an improvement of great value in those days. Ever since varieties of the same upright growth and strong leaf-power have proved to be the best disease-resisters, and, fortunately, the tubers of several of these are now of good quality. Tender-stemmed late-growing varieties which fall and cover the ground not only prevent evaporation from the soil but lose all their best leaves prematurely through want of light and air, the weaker leaves towards the tops of the stems alone remaining (as long as they can) to exhale moisture and carry on the other functions of plant life. For this reason such plants fail to withstand the fungus, which readily takes possession."

Mr. Henslow drew attention to the recommendation of his father (the late Prof. J. S. Henslow) to save the starch from Potatoes which might be so far decayed as to be useless as an article of food, for 75 per cent. of starch can often be recovered from such tubers. Several Suffolk farmers followed his suggestion in 1845, when whole fields were utterly destroyed by the disease. Mr. Henslow would be glad to describe the method to anyone who will communicate with him at Drayton House, Ealing.

*Stylidium graminifolium.*—Mr. Morris called attention to a plant exhibited, a native of Australia. It is well known for the peculiarity of its irritable style. This is at first bent to one side, but when touched at the base suddenly flings itself over to the opposite side of the flower. A similar movement is observable in *Maranta*, a plant allied to the Ginger.

*Cypripedium superbians.*—A plant was exhibited by Malcolm S. Cooke, Esq., of Kingston Hill, of this Orchid, remarkable for having three flowers, two of which bore double labella, while the third was twin-petalled. Dr. Masters observed that the number of malformed blossoms of Orchids which he had received was on the increase; many occurring on *C. Sedeni*, they being always late flowers which are malformed, according to Mr. Veitch's experience. *C. Lawrenceanum* is another which affords many monstrous conditions. Dr. Masters raised the question whether it might not be in many cases an indirect result of hybridisation. *C. superbians* originated from a single plant accidentally included in a batch of Orchids, and though usually regarded as a distinct species, may possibly be (as Mr. Veitch suggested) a natural hybrid.

*Agapanthus umbellatus Malformed.*—Mr. Wilson showed a flowering scape with the superficial tissue "ripped up," as it were, at various places along the edge of the somewhat flattened stem. It appeared to be due to an irregularity in the rates of growth of the tissues, so that the superficial layers had become ruptured at places, and curled outwards.

*Jeffersonia diphylla, Fruit of.*—Mr. Wilson exhibited a specimen of the fruit of this Berberidaceous plant. It consists of a single carpel or "follicle," but instead of dehiscing down the ventral suture, as in *Aconite*, it bursts by a semi-circumscissile dehiscence, the lid remaining attached at one, the ventral side. In most cases of "pyxis" the lid is quite separate, as in *Henbane*, *Plantains*, and *Anagallis*. As the fruit is at right angles to the stalk, it has an extraordinary resemblance to a miniature pipe.

*Daffodil Bulbs with Merodon.*—Mr. Wilks exhibited bulbs of the double maximus, with the grubs of *M. equestre* within them. They destroy the interior of the bulb, but their presence brings about a proliferation, as an immense quantity of bulbils are produced, which would not otherwise be the case. Hence they may be regarded as useful for the purpose of multiplication, though of course accompanied by the destruction of the flower which the original bulb would have borne. It appears that the grub descends into the ground in autumn to form

the chrysalis, the imago escaping in the following summer. Hence the best period for examination of bulbs, in order to destroy the grub, would be July.

*Gloxinia Leaves, Diseased.*—Leaves covered on the under side with light brown spots and patches were received from Bucks Hill, Herts. It was first suggested that overwatering, especially with cold water, might have been the cause, as this is apt to produce similar injuries; but a microscopic examination revealed thrips and acari, which it was thought was no doubt the real cause of the mischief; consequently it should be treated as usual with tobacco powder.

*Haastia pulvinus, Hk. f.*—A fine specimen of this remarkable composite was exhibited by Mr. Richards, obtained by him from Mount Perceval, Anwin, at an elevation of 5000 feet. It forms dense masses of agglomerated woolly capitula with yellow florets.

The next meeting of the Scientific Committee will be held in the Council room on October 14th.

## GOODIA LATIFOLIA.

THERE are many plants suitable for cultivation in greenhouses that are now seldom seen in collections, though they would help

FIG. 20.—GOODIA LATIFOLIA.

materially in increasing the diversity of effect in houses too frequently distinguished by monotony. A neglected plant almost confined to botanic gardens is *Goodia latifolia* (fig. 20), an Australian evergreen shrub, which has been in this country for a great number of years, but has gained a small share of popularity. These old plants are unknown to the present-day gardeners, and when a specimen is exhibited or some old collection is visited when the plants are flowering they attract as much attention as a novelty. This *Goodia* is not a sensational plant by any means, but it is well worth growing. The golden flowers, with a dash of red at the base of the "standard," are numerously borne, though comparatively small individually, and a well developed specimen is a useful occupant of a conservatory or

greenhouse. Both *G. latifolia* and its relative *G. pubescens* require a compost of loam and peat with good drainage, and they can be increased either by seeds or cuttings, the latter receiving similar treatment to Heaths or other hardwooded plants.

**EVENTS OF THE WEEK.**—To-day (Thursday) the Exhibitions at Shrewsbury and Newcastle-on-Tyne are continued, the latter also lasting over to-morrow. On Friday the Devon and Exeter Exhibition is held, and on Saturday, Leith. On Tuesday (August 26th) the Royal Horticultural Society's Committee meetings will be held at the Drill Hall, Westminster, and the Calne Horticultural Show and Floral Fête will be held on the same day.

— **THE WEATHER IN THE SOUTH.**—The bright days of last week led many to hope that summer had come at last and to remain over the harvest, but on Monday the temperature fell and the sky became overcast, and on Tuesday rain continued, though not very heavily, nearly the whole of the day. Yesterday (Wednesday) was fine.

— **ALEXANDER PEACH.**—The late Mr. Wildsmith, who knew what were the best sorts to grow of most kinds of fruit trees, had a very high opinion of this Peach, claiming for it the position of being the best early variety in existence. From his suggestion we planted several trees of it last autumn in south and westerly aspects. They have made capital growth, and we hope for a limited crop of fruit next year.—E. M., *Hants.*

— **FOWLS AND FRUIT.**—Perhaps the following may be of some interest, now that we have to deplore an almost total absence of fruit throughout the country:—A few days ago I visited Mr. Grant, market gardener, at Bracebridge, near Lincoln, who has an orchard several acres in extent. Very little fruit was to be seen, except in one corner about 50 yards square. The trees there were literally breaking down by the weight of fruit, this limited space promising a better supply than all the other trees in the orchard put together. And why? Because about 100 fowls had been kept—wired in—in that space for the last two or three years, and it appears to me that the poultry in question must have destroyed, or at any rate checked, that destructive pest—the caterpillar—in some stages of its development.—ALBERT WIPF.

— **ALEXANDER AND ALEXANDRA NOBLESSE PEACHES.**—Three years ago I wished to get a tree of some size of the Alexander to replace one in an early house, and was asked to take one of Alexandra Noblesse. I was supplied with a maiden tree of the variety wanted, which was planted against a west wall, where it is now, and has ripened a fair crop of highly coloured fruit, commencing about the 25th of July. Many of the fruits had split stones. Is this a failing of the variety, or is it due to the wet sunless season, or for lack of something in the soil? It is now about to be moved indoors.—R. G., *Mid-Sussex.*

— **CLITORIA TERNATEA.**—We have grown this plant during the last seven years, and its brilliant blue flowers are much admired. There are three reasons which prevent its becoming more generally cultivated. First, its great beauty is so little known; secondly, to grow it successfully abundance of heat and moisture are requisite at all times; and thirdly, it is liable to be infested with red spider. Seed should be sown in the early part of March in sandy peat soil, plunging the pots in a brisk heat. If three or four seeds are put into 4-inch pots they can be shifted into larger pots without materially disturbing the roots. A compost of turfy peat and loam, with sand and leaf soil added, will grow this plant well, provided it receives abundance of moisture both at the roots and on the foliage, and occasional applications of liquid manure when the pots are full of roots. Ten-inch pots will suffice for rooting space. The growths need to be near the glass in the stove, where ample light can be secured and trained to wires stretched from rafter to rafter. The best show of plants and bloom which I have yet seen was in the Banana house at Sion, where Mr. Wylhes manages to grow it well.—S.

— **MR. ROBERT OWEN'S NURSERY AT MAIDENHEAD** is worth a visit just now, the Begonias and Pelargoniums under glass, with the Dahlias out of doors, providing strong features of interest. During the time that he has been established in business Mr. Owen has got together a well-furnished and compact establishment, and nothing could excel the cultural excellence of his plants, which are without exception admirably grown, and no plants sent out in similarly healthy and clean condition could fail to give satisfaction.

— **TUBEROUS BEGONIAS** form one of Mr. Owen's strongest features. He has a large and good collection, comprising some hundreds of seedlings, many of considerable merit, and ranging in colour from white to blush, pink, rose, salmon, orange, vermilion, scarlet, and crimson. The majority of the singles, in fact, were unnamed seedlings, and among them many were noted of improved form, colour, size, and habit of growth. Hybridisation is being effected with a view to getting a strain throwing their flowers up boldly on stiff, erect stems. The compact Cyclamen-like habit of growth of Mr. Owen's Begonias is very noteworthy. Among named varieties may be noted Duke of Westminster, salmon-red; Multiflora pendula, rosy carmine, useful for baskets; and the following doubles:—Empress, salmon-pink; General Gordon, light scarlet; Serapis, bright rose, light centre; Leviathan, salmon-rose; Rosette (Owen's) blush, suffused with rose; Eurydice, white, remarkably free; Davis, fl.-pl. superba, and D. fl.-pl. superba alba, both good in habit, and very free. A large number of Begonias are also planted out in beds.

— **IVY-LEAVED PELARGONIUMS.**—Something has been done to popularise these remarkably useful greenhouse and conservatory plants by the excellent collection of them that has been grown at Chiswick this year. Mr. Owen grows them largely at Maidenhead, and he has devoted much attention to improving the section, with remarkably successful results. Many good judges consider his Souvenir de Charles Turner to be the best of the section; it is certainly a beautiful variety, carmine in colour, the flowers large and very freely produced. A good trio of his are Edith Owen, carmine, dwarf and floriferous; Robert Owen, a rosy red, the individual flowers very large; and Beauty of Castle Hill, deep rosy red. It is to be hoped that the culture of this very valuable section of Pelargoniums will largely increase.

— **LILIUM GIGANTEUM.**—I consider this the most stately and beautiful of all the Lilies, yet it is seldom seen in good condition; and as I have been fairly successful in its culture I venture to give the following brief directions founded on the practice I have adopted. Procure good sound bulbs, and select a rather dry and warm corner facing south in which to plant them, using a mixture of loam, leaf mould, and sand, covering not more than 2 inches deep, about the middle of October, well mulching with manure during the winter. Slugs are very troublesome in the spring, and disfigure the plants very much if left alone. A sprinkling of ashes will stop them if afforded every other day. The plant represented in the enclosed photograph was grown from a bulb planted in October, 1887. It has three stems about 8 feet 6 inches high, with from twelve to fifteen blooms on a stem.—T. TEBBY, *Welfield Gardens, Builth.* [The plant closely resembles one grown by Mr. Tebby, which was engraved in the *Journal of Horticulture*, March 7th, 1889, and represents good cultivation.]

— **MR. E. S. DODWELL'S** garden in Stanley Road, Oxford, is a CARNATION PARADISE. Time was when this veteran florist fought London fogs, smoke, and cats in a garden at the foot of a railway embankment in Clapham, and those who visited him there in years gone by will recall the wonderful results achieved under the difficulties engendered by such adversaries. In his pleasant provincial home Mr. Dodwell has surrounded himself with his favourite flowers, and given them such chances of doing themselves justice as few gardens afford. He has thousands of plants, embracing the best known varieties, and, as he tastes deeply of the fascinations of seedling raising, he also has numerous varieties as yet unknown to fame. The majority of the plants are not so severely disbudded as to be rendered useless as decorative objects, each carrying several good blooms. They are grown in 8-inch pots, the surface of the soil in each being covered with oyster shells, probably with the main object of conserving moisture. Structures of a somewhat novel character have been erected for the plants; they are quite open at the sides, but with glass roofs, now shaded with white netting, and the pots are stood on a stage about a foot from the ground, so that the flowers are at a convenient height for examination and inspection. For every Carnation lover, be he florist or not, there is a

rich store of pleasure in this garden. There are Carnations and Picotees all round, and if in looking over it such a prosaic thing as a few rows of Celery are discovered, it is felt that they have crept in surreptitiously, and that with the next batch of seedlings they will have to depart.

— IN 1883 the Californian output of dried Peaches was 600,000 lbs. In 1889 it was 3,200,000 lbs. During the same period Apricots increased in yield from 150,000 lbs. to 2,000,000 lbs., and Prunes from 500,000 lbs. to about 25,000,000 lbs.

— GARDENING APPOINTMENT.—We are requested to state that Mr. W. Guy, late foreman at Eysham Hall, Witney, has entered on his duties as head gardener to F. Townshend, Esq., M.P., Honington Hall, Shipston-on-Stour.

— HELENIUM PUMILUM.—This is a useful, hardy herbaceous perennial, with yellow composite flowers, and grows about 18 inches high. The flowers are about 2 inches across, freely produced, and are useful for cutting. *H. autumnale* is a taller grower, and blooms in September. They may be raised from seed.—E. D. S.

— SHARPE'S QUEEN PEA.—Allow me to say that I consider this one of the best Peas I have grown or seen. It has long well-shaped pods filled with from ten to twelve large Ne Plus Ultra-flavoured peas. I regard it as being equally good for the gentleman's table and the market gardener's basket. I have this year seen it at many shows, and always in the front rank. It is of medium height, a heavy cropper, and of unquestionably good quality.—D. LUMSDEN, *Bloxholm Gardens*.

— ACCORDING to *Le Jardin* it would not do to take ENGLISH DECORATIONS for models, but, it adds, "Our neighbours make very graceful crowns by employing *Arum æthiopicum*, *Lilium Harrisii*, and *Stephanotis floribunda*, plants which are not cultivated at Paris for cut flowers." While acknowledging the compliment, we may add that it would be as unwise for us to follow the nomenclature of our neighbours as it would be for them to copy our methods of decoration. What is meant by *Arum æthiopicum*? Probably the so-called *Arum Lily*, but that is *Calla*, or *Richardia*, *æthiopica*.

— ANNUAL CHRYSANTHEMUMS have been, and still are, in great demand in Covent Garden Market. While calling at Mr. E. F. Such's extensive hardy plant nursery at Maidenhead last week a Journal representative observed a bevy of women at work among a large square of these gay flowers, cutting and bunching them for market. Thousands of bunches have been cut during the past two months, and the demand still continues. There is a bright and cheerful appearance about a bed of these flowers which should render them acceptable in many gardens where they now have no place. The colours vary considerably, some being yellow with a dark central ring, others rich velvety crimson or brown. Treated similarly to other hardy annuals—that is, sown where they are to flower out of doors as early in April as the weather permits, they soon come into profuse and continued bloom.

— CUCKFIELD COTTAGERS' HORTICULTURAL SOCIETY.—This year the twenty-ninth annual Show was held by kind invitation of T. W. Erle, Esq., in his grounds at Mill Hall, on Wednesday, the 13th inst. The cottagers' exhibits were of the usual fine quality, and the neighbouring gentry sent liberal supplies of plants, as did also some half dozen men in the trade, altogether making a good display. Amongst the few special prizes for gardeners most interest was evinced in the keen contest for Messrs. Sutton's prizes for a tray of vegetables. It was decided in favour of Mr. George Stringer, gardener to R. A. Bevan, Esq. (President of the Society), Mr. Manton being a very close second. As if to make up for last year's wet day, the weather was all that could be desired. Mr. and Mrs. Erle entertained the *élite* of the neighbourhood to an "At Home," which was well responded to. In the evening the whole of the garden was thrown open to visitors.

— NEW RECREATION GROUND FOR BEDFORD.—At the request of the Bedford Corporation plans have been prepared by Messrs. W. Barron & Son, landscape gardeners, of Barrowash, Derby, for laying out their Mill Meadows Estate as a public recreation ground. The Estate consists of a long and rather narrow strip of land between the upper and lower streams of the River Ouse, about thirty acres in extent, the whole of which is now subject to floods, with the exception of a few acres at the upper end which have been raised. The scheme which has now been submitted will obviate these floods for the future. Both

the upper and lower stream will be widened, and a weir constructed 100 feet wide, spanned by a rustic bridge. The plans also provide for an ornamental lake about three and a half acres in extent, connected with the upper stream. There is already a public park in Bedford nearly seventy acres in extent, which was laid out and planted by Messrs. Barron in 1884.

— DEATH OF MR. HENRY BENNETT.—Rosarians will learn with deep regret of the death of Mr. Henry Bennett of Shepperton, the famous raiser of seedling Roses, and the announcement will come somewhat as a surprise, for he was a man of apparently robust physique, and by no means advanced in years. Mr. Bennett was at one time a farmer near Salisbury, but subsequently took up Rose growing, with results that must be familiar to the great majority of lovers of the Queen of flowers. As a raiser of Pedigree Roses he had done valuable service to the horticultural community. The great H.P. Her Majesty almost caused a sensation in 1882, and Mrs. John Laing, shown in 1886, is proving of sterling merit. In the following year came his charming Tea Princess Beatrice, and last year his new Tea Cleopatra was offered for the first time. The Polyantha Roses Golden Fairy and Little Dot, also raised by Mr. Bennett, were greatly admired on many occasions when exhibited by him. These are only a few out of many of his seedlings. Mr. Bennett was for some time on the Floral Committee of the Royal Horticultural Society, and a few years ago he journeyed across the Atlantic for a tour amongst American Rose growers, by whom he was very heartily received. He was a man of quiet and unassuming manner, but has left behind him results of patient and persevering work that will not be forgotten for generations.

— DOES FRUIT GROWING PAY?—Fruit growing as a whole, says an American writer, is, without doubt, a profitable occupation; yet the majority of farmers who engage in it are probably disappointed because their expectations have been placed so high that the result must necessarily fall below their hopes. Estimates for future profits are often based upon prices received in the home market for fruits brought from a distance. Especially is this true regarding small fruits. The grower naturally reasons that his home-grown fruit will go into the market in so much better condition than that which is shipped from a distance that it will bring quite as good a price, even if somewhat later in season. But by the time his trees are grown and his fruit is ready for market the conditions may have changed. Some other grower, not so very far away, may have found the excellent opening offered by the same market, and is there as a competitor. His neighbours have been inspired by the same idea at about the same time, and are hardly a season behind him with their products. Or his first crops, owing to imperfect methods of cultivation and handling, knowledge of which can only be obtained by experience, have failed to come up to the high standard of his hopes.

— THE writer goes on to say:—These drawbacks may lead him to the conclusion, if he is a man easily discouraged, that fruit-growing is not profitable. Yet, with all these discouragements, it is strongly probable that his trial acre of Strawberries, or Currants, or Blackberries has paid a better net profit than any possible acre of Wheat, or corn, or meadow. If the acre of fruit has not made a fortune, it has at least indicated the road to a better income. If the crop was Strawberries, the experience gained will enable one to duplicate it to better advantage, with a better knowledge of the most desirable varieties for his locality. Then another acre may be put in Raspberries and Blackberries, which will follow the Strawberries in the season of harvesting and marketing. One each may be put in Currants and Gooseberries, which among small fruits best bear shipping, and will enable the cultivator to test the value of other markets after the home trade has been supplied. Plums, Cherries, Peaches, &c., will follow in their natural order, until the fruit farm, large or small, becomes an accomplished fact, and then, if it is managed as a systematic business, it will be strange indeed if it does not yield a handsome return for the capital and labour invested.

— THE writer concludes:—Fruit is every year becoming more plentiful in our markets, and the increased consumption keeps pace with the supply. If this condition forbids great profits to the individual specialist in fruit culture, it improves the chances for the many, and is for the best interest of agriculture at large. It is better that many should be able to acquire a competence than that one should make a fortune, and it is one of the benign influences of our progressive agri-

culture that we can put within the reach of all classes the most wholesome of foods. Fruits which were once known only as delicacies by the masses are now upon their tables daily in their respective seasons. As our population increases, farmers all through the great eastern and middle sections of the country cultivate mainly the smaller and more delicate products of the soil. The orchard, the garden, and the dairy will take the place of grain fields; and the farmer who plans to follow this line, content with moderate returns, will not be the one to exclaim that fruit-growing is unprofitable.—(*American Agriculturist*.)

— THE POTATO DISEASE IN IRELAND.—A daily paper publishes the following gloomy intelligence:—"At the last meeting of the Westport Board of Guardians, Father O'Connor, P.P., Achill, said the Potato crop in Achill had failed entirely. It had been destroyed by the rains of the past three months. Mr. Denver stated that he had a distinct recollection of the great famine of 1847 and 1848, and he never remembered since then a worse appearance of the Potato crop than this year. The people had no Potatoes nor had they fuel. There were twenty Guardians present at the meeting from every part of the Union, and all agreed that the present condition of the Potato crop threatens a serious famine this winter. A resolution urging the speedy carrying out of a railway line from Westport to Mulranny, with a view to give employment and relieve the distress, was adopted unanimously. The spread of the Potato blight is daily becoming a matter of increasing anxiety to the people along the western seaboard, and each day's rains adds to the probability of widespread destitution along the west coast. The Tuam Board of Guardians have passed a resolution calling on the Local Government Board to inquire into the matter, and similar resolutions, some of them expressing the gravest apprehensions, have been passed by the Newport (Co. Mayo), the Swinford, the Killala, and the Galway Board of Guardians. In the neighbourhood of Glenties (Co. Donegal), Potatoes have been almost completely destroyed. Equally unfavourable reports come from south and west Cork, and altogether the prospect is very discouraging."

— PRIMULAS.—At the last meeting of the Walkley Floral and Horticultural Society, Mr. William Marshall read a short but pithy paper on the cultivation of the Chinese Primula. A few of his remarks applicable to the present time of the year may be noted. The compost for the flowering stage should consist of two parts fibrous loam, one part leaf soil, and one part silver sand, with a dash of Beeson's manure or bone dust. This well mixed will be greatly improved if allowed to remain on the potting bench three or four days before being used. He recommended 48-size pots for the plants, and moderately low potting, to allow of a light top-dressing later on. After potting the plants are placed in a cold frame partially shaded, keeping it closed for a time; after which the lights are removed, but placed on again in the case of heavy rain. About the middle of September they require to be taken into the greenhouse, and that is the time to apply the top-dressing. The free use of charcoal is good for the double varieties. They soon make roots into the top-dressing, and that prevents the swaying about of the plants, and renders them less liable to decay in the winter months. The temperature for November, December, and January should range from 45° to 50°, and as the days get longer 5° higher. Among the best of the double varieties he recommended Marchioness of Exeter, a plain leaved variety with red stalks and beautiful white flowers; White Lady, Alba plena, Prince of Wales, and Snowflake.

— THE PHYLLOXERA IN FRANCE AND GERMANY.—A Paris correspondent telegraphs:—"The phylloxera has invaded the Department of the Marne, whence comes all the French champagne. The Prefect of the Department has sent a report on the subject to the Minister of Commerce, which leaves no room for doubting the evil news. He says that the Vines over a band of country extending from Vincelles to Treloup have a pale yellow tinge instead of their natural green, and that the small fibrous roots are covered with nodosities. The Minister has sent M. Douthe, a professor of agricultural science, who studied the phylloxera in the south of France, to Epernay. He is instructed not to hesitate if he judges well to apply the Government rules for stamping out the disease. The Prefect says the whole country is terrified at the visitation." A Berlin correspondent telegraphs:—"The phylloxera has appeared on the Rhine, and the vineyards at Mayence, Bieberich, Rudesheim, Bingen, and other places are attacked. Great alarm prevails amongst the Vine growers."

— THE 1890 FRUIT CROP IN AMERICA.—The New York *Mercantile and Exchange Advocate* says:—"As the season advances more

complete reports from various sections indicate that the general fruit crop of 1890 will be the smallest for many years, which is to be regretted, from the fact also of a general feeling of depression in agricultural interests throughout the country. One favourable feature, however, is that those having partial crops will find their net results at the end of the year about equal to the seasons of full crops. This has been the result of the present truck crops in the South, which were likewise seriously damaged by the early frosts, but very remunerative prices have prevailed, and the expenses of harvesting and shipping have been materially lessened. This will be true of the fruit crops, and more attention can be given to the gathering and packing, and by thus improving the quality of the shipments their value may be enhanced. The loss most seriously felt by dealers and consumers generally will be that of the Peach crop, which is almost a total failure in all sections of the country except California, and it will be considered a luxury the present season. Its most natural substitute, the Pear, is also a general failure. The same severe frost which destroyed the Peach crops also blasted the Pear buds, and the late reports from many of the large Apple sections in the Hudson River counties and western New York state that a great deal of the young fruit is dropping from the trees, and there are indications of a short product from this principal source of supply. The early crops of fruits, such as Strawberries, Raspberries, and Currants, thus far have been unusually short, and seem to have fruited very lightly, which is also accounted for by the open winter, and then being followed by the severe frost during the time of the early development of the plants." The *American Agriculturist* says:—"Apples appear to be scarce in all sections, and prices are likely to rule high. The supply of new Apples has increased from Virginia, Maryland, and New Jersey. For the small lots arriving 4 dols. to 5 dols. per barrel is about the rate. Evaporated Apples are more inquired for, with sales at ten to twelve cents per pound. The Apple crop of Nova Scotia will be below the average this season. Great ravages have been committed by caterpillars, which have stripped whole orchards. The Canadian fruit crop promises to be a fair one on the whole. Peaches have escaped the warm and unfavourable weather of winter much better than in the great Peach-growing sections in the United States."

### NEPENTHES BURKEI EXCELLENS.

THE beautiful *Nepenthes Burkei* introduced by Messrs. James Veitch and Sons from the Philippine Islands through Mr. David Burke, after whom it is named, proves to be an exceedingly fine addition to a genus exceptionally rich in noble forms. It is remarkable, too, for being the most variable species of *Nepenthes* yet observed, in proof of which two very striking deviations from the type were exhibited by the firm at the meeting of the Royal Horticultural Society on the 12th inst., under the names of *N. Burkei excellens* and *N. Burkei prolifica*. As distinguished from the type, the variety *excellens* (the subject of our illustration) has much larger and somewhat more cylindrical pitchers that are more profusely and more richly coloured. The sharp-pointed lobed rim of the aperture is broader and of a rich chestnut red; the spots on the pitcher are larger and more numerous; the operculum or lid is also prettily spotted, while in the type this organ is almost destitute of spots. In strong contrast to the variety *excellens* stands the variety *prolifica*. This is a dwarfer plant that branches freely, the leaves are smaller, and the produced midrib is longer and more slender, so that the pitchers appear as if suspended by fine threads. The pitchers are much smaller than those of the type as well as those of the variety *excellens*, but are as richly coloured as the latter, especially the operculum or lid, on which the spotting is particularly attractive and distinct. An award of merit was granted last week by the Floral Committee of the Royal Horticultural Society to the variety represented, and we think it more than deserves the honour accorded.

### SOUTH STONEHAM HOUSE.

THIS, the newly acquired residence of S. Montagu, Esq., M.P., President of the Royal Southampton Horticultural Society, has during the last few years become famous in the Southampton district for the excellent Grapes shown at the various exhibitions in the autumn in the southern part of Hants. Since the new owner came into possession on

the decease of the late Captain Davidson, many alterations have been carried out, especially in the grounds about the mansion, and all of them improvements undoubtedly.

The house is built of red brick pointed with stone, standing on an elevated site, from which is obtained a good view of the river Itehen and the hills in the distance. The river runs close past the foot of the grounds, another stream, Monks, connecting with the Itehen at Wood Mill, at which there is a capital salmon pool, which belongs to Mr.

pletely covered with its showy blossoms, which are white with a blood coloured spot at the base of each petal. The effect was grand. *Garrya elliptica* and *Bignonia grandiflora* also occupy positions on the same aspect. On the eastern end is a very fine mass of *Clematis montana* in excellent health, also of *Aristolochia siphon* growing luxuriantly. On the north or carriage front the walls are being fast clothed with various Ivies, conspicuous being *Regneriana* and *Gold Clouded*. A narrow terrace of grass runs along the south and east sides of the house, bordered

FIG. 21.—NEPENTHES BURKEI EXCELLENS.

Montagu, and from which I had the pleasure of seeing a splendid haul of fish taken on the morning of my visit. Something over thirty very fine salmon were caught in one day with the net. To return to the house. This is partly covered with climbers, some of them remarkably fine. For instance, on the south front a plant of *Aimée Vibert Rose* 40 feet high was covered with clusters of pure white flowers from top to bottom—a mass of snowy whiteness, agreeably set off by the deep green foliage. On a southern aspect there is no Rose which can vie with this for freedom of flowering and gracefulness of character. On the opposite side of the doorway is a wonderful plant of the *Gum Cistus*, nearly 20 feet high, and of proportionate width. It was com-

with a broad gravel path, which is kept scrupulously clean and firm. The gravel is a dark red, and 400 loads were laid down last year.

Extending in an easterly direction is a well kept tennis lawn, capable of accommodating four sets of players at the same time. On the south and east end of this piece of grass is a raised narrow mound of shrubs, the back entirely planted with common Laurels, now in rude health, and which are kept closely pruned every year. At the front of these are various kinds of evergreen shrubs, dotted here and there with *Acer Negundo variegata*, the border reaching probably 60 yards. The most remarkable feature about this is the brilliant display made all through the summer and autumn by the masses of *Tropæolum*

speciosum, with which the border seems full; the threadlike shoots entwine themselves amongst the shrubs the entire length of the border, and are covered with brilliant blossoms. This is a sight to be remembered. The northern aspect suits the growth of this *Tropæolum* to perfection. An Ivy-clad building on the same side was remarkable for the manner in which a plant of *Eccremocarpos scaber* was growing at the base; the shoots, profusely covered with its orange red blossoms, came out in great relief in front of the Ivy, which made a capital background and also provided support for the entwining of the plant.

Passing the lawn and good specimens of *Coniferæ* and noble Elms, we find what was formerly a wilderness of Nut bushes and weeds transformed into a Rose garden, the boundary being formed with an herbaceous border edged with white Pinks, which are to be replanted every year to keep them small and neat. This makes a neat as well as a useful edging to such a border. The portion in the centre devoted to Roses mainly grown on the dwarf system is laid out in beds edged with Box, and narrow gravel paths between; the leading varieties were planted and are thriving well.

The kitchen garden is not large, but well situated; the soil, a deep loam resting on gravel, is very fertile, as is evinced by the crops of vegetables and the surrounding trees. A broad path leads through the centre of the garden, and on each end of it is a wide border filled with herbaceous plants. The quarters are well stocked with vegetables and fruit, heavy crops of the latter in all sections, but Plums and Pears, are to be seen, even the latter are represented by a fair crop. The Morello Cherry wall is especially worthy of note; it is situated behind the offices and faces almost south. The wall is 50 yards long, and is furnished from end to end and from bottom to top with trees as even as it is possible to find them, and with a crop of fruit as good as could be wished. The trees are in the best of health, and evidently the treatment accorded is of the right kind.

The glass department is not very extensive, but the houses are well built. A lean-to range running across the north end of the kitchen garden, and facing south, is divided into four vineries, each about 30 feet long, 18 feet wide, and about 14 feet high at the back, the remaining house being devoted to Peach culture. The trees have been newly planted, and are most promising. The Muscat Grapes, mainly of the Alexandria variety, and one or two rods of Madresfield Court, are bearing substantial bunches. Of the Cannon Hall variety there are bunches with extra large berries, but, as usual with this variety, Mr. Hall experiences a difficulty in obtaining a good set. Another house is mainly occupied with early varieties—Black Hamburg, Buckland Sweetwater, Foster's Seedling, Black Prince, Madresfield Court, all in first-class condition. The last house of the range is devoted to late sorts, of which there are some very fine crops of Alicante, Lady Downe's, and Gros Colman, one bunch on the rod of the latter measuring 15 inches long, with large berries. Very fine are the bunches of Alicante considering that each cane carries a full crop of fruit, not a few sensational bunches. The Vines here have to produce fall crops, and as the Grapes are always remarkable for the exceeding high finish at the autumn shows they reflect all the more credit on their cultivation. Ample space between each rod is allowed, so that the foliage obtains abundance of light and air. The border is kept thinly mulched with fresh horse droppings, which induces surface roots in abundance.

Useful lean-to Cucumber and Melon houses are situated at the east end of the range, in which are also grown small stove plants suitable for dinner table decoration. A handsome new span-roofed greenhouse has lately been added, which is 50 feet long, 20 feet wide, and 12 feet high in the centre. This is filled mainly with soft-wooded plants, which are found useful for supplying the house with cut flowers. Mr. Hall deserves great credit for the manner in which every department is managed, and I am indebted to him for his courtesy during a hurried look round this interesting garden.—VISITOR.

## STRAWBERRIES—A VOICE FROM AMERICA.

I HAVE been reading with great interest Mr. Hibberd's paper in *Journal of Horticulture* of July 10th, and am moved to enclose you a chapter of my own from the *Country Gentleman*, which may perhaps have an interest as showing some American aspects of the case. I am particularly interested in what our friend Mr. Hibberd says of the *Fragaria chilensis*, which goes commonly as the "Chili Strawberry." He speaks of the "Chili species deficient often in pollen," and I presume he means under cultivation. Now, I have never been able to find a plant of the "Chili species" under cultivation. Years ago we all thought the lighter fruited forms of the garden Strawberry were to be referred to the "Chili species," but since I have been able to see this species growing naturally in its sub-arctic home, and not merely know it from dried specimens, I have my doubt whether it is in cultivation—some little doubt whether the true species has ever been in cultivation at all.

I may say here, as a student in botany as well as one devoted to horticulture, that I am shy in accepting the numerous "species" as often given us; although we may grant in these "evolutionary" times that what is or what is not a species is neither more nor less

than the opinion of an expert, but we who have travelled thousands of miles over a country of the huge extent of ours, seeing "species" under so many different conditions, may be permitted to have a practical opinion, and we learn by a sort of *coup d'œil* to tell a species through all its varying forms. It is easy to tell a form of *F. vesca*, of *F. virginiana*, and of *F. chilensis*. In such forms as *F. canadensis*, *F. illinoensis*, *F. grandiflora*, &c., I should take no stock. In the Strawberry we usually have several common peduncles from the same plant. The first is rather long, the later one or more scarcely any. Anyone who has seen *F. chilensis* in its native places would scarcely mistake it, for the primary peduncle is seldom less than a foot, and the pedicels of proportionate length. The flowers are also enormously large, and the runners extend to a length unusual even in a Strawberry. The fruit, however, of a prevailing light tint, very little of the rosy character of our Virginian Strawberry, is no larger than the average of our wild Virginian fruit. The leaves are just on the other side of the Virginian. While the *F. vesca* has very highly plaited leaves on the one side of that species, the "Chili" has scarcely any plaits at all. The leaves are thick, smooth, and glossy.

Another reason why I doubt that the true Chili Strawberry in any form is in cultivation, is because reference is made to its occasional tendency to unisexuality. We find the tendency comes with decreasing vital power. The Strawberry loves the cool. When its vital powers are weakened by exposure to heat and drought the pistils are partially suppressed, and stamens are strengthened. The plantation becomes barren, not because the male plants outrun the females by reason of superior vigour, as stated by Mr. Hibberd, for the male plants are not more, but less vigorous, but by reason of the actual loss of power to produce pistils. There is no tendency in the wild "Chili" Strawberry to dioecism, and unless cultivated for a long time under unfavourable conditions in the comparatively favourable Strawberry climate of Britain, I should doubt the genuineness of the "Chili" plants.—THOMAS MEEHAN.

[We are pleased to hear from Mr. Meehan, and readily publish his observations on this subject. The following is the enclosure referred to:—]

### DEGENERACY OF STRAWBERRIES.

Cultivators usually aim at something different from what Nature, unaided by man, desires, and hence we cannot always profit by what Nature teaches in the growth of plants. Still, we can profit by knowledge, though we may not always need to apply it at once. I never knew knowledge to hurt anyone. Even those who deride abstract knowledge are continually seeking it, and go to those—for some such information—whom they profess to hold in contempt.

One of these good, inconsistent souls said to me recently, "Can you tell me why it is that the further we go south the less success we have with the Strawberry? We never see there the fine luscious fruit we get in the Northern States; yet the soil is surely as good there as anywhere, and the cultivator gives them as much intelligent attention." "Because," I replied, "the 'Strawberry spot' prevails on the leaves to such a great extent." But I might as well talk to the winds. What did he know about "Strawberry spot," or in what way it had an injurious influence on Strawberry culture? Perhaps many of us who do not look on science as something pedantic, do not know quite as much about this as desirable. I have thought that a few lines on the subject might interest many readers.

Nature has placed the Strawberry where the earth is cool. Cultivated Strawberries are of three species—*Fragaria virginiana*, *F. vesca*, and *F. chilensis*. I doubt much whether there has been hybridism between these, though so stated in horticultural works. My own opinion is that our common garden Strawberry is *F. virginiana*—the commonest wild species pure and simple. This is confined to the lower lands, and is found in the shade of bushy thickets or among the cool grass in damp ground. *F. vesca* is the parent of the Alpine Strawberries. It is readily distinguished by an acute eye, through its much finer-plaited leaves. This is only found at low elevations in northern latitudes. As we go south, it is only found high in the mountains. Even in Mexico it finds a home in such situations. But wherever it is, its home is in the cool and shade. *F. chilensis* is a pale-fruited species, and it may have the parentage with which it has been credited of some of the pale varieties that used to be found in gardens. I have seen this in its greatest perfection in the far north-west, following in the wake of the receding glaciers. In these cool parts of the northern and southern hemispheres it has found its favourite home.

Now, the cultivator wants the Strawberry where it is not shady, and where instead of the soil being cool it rises to 80° or 90° before the summer is over. The power to resist disease we know as vital power, without understanding precisely what this power is. At

any rate, we say the vital power is weakened under these unnatural conditions, and in course of time the spot follows, and the variety "wears out." We have to get new varieties—not so much to improve the race as to keep it up to a fair standard. We have had hundreds of new kinds the past quarter of a century, all thought by good judges to be better than existing kinds, but really no better, and in many cases not so good as those they supplanted. I doubt if any variety now popular ever gave the yield Wilson's Albany gave—if any give the delicious flavour of Burr's Pine, or any compare in combined size, flavour, and productiveness with such as the good Dr. Knox of Pittsburg gave us in Jucunda. But these kinds are certainly no good now. Our nursery lost a good customer but a very few years ago through selling undoubted Albanys to a customer who ordered them, but could not be made to believe such worthless things were true. The new forms replace those which have degenerated, and will in turn degenerate and be replaced by others in turn. The wild forms in their cool shady homes can resist the "spot." We never see it on them, but after a few years of the heat of open culture their power to resist is weakened, and they fall an easy prey.

What is the "spot?" Botanists know it as a fungus, and name it *Sphaerella fragaria*. Prof. Dudley of Cornell has recently given

FIG. 22.—STRAWBERRY LEAF FUNGUS.

minutely its history, and the annexed cut is from the bulletin of the University.

This minute fungus pushes its way through the cells of the leaf interior, destroying the structure, and we are enabled to see the result of their work in the spots appearing about the time the fruit is setting. The leaves in this condition can only perform half their work, and the result is that the whole system goes down rapidly, and plants from them take the same course.

It is interesting to note how much longer some seedlings will resist the spot than others. Some will become affected in two or three years of open sun culture; others will be fungus proof for a number of years. We have had Sharpless for possibly ten years, and it is free from spot yet, but we do not expect to see it many years longer. But this was a seedling raised in the mountains of Pennsylvania, where from the elevation and consequent coolness the health of the parent plants must have been prime. The further we get south the longer the heat period, and the greater the enervation of the plants.

But, may say the caviller, what do we gain when this science has been taught? We must grow Strawberries even in hot places. We cannot pick out the spot-free places in mountain tops and shaded woods. True, but we can manage often without much great cost to shade the soil. The great success of Knox was as much because he kept the plants in dense rows, and kept a thick coat of straw between to shade the ground, and the most wonderful fruit and wonderful crop on the most wonderful spot-free plants I ever saw was many years ago at York, Pennsylvania, where the owner put several inches deep of corn stalk between the rows.

One can readily understand that in many places where Strawberries are largely grown corn stalks are scarce, and straw not to be had, but in small blocks where excellence is desirable without regard to a little extra cost it is another thing.

In any event it can certainly do no harm to know that great heat is an unnatural condition for the Strawberry plant; that under such conditions the vital power of the plant becomes enfeebled; that when enfeebled, a fungus that causes the Strawberry leaf-spot attacks them; that when the fungus gets a good hold the variety "wears out;" and that in order to keep the race up to a fairly respectable standard new varieties must be continually introduced to replace the enfeebled ones.—THOS. MEEHAN, *Germantown Nurseries, Philadelphia.*

#### AMATEURS' CLASSES.

YOUR correspondent, "Novice," in the last issue of the Journal, directs attention to the necessity for more classes for amateurs in Chrysanthemum schedules, and states that he has been thus far unable to find special provision for amateurs in any schedules that have come under his notice. If he will kindly send me his address I shall be very pleased to forward to him a copy of the schedule of the National Chrysanthemum Society, and therein he will find some nine or ten classes specially for amateurs. These are divided into two sections, one being for amateurs who have no paid assistance, and the other for amateurs who employ not more than one permanent gardener. I venture to hope that such classes will fulfil the requirements of "Novice." I may perhaps state that amateurs form a very large element in the composition of this Society, and that classes of the kind I have referred to are likely to be increased rather than otherwise.—WILLIAM HOLMES, *Hon. Sec., Frampton Park Nurseries, Hackney.*

#### EARWIGS AND CHRYSANTHEMUMS.

EARWIGS should be hunted down by placing for them hiding places where they can crawl into at the approach of day. Besides searching for them among the plants with a light at night, simple contrivances—such as hollow broad beanstalks and folded strips of brown paper—are placed among the plants, and the old and excellent plan of placing a small inverted flower pot, with a little dry hay or moss in it, on the top of a stake near the plants, from which the insects can be shaken every morning, may be adopted.—E. D. S.

#### PLANTS AT MAIDENHEAD.

MR. ROBERT OWEN'S Chrysanthemums are well known in circles devoted to the Autumn Queen. He has a large collection of plants, comprising, perhaps, 3000, and they are at the present time in remarkable health and vigour, having made splendid growth. The majority are arranged in large blocks screened by hedges of Scarlet Runners and Lombardy Poplars. Many are seedlings. The new American variety, Harvest Queen, which (report says) is going to be an improved Elaine, owing to its better habit, is promising remarkably well, and so far as growth is concerned is all that could be desired. Amongst those in bloom the best are Miss Phyllis Broughton, a large white Pompon; Golden Shah, excellent in colour and very free; Goldsmith, also very bright and floriferous; Flora, a useful old yellow; Jacintha, lilac; Mr. Selly, blush, yellow centre; and Mrs. Hawkins.—W. P. W.

#### AN OLD CHRYSANTHEMUM BOOK.

A copy of an exceedingly interesting book on Chrysanthemums was recently placed in my hands, and a few notes respecting it may be worth a little space. The title itself is a curiosity—one of the old style as to length. It runs in this way:—

"A Treatise on the Cultivation of the Chrysanthemum for the Production of Specimen Blooms, with an enumeration of the best Varieties, founded on the experience of G. Taylor. To which is added a list of the best sorts of those let out in 1851 and 1852, with cultural hints and descriptions of a selection of Pompon and Anemone varieties. Second Edition. London: Printed for and published by the Author, Park Street, Stoke Newington, Middlesex."

The book is a small one, consisting of sixteen pages, the printed matter of which is 3 inches wide and 5½ deep; so that it is evident the author did not try to expand his subject unduly. He commences modestly, and observes:—"My desire is to foster that enthusiasm which is now manifest in favour of a flower which is now claiming the attention of the admirers of floriculture—one worthy of being more extensively cultivated for competition, especially as it serves to enhance the beauty of our conservatories and gardens during a season of the year when the greater portion of floral beauty is absent, and to increase a love for its cultivation." Turning to the culture, Mr. Taylor recommended striking cuttings as early after flowering as possible, and advises a cold frame as a more suitable place than a heated structure. Potting is performed at the end of March, employing "one-third yellow loam, one-third rotten turf, and one-third decayed manure, adding sufficient rough sand and grit to make the whole porous." The cuttings were rooted in 3-inch pots and shifted into 6-inch pots and then placed out of doors. The final potting was done at the end of June or beginning of July into 11-inch pots, which were plunged two-thirds in the ground. The liberal supply of water is advised, and the application of liquid manure (the drainage of stable manure) was commenced at the end of August. Guano was also used at the rate of half a pint to eight gallons of soft water; but all supplies of this kind were stopped when the blooms commenced expanding. Disbudding and "taking the bud" are noted, and the ravages of earwigs are described and the beanstalk traps used by the author. It is also mentioned that the varieties which flower early will have to be kept "in the shady part of the greenhouse till the exhibition, which at Stoke

Newington is the third week in November," an unusually late date for a south county show.

Numerous varieties are named for different purposes, some of which may be included. Some of the names are erroneously spelled, but are given here in the form they are printed. For instance, those recommended for outdoor culture are Aristides, Beauty, Campestrani, Clustered Yellow, Duke, King, Princess Marie, Pio-Nono, and Vesta.

A list is also given of varieties recommended for exhibition as cut blooms, which comprises several still well known in their respective classes, with others that have long since disappeared. They are as follows:—Annie Salter, Cyclops, Christine, Defiance, Dupont de l'Eure, Formosum, Gem, Goliah, Lysias, Nonpariel, Phidias, Queen of England, Rabelais, Rebecca, Sydenham, Themis, Two-coloured Incurved, and The Warden.

The list of varieties sent out in 1851 include Arc en Ceil, Guillaume Tell, Madame Corbay, Marshal Ney, Madame Aubry, Miss Kate, Monge (reflex) Plutus, Racine, and Rosa Mystica—fine broad petals, similar in form to Vesta, very light rose.

Varieties sent out in 1852:—Astrolabe, Alcibiade, Christophe Columbe, Fortune, Leon Laquay, Lingot d'Or, Nell Gwynne, Pouche d'Or, and Rautonette.

These are all more or less cupped or incurved flowers.

In a chapter on the qualities of the Chrysanthemum he says: "As regards the properties which constitute a perfect flower, I consider that each petal should be broad, thick, smooth at the end, and a little cupped or curved, but not so as to show the under part too much; the centre should be good, the whole flower forming a little more than half a ball. Vesta, in my opinion, nearest approaches these properties."

As the best light Anemones he names Gluck, Fleur de Marie, Nancy de Sermet, Madame Godereau, Marguerite d'Anjou, Reine Marguerite, Avæoliflorum and Junon.

Several other lists are interesting, notably that of Pompons, introduced in 1846 by Mr. Fortune, comprising Argentine, Asmodée, Autumn, Circe, Colibir, Cybele, Daphnis, Elise Miellez, Gil Blas, Henriette Lebois, La Jongleur, La Ficance, La-nain-bébé, Madame de Merbel, Maria Taillard, Modèle, Ne Plus Ultra, Piquillo, Perfecta, Roi de Lilliput, Sacramento, Surprise, Solfaterre. Pompons sent out in 1852 include Beauty of Toulousaine, Bouquet parfait, Chedevielle, Dame Blanch, Graziella, Hendersoni, La Rousse, La Vapuer, Lais, Phœbus, President Decaisne, Quasimodo.

In the course of the book Mr. Taylor states that in 1852 he was "Awarded at the Stoke Newington show first prize for twenty-four flowers, silver cup, value 5 guineas; also in 1851, first for twenty-four, twelve, and Anemone varieties." The copy I have was only lent, but I should like to procure one myself, either by purchase or exchange.—C.

## HORTICULTURAL SHOWS.

TAUNTON DEANE.—AUGUST 12TH.

