## TO OUR READERS.

---

ON the completion of another half-yearly volume our first duty and pleasure is to acknowledge the greetings of those numerous readers who have appended them to their letters and communications during the past few weeks, and to assure our friends that their good wishes are esteemed and reciprocated.

Several of those letters we are tempted to publish, but we can only give extracts from two of them—one as a type of those showing that our contributors have not laboured in vain, but that the seed they have sown has produced fruit; the other as a proof of earnest reading, and a novelty—even to us who are accustomed to a variety of styles—in expression.

“Last year” writes a correspondent, “I sent you a letter on my success in Grape-growing; this year I send you an example of my work. Each year I have improved on the past, and this season the crop is better than ever. I wish also to say that I owe all my success to the Journal, and I look for the paper every Thursday afternoon with as much interest as I look for my dinner.”

Our only comment on this letter is that we hope the writer of it will always have a good Journal, a good dinner, and good Grapes.

The next letter we have preserved is dated several weeks back, and is somewhat amusing. “I am,” says the writer of it, “always glad to receive the Journal. The last number arrived after a long and busy day, and at night I was too tired to read it all, but awaking about two o'clock in the morning I slipped on my jacket and slippers, went down stairs and read with much pleasure the first day of a ‘Week in Belgium’ and Mr. Pettigrew’s ‘Autobiography,’ and then went to roost again.”

We do not desire to disturb the repose of our readers, but wish to make our pages both interesting and useful, and with such skilled and ready helpers as we are so fortunate as to possess we shall not fail in our object.

### CORDON FRUIT TREE TRAINING.

**R**EPEATEDLY has the value, importance, and simplicity of cordon fruit tree training been set forth in the Journal, and very gratifying is it to know that many readers have been induced to adopt this system of fruit culture. It must, indeed, eventually become the most popular of all in gardens, for the simple but weighty reasons that it insures fruitfulness in the trees when very young, it usually affords a supply of fruit when most other systems fail, and it requires so little space that it is as applicable to small as to large gardens.

What, then, is a cordon? It is a small tree with a single stem and no branches, the stem being thickly set with closely pruned spurs upon which the fruit is borne. It is trained either against a wall or wire fence, erect, aslant, or bent down at right angles to the ground and trained along within a foot of its surface, the different methods being technically termed vertical, diagonal, and horizontal. Vertical cordons are sometimes used for very lofty walls or buildings, and they are undoubtedly useful for filling narrow spaces or nooks. But preference is usually given to the diagonal form because of the greater length of stem which is trained to an angle of  $45^{\circ}$ . Du Breuil, the originator of this system, advises in his valuable book "De la Conduite des Arbres Fruitiers," that they should at first only be trained to an angle of  $60^{\circ}$ , and not brought so low down as an angle of  $45^{\circ}$  till the cordon has made two-thirds of its full growth. But they have been found to answer admirably when kept to the lower angle from the first, the plan followed here being to plant the trees 18 inches apart, as Du Breuil advises, to make a mark for each tree from top to bottom of the wall at an angle of  $45^{\circ}$  for the trainer's guidance. To insure uniformity horizontal cordons have been commended for the growth of such choice and tender sorts of Apples, as Calville Blanche, Newtown Pippin, and American Mother when trained to low walls, or upon wire along the margin of fruit borders. This they are certainly calculated to do, but I must confess that, judging from the poor crops upon those which I have seen, success is improbable without affording shelter to the blossom, which may easily be done from their closeness to the surface of the ground.

Double cordons are occasionally to be met with, but they are undesirable, the difficulty of keeping an equal distribution of vigour being altogether avoided by keeping to that best of all forms the single-stemmed diagonal. The famous diagonal cordon Pear trees at Holme Lacy, the seat of Sir Henry Scudamore Stanhope, were planted, one half in 1861 and the other

half four years later, and the trees were allowed to bear fruit in three years after the planting. Almost all the trees have continued to yield large crops of fruit annually—fruit that is infinitely superior to that grown on pyramids or espaliers, and the trees continue in full health and vigour. This wall is 111 feet long and 11 feet high, it faces the south, and the trees incline to the west.

In the winter of 1873 I planted an east wall 200 feet long and 10 feet high with single cordon Pears, which incline to the north. A few of them were allowed to bear some fruit in 1875, to afford proof of how soon it might be had by this method. Very few of them fail to yield crops of excellent fruit now, but it cannot be said that any of the trees are yet in full bearing; still it is surprising what a large number of dishes of fine fruit they afford for the dessert. My reason for saying they are not in full bearing is the small size of the spurs, they will bear more and more fruit as they increase in size, which they will continue to do for some years to come. Much difference was perceptible in the upward growth of the various sorts; some, like Pitmaston Duchess, growing with a sturdy vigour that soon brought it to the top of the wall, while others, like Dana's Hovey, have hardly yet attained the required length of stem. Many years are required to obtain perfect uniformity of appearance along the whole of the wall, and Du Breuil's computation that a wall 12 feet high would be covered in five years only proves correct of some vigorous trees, and not of all.

Much hesitation was shown by many good gardeners in the adoption of cordons, and it was by no means uncommon to hear such terms as "toys" and "nurserymen's puffs" applied to them. It was also thought that the unusual suppression of vigour involved in confining the growth of a fruit tree to a stem some 10 or 12 feet long and to closely pruned spurs, would result in attempts to make fresh growth rather than a regular yield of really useful fruit. All such ideas have proved erroneous, and the only objection now raised is the small quantity of fruit that a cordon can possibly bear at best. This difficulty is, however, readily overcome by planting two or a dozen of any sort much in demand, and this must be regarded as a decided advantage, for more or less variety may be had at will, and a much better succession of fruit maintained than was possible before. Moreover, in the little garden where of yore a solitary Pear tree was all that wall space could be afforded for, a dozen or two of cordons may now be found, and the attendant advantages on this improved state of things are so apparent that I need not enlarge upon them.

Regarded at first as specially suitable for Pears on the Quince, cordons have subsequently been utilised in the culture of Apples, Plums, Cherries, Damsons, Currants, and Gooseberries. Much has been done in this direction at Barham Court, the seat of Roger Leigh, Esq., under the superintendence of Mr. Haycock, and at The Mote, the residence of Lady Howard De Walden, by Mr. Peirce, both gardens being situated in the centre of the Kentish fruit-growing district, and in both are to be seen large numbers of diagonal cordons, not only on walls but on double and single trellises. The latter at The Mote are taken right across the squares of the kitchen garden at regular intervals, affording a remarkable contrast to the old espaliers which used to bear such wonderful crops of fruit, and about which accounts appeared in the Journal many years ago. This is an example of progress and not of mere change

that is quite worthy of record. The espaliers answered admirably for many years, but they eventually became a thicket of huge spurs at the top, and the lower branches lost all their vigour and fruitfulness.

Eighteen inches apart is the best distance for cordons. Select vigorous young trees, and shorten the leading shoot to about 2 feet of the current year's growth at the time of planting. It may be allowed to extend 2 feet annually till it reaches the top of the wall, not in one growth, but rather by nipping off the end in spring after it has grown a foot long, in order to render the buds at the base of each leaf full and plump, and a vigorous second growth soon follows, which is best left unshortened till the leaf falls in autumn. Pinching the laterals three or four times may only be done in warm, sunny, southern gardens; in less favoured situations two prunings, one in July and the other in October or November, are all that must be ventured upon to secure well-ripened fruit buds upon the spurs.—EDWARD LUCKHURST.

#### HINTS FOR AMATEURS.

A FEW seasonable and practical notes are always welcomed by amateurs, who often encounter difficulties which are easily surmounted under the aid of a little clear explanation. To assist in this way was the writer's object in penning the following notes.

**COLEUS.**—There are numerous beautiful varieties of these; and as they can be had very cheaply by post, all with a greenhouse or even a frame may possess them—for a time at all events. When first required, or when potted from cutting pots, they should be placed in the small pots, using any light sandy soil. The warm moist atmosphere of a Cucumber or Melon frame will most quickly establish them: after this they may be grown during the summer and early autumn months in an ordinary cool greenhouse. If it is intended to increase the variety, the young plants should be allowed to grow till long enough to admit of the top being taken off and struck (which is an easy matter providing the cuttings are placed in heat); otherwise stop beyond the second joint, potting when breaking afresh. To secure plants of good shape, pinch out the points of the fresh growth at the first joints, and, if well rooted, transfer into larger pots. This ought to be the final potting, and the 8-inch pots should in most instances be the largest size employed. Overpotting is often a cause of failure in the case of Coleuses grown in cool houses. No particular compost is necessary; that which will suit them well consists of two parts of light turfy loam to one of leaf soil, with a slight addition of sifted decomposed manure and sand. The pots should be clean and very carefully drained. When well established frequent supplies of liquid manure will be found most beneficial, withholding this and giving much less water as the nights become colder, or they will soon lose their foliage. The pyramidal method of training is most suited to Coleuses, and especially the coarser-growing varieties. To secure pyramids pinch back a third time all growths with the exception of one near the centre; this to be staked and to grow unrestricted, and, the base being formed, all that is necessary is to stop the side shoots from the leader to the required length till the specimen is formed, when stopping should cease. Some of the smaller-leaved kinds are very pretty grown in 5-inch pots and pinched so as to form neat flat heads.

**FUCHSIAS.**—Much of the foregoing relating to potting, pinching, and training is equally applicable to Fuchsias. They are not, however, so "good-tempered" as Coleus, and succeed indifferently in the seldom-syringed, badly shaded, and badly ventilated houses of many amateurs; indeed, would thrive far better in the open. Fuchsias are liable to be infested with thrips, and especially with red spider, which in either case results in a check to the growth and a loss of the foliage. Frequent syringing will keep down either pest. Should, however, syringing fail to check thrips or aphides, next to fumigation with tobacco paper a decoction obtained by boiling soft soap and quassia chips will prove an effective insecticide and less injurious to the plants operated upon. It will soon be found at what strength to use the solution, but for the beginners' guidance we recommend preparing at the rate of 1 lb. each of quassia and soft soap, boiling these in about a gallon of soft water till the chips sink, when the solution may be poured off and used as required at the rate of half a pint to a gallon of soft water. In the evenings syringe the infested plants freely with this, repeating the operation occasionally, and increasing the strength if necessary. Quassia chips can be procured cheaply from most chemists. Red spiders are very minute, but whenever they, or rather their work, is discovered, and which is soon apparent in the yellowish tinge assumed by the foliage

where affected, mix a handful of flowers of sulphur with the syringing water, and with the syringe discharge on to the under side of the leaves. This should be continued till the cure is effected. Vines, Peaches, Melons, Cucumbers, and other kinds of fruits should, when infested by either red spider or mildew, be similarly treated. The sulphur will not injuriously affect the fruit, and can be syringed off at any time. Both the above remedies are simple and cheap, and are recommended for flowers and fruit trees, in the open as well as under glass.

**TORENIA FOURNIERII.**—This easily-grown beautiful annual succeeds admirably in a cool greenhouse, and is very effective when associated with Pelargoniums, Coleuses, and Balsams. The seed germinates freely in heat providing it is not buried deeply. Those who may have their stock now in the seed pots or pans should not long delay potting off the seedlings, which may be performed when large enough to handle. A light sandy soil is most suitable in the first instance, but when the final potting is given soil similar to that above recommended for Coleuses ought to be employed. If it is intended to flower the plants in 5-inch pots, pot off the seedlings singly into thumb pots; or three plants may be disposed round the sides of 3-inch pots, and eventually transferred to 6-inch pots. In the former instance the plants assume a trailing habit, but by growing them in threes they are induced to grow more erect, and in this way are most showy. It is advisable to grow them in gentle heat and where but little shaded till well established, and to pinch back the young growths till well furnished with flowering shoots. Liquid manure occasionally supplied will much improve the colour of the bloom as well as increase the vigour of the growth. This *Torenia* flowers very freely in cottage windows. *T. Baillonii* is a yellow-flowering kind.—W. I. M.

#### THE BEST TIME TO PLANT STRAWBERRIES.

As a rule I think Strawberry growers make new plantations too late in the season. Few think of planting until the end of August or during September, when the plants have barely time to root in the soil before the cold weather stops all growth, and the following spring they are neither strong nor fruitful, but must grow for the greater part of the season before they are capable of bearing a crop of fruit. According to my experience better results than this may be had from the same amount of labour, the only difference being in the time of planting. The advantages of early planting may be easily shown.

All new Strawberry plantations should be formed as early in July as possible. By the end of September the plants will be well established, and a good crop of fruit will be had the following season. Indeed a season is gained by early planting. We intend destroying some of our old Strawberry plants as soon as the crop has been gathered, and making new plantations at once in well trenched and manured ground. In clearing off the old plants, however, all will not be thrown away, as those runners which were allowed to root into the ground about the edge of the rows last year will be carefully lifted and saved for planting. Plants of this kind we find are the best of all for making an early fruitful plantation, and they can be easily secured without loss or much labour. Besides this, they fruit sooner and more freely than small scarcely rooted runners. We have no objections to plant Strawberries after Strawberries, but others may wish to change the position of the beds, in which case the young plants can be lifted and planted in their new quarters while the fruit is still on the old rows, and a very early start will thus be secured. By following out a system of this kind no one need have a Strawberry plantation without a crop, but under the late mode of planting one year's crop is always lost.

New Strawberry ground cannot be too clean and free from weeds. In preparing the ground for Strawberries any rough material may be placed in the bottom of the trenches and the best of the dung placed nearer the surface. Before planting the soil should be allowed to become rather dry on the surface, and immediately afterwards it should be trodden all over and rendered as firm as possible. This has a tendency to make the plants grow dwarf, robust, and fruitful in character.

Good balls of soil should be secured with the young plants when lifting them, and they should be well watered in dry weather.—A KITCHEN GARDENER.

**THE DOMINY PRESENTATION.**—Mr. Dominy's best friends must needs feel delighted at the quiet and efficient way in which subscriptions to his presentation fund have been obtained. Indeed all who know Mr. Dominy will feel it a privilege to express their good will and respect for such an earnest and original worker. It

is most desirable, however, that horticultural amateurs, and the patrons of gardening generally, should have a clear idea of Mr. Dominy's merits, since these have been of the most practical kind. He was absolutely the first cultivator to succeed in the hybridisation of Orchids and Nepenthes. *Cattleya exoniensis* and *Calanthe Veitchii*—the one a most beautiful, and the other a most useful Orchid—are alone sufficient as examples of Mr. Dominy's work in this way. But he has done much more than raise these lovely plants, for he raised hybrid Orchids at a time when such a result was deemed highly improbable if not impossible; and his practice in this way was distinctly ahead of the botanical science of the time. Even Darwin's work on the "Fertilisation of Orchids" was not written until long after Mr. Dominy had demonstrated the possibility of their being not only fertilised but hybridised successfully. The Horticultural Society of Exeter were, I believe, the first to honour Mr. Dominy's skill and labour in this way, and now an opportunity presents itself for all interested in gardening to join in honouring Mr. Dominy's labours in the cause of horticulture. We all owe a debt of gratitude to Sir Trevor Lawrence, Bart., M.P., 57, Prince's Gate, London, W., inasmuch as he has kindly consented to receive subscriptions from those who are desirous of thus honouring Mr. Dominy's original labours.—DUBLINENSIS.

### NATIONAL ROSE SOCIETY, CRYSTAL PALACE.

JULY 2ND.

ROSE SHOW at Sydenham under the auspices of the National Society invariably attracts many visitors, but they have scarcely been more numerous on any previous occasion than they were on Saturday last. Typical

July weather prevailed, the heat being intense, tempered only by a slight haze and a breeze, which though perceptible outside had

little effect upon the huge glass structure that seemed to have been converted into a vast tropical house. A thick awning was suspended over the tables bearing the blooms, but in a few hours the effects of the high temperature were manifest in most of the stands. Many classes were well filled, the general quality being satisfactory, though instances were not wanting where the blooms were characterised by considerable roughness. The amateurs appeared in strong force, the majority staging handsome collections of fresh brightly coloured blooms. Indeed as regards colour the blooms were fine throughout all the classes the crimsons being particularly rich. That there is no diminution of interest in the Society's exhibitions, either on the part of the exhibitors or that of the public, was well indicated at the Show of 1881 by the extent of the display and the number of visitors—facts which must afford a deserved satisfaction to all the officials connected with it.

**AMATEURS' CLASSES.**—The competition in many of these classes was keen and interesting, the general quality being highly commendable, and occasioning the Judges considerable difficulty in awarding the prizes in some instances where there were a large number of entries nearly equal in merit. A very satisfactory neatness of form accompanied by fresh, bright, well-developed colours marked most of the blooms, and in some of the leading collections flowers of fine substance and size, yet without any approach to coarseness, were included. The principal class was that for forty-eight, distinct, single trusses, in which the first prize was a challenge cup offered by nurserymen and £6. Only three collections were, however, staged, R. N. G. Baker, Esq., Heavitree, Devon, easily securing chief honours with beautiful blooms of great substance, full, even, and the colours very rich. The varieties represented were Mrs. Baker, Duke of Connaught, Devienne Lamy, very fine; Louis Van Houtte, Senateur Vaisse, bright; Auguste Rigotard, fresh; François Michelin, very good; Madame Victor Verdier, Comtesse d'Oxford, Marguerite Brassac, full, handsome; Star of Waltham, Camille Bernardin, Marguerite de St. Amand, Duchesse de Caylus, very neat; Gabriel Tournier, Comte Raimbaud, Ferdinand de Lesseps, bright;

Madame Sophie Fropot, Beauty of Waltham, Madame Etienne Levet, beautiful; Alfred Colomb, John Bright, excellent; Duke of Edinburgh, large; Madame H. Jamain, Charles Darwin, Penelope Mayo, handsome; Sultan of Zanzibar, Madame Gabriel Luizet, Victor Verdier, Mrs. Laxton, Thomas Mills, Marie Baumann, good substance; La France, Le Havre, Sir Garnet Wolseley, Alfred K. Williams, bright; Dr. Andry, Baronne de Rothschild, Mdle. Marie Rady, Pauline Talabot, Mons. E. Y. Teas, Marie Verdier, Mdle. Marie Cointet, Marquise de Castellane, Madame A. Lavallé, and Dupuy Jamain. Mr. J. French, gardener to the Rev. J. P. Tomlinson, Rooklands, Torquay, was placed second with smaller blooms of less substance, but very fresh, and including a good selection of varieties. The best blooms were Prince Camille de Rohan, Sir Garnet Wolseley, Madame Etienne Levet, Alfred Colomb, and Marie Baumann. Thomas Hall, Esq., Larch Wood, Roekferry, was third with a slightly irregular collection. Thomas Methven and Duchesse de Caylus were, however, well represented.

For twenty-four single trusses Mr. R. N. G. Baker was again first in a class of five competitors. The quality of his blooms was very similar to that distinguishing the collection mentioned above. Some of the most noticeable were Marquise de Castellane, Mons. E. Y. Teas, Charles Lefebvre, Duke of Edinburgh, Mrs. Baker, Duke of Wellington, Thomas Mills, Mrs. Laxton, Duchesse de Caylus, Alfred Colomb, and Mdle. Marie Rady. Mr. Chas. Davies, Grammar School, Aynhoe, near Banbury, followed with even and beautiful blooms; Pauline Talabot, Charles Lefebvre, Xavier Olibo, Dr. Andry, John Stuart Mill, and Marguerite Brassac being fine. The Rev. J. P. Tomlinson was third, and Mr. John Hollingworth, Turkey Court, Maidstone, fourth, both with very fair examples. The best twelve triplets were staged by the successful exhibitor Mr. R. N. G. Baker, who had Hippolyte Jamain, Alfred Colomb, La France, François Michelin, Duke of Connaught, Mons. E. Y. Teas, Mdle. Marie Rady, Marquise de Castellane, Penelope Mayo, Marie Baumann, and Duke of Edinburgh in excellent form. Mr. Hollingworth, the only other exhibitor in the class, was second with fine examples of Le Havre and Camille Bernardin amongst others.

In the class for twelve Teas or Noisettes, distinct, single trusses, the first prize consisted of a five-guinea silver cup presented by Mr. G. Prince of Oxford, which was won by Mr. C. Davies, with very neat and pretty blooms of Maréchal Niel, Mons. Furtado, fine; Catherine Mermet, a remarkably handsome bloom of good substance and exquisite form, for which the Society's silver medal was accorded as the best Tea Rose in the Exhibition; Belle Lyonnaise, Souvenir de Paul Neyron, Marie Van Houtte, Madame Caroline Kuster, Bouquet d'Or, Countess Nadailac, Souvenir d'un Ami, Jean Ducher, and Niphotos. J. P. Hawtrey, Esq., Aldin House, Slough, followed with smaller but still creditable blooms. Souvenir de Paul Neyron, Hippolyte Jamain, and Madame Caroline Kuster were especially noteworthy. Mr. Hollingworth had a fine Souvenir d'un Ami and Jean Ducher in his third-prize collection; Mr. T. B. Hall being fourth with Alba Rosea and Marie Van Houtte in good form among others.

In Division D the principal class was for thirty-six single trusses, six even collections being staged. Mr. T. Jowitt, Old Weir, Hereford, secured the chief honours with fresh handsome blooms, not large, but of good substance and very bright. The varieties were Peach Blossom, Exposition de Brie, Edouard Morren, Fisher Holmes, Duchesse de Vallombrosa, Senateur Vaisse, Marie Finger, Alfred Colomb, Madame Angele Jacquier, Belle Lyonnaise, Mrs. Baker, Princess Mary of Cambridge, Horace Vernet, Gabriel Luizet, Ferdinand de Lesseps, Baronne de Rothschild, Prince de Rohan, Madame Julie Daran, La France, Etienne Levet, Marguerite de St. Amand, Mons. Fournier, Cheshunt Hybrid, Mons. Boncenne, Mons. Noman, Sir G. Wolseley, Madame Lacharme, Louis Van Houtte, Elie Morel, Jean Liabaud, Mdle. Verdier, Alexis le Père, Marquise de Castellane, Marie Baumann, and Charles Rouillard. Mr. J. Brown, gardener to H. J. Waterlow, Esq., Great Doods, Reigate, was a close second with a fine collection, but the most remarkable bloom it included was a grand example of Mdle. Marie Rady of excellent form and unusually bright in colour, well meriting the Society's silver medal awarded it as the best Hybrid Perpetual Rose in the Show. Mr. J. Davis, The Square, Wilton, Salisbury, and Mr. W. Harrington, Corbetstye, Romford, were awarded equal thirds; and Mr. J. H. Pemberton, Havering-atte-Bower, Romford, was placed fourth.

The competition in the class for eighteen single trusses was very keen, twelve collections being staged nearly equal in quality. Mr. W. J. Grant, Hope End, Ledbury, Hereford, secured the chief prize—a piece of plate value four guineas offered by an amateur—with fresh and creditable blooms. A. K. Williams, Dr. Andry, Dupuy Jamain, Paul Jamain, Gabriel Tournier, and Marquise de Castellane were very well represented. Mr. T. Jowitt followed very closely; T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, and Mr. Edwards, gardener to Rev. Canon Tarver, Stisted Rectory, Braintree, Essex, being third and fourth respectively. The most remarkable competition was, however, as usual in the class for a dozen single trusses, no less than twenty stands being contributed—two more than last year. Mr. J. Ridout, gardener to Thos. B. Haywood, Esq., Woodhatch Lodge, Reigate, was most worthily accorded the premier prize for a very handsome collection which this skilful grower has scarcely excelled on previous occasions, fine as his blooms invariably are. Regularity of form, substance, and an unrivalled richness of colour distinguished all the flowers. The varieties were Marquise de Castellane, Marie

Baumann, Duke of Wellington, Duchesse de Vallombrosa, Comtesse d'Oxford, Countess of Rosebery, Edouard Morren, Marie Rady, Beauty of Waltham, Duke of Edinburgh, Alfred Colomb, and Etienne Levet. The remaining prizes were taken by Mr. Grant, Mr. Alfred Evans, Marston, Oxford, and the Rev. H. Biron, Harbledon, all exhibiting well. For six triplets a dozen competitors entered. Mr. Pemberton was first with substantial examples of Exposition de Brie, Baronne de Rothschild, Marquise de Castellane, Duke of Edinburgh, Marie Cointet, and Charles Lefebvre; Mr. Fred. C. Pawle, Northcote, Reigate, taking the second place for good blooms. Mr. Moorman, gardener to the Misses Christy, Coombe Bank, Kingston, being a very close third with good quality blooms, and Mr. Grant fourth. Mr. Pemberton was again the most successful exhibitor of nine Teas and Noisettes, staging pretty blooms of Souvenir d'un Ami, Madame Bravy, Belle Lyonnaise, Niphotos, Adam, Caroline Kuster, and Homère. Mr. F. Gurden, gardener to Miss W. Taylor, Manor House, Headington, Oxon, was third, followed by the Rev. H. B. Biron and Mr. Grant.

The class for twelve single trusses in Division E was fairly well filled, six stands being contributed. Mr. W. H. Wakeley, Macklands, Rainham, was first with excellent blooms, of good substance and neat in form. The Rev. H. A. Berner, Harkstead Rectory, Ipswich, was a close second; Mr. F. T. Wollaston, Dovers, Reigate, third; and Mr. Charles Taylor, Headington, Oxford, fourth. For nine singles Mr. Wakeley was again to the front with a similar collection, followed by Mr. J. Burton, Sawtry, Peterborough; Mr. C. Horne, Park House, Reigate; and Mr. E. Mawley, Addiscombe, Croydon. There were eleven stands of six single blooms, of fair quality generally. The prizetakers were Mr. C. E. Cuttrel, Chapel Croft, Dorking; Mr. F. Burnand, Farningham, Kent, a very close second; and John E. Coleby, Esq., Wimbledon, third. Six Teas or Noisettes were contributed by eight exhibitors, Mr. E. Mawley carrying off the chief prize for good examples of Madame Camille, Alba Rosea, Marie Van Houtte, Rubens, Souvenir d'un Ami, and Madame Willermoz. Mr. Slaughter, Jarvis Villa, Steyning, was a good second, Mr. E. Horne and the Rev. H. Berner following closely in that order.

The next four classes in the schedule were denominated extra, being chiefly for Roses grown in the suburbs of London by amateurs. Of six single trusses of suburban-grown Roses there were four exhibitors, three being from Wimbledon, and well maintaining the credit of the district. John E. Coleby, Esq., was accorded the chief prize (a piece of silver plate, presented by Mr. Edward Mawley) for small but neat and fresh blooms of Louis Van Houtte, Victor Verdier, Alfred Colomb, François Fontaine, and Capitaine Christy, the last-named being unusually fine. Mr. W. Scott, Clinton Villas, South Wimbledon, was a good and close second, staging excellent examples of Hippolyte Jamain, Louis Van Houtte, and Abel Carrière. Mr. T. Foote, gardener to Mrs. Tredwell, Leigham Court, Streatham Hill, was third; and Dr. Pitcairn, Wimbledon Hill, fourth, both with creditable collections. In the class for six single trusses, confined to amateurs who had not previously taken a prize at any exhibition of the Society, there were eleven entries, Mr. Alfred Slaughter securing the first prize for a highly satisfactory collection of good quality blooms, which promised well for the future efforts of their owner. The varieties represented were La France, Baron Adolphe de Rothschild, Comtesse d'Oxford, Catherine Mermet, Mons. E. Y. Teas, and Mdle. Marie Verdier. Mr. J. Burton was second, having Capitaine Christy, Reynolds Hole, and Exposition de Brie very fine. Mr. Moorman obtained the third position with bright well-formed blooms, and the Rev. Page Roberts, Scolc Rectory, was fourth. Only one stand of six suburban-grown Teas or Noisettes was contributed—namely, by Mr. H. W. Tyrrell, The Cottage, South Norwood Park, for which the second prize was awarded. They were not large, but of fair quality. For six new Roses not in commerce previous to 1878, Mr. J. Pemberton obtained the silver cup presented by George Baker, Esq., as the first prize. The varieties were Charles Darwin, Barthelemy Joubert, Harrison Weir, A. K. Williams, Countess of Rosebery, and Duchess of Bedford, of medium size, but very bright. Mr. Jowitt was a close second, staging Mabel Morrison, remarkably fine; Mrs. Jowitt, Madame Gabriel Luizet, Madame Alfred Dumesnil, Madame Julie Dymonic, and a seedling. Mr. P. Hawtrey was third with Mrs. Harry Turner, Jules Finger, Richard Laxton, and Beauty of Stapleford, in addition to several of those mentioned above.

**NURSERYMEN'S CLASSES.**—Following in the order of the schedule we commence with the classes open to nurserymen only, which was divided into two divisions, A and B. For seventy-two distinct varieties Mr. B. R. Cant, Colchester, was awarded the premier position with a capital collection, comprising Edouard Morren, Mons. E. Y. Teas, Marquise de Castellane, Dr. Sewell, Comtesse d'Oxford, Prince Arthur, Madame Gabriel Luizet, Marie Baumann, Abel Grand, Charles Lefebvre, Marguerite de St. Amand, Alfred Colomb, Comtesse de Serenye, Dupuy-Jamin, Princess Mary of Cambridge, Madame Prosper Langier, Hippolyte Jamain, Abel Carrière, Madame Lacharme, Reynolds Hole, Ville de Lyon, A. K. Williams, magnificent; Duc de Wellington, Senateur Vaisse, Emily Laxton, François Michelin, Horace Vernet, Devoniensis, Ferdinand de Lesseps, Baronne de Rothschild, Etienne Levet, Mons. E. Dupuy, Jules Chrétien, Duchesse de Vallombrosa, Camille Bernardin, Marie Van Houtte, Fisher Holmes, Elie Morel, Maurice Bernardin, Annie Laxton, John Hopper, Mdle. Marie Cointet, Le Havre, grand; Madame Nachury, Madame Thérèse Levet, Madame C. Kuster, Boieldieu, Madame Bravy, Madame Ferdi-

nand Jamain, Mad. Caillat, Constantin Tretiakoff, Capitaine Christy, Duchesse du Caylus, Reine du Midi, Mrs. Baker, Sophie Coquerelle, Mrs. Laxton, Madame Truffaut, Mons. Noman, and Duke of Edinburgh. Mr. C. Turner, Royal Nurseries, Slough, ran Mr. Cant very closely, and received the second prize: Horace Vernet, Star of Waltham, A. K. Williams, Madame Victor Verdier, Senateur Vaisse, Souvenir de W. Wood, Harrison Weir, Le Havre, and Etienne Levet were all handsome in this collection. Messrs. Curtis, Sandford, and Co., Devon Rosery, Torquay, were awarded the third prize, Mons. E. Y. Teas, Duke of Edinburgh, Etienne Levet, and Madame Lacharme being the most noticeable flowers. Many of the others were not so fresh and bright as those staged by the two former exhibitors, but considering the great distance they had travelled, and that they were cut in a temperature of over 80°, it was surprising they secured the honours they did. Messrs. James Mitchell & Sons, Piltown Nurseries, Uckfield, Sussex, were placed fourth. There were five competitors.

For forty-eight, distinct, three trusses of each, Mr. Cant again secured the premier position with a magnificent collection, including Antoine Ducher, Maréchal Niel, Edouard Morren, Dupuy Jamain, Mdle. Eugénie Verdier, Général Jacqueminot, Duchesse de Vallombrosa, Catherine Mermet, Annie Laxton, Prince Arthur, Madame Marie Finger, Etienne Levet, Ville de Lyon, Ferdinand de Lesseps, Comtesse de Serenye, Mdle. M. Dombrain, good but not often seen; Louis Van Houtte, Alfred Colomb, Le Havre, Horace Vernet, Gloire de Vitry, Madame Prosper Langier, Madame Ferdinand Jamain, Maurice Bernardin, Marguerite de St. Amand, Exposition de Brie, Devoniensis, Jules Margottin, Fisher Holmes, Countess of Rosebery, François Michelin, Constantin Tretiakoff, Madame Gabriel Luizet, fine; Elie Morel, Rubens, Comtesse d'Oxford, Souvenir de la Malmaison, Charles Lefebvre, Marie Van Houtte, Abel Carrière, Mdle. Marie Cointet, Maurice Bernardin, Marquise de Castellane, Madame Charles Wood, John Hopper, and Dr. Andry. Mr. Turner was awarded second honours. Marguerite Brassac, Maréchal Niel, Constantin Tretiakoff, Prince Arthur were very fine. Messrs. Curtis, Sandford, & Co. were a very close third; their Marie Verdier, Madame Gabriel Luizet, Alfred Colomb, and François Michelin being magnificent. Messrs. Paul & Sons were fourth with a very fresh collection, but the blooms rather small. In this class there were also five competitors. In the class for twenty-four, distinct, three trusses of each, Mr. Cant, as in the previous classes, was again to the front with a superb collection, but containing most of the varieties named above. Mr. Turner and Messrs. Curtis & Co. occupied exactly the same positions here as in the other classes—second and third respectively, and Messrs. Paul & Son fourth. There were four collections staged.

Teas were well and boldly exhibited by the trade. Mr. Prince's collection of twenty-four was exquisite, so even and regular, and consisted of Belle Lyonnaise, Madame Charles, Madame Camille, Homère, Innocente Pirola, Marie Sisley, Comtesse Nadaillac, Comtesse Riza du Parc, Souvenir d'Elise Vardon, Anna Ollivier, Alba Rosea, Maréchal Niel, Souvenir d'un Ami, Perle des Jardins, Rubens, Madame Willermoz, Souvenir de Paul Neyron, Souvenir de Madame Pernet, Jean Ducher, and Marie Van Houtte. Mr. Cant was awarded the second prize. Many of his flowers were larger than Mr. Prince's, but others were loose. Devoniensis, Niphotos, Madame Lambert, Jean Ducher, Madame Margottin, Goubault, and Catherine Mermet were handsome. Messrs. James Mitchell & Son received the third prize, and Messrs. Paul & Son the fourth, both exhibiting good collections.

In the second division of the nurserymen's classes the principal was that for forty-eight single trusses, in which seven competitors appeared. Cranston's Nursery and Seed Company, Hereford, were easily first with beautiful blooms of admirable quality, Duke of Edinburgh, Exposition de Brie, Louis Van Houtte, Mary Pochin, Pierre Notting, Marquise de Castellane, and Mons. Boncenne being especially noteworthy. Mr. James Walters, Mount Radford, Exeter, was second with smaller blooms of good substance. Messrs. G. Bunyard and Co., Maidstone, and Messrs. Keynes & Co., Salisbury, were third and fourth respectively. With eighteen triplets Messrs. Cranston were again in the chief position, staging similarly fine blooms to those in the collection already mentioned. Perle des Jardins and Constantin Tretiakoff were very handsome. Mr. J. Walters, Messrs. Keynes & Co., and G. Bunyard & Co. followed in that order, all contributing very good blooms. Messrs. Kinmont & Kidd, Canterbury, had the best twenty-four singles, of very fine quality and well selected. La Rosière, Duke of Edinburgh, Lord Macaulay, and François Michelin were notable for their admirable form. Mr. G. W. Piper, Uckfield, and Mr. J. Walker, Tbame, secured the third and fourth awards with fair examples. The winning collection of eighteen Teas or Noisettes was staged by Messrs. Cranston. It included fine representative blooms of the following varieties—Catherine Mermet, Caroline Kuster, Gloire de Dijon, Anna Ollivier, Madame Willermoz, Maréchal Niel, Souvenir de Paul Neyron, Perle des Jardins, Souvenir d'un Ami, Niphotos, and David Pradel. Mr. G. W. Piper took the second place with blooms very close to the preceding in point of quality. Mr. J. Walters, and Mr. J. Mattock, Headington, Oxford, secured the remaining prizes.

**OPEN CLASSES.**—For twelve new Roses not in commerce previous to 1878 there were four exhibitors; Mr. C. Turner, Slough, and Messrs. G. Paul & Son, Chesbunt, being awarded equal first prizes for handsome collections; Messrs. Curtis, Sandford & Co., Torquay, the Cranston Nursery and Seed Company, Hereford, following. In

the Slough stand the varieties were Countess of Rosebery, Duchess of Bedford, Egeria, Charles Darwin, Mrs. Harry Turner, Madame Morane, Harrison Weir, Jules Finger, Wilhelm Koelle, Madame Eugénie Finger, Dr. Sewell, and Barthelemy Levet. The Cheshunt stand included Comtesse de Choisseul, Dr. Hogg, Mabel Morrison, Madame Julie Dymonier, and Catherine Soupert, in addition to several of those named above. The Devon firm showed Leon Renault, Duke of Teek, Madame Etienne Levet, Ferdinand Chaffolte, and Souvenir de Madame Robert, very fine; Messrs. Cranston having Mrs. Jowitt, Boieldieu, Eliza Taisson, Edward Pynaert, and A. K. Williams noteworthy. For twelve single trusses of any yellow Rose Mr. G. Prince of Oxford was first with a stand of good Maréchal Niels, one of which was selected to be honoured with the Society's silver medal as the best Noisette in the Exhibition. Mr. C. Davies followed with Marie Van Houtte in good condition; Mr. Walters taking third with fair Maréchal Niels. For twelve blooms of any white Rose Mr. R. B. Cant was first with Devonensis, fine; and Messrs. Curtis, Sandford, & Co. second with Duchesse de Vallombrosa, both neat and of good size. For twelve pink Roses Messrs. Curtis, Sandford, & Co. were first with François Michelin, fine; Mr. R. N. G. Baker being second with Etienne Levet, of good substance and colour; Mr. R. B. Cant was third; and in the next class for twelve crimson Roses was first with Alfred K. Williams, bright, full, and excellent; Mr. R. N. G. Baker followed with Duke of Edinburgh, very handsome; and Messrs. Curtis, Sandford, & Co. were third with Général Jacqueminot, of good form and colour. For six single trusses of any Rose Mr. Slaughter was placed first with Belle Lyonnaise in admirable form; Mr. Wakeley following with Capitaine Christy.

*New H.P. Rose General Roberts.*—Only one exhibitor appeared in the class for a seedling Rose not yet in commerce or announced—namely, Mr. C. Turner, who was awarded the first prize for a Hybrid Perpetual crimson variety named General Roberts. It is a bright-coloured handsome Rose of good form, somewhat resembling Charles Lefebvre in the build and petal, and possessing a tint suggestive of the Duc de Wellington.

Miscellaneous exhibits were not very abundant. Messrs. Cranston sent half a dozen boxes of Roses; Mr. G. Prince of Oxford had five boxes of Tea and Moss Roses; Mr. Walker, Thame, Oxon, four stands of Sweet Williams and Roses; and Messrs. John Laing & Co. contributed a stand of Tuberos Begonia blooms.

#### THE BEST ROSE IN THE SHOW.

A well-known rosarian sends the following:—"To find the best Tea Rose was a very great difficulty from an *embarras de richesse*. To find the best Noisette was equally difficult from a contrary reason. It was eventually found in a box of rich-coloured Maréchal Niels of Mr. G. Prince's, his bloom being run closely by a remarkably fine Caroline Kuster shown by Mr. Hawtry.

"But, as might be expected after such a winter and such a spring, there was not a first-class Noisette to be found in the Exhibition. It will probably be submitted to the Committee whether this is not too small a class of Roses to be judged separately.

"The best Tea took much consideration. Several Souvenir d'Elise were extremely fine—in fact, almost to coarseness. Niphotos was shown in greater perfection than any other of its class, no less than three being submitted for second consideration, Miss H. Taylor's being particularly fine. Three Paul Neyrons also were at one time possible candidates; but at length, in a very beautiful prize Tea box of Mr. C. Davies there was found the unmistakable queen of the Show—a very large most perfectly-shaped Catherine Mermet.

"Neither was the best Hybrid Perpetual this year easy to ascertain. A. K. Williams at one time seemed likely to be honoured in the splendid twelve box from Mr. Cant, there not being another first-rate specimen at the Palace. Two Marie Radys appeared as its rival, both of a shape and colour very near to perfection, in the boxes of Mr. Haywood and Mr. Waterlow, the former's only fault being a little want of size. The Rose eventually accepted as second was a Madame G. Luizet, a comparatively new Rose with large pointed bud and the smoothness and gloss of delicate peach-coloured ivory. Want of foliage was fatal to its further pretensions, Mr. Waterlow's Marie Rady being as perfect in this as all else.

"It was prophesied by one of our largest exhibitors that the Alexandra Palace Show on July 9th will be the great show of this season.—A. C."

#### THE BEST REMEDY FOR THE GOOSEBERRY CATERPILLAR.

I HAVE been rather amused at the alarm expressed by some of your contributors in case they used white hellebore powder, fearing they would poison themselves or their employers. I have employed it for more than twenty years. If anyone dusted his Gooseberry bushes with hellebore powder as thickly as the hedges of a dusty road it could all be readily washed off. I can most strongly recommend the following as a safe and sure remedy—Put 4 ozs. white hellebore powder and 2 ozs. of quassia chips into a two-gallon stone bottle, fill it with boiling water, shake it well, and allow it to become cold. Pour some of the contents into a basin or bucket, and with an old whitewash brush sprinkle it over the bushes, holding up the lower branches with a stick;

dash some of the liquid on to the under side of the leaves. I have found this most efficacious, not only for Gooseberry trees, but also for Currants, Raspberries, and Rose-tree pests.—G. O. S.

#### ANDROSACE LANUGINOSA.

THE Primula family contains a large number of beautiful and much-appreciated plants, which possess greatly varied claims upon the attention, some producing brilliantly coloured flowers, while others of more modest pretensions with soft-tinted flowers are yet recommended to notice by a charming gracefulness. Among the latter may be included the Androsaces; several of which are grown on rockeries in British gardens, chiefly from the European Alps and the Pyrenees. Among those that are particularly well known may be mentioned A. Chamæjame (the Bastard Jasmine), A. carnea, and A. laetea, the latter being particularly pleasing when growing in tufts on the rockery, and bearing its pretty star-like white flowers in profusion. One, however, that is not too commonly

Fig. 1.—Androsace lanuginosa.

seen is the Himalayan species represented in the woodcut (fig. 1)—namely, A. lanuginosa, the Woolly-leaved Androsace. This, though also dwarf, is not quite so diminutive as some of the other species, but it varies somewhat according to its position—that is to say, whether it be grown on the rockery or in a border, as is sometimes done with good results. It produces its soft pink flowers, which have a yellow centre, in close umbels, and these present an agreeable contrast with the white woolly leaves. The plant also succeeds under culture in pots, but this is not generally advisable except to maintain the stock where there is a danger of losing the older plants.

#### CANTERBURY ROSE SHOW.

JUNE 30TH.

IF Farningham can boast of the picturesque surroundings of its Rose Show, Canterbury may equally boast that it has one of the very best rooms in which a Rose Show can possibly be held. Lighted almost entirely (except the end windows) from above, giving therefore to no one exhibitor above another the advantage of a good light of which his neighbour is deprived, and affording ample freedom of circulation as the stands are arranged along the sides of the room against the wall, it leaves nothing to be desired in this respect; and possessing, as the old city does, some most enthusiastic rosarians, it is no wonder that it has so soon acquired a name for itself, and stands out as a successful instance of what energy can do.

A glance round the room before the judging commenced made it evident, that although many of the stands were of great excellence, yet on the whole the Roses were not quite equal to those of last year. The Rev. H. B. Biron was there as usual in good form; and had it not been that it was so arranged that the medals of the National Rose Society could not come into the classes in which he competed, one at least of them would have fallen to his share, as the stand for

which he gained the cup given by Mr. Hardy was unquestionably the best box exhibited in the local classes, if not the best box in the Show. In the amateurs' class for twenty-four blooms the first prize was gained by Mr. Brown, gardener to A. J. Waterlow, Esq., for a fine stand of blooms, amongst which were La France, Henri Ledechaux, a fine bloom; Eugène Furst, Fisher Holmes, Annie Wood, Léon Renault, Charles Lefebvre, Baronne de Rothschild, Madame Charles Crapelet, Marie Baumann, Duke of Connaught, Charles Darwin, Marie Rady, Etienne Levet, and Madame Thérèse Joigneux. Mr. John Hollingworth was second with a good stand, but the flowers had opened too much; amongst them was a good bloom of the lovely Madame Gabriel Luizet, Thos. Mills, Senateur Vaisse, Duke of Edinburgh, &c. In the class for twelve Teas Mr. Waterlow and Mr. Mitchell were equal first. Mr. Mitchell's flowers were Adam, Souvenir de M. Pernet, Madame Joseph Halphin, Devoniensis, Josephine Malton, Adrienne Christophle, Souvenir d'un Ami, Duc de Magenta, Jean Ducher, Catherine Mermet, Souvenir de Paul Ncyron, and Maréchal Niel. Mr. Waterlow had Gloire de Dijon, Souvenir d'un Ami, Devoniensis, Marie Guillot, Madame Camille, Madame Hippolyte Jamain, Marie Van Houtte, and Madame Nabonnand.

In the class for eighteen Mr. J. Wakeley of Rainham was first with an excellent box, containing fine blooms amongst others of P. Arthur, Ferdinand de Lesseps, Duc de Wellington, Abel Carrière, Fisher Holmes, Marquise de Castellane, and Napoleon III. Mr. G. Mount, Harbledon, was a good second; his most noticeable blooms being Louis Van Houtte, Penelope Mayo, Alfred Colomb, and La France. Capt. Lambert was a good third. In the class for twelve Mr. Wakeley was first with an excellent box, which gained him also the silver medal of the National Rose Society for the best box in the first five classes. It contained Duke of Edinburgh, Marie Baumann, Duchess of Vallombrosa, Exposition de Brie, Duke of Wellington, Senateur Vaisse, a grand bloom; Etienne Levet, and Lord Macaulay. In Class T, for twelves, the Rev. H. B. Biron had a splendid box, containing a grand bloom of Eugène Furst, Penelope Mayo, Xavier Olibo, Etienne Levet, Capitaine Christy, François Michelon, very fine; Marie Baumann, fresh and lovely; Marie Cointet, Star of Waltham, and Dr. André. Capt. Knight of Bobburg near Sittingbourne had a good box of twelve Indicas and six H.P.'s, comprising La France, Hippolyte Jamain, Capt. Christy, Sultan of Zanzibar, Alba Rosea, Catherine Mermet, Cheshunt Hybrid, Marie Baumann, and Marie Van Houtte. Mr. George Mount had an excellent box in the same class: amongst his flowers was one of the finest blooms of Marie Guillot I have seen. In the class for six of a sort Mr. H. R. Peckham and Mr. G. T. Peckham were equal first; the one with a fine box of Maréchal Niel, the other with a very good one of Marie Baumann. In the class for twelve Teas Capt. Knight was first with a box containing some examples of vigorous growth, but a little too coarse and overblown; while for six Teas Mr. G. Mount had a very pretty little box of Marie Guillot, Catherine Mermet, Maréchal Niel, Souvenir d'un Ami, Niphetos and Marie Van Houtte.

I have thus briefly noticed the chief stands in the Show. They manifested good culture and careful management, and showed very clearly how such an exhibition of this kind tends to promote Rose-growing. The bronze medal of the National Rose Society for the best bloom in the Show was awarded to Mrs. Peckham for a fine example of Alfred Colomb.

The stands for table decorations of Roses and Ferns were certainly not equal to last year. Mrs. Biron, however, took her accustomed place as gainer of the first prize. The Show was eminently successful, and too much praise cannot be given to the Rev. H. B. Biron and Mr. Mount for the courteous and kind manner in which they met the wants of the exhibitors.—D., Deal.

#### UNHEATED STRUCTURES FOR FRUIT TREES.

I AM glad to see in the pages of your valuable Journal that cool and cheap structures are advocated for fruit culture. All are not able to have their houses heated, though they might have cool houses, which if properly managed would be very profitable. We have a large unheated orchard house here, and could not wish for better crops of Peaches, Figs, and Nectarines than are gathered annually, and the climate in this part of Lincolnshire is very treacherous during the early spring months.

Of late years Peach trees on walls outside have not succeeded. In fact, the trees in most cases are dead or nearly so, while those protected with lights are generally satisfactory. Skilful management is wanted, and with care good crops of fruit can be obtained from trees in cool structures in most localities. A question I have often put to gardeners is—What is your reason for preferring a heated orchard house to a cool one? The answer generally is, "I find it so useful for holding the bedding plants in the winter." Very seldom do I hear that it is of any benefit to the trees. I am inclined to think it detrimental.—LEADENHAM.

#### LEEDS HORTICULTURAL SOCIETY.

ALMANACK makers might win a reputation for weather wisdom if they could obtain early information as to the fixture of the summer Show of this Society, and then announce that thunder might be

expected about noon, and rain, more or less heavy, on one or all of the days during which the Exhibition would be open. During the last few years large, varied, and splendid displays have been provided in the Horticultural Gardens; but the rain has been incessant, and the results almost disastrous. This year thunder and some rain occurred on the opening day, and a threatening drizzle for a great portion of the second day; yet notwithstanding on the first, or half-crown day, upwards of £300 was taken at the gates. The total amount taken during the three days exceeded £600, or about a third more than the returns last year. All must hope that this will enable the Committee to meet all demands and start on a more substantial basis, as they have had to contend with extraordinary obstacles, and by their perseverance under difficulties the directorate of this Society certainly deserves success.

The Exhibition, which opened on the 29th ult. and continued for three days, although not in all the sections quite equal to that of last year, was yet, considering the conditions under which it was held, a display of considerable magnitude, and in most of the departments of great excellence. There was a slight falling-off in the specimen plants and the effect groups, yet local competitors staged most creditably, while Pelargoniums were splendid, Orchids much better than on previous occasions, and the display of fruit was highly satisfactory. The large plant tent, upwards of 400 feet long, would have been well filled had not some exhibitors who had entered failed at the eleventh hour to fulfil their engagements, than which scarcely anything can be more disappointing to managers of shows.

The classes of this Show can only be referred to briefly, other reports pressing for a share of the space at disposal. In the open class for sixteen specimen plants Messrs. Cole & Son had the premier position with fine plants that have often been described; followed by Mr. Frankland, gardener to John Barran, Esq., M.P., with a most creditable collection, in which Erica ventricosa was splendid, and the other plants good. Mr. Tuke, gardener to G. Gelder, Esq., was placed first in the amateurs' class for six plants with admirable examples, Ixora Williamsii being of great excellency, and all the others fresh and good. Mr. Wright, gardener to Grosvenor Talbot, Esq., was second, also with good plants. For three plants Mr. Tuke was again an excellent first; Mr. Rollisson, gardener to Walter Bateman, Esq., Harrogate, second; and Mr. Winterbourne, gardener to F. Simpson, Esq., Weetwood, third. In the open class for six fine-foliaged plants Messrs. Cole, Winterbourne, and Conyers secured the prizes in the order named, all staging remarkably well, and the competition was very close. Ferns were also very fine, Messrs. Cole, Eastwood, gardener to F. W. Tetley, Esq., and Mrs. Smith, Headingly, being the successful competitors. Messrs. Rylance, Aughton, Ormskirk, and Goodchild, Chapelton, were placed first and second respectively in the class for hardy Ferns, with good specimens.

GROUPS.—In the open class for a group arranged for effect in a space not exceeding 300 feet Mr. Simpson, New Lane, Selby, secured the first position, Mr. Frankland following. So close were these groups in merit that it was only after long examination that the Judges could make their awards. They were, however, unanimous, and were also fortified by the referee, Mr. Wm. Dean, that the bright and cheerful margin of Mr. Frankland's arrangement could not compensate for its heavy centre of formal specimen Fuchsias. Mr. Simpson's group lacked in brightness, but true taste was displayed in the arrangement, especially in bringing tall Palms to the front, especially at the corners, and forming at their base a pretty groundwork of small decorative plants; it was, in fact, the freedom and diversified character of this group that secured it the foremost position. In what is termed the 150 feet class for amateurs the Mayor's prize, a splendid timepiece, was well won by Mr. Hemming, gardener to H. Oxley, Esq. The arrangement was marked by a striking absence of packing and crowding, the variegated Yuccas, Dracænas, and Pandanus being dispersed to great advantage. Kalosanthes, very bright, imparted colour, and the margin was cheerful yet free. Following the principle on which the awards were granted—and it required some moral courage to do so in this case—Mr. Wright was adjudged the second prize because he had avoided packing and arranged the plants at his disposal to the best possible advantage. Mr. Tuke was placed third with a group which at the first glance was the most imposing of all. The plants were in excellent condition, and a good floral decorator could in ten minutes have disposed them so that the group would have been first instead of third. It was much too formal, and was deficient in diversity, freedom, and picturesque effect. The 100 feet groups were not satisfactory. These small arrangements can be rendered more satisfactory when formed in half circles, the side of a tent or building forming a background, than in the form of floral haycocks. Mrs. Smith and Messrs. J. W. Crawford and A. Harrison were the prizewinners.

Orchids.—These were more numerous than on previous occasions, and formed a fine feature. For six plants in flower Mr. Mitchell, gardener to Dr. Ainsworth, Broughton, Manchester, was an easy first. Aerides Lobbi Ainsworthianum was very fine with three rich spikes, one of them with four branchlets; A. Veitchii, A. Larpentæ, Phalæopsis grandiflora, Odontoglossum crispum, and Cypripedium barbatum were also in excellent condition. Mr. Rollisson was second, Mr. J. Sunly, Halifax, third, an extra prize being awarded to Mr. Frankland. For three plants Dr. Ainsworth was again to the fore with a charming example of Vanda Bensoni, a fine form of Cattleya Mendelli, and Dendrobium formosum. For a single specimen Mr. Hemming

was first with *Cypripedium barbatum* with about one hundred fine flowers, the growth also being vigorous. Mr. Dale, gardener to Alderman Lapton, Anerley Lodge, was second with *Stanhopea tigrina* with six grand flowers; and Dr. Ainsworth third with *Odontoglossum Rossi*, a fine plant of this pretty miniature, but only half the flowers were expanded.

*Pelargoniums* were splendid. In the open classes for Show, also for French, varieties the prizes went to Messrs. Rylance, Lazenby, and May, the specimens of the last-named exhibitor being smaller than the others, but densely flowered, vigorous, and fresh. Messrs. G. Winterbourne and Eastwood were the chief prizewinners in the corresponding amateurs' class. Messrs. Pybus and G. and W. Winterbourne had the prizes for Zonals with grand specimens, Mr. Rylance being first with Fancies and Mr. Eastwood with double-flowered Zonals. Messrs. Pybus and May secured the prizes for Roses in pots with dwarf examples and good blooms. Fuchsias were good, Mr. Eastwood taking the chief prize with well-flowered pyramids. Gloxinias were excellent from Mr. W. Winterbourne, Mrs. Smith, and Mr. Eastwood. Tuberos Begonias were very poor, and *Calceolarias* fading. Bedding plants in pans from Messrs. A. Simpson & Son and Lazenby were excellent, but the group of these plants arranged for effect appeared to be quite misapprehended, and it is a question if the Judges did not err in awarding the prizes. This class can well be cancelled. Mr. Hartly had the chief prize for twelve Show Pansies in pots, and Mr. Mann, Shadwell, for twelve Fancies.

*Cut Flowers.*—Miss Tatham's prize for a group of natural flowers in stand for the dinner table was won by Messrs. Jones & Son, Shrewsbury; the best wedding bouquet was from Mr. Rylance, and best ball bouquet—by far the best bouquet in the Show—came from Mr. Featherstone. Messrs. Cranston secured the chief prizes for Roses in the open class, followed rather closely by Mr. May, and Mr. Jowitt in the amateurs'. Fine stands of Pansies were shown, the chief prizes going to the exhibitors who were successful for plants in pots. Mr. Faulkner, gardener to F. R. Leyland, Esq., Woolton Hall, Liverpool, had the premier prize for stove and greenhouse flowers with a splendid stand, followed by Mr. Taylor, Apperley, and Mr. Rollisson.

**FRUIT.**—This was an excellent display, and the competition was very close indeed in many of the classes. For four dishes the special prize was won by a point by Mr. Clayton, The Gardens, Grimstone Park, Tadcaster, with a good Pine, Black Hamburgh Grapes, Peaches, and Nectarines. Mr. Wallis, The Gardens, Kirby Hall, York, following; fine Chasselas Musqué Grapes almost or quite equalling in merit Mr. Clayton's Pine. In the class for six dishes Mr. Faulkner staged an excellent premier collection including black and white Grapes, Pine, Melon, Peaches, and Nectarines, all very good; Messrs. Clayton and Wallis followed closely. In the open class for four dishes Mr. Faulkner was again first; Mr. Mann, St. Vincent's, Grantham, second; and Mr. Clayton third. Mr. Wallis was an excellent first for black and white Grapes; and Mr. Wood, gardener to J. Padgett, Esq., Tranfield, Guiseley, second. For a single dish of black Grapes the prizes went to Mr. Walker, gardener to Mrs. Taylor, Mr. Wood, and Mr. Hickson, Clifford. The black Grapes, though generally good, were more or less deficient in colour. Mrs. Smith was first with white Grapes (Muscats); Mr. Wallis being second with Chasselas Musqué; and Mr. Taylor, gardener to Sir H. Ripley, third with Buckland Sweetwater. Mr. Clayton secured the first prize for a Pine; Mr. Crowe, Bradford, for Peaches; Mr. Mann for Nectarines; Mr. Frankland for Figs; Mr. Weatherill, gardener to Mrs. Norton, Sandal, Wakefield, for Melons, with the variety "Best of All;" Mr. Taylor for Cherries; and Messrs. A. Simpson & Son for Strawberries; and Mr. Mann for Cucumbers. In most of the above classes the competition was good, and many dishes of excellent quality were staged than can be noticed in the outline report of a generally excellent show.

Messrs. Dickson & Sons, Newton Nurseries, Chester, were highly commended for Pæonies. Mr. Hartley, Headingley, highly commended for a miscellaneous collection of cut flowers; and Mr. Wood, Woodville, Kirkstall, very highly commended for a most meritorious collection of alpine plants.

#### THE ANTLER MOTH.

AN appearance of the larva of the antler moth (*Charæas graminis*) in excessive numbers has afforded during June an entomological sensation to the many persons who are always on the outlook for something novel or startling, thus forming one precursor of the "big Gooseberry" season that sets in amongst our journals when parliamentary and general news begins to get scarce. As is also usual, the ordinary paragonist has been led thereby to make conspicuous the meagreness of his knowledge in reference to natural history facts which are tolerably prominent.

Early information upon the subject was obligingly sent to this Journal by a correspondent who had observed thousands of the caterpillars on Pendle Hill, where, however, occurring amongst wild grasses, and near mixed herbage, it was at first doubtful what the species might prove. In a daily contemporary shortly after an account was published of the ravages committed by the caterpillars in the agricultural districts near Clitheroe. "The insects come in dense clouds, and the houses and country literally

swarm with them; they eat up the grass, and almost everything green." Subsequently there was noticed an extensive migration of these caterpillars in the direction of Chipping. We naturally conclude that there is some exaggeration in this and similar newspaper reports. Doubtless there is; but Mr. J. B. Hodgkinson of Preston, a well-known entomologist, writing to an entomological journal, grants that there is something extraordinary about the case, especially as he had lived two years previously in the district infested and only saw a few stragglers. He remarks that a friend of his took shelter from a shower of rain in a quarry, and there perceived some of the caterpillars in question dropping over a ledge of rock into a hole which chanced to be beneath. "Such were the immense numbers that the hole, from which they could not extricate themselves, had the appearance of a seething caldron of living creatures."

The antler moth (*Charæas graminis*) belongs to the Noctuid group of our British moths, and, like many in that group, is not easy of recognition from a verbal description; it is nearly related to the familiar Cabbage moth (*Mamestra Brassicæ*), though not similar in its markings to that species. The caterpillar is smooth and greyish brown, with the head rather darker; there are three longitudinal yellowish stripes. Immediately behind the head is a small horny plate, and another on the last segment, indicating that the caterpillar is adapted for a mode of life more or less subterranean. It is during August and September that the moths emerge, and, by the testimony of Mr. Wailes and others, we are given to understand that their favourite time of flight is about 8 A.M. Doubtless the eggs are deposited during those months, and (probably) the young brood hatches out soon after, hibernates, and feeds up in the spring and summer, when only the caterpillars have been noticed by the ravages they commit.

The Swedish naturalist Linnæus referred to *C. graminis* as one of the specially injurious insects of his native land. In some years the greater part of the crop of hay has been destroyed by it, though it has not been so troublesome of late. In England the species had not shown a particular liking for cultivated lands, but had several times been noticed in extensive commons, or the slopes of mountains. Its recent proceedings, however, are more alarming. An observer who had noticed many of the caterpillars between Skiddaw and Keswick fifty years ago found that they were attended by large flocks of rooks, which preyed upon them all day. As yet there have been few instances of the occurrence of the species in the south of England. Upon and near Pendle Hill, in June of this year, it would seem that the caterpillars had been subject to the attacks of a parasite from the shrivelled state of some specimens sent to us. It was also reported that numbers had been trodden under foot, hence it might be presumed that there at least the caterpillars did not confine their attacks to the roots of grasses. We may infer that, in the case of fields found to be infested by these caterpillars, there can be no remedial process except the severe one of the destruction of both grass and caterpillars by turning over the soil, and the application of diluted paraffin, gas-lime, or some other solution fatal to insect life, or the surface ought to be burnt.—J. R. S. C.

#### RICHMOND HORTICULTURAL EXHIBITION.

JUNE 30TH.

THAT important factor in the success of flower shows, the weather, could not have been more favourable than it was on Thursday last, when the above-named vigorous and prosperous Society held their seventh annual Exhibition. The usual picturesque site—namely, the Old Deer Park, was chosen, and the best evidence of the continued and increasing popularity of the Show was the very large attendance of visitors. As regards the exhibits there was a noticeable falling-off in numbers in some classes, but for general good quality and freshness the plants have rarely been excelled at a local exhibition. Four large tents were occupied, one with plants, a second with cut flowers and table decorations, a third with fruit and vegetables, and the fourth with cottagers' productions.

**STOVE AND GREENHOUSE PLANTS.**—These were not represented by many collections, but the specimens staged were in healthy condition, some flowering remarkably well. The principal class was for nine plants, and in that Messrs. Jackson & Son, Kingston, carried off the chief prize with good examples, similar to those which have already figured conspicuously at many of the metropolitan shows. *Erica ventricosa* Bothwelliana, *Dracophyllum gracile*, and *Clerodendron Balfourianum*, were the most noticeable, being evenly trained and flowering freely. The second position was accorded to J. H. Hinnell, gardener to A. Davis, Esq., Anglesea House, Surbiton, for a highly creditable collection, in which a globular-trained example of *Phenocoma prolifera* Barnesi was especially noteworthy for its health and the number of flowers it bore. Very rarely is a better specimen of this plant seen, for it is by no means easy to preserve it in satisfactory condition, especially when of a large size. Alla-

manda Hendersoni and *Statice profusa* were also well shown by the same exhibitor. Messrs. Peed & Son of the Norbury Nurseries, secured the third prize for smaller but fairly good plants. In the Society's district class for six specimens the competition was limited to Mr. Crafter, gardener to Miss Finch, Woodlands, Kingston Hill, and Mr. Attrill, gardener to C. J. Freake, Esq., Bank Grove, Kingston, who were accorded equal prizes.

*Pelargoniums*.—A pretty though not an extensive display was contributed in the classes devoted to these plants. For six Show *Pelargoniums* Mr. Wiggins, gardener to H. Little, Esq., Hillingdon Place, Uxbridge, was the principal exhibitor, securing the premier award with the plants which gained similar honours at South Kensington a day or two previously. Mr. Croxford, gardener to Mrs. Dunnage, Albury House, Surbiton, was a close second with neat plants flowering freely; and Mr. Wells, gardener to C. W. Selwyn, Esq., Selwyn Court, Richmond, was placed third with healthy specimens, but not bearing very numerous flowers. Fancy varieties were not very well represented; the principal prizes were taken by Messrs. Attrill, Crafter, Wells, and Bond, gardener to Miss Evans, Beech House, New Hampton, in the order named for moderately good plants.

*Fuchsias*.—These were sufficiently numerous to produce an important part of the display in the large marquee devoted to the plant classes. They were mostly, too, in very satisfactory condition both as regards healthy growth and floriferousness. The plants were not in any case excessively large, but compact vigorous growth characterised the majority. For nine specimens Messrs. Crafter and Wells, and Mr. Morrell, gardener to J. S. Rutter, Esq., The Cedars, Richmond, were the prizetakers, all staging good examples varying chiefly in respect to regularity of outline, flowers being numerous on nearly all the specimens. In the district class for six Messrs. Bond, Morrell, and Wells contributed collections of similar quality to those in the open class.

*Begonias and Caladiums*.—Fine-foilage varieties of *Begonias* were represented by two very creditable collections, the chief position being accorded to Mr. Morrell for healthy examples of *Queen Victoria*, *Sambo*, and *Madame Butt* among others of less note. The leaves were of considerable size and the colours well developed. Mr. Sallows, gardener to J. J. Flack, Esq., Heddingham House, followed closely with similar specimens, also well grown. Two collections of six *Caladiums* were staged by Mr. D. East, gardener to F. Wigan, Esq., Clare Town, East Sheen, very deservedly securing the chief prize for fine specimens in vigorous health, and bearing well-developed and brightly coloured foliage. The pots, too, were not out of proportion to the size of specimens as is frequently the case with such plants to their great disadvantage in point of elegance. Mr. Wells followed with much smaller examples but in fair condition.

**FINE-FOLIAGE PLANTS**.—These were not quite so numerous as on some previous occasions, especially as regards the general kinds ranked under that head, such as *Crotons*, *Dracenas*, &c.; but *Ferns* were strongly represented, and in several of the collections admirable specimens were staged. The two special prizes offered by Mr. F. R. Kinghorn for nine fine-foilage plants were secured by Mr. Bates, gardener to J. E. Meek, Esq., Poullett Lodge, Twickenham, and Mr. Prickett, gardener to Dr. Francis, Manor House, Richmond, in that order. The first-named had very good examples of *Yucca aloifolia*, *Pandanus Veitchii*, and *Dracena Baptisti*. Mr. Prickett's best plants were *Alocasia macrorhiza* and *Maranta zebrina*.

*Ferns*.—The chief class was for eight exotic *Ferns*, open to all exhibitors. Mr. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House, Acton, obtained the principal honours with a most creditable collection, which would have rendered him a formidable competitor at some of the larger shows this year. The most noticeable were two handsome specimens of *Gleichenias*—*G. Mendelli* and *G. flabellata*—each over 6 feet in diameter, well and evenly trained in a globular form, and especially remarkable for the fresh green appearance of the well-developed fronds. A fine piece of the dwarf *Davallia bullata* was also shown in first-rate condition; *Thamnopteris australasica*, *Adiantum cardiochloena*, and *A. farleyense* being similarly good. Mr. Child, gardener to Mrs. Torr, Garbrand Hall, Ewell, followed closely with very healthy examples of *Microlepia hirta cristata*, *Davallia Mooreana*, *Dicksonia squarrosa*, *Phlebodium aureum*, and *Gleichenia dichotoma*. Mr. Morrell was a good third with smaller but vigorous plants. In the district class for six Mr. East was first, staging good plants, *Cyathea dealbata* being particularly fine; Messrs. Morrell and Prickett taking the remaining prizes in that order. Hardy *Ferns* were numerous and fresh, Messrs. Prickett, Morrell, and Crafter being the prizetakers.

*Palms*.—Special prizes was offered by Mr. H. Herbst, Kew Nursery, Richmond, for six *Palms*, distinct varieties, in pots not exceeding 12 inches in diameter. Three collections were staged, Mr. Bates securing chief honours for half a dozen very even and graceful specimens of *Thrinax elegans*, *Latania rubra*, *Kentia Fosteriana*, *Cocos Weddelliana*, *Livistona rotundifolia*, and *Hyophorbe Verschaffelti*. Messrs. Hudson and Prickett followed closely, the former having a pretty example of *Kentia australis*.

**GROUPS**.—The four groups staged in competition for the £5, £4, and £3, offered as first, second, and third prizes respectively in the class for a group to occupy a space not exceeding 100 square feet, were arranged near the sides of the principal plant tent, and contributed greatly to the bright effect. With the exception of the fourth they

were all of a similar style, though of very different degrees of merit, and it is gratifying to see some general departure from the too common banked-up system prevailing in the arrangement of groups. Mr. Hudson was worthily placed first with one of his most tasteful groups—light, elegant, and effective. The groundwork consisted chiefly of *Adiantum cuneatum*, among which appeared, informally disposed, small plants of *Caladium argyrites*, *Gloxinias*, *Lilies*, and *Begonias*, a few taller *Palms* being scattered about, and a noble specimen for the centre. There was not the slightest approach to crowding, and yet every part was well filled, a most satisfactory softness and evenness pervading the group as a whole. Messrs. Hooper and Co., Covent Garden, were second with a slightly heavier arrangement, but by no means devoid of beauty; Mr. W. Brown, St. Mary's Grove Nursery, Richmond, following with a similar pleasing group. Mr. Munro, gardener to Lady Chichester, Cambridge House, being fourth with a collection of good plants, but rather too formally disposed.

*Cut Flowers*.—*Roses* were the most numerous represented in these classes, but, owing no doubt to many exhibitors reserving their strength for the National Rose Show at the Crystal Palace, the quality generally was not quite up to the usual standard. In the nurserymen's class for thirty-six triplets Messrs. G. Paul & Son, Cheshunt, were the only exhibitors, being deservedly awarded the first prize for a bright collection. The same firm obtained a similar position with twenty-four triplets, followed by Mr. Rumsey of Waltham Cross. In the amateurs' class for twenty-four single trusses Mr. L. Stephenson, gardener to T. Bull, Esq., Red Holm, Teddington, was first with a good selection; Mr. Moorman, gardener to the Misses Christy, Coombe Bank, Kingston-on-Thames, following closely. Indeed there were very few points difference in the quality of these two exhibits. Mr. Hudson was third with fair blooms. In the other classes the chief prizetakers were Mr. E. Mawley, Addiscombe; Mr. E. Berry, gardener to the Countess of Leven; and J. Wigan, Esq., Cromwell House, Mortlake; with Messrs. Lambert, Bates, and Lake.

*Bouquets*, *buttonholes*, and *vases* were very numerous. Mrs. Hudson The Gardens, Gunnersbury House, was especially successful with the last-named, contributing similar tasteful stands to those which have obtained honours in two previous years. Mr. W. Brown also exhibited well, and many others contributed in the several classes.

**FRUIT**.—Though not of remarkable quality this was fairly shown, and the competition in the *Grape* classes was unusually keen. The best collections of six dishes were shown by Mr. Fry and Mr. Davis, gardener to the Rev. L. Morris, the former having a good *Queen Pine Apple*. *Black Grapes* were of fair quality, Mr. Feist, gardener to R. T. Ashton, Esq., Mr. Fyffe, gardener to W. W. F. Dick, Esq., Thames Ditton House, and Messrs. Bates and Lake, being the chief exhibitors. Three bunches of *Black Hamburgs* from Mr. Bates were particularly well finished and of good size. *White Grapes* were contributed by Mr. Feist and Mr. Wagstaff, gardener to J. H. Blam, Esq., Firsleigh, Isleworth, in moderately good condition, but the majority were rather green. Messrs. Sutton & Sons' prizes for a brace of *Melons* were accorded to Mr. Morrell and Mr. Beckett, gardener to J. P. Currie, Esq., Sandown House, Esher; the former for *Suttons' Hero of Bath*, and the latter for *Suttons' Hero of Lockinge*. Messrs. G. Paul & Sons' prizes for two dishes of *Strawberries* to be judged by flavour were secured by Mr. Crocker, gardener to W. Rogester, Esq., Lawn Lodge, Isleworth, with Sir Joseph Paxton and Sir C. Napier; Mr. J. Wagstaff taking the second place with *British Queen* in the place of Sir C. Napier.

*Vegetables* were abundant, of first-rate quality in the majority of cases. The chief prizes were secured by Messrs. Waite, Munro, Beckett, Hughes, and Brown. *Cucumbers* were also numerous, especially in the classes provided by Messrs. Sutton & Sons and Messrs. Daniels Bros. The varieties selected for honours in the former being *Tender and True* and *Duke of Connaught*, and in the latter *Daniel's Defiance*.

*Miscellaneous exhibits* were very abundant, several very handsome groups being contributed. Mr. Little sent a handsome collection of *Pelargoniums*, the General Horticultural Company a group of choice plants, Messrs. Osborn & Son a collection of fine-foilage plants, Messrs. G. Paul & Son a group of small *Roses* in pots, Mr. Kinghorn an effective group, Messrs. Jackson & Son a collection of stove and greenhouse plants, and Messrs. Fromow & Son a group of miscellaneous plants, and Messrs. J. Laing & Co. a group of *Tuberous Begonias*.

#### TEMPERATURE IN VINERIES.

YOUR correspondents have explained how rigid are the rules as to temperature enforced by some *Grape-growers*. I will give an experience of the other extreme, where thermometers are altogether dispensed with and judgment alone depended on. I do not condemn thermometers, far from that; but it is only necessary in Britain to add artificial heat to equal the climate where the *Grape* grows naturally.

To ripen *Grapes* and to ripen the wood sufficiently to secure a successional crop unquestionably requires a certain amount of heat, and light, and air; but it does not require that the heat, and light, and air should be a gradual rise and fall. For illustration I will take *Black Hamburg* and *Lady Downe's Grapes*, these

being two of our most useful varieties, and the one not too particular as to conditions, and the other demanding close attention during the eraeking and scalding period. In my small house of Black Hamburgh, when I grow a few bunches for exhibition, I never have a thermometer, it being quite unnecessary; but during the above periods, or rather that of "scalding," to let Lady Downe's be in a heat of over 88° or below 70° is to court scalding, as also is giving a heavy watering and at the same time pinching. In nature, and where the Vine grows naturally, we have extreme fluctuations, or perhaps, more correctly, sudden fluctuations of temperature; and though desirable to avoid these, yet there is sufficient provision in the constitution of the Vine generally to withstand the same rate of fluctuations as we have where the Vine grows naturally.

In my vinery I grow fifteen varieties, and but for having Lady Downe's of the number I should not be particular whether my thermometer was inside or outside the house; in fact, since

winter up to the last day of June there was no thermometer in the house, and I have only taken one in now to save this troublesome Grape. In my other house, which is 212 feet long, I have Grapes in the front and Peaches along the back, and Nectarines, Figs, Apples, Pears, Tomatoes, Geraniums, and Fuchsias. All the fruit trees are laden, and are in vigorous health, and this year I have never had a thermometer in the house. This is my experience in fruit-growing, and if there be those who doubt, I say to them, Pray come and see.—JOSEPH WITHERSPOON, *Red Rose Vinery, Chester-le-Street.*

#### ARALIA SPINULOSA.

MANY diverse forms of Aralia are grown, all more or less useful; some delicate and elegant, such as the well-known and highly valued *A. Veitchii* and *A. gracillima*. Others, again, are of bold imposing habit, being suited for conservatory decoration, and

Fig. 2.—ARALIA SPINULOSA.

a few figure conspicuously in the subtropical garden. The one shown in the annexed woodcut is very distinct from the majority, but not less attractive when well grown, to insure which a temperature intermediate between a stove and a greenhouse seems to be required, though it grows freely in a stove. A compost of good light turfy loam with a little peat or leaf soil and sand suits it well, liberal supplies of water being needed when the plant is growing. It is one of the novelties being sent out this year by Mr. B. S. Williams, Upper Holloway, to whom we are indebted for the figure. He gives the following description of it—"The leaves are pinnate, alternate, with the pinnae ovate acuminate, of a dark green colour, margined with little reddish-crimson spines or prickles. The stem and petioles are spotted and suffused with crimson. When in the young state this plant will form a pleasing

object of decoration for the dinner-table, or when large a suitable subject for exhibition purposes."

#### FARNINGHAM ROSE AND HORTICULTURAL SHOW.

JUNE 29TH.

UNDER the brightest of skies and with a pleasant cool air to temper the heat, the third Exhibition of this Society opened under most favourable auspices, and nothing could be more picturesque than its surroundings. The tents were pitched in a meadow by the side of the Darenth opposite the "Lion," a hostelry so dear to all lovers of the gentle craft (why striking a hook into a poor fish could ever have been dignified by this term I know not), and no one who loves quiet pastoral scenery but must have felt that they were in the midst of an exceptionally good specimen of it at Farningham. The exhibits

were contained in three tents. In two of these were to be found the collections of stove and greenhouse plants, Ferns, Orchids, table arrangements, and the miscellaneous collections which are generally found in a truly good exhibition such as this. Very beautiful plants, both flowering and fine-foliaged, were contributed by Messrs. Umfreville, Spottiswoode, Dunbar, Mildmay, Sir William Hart Dyke, and others, and reflected great credit on the cultural skill of the various gardeners who have charge of those establishments. The arrangement for a table by Mrs. Seale of Sevenoaks, whose practised hand was very evident, was very beautiful. White Water Lilies and the Ox-eye Daisy formed no small part of it, and, as may be readily imagined, its simplicity was its great charm. The three stands for a table exhibited by ladies displayed some admirable examples of good taste; but the chief point of attraction at the Exhibition, and that which will most interest the readers of the Journal, was the Rose tent. The first prize for thirty-six was awarded to Mr. B. R. Cant of Colchester with a box of blooms, which, although not perhaps quite up to his usual excellence, contained some fine Roses. Amongst them were Duke of Edinburgh, Hippolyte Jamain, Marie Van Houtte, Madame Lacharme, Duchess of Vallombrosa, Maurice Bernardin, Charles Lefebvre, Devoniensis, Rubens, Maréchal Niel, Madame C. Maurice, a dark Rose, apparently of good quality; Marquise de Castellane, and Louis Van Houtte. Mr. Wakeley of Rainham was awarded the second prize; his box containing amongst others La France, Thomas Mills, Marquise de Castellane, Duke of Wellington, Ferdinand de Lesseps, Dr. Andry, Marie Finger, and Abel Carrière. Messrs. George Bunyard & Co. of Maidstone were third, and Messrs. Kinmont and Kidd of Canterbury fourth. Mr. Cant also exhibited an excellent box of twelve Teas, consisting of Rêve d'Or, Niphetos, Anna Ollivier, Rubens, Madame Caroline Kuster, Catherine Mermet, Marie Van Houtte, La Boule d'Or, Maréchal Niel, Madame Willermoz, Devoniensis, and Moiré. The first prize for twenty-four and the silver medal of the National Rose Society was awarded to J. F. Burnaby Atkins, Esq., of Halstead Place, Sevenoaks, for an excellent box containing Charles Lefebvre, François Michelin, Ferdinand de Lesseps, Countess of Oxford, Fisher Holmes, John Hopper, Marie Baumann, &c. The second was won by the Earl of Stanhope, the best of whose Roses were Camille de Rohan, Maréchal Niel, Beauty of Waltham, and Duchesse de Vallombrosa. The first prize for the best box of twelve and the bronze medal of the National Rose Society was awarded to Frank Burnside, Esq., of Farningham, the indefatigable President of the Rose Society, containing amongst others Etienne Levet, A. K. Williams, Duke of Edinburgh, Etienne Dupuy, Maréchal Niel, Marie Baumann, François Michelin, Horace Vernet, and Rêve d'Or. The second prize was awarded to the Rev. J. M. Fuller, in whose stand were capital examples of Dr. André, Louis Van Houtte, Devoniensis, and Marie Finger. For the best box of twelve blooms of any Rose Mr. Burnaby Atkins was again first with a fine box of La France, and Mr. Cant second with a very beautiful box of Madame Lacharme, very pure in colour. Mr. Burnaby Atkins was also first in the class for six blooms with a neat box of Duke of Edinburgh. In the class for six Teas Mr. J. Wakeley was first with Souvenir d'un Ami, Celine Forestier, Niphetos, Comtesse de Nadaillac. Dr. Tucker and Dr. Ashurst also exhibited good Roses.

The experience that has been gained in former exhibitions brought its recompense in the present one. All the arrangements were excellent; and although the hour for the Judges to commence was somewhat delayed yet all went smoothly. The excellent Secretary, Mr. Burnside, had provided for all contingencies; and in this he was ably seconded by Mr. Hall, who, although a successful exhibitor in former years, did not compete this season; and the consequence was, that although there was not sufficient space for all the exhibits everything went smoothly, and satisfaction was given both to exhibitors and the public, and this spirited little Society may hope for a long lease of usefulness and pleasure.—D., Deal.

MR. THOMAS NICOL sends the following upon CEDRUS DEODARA:—"The review of 'A Manual of the Coniferae,' in the Journal of the 30th ult., mentions the Cedrus Deodara at Dropmore, and refers to the introduction of this valuable Conifer by the Hon. W. Leslie Melville. I have heard the story of the introduction of the seeds as given in the Journal many years ago. The trees at Melville House in Fife are magnificent specimens, and not less interesting and stately examples are growing thrivingly in the flower garden in front of Kingsdale House, near Kennoway, also in Fife. Kingsdale at one time belonged to the Leslie-Melville family. These Deodars are admired by all visitors to Kingsdale. They are adorned with lusty outspreading branches to the

ground, and stand the severest winters well. Their trunks are of considerable thickness, and extend rapidly."

— THE same correspondent, referring to the DESTRUCTION OF CABBAGES IN FIFESHIRE, observes—"In almost every district of Fife the Brassica tribes are infested by a maggot which devours the fibres and root stem of Cabbages, Borecole, Cauliflower, Broccoli, Brussels Sprouts, and Savoys. The plants wither away, and are removed from the ground by the slightest touch. The roots are blackened by being devoured by the insects, which are white, and literally cover the underground stems. Several remedies have been applied, but they have mostly been too late in being adopted to prove effective."

— MR. R. P. BROTHERSTON sends us a very fine spike of that showy and useful Orchid EPIDENDRUM VITELLINUM, which had over a dozen expanded flowers of unusual size, and with the rich orange tint characterising the species well developed. It is quite equal to the variety known as E. vitellinum majus both in size and colour, and the plant producing it has evidently been under the care of a skilful cultivator. The flowers of this Orchid are admirably adapted for bouquets and buttonholes when wired singly. We recently noticed some very tasteful examples of its utility in this respect in Covent Garden, and a number of buttonholes in which the flowers were freely employed in combination with other Orchids and Forget-me-nots attracted much attention at one of the floral exhibitions a few weeks since. The same correspondent also sends blooms of seedling Fancy Pansies, many being of excellent quality.

— "A READER of the Journal for twenty years" sends the following description of A NOVEL WAGER in the vale of Evesham—"There has been for some years a certain amount of rivalry between the market gardeners of Pershore and Evesham as to the size and quality of the fruits and vegetables grown in the two districts. One of the frequent arguments on this point led last week to a friendly bet of £5 between Mr. Jas. Cosnell, The Hurst, Pershore, and Mr. Edwin Grove of Evesham, as to which could pick a pot of Crown Bob Goosberries 72 lbs. in weight with the smallest number of berries. The trial came off on Wednesday last, Mr. Jas. Cosnell winning by no less than 420 berries, the numbers being—Cosnell, 2890; Groves, 3310."

— AN illustrated work on Orchids, entitled the "ORCHID ALBUM," is announced to be issued monthly. It will be conducted by Messrs. Robert Warner and B. S. Williams, both well-known authorities upon this beautiful and peculiar order of plants. The botanical descriptions are to be contributed by Mr. Thomas Moore, and the coloured plates will be the work of Mr. J. N. Fitch. An interesting, instructive, and accurate production may be confidently expected, and it will no doubt be cordially welcomed by Orchid growers generally.

— WE cite the following from an American paper on PREPARING RAISINS IN CALIFORNIA:—"California seems to be the land of fruits, so varied are the products of her soil in this respect. The vast quantity of Grapes produced has naturally led to the making of raisins. The process varies somewhat in different localities. In Mr. Blowers' vineyard, Yolo county, the Grapes are allowed to remain on the Vine until of a golden colour and translucent. Then they are picked and put on wooden trays 2 by 3 feet in size, placed between the rows, sloping to the sun. When half dried they are turned by putting a tray on the top, and by inverting them both are transferred to the new tray. When the Grapes lose their ashy appearance, and after removing the green ones, the rest are put into large sweat-boxes, placing sheets of paper between every 25 lbs. of raisins. They are left there for two weeks, when the stems are tough and the raisins soft. The packing follows, in which iron

or steel packing frames are used, the raisins being assorted, weighed, inspected, and made presentable."

— WE have received from Messrs. Daniels Brothers, Norwich, some very fine SWEET-WILLIAMS, representing numerous rich and delicate colours, the flowers being large, of good form, and the trusses full. One variety with pure white flowers was particularly noteworthy, being of fine substance. Among the others the following colours were excellent—pink of several shades, mottled or plain, the margins being in some cases neatly fringed; broad or narrow crimson zones with a clearly defined white edge; very rich crimson; deep maroon; delicate pink zone and white margin. They indicate a very satisfactory strain.

— IN reference to "L. J. K.'s" inquiry respecting PELARGONIUM-FLOWERED PANSIES, we are informed that some three or four years ago an engraving of a Pelargonium was published in one of our first nurserymen's catalogues, and by an inadvertence it was referred to in the letterpress of the catalogue as a Pansy. Judging, therefore, by the engraving and description in the catalogue, the firm had for sale a Pansy with all the characteristics of a Pelargonium. The mistake was speedily rectified, and this error possibly gave rise to a notion that there really was a race of Pelargonium-flowered Pansies.

— A DUBLIN correspondent sends the following, and desires to know if any other readers of the Journal have observed similar peculiarities—"A large plant of HEDYCHIUM GARDNERIANUM in bloom has stood on a table in my drawing-room for ten days past. Aspect of room E., S., and W., therefore exposed to sun all day. The plant constantly drips water from points of leaves, so much so that a cloth protecting table has become partially saturated. Room is very dry, and many other specimen plants on other tables quite dry. Is this usual? It has interested me much."

— REFERRING to the DESTRUCTION OF WIREWORMS, "C. B." writes:—"Some years ago one of the agricultural journals recommended rape-cake dust for the extermination of wireworms. The rape-cake should be well pulverised and scattered broadcast over the land, and be well raked in. The wireworms eat it to repletion."

— A CORRESPONDENT recommends LYCHNIS FLOS-JOVIS as a fine old herbaceous plant for growing in shrubbery borders for affording flowers for cutting of a colour that he finds much appreciated by ladies—a clear yet soft pink. The plants, he says, will grow in almost any kind of soil, and the compact medium-sized trusses are admirably adapted for vase-decoration.

— THE ninth Exhibition of the DUNKELD ROSE AND PANSY SOCIETY is announced for Wednesday, July 13th, when prizes will be offered in twenty-six classes for Roses, Pansies, and wild flowers.

— THE "Prairie Farmer" states that "GRAFTING WAX FOR OUT-OF-DOOR WORK is best made as follows:—Rosin, five parts; beeswax, two parts; raw linseed oil, one and a half part; heat all together in a large kettle until it quits foaming, then pour out into cold water, and when cool enough work it by pulling like "toffy" until light in colour. It then may be used in mass and spread on with the fingers, or poured on to thin cloth and spread thin on it with a spatula, and the cloth then cut into narrow strips to bind around the graft; or the cloth may be cut into narrow strips and run through the wax when hot and wound into a ball. When top-grafting is done outdoors in the spring the temperature is generally very variable, and this wax at times will be found too hard or too soft, but it can be hardened by putting in more rosin or softened by putting in more oil. It can also be used by melting it and applying when liquid with a swab or spatula. It should not be applied very hot, but there is

little danger in this, for the tree will stand more heat than one would think. If applied thinly and quickly it may be put on smoking hot."

— THE annual FLOWER SERVICE AT BERKELEY CHAPEL was recently held, the Princess of Wales, with Princesses Louise Victoria and Maud of Wales, and the Duke and Duchess of Teck, with all their children being present. The young Princes and Princesses presented offerings of fruit and flowers. After a short but most beautiful service, including an address by the Rev. T. Teignmouth Shore, chaplain to the Queen, the fruits and flowers were sent to the various hospitals for sick children, the Princess of Wales, Princess Mary Duchess of Teck, and several ladies of rank taking them to the hospitals and distributing them there.

— THE Japanese, a contemporary remarks, are passionate lovers of gardening, which is carried on by all classes of society, from the great in palaces to the humblest workman. Gardening, as well as the art of making bouquets, is taught in schools; and nowhere perhaps are there so many gardens as in Japan. The plants cultivated in the small private gardens are mostly miniature representatives of great trees. All new species and varieties of garden flowers and trees are sold at high prices, and become known throughout the country with great rapidity.

#### LISMORE, CO. WATERFORD, HORTICULTURAL SHOW.

THE annual Exhibition here has more than a local fame—indeed it induced me to organise a party and to drive fifty miles to see it, and I was amply repaid. As the prize list and other local features would not have a general interest I merely refer to a few special points of importance, such as might strike a stranger, without referring to names. One name, however, cannot be passed over—the Patron of the Society, the Duke of Devonshire, under whose fostering care and his representative, Lismore, as well as this Society, have become models for imitation. To say this in such an exciting time is the highest praise. The Ballyain Gardens, belonging to the Duke, where the Show was held, is on the other side of the river (the Blackwater, the Rhine of Ireland) from that in which the Castle, the best preserved and finest of Ireland's great old feudal strongholds, is situated, and from these gardens the visitor looks down on the winding mazes of the river, with the dark tree-and-foliage background beyond, and on a smiling prospect that it would be difficult to rival. In the larger marquee the most striking feature was the Roses. The classes for thirty-six, twenty-four, eighteen, and twelve blooms were filled, some having as many as five competitors. This would have been worth seeing alone, when it must be remembered that the most competent Judge, himself a distinguished gentleman amateur, told me that in the stand of thirty-six he could not find an imperfect or faulty Rose, and the other stands deserved the same high meed of praise. I commenced with Etienne Levet to take the names of a dozen best, but gave it up, so difficult was it to decide. The explanation of the excellence was said to be, beside the attention and love for the Rose of the exhibitors and their gardeners, the suitability of the vale of the Blackwater and its soil for the Rose. Coleuses, stove and greenhouse plants, beside the fine collections of early vegetables, were special features. All visitors, especially strangers, could not fail to be struck with the energy and courtesy of the Hon. Secretary, W. Ross Baldwin, Esq., Roseville, Lismore, and his assistants. A fine collection of Roses, Begonias, Pelargoniums, and Petunias, not for competition, was sent by Mr. Hartland, Cork.—W. J. M., *Clonmel*.

#### MR. GEORGE WILLIAM JOHNSON.

FOR upwards of half a century the name of Mr. G. W. Johnson has been associated with the gardening literature of this country. So early as the year 1826 we find him communicating articles to "Loudon's Gardener's Magazine," and in 1829 he published his "History of Gardening," which is the most complete work up to the date of its appearance which has been written in the English language.

Mr. George William Johnson was the younger brother of the late Mr. Cuthbert William Johnson, the well-known writer on agricultural subjects. They were the sons of Mr. Wm. Johnson of Widmore House in Kent, where the eldest son was born. Mr. G. W. Johnson was born at Blackheath in Kent, 5th of November, 1802. He is descended from a Durham family long settled at Loup and Cainrow in that county. His grandfather came to London early in the last century, where he established himself as a goldsmith and banker, and having amassed a large fortune he was at the time of his death in 1790 possessed of Easby Abbey

in Yorkshire, Welders, near Chalfont St. Giles, in Buckinghamshire, and the Vauxhall Distillery (now Messrs. Burnett's) in Surrey. Mr. G. W. Johnson's father inherited the Vauxhall Distillery and the Buckinghamshire property with a share of the personal estate, while his uncle succeeded to Easby Abbey and a competency. Some changes in the excise laws by which the trade of the English distillers was injuriously affected induced Mr. Johnson to dispose of the distillery, and being a man of active mind and great ingenuity he embarked in various commercial speculations, of which the celebrated Colebrookdale China Works was one. After some years he retired from these, and eventually established the Salt Works at Heybridge in Essex. Here it was that his two sons, Cuthbert and George, found an occupation suitable to their natural inclinations, for early in life both brothers evinced a strong predilection for the study of practical chemistry and the cultivation of the soil. The Salt Works enabled them to carry out those experiments in the application of salt as a manure, which culminated in a work by Mr. Cuthbert Johnson entitled "The Uses of Salt in Agriculture." One of their most important discoveries was a method for the separation of the sulphate of magnesia or Epsom salt from sea water, by which the price of the article was very much reduced.

We have already stated that Mr. Johnson's connection with the gardening press began in 1826, but before this he had written articles for the *Essex Standard*, published at Chelmsford. His first communication to "London's Magazine" was upon "The Employment of Salt as a Manure in Gardening." In the same journal he began in 1827 a series of papers entitled "Outlines of Horticultural Chemistry," which extended over two volumes. His first independent work was "A History of English Gardening, Chronological, Biographical, Literary, and Critical," published in 1829. It contains a vast amount of information, and exhibits great patience and research on the part of the author. In addition to the record of almost every work on gardening which has issued from the press in this country, together with their various editions, there is a short biographical sketch of the authors, rendering the book full of interest. Mr. Johnson tells an anecdote in connection with this work which affords him great amusement. Some years ago he called at the shop of Pamplin, a second-hand bookseller in Frith Street, Soho, and inquired for a particular edition of a certain work, which the bookseller told him never existed. "It is mentioned in Johnson's 'History of Gardening,'" said Mr. Johnson. "Ah," said Pamplin, "that is not a book of much authority." "I am aware," said Mr. Johnson, "that it has many faults, for I am the author of it!"

While still continuing his connection with the Salt Works Mr. Johnson devoted all his spare time to the pursuit of literature and the cultivation of science. At Great Totham where he resided he conducted experiments in gardening, and especially in the application of substances as manure. But the versatility of his mind led him to other pursuits, and he, after great research, wrote a "History of Great Totham," which was printed by Mr. Charles Clarke, at his private press in the village, in 1831. This work is now extremely scarce, and is eagerly sought after by collectors at prices the mention of which produces a smile on the author's countenance. During his researches at the reading room at the British Museum while the "History of Great Totham" was in progress Mr. Johnson discovered that one Edward Goodshaft had left an estate for the benefit of the poor of the parishes of Great Totham and Little Braxted in Essex. This benefaction had for many years been diverted, and the parishes which were interested in it were ignorant of its existence. It was through Mr. Johnson discovering an extract from the will of Goodshaft that the property was restored. In 1835 he published a memoir of John Selden, which was dedicated to the late Earl of Derby when he was Lord Stanley. In 1839 the two brothers edited an edition of Paley's works with very copious notes, the "Natural Theology" being undertaken by Mr. C. W. Johnson, and the "Evidences of Christianity" by Mr. G. W. Johnson, the latter of whom having for some time been reading for the bar, was called by the Society of Gray's Inn in 1839, and then he proceeded to India at the time of Lord Auckland's administration as Governor-General. He was appointed Professor of Moral and Political Economy in the Hindoo College at Calcutta, and besides being co-editor of the *Englishman* newspaper, he edited the *Government Gazette* for Lord Auckland. His residence in Calcutta did not extend beyond three years, and he returned to England in 1842, when he wrote "The Stranger in India," in two vols., which was published by Colburn in 1843.

Before starting for India Mr. Johnson had been consulted by the churchwardens of Braintree in Essex on the question of a rate for the repair of the church which had fallen into disrepair. This became a question of great public importance, and it was

on Mr. Johnson's advice that the churchwardens imposed the rate. The church was in a very dilapidated state, so much so as to be thoroughly unsafe. The churchwarden, a Mr. Velly, summoned a meeting of ratepayers of the parish to consider the state of the church, and to propose a special rate for its repair. The parish of Braintree consisted almost entirely of silk-weavers who had settled there years before. The majority of these were dissenters, consequently much averse to helping in anything to do with the church; the question, therefore, when put at the meeting was only agreed to by a very small minority of the ratepayers, the majority refusing to pay a farthing in such a cause. Mr. Velly in despair went to Mr. Johnson to ask him what he thought could be done when the case was so urgent. "What shall you do?" said Mr. Johnson, "why, sir, if the case is as urgent as you say it is you ought first to consult an architect, obtain his opinion as to the state of the church, then call a meeting of ratepayers and inform them of his opinion. If the dissenting majority still hold out request the signatures of the church minority consenting to a rate for repairs, and on that minority proceed accordingly."

Mr. Velly acted on Mr. Johnson's advice. He consulted two architects, who both pronounced the church unsafe and in need of repair; then he called a meeting of ratepayers as arranged, and on the majority refusing as usual to consent to a rate, he obtained the signatures of those who did agree, and with their co-operation the church was restored.

The dissenters, indignant at the course taken by the churchwarden, carried the question to a court of law, and the case was heard at Westminster in January, 1846, where it was argued by Sir Fitzroy Kelly, Q.C., Mr. T. Barnes, Q.C., and Mr. T. Arnold for the plaintiffs in prohibition; and by Sir F. Thesiger, Mr. G. W. Johnson, and Mr. W. Ogle for the defendants. Lord Denman and the three other Judges of the Court of Queen's Bench and the Court of Exchequer decided that the opinion given by Mr. Johnson was perfectly correct, and according to precedents dating as far back as the reign of Queen Elizabeth. This decision was appealed against, and the adverse majority being led by Mr. Courtauld of Gosfield Hall, carried the case to the House of Lords, who decided that the adverse opinion must prevail if sustained by a majority of the parishioners. A few months ago we saw the following announcement in the *Times*—"Mr. Samuel Courtauld of Gosfield Hall, Essex, died on Monday, in the eighty-eighth year of his age. Had the death of Mr. Courtauld happened some thirty or forty years ago a popular hero would have passed away; but he had lived to be almost forgotten, reposing, as he had done for nearly thirty years, on his laurels. It was he who, in the very first year of Her Majesty's reign, raised in the Consistory Court the question as to the legality of a church-rate imposed by a minority of parishioners against the will of the majority. This was known as the 'Braintree case,' and its final decision on appeal by the House of Lords in 1853 practically gave the law of church-rates in every shape its *coup de grâce*. Mr. Courtauld was the head of a large crape manufactory at Halstead. He was uncle of Mr. George Courtauld, M.P. for Maldon."

On his return from India Mr. Johnson settled at Winchester, and again turned his attention to gardening pursuits. His first success was the issue of "The Gardeners' Almanack," published by the Stationers' Company, which continued without interruption from 1844 to 1866. In 1845 was published "The Principles of Practical Gardening," the object of which is thus stated in the preface—"For nearly twenty years the author of these pages has laboured to make the gardeners of England more generally aware than they are, even at present, of the principles on which their practices are or ought to be founded. The results of his early researches have from time to time been made public, and those together with more that are new he now offers to his readers in a collected and orderly form."

This work was subsequently much enlarged and re-issued in 1862 under the title of "The Science and Practice of Gardening." "A Dictionary of Gardening" appeared in 1846 and met with a welcome reception. This was the forerunner of "The Cottage Gardener's Dictionary," published in 1852. In 1847 Mr. Johnson commenced a series of works called "The Gardener's Monthly Volume," the first volume of which on the Potato was written by himself. Twelve volumes of this series appeared, each of which is devoted to some important subject connected with gardening, and written by the best authorities.

On the death of his father-in-law, Mr. Newington Hughes, a banker at Maidstone, Mr. Johnson succeeded to his property, and thus the Fairfax MSS. came into his possession. These consisted of the whole of the correspondence of Ferdinando Lord Fairfax and his son Thomas, the great parliamentarian general during the period of the civil wars. They were discovered in a chest which

was sold as old lumber at a sale at Leeds Castle in Kent, the seat of the Fairfax family, on its coming into possession of the late Mr. Wykeham-Martin. The purchaser was a shoemaker of Maidstone, who cut up the letters as he required them to take measurements in his trade. On one occasion when he called on Mr. Hughes, and in his business capacity made use of a portion of an ancient manuscript, the keen eye of the antiquarian was arrested, and

after an examination of the precious documents Mr. Hughes became the purchaser of them. When they came into Mr. Johnson's possession he offered them to Mr. Richard Bentley with a view to publication, and they were eventually published in four large octavo volumes, the first two of which were edited by Mr. Johnson in 1848.

We come now to a period of Mr. Johnson's career when his

Fig. 3.—MR. GEORGE WILLIAM JOHNSON.

name became more familiarly and intimately connected with horticulture. He entertained an opinion that the time had come when the gardening taste of the country had so greatly developed among the middle classes that a journal issued weekly, giving advice as to the operations to be attended to in small gardens, would meet with a ready circulation. Mr. Johnson consulted Mr. Orr, at that time an extensive publisher in Paternoster Row, on the subject, and the result of the consultation was the publication

on the 5th of October, 1848, of the first number of *THE COTTAGE GARDENER*. It was a modest production of twelve pages, but it was stored with wisdom and knowledge communicated by some of the best practical men of the day. The venture was justified by the result, for *THE COTTAGE GARDENER* was a wonderful success from the first.

In the year 1851 a friendship sprang up between Mr. Johnson and the present editor, Dr. Hogg, which through all these years

has been a source of unalloyed pleasure and happiness to both. Imbued by the same feelings and actuated by the same motives these two gentlemen have, during a period of thirty years, worked in perfect harmony, devoting themselves to the service of the public, and doing whatever seemed to them to contribute to the welfare and enjoyment of a large mass of the population of these kingdoms and their dependencies. THE COTTAGE GARDENER continued to prosper and increase in influence and in power. As its field of readers increased its sphere of usefulness widened also, and the work of its Editors was to meet the requirements of those who came to them for instruction. By degrees these requirements rose to a higher standard than was contemplated when THE COTTAGE GARDENER was first published, and the universal opinion of the public was expressed by a writer in *The Quarterly Review*, when he said that THE COTTAGE GARDENER was for the occupiers of a cottage to which a double coach-house was attached. Acting on this hint the Editors decided on changing the title to THE JOURNAL OF HORTICULTURE, and for the last twenty-one years our Journal has appeared under that designation. In addition to the works already mentioned Mr. Johnson wrote "The Chemistry of the World," "The British Ferns Popularly Described," besides many pamphlets on various subjects.

On the close of last year Mr. Johnson retired from a life of activity to enjoy the repose which he so well earned; and our readers, we are sure, will unite with us in the hope that he will long continue to participate in the pleasure which a quiet life in the midst of a garden of pleasures can afford.

#### BRENTWOOD HORTICULTURAL SOCIETY.

JUNE 30TH.

THE summer Exhibition of the above Society was held in the grounds of Countess Tasker, and was favoured with fine weather—a rarity for the summer Exhibition. The attendance of visitors was large. In the latter part of the day the shops were closed, and the tradespeople gave their assistants an opportunity of witnessing the Exhibition. The season being cold late Roses and outdoor products were not up to the usual standard, but indoor productions were well represented. We regret, however, that owing to the great demands upon our space the exhibits can only be briefly alluded to.

In the class for twelve plants, flowering and fine-foliage, a silver cup was offered, which was won by Mr. Harris of Chelmsford, whose collection contained some handsome plants. The second prize was taken by Mr. Young, gardener to O. E. Coope, Esq., Rochets, South Weald, with good specimens; the third prize being secured by Mr. Wise, gardener to W. A. A. Ogg, Esq., Hampton House. For six stove and greenhouse plants Mr. Bones, gardener to D. McIntosh, Esq., Havering Park, and Mr. North were the prizetakers. Mr. Bones was also first with six fine-foliage plants, showing admirable specimens of Crotons and other plants. Exotic Ferns were well represented by Messrs. Bones, Harris, and Wise, who gained the prizes in that order. Pelargoniums were shown by Messrs. Bones and Meadmore in very fair condition, and secured the chief prizes. The prizes for specimen Fuchsia were awarded to Messrs. Wise, Meadmore, and Dr. Quennell. The Roses were but poorly represented. Messrs. W. Paul & Son had some good stands not for competition. For forty-eight varieties Messrs. Saltmarsh were first, and Mr. Meadmore second. Mr. Harrington, the Rev. J. B. Pemberton, Mr. J. C. Quennell, Mr. Clements, Mr. Charter, Mr. Edwards, gardener to the Rev. Canon Tarver, and Mr. Carver, gardener to J. Postans, Esq., secured the other principal prizes.

The exhibition of fruit was good for the season, especially Grapes, Peaches, and Melons. For a collection of four dishes of fruit the first prize fell to Mr. Brunt, gardener to Lieut.-General Fytche, Pyrgo Park, Romford, who had a green-fleshed Melon, Elruge Nectarines, Téton de Venus Peaches, and Black Hamburgh Grapes; second Mr. Foster with Black Hamburgh Grapes, Buckland Sweetwater Grapes, Royal George Peaches, and an excellent Golden Perfection Melon; third Mr. Bones for Black Hamburgh Grapes, Muscats not ripe, good Royal George Peaches, and a green-fleshed Melon. Extra prize to Mr. Wilson, gardener to E. H. Hardwick, Esq., Herongate, for Black Hamburgh Grapes, a dish of Peaches (two sorts in it), Strawberries, and a dish of Elruge Nectarines. Grapes, Melons, Gooseberries, and Currants were also fairly represented. Vegetables not very numerous but of good quality.

#### TUBEROUS-ROOTED BEGONIAS.

SLOWLY but surely have tuberous-rooted Begonias made their way to a prominent position in the front rank of our most cherished garden flowers—slowly at first, but with accelerated speed since the beautiful varieties obtained by cross-breeding and ever on the increase have been brought into commerce. Regarded on their first introduction during the first decade or two of the present century as tender stove plants and treated as such for a long while subsequently, it was not easy to induce oneself to regard them as greenhouse plants of most easy culture;

and it certainly was a surprising revelation when we were told that the brilliant-flowered native of Peru, *B. Veitchii*, had proved so hardy under culture in this country as to bear the effects of severe frost with impunity. In many a garden the hint was turned to best account, not by attempts to prove that other varieties were hardy, but by planting trial beds with a mixture of several sorts in summer, and thus proving that here, at any rate, was an invaluable rival to our choicest bedding plants, free of growth, profuse of flowers—flowers that were unspoiled by rain, and which now vie with Geraniums in brilliancy of colour, and are no unworthy compeers of the softer-tinted Verbenas and Fuchsias, for the colours are so varied, embracing scarlet, crimson, white, yellow, pink, carmine in so many shades and such marvellous delicacy of tints, as to render a description of many of them so difficult that two persons hardly ever describe them alike; and when we see in the catalogues such terms as "sparkling cinnabar-red," "fiery scarlet-red, shaded deep velvet," and "purplish vermilion scarlet," we may be certain that the colourist has felt puzzled how to convey some idea of the singular combination of colour to be found upon a single petal. But it is not solely for the flowers that we value this beautiful section of the Begonias; the foliage in its way is equally attractive in form, colour, and the singular venation that in some instances assumes the form of irregular network. The colour is singularly complementary to that of the blossom. Take for example the Hon. Mrs. Albert Brassey, with its bright rich glowing scarlet flowers, which appear all the more brilliant from the soft quiet tone of its deep green foliage; or the new dwarf variety Commodore Foot, with deep velvety crimson flowers nestling among very dark green downy foliage; or the L'Abbé Froment with its bold large handsome foliage, out of which springs lovely clusters of delicate yellow flowers.

To develop the full beauty of foliage and blossom pot culture under glass is absolutely necessary. This, however, involves no outlay for artificial heat, for the amateur who has wintered his tubers upon a back shelf of his little greenhouse or conservatory has only to take them down in March and repot in a compost of equal parts of fibrous loam, leaf soil, and a little sand, using plenty of drainage, then place them in a light airy position, and be careful not to overwater, but only to keep the soil moderately moist till the roots are fairly spreading in it. Pay particular attention to this, or the tubers may decay. Some of the tall-growing sorts require supports, but no artificial training or pinching is necessary. Take care not to crowd the plants, but afford each ample space for the full play of light and air around them to induce as dwarf bushy a habit as may be, a few plants so managed affording much more gratification than a crowd with slender attenuated growth ever can do.

Another easy and desirable way of growing many of them is as basket plants suspended from the roof of a conservatory, taking care to select sorts with drooping growths. Many varieties have pendant flower clusters, but it is worth some attention to secure the best for this purpose. In addition to those mentioned last week, one of the best for baskets is the grand new variety Gohath with its magnificent pendant clusters of a rich orange colour, developed so fully in the unopened flower buds as to render them singularly striking and ornamental. With this I may select of older and better known varieties Prince of Denmark, deep pink; Sedeni, bright crimson; Admiration, rosy red; Purple Emperor, purple magenta; and the grand double variety *Pæoniaeflora* with its huge salmon-coloured flowers, as an excellent half dozen wherewith to begin basket culture. To facilitate their management and to enable one to enjoy a close inspection, each basket should have a chain and an ornamental counterpoise running over a wheel fastened to the roof so that it may be lowered or raised at will.

Before planting Begonias in open beds especial care must be taken to have the soil thoroughly light, rich, and well drained. Bring on the plants as forward as possible in spring, but do not plant out till the end of May, or rather till settled warm weather insures a quick establishment in the beds, for then they grow so fast as to well reward one for the exercise of a little patience. Once in bloom they continue in full beauty till checked by frosts, and if lifted with care in autumn before the cold has injured them, and transplanted to an orchard house border with Russian Violets and Chrysanthemums, they continue bright and attractive well into December, without detriment to the tubers, which are afterwards carefully stored in dry sand in a frost-proof shed till the following spring.—E. L. S.

ROSES ON THEIR OWN ROOTS.—Your correspondent, Mr. W. Taylor, in a very interesting letter on Roses on their own roots,

says that other Roses besides Teas succeed well if grown from cuttings. Would he send a list of the Hybrid Perpetuals which succeed best grown in this manner, and oblige?—AN OLD CORRESPONDENT.

#### ALONSOA INCISIFOLIA.

THE woodcut (fig. 4) represents a spray of an old but useful plant, that when well grown produces a most effective display in a greenhouse. Its long slender racemes of bright orange-scarlet-tinted, peculiarly formed flowers are produced very freely, and a

Fig. 4.—*Alonsoa incisifolia*.

few good specimens can be most advantageously employed for arranging with other plants bearing lighter or quieter-coloured blooms. It succeeds well in pots, moderately light soil being required, and a few stakes may be employed to keep it in shape, as it is of somewhat straggling habit when left unattended in that respect.