THE usual good fortune which attends this Society in respect of weather did not fail it even in this very uncertain season, and when so much depends on this important factor in an open air fête as this Show is, it is of course a subject of hearty congratulation on all sides when the weather is fine; and truly this is the fête day for the beautiful west county town. It is the day of the year. The buildings blossom out in bunting in all directions, the streets are thronged with people, the market place is turned into a fair, and special trains bring a large number of visitors from places as far distant as Bristol, while waggons, vans, and traps of all kinds bring in the country people from the neighbouring villages in large numbers. This must not, however, all be set down to love of horticulture. The grand firework display brings a large number of people, although the dense crowd which thronged the tents in the afternoon clearly showed that a great deal of interest was excited in this beautiful annual display.

The Show was of its usual extensive character. A tent for the open classes, another for amateurs, a third for fruit and vegetables, a fourth for cottagers, and a fifth for table decorations and bouquets, were proofs of the great extent and comprehensive character of the Exhibition. There was also a bee Exhibition, so that everything was done to meet the tastes of the visitors, while the excellent band of the Royal Marines discoursed most lovely music.

Like most other places the character of the Exhibition has considerably altered; one by one the amateur exhibitors of large stove and greenhouse plants are disappearing, and since last year Mr. Cleave of Crediton has given them up. These changes made a considerable difference, and the main stay of this part of the Exhibition was Mr. James Cypher of Cheltenham, whose plants were of the usual wonderful character; indeed, there were miles between him and the second prize.

On entering the large tent the first point of interest was the beautiful stand of Gladioli exhibited by Mr. James Kelway of Langport, our great English raiser and cultivator of that splendid autumn flower, whose culture of twenty-four acres shows to what a great extent his love for the flower has led him. The spikes exhibited were, as is usually the case with him, nearly all his own seedlings. Shakespeare, Horace Vernet, and one or two others being the only French varieties shown. Some of these seedlings were very beautiful, Lady Carrington being especially fine. Three of these were selected for certificates—Mr. Fowler, Semolina, and Dradacia. The first of these is a very novel flower of the Eugène Scribe shade of colour, but larger, finer, and more distinct in its colouring than that fine old flower. It is many years since Mr. Kelway and myself first met, and I do not think that either of

us is one whit the less enthusiastic about the Gladiolus than we were. We differ in some points in connection with it, but certainly not in our love for it. In this large tent so worthily opened by this collection were placed the large flowering stove and greenhouse plants of Mr. Cypher and others, while around the sides on stages the Zonal Pelargoniums, the Begonias, and others, on one side, and the collection of cut flowers, Roses, Dahlias, Asters, Verbenas, Hollyhocks, &c. Mr. Cypher's twelve flowering plants consisted of the following sorts:—Ixora Regina, Ixora javanica, Clerodendron Balfourianum, a large and beautifully flowered plant; Statice profusa, Ixora Jubilee, Erica Austiniana, Allamanda Hendersoni, Erica Irbyana, Bougainvillea glabra, Allamanda nobilis, Ixora Duffi, Erica tricolor coronata, and Stephanotis floribunda.

In the class for six stove and greenhouse plants in bloom, Mr. Cypher was again first with Erica Macnabiana, Statice profusa, Allamanda grandiflora, Erica Turnbulli, Ixora coccinea, and Erica Irbyana; and also in the class for fine foliaged plants, with Latania borbonica, Anthurium Veitchianum, Croton Sunset (a grandly coloured plant), Cordyline indivisa, Croton angustifolium, Kentia Fosteriana, Croton Victoria, Cycas revoluta, Dasylyrion, and another. The centre of this tent was filled up with exotic and hardy Ferns, Lilies, Fuchsias, Selaginellas, and other plants of more or less interest. There is, however, very little change in the plants from year to year. Instead of, however, being placed on the stages, they were on the ground, where they are not seen so well although the flowers are, yet the effect is not so imposing as when they are placed on stages. Nowhere do I see the Zonal and Nosegay Pelargoniums so well exhibited as here. They are one mass of flower; not, as generally seen, large green plants with half a dozen trusses of bloom.

In the second tent, which was devoted to amateurs, the first object on entering was a fine stand of choice plants of Liliams, Begonias double and single, cut blooms of Carnations and Picotees, and decorative plants of various kinds. This made a very imposing display. Here again the large specimen plants in flower, fine-foliaged plants, Ferns, &c., occupied the space, and in fact the whole tent was a repetition on a somewhat reduced scale of the former tent; and here, as there, the cut flowers formed a very special feature. Begonias, especially the doubles, were well represented; those in the first prize lot from Mr. W. H. Fowler of Claremont being remarkably fine. They consisted of Lord Londesborough, Glow, Sulphur Queen, and Taber.

It was in this tent especially that the loss of such exhibitors as Mr. Cleave and Mr. Lawless was especially felt, for although the plants shown by Mrs. Pearce, and others were very good, they have not yet reached the colossal proportions of their predecessors. She exhibited fine well bloomed plants of Phœnocomma prolifera, Anthurium Andrea-num, Clerodendron Baufourianum, and the plants which are usually shown at this season of this year, and we may soon hope to see them equalling in grandeur the plants formerly exhibited.

I have rarely seen Roses shown so well at this season of the year, the Teas being especially good; in fact our Tea champion, the Rev. F. R. Burnside, exhibited a stand of which he need not have been ashamed had he shown at the very height of the Rose season. The H.P.'s were also very good, but as usual at this time they displayed a certain lack of fulness and brilliancy, but withal that there were some excellent blooms. In the class for forty-eight singles Mr. Prince of Oxford was first with the following—Dupuy Jamain, Baron Bonstettin, Prince Arthur, Baroness Rothschild, Souvenir d'Elise Vardon, Queen of Queens, Devienne Lamy, Ulrich Brunner, Mrs. John Laing, Alba rosea, Gabriel Luizet, Maréchal Niel, Comtesse de Nadaillac, Countess of Oxford, The Bride, Madame Hoste, Xavier Olibo, Marie Verdier, Madame de Watteville, Niphotos, Catherine Mermet, Grace Darling, Duke of Wellington, Earl of Dufferin, Alfred Dumesnil, Marie Rady, La France, Victor Verdier, Victor Hugo, &c. Messrs. Cooling & Son of Bath were second in the class for twenty-four trebles. Mr. J. G. Budd of Bath was first with good blooms of Alfred Dumesnil, Her Majesty, Marie Rady, Mrs. J. Laing, Ulrich Brunner, The Bride, Prince Arthur, Alfred Colomb, Marie Van Houtte, François Michelin, A. K. Williams, Alba rosea, Duke of Wellington, and Her Majesty. Mr. H. Phillips was second.

In the amateurs' forty-two singles Mr. S. P. Budd was first with François Reve (?), Eugène Verdier, Earl of Dufferin, Alfred Dumesnil, Marie Cointet, Lady Helen Stuart, Catherine Mermet, Madame C. Wood, Louis Van Houtte, Alba rosea, A. K. Williams, Madame G. Luizet, François Michelin, The Bride, Niphotos, Louis Baron, Mrs. J. Laing, Ulrich Brunner, &c. The veteran florist, Mr. Hobbs, of Lower Easton, Bristol, was second. In the class for twelve varieties, the Rev. F. R. Burnside was first with clean and beautiful blooms of Souvenir d'Elise, Anna Ollivier, Marie Van Houtte, The Bride, Catherine Mermet, Madame Bravy, Hon. Edith Gifford, Francisca Kruger, and Etoile de Lyon. This was a very beautiful box, and excited general admiration. Mr. Burnside also took the first prize for Teas with a still more beautiful stand, consisting of the Hon. Edith Gifford, Catherine Mermet, Souvenir d'Elise (this was a grand bloom of great depth of petal, and perfection in shape), Madame Lambard, Marie Van Houtte, Innocente Pirola, Souvenir d'un Ami, and Madame Burnside—a most lovely stand.

There are several stands of Gladioli exhibited in this tent, but that brought by W. Herbert Fowler, Esq. of Claremont, Taunton, was far ahead of the others. It contained the following French varieties:—Tour du Monde, Atlas, Distinction, Sceptre de Flore, Nereide, and Pollox. As this was Mr. Fowler's first exhibit of this beautiful autumn flower it deserves especial notice. The spikes are long, well formed, and good in colour, reminding one of the days when Mr. Debreë used to exhibit.

Table decorations and bouquets are always a strong feature at the Taunton Show, where a tent is appropriated to them on this occasion. Four tables were arranged, the first by W. B. Cleave, Esq., although it might not meet the requirements of the fashion of the day, which requires the decorations to be low and the flowers all of one colour, was, I think, in the very best of taste. It might have been set up (and I could give it no higher praise) by Miss Cypher in her best days, the main feature being three tall centrepieces most gracefully filled with light and elegant flowers, such as Francoas and Pancratiums, while the bases were well filled with more solid flowers, Dipladenias, &c. The second table was more remarkable for the quantity of lamp and candle shades than for anything else, while the third erred on the side of poverty. Simplicity is all very well, but to decorate a table with the common wild Poppy and with Grasses is a little too meagre for effect. A line must be drawn, and I think it may be drawn at wild Poppies, which, moreover, are objectionable for their smell. The hand bouquets were large, too large I think, but then the wording of the schedule was curious—"a hand bouquet suitable for a drawing room." The first prize was awarded to a very beautiful one, consisting of white flowers. The single stands for dining rooms were also of very great merit, the first with its beautiful bits of *Gloriosa superba*, *Pancratiums*, and *Francoas*, was light and elegant. There were also some very excellent bouquets of wild flowers, some of them very tastefully arranged.

Other cut flowers—*Dahlias* (Show, Fancy, single, and Cactus), *Asters*, and *Hollyhocks* were well shown, especially when the season is taken into account. Some very beautiful *Carnations* and *Picotees* were shown by Mr. H. Fowler, not, of course, quite up to the mark of the well dressed blooms that are set up by Mr. Turner and Mr. Douglas, but still very beautiful; the yellows, such as *Dorothy*, *Mrs. Reynolds Hole*, *Terra Cotta*, and *Agnes Chambers*, being much admired. He also secured the first prize for *Cactus Dahlias*, while in the Show varieties it was pleasant again to see Mr. Hobbs holding his own.

During the many years that I have been permitted to visit Taunton I have seen many changes in the *personnel* of the Society. Presidents, Secretaries, and Committees have all changed, but through all there has always been manifested a kind and courteous consideration for exhibitors and Judges, and never has this been more shown than under its present arrangement. The young and active Secretaries, Messrs. Maynard and Hammet, exerted themselves to their utmost to make all go smoothly, while the Committee worked heartily for the same good end, with the usual result that attends such efforts, good will and kindly feeling all round.—D., Deal.

*Fruit and Vegetables.*—The exhibits of fruit and vegetables by professional gardeners fully filled the large tent, and a grand lot of produce was staged, the competition being very keen throughout. In the premier class for fruit, or that for a collection of ten dishes, Mr. W. Iggulden, gardener to the Earl of Cork, Marston House, Frome, was placed first, having exceptionally well coloured *Madresfield Court* and fairly good *Muscat of Alexandria Grapes*, a good *Smooth Cayenne Pine Apple*, handsome *Blenheim Orange Melons*, fine *Sea Eagle Peaches*, Lord Napier *Nectarines*, *Brown Turkey Figs*, *Hemskerk Apricots*, *Jargonelle Pears*, and *De Montfort Plums*, all in good condition and well coloured. Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Hill House, Langport, was a close second, his collection including good *Madresfield Court Grapes*, *Smooth Cayenne Pine Apple*, *Dymond Peaches*, and fine *Brown Turkey Figs*. Mr. Crossman, gardener to J. Brutton, Esq., Yeovil, was third. There were eight entries in the class for four varieties of fruit, Mr. Iggulden again being placed first; Mr. Daffurn, gardener to Donald Cox, Esq., Weston-super-Mare, being a good second, and Mr. Webber, gardener to G. F. Luttrell, Esq., third, all having excellent dishes throughout. The first prize for a *Pine Apple* was awarded to Mr. Nicholas, gardener to Earl Fortescue, Castle Hill, Devon, who had a grand fruit of *Smooth Cayenne*. The competition with *Black Hamburgh Grapes* was close, great size of berry and good finish gaining Mr. E. T. Hill, Bristol, the first prize. Mr. Iggulden was second, and Mr. Lloyd third, both having excellent examples. In the any other black class Mr. Iggulden led with well finished *Madresfield Court*, Mr. Lloyd being a close second, and Mr. Daffurn third, both having the same variety in good condition. *White Grapes* were not so satisfactory. Mr. Lloyd was well first with *Muscat of Alexandria*, Mr. Iggulden second, and the Rev. Spekes-Mules, third. With any other white variety Mr. Luttrell was first with *Buckland Sweetwater*, Mr. Iggulden second with *Foster's Seedling*, and Mr. C. Cooper, gardener to G. L. Collard, Esq., third. *Melons* were fairly good. Mr. Crossman was first with *Hero of Lockinge*, and Mr. G. Bridge second with the same variety. A handsome dish of *Grosse Mignonne* gained Mr. Daffurn the first prize for *Peaches*, Mr. Crossman being second. The last-named took first for a grand dish of *Pine Apple Nectarine*, the second going to Mr. Daffurn for handsome fruit of *Elruge*. Mr. R. Huxtable, gardener to T. M. Newton, Esq., was first for *Apricots*, and Mr. Iggulden second. *Cherries*, principally *Morellos*, were very fine, but these were quite eclipsed in every way by a grand dish of *Castle Hill Seedling* staged by Mr. Nicholas. *Plums*, *Pears*, *Apples*, and other hardy fruit were also well represented.

*Vegetables* were exceedingly numerous and good in quality, though a tendency to coarseness is always noticeable at the Taunton shows. Mr. Webber and Mr. W. Every were placed equal first for ten varieties, though the former certainly had the best collection. Each had several extra good dishes of popular varieties. Special prizes were also offered for collections of vegetables by Messrs. Webb & Sons and Messrs. Sutton & Sons, each attracting good competition. For the former Mr. H. Moore was first, Mr. J. F. C. Parsons second, and Mr. D. E. Perkins

third. Mr. Moore was also first for Sutton's prizes, Mr. G. Lock being a good second, and Mr. G. Ricks third. *Tomatoes* were remarkably fine. Mr. Wills was first for a single dish, and Mr. G. Lock second, both staging *Perfection*. Messrs. Lloyd, Crossman, Drayson, Madley, Turner, Bryant, and Gibbs also exhibited successfully in the various other classes for vegetables.

#### MAIDENHEAD.—AUGUST 14TH.

THE twelfth annual Show of the Maidenhead Horticultural Society was held in the grounds of Curtisfield, Maidenhead, on the above date. Without displaying any features of a special character, it brought together a collection of exhibits, both flower, fruit, and vegetable, of good average merit. Flowering and foliage plants, cut flowers, fruit, and vegetables were all well shown. It would appear from the annual report that the financial position of the Society is not entirely satisfactory, the balance-sheet showing a deficit in 1889, following a still more serious one in 1888. It is to be hoped that the present year will yield an improvement, as a continual "down grade" movement in money matters cannot always go on. Possibly the unsatisfactory financial position may have led to economy in the matter of schedules, for it proved a difficult matter to obtain one from the Secretary, Mr. O. King. Another official, however, proved very obliging, and is thanked for his courtesy. The band of the Royal Horse Guards was in attendance during the afternoon, and there was an attraction for feathered fanciers in a poultry exhibition. The principal awards in the horticultural section are appended, but the amateurs' and cottagers' classes, though interesting locally, were too numerous to be dealt with.

*Groups* formed a very pleasing feature in a large tent devoted to flowering and foliage plants. Two classes were provided, the first prize in the larger (12 by 10 feet) being won by Mr. Aitken, gardener to Major Meeking, Riching Park, Slough, whose arrangement, though perhaps a little overburdened with bloom, was undeniably attractive. The popular Maidenhair Fern formed a cool groundwork, from which sprung *Gloxinias* and *Crassulas*, table plants comprising *Vallota purpurea*, *Lilium speciosum*, *Celosia pyramidalis*, *Tuberoses*, *Gladioli*, and the graceful flower spikes of *Francoa ramosa*. Small-leaved *Crotons* were also used, but a little too freely for securing a perfect effect. Altogether quieter in tone was the second prize group of Mr. W. H. Austin, Chalvey, Slough, but here the other extreme had been gone to, and the cultural merit of the various plants used was much in the rear of the winning group. Mr. T. Lockie, gardener to G. O. Fitzgerald, Esq., Oakley Court, won in the class for group 6 feet by 5 feet, but this was altogether too lumpy and packed. The plants were well enough grown, the *Gloxinias* in particular being very fine, but the mass of colour, both of flower and foliage, was too heavy. A prettier group came from Mr. D. Paxton, gardener to the Hon. C. S. Irby, Hitcham Grange, Taplow, but it was a little too flat, and only second prize was awarded, while the third prize collection of Mr. W. R. Williams, gardener to J. M. Richardson, Esq., Seymour Court, Great Marlow, was arranged on very primitive lines. Great as the advance has been in this class of work, it is evident that very much remains to be learned.

*Flowering and Foliage Plants* were a very good display on the whole. Amongst the former *Tuberous Begonias* showed the marked improvement that has taken place in these plants of late years, and also their great value for decorative purposes. Six plants were asked for, and the first prize went to Mr. Lockie's specimens, beautiful plants which did him very great credit. They were about 2½ feet high from the edge of the pot, and the same in diameter, well clothed with clean substantial foliage from top to bottom, and admirably bloomed. The varieties were not named, possibly they own no names, but they were not the less highly attractive. Mr. A. Deadman, gardener to G. Higgins, Esq., Ray Park, was second with smaller plants, but similarly healthy and well flowered, and the varieties were good. Mr. Goodman, gardener to C. Hammersley, Esq., Abney House, Bourne End, was a close third, and judging from the character of his exhibits, as well as the others, *Begonias* would seem to be well grown in Berkshire. *Fuchsias* were correspondingly good, large vigorous plants, freely clothed with flowering growths from Mr. G. Hopkins, gardener to J. W. Burrows, Esq., The Elms, Cookham, winning somewhat easily. The useful old varieties, *Mrs. Marshall*, a good plant, but only in bud, *Rose of Castile*, *Try-me-Oh!* and *Warrior Queen* were among them. Smaller plants from Mr. Masson, gardener to Miss Goulden, The Grove, Cookham, took the second prize. They were more formally trained than Mr. Hopkins' plants, for which they were no better, but had an advantage in being a little further advanced in bloom. Mr. Paxton followed. Mr. Hopkins also won with *Coleuses*, but with *Cockscombs* Mr. Lockie and Mr. Masson could not be separated. The former had the smoothest combs, the latter the dwarfest plants, carrying splendid foliage as well as heads. Mr. Lockie, a good cultivator, won again with foliage plants, his *Dieffenbachias* (*picta* and *magnifica*) being splendid, and *Dracæna Lindenii* excellent, while plants of *Acalypha macrophylla*, with their warm foliage of various tints, showed up well. *Stove and greenhouse Ferns* were finely shown by Mr. Aitken. His *Gold and Silver Ferns* told splendidly; *Gymnogramma Alstoni* (gold), and *G. peruviana argyrophylla* (silver) being a beautiful pair of plants. He also won with six stove and greenhouse plants, large and well-flowered specimens, and with a single specimen plant. These huge plants do not, however, command the attention that they once did. *Zonal Pelargoniums* came from Mr. Aitken, well grown and finely flowered, but a little past their best, the varieties being *Constance*, the valuable double *F. V. Raspail*, *Royal Osborne*, the fine double white *Le Cygne*, and *Daphne*. Mr.

Hopkins was second. Mr. Lockie had the best table plants, Messrs. Aitken and Williams following. Messrs. Sutton & Sons of Reading showed a collection of their Gloxinias, the plants having been raised from seed in February; each was a sturdy little plant, bearing a pair of good flowers.

*Cut flowers* occupied one side of the large tent, and formed a very beautiful display. Mr. J. Walker of Thame was first with Roses, Messrs. J. R. Tranter, Henley-on-Thames, and E. F. Such, Maidenhead, following. Mr. Walker also won with both Show and Cactus Dahlias, the former comprising Colonist, Geo. Barnes, J. T. West, Purple Prince, M. Chévère, Flora Wyatt, Jas. O'Brien, Miss Cannell, Hope, Jas. Vick, Mrs. Gladstone, and John Wyatt; the latter, William Pearce, Miss Sherriff, Lady M. Marsham, Charming Bride, Mrs. Hawkins, and Empress of India. Mr. J. Davis, gardener to Maj.-General Davies, Lowood, Maidenhead, also had a very attractive stand in the Cactus class. One of Mr. Walker's best exhibits was a stand of Zonal Pelargoniums, single trusses, not in competition. His Zinnias and Asters, with which he was also first, were likewise very good, especially the former, minor prizes in these classes going to Messrs. W. Pond, W. Wheeler, Tranter, Davis, Such, Hopkins, W. H. Austin, and Paxton. In the class for twelve bunches of hardy flowers the majority of the exhibitors contravened the schedule, staging Asters, Stocks, and Zinnias, Mr. Masson being perhaps the chief offender. The Judges, however, accepted the situation, and awarded the prizes according to the merits of the stands, Mr. Masson, who had an undeniably beautiful collection of flowers, being therefore placed first, Mr. W. H. Castle second, Mr. E. F. Such and Mr. Austin equal third. Mrs. Broughton, Norfolk Road, Maidenhead, was first with a bridal bouquet. Miscellaneous cut flowers comprised stands of Pansies and Roses from Mr. Such, also a collection of herbaceous plants, for which he was highly commended; stands of their beautiful Begonias, from Messrs. Laing and Sons, Forest Hill, also highly commended; a fine collection of flowers from Mr. R. Owen of Maidenhead—including a stand of his fine single Begonias (highly commended); and a display of Carnations, Phlox Drummondii, Petunias, Hollyhocks, and other flowers from Messrs. Sutton and Sons, Reading, which were also highly commended.

*Fruit* was well and extensively shown. Mr. Goodman won with six dishes, including excellent clusters of Black Alicante Grapes and a good Victory of Bristol Melon; Mr. Osman, gardener to S. J. Barker, Esq., Ottershaw Park, Chertsey, being second, and Mr. Aitkin third. Mr. Paxton won with a smaller collection, and also with dishes of outdoor fruit, his Brown Ischia Figs and Moorpark Apricots being very good indeed, Mr. Goodman following here. The latter won with both Nectarines and Peaches, the former a good dish of Elruge, the latter a correspondingly excellent dish of Bellegarde, and then followed up with these successes by victories both with Melons (Hero of Lockinge) and Plums (Jefferson). Mr. Osman, a good Grape grower, was first in all the Grape classes, one being for Black Hamburgs, a second for any other black (Alicante), a third for Muscats, and a fourth for any other white (Buckland Sweetwater), a result of which he has reason to be proud. Mr. Davis won with dessert Apples, having a good dish of Irish Peach, and Mr. Aitken with kitchens.

*Vegetables* were well shown for the Society's prizes, Messrs. Lockie, C. J. Waite, Goodman, Aitken, J. Knight, G. Davis, G. Quelch, W. H. Castle, Paxton, J. Dawe, G. Head (Winkfield), W. Pond, J. Hanch, A. Deadman, T. Willis, G. Martin, W. Thatcher, W. R. Williams, W. Wheeler, A. Simmons, G. Hopkins, J. Burdett, and W. H. Austin all showing successfully; but perhaps the most noteworthy exhibits were in the classes for Messrs. Sutton's and Webb's special prizes. These comprised fine examples of the various specialties of the two firms. In each case six kinds were asked for. Messrs. Sutton's chief prize was won by Mr. Wilkins, gardener to Lady Theodore Guest, Hensbridge, Blandford; the second by Mr. C. J. Waite; and the third by Mr. T. Lockie, Sutton's Perfection Tomato, Satisfaction Potato, and New Intermediate Carrot being remarkably well shown. Their Tomato, it may be added, was also finely shown for the Society's prizes. Mr. Wilkins also secured Messrs. Webb's principal prize, their minor awards going to Mr. T. A. Beckett, Cole Hatch Farm, Amersham (second) Lockie and C. J. Waite, the two latter being placed equal third. Webb's Gem Carrot was very finely shown, also Rousham Park Hero Onion.

#### WALKLEY (SHEFFIELD) SHOW.

THE ninth annual Exhibition of the Walkley (Sheffield) Amateur Floral and Horticultural Society was held on Thursday, August 14th, at the Church Schoolroom, Walkley. The Show was opened at two o'clock by Councillor B. Gleadhill, and he was supported by Councillor J. Sutton, the Vicar (Rev. T. Smith), the President (Mr. T. B. Hague), the Secretary (Mr. M. Taylor), the members of the Committee, and others. Taking the Show altogether, it was about equal to many of those held in former years, but the unfavourable weather of the last few weeks had the effect of preventing good exhibits of Dahlias and Roses, and vegetables were not quite up to the usual standard.

Some creditable groups of plants were arranged, Mr. F. C. Barnes taking the first prize with a group of flowering and foliage stove plants. Mr. Jarvis was second, and Mr. Swindin third. Mr. H. Broomhead sent a group of double and single Fuchsias, not for competition. The first prize in those for competition was awarded to Mr. Jarvis. For foliage plants Mr. G. Walker was first, and in the class for Ferns, in which he was also first, he had two splendid examples of the Squirrel's Foot Fern (*Davallia bullata*), and *Pteris scaberula*. Amateurs growing plants like these deserve to be commended. Mr. M. Taylor had some

splendid *Caladiums*, for which he took first prize, including the pretty little *C. argyrites*, good for table decoration, also the best of the stronger growing varieties. Mr. T. B. Hague showed a good collection of hardy cut flowers, including Cactus Dahlias, Phloxes, Gladioli, Poppies, Carnations, and Picotees. *Campanula fragilis*, a good window flowering plant, was shown in excellent condition by Mr. Jarvis. The largest foliage plant in the Show was exhibited by Mr. Laughton. It was a handsome specimen of *Yucca aloifolia variegata*. Good Pansies were getting scarce, but the best were shown by Mr. Carlton.

In the vegetable classes, the first prizes were taken by Messrs. Jarvis, Wood, Turner, Maiston, Wilson, and Jackson. The annual show always brings to a close the mark-winning year in connection with the bi-monthly floral meetings of the society. Members have a great opportunity at the annual exhibition to make up for lost time by exhibiting largely and gaining a considerable number of extra marks. In addition to exhibits staged at the Show the gardens and greenhouses of the members who wish it are inspected and judged. The two most successful members in gaining marks of merit during the year are Messrs. Jarvis and Barnes, the former heading the list with 661, the latter being over 100 behind him. Many other members hold very respectable positions below them, which no doubt they will endeavour to maintain and improve upon another year.

#### NATIONAL CO-OPERATIVE FESTIVAL AND FLOWER SHOW.—AUGUST 16TH.

THE National Co-operative Flower Show and Exhibition of Industries grows yearly in magnitude. Five years ago the first fixture of the kind was held at South Kensington; on Saturday last one of the large naves at the Crystal Palace and several passages adjoining the side courts were filled with workmen's flowers and produce, and various exhibits from professional gardeners. In 1888 over 3000 entries were received; in 1889 the number was 4191, and this year it has increased to 4546. The following were the entries in the workmen's classes:—Vegetables 1777, flowers 1296, fruit 209, women's and miscellaneous exhibits 201. Of Potatoes there were 321, Beans 254, Peas 120, Onions, Shallots, and Leeks 256, Garden Turnips 90, Vegetable Marrows 84, Beet 82, Lettuces 81, Carrots 77, Radishes 71, Cabbages 60, Cucumbers 60, Tomatoes 42, Parsnips 39, Celery 37, and Cauliflowers 23. The task of judging these was a by no means light one, and in many instances extra prizes had to be awarded to do justice to the exhibits.

Individually considered the vegetables were highly meritorious. Potatoes were as fine as they could possibly be, indeed many were too large, but this is not of so much importance in the case of cottagers as in that of professional gardeners. Nearly all the best varieties were represented, together with many new sorts. Spring Onions were wonderfully fine, being excellent alike in size and maturity. Such fine bulbs could only be obtained at this time by sowing under glass in January or February, treating them like bedding plants, and planting them out when the weather was favourable. Autumn Onions were perhaps as fine as have ever been seen. Shallots were also splendid. Last year there was but one section for these, and single bulbs of the large variety took all the prizes. This year there were two sections, one for clusters of the small kind exhibited as grown, and the result was much more satisfactory. Carrots were superbly shown in each of the three sections, those of the Early Horn, Intermediate, and Long Surrey types respectively. They were of large size, good colour, and very clean. Beet was admirable both in size, cleanliness, and colour. Turnips were good, but included some that were a little coarse. Peas were large in pod, but not well filled, which is somewhat general this season. In the class for "One and All" Exhibition Marrow, a variety of the Duke of Albany type, there were forty fine dishes. Beans were very fine in all the sections, as were Vegetable Marrows, but some of these were rather old. Lettuces were fine in both sections, Cos and Cabbage; and Leeks, considering the earliness of the season, were very good. Celery and Cucumbers were of about average merit, Cabbages large, fresh, and good; but Cauliflowers, with the exception of one or two dishes, were too far gone and somewhat open. Collections of herbs were very good, but there was a noticeable lack of Parsley; no doubt many cottagers consider this too common to be worth showing, but that is a mistake; it ought to be in every collection.

Cut flowers were well and largely shown; on the whole they were better than last year, but there was room for improvement in the bouquets. Fruit was the weakest portion of the Show. With the exception of Red Currants and Gooseberries it was poorly shown, Apples, Pears, and Plums being small.

The total number of classes in the schedule was upwards of 240, and with the enormous number of entries referred to above it would have been futile to attempt to take the names of the prizewinners. The character of the Exhibition has therefore been briefly sketched. It was organised by Mr. E. Owen Greening, the Managing Director. Mr. William Broomhall admirably fulfilled the duties of General Secretary.

Upwards of 34,000 persons visited the Palace—a good return for enterprise in advertising, and the best testimony of the attractiveness of the Exhibition.

#### [DUNMORE EAST.

THOUGH Dunmore East is situated beautifully as a seaside fashionable resort, the country around is by no means fertile, nor the residences of the gentry (where high-class gardening could be carried to perfection) at all numerous, yet year after year, as detailed in the *Journal of Horticulture*, a show is held, highly creditable to the garden

proprietors, and still more to the gardeners. Does not this fact bring to shame more favoured localities where all the facilities and means to boot exist in profusion? The Show was held on the 15th inst., Lady Day, a general holiday in this country, and vast numbers of persons were brought down from Waterford and elsewhere by the steamboats, and as there was a lively breeze the upwards of twenty miles sail down was most enjoyable. A splendid marquee was used by the Committee by "Unite," London, and placed in the beautifully situated little Park right over the bay, affording a grand panoramic view, the county Wexford being on the other side, with Hook Head, on which is the grand marine residence of the Marquis of Ely, Loftus Hall.

The Committee is happily constituted of proprietors, gardeners, and clergymen of both denominations, having for President and Vice-President the Hon. Dudley Fortescue and Lord James Wandesforde Butterworth, with the Rev. J. D. Forde, the courteous Secretary and Treasurer, assisted by Mr. Harvey. As usual the exotic Ferns, of which there were magnificent specimens several feet through, of *Adiantum gracillimum*, *A. farleyense*, *A. formosa*, and *A. trapeziforme*, with an immense *Gymnogramma*, from Somerville, the Palms from the splendid marine residence of Mrs. Malcomson, Villa Marina; the Crotons, Dracenas, and ornamental foliage plants; the fruit and vegetables—the latter section largely filled—with contributions from the rector, Rev. Mr. Gilmour; from Lady Carew, Woodstown; Sir Robert Paul, and others, were conspicuous features. The following is merely an outline summary of the prize list.

In the section for plants in which the competition was open, the President, the Hon. Dudley Fortescue (gardener, Mr. J. A. Calthorpe) won the first prize for exotic Ferns, for plants of ornamental foliage, for *Coleus*, finely coloured, Tree Ferns, *Caladiums*, very rich in venation, and for a specimen plant, the Judges having selected an immense *Adiantum gracillimum*. Mrs. Malcomson, Villa Marina and Ballinakill (gardeners, Messrs. D. Murphy and Noonan respectively), showed well in most of the classes, coming first for Cockscombs (good), double Zonals and native Ferns, and second for exotic Ferns, ornamental foliage plants, and single Zonals.

In the cut flower department there was more competition, some of the exhibits having much merit, Lady Carew, (gardener, Mr. O'Brien) having first for double Dahlias, Asters, six *Gladioli* spikes, distinct, and hand bouquets, with second for African Marigolds; Sir Robert Paul, Ballyglan, showed well, coming first for twelve single Dahlias, twelve Asters, distinct, African Marigolds, and for single Zonals in trusses of three. One of the sights in this section was a trophy stand of about a score spikes, each distinct, of *Gladiolus gandavensis* from Lord James Butler, one of the most striking objects at the Show, very finely developed spikes too. Mr. Calthorpe won prizes for Zinnias, Pansies, and six *Gladioli* spikes, Mrs. Jacob for single Dahlias, hand bouquets, Asters, and first for Pansies.

In fruit Mr. Calthorpe showed a splendid specimen of Sutton's Triumph Melon, easily winning the first prize; and the same for Black Hamburgh and Alicante Grapes, magnificently shown. He was equally successful in white Grapes with large bunches of Muscat of Alexandria, and kitchen Apples. Mrs. Malcomson's Black Hamburgh Grapes were not quite finished; she was, however, a capital first for Barrington Peaches and Morello Cherries. Lady Carew scored first for Victoria Plums and dessert Apples, and second for Pears; Mrs. Jacob being first for Pears, and Miss Armstrong first for Gooseberries.

The entries for vegetables were more numerous, and went chiefly to Lord James Butler, Hon. Mr. Fortescue, Sir Robert Paul, Lady Carew, Mrs. Malcomson, Mrs. Jacob, and Mr. Dobbyn, all classes being well filled, as many as seven and eight entries; all good. A Committee of ladies judged the table decorations. There was also a children's class and an outdoor window gardening competition. Mrs. Goff of Glenville, near Waterford, had a magnificent, upwards of 7 lb., Melon (Sutton's Triumph), and spotted and marked *Gloxinias* not for competition; and Mrs. Alcock a fine specimen *Campanula*. Too much credit cannot be given the Rev. Mr. Forde for the perfect arrangements of the Show. General satisfaction seems to have been given by the Judges, who were Mr. Hugh Crawford, Kibronagh Gardens; Mr. Thomas O'Shea, Clonmel Asylum Gardens; and your correspondent—W. J. MURPHY, Clonmel.

#### FRUIT FORCING.

**PEACHES AND NECTARINES.**—*Planting Trees for Early Forcing.*—If houses have to be planted or old trees replaced, and fruit is wanted next season at an early period, the trees should be planted as soon in late summer or early autumn as the growth is perfected, the wood and foliage ripe, and the buds developed. The most suitable trees are those that have been grown two or three years under glass, and are well furnished with branches and bearing wood, having been lifted annually or biennially. These will lift with fibrous roots, and if of home growth with balls of soil speedily becoming established. Trees grown three or four

years trained to walls, and that have been lifted each year or every second one so as to secure sturdy well matured wood, are eligible, but trees that have been grown in the open ground are not suitable for planting with a view to having fruit next season, especially at an early period. Those trained to walls and intended to be moved to houses for starting early ought now to have the soil taken out as deeply as the roots, digging the trench around them one-third the distance from the stem that the trees extend. The trench so made should remain open for a fortnight or three weeks, when it may be filled again, care being taken not to allow the trees to want water whilst the trench is open, not giving more, however, than is necessary to prevent severe flagging. This will only be necessary for trees having a tendency to late growth, or where any doubt exists as to the maturity of the wood and buds. It will effectually check the growth and ensure its ripening, whilst it will materially assist lifting with soil and a mass of fibrous roots. The trees for early forcing should be planted at the end of September, and lifting early forced trees should commence as soon as the leaves give indications of falling. It will not matter about a few sappy laterals; their softness, if they survive, will tend to the manufacture of roots. Soil should be obtained in readiness, so that work of this kind can be performed with the utmost promptness and dispatch. Clean drainage too in different sizes should be provided. The soil may consist of any good loam, preferably strong and calcareous, the top 3 or 4 inches of a pasture overlying limestone or chalk being best, especially if interspersed with flints. Such will grow Peaches and Nectarines to perfection without any admixture. Light soils are the worst. Those that are sandy should have an addition of a fourth of clay or clayey marl, finely divided and mixed with the soil. If this cannot be had, chalk may be used to the extent of one-sixth, and the border must be made compact. Peaches will not thrive in light open soil. Very stiff soil may be improved by an addition of brick and old mortar rubbish.

**CUCUMBERS.**—Add fresh soil from time to time as the roots protrude from the sides of the ridges or hillocks, encouraging autumn fruiter to make a strong but healthy growth, affording plenty of water at the roots, but not too much, with a moist genial condition of the atmosphere by syringing at closing time, and damping available surfaces occasionally. Sufficient fire heat must be employed to prevent the temperature falling below 65° at night, and to maintain it at 70° to 75° by day. Old plants should have the exhausted growths cut away and others thinned where likely to be crowded, so as to admit light and air, securing a sturdy solidified growth and a succession of bearing wood. The syringe should be regularly employed about 3 P.M., and if mildew appear dust with flowers of sulphur in the evening, maintaining a somewhat dry freely ventilated atmosphere. Black aphides are sometimes troublesome. They are best exterminated by fumigation, which must be done carefully with good tobacco paper. The operation is most efficacious when performed in the evening and repeated early the following morning. The foliage should be dry, the smoke delivered cool, and free ventilation afforded afterwards.

**MELONS.**—Let the latest plants be placed out at once. Train with a leading shoot until it reaches two-thirds across the trellis, then pinch out its point, rubbing off the laterals up to the trellis, and then every alternate one on opposite sides of the primary growth. Maintain a temperature of 65° to 70° at night, 70° to 75° by day, 80° to 85° from sun heat, closing early so as to increase to 90° or 95°. Do not stop the laterals unless they fail to show fruit at the second or third joint. Weakly plants should have the first show of fruit removed, stopping the laterals at the second or third joint, relying on the sub-laterals. Early ventilation with plenty of light will secure sturdy, thoroughly solidified growth. When Melons are ripening no water should be given at the roots, and air should be freely afforded. A little ventilation constantly will prevent the deposition of moisture on the fruit and insure its ripening without cracking; but in dull weather it will be necessary to have gentle warmth in the pipes to secure the requisite temperature. Plants showing fruit should also have a rather warm and dry atmosphere, ventilating freely so as to have the pollen and pistil in the right conditions for fertilisation. This should be attended to daily as the flowers become fully expanded. Stop the shoots at the time of fertilisation one joint beyond the fruit. Afford every encouragement to plants swelling their fruit, watering and affording liquid manure at the roots as necessary. Keep the laterals well in hand, and let the principal leaves have due exposure to light and air. Maintain moisture by damping available surfaces when they become dry, syringing and closing early in the afternoon.

Late plants in pits and frames are swelling the fruit freely. Earth up the roots if necessary, but late plants on manure beds do not require a large amount of soil. Generally they grow too much, which can only be prevented by a firm condition of the soil and timely attention in ventilation. Keeping the growths thin is also necessary to secure sturdy stems and firm textured foliage, the laterals not being allowed to interfere with the principal leaves. If the weather be cold or dull afford good linings and admit a little air, as nothing is so fatal to quality in Melons as a close atmosphere. Sprinkling should only be practised on fine afternoons. If black aphides attack the plants fumigate moderately on two or three consecutive evenings. Examine them frequently for canker, promptly applying quicklime to the affected parts. Gradually withhold water at the roots and moisture from the atmosphere when plants are ripening their fruits, and if a little extra heat be afforded by linings of sweet material so as to admit of a free circulation of air the quality of the fruit will be enhanced, and this will often prevent cracking.

## KITCHEN GARDEN.

**TOMATOES.**—The season so far has not proved favourable for these in the open air, but they are as good as usual under glass, and as the open air crops will not be a great success extra attention should be devoted to those under glass. Plants that have been restricted should be allowed to make a fresh leader, and go on for some distance to form a few more clusters of fruit for late ripening. If the main stem of any is exhausted and shoots are growing from the base, encourage these by cutting the old stem down. A second crop will be quickly secured in this way. All old plants that have filled their pots, or limits, with roots should have a firm top-dressing put to them, consisting of half loam and half manure. Cut the fruit as it begins to ripen, as if it is allowed to hang on the plants long after it is ripe it will retard the swelling of the others. Do not attempt to force the plants by keeping the house close, as they will make more progress if grown with a free circulation of air.

**WINTER SPINACH.**—This is one of the most useful crops anyone can grow. It is capable of filling up many gaps in the kitchen, and one or more good breadths of it should be grown in all gardens. It may be sown at once, and again in September, but the present sowing may prove as good as any, and those who can only accommodate one crop should sow now. The prickly variety is usually preferred, though many gardeners find the broad-leaved variety equally hardy. Both may be tried. The crop may follow Potatoes or Peas. The seed should be sown in drills 15 inches apart and 1 inch deep. We gather from our present sowing in the early winter, and the plants grow luxuriantly again for a further supply in the spring.

**THE FIRST MUSHROOM BEDS.**—We can hardly expect open air Mushrooms to be plentiful this autumn, but should they be so the supply will not go far into October, and where Mushrooms are required then and during the end of the year the first beds must be formed by the end of August. It is somewhat difficult to get the most suitable materials at present, as most of the horses are on grass, but wherever a few barrow or cartloads of horse droppings can be collected a bed may be formed. There is little difficulty in preparing the manure now, as it will dry sufficiently in a few days if spread in an open shed. Turfy loam may be added a few days before the bed is formed, as it will absorb the juice of the manure and improve the bed. We make the first bed against a wall in a cool shed or outhouse, about 18 inches deep at the back and 10 inches in front. If the manure is in good order the bed may be made up, spawned and soiled on the one day. The material should be trodden as firmly down as possible, as the firmer it is the better does it retain the heat, and this not only produces an early crop, but a long continuance of good Mushrooms.

**AUTUMN ONIONS.**—These are not so large as usual, nor so well ripened, but many of them are now beginning to split, and these are useless for keeping. All the bulbs should be drawn and laid in the sun to dry. This will prevent their splitting, and they will ripen for storing and for use till Christmas. They are especially valuable to those who are deficient in spring sown Onions.

**LATE PEAS.**—When records of the Pea crop of 1890 come to be written few of them will be couched in glowing terms, as the season has been a very indifferent one for Peas, the pods taking so long to fill, and the flavour has been generally deficient. Late varieties sown at the usual time are very backward, and will require special treatment to make them pod freely in October. If they are shaded by other rows of Peas or any other tall growing crop, the sooner they are fully exposed to the sun the better, and should the weather prove dry they should be liberally supplied with guano water.

**PESTS.**—The Parsley we noted as having failed some weeks ago received at that time a heavy watering in which petroleum was mixed at the rate of one wineglassful to the gallon. This entirely destroyed the grub, and green leaves are now pushing freely. The Carrots subjected to the same treatment have not improved, as the grubs had buried themselves in the roots beyond the reach of the oil, but next year an experiment will be made by sprinkling the surface of the soil with the oil before it is forked over for the reception of the seed. Caterpillars which may now be appearing on Cauliflower should be picked off before they become numerous. The season has been in favour of slugs and snails all through, and care must be taken that they do not destroy the young crops of Cabbage, Lettuce, Endive, and other plants.

**LEEKs.**—Huge Leeks are very desirable for exhibition, but they are not particularly useful for other purposes, and unless they are wanted for showing much time need not be devoted to their culture. The large plants must, however, be carefully earthed up at the present time. They should also receive liberal quantities of strong liquid manure. The soil should not be put to them in large quantities, but only a little weekly. When it is raised so much that the plants appear to stand on ridges, the best place to feed is between them, as if the liquid manure is emptied down amongst the leaves it is apt to do injury.

**LARGE SPRING ONIONS.**—These are very backward this season, as plenty of sunshine is essential to their development. To aid them in swelling and ripening we find it a good plan to draw the soil away from the bulbs and leave each resting in a hollow. The sun has a most beneficial influence over them then, and when liquid manure is given it is an easy matter to fill the vacancy around each bulb.

## PLANT HOUSES.

**Gardenias.**—Cuttings of soft-growing shoots should be inserted singly in small pots, well watered, and placed in the propagating frame

until they are rooted. When inserted thickly together they should be potted singly directly they are rooted. When well established in small pots, pinch out the leader to induce them to branch. Young plants always produce the finest flowers, and if kept growing from the time they are rooted without a check they are not difficult to keep free from insects, and by the following autumn will be fully 2 feet through.

**Clerodendron Balfourianum.**—Plants grown as bushes, flowered early in the year, and confined at their roots, will have thoroughly ripened their wood and rested in an intermediate temperature. If the shoots are partially pruned back and the plants placed in brisk heat they will break into fresh growth and produce a second crop of flowers. Push plants into growth that have only just flowered, and fully expose them to the sun. Wood made in a moist shady atmosphere is difficult to ripen thoroughly in autumn. Feed with weak stimulants plants that are lengthening out their growths.

**Tydas.**—Evergreen varieties such as Madame Heine should be placed in 5-inch pots and grown in an intermediate temperature. Admit air freely when the weather is favourable, and close the frame early in the afternoon. Shade the plants from bright sunshine, but be careful not to allow water to fall on their foliage, or it will be browned and disfigured. The same care is necessary with those that make tubers. These kinds will be growing rapidly, and may need a few light stakes to support them. The frames in which they are grown will need fire heat if the weather continues cold. Nothing is gained by starving them. They must be kept growing after they are started, or they will not attain their full size and give satisfaction.

**Gloxinias.**—Place seedlings in their flowering pots, 4 or 5-inch, according to their size. Allow the young plants to come forward gradually, and in due time they will push up fine flowers. These plants do well in loam with one-third leaf mould and one-seventh manure and sand. Shade from the sun, and water carefully until they are rooting freely.

**Gesneras.**—Place these in from 5 to 7-inch pots according to the variety and the number of plants in each pot. To grow these well they must have a warm moist atmosphere where they can be shaded from the sun. No water must be allowed to fall upon their beautifully marked foliage. If possible stand them on a bed of moisture-holding material. Give water carefully at first, but do not allow them to become dry. They will do well in the soil advised for Gloxinias, but add more sand.

**Justicia flavicoma.**—This plant is useful for any position, but stands longer when in bloom in the conservatory and intermediate temperatures than in the stove. Feed all the earliest plants with weak stimulants, shade from the brightest sun only, and keep the plants moderately close in cold frames. Those in a more backward condition should be pushed forward for a time in brisk heat. Cuttings that were rooted late will only need 4-inch pots, and should be grown without pinching.

**Plumbago rosea.**—The shoots of these should be allowed to extend. Do not hurry them, or they will soon run up tall and fail to flower as profusely as those that are grown under cooler and more airy conditions. Watch for thrips, which is very liable to trouble these plants, and is best destroyed by dipping in or syringing with a weak solution of tobacco water.

**Pandanus Veitchi.**—Suckers from plants that are throwing them up freely near the base may be carefully taken off and inserted in small pots. They will root quickly in sandy soil if placed under handlights and kept close. When well rooted they should be placed into larger pots, and if grown in a close moist atmosphere, and fully exposed to the sun, they will grow rapidly and be well coloured. It is only when grown in the shade that this useful decorative plant fails to colour and turns green.

## THE BEE-KEEPER.

### FOUL BROOD.

It is to be regretted that this disease is spreading widely in a most virulent form, and at a time which makes it most difficult to combat owing to the scarcity of honey. These two evils combined are almost enough to induce many to relinquish bee-keeping as unprofitable and annoying. One of the most extensive apiaries in Scotland has been attacked with the most virulent form of foul brood, and a number of others are victims also. The owners have traced its introduction to imported queens. At all events the disease in every instance has had its rise in hives that were perfectly healthy previous to their introduction. It is a pity there is not some means of preventing queens being sent from infected stocks. If that were so it would be better for all concerned, and bee-keeping would be less of a lottery and more remunerative than it is at present.