The species which has been known under the names of *Hemeris* and *Celsia urticifolia* is a native of Chili, whence it was introduced at the close of the last century. The upper leaves only are shown in the figure, but the lower are broader and more deeply cut, from which circumstance the specific name is derived. The black spot in the centre of the flower also distinguishes the plant from some other forms.

#### MAIDSTONE ROSE SHOW.

ON a very hot and ruinous day for Roses this very excellent little Exhibition was held on Monday last at the Concert-room, and although small in number yet the Roses were of first-rate quality; indeed, very few flowers of indifferent quality were shown, and the Teas were exceptionally good, and for a small Show large in number. Mr. John Hollingworth, probably the oldest Rose exhibitor in England, was in full force, and showed some excellent Roses;

indeed, it would be invidious to particularise, although the Judges had to do so, and select the best box in the Show irrespective of numbers, an honour which fell to the Rev. H. B. Biron, of which more presently. The first prize for eighteen was awarded to Mr. J. Hollingworth, Turkey Court, Maidstone, for a box containing Etienne Dupuy, Gabriel Tournier, Annie Wood, Sir Garnet Wolseley, Avocat Duvivier, Marie Rady, Thomas Mills, Baronne de Rothschild, Madame Victor Verdier, Pauline Talabot, Paul Verdier, Comtesse d'Oxford, Dupuy Jamain, Xavier Olibo, Pierre Notting, Le Havre, and Thomas Mills. Mr. F. Warde was second with a box of nearly equal merit. The prize for the best twelve was awarded to the Rev. H. B. Biron for a box containing Roses of his usual excellent quality; in fact, it gained the National Rose Society's silver medal as the best box in the Show. It contained a grand bloom of Marie Baumann, La France, Marie Rady, Capitaine Christy, Marguerite de St. Amand, Star of Waltham, Eugénie Verdier, Souvenir de Paul Neyron, a splendid flower; Eugène Furst, very fine; François Michelon, Reynolds Hole, and Lord Macaulay. Mr. H. W. Wakeley was second with a good box, consisting of Paul Verdier, Baronne de Rothschild, Capitaine Christy, Alfred Colomb, Pierre Notting, Maréchal Niel, Duchesse de Vallombrosa, Xavier Olibo, Camille Bernardin, John S. Mill, Etienne Levet, and Duke of Connaught. The cup for twenty-four, given by the Mayor of Maidstone, was won also by Mr. Hollingworth with a fine box containing Paul Neyron (a not overgrown bloom, and full), La Rosière, Napoleon III., Caroline Kuster, Baronne de Rothschild, Gloire de Santenay, Etienne Levet, Capitaine Christy, and Camille Bernardin.

In the class for six Mr. P. Burnside was first with a very nice box containing Duke of Edinburgh, a fine bloom, which gained him the bronze medal of the National Rose Society for the best Rose in the Show; Baronne de Rothschild, Charles Lefebvre, Devoniensis, La France, and Catherine Mermet were also fine. Mr. Wakeley was second, and Mr. G. Mount and Rev. J. M. Fuller equal third. In the class for twelve Teas, for which several boxes were staged, Captain Knight of Bobburg was first with good blooms. Mr. John Hollingworth was second. In the class for six Teas Austin J. Killick, Esq., was first with excellent blooms. In the class for twelve blooms, six Hybrid Perpetuals and six Teas, the Rev. H. B. Biron was again first.

The ladies' challenge cup for the best stand arranged with Roses and foliage was won and finally retained by Mrs. H. B. Biron, whose arrangement was simple and excellent. There were several good buttonhole bouquets, although the usual fault was committed in many instances of putting too much into them.

The arrangements were all quietly and effectually carried out by the Secretary of the Society, Mr. Hubert Bensted, who may well be congratulated on the success that has attended his disinterested labours, for he is not now an exhibitor, but can rejoice to see others win the laurels he at one time carried off.—D., Deal.

#### CALOCHORTI.

OF late years we have had, by the zeal of collectors, a large number of bulbs introduced to our gardens from California—*Calochorti*, *Cykelobothra*, *Brodiaea*, and others, some of which are easy enough of cultivation, while others are difficult, not to grow, but to flower. Amongst the most quaint and beautiful of these are the *Calochorti*, or, as they are fancifully called by some, the Butterfly Tulips of California. Some years ago, captivated by flowers I had seen, I obtained a few of the bulbs and grew them in pots. These flowered beautifully, and were certainly a very great enjoyment from the peculiarity of their colouring and general elegance; but since then I have not been so successful. They grow well enough, make good foliage, but before they show bloom there are symptoms of failing, and they die off before flowering. I have asked many growers of such plants how they succeeded with them, and have been generally answered by a declaration that they experienced the same want of success. I have been, indeed, informed that they grow very well in a cold frame planted out; but I have not cared to try this, for we do not get much benefit from their beauty unless the flowers are cut. There must be, one would think, some way of managing them, and if any of the readers of the Journal have succeeded with them I shall be very thankful to be told how. The plants have this year bloomed somewhat better, but still they are not satisfactory, and a pot or two of seedlings from which I had been expecting much have again disappointed me by not flowering.

After saying this it may seem useless to direct attention to these bulbs, but all may not be so unsuccessful in growing them as I have been. Moreover, someone may hit upon a plan for their culture which may obviate the difficulties, just as the late Mr. Charles Leach found out twenty years ago the plan for growing *Disa grandiflora*, as I believe there is much to be learned as to the culture of many species of Lilies concerning which we get no satisfactory results.

Taking, then, the *Calochorti*, the following are the most beautiful. *C. caeruleus*.—A very curious dwarf-growing species. I do not see it in Mr. Ware's list under this name; but as he describes

*C. elegans* in much the same way as I should describe this—white with purplish hairs, almost reminding one of the mouth of the goat-sucker—it may be that it is the same, for there has been a curious confusion both of the generic and specific names of these bulbs. *C. albus*.—Pretty, drooping, white-fringed flowers. *C. luteus*.—I received some years ago from Messrs. Backhouse a variety of this called *oculatus*, very beautiful, with deep black spots in the petals, which I have found the most easily grown of any I have. It has bloomed every year, and is really very pretty. *C. pulchellus*.—Drooping yellow curiously formed flowers. I have recently had it in flower, and it is sure to attract anyone coming into the greenhouse by the quaintness of its appearance. *C. splendens*.—Large, deep, open lilac flowers. This is one of those very beautiful species which have earned for them the name of Butterfly Tulips. *C. venustus*.—This I think is the most beautiful of the whole tribe. Nothing can be more charming than its combination of colours—white, yellow at the base, with crimson pencillings in the petals.

There is one provoking thing connected with all these Californian bulbs—viz., that their foliage is so unsatisfactory, it is lowly and spreads about over the pots—no neatness whatever in it, and adding nothing, as in so many plants, to the beauty of the flower.—D. O

### ROYAL BOTANIC SOCIETY.

JULY 6TH.

THE second Summer Show of this Society, though not quite so large as in some previous years, was yet extremely attractive, fruit being remarkably well shown. The following is a brief review of the principal features.

**STOVE AND GREENHOUSE PLANTS.**—In the open class for twelve Messrs. Jackson & Son, Kingston, were easily first with neat specimens, two fine *Kalosanthes* being noteworthy—viz., *K. coccinea superba* and *Mr. Duphemis*. Messrs. B. Peed & Son, Lower Streatham, were second with smaller plants; Mr. G. Wheeler, gardener to Lady Louisa Goldsmid, Regent's Park, being third. For six plants from amateurs Mr. D. Donald, gardener to J. G. Barclay, Esq., Knott's Green, Leyton; and Mr. Child, gardener to Mrs. Torr, Garbrand Hall, Ewell, were the prizetakers. The best nurserymen's six was from Messrs. Jackson & Son, *Kalosanthus Dr. E. Regel* being especially fine. Messrs. B. Peed & Son, Lower Streatham, took the second place with fine specimens.

**Pelargoniums.**—These were not largely represented, nor were the specimens of extraordinary merit, but the flowers were fine and the colours good. Mr. C. Turner, Slough, was first in the nurserymen's classes for Show and Fancy varieties, showing very fair examples of good varieties. Mr. J. Wiggins, gardener to H. Little, Esq., Hillingdon Place, Uxbridge, also carried off the prizes in the amateur classes with neat specimens. Zonals were shown by Mr. J. Catlin, gardener to Mrs. Lernitte, Finchley, and by Mr. W. Meadmore, Romford, the former having very well-flowered plants.

**Tuberous Begonias.**—Only two collections were staged, Mr. H. Coppin, Shirley, Croydon, being first in the nurserymen's class with compact specimens fairly well flowered; Mr. J. Child obtaining a similar position in the amateurs' class with larger, looser, but freely flowered specimens.

**ORCHIDS.**—A very pretty bank of these was formed in the usual position, many handsome specimens being staged. Mr. B. S. Williams, Upper Holloway, secured the chief position in both nurserymen's classes with good examples of *Brassia verrucosa major*, *Cypripedium barbatum major*, *C. superbiens*, *Epidendrum vitellinum majus*, *Cattleya Mossiae superba*, and *Lælia purpurata*. Mr. H. James, Norwood, was a good second with twelve, and also second with six, Messrs. Jackson & Son being third. The prizes for amateurs were taken by Mr. J. C. Spyers, Orchid Grower to Sir Trevor Lawrence, Dorking, who showed *Epidendrum nemorale* in magnificent condition; *Dendrobium McCarthiae*, the brilliant *Renanthera coccinea*, and *Lælia purpurata* being also very fine. Mr. C. Coningsby, gardener to C. Dorman, Esq., Sydenham, obtained the second prize for twelve with a very interesting collection of well-grown plants. The winners of the prizes for six were Messrs. Coningsby and Child, both staging fine plants.

**FINE-FOLIAGE PLANTS.**—The best six fine-foliage plants in the nurserymen's class was from Mr. B. S. Williams, who had good *Crotons*, *Palms*, *Ferns*, &c. The same exhibitor had the best six *Ferns*, the *Gleichenias* being very fresh. Mr. H. James was second in the former class. The chief amateurs' collection of six fine-foliaged plants was contributed by Mr. Rann, gardener to J. Weston, Esq., Handcross Park, Crawley, the plants composing it having been frequently mentioned at previous shows this year. Mr. Rann was also second with six *Ferns* in fine condition. Mr. G. Wheeler was second in the former class; Mr. R. Butler, gardener to H. Gibbs, Esq., St. Dunstan's,

Regent's Park, being third. The first prize for *Ferns* was secured by Mr. H. Brown, gardener to T. A. Steel, Esq., Littlecote, Streatham, with very large *Davallias* and a handsome *Gleichenia microphylla*. An extra prize was accorded for a good collection of *Ferns*.

**Cut Flowers.**—Roses were fairly represented by Mr. C. Turner, Slough, Messrs. G. Paul & Son, Cheshunt, Mr. B. R. Cant, Colchester, among the nurserymen; and by Mr. Moorman, gardener to Miss Christy, Coombe Bank, Kingston, Mr. G. P. Hawtrey, Slough, and Mr. J. Hollingworth, Maidstone, among the amateurs. The other classes were well filled.

**FRUIT.**—The Fruiterers' Company's prizes for collections of fruit were awarded to Mr. W. Coleman, The Gardens, Eastnor Castle, for a handsome collection, *Black Hamburgh* and *Gros Maroc Grapes*, *Bellegarde* and *Royal George Peaches*, *Lord Napier* and *Violette Hâtive Nectarines* being especially fine; and Mr. W. Wildsmith, gardener to Viscount Eversley, Heckfield, for a collection nearly equal to the other in merit. The Society's prizes for six kinds were secured by Messrs. Wildsmith, Coleman, and G. Miles, The Gardens, Wycombe Abbey, Bucks, all showing very well. There were eight competitors. For a basket of *black Grapes* there were eleven entries, mostly of fair quality. Mr. P. Edwards, gardener to Miss Tristram, Liphook, Hants, Mr. Wildsmith, and Mr. Coleman were the prizetakers in that order. In the other classes for *Black Grapes* Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Mr. Wildsmith, Mr. Edwards, Mr. Bolton, gardener to W. Spottiswoode, Esq., Sevenoaks, and Mr. Tucker, gardener to J. L. Lovibond, Esq., Farnborough, were the prizetakers. *Pine Apples* were well shown by Mr. G. Bailey, The Gardens, Shardeloes, Amersham; Mr. J. Wilkinson, gardener to Viscount Gage, Lewes; and Mr. W. Pratt, The Gardens, Hawkstone, Shrewsbury, who secured the prizes. *White Grapes* were rather unripe. The chief prizes were accorded to Mr. P. Feist, gardener to J. Ashton, Esq., Bishopgate House, Staines; Mr. Blundell, gardener to T. Holman Esq., Sussex; Mr. Tucker; Mr. J. Douglas, gardener to F. Whitbourne, Esq., Loxford Hall; and Mr. W. Mowbray, gardener to the Earl of Leven and Melville, Slough. *Melons*, *Peaches*, *Nectarines*, *Strawberries*, and *Cherries* were also shown in large numbers.

**MISCELLANEOUS.**—Messrs. J. Veitch & Sons contributed a handsome group of novelties, and were awarded a small silver-gilt medal. Mr. B. S. Williams sent a group of choice plants, and was accorded a large silver medal. Messrs. John Laing & Co. were awarded a large silver medal for a group of fine-foliage plants and *Begonias*. The General Horticultural Company staged a magnificent collection of *Crotons* and *Ferns*, the former remarkably well coloured. A silver medal was awarded. Messrs. J. Carter & Co., High Holborn, secured a similar award for a large collection of *Petunias* and *Coleuses* similar to those they had at Kensington. Mr. B. Morrell, gardener to E. Rutter, Esq., Richmond, obtained a small silver medal for a group of very fine *Gloxinias*. A silver medal was awarded to Messrs. Low & Co. for a collection of *Orchids* and *Anæctochili*. Large bronze medals were awarded to Mr. G. Wheeler for a group of plants; to Messrs. W. Paul and Son, Waltham Cross, for several boxes of *Roses*; and to Messrs. H. Cannell & Son, Swanley, for a collection of *Pelargonium* blooms and Mr. Wiggins secured a small silver medal for a group of new *Pelargoniums*.

New plants were abundantly shown, and many were certificated, but we are compelled to defer their description to our next issue.

#### HARDY FRUIT GARDEN.

NOTWITHSTANDING the cold and drought of the spring and early summer months the fruit crop is now found to be in a more satisfactory state than might have been expected. Apples are plentiful, so also are Plums and Cherries. Pears are very thin, in some cases nearly a failure. Apricots are light, the best being *Blenheim* or *Shipleigh*, *Kaisha*, *St. Ambroise*, and *Moorpark*. Peaches and Nectarines with Figs are very variable. Bush fruits, with the exception of Raspberries, which in many instances had the fruiting canes injured by the severe frosts of winter, are exceedingly abundant and fine, especially Currants—Red, White, and Black. Strawberries are abundant and the fruit generally of good quality, though not so large as could be wished, no doubt owing to the drought. Continue to carry out former directions as regards stopping or removing superfluous or fore-right shoots, nailing, tying-in, or laying-in to the wall the necessary supply of young shoots, so as to admit increased light and air to ripen the wood and buds. Pay particular attention to the trees, and do not allow insects to spread, but promptly apply an insecticide. Red spider is appearing on wall trees, which should be forcibly syringed

in the evening of hot days, and well supplied with water at the roots, especially those carrying full crops and with the roots restricted. Vines trained to walls should have the growths closely nailed in, not allowing them to become too crowded, but train in rather thinly and keep the laterals closely stopped, in order to obtain every advantage in the way of increased temperature which the wall may afford. Figs should have similar attention, rubbing off foreright and all superfluous growths, taking out the points of all shoots except extensions at the fifth leaf, and keep them well secured to the wall. Outdoor fruit ripening must be protected by nets or in some other way from the ravages of birds. Ground intended to be planted with Strawberries should, as it becomes cleared of early Potatoes or Peas, be prepared by well manuring and trenching. It is not usual, except for forcing, to layer the plants in small pots, but it is advisable to obtain strong well-rooted runners, which if turned out when they have filled the pots with roots where they are to remain, will sooner become established and afford a full crop of fine fruit another season. The best varieties with us are Pioneer, Vicomtesse Hericart de Thury, President, Sir Joseph Paxton, Dr. Hogg, Elton, Lucas, Unser Fritz, and Loxford Hall Seedling.

#### FRUIT HOUSES.

*Peaches and Nectarines.*—The fruit being all gathered in the earliest houses attend still to syringing the trees to dislodge red spider if it has obtained a footing, and if there be any scale syringe with water at 120°, holding in solution 4 ozs. nicotine soap to the gallon. For dislodging red spider the garden engine is more effectual than the syringe. The roof lights should be removed from the earliest houses so soon as the buds are fairly plump, but avoid over-development, which is more to be guarded against than immature wood and imperfect bud-formation in early houses. If the lights cannot be taken off and the trees exposed to rain, the inside border must be well watered; and an occasional supply of liquid manure will greatly assist weakly trees, or those that have carried heavy crops, in forming plump flower buds. Air must be admitted fully both at the back and front of the house day and night. In succession houses where the fruit is swelling after stoning the syringe must be employed vigorously to keep red spider in check, having the trees free of the pest by these means or the application of an insecticide by the time the fruit commences ripening, when the syringing must cease, maintaining a good moisture by damping the border frequently. Give air freely in all favourable weather, and close early with plenty of moisture, so as to enable the fruit to swell to a good size as well as to economise heat; admit, however, a little air at the top of the house constantly. Attend regularly to tying down the shoots as they advance, thin out any superfluous, pinching in laterals on strong growths. See that there is not any deficiency of moisture in the borders, giving when necessary a good watering, and supply weakly trees or those carrying heavy crops with liquid manure, and mulch the surface of the borders. If mildew appear dust with flowers of sulphur, discontinue syringing for a time, and admit air freely.

*Figs.*—The first crop in the early house with the trees planted out are now all gathered, and the treatment advised in a former calendar will be in force, under which conditions the second crop will advance rapidly; and as there is sure to be plenty of fruit it must, if not already done, be freely thinned, reserving those for the crop at the base of the shoots. Syringe the trees freely twice a day, red spider being unusually prevalent this season. Trees in pots as well as those in restricted borders will require water frequently and copiously, and on every occasion mix a little guano with it, about 1 lb. to twenty gallons of water. Tie-in the shoots to the trellis as they advance, stop as necessary, removing those not required, and regulate those retained, so that sun and air may mature them. In houses with the fruit ripening maintain a free circulation of dry warm air to insure its ripening perfectly. Trees in pots which will be required for early forcing must not now be neglected, but be attended to regularly in watering with liquid manure, syringing them occasionally to keep down red spider.

#### FLOWER GARDEN.

Constant care and attention are necessary in this as in every other department to secure neatness. Weeds must be destroyed by frequent hoeing and raking. Lawns will need the machine run over

them at frequent intervals, and the edges of walks and beds require to be neatly trimmed with the edging shears. Take advantage of rain to roll gravel walks, keep them as smooth and firm as practicable. Beds that have been mulched show a marked contrast to those that have not; the plants, having grown freely, require but little attention as regards weeding and watering. Peg down all kinds of trailing plants as they advance in growth, encouraging them and all others to cover the beds as quickly as possible. In watering Calceolarias pour the water between the plants instead of over the leaves, as this as well as heavy rains weigh down the flower heads which may be obviated by twigs of some light kind thinly placed amongst the plants before they bloom. The weather has been too dry for carpet-bedding plants, and unless watering is attended to the progress is very small. Confine the plants to the lines or spaces allotted to them, so that the design may be well defined. Subtropical plants cannot in warm weather be overwatered, but mulching with well-decayed manure will lessen the necessity for it, and encourage surface-rooting and free growth, upon which depends the beauty of these plants. Stake and tie securely as they advance, treating Dahlias and Hollyhocks similarly. Pinks and Carnations should be neatly staked before they become too forward. Push forward the propagation of these by layers and pipings, choosing an old spent hotbed for the latter on which to place the handlights, inserting the cuttings in sharp sandy loam; keep them well shaded, and sprinkle occasionally to keep the atmosphere moist. Roses must be well supplied with water or liquid manure, and the flowers as they fade should be removed, shortening back a little those of the Perpetual class as they cease blooming, and encouraging them in every possible way to make free growth and insure good autumn blooms. Cuttings of Roses root freely if ripened wood is selected, inserting them in sharp sandy soil in frames or handlights kept close, shaded, and sprinkled daily. Briars and other stocks will soon be sufficiently forward for budding, which should preferably be done in dull or after moist weather, as the bark then separates freely. Select buds on wood that has borne flowers, as these are more mature than such as are obtained from quick-growing barren shoots. In extracting the wood from the bud care should be taken that the bark is not bent too sharply or bruised, for if this be done the bud is sure to turn black and fail. For such varieties as Maréchal Niel trained to walls cut out the old flowering wood, laying-in this year's young wood to replace it for next year's bloom.

#### PLANT HOUSES.

*Stove.*—The present is a good time to examine the general stock of stove plants to see what may need increasing, it being preferable in many instances to propagate young plants and discard those that have been used some time. Cuttings of most hardwooded plants will now root freely if inserted in sandy soil, placed in a close frame, and shaded until rooted, when they should be gradually inured to the air of the house, and be potted-off singly, keeping them slowly growing through the winter. These will be in an advanced state by spring, and calculated to make a good growth. Gardenias, Ixoras, Tabernæmontanas, Medinillas, Rondcletias, Bougainvilleas, Clerodendron, Combretum, Stephanotis, Thunbergias, Dipladenias, and Æschynanthuses strike freely at this season.

The successional batch of Euphorbia and Poinsettia cuttings inserted some little time ago will now be rooted, and should at once be transferred to large pots, as it is important they do not remain so long in small pots as to become stunted, otherwise a free growth can hardly be expected afterwards. Poinsettia cuttings may be inserted as they are obtainable, and in a rather close frame they will root freely and make dwarf plants very useful for decorative purposes. Any choice varieties of Gloxinias may now be propagated by leaf-cuttings, which root better now than earlier in the season, when they are soft.

The earliest-flowered Ixoras if placed in a brisk heat will grow and flower again, and will be found extremely useful for cutting during the autumn. If the pots are well filled with roots afford weak clear liquid manure, being careful not to apply it too strong or the roots will be injured. *I. aurantiaca* and *I. coccinea* are the best for this purpose.

For summer and autumn decoration *Æchmeas discolor* and *miniata* are very useful, and should be provided in quantity, they being best grown as single crowns in 6 or 7-inch pots. They succeed in either loam or peat, with about a sixth of sand and a few fine crocks, and some pieces of charcoal to keep the soil sweet, as the plants being epiphytal consequently require plentiful supplies of water, but the compost must be loose so as to allow it to pass away freely. They should be grown on shelves near the glass, so as to cause them to flower strongly. *Tillandsia Lindenii* is of easy growth and one of the most beautiful. Its leaves are long and narrow and generally curved, and when in flower has a fine appearance. It must be grown in a light position, and not have too much heat or be overpotted.

Young plants of *Stephanotis* being grown on for next season's flowering should have their shoots regularly trained near the glass, where they will be exposed to the light and have sufficient air to secure the maturation of the growth. *Clerodendron Balfourianum* that has flowered may, if it be desirable to increase the size of the plants, be placed in heat; and if requiring more root room afford it, employing good yellow loam. The young shoots must be trained near the glass so as to insure sturdy growth. Plants of this as large as desired can after flowering be placed in a light position in a temperature slightly less than the stove, giving no more water than will prevent flagging, and after a rest of about six weeks they may be introduced to heat and induced to flower again.

## THE BEE-KEEPER.

### THE ART OF SUPERING.

SUCCESSFUL supering is an art acquired by steady thoughtful practice. Beautiful supers of honeycomb are very desirable, and thousands of efforts are unsuccessfully made to obtain them. How many supers, large and small, costly and common, are placed on hives every season that are never filled! Failures in supering are common and discouraging to many apiarians. The successes of others more experienced and skilful in supering, tend to keep alive and encourage the hope in all that future attempts will be crowned with success.

The difficulties in the way of successful supering are, first, unfavourable weather for honey-gathering; secondly, the instinctive desire or passion for swarming on the part of the bees. To meet these difficulties much manœuvring is often necessary, and therefore we regard successful supering as an art. The question of profit and loss in supering is not to be considered in these notes, only the best ways of obtaining super honey. White virgin honeycomb taken from the sides and crowns of large swarm hives, or bars of white comb outside the brood nest of bar-frame hives, are quite equal in quality and appearance to super honey. Some eight or ten years ago it was suggested that by enlarging bar-frame hives, and by using a greater number of frames in them, virgin honey might be obtained without supers. Efforts in this direction are now being made. Sections of supers are being used and filled in the places of bars.

Large hives are requisites in the work of successful supering. If much work has to be done, or done rapidly, many hands must be employed. The effective strength of hives should be equal to the work expected. Large strong hives capable of gathering from 3 to 7 lbs. daily during a glut of honey, speedily fill good large supers. The superiority of large hives for this work is so evident that it is unnecessary to use a single argument or illustration.

Hives are usually ready for supering about ten days before the bees are ready for swarming. If supers are placed on hives before the bees begin to be straitened for room they do not enter them till they are straitened, sometimes never enter them at all, and sometimes enter them for breeding purposes. In favourable weather the time for supering to commence is when the hive is filled with brood from side to side, and this happens about ten days after all the combs are covered with bees. At such times bees want more store room, and readily enter supers and commence work. "Yes," the reader may say, "I know all this, and have done it many times, but my bees invariably swarm and never fill the supers." This is a common occurrence and a great difficulty everywhere. The wings have been cut from queens to prevent such swarms flying away, or rather to secure their return if they fly away. Another manœuvre is to cut all royal cells from

the combs before the supers are used, and afterwards to examine the hives every few days with a view to remove every royal cell whether tenanted or not. If two or three sets of royal cells are removed or destroyed the bees often become discouraged, abandon all preparations for swarming, and set to work in earnest to fill supers. But how can hives be examined internally with supers on them? We place our supers on paper so that their combs are not cemented to the crowns of the hives, and therefore can be easily lifted off and on the hive without injury to the combs.

In some apiaries managed on both the swarming and non-swarming principles—in other words, in which both swarms and supers are sought—there is practised a wise and excellent way of having supers filled without danger of losing swarms. One hive swarms naturally or is swarmed artificially, and the swarms are hived. Next day take the queen from the hive ready for supering, or in this case nearly ready for swarming, and give her to the hive that swarmed, and then super the hive deprived of its queen. Thus two great advantages would be gained. The hive that yielded the swarm would have a pregnant and productive queen, and would soon be ready to yield another swarm equal in every way to the first; and the supered hive full of bees and brood would not and could not swarm till the young princesses came to maturity and piped for three days. Piping would probably begin on or about the fifteenth day after the removal of the queen; and while piping is going on how easily all the queens but one could be destroyed. By lifting the super off and driving all the bees into an empty hive the supernumerary queens would be got rid of, and swarming would be next to impossible for about another three weeks. Meanwhile the bees, without brood to nurse, would go on gathering honey. Hives treated in this fashion in good seasons become too plethoric; but if super honey is the summum bonum—the only thing aimed at—it would be easy to give it (the hive honey) to the bees of supered hives to be carried aloft. We say nothing here about the loss of weight sustained in reshipping honey from one hive to be stored in supers on another. To those who merely want super honey or ornamental glasses completely filled this practice is recommended.

The practice of getting early swarms, hiving them in moderate-sized hives, and supering them as soon as they are filled, we strongly recommend. The Stewarton system of putting two swarms into a hive for supering purposes we do not recommend for profitable general practice, but for the purpose of getting a large quantity of super honey from a given hive the practice may be copied now and then. A swarm of bees in May from a large hive is capable of doing a great amount of work of all kinds; and if my only aim were to get the largest possible amount of super honey from the apiary I would never unite two swarms at the swarming season. Two or three swarms may be united with advantage at the end of the honey season to make a hive strong for winter and for work the year following, and is the time to lay the foundations for early swarms and successful supering next year.

Bees naturally swarm once a year as birds build their nests, and by letting them swarm they obey a law of Nature; and though in some extra fine honey years early swarms become parent hives by sending off virgin swarms, they are more easily prevented from swarming than old stocks that have not swarmed at all. Hence they readily take to supers and work heartily in them. Swarms—early swarms—rise in honey seasons to the greatest weights, and by using a little ingenuity in getting them to store honey in supers and side boxes a great amount is sometimes obtained. Even from second swarms and turn-outs early and late supers may be obtained in honey seasons. Early supers are obtained from second swarms and turn-outs in this way. The queens in such swarms are not fertilised, and generally speaking do not begin to lay for ten days after they are hived. Very well, by hiving them in hives with small supers on them the bees commence to build their combs in the supers, and may fill them with sealed honey before the queens begin to breed. Even in unfavourable weather small supers may be filled on such swarms by giving them the honey of the old parent hive after its bees had been turned out.

In using supers a little white guide comb is necessary—natural comb is better than artificial foundations—to induce the bees to enter them at once, and when they commence to fill them it is fortunate if the weather does not cause them to halt before they are filled.

We have not yet tried sectional supers, but have ordered some sets of sections in order to give them a fair trial this year. At present we like best supers of some size, with good thoroughfares between hives and supers. All efforts to prevent breeding in supers have failed. Even if queens are prevented from entering supers, breeding may take place in them, for bees have the power to decide what combs shall be used for brood and what for honey,

and they assist the queen in distributing her eggs in the cells. Wherever bees can go eggs can be carried and used. In supers the bees prepare the cells for the reception of eggs, frequently cutting honey cells to the proper depth for brood.—A. PETTIGREW.

#### HOW TO MAKE THE MOST OF A STOCK IN A STRAW SKEP.

AN esteemed correspondent of this Journal, in a private letter to me, suggests a second article on the above subject, the object in view being honey rather than increase; and, as I do not wish it to be understood that I consider skeps of use only to stock bar-frame hives from, I accept the hint.

At the outset, however, I must be permitted to describe the sort of skep I should select for the purpose, for there are many styles in use, from the close-top dome-shaped "ruskie," of ancient days, to the capacious Pettigrew skep with its perpendicular sides, flat top, and super hole. In course of veering towards the bar-frame hive Mr. Pettigrew has suggested flat wooden tops with slits to allow the use of foundation; and as many such are already in use in the country, and likely to increase among those who follow his teachings, I shall take it as the hive most nearly approaching my idea of a perfect skep. I should protest, however, against the inordinate and unalterable capacity of the hives Mr. Pettigrew recommends. While I recognise the merits of the skep in its circular form and non-conducting material, I must be permitted to point out its disadvantages from my point of view. These are the want of elasticity, enabling the bee-keeper to contract or expand according to the state of the stock or the necessities of the season; the impossibility of determining at a glance the condition of the interior, such as the first laying of a queen, or the incipient stages of foul brood; and the difficulty of using such modern and undoubted helps as comb foundation and the honey extractor. A weak stock placed on three sheets of comb foundation early in spring is at present stronger than stocks whose bees were then scattered over six or eight frames, and that simply because from the first they have been kept crowded so as to keep their whole domicile warm. For similar reasons Mr. Pettigrew's large skep stocks, though they throw grand swarms, do so too late to take full advantage of the principal honey harvest. Only where heather abounds do they generally give large results.

Were I ever again to use skeps (except purchased ones for stocking bar-frames) I should have my hives made of a uniform diameter of not more than 14 inches, each hive to consist of a body 9 inches deep, two nadirs of half that depth, and at least two supers of the same dimensions, each section to have the top formed of bars temporarily fastened into a wooden rim. Practically this would be the skep transformed into a Stewarton hive. As each nadir and super is exactly half the size of the body, two of them lashed together might form a body hive for temporary use, and thus tend to lessen the number of useless encumbrances where hives of all sizes are kept.

The bars forming the top of each section should be about an inch broad and half an inch apart, except in supers, where 2 inches from centre to centre is the proper distance. They should be all fitted with comb foundation, and no slides used between, only a quilt to cover them. With such a hive managed on the Stewarton system I should have no fear as to results. The bees would winter cosily in the 9-inch body, and as they became crowded in spring a nadir with comb foundation would be added; then a super if honey were abundant; then another nadir to give increased breeding room; then other supers *ad infinitum!* The miserable little supering hole, and the wooden ekes so common, are but clumsy expedients compared with a top of open bars and nadirs fitted with comb foundation. The ordinary supering hole soon gets so nearly filled with comb that there is great obstruction to the passage of bees and fresh air, and the tiering up of one super over another is almost useless. A top of bars and open slits gives free access and ventilation. The usual eke is generally filled largely with drone comb, to the detriment of the stock. Nadirs fitted with comb foundation would prevent this and largely increase the force of workers. The bars also, though temporarily fixed, might at any time be loosened, and, the attachments of a central comb being cut from the hive sides, it could be withdrawn for inspection without serious detriment; and thus to some extent would the hive combine the advantages of the skep, the Stewarton, and the bar-frame. Under no other circumstances could I think of recommending beginners to use straw hives. To sum up shortly: Were I the possessor of a stock in such a hive, and wished for the largest amount of honey, I should start the bees in spring in the smallest space possible, enlarge by nadirs only as they became

crowded; super as soon as the honey flow commenced; give plenty of doorway and gentle upward ventilation, thus lessening the risk of swarming. Attention to the state of the supers obtained by a peep between the bars would give warning when another was required, and so long as there was a prospect of honey to be got these should be tiered up as fast as the bees were found to crowd them. After all a swarm may come off, but it is possible in such a hive to cut out all royal cells and return it. Rather, however, after hiving it in a 9-inch body, I should prefer to place it on the old stand and within a day or two transfer to it the unfinished supers left on the parent hive. The latter thus contracted might still be fit for super work, while the former, greatly strengthened by the flying bees, would work with the energy that natural swarms always possess. The supers alone are in this case supposed to be taken for honey, the contents of body and nadirs being left to the bees. Although there may be nothing new in these hints, I venture to think they are improvements, and may meet the case of some who dearly love the straw.—WILLIAM RAITT, *Blairgowrie*.

#### TRADE CATALOGUES RECEIVED.

E. H. Krelage & Son, Haarlem.—*Catalogue of Bulbous and other Plants.*

Damman & Co., Portici, Naples, Italy.—*Catalogue of Vegetable and Flower Seeds and Bulbs.*

W. Dobbie, 62, Preston Street, Faversham.—*Select List of Pelargoniums and Fuchsias.*

\* \* All correspondence should be directed either to "The Editor" or to "The Publisher." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

**Clematises in Pots** (*J. P.*).—See No. 45, page 349, of the last volume of this Journal for full particulars of the culture requisite for Clematises in pots. The following varieties would probably suit you and maintain a succession of flowers during the period named:—Lady Londesborough, Standishii, Miss Bateman, Albert Victor, Lord Londesborough, The Queen, Sir Garnet Wolseley, Fair Rosamond, Sophie flore-pleno, John Gould Veitch, Lucie Lemoine, Lawsoniana, and the Jackmanni forms. The circumstance you mention respecting the Hedychiams is very curious, but is no doubt due to the plant being in a very dry atmosphere.

**Sheffield Rose Show** (*T. K.*).—This Exhibition of the National Rose Society will be held on Thursday, July the 14th.

**The Gooseberry Apple** (*J. L.*).—The variety you have is known under the above name. It is a valuable late-keeping culinary Apple, which comes into use in November and continues "till Apples come again." It is extensively cultivated in Kent and Sussex, especially about Faversham and Sittingbourne, for the supply of the London markets. Ronalds' Gooseberry Pippin is quite distinct from the above, being a fine dessert Apple, ripe in November and continuing till February, but it is now rarely seen.

**Onion Attacked by the Grub** (*E. B. M.*).—Your Onions are being destroyed by the maggots of the Onion fly (*Antbomyia ceparum*). As soon as the presence of this insect is detected all the plants attacked, which are easily known by the leaves fading, should at once be pulled up and burned, giving the beds a good supply of lime water, which may be made by placing a peck of quicklime in a tub and pouring over it thirty gallons of water. Stir it well up and allow it to stand twenty-four hours. A dressing of soot is also a good application, and so is a strong solution of soap-suds. The best remedy, however, is to apply soot to the ground before sowing the seed, or a light dressing of gas lime, half a peck being sufficient for a square rod—30¼ square yards.

**Hen Manure** (*Idem*).—Fowl dung is a very valuable manure, especially for soil such as yours—*i.e.*, of clayey nature. It should be used in less proportion than other manures, and is best applied mixed with an equal quantity of soil. It is suitable for every description of vegetables.

**Lemon-scented Verbena** (*W. L.*).—The botanical name of this plant is *Aloysia citriodora*; it is also referred to the genus *Lippia* by some authors. Occasionally the leaves have been used as tea or to afford a flavouring to various articles of confectionery.

**Culture of Fadyenia prolifera** (*N. G.*).—This curious little Fern requires the temperature of an ordinary exotic fernery, or the cool end of a moist stove. It succeeds in a compost of peat and sand with abundant drainage, a wide shallow pan being best suited for it, as the long narrow fronds can then extend freely. When the young plants are produced at the point they will soon root in the soil, and may be either separated or allowed to remain, the latter being generally preferred, as they impart a peculiar appearance to the plant. It is usually found advisable to cover the plant with a bellglass to preserve an equable temperature and moisture about it.

**Vines in Pots** (*T. S.*).—If, as you say, the position the Vines now occupy is too shaded by all means remove them to the orchard house mentioned, training

the rods where they will be fully exposed to the sun in order to ripen the wood. When the leaves commence changing colour place the Vines out of doors, securing the rods to the wall to ensure their being thoroughly matured. It is a good plan to stand each pot on a brick to prevent worms entering, and if the plants are to remain outside during the winter surround the pots with coal ashes, which obviate the danger of frost breaking the pots.

**Culture of Oncidium Papilio (X. Chester).**—This peculiar but attractive Orchid is usually treated as an epiphyte, being grown upon a block of wood either suspended from the roof of the house, or with one end placed in a pot of peat and sphagnum well drained. A winter temperature of 55° to 60° suits it very well, allowing a rise to 10° above the last-named temperature during the summer, shading from the sun, and carefully supplying water both in the growing season and when at rest. The pseudo-hulbs must not be allowed to shrivel at any time, as considerable injury will result to the plant, from which it rarely recovers satisfactorily.

**Oyster Shells for Garden Purposes (G. O. S.).**—We have employed the shells rather extensively both crushed and calcined. For crushing them when small quantities only are required, an iron plate and an ordinary heavy hammer are sufficient, whilst for larger quantities a mortar will be needed. To effect the calcining an oven or a kiln is necessary, so that by subjecting the shells to strong heat they will be disintegrated. In this state they may be used for all purposes similarly to lime, especially for fruit trees.

**Wintering East Lothian Stocks (R. B.).**—The best time to sow the seed is early in August. When the young plants produced have formed two or three leaves they should be potted three around the sides of a 3-inch pot in rather gritty loam. Before severe weather commences have the pots plunged in coal ashes, and the plants covered with a frame or handlight, air being admitted freely in mild weather, and protection afforded over the lights.

**Erythrina Crista-galli Losing its Lower Leaves (John Pearson).**—The lower leaves and flowers frequently fall when the plant is grown in too warm and dry an atmosphere, and is not well supplied with water. Keep the plants in a light position, and syringe daily to check red spider, and when the plant is growing freely afford weak liquid manure liberally.

**Tuberous Begonia Treatment (Mrs. Webster).**—The plants have no doubt received a check through being removed from the stove without being inured to the change. They certainly should not have been removed until they were coming into bloom, and the check is sufficient to account for their unsatisfactory condition. Place the plants in a cool house or pit, arranging them near the glass, affording shade for an hour or two at midday, and they will probably recover.

**Peach Trees Shedding their Leaves (J. T. Sinclair).**—The most probable cause is a sudden check, owing, we think, to the trees being allowed to become dry at the roots. There is, however, red spider on one of the Peach leaves and also on the Vine leaves, quite sufficient to account for their drying up and withering. Thorough syringings in the evening is the safest remedy, directing the water forcibly against the under side of the leaves. Nicotine soap at the rate of 3 ozs. to the gallon of water will destroy the pests, applying it at a temperature of 90°, washing it off the following evening if applied to the Vines. Add a little guano to the water for the trees in pots, about an ounce to a gallon, and before watering the borders sprinkle a little of the same over them.

**Peach and Nectarine Leaves Perforated (E. S. A.).**—The holes are not caused by any insect, but are due to scorching, which may have arisen from the sun acting powerfully on the leaves whilst wet, which destroys their tissues. There is no trace of scale on the leaves, which are small and thin in texture, and certainly would be better for more ventilation. The point of the shoot of the Nectarine is infested with red spider, the remedy for which is frequent forcible syringings or the application of an insecticide. Neglecting to syringe is the cause of its present condition. Caterpillars have caused the injury to the Peach leaves. They will generally be found on the under side of the leaves or rolled in them. A solution of soft soap will destroy them, and so will most insecticides, but hand-picking is the surest, although a tedious remedy.

**Bouvardia Treatment (N. D. S.).**—The best plan is to strike cuttings early in the year, grow them on, and plant them out in May in a pit or frame containing good rich soil. Supply water liberally, and lifting and potting them in September. To ensure their flowering in winter they should have a light position in a temperature of 55° to 65° artificially, and 10° to 15° more from sun heat. The plants probably are not in a healthy state at the roots.

**Eucharis amazonica not Flowering (Exeter).**—The plants having yellow leaves indicates ill health, no doubt due to the roots being in bad condition. Turn the plants out of the pots, remove all the soil not occupied with roots, and repot in good fibrous yellow loam, keeping the bulbs about 2 inches beneath the surface. Syringe freely, only keeping the soil moist until the plants start into growth then supply water abundantly, and when in free growth liquid manure will be beneficial. In potting good drainage must be provided, making the soil moderately firm. Shade from bright sun for a time, and if a bottom heat of 85° to 90° is at command it would facilitate the rooting. After growth has ceased place the plants in the coolest and driest part of the stove but in a light position, and water only to prevent flagging. After subjecting them to this treatment for a couple of months remove them to a warmer position, and encourage growth by a moist atmosphere, copious supplies of water, and bottom heat.

**Grapes Scalded (T. N. A.).**—Lady Downe's is a variety particularly liable to have the berries scalded, and even experienced cultivators find it difficult to prevent. Avoid a low night temperature, 65° to 70° being safe, ventilating night and day, increasing the supply of air early in the morning as the sun gains power. If attention to those matters fails to produce any beneficial effect the glass may be lightly shaded with limewash, which can be removed when the stouing period is past.

**Treatment of Fuchsias (P. S.).**—The cultural particulars on page 2 of the present issue will probably meet your requirements. Fumigation is no doubt needed, and probably the plants have been allowed to become dry at some time.

**Names of Plants (A. M. B.).**—The specimen you previously sent was too crushed to be recognised, but from your description we should think it must be the common Stonecrop, *Sedum acre*. (W. J.).—1, *Bougainvillea glabra*; 2, *Tecoma stans*; 3, *Adiantum trapeziforme*; 4, *Adiantum macrophyllum*. (W. R.).—Both specimens were much crushed, but the long flower resembles *Crinum capense*, the other is quite unrecognisable. (E. M.).—1, *Mimulus cardinalis*; 2, an *Oenothera*, but so withered as to be undeterminable; 3, *Ranunculus acris flore-pleno*; 4, *Hesperis matronalis*. (A Young Gardener).—Materials in bad condition though carefully packed. 1, *Galium saxatile*; 2, *Potentilla reptans*; 3, *Lychnis viscaria*.

## COVENT GARDEN MARKET.—JULY 6.

THE prices and supplies continue very similar to those quoted last week. Strawberries being still very abundant.

## POULTRY AND PIGEON CHRONICLE.

## THE DISEASES OF SHEEP AND LAMBS.

(Continued from page 542.)

IN concluding our remarks last week upon the subject of diseases in sheep being caused by the use of artificial manures, as supposed by some persons, we stated that the mistake made was by accepting a coincidence instead of a cause. It is, however, a matter of so much importance to the home farmer to understand whether this is or is not a possible question that we ask, Is it possible that artificial fertilising substances such as superphosphate, guano, and nitrate of soda can act upon the health and constitution of the animals which consume the roots produced by these materials, seeing that manures are changed into compounds adapted for feeding and fattening the stock? This matter is, in our opinion, decided at once if we look to the analysis of these manures, and also the composition of roots—such as Mangolds, Swedes, and Carrots—as given by Dr. Voelcker in his analysis of the different items. It is however, we fear, too often the case that negligence or ignorant management of sheep, especially in feeding ewes during pregnancy, is attributed to causes of such as we have above alluded to, instead of admitting that any mistakes have been made in the management of the stock.

We have now before us important questions, the investigation of which will show how formidable are the diseases to which we shall refer, with the view of describing both cause and effect, which cannot be too well understood by all persons whose time and capital are employed in the rearing and feeding valuable animals like sheep and lambs. One of the most disastrous diseases which we have to contend with of the present day is the lameness of sheep stock, which shows itself in many different ways. Nothing but considerable experience on the part of the home farmer and his shepherd can at all times distinguish the nature and cause of the outbreak when sheep are first taken or attacked with lameness, for in the early symptoms "foot rot," which is a distinct disease from the "epidemic lameness" or "foot-and-mouth disease," the symptoms at the first outbreak are often so

similar that even the best-informed veterinary professors frequently make a serious mistake in characterising these complaints. The consequences of such mistakes under the present rules and regulations as to the latter, as issued by the Privy Council, are often disastrous to the farmers and others engaged in the sale and purchase of sheep. It is no uncommon thing for the local authorities in certain districts under the report of the veterinary to prevent the movement of stock and declare a district infected with foot-and-mouth disease, when there are strong reasons for believing that the sheep were merely suffering from foot rot aggravated, as it often is, by internal fever, and showing not only lameness in the feet, but also similar affections in the mouth to that which is observed in the foot-and-mouth disease. In our practice and management of sheep we have seen these aggravated and fever symptoms of foot rot in the animals many years before the great outbreak of foot-and-mouth disease in 1839 and 1840, at which time the sheep stock as well as cattle suffered more or less in every district of the kingdom. It was so general that the farmers in selecting their sheep for breeding, both ewes and rams, had but little choice without breeding from infected animals, and thus it has become unfortunately hereditary. It has therefore now for many years been difficult to avoid breeding from animals suffering from lameness or tainted through constitutional or blood diseases; nor must the home farmer be misled by the disappearance of the disease or defect during one or two generations, for not only does it appear again with all its pristine force in consequence of constitutional or hereditary peculiarities, but also by the action of the atmosphere and the nature and condition of soils whereon the animals are bred and fed.

So far back as the year 1826 we never could obtain the Dorset and Somerset horned sheep direct from their native counties without their being attacked with foot rot on their arrival upon the farm for lambing and winter feeding. In our endeavour to avoid this we for some years kept no sheep at all between the 1st of May and the 1st of October; but it made no difference, for never in any instance did these kind of sheep remain free from lameness beyond a fortnight after entry on the farm, thus showing that the foot rot—not only appearing in the foot, but also attended with fever—had become hereditary in this sort of sheep, although the symptoms varied greatly in some seasons. At that period, and before the great outbreak of foot-and-mouth disease in 1839 and 1840, we always considered that in buying Hampshire Downs, South Downs, and other breeds from various counties, except the south-western, that we were safe against foot rot attacks, unless the stock were brought into contact with flocks infected with that complaint.

Let us contrast that period with the present time, and who can say that we are safe from lameness, call it what we will, either "foot rot" or constitutional and hereditary foot-and-mouth disease, appearing in our flocks of sheep? Nor is it confined to any particular breed or district, as it was principally before 1839, showing, in our opinion beyond dispute, that the lameness in sheep, with all its varied accompanying symptoms, is quite beyond our control as regards the outbreak, but on its appearance the symptoms may not only be mitigated, but so far cured as to be enabled to feed or fatten both sheep and lambs with profit.

We now proceed to explain, through our experience and the experiments of others, the mode and management necessary to avoid the extraordinary disasters which we have known to occur under neglect and in the absence of precautionary treatment. At the same time we shall take care to allude to the new remedies lately advised for use. The precautionary treatment to which we refer consists not only in feeding the stock on the driest soils during the winter months, but also of using known effectual remedies at the earliest appearance of the disease, and at the same time to regard the necessity of removal and absolute separation of those animals under treatment from the sound and healthy portion of the flock. Epizootic foot rot or murrain consists in inflammation of the skin connected with the hoof, the formation of blisters upon the heels and between the digits, which in three or four days break and expose deep red inflamed and tender surfaces; these for a short time discharge a thin serous fluid, in a few days ulcers begin to form, and the discharge of a white offensive matter commences. The two fore feet are those generally affected, frequently, however, extending to the hinder ones, especially when neglected. In cases of epizootic foot rot no time must be lost in applying a remedy, for the ulcerative stage having commenced the groundwork of a disease may be laid that will often require weeks or even months to remove. As soon as the sheep appear lame our old plan was to immediately remove those animals attacked to a dry and clean situation, and after cleansing the foot from all dirt to apply with a piece of tow a lotion composed of two

drams of blue vitriol dissolved in a pint of water, keeping the tow in position by twisting one end into yarn and tying it round the foot. This remedy is safe, but the sheep should be examined daily, dressing the feet of those attacked immediately.

Where it is not convenient to separate the stock, especially in the case of ewes and lambs whilst folded upon Turnips on arable land, we have a catch coop always made ready in the field, to which the flock may be driven daily, and receive there the attention required. By this plan of daily attention and treatment we have kept under control the most formidable and difficult cases, and for a long series of years have never suffered a loss of 6*l.* per head on the flock. In some obstinate cases we have found under the most strict and continuous attention that the inflammation will spread under the hoof, suppuration ensuing, in which case the undermined part of the hoof should be carefully removed by a sharp hook-shaped knife, with a strong but narrow blade, and the vitriolic lotion applied. In case of blood flowing the application must be deferred for an hour or two, and the animals after the feet have been dressed should be allowed to stand quietly in a pen well littered with dry straw for several hours, because if they are turned out immediately on the dirty ground the dressing will prove ineffectual.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—Some horses will still be required in connection with mowing the grass, carting and stacking the hay. Nearly all the fallow land intended for roots has now been seeded, for although there are many acres of land to be seeded with common Turnips, yet these principally consist of fields which are or have been under green crops, such as Trifolium, Vetches. Such crops, where grown on the sandy loam or mixed soils, are nearly sure to leave a portion of Couch grass after them. If, however, it does not amount to more than a bunch here and there it need not hinder the ploughing and seeding immediately; for in case our old system is adopted of setting the women to fork out the tufts of Couch either before ploughing or after they show up when the land has been seeded, it will be easily got rid of. The importance of this plan is that the seed time is not delayed; and when the land is ploughed, worked down, and seeded the same day a season is secured, for let the weather be either very dry or very wet afterwards the best seed time has been obtained. The haying time, up to whilst we write, has been rather catching, which is very unfortunate considering that the crop, whether upon arable or pasture land, is one of the lightest we can ever remember. In the event, therefore, of the hay being stained and damaged by rain, it should be remembered that even if damaged by rain it is not so serious a matter as stacking whilst in a damp state, for nothing can retrieve such a mistake. We therefore recommend the home farmer to stack his hay dry without reference to the time he has to wait to obtain it in that condition; for although it may be ever so seriously injured by rain, if at the time of stacking it is quite dry it will always be valuable fodder if spiced or flavoured with some of the articles of which there are many now offering by different parties. It is not our province, however, to recommend any vendor in particular, but we name Bowick & Co., Simpson's, Myers', Thorley's and others. The home farmer has therefore only to use them as directed whilst building the rick of hay, and he may calculate upon an improved article which the cattle will eat readily, and will pay well for the cost and trouble of applying the spice. It is, too, very important as compared with the plan we formerly adopted of applying salt to damaged hay, which we must say we found comparatively worthless to that treated with the flavouring materials of the present day. It is not only in the case of hay which has been injured by bad weather that we would apply the spices or flavouring materials, but we would also use them in stacking hay the produce of poor soils; for in these we find but little nutriment, and therefore these spices, &c., can be obtained and used for the purpose of improving the feeding value, as well as furnishing an agreeable aroma, enticing to the cattle.

*Hand Labour,* both of men and women, will now be required in connection with the various kinds of work we have just alluded to; but more especially in the cutting of grass and the making of hay in the irrigated meadows, where it is difficult to work machinery amongst the water-carriers and drawing-trenches. Planting Cabbages, Kale, and Broccoli will still be required on the land as fast as ploughed after green crops, or the plants may be laid along the furrow and ploughed in, if care is taken to employ a trusty man to follow, whose business will be to release any plants buried entirely and to partially cover those which were not buried deep enough.

*Live Stock.*—The sales of rams of the different breeds of sheep will soon begin, and the home farmer will have to select his male animals for breeding purposes, not only for sheep but for his dairy cattle also. We must here tell him that by his own intelligence, or through the experience of others, he has both the means and power of controlling and modifying the form of all the animals which he requires on the farm, because such modified forms can be handed down to the progeny. Being departures from the primitive or natural type, the form can only be maintained by assiduous attention

on the part of the breeder, not only because the qualities of the male animal can be brought to bear upon larger numbers, but also because of his own special endowments it is best to seek for improvement of form and quality through him. The home farmer must remember, too, that qualities both of the form and also of the character become hereditary in proportion to the frequency of their repetition in past generations; but that it is dangerous to breed from any animal with important defects, however high its pedigree. We must also state that healthful well-formed animals without hereditary taint, even if closely related, may be safely permitted to propagate their kind, provided the practice be not continued through many generations. It should also be borne in mind that young animals should be first mated with the best of their own kind, in order to avoid the reappearance of stain in any future progeny. Horses are an important part of the live stock, especially when we breed our own, and many of the above observations apply with equal force to horses as well as cattle; but of course there are other points to be considered, as between working animals and those which only furnish food for man. The management of horses at this time of year is, in the hands of some parties, called a very simple matter—merely to feed them well and turn them out at night time either into littered yards with Clover in the eribs or turn them to graze in pasture or on the arable land upon Clover, and Saintfoin. We, however, cannot say that we approve this plan, for in our changeable climate we often get frosty or very cold nights, and when horses have worked hard during the heat of the day—frequently in an excited state of perspiration—the change is too great between their state and condition at day and at night time. We have always preferred an airy stable with boxes for the animals 10 feet by 12 feet, both for their health and freedom from accident, and at the same time for obtaining the full value of their manure.

#### VARIETIES.

ANGORA RABBITS. — “A RABBIT FANCIER” writes to us as follows—“Having for several years taken a great interest in rearing and breeding Rabbits I send you a few particulars, which I think will be interesting to some of your readers, about a pair of Angora Rabbits I now have, the habits of which I consider peculiar and certainly very uncommon for this class of pets. The animals have never been separated. There is no fear of their young being killed. They have been kindled all over the hutch, but the male on perceiving this immediately takes them up and carefully places them one by one in their nest. When there he watches over them with paternal care, and guards them from every intruder by stationing himself before the corner where the nest is. When I cleaned the hutch out for the first time I put the young in a basket; no sooner had I done this than he immediately jumped on the basket, and stayed there until the young were removed again to their hutch. This is the first time I have kept a pair together. I believe that all Rabbits have an intense affection for their young; and I conclude from the above facts that it is solely through fear that a doe when left by herself sometimes destroys her young.”

— THE AMERICAN CHEESE TRADE.—It is evident from the figures compiled of the manufacture and sale of cheese that the home trade is rapidly growing. This growth is estimated at from 12,000,000 to 15,000,000 lbs. a year. The conditions that govern the cheese trade are different from those that influence the sale of butter. Only a dozen States out of the thirty-three produce as much cheese as they do butter. The *per capita* consumption of cheese in this country is now between 4 and 5 lbs., but is rapidly increasing. The combinations and competitions of freight lines make a difference in the price of the article, but American cheese is handicapped about 2½ cents a pound when placed on the Liverpool market in competition with the English product. In 1880 over 40,000,000 lbs. of cheese were sent out of the country, Great Britain taking 65 per cent. of the quantity. The typical cheese market in the United States is at Little Falls, N.Y.; Elgin, Ill., comes next, and St. Albans third in the list in importance. New York receives more than one-half the cheese products of the country; Chicago comes next.—(*The Prairie Farmer.*)

— POINTS OF A GOOD COW.—A practical agriculturist gives in the *Irish Farmer's Gazette* the following description of a good cow:—“The muzzle should be rather large, but the head small and bony, with the face dished and wide between the eyes; horns rather small, and amber colour; ears small, thin, and yellow; neck thin and long, with clean throat; neck will drop a little in front of shoulders, making what I call a ewe neck; shoulders sloping, not heavy, but

lean or bony; back level, with good width of hips. The backbone should be rough or loose-jointed. I consider this one of the best points. As you move your hand along the back the joints seem to be further apart and open. Barrel broad and deep at the flank, with the back ribs wide apart. Rump long and rather wide; thighs long, thin, and wide apart, with legs short and bone fine; hoofs rather long, but small; milk veins large, and where they enter the body you can stick your fingers in. Udder well forward and well up behind, with four good large teats set square and wide apart. Udder soft and pliable, and not fleshy, so that when the milk is drawn the udder is nearly gone. Tail long and slim, with a good switch. Skin should be soft and yellow, with a good escutcheon, and mild disposition. The cow filling the above description, or nearly so, I have always found a good one.”

## POULTRY AND PIGEONS

### PRACTICAL SCIENTIFIC BREEDING.

(Continued from page 522.)

#### FEEDING.

ALTHOUGH it may seem to our readers that the question of feeding does not properly come within the scope of an essay upon “breeding,” yet the two subjects are so closely connected that the greatest amount of trouble as to breeding will be wasted unless proportionate attention be given to the question of food.

We have sometimes been amazed at the difference between chickens hatched from the same parents and at the same season of the year, but differently treated as to food. We do not refer to cases where the youngsters have been starved, or half starved, and otherwise neglected, but to instances in which food has been abundantly supplied, and the fault has been rather in the quality than the quantity.

Before entering upon the discussion of the best method of feeding the growing birds, a few words as to the treatment of the breeding stock may not be out of place.

It is obvious that the chief points to be borne in mind here are, that the supply of food be such as shall promote a general, healthy, and vigorous state of the constitution, which implies a freedom from excessive fat, and also such as shall supply the necessary materials for the formation of eggs.

The egg of the domestic fowl when deprived of its shell consists of 71¾ parts of water, 14 parts of albumen or flesh-forming material, 13 parts of fat, &c., and 1¼ part of phosphates, &c. The proportion of flesh-forming material to fat is far larger in the white than in the yolk, but that is not of importance for our purpose. The shell of the egg is mainly composed of carbonate of lime or hard chalk.

The secretion of an excessive amount of fat by the hen has by experience been found to be a hindrance to laying, but once hens are in full lay a larger proportion of fat-forming food becomes necessary in order to supply materials for the eggs.

The following table, the chief parts of which were first compiled by Mr. Tegetmeier, but which has since been added to by Mr. Lewis Wright, and in which we now further include bran, carrots, parsnips, turnips, and onions, will be useful for reference:—

There is in every 100 parts of	Flesh formers.	Fat or oil.	Starch.	Bone formers.	Husk or fibre.	Water.
Beans and Peas .....	25	2	48	2	8	15
Oatmeal .....	18	6	63	2	2	9
Middlings, Sharps, or Pollard .....	18	6	53	5	4	14
Bran .....	16	4	43	6	17	14
Oats .....	15	6	47	2	20	10
Wheat .....	12	3	70	2	1	12
Buckwheat .....	12	6	58	1½	11	11½
Barley .....	11	2	60	2	14	11
Indian corn .....	11	8	65	1	5	10
Hempseed .....	10	21	45	2	14	8
Rice .....	7	A trace	80	A trace	—	13
Potato .....	6½	A trace	41	2	—	50½
Onion .....	1½	0½	4½	0½	—	91
Parsnip .....	1½	1½	8½	1	—	81
Carrot .....	0½	0½	5	1	—	89
Turnip .....	0½	0½	4	1	—	93
Milk .....	4½	3	5	0½	—	86½

Cabbage, cauliflower, and broccoli, though containing 90 per cent. of water, are otherwise very rich in flesh-formers, and may,

therefore, with great advantage be mixed with other feeding which is deficient in this respect.

Dari, which has been recently introduced as an article of poultry food, contains eight or nine per cent. of flesh-formers.

There can be no hard-and-fast rule laid down as to feeding the breeding stock. The Asiatics are so very different from some of the other breeds, such as Spanish, Hamburgs, &c., that a course of feeding which is suitable for these latter sorts would be far too fattening for the Asiatics. The food must be selected according to the variety kept, and must also be varied to suit the season of the year. Indian corn, for instance, which contains a large proportion of warmth-giving materials (fat, starch, &c.), should be chiefly used in winter, and may be given to the breeds which are not apt to run to fat in larger quantities than the birds of fuller habit. It may also be given with less danger of evil results when the hens are in full lay than at other times. A change of food is beneficial, and for this reason mixtures of whole grain are not to be recommended. It is far better to give one grain for a time, and then change to another, than to give a mixture of several.

With regard to soft food the case is different. Here the means of varying the character of the food are numerous, and a judicious blend of meals, with potatoes, parsnips, turnips, &c., may with advantage be resorted to.

The soft food should, when possible, be cooked, just as much water as the meal will absorb being used. Cooked food is much more easily assimilated than raw, and the mixture of a moderate proportion of water helps the process of digestion. A liberal supply of fresh green food is indispensable, and if the birds be confined a small portion of animal food may be given with advantage.

The supply of gravel or sand to keep the gizzard at work, and of lime rubbish in some form to make the shells for the eggs, must not be omitted.

The feeding of the chickens has, as we have already said, an important bearing upon their maturing early or late, and consequently upon their ultimate size. Where size is an object food containing too large a proportion of flesh-formers must, after the first two or three months of the chicken's life, be withheld or given only in conjunction with other food containing bone-making materials. Bone-meal has of late years been largely used for mixing with chickens' food, and may with advantage be used from the first and continued until the birds reach maturity. About one-tenth of it added to the soft food is sufficient. During the first three months of the chick's life no apprehension as to forcing the birds to too early a maturity need be felt, and food containing plenty of flesh-formers, as also a moderate supply of meat, may be given.

Oatmeal should at first form the chief food, varied with a mixture of Indian meal and middlings; later on the quantity of oatmeal must be diminished and bran may be added, while after three months buckwheat, wheat, or barley may be given, as grain with barley-meal, middlings, bran, and Indian meal as the chief materials for forming the soft food. Pea-meal in moderate quantities is good at first, but should be avoided afterwards as being too stimulating.

Where size is not an object, and early maturity is desired, a diet in which flesh-formers are largely present may be adopted throughout.

A word of caution may be added as to breeds in which largeness of comb is a disadvantage. Here especial attention to the exclusion of all over-stimulants from the food is essential. We have seen more than one first-rate Brahma cockerel spoiled by injudicious kindness in the matter of feeding. A few scraps of meat gathered from the lunch table have just been too much for a springing comb which was all right before, and the prize which would otherwise have been gained has had to go elsewhere.

The quantity of food and the number of meals to be given have been so often discussed in these columns that we do not think it necessary to deal with them here.

#### FANCIERS v. FARMERS.

ANYONE reading the article headed as above in your last issue would think that there is a certain number of persons who wish to decry everything in the way of poultry, more especially the Dorking fowl. As I believe I am one of those alluded to, for the reason that I have considered it a duty incumbent on me as one knowing for the last half century or thereabouts from actual observation, and also from those who kept the true Dorking, Sussex or Surrey fowl as it was called—the Dorking being the white variety of the latter two, and they otherwise being all one

breed—I feel, I say, it a duty to prevent if I possibly can the extinction of such breed, and its name, &c., being shifted on to a mongrel.

It has been stated by several that the Dorking was not a true breed. I affirm that it was as much a true breed as a Polish, a Cochin, or a Hamburg fowl—as much a true breed as in cattle is the Sussex, the Shorthorn, the Hereford, and others. I know from long observation of the different stocks of poultry of farmers in Surrey, Sussex, and Kent that the utmost care was taken to keep and preserve the breed pure, and I was a mere child when my father, who kept Dorkings before I was born, pointed out to me, while looking at fowls belonging to an uncle of mine, that the peculiarity of the fowl consisted much in its having a white leg and five toes; and I also remember my father saying (and it made a great impression on me at the time) that as far as he knew it was the only breed that had a white leg on a dark fowl, and often in later years have we talked about this particular breed—its size, quality, and general usefulness. Also, I have three uncles who were most particular to keep their stocks pure, besides other friends who prided themselves in their poultry. It has been stated, and which I say is inaccurate, that the Dorking is a composite fowl. If so, where did it get the white leg from? as I can confidently state that in the stocks of these birds that were kept by my family and others that I knew, I never saw any but pure white legs, and the form and quality for table purposes left nothing to be desired.

Again referring to cattle, the Shorthorn has what the present so-called Dorking fancier would call fancy points, such as the pure white nose, &c. It is bred solely for "table purposes," and yet no animal would be noticed in a Shorthorn class with a dark nose. The prizes are for Shorthorns, and not for a cross-breed. So in the Sussex classes of cattle; they all have their points of breed, and those points have been carefully kept, and yet in each and also other breeds grand results have been the consequence. Then why is the true breed of Dorking to be obliterated as a fowl, and crossed and crossed till it no longer has the points showing the pureness of the stock? A Booth or a Bates, taking the Dorking in hand as they did the Shorthorn, would have produced much finer results from the pure Dorking, keeping it pure by selecting the best and the best, and not crossing and crossing, and absolutely doing away with some of the most certain indications of the purity of the breed. I firmly believe that the birds of which I write are the actual descendants of those described by Columella. At least this I can say, and that most truthfully, the birds that I remember in my young days answered fully to the description he gives, and his accuracy of description is universally acknowledged.

In the article it is said "The praisers of the time that is past" declare that the Dorking of to-day is a miserable impostor. It has nothing to recommend it to any other notice than a general condemnation. It has black feet, it has big bones, it has coarse flesh, in a word it is everything that is bad." Now, sir, I must say this is a most unfair statement of what has been said, at least by myself. What I have said is that the fowls are not Dorkings; nor are they. They are mongrels, crossed and crossed to get size, which their combs, legs, carriage, &c., show. They are much coarser than the Dorking in flesh, as everyone knows, if he knows anything about fowls, that the larger the fowl the coarser the grain of the flesh must be, and they are much larger in bone; but I never have seen anyone who said they had black feet, therefore I dismiss this part as a wrong statement. I, nor anyone, I believe, ever said they were worthless, for some people like large coarse meat. What I said, or intended to say, was that they were not Dorkings, and as such were not entitled to be exhibited in a Dorking class more than a cross-bred in a Shorthorn class. It is quite true that I have seen the winners of prizes and much-lauded birds that were not Dorkings at all. It is not a matter of conjecture on my part; I know it. A so-called Dorking which belonged to Mr. Fisher Hobbs took the prize at Birmingham, and Mr. Fisher Hobbs told me himself that it was a half-bred Cochin and Dorking. I know of many other cases (and when the proper time comes I shall declare them) where cross-breeds have won. If the prizes are for Dorkings, why are they given to cross-breeds? Neither in cattle, nor sheep, nor pigs are they so awarded, but the distinctive points of each breed are duly considered, and carried to the highest excellence. Why is the true white-legged Dorking to be stamped out? When you have got rid of the white leg of the Dorking fowl you have got rid of the only white-legged breed that I know of, and poultry shows were instituted to maintain the pureness of the different breeds. Again it said, "The successful Dorking fanciers of to-day assert that as table fowls their birds are better than ever they were, and there are not wanting independent witnesses to corroborate this view."

I contend for my own part that I am a perfectly independent

witness, and so are others I know. I neither exhibit nor sell; I know none of the fanciers, and if I did it would make no difference. I should judge their birds, not them. I have no wish to make enemies, but I must speak the truth to the utmost of my power, and I do not attack anyone; but I must say that I have often seen prizes awarded to fowls in a Dorking class that were decidedly mongrels. This I know, and to my sorrow, I never had any sooty-legged fowls in my yard until I bought some first-prize birds, and now I consider my stock utterly ruined. Yesterday the only bird left of my old strain was killed in mowing the grass. She had pure white legs, feet, and toe nails.

Again as concerns farmers. At Lewes only last week a farmer's wife asked me where to get some true-bred Dorkings, as she did not like the new style of bird at all for the farmyard. I could only answer, "I wish I knew."

One would be led to suppose from reading the following that it is only now, or since poultry shows were instituted, that there have been fanciers, I mean the intelligent fancier and breeder:—"Many of the useful qualities of a breed are doubtless sacrificed by the fancier in his efforts to attain perfection in standard points; but it must never be lost sight of that but for the fancier certain breeds, which are the most useful for the purpose of crossing-in with common fowls, would hardly have been produced at all." Why is it so requisite that there must be crossing? In cattle, sheep, &c., the more pure the breeds are kept the better the farmer considers his stock, and I know the old poultry fancier and breeder long before the shows were in vogue was the most careful of the purity of his stock, and quite as proud of them as if he won his cups or money. The poultry, Pigeon, and Rabbit fancier is not a creation of to-day. He existed long, long before my time, and it is to him we owe the different breeds that now adorn our farmyards. I will not make comments on other breeds of fowls as regards shows; but this I do say, that nothing to my mind has been more detrimental to the true Dorking—the old English, a fowl of world-wide reputation—than poultry shows and so-called fanciers.—HARRISON WEIR,

#### PESTS OF THE POULTRY YARD.

No one will keep fowls, no matter whether they be many or few, for long without finding out that numerous pests soon congregate about their houses and runs, and prove a source of much annoyance. Like the numerous pests of our gardens those of the poultry yard come in their seasons, and some which are injurious or destructive now may be harmless later on in the season. This applies particularly to young chicken pests, such as rats, hawks, jackdaws, and such like. Rats are a great pest to many poultry-keepers. At times they destroy much food, and when young chickens are about they are constantly on the alert, sometimes bolting off with them during the day, and killing numbers at night whenever they chance to get into the coop or house containing them. This is the case not only with chicks a few days hatched, but also with those which are some weeks old. Ducks, too, are always most liable to be destroyed by rats until they are quite half grown or more, and many are the complaints we hear respecting them and the extra labour it takes to secure them from being destroyed.

The best way to reduce labour and risk is to destroy the rats. Putting rat-proof houses up and allowing them still to exist is never satisfactory. Much can be done with traps; and poison used in the form of powder, so that they cannot carry it in the way of other animals, soon thins them. Those who have had most experience with them never allow a number to be gathered together before beginning their extermination, but they generally catch every one on its arrival.

Young chicks are not the only thing they destroy either, as I have known them to take eggs from under hens when they are set for hatching, and they have also taken eggs from the nests as soon as they were laid; in fact, for some time I had an old chap in my yard who appeared to know the meaning of the noise the hens made as they came from the nests, as I had to be very sharp or no egg was to be found. When this began at first I was inclined to think that somebody was stealing the eggs, but when I had found one or two drawn to a hole close by the thief was soon destroyed.

Hawks only pick up chickens when very small, and in districts where they are plentiful they must either be shot or the chicks kept under protection until they have gained some size; but jackdaws are much worse than hawks, and lately I have lost several of my best chicks by them. These birds build plentifully in a large wood close by, and when their young are in the nests they will carry everything to them. When once they begin on a brood of chickens they seldom stop until all have been destroyed, unless the chicks are removed or the thieves killed. When the mothers

are cooped up and the chickens running outside they are more liable to be taken than when the hen is allowed to walk about with her brood, as she, if a good one, is generally too strong for a jackdaw.

It is a curious fact that it is only the head of the chicks that these depredators take, as they always leave the body entire behind them. When this was done with some of mine I shot the first jackdaw I came across, and hung up its body as a warning to its race close by the coop where the chicks were. When I went back again I found another chicken's head gone, so that this plan failed; but when the jacks were cut up and thrown in pieces about the scene of their crimes no more of them were ever seen about that place for the season.

Some say that cats are a pest about the poultry yard, but if they are accustomed to the fowls and the fowls used to them their presence is an advantage, and frequently saves much damage from being done to the fowls by the subjects we have just mentioned; and they also keep mice away, and these little creatures, although not having confidence to attack a fowl, are capable of making a larger hole in the grain sack than most of us like.

I was rather astonished the other day when one of the keepers told me that he knew of a fox's "nest" little more than a rifle shot from our poultry yard, as foxes are pests of the greatest magnitude, and the largest fowls are no safer from them than the smallest. In such cases open roosting must not be encouraged.

Insects may also be included as pests of the poultry yard, but when these become so plentiful that they do injury to the fowls their owners or those in charge are much to blame, as it is only through neglecting the common rules of cleanliness that harm can come of this, and the remedy is very apparent.—M. M.

#### OUR LETTER BOX.

**Chickens Ailing** (*W. Booth*).—We can hardly tell from your description what is the ailment of the chickens. Is there any ulceration of the mouth or throat? If so burn it with lunar caustic every three days until the ulcers disappear. We fear, however, that it is a general low state of the system from which your chickens are suffering. Is their run sweet, or have many fowls been upon it? Try the effect of more stimulating food, change the Indian meal for barley meal or oatmeal, and mix with boiling water or cook the food for a short time; give also some bread and ale once a day. You say rain water is given them. That may be the cause of the mischief, as this hot weather may have made the rain water foul. Put a little of McDougall's fluid carbolate in the water. Write again with further particulars.

**Cow in Calf** (*A Gardener*).—From our own experience we would say that there is nothing unusual in the condition of your cow, and that the probability is she is in calf.

**Prickly Comfrey**—*Symphytum aspernum* (*T. James*).—It should be grown in deep highly manured soil, and though it is quite hardy a good covering of manure placed round the crowns in winter is very beneficial, the manure in the spring being pointed in with a fork. Prickly Comfrey cannot be grown too quickly, for if grown slowly by lack of nourishment it is apt to be bitter; cattle do not always eat it readily at the first, but they generally "soon take to it," eat it freely, and thrive well. It is cut and given to the cattle in a green state, or partially withered, and in rich, deep, and rather moist soil it yields very large crops of produce. Divisions of the roots may be planted 3 feet apart, from November onwards, in well-enriched soil; indeed, the preparation of the soil and mode of culture usually applied to Rhubarb are precisely suitable to it.

#### REMARKS.

26th.—Very fine; bright sunshine throughout.

27th.—Cool, overcast; slight showers.

28th.—Fine, with a good deal of bright sunshine, although at times overcast.

29th.—Fine and bright.

30th.—Warm; very fine pleasant day.

1st.—Hot, very fine day, stormy appearance towards evening; fine starlight night.

2nd.—Fine, but at times very cloudy.

A fine dry week, with the temperature slightly above the average.—G. J. SYMONS.

14th	TH	The National Rose Show, Sheffield. Chiswick Horticultural

### HERBACEOUS AND ALPINE PLANTS.

OUR purpose in penning these remarks is to assist readers in selecting the choicest and best species and varieties obtainable. The mistake hitherto made by many amateurs has been in their planting any and every species they could obtain simply because it was fresh. By this system the borders became crowded with a host of plants producing inconspicuous flowers, whence, instead of a bright and continuous display, disappointment is the only return. The employment of hardy plants in the flower borders and the shrubbery borders has increased during the past few years, and if a judicious selection is made from the immense numbers of plants now obtainable the fashion must become, and remain, popular, because a beautiful display may be maintained almost throughout the season, from which flowers for vases, for table decoration, bouquets, and buttonholes may be constantly gathered without the slightest injury to the plants. These results are, moreover, obtainable with comparatively small cost, even by those having nothing but an ordinary villa garden and without any glass structure.

In the cultivation of perennials soil is of the first importance, and for many of the choice alpine kinds situation also must be studied. In the first place the borders must be well drained, and if the natural soil is poor and exhausted it should be removed or incorporated with some rich and fertile material. The best we consider is a combination of loam, leaf soil, and well-decomposed manure, to which the admixture of some sharp river sand or the grit from road sweepings will be of great assistance. There are many peat-loving plants, but the soil just named will be found the best for a general foundation. Those plants requiring peat or limestone grit can easily be accommodated with their peculiar wants at the time of planting.

In gardens of sufficient size a well-made rockery is a most interesting addition, but in small gardens the attempt should not be made, for we have never seen good results in such places; besides, it is really unnecessary, there being a great number of hardy alpine plants that may be grown in clumps in the borders with ease, especially if a few pieces of rock or large stones are laid round them. But where space will permit the rock garden when properly constructed is a never-failing source of pleasure; indeed many an old wall may be readily converted into a lovely rock garden by the judicious planting of *Sempervivums*, *Sedums*, *Saxifragas*, *Aubrietias*, *Wallflowers*, *Drabas*, and similar plants. If a situation is to be selected for the construction of rockwork, choose a place in which the alpine plants when in their positions shall be sheltered

or screened from the morning sun during summer. A mistake is frequently made by amateurs respecting the supply of water to alpines. Many people imagine because these plants often grow on and amongst bare rocks and stones, that little or no water is necessary to their existence; nothing, however, is more erroneous, for alpines are thirsty plants and during the summer months should be watered liberally. The rockery should not be made to display itself, but should be so constructed that every nook and every ledge should form a resting place for some particular form of vegetation to grow upon or trail over, while at the base sundry nooks may be converted into bogs for the accommodation of such plants that require this particular care, and if a small pool of water is available there are numerous aquatics which will amply repay for the very little care they require.

In planting the herbaceous borders strict attention is necessary in the arrangement according to the natural heights, and in placing the plants so that they are not in straight rows from front to back, and so to intermix the plants that all the year round the border shall be gay. Deciduous and evergreen kinds should also be carefully interspersed in order that a general effect may be produced. The dwarf kinds which will be front-row plants should be slightly elevated, and, as before remarked, have some good-sized pieces of rock placed round them, as this keeps the crown of the plants from decaying in winter. Thus treated they will soon form beautiful clumps. In the matter of colour our readers will scarcely need reminding that two shades of the same colour should not come together. Some mistakes and failures are sure to be made the first year, but these must be carefully noted and remedied in autumn. The latter plants, or, indeed, the dwarf kinds also where they require it, must be carefully staked and tied to keep the borders orderly and to prevent the shoots being broken down by wind or rain; but by no means be lavish with artificial supports, for the less they are used the more natural everything appears. Where seeds are not required pick off the capsules as soon as the flowers fade, and if seeds are to be saved thin-out the capsules to prevent undue exhaustion of the plants. When the seed is ripe sow it at once. We prefer this plan to the one usually adopted of storing it until the following spring.

A few words respecting the manner of keeping the flower borders may not be out of place. All the year round weeds must be kept down; especially during the summer months must the hoe and rake be employed, but it is in the late-autumn treatment in our opinion lies the secret of success or failure in the cultivation of herbaceous plants. In the majority of gardens the plants are cut back and the borders dug over so as to make all neat by Christmas. This digging or turning-in, as the operation is technically called, is the great fault committed by those who do not study their plants. We do not believe in digging flower borders periodically. Let the leaves fall upon in autumn, and take a few barrowloads of good soil and sprinkle over them; this will make everything look clean and presentable, will retain the natural manuring in the shape of decomposed leaves which plants so much like, and will recompense for the loss in bulk which arises during summer through carrying off the rakings from the borders. This simple but beneficial plan has another virtue, inasmuch as borders thus treated may have numberless bulbous plants interspersed, and these will throw up their charming flowers in many

instances whilst their neighbours are at rest, and modestly retire when they again put forth their summer verdure. Under the digging system, however, this is simply impossible.

Cowper thus describes a well-kept flower border—

“Few self-supported flowers endure the wind  
Uninjured, but expect the upholding aid  
Of the smooth-shaven prop, and, neatly tied,  
Are wedded thus like beauty to old age,  
For interest sake, the living to the dead.”

Jerrold's idea of a garden is in itself a beautiful idea, which we cannot do better than transcribe. He says—“A garden is a beautiful book writ by the finger of God. Every flower and every leaf is a letter. You have only to learn them and join them and then go on reading, and you will find yourself carried away from the earth by the story you are going through. You do not know what beautiful thoughts grow out of the ground and seem to talk to a man. And, then, there are some flowers that seem to me like overdutiful children; tend them ever so little and they come up and flourish, and show, as I may say, their bright and happy faces to you.” This latter remark of Jerrold's is peculiarly true of alpine and herbaceous plants, for they certainly do yield a maximum of pleasure for a minimum of care.—W. H.

(To be continued.)

### SUMMER-SOWN ONIONS.

ONIONS sown in July ought certainly to be termed summer-sown, and yet by some curious inadvertence we have drifted into the habit of calling them autumn-sown. Let us be accurate in everything relating to this crop, for it is one of great importance, to which we must turn for a supply—not momentarily, but for a period of some months' duration when the winter store of spring-sown Onions is exhausted, say by the end of March. “Many a time and oft” have I known beginners at a loss then; nay, I must plead guilty to having been in a similar predicament myself more than once. How was it? Through ignorance? Undoubtedly it was so in part, but not wholly so, for had I not taken especial care to sow plentifully all the best sorts of Tripoli at the right time? and yet, when I had to begin using them, they were so small that a dozen were barely equal to a full-grown Onion. A little attention to securing a sort which developed bulbs of a useful size sufficiently early set matters right, and no time was lost in acquainting readers of the Journal of it.

Appeals for information about this matter that have reached me recently, and others made last year, prove, however, the existence of a necessity for again writing about it. The best Onion of all for our purpose is The Queen, and yet, strange to say, very little is known about its real value. Turn to some of our leading seedsmen's catalogues, and you will find such descriptions as this:—“Queen, a very pretty little white Onion, of quick growth.” “The Queen, a miniature silver-skinned variety, of rapid growth.” “New Queen, the smallest and quickest grower; best for salads.” Now, to my mind the impression conveyed by such descriptions is certainly not of a nature to induce us to regard this as a really useful vegetable of such importance that upon it alone can we depend for a supply of good Onions in spring and early summer. Yet that is undoubtedly what it is, for it swells into bulbs so early that with plenty of it sown in July with its large congeners, the Flat and Globe Tripoli, we can depend under good culture upon having it ready to our hand good in March, better in May, and best at midsummer. Nor can objection be taken to it upon the score of size. To be accurate, I have just been to a large bed of it, and find that while most of the growing bulbs are about 3 inches in diameter yet there are many fully 4 inches across, which, I think, it must be granted is by no means a despicable size.

July 15th is my favourite date for sowing The Queen, and with it on the same date for a succession the Globe, Tripoli, and Giant Rocca. Sow thickly to facilitate watering, and prick out, as soon as the seedlings are large enough, in rows 9 inches apart and 6 inches asunder in the rows. Take care that the soil is rich, and apply water copiously till the plants are fully established and are growing freely.—EDWARD LUCKHURST.

### THE FRUIT SEASON IN WILTSHIRE.

AS blossom must precede fruit, I will first notice—what, indeed, every eye has seen—that this has been a wonderful season for bloom on hedge and tree, alike in field and garden. From first to last it has been the same, from the Blackthorn down to the Elder. Now, however, it is of fruit and not flower that I have to speak.

Let me take the most useful first—Apples. The early varieties have a large crop on them, whether they be eating or cooking. Irish Peach shows abundantly its ruddy cheek, and so equally Hawthornden. The latter are, perhaps, not so abundant, and some consider them actually deficient; but it must be remembered that the earlier are now the larger and catch the eye more readily. I am told also that the cider varieties have a good crop on them. Pears far more than for several years, but can hardly be considered abundant. Plums, the good bearers such as Victoria have to be thinned, while the less heavy croppers are only half covered. Of all bush fruit there is plenty. Raspberries seem all we can wish. Gooseberries quite an average crop. Cherries seem to fall off very rapidly and in great numbers. Damsons and Bullaces fair only. Strawberries are very flourishing, but the damp has caused the slugs to make havoc. Filberts and nuts not numerous; out-of-door Grapes poor, while Medlars are abundant.

Balancing one variety of fruit against another, I should say that there is every promise of a general good crop. In my own garden I have not had such an one since the year 1874. But for the severe frosts of June 7th and 8th this year would have been quite equal to that of seven years ago.

The above remarks refer chiefly to fruit on trees in the open ground. One word upon that on walls: Apricots are nil, Peaches and Nectarines a fair average crop, so, also, the higher classes of Plums usually indulged with a wall. Walnuts will this winter be enjoyed, but not in great numbers, still it is something to have any after the sad experience of two seasons. The gardener, and particularly the fruit gardener, has cause to raise a note of thankfulness. The terrible disappointments of 1879 and 1880 are not for him this year; labour has not proved in vain, and fond expectations have not again been disappointed.—WILTSHIRE RECTOR.

### FANCY PANSIES.

AS this is the season of the year when many are procuring Pansies, it may be useful to some of your readers to have a few practical notes. It is only of late years that my favourites the Fancies have come to the front, the old florists admiring only the self and belted varieties. The great beauty of the Fancy varieties, however, has now won them a position, and we now have them in great variety. Several good florists whom I know grow them almost exclusively, finding it pays well. Why have we not classes for pots of Fancy Pansies at our shows? At the Manchester Whit-week Show Pansies are shown in pots, and the result is an increased interest in Pansy culture in the locality. The florists in the neighbourhood grow Pansies very successfully, and I now give a few details of their mode of culture.

Plants procured now should be planted at once. If there are several growths spread them out as far as possible, burying any long straggling shoots nearly to the point. As the blooms are always near the point of the shoot nothing will be lost in display, and the half-buried shoot will send up small offsets which will be useful as cuttings. The most suitable soil is that which is rather light and sandy, liberally manured, and such as will not be likely to become dry too soon. Such is our soil, and in it Pansies grow as luxuriantly as Watercresses. If the soil is unsuited for Pansies—for example, a heavy clay soil—a mixture of well-decayed manure, bog, and sand should be placed round each root; this will help the plant and make it independent of the native soil. The most suitable position is a border which has sunshine only in the morning and good light during the rest of the day; but I have a bed exposed all day to the full power of the sun, and the plants are in good condition and full of bloom. The Pansy succeeds well planted in the mixed border, but a bed containing nothing but Pansies is always interesting. When such a bed is to be made the gardener has an advantage, because he can select a suitable position, and can make the soil suitable by adding manure, sand, and bog. For a bed of Pansies it is wise to have twenty or thirty varieties carefully arranged as to colour. Before planting carefully examine the plants for traces of the fly, which has made sad havoc with the stocks of some nurserymen this year. If there is the least trace of this insect pest, or as a great florist said to me the other day, “whether there are or not,” the plants should be dipped in a solution of soft soap and water. In dry weather the bed should be well watered twice a week, as Pansies are impatient under drought. The instructions given above will be sufficient for the present, as the culture is very simple at this period of the year. The most important point is propagating at the right time and in the right manner. At the proper season I hope to send a few practical notes.

As Pansies can readily be procured now it will be wise in the persons anxious to commence growing them to procure one plant of each variety, and a foundation for a good stock for next season

will then be laid. A stock of good varieties being secured, the only object at present should be to induce free growth. It must also be borne in mind that in order to have a good display of bloom fresh plants should be raised every year. I venture to say that few hardy plants so well repay the trouble taken in their culture as these Pansies; they are easily cultivated, need no artificial heat, and have a range of unusual and beautiful colours. I now give a list of varieties which I have grown, and which I can recommend as being free bloomers and really good for general purposes. All the following are Fancy varieties:—Countess of Strathmore, George Vair, Thomas Grainger, Comet, Leith Walk Hero, Vesta, David Smith, Mrs. B. Brooke, Mrs. Felton, Buttercup, George Wood, Miss Darling.—VINDEK.

### ALEXANDRA PALACE ROSE SHOW.

JULY 9TH.

ANNUALLY for some years past there has been a large and successful exhibition of Roses at Muswell Hill, but it may be safely said that as regards the general effect the display of the present year has never been equalled. Indeed it is doubtful if a more artistic Rose show has been witnessed in the neighbourhood of the metropolis; certainly some of the most experienced rosarian exhibitors testified to the fact that it was the most beautiful exhibition of Roses they had seen.

The large and handsome central hall was fully occupied with lines of tables, upon which the competing stands in the amateurs', nurserymen's, and open classes were placed. Flanking these on each side, forming the boundary of the Show, and extending the length of the hall, were high sloping stages that bore the contributions to what might be not inappropriately termed the gigantic competition of a thousand blooms. These flowers were chiefly arranged in concentric semicircular lines, the colours being tastefully disposed and the effect very bright and pleasing. There was only one defect in this portion of the Exhibition, and that was due to the boarding being covered with partially dried grass, which imparted a rather dull and unfinished appearance to the stages, as it formed a very unfitting background for the blooms. Had fresh moss been employed or the grass covered with green baize similar to that surrounding the tables a great improvement would have been effected. As an additional artistic attraction an ornamental iron arch was placed at each end of the central path, and from these were suspended numerous baskets of Roses, that only required a few sprays of greenery to have rendered them completely charming. Large Tree Ferns, glass trumpet stands, and miscellaneous plants were freely employed in suitable positions to increase the beauty of the display and furnish an agreeable tone to the brilliancy of colour afforded by the Roses. The glass stands were particularly noteworthy for the simple yet effective manner in which they were decorated. Long sprays of Mock Orange accompanied by small branches of the Purple Beech, Fern fronds, and other foliage gracefully arranged were the chief materials employed. This very successful attempt at an innovation in the mode of holding Rose shows deserves to be followed up; and for a place of public amusement it is unquestionably well suited, as it renders the exhibition of greater interest to those numerous visitors who are not rosarians and yet can admire a pretty floral display.

All the arrangements were well conducted, and the lessees, Messrs. Jones & Barber, and their horticultural superintendent, Mr. J. Forsyth Johnson, deserve to be complimented upon the admirable results achieved.

**AMATEURS' CLASSES.**—Half a dozen classes were provided for amateurs, and in nearly all the competition was keen, and the blooms of good quality. The prizes ranged in value from £5 to the same number of shillings, the number of blooms stipulated for being from forty-eight to a dozen. The principal class was for forty-eight single trusses, and in that five competitors appeared. T. Jowitt, Esq., Old Weir, Hereford, was accorded chief honours for a collection of fresh, bright, and beautiful blooms, representing the following varieties among others:—Star of Waltham, fine; Marquise de Gibot, Marguerite Brassac, Capitaine Christy, good; Duke of Wellington bright;

Madame Sophie Fropot, Madame Marie Finger, Madame Victor Verdier, Marquise de Castellane, fine; Fisher Holmes, Madame Charles Wood, Annie Laxton, excellent; Xavier Olibo, Victor Verdier, large and full; Marguerite de St. Amand, neat, bright; Baronne de Rothschild, Duchess of Bedford, Edouard Morren, Duchesse de Morny, Charles Lefebvre, Mons. E. Y. Teas, Mrs. Baker, Marie Cointet, Général Jacqueminot, Souvenir d'Elise Vardon, Exposition de Brie, Princess Beatrice, Prince Arthur, neat, fresh; Duchesse de Vallombrosa, Horace Vernet, Elie Morel, Louis Van Houtte, Sénateur Vaisse, Sir Garnet Wolseley, Comtesse de Seneye, and Dr. Andry. This was a very satisfactory collection, and was greatly admired. R. N. G. Baker, Esq., Heavitree, Devon, followed closely with very neat blooms, but scarcely so fine as on the preceding Saturday at Sydenham. Some of the finest were Sénateur Vaisse, John Stuart Mill, Madame Sophie Fropot, Sultan of Zanzibar, Reynolds Hole, Marie Verdier, Alfred Colomb, and Marie Rady. The remaining prizes were secured by G. P. Hawtrey, Esq., Slough; Mr. John Hollingworth, Maidstone; and Mr. Joseph Davis, Wilton, Salisbury.

In the following class for thirty-six blooms, single trusses, Mr. T. Jowitt was again foremost among five exhibitors with handsome blooms of similar varieties to those already enumerated; but the following were unusually fine—Marie Baumann, Mons. E. Y. Teas, Marquise de Gibot, Baronne de Rothschild, Sénateur Vaisse, Marquise de Castellane, and Charles Lefebvre. Mr. R. N. G. Baker again took the second place, showing Alfred Colomb, Marie Rady, Devienne Lamy, and Le Havre in excellent form, his other blooms being of fair quality. Mr. C. Davies, Aynhoe, Banbury, and Mr. J. Hollingworth were third and fourth respectively. For twenty-four triplets the Old Weir Roses were again placed in the principal position, and as in the previous classes they well deserved the honour. Louis Van Houtte, Duchesse de Morny, Princess Beatrice, and Peach Blossom were the finest examples in the stand. Still again were the Heavitree Roses in the second place, and perhaps even closer than in the other classes. Messrs. C. Davies and J. Davis secured the third and fourth positions with neat and bright blooms.

In the class for twenty-four single trusses Mr. Wm. Harrington, Corbetstye, Romford, Essex, carried off the first prize with flowers of good substance and very bright. Some of the most notable were Sénateur Vaisse, Beauty of Waltham, Prince Arthur, Exposition de Brie, Lord Macaulay, and Dr. Andry. The Rev. J. A. Williams, Yardley Wood Vicarage, Birmingham, was a very close and good second, staging fine blooms of Prince Camille de Rohan, Marie Baumann, Annie Laxton, Comtesse de Seneye, and Marie Van Houtte. J. H. Pemberton, Esq., Havering-atte-Bower, was third. There were six entries of twelve single trusses, most of satisfactory quality. Mr. Harrington; Ernest Wilkins, Esq., Lyndhurst, Sutton, Surrey; Edward Mawley, Esq., Addiscombe, Croydon; and Mr. J. H. Pemberton were the prizetakers in the order named. Teas and Noisettes were fairly represented in the class for twelve, seven collections being contributed; and though the majority of the blooms were rather small, still in the leading stand from Mr. C. Davies flowers of good substance were included. Of these the best were Mons. Furtado, Bouquet d'Or, Souvenir de Paul Neyron, Caroline Kuster, Madame Lambard, and Madame Hippolyte Jamain. Mr. Hollingworth had some fine examples of Souvenir d'un Ami in his second-prize stand; Mr. Harrington showed Niphotos, Madame Sertot, and President well; Mr. Mawley having Rubens and Madame Guillot in good form.

**NURSERYMEN'S CLASSES.**—In the five classes appropriated to nurserymen some handsome collections were staged, and the blooms generally were more neat and even than at the Sydenham Show. Mr. B. R. Cant, Colchester, was to the fore with seventy-two single trusses, which well merited the position accorded them. It is unnecessary to enumerate all the varieties, as the stand which gained a similar position at the National Society's Exhibition was from the same firm, and the names were then given in full. However, the following few deserve notice as being especially fine:—Xavier Olibo, Alfred Colomb, Ferdinand de Lesseps, fine; Boieldieu, neat; Duchesse de Morny, full; Abel Carrière, very rich; Dupuy Jamain, Baron de Bonstettin, A. K. Williams, very fine; Duke of Teck, Victor Verdier, Baronne de Rothschild, Horace Vernet, Madame Clemence Joigneaux, Pierre Notting, Abel Grand, Annie Wood, Comtesse de Seneye, Innocente Pirola, Magna Charta, Marguerite de St. Amand, and Duke of Wellington. Cranston's Nursery and Seed Company, Hereford, followed with blooms of fine substance, bright, fresh, and of good varieties—indeed, they were very close to the preceding in merit. Sénateur Vaisse, Marquise de Castellane, Horace Vernet, Charles Lefebvre, Madame Charles Crapelet, Le Havre, Alfred Colomb, A. K. Williams, and Dupuy Jamain were admirable. Messrs. Paul & Son, Cheshunt, were third with rather loose and small blooms.

For forty-eight triplets Mr. B. R. Cant was first among five exhibitors. His best blooms were Countess of Rosebery, François Michelon, Dr. Sewell, Comtesse de Seneye, Capitaine Christy, A. K. Williams, Ferdinand de Lesseps, Xavier Olibo, Alfred Colomb, Duke of Teck, and Reine du Midi. Mr. C. Turner, Slough, secured the second award for a neat and pleasing collection, which included Louis Van Houtte, Duchesse de Morny, A. K. Williams, Mrs. Turner, Exposition de Brie, and Prince Arthur in good form. Messrs. Cranston and Paul & Son followed. Mr. C. Turner had the best twenty-four Hybrid Perpetuals; the varieties being Star of Waltham, John Hopper, Princess Beatrice, Louis Van Houtte, Dr. Sewell, Madame Lacharme, Duchesse de

Morny, Charles Darwin, Avocat Duvivier, Madame Thérèse Levet, Elie Morel, Countess of Roseberry, Triomphe de France, La Rosière, Sir Garnet Wolseley, Baronne de Rothschild, Marie Baumann, A. K. Williams, Duke of Connaught, Comtesse de Serenye, Marguerite de St. Amand, Comtesse Tretiakoff, and Beauty of Waltham, all very bright and of excellent quality. Mr. G. Prince, Oxford; Mr. John House, Eastgate, Peterborough; and Mr. B. R. Cant followed in the order named. Mr. C. Turner was also first with twenty-four single trusses, a class in which the competition was very keen, nine stands being contributed. Messrs. Kinmont & Kidd, Canterbury, took the second position for creditable blooms; Messrs. John House and E. P. Francis & Co., Hertford, being third and fourth with neat stands.

Four competitors appeared in the class for twelve Tea or Noisette blooms, and some remarkably handsome examples were included in the leading stands. Messrs. Paul & Son secured the chief honours with fine flowers of Caroline Kuster, Souvenir d'un Ami, Devoniensis, Catherine Mermet, Madame Willermoz, Jean Ducher, Souvenir d'Elise Vardon, Madame Lambard, Rubens, Niphotos, Bouquet d'Or, and Alba Rosea. Mr. G. Prince was second, also with good blooms, Amazon, Marie Van Houtte, Madame Guillot, Devoniensis, and Mons. Furtado being the best. Mr. Cant had Innocente Pirola, Bouquet d'Or, Madame Welch, Jean Ducher, and Madame Bravy in good form in his third-prize stand.

OPEN CLASSES.—The chief class in this section was that for the best thousand Roses, for which gold, silver, and bronze medals were offered, the blooms remaining the property of the lessees after the Exhibition. There were four entries, the disposition of which have already been referred to. Mr. T. Jowitt was accorded the principal prize for a handsome and diversified collection, the Roses being arranged in concentric lines in three connected semicircles. The colours were bright and tastefully arranged. Messrs. Cranston were second with two beds of blooms, one on each side of the hall in the form of quadrants, very pretty and effective. Messrs. Paul & Son had three large oval beds of fresh clean Roses, but not quite so bright as in the others. Next in interest to the above were classes for white, dark, pink, and yellow Roses, twenty trusses of each. In the first-named Messrs. Paul & Son were first with Souvenir de la Malmaison and Mdle. Bonnaire, both fine; Mr. Cant followed with Mdle. Bonnaire and Devoniensis, and Messrs. Cranston with Niphotos. The best dark Roses were A. K. Williams, Marie Baumann, and Reynolds Hole from Mr. Cant, all being excellent. Messrs. Paul also had the first-named variety in good form, Messrs. Cranston being third with Madame Charles Wood, and Mr. G. Prince held a similar position with Horace Vernet. Messrs. Cranston were first in the pink variety class with Baronne de Rothschild, fresh, full, and handsome; and third with Marquise de Castellane. Mr. Jowitt followed with Duchesse de Morny, uncommonly fine both in form and colour. Mr. Cant was first with Marie Van Houtte and La Boule d'Or in the yellow variety class, having handsome flowers of each. Mr. G. Prince was second with Maréchal Niel and Reine du Portugal. Messrs. Paul and Cranston secured the prizes for twenty trusses of Rose buds, each firm contributing pretty collections.

Another distinct section of the open classes was for bouquets of Roses—white, dark, pink, yellow, and mixed. Several very pleasing bouquets were contributed in each class, and these being placed upon a central circular table proved a great attraction. The principal prizetakers were Messrs. Paul & Son, Cranston, Cooling & Sons, J. House, R. T. Veitch of Exeter, and Wilkins.

NEW ROSES.—A class was provided for six trusses of any new Rose not in commerce, and three exhibitors appeared, who were accorded the prizes in the following order—Mr. B. R. Cant first for *General Sir Evelyn Wood*, a Hybrid Perpetual Rose of good promise, very close and compact, of moderate size, and of a clear light purplish rose tint; Mr. C. Turner second for *Alice Turner*, also a Hybrid Perpetual of a soft, bright, rosy scarlet tint, neat in form and very effective—a most pleasing shade of colour; Messrs. Cranston third for *Mary Pochin*, a bright crimson scarlet Rose of moderate substance; petals broad, brighter in the upper surface.

Miscellaneous exhibits were not very numerous, but Messrs. H. Cannell & Son, Swanley, had an attractive collection of Pelargonium blooms comprising a large number of handsome varieties, and Mr. G. Prince exhibited several boxes of Tea and Noisette Roses, with a pretty collection of Rose buds. Both firms were highly commended.

#### CARDUUS ERIOPHORUS.

I HAVE been much struck with the beauty and elegance of the cotton-headed Thistle, *Carduus eriophorus*. I found some plants in the neighbourhood of Boulogne and brought home the seed, from which I have raised one plant. It is now rather more than 5 feet high and about the same in diameter at the base, and forms a pyramidal plant of no common elegance, though not yet in bloom. The heads of the Thistles are very curious covered with a cottony down; the flowers are a deep purple, and larger than any other Thistle that I am acquainted with. The leaves are half clasping the stem but not decurrent, cottony beneath, deeply pinnatifid with double lobes, one of which points upward, the other downward. I do not know if it is often used as a decorative plant, but I can highly recommend it as such. I have grown

*Onopordum acanthium* (Cotton Thistle) for decorative purposes; it makes a noble plant some 7 feet high, and a friend of mine last year had a hedge of it that formed a background of unique appearance, but it is inferior to the former plant for decorative purposes.—GEORGE DOWKER.

#### WIMBLEDON FLOWER SHOW.

WIMBLEDON is a notable place for contests, and the fine common is the rendezvous of thousands who congregate there from day to day at this period of the year. It is fitting that among other organisations the district should have a horticultural society, for it is studded with good gardens managed by intelligent men and excellent cultivators. The ninth Show was held on Thursday last, by the kind permission of Mr. Walters, in the well-timbered grounds of Woodhays, the visitors being further favoured with access to the flower garden which Mr. Bridger had rendered so attractive by its brightness and extreme neatness. The Exhibition was in most respects fully equal to those of the past, and in some respects decidedly superior. A new feature this year consisted in the groups of plants arranged for effect, and the competition was so good that this department of the Show and the Roses and cut flower classes, including vases, bouquets, &c., shared about equally the attention of the visitors. Of fruit the display was very creditable, and vegetables were admirably represented, the Judges having had great difficulty in making the awards.

Only the general character of the Show can be noticed, the effect groups claiming prior attention. These were arranged along the sides of the marquee, most of them being of semicircular form, which is perhaps the best mode of disposing of collections ranging from 50 to 100 superficial feet in extent, larger groups having a greater lateral extension according to the width of the tent. By this arrangement only one "face" has to be produced, and this with small groups can be rendered more picturesque than when the arrangement is of square or circular outline. In the open class for groups of 100 square feet Mr. Stevens, St. John's Wood Nursery, Putney, was worthily placed first with a free and diversified arrangement, the plants being in excellent condition; the margin of Gloxinias and Selaginellas was very attractive. Messrs. B. Peed & Son, Streatham, were second with a very bright arrangement, the Heaths showing to great advantage. Although this group was not crowded it was too smooth to gain a higher award. Mr. Law, gardener to R. S. Dean, Esq., The Priory, Wimbledon, was the remaining prizewinner, and well deserved his position. In the smaller 50-foot groups Mr. Bridger; Mr. Stratton, gardener to Miss Forbes, Chester House, Wimbledon; and Mr. Bentley, gardener to Sir Thomas Gabriel, Bart., Roehampton, were awarded the prizes in the order named for arrangements of considerable merit, but in some of them the plants were rather too closely packed, and the groups too formal. Prizes were also offered for still smaller groups of 40 square feet open to amateurs not employing a regular gardener, and highly creditable displays were arranged by Messrs. Dove, Collins, and Maton, the prizetakers in this class. Mr. Thompson, nurseryman, Wimbledon, arranged a beautiful group not for competition; the margin of *Caladium argyrites* was particularly attractive. Messrs. J. Laing & Co., Forest Hill, had also a fine group composed of valuable plants tastefully arranged, also a box of splendid Begonia flowers. For these collections certificates of merit were deservedly awarded.

In the specimen plant classes the competition was good, and many excellent examples of culture were staged. Stove and greenhouse plants and Ferns were generally very good, many plants in the last-named class being superior. Zonal Pelargoniums were not on the whole quite so good as we have seen them. *Caladiums*, *Gloxinias*, and especially *Tuberous Begonias* were very fine, and *Coleuses* and *Achimenes* good. The principal prizetakers in the above classes were Messrs. Bentley, Bridger, Stratton, Law, Wormald, Starr, and Forbes. Mr. Legg, Worple Nursery, exhibited a fine group of the newer varieties of Zonal Pelargoniums in 5-inch pots. The plants were splendidly grown and flowered, and merited, as they received, high commendation. Some excellent stands of Roses were staged, and the competition in the principal classes was very close. In the open class for twenty-four blooms Messrs. Gibson, Moorman, and Berry were the successful exhibitors, and in the special prize for twelve blooms Dr. Brooklees was first, Mr. Moorman second, and Mr. Coleby third. Messrs. Veitch & Sons, Chelsea, showed splendid stands, not for competition, and for which a certificate of merit was granted.

Fruit was generally of good average quality. For a collection of six distinct dishes Mr. Davis secured the premier position with black and white Grapes, Figs, Melons, Peaches, and Nectarines. For black Grapes Mr. Law was in the first position; for white Grapes Mr. Bentley; and Messrs. Alderman, Davis, and Cole were the most successful exhibitors of Peaches, Nectarines, and Strawberries. Mr. Bennett staged a collection of six bunches of Grapes and six Melons not for competition, and received a certificate of merit.

Vegetables were very good indeed, and it is seldom that there is such close competition as existed in the class for twelve dishes staged by Messrs. Fanning, Gibson, and Law, who were awarded the prizes in the order named after a long and critical examination by the Judges.

A great number of special prizes were provided by supporters of the Society, including Lady Peek, who provided prizes for hardy flowers; and Sir Trevor Lawrence, Bart., for table plants. The com-

petition in these classes was good throughout. Cottagers staged garden produce of great excellence, and the contributions of wild flowers and grasses by school children were very meritorious. The Show was excellently managed by Mr. Rolt, the able Secretary, and the members of the Committee, and was altogether both enjoyable and successful.

#### CROTON SINITZINIANUS.

AMONG the new Crotons with narrow leaves this appears likely to obtain a high position, for when in good condition it is scarcely surpassed in elegance of habit. To render it most effective, however, the yellow and dark green tints in the leaves require to be well and clearly developed, or there is a slight approach to

dulness in the appearance of the plant. The introducers, Messrs. Veitch & Son, Chelsea, have favoured us with the accompanying woodcut, which faithfully represents the characters of the plant as it has been shown at various metropolitan exhibitions, when certificates have been awarded for it. The firm also gives the following particulars concerning it:—"An elegant variety, kindly sent to us by Sir William Macarthur, of Camden Park, near Sydney, New South Wales. The plant is of very light and pleasing aspect. The leaves are narrowly lanceolate, gracefully arching and variable, some with interruptions, others with the blade spirally twisted two or three times round the midrib at the middle; others again crisped and undulated. In colour they are deep olive green variegated with straw yellow, which is constant.

Fig. 5.—CROTON SINITZINIANUS.

It is one of the best of Crotons for table decoration. We have much pleasure in dedicating this elegant plant to Monsieur Peter Sinitzin, an accomplished Russian amateur."

#### CARDIFF ROSE SHOW.

ONE of the latest adhesions to the cause of the Rose has been the flourishing town of Cardiff, and thus her majesty has been able to assert her sovereignty in the principality. A Society has been started under the most favourable auspices; and although most of those who exhibited had never seen a Rose show before and knew nothing of the quality of flowers required to win success, yet as a first attempt it may be regarded as a success, and an indication has been given of future progress. The Exhibition was held in the Drill Hall, a grand building for the purpose, with the light from above and abundance of room for moving about. The flowers were arranged on two long tables running the entire length of the room; in fact rather too much space had been allowed, but this and other matters will no doubt be

rectified at the next Exhibition of the Society. The principal exhibitors were amongst nurserymen the Cranston Company from Hereford; and amongst amateurs Mr. Pettigrew, gardener to the Marquis of Bute, Cardiff Castle, and Mr. Crossley, gardener to Lord Windsor at St. Fagan's. There were many other exhibitors, but the stands exhibited by them far surpassed any others.

The Cranston Company, as might have been expected, being near home exhibited some very fine flowers, notwithstanding that their own Show at Hereford was held on the same day, their immense stock enabling them to compete at both successfully. In the stand for thirty-six blooms, in which they gained the first prize, were excellent flowers of Madame Charles Wood, Fisher Holmes, Eugénie Verdier, Perle des Jardins, Comtesse d'Oxford, Exposition de Brie, Madame Vidot, a Rose rarely seen on the exhibition table; Horace Vernet, Niphetos, Hippolyte Jamain, Marie Guillot, a very beautiful Tea; Annie Laxton, Auguste Neumann, Lord Macaulay, Edouard Morren, Mons. Boncenne, and Souvenir d'Elise. Mr. J. Tresider of the Ely Road Nursery was second. In the class of twenty-four trebles the

Cranston Company were again first with fine blooms, among which were Baronne de Rothschild, Duchesse de Vallombrosa, Marie Baumann, Mons. Noman, Le Havre, Marie Cointet, Boieldieu, very fine. They were also first in the class for twenty-four single. Capt. Christy, A. K. Williams, Madame Lacharme, very pure; Mrs. Baker, Comtesse de Serenye, extra; Mons. E. Y. Teas, Jean Liabaud, Marie Cointet, Général Jacqueminot, La Rosière, and Madame Charles Wood were exceptionally good. But their most taking stand was that for twenty-four Teas and Noisettes, although some have contended that it was impossible to show twenty-four good Teas. It contained Maréchal Niel, Catherine Mermet, Madame Camille, Madame Caroline Kuster, Louise de Savoie, Madame Ccline Noirey, Innocente Pirola, very beautiful; Perle de Lyon, Comtesse de Nadaillac, a lovely bloom; Devoniensis, Marshal Bugeaud, Souvenir de Paul Neyron, Madame Hippolyte Jamain, Rubens, Madame Furtado, Madame Sertot, Madame Emilie Dupuy, Perle des Jardins, Bouquet d'Or, Marie Van Houtte. This box certainly attracted, and deservedly, more attention than any other in the Exhibition. In the stand for twenty-four blooms of one variety they gained the first prize with clean blooms of Mons. Noman, and in that for twelve Teas with a beautiful box of Perle des Jardins.