#### CAN THE DISEASE BE CURED?

This is an oft-repeated query, to which we answer, "No; not to pay." The "purgatorial process," as given first in this

Journal, and which the Americans recommend, is the surest way of banishing the disease. So long as a piece of infected comb remains in the hive assuredly will the disease break out anew the moment the hive is in a favourable condition for its propagation.

#### IMPORTED WITH QUEENS.

If queens are raised in diseased hives, then in all likelihood they will transmit the disease. Or if drones are in an infected hive they may transmit the disease to the queen and progeny. I never experienced a case of foul brood that I could trace to the introduction of imported queens; but my method of treating them may have helped to this immunity. I usually open the cages containing queens and air the bees and queen well, transferring them to a clean cage and feed with honey from the hive ready to receive them, this being a kind of purgatorial process similar to the original one. I have in a previous article stated that I do not believe a queen could continue laying eggs for any length of time with the disease in her system, but from the destructive nature of the germs she would fall a victim to the malady. I believe it possible, if not probable, that queens may contract the disease or something that will produce it from being confined while in transit to this country, and thus be the means of introducing foul brood, although sent from an apiary entirely free from it. Poultry and other animals become diseased, even in cases where ventilation was considered perfect. I am cognisant of cases of rabbits and ferrets becoming diseased while in transit by rail of less than fifty miles, then why not bees?

#### A LIKELY CAUSE OF INFECTION.

Foul brood is very contagious, so that great care is necessary to keep the healthy and unhealthy, or anything that has been in contact with the latter, separate and out of the reach of the former. Perhaps the most dangerous agents for spreading the disease are robber bees, and the present year being favourable for them, they may have been the direct cause of the prevalence of so much disease in apiaries. To those unacquainted with the habits of bees the presence of robbers may not be detected until the mischief is done. Practical bee-keepers are always on the watch, and seldom fail to detect a robber however cunning she may be. They sometimes continue their depredations for a long time without bringing many of their sisters to the spoil. These Corsair bees are mostly the aged ones, and carry the disease to and fro, because foul-broody hives are liable to be invaded, so that from one infected hive many may, by the above means, become infected within a few weeks. It is hoped that all those who may have infected hives will take prompt measures to stamp out the disease, and make no attempt to cure the hives in any other way. It is a duty they owe not only to themselves but to their fellow bee-keepers and the country.

It has been asserted by different authorities that the disease is curable, and has been cured by different antiseptics employed but whenever these were tried by uninterested persons they always failed. From the very unindestructible nature of the germs this is not difficult to account for. They resist a greater heat than that of boiling water, and a greater degree of cold than that of zero.

In most cases the disease has run its course before it is detected, and the very opening up of the hive may spread it to a great extent. The clothing and hands of the operator may get infected, then apiaries are at his mercy. Hives may be carried within doors and the combs sprayed with acids or other antiseptics, but anything strong enough to destroy the germs, or rather alter the nature of the combs and their contents, so as to become unfavourable as a nidus for the germs, would injure, if not destroy the bees. Besides, it takes all the year for a hive to be in a state for profit, and young swarms improve much quicker than old and diseased stocks will do.

While I am writing two letters have come to hand asking if the disease could be imported with foundation made from wax from diseased stocks. I am unable to say positively whether it

could or not, but I should not be surprised if hives became diseased through infected foundation. As prevention is better than cure avoid crowding bees into little space or spreading brood, as I believe overheating to be the prime cause of foul brood, and the opposite may have the same effect. I am in favour of using carbolic acid and things of the same nature freely about the hive, but if I discovered foul brood I would make no attempt to cure or experiment with it further than removing the hive with bees within doors, transferring the latter into a straw hive for two or three days, then transfer again for the same time, after which I would put them into their permanent hive and watch results.

To have an entire immunity from foul brood amongst the hives requires far greater care than many are apt to think necessary or give to their hives. We regret to learn that the plague is so virulent and widely spread that slabs of comb sent us contained scarcely a single living nymph. We hope no pains will be spared to get rid of the disease, so that 1891 may be a cheerful and profitable year.—A LANARKSHIRE BEE-KEEPER.

#### CARBOLIC ACID.

WILL "A Lanarkshire Bee-keeper" be so good as to explain how to proceed with carbolic acid, as he said some time ago that he uses it in a crude state to drive bees from supers, also where I can procure carbolised paper? I wish to thank the "Lanarkshire Bee-keeper" for his sound advice, which I have read in the Journal, and acted upon with the greatest success for over eleven years.—G. C.

[Carbolic acid is used in the apiary to prevent robber bees attacking a hive when manipulating. The bee-keeper in this case must keep a watch, and whenever a robber alights a feather dipped in the acid applied to the bee or the place it alights on will prevent it filling itself with honey and attracting others, until the operator gets the hive closed. A little acid smeared upon the tops of the bars is cleaner and more effective than smoke as a subjugator, and when judiciously used acts as a preventive against foul brood and moths. It is unsurpassed for clearing bees from frames or supers, and is best used upon paper, as it drives the bees from any frame the bee-keeper desires, leaving the rest of the hive unmolested. There are other uses for it which I will pass over for the present, but may explain at some other time.

I use medium brown paper, and preserve the sheets. Those I have in use are at least twenty years old, and are kept straight in book-form between two boards. This is necessary, so that they pass easily between the combs. When the paper is too thin it buckles, and when too thick is apt to cut the combs when they are closely built. I use a feather to smear the acid upon the paper—a very little does—and mostly near the bottom edge of the paper, which should have a second bend, or two pins near the top to prevent it slipping down when the hive and supers are deep.

I prefer crude acid, which may be had of any chemist or apothecary.—A LANARKSHIRE BEE-KEEPER.]

#### CANDY AND THE BENTON CAGE.

IN the issue for July 24th "A Lanarkshire Bee-keeper" refers to candy in connection with myself, and says he used similar mailing cages to the "Benton" long before Mr. Benton. I suppose his similar cages consisted in boring holes in a block of wood by means of a centrebit. I am not aware that Mr. Benton claims to be the first to hollow out cages in that way, nor do I consider that anyone can claim to father the idea, as the centrebit is old, Holman Hunt having pictured it in the tool rack in his picture of the "Shadow of Death" as being a carpenter's tool in the time of our Saviour, though, without a doubt, the model he used was made in Sheffield.

The first "Benton" cage was sent to me in the autumn of 1883. It had four round holes in it; at one end was a bottle of water, at the other a bottle of candy, next to it a hole without any air holes, and next to this a hole that was well ventilated. This was Benton's invention, the Benton cage consisting of two chambers for the bees, one ventilated, and the other not. The two side grooves were borrowed from my cage, in which he had been mailing queens to America.

In 1883, as the readers of the "B. B. J." for that date remember, I had had a good deal to say about candy as food for bees, having made the discovery that bees could eat and live on candy or dry sugar alone, provided the grains were small enough. At that time everyone thought that water in some form was necessary,

and I got well laughed at for my assertion. Mr. Benton and myself had been working for a long time jointly trying to solve the mailing problem, and we discussed the so-called "good candy" invented by Mr. Scholz, consisting of granulated sugar and honey mixed, the idea being that the honey stuck to the sugar from which the bees licked it. Mr. Root used very fine sugar so as to have more surface for the honey to adhere to, but the bees never ate any of the sugar, and provision had to be arranged for the sugar to get out of the cage on a long journey. I urged on Mr. Benton to make up a food of my candy crushed and then stuck together again by means of honey, when, I told him, the bees would eat all before them. He did not believe they would do so, but still he thought that sugar ground as fine as flour would give more "surface." He tried it and found the bees ate both sugar and honey. This caused quite a sensation when a queen with a score of worker bees were sent in a dry pine box on a twenty-five-days journey without water.

I do not claim, and never did claim, to have been the first to feed bees on candy, but what I do claim is the discovery that bees can eat and live on dry sugar alone, "provided," as I have stated above, "the grains are small enough." Most people think that baked lump sugar is really dry, and therefore an utter absurdity to suppose that animal life can be sustained by it without water, while, as a matter of fact, such sugar is 50 per cent. water, and only 1 per cent. more water will make very soft—too soft for mailing purposes; therefore the matter is not so absurd as it seems. Mr. Benton used a three-hole cage in 1880 very similar to the one he uses now, with a bottle of water at one end, the bees in the centre one, and the other filled with candy, but the two are totally distinct.—A HALLAMSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

Dicksons (Limited), Chester.—*Catalogue of Dutch and other Bulbous Flower Roots.*

Sutton & Sons, Reading.—*Highly Illustrated Bulb Catalogue.*

Van Meerbeek & Co., Hillegom, Holland.—*Catalogue of Dutch Bulbs.*

Geo. Bunyard & Co., The Old Nurseries, Maidstone.—*Catalogue of Strawberries and Summer Fruits.*

G. E. Elliott, Huddersfield.—*Catalogue of Flower Roots, Roses, &c.*

E. P. Dixon & Sons, Hull.—*Catalogue of Bulbous and other Flower Roots.*

J. R. Pearson & Sons, Chilwell, Notts.—*Catalogue of Dutch Bulbs and other Flowering Roots.*

Wm. Clibran & Son, 10 and 12, Market Street, Manchester, and Oldfield Nurseries, Altrincham.—*Autumn Bulb Catalogue.*

John Watkins, Pomona Farm, Hereford.—*Descriptive List of Strawberries.*

J. H. Krelage, 17 to 27, Kleinen, Houtweg, Haarlem, Holland.—*Catalogue of Dutch Flower Roots.*

Richard Gilbert, High Park Gardens, Stamford.—*Catalogue of Strawberries.*

**Grapes Discoloured (W. J.).**—The discoloration of the fruit has been caused by the temperature of the house having fallen too low at night on one or two occasions, and the consequent coldness of the berries has been followed by a deposition of moisture on them from the atmosphere in the form of dew. Then the house having become too hot on some morning before air was admitted, the ventilators were opened too widely at once, and the sudden evaporation from the fruit injured the cuticle. The berries have had a narrow escape of being scalded and spoiled.

**Sudden Death of Gooseberry Trees (G. C., Morpeth).**—We cannot possibly account for the sudden collapse of the young trees, but publish your remarks in case any of our readers can offer a solution of the problem. They are well rooted, presumably, from cuttings inserted last autumn. You say—"I could see nothing wrong with them on Saturday, and this morning (Monday) there are a number of them all withered, and the bark at the roots is quite rotten." Sunday, it appears, therefore was the fatal day, and we suspect the cause of the misfortune must be sought for locally.

**Melons Splitting at the Stem (R. H.).**—When the fruit commences ripening there is almost invariably a separation of the cuticle at the base of the stalk, and if the fruit remains too long uncut, and there is much moisture in the atmosphere, decay ensues. Also if the plants are grown in too rich soil, and the night temperature falls too low, the atmosphere being at the same time moist, the fruit will often split and decay instead of ripening. You should have described the conditions under which the plants are grown, the temperature maintained, and the system of ventilation adopted. You can still do so if you desire further information.

**Fruit Values (Idem).**—We have not the slightest objection to your writing on the subject, and asking for some closer approximation to actual prices of Peaches, though you admit that the quotations referred to are in "close accord with those of other authorities." No doubt that is so, because they are obtained on the spot by persons who have been accustomed to estimate the value of fruit for many years, and who do not seize on special samples and from these publish inflated prices. The market returns of live stock are not founded on extraordinary prices obtained for extraordinary animals, or they would be misleading, but fair representative values are given, and it is the same with fruit. No doubt the prices with which you have been furnished would be given for fruit that had won high honours at an important exhibition; and if your fruit is of that high value it will realise the amount named, not otherwise, as you will find if you send a consignment. The prices you quote are very much further from "an approximation to actual prices" than those which are published by disinterested authorities. Of this we have no doubt whatever. The fruiterer who has given you his prices can only deal in the highest class fruit, and this only forms an infinitesimal proportion of the bulk sent to market.

**Tecoma radicans (G. R. A.).**—It is difficult to ascertain when this beautiful deciduous climber was introduced to this country from North America, its native place of growth. It was evidently cultivated in this country by Parkinson in 1640, as he has described it minutely, adding, "This never bore flower with mee, nor any other that hath it in our country that I could heare of." From that we may infer it could not have been long and generally cultivated, as the plant blooms freely enough when a few years old and the wood is well ripened. It used to be called *Bignonia radicans*, but was transferred to *Tecoma*, the difference in the genera consisting chiefly in the partition of the fruit. Plants are raised from cuttings and layers in the autumn, and grow luxuriantly in rich soil, but firm growth in firm soil containing chalk is promotive of flowering. It would flower with you in a hot sunny position, such as trained to a south wall, and the growths thinly disposed and matured. It is popularly known as the Ash-leaved Trumpet Flower.

**Summer Pruning Pear Trees (B., Cork).**—Provided three good leaves are left on the cut-back shoots, and the trees are not very luxuriant in growth, the whole of the buds will not push, but the top one will, and perhaps the second. They have been cut back too closely, and it would have been better to have left five or six joints, then cutting them back to three in September. Your gardener should read the *Journal of Horticulture* attentively, and if he is in doubt how to proceed in any matter, to write for information before going too far. If the Pear trees are young and robust it might be advisable to drive down a spade and cut some of the roots at a third part distant from the stem that the trees are in height; but if they only make moderate growth, we do not think you need be under any apprehension of the base buds starting into growth this year.

**Lily of the Valley (C. B. C.).**—You could scarcely expect many flowers this year from a bed planted last season with growing, not flowering, crowns, and especially as the soil is, as you say, very "tough." When the plants are established they grow and flower well in strong soil, but do not establish themselves quickly in such soil. No doubt the bed would have been improved if a quantity of wood ashes and decayed vegetable matter, also soot, had been incorporated in the soil; still if the plants have made strong leaves and crowns this year they will probably flower next season. If a little of the strong soil can be forked away without injuring the crowns or materially disturbing the roots, and a mixture of the kind suggested spread on the beds 2 or 3 inches thick and allowed to decay, the effect will almost certainly be beneficial. You say you "filled" the bed with plants. Perhaps they are too crowded, in which case bold crowns and fine spikes will be comparatively

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Begonia Carrieri (J. F. S.).**—It is not uncommon for seedlings of this floriferous *Begonia* to produce rosy-tinted flowers. The flower you enclosed in the letter was, as might be expected, spoiled in the post.

**Show Prizes (E. W.).**—You requested us to insert the date of your Show, and we inserted it. We said nothing about either open or local classes, and the matter you send and describe as a "correction" is really an addition, and undoubtedly an advertisement. The charge for its insertion can be furnished by the publisher if you wish the announcement to appear.

few in number. If you like to state the distance from each other the crowns were planted, we shall be glad, if you wish, to refer to the subject again.

**Mushrooms in Frames (E. G. B.).**—You state the depth of the frames, but not the depth of the beds in them. If, however, they are over a foot thick, firm, and made of good material in a properly moist state they ought to grow good crops of Mushrooms. In bright weather they will be too hot, and the sashes should be covered with two or three thicknesses of mats, or with 6 inches of hay or straw. In this case the covering on the beds need only be an inch or two thick, and kept damp, though not very wet, for preventing the evaporation of moisture. Plunge a thermometer 2 or 3 inches deep in the bed, and so long as it registers over 100° prop up the sashes at the back. When the temperature falls below 90° insert the spawn, and a day or two afterwards, provided the heat does not rise, spread on some good soil moist enough for compression, and beat it down to an inch in thickness if heavy, nearer 2 inches if of a sandy nature; but Mushrooms do not like poor light soil, and the escape of moisture from the soil must be prevented by damp litter coverings. Your question respecting moss litter does not permit of a categorical reply. The best manure from horse stables cannot be excelled, but the moss litter after use in stables, not too wet, also with a sixth part of loam added, is better than inferior stable manure, which contains much straw. Some persons succeed in growing excellent crops of Mushrooms with the moss bedding, others fail. It is a question of judgment in its preparation for the purpose in question. It is never a "trouble" to us to answer questions when we can answer them usefully, and we trust this reply will be serviceable to you and other readers at this the proper time for making Mushroom beds for bearing in the autumn and early winter.

**Writing Well (Disappointed).**—You say you "want to write well but cannot," and wish for helpful hints. We suspect that the main cause of your disappointment is due to lethargy or natural despondency. You do not do the best you can often enough—or, in other words, you do not persevere. Persons who take up the pen intermittently, dash off a letter to the press, and find "a good deal of it not printed," then complain, never become good writers, because they have not clear perceptions of literary merit. What you call a "good deal" taken out, editors, you may depend, call by another name—"bad" deal. It is their duty and interest to retain what is good and eliminate what for various reasons they deem unsuitable. Ill-formed expressions, covert allusions, inflated language on the one hand, or the use of "slang" terms on the other, are either modified or rejected. A man such as yourself, who is able to write a short letter correctly and well can, if he tries, write a longer; but the longer it is the greater the necessity for care in avoiding the repetition of terms; also of guarding against the habit that seems so easy to acquire of expressing the same idea over and over again in different words. Writing is not so much a "gift" as an acquired art. It is true that some persons have a greater aptitude for it than have others, but all the same those who have become the most accomplished have striven the hardest to excel. No labour has been too great to be feared, and some of the most eminent of authors have written chapters several times over before they were satisfied with their work. Here is what one of them confessed not long ago:—"I was a thorough bad lot at school—bright, I think, and quick, but with no perseverance whatever; no patience, no application. And certainly now I have all those qualities in an extraordinary degree. I don't know what changed me. I had an immense ambition to be a writer; and when my father died in '77, leaving nothing—well, it was that or something less palatable. After that I went in for writing, to the exclusion of everything else. I was not well educated, but had always been, from a little child, a voracious reader, and determined to get on. After I had been writing awhile I awoke to the folly of letting myself drift into a first-person, present-tense style, which I thoroughly despised, and a lecture of Mr. Ruskin's to art students put me on the right track. After that, how I worked! I have many a time written a story eight or nine times over before I satisfied myself with it. I used to take a novel of W. Collins and pick the sentences to pieces, note the crisp, concise style of them, and get them into my head, so to speak. Then I would go at my own work, never using a long word when I could find a short one to answer the same purpose; never using a Latin word when I could find a Saxon to express the same meaning; never using two adjectives where one would do, or one at all when it could be avoided; never using a French word unless it was impossible to find the Saxon meaning in English, and never quoting bits of poetry unless really necessary." From the experience thus embodied you may derive encouragement; and if you are equal in discrimination and perseverance with the authoress in question and proceed on the lines indicated, you may hope for a fair measure of success. It may not, and probably will not, very closely approach that attained by this "bad lot at school" and "not educated" girl, because she now earns at the least £1800 a year by her pen. If you earn half that, after long striving, you will, perhaps, no longer be what you now describe yourself—"disappointed."

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens should be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp.

(W. E. B.).—*Rosa microphylla rubra*, a variety of *microphylla*, which species is a native of the Himalayas and of China. The shrub is *Rhus cotinus*, and is commonly known as the Smoke Tree, from its peculiar floral appendages.

COVENT GARDEN MARKET.—AUGUST 20TH.

MARKET dull, with good supplies of indoor fruit; outdoor fruit coming short.

HARVEST TIME.

BUSY harvest time is again upon us, and we began reaping corn under a sunny sky with the barometer steady and tolerably high, but it had not reached "Set Fair," nor has it done so once this summer. The faint promise of more settled weather has not held good. Twice has the mercury fallen below "Change," and we are writing this article during an exceptionally severe thunderstorm, accompanied by such a heavy downpour of rain as will make

its way into every badly built corn shock and every loose sheaf. On the whole the crops are good, and with us decidedly above the average. Barleys are a big crop, so are Oats; Winter Beans are excellent, and with Wheat up to £2 a quarter we long for fine weather to impart quality to both Wheat and Barley, and enable us to realise the fair promise of an abundant yield and profitable prices which seemed so possible only a week ago. Ah! there is a gleam of sunshine; the storm is o'er, the clouds are passing away, and all may yet be well. Let us take the broken weather as an incentive to exertion, and strive to the utmost to save the harvest.

As a means to so desirable an end we have endeavoured so to arrange the work and the rate of pay that the workmen can have no just cause of complaint, and no question can arise to cause friction or any dispute during harvest. All the corn upon every farm has been put in the harvest. Each man has to reap a given number of acres. The men select the lord of the harvest, who for the time being is foreman and leader. The price paid per acre is inclusive of binding and stacking, and if a self-binder is used due allowance is made for it. But we assist the men with all the extra help we can command, as that is a matter clearly in our own interest. The rate of weekly advance out of the gross amount to be paid for the work is £1 per man; a shilling each is given to "bind the bargain" when the terms are decided, and 2s. 6d. each is also given at the final settlement when the balance due to each man is paid him.

The Truck (Amendment) Act of 1887 renders payment by beer or other intoxicating drink illegal, and it is only when labourers board in the house that there should be any question about drink of any kind. We have long discontinued any allowance of beer or cider, simply because it was a nuisance, and once there was a clear understanding that all payments were to be made in money the nuisance ceased. Kindly feeling between master and man is highly desirable, and we have not found pandering to the common greed for drink tend to promote it. Rather, much rather, was it a source of ill-feeling, and the cause of many a growl, for the conception of what is enough in the way of drink allowance by the ordinary labourer is a remarkably near approach to the verge of intoxication.

On every large farm in hand it has been our custom to supply a reaping machine, with a change of horses every two hours, and this is taken into account when the price per acre is settled with the men. A self-delivery reaper with its rakes is a real labour-saving appliance, and a fair calculation as to the extent of its use can be made beforehand. But the self-binder is much more of a speculative affair. Given a full crop of clean, upstanding growth, when the corn is well out of the milky stage, a self-binder before all things say we, if only we could be certain that the corn would not be beaten down! But that is precisely our difficulty, and it never was greater than in the present summer of unsettled weather. The only thing we can do is to base our calculations upon the condition of the corn, and to have an explicit understanding with the men that if the self-binder can be used it must be used, and then there must be a proportionate reduction in pay. It would be ridiculous to suppose the men would regard such an implement with favour, and the master, while bound to enforce its use, will do well to consider the men so far as is possible.

We are often told that a day labourer is so badly paid that if it were not for the extra pay of hay and corn harvest he could not get on at all. We agree so far as the day pay question goes, but then we altogether object to day pay if it can be avoided, and it can in a much greater degree than obtains recognition on most farms. Piecework involves a little more care in the supervision, and a certain amount of preliminary calculation, but it is unquestionably more satisfactory from whatever point of view we regard it. Far better it is to retain the services of a few really good skilful workmen who have the healthful incentive of piecework to exertion, than to have a greater number of underpaid day labourers, who, having no such incentive, do as little as possible, complain bitterly

of their lot, and naturally feel that they are oppressed and down-trodden by a master, who pays as little as he can, and gives them so few opportunities earning extra pay.

#### WORK ON THE HOME FARM.

If the cattle Cabbage has not been sown no time should be lost in getting in the seed. Transplantation from a seed bed will probably be an early and expeditious thing this damp season. But if land can be had preference should always be given to drilling the seed for the greater certainty of obtaining a plant, and for economy of labour. It is quite possible that we may have some dry hot weather yet, and then the advantage of drilling will be sufficient to well reward us for our diligence in an early preparation of land for the drilling.

This is decidedly a light land farmers' season, and they should have no difficulty about drilling Cabbages and stubble Turnips. Trifolium incarnatum of both early and late varieties should be drilled upon the first clean stubbles available, wherever this crop answers, as it is a most valuable early spring fodder, of immense bulk and most nutritious.

General complaints are again prevalent of much spoiled Clover hay, as was to be expected in so wet a summer. One manager of a certain home farm declares that he has hardly any good hay. Has he ever heard of ensilage? He must have done so, and might have turned most of his first cut of Clover to good account by means of it. Professor Wrightson says, in the *Agricultural Gazette*, "That he has a fair heap of some 300 tons of meadow grass made into silage, which is weighted with a substantial hayrick on the top. The heat a few inches beyond the surface is about 140°, and the smell, as tested by borers, is like rich plum cake hot from the oven."

Most disheartening has been much of the work done among root crops. Repeatedly have hoed weeds struck root again, and now that harvest work is in full swing there is no time to take advantage of fine weather for more hoeing. Upon clay farms not only are the roots foul with weeds, but the crop has a stunted, meagre appearance that is very unsatisfactory. Here again the advantage is with the light land men, for whom the outlook is very satisfactory.

Of the harvest we can only say that upon many farms Barley will be reaped before Wheat this year. The crop of the year on heavy land farms is the winter Beans, which are excellent.

**THE HARVEST.**—An estimate of the harvest is given by *The Mark Lane Express*, which publishes a summary of replies it has received from more than four hundred correspondents scattered over the United Kingdom, who were invited to send in returns as to the various crops in their districts. These returns "show that Wheat is 3.1 per cent. under an average, Barley 0.8 per cent. over an average, Oats 2.7 per cent. over an average, Potatoes 0.1 per cent. over an average, Beans 2.5 per cent. over, Peas 1.8 per cent. under, roots 3.6 per cent. under, and hay 18.9 per cent. under. In the case of two of these crops, however, the figures do not tell the whole story. In the case of Potatoes the great bulk of the correspondents speak of them as diseased—a larger number, in fact, than has been the case in any year since these returns were started. In the case of hay, also, although the figures show the crop to have been about four-fifths of an average one, it is very evident that much of this is damaged. More than half of the entire number of correspondents refer to this fact. With these facts in mind, however, it is still evident that, although the year is not fulfilling its high promise, the crops all round are fairly within what may be called 'the average zone'—i.e., if there is no wonderful abundance, there is, on the other hand, no story of great disaster."

#### REMARKS.

10th.—Wet all the morning, then fair and bright; sun in late afternoon; wet again in the evening and night.  
 11th.—Wet till 9.30 A.M., then fine with occasional sun; thunder heard in the distance in the afternoon; slight shower, but no measurable quantity; dull night.  
 12th.—Heavy, close morning; drops of rain in the morning, and gleams of sun during the day; fine night.  
 13th.—Bright morning, fine day, and dark night.  
 14th.—Fine and bright early; overcast at 11.30 A.M., with occasional sun, and dark night.  
 15th.—Wet early; fine at 9 A.M., shower at 10 A.M., bright sun at 1.30 P.M., but generally dull.  
 16th.—Slight shower early; fine, with bright sun and high wind in morning; the wind less in the afternoon; fine evening.  
 The temperature for some weeks has been very uniform and near the average; the rainfall since the downpour of July 17th has been small.—G. J. SYMONS.

## A TOUR IN IRELAND.

SINCE my last notes appeared in these pages over 1600 miles have been traversed in the cause of horticulture, and, as was indicated in the article mentioned, upon the date of its publication the writer was wandering in the Green Isle through farms, orchards, and gardens. The objects of my mission were twofold—first on behalf of the British Fruit Growers' Association, in company with Mr. Gordon, to make careful observations respecting "the present condition and prospects of fruit culture in Ireland;" and secondly, to see as many of the best gardens as time would permit. Ostensibly a holiday, the journey really involved a considerable amount of hard work and much thought in formulating a programme. Change of occupation and change of scene are often, however, more beneficial than mere idle rest, as I have proved on many occasions, the present amongst the number. Having travelled throughout the length and breadth of the land, it may be imagined that my note-book is well charged with records destined to be transferred to the Journal pages, but in the present introductory article generalities can only be dealt with. Full details of the fruit observations will be given in the official report to be published by the Association, while the gardens visited will be described in early issues of the *Journal of Horticulture*.

Ireland is a comparatively unknown country to English gardeners, for though the larger shows attract exhibitors and others to Scotland, it is so rare that any event of this kind is sufficiently important to induce a journey to the sister isle, that the country may be said to be horticulturally forgotten. There was a time when nurserymen's travellers used to regard their Irish journeys as amongst the most profitable they undertook, and through them we occasionally heard of what was being done in gardens and gardening. The times have changed; very few commercial horticulturists now visit Ireland, partly, doubtless, because money has not been so freely expended in gardens there during recent years, but mainly for the reason that the home nurserymen, like the Messrs. Dicksons of Belfast and Newtownards, McClelland of Newry, and the Hartlands of Cork have so extended the scope of their respective businesses that there is little room for outsiders except dealers in specialties. A few gardeners who have lived in Ireland, or have friends there, pay an occasional visit, but they seldom venture on an extended tour, and if it were not for our writing friends in the country itself very little would now be heard of Irish gardening news. Yet although the gardens are fewer and more widely placed, as good practice can be seen there as anywhere in Great Britain, and no thoughtful man could take a journey through the best districts and gardens without learning some useful lessons.

Apart from all political considerations (and horticultural papers have no politics) farming and gardening are in many ways very different in Ireland from what they are in Britain. Except in a few districts the rainfall is largely in excess of the average in this country, reaching as high as 45 or even 50 inches as an average, which is almost tropical, and the effects upon vegetation and cultivated land generally can be readily understood. This, too, as regards most districts is not confined to certain seasons of the year, but means continual almost daily drenching showers, which with the attendant cloud and consequent diminution of direct sun heat would seem to indicate a deficiency of ripening power that would have marked effects on seed and fruit bearing plants and trees.

But another agency comes into operation—the uniform mildness of the climate, and as regards trees the want of ripening influence is not so seriously felt as might be imagined. Still it is a difficulty that requires consideration, and some of the best examples of fruit culture are found in open exposed situations upon the eastern side of the island. The effect of such a rainfall upon the fertility of the soil must be great, and it is quite certain that in many districts where the land has deteriorated in productiveness it is due to the fact that but little is added to restore the fertility exhausted by the crops or washed out by the rain.

It is a common idea that Ireland is so largely composed of mountain and morass that the area of land suitable for cultivation is extremely small; as a fact, out of about 20,000,000 acres forming the total area of the country only 5,000,000 are cultivated, and judging from my observations not half of that land is employed to the best advantage, while the area of cultivated land could be largely increased. A large portion of the unoccupied land is, of course, quite unfitted for farming or gardening in any form, and it would be a waste of money and labour to attempt reclaiming many swamps or bogs and rocky wastes; but there are deserted or thinly populated districts comprising land that could be easily rendered as fertile as any in England. It is remarkable, but the same thing is seen in Britain—that most of the lowest rented land is the worst cultivated and gives the worst returns, not because the soil itself is bad, but because insufficient capital and labour are expended upon it to insure profitable crops. Energy, industry, and enterprise give similar results in Ireland to those secured by the exercise of those qualities in other countries, and examples of successful cultivation can be found in nearly every county, from Londonderry and Antrim in the north, to Cork and Kerry in the south; but they are not so numerous as they should be, or as they might be expected to be, when the effects of skilful labour are so apparent.

In the north of Ireland we see a greater variety of crops—Potatoes, Oats, Barley, Wheat, and Turnips well grown, the land clean, and in many cases the farming would compare with the best in England. Flax, however, is there the staple of the agricultural crops, 100,000 acres in the province of Ulster alone being devoted to it, though in the three other provinces together the total does not exceed 2000 acres. Flax is an exhausting crop, but it is generally sown with Clover or Grass, is pulled in August, and followed by pasture for a year or two. The cultivation, pulling, steeping, and preparation for the mills employ a number of people, while the linen factories and bleaching establishments provide a still further important industry in the neighbourhood of Belfast and several other towns in the north. Flax is a fairly profitable crop, but some farmers complain that their returns are not so good as they were formerly; on the other hand, I met some who admit that combined with other crops it enables them to gain a comfortable living.

One point strikes a visitor who happens to travel through Ireland about the time the grass is cut for hay, and that is the enormous return obtained; the fields early in August were thickly studded with huge haycocks more like small ricks than such as we are accustomed to see. It was also strange to see men and women tossing the hay with their *hands*, and more than one intelligent man assured me it was too heavy to use forks. Owing to the uncertain weather and frequent rain the hay has to be left out much longer than with us, and this must have a deteriorating effect on its quality. On some estates grass silos have been tried and proved very satisfactory in wet seasons. A run through the country gives a good idea how the term "Green Isle" has been obtained, for the fresh green of the grass is very noticeable, and the proportionate acreage is great in many districts.

Potatoes constitute such an important crop that they demand a word or two of reference in these notes, and it is deplorable that the rumours as to the prevalence of disease in the South are

only too true. I passed thousands of acres of Potatoes that look as though they had been burnt, and the effect of such wholesale destruction can be imagined where so much depends upon the crop as the staple food of the people and the pigs. In England, even amongst the poorest classes, the Potato is regarded as a useful vegetable, but as an accessory only; in the South of Ireland it is perhaps more important than bread. It has been said that "The Potato is the curse of Ireland," and there is some truth in the statement, for where nothing else is grown a bad season means a famine in its worst form. North of Belfast I observed comparatively little disease, though it was appearing in places, but from Cork to Skibbereen an old farmer assured me that there will be scarcely a sound tuber saved, and it is said that the moisture laden winds from the Atlantic spread "the blight" with astonishing rapidity. It may be asked, Is the system of cultivation best calculated to guard against the evil? and it must be admitted that it is not. In too many cases the bed system is adopted; the Potatoes are planted thickly, and the dense masses of succulent haulm in such a climate afford a most suitable nidus for the fungus. Even where the rows are separate they are too near together with few exceptions. Then, too, although so many improved varieties of Potatoes have been sent to Ireland quantities of coarse sorts are still grown that would not be tolerated here, and cannot be expected to yield good results even in the best seasons. Before closing this Potato paragraph it must, however, be remarked that the Irish people know how to cook the popular tuber to perfection. In the hotels and restaurants of the cities, in farm houses, and in the cabins of the poor, the Potato is cooked in its "jacket," and turns out a delicious ball of white floury substance such as a Briton can fully appreciate. The only badly cooked Potatoes I had during the whole of my journey were prepared in the conventional English method.

As to the fruit, a few words must suffice at present. Orchards are confined to a few districts, and in only one did I see any attempt to grow fruit on the market garden system, but there the results were satisfactory in no ordinary degree, the appearance of the cottages, the people, and the whole neighbourhood indicating a degree of comfort that is foreign to Irish country districts. We found Apple trees flourishing and bearing good crops from the extreme north down to Cork. Small fruits also succeed, but in respect to the orchard trees bad cultivation, or no cultivation at all, is the rule. Old lichen and moss-covered trees predominate. Few attempts are made at planting young trees, and if that is done they are placed in the same situations as the others occupied, careless gathering of the fruits, no selection for market, nor attempts to prolong the season, characterise the methods adopted. Yet the occupiers of some orchard land were paying over £3 an acre, and earning a good living, while land on the same estate was let at 10s. down to as low as 4d. per acre.

Reference to the chief characters of Irish gardens must conclude this rather long introduction, and first it must be said that Ireland is a beautiful country. It abounds in delightful scenery, more mountainous and bolder in character than is seen in England, but as regards most districts less rugged than the Highlands of Scotland or the north of Wales. In the selection of sites for gardens full advantage has in consequence been taken of the natural attractions of the country, and the majority of estates abound in delightful views. Then also the moist warm climate admirably favours the growth of trees and shrubs, with the result that we find magnificent specimen Conifers with other evergreen and deciduous trees, some of which could not be equalled out of Ireland. If, too, we journey south, especially to Fota, between Queenstown and Cork, we come to a subtropical climate, and find Palms, Tree Ferns, Bamboos, and countless other plants that we are accustomed to see grown under glass flourishing out of doors as freely and vigorously as they could do in their native countries. There is thus plenty of scope as regards the occupants of the gardens, and wherever an attempt has been made to effect an improvement full

advantage has been taken of this. The charming glen at Glenstal Castle is a magnificent example of what can be effected in adding to great natural attractions.

Many of the larger gardens are managed upon strictly commercial principles, all surplus produce being sent to market, and it is surprising what some able gardeners accomplish in this way, assisting to maintain extensive pleasure grounds in good condition that would otherwise have to be neglected. One of the best examples that came under my notice was a comparatively small garden in the suburbs of one of the larger cities. It was owned by a wealthy retired merchant who has had a large share of this world's success, mainly due, no doubt, to his own energy and perseverance, but he attributes his progress in a large measure to his love of horticulture. Early morning and evening exercise in his garden has, he says, helped greatly to maintain a naturally good constitution, the healthful mental rest enabling him to concentrate his working hours upon his business. He employs gardeners, but superintends the work himself, and grows flowers, fruit, and vegetables as a hobby, but with the intention of making the garden pay for itself as an example of what can be accomplished. He has ample for his family, sufficient for his friends, for the deserving poor and the sick, the surplus being placed in the market with all the judgment a practical man can exercise, and the result last year was a balance of £80 after paying all expenses. It is true some capital has been expended in producing this result, but a substantial interest has been obtained, and not only in the actual return, but in the satisfaction derived from setting a good example.

Earnest collective thanks to the numerous friends who so kindly assisted in rendering my journey one of the most agreeable I have undertaken must conclude this letter, and I hope to refer to some of them with their gardens individually on future occasions.—LEWIS CASTLE.

## GROWING AND SELLING FRUIT.

THE first consideration in growing fruit for profit is naturally how to make the most money out of it, so at the commencement I will mention a few things applicable to marketing and selling fruit in general, and then give some information on planting different kinds of fruit trees, the preparation of the soil, packing, &c., in order to prevent needless repetition.

SELLING.—In order to effect a ready sale for fruit of any kind in these days of keen competition, it is necessary to grow larger and more highly coloured samples than anyone else if possible; to strive after quality—as this is understood in the market—more than for quantity, although the latter must not by any means be overlooked. And here let it be noted, if the fruit is to be sold privately, good flavour and a proper degree of ripeness will be great recommendations to your customers to come again; but if you intend selling through an agent in the market, flavour will count for nothing, but size, colour, and soundness of condition are everything towards securing the highest price. All fruit for sale, therefore, should be grown as large and as highly coloured as possible, gathered and packed before it becomes soft and over-ripe, and should always be honestly graded, that is not putting all the small and deformed fruit at the bottom of the package and a few very fine specimens on the top, but keep each size separate. Next strive to have your fruit in the market when there is not a glut of the same kind there. Very early and late samples always sell the most readily.

PACKING.—This requires great care, for no matter how good the sample is, if it is badly packed it may only obtain the lowest price in the market, and months of labour and anxiety will be lost in a few hours. A few general principles only will be mentioned now, further particulars will be found under each kind of fruit. Always pack as carefully for a short journey as for a long one, and always pack firmly—that is, none of the fruit should be able to move in position when fastened down. All movement means damage. On the other hand, no pressure must be applied to soft fruits. All fruits should be gathered only when perfectly dry, not starting to gather them when there is a heavy dew, or immediately after showers. Pack in small parcels to prevent crushing and fermentation. When gathered send to the destination as soon as possible; delay means depreciation of sample. Be very careful that no damaged fruits are sent, as very few of these will

soon spoil all the good ones if any delay occurs in the transit or sale, and always keep everything perfectly clean and dry.

**COMPENSATION FROM LANDLORDS FOR PLANTING.**—It is only possible to give a few general hints on this subject, as so much depends on the customs of the locality, the kind of fruit planted, length of the lease, &c., but fruit growing has one drawback to those who are not freeholders, as it necessitates a large outlay at the commencement, and the first few seasons the returns are comparatively small. Again, there is always a certain amount of risk attached to fruit growing which no care or foresight on the part of the grower will altogether remove. It is, therefore, necessary before any planting is done to have a proper agreement as to compensation for unexhausted improvements, drawn up by a competent person, and duly signed by the landlord and all parties concerned. A very fair way, if it can be so arranged, is for the land and trees to be let by auction in case of expiration of tenancy, the incoming tenant paying the outgoing one the auction price for the trees which the latter had planted or purchased, and by this means securing the right to sell again for what he can get, the landlord retaining the power of choice as to tenants, but in the case of refusing acceptance to pay the outgoing tenant the sum offered. Another way is for the landlord to pay for the trees and planting in the first instance, the tenant to pay a fair interest on the outlay as a rent charge in addition to the ordinary rent, or a lease may be arranged for not less than nineteen years, to cover the tenant's expenses for planting by a low rent, and give him an opportunity of getting a return of his outlay. The above remarks apply principally to standard Apples, Plums, and Cherries, which are longest in reaching their full size. Bush fruits give a quicker return, and are also much sooner exhausted.

**PREPARATION OF SOIL AND PLANTING.**—One great step towards success is to have the soil in a suitable state for fruit trees before planting, and this is especially the case in planting standard trees which will remain in the same position for half a century and upwards. In the first place, then, all fruits require the soil to be thoroughly drained. Stagnant water near the roots is fatal to success. Before planting, therefore, if there is any doubt on the subject dig a hole 2 feet deep, and if water is found in any quantity drains must be laid to take it away before planting is attempted. All drains should be laid not less than 3 feet deep, and down the centres of the spaces between the rows where large trees are to be grown, or they will soon be choked by the roots. The distance of the drains from each other should vary from 10 feet in very bad cases and heavy soil to 30 feet in better and drier positions. All drains should have a good fall to prevent their choking by sediment. Draining will add considerably to the expense of planting, but the cost of this ought not by any means to fall on a tenant. It is not desirable, as a rule, to plant fruit trees where draining will be requisite, as low or flat situations are naturally cold and damp, and liable to be affected by late spring frosts, while hill sides, sloping to the east or south, or high flat lands are the best, because they are naturally drier and warmer. Having made sure the drainage is right the texture of the soil will next require attention. If it is very hard and firm beneath the first spit it should be trenched 2 feet deep or ploughed with a subsoil plough, keeping the best soil on the top; but as a rule, if the land has been previously under good cultivation, no trenching will be necessary if large holes are dug for planting, and the soil loosened well at the bottom. In all cases these holes should be large enough to spread the roots of the trees out flat all round. The trees should always be planted as deeply as they were before, but not any deeper. In wet positions and heavy cold soils it is often recommended to plant on mounds of earth, but it is far better either to correct the soil before planting or to choose a better position, as the roots of trees will always eventually work downwards.

As a rule only Strawberries and Raspberries will require manure when they are planted or a short time previous to planting, except in a few instances where the ground is exceptionally poor, such as light sandy soils. In such a case it will be advisable to give a good dressing of farmyard manure for all kinds of bush fruits also. Strawberries require to be planted in August in order to get a good return the first season. All other kinds of fruit should be planted early in the autumn as soon as the leaves begin to fall. They succeed much the best if a good mulching of litter, half decayed leaves, long dry grass, short straw, or some similar matter is spread around the stem about 1 foot further out than the roots extend, and 4 inches thick. This will keep the roots warm in frosty weather, and keep the moisture in the ground when the dry weather comes in the following summer.

**SHELTER.**—This is often of great service in spring when the trees are in flower, and much more so in autumn in the case of Apples that are nearly ready for gathering. The strong gales that are often prevalent at that time do much damage, and sometimes destroy all chances of profit that would otherwise accrue. In all

places that are much exposed, therefore, it is well to plant a narrow belt of trees for shelter on the sides where the strongest and coldest winds come from. In most instances this will be the south-west, north-east, and north. Trees for the purpose of shelter should be quick-growing—thick enough to form a good screen—not likely to encourage insects, and sorts that will live in good condition as long as they are likely to be wanted. Observation of forest trees growing near will be the best guide for the planter. The Spruce Fir is often one of the best trees for this purpose, and will grow in most places. The Scotch Fir is also suitable on some soils, and a few Larch may be planted among either of these. The Lime should not be planted anywhere near fruit trees, as it is too much subject to insects. Of course in the case of small gardens where only a few trees are grown there will be no necessity for planting shelter trees, or at any rate it would be impracticable in the majority of instances; but where a number of allotments are grouped together in exposed situations with a view to fruit culture, or in any plots that exceed the size of an ordinary cottage garden, it will pay to make arrangements for this end when the lease or agreement is drawn up.—W. H. DIVERS.

(To be continued.)

### ADIANTUM FORMOSUM.

THIS is one of our oldest and best known Adiantums. In the days of large specimen plants this Fern was much sought after for the reason that it is one of the quickest and strongest growers among exotic Ferns, and can by frequent shifts into larger pots soon be readily grown into specimens of any desired size. It is also very accommodating as to temperature and can be grown to perfection in an ordinary greenhouse, in fact better than in a high stove temperature. In a very high temperature it is apt to suffer if the soil be dry at the roots, which is very detrimental to its growth and vigour. Unlike *Adiantum cuneatum* it resents being cut down, nor does this need to be done very often, as it is evergreen, and for three parts of the year at least it is in active growth; therefore, any wholesale removal of fronds in a well managed and active growing plant is unnecessary. The older fronds become brown and shabby in time, but they should be removed gradually as younger fronds arise.

*Adiantum formosum* was introduced from New Holland in 1820. Its specific name, *formosum*, means handsome, and a well grown specimen, whether small or large, and in a healthy state, is certainly very attractive. The fronds are strong and branching in a vigorous plant, but smaller and lighter are also thrown up at the same time, and serve to hide the stipes of the taller fronds from view. The stipes are black, wiry in texture, and the rachides are the same. The leafy parts of the fronds are deep green, and the pinnules are prettily toothed on the margins. For any purpose where large, broad fronds are required this *Adiantum* is very useful, but it is not a popular Fern for cutting purposes.

Its underground rhizomes are produced very freely round the edges of the pots and over the drainage. They, with their numerous root fibres, absorb a quantity of water at all times, hence the necessity of supplying plenty will be apparent when the plants are in free growth. Being a strong grower a stronger soil may be used for it than is customary with some of the weaker growing varieties of Adiantums. A compost chiefly made up of turfy loam, silver sand, and charcoal broken small, will form a suitable mixture for potting at any stage. Such material needs less compression when potting than lighter soil does, and there is also in it more quality and richness in a form that is readily available for the numerous small fibres to feed upon as they increase in quantity and demand their due share of support. When repotting, any stout portions of these rhizomes that are furnished with a growing point, and which may be accidentally broken off, or intentionally separated from the plant when shifting, may be utilised by placing them thickly together in a 5 or 6-inch pot, covering them with soil, and watering them carefully. These, if detached and potted in the spring, will, in the course of the season, if grown in moist atmosphere and gentle heat, afford some excellent bushy plants. This method of increasing the stock is quite equal to, if not better than, division of larger plants from the fact that fronds are produced of more uniform strength, and particularly so if the portions of rhizomes selected are as near as possible of one thickness.

Plants may be had of almost any size by frequent shifts into larger pots, but the larger the pot the more unwieldy the specimens become, though they are certainly attractive and handsome when through plenty of root room the fronds have attained a maximum height of 2 to 3 feet, and plenty are produced. A 15-inch pot will hold a large specimen, but more manageable plants are grown in smaller pots. A good shift once a year is generally sufficient to grow specimens under greenhouse treatment, but in a moist and

warm stove temperature if large plants are required quickly they may have an additional shift in the early autumn, which, with good treatment, will carry them through the winter in a gently growing condition. Plenty of light, with some amount of shade from direct sunlight in the summer time, is necessary. Liberal supplies of water at the roots, freedom from draughts, and careful general attention, will always secure fine plants of this attractive Fern.—E. D. S.

### TOMATO NOTES.

I READ with great pleasure the communication on Tomatoes from "E. D. S." on page 129. He appears surprised we do not see the Golden Tomatoes in our shop windows, nor the Plum and Cherry-shaped fruit. I suppose there is a reason for everything, and the reason in this case is not far to seek. The British public are very conservative about their food. The red Tomatoes found favour in this country prior to the introduction of the yellow varieties, and they only hold their own, as far as flavour is concerned, by popular prejudice, for connoisseurs of this fruit are, without exception, in favour of the yellow varieties. The flavour of these is superb. Could the shopkeepers prevail on their customers to try them, I venture to say the market men would soon supply fruits of this colour in the same manner that they do the red sorts. The Plum-shaped varieties, such as Nesbit's Victoria, are too small for the market, and I fear the Cherry and Currant varieties will never find favour with the general public. They are very ornamental, but for market work we require something more substantial.

When Tomatoes are planted in beds and borders as we usually see them, I have concluded, from close observation, the soil should be very firm, especially if it be light. I prefer ordinary garden soil as hard as bricks. If small plants are put out in such soil they grow sturdily, and soon commence flowering. This I find an important condition, for if the soil is at all loose or free the plants make gross growth, and are often 2, or even 3 feet high, before we get a single flower truss. The blooms produced on such plants do not set so freely as those growing in a firm soil. The difference will be clearly seen when the bunches of fruit are hanging; those on the gross growing plants will be 2 feet from the bed, while those, on the other hand, will require tying up to keep them from the soil. I believe it is an admitted fact that these plants do not require nearly the amount of water it was customary to give them a few years ago. I only have my plants watered sufficiently to keep them from flagging till I have secured the first truss of fruit, neither do I use any stimulant till after this period. I consider it unwise to administer any stimulants to the plants in their early stages, for it produces that which should be scrupulously avoided—viz., gross sappy growth. It is also a mistake to give much water to plants growing in borders, for it has a tendency to aggravate the disease. Of course plants in pots will require a greater supply, in accordance with the quantity of soil at the disposal of the roots. It is surprising what good crops can be produced in a shallow bed of soil. I have grown an excellent crop of Hackwood Park in a depth of 4 inches of soil, and the bed not more than 15 inches wide. It is generally admitted that the round varieties are more esteemed than the corrugated, and rightly so, but good culture has much to do with the shape of the fruit. I have seen a striking instance in point this season. The variety was Perfection; the fruits grown in the house were of beautiful shape, and all that could be wished, while the same variety planted outside has produced ugly corrugated fruit; both sets of plants were from the same packet of seed. The round varieties may not set quite so freely as the other section, but the fruits are heavier in a striking degree.

I am pleased to read "E. D. S." has been successful in resisting the attacks of the disease. There is no doubt previous experience has taught us much on this subject. In the year 1888 the disease caused dire destruction throughout the country, but luckily gardeners did not follow the Micawber policy adopted by our agricultural friends, but set to work with true British pluck to master it. Have we done so? I fearlessly assert we have advanced greatly in that direction. We were aware of the conditions most suitable for its development, and, like sensible people, have fought boldly against these conditions. It has not been mere chance work either, for the season has not been favourable to easy culture. In this district we have the disease, but we mastered it so far as to secure good crops of fine fruit. The conditions favourable to its development being a cold damp atmosphere the remedy is found in the opposite—namely, a light buoyant atmosphere. When the air outdoors was charged with moisture, as it has been repeatedly this season, a little warmth in the pipes has secured the dry conditions so delightful to the Tomato and detrimental to

almost all other plants. I kept my plants quite clear of this dreaded fungus till the middle of July by active watching and constant care, then a few spots of it were discovered. The houses were kept very dry and airy, and I had the satisfaction of seeing the spots die out instead of developing. This state of affairs continued till the first week in August, when I was away from the plants for a week; on my return I found it had greatly developed, but as the crop has been very satisfactory I do not fear much from the results. I should like to hear how the readers of the Journal have fared this season with our common enemy.—JAMES B. RIDING.

### THE B. S. WILLIAMS MEMORIAL FUND.

WE have been desired to insert the following in reference to the above fund which is being established. "To perpetuate the memory of the late Mr. B. S. Williams, by investing a sufficient amount to place a certain number of orphans of gardeners on the Gardeners' Orphan Fund as 'Williams Memorial Orphans,' and also to give prizes in money with Williams Memorial Certificates for excellence in the cultivation of plants."

GENERAL COMMITTEE (with power to add to their number.)

- Chairman.*—Shirley Hibberd, Kew, near London.  
*Hon. Treasurer.*—H. J. Veitch, 544, King's Road, Chelsea, S.W.  
*Joint Hon. Secretaries.*—A. Outram, 7, Moore Park Road, Fulham, S.W.; John A. Laing, Stanstead Park, Forest Hill, S.E.

#### NOTES ON THE CRYSTAL PALACE ROSE SHOW.

THE National Rose Society's Metropolitan Exhibition of 1890 is, I think, notable for the way in which the blooms lasted. Never in my experience of N.R.S. exhibitions, and it dates from the Show held in St. James's Hall, have exhibitors had such an easy staging time, or the public gone home at the close of the Show with such fresh young blooms and Sunday buttonholes. It seemed more like a northern exhibition, where one expects blooms to stand, both on account of the cooler air as well as that later in the month Roses are given and possess more stamina. The only day in the past Rose season when we were at all troubled by the heat was at Leicester on August 5th; there the heat was intense, and one exhibitor from Scotland was in the larger classes completely driven off the exhibition table.

The Crystal Palace Show was remarkable for another thing, and that was the awarding of two gold medals for new Roses, a circumstance unique, I believe, in the annals of the N.R.S. Of the best Roses in the Show there was nothing very remarkable; good, of course, the silver medallists were, but there seemed a little uncertainty as to which of the two Catherine Mermets of Mr. Burnside was awarded the medal; for lasting qualities those who saw the good condition of one of them three days after at Gloucester will be able to decide. In the trade division it was thought by some that Comtesse de Nadaillac in Mr. Prince's stand must have run Messrs. Harkness's Catherine Mermet very close indeed.

Another thing to be noticed was the number of exhibitors in Class 17, "open only to amateurs who have never won a prize at an Exhibition of the National Rose Society," always an interesting class. This year there were seven exhibitors, and on the whole good. It is not at all improbable that the winners of the first and second prize will be heard of before long in the front rank. I hope they will. It gave us great satisfaction, although some of us tried our best to prevent it, that a new name was ordered to be engraved on the metropolitan challenge trophy, amateurs. I cannot help thinking that if the plan of the northern Exhibition was adopted here it would lead to greater competition. At present, in order to compete for the challenge trophy, a man must grow largely rather than well and I should imagine there are but

few exhibitors who do not feel it a strain upon their resources to stage forty-eight varieties. This is always the case with us; indeed, it was not until the day before the Show that we had forty-eight varieties out, and it seemed we should repeat our performance of 1888 and be able to show garden Roses only. If we must have a class for forty-eight at the early shows have it, but do not confine the competition for the metropolitan challenge trophy, amateurs, exclusively to exhibitors in one division only; let it be competed for in an additional class for twenty-four or thirty-six, and call it the trophy class open to all amateurs.

The classes for garden Roses were better arranged this year. The first prize stands were very good, and from the interest taken by the public in this class it is not the least important feature in the Exhibition. Would it not be well another year to limit the number of trusses to a bunch? Of new Roses I will say nothing now, hoping to send a few notes upon them later on; but this suggestion I should like to make. When called upon to award gold medals and certificates for new Roses it would, I am sure, give greater satisfaction to both exhibitors and judges if those previously appointed to adjudicate could adjourn at a stated time to a private room with the blooms and specimen plants, and there, seated round the table, go thoroughly into the merits of the Roses one by one, without interruption from eager reporters and the curious public, formally recording their votes in a systematic way, for or against the Roses presented, and decide the question once for all.—J. H. P.

#### TRUFFLES.

A FEW days ago, under the shade of some large Oaks here, I found what proves to be a fair-sized specimen of the common Truffle (*Tuber*

FIG. 23.—TRUFFLES.

*æstivum*). Not having seen one before I was somewhat puzzled to know what it was. I showed it to several friends, but no one seemed to know it; still I had an idea it must be a Truffle. I referred to "Thompson's Gardeners' Assistant;" there I found it figured and fully described, and this morning (August 20th) I made a further search and found eleven more, but all smaller than the one I found first. Some I found entirely underground, while others had their upper side exposed.

The surface of the Truffle is rough, warty, and black; the flesh is of a greyish colour veined with black. When cut through it has a powerful smell, but not unpleasant. I cannot hear of any being found around here before, though I am informed it is frequently found in Dorset, Devon, and Wilts. Perhaps some of your readers may have found it in other places, if so it would be interesting to know where and under what circumstances. Perhaps I ought to have stated that those I found were growing in soil that was moved about ten years ago.

Thompson says: "Truffles constitute a much-esteemed luxury seldom indulged in by any but the rich. They are used in sauces, gravies, and in a great variety of dishes; indeed it is an axiom with first-rate French cooks that the Truffle improves all that it touches. However, there is no doubt that they are indigestible and injurious when eaten in large quantities."—JOHN WILLIAMS, *Whitbourne Hall Gardens, Worcester*.

[The fine specimen of the Black Truffle figured was dug in an Oak wood in Berkshire. Truffles are regarded as a choice dish on the tables of the affluent. They are generally found in chalky or clayey chalk soils. Just as many aerial Fungi only grow on dead wood, and that of a particular kind, so the Black Truffle is only met with among the roots of trees, and more especially the common and Evergreen Oak and *Quercus coccifera*. It is among the roots of these trees that the Truffles are most abundant, and acquire a perfume that makes them esteemed all over the world. Truffles increase like other allied Fungi. When ripe they contain minute spores not exceeding 1-250th of an inch in diameter, and when the Truffle decays in the ground, these produce white threads, or

mycelium, like Mushroom spawn when running, and a fresh crop results. Dogs are trained to find them, and a "Truffle dog" is regarded as a requisite on some large estates.]

### ENGLISH ARBORICULTURAL SOCIETY.

THE sixth annual excursion of the above Society took place on Wednesday and Thursday, August 20th and 21st. It was a new departure for the excursion to last two days, but the success and pleasure that attended the change ought to make it customary in the future, as the extra time at night can be utilised for holding the annual meeting, which saves a day later on the season. The place chosen this year was Skipton and Bolton, in the West Riding of Yorkshire. The party travelled by the railway from Carlisle, where the different contingents met, and arrived at Skipton about 11.45 A.M., and immediately on their arrival were entertained to luncheon at the Ship Inn (the quarters appointed for the Society to stay at) by Lord Hothfield, the owner of Skipton Castle, to whom the Society feel very much indebted for his princely hospitality. After luncheon the party proceeded to visit Skipton Castle, which is famous in history through the Clifford family, which have retained it from 1311. It was given to Robert, Lord Clifford, by Edward II. in the fourth year of his reign. The building is a very fine old baronial castle, and is very dear to most Yorkshiremen, as it forms a connecting link in the history of Yorkshire down to the present noble owner, Lord Hothfield. From the entrance gates a fine view of the castle and grounds is obtained. Mr. Ross, sub-agent to Lord Hothfield, proved an attentive guide, as he pointed out every object of historic or modern interest to the visitors. Close to the entrance gates is a fine English Yew, which is 20 inches quarter girth 4 feet from the ground, and is said to be over 500 years old. The walls of the castle are over 4 feet thick, and as the party inspected the interior of the castle they were shown some fine old tapestry, and the room the "Fair Rosamond" was imprisoned in. Some Spanish Chestnuts were also inspected, and one member of the Society interested his hearers by stating that is the only tree that a spider will not spin a cobweb on. The tower of the castle is 80 feet high, and a fine view of Pendle Hill in Lancashire can be seen on a fine day. Lady Ann Clifford, after the Civil Wars, restored the building in about the year 1659. There remains here a strong muniment room, which is supposed to contain most interesting documents, as the castle has been built about 800 years. On entering the terrace to the east of the castle some fine Sycamores were inspected, one blown down a few years ago had 250 cubic feet of wood in it. The quarter girth of some of these trees was from 27 to 30 inches each; the average of these trees would be about 70 feet; they are planted about 350 feet above the sea level, and, from Mr. Ross's belief, are about 300 years old. Each tree would average about 300 feet of wood.

The party here inspected an ancient mead with much interest; they then proceeded to their carriages and drove to Eshton Hall, by way of Gargrave, the seat of Sir Matthew Wilson, who received them at the front of his mansion, and spoke most hopefully of the future of the Society, and at once consented to become an honorary member; he regretted his inability to accompany them through age, but he said they would find an invaluable substitute in his head gardener, Mr. A. Temple. Eshton Hall is a very fine building. Handsome stone vases adorn the terraces, which were all filled with the old favourite Tom Thumb Pelargoniums, which were one mass of bloom, and had a pleasing effect in contrast with the building that all admired.

A fine tree of the yellow-flowered Horse Chestnut also adorned the lawn, and in the distance was observed the beautiful silver foliage of the Abele Poplar, and on the left were also very fine specimens of the copper-coloured Beech and Wych Elms. Near to the head gardener's house (Mr. A. Temple) there is a splendid avenue of Coniferae, including *Thuia borealis*; *Juniperus* 30 feet high; *Thuia occidentalis*, 35 feet high; a variegated Thorn, 24 feet high; and a splendid example of what was, after much discussion amongst the members, termed a fine specimen of the variegated American Oak, which had a most pleasing and telling effect in the landscape. There was also an admirable addition in an Evergreen Oak, as an imposing confère—typical representatives of the vegetable kings of the forest.

Here the party entered the kitchen garden, which is not large, but was well stocked with vegetables. Celery was most healthy and vigorous; Peas in full bearing and healthy condition. Mr. A. Temple confines himself mostly to the old and tried varieties—Veitch's Perfection, Ne Plus Ultra, and Prince of Wales; and he considers those, after long experience, a trio amongst the many varieties of this choice legume hard to beat. A new Pea (Evolution) has been tried this year, and promises to be an immense

cropper, as it fruits well from the bottom of the haulm upwards. All the usual varieties of winter varieties of the Brassica genera also afforded evidence that the kitchen garden at Eshton Hall receives due care and attention. Cos and Cabbage Lettuces on the Vine border were admirable examples of good culture, such as to cause envy in the minds of those who are partial to a good salad.

Mr. A. Temple has not yet had charge of these gardens twelve months, and the progress he has made is wonderful. We were shown on a south wall Peaches of the Waterloo variety on trees planted this year without any protection, quite ripe; also fine fruit on Apples Cellini, Pott's Seedling, an Al variety; Lord Suffield, Lane's Prince Albert, and King of the Pippins; this evidence of success becomes the more remarkable as 8° of frost were registered on the 30th of May last. The glass structures were then viewed. The Peach houses are lofty lean-to houses, and trees of Bellegarde were very fruitful. In the vineries Black Hamburgh, Gros Maroc, and Alicante Grapes were exceedingly well finished. Muscat Hamburgh was also bearing fine bunches of fruit from 3 to 4 lbs. each. These Vines are sixty years old, and were planted something like the historical Vines at Raby Castle in carrion. We observed Madresfield Court inarched on Foster's Seedling as an experiment, but Mr. Temple states he has been most successful with that variety on the old Tokay. The rest of the glass structures were then visited, including span-roofed, stove, and greenhouse plant, structures all filled with well-grown varieties of the usual typical stove and greenhouse plants. Two favourite Melons at Eshton are Countess, a fine pale flesh variety; and Harefield Grove. The party then visited the park, were shown some fine Sycamore trees worth about £20 each, but the proprietor will not have any of his favourites cut. Some fine Larch were inspected, 115 feet high, and 23 inches quarter girth, and supposed to contain over 140 cubic feet. It may be well to mention that all the Larch planted previous to thirty years ago are doing well generally in Yorkshire, which proves, perhaps, that climatal changes have had much to do with the decrease.

The visitors again re-entered their carriages, and drove hastily back to dinner at their rendezvous, "The Ship Inn," Skipton, where the host and hostess had prepared a most substantial dinner for the party. Mr. James Watts, Carlisle, was in the chair, Mr. Balder, sen., Dalston, in the vice-chair and they were supported by the following members:—Mr. J. Davidson, Secretary and Treasurer to the Society; Mr. Coroner Graham and Mrs. Graham; Mr. A. Ross, sub-agent to Lord Hothfield; Mr. John Mitchell, forester to His Grace the Duke of Devonshire; Mr. James Mitchell, Freystone Hall, Leeds; Mr. R. E. Anderson; Mr. Robt. Collins, forester to His Grace the Duke of Sutherland, and Mr. F. Collins, jun.; Mr. William Forbes, Councillor Davidson, Messrs. Bernard Cowan, Thomas Vasey, land agent, and T. Gibson, journalist, South Shields; Mr. Jos. D. Coxon, forester to His Grace the Duke of Northumberland; Mr. Robt. Robinson, Castle Eden, Durham; Mr. Wm. Fell and Mr. Brown, Wentworth Nurseries, Hexham; and Mr. Jcs. Robson, Nurseryman, Hexham; Mr. Daniel Polson, *Hexham Herald*, and Mr. J. Balder, jun., land agent, Hexham. After dinner the annual business meeting took place, when Mr. Wm. Forbes, forester to S. C. Lister, Esq., Swinton Masham, Yorkshire, was awarded the Society's first prize of a silver medal for an essay on "Timber Trees." The election of officers also took place, Mr. Thomas Taylor, Chipchase Castle, being elected President for the ensuing year.

The next morning the party breakfasted at seven o'clock, and their carriages were ready at eight o'clock, whence they proceeded to Bolton Abbey, the seat of His Grace the Duke of Devonshire. The party were met by his head forester, Mr. J. Mitchell, at the Devon-hire Arms. On entering the grounds to the right is a fine view of the Abbey, and to the left the shooting lodge of His Grace the Duke of Devonshire, which had a very fine mixture of herbaceous plants alongside of the lodge. A peculiar formation of the river was pointed out as containing extraordinary contortions and gyrations—the Skipper's Wheel. Close to the Abbey, to the left of it, are some large Ash trees supposed to be over 200 years old, 90 feet high, and 3 feet quarter girth at the ground. From there is also seen a very fine waterfall, which reminds one of the charms of Wordsworth's poem, "The Falls of Lodore." Here are also some handsome Sycamores. The Abbey is a fine old classic building, but time and space will not permit us to dwell too long on the historic associations of it, all of which the party explored and felt the deepest interest in. In a line with the Abbey is a specimen of the true Irish Cross erected as a monument to Lord Frederick Charles Cavendish. Further on is also a drinking fountain to his lordship's memory. From there is also obtained a view of the old deer forest, which contains fine old red deer. Crossing the river Wharfe you enter Wharfedale, and on a summit get a grand view of Bardon Tower, 300 feet above the level of the Wharfe, and the home of the Shepherd Lord Clifford.

At different parts of the river there are three most beautiful views; the dell here was most enchanting, Mountain Ash in berry contrasting so well with the other shades of forest trees.

The party entered the Old Deer Forest at a point called the "East Nab," and viewed some fine old gnarled Oak trees, which the party thought ought to be photographed, as they are now in the age of decay, having been planted it is supposed nearly 1000 years ago. They are about 50 feet high. The party here viewed what is termed the Valley of Desolation, which is so called because a tremendous flood once devastated trees and all before it. However, at the time of our visit it had not much semblance to that appellation, but quite a cheery aspect instead. Another beautiful waterfall was here inspected of over 40 feet high, quite perpendicular and precipitous in the arrangement of the threatening boulders that threatened to come down in the seething cauldron below. The plantations under Mr. A. Mitchell's care are 1721 acres, and there are twenty-eight miles of walks in them, which are at least cleaned twice a year, principally for the convenience of visitors. Several plantations were here viewed, which were interesting to the Society. One plantation of 194 acres had been planted by Mr. Mitchell, and included trees nine, six, and four years old, principally of Larch, which were free from disease, this never appearing till they are about fifteen years old. The subsoil is a yellow clay, accompanied with a sandy grit. Barden Fell Wood was also visited, including Larch and Scotch Fir, all in a very healthy condition. The party then inspected Barden Tower, also Pembroke Seat, of which there is a splendid view, rich in woodland and valleys, with the continual roar of the Wharfe over its rocky course.

The party from here adjourned to Strid Cottage, the house of their esteemed guide, Mr. J. Mitchell, where a sumptuous luncheon had been prepared by order of the Duke of Devonshire. The Strid Cottage is a fine Gothic structure, large and spacious, with a terraced garden in front, and there is a fine home nursery where Mr. Mitchell grows thousands of seedling trees. After luncheon, as Mr. Bernard Cowan the night before had carried a proposition that lady members be admitted to the Society, on the motion of Coroner Graham, seconded by Mr. Wm. Fell, it was decided that Mrs. Mitchell be the first honorary lady member in recognition of the kindness shown by her to the party. A vote of thanks to the Duke of Devonshire and Mr. Temple, a quick move back to catch the train brought the Society's two-days trip to an end, and it may be safely said that the members received much valuable instruction from their outing, accompanied on all sides by a genuine Yorkshire welcome. This will be remembered by the Society as one of their most successful excursions.—BERNARD COWAN.

### FUCHSIAS FOR BEDDING.

THAT Fuchsias are destined to take high rank in the embellishment of the flower garden in the future does not admit of a doubt. Every year's experience more fully proves their value. Whether in sunshine or rain they continue flowering, and planted in beds or borders have a charming effect. At Heckfield Fuchsias were favourites with the late Mr. Wildsmith, and effectively employed in the flower beds on the terrace there. Grouping several plants together on slightly raised mounds on the grass, choosing free-growing varieties of a wavy habit, displays them to the best advantage. Specimens from 4 to 5 feet high, or rather more, are suitable for this purpose, those of less size not being sufficiently imposing in appearance, nor should the plants be less than 2 feet through at the base; the branches should be graceful and glowing, not having been pinched too late before flowering commences. Arranged in groups of three or more plants together of one variety, with a lawn space of quite 6 feet between them, a pleasing effect is produced. The pots are plunged over their rims, and the roots well supplied with water. If the position is partially shaded so much the better for the successful growth of the plants; hot sun with a parching dry air not being the best of weather for Fuchsias.

To have the plants in good condition for this form of decoration they need preparing by striking cuttings in the autumn, keeping the plants steadily growing during the winter months, and affording them a season's growth in the greenhouse until large enough for the purpose. The following year they will be quite ready to take, when large enough, their place on the grass, or if some are employed in the beds these will come in as specimens for the grass. Those less than 2 feet high, when needed for large beds, are useless for giving immediate effect. Whether for beds or as specimens on the grass, a special system of preparing the plants in the spring must be practised. They must not be grown in heat with the idea of their attaining a large size previous to placing them out, and then expect

them to flourish. Much more likely are they to shed a great number of leaves. The plants should be prepared in cool quarters, to induce a stocky hardy growth, so that when planted they will take freely to their new quarters. In hot dry weather Fuchsias enjoy plenty of moisture at the roots, and indeed they must have it if success is expected. The manner of planting and the arrangement on the grass must be left to personal taste, but in my opinion a mass of one variety is preferable to mixing the colours, which gives a too "spotty" appearance. Having recently had opportunities of inspecting many varieties besides those we grow here, I give a list of the most suitable for planting out.

*Annie Earle*.—This is a free flowering variety, having very short blooms, yet is most effective.

*Mrs. Marshall*.—Most profuse in flowering, having a graceful habit, one of the best.

*Madame Cornellison*.—Although an old variety, still one of the best. The habit is somewhat stiff, and bears abundance of bright looking flowers.

*Rose of Castille*.—A well known free blooming variety, of a somewhat erect yet free and floriferous habit of growth.

*Tower of London*.—Very suitable for outdoor growth. The flowers have a bold appearance, and are of large size.

*Daniel Lambert*.—Scarlet and purple; free in growth and effective.

*Henry Brooks*.—Free flowering, and well adapted for the purpose in question.

*Elegans*.—Bushy habit, short-jointed growth, very free in blooming.

*Charming*.—This is especially graceful. The foliage pale green, the flowers borne freely in graceful clusters.

*Lord Beaconsfield*.—A pale self-coloured red. The tube is of extra length, strong growth, and a most effective variety, especially on grass.

*Annetti*.—This having very large foliage has a bold appearance. It does not flower well in the shade, but in the open its bright red flowers are freely produced.—E. M.

EVENTS OF THE WEEK.—To-day (Thursday, August 28th) is held the Show of the Oxfordshire Horticultural Society. On Friday Exhibitions are announced by the Dunfermline and West of Fife Horticultural Society (two days), and the Montrose Horticultural Society (two days), while Sandy (Beds) Show is fixed for the same day. On Saturday the annual Exhibition of the Falkirk Horticultural Society will be held.

— THE WEATHER.—This of late has been cold and showery in the Metropolitan district, and on Sunday afternoon a violent hailstorm did considerable damage in many suburban gardens.

— GRAPE AND DAHLIA CONFERENCE AT CHISWICK.—This combined Exhibition of the noblest of autumn flowers and the most important of dessert fruits, to be held on September 23rd and 24th, ought to be and doubtless will be, both attractive and instructive. The Dahlias are to be staged in groups of Show, Fancy, Cactus, Single, and Pompon varieties. Collections of Grapes are to be arranged in groups: A—Sweetwater Grapes, including Chasselas and Muscadines; (1) Black or purple berried varieties; (2) White, green, or golden berried varieties. B—Muscat and Frontignan Grapes: (1) Black or purple berried varieties; (2) White, green, or yellow berried varieties; (3) Frontignan. C—Vinous or late keeping Grapes: (1) Black or purple berried varieties; (2) White or golden berried varieties. Classes are also provided for Grapes of very high flavour (any kind). American varieties: Grapes grown entirely in the open air; Grapes grown under glass without artificial heat; foreign-grown Grapes; pot Vines with fruit; examples of packing Grapes for market, to be sent by rail; examples of packing Grapes, 4 lbs. to 6 lbs., for private use, to be sent by rail; examples of the enemies of the Grape Vine—diseases, injurious insects, &c. Thus this programme is sufficiently comprehensive, and the Exhibition should attract a large number of visitors. The Dahlia Conference will be held on Tuesday, September 23rd. Mr. Harry Turner (President) in the chair, and papers will be read by Mr. Shirley Hibberd, Mr. T. W. Girdlestone, and Mr. W. H. Williams. The Grape Conference will be

held on Wednesday, September 24th, Dr. Hogg (President) in the chair, and papers will be read by Mr. T. F. Rivers, Mr. R. D. Blackmore, Mr. W. Thomson, and Mr. W. Coleman. The opportunity seems a fitting one for a gardener's holiday, with the object of gaining information that may be of service both to gardeners and their employers.

— THE CRYSTAL PALACE FRUIT AND DAHLIA SHOW will be held on Friday and Saturday, September 5th and 6th. On Friday at 3.30 P.M. the British Fruit Growers' Association will hold a conference in conjunction with the Show, W. Rait, Esq., in the chair. Papers will be read on "Ireland as a Fruit Producing Country," Peaches and Nectarines, Plums for market and Cherries for market. At the Brighton Conference on September 11th the Mayor has promised to take the chair, and several important papers will be read.

— THE POTATO CROP IN IRELAND.—All will regret to see such a dismal account as is given in this Journal on page 160. I think much might be done to avert such a wholesale loss by planting more of those sorts that come early to maturity, and can be cleared off the ground long before the heavier cropping sorts are fit to lift. We have been working on this principle for the last eight or ten years, and we never have any serious loss by disease. What little loss there is in weight of crop is amply compensated for in the fact that every foot of ground so occupied is at once filled up with winter vegetables—Broccoli, Brussels Sprouts, Savoys, winter Spinach, Turnips, &c., of which full crops are secured, which cannot be done after later sorts.—R. I.

— LATE DUKE CHERRY.—Those who require a good late Cherry cannot do better than plant this variety at the present time. We have fruits of it hanging on a tree growing against a wall with a west aspect, and the weather experienced of late has not been of the best for the long keeping of Cherries.—E. M.

— PEACH GROSSE MIGNONNE.—This is an excellent early outdoor variety. We gathered good fruit of it from a heavy cropped tree on August 6th. The colour on the sunny side was very rich, and the flavour quite first-rate, when we consider how much against good outdoor Peach culture the weather has been of late.—E. M., *Hants*.

— DRACÆNA LINDENI SEEDING.—Mr. R. Saunders writes:—"We have at the present time a plant of *Dracæna Lindenii* carrying seven seed vessels, with every appearance of maturing them. I believe it is somewhat unusual for the plant to produce seed. I may add that they are the only ones that set on a spike 18 inches long, with some hundreds of its very fragrant and comparatively insignificant flowers."

— VERATRUM ALBUM.—This is another rarity now in flower here; in fact it has been out a considerable time. Its appearance is that of a very robust Butterfly Orchis (*Habenaria*). It is about 30 inches high, growing in a specially prepared Lily bed; good soil, but not peat. Flowers of a distinct character are scarce at the end of summer, but this is one to strike an observer. It seems to require to be established a long time before it throws up a flower spike, otherwise I should say it is a hard plant to kill.—J. R. N., *Campan*.

— BULBS FOR THE LONDON PARKS.—Messrs. James Carter and Co. request us to announce that they have again the entire orders for bulbs to be planted in the London Royal parks, and also the parks and gardens under the control of the London County Council. These include Hyde Park, Regent's Park, Battersea Park, Kensington Gardens, Victoria Park, Kennington Park, Hampton Court, Thames Embankment, Victoria Embankment, Finsbury Park, Southwark Park, Ravenscourt Park, Bethnal Green, Leicester Square, Myatt's Fields, Dulwich Park, and Clissold Park.

— CALIFORNIAN FRUIT.—The scarcity of most kinds of fruits throughout the Eastern and Central States makes the good crop of Californian fruit this year of greater importance than ever before. The people of the United States have the advantage of living in a country so large that they can supply themselves with necessaries and most luxuries despite any scarcity that may prevail. California fruit has heretofore been reckoned superior in appearance, but hardly up to the mark in flavour and quality. This has been due perhaps to excessive reliance on irrigation, just as many of our own fruits are watery and poor in an extra wet season. But good or poor, the fruit of the Golden State will this year be in demand.

— THE SAGO PALM.—The Sago Palm bears fruit but once. Its load of nuts is its final effort; it has fulfilled its allotted task in the

great round of Nature, and there remains nothing for it but to die: The nuts become ripe, and are strewn in thousands around the tree until the fruit stalk stands up by itself empty and bare. The great branches turn brown and drop one by one to the ground. Inside the trunk the work of decay is going on until what at one time was a mass of white Sago and pith becomes nothing but a collection of rotten brown fibres. One day the trade-wind blows perhaps stronger than usual, and the leafless column of the trunk falls with a crash, destroying in its fall many of the young Palms that are already springing from the nuts scattered some months before.—C. M. WOODFORD.

— PEA WILLIAMS' HOLLOWAY RIVAL.—I have grown this variety for two seasons, and consider it the most prolific main crop Pea I have yet had. The habit is the counterpart of the good old Harrison's Glory, but for productiveness the latter is "nowhere." The height of Holloway Rival is in ordinary seasons about 3 feet; this year, however, it has added another foot to its former record, while from the ground to the top of the stakes the plants are covered with pods, each of which contains from seven to nine peas. As far as the flavour is concerned few persons, I think, would ask for better, for even when getting somewhat old I have heard them pronounced "delicious." It has the reputation of being mildew resisting, and as far as our experience goes this reputation is maintained. While others alongside of them are smothered this variety is free from it.—HANDY ANDY.

— FRUIT EVAPORATION.—This is carried on to an enormous extent in America, especially in New York State and California. The fruits evaporated are principally Apples, but nearly every fruit is utilised. The value of evaporated fruit from California alone amounted in 1888 to nearly half a million pounds sterling. It takes 8 lbs. of fresh fruit to make 1 lb. of evaporated Apples. We get an idea of the work entailed in the operation of fruit drying, and the scale on which it is carried out, by the following particulars regarding New York State:—In 1888 250,000,000 lbs. of green Apples and 50,000 quarts of Raspberries were operated upon, which produced more than 30,000,000 lbs. of evaporated fruit, valued at nearly £30,000. During the operation 19,000 tons of coal were burnt in 1500 drying houses, and 45,000 hands were employed.

— ASHES FOR GARDENS.—A great deal of potash is exhausted from the soil by garden vegetables, and even in land naturally rich in this substance it is apt to set into insoluble and unavailable forms for use by growing crops. In gardens always well manured in other respects, a lack of potash may make them less productive than their condition otherwise will warrant. Wood ashes mixed with soil aid powerfully in keeping it moist. The potash then becomes a solvent, and by keeping soil moist it greatly increases the value of any manures that have been applied. It is often remarked that gardens dry up quickly despite good cultivation. This is often caused by an excessive amount of coarse stable manure. It needs wet summers to enable crops to grow without injury over so much coarse manure. When it becomes dry it is an injury rather than a help to plant growth. Wood ashes are a more effective because more constant remedy for drought than watering the plants can be.

— CHARD FLOWER SHOW.—The annual Show was held at Chard August 12th, when £150 was offered in prizes. In the class for nine stove and greenhouse plants in bloom Mr. James Cypher, Cheltenham, was first with grand specimens of *Ixora Regina*, *Clerodendron Balfourianum*, *Erica Irbyana*, *Allamanda Hendersoni*, *Bougainvillea glabra*, *Ixora Duffii*, &c. Mr. Cypher was also first in the class for nine stove and greenhouse foliage plants. In this class he showed a magnificent specimen of *Latania borbonica*. Mr. Cypher was again first for six plants in flower. In this class he had a formidable competitor in Mrs. Pearce of Southampton. The Show was a great success, and the vegetables and plants were equal if not superior to any seen at shows in the West of England. Besides the specimens sent for competition there were several groups of plants and cut flowers not for competition, amongst which was a fine display by Messrs. Jarman & Co. of Chard, who had, in addition to a group of choice plants, boxes of Carnations, containing all the leading varieties, trays of Show and Fancy, also Cactus Dahlias, amongst them being two fine seedlings, which attracted much attention.—M.

— REPOTTING ADIANTUM CUNEATUM.—Cultivators of this plant may safely follow the advice given by Mr. Young on page 136. It is a mistake to be continually repotting this and other Ferns. I have

here a pair of plants of *A. cuneatum* which have not been disturbed for at least ten years. They occupy 20-inch pots, and are as nearly as possible the same size—viz., 5 feet through, or if measured over—that is, from the points of the fronds on one side to the same on the opposite side—8 feet. The fronds are large and of a healthy dark green colour. During such weather as we are now having water is given about every other day, but in bright warm weather they have it every day with occasional additions of such manure as happens to be about—guano, fish-potash, soot, or cowshed water. Indeed they do not object to stronger doses of these than is generally considered safe. There is also here a plant of *A. concinnum latum* that has been in the same pot for some years, and is subjected to similar treatment as the above mentioned. It has at the present time about eighty fronds (all this season's growth), those fully developed measuring from 3 to 4 feet in length.—T. S., *Henbury Hill*.

— RHODOCHITON VOLUBILE.—We grow this somewhat peculiar-looking yet interesting and showy greenhouse climber, and well does it repay the attention it receives. As a supplement to the note by Mr. A. Young, on page 136, I would say that it is easy of growth. Seeds sown in March in sandy soil and given a brisk bottom heat quickly germinate. As soon as large enough to handle the plants are placed in small pots, keeping them in a temperature of 60° until established, when cooler quarters will suit them. As growth proceeds some form of training the young shoots is necessary, so that the flowers which droop downwards may be seen. Wires stretched under and close to the rafters in the greenhouse are suitable, and the flowers show to the greatest advantage. Wire trellises may be made for the plants if they are required for moving about. Strong healthy plants will flower in August from the March sown seed. Red spider is an enemy of this climber, and should be kept in check by copious supplies of water both on the foliage and at the roots. Occasional applications of weak liquid manure promote healthy growth, and consequent freedom in flowering. A compost of three parts loam to one of peat, the same amount of leaf soil, and a free admixture of sharp sand, will grow the plants well.—E. M.

— THINNING FRUIT.—It is a midsummer work of great importance to thin out the winter fruit, and sometimes in a large orchard it looks like an endless job; but where there are large over-bearing trees it is almost a necessary labour if one expects to preserve the strength and vitality of the trees and to get good fruit from them. In thinning out the fruit in the orchard one must be his own judge as to what trees need the work, and for what purpose he wants the fruit. Where the fruit is to be sent to the market a great deal of thinning out will be well repaid; in fact, if fancy fruits are to be raised for sale it will pay to thin out about one-half the fruit. Many orchardists cannot do this, for it seems like a waste of fruit. It may be a waste in quantity, but not in quality. One large juicy Pear or Apple will bring more than two small ones. In addition to this the fancy fruit will often find purchasers, while the small will rot on the stands before anybody cares about buying them. The trees are also injured by allowing too much fruit to remain on the branches. Limbs if not broken off are at least twisted out of shape and the whole vitality of the tree lowered by the excessive strain upon it. One must go through the trees systematically, pulling off all the wormy small fruit that can be found. Sometimes a gentle shake of the tree will bring down many of the worthless, for as a rule they are not so firmly fastened on the branches as the better fruits. Where two or three Apples or Pears are hanging from the same spur it is pretty safe to pull one or two of them off. Fruit should never, for proper development, hang together, nor rest upon a branch or limb of the tree. It should have no support except that which comes from the stem. During years of scarcity of fruit many who make a practice of thinning out fruit other years refuse to pull any off. They become frightened, and think that every Apple and Pear will count. This is a mistake, for if the fruit is scarce the chances are that the price of fancy fruit will be very high, and it will pay all to make the fruit on the trees as large and perfect as possible. The prices they will realise will demonstrate to them the advisability of thinning out in summer, even though there are but very few Apples and Pears on the trees. There is nothing lost in this work when it is properly done.—GEORGE WILSON.— (*American Agriculturist*.)

#### PEAS.

As Peas are most important vegetables, care is necessary in selecting suitable varieties in order that a daily supply may be maintained. Those, like myself, who have no ground to spare, cannot afford to have

a glut of Peas at one time, consequently reliable varieties must be depended on, and new sorts grown only sparingly. It is very interesting to watch new varieties, especially when they (as is usually the case) are to excel all other sorts in cultivation, and I thank H. S. Easty for giving his experience of new Peas as tried with older sorts. Among the new early Peas I have tried this year Sutton's Improved William I. proved the best. It is a great improvement on the old William I. It comes in more than a week earlier, and is at least 6 inches shorter. With me, as with Mr. Easty, William I. varies, while the Improved William is regular in pod and growth. I think William Hurst will make a good dwarf Pea, but it came up so badly with me that I could not judge fairly of it. I tried Carter's Anticipation. It gave a good crop of good peas very similar to Prince of Wales both in habit and crop. If I were limited to only one variety I think it would be Prince of Wales. I shall be glad if some of your readers will name a more useful variety for the general crop.—J. L. B.

#### AMATEURS' CLASSES.

THE remarks of "Novice," page 143 of the *Journal*, will be echoed loudly, I imagine, by many of the same class of cultivators. Around the outskirts of towns, and even in them, there are numbers of amateur Chrysanthemum cultivators who spend much time and money in attending to the wants of their favourites, and I know of no body of growers who are more enthusiastic than they are. Dealers in Chrysanthemums find some of their best customers among amateurs, who have in many instances just cause for complaint in the way the classes are made and the prizes allotted. But there is another side to the question. Committees of Chrysanthemum societies have to consider the public, who in most instances are their main supporters. This renders their task of pleasing everybody in the manner of arranging the classes and value of the prizes arduous. Managers keep in mind that the public go to shows to see, not merely numbers of flowers, but the best that it is possible to obtain by advanced cultivation, and thus the classes are arranged in the manner most likely to insure the object in view. It is well known that by far the greatest interest is attached to the "open" classes, and without any exception that I can call to mind the finest flowers have been found in those classes. It will be conceded, therefore, that committees are justified in providing classes that bring together the finest blooms. The second part, that relating to growers within a certain radius, is so arranged to please the subscribers. I know it is a fact that many subscribers who are not exhibitors do not like to see what they term strangers come and take away all or the best of the prizes from the local growers, who may be equally as clever, only they do not happen to have the same opportunities as those who can show in the "open" classes. I know that is the reason why many classes are made with a limitation to the distance in which a competitor shall reside.

From the foregoing remarks it may be thought I do not consider that amateur cultivators contribute sufficient merit to an exhibition to warrant committees in providing better prizes for them. I do not wish in the least to speak disparagingly of this body of cultivators. I know many cases where they have staged flowers which could not be found fault with by the best judges. At one large exhibition the premier incurved bloom was found in the stand of an amateur, and I, as a competitor in the open classes, had to "take a back seat." I was much pleased that the person in question succeeded in beating all his more favoured brethren, because he was, and is still, one of the most enthusiastic amateurs that I know.

That body of cultivators to whom "Novice" belongs may and do contribute largely in point of numbers to a show, but for reasons which are obvious to all, the high quality which is aimed at is not generally found in their exhibits; hence the apparent reason why amateurs are not so well provided for as those who compete in the open classes. In no place that I know are there so many amateur Chrysanthemum growers as around Portsmouth, and nowhere does this section receive so much encouragement at the hands of the Committee of the Chrysanthemum Society. As many as twelve classes in the cut bloom part of the schedule are specially set apart for amateurs, and good prizes are offered. This, it must be conceded, is liberal treatment in a schedule consisting of thirty-eight classes for cut blooms. Yet in spite of this generous treatment they are not quite satisfied, and a considerable number have formed themselves into a society which they term the "Portsmouth Cottagers' Floral Society." This Society has not been formed in antagonism with the chief Society, but rather with a view to assist it, by subscribing to and collecting funds, whereby a special class and suitable prizes may be obtained and offered by this newly formed body of enthusiasts, to be competed for at the parent Society's exhibition in November, such competition to be limited to members of the newly made Society. Such a project cannot but commend itself to all concerned in the advancement of Chrysanthemum culture. I would specially draw "Novice's" atten-

tion to the advisability of his instituting such a society in the neighbourhood where he resides, if he does not already belong to the one named.—E. MOLYNEUX.

### NAMING FLOWERS AT EXHIBITIONS.

I EXHIBITED at our Show in two classes for Gladioli, setting up in each class seedlings of my own raising, none of which had been named, placing a card with them, which I enclose. The Judges awarded the first prize to another collection, admittedly inferior to mine, disqualifying my collection for not being named, according to rule (schedule enclosed). I maintain I had complied with the rule as to naming when I affixed the enclosed card, "Gladiolus seedlings." Am I right? I may add there was no question about mine being by far the best exhibited, and an extra prize, equal in value to the first, was awarded, but that only leaves them equal to an inferior exhibit. I enclose herewith a few of the spikes shown after taking off some of the faded blooms, and should be glad to have your opinion of their quality.—II. ELLIOTT, *Jersey*.

[We print Mr. Elliott's letter in order that florists and exhibitors who are interested in this subject may express their opinions thereon. Seedling flowers, and indicated as such, are regularly exhibited in prize-winning stands at the National Carnation and Auricula Societies' Shows, and we have seen prizes awarded under similar conditions for Gladioli at the Crystal Palace. Over the prize list in the schedule sent by Mr. Elliott are these words: "All plants, cut flowers, fruits, and vegetables must be named." The Judges have interpreted those words literally. The "instruction" is loosely framed. In the first place it does not state that "varieties" must be named, but (as regards this case) "cut flowers" only. Mr. Elliott's flowers were Gladioli seedlings and were so named. Ought they therefore to have been disqualified?

We must point out another fault in the stipulation, for it does not say the flowers are to be "correctly" named, and therefore the Judges, following their practice of literal interpretation, must admit a stand if half the flowers are misnamed, while disqualifying a stand of superior examples—seedlings—that are not misnamed.

When rules permit of such an absurd possibility, ought not the *object* of naming exhibits to be considered? Is it not to enable visitors to procure varieties which they see and admire though do not possess? That, we conceive, is the main object. But of seedlings exhibited the first time there may be no duplicates, and in that case names could be of no service to visitors who might wish to purchase the varieties.

When a person exhibits new flowers of his own raising superior in merit to established varieties we think he deserves additional credit for his achievement. The seedling Gladioli spikes and flowers before us are very good indeed, or, to repeat the verdict of the Judges who disqualified them, "All in quality." Would they have been wrong in admitting them under the circumstances?]

### CANFORD MANOR.

THERE are no better-known places in the West of England than Canford Manor, and, judging from what is being done there now, its reputation is likely to be considerably enhanced from a gardener's point of view, as well as that of the inhabitants generally of this favoured part of our islands. There has been a Manor House at Canford from time immemorial, new buildings springing up out of the old ruins, each time larger and more imposing in appearance than the predecessors. As might be expected, it is close—too close, in fact, for modern ideas—proximity to a river, the Stour being the selected watercourse. Part of the building still preserved is supposed by some to have been built by John of Gaunt, Duke of Lancaster, though this is attributed by Hutebins to William Montacute, first Earl of Sarum. At one time the house and large estates connected therewith were owned by the Lords de Mauley, and subsequently were in the possession of the Countess of Richmond, mother of Henry VII., and from whom the Lady Wimborne claims descent. Lord Wimborne, the present owner of this noble property, has largely added to the mansion much of its imposing appearance, including the high tower over the principal entrance, and the perfect interior arrangements being due to him. The fifteenth century style of architecture is that adhered to, but much of the effect is marred by the low position, and from which there was no escape.

My first visit was paid to Canford Manor last January, or at the time when Lord and Lady Wimborne were entertaining the Prince of Wales in a truly royal manner, this taxing the resources of the establishment generally and the garden in particular to its fullest extent. The conservatory adjoining the mansion is a large plain rectangular building, but, as often happens, such structures can be more effectively filled with plants than is the case with more fanciful houses. A serpentine walk runs through the length of the conservatory, and in the beds formed by the curves there were at that time grand masses of forced Rhododendrons, hundreds of Poinsettias, Arums, Salvias, Camellias, and berried Solanums, among which were effectively interspersed handsome specimen Palms, Tree and other Ferns. The walls of the corridor leading from the mansion to the conservatory were all clothed with Lycopodium and Maidenhair Fern, and altogether a very delightful promenade was formed.

There are about fifty acres of dressed pleasure grounds connected with Canford Manor, all being in perfect order and remarkably well stocked with flowering deciduous and evergreen trees and shrubs, and an

exceptionally fine lot of Conifers. In respect to the latter it is very evident the place must, sooner or later, become famous, for nowhere else have I seen so many species in varieties in such excellent health and vigour. I cannot at the present time give the ages and dimensions of the trees, and can only briefly enumerate a few of the many grand specimens to be seen. The Piceas, or Abies as they are now termed, are particularly well represented, the specimens of *Abies nobilis*, *A. Douglasi*, *A. grandis*, *A. cephalonica*, *A. czeelsa*, *A. canadensis*, and *A. pinsapo* being the most noteworthy. There are numerous fine specimens of *Wellingtonia gigantea*, *Cupressus Lawsoniana*, *Thuia Lobbi*, *Taxodium sempervirens*, *Cryptomeria elegans*, and Pines in variety in various parts of the grounds, much taste and skill being expended in their grouping. The erect form of *Cupressus macrocarpa* is very conspicuous in different parts of the grounds, two fine specimens—one on each side of a grand pair of entrance gates—being particularly well placed. Nor have the owners of Canford neglected to add the later introductions of Conifers to their collection, as on all sides may be seen good sized trees of the various handsome *Retinosporas*, some of which are 15 feet high, perfect pyramids of the beautiful *Thujopsis dolabrata*, *Cupressus elegans*, Golden Yews, Golden Thuias, and Junipers. In addition to this, a pinetum on a large scale was planted last winter, no expense being spared either in the preparation of the site or in laying in a good stock of choice species and varieties.

In all directions are to be seen large masses of Rhododendrons, Kalmias, Belgian Azaleas, and other peat-loving plants, all these thriving and flowering remarkably well. Various other beautiful flowering shrubs and trees are represented; and a large rosery filled with dwarf plants, these only recently being pegged down and reduced to really good order, has this summer yielded a wonderful profusion of fine blooms. An Italian garden is a recent addition to the place, and promises to become quite a feature. There is also a large, well-stocked herbaceous garden, surrounded by a hedge of Sweet Briar; and last, but not least, a large flower garden, with fountains and other accessories, close to the mansion. During the winter nearly the whole of these beds are neatly planted with dwarf Conifers, Rhododendrons, Mahonias, Hollies, and Vincas. Very effective were the two very large central beds, each holding about 1500 Conifers and shrubs. The centres were raised considerably and planted in panels. Masses of the bright little *Retinospora plumosa*, including both gold and silver forms; *Thuia occidentalis aurea* and elegantissima, the erect green form; gold and silver *Cupressus Lawsoniana*, and *Taxus baccata aurea* and elegantissima, alternating with masses of dwarf Rhododendrons principally, and the latter are removed late in the spring and their places taken during the summer by Pelargonium Henry Jacoby, and other brilliantly flowering tender plants. Being planted in rather poor soil, the Conifers do not grow very strongly, and thus dwarfing them, in addition to long keeping them to a useful size, really improves their bright colours. A very effective summer arrangement consists of a central specimen *Cordyline* 5 feet high, a mass of *Retinospora*, with large numbers of *Lobelia fulgens* pushing through. The centres of fountain basins, filled with *Osmunda regalis* with scarlet Gladioli, are very effective, and other somewhat similar combinations are good. Beds of dwarf Hydrangeas are very showy and certainly very uncommon. Grand standard Zonal Pelargoniums, 5 feet high, with heads 4 feet through, the pots containing these being plunged in the turf, are remarkably effective; and fine specimens of *Latania borbonica* and green Dracenas, in cork-covered tubs, set on the terraces, are also highly ornamental. Altogether this flower garden is a good example of what can be done towards beautifying a garden in the winter, empty or naked beds presenting anything but a cheerful aspect, while the contrast afforded by the Conifers and other hardy ornamental plants with bright summer flowering plants is far more pleasing than a mass of the latter only. I must not omit allusion to a grand Magnolia wall overlooking the flower garden, this probably being quite unique. It is 250 feet long and 25 feet high, and at the present time the trees are flowering abundantly.