In the amateur class Mr. Crossley was first with Ville de St. Denis, Abel Grand, Alfred Colomb, Mdle. Annie Wood, Marquise de Castellane, Génér al Jacqueminot, Capt. Christy, Charles Lefebvre, Mdle. Marie Cointet, La Fontaine, Pierre Notting, Marie Baumann, Maréchal Niel, Centifolia rosea, Comtesse de Serenye, very fine; Star of Waltham, Sultan of Zanzibar, V. Verdier, Madame Lacharme, François Michelin, Bessie Johnson, and Boieldieu. Mr. Pettigrew was a good second, and had among others fine blooms of Madame Lacharme, La France, and Baronne de Rothschild. In the class for twelve Mr. Moore of Coedyleon, Cardiff, was first with Marie Baumann, Sir Garnet Wolseley, Madame Eugénie Verdier, Louise Maynard, Abel Grand, Hippolyte Jamain, A. K. Williams, Marquise de Castellane; and in the class for twelve Teas Mr. Crossley was again first with Perle des Jardins, Letty Coles, Belle Lyonnaise, Catherine Mermet, President, Maréchal Niel, Souvenir d'un Ami, Lamarque, Devoniensis, Niphotos, and Celine Forestier. He was also first in the class for twelve of one sort with Marie Finger, and first in the class for six Teas or Noisettes with Gloire de Dijon.

The Marquis of Bute's liberal prize of £5 for the best twelve blooms of the old York-and-Lancaster Rose, or rather the Rose generally known as such, was won by Mr. Pettigrew; and the prize for the best twelve of Baronne de Rothschild was awarded to Mr. Crossley for a beautiful box of blooms, Mr. Pettigrew being a good second with a very fine box. It should be noticed that the scarcity of good blooms in the other boxes exhibited arose partly from the fact that a tremendous thunderstorm burst over Cardiff on the evening before, accompanied with torrents of rain, and that, as many of the exhibitors waited until the morning to cut their blooms, the greater portion of them were destroyed by it. The arrangements were carefully carried out by Mr. Pettigrew under the able superintendence of Major Knox. There was also an excellent show of Strawberries, some fine dishes of President, Sir Charles Napier, and Amateur being staged, and altogether the town of Cardiff may be congratulated on the step that it has made. The National Rose Society's medals were won by Mr. Cranston and Mr. Crossley.—D., Deal.

#### SUTTONS' MARVEL CABBAGE LETTUCE.

I HAVE grown many Cabbage Lettuces and seen many more, but I have no experience of any to surpass the one named above. It is superb in every way. At first the young plants are nearly black in colour and of no great promise. As the outer leaves do not extend far, consequently it can be grown close together; but from this small state it quickly assumes large proportions, and solid heads are soon formed of great crispness. I have several new vegetables on trial here this season, but none has pleased me so much as this Lettuce. Our stock of seed being very limited it was sown very thinly on a 4-foot bed. A number of the seedlings were transplanted, enough being left for a crop, and these are now very fine.—J. MUIR.

#### WHAT PLANTS USE.

(Continued from page 535.)

VERY few places have an adequate supply of proper water, and without this many failures, or at best very partial success, attend even well-directed labour and judiciously laid-out money otherwise. The first thing to consider in erecting glass houses which are to be filled with occupants requiring large quantities of water is where the water is to come from. Often it is the last, and its procuring afterwards costs more than can well be afforded. Too often the labour that ought to be spent elsewhere is spent in carrying it from a distance in cans; disappointment and failures follow, where otherwise success and satisfaction might result.

Closely allied with the subject of watering is the one of drainage. We cannot in this place enter into the subject deeply, and as it has often been treated on in the pages of the Journal it is

only necessary to draw attention here to the cleansing effects of draining. Soils from which water cannot readily escape generally contain matter noxious to vegetation. It is also known that when such lands are effectively drained the noxious matters disappear in time—are, in fact, washed by the descending rain out of the soil, and carried away by the drains. Soils into which water soaks but never passes through are always full of matter hurtful to vegetation. Even necessary food when present in superabundant quantity is hurtful, and often destructive. Soils into which much nourishment is washed by water, and never any washed out, speedily become unfit for plants. Very many old Vine borders are in this condition, especially those inside. More than once has the writer assisted in renewing inside borders of vinctries, and been astonished to find not a living root in the old soil. No doubt many readers have noticed the same. As we grew older wonder ceased at that. The wonder now is how any living thing can exist in some of them. Once we tried when very young to improve some fine Fuchsias by soaking the soil in which they grew with pure cow urine. It killed them. Since we have grown them with cow urine only for manure, and that with much success; but then it was given much diluted, and only at intervals. Between times liberal waterings were given of clean water, which effectually prevented any injurious accumulation of the salts contained in the urine.

It is seldom that the waterings which Vine borders receive filter through into the drains; and yet they should, otherwise of what use are the drains? Salts are necessary to plant life, and with ammonia are very helpful when they do not exceed a certain proportion in the soil. We all know that. When they are present in too great quantity they become actually poisonous. In hundreds, thousands of Vine borders, throughout the land salts are present in excessive quantity. When liquid manure is given to inside borders just in sufficient quantities to moisten the whole there is an addition to that border—of what? Water and manure? No, but manure only; for the water soon escapes by evaporation from the surface or by the leaves of the Vines, and a portion, very often a large one, of the manure is left behind in the border. This operation continues until so much accumulates that the roots perish, or travel away to more wholesome if poorer material. We all know that Vine roots travel far, but few dream that they are "driven from home."

The writer once served in a garden when the Vines were past their best and very near their worst. It was not for want of manure nor top-dressings. We ventured to hint to the head gardener that perhaps the borders were too rich. His opinion was they were too poor—exhausted he said. Fuchsias were being potted at the time, and as he laughed at my idea that the borders were too rich, it was proposed that a portion of the Fuchsias should be potted with soil from the borders without any addition save sand. This proposal was acceded to, to teach us how ignorant we were, for our reputation was risked by maintaining that they would fail to root in it, as proved to be the case. We went another step. It was proposed to take a given quantity of soil from the border and to make liquid manure with it, and to try it against an equal amount of cow manure. Each was used on an equal number of the afore-mentioned Fuchsias to test their value, and the liquid manure made from the soil taken from the border actually proved stronger than that from the cow manure. The whole border was a manure heap, and a strong one. Many borders are in the same condition.

How is this state of matters to be remedied or prevented? By withholding manure? By no means. How does Nature prevent an undue accumulation of acids and salts? She washes them out. Why cannot we do the same? Some fear to impoverish their borders if they do so. But there is no real danger of that. It is only when these are present in too great quantity that they are removed at all. Soils hold saline and other matters in spite of water, indeed filter them out of water. There is no fear then of impoverishment ensuing when water is passed through borders in quantities sufficient to cleanse them. Moreover, liquid manure should follow, for one dose will never harm unless too strong, but the very reverse. It is only when too strong or when the borders are already too rich that it does harm, and this over-richness cannot be better dealt with than by washing. Some may be inclined to ask, "Why wash out manure and then add more?" Well, the fact is, few manures possess the different salts which Vines need in the proportion required. No matter, then, how carefully we apply manure, there will be left in the soil the matters which were present in excessive quantity in the manure applied. Again, even under-manured soils through which water never passes accumulate hurtful matters which water is capable of removing. Soils may be poor and also noxious; soils may be rich and yet wholesome. It is not only excessive accumulations

of manurial matter which render soils noxious, but acid and other matters seldom fail to accumulate unless the soil is cleansed by water and air. Aërated soils are seldom noxious, and nothing secures the aëration of soils compared with waterings if the soils are properly drained. As the rain fills the pores of the soil the air it contains is driven out; as the water drains off the air follows, and thus is renewed. The air as well as the rain is generally warmer than the soil, and they therefore warm it. When it does not pass through but stagnates instead, sourness, coldness, and generally unwholesomeness is the result.—SINGLE-HANDED.

#### HORSHAM ROSE SHOW.

THE fact of the heavy thunderstorm rain of July 5th not having reached this district was rather a disadvantage to the Horsham exhibitors, watering being comparatively at such a time of very little use. Notwithstanding, the Show was a fairly good one. The honours of the day belonged distinctly to Mr. A. Slaughter, who, amongst other first prizes, obtained that for twelve Teas, the box being also the best in the Show, and thus gaining the National Rose Society's silver medal, and also containing a Rose, Madame Lambard, which obtained of itself the Society's bronze medal as being the best Rose in the Show.

Probably very considerable difficulty was experienced in comparing Hybrid Perpetuals with Teas; the best of the former was unmistakably a large Marie Baumann in Mr. Sharp's box of six of the same kind. Mr. Mawley exhibited an A. K. Williams of considerable merit. Mr. Slaughter obtained a second prize for twelve of any kind, showing very fine Baronne de Rothschild, Camille de Rohan, and Comtesse de Serenye, being only surpassed by an almost faultless box shown by Mrs. Henry Padwick, in which were splendid specimens of Etienne Levet, Paul Neyron, Prince Camille de Rohan, and Duchesse de Vallombrosa. In the open class of twenty-four Mr. Piper was first, and Mr. Brown of Reigate a very good second; in the open twelve class Mr. Mawley of Croydon was first; in the eighteen of the Society Mr. Sharp obtained a first; in the open twelve Hybrid Perpetual class Mr. Piper's liberal prizes, for Roses to be selected from his catalogue, were gained by the Rev. A. Cheales and Mr. Graveley of Cowfold. The coolness of the day contributed to the excellent appearance of the Roses, and contrasted agreeably with the oppressive heats of the earlier part of the week.

It is to be regretted that this spirited and liberally conducted Society does not receive either the local or county support to which it is entitled. The attendance during the afternoon was very scanty.—A. C.

#### DAY'S EARLY SUNRISE PEA.

WILL any readers of the Journal who have grown this Pea be good enough to state their experience with it? There are a great number of people, myself among the number, who cannot afford to try all the novelties the first year of their introduction, but wait with much anxiety for information which that year affords. The second year's sale of a new vegetable, if it is of proved excellence, is always great, and if the price is slightly lower it is a great advantage to many purchasers and no loss to the vendors. I have heard an excellent account of the Pea in question from a friend who has seen it growing; and another friend who has partaken of a dish states that it is a very good Pea, but not better than William I. nor quite so early; yet another informant states it is finer than William I. in appearance, but not quite so good in quality, while there is no difference in the two varieties as to the period of use. This evidence is a little conflicting and not quite satisfactory, and I feel sure a record of the practice of cultivators would be welcome to many.—CLERICUS.

#### REIGATE ROSE SHOW.

IN the Priory, one of the prettiest places where places of that character abound, by the kindness of Lady Hay Somers the Reigate Show was held this year on Tuesday last, the 5th inst., which we are told, and which indeed we hardly need to be told, was one of the hottest days we have experienced for the last twenty years—as much in the extreme of heat as was that awful Tuesday in January in the extreme of cold. It may be readily imagined, as the Exhibition was held in a tent, that it was very trying for the flowers, and long before the Show was over they must have been quite *passée*; but in the morning, when the Judges went round, they were very fine—indeed, how can it be otherwise when Reigate possesses such keen lovers of the Rose and such successful exhibitors as Mr. Baker, Mr. Haywood, Mr. Wollaston, Mr. Sargent, Mr. Waterlow, and Mr. Pawle, who have mostly won high honours, and that very often, in our metropolitan shows?

In the class for twenty-four Mr. A. J. Waterlow was first with an excellent box, containing King's Acre, Capitaine Christy, Marquise de Castellane, Devoniensis, François Michelin, Marie Baumann, La France, Edouard Morren, Bouquet d'Or, Baron Hausmann, Abel Carrière, Perfection de Lyon, Etienne Levet, Madame Hippolyte Jamain,

Penelope Mayo, Dupuy Jamain, Comtesse de Serenye, Marie Cointet, François Premier, Duchesse de Caylus, Camille Bernardin, Pierre Notting, Marie Rady, and Charles Lefebvre. Mr. Haywood was a good second in the class for twelve. Mr. Haywood had a splendid box, containing Marie Verdier, Mons. Noman, Louise Pernet, Baroness Rothschild, Madame Hippolyte Jamain, Madame Victor Verdier, Mons. E. Y. Teas, Duke of Edinburgh, Marie Rady, Madame Lacharme, and Charles Lefebvre. In the class for trebles Mr. Sargent was first with Horace Vernet, Madame Hippolyte Jamain, Emilie Hausburg, Camille Bernardin, Duchesse de Vallombrosa, Madame Lacharme, Marie Baumann, and Capitaine Christy. In the class for twelve Teas there was a keen contest between the excellent President of the Society (Mr. Geo. Baker) and Mr. Waterlow, decided in favour of the latter ultimately, but with very little to spare—in racing parlance, won by a head only. Mr. Waterlow's contained Gloire de Dijon, Caroline Kuster, Bouquet d'Or, Madame Camille, Catherine Mermet, Madame Willermoz, Souvenir de Paul Neyron, Alba Rosea, Marie Guillot, Jean Ducher, Niphetos, and Jean Pernet. Mr. Baker's box contained Niphetos, Madame Charles, Céline Noirey, Souvenir d'Elise, Alba Rosea, Souvenir d'un Ami, Anna Ollivier, Archimede, Devoniensis, Rubens, and Marie Guillot. In the class for six Teas Mr. E. Mawley was first with Caroline Kuster, Innocente Pirola, Jean Ducher, Marie Van Houtte, Perle des Jardins, and Souvenir d'un Ami. This was an excellent box, and reflected great credit on an exhibitor who has so small a number of plants. The much-coveted prize of the gold medal of the National Rose Society, which was generally admired, was won by Mr. Sargent for the best box of twelve blooms of one kind with a splendid stand of Baronne de Rothschild. The silver medals for the best Hybrid Perpetual was won by Mr. Haywood for a splendid bloom of Charles Lefebvre; and for the best Tea by Mr. Geo. Baker. The prize for the best six of any one kind was taken by Mr. Stone with a good stand of Marie Baumann; and the second by Mr. Cuthill for a nearly equal stand of Général Jacqueminot. I am aware that this is rather an imperfect record of the doings at Reigate, but with the thermometer at 85° in the shade, and the prospect of a journey to Cardiff in the afternoon, I think the readers of the Journal will not be very hard upon the writer.

In one respect there was a great falling-off in the Exhibition—the stands of cut Roses and foliage. When I first visited Reigate there was a tent full of these, and most of them excellent in design and execution; this year, owing to what cause I know not, there were only four, the first prize being awarded to a very beautiful stand of wild Roses and foliage exhibited by the same lady whose stand some three years ago was so exquisite—Miss Thornton, and with whom the Treasurer declares I fell in love on account of it! Her stand this year was somewhat like it, and set up with the same good taste. The second stand was also very pretty. The hand bouquets of Roses were of no special merit; but then it is a most difficult thing to make a bouquet of one flower alone, and especially of the Rose, to look elegant. I must not omit to mention that Messrs. James Veitch and Sons of Chelsea sent down a most interesting group of plants, which occupied one end of the tent, the plants which attracted most attention being the Nepenthes, Sarracénias, Droseras, and Cephalotuses.

Reigate possesses in its President one of the most genial and hospitable of men, and one who never fails to show honour to all who love his favourite flower; and I am sure all who know, and who consequently value him, will wish that he may be spared for many years to preside over a Society which fosters the Rose.—D., Deal.

#### THE ST. OSYTH SEED FARMS IN JULY.

WITHIN a few miles of the Essex coast, in the direction of Clacton-on-Sea, is situated the small and quiet village of St. Osyth. This has long been invested with much interest to the antiquarian, as the reputed site of a nunnery said to be the most ancient institution of the kind in the county, and originally founded by a daughter of one of the East Anglian kings. It is near this historic village that the travelling horticulturist will find an estate of surpassing beauty should he be fortunate enough to visit the district during the summer months. The beauty does not consist in verdant lawns, winding walks, majestic trees, or elaborately designed flower beds. The flowers are indeed there, but in lines hundreds of yards long, or in large quadrangular patches each nearly an acre in extent. It is in these masses of colour that we find a beauty, a splendour—nay, even in some cases a gorgeousness, that cannot be rivalled in ordinary gardens.

Few indeed have the opportunity of seeing annuals and other popular flowering plants in such quantities as they are grown in Messrs. J. Carter & Co.'s seed farms, and those who are only accustomed to the slender lines and diminutive plots of those flowers ordinarily seen in gardens could scarcely imagine the magnificent effect produced by the huge masses of scarlet, pink, yellow, and blue. Of course there is a far more practical signification attached to them than their brilliancy or beauty to the visitor, for they represent a portion of the stock in trade of a great firm, and as such we perceive in the high quality of the strains, and the care exercised to preserve them pure, the most substantial testimonials it is possible to obtain. Annuals are chiefly

grown at the St. Osyth farms, vegetables being only represented by a few choice Peas and Lettuces, the bulk of the stock in this department being grown elsewhere. To enumerate the former alone would far exceed the space at our disposal, but a few of the most remarkable, together with the most distinct and striking novelties, may be briefly indicated to convey some idea of the extent and nature of the work done. One of the first attractions was a large square bed of the Blue Woodruff (*Asperula azurea cæspitosa*), of tufted habit, and, viewed in the mass of a soft blue tint, reminding one strongly of the peculiar steely hue characterising the flower heads of some *Echinops*. Near this were masses of the light yellow composite *Helipterum Sandfordi*, and beds of the large pale yellow Wallflower-like *Erysimum arkan-sanum*. Clarkias in several portions of the farm were grandly represented, especially noteworthy being a beautiful novelty which originated there entitled Mrs. Langtry. This is unquestionably a distinct and handsome variety, the petals having evenly rounded margins, rich crimson in the centre, with a broad and clearly defined marginal band of white; it is very constant and will probably become a popular favourite. Passing large extents of *Leptosiphons*, yellow and purple Sweet Sultans, we next noted several select varieties of *Godetia* in similar profusion. G. Lady Albemarle is now an established and well-known form,

Fig. 6.—Clarkia Mrs. Langtry.

and the crimson flowers produce a grand effect; yet the new variety Princess of Wales with bright crimson flowers having a lighter centre, and of very compact habit, is even more attractive. *Eschscholtzias* are extremely brilliant, the bright yellow *E. californicus* and *E. crocea*, with its varieties, and the handsome orange and dark scarlet *E. Mandarin* are well represented. A very distinct and pretty form with soft, clear, rosy-tinted flowers selected from the last-named, is also being tried, and is likely to prove an acquisition of considerable value. Efforts are being made to secure a Mandarin *Eschscholtzia* that shall have the inner surface of the flower of a similar tint to the outer portion of the petals, and already there is evidence of some progress having been made. The bright pink *Saponaria calabrica* occupies hundreds of square yards, while the dwarf free-flowering *Silene pendula compacta* was seen in equal quantities; *Antirrhinums* of diverse hues, bright blue *Clintonias*, and soft azurean *Kaulfussias*, all contributing to a vast panoramic plateau of colours. Now an unsurpassed bed of dark crimson *Candytuft* came in view, and the richness of colour was still further heightened by contrast with huge breadths of the sweet white *Alyssum* which load the air with delicate perfume. The *Candytuft* is remarkably fine and merits all that can be said in its praise, for both in compactness of habit and depth of colour it is superb.

Another important feature is the breadths of Virginian *Stock* of several fine varieties, but one, a recent selection on the farm, now well tested and perfectly true, is named Fairy Queen—a well-chosen title for what is by far the most handsome form that has yet come beneath our notice. It is dwarf and compact in habit, and the flowers when they first expand are a very bright rose colour with a distinct approach to scarlet, which as they become

older fades to a lighter hue, and when seen in a mass the combination of these tints produces a soft yet bright hue that is most pleasing. A short distance from these *Convolvulus minor mon-strosus* presents a grand sheet of the most brilliant blue flowers relieved by the white centres. So even was the bed that it resembled a handsome and elaborate mosaic pavement in blue and white, the foliage being scarcely visible. A variety of the smaller *Convolvulus* termed *unicaulis* is also notable. Its peculiarity is, as the name implies, the production of a single stem, which seems to concentrate the strength of the plant in one head of flowers, consequently these came of great size and surprising richness of colour. Larkspurs are grown in variety, early and late, tall and dwarf, in many shades of colour, but the most striking of all is a soft rose-coloured double form which has the flowers so closely crowded on the stem as to constitute veritable wreaths. Sweet Peas are largely grown of many distinct shades of colour. One large patch nearly half an acre in extent of the Invincible Scarlet produced an indescribably brilliant effect, while correspondingly soft in shade was a breadth of Painted Lady, the upper petals or standard of which are bright rose, and the lower white. Both are handsome varieties, and as grown at St. Osyth they are as true as possible. *Tropæolums* next merit attention. The thoroughly useful King of Tom Thumbs was in admirable condition, the lines of dwarf compact plants appearing almost as if they had been moved to bring them to such an exact level. The foliage, as is well known, is very dark, and the flowers rich scarlet, but a selection named Empress of India is considered to surpass it. The plant is similar in habit and foliage, but the flowers are said to be much deeper and richer in hue; these, unfortunately, we were unable to see, as none was expanded at the time of our visit. Probably, however, visitors to the Kensington meetings will soon have an opportunity of seeing it. The fine Marigold, *Calendula officinalis Meteor*, deserves a passing word of notice, for its distinctive characters were well shown in a large bed of it there, very little variation being perceptible in the colours or markings of the flower heads. Some of these exceeded 3 inches in diameter, even and circular in outline, the florets being light orange yellow neatly margined with bright orange. Choice selected strains of Pansies, yellow, purple, and blue, were observable; one, the Beauty of St. Osyth, being a fine velvety black. *Rhodanthes*, too, were attractive, both the *Manglesi* and *maculata* varieties; and there, as elsewhere, an improvement in the old types had been effected by selection. This was a *Manglesi* form, very dwarf, remarkably profuse in flowering, and the flower heads of an uncommonly bright rose colour. Sweet-Williams were very handsome, some of the flowers exceeding an inch in diameter, of excellent form, substance, and colours. *Viscarias*, too, were abundant and attractive, especially the dazzling *V. cardinalis*; the dwarf bright blue *Lupinus nanus*, the double white *Chrysanthemum Dunnetti*, the bright yellow and pretty *Bartonia aurea*, with innumerable other beautiful plants, which cannot be noticed at length. We may conclude the notice of this portion by a brief reference to a remarkably dwarf *Mignonne* entitled Golden Queen, which forms compact plants about a foot high, branching freely, and bearing close spikes of yellow-tinted flowers. The closeness yet vigour of the plant is very striking.

Peas have been casually alluded to, and it is only necessary to add that several very promising novelties are on the way. One tall variety bids fair to be the latest Pea grown, and several other medium-height forms which appear unusually prolific and of good quality have not yet been named. But by far the most striking among the Peas was *Stratagem*, which is rather largely grown on this farm, and in every portion it was of similarly excellent appearance, the very short but strong haulm being loaded with large handsome pods well filled with peas. In some instances so abundant was the crop that it was jokingly suggested the pods had been placed on the haulm. Telephone was also in first-rate condition, and as any doubt as to its distinctness must have long since ceased, it is unnecessary to refer to the characters it so clearly bears there. Many other Peas are also grown for trial, and thus a good opportunity is afforded of testing their respective quality. With this we may conclude these few notes upon one of the finest-kept business establishments of the kind we have had the satisfaction of visiting.—VISITOR.

#### SHREWSBURY ROSE SHOW.

THE annual Rose Show of this flourishing Society was held in the Music Hall of this ancient town on Thursday, July 7th, with the enviable adjuncts of admirable management, lovely weather, numerous visitors, and superb Roses; yet, notwithstanding these indispensable elements of success, your reporter never found his expe-

rience help him so little in chronicling for this Rose Journal the leading features of the Exhibition. Mainly was this the case for the following reasons. The schedule is divided into two classes only (1), "open to all," whether amateur or nurseryman; (2) "open only to Shropshire and Montgomeryshire"—a plan obviously exposed to many fatal objections, and proved so here by an almost entire absence of competition in the former class. Mr. Jowitt, The Old Weir, Hereford, most pluckily competed against Cranston's Nursery and Seed Company, Hereford, with seventy-two single varieties, and made a close and gallant fight, or otherwise the latter would, uncontested, have had their own way throughout every class. The public, however, were little losers by want of competition, as Cranston's Company exhibited their very best, evidently with as much pains and in such a brilliant manner as if every prize was keenly contested and each point of consequence. Their forty-eight trebles, that *bête noir* of every exhibitor except a leviathan, and in perfect cutting form, was throughout absolutely faultless in brightly coloured smooth symmetrical blooms.

Thus wholly indebted as the Society was to the Hereford contingent, and admirable as were the exhibits it has been our pleasure to record, it is all the more regrettable that in staging the seventy-two varieties an unaccountable imbroglio followed in both these collections, which no impartial report could omit. In Cranston Company's collection H.P. Capitaine Christy was shown in duplicate, while in Mr. Jowitt's collection more than one irregularity was apparent—most unusual, it must be allowed, in the case of so skilled and experienced a stager. The management, on the recommendation of the Judges (there being no third competitor), equally divided the awards in this class into two special prizes, as the Roses on their merits richly deserved.

To particularise specially fine blooms in Cranston's seventy-two collection, single blooms, the following were grand specimens, including for the year a fine sprinkling of Teas:—H.P. Madame Charles Wood, superb; Teas Souvenir d'Elise, Anna Ollivier, and Catherine Mermet, each of fine form and size; also Tea Marie Guillot, H.P.'s Mdle. Julie Dymonier, a new stout-petalled pink Rose of undoubted promise; Louis Van Houtte, Dr. Andre, very smooth and fine; Mdle. Bonnaire, good size and exquisite purity; Abel Carrière, intensely dark; A. K. Williams, fine in usual colour and form; and Edouard Pynaert. In Mr. Jowitt's seventy-two collection specially noticeable were H.P.'s Madame Ducher, new and very promising; Duchess of Bedford, a great acquisition; Sir Garnet Wolseley, fine symmetry; Mary Pochin, fine colour, but too small; Mabel Morrison, a wonder of the season, perfect substance, with a dash of colour in just one outside petal to prove its sportive origin; and Duchesse de Morny, exquisite.

In Cranston Co.'s collection of forty-eight varieties not already mentioned, H.P.'s Countess of Oxford, Constantin Tretiakoff, superb; Mons. E. Y. Teas, Madame Noman, exquisite; Duke of Connaught, small, but compact and fine; Mons. Bonstettin, bright and black; Madame Ferdinand Jamain, neutral colour, of great substance, new and useful; Marquise de Montmartre, as seldom shown; Bourbon Souvenir de la Malmaison, clear flesh with no coarseness; and again Madame Charles Wood, each absolute perfection.

In twenty-four Tea and Noisette Roses, specially noticeable in Cranston Co.'s fine collection were Comtesse de Naidallac, Madame Lambard, and Innocente Pirola, new and very promising.

In the close division, open only to Shropshire and Montgomeryshire, exhibitors, with one or two exceptions, hardly showed their best. This much may be said by way of allowance, that a foot-note in the schedule of prizes officially forbidding any "artificial support" was as needless as it was cruel; indeed, most of the Roses out of their deep mossy graves seemed to helplessly point to their crippled charms, and mutely murmur a protest.

It only remains to mention that the Rev. John A. Williams, Yardley Wood, Birmingham, and the Rev. C. H. Bulmer, Credenhill Rectory, Hereford, acted as Judges throughout the several classes; and that, as is usual at these exhibitions, the Hon. Secs., Messrs. Adnitt and Naunton, thoroughly succeeded in the task they set themselves—to make everyone feel thoroughly at home, and the Exhibition, florally at least, a success.—THE HEREFORDSHIRE INCUMBENT.

## GLASS STRUCTURES FOR AMATEURS.

### VINES.

**TEMPERATURE.**—From the commencement of March the temperature should be kept at 50° artificially, and advance by sun heat to 60° or 65°, ventilation commencing from 55° and closing with sun at 65°. When the Vines are in leaf gradually raise the temperature to 55° at night and 60° to 65° by day, and 70° to 75° from sun heat. When the bunches come into flower the temperature should be increased to 60° to 65° at night and 70° to 75° by day, or a few degrees more from sun heat, and those temperatures should be maintained until the fruit is thoroughly ripe. Five degrees less at night will not be injurious, and the greatest possible benefit result from allowing an advance to 85° or 90° in the afternoon of fine days. The fruit being ripe, the temperature may gradually fall to 50° at night, and after October the house may be kept at 40° or 45° artificially, ventilating on fine mornings and very freely above 50°, closing between that and 45°. Grapes or the Vines that produce them, if assisted with a little fire heat in

spring, so as to give them a start and have them in a forward condition by the time summer arrives, will give much better results than those that have most of their work to do when the warm weather arrives and are not able to complete it before it becomes too cold for perfecting the crop. Grapes are so valuable that even those with but one house should strive to have them in the best possible condition. If a supply of Grapes be wanted, say in September, sun heat in most seasons will ripen the fruit fairly well without artificial aid, though those assisted are very much better. In this case only such kinds as Black Hamburg should be grown; and even with what are termed "cool house" Grapes the assistance of a little fire heat in spring and when ripening, should the weather be unfavourable, will be very beneficial.

**Ventilation.**—The object of ventilation is to prevent the temperature from rising too high and induce a sturdy, healthful growth. At the commencement of activity in the Vines the house must be ventilated to suit the Vines, and not any other plants in the house, unless, of course, they are the primary object. The ventilation should commence from the minimum day temperature—i. e., 55°, and in such proportion as not to lower it. It is of the utmost consequence to attend to ventilation in the early stages of growth, so as to secure short-jointed wood and well-developed foliage. The ventilation should not only be commenced early and increased with the rising temperature, but it must be reduced early and gradually with the declining heat. The chief considerations are to admit air early, and thereby prevent scorching, and to close early. One example will suffice to show what is meant. Granted the Vines are in full foliage and the Grapes swelling, the temperature at night 60° to 65°, or it may fall to 55° without injury. The sun on a fine morning will soon raise the temperature 5° to 10°, or to 70° or 75°, when air should be admitted, increasing the ventilation in proportion to the temperature, allowing an advance to 80° or 85°. When the heat lessens close the house at 80°, and so timed that the temperature will, instead of falling, rise 5° to 10°, or 85° to 90°. It is not the afternoon but morning sun acting on cold moisture-laden surfaces that scorches. When the Grapes are ripening a free circulation of air is essential to good finish.

**Moisture.**—Damping the Vines may be practised every fine afternoon from the time the buds commence swelling until the flowers open, when it must be discontinued, and should not again be resorted to unless there is clear rain water at command, and then it may be continued occasionally on fine afternoons. The house should be well damped at closing time, and again if the surfaces become dry before night. When the weather is hot damping may be practised at noon as well as in the early part of the day. Syringing the foliage must cease when the Grapes show colour for ripening, and damping must be gradually reduced.

**Watering.**—The border must not be allowed to become dust-dry in winter, and when the Vines commence growing a thorough soaking should be given the inside border with tepid water. The border must not after this be allowed to become dry, supplies being given as necessary to keep the soil moist, which will be needed about once a fortnight after the first month, and once a week in hot summer weather. Afford a thorough supply when the Grapes are colouring, which will usually be sufficient to mature the crop; but there must not be any deficiency of moisture in the soil when the crop is finishing, or it will not do so satisfactorily. Liquid manure will be beneficial when the fruit is swelling and up to colouring.

I have not thought it necessary to enter into minute details upon other points in Grape culture, as they are from time to time treated in special articles, and instructions are given periodically in the calendar as well as in the correspondent's column. I will only add avoid overcrowding of the foliage, overcropping, and over-dryness at the roots when the Vines are in full foliage.—G. ABBEY.

## GLADIOLUS COLVILLEI ALBUS.

WHITE flowers of elegant outline are so valuable for vase decoration, and generally so acceptable, that I am induced to say a word in favour of this chastely beautiful variety. The improved florists' varieties of *Gladiolus gandavensis* are most imposing and stately, but the spikes are too heavy to be of service for many purposes of floral decoration, and further, they are autumn rather than summer flowers. The earlier forms with their slender spikes and more thinly disposed flowers are, both as to their time of expansion and light and pleasing character, of special value to many cultivators. The early species and varieties are also very hardy, and are seldom injured by the disease that destroys the corms of so many of the others, and therefore these early sorts, and especially, I think, *G. Colvillei albus*, have claims to more extended cultivation. I have had plants flowering in pots, and they were

charming in the greenhouse a month ago, seven corms having been placed in a 6-inch pot at the time the Hyacinths were potted in October. Other corms were planted in clumps of a dozen in the borders, and produced a number of delightful spikes in June. No flowers in the garden were more prized than these by the young lady flower-gatherers whose duty and pleasure it is to render the drawing-room attractive, and the hundred corms planted last autumn have proved such a great success that I am urgently pressed to plant more, and shall certainly have great pleasure in doing so, for the wax-like flowers are most charming. —S. W.

#### THE ROSE ELECTION.

OUR Journal begins to teem with notes of the various Rose contests now coming on "fast and furious." The elections of the past two years have been partial, and not restricted to exhibition qualities—to many the one essential. It would seem, then, not inappropriate that in the parliament of Queen Rosa we might at least have a "general election" every three years and pin our faith on "triennial parliaments!" As it is to be an election of exhibition varieties it is necessary that there should be qualification for voters. We see no reason to lower the franchise. We take it that "every voter must be a prizetaker at a 'national' exhibition, or a frequent prizetaker at local Rose exhibitions." Any person thus qualified is hereby asked to assist by answering the following questions:—Name the best forty-eight exhibition varieties of the Rose. Distinguish the best twelve and second best twelve by some mark. The list will be considered as named in order of merit unless the contrary is stated. It will be noted that all varieties of the Rose are to be included. Latest date for returning the voting papers to me, August 31st.—JOSEPH HINTON, *Warminster*.

WE are informed that the STRAWBERRY FÊTE, which was held in the gardens of the Royal Horticultural Society at Chiswick on the 2nd inst., was a great success. The garden was crowded with a fashionable company, who evidently thoroughly enjoyed themselves, the weather being all that could be desired.

— MR. SHIRLEY HIBBERD will deliver a LECTURE ON THE CARNATION, in the conservatory at South Kensington, in connection with the Exhibition of the National Carnation and Picotee Society, at 3 P.M. on Tuesday next.

— A HOUSE-KEEPER writes to us as follows on PRESERVING FRUIT—"Some time ago I read in the Journal from one of your correspondents, that in preserve-making only a quarter of a pound of sugar to the pound of fruit should be used, the old-fashioned pound to pound being a mistake. Would some of your correspondents say if this is so, and if the fruit so preserved will keep?"

— WE have received from Mr. G. Bunyard of Maidstone the haulm and pods of a NEW PEA which came under their notice last year, one plant of which produced 380 peas. It has this season maintained its fertility. Mr. Bunyard states that "although of the Ne Plus Pea race it is a sport from Best of All." The pods are more curved than either of the varieties named, and are closely packed with dark green peas of excellent quality. Many pods contained ten peas, and the majority of them nine. The plant sent is very strong and short-jointed and about 4 feet high, the pods being produced in pairs.

— WE regret to learn, owing to some negligence of the railway authorities, that a skilled rosarian who had taken notes of the HEREFORD ROSE SHOW with the object of furnishing us with a report is unable to do so, as that portion of his luggage containing his notes appears to have been lost in transit. We hear that Messrs. Cranston & Co. staged magnificently at the

Show in question, and with Mr. Jowitt secured the premier prizes. We trust that our esteemed coadjutor will speedily recover his lost property, and that our readers will yet have the pleasure of reading his observations on the Show that he visited.

— "A WILTSHIREMAN" writing to a daily contemporary sends the following observations upon ASPARAGUS—"The wasteful way in which this delicious vegetable is cut and consequently brought to table is a striking example of the loss the public suffers, and apparently without complaint, in conformity to custom. When I see in the London markets the handsome bundles of large "grass," about six-sevenths of which is white and uneatable and only one-seventh eatable, and know that the same length might be sold for the same price all eatable, I cannot but regret the sad loss and waste of 600 per cent. on this article of food. The evil arises from cutting the Asparagus too soon and below the surface of the beds. I allow mine to grow 8 or 9 inches above the ground, and then cut an inch above the ground, and thus obtain 7 to 8 inches of green tops, the whole of which is eatable and of good flavour. Asparagus should be cooked standing in bundles in the pot with the tops just above the water to prevent their being overdone whilst the stems are being cooked sufficiently. If any of your readers who grow Asparagus will try this plan of cutting and cooking they will find they have saved the large per-centage I have mentioned, and better knowledge on the part of the public would soon bring green and eatable instead of white and uneatable Asparagus to market."

— THE enterprise of Americans is proverbial, and they are noted for turning everything to account. Even the PIG IN THE ORCHARD has its uses, for a contemporary states—"We have each year new remedies for protecting our Plums, believed by their inventors to be infallible, but most of them of no more utility for the purpose than moonshine. For the Plum-gouger, the pig in the orchard to eat all the early falling fruit, or the careful gathering of all such fruit and burning it; and for it and the Plum curculio the jarring of the insects from the trees at least once each day, in the cool of the morning or evening on sheets, and killing them, seems to be the only sure plan of getting a crop of Plums in orchard culture."

— THE WINE TRADE OF CALIFORNIA appears to be developing enormously. Mr. Consul Booker's figures show, that although the phylloxera seriously menaces the prosperity of some districts, the vintage of 1880 was close upon 12,000,000 gals. : 2,487,353 gals. of wine and 189,098 gals. of brandy were exported. A vineyard can be planted and maintained in California till its first year of production for from 70 to 75 dollars per acre. It is impossible as yet to make a classification of Californian wines. In the best districts varieties of Vines are still cultivated which deteriorate the quality of their characteristic products. In some places the cultivation of the best varieties suited to climate and soil has scarcely begun. Few vineyards, therefore, are capable of turning out completely blended and perfect wines. The scarcity of choice cuttings has frequently compelled the *vigneron* to plant whatever could be found most conveniently; but now that it has been proved to demonstration that it pays to grow the Vine in California, this lack of enterprise is not likely to last long. The capital already invested amounts to 30 million dollars, and provided that the danger from the phylloxera does not increase, it is soon likely to be quadrupled.

— THE HOT WEATHER experienced in most parts of England, and especially noticeable in London, during the first three days of the week, has, says the *Colonies and India*, led to the drawing of comparisons with that met with in other parts of the world. We believe that 86° in the shade is the highest temperature fairly registered by meteorologists this summer, though doubtless the

radiations from the pavements and walls in London streets has caused the mercury to reach a still higher grade. This is nothing abnormal, and an Australian, Canadian, or Anglo-Indian would consider it by no means unpleasantly warm. A temperature of 86° is that of an ordinary summer's day up-country in the Australian colonies, and outdoor work is in no way interfered with; the air, though hot, being bracing and uncontaminated by smoke, except perhaps from casual bush fires. But when the three-figure stage is reached there is little to be done but wait for a change. In Australia the extreme of heat is generally reached after Christmas; at Narrabri, in New South Wales, last March the mercury rose to above 103° in the shade for eight days in succession, and last summer at Bourke the thermometer registered from 105° to 114° for an entire week. We believe that the highest shade temperature recorded is that of 126° in Queensland some years ago, and meteorologists report that the country some three hundred miles north of Adelaide may be considered the hottest part of the world. But, except on the coast, the great heat of Australia and Canada is not depressing in its effect; and the rosy cheeks of the children in the interior tell plainly enough that it is not unhealthy. At Sydney it is very rare for the mercury to reach 100°; at Melbourne it occasionally exceeds that figure, but only for a day or two at a time. There is no disputing the fact that a temperature of 90° at Bombay, Madras, or Calcutta, or on the Gold Coast, or in Mauritius, is more enervating than that of 100° at a bush station in Australia or the Dominion. So long as the air is perfectly pure and dry great heat is not unhealthy, except in the cases of invalids and very young children; and we doubt whether any English settler in ordinary health, and using precautions dictated by common sense, has ever been prejudicially affected by an Australian summer sun. [92.7° was registered on the 5th inst. by Mr. G. J. Symons.]

— WE have received the fourth part of the work entitled "NEW COMMERCIAL PLANTS AND DRUGS," by Mr. Thos. Christy, which, like the preceding numbers, contains a large amount of useful and interesting particulars concerning many exotic plants of economic value. Their chief medicinal properties, or their uses as affording various products such as fibre and rubber, are fully described, and in several instances illustrations are given showing the chief botanical characters of the plants. The following extract upon the Cearà Rubber (*Manihot Glaziovii*) will convey an idea of the general character of the work:—"The Pará (*Hevea brasiliensis*) and Central American (*Castilloa elastica*) Rubbers may be considered a failure as regards their becoming objects for cultivation in plantations in India, &c., however suitable they may be for planting in forests, where a quick return of profit is not expected. The limited range of country in which suitable climate and surrounding circumstances can be found in India, the difficulty of propagation, and the length of time which must elapse before a profitable and regular yield of rubber can be obtained, is entirely against their adoption as a source of income. On the other hand the Cearà Rubber is remarkable for its hardiness, and for its ability to grow in rough stony ground and in a wider range of climate and elevation. The ease with which it is propagated, and the speedy yield of rubber of good quality, render it a species peculiarly suitable for cultivation in India and Australia as a valuable source of rubber."

— ONE of the Judges who officiated at the BRACEBRIDGE SHOW, near Lincoln, last week, writes in terms of high approval of the groups of plants that were arranged for effect in one of the tents there. Without these groups the Show would have been a comparative failure, with them it was a great success. They were arranged on a strong stage raised a foot from the ground. The first-prize group of Mr. Wipf, gardener to W. Clayton, Esq., the High Sheriff of the county, was remarkable in having an

arch across the back covered with *Cissus discolor*, and from the centre there was suspended a fine *Nepenthes*. Mr. Ruston's group was a very close second, the back plants of *Ficus Parcelli* associated with *Trachelium cæruleum* having a beautiful effect. The other groups of Major Ellison, Mr. Greenham, and Mr. Shuttleworth, for which prizes were awarded, were all meritorious but as a rule this arrangement was too smooth. Fruit was good generally; some Grapes sent by C. Minton Campbell, Esq., from Staffordshire, being of great excellence, and Canon Hole's first-prize Roses were extremely fine and well arranged. Mr. Ellison's fine fruit garden was a source of great attraction to the visitors, and its condition reflects great credit on both the owner and gardener.

— A CORRESPONDENT of the "Prairie Farmer" referring to the FRUIT AND FLOWERS OF THE ROCKY MOUNTAINS says—"The Commissioner of Agriculture at Washington could do the horticultural industry of our country valuable service by a careful investigation of this region of country, gathering and sending out to intelligent cultivators many promising varieties of our wild fruits and flowers. In Currants we find a large variety of the Black, Red, and Yellow. The flora of these grand old mountains for variety and beauty cannot be surpassed by any country. Our Conifers on account of their beauty and hardiness are attracting the attention of western nurserymen. The beautiful dwarf Oak and the dark green Alder intermingle with Roses, Spiræas, Columbine, Lilies, and thousands of other flowers, while the Mountain Ivy and fragrant Clematis covering trees and rocks all combining to teach us that the Creator did not form these mountains and canyons as a hiding place alone for gold and silver, but has placed His richest treasures on the surface free and visible to all; and yet man in his greed for precious metals passes them all by unnoticed and unappropriated."

#### THE PAULOWNIA IMPERIALIS.

WHEN in Florence the middle of last April I was much struck with the flowers these trees were covered with, resembling a blue Foxglove, if there be such a flower. The scent also was delicious. I have tried without success to obtain a plant suitable for a pot. It would enliven a conservatory, and fill the house with its perfume. Can anyone inform me where it can be obtained? I also saw at Monaco, and in Dr. Bennet's garden at Mentone, a very beautiful *Bougainvillea* growing most luxuriantly, the bracts or floral leaves being of a deep purple and crimson colour. I should like to know the name of this sort. Dr. Bennet told me it came from the Brazils. A son of mine living in Assam informed me that this plant climbed up the trees and hung down in large festoons, and that it always killed the tree to which it attached itself. I had several cuttings sent home from Mentone. I believe they have all struck root.—PHILODENDRON.

[We have seen *Bougainvillea glabra* richer in colour in Italy than we have ever seen it in England. When your plants flower please send us a spray.]

#### ROYAL HORTICULTURAL SOCIETY.

JULY 12TH.

FEW exhibits were contributed at this meeting, but those few were of excellent quality, as was indicated by the awards of the two Committees to whom they were submitted.

FRUIT COMMITTEE.—Henry Webb, Esq., in the chair. Mr. Wilkinson, gardener to Viscount Gage, Firlie Place, Lewes, sent dishes of Pitmaston Orange and Victoria Nectarines well ripened with a good Queen Pine Apple, for all of which cultural commendations were awarded. Mr. Wm. Taylor, The Gardens, Longleat, Warminster, sent two Melons; one very large, a selection from Eastnor Castle, and the other a superb example of the old Cashmere, the flavour being grandly developed. A cultural commendation was awarded for this Melon, which was unanimously decided to be one of the best flavoured ever brought before the Committee; indeed it quite spoilt the others exhibited at the same time. Mr. Carmichael, The Gardens, Nowton Court, Bury St. Edmunds, sent a seedling Melon, a cross between A. F. Barron and Dickson's Exquisite; it was a green-fleshed variety of good size and fair flavour, and the Committee expressed a desire to see it again. Mr. C. Ross, gardener to C. Ross, Esq., Welford Park,

Newbury, and Mr. John Butcher, Stratford-on-Avon, also sent Melons that were not of unusual merit. Mr. H. Shepherd, gardener to J. Billingham, Esq., Moorcroft, Coham, Surrey, sent a twin example of Cucumber Empress of India. Mr. R. Dean, Ealing, exhibited a kidney Potato named Early Comet, a cross between American Success and Woodstock Kidney. It is to be tried at Chiswick.

**FLORAL COMMITTEE.**—J. McIntosh, Esq., in the chair. Messrs. H. Cannell & Son, Swanley, exhibited several stands of Zonal Pelargoniums, including the dark scarlet Henry Jacoby, the dazzling scarlet Nemesis, and the white form Eureka certificated at the beginning of the year. Some fine Larkspurs and Verhena blooms were also shown, a number of good varieties of the latter being represented. The best were Mellendins grandiflora, bright scarlet, white eye; Sir Garnet Wolseley, bright purple, very large; Edward Perkins, white, pink eye; and Dr. Feyerlin, very deep purplish crimson. Several other new streaked and parti-coloured varieties were staged. Flowers of a Solanaceous plant named Nicotiana affinis were also sent; they have a long tube and spreading ovate white petals, possessing a powerful fragrance. The plant is an annual, and is said to thrive well out of doors. A vote of thanks was accorded for the collection. Mr. W. Bull, Chelsea, sent a collection of new plants, among which examples of the following—*Disa grandiflora* Barreli, with large bright scarlet flowers; the peculiar *Senecio stenocephala*, with deeply heart-shaped and sharply serrated leaves, and tall close spikes of yellow flowers; *Pellionia Daveauana*, a pretty little stove plant suitable for growing in a shallow pot or pan; a fine *Rhopala* named R. Jonghei, and several forms of *Odontoglossum vexillarium*. A group of "decorative" Nougay, Zonal, and Ivy-leaved Pelargoniums was sent from Chiswick, several very pretty varieties of Lemoine's raising being represented. One pretty unnamed variety with neatly fringed circular pink and white flowers was noticeable, and one named Madame Harmant with large even white flowers slightly feathered with crimson at the base was also noteworthy. The well-known and handsome Madame Thibaut was in good form with large trusses of its brightly coloured flowers. Several were certificated both by the Floral Committee and the Pelargonium Society, and are described below. Cranston's Nursery and Seed Company sent flowers of the new H.P. Rose Mary Pochin, referred to on another page. Mr. Hodges, gardener to Mr. Edwin Wright, Gravelly Hill, Birmingham, sent flowers of *Cattleya gigas imperialis*, very large and richly coloured, for which a vote of thanks was accorded. A similar award was granted to Mr. C. Osman, Sutton, Surrey, for flowers of a bright salmon scarlet Zonal Pelargonium. A vote of thanks was accorded Mr. G. F. Wilson of Weybridge for a plant of *Hibiscus Hugeli*, a distinct and curious species. The leaves are deeply cut into five segments, and closely resemble some of the fragrant-leaved Pelargoniums, the flowers being of a soft purplish mauve with rounded petals, and about the size of a large Mallow, but not spreading as in that plant.

First-class certificates were awarded for the following plants:—

*Lælia Philbrickiana* (Veitch).—A very pretty hybrid between *Cattleya Acklandiæ* and *Lælia elegans*. The flowers are borne in short racemes; the sepals and petals of a glossy purplish colour spotted with a darker shade; the lip two-lobed and very rich crimson in tint; two lateral wings being nearly white, and the column purple. The leaves are 3 to 5 inches long, and the bract elliptical in form. The *Cattleya* parentage very strongly predominates in the flowers.

*Carnation Gloire de Nancy* (Veitch).—A charming variety with full pure white flowers, extremely fragrant—quite a Clove perfume.

*Croton rubro-lineatus* (Veitch).—A showy form with leaves a foot or more long, 2 to 3 broad; the midrib bright crimson streaked laterally with yellow, and blotched with green between the veins. Very bright and effective.

*Athyrium Filix-femina acrocladon*.—A pretty dwarf Fern from A. Clapham, Esq., of Kensington, and suggestive in general appearance of the Parsley Fern, *Allosorus crispus*. The fronds are very neatly crisped, and being only a few inches high it will no doubt prove useful as an edging plant either for the stages of a conservatory or for groups.

*Ctenkowskia Kirkii* (Bull).—A Scitamineous plant allied to *Kämpferia*, with bright shining green tapering leaves 12 to 15 inches long. The flowers are borne several together at the top of a scape about 10 inches high. There are three large round pink petals, the lower one considerably the largest, and dashed with yellow in the centre.

*Oncidium Gardnerianum* (Bull).—A handsome specimen of this fine Orchid was shown, bearing several panicles of large flowers. The blooms are about 1½ inch in diameter; the lip rounded, bright yellow, and edged with light brown, the sepals and petals being barred with yellow and brown.

*Iris Kämpferi Seraph* (Bull).—One of the double forms, the petals being white tinged and edged with purplish blue. Very delicate in colour.

The following were shown from the Society's Chiswick Garden, and were mostly Lemoine's seedlings:—

*Pelargonium No. 76*.—A pretty "decorative" variety with neat circular bright rose and white flowers, having fringed margins. Very free and attractive.

*Pelargonium Madame Harmant*.—Also a decorative variety, with

white flowers of good form and substance, slightly streaked with purple at the base of the petals.

*Pelargonium Mont Blanc*.—An Ivy-leaved variety with very full double white flowers, which have a very faint pink tinge in the centre. Truss large and compact.

*Pelargonium Henri Cannell*.—A double Zonal with a large full truss and very dark rich scarlet flowers. Especially remarkable for the depth of colour.

**SCIENTIFIC COMMITTEE.**—Dr. M. T. Masters in the chair.

*Gooseberry Blight*.—Mr. W. G. Smith observed that he had discovered Uredo-like spores upon the same mycelium which produced the *Æcidium grossulariae* on the surface of the fruit exhibited last time.

*Liriodendron*.—Mr. G. S. Boulger exhibited a blossom of Tulip Tree, which appeared to be a distinct variety from the common form. Although but one species is recognised Dr. Masters observed that at least two varieties were recognisable—the variegated and an entire-leaved form.

*Gynnaënia conopsea*.—Mr. Boulger also exhibited a very fine spike of this Orchid.

*Tonga*.—Dr. Masters exhibited the dried plants yielding this drug. It consists of stems of an Aroid, *Raphiodophora*, and leaves of a Verbenaceous tree. It comes from Fiji.

*Pear and Pelargonium Leaves*.—He showed specimens of the former attacked by some mites or other insects, and the latter spotted, apparently by bad cultivation.

*Anthurium Kalbreyeri*.—A very fine specimen of this plant was exhibited by Mr. Veitch from New Grenada. It received a botanical certificate.

*Malformed Digitalis*.—Mr. Henslow showed drawings of a Foxglove in which the corolla was split up, some of the divisions being converted into stamens.

#### HEXACENTRIS MYSORENSIS.

SOME weeks ago a correspondent sent us a spray of this beautiful stove climber (see next page), accompanied by the following remarks—"A plant of *Hexacentris mysorensis* is now flowering profusely in my stove, and is so bright and curious in its flowers that all who see it admire it very much. That so attractive a plant, and one that has been so long in this country, should remain comparatively unknown or neglected is a great surprise to me, and my object in writing these few lines is to draw attention to what I find a really valuable plant. My specimen is, perhaps, a dozen years old, and is trained up a pillar and over the central walk in a large span-roofed stove, and when the fine pendant racemes of large rich crimson and yellow flowers are produced in profusion the beauty of the plant is almost indescribable. The plant is growing in a small prepared border of light loam, peat, and sand; and, as the root space is very limited, we occasionally give a good supply of very weak liquid manure, which greatly encourages the growth and increases the size and brightness of the flowers. Little attention is required in pruning, removing the weak shoots and the unripened portions of the others being the chief requisites in this respect. Though an old plant it certainly deserves to be more generally grown at the present time than appears to be the case, and I cordially recommend it those who may desire a distinct and beautiful addition to their stove climbers."

#### SHOULD FLOWERS BE DRESSED OR NOT?

"I HAVE been looking over some back numbers of the Journal and have read many communications on the subject of dressing flowers, but so far as I can judge the advocates of the practice are confined to those whose great object appears to be to win prizes at exhibitions, while the opponents do not appear to be exhibitors, but just ordinary cultivators, and, perhaps, care more for growing Potatoes and Grapes than flowers. Both parties, therefore, appear to be prejudiced, perhaps without knowing it; and I should like some grower of flowers who can judge calmly to give his views on this subject, which has been warmly discussed in our bothy."

The above letter has been submitted to me with a request that I give the subject of it consideration, and forward such a reply as I deem suitable under the circumstances. I have not been in a writing mood of late, and the subject is not a particularly inviting one, as there are so many people having stronger views than I entertain, on whichever side of the subject their sympathies lie. Still I will endeavour to treat the question on its merits, and shall much regret if there are any readers sufficiently sensitive to feel in the slightest degree uncomfortable by anything I may say in reference to a practice in which they are interested.

In connection with this practice of dressing flowers it will be well to remember that there are two distinct classes of cultivators whom it interests—the larger class, who grow flowers for home decoration; and the smaller, who grew them for exhibition. This fact being recognised, there can be no surprise at the difference

of opinion that prevail on the subject. For the purposes for which probably fifteen out of every twenty cultivators grow flowers a high style of dressing is not required, and if it were it could only be effected at the sacrifice of other more important

duties that ought at the same time to be discharged. A high artificial system of dressing flowers will never be popular with gardeners and the great majority of cultivators, for neither themselves nor others for whom the flowers are provided consider that

Fig. 7.—HEXACENTRIS MYSORENSIS.

these are enhanced in beauty by any serious manipulation of their petals. They prefer the flowers to be as well grown as possible—large, bright, and full; but would never think of discarding a flower from a vase, or rejecting it from the bouquet or button-hole, because of a faultily marked petal or two, according to the florists' standard. In fact, what may be a glaring fault in the eye of the

florist is not regarded as a fault of any importance by the cultivator who grows flowers for home or garden adornment, and yet one class of growers may love their flowers as ardently as the other.

But, apart from the gardener's point of view, there are a great number of persons of education, taste, and refinement who do not

consider flowers—say Carnations and Picotees—improved by the dresser's art, and their objection to them is simply this, that the flowers when dressed look too much like the artificial productions which are so cleverly manufactured and arranged in shop windows; and I almost think that the more perfectly artificial flowers are manufactured, in the same ratio is the taste for flowers well grown, but possessing the free, chaste, delightful forms and markings of Nature, increased.

Without any amalgamation of effort the love for flowers is increasing. If we look at the trade in flower seeds and plants as it was half a century ago and look at it now it is evident that the taste for flowers, undressed flowers, has increased prodigiously—so much so that it is not easy to appreciate its magnitude; but has the increase of those particular florists, whose standard consists of highly dressed flowers formed and marked according to prescribed rules, increased in the same ratio? I think not. The weight of evidence of the aggregate number of growers and lovers of flowers is in favour of those flowers that have been produced by good cultural care, but aided so far as regards the arrangement of their petals by little or no manipulative dexterity.

But while well-grown and undressed flowers are preferred for quiet home adornment, a different class of flowers is requisite for the exhibition stands. Undressed flowers have little chance of gaining honours there—not because such flowers are less beautiful in the estimation of the majority of cultivators than flowers that have been dressed, but because the former do not approach the standard—a fancy standard after all—that the professional florists have established. There is no reason that one section of growers should quarrel with the other; both have their “fancies,” and have a right to enjoy them, and both can adduce arguments in favour of their own practices.

But the advocates of dressing occasionally weaken their position by attempting to prove too much. They go so far as to assert that pruning trees, training plants, thinning Grapes, trimming and cleaning horses, washing faces, &c., are analogous to dressing Carnations according to the present high style adopted by the florists. The analogy referred to is wholly fanciful, and is not based on any sound principle. It is an axiom that if you destroy the premisses on which an argument is based the argument of necessity falls to the ground. The practices referred to in the animal world, then, are indisputable necessities inseparable from cleanliness, health, and civilisation. The arbitrary rules of dressing flowers are founded on no such bases—in fact, there is no such analogy as represented, because on one side the practices are founded on natural principles, and the other on the fanciful notions of individuals. Pruning trees, training plants, and thinning Grapes are also necessities that are admitted—essentials of cultivation. A wall tree or a Vine must be pruned, or it is impossible they can serve their purpose or bear fruit satisfactorily. It is similarly indisputable that Grapes must be thinned. No mere fancy of an individual can endure for a moment against an admitted necessity. Plants, too, must be trained, or they fail wholly and entirely in the purpose for which they are cultivated. If a limited amount of space has to be occupied with certain plants, or plants are required for an obvious purpose, it is equally obvious and indisputable that the plants must be trained and produced accordingly, or failure results. The comparisons instituted, in fact, are not debateable on any common principle. No one can say that plants should not be trained, but thousands of excellent cultivators and real lovers of flowers do not consider that flowers are improved by excessive manipulation of their petals.

The general unpopularity of dressing flowers as at present conducted is evident from the fact, that notwithstanding the efforts made to extend it during half a century, the energy of its promoters, the contributions of its adherents, and the aid rendered by the press in reporting exhibitions of such flowers, the societies under whose aegis they are placed do not appear in such a flourishing condition as their promoters desire. If those societies and their mode of exhibiting adopted in connection with them have the sympathy of the flower-loving public generally, donations and subscriptions will flow in; if not, a powerful negative answer is supplied, that however strongly certain florists feel on the subject of flower-dressing the practice is not popular, and it is questionable if there are a greater number of flower-dressers now than there were thirty years ago. I think mere trimness, primness, and formalism are on the wane in gardens, and it does not now appear the general desire that Nature should play second fiddle to Art. Still, where the object of growing certain flowers is to obtain prizes the flowers must be produced in a condition to win them; or to sum up the question in a sentence, it does not appear to be necessary to dress flowers to be admired in the garden or in rooms, but they must be more or less

dressed for securing honours at an exhibition.—A NORTHERN GARDENER.

#### ROMFORD HORTICULTURAL SOCIETY.

THE above Society held its summer Exhibition on the 7th inst. in Marshall's Park adjacent to the town, the weather being all that could be desired for the occasion. Taken on the whole it was the best summer exhibition we have seen at Romford, the exhibits being above the average. Stove and greenhouse plants were well represented by Mr. Bones, gardener to D. M'Intosh, Esq., Havering Park; Mr. Douglas, gardener to F. Whitbourn, Esq., Ilford; and Mr. Young, gardener to O. E. Coope, Esq., Rochets, South Weald. Mr. Douglas contributed half a dozen Orchids, which were a great attraction, amongst them being a finely flowered *Oncidium macranthum*, a *Masdevallia*, an *Epidendrum vitellinum*, &c. The same exhibitor also contributed a stand of Carnations, which were much admired. Mr. Bones was first for stove and greenhouse plants, his collection containing good specimens of *Crassula coccinea*, a finely bloomed *Clerodendron Balfourianum*, *Erica Paxtoni*, an excellent *Ixora*, and a finely bloomed specimen of *Bougainvillea glabra*. Mr. Douglas was second with a fine *Clerodendron*, *Erica ventricosa* *Bothwelliana*, *Statice profusa*, an *Aphelexis*, *Bougainvillea*, and *Dracophyllum gracile*. Mr. Young also contributed some good plants; a freely grown and not too formal *Clerodendron*, and a good *Genetyllis*. Mr. Douglas secured the first prize for the best specimen plant, and Mr. Young second. Foliage plants were well shown by Messrs. Bones and Young. Exotic Ferns were also exhibited in good form by Messrs. Young, Bones, Meadmore, and Woodhams.

Roses were very good in quality, Messrs. Cant of Colchester being first with an admirable stand, Messrs. Meadmore and Saltmarsh following in order; very few of the new varieties being exhibited, but some of the old sorts, especially *Marie Baumann*, were, as usual, excellent. The Rev. J. H. Pemberton was successful in his class. Mr. Bones contributed some fairly grown *Fuchsias* for the season, and Messrs. Saltmarsh & Son a fine collection of *Tuberous Begonias*, equal to any we have seen this season. The best-arranged basket of plants in pots was sent by Mr. S. Ford, nurseryman, Warley. *Gloxinias* were also shown in good condition by the same exhibitor. *Variogated Pelargoniums* were well shown by Messrs. Meadmore and Saltmarsh & Sons. *Zonal Pelargoniums* were also shown by Messrs. Meadmore, Harrington, and Mr. James Hooper. The *Caladium* and *Coleus* did not call for special notice. The best single bloom of any Rose—Mr. Ford first, Mr. Woodhams second, Mr. Nairns third. Twelve Roses, not open to exhibitors in other classes—viz., forty-eight and twenty-four—the prizes being secured by Messrs. Burgess, Nairn, and Brunt. For the most tastefully arranged vase of cut flowers for table decoration Messrs. Douglas and Soder were successful. Cut flowers in bunches were shown by Mr. Douglas, Mr. Bones, and Messrs. Saltmarsh & Son; *Pansies* by Messrs. Saltmarsh and Son, and by Mr. Ford.

Fruit was exhibited in goodly quantity, but the Grapes were deficient in colour. Mr. Carver first, Mr. Fairman second, Mr. Foster third. *White Grapes*.—Mr. Carver first, Mr. Foster second, Mr. Worthing third. *Collection of Fruit*.—The only competitor was Mr. Brunt, gardener to Lieut.-General Fytche. *Melons, Green-fleshed*.—Mr. Foster first with an excellent *Golden Perfection*, Mr. Brunt second with *Thornton Hybrid*. *Strawberries* were fine and very bright in colour, having evidently benefited by the heavy rain of the previous Tuesday. Excellent dishes of *Eleanor* and *Loxford Hall Seedling* were shown; the former, although an old variety, is not to be despised, and as a late variety is invaluable. *Gooseberries, Currants, and Raspberries* were also abundant and good. A dish of last year's *Apples* was exhibited in fine condition, the fruit being large and fresh-looking. It was represented as a good kitchen *Apple*, and bore the name of the *Stacpoole*—I think the name of the raiser.

The vegetables were good and abundant, the baskets of eight varieties being fine and well set up, the prizes going to Messrs. Bones, Brunt, Douglas, and Soder.

The cottagers' productions were remarkably good, and did great credit to the producers; and in a class specially for amateurs there was excellent competition. Altogether the Show may be considered quite a success.

#### A BOUQUET OF WILD FLOWERS.

WHAT was recently said about double flowers has been freely criticised, and we are glad at the result. One critic wonders if we think wild *Pansies* anything but weeds compared with cultivated flowers. We appreciate cultivated *Pansies*, but after all they are not really so very much lovelier or sweeter than the wild *Viola*. They are larger, and the varieties are numerous; but there is a limit to the enjoyment of mere variety. It is said that double *Roses* are more beautiful than single *Roses*; that the *Duke of Edinburgh* is transcendent in its beauty compared with the *Dog Rose*. *Roses* are very beautiful undoubtedly, but not one double *Rose* in all the long list possesses the simple elegance and quiet beauty of the *Briar*. *Maréchal Niel* cannot be dispensed with, nor *Beauty of Waltham* either; but the sweet blossoms on the *Briar* in June are more pleasing.

Dahlias and Hollyhocks, and a host of other prim, double, artificially moulded flowers, are paraded as among the "grand" productions of the florist. A mass of flaming Hollyhocks doubtless make a brave show when backed up with taller greenery behind, but anyone who thinks that such flowers ought to be ranked high possesses but a poor taste. For making a show they are very fine; for close examination they are very poor. They are "monstrous" abortions, wispy deformities, and are far behind a good strain of single Foxgloves, or single Hollyhocks even, either as landscape flowers or for being individually inspected, and the same is true of the Dahlia. Variety is wanted in single Hollyhocks and single Dahlias, and other single flowers, including Roses, for the production of double flowers of all kinds has gone much too far.

We hold tenaciously by the position taken up in our "protest," and are not greatly concerned whether the majority are with us or not. The decided "Yes" with which some have answered the questions "Is our sense of the beautiful to be measured by inches?" and "Is beauty become a matter to be decided by arithmetic?" is at least simple, and more to be commended than the "much counsel darkened with words," and not understandable of others. It was not, however, what the critics have said that impelled us to take a pen in hand, but a bouquet of wild flowers which stands before us now. We have a Fern case filled with the fruits of many an exploring ramble in the glens. These we would not exchange for a whole houseful of Adiantums and Pterises. So our glasses might be filled with garden flowers, but we love the wild ones better, and therefore the flowers which cheer us when the day's work is done are wild flowers gathered by waysides, hedgesides, and other spots where the gems below-named grow.

The first to be named is the common Ox-eye Daisy—the Horse-gowan of our young days. It is a little too common, or its merits would have been recognised before now. It is despised, but if only those who despise it would look at its spotlessly white petals their opinion would change. Compare it with the now popular Paris Daisies and see which stands the ordeal best. Some think that its golden centre spoils it. Look at the arrangement of the florets in that centre, and compare it with the back of your watch if it be a plain one, and you will see that it has at least furnished a design, long considered inimitable, to the watchmaker. Again, one of our best flower gardeners has pronounced the combination—yellow and white—when in a flower bed to be a soft and pleasing harmony.

The elegantly-cut snow-white flower which stands all over and above the bouquet like a veil is the *Stellaria Holostea*, and a beauty it is, which no garden flower need pretend to rival. The small tufts of still smaller flowers which form part of the bouquet are composed of the sweet-scented Woodruff, *Asperula odorata*, a plant so common and so much appreciated for planting on rockeries and rooteries and similar positions, and for scenting clothes, &c., that no one will seek to dispute its charms. These are all the whites, with the exception of a spray of Guelder Rose found by a river's side, and which had probably escaped from cultivation.

Of yellows the first is the small, elegant, and sweet Lady's Bedstraw, which resembles in odour and in size of flower the little Woodruff. The next among the yellows is the common Buttercup, or, as my children call them "cuppy shells." A yellow *Mimulus*, and a bonnie little yellow one which we are unable to name belonging to the same order (*Scrophulariaceæ*), and the well-known Water Iris complete the list of yellow flowers. Among the blues are three or four species of Forget-me-nots and three Veronicas. Praising the Forget-me-nots is unnecessary; but we will stay to say that the little Veronicas, which in June gem every wayside and waste, are quite as lovely as are the Forget-me-nots. Blueish but not blue are the splendid *Geraniums pratense* and *sylvaticum*. We gathered *G. pratense* in a meadow where thousands of flowers waved, and a more enchanting sight it would be difficult to imagine. The Bluebell Hyacinths we found where they grew in acres. The humble but pretty wood Violets and the wild Pansies grew together by a stream.

Among the reds were first the Ragged Robin, or, as it is sometimes called, "Torn Jacket," and also Cuckoo-flower: its botanical name is *Lychnis Flos-cuculi*. When a man has many aliases beware of him. When a flower or a fruit or a vegetable has, get acquainted with it. This one with the many names we commend to the florists as one which Nature presented us to show that pennies were not her model, and we recommend her "novelty" to them. Robin's near friend the red Campion, which comes nearer the artificial standard, we found on a bank. There was a large bed of it, but its otherwise blazing colour was toned down by being mixed and surrounded with tender green.

We have red Clover in our bouquet, and it is as good as many

a garden flower. There are spikes of *Orchis mascula* and *O. pyramidalis* of a reddish tinge, and these like many more wild flowers, and unlike not a few garden and especially double ones, will only prove how beautiful they are when peered into. Last, by no means least, among the red flowers of our bouquet are buds and open blossoms of *Rosa canina*. We will not praise it, but we ask those who have never done so to look at the flowers closely, and not as if there were no beauty in it than can be seen at a glance. Among our yellows we forgot to mention the yellow Broom and the little yellow Lotus. Grasses stand up through the whole, and as a fringe there are Lady, Oak, and Becc Ferns, and altogether it would be difficult to match our bouquet with all the wealth of the garden from which to choose materials. Only a few of the flowers have been named, which may be found anywhere almost in the country in summer, and we know of no more enchanting treat than to wander by the brawling stream, the braes, and explore the "dens" in summer time, in order to gather the spoils which gem the earth, and to give them to those we love.—SINGLE-HANDED.

### PRESENT-DAY FLOWER GARDENING.

[Abridged from a paper read at a meeting of the Scottish Horticultural Association by Mr. R. P. Brotherston.]

To arrive at a somewhat correct idea of the flower gardening of the present day it will, perhaps, be of some advantage to cast our minds for a few minutes into the past, say fifty years back—that glorious period for the gardener when no propagating in spring and autumn ever disturbed the serenity of his quiet life; when the trimming of a hedge, the building of a hothed, the correct nailing of a fruit tree, were only relieved by the gentle excitement of carrying torches of burning paper through his hothouses to supplement the heating power of his flues in keeping king Frost at bay. These were the days when a gardener could afford to do things well. Then he planted fruit trees to benefit the succeeding generation, and established Vines to outlast the vineries that covered them. In these days one of the chief accomplishments of his assistants was the knowledge of the names of the greatest possible number of flowers; the days when the process of setting Melons was regarded as a mystery. But during the next quarter of a century the world made way in great strides, and all these things were becoming common.

During that period what some term a "monster," others an "idol," appeared, and invaded almost every garden in the land. It had to be put up in the best quarters during the winter months, through the spring time it appropriated all available space in glass structures, and a new class of frames had to be invented to prepare it for the outside weather. Throughout the summer and autumn months it filled series of beds and borders specially prepared for its reception and for the display of its gaudy beauty. It grew beyond the bounds of these, kicked the poor old Bachelor's Buttons, *Gentianellas*, the Pinks and the Carnations, and all the hardy kith and kin into the rubbish heap, and established itself in their places; then overran Vine borders and Peach borders, and took possession of window boxes. By-and-by it selected all the hardy flowers suitable for its own ends, and spread itself a floral carpet in the spring; then filled the beds in winter with particoloured greens from the kitchen garden and miniature trees from the woods, and worse than all began to fill the gardener's mind, and left little room for thoughts of building hotheds or clipping hedges, so long as they were out of the ken of his new charge. The correct way to nail fruit trees began to be forgotten, and gardening students hardly knew there had been Bachelor's Buttons and Pinks! A few years later the "Kays" in their glaring yellow, the "Kings" in their royal purple, and the "Tom Thumbs" in their glowing scarlet, which had reigned so long without a rival, had their rights disputed by a race of foreigners popularly known as subtropicals; and following closely on these came a race of dwarf-growing foliage plants, which were amenable to the torturing arts which had been forgotten since the days when the topiarist cut out living shrubs into peacocks and vases!

But now another class of flowers began to find a place in gardens here and there throughout the country; and a select band of writers whose glory it was that they had not bowed down to nor worshipped the idol, attacked it strongly with the avowed purpose of driving its image from the fair face of the earth. Those who could not be brought to anathematise the system of bedding-out and hurl it from their gardens were lectured on their "depravity," and advised to furnish themselves with colours and brushes, and lay down their beds and borders permanently in oils. The most telling adjectives were employed in depicting the beauties of what were sometimes mere weeds, and in denouncing everything on which the enemy had set its seal; yet "hedding-out" is with us still, a part of our gardening institutions.

For the past week or two this work of "bedding-out" has been engaging the attention of most gardeners, and it will be only fitting after having thus glanced at the way it has worked itself into gardens to give it the first place in this notice of present-day gardening. The hedding-out of to-day is something quite different from what it was even so late as fifteen years ago. The glaring contrasts and overpowering colours of that time have been done away with to a

very great extent. The trimness of that period has been modified by the introduction of plants of graceful habit or beautiful foliage, selected from the subtropical plants which were fashionable for a short space. Carpet bedding in its worst aspects is being got rid of, and the gardener has begun to see that cutting-up a small rectangular or circular piece of ground into a lot of ingenious lines, and planting the whole with a combination of various colours, has not the slightest approach to true beauty. As with beds filled with flowers so with those filled with carpeting plants, simplicity in arrangement and colouring gives the greatest amount of pleasure. Another point in all flower beds, which perhaps is not so common now as we hope to see it in the future, is making them as much as possible a part of the lawn on which they stand. Every flower bed should rise from the grass by which it is surrounded without any portion of bare soil intervening between the flowers and the grass; the flowers, in a word, ought to rise out of the grass.

In autumn we cannot dispense with strong colours, but it is not a necessity that we should make them glaring in their intensity by placing strong colours in proximity. By using neutral shades and harmonising the strong colours we are obliged to use, the most fastidious taste need not be offended. And there is, again, in the matter employing a great number of neutral-tinted foliage plants, such as dwarf Sedums, Sempervivums, and various plants of a green shade to the exclusion of colours of a rich shade, an insipidity that

Fig. 8.—*Oenothera Lamarckiana*.

will hinder this style of planting from gaining ground. Besides, any system of flower gardening which places flowering plants in a position subordinate to those remarkable for the beauty of their foliage alone, is never likely to gain general and lasting approval.

Turning now to hardy plants, it is only fair to notice here, that through all the fever of excitement produced when that feature of gardening called "bedding-out" was at its height, there were still many gardens throughout the country which maintained in their integrity the old herbaceous borders. True, there might not be one plant in every 10 yards worth keeping, but this fact nevertheless remains, that through all the bedding-out period these borders have been kept intact, living museums as it were of the gardening of the ancients. Some, again, were improved more or less by the addition of the best of the florist flowers as they were produced. One such garden is within my recollection, where along with many good hardy flowers were added collections of Phloxes, Pentstemons, Hollyhocks and Dahlias, also Stocks, Asters, Heliotropes, clumps of Mignonette, Roses, sweet-scented Geraniums, and Fuchsias, backed by lines of Sweet Peas. The great majority of hardy perennials must sink to their own level in the course of time, only the cream being allowed in gardens, while the important forms of the florist will be more and more appreciated and cultivated.

There is another form of flower gardening which has advanced a slight degree during the last few years, a form which may be designated shrubby gardening, and which is a mixture of flowers amongst shrubs. As a feature in pleasure grounds I am hopeful of seeing the whole arrangement of shrubberies changed. Not only in small enclosures of a few acres, but on the largest estates, where hundreds of acres are enclosed, the shrubs are almost, without exception, fighting amongst themselves the battle of the "survival of the fittest," which means, as a matter of course, the strongest-growing Laurels. I would allow every shrub to stand by itself quite clear of its neighbours, and with a carpeting of grass under and around it. It would take a little more space to form blocks to views and screens on this system; but the improvement would in all respects be so great as to be worth much more space being devoted to Conifers and evergreens.

Then we have "gardening on the grass," a style which has come down to us from before the time of the memory of the oldest inhabitant, and which Mr. Wm. Thomson pointed out the other week as being quite common throughout Scotland. This is a form of gardening which, from my own experience, is suitable only for spring and early flowering bulbous plants and flowers which, like Primroses, are not harmed by having their foliage removed by the scythe in summer. It is an adjunct to the garden, but does not and cannot supersede the cultivation of flowers in beds and borders; but even in this style of gardening it is curious how the spirit of "bedding-out" is still to be found. Just conceive the want of taste, and the knowledge of the fitness of things, displayed by that gentleman who has a St. George's Cross and the initials of his name (in enormous capitals no doubt) worked out on grass in a field before his windows with nodding Daffodils! Talk of "depravity" amongst gardeners! Surely they do not indulge in such vagaries as this!

Perhaps the best feature in the aspect of the flower gardening of to-day—from the gardener's point of view, of course—is this, that there is no necessity to follow every shifting current of change. In the days when Pelargoniums, Calceolarias, and Verbenas reigned supreme and unassailed, a gardener was ashamed of himself if he was without the trio. He can now follow the bent of his own mind so long as he carries the approval of his employer with him, and go in for Lilies and Daffodils and "aesthetics" generally. He may even grow single instead of double Daisies; he may also continue in his "depravity" and cultivate the flowers of the paint pot, and still find admirers of all or every system; but above everything let him not imitate the person who had a certain long-eared animal to dispose of at a neighbouring market, and who in trying to please everybody by following that many-minded individual's advice, was so unfortunate as to lose his "neddy" through his too obliging behaviour, and to be called a fool for his pains.

#### *OENOTHERA LAMARCKIANA*.

I SEND you a box of flowers from a noble plant that grows in my pleasure ground. The growth is somewhat spreading yet upright, and, during the evening especially, it brightens the grounds more than any other plant I possess. On inquiring of a gardener for the name of the plant his reply was, "Oh, it's a common thing, and grows anyhow in cottage gardens; it's the old Evening Primrose!" Respectfully doubting his authority I send flowers for your inspection. As to its growing "anyhow," I esteem that a virtue for the purpose for which my plants are grown—*i.e.*, rendering the shrubby borders cheerful in the cool of the day. My plants were raised from seed that was sown in the open ground with Sweet-Williams, the seedlings being in due time transplanted and finally removed to their present position. Some of the flowers are 4 inches in diameter.—E. MARSDEN.

[It is not often we receive such a box of flowers—a whole armful, but not one of them expanded. So far as we can judge the above is the name of this *Oenothera*. Its large yellow flowers are very conspicuous in the "cool of the day." The "old" Evening Primrose is *Oe. biennis*. As we happen to possess an engraving in miniature of *Oe. Lamarckiana* we publish it, as it well shows the

character of the plant, and will aid our correspondent in identifying his favourite.]

#### REVIEW OF BOOK.

*Success with Small Fruits.* By EDWARD P. ROE. London: Seeley, Jackson, & Halliday, 54, Fleet Street.

THIS beautiful American volume, which is dedicated to Mr. Charles Downing, has been on our table for some time. It is American in all its aspects—style, tone, paper, and illustrations, the latter being numerous and many of them of great artistic merit. The author is a free and florid writer; indeed we shall not be surprised to find that matter-of-fact individuals who seek for instruction wholly, and cannot endure a grain of chaff among the wheat, will deem him garrulous. The diversified style is, however, designedly adopted. "Since," says the author in the preface, "the fruit garden and farm do not develop in a straightforward matter-of-fact way, why should I write about them after the formal and terse fashion of a manual or scientific treatise? The most productive varieties of fruit, blossom and have some foliage which may not be very beautiful any more than the departures from practical prose in this book are interesting; but, as a leafless plant or bush laden with fruit would appear gaunt and naked, so to the writer a book about them without any attempt at foliage and flowers would seem unnatural. The modern chronicler has transformed history into a fascinating story. Even science is now taught through the charms of fiction. Shall this department of knowledge, so generally useful, be left only to technical prose? Why should we not have a class of books as practical as the gardens, fields, and crops concerning which they are written, and at the same time having much of the light, shade, colour, and life of the out-of-door world? I merely claim that I have made an attempt in the right direction, but, like an unskilful artist, may have so confused my lights, shades, and mixed my colours so badly, that my pictures resemble a Strawberry bed in which the weeds have the better of the fruit."

We cannot refrain from saying that there are some literary weeds in the work, yet it contains much matter that is both interesting and instructive. All the small fruits that are so extensively cultivated in America are referred to more or less copiously, special attention apparently being given to Strawberries. The chapter on a southern Strawberry farm includes Negro life and dialogue and a dozen engravings, the whole process of strawberrying during the season being fully delineated. Black overseers are on one farm that is particularly noticed preferred to the whites, as they "drive on the work with tireless energy."

As this is Strawberry time an extract from the volume will be instructive to some readers and will show the character of the work. It is in reference to the origin of the present race of Strawberries. Marvellous is the advance that has been made, and the truth of the adage is apparent in the improvement of this fruit, that "great results from little causes spring."

The innumerable varieties of Strawberries that are now in existence appear, either in their character or origin, to belong to five great and quite distinct species. The first, and for a long time the only one of which we have any record, is the *Fragaria vesca*, or the Alpine Strawberry. It is one of the most widely spread fruits of the world, for it grows, and for centuries has grown, wild throughout Northern and Central Europe and Asia, following the mountains far to the south; and on this continent, from time immemorial, the Indian children have gathered it from the Northern Atlantic to the Pacific. In England this species exhibits some variation from the Alpine type, and was called by our ancestors the Wood Strawberry. The chief difference between the two is in the form of the fruit, the Wood varieties being round and the Alpine conical. They are also subdivided into white and red, annual and monthly varieties, and those that produce no runners, which are known to-day as Bush Alpines.

In connection with the white and red Wood and Alpine Strawberries we find in 1623 the name of the Hautbois or Haarbeer Strawberry, the *Fragaria elatior* of the botanists. This second species, a native of Germany, resembles the Alpine in some respects, but is a larger and stockier plant. Like the *Fragaria vesca*, its fruitstalks are erect and longer than the leaves, but the latter are larger than the foliage of the Alpine, and are covered with short hairs both on the upper and under surface, which give them a rough appearance. As far as I can learn this species still further resembled the Alpines in possessing little capability of improvement and variation. Even at this late day the various named kinds are said to differ from each other but slightly. There is a very marked contrast, however, between the fruit of the Hautbois and Alpine species, for the former has a peculiar musky flavour which has never found much favour in this country. It is, therefore, a comparatively rare fruit in our gardens, nor do we find much said of it in the past.

There is scarcely any record of progress until after the introduction of the two great American species. It is true that in 1660 a fruit-

grower at Montreuil, France, is "said to have produced a new variety from the seed of the Wood Strawberry," which was called "the Capron," and afterwards the "Fressant." It was named as a distinct variety a hundred years later, but it may be doubted whether it differed greatly from its parent. Be this as it may, it is said to be the first improved variety of which there is any record.

Early in the seventeenth century intercourse with this continent led to the introduction of the most valuable species in existence, the Virginian Strawberry (*Fragaria virginiana*), which grows wild from the Arctic regions to Florida, and westward to the Rocky Mountains. It is first named in the catalogue of Jean Robin, botanist to Louis XIII., in 1624. During the first century of its career in England it was not appreciated, but as its wonderful capacity for variation and improvement—in which it formed so marked a contrast to the Wood Strawberry—was discovered, it began to receive the attention it deserved. English gardeners learned the fact, of which we are making so much to-day, that by simply sowing its seeds new and possibly better varieties could be produced. From that time and forward the tendency has increased to originate, name, and send out innumerable seedlings, the majority of which soon pass into oblivion, while a few survive and become popular, usually in proportion to their merit.

The *Fragaria virginiana*, therefore, the common wild Strawberry that is found in all parts of North America east of the Rocky Mountains, is the parent of nine-tenths of the varieties grown in our gardens; and its improved descendants furnish nearly all of the Strawberries of our markets, while the *Fragaria vesca*, or the Alpine species of Europe, is substantially the same to-day as it was a thousand years ago.

As in the Alpine species there are two distinct strains—the Alpine of the continent and the Wood Strawberry of England—so in the wild Virginian species there are two branches of the family—the eastern and the western. The differences are so marked that some writers have asserted that there are two species; but we have the authority of Prof. Gray for saying that the Western, or *Fragaria illinoensis*, is perhaps a distinct species, and he classifies it as only a very marked variety.

There are but two more species of the Strawberry genus. Of the first of these, the *Fragaria indica*, or Indian Strawberry, there is little to say. It is a native of Northern India, and differs so much from the other species that it was formerly named as a distinct genus. It has yellow flowers, and is a showy house plant, especially for window baskets, but the fruit is dry and tasteless. It is said by Prof. Gray to have escaped cultivation and become wild in some localities of this country.

*Fragaria chilensis* is the best species or subdivision that we now have to consider. Like the *F. virginiana* it is a native of the American continent, and yet we have learnt to associate it almost wholly with Europe. It grows wild on the Pacific slope from Oregon to Chili, creeping higher and higher up the mountains as its habitat approaches the equator. "It is a large, robust species, with very firm thick leaflets, soft and silky on the under side." The flowers are larger than in the other species; the fruit, also, in its native condition, averages much larger, stands erect instead of hanging, ripens late, is rose-coloured, firm and sweet in flesh, and does not require as much heat to develop its saccharine constituents; but it lacks the peculiar sprightliness and aroma of the Virginian Strawberry. It has become, however, the favourite stock of the European gardeners, and seems better adapted to transatlantic climate and soil than to ours. The first mention of the *Fragaria chilensis*, or South American Strawberry, says Mr. Fuller, "is by M. Frezier, who in 1716, in his journey to the South Sea, found it at the foot of the Cordillera Mountains near Quito, and carried it home to Marseilles, France." At that time it was called the Chili Strawberry, and the Spaniards said that they brought it from Mexico.

From Mr. W. Collett Sanders, an English antiquarian, I learn that seven plants were shipped from Chili and were kept alive during the voyage by water which M. Frezier saved from his allowance, much limited owing to a shortness of supply. He gave two of the plants to M. de Jessieu, "who cultivated them with fair success in the Royal gardens." In 1727 the Chili Strawberry was introduced to England, but not being understood it did not win much favour.

Mr. Fuller further states—"We do not learn from any of the old French works that new varieties were raised from the Chili Strawberry for at least fifty years after its introduction." Duchesne, in 1766, says that "Miller considered its cultivation abandoned in England on account of its sterility. The importations from other portions of South America appear to have met with better success; and, early in the present century new varieties of the *F. chilensis*, as well as of the virginiana, became quite abundant in England and on the Continent."

If we may judge from the characteristics of the varieties imported to this country of late years the South American species has taken the lead decidedly abroad, and has become the parent stock from which foreign culturists, in the main, are seeking to develop the ideal Strawberry. But in all its transformations, and after all the attempts to infuse into it the sturdier life of the Virginian Strawberry, it still remembers its birthplace, and falters and often dies in the severe cold of our winters, or, what is still worse, the heat and drouth of our summers. As a species it requires the high and careful culture that they are able and willing to give it in Europe. The

majority of imported varieties have failed in the United States, but a few have become justly popular in regions where they can be grown.

Thus the two great species which to-day are furnishing ninety-nine hundredths of the Strawberries of commerce and of the garden, both in this country and abroad, came from America, the *Fragaria chilensis* reaching our Eastern States by the way of Europe, and in the form of the improved and cultivated varieties that have won a name abroad. We are crossing the importations with our own native stock. President Wilder's superb seedling, which has received his name, is an example of this blending process. This berry is a child of the La Constante and Hovey's Seedling, and, therefore, in this one beautiful and most delicious variety we have united the characteristics of the two chief Strawberry species of the world, the *F. virginiana* and *F. chilensis*.

This is only a very small portion of what is written on the Strawberry in the volume under notice, and the history and culture of other small fruits are fully described. The work will form a handsome addition to any garden library, and those who are interested in the subject of small fruits and have plenty of time for reading, may pass a few pleasant hours in perusing the pages of this attractive volume.

#### TRACHELIUM CÆRULEUM.

As a blue-flowered plant both for the conservatory and the flower border during the summer and autumn months this easily cultivated perennial is deserving of notice. It is a very old plant, and in a neglected state is devoid of attraction, but vigorously grown specimens with heads of flowers from 8 inches to a foot across cannot be passed in silence. Small plants in 5-inch pots and large specimens in 8-inch pots are equally valuable according to the position which the plants are required to occupy. They are readily raised from seed, which is best sown about May, but may be sown now, and good flowering plants may be had next year; or they may be propagated from cuttings inserted at the present time. The plants may either be grown in pots during the summer, plunged in ashes in the open air, or planted in rich soil in May and potted in September. The plants are hardy or nearly so, but are best wintered in pots in a pit from which frost is just excluded. If wintered in a greenhouse they must have a position within a few inches of the glass, or the growths will probably be so much drawn as to render the plants comparatively worthless.

—A FOREMAN.

#### KITCHEN GARDEN.

THE continuance of hot dry weather has rendered it extremely difficult to maintain a succession of young vegetables, which could only be secured where a timely and liberal supply of water has been afforded. The recent rains have permitted the planting of Broccoli and other Brassicas for winter and spring use. This is a good time to plant the main crops of Broccoli, and in long-established gardens where the soil is rich digging will not be necessary. Cauliflowers for autumn and early winter, as well as for lifting before severe weather for protecting in frames, must be planted at once. Proceed with planting Celery for late use in prepared trenches. Make a first sowing of White Naples and Tripoli Onions, if large bulbs are in demand the ground must be well enriched. Early Horn Carrot may be sown on a sheltered border for drawing during the early spring months. Sow Cabbage for an early supply; Ellam's Early Dwarf, Hill's Incomparable, and Wheeler's Imperial are suitable; in warm localities from the 20th to the 24th is early enough. Sow Bath or Brown Sugarloaf and Neapolitan Lettuces for late use, Stanstead Park being also good for this sowing. Rosette Coleworts will be fit for pricking out from the seed beds preparatory to being transplanted, and when the requisite numbers are withdrawn thin the remainder to 2 or 3 inches apart. Sow Turnips for late use in an open situation, and attend to prior-sown crops in thinning, and dusting with quicklime early in the morning as a preventive of the Turnip fly. Sow Chervil on a sheltered border, and the plants produced will give a supply for the greater part of the winter. Take

up Shallots and Garlic when fit and store after well drying. Tomatoes trained to walls or stakes should be well attended to in stopping all lateral growths, and when sufficient fruits are set stop the leading shoots so as to direct all the energies of the plant to the maturation of the fruit. Examine ridge and Gherkin Cucumbers frequently, keeping the shoots moderately thinned and stopped as required.

#### FRUIT HOUSES.

*Vines.*—Late Grapes and intermediate crops about colouring should have a night temperature of 65° to 70°, and in the case of those ripening ventilate freely whenever the weather permits. Red spider is very troublesome this season, therefore apply sulphur to the hot-water pipes, and sprinkle the inside borders with guano, damping well with the syringe. The ammonia vapour is inimical to insect life and beneficial to the foliage. Where Grapes are swelling abundant supplies of water or liquid manure must be given to the borders in dry weather, mulching the surface with short manure. The temperature of houses containing late Grapes passing through the stoning process must not be allowed to fall too low at night, or scalding will be sure to follow. Admit air freely by day, and keep the temperature at 70° at night. Muscats should be in the last stages of ripening assisted with a little extra fire heat, allowing an advance by day to 90° or 95° with plenty of air, which insures their acquiring a rich vinous flavour and the fine golden colour characteristic of perfect finish. Vines in pots for early forcing are now ripening their wood, and although a drier atmosphere is desirable a good syringing on fine evenings should be given to keep the foliage free from insect pests, and the watering must be maintained at the roots. Avoid extremes, exposing the growths to all the light possible to develop the eyes. Examine ripe Grapes frequently, keep laterals closely stopped, and if very ripe shade during bright sun to preserve the colour and bloom. Young Vines planted this season should be allowed to grow freely if they are to be cut back to three or five eyes at the winter pruning. Any intended for fruiting next season should be stopped to 7 or 8 feet, and kept closely pinched to that extent; but above this length the laterals may be allowed to remain, which will aid the formation of roots.

*Melons.*—It is important that the late plants should be in their positions, therefore clear out exhausted plants and prepare for a fresh start as soon as possible. In the meantime keep the seedling plants near to the glass and support with small stakes, removing all laterals as soon as discernible up to the height required to reach the trellis. Secure a bottom heat of 85° to 90° for young growing plants, with a moist atmosphere, shading only for an hour or two at mid-day, or only to prevent flagging. Syringe freely, except when the flowers are setting or when the fruit is ripening, being careful not to allow one or two fruits on a plant to take the lead. Keep a strict look-out for canker, and promptly subdue it by rubbing quicklime into the affected parts. Ventilate freely when the fruit is ripening, and maintain a dry condition of the atmosphere, not only to secure flavour but as a safeguard against cracked fruits.

*Cucumbers.*—Fire heat will not now be necessary in this department, but the temperature must not be allowed to fall below 65° at night, and 70° to 75° should be secured in the daytime. Afford copious supplies of liquid manure about twice a week, and maintain plenty of atmospheric moisture in hot weather, syringing on fine afternoons, and closing at about 4 P.M. Earth up plants that have been in bearing some time, maintaining a firm condition about the roots, expelling worms with lime water. Remove bad leaves, exhausted growths, and deformed fruits, keeping the shoots stopped as necessary, and a good supply of young growth for successional fruiting trained in, avoiding however, overcrowding. Train, thin out the growths, and stop plants in frames, earthing up the roots, removing the lights for a few hours on showery afternoons, otherwise sprinkling the foliage at about 4 P.M., and close the lights at the same time, not allowing an advance above 90°. Fumigate moderately and frequently upon the first appearance of aphides. Now is a good time to sow a few seeds for autumn fruiting. About four weeks are necessary at this season to secure sturdy plants, therefore make the necessary arrangements by collecting and preparing fermenting materials and soil, thoroughly cleansing the house. Although no fire heat is necessary at present, a

gentle bottom heat is essential for young plants, being careful to well test the heat before planting.

#### PLANT HOUSES.

*Greenhouse.*—Preparation should be made at once to obtain a stock of Zonal Pelargoniums for winter flowering. Plants that were struck last autumn or early in spring are the best for this purpose, and should at once be placed in 6-inch pots. Employ fibrous loam with a sixth of well-decayed manure and a sprinkling of sand, potting firmly, and plunge outdoors in ashes in the sun. Pinch out all flower trusses as soon as formed, stopping the plants to keep them in form, allowing them abundance of water, and be careful not to allow them to root into the plunging material. Vesuvius is still one of the best scarlets, Charles Smith being also good, with Alonzo, David Thomson, Lizzie Brooks, Mrs. Whiteley, Burns, H. M. Pollett, Commander-in-Chief, Kleon, Polyphemus, Mrs. Chandler, and John Gibbons, which are all shades of scarlet or crimson. Titania, salmon; Aida, white, suffused rosy pink; Miss Gladstone, Remus, both white with pink centres; Marguerite Ponton, salmon, white margin; Louisa, Lady Sheffield, Sybil Holden, pink or rose shaded purples; Mrs. Leavers and Madonna, rose; White Vesuvius and White Clipper; and in doubles Wonderful, Mr. H. Cannell, Souvenir de Carpeux, General de Galliffet, Duchess of Connaught, Guillon Mangilli, and Alba Perfecta are good.

Encourage Chrysanthemums as soon as the roots have taken to the soil with liquid manure at every alternate watering. If the pots are three parts plunged it will save watering, but on no account must they be allowed to root into the plunging material, and afford the plants plenty of room.

Attend well to Salvias, potting them in good loam with a sixth of decayed manure. Plunge in ashes in a sunny sheltered position out of doors, and never allow them to want for water, or they will lose their lower leaves. Stop the growths to ensure a branched habit.

Roses in pots for winter forcing may be encouraged to make all the growth possible, keeping them plunged in ashes, and with plenty of room, mulching the surface of the soil with short manure, and afford liquid manure twice a week. They will make much better growth on a north border than in the full sun, but they must be moved to a sunny position in September to harden the growth. Keep aphides under by the application of tobacco water, subduing red spider by syringing or promptly applying an insecticide, and dust with flowers of sulphur upon the first appearance of mildew, as upon the healthiness of the plants depends their flowering well. Echeveria retusa and E. fulgens for winter flowering should be treated liberally for the next two months, affording them weak liquid manure. They will thrive much better outdoors than under glass.

Heaths of the early-flowering section that have made good growth should be placed outside to thoroughly ripen the wood, and it is necessary to observe that those with the softest growth will need a longer time outdoors than with shorter and harder growth. In removing the general collection of Heaths outdoors it is necessary in bright weather to place them at the north side of a wall for a few days, for if suddenly exposed to the sun the leaves turn brown. When in position out of doors a piece of canvas should be placed on the sunny side to prevent the pots becoming hot and destroying the roots. Pay strict attention to watering them, as they will need more than under glass. Young Heaths making free growth must receive attention in stopping and training, keeping the strongest tied out horizontally, leaving the weaker upright. The general stock of young hardwooded plants will need similar attention.

*Orchids.*—Cattleya Mossiæ and Lælia purpurata starting into growth should be repotted, being careful not to damage the eyes. Cattleyas that are growing require plenty of moisture to enable them to make plump good pseudo-bulbs. Many early-growing plants have completed their growth for the season, and must be removed to a cooler house where an average temperature of 60° is maintained without sun heat. Dendrobiums will frequently make a second growth when kept in warm quarters, but the new growth seldom becomes properly matured, therefore place the plants when the growth is completed in a house less charged with heat and moisture, and afford a greater supply of air. They will need to be inured to the change before being returned to their former quarters at the end of

summer. Give weak liquid manure to Calanthes, and keep the foliage free from insects by frequent sponging. Thunia alba and T. Bensoniæ come into flower at a time when they are very useful, and should be in every collection. They are of easy culture, and require when growing the treatment of Calanthe vestita. Syringe plants on blocks frequently, especially after hot days. Ventilate the houses about seven in the morning, and close about four o'clock. Anæctochili when growing and in good health should have plenty of water; those grown under handglasses must have the glasses tilted on one side to admit air as a safeguard against the plants damping off, and the glasses should be removed for a couple of hours every morning. Many Odontoglossums and Masdevallias now require potting, particularly those growing strongly and having filled their pots with roots. Keep the temperature in the Odontoglossum house cool, syringing and ventilating freely, the bottom ventilators being left open all night.

## THE BEE-KEEPER.

### ALTERATION OF SEX IN EGGS.

WHAT more unlikely and wonderful than this? What harder to believe than the statement of fact that all the eggs of queen bees are naturally and originally male, many of which are changed and become female in character in passing down the bodies of queens? In the history of bees many wonderful points strike thoughtful students. One of these is the well-established fact that all eggs in their origin are male and convertible into the opposite sex. For nearly forty years I believed that all eggs laid by queen bees were alike, and convertible by after treatment into queens, drones, or workers. By a fair and satisfactory experiment made in my own garden I found that this was a mistake; that the notion was altogether wrong; and that eggs as they fall from queens are either male or female and remain unchangeable in that respect, but that the eggs which are femalised in character before they are laid are convertible into either queens or workers by after treatment in their cells. It has been long known that eggs meant for workers are twenty-one days in hatching, and which may be placed in royal cells by the bees and hatched as queens in fourteen days. Though the mystery of this change or transformation in the cells is great it is not a change of sex, for both queens and workers are female, the one perfect or fully developed, the other imperfect; but whether the special after treatment is applied to eggs in royal cells or to those in worker cells is an unsettled question. If the special treatment be given solely to royal cells, if the inmates are royally fed, we have some reason to believe that the treatment is meant to develop and perfect young queens in every respect. If the special treatment is applied to the eggs in worker cells it will go so far to prove that it tends to dwarf the insects and interferes with their development. The whole of this interesting subject is clouded in mystery. Everywhere we have evidence of design and wise arrangement, and see cells provided for the eradling of young queens, bees and drones, and suitable, too, for acting as reservoirs for honey. In considering the subject of treatment that the three kinds of bees receive in their cells, it should not be forgotten that queens are only fourteen days in their cells, bees twenty-one, and drones twenty-four. The subject, beset as it is with difficulties, presents a wide and interesting field for future investigation, and it is to be hoped that some apiarian students will turn their attention to it.

That "all eggs in the ovaries of queen bees are naturally and originally male, and develop as males when laid without being impregnated, but are changed to female if impregnated before being laid," is a statement of Baron Berlepsch, the truth of which has been illustrated and confirmed by extensive experiments and well-established facts. Notice first that unmated queens are not unfertile, they lay male eggs. Some queens are hatched with defective wings and cannot fly, and, as queens are mated outside their hives, those that cannot fly remain virgin. Many queens perfect and able to fly remain so by reason of misfortune or inclement weather. Many of these queens lay eggs which are capable of hatching into drones only. Such queens are drone-breeders.

Now notice that queens mated in early life are capable of laying both male and female eggs. Those who have investigated this subject say that in the bodies of queens there are small sacs, by name spermatheca, which receive and retain for use the sperm, that queens have the power of using it at will, and that all eggs touched by it in passing are changed from male to female. This

will appear to many students of nature to be anomalous and extraordinary. As queens live four years and are wonderfully prolific, the contents of their spermatheca are sometimes exhausted before they cease laying, or rather before they die; the eggs laid after the spermatheca has been emptied remain male and hatch into drones. Though we have had many queens die of old age, and have known many hives of our own bereft of their queens by age, we have never known a mated queen become a drone-breeder merely in her old age. We have seen queens by reason of age totter and stagger as they walked, others dethroned and cast out of their hives in a state of dotage, and one this year lost a limb and could not walk on the combs, but fell to the board again and again. All these continued to lay female eggs till the very last. Other teachers, amongst them Dzierzon, Berlepsch, and Woodbury, have had fertilised queens that became simply drone-breeders in their old age, and the statements of these able men are trustworthy.

If other proof be wanted to establish the statement that all eggs of queens are naturally and originally male, it will be found in the fact that from parents of different races, say from Ligurian queens and common drones, we have no half-bred males. Paternal influence does not affect the direct male progeny; indeed half-bred drones are an impossibility. While young queens and working bees are decidedly cross-bred, the direct male offspring share no influence but that of the mother. Let me now call the reader's attention to a nice point or distinction between the words "half-bred" and "cross-bred," also between "direct" male progeny and "indirect." While drones have no half-bred—that is to say, direct male progeny, there is the possibility, nay, the likelihood of the second and third generations catching up and possessing some of the characteristics of the grandfather. This is the idea I wish to convey, that while drones have no sons of their own they may have daughters which may carry the characteristics to future generations of both male and female offspring. The history of drone life is stranger than fiction, and is perhaps without a parallel in natural history.

Again, it is known that some workers lay a few eggs which invariably hatch into drones, and as workers are imperfect females, incapable of fecundation, these fertile workers lend some small additional proof to support the statement that all eggs of bees are originally male in character.

This subject is fully discussed and elucidated in a small pamphlet written by Baron Berlepsch, called "The Dzierzon Theory." We heartily commend this pamphlet to the notice of our readers. At page 26 the Baron says "that queens' eggs are susceptible of development though unimpregnated, but masculinity pre-exists therein, which, marvellous indeed! is transformed into femininity by impregnation with the male sperm. I am anxious to attract the attention of my readers to this portion of the theory, for it is the most important of all the propositions I have undertaken to discuss. With its aid almost everything relating to bee culture becomes intelligible, without it hardly anything is clear. He who does not fully comprehend this point will grope in the dark in all his operations, and be constantly exposed to mistake and disappointment."—A. PETTIGREW.

\* \* \* All correspondence should be directed either to "The Editor" or to "The Publisher." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

**Parcels Sent by Post (To Correspondents).**—We occasionally receive portions of fragile cardboard boxes that are addressed to us, and from which the contents have escaped in transit through the post. Two of such cases have occurred this week, and we have no means of knowing who were the senders. If what has been sent by correspondents this week is not referred to in our next issue it may be concluded that the contents of the parcels have not reached our hands.

**Pipes for Connecting Houses (B.).**—You may employ 2-inch pipes as connections between the boiler and houses, having a few feet length of pipe near the boiler, both on the flow and return pipes of the same size as the apertures or sockets of the boiler. We never recommend any particular boiler, but we should certainly have one that exposes a large amount of surface to the direct action of the fire, which quality is possessed both by the tubular and saddle in their improved forms.

**Aerides Bearing Seed (J. Smith).**—It is quite possible that the seed

vessels produced on your plant are the result of cross-fertilisation by insect aid. A hybrid *Aerides* has been raised between *A. affine* and *A. Fieldingi*, and is known as *A. hybridum*; so your friend must have been incorrectly informed.

**Rubus rosæfolius (Sot).**—It succeeds best in a greenhouse, and you may confine the pruning at present to the removal of any weak or straggling shoots. When the growth is completed the plant may be placed in a sunny and open position outside for a time to mature the wood, subsequently removing it to the greenhouse before the approach of cold or wet weather.

**Heating Greenhouses (J. L.).**—We have no experience of the stove alluded to, but rightly managed we have no doubt it answers the purposes the maker claims. Heating with oil or gas is, however, more costly than heating with coke or coal, and stoves are from the greater heat of their radiating surface not so favourable to plant life as that obtained by heating with hot water. We should have a stove boiler, and have two rows of 3-inch pipes along the front of your house. (G. H. H.).—Your house could be heated by gas or with oil, but both are more costly than heating in the ordinary way with hot-water pipes and a boiler. See answer to "J. L." The best manure for plants it is difficult to name, all being good. You may safely try those that are advertised in our columns, and you will soon perceive which is the best adapted for your soil and plants.

**Grapes Scalded (W. A. B.).**—Your vinery has been kept closed too long in the morning, and then the ventilators have been opened too widely at once to reduce the heat, hence the injury to the Grapes, after possibly a cold night. Leave the top ventilators open an inch or two all night, and increase the air very early in the morning—immediately the sun increases the temperature of the house. Ventilation should always be given on the principle of checking the rapid advance of the heat, not allowing it to increase considerably, and then endeavour to reduce it by throwing the windows wide open as if airing a bedroom.

**Stopping Cucumbers (A. Boyle).**—The main branches may extend until they nearly reach across the frame or trellis, and then have their points removed. Laterals or side growths will then be produced, and these may either be stopped at one joint beyond the fruit or at the joint where the fruit is produced, according as there is space in the house or frame for the development of the foliage. We have had equally satisfactory crops by adopting both modes of stopping. The growths of ridge Cucumbers only need stopping when the plants are growing very strongly, or when the main branches have extended about 3 feet.

**Stable Manure Dry (B.).**—If water is poured on the heap occasionally and sufficiently, and the material is moved with a fork two or three times a week, fermentation will take place, and the manure will be brought into a fit condition for use.

**Red Tripoli Onion (W. P.).**—The bulb you have sent is of this variety, which is very useful for autumn sowing.

**Grapes Cracking (Anxious).**—The variety to which you allude is probably either the Tokay or Trévère Frontignan. Cracking is caused by an undue pressure of sap on an unelastic skin. Three modes have been found more or less effectual in mitigating the evil complained of—1, Cropping fully, not lightly; 2, diminishing the supply of water to the roots, but not unduly restricting atmospheric moisture; 3, cutting notches half through the laterals that bear the bunches, so as to check the flow of sap to the berries. You can adopt either of the remedies that can be applied the best in your particular case. If after doing so the cracking still continues you may remove a leaf or two from beyond the bunches, even at the risk of somewhat diminishing the size of the fruit.

**Grapes Shanking (L. M.).**—The parcel you have sent has not yet come to hand. It does not necessarily follow that the present crop of Grapes must be heavy to cause shanking, as, if the Vines have been overcropped in previous years or otherwise debilitated, the evil will show itself. If the Vines were not overcropped, and the border was neither too wet nor too dry, it is deficient in the elements necessary for perfecting the crop. Place the roots in fresh loam in which is incorporated a fourth part of wood ashes and a fifteenth part of crushed bones, surface-dressing the border with rich manure. If the roots take possession of this freely and the Vines are not unduly dropped nor forced, are watered sufficiently yet judiciously, and the foliage is kept thin and clean, the Grapes will not shank, at least to any serious extent. The worst case of shanking that ever came under our notice was cured by adopting the practice we have indicated and invigorating the Vines. There may be other circumstances that contribute to shanking, but in nine cases out of ten it arises from debility of the Vines; this we have proved by direct experiment.

**Stopping Currants (G. Mason).**—You may stop or remove what is termed the watery wood. All shoots growing into the interior of the bush, to the exclusion of light and air, may be cut back when about 9 inches in length, far enough to render the centre of the bush completely open. In about another fortnight the watery or wild-looking breast-spray all round the exterior may be pruned back to within 4 inches of their base. This leaves a regular tuft of foliage all round, absolutely necessary for a partial shade to the swelling fruit. Some intervening spray between each two branches must be served likewise; and if growing freely the leading points of the shoots may be stopped also.

**Planting Broccoli (A Young Gardener).**—There are many other young gardeners beside yourself who regret they have not given more attention to the cropping of the kitchen garden. It is not too late to plant Broccoli now—indeed, we have a great number that are not ready for planting, and on them we shall rely for the bulk of our produce next spring. We do not admire plants that are large at this time of the year, but prefer small, dwarf, sturdy plants, and we endeavour to keep them so by permitting no overcrowding in the seed beds and no weeds to shelter the stems afterwards and make them tall and tender. You may sow the Walcheren Cauliflower now if you can dig up the plants in November, or before severe frosts occur, and place them in pits from which frost can be excluded. We have frequently had a valuable supply of small heads throughout January from plants that have been so treated.