There are a useful lot of plant and fruit houses located near to the kitchen garden, and in this department very great alterations and improvements have been made since Mr. T. H. Crisp has been in charge of the gardens generally at Canford Manor. The vineries have been completely overhauled, both the borders and Vines being renovated, and already there is a marked improvement noticeable. Muscat of Alexandria is very good indeed, and Muscat of Hamburg is very rarely seen in such superior condition, this highly flavoured Grape being one of the most difficult to grow. Gros Colman promises to be very large, and Alicante will be fine. All are carrying good crops and give evidence of superior cultivation. The Peach houses were much pulled about last autumn, many worthless old trees being superseded by serviceable young trees brought in from the open walls, and already the character of the crops has greatly changed for the better. Figs in pots and otherwise are good. Mr. Crisp is much pleased with Veitch's new Figs, notably St. John's, Violet Sepor, Bourgasotte Grise, and Bourgasotte Blane. Some of the trees in 10-inch pots have yielded fifty fine fruits, and are good examples of what can be done with Figs in pots. Melons, Cucumbers, and Tomatoes are all extensively and well grown under glass, and very large quantities of Strawberries and choice vegetables have to be forced. Immense numbers of flowering as well as fine-foliaged plants in pots are grown for conservatory and house decoration, as well as for affording almost unlimited supplies of cut flowers.

Orchids are being taken in hand, and of these there are about 900 plants in addition to *Calanthes*. Already there are good stocks of

*Zygopetalum Mackayi*, *Phaius grandiflorus*, *Epidendrums*, *Cattleya Mendelli*, *Laelias purpurata* and *anceps*, *Dendrobiums*, *Odontoglossums*, and *Masdevallias* in variety. These are being largely added, recent purchases comprising hundreds of plants. *Calanthes* are particularly valued, these being of so much service during the winter months. Nowhere else have I seen such a grand batch, no less than 800 pseudo-bulbs being grown. They are principally in 32-inch pots, the compost used being fibrous loam, from which all loose particles are well shaken, and well rooted; they are fed with Wood's "Le Fruitier." Scores of *C. Veitchi* have pseudo-bulbs from 12 inches to 15 inches in length, and the grand spikes these give are largely used for dinner table decoration. Carnations, notably the *Souvenir de la Malmaison*, are quite a specialty, about 1000 fine healthy plants being grown, and a grand lot of bloom they will produce next season. Tea Roses are also in great demand, there being 100 strong comparatively young plants of these on their own roots in 10-inch pots, and a considerable number planted under glass. *Maréchal Niel* in several positions is doing exceptionally well, and *William Allen Richardson* is another great favourite. Both

enclosed by coarse mesh galvanised wire netting, and the whole is kept watered in an ingenious yet simple manner. There being a good water supply and high pressure, this is taken along the top of the wall by means of a perforated lead pipe, and on turning a tap abundance of water quickly percolates through the whole mass of soil and roots. The fronts of the stages are also neatly fringed with Ferns and Lycopods, these rooting in a small quantity of soil enclosed in brick troughs. An old conservatory has been turned into a Palm house, and a very serviceable lot of Palms for house decoration are to be seen in it just now, the Tree Ferns also being in excellent health and vigour.

The kitchen garden, compared with the other departments, is not very extensive, but it is well stocked, vegetables of all kinds being plentiful and good in every respect, cleanliness and order prevailing everywhere. An effort is being made to improve the fruit trees on the walls, the work of re-arranging and replanting being carried on at the proper times. Nowhere else have I seen such fine espalier trained Apple and Pear trees. The fencing used for the purpose is unusually substantial and decidedly ornamental in character, and these are closely

FIG. 24.—CANFORD MANOR.

Gardenias and Bouvardias planted out in well heated pits are in excellent health and very clean, and are found of great service. The usual assortment of stove flowering and fine-foliaged plants are to be seen, including *Allamandas*, *Bougainvilleas*, *Alocasias*, *Crotons*, *Dracenas*, *Pandanuses*, all being of a serviceable size, good health, and very numerous. *Allamanda Hendersoni* on roof of Orchid house is flowering grandly, and will continue to do so for several months longer. About 1400 fine plants of *Chrysanthemums* are grown, and still more double Violets, *Salvias*, *Arums*, *Libonias*, *Poinsettias*, and other serviceable winter flowering plants are being prepared very extensively, and at the present time there is a grand display of tuberous *Begonias*.

The warm fernery is remarkable attractive, quite a transformation scene having been effected in a short space of time. There are an abundance of serviceable plants in this house, but *Adiantum cuneatum* is the most extensively grown for cutting from. The high back wall has recently been covered by Mr. Crasp entirely with Maidenhair Fern, among which *Begonias* of the Rex type are freely interspersed, and the effect is much admired. The plants are growing in light turfy loam

furnished with healthy trees. An excellent crop of Pears are swelling. Those bearing the most freely are *St. Michaels*, *Glou Morceau*, *Beurré Hardy*, *Marie Louise*, *Van Mons Leon Leclerc*, *Williams' Bon Chrétien*, *Durondeau*, *Winter Nelis*, *Huyshe's Victoria*, *Knight's Monarch*, *Verulam*, *Hacon's Incomparable*, *Beurré d'Amanlis*, *Duchesse d'Angoulême*, *Doyenné d'Alençon*, *Citron des Carmes*, *Jargonelle*, *Eyewood*, *Beurré Duval*, and *Vicar of Winkfield*. Of Apples, the most productive this season are *Cox's Orange Pippin*, *Fearn's Pippin*, *Golden Pippin*, *Kerry Pippin*, *Manks Codlin*, *Wellington*, *Blenheim Orange*, *Winter Hawthorden*, and *Lamb Abbey Pearmain*. Apricots and Plums are failures, but *Gooseberries*, *Currants*, *Raspberries*, and *Strawberries* all yielded good crops.

The foregoing is only a brief outline of what I saw at Canford, there being abundance of material for a much longer notice of the gardens. I should like to add that Lord and Lady Wimborne have every reason to be proud of their beautiful country residence and surroundings, and also to be well satisfied with what is being done by their able and most energetic gardener, Mr. T. H. Crasp.—W. I.

## ROYAL HORTICULTURAL SOCIETY.

AUGUST 26TH.

OWING, no doubt, to the fact that many horticulturists are now taking their holidays, the meeting at the Drill Hall on Tuesday last was not largely attended either by exhibitors or visitors. There was, however, a fair gathering at the afternoon meeting when Mr. J. Douglas discoursed upon Hollyhocks.

FRUIT COMMITTEE.—Present: T. Francis Rivers, Esq., in the chair, and Messrs. P. Crowley, Harrison Weir, A. J. Pearson, J. Cheal, J. Willard, G. Bunyard, W. Warren, G. Wythes, F. Q. Lane, A. Balderston, J. Smith, and J. Wright.

Mr. Allan, Gunton Park, sent a seedling Grape between Muscat of Alexandria and Black Morocco. It appeared to closely resemble the latter variety, and the Committee desired to see it again when fully ripe. Mr. Allan also sent bunches of Duke of Buccleuch Grape grafted on Alnwick Seedling, full, large, and good; Mrs. Pearson, grafted on a seedling Grape, long bunches, and good berries; and Gros Maroc, grafted on Frankenthal, very fine bunches and berries, these possessing the Black Hamburg flavour in a marked degree, and considered of exceptionally good quality. A cultural commendation was unanimously awarded. Mr. Allan further exhibited a dish of good Strawberries, second crop fruits produced by forced plants of La Grosse Suerée, and for these received a vote of thanks.

Mr. Taylor, gardener to Sir John Lubbock, Bart., M.P., High Elms, Down, Kent, sent fine specimens of Lady Sudeley Apples from a three-year-old tree which had produced two dozen fruit; they were not quite ripe (vote of thanks). Mr. Wythes sent very fine Sea Eagle, also Princess of Wales Peaches from Syon House (vote of thanks). Mr. W. Farr, Patshull Gardens, sent another fruit of his Melon, but, though tempting in appearance, its quality did not justify any mark of approval. Mr. Ely, gardener to J. C. Stevens, Esq., Henley-on-Thames, sent Ely's Favourite Melon, which resembled the Beechwood, but was not so good, and was passed.

Messrs. James Carter & Co. sent a dish of the Blenheim Orange Tomato, orange, with a tinge of red; also a dish of Market Favourite, flat, highly coloured scarlet fruits. The former had scarcely any seeds, but all the fruits were over-ripe for testing their true quality. Mr. Bones, gardener to J. Donaldson, Esq., Tower House, Chiswick, sent very large fruits of Tower House Favourite Tomato. They were considered well grown and of good quality, but not superior to other forms of the Perfection type now in cultivation. Mr. R. Ridley, gardener to F. F. Miéville, Esq., Duncroft, Staines, sent a handsome looking white seedling kidney Potato, and it was advised to be tried at Chiswick.

Mr. T. H. Crasp, Canford Gardens, Wimborne, sent remarkably fine fruits of Red Magdalen Peaches, the finest of the variety ever seen on the table, and a cultural commendation was unanimously awarded. Mr. Crasp also sent a collection of thirty dishes of very good Apples, and a bronze medal was recommended.

ORCHID COMMITTEE.—Present: Harry J. Veitch, Esq., in the chair, and Messrs. J. O'Brien, J. Douglas, E. Hill, J. Dominy, H. Ballantine, Lewis Castle, and Dr. M. T. Masters.

Messrs. H. Low & Co., Clapton, sent a box of flowering plants of Vanda Kimballiana, some of the racemes bearing ten of its bright and pretty flowers (silver Banksian medal). E. G. Wrigley, Esq., Howick House, Preston, sent several fine Cattleyas, for one of which, C. Massaiana of the C. aurea type, a first-class certificate was awarded. Alfred Wilson, Esq., Westbrook, Sheffield, also sent a handsome variety of C. Hardyana which secured an award of merit. M. G. Cooke, Esq., Kingston Hill, Surrey (gardener, Mr. Cullimore) sent two varieties of Lælia elegans, which were not considered superior to others in cultivation and were passed. One variety with broad petals had been previously certified. Mr. G. Wythes, Syon Gardens, Brentford, showed several spikes of Satyrium carneum.

Drewett O. Drewett, Esq., Riding Mill-on-Tyne (gardener, Mr. H. A. Keeling), contributed three hybrid Cypripediums, one named C. Constance from C. Curtisi and C. Stonei; another named Alee from C. Spicerianum and C. Stonei; the other from C. lævigatum and C. venustum named Alfred (award of merit). Mr. J. Douglas, Great Gearies Gardens, Ilford, exhibited a plant of Cypripedium Numa with very large dark flowers. It had been previously certified. Messrs. J. Veitch & Sons, Chelsea, sent several interesting Orchids, including the true Brazilian Lælia grandis and Cypripedium H. Ballantine, a cross between C. Fairrieanum and C. purpuratum, the dorsal sepal beautifully veined with deep purplish crimson on a white ground. Baron Schröder, The Dell, Staines (gardener, Mr. Ballantine), exhibited two racemes of the wonderful Cypripedium Morganæ bearing four and five large handsome flowers each, the plant producing them having five spikes and twenty-one flowers. A cultural commendation was awarded for these fine specimens.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair, and Messrs. Shirley Hibberd, C. T. Druery, R. Dean, H. Herbst, W. C. Leach, H. Cannell, B. Wynne, Wm. Kelway, H. Turner, C. Noble, G. Paul, T. W. Girdlestone, J. Walker, F. Ross, and the Rev. H. H. D'Ombraim.

Messrs. J. Veitch & Sons, Chelsea, had a large collection of specimens of ornamental trees and shrubs, including many beautifully variegated varieties (silver Banksian medal).

Messrs. Paul & Son, Cheshunt, exhibited a very bright, varied, and beautiful collection of hardy flowers (silver Banksian medal).

The Rev. H. H. D'Ombraim, Westwell Vicarage, Ashford, showed three good varieties of Gladioli, two spikes of each, the flowers of excellent size and shape.

Mr. R. Dean, Ealing, sent flowers of African Marigolds, and a plant of white Mignon Aster.

Messrs. H. Cannell & Sons, Swanley, had a group of seedling tuberous Begonias, lifted from the open ground on Tuesday morning, the flowers large, bright, and varied in colour. Several good Coleuses were also shown from Swanley. Messrs. J. Cheal & Sons, Crawley, sent boxes of Pompon, single and Cactus Dahlias that made an effective display. Messrs. H. Low & Co., Clapton, showed a box of Liliun Wallichianum superbum and L. nepalense flowers, for which a cultural commendation was awarded. Messrs. Kelway & Son, Langport, had an extensive collection of Gladioli, Delphinium, and Gaillardias, several of which were certificated (silver-gilt Banksian medal). Messrs. F. T. Smith and Co., Dulwich, and Stuart & Mein, Kelso, sent some Hollyhock flowers (votes of thanks), and from the Society's Gardens at Chiswick came a group of Asters in pots.

## CERTIFICATED PLANTS.

*Cattleya Hardyana*, Wilson's Variety (A. Wilson, Esq., Sheffield).—A handsome Cattleya with large flowers, deep crimson sepals and petals; the lip an intensely rich magenta with a yellow throat. (Award of merit.)

*Cattleya Massaiana* (E. G. Wrigley, Esq.).—An extremely beautiful variety of the C. aurea type. The lip rich gold, netted in the throat, and tipped with dark crimson; the sepals and petals of a peculiar rosy shade (First class certificate.)

*Cypripedium Alfred* (Drewett O'Drewett, Esq.).—A hybrid from C. lævigatum and C. venustum. The flowers neat but not remarkable for brightness of colouring. The ovate dorsal sepal was white veined with green, the lower sepals similar; the petals are broad and twisted, spotted and tipped with reddish brown, and edged with dark hairs; the lip yellowish green.

*Mentzelia bartonioides* (Mr. G. Wythes).—An attractive Mexican annual, with large bright yellow flowers and dense clusters of long yellow stamens; the leaves soft green and cut at the margin.

*Geranium Shirley Blue* (Rev. W. Wilks).—This was shown by Mr. Wilks as a supposed hybrid, with a letter stating that "A plant of G. Endressi and another named G. Armenum (not the true Armenum), growing side by side, the supposed hybrid appeared in 1888. It is midway between the parents in growth and leaf, the colour being a very pale clear reproduction of the doubtful G. Armenum. Its growth is vigorous and it flowers unceasingly from the end of May until frost comes. The flowers are neat in form, blue, white centre, with rosy veins, the leaves palmately divided. (First-class certificate.)

*Lælio-Cattleya Proserpine* (Messrs. J. Veitch & Sons).—A hybrid between C. velutina and Lælia pumila Dayana; the flowers of moderate size, the sepals and petals recurving, veined with pale rosy crimson on a white ground, the lip tipped with rich crimson, and heavily veneered with crimson in the centre. (Award of merit.)

*Gladiolus Baron Schröder* (Kelway).—Brilliant scarlet, with a purple dash of colour in the centre; the spikes long and compact.

*Gaillardia Wendell Holmes* (Kelway).—Single, rich crimson centre tipped yellow.

*Pentstemon Le Borda* (Kelway).—Flowers large, very deep purple, and light throat.

*Dahlia Duke of Clarence* (Cheal & Sons).—A Cactus variety with deep rich magenta flowers. Very effective and handsome.

*Dahlia Eclipse* (Cheal & Son).—A single variety with large full purple flowers, reddish in the centre.

*Dahlia Northern Star* (Cheal & Son).—Single, deep red in the centre of the florets, evenly margined with bright yellow.

*Dahlia Mrs. J. Douglas* (H. Cannell & Sons).—A Cactus variety of a most distinct shade of colour, a purplish salmon, deeper in the centre, and almost bronzy in the outer florets.

*Dahlia Muude* (Mr. T. S. Ware).—A single variety, with blooms of good shape, pure white, regularly margined with crimson purple.

*Dahlia Mrs. Stanley* (Mr. J. G. West, Cornwalls, Brentwood).—A decorative variety of the Cactus type, of an extremely bright rosy shade; fresh and beautiful.

*Dahlia Canary Bird* (Mr. G. S. P. Harris, Orpington, Kent).—A handsome show variety, deep well-proportioned blooms of a clear bright yellow colour.

*Phlox Le Soleil* (Paul & Son).—A pretty variety with large flowers bright rose shading to white in the centre. (Award of merit.)

*Potentilla formosa pallida* (Paul & Son, Cheshunt).—A peculiar variety with pale rosy salmon coloured flowers, having a bright crimson spot at the base of each petal. (Award of merit.)

## HORTICULTURAL SHOWS.

READING.—AUGUST 27TH.

THE autumn Show of this Society was held in the picturesque Abbey Ruins and the Forbury Gardens, on Wednesday, and presented in several features a most satisfactory advance on the shows of the past few years. The large marquee was devoted to plants, groups, cut flowers, and fruit, while another portion of the Ruins was occupied with one of the most extensive and admirable displays of vegetables ever seen in Reading or elsewhere. The weather was some-

what changeable, with occasional showers, which rather marred the Exhibition as a public gathering, but there was a fair attendance during the afternoon.

## FRUIT.

An important portion of the Exhibition was formed by the fruit in competition for the substantial prizes provided by the Society, and the general quality of the exhibits was highly satisfactory, the entries in the Grape classes being particularly numerous. For a collection of eight dishes of fruit Mr. Goodman, gardener to C. Hammersley, Esq., Bourne End, was awarded first honours, showing dishes comprising about twenty handsome fruits each of Pineapple Nectarine, Barrington Peach, Moor Park Apricots, and Washington Plums, all finely ripened; also a dish of very large Castle Kennedy Figs, a good Victory of Bristol Melon, with fairly good Alicante Grapes, and rather green Muscat of Alexandria, the Grapes being the weakest part of an otherwise excellent collection. Mr. Ashby, gardener to Mrs. Fanning, Whitechurch, was second, showing Grosse Mignonne Peaches, Victory of Bristol Melon, Elrue Nectarine, Brown Turkey Figs, Morello Cherries, and Madresfield Court Grapes in capital condition. The third prize was taken by Mr. Aitken, gardener to C. Meeking, Esq., Riching's Park, Slough, Pineapple Nectarine, Jefferson's and Kirke's Plums being his best dishes. There were five competitors in this class. Four entered with six dishes of fruit. Mr. Paxton, gardener to the Hon. C. S. Irby, Taplow, leading with creditable examples of Violette Hâtive Peaches, Lord Napier Nectarines, Jefferson Plums, Brown Turkey Figs, Victory of Bristol Melon, and Madresfield Court Grapes. Mr. Osman, gardener to L. J. Baker, Esq., Ottershaw Park, was second, his Alicante Grapes being remarkable for the density of their bloom, and Buckland Sweetwater was represented by large well ripened clusters. Mr. Maher, gardener to A. Waterhouse, Esq., Yattendon, followed; large Barrington Peaches, good Morello Cherries, and a neatly netted Silver Queen Melon being most noticeable. Peaches were notable for their size, some also were finely coloured, especially the first prize dish of Bellegarde from Mr. Lockie, gardener to the Hon. G. Fitzgerald, Windsor. Mr. Lawrence, gardener to Mrs. Owen Knox, Caversham, was second with fine fruits of Barrington; and Mr. Goodman third with Noblesse. A dozen dishes were exhibited in this class. Nectarines were not so numerous. Mr. Pound, gardener to G. May, Esq., Caversham, was first for Pineapple, beautifully ripened; Mr. Goodman second with the same variety; and Mr. Cox, gardener to J. H. Blagrove, Esq., Calcot Park, third with Victoria. Apricots came from Mr. Bright, gardener to P. Karlake, Esq., White-knight Park; Mr. Howard, gardener to Mrs. Myers, Benham Park; and Mr. Goodman, who took the prizes in that order.

In the class for three bunches of Black Hamburgh Grapes there were six entries, Mr. Ashman, gardener to C. T. D. Crews, Esq., Billingbear, taking the first place for large bunches and good berries moderately coloured. Mr. Osman was second for smaller bunches of rather better colour, and Mr. Pound third for good bunches, but the berries were small and somewhat crowded. With three bunches of any other black Grape, Mr. Osman won first honours with very handsome well coloured Alicante; Mr. Pound was second with heavy bunches of the same variety, and Mr. Turton, gardener to J. Hargreaves, Esq., Maiden Erleigh, followed with Madresfield Court of good size in bunch and berry, but much rubbed. There were three other exhibitors. For three bunches of White Muscat, Mr. Maher took the first place for large well ripened bunches, Mr. Osman followed with smaller bunches, and Mr. Ashby was third for loose bunches but ripe. In the any other white variety class Mr. Pound led with clean examples of Foster's Seedling, Mr. Ashman followed with Buckland's Sweetwater, and Mr. Osman was third with Foster's Seedling.

Apples were well shown in both the classes devoted to them. With six dishes of culinary Apples Mr. Dockerill, gardener to G. W. Palmer, Esq., Reading, took the lead, showing large handsome fruit of Ecklinville, Emperor Alexander, Lady Henniker, Stirling Castle, Warner's King, and Keswick Codlin. Of the nine other competing exhibits, that from Mr. Turton was second, and from Mr. Paxton third. Mr. R. Webb, Beenham, won first prize for six dishes of dessert Apples, showing clean bright samples of Cox's Pomona, Cox's Orange, Worcester Pearmain, Blenheim Pippin, Duchess of Oldenburgh, and Devonshire Quarrenden. Messrs. Howard and Paxton followed. Mr. Goodman had the best three dishes of Plums, fine specimens of Jefferson's, Kirke's, and Monarch. Mr. Howard followed with Pond's Seedling Green Gage and Jefferson's. Mr. Webb was third.

## PLANTS.

These were not largely shown, but there were fine specimens in several classes, notably those which gained Mr. Mould of Pewsey the premier honours for nine stove and greenhouse plants. Mr. Aitkin, who had the best six fine foliage plants, also contributed handsome specimen Ferns, Crotons, and Palms; being followed by Mr. Currey, gardener to Lt.-Col. Pepper, Salisbury, and Mr. Howard of Benham Park. Ferns and Selaginellas from Messrs. Aitkin, Howard, and Dockerill were distinguished by their fresh healthy condition. The best specimen new or rare plant was a specimen of *Catasetum Bungerothi* from Mrs. Owen Knox, with a raceme of eight large creamy flowers.

Groups of plants arranged for effect were tasteful, especially that which gained Mr. Aitkin the first prize, Lilies and Francoas forming the chief features. Mr. Bright was second, Mr. Butcher third and Mr. Mayne fourth. Zonal Pelargoniums, Fuchsias, Dahlias, Begonias, miscellaneous cut flowers and floral decorations were all well represented, but we cannot devote space to a full record of all the exhibits this week. Roses were admirably shown by Messrs. Perkins & Sons Coventry,

Jefferies & Sons, Cirencester, and E. F. Such. Mrs. John Laing was finely represented.

## VEGETABLES.

The exhibits in the special classes provided for vegetables constituted a feature of great interest, and the Reading Society may congratulate itself upon having had probably the finest display ever entered in competition at any show in this country. The quality was remarkable throughout, as well as the care exercised in staging.

Messrs. Sutton & Sons' valuable prizes for a collection of vegetables arranged in a space of 6 feet by 4 feet brought an astonishing competition. No less than fifteen competitors entered, and we have never seen such an effective, even, and excellent display of vegetables at any show in this country. The stages were specially prepared, sloping to the front, covered with deep red cloth, and draped with white tiffany in front. Most of the exhibitors had selected Parsley as the groundwork, and very rarely is such taste seen in the arrangement of vegetables; in fact few would believe what a fine effect can be produced. The Judges had a formidable task in determining the positions of the exhibitors, but after very close examination, the premier award of ten guineas was adjudged to Mr. Lye, gardener to W. H. Kingsmill, Esq., Sydmonton, for a remarkably fine collection of the following sorts:—Perfection, Chiswick Red, and Maincrop Tomatoes; Potatoes, Reading Usset, Satisfaction, Prizetaker, and Windsor Castle; Black Beet, Silver Globe, Imperial Reading, Crimson Globe, and Golden Globe Onions; Yellow Perfection and Snowball Turnips; Solid White and Sulham Prize Celery; Prizetaker Leeks; Mammoth White and Scarlet Runner Beans; Canadian Wonder Beans; Lockie's Perfection Cucumbers; Duke of Albany and The Duchess Peas; Pen-y-byd Vegetable Marrow; Superb White Cos Lettuce; Red Intermediate and Champion Scarlet Horn Carrots, Imperial Cabbage, Autumn Giant Cauliflowers, Matchless Brussels Sprouts, Tom Thumb Savoy, Green Globe Artichokes, Turnip-rooted Beet, and Blood Red Cabbage. Mr. Wilkins, Henstridge, Dorset, was second; Mr. Waite, gardener to Col. the Hon. W. P. Talbot, Glenhurst, Esher, was third; Mr. Bowerman, gardener to C. Hoare, Esq., Hackwood Park, was fourth; Mr. Kneller, gardener to W. S. Portal, Esq., Malshanger Park, fifth; and Mr. Haines, gardener to the Hon. P. D. Bouverie, Colehill House, was sixth. Messrs. Carter & Co., High Holborn, also offered important prizes for collections of vegetables, which brought good competition, the winners being Mr. Lye, Mr. Goodman, and Mr. Waite, who had tastefully arranged and highly satisfactory collections.

Messrs. Webb & Sons, Wordsley, contributed special prizes for vegetables, which were won by Messrs. Bowerman, Waite, and another whose name did not appear, all the exhibits being of excellent quality. Mr. Fidler, of Reading, was another donor of special prizes for vegetables, Messrs. Beckett, Lye, and Bowerman being successful in a good competition. Onions, Potatoes, Beans, Vegetable Marrows, Carrots, Turnips, and Cabbages were all largely and well shown.

## MISCELLANEOUS

Non-competing exhibits were numerous and of capital quality, but the most remarkable was a collection of plants and floral decorations from Mr. G. Phippen, Broad Street, Reading, which was arranged tastefully on a long table at the upper part of one of the banks. Messrs. Kelway & Son, Langport, had a large group of Gladioli and other flowers. Mr. E. F. Such, Maidenhead, contributed an extensive collection of hardy and other flowers. Messrs. J. Laing and Son, Forest Hill, sent stands of Tuberosus Begonias and hardy flowers. Messrs. J. Cheal & Son, Crawley, showed single Pompon and Cactus Dahlias; Mr. C. Turner, Slough, had large collections of Dahlias, and from The Vineries, Wokingham, Berks, came a collection of thirty large Melons.

It is always satisfactory to be able to record an improvement, and this can certainly be done in the case of the Reading Society's autumn Show for the present year. It also indicates that though specimen plants may become scarce, there is ample material available in a good district to render an exhibition both horticulturally and popularly successful.

## WILTS.—AUGUST 20TH.

In the beautiful and well-kept episcopal grounds, and under the very shadow of the beautiful cathedral of Salisbury, the Wilts Horticultural Society held its annual Exhibition of plants, fruits, flowers, and vegetables on the above date. The afternoon and evening preceding the Show being very wet, great anxiety was experienced by well-wishers of the Society as to what the weather might be on "show day." This, fortunately, turned out to be everything that could be desired, with the result that the Committee, presided over by the Mayor of the city (George Nodder, Esq.) and the energetic, courteous, and very business-like Hon. Secretary (Mr. W. H. Williams), are to be congratulated upon the success of their labours in getting together such "good all-round" exhibits. The following are the awards made by the Judges.

## PLANTS.

*Open Classes.*—The absence of Mr. Lock's plants (which are not being exhibited this year) was very noticeable in this division of the Show. For twelve stove and greenhouse plants, distinct, six foliage and six flowering, £15, £10, and £5 were offered to be competed for. There were only two lots staged, Mr. James Cypher, Cheltenham, and Mr. Wills, gardener to Mrs. Pearce, Bassett, Southampton, taking first and second prizes with good all-round stuff. Mr. Cypher's plants, though capitally grown, were smaller than he had been accustomed to stage in Salisbury in competition with the Crediton plants, and com-

prised *Latania borbonica*, large and fresh; *Kentia australis*, *Cycas revoluta*, *Croton Queen Victoria*, *C. Sunset*, and *C. Thompsoni*, having clear well coloured leaves; *Dasyliion acrotrichum*, and well flowered plants of *Statice profusa*, *Stephanotis floribunda*, *Ixora Pilgrimi*, and *Ericas Turnbulli*, *Austiniana*, and *Fairricana*. Mr. Wills's best plants were *Cycas revoluta*, *Erica Eweriana*, and *Ixora Williamsi*. Mr. John Curry, gardener to Col. Pepper, Milford Hill, Salisbury, was the only exhibitor in the class for nine stove and greenhouse plants, four in flower and five foliage, and he received the first prize for a very creditable lot, showing fine *Cycas revoluta*, *Latania borbonica*, *Croton Queen Victoria* and *Prince of Wales*, *Allamanda grandiflora*, &c., in good condition.

In the class for six exotic Ferns Mr. Wills secured first position with *Dicksonia antarctica*, *Microlepia hirta cristata*, *Nephrolepis davalloides furcans*, *Adiantum cardiochloenum*, *Davallia polyantha*, and *Davallia Mooreana*, good all-round, fresh, well grown plants. Mr. F. Smith, gardener to the Lord Bishop of Salisbury, the Palace, Salisbury, was a good second, his half dozen including a grand plant of *Gymnogramma chrysophylla Lauchiana*; and Mr. Curry was third with much smaller plants. Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, was easily first for six *Begonias*, distinct, showing well trained, fresh, and finely flowered plants. Mr. A. Robey, gardener to Captain Greenwood, Harsham Cliffe, Salisbury, was second; and Mr. F. Smith was third. Mr. E. L. Brown, Wilton Road, Salisbury, was the only exhibitor of six *Fuchsias* in the open classes, and he was awarded the first prize for a very creditable half dozen plants. Groups of miscellaneous plants arranged for effect in semicircle 12 feet in diameter, have of late years become quite a feature at this Show; but this year there were only two groups arranged in both the open and the class provided specially for gentlemen's gardeners, in both of which Mr. Lock used to successfully compete. There was, however, no falling off in the quality and arrangement of the plants employed on the present occasion. The groups were very close to each other in point of merit and position, and although the latter circumstance admitted of the Judges seeing both arrangements at the same time, it took them some time to arrive at a decision. Ultimately Mr. Wills was awarded first position in both classes; the second going to Mr. Curry in both cases. The first prizes of £5 and £4 in these classes were given by the Earl of Radnor and Messrs. Keynes, Williams, and Co., Salisbury. Bridal wreath was used very effectively and freely in Mr. Wills's groups. Their arched flowered spikes rising out of a groundwork Maidenhair Fern (*Adiantum cuneatum*) giving in connection with several graceful Palms judiciously intermixed a light and pleasing contrast to the brightly coloured *Crotons*, *Celosias*, and the dark green feathery foliage of *Asparagus plumosus* and *tenuissimus*, the whole being edged with *Panicum variegatum*.

*Amateurs (within a radius of six miles of Salisbury)*.—These classes are generally well contested at this Show. For a group of plants arranged for effect in semicircle, diameter 10 feet, Dr. F. W. Coates (an enthusiastic horticulturist) secured the first position, winning the Mayor's cup, value £5, with capital plants most tastefully arranged, the whole presenting a bold yet natural appearance. Mr. E. L. Brown was a good second, and Mr. J. W. Lovibond, St. Anne Street, Salisbury, was a good third with a group arranged in a semicircle of 8 feet in diameter. Mr. Frank Pearce, Crane Street, Salisbury, was a very good first; Mr. E. Waters, Salisbury, was second; and Mr. Heuxman, gardener to Mr. H. G. Gregory, The Island, Salisbury, was a creditable third.

*Ferns*.—Mr. E. L. Brown had the best six Ferns, distinct; Mrs. Graves, Delapré, Salisbury, the second best; and Mr. J. E. Nightingale, Wilton, the third best, all showing fairly good plants. With six Zonal *Pelargoniums* Mrs. Graves was first and Mr. Lovibond second. Mr. E. L. Brown, Mr. Lovibond, and Mr. Smith, Westbourne, Salisbury, were first, second, and third, in that order, for six *Coleus*. Mr. Lovibond had the best six *Fuchsias* and Mr. A. Robey the best six *Begonias*, both showing creditable plants.

#### FRUIT.

*Open Classes*.—In addition to the Society's first prize for a collection of eight kinds of fruit, a silver medal was presented by Messrs. Wood & Son, Wood Green, London, for cultural skill. Four good collections were staged, Mr. H. W. Ward securing premier honours with good all-round fruit, consisting of a medium size *Queen Pine*, *Muscat of Alexandria* and *Madresfield Court Grapes*, large well-coloured *Sea Eagle Peaches*, *Pine Apple Nectarines*, *Moor Park Apricots*, large *Castle Kennedy Figs*, and *Lockinge Hero Melon*. Mr. Iggulden, gardener to the Earl of Cork, Marston House, Frome, was a good second, his best dishes being *Madresfield Court Grapes*, *Bellegarde Peaches*, and *Blenheim Orange Melon*. Mr. Evans, gardener to Lady Ashburton, Melchet Court, Romsey, was third; this collection contained a grand dish of *Brunswick Figs*. Mr. Inglefield, gardener to Sir John Kelk, Bart., Tedworth House, Marlborough, was awarded an extra prize; his collection contained good examples of *Black Hamburgh Grapes*, and very fine *Walburton Admirable Peaches*, being large, even, and well coloured. Mr. Budd, gardener to F. G. Dulgaty, Esq., Lockerley Hall, Romsey, had the best *Pine Apple*, Mr. Ward the second best, and Mr. Evans the third best, all showing medium-sized *Queens*.

*Grapes*.—Out of six good stands of three bunches of *Muscat of Alexandria* staged, Mr. Davidson, gardener to Lord Wolverton, Iwerne Minster, near Blandford, was first, showing medium-sized well-coloured bunches. Mr. Inglefield was a very good second, staging larger and more compact bunches, but not so bright in berry. Mr. Budd was third.

Out of a like number of bunches of *Black Hamburghs*, Mr. Charles Warden was awarded first place for medium-sized compact bunches, perfectly coloured, and carrying a fine bloom. Mr. Inglefield was a very close second; and Mr. Neville, gardener to Mr. F. W. Flight, Twyford, Winchester, was a creditable third. In the any other black Grape than *Hamburgh* class, Mr. Warden again led the way with medium-sized well-coloured bunches of *Madresfield Court*; Mr. Iggulden being a good second for the same variety; and Mr. Davidson third, showing good well-coloured bunches of *Black Alicante*. In the class for any other white Grape than *Muscat*, Mr. Warden came to the front again, showing good sized bunches of *Buckland Sweetwater*, large in berry, and beautifully coloured; Mr. Ward being a close second with the same variety; Mr. Neville securing the third place with large bunches of *Foster's Seedling*, which, had they been allowed to remain on the Vines for another fortnight, would stand a good chance at the Crystal Palace if shown.

Mr. Ward had the best flavoured Melon in a good fruit of *Sutton's Hero of Lockinge*. Mr. Northeast, gardener to Mrs. Torrance, Norton Bavant, Warminster, was second. Mr. Inglefield was first for large even fruits of *Walburton Admirable Peach*; Mr. Ward being a very close second for large, even, and well-coloured fruits of *Bellegarde*. Mr. Iggulden was first for medium-sized well-coloured *Lord Napier*. The name of the winner of the second prize did not appear with the exhibit. There are only two prizes offered in the schedule for Melons, Peaches, and Nectarines. Mr. Ward was first for *Moor Park Apricots*; Mr. Browning, gardener to Sir Talbot Baker, Bart., Ranstone, Blandford, was second; and Mr. Inglefield third. Mr. Ward had the best dish of *Plums*, showing large, even, well-ripened fruits of *Guthrie's Late Gage*. Mr. West, gardener to J. R. Wigram, Esq., Northlands, Salisbury, was second with a nice dish of *Oullins Golden Gage*; Mr. Iggulden being third. In the class for three dishes of dessert Apples, Mr. Budd was accorded first position, his best dish being *Red Astrachan*. Mr. Smith was awarded the second position, though in the opinion of those competent to form a correct decision the exhibits from the Palace gardens ought to have been placed first. Mr. Browning was third. With a like number of dishes of culinary Apples Mr. Smith was a good first, staging large, clean, even fruits of the *Queen*, *Emperor Alexander*, and *Ecklinville Seedling*. Mr. Budd was second, and Mr. Browning third. Mr. Browning was first for four dishes of *Pears*; and Mr. Smith second. This was a poor class. In the amateur classes for collections of fruit, *Grapes* and single dishes of fruit, Mr. E. L. Brown was the most successful exhibitor; his two dishes of *Bellegarde Peaches* were quite as good as those shown in the open classes. Mr. E. A. Rawlence, Newlands, Salisbury; Mr. Turnbull, Salisbury; and Mr. Lovibond were also successful exhibitors of fruit in these classes.

#### VEGETABLES.

*Open*.—There is only one class provided in the schedule for gentlemen's gardeners—namely, a collection of twelve kinds, and generally four noted exhibitors of vegetables enter into the contest for the three prizes given in this class by the Earl of Pembroke. This year Mr. Haines of Coleshill House Gardens, Highworth, did not put in an appearance, thus leaving the contest between Mr. T. Wilkins, gardener to Lady Theodore Guest, Inwood House, Henstridge, Mr. Inglefield, and Mr. Pope, gardener to the Earl of Carnarvon, Highclere Castle, Newbury, who took the prizes in the order in which their names appear, all showing first-rate produce neatly set up and fringed with curled Parsley. But the contest between Mr. Wilkins and Mr. Inglefield was a very close one. The former staged grand white *Celery*, *Sutton's Satisfaction Potato*, large, clean, and even; extra fine *Ailsa Craig Onions*, good *Autumn Giant Cauliflowers*, very fine *Lyon Leeks*, *New Intermediate Carrot*, *Perfection Beet*, *Veitch's Prodigy Peas*, *Sutton's Perfection Tomatoes*, *Chelsea White Beans*, *Globe Artichoke*, &c. Mr. Inglefield's best dishes were *Autumn Giant Cauliflowers*, large, close and white, *New Intermediate Carrot*, *Ne Plus Ultra Potato*, and *Ailsa Craig Onions*.

#### CUT FLOWERS.

*Open*.—These classes were well contested. With twenty-four *Roses*, single trusses, distinct, Mr. A. Pomeroy, gardener to Dr. Seaton, Bitterne, Hants, was first for a fairly good lot of blooms. With twelve *Roses*, distinct varieties, Mr. Neville was a good first, Mr. Browning second, and Mr. Smith third; all showing well. Mr. Budd was first for eighteen bunches of flowers, distinct, and Mr. Iggulden was a good first for twelve bunches; his stand included blooms of *Cattleya Gaskelliana*, *Cattleya crispa*, and *Ixora Williamsi*; Mr. Browning being second. With a dressed flower stand for dinner table decoration (prizes given by Mr. E. Hulse, M.P.) Mr. Cypher was a good first, employing choice flowers with his usual good taste in the arrangement; Miss J. L. Smith, Winchester, and Miss Flight, Twyford, Winchester, taking second and third in that order for good arrangements.

*Ladies' Classes*.—Miss Agnes Flight was first with a vase for the decoration of a dinner table with a very good and informal arrangement, Miss C. Brown being a very good second; so good, indeed, that the three Judges engaged in making the awards in these and the principal plant classes obtained the opinions of two medical and clerical gentlemen interested in such matters who were close by at the time; Miss Lovibond being a very good third. For a dressed basket for decoration of drawing room Miss M. E. Brown won the challenge trophy, value £3 3s., with a very good arrangement, Miss Agnes Flight and Miss Lovibond taking second and third prizes also for good arrangements. With six buttonholes Miss Flight and Miss M. E. Brown were equal first, and

Miss E. Burt, Winterbourne Dauney, Salisbury, was third. For three ladies' shoulder sprays the prizes went to Miss Flight, Miss E. Burt, and Miss C. Brown.

*Non-competing Exhibits.*—Messrs. Keynes, Williams & Co. of the Castle Street Nurseries, Salisbury, made a grand display of Roses and Dahlias, including all the best and newest varieties, in fine condition, and being set up to the best advantage they commanded great attention from visitors; as also did the fine assortment of flowering herbaceous plants, Gladiolus, Carnations, Begonias, &c., staged and admirably arranged by Messrs. Robert Veitch & Son of Exeter. Mr. B. Latham of the Shirley Nursery, Southampton, also showed a good stand of herbaceous plants in flower. Mr. A. G. Bedford of Harnham, Salisbury, contributed a group of miscellaneous plants arranged with taste.

#### SHROPSHIRE.—AUGUST 20TH AND 21ST.

FINE weather favoured the annual Show of this Society, now fifteen years old, and we are pleased to see that it is still growing in favour with the public, nearly 20,000 attending on the first day and 45,000 the second, this being the greatest number of any year since the opening. It was the finest Exhibition ever seen in Shrewsbury, judged from a horticultural point of view, and with regard to the exhibits in all the principal classes. The tents in extent and situation were much as usual, but the interior arrangements of several were different and improvements were evident. Each section had its special admirers. Plants were crowded into the largest tent, where the prizes of £25, £20, and £15 for twenty stove and greenhouse plants brought some of the finest specimens ever seen in the Midlands. Mr. Cypher admitted before the judging took place that he was "beaten," and ultimately accepted his position with that good grace only found as a rule with those who are experienced in exhibiting. Mr. Cypher has shown better at Shrewsbury, but the plants would have to have been remarkably good indeed to excel the huge, grandly furnished, superbly flowered specimens from Mr. Finch of Coventry. Mr. Farrant, gardener to Mrs. Judson, Shrewsbury, is an old exhibitor at this Show, and his securing the £10 for nine stove and greenhouse plants as well as the £4 for six plants in the next class as the first prizes gave general satisfaction. The Ferns that secured Mr. Lambert the first prizes in all the classes were the best examples yet staged at Shrewsbury, and the attractions of the large tent were further augmented by the great variety of fine *Dracænas*, *Caladiums*, *Coleuses*, *Begonias*, and *Pelargoniums* arranged round its margins.

Fruit made an extensive and admirable display. Grapes were a magnificent feature, and all classes were well filled. The collections of fruit, twelve dishes, brought Mr. Dawes of Temple Newsam, Leeds, into the front rank, the whole of his exhibits in the first prize collection being remarkably good, particularly the Queen Pine Apple, and Mr. Goodacre was a very close second. In the collection of nine dishes Mr. Lambert staged the first prize collection, which were most creditable. The £10 offered as a first prize for six bunches of Grapes invariably brings some of the best Grapes in the country to the fore, and this may justly be said of the majority of the bunches shown on this occasion, Mr. Goodacre being first with, amongst others, some marvellous clusters of Muscat Hamburgh. Mr. Haynes, Rockferry, the Hon. C. H. Wynn, Corwen, Mr. Daws, and Mr. James Watson were the other prizetakers in this important class. The Rev. T. M. Bulkeley-Owen, Tedsmore Hall, Mr. R. Pilkington, Mr. Blair, Trentham, and Mr. Lambert were amongst the leading prizetakers in Grapes, the latter staging Muscat of Alexandria in unusually fine condition. Peaches, Nectarines, Apricots, and Plums were staged in quantities, and although some of the dishes were composed of inferior fruits, the prize ones were of the highest merit, especially those competing for the prizes offered by Messrs. Wood & Son, Wood Green, London.

Vegetables have been more numerous but rarely better. Mr. Wilkins of Blandford had the distinction of beating Mr. Lambert for twelve dishes, his Ailsa Craig Onion and other samples being particularly good. The contest between these two exhibitors was very keen last year, and Mr. Wilkins may be congratulated on his good feeling on renewing the fight and its results. Mr. Lambert held his old position in the six dish contest, but the most extensive collections were those shown for the many handsome prizes offered by Messrs. Webb and Sons of Wordsley. Here Mr. Waite, Glenhurst, came first, Mr. Lambert second, Mr. Wilkins third, Mr. Austin fourth, and many good collections were left out. Although the Potato disease is so disastrous in many parts of the country no one could have thought so to judge by the fine collections shown here, Mr. Lambert being first and second for six dishes, and also first for three dishes. Tomatoes were deficient in size, and the Onion classes were destitute of the huge specimens so conspicuous in the collections. Only one dish of Runner Beans was staged, but the class contained several dozen dishes of Dwarf Beans, the majority being Canadian Wonder.

As usual the cottagers made a display of plants, flowers, fruit, and vegetables that would be regarded as a wonderful horticultural show in itself in many parts.

In special exhibits the local nurserymen are not now the only ones who contribute to the Shrewsbury Show. Messrs. B. S. Williams & Son, Holloway, London, staged a fine lot of Orchids and stove and greenhouse plants; Messrs. Dicksons (Limited), Chester, had an attractive table; Messrs. Birkenhead a rare collection of Ferns; Messrs. Pritchard and Sons most showy plants, cut flowers, &c.; Messrs. Jones & Sons were excellent in this respect, while Mr. Murrell had a splendid group of Tuberosus Begonias in pots, cut Roses, &c.; Messrs. Laing and

Mather, Kelso, showed extensive stands of Carnations and Picotees; Mr. Lister, Rothesay, a fine lot of Pansies; Messrs. Webb a splendid show of their specialities in vegetables; Messrs. Laing & Sons, Forest Hill, Begonias; Messrs. Cannell & Sons, Swanley, Zonal Pelargoniums; Mr. Davies, Yeovil, a wonderful display of cut Tuberosus Begonias; Messrs. Richard Smith & Co., Worcester, a fine group of plants and hardy cut flowers. Mr. Eckford exhibited various kinds of Sweet Peas, some of the new kinds being exceedingly pretty, as were the cut Roses from the English Fruit and Rose Company, Hereford. Much interest was also shown in the collection of Kentish fruits exhibited by Messrs. Bunyard and Co., Maidstone. The Committee awarded Messrs. Williams, Pritchard, Jones, and Birkenhead silver medals for their exhibits; and bronze medals and certificates were given to others, which is undoubtedly a step in the right direction, as these collections are highly instructive, and contain many useful specimens not found in ordinary classes. Messrs. James Carter & Co. secured a first-class certificate for their new Tomato Blenheim Orange, a yellow kind suffused with crimson, of exquisite flavour.

The decorative department confined to cut flowers was hardly equal in quality to some former years, many of the exhibits bearing traces of having been exposed to ungenial weather.

The following is a list of the prizewinners in the principal classes.