**Cactuses not Flowering (T. Lloyd).**—Place the plants near a south wall or fence, either plunging the pots in which the plants are growing in larger pots or in ashes. If the soil is poor and crowded with roots, and the leaves of the plants thin and of a flaccid nature, remove an inch or two of the old soil from the pots and add fresh compost, half turfy loam and half decayed manure. See that the drainage of the pots is effective, and then water them copiously, especially during hot weather. Many plants of this nature are starved by the want of support during the summer months. They should be treated liberally in the summer, gradually rested in the autumn, and kept dry in winter; they may then be expected to flower in the spring.

**Ellam's Early Cabbage (Judson).**—It is an excellent early variety, of compact growth, and hearts quickly. As the quality, we have found that nearly all Cabbages are good when generously grown; this we know is good, as we have grown it during the present season. About the last week of the present month is a suitable time for sowing Cabbage seed. It is important that it be sown very thinly in an open situation. It is a good practice to sow in drills 6 inches or more apart, saturating them, if the soil is dry, before the seed is sprinkled in them, and covering the ground with mats for three or four days afterwards, removing them at night. The covering must cease the moment the first seedling appears, or the whole will be ruined. This shade is only necessary during very hot and dry weather.

**Pelargoniums at Kensington (J. P.).**—We do not undertake to state the names of all the varieties shown at exhibitions, but we are enabled to give you the names of thirty of those in Mr. Charles Turner's winning collection of thirty-six show varieties; the others were unnamed seedlings:—Alice, Constitution, Duke of Connaught, Emperor William, Faust, Hector, Heroine, Mountain of Light, Maid of Perth, Minotaur, Ritualist, Sir Walter Scott, Trojan, The Baron, Amethyst, Bertie, Claribel, Countess, Dauntless, Douglas, Fireball, Fortitude, Illuminator, Invincible, Joe, Magician, Marmion, Modesty, Valiant, and Virgin Queen.

**Names of Plants (M. G.).**—As you remark that your tree produces flowers we will endeavour to supply you with the name of it if you will send us a flowering spray. We cannot identify the tree from the small flowerless specimen you have sent. (*F. L. P.*)—The Salsafy, *Tragopogon porrifolius*. (*J. McP.*)—*Agrostemma Githago*.

**Modern Bee-keeping (C. N. A.).**—As you state that you "prefer the silence which is golden," and as you do not state the names of any individuals who feel themselves aggrieved, we fail to see that the publication of your letter would serve any useful purpose. We perceive that you do not question the accuracy of the statements in the article to which you refer.

**Moths in Hive (H. D.).**—It is difficult to eject them if they obtain a footing in a hive, where they will deposit their eggs, and they now and then increase so as to cause its entire destruction. When these vermin have established themselves we know of no remedy but driving the bees into another hive.

**The Destruction of Queens—Water for Bees (H. M.).**—Under the circumstances you suppose young queens get hatched only very exceptionally. The rule is this: Weather permitting, the swarm issues at the time of the sealing of the most forward queen cells; but if weather does not then allow the colony to depart, the queen cells are still continued and sealed in due course. This condition of expectancy may last some days, but if no opportunity arrives for the bees to fulfil their intention they abandon it and tear open the royal cells and destroy their occupants. Generally, no doubt, the movements of an unhatched queen within her cell showing that her exit is imminent, stimulate the bees to decision, and the work of destruction begins. When a super is accepted the queen cells within could not be more advanced than the stage of sealing, and then it would be grubs or nymphs, not queens, that would be killed and ejected. Water should always be placed near bees, so managed that they cannot commit suicide by drowning. Water is always useful, but it is essential when honey is not being collected. Freshly gathered honey is both food and drink, but the thick evaporated honey of sealed honeycomb needs to be mixed with water before it can be used in grub-raising.

**Transferring Bees from an Old Skep (Bertie).**—The bees need not necessarily be removed because the top of the skep has sunk, for even if the combs have so dropped that their bottom edges have met the floorboard, then the bees will channel passage way in sufficiency for themselves. As the skep is old and tender it may be wise to drive a swarm from it into a new hive, placing this swarm upon the stand of the old skep and removing the latter a couple of yards or so. Three weeks after the whole of the brood will have hatched, so that a second driving will leave only combs and honey. The new-driven swarm will now be added with proper precautions to the bees in the new hive. Two or three days before driving the second time it would be an advantage to bring the hives close side by side. The old hive will now yield its honey without any loss. The swarm of course should be fed, or at this late season it would hardly be able to prepare for winter. Feeding swarms is always good economy.

COVENT GARDEN MARKET.—JULY 13.

We have now seen the bulk of the Strawberry crop and are busy with bush fruit and Cherries, supplies being good and fair remunerative prices made. Grape trade heavy.

POULTRY AND PIGEON CHRONICLE.

THE DISEASES OF SHEEP AND LAMBS.

(Continued from page 21.)

THE epizootic foot rot or murrain with our mode of treatment of the sheep whilst suffering under the disorder having been described, we must now allude to the disease known to veterinary practitioners as "vesicular epizootic" or the "foot-and-mouth disease." It has been described as follows:—"This affection is highly contagious. When once produced it will spread rapidly through a whole flock, and may be communicated to other cattle, like the ox, pig, &c. It is ushered in by fever. The sheep becomes extremely lame, it walks upon its heels, there is much tenderness upon the coronet, in two or three days the hoof round the entire foot begins to separate, and blisters have formed round at the union of the hair and hoof and between the toes. The duration of this disease, if proper remedies are applied, is from seven to fourteen days. Treatment: Freely purge the sheep with salts and sulphur, keep them quiet, their feet clean, and recovery will take place within a fortnight. Should any part of the hoof be separated it may be removed, and the foot dressed with the vitriolic lotion, as recommended in the epizootic foot rot." This description bears much resemblance to that which we gave last week as the symptoms of the epizootic foot rot. It will, however, make some difference to the home farmer as to which complaint his sheep suffer from, for although they both yield to the same treatment, yet the foot-and-mouth disease is temporary, whilst the sheep are always liable to attacks of foot rot in very wet seasons.

We have now, however, the gratification of announcing a new and speedy remedy for the foot-and-mouth disease, which if carefully carried out will reduce the injury inflicted upon the animals to a minimum. We allude to the use of salicylic acid, as described by Sir E. C. Kerrison, Bart., in a short essay, just published in the "Journal of the Royal Agricultural Society of England," under the heading of "Remedy for Foot-and-mouth Disease." He says, "For all the ailments connected with this disease veterinary science has up to now discovered no speedy cure. Reading in the Times a short time ago that by the use of salicylic acid in Silesia and other parts of the continent this disease was speedily arrested, I purchased a quantity in case of accident. Salicylic acid has been for some time in use in our hospitals as a quick and speedy remedy for rheumatic fever. I had my reasons therefore for believing that this acid must be a valuable medicine in cases of feverish symptoms. On the 10th of January four of my bullocks were pronounced to have foot-and-mouth disease. One had a very swollen tongue, and was very ill. I ordered at once the following remedy to be used. Receipt:—Pour some hot water on about three tablespoonfuls of salicylic acid in an earthen vessel, adding lukewarm water to make up a gallon. The mouth and feet of the diseased animals should be carefully washed three times a day with this liquid, and the tops of the hoofs well powdered after each ablution. Also dissolve two tablespoonfuls of the acid in hot water, and add it to the drinking water of the animals. The sheds must also be kept quite clean, and all dung must be saturated with the acid to prevent further infection." The essay goes on to state the result of the use of the receipt above described upon the cattle on Sir E. C. Kerrison's farm at Oakley Park, Scol, Norfolk. "The fourth day after treatment these bullocks began to eat, and by the 15th of January the whole

number were chewing their cud as usual. Since that time a month has elapsed, and although they have been supplied with their usual food they have increased in value from 6s. to 7s. a head. On the 15th the wind changed to the east, and carried infection to twenty-three calves 50 yards distant in a covered yard. Now, said the local veterinary surgeon, these calves will die like flies. I certainly had my misgivings about two puny calves, which I always thought would die a natural death without disease; but the whole twenty-three have recovered, the disease in every case lasting only four days. Again, when the wind turned to the south twelve cows became affected, ten being in milk. All these have recovered, five days being the longest period any of them were ill. They have hardly wasted at all in their milk, and I expect that on the eighth or tenth day from their infection they will be pronounced sufficiently sound for their milk to be used. It is further stated that a sow was then seized with the complaint. The veterinary inspector advised me at once killing the young pigs, as they would surely die; indeed, such has been the case in my neighbourhood under the old treatment. It is rather a difficult operation to smear the pig's snout; she was therefore only given water impregnated with the acid. In two days she was perfectly cured, and her five pigs are quite well, and will no doubt live to accomplish the aim and object of a pig's life—to get fat in the shortest possible time. Up to this date forty-three head of stock have had it for an average time of about four and a half days each. In order to spread this far and wide, having been once President of the Royal Agricultural Society, I have taken advantage of the kindness of the Editor of its 'Journal' to give through its medium the earliest intelligence of this German discovery."

Our readers will no doubt feel interested in the extract we have made from this essay, for the subject is treated in a full and practical manner both as to the remedy, its administration and results, that it cannot fail to be of the highest consequence to the home farmer in his everyday management of cattle. Everyone should, as occasion requires, test this valuable remedy upon all kinds of stock. It must be considered that this remedy is available for all cattle, including sheep and lambs, when attacked with any disease induced by fever or inflammation under whatever form or character it may assume. No doubt ordinary foot rot will yield to this remedy, for it is essentially a feverish and inflammatory complaint, sometimes only attacking the feet, at others affecting the mouth, eyes, and udders, but every instance will probably be successfully met by the use of this acid. Whatever advantage this remedy will prove to other stock on the farm, sheep and lambs will in fact receive greater benefit under treatment than all the others, because they are nearly always in the open air, whilst all the other animals in ordinary management are often accommodated in winter with shelter. The home farmer should therefore consider the effect of our sheep and lambs being continually exposed to heavy rains, snow, frost, and high winds. It is no wonder that our sheep suffer more from inflammatory disorders accompanied with more or less fever than other stock, and strictly speaking we have a long list of complaints too numerous to mention here. Scarcely any losses which we sustain in sheep-management, except those arising from accidental causes, may be traced to inflammation as their origin, whether the complaint assumes the form of rheumatism, joint diseases, quarter-ill or black quarter, diarrhoea, or affections of the lungs, kidneys, and the udders of ewes. It is very clear that we have a right to expect a speedy cure of nearly all these complaints as soon as apparent, and very probably the prevention of most of them by the treatment we have been describing, if by intelligent observation the premonitory symptoms are discovered in good time.

One of the most serious disorders which the flockmaster has to encounter is abortion amongst his breeding ewes, and when it happens it frequently extends to large numbers, for we have in our flocks occasionally lost from twenty to fifty lambs by premature birth, or by lambs born dead. Practically this is often attributed to the improper feeding of the ewes, and no doubt it is so in some cases. We have noticed, and more especially since the foot rot has been so prevalent, that it may more strictly be induced by internal fever accompanying foot rot, and also by inflammation, the consequence of long and excessive rains to which breeding ewes are exposed in the open field feeding. This disorder once commenced, it is difficult to say how far it may extend. One of the best ways to prevent its spreading amongst the ewes, is to remove every animal as soon as it exhibits any signs of the complaint and place them under treatment, and treat the remainder of the flock with the drink of salicylic acid diluted. In the event of animals suffering severely after abortion, they should not only be allowed the prescribed drink several times a day, but when the placenta does not pass away in a natural manner and

at the proper time, it often affects the parts in a way which eventually leads to mortification and death. Our new remedy, however, it is stated meets these cases in a really practical manner, and by injections into the affected parts it completely prevents them from assuming any serious aspect.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—Horses are still employed on the land preparing for the seeding with common Turnips, and occasionally ploughing or scarifying the fallows intended for Wheat: in fact, it is now none too soon for laying out the dung, if either town or yard manure is used, which should be spread and ploughed in immediately with a cross ploughing. If the land is clean and free from Couch it may then be allowed to lie undisturbed until about the last week in September or first week in October, and then be ridged up into such sized ridges as the nature of the soil requires. Working on the fallows must not interfere with other horse labour of more immediate necessity, such as carting hay to the stack and cutting grass with the mowing machine. In some of the late districts there is much pasture and meadow grass only just becoming fit for cutting, and the recent hot weather on all cold meadow lands has improved the bottom grass to a considerable extent. Horses are at present engaged in ploughing the land rather shallow where Swede seed was drilled in the middle of last month, but afterwards destroyed by the flea or beetle. It is practically useless to attempt to save the plants when the weather is hot and dry, because when the fleas are very numerous the young plants are soon destroyed. It is therefore hopeless under such circumstances to talk of saving the plants. We have never seen it done upon anything but a small patch in garden work, and even then with the greatest difficulty and by both early and late attention—such as we consider quite out of the range of farming operations in general. We must, however, refer to the time of the attack, for if the plants grow and show four leaves before the flea attacks them they may probably be saved by strewing lime on the land in the early morning while the dew is on the leaf. At the same time the home farmer need not begrudge the lime, for it is a capital manure upon nearly all soils if it should fail in saving the Turnip plants. Horse-hoeing of the Mangold, Swedes, and early Turnips must be continued. As we have lost a field of Swede plants by the flea we shall, as fast as the ridges are ploughed, sow immediately 3 lbs. of seed of the Red Mammoth Turnip per acre. This will seed the land very thickly broadcast; but this answers a good purpose, because our plan is to run the horse-hoe through them set at the width of 18 inches. In this way we have generally secured a regular plant, and, not being so thick after horse-hoeings, it very much facilitates the hand-hoeing as compared with the drilled plants.

*Hand Labour.*—Men are now required in haymaking, stacking, &c., in Turnip and Mangold hoeing, also mowing by scythe in the water meadows. Women will of course assist in haymaking in the meadows, and also in singling the root crops after horse and hand-hoeing.

*Live Stock.*—We last week referred to the choice of rams to run with the breeding ewes in the stock flocks for maintaining the breed, or crossing in any direction for the purpose of improving or altering the character of the flock. We must now, however, refer to the selection of rams for the off-going ewes—that is to say, the ewes to be sold to graziers for lambing in the winter or spring, and the lambs for sale as fat stock at Easter and following periods. In this case, if we have Hampshire or west country down ewes in our flock, the best plan is to use either a Cotswold or Oxford down ram; for although the lambs will not prove so good and short-woolled, yet there will be a far greater per-centage of twin lambs. We do not reckon above 90 per cent. of lambs from the Hampshires of the pure breed, yet we get 110 per cent. when the lambs are cross-bred with the Oxfords and Cotswolds. If we refer to the Leicesters or any long-woolled breed, and require their produce to be sold as fat lambs, we highly approve the use of the Somerset horned ram, for that will not reduce the number of twins but improve the quality, and at the same time shorten the wool—a matter of great importance. We always expect the largest number of twins in comparison with any other breed or cross, not less than from 120 to 130 per cent. The sheep on the hill farms will, after finishing the Vetches, feed off the second growth of Clover and Saint-foin, going to a folding of Rape at night time; and if it is required to feed any of the lambs or ewes, they should have about half a pound of cake or cracked beans per head in their troughs on the Rape folding. As the Rape, however, is very forcing food, care will be required to prevent the stock from becoming hoven or blown. Our plan is to let them feed for about twenty minutes, and then turn them back for about half an hour, and it will be found on their returning to the fold after that time the Rape or any succulent food will never injure them. The bullocks fattening in the pastures may require some cake also if the weather continues very dry, and water supplied if they have no pond or brook to go to. All the weaning calves will now be doing well if they get plenty of grass, if not Clover may be cut up and given them, otherwise an allowance of cotton cake will be necessary.

#### HARVEST PROSPECTS IN EUROPE.

THE Austrian Government has received from the Austro-Hungarian Consuls in the various countries of Europe a series

of special reports on the present state of the crops, and the prospects of the coming harvest throughout the Continent. The results have been published by the Vienna Minister of Agriculture, and may be summarised as follows:—

Throughout Southern Europe cereal crops are, with few exceptions, in a very satisfactory condition. In a majority of districts there will probably be considerably more than an average harvest. It is only in Portugal that the yield promises to be below the average. In Spain and most parts of Italy the promise is satisfactory; in Lombardy, Greece, and most parts of the Balkan countries, highly satisfactory. In the lower parts of Bulgaria, Servia, and Roumania, however, the spring floods have done great damage. The excessive rains and floods in Moldavia have so injured the crops that only half the average yield is expected.

In Central Europe generally there is promise of a satisfactory average harvest. In Switzerland the result is expected to be considerably in excess of the average. In Germany the only provinces where the yield will fall sensibly short of a fair harvest are East and West Prussia, the falling-off being attributed to a wet autumn, a severe winter, and a cold damp spring. From Russian Poland, too, owing to the same causes, the harvest will probably be considerably below the average. In Saxony, Thuringia, and some other parts of Germany, the so-called English variety of Wheat (*Triticum turgidum*) has done badly, but the native variety (*Triticum vulgare*) has thriven well.

In Western Europe, including France, Belgium, and the Netherlands, the cereal crops are generally in a very satisfactory state. It is only in some parts of Southern France that the yield promises to be below the average. In Holland, on the other hand, the prospect is highly satisfactory, considerably more than the ordinary yield being anticipated.

As regards Eastern Europe, the harvest in Russia will be very unequal in different parts, but the general result will be an average harvest. In several Governments the severe winter has killed the seed, and the spring-sown crops have progressed but slowly; but from most districts the reports are satisfactory.

Taking Europe as a whole, the harvest of the present year promises to yield more than the average. The result will, however, be in part due to the fact that the area sown with cereals is larger than the average for some years past.

#### VARIETIES.

THE ROYAL AGRICULTURAL SHOW AT DERBY.—Although there is a slight falling-off in the entries in the classes of live stock of the Show now being held in Osmaston Park, still the Exhibition is one of great magnitude, and worthy of the Society under whose auspices it is held. Of implements there is a remarkable display, consisting of 377 stands and nearly six thousand articles. The museums of the great seed farms, we are informed, attract much attention, as may be expected when, amongst others, such firms as Messrs. Sutton, Carter, and Webb put forth their strength, as we learn they are doing at Derby. Their splendid collections of seeds, roots, grasses, &c., strikingly represent the great importance of this section of British agriculture, and the skill and enterprise with which the seed industry is conducted in this country.

— THE CROPS IN THE MIDLANDS.—Judging from the passing glance that is obtainable from a Midland express from London northwards, a journey that will be traversed by thousands this week, the corn crops generally are looking decidedly better than they were at the corresponding period last year. True there are far too many Charlocks and Poppies in places, and many fields of Wheat and spring corn that are far from satisfactory, yet, notwithstanding, there is a decided improvement in the aspect of the country. The hay crops, if crops they can be called, are strikingly deficient; but Beans and Peas are looking well; Potatoes excellent; and Turnips and Mangolds appear to have got a fair start, and, weather and weeds permitting, good crops may be expected. The fruit crops are far superior to those of the past few years, and altogether signs are not wanting that we are nearing brighter and better times, so far at least as regards the productiveness of the soil.

— LEGHORN EGGS.—*The American Poultry Yard*, in recommending Leghorns for laying qualities, says—"It is a mistake to suppose, as many do, that the egg of a Leghorn is necessarily a small egg. Of course it will not equal in bulk the egg produced by a fowl three or four times as large, but in proportion to the bulk of

its body the Leghorn, under proper treatment, will yield eggs that are thoroughly respectable in size; and the only wonder is that when the comparatively small bodies of the fowls are taken into account they can by any process of nature produce the weight of eggs yielded up every season during their period of usefulness." We must confess that our experience has led us to arrive at the conclusion that Leghorn eggs are decidedly small. We shall be glad to hear from such of our readers as keep Leghorns what their experience has been.

— AGRICULTURAL PROSPECTS.—Our reports this week are not on the whole in favour of a remunerative harvest. The Wheats vary in different localities, but as a rule they appear to be a rather thin crop. With the exception of early-sown Barleys on kind land, the spring corn is also stated to be thin, and even the best crops are short in the straw. The great deficiency of the hay crop is no longer a matter of uncertainty. The thunder rains have benefited the root crops and helped the growth of aftermath Clovers and grasses. Stock of all kinds are doing well, but prices continue to be disappointing. Altogether the outlook is not very cheering.—(*Mark Lane Express*.)

— REMEDY FOR FLUKE DISEASE IN SHEEP.—Mr. J. R. Millington, writing to the *Irish Farmer's Gazette* upon the fluke disease, observes—"The eminent London cattle auctioneer, Mr. Thornton, gave a friend of mine the following recipe as a remedy for fluke disease in sheep; and as I am sure he would not give it unless he believed it likely to be efficacious, I submit it to your readers. The remedy is so simple, and the matter is of such pressing importance, that a trial ought to be made and the results published. The remedy is 1 oz. of podophyllin root in half a gallon of water, boiled well or simmered before the fire. The dose two tablespoonfuls on two successive mornings, to be given cold, and the doses repeated at the end of a week. This medicine will not injure sheep in lamb or that have lambed. Podophyllin is a medicine of comparatively recent introduction, and is the root of the May Apple or wild Lemon, and is a common herb throughout the American States. It has superseded to a great extent the various preparations of calomel, &c.; indeed, it is known by some as the vegetable mercury, and as a cathartic it has been found invaluable. If it be as effective a remedy for the fluke in sheep as it is in some diseases of the human subject, its use will be a boon to farmers."

## POULTRY AND PIGEONS

#### POULTRY NOTES.

It is now full time that the old birds, which are likely to be wanted for exhibition at the leading shows, should be getting rid of their old plumage. If they are not beginning to moult of their own accord some artificial means of starting a moult may be tried. Shutting the birds up in very warm houses or pens and giving them a little hempseed mixed with their other grain food is the best plan for the cocks and non-sitting hens. Hens of the sitting sorts should be allowed to lie a few weeks if possible before being treated as above suggested.

It should be remembered that as a general rule hens will not moult so long as they are laying, and also that a very full state of the system is bad for the commencement of a moult. It is best, therefore, to allow the birds before they commence moulting to get rather below their usual condition, and then as they progress in the moult to gradually increase the feeding, and thus get them into their best form just at the time when they are most wanted for exhibition. Show birds are to a certain extent like athletes, and can more easily be got into condition for one or two events than kept a long time in high condition. Let the system of feeding now adopted be such, therefore, as to rather bring down the weight of those of the birds which are unduly heavy, and stop the laying of the hens. Scanty meals of non-stimulating food will do this. Birds that are in low condition or are of weakly constitution must not be included in this regimen, or their systems may be too much reduced to stand the strain of moult.

THE white breeds, and such of the other kinds as turn yellow through exposure to the sun, must be moulted in some place where there is no strong sunlight. Many fanciers moult them in houses

on straw, but unless the birds be delicate we hardly approve of this. Nothing takes the stamina out of a healthy bird so much as long confinement in a house; and although no evil results may at once appear, the effects will probably show themselves in the ensuing breeding season in unfertile eggs and weakly chickens. If the necessary amount of shade can be secured by any other means we never pen up our birds to moult, but allow them as much liberty as possible on every fine day.

A CORRESPONDENT last week, in speaking of rats as poultry pests, recommends their extermination as a remedy. That is all very well in theory, but can only be carried out in practice in exceptional circumstances. One's neighbours are by no means always so particular in respect to exterminating these gentry as one could wish, and with a thriving colony next door dwelling undisturbed it is useless to rely for safety upon exterminating occasional visitors. We once were so badly overrun that the rats actually ate their way through the woodwork of an artificial mother and killed all our early chickens. We then determined to put no further trust in wood, and constructed a rat-proof sleeping place for our young chickens as follows. We obtained a sheet of thin iron 6 feet long by 3 feet wide. The outer edge of this, to the extent of  $1\frac{1}{2}$  inch, we bent up at right angles to the rest of the sheet and nailed to a wooden framework made of  $1\frac{1}{2}$ -inch square scantling. This made a sort of tray, which held just a sufficient depth of dry earth for the chicks to lie and run about on. We next constructed a sort of bottomless cage of similar scantling and three-quarter-inch-mesh galvanised wire. This cage was 2 feet in height, and being so constructed as to fit exactly upon the framework of the iron tray, measured 5 feet 9 inches in length and 2 feet 9 inches in width. A stout pair of hinges at the back and a hook and eye at the front completed the arrangement. A hook in the back wall and a thick cord attached to the front of the cage afford the means of keeping it open in the daytime. The artificial mother is placed inside this cage, and once it has been fastened up for the night the fancier can rest assured that no rats will reach his chickens.

ANOTHER method of baffling the rats is to raise the chickens' sleeping house on iron bars or stoneware pipes a couple of feet from the ground, taking care to keep it sufficiently far from the wall not to allow the rats to get a means of access and attack in that direction. In order to eat their way through woodwork rats require some convenient place from which to work, which this arrangement prevents. A sloping plank with boarded sides and wired top affords a means of access to the chickens, which they soon learn to use. This must of course be taken down at night and the entrance closed.

WHERE the houses are of stout wood, and so placed as to be accessible on all sides, we have found that rats may be entirely excluded by simply digging a narrow trench 1 foot deep all round each house, putting down three-quarter-inch galvanised wire netting 1 foot in width in the trench, nailing the top of the wire to the woodwork of the house, and filling-in the trench with fine sand or gravel. We do not say that this plan is infallible, but we have never, after several years' experience, known a rat to make his way into a house so secured.

### POULTRY AND PIGEONS IN SUMMER.

IT is a common mistake to think that poultry require no attention at this time of year. The days are long, the weather may be expected to be fine, and cold rain and winds, their great enemies in winter, absent; therefore it is thought no ill can befall them. This unfortunately is an error. There are many diseases which indirectly result from heat, and somehow we have always found the summer complaints of poultry far more difficult to deal with, and far more quick in their progress, than those which attack them during the colder months. As a timely warning we will enumerate some of them and some of their causes.

To begin with. All the evils which result from overcrowding must now specially be guarded against. Water quickly becomes foul if exposed to the sun, and we see at the bottom of neglected pans a nasty green growth. They should constantly be scoured out and a few drops of Condy's fluid put in the water. The ground, too, when there is little rain to wash it, quickly becomes tainted, and even good large grass runs if constantly occupied become the same. If it is attempted to keep poultry (though we always deprecate this) in small gravel yards, their surface must be constantly turned and watered with a weak solution of

carbolic acid. Grass yards are more easily kept sweet if constantly mown; the growing grass seems to absorb impurities. In spite of such precautions we have lately lost a number of chickens simply from putting them into large grass yards which had been too long inhabited by adult birds and so tainted. Again, in hot weather the air as well as the water and earth is very easily vitiated. If poultry houses are situated where it is unsafe to leave the doors open at night it is a good plan to have temporary wire doors opening inwards placed inside the wooden doors; we have some such, and they enable us without fear of vermin to leave the houses well ventilated at night. All half-grown birds should now be taken away from coops and put in houses, and the coops of small chickens must never be entirely shut up at night. All soft food soon becomes sour; the greatest care must be taken to mix no more than is at once required. Sour food is a frequent cause of diarrhoea, which in very young chickens is at this time of year an almost incurable malady, and (such is our experience) highly infectious. We have lost several valuable chickens by it from putting them among rank grass; in such places grit is often absent, and they eat coarse and indigestible herbage, internal inflammation comes on, they fade to skeletons, and die.

Ducks will hardly bear any cooping now. Those who have large enclosed wire runs, with or without houses, will find it best to turn the ducklings and their mothers or foster-mothers loose in them, and not to coop them at all. Young Turkeys should by this time have complete liberty and no longer be cooped; it is wonderful how fast they grow when once they begin to perch.

For Pigeons very similar precautions must be taken; their lofts and houses well ventilated, their nests kept scrupulously clean, and the ground of their aviaries frequently sprinkled with disinfecting fluid. Their baths, too, should be filled with fresh water three times a day. Many people are ignorant of the fact that Pigeons like and require in summer a considerable amount of green food. It is a good plan to plant a large Lettuce or Cabbage now and then in their aviary, and to see how rapidly they devour all but the toughest part of the stalk.

We have at times spoken of canker as almost incurable among young Pigeons, and ought therefore to relate a decided cure of it, which we have lately made, and its method. A pair of Blue Fantails, bred, it should be said, from two nearly related birds, at about a month old showed every external sign of it—viz., roughness of feathers, panting, and mopishness, and became quite light; examination proved their throats to be, as we expected, full of canker. We simply scraped it out every day with a quill, and gave them each one of Hammock's pills. At first we had no real hope of effecting a cure, but the Pigeons continued to eat, and gradually became heavier in hand. After about a week we observed that the canker returned much less rapidly, and then only one speck appeared daily in the corner of the mouth of each; this we always scraped away till the surrounding skin bled, and now after three weeks' treatment they are fat, have no more pills, and only the faintest traces of canker. We believe them to be really cured.—C.

### REMARKS.

3rd.—Very fine, warm, breezy day.  
 4th.—Very warm, bright, and fine.  
 5th.—Very hot oppressive day; temperature higher than on any day since 1868. Lightning in south-west 10 P.M., and violent thunderstorm from midnight till 3 A.M. on the 6th.  
 6th.—Very close, with slight rain and thunder in early morning; heavy rain for short time 11 A.M.; fine, breezy, and cooler in afternoon and evening.  
 7th.—Cool overcast morning; fine bright afternoon and evening.  
 8th.—Cloudy and cool, thunder 1.15 P.M.; showery afternoon and evening.  
 9th.—Fog in early morning, dull at first; fine bright day; overcast evening.  
 Temperature very much above the average notwithstanding the coolness of the 7th, but the week not quite so hot as that ending June 4th.—G. J. SYMONS.

### STRIKING ROSES IN SUMMER.

**A** CORRESPONDENT having asked for the names of such H.P. Roses as will grow on their own roots, I have to say that I have not found any which will not succeed in that way at least as well as they will in any other. It is true I have not grown them all, nor a sixth part of such as may be said to be in general cultivation amongst large exhibitors; but as no failures have occurred amongst those which have been tried, and they represent all classes, it may be assumed that although under certain conditions some varieties will not strike root as freely as others, yet when once rooted they will all grow well, and that those which will not strike readily under one system will freely do so under another. There is probably not a Rose grown which will not freely root at this time of the year if the cuttings are treated in the way I shall attempt to describe.

Most people who have attempted to grow Roses have also at some time tried to bud a few; they will therefore understand that when a Rose shoot is in the condition of having buds fit to insert, it is also then in the best condition for making into cuttings, with a chance of every cutting striking root. To those who do not know anything about budding I may say that the growth is generally in the best condition at the time of flowering, or immediately afterwards. A shoot which has produced a flower, and still has its foliage healthy, will generally have little plump buds in its axils, and these before they start into growth are in the best condition for the purpose of propagation either by buds or cuttings. It is not really necessary that a shoot should flower to be in this condition; on the contrary, those which have not produced a flower, if the growth is sufficiently hard, will probably strike root the quickest; but as everything depends on the condition of the wood I am anxious to make this part of the subject plain. It must be moderately hard, bearing fresh healthy leaves, and must not be too vigorous. Medium or even weak growths will be found to root more freely than those which are strong and succulent. Having decided that the growth is in a suitable condition for making cuttings, the soil must be prepared to receive them—for remember, that when once they are severed from the parent plant every minute of exposure to the action of the air before insertion will probably add a day to the time it will take them to strike root; and further, that the value of the future plant altogether depends on its striking root without losing its present foliage. It will, I think, not be too much to assert that more Rose cuttings fail to strike by being dried during the process of making and insertion than by any other cause.

Keep the wood and foliage perfectly fresh and failures will be few; permit the bark to shrivel and the leaves to flag and the losses will be many.

I prefer to have my cuttings for striking in summer in such a position that the sun cannot shine directly on them, but still so that they may have the benefit of all the daylight there is. The best place, then, I consider is quite close to the north side of a rather high wall, and if there are no plants growing there so much the better. Another advantage which this position possesses is that the fluctuations of temperature are not so great as in other parts of the garden, hence the condensation of moisture, that great producer of "damping-off," is not so great. My propagating frames are very simple, consisting of bottomless boxes fixed on the ground after it is prepared for the cuttings; or if the boxes are not sufficiently deep to give a couple of inches of clear head-room above the cuttings they may be fixed on the ground first, and then the interior can be lowered to the required depth, taking care that the soil to receive the cuttings is sweet but not rich. It will be an advantage to place an inch or two of gritty soil—say a third road grit or sand to two-thirds of well-pulverised soil, such as would be found on the surface of a flower border. The size of the boxes is immaterial, so long as they do not reach out too far from the wall. Mine are generally boxes such as have been used for growing French Beans in during winter, the bottoms of which invariably decay before the upright parts, and they then serve this purpose as well as new boxes would. The size of them is 32 by 12 inches, and 9 inches deep. The greater part of our propagating is done in boxes of this length and breadth, although they are not of uniform depth, and they are covered with panes of glass about 12 by 10½ inches, three panes covering each box. Some long strips of paper about an inch wide are cut, a little paste (merely flour and water mixed without boiling), and a small paint brush are in readiness before the cuttings are taken off.

Where a long shoot can be spared it may be made into several cuttings, as it is not necessary to have a heel to them, as many people imagine. One joint below ground and one above is sufficient, but more will do no harm provided there is no soft growth left on the upper part. Use a dibber without a sharp point, so that it may leave the bottom of the hole flat for the cutting to rest on, then make the soil quite firm round it without bruising the bark. Have one box filled as quickly as possible, give a rather heavy watering, place the glass over immediately, and paste the strips of paper partly on to the box and partly on to the edges of the glass, so that no air can enter. If the panes fit closely together on the top it will not be necessary to place paper across; but if there is more than room to stick the point of a knife in, the widest spaces should have paper pasted on them as well. Do not allow the glass to be lifted for four weeks, by which time you will have plants instead of cuttings, and they then must be treated accordingly. Among the sorts which I have doing well are Etienne Dupuy, François Michelin, Mdle. Thérèse Lcvet, La France, Duchesse de Vallombrosa, Marie Baumann, Alfred Colomb, Jules Margottin, Victor Verdier, Achille Gounod, Madame Clemene Joigneaux, Général Jacqueminot, Centifolia Rosea, John Hopper, and Beauty of Waltham.

There is a Rose, I suppose it is a H.B. Paul Verdier, which I would specially recommend to those who have to supply cut flowers, as it comes in just as the H.P.'s are getting past their

best. It is a red incurved flower of good shape, and ought to be useful for a late exhibition stand, but I seldom see it. It does well with me on its own roots, every bloom coming good.—WM. TAYLOR.

#### DAY'S EARLY SUNRISE PEA.

IN reply to "CLERICUS," I may state that the above Pea was sown here on a south border on March 10th, and the first dish was gathered on July 4th. William I. and Ringleader, sown on the same date, we gathered from on June 18th. William I. has been particularly good, carrying a heavy crop of well-filled pods of splendid colour, the peas being of excellent flavour when cooked. I consider Early Sunrise has quite failed as a first early Pea, seeing that it was a fortnight later than the others, and it is inferior to some varieties in cultivation as a second crop. It has one good point—namely, its dwarf habit, and it is of good flavour, but not so good in colour as William I.—G. SUMMERS, *Sandbeck Park*.

I HAVE no doubt about this Pea taking a position as a standard early variety. Though the difference in time at which the Early Sunrise and William I. come into bearing is hardly worth mentioning, yet the former, perhaps, has the advantage, as the pods fill more quickly than is the case with the other, which takes some days before they are serviceable, though outwardly they may appear quite full. Early Sunrise is essentially a dwarf Pea, growing with us to an average height of 2½ feet; the other is a tall Pea. Early Sunrise remains longer healthy and in a bearing condition, while William I. has the advantage in having double the number of peas in each pod. Both are good-flavoured Peas. William I. is now difficult to obtain true to name. Altogether I consider Early Sunrise a Pea well worth growing, and as this year the price was only 3s. 6d. per quart, no doubt it will be reasonable in price another season.—R. P. B.

WITH seed bought of Mr. Richard Cleaver of Lichfield, who obtained it in sealed packets through Mr. Robert Cooper of London, I sowed two rows of Sunrise on St. Patrick's Day (March 17th) on land which was well manured for a last year's crop. They showed bloom on May 28th, and the first gathering was made on Tuesday, July 12th. In quality, size, and flavour the Pea is good, and the haulm is covered with fine pods from bottom to top. In consequence of the high character given to this as an early Pea by the advertisers, I did not sow Kentish Invicta, on which I have relied as a first early, until April 16th—a full month after Sunrise; and yet we gathered from the Invicta on July 9th, three clear days before Sunrise. William I., sown on May 2nd, was gathered from simultaneously with Sunrise on July 12th. These Peas are all growing on the same plot of land within a few yards of each other, and the only difference in treatment is that the Invicta and William I. were manured at the time of sowing, and Sunrise was sown on land rich from last year's tillage. It will thus be seen that to call Sunrise early is a misnomer, and that its sun rises with the sluggard—when others have done a good portion of their work. Those who advertised it as "a Pea as early and good, if not better, than Ringleader," have caused me a great disappointment by keeping me out of Peas two or three weeks. I shall not again trust to highly praised novelties.—CHARLES BARNES, *Lichfield*.

#### NOTES FROM THE CAMBRIDGE BOTANIC GARDEN.

DURING a recent visit to the botanic garden of our celebrated University of the Light Blues I observed several plants worth noting in the pages of the Journal, and therefore I send you the following jottings. I may remark that the general appearance of the garden is very satisfactory, as it might be expected to be under the able superintendence of Mr. R. J. Lynch.

EPIDENDRUM PRISMATOCARPUM.—This has been in flower for many weeks, and though not showy it is extremely attractive from its large spikes of yellowish flowers with dark chocolate blotches and pink labellum. It is robust in habit and easily cultivated, while from the persistency of its blossom it is worth the attention of every collector.

LONICERA GRATA.—Of this fine shrub there is an excellent specimen, and it is one of great value and beauty. It flowers most profusely and is sweetly scented. It closely resembles in its floral characters the common Honeysuckle, but requires no support. From this habit—of a close-growing much-branched shrub—it is able to take a place where the climbing Honeysuckles could not be grown. It is said to live longer than most other species, and to be inferior only in vigour to *L. japonica*. It flowers from early

summer to late in autumn. It is a native of North America from Carolina to New York.

LATHYRUS GRANDIFLORUS.—Common as this is, it is, perhaps, the finest of all in size and beauty of blossom, while it is not surpassed in the length of its blooming season. It is very pretty in combination with some other plants, and recently we have admired it trailing among grass. There is scarcely anything more charming to grow beside a cottage door or to cover low palings.

GALIUM RUBRUM.—This very rare species is without doubt the choicest for garden culture. It has slender stems about 1 foot high, which now bear numbers of tiny red flowers—a colour quite exceptional in this genus. The leaves are narrow and small, and the loose inflorescence is extremely graceful and light in appearance for the purpose of relieving the colour of bright flowers in floral arrangements.

SCARLET POPPIES.—The new *Papaver umbrosum* is one of the finest, and, growing on the rockwork, is the most attractive of plants there in flower. It is nearly allied to the Corn Poppy (*P. Rhæas*), of which it is, perhaps, a variety. It is much superior in its more compact habit and finer foliage. The flowers, too, are deeper in colour with greater substance, and the intensely black blotches contribute greatly to its handsome character. It was distributed by Mr. Thompson of Ipswich, who marks it a biennial, under the treatment for which it has done well. *P. bracteatum* on the herbaceous ground has been magnificent—far finer than the comparatively pale *P. orientale*. Of that species it is properly a variety, distinguished by having bracts beneath the flowers. Some years ago in the Jardin des Plantes was to be seen an interesting variety with monopetalous flowers. Can any reader say where this is to be obtained?—VISITOR.

#### SHEFFIELD ROSE SHOW.

JULY 14TH.

GAIN has the National Rose Society held a successful provincial Exhibition—one, indeed, which deserves to rank high in the records of Rose shows, not for extraordinary quality of blooms or unusually keen competition in the classes, but for general average excellence, magnificent weather, and a great attendance of visitors. Perhaps, however, the high-sounding adjective applied to the weather requires a little qualification. It was hot, and a temperature above 90° in the shade is not the most suitable for the Roses, the exhibitors, the officials, or the visitors; consequently all suffered more or less, but the Roses apparently the most. Not only after they were placed upon the exhibition tables, but before they arrived, many had reached a condition that effectually damped their owners' hopes of a high position in the ranks of the competitors. Nevertheless many very bright and beautiful blooms were contributed, and some of the leading collections would have borne comparison with any that have been shown this year.

After some experience in Manchester in previous seasons the Committee of the Society very wisely accepted the cordial invitation to hold a show at Sheffield, an invitation that was supported by liberal financial arrangements, and as a very satisfactory result the Exhibition was attended by nearly 10,000 visitors, thus giving the encouragement that had been so well deserved. A Rose show in Sheffield is indeed a novelty, for it is said to be the first exhibition of importance exclusively devoted to Roses that has been held in the smoky town. The Botanic Garden was a well-chosen site, and the bright appearance of the grounds tended greatly to increase the attractions. A large marquee 70 yards in length was erected to contain the exhibits; two side tables extending the whole length of the marquee bearing the majority of the Roses, a portion of the central stage being also occupied with them. But on the latter table the chief feature was an extensive and beautiful group of plants from Messrs. Fisher, Son, & Sibray, Handsworth, comprising a large number of

Pelargoniums, Begonias, and miscellaneous flowering and fine-foliage plants. This contribution added considerably to the beauty of the Show, imparting a pleasing relief to the formal lines of boxes. All the arrangements were carefully executed, the only defect being an unfortunate delay in the judging, partially caused by the late arrival of an important exhibitor. With this exception everything was satisfactory, and it is to be hoped that many years will not elapse before Sheffield will witness another Exhibition of the National Rose Society.

**AMATEURS' CLASSES.**—In this portion of the schedule ten classes were devoted to amateurs, and for the convenience of exhibitors they were arranged in three divisions, no competitor being allowed to stage in more than one of those sections. Though the competition was not remarkably keen in any of the classes, yet several praiseworthy collections were contributed which for the freshness and good form of the blooms they contained have scarcely been excelled at either of the metropolitan Rose shows this year. The extreme heat, of course, exercised an injurious influence upon the general condition, and taking that into consideration with the distance many had travelled they were better than could have been expected. In Division C the chief class was for thirty-six single trusses, and in that Mr. T. Jowitt, Old Weir, Hereford, well won the premier prize of a silver cup value ten guineas, given by the Master Cutler of Sheffield, with blooms of fine quality and admirably representing some of the best varieties. Comparatively few weak blooms were observable, and the stand was good all round; but the following Roses were especially noteworthy for their substance and colour—Madame Charles Wood, Comte de Raimbaud, Lord Macaulay, Dupuy Jamain, A. K. Williams, Reynolds Hole, Horace Vernet, Marguerite de Brassac, Duchesse de Morny, Lord Herbert, and Duke of Edinburgh. The Rev. Canon S. Reynolds Hole, Cauntton Manor, Newark, was second, being a formidable competitor for Mr. Jowitt, and running him closely with bright fresh blooms, the only defect of which was perhaps a little want of size and substance. Mr. T. B. Hall, Larch Wood, Rock Ferry, Cheshire, was third with small but clean examples. For twelve triplets Mr. Jowitt was again to the fore with a similarly handsome collection to that which gained the honours in the preceding class. Duchesse de Morny, fine; Marie Baumann, A. K. Williams, very bright; Louis Van Houtte, Mons. E. Y. Teas, Le Havre, neat; and Horace Vernet, handsome, were some of the most noteworthy blooms. The second prize was withheld; Mr. J. Howe, Nottingham, being placed third with a fair collection. In the class for twelve Teas or Noisettes the chief prize consisted of five guineas and a silver cup, value ten guineas, presented by a member of the National Rose Society. This was won by Mr. T. B. Hall with a really handsome stand of blooms. The varieties were Souvenir d'un Ami, Madame Margottin, Madame Berard, Mons. Furtado, Comte de Paris, Niphotos, Catherine Mermet, Marie Van Houtte, Souvenir de Paul Neyron, Souvenir d'Elise, Marcellin Rhoda, and Madame Bravy. Canon Hole followed closely with a good collection.

The second division also contained three classes, the principal being for two dozen single trusses, in which five collections were staged. Mr. E. K. Whitwell, Barton Hill, Darlington, was the most successful exhibitor, gaining the five-guinea silver cup offered by the town of Sheffield for satisfactory fresh even blooms of the following among others—Marie Baumann, very neat and bright; Marguerite de St. Amand, full; Alfred Colomb, neat; Thomas Mills, fresh; Madame Hippolyte Jamain, large, good form; Mons. E. Y. Teas, Madame George Schwartz, Madame Noman, fine; and Charles Lefebvre. Mr. C. Davies, The Grammar School, Aynhoe, Banbury, was an admirable second with fresh substantial blooms of Devienne Lamy, Madame Charles Crapelet, Madame Prosper Langier, and Horace Vernet among others. The Rev. E. N. Pochin, Barkby Vicarage, Leicester, and the Rev. J. A. Williams, Yardley Wood Vicarage, Birmingham, secured the remaining prizes with blooms that had evidently been of fair quality, but which had suffered considerably in travelling. Mr. C. Davies had the best eighteen single trusses, followed closely by Mr. Whitwell and Mr. J. Radford of Nottingham, the prizetakers and the only exhibitors. Two stands of nine Teas or Noisettes were shown; Mr. Davies being again successful in obtaining the chief honours for neat and well-formed blooms of Madame Hippolyte Jamain, Homère, Smith's Yellow, Souvenir de Paul Neyron, Maréchal Niel, Catherine Mermet, Marie Van Houtte, Souvenir d'un Ami, and Alba Rosea—a very pretty collection. The Rev. J. A. Williams was second with smaller but fresh examples, Maréchal Niel, Céline Forestier, and Devoniensis being noteworthy.

In the third section of the amateurs' classes the keenest competition was for a dozen trusses, eight stands being entered. Mr. E. Loseby, Nottingham, secured the premier post of honour with fine blooms of Alfred Colomb, Docteur Andry, Madame Charles Wood, Charles Lefebvre, Victor Verdier, and Marquise de Castellane, these being much the best in the box. The Rev. J. H. Pemberton, Havering-atte-Bower, Essex, was accorded the second position for a collection very close to the other in merit; Mr. Julius Sladden, Seward House, Badsey, Evesham, and Mr. W. Wallis, Alexander Road, Burton-on-Trent, taking the other prizes in that order. The exhibitors and prizetakers for six single trusses were Mr. E. Mawley and the Rev. Alan Cheales; and for the same number of Teas or Noisettes the two last named were placed equal, preceded by Mr. J. H. Pemberton, all staging rather small but neat blooms. In the class for half a dozen distinct new Roses not in commerce previous to 1878, Mr. T. Jowitt

contributed the only collection, and secured the principal prize with good representative blooms of Mrs. Laxton, Duchess of Bedford, Harrison Weir, A. K. Williams, Penelope Mayo, and a seedling of moderately good substance and very bright in colour somewhat resembling A. K. Williams.

**NURSERYMEN'S CLASSES.**—Owing to a considerable delay in the judging of these classes, chiefly due to the reason above named, the tent was crowded with visitors holding private view tickets before we could obtain the necessary notes, and even securing the names of the best blooms in the leading collections was a work of considerable difficulty—almost an impossibility. This was especially the case with the stands of seventy-two blooms which were near the entrance to the marquee. Being the great feature of the Show the visitors clustered closely round these, and some of the ardent rosarians were so busily engaged in examining and criticising the respective merits of the blooms that they very reluctantly made way for others who were patiently waiting to obtain a glimpse of the stands. As regards quality the majority of the nurserymen's blooms were very satisfactory indeed; in several collections flowers were staged that have not been rivalled this season. There was, too, a noticeable difference in the relative position of the great Rose-growing firms, some that ranked high at the Sydenham and Muswell Hill Shows only taking second and third-rate positions at Sheffield, while the converse applied to some that had this season hitherto not been in their best form. The silver cup given by the Mayor of the town and £5, which constituted the principal award in the class for seventy-two blooms, were won by Cranston's Nursery and Seed Company, Hereford, who had a grand collection of fresh substantial blooms representing most of the best exhibition varieties in commerce, and well meriting the honour accorded for them. A dozen of the most noticeable were A. K. Williams, Senateur Vaisse, Mons. E. Y. Teas, Charles Lefebvre, Capitaine Christy, Beauty of Waltham, Camille Bernardin, Niphotos, Duke of Edinburgh, Madame Gabriel Luizet, and Madame Hippolyte Jamain. Messrs. Keynes & Co., Salisbury, followed with even and creditable blooms, La Rosière, Pierre Notting, and Alba Rosea being remarkably fine among many others of good quality. Mr. B. R. Cant, Colchester, was third with bright blooms, but slightly deficient in substance; Messrs. G. Paul & Son, Cheshunt, taking the fourth position. With forty-eight triplets Messrs. Cranstons were again the principal exhibitors, gaining the premier position with stands very similar in quality to those in the previous class. Messrs. Keynes & Co. also followed the Hereford firm as closely as before, staging fine examples of Alfred Colomb, Black Prince, Alfred Dumessnil, Charles Lefebvre, Star of Waltham, Madame Gabriel Luizet, Avocat Duvivier, Marie Rady, Ferdinand de Lesseps, Auguste Rigotard, and Souper et Notting. Messrs. G. Paul & Son were placed third for smaller but neat blooms. Twenty-four triplets were contributed by four exhibitors, Mr. G. Prince of Oxford being selected for the chief honours; his stand included some handsome blooms of approved varieties, fresh and of good substance. Messrs. Cranston and G. Paul & Son were second and third respectively. Tea and Noisette Roses were represented by three very satisfactory stands in the class for eighteen trusses, Mr. G. Prince securing the most important award with blooms of the style for which he is famous. Some of the best were Amazone, Devoniensis, Clothilde, Catherine Mermet, Souvenir de Paul Neyron, Niphotos, Souvenir de Jean Pernet, Souvenir d'un Ami, Marie Guillot, Marie Van Houtte, Madame Nabonnand, and Countess Ouaroff. Messrs. Paul & Son were second, Souvenir d'Elise Vardon, Niphotos, Alba Rosea, and Devoniensis being good, Messrs. Cranston taking the third position. In the three other classes for nurserymen in the second division—namely, for thirty-six single blooms, eighteen triplets, and twelve Teas, the competition though not exciting was fairly good, the prizetakers being Messrs. H. Frettingham, Beeston, Nottingham; Davison and Co., Hereford; C. Turner, Slough; John Jefferies & Son, Cirencester; and Messrs. Cooling & Son, Bath.

**OPEN CLASSES.**—The most important of these was for twelve new Roses not in commerce previous to 1878. Messrs. Cranston carried off the premier prize with fine blooms of Countess of Rosebery, Dr. Sewell, Madame Julie Dymonier, Mary Pochin, much better and fuller than it has yet been shown this season; Madame Marie Verdier, Charles Darwin, Jules Finger, Madame Ducher, Duchess of Connaught, Richard Laxton, Souvenir de Madame Robert, and Mrs. Jowitt. Messrs. G. Paul & Son secured the second place with even fresh examples of Wilhelm Köelle, Comtesse de Choisseul, Ferdinand Chafolte, Madame Eugénie Verdier, Duke of Teck, May Quennell, Charles Darwin, Paul Jamain, Penelope Mayo, and Madame Ducher. Mr. H. Frettingham was third, staging similar varieties to those in the preceding two, except Constantin Tretiakoff, which was represented in the Nottingham stand. The next four classes were devoted to collections of a dozen blooms each of light and dark Hybrid Perpetuals, Teas, and yellow Roses. The best twelve blooms of a dark Hybrid Perpetual Rose among ten stands entered were exhibited by Messrs. Cranston, the variety being A. K. Williams, very fine in form, substance, and colour. Mr. T. Jowitt was a good second with admirable examples of Horace Vernet; Mr. G. Prince taking the third place with the same variety nearly equally as fine. In the corresponding class for light Hybrid Perpetuals Messrs. Cranston were again first with exquisite blooms of Madame Noman, as even as possible and of the most symmetrical form imaginable. This stand was greatly admired, and deservedly, for rarely has this beautiful

variety been seen in such condition. Mr. T. Jowitt followed with Duchesse de Morny, very handsome, and Messrs. John Jefferies and Son with Marguerite de St. Amand, also fine. For twelve blooms of a Tea or Noisette Rose Messrs. G. Paul & Son won the premier honours with Niphotos in excellent form; Messrs. Keynes & Son were second with the same variety; and Mr. B. R. Cant was third with Maréchal Niel, also taking the first place with that variety in the class for yellow Roses, in which Mr. G. Prince followed with Perle des Jardins neat and fresh, and Messrs. G. Cooling & Son with Maréchal Niel. The only other class in this section was that for three trusses of a new seedling Rose, to be called the Rose of Sheffield, but only one exhibitor appeared, and the variety was not considered sufficiently meritorious to receive the award.

**DISTRICT CLASSES.**—Six classes were appropriated to Roses grown in the district of Sheffield, five being for exhibitors residing within thirty miles of the town, and one for those within six miles. Entries in the majority of the classes were by no means numerous, nor were the blooms of extraordinary quality—indeed, some of the collections were much below the average. A few good stands were, however, contributed, and among these was the collection of thirty-six single trusses, with which the President of the National Rose Society, Canon S. R. Hole, of Caunton Manor, Newark, secured the silver cup given by the President of the Sheffield Botanical Gardens. The blooms in this stand were very neat, bright, and mostly of good substance. The most noteworthy varieties were Xavier Olibo, Mons. E. Y. Teas, Marie Baumann, Madame H. Jamain, Louis Van Houtte, Duke of Wellington, Penelope Mayo, and Marie Rady. The only other exhibitor was Richard W. Proctor, Esq., Ashgate Road, Chesterfield, who was accorded the second prize. In the remaining classes the chief prizetakers were Messrs. R. Proctor; Charles Storey, Attercliffe; H. Brittain; John Bateman, South Street, Sheffield; W. G. Jackson, Mansfield; J. Mallinder, Hodsock Priory, Worksop; and T. Kirkby, Barnes Hall, Sheffield. The prizes for six trusses of Roses grown within six miles of Sheffield were offered by the Committee of the Botanical Gardens. There were thirteen collections staged, mostly of good quality considering the unfavourable district in which the Roses were grown. Mr. Enoch Holland, Sandygate, secured the chief position with fresh, bright, and pretty blooms, of which the best were Mons. E. Y. Teas, La France, Charles Lefebvre, Marquise de Castellane, and Fisher Holmes. This stand well merited its position, for the blooms would not have disgraced some of the larger collections. Mr. Frank Urton, Green Hill, Derbyshire, followed, having Marie Baumann, Capitaine Christy, Marquise de Castellane, and Charles Lefebvre in good form. Mr. J. Keeling, The Gardens, Mount View, was third with Souvenir de la Malmaison, Marquise de Castellane, John Hopper, Charles Lefebvre, and Marie Baumann, fresh and neat.

Roses in pots were represented by only one collection from Messrs. G. Paul & Son, who were accorded the premier prize for healthy and fairly well-flowered specimens of moderate size. Bouquets of Roses were numerous, and some were very tastefully arranged. These were distributed by lot among the lady visitors, and the demand was surprisingly great. The principal prizetakers in these classes were Messrs. Cranston, G. Davison & Co., G. Paul & Son, Cooling & Son, T. Kirkby, and G. Miller, Wadsley House.

The Society's silver medals for the best Hybrid Perpetual and the best Tea or Noisette were secured by Messrs. Keynes & Co. for Lord Macaulay, and Messrs. Cranston for Niphotos, both handsome representative blooms of their respective varieties.

## HERBACEOUS AND ALPINE PLANTS.

(Continued from page 26.)

### AQUILEGIAS.

A VERY showy genus, the generic name of which is derived from the inverted petals, which are lengthened out into long spurs, and bear a fancied resemblance to the talons of an eagle (Aquila); the English name Columbine, however, is derived from a far more peaceful member of the feathered tribe—the Dove (Columba), from a supposed resemblance of the flowers to little groups of these birds. The general characters of the genus are five regular petaloid sepals, which are for the most part highly coloured, and the same number of two-lipped petals, which are tubular and nectariferous at the base, whilst a portion of the stamens are very small and abortive, and five sessile many-seeded carpels, which assume the shape of little bags (follicles) when mature. In our younger days few gardens were without their Columbines, which were for the most part seedling varieties of the British species *A. vulgaris*, although some few exotic kinds have been introduced to cultivation upwards of a hundred years. We now, however, possess some very fine species, some natives of the mountainous parts of North America and California; others from the alpine regions of Europe, whilst a few have come to us from the lofty Himalayas. With some of these, which naturally grow at considerable elevations, difficulty is experienced in keeping them in a thriving condition; indeed, in the southern parts of England Columbines appear to exhaust themselves in one or two seasons; in the north, however, and in

Scotland they thrive with very little care. We have found that Aquilegias prefer a moist and sheltered position, but they like good exposure to the sun. The strong robust kinds will grow well and flower profusely in almost any ordinary garden soil, but the dwarfer and more delicate kinds which are placed in the rock garden should be planted in good friable loam. These plants cannot be maintained true by seeds if several species are grown together on account of their so freely hybridising, and undoubtedly many of the forms found wild are not distinct species, but natural hybrids and seedling varieties, so that when good and true seed cannot be obtained increase must be effected by division of the roots.

*A. alpina*.—This fine rock plant produces flowers nearly 3 inches in diameter, and is sometimes known by the name of *A. grandiflora*; it is not of a delicate constitution, and may be grown either in the rock garden or the border. The height is usually about 12 inches, but in some varieties this is exceeded, whilst in others it is considerably less. The whole flower is rich bluish purple in some varieties, in others the sepals and spurs are deep blue, whilst the petals in the centre of the flower are white; it also has short spurs. May and June. Alps of Europe.

*A. aurea*.—A vigorous-growing plant of great beauty. It attains a height of about 3 feet, bearing bold triternate glaucous leaves;

Fig. 2.—*Aquilegia caerulea*.

flowers of a uniform bright canary yellow tinged with green, the long spurs being recurved. May and June. California.

*A. caerulea*.—This beautiful little gem was originally confounded with *A. leptoceras*, a totally distinct plant. It is undoubtedly one of the very finest species yet introduced. The leaves are biternate, lobes broad and dark green. The stems are branched and bear a profusion of its large erect flowers. The sepals are delicate blue, and the petals white; the very long and slender spurs are also blue with green tips. There is also a pure white form of this species. It grows from 10 to 18 inches high, and flowers in June, continuing many weeks in full beauty. It delights in rich loamy soil. Native of the Rocky Mountains. The annexed reduced figure represents a plant of this species.

*A. californica*.—A superb border plant from California, attaining a height of 3 feet or more. It forms a fine mass. The flowers are deep orange outside, rich yellow within, the sepals and petals being much shorter than the spurs. July and August.

*A. canadensis*.—This species was first introduced to our gardens from Canada by Tradescant so long ago as 1640. It was much admired at that time, and the seed was eagerly sought, but it did not perpetuate itself always true. It is a desirable plant on account of its bright colour. It grows about 12 to 18 inches

in height, the sepals and petals being reddish-scarlet tipped with orange, the spurs short and straight. April and May.

*A. chrysantha*.—Another very fine Mexican border plant, attaining a height of about 2½ feet. Leaves ample, triternate, glaucous. The stems are much branched, and bear an immense quantity of its golden yellow, long-spurred, and very fragrant flowers. It is an exceedingly handsome species, commences to bloom about the month of June, and continues to make a grand display for many weeks. The woodcut is a reduced representation of this fine plant.

*A. glandulosa*.—With this lovely Siberian species we have experienced much trouble. At one time we concluded it was very delicate and could not endure our winters; now, however, we have altered our opinion, consider it quite hardy, and incline to the belief that it is of biennial duration only—at least this has been our experience in the London district. It well repays for all extra care and trouble; it grows in a tufted manner, and is dwarf in habit, seldom exceeding a foot in height. The leaves are triternate, segments coarsely lobed. Stems one-flowered. Flowers 3 to 4 inches in diameter; sepals nearly oval, very much larger than the petals, deep rich blue; petals the same colour, but tipped and margined with creamy white. It prefers a somewhat light and well-drained soil, but not peat. May and June.

Fig. 10.—*Aquilegia chrysantha*.

*A. pyrenaica*.—An exceedingly beautiful dwarf-growing rock plant from the Pyrenees. It attains a height of about 9 inches; it is tufted in habit. Leaves tripartite, obscurely lobed, glaucous. Flowers large, of a uniform purplish mauve; spurs short and thick, tipped with green. It flowers in May.

*A. siberica* (see page 56).—A handsome Columbine from Dauria, and hence occasionally seen under the name of *A. vulgaris dahurica*. The double form shown in the woodcut is particularly beautiful, especially when it has attained a good size. The flowers are rich blue and white, the leaves being palmately divided, and the plant of compact habit.

*A. Skinnerii*.—This is later flowering than the majority of the species. It grows upwards of 2 feet in height, and forms a beautiful plant in the border. The flowers are somewhat like *A. canadensis* in colour, being scarlet tipped with yellowish green. Unlike the last-named plant, however, the spurs are very long. It flowers in July and August. From Guatemala.

*A. vulgaris* is the English representative of this family, from which many beautiful forms have sprung. In the normal type the plants attain a height of from 1 to 3 feet. The flowers vary from blue to white and red. The cultivated varieties are very beautiful, some being large and pure white. *A. vulgaris alba*. Then we have double whites; *A. vulgaris albo pleno*, double blue; and a beautiful double striped *A. vulgaris caryophylloides*, in which the ground colour is white, the sepals and petals being flaked and striped with reddish crimson and purple. All the varieties of this species make showy border plants, and are useful for naturalising in woods and coppices.—W. H.

DESTROYING APHIDES ON PEACH TREES.—Judging from what is published at intervals on this subject it would appear that the "black fly" as it is termed, is difficult to extirpate. I will, therefore, state my experience in cleansing the trees. We have here a

fine wall of Peach and Nectarine trees, and when they were blooming the pests attacked them when the fruit had set. I syringed the trees on three successive evenings with one quart of Griffiths and Avis' tobacco water to four gallons of soft water heated to 120°, followed in the morning with a drenching of clean water from the garden engine. They became perfectly clean, and I have not seen an insect since. The trees are all carrying a heavy crop of fruit, and are in a very healthy condition. Trees in the neighbourhood are much injured by the Peach aphid this year, as no doubt those referred to would have been had not the above remedy been adopted, and especially applied in good time.—A. YOUNG.

#### WEST KENT HORTICULTURAL SOCIETY.

JULY 16TH.

CAMDEN PARK, Chislehurst, where the Show was held last Saturday, is one of the finest of positions for an exhibition of this nature on a tropical day. Highly situated, the benefit of whatever breeze there is, is perceived, while the timber trees afford the shade that is so grateful in sultry weather. The day of the Show, however, was not oppressively hot, and was largely attended during the afternoon and evening; and it must be said the display was worthy of all the patronage it received, and was a credit to the beautiful district in which it was held. On some former occasions we have observed that the leading nurserymen have been the chief contributors to the Society's shows; but it was not so on this occasion, the competition in the classes being excellent, and some of the plants were worthy of being staged at any show in the kingdom. True, several nurserymen arranged excellent groups—to wit, the General Horticultural Company, whose highly coloured Crotons associated with *Adiantum Bausei* were much admired; Mr. B. S. Williams, whose Orchids and collection generally, including a fine plant of *Cypripedium superbiens*, commanded attention; Messrs. John Laing & Co., whose really fine and valuable group was not surpassed for richness and effect; Messrs. Ponsford & Sons, florists, Brixton and Camberwell, whose plants were alike choice and in excellent condition; Mr. James Wingfield of Widmore Hill, Bromley, who arranged a display of considerable merit; and Messrs. Cannell & Son, whose magnificent stands of Zonal Pelargoniums and Verbenas commanded general admiration. Those exhibitors undoubtedly contributed admirably; but the local exhibitors in many of the classes occupied the space allotted to them most worthily.

No pretence is made to dwell on every collection and name every prizetaker, all that can be done is to refer briefly to the most noteworthy exhibits. In the open class for twelve stove and greenhouse plants in flower Messrs. Peed & Son, Norwood, were the only exhibitors, and staged a fresh and bright collection of medium-sized plants. In the class for nine plants Mr. Gibson, gardener to A. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, secured the first position. Some of the plants were of remarkable merit. *Dipladenia amabilis* was the finest plant we have seen this year; *D. Regina* was very good, *Ixora Williamsi* superior, and *Stephanotis* and *Allamanda Hendersoni* were in a highly satisfactory state. Mr. Mitchell, gardener to Mrs. Arbutnot, Bridge End Place, was an excellent second, the notable plants being *Aerides odoratum* 4½ feet in diameter with sixty or seventy fine spikes, and a fine specimen and variety of *Anthurium Schertzerianum*. Mr. Archer, gardener to Capt. Aylward, Crofton Court, Orpington, was third with large plants of considerable merit. Single Zonal Pelargoniums in the open class were very fine, Mr. Mitchell having the first position with fresh, bright, and good examples not too formal; Mr. Lover, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, following rather closely. The same exhibitors, but in reversed positions, were successful with double varieties, which were better than are usually seen at exhibitions. Show and Fancy varieties were less noteworthy, the hot weather having deprived them of their freshness. There was good competition in the open class for nine fine-foliaged plants; Mr. Kent, gardener to J. Heritage, Esq., Lodgewood, Orpington, securing the first position, *Caladium Prince Albert Edward* being extremely fine. Mr. Mitchell followed closely with smaller but very fresh examples, the trio of *Marantas bella*, *ornata*, and *Jenningsii* being in excellent condition.

Ferns were admirably represented, some, or indeed most of the plants in the single specimen class, of which there were a large number, being of great excellence. The plant to which the first position was worthily assigned was a splendidly grown specimen of *Gymnogramma Wetenhalliana* exhibited by Mr. Mitchell. Mr. Gibson was second with a healthy example of *A. farleyense*; and Mr. Gammon, gardener to C. Boesey, Esq., The Pines, Bickley, and A. Bradford, Esq., Elmstead, Chislehurst, equal thirds; the former with *Davallia Mooreana*, the latter with *Adiantum cuneatum*. We never saw this good old Fern staged in better condition, and if Mr. Bradford had been placed equal second instead of third no injustice would have been done. In the class for six plants Mr. Mitchell was again to the fore, followed by Mr. Saville, gardener to G. Phillips, Esq., Elmstead Lodge, Chislehurst, and Mr. Gammon, all of whom staged collections of great merit. Selaginellas were not equal to the Ferns, and only one plant, *S. involvens*, 4 to 5 feet in diameter, was noteworthy. It was exhibited by Mr. Cooper, gardener to M. Yeatman, Esq., Strawfield, Widmore Hill, the chief prizetaker in the classes for these plants. The best Gloxinias—and fine they were—came from

Mr. Bridger, gardener to J. B. Alston, Esq., Fairfield, Bickley, some of the plants bearing nearly a hundred flowers. The same exhibitor was first with Achimenes, which were excellent. The best Fuchsias and Dracænas, both good, came from Mr. Mitchell; Tuberos Begonias, also good, from Mr. Saville; and Caladiums from Mr. Gammon. Messrs. Archer, Mitchell, and Whitehouse, gardener to J. Cameron, Esq., Park Road, Beckenham, also shared in the honours in these classes.

ROSES.—Considering the great heat of the preceding days Roses were remarkably fresh but on the whole rather small, it evidently having been necessary to cut before the blooms were expanded. In the open class for forty-eight triplets Mr. Cant, Colchester, secured first honours with an excellent collection containing many fine blooms, the remaining prizes going to Messrs. Paul of Cheshunt and Laing of Forest Hill. These exhibitors had the same positions in the class for twenty-four single blooms, all staging well. For twelve blooms (open class) E. Mawley, Esq., Lucknow House, Croydon, was an easy winner with fresh and good blooms, Innocent Pirola being the gem of the stand. Mr. Rumsey, Waltham Cross, and Mr. Bunyard, Maidstone, followed in this class, their collections being of nearly equal merit. For twelve Roses of any one variety Messrs. Paul were first with a beautiful stand of Niphetos, Mr. Cant second with rather small but very bright blooms of Maréchal Niel, and Mr. Rumsey third with Pierre Notting.

In the amateurs' class of twenty-four single blooms Mr. Burnaby Atkins was an excellent first, and secured the National Rose Society's medal with a charming stand, in which Duke of Connaught, very bright; Reynolds Hole, Dupuy Jamain, Annie Wood, Marie Baumann, Dr. Andre, Madame Margottin, Jean Pernet, Madame Bravy, and Souvenir de Paul Neyron showed to great advantage. The flowers were remarkably well staged and the foliage very good. The Society's bronze medal was won by Mr. A. Pearce with beautifully fresh but small blooms and fine foliage. Messrs. Christy, Whitehouse, Cameron, and Mrs. Fuller were also prizewinners, the last-named exhibitor staging a beautiful stand of Marie Van Houtte, and Mr. Christy one of Comtesse de Serenye, which secured the chief prize in the class for one variety. Owing to some mistake in placing the prize cards we were unable to distinguish the winners of several of the prizes.

TABLE DECORATIONS.—Special attention is devoted to this section of the Show, and liberal prizes are provided. A large marquee was devoted to the exhibits, which were characterised by extreme lightness. The first-prize table, 10 by 5 feet, was arranged by Miss R. A. Tweedie, Borington, Bickley. The centre was an oval lake with a porcelain boat decked and surrounded with grass and Cornflowers. This centrepiece was about 4 inches high, and its toy-like artificiality was the weak point of an otherwise chaste and charming table, the eight small baskets and vases being tastefully filled with Tropæolums, yellow Columbines, and grasses. The second-prize table of Mrs. T. A. Mitchell was more free and pleasing, but we understand the Judge did not consider it sufficiently diversified, all the vases being filled alike. Miss F. A. Sentence was placed third for a chaste yet bright arrangement, and an extra prize was deservedly awarded to the Misses Scott of Abbyfield, Binkfield, for a most tasteful arrangement of grasses and Poppies, also to Miss Baggallay of Beckenham; but why the beautiful table of Mrs. Scott, jun., of Elmfield was passed over surprised not a few critical visitors. The smaller tables furnished with wild flowers were charmingly arranged, the successful exhibitors being Misses J. & A. Turner, Sentence, and Field.

FRUIT AND VEGETABLES.—The display was not large but generally very good. Mr. Tucker, gardener to J. Lovibond, Esq., Starts Hill, Farnborough, was very successful, winning the first prizes for a collection of nine dishes for black and white Grapes, heaviest bunch of Grapes, Melon, Cherries, and three dishes of Strawberries. Mr. Mitchell was first with Muscats, good; and Messrs. Bradford, Maynard, Whitehead, and Gammon secured prizes for highly creditable produce in the different classes. A collection of fruit of great merit was also staged by Mr. Neighbour, gardener to G. Wythes, Esq., Bickley Park. A noticeable feature of this department was the Eleanor Strawberry, represented by many fine dishes, showing its excellence as a late variety.

Vegetables, considering the tropical heat that has lately prevailed, were very good indeed and a credit to the exhibitors and prizetakers, Messrs. Gammon, Real, Maynard, Humphrey, and Eke. The cottagers' produce was also of a very high order of excellence.

The Exhibition was well arranged by Mr. Eyles, and the Secretary and Committee vied with each other in rendering it as agreeable as it was successful.

### COLEWORTS.

PROBABLY few crops are of greater service in the garden than Coleworts, and yet they seldom have prominent notice in the gardening press. This is one of the staple crops of market gardeners, who occupy ground with Coleworts that has been vacated by early crops of Peas, Potatoes, &c. They are also planted between rows of Dwarf Kidney Beans—in fact everywhere where space can be found either between other crops or under trees. They are pulled up and sold in bunches during the winter and spring, and when fresh no green vegetables are more delicious. Coleworts, then, it will be seen, form an adven-

titious crop of such great value as to be regarded as a staple product of the garden. Almost any of the small Cabbages of the Early York type may be used as Coleworts, and as regards quality nothing of their kind can surpass them, but they lack the all-important essential of hardiness, which is possessed by the true Rosette Colewort. It is questionable if the frost-enduring property of this variety is sufficiently understood by cultivators generally. During the last extremely severe winter large breadths passed almost scatheless through the ordeal, while Savoy and Kales were killed. Probably the dwarf habit of the Colewort was much in its favour, as the plants could be the more effectually protected by the snow; but apart from this it is a distinctly hardy vegetable, and as such it has strong claims to the notice of gardeners.

The plants ought now to be ready for planting out, and those who do not possess them would make as good an investment in purchasing a few hundreds as in buying a new Coleus. An impression prevails in the minds of some people that early July is soon enough for sowing Coleworts; but it is not. About the middle of May is the proper time, and the plants are then ready just when they are wanted, and have time to become strong before winter. Strong plants may be planted about 15 inches apart, and if they have been raised from a true stock they will have an attractive appearance in the autumn, as all the plants will be of the same height, and the rosette-like heads appear as if they had been cast in a mould.

Those who had large breadths of Coleworts last year felt themselves fortunate, but such individuals were not a majority; on the contrary, this simple yet important crop was absent from many gardens. The value of this crop is now referred to, so that those who desire to have it in their gardens may obtain plants, as there is no better time than the present for planting, and vacant ground cannot be better occupied than by devoting at the least a portion of it to the really serviceable vegetable.—A MARKET GROWER.

### KINGSTON AND SURBITON ROYAL HORTICULTURAL SOCIETY.—JULY 13th.

THE seventeenth annual Exhibition of this Society was held in the beautiful grounds of Bank Grove, Kingston, the residence of J. C. Freake, Esq. Bank Grove is charmingly situated on the banks of the Thames, and has been long celebrated for its collection of Camellias, Sikkim Rhododendrons, and rare exotics. The grounds contain many very fine examples of Coniferæ, besides numerous lofty and stately old trees; it was under the shade of some of these the Society were fortunate in being allowed to pitch their tents, and never have they had such a fine display. The large marquee, 150 feet long by 50 feet broad, was full, and presented a most pleasing effect. The centre stage was occupied with the larger foliage and flowering plants tastefully arranged, while at the sides on the ground were sixteen groups of plants, most of them in competition.

Prizes were given by H.R.H. Prince Leopold for groups to occupy 100 square feet, arranged for effect, and there were six competitors, all exhibiting good and close collections. The Judges experienced great difficulty in determining the awards, for none of the six collections contained a bad or unsightly plant, and each was arranged with great taste. The premier award was secured by Mr. Beckett, gardener to J. C. Currie, Esq., Sandown House, Esher, but he was run very closely by Messrs. Hooper & Co., Covent Garden, who, in the opinion of many, had the most effective group. Messrs. Hooper and Co. received the second prize, and Mr. Brown, nurseryman, Richmond, the third. Messrs. Laing & Co., Forest Hill, and Mr. Stevens, nurseryman, Putney, also exhibited in this class good collections. The Society also provided substantial money prizes for groups of smaller dimensions, 50 feet square; there were also six entries in this class, and the awards were made in the following order:—Mr. Brand, gardener to W. Clay, Esq., Elm Villa, Kingston; Mr. Croxford, gardener to Mrs. Dunnage, Albury House, Surbiton, and Mr. Clark, gardener to A. Nagle, Esq., Surbiton. For twelve miscellaneous plants Messrs. Jackson & Son, Kingston, were first, exhibiting amongst others a very fine *Ixora Williamsii*, *Calanthe veratriflora*, *Dracophyllum gracillimum*, some large Ericas, and a handsome *Statice*. Mr. W. Bates, gardener to J. Meek, Esq., Twickenham, who received the second prize, had charming specimens of *Allamanda Hendersonii*, *Stephanotis floribunda*, and *Cocos Weddelliana*. Messrs. B. Peed and Co. were placed third. For nine stove and greenhouse plants Messrs. Jackson & Sons and B. Peed & Co., Norbury Nurseries, Streatham, were the only exhibitors, and were first and second respectively. In the class for six stove and greenhouse plants Messrs. Croxford and Beckett divided the honours in the order of their names. Fine-foliage plants were numerous, there being no less than nine competitors. The chief award fell to Messrs. Hooper & Co.; Mr. Crafter, gardener to Miss Finch, Kingston Hill, was placed second, and Mr. Gregory, gardener to J. Weymouth, Esq., Bushey Nook, Teddington, third. Ferns were well represented in both the classes for six and three exotics and for nine British, the chief awards

being obtained by Messrs. Beckett, Crafter, and J. Watson, gardener to Captain Cundy, Surbiton. Fuchsias, Gloxinias, Achimenes, Begonias, Caladiums, and Coleus were well represented, and added much to the general effectiveness of the Exhibition. Mr. Wiggins, gardener to H. Little, Esq., Hillindon Place, Uxbridge, staged a large and effective group of miscellaneous Pelargoniums, and was first in the class for six Show varieties, Mr. Croxford second, and Mr. Beckett third. For six Fancies Messrs. Attrill, Beckett, and Wiggins were placed in the order of their names.

Cut Roses formed a most important addition to the Show. Messrs. Paul & Son, Old Nurseries, Cheshunt, Messrs. Laing & Co., Forest Hill, and Mr. W. Rumsey, Joynings Nursery, Waltham Cross, were first, second, and third respectively for forty-eight cut blooms, distinct. In the class for twenty-four Mr. C. Davies, The Square, Wilton, Salisbury, was first, and Mr. Moorman, gardener to Miss Christy, Coombe, second. Several collections of twelve and six Roses were staged, the majority of them being of good quality. Messrs. Lee & Son, Hammersmith and Ealing, sent six boxes of Roses, not for competition, and Messrs. Veitch & Son the same number of boxes, each box containing twenty-four varieties, the whole of which found a large number of admirers.

Fruit, especially Grapes, were well exhibited, Mr. Bates gaining the first prizes in both classes for black and white Grapes; in the other classes, though only moderately filled, the quality was very satisfactory.

Vegetables were also of first-rate quality, Messrs. Beckett, Starr, and Waite sharing the honours in the class for twelve distinct varieties, and Messrs. Crafter, Lambert, and Croxford for six.

Six competitors entered for the special prizes given by Sir Trevor Lawrence, Bart., M.P., for nine plants suitable for the table. All the collections were very evenly matched. Messrs. Beckett, Brand, and Brown were the prizetakers. Table decorations and buttonholes were well represented, as well as the amateur and cottagers' divisions. Miscellaneous groups were contributed, not for competition, by Messrs. Lee & Son, Hammersmith and Ealing. This firm contributed three groups, each illustrating the usefulness of hardy trees and shrubs for effective grouping; one of these groups contained a large quantity of small and beautiful Roses in pots, which were much admired; other contributors, not for competition, were Messrs. Jackson & Son, Wiggins, and Slade.

#### FRUIT PROSPECTS IN GLOUCESTERSHIRE.

THE fruit prospects in this part of Gloucestershire are better than they have been for several years past. A larger and better crop of Strawberries I never had; in fact I have had so many that I have not known what to do with them. It has been a decided case of *embarras des richesses*. We have filled all the jam pots, given away to friends several basketfuls in a day, sent fruit to the hospitals, invalids, &c., and yet that did not clear them off, so I invited troops of children to come in and assist. The varieties I grow are Early Prolific, Keens' Seedling, Vicomtesse Héricart de Thury, Sir J. Paxton, and President, with a few of Myatt's Prolific, Lucas, and Myatt's Victoria. The Raspberries bid fair to be as good a crop as the Strawberries. I have also good crops of Red Currants, Black Currants, and Gooseberries. Plums are a fair crop. The Apples are a good crop; I thought I should have some thinning to do, but many fruits fell off in kernelling, but there are plenty left now. The Pears are partial, some trees with plenty of fruit, others a blank. I have only one Peach and one Apricot tree, and they have fruit this year. I do not attempt to grow these last-mentioned fruits, because in our cold springs they are usually disappointing. It is better to have a crop of Victoria Plums every year than a crop of Peaches one year in seven, which is about all we can rely upon. The fruits should be under glass in this part of the country. I have not been in many other gardens, but in those I have seen, and from what I hear generally, the small fruits are plentiful, and there is a good sprinkling of Apples.—AMATEUR, Cirencester.

#### WEST OF ENGLAND ROSE SHOW AT HEREFORD.

IN the train from Credenhill to Hereford on the early morning of July 6th a pretty and very well-developed Hereford lass remarked, "I knew it would rain cats and dogs to-day." I said, "Why?" "Don't yer know, sir, it's the Hereford Rose Show?" It did rain and no mistake, and withal just when the local growers would be cutting their blooms. However, as a slight encouragement for next year, it did not rain quite so hard this year's Show day as last year's! But to business. The Show was not a great success. It was small, very small, for Hereford. The writer of these notes saw two years ago six seventy-tuos staged for certain, if not seven—the "HEREFORDSHIRE INCUMBENT," who was then Secretary, would know which figure is the correct one—and yet there were some good boxes shown. The famous Hereford growers—the Cranston's Company and Mr. Jowitt—were in much better form than they were four days before at the Crystal Palace.

In the amateurs' classes for thirty-six single trusses Mr. T. Jowitt

was first, staging grand blooms of Marie Louise Pernet, Duchesse de Vallombrosa, Marquise de Mortemart, Marie Baumann, Senateur Vaisse, Dupuy Jamain, Louis Van Houtte, Duchesse de Morny, Madame C. Wood, Mary Pochin, and Annie Laxton. Mr. J. H. Arkwright of Hampton Court, Leominster, was a very good second, his colour being throughout excellent. A bloom of Sultan of Zanzibar in this box was perhaps the most remarkable Rose in the Show; it was in form after a grand Louis Van Houtte. Monsieur Noman, Le Havre, very large; Ernest Herger (a Rose I never saw before), Baron Hausmann, A. K. Williams were also very good. Rev. C. H. Bulmer was third with good blooms of Madame C. Kuster, Mons. E. Y. Teas, Annie Wood, very beautiful; and Lord Macaulay. For eighteen trebles Mr. Jowitt was again first. Here Mons. Noman was very good, and Duchesse de Morny in that perfect colour, form, and size in which he alone seems able to exhibit it. Mr. J. H. Arkwright was second with good and very bright examples of Edouard Morren and Marie Cointet. Mr. Thomas Jowitt was the only exhibitor in the class for twenty-four singles. La Duchesse de Morny was again splendid, also Mabel Morrison was much fuller than usual and of the purest white, while Dupuy Jamain was grand in size, substance, and colour. For twelve singles Mr. Thomas Jowitt was first, and the Rev. J. A. Williams, Yardley Wood Vicarage, second.

In the nurserymen's seventy-tuos (open) Cranston's Nursery and Seed Company were first, the following blooms being very good:—Mrs. Baker, La France, Ferdinand de Lesseps, Princess Mary of Cambridge, Dr. Andry, Marquise de Mortemart, Le Havre, Mdle. Eugénie Verdier, Thomas Mills, Marie Cointet, superb; Horace Vernet, Maréchal Niel, Madame Ducher, Madame A. Dumesnil, Abel Carrière, A. K. Williams, Mdle. Bonnaire, good size; Adam, Miss Hassard, Constantin Tretiakoff, Mons. E. Y. Teas, Niphotos, La Rosière, Anna Ollivier, Catherine Mermet, Perle des Jardins, Madame Marguerite Manvoin, and Madame Noman, a lovely bloom. Second Messrs. Curtis, Sandford, & Co. with good samples of La France, Souvenir d'un Ami, Fisher Holmes, and Harrison Weir. Third Messrs. Davison & Co., Hereford. In this stand I noticed as particularly good A. K. Williams, Ferdinand de Lesseps, and Star of Waltham. For seventy-two single trusses, distinct, open only to growers outside Herefordshire, Messrs. Curtis, Sandford, & Co. were the only exhibitors, and were awarded a special prize. For thirty-six trebles Cranston's Company were first with Constantin Tretiakoff, Charles Lefebvre, Annie Laxton, and Madame Furtado especially fine. Messrs. Davison & Co. second with lovely trebles of Xavier Olibo, Comtesse C. de Chabrilant, and Marie Cointet; and Messrs. Curtis, Sandford, & Co. third. Considering that Messrs. Curtis had to cut early the day before and travel so far that extremely hot Tuesday (the 5th), it is wonderful how they managed to show as well as they did. Some of the Teas were excellent. Mr. Grant of Hope End, Ledbury, was first for twelve distinct, with large and well-formed examples of Homer, Niphotos, Devoniensis, and Jean Pernet. Cranston's Company second, and Messrs. Davison third. In Class D, twenty-four single trusses of any one Rose, there were four boxes staged—two each of Marie Cointet and Comtesse de Serenye. Cranston's Company were first with Marie Cointet; Messrs. Curtis, Sandford, & Co. second with Comtesse de Serenye; and Davison & Co. third with Marie Cointet. In the classes open to amateurs residing in Herefordshire Miss Bulmer showed well. In the class for twelve trebles Duke of Edinburgh, Madame Rothschild, Marie Van Houtte, and Monsieur Boncenne were really grand. These Hereford prizes were divided generally among Mr. Grant of Hope End, Mr. Woodhouse, and Mr. Talbot, gardener to Sir G. Cornwall, Moccas Court.

I cannot leave this short report without bringing to the notice of the readers of the Journal a box of six Maréchal Niels exhibited in the cottagers' class. The plant which bore these blooms was, I hear, budded on a standard Briar and planted against an ordinary thatched Herefordshire cottage, all the six blooms being plucked from underneath the eaves of the roof. I measured one, the largest bloom, and although it had not lost its shape the diameter was  $7\frac{1}{2}$  inches! I remember Mr. George Paul's fine blooms last May, but he would have been the first to acknowledge the size and splendour of this cottager's six.

I hope that he who reports the West of England Show next year will not lose his notes, so that the delay occasioned this year may not occur again. I have purposely left out much matter which, however interesting it might be to Hereford, yet would "fall flat" if printed more than a fortnight after the Show.

#### PELARGONIUMS AT SWANLEY.

A LARGE establishment, where all the best varieties in commerce are grown, affords an excellent opportunity for comparing the merits of the varieties and noting those that are in superior condition at the time the collection is inspected. A visit is thus rendered instructive, and a record of it, however brief, may prove serviceable to those who have not the opportunity of inspecting the plants.

Several houses, each 100 feet long, are devoted by Messrs. Cannel & Son to Pelargoniums of all kinds; Zonals, Show, Fancy, Ivy, tricolor, and bronze types being represented, but the single and double Zonals were particularly numerous. Two houses were occupied with the varieties in each of these sections, and the blaze of

colour produced can scarcely be imagined by those who have not witnessed such a display. It is, indeed, an exhibition in itself, and one that represents the outcome of intelligent persevering application by many individuals to the crossing and rearing of improved forms in this large and beautiful section of a great genus.

Taking the double varieties first, a few of the best were the following:—F. V. Raspail, a handsome variety, with deep rich scarlet flowers of excellent form, and borne in compact trusses. Mr. H. Cannell, an American variety of great promise, very bright scarlet; truss large. Jewel, a fine old scarlet-flowered variety, is very useful, as the individual pips being of good form, bright in colour and furnished with long stalks, are admirably suited for wiring singly for buttonholes or bouquets, but especially for the first-named purpose. Emile de Girardin is one of the best rose-pink-flowered doubles in commerce, raised by M. Lemoine of Nancy. The flowers are of fine even form in full compact trusses. M. Lelandais, also pink and from the same raiser, is a considerable improvement upon an older variety known as Madame Boutard. Roi des Violetts, very distinct, especially remarkable for the bright purplish violet tint of the flowers, the shade distinguishing it amongst hundreds of other plants of the same type. Victor Hugo, a variety with salmon-coloured flowers, scarcely surpassed in the tint; the truss, too, is of considerable size and very full. Mr. A. Dupuis is a lighter-tinted form of the same colour, but not less

Fig. 11.—*Aquilegia siberica* fl.-pl. (See page 53).

beautiful; the petals having a faint margin of white, which imparts a peculiar appearance to the plant. Heroine and Candidissima plena were the two finest double whites in flower at the time of my visit. The former is noteworthy for the great size yet neat form of the flowers, while the latter has the pips unusually full.

The single Zonal varieties were even more brilliant than the doubles, for, like many other plants, the shades of colour never seem so dazzling in the latter as in the former. When large numbers of plants are together this is particularly noteworthy, and I have never seen a more striking instance of the fact than the one now recorded. The difficulty of selection, too, is much greater among the singles, for there are so many of first-rate quality both in colour and form of flowers, that for every one named below there are half a dozen equally good. Two remarkably beautiful forms are Dr. Orton and Henry Jacoby, both somewhat in the style of the Nosegay section with enormous trusses of dark crimson flowers. These are, indeed, the two darkest forms at present grown, and latterly Henry Jacoby having received so many favourable comments in the Journal, the demand has increased to such an extent that the supply can only be maintained with considerable difficulty. It is most effective in pots, and in some gardens it has been employed for bedding-out with such satisfactory results that still further attention is being given to it for this purpose. Future Fame is a remarkable variety with very large bright scarlet flowers of excellent form and substance. Some of the single pips exceeded 2 inches in diameter, and a good truss of such flowers, as can be readily imagined, is very effective. Sybil Holden is a beautiful pink-flowered variety, especially useful in winter, when its large handsome trusses are freely produced, and the soft tint of the flowers is very pleasing. Lizzie Brooks is a thoroughly

useful scarlet form of dazzling colour, and very free. Guinea is well known as probably the nearest approach to a yellow yet obtained amongst Zonal Pelargoniums; the flowers, too, are of neat form, and the truss is full and compact. Miss Hamilton, with delicate pink-tinted flowers, is very attractive, and deserves to be included in all collections. Fanny Catlin is one of the best salmon-coloured varieties, the pips being of considerable size, symmetrical form, and rich colour. Many more were worth noting, but especially the white variety Eureka, which has been several times exhibited at Kensington, and was early in the present year honoured with a certificate. It well maintains its character as one of the best in its class; it is very compact in habit, the flowers being large and pure white.

Houses of similar dimensions to those above mentioned are devoted to the Ivy-leaved forms, the Show, Fancy, Decorative, Tricolor, and Bronze varieties, all in similarly beautiful condition, and to enumerate the best of which would alone fill several pages. A few additional notes will, however, be reserved for transcription at some future convenient opportunity: and in the meantime all those who wish to obtain an adequate idea of what has been effected in improving the Pelargonium should endeavour to visit the "Home for Flowers" at least once in the season.—AN AMATEUR FLORIST.

#### THE CHISWICK, TURNHAM GREEN, AND DISTRICT HORTICULTURAL SOCIETY.

LAST April an Exhibition of spring flowers was held in the Vestry Hall at Turnham Green on behalf of the funds of the West London Hospital, and the results were so encouraging that it was determined to form a Society in the district. A Committee was formed, the patronage of the Royal Horticultural Society was secured, and permission to hold the Shows in the Chiswick Gardens was granted. The Society was thus established under favourable auspices, and with a practical executive and such industrious officials as J. T. Smith, Esq., as Honorary Treasurer; J. T. Musgrave, Esq., as Honorary Secretary; and Mr. A. F. Barron as Honorary General Manager, an excellent schedule was prepared, which resulted in a good and well-arranged Exhibition on Thursday last.

The Show was in one respect novel, as it was the first that has probably ever been held in a vinery. The day was one of the hottest of the year. "Why not, then, have held it under canvas in tents on the lawn?" some may ask. The answer is simple, "Because such tents are too hot." As practical gardeners know, a large and well-ventilated vinery, with the roof covered with foliage, is really cool and refreshing during a brilliant tropical day. But besides the shaded roof in this case a canvas awning was provided, and the result was that, except in the shade of the few large trees, the vinery was the coolest place in the garden, a tent in which the table decorations were placed being oppressively hot in comparison.

But the vinery in question is an exceptional one. It is nearly 200 feet long, about 30 feet wide, and so lofty that an arch-like ladder on a railway is provided for the convenience of the Vine-dressers. It was, then, in this great curvilinear structure that the Show was held, and the exhibits occupied every available foot of space. Down the centre were arranged the groups of plants for effect and large specimens in the classes, the side tables being devoted to smaller plants, fruits, vegetables, Roses, and other cut flowers.

Only a sketch of the Show can be given and the prominent exhibits noticed. Undoubtedly the great feature of the Show was the competition in the open class for the effect groups, the space not exceeding 100 square feet. The groups were semicircular, and the plants arranged on the ground. As examples of picturesque arrangement the winning groups have never been surpassed; indeed, the third-prize collection of Messrs. Hooper would have had a first position in any other show that we have seen where there has been competition for groups of this size and form.

It is not easy to describe the groups, but an idea may be afforded of their charming appearance. The first-prize arrangement of Mr. Brown, St. Mary's Grove Nursery, Richmond, was light, free, cool, yet bright. The groundwork was of Maidenhair Ferns, rising from which here and there were Gloxinias, and towards the front small plants of *Caladium argyrites*. The central large plant was a well-coloured example of *Croton undulatus*, flanked with rather tall *Coccoses*. At the back were taller Palms and an untrained *Allamanda*. All these plants were thinly disposed, so that there was abundant space between and under them for small *Ixoras*, *Kalosantheses*, and *Pandanus Veitchii*, which appeared as if growing from a groundwork of Ferns. There was a little too much packing of the smaller plants near the front—a fault that is apparent in nine out of every ten groups of this nature; but taking it altogether the arrangement was very beautiful. The second-prize group of Mr. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House, was a marvel of elegance and grace. The groundwork was generally the same as the other, but with more and better Gloxinias, but no touches of bright colours. The pretty base was canopied with the most slender of Palms, through which the groundwork was seen as if through a gauze-like network of foliage. The back plants were heavier Palms, a *Croton* flanked with *Pandanus Veitchii* and *Liliums*. If there was a fault in this

group it consisted in the light Palms being placed with too great regularity, which gave to the arrangement a rather formal aspect, and a few brighter flowers were wanted to add richness; still the group was a charming one, and was much and deservedly admired. The third-prize group above alluded to was the most free and natural in arrangement of the whole. There was a total absence of packing and formalism; in fact, if we suppose the groundwork of small Ferns had been grass a child might have crept all over the space round and under the other plants without injuring them. The central plant was a fine specimen Tuberos Begonia, relieved by silvery Caladiums and isolated clumps of Paris Daisies, the whole overhung by a back central Palm. In the front were three *Dracenas* placed triangularly with a Carnation in the centre. Towards the margin *Gloxinias*, *Panicums*, and small scarlet *Begonias* were arranged amongst the Ferns, and the two back flank plants were a pair of fine *Cocoses*; altogether this was a rich, diversified, and meritorious arrangement. Mr. Fromow, nurseryman, Turnham Green, was deservedly awarded an extra prize. Mr. Darvil, gardener to C. Brown, Esq., Grosvenor House, Gunnersbury; and Mr. Stevens, St. John's Nursery, Putney, arranged creditable groups in this fine class. Valuable and artistic groups not for competition were provided by Mr. Herbst, Richmond, who turned the fine *Lilium Brownii* to excellent account with Ferns and dwarf Palms; by Mr. Roberts, The Gardens, Gunnersbury Park, whose plants were excellent and tastefully dispersed; and by the General Horticultural Company, the group being large, varied, and most meritorious, the brightness of choice *Crotons* and *Dracenas* having a fine contrasting effect. The amateurs' groups of 60 feet must be dismissed in a few words. By the want, we presume, of a more suitable position and more space they were packed on a high stage in three narrow tiers, and the effect was destroyed; indeed, exhibitors have no chance of arranging their plants effectively under such conditions. If they must have a stage let it be a foot only from the ground, and quite flat. The successful competitors were H. Perkes, Esq., Heathfield Cottage; J. Donaldson, Esq., Tower House; and B. Hardy, Esq., Gordon House, all of Chiswick. As a rule staging for groups is not required, and there is a great deal too much timber used in exhibitions generally.

Mr. Croucher, gardener to J. Peacock, Esq., Sudbury House, Hammersmith, arranged a very interesting group of plants in the cut-flower tent; *Cycads* and *Orchids* being attractively associated, and succulents were curious in more ways than one. A venerable pair of *Pilocerus senilis* grey with age represented the "old man and woman," smaller plants "the children," and a mere dot "the baby." *P. Dantivizi*, trim and stately, impersonated "rich relations" that stood a little aloof; and three rather seedy-looking examples "impecunious relations" that lurked partly in the background. To complete the fancy, *Odontoglossum vexillarium* was submitted as typical of civilisation, and *Echinocactus grandicornis* of savage life. A little discussion was had as to whether Mr. Peacock's plants or his gardener's were the most curious examples of creation, and the question was left an open one.

In the specimen plant classes Mr. Hudson overpowered all rivals, his plants, both ornamental-foliaged and Ferns, being of striking excellence.

Amongst cut flowers Messrs. Lee & Sons' six boxes of beautiful *Roses*, and Messrs. Cannell's splendid contribution of *Zonal Pelargoniums* and *Verbenas*, far surpassed any exhibits in competition, and added greatly to the beauty of the Show. Messrs. Hudson, Brown, and Harris showed good mixed stands, the last-named exhibitor winning a special prize given by Mr. Aldous for table decorations. The prize brides' bouquets consisted almost entirely of *Stephanotis* and Ferns, and the epergnes generally were overcrowded with flowers.

The show of fruit was of limited extent, but the quality was generally good. Mr. Hudson was very successful, and his prize collection of six dishes included splendid *Madresfield Court* and good *Muscat Grapes*, a *Queen Pine*, *Marcellus Melon*, *Bigarreau Cherries*, and *Lord Napier Nectarines*; and a most meritorious collection, not for competition, was staged by Mr. Roberts of Gunnersbury Park, including splendid *Foster's Seedling* and good *Black Hamburg Grapes*, all the other dishes bearing the stamp of good cultivation.

Vegetables were not noteworthy, except the four dishes of *Peas*, *Stratagem*, *Pride of the Market*, *Telephone*, and *Telegraph*, staged by Messrs. Marriot and Richardson of Boston, who were awarded the prizes in the order named. These dishes were magnificent, the pods being marvels of high cultivation, such as have not been surpassed at any show, if equalled.

Messrs. Charles Lee & Son arranged highly attractive groups in the open air, consisting of a fine assortment of ornamental deciduous trees from their arboretum, with *Roses*, *Euonymuses*, &c. Specially noticeable were the fine variegated shrubs *Acanthopanax variegata*, suitable alike for forcing and border decoration, and *Cornus mascula elegantissima*, compact in habit and rich in colour. The *Fairy Rose*, *Little White Pet*, was also much admired, and should be grown by all who desire a profusion of small pure white flowers for cutting.

Altogether the Show was very satisfactory, and the gardens were greatly enjoyed by the large number of visitors.

**FOXGLOVES.**—We have these in various colours, from dingy yellow, various shades of pink to pure white, some spotted and some self-coloured, and they are just now amongst the most beautiful

of flowers. We find them growing wild in clumps sheltered in front of some native shrub, a mass of wild *Rose* or *Bramble* very likely, and in a state of cultivation no position suits them better than in front of shrubs. The present is the time to plant out seedlings to flower next summer. Since I planted some five or six years ago they have become quite naturalised here.—R. P. B.

### THOUGHTS ABOUT ROSES.

[Uttered at Sheffield, July 14th, 1881, by the Rev. S. Reynolds Hole.]

MANY years ago, in the palmy days of the Garrick Club, when Dickens, and Thackeray, and John Leech, and A'Beckett, and Douglas Jerrold, and Shirley Brooks, and many other bright stars no longer visible in this firmament, were its constant inmates, I was engaged there one evening, like a good gardener, in the act of fumigation—I was destroying a weed. I had two companions, and a conversation arose between them concerning a work which had been recently published, and had created a great interest—Buckle's "History of Civilisation in England." The dialogue ultimately resolved itself into an argument as to the future achievements of science and philosophy; one of the speakers, who was then among the most brilliant writers of *The Times* newspaper, prophesying unlimited power and happiness from the victorious march of intellect; the other expressing far less confidence in the capacities of human reason, maintaining, with Newton, that it always had been, as it was and would be, but as a little child picking pebbles on the great sea's shore, and that for himself, the chief result of his knowledge was to show him how little he knew. My humble sympathies were all with him who expressed these latter views of the question. His name was William Makepeace Thackeray; and my humble sympathies are with him now, when, after thirty-five years of enthusiastic love among the *Roses*—thirty-five years of daily observation, anxious inquiry, careful culture—I come to communicate results.

I feel much as I felt when, travelling on the underground rail, I misunderstood directions, and, crossing the wrong bridge, found myself, after forty minutes' absence, at the station from which I started. I go back thirty-five years—nay, to a yet more distant period, for there is a tradition in my family that my love of the *Rose* began with babyhood, and that I made a clutch at an artificial specimen that adorned my nurse's cap (I can't say whether the *Rose* was a *Monthly Rose*, but I have a strong idea the nurse was), and tried to devour it, and so to die of a *Rose*, without the aromatic pain, and I recall the same unsatisfied craving for the *Rose* in its perfection which I feel to-day; and though since that distant date I have grown *Roses* by the thousand, and instituted *Rose* shows, and won silver cups by the score, and walked through miles of *Roses* as a judge, and written a book about *Roses*, I am here after all to confess that my knowledge as compared with my ignorance is as a penny squib to a comet, as an unfledged tom-tit to a flying eagle; that I have made mistakes innumerable; that I have planted too deep and too shallow, pruned too long and too short, too early and too late, manured too much and too little, exhibited flowers which were superannuated and flowers which had not arrived at rosehood; that I have succeeded where I expected to fail, and failed where I hoped to succeed.

The explanation is, that the *Rose*, like the only object of our admiration which excels her in beauty, that *Flora*, like the rest of the fair sex, is delightfully mysterious and difficult to understand. From the variableness of our climate, from differences of soil, from delicacy of constitution, lovely *Roses*, like lovely ladies, are by no means easy of cultivation. In both cases you may be too attentive, and then the objects of your affection exalt themselves unduly, or, as we gardeners term it, "run to leaf." On the other hand, if you have been neglectful or indifferent, when you go to gather *Roses* you will find thorns. You must be devoted, but not too demonstrative—hopeful, but not presumptuous; and then, when your loyalty and love are proved, you may win the smile of beauty; even then uncertain and capricious, coming sometimes when we least expect it, and suddenly changing into a frown without a glimpse of explanation. Ah, my brothers, don't you remember how graciously and beautifully that *Marie Baumann* came out on the eve of the show, when you had given up hope, and how on the contrary, that *Marie Finger* (will anyone inform me whether *Marry Finger* means the third of the left hand?) on whom we relied so confidently, shut herself up, and remained motionless, as though in a swoon, despite every effort which was made to rouse her by blowing into her face and putting her feet in hot water?

But you will begin to murmur internally, "Surely this man is not come all the way to Sheffield to tell us that he knows nothing," if not to express your remonstrance, as when the blue ox of *Artemus Ward* rubbed some of his paint off against the central pole of the exhibition tent, and the spectators openly declared that "that sort of thing would not go down in their enlightened district." I hear you say, "Let us have the results of your experience, however small they may be;" as when an Oxford examiner, being told by an undergraduate who had failed dismally, that he had not been questioned upon the subjects which he knew the best, tore off a tiny scrap from the paper before him, and handed it to the plaintiff, saying, "Be so good as to write what you know on that."

Gladly and unreservedly I offer you the results of my experience with regard to the cultivation of the *Rose*. In the first place, as I

have already intimated, your heart must be in your enterprise. There is a good deal of "more verbiage"—frothy effervescence, humbug—in some of those gushing expressions of delight and admiration which we hear so often. "Oh, Canon Hole, what a heavenly duck of a Rose!" "Well, it's not quite in its best form as you see it there." "No; but isn't it too awfully jollily not quite?" Misled on one occasion by these professions of adoration, I presented a lady with a lovely Rose, and not long after, when she became intense upon some other topic, she began to pick off the petals! I stood astounded, like Launcelot when

the Queen  
 Brake from the vast oriel-embowering Vine  
 Leaf after leaf, and tore, and cast them off,  
 Till all the place whereon she stood was green;

and then I remembered that I had business in another direction, and I went to it a sadder and a wiser man.

Then there are not a few professed admirers of Roses who only want them to show, or to cut, or to make their neighbours jealous. They have no true appreciation of the flower as a thing of beauty and a joy for ever, but regard it as ornamental furniture, and "the sort of thing one likes to have, you know." They come into your garden, and you show them some specimen of perfect loveliness, and they turn away, saying disdainfully, "We have heaps of those," as if they were coals or Potatoes; or, should it happen to be something which they do not possess, they condescend to take a note of the name, and they seem to think that they are conferring a great honour, not only upon you, but upon the whole vegetable kingdom, when they make the announcement, "We must have that."

Supposing the love to be sincere and the intentions hearty, what next? Pure air. And with a most unaffected sorrowful sympathy I speak those words, because to hundreds who love the Rose as well as I do they mean, No hope. Every year, and many and many a time in that year, "when the bloom is on the Rye" and on the Rose, I wish from my heart, as I wander in my peaceful pleasant garden, that my brothers—born and bred some of them 'mid gardens and green fields, but now toiling in dusky lane and wrangling mart, and having only caged birds and window plants to remind them of the past—could share my happiness. I have seen good Roses, it is true, which were grown within three miles and a half of St. Paul's Cathedral, and were exhibited at the first Crystal Palace Rose Show by the grower, my friend Mr. Shirley Hibberd. But the disappointments are so many, and the successes so few, that I should say to all persons proposing to grow Roses within six miles of a smoky manufacturing town or city, as *Punch* said to all persons about to marry—"Don't."

This pure air must nimbly and sweetly recommend itself to the Rose, but must not visit her cheek too roughly. Roses must have shelter, but not shade—free trade in sunshine, but protection from storms. They should have a screen of shrubs or of walls, but it must not be placed too near it. They dislike wind; and as all things else which are fresh and clean, from a fair reputation to a leg of mutton, they must not be blown upon. Let your Rose trees have all the sun (it is not much) which can be had in this cloudy clime.

As to soil, I have seen Roses growing, and have grown them, in all kinds of earth, from a heavy moist red clay to a light marly loam—in everything except gravel. If you have not a good soil naturally you must have it artificially; if it's too heavy make it light with lime, ashes, burnt earth; if it's weak strengthen it with turf, leaf mould, &c. Unbounded nonsense is emitted concerning soil. If Roses were good to eat we should have no more of it; but, as it is, you will hear persons who grow delicious Asparagus, the mealiest of Potatoes, and the biggest of Strawberries, maintaining that it is simply impossible to grow Roses in such a soil as theirs. The best soil which I have ever possessed was a rich old pasture broken up some six years ago. It was "double dug," and, having been well manured and manipulated ever since it is now most friable, mellow, and nutritious—good enough for pot Roses without any addition except the crocks for drainage.

What form of Rose tree shall we grow? Our fathers were in ecstasies when Mr. Lee of Hammersmith, and Mr. Rivers of Sawbridgeworth, introduced from Belgium (I think) the tall standards, and they bought them at a guinea apiece. Their children denounce them as mops and broomsticks—unnatural, and therefore unsightly; they are gradually disappearing, but a few old fogies, including yours sincerely, will plant a few standard Briars each year, and bud them in some quiet corner, because when there is a genial frostless May—a phenomenon which occurs in this country about twice in a long lifetime—those buds will produce the loveliest Roses which the rosarian can hope to see. With us (the fogies) they will perish, until—like single Dahlias, stage coaches, short waists, and cracked china—they are reproduced by Fashion as delectable novelties, and Vox Populi shouts, "Bravo! Beautiful!"

The bush is beyond a doubt the prettiest form in which we can grow the Rose, and this we obtain by grafting, or budding, or by striking cuttings from the parent plant. You have all the beauty of flower, foliage, and form under your eye, with this additional and supreme advantage—the standard tree, that, when you have placed a thick blanket—that is a good covering of straw manure, over your sleeping beauties towards the end of November—you may go to bed with the thermometer at zero and dream of Rose shows. A bed of these dwarf Roses, with the long laterals pegged down one year and blooming from laterals of their own the next, is one of the most charming sights in a garden. The bed should be round or

oval, raised in the centre, and with a large surrounding of well-kept weedless grass.

On what foundations shall we build? This depends much upon the soil. Make experiment. Procure Rose trees on the Briar, on the Manetti, and on their own roots, from the nurseries, and also Briar and Manetti stocks for budding in due season. Try your hand at striking also, and note results. In my own case the foreigner (it takes its name from Signor Manetti, who raised it from seed at Monza, gave it to Signor Crivelli of Como, and he sent it to my beloved friend—the beloved friend of all rosarians—Thomas Rivers of Sawbridgeworth, about the year 1833), the Manetti in my strong soil is worthless; the indigenous Briar, the English Dog Rose, is always a success. Nevertheless, I am more and more inclined by my experience to the belief that the favourite Rose tree of the future will be the Rose tree on its own roots. Meanwhile give me the Briar, whether it be grown from seed, struck from cuttings, or taken from the hedgerow or the wood.

What sorts, what varieties of Roses shall we grow? All sorts. Single and double, large and small; and in all forms—trailing along banks or towering on walls; making fountains, arches, and aisles; glimmering in plantations like "stars which in earth's firmament do shine;" rising from beds of shrubs, or circling them, as we saw the old China Rose the other day in the gardens of the Crystal Palace. He is no true rosarian who does not love all the Roses, and some of you may have read the public and indignant protest which I have made against an accusation which has been brought against us, that because we believe those Roses which you have seen to-day to be of all the most beautiful we are indifferent as to the other varieties; and it has been suggested, that because the National Rose Society proposes to publish a catalogue of Roses most suitable for exhibition, it may be necessary to establish a rival institution to watch over the interests of Roses for the garden only. I think—and it is such a happy thought as even Burnand himself never excogitated—that I know more rosarians and more of the rosarian mind than any other living man, and what I know most surely is this—that he who loves one Rose loves them all. Only the other day when I had left in my garden some of the loveliest Roses I ever grew, and was on my way to the station that I might adjudicate next day at the Crystal Palace aforesaid, I surprised a servant who was with me by stopping my dog-eart to gaze at a garland of Dog Roses drooping down the roadside hedge, and I believe that most of my brethren would have been as charmed as I was. Where is the exhibitor of Roses who does not grow Roses which are not available for exhibition? Name the writer on Roses who writes about show Roses only. Thomas Rivers gives us half a dozen pages in his "Rose Amateur's Guide" as to the exhibition of Roses in pots. William Paul, in "The Rose Garden," the same quantity on cut Roses for show, the remainder of the three hundred pages being devoted to garden Roses. Shirley Hibberd, in the "Amateur's Rose Book," gives a similar space to the subject of exhibition; and even he who wrote specially upon it, "How to Show the Rose," occupies not less than two-thirds of his book in discoursing upon the garden Rose.