#### PLANTS.

The chief plant exhibits were arranged in the centre of a large tent with side tables for smaller stuff, such as table plants, &c. In the large class for twenty stove and greenhouse plants, foliage and flowering, there were three competitors, honours falling to Mr. Finch, gardener to J. Marriott, Esq., Coventry; J. Cypher, Cheltenham; and J. F. Mould, Pewsey, in the order named. Whilst all three were good there could be no difficulty in deciding their respective merits, the first being a fresh, even, and valuable exhibit. Mr. Cypher's foliage was also very bright and clean, and neither need fear the disgrace of being second to the other. Mr. Roberts, late of Highfield, Leek, is missed in this class, but it is to be hoped he may soon find it convenient to enter the lists again. For nine stove and greenhouse plants Mrs. Judson, Shrewsbury (Mr. Farrant, gardener), was first, and Mr. Flack, gardener to J. H. Gartside, Esq., Cholmondeley, second. Six stove and greenhouse plants, open to Salop, Mr. Farrant took first and third; Mr. Pearson, gardener to Lord Berwick, Attingham Hall, was second. Exotic Ferns.—Mr. Lambert, gardener to Col. Wingfield, with beautiful specimens, took first for six exotic Ferns, and for six ditto, open to Salop, also took first, Messrs. Farrant and Pearson following for second and third respectively.

For six plants in flower (Orchids included), a good competition resulted in Mr. Finch taking first, J. Cypher second, and J. F. Mould third. Mr. Cypher had his own way for six Palms in variety, and Mr. Lambert carried off first and second for *Dracænas*, Mr. McRennie, gardener to T. F. Kinnersley, Esq., Leighton Hall, taking third.

Six *Caladiums*.—Mr. Farrant took off first and second prizes for excellent plants. Mr. A. Myers, Shrewsbury, Dr. Burd, Shrewsbury (Mr. Bayliss, gardener), and Mrs. Wace, Shrewsbury (Mr. Walford, gardener), in the order named were successful for four *Coleus*; and for four *Fuchsias*, Mr. Philips, gardener to W. H. Herbert, Esq., Shrewsbury, Mr. Bayliss, and Mr. Rogers, gardener to W. J. Wyley, Esq., were first, second, and third respectively, with fresh, well flowered, but not very large plants.

For six *Begonias*, H. Owen, The Cedars, was first, A. Myers second, and Rev. H. Charter (Mr. R. Oakley, gardener) third; Mrs. Lawrence-Bird taking first for six double *Geraniums*, A. Myers and H. Owen second and third. Twelve table plants.—For these Mr. Lambert was well first, Mr. Farrant taking away second and third. An interesting class for fifty miscellaneous plants resulted in the Hon. W. H. Herbert securing first, R. Cowell, gardener to R. B. Philips, Esq., Hanwood, being second; whilst for collection of twenty-five ditto, Mrs. Wace, H. Owen, and Dr. Burd took the prizes in the order given. The group of plants arranged for effect, hitherto an interesting feature, was this year conspicuous by its absence, but among so many meritorious exhibits and well filled tents it could hardly be missed. The amateurs' plant classes, not enumerated here, were all well represented, as were also the plant, flower, and vegetable classes of the cottagers. These form an important feature of the Show.

#### CUT FLOWERS.

Twenty-four cut Roses.—Messrs. Perkins & Sons, Coventry, first and second; Messrs. Dicksons, Limited, Chester, third. For eighteen ditto Messrs. Heath & Son, Cheltenham, were first, and Mr. J. Davis, Leominster, second; Mr. A. Williams, Shrewsbury, being first for six in amateurs' class. Dahlias.—For thirty-six Messrs. W. Heath & Son were first, and Mr. W. Shaw, Kidderminster, second. Messrs. W. Heath and Son were also first for twenty-four, Mr. J. Davis coming second, and Mr. T. Diggory, Threopwood, third. For nine blooms in the amateurs' class Mr. A. Lowe, Dorrington Wood, was first; Mr. David Askin, Oswestry, second; and Rev. H. E. Carter third. Single Dahlias.—Rev. T. M. B. Owen was first for twelve, and Mr. W. Shaw second. Gladioli.—Mr. Shaw also stood first and second for eighteen; Messrs. Yarde & Co. Northampton, being third. For six, Mr. G. F. Fox, Shrewsbury, first, and Mr. A. Lowe second and third. Asters.—Messrs. J. Davies and A. Myers took honours in the chief class for twenty-four blooms, and for the rainy season that we have had were very good, indeed the same may be said of the other outdoor flowers in the various classes. The stands of twelve bunches cut flowers were

really good, Mr. Blair standing first, and Mr. Shaw and Mr. Pearson getting second and third places. For six bunches Mr. Farrant was second. Hardy herbaceous flowers.—Rev. T. M. B. Owen, with two magnificent stands, took first and second for twelve bunches, and for six Messrs. Wace and G. Burr took first and second. Carnations.—For twelve W. Adams and A. W. Warby, and for twelve Picotees Messrs. Sydenham (Birmingham) and Helliwell (Todmorden) stood in the above relative positions; whilst in class for twelve Carnations or Picotees the two last named were successful. Marigolds, French and African.—Messrs. Fletcher, Shifnal; and Lowe, Dorrington, were first and second for each; and for Fancy Pansies Messrs. H. Pattison, A. Myers, and Mrs. Fowler took the honours. Mr. A. Myers was first and second for Zonal Pelargoniums, twelve trusses; and for doubles ditto Messrs. W. Shaw first, and A. Myers second and third.

Ball or Hand Bouquet.—Mr. Blair, Trentham, was first, and Messrs. Jones & Son, Shrewsbury, had a special prize. Messrs. Jones and Son were awarded special first for bridal bouquet, and took all honours for three buttonhole bouquets, coming in first and second for stand of cut flowers for table decoration; Mr. F. C. Arkwright being third. Mr. T. Mcare was first in amateur class for ball bouquet; Dr. Burd second. Three buttonhole bouquets, Hon. W. Herbert and Miss Wigan being first and second. Mrs. Thomas and Hon. W. Herbert first and second for stand of cut flowers. At the end of the centre table in this tent Messrs. Jones & Son had arranged a floral stand most artistically, and were deservedly awarded the Society's silver medal.

#### FRUIT.

In the various fruit classes the competition was most keen, as can be gathered from the fact that upwards of 300 bunches of Grapes were staged. The quality was also most excellent. Black Grapes were particularly good and well coloured; this, however, could not be said of Muscats and other white Grapes generally, the season has been more unfavourable to them than the black. Mr. Dawes, gardener to the Hon. Mrs. Ingram, Temple Newsam, easily gained first for collection of twelve dishes; Mr. Goodacre, gardener to Earl of Harrington, second. In the collection open to Salop only, Mr. Lambert, Colonel Wingfield's gardener, was first; Mr. Pearce, gardener to S. K. Mainwaring, Esq., Oteley second; and Mr. Bramwell, gardener to H. France-Hayhurst, Esq., Wellington, third. Six bunches black, Mr. Goodacre first, a very fine exhibit, marred only by the lack of colour in Muscat Hamburg, which rarely does colour well; Mr. Barker, gardener to G. Raynes, Esq., Rockferry, came second; and Mr. Bennett, gardener to Hon. C. H. Wynn, Rûg Corwen, third. These three lots were very even and required a great deal of judging to decide between them. Mr. Dawes was fourth; and Mr. Gant, gardener to J. Watson, Esq., M.P., fifth.

Three bunches of Black Hamburgs which secured first to Rev. T. M. Bowen (Mr. Langley, gardener) were magnificent samples. Mr. Bramwell was second; Mr. J. T. Herries, Stone, third; Mr. McVinish, gardener to N. C. Curzon, Esq., Lockington Hall, Derby, fourth; Mr. Flack, gardener to J. H. Gartside, Esq., Cholmondeley Castle, and Mr. Pearce, Oteley Park, equal fifth. For three bunches any other black, Mr. Pearce, Oteley Park; Mr. Middleton, gardener to — Pilkington, Esq., St. Helens; and Mr. Barker were placed in the order named. Mr. Middleton was first for four bunches of white Grapes, closely followed by Mr. Wallis, gardener to R. Sneyd, Esq., Keele Hall; Mr. Blair, Trentham, being third. Mr. Middleton was again first for three Muscats; Mr. Wallis and Mr. McVinish taking third. Mr. Blair, Trentham, came in first for the three any other white; G. Meakin, Stafford, second. For two Hamburgs Mr. Bramwell, Mr. Langley, and Mr. Lambert took the honours in the order given.

There was good competition for two bunches of black and two of white Grapes, open to Salop only. In the former class Mr. Pearce, Oteley, stood well first, Messrs. Bremmell and Gant equal second, and G. Burr third; whilst for white, Mr. Bremmell was first, Mr. E. Broughall of Rugton second, and Mr. Pearson third. Peaches were strongly shown. A dish of Princess of Wales secured first honours for Mr. McVinish, and a very fine dish of Nectarine Peach brought second to Mr. Craven, gardener to J. G. Morris, Esq., Allerton Priory; Mr. Gilman, gardener to Earl of Shrewsbury, being third. Mr. C. Davies, Maidstone, was first for Nectarines; Mr. Gilman and Mr. J. Davies second and third respectively.

*Apricots.*—Mr. Pearson, Mr. Langley, Mr. McReadie, and Mr. N. E. Owen, gardener to Sir R. F. Sutton, Bart., Combermere Abbey, in the order named, divided the honours in this class; and for green or yellow Plums, Mr. C. Davies, Mr. Palmer, Thames Ditton; and Mr. Blair, Trentham, did likewise. Mr. C. Davies, Mr. Blair, and Mr. Lambert gaining the prizes for purple or red Plums.

*Melons.*—These were also shown in force. Special prizes were offered by enterprising firms for best exhibits of their new and favourite varieties. There does not seem, however, to be any variety that finds so much favour with the judges as does the popular Hero of Lockinge. This variety was prominent here. Mr. Craven was first for green flesh; Mr. Bennett, Rûg, second; and Mr. G. Meakin third. Mr. N. E. Owen for six dishes of hardy fruit stood first; Mr. Pearson and Mr. C. Davies second and third. Mr. Langley was first for dishes of scarlet Plums and Cherries.

#### VEGETABLES.

Collection of Twelve Varieties.—This class was keenly contested and the exhibits were highly meritorious. Mr. Wilkins, gardener to Lady Theodore Guest, Henstridge, came in first, followed closely by Mr. Lambert and Mr. Corfield, gardener to Capt. Cunliffe. For six varieties,

“open to the county only,” Mr. Lambert and Mr. Corfield were successful, Mr. Lambert also coming in for three dishes of Potatoes, and gaining second for a single dish, Hon. P. Talbot and Miss L. Burd being first and third. Tomatoes.—Among many dishes Mr. Langley took first, Mr. W. H. Jones, Thornton, second, and J. R. Greatorex third. Mr. Waite was first with a dish of Peas, Mr. Lambert first for spring Onions and third for autumn ditto, Mr. Waite and Mr. Bremmell being first and second. Mr. Craven, with Lockie's Perfection, was ahead with a brace of Cucumbers, Mr. Bremmell and T. A. Dickin taking second and third places. Mr. Pearson first for Cauliflowers, closely followed by Mr. McVinish and Mr. Forder, gardener to Col. Cornwallis West, the latter being first for Celery and Parsnips and third for Carrots, his exhibits being clean, carefully grown examples. Mr. A. W. Darby was first for French Beans and Carrots and second for Parsnips.

#### SPECIAL PRIZES.

By Messrs. Webb & Son, for collection of vegetables.—Mr. Waite was placed first, Mr. Lambert second, Mr. Wilkins third, Earl of Dudley's gardener fourth, and Mr. Forder and Capt. Cunliffe dividing fifth. By Messrs. Sutton & Sons, for Melons.—Mr. Craven first, Mr. Farrant second, Mr. Pearson third, and Mr. Bennet fourth. Mr. Bramwell took the first prize for Melons, Mr. S. T. Wright, gardener to C. Lee Campbell, Esq., Glewston Court, Ross, Mr. Forder, and Mr. Holloway following. Messrs. Townsend, Arkwright, and Waite secured the Tomato prizes, and Messrs. J. Davies and Forder those for Carrots. Mr. Wright was first with a dish of Peas, Messrs. Waite and Forder succeeding in the order named. By Messrs. Carter, for dish of Beans.—Mr. Wilkins first, Mr. Waite second, Mr. Lambert third, and Mr. Forder fourth, their prizes for Tomatoes being taken by Messrs. Craven, Waite, Lambert, and Gant. Mr. Craven was first in their Melon class, Messrs. Forder, Lambert, and Gant following. By H. Deverill, for Onions, “Deverill's Varieties.”—First, Mr. Wilkins; second, Mr. Waite. By Messrs. Wood & Son, dishes of Peaches and Nectarines, eight each.—First, Mr. Blair; Mr. Wallis, Mr. G. Meakin, and Mr. Goodacre succeeding in order of their names.

#### NEWCASTLE.

THE Durham, Northumberland, and Newcastle-on-Tyne Botanical and Horticultural Society held their autumn Exhibition on Wednesday, Thursday, and Friday last week. The weather during the last few years has been most unpropitious in the interests of the Exhibition; last year left the Committee in debt, and it was only through the income derived from a grand concert that the Committee were able to make good the deficit. This year the first day the weather was fine, but we regret to say the second and third days were unfavourable.

Speaking of the Exhibition, there was a falling off in the exhibits as regards number; especially was that the case in plants, and had not the local nurserymen come forward a good deal of vacant space would have been the result. We have commented in these columns before that we think it is a pity the Society discontinued giving prizes in their schedule for groups of plants, as they in all cases materially assist in giving a show an imposing effect. However, the defect, as already stated, was materially obviated by the large, excellent, and varied collection of plants supplied by the nurserymen. The Society has also discontinued prizes for table decorations, which were always an important feature at the autumn exhibitions. The quality of the exhibits this year was really excellent, the fruit generally being very superb, the Grapes forming a most prominent feature, and it is no exaggeration to say that they would have been hard to surpass in any exhibition in the kingdom. Mr. J. W. McHattie, gardener to the Marquis of Lothian, Dalkeith, as a new exhibitor at Newcastle, was most successful in fruit. The prize schedule for the autumn Show is £269 13s., and is divided into three divisions, viz., Open A Division, and B opened to all, and C to amateurs only.

In the A division, for eight stove and greenhouse, Mr. G. H. Letts, gardener to the Earl of Zetland, Aske Hall, Richmond, was first; he showed a fine *Phenocoma prolifera*, highly coloured, 5 to 6 feet across; and, what is now not often seen, *Dipladenia boliviensis*, very fine indeed; also *D. amabilis*, *Statice profusa*, *Allamandas grandiflora* and *nobilis*, *Ericas* *Parmentieri* and *Turnbulli*, both well flowered. Mr. Henry Johnson, gardener to J. B. Hodgkin, Esq., Elmridge, Darlington, was second with good examples of *Ericas* 4 feet through. Mr. F. Nicholas, gardener to the Earl of Zetland, Upleatham, was first for six plants, *Anthurium Andreanum*, ten flowers, 7 to 8 inches across, very striking indeed; *Clerodendron Balfourianum*, good; *Erica Austiniana* and *æmula*, profuse in bloom; *Allamanda nobilis* and *Cypripedium Laurenceanum*, with thirty flowers each, 6 to 7 inches across; this plant was much admired by everyone. Mr. Henry Johnson was second; his best plants were *Erica Eweriana superba*, and *Allamanda Schottii*. In 7-inch pots some fine *Lilium auratum* were shown with five stems, and well studded with flowers, by Mr. Thomas Bell. For four *Ericas* Mr. F. Nicholas was first with *Eweriana*, *Austiniana*, *ampullacea*, and *Irbyana*. Mr. Henry Johnson was second.

For six exotic Ferns, in Class C, Mr. Henry Johnson was first and Mr. John McIntyre, gardener to Mrs. Gurney Pease, Woodside, Darlington, second, the former showing *Microlepia hirta cristata* 10 to 12 feet across, *Dicksonia antarctica*, *Davallia Mooreana*, and *Adiantum cuneatum Veitchi*; and in the Class A Mr. McIntyre was first with *Microlepia hirta cristata*, *Lygodium scandens*, *Gleichenia rupestris*, *Dicksonia antarctica*, *Davallia fijiensis plumosa*, and *D. Mooreana*, 6 to 7 inches across, *Gleichenia rupestris*, and a fine plant of *Lomaria zamiaefolia*. For eight foliage plants Mr. G. H. Letts was first with well grown

plants of *Cycas circinalis*, *Cordyline indivisa*, *Cycas revoluta*, *Kentia Fosteriana*, *Chamaerops excelsa*, *Encephalartos villosus*, and two splendid coloured *Crotons* *Johannis* and *Montfortiensis*. Mr. McIntyre was second with *Crotons* *intermedia*, *angustifolia*, *aigburchiensis*, *Phoenix rupicola*, *Cycas revoluta*, &c.

For twenty-four Dahlias, distinct, the name of the first prize winner was omitted, but the blooms were good examples of Geo. Barnes, Vice President, Mr. Rawlings, Goldfinder, Crimson King, Mr. Glasscock, Royalty, Nellie Cramond, R. J. Rawlings, Harry Keith, Mrs. Gladstone (the latter a fine formed light flower), Thomas Hobbs, Royal Queen, Major Clarke, Cardinal, J. G. West, W. Rawlings. Mr. N. Walker, Low Fell, was second, and his blooms included J. M. Keynes, James Vick, Shirley Hibberd, Mr. Gladstone, Mrs. Langtry (a very fine flower). Four collections were exhibited, and they formed a striking feature in the Exhibition; some coarse flowers were staged, but generally the blooms were good, and an improvement on former years. For twelve Dahlias, fancies, Mr. Geo. Humphries, Kington Langley, Chippenham, was first. There were seven lots staged. In the first were John Lamont (crimson, very fine), John Cooper, Plutarch, Major Bartlett, J. B. Camm, Henry Eckford, Mr. Sanders, Duchess of Albany, and Gaity. Mr. M. Campbell was second with unnamed flowers, but rather coarse. Mr. Humphries was also first for twelve bunches of Pompon Dahlias, which were effectively and neatly staged with buds and foliage, and received a good deal of attention from the visitors. They included such varieties as Little Duchess, Dora, Eurydice, Darkness, Lælia, Mabel, Favourite, Grace, and E. F. Juncker. Twelve bunches of single Dahlias by Mr. Harkness were good, and received the premier award of the Judges, but were unnamed.

For twenty-four Hollyhocks, not less than twelve varieties, Mr. Adam Rogerson, North Middleton, was first, the best flowers being Earl of Dalkeith, six blooms of Peri, a fine white variety; Venus, rose coloured; La Grande, Lord Decies, Grace Darling, and Maggie Bohm. These flowers were grand, and show that the future of the Hollyhock will not be lost sight of. Rumour has it there is now a simp'e well known specific to which the Hollyhock disease succumbs, which is soon to be made public. However, south of Newcastle it would have been difficult to have found Hollyhock flowers anything like so fine as those referred to. There were four collections of twenty-four staged. Mr. Richard Mann, School House, Shadwell Lane, Leeds, was second.

Gladioli were also exceptionally well shown, and Mr. A. G. Brown, Whitburn, was well and justly placed first; Mr. R. Walker, Low Fell, Gateshead, second; and Messrs. Harkness & Sons third. In the first stand were splendid spikes, quite fresh, and each flower very large. The best blooms were Mr. Davison, white tipped with violet and purple centre; Dr. Beatty, scarlet, and best of its type; Electra, white to rose, and flushed with pencilled crimson; Orpheus, a blush; also some fine spikes of Shakespeare. Mr. H. Walker was second, and his stand contained similar flowers to the above. For six Roses Messrs. Harkness and Sons, Bedale, were first with very good blooms indeed. The best shown were Mrs. John Laing, Marshall Wilder, Exposition de Brie, Madame Eugène Verdier, Etienne Levét, Ulrich Brunner, Duchesse de Caylus, Reynolds Hole.

For eighteen bunches of herbaceous plants or border flowers as described in the schedule, there were four stands, and as showing the growing popularity of these flowers they evoked as much interest, if not more, than any of the exhibits in the Show. The first collection of Mr. John Short was unquestionably well staged, indeed this went far to secure him premier honours. Phlox Richard Wallace was grand, and Delight likewise good; *Coreopsis Drummondii*, *Lilium tenuifolium roseum*, *Montbretia crassifolia*, *Chrysanthemum maximum*, *Bocconia cordata*, *Lilium auratum*, *Achillea ægyptiaca*, *Gladiolus La Férelle*, *Hyacinthus candicans*, *Statice latifolia*, *Gladiolus brenchleyensis*, *Eryngium Oliveranum*, *Lilium Harrisii*, *Helenium pumilum*, *Helianthus multiflorus major*, *Carnation Constellation*, and a seedling. Messrs. Harkness & Sons were second, but they lacked that careful staging hitherto generally shown by this firm, but in quality the flowers were unquestionably good, and included fine large bunches of *Pyrethrum Vivid*, *Carnation Germania* (the latter a charming sulphur yellow variety), *Phlox D. Syme*, *Gladioli* (Lemoine section), *Harpalium rigidum*, *Scabiosa caucasica*, *Echinops*, *Pyrethrum Mont Blanc* (very fine), and *Pyrethrum maximum*. Mr. Thomas Battersby, Hagg Hill, Blaydon, was third with also a very fine collection; in fact, every collection was of superior merit.

Asters, Globe, in twenty-fours, were represented by seven lots. Messrs. Henry Clark & Son were first, and for feathered Asters, also seven lots, Mr. A. G. Brown, Whitburn, was first. For twelve Carnations, not less than six varieties, Mr. Geo. Dixon was first, as well as for Picotees. Pansies, Show and Fancy, were also equally well shown. For twelve bunches of stove or greenhouse flowers the competition was excellent. Mr. G. H. Letts was first with large bunches of *Dipladenia amabilis*, *Anthurium Andreanum*, *Saccolabium major*, *Disa grandiflora*, *Shubertia grandiflora*, and *Stephanotis grandiflora*. Mr. Henry Johnson was second. For six bunches of cut flowers, Mr. J. McIndoe, Hutton Hall was first, *Stephanotis floribunda*, *Disa grandiflora*, *Erica insignis* and *Cypripedium Warrenii* being well represented.

Table plants were shown in great numbers. Mr. Henry Johnson was first amongst five exhibitors of excellent specimens. Table decorations were also excellent, and occupied a large area of space. Mr. Joseph Punton, gardener to Thos. Hodgkin, Esq., Benwell Dene, was first for a drawing-room cpergue, which was very effectively and

neatly arranged, and included *Ixoras*, *Gladioli* The Bride, *Oncidium flexuosum*, and *Cattleyas*, well draped with choice Ferns. For a basket of cut flowers Mrs. Oliphant, 36, Green Market, Newcastle, was first with charming blooms of *Disa grandiflora* worked over the top of the basket. For a bridal bouquet Mr. Oliphant was also first with the usual white flowers employed on these occasions. Mr. J. R. Chard, Brunswick Nurseries, Newington, London, was first for a hand bouquet, in which *Caladium argyrites* was effectively used amongst some choice Orchids. Mr. John Jennings was second. For ladies sprays or coiffeurs there were eleven entries, Miss F. Handyside, Newcastle, being first. For a gentleman's buttonhole twenty examples were staged. Mr. John Battersby was first with a pip of *Francoa ramosa*, *Odontoglossum Cervantesi*, *Jasminum officinale*, *Bouvardia*, and a leaf of *Ampelopsis Veitchii* against a background of *Adiantum gracillimum*. In the corresponding class Mrs. E. Adams was first, and Mr. Oliphant again first for a basket of cut flowers. Mr. Jennings was first for bridal bouquet, and for a hand bouquet Mr. Isaac Lawson was first.

#### FRUIT.

In this lay the strength of the Exhibition. Grapes were particularly well shown, the collections in every case being very fine indeed. Mr. J. McIndoe was first with twelve dishes. Duke of Buccleuch and Black Hamburg Grapes were very superior, averaging from 3 lbs. to 4 lbs. each. Violet Hâtive Nectarines, Souvenir de Congrès Pears, Brown Turkey Fig, Best of All Melon, Bigarreau Napoleon Cherries, Apricots were all good. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Gardens, Derby, was second, staging Gros Maroc and Muscat of Alexandria Grapes, the latter scarcely ripe, Smooth Cayenne Pine, Lord Napier Nectarine, Barrington Peaches, &c. Mr. J. Hunter, Lambton Castle, was third, his collection including good examples of Canon Hall and Gros Maroc Grapes, Louise Bonne de Jersey Pears, and Irish Peach Apples.

For a collection of eight dishes Mr. J. Hunter was first with fine bunches of Canon Hall and Gros Maroc Grapes, and Early Grosse Mignonne Peaches, Louise Bonne de Jersey and Magnum Bonum Plums were very good. Mr. J. McIndoe was second, with Duke of Buccleuch Grapes and Black Hamburg and Scarlet Premier Melon, fine. Mr. John McIntyre was third. For six dishes of fruit, Pines excluded, Mr. Thos. Cowperthwaite, gardener to John Hutton, Esq., Castle Eden, was first, exhibiting finely finished bunches of Black Hamburgs, Brown Turkey Figs, Peaches and Nectarines. Mr. Richard Westcott, Raby Castle, was second. For six dishes of hardy fruit Mr. W. J. Short was first, Mr. James Tullett second, and Mr. Richard Westcott third. For six bunches of Grapes, not less than three varieties, Mr. J. W. McHattie, gardener to the Marquis of Lothian, Newbattle Abbey, East Lothian, was placed first, which award he well deserved, for well finished bunches of Madresfield Court, well coloured Muscat of Alexandria, Black Hamburgs, averaging 3 to 4 lbs. each, and all equal in size and shape. This was an unusually fine exhibit. Mr. John Potter was second with Black Alicante, Muscat of Alexandria, and Gros Colman. The same exhibitor was also first for two bunches of Black Hamburgs, amongst seven lots staged. For two bunches of Black Alicante Mr. Potter was first, and Mr. J. H. McHattie was first for two bunches of black Grapes, any other sort, with Lady Downe's, and he was again first for two bunches Muscat of Alexandria, well grown and finished and perfectly ripe. In white Grapes, any sort, Mr. Hunter was first with Duke of Buccleuch. For two Apples Mr. R. Nicholas was first with Smooth-leaved Cayenne, 7 to 8 lbs. weight. Thirteen dishes of Peaches were staged, but were unnamed, Mr. Thomas Taylor being first. For Nectarines, amongst eight dishes, Mr. J. H. Goodacre was first.

For Apples, dessert, Mr. J. McIndoe was first with Lady Sudeley, Duchess of Oldenburg, Worcester Pearmain, and Ribston Pippin. For baking Apples Mr. McIndoe was also first, including Alexander McIndoe's Russet (a fine new variety, twice the size of the ordinary variety), Ecklinville Seedling, and Warner's King. There were five lots staged, all highly commendable. For Pears Mr. J. Hunter was first, Louise Bonne de Jersey, Bellissime d'Hiver, Victoria, and Beurré de l'Assomption being very fine; and Mr. J. McIndoe second.

All the local nurserymen sent stands of plants not for competition, Messrs. Wm. Fell & Co., Hexham, sending a fine stand of Coniferæ and herbaceous flowers; Messrs. Little & Ballantyne, Carlisle, a mixed collection, including some handsome new *Crotons*; Mr. Jos. Watson, nurseryman, Fenham, Newcastle, a fine mixed stand of plants, including *Clematis* Miss Bateman; all the above received certificates of commendation from the Society. Mr. J. Robson, Hexham, showed a new climbing Rose, Gloire de Margottin, Coniferæ, and herbaceous plants; Mr. J. W. Tate, 1, Crow's Nest Lane, a fine lot of table plants; Kent & Brydon, Darlington, stove and table plants; Messrs. Stuart and Mein, Kelso, Carnations; Messrs. Dobbie & Sons, Rothesay, Pansies shown in stands. Mr. John Forbes, Buccleuch Nurseries, Hawick, showed three new Colcuses, Lady Elgin, mixture of maroon, green, and yellow; Buccleuch Beauty, lemon yellow, spotted green; Wm. Stanley, groundwork red, and some fine Pentstemons, Mr. Gladstone being fine, closely set, and thick in the spike.

After the judging was over the Committee and officers lunched together, the President, John Cowen, Esq., Blaydon, in the chair. He was also supported by Councillor Baxter Ellis, the Chairman of the Society, the Mayor of Newcastle, and several Councillors. The health of the Society was drunk most enthusiastically, and the staging Committee and the Secretary, Mr. J. J. Gillespie, were thanked for their services so ably rendered to the Society.

## DEVON AND EXETER.—AUGUST 22ND.

THIS Society held its annual Exhibition of plants, fruits, flowers, and vegetables on Northernhay, Exeter, on the above date. Northernhay is a public garden, occupying an elevated position within a few hundred yards of the Queen Street Station of the London and South-Western Railway, and is in every way a very suitable place for the holding of the summer annual Show. Fortunately on this occasion the weather was everything that the indefatigable Hon. Secretary (Mr. G. D. Cann) and the Committee could wish, with the result that the Show was one of the best in every respect that the Society has had for a long time.

## PLANTS.

In the twenty-five classes provided in the Society's schedule for plants the absence of Mr. Lock's exhibits was, as at Southampton, Taunton, and Salisbury, during the shows held in those important horticultural centres within the last three weeks, very noticeable in the general display. With nine stove and greenhouse plants and flowers, distinct, Mr. W. Rowland, gardener to W. Brock, Esq., was first. His plants of *Clerodendron Balfourianum* and *Stephanotis floribunda* were fine specimens of good culture. *Allamandas nobilis* and *Hendersoni*, *Ixora Williamsi*, *Dipladenias amabilis* and *Brearleyana* were also good. Mr. Curry, gardener to Colonel Pepper, Milford Hall, Salisbury, was second with good plants. In the corresponding class for a like number of stove and greenhouse foliage plants the same exhibitors occupied the same positions as in the preceding class. Mr. Rowland's Palms were large and good, but his Crotons were rather deficient in colour. He staged *Dicksonia squarrosa*; Crotons *Disraeli*, *Johannis*, and *Andreanus*; *Latania borbonica*, *Kentia Belmoreana*, *Dicksonia antarctica*, and *Anthurium Warocqueanum*. With nine stove and greenhouse Ferns Mr. Ebbot, gardener to the Rev. Hamilton-Gell, Winslade, Exeter, was placed first for very good plants of medium size, and very fresh. The best of these were *Microlepia hirta cristata* and *Goniophlebium subauriculatum*, Mr. Rowland being second. The last-named exhibitor was first in the following classes:—Six *Dracenas*, six *Fuchsias*, three *Liliums*. Mr. Ebbot was first for six *Caladiums*, staging, like Mr. Rowland in the foregoing classes, very creditably grown plants. Mr. W. C. Sim was first for six tuberous-rooted *Begonias* and for six *Cockscombs*, showing good plants in each case. Mr. T. Knapman was first for six *Zonal Pelargoniums* with well grown plants, being also first for a like number of double-flowered *Pelargoniums*. For a group of miscellaneous plants arranged for effect in an oval with a diameter of 12 feet by 16 feet, Mr. Rowland was awarded a silver cup, value £5, for a very good arrangement of suitable plants, Mr. Curry being a good second, and Mr. W. C. Sim third. In the class reducing the diameter to 12 feet by 8 feet Colonel Garrett was first and Mr. Knapman second, both exhibitors arranging very good groups.

## CUT FLOWERS.

The seventeen classes devoted to cut flowers were well contested, the exhibits in most cases being very meritorious. With twenty-four Show and Fancy Dahlias, distinct varieties, Mr. S. Cooper was first, and Mr. Nation second, both showing stands of even fresh blooms of leading varieties. With twelve blooms of the same description of this still popular flower, the same exhibitors occupied a like position, but in the class for twelve Cactus and decorative varieties, distinct, their positions were reversed, Mr. Nation taking first place and Mr. Cooper second. With six varieties of the Dahlia Mr. Knapman was first and Mr. Cooper second, the last named exhibitor taking first for six bunches of Pompons arranged with foliage. Mr. W. H. Fowler, Taunton, had the best twelve spikes of *Gladioli*, distinct, with a very good stand, Sir W. Lethbridge being second. Mr. Fowler was first for twelve Roses, showing fresh even blooms. Mr. Nation, Mrs. Hart, and Mr. Cooper were successful exhibitors of *Asters*, staging good blooms. Mr. Kneel had the best stand of twelve *Hollyhocks*, and the Rev. J. L. Gibbs the second best. Mr. Fowler was first for a very good stand of twelve *Carnations*. Messrs. Hamilton-Gell, Richards, Knapman, Cooper, and Mr. Macalister were also successful exhibitors in minor classes.

## FRUIT.

This was well shown throughout all the twenty-four classes provided for it. There were several good collections of ten kinds staged in competition for the silver cup, value £5 5s, given as a first prize by those generous supporters of horticulture, Messrs. Robert Veitch & Son. Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, was first with good fruit, consisting of medium-sized Queen Pine, Muscat of Alexandria and Madresfield Court Grapes, Blenheim Orange Melon; Sea Eagle Peaches, large, even, well-coloured fruits; large Brunswick Figs, Moor Park Apricots, Pine Apple Nectarines, Green Gage Plums, and Red Astrachan Apples. Mr. J. Lloyd, gardener to V. Stuckley, Esq., Langport, was a good second, his best being a fine Smooth Cayenne Pine Apple, Pine Apple Nectarines, Muscat of Alexandria and Madresfield Court Grapes, and a hybrid Melon. Mr. Iggulden, gardener to the Earl of Cork, Marston, Frome, was third. In the class for six kinds of fruit (Pine excluded) Mr. Mairs, gardener to Sir John Shelley, Bart., was first with even and fairly well coloured bunches of Gros Maroc, Barrington Peaches, Blenheim Orange Melon, Pine Apple Nectarines, Moor Park Apricots, and Kirk's Plums, a good even lot of fruit. Sir W. H. Walrond's gardener was a good second, showing in his collection grand bunches of Alwick Seedling Grapes. Mr. Bull, gardener to Sir R. Buller, Downes,

Crediton, had the best Pine Apple, and Colonel Garrett the second best. Mr. Iggulden was first for three bunches of Black Hamburg Grapes, his bunches being well coloured, but lacking freshness; Mr. Lloyd was a good second. Mr. McMillan, gardener to Sir G. Stuckley, was first for Muscat of Alexandria, staging good-sized well-coloured bunches; Mr. Lloyd taking second place with good exhibits. Mr. Iggulden was first for Madresfield Court with bunches of medium size and good colour, Mr. Lloyd being a good second. With three bunches of Black Alicante, Mr. Copp, gardener to W. E. S. Erle Drax, Esq., Holnest House, Dorchester, was first, staging medium-sized, well-coloured bunches, carrying a grand bloom, Lord Poltimore's gardener being second; Mr. H. W. Ward being first for Foster's Seedling, staging large well-coloured bunches, Mr. Iggulden being second. Mr. Luttrell's gardener (Dunster Castle) was first for Buckland Sweetwater, having large well coloured bunches. Mr. Benmore was second with nice bunches. The best dish of Peaches came from Dunster Castle, Royal George; Mr. H. W. Ward being a very close second, with large, even, and finely coloured fruits of Bellegarde.

Mr. Lloyd was first for Nectarines, showing fine Pine Apple, and Mr. Ebbot was a good second. Mr. Iggulden had the best flavoured Melon with Countess, Mr. H. W. Ward being second with Hero of Lockinge. Lord Poltimore's gardener had the best flavoured scarlet-flesh Melon with Blenheim Orange, the Rev. Sub-Dean Acland being second. Col. Garrett and Mr. Luttrell were first and second respectively for Apricots, showing good sized even bright fruits. Mr. H. W. Ward had the best dish yellow or green Plums, staging large ripe fruits of Guthrie's Late Gage, Mr. Iggulden being second. The last named exhibitor was first for a dish of dessert Apples, with Beauty of Bath in good condition; and Miss Fripp had the best dish of culinary with Lord Suffield. Lord Poltimore's gardener had the best dish of red or purple Plums, showing fruits of Kirk's. He also had the best dish of Pears in Jargonelle. Mr. H. W. Ward was first for White Currants and for Gooseberries, showing good fruits in both cases. Sir John Walrond's gardener had the best dish of Cherries, Mr. Mairs, gardener to Sir J. Shelley, being second.

## VEGETABLES.

The twenty-five classes provided for these were well filled, the chief point of interest being centred in the collections of twelve kinds. Mr. Copp was first, showing grand Autumn Giant Cauliflowers, Sutton's New Intermediate Carrot, good specimens of Wright's Celery, and Ellcombe's Improved Parsnips; clean solid Lyon Leeks, Veitch's Main Crop Onion, Tomato Perfection, Ne Plus Ultra Bean, Sutton's Seedling Potato, Duke of Albany Pea, &c. Mr. Mairs was second, his best dishes being Autumn Giant Cauliflowers, New Intermediate Carrot, and Perfection Tomato. Rev. Sub-Dean Acland was third, and an extra prize was awarded to Mr. John Drew. Cucumbers were shown well by Mr. Luttrell, Mr. Mairs, and Lord Poltimore's gardener. Mr. Lloyd had the best twelve bulbs of autumn-sown Onions, showing Giant Rocca, large, clean, even, and firm as a deal board. Mr. Luttrell had the best dish of spring-sown Onions and Mr. Mairs the second best in a good class. Mr. Copp was first for twelve white kidney-shaped Potatoes with grand tubers of Sutton's Seedling, the Rev. Sub-Dean Acland having the best dish of coloured kidney-shaped Potatoes with Prize-taker. This gentleman was also first for twelve white round and twelve coloured round Potatoes, showing London Hero and The Dean in the respective classes in good form. Mr. Sims was first for a dish of twelve Tomatoes, showing Sutton's Perfection in fine condition.

## MISCELLANEOUS EXHIBITS.

Messrs. Robert Veitch & Son had a grand bank of miscellaneous plants and cut flowers effectively arranged, and which made quite an imposing display in themselves; these included Palms, Japanese Maples, Roses, *Gloxinias*, *Gladioli*, *Carnations*, &c. Messrs. J. Crispen & Sons, Nelson Street, Bristol, showed cut blooms of Orchids—*Cattleya gigas* Sanderiana, *C. Harrisonae*, *Dendrobium Dearei*, &c. Mr. James Walters, Mount Radford Nursery, Exeter, had eight stands of very good Roses. Messrs. Robert Veitch & Son obtained a certificate for a new Shallot named Veitch's Exhibition Purple. This variety is of great size. 60 lbs. of "Early Puritan" Potato were also exhibited by this firm, which were the production of 1 lb. (three Potatoes) planted last March. This was given a special certificate.

## FRUIT FORCING.

VINES.—*Early Forced Pot Vines*.—Those for starting in November must not be allowed to become dust-dry at the roots. They will be at rest, the wood ripe, the laterals closely pruned, and the canes shortened to about 6 feet, more or less, according to the situation of the eyes. Whilst the cuts are dry dress them with styptic or knotting to prevent trouble when placed in heat through bleeding. They should be kept in a cool airy house.

*Earliest Forced Planted-out Vines.*—It is not necessary to wait until all the leaves have fallen before pruning matured Vines for early forcing, but the wood must be brown and hard and the leaves turning yellow. The pruning will cause the Vines to go more quickly and thoroughly to rest. If in good condition they will afford bunches quite large enough when pruned to a couple of buds from the base, but if the Vines are weak from a long course of forcing or overcropping, the spur shoots may be left a little longer, with a view to larger bunches. When this method is adopted shoots should be taken from as near the base as possible in the spring, and not allowed to carry fruit, but be stopped at about the sixth leaf and the laterals at the first leaf, and subsequently as produced. Such shoots are sure to form good buds; the extra foliage will tend to invigorate and support the fruit on the other shoot, which can be cut away in due course in favour of the one for fruiting the following season. This alternate system of fruiting necessitates the shoots being kept wider apart for development and exposure to light and air. If the Vines are grown on the extension system it will only be necessary to cut back to bold buds on firm ripe wood, being guided by the space at command, for there must be no overcrowding. It is important that the house be thoroughly cleaned and the Vines also. Any weakly Vines, or those in an unsatisfactory state, may be improved by removing the soil down to the roots and substituting fresh loam, with an admixture of crushed bones, to the extent of a bushel to twenty bushels of loam; and if calcareous matter be wanted add from a sixth to a tenth of old mortar rubbish, more being required for heavy than light soil.

Lift any roots available for the purpose, laying them upon the fresh compost, and cover 3 or 4 inches deep. This is best done before the fall of the leaf. It is a mistake to allow Vines to become dry at the roots when at rest. Cracked borders through dryness detach the finer and best roots; besides, the border is difficult to bring into a thoroughly moist condition. The outside border should have a covering of some kind to protect the roots from the heavy autumn rains, which reduce the temperature considerably. Glass lights are preferable, throwing off heavy rains whilst allowing the sun's heat to penetrate the soil. Many persons, however, are obliged to rest content with a covering of leaves and litter after cold weather sets in. Though good Grapes can be produced without material to throw off the rains, yet reason and practice justify their employment wherever available, for the exclusion of moisture in undue proportion to the requirements of the Vines.

*Young Vines.*—Those which have made a strong growth and are late in ripening should be assisted with fire heat, maintaining a maximum of 75° and a minimum of 65° artificially, continuing it until the wood is ripe, accompanied with free top and front ventilation. Discourage any further growth by the removal of the laterals as they appear.

*Late Grapes.*—Many are too late. They should be assisted with fire heat, maintaining a night temperature of 70° to 75°, falling 5° to 10° during the night, increasing to 80° to 85° by day with sun, accompanied with a free circulation of air, and a little at night. It will require sharp firing to finish those that are only commencing to colour before the days are too short to admit of free ventilation; indeed, more can be done in the next four or six weeks than in twice the time later on. Those Grapes well advanced in ripening may have the atmospheric moisture reduced; those only colouring should have a moderate amount of moisture to assist their swelling, not neglecting to apply water to the inside border as may be necessary.

*PINES.*—Suckers from the summer fruiters will soon be ready to re-pot. It is well to divide the plants into two batches. The strongest plants should be shifted into their fruiting pots as soon as ready, employing 10 or 11-inch pots according to kind, affording the plants a position near the glass in a light airy house, keeping them gradually growing through the winter. The plants so treated will be readily started into fruit next May or June, and will afford a good supply in late summer or early autumn. The other plants, suckers from the summer fruiters not large enough to shift into fruiting pots, winter in their 7 or 8-inch pots, transferring them to the larger as soon as ready in the spring, which, with suckers of Smooth-leaved Cayenne that were started last March, will afford a successional supply of fruit through the winter months.

A re-arrangement of the plants should now be made in order to separate the fruiting from the non-fruiting, as many of those that were started from suckers of last summer's fruiters will have fruit swelling. Those plants not fruiting will have completed the growth, and should have air very freely for the next six weeks, when the temperature exceeds 80°. Plants well rooted should have a bottom heat of 80° to 85°, but recently potted plants, or those not having roots well established in the fresh compost, maintain at 90°.

Plants swelling the fruit should have moderate atmospheric moisture, admitting a little air at the top of the house early in the morning, so as to allow of any superfluous moisture escaping before the sun's rays act powerfully upon the fruit. Any fruit it is desired to retard should be moved to a rather cool or shady house, affording abundance of air.

*ARALIA VEITCHI.*—Small plants that have been grown in the stove up to this date, and are large enough for table decoration, should be gradually hardened and placed in a cooler structure. In brisk heat they soon run up too tall, but in a temperature of 50° they will be perfectly safe and remain of a suitable size for a long time. The same applies to

A. V. gracillima and A. leptophylla. Plants of the latter that are growing too tall may be cut into lengths of two or three joints, and inserted singly in small pots. The top eye should be level with the soil, so that when placed into larger pots the old portion of the young plant can be buried.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### AT THE HEATHER.

ON the 7th of August, fully a fortnight later than in 1889, we placed our bees among the Heather. Although later this year it is as fresh and profuse in blossom as it was last year, and a few fine days are all that are necessary to secure a large yield of honey. The Thyme was also beautiful, and its perfume agreeable.

#### HOW FAR BEES FLY.

I started at a point where I was sure they would be on fields of Thyme, and travelled westward for three and half miles where there was a break in the flora which the bees had reached, but I do not think had gone beyond it. By the time I had reached the spot the day was declining, still many bees were active upon both Thyme and Thistles, the only variety, however, being Carniolians; not another bee was seen. Half a mile nearer the hives Syrians appeared, and I had to travel a considerable distance nearer home before other varieties were traced. This is not the first time I have witnessed the Carniolians the farthest from home, and I am hopeful that they will form the heaviest hives at the end of the season. But what about their swarming propensities? The rumour that they swarm excessively is a myth arising through a misunderstanding of the nature of bees and their habits. My bees are crowding 6000 cubic inches, and they have shown no inclination whatever to swarm, and will not until the queen shows signs of exhaustion.

#### MOVING BEES SAFELY.

To send or take hives safely a long distance without worrying or overheating the bees is the key to success at the moors, and a great means of ensuring immunity from foul brood. Our bees had to be carted upwards of three miles and then sent nearly fifty by rail, yet not a bee escaped, nor was a dead one found, though they were confined for seventeen hours during the hottest day of the season. It will be remembered that previous to our instructions for taking bees to the Heather the late Mr. Wm. Raitt recorded the suffocation of his bees during transit of only a few miles. Profiting by our instructions he took them safely the following year, and gave the method as original, which has been reproduced in the "Bee-keepers' Record" for August, but the attentive reader will not fail to observe that there is as much need for reform in the hives as there was in the ventilation of them.

#### OBSERVATIONS.

We have observed little of interest to record further than that in less than five minutes after the bees were set free they were entering their hives with honey and pollen. They as usual flew low, and took circuitous routes to escape the wind. Although the day may appear to us likely to be fine, before rain the bees remain idle.

#### THE WEATHER.

Since the 22nd August, when we had near Leadhills a fall of snow, the weather has been very changeable—frost, high winds, with heavy rain and bright sunshine alternating. During the week honey was gathered on two days. The Heather is in splendid bloom, and with two weeks' fine weather hives which are in good condition will be sure to rise rapidly in weight. It is to be regretted, however, that many hives I have witnessed are in very poor condition, and very far below the strength they ought to be at the moors.

## QUEENLESS HIVES.

Amongst many hives I have examined there will be on an average 15 per cent. queenless, and in one apiary of thirty I counted six dead, and the hives being robbed from that cause. It is a great mistake to set strong and weak hives near each other, as the latter are sure to be robbed, and, what is more detrimental, not a few of these have symptoms of foul brood. From the distance bees fly, and their proclivities to rob, the disease may be spread to a very wide extent. From the catching nature of the disease it will be easily understood why it so mysteriously appears in apiaries supposed to be completely isolated.

## WHITE HEATHER.

White Heather is somewhat plentiful in the district. It is a great favourite amongst ladies, who have requisitioned me to supply them, as also are the White Harebells or *Campanula rotundifolia alba*. The wild Pansies are fine, some of them very large and beautiful. *Myosotis palustris* is simply grand. I saw some Gentians, and of course other wild flowers common in upland districts, of which I am not botanist enough to describe. The search for these further tends along with the bracing atmosphere to increase the vigour of invalids as well as that of—  
A LANARKSHIRE BEE-KEEPER.

TOADS EATING BEES.—ON Sunday the 10th inst. a gentleman in the flower garden here and his valet with him were interested in watching a bee going from flower to flower over the Lobelias. Noticing a large toad underneath the Lobelia in chase of the bee they watched its movements. The toad followed the bee for some distance, caught it, and ate it. Not hearing of such a thing before, I thought the fact might be of interest to some readers of the Journal.—GEO. HAWKINS, *Ewenny Priory Gardens, Bridgend.*

## TRADE CATALOGUES RECEIVED.

Sander & Co, St. Albans.—*Orchid Catalogue.*  
Little & Ballantyne, Carlisle.—*Select Bulbs.*  
Harrison & Sons, Leicester.—*Flowering Bulbs and Roots, 1890-91.*  
Benjamin Soddy, 243, Walworth Road, London, S.E.—*Catalogue of Hyacinths, Tulips, and other Bulbs.*  
Robert Veitch & Son, 54, High Street, Exeter.—*Catalogue of Dutch Bulbs and other Flower Roots.*  
Fisher, Son, & Sibray, Handsworth, Sheffield.—*Catalogue of Bulbs and Flower Roots.*  
W. Cooper, 751, Old Kent Road.—*Catalogue of Greenhouses, Frames, &c.*

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Late Questions** (*F. N., G. H., W. E. T. and J. H.*).—Letters arriving on Wednesday cannot be answered in the current issue.

**Waterproofing Calico** (*R. C.*).—You will find the method of waterproofing described in answer to another correspondent ("C. H. M."), and the information there given will possibly meet your requirements.

**Fumes from Coke** (*G. H.*).—If the combustion is "perfect"—that is, everything consumed—no injury will ensue; but it is doubtful if that is so, and the fumes from a furnace are better outside glass structures than in them. Your case is inadequately stated.

**Selenium pumilum** (*S.*).—You are quite right. The flowers of the plant referred to on page 159 are included in a coloured group on page 78 of Carter's Catalogue of last year. It is a very accommodating plant, and will grow and flower freely in ordinary fertile soil in town and country gardens.

**Thrips on Grapes** (*T. T.*).—Though, as you say, you can destroy thrips on the leaves by sponging them with Fir tree oil, you "cannot sponge the bunches." You may try the Lethorion vapour cone as you suggest, and you will find another fumigating insecticide referred to in another column by a very eminent gardener.

**Exhibiting Vegetables** (*W. S.*).—Undoubtedly the custom is to exhibit one variety of Potato only in each dish, though some judges might possibly admit more, but the chances would be all against the exhibitor. It is never safe to depart from established custom, though the wording of a class may appear to afford the opportunity.

**Purple-podded Pea** (*Rustie*).—The above is the name of the variety of which you have sent pods. It is a very old Pea, but only grown as a novelty. The pods are very deep purple in colour, and retain it when dried. The peas are neither of good colour nor flavour when cooked. When the soft young pods are cooked, as they may be, and eaten like Kidney Beans, the purple colour vanishes.

**Flowers for Beds in the Autumn** (*Le Roi*).—If you can procure plants of dwarf early flowering Chrysanthemums, many of which are grown in 5-inch pots in nurseries, they would render your beds gay almost at once, and continue until checked by frost. In ordering plants, the best course will be to state your requirements to the vendor and leave the selection to him. You will then receive better value for your money than by making your own selection.

**Capsicums Unhealthy** (*R. D.*).—Without knowing the treatment the plants have received and the position they have occupied, we cannot state the precise cause of their present condition. The leaves suggest that they have not had sufficient sun and air, but too much atmospheric moisture. These plants often succeed much better in frames than more or less shaded stoves, and we have had excellent crops from plants that were plunged close to a wall facing south about the middle of June.

**Poinsettia Leaves Discoloured** (*T. L.*).—The appearance of the leaf suggests that it has not been able to elaborate and assimilate the sap, possibly because of insufficient sun. Though the leaf is large it is not so stout as is desirable, and perhaps the plants have been too generously fed. We should not supply them with liquid manure at present, and we do not apprehend they will be seriously injured if carefully watered and not shaded, though if they are in a shaded position now they must not be suddenly exposed to the sun.

**Tomatoes not Colouring** (*D. W. B.*).—The fruits you sent were not ripe, and your letter did not reach us in time to be answered last week, as it was sent to the publishing department. After keeping the fruits in the sun for a few days they decidedly improved in colour with the advance in ripening. If the fruits on the plants are not shaded by leaves, and the weather not continuously dull, and they are allowed to ripen, yet still do not colour, we can arrive at no other conclusion than that the variety is naturally pale, and we should grow another next year. We think, however, that those sent were not sufficiently exposed to the sun during the process of ripening.

**Dahlia Leaves Eaten** (*N. H. T.*).—There is every appearance of the leaves having been attacked by one of the leaf miners, the larvæ of various species of insects. The havoc may have been effected and the miner escaped before the damage was observed. There is nothing in the leaves now, as there usually is in cases of attack by the leaf miners, but we have noticed similar skeletonised leaves on Celery, and especially Chrysanthemums, due to leaf miners and the subsequent extraction of matter by earwigs and other predatory creatures. The only thing we can suggest is to keep a keen eye on the plants, especially at night, and, finding out the enemy, promptly take remedial steps.

**Gooseberry Bushes Dying off Suddenly** (*G. C.*).—This is often due to the devastation of the larvæ of the clear-wing moths, which live in burrows in the roots and stems of many plants, doing considerable damage, whole branches and sometimes whole bushes collapsing suddenly from their assaults. The most destructive to fruit trees, and particularly bush fruits, is the larvæ of *Sesia tipuliformis*, which is in the moth state not readily caught; but that is the only means of lessening the evil. They are usually found in the angles of branches or about the bushes, on which they deposit their eggs at this time of year and earlier. There is no Vine louse that attacks Gooseberries. Your letter arrived too late for being referred to last week.

**Rose Leaves Diseased** (*H. C.*).—The leaves are infested with a fungus, due to the damp location and ungenial soil. Collect all the leaves fallen or infested and burn them, and dress the ground with sulphate of iron at the rate of a quarter of an ounce per square yard, not pointing it in, and syringe the Roses with sulphide of potassium, of which Harris's is a good preparation—it may be had of most nurserymen—following the instructions. The Roses would be best lifted in November, following with a thorough stirring of the soil and mixing with it some old mortar rubbish and loam of a more open nature before replanting the Roses. About a sixth of old mortar rubbish would assist the Roses to make firmer wood and flower more satisfactorily, as well as

enable them to better resist disease. Draining, if necessary, should also be attended to, the drains having proper fall and outlet.

Mushrooms in the Summer (J. W. C.).—If you read the work carefully, especially the supplement to the first edition, you will find you have departed very materially from the advice on a very important matter—namely, the time of making and spawning the beds.

Temporary House for Protecting Chrysanthemums (C. H. M.).—The plants may be sheltered very well in the way you propose. A framework of laths sufficiently strong to resist wind and bear the weight of any snow that may fall will be necessary on which to securely tack the waterproof material used for the roof, which should have sufficient slope to throw off rain.

Grapes Infested with Mealy Bug (Old Subscriber).—This pest is not readily eradicated from Vines and houses where it has obtained a hold. It is best assailed in autumn after the growths are matured and the Grapes are cut.

Names of Fruits.—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not.

Names of Plants.—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores.

Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens should be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp.

COVENT GARDEN MARKET.—AUGUST 27TH.

MARKET very quiet and getting very bare ; little or no sieve fruit reaching us.

Table with 4 columns (s, d, s, d) listing prices for FRUIT (Apples, Lemons, Oranges, Peaches, etc.) and VEGETABLES (Mushrooms, Mustard & Cress, Onions, etc.).

Table with 4 columns (s, d, s, d) listing prices for CUT FLOWERS (Arum Lilies, Asters, Carnations, etc.).

Table with 4 columns (s, d, s, d) listing prices for PLANTS IN POTS (Aralia Sieboldi, Geraniums, Heliotrope, etc.).

AMONG THE SHEEP.

THE arrangement of flocks for breeding purposes receives special attention at this period of the year, and the improvement or deterioration of a flock depends very much upon the judgment

care, and enterprise given to the work. A high standard of excellence is not attained in a season or two, nor is it altogether desirable or wise to attempt too much at once, simply because the outlay involved would be so heavy that anything like profit upon expenditure would be impossible.

Bearing this well in mind we are yet able to do much every year by a close weeding out of every inferior or delicate ewe, by the careful selection of tups, or in other words by judicious breeding or cross-breeding. In the hire or purchase of tups a considerable outlay is unavoidable. A really good well bred tup is not to be bought for less than five to seven guineas, anything below the lesser price being certain to be deficient in some important point. The ordinary farmer probably does well not to aspire to a purely pedigree flock, but he may nevertheless find high breeding very much to the purpose if kept within reasonable limits. We have this season seen an exceptionally good fall of lambs from a flock of superior half-bred Suffolks, the tups being pure Cotswolds which had cost the farmer seven guineas apiece. These were obtained from Mr. W. Oakey of Great Wilbraham Hall, Cambs, from whom we have frequently had excellent Hampshire Downs. With Mr. Oakey tups of the best breeds are a specialty, and many a farmer will make a special journey to Wilbraham during the next week or two to select animals for the coming season.

One of the most remarkable examples of flock improvement is that of the College of Agriculture at Downton. Spirited buying, careful weeding, and constant attention has led to such decided improvement that the average price of the tups has risen annually at the rate of more than £1 per head, the average per head now being over £10. This is a pure Hampshire down flock of some 1200 prime ewes, notable for early maturity, the lambs attaining the size of full grown hoggets by the middle of June, and they are then worth from 60s. to 70s. apiece. At the annual sale held at the College on the 7th inst. ten lamb tups were let at an average price of £23 16s. 9d., the highest amount being fifty guineas for one of the best young rams that ever entered a sale-ring. A similar amount was also realised for the best lamb tup among those which were sold. The Downton College flock has become so famous in the showyard for all classes of Hampshire downs that the leading place appears to be taken by it among flocks of this breed. Other flocks have also an excellent record, the averages for tups at recent tup sales being Winterbourne Stoke, £8 5s.; Stratford-sub-Castle, nearly as high; and Mr. James Harris of Winchester, £6 4s. 2d.

Of the favour in which Shropshire sheep continue to be held we have evidence in the high prices realised in recent sales, plenty of tups going for £50 each. At the Yardley sale one of Mr. G. Graham's shearling tups sold for 105 guineas, and at the Hattons sale the ram average was £19 17s. 1d., and the ewe average £5 10s. 10d. At the Uppington sale a two-shear ram also realised 105 guineas, the average price being £18 1s. 2d. The progeny of a 100-guinea ram should be profitable, but very much depends upon the ewes.

Although the principal ram sales will be held this month, that of ordinary animals will continue for another month. Lambing has to be timed in accordance with the earliness or lateness of each locality. Earliness is all-important to ram breeders, but for flocks generally the root crop, pasture area, green crops on arable land, and store of dry fodder, all exercise some influence upon the lambing season, and must be taken into account now. We want no starveling lambs, and must be prepared to feed them well enough to promote vigorous growth and healthy condition from the birth.

Appeals to scientific men for aid, and the remarks often made about foot-rot, go to show the prevalence of much ignorance about this very common and troublesome complaint among sheep. We have seen it described as soreness and ulcers either in the division of the hoof or on the outside of it. But we have had many a case where the hoof has been much swollen and heated, without any exterior sore or wound of any kind. In due course the swelling

bursts, there is a discharge of pus; linseed meal poultices, sponging with warm water, and dressing with Gells' ointment, gradually effecting a cure. Flocks affected with foot-rot cannot be quite cured; the disease may be kept very much under, but it will break out again in a tainted flock, and we certainly should not like to add purchased animals to such a flock, as they would certainly have foot-rot sooner or later.

#### WORK ON THE HOME FARM.

There is nothing like regularity or order in farm work this summer; while corn stacks are being built grass is being mown for hay. Corn harvest and haymaking are going on together in the midland and eastern counties. Only in the west has the hay been secured in good time and order; and even there the usual order of things is reversed, for the pastures are almost bare, while the usually parched pastures of East Anglia abound with luxuriant growth. In the Leicestershire Stilton cheese district we have this year seen hay cobs being made in the midst of harvest time. A Leicestershire cob is literally a big haycock 8 or 10 feet in diameter. It is well trampled by a man, and when it is a few feet in height an ordinary waggon rope is placed around it near the bottom, for a horse to draw it along upon the surface of the meadow, while more and more hay is piled on, till it becomes too heavy for the horse to move it further. It is then topped up, and when finished has very much the appearance of a huge sugar-loaf. The hay is then safe from harm by rain, and can be removed to the rick at any time. Another curious feature in Leicestershire pastures at this season of the year are the huge conical dung heaps, built at such an acute angle as to throw off all rain; and there would certainly be less tendency to violent heating in such heaps than there is in the common flat angular mixen. They are not placed by the roadside or near a hedge, but are right out in the middle of the pasture, so that any liquid manure escaping from the heap would not be wasted.

The large herds of cows are not driven from the pasture for the milking, but are milked in the open wherever they may be, without trouble, as they are accustomed to stand still for milking without being tied up. As each cow is milked the milk is poured into a large tin "churn" with a hinged lid, which is drawn about the field in a light cart. The advantage of this plan is obvious. The milk goes to the dairy perfectly sweet, for the pails are quite clean, and the churn which we saw glistened like silver, all labour about cowsheds and yards is avoided, and much time saved in several ways. If that time were devoted to the extermination of the "Leicestershire Gooseberries," as the Thistles which abound in the pastures are termed, it would be much to the Stilton cheese maker's advantage, for in many parts the Thistles are so thick as to quite prevent grazing.

#### OUR LETTER BOX.

**Brewers' Grains for Cows (A. J.).**—Brewers' grains are certainly not to be regarded as a prime article of food for dairy cows, but a moderate quantity may be used with advantage mixed with other food. Here is the analysis—Water, 76.4; Albuminoids (flesh formers), 5.0; fats, 0.4; carbo-hydrates (heat givers), 9.4; ash, 1.2; which shows a fair proportion of nutriment, the albuminoids being rather superior to those of rich pasture; but then a cow may eat its fill of pasture herbage without risk of taint to milk or butter, while a full dietary of grains would undoubtedly affect the flavour of butter. The rule, therefore, is a good one to use grains liberally only for cows the milk from which is used or sold at once, and only moderately for cows when the milk is used for butter. Do not use any linseed cake for milking cows, a little cotton cake and palm nutmeal are much preferable.

#### METEOROLOGICAL OBSERVATIONS.

#### REMARKS.

17th.—Bright morning, fine day and night.  
18th.—Dull and heavy early; dark, high fog at 10 A.M.; bright sun at 12 noon; fine rest of day and night.  
19th.—Dull, heavy morning; rain at 9.30 A.M., and off and on all day.  
20th.—Early morning dull and wet; fine at 9 A.M.; fine afternoon and night.  
21st.—Fine but dull early, generally dull with an occasional gleam of sun; sharp rain at 5.30 P.M. for a few minutes; fine but dull night.  
22nd.—Bright early; fine and bright all day; fine night.  
23rd.—Dull and blustering morning; sharp rain at 11.30 A.M.; sunshine at 12.30; fine remainder of day and night.  
Temperature very similar to previous weeks; night temperatures very uniform.—G. J. SYMONS.

HOWEVER sharply opinions may be divided on certain matters, they are forgotten for the time in the face of a threatened famine, and the best dictates of humanity evoke feelings of sympathy with the poor people who have to suffer extreme privations through the loss of a staple crop. This unfortunately appears to be not a very remote probability in some districts in Ireland. It was hoped by all that the reports which have been published from time to time of the condition of the Potato crops there were not well founded. It is well known that the element of fear tends to exaggeration of expression in reference to a dreaded calamity that is felt to be impending, and it would be idle to ignore the fact that in these days of a wild race for news there is a strong disposition to indulge in sensationalism to arrest the attention of a never satisfied public. Therefore it was that the real condition of the crops in the Sister Isle was slowly understood outside it. I was amongst those who had indulged in the hope that the Potatoes in large districts, where practically nothing else is grown, were not so severely stricken as had been depicted. I would fain hope so still, but since Mr. Lewis Castle has seen and described them the extreme seriousness of the visitation may be admitted. My coadjutor is not prone to exaggeration in statement, and he would have much greater pleasure in showing the best side of Ireland than the worst, therefore what he has said on the subject under notice may be taken as a thoughtful record of actual facts.

Confirmatory evidence is afforded by the official report of the Irish Land Commissioners, which deals with the condition and prospects of the Potato crop up to August 15th. The report is a gloomy one, but not without a ray of light. Only in five or six counties is the crop said to be an average one, and it is noteworthy that this occurs in districts where the crops are grown for sale. Whether those districts are naturally adapted for Potato culture, and so situated in respect to altitude, drainage, and rainfall as to be repellent to the spread of the disease, I know not; but the report contains internal evidence that a goodly share of the immunity is due to intelligent management and good cultivation. Where Potatoes are extensively grown for sale in England much thought is devoted to the production of full and sound crops. The selection of varieties best adapted to the soil and situation, the preparation of the soil, the choosing of tubers for planting both in respect to size, soundness, change of seed, vitality, also manuring and general routine work, all receive the most careful attention, founded both on experience on a large scale, and trials of different methods on a small, conducted on a scientific basis with the object of gaining information that will enable the best possible return to be obtained from the amount invested in the culture. The prices for Potatoes have ruled so low of late years that it has only been by the utmost care and best possible management that even a small profit could be obtained; and for gaining anything like a satisfactory return the fullest crops of the best marketable tubers have been essential. Necessity has stimulated endeavour in the production of such crops, and there is no manner of doubt that they are now much better than was the case some years ago, when a loose slipshod routine generally prevailed. It may be, then, that in those districts of Ireland where the crops are the best and the murrain the least destructive that the happy result is to a consider-

able extent the outcome of better management than obtains where worthless disease-stricken crops are so lamentably prevalent.

There are, no doubt, localities in Ireland, as in England, which are distinctly unfavourable to the production of full sound crops of Potatoes, and extremely liable to the attacks of the murrain. It may, indeed, be beyond the power of man to succeed in the culture during a drenching season, and where the winds, as the peasant said, "bring the blight from the sea." They bring it inasmuch as they bring the means by which it is engendered, exists, and spreads—moisture laden air over already stagnant soil. Under those conditions the most robust varieties, with the strongest leaf power for maintaining the purity of the sap, may eventually be seized by the enemy and converted into a mass of blackness and decay; but they will be the last to succumb, as the succulent stemmed sorts, not strong enough to stand upright, and with weak acting leaves, will be, as they always have been, the first to fail. It may be assumed that at least a large number of the Irish peasantry with their patchwork plots, which just keep them and Denis, the pig, alive in fair seasons, may not be aware of these facts, and if they were, are not able to procure more suitable varieties for battling with adverse circumstances, but must, perforce, plant such as they have, and of these possibly, and in seasons of scarcity certainly, the worst tubers of essentially bad stocks, because the best have been eaten, the small and weak being saved for seed. That used to be the custom in English counties before the scourge came, and for some years subsequently, until familiar varieties were annihilated, stronger sorts raised, and better methods adopted.

That the disease is intensified not by inferior sorts alone but by impoverished soil is apparent from the observations of the Commissioners, such as an "absolute failure in poor land" in one district; and in another, "In good well-farmed land the disease is not serious, but in poor and badly farmed land the tops are black and tubers affected." Then speaking of another county they say—

"Crops very much below average; disease general throughout; distress appears worse along the seacoast, where Potatoes planted in bog were much damaged by early frosts. The effect of the blight has been to almost destroy the crop in some cases; stalks blackened and withered up; tubers not as yet affected except in rare instances, but generally very small and immature, owing to blight setting in unusually early. Tubers in many instances will be absolutely unfit for human food. In the poorer badly cultivated districts the crop will be an entire failure; in good dry well farmed land results will prove much better."

That is only what might be expected. If everything but water of which the Potato is composed is drawn out of the land by continuous cropping, the result is inevitable. Neither an Englishman nor an Irishman can grow good Potatoes under those conditions, any more than he can draw good money out of a bank if he has not put any in. It is true that the "dry" land indicated as favourable cannot be made so by cultivators in a wet season; but much land might be made drier than it is by draining, and even without the cost of digging trenches and laying tiles, however desirable and profitable such work may be, but simply by deeper stirring and breaking up the hard crust of the subsoil, that may have been undisturbed for generations, so that the water can pass more readily down; and also—and this is not less important—by planting strong, rigid stemmed varieties thinly, so that the sun can shine down between the rows on occasional bright days, and evaporation can have free action on every favourable opportunity. When the ground is covered by a thicket of soft stems, the result both of inherent weakness and close planting, the soil is simply saturated—choked, and reeking vapour on warm days rots the growths in its struggle to escape. We have no right to expect healthy plants under these circumstances, and the unhealthy are attacked by the fungus the first, and suffer the most.

From a remark made by Mr. Castle in his article last week it is almost certain that the disease is unwittingly invited by the

crowded lazy-bed method of culture that appears to be adopted. Growing the plants on raised beds may be the very best system to pursue in some soils and situations, but if they are planted so closely as to grow into a dense mass of interlacing stems, and a crowd of leaves struggling with each other for light and perishing in the contest, the advantages which the ridges might otherwise possess vanish, and disease runs riot through the spoiled plantations.

A change of methods in the direction indicated—the thinner planting of stronger upright-growing varieties in low-lying positions where the rainfall is great, keeping the land clean, and not covered with growths as with a blanket, is the most likely course of procedure for, if not preventing the disease, minimising its virulence; but a most serious matter is the impoverished soil. Early varieties, which often escape the disease when late sorts fail, have been recommended, but these require the best of soil for yielding substantial crops. In very poor land the return they give is next to nothing. There is no doubt of what much land in Ireland needs for restoring its lost Potato-growing fertility—potash, phosphates, lime, and perhaps the cheapest manner in which they can be conveyed is in the form of superphosphate of lime and kainit. How they are to be got to the starving land it is not in my province to suggest. Many persons appear to be anxious to do something for Ireland, as I am; but the best I can give is this small contribution.—J. WRIGHT.

### THE GUILDHALL (LONDON) FRUIT SHOW.

WHEN Sir James Whitehead, Bart., was Lord Mayor of London last year he on more than one occasion directed prominent attention to the subject of fruit culture, and the presentation of fruit according to ancient custom by the Fruiterers' Company at the Mansion House, he desired should consist entirely of home grown produce. Sir James was chosen Master of the Company for the present year, and with the object of promoting the "extended and improved culture of useful fruit in the homesteads and cottage gardens of the kingdom" an Exhibition, as has been previously indicated, is to be held in the Guildhall on the 6th, 7th and 8th of October. The Executive Committee appointed to carry out the project are Sir James Whitehead, Bart. (Chairman), with Dr. Fotherby and Messrs. H. R. Williams, R. S. Mason, A. H. Smee, T. F. Rivers, J. Cheal, G. Bunyard and J. Wright. The schedule that has been prepared by them is now before us.

In order that northern growers may not be handicapped the country has been divided into three zones by drawing a line from east to west, thus separating them from the south, and from about the centre of that main boundary line a second line was drawn to the south coast, thus forming two other zones. The counties in each are enumerated in the schedule, and prizes are offered in each zone. For cottagers the total number is seventy-two, varying in amount from 30s. to 10s. for three dishes of Apples and Pears respectively, and 15s. to 10s. for single dishes. For farmers there are forty-five prizes, ranging from 40s. to 20s. for six dishes, and 20s. to 10s. for three dishes of the same kinds of fruit. For gardeners and amateurs there are sixty-three prizes, the amounts being substantially the same as in the farmers' section for hardy fruit.

Prizes are also offered to amateurs and gardeners in the United Kingdom for Grapes and Tomatoes. The prizes for six bunches of black and six of white Grapes respectively are—firsts, the Company's silver medal and £3; seconds, £3; and thirds, £2. A class is also provided for fifty dishes of hardy fruit, thirty Apples and twenty Pears, for which the gold medal, silver-gilt and silver medal of the Company are offered, and will be worth winning as the first of the kind provided for distribution.

Prizes are offered for jams and preserves. A class is also provided for nurserymen in the respective zones for tables of fruit. For these no money prizes are given, but the framed certificates of the Fruiterers' Company will be granted for meritorious exhibits—the first that have been prepared for the purpose, and will no doubt be appreciated by their possessors.

We are desired to request gardeners and other interested in fruit culture to make this Exhibition known amongst cottagers, farmers, and friends in their districts, and to write for schedules, that can be usefully distributed. These will be most readily supplied by O. C. T. Eagleton, Esq., 40, Chancery Lane, London, W.C.

There is such a general scarcity of fruit this year that we suspect there will be room for all that are sent; but, as a rule, the lighter the crops the finer the specimens, and very good examples should, therefore, be forthcoming.

### TREE PLANTING.

To the popular belief that winter is the time for tree planting, the failure of many a planting scheme, the loss of thousands of young trees, and the slow growth of the survivors is probably owing. No doubt careless slovenly work has caused some losses, but it is deficient practical knowledge that renders so much of the results of this important work unsatisfactory. A man may have the greatest fondness for trees, may make it one of the chief objects of life to improve his estate by judicious planting and thinning, and yet be ignorant of the cultural points upon which success so entirely depends. Failures are most vexatious where success is known to be possible. Here is a case in point. It became necessary to remove a considerable number of young fruit trees from a kitchen garden, and it was decided to turn them to account for making two orchards, or plantations rather, one in a deep rich loam, the other in a light gravelly soil. The trees were fine healthy young pyramids from 5 to 7 feet in height, very robust, and in every way suitable for the required purpose; they were transplanted, but for five years subsequently they made no appreciable growth. There they remained year after year alive, but making no progress and bearing no fruit. Whether the roots were much lacerated or reduced, or were much exposed to air and frost during the transplanting, I am unable to say, for I am only able to speak positively to the facts of planting results which during the time mentioned came under my own observation. Certain it is that there must have been some lamentable bungling to have so seriously arrested the growth of healthy trees in a generous soil where timber trees and Conifers were all growing with remarkable vigour.

I mention this instance of failure by way of warning, and now proceed to show what is necessary to be done in preparing for planting, in planting, and in the subsequent care of the trees.

Every tree established in the soil that is to be transplanted this autumn should now, at once, have its leading roots severed by a spade at distances of 18 inches to 3 feet from the stem, according to its size. This will induce such a free putting forth of rootlets, every one of which is a feeder or absorber of food from the soil for the tree, that when the tree is transplanted in October or early in November it is certain to become quickly established in the soil and to grow freely and strongly next year if only the planting and subsequent management is correct.

The most delicate and sensitive parts of the roots are the extremities; it is there that the rootlets or feeders are. These rootlets are thickset with minute hair-like filaments, and it is these filaments precisely through which the tree obtains food and moisture from the soil. When the rising temperature of spring causes the buds to swell, sap is drawn from the adjacent tissue, its place is supplied by other stored sap from cells around and below it, and so onwards down to the roots, which should be in a condition to afford a full supply then and onwards continuously throughout the season of growth. The roots of healthy trees well established in the soil always do this, and the trees sustain no check, but those of newly planted trees often fail to respond to this call of Nature, simply because they cannot. Either from late or careless planting they have no rootlets, and till these feeders are formed there is a cessation of leaf and branch growth, and the tree sustains a serious check just when it ought to be in the full flush and pride of spring growth.

This spring-halt is common to all badly planted trees. I have seen it in Grape Vines placed in costly glass houses, and planted in borders prepared for them with elaborate care, in fruit and forest trees of all sorts, in bush fruit and shrubs also, and it is just because I have so seen it that I am writing this article at the present time to beg all who have planting to do in the coming season to be on the alert now, and to have everything in readiness for early autumn planting. If you have to transplant trees or shrubs whose roots have not been disturbed for three or four or more years secure plenty of feeders in the way I have shown, and you will have taken the first and most important step towards final success. If you have stations to prepare for tree or shrub get them all done in September before heavy autumnal rain sets in. Seventy-two cubic feet of sound fertile soil is necessary for every fruit or forest tree planted in a prepared station; or, in other words, the station soil should be 6 feet square and 2 feet deep, with at least 6 inches of gravel or broken stones beneath it, and if the subsoil is at all of a close retentive nature be very sure to make due provision for keeping it quite free from any accumulation of stagnant water by

placing a row of 2-inch land drain pipes across the middle of the station beneath the gravel, and connecting them with the nearest drain or outfall.

Land for plantations, belts, and clumps of forest trees should all be trenched two-spit deep, and the subsoil beneath the lower spit well broken up with a strong full-sized digging spud or fork. Although this work is done by the perch, it answers best to lend the workmen tools, upon condition that they are to replace any that are broken through carelessness. A gang of men got together, often hastily, for such work, is certain to have many old tools with which it is quite impossible to do good work, and it is clearly in the master's interest to supply strong useful tools, and to see that good work is done with them. The depth must be gauged frequently, and a sharp eye kept upon the bottom spit men, who can easily scamp much work if not looked after very closely. See that they send their tools well into the subsoil, and insist upon having good work for good pay.

For fruit plantations precisely the same process of trenching is necessary, and in addition work in plenty of old well-decayed farm-yard manure, or decayed dung from the stable, cowyard, or pigstye, it matters not which. To grow fine fruit and plenty of it we must have robust growth. The fruit trees which I planted in Sussex some twenty years ago, to which Mr. Wright calls attention on page 152, had plenty of such manure in the soil, and also had plenty of sewage regularly in summer. At the outset I saw that the natural soil was very low in fertility; timber, underwood, and pasture all showed this clearly. Thorough drainage and the free use of manure, coal ashes, and lime, soon wrought a radical change, the best evidence of which was afforded in the fruit trees which Mr. Wright saw in the fourth year from the planting, each clothing between 100 and 200 square feet of wall space, and bearing full crops of fruit; in the Raspberry canes 10 and 12 feet in height, and in the extraordinary vigour of other tree, shrub, and plant growth. Always since that time the inseparable trio—drainage, fertility, and mechanical division—have formed the basis of my practice in garden, farm, and forest soil, and it is assuredly a safe basis which never fails one. Last autumn I made a plantation of Duchess of Oldenburg Apple in the Essex clay, which was trenched and well dressed with plenty of manure taken from an old mixen. Nothing can be more satisfactory than the growth of the trees this summer. Two or three years of such robust growth is quite certain to lead to a yield of really fine fruit, and there is no more saleable fruit than this handsome and most prolific Apple. Only take care to purchase trees on the Paradise stock, and three or four years old, then with soil well prepared, and careful planting, success is pretty well assured.

Planting is a matter of the first importance, and I must leave that for my next paper on this important subject. My especial desire was to sound a note of warning to planters to be ready. I have done so, and strongly advise prompt action, in order that all may be in readiness for planting either in October or early in November.—EDWARD LUCKHURST, *Warrens, Harold Wood, Romford.*

## GROWING AND SELLING FRUIT.

(Continued from page 175.)

**CHOICE OF VARIETIES.**—This will be treated of under the separate headings of each kind of fruit, and a few words on the subject in general are all that are required here. In the first place, only two or three varieties of each kind should be planted if profit is to be the object in view. Secondly, it is impossible to give a list of varieties that will suit every case, especially of Apples and Strawberries, because local circumstances as to soil and atmosphere greatly affect these two fruits. If any doubt is felt on this point the best plan is to consult a professional gardener or fruit grower who has been for some time in the district, and who will be able to give advice from his own experience as to what varieties are best suited for the purpose required in the locality. It should always be kept in mind that size, colour, and firm texture are all that are required by market salesmen.

**LOCAL SOCIETIES FOR ENCOURAGING FRUIT GROWING.**—These are a great aid to the cottager and others who are not able to employ professional assistance, also of benefit to the professional men who join them, and may easily be started by a few persons in any parish. All that is necessary is that a few who are interested in the matter should agree to meet together in the parish reading room or club room, and compare notes and experience, taking one or two subjects once a fortnight, and bringing specimens of whatever is under consideration for the time being, or anything specially worthy of notice. I have had considerable experience of similar meetings, and can testify to their utility when properly managed. A few simple rules are required to secure order at the meetings and

start the society on a firm basis, appoint officials, &c.; also a small contribution from each member (about 6d. quarterly would probably suffice) to pay the few small charges that necessarily arise. By forming societies like this growers could soon find out the best markets in the kingdom; also any unprincipled dealers could be reported for mutual benefit and protection, and if all the societies were registered at a central office much good might be done in many ways to develop and encourage the home fruit trade.

**KINDS OF FRUIT BEST ADAPTED FOR PROFITABLE FRUIT CULTURE.**—These are Apples, Strawberries, Black Currants, Gooseberries, Raspberries, Red Currants, Cob Nuts, Cherries, Plums, and Damsons, and are mentioned here in their proper order when profit is the chief consideration. Besides the above, which are for growing in the open fields, the walls of houses and outbuildings will bring in good returns if covered with Peaches, Apricots, Pears, or Morello Cherries.

### THE APPLE.

The Apple is placed first on the list because in the majority of instances it is the most profitable fruit the cottager and those with small plantations can grow. It has one great advantage over almost all other fruits—viz, it will keep in marketable condition for several weeks, while most others have to be disposed of as soon as gathered. It is not estimated highly by many people as a "profitable fruit," because they are only acquainted with inferior varieties or grow too many sorts, and therefore do not get enough to sell profitably.

**SOIL.**—The Apple will grow in almost every kind of soil with care and attention, but thrives best in a good deep loam that is not too retentive of moisture, and, on the other hand, is not liable to become very dry in summer. Stony ground will grow good Apples also if deep and moderately moist at the bottom. Soils which contain a large quantity of iron are not good. Stony ground will require more manure than a good deep loam does, but, on the other hand, has some advantages which do not always accompany a richer soil. For instance, in dull and wet seasons the wood will ripen much better in poor stony soils than in richer ones, and thus a good crop will be more likely to follow. Apples should not be planted in ground that contains much water until drains have been laid to remedy this defect. Stagnant water in the soil is fatal to success in the culture of this fruit, being one of the causes of the disease called canker, it also prevents the wood ripening properly in the autumn. Soils that contain much chalk are not recommended for Apples.

**SITUATION.**—North of London Apples should not be planted in low and damp positions, as the spring frosts are always far more severe in such places. It is best to plant in high and airy situations, and plant trees for shelter as before advised. In districts south of London this is not quite so important.

**PLANTING.**—This should be completed as early as possible in the autumn after the trees have commenced shedding their leaves. Standard trees on stems 5 or 6 feet high are the most profitable in the end, and may be bought from 18s. to 24s. per dozen, or cheaper in large quantities. They may also be raised at home by sowing the pips of the wild Crab, and budding or grafting the young plants when they are about three years old with good sorts; but as this takes such a long time before the trees arrive at a bearing size, it is not recommended in fruit growing for profit. Standard Apples should be planted 30 feet apart each way (it is often recommended to plant closer than this, but it should be remembered the trees require abundance of air and light when they reach their full size), and will then cost about £8 per acre for planting and staking, exclusive of fencing, draining, &c., which are not always necessary. The spaces between may be cropped with Strawberries, bush fruits, vegetables, or a combination of these, until the Apple trees reach their full size. Strong growing healthy young trees should be selected for planting with straight and stout stems and clean healthy looking bark; in about eight years after planting they will bear from 1 to 2 bushels per tree, and thus give 70 bushels per acre, worth about £15. After this the crop will increase rapidly until the trees reach their full size, when in good seasons from 400 to 500 bushels per acre may be gathered, worth £70 to £90 gross. A word of caution is here necessary. The grower must not expect a full return every year, or he will be greatly disappointed; indeed a full crop is very seldom brought to maturity.

If the situation is considered too open for standard trees on account of the wind blowing off the fruit or from any other cause—for instance, if the soil is too shallow to support large standard trees—this may best be judged by the growth of timber trees near. In such cases dwarf trees may be planted, and will pay well, although it is not possible to get such large crops from these as from standard trees. They may be planted 12 feet apart in the rows, and 16 feet between the rows, and should always be obtained on the Crab

stock. The smaller growing Paradise stock, although giving some very showy fruit, is of no use for profitable fruit culture, the weight grown per acre not being enough to pay well. Young trees may be bought cheaply as maidens—that is, one year from the graft or bud. They will consist of two or three shoots. The straightest and most central of these should be shortened back to about 1 foot in length at the spring pruning, the others to 6 inches. What is required eventually of these dwarf trees is to get them to form one central stem as straight as possible about 10 feet in height, well furnished with side branches all round to within 18 inches of the ground, and pyramidal in shape like a sugarloaf. The central shoot should have about one-fourth of its length cut off every year in order to make it branch out well, the side branches also being shortened to a similar extent, leaving the bud at the end pointing in the direction it is desirable for the young shoot to grow, and keeping them tied into position when necessary. When the tree reaches the required size it must be kept within bounds after by pruning the young shoots back every winter to within an inch of where they started the previous spring. Summer pruning is also of great advantage to these dwarf trees, and consists in shortening all young shoots back to about 4 inches in length by the end of July, except those required for extending the branches, which should be left full length until the winter. By this means the fruit is more exposed to the sun, and the flower buds for next year are strengthened. Trees treated on this system will bear good fruit in five or six years from the graft, and at the age of twelve years will bear from one to two bushels each, and be worth from £40 to £50 per acre gross in a good season with a full crop. The cost of the trees and planting in the first instance, exclusive of fencing, draining, and all extras, will be about £12 per acre, and when the trees are over four years old the cost of pruning, training, &c., yearly will be from £2 to £4 per acre. Sometimes these dwarf trees persist in growing strongly without fruiting. A severe check is the only cure for this, and is best accomplished by digging a trench round the tree in the winter about 5 feet from the stem, laying every root bare without bruising them, and working out all the soil from underneath with steel forks, cutting asunder all roots that go down straight beneath the tree and all that extend beyond the trench, then filling up the trench again, and mulch as for newly planted trees. I have a tree of Alfriston which was treated in this manner, and the next year it was full of fruit although it had never borne any fruit previously through growing too strongly to form fruiting buds.

Having decided what kind of trees to plant they should be placed in position as soon as possible, spreading the roots out evenly all round, treading the soil firmly, and finishing off by mulching as advised in the general directions for planting. As soon as standard trees are planted they should be fastened upright by putting a stake down on each side of the tree 9 inches from the stem, and as tall as the first branches of the top. A cross piece should be nailed to each stake at the top and the tree tied to this with tarred string. A piece of old sacking should first be put round the stem of the tree to prevent any injury to the bark. These stakes (two for each tree) will last as long as required if made of well seasoned larch poles, prepared some months before they are wanted and dipped in creosote or boiling tar 2 feet in length at the bottom. When the trees are made secure and mulched no more attention will be required until pruning time in February, unless rabbits or hares abound in the neighbourhood; if so it will be necessary to protect the trees as soon as planted either by surrounding the whole plantation with a rabbit proof fencing, or placing a narrow strip of wire netting about 2 feet high round the stem. This should be cut just wide enough to allow the tree to swell about three times its present size, and then have two ties with galvanised wire at the edges to keep it together. A cheaper way than this in the first instance, but not lasting so long, is to wind a strip of stout brown paper round the stem of the tree and then to put some ordinary coal tar on the paper; this will last about three years, but this will require a little fresh tar every winter before snow comes.

PRUNING.—If the trees are planted before the end of December, and have plenty of good roots, the young shoots forming the top should be shortened back in the following February or early in March. It is easy to see where they were cut the previous winter, and which part has grown since then. They ought to have made five or more good shoots. These should be shortened back, leaving about 9 inches in length, and cutting to a bud that points outwards from the centre of the tree. It is especially necessary to be careful about this latter point in order to get the young tree to grow open in the centre. Any weak shoots should be cut back to about 2 inches, also any that are crossing others or growing towards the centre; what is required being from five to seven main branches growing upwards and outwards, so as to form an even-shaped and well-branched head or top. No more attention will be required

until the following February, when any shoots should be cut well back that are crossing the others or growing inwards as before. The leading shoots may be left entire if there are sufficient, if not they should be shortened back half their length. Any shoots growing outwards from these may be left entire if they have plenty of room. After this very little pruning will be required for these standard trees, with the exception of cutting the small branches out from the centre of the trees in two or three years, and thinning out a few of the weaker branches all over if the top becomes thick. This is best done in autumn as soon as the fruit is gathered, as the strength of the branches is more easily judged at that time; also the thickness of the top can be better seen. The branches removed should be cut off close to the larger ones without leaving any stumps remaining. All that is necessary to attend to besides this is to keep the ground well cultivated to prevent weeds growing, and to attend to the stakes and ties as required in order to keep the trees from blowing about by the wind, also to ensure that the ties do not bruise the skin or bark of the trees.

If from any cause the trees are not planted until late in the spring they will not make much growth the first year, and pruning is best deferred until the next spring, and then performed as advised for the first season. Treated in this manner they grow away freely at once, having good roots to supply them with nourishment.

GATHERING.—Apples for storing are ready to gather when they leave the tree easily, and on cutting the fruit open the seeds are found to be turning brown. For early use and marketing this is of no consequence. They may be had as soon as they reach the size of small Oranges, but if required for storing the colour of the seeds or pips should always be brown when they are gathered, or they will shrivel in the skin and be useless for sale. Great care should be taken in gathering not to bruise the fruit, as this is fatal both to good prices and to good keeping. If intended for present sale they should be packed and sent off as soon as possible. Never gather when they are damp or wet; and if by any means a sharp frost occurs while they are on the trees (as in the case of late varieties it occasionally will do) leave them until another day before gathering.

PACKING.—This must vary according to the custom of the market for which they are intended. Those for London markets should be packed in "sieves" or baskets holding about one bushel, which the salesmen supply in some cases, and in others the growers find their own. Cover the sides with "fruit paper" or "cap paper," the fruit being graded—that is, each side kept separate—taking especial care that all the fruit in each package is of the same size, sort, and quality (the salesman should be made to understand this), and that no damaged fruits are put in. Place another sheet of paper over the top, then some dry straw or hay, or if in the summer long green grass is generally used. These should be flattened over the top of the "sieve," to prevent bruising when another is placed on the top. A stick of hazel about as thick as a man's thumb should then be split lengthwise, and the two pieces placed crosswise over the top of the straw, pushing the ends through under the top of the basket to keep them in their place, and cutting them off even. Each basket then only requires a label, and is ready for the market. In the northern provincial towns, such as Manchester, Sheffield, Bradford, &c., Apples are sold by the stone of 14 lbs. weight at from 1s. to 2s. 6d. per stone, and it is not important what kind of parcels they are packed in, whether boxes or baskets, so long as they travel well, are easily lifted about by one or two men, and the nett weight of the fruit is carefully ascertained in stones or half-stones by weighing the packages before filling and again after. Whatever market they are intended for they must always be packed with the same care, honestly graded, and should arrive not later than the middle of January, after which date the markets are flooded with inferior but more showy American fruit, which bring the prices down for English samples.

STORING.—Apples may easily be stored so that they will keep until the end of January. They may also be kept until June, but as there is nothing gained by keeping them so late—in fact prices are much lower than when sold earlier—it would be useless to treat of it here. To keep Apples until January a dry room or shed is required, where frost can be excluded from them, and which can be ventilated in favourable weather to keep the air pure and healthy. If this room is partly or almost entirely underground the fruit will keep fresher and firmer, provided the air is not allowed to get too damp, and the walls are thoroughly waterproof. All light should be carefully excluded, except when packing or examining the fruit. Never lay the Apples on straw or hay, or anything of a similar nature, as it imparts a musty flavour to them. All strong smells, such as tobacco smoke, tar, carbolic acid, or paint should be carefully kept from them. Do not lay the fruit on earth, brick, or stone floors, or on new deal boards. Bare boards

will do very well if not made of deal or any strong smelling wood, If not intended for keeping more than a month, the fruits may be three or four deep if carefully put down, but if space allows they are much the best in single layers, especially some kinds which "sweat" very much soon after they are gathered. If intended for keeping any length of time provision must be made when storing for examination once a week. In such cases they should only be stored one layer deep, and it is best to fit up shelves to lay them on just wide enough to admit of easy examination without moving the fruit. Never store any small or deformed fruit, they should be sold when gathered to the cider makers or hawkers. It is a good plan in frosty weather to spread sheets of newspaper all over the Apples. These assist in protecting the fruit, and if there is any danger of frost getting in the room, some petroleum lamps or gas stoves should be lighted, so as to keep the temperature above 36° and under 40°, as many varieties are quite spoiled if frozen severely.—W. H. DIVERS.

(To be continued.)

### THE BRITISH FRUIT GROWERS' ASSOCIATION.

A MEETING of the Executive Committee of the above Association was held in the Horticultural Club Room, Hotel Windsor, Victoria Street, S.W., at 5 P.M. on Thursday, August 28th, Mr. T. F. Rivers in the chair. After the minutes of the previous meeting had been read and confirmed, the Hon. Secretary presented the following report with regard to the business transacted since the July meeting.

*The Strawberry Report.*—In accordance with the resolution of the Committee the report of the Strawberry Exhibition and Conference in St. Stephen's Hall, Westminster, on June 27th last has been printed in book form and distributed free to all members. It is also on sale to the general public, and can be had post free for 1s. from Mr. Lewis Castle, Hotham House, Merton, Surrey. In addition to the complete historical and cultural information embodied in the papers read at the Conference, a chapter has been incorporated on Strawberry Forcing by an experienced cultivator. Many letters have been received expressing much satisfaction with the Association's first publication.

*The Leicester Conference.*—At the Leicester Conference on August 5th, the programme as arranged was carried out to the letter. James Ellis, Esq., M.P., occupied the chair, and Messrs. Rivers, Ingram, Pearson, and Bunyard read the papers announced. Several members of the Association journeyed a considerable distance to be present, and the Conference was attended by over 200 persons, the Chairman being supported by the Mayor of Leicester, Dr. Lankester. A Committee of the Town Council had made the necessary arrangements for the Conference, having placed a large tent at the disposal of the Association. The readers of papers and officials were also entertained at lunch by the Mayor and Committee. Special thanks are due to the Abbey Park Superintendent, Mr. J. Burn, for the assistance rendered in the arrangements of what proved to be a very satisfactory gathering.

*The Irish Tour.*—In regard to the inspection of fruit culture in Ireland the delegates, Messrs. Castle and Gordon, left Leicester in the evening of August 5th, proceeding direct to Ireland *via* Stranraer and Larne. Investigations were commenced in the counties of Londonderry and Antrim, and continued thence south to Cork and Kerry, taking all the principal districts in the way. They also proceeded to Limerick, and returned to Dublin, where they were received by the Council of the Royal Horticultural Society of Ireland, who have promised every assistance in collecting any further information required to complete the report. The outline report to be presented at the Crystal Palace on September 5th will comprise the chief subjects that will be dealt with more fully in the official report to be published later on. It is only necessary to say here that thousands of acres of fine land suitable for fruit culture were inspected, and that fruits, especially Apples, were good, succeeding even under the worst treatment, from the extreme north to the south; that good culture was seen in a few instances, and the results there were as satisfactory as anywhere in England, and that imported fruit had a large place in the shops and markets of the principal towns, proving the existence of a demand for fruit. The delegates experienced much courteous attention during the journey, and the objects received the hearty approval of all with whom it was discussed.

Sir Charles B. Barrington, Glenstal Castle, Limerick, having kindly consented to become a Vice-President of the Association, was unanimously elected to that office. Votes of thanks were also unanimously accorded to Mr. James Ellis, Dr. Lankester, Mr. Burn, and other officials at Leicester, who have assisted so greatly in the arrangements for the Conference.

The following programme was adopted for the Conference to be held at the Crystal Palace, Sydenham, on Friday, September 5th next, at 3.30 P.M.

#### SUBJECTS.

*Fruits in Ireland*, by Mr. Lewis Castle and Mr. George Gordon.

*Peaches and Nectarines*, by Mr. T. Francis Rivers.

*Plums for Market*, by Mr. J. Smith, gardener to the Earl of Rosebery, Mentmore.

*Cherries for Market*, by Mr. G. Bunyard.

Exhibits of Apples and other fruits from Ireland are promised.

The Brighton Conference will be held in the King's Room, Royal Pavilion, on September 11th, at 4 P.M., the Mayor of Brighton in the chair. This will be the second day of the annual Autumn Show under the management of Mr. Edward Carpenter, and a good display of fruit is expected.

#### SUBJECTS.

*General Fruit Culture*, by Mr. T. F. Rivers.

*Grapes for Market*, by Mr. J. Roberts.

*Tomatoes for Profit*, by Mr. W. Iggulden.

*Wall Fruit*, by Mr. R. Smith.

Members' tickets admit to the Brighton Show and Conference.

### GENISTA CAPITATA.

UNDER the above name specimens of an attractive hardy little plant of shrubby habit were exhibited early in the present season at one of the Royal Horticultural Society's meetings, and concerning its useful-

FIG. 25.—GENISTA CAPITATA.

ness there can be no question, whether the name be aptly applied or not. A variety of *Genista umbellata* has been named *capitata*, distinguished from the species by the silky hair clothing the branches and leaves, and said to be a native of Mogador. It was also described as *Spartium capitatum*, and appears to be the plant shown at the meeting in question, and of which an illustration is given in fig. 25. The leaves are trifoliate, the bright yellow flower in compact terminal heads, and are produced freely. The species is a native of Barbary, being found on dry hills. A *Genista* quite distinct from the above has appeared in gardens under the name of *G. umbellata*, which has been assigned a place among the varieties of *G. lusitanica*, a spiny shrub, native of Portugal.