In fact, and *in fine*, it seems to me (though I must whisper this quite *sub rosa*) that some of our friends—who from soil, situation, or want of zeal do not grow the most perfect Roses in their most perfect form—are at times a little invidious ("we are the sons of women, Master Page"), and that when they declaim against our "huge, fat, overgrown Roses, which anybody can have who will pluck off all the buds but one, and put on tons of manure;" and when they go into ecstasies about "the darling old Cabbage, and the exquisite York-and-Lancaster, and the dear old Tuscan, and the rich velvety Damask, and the little gem Rose de Meaux;"—this in most cases means to me, "You won't find a Rose in my garden which anyone would look at at a Rose show." It has the same significance as when short girls call long girls gawky maypoles, or as when gentlemen who are not at their ease on horseback disparage the pleasures of the chase. Give me the sight that is clear enough, and the heart large enough, to see and to admire beauty wherever and in whatever form it is found. I don't believe in musicians who chatter when others sing or play. I condemn the critic who gloats upon a flaw (just as that clumsy rider of whom I spoke will go a mile out of his way to find a weak place in a fence), who, if he praises, nullifies his praise. "Ah, yes, she's pretty, but, my dear fellow, she has the fist of a pugilist;" "bats nicely, but a mere dummy in the field;" "fair at feathers, but a muff at fur" (this I once heard from a third-rate shot of one of the best gunners of the day who had missed an invisible rabbit); "undoubtedly a nice little horse, but I hope you have not given much for him, for those hocks will never carry your weight."

I am constrained to confess that H.M. the Queen of Flowers is not refined in the matter of diet. She is a gross feeder, and when I think of the quality and the quantity of her favourite food I recall a passage in the letters of Charles Kirkpatrick Sharpe—"I met Mrs. Siddons at dinner just before the death of her spouse. It was at Walter Scott's, and you cannot imagine how it annoyed me to behold Belvidera guzzle boiled beef and mustard, swill porter, take huge pinches of snuff, and laugh till she made the whole room shake again." So does the Prima Donna of our stage; so does the Rose rejoice in strong sustenance, solid and fluid, with occasional pinches of tobacco powder and lac sulphur; but, as with Mrs. Siddons, they who had dined with her forgot the beef, and the beer, and "the pungent grains of titillating dust" when she appeared in all her power

as an artist, so when we see the Rose in her beauty we forget the midden and the tank. I go further than this in my devotion to the ladye of my love, and her likes are mine also. However unsightly to the eye or unsavoury to the nose, they seem to say, like the Earth in the Persian fable, "I am not the Rose; but cherish me, for we have dwelt together;" and they do not appeal in vain.

Ever since I lost my heart to the Rose I have been trying to discover the esculent which she most prizes, and at this present time her menu in my garden consists of eight different kinds of (if I may be allowed the expression) manure. These were applied some weeks ago, so that they have been well washed in by the rains, and in every case part of the bed was left without any addition, so that a comparison of results could readily be made. These confections are:—1 cwt. of Peruvian guano; 1 cwt. of pure dissolved bones; 1 cwt. of these two in combination,  $\frac{1}{2}$  cwt. of each; 1 cwt. fine bone-dust; 1 cwt. ammonia phosphate; 1 cwt. mineral phosphate; a small bag of Clay's fertiliser; an unmeasured quantity of liquid manure from a farmyard tank.

Three of these have signalled themselves by a special success—the farmyard liquor, the Peruvian guano, and Clay's fertiliser. Pure dissolved bones is second after an interval, closely followed by mineral phosphate. Ammonia phosphate a bad fourth. The rest nowhere. I was prepared for the success of Clay's fertiliser, having seen a grand collection of standard Rose trees in pots at the April Show of the Royal Horticultural Society at Kensington, grown by Messrs. Veitch of Chelsea, and assisted by the reverend—I beg pardon—assisted by the tonic aforesaid. I do not, of course, regard this report as final, and shall note carefully, *pro bono publico*, the future influence of my application; nor must I forget to remind our younger brethren of other victuals which are wholesome for the Rose, and which they will find in the sheep-fold, in the hen-roost, and the dovecote. Malt-dust, the sweepings of the kilns, or better still, but costlier of course, malt-culms, are also nutritious food. Mr. Rivers's prescription of malt dust and contributions from the stable, mixed and fermented with liquid manure, is probably the most powerful stimulant which can be given; and I have recorded how, many years ago, I took off my coat and barrowed a large heap of it to a lot of budded standard Rose trees, just before a very heavy thunderstorm, and how, some weeks afterwards, this adroit manoeuvre in manures achieved for me the highest honours of the year—the first prize for forty-eight Roses at our National Show in London. But that victory annihilated the army who won it; not one of these soldiers ever fought again.

What is the main result of my long and varied experience in this matter? It is that I find myself, as upon the Metropolitan Railway, at the place from whence I came. The system which I followed thirty years ago I propose to follow so long as I am attached to this machine, and have the happiness of growing Roses—namely, to give them a liberal supply of farmyard manure about the third week in November, which will act both as food and clothing also: to dig this in early in March, and afterwards to apply occasionally liquid from the tank or some other of the refreshments to which I have referred. From bird or beast, bovine, ovine, porcine, equine, animal or vegetable, dust of bone or barley, I recommend all to your experiment, and leave to you the selection of the fittest.

But the young rosarian must not place his main reliance on these enrichments, beneficial, indispensable as they are—*O formose puer, nimium ne creta manure heap*—but must regard his soil and its cultivation as of primary and perpetual importance. Success in Rose culture can only be attained in accordance with the universal and eternal law—you must work to win. There must be draining and digging, hoeing and weeding, and a watchful loving patience, which defends the Rose from its enemies as well as surrounds it with friends. Hence the paucity of rosarians worthy of the title. There are numbers who gush at shows, take down names, give orders, plant Rose trees, but who never stoop to pull up a weed; and as for extracting the grub from his leafy bower and handling him somewhat severely between finger and thumb, why that is "simply disgusting!" These are the sort of people who think when they have signed a cheque that Roses should immediately spring up around them about the size of punch-bowls, and that thankful nightingales should sing in them night and day. Somehow this firework won't go off. "Oh, yer don't want to go into business, don't yer?" said an angry father to his lazy and loutish son; "Yer want an appointment in the Post Office, do yer? Post Office indeed! Why all you're fit for is to stand outside with your tongue out for people to wet their stamps against!" He who would grow Roses must not be afraid of dirtying his fingers—of resembling that clergyman of whom Sidney Smith said, that he "seemed to have a good deal of his glebe on his own hands;" or of a likeness to Martin Barney, to whom Charles Lamb remarked over a rubber, "Oh, Martin, Martin, if dirt were trumps what a hand you'd have!"

Where shall we buy our Rose trees? From any extensive Rose nursery which is nearest to you and has a soil most like your own, or from any of those professional rosarians who have shown you to-day what the Rose can be. I say can be, because you must not expect to achieve perfection at once, and your first flowers may perhaps disappoint you. Only be not discouraged; work at your model bravely, and you shall reproduce it.

And I advise amateurs to visit some of the renowned homes of the Rose. They will find a far more genial welcome than the mere com-

mercial spirit can give to a customer, because the hearts of our Rose merchants, whose friendship I have enjoyed for so many happy years, is with the Rose; and they will have men as pupils, and please themselves more completely as purchasers, than by any amount of reading or correspondence.

And, on behalf of these visitors, may I express the hope that my professional brothers will take into consideration whether, in addition to their standard and dwarf Rose trees, they might not exhibit the Queen of Flowers in some other form of beauty—showing us, for example, the best varieties of climbing and pillar Roses, Roses for a shrubbery, Roses for beds, uniform or in contrast, Roses for edging, Roses for bouquets, &c.

But I forget that this is the overture, not the opera, and I hear a bugle-call from conscience, "Let the canon cease firing."

It only remains for me, as President of the National Rose Society, to thank you heartily for the pleasant reception which you have given to our brotherhood to-day, and to solicit those who sympathise with us in our desire to extend the love and successful culture of Roses, and therewith, as many who hear me can testify, the happiness of human life, "the purest of human pleasures," to ask those who are inclined to help us to signify their wish to me or to our Secretaries, that their names may be enrolled upon our lists.

THE PELARGONIUM SOCIETY will, by kind permission of the Royal Horticultural Society, have a "field day" in the gardens at Chiswick on August 3rd. The arrangements will comprise the annual general meeting, a critical inspection of Pelargoniums under trial, and a luncheon in the vinery. Members of the Pelargonium Society are alone admissible, but persons wishing to participate may enrol themselves as members by application to the Hon. Sec., Mr. Shirley Hibberd, 15, Brownswood Park, N.

— THE HEAT IN LONDON has recently been very intense; 95° in the shade were last Friday registered by the Meteorological Department of the Board of Trade, although in some parts of the metropolis the extraordinary reading of 98° was recorded. On Tuesday the 5th inst., when the heat was broken up by a violent thunderstorm, the shade temperature was 92°. That had been exceeded only four times within twenty-three years. On the 16th June, 1858, the record was 94°; July 22nd, 1868, 96°; July 17th, 1876, 94°; and August 14th, 1876, 93°. Assuming last Friday's reading of 98° to be correct, it was the hottest day which has been experienced in London for nearly a quarter of a century. New buildings in progress were covered with awning to enable the men to continue their work; and fans have been employed nearly as freely by the male as the female population. Vegetation is exhausted, and many forest trees are flagging and casting their leaves.

— INTERNATIONAL HORTICULTURAL EXHIBITION. — We have received the following letter from Mr. Bruce Findlay pertaining to the Jubilee Festival of the Manchester Royal Botanical Gardens:—"The above Exhibition will be held in the Royal Botanical Gardens, Manchester, on the 24th of August and three following days. The Exhibition will be on a large scale, and 4 acres of additional land have been taken for the purpose. The total cost is estimated at £4000, and the Committee hope to raise this amount in subscriptions, so that the receipts at the gates may go towards the erection of the new glass so urgently needed in the gardens, thus leaving a permanent monument of the Jubilee year, from which it is hoped that visitors may derive pleasure and profit for many years. Nearly £3000 is subscribed, and by making this appeal in behalf of an institution which has done good work in the past, the Committee hope to obtain the additional sum required. A banquet will be held in the Manchester Town Hall on the evening of 24th August. Subscribers of £10 and upwards

will be entitled to one banquet ticket and four admission tickets for the opening day; subscribers of £5 will be entitled to four admission tickets for the opening day." Mr. Findlay will send forms of subscription to those who are desirous of contributing to the Exhibition fund.

— MR. RAITT writes to us as follows under date July 12th on STRAWBERRIES IN SCOTLAND:—"This is a disastrous year in our small fruit line. Half the acreage here in Strawberries is destroyed by frost and caterpillars, the other half only a third to half a crop—a loss of £6000 to £8000 to this parish alone. The caterpillar on Strawberries has not (except last year) been noticed before. I am sending full-grown specimens to an entomologist to have them identified. Many acres of plants are totally destroyed. The lowest temperature registered on the 8th of June was 10° below freezing, on July 1st 6° below, the mercury being at freezing point half the nights between those dates. Beech hedges are quite browned and the injury great."

— "J. G." sends the following upon POLYGONUM CUSPIDATUM—"I observed this species growing most luxuriantly in a small nursery at Warley a few days ago, and was induced to measure the height and size of the branches or flowering stems, the tallest of which was 11 feet in height and 4 inches in circumference. How very little this fine-growing plant is known! It is admirable for filling up blanks for the summer, and its beauty as a flowering plant is not to be despised in the autumn."

— MESSRS. NANZ & NEUNER, 192, Fourth Avenue, near Walnut Street, Louisville, Kentucky, write to us as follows relative to the NEW DOUBLE WHITE BOUVARDIA ALFRED NEUNER:—"As some doubt appears to exist with regard to the agency in Great Britain for our new double white Bouvardia Alf. Neuner, we beg you will be good enough to announce that we have appointed Messrs. Jas. Carter & Co., of 237 and 238, High Holborn, to be agents for this plant in Great Britain."

— RELATIVE TO CUCUMBERS IN AFRICA a daily paper publishes the following—"The town of Sfax, which has lately been bombarded by the French, is, or was until recently, an exceedingly favourable specimen of a town in North Africa. It seems to have derived its name from one of the vegetable products for which it is most celebrated—that is to say, the Cucumber, which in the Arab language is called Sfakou. In the culture of this plant and of the Melon the Sfaxians take great delight, and the soil of the place is evidently most favourable for their growth. Besides these, fruits and vegetables of almost all kinds are grown in immense abundance in the great gardens which surround the town on every side. It is here in these gardens, amidst groves of Olives, Palm trees, and Orange trees, that the townsfolk retire in the heat of the summer, taking refuge in the *bordjs* or square villas built in the middle of each garden plot, and surrounded by a luxuriant growth of Jasmine, possessing a peculiarly sweet and powerful fragrance."

— A CORRESPONDENT sends us a note on the USE OF SALT IN GARDENS, to the effect that near an Asparagus bed, which has been salted for a number of years, and some of the soil from which has occasionally been spread on the land adjoining, the few rows of Onions on one side and Cauliflowers on the other have withstood the drought much better than the rows further from the bed where the ground has not been salted. There is no doubt that the judicious use of common salt in gardens where the soil is of a dry nature and the rainfall slight, is of considerable advantage in seasons like the present. We have used salt for a number of years, and it has proved of great value when the summers have been hot and dry.

— VICK'S Illustrated Magazine contains the following note upon a plant that is scarcely known in English gardens—"Any

of our young friends who have not tried a plant of the HONEY BELL, OR MAHERNIA ODORATA, may find it a charming little pet. The foliage is delicate and finely cut, the plant becomes a foot or two in height, branches freely, and bears a great profusion of little nodding yellow flowers of the sweetest perfume. It is almost continually in bloom, and is an excellent plant for the window in winter. It is of the easiest culture, either in the greenhouse or window garden, in a light and moderately rich soil. The name of this plant is an evidence of the difficulty botanists sometimes meet with in naming a newly discovered plant. A genus of plants to which this one is very closely related had been named *Hermannia*, after a noted German botanist, and for this later-found genus the name *Hermannia* was transposed into *Mahernia*, thus still honouring Herr Hermann while indicating botanical relationship."

#### MESSRS. C. LEE & SONS' ARBORETUM.

A FEW minutes' walk from Isleworth station, on the Hounslow branch of the South-Western Railway, are situated three of Messrs. C. Lee & Sons' nurseries—namely, one where softwooded plants are chiefly grown, one where ornamental Coniferæ, such as *Retinosporas*, *Biotas*, &c., are largely propagated, and one known as the arboretum, which contains an extensive collection of trees and shrubs. All are well worth a visit, but it is concerning the last-named that we submit the following brief notes, which, however, can convey but a very imperfect idea of the diverse and beautiful forms represented. The variations from well-known types of trees and shrubs may be considered as ranking under three heads—the variegated, the weeping, and the cut-leaved forms. There is scarcely one of the common trees or shrubs that has not varieties showing some of these characters, in many instances so developed as to render them attractive in the highest degree; others being extremely graceful in habit, while some are so grotesque or peculiar as to merit remark only as curiosities. It is amongst the deciduous section of tree life that these variations are most striking, and it is surprising what a number of forms have been obtained by some men who have specially devoted themselves to the work. This is particularly notable respecting the gold and silver variegated forms, one successful raiser of which was accustomed to jokingly inform inquirers that he painted the seeds white or yellow according to the kind of variegation he required. Some strange, but not improbable, accounts have also been related about "sympathy" amongst plants—that is, inducing variegation in a plant by placing it near or in contact with one already marked by the desired character. However, it is unnecessary now to enter into a discussion of the causes. In the Isleworth arboretum we find some of the best results, which will be referred to in the course of the following notes.

OAKS.—These are very strongly represented, and though the period of our visit was somewhat too early in the season to observe them all in their best condition, yet many beautiful forms had their foliage well developed. One that especially deserves notice is the Golden Oak, *Quercus concordia*, in its way one of the finest in the genus. Among other trees it is most effective, the clear bright yellow hue of the leaves contrasting beautifully with dark evergreens. Few large specimens are seen; indeed it is in comparatively few gardens the tree is represented at all—a fact that is greatly to be regretted. Another distinct and effective Oak is *Q. rubicunda*, which has handsome reddish-purple leaves, very dark. It is a fine companion for the preceding or other light-coloured forms. *Q. purpurascens* is also a purple-leaved variety, not quite so bright as the former, but still pleasing and useful. Among the variegated forms *Q. albo-marmorata*, *Q. argentea*, and *Q. fastigiata variegata* are especially noteworthy, and to these may be added the variegated Turkey Oak, which is perhaps unsurpassed in the clearness of the variegation and the distinctness of the contrast between the bright green centre and white margin of the leaves. Of the cut-leaved forms *Q. filicifolia*, *Q. heterophylla dissecta*, and *Q. pectinata* are remarkable, while as a variety with uncommonly large leaves *Q. americana macrophylla* is worthy of notice. Pendulous or weeping forms are also represented, but they are comparatively unattractive. Dozens of other more or less distinct and pretty varieties are grown, but cannot be now referred to.

MAPLES.—One of the finest of these at the time of our visit was a form which had been raised in the nursery, and is named *Acer Webbianum*, after the manager of this department, Mr. Webb.

It is a very distinct and extremely handsome form, with broad leaves beautifully mottled, splashed, and streaked with clear white. The variegation is so strongly marked that the value and effectiveness of the tree can scarcely be overrated. Another very promising Maple which has also originated at Isleworth is at present unnamed. In this the petioles are bright red, and the blade of the leaf is streaked with pink, white, and green, the first-named tint being particularly bright. *Acer Schwedleri* has its young growths bright red, and when the tree has attained a good size it is most attractive; either planted singly or amongst others it

is very ornamental. *Acer elegantissimum*, which, like many others, is a variety of *A. pseudo-platanus*, deserves a high place in the ranks of thoroughly useful and handsome Maples. The body colour of the leaves is a deep rich green, and the variegation a clear bright yellow. This does not appear to be much known at present, but it is undoubtedly destined to attract popular favour, and may be justly described as one of the best in commerce. *Acer Reitmabachii* is a magnificent variety when in good condition, its large rich purple glossy leaves being uncommonly showy. *Acer purpureum* is another purple-leaved form, but scarcely rival-

Fig. 12.—CYTISUS PURPUREUS MAJOR.

ling the former. Of the numerous other Maples grown the following deserve brief mention—*Acer Leopoldi*, variegated with white and pink; *A. platanoides variegatum*, very fine, white and yellow; *A. purpureum variegatum*, purple and yellow, handsome; *A. lævigatum*, red stems and petioles; *A. platanoides dissectum*, leaves elegantly cut; *A. laciniatum*, also with cut leaves; *A. platanoides cucullatum*, peculiar hooded leaves; and *A. villosum*, which has extremely large green leaves—indeed it is scarcely excelled among Maples in the size of the leaves.

Almost all the common genera of trees and shrubs are similarly represented by beautiful forms that are only too little known. Elms of most diverse characters and habit are seen, also Chestnuts, Limes, Ashes, Walnuts, Beeches, Birches, Cherries, Pears,

Thorns, Elders, Filberts, Alders, Poplars, and Willows, with many others, variegated, weeping, and strangely formed—a host of notabilities, the description of which would far exceed our purpose at present. Though it is invidious to select one for special comment from amongst so many that are good, these notes may be fittingly concluded by a reference to a flowering shrub that was certainly unsurpassed in the whole collection at the time of our visit, and which well merits a place in every garden where shrubs are valued. This is

*CYTISUS PURPUREUS MAJOR*, of which the woodcut (fig. 12) represents a spray, well showing the chief characters as regards the disposition of the flowers on the branches, but which can convey no idea of the tree's greatest attraction, the rich bright purple hue

of the blooms. The specimens at Isleworth are grafted on clean stems 4 to 5 feet high, and have fine close heads 3 or 4 feet in diameter, of hemispherical form. The flowers are produced in great profusion; indeed so numerous were they that the foliage was scarcely visible on some of the standards, and the pleasing purple tint already referred to is especially noticeable on a bright sunny day. The plant is unquestionably a really useful one, and deserves to be much more generally known.—VISITOR.

#### HITCHIN ROSE SHOW.

THE first Exhibition of the Hitchin Rose Society was held on Wednesday last under the favourable auspices of fine weather and fair Roses. The Society originated through the endeavours of the Rev. F. H. Gall, the Honorary Secretary. At present the scope of the Rose Society is limited to the locality of twenty miles from Hitchin; and although Hertfordshire includes the gardens of several of the principal cultivators and exhibitors of the Rose, these, with the exception of Messrs. Francis of Hertford, who are chiefly occupiers of light land, are not within the radius. The hot chalky soil of the district is, perhaps, as unsuitable as any in the latitude for the growth of exhibition Roses, and consequently the drift or boulder clays of the neighbouring counties produced the blooms of at least four of the chief exhibitors, and it may be a question whether chalk and gravel-grown Roses should not in future be made the subject of a separate class at Hitchin.

In the open class for twenty-four varieties Messrs. E. P. Francis and Co., of the Hertford Nurseries, were first with fine-coloured and regular blooms, including Madame Victor Verdier, Antoine Ducher, and Elie Morel, the latter two being exceptionally good blooms of uncertain varieties. Messrs. Francis had also good flowers of A. K. Williams, Pierre Notting, Marguerite Brassac, Reynolds Hole, and Marguerite Jamain, a light Rose of the type of Marguerite de St. Amand, but a little thin. The Rev. W. H. Jackson of Stagden Rectory, Bedford, was second with several very fine blooms, but his stand was less regular than the last; his best Roses were Pierre Notting (very large, and which obtained the silver medal of the National Rose Society as the best H.P. in the Show), Madame Gabriel Luiset, an excellent light Rose, and almost constant this season as a good show variety; Baronne de Bonstetten, Jean Liahaud, Marie Rady, Madame Victor Verdier, and Marguerite de St. Amand. Mr. Laxton of Bedford was third, having A. K. Williams, Marie Rady, Souvenir d'Elise, Madame Prosper Langier, Comtesse d'Oxford, and Catherine Mermet amongst his best blooms.

In the amateurs' class for twelve varieties the cup (not the conventional two-handled useless piece of metal-chasing of wafer constitution, but a good, substantial, plain English silver pint) fell to the lot of the Rev. E. L. Fellowes of Wimpole Rectory, Royston, who had the best and prettiest stand in the Exhibition, and well sustained the reputation of the Wimpole Roses. Horace Vernet, Paul Verdier, Auguste Rigotard, Senateur Vaise, Reynolds Hole, Marie Van Houtte, Le Havre, La France, Marguerite Brassac, Sir Garnet Wolseley, and Marie Rady were all good alike, and Comtesse de Serenye as well as could be expected. Mr. Jackson was second, and the Rev. W. F. Jennyns, Knehworth Rectory, third.

Teas and Noisettes were particularly good, and in the open class for twelve varieties Mr. Fellowes was first, his best blooms being Comtesse de Nadaillac, on this occasion in her deepest colours, Triomphe de Rennes, Madame Caroline Kuster, Alba Rosea, and Catherine Mermet. Mr. Laxton was second, having good flowers of Madame Barillet Deschamps, pure white; Triomphe de Rennes, Devoniensis, and Catherine Mermet amongst his best blooms.

In the amateurs' class for nine Teas and Noisettes Mr. Fellowes, who was again first, had Anna Ollivier, Perle des Jardins, Marie Van Houtte, Amazone, promising for exhibition; Comtesse de Nadaillac, Souvenir de Madame Pernet, Jean Ducher, and Madame C. Kuster, all good. The Rev. W. H. Jackson was second, his fine bloom of Catherine Mermet being crowned with the bronze medal of the National Society as the best Tea or Noisette in the Exhibition. Mr. Jackson had also good flowers of William Allen Richardson, very distinct in colour, orange apricot, but thin; Maréchal Niel, Innocente Pirola, and Comtesse Riza du Parc. The minor classes were fairly well filled, but principally by locally-grown blooms from the chalk.

Mr. Gall is to be congratulated upon his quiet, inexpensive, and yet most successful management, and not a few will be disappointed if there be not another and a long continuation of such Rose shows at Hitchin.—T. LAXTON, Bedford.

#### SUMMER-SOWN ONIONS.

STRICTLY speaking, Mr. Luekhurst is correct in describing Onions that are sown in July as summer-sown, but he will not change the old time-honoured and well-understood designation of such Onions. Winter Onions they have been, I believe, from time immemorial, and winter Onions they will remain, the term being clearly distinctive from spring Onions and intelligible. Of far more importance is his experience of the Silver Queen Onion for sowing at this period of the year, for it is a fact that Onions are often wanted in the spring before they are ready. My

experience with the variety named is the same as Mr. Luekhurst's. The Queen sown in July is most valuable for early use. So is the old silver-skinned pickling Onion. Let Mr. Luekhurst try this with the Queen as I have done, and he will, perhaps, be astonished at the fine bulbs he will have. Either or both of these so-called small Onions ought to be sown in addition to, not instead of, the ordinary Tripoli Onions any time before the end of the present month, and an early and prolonged supply of fresh Onions will be had during the spring and summer, until the regular spring-sown crop is ready for pulling.—J. D. E.

#### THE NATIONAL CARNATION AND PICOTEE SOCIETY.—JULY 19TH.

THE Exhibition of the southern section of this Society was held at South Kensington on Tuesday last, and proved the largest that has been held since the Society commenced its new series of exhibitions. The flowers were finer than could have been expected in such hot weather, whilst in Scifs and Fancies the numbers staged far exceeded all previous exhibitions. The new flowers were remarkable, and the raisers deserve high commendation. Annexed are a few notes of the best flowers shown.

In the first-prize collection of twenty-four Carnations Mr. E. S. Dodwell had fine examples of the following:—Fred, s.B., a very broad-petalled variety with bold markings, the same variety winning the prize as the premier Carnation in Mr. Douglas's stand of twelve. Other scarlet bizarres were James McIntosh, a large high-coloured flower with a good petal; George, s.B., with a petal similar in shape to Admiral Curzon; Arthur Medhurst, s.B., excellent; Seedling, s.B., a full flower, with large petals full of colour. In crimson bizarres Master Fred Hewitt was fine, and Shirley Hibberd, too, was good; Mr. Gorton, with the finest petal in the stand, lacked colour; Harry Matthews, s.F., a large flower, was first-rate; Mrs. Matthews, r.F., a fine flower, won first prize as a seedling. This stand altogether was fine, lacking only in the purple flakes, which, owing to the heat, had gone off.

Mr. Douglas had fine flowers of Joseph Crossland, s.B., a seedling of Mr. Simonite's, a full bold flower with deep maroon stripes; Admiral Curzon, Robt. Lord, and Dreadnought, s.B.'s, were all fine; Wm. Spoor, s.B., a Newcastle variety, lacked purity in its white, in other respects it was a fine large flower. The purple flakes were quite a feature in this stand, and improved it very much; they consisted of Florence Nightingale, Earl of Stamford, and Jas. Douglas. Mr. Charles Turner had also some fine examples, his best flowers being John Burnett, s.B.; Mars, s.B.; Matador, a s.F. with large petal and very bold marking, winning first in class; they were, however, far past their best. Mr. J. Hines had a fine s.B. called Godbold; this was extra fine. Mr. Douglas's second-prize collection of twelve Carnations included the premier bloom, Fred, s.B., a seedling raised by Mr. Dodwell, an extra fine flower.

The Picotees were very fine, Mr. Douglas winning first for twenty-four with fine specimens. Amongst the best were Jessie, L.P.; Norfolk Beauty, H.P.; Mrs. H. Chancellor, H.P., winning the premier place as the best Picotee in the Show. Thomas William, L.R.P., was here very good, as also in the classes, and no doubt it is the best light red in cultivation; Clara Penson, L.P., fine and large; and Her Majesty, L.P., was also very fine. Mr. Charles Turner was second with handsome flowers of Mr. Payne, H.R.; Dr. Epps, H.R.; Thomas Jivens, L.R.; and Tinnie, H.P., a seedling raised by Mr. Dodwell. In the twelve Picotees Mr. Douglas was first, and Mr. Dodwell second. Mr. Douglas had Princess of Wales, H.R., handsome; Mary, L.P., was also extra fine. Mrs. Gorton, L.R., a seedling of Simonite's, was also shown fine here. In Mr. Dodwell's stand Marvel, H.P., was noteworthy; also Mary, which won first prize as a seedling. Minnie, L.P., raised by Mr. Lord, was in beautiful condition. The Judges were Messrs. Llewelyn, Thos. Moore, Rev. F. D. Horner, Hewitt, Simonite, Rudd, Lord, Kirtland, Turner, and Ball.—GEO. RUDD.

A list of the awards with the names of the principal varieties shown is appended, and the number of entries will convey some idea of the extent of the Exhibition. The blooms were arranged upon tables in the Council-room, some of the collections not in competition being placed in the corridor.

CARNATIONS.—Most of the classes were well filled and the quality good. The principal class was that for twenty-four blooms, not less than twelve distinct varieties. The premier prize was secured by E. S. Dodwell, Esq., 11, Chatham Terrace, Larkhall Rise, Clapham, with handsome blooms of John Ball, Master Fred, Fred, James McIntosh, James Cheetham, Mrs. Matthews, John Keet, Thomas Moore, George, Admiral Curzon, Mrs. Tomes, Arthur Medhurst, Harry Matthews, Squire Llewelyn, E. S. Dodwell, William Skirving, Mrs. Gorton, and Shirley Hibberd. Mr. J. Douglas, gardener to

F. Whitbourn, Esq., Loxford Hall, Ilford, was a very close second, the following varieties being especially fine—J. Douglas, Rifleman, Florence Nightingale, Joseph Crossland, Sportsman, Sarah Payne, John Keet, Lord Wilton, Sybil, Falconbridge, Robert Lord, Clipper, J. D. Hextall, John Bayley, Earl of Stamford, Admiral Curzon, Wm. Spoor, J. Merryweather, Dreadnought, and several seedlings. Mr. C. Turner, The Royal Nursery, Slough, was a good third, having James Taylor, Mars, and Sporting Lass in good form. Mr. H. Hooper, Vine Nursery, Bath, was fourth; and Mr. J. Hines, 81, Bramford Road, Ipswich, fifth.

For twelve dissimilar blooms Mr. E. S. Dodwell was an excellent first with substantial blooms of Master Fred, Fred, Squire Penson, James McIntosh, Thomas Moore, Arthur Medhurst, Harrison Weir, Mrs. Tomes, Seedling 216, John Ball, George, and Squire Llewelyn. Mr. Douglas followed closely, staging good examples of Fred, Clipper, J. Douglas, Sybil, and John Keet. Mr. J. Matthews, Wandsworth Road, was third; Mr. J. Hines, fourth; Mr. J. Buxton, Manor Street, Clapham, fifth; and Mr. J. Duffield, gardener to H. K. Mayor, Esq., Winchmore Hill, sixth. There were seven entries in this class, the competition being generally good.

For six dissimilar blooms there were six entries. Mr. Arthur Medhurst, Clapham, was placed first with Dr. Cronin, John Bayley, Fred, Mrs. Gorton, and George, bright, clean, and of fair form. Mr. V. P. Healy followed with Othello, Stanley Hudson, John Buxton, G. F. Wilson, Titian, and Bayley Junior. James P. Sharp, Esq., Perry Barr, Birmingham, was third; E. H. Allen, Esq., St. John's, Putney Hill, fourth; and Master Harry Matthews fifth.

Single specimen blooms were very numerous, about 167 being staged in all the sections. *Scarlet Bizarres*.—Mr. C. Turner was first with George, Mr. J. Douglas second with Robert Lord and fifth with Dreadnought, Mr. E. S. Dodwell third with Arthur Medhurst and fourth with George. Forty-six entries. *Crimson Bizarres*.—Mr. J. Douglas was first with John Simonite, second with Crimson Banner, third with Lord Milton, and fifth with Lord Milton; Mr. E. S. Dodwell being fourth with Rifleman. Thirty-one entries. *Pink Bizarres*.—Mr. J. Douglas was first with Sarah Payne, third with a seedling, fourth and fifth with Albion's Pride. Mr. E. S. Dodwell was second with Sarah Payne. Thirty-three entries. *Purple Flakes*.—Mr. J. Douglas was first, second, and fifth with Florence Nightingale, Mr. C. Turner third with Lady Peel and fourth with Sporting Lass. Twelve entries. *Scarlet Flakes*.—Mr. C. Turner was first and second with Matador and a seedling; Mr. E. S. Dodwell was third with a seedling, Mr. J. Douglas fourth with Sportsman and fifth with John Bayley. Twenty-four entries. *Rose Flakes*.—Mr. J. Douglas was first with Sybil and third with John Keet, Mr. C. Turner second with John Keet and fifth with Jessica, Mr. E. S. Dodwell being fourth with James Merryweather. Twenty-one entries.

**PICOTEES**.—These also were abundant, bright, clean, and fresh. For twenty-four blooms, not less than twelve dissimilar varieties, Mr. J. Douglas was well to the fore with a pretty collection, including the following—Mrs. Payne, J. J. Bryant, Nymph, Brunette, Mrs. Gorton, Norfolk Beauty, Mrs. Bower, Princess of Wales, Ethel, Royal Visit, Jessie, Clara, Her Majesty, Clara Penson, Ann Lord, Mrs. Chandler, very fine, and a sport from Ethel, heavy-edged rose variety. Mr. C. Turner took the second place with fine examples of Mrs. Chancellor, Dr. Epps, Constance Heron, T. Jivens, Edith D'Ombraïn, J. Bolton, and Dr. Abercrombie. Mr. E. S. Dodwell was third, showing Jessie, Muriel, Zerlina, and Edith D'Ombraïn in fair condition. Mr. Hooper was fourth. These being the only collections staged.

For twelve dissimilar blooms Mr. J. Douglas secured chief honours with Clara Penson, Mrs. Chancellor, Brunette, Mrs. Payne, Mrs. Vivian, Jessie, Royal Visit, Violet Douglas, Princess of Wales, Mrs. Gorton, and Rosy Queen, all of fair quality. Mr. E. S. Dodwell followed, having Zerlina, Royal Visit, Dr. Epps, and Edith D'Ombraïn very fine. Messrs. J. Matthews, J. Hines, J. Buxton, and G. Duffield taking the remaining prizes in that order. There were seven entries.

For six dissimilar blooms Mr. Arthur Medhurst won the chief position with Zerlina, Edith D'Ombraïn, Mrs. Dodwell, Royal Visit, Lizzie Tomes, and Ann Lord. Mr. J. P. Sharp followed closely. Messrs. E. H. Allen, V. P. Healy, and H. Matthews being third, fourth, and fifth respectively among six exhibitors.

Single specimen Picotee blooms were well represented, 158 being staged. *Red, Heavy-edged*.—Mr. Brown was first with Emmeline, Mr. Douglas second with J. B. Bryant, Mr. C. Turner third with Picturata, Mr. J. Hines fourth with Wm. Summers, and Mr. E. S. Dodwell fifth with Brunette. Twenty-seven entries. *Red, Light-edged*.—Mr. J. Douglas was first, second, third, and fourth with Thomas Williams; Mr. C. Turner fifth with Rev. F. D. Horner. Fifteen entries. *Purple, Heavy-edged*.—Mr. C. Turner took all the prizes with Mrs. A. Chancellor, very fine. Twenty-eight entries. *Purple, Light-edged*.—Mr. J. Douglas was first with Miss Clara Penson, second with Her Majesty. Mr. E. S. Dodwell was third with Ann Lord and fourth with Minnie, Mr. C. Turner being fifth with Baroness Burdett Coutts. Twenty-eight entries. *Rose or Scarlet, Heavy-edged*.—Mr. C. Turner was first and second with Fanny Helen, and third with a seedling, Constance Heron; Mr. J. Hines fourth with Mrs. Allcroft, and Mr. J. P. Sharpe fifth with a seedling. Thirty-six entries. *Rose or Scarlet, Light-edged*.—Mr. Sharp first with Mrs. Allcroft, Mr. C. Turner second and third with Evelyn and fourth with Luey, Mr. H. Hooper fifth with Beauty of Bath. Twelve entries. *Yellow Grounds*.—Mr. J. Douglas first with Prince of

Orange, second and fifth with Princess Beatrice. Mr. H. Hooper third and fourth with Countess of Pembroke. Twelve entries.

**MISCELLANEOUS CLASSES**.—For twenty-four blooms of selfs, fancies, or yellow-ground varieties, Mr. C. Turner was first with a beautiful stand of blooms representing the following varieties—Enrydice, Constance, Cremorne, Captain Dalgetty, Seedling, George, Arthur Medhurst, Duchess of Edinburgh, Mrs. Willis, Géant des Battailes, Titian, John Burnet, G. P. Hawtrey, Elegant, Jessica, and Rembrandt. Mr. J. Douglas was a good second, Mr. J. Matthews third, and Mr. H. Hooper fourth.

For twelve of the above types Mr. E. S. Dodwell was in the chief position with neat brightly coloured flowers. Messrs. A. Medhurst, Duffield; H. Catley, Bath; and John Abercrombie, Cheltenham, securing the remaining prizes.

For twelve yellow ground Picotees Mr. Douglas was adjudged the chief honours for neat blooms of Prince of Orange, Mrs. Coleman, Alice, Beatrice, Eleanor, and Lightning. Mr. H. Hooper was placed second, and Mr. H. Catley third.

In the class for twelve plants of distinct kinds, in pots not exceeding 8 inches in diameter, only two collections were staged, Mr. C. Turner securing the premier prize with handsome specimens bearing from four to seven flowers each. The Carnations were Rembrandt, Rifleman, John Burnett, George, and Jupiter. The Picotees were Mrs. Payne, Mrs. H. Chancellor, Constance Heron, Dr. Epps, Royal Visit, Clara Penson, Tinnie, Louisa, Dr. Abercrombie, and Lady Carrington. Mr. J. Douglas was second with a less even but good collection, comprising the following—Carnations: Seedling 423, James Taylor, William Spoor, William Carrick, Albion's Pride, John Bayley, and Satisfaction. Picotees: Royal Purple, Brunette, Mrs. Gibbons, and Mrs. Bowers.

In addition to the collections in competition the following were staged:—Messrs. J. Veitch & Son, Chelsea, contributed a handsome collection of border Carnations and Picotees, ten boxes being shown, each containing three dozen blooms, representing a large number of beautiful varieties. Some of the best were the following:—Carnations: Isaac Wilkinson, Campanini, Earl of Stamford, Mars, Rosina, a very pretty rose flake; Defiance, scarlet flake; Lord Chelmsford, rose flake. Selfs: Lothair, Black Knight, Chromatella, Fire-eater, Bride, Princess Alice, Elysian Beauty, very soft pink; Auctioneer, bright purple; Crimson Pet, very deep crimson; The Coroner, dark salmon; King of Yellows, fine yellow; and Daniel Dedworth, very bright purple. Picotees: Mrs. Raynor, heavy rose edge; Brunette, heavy crimson edge; Royal Visit, heavy rose edge; Edith D'Ombraïn, heavy rose edge; and Lothair, heavy crimson edge.

Messrs. Cranston's Nursery and Seed Company, Hereford, exhibited eleven boxes of Rose blooms in admirable condition—bright, fresh, and of excellent form and substance generally. A large number of varieties were represented, among them being the brightly coloured Hybrid Perpetual Mrs. Jowitt, which was accorded high honours last year. Messrs. H. Cannell & Sons, Swanley, Kent, exhibited four stands of Verbenas and three of Carnations and Picotees, comprising many fine varieties. The Verbenas were particularly bright, and attracted much attention.

#### REVIEW OF BOOK.

*A Manual of Injurious Insects, with Methods of Prevention and Remedy for their Attacks to Food Crops, Forest Trees, and Fruit, and with Short Introduction to Entomology.* By ELEANOR A. ORMEROD, F.M.S., &c. London: Sonnenschein and Allen, Paternoster Square. 1881.

WE have added a date to the title of the above, though in actual fact the volume bears no date, and we are sorry to perceive that the practice of publishing works undated is becoming very common. The press teems now-a-days with so many works which profess to be manuals, but which the student finds sadly wanting, that it is agreeable to get hold of a book so entitled which really is a handy guide to the subjects it discusses. Not unfrequently it has been said, and with truth, that the majority of our entomologists have rendered very little service to horticulture, they being too much absorbed either in forming collections or hunting up new species. This manual, the only work so far as we are aware which has appeared in England in which the subject is aptly treated in accordance with the title as above given, is from the pen of a lady. Henceforth our entomologists of the male sex will have to look after their laurels.

The book is suitably divided into three parts, the headings being "Food Crops," "Forest Trees," and "Fruit Crops," and the alphabetical arrangement is adopted throughout—that is, with application to the plants, not to their enemies—on the whole decidedly the best plan, although there are insects that range from plant to plant, and can scarcely be said to be restricted to any one species. No doubt some will ask, "Why was there not a fourth part, in which those insects might have been referred to that destroy or disfigure flowers in the garden, conservatory, or hothouse?" Certainly this is an important subject, but it is a very large one, and we incline to think Miss Ormerod has done

wisely in limiting her researches, at least for the present. We should, however, like to see added to any future edition of this "Manual" a few observations upon those insects which, by acting as foes to injurious species, deserve to be encouraged in our gardens.

The introduction to entomology is well executed considering its necessary brevity, and throughout the book the descriptions are clear and popular, woodcuts being introduced here and there which are on the whole well drawn though not all original. Much of the matter in the book commends it to the farmer as well as to the gardener; for a particular notice is given of the species infesting corn, the Hop, the Potato, Beans, Peas, Carrots, and Turnips. Miss Ormerod very wisely insists upon the axiom that "prevention is better than cure;" and of methods of prevention she says, "The most serviceable are based, not on applications when the crop or trees are undergoing attack, but rather on modes of cultivation and treatment which may diminish the amount of insect presence beforehand, by clearing away all points of harbourage and breeding places, as well as attacking the pest generally and on a broad scale at the points where the details of its habits show that it is most open to injury." The value—now insufficiently recognised—of gaslime is insisted upon, the authoress remarking that as a dressing for insect-infested land it has scarcely an equal, for it not only kills many pests, but by the chemical alterations it undergoes it eventually becomes an excellent manure.

Inquiry was recently made in this Journal concerning the best method of extirpating the wireworm. Miss Ormerod recommends deep trenching in gardens, and trapping also by burying pieces of Carrot or Potato; paraffin diluted with fifteen times its bulk of water and applied continuously has been advantageously used in the north. We notice, when writing upon the Gooseberry and its pests, Miss Ormerod, while admitting the virtues of hellebore as a destroyer of the sawfly caterpillar (more especially), considers the employment of it is dangerous, lest any portions of the powder should adhere to the berries. A dusting with the flour of sulphur, done when the bushes are damp from dew, she considers is quite as efficacious. Amongst the insects of the Gooseberry the caterpillar of the V-moth (*Halia wavararia*) might have been mentioned; it is rather common on the leaves some seasons. Also as frequenting the Currant, there should have been notice taken of that pith-miner, the larva of *Sesia tipuliformis*. An allied species, *S. myopæformis*, is not named amongst the feeders on the Apple and Pear; recently an instance was reported to this Journal of its occurrence upon the Apricot. There are sundry other omissions, particularly in the Lepidopterous order; but it is not to be expected that in a first edition of such a book anything approaching comprehensiveness could be attained. To the Vine, we think, a separate chapter ought hereafter to be given. There is only a passing notice of the Vine weevil (*Otiorynchus sulcatus*) under the heading of the Raspberry. Doubtless Miss Ormerod will be glad to receive from gardeners information as to how far they have tried or tested her preventive or remedial methods.

#### WIRRAL ROSE SHOW.

SATURDAY, JULY 16TH.

THE above Society held their Show in the Park grounds under much more favourable weather than last year, but the heat was excessive, and both in colour and freshness the blooms were far behind what we have seen staged on many previous occasions. The competition was not keen throughout the Exhibition; yet, taking all things into consideration, the Show was really a good one. That brilliant Rose Horace Vernet was staged in excellent condition, especially in the Hereford boxes, and was generally better in quality than any other variety in the Show.

In the class for seventy-two single blooms two collections were staged—namely, by Messrs. Cranston & Co. and Messrs. Davidson and Co., the former taking the lead with superior blooms, a few of the best being Perle des Jardins, Mrs. Laxton, Countess of Oxford, A. K. Williams, very bright and good; Senateur Vaisse, fine; Niphotos, Mdle. Marie Rady, Exposition de Brie, Marquise de Castellane in splendid condition; Auguste Neumann, Le Havre, Alfred Colomb, Horace Vernet, very brilliant; Peach Blossom, Souvenir de la Malmaison, very fine without being coarse; La France, and a large flower of Etienne Levet. Messrs. Davidson & Co. staged much smaller but very even blooms of Alfred Colomb, Jean Liabaud, Marie Baumann, Général Jacqueminot, Marie Finger, Duke of Edinburgh, bright; Lord Herbert, good; Xavier Olibo, Mons. E. Y. Teas, fine; Charles Crapelet, and Maurice Bernardin. The same exhibitors were the only competitors in the class for thirty-six triplets, and obtained the prizes in the same order as in the preceding class, Messrs. Cranston & Co. showing a good even lot, including good blooms of Mrs. Laxton, bright; Mdle. Eugénie Verdier, A. K. Williams, Sir Garnet Wolseley, bright and very fine; Madame Charles Wood, Madame

Lacharme, a very fair bloom; Capitaine Christy, large and good; Princess Mary of Cambridge, Edouard Morren, very good; Mdle. Bonnaire, Beauty of Waltham, Perle des Jardins, bright and of good size, Charles Lefebvre, good; Duke of Wellington, brilliant; François Michelin, large and fine but rather short of colour; and Marguerite de St. Amand. The blooms of Messrs. Davidson & Co. were considerably smaller, but in very fresh bloom.

In the class for thirty-six single blooms four lots were staged. Mr. T. Griffiths, Hereford, was placed first with fresh and fine blooms. Beauty of Waltham was a model of perfection and the finest of its kind in the Show; Ferdinand de Lesseps, Alfred Colomb, Marie Baumann, Sir Garnet Wolseley, Charles Darwin, Royal Standard, May Quennell, Madame Vidot, Baron Haussmann, and Lord Macaulay were all in fine condition. Mr. George Prince of Oxford was placed second with a fine stand containing excellent examples of Devienne Lamy, Camille Bernardin, Beauty of Waltham, Louis Van Houtte, Niphotos, Marie Guillot, Maréchal Niel, Jean Ducher, Madame Lambard, Rubens, Catherine Mermet, and Capitaine Christy. Messrs. J. Dickson & Sons, Newton Nurseries, Chester, followed closely, and secured third honours. Messrs. F. and A. Dickson & Sons, Chester, also staged a good even collection. In the class for eighteen varieties, three blooms of each, Mr. G. Prince of Oxford was again first, closely followed by Mr. T. Griffiths, Hereford. In the class for twelve blooms of any one Hybrid Perpetual Rose Messrs. Cranston and Co. were easily first with a brilliant box of Horace Vernet, Mr. G. Prince second with large blooms of Alfred Colomb but deficient in colour, and Messrs. F. and A. Dickson & Sons third with Marie Baumann, rather small but very bright. In this class there were five competitors. For twelve varieties, single blooms, not in commerce before 1878, Messrs. Cranston & Co. were first and Messrs. Davidson and Co. second. In the first-prize lot were staged Mons. Alfred Dumesnil, Jean Sisley, good; Madame Ducher, Mdle. Marie Verdier, Duke of Teck, Duchess of Westminster, Duchess of Connaught, Charles Darwin, and Countess of Rosebery.

For twelve Tea or Noisette Roses Mr. G. Prince, Messrs. Cranston and Co., and T. B. Hall, Esq., a local exhibitor, took the prizes in the order as named, Mr. Prince showing the finest Tea Rose in the Show—Comtesse de Nadaillac, full and good; Anna Ollivier, large and fine; Madame Caroline Kuster, Souvenir d'un Ami, Souvenir de Madame Pernet, good; Marie Guillot, Jean Ducher, brilliant; Maréchal Niel, and a good Souvenir d'Elise Vardon. Messrs. Cranston showed good examples of Catherine Mermet, Niphotos, Comtesse Riza du Parc, Souvenir de Paul Neyron, and Madame Hippolyte Jamain. The third collection contained similar varieties but smaller than the above.

In the classes open to all amateurs Mr. T. Jowitt obtained the premier award for thirty-six single blooms with one of the finest boxes in the Show, the stand scarcely containing a faulty bloom. A. K. Williams was of remarkable merit, and Dr. Andry, La Duchesse de Morny, Le Havre, Senateur Vaisse, Mons. Boncenne, Etienne Levet, Comtesse de Serenye, Belle Lyonnaise, Mary Pochin, and Mdle. Marie Cointet were large and in grand condition. D. L. Codrington, Esq., was placed second, the blooms being much inferior to the above. For twenty-four single blooms Miss Massey was well first with good blooms, the most noticeable being Marie Baumann, Baronne de Rothschild, Etienne Levet, Paul Jamain, Prince of Wales, and The Shah. C. J. Day, Esq., was a good second, showing fine blooms of Alba Rosea and Comtesse de Nadaillac; William Stubbs, Esq., being a close third, having a good bloom of Duchesse de Morny. T. Griffiths, Esq., Oxtou, and the Rev. L. Garnett took the prizes as named in the class for twelve single blooms, the former showing La France, Capitaine Christy, Dr. Andry, and Mdle. Eugénie Verdier, rather small but fresh. T. B. Hall, Esq., was the only exhibitor in the class for twelve Teas or Noisettes, and staged a very creditable collection.

The remaining classes were open to the hundred of Wirral and to amateurs residing within ten miles of the Liverpool Exchange. In the class for twenty-four single blooms Mr. T. B. Hall was first with an excellent stand—Dupuy Jamain, Thomas Mills, Marquise de Castellane, Mdle. Marie Rady, La France, and Baronne de Rothschild being the principal blooms; the others being fresh and good. Mr. Griffiths was second with blooms of Magna Charta, Hippolyte Jamain, and François Michelin. Mr. Wm. Mease, gardener to C. W. Newmann, Esq., being third, also with a good stand, and Mr. Joseph Mayers fourth. Five lots were staged. In the class for eighteen single blooms Mr. T. Griffiths was first; Messrs. T. B. Hall and Mease being equal second. Messrs. D. Walford, Esq., T. B. Hall, and T. Griffiths were the prizetakers in the class for twelve blooms, in which there were seven competitors. The exhibitors in the above three classes were not allowed to compete in the three following. For eighteen single blooms J. W. Hodgson, Esq., was first, and Mr. C. Waterman, gardener to A. Tate, Esq., second. In the class for twelve blooms J. G. Churton, Esq., was first; Messrs. J. Hargreaves and J. W. Hodgson taking the remaining prizes. For six blooms Messrs. A. Tate, J. G. Churton, and J. W. Hodgson securing the prizes in the order as named.

In the class for nine Tea or Noisette varieties Mr. T. B. Hall took the lead; Mr. H. J. Tippet second, and Mr. Joseph Mayers third. In the corresponding class for six Mr. Hall was first, Mr. E. Claxton second, and Mr. Mayers third. For three blooms Mr. Hall was again first, having a good bloom of Madame Bravy, which gained the

premier award for the best bloom. In the class for three Hybrid Perpetuals Mr. Joseph Armstrong, jun., was first, staging a fine-coloured bloom of Général Jacqueminot, which was selected and awarded the premier award for the best dark bloom. Mr. Inman being second in this class. In the remaining classes the principal prizetakers were Messrs. H. Mercer, W. Aspinall, and Roger Williams; the first and last exhibitor also taking the prizes as named for the bouquet of Roses.

Miscellaneous Exhibits.—A collection of Roses was sent by the Mayor of Birkenhead, and seven boxes of triplets from Messrs. Cranston & Co., Hereford. Mr. Samuel Johnson, South Grove Nurseries, Oxtou, staged an interesting group of miscellaneous plants, including Orchids, Crotons, Ferns, Palms, Zonal and choice Regal Pelargoniums, the whole being effectively arranged.

The Exhibition was well arranged, and the details aptly carried out under the direction of Mr. Smith and W. E. Hall, the Hon. Secs.

**MR. SMEE'S GARDEN—PARISIAN CHAIN BLINDS.**

VISITING Wallington near Croydon recently (a name well known to newspaper readers) I had the pleasure of inspecting Mr. Smee's picturesque garden at The Grange. There is no trimness, prim-

ness, nor laboured daintiness there, but all is free, natural, and almost beautifully wild. There are deeply shaded dells of Ferns, where the Osmunda luxuriates and the Struthiopteris rises like elegant Palms. There are sheltered nooks where the charming Filmy Ferns refresh by their verdant and elegant fronds. There are Roses that ramble to the tops of the trees, forming floral festoons, and affording grateful shade for Sarracenia planted at the base of rocks. There are aquatics growing in tropical luxuriance, and rockeries run wild, the plants being obedient to no law but the "survival of the fittest." There are twisting densely canopied walks, mounds, streams, bridges, and rushing waters everywhere. There is there, if anywhere, the "cool grot and mossy dell," where the romantic may imagine with Lord Mornington that "rural fays and fairies dwell." It is a charming retreat on a sultry day. It is the "My Garden" of the late Mr. Smee, and there is no wonder that he enjoyed it. The garden remains the same now as then, the trout stream still meanders through the ground, and the thatched shanty still exists.

But there is a great addition—a fine and well-appointed new mansion in admirable keeping, architecturally, with the character of the grounds; near this mansion is an enjoyable conservatory,

Fig. 13.—PARISIAN CHAIN BLINDS.

and on the conservatory are the blinds under notice. This structure is, however, as much a fernery as conservatory, Tree Ferns and Palms predominating, with just a few flowers to impart a ray of brightness here and there. The plants in this house are in excellent health, and the shade is both grateful to them and to their admirers. The Parisian blinds are much liked by Mr. Smee, and for such houses as this in such sultry weather nothing can surpass them for the purpose for which they are employed. They are made in Paris and used extensively on the continent, Messrs. Richardson & Son of Darlington being the agents for them in this country. As is stated in the prospectus referring to them, "These blinds are made of thin wood laths, with narrow spaces between, and connected by galvanised iron chains, as shown above; they are painted green, and intended to be fixed on the outside of conservatories or hothouses. A single cord running over a pulley rolls up each blind from the bottom. They are usually left fixed through the entire year, and afford protection from frost in winter as well as shade from the sun in summer. They are particularly neat in appearance, and are more durable than blinds of any

other kind—in fact they are almost imperishable. They are supplied direct from the manufactory in Paris in about three weeks after date of order, and are made to any size, but the width should not be more than about 5 feet." There appears to be no exaggeration there judging by those in use at The Grange, for they answer their purpose well, and would be welcome additions to glass structures where shade is needed in gardens generally during "a double-cometed July," such as thousands are panting under at the present time. Such a garden as Mr. Smee's and such a shade as these blinds afford are peculiarly grateful, refreshing, and beneficial to those who have the privilege of enjoying those cool and "green retreats" during the present exhausting and tropical weather.—J. W.

**MR. SHIRLEY HIBBERD'S LECTURE ON THE CARNATION.**

ON the occasion of the National Carnation and Picotee Society's Exhibition in the conservatory of the Royal Horticultural Society,

a lecture on the Carnation was delivered by Mr. Shirley Hibberd. He said—

The Carnation is the true Gilloflower, and one of the oldest of all flowers when regarded as a subject of the florist's care. When we turn to the old books we find Gilloflowers and Violets innumerable. The stock is a Violet, and so is the Lily of the Valley. Amongst the Gilloflowers we find the Wallflower, Stock, and Rocket, besides the Clove, the Pink, and the Sweet-William, which was often called Sweet John, and our flower of to-day, the Carnation. If you will turn to Parkinson's "Paradisus" you will find at page 318 a chapter headed "Carnations," and therein is a list of nineteen named varieties, comprising The Gray Hulo, The Chrystall, The Stript Sauadge, The Cambersine, and The Great Lombard. At page 310 is a list of thirty "Gilloflowers," comprising The Bristow Blew, The Red Douer, The Daintie, The Sad Pageant, The Stamell, The Tawny, and Master Taggie his Ro-e. The arrangement of the flowers in two classes by Parkinson has no scientific value, because it depends chiefly on the relative sizes of the flowers: the largest, as a rule, were Carnations, and the smaller were Gilloflowers. But if we could hunt up the fifty or sixty sorts he was acquainted with we should probably class his Carnations as Cloves and his Gilloflowers as Carnations. It is a matter of some importance, however, to note that the Carnation is *the* Gilloflower of the old poets and herbalists. Other Gilloflowers were described with a qualifying adjective, as "Stock Gilloflowers," "Cuckow Gilloflowers," and so forth; but these are the true Gilloflowers, and the name takes us to the sunny lands of the Latin races, for it has a Latin root, and it gives us the suggestion that the Carnation is not in a proper sense of the term a native flower. We have a wild Pink, indeed, and a most lovely flower it is, but it does not appear to possess the elements needful for the formation of such rich and refined flowers as are brought under our notice to-day. In common with many other garden flowers which are undoubtedly represented by wildings of the woods and fields, the influence of a south European climate appears to be and to have been needed for their full development. Hence we may treat with respect the probable reference to the Carnation by Pliny in the eighth chapter of his twenty-fifth book as the Cantabrica, which he says was discovered in Spain in the days of Augustus Cæsar. It is amusing to note that Pliny antedates the "Soppes in Wine" of the old English writers by describing the Spaniards as employing this flower to give a spicy flavour to their beverages. In Philemon Holland's grand translation we read, "At this day in their great feasts where they meet to make merry Sans-nombre, they haue a certain wassell or Bragat, which goeth round about the table, made of honied wine or sweetmead, with a hundred distinct herbs in it; and they are persuaded that it is the most pleasant and wholesomest drinke that can be deuised; yet there is not one amongst them all who knoweth precisely what speciall herbs there be in all that number. In this only they be all perfect, that there go a hundred several kinds thereto, according as the name doth import." Thus in the endeavour to trace up the geographical history of the Carnation we are reminded of the wisdom of our forefathers, who preferred to employ Carnations, and Roses, and Borage, and Woodruff, and Tormentil to flavour their drinks, than to combine destructive alkalis with equally destructive ardent spirits, or to take revenge on the blessed sunshine and the delightful thirst it engenders by swallowing frothy fluids with mysterious names and much more mysterious properties. To return to the flowers, it seems that the south of Europe gave us the first start in high-class Carnation culture, as it gave the first start and sustains the latest fashion in the selection and management of Daffodils.

Thus we are prepared to open the pages of the renowned John Gerarde in a state of preparedness to believe that the Carnations he obtained from the worthy merchant, Master Nicholas Lete, were the first of their kind seen in this country. And the mention of its introduction by Master Lete from Poland affords me a proper excuse for declaring that the present Exhibition is the tercentenary of the Carnation; for the work of Gerarde was published in 1597, and we may reasonably contend that it was in or about the year 1581, or say sixteen years before Gerarde's book was completed, which carries back the history of the Carnation to a date exactly three hundred years from the present time.

So far good: in these matters we must pay respect to authority. But we must not forget the scriptural precept to "prove all things." On turning to "Haydn's Dictionary of Dates," under the word Carnation, I find it stated, on the authority of Stow, that the flower was introduced from the Low Countries in the year 1567. It would not be difficult to harmonise this statement with the story of its introduction by Master Lete, for this we may be sure of, that it had been in the country some time before Gerarde's "Herball" appeared. But I would suggest that the

flower is really of greater antiquity than appears from these evidences. The "Carnations and Streaked Gillvors" that Perdita describes as the fairest flowers of the season, were probably as old as any flowers of the English garden; for we cannot imagine Shakespeare, in such a scene and context, introducing any flowers that had but recently come into cultivation. The "Winter's Tale" was written in the year 1601, or only three years after the publication of Gerarde's book; and Perdita speaks of these flowers as deriving their special qualities, or, as we should say, "properties," from the arts of the florist, and as therefore less worthy of her attention. They are such, she says, as "some call Nature's bastards," and she seems pleased to own that "of that kind our rustic garden's barren." This goes at least to show that there were many varieties of the flower known in the year 1601, and that they were so far common that the humblest lovers of the garden could afford to reject them if they were stigmatised as "Nature's bastards." Finally, to make an end of this part of the subject, it may be proper to state that we learn from Chaucer that the Clove Gillflower was cultivated in this country in the reign of Edward III., and was commonly used to give a spicy flavour to ale and wine.

(To be continued.)

#### HARDY FRUIT GARDEN.

THE forward Apricots and Peaches will now require attention to give the fruit the benefit of sun and air, turning the leaves aside, but avoiding as far as possible the too common practice of removing those that shade the fruit. Fruit trees generally have not made so much wood as usual, but they should be examined frequently, nailing or tying-in leading shoots, and pinching those required to form spurs. Lay in the young wood of Peaches, Nectarines, and Morello Cherries, allowing sufficient space between each for the admission of light and air, so as to secure well-matured wood. Complete as soon as possible the removal or shortening of the breastwood and stopping the side growths, laying in wood where necessary to fill vacant spaces, and secure the extensions of Pears, Plums, Cherries, and Apples, also attending to the requirements of bush, pyramidal, and espalier fruit trees as advised in former calendars. Let fruit trees against walls be syringed occasionally in hot weather, and those swelling off their crops be assisted with liquid manure, unless the trees are vigorous and carrying but light crops of fruit. Apricots ripening will need protecting from birds and ants. Guano strewed in the runs of the latter and over their nests will mostly cause them to change their quarters, or pouring nicotine soap at a strength of 6 ozs. to a gallon of water at 100° over their nests will destroy them. They may also be trapped by placing a number of jars at the base of the wall containing about an inch depth of treacle and water. Earwigs are troublesome, and may be trapped in pieces of beanstalk cut into lengths of about 6 inches inserted among the branches. Examine them every morning, blowing any concealed inside into a bucket of water. Woodlice may be trapped in small pots baited with a boiled Potato covered loosely with a little hay. Continue to pot runners of Strawberries as they can be procured for the purpose of forming new plantations or for forcing. Budding must now be followed up generally with fruit trees; and where it is requisite to fill up vacancies in established trees or to change the variety, buds may be inserted with every prospect of success in wood of one or more years' growth, providing the bark is not too rough and hard, in which case it is better to head down early in spring and work upon the young wood when sufficiently matured in summer.

#### FRUIT HOUSES.

*Peaches and Nectarines.*—The earliest trees from which the fruit was gathered some time since will still require attention in watering the borders and in syringing the foliage, so as to maintain it healthy and secure plump flower buds for next year. This will be more particularly necessary where the roof lights cannot be removed, and in that case the lights must be open to the fullest extent day and

night. In the second house the fruit is nearly all gathered, and watering inside borders must not be neglected, nor syringing the trees so as to preserve the foliage in good condition. Trees enfeebled by forcing may be afforded liquid manure plentifully, which will help them to form plump flower buds. Cut out the growths (not extensions) that have borne fruit this season, and if there is any approach to overcrowding remove weakly growth, or where too crowded thin so as to allow that retained to become well matured. The fruit in the third house is now ripening fast, and must have good supplies of water and liquid manure. Fire heat will not be required, and if it is wished to bring the fruit forward allow the temperature to advance to 85° or 90° after free ventilation, which will be very much better than fire heat. Cease syringing the trees when the fruit commences ripening, and yet keep a moderate proportion of moisture in the house for the benefit of the foliage. In very hot weather the fruit ripens more quickly than is required, in which case retard by shading. Have the fruit near the glass to insure its colouring. In the next succession house supply the borders with liquid manure or water as may be needed. The trees must be well syringed and the shoots tied in closely, stopping laterals at one joint, also irregularities of growth. In late houses ventilation will be needed to the fullest extent in hot weather, and the borders must be well watered; liquid manure assists the fruit, and mulching will help to keep the roots near the surface, lessening the necessity for frequent watering. See that there is not any overcrowding of the growths.

#### ORCHARD HOUSE.

Cherry trees in pots when the fruit has been gathered may be removed to a sunny position in the open air to harden the growth and perfect the fruit buds. The pots should be plunged, supplying water freely and syringing. Apricots are fast approaching maturity, and must not now be syringed. The early Peaches are ripening, and should be treated similarly to Apricots. The fruit of other Peaches Nectarines, Plums, and Pears are rapidly swelling, and the trees should be abundantly supplied with water, whether they be planted out or in pots. Liquid manure also may be applied occasionally, and the surface dressing renewed. Secure a moist atmosphere by syringing the trees freely and closing the ventilators between 5 and 6 P.M., opening them again between 6 and 7 A.M. Stop strong shoots where necessary, and rub off superfluous shoots, so as to admit light and air freely to the fruit. Fig trees in pots should have the young shoots stopped where found necessary, and be plentifully supplied with water and liquid manure whilst the fruit is swelling. Be careful to prevent a check, which is almost certain to result in the fruit dropping. A top-dressing of rich material will assist the fruit in swelling, also prevent dropping by encouraging surface-rooting. Ply the syringe freely until the fruit is ripening. Fig trees in an orchard house are not to be relied on for a second crop, but if the stopping has been attended to they will, if removed to a house with a slight artificial heat as soon as the first crop has been gathered, afford a second crop of ripe fruit. Vines in pots or otherwise will have the fruit fit for thinning, and should be carefully done. Supply liberally with liquid manure, and mulch the surface of the soil with short manure.

#### FLOWER GARDEN.

Flower beds require frequent attention to remove dead or decaying leaves and flowers; removing the seed pods not only improves the appearance of the plants, but tends to a free and continued production of flowers. Verbenas, Petunias, and similar plants should be pegged down and picked over, also thinned by pinching a portion of the growths back. Calceolarias, Violas, Verbenas, and similar moisture-loving plants should have abundance of water in dry weather, but it should not be given over the flowers. Free-growing plants employed for carpet bedding soon encroach on weaker varieties if not frequently pinched-in; the marginal lines and those forming the design must be kept clear and distinct. Subtropical plants advance rapidly, and unless securely staked and tied they are liable to be damaged by the wind; similar remarks applying to Dahlias and all plants having a large leaf surface. Mulching with short manure and copious supplies of liquid manure are absolutely necessary to have these plants in good condition. Asters, Stocks, Zinnias, Marigolds, and similar plants should, when in free growth, receive liquid

manure abundantly, and if flowers of extra size are required the buds must be thinned. Prick off hardy perennials, and sow again if necessary. Roses must as they cease blooming have the growths shortened back a little, and be watered with liquid manure to insure a free growth and good autumn bloom, mulching with short manure a few inches thick. Syringe the plants in hot weather. If mildew appear syringe with pentasulphide of calcium, using a wineglassful to a gallon of water. Push on budding whilst stocks and buds are in good condition, continuing to make cuttings of ripened growth, inserting them under handlights.

#### PLANT HOUSES.

*Stove.*—Plants that continue flowering through the summer and autumn, such as Allamandas, Dipladenias, and Bougainvilleas, are free-rooting, and should be assisted with a surface dressing of manure and liberal supplies of liquid manure applied before the plants become too much exhausted. *Eucharis amazonica* can hardly be grown in too great quantities where cut flowers are in request; and where sufficient plants are grown it may be had in flower all through the year by growing and resting some of the plants at different seasons. Plants that have completed a good growth since flowering should now be rested by withholding water until the leaves flag slightly, when a little should be given them, but not enough to induce growth. Place the plants in a house where the temperature is 5° or 10° lower than that in which the growth has been made for about six weeks, watering only to prevent the foliage becoming dry. After this remove them to their growing quarters, and they will soon produce their flower scapes, especially if bottom heat be afforded.

Celosias from late-sown plants for autumn flowering, when they are very useful, should receive timely attention, not allowing them to become stunted for want of root room, and not affording more heat than will maintain them in steady progressive growth. The display of fine heads of bloom is in proportion to the size and strength of the plants. Very useful plants may be grown in 6 or 7-inch pots, but very much finer will need 9 or 10-inch, in either case keeping them as near the glass as possible. A cold pit is suitable at this season kept rather close. Liquid manure may be afforded once or twice a week, and use the syringe daily to keep red spider in check. *Athurium Schertzerianum* requiring more root room should be potted now the flowering is over, and this will afford the plant the benefit of the fresh compost whilst making its growth. Being a surface-rooting plant it does not require a great depth of soil, but must have efficient drainage. It does well in fibrous peat, a third of sphagnum, and about a sixth in equal parts of rocks, chareoal, and sand.

## THE BEE-KEEPER.

#### SWARMS UNITING.

THE other day I had some experience in hiving swarms that had clustered together, the narration of which may be helpful to some readers. The present season in Scotland has been rather productive of such mishaps, owing mainly to the rarity of suitable swarming weather and the suddenness of its arrival when it comes. The case I refer to was that of a neighbour, no less than five of whose large supered bar-frame hives had swarmed one after the other, all the swarms settling together in the next garden on an espalier Apple tree. I calculated the united cluster at 30 lbs. weight at least. The owner had been three hours at work endeavouring to hive the bees before I appeared on the scene, but as fast as he removed one of the three skeps propped over the cluster the bees left it and returned to the tree. To have attempted to get such a mass of bees into one hive might have been good policy so far as reaping a large harvest from one hive was concerned, but when this involved the loss of four fertile queens it was not to be thought of. My first determination, therefore, was to secure the queens. As one of the three skeps was quite full of bees, which also hung in a compact cluster a foot below its mouth, it was first set aside across two sticks resting on an empty box. Evidently this portion contained at least one queen, as the bees remained content after being separated from the clustering mass on the tree. By

boring into the cluster on the tree with a stick, and injecting a little smoke, I generally find the queens rush to the surface. In this way I secured one queen, which was caged, and the cage thrust through the crown hole of the emptier of the remaining two skeps. A second queen was found dead under the cluster. There remained two to be accounted for, neither of which could be seen. By way of a test a second skepful of bees was removed and placed on the ground a few yards off. Watching it for a few minutes it became evident by the increasing commotion that no queen was in it. I therefore at once pulled the cage out of the third skep and inserted it in the removed one. In a moment the hum of contentment showed all right there. In due time the third skep was similarly removed, and, as it remained quiet, gave proof of having a queen. As there still remained a small cluster contentedly on the tree it was hived in a fourth skep, and proved also to have a queen. As this was a small cluster the queen was taken away, re-introduced to one of the parent hives, and the bees joined to those of another skep.

Had any of the queens remained unaccounted for I should have made a search further while running the bees into their new bar-frame hive; as it was, it was at first thought that six hives had swarmed, and that one queen was still to be sought for. The first and largest portion of the bees was therefore run up a sloping sheet into a sixteen-frame hive, a queen secured and temporarily caged in the hive then being filled. As no other was found she was released, and it was discovered that there had been only the five swarms.

The disposal of such enormous masses of bees is often a question with bee-keepers. A year or two ago a gentleman just arrived from East Lothian said that when he was leaving there a man was attempting to hive the united swarm from sixteen hives into a washing tub. A neighbour of mine, for want of another plan, hived three top swarms into one hive and lost two of the queens. This was about a week ago, but already the bees have filled a large hive, and are doing splendid work in two tiers of supers. It may during a glut of honey, and when comb foundation and supers are available, be the best policy to hive large masses together, but it is bad policy to allow even a laying queen to be sacrificed in doing so.

I have a stock formed of three swarms that went together just a week ago. I saved two of the queens by picking them off the cluster while on the tree. This stock has already as much super honey as any old stock in my apiary. In another case, two days ago, a first swarm was being run into a bar-frame hive when another came off and settled on the same hive. As I failed to see a queen I waited for an hour or two, when by gently pushing the bars aside I easily discovered a queen by the ball of excited bees that hug her in such a case. The ball was lifted out with a spoon, the bees dispersed, and the queen restored to the hive from which she had swarmed. Duplicate queens can thus easily be removed a few hours after the swarm is hived. In skeps the balls are usually to be found on the floorboard.

In the case of the united swarm last mentioned a rather rare circumstance transpired. After the queen referred to had been removed the bees continued very excited, which led me to think they had balled the other queen. This I found to be the case. She also was caged, but left in the hive. Still the excitement continued all night, and next morning when I went to liberate the queen I found the cage surrounded by an excited mass of bees. Still I thought it safe to liberate the prisoner. At once she was again balled. Such a case could only be accounted for by supposing that in some mysterious way a third queen had entered the hive, so I at once removed the balled queen. In a few moments the excitement died away, the bees set to work with a will, and in twenty-four hours had all their combs built out and mostly furnished with honey, besides starting in a case of sections. The intruder, of which I only had one hasty glance, turns out to be the late head of a nucleus that stands 10 yards off. She had been out on her wedding trip while the swarm was in the air, and joining it entered the hive, where she seemed to be preferred to the pair of old queens. A few hours more and I should have been minus two fertile queens, which means just now a prospective loss of five thousand bees a day for at least a week.

It may not be possible to return each queen captured to her own hive. In the above case I knew the queens by sight—one little advantage of keeping various races and crosses in an apiary. Had I not been sure where each belonged to I should have introduced them with all the precautions taken with strange queens, cutting out royal cells, &c. As it was, I simply let them run in at the door.

After-swarms very frequently contain several virgin queens, which may be easily captured and made use of in a similar way to the above if they are considered worth the while, but in bar-

frame management after-swarms are not generally allowed, and are easily prevented.—WILLIAM RAITT, *Blairgowrie*.

#### TRADE CATALOGUES RECEIVED.

James Walters, Mount Radford, Exeter.—*Catalogue of Roses*.  
L. Spath, Kopnickstrasse, 154, Berlin.—*Price List of Bulbous Plants*.

**Lygodium scandens** (*R. G.*).—If the specimen is sufficiently large and in good condition it will be suitable for exhibiting either in a collection of Ferns, or a collection of miscellaneous plants from which Ferns are not excluded.

**Liquid Manure** (*Idem*).—If the liquid in the tank is not too strong it will benefit all kinds of softwooded plants and fruit trees in pots that require more nourishment than the soil affords. It must not be given to hardwooded plants, nor do we advise its use for Ferns without knowing its nature more precisely and the condition of the plants. For all kinds of plants in pots liquid manure is best given in a comparatively weak state, with alternate applications of pure water.

**Hot-water Pipes** (*A Lover of Grapes*).—We are quite unable to explain the differences in the prices to which you direct our attention, neither do we quite understand the advertisement. You had better write to the firm for further particulars and specific information on the subject. If you obtain a written warranty that an article is sound and of good quality you will, we presume, purchase at the lowest quotation.

**Preserving Walnuts** (*T. G.*).—As you have no cellars at your command we should place the nuts in large earthenware pipkins, or failing these in large flower pots, and bury them in a cool position in the garden. We have kept nuts successfully by this simple method. In some of the pots we have mixed sand with the nuts, others sawdust, and in other pots the nuts have been placed without either sand or sawdust, and there was little or no difference in the results. Walnuts may be kept for a considerable time in an ordinary shed if they are placed in pots with moderately moist sawdust, but not that from Fir trees, which contains turpentine.

**Fuchsia Flowers Spotted** (*C. D.*).—Owing to the blooms having been placed loosely in a box they had been so dashed in transit, and also withered, that they arrived shapeless and shrivelled. The material of which your floor is formed is not the cause of the flowers spotting. A damp floor during such hot weather as we have recently experienced is not injurious, but the contrary, to Fuchsias, provided the ventilation is properly managed. You either keep your house too close, or air is not admitted sufficiently early in the morning. Leave the top lights open to an extent of 6 inches all night, increasing the ventilation the moment the sun shines on the house in the morning, the front ventilators also being opened before 8 A.M. during hot weather.

**Campanulate Foxgloves** (*Mrs. Davidson*).—Such flowers as you have sent are frequently met with in gardens, but we are not aware that the peculiarity has been "fixed"—i. e., that all the plants raised from seed from the abnormal flowers produce similar flowers. We have seen plants having flowers like those you have sent in a garden this year, that last year produced ordinary flowers. Save seed only from the large flowers, and we shall be glad to know if the plants that you raise inherit the character of the parents. The stems are fasciated, but the cause of the fasciation is not known. The reason you suggest for the character of the flowers is not tenable.

**Packing Flowers** (*J. T. S.*).—Plants sent to be named should be packed in boxes sufficiently strong that they are not crushed in transit. The ends of the stems should be wrapped with damp moss, and the flowers packed in green leaves such as Spinach or Rhubarb. They then arrive in a fresh state. If sprays are simply enclosed in envelopes the flowers are generally so much crushed that it is either impossible to determine the names, or much time is lost in endeavouring to do so. When sprays are packed in dry wadding it usually extracts the moisture from them and the flowers arrive in a withered state. Of the sprays sent in your envelope the white flower is crushed almost beyond identification, but we think it is *Ranunculus aconitifolius flore-pleno*; the yellow flower is *Lysimachia thyriflora*, and the other *Astrantia major*. Each flower sent to be named should have a number attached which is visible without untying the ligature that binds it to the stem. Tin boxes are the best of all for packing flowers in.

**Making a Lawn** (*J. S. J.*).—The best time for digging up a lawn and sowing grass seeds is probably during fine weather in April; but it may be done at any time before September if the ground is moist and the weather genial. For digging up an old lawn and cleansing it from weeds, which is very important, dry weather is favourable; but it would be little use sowing the seed when the ground is hot and dry as dust, neither would a shower that moistened the surface only, leaving the ground dry below, render the plot suitable for sowing. We never submit estimates of cost, nor can we name the best mixture of Grasses for your purpose without knowing the nature of the soil. The most economical plan you can adopt is to state the size of your ground and the nature of the soil to an experienced lawn seedsman, and you will be supplied with the proper mixture and quantity with the cost thereof. If you order your own mixture the cost will be greater, while the results will not be better. Lawn seed cannot well be sown too thickly, thin sowing being false economy. Reliable seedsman advertise in our columns.

**Naming Coleuses** (*Stoke-on-Trent*).—As we have many times stated, we do not undertake to name varieties of plants, but only species, and as the leaves you have sent represent varieties we cannot name them. Coleuses are now so numerous, and many of the varieties so closely resemble each other, that it is not possible to determine the names from leaves without comparing them with the plants in a large named collection. If you send leaves to the florist from whom you purchased the plants he will name them for you; or a

nurserymen with whom you have a trade connection would doubtless oblige you if he be able to do so.

**Winter Cucumbers (A. B. W.).**—You cannot, we think, grow a better variety than the Telegraph for affording such fruits as you require during the winter. During the last week of the present month is a good time for sowing seed or striking cuttings. You must not, however, strike cuttings from your present plants, as we fear from what you say that they are affected with the disease. If this is so you must adopt promptly the remedial and preventive measure recommended to "H. H." in this column, or the chance of your succeeding with winter Cucumbers will be extremely remote.

**Bouvardias for Market (Idem).**—Some of the best are B. jasminiflora, B. Humboldtii corymbiflora, B. Vreelandi, and the scarlet variety B. Hogarthi. You do not ask for any cultural notes, so we presume you are conversant with the usual practice that is pursued by growers of these plants.

**Cucumbers Spotted (H. H.).**—We do not attribute the condition of your plants to any error in cultivation. They have been attacked by a disease that is most difficult if not impossible to cure. We recently saw a large house of plants in charge of a most skilful and generally highly successful grower of Cucumbers. His plants were stricken the same as yours, and the disease spread in spite of every remedial measure that he applied. We should destroy the plants, clear out every particle of soil, thoroughly cleanse every portion of the structure, walls, floor, and woodwork, and disinfect the house with sulphur. By doing this, and obtaining soil from a fresh source, you may perhaps succeed with the next crop; but unless you adopt energetic measures for stamping out the disease it will cause you trouble and loss for years.

**Pugs (A. B.).**—Questions such as you have submitted are beyond our province, and we cannot undertake to answer them, neither is the subject suitable for discussing in our columns.

**Choice Carnations and Picotees (G. T.).**—It is not possible to name any one variety in each class that can be relied on as the "best" during all seasons and in different situations. The following, however, are good. *Carnations*: Scarlet Bizarres—Admiral Curzon and Dreadnought are so much alike as sometimes to be undistinguishable. Crimson Bizarres—Rifleman is fine, but in some places comes defective; then substitute J. D. Hextall. Pink and Purple Bizarres—Sarah Payne, William Murray, and Unexpected. Purple Flakes—Dr. Foster, James Douglas, and Squire Meynell. Scarlet Flakes—Clipper and Sportsman. Rose Flakes—John Keet and Sybil. *Picotees*: Heavy Red—John Smith. Light Red—Thomas William. Medium Red—Lucy. Heavy Purple—Zerlina. Light Purple—Mary or Ann Lord. Medium Purple—Alice. Heavy Rose—Lady Louisa or Miss Horner. Light Rose—Mrs. Allcroft. Medium Rose—Miss Wood.

**Carrots Grubbed (A. A. E.).**—Grubs are quite a plague this season both with Carrots and Onions, the latter in many places being entirely destroyed. The destruction of the Carrots is caused by the larvæ of the Carrot fly (*Psila rosæ*), which bores into the roots, and ultimately causes the death of the plants. We do not know anything that you can apply or do to save the remainder of the crop beyond pulling up the plants attacked. A dressing of gas lime at the rate of a peck per rod (30½ square yards), scattered over the ground and pointed in before sowing, is a good preventive; also quicklime at the rate of a bushel per rod; but a dressing with sand saturated with spirits of tar (creosote) spread evenly over the ground before sowing and lightly forked in is the best remedy we have tried. A gallon of the creosote will saturate sufficient sand to apply to 2½ rods, or 75 square yards.

**Concrete Walk (W. C. B.).**—A layer of stones, brickbats, or clinkers should be put in to form a dry bottom, 6 inches being sufficient. Then a layer of rather coarse gravel in the proportion of one part lime to five of the gravel, formed into a mortar-like consistency with water, put on 3 inches thick, rising about 2 inches from the sides to the centre. Roll firm, and then put on about half an inch thickness of best fine gravel and roll again until quite solid. This forms a durable pathway, but not equal to those formed by employing Portland cement in place of the lime. A foundation is formed for the walk, and to the ordinary gravel employed for walks is added a fifth of cement, bringing it to the consistency of mortar with water, placed 3 inches thick, and made even in the surface. It sets like rock, and wears capitally.

**Fuchsias and Pelargoniums Withered (W. S., Dalton-in-Furness).**—It is impossible for us to answer your question without better specimens to enable us to find the cause of the evil of which you complain. Those you sent enclosed in a letter were crushed into a shapeless mass. If you will send us sprays or cuttings from the plants—foliage, as well as flowers—packed in a small box so as to arrive in the condition in which you send them, they shall be carefully examined. You had better also repeat the purport of your present letter when you send fresh specimens.

**Names of Plants (G. O. S.).**—*Clematis Vitalba*. (M. J.).—1, *Francoa appendiculata alba*; 2, an uncommonly fine specimen of *Rondletia speciosa major*; 3, *Meyenia erecta*; 4, *Spiræa vacciniifolia*; 5, *Retinospora plumosa aurea*; 6, *Geranium pratense*. (A *Young Gardener*).—1, *Spiræa Ulmaria*; 2, *Reseda alba*; 3, *Centaurea Scabiosa*; 4, much withered, but resembles *Helianthemum canum*. (G. L.).—A very imperfect specimen, but probably *Vicia tetrasperma*. (W.).—*Anthericum Liliago*.

**Choosing Skeps for Keeping (R. H., Bucks).**—Since you determine to retain but two of the four hives we should recommend you to take the honey of the old skep and that of the first swarm. Our reasons are as follows:—The old skep breeds immense numbers of drones, pointing either to some defect in its queen or to an excessive quantity of drone cells. Then the first swarm has the old queen formerly in the aforesaid skep. Arranging thus you retain two casts, the queens of which are necessarily young and which have probably filled their respective hives with worker comb only. Your plan will be by slow removals to get your hives standing in pairs, each containing one condemned hive. At the close of the honey season drive the bees from the condemned and add to the companion hives; appropriate the honey, and save if possible all the brood. This you will best do by putting two or three skewers through a snug straw cap, and threading the pieces of brood comb upon those, keeping the correct distance apart. The straw cap will now be put over the weaker lot, and removed when all the grubs have hatched out. The little lot of bees remaining in the cap can be got rid of by placing the edge of the inverted cap against the alighting board and patting as in driving.

COVENT GARDEN MARKET.—JULY 20.

STRAWBERRIES are now practically over, and bush fruit is arriving in large quantities; the supply of Grapes continues abundant.

POULTRY AND PIGEON CHRONICLE.

THE DISEASES OF SHEEP AND LAMBS.

(Continued from page 46.)

IN the treatment of contagious diseases carbolic acid has been used for some years on account of its antiseptic properties, and also as a valuable preventive of zymotic affections. We, however, anticipate that salicylic acid will entirely supersede the use of carbolic acid, for although the former has only lately been recommended, its speedy action in all cases where fever prevails gives it an advantage over any other remedy yet discovered.

We must now call attention to the disorder called "husk or hoose," for in some seasons we have known many lambs and hoggets lost from this complaint, it being caused by an accumulation of filaria in the bronchial tubes, which are a kind of thread-like worm, and from the deposit of the ova of these creatures they are found in countless numbers in the air cells and minute bronchial tubes, especially on the edges of the lungs. The appearance of these after death has been examined by the use of the microscope. Many lambs have also been lost occasionally from a worm of the filariæ tribe being located in the third stomach of the animals. Up to the present time we have but little evidence to produce as to the cause of these parasites, but the treatment has been very successful for destroying them by moderate doses of turpentine, lime water, and oil. We, however, strongly incline to the idea that the use of salicylic acid would be likely to be of service, and recommend a trial of it, for it is more than probable that some inflammatory or feverish action prevailing in the parts has been the cause of the filariæ locating in the lungs as described; at any rate, it is worth a trial in the event of an attack of these worms.

We have now to mention the serious affection to which the best and fattest wether lambs and ram lambs are subject—the stoppage of urine, attended with acute inflammation of the bladder. This disease was seldom noticed until the free use was made of the Mangold roots in feeding our stock. We have found that it arises from the deposit of sugar in hard globules, and these become fixed at the mouth of the bladder or the narrow pass of the

urethra. In fact, we could come to no other conclusion when we found that the ewe lambs never suffered from this cause, consequent no doubt upon the wider urinal passage in their formation. Our fattening lambs have suffered most extensively from this cause, and the fattest animals are always most liable to be attacked. Unfortunately, too, we have never found any remedy, nor is the flesh of the animals any use to the butcher, as the meat is found in a diseased and offensive state. Very fat wether sheep also suffer from the same cause, but not the ewes, therefore the only preventive is not feeding with Mangolds after the animals are about half fat.

Diseases arising from blood-poisoning may be now referred to, and we cannot do better than quote from a lecture lately delivered at the Kingscote Agricultural Association in Gloucestershire by Professor McBride of the Royal Agricultural College on "The Prevention of Diseases in Cattle and Sheep." He says, in speaking of splenic apoplexy, "This is a true form of anthrax fever, which is due to the presence of an organism in the blood which is particulate and definite in its structure. Splenic apoplexy may be prevented in the same way that quarter evil may—by the use of sulphur fumigations, and by the use of salicylic acid. Salicylic acid is, in fact, a wonderful preventive in all blood diseases; take for instance splenic apoplexy, black quarter, pleuro-pneumonia, foot-and-mouth disease, small pox in sheep—in fact, all our contagious and infectious diseases. If you will use sulphur fumigations and salicylic acid I will stake my reputation that you will prevent them." We must accept this statement as of the highest importance, and will therefore give Dr. McBride's statement of how to use the said remedies. He says, "In sheep practice, however, in which drenching is a serious matter, sulphur fumigation is extremely useful. Place some live coals in the house, sprinkle sulphur over them, and let the sheep inhale the gas given off. If you ask me what strength should be the fumigation, I would say the better plan is to let the man stay in the house with the sheep, and if the fumes are too strong for the man they are probably too strong for the animals."

This plan of fumigation is very well as a theory, and may be done by a veterinary, but in some blood diseases the sheep are only attacked a few at a time, and practically in a large flock it is quite beyond our everyday practice to carry it out. It must be considered that when the flock is attacked with pleuro-pneumonia, foot-and-mouth disease, small pox, sheep scab, or, in fact, by any contagious disease, if it is general and applies to a majority of the animals, the treatment as here recommended may be resorted to for the whole flock under veterinary instructions and careful treatment by the home farmer. If, however, only a small number should be suffering salicylic acid alone will probably be sufficient, not only to cure, but to prevent the extension of disease if given internally and applied externally. Fumigation must not be carried on to excess by continuing it, especially for pregnant ewes, as they may break out with a serious scour, or they may commence lambing prematurely and bring dead lambs. These observations lead us to a point when we must anticipate the lambing time, and be prepared for every emergency and all the accidents attendant upon parturition, such as inflammation of the udder, injuries to the womb, and internal fever. Now we have the salicylic remedy the home farmer may (if he has kept his ewes generously and also judiciously during the period of gestation) look forward to the time of lambing and all the attendant results without fear of serious losses, which many farmers have suffered in times past. We have in bygone days suffered loss from serious attacks of inflammation in the udder of our ewes; we treated them by freely bleeding from the neck vein, and used the sugar of lead ointment, except when mortification threatened, we then applied verdigris ointment most successfully. Now with a salicylic drink internally, and a lotion of the same applied to the parts affected, we may by timely attention avoid the necessity of bleeding. This must be considered an improved practice, because the animal would not be reduced in condition, but the fever and inflammation would be speedily reduced, and most probably without diminishing the supply of milk, except for a short time. Formerly in all the most serious cases we never expected the animal to give milk again, and we were glad to save its life as the result of our remedies.

Our further remarks will refer chiefly to the lambs from birth until they are about a month or six weeks old. The two most formidable complaints to which they are subject is the "white scour" and swollen joints, called rheumatism or joint fellow. Our new remedy will again serve us in good stead in both these cases if ordinary good management is adopted by the home farmer and his shepherd. The white scour is generally caused by the ewe's milk being in an unhealthy state, arising from either internal fever or blood-poisoning, both of which will be neutralised

by the drink of salicylic mixture. The careful management to which we have alluded consists in one respect of noticing daily if the ewes have too much or too little milk for the lamb in its infancy, and this cannot be properly attended to but by the actual cooping of the animals, and examination of the udder of any ewes the lambs of which may be doing badly or suffering under the scour. The best treatment for the lamb in its infancy would be a few drops of laudanum, called tincture of opium, in a little warm water; we have usually found this to be effectual if the dose is repeated every four hours until the disorder ceases. But we make no doubt that scour in lambs, at any period after they are a month old, may be treated as successfully with the salicylic remedy as sheep of any other age. Scour or diarrhoea affecting them arises from internal derangement, of which feverish symptoms are the basis. With regard to the rheumatic or swollen joints from which the lambs suffer, that also arises from either too much milk or too little; for if the milk is allowed to accumulate in the ewe's udder it becomes distasteful, and the lamb refuses it altogether, and is then subject to taking cold in the joints through partial starvation, just in the same way as when the ewe has an insufficiency of milk to sustain the lamb in health and condition. We have on certain occasions attempted to save lambs thus affected, but they do not pay for saving, and we have therefore preferred to destroy them; still we believe that the salicylic drink may be given both to ewe and lamb at the early stage with advantage, and we advise the trial of it.

#### WORK ON THE HOME FARM.

*Horse Labour.*—In the late districts some horses will still be engaged in drawing the mowing machine and in carting the hay to stack. Some Turnips after green crops will have to be sown, also after Rye, winter Barley, or early Peas; for after the crop is cut it may be set up on one-third or fourth of the land, and the intervals sown with Turnips and manure drilled with the seed whilst the land is moist, soft, and workable. If left only for a day or two the soil soon becomes hard and dry at this time of year, the crop being lost not only for want of moisture but because it cannot be worked fine—so essential to the successful growth of root crops. We note on all the light soils that the Poppy makes a great show in the corn, and on light land it is about the most difficult weed we have to contend with. At the time when Charlock and such weeds can be pulled with the weeding machine the Poppies are small and cannot be touched in using the machine, nor can they be kept down, except in the corn crops, without the corn is drilled at 10 or 12 inches and the land horse or hand-hoed, or both. The injury and damage done by the Poppies is that they compete with the corn, and if left to seed require nitrogen for perfecting their seed heads like corn. In carting much of the late pasture hay to stack it should be remembered that in case it is gathered dry and well made there is but little nutriment in it. Although the Sweet-scented Vernal Grass gives it a pleasant aroma, it will pay for spicing at the time of stacking better than by using the spice at the time of feeding the animals. It may then be used as long hay if spiced in the rick, but otherwise it is used in admixture with chaff, and consequently with more waste.

*Hand Labour.*—Hoeing the root crops will now form the chief labour both for men and women, and the earlier this is done the better—as soon as the plants are strong enough for the horse-hoe to pass between the lines without burying them. With regard to the second hoeing, the sooner it follows the first the better, because the weeds are so much more easily destroyed whilst young. It often happens that in delaying the second hoeing the harvest is ready before the hoeing is quite completed. It should therefore be foreseen as much as possible, so as to finish the hoeing of root crops before the harvest begins, as it always costs more to hoe the root crops during harvest, besides which it is often difficult to get hoers at any price. This is now the time of year when the mode of cropping and the rotation adopted is seen to the best advantage; and as we have from time to time stated the rotation we recommended for different soils we will now state the rotation of crops grown on a farm we had in hand some years ago, the soil being a sandy loam, the subsoil varying in strength from rather strong clay to a mild brick earth. The farm consisted of 100 acres of arable and 25 acres of pasture land. We grew 40 acres of Wheat, 26 acres of Oats, 15 acres of Potatoes, 8 acres of Mangold, 2 acres of Carrots, 2 acres of Cabbage, and 7 acres of Clover. Our root crops were added to largely by sowing Turnips after the White Canadian Oats, this crop being always fit to reap before the Wheat; and in an early district we were enabled to sow a long lain of Turnips, drilling them daily as fast as the crops were cut, and completed before the corn was carried to the stack. It will be observed that the 100 acres of land, cultivated according to the before-named rotation of crops, whilst it affords 81 acres of saleable produce it gives a considerable acreage of root-produce of more or less value for the feeding of stock during the year, our object being to grow the greatest amount of saleable produce, and to maintain the largest number of valuable stock during the winter months. The men should be employed in all sorts of work which will anticipate the requirements of harvest, in order that comparatively unimportant work may not interfere with the busy harvest period.

**Live Stock.**—A good supply of water is of the utmost consequence for all kinds of stock, and in the absence of rivers or brooks, ponds must of course be made and kept in condition to hold water. We call the attention of farmers occupying the hill districts to our description of making ponds, with illustrations, given in these columns on May 2nd, 1878, page 346. To dairy cows access to water is extremely important, perhaps more than any other stock; nevertheless, sheep require water in the hill districts, especially where they are not receiving succulent food, such as Vetches or Rape, and only feeding on old leas or down pastures. We must again call attention to the summer management of sheep, for we have recently seen a flock of 150 or more all huddled together under a tree at the side of a canal bank, and where they were allowed to remain for six or seven hours, and of course leaving both the dung and urine where it could do no good. This brings to our mind the plan we have previously named in these columns—our practice of folding the sheep during the day from ten o'clock until four in the afternoon upon the arable land, giving them a fold of green fodder early in the morning, and allowing them to graze on the Saintfoin or Clover leas or pastures and parklands during the night. Where some such plan is not adopted a serious loss of manure must be the result. It should be borne in mind that one of the principal objects of feeding sheep ought to be considered—that of manuring the land, especially of the outlying and hill districts. We address these observations also to the home farmer having parklands under his care, because where there are spreading trees the sheep are sure to resort to them for shade, and under such circumstances the manure must be totally lost.

VARIETIES.

**COMMENCEMENT OF HARVEST.**—Winter Oats are being cut on a farm at Datchet, and with a continuance of the present splendid weather harvest operations will soon become pretty general in the home counties of Middlesex, Berks, Bucks, and Surrey. All the cereals are looking well, but the root crops greatly require rain. A Sussex correspondent informs us that the corn is ripening rapidly, and that the cutting will commence in many places this week; and next week, if the present fine weather continues, the harvest will be general. The corn is generally short in the straw, but the yield is expected to be better than that of last year.

**— GROUSE IN THE HIGHLANDS.**—Grouse prospects in the West Highlands are reported as favourable. Coveys are numerous and healthy, though young; birds as a rule fully a month behind last year. The weather during the past week has been wet and drenching, but the birds have had capital shelter. Most of the moors in the west are already let.

**— GRASS CULTIVATION.**—The Prince of Wales had his special attention directed by Lord Leicester to the production of grass in growth exhibited by James Carter & Co. at Derby. Messrs. Carter explained to His Royal Highness that the grass was sown on June 2nd, mown for the first time June 20th, and since mown six times in a period of about three weeks. This is admitted to be a most marvellous result, and His Royal Highness expressed his approbation of the exhibit.—(*The Daily Chronicle*.)

**— THE DERBY AGRICULTURAL SHOW.**—We are requested to state that the winners of the prizes recently awarded by the Royal Agricultural Society at their Derby Meeting for the best farms, used seeds supplied by Messrs. Webb & Sons, Wordsley, Stourbridge. For Dairy Farms above 150 acres.—First prize, 100 guineas, Mr. Geo. Bryer, Markeaton Park, Derby; 2nd prize, 50 guineas, Mr. Jno. Hellaby, Twyford; 3rd prize, 25 guineas, Mr. Arthur Stretton, Whichnor Bridge, Lichfield. For Dairy Farms not exceeding 150 acres.—First prize, 50 guineas, Mr. Alfred Milner, Alfreton. For the Best Arable and Mixed Farm.—First prize, 50 guineas, Mr. F. Price, Baynes Heath, Atherstone.

**— THE ROYAL SHOW AT DERBY.**—This has proved a great success so far as regards the weather and the number of visitors, the former having been magnificent and the latter very numerous—considerably exceeding one hundred thousand. The stock department of the Show was by no means equal to the previous great displays of the Society. There was a considerable falling-off in the number of horses; cattle were also represented in diminished numbers. Sheep were generally good, some of the classes being admirably filled, and pigs were seen in as fine condition as at any previous gathering. The display of implements was of great magnitude, the articles surpassing both in numbers and quality those exhibited at any past meetings of the Society.

**— BRITISH BEE-KEEPERS' ASSOCIATION.**—The following is the programme of arrangements for the South Kensington Show:—Tuesday, July 26th: Judging commences at 10.30 A.M., Show opens at 1 P.M.; 2 P.M., commencement of driving competition in the bee tent; 3 P.M., quarterly meeting of the Committee for the purpose of conferring with representatives of county associations; 5 P.M., Mr. Frank R. Cheshire has kindly promised to deliver a lecture—subject, "Bees as Florists, Hybridisers, and Fruit-producers," illustrated by new and original diagrams. Wednesday, July 27th: Show opens at 10 A.M.; displays of manipulations, accompanied by short lectures, given at intervals throughout the afternoon in the bee tent; 5 P.M., general meeting of the members of the Association, the Baroness Burdett-Coutts, President of the Association, in the chair. Thursday, July 28th: Show opens at 10 A.M.; displays and lectures in the bee tent throughout the afternoon; 5 P.M., distribution of prizes by Her Royal Highness the Princess Christian. All the above meetings will take place in the Committee-room adjoining the Show. Friday and Saturday, July 29th and 30th: Show opens at 10 A.M.; no displays or lectures will be given in the bee tent on these days. Monday, August 1st: Show opens at 10 A.M.; displays and lectures in the bee tent throughout the afternoon, admission 3d. Members attending the Show will be required to bring their tickets of membership, which have been forwarded to all those who have paid their subscriptions for the current year, otherwise they will have to pay for admission to the Gardens.

POULTRY NOTES.

ON looking through M. Lemoine's interesting work on the poultry yard we came upon a passage which seems specially appropriate to the present season. Having observed that birds which plucked out and eat their own or other birds' feathers ceased to do so upon having an abundant supply of feathers thrown down in their yard, M. Lemoine had some feathers analysed, and found them to be composed of the following materials:—

Carbon	.. .. .	52.42
Hydrogen	.. .. .	7.21
Azote	.. .. .	17.89
Oxygen and Sulphur	.. .. .	22.48
		100.00

M. Lemoine hence concluded that feather-eating was simply the result of an insufficient supply of sulphur, and he recommends that during moult a liberal allowance of flowers of sulphur be given to the birds. Some of our readers have, we know, found a few doses of flowers of sulphur an efficacious remedy for feather-eating, but M. Lemoine's experience goes to show that sulphur will in all cases facilitate moult. This seems well worth a trial.

A CORRESPONDENT of a contemporary, writing over the signature "S. H.," gives a somewhat amusing account of a variety of fowls "made" by himself with a view to checkmate the poultry thieves of the northern suburbs. Upon moving to a new house, called Hermitage, somewhere near Seven Sisters Road, he found the thieves too much for any ordinary breed of poultry. It thus "became suddenly necessary to secure a race of non-thievable poultry," and the result of some time and thought was a breed which, in "S. H.'s" own words, "may be described roughly and with a touch of the longbow as follows:—They lay all the year round, are perfectly restricted in range by a 2-foot fence, are good scratchers, good sitters, good mothers, and as hardy as any race known; they are perfectly silent, utterly invisible, and never use their wings." He called his fowls "Hermits," and professes to have spent three years in making the new breed, and three more in fining it down to a standard. "S. H." does not say whether any of the breed are still in existence, and unless it may be inferred that Dark Dorkings and Cochins had something to do with its origin, we are not enlightened as to the process of manufacture. If the whole story is anything more than a shot from the longbow, "S. H." would confer a benefit upon metropolitan poultry-keepers by informing them how the Hermits were made, and also as to their present existence or non-existence.

IN this dreadfully hot weather special care must be given to

cleanliness, ventilation, and the supply of clean fresh water to the birds. Do not leave the drinking vessels exposed to the sun, but put them in some shaded part of the run, or improvise a shade for them if necessary. If there be not sufficient natural shade for the birds this should also be furnished by thatching a few hurdles with straw or other like material, and raising them a couple of feet on short posts driven into the ground. Use carbolic fluid or some other disinfectant liberally, and see that the dust bath is kept well supplied. Paraffin or petroleum rubbed into any crevices where the insect pests collect will put them to flight or exterminate them, and a good coat of white-wash will also be of advantage.

It is now time that the chickens be thoroughly weeded out. Even the later ones ought to be old enough to show their quality, and, apart from the question of space and overcrowding, which is of primary importance, it is false economy to keep over chickens which are not of high quality. The days are gone by when birds fetched high prices simply because they were pure bred. Fancy poultry are so widely spread through the country that it is only really good specimens which will command good prices; it is better, therefore, to kill off and send to the market or consume at home all the second-rate chickens. The only exceptions to this rule are the breeds which have a special reputation for laying qualities. Defective specimens of these can generally find a market at something over killing value, and an attempt to dispose of them by advertisement will usually prove successful.

#### FANCIERS v. FARMERS.

WHEN I wrote in answer to the article on page 23 I could not go so fully as I could have wished into the matter, I therefore renew the subject. The writer of the notes referred to says "the fancier, as a fancier, has nothing to do with the food supply." Indirectly he has. If the writer knows anything about the reason why the poultry shows were instituted he will well know that the reason assigned was for the benefit of our food supply, and the press loudly proclaimed with such inducements as the shows held forth that we soon should have much finer poultry and almost eggs to spare. Then, again, who are the fanciers? Surely not those who buy up a few well-bred birds, show them and get prizes as long as those birds last, and advertise birds and eggs from such and such a prize strain. A fancier is one who keeps anything from the pure love of it, looking to and keeping and purifying its most minute points of stated excellence and beauty. Take the Auricula, the Picotee, the Polyanthus, the Tulip, and other fanciers. Would they, any one of them, sell or part with their pet flowers? No: instead of this they will sit and gaze at them with a loving tenderness by the hour, and when they sleep dream of their loveliness, or pass sleepless nights longing for the morning to again behold them. Does anyone know such an enthusiast in poultry? If so, then dub him a fancier; but not the little dealer who would fain, as he moves in a respectable circle, be considered one, nor the man who kills the birds he ought to love by sending them from show to show until they die from sheer exhaustion through his greed for gain.

"Fanciers *versus* farmers" in poultry. How oddly it reads to one who has been among poultry all his life! *Versus* farmers! Where did the so-called fancier, the self-dubbed fancier, get his fowls from when the poultry mania arose? Why, he trotted off far and wide to the farmer for his Dorkings, also for his Hamburgs, his Game fowls, and others; and from them he started himself in business, and by the help of the press he, to the farmer's astonishment, laid down the laws for the good, bad, and indifferent of poultry breeding. Who brought the Buff Cochin into notice? Mr. Stringer, a farmer. The Partridge Cochin? Mr. Punchard, a farmer; and has there been any better shown than these two farmers exhibited? Again, Mrs. Herbert for White Cochins—a farmer's wife. Everyone knows the splendid Game fowls that were to be seen in farmyards and runs. "Yes!" will say the so-called fancier; "so far we are one. You had the Polish, the Malay, Spanish, &c. But have we not introduced the French varieties?" True, this may be: but did you do it for the love of the thing as a fancier? No! You did it for gain, became little dealers, and you know it. Hark, you farmers at what the fanciers have done for you!—made a big mongrel from your old English Dorking, and ask you 2*s.* a dozen for the eggs.

Why is the fancier so anxious to breed poultry pure that the farmer may have them to cross with his "common fowls?" Looking over some of the cross-bred poultry yards of late, I think I never saw a more dreary sight in the way of poultry—all sorts of form, all sizes, all colours, comb, top-knot, &c. And this is what "the fancier" wants the intelligent farmer to do. For my part I have known, and happily I do still know, a number of farmers,

and I may add intelligent farmers—so intelligent that they are not, in my opinion, likely to buy the eggs of dark-legged mongrels at 2*s.* a dozen, or even at 12*s.*, of their truly disinterested kind friends the fanciers, even if it is to improve their poor white-legged delicate home-grown Dorking. There are many other breeds that the intelligent fancier has taken in hand for exhibition purposes, which, taking them as they were even twenty years ago, he cannot point with pride and say they are better, or even so good. A reporter, and also a good judge of many years standing, mentioned this to me a few days back, and he is not the only one by many who has observed the gravity of the situation. I suppose prices are going down or their little playful ways are found out, as "the fanciers" are now bidding up for the farmers to help and buy.

But the farmers are not so foolish as to spoil their stocks, when they have them, of the old true Dorking; and they know also that you cannot get flesh and eggs from the same fowl no more than you can get flesh and butter from the same cow, however much the wisecrackers of fanciers try to beguile them into a cross for that purpose. Though the old Dorking laid a fair quantity of fine eggs, still as a table fowl it was pre-eminent. The exhibition Dorking is the very worst layer I ever had.

You say, in the way of eggs "During the last few years there has been a tendency to improvement." Which way? More from abroad or from home produce? If I remember rightly, the Government return shows that the import of eggs is still on the increase.

The small farmers are asked to keep good poultry, of course the fancier's poultry. Where would he get the capital to buy it at prices now asked for it? and if he had many he would have to buy grain, &c., and then where is the profit?

Again you say, "Many of the useful qualities of a breed are doubtless sacrificed by the fancier in his efforts to attain perfection in standard points." Surely this is a misprint. Take table poultry, take the egg-producing fowl, how is perfection to be gained if you sacrifice its usefulness? I fail to see how; but no doubt the intelligent fancier knows right well.

"The best results both as regards table and laying qualities which we have heard of have been attained by taking the products of the fancier's labours, undoing the harm and retaining the good which had been accomplished, and then, regardless of fancy points, developing the useful qualities by careful selection and judicious crosses." Read this, ye farmers. What you have to do is merely to buy of the fanciers, and then use your own brains and time to undo what they have done for you. You had a good fowl, the Dorking. They have muddled it. Buy it of them, and undo their work, and restore it to its original fine quality and usefulness. No, stay; this is far better: Try with the stocks you have to make it what it once was, the king of the barndoor.

Why the man who buys a few fowls, who never kept any before, should immediately call himself a fancier and look down on the farmer who has kept poultry all his life, and probably to advantage in every sense—why that man who buys such fowls, and by the exhibition of them obtains prizes, should call himself a fancier and lecture the farmer as if he were an imbecile, is a matter beyond my comprehension, and I am sorry to say that there are others equally as dull as myself.—HARRISON WEIR.

P.S.—In the nineteenth line from the top of the second column, page 23, the word "have" should have been printed "had."—W. H.

#### WINTER AND SPRING FLOWERING PLANTS.

It not unfrequently happens when flowers abound during the summer months, that gardeners and cultivators overlook or neglect to give the requisite attention to those plants that are to maintain the supply of bloom during winter. No doubt the propagating season is a busy and important one, and many then determine to excel the supply of past years in winter. I have known cultivators who have been stimulated early in the season, probably by a visit to a neighbour's garden and seeing the rich display there, to propagate a good supply of winter plants. In spite of these exertions, as the season has advanced the winter plants have been neglected or carelessly grown, and in the end the supply is little or no better than in previous years. To achieve success in the production of abundance of choice flowers during the winter and spring, the end for which the plants are grown must be kept in view. Much intelligence and forethought are requisite from the time the plants are raised from seed or cuttings. To be seasonable perhaps no time is more important than from the present onwards if satisfactory results are anticipated. The propagation of the different kinds should have been effected before this, except in the case of a few which may be rooted now and grown with success.

Poinsettias are useful plants for winter, and the main batches should now be growing sturdily. If properly treated and well hardened they will now do without the aid of artificial heat. If grown in strong heat they invariably become excessively tall and produce only moderate-sized bracts, losing their foliage towards autumn. When grown under cool treatment they advance slowly and strongly, and retain their leaves well if removed to warmer quarters in autumn before being checked with the cold. If the final potting has not been done it should be attended to at once; 5 or 6-inch pots are large enough, and when these are full of roots liquid manure may be liberally supplied. If strong cuttings can still be obtained from the stock plants they should be inserted at once, or not later than the end of the month. They root readily if kept close under handlights or bellglasses in heat. The cuttings can be inserted singly in 4-inch pots.

Euphorbia jacquiniæflora can still be propagated, and if rooted without delay useful plants will be obtained for the front edge of the stove stage. It is advantageous to root four or five cuttings together in each 4-inch pot, as then they produce a better display than if grown singly. They must after being rooted be grown in a light position, plenty of air being

needed to ripen the wood as it is developed, as upon this depends to a large extent how the plants flower afterwards. It must be borne in mind that rapid growth is not the essential in their latter stages; weakly plants cannot produce fine bracts or brilliant flowers. Time and labour are wasted in growing many winter-flowering plants unless constant care is taken to produce well-ripened and solid growth.

Scutellaria Mocciniana I have hitherto found rather difficult to manage to produce a good supply of its fine flowers in winter. If rooted early and grown freely, pinching the shoots, they have generally failed to give me satisfaction. The finest trusses of bloom can be produced by constantly striking cuttings and growing them without check until they flower. A batch or two rooted now and grown rather quickly would prove very useful at a time when such flowers generally are scarce.

Abutilons succeed best in winter if rooted about this time. They should be inserted in 3-inch pots, to be afterwards transferred to 5-inch pots. The plants must be grown for a time in a close warm pit until established. Cultivators not unfrequently make a mistake in winter by placing the plants when in flower in too cool a structure. They thrive in cool conservatories during the summer months, but in winter the case is very different; they soon become checked in a cold house, and discontinue producing their flowers. When growing them to be of service they should not be tall to start with; thus late propagating is recommended, and if sturdy plants are produced by November not more than 9 inches or 1 foot in height they will do well. After that date a suitable temperature must be given them, when growth will continue and flowers be produced in succession for a long time. They will continue growing in a temperature of 50°, and even in the stove they grow more rapidly and produce their flowers more quickly than when placed in an intermediate temperature. It is desirable to have a batch in the stove as well as in a lower temperature, and the succession of flowers is maintained over a greater length of time. They well repay any trouble if solely grown for the stove during winter. The following are useful varieties and flower profusely in a small state—Boule de Neige, white; Marshal, reddish cinnamon; Aurelia, light golden yellow; Desboisi, Letitia, and venosum roseum, rose colour, the flowers of the latter being darkly veined; Darwinii is also useful. Such varieties as Boule d'Or grow too strongly and large before producing flowers in small pots.

Clerodendron fragrans flore-pleno is a useful autumn-flowering plant not generally cultivated. It can be had in flower in succession through the greater part of the summer as well as the autumn. Its flowers, which are white when produced in autumn, are slightly shaded with pink during the summer; they are double, and well adapted for wiring for buttonholes or for bouquets. The flowers are produced in compact heads at the termination of the shoots. When grown in 4-inch pots it is very suitable for small vases. It succeeds best when grown in small pots, and flowers freely if confined at the roots. If allowed plenty of root room it is sure to fail, as the growths are strong and soft and do not produce flowers. If the pots are plunged in tan or leaves the roots quickly enter the plunging material, and very strong growths result with quantities of young shoots from the roots outside the pots. Some time ago I gave a plant to a friend, who planted it out when he returned home. It quickly grew to an immense size, producing leaves nearly as large as Rhubarb

leaves, but no flowers. It was afterwards discarded as useless. To grow it successfully the roots must be confined in small pots, when it flowers freely and is really useful. Cuttings inserted now singly in the size of pot recommended for it, soon root and make useful plants in the autumn. *C. floribundum* is similar in habit of growth, differing only in the colour of its flowers.

Begonias of the *manicata* type, as well as *B. Ingramii*, should now be in cold frames, where they will do well for a time. If not already in their flowering pots they should be placed in them without delay. When removing such plants from frames in autumn care must be taken not to excite fresh growth. I have seen Euphorbias, Poinsettias, and others when removed from cold frames and placed in strong heat again start into rapid growth, afterwards producing only a poor supply of flowers.

*Serieographis Ghiesbreghtiana* is an excellent old but useful plant, producing its sprays of scarlet flowers during the dark days of November and December. This, however, depends much upon the time the plants have their last pinching. The end of August is fully late enough. When in flower this plant is at home either in the stove or in the conservatory. Although a greenhouse plant, it enjoys a little warmth in its early stages as well as in the autumn months. Where Calanthes are grown in quantity no better plant can be found to arrange amongst them. The fine dark foliage not only hides the bareness of the Calanthe pots but shows to advantage their delicate flowers. In addition the bright scarlet sprays contrast admirably with the Calanthes, and give to the whole a beautiful effect. Six-inch pots are suitable, and potting must be done by the end of the month. When grown dwarf this plant is suitable for room and table decoration, and for this purpose at least half a dozen cuttings should be placed in a 5-inch pot and grown together without stopping if rooted about this time. If rooted a little earlier one pinching will be sufficient.

*Thyrseanthus rutilans* keeps much dwarfer and cleaner when grown through the summer under cool treatment. Cuttings may still be rooted and will make valuable little plants.

*Plumbago rosea coccinea* is a useful plant for decoration, but of no service for cutting unless wanted for one night only. It should not be propagated too early. Grow the young plants rapidly until the end of this month, when they should be finally potted, and then be gradually subjected to a ripening process afterwards. Pinching should be discontinued during the month of August, and when carrying out this operation a quantity of the tops should be rooted in small pots and afterwards subjected to the same treatment as the general stock. A number propagated late and grown together in small pots are valuable to stand near the edge of stages in warm plant houses. It is surprising what can be done even with late propagating with a number of suitable plants to render the houses gay and attractive during the winter months.

Zonal Pelargoniums are the most useful and brilliant plants we possess for flowering during the winter and spring months, and when these are grown well not even that most popular of flowers the Chrysanthemum can equal them. When staged side by side the Chrysanthemum is dull in comparison with the Pelargoniums. Many still contend, in spite of all that has been written in their favour of late, that they will not do well in the north. That this is the greatest fallacy that can be conceived is proved by the fact that there are many northern gardens where they succeed grandly. They are, perhaps, more easily grown and more accommodating than any other class of plants grown for winter decoration. All the attention they require after frost is past is being placed in their full-size pots, hardened off and placed outside on ashes all summer until the approach of frost, watering when necessary, stopping the shoots, and removing the flowers and bad leaves as they appear. If it is desirable to increase the stock of any good kinds it can still be carried out. No better system can be adopted than placing a number of cuttings in each pot and allowing them to grow together, as they make good plants quicker than if grown singly when late propagation has to be resorted to.—WM. BARDNEY.

SHRUBS FOR A TOWN.—Can any of your numerous readers give me the name of an evergreen most likely to succeed well as a

hedge in an elevated and moderately exposed situation (facing south) in the outskirts of a rather smoky town? Soil a good sandy loam and well drained, as well as an extra depth. Elevation above sea level 600 feet.—LANCASHIRE.

#### PREPARING FOR WINTER.

(Continued from page 524, last volume.)

##### CARROTS.

THERE are certainly but few people who do not relish young Carrots. That these can be had with but little trouble all the year round is well known to the majority of professional gardeners, but a few hints on the subject may be of service to amateurs. The owners of small gardens ought really to grow small breadths of Carrots, and one variety only—viz., the Nantes Horn. About four sowings to be made during the year, the first on a warm border in January or early in February, the next early in April, the third and the largest sowing either late in June or early in July, and the last about the middle of August. The produce of the two former sowings will be available during the summer and early autumn months, and from the two latter delicious Carrots may be drawn throughout the winter. It is very probable that the present system of growing Carrots will eventually be changed, especially where the spring-sown crops are usually damaged by the maggot or fail to keep well. I know two large gardens where these difficulties have been met by sowing the principal crops in July, thereby securing a supply of roots very superior in every respect. Some of the cleanest and best Carrots exhibited at some of the late autumn metropolitan vegetable shows were July-sown Nantes Horn. Another advantage of this system is, it admits of a crop of early Potatoes being taken off the land prior to sowing Carrots. During most seasons roots large enough for all ordinary purposes may be obtained by sowing seed at the present time in succession to early, and in our case to second early Potatoes. The late extremely hot weather has been very unfavourable to seed-sowing, but it has had the effect of rapidly maturing the Potato crops. These, with the exception of the Scotch Champions and Magnum Bonum, and which I am pleased to state are in the fields, will be cleared off early, and after the first good soaking of rain the ground will at once be planted with vegetables for the winter. Where the ground is somewhat moist when the Potatoes are lifted it is levelled as the process goes on, being cleared of rubbish, trodden, and raked over. The drills are then drawn, and a few hours prior to sowing are soaked with water, this being preferable to watering after the ground is levelled over the seeds. As the Carrots do not make much top growth the drills may be drawn 9 or 10 inches asunder, and the seedlings thinned to about 2 inches apart. The roots should only be pulled as required, otherwise they will shrivel and lose that sweetness for which they are much prized. To be able to draw them at all times, part of the bed may be covered with litter whenever severe frost is anticipated.

##### LETTUCE AND ENDIVE.

The ground having been quite cleared of Potatoes no time should now be lost in sowing the seeds of these invaluable salads. The former from this date will not attain to a great size, but they will form crisp hearts suitable for mixing with the more blanched Endive. Lettuces obtained from seed sown earlier in July are sometimes the best for lifting and storing in frames; but this season, owing to the warmth in the soil, those sown at the end of July or early in August may form hearts before frosts are experienced. The remainder of the seed of the Cos varieties may be sown, and with these seed of All the Year Round and Hardy Hammersmith Cabbage varieties, in rows about 10 inches apart, and thinning out the seedlings to about 8 inches asunder. To secure plants to stand out during the winter (these being for the earliest supply next spring), sow seed on a warm border about the third week in August and again early in September, this precaution being taken in order to be certain of rather small plants which only are really hardy. It is advisable to prick out a few plants where they may be covered with handlights or a frame, as those in the open are liable to be destroyed by birds and slugs. Hicks' Hardy White Cos and the Black-seeded Brown Cos have proved hardy and good; and of Cabbage varieties at present I give the preference to the Hardy Hammersmith, Suttons' Commodore Nutt, and All the Year Round.

When good Lettuce can be had Endive is not so much required, at the same time it much improves the appearance of a salad, and for that reason is grown and sent to the London markets especially as much as possible throughout the year. The principal and most valuable crop, however, is that obtained by sowing at the end of July and early in August. The Moss Curled is very good for the earliest sowing, as it is close-growing and blanches quickly, but is the most tender variety. The rows of these may be disposed

about 10 inches apart, and the seedlings be thinned to the same distance. The Green Curled is a hardier variety suitable to succeed the Moss Curled, and for the latest supplies Improved Round-leaved Batavian is invaluable. These, being stronger-growing, should be disposed about 12 inches apart each way. But little blanching is required in the case of the Moss Curled. A slate or board laid over them, or flower pots inverted over them, will soon effect this. The larger varieties may be tied up with matting in the same way as Lettuces are sometimes tied. Neither variety is really hardy, and for this reason these and all full-grown Lettuces should, before severe frosts are anticipated, be lifted and stored away in cold frames. To facilitate the operation of lifting, lightly tie up the leaves, and this will also admit of the plants being packed closely in the frames. Old Cucumber and Melon frames are suitable for this purpose, and the plants should be lifted with good balls of earth during dry weather, brought off the ground with a handbarrow, and be firmly packed in the moist rich soil. Should the soil in the frame be dry water the plants as the lines are worked in, after which little or none will be required. Keep the plants dry overhead, give air freely night and day whenever possible, and cover the frame with mats or other material during frosty weather. Blanch a few plants of the Endive at a time, which is done by simply tightening the ties. Mice are apt to be very destructive among Endive, and last season after a long severe frost I had the mortification of uncovering a frame containing nothing but heartless specimens. A few of the least injured were rubbed over with phosphorus paste, and this proved fatal to their enemies.

#### LEEKS.

Although I have grown Leeks for a considerable time I never thoroughly appreciated them till last winter. Not only were they the only really hardy vegetable grown here, but the severe frosts appeared to improve their quality. Fifteen hundred Leeks will be grown here, and in all probability none will be wasted. If large Leeks are required they may be grown in trenches in much the same fashion as Celery, as they delight in abundance of manure and moisture. For ordinary purposes they may be at once dibbled in deeply dug and well-manured soil. In one case a long east border is devoted to them. The rows running lengthways of the border are from 15 to 18 inches apart, and with a blunt dibble holes 8 or 9 inches asunder, 6 inches deep, and 3 inches in diameter are made. The plants obtained in the open ground from seed sown in March are dropped into the bottom of the holes, a small quantity of soil is placed over the roots, and watered in. Unless the soil is unusually stiff no earthing-up in order to blanch the stems will be required. The Musselburgh is the variety grown here.

#### TURNIPS.

Seed of these may also be profitably sown immediately after the ground is cleared of the early and second early Potatoes. For the earliest supplies Suttons' Snowball and Carter's Jersey Lily are suitable, and to follow these Veitch's Red Globe and the Chirk Castle Black Stone. All will keep sound in the open during ordinary winters, but it is, perhaps, advisable to pull and store a quantity of the three former in case of another severe winter. The last-mentioned and the Green Round are very hardy, and should be sown in good proportions, especially if greens are desired in the spring. Make the soil firm previous to sowing, dispose the drills about 15 inches apart, and thin out the seedlings before becoming drawn to about 12 inches apart.—W. IGGULDEN.

(To be continued.)

#### NOTES ON CAMELLIAS.

AS Camellias are treated in summer so will they bloom in winter and spring. If badly managed and neglected now, the best attention when they are about to bloom will never produce a good supply of flowers. We are always most particular about our plants when they are making their young wood, and after that they are left very much to themselves, the only attention they receive being to keep the leaves clean and the roots moist. Camellias in the best of health must never be neglected when growing freely, and those in a sickly condition can only be restored to health in the season when growth takes place. This applies equally to plants in pots, boxes, planted out in the conservatory, and in the open air, in all of which ways Camellias deserve to be extensively grown. To stimulate their culture more extensively much need not be said here. We have no fear that Camellia culture will not extend fast enough, but we are not so sure that it is always carried out in the best manner possible. Many have a grand show of blooms at one time, but the great object is to have them in succession. A great number of plants are not wanted to secure this.

From half a dozen plants we gathered blooms from the beginning of November until May last, and when they can be had like this they are by far the most useful plants in our gardens. The plants we refer to are good-sized specimens planted out chiefly in a conservatory bed, and each one supplies bloom for two months or more. Indeed there are one or two which we generally cut from at Christmas, and again at Easter.

Respecting the best mode of growing Camellias, the planting-out system may be regarded as the best. In this way plants soon become fine specimens, and the growth and bloom they produce are much more luxuriant and abundant than when confined to pots. The proper time for planting out is just when they are beginning to grow. Sometimes this may be very early in spring, in other instances very late; but late or early, when they reach the state we have indicated is the time to plant. When planted at first they are sometimes a little slow in making much growth, and on this start depends their immediate and future well-being. When growth has fairly commenced there is little danger of a stop afterwards, and for this reason care should be taken to place suitable material near the roots at first. As they extend outwards they appear to thrive in almost any kind of soil. Some of our bushes, which annually produce thousands of blooms, have their roots in a peculiar indescribable soil. Of late years we have seen Camellias do very well with no liquid supply but pure water, and many cases of weakness are attributable to insufficient water at the root. It has been stated that as soon as the flower buds of Camellias are visible water should be withheld for a time, or large quantities of it might cause the buds to form fresh growths. This may be so, but no harm will result. Some of our plants make second growth, and these second growths set their buds later than the first, and an excellent and long succession of bloom is the consequence.

When the plants are starting into growth it is good to syringe them once or twice on every bright day; but as the leaves become well developed and the buds formed this need not be continued unless the plants are very dirty, and then one thorough good sponging and brushing will be far more satisfactory than a number of sprinklings. It is bad practice to allow the plants to remain always in a half-dirty state, but very often this condition is produced by defective root-action and injudicious watering. In pots Camellias require more attention than when planted out. When the roots are confined to a small space soil must be good, watering particularly well attended to at all times, and even then there is always danger of the soil becoming too dry.

Many who have large specimens in pots are afraid to plant them out, as it is the impression that nothing but very small plants will bear transferring from the pots to a bed. Our experience is different from this. No longer ago than last March one of the largest Camellias we had in a box about a yard square was planted out, and the young growth made since then is both abundant and healthy. As this plant stood outside all winter and had its leaves very yellow we almost despaired of its recovery; but we shall not be in a dilemma of the kind again, as, although the plants may assume an unhealthy colour when wintered in pots and boxes in the open air, they do not appear so when planted out and established. Their appearance then is highly pleasing, and it is surprising that Camellias are not more grown in the smallest as well as the largest collections of evergreens. It would be interesting if your readers throughout the country would plant at least one in the open air, and watch and record the result.

Once or twice previous to this we have objected in these pages to shading Camellias at any period of their growth, and although my views on the matter were not generally accepted, we still from experience think we are right. The finest of our young Camellia wood has been grown so close to the glass that it touched it in many instances; but shading from the sun has never been done, nor was there any need for it, as the leaves never showed the least signs of being injured: on the contrary, they have attained a rich dark glossy green colour which might have been looked for in vain in the shade. Those who begin shading their Camellias when the growths are most tender must of course continue it; but it would be better if it never was begun, and plants in pots require it no more than those planted out if well attended to.

It is generally understood that the Camellia will not submit to be forced into bloom at a stated time. At flowering time this is true, though it may be forced to have it early in bloom; but it is in the spring and summer this must be done. Secure early buds, and the early forcing is done at the same time. Previous to the buds being formed Camellias will bear a high temperature, and for a time after the buds are visible, but after they are half swelled artificial heat does no good and should be withheld.

As to whether it is best or not to place Camellias out of doors in the autumn there are many opinions. As a rule they are best outside, providing they are well attended to with water. Plants,

however, which have been growing in the shade must be taken out with the utmost caution, or all previous care in this direction will be lost. At first such plants should be placed in a shady position, such as behind a north wall; but here they must not remain long, and under all circumstances the sooner they can be made to endure exposure to the sun the better will they bloom during the short days.—J. MUIR, *Margam*.

#### WATERLOO, SEAFORTH, AND CROSBY HORTICULTURAL SOCIETY.—JULY 20TH.

THE above Society held their sixth annual Show of fruits, flowers, and vegetables in the spacious houses belonging to the International Marine Hydropathic Establishment. The Show on the whole was very good considering the prizes offered were small and not sufficient to bring distant exhibitors, and in consequence the exhibits were principally from local growers. One of the main objects of this Society at the present is to encourage amateur cultivators who do not keep professional gardeners, and also cottagers, to grow and show window plants and vegetables. In the classes devoted to both amateurs and cottagers the exhibits were very creditable indeed, and much superior, especially the window plants, to what we have seen staged at many other similar exhibitions. The day was fine, and judging from the number of visitors the Exhibition financially could not fail to prove a decided success, and we hope as the Society prospers the Committee will give more encouragement to the two classes of exhibitors referred to.

In the class for stove and greenhouse plants in flower Mr. G. Brown, gardener to E. K. Musspratt, Esq., Seaforth House, was the successful exhibitor, and staged a good *Plumbago capensis*. Mr. E. Taylor, gardener to C. Crosfield, Esq., obtained the highest honours for foliage plants, and was very successful throughout the Show. Caladiums were staged in very good condition by Mr. Jones, gardener to C. Clark, Esq., the same exhibitor being also first for stove and greenhouse Ferns. A good *Adiantum cuneatum*, over 3 feet in diameter, was exhibited by Mr. J. Edwards, gardener to B. Gibson, Esq., and obtained the first prize for a single specimen. It is scarcely necessary to say hardy Ferns were shown in good condition when we state that most successful exhibitor of these plants, Mr. C. Rylance, took the lead. The Balsams were shown in fine condition, also the Tuberous Begonias, which were well flowered and remarkably strong, Mr. T. Jones being the successful exhibitor in both classes. Coleuses was very well represented, and some creditable plants were staged by Mr. Perry, gardener to T. Etty, Esq. The Fuchsias, especially those contributed by Mr. R. Smith, gardener to J. C. Hall, Esq., were well bloomed and very good plants. Mr. Rylance took the lead for Zonal Pelargoniums, followed closely by Mr. Clarke. The model flower gardens were a great feature in the Show, and attracted considerable attention.

Small fruits were shown in large numbers, but in other classes the competition was not large; Mr. Wilson, gardener to E. J. Reynolds, Esq., West Derby, was awarded the first prize with a nice dish of Black Hamburg Grapes and a good dish of Royal George Peaches. Mr. Woollam and Mr. G. Brown took the remaining prizes, the former showing very fair Grapes and a good dish of Violette Hâtive Nectarines. Mr. Wilson was again first for two bunches of Black Hamburg Grapes, the bunches not large but well coloured. Mr. W. Whitty, gardener to J. W. Cookson, Esq., second with Alicantes. For two bunches of white Grapes Mr. Harrison, gardener to E. F. Hollies, Esq., was first with Foster's Seedling, and Mr. Wilson second with the same variety.

Vegetables were very well and numerous shown, especially in the single dishes, such as Potatoes, Cucumbers, Turnips, Peas, and others; some of the principal prizetakers being Messrs. G. Brown, Woollam, W. Birch, H. Hayward, Maughan, Green, Bower, Jaiger, Holmes, and Smith.

*Miscellaneous Exhibits.*—Messrs. R. P. Ker & Sons, Aigburth Nurseries, Liverpool, contributed a large and very effective collection of plants, which added materially to the attraction of the Exhibition. It included well-coloured Crotons, such as *Maculatus*, *Andreas*, *Baronne de Rothschild*, and others; all the newest *Dracænas*, *Coleus*, *Palms*, *Bouvardias*, *Zonal* and choice *Regal Pelargoniums* intermixed with *Ferns*, *Nertera depressa*, and others. Messrs. James Dickson and Sons had a good box of herbaceous cut blooms and Roses, having fine blooms of *Camille Bernardin*, *Duke of Connaught*, *Beauty of Waltham*, *Pierre Notting*, *Elie Morel*, *La France*, *Comtesse de Serenye*, and others. Mr. Henry Middlehurst, seedsman, &c., Liverpool, showed some very fine well-shaped Cockscombs with a few other small decorative plants, Mr. Holmes staging a collection of Potatoes. No attempt is made to give a full report of all the various exhibits, time only permitting a brief sketch of a few of the principal.

#### BARTONIA AUREA.

THE Loasa family is an interesting one, especially to botanists, but it includes several plants that well deserve the attention of cultivators who can only afford to regard the utility of a plant in a decorative point of view. Some of the Loasas themselves, despite their unpleasant armature of poisonous glands, are by no

means devoid of beauty, but among their allies few if any surpass in brilliance of colour and showiness of flowers the Californian annual, *Bartonia aurea*. It is aptly termed the Golden *Bartonia*, for the flowers possess that rich yellow tint in perfection. The individual blooms are of sufficient size to render them conspicuous, and, moreover, so open when fully expanded that the whole form and colour are seen to the best advantage. When the sun is shining upon them they are especially brilliant, and even a small bed is almost dazzling in its effect, suggestive of a race of *Buttereups* with gigantic flowers very little less glossy than the commoners.

The plant appears somewhat partial to a moderately damp

Fig. 14.—*Bartonia aurea*.

situation—not that it will endure much stagnant moisture, but it will certainly not thrive in a very dry position. England is indebted to the collector Douglas for this among so many other plants, and the first examples grown in this country flowered at the Royal Horticultural Society's Gardens forty-five years ago, so that it is far from being a new friend.

#### DIFFICULTIES IN GRAPE-GROWING.

AS a Grape-grower I shall long remember Monday the 4th inst. In a house of Black Hamburgs, a lean-to 20 feet long by 10 feet wide, every bunch on the upper half of the rods was badly scalded. The front sashes are 3 feet deep and one-half of them open. The top ventilators are at each end—that is, the triangular pieces under each end of the roof open to the depth of 2 feet. These have been half open all night since the 1st of June, and on the day in question were, with the front sashes, open to their full extent; also, as the most forward bunch had commenced colouring, syringing had been discontinued a week before. Can any of your readers help me with advice how to prevent this in future? It seems absurd to think of shading Vines. The late Mr. Rivers mentions in one of his books, "that Grapes can bear any amount of sun heat." Perhaps some may feel inclined to attribute it to insufficient top ventilation; but I fail to see that, considering the house has been in precisely the same state for the last fifteen years without any scalding taking place. Strange to say, in

another lean-to house 14 by 8 feet, with the same due south aspect, one of the same range, and in the same border, there was not a single berry scalded. It is built from directions in one of Mr. Rivers's books with only a 6-inch board, opening the whole length in front and immediately under the glass at the back. The only difference in the two houses is that the former has the dwelling house for a back, while the latter stands alone with a 9-inch wall for a back, and that the Grapes in the former were a fortnight in advance of those in the latter. Both houses are without fire heat, with exactly the same aspect and border, yet in that standing alone the Grapes are always a fortnight or more behind those in the other. Would building a stable or coach house at the back make the Grapes as early and as fine as those in the other house? For besides being later, neither bunches nor berries are nearly so large. I may add the smaller house is only 8 feet high at the ridge plate, while the larger is 12 feet, the former of course having a sunken path.—JACOB ROBINSON.

#### NOTES ON PELARGONIUMS.

PELARGONIUMS have well repaid cultivators for the attention bestowed upon them, and a great improvement has been effected. They were originally introduced from the Cape, and were some time in the country before much was done in the way of hybridising and raising seedlings. Many of the original species were very peculiar in colour and shape of the leaves, and variously scented. The raising of varieties of distinct colour and regularity of shape has been a continual success. No plant has yielded more freely to the skill of the horticulturist than the Pelargonium, and, what appears strange, those hybrids have retained certain characters which keep them in somewhat distinct sections. For instance, the large-flowered or Show section, the Fancies, the Zonals, the Ivy-leaf, the scented-leaf section, the Oak-leaf and Unique sections. These sections do not appear to cross with each other very freely, but I am convinced they will do so if the proper means are applied. Some fifty years back it was not the custom to cut them down every year, and plants might frequently be seen from 10 to 12 feet high, and they were very showy among tall plants in the conservatory. At that time there was a moderately good collection of hybrids, but very different in shape and marking of the flowers to those of the present day; the petals were long, narrow, and the colours run and very much pencilled.

Amongst the early raisers of seedlings were Gaines of Battersea and Dennis of Chelsea. Each having a good collection of Cape introductions, commenced hybridising in a somewhat promiscuous manner by simply placing the original species among the hybrids and sowing all seeds that were produced. They were successful in producing many good and showy varieties, one of which, Gauntlet, has not been surpassed to the present day for forcing and cut flowers, and has been of great value to growers for the market. I could name many old varieties that were deserving of being retained on account of some desirable characteristic they possessed. For instance, the Yarborough for vases in the open ground has never been equalled for its floriferous habit. It has been the fashion to obtain large flowers of regular outline and distinct markings, and the raisers have succeeded in a remarkable degree. Great praise is due to the florists for what has been done, yet there remains a wide field for enterprise. There are many colours in the genus that require to be brought forward, such as yellow, green, and that exquisite orange maroon that we see in *P. ardens major*, also that distinctness of *P. tricolor*, and it would be desirable to introduce scarlet into the large-flowered varieties, and the Unique section with its unequalled colours deserves attention. I think a section of selfs would be desirable, and the flowers of the scented section could be greatly enlarged and diversified in colour. The Ivy-leaf section remained for years with only the white and pink. Now we have a marked improvement, including doubles. The continental nurserymen have done much in introducing doubles and fringed edges, which are improvements on one of our old favourites, *Dr. André*, which is still in cultivation.

Considering what has been done there is yet a great prospect of reward if hybridisation is carried out in a judicious manner, respecting which I will say a few words. The plant you intend to produce seed should have the stamens carefully removed a day or two before the pollen is ripe, then introduce pollen that is perfectly ripe and dusty. The brighter the day the better for the operation. Keep the house warm, exclude insects, and there will be a chance of success. As a proof that the sections will cross I must adduce the fact that it has been done. An old hybrid, Moore's Victory, was a cross between the Oak-leaf and the scarlet, and had scarlet flowers; Lady Mary Fox was a cross between the large-flowered and the scarlet, and also had scarlet flowers; also Princess Victoria, another cross with large scarlet flowers, but all attempts to propagate it failed. It is a matter of consideration

how far a plant must be removed from the original before it will assume the character of a species by reproducing itself from seed, but we have these characters in Christine, which is the leader of a section with soft leaves and pink flowers, which I suppose must have been derived from the peppermint-scented, as no other has leaves of that description. Zonals with various-coloured leaves have multiplied to an almost unlimited extent. Some Pelargoniums have the quality of not shedding their flowers, which renders them very desirable for cut flowers. Plants which have a bad habit may be greatly improved by proper cultivation, as may be seen by the productions of growers who make a speciality of some particular variety.—R. C.

#### CULTURE OF THE LOQUAT.

SOME weeks ago an excellent woodcut of the Loquat fruit was published in this Journal, and perhaps in further reference to the culture of this plant the following extract from an article written by Mr. Donald Beaton, which appeared in the *Cottage Gardener* thirty years ago, may interest some readers:—"Then there is the Eriobotrya, or Loquat, another Applewort closely allied to the Photinia, which is all but hardy about London, and quite so in the south-west of England. I have had it stand many a hard winter in Herefordshire after grafting it on the common Thorn, but I think the Quince would make a more natural stock for it. I think the fruit of it is called Japanese Medlar, and Loquat by the Chinese. At any rate we had a beautiful dish of this fruit exhibited the other day in Regent Street from Mr. Tillery, gardener at the Duke of Portland's; but, although our teeth watered to be at them, we could not taste them because we had no orders, and we are very particular about such fruits as are sent in this way. Any fruit is quite safe in our hands, but in this instance I could see very plainly that the lecture about these Loquats set the teeth on edge. Mr. Tillery sent an excellent account of how he managed to bring this fruit to table. It is thought a good deal of coming in in succession early in the spring when other fruits are getting scarce. The trees are uncovered in the summer, as they might be under Mr. Rivers' orchard house plan. In September they come into blossom, the glass is put on, the temperature got up to stove heat after a while and kept so through the winter, and the result is a fine crop of fruit early in the spring. These Loquats look very much like small Apricots. I fruited them myself once, but it was on the cold system, as at Walcot, and we did not think much of them—hence my desire to taste them now to know the difference, for I can easily conceive how the high winter temperature must improve the flesh and flavour. On the cold system I can vouch they are not worth growing in England, except for curiosity."—AN OLD READER.

#### SUTTON COLDFIELD ROSE SHOW.

SITUATED near the metropolis of the midlands, and having a Crystal Palace and Pleasure Grounds, Sutton Coldfield was considered a suitable place for an exhibition of the Rose. A liberal schedule was therefore prepared, principally by the Rev. J. A. Williams, who has laboured indefatigably in the undertaking, and the high esteem in which he is held by rosarians ensured their support. The result was a very excellent and successful Show on Friday last. A capacious marquee about 150 feet long was devoted to the Show, a central table and side tables along the margin of the tent being nearly filled with the boxes. The centre of the principal table was furnished with *Dracænas*, *Acers*, &c., and a shelf in front of the boxes and below them enabled the Rose boxes to be masked by a fringe of Ferns, &c., hence the tent had a rich and picturesque appearance. The plants were supplied by Mr. Gough, the able garden Superintendent of the Crystal Palace Company, and the Show was arranged by Mr. William Dean. The day was dull yet dry—just the weather for keeping the blooms fresh, and fresh they were and beautiful. The dark Roses were unusually brilliant, the colours being most intense, while the Teas were of unsurpassed loveliness. The class for eight varieties of these in triplets was an experiment, justified by the results, and the effect of the boxes of Messrs. Mack, Prince, and Mattock entranced the visitors.

In the nurserymen's class of forty-eight single trusses the Cranston Company were decidedly in advance of their rivals, and added one more to their long list of honours. The blooms were not so large as we have seen from Hereford, but were firm, compact, fresh, and bright. Jean Cherpin was conspicuous by its broad purplish petals, and was much fuller than is usually seen. The largest bloom in the stand was Madame Charles Wood; and very fresh and beautiful were Duc de Wellington, Duchesse de Caylus, Fisher Holmes, Marie Rady, Le Havre, Madame Victor Verdier, Alfred K. Williams, Mrs. Jowitt, Xavier Olibo, Emilie Hausburg, Mons. Etienne Levet, and Louis Van Houtte. The light-coloured flowers were not equal in merit to the darks; the best were Comtesse de Serenye and Madame Gabriel Luizet—a beautiful bloom of a distinct and charming Rose. Duchesse

de Vallombrosa, Baronne de Rothschild, La France, and Madame Lacharme were in fairly good form, and Maréchal Niel bright. Mr. Frettingham, Beeston, Notts, was second with smaller blooms, but the darks were remarkable by their brightness, and the lights were fresh and clear. Mons. E. Y. Teas, Louis Van Houtte, and Jules Chrétien were the most noteworthy blooms. Messrs. Davison and Co., Hereford, were third with generally larger examples, some being very good, others rather rough and defective. Three other collections were staged in this class. In the class for twenty-four blooms Messrs. James Dickson & Son were placed first with charmingly fresh and clean flowers well relieved by the foliage. The finest bloom in the stand, if not in the Show, was Louis Dorc, bright carmine in colour and very full. Comtesse de Serenye was of remarkable excellence, as were also A. K. Williams and Marie Baumann, while Senateur Vaisse, Ferdinand de Lesseps, Pierre Notting, and François Fontaine were very good—a rich stand, the light blooms being few and not generally of great merit. Messrs. Perkins & Sons, Coventry, and G. Prince, Oxford, were placed equal seconds, the Coventry blooms being generally the most level and compact; but a few in the Oxford stand, notably Devienne Lamy, Charles Lefebvre, and Fisher Holmes, were of extreme merit. Messrs. Jefferies & Sons, Cirencester, were third with a good stand, which contained a grand bloom of Mabel Morrison. Six collections were staged in the class for sixteen distinct varieties, three trusses of each, the Cranston Company, Mr. Prince, and Messrs. Davison & Son securing the prizes in the order named. The first-prize collection was magnificent, the second fresh and beautiful, and the third good, as also were the stands of Messrs. Perkins, House, and Jefferies, which would have been in the prize lists in an ordinary competition.

In the amateurs' class the silver cup for thirty-six blooms was won by the redoubtable Mr. Jowitt. The blooms generally were of great excellence, the darks brilliant in colour, and the lights fresh and clean. Reynolds Hole, Marie Baumann, A. K. Williams, Jean Liabaud, Marie Rady, Comtesse de Serenye, La France, and Alfred Colomb were the finest blooms in this stand. Mr. Charles Davis, Anyhoe, Banbury, was an excellent second with larger flowers, some of which were very fine, but others, on the contrary, had lost their freshness. Third honours went to the Rev. H. W. Watson, Berkswell Rectory. Mr. Jowitt was first with eight triplets, but the blooms were not equal to those in the preceding class. Six highly meritorious stands were staged in the class for twenty-four blooms, Mr. Jowitt easily securing first honours with almost faultless specimens, nearly all of them being of good form and great substance, while the colours were all that could be desired, Duc de Wellington, Exposition de Brie, Senateur Vaisse, and Emilie Hausburg were superb, and La France and Baronne de Rothschild were amongst the best of the light varieties. Mr. Davis and Mr. A. Evans, Marston, Oxon, had the remaining prizes in the order named with stands of very equal merit. Some good stands were exhibited in the class for twelve blooms. Mr. A. H. Griffiths, Edgbaston, secured the first position with blooms of considerable merit, most of them being very good but staged rather too low. Souvenir de Spa was brilliant in this stand. Mr. Julius Sladden, Evesham, was an excellent second with smaller and very fresh blooms excellently arranged. Mr. Griffiths was also first in the local amateurs' class, apparently being the only exhibitor. A class was provided for exhibitors who did not compete in the foregoing classes, and Mr. G. H. Fewkes, Erdington, Warwickshire, Miss Watson-Taylor, and Mr. Walters, Burton-on-Trent, were awarded the prizes in the order named. All the stands were very fresh and the flowers admirably staged and a credit to the exhibitors.

Mr. Jowitt secured the first prize for twelve English-raised Roses with Beauty of Waltham, Duke of Edinburgh, Penelope Mayo, J. S. Mill, Peach Blossom, Lord Macaulay, fine; Sultan of Zanzibar, rich; Royal Standard, Reynolds Hole, General Evelyn Wood, and Duke of Connaught. The same exhibitor also secured Mr. G. Paul's prize for six Cheshunt-raised Roses with Princess Mary of Cambridge, Reynolds Hole, Sultan of Zanzibar, Mrs. Laxton, and Duke of Connaught.

For twelve blooms of any yellow Rose the prizes went to Messrs. Prince and Mack, both staging Maréchal Niel very fresh and rich. For twelve of any pink Rose Messrs. James Dickson & Co. were first with Comtesse de Serenye, Mr. Jowitt second, and Mr. Prince third with the same variety; the other varieties staged were Baronne de Rothschild and Marguerite de St. Amand. For twelve of any rose-coloured Rose Mr. Prince was first with Souvenir de Mons. Boll, a large flat flower of the Paul Neyron type, but richer and very imposing. Messrs. Cranston & Co. were second with Marquise de Castellane, very good; and Mr. House, Peterborough, third with Mdlle. Marie Verdier. For twelve of any dark Rose Mr. Jowitt was first with a splendid stand of Devienne Lamy, Mr. Frettingham being an excellent second with Marie Rady, and Messrs. James Dickson & Son third with Marie Baumann. This section of the Show was much more interesting than if the competition had been in the usual manner, for stipulated varieties.

TEA ROSES.—Fine as many of the stands were in the preceding collections the Teas surpassed them if possible, and it will not be too much to say that they formed the finest show of the year of these beautiful flowers. The class for eight triplets was a decided success, so fresh, fine, and level were the blooms. Messrs. Robert Mack and Son, Catterick Bridge, Yorkshire; Mr. Prince, Oxford; and Mr. Mattock, Oxford, were the winners respectively, all staging most beautiful stands. The Yorkshire stand contained Madame Hippolyte

Jamain, Reine du Portugal, and Comtesse de Nadaillac, all splendid; while very fine indeed were Marie Van Houtte, President, Jean Ducher, Maréchal Niel, and Souvenir d'un Ami. Mr. Prince staged Marie Van Houtte, Souvenir de Paul Neyron, Perle des Jardins, and Madame Lambard in superb condition; and Mr. Mattock's blooms were very clean. For twelve single blooms Mr. Mack and Mr. Prince were placed first and second respectively with beautiful stands, Mr. House and Mr. Mattock being equal thirds. The Peterborough stand contained a fresh bloom of Reine Marie Henriette. Mr. Mack staged a magnificent Anna Ollivier, and Mr. Prince had Marie Van Houtte almost equally fine.

In the amateurs' class for a stand of twelve blooms Mr. Davis was an excellent first with a superior stand comprising Catherine Mermet, splendid; Maréchal Niel, Jean Ducher, Perle des Jardins, extra fine; Souvenir d'un Ami, Madame Camille, Madame C. Kuster, Souvenir d'Elise Vardon, Marcelin Rhoda, Comtesse de Nadaillac, Madame Hippolyte Jamain, and Madame Lambard. Miss A. Evans, Marston, Oxford, had the second prize with a creditable stand. In the class for six Mr. Mawley, Croydon, was clearly first with excellent blooms, but too thinly staged, and their appearance was marred by the great display of brown moss; Miss Watson-Taylor, Headington, Oxon, had the remaining prize with fresh and clean blooms.

Prizes consisting of a pair of silver fruit stands value eight guineas, a silver cup value five guineas, and another cup value three guineas, were provided for groups of plants arranged for effect, the space not being limited. The first prize was secured by Mr. Hans Niemand (Mr. Spinks, manager) for a group covering a space of nearly 300 feet. It was extremely light, the flowering plants consisting of Lilliums, Hydrangea paniculata grandiflora, very fine; and Begonia parviflora. These were dotted rather too regularly amongst Ferns and Palms. Eulalia japonica variegata and E. zebrina were employed effectively, and rustic stands tastefully furnished imparted diversity, but the two best were placed too far back. Some groups of the newer Dracenas and Adiantum Bausei, and a fringe of Isolepis dotted with Caladium argyrites, completed the arrangement; that was deficient in brightness, especially as the day was dull. Mr. Jinks, gardener to J. E. Wilson, Esq., Edgbaston, was an excellent second with valuable and well-grown plants, but arranged with too much regularity from front to back; indeed, it is not easy to arrange specimen plants effectively in a group. Messrs. Pope & Sons were third, Kalosantheses being very fine. Three large groups were arranged round the sides of a large tent, the centre of which was occupied with such a display of glass from the executors of the late Mr. Joseph Webb, Coalbourn Hill Glassworks, as is seldom seen at a flower show. The designs for various table ornaments were most diversified and artistic, and the collection was a valuable and appropriate contribution, which attracted much attention. Similarly attractive in this tent were the unbreakable enamelled iron flower pot covers and saucers exhibited by Mr. Wilton, London Road, Liverpool. These are extremely light and very attractive, being hand-painted. Flowers of various kinds are shown in their colours, and the effect is very artistic. These stands attracted almost as much attention as the Roses.

Bouquets.—A silver cup was offered for one bride's and two bridesmaids' bouquets, and was won by Mr. Spinks with medium-sized examples most tastefully arranged, but rather too much clouded with Ferns. Messrs. Pope & Son, Birmingham, were second with larger bouquets, but rather too conical and closely packed; Messrs. Jones and Son, Shrewsbury, being third with large and elaborate arrangements, but scarcely any Fern fronds to relieve the flowers. Still all were far above the average order of merit, which makes Mr. Spinks' honour the greater.

Mr. Verregans exhibited a basket of remarkably fine Tuberoses, associated with Bougainvillea glabra and edged with Isolepis—a most beautiful arrangement; and Messrs. Wm. Paul & Son, Prince, and Mattock sent large collections of and highly attractive stands of Roses not for competition.

The Show was admirably managed, and Mr. Williams, by his great and successful exertions, won, as he deserved, the high approval of all.

#### CULTIVATION OF THE AURICULA.

THE cultivation of the Auricula may be said to commence with the repotting of the plants. There are various opinions as to which is the best time for this work. The old growers recommend that it should be done in August, I prefer the first or second week in May; the plants have then a better chance of becoming established and the pots well filled with roots by the time the plants go to rest in autumn. The compost should consist of sound turfy loam two parts, old hotbed manure one part, a little charcoal the size of split peas, and sufficient coarse sand to keep the soil porous. If the loam is of a rather strong nature a small portion of leaf soil may be added with advantage, the whole to be mixed together during the previous autumn and be frequently turned and sweetened, but it should not be sifted.

The pots should be clean and proportioned to the size of the plants. For strong growers a 4½-inch pot is quite large enough, and for such varieties as George Lightbody and Lancashire Hero a smaller one will suffice. It is a great mistake to overpot. Place sufficient drainage in the pot, and protect it with

some of the roughest portion of the compost to keep the soil from being washed down amongst the crocks, and over this a little finer soil. Shake all the old soil from the roots and cut the tap-root well back, leaving only a few new fibres near the neck of the plant. Dust the cut part with pounded charcoal or quicklime to stop bleeding, spread the roots evenly over the soil, and fill up to the collar of the plant, pressing the soil rather firmly.

As the plants are potted they should be placed in frames under a north wall, and be kept close for a week or so until they have taken to the new soil. Give no water until the third or fourth day, to allow time for any roots that may have been bruised to heal. If water is given as soon as the plants are potted it washes the soil to a close compact mass—a condition in which the *Auricula* does not delight. When they have become established admit plenty of air; in fact the lights should be removed in the daytime except during rain.

The only attention they require during the summer months is careful watering, keeping down green fly, and the removal of such leaves as are quite dead or have turned of a slimy nature.

In November the plants should be taken to their winter quarters, where they will remain until the bloom is over. If in frames these should have an eastern or southern aspect; but if a small-span-roofed house can be devoted to them they will be more enjoyable and can be attended to in all weathers. Give abundance of air all through the winter months, closing only in hard frost. As the year draws to a close apply water very sparingly, but on no account let the soil become dust dry, or the fine roots will perish. By the end of February growth will have commenced if the weather is open, and a little more water should be given. It will now be necessary to provide protection of some description for the house or frames in case of hard frost. For this purpose I employ thick sacking placed double on the roof, with rollers to wind it up the same as for shading during summer, for it must be borne in mind that if the truss is frozen the bloom will be crumpled and imperfect.

In March a top-dressing of rich compost should be given; this should consist of one-half loam and half old sheep or cow dung. Gently stir the surface and remove the soil, adding the fresh compost. As growth advances the buds should be thinned, so that an even head of from five to eleven pips may be secured according to the size of the plant. As the pips commence expanding a light should be placed on the lights during bright sunshine, or the bloom will be speedily destroyed.

**PROPAGATION.**—The *Auricula* is propagated by seeds and offsets: by the former to obtain new varieties, and by the latter to perpetuate existing fine varieties. To obtain seed the flowers should be artificially fertilised. To do this take a small camel-hair pencil and collect the pollen from the small anthers that grow round the tube of the flower, and apply it to the pistil of the one it is desired to take seed from. In crossing it is best to keep the classes separated—*i.e.*, green edges should be crossed with greens, greys with greys, whites with white edges, &c.

By the end of July the seed will be ripe, and should be sown at once in 5-inch pots upon the same kind of compost as the plants are grown in. Fill the pots to an inch of the top, and press the surface firm, and scatter the seed evenly over the soil, but do not cover it with additional soil. Place a piece of glass on the top of the pot to prevent evaporation, and let the pots stand in saucers of water, which should be filled at intervals as the surface shows signs of becoming dry. The young seedlings delight in a close moist atmosphere in their early stages. I have no doubt many of the failures we hear of with *Auricula* seed is caused by burying the seed, or the surface of the soil being dry and wet alternately.

In about three weeks some of the seed will germinate, but a portion will lay dormant until the following spring, so the seed pots should not be hastily put aside. When the young plants have made three pairs of leaves prick them out in other pots; and if they cannot receive daily attention it will be best to cover them with a piece of glass the same as recommended for the seed pots, and as the plants become established give air by tilting the glass on one side.

Offsets are the young growths formed in the axils of the leaves, and suckers are produced upon the tap-root. These when large enough should be taken off and potted singly in small pots, or several may be placed round the edge of a larger one. Afterwards pot singly in small pots, and treat as recommended for the old plants.—B. SIMONITE.—(*Read before the Paxton Society at Wakefield.*)

**GRASSHOPPERS IN TURKEY.**—Similar devastations to those which we reported from the Caucasus some time ago are now caused in Turkey by grasshoppers. The Turkish Government is compelled to employ extraordinary measures to overcome the

plague. A particularly voracious species has appeared in the Bodirum district (Smyrna), and the whole population is employed to combat the insects. At Angora all business was suspended for three days by order of the Governor-General, and all the inhabitants were ordered to march out into the fields to destroy the grasshoppers. Every inhabitant was compelled to deliver 20 oka (about  $\frac{1}{2}$  cwt.) of dead grasshoppers to the officials. The swarms are said to emanate principally from Persia.—(*Nature.*)

#### DAY'S EARLY SUNRISE PEA.

"CLERICUS," on page 31, desires the opinion of growers as to the merits of this Pea. I sowed it alongside and on the same day with William I. and Dickson's First and Best. It was ready to gather about two or three days after First and Best, and about the same time as William I. It is from 1 to  $1\frac{1}{2}$  foot dwarfer than these varieties, the pods are closer to the ground, and it is wonderfully prolific. The woodcuts of it published show eight peas in a pod. I find few pods with more than six peas, but as they are of large size and the pods produced in great abundance, mostly in pairs, the yield is heavy. It is good in quality, but not equal to the later wrinkled Marrows, such as Champion of England and similar sorts; still I think its merits are such that it will become a standard early kind.—J. E.

A CORRESPONDENT on page 31 of the *Journal of Horticulture* makes some inquiries about this Pea. I may say that I tried it and another new variety, American Wonder, with Little Gem and Advancer. Sunrise was the first in flower, but it is slow in forming pods, and was not ready for use until three or four days after the other sorts. It is a white wrinkled Pea, and grows about 2 feet high, but the pods are small and not well filled, and I certainly do not consider it equal to Advancer and should not recommend it. American Wonder is a very good dwarf early Pea. It grows about 9 inches high and is very prolific.—EXPERIMENT.

IN reply to the inquiry made by "CLERICUS" upon the above, I hope the following account will be of some use to him and others. Having grown it this season, I find it has a very good habit, being short-jointed and strong and a good cropper. The pods are well filled, having nine and ten peas in each, and the flavour is all that can be desired. But I find it is not so early as Dickson's First and Best. The two sorts were sown on the same day, the 19th of February, and Dickson's was ready fully ten days before Day's Sunrise.—JOURNEYMAN.

ADVERSE circumstances prevented the sowing of this Pea until April 6th, William I. and Alpha being sown at the same time. The first pods of William I. were gathered July 5th; Early Sunrise and Alpha, July 15th. Early Sunrise commenced to form pods at the fourth joint, or at most the fifth, 8 or 9 inches from the ground, bearing its pods mostly in pairs, from thirteen to fifteen joints on a length of haulm of 3 feet 6 inches, the average number of peas in a pod being five, and of pods per haulm twenty-one; peas per plant 105. William I. had twelve pods from seven joints, commencing to form pods at 2 feet 4 inches from the ground, height of haulm 4 feet 3 inches; the number of peas per pod six, and those per plant seventy-two. Alpha commenced to form pods at the seventh joint, 2 feet 4 inches from the soil, producing them mostly singly from fifteen joints, eighteen in number on a haulm 7 feet in length; the number of peas six, or 108 per plant. The best examples of each were taken for comparison. William I. filled well, Alpha good in that respect, but Early Sunrise filled very indifferently, frequently not more than half its possible number—seven or eight, some pods not having more than four peas. The peas are much larger than either William I. or Alpha, and the quality is excellent. The plant is very robust, the crop lasting some time.—G. ABBEY.

It may interest your readers if I supplement the observations of your several correspondents in your last issue by giving you my experience of the above Pea. My gardener sowed one pint of seed very sparsely in ordinarily prepared ground under a south wall on the 16th March in seven rows (each 20 feet long) in a common drill 2 inches deep, and the crop is the largest I have ever seen—the haulms 5 feet high, and loaded with pods of full size from top to bottom. I cannot say when they came into bloom, but we commenced picking about the 20th June, and have continued almost daily ever since, there being still plenty more to gather, besides leaving sufficient for seed. In addition to this, which is equally important, the quality and flavour have been

excellent all through, superior to William I. and other early sorts, and very little inferior to Yorkshire Hero, Advancer, and others that follow later.—C. H. P., *Cardiff*.

#### NYCTERINIA SELAGINOIDES.

ONE of the prettiest dwarf annuals suitable for edging large beds is that represented in the woodcut (fig. 15). The plant is by no means a novelty, but, like so many old favourites that have been partially displaced by more modern rivals, it is seldom seen in gardens except where simple flowers are treasured. Amidst the numerous floral attractions this season in the Royal Horticultural Society's Gardens, Chiswick, some rows of this *Nycteria* have been especially noteworthy, and many visitors have admired the compactness of its habit and the abundant white and rose flowers. These at a glance resemble some of the dwarf *Silenes* or *Saponarias*, and in appearance there is little to suggest the relation of the plant to the *Scrophularias*, in which family it is included. It

Fig. 15.—*Nycteria selaginoides*.

succeeds in almost any soil that is not too heavy or wet, and, as above stated, it is particularly well adapted for an edging to a bed of miscellaneous plants.

#### PLANT-GROWING FOR MARKET IN SCOTLAND.

MOST readers of the *Journal of Horticulture* must be familiar from its pages with all the great market plant-growing places about London and in the neighbourhood of all large towns in England, but it is very rarely indeed that we see any remarks on plant-growing for market in Scotland. Yet a great trade in decorative plants is being established there, as was proved to us some time ago while calling on Messrs. William Thomson & Sons of the Tweed Vineyard, Galashiels. Since we last saw this establishment some six years ago the glass houses have been much extended and their occupants greatly changed. Then Pine-Apple plants and Vines in pots were nearly the only plants grown, but now they have given place to small plants which are annually grown by thousands, and the demand for them about Edinburgh, Glasgow, and elsewhere is rapidly increasing, which is not surprising, as we cannot remember seeing plants for market that would surpass those grown at Clovenfords for general quality.

To make these notes more readily understood it may probably be best to take the houses in rotation, and starting from the lower end we first entered an Orchid house in two divisions, altogether about 140 feet long and 18 feet wide. The plants are grown throughout the year in a much lower temperature than is gene-

rally employed, and that the treatment agrees with them is easily seen from the excellent health of the grand specimens of *Vandas*, *Laelias*, *Cattleyas*, and *Cypripediums*. The next is a propagating house about 150 feet long by 16 feet wide, devoted to young Ferns, with stove and greenhouse plants, and we noticed that they only comprised large numbers of a few of the most useful and effective classes of plants, such as *Adiantum cuneatum*, *Cocos Weddelliana*, one or two varieties of *Pteris*, *Dracenas*, *Crotons*, &c., besides large quantities of *Bouvardias*, *Begonias*, *Fuchsias*, and *Eucharises*. The adjoining house is planted as a vinery with Muscat Vines; it is 200 feet long by 18 feet wide, and is a lean-to, with a pathway up the back, and a great space for plants beneath the Vines. This is filled in winter with thousands of small plants of *Erica gracilis* and *hymnalis*, and large quantities of *Epacris*. The Vines in this house are not started into growth until well into February. A late vinery 180 feet long by 25 feet wide, planted chiefly with Gros Colman, Lady Downe's, and the Black Alicante, the roots of all being outside, the inside of the house having a floor of concrete, is occupied with thousands of *Hyacinths*, *Lily of the Valley*, and other bulbs in the spring. Along the back wall there is a bed 5 feet in width, and in this *Camellias* are planted out for supplying cut blooms. Adjoining is a late Muscat house 200 feet long by 16 feet in width; underneath the Vines were fine *Roses* in pots, grown chiefly to supply cut flowers.

In front of the Muscat house is a structure 200 feet long by 14 feet in width, and in front of this is a span-roofed house 140 feet long and 18 feet wide. The first of the two was filled with fine *Primulas*, *Cinerarias*, and *Pelargoniums*; 100 feet of the last contained *Pelargoniums* and many hundreds of *Azaleas* in 5-inch pots. The lower 40 feet of this house is divided from the remainder, and is employed for forcing. In another range we come to a house 200 feet long, which contained many hundreds of the hardier *Palms*. Several large frames were full of hardy Ferns, *Hydrangeas*, *Saxifrages*, and a variety of other plants. Close to them is a span-roofed intermediate house about 95 feet long by 15 feet in width; Ferns, *Odontoglossums*, &c., were most attractive there.

From the frequency we have had occasion to mention "vinery" in the above notes some of your readers who may have seen Clovenfords will have been led to suppose that some of the large vineries there have been turned into plant houses, but this is not so. As yet we have not come to the "big vineries" or principal Grape-growing quarters. These consist of five span-roofed houses, four of which are each 200 feet long by 24 feet in width, and the fifth is a little shorter but of the same width. Four of these form a block together, one being a corridor, the other three running out from it. The corridor is planted with Black Hamburgs and Duke of Buccleuch. The latter still bears well and gives great satisfaction. It is not treated so much on the close-spur system as formerly, but a good quantity of young wood is left annually, as it is found to bear best in this way. The first of the other three houses is planted entirely with Lady Downe's; the thousands of bunches from 2 lbs. to 4 lbs. in weight are not cut until February. The next house is planted with Gros Colman and Black Alicante, and an adjoining house with Gros Colman and Gros Guillaume. Trials of the different forms of this last-named Grape have been going on, and all have proved to be the same, so that Seacliffe Black and the Charleville variety are simply Gros Guillaume. The other large house stands some distance from these on a more elevated site. This is planted with Lady Downe's and Alicantes. Close to the last is a vinery 70 feet long by 18 feet wide. This is planted with Lady Downe's.

The improved cruciform and terminal saddle boilers are almost exclusively used for heating, and the fuel consumed is chiefly coke. As was stated at the commencement of these remarks, most of the plants find a market in Edinburgh and Glasgow, but most of the Grapes are dispatched direct to Covent Garden.

Many details which would no doubt interest some of your readers have unavoidably been omitted from these notes, but we cannot do better than advise all who are ever within a hundred miles of Clovenfords to go and see it. To all interested it would amply repay a much longer distance than this. It is situated amongst the hills, where pure air, clear water, and fine loam abound, but is only an hour's ride from Edinburgh, and the station being so near is a great consideration; besides, for many miles around the district is full of historic interest. Only ten minutes' walk from Clovenfords there still stands in an excellent state of preservation the house of Ashestiel, in which Sir Walter Scott composed much of his poem "Marmion," and many of the scenes so vividly depicted there remain unchanged.—VISITOR.

ENGLISH IRISES FROM SEED.—We have at present a beautiful bed of these in flower from seed sown about four years ago. Appa-

rently they come very true to their variety, as many of them are exactly similar in colour to each other, also to named sorts growing in the borders. When seed is required flowers which are fading should not be cut off, but the capsule left to produce seed, which when ripened should be gathered and sown at once in drills 6 inches apart. Several of our plants flowered the second year after sowing, they were then lifted and transplanted 6 inches apart in beds where they were required to flower. Autumn is by far the best time to transplant. If at all practicable masses are the best, as the colours harmonise perfectly though mixed.—R. P. B.

#### MR. SHIRLEY HIBBERD'S LECTURE ON THE CARNATION.

(Continued from page 65.)

AN exhibition does not reveal to us all the glories of the Carnation family, but of certain classes of flowers that have been trained, as we may say, to certain standards of quality. I have heard to-day a question often asked at a Carnation show—"Why are there no Pinks present?" There are two reasons for the non-admission of Pinks to this Show; one is that they are not Carnations, and the other is that they do not now exist as flowers, for they attain perfection in the month of June and cannot be presented at a July show. Although, from the botanist's point of view, the Pink and Carnation are closely related, they are in the view of the florist separated by a wide gulf, for it is impossible to cross them, and consequently we cannot raise a Carnation from a Pink, or a Pink from a Carnation, or secure a race of flowers midway between them. The Carnation as a show flower is not allowed to sport into as many varieties as it pleases. It is, however, capable of producing almost every colour except true blue. The shades of red appear to be proper to it, a point in which it agrees with the wild Pink. It is from this circumstance it takes its name of Carnation, the exact meaning of which is flesh-coloured. You will remember that in the remarkable description of the death of Falstaff by Dame Quickly, in Shakespeare's *Henry V.*, the touching pathos is brightened by a stroke of wit, the effect of which is to remind us that the brave Sir John was a notable coward. The Dame says, "A' could never abide carnation; 'twas a colour he never liked;" real fighting and flesh wounds being not to the liking of Falstaff and his cutpurse followers. It is singular that this name, which equally with Gilloflower is derived from the Latin, apparently furnishes the basis of another of the old names of the flower; for the Carnation is the "Coronation," the chaplet flower, which Spenser describes as "worn of paramours," its gay colour and spicy perfume doubtless rendering it a fine antidote to the proper melancholy of a lovesick swain.

All the colours we now find in the Carnation were known to the old florists, and John Parkinson descants on the beauties of the yellow Carnation in such a manner as to suggest that the yellow ground Picotee was not unknown to him, although he gives no definite hint of its existence. The true foundations in floriculture laid by him were soon freely built upon, for in the year 1676 John Rea had 360 sorts of Carnations; and from this time the popularity of the flower appears never to have waned in any serious degree.

The modern history of the flower dates from the 25th July, 1850, when the first proper exhibition in the south of England took place in the Royal Nurseries at Slough, and the National Carnation and Picotee Society was formally founded. It is with unspeakable pleasure I find in the records that in the first start of this Society the names of Turner and Dodwell appear as the leading prizetakers, both at the show just referred to and the second show that was held at Derby on the 7th of August in the same year. Thus the year 1850 was a great year in the history of floriculture; and it seems scarcely possible, although it is perfectly true, that the two masters of the Carnation in that day are masters now, apparently younger and more enthusiastic, but with an immensity of acquired experience to sustain their zeal and constancy. Their presence here to-day may be regarded as a delightful commentary on the declaration of Wordsworth, that "Nature never did betray the heart that loved her," and we may regard each of these as favoured by the Fairy Queen, who "crowns him with flowers and makes him all her joy."

It is an interesting and somewhat remarkable fact that the Carnation and its several relations, as Pinks, Picotees, and the like, endure with patience the smoke and dust of great towns. Mr. E. S. Dodwell has put the capabilities of the flower in this respect to the severest test imaginable, for he brings forth from year to year the most perfect blooms, taking a fair share of the prizes, as in the memorable year 1850; and his garden is favoured by a railway company with a perennial shower of blacks night and day the whole year round. Indeed, the *Dianthus* family

appear to have somewhat of the same sociable temper as the singing birds; they appear to love the habitations of man, and hence the prudent botanist who wants a specimen of the true typical *Dianthus caryophyllus* will begin to hunt for it on castle walls, ruins, or on the roofs of old sheds and cottages. I remember making a grand find in a hunt of this sort. Being on the rampage with a friend, we made discovery of a cottage roof all glorious with tufts of wild Pink, Houseleek, Stonecrop, Rock Rose, Ragged Robin, and Stitchwort, all embedded in cushions of golden moss, and wreathed about with garlands of Roses. We resolved to derive from this floral roof a grand intellectual and æsthetic treat, and were preparing to make sketches and draw up a careful catalogue of the plants. The owner of the cottage came out, and smiled approvingly when we told him we had found an Eldorado on his roof, and intended to make a picture that posterity would rave about, and that would turn the heads of all botanists, florists, painters, and dadoists; so that probably the world would begin to revolve in a new way, with his huge chimney for its future axis. But it came on to rain, and like a pair of cowards we fled, promising to be on the spot next morning to accomplish the task that should renew humanity. And we were there next morning; but the scene was changed. The worthy man was on the roof, scraping away with a hoe. He had cleared off all the vegetation to display the original red tiles; and he said, with a pride that to us was deadly, "I thought it a pity that you should paint my cottage with all that rubbish on it; for them tiles I put on myself, for that's my trade, and I am proud of it; for I'm a tiler, every inch of me." What we lost individually is as nothing to what the world lost through this blundering vandalism.

The mention of vandalism reminds me that I just now spoke of æsthetic delights. Fifty years ago the cultivators of taste in Germany were called æsthetics, because they sought and encouraged the cultivation of beauty. There are now amongst us, even in the bright world of flowers, those who profess to be æsthetics, and who coolly propose that we should undo and utterly waste the work of centuries of floriculture, and allow Nature to assert herself according to the original pattern of things as on the third day of creation. Yes; they dare to doom our double flowers to an ignominious oblivion, and they fondly hope we shall destroy our proper garden flowers, and plant in their place those that Nature cultivates so nicely in the woodlands and on the mountains. They really aim at destroying all our outdoor pleasures, because the wild flowers are far more delightful when we have to search for them in their own breezy haunts than they are when we bring them into the garden. Thus, if we lose our highly cultivated flowers, and lose also the peculiar and ever fresh delight of searching for the wildlings in their native haunts, there must be an end of gardening altogether. To put our beautiful garden flowers under a ban is the work of a Caliban, whose great delight should be with his long nails to dig pig nuts. Let him sing in his empty dream of delirious joy, "Ban, ban, ban, Caliban; has a new master; get a new man." Caliban and his dadoistic friends will have their day and cease to be, and the good old garden flowers will continue to delight mankind and justify the labours of the florists.

It is interesting to note that two great authorities give the florists full credit for their making of the flower that has thus far occupied our attention to-day. Turner, writing about 1550, says: "The garden gelouers are made so pleasaunt and swete with the labours and witt of man, and not by Nature." And Withering, in the eighteenth century, wrote: "The art of floriculture, sometimes despised with a reprehensible degree of fastidiousness, has in this instance transformed a plant, comparatively obscure, into one of the most delightful charms which the lap of Flora contains."

#### CLERODENDRON BALFOURIANUM.

HAVING grown the above as small bushy plants in 5 and 6-inch pots for some years past, I can safely recommend it as being the most effective and useful plant for indoor furnishing that I am acquainted with. This is especially the case in spring and early summer, its natural time of flowering. Although I have found it to be very accommodating, I have had it in bloom continuously for six months simply by keeping the plants back in dry positions with a temperature of about 50°. The effect produced by a number of these in a mixed collection of plants is very telling and brilliant, and I venture to predict that when its merits in this small form become better known it will be grown very extensively.

Its culture is easy, the chief point requiring attention being persistent stopping while growing, even from the cutting stage. A shallow pit I have found to be the best place to grow them in, where they can have plenty of light and be near the glass. Good

loam, peat, and Mushroom dung in equal proportions, with a liberal sprinkling of sand, is the best compost for them. When the plants are considered large enough they will remain healthy in the same sized pots for years if assisted, at the commencement of growth and when the bloom is forming and expanding, with liberal supplies of Clay's fertiliser. I have not grown it in the standard form, but hope to do so next season.—D. THOMAS, *Drayton Manor Gardens.*

WE have received the first part of the "ORCHID ALBUM," the projected publication of which was recently referred to in these columns. The style and general execution of the part now before us fully confirms the opinion we expressed—*i.e.*, that it is likely to be a really useful and handsome work. Coloured plates of *Oncidium concolor*, *Lælia Schröderii*, *Cattleya Mendelii grandiflora*, and *Epidendrum vitellinum majus* are admirable, depicting the chief characters of the plants, though in two instances the exact tints have scarcely been obtained. This is not surprising, for Orchids of all flowering plants are the most difficult to represent faithfully in this respect. As regards the delineation of form all the plates are very satisfactory, and the slight difference in the shade mentioned is practically of no importance. Full botanical descriptions accompany each plate, with references to synonyms, authorities, and other works where the plants have been figured or described. In addition, much general information is given concerning their history and culture, rendering the book at once scientific and popular.

— THE following extract from the above-mentioned work upon the culture of *ONCIDIUM CONCOLOR* will indicate the scope of the instruction given, and may also prove useful to some of our readers:—" *Oncidium concolor* succeeds best in a compost of peat with a little sphagnum moss added, and with plenty of good drainage. We have grown it most successfully in small pans, but it can be cultivated either in a basket or on a block. It would succeed equally well in a pot, but the drooping character of the flower spikes renders it a most fitting subject for growing in either of the above-named receptacles, and for suspension from the roof. As to temperature, we find it succeeds best in the *Odontoglossum* house during the summer months. After it has flowered, and while it is making its growth, a copious supply of water should be given to it, always keeping the soil moist until the growth of the bulbs is completed. When it has finished its growth it should be removed to the *Cattleya* house, where it should be kept moderately dry until it produces its spikes, about March or April."

— IN the Cape House at Kew the very distinct Bellflower, *CAMPANULA VIDALII*, is now very attractive, a number of plants in pots being arranged on the side stages. It is a semi-shrubby or woody species from the Azores, where it was found growing upon a rock on the east coast of Flores by Captain Vidal, after whom it is named. It has narrow somewhat spatulate leaves with serrated margins, the flowers being white and glossy, bell-shaped, but curiously contracted in the middle. They are produced very freely, and when the plants are in such condition as those at Kew they are important and valuable additions to any cool house.

— IN the new Victoria house of the same gardens a pretty ally of the *Mussaendas*, *HOWARDIA CARACASENSIS*, is also flowering. It is of shrubby habit, having elliptical light green leaves and axillary or terminal rosy-coloured tubular flowers about

1½ inch long, each attended by an ovate bright rosy appendage, which is really one lobe of the calyx greatly enlarged. A number of flowers being produced together imparts a pleasing appearance to the plant, and it would form a suitable companion for *Mussaenda frondosa*, the bright rose colour of the one affording a striking contrast with the white and yellow of the other.

— MR. LAXTON of Bedford sends the following account of AN ECONOMIC MODE OF GROWING POTATOES:—" I have recently seen a plan adopted by a cottager of growing together in alternate rows early varieties of Potatoes with the late strong-growing sorts, such as Early Rose or Myatt's Prolific Ashleaf, in combination with *Magnum Bonum* or *Champion*. The Potatoes are planted in rows 2 feet apart, the varieties alternating; the early sorts can then be dug some weeks before the later varieties are fit, and these, after the earlies are harvested, have an additional earthing-up and find plenty of time and room to develop a full crop; the intervening space from which the early Potatoes have been removed being utilised for growing Brussels Sprouts, Broccoli, Turnips, or other fall crop. The plan is the most practical and economical I have yet seen for obtaining the utmost quantity from the least ground, and securing a successional green crop in the same season. The matter seems worth the attention of field and market growers, and I intend trying it next year in the Experimental Grounds at Girtford. In Bedfordshire with light crops, Early Rose, Shaw's, and other early varieties of fair quality have this season scarcely realised an average gross return of more than £4 per ton, and with such prices and seasons it will be impossible to grow the Potato remuneratively in this country and to keep pace with foreign competition, unless every available means be resorted to for obtaining increased quantity of produce as well as improved quality, the varieties being also especially selected as suitable to English tastes—a desideratum which the imported sorts do not at present generally supply."

— AT Chiswick now there is a brilliant display of Tuberos Begonias, many being seedlings of great promise and of various shades. One that especially deserves notice is *BEGONIA QUEENIE*, which has large rose-tinted flowers that are borne very freely, and the plant being of vigorous yet fairly compact habit renders it additionally pleasing. The colour is very bright and clear indeed, when as we recently saw it the variety can scarcely be surpassed. The Floral Committee of the Royal Horticultural Society, when recently visiting the gardens, signified their opinion of the merit of this variety by awarding a first-class certificate for it. Several orange, pink, and scarlet forms also possess considerable merit.

— MR. E. WILSON, Hardwick Hall Gardens, sends the following upon *PRIDE OF THE MARKET PEA*:—" Anyone in want of a really good dwarf Pea should grow this. I had a packet of seed this spring, which was sown April 23rd, and the plants are now (July 23rd) bearing an extremely fine crop of pods. The pods are like *Ne Plus Ultra* but longer, with nine peas in a pod, of a deep green colour, and when cooked of first-class flavour; it is equal to any other dwarf Pea that has come under my notice."

— THREE very pretty small-flowered Begonias are *B. RICHARDSIANA*, *B. NATALENSIS*, and *B. SCHMIDTII*, all of which are flowering at the present time in some large collections. The two first-named have small white flowers produced in great abundance, *B. Richardsiana* having also very neatly cut leaves. Both are of slender habit, but make handsome little specimens when well grown. *B. Schmidtii* is especially remarkable for the compactness of its habit and the slight metallic lustre the leaves possess. Young plants in small pots are very useful, and they continue blooming for a considerable time.

— A HANDSOME specimen of the remarkable Orchid *VANDA*

(RENANTHERA) LOWII, which stands about 6 feet high, is now in flower at the Victoria and Paradise Nurseries, Upper Holloway. It has six long flower spikes, one at the present time exceeding 7 feet in length, and has about 194 flowers and buds. This plant will be in flower for several weeks, and should be seen by every Orchid-grower.

— A CORRESPONDENT of the American Gardener's Monthly has the following note upon *ÆSCULUS CALIFORNICA*:—"No one travelling along the foothills of our mountain ranges in spring will fail to remark the bright green colour of our common California Buckeye, nor to note the light rose tint of its blossoms. One of the first to bud and leaf, it is also one of the first to catch the eye at the opening of spring. It is somewhat remarkable that the *Æ. californica* is not more extensively cultivated as an ornamental tree (or perhaps I should say shrub) in our landscape collections. True it supports its bright green colour but a short time, but its beauty for this short period, when most other deciduous trees are so bare, will surely compensate one for the labour expended on its planting and culture. It is propagated from the seed, and flourishes best in a gravelly soil, such as is found in the foothills of the Sierra Nevada and Coast Range mountains. The nut, though considered poisonous in its crude form to both man and beast, is largely used by the Californian diggers as food."

— THE same periodical gives these remarks upon HYBRIDISING PITCHER PLANTS:—"The finest set of hybrid *Nepenthes* I ever saw was at Such's Nurseries, South Amboy, N.J., and some of these same hybrids are named, figured, described, and sent out by English nurserymen; but in no case have I seen the credit given to the raiser—namely, Mr. James Taplin, of Maywood, N.J., and who was for years manager of Mr. Such's place. Certainly Mr. Taplin is an Englishman, and one of the best practical gardeners who ever came to America, but the work he does in America we will claim as American."

— WE are desired to announce that the fifth annual Exhibition of the St. Giles's CAMBERWELL AMATEUR FLORAL SOCIETY will be held at Camden House, Peckham Road, on the 8th, 9th, and 10th of August.

#### WHAT PLANTS USE.

(Continued from page 30.)

**WATER.**—Water is always present in the atmosphere. Air at a temperature of 32° is saturated with a 160th part of its bulk of water. Saturation is the point at which, were more water added, it could not be held in solution, but would appear as mist, fog, or dew. The same phenomenon occurs if the temperature be suddenly lowered; it is then incapable of holding it in solution and the water is precipitated. It is found that the capacity of the air for water is doubled by every rise in the temperature of 27°—that is to say that air, which at 32° is saturated with a 160th part of water, if raised to 59°, instead of being moist it will be dry and capable of containing an eightieth of its own weight. Again, if air at 59° containing an eightieth part of water be raised to 86°, it will be very dry and capable of containing a fortieth part.

Moisture in the atmosphere is very necessary to plant life, and when it is absent vegetation is impossible. General readers are all acquainted with the deadly nature of the simoom, and its destructive nature is in great part owing to the fact that it is singularly deficient in moisture. With a capacity for a thirtieth part of its own weight of water, it frequently contains no more than a fifteenth of that amount.

When air is too dry it absorbs the moisture from plants with greater rapidity than it can be replaced by the roots and flaccidity ensues, than which no more weakening influence can be brought to bear on plants. Out of doors well-rooted plants, which grow in soil fairly moist, seldom fail by over-evaporation. The fact is, even in dry weather the air seldom contains less than two-thirds of the maximum amount which it is capable of containing, and it is often saturated. Unless the air is completely saturated evaporation always takes place from plants; for this reason it is not a good plan to put out even well-rooted plants in dry weather. The time to do it is when the air is near saturation point, for

then the plants will strike root readily. Cuttings make roots quicker when covered by bellglasses or close case for the same reason; indeed, many kinds of plants fail to root unless the tops are continually surrounded by an atmosphere containing the maximum amount of water of which it is capable of holding. Such tender plants as Melons and Cucumber plants and forced Vines are in winter, frequently suffer in early spring from the extreme dryness of the air. It happens very frequently that, with the air below freezing point in temperature, a clear sun shines and raises up the temperature of such houses considerably. Shading we all instinctively avoid if we can, for we all know it is an evil which results in tender growths, which cannot bear hot sun or dry air, nor yet produce the best results in the production of fruit or flowers. Ventilating is dangerous because of its admitting air destructive in its coldness and aridity. Scorching we cannot risk, and we are often in doubt what should be done. Often we forget what is wanted to prevent the excessive evaporation which causes flaccidity. Air with often less than a three-hundredth part of water, when admitted, even in small quantities, to a structure where the temperature is between 80° and 90°, soon approaches in its character the simoom. It is not enough to add heat; it is not even enough to add the necessary carbon—exhaustion, swift and sure, will follow unless a due amount of water be also added. No structure is fit for forcing purposes unless proper provision is made for the admission of air warmed and moistened.

Different subjects require different degrees of moisture in the air. The saturation which is necessary for the Pitcher-plants and Orchids from the steamy shady groves of the tropics would prove ruinous if applied to the Vine, which thrives in the clear sunshine and arid air of inland Spain and Italy. Generally speaking the nearer saturation point the atmosphere of an Orchid or *Nepenthes* house is, at least when the plants are making their growth, the better. If the air of a vinery contain about two-thirds of the water it is capable of holding it is too moist—warty excrescences will follow, the elaboration of sap be sluggish, and the general results unsatisfactory. When the leaves of Vines are young and tender and the sun is powerful a little more ought to be allowed, but in the case of Vines after the leaves have gained substance much less will suffice—indeed will be preferable, for then with plenty of air, heat, and light, growth in its true sense will go rapidly on. We do not mean that the air should never contain more than that, for we think that nightly dewings are of great benefit.

This leads to a few words on dew. In tropical regions, whence most of our hothouse plants come, and even in the warmer parts of the temperate regions where Vines, and Peaches, and other plants grown under glass at home thrive outside, the days are hot, clear, and dry; the nights cool and moist. We do our best oftentimes to reverse this in our vineries. We "damp down" and "sprinkle" even when days are dull and the temperature low. Moisture in the air is necessary, but too much is hurtful, and often we keep the air moist during daylight to a hurtful extent. Nature teaches us the opposite. By night we, in too many instances, keep up a high and a dry temperature. Nature teaches us the opposite. In our remarks on air, &c., we tried to show how high night temperatures undo the previous day's work. Not only so, but high night temperatures cause exhaustion as well, and even by daylight they fail to go forward as under more natural treatment they would. After a hot day Vines and other plants need rest and refreshment. Why deny them? Under even tropical skies the nights are cool, and plants are bathed copiously by an abundant dew. Under this bathing flagged plants recover their freshness and prepare for another day. This we should imitate.

It is easily done. If after a hot dry day we sprinkle water over a vinery floor and open all the ventilators the Vines will be dripping with dew by morning. The reason is this: The air in the vinery at the close of a hot day is warm and its capacity for water great. When water is sprinkled about the air takes up much of it and retains it. When the cool night air is admitted by the ventilators the air inside is cooled and its capacity for water reduced; it becomes saturated and ready to deposit its water. Moreover, the air cools the Vine leaves more rapidly than the stages, borders, walls, or paths, and therefore the moisture-laden air coming in contact with the cool leaves deposits part of its load and the Vines become covered. Should there be any heat in the pipes this will not occur, however, for then the capacity of the air for water will be maintained, and the moisture will be passed out by the ventilators instead of being deposited on the leaves. Even with closed ventilators the dew will be deposited, always provided the sky is clear and the outside air cool. A damping of the back wall in the case of lean-to vineries will help the deposition of dew greatly, for the wall will retain its heat after the Vines have lost theirs; hence the air will gain

heat and moisture when in contact with the wall, and part with both when in contact with the cooler Vines. But we prefer, for reasons stated elsewhere, to keep open ventilators, in summertime at least.

What is true of the deposition of dew on Vine leaves is also true of almost everything else under glass. In the case of Melons and Cucumbers, however, it is wise to have a higher minimum temperature than for Vines. Anything between 40° and 55° we consider to be high enough during darkness for Vines; anything higher we consider hurtful. With Melons the case is different. Vines will receive no check by being subjected to a temperature of 45°, but Melons will. Moreover, Melons will rest in a higher temperature than Vines: it is, therefore, not necessary to give Melons ventilation at night unless the weather be very mild. A good sprinkling, and when necessary syringing, will load the air with moisture. All that is necessary in order to bathe the Vines with it is to let the temperature rise to 90° before night and fall to 60° by night. Melons otherwise healthy will be greatly benefited by this treatment, especially in hot weather. Some people—indeed many of our very best gardeners—consider 70° a proper night temperature. We are of an opposite opinion. Unless there is need for hurry in order to have the first ready by a given date we think 60° high enough, and all things being equal otherwise, we have found Melon plants so treated stouter, more robust, and to finish off finer fruit. Indeed the air in our pits is down in cold mornings to 55°, and even lower, without ever harming the plants that we could see, but the very reverse. It is not a good plan, though, to allow the bottom heat to fluctuate greatly. In nature the air has a wide range of temperature, but the soil heat is much steadier, and a lesson is thereby read to us which we would do well to learn and practise accordingly.

Perhaps we should in this place say a word on syringing. Syringing to remove insects is a very necessary operation. Insecticides are commonly applied diluted with water by means of the syringe. These are subjects which have been treated on again and again, and it is not our intention to say anything of them under our present heading at least: we merely mention them here that we may not be misunderstood. We repeat that syringing with pure water to remove insects, and also that the employment of the syringe in the distribution of diluted insecticides, are necessary. What we wish to discuss here is the damping or syringing of plants. We do not think the practice good—at least as it is generally done. It is far better to damp them with dew than to do it by means of the syringe. True, in a majority of plant houses plants would never be covered by moisture unless syringed. In that case it is the great heat that is to blame. In numberless cases the moisture which is applied by the syringe to plants in stoves, and even vineries, late in the day or early in the evening is all dried up in the course of an hour or two. When this happens harm is done. Nature at night gives moisture to the plant by the air. Many cultivators reverse this. Instead of supplying the plant with moisture by night from the air, the capacity of the air for water is maintained at a point at which it abstracts water from the plant. This is all wrong, and it is unnatural; indeed, we do not know whether syringing under such circumstances is not an evil. Under natural conditions syringing is quite unnecessary: under unnatural conditions, such as a too high and dry an atmosphere, it seems at first sight as if it could only do good. It certainly tends to bring the air, for a time at least, to saturation point; but it is an evil when the drying influence of hot-water pipes causes its speedy evaporation from the moistened plants.

It often happens during the dull days of winter that there is more moisture inside glass houses, especially those kept at cool greenhouse temperatures, than is good. Damping-off of Primulas and other soft plants, moulding of Grapes, &c., are caused by this state of matters. To prevent dampness free ventilation in bright weather with a little fire heat should be given. In winter there is often little sunshine, and very often the air is very near saturation. Inside the structures, in the absence of either fire heat or sunshine, the air is very similar—only worse, for the constant circulation outside helps matters: inside the occasional waterings aggravate them. The cure is fire heat. Fire heat or sunshine, no matter how little, will raise the temperature inside a few degrees above the outside air, and by that means increase its capacity for water. When this is the case the air will begin to absorb moisture, and if the top ventilators be opened this warmer air will pass out, carrying its load of moisture with it. That which enters from below being colder has not the same capacity, and though apparently containing more than the inside air, actually contains less. On being admitted its capacity is increased, and it in its turn absorbs and carries its quota of water away. This is the case even when the outside air is damp, but it is always best to take as

much advantage of bright weather for doing all necessary watering and for drying up damp. Even in wet weather houses which are kept at a high temperature need damping. All that is wanted to prevent damping off is a little heat to warm the air and a little ventilation to keep it circulating.—SINGLE-HANDED.

(To be continued.)

### CUNONIA CAPENSIS.

HORTICULTURAL visitors to the Duke of Northumberland's celebrated Syon House Gardens may invariably rely upon seeing much that will interest them, and if they be favoured with the company of the courteous and able gardener, Mr. Woodbridge, it will be strange if they do not add some items of knowledge to their store. All departments are well managed and satisfactory. In the numerous vineries and fruit houses we see good crops of Grapes, Pines, Melons, Figs, and Peaches. The kitchen garden is clean and well cropped, the plant houses gay with healthy and freely flowering specimens, the flower garden bright and effective, and the park is always beautiful, but especially in the summer, when the stately trees are in the best condition. To refer at length to each of these departments would fill several pages, not perhaps unprofitably to some readers, but for the present a brief note upon a remarkable and handsome tree recently flowering in one of the houses must suffice.

*Cunonia capensis* is not very frequently seen in gardens now; indeed it was better known twenty or thirty years ago, and though one of the most beautiful flowering trees that can be grown in a conservatory, greenhouse, or similar structure, it appears to be comparatively rare. Probably one reason for this is that the propagation has been found rather difficult, yet the tree is of free growth, and attractive even when not flowering, and would well repay for any attention bestowed upon it. The conservatory at Syon possesses a specimen which is reasonably believed to be unrivalled in this country, and when bearing some dozens of its long close racemes of white flowers the effect produced is really magnificent. I was fortunate enough to call upon Mr. Woodbridge when the tree was in its best condition, and though it did not occupy the most favourable position, being partly hidden by other trees and shrubs in front, it was yet surprisingly beautiful. The specimen is about 15 feet high in a large pot, and bears pinnate glossy green leaves, and racemes in some cases nearly a foot in length. The species is, as its specific name implies, a native of the Cape of Good Hope; it has been in cultivation over sixty years, and the genus constitutes the type of a natural order allied to the Saxifragas. The following extract from Burchell's Travels in Africa may be of interest—"This is a handsome tree, with fine shining green foliage, contrasted by numerous, dense, elongated bunches of small milk-white flowers, and twigs of a red colour, having the habit rather of a tropical than of a Cape plant. Its colonial name is Rood Elze (Red Alder), although the tree has not, in any point of view, the least resemblance to the Alder of Europe; but the waggonmakers say there is some similarity in their wood. I am inclined, however, to believe that the name was given rather in consequence of their growing in similar situations."

The woodcut (fig. 16) faithfully represents a raceme and leaf from the Syon specimen, and the effect of such a tree in full flower can be better imagined than described.—L. CASTLE.

### ROYAL HORTICULTURAL SOCIETY.

JULY 26TH.

RARELY are there so many diverse and concurrent attractions in the Society's Kensington garden as was the case last Tuesday, when, in addition to the ordinary meetings of the Fruit, Floral, and Scientific Committees, the arcades and corridors were occupied with a medical and sanitary Exhibition, and the British Bee-keepers' Association's Show. The horticultural portion was somewhat limited it is true, but visitors found plenty both to interest and instruct them in the combination of exhibits.

FRUIT COMMITTEE.—Harry Veitch, Esq., in the chair. The duties of the Committee were not at all arduous on this occasion, for the contributions were comparatively few, yet, though not extensive, they were mostly of good quality. The chief feature was a collection of Tomatoes in pots from Messrs. James Carter & Co., High Holborn, comprising a large number of varieties, all the best in commerce being represented, both large and small-fruited forms. Of the latter the Red Currant was particularly noteworthy from a decorative point of view, as the long racemes of small globular bright red fruits were very attractive. Several varieties with yellow fruits were also shown. Among some new varieties was one named Dedham Favourite, and this was deemed by the Committee worthy of a certificate, which was consequently awarded for it. The fruit is bright

Fig. 16.—CUNONIA CAPENSIS.

red in colour, globular in form, very even without any corrugations, and attains a good size. The plant also appears to be prolific, for a small specimen was bearing over a dozen large and handsome fruits. The collection was deservedly awarded a silver medal.

Another exhibit of some interest was a collection of about forty varieties of Gooseberries from Mr. J. Walker of Thame, Oxon. Numerous very distinct forms were shown both of the yellow and red types, among the latter the small dark-coloured form known as Ironmonger being noteworthy; it is a variety of good flavour, but not equal to Red Champagne. A vote of thanks was accorded for the collection. Mr. Hutchings, Rickmansworth Nursery, sent some examples of a Pea called Challenge the World, which was characterised by the Committee as a good stock of Ne Plus Ultra. Mr. J. Salter, gardener to J. Southgate, Esq., Leigham Court Road, Streatham, contributed a new scarlet-fleshed Melon named Champion. It was stated to be the result of crossing Read's Scarlet-flesh with Eastnor Castle, and it resembled the latter parent in size. The fruit was, however, deficient in flavour, though the flesh was solid and of good depth.

FLORAL COMMITTEE.—James McIntosh, Esq., in the chair. Messrs. J. Veitch & Sons' group of new and rare plants constituted the chief attraction in the Council-room, and were much admired both by the horticultural and other visitors. A pretty little collection of the small-flowered *Phalanopsis violacea* was shown, ten plants in pots being staged, all flowering and in excellent health. We understand that Messrs. Veitch have secured a large stock of this attractive species, which, though not entitled to rank among the finest forms of the genus, yet possesses a quiet beauty that is very pleasing. The leaves are bright glossy green, and the flowers small, scarcely 2 inches in diameter, the upper petals and sepals being greenish white, and the lower with the centre of the flower bright rosy purple or crimson. A handsome vigorous specimen of the well-known climbing Liliaceous plant *Gloriosa superba* was also shown trained over a flat trellis 3 or 4 feet high. It was bearing several of the characteristic orange-coloured flowers with curiously twisted petals. The charming variegated plant *Phyllanthus roseo-pictus* was represented by a well-coloured specimen, the oval leaves being very clearly mottled with bright rose, white, and green. A small group of Liliums, and several plants which were certificated and are described below, completed the collection. The Lilies were *L. auratum* and its beautiful varieties *virginale* and *platyphyllum*, which were certificated last year.

Messrs. H. Cannell & Sons, Swanley, contributed a fine stand of Verhena blooms, comprising some dozens of distinct varieties—light and dark purple, lilac, mauve, pink, scarlet, and crimson, some being striped. Very large and handsome African Marigold blooms were also shown, some 4 inches in diameter, globular, and even in form and brightly coloured. Mr. B. S. Williams, Upper Holloway, sent a new Maranta named *M. Leitzei*, the leaves being elliptical in form, purple on the under surface, and striped with light and dark green on the upper surface. Mr. H. Eckford, The Gardens, Sandywell Park, Cheltenham, exhibited several seedling Begonias, Coleuses, and Pelargoniums, among the latter the best being *Apelles*, a deep scarlet form with a very large truss. Messrs. Hooper & Co., Covent Garden, sent a plant of the double pink-flowered Ivy-leaved Pelargonium *Madame Crousse*, and a rich scarlet *Canna* named *Nardy*. Mr. Hodges, gardener to Edwin Wright, Esq., Gravelly Hill, Birmingham, was accorded a vote of thanks for a flower spike of *Oncidium Lanceanum*, the blooms being of great size, and the contrast between the lilac-purple lip and dark chocolate sepals and petals strongly marked. Mr. J. Cloke, gardener to J. Tinné, Esq., Briarley, Aigburth, Liverpool, was accorded a similar recognition for a new *Croton*, the result of a cross between *C. Weismanni* and *C. Disraeli*, the leaves resembling the latter in form, but possessing more of the colour of the former. Mr. A. Rundell, 70, Fortress Road, Kentish Town, sent some seedling Fuchsias; several pretty groups being also contributed from Chiswick. The Tuberous Begonias were especially fine, and the cultural commendation awarded for them was well merited. *Torenia*s were also shown in good condition. Some plants of *Cassia corymbosa* were noteworthy, and it is surprising that this showy species is not more frequently seen. The leaves are pinnate, bright green, and the flowers are dark yellow very freely produced. It seems to succeed very well at Chiswick planted out during the summer, and in one of the beds there now some specimens are not only healthy but flowering freely.

First-class certificates were awarded for the following plants:—

*Montbretia crocosmaeflora*.—This was exhibited from the Society's Garden, but it is one of Mr. Victor Lemoine's novelties. It has narrow tapering grass-like leaves 2½ feet high, and bears racemes of bright orange-coloured flowers. It is very free and attractive.

*Tachadenus carinatus* (Veitch).—An evergreen plant from Madagascar, introduced in 1858. It is an ally of the *Gentians*, and is sometimes seen under the name *Lasianthus carinatus*. The flowers are tubular with a spreading limb, or what is termed salver-shaped, the lobes being ovate in form and lilac purple in colour. They are borne two or three together on the top of the stem, and are not unlike some of the *Vincas*. The leaves are oval, an inch long, glossy green, and opposite. The plants shown did not exceed 8 inches in height. Messrs. Veitch also received certificates for *Rhododendron Duchess of Connaught*, one of the greenhouse forms, said to be a hybrid between *R. Lohhi*, *R. javanicum*, and *R. jasminiflorum*, and

for *Ixora Burhidgei*, both of which had been removed from the Council-room before our reporter arrived there.

SCIENTIFIC COMMITTEE.—Rev. H. H. Crewe in the chair. Mr. W. G. Smith exhibited specimens of Pea leaves attacked with *Erysiphe Marshii*, showing the black conceptacles. He observed that it was particularly fatal to late Peas, which could not consequently be grown easily about London. *Puccinia Menthae*.—He also showed specimens of this fungus.

*Effects of Late Frost in Belgium*.—Mr. McLachlan described the great destruction amongst Conifers, Yews, Box, and fruit trees which he had seen in that country. A report was about to be drawn up on the subject.

*Lilium speciosum rubrum*.—Mr. G. F. Wilson showed leaves decaying apparently from wet, chilled, followed by heat of the sun. He also showed a fine spike of *Gladiolus Lemoinei*, a hybrid between *G. gandavensis* and *purpureo-auratus*.

*Pear Fruit and Leaves Diseased*.—The Rev. G. Henslow exhibited a Pear in which hypertrophy of the grit had occurred, and which appeared as an efflorescence at certain spots.

Plants exhibited from Messrs. Veitch.—*Ixora Burhidgei*, with splendid trusses of scarlet flowers with the peculiarity of blossoming a long way down the stem—for about 8 inches—thereby producing a very large mass of flowers; *Lindenia nivalis*; *Crinum Verschaffeltianum*, a large handsome plant with spreading leaves striped with white; *Rhododendron Duchess of Connaught*, a fine new hybrid form of *jasminiflorum* section involving three parentages.

*Proliferous Mignonette*.—Mr. W. Balchin of Hassock's Gate forwarded two fine spikes of his *Reseda odorata prolifera alba*, which received a first-class certificate a short time ago. The spikes had emitted lateral branches, all of which were profusely covered with flowers, these lateral branches all issuing from the middle of flowers and occupying the place of the pistil. The scent was very powerful, and much resembled that of Peach or Apricot.

#### ABOUT PINKS.

PINKS are now in flower, and this is also the time to think about propagating stock for another season's bloom. Considering the sweetness of Pinks it is somewhat remarkable we see so few of them in gardens. Nothing can excel the flowers for filling small glasses, their quiet beauty being only surpassed by the delicacy of their perfume. It would hardly be safe to say that Pinks are difficult to cultivate, for in a sense they are not, but in our garden we have great losses amongst them. Neither Picotees, Carnations, nor Pinks, succeed well unless they are the very strongest-growing sorts. The beautiful Mule Pinks, both the coloured and the white variety, do not thrive well. Any kind reader who has a few of the above white Mule Pinks to spare would confer a great favour by sending me a few cuttings or small plants.

As to propagation. Laced Pinks are propagated just now from pipings. A piping is simply a growth pulled out of a joint instead of being cut through with a knife. These strike root freely out of doors if inserted in a corner where they can be kept quite cool; or they may be dibbled into a cold frame, either in soil placed in the frame or into boxes. It is hardly possible to fix them in the soil too firmly. It must be remembered to shade them closely from sunshine. When the pipings are well rooted they should be planted where they are wanted to flower. *Anne Boleyn*, which we grow extensively for the sake of its flowers for cutting, blooms later than the laced sorts, and I propagate it along with Carnations by layering in August. One of the brightest flowers just now is *Napoleon III.*, which is very closely allied to the Mule Pinks, and like them not easily kept. Then there are the cutting Pinks, of which *Ascot* may be taken as a type—a very useful class for supplying cut flowers, and which are best propagated from pipings inserted at the present time. The double forms of *Dianthus plumarius*, white and pink, are extremely useful, and come into bloom before any of the others.

Of the white there are two forms, one perfectly pure, the other a soft grey when seen in a mass, or when the flowers are cut and tied in bunches. The pure white is the best variety to grow. The simplest method of increasing these is to pull the old plants to pieces in September, at which time the stems are covered with growing roots, and plant them either in nursery lines until spring, or, if convenient, in the places where they are to flower. They make capital edging plants in some positions, either of one colour, or white and pink mixed. We have two rows very beautiful just now, each about 350 feet in length.

Messrs. Dicksons & Co. of Edinburgh have what they term a collection of "cutting" Pinks. We have some of them in flower, the best being these—*Spicata*, a fimbriated white with reddish centre; *Odorata*, fimbriated pink; *Rohusta*, a very fine variety, fimbriated pink; *Beauty*, a miniature *Anne Boleyn*, grows about

6 inches in height, and remarkably free. I think these will all prove worth growing. I intend to propagate them by division in autumn.—R. P. BROTHERSTON.

### CULTIVATION OF THE GOOSEBERRY IN THE NORTH OF ENGLAND.

THE Gooseberry is generally supposed to be indigenous to the island of Great Britain; but whether this be so or not, there is certainly no country in which it arrives at a greater degree of perfection than in the British Islands. It is always found to flourish best in temperate climates, and where the climate inclines to be cold rather than warm. It is not found, for instance, in Africa, in the South Sea Islands, or between the tropics of either hemisphere, but is found in the temperate parts of Europe, America, and Asia. In the southern and central parts of Africa the plant is perfectly unknown, except in some situations where, among the high mountains, the temperature is low enough to suit its requirements. Persons who have resided a long time in India, and who during that time had never seen a Gooseberry or Currant, speak with delight of the European character which these plants give to the scenery of the mountains in the north of that country.

It is not exactly known when the Gooseberry became an object of cultivation in this country, but it had become a garden fruit in the reign of Henry VIII.; for the old writer Tusser, who lived in that reign, says, in his "Five Hundred Pointes of Good Husbandrie"—

"The Barberry Respes, and Gooseberry too,  
Look now to be planted as other things do."

Soon after this period descriptions were given of about a dozen varieties—and among the rest one called the *Blue*, a colour not now found among the hundreds of varieties in cultivation. The fruit was apparently very small when the plant was first brought under cultivation, resembling the small tasteless fruit which is still found in the south of Europe; and in point of size, at least, it does not appear to have improved much for more than a century after Tusser's time, as may be inferred from the surprise expressed by Pepys at seeing Gooseberries as big as nutmegs. At every subsequent period (says an interesting and useful little tract called "The History and Cultivation of the Gooseberry," printed at Sheffield, and from which much of the information in this article is taken) the Gooseberry has claimed a share of attention from horticulturists. It has found a place alike in the garden of the nobleman and of the cottager, and has amply rewarded by its abundant and profitable produce the skill of the gardener, and by its increased size the care of the amateur grower. Indeed, the success which has attended its culture under the spare house of the artisan seems to entitle it to the distinctive appellation of *the poor man's fruit*.

It has been ascertained that under favourable circumstances the Gooseberry will attain to a considerable age and grow to a great size. Bushes have been grown to measure from 12 to 18 yards in circumference after being planted about fifty years. The garden of Sir Joseph Banks at Overton Hall, near Chesterfield, contained at one time two remarkable Gooseberry plants. They were trained against a wall, and the branches of each measured upwards of 50 feet. In this country the plant shows a marked preference to cool situations. The fruit in the southern parts of England is not nearly so good as it is in the north, and in general the flavour of the Scotch Gooseberry is much superior to those produced in any part of England; while in Scotland itself, the Gooseberries grown about Dundee, Aberdeen, and Inverness exceed in flavour those grown in the southern counties.

As far as regards mere size and appearance, however, the Gooseberries of Lancashire are unequalled by any in the world. Growers there have devoted so much attention to them as to have attained to almost absolute perfection in the matter of their cultivation. In the counties of Lancashire, Cheshire, Staffordshire, and Warwickshire, the striking improvement which has taken place in the cultivation of the Gooseberry is to be attributed less to the professional gardeners or market gardeners than to the mechanics who very generally spend their leisure time in the pleasing occupation of gardening, and particularly in the culture of the Gooseberry; and it is to their industry and perseverance that we owe the production of most of our largest and best varieties. The custom of gardening has a tendency to improve both the health and the morals of the people. Any pursuit which makes men acquainted with the peculiarities of vegetable economy, in however small a degree, has a beneficial effect upon the heart and understanding; and it is certainly better for working men to vie with each other in raising large Gooseberries than in those games of chance and in cruel sports to which the leisure hours of the working classes have

been too often devoted. The one is a rational and innocent emulation, the other a degenerating excitement or a brutal indulgence.

The origin of the different kinds of Lancashire Gooseberries is often indicated by their names, which are generally fanciful, often local and personal, sometimes even absurd, but frequently characteristic of the manners of the county in which they are produced. Galloper, Green Corduroy, Tom Joiner, Lancashire Witches, Dan's Mistake, Roaring Lion, Richmond Lads, Cheshire Lassies, Jolly Miner, Porcupine, Jolly Painter, Top Sawyer, Crown Bob, &c., are sufficient specimens. It is not to be expected that so much attention should, however, be given to the cultivation of the Gooseberry in the counties named without the operation of some external stimulus; therefore Gooseberry shows have long been established in different parts of Yorkshire, Lancashire, and Cheshire. The time and conditions of these meetings are determined by certain rules, and the minor details of each show are generally settled in the spring, from which time until the day of the exhibition each competitor entered in the list subscribes a small weekly sum towards the purchasing of prizes. The prizes are sometimes given in money, but often in kind. The exhibition of the fruit and adjudication of prizes generally take place in July or August, and the weight of the different sorts is published in the report of the shows given in the newspapers of the town where the show has been held, while the result of the shows in various parts of the kingdom have for a long time been printed in Manchester, and circulated chiefly among the growers, in what is called "The Gooseberry Book."

We may now state a few particulars to illustrate the progress which has been made in the cultivation of the Gooseberry. About a century ago it was considered an extraordinary thing when a Gooseberry was grown which weighed down the old spade-guinea which was then in circulation. Berries were soon after produced that weighed twice as much; and now, little would be thought of show fruit which would not weigh five or six times as much. The largest Gooseberry on record was a handsome yellow fruit called Teazer, which was shown at Stockport in July, 1830, and weighed 32 dwts. 13 grs. The heaviest red berry on record was the Roaring Lion, exhibited at Nantwich in 1825, and weighed 31 dwts. 16 grs. The heaviest white was a fruit of The Ostrich, 24 dwts. 20 grs., shown at Ormskirk in 1832, in which year the largest red was only 27 dwts. 13 grs. In the same season a seedling green was exhibited at Nantwich of the weight of 30 dwts. 18 grs. To this statement of the weight to which the fruit has sometimes been grown, it may be of interest to add that a seedling plant of reputation has been known to produce when sold upwards of £32. This is a rare case; but it is not at all unusual for twenty guineas to be brought in by the distribution of a single bush.—J. G. W. (in *The Gardener*).

### ORCHIDS IN FLOWER AT KEW.

THE Orchid house at Kew is now looking very gay, and several plants that are now in flower are of special interest. Amongst them during a recent visit we especially noted a grand display of *Aerides odoratum*; their long drooping racemes of pure white flowers which are marked with light lilac are very showy, and the beautiful perfume they exale entitles it to a place in every collection. This species is grown in quantity at Kew, for there were several large specimens in flower. *Aerides japonicum* is a pretty dwarf species, and flowering freely in the cooler house; the flowers are pure white blotched and barred with lilac, and scented similar to *A. odoratum*. This is a very desirable species to grow, and for the greater part of the year it seems well satisfied with the temperature of the *Odontoglossum* house. *Burlingtonia fragrans* is a little gem; the white and yellow flowers are thickly set on a drooping raceme, and are always appreciated whenever in flower. *Cattleya superba* is not often met with in flower; it certainly is worth seeing, as it is undoubtedly one of the best of the genus to which it belongs. It is considered by many to be a difficult plant to manage, but at Kew it seems quite at home growing on a piece of Fern stem suspended from the roof in the warm compartment. The flowers are very showy, the sepals and petals spreading, of a bright purple colour. The lip has a peculiar curve forming quite a hook, colour deep purple; the throat or base of the lip is white with a broad stripe of canary yellow. *Catasetum tabulare* is a peculiar flower; the colour of the flower is not the brightest, but the peculiar tongue-shaped lip gives the flowers a quaint appearance. *Dendrobium Calceolaria* is in good condition; one plant had a dozen long drooping spikes, the sepals and petals are pinkish yellow in colour, the pocket-shaped labellum with its interior blotch of dark brown makes it extremely handsome. *Dendrobium Tattonianum*, an Australian species, is

beautifully in flower; the individual flowers are not large, but when seen with several racemes of flowers fully expanded it is well worth growing. Some species of *Epidendrum* are always in flower, the most conspicuous at the present time being *E. vitellinum*; amongst the others of less value may be mentioned *E. aromaticum*, *E. virens*, *E. radiatum*, and *E. selligerum*.

*Oncidium ampliatum* is a good old kind; the light yellow flowers are very telling, and show off to great advantage amongst the surrounding dark green foliage. *O. sphacelatum* and *O. leucochilum* both do their share towards making the house gay; the same may be said of *Lycaste aromatica* and *L. Deppei*. *Stanhopea oculata* and a species named *grandiflora* were in good condition. The latter may be pronounced to be a first-rate Orchid; the flowers are large, pure white, or creamy white; the peculiar-shaped leathery labellum is faintly marked with crimson. Amongst the other plants in flower are *Cymbidium pendulum*, *Sobralia macrantha*, *Mesospinidium vulcanicum*, *Odontoglossum pulchellum*, *O. cordatum*, and *Masdevallia Harryana*.—W. K.

#### PORTRAITS OF NEW AND NOTABLE PLANTS.

**KNIPHOFIA UVARIA VAR. MAXIMA.** (*Nat. ord.*, Liliacæ).—“This is the plant now widely spread in gardens under the name of *Kniphofia*, or *Tritoma maxima* or *grandis*. Though for garden purposes it has an individuality of its own, I cannot find any characters to separate it specifically from the well-known Red-hot Poker plant, *Kniphofia Uvaria*, from which it differs by its more robust habit, longer and broader leaves, stouter scape and rather longer flowers, with more decidedly exerted stamens and style. The drawing was made from plants which flowered in the herbaceous ground at Kew in October, 1879, which we received from Max Leichtlin, Esq. It is a native of the Orange Free State, whence we possess dried wild specimens gathered by Mr. Thomas Cooper in 1862.”—(*Bot. Mag.*, t. 6553.)

**HECHTIA CORDYLINOIDES.** (*Nat. ord.*, Bromeliacæ).—“This fine new Bromeliad is just like the three *Hechtias* already known (*H. glomerata*, *Gheisbreghtii*, and *argentea*) in habit and leaf, but it differs from them entirely in inflorescence, its minute white flowers arranged in ample panicle, recalling *Cordyline* and *Dasylium* more than any recognised Bromeliaceous type. The genus is exclusively Mexican, and represents in the northern half of the continent *Dyckia* of Brazil and the Argentine territory, from which it differs mainly by its polygamo-dioicous flowers. The drawing of *H. cordyliuoides* was made from a plant that flowered in the Cactus house at Kew in the summer of 1880. We have had the plant some time, and have no precise record of its history, but there is in the British Museum a dried specimen of the same or a closely allied species gathered by Dr. Schott on the Cerro de Maxeana, in the province of Yucatan.”—(*Ibid.*, t. 6554.)

**BEGONIA SOCOTRANA.** (*Nat. ord.*, Begoniacæ).—“A beautiful species, of which tubers were brought by Dr. I. B. Balfour from the dry and hot island of Socotra, in the Indian Ocean, off the coast of Arabia, one of the last places in the world in which a *Begonia* could have been expected to occur. From the geographical position of that island the affinity of this discovery may be conjectured to be either Asiatic or African, and, upon the whole, though referable to none of the sixty sections of the genus founded by Klotzsch and A. de Candolle, it must, I think, be placed in the African one of *Augustia*, from the characters of which it differs chiefly in the male perianth having four segments, in the shorter filaments, rounded top of the anther, in the six lobes of the female perianth (instead of five), and the untwisted arms of the style—characters all of which, except the last, occur in the Natal *B. geranioides*, to which *B. socotrana* is unquestionably closely allied. This is only one of the many most interesting plants brought by Dr. I. B. Balfour from an island which he alone has had the good fortune to explore, and the publication of the results of which exploration are awaited with impatience by botanists no less than horticulturists. The Royal Gardens are indebted to Dr. Balfour for tubers, which he liberally presented to that institution in April, and which flowered in December, a season when such a plant is doubly welcome to the cultivator, as the similar *Begonias* of the Andes, which make so magnificent a show in the conservatory during the summer and autumn months, are then all long past flowering. It is easily propagated by its tubers, and as the Kew plants continued in flower for two months in a warm conservatory, it will doubtless prove a great favourite.”—(*Ibid.*, t. 6555.)

**MUSSCHIA AUREA.** (*Nat. ord.*, Campanulæ).—“This is the most beautiful of the indigenous plants of Madeira, of which Mr. Lowe, in his *Manual of the Flora of that island*, says—“Nothing can exceed the singularity and splendour of a fine panicle as it occurs on its native rocks; almost wholly of a rich golden-yellow,

and shining as if varnished, in full contrast with the equally bright shining dark green foliage.’ And again—“Had this plant grown in Italy, it might well be supposed to have suggested the idea of the famous golden branch of the Cumæan Sybil to the Roman poet.’ Though more beautiful, in point of singular appearance it falls short of its only congener, *M. Woollastoni*, also a native of Madeira, which has larger and very pale flowers, surmounted by a columnar green style with five spreading and recurved arms, each one-half to nearly an inch long. With regard to this last species, it may be well to record here Mr. Lowe’s observation (*Manual*, p. 577) that the flowers in its native state are much more coloured than under cultivation, and the corolla is of a dull ochreous yellow streaked with dull red, giving it somewhat of a purpurascence or lateriteous tint. *M. aurea* is a common plant on the sea cliffs of Madeira, and also ascends the ravines, rooting deeply into fissures of perpendicular dry sunny rocks. It was introduced into England in 1777 by Masson, a collector sent from Kew to South Africa, who visited Madeira *en route* to his destination. The specimen figured flowered at Kew in July and August of last year. The whole plant abounds in milky juice.”—(*Ibid.*, t. 6556.)

#### GARDEN GOTHS AND FLORISTS’ FLOWERS.

IN a peculiar mixture of gospel and gush a contemporary informs us that all the horticultural papers, save one, have become “advocates of weeds,” and that it is “our bounden duty to warn the public against these Goths of the garden, because they are preachers of mortification and aim at the revival of flagellation in the world of taste and beauty.” Very neat that; nothing verbose about it, but pithy, perspicuous, and clear. How the florists will like it, practical men that they are, and haters of nonsense!