### PEACHES AND NECTARINES.

NEW borders must have efficient drainage, the bottom of the border being concreted if the stratum beneath be unfavourable. Gravel free of clay or loam, or an unbinding gravel consisting of pebbles with sand and an eighth of stone lime well burned, form an admirable con-

crete, the lime being slaked and the whole formed into a mortar-like consistence, laying it 4 inches thick and treading it firm. Wide and deep borders are a mistake. The width of the trellis the trees are to cover is quite wide enough for any fruit tree border. To begin with one-third the width of the trellis is quite sufficient. Drains with proper fall and outlet are essential. They should be laid so as to run the water clear of the bottom of the border or the surface of the concrete. Nine to 12 inches thickness of drainage is necessary. The best we find is formed of 9 inches of brickbats or other rough material, the roughest at the bottom, and dwindling to road metal size at the top, finishing with 3 inches thickness of old mortar rubbish, freed of pieces of wood and old laths. So formed the drainage will keep sound for an indefinite period. Twenty-four inches depth of soil is ample. It might be higher at first to allow for settling, but if in good working condition and put together rather firm, settling will not materially affect the depth. The best varieties for very early forcing are Alexander and Waterloo, the latter the higher coloured and heavier fruit. Hale's Early, Early Alfred, Royal George, and Grosse Mignonne are free bearers, and if given proper exposure to light are good in colour, finishing well in every respect. The light coloured Peaches, such as Early Rivers and Noblesse, are not so much appreciated, but there is nothing to equal them in quality. Of Nectarines, Lord Napier is the largest and best of the earlies. Hunt's Tawny colours well, but is small; the quality is very good. Elruge attains a good size, when the fruit is well thinned, and it colours finely under proper exposure.—I.

### SEASONABLE HINTS ON FLORISTS' FLOWERS.

*Auriculas.*—There can be little doubt, I think, that a cold and moist season is favourable for the Auricula. Where the collection is protected from heavy drenching rains the plants are not stimulated so much, and there is not so great a tendency to throw up autumn blooms, a catastrophe the grower always likes to avoid, as his prospects of a good spring bloom is thereby destroyed, the plant that has flowered in the autumn never doing much in the spring. The plants now require simply looking over carefully, all dead leaves to be removed or taken away, and if by any chance there has been a drip on the frames, and thereby the soil in any of the pots has become soddened, they must be removed to another frame where they will be free from it. Should the surface of any of the soil have become green or hard it must be gently moved with a blunt piece of stick. Where offsets have been taken previously they may now be placed into small pots, as thereby their growth into flowering plants will be accelerated. It is probable some of the plants may have suffered from black rot. Where this is the case the best hope of the grower is on offsets. Of late my mind has been much exercised as to the age of Auricula plants. Has any grower ever noted how long-lived an individual plant of any variety is? I have noted in some of the species of Primulas, even in our common wild Primrose, that the plants do die off, and their place is occupied by self-sown seedlings. Is this the case with the florists' Auricula? and if so may not the rot, which as far as my experience goes attacks only the larger plants, be the natural way in which the old plants commit the happy dispatch, and make way for their children? Perhaps Mr. Horner will tell us what his experience is. I only put forward a suggestion, and am anxious really for information. If it be not so how is this plague to be avoided? By the end of this month (September) the plants will have to be moved to their summer quarters facing the south, and it will therefore be necessary as soon as possible to clean fresh putty and glaze the frames, so as to secure the plants from drip during the winter, when it is much more injurious to them, as the wet pots are apt to become frozen. Water will be given more sparingly as the days become shorter and the power of the sun less. It is not well to water all the plants at one time, as some will require it oftener than others, owing to the condition of the roots, and the grower must be guided by his own judgment as to when it is to be given.

*Carnations and Picotees.*—This has been undoubtedly a very indifferent year for these beautiful flowers, and even where growers have the advantage of a house they have complained, and where cultivation is carried on out of doors either in the open ground or in pots, the cold wet weather has been very trying, and I imagine that this will extend to the layering. The "grass" is somewhat tough and hard owing to the long cold, and it is not likely that they will emit roots so freely as when the grass is in a more healthy condition. Towards the end of the month it will be necessary to take off all the layers that are rooted, and place them either singly or in pans in small pots where the method of growing them in pots is adopted, or plant them out in beds where they are so grown, where plants are in beds or borders, and used only for decorative purposes, for which I do not think the florists' varieties are adapted. If there is no increase required they may be left alone to form large "stools," which will always give an abundance of flowers, the flowering stems having been cut off. The strong growing selfs and yellows are the greatest favourites, and form pretty and interesting clumps, which the more delicately marked and refined Picotees fail to do, and one has only to see how the old Cloves are left in many a cottage garden to see how admirably they succeed when left alone.

*Gladiali.*—There is little to be done now but enjoying the results of previous work, and if they have been properly staked and tied they will require but little more unless the grower be ambitious to exhibit, when they will need to be shaded. There is no doubt that a moist cool season such as we have had suits them, and should it be succeeded by a dry autumn the corms ought to lift well and be of good size. If seed is

required it would be well to cross the varieties, and no flower is more easily operated upon, but it will be well to fertilise only one or two flowers on a spike and pull all the rest off. Where seed is not required the flowering part of the plant should be cut away, so as to allow all the vigour to be thrown into the corm—in fact leaving it to perform only one operation at a time. We shall require a dry autumn, as the corms are pretty sure to be full of water after such a season as we have experienced.

*Pansies.*—It will now be time to pot these, and it is only in this way that we are able to grow them in this part of England. I always plant mine out after they have finished flowering, and at this time take them up and divide them, putting them into small pots, and so keeping them through the winter. Where cuttings have been taken they may be potted in like manner, placed in a cold frame, kept close for a few days, and then given all the air possible. They should be kept moderately moist, but damp should be guarded against. The simpler the soil the better, as it is not desirable to stimulate growth so much as to promote root-action during the winter.

*Roses.*—It goes rather against the grain, even for an old-fashioned florist, to class the Rose amongst florists' flowers, but I suppose we must do so. Notwithstanding all the wet we have had, it has been so far a fine time for autumnal blooms, though it seems hard to class August amongst the autumn months. We have had splendid weather for Hybrid Perpetuals, and I have seen as fine blooms as are often seen in the full height of the season; and how lovely the Teas are! and what an unfailling supply of beautiful blooms they give! There is not much that they require now save forethought for the time that is coming. If any alterations are to be made in the Rose garden they ought now to be planned, so that when the time comes they may be carried out without delay. Some growers recommend—and I have tried it for the last two years—to treat them as we do Raspberries—cut out all the wood that has bloomed, and which would have to be cut away in spring, so as to allow a free current of air and plenty of sunlight to get access to the plant and so ripen the wood. This saves, too, the work in spring, when there is so much to occupy our thought and time. When the new shoots of the year are very long they should be topped, and a stake put to them, so that they are not "wobbled" about by the wind. Now will come the time, too, when the result of notes taken during the summer will bear fruit in orders to "the trade," so that next month they will see the arrival of the packages which so delight the grower with fond anticipations of future pleasure.—D., Deal.

### NOTES ON STRAWBERRIES AND PEACHES.

#### LOXFORD HALL.

THIS appears to be a good late variety as far as cropping and flavour are concerned, but its pale colour is objectionable on the dessert table. I have seen this year several good dishes of fruit, but none good in colour.

#### WATERLOO.

At the late Southampton Show, held on August 2nd, an excellent dish of this Strawberry was exhibited, thus proving its value as a late sort, as Strawberries at that date so far south of England are rather rare. Its flavour too is pleasing; the growth is good, although runners are not freely produced, as in some varieties.

#### SIR JOSEPH PAXTON.

In recent issues of the Journal I was pleased to see this variety so highly spoken of. It is good in all seasons, and the best wet weather variety we have. The flesh being fine it is less affected by rains than most others. The Captain possesses this quality also, but as this is a shy bearer it will not be nearly so largely grown as Sir J. Paxton. This latter variety—"Joes" as they are called by the market men—is extensively cultivated in Hampshire for supplying the London, Manchester, Birmingham, and Glasgow markets. Several hundred acres of it are grown; indeed with the exception of a few Noble and Alice Maud, which are planted for earliness, "Joes" form the entire crop. When I say that as many as sixty tons have been sent away from Botley Station in one day it will give an idea of the numbers cultivated. The travelling qualities of Sir Joseph is improved by gathering the fruit just before it ripens. This is found the best plan, as in warm weather the fruit "colours up" during the journey. A little more than the ordinary distance of 2 feet is required in planting, as in suitable soil the growth is robust. Early planting of the runners is a decided gain. The best plants are those which have been layered into 3-inch pots at the beginning of July, and planted before they become root-bound. The difference between early planting, say in August, and that of deferring it until March will be seen in the crop produced the following season. In this district (Hampshire) fruit of this variety is ready to be gathered in quantity about the 10th of June.

#### STRAWBERRY RUNNERS.

When runners are obtained from a distance, some perhaps having but few roots, the best plan is to establish them in 3-inch pots in a compost of loam and horse manure, about half of each, standing them in a cold frame, which should be shaded from bright sun for a few days. Directly the pots are full of roots plant out. By the little extra attention much time is gained. If the roots arrive in a dry state they should be placed in water for a few hours; and if the soil be moist, as it ought

to be when potting, but little water need be given to the plants for a day or two.—E. M.

#### PEACH SEA EAGLE.

It is not often this variety is had ripe so early as the beginning of August. At the Southampton Show, held the 2nd of the month, Mr. Iggulden staged two capital dishes of it there, both being highly coloured fruits of large size and excellent flavour for the variety, which is not looked upon as being one of the most noteworthy kinds in that respect, although it has a commanding appearance, and well worth attention as a late variety.—E.

#### PEACH BARRINGTON.

So fine was this Peach exhibited at Southampton Show August 2nd, that many gardeners doubted its being that variety. The fruit shown there by Mr. Allen were large, round, and of magnificent colour, and easily secured leading position in the class for one dish of Peaches. Given plenty of light this variety does colour well, and in that manner is one of the best Peaches we have for midseason use.—M.

**EVENTS OF THE WEEK.**—On Friday and Saturday, September 5th and 6th, the Fruit Show and the National Dahlia Society's Show will be held in the Crystal Palace, Sydenham. The British Fruit Growers' Association will hold a Conference in the south saloon of the Crystal Palace on Friday, September 5th, at 3.30 P.M., when the subjects for discussion will be "Fruit in Ireland," "Peaches and Nectarines," "Plums and Cherries for Market." On Tuesday, September 9th, the Royal Horticultural Society's Fruit, Floral, and Orchid Committees will meet in the Drill Hall, James Street, Westminster. The early Show of the National Chrysanthemum Society will take place on Wednesday and Thursday, September 10th and 11th, at the Royal Aquarium, Westminster, early Chrysanthemums, Dahlias, and Gladioli being the chief features. The Floral Committee will also meet at 12.30 P.M. The Brighton Horticultural Society's Show will also be held on Wednesday and Thursday, September 10th and 11th, in the Royal Pavilion; and on the second day (September 11th) the British Fruit Growers' Association have arranged for a Conference in the King's Room at 4 P.M.

— THE WEATHER has given some earnest indications of approaching autumn. On several mornings frosts have been experienced in the metropolitan district, Dahlias and Vegetable Marrows being much injured in low and exposed situations.

— A DEPUTATION of the NATIONAL CHRYSANTHEMUM SOCIETY met Lord Brooke, M.P., President of the Society, at Anderton's Hotel, Fleet Street, at 2.30 P.M. on Wednesday last, September 3rd, to discuss the arrangements for the Centenary Exhibition Conferences and banquet, to be held at Westminster on November 11th, 12th, 13th, and 14th, 1890. Mr. R. Ballantine was in the chair, and the members present were Messrs. W. Holmes (Hon. Sec.), J. Laing, Lewis Castle, G. Gordon, and Briscoe Ironsides. A full and interesting programme was adopted for recommendation to the General Committee. It was thought advisable to have an opening ceremony and a conference on the first day; the second conference and banquet on Nov. 13th. A conversazione, with distribution of prizes and closing ceremony, on Nov. 14th. The programme will be considered in all its details at the Committee meeting in Anderton's Hotel on Monday next at 7 P.M.

— ROYAL HORTICULTURAL SOCIETY.—Questions having been asked as to whether fresh fruits may be shown at the forthcoming Exhibition of Preserved Fruits, Jams, &c., to be held by the R.H.S. in the Drill Hall on Oct. 14th, 15th, 16th next, it may be as well to call the attention of intending exhibitors to the following decision of the Council:—"Any new or rare fruits submitted to the Fruit Committee will be heartily welcomed, but there will not be room for general collections of fresh fruit. The Show will be exclusively of preserved fruits, with the exception of novelties in flowers and fruits sent for the judgment of the Committee." The jams and other preserves are to be as far as possible in glass vessels or "packages," although other materials are not absolutely prohibited. At the Grape Show at Chiswick a silver-gilt cup will be awarded in Class X. for the best examples of packing Grapes, 4 to 6 lbs., for private use, to be sent by post or rail.

— POSOQUERIA LONGIFLORA, though not very useful in a decorative point of view, is very fragrant. A plant in a stove or a warm Orchid house fills it with fragrance in the same way that the *Boronia megastigma* does in the greenhouse, but of course the perfume is different.—O. U.

— HELICONIA AUREO-STRIATA is out of the run of ordinary variegated stove plants, but nevertheless it is still worthy of cultivation in the best garden where stove plants are grown for decoration. We grow it in equal parts of loam and peat, and well exposed to the light, but not direct sunshine.—Y. G.

— APPLE STIRLING CASTLE.—In a scarce Apple year like the present it is as well to notice which varieties have come through the ordeal the best. Stirling Castle is laden, whilst other varieties are almost bare. This Apple should be planted on the Crab stock, as on this it fruits most profusely, too much so in fact. It is useless to plant it on dwarfing stocks, as the trees grow so scrubby.—Y.

— LIKE many other old plants *GLORIOSA SUPERBA* is coming to the fore, but why it should have been banished I am at a loss to understand, as what trailing stove plant could be more beautiful during the summer months? We grow it along the light iron supports in the *Cattleya* house. There are evidently good and poor varieties even of the variety *superba*. The variety we have is the best I have seen.—A.

— HYMENOCALLIS MACROSTEPHANA somewhat resembles *Pancreatum fragrans*, but is far preferable in every way. The flowers are delightfully fragrant, and more massive than the *Pancreatum*. I believe it is scarce; at least it is very seldom seen. It is of the easiest culture, but thrives better in a rather high temperature and moist atmosphere, and must also be heavily shaded. When exposed to the sun the foliage gets scorched. It will also thrive under the shade of other plants.—O.

— THE handsome NEW CUCUMBER which attracted so much attention at the Reading Horticultural Society's Show on August 27th was awarded a first class certificate of merit in addition to the first prize for the best brace of Cucumbers. It has had first class certificates at the Royal Horticultural and Royal Aquarium Shows this season, and we learn that Messrs. Sutton & Sons, Reading, have purchased the entire stock of seed of the raiser, Mr. Mortimer, and will distribute it during the coming spring.

— PLATYCODON MARIESI.—This somewhat scarce plant is now flowering well in this district. Considering its distinct character and unique buds and flowers, it is remarkable it is so seldom seen. Its requirements appear to be few. Here it is simply growing in ordinary soil on a sloping bed on a lawn, and with great freedom. It is about 18 inches in height, the leaves and stems intensely glaucous, and the flowers of a deep purplish blue, and of some substance, and altogether a desirable plant for the hardy flower garden.—S.

— A TIMELY HINT.—Having had early frosts the last two or three years it will be wise for northern growers of Chrysanthemums to be on their guard this year, and as some perhaps have not convenience for protection without housing, which in the latter part of September is rather early (for certain purposes), I would suggest pieces of old newspapers, made in the form of small cones, and drop one over each bud at night. If there is any indication of frost, of course, it would not be practicable for bush plants, but for those grown to produce large blooms.—J. T. P.

— I CONSIDER *GESNERA EXONIENSIS* is the most useful of all the Gesneras, as it is admirably adapted for winter decoration, especially when it can be shown in the dining or drawing-room by either gas or lamp light, as then its beauty is fully brought out. The details of culture are simple, yet these must be rigorously carried out, or poorly grown and badly coloured plants will be the result. The best position is in a close, warm, and moist pit or stove, where they may be shaded from sun. Water must not be allowed to fall upon the foliage, but it can be freely supplied about the stage amongst the pots and on the floor. The compost I have found most suitable consists of equal parts of loam, peat, and leaf soil, with a good addition of sand and charcoal broken fine. Whilst in free growth care must be taken not to allow the soil to become dry. As the foliage decays, dry and store the roots similar to *Gloxinias*. In our case the roots were started a month since; these were removed carefully from the old soil, and arranged in a box of soil. They soon started into growth; they are now potted into large 60's, and will even-

tually be placed into 6-inch pots. If extra large plants are desired 7 or 8-inch pots are not too large. The best plants I ever saw were grown in a propagating house.—A. YOUNG.

— SHARPE'S QUEEN PEA.—May I add my testimony to that of your correspondent, Mr. Lumsden, on page 159, in favour of the above Pea? I can fully endorse all that he says in its favour. Coupled with its sturdy growth and free-bearing qualities, it has the power of retaining its flavour when we should consider it absent in some varieties; in fact I consider it the best flavoured Pea. To anyone on the look-out for a good Pea let me advise them to give Sharpe's Queen a trial.—R. PINNINGTON. [Messrs. Sharpe have sent us some samples of this Pea which fully bear out all that has been said about it. The pods contained nine and ten fine peas each]

— THE WEATHER IN SHROPSHIRE has been very cold this last week or two, especially at night. On Thursday night last I had some Gourds cut down by frost, and on Sunday morning 3° were registered. We had hail on several days and very heavy rain. On the first Saturday morning in August we had 2° frost registered, but I may say that our gardens catch all the early frosts, as we are rather low lying and damp. Fruit crops this year are very poor; many large orchards have no fruit at all in them, and Plums are very scarce. Apricots are a poor crop with us, but outdoor Peaches are good, and will be if we can get a few fine weeks to ripen them. They are late, as I have picked none from our trees yet. I have never seen such a crop of Hazel Nuts in the woods and hedges, all the bushes being loaded.—JOHN ETTLE.

— STRAWBERRIES.—I have been much interested in Mr. Mehan's remarks on the Strawberry, page 162, and my own experience has proved them to be correct. If more Strawberries were planted in the shade they would be less troubled with spot, red spider, &c. Fresh plantations would not be required so often, the fruits would be more numerous, and the quality much better. This season our heaviest crop was gathered from Elton Pine, planted about seven years ago by the side of a line of Pear trees. In other parts of the garden we have the same variety two, three, and four years old, but the crops did not equal those shaded by the trees in abundance, size, or flavour. I could give more instances, but I choose this one on account of the age of the plants, which I think will be sufficient to corroborate Mr. Mehan's statement that in a shady place the Strawberry feels most at home.—A. SCOTT, Rathmore, Belfast.

— NAMING FLOWERS AT EXHIBITIONS.—Is it possible for an exhibitor to place a name on a variety that has not yet been named? Surely the Judges in Mr. H. Elliott's case went beyond their duty. He (Mr. Elliott) so far named them as to call them "seedlings." This sort of disqualification greatly annoys young exhibitors. The object of naming is certainly that other exhibitors may procure the varieties. In the matter of "seedlings" that could not be done. Even when the rule runs that each bloom must be "correctly named," how difficult it is for the young exhibitor to do this. Often, very often, the plants are sent out under a wrong name, and this is wholly an accident. How can the tyro know whether the name be correct or not? He must trust the seller, who, through no fault of his own, may yet send the wrong variety. Then often the name is just placed in front of the bloom, and if a gusty day, it may be blown away before the judges visit, or by the manager of the tent moving the stands. This always appears to me a regulation that should only be acted on when it is evident that the exhibitor has paid no sort of attention to it, and the whole stand is nameless. It is not easy to frame a regulation, any more than an Act of Parliament, without flaw, and most have to be acted upon less rigidly than as printed. In my opinion Mr. Elliott has been hardly treated.—Y. B. A. Z.

— CARNATIONS AND PICOTEEES.—No time should be lost in preparing stock for another year. They can be layered, or cuttings may be taken with a sharp knife. The latter should be cut to about the fourth joint, inserted in 5-inch pots of light sandy soil, plunged in an old Cucumber or Melon bed, shaded from hot sun, and gently syringed twice a day. They will form roots in three weeks or a month, when air should be admitted gradually until the lights can be removed. When sufficiently strong they should be placed singly into large 60-pots, and arranged in a cold frame and kept close for a few days, air being admitted as previously advised. They will make good plants by the spring, when they should be placed into 6-inch pots in a compost of two parts loam, one part leaf soil, one part sharp river sand, or planted out in beds as they are required. Layering is easily performed where time can be spared; the plants having been cleared of

all old flower stalks and weeds removed, the soil around them should be loosened and some fresh added. The shoots selected should be denuded of their leaves at the base of the stem. A slit should be cut in an upward direction, so as to form a tongue, which should be pegged firmly in the ground and covered to the depth of an inch, care being taken to see that the tongue and main stem be separated. They will root in about a month or five weeks. After layering, some soil should be drawn up to them, so as to form a sort of basin, and supply water when the soil is dry. When rooted they can be removed from the old plants, and, potted or planted as stated above, they will make useful plants to flower next season.—B. B.

## THE CYCLAMEN.

THE best method of growing the Cyclamen to a high state of perfection is to treat it as an annual. It is a common practice to sow the seed for the year's supply during the early months of the year, and then forward the plants in brisk heat for some months. Fair results may be accomplished by this system, but the utmost care is necessary to avoid a check to the young plants or prevent their foliage being drawn. Even if these evils are overcome plants in 4-inch pots only can be produced by the end of the season.

Sow the seed at once, so that the plants have before them twelve to fifteen months in which to develop, and there is no difficulty in having large plants that will produce scores of flowers each, and prove highly ornamental in any position. Sow the seed evenly on the surface of fine soil in well-drained pans, a layer of leaf mould being placed over the drainage, and then a compost of loam and leaf mould in equal proportions, with the addition of sand. If the soil is suitably moist, and the pan can be plunged, covered with a square of glass and shaded, no water will be needed before the seed germinates. The pan should be placed in a temperature of 60°, and the young plants gradually exposed to the light and air of the house by the time their first leaf is developed; they should then occupy a position close to the glass, where the temperature at night will range 5° lower.

When large enough transplant the seedlings about 1 inch apart in pans, where they should remain until large enough for 2-inch pots. They must not be crowded before they are potted singly. To prevent the soil drying too rapidly in the small pots, plunge them amongst sand, fine ashes, or cocoa-nut refuse on a shelf close to the glass. If the night temperature during the winter does not fall below 50° they will grow sturdily and be stiff little plants not more than 1 inch high by the time they are ready for larger pots. The crown of the young plant should be just above the surface of the soil when transplanted from the seed pan, and also when they are potted.

The next shift must be into 4-inch pots, using the same compost. This time the pots appear to be large for the plants, but with good treatment the latter will soon develop large leaves and plenty of roots. In this size it is often difficult to accommodate them on shelves; in fact they are better stood together in a low house, where they can enjoy a moist base, such as ashes afford. Unless very carefully attended to shelves prove too hot and dry.

The next shift should be into 5-inch pots, and in these the plants will develop into strong flowering plants. The largest and strongest when ready may be placed into pots 2 inches larger. If the plants have been kept growing the last shift should take place about the end of August or the first week in September. When placed into 5-inch pots the soil must consist of loam three parts, one part leaf mould, one-seventh of manure and sand. The soil must be pressed more firmly into the pots than was the case at the earlier pottings.

From the time the seed germinates the soil about the plants must never be allowed to become dry. This is one of the mistakes that is often made, and the plants are seriously checked in their early stages. Abundance of water is needed both at their roots and over their foliage. Even after flowering they should not become dry if any of them are to be retained for flowering again. Very frequently old plants after flowering are ruined by carelessness in supplying them with water.

When the plants have been fully exposed to light in the house in which they are raised no shading will be needed before they are placed into 5-inch pots, and only then if the weather proves exceedingly hot and bright. Cyclamens are frequently shaded too much, and the foliage becomes drawn in consequence. When ventilation is liberal and the sun bright, syringing and damping the house will prevent injury from flagging.

Little ventilation will be needed during the early stages of the plants' growth; but from the time they are established in 2-inch pots air should be admitted whenever favourable to maintain dwarf compact growth. The ventilation must be gradually increased as

the days lengthen and the plants increase in size until cool airy treatment can be given, which is necessary from the time they are placed into 5-inch pots. During the early growth of the plants the house should be closed early in the afternoon, while later in the season the ventilators may remain open at night.

If Cyclamens are kept growing and the syringe freely used insects are not a source of trouble; but if the soil about the roots and the atmosphere of the structure become dry aphides increase, but are readily destroyed by slight fumigations with tobacco. Although a moist atmosphere is necessary a stagnant one must be avoided, or their beautiful foliage will damp and thus give the appearance of disease.—W. BARDNEY.

## PHOSPHORUS.

THIS chemical element "is never found uncombined in nature, but always in combination with oxygen and a metal (chiefly calcium) as a metallic phosphate. Apatite, phosphorite, and coprolites are minerals composed chiefly of calcium phosphate."—("Murby's Inorganic Chemistry," p. 148). Apatite is a compound of phosphate of lime with fluoride and chloride of calcium, forming in Spanish Estremadura whole beds alternating with limestone and quartz. It is imported into this country, and used for the same purpose as bones—namely, to enrich the soil with phosphoric acid. Phosphorite consists essentially of phosphate of calcium. Coprolites are the fossil remains of extinct animals found abundantly in the lias, greensand, and Suffolk crag. Their constituents are chiefly phosphates of calcium and magnesium, carbonates of those, and some organic matter. They possess well-known fertilising properties. Reduced to powder they are used as ground bones, treated with sulphuric acid they form superphosphate of lime. Those are some of the sources from which phosphorus or phosphoric acid is derived, but principally, as a fertilising agent, from bones consisting of calcium phosphate. Animals derive their substance from plants, these take it from the soil, in which it exists in small quantities, and soils are derived from the primitive rocks by disintegration.

Phosphorus, combined with other elements, exists in the brain, the blood, and all the soft animal tissues, therefore is one of the essential chemical elements found in all living subjects. Uniting with oxygen it cannot remain unchanged when exposed to the air, therefore always occurs combined with other elements.

Of the use of phosphorus to plants little is known, its uses not being determined with much certainty. It is considered that it acts not only in building up, but in energising the actual living substance of plants as well as animals—viz., the protoplasm, and is the principal agent in the transference of the living principle or the protoplasmic substances from the formative cells to those in which they are to be employed, whether those obtain in old tissues or the formation of new. Phosphorus on these premises is the energiser if not the inductor of the living substance in plants. These derive it from the soil, where it exists combined with other elements, the principal source of supply being phosphates of lime. These differ in the per-centage both of phosphoric acid and calcium. Some limestones contain as much as 7 per cent. of phosphoric acid, others scarcely a trace, and their value depends on the solubility in water. Phosphorus, however, seems to be inseparable from lime, at least those elements—viz., calcium and phosphorus—are found in the ashes of all plants in greater or less degree.

Soils deficient in phosphoric acid cause a dwarf and stunted growth, which on the application of phosphatic matter is relieved, the plants are rendered vigorous and healthy by the presence of this essential element in their food. Lime or calcium supplies plants with sulphur and phosphorus from the sulphate and phosphate of that substance respectively, and equally important with that or the basic element—viz., calcium combined. Calcium neutralises acids, not only in the soil but in the plants; oxalic acid forms largely in the tissues of growing plants, and is injurious when it is in excess; lime of itself forms nitrate of that substance when applied to soils, and it is believed that bacteria remaining inert amid vegetable acids are on lime being present to neutralise the acids made active, and the lime through their agency is changed into nitrate. Lime on entering the plant tissues combines with the oxalic acid forming oxalate of lime, which is not injurious, therefore neutralising acids in soils by lime dressings converts their poisonous elements into nutrition of a wholesome nature, and prevents the acids formed within the plant becoming injurious.

Oxalic acid combines with magnesium, forming an insoluble salt or oxalate of magnesium; but when this substance is in excess the salt is reacted upon, and becomes soluble, or partly so, the acid acting with increased energy injuriously on the plant tissues. Oxalic acid also combines with potassium, and forms oxalates, but these are of two kinds—viz., a neutral and a supersalt, and practi-

cally do not neutralise or render the acid innocuous. This combines with sodium, but the oxalate is dissolved by sulphuric acid, the decomposition resulting in free oxalic acid. Ammonium or ammonia is neutralised by oxalic acid, so that ammoniacal, potassic, and sodic elements are not antiseptic. Calcium completely exorcises oxalic acid, eliminating and converting it from an injurious to a perfectly harmless if not beneficial and essential substance. So strong is the affinity of oxalic acid for lime that it separates it from all other acids unless they are present in excess, and forms with it an insoluble salt—viz., oxalate of lime.

Oxalic acid is formed by potash and soda acting on vegetable matter or humus. The salts or oxalates resulting are decomposed by sulphuric acid, whereby free oxalic acid is obtained, but these oxalates must first become calcium salts; in fact it is from sodium oxalate that the calcium salt is formed, which decomposed by sulphuric acid liberates free oxalic acid. Therefore, the remedies for plant poison or an excess of oxalic acid are potash, soda, magnesia, and lime. These are most active when acted upon by nitric acid—that is, they are most stimulating to vegetation when applied to soils in the nitrate state. This is found in practice to produce the evils it is desired to eradicate, as a superabundance of potash and sodium have no neutralising effect on free oxalic acid, consequently these do not subdue its virulence in plants liable to fungoid attacks, but aggravate gum in the Apricot, Cherry, Nectarine, Peach, and Plum, unless they also are neutralised by sulphur, or there is lime neutralising the oxalic acid simultaneously counteracting their inducements to the formation of the virus. Instead, therefore, of administering nitrates of soda and potash, chloride of soda and muriate of potash are found most conducive to health and fertility when the tendency to disease is induced by sappy growths, and imperfect setting and stoning of the fruits of the trees named.

Now we have some palliation, and singularly enough an acid—viz., hydrochloric. Chlorine or chloride of soda combines directly with hydrogen (that is produced where there is an excess of organic matter in soils), forming hydrochloric acid. This is also produced by application of salt or sodium, and the acid so formed has the property of rendering silica soluble. This substance passes into plants by their root hairs, is broken up by oxalic and citric acids in the plant tissues, forming new compounds, whilst silica is set free in the sap, and is added to the walls of the cells, whereby they are hardened, especially the cuticle, and the plant is better able to resist attack by fungi. It also prevents the softening sappy tendency of nitrates on the plant tissues. In lime we have sulphur, but its uses to plants are not known, or uncertain. It is, however, considered essential to living beings, and is absorbed by the roots of plants from the soil in sulphate form. It seems that sulphates are broken up on contact with oxalates, organic compounds built up into protoplasm, sulphur being an element always present in the living substance. Sulphur in sulphate form is, therefore, an antidote internally, and sulphides externally of plant diseases of the fungoid character.

All the substances named are essential to plant life, but their benefit depends on the maintenance of a certain equilibrium between opposed and equally energetic forces. If oxalic acid is not converted into oxalates decomposition of another kind sets in, which results in disease and death. This is the case in gum; it is the case in canker. The former was long considered referable to errors of culture, or unsuitability of soil and climate. Those undoubtedly have a predisposing tendency to render the plant tissues assailable by the fungus, and it is useless attempting to avoid its attacks by any external means without first inducing health in the tree liable to attack.

Nitrates are useful in accelerating growth where there is weakness, and with their base forming their respective oxalates with oxalic acid, yet they are liable to induce grossness, whereby plants are rendered more easily permeable in their tissues by fungoid germs. Muriates and sulphates have an invigorating and at the same time a counteracting effect on plants. Muriate of potash whilst stimulating the living substance liberates silica, hardens the cell walls, energising the protoplasmic molecules, whereby health and fruitfulness are assured; alien matters are utilised or eliminated, if not actually expelled. Sulphates contain the essential sulphur, but the counteracting or building up principle is less pronounced; indeed an excess of sulphuric acid appears to react on itself or frustrate the object for which that it is combined with is applied. None of those objections arise when the base is lime. In any form it is highly antiseptic, especially when combined, as it is more or less, with the protoplasmic energisers sulphur and phosphoric acid. It neutralises oxalic acid, forming it into an insoluble oxalate, eats up the free acid of the Apple and Pear, and prevents saccharine and starchy substances from being converted in the stone fruits into gum.

Lime is more valuable still as a source of phosphorus. Soils generally contain, as before stated a small quantity of phosphates

of lime. These are removed with crops, hence arises the necessity of affording new supplies. The principal sources of phosphates are bones and coprolites. They would not be soluble in soils if these did not contain acids, whereby the bones and coprolites or other mineral phosphates are slowly decomposed. The quantity rendered soluble is not such as to meet (unless the phosphates abound in large quantity) the requirements of plants grown for their crops. For special purposes ground bones and coprolites answer, also partly broken, crushed, or other descriptions of bones answer for fruit borders, but these forms, though lasting, are hardly up to the times. Indeed so uncertain is the supply of phosphoric acid by the use of whole or ground bones and coprolites, that to prevent waste in the plants having to liberate it by their roots or the acid they give off, that it is desirable to afford this substance, for economic and certain supplies, in a soluble form. This is effected by converting the phosphates into superphosphates by an acid, usually sulphuric, which readily dissolves in water, and plants obtain it in quantities suited to the current requirements.

The principal matter on which the application rests is that in superphosphate the plants are immediately provided with calcium, sulphur, and phosphorus. All are of the greatest value to plants, especially fruit trees. Phosphorus, however, is the great factor to be reckoned with in their health and fruitfulness. Applied to the soil, its first important business is to encourage root action, especially surface roots. These soon show the result in the leaves. They do not send up matter which causes the leaves to become larger as from potassic, sodic, and ammoniac applications to the soil, but they transmit the living substance, the building up principle, the leaves become stouter, harder in texture, and enlarge the useful part or fruit, not the least of the benefits being the acquiring by the leaves of the colouring matter or chlorophyll, which the plant seems capable of storing in the wood. By some unascertained process the chlorophyll, in the ripening of fruits, give them their mature colour as well as that they have up to the ripening period, the finish of all fruits depending as regards colour on the amount of chlorophyll stored in the plant or present at ripening, and available for conversion from the intensest green into the glowing purple of Gros Colman, or the rich amber of Muscat Grapes.

On these grounds phosphatic manures seem best suited to the requirements of fruit trees, and are advised as remedial of ill health and sterility.—G. ABBEY.

## ACACIAS.

THESE are among the most easily cultivated of greenhouse plants. Some have a tendency to make long straight shoots; these are very suitable for training up pillars or upon rafters in conservatories, where they form grand ornaments in the late winter or early spring months. The most handsome in this respect of all the species is, perhaps, *A. Riceana*. Its graceful slender growths, depending like a Weeping Willow, rendering it singularly effective for training to a pillar or arch in a conservatory. Its pale yellow flowers produced in long solitary spikes from the axils of the growths in spring are very distinct, the foliage being deep green, linear, whorled, or scattered, so that whether in or out of flower it is a very effective plant—indeed one of the finest for pillar, arch, or roof covering in conservatories. The next for pillar and roof covering that I have seen has the name of *A. mica*, which, however, I cannot find enumerated in any list of plants. It makes somewhat slender growths, glaucous, and produces pale yellow flowers in racemes very abundantly, having a very handsome appearance in spring. *A. oleifolia elegans* also is a good pillar plant, and *A. longifolia magnifica*, with its deep yellow spikes of bloom, is one of the best for the same purpose. *A. juniperina* and *A. pubescens* may be mentioned as useful for low pillars. Occasionally the straight branched kinds, as *A. lophantha*, *A. dealbata*, &c., are seen trained to roofs, which is quite unsuited to them. In no place do the tall spreading Acacias appear so well as where they can display their growth—the foliage being really handsome in these last enumerated—as a position in a winter garden or conservatory planted out. But these plants have one great defect—their closing their leaflets at night, which is fatal to their employment in some conservatories.

Most of the species, however, are suitable for growing in pots, or large specimens may be grown in tubs as bushes or pyramids.

Acacias are very floriferous, but they need full exposure to light to insure the thorough solidification of the growth. Plants kept under glass through the summer, where they necessarily have to make their growth under the shade of climbers or a shaded roof, are not nearly so satisfactory as those placed outdoors from early or mid-June up to mid or late September. Without this accommodating nature they are hardly suitable for small houses, for whatever may be their heights described in lists, the plants generally much exceed the proportions accorded them. *A. pulchella*

described as growing 2 to 3 feet high. I have had it make fully that amount of growth in one season. There is one thing, however, about Acacias that renders them more accommodating than other plants, and that is their bearing cutting well, and this means their being kept young and fresh-looking in moderate-sized specimens.

The best time to prune Acacias is immediately after flowering. The principle, however, to be adopted is laying a good foundation by pinching and attention to pruning in the early stages, which, as most of the plants are raised from seed, requires an effort, as the ambition of most growers is to get a large and early flowering plant as soon as possible. The plant must be headed early if it is to have a well-furnished base. The strong growth will monopolise all the sap, and so much so as to impoverish the weaker growths, whilst usually the most floriferous succumb. This must be prevented by cutting back the strong growths and so equalise or distribute the sap, causing, as far as practicable, an equality of growth. The pruning may be to the old wood, but the growth will neither be so free nor desirable as from growths of the previous year. In fact, when an Acacia becomes old, bare, and tall, it is best to discard it altogether, and others should be grown to supplant it. The pruning in most instances will be confined to shortening strong growths and irregularities, and cutting out weakly and dead wood, so as to have a compact, sturdy, well furnished specimen. This if done as the plants cease flowering will keep them in useful form for a number of years. They should be kept rather drier after pruning, and when fresh growth is being pushed they may be potted, merely loosening the sides of the ball, and transferring to pots a couple of inches larger, draining well, and in potting making the soil as firm as the ball. Three parts turfy loam of a friable nature, with a third of leaf soil or fibrous peat and a free admixture of sand, will grow them well. Water carefully, and damp overhead morning and afternoon until the roots have taken to the fresh soil, when as the growth advances they will require more copious supplies of water.

In June, as before stated, the plants may be placed outdoors in a position fully exposed to the sun, but sheltered from winds. The pots should be stood on a concreted bottom or a good thickness of ashes, and be plunged to a little of the rim in that or similar material, allowing space between the plants for the free access of light and air. Copious supplies of water will be necessary, never allowing them to lack it, nor giving any until it is required, always affording it so that the soil is moistened to the drainage. In these quarters they will make clean healthy growth, ripening the wood perfectly, and that when that is effected a full amount of bloom may be expected. In hot weather a good syringing in the evening will be useful in cleansing the foliage and preventing attacks of red spider. The plants should be housed at the end of September or early in October, assigning them a light airy position in a house with a temperature of 40° as a minimum, and 45° to 50° as a maximum from artificial heat, in which they will flower in due season. An effective display will be assured of what are at least showy plants, and though not as durable as many the sprays are useful in a cut state, the yellow balls or spikes, as the case may be, enlivening otherwise formal arrangements. They are also brilliant for decorative purposes indoors, and are in no way injured, even where there is gas, by a brief sojourn in corridors, halls, &c.; of course they cannot well be used in places that have a pale white or yellow ground, but they tell well against a ground of green or blue.

Acacias, though of the freest and easiest culture, cannot bear water-logging. If ever the soil gets sodden and sour the plant will lose its roots, and it will seldom if ever recover. *A. oleifolia elegans* is one of the most difficult in this respect. *A. Drummondii* may also be mentioned as one that does not endure a sodden condition of the soil.

Propagation is readily effected by seeds, which are best sown as soon as ripe, or they may be kept until spring, using fibrous loam with a third leaf soil or peat, or the seeds may be sown in sandy peat. Cover about a quarter of an inch deep, more or less according to the size of the seeds, their diameter being a proper depth, and place in a house with a temperature of 55° to 60° artificially, and when up keep close to the glass to prevent drawing. Pot the plants when they are showing the second leaves, and keep in the same temperature well up to the glass until established; then remove to a cooler house or pit, where the plants can be grown sturdily. Shift into larger pots as required, but avoid overpotting, and pinching-in irregularities bushy flowering plants may be had in about three years.

The freer-growing species, or those grown in quantity for subtropical work, as *A. lophantha*, *grandis*, and *dealbata*, make fine decorative plants the first year if sown early in February, grown on in gentle heat, and planted out early in June, and in good rich soil. Those grown under glass being shifted into larger pots as required, and not suffered to lose the lower leaves through lack of

water or being too crowded, make useful plants for greenhouse or conservatory decoration during the winter, and are useful for decorative purposes indoors. They, however, require light

decorative purposes care must be taken not to overwater, especially when in cool places, from which frost is barely excluded.

Propagation is also effected by cuttings of the half-ripened

FIG. 26.—ACACIAS.

1, *A. cordata*; 2, *A. pulchella*; 3, *A. verticillata*; 4, *A. Drummondii*; 5, *A. armata*.

situations, sometimes being seen flourishing in a light window of a sitting room for months or years, whilst those in the dark recesses of corridors or halls have collapsed. When used for

wood, taking it off with and inserting with a heel, root freely during the summer. Drain the pots well, and fill to with three-quarters of an inch of the rim with peat and sand in equal parts,

surfacing with half an inch of sand, making thoroughly firm. Insert the cuttings at once, water well, and stand aside for a short time to dry, then place in a close frame or cover with a bellglass, shading and watering so as to prevent flagging. They do not require heat, rooting as well or better in a close pit or house without heat. Pot when rooted, and keep in a close pit or house until well established.

Some of the most desirable for pot culture are the following:—

*Acacia cordata*, fig. 26 (1).—A very distinct and graceful species, having long, slender, but slightly branching stems, densely clothed with leaves and flowers. The latter are in very small globular heads, creamy white. The leaves or phyllodes are cordate, angular, and with a tapering point.

*A. pulchella*, fig. 26 (2).—One of the most beautiful of the Acacias, as it is extremely floriferous, with showy flowers. The plant is of spreading habit, with small pinnate leaves three-quarter inch long, the pinnæ narrow. The flowers are in globular heads, half inch in diameter, bright golden yellow, and slightly fragrant. They are borne on slender peduncles, 1 inch long, solitary on the axils of the leaves, but produced very freely all over the plant.

*A. verticillata*, fig. 26 (3).—Tall growing, of somewhat cylindrical habit, the dark foliage and stem contrasting with the soft yellow flowers. The leaves or phyllodes are half inch long, very dark green, narrow, sharp, and arranged six or eight in a whorl. The flowers are in a dense spike 1 inch or more long, sulphur yellow, usually solitary, sometimes slightly branched at the base, fragrant.

*A. Drummondii*, fig. 26 (4), is certainly one of the best, the flowers being borne in axillary spikes, drooping gracefully. In a good specimen, which is as difficult to get as most of the kinds are to keep from growing too much, this is one of the most handsome of spring flowering greenhouse plants, the chief points to be guarded against in its culture being overpotting and over-watering. It is also rather subject to attacks by red spider, which can be subdued by judicious yet efficient syringings.

*A. armata*, fig. 26 (5).—This attains to a height of 6 to 10 feet or more, and forms a very handsome pyramid, its long annual growths gracefully arching being studded with solitary globular heads in March or April are very pleasing. If there is only room for one this may be given preference. By gentle forcing it may be had in flower from December.

*A. diffusa* has the flowers globular and usually twin, produced somewhat freely, the growths being diffusely procumbent. It attains to a height of about 3 feet.

*A. oleaefolia elegans* is very handsome, the heads of bloom disposed in racemes, the plants being of graceful habit, and the flowers are very bright. It is *A. lunata* of the botanists.

*A. grandis* is certainly but a variety of *A. pulchella*, but rather freer in growth, though both are free enough, soon forming specimens 10 to 12 feet high when the object is a pyramid, and the leading growths trained up. It flowers from February to May, the flowers being globular very freely produced.

*A. longifolia magnifica* is a fine erect growing kind, the leaves being linear lanceolate, the flowers borne profusely in loose spikes from the axils of the leaves, and during the early spring months. It attains to a height of a dozen or more feet, but can be kept to six by judicious pruning, which it seems to flower all the better off, at least the sprays are longer and the flowers finer.

The species named are all for the greenhouse. I have not grown any of the stove species. White scale is the great enemy of Acacias. I know of no better remedy than applying methylated spirits carefully to the stems and other parts affected with a small brush, and the cleansing influence of rain when placed outdoors is exerted most beneficially on the plants towards autumn. Indeed the plants usually come in in splendid flowering condition.—A. G. Y.

## THE FRUIT ROOM.

AMONGST the various appendages to a garden an efficient fruit room is certainly not the least important, yet such a room we seldom see. Generally some back shed is fitted up with shelves in a very rough manner, and on these the winter Apples and Pears are laid, more or less thick as the crop may have been. In too many instances they are obliged to be laid too thick for their keeping well; as they are likely to be all wanted there is no alternative but to place them so if the space be too limited for their being kept more thinly. Although we all know that good-keeping fruit will remain sound a considerable time, even when subjected to this treatment, there is no doubt but it would keep much longer if allowed more room from the first, and those instances in which fruits have been kept for long periods will be found to be where plenty of space was accorded them. Some other conditions seem necessary for the well keeping of fruit, and it will be advisable to point out a few of these individually.

Whatever may be the reputation of a certain variety of fruit for keeping purposes, there is no question but its merits that way are influenced by the situation in which it is grown, as well as the period at which it is gathered, and the condition of the atmosphere at the time. By way of exemplifying these three conditions it will be as well to take a very common case to point them out, and though there may be some difference of opinion on the habits and qualification of the variety given as an example, there is certainly none that has a wider reputation; I therefore, by way of pointing out the conditions necessary to enable a fruit to keep as long a period as possible in a sound condition, will take the Ribston Pippin Apple as an example, not on account of its long-keeping capabilities—on the contrary, it is only an indifferent one in that respect; but by it we may learn the laws that govern other fruits as well. In very many districts the Ribston Pippin Apple has ceased to be cultivated as a profitable fruit; the trees thriving indifferently for a very few years, either die off or linger on a wretched existence, the dead branches almost equalling the live ones in number. Though there is generally a fair proportion of blossom each season, what fruit there is can seldom be classed higher than second, or perhaps third-rate. Now, these fruits have, in many of them, the germs of decay before they are gathered from the tree; black specks near the eye, or in some cases near the other end, turn into a mass of decay of a peculiarly bitter quality, differing widely from the ordinary "rot," by which most other fruits are carried off more quickly, but not less surely, than by this black bitter spot of the Ribston.

Whatever may be the different opinions regarding this, it seems pretty generally admitted that it is mostly due to the diseased condition of the tree on which it grows, or perhaps the worn-out constitution of the variety. Whether this be so or not (and there seems every reason to believe it is so), certain it is that a very large proportion of the Ribston Pippin Apples that are grown fall a victim to this black spot, which, by being of an intense bitter, disqualifies this Apple from mixing with others for making cider, which the decay in other fruits does not necessarily do, as they are not so bitter. Now, this bitter principle is doubtless imparted to the fruit by the decaying process it goes through differing from the same conditions by which other fruits become decayed and rotten; and whether the chemical change which takes place in the Ribston Pippin has its origin in the imperfect condition of the fruit at the time it is gathered, and the latent seeds of this disease be engendered then or afterwards, certain it is that a very great proportion of the fruit of this variety falls a victim to this disease. Though some situations favouring the better development of the fruit may render them less liable to it than in others, still it is reasonable to suppose that those places now in a great measure exempt will eventually become diseased like the rest, and the Ribston Pippin Apple will become a matter of history. The purpose is not now to prognosticate this, but to point out what conditions are necessary to preserve what healthy fruit there may be as long as it is possible to do so.