In future there must be no discussion on flowers in the gardening press. Everything is settled by our infallible dictator in his little “world of taste and beauty.” Editors, be careful. If a writer thinks a blue flower is prettier than a red one it is your opinion, not the writer’s, and you are the “advocates and exponents of blue.” This is very serious, and you will become “preachers of mortification,” for, of course, what your correspondent may consider right the oracle will rule wrong; it is his “bounden duty” to do so.

I would not have you, Mr. Editor, distinguished as a florists’ nurse; but even at the risk of this I think you will permit me to say a word in favour of florists’ flowers, just as you have permitted others to extol them. Nay, you cannot be an enemy of these flowers, for have you not prepared a manual upon them, which has been more largely circulated than any work of the kind in our language? But much as I love these flowers I decidedly refuse to go frantic if some individual prefers a single Rose to a double one; yet for the so-called florists’ flowers I claim pre-eminence. They are beautiful in themselves, in their colours, markings, symmetry. They to my mind represent the tractability of Nature, which is guided to an end by the act of man. They remind me of worthy men of the past—devoted, persevering students of Nature, who have laboured long in the cause they loved, and have written their names in living colours and on tablets which, if fragile in character, are durable, and if old are yet new every summer. Such associations as these impart a charm to the flowers that enhances their value. I have grown them long and exhibited them, even from youth upwards to the time of the “sere and yellow leaf,” and I hope to love and grow them to the end. What have we amongst flowers more magnificent than the Rose, more stately than the Hollyhock, more noble than the Dahlia, more charming than the Carnation, more refined than the Auricula, more brilliant and varied than the Pelargonium? and there are others in their way as beautiful as these. It is my experience that whenever these flowers are seen in their best condition they are admired greatly by the majority who inspect them. I wish that more would become cultivators as well as admirers. The occupation is as healthy as it is delightful, and not the less so because the pleasure is not a selfish one. Every true florist desires others to emulate him and excel him if they can: hence the societies that are established, and which deserve support and success. A wider brotherhood is hoped for and worked for, and if half the inhabitants of this island were enrolled in the florists’ ranks the results, I am convinced, would be distinctly and decidedly beneficial.

I do not ask you to endorse all that I say, Mr. Editor; nor desire your correspondent “SINGLE-HANDED” to cease his arduousness for his wildings. The bomb he has thrown in the camp and caused such consternation will do no real harm to earnest men. His flashes of fancy may be too much for the unstable, and may lead to temporary mental derangement of those of ultra sanguine temperament; but the effect on the great body of cul-

tivators will be to stimulate to further effort, and determine that the flowers they cherish shall not be overgrown by pretty weeds, nor even the sweet wild Rose.—L. M.

[Our correspondent's remarks are just; we are true gardeners, and can admire single or double flowers alike according to their merits, and hence we afford scope for the discussion of these or any other horticultural subjects that are capable of being treated from different points of view.—ED.]

#### NOTES ABOUT CHRYSANTHEMUMS.

THERE can be no doubt that the Chrysanthemum is a general favourite and popular flower, except with those who admire flowers only for their fragrance. I know ladies who would prefer a single spray of Mignonette or Lily of the Valley to a barrowful of Chrysanthemum blooms, yet they tolerate their growth because they produce a display as well as variety, thus adding cheerfulness to houses or conservatories during the dark gloomy days of November and December. They are invaluable for many purposes of decoration, and to do without them where flowers have to be produced in abundance at that season of the year would be almost impossible. When large blooms are grown for exhibition they certainly are very beautiful when staged, but are nearly useless for other kinds of decoration. They look very well in large houses amongst Camellias, Ferns, Palms, and other large plants, and yet in many gardens they could not be accommodated; if they could I cannot see the utility of growing plants for this purpose on the same system as if growing for exhibition. A plant grown, say, from March to November to produce one bloom, or at the most three, is not a system that is ever likely to become general with those who grow the plant for usefulness or for effect. Again, the Chrysanthemum certainly looks beautiful where trained to represent a pincushion with a number of pins neatly arranged. Such plants may gratify the taste of those who admire formality. This sort of training will now be occupying the attention of exhibitors until November; it is considerably overdone, and the plants when finished are most unnatural-looking objects that can possibly be imagined.

The grower for cutting and decoration is often ridiculed by those who practise the close training because his plants are not so neatly trained; the exhibitor forgets the two have different objects in view. One grows the plants so that when staged with others the whole is in harmony and the taste displayed effective throughout; the other grows for public exhibition. Arrange these formal plants with others for effect, and they break the display and look anything but beautiful. I once grew a number of close-trained specimens, and after all the labour in training I was disappointed with them when they had to be arranged with other plants. My only object in alluding to this formal training is to deter cultivators who intend growing for decoration, and have decided to have formal plants for that purpose after seeing them at some past exhibition. The labour spent in growing half a dozen close-trained plants is as much as need be spent in growing fifty others more suitable for effective decoration.

Plants propagated now or any time during the next two weeks make capital specimens for arranging with plants of a dwarf nature. They root readily if kept close in a frame and shaded during the day from strong sun. Cuttings of Pomponé varieties should be inserted in 5-inch pots, about six in each pot, and the whole when rooted allowed to grow on together. The large-flowering kinds, such as Elaine, Empress of India, Queen of England, and others, can also be grown on the same system if deemed advisable, or singly in 4-inch pots. They should be grown on without stopping when rooted, and each large-flowering kind should only be allowed to carry one bloom, all others being removed as soon as they can be seen. The Pomponés need not be so severely disbudded. James Salter is a capital early-flowering kind, and when a few cuttings are grown, as recommended for the Pomponés, they look remarkably well. When well rooted and hardened off they must be grown outside and treated the same as the general stock.—SCIENTIA.

#### KITCHEN GARDEN.

POTATOES of the earlier varieties are, from the unusually long period of dry weather, quite ripe, and should be taken up at once, as

with a change to wet weather it is very probable the disease will attack them. The tubers required for use should be selected and stored away, while those for seed may be placed in an open shed so that they may be thoroughly dried; the ground will then be available for Brassicas for autumn, winter, or spring use, which should now be planted with as little delay as possible, also late crops of Broccoli. Cauliflowers for late use and lifting for protecting in frames may still be planted. Sow Cabbage seed from the 6th to the 8th of next month for the main crop, pricking off the earlier-sown as soon as fit; the advantage resulting from this treatment amply compensates for the time occupied in its performance. About the 10th of next month the main sowing of Tripoli Onions should be made, also Winter or Prickly Spinach, allowing a distance of 18 inches between the rows. A sowing should be made of Lettuce for late autumn and winter use of such kinds as Hicks' Hardy White, Bath or Brown Sugarloaf, All the Year Round, and Stanstead Park. Carrots for spring use may now be sown in drills about 10 inches apart in a somewhat sheltered situation where the soil is of a friable nature. Another good breadth of Turnips should be planted in an open situation—Early Snowball, Six Weeks, Veitch's Red Globe, and Orange Jelly being suitable varieties. Sow Chervil and Corn Salad, these will now stand for late use. Continue to sow Endive, making the last sowing the first week in next month, and where this is in request a good breadth should be planted from the earlier-sown plants. Take advantage of suitable weather for earthing up early Celery, but before doing so make sure that the roots are in a sufficiently moist soil to ensure vigorous growth. Late Peas, also Runners and Dwarf Beans, should receive a liberal supply of water or liquid manure to keep them in bearing, as they require in dry weather a good soaking at least once a week. To have Cos Lettuces in good condition it is a good plan to mulch the soil with half-decayed manure between the rows, and water the whole surface occasionally. Autumn-sown Onions, Shallots, and Garlic may be taken up when growth has ceased, spreading the bulbs on the ground for a few days so that they may be well dried before storing. Cut and tie up Basil, Marjoram, and other herbs for drying when they are in flower and quite dry. Attend to stopping and thinning Gherkin and Ridge Cucumbers, allowing them sufficient moisture, similar remarks applying to Tomatoes, the laterals of these being kept closely pinched.

#### FRUIT HOUSES.

Vines.—Late Grapes must be early and thoroughly ripened, and to secure this they should now be colouring, and then they—even such varieties as Gros Colman, Gros Guillaume, &c., that take a long time to ripen—may be expected to be fully ripe by the middle or end of September, and any not then ripe will stand a poor chance of becoming so or of keeping satisfactorily. All late Grapes require a high temperature to finish them off, and were this accorded their flavour would not be so much condemned as it now is. To effect the ripening thoroughly a temperature of 70° to 75° should be maintained by artificial means, with a circulation of air constantly. Ventilate houses freely that contain Lady Downe's till the scalding period is past, which is when they have commenced colouring, keeping the night temperature at 70°. Do not allow the inside borders to lack moisture, applying weak liquid manure or guano water in a tepid state in the early part of the day. Keep the laterals in bounds by pinching, not allowing them to become crowded and so necessitate their removal in large quantities, as this gives a check to the root-action and not infrequently results in shanking. Late Hamburgs need not be hurried, but should have fire heat if necessary to maintain the night temperature at 60° to 65°, and 70° to 75° by day, allowing an advance to 80°, 85°, or 90° from sun heat. A good proportion of atmospheric moisture will assist the swelling, especially in the latter part of the day, keeping the borders thoroughly moist by applying tepid liquid manure at intervals of about a week. A temperature of 60° is sufficient for Vines with the fruit ripe. Should excessive rains set in early Vines in outside borders will be induced to continue in growth, which should be prevented, stopping all lateral growths as produced, and protect the border from further moisture so as to induce early maturation and rest. Keep newly planted Vines in full growth by the maintenance of a humid atmo-

sphere, and frequent surface supplies of water to the border to encourage surface-rooting.

*Melons.*—During dull weather fire heat will be necessary for plants setting their fruits as well as for those ripening. Earth up those plants that have just set their fruit, keeping the laterals closely pinched to one joint, thinning if necessary to secure plenty of light and air for the principal foliage, syringing freely on fine afternoons, and supply tepid liquid manure about twice a week. Continue to support heavy fruits by means of tables, and be sparing in the supply of moisture directly the fruits begin to ripen, but do not allow the foliage to flag. Plant out the latest plants without delay, and encourage them by every means to make strong growth, securing to them a minimum temperature of 70° to 75°, rising to 90° or 95° in the afternoon after closing, with a moist atmosphere and as little shade as possible. In pits and frames the last batch should be growing freely, and should have every alternate lateral removed, stopping the leaders when they have travelled two-thirds of the distance. When coming into flower apply a good lining and leave the ventilators open constantly, fertilising the blossoms from day to day as they open until a sufficient quantity is set and swelling.

*Cucumbers.*—Pot off the plants for autumn fruiting as they become ready, removing the points of those for planting in frames above the second rough leaf, those for houses trained to a small stick, and the laterals rubbed off to the height from the surface of the bed to the trellis. Complete the preparation of the fermenting materials and soil, also cleansing the house. Should the weather be dull a little fire heat will be essential to the health of the plants, securing a minimum temperature of 65° to 70°, and 5° more by day. Add a little fresh soil to the surface of beds with plants some time in bearing, and supply tepid liquid manure, shading only to prevent flagging. Fumigate upon the first appearance of aphides, and apply flowers of sulphur for mildew, and quicklime as an antidote to canker. Keep the growths fairly thin, cutting out old growths and laying in young fruitful growth.

*Figs.*—The second crop of the early-forced trees in pots will be ripening fast, and the supply of water must be carefully regulated, or the fruit will be deteriorated in flavour; and the syringing must cease, other means being taken to eradicate red spider if it has obtained a footing. An insecticide applied with a brush to the under side of the leaves, though a tedious is a certain means of destroying the pest. The second crop of fruit on early-forced trees in borders will soon be ripening, and will need a circulation of dry warm air constantly. As soon as the fruit has been gathered the ventilation must be continued to ripen the wood, and when this is effected trees in pots may be plunged in ashes out of doors in a warm situation. It is of primary importance that the wood be thoroughly ripened, especially in the case of trees subjected to early forcing. The latest forced trees that ripened the first crop in June have the second crop swelling, and must be liberally supplied with water, or if necessary with liquid manure, and be freely syringed.

*Pines.*—Take advantage of the space, rendered available by the plants started early in the year having ripened their fruits, to give successional plants the benefit of more room, a sturdy growth being essential to the production of fine fruit. Suckers from the plants above alluded to will now be in a fit state for potting. In the preparation of beds at this season care must be exercised, particularly in the case of those composed solely of fermenting materials. Beds having had a liberal supply of new material in spring will scarcely need any now. Dig to a depth of about 18 inches, and if necessary add a foot of new tan, incorporating it with the old to the depth named. If absolutely necessary to make new beds 2 feet of new tan will be sufficient. A cool moist pit or frame is the best for rootless suckers at this season, with a fermenting bed at about 90°. In potting ram the fibrous loam firmly in the pots and about the base of the suckers, water well, and in plunging cover the surface of the soil in the plunging material, so as to prevent its becoming dry. Shade and ventilate a little when the temperature reaches 85°.

*Cherry House.*—The trees should now be exposed to the air as much as possible, removing the roof lights. This will have the effect of arresting premature growth, to which the Cherry, in common with

other stone fruits subjected to forcing year after year successively, is peculiarly liable. Syringe occasionally to remove red spider from the foliage, and black aphides must be destroyed by means of tobacco water or some approved insecticide. The border must not be allowed to become parchingly dry, but a good watering may be afforded, or for weakly trees liquid manure is beneficial.

#### PLANT HOUSES.

*Greenhouse.*—The early Pelargoniums should now be cut down, allowing the soil to become dry before doing this. The Show varieties or other large-flowered forms will bear heading more closely in than the Fancy sections. Cut those that are as large as required to about a couple of eyes from the base of last season's growth. Place the plants in a pit or frame, and keep rather close until growth has commenced, sprinkling in the afternoon of fine days, being careful not to make the soil very wet. Later plants may, as soon as the flowering is over, be placed outdoors in a sunny position to ripen their wood. *Lilium auratum* coming on for later flowering will need copious supplies of water, surfacing the soil with old cow dung, and keep the plants well supported with sticks. Those that have flowered should be placed outdoors and well attended to with water so as to preserve the foliage healthy, thereby accumulating as much strength in the bulbs as possible for next season's flowering. *Lilium speciosum* vars. with a number of bulbs in a pot should be well tied out, so as to admit plenty of light and air. Keep a sharp look-out for aphides, afford liquid manure liberally, and they will retain the lower leaves until the flowering is over.

*Kalosanthes* cuttings may now be inserted. They strike freely in sandy loam, taking shoots of about 6 inches length, stripping off the lower leaves one-third of their length, and insert them singly in small pots, or half a dozen in a 6-inch if it is desired to obtain good-sized plants in a little time. They only need a cool pit or cold frame, and must not be overwatered.

*Hardwooded Plants.*—Such plants as *Acacia*, *Adenandra*, *Aphelaxis*, *Boronia*, *Correa*, *Darwinia*, *Eriostemon*, *Leschenaultia*, *Pimelea*, *Pleroma*, *Tremandra*, *Nerium*, and *Pultenæa* are better for being placed outside: the hardening process which the growths undergo in the open air stops the further extension of the summer wood, and causes at once the formation of flower buds. In doing so they must not at first be placed where they will be exposed to the direct rays of the sun at midday. The pots should stand on a bed of ashes 6 inches thick. Syringe the plants in the afternoon, directing the water against the under side of the leaves. *Acrophyllum*, *Dracophyllum*, *Hovea*, *Gompholobium*, *Roella*, *Phænocoma*, *Witsenia*, and *Statice* are better not subjected to open-air treatment, as they set their blossoms freely when in a healthy condition without exposure.

Young plants of *Azaleas* being grown as quickly as possible and started early are setting their buds, which should at once be pinched out, and the plants liberally supplied with heat and moisture to secure a second growth. Directly the buds form they must be removed, for if delayed they will merely make a short growth and form flower buds again. Keep thrips and red spider under by syringing. Older plants that flowered early, and which from being in heat and moisture have completed the growth and set their flower buds, may be placed outside, treating them similarly to the hardwooded plants as before advised.

*Ferns.*—Small plants that were potted in spring, or such as did not require more root space in spring, will now probably require potting. *Gleichenias* should never be allowed to suffer from their creeping rhizomes extending over the rims of the pots, and they must never be allowed to suffer for want of water, as if the young fronds flag they never afterwards attain their proper size. *Adiantum cuneatum* with *Pteris serrulata*, grown for cutting or decoration in 6-inch pots or smaller, have made good growth, and should be placed in a position where they will become properly hardened before winter. If grown in a moist atmosphere and much shade they must not be placed where they will be exposed to the sun, or they will lose colour. Tree Ferns must not suffer through insufficient supplies of water, or the fronds will be seriously crippled, especially such as *Cyathea dealbata* and *Alsophila excelsa*.

## THE BEE-KEEPER.

### UNFINISHED SECTION BOXES.

THE termination of the honey harvest is nearly certain to leave in the bee-keepers' possession a number of sections either half finished so as to be unmarketable, or with that tantalising approach to completion which gives them their full quota of honey without enabling them to secure good prices. A correspondent asks me to give information in reference to this difficulty, which is so common, and has so much to do with profit in these days when sections almost cause extracted honey to be forgotten, that I make it the subject of a few lines.

If several hives are engaged in the work of filling sections of the same size we treat them all alike during the continuance of the honey flow. Every two or three days the racks are uncovered in order that the completed boxes may be removed. All parts of the rack do not progress with equal rapidity, and want of observation here is largely the cause of the difficulty many bee-keepers have in getting their boxes sealed. If the space between the hive and rack is all open, the boxes in the centre lying over the brood nest are sealed most quickly; but if the bees be admitted only towards the end of the rack, then the part immediately over the opening will make most rapid progress. (This fact, let it be remarked in passing, condemns the zinc queen-excluder as always reducing the honey yield.) We have standing by our side the sections furnished with foundation which are to substitute the full ones; but if the latter are drawn out and at once replaced by the former, we have boxes which will require some days for comb-building and storing occupying the best place for sealing, while those that only need their finishing touches are kept in an inferior position for receiving them. As a consequence, at our next visit the foundation previously given will be found to be perhaps half stored, while the surrounding boxes will not be in so many cases completed as would have been had they been transferred to the best position. It is wise, therefore, whilst avoiding overmuch disturbance, to put the most advanced boxes into the spot where most rapid work is done, giving the empty ones to the spaces left.

If the honey yield is slackening and promising shortly to close, the contraction of the rack is more desirable than filling up gaps; we thus concentrate the bees and get more rapid progress in the boxes remaining. If, however, the stock is extremely strong and seeming to do better than some others, rather add empty boxes than contract, for a reason which will appear presently.

At length the yield is so reduced that no progress is made, and the danger of the bees carrying down the unsealed honey threatens us. We now take off all sections from the hives which seem doing least, with the idea of giving them for completion to the most vigorous stock, which will have to be helped in its work by being fed with diluted extracted honey. The boxes removed and the rack carefully taken off, we examine the combs, and pass as many of them as our objects may make desirable through the extractor. We must be careful in making our selection of combs should we take those not containing fed syrup. The honey will now require dilution. Newly gathered nectar contains very varying quantities of water, depending upon source and season; but it is perhaps a fair average to say that evaporation reduces five pints of gathered nectar to one pint of honey. The beginner at this work will perhaps argue, "What is the use of my adding water which will require to be again removed?" but experience shows that unless the quantity be at least doubled by dilution immense loss is the result. To prove that bees prefer to handle thin honey, take a comb half filled with sealed store, pour diluted honey into the empty cells, and then uncap the rest and expose somewhere in the apiary. The bees will crowd upon the former, and until it is gone will almost neglect the latter. The method of feeding must be determined by the hive. I feed thus at the hive door upon a stage, which prevents all possible robbing, and the trouble is almost nil. The Americans feed largely under a division board which does not quite reach the floorboard. For continuing this work into quite chilly weather I prefer a feeder which I exhibited last year, and which gives the bees an uninterrupted line of food at the base of the hive. The feeder can be constantly refilled without removal. All our stocks will at length have lost their sections save one, and this one will be continually provided with the partially completed boxes we are keeping in store until we have no others to supply. The reduction of the size of their erate will then follow. A few points will have to be attended to here, and amongst these none is more important than keeping up a steady supply, otherwise the bees begin to seal before the comb

is duly thickened, and then when food is again given they draw out the neighbouring unfinished cells and give the comb an ugly uneven face. The sections retained for completion ought also to be kept in a warm place.—F. CHESHIRE, *Avenue House, Acton, W.*

### THE MOORS.

PLEASE say what hives I should select to send to heather to secure good results in quantity and secure transit—I mean tops or stools.—K. E., *Montrose.*

[The weather during the period of heather bloom is in a majority of seasons too cold and unsettled to make it profitable to remove bees to the moors unless special precautions are taken to secure stocks fit to store a surplus, even in the most untoward circumstances. The above question does not, therefore, in my opinion, admit of a categorical answer. If bar-frame hives are used, special means must be taken to prepare for the moors. Having several stocks to select from, those with young fertile queens should be chosen, and a few days before the heather blooms these should be strengthened to the fullest extent by removing all combs not well filled with brood or eggs, replacing them with full brood combs from the hives to be left at home. In this way the stocks to be removed may be expected within a few days to have a superabundant population fit for the exhaustive work on the heather. When removed to the moors, after of course securing the combs from shifting and giving abundant ventilation, a pile of supers should be placed in position consisting largely of those partly finished on the Clover. A skepful of driven bees minus their queen may at the same moment be run in at the entrance to make assurance doubly sure. Under such circumstances success is certain if honey is to be had at all; for it is well to remember that bees dwindle very rapidly on the heather, and ordinary stocks may thus in a few days become too weak for profitable work.]

In the case of skeps being selected, those with old combs should be preferred, having, as before, young queens. Thus stocks that have swarmed may be selected. These should of course be such as to permit of liberal supering. For every stock thus selected a skepful of driven bees from other stocks should be taken, to be run in as before, immediately the stocks are located on the moor. The gorged and alarmed state of the bees after the journey will render any precautions in thus uniting almost superfluous.

If run honey is wished for, a second storey, whether of wood or straw, should be fitted with full sheets of comb foundation and placed instead of supers. It pays to press down combs thus obtained, and as the extractor cannot be used with ripe heather honey I know of no better means of securing it in its purity.

If time permitted much may be done a week or two before the heather blooms to prepare good stocks for removal. The period of scarcity between Clover and heather may be tided over by very slow but continuous feeding with extracted honey, brood-rearing thus promoted, and spirit maintained among the earnest workers. Supers may be selected or produced furnished with comb ready to fill, &c.

The stocks that are to remain at home, weakened as they are by the removal of part of their brood or bees, should be treated as in spring—that is, encouraged to continuous breeding till the deficiency is made good. Pure sugar syrup fed in small quantities at first, and after a week or two quite rapidly, will make such stocks quite equal to those that return from the moors.

Those who are fortunate enough to have locations already within reach of the heather should treat their stocks similarly—that is, select certain stocks to be strengthened at the expense of others. Those standing side by side may be united under proper precautions, a nucleus being formed from one of the stocks in order to preserve one of the queens if desired. Only combs containing brood should be allowed in the united stock, the rest being stored away to assist in wintering, or left in the nucleus if strong, or extracted. A second storey of old combs, though excellent as a means of getting large returns in Clover by the extractor, is not to be recommended when heather is in view. It is only by severe mashing and mixing of pollen, &c., that the heather honey can be taken from such combs. I therefore recommend for those who prefer run honey that the second storey be filled with comb foundation only. A sheet of foundation to fill a Woodbury frame costs  $4\frac{1}{2}d.$ , which is a mere trifle on the value of the 5 or 6 lbs. of honey that may be stored in it; besides that it will be worth  $3d.$  or so afterwards as raw wax.

The approaching heather season promises fairly to be a good one. The bloom is early and the signs are in favour of suitable weather. In Scotland stocks were never in better condition to take advantage of it, for it has been pre-eminently a breeding season. No glut of honey to check breeding has taken place, only a steady though too slow income of it. Even till now (July 25th)

stocks are still swarming. I had four top swarms last week. Let us hope the present may equal, if it does not exceed, the splendid autumn of 1880.—WILLIAM RAITT.]

**Select Carnations and Picotees (E. Milton).**—The following are six excellent varieties in each class:—*Scarlet Bizarres*: Admiral Curzon, Dreadnought, Sir J. Paxton, Mercury, Lord Napier, and Mars. *Crimson Bizarres*: Rifleman, J. D. Hextall (sometimes pink and purple), Lord Milton, Lord Raglan, John Simonite, and Captain Stott. *Pink and Purple Bizarres*: Sarah Payne, William Murray, Unexpected, Falconbridge, Eccentric Jack, and Satisfaction (pale, but very fine petals). *Purple Flakes*: Dr. Foster, James Douglas, Squire Maynell, Florence Nightingale, Mayor of Nottingham, and Squire Trow. *Scarlet Flakes*: Clipper, Sportsman, John Bayley, Annihilator, Mr. Battersby, and Dan Godfrey. *Rose Flakes*: John Keet, Sibyl, James Merryweather, Apollo, Rose of Stapleford, and Maid of Athens. *Heavy Red Picotees*: John Smith, Princess of Wales, J. B. Bryant, Master Norman, Mrs. Dodwell, and Brunette. *Light Red Picotees*: Thomas William, Violet Douglas, Clara, Thomas Jivons, Mrs. Bower, Lucy (medium), Rev. F. D. Horner (medium), Wm. Summers (medium). *Heavy Purple Picotees*: Zerlina, Alliance, Isabella, Silvia, Mrs. Douglas, and Lizzie Tomes. *Light Purple Picotees*: Mary, Ann Lord, Her Majesty, Minnie, Alice (medium), and Fanny (ditto). *Heavy Rose Picotees*: Lady Louisa, Miss Horner, Edith Dombain, Mrs. Payne, Royal Visit, and Mrs. Lord. *Light Rose and Scarlet Picotees*: Mrs. Allcroft, Julia, Daisy, Mrs. Adams, Ethel, Mrs. Nicholls, and Miss Wood (medium).

**Disposal of Sewage (N).**—We have seen the plan you suggest of removing the manure adopted with the best results, and as it appears well adapted to your circumstances we advise you to carry it out. House slops of all kinds, including soapsuds, should be utilised in the garden. Probably in your small establishment one tank, in a convenient place and not obtrusive, into which the liquid can be conducted through pipes, would suffice. You would not have sufficient to be of practical use for distributing through a series of pipes and taps at different points. We should have a tank near the place where you keep manure and store garden refuse, then when the liquid was not required by growing crops it could be poured periodically over heaps of soil or decaying vegetable matter of any kind, and you would thus have a valuable compost heap for spreading on the land and digging-in as required. Soil, weeds, roadside trimming, or refuse of any kind saturated in the manner indicated would be rendered of great manurial value by the practice indicated. A good water barrel on wheels, into which the liquid could be poured and removed daily or when needed, would be sufficient in a very small household without laying down pipes. The contents of the manure barrows mixed with earth freely can be spread on vacant land and dug-in when convenient.

**The Virginian and Chilean Strawberries (J. E.).**—The following descriptions of these two species are given in Don's "Dichlamydeous Plants," and represent their most important characters:—*Fragaria virginiana*: Flowers late, dioecious from abortion, rather campanulate; petals ovate; leaflets coriaceous, not plicate; petioles short; peduncles and pedicels the length of the leaves; receptacle very tumid, pendulous; styles very long. Flowers white. Fruit deep red when ripe. A native of Virginia. This is the parent of what are termed the scarlet and so-called black Strawberries, of which the following were some of the early varieties:—Cockscumb, Grove-end Scarlet, Knight's Scarlet, Sir Joseph Banks' Scarlet, Wilmot's Scarlet, and Elton. *Fragaria chilensis* is thus described: Flowers always dioecious from abortion, leaflets obovate, obtuse, coarsely serrated, coriaceous, wrinkled, clothed with silky hairs beneath; calyx and peduncles silky; peduncles thick; fruit pendulous; sepals erect. Fruit rose-coloured, flesh white. Native of South America, in Chili and Peru. This, with *F. grandiflora*, were the principal progenitors of the Pine Strawberries. Some of the early varieties were Black and Scarlet Chili, Patagonian, Wilmot's Superb, and Canterbury. The races have now become so intercrossed that it is difficult to give the origin of some varieties now in general use. The variety you name can be obtained from Messrs. Ellwanger & Barry, Mount Hope Nurseries, Rochester, New York.

**Bougainvilleas spectabilis and glabra (J. M.).**—The plant you have appears to be *Bougainvillea spectabilis*, as near as we can judge from the crushed leaves we received. This species differs chiefly from the more generally grown *B. glabra* in the larger deeper-coloured flowers and in the leaves being also larger and slightly hairy, whereas those of the other are quite smooth. Both are essentially stove plants, though *B. glabra* will thrive in a cooler temperature; but that is a much more freely flowering form than *B. spectabilis*, which, even when in good condition and well attended, is often several years before it produces flowers. *B. glabra* is by far the best suited for culture in pots, as handsome little specimens can be soon obtained, and plants may occasionally be seen in Covent Garden Market growing in 48 and 32-size pots, yet bearing abundance of bright rosy flowers. Encourage your plant to make vigorous growth in a light warm position, gradually lessening the supply of water as the wood becomes matured; give the plant a good rest, prune closely early in spring, and start it in heat if possible. However, you would find *B. glabra* of much more service.

**Keeping Black Hamburgh Grapes (M. M.).**—The Grapes being now ripe it will be necessary, in order to retain them in good condition as long as possible, to keep them cool, allowing a free circulation of air night and day, and when the sun is very powerful it will be necessary to shade for a few hours in the hottest part of the day. Sprinkling the floors in the early part of hot days will also be beneficial. Sufficient water must be afforded the border, especially that inside, to maintain the foliage in good condition. The shading will only be necessary during hot days in August and early September. Keep the laterals closely stopped to one joint, and examine the bunches occasionally for decayed berries, which must be removed promptly. Fire heat will not be necessary for the next six weeks, unless the weather prove very wet and dull, when a little by day will be beneficial so as to admit of a change of air, not raising the temperature by that means above 60° in the daytime, and turn off the heat early, so as to have the pipes cool before night. After September an equable temperature

of 45° to 50° should be secured as far as practicable, and the Grapes will keep till November, probably later if they have been well finished.

**History of the Hop (R. N.).**—The Hop (*Humulus Lupulus*) is found in many parts of temperate Europe, Asia, and North America, and is included in the British native flora. It is a relative of the Nettles and Hemp. It was known to the Romans under the name of *Lupus salictarius*, under which it is referred to by Pliny, the title, it is said, having been applied to it owing to the tenacity with which it clung to Willows. The plant was first generally cultivated in Flanders and Holland, whence the culture and use of the flower beads for beer were introduced to England about 1524. It was not, however, largely grown for a considerable time, the chief part of the supply being derived from Flanders. Tusser, in 1562, mentions the plant and gives directions for its culture, and in Lyte's translation of Dodon's Herbal (1578) an illustration and full description are given, with the accompanying observation as to its use. "The brewers of Ale and Bier do heape and gather the belles or knoppes together to giue a good relish and pleasant tast vnto their drinke." Gerard and other later writers also fully describe it. Since then the cultivation of the Hop in England has greatly extended, and at the present time many thousands of acres are devoted to it. Kent, Sussex, and Hampshire are the principal sources of the supply. The generic name, *Humulus*, is considered to be derived from *humus*, the ground, or *humilis*, humble, in allusion to its habit of growth when unsupported. The specific designation appears to be a diminutive of the old Latin name. You will find descriptions in any work on the British Flora.

**A Floral Dial (Rosa).**—There is much uncertainty attending all lists of the kinds you mention, as the weather exercises a great influence upon the opening and closing of flowers. The following floral clock or dial of British flowers is a good example of such arrangements. The times given indicate the periods at which the flowers either open or close:—*Tragopogon pratense* opens at 3 A.M., closes at 12 P.M.; *Cichorium Intybus* opens at 4 A.M., closes at 4 P.M.; *Lapsana communis* opens at 5 A.M.; *Ranunculus hulosus* opens at 6 A.M.; *Nymphaea alba* opens at 7 A.M., closes at 5 P.M.; *Anagallis arvensis* and *Dianthus prolifera* 8 A.M., the latter opening at 1 P.M. and the former at 2 P.M.; *Ranunculus Ficaria* opens at 9 A.M.; *Lapsana communis* closes at 10 A.M.; *Ornithogalum umbellatum* opens at 11 A.M.; *Leontodon hispidum* closes at 3 P.M.; *Silene nutans* opens at 6 P.M., and *Oenothera biennis* opens at 7 P.M. The *Bignonia* will succeed in a greenhouse in your position. The original floral clock composed by Linnaeus consisted of the following plants, which it may be remarked do not in England correspond to the times stated so faithfully as they probably did at Upsal. The periods named are those at which the flowers expanded:—*Ipomoea Nil*, 3 to 4 A.M.; *Tragopogon pratense*, 4 to 5 A.M.; *Papaver nudicaule*, 5 A.M.; *Hypochaeris maculata*, 6 A.M.; several species of *Senecio* and *Hieracium*, 6 to 7 A.M.; *Laetuca sativa*, 7 A.M.; *Specularia Speculum* and *Calendula pluvialis*, 7 to 8 A.M.; *Anagallis arvensis*, 8 A.M.; *Nolana prostrata*, 8 to 9 A.M.; *Calendula arvensis*, 9 A.M.; *Arenaria rubra*, 9 to 10 A.M.; *Mesembryanthemum nodiflorum*, 10 to 11 A.M.; *Ornithogalum umbellatum*, 11 A.M.; several *Ficoideous* plants, 12 A.M.; *Scilla pomeridiana*, 2 P.M.; *Silene noctiflora*, 5 to 6 P.M.; *Oenothera biennis*, 6 P.M.; *Mirabilis Jalapa*, 6 to 7 P.M.; and *Cereus grandiflorus*, 7 to 8 P.M.

**Manure for Strawberries and Cherries (D. D. H.).**—Soil that is well drained and enriched with manure from a farmyard, pigstye, cowshed, or stable answers fairly well for Strawberries if it be shallow or deep. The plants, however, soon become exhausted in shallow soil under ordinary conditions of culture, and are only to be retained in full vigour by heavy annual dressings of manure dug in between the rows as soon as the fruiting season is at an end, and by copious waterings of sewage or other liquid manure during the season of growth. In many gardens the available supply of solid manure is so limited that none can be spared for the Strawberry bed; sewage of which every householder has a regular daily supply then becomes our substitute, the soil between the rows being broken up when the fruit is done, just as it would be if we had manure to dig in, and then the sewage is poured over it frequently till growth ceases in autumn. If planted carefully Cherries answer in soil of ordinary fertility, such as will produce good vegetables without any subsequent addition of manure; sewage, however, may always be given with advantage before the blossom expands and while the fruit is swelling. In poor thin soils stations must be made for the trees, each station being 6 feet square and 2 feet 6 inches deep. Lay a drain of common 2-inch land drain pipes across the middle of the bottom of the hole, and connect it with the nearest branch or main drain to render the roots safe from any accumulation of stagnant water, then cover the bottom of the station with 6 inches of broken bricks, stones, or clinkers—9 inches would not be too much in a wet low situation—and then fill the hole with sweet rich loam, in which plant the tree. If when the hole is made you find a substratum of gravel there will then be no occasion to use either broken stones or drain pipes, as all superfluous water is certain to pass away quickly. Careful planting involves close attention to details, and that is why we allude to them here. But Cherry trees are apt to flourish for a few years and then become barren, sickly, and not unfrequently die outright; they must, therefore, be watched closely, and prompt attention be given to the slightest indication of debility, which undoubtedly arises most frequently from exhaustion. The station once abounding with fertility has become sterile, the roots having ramified in it till it has become permeated with them in every direction and lost all its goodness. The remedy is obvious. Make a trench 2 or 3 feet wide and 2 feet deep around the station, fill it with soil similar to that used for the station, and feed the roots with sewage until they have entered the new soil.

**Cherries Shedding Fruit (Idem).**—The falling of the immature fruit of Cherries has been very prevalent this year; so, too, has that of Apples and Pears, all which is doubtless owing to the drought, just as in some seasons it is attributable to unripe wood, and in others to damaged blossom by late frosts. Your idea that the loss of the Cherries proceeds from a deficiency of lime in the soil could only be entertained if you had stated that it had invariably been the case during a period of consecutive years. No doubt the want of lime and potash in soil not unfrequently is the cause of a paucity of fruit, and if it be so in your soil a prompt and efficient remedy may be had by a plentiful dressing of wood ashes and lime.

**Liquid Manure for Dahlias (S. H.).**—We do not advise you to merely "sprinkle" the solution of sulphate of ammonia on the ground, but to pour it on copiously, at a strength of not more than half an ounce to a gallon of water, as often as is required to keep the soil moist, not on the surface merely but below where the roots are working. A gallon a day to each plant will not be too much in dry weather if the plants are of large size and in free growth. Sow the seed of your plants as soon as it is ripe. Layer the Carnations immediately the growths are long enough, whether the plants are flowering or not. Erpetion reniforme is by no means common and well deserves attention. It is known popularly as the New Holland Violet, and is related to the Violas. It is usually propagated by cuttings or dividing the plants, and we have no experience of the length of time the seeds are germinating, though probably it would scarcely

exceed a few weeks. The plant is rather delicate, and requires protection in cold and northerly districts. We regret to hear of your indisposition, and can wait patiently for the plant you have kindly promised to send us.

**The Joanneting Apple** (*R. Essex*).—The Apple respecting which you inquire is the above, which is also known under the names Ginetting, Juneting, Early Jenning, White Juneating, Juneating, and several others. The following description of it is given in the "Fruit Manual":—"Fruit small, round, and a little flattened. Skin smooth and shining, pale yellowish green in the shade, but clear yellow, with sometimes a faint tinge of red or orange, next the sun. Eye small and closed, surrounded with a few small plaits, and set in a very shallow basin. Stalk an inch long, slender, and inserted in a shallow cavity, which is lined with delicate russet. Flesh white, crisp, brisk, and juicy, with a vinous and slightly perfumed flavour, but becoming mealy and tasteless if kept only a few days after being gathered. This is the earliest Apple of the year; it is in greatest perfection when gathered off the tree, or immediately afterwards, as it very soon becomes dry and mealy. The tree does not attain a large size, but is hardy and healthy. It is not a great bearer, which may in a great measure account for it not being so generally cultivated as its earliness would recommend it to be. If worked on the Paradise stock it may be grown in pots, when the fruit will not only be produced earlier but in greater abundance than on the Crab or free stock." Respecting the derivation of the name the same work states:—"Apples were called Joannina because they ripened about St. John's Day, and we have among the old French Pears Amire Joannet, the 'Wonderful Little John,' which Merlet informs us was so called because it ripened about St. John's Day. If, then, we add to Joannet the termination *ing*, so general among our names of Apples, we have Joanneting. There can be no doubt that this is the correct derivation of the name of this Apple."

**Select White, Yellow, and Dark Roses for Standards** (*J. S.*).—Three white varieties are Boule de Neige, Baronne de Maynard, and Mrs. Bosanquet (China). Instead of the two latter, unless you are particular in having white, we should have Baronne de Rothschild and La France. Three good yellow Roses are Celine Forestier, Belle Lyonnaise, and Perle des Jardins, though we do not recommend them for outdoors as standards, as they are tender and liable to be killed by a severe winter even when protected. Gloire de Dijon is more reliable—indeed, the only one that survived the last severe winter with us. Three dark varieties are Charles Lefebvre, Louis Van Houtte, and Prince Camille de Rohan.

**Bouvardia Culture** (*Idem*).—Some of the best forms are—The Bride Vreelandi, umbellata alba, and Humboldtii corymbiflora, all white; rosea oculata, umbellata carnea, intermedia, and longiflora flammea, all blush, rose or pink; triphylla, leiantha. Brilliant, elegans, all scarlet; and flava, yellow. The plants are best grown from cuttings of half-ripened growths in spring, which strike readily in gentle bottom heat. Pot them singly when rooted, and grow near the glass in a temperature of 60° to 65° artificially, and 75° or more from sun heat. Stop them when 6 inches high, and again when a few inches of fresh growth is made. Plant out when strong in a pit where there is a bed of turfy loam, and where there is means of maintaining the temperature above named. The plants may be planted 15 to 18 inches distance. Have them duly supplied with water, and ventilate freely in favourable weather, withdrawing the lights by the middle of July, and let the plants be exposed until about the middle of September; then lift them, placing them in 7 or 8-inch pots in good loam, keeping them rather close, and sprinkled until established. To flower through the winter a temperature of 55° to 65° artificially, and 70° to 75° from sun heat, is necessary.

**Names of Plants** (*A Reader*).—1, *Silene perfoliata*; 2, *Viburnum dentatum*; 3, *Juniperus oblonga*. (*Miss Bayley*).—*Spiraea Filipendula*. (*H. H. T.*).—*Philadelphus coronarius*, the Moek Orange. (*J. M.*).—The two or three leaves sent were not recognisable. (*J. R.*).—The purple flower is *Hardenbergia Comp-toniana*; the white one is *Phyteuma spieatum*.

**Preventing Swarming by Supering—Marking Bees** (*H. M., Southport*).—Supering will not always prevent swarming, but if be done skilfully it is generally successful. The confinement of the queen prevents swarms issuing but it is a question whether the risk and disturbance to the whole colony does not far outweigh the advantage. If queen cells are already started before the super is put on failure will be the rule. The queen cells should be removed and the brood nest arranged so as to give the queen room for ovipositing. Whether bees gather from the flowers in your garden will depend upon the general condition of the honey yield. Less than a week since honeycomb could be left about in the apiary without receiving any attention, to-day a single spilt drop of honey produces a scramble more noisy than pleasant. You can easily mark your bees. Sir John Lubbock made lasting acquaintance with single ones by giving them dabs of paint of different colours on the thorax. Your plan will be more simple. A little flour in a dredger shaken over the departing bees on the alighting board will immediately determine whether they are in any number visiting the Borage, &c., you have provided.

**Finishing Sections** (*Buzz*).—See article on page 91, which furnishes a reply to your inquiry.

COVENT GARDEN MARKET.—JULY 27.

LARGE quantities of soft fruit have reached us during the week, making good prices, but are now showing signs of a finish. Peaches and Nectarines are still in demand and realising their full value. Trade falling off.

VEGETABLES.

POULTRY AND PIGEON CHRONICLE.

THE FIELD CULTIVATION OF STRAWBERRIES.

THIS is a subject to which the home farmer will be required to give more attention in the future than he has done in the past, for upon various estates there is more land in hand than we have ever known before. As ordinary farming has been less profitable during the past few years than it had been previously, it is of great consequence to consider how far Strawberry cultivation can be introduced on the home farm to assist in maintaining the advantages which ought to be derived from the occupation. Upon numerous estates the farm manager is probably comparatively unacquainted with the best mode of growing this fruit; he may, however, be greatly assisted by the head gardener. In proof of this the readers of this Journal may refer to the clever and practical treatment of the subject of "Strawberry Farming" by Mr. William Raitt of Blairgowrie, given on the 30th of December, 1880, and continued until the 10th of February of this year, and which we have perused with much interest.

We take up the culture of Strawberries because we have witnessed the extraordinary benefit to be derived from their cultivation upon land formerly waste. This tract of land, to the extent of 1200 acres, is now in great part converted into some of the finest fruit gardens in the kingdom, but more especially by its production of Strawberries. Some of this land is let to more than twenty different tenants, and we have long observed the practical management adopted by these occupiers. There are several acres of such land still remaining as worthless common. The home farmer is much more at liberty in adopting any new mode of cultivation than ordinary tenants, who are often impeded in their farming operations by restrictive covenants in their leases, for he has only to prove by well-conducted experiments that his cultivation of any crop is profitable, and it will meet with the approval of his employer.

In estimating our position as to the policy of cultivating Strawberries many points will arise, all being of more or less importance. Soil, situation, and aspect, however, are the three leading points to be considered; still it must be remembered that we have numerous kinds of Strawberries obtainable for growth, and adapted for our purpose. The land may vary in many respects, yet we find that the sorts of fruit and their habit of growth are quite as numerous as the variations of the soil. We have recently heard the observation that the production of Strawberries will soon be overdone, and they will not be worth cultivation. But can we produce them in such abundance as to become unprofitable? We cannot conceive such a state of things, for we can surely grow Strawberries as cheaply as those which are imported, the only point against us being that they are imported a little before ours are ripe, owing in a great measure to the late and cold springs unfortunately peculiar to our climate. At all other times we

have the advantage that the fruit with which we supply the market is in better condition, and the further advantage of being able to grow the heaviest crops possible of the second early and late sorts. If the produce of these was doubled immediately it would scarcely affect the price, for we find that the slightest diminution in price is immediately followed by an extraordinary increase of consumption, and one of the most hopeful prospects for the grower (especially if the later varieties are grown) is the great and increasing demand by the wholesale jam-makers for fruit suitable for preserving purposes. Under these circumstances there is great encouragement for the home farmer to introduce into his business the growth of this fruit.

Many of the strong soils prove suitable for Strawberries, and if to make a general observation we must say that a strong gravelly soil of a yellow or partially red colour of the subsoil intermixed with clay is about the best land for the production of the second early and late varieties. On the other hand, for early fruit-production the sands with a blue pebble in them are well suited, for such soils generally produce good elm timber, and these trees afford excellent shelter for early fruit growing. We may find some of these sandy soils too light, requiring (to give them a staple sufficient to produce the finest fruit) a moderate application of gravelly clay occasionally, or chalk marl, containing about 20 or 30 per cent. of carbonate of lime. These sands, too, are very subject to weeds, and should have a moderate dressing of either chalk or lime. Various strong clays when properly drained we have noticed bear excellent samples of this fruit, especially those clays containing a large portion of potash; but this cannot be ascertained except by analysis, for we have grown splendid fruit upon the rank and tenacious yellow clay. We have seen parts of three fields of strong yellow clay, upon which for a period of sixty years abundant crops of many kinds were grown without the application of any manure. Upon analysis this soil was found extremely rich in potash, whilst the adjoining land, bearing similar appearance, scarcely yielded a trace of potash. This fact ought to induce the home farmer to understand the nature of the land, but more particularly of the subsoil, before he begins to cultivate Strawberries. As a general rule any land may be made suitable for this fruit if the climate and situation of the land are favourable. We would not recommend its growth upon exposed and hilly land where the rainfall is excessive, nor upon any land (however suitable in other respects) if situated in valleys below the level of night fogs, for in our climate we often get night frosts destructive to fruit very late in the spring. Where the land is well situated we have by draining made excellent Strawberry gardens upon what consisted previously of peat bogs and quick-sands, thus proving if the situation is favourable almost any soil may answer for the production of this fruit.

Turning to the mode of culture in the field we ask the home farmer to give up all idea of spade or fork culture, and rely chiefly upon the plough, the subsoil plough, the double-breasted plough, the horse hoe, and the hand hoc alone. To illustrate this we will take a piece of level land of any of the soils we have named in the fallow state, and as soon as it is clean and free from Couch and weeds let it be ploughed about 8 or 10 inches deep, the subsoil plough following breaking up the subsoil about the same depth, and repeat the work by carrying it out crossways. This will render the subsoil accessible to the roots of the plants, and is the most important point in the cultivation, for it often happens that the best soil for the purpose is that situated just below the depth of ordinary ploughing. As a rule the fallowing may be done best in the spring and summer, but the subsoiling in the months of September or October if done by horse labour. In preference to horse labour, either in making the fallow or subsoiling and deepening the tillage, there is nothing like steam power, more particularly upon hard conglomerate gravels, or soils containing boulder stones. Again, if time is an object, so that the field is required for planting at a given time, that object can always be best obtained by the use of steam power.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—Horses are engaged in the late districts in cutting the meadow grass and carting the hay to the stack. In the eastern, south-eastern, and home counties cutting Rye and winter Barley and carting to stack will be going on. At all possible intervals the completion of Turnip-sowing should receive attention, it having been so far delayed by the dry and hot season that in various instances the young Swede plants as well as Turnips have been destroyed by the fly. Sowing a second time, and consequently extra tillage, will be required, employing the horses until the harvest is ready. After that so many fields of Turnips having failed, increased exertions will be made to obtain Turnips after Rye, winter Barley, Peas, Vetches for seed. We can only advise that this should be

done, for there is more probability of obtaining a plant after a good rain than during the late hot and dry weather. Care should be taken to keep the land as fast as ploughed worked down and the seed drilled with manure every evening whilst the land is moist and fine. As we have often stated in these columns, this can easily be done by setting up the corn on one-third of the land as fast as it is cut, leaving the remaining third of the land to be seeded after the crop has been cleared off. The Wheat in the early districts is being cut and tied by the self-binding reaper. This is hard work for the horses, and in order to make long and effective day's work the horses should be changed every four hours during the day's work. Under any circumstances, but more particularly where the crop is heavy, the horse labour is severe for them—much more so than their labour in tillage, to which work they are chiefly accustomed. We must again call attention to the early cutting of Wheat, for when the moisture cannot be pressed out of the grain it is then fit for reaping, and will certainly take more or less injury by standing in the field. There is no doubt that although the sun is necessary in the ripening of the corn it will greatly injure it if, after being ripe, it is too long exposed to its influence. Quite irrespective of receiving injury in that way, there can be no doubt that corn cut early will receive far less damage if wet and adverse weather succeeds; in fact, there is practically every reason why corn should be cut at the earliest period, and nothing in favour of delay. In order, however, to avoid delay the harvest must be anticipated by hiring a sufficient staff of workmen to assist in securing the corn as fast as possible as it becomes fit for stacking. We have no doubt, in a season like what we have lately experienced, it will be advisable to some extent to thrash the corn in the field and stack the straw, instead of the usual mode of making the ricks of corn as fast as ready in the field. In this plan much labour is saved, as well as risk of damage, and in these days of low-priced corn and high-priced labour in the interest of the home farm this matter must be duly considered, and every possible saving made consistent with the condition of the grain; but the extra labourers required must be engaged by anticipation, otherwise it will not answer to undertake any extra labour.

*Hand Labour.*—Men are trimming and thatching the haystacks, hoeing the Mangold the last time, and Swedes and Turnips as the plants become large enough for hoeing, as so many have been seeded the second time. Much general work is now going on preparatory to the commencement of harvest.

*Live Stock.*—The stock flocks on the hills are very short of food, and likely to be for some time to come. The crops of Rape are drying up, instead of supplying us with luxuriant food as in ordinary seasons. In many instances there is but little grass or promise for it at present on meadows or parklands cut for hay; and where the grass has been fed by stock there is little succession of grass, both sheep and cattle in some cases being very short of water, and where that is the case they suffer far more than from a short supply of food. Linseed cake is now the best supplement for short keep, as it never makes the animals thirsty like bean or barley meal. The fairs are now being held, and auctions also, for the sale of rams and breeding ewes both of the long-wooled and the short-wooled breeds. As we fear that the hardihood and constitution of the rams have suffered in no slight degree from the practice now so general of forcing them to an unnatural size at an early age, we must caution the home farmer against buying or rearing his rams in such a helpless condition. Under any circumstances we find it a good plan to shear the ram lambs now, the sooner the better. At the fairs now taking place a large proportion of the stock ewes are in low condition; and as this is another extreme how can we expect but that disease will be engendered in the offspring where the blood of the parents is in an unhealthy state from what we may call under-feeding of the ewes and that of the rams from over-feeding. In all cases where rams are required to be mated with ewes for producing early fat lambs at Easter it is of great consequence to select rams with close short wool for service with the different tribes of down ewes, and also to select rams of the horned Somerset or Dorset breed for service with the Leicesters and other long-wooled ewes. This is especially seen to be of great advantage in the case of twin lambs, because, these requiring a longer time in feeding, their coats are apt to become hollow and loose. These never attract the attention of the butchers, hence the care required in the mating of the stock for breeding lambs for the early London and provincial markets. We must again call attention to our plan of folding sheep in the day instead of at night, in order that the manure and droppings may fall where it is beneficial to the land, for we daily notice large flocks of sheep collected together under trees, where their manure is all wasted.

#### VARIETIES.

*THE BRITISH BEE-KEEPERS' ASSOCIATION.*—The annual Exhibition of this Society was commenced on Tuesday last at South Kensington, and will continue until next Monday, August 1st. The exhibits are on this occasion staged in the arcade near the Council-room, and not in the corridors, as last year, as these are now occupied with the Medical and Sanitary Exhibition. The entries in the chief classes are numerous, and some honey of excellent quality is shown, hives and other apiarian requisites being well represented.

The following is the programme of arrangements for the four remaining days:—Thursday, July 28th: Show opens at 10 A.M.; displays and lectures in the bee tent at intervals throughout the afternoon; 3.30 P.M., distribution of prizes by H.R.H. the Princess Christian. All the above meetings will take place in the Committee-room adjoining the Show. Friday and Saturday, July 29th and 30th: Show opens at 10 A.M.; no displays or lectures will be given in the bee tent on these days. Monday, August 1st: Show opens at 10 A.M.; displays and lectures in the bee tent throughout the afternoon. Admission 3d. Members attending the Show will be required to bring their tickets of membership. A report of this Show, and of Mr. Cheshire's lecture on "Bees as Florists, Hybridisers, and Fruit-Producers," will be given in our next issue.

— DISEASED FOWLS FOR THE TABLE D'HOTE.—A daily contemporary observes—"All persons who are planning a tour in Switzerland will do well to make a note of the fact that the Swiss journals, for some three weeks past, have been much occupied with correspondence about a disease in the fowls which is causing no small anxiety to the hotel-keepers. It goes by the name of the 'Hühner-Cholérine,' or simply 'Hühnerpest.'" The demand for fowls for the *table d'hôte* is enormous during the season, and far larger than Switzerland itself can supply. Nearly all the great hotels purchase their fowls from Italy or France, and it appears that the disease occurs most frequently in the imported birds, has rarely been detected in the natives, and has almost certainly being communicated to these latter during their short companionship with their foreign kinsfolk. No one who has caught sight of a number of these wretched creatures during their transport over the Alps, say across the St. Gothard Pass, can be astonished at their sickness. They pass in the course of a few hours from a tropical into an arctic climate, and then descend again from the snow into the fiercest heat. Such changes are trying enough to the human pedestrian, who enjoys freedom of motion, which supplies some corrective. But these miserable birds, often poor scraggy creatures at starting, are packed together in basket-eages almost as closely as sardines. The sight of their heads craned piteously out of the holes in their prison, screeching for liberty, must have touched the heart of many a member of the Society for the Prevention of Cruelty to Animals."

— A GOOD HARVEST.—The *Daily News* thus graphically describes the advantages of a good harvest, and the description is not overdrawn. "Every village and country town in the kingdom feels the effect of a good harvest. Everything is livelier and busier. There is more money going among all classes. The railways have more traffic and more travellers; the shopkeepers see more customers, and the labourers are more fully employed. There are fresh orders for the commercial traveller when he comes round, and great business houses in London, Manchester, Leeds, or Birmingham report a lively demand for their goods. The movement, like the ripple made by Pope's pebble in the peaceful lake, spreads in widening circles all round. From the tradesmen in the towns and villages it spreads to the wholesale houses, thence to the manufacturers, and so on to the workman, to the producer of raw material, and back to the farmer again. A flourishing agriculture makes a flourishing home trade, and a brisk home trade quickens the demand for agricultural products in the towns, and prices are forced up by the increased consumption. The food which would have had to be purchased has been grown at home, and the nation is the richer by the whole of the difference between the value of the cereal produce last year and that of the harvest now about to begin."

## POULTRY AND PIGEONS

### FANCIERS v. FARMERS.

IT is impossible for a Dorking fancier not to be interested in or amused at the letter of Mr. Harrison Weir, which under the above heading appeared in your columns of the 7th inst. Before now I have done the little in my power directly to call the attention of poultry fanciers to what I believe to be the true type of Dorking, and indirectly to influence judges to give prizes to birds

of that type. It may be said that the question in the Dorking controversy is what that type is. This I cannot allow. I have never met with any fancier breeder who really had much doubt about it. The difference has been as to what defects should be considered disadvantages and what absolute disqualifications. Other fellow fanciers and breeders have taken the same course; and we have, I think, been always anxious (for my own part I certainly have) to get the opinion of the older Dorking fanciers such as Mr. Weir. I am, therefore, a little astonished and indignant to read his comparison between fanciers and farmers to the obvious disadvantage of the former. We fanciers have been the cause of the decline, aye, and the loss of a valuable breed of poultry, which we ignorantly thought we were all the while encouraging! I venture, therefore, to trespass once more upon your space, and to examine some of Mr. Weir's statements and the arguments he draws from them, which, however, might not, I think, lead everybody to the same conclusions. "I know," he says, "from long observation of the different stocks of poultry of farmers in Surrey, Sussex, and Kent, that the utmost care was taken to keep and preserve the breed pure;" and a little further on, "At Lewes, only last week, a farmer's wife asked me where to get some true-bred Dorkings, as she did not like the new style of bird at all for the farmyard. I could only answer, 'I wish I knew.'" But why, in the name of common sense, if these farmers took so much pains to keep this breed pure, have they so utterly failed that it cannot now be obtained even by one having such exceptional acquaintance with the poultry-growing districts as Mr. Weir? Why, if it was so pre-eminently excellent for the table, has it been allowed to die out by the caterers for the London markets? What occult power has been given to the "fanciers" that have been able to drive out from all the farms of Surrey, Sussex, and Kent a useful and palatable breed of poultry, and to introduce instead a coarse-fleshed and mongrel race? I believe the answer to be a very simple one and twofold. First, that the old Dorking was a delicate bird, and so when not really cared for by enthusiastic fanciers, died out. Second, that the farmers who admired it were too careless or too stupid to see this, and so let it die out without making any intelligent attempt to improve its constitution, while retaining its admittedly excellent qualities as a table fowl.

"Why," says Mr. Weir, "is the true white-legged Dorking to be stamped out?" Why, indeed! But who wishes to stamp it out? and who, if he wished, could do so when, according to Mr. Weir, it no longer exists? But to leave behind the peculiar inferences which Mr. Weir draws from his own facts, I do not believe that there really is much difference of opinion between him and ourselves, the present fanciers and breeders of Dorkings, as to what a true Dorking should be. Some time ago, unfortunately, mongrels did often appear in the prize list, and I heartily re-echo your correspondent's words—"If the prizes are for Dorkings why are they given to cross-breeds?" This was the question in the mouths of all of us some four or five years ago. It was not we who showed the mongrels. Two or three exhibitors did, and the judges persisted in giving them the prizes. That was not our fault; we grumbled and exclaimed against such decisions, and finally stopped them. The judges, too, who made such awards were no young and inexperienced fanciers. The late Mr. E. Hewitt, all round a most excellent judge, for a time made the great mistake of selecting for honours long-legged coarse-boned Dorkings. Again at Birmingham Mr. Baily one year gave second prize to a cockerel in the White Dorking class which was avowedly a first cross with a Light Brahma; he had a pea comb and feathers on his legs. We fanciers suffered grievously at the time from such blunders. But why blame us when we did all in our power to counteract them, and have now made them almost impossible? Of course no fancier ever bought such birds at their catalogue price of £1 or £2; but we preferred giving our £10 or £20 to each other for unnoticed specimens.

I do not rush into the large question whether, apart from the enthusiasm of "fancy," any race is likely to be kept long pure or to be improved. Abler pens than mine have done justice to it; but I do protest, as a Dorking fancier, against the assertion that the present Dorking fanciers wish in any way to depart from the old recognised Dorking characteristics, though I believe most of us are glad that by careful selection we possess a really hardy race, which I well recollect my earliest Dorkings were not, and that in four months we can produce chickens of a size which formerly six months would hardly have given us. I do not desire to write with any asperity; there are plenty of subjects in life for controversy without quarrelling over our amusements. I firmly believe that Mr. Weir and others who agree with him are entirely under a misapprehension as to the points which present Dorking fanciers breed for, and unjustly credit them with the vagaries of some few overworked judges.

I believe a new "Standard of Excellence" is likely to be published by the Poultry Club. This, it is to be hoped, will clearly show what our ideal Dorking is.—O. E. CRESSWELL.

### POULTRY NOTES.

TRULY history repeats itself. Twenty-seven years ago Mr. L. A. Meall, in writing his new edition of "Moubray on Poultry," discussed the Dorking question, and contended that the White Dorking was the only genuine and original breed entitled to that name. He refused to allow that the coloured birds, which he called "the Sussex fowl or 'Improved' Dorking," were anything more than the result of crosses. The following extract is instructive:—"Not that we wish to speak in any way disparagingly of the merits of the Sussex *as a fowl*, for we readily admit that cross-bred birds often surpass their original progenitors; but all we contend for is, that *as a breed or variety* they ought not to be permitted to be classed or to enter into competition with that of the true-bred White Dorking." To-day we have Mr. Harrison Weir adducing a similar charge against the modern Coloured Dorking, with the difference, however, that it is not for the White Dorking alone that he claims title to purity of blood, but also for the very birds which Mr. Meall denounced nearly thirty years since as being mere pretenders to the name.

IN his first letter Mr. Weir disclaimed having said all that we attributed to "the praisers of the time that is past" in reference to the demerits of the modern Dorking. We never alleged that he had, but we think we may now safely leave it to our readers to judge whether our statement as to the general condemnation of the modern Dorking by the admirers of the Dorking of the past was an exaggeration. With the single exception that Mr. Weir does not allege that the modern Dorking has "black feet" (an expression which we of course did not intend to be taken literally), and substitutes the term "sooty-legged" as conveying his ideas in this respect, we really cannot see that his estimate of the modern Dorking differs very much from that attributed by us to the "praisers of the time that is past." We will not attempt to combat these doctrines, as there are apparently others able and willing to do so, and it has been discussed at some length recently.

MR. WEIR must have been grievously affected by the death of that last bird of his old strain, or he would surely not have run such a tilt as he has done against all modern poultry fanciers. Having said in his first letter that he "knows none of the fanciers," he in his second describes them as "little dealers who buy up a few well-bred birds, show them, and get prizes as long as those birds last, and advertise birds and eggs from such and such a prize strain;" and again as men "who kill the birds they ought to love by sending them from show to show until they die from sheer exhaustion through their owners' greed for gain." It is true that he denies the right of such men to be called fanciers, and defines a fancier as "one who keeps anything from the pure love of it, looking to and keeping and purifying its most minute points of stated excellence and beauty," but he also implies that no such enthusiasts in poultry exist. All we can say is that Mr. Weir evidently "does not know any of the fanciers," and that if he did he would find amongst their ranks many who are just as far removed from "little dealers" as the fanciers of flowers he refers to. There are, of course, dealers in poultry just as there are nurserymen who supply the wants of the fanciers of flowers, but that does not justify the condemnation of all modern fanciers, nor indeed such a sweeping condemnation of those who earn a living by exhibiting and dealing in fancy poultry. Many dealers are perfectly free from blame on the score of cruelty in over-exhibiting their birds, and surely dealing in poultry is not of itself a more vicious pursuit than dealing in anything else.

THE illustration drawn from the fanciers of flowers shows clearly the distinction we sought to draw between the fancier and the farmer, by which latter term we meant the man who keeps poultry for the supply of eggs and meat. Would anyone think of blaming the enthusiastic gazer upon the Auricula or the Tulip because he did not devote his attention to the Potato or the Onion? We contended, and still contend, that the fancier as fancier has no more to do with the edible qualities of his pets than the Tulip fancier has to do with the question whether or not his choicest bulbs would eat well if cooked. Indeed, we are surprised that Mr. Weir, who shows so fine an appreciation of the "loving tenderness" of the true fancier, should for a moment be led so far away

from the paths of the true fancier as to calmly contemplate the appearance of his favourites on the dinner table.

ONE word as to crosses. Mr. Weir asks, "Why is the fancier so anxious to breed poultry pure that the farmer may have them to cross with his common fowls?" We answer that the fancier has no such anxiety. He does not in the least regard what the farmer may do in the way of crossing. It does not in the least concern him; but as we write for farmers as well as fanciers, we advise the farmers to do what we have found most advantageous. If the farmer has a breed of poultry, be they ancient Dorkings or be they anything else, which gives him a liberal supply of good-sized eggs, is hardy, and makes a fine table fowl, let him keep to it by all means; but if this breed cannot be found—and we frankly confess that we do not know where to find it—then we advise as the next best course the use of a judicious cross. It is well known that however much the original good or useful qualities of a breed may have been lost by breeding for purely fancy points, these good qualities almost invariably re-appear upon an entirely fresh cross. It is further well known that although it is difficult to combine very superior laying and table qualities in the same breed, yet both these qualities may be found in cross-bred birds. We therefore recommend the farmer to make an effort at improvement in this direction. If the cross be judicious there may be some variety in "colour, comb, and topknot," which are purely fancy points, with which the farmer as such is not concerned; but there should not be any great variety in size or shape, nor yet in laying qualities, which are the matters of most importance to the farmer.

IN using the heading, "Fanciers *versus* Farmers" we did not mean to imply that there was or should be any hostility between the two classes. We do not for a moment doubt that many farmers have been and are good fanciers, but in so far as they have become fanciers of poultry we think it will be found that they have ceased to be farmers of them. In some breeds, and perhaps more in the Dorking than any other, the two aims are, to a certain extent, consistent with each other; but even here the struggle between utility and beauty must come sooner or later, and one has to give way to the other. To the fancier beauty is of primary importance, and utility must take a secondary position. To the farmer the useful qualities are all-important, and beauty is hardly worth consideration. We simply desired to emphasise this distinction, and we do not suppose that our title conveyed to any other of our readers than Mr. Weir the idea that we meant to imply the existence of any hostility between fanciers and farmers.

### OUR LETTER BOX.

**Boiled Indian Corn** (*J. J.*).—Boiled Indian corn mixed with bran is good food for working horses if given at the same cost as two bushels of Oats and half bushel of Beans per week, and is especially adapted for feeding mares with foals.

### REMARKS.

17th.—Brilliantly fine and hot.  
18th.—Fine, bright, very warm.  
19th.—Misty early, afterwards fine, bright, and hot; latter part of the day cloudy and oppressive.  
20th.—Much cooler; overcast at first, afterwards bright and fine.  
21st.—Very fine, with cool breeze.  
22nd.—Overcast, cool, and slight showers.  
23rd.—Fair, but very dull and rainy-looking at times.  
The early part of the week nearly as hot as the previous one, but since the 19th it has been much cooler, though almost without rain. For the whole week the temperature, though much below last week, is considerably above the average.—G. J. SYMONS.

4th	TH	Sale of Orchids at Mr. Stevens's Rooms, Covent Garden.
5th	F	
6th	S	
7th	SUN	8TH SUNDAY AFTER TRINITY.
8th	M	Camberwell Amateur Floral Society's Show.
9th	TU	Royal Horticultural Society, Fruit and Floral Committees at
10th	W	[11 A.M.]

### RASPBERRIES AND RATIONALISM.

**R**ASPBERRY crops have been generally very good this year, but some of them might possibly have been better had a more intelligent system of management been pursued in one extremely simple yet highly important particular—namely, thinning out the growths at the proper time and in a proper manner. Raspberry canes are like young Vine rods; if the wood is not matured and the buds in the axils of the leaves are not bold, the best crops of fruit cannot be expected. These essentials of fruitfulness cannot be produced if the growths are overcrowded in summer. It is the custom to thin out the canes of Raspberries during the winter—removing those that have yielded fruit, and at the same time a number of the young growths, retaining the best for producing the future crop. This is all very well, indeed the practice cannot be dispensed with; but if Raspberries are well managed there is no necessity for doing such work in the winter, or very little of it will need to be done then. The proper time for thinning Raspberry canes is in early summer, say about May, and again in July or early August, immediately after the fruit has been gathered. There is time for the latter process now, and those who adopt it will find the benefit of having done so in the better crops of fruit that will be produced another year.

At the present moment there are hundreds of plantations of Raspberries where the growths form a dense thicket. Each stool consists probably in the majority of cases of about half a dozen fruiting canes, or canes that have just fruited, and from twelve to twenty young growths, a limited number of which will be secured to the stakes or wires, the others being cut out or pulled up after the leaves have fallen. Let anyone who has a bed of Raspberries in the condition described examine the canes now, and those that have fruited will be barren quite half their length from the ground, while the new canes will only have bold buds near the top where they have been under the influence of light and air, the lower and stronger portions of the growths having no prominent buds in the leaf axils. Now the mere strength of a Vine or Raspberry cane is of little or no use for fruiting if the axillary buds are not fully developed and the wood ripened. A Vine cane for instance, not thicker than a lady's finger will, if short-jointed, studded with bold buds, and matured, afford a far better crop of Grapes than a cane half as thick again as a man's thumb will produce, and that is green, soft, pithy, and destitute of round hard nut-like buds.

It is not possible that hard fruitful growths can be produced

by the summer-crowding or thicket system—air and light must have access to the foliage in summer. It is no use admitting them to the leafless stems in winter, as the nature of these cannot then be changed. The overcrowded plantations require relief now—at once. Every day's delay is dangerous. The first thinning really ought to have been done in the spring by pulling up the superfluous suckers when from 6 inches to a foot high, and those remaining, half a dozen or so from each root, would have been very different now—shorter-jointed, firmer, with bolder axillary buds almost to the base of the stems. If the young growths referred to are pulled up in wet weather in spring and planted at once they grow freely and form good canes by the autumn. Where this spring thinning has been neglected, as it has been in the great majority of gardens, let not the evil be aggravated by further neglect, but proceed promptly to remove the canes that have produced fruit, thinning out at the same time some of the current year's growths if, as they are almost sure to be, too numerous, and those remaining will yield twice the quantity of fruit that they would do if left to struggle for two or three months longer for the light and air they need, and in thus struggling exhaust themselves and weaken the plantation.

This work of summer-thinning is, if apparently simple, yet of real importance, but it can only be effectual by being properly done. A reckless boy or a rough workman will do as much harm as good. The thinning must be carefully and intelligently done. The operator must be made to understand that while it is of importance to remove the old canes and superfluous growths, it is imperative that the leaves be left on those remaining, as without leaves now there can be no fruit next year, and if those leaves are not developed the crop cannot be satisfactory; hence the importance of thinning in the first place, and the absolute necessity of doing the work with care and in a proper and reasonable manner. Every movement of a man's body among the growths should be in obedience to reason, not in spite of it, and every movement of the hand and knife be accompanied by thought and guided by intelligence. This is what is meant by doing work in a reasonable manner. We want more of such work in gardens—more thought, and less of mere rule of thumb; more individual intelligence, and less of that blind follow-my-leader routine that has brought so many Raspberry beds into their present unsatisfactory state. Let us not leave them there, but adopt forthwith a more rational system of procedure, and assuredly great gain will follow.

It is not at all difficult to remove the canes from Raspberries now and leave the foliage uninjured on those that are relied on for the next year's crop. The operator must first make his selection of the best canes, then sever the others and remove them gently downwards until they lie flat on the ground. Scarcely a leaf need be broken in doing this work. The canes left may be very loosely secured to the stakes; the refuse can then be removed, and the bed will have a neat appearance, showing that it is cared for and tended by a real gardener, and not by an untrained manual worker, so many of whom pass as gardeners now-a-days to the prejudice of competent men, and also, it may be added, of employers. No gardener ought to be placed in charge of any establishment of importance who is not able to give a reason for everything he does. He will then work on a sound principle, and certain of the results that will follow; but a man who works by guess, does

something that he thinks he has seen others do, is about as apt to fail as succeed, as there may be circumstances which his untrained mind did not enable him to appreciate that rendered his and his neighbour's case the reverse of identical. There is nothing more true than the old saying, that work well done is twice done, and this applies with special force to Raspberries, and indeed Vines and fruit crops generally; for if pruning and thinning are properly done in summer the crops of fruit are greatly increased, and the winter work is reduced by half the labour that would be otherwise requisite for its performance.

By adopting the practice recommended in Raspberry culture large bunches of fruit are produced almost to the ground, and with otherwise good culture three quarts of fruit have been gathered from a bush; according to the rough-and-ready mode of culture, or want of culture, not more than one quart would have been produced on the same space of ground. By the thicket system the soil is exhausted, while light and air are not utilised; but by a more rational process the resources of the soil under the beneficent influences of those all-important elements are turned to direct and profitable account. Old diggers will probably not accept this doctrine, but young probationists may possibly ponder over it with advantage. In the meantime, however, all who grow Raspberries will not err by thinning out the crowded growths now instead of waiting until winter.—A NORTHERN GARDENER.

#### CARNATIONS FROM SEED.

BEAUTIFUL as the choice named varieties of Carnations admittedly are that are propagated by layers, it is a question if they are so useful to the majority who grow flowers for decorating their rooms and gardens as Carnations that are raised from seed. Many of the finer florists' varieties that are so regular and rich in their markings are comparatively delicate in constitution, and if the plants pass the winter in the open ground they produce but few flowers the following summer. It is true that such varieties are usually wintered in pots, and undoubtedly they are worthy of the attention that they receive in this respect; yet there are many great admirers of Carnations who are not able to grow them after the manner of the florists, nor do they desire to grow them with the same object, yet they may have hundreds, even thousands, of these sweet and attractive flowers, with almost the same ease and certainty as they can produce Wallflowers and Sweet-Williams; and this is by raising the plants from seed.

A strong well-grown plant of a seedling Carnation will produce five, even often ten times, as many flowers as a plant of a named florist's variety that is the result of a layer, and the flowers of the former will be as valuable for vase decoration as the latter, and can be cut without compunction or hesitation. Indeed, when a plant produces fifty or a hundred flowers, as many seedling Carnations will and do, it is an advantage to the plants to relieve them of a portion of their burden, and there are at the same time plenty of flowers both for the vases indoors and for leaving the plants attractive in the flower beds. Further, increasing the plants or raising a stock in the manner indicated being the easiest mode of all, it is suitable for beginners who will, after growing seedlings for a year or two, almost certainly desire flowers of higher quality, and gradually they will gain experience and also be impelled to purchase a few of the named varieties, and thus become florists. This is in fact the way in which new florists are made. They start like boys at school with what is easy, and on accomplishing their first task acquire a liking for the work, and so go on step by step to greater attainments, and become in time teachers instead of learners. Is not this the course that the cutler florist of Sheffield pursued—Mr. B. Simonite, who now ranks among the foremost Carnation growers of the day, and is the raiser of some of the standard varieties? Let others follow in his footsteps. The path leading to success is open to all, if it is pursued intelligently and perseveringly.

But it may be urged that a portion of the plants that are raised from purchased seed will produce single flowers. No doubt this will be the case, but even those are suitable for cutting; yet the great majority of the plants will yield double flowers, a few of which in all probability will be of standard merit and worthy of being perpetuated by layers. This very probable step is a clear step in advance to floristhood, and is certain to lead to further progress, and possibly to future fame. It is encouraging, too, that plants thus raised—that is, by layers from seedling plants, nearly always flourish. They appear to inherit in a great degree the vigour of the parents, with their hardiness and floriferous character, while the markings usually become brighter and more

defined. But it is for affording cut flowers and making gardens delightful that the mode of raising the plants from seed is recommended. Carnation seed is usually grown on the continent, where great care appears to be taken in selecting the varieties, for assuredly the produce of the seed that is sold by the leading nurserymen and seed merchants is much superior to that of a few years ago.

The seed may be sown either in the spring in a little heat or late in summer, in this case no artificial heat being required. Spring-raised plants are apt to become too large before winter, yet few, if any, of them flower; therefore summer sowing is preferable, as sturdy plants are produced that will pass the winter with little or no protective aid, and will flower beautifully the following summer. June is perhaps the best month for sowing, but if seed is sown now—at once, a valuable stock of plants may be obtained that will eventually give much satisfaction.

It is well to sow in boxes, nearly filling them with a mixture of sandy loam and leaf soil, watering it copiously, sprinkling the seed thinly, and covering with squares of glass. The boxes should either be placed in a shaded position or covered from the rays of the sun, it being essential that the soil be kept constantly and regularly moist. Shortly the seedlings will appear, when air and light must be admitted; and in due time the young plants must be transplanted in generous soil, either in other boxes that are larger and deeper, or under handlights, and a stock of healthy plants and eventually a wealth of handsome fragrant flowers will reward the cultivator for his pains.—J. W.

#### NEW PEAS—CARTER'S STRATAGEM.

PERMIT me to thank all those correspondents who have communicated their experiences in the culture of Day's Early Sunrise Pea. Although there is a great divergence of opinion relative to the merits of that Pea, I think we shall at least be justified in leaving out the adjective "early." Day's Sunrise appears to be a good second early Pea, but I shall not venture to rely on it for a first crop. It appears to me that such letters as those that have been published cannot fail to be of great practical value to many whose love for their gardens is greater than their means of purchasing new introductions. I must confess to a hankering after everything that is new, but can no longer indulge in the pleasure of purchasing articles of speculative merit; I have, therefore, perforce to bide a wee, and profit by the experience of others. It is a great satisfaction that there are those in the gardening ranks who are so ready to aid through the medium of the Journal in imparting information that is of substantial use to many readers; and as experience has taught me that a specific request is followed by the most satisfactory results, I will now venture to ask for practical information relative to the merits of Carter's Stratagem Pea that was sent out this spring. There must be several readers who have tried this Pea, and information given in respect of it with the same freedom as in the case of Day's Sunrise will be very welcome to me, and I doubt not to many others similarly circumstanced.—CLERICUS.

#### DIFFICULTIES IN GRAPE-GROWING.

YOUR correspondent Mr. Jacob Robinson, writing under this heading in your last issue, may consider himself fortunate in managing to keep his Vines from scalding for so many years past. If I read correctly his statement I must at once conclude his vinery is insufficiently ventilated. During the extreme heat experienced of late, vineries could not be too much ventilated; scarcely a breath of air existed, and the ventilators opening only in the end is not sufficient to cause a thorough circulation of air, which is most essential to the proper development of Vines. It would prove a decided advantage to the Vines if the house were more freely ventilated at the top, and undoubtedly prevent the bunches being scalded in future. It is not easy to determine the cause of scalding on this particular occasion. The Vines might have been dry at the roots, or their energy so depressed from one or more causes that it would be impossible for them to resist the burning heat of the sun. It is not easy to suggest the reason why the Vines do not do so well in the other house. It not unfrequently happens that Vines in the same house do not always do alike, some doing well, while others will do but poorly. The erection of stables or any other structure at the back could make little difference. They should do as well with only a back wall as if joined to any other building. Hundreds of vineries are built with only a single wall at the back, and answer remarkably well. Have the Vines been overcropped at any time during their existence? The soil in the border may have become exhausted, and be the cause of the deficiency in size of bunch and

berry ; if so, the roots should be lifted wholly or partially, and the border renewed with fresh soil. This might prove very beneficial and produce the desired effect. Vines that have been restricted in growth for a number of years often produce small bunches and berries. The growth should be allowed to extend at the top and bottom, which would increase the root-action, and add vigour and energy to the Vines.—W. B.

MR. ROBINSON thinks it absurd to shade Vines to prevent them scorching. It is seldom that shading is necessary ; but under the extreme heat that has been lately experienced, together with the insufficient provision for ventilation of the vineries under notice, a little whitewash sprinkled on the glass would have been a very wise proceeding, or at any rate far less absurd than allowing the Vines to be injured. It is not at all rare for the most accomplished of Grape-growers to shade the Vines slightly when they are endangered by extreme heat, and certainly a film of whitewash does not obstruct the light any more than the clouds do on a dull day. It is questionable if the ventilation described was advised by Mr. Rivers. His system, if I remember rightly, applied to span-roofed houses, where the circulation of air is much greater than at the top of a lean-to, where the radiation of heat from the wall above is very considerable. Rather than have a house so close as that described I would break a few of the top squares, and also shade if it were needed, as the lesser of two evils.—GRAPE-GROWER.

I REMEMBER some years ago, when Blondin the celebrated tight-rope walker came to Cirencester, about half the Grape-growers had their Grapes badly scalded. It was an unusually hot day, with the thermometer registering over 90° in the shade. On a bright sunny morning, whilst many amateurs had gone up into Earl Bathurst's park to see the performance, the mischief of scalding was done. I put every ventilator in my house open to the fullest extent, also the door, and escaped with only one bunch scalded. This was ten or twelve years ago, and we have not had another day to equal it since. We have had a day or two with the thermometer about 90° this year, and I kept a sharp look-out on the vinery, but, as there was plenty of foliage at the top, did not open all the ventilators to the fullest extent. I think that in all probability many years will pass before Mr. Robinson's Grapes are injured again, but if they are it will be a sure sign that the ventilation is not sufficient. It evidently was not sufficient for the exceptional weather we have lately experienced. I think there is no doubt his second house would be improved by more shelter.—AMATEUR, *Cirencester*.

POSSIBLY many of your readers will take a lively interest in the statement of Mr. Jacob Robinson concerning the scalding of Grapes, for without doubt this has been a most trying season for amateur Grape-growers, and perhaps, too, for some others. Your correspondent has a lean-to house 20 feet long, 10 feet wide, and 12 feet high, built against the south side of his dwelling-house. The front sashes are 3 feet deep, and every other one opens for ventilation. The roof is fixed, and top ventilation can only be had by means of the triangular pieces which open under each end of the roof to the depth of 2 feet. The ventilators were open to their full extent on the 4th ult., and had been partially open throughout the previous night, yet every bunch on the upper half of the rods was badly scorched, and your correspondent naturally wants to know the reason, and how to prevent a recurrence of such a misfortune.

We will first confine our attention to this house, and see why the Grapes should scald there, and possibly at the same time some light may be thrown on the opposite side of the question as to why they did not scald in the other house, which was simply a continuation of the building in which the injury took place.

Your correspondent quotes from Mr. Rivers' book that "Grapes can bear any amount of sunshine," which is possibly correct when the air in which they grow is not confined, also in ordinary summers and ordinary vineries it may be said to be almost correct if we except one or two varieties of Grapes. But Mr. Rivers, although he lived a long and noble life, did not experience many such extraordinary ranges of temperature as we have done during the last six or seven months—viz., from below zero to 97°, and it is probable that had that good and honest man lived to this time he might have seen occasion to modify some of his ideas, as I have some of mine, relating to this subject.

Not long ago I held the opinion, and many a good cultivator shared it, that what was called scalding was the result of too rapid evaporation, and was in fact a chill rather than a scald. Now, although I have no doubt that a similar effect to scalding is often produced in this way, yet I have had ample proof that in a

certain stage of growth actual scalding is liable to take place independent of the state of the atmosphere as to humidity. The stage at which this is most likely to happen is during stoning, when there is no visible growth of the berry ; and as Grapes grown in an unheated house will generally colour simultaneously with their last swelling, the danger is often not passed till colouring has commenced. Before stoning, and also immediately after, the Grapes will bear with impunity, as far as scalding is concerned, a much higher temperature than they will during that process. If the thermometer is kept in the shade, as it always ought to be, it is not advisable to allow it to rise much higher than 80° during the time of danger. Of course, with the tropical weather we lately had the temperature could not be kept so low, but in my case every available ventilator was open, sometimes including the doors ; and although Mr. Jacob Robinson says "it seems absurd to think of shading Vines," yet we pocketed the absurdity and sprinkled some whiting and water over the roof with a syringe, and had we such a sun trap as Mr. R. to deal with, we should probably have added a handful of soot.

Your correspondent's house, standing as it does against the south wall of the dwelling-house, which probably rises 20 or more feet above it, and catches and stores up the rays of sun all day long, will at midday, on such a day as that mentioned, have a sun temperature of 140° or 150°, which is thrown back with the reflected light on to the Vines. Is it, then, a wonder that they should suffer ? The end ventilators under such conditions would be of little use, as the air outside above them would be nearly, or quite, as hot as that under the Vines. I certainly advise Mr. Robinson to have more top ventilation, which, although it might not have the effect of keeping the temperature lower on such a day as that under consideration, would cause a greater circulation of air, and that alone would lessen the danger. Removing the glass to the width of 6 or 9 inches at the top, and placing a board on hinges there similar to what he has on his other house, would probably answer the purpose. Also he must not be afraid to shade a little during stoning, and also during flowering, should the weather be excessively bright. A little whiting and water put on the glass with a syringe is as good as anything, as it is easily and quickly applied and comes off with the first shower. The reason scalding has not taken place in previous years is that we have not before had so high a temperature so early in the season. Four years ago we had the thermometer above 90° one day in the middle of July, and once again in the middle of August ; but I think there was nothing like the continued sunshine which we have this year experienced.

And now, why did not the Grapes scald in the other house, which is merely a continuation of the same range and the same border ? Because there the ventilation is thorough, and it is not so much required. A mere 9-inch wall at the back, only rising to the height of the house, which is but about 8 feet, will not husband up any heat when shaded by the Vines, and a 6-inch board running the entire length at the highest point and opening to the north will, in conjunction with a similar ventilator running along the front, generally be quite sufficient. To the further question, Would building a stable or a coach-house at the back make the Grapes as early and as fine as those in the other house ? I should say, Probably not, unless the roof is carried to the same height as the other house, and the wall of the coach-house or stable is also carried up as high as that of the dwelling-house ; but undoubtedly a building of any kind, or even a brick screen run up behind the 9-inch wall, leaving a hollow air-tight space only 3 or 4 inches between, would assist considerably in keeping up the temperature in spring, and thereby forward and improve the crop.—WM. TAYLOR.

#### ALPINE AURICULAS.

IN the spring of the year few flowers are more lovely than the above, and they are worthy of every care and extensive cultivation. The Alpine varieties are very easy to manage, and can be readily obtained from seed or by dividing the plants after flowering. The seed on established plants outside will now be ripe, and should be sown at once after being gathered in pans filled with any light compost. The seeds should be sown on the surface ; covering is not necessary when the soil is made even and smooth, well watered, and covered with glass until the seed germinates. The pans containing the seed will do in a cold frame, or better still if they can be placed where a gentle heat can be given, as under these circumstances the plants make greater progress. It is judicious to encourage the seedlings as much as possible, so that they will be strong before winter. When in cold frames they only grow slowly at first, and are very small when winter approaches, and in consequence are liable to damp off. Great advantages are to

be gained by pushing on the seedlings at first and having them pricked-out singly in other pans or boxes to become established before winter. They can be wintered in cold frames, and in early spring, when all fear of frost is past, they should be planted in beds prepared for them by the addition of old potting soil and leaf soil. The plants should be about 4 inches apart, and remain in these beds until they flower, when only the best should be retained. Many of the strongest will flower the first season, but when in such a weak state it is difficult to judge of their merits; but the second season they should be strong and flower profusely, when seed can again be saved from the best varieties.

It is wise to allow them to flower before planting them in permanent positions. The soil should be made rich and light, so that water will not stagnate about the roots. They should be taken up, divided, and replanted every two years after flowering. It is not necessary to do it annually, as they look much better in good clumps when employed in shrubbery borders or similar positions than when single crowns are grown. Those that have not commenced cultivating Alpine Auriculas should lose no time in obtaining some seed, as they not only enliven the garden outside in spring, but are admirably adapted for pots in conservatories or any house that has to be kept gay in early spring. When grown in pots they should be placed in them after they have flowered, and will soon become established and flower well in the early spring. Good plants can be lifted and placed in 5-inch pots and kept close in a frame for a short time until they become established. The plants can then be placed outside until the approach of frost, when they can be wintered in any cool structure, and will well repay for any care or trouble devoted to them.—SCIENTIA.

#### LIVERPOOL HORTICULTURAL SHOW.

WHEN the gardeners of the Liverpool district produced the first great Show of the present Association in 1879 there was by no means an unanimity of opinion that they would remain sufficiently united to place the organisation on a firm basis and produce other shows of a similar nature. They have, however, had two shows since then, and the Exhibition now to be noticed was decidedly the finest of the three; indeed it ranked amongst the finest provincial gatherings of the kind that has been seen this year. The Exhibition was held as usual in Sefton Park, and the several fine marquees and the great display of horticultural implements and appliances presented quite an imposing appearance. A new feature was the groups of plants arranged for effect, and as a first attempt the result was highly encouraging. The competition and the plants were both good, but there is something to be learned in the tasteful disposition of the collections, and the reason becomes the greater for continuing the classes. The specimen plants were generally of the highest merit, and the fruit was excellent, the Pines, Grapes, and Peaches not having been surpassed at any other show that we have seen this season, while the vegetables were of good average quality.

The capacious marquee in which the specimen plants were arranged had a magnificent effect. The chief collections were arranged down the centre, on the ground, tables extending round the sides for smaller plants in the different classes. The first class in the schedule was an open one for twelve stove and greenhouse plants, six to be in flower, the prizes being £12, £8, and £5; these were won respectively by Messrs. Cole & Son, Manchester; Mr. Peers, gardener to G. Raynor, Esq., Wavertree; and Messrs. W. Caldwell & Sons, Knutsford. It is not necessary to enumerate the first-prize collection, the Manchester plants being well known; it must suffice to say that the group was a strong one, or it would not have secured the position against such meritorious examples as were staged by the local exhibitor. These included large and fine specimens of *Dicksonia antarctica*, *Latania borbonica*, *Cybotium princeps*, *Calamus ciliaris*, with about twenty growths from 6 to 8 feet high; *Croton angustifolius*, splendid; and a good *C. Disraeli*; *Allamanda Hendersoni*, very fine; *A. grandiflora*, good; with creditable specimens of *Bougainvillea glabra*, *Statice Holfordi*, *Vinca alba*, and an *Erica*. The Knutsford plants were neat and generally good, but not so large as the others. The next class for ten plants (local) was perhaps the most prominent feature of the Show, several exhibitors staging remarkably fine collections. The first-prize group from Mr. Mease, gardener to C. W. Neumann, Esq., Wyncote, Allerton, has rarely been surpassed at this season of the year. *Croton variegatus*, 8 feet in diameter and in splendid colour, was equalled by *C. interruptus*, and between them was a very fine *Latania*; *Alocasia macrorrhiza variegata* was vigorous and clearly marked; *Erica jasminiflora alba*, 3 feet in diameter, very fresh; *Alocasia metallica*, fine; *Clerodendron Balfourianum*, a grand oval about 5 feet high; *Bougainvillea glabra* of the same size and in superb condition; a splendid specimen of *Allamanda Hendersoni*, and a rich mass of *Kalosanthes coccinea* 4½ feet in diameter, completed this noble group. Mr. Faulkner, gardener to F. R. Leyland, Esq., Woolton Hall, was an excellent second. He staged the finest *Vinca* that has been seen for years, *Kalosanthes miniata* about equally

fine, *Erica metulæflora superba* very rich, with *Dipladenia amabilis* and *Allamanda nobilis*, both very good. The best foliage plants were *Gleichenia rupestris*, *Kentia australis*, very fine, and a healthy *Cocos Weddelliana*. Mr. Blomily, gardener to H. Crossfield, Esq., Oaklands, Aigburth, had third honours with a neat, bright, and fresh collection, the notable plants being the best *Croton Weismanni* in the Show and seldom surpassed anywhere, a good *Brainea insignis*, and a fresh and healthy specimen of *Ixora coccinea*. In the open class for six plants in bloom the last-named exhibitor won premier honours. *Kalosanthes coccinea* 4 feet in diameter was splendid in truss and rich in colour, the finest variety we have seen of this good old plant; *Allamanda grandiflora*, excellent; *Ixora javanica*, a one-sided specimen; a very good *I. coccinea*; *Bougainvillea Vreelandi*, 3½ feet across; and *Statice Holfordi*. Messrs. Cole were second in this class, and Mr. Faulkner a remarkably close third. In the local class for four plants the prizes went to Messrs. Mease, Blomily, and Faulkner in the order named. Mr. Mease's *Bougainvillea* and *Allamanda* were of great excellence; Mr. Blomily's *Kalosanthes Madame Celeste* Winans, silvery pink, 4½ feet in diameter, highly attractive; and Mr. Faulkner's *Vinca* and *Lantana Distinction* being the noteworthy plants in this class. Mr. Blomily, who is clearly a first-rate grower of *Ixoras*, secured the first prize in the single specimen class (stove) with a remarkably neat and fresh example of *I. coccinea*; Mr. Mease being second with *Allamanda nobilis*; and Mr. Ramsden, gardener to W. Rathbone, Esq., Green Park, Wavertree, third with *A. Schottii*, both exhibiting fine specimens. In the corresponding class for greenhouse plants Mr. H. Elliott, gardener to Mrs. Bateson, New Heys, Allerton, was placed first with *Erica retorta major*, remarkably well grown, the plant being 3½ feet in diameter and the flowers very fine; Mr. Cromwell was second with a good *Erica ampullacea* Barnesi, and Mr. Mease third with the seldom-seen but good old Cape plant *Selago corymbosa*.

Mr. Cubbon, gardener to Mrs. Alison-Johnson, was in the foremost place in the open class for eight fine-foliaged plants with excellent examples of culture, closely followed by Mr. Peers and Messrs. R. P. Ker, the last-named exhibitors staging a very fine specimen of *Croton Disraeli*. In the class for six plants Mr. Cromwell was first, *Croton Weismanni* being in superior condition, and *Anthurium crystallinum* having grand foliage. Mr. Faulkner was a good second in this class, and Mr. Finnigan, gardener to W. Burnfeet, Esq., Huyton, third with neat specimens. Mrs. Ramsden was placed in the first position in the open class for eight Ferns, his best plant being *Alsophila excelsa*, healthy and fine. Mr. Faulkner was an extremely close second, *Adiantum lunulatum* 4½ feet in diameter and *Davallia Tyermanii* being perfectly unique, while *Nephrolepis davallioides furcans* was very fine. Mr. Gore, gardener to Thomas Holder, Esq., Aigburth, was third, his most attractive plant being *Leucostegia chærophylla*, a fine example of an elegant Fern. In the local class for six plants Mr. Peers won the first prize with superior specimens, *Cybotium barometz*, deep green, *Davallia polyantha*, and *Gleichenia rupestris glauca* being very fine. Mr. Roberts had the remaining prize with a meritorious collection. In the single specimen class Mr. Whitfield, gardener to J. T. Cross, Esq., Aigburth, and Mr. Cromwell secured the prizes respectively, both with *Adiantum farleyense*. A fine plant of *Adiantum Flemingii* was exhibited and highly worthy of a prize, but no exhibitor's name was attached to it. In the open class for twelve hardy Ferns Messrs. Faulkner and Gore were the prizewinners, and in the local class for six plants the first-named exhibitor and Mr. Cubbon were awarded the prizes for very fresh and healthy specimens. *Selaginellas* were not large, but very healthy, the prizes for six pans going to Messrs. Wright, gardener to E. Lawrence, Esq., Beechmount, Aigburth; Cubbon, and Foster, gardener to J. Brancker, Esq., Wavertree; the notable pans were *S. atroviridis*, *S. Wallichii*, and *S. umbrosa* in the first-prize collection.

Orchids were sparsely exhibited. It is, no doubt, rather late for these plants, still good examples are usually forthcoming when open classes and good prizes are provided. In the local classes for four Orchids Mr. Sherwin, gardener to M. Sparke, Esq., Charleswood, Roby, was the chief prizewinner, the best examples being a fine pan of *Disa grandiflora* with thirteen spikes, several bearing four flowers, *Odontoglossum Uro-Skinneri*, and *Saccolabium Blumei majus*. Mr. Mease followed, his notable plant being one of the finest varieties of the above-named *Saccolabium* that has ever been exhibited, the spike being vigorous, the flowers fine, and the colour rich. Mr. Landon, gardener to Mrs. Banner, Birkenhead, secured the first prize for a specimen Orchid with *Oncidium Lanceanum* with seven spikes, the best having twelve flowers. The third-prize card was placed, by mistake we presume, to a strong plant of *Anthurium Andreanum* exhibited by Mr. Mease, and on attention being drawn to the circumstance the honour was transferred to *Peristeria elata* with fifteen spikes from the same exhibitor.

Zonal *Pelargoniums* were very fresh and fine. There were classes for pyramids as well as for ordinary dwarf-trained plants; the former were about 4 feet high and 2½ feet in diameter at the base, covered with fine trusses and foliage. Messrs. Whitfield and Lockett were the successful exhibitors. The dwarf plants, 3 to 4 feet in diameter, were equally good from Messrs. Wright, Whitfield, and Hurst. *Ericas* were small but fresh from Messrs. Caldwell, Faulkner, and Cole. *Fuchsias* were good but much too crowded. In the class for six distinct varieties Mr. James Hurst staged some well-grown and profusely flowered plants, such as *Marginata*, *Surprise*, *Miss Moon*,

John Gibson, and Mrs. Marshall. Mr. Butler was a good second; and Mr. Gore, gardener to T. Holden, Esq., Aigburth, third. In the class for three plants Mr. Wright, Mr. Savin, gardener to Henry Thomson, Esq., and Mr. W. Evans obtained the prizes. Coleuses were very good, and Messrs. Savin and Bustard took the lead, while Messrs. Mease, Evans, and Savin took the prizes for Achimenes, which were shown in better condition than at any previous shows of the Society, but there is still room for improvement. Tuberous Begonias were a great feature in the Exhibition, and the plants showed a marked improvement over those shown last year. In the class for six Mr. J. Hurst and Mr. Wright took the lead, both staging excellent plants well grown and bloomed. For three plants Messrs. Wright, B. Cromwell, and Evans took the prizes in the order as named. In the class for a single specimen there was good competition, and plants nearly 4 feet through were staged; the prizetakers being Messrs. Mease, Hurst, and Wright. Some good plants of Caladiums were shown by Messrs. Mease and Wright. Cockscombs were only of moderate quality. Balsams were better, some of them good; the principal prizetakers being Messrs. A. R. Cox, Savin, and Mease. Petunias were staged in very good condition, and that successful exhibitor, Mr. Mease, again coming to the front, followed by Mr. Hurst, gardener to W. B. Bowering, Esq., Aigburth. The plants were 2 feet in diameter, densely flowered and effective.

Table plants were not shown in large quantities, Mr. W. Pratt being first for eight plants with *Croton majesticus*, *Dracaena Ernesti*, *Aralia elegantissima*, *Kentia Balmoriana*, *Pandanus Veitchii*, *Geonoma gracilis*, *Aralia Veitchii*, and *Dracaena gracilis*. Mr. J. Ward and Messrs. Jones & Sons, Shrewsbury, had the remaining prizes.

In the class for new and rare plants sent out since 1878 Messrs. R. P. Ker & Sons, Aigburth, obtained the Society's gold medal, and staged a neat and attractive group, such as *Croton interruptus aureus*, a fine narrow-leaved variety; *Croton Warreni*, an excellent plant in good character; *C. Hawkeri*, fine; *C. Devoniensis*, *C. Finneanus*, the result of a cross between *C. Williamsii* and *C. Disraeli*, and promises to become a good and distinct variety; and *C. Aigburth Beauty*, another promising seedling; *Maranta Clokei*, *Adiantum Bausei*, *Lomaria obtusatum* (New California), a very fine and distinct form, for which a first-class certificate was awarded; *Dracaena Bella*, *Juncus zebrinus*, *Begonia Daviesi hybrida*, one of the finest of the doubles, being very dwarf, and flowering abundantly; Ivy-leaved *Geranium Gloire d'Orleans*, brilliant and good; *Dracaena Lindenii*, and *Nidularium splendens Binoti*.

GROUPS.—The prizes offered for groups were very well competed for considering it is the first year for such competition, three groups being staged in the open class, and six in the class devoted to local exhibitors. The plants were arranged in the centre of two long tents, with the Roses and other cut flowers round the sides of one, and the fruit and vegetables round the other. The collections were a fine feature of the Show, and added materially to its attractiveness. On the whole they were not of that excellence we have seen at some other exhibitions, at the same time they were very creditable to the exhibitors. In the open class, space not exceeding 250 square feet, Messrs. R. P. Ker & Sons, Aigburth Nurseries, were first, and staged choice plants, including two very fine Prince of Wales Crotons, a good *C. Queen Victoria*, intermixed with *Gloxinias*, Ferns, Palms, *Begonias*, Zonal and Regal *Pelargoniums*, *Dracaenas*, and many others. Messrs. Caldwell & Sons, Knutsford, were second, the old *Vinca alba* showing to advantage. Messrs. F. & A. Dickson & Sons were third, having in their group a few good plants of *Acer Negundo variegata*, which imparted to the group a light and beautiful appearance. The local groups were also circular, the space not exceeding 150 square feet. Mr. A. R. Cox was placed first with the lightest and most distinct group in the Show, the groundwork consisting chiefly of Ferns, out of which were elevated Palms, Crotons, *Dracaenas*, Coleuses, *Alocasias*, *Lobelias*, and other plants, the pots being hidden from view with *Selaginellas* and other suitable plants. The arrangement was too artificial, and lacked brightness. Mr. Mease was placed second, and Mr. Sherwin third; but the arrangements were too formal, more relief being needed by placing taller plants near the front. Messrs. James Dickson, Newton Nurseries, staged an excellent collection of choice new Conifers, for which they obtained the Society's gold medal. Messrs. F. & A. Dickson also staged a very fine assortment.

CUT FLOWERS.—These were shown in good condition in all the classes devoted to them, and the competition was keen in many instances. The Roses were good and numerous considering the lateness of the season. The box of stove and greenhouse blooms staged by Mr. Faulkner are worthy of special note, also the box of herbaceous cut blooms shown by Mr. Mease. In the class for forty-eight Roses, triplets, Messrs. Cranston & Co., Hereford, staged in their usual style and secured their usual position—first. It is not necessary to enunciate the varieties. The same exhibitors had the first position in the class for forty-eight single blooms, followed by Messrs. James Dickson & Sons and Messrs. F. & A. Dickson & Sons of Chester. In the first lot Mrs. Jowitt was the best bloom in the stand, other good blooms being Louis Van Houtte, Fisher Holmes, Madame Gabriel Luizet, L'Esperance, Hippolyte Jamain, Duchesse de Vallombrosa, Dr. Andry, and John Hopper. The most noteworthy blooms in the second stand being Louis Doré, a fine Rose; Masterpiece, fine; Comtesse de Paris, Madame Ducher, Empress of India, and a good example of *Niphetos*. The third-prize lot was smaller but even, the best

blooms being Duchess of Bedford and A. K. Williams. Mr. Jowitt, Hereford, was the only exhibitor in the open amateur class for twenty-four triplets, and staged in his usual excellent manner. In the class for twenty-four single blooms J. B. Hall, Esq., Leechwood, Rock Ferry; Mr. W. Owen, gardener to T. Griffiths, Esq., Oxton, Birkenhead; and Mr. Mease obtained the awards as named. In the first stand good blooms of Dingee Conard, Mdle. Marie Finger, Perle des Jardins, and Duke of Edinburgh were staged. In the class for twelve blooms D. Walford, Esq., Bebington, Birkenhead, was first with a good *Maréchal Niel*, Beauty of Waltham, and La France. Mr. Owen was second, having a good Mdle. Eugénie Verdier, Mr. T. B. Hall being third, having a good *Sénateur Vaisse*. In the class for twelve blooms of any one dark variety Messrs. Cranston & Co. were first with fine blooms of Mrs. Jowitt, which is evidently a fine late Rose, and was very rich in colour. Messrs. James Dickson & Sons were second with Alfred Colomb; and Messrs. F. & A. Dickson and Sons third with the same variety. Messrs. Cranston & Co. were again first in the class for twelve blooms of any light Rose with *Baronne de Rothschild*. In the class for the most tastefully arranged box, the prizes being given by Messrs. Cranston & Co., the first prize was won by E. Laxton, Esq., Ask Villa. The stand contained many Teas, and was edged with *Asplenium Ruta-muraria*. Mr. Waterman, gardener to A. Late, Esq., was second. Only two lots were staged. One exhibitor only staged for the prize given by Mr. W. Paul, Waltham Cross, for twenty-four blooms staged with buds and leaves as cut—namely, Mr. T. B. Hall, but the stand was not remarkable, as there were no buds and but little foliage, yet the blooms were good. Mr. W. Paul staged several boxes of blooms not for competition, which were highly commended by the Judges. Amongst the blooms *Lady Sheffield* is a promising Rose, being many shades lighter than *Marie Baumann*; *Duke of Albany*, a good Rose, much after the style of *Duchess of Bedford*. One of the boxes contained a rather promising unnamed seedling, the edge of the petals being slightly tipped with white. In the same box *Masterpiece* was good, also *Red Dragon*, said to be a good climbing Rose. Messrs. Dickson & Robinson of Manchester also staged a good general collection of Rose blooms, which were also highly commended. Messrs. Cranston & Co. exhibited a box of their new Rose *Mrs. Gretton*, a good dark variety, which was awarded a certificate of merit. As may be imagined by its parentage—Louis Van Houtte and Xavier Olibo, it is extremely rich; the form is also excellent, the centre being full and symmetrical, and the stout outer petals recurving gracefully. Some pilferer abstracted one of the blooms, but as the buds had been previously cut out he will not be much the richer for his pains nor easier in his conscience—if he has one.

In the class for eighteen varieties of stove and greenhouse cut flowers Mr. Faulkner was first with very fine bunches of *Kalosanthes coccinea*, *Odontoglossum vexillarium*, *Lapageria alba*, *Ixora Prince of Wales*, *Erica tricolor*, *Eucharis*, *Allamanda Hendersonii*, *Anthurium Schertzerianum*, *Ixora Williamsii*, *Dipladenia grandiflora*, and *Ericas Fairriana*, *Aitoniana*, and *Shannoni glabra*; Mr. J. Ward and Mr. Mease being placed equal second with very creditable boxes. In the class for twenty-four herbaceous cut blooms Mr. Mease took the lead with an excellent lot, including *Lilium auratum*, *L. candidum*, *Campanulas*, *Hypericum calycinum*, *Alstromeria aurea*, *Spiræa venusta*, and others; Messrs. J. Dickson & Sons, Chester, being second, and Messrs. F. & A. Dickson & Sons third, both having good collections. For twelve varieties Mr. Faulkner was first, showing *Dahlia Yuareii* very fine, Mr. Mease being second, and Mr. W. Bustard, gardener to J. Lewis, Esq., being third. For the best collection of wild flowers Mr. W. Friar, gardener to J. F. Robinson, Esq., Mossley Hill, who staged about one hundred varieties, was awarded the first prize; Mr. R. Gore being second. For two hand bouquets Messrs. Jones & Sons, Shrewsbury, Turner & Co., Liverpool, and Mr. John Mossley, Bolton, took the prizes in the order named. The awards went in the same order for one hand bouquet. In the local class Mr. H. Bodsworth, Stone House, Allerton; Mr. Evans, and Mr. Whitfield were the prizetakers.

FRUIT.—The show of fruit on the whole was excellent, and the competition keen in the Grape classes as well as in those devoted to Peaches and Nectarines. In the class for eight dishes, distinct, not more than two varieties of Grapes, two collections only were staged; Mr. J. Ward, gardener to T. H. Oakes, Esq., Alfreton, Derbyshire, and Mr. Faulkner, gardener to R. F. Leyland, Esq., Woolton Hall, Liverpool, securing the prizes in the order named. Mr. Ward had good dishes of Brown Turkey Figs, Bellegarde Peaches, Jefferson Plums, Downton Nectarines, Colston Basset Melon, Queen Pine, with Black Hamburg and Muscat of Alexandria Grapes. Mr. Faulkner showed Princess of Wales Peaches in excellent condition and a fine Queen Pine. In the corresponding class for six dishes four collections were staged. Mr. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Liverpool, was awarded the first prize, having good Muscat of Alexandria and Madresfield Court Grapes fine in berry and colour, Conqueror of Europe Melon, Brown Turkey Figs, Pine Apple Nectarines very fine, and a superior dish of Bellegarde Peaches. Mr. Mease, gardener to C. W. Neumann, Esq., Wyncote, Allerton, was placed second, and staged very fine Muscat of Alexandria and Black Hamburg Grapes, and a good Hero of Lockinge Melon; the third prize being obtained by Mr. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, Cheshire, who staged good Madresfield Court Grapes and fine Royal Charlotte Peaches. For two Pines Mr. Faulkner; Mr. Goodacre,

gardener to the Earl of Haddington, Elvaston, Derby; and Mr. William Pratt, gardener to Lord Hill, Hawkstone, Salop, took the prizes in order named, all showing Queens in good condition, especially those that obtained the first award. In the class for one Pine Mr. Faulkner was again first with a good Queen; and Mr. S. Whitfield, gardener to J. T. Cross, Esq., Beechwood, Aigburth, was a good second. The competition was good in the class for four bunches of Grapes, two white and two black; Mr. Elsworthy, a local exhibitor, being the most successful, and staged well-coloured examples of Black Hamburg, Muscat of Alexandria, Madresfield Court, extra fine; and a moderately fine bunch of Duke of Buccleuch. Mr. Ward was second, showing a good bunch of Buckland Sweetwater and other well-coloured examples, but smaller than the first-prize collection. Mr. Hannagan was third with bunches of good size, large berries, but not well finished. Ten exhibitors staged in the open class for two bunches of black Grapes, the first and third prizes remaining in the neighbourhood. Mr. J. Barker, gardener to Alderman Raines, Rock Ferry; Mr. J. Ward; and Mr. J. Dickinson, gardener to G. Atkinson, Esq., Rock Ferry, obtained the prizes as named with fine Black Hamburgs. For two bunches of Muscat of Alexandria Mr. Mease took the lead with very good and well-finished bunches, without doubt the finest in the Show. Mr. Elsworthy followed, showing good examples. In the local class for the same variety Mr. Mease was again first, followed by Mr. R. Brownhill, gardener to T. Hargreaves, Esq., Ravenswood, New Ferry. Mr. Metcalf, gardener to R. Anderson, Esq., Holt House, Tranmere, was placed third. In the corresponding class for two bunches of black Grapes Mr. Metcalf was first with fine Black Hamburgs, Mr. J. Barker second with Madresfield Court, and Mr. Elsworthy third with the same variety. In the open class for one dish of Peaches Mr. Elsworthy took the lead with remarkable fruit of Bellegarde; Mr. A. R. Keen, gardener to Sir T. Earle, Allerton Towers, second with Grosse Mignonne; and Mr. Goodacre third, showing the same variety as the first-prize dish. Six lots were staged. Mr. Elsworthy was again first in the local class for one dish, showing the same variety, followed by Mr. W. Evans, gardener to Mrs. Lockett, Grassendale, and Mr. A. R. Keen. In the open class for one dish of Nectarines Mr. A. R. Keen staged some fine large fruit of Downton, and obtained the first prize; Mr. Elsworthy second with Pine Apple, and Mrs. Horsfall third with Pitmaston Orange. In the local class Mr. A. R. Keen again took the lead with the same variety. Mr. Roberts, gardener to W. D. Holt, Esq., West Derby, and Mr. W. Evans took the remaining prizes. In the open class for one Melon Mr. Elsworthy took the lead with Dickson's Exquisite, fine in quality; Mr. Hannagan second with Conqueror of Europe, and Mr. Faulkner third with Best of All. Mr. W. Landon, gardener to Mrs. Banner, Pool Bank, Mr. Faulkner, and Mr. J. Dickinson secured the prizes in the local class. For one dish of Strawberries Messrs. Faulkner, Mease, and Elsworthy took the prizes with Eleanor, Mrs. Laxton, and Sir Charles Napier. One dish of Cherries—Mr. Hannagan first with White Heart, Mr. Elsworthy second with May Duke, and Mr. F. Ferguson, gardener to T. S. Patterson, Esq., third. In the class for six dishes of hardy fruits Mr. Hannagan was first, showing Early Beatrice Peach, Early Orleans Plum, White Heart Cherries, and British Queen Strawberry. Mr. W. Pratt was second, having good dishes of Apricots and Cherries, and Mr. Edwards third.

**VEGETABLES.**—These were staged in large numbers, and a marked improvement was apparent over those staged at the two preceding shows by local exhibitors. In the open class for twelve dishes, distinct varieties, there was only one exhibitor—Mr. J. Lambert, gardener to C. W. Wingfield, Esq., Onslow Hall, Salop. In the local class Mr. Faulkner was first, the best dishes being good Stamfordian Tomatoes, Telephone Peas, Early Nantes Carrots, and White Stone Turnips. Mr. A. R. Cox, gardener to W. H. Watts, Esq., was second; and Mr. Mease being third, his collection including a very fine dish of Mushrooms, eight collections being staged. For six dishes of Peas Mr. Mease was placed first with Telegraph, Telephone, The Baron, Laxton's Supreme, Challenger, and Stratagem; Mr. J. H. Goodacre second, having Day's Sunrise, Emperor of Marrows, Ne Plus Ultra, Harrison's Glory, and Criterion; Mr. J. Lambert being third. In the local class for four dishes Mr. Faulkner was first with Stratagem, Telegraph, The Baron, and Telephone; Mr. L. F. Turner, gardener to D. McIver, Esq., M.P., Bromborough, second, showing well Pride of the Market; Mr. A. R. Cox, Elm Hall, Wavertree, was third with similar varieties. In the class for six dishes of Potatoes, three round and three kidneys, Mr. Lambert took the lead with Schoolmaster, International, fine; Vicar of Laleham, Porter's Excelsior, and Fenn's Bountiful; Mr. Mease followed, showing well Pride of Ontario and Early Vermont; Mr. F. M. Green, Hale Hall, Liverpool, third, showing International, fine. In the local class Mr. W. Evans, Mr. T. Turner, and Mr. Mease took the prizes, showing much the same varieties. Messrs. Ward, C. Finnigan, and J. Lambert took the prizes for three dishes of Tomatoes; and Messrs. Mease, T. Wright, and Elsworthy for one dish. The prizes for Cucumbers were obtained by Messrs. C. Finnigan, E. Green, and G. Butler, gardener to T. Drysdale, Esq., Mossley Hill.

**IMPLEMENTS.**—The Society's gold medal was awarded to Messrs. Foster & Pearson, Nottingham, for their improved span-roofed portable greenhouse, which was strong yet light, ventilated on the most improved system, and the door latch superior to anything of the kind before exhibited. They also exhibited their patent span-roofed pit—a great acquisition. The Liverpool Horticultural Company (John

Cowan), also exhibited a greenhouse, portable, filled with plants and good Vines; also a collection of frames, for which they were commended. Messrs. F. & S. Mee of Liverpool were highly commended for a collection of boilers, &c. Mr. Joseph Bramham also exhibited his Allerton Priory boiler, and was awarded a certificate of merit for a small heating apparatus. Messrs. Glassey & Co., Liverpool, were awarded a certificate of merit for hand-painted vases and flower-pot covers; and Mr. Doyle of Liverpool for a collection of ornamental wirework.

Valuable miscellaneous collections of plants from Mr. B. S. Williams of Holloway, Messrs. Ker of Aigburth, and Mr. Cowan contributed materially to a really fine Show. Mr. Richardson the President, Mr. Bridge the Secretary, and all who aided in the arrangements, deserve high praise for the manner in which the Exhibition was conducted.

#### SHRUBS FOR A TOWN—ILEX HODGINSII.

YOUR correspondent "LANCASHIRE" asks on page 14 of the Journal for information about evergreens suitable for a hedge in an exposed smoky situation. The Yew and Thuja Lobbii both make capital hedges, but do not always thrive in such situations

Fig. 17.—*Campanula turbinata*. (See next page.)

as "LANCASHIRE" describes, therefore Conifers should not be planted in the neighbourhood of towns. For this purpose Hollies are indispensable, and none can be compared to *Ilex Hodginsii*; it is a strong and robust grower, with large, bold, and beautiful dark green leaves. It not only lives in smoky places, but thrives well and grows with great luxuriance. After several years' experience in the neighbourhood of one of the worst towns in Lancashire I have found nothing to equal the Holly referred to for any purpose, either as single specimens on lawns or for shrubbery borders, and if more largely planted in many places greater satisfaction would have been given, and much more pleasure derived from it, than from the dead or dying objects to be seen in the majority of gardens in the neighbourhood of towns. When using this Holly for a hedge some care should be taken to keep it in order

with the knife instead of cutting it with shears. When left to grow naturally it is very liable to grow thin on the most exposed side, but attention to pruning remedies this, and the hedge in consequence grows thick and resists with much greater force the wind and chemical vapours carried with it. It is also important when growing as single specimens that the same precaution is taken. *Ilex Hodginsii* has during the past severe winter or two lost a much less per-centage of foliage than any other variety. The common Holly, recommended by many for the purpose of forming hedges, is not suitable for the neighbourhood of towns, and is considerably injured or will die where *I. Hodginsii* flourishes and does well. I am acquainted with a hedge planted about twenty years ago of this variety in the neighbourhood of Liverpool, and on the worst side of the town for the growth of evergreens. It is now about 25 feet high and nearly as many feet through at the base.—LANCASTRIAN.

#### PLANTS CERTIFICATED AT CHISWICK.

AT a meeting of the Floral Committee held at Chiswick on the 22nd ult., James McIntosh, Esq., in the chair, certificates were awarded as follow:—First-class certificates were granted for the undermentioned Pelargoniums as bedding plants:—*Erckmann Chatrian* (Lemoine).—Plant of very dwarf compact habit, very free-flowering; trusses very large and compact, of a beautiful crimson-shaded scarlet; very showy. *Député Duvaux* (Lemoine).—Very dwarf habit, free-flowering; trusses large, well thrown above the foliage; very dark scarlet. *No. 9* (Lemoine).—Fine close-growing habit, very free-flowering; the trusses very large, and well thrown up, of a beautiful clear scarlet; very effective. The following received second-class certificates:—*Louis* (Pearson).—Plant of very fine dwarf habit, free-flowering; trusses and individual flowers large, of a beautiful magenta-scarlet; good. *Excelsior* (Denny).—Fine dwarf habit, free-flowering; the individual flowers large, of fine form, bright scarlet with distinct white eye; very pretty.

SINGLE PELARGONIUMS IN POTS.—First-class certificates were granted to *Dr. Orton* (Pearson).—Plant of very fine dwarf compact habit; very free-flowering, the trusses and individual flowers large and of fine form, very dark scarlet, very effective for pots. *Hettie* (Pearson).—Plant of very strong vigorous habit; very free-flowering, the trusses very large, well thrown upon very strong footstalks; the individual flowers very large, of fine rounded form, very pleasing magenta shaded scarlet with clear white eye; remarkably fine. Similar awards were made in the class of double-flowering Pelargoniums to *Sylvia* (Pearson).—Plant of very dwarf compact habit; remarkably free-flowering; trusses of medium size, very compact, well thrown above the foliage. Flowers beautiful shade of pink; very fine. *Hero* (Pearson).—Plant of remarkably dwarf habit; very free-flowering; trusses large, the individual flowers also large and double, of a clear magenta scarlet; very effective. *No. 62* (Lemoine).—Plant of very vigorous habit; very free-flowering, the trusses and individual flowers large and full; flowers very clear salmon. Also to the Ivy-leaved Pelargonium *Anna Pfützer* (Lemoine).—Plant of long trailing habit, free-flowering; leaves slightly zonate; flowers very large, semi-double, pink, slightly shaded with magenta, the top petals having distinct bands of purple; very distinct and pretty.

LANTANAS IN POTS.—First-class certificates:—*Reveil* (Lemoine).—Plant of very fine dwarf compact habit, remarkably free-flowering, the trusses of medium size, of a bright yellow colour; very fine. *Giselle* (Lemoine).—Plant of tall vigorous growth, very free-flowering, the trusses of medium size, composed of two colours, the upper part of the truss composed of florets of a pale saffron yellow shaded with pink, the remaining part of the flower very pale pink, with a slight shade of magenta; very pretty.

PENTSTEMONS.—First-class certificates:—*Jeanne d'Arc* (Lemoine).—Strong vigorous habit, very free-flowering; flowers large, pure white. A great acquisition. *Edison* (Lemoine).—Strong vigorous growth, very free-flowering, the individual flowers very large, beautiful dark purple, with very distinct white throat, slightly streaked with purple; very fine. *Marjolaine* (Lemoine).—Very strong habit, very free-flowering; individual flowers large, dark scarlet on upper side, and having a very distinct white throat; a good variety. *Begonia Queenie* (Royal Horticultural Society) received a similar honour. Plant of strong vigorous growth, very free-flowering; flowers large, and of a good form, of a beautiful magenta shaded pink; very fine.

The Fruit Committee (Harry J. Veitch, Esq., in the chair) examined the collections of Peas and Potatoes sent for trial, when the following awards were made:—

PEAS.—*Pride of the Market* (James Carter & Co.).—A dwarf blue wrinkled Marrow. First-class certificate. *Robert Penn* (Hurst and Son).—A dwarf wrinkled Marrow. First-class certificate.

POTATOES.—*Cosmopolitan* (Dean).—A large early white kidney. First-class certificate. *Early Cluster* (Dean).—A half round early white Potato; very short haulm. Considered suitable for forcing. First-class certificate. *Lord Mayor* (Dean) was greatly approved, and ordered to be cooked and exhibited at South Kensington.

A POTATO GARDENER'S DILEMMA.—I have a large square of Magnum Bonum Potatoes in my garden which have been planted

far too close, the rows being only 2 feet apart. The haulm is at least 3 feet high and very dense. No sun can penetrate, and very few tubers seem to be forming. What must I do? Is it any use stopping the haulm and taking out a portion to let in the sun? There are at least six stalks to each plant. Might I cut out some and stop the others? I shall be glad to have the opinion of experienced cultivators of Potatoes on this point.—F. S.

#### CHOICE CAMPANULAS.

BELLFLOWERS are such general favourites—from the humble but pretty native *Campanula rotundifolia* to the stately Canterbury Bells and the "steeple milkie Bellflower" of Gerard, or the pyramidal *Campanula* of botanists—that a few notes upon some distinct and rather uncommon forms will no doubt be welcomed by many readers. In a genus containing about two hundred species there might naturally be expected to be considerable variation in floral form and habit; such is the case with the Campanulas to some extent. As regards habit, there are numerous gradations—from plants of quite prostrate growth with diminutive flowers, to others 3 or 4 feet in height, erect, and stately, and bearing flowers like small cups. In form the flowers are open, resembling shallow funnels or saucers, or bell-shaped, of varying depth. Colours are, however, very slightly diversified, except so far as shades of purple and blue are concerned; those are, indeed, numerous, and white-flowered varieties are also known in many of the species. Scarcely any other departure from the normal tints is observable, unless it be in the direction of mauve or lilac.

As to what may be termed the cultural uses of Campanulas we find them suited for rockeries and borders outside, and for pots in greenhouses and conservatories, some few species being suited to either mode of cultivation, and others being specially adapted for one only. Some of the dwarf forms are particularly useful in pots as a margin to groups and the stages of houses, while the old "Chimney Campanula," *C. pyramidalis*, is so well known and generally appreciated for culture in pots as a really ornamental and effective plant, that it does not need comment. However, it is not my intention now to dilate upon the beauties and uses of the whole genus, which would only weary your readers and myself too; but, as stated at the commencement, to glance at a few of the less common.

Taking the dwarf species of Bellflower first we have several pretty forms represented in our gardens, amongst which one of the most attractive is *C. turbinata* (fig. 17, page 102), which was originally introduced from the mountains of Transylvania, where it is found growing at moderate elevations. It is of tufted habit, and is usually about 6 inches in height, or rarely exceeds 9 inches, the open bell-shaped bright blue flowers being very freely produced. As regards situation, the plant thrives either in well-drained borders or upon rockeries, though the latter position is better suited for it, and many little nooks may be rendered attractive by judicious planting. Another useful species is *C. carpatica*, which is noteworthy for the fact that it continues in flower for several months, frequently as late as September, and it is also adapted for rockery, borders, or pots. It is usually rather taller than the last-named, but is of compact growth; the flowers are marked by a very pleasing bright shade of blue. *C. pulla* (fig. 18), a charming little Austrian species, is now in excellent condition in those gardens where it is grown, and particularly notable is it on the rockery in the Royal Horticultural Society's Garden at Chiswick, where also most of the forms here described are well represented. The leaves of *C. pulla* are oval and smooth, the neat purplish blue bells being borne singly on the summit of the slender stems, and are slightly deflexed or nodding. This is one of the best for the rockery. *C. garganica*, *C. rupestris*, and *C. muralis* are all

Fig. 18.  
*Campanula pulla*.

pretty and well worth growing wherever they can be accommodated.—X.

(To be continued.)

### THE ROYAL SOUTHAMPTON HORTICULTURAL SHOW.

GRADUAL favourable progress is, in the general affairs of life, the surest, most substantial, and most satisfactory mode of advancement, and it seems that horticultural societies are no exception to the rule. Twenty years ago a few energetic and persevering horticulturists succeeded in establishing on a firm though modest basis, in the ancient city of Southampton, a Society which had for its chief object the encouragement of gardening in the locality. Difficulties had to be encountered, as is the case in every effort of the kind. Patrons, subscribers, and exhibitors had to be found, shows had to be inaugurated, and their occasional unavoidable want of success in a financial point of view combated by further strenuous efforts, yet through all the Society has steadily made its way to a sound and high position amongst associations of the kind. The Exhibition held on Saturday and Monday last must have afforded such of the original projectors as were present an unbounded satisfaction at the admirable results that had been achieved by continuous ardent perseverance. Both in extent and quality the Show was undoubtedly one of the best which has been held in the provinces this season, and the advance in the number of exhibits since last year was remarkable. Two hundred additional entries represent not only a considerable total extension of the display of fruit, plants, and vegetables, but it also gives the best indication of success and promise of future prosperity, a greatly increased local and general interest in the Society's exhibitions.

The usual site was selected—namely, Westwood Park, an elevated and picturesque position north of the town, admirably suited for the purpose, but unfortunately, owing to the rapidly increasing value of the land for building purposes, it is extremely improbable that the Society will be able to obtain it another year. In view of this approaching difficulty a meeting is to be called (see page 106) on Wednesday next to consider the possibility of securing land that could be used as a garden and as a permanent site for the Exhibition. The necessary capital it is proposed to raise by the issue of shares. It is desirable that this project may receive substantial support, as if carried into execution in a judicious manner Southampton will obtain an additional attraction of considerable importance.

At the Show now under consideration five large marquees were fully occupied with the exhibits in the various and numerous classes. Three, each 60 or 70 yards in length, were placed side by side, and these contained the majority of the plants, groups, collections, and single specimens. Another of similar dimensions included the table decorations and bouquets, while the fifth was occupied with fruit, vegetables, and cut flowers. Most of the classes were well filled, and in some the competition was so keen that the Judges had no slight difficulty in determining the relative position of the exhibitors; indeed, the Judges seemed altogether rather hardly worked, and a little more assistance in that department would effect a great improvement. Most of the arrangements were satisfactory and creditable alike to the Committee, the Secretary, Mr. C. S. Fridge, and the enthusiastic Chairman of the Show Committee, Captain Gibbs. The following notes upon the chief classes will convey some idea of the extent and merit of the display.

**STOVE AND GREENHOUSE PLANTS.**—The most important class as regards the money value of the prizes was that for twelve stove and greenhouse plants, six in bloom, the first consisting of £20, subscribed by Southampton and county, the second and third being respectively £15 and £10. Three collections were staged, the chief honours being secured by Mr. E. Tudgey, gardener to T. F. G. Williams, Esq., Henwick Grange, Worcester, who contributed some of his magnificent specimens in their best condition. Among the most noteworthy was a magnificent *Pritchardia pacifica*, *Dipladenia amabilis*, well flowered and extremely brightly coloured; *Erica Parmentieri rosea*, 6 or 7 feet in diameter, globular in form, very healthy, and flowering freely; *Erica ampullacea Williamsi*, very beautiful; *Croton Queen Victoria*, good colour; with *Ixora Dixiana*, *Cordyline indivisa*, *Gonoma gracilis*, *Latania borbonica*, and *Athurium Schertzerianum*, also noteworthy for their vigorous health. Mr. T. Cypber, Queen's Road, Cheltenham, was placed second with a handsome collection, in which a grandly coloured *Croton Disraeli*, *Allamanda nobilis* with very fine flowers, *Latania borbonica*, *Enccephalartos villosus*, and *Cordyline indivisa* of great size and in admirable health, were the principal features. Mr. C. Rann, gardener to J. Warren, Esq., Handcross Park, Crawley, followed, having gigantic examples of *Latania borbonica*, *Areca superba*, and *Cycas revoluta*; *Allamanda Wardleana*, *Gleichenia rupestris glaucescens*, *Croton variegatum*, and *Statice Gilberti* being also well represented. These three collections were very close in merit, all the plants being fine, and it required some careful consideration to determine the awards.

**GROUPS.**—Following the order of the schedule, the next class which requires notice was that for collections of plants arranged for effect as central conservatory groups in a space of 11 feet by 10 feet. The first prize, consisting of £6, was presented by the President of the

Society, Hans Sloane Stanley, Esq.; the second, third, and fourth prizes being respectively £4, £3, and £2. There were eight groups staged, all very similar in composition and nearly equally formal. They were of pyramidal form, the plants being closely placed, in some instances approaching to crowding; and if there was one portion of the Show that admitted of improvement it was in the class for groups, for though the plants were healthy and fresh the arrangement was not all that could be desired. Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, was adjudged the premier position for a miscellaneous collection of fine-foliage and flowering plants in excellent condition, and not so crowded as in some of the other contributions. Mr. J. Kingsbury, nurseryman, Bevois Valley, was second with a bright and effective group. Mr. Philp and Mr. J. Amys, gardener to the Hon. Mrs. Eliot Yorke, Netley Fort, taking the third and fourth positions with collections varying chiefly in the number of flowering plants they contained.

**COLLECTIONS OF PLANTS.**—Four or five classes were devoted to collections of miscellaneous plants—that is, groups containing stated numbers of plants but not arranged for effect, the merit of the individual specimens alone being taken into consideration. For eighteen plants, not less than six in bloom, Mr. E. Wills was the chief prizetaker, staging some well-grown examples, among which the following were notable:—*Maranta roseo-picta*, very large, vigorous, and the foliage well coloured; *Alocasia metallica*, a handsome specimen over 6 feet in diameter, the peculiar metallic lustre of the foliage being superbly developed; *Alocasia Lowii* was similarly fine. *Dieffenbachia Bowmanni* and *Maranta Mackoyana* were also well represented. Mr. N. Blandford, gardener to Mrs. Haselfoot, Moor Hill, took the second position; a remarkably handsome globular-trained *Lasiandra macrantha*, a healthy well-flowered *Eucharis grandiflora*, *Dicksonia antarctica*, *Allamanda nerifolia*, *Dipladenia amabilis*, *Hibiscus Cooperi*, and *Croton Disraeli* being neat and fresh among others. The plants in this group, though generally smaller than the preceding, were characterised by a very creditable, clean, healthy appearance. Mr. J. Amys was third, having good examples of *Vinca alba*, *Lygodium scandens*, *Cycas revoluta*, and *Adiantum cuneatum*, the principal defect being a slight weakness in the flowering plants.

For fifteen miscellaneous plants Messrs. Jackson & Son, Kingston-on-Thames, were awarded the chief prize for the usual satisfactory specimens exhibited by this firm. *Stevensonian grandifolia*, *Allamanda Hendersoni*, *Erica Fairrieana*, *Phyllotænum Lindeni*, *Statice Butcheri*, and *Kalosanthes Dr. E. Regel* were all of considerable size, healthy, and effective. The *Kalosanthes* in particular was remarkably beautiful, the variety being one distinguished for the great size of flowers and truss and the strikingly rich colour; the specimen, too, was of even globular form, the trusses being very numerous. Mr. J. Kingsbury had neat specimens of *Begonia Weltoniensis*, *Justicia rosea*, *Begonia metallica*, and *Swainsonia galegifolia alba*, a pretty old papilionaceous plant that is not too frequently seen in gardens now. Messrs. Oakley & Watling, St. Mary's Road, were third with smaller but well-grown plants, the most noteworthy being one that is seldom staged at exhibitions—namely, *Posoqueria longiflora*, an ally of the *Bouvardias*, with long white flowers. Collections of nine plants were exhibited by Mr. E. Molyneux, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham; and Mr. J. Burden, gardener to C. Y. Mercer, Esq., Hillfield, Bassett, who were first and second respectively, the latter having a very pretty example of the variegated Vine, *Vitis heterophylla variegata*. A class was provided for a collection of nursery stock to occupy a space of 16 feet by 3 feet, the pots not to be larger than 8 inches in diameter. Mr. J. Kingsbury was placed in the foremost position with a very large and diversified assortment of *Coleuses*, *Pelargoniums*, *Lobelias*, *Fuchsias*, *Verbenas*, *Begonias*, and many other plants, some small specimens of the free-flowering *Begonia parviflora* being especially noteworthy. Messrs. Oakley & Watling were second, and Messrs. J. C. & H. Ransom, Hill Gardens, Hill Lane, third, each with healthy little plants.

Orchids were not largely represented, but the two exhibitors had some neat specimens. Mr. J. Osborn, gardener to H. C. Buchan, Esq., Wilton House, secured the chief honours with a good collection of healthy plants. *Cypripediums* were particularly well shown, the forms being *C. Parishii*, *C. Lowii*, *C. Stonei*, *C. Veitchii*, and *C. Dominionum*. *Oncidium Weltoni* and *O. dasystyle* were also noteworthy, with *Masdevallia bella* and *Epidendrum vitellinum majus*. Messrs. Jackson & Son followed, having *Dendrochilum filiforme*, *Saccolabium Blumei majus*, and *Disa grandiflora* in good condition among many others.

In the two classes for *Begonias* some well-flowered plants were staged, though the competition was not very keen. The Hon. Mrs. Eliot presented the first prize for eight *Begonias* in flower, and this was won by Mr. E. Wills, chiefly with tuberous varieties, the plants being healthy, and bearing a number of brightly coloured flowers. Mr. Blandford was a close second, the most noteworthy plant in his collection being a seedling tuberous variety named *White Beauty*, which had large white flowers, and appeared to be very free. For four *Begonias* Mr. J. Osborn carried off the chief prize with good plants of *Kallista*, *Emperor*, and *Vesuvius* among several unnamed seedlings; Mr. Burden taking the second place with smaller plants, but otherwise of good quality. *Fuchsias*, *Pelargoniums*, *Celosias*, *Achimenes*, and *Coleuses* also contributed to the display, the most successful exhibitors being Mr. Allen, gardener to J. Bailey, Esq., Elmfield Hill; Mr. Blandford, Mr. Molyneux; Mr. R. West, gardener

to R. Wigram, Esq., Northlands, Salisbury; Mr. G. Windebank, Mr. E. Wills, Mr. J. Burden, and Mr. Osborn.

**Ferns.**—Several classes were appropriated to Ferns, and some satisfactory specimens were contributed, though the collections were not numerous. For six stove or greenhouse Ferns Mr. E. Wills was the premier exhibitor, winning the first prize with the following:—*Nephrolepis davallioides furcans* was large, healthy, and handsome, the fronds with their curiously forked pinnae being rich bright green in colour; *Davallia Mooreana* was in first-rate condition, also *Adiantum cardiochloena*, *A. concinnum latum*, *A. cuneatum*, and *Cibotium spectabile*. Mr. Hayes, gardener to H. Barlow, Esq., Oatlands, Shirley, had the best four Ferns, very neat examples of *Adiantum scutum*, *A. farleyense*, *A. pubescens*, and *Davallia Mooreana*. Messrs. Amys and Molyneux followed, the former having a healthy specimen of *Adiantum Sanctæ-Catherinæ*. Messrs. Jackson & Son were the only exhibitors in the other class for four, and obtained the first prize with well-grown plants, *Platyterium grande* and *Brainea insignis* being especially noticeable. Mr. E. Wills won chief honours for six hardy Ferns, comprising *Scelopendrium vulgare crispum*, *Lastrea Filix-mas cristata angusta*, *Struthiopteris japonica*, *Onoclea sensibilis*, and *Trichomanes radicans*, all fresh and healthy. Messrs. Jackson followed with similar plants.

**Table Decorations and Cut Flowers.**—In the class for the most tasteful table for six persons there were six competitors, who had arrangements varying greatly in style and merit. Mr. F. E. Chamberlain, Rose Villa, was adjudged the first prize for a table, which was noteworthy for the lightness and brightness of the general design and the neatness of the execution. The three central stands contained *Pelargoniums*, *Begonias*, *Carnations*, *Bougainvillea glabra*, and *Plumbago capensis*, with fronds of *Adiantum cuneatum* in sufficient abundance to tone the brightness of colour without imparting heaviness. The single glasses each contained a Rose bud, and the fruit comprised Peaches, Pears, Gooseberries, Apples, Plums, and Apricots. The second position was accorded to Mrs. Fuidge, 39, York Street, Avenue, for a graceful contribution, the central stands containing very choice flowers, grasses, and Fern fronds. Mrs. E. Wills, Bassett, and Mr. A. B. White were third and fourth respectively. Bouquets were numerous, the prizewinners being chiefly Messrs. Cypher; Wyatt, The Park, Sarnam; and E. Hillier, Winchester. Among the cut flowers the principal classes were for Roses and Dahlias. Messrs. Keynes & Co., Salisbury, had the best twenty-four Rose blooms, very fresh, and of good quality; Mr. W. J. Cross, Salisbury, securing the second position in the same class. For twelve show Dahlias Messrs. Keynes were also first, staging handsome blooms of the following varieties—Professor Fawcett, Mr. Percy Wyndham, Christopher Ridley, Rosy Morn, Flora Wyatt, and several others. Messrs. C. Pay and Horsefield followed with smaller blooms.

**FRUIT.**—In point of numbers fruit was well represented, and the quality also was in most of the leading collections very satisfactory. The most important class was that for eight dishes, the first prize of five guineas being presented by the Southampton Tramways Company. This was secured by Mr. J. Ollerhead, gardener to Sir Henry Peek, Bart., Wimbledon Park, who had some well-finished and creditable examples. The varieties were the following: Grapes—*Muscate of Alexandria*, handsome bunches and berries; Black Hamburg, good-sized berries and bunches, excellently coloured; and two fine bunches of a white Grape said to be a seedling not in commerce. Pitmaston Orange Nectarines well ripened, Royal George Peaches, fine; Smooth Cayenne Pine Apple, Brunswick Figs, and Dumeaux's Improved Melon beautifully netted. Of the remaining four exhibitors Mr. F. Thomson, gardener to W. Baring, Esq., Norman Court, Dean, was awarded second honours for some good examples of Bigarreau Napoleon Cherries, Grosse Mignonne Peaches, Elruge Nectarines, White Marseilles Figs, and Cox's Golden Gem Melon. Mr. J. Budd, gardener to F. G. Dalgetty, Esq., Lockerby Hall, Romsey, and Mr. F. Thirlby, gardener to the Right Hon. Lord Mount Temple, Broadlands, Romsey, were third and fourth, both showing well. There were also five entries for six dishes, Mr. E. Molyneux winning leading honours with some remarkably handsome superbly finished Madresfield Court Grapes, large in berry and bunch. Read's Hybrid Melon was finely netted, and *Violette Hâtive* Peaches were also noteworthy. Mr. R. McMillan, gardener to Hans Sloane Stanley, Esq., Paulsons, Romsey, was second with handsome Royal George Peaches amongst others; Mr. J. Horsefield, Heytesbury Park, Wilts, and Mr. T. Osborn being third and fourth.

**Grapes.**—There was good competition in these classes. For three bunches of black Grapes eight collections were staged. Mr. E. Molyneux was first with Madresfield Court Grapes, finely coloured; Mr. Horsefield second with Black Hamburg, medium size bunches, but well finished; and Mr. E. Hillier third with the same variety. Ten exhibitors appeared with three bunches of white Grapes, the prizes being secured by Mr. E. Molyneux with *Muscate of Alexandria*, excellent; Mr. Ollerhead with the same variety; and Mr. J. Hall, gardener to Captain Davison, South Stoneham House, with Cannon Hall Muscat, rather green, and Buckland Sweetwater, good colour. For a single bunch of Black Hamburg there were thirteen entries, the first prize being presented by Mr. W. Wildsmith, The Gardens, Heckfield. Mr. W. Sanders, gardener to J. East, Esq., Longstock House, Stockbridge, was first with good bunches, well coloured; Mr. Ollerhead a close second; Messrs. E. Hillier and J. Budd being third and fourth.

Peaches, Nectarines, and Melons were abundantly represented, especially the latter, the most successful competitors being Messrs. Rann, Molyneux, Thomson, Osborn, Budd, Thirlby, and Windebank. Melons were especially strongly shown, there being no less than twenty-three fruits staged in the two classes for a single green and scarlet-flesh variety respectively.

Apples, particularly the culinary varieties and other outdoor fruits, were also shown in great numbers.

**VEGETABLES.**—Like all the other sections of the schedule, the classes for vegetables were well filled, and the quality of the exhibits generally creditable to the growers. For twelve distinct varieties Mr. W. Sanders was a good first with clean, even, and substantial examples of Stamfordian Tomatoes, New Flanders Scarlet Carrots, Telephone Peas, Tender and True Cucumbers, and International Kidneys amongst others. Mr. Molyneux was a close second. There were fourteen exhibitors in the class for nine varieties of vegetables, Messrs. J. Allen, West, Amys, Pope, and Pay being the prizetakers in that order with well-grown specimens. For six varieties Captain Gibbs, Redthorn, Portswood, won the first prize with an excellent collection. Potatoes were also numerous and of good appearance, several other classes being similarly well filled. The cottagers' productions were very praiseworthy, and their contributions occupied considerable space in one of the marquees.

The miscellaneous exhibits did not constitute a remarkable feature in the display as regards numbers, but several interesting collections were staged. Messrs. Cannell & Son, Swanley, Kent, were the chief exhibitors, well deserving the certificate of merit awarded for their stands of Zinnias, Marigolds, Verbenas, Carnations, Picotees, Tuberous Begonias, and *Pelargoniums*, all of which were greatly admired. Messrs. Keynes & Co. had some stands of handsome Dahlia blooms; and Messrs. Elcombe & Son, Romsey, a fine group of Zonal *Pelargoniums* in pots.

Unfortunately the weather proved rather unfavourable upon the opening day of the Show, rain being frequent during the morning and afternoon, but notwithstanding that a very good company assembled; and with the attendance on the popular day, Monday, it is probable the Exhibition will prove as successful financially as it was from a horticultural point of view.

#### LETTUCE FOR WINTER SALADS.

I CAN fully endorse all that Mr. Iggulden has to say on this subject in his able contribution to last week's Journal, and think with him that it is necessary to maintain an abundant supply of Lettuce for that season of the year, which is in many establishments more important than the supply of Endive. The selection of varieties is a good one, but I may be permitted to ask why he has omitted from that list Tom Thumb, a variety I have hitherto found useful in every respect and of first-rate quality. It is an invaluable variety when late sowing has to be resorted to, as it turns in and hearts quickly.

Perhaps Mr. Iggulden gives preference to Suttons' Commodore Nutt, and has found that variety superior to Tom Thumb; if so, I shall be glad to know in what respects it differs and shows its superiority. I am anxious to obtain any good useful kind of superior quality for winter work, and any information pointing out the difference between the two varieties will be acceptable to—  
—A GROWER OF SALADS.

THE number of visitors to the ROYAL HORTICULTURAL SOCIETY'S GARDEN at South Kensington, and the Medical and Sanitary Exhibition, on Bank Holiday, was 12,209.

— CRANSTON'S Nursery and Seed Company of Hereford have now an extensive and beautiful EXHIBITION OF ROSE BLOOMS AT REGENT'S PARK, a stage extending the whole length of the corridor leading to the conservatory being occupied with the boxes. About two thousand blooms are shown, representing most of the best varieties in commerce, and considering the late period of the season their freshness and quality are surprising. Indeed, some of the blooms would have taken a high position at any show this year. A box of the bright and beautiful Rose Mrs. Jowitt was especially noteworthy on Tuesday, the substance and colour of the blooms proving how well the variety merits the honours it has

obtained. The Exhibition will continue until the 9th inst., a large number of fresh blooms being brought from the Nursery daily to maintain the display.

— A CORRESPONDENT writes to us from Lincoln as follows—“‘LANCASHIRE’ in your last issue wants to know a SUITABLE SHRUB FOR A HEDGE in a smoky district. From personal experience of smoky localities I recommend a Yew hedge; we have two such, one 60 yards the other 200 yards long; and as to smoke, woe to the district that has more, and our hedges are thriving much better than can be expected, and, situated as we are on a hillside, high winds and gales are the order of the day.”

— A CORRESPONDENT sends the following note on MR. COOKSON'S COLLECTION OF ORCHIDS AT OAKWOOD HALL, WYLAM—“These have been considerably increased in numbers, with glass accommodation to hold them. The Orchids are placed on stone slabs for stages, covered with 2 or 3 inches of white gravel. The pots are all placed in other pots, which are again placed in saucers containing water, the object of which is to prevent the progress of insects. The following were in bloom—*Dendrobium Jenkensis* with six or seven flowers, *Thunia Marshallii* with six flowers open, and *Masdevallia bella*, besides *Phalanopsis*, *Vandas*, and *Saccolabiums*. There was a fine seed pod on *Odontoglossum Uro-Skinneri* which had been crossed with *Odontoglossum Chestertoni*.”

— AT THE WEST OF SCOTLAND PANSY SHOW which was held last week, in the competition open to nurserymen only Mr. W. Dickson, Paisley, secured first prize for twenty-four blooms of Show Pansies; and for a similar number of Fancy Pansies Messrs. Paul & Son, Paisley, were first. Mr. Storrie, in the amateurs' class, had the best eighteen blooms of Show Pansies; and Bailie Goodwin was first for twelve distinct varieties of Show Pansies. In the open competition for twenty-four Show Pansies Mr. Lyle came first with a splendid lot of beautifully shaped and clearly defined blooms. For twelve flowers of the same class Mr. Buchanan was first, and in the Fancy Pansy class Mr. Storrie carried off the honours. The best bloom Show Pansy in the Hall was exhibited by Mr. T. M. Crorie, Kilbarchan. It is named “David Malcolm,” and was raised by Mr. Cuthbertson, Rothesay, last year, and since then it has received three certificates. The Pansy is a rich glossy black self, so smooth that the joining of the petals can scarcely be seen. It is of medium size, perfectly circular, with smooth overlapping petals of great substance, and a small orange eye with a halo of velvet. The top petals are velvety black, the lower petal shading to rich purple. In the confined classes Mr. Dalglish carried off all the first prizes, and for twelve bunches of *Violas* Messrs. Dickson & Co., Edinburgh, had the best exhibit.

— ROSES IN SCOTLAND.—The “North British Mail,” referring to the Roses at the above Show, states that “The Tea Roses shown by Mr. Gray, Dunkeld, were universally admired; some of the best authorities on the subject asserted that they were the finest blooms ever grown in Scotland. His stand included *Mdlle. Van Houtte*, *Souvenir d'un Ami*, *Alba Rosea*, *Madame Willermoz*, and other equally choice Roses. For the best Rose bloom in the Hall, Mr. Wallace came first with an excellently grown specimen of *Pierre Notting*. The feature of the Show, however, was probably the stands of Roses exhibited by Messrs. A. Dickson and Sons, Newtonards, and Mr. Hugh Dickson, Belfast. In the principal class, the competition for forty-eight Roses, distinct varieties, Messrs. A. Dickson & Sons were first, and in the next class, for twenty-four, Mr. Hugh Dickson was first.”

— AN EXHIBITION AND CONGRESS in connection with the CULTURE OF VINES is appointed to take place in Milan in September next. The Congress, which will be composed of experts from

various countries, will be charged with the duty of inquiring into the subject of the disease which has of late years rendered the wine crop so uncertain. The Exhibition will consist mainly of appliances for the application to vegetation of insect-destroying agencies, of machines and instruments for grafting, of photographs, plates, and printed publications relative to the Vine disease, specimens of Vine parasites, and numerous other objects serving similar purposes.

— We are requested to announce a special general meeting of the members of the ROYAL SOUTHAMPTON HORTICULTURAL SOCIETY will be held at the Kell Memorial Hall, Bellevue Road, on Wednesday, August 10th, at eight o'clock in the evening, when General Lacy will propose the following resolution, by the authority of the Provisional Council:—That the great difficulty the Committee has experienced this year in securing an eligible site for the Summer Exhibition, a difficulty which it is feared will be almost insurmountable in the future, showing the immediate necessity for securing a site for the proposed gardens; and having promises to the extent of over £3000, of which £2300 is promised in writing, the Council are hereby authorised to incorporate the Royal Southampton Horticultural Society forthwith, under the Limited Liability Companies Acts, upon the following basis:— 1, That the memorandum of association shall contain a proviso securing to annual subscribers all the privileges of admission to the shows at present enjoyed by them. 2, That the nominal capital of the Society shall be £10,000 in 10,000 £1 shares. That the first issue shall be 5000 shares. 3, That the contract with Sir Edward Hulse for the lease of the proposed site in Bannister's Park shall not be signed until the first calls upon not less than 3000 shares are paid into the Society's bank. 4, That of the first £3000 subscribed, £1500 shall be invested as a reserve fund, and the remainder expended in enclosing and partially laying out the site. 5, That all additional capital subscribed of the first issue shall be equally divided between the reserve fund and the expenses for completing the gardens. 6, That no outlay for glass structures shall be incurred until the whole of the first issue has been subscribed. Persons desirous of assisting the proposed Company are requested to communicate with the undersigned. Subscriptions are invited towards the expenses of promotion.—W. Lacy, Major-General, *Chairman*, The Polygon; C. S. Fuidge, *Secretary*. Office, 39, York Street, Lower Avenue, Southampton.

— A CORRESPONDENT has obliged us with a report of the STIRLING HORTICULTURAL SOCIETY'S SHOW, which, however, arrived too late for insertion, and we are only able to publish a condensed note of it. In many respects the Exhibition, which opened on the 26th ult., was a very good one, but the arrangements appear to have been very faulty. “By the time the Judges ought to have been proceeding with their work most of the tables were still to erect, and one of the tents was only partially erected. Indeed the arrangements were not wholly completed at all the first day. The consequence was that the Judges performed their duties under very trying conditions—the Grapes, for instance, having to be judged three times and the awards as often altered before the decisions were finally given. Notwithstanding this the awards were very satisfactory, except in the fruit classes, where the Judges' awards were by no means generally approved.” The collections of plants arranged for effect are described as forming “ridges 8 or 9 feet high in the centre, sloping like a house roof to nothing at the sides, and as evenly and densely filled with as many plants as could possibly be crushed in.” Mr. Thomas Boyd, Callander House, Falkirk; Mr. Russell, Keir House; and Mr. John Robertson, Springbank, Stirling, received the prizes. For specimen plants Mr. Souza was first with magnificent examples, Mr. Russell, Keir, having the same position for six fine-foilage plants. Roses were good from Mr. Alex. Hill Grey, East Ferry, Dunkeld;

Mr. A. Kirk, gardener to J. T. Thomson, Esq., Norwood, Tilli-coultry; and Mr. James Dick, Kippen. Mr. T. Lowe had the premier award for a collection of twelve kinds of fruit, and Mr. T. Boyd for eight dishes of hardy fruits. The show of vegetables was extensive and the samples very fine, especially the first-prize collection of twelve kinds from Mr. J. Souza.

— REFERRING to the disease known as the **YELLOW IN PEACHES**, which has been stated to have been caused by Bacteria, the "American Prairie Farmer" states:—"The true cause is diminished vitality of the trees, which invites the Bacteria. Potash, potash salts, the potash derived from ammonia, common salt, and soda salts, and the salts and sulphates of iron and manganese, appear to be the tonics and stimulants best adapted to strengthen the vital forces of the trees, giving them the strength to ward off these deadly parasites. But parasite is not a good name for Bacteria, for parasites generally prey on living organisms, but do not destroy the life, while Bacteria destroy life in all parts that they occupy. We had an idea that thorough investigation might find a medication of some kind that the tree would absorb in its tissues, that would be a specific poison to Bacteria and not to the tissues of the tree; but further investigation leaves us little hope that this is possible, for Bacteria are found to be the hardiest of all forms of life to destroy. Very few of the most virulent and deadly mineral or vegetable poisons have any effect on them; they can withstand extreme heat and cold, and it is scarcely reasonable to suppose that we will be able to find anything that will destroy their life without at the same time destroying the life of the tissue occupied by them." Our American friends might try Keel's blight destroyer, which is said to be a specific for all the diseases of the Peach. It is applied with a vapouriser, and is sold by Mr. Alfred Howes of Walcot Parade, Bath. We have found the application efficacious as applied to plants attacked with insects, but have no unclean or unhealthy Peach trees on which to try the effects of the preparation.

— THE report of the Select Committee appointed to inquire into the assessment of **EXTRAORDINARY TITHE**, is an ample justification of the strong complaints which have been made by agriculturists against the imposition of this additional charge on their land and its produce. The impost originated under the Tithe Commutation Act of 1836, which empowered the Commissioners to make Hop gardens, market gardens, and orchards into separate districts, on which an extra assessment was to be levied. This distinction was based on the plea that the produce of garden and orchard land is more profitable than that of ordinary arable land. If a district producing Hops, fruit, or vegetables is converted into corn land the extraordinary tithe ceases; and when land previously devoted to grain or pasture is cultivated for Hops or gardens the extraordinary charge begins to run. The practical objections to this system are obvious. The ordinary tithe is merely a charge on the land, while the extraordinary tithe is a charge on production. It is easy to see that land which would return a good rate of interest if devoted to the growth of garden produce, is very likely to be left to the less profitable cultivation of corn and other field crops by the dread of the augmented tax, which thus cramps the energies of agriculturists. Then, again, hardships are unavoidably created in certain cases owing to the difficulty of drawing a distinction between agricultural and garden produce. Some crops, such as Potatoes, Cabbages, Peas, and Beetroot, are classed both as field and garden produce, and in some parts of Scotland even Strawberries are regarded as field crops. The difficulty of drawing a clear line between the two has given rise to considerable litigation at times, and it is one of the grievances of farmers that they have been compelled to pay extraordinary tithe for land which is not devoted to market garden purposes. The general effect of the operation of this

increased assessment is recognised by the Special Committee as mischievous, and by way of remedy they recommend that no new districts shall hereafter be created. They also suggest schemes for commuting or reducing the obnoxious burden wherever it now exists. There can be little doubt that the adoption of these proposals would largely encourage the growth of market garden produce in this country, which is now checked by the tax on production. Agriculturists are deterred from turning their arable land into garden ground by the increased assessment of tithe to which the latter is subject, and the result is that we have to import every year some five or six millions sterling worth of produce, much of which we could grow for ourselves if agriculturists were not handicapped by a tax on production as well as on land. The Committee propose a substantial measure of relief, which is called for alike in the interest of producers and consumers.

#### CROTONS AT AIGBURTH.

IN the extremely neat and well-furnished nurseries of Messrs. R. P. Ker & Son at Aigburth, near Liverpool, the Crotons command attention by their free growth and bright colours. They are grown in a very simple manner, and are decidedly imposing. It does not appear to be the practice to stop the plants, but to let them assume a natural habit, growing tall or branching according to the nature of the variety. Generous culture is given, and the size and colour of the leaves show that the plants are in competent hands. A specimen of *C. Disraeli* is no doubt one of the finest in the country—a well-furnished and informal pyramid 6 or 7 feet high, well coloured, and in fine condition. Mr. Williams' new spiral-leaved variety, *C. Warreni*, is in superb health and rich colour; it is quite unique by its gracefully arching leaves, which are long, narrow, and twisted with the regularity of a corkscrew. The proprietors have reason to be proud of this beautiful plant, and no doubt they are.

A pair of plants of *C. Prince of Wales* admirably show the decorative value of the variety when well grown. These plants are about 6 feet high and have never been stopped. They have produced no side branches, but form straight columns of foliage from the pot to the golden weeping crown that forms the summit of each plant. Even the leaves that were attached to the cuttings are as fresh as ever. For various purposes of decoration such plants as these possess great value, and could not be equalled by plants that have been stopped. *C. Evansianus* is equally remarkable. It is simply a straight stem more than 6 feet high, with fine and richly coloured leaves from the soil upwards. It is a picturesque and brilliant column that would tell with great advantage in a group arranged for effect, or similar plants would be fine for staircases and halls that are occasionally desired to be furnished with valuable plants. *C. Victoria* is remarkable by its vigour and its large rich foliage, and, grown as the plants are, every leaf is seen to advantage. *C. Princess of Wales* contrasts effectively by its cream-coloured foliage, and grown unchecked is very elegant; and of the still lighter and new *C. Hawkeri* there is one of the finest plants we have seen. This variety branches naturally, and forms a beautiful object by the transparency of its leaves. It is the best of all Crotons for room and table decoration under artificial light, and for this purpose will probably be extensively grown. *C. Hanburyanus* has imposing foliage, but does not colour so early as some others; it is a noble form for autumn, when its colours are the brightest.

There are a great number of others, including most of the newer varieties in cultivation, but one at least may be noticed, as it is not generally known. It is a new form distributed by Messrs. Ireland & Thomson, named *C. interruptus aureus*—not a happy name, as it has no resemblance whatever to *C. interruptus*. The new variety is of slender growth, after the manner of the old *C. angustifolius*, but is brighter than that bright and useful old form, and its habit is all that can be desired. It forms a perfect pyramid in a small state without being pinched, and a large specimen must be very imposing. This is likely to prove one of the finest of table plants—at least during the daytime, yellow not showing under artificial light, and it will be valuable for general decorative purposes. It was certificated at Liverpool two years ago.

There is a good general collection of plants in this nursery, but the Crotons are of special excellence and highly creditable to the cultivators.—VISITOR.

**OLEARIA HAASTII.**—I have this beautiful shrub in full bloom. It is one mass of flowers of a delicate creamy white, which are

agreeably fragrant; and being much admired I have thought it well to draw the attention of others towards it, as it has not been long introduced into this country, yet sufficiently so to try the hardiness of its constitution. With me it stood against the full force of a north-easterly wind that blew for weeks, killing and injuring many old-established trees around, and yet not a leaf was turned brown. *Viburnum Awafurkii* was one of the first to go in the same position, though I have one plant left and doing well in a sheltered corner. The Loquat, too, is alive, though sadly crippled.—HARRISON WEIR.

#### CLERODENDRONS AT DRAYTON MANOR.

HAVING seen the small plants of *Clerodendron Balfourianum* referred to by Mr. Thomas on page 81, I can bear testimony to their usefulness and great decorative value. By this simple mode of culture this beautiful plant can be grown by many who have only small houses at their disposal, as there is no need for training the growths to wires near the glass, nor for securing them to balloon trellises, which occupy much space. When the plants are from 6 to 9 inches high they are simply stopped, and as fast as further growths form they are kept pinched to a leaf, the same as Peach trees are pinched for bearing on the spur system. Eventually clusters of flower buds form, and when the *Clerodendrons* flower they resemble in character dwarf *Hydrangeas*, but are far more beautiful. There is little doubt that others will try the pinching plan that has been recommended, and a valuable addition to early summer-flowering decorative plants will be the result. Plants such as those grown at Drayton Manor would sell well in Covent Garden Market.

There is much more that is noticeable at Drayton Manor and its 75 acres of pleasure grounds, noble walks, grand terraces, fine Conifers, and splendid avenues of *Araucarias*, *Pinus excelsa*, and Irish Yews. The glaucous form of *Cedrus Atlantica* is superb, and ought to be in all collections. *Larix Kämpferi* is about 9 feet high and through; and there are hundreds of fine examples of various Conifers, and splendid masses of Golden Yews tastefully grouped; but the *Araucaria* avenue, backed with a line of the Douglas Yew, is the feature of the grounds. The glass structures are extensive, and include a remarkably fine range of vineries, the rafters being of iron, and the sashbars of copper. The Grapes are also fine, a late house having a splendid crop, the early varieties being cut. Rich surface dressings and copious supplies of water—in a word, plenty of healthy roots and plenty of food, are the elements of success. Peaches, Figs, Plums, and Pears are largely grown under glass, and the kitchen garden is in a high state of fertility and profitably cropped. Weeks's tubular boilers are much liked by Mr. Thomas, one to which 3000 feet of piping is attached having worked satisfactorily for thirty years. It must have been one of the first that was made; it has just been new bottomed, and is commencing another term of work. There are very good plant houses erected by Mr. Gray, and a fine octagonal domed conservatory, which is an attractive adjunct of the mansion. All these and more merit attention; but after all nothing was more striking, because novel and effective, than the dwarf *Clerodendrons* above referred to, and Mr. Thomas has done well to make his simple and easy mode of culture known.—A TRAVELLER.

#### SINGLE v. DOUBLE FLOWERS.

THERE is much that is worth noting and remembering in both the articles contributed by "SINGLE-HANDED," but as there is some little difference of opinion between him and myself, it will be as well to explain my views more fully. This I will do by referring to some of what I have proved to be really useful flowers, and your readers can then judge for themselves.

The Pansy has already had a decision in its favour. Roses have not come off quite so well. I admire and use wild Roses; at the same time I should not prefer a bunch of wild Roses to one composed of open and unopened buds of *Maréchal Niel*, *Safrano*, *Niphotos*, *Général Jacqueminot*, *Coupe d'Hebe*, and *Cabbage Roses*, though I certainly would not object to the wild variety being associated with the others. Need I remind your correspondent that "*Dahlias* and *Hollyhocks* and a host of other prim, double, artificially formed flowers," is a rather loosely worded definition? Single *Dahlias* are well represented in gardens. Single *Hollyhocks* are not in the least likely to rival the double forms, for the simple reason that they are not nearly so effective. I do not know any more effective plant than the *Hollyhock* for late flowering. Why should we examine everything closely?

Though *Hollyhocks* are not particularly beautiful under close inspection, then "let distance lend enchantment to the view." As to the "host" of other double flowers, does that mean every double form, or does "SINGLE-HANDED" make reservations? I readily grant that many double flowers are unattractive. For instance, a double *Fuchsia*, a double *Petunia*, a double *Pelargonium*, or a double *Campanula*, are not improvements on the single forms; but these do not necessarily decide the question. In a previous communication I named some wild flowers the double forms of which I thought prettier than the single. I now ask if your correspondent would expel Mule Pinks, common double Pinks, laced Pinks, Picotees, Clove Carnations, and florists' Carnations from gardens, and substitute single forms in their places? Would he place double Stocks, Asters, Marigolds, Peonies, Wallflowers, Zinnias, Primulas, Azaleas, and Camellias in the background, and substitute single forms for them? If so, for what reason? Certainly not because the single forms are more beautiful, nor even because they are more useful for various purposes of decoration.

With regard to wild flowers contrasted with those that are cultivated, let us consider of what "SINGLE-HANDED" tells us his bouquet was composed. If instead of the Ox-eye Daisy we substitute *Eucharis*, or the old *Pancreatum speciosum* instead of the *Woodruff*, *Rogiera cordata*, white *Bouvardia*, white *Heath* or *Rhynchospermum*; and *Odontoglossum Alexandræ*, *O. cirrhosum*, *O. Pescatorei*, or *Stephanotis* in place of *Gueldre Rose*, should we spoil our bouquet? If for yellow, *Alstroemeria*, *Masdevallia Davisii*, *Lonicera japonica*, or *Aquilegia chrysantha* were employed, should we be destitute of taste? Amongst wild *Forget-me-nots* only one is worth cutting, and that is *M. sylvatica*, and amongst wayside *Veronicas* only one is showy—namely, *V. Chamædrys*; but place either *V. rupestris* or *V. verbenacea* beside it, and see how this pretty wayside flower must yield the palm to its cultivated congeners. I would commend the double forms of the wild *Geranium* as superior by far to the singles for garden plants. Then the reds are a really poor selection. Why, the rose variety of the common *Milfoil* is far superior to any of them, and so is the dark variety of *Centranthus ruber*. But if you pass these by and employ in the bouquet some red Rose buds, sprays of *Zonal Pelargoniums*, single flowers of *Epidendrum vitellinum*, or *Ixora* flowers, what a different effect is produced!

With "SINGLE-HANDED'S" remarks about florists' flowers I cannot agree. We have certain standards of beauty in form in architecture and kindred arts, in the animal kingdom and in the vegetable kingdom, and the forms which are condemned as being in bad taste are in all cases recognised as standards of beauty. We simply cannot help ourselves in this matter. Even "SINGLE-HANDED," when picking his bouquet, has selected the perfectly circular *Horse-gowan* to head his list, the largest and roundest of the *Starworts*, the common *Buttercup*, *Forget-me-nots*, two of the largest and roundest *Geraniums*, and red *Clover*—actually approaching the model of the double flower. What would your correspondent make as the standard of beauty in flowers? If we take a *Geranium* with three or five pips to a truss, and with pips a quarter of an inch in diameter, shall we let it remain so? or may we improve (?) it to a certain extent in size, in roundness, and in the number of flowers? If so, where shall we stop? Take the *Phlox*; shall we return to the starry *P. pyramidalis*, and consign the newest varieties to the rubbish heap? Or the *Gladiolus*, shall we again grow the varieties which held sway before *Berthe Rabourdin* appeared? The true lover of flowers sees beauty in all—the wild Rose and the cultivated, the wayside annual and the exotic.—R. P. BROTHERSTON.

[With this communication Mr. Brotherston sent us a huge bouquet of hardy flowers, some double, some single; all are equally beautiful, and excellent examples of cultivation.—ED.]

#### RENANTHERA LOWII.

ONE of the most remarkable members of a large and interesting family of plants is the superb Orchid *Renanthera*, or *Vanda*, *Lowii*, which is well known, at least by name, to most growers who make a speciality of these plants. Not that it is at all common, for on the contrary it is extremely rare, but because a few large specimens included in some amateur and trade collections have flowered at various times, and, being described, have attracted the attention not only of orchidists but of plant-growers generally. Some, too, have been exhibited occasionally, and these have served to still further extend the fame of the plant both as regards its beauty and peculiarity. Still, however, it is by no means frequently in flower, and quite a sensation is yet created amongst Orchid lovers by the announcement that an example can be seen in that condition. Such, indeed, was the result of Mr.

B. S. Williams's intimation that he had his handsome specimen in flower, and in consequence the Orchid house containing it at Holloway has been entered by many interested visitors during the past week, and doubtless many more will yet have an opportunity of seeing it, as the plant appears likely to continue in flower for several weeks. All that have the opportunity will certainly not regret the time spent, for the Orchid is in fine condition, and perhaps few better displays of flowers have been produced—in England at all events. Of course we can never hope to rival such specimens as have been found attached to the trunks

of trees in its native home—Borneo. Reliable travellers have stated this *Renanthera* is so vigorous that sometimes examples have been observed with two hundred branches, each bearing two to four spikes of flowers 10 or 12 feet long, thus bearing collectively several thousands of flowers. British Orchid growers can afford to be content with less extraordinary results than these; but even in our dull climate, and under the artificial conditions imposed by cultivation in glass houses, the plant is found to be when healthy remarkably strong-growing, and, as an experienced orchidologist has remarked, it appears to disdain our attempts to

Fig. 19.—RENANTHERA LOWII.

limit it to the moderate extent of ordinary Orchid houses in this country. Even when not flowering it has a noble appearance, and seems to occupy a regal position among the *Vandas*, to which it is closely related both structurally and in general superficial characters.

The genus *Renanthera* is not a large one, and it is chiefly separated from *Vanda* by some slight differences in the mode the lip is attached to the column; in other respects, especially in the growth and leaves, there is a striking similarity between the best-known forms of each genus—indeed, the one now specially referred to here, *R. Lowii*, was originally described by Lindley as a

*Vanda*, and it was not until better materials had been submitted to Reichenbach that it was allocated to its present position in the Orchid family. Mr. Hugh Low, when holding the post of Colonial Treasurer at Labuan about 1846-7, was fortunate enough to discover specimens of the plant, some of which he succeeded in forwarding to England then or a short time subsequently. Some years, however, elapsed before flowers were produced, and I believe that the honour of having been the first to flower the plant in England rests with Mr. Pilcher, who had charge of the celebrated Ruckerian collection of Orchids at Wandsworth. It seems strange that twelve years should have elapsed from the time the

plant was made known until living flowers were seen, and yet that appears to have been the case, for it was in the autumn of 1862 that Mr. Rueker's gardener succeeded in gratifying not only his employer but a small world of Orchid lovers and growers. Since then, however, similar results have been produced in various collections. A year or two since a fine example was flowering at Ferrières, Baron Rothschild's noted estate in France, and one spike, it is said, was over 9 feet long. A few have also been shown at the chief metropolitan exhibitions.

The Holloway specimen, of which the woodcut (fig. 19) is a representation, is growing in a large pot with perforated sides, and from the top of the compost of charcoal, potsherds, and sphagnum moss the height of the plant is 6 feet. From the axils of contiguous leaves near the summit of the stem six pendulous spikes have been produced, the largest being 7 feet 3 inches in length, and bears thirty-one flowers with several buds not yet expanded. The total number of flowers and buds upon the plant is 194. All the flowers, except two or three at the base of each spike, have the petals and sepals alike, being burred and blotched with deep reddish brown upon a yellow ground, and when the plant is sufficiently elevated to enable this colouring to be seen to the best advantage it is very striking. The two or three mentioned above as differing from the other flowers are very remarkable. They have slightly broader petals and sepals, the ground colour being an orange yellow marked with small purplish or crimson dots. These flowers are invariably found at the base of the spikes produced by *Renanthera Lowii*, and they have occasioned much comment amongst botanists and others. It has been thought to be similar to the dimorphism observed in other Orchids that have one form of flower in which the pollinia only is produced, or perfect, and the other with a stigma but defective in the pollinia, thus approaching the monœcious state amongst other plants; indeed, it has been generally accepted as such, but an eminent authority, having subjected the flowers to a careful examination, states that there is no appreciable difference in the structure of the two sets of flowers produced by the *Renanthera*. One interesting observation has, however, been made—namely, that the basal flowers have a much stronger and more pleasant odour than the others, and this may have some bearing upon the subject. At all events the matter should be of sufficient interest to induce those growers who have the opportunity to make some careful observations with a view to determining it.

Another species of *Renanthera*—viz., *R. coccinea*, may not unfittingly be referred to, as it is the oldest known form of the genus in cultivation. It is also very beautiful, and is scarcely less noteworthy than its remarkable relative. It is a native of Cochin China, and was first brought into notice at the close of the last century by the writings of a missionary named Loureiro and several other travellers. It is said to be cultivated in China, where it is grown in baskets and employed for decorating rooms, being suspended from the ceilings. The sight of some specimens in flower in such positions induced certain writers to characterise it as the most handsome of plants; but though undoubtedly attractive in a high degree, it is scarcely entitled to such unqualified praise. The flowers are borne in spreading panicles, not in spikes like *R. Lowii*, the sepals being narrow spotted with orange-scarlet; the petals are broader, of a reddish-orange hue without any markings. A plant of this species first flowered at Claremont in 1827. *R. matutina* is a small-flowered form, very distinct from the others but pretty, the blooms being yellow spotted with crimson, and produced in great numbers upon panicles like the last-named. It has been found in Java and the Phillipines.

Regarding the dimorphism of Orchids, the *Cycnoches Warscewiczii* shown last year at Kensington was an admirable example, and one of the most strongly marked I am acquainted with. Some *Catasetums* and allied genera exhibit similar peculiarities.—L. CASTLE.

#### NEWCASTLE FLOWER SHOW.

THE summer Show of the Newcastle Horticultural and Botanical Society was held in the Leazes Park on the 27th, 28th, and 29th ult., and was by far the best the Society has ever held as regards both the number and high quality of the exhibits. The Society this year are making some new departures from their former system by holding no autumn exhibition. This, no doubt, may be attributed to the circumstance that in the Town Hall there is not room to hold sufficient people to make the shows "pay." This is the more to be regretted, as the autumn exhibitions have generally been exceedingly good. However, it behoves the directorate to make every effort to surmount their financial difficulties, and place the Society on a firmer footing. On the first day of the summer Show under notice the weather was very fine; the second day it rained heavily towards evening, which, we fear, must have reduced the takings by some hundreds of pounds,

but upwards of twelve thousand visitors attended the Exhibition on the opening day.

The Exhibition was held in a series of tents arranged side by side with their sides opened, thus forming a pavilion of flowers, &c., about 90 yards by 50. The sides were neatly edged with crimson, giving a fine effect to the whole. We will now refer to the exhibits according to their arrangement in the schedule. For eight plants in bloom, dissimilar, £26 and the Knightian medal were provided, the first prize being £12. This was won by Mr. Cypher, Cheltenham, his plants consisting of a fine *Clerodendron Balfourianum* over 6 feet high and densely covered with flowers, *Ixora Fraseri* well flowered, *Erica tricolor Kingscottiana* over 5 feet through, *Allamandas Hendersoni* and *grandiflora*, a fresh *Dipladenia amabilis*, and three other *Ericas* completed the collection, which was of remarkable merit. Mr. E. H. Letts, gardener to the Earl of Zetland, Upleatham, was second with an excellent-flowered *Stephanotis floribunda*, *Anthurium Schertzerianum* with forty flowers, *Ericas insignis* and *ampullacea*, all of great excellence. Mr. E. Tudgey, gardener to T. F. G. Williams, Esq., Henwick Grange, Worcester, was third with a very fine group of plants. In the class for eight foliage plants there were six competitors. The plants attracted much attention, and formed one of the strongest features of the Show. Mr. Letts was first with remarkable specimens of *Crotons majesticus* and *Johannis*, both finely coloured, and the leaves of great size; *Dasylium acrotrichum* was splendid; *Encephalartos Vroomi* was superb—supposed to be one of the finest specimens in England—*Gleichenia rupestris glaucescens* was over 9 feet through. Altogether they were a majestic lot, and well worthy of the premier honours. Mr. Hammond, gardener to Sir Wilfrid Lawson, Bart., Brayton Manor, was second with good specimens of *Croton majesticus*, *Dasylium glaucum*, *Latania borbonica*, and a capital *Cycas revoluta*. Mr. Cypher was third, *Croton Johannis* being very fine, as also was *Gleichenia rupestris*.

For groups of miscellaneous plants there were seven competitors, Mr. Hammond being first with a most effective arrangement, the charm of which consisted principally in an absence of packing. At the base of each tall plant small Ferns and flowering plants were grouped. *Acalyphas* well coloured were used with great effect. Mr. Noble, gardener to Theo. Fry, Esq., Woodburn, Darlington, was second with a very effective group; Mr. Thompson, nurseryman, Fenham, Newcastle, being third. Many of the other groups contained fine flowering plants, but were defective in arrangement.

Two collections of Orchids only were staged. Mr. Cypher was placed first with a good plant of *Cattleya crispa*, *Odontoglossum vexillarium* with five spikes and thirty-six blooms, and *Saccolabium Blumei* three spikes.

Ferns were not so numerous as usual, Mr. Noble being first in the principal class, followed by Mr. Hammond, both of whom showed excellent specimens. For three *Crotons* Messrs. McIntyre, Hammond, and Black were successful in the order named. *Dracænas* and *Tuberous-rooted Begonias* were well shown, Mr. Hammond being the most successful exhibitor. Mr. Letts had the first prize for *Ericas*. Pans of bedding plants, alpine or rock plants, and hardy succulent plants, dissimilar, were very good; Mr. Larke, gardener to the Rev. R. F. Wheeler, Whitley Vicarage, securing the first prizes in each class. These collections were much admired by visitors, and formed a pleasing feature of the Show.

ROSES.—Competition in the Rose classes has always been encouraged by the Society, and the display was unusually fine. The exhibitions of previous years have generally been too early for north country growers; however, this year they have had a much better chance. The Roses shown by Mr. Whitwell, Barton Hall, Darlington; Messrs. Mack & Son, Catterick Bridge; and Mr. Jos. Watson, Fenham Nurseries, were extremely fine considering the extraordinary winter and spring there has been in the north. For forty-eight Roses, not less than twenty-four varieties, Messrs. Cranston, nurserymen, Hereford, were first with extraordinary blooms of Charles Lefebvre, Comtesse de Serenye, Mrs. Jowitt, Madame Sophie Fropot, Mdlle. Marguerite D'Ombraïn, Emilie Hausburg, Louis Van Houtte, Marie Finger, John Stuart Mill, Marie Rady, Mdlle. Marie Verdier, and Exposition de Brie. Messrs. Mack were second with very good blooms of Alfred Colomb, Marie Baumann, Baronne de Rothschild, and Mons. E. Y. Teas; Mr. Jowitt, Hereford, securing third honours. Six collections were staged. For thirty-six Roses, not less than eighteen varieties, Messrs. Cranston were again first, the stand containing superior blooms of Mrs. Jowitt (a new Rose of a deep crimson scarlet shade of colour), Pierre Notting, Jean Liabaud, Madame Thérèse Levet, Fisher Holmes, Alfred Colomb, Baronne de Rothschild, Duke of Edinburgh, and Madame Chas. Wood. Mr. Whitwell was an excellent second with fine examples of La France, Reynolds Hole, Dupuy Jamain, Madame Berard, Emilie Hausburg, Marie Baumann, Comtesse de Serenye, Leopold I., and Thomas Mills. For twelve Roses of any variety Messrs. Cranston were first with Mrs. Jowitt. For twelve Tea-scented Roses Messrs. Mack & Son were deservedly first with charming blooms of Souvenir d'un Ami, Madame Berard, Belle Lyonnaise, Maréchal Niel, Madame Hippolyte Jamain, Niphotos, and Jean Ducher; Messrs. Cranston securing the second prize.

TABLE DECORATIONS.—These are generally of a superior character at the Society's shows, and we have seen them much better, and also the prizes much more severely contested for than on this occasion. For the most tastefully decorated table Mr. M. Thompson, gardener to Lindsay Wood, Esq., South Hill, was first with a very effective

arrangement. Mrs. Gellender, Grey Street, Newcastle, was second; and Mr. Whiting, gardener to Mr. Walker, Shot Tower, third. Table plants were very good, Mr. Hammond, Mr. Whiting, and Mr. Cypher being placed respectively in the order of merit. Mr. Hammond's plants consisted of *Cocos Weddelliana*, *Croton angustifolius*, *Grevillea robusta*, *Croton Sunset*, *Pandanus Veitchii*, and *Croton nobilis*. Epergnes, basket of cut flowers, bridal bouquets, hand bouquets, and buttonholes were shown, the latter embracing thirty entries. Of the above the first prizewinners were Messrs. Cypher, Larke, and J. Battensby.

**FRUIT.**—The fruit was decidedly superior to that staged at any summer exhibition the Society has held, and was nearly, if not quite, equal to the displays at the autumn shows, which have been admittedly amongst the best in the provinces. For a collection of eight dishes of fruit the sum of £15 was divided into four prizes, besides for the first the bronze Knightian medal. Five collections were staged. Mr. Mann, gardener to Mrs. Hornsby, St. Vincent's, Grantham, was first with superior dishes of fruit. He had a Queen Pine (3 lbs.), capital bunches of Black Hamburg and Muscat of Alexandria Grapes, from 3 to 4 lbs. weight; the berries were large, finely coloured, and evenly shaped. Pitmaston Orange Nectarines, Dr. Hogg Peaches, Brown Turkey Figs, a large Eastnor Castle Melon, and Black Tartarian Cherries. Mr. Edmonds, gardener to the Duke of St. Albans, Bestwood Lodge, was second with good Black Hamburg and Muscat of Alexandria Grapes, Royal George Peaches, Elruge Nectarines, and a good Queen Pine; Mr. Ingram, Alwick Castle, being third. For four dishes of fruit, Pines excluded, there were ten entries. Mr. A. Mackie, gardener to J. R. M. Plews, Esq., The Woodlands, Darlington, was first with Black Hamburg Grapes. Elruge Nectarines, Noblesse Peaches, and a Queen Emma Melon, all very good. Mr. Johnson, gardener to H. Nimmo, Esq., Castle Eden, was second; and Mr. Ingram being third, both staging meritorious collections. Many of the other collections contained excellent fruit, Mr. Jowsey of Ledbury Park having very fine Grapes, Pine Apple, and Peaches. Two Pine Apples only were staged, Mr. Ingram being first, followed by Mr. Letts. For four bunches of Grapes, not less than two varieties, Mr. Hammond was first with admirably finished berries of Black Hamburg and Buckland Sweetwater. Mr. Jowsey was second, and Messrs. Mavin & Son, Whitley, third. In the other principal Grape classes Messrs. Mavin, Harwood, and Hammond were the winners of the first prizes. The produce was excellent, and the competition keen. Melons were numerous shown, Messrs. Thorburn and Mann being respectively first in the classes for green and scarlet-fleshed kinds. Thirteen dishes of Peaches were staged. Mr. J. H. Clayton, Grimston Park, Tadcaster, was first, Mr. McIntyre second, and Mr. H. A. Mann third, all staging superior fruit. There were also thirteen dishes of Nectarines, which were also very good. Figs, Cherries, and Strawberries were exceedingly good, the latter being large in size and of excellent colour. The best variety was Sir Joseph Paxton, shown by Mr. Fister, gardener to Mrs. Joicey, Blenkinsopp Hall. Excellent dishes of Tomatoes were shown by Mrs. McIntyre. Seventeen brace of Cucumbers were staged, Mr. Ingram being first with Telegraph.

The above refers to what is called the A Division, and consists of nurserymen's and open classes. The B Division is for the products of local gardeners and amateurs. In the class for six plants in bloom Mr. E. Adams, Swalwell, an amateur, was deservedly first, and secured the first silver Banksian medal with creditable plants of *Phœnocomma prolifera Barnesii*, and a fine plant of *Kalosanthes coccinea* with sixty trusses of flower—a plant that is rarely well shown at Newcastle; of *Ericas* he had in superb condition *ferruginea major* and *Turnbullii*. Mr. Noble was second with a good *Lapageria rosea* and *Erica retorta major*. Mr. Battensby was an excellent third; his plant of *Ixora Williamsii* was perhaps the best of its kind in the Show, having over sixty trusses. Foliage plants were also good in this class, Mr. E. Tudgey securing the first position with *Cycas revoluta*, *Cocos Weddelliana*, *Dicksonia antarctica*, *Areca lutescens* with three fine stems, *Pritchardia pacifica*, and *Cycas Normanbyana*. Mr. Hammond was a close second, having *Phoenix pectinata*, *Croton Disraeli*, and *Chamærops humilis tomentosa* in fine condition. There was great competition in the class for six Ferns, Mr. Noble being first with superior specimens of *Gleichenia rupestris glaucescens*, *Cibotium regale*, *Thamnopteris australasica*, *Gleichenia Mendelli*, and *Microlepia hirta cristata*. Mr. C. Crossland, Oakfield House, was second. British Ferns were very good. Mr. J. B. Robson, Newcastle, securing premier honours, with Mr. N. Black second. Mr. Methven was first with *Ericas*, followed by Mr. Letts. Zonal Pelargoniums, Coleuses, table plants, and Fuchsias were numerous, the prize plants of the latter from Mr. Deighton, Gateshead, a working man, were very fine and highly creditable to the exhibitor.

Cut flowers were good in this section of the Show. For twenty-four Roses Mr. E. R. Whitwell was first, his most striking blooms being *Emilie Hausburg*, *Marie Baumann*, *Baronne de Rothschild*, *Alfred Colomb*, *Duchesse de Vallombrosa*, *Madame Lacharme*, and *Reynolds Hole*, all of which were splendid. Mr. T. Jowitt was second. For twelve Roses Mr. Jowitt was first. Bridal and hand bouquets and epergnes were fairly good, Messrs. Rutherford, M. Larke, and C. W. Baynes taking the principal honours. Herbaceous flowers were, as usual, strongly competed for, Mr. Battensby being first with a fine stand; Mr. W. H. Wilson, Gilesgate, Durham, second.

The C Division is confined to amateurs only, which means in the

north anyone who does not employ a professional gardener. Many of the exhibitors are only working men, and it was gratifying to see such excellent productions in every department. Messrs. Battensby, Adams, Morris, Deighton, Atkinson, Lambert, and Oliphant contributed principally to this section of the Show.

Several valuable groups of plants, &c., were sent not for competition. Mr. B. S. Williams, Upper Holloway, London, exhibited a most valuable and diversified group, including Orchids, fine-foliaged plants, and Ferns; *Dendrobium formosum giganteum* and *Agapanthus umbellatus alba* were much admired. Messrs. J. Robson and Son, Hexham, had a collection of Coniferæ; Messrs. Wm. Fell and Co., Hexham, also contributed Coniferæ, consisting of many new varieties, also a fine collection of rock and alpine plants; Messrs. Finney, Newcastle, natural Grasses and seeds; Mr. Jos. Watson, Fenham, rock plants and Coniferæ; Mr. W. H. Hilton, unbreakable hand-painted flower-pot covers; Mr. J. Mackenzie a new *Lobelia* named *Compacta Bella*, which was certificated; Mr. Wm. Tweddle a tray of wild fruit; Mr. J. Crossling, Newcastle, ferneries; Mr. G. T. Reed, lawn mowers; and Messrs. Dinning & Cooke, Newcastle, their patent hot-water apparatus.

The day's proceedings, we were informed, were brought to a close by the Committee and their friends, the principal exhibitors, the Judges, the High Sheriff of Newcastle, several Town Councillors, and a deputation from the York Floral Society, dining together. After dinner some discussion ensued relative to the encouragement the Committee have received from the Town Council. Hitherto that body has charged them £40 for the use of the Park, but this year they have allowed them to have it for £60.

The Committee and Secretary were active, as usual, in rendering the Show complete and making it enjoyable to all.

#### SHADING CAMELLIAS.

MR. MUIR has, no doubt, full justification for his remarks on this question as founded on his own practice; yet, nevertheless, it is not wise to write dogmatically on the subject and assert that Camellias do not need shading. In all probability my experience with Camellias is as great as that of your correspondent, and my means of observation greater, as I have inspected plants in nearly every county of England, and in many instances have found that shading was essential, even when the cultivators of the plants had endeavoured to relinquish the practice and regretted its necessity.

Very much depends on the district in which Camellias are grown, and more probably on the glass that is used, as to whether the plants need shading or not. In a limestone district the plants, as a rule, must be shaded. Why this is so I can scarcely tell, but can vouch for the fact, as I also can for red spider being more prevalent in some localities than others, while I cannot exactly state the "reason why."

I have just inspected one of the finest collections of Camellias in the kingdom. The specimens are such, both as to form and vigour, that it would not be easy to excel, and I have certainly not seen any in Wales to equal them. There are larger specimens in Wales, but few, I think, more handsome, and none, I feel confident, more healthy. It is a fact that the plants to which I refer could not be in the splendid condition they are if shading was not resorted to. They are in the charge of a gardener who ranks amongst the highest in the profession, and is one of the last men who would adopt a practice that could be dispensed with. He is not a mere imitator of other men's practice, but rather a leader in his vocation. It is necessary to state this, or your correspondent might fancy the Camellias are in incompetent hands. On the contrary, they are in the charge of a skilled cultivator, who finds that shade for the plants is imperative.

No doubt there are cases where Camellias are shaded more than is necessary, but to assert they do not need shading at all is to go to the other extreme, and extremes are proverbially unsafe.

Mr. Muir says in his case the foliage has "attained a rich, dark glossy green colour, which might have been looked for in vain in the shade." No doubt this is quite true as limited to the plants in his case; but if he intends his remark to be of general application I join issue with him, and submit that growths equally rich, glossy, and in all respects satisfactory, can be produced from plants that have been judiciously shaded. I am prepared to have examples sent to the Editor for comparison with the best that can be produced from unshaded plants, with the view of testing the point as to whether shading is in all cases a fallacy in the culture of Camellias.—NOMAD.

**DAY'S EARLY SUNRISE PEA.**—Are there two varieties of the above Pea in commerce? I am induced to ask the question from the remarks on page 79 of your last issue, where one of your corre-

spondents says it has haulm 5 feet high, and another that it has nine or ten peas in a pod.—G. S., *Sandbeck Park*.

CHAPTERS ON INSECTS FOR GARDENERS.—No. 26.  
NEW SERIES.

IN previous articles that have been comprehended in this series some account has been given of the galls produced upon trees and plants by various two-winged and four-winged flies. Many of the larger galls serve as homes or resorts for more than one species of insect, and the concluding page in the history of most that are left undisturbed is their demolition by small parties of Acari or mites, though some escape for a long time, as for example the well-known oak-gall (fig. 20). This, the marble or Devonshire gall, is the work of *Cynips Kollari*, a four-winged fly, and rightful occupier while a grub of the central hole, into which, however, parasites occasionally intrude and devour it before it is mature. In addition to these we also find in the galls what are called the "inquilines," or fellow-lodgers. Their abodes are scattered throughout the substance of the gall. To obtain the insects within these galls titmice and other birds drive holes in them, and the effect of the weather so softens them ultimately that mites can break them up and feast on their contents.

But we have also a group of mites that are actually the producers of galls, and to a moderate extent several species are found to be not merely disfigurers—they check growth or develop an unhealthy action in the plants they attack. So doubtful was their history during the early years of scientific research, that not a few of our naturalists were led to regard the galls caused by mites as simply instances of fungoid or other vegetable growths induced by the state of the air. With ordinary galls there is seldom any difficulty, when a number are examined, in detecting the tenants or some traces of them; but the tiny, and occasionally almost transparent, mites escaped observation until the experiment was

Fig. 20.—Oak Galls.

made of soaking the galls in water and examining the solution. Most persons have noticed at some time or other upon the leaves of the Lime numerous little projections that from their shape have received the name of "nail-galls," and in which, when they are cut open, we perceive nothing but a crowd of minute vegetable hairs. Reaumur, one of the highly honoured entomologists of France, saw these a century and a half ago, and he presumed that insects had to do with them; after a good while he found some. From his description, however, these must have been creatures preying upon the mites. It was not until the year 1851 that the producers of these nail-galls were detected by M. Dujardin, and the species was named *Phytoptus Tiliæ*; it is one of those that are semi-transparent.

It is not necessary to describe fully the habits of the *Phytoptidæ* or gall-mites, but it may be stated that they live usually in colonies composed of both larvæ and mature mites, the larvæ in some species having only four legs. The head of the mature insect is hardly distinguishable from its body. It is furnished with short thick palpi, and the legs appear to be not only clawed at the tips, they have also beside the hard claw a moveable soft one, or sucker. Yet it is curious that these mites are not particularly fond of locomotion. "They waggle about in an aimless way, turned from their path by any obstacle, such as meeting one of themselves," writes Mr. Murray, who has been so fortunate as to see some crawling about; and yet, for all that, they manage to spread themselves over a whole tree or an entire hedge. For although they will infest the same plant year after year if not meddled with, they also appear in new localities. And here is a puzzle: What becomes of the gall-mites that infest buds when there are no buds for them to consume—*i.e.*, during the greater part of the year? They vanish from the plants, and no one can say where they go; but they re-appear sure enough in their

proper season. The *Phytoptidæ* (as might be supposed) occurring within buds are principally injurious. They do not form distinct galls like the leaf-infesting species; they give to the whole bud a rounded puffy aspect, the leaflets within look "raw," and eventually the bud decays and drops. Nor is the result by any means salutary to the plant. We have never been able to perceive these with the unassisted eye; with a good hand-magnifier they may be observed, even if they are quiescent. *P. taxi*, described in the *Gardeners' Chronicle* with doubt as a *Tetranychus* or a spinning mite in 1875, was perceived by Professor Thistleton Dyer to be doing damage amongst the Yew hedges about London, the buds appearing as if they were frost-bitten. In Europe species have been found upon the Hazel and the Peach which at present have not occurred in England. The most familiar example of a bud-mite is *P. ribis*, which has occurred upon the Currant throughout Britain, being, however, more common in Scotland than in England. Hundreds of mites are congregated in a single bud, and each one that is touched shrivels up, perhaps the branch also dies off. Mr. Murray, concluding that the mites are lodged about the buds late in autumn, advises close pruning as an effective check.

The gall of the Lime has been already referred to; still more conspicuous is the gall that occurs upon the Sycamore, which is always red or purple. The Lime nail-gall is mostly reddish at one period, fading into brown. *P. aceris* develops these Sycamore galls, and also, probably, the crowded hairy galls usual on the under side of Maple leaves. The Pear has its special mite foe in *P. pyri*, an insect which, it may be, prefers a warmish temperature, since its prevalence on the Continent is greater than in England. It is chiefly on the young leaves that the Pear mite shows itself, covering them with unpleasant-looking blotches, at first pale red, afterwards black. In the swellings are minute holes, either made by the older mites for the purpose of exit, or else made by a parasite enemy of the mites. Upon the Plum, produced by *P. pruni*, galls are commonly noticeable; these appear on both sides of the leaf, rounded like purses or little bags, occasionally club-shaped. White hairs frequently grow outside these galls, the interior being full of hairs, as is usual. Foreign observers have discovered more than one species upon the Apple; these, though unnoticed here, may occur with us. In these instances of fruit trees thus affected no actual injury is done by the mites. A special interest belongs to a gall-mite taken upon the Vine, named *Phyllerium vitis*, because its effects seem by some gardeners to have been ascribed to the work of the *Phylloxera*. This mite develops warty spots or patches on the under side of the leaves, and it is very difficult to discover. Botanists, indeed, for a long while supposed insects had nothing to do with these patches. What have been called "the clusters" of the Ash have now been proved to be morbid growths by myriads of a gall-mite, glossy in appearance, and excessively small. The parts attacked are the styles of the flower, which increase to a monstrous size, turning a greenish or blackish brown. The "clusters" are dotted with hairs on the upper side, and they become very hard; there is no hollow within them. Passing over many others, we can only add that a species of *Phytoptus* visits the Strawberry, making its home in galls which arise from its punctures. These are short, very hairy, and purplish, set thickly together in the leaves.—J. R. S. C.

#### THE ART OF COLOURING GRAPES.

It is pitiable to see Grapes which are fine in every other way—large and regular in berry, beautiful in form, and large in size of bunch—yet lacking that all-important point of excellence, good colour, and consequent good flavour. It is possible to have good colour without good flavour, inasmuch as colour under good cultivation will come first, but it is not possible to have good flavour without good colour. I do not say that Grapes should be all either black or yellow; there are some of the best flavoured varieties which will not, under any system of cultivation, approach either of these colours, and are therefore not so much grown as their merits would warrant; but when we see, as all of us who attend exhibitions do see every year, red Grapes conspicuously labelled Black Hamburgh, and Muscat of Alexandria as green as a Leek, we may be sure there is something wrong either in the culture or nomenclature. At local shows especially, judges have an unthankful office to perform when size is pitted against finish, and of course everybody is on the side of the giants. At the larger shows, in consequence of a greater number of persons attending who know what a bunch of Grapes should be, and there being amongst the crowd a certain amount of confidence in the great men who are supposed to act as censors on such occasions, the task of judging is not so thankless.

In the case of Muscats at the early summer exhibitions we must, I suppose, be content to see them green, for they have never to my knowledge been shown otherwise, and I think it is a pity they should be invited at all before the end of July. But Hamburgs are just as easy to colour in April as in September. They are not, perhaps so easy for everybody to grow in the winter months as they are in the summer, but any person having grown them at any time of the year, and brought them in good condition through the stage of stoning, the question of colouring is then merely a matter of air and light acting on a good supply of healthy foliage; and I should not be afraid to say that if a house of Hamburgs were given over to me at this stage in a moderately healthy condition as to foliage, that I could ensure the colouring of all such berries as would not shank. The process would be a very simple one. I should first take great care that the quantity of fruit was not in excess of the capabilities of the foliage. There can be no rule laid down for this, as one good substantial leaf in full sunlight is worth more than a dozen flimsy ones which are partially shaded. What would be a heavy crop for one Vine where the plants are close together might be a light crop for another where more space is allowed. Next I should see that the border was never dry, and lastly that the house was never without ventilation unless for an hour or two when a cold spell of wintry weather came on suddenly.

A minimum temperature of 65°, with a rise of 80° by sun heat if the fruit has to be hurried in ripening, and all the air continually that these conditions will allow without admitting a cold draught or necessitating too much hard firing, is the treatment recommended. The colouring cannot take place without a constant change of air. The colder the outside temperature the smaller of course must be the aperture for ventilation, and in frosty or rough weather sufficient air will often enter through the laps of the glass during nights and dull days; but this constant stream of fresh air till we find some better method at this particular stage is an imperative necessity. When Grapes of the Hamburg class are not forced, and there is no necessity to hurry them, the simplest way to ensure colouring is to leave them open night and day. There is far too much opening and closing of ventilators with most of us.

The thick-skinned Grapes, such as Lady Downe's and Alicante, which are intended to be kept through the winter for use in February, March, April, and May, require a higher temperature at this stage than is necessary for Hamburgs, and they will do with a less amount of ventilation when once the stoning process is over. The colouring of this class of Grapes should commence at the end of July or the first week in August, and a minimum of not less than 65° should be kept for two months afterwards. If a little ventilation can be allowed all night so much the better, but it is an absolute necessity to have some before the temperature rises in the morning.

Muscats, to colour them well, require similar treatment to the thick-skinned varieties, but there is this difference between them—all black Grapes will colour without direct sunlight on the fruit, but the Muscat of Alexandria and its allies of the same colour will not; they must therefore be trained wider apart, and if necessary the leaves where they shade the bunches must be tied back. I think, too, that no class of Grapes better pays for an extension of growth beyond the bunch than this; 6 feet apart is near enough for the rods, and the growths should be allowed to meet, but not to overlap or become crowded.—WM. TAYLOR.

#### HARDY FRUIT GARDEN.

APRICOTS, although they promise to be of excellent quality, are very scarce. Plums on trees trained to walls are rapidly swelling; indeed some of the early kinds, such as July Green Gage, St. Etienne, and De Montfort—three of the best dessert Plums preceding Green Gage—are nearly ripe. Early Rivers in the open is in an advanced stage for ripening. This is an excellent early culinary Plum, and one of the most certain croppers. Keep the leading shoots of wall trees closely nailed in or tied, continuing to remove or stop superfluous or fore-right shoots, so as to admit light and air to the principal shoots and secure the thorough ripening of the wood. Treat Vines against walls in a similar manner, so as to admit the sun and air freely to the fruit, which should be kept rather close to the wall, and the berries on

each bunch carefully thinned out. Examine ripening fruit, such as Apricots, Peaches and Nectarines, and remove them before they fall from the trees, the fruit being benefited than otherwise by keeping them a day or two in an airy fruit room before being sent to table. Such fruits as Cherries, Gooseberries, Strawberries, &c., should not be gathered until they are required. Protect Morello Cherries from birds. Net a sufficient number of bushes of Red Warrington or other late Gooseberries, also Red and White Currants, to preserve the fruit to a late period. Mats, though often employed, are very unsuitable, as they exclude air and light; hexagon netting is most suitable for the purpose, the fruit not being deteriorated in flavour as when covered with mats. Runners of Strawberries may be potted as they can be obtained for forming new plantations or forcing. Spare no effort to keep down weeds in the open quarters or elsewhere by surface-hoeing in the spaces between the trees.

#### FRUIT HOUSES.

*Peaches and Nectarines.*—The full exposure of the foliage to the influence of sun and air is of the greatest importance in the cultivation of these, and indeed all fruit trees. This is necessary from the commencement of growth, with a proper admission of air, so as to secure the solidification of the wood and thick-textured or leathery leaves, which are more proof against insect attacks and less susceptible of damage from adverse atmospheric conditions than attenuated wood and foliage. As soon, therefore, as the fruit is gathered no time should be lost in cutting out wood on which the current year's crop was borne; and where there is any approach to overcrowding the shoots should be well thinned. To maintain the foliage in a healthy condition syringe forcibly, so as to subdue red spider and preserve the foliage healthy. If there be any scale apply an insecticide. The border also must be kept in a thoroughly moist condition, and an occasional application of tepid liquid manure will assist weakly trees to plump the flower buds. The lights should be continued over the trees, air being admitted day and night until the buds are developed, when it will be advantageous to remove the roof lights.

#### FLOWER GARDEN.

Where there is an abundant supply of water, and it has been used liberally along with mulching the surface of the beds, the plants are now making an effective display and should be frequently examined, removing faded flowers and bad foliage. Carpet beds will need attention in pinching and pegging. Propagation will soon have to be commenced, beginning with Tricolor, Bronze, and variegated Pelargoniums, for if deferred until late in the season they do not root freely on account of their succulent growth. Three cuttings may be inserted in a 3-inch pot, and placed where they will have protection from heavy rains, but otherwise fully exposed to sun and air. When the variegated kinds are in, a commencement should be made with the green-leaved varieties. It being undesirable to commence cutting the plants directly they commence filling the beds, a reserve garden from which cuttings can be taken without interfering with the beds is a valuable adjunct where numbers of bedding plants are required. Stock plants being kept of Alternantheras, Coleus, and Iresines, cuttings should at once be taken; they strike freely in a cold frame kept close and shaded from sun, and when established should be moved to a house where there is a temperature of not less than 55°. Verbenas, Petunias, Lobelias, and Ageratums strike freely at this season in a cold frame kept close and shaded, hardening them well off so as to have strong established plants by the autumn, as such winter more satisfactorily than those struck later in the season in heat. See that border plants have the needful support in staking and tying, also Hollyhocks and Dahlias, as well as the taller-growing subtropical plants, giving those abundant supplies of liquid manure in dry weather. Pippings of Pinks may still be inserted, and any that are rooted planted out where they are intended to bloom. Proceed at once with the layering of Carnations and Picotees, and sow seed in pans or boxes. The summer bloom of Roses being over or nearly so, cut in all straggling shoots, and give every encouragement to the plants to make young wood for autumn flowering. Cuttings of ripe wood inserted now will strike freely in sandy soil under handlights, kept close and shaded until rooted. We prefer them on their own roots for massing, especially where the soil

is light, in which with liberal treatment they succeed capitally. Clematises and Tropæolums require training, keeping the growths evenly disposed. The Clematises are now in great beauty, and never look so well as when trailing on stumps, rockeries, or trellises.

#### PLANT HOUSES.

*Stove.*—*Toxicophlæa spectabilis* deserves extensive cultivation for its agreeable odour, and the white flowers are produced freely in corymbs from the points and the axils of the leaves, not unlike an *Ixora*. It does well in pots or planted out, answering well in sandy peat for pots, and does not need a great amount of root space. *Hoya bella* is one of the most beautiful flowers, and for bouquets or buttonholes it is unrivalled. It does exceedingly well as a basket plant grown in sandy peat. It does not require a great deal of root space, care being taken not to overwater. *Æschynanthus* in baskets, or in pots placed in baskets lined with moss, must not be allowed to want for water, or they will probably cast their flowers, but an excess of water causing the soil to become sodden will have a similar effect. In late summer and autumn they are very effective. Gardenias struck in spring and grown for winter flowering should be shifted into 8 or 10-inch pots, not allowing them to become root-bound before they are shifted into the above-sized flowering pots, so as to have them well established before autumn. Early-flowered Gloxinias should be gradually dried off, but not by withholding water altogether, allowing sufficient to insure a gradual rest. Early-sown seedlings should be given 5 or 6-inch pots, and if grown near the glass, with shade only from bright sun, they will make a fine display in early autumn. Winter-flowering Gesneras, such as *G. exoniensis*, *G. zebrina*, and *G. zebrina splendens*, should have light positions, so as to secure a sturdy growth, feeding them occasionally with weak liquid manure. All winter-flowering plants should be encouraged to make firm sturdy growth, exposing the plants to all the sun and light possible, as they require all the stored-up sap good cultivation can afford to flower well in the dark winter months. *Euphorbia jacquiniæflora* is naturally of a straggling habit, which in some measure may be obviated by stopping; but it must not be practised too late, or the growth will be puny. The last stopping should now be given, and the plants encouraged by keeping them near the glass in a genial atmosphere and temperature. Afford liquid manure to *Allamandas* that have been in flower some time, also to *Bougainvillea glabra* and *Clerodendron Balfourianum* that have been rested, again placed in heat and moisture, and which are advancing for late flowering.

*Orchids.*—The nights are now becoming colder, and any cleaning or repairs needed by the heating apparatus should at once be attended to. The East India house may range from 75° to 85° by day, with an average of 65° at night, the *Cattleya* house about 5° less. Continue the same general treatment to the occupants of the East India house. Shading on the *Cattleya* house should be almost, if not entirely, dispensed with, doing so only when the sun is very bright, but be careful not to make a change suddenly. *Cattleyas* making their growth should receive all possible encouragement. Early-flowering plants have completed their growths, and should be moved to a cooler house, where the moisture is less and more air can be afforded. *Dendrobiums nobile*, *Cambridgeanum*, and many others should be placed where they will receive the full sun and light to ripen them properly. Shading will no longer be necessary for *Calanthes Veitchi* and *vestita*, but they should be watered liberally at the roots for some weeks longer. Fumigate frequently to keep thrips under, and sponge the leaves of those infested with scale with a strong softsoap solution, and afterwards wash them with tepid clear rain water.

#### WOODEN FOUNDATION.

EVERYONE who has had anything to do, even the slightest, with scientific bee-keeping must be convinced of the value to bees and bee-masters of comb foundation. Personally I am disposed to

endorse Messrs. Abbott's view that, now comb foundation is so good, so strong and perfect, and at the same time so moderate in price, it is doubtful whether true economy is not best shown by not using combs a second time. There is something about the foundation that the bees appear to like, and they exclaim like the guest at the feast, whose silence obtained for him the character of being exceedingly clever till the apple dumplings were too much for his gravity, and he burst out with, "Them be the jockeys for me!" It appears to me that the bees express, doubtlessly in better grammar, similar sentiments. I placed a bar with some comb in one hive, and in another a bar with an inch of wax foundation in two pieces (part yellow, part white). In twenty-four hours I removed both; the comb appeared scarcely touched by the bees, but the foundation was built on "all along the line;" and, what very much surprised me (a young hand and very ignorant), the bees had built up yellow cells on the yellow foundation and white on the white! How could they tell the difference and manage this? It seems to me that the midrib is the difficult point of manufacture to our industrious little workers, but when this is provided they lay on the cells at express power.

I have seen wooden foundation vaunted as preventing sagging, and being stronger, &c. Accordingly I invested in some and tried six frames. It appeared a first-rate article, and when fitted to the frames the latter were certainly as strong as possible. I expected grand success. Great, however, was my dismay on the first time of opening (they were placed in different hives) to find the first pair that happened to be next each other glued together, the comb being built irregularly and attached to both wood foundations. The bars could not be removed without a rupture and the falling of a large piece of comb. Then I found much uncovered—in fact, if the wax had been at all interfered with, here the bees had left it bare, but then to make amends, and determined, as is their wont, to economise space, they had built out the next comb to fill up the space—a great evil, as the comb becomes so heavy that in hot weather it breaks off, and sad havoc and loss ensue. Still more surprising, I found that though the wax was worker cells on the wooden foundation, they disregarded it and built drone comb over, and on the irregularly built cells they set to and built out some pieces of perfect two-sided comb with central portion and cells, both sides sealed complete on one side of the wood; in fact it seems to me that they are tempted by it to all sorts of vagaries. Of the twelve faces that these six sheets have I have only seen one at all even and respectable, and this was not built over all the face; in fact, the bees evidently do not like some portions of it. I cannot recommend it, and, with the present beautiful wax foundation, for general purposes it appears perfectly unnecessary. Lastly, it seems to me to yield its contents to the extractor with difficulty.—Y. B. A. Z.

#### THE BRITISH BEE-KEEPERS' ASSOCIATION AT SOUTH KENSINGTON.

THE seventh Exhibition of this Association, which opened in the gardens of the Royal Horticultural Society on Tuesday in last week, has been rather conspicuous for the quantity and excellence of the honey than for evidences of progress amongst appliances. The total entries numbered 274, while the attendances have been on the whole satisfactory, and the interest in the subject evidently growing. In Class 2 the Carniolian bees were very distinct. This variety, though sombre in hue, should be encouraged, since they are good workers, not persistent swarmers, and extremely mild in temper. Observatory hives brought out one or two impracticable novelties, and we were glad to see that the mistake was not repeated of giving prizes where large flight space involving wholesale death to the bees was a necessary part of the construction. Mr. Holland showed a pretty and ingenious observatory, which at present partly involves this indicated defect, which without difficulty he could remedy. Mr. Scott showed a hive in which the frames fit together, but have glass between the combs. These can be independently lifted for observation. In our opinion the old form of observatory, in which the combs are visible constantly and without interference, yet remains to be excelled.

The judging of the next four classes has failed to give general satisfaction, and several weighty opinions are pronounced against it. Mr. Griffin took first honour in Class 4 for the most complete hive. The leading feature of his exhibit was a series of chaff-packed slabs which fit in between the bees and the hive side; but since 1 inch of cork dust placed permanently between the hive sides would afford at least four times as much protection as these slabs, we hardly see the reason for incurring their cost and of augmenting the size of the hive so immensely in order to give them accommodation. The body is well made and the frames move on thick

brass runners. These would of course maintain their form better than zinc, but they would cause loss of heat by conduction when the hive is contracted in winter, since half their length would be outside, while they would give more opportunity for propolisation. Mr. Abbott was second with the now well-known combination hive, to which he adds dummies with side pieces held against the hive walls by a wire spring. Would not propolis soon render the spring useless? Mr. Hooker showed his Alexandra hive, to which was awarded third place. He now provides a square Stewarton on the floorboard, and proposes when swarming seems imminent to draw the slides and so at once stop the exit of the bees by nading. Messrs. Green introduced a novelty by adding to their frames a pewter slip, which rests on the runner, giving a very smooth motion, and likewise keeping the frames at the correct distance from each other. We should have put No. 3 higher and given this hive a place. In Class 5 Mr. Abbott was first, with a hive in which the frames have broad ends, while about 3 inches intervenes between the frame end and the hive side. To this space the bees must of necessity have access, and would at once build comb in it when the hive became full. Propolisation will in our opinion quickly so fix the frames as to make them unworkable, while in winter the protection would be even less than that afforded by quarter-inch deal side. In Class 8 Mr. Martin staged a neat skep with a central round hole, over which he places a board channelled in the form of a cross, upon which he stands section boxes in two lines at right angles to each other. Some good section racks were shown, but amongst these we find wooden separators, which have been all but universally condemned by honey-producers. They buckle, and are very likely to have comb attached to them.

The display of honey has not hitherto been equalled. The total weight was nearly three tons, while the flatness, finish, and colour of the sections seemed to leave but little room for progress in this direction. The extracted honey was bright and tough, with hardly an exception, and must constantly have sorely puzzled the Judges in making their awards. For the best exhibition from one apiary Mr. Thorne was to the front with a magnificent lot of 384½ lbs., which with his other entries brought his total up to 528 lbs., by far the largest amount of English honey yet staged by one exhibitor. Mr. Walton came second with 227 lbs., and Mr. Hooker third with fourteen dozen 1 lb. sections, all of admirably even quality. The next class for supers not sections was on the whole poor, and calls for little remark. The glass supers, handsome but unsaleable, are clearly giving way before the handy sections. The cost and risk of transit, without a chance of sale, will in the end banish these ornaments from our exhibition benches.

Class 13, Best twenty-four 2 lb. sections.—Mr. Walton surpassed Mr. Thorne with boxes that can only be equalled. Miss Gayton and Mr. Thorne were second and third in a class in which to win is an event. We were glad to notice Mr. Bower, the worthy Hon. Sec. of the Midland Counties Bee Association, was there an exhibitor. Of the remaining honey classes the running was often so even that criticism is needless. It is nevertheless remarkable that none of the entries was staged badly or call for any adverse comment.

The silver medal for foundation was replaced at the desire of the Judges for two of bronze, one to Mr. Raitt for thick foundation, the other to Mr. Abbott for thin. A silver medal was awarded to Mr. Abbott, jun., who showed Faris's method of making foundation by dipping. In this he displayed considerable dexterity, nearly if not all the sheets being turned out perfect. Mr. Cowan again won in the class for extractors. The machine in principle is that of last year with an additional movement by which the combs can be more readily put in position. Mr. Abbott showed an expeditious way of sealing honey jars. These are first coated with wax on the lip; waxed paper is then, after filling, pressed upon the glass; the two surfaces of wax unite, and a complete closure is effected.

For the best microscopic slides illustrating the natural history of the honey bee, Mr. F. Enoek most deservedly carried off the silver medal. The slides were four dozen in number, and if not unapproachable are certainly as yet unapproached. The preparation of parts *in situ* without pressure gives an opportunity of examining structure that flattened chitine could never afford. The beauty of these objects when properly illuminated must be seen to be appreciated. On some slides he brings side by side the homologous parts of drone, worker, and queen, which gives a ready means of comparison, and on others displays the parts illustrative of the complete anatomy of the insect. Some clever sections and some specimens of the interesting parasite *Stylops Speneii* were included in the collection.

The Baroness Burdett Coutts distributed the prizes on Thursday, July 28th. The Rev. H. R. Peel has sufficiently recovered from his severe illness to allow him, to the delight of all, to be present

during a part of the time the Exhibition was open, Mr. T. W. Cowan kindly taking general oversight during the whole week. The report of Mr. Cheshire's lecture on Bees as Florists, Hybridisers, and Fruit-producers, will be given in an early issue.

\* \* \* All correspondence should be directed either to "The Editor" or to "The Publisher." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Camellias in Covent Garden** (*T. J., Rugby*).—The prices for blooms vary considerably according to the demand and the quality of the flowers. At the season you name the wholesale price usually ranges from 2s. to 6s. a dozen.

**Conifers Unhealthy** (*Lady Grey*).—The spray you have sent was wrongly named. It is not *Pinus insignis*, but *Abies* or *Picea Pinsapo*, which has been injured by frost more or less in nearly all parts of the country, and has evidently not escaped in your collection.

**Mildew on Peas** (*Rex*).—It is very difficult to destroy mildew on Peas. We have checked it, however, by syringing them with a solution of salt and soft soap, half an ounce of the former and 2 ozs. of the latter dissolved in a gallon of water and applied at a temperature of 120°. Prevention is much better than cure, and this consists in having the ground trenched and enriched to a depth of 2 feet and supplying liquid manure occasionally in dry weather. In all probability liquid manure given in sufficient quantity to penetrate below the roots would benefit your Peas considerably.

**The Cucumber Disease** (*J. S. R.*).—When questions arrive on Wednesday morning, and answers are given by request in the "next issue," they must necessarily be brief. The answer given to a correspondent on page 518, the issue of June 23rd last, is precisely applicable to your case. As you are an old subscriber you will have this number and can refer to it. The disease that is attacking your plants is, we fear, incurable.

**Roses Unhealthy** (*An Irish Subscriber*).—The injury of your Roses is due to a small maggot which burrows into the leaf. No remedy that you can now apply will be effectual, but you had better saturate the soil with liquid manure to promote more vigorous growth, and in the winter remove the surface soil and treat as recommended to another correspondent, Mrs. Syllas.

**Stocks for Spring** (*Alarmed*).—You need be under no alarm at all. Your "Mid-Lothians" now 2 inches high and bushy are not a day too early, for even if they commence flowering in the autumn they will continue producing spikes throughout the winter if placed in favourable position, and will be fine in the spring. We have plants now 6 inches in diameter and nearly the same in height that will afford us a profusion of flowers during the ensuing spring—at least such plants have never failed to do so when they have been well cultivated. Carry out your project and you will attain the end desired.

**Grapes Shanking** (*L. M.*).—The box arrived after our reply to your letter was prepared, but on examination of the contents we concluded that the answer published on page 14 required no extension nor qualification. Your Vines require fresh soil of a more free and porous nature; indeed, such compost as we named in the answer referred to. The roots sent were in a very unsatisfactory state, and until you induce more healthy root-action the Grapes will continue shanking. If you require more precise information we will readily supply it on receiving a full and precise statement relative to the condition of the Vines and border.

**Moss on Lawn** (*E. M. S.*).—In all probability your lawn needs draining, as the moss indicates the presence of stagnant water in the soil. If drainage is not needed, then all the moss should be removed with a sharp-toothed rake and a heavy dressing of lime and fresh soil spread over the surface; this will check the growth of, if not destroy the moss, and promote the growth of grass. The soil is either too wet or too poor, we cannot tell which. If the former, drainage is the remedy; if the latter, dressings of rich soil after liming, sowing at the same time fresh lawn seed thickly.

**Management of Vinery** (*Yorkshire Curate*).—It is impossible for us to reply fully and satisfactorily to questions that arrive on Wednesday morning; and we can only say briefly, Damp the house once a day in hot weather, let the minimum temperature be 60°, and let the laterals alone till your question is more fully answered next week.

**Potato Haulm Crowded** (*Puzzled*).—Too close planting is a great evil and difficult to remedy. To stop, or rather cut back the growth, does not answer, as that will stay the growth of the tubers. If the weather should prove favourable—i.e., dry, they will probably afford fair results. Instead of cutting back the haulm we should prefer to reduce the shaws to about three to each stool and leave them their full length, as everything in the matter of tubers depends on the development of the haulm.

**Vigorous Vines not Fruiting Satisfactorily** (*Yorkist*).—The Vines are evidently in good condition, and only need to have the wood better ripened, with the pruning less close in winter, to insure good results. We presume the side shoots are not close together, but are so far distant as to admit of the foliage being fully exposed to light and the principal leaves not crowded by

undue extension of the laterals. The side shoots should with vigorous Vines be at least 18 inches apart, and the principal leaves have full exposure to light and air. With vigorous Vines, as yours appear to be, a circulation of dry warm air will be necessary not only to ripen the Grapes but to secure the ripening of the wood, continuing it after the Grapes are colouring until the wood is thoroughly brown and hard, when a less amount of heat will be necessary for the keeping of the Grapes. In pruning leave two or three eyes, cutting back to a plump bud, and you will obtain larger bunches. This will of course cause the elongation of the spurs more rapidly than by closer pruning, but when they become too long they may be displaced by others nearer to the rods.

**Mildew on Roses** (*Mrs. H. Sylls*).—The spray sent arrived much withered, but so far as we can understand the condition of your Roses they appear to be in an unsatisfactory state owing principally to poverty of soil. The growth sent is very weak and is infested with mildew. When Roses are unhealthy they are sure to be attacked by insects and parasites. Yours, in addition to the mildew, appear to be eaten by a small caterpillar. The remedy we propose is a copious supply of liquid manure to the roots at the present time, syringing the foliage with a solution of soft soap and dusting when wet with sulphur, and in winter the removal of the surface soil, adding fresh compost and a mulching of rich manure. After the pruning is done it will be well to paint the stems with a mixture of sulphur and tobacco water, a little clay being added to cause it to adhere to the branches.

**Thrips on Vines** (*G. C.*).—The leaf you have sent is much infested with thrips, and if their increase is not checked the Vines will be seriously injured. It is no use sulphuring the pipes, and as the Grapes are colouring you cannot apply an insecticide with the syringe. We should sponge every leaf with a solution of soft soap and tobacco water, or solutions of Gishurst compound, nicotine soap, or other efficient insecticides that are advertised will do equally well if you follow the instructions that accompany them. The sponging may appear to you tedious work, but if you can save the Vines from ruin by a few days' labour you will have an ample reward. Your Vines ought to have had better attention previously, and the house should have been fumigated regularly. The plants infested can be laid on their sides on a mat and thoroughly syringed with an insecticide for the destruction of the insects.

**Cherries Falling** (*F. J.*).—In the absence of information to the contrary it was assumed your question had reference to an old tree, and that partial exhaustion was the cause of the evil complained of, hence the reply. We agree with you that it would be a pity to mutilate what appears to be a healthy young tree. All you can do is to shorten the growths at once to within four or five leaves of the base, so as to aid the maturation of the wood remaining and promote the formation of fruit buds. Are the main branches of your trees too crowded? This you can determine by the following rule:—The leaves on every main branch should have space for development without overhanging those of the branch below it; or in other words, a little of the wall should be seen between the branches. Overcrowding in the manner indicated is much too common and the cause of many failures with Cherries and other fruits. Where it occurs note should be made now, and a few branches be removed and the others re-arranged as soon as the leaves have fallen.

**Kava, Macropiper methysticum** (*A Young Gardener*).—This plant grows in most of the islands of the Pacific Ocean, and is called *ava, cava*, or *kava*, whence the name of Ava pepper; in the Caroline Islands it is called *shika*. The root is the part employed, and from it the natives of these islands prepare a beverage which they drink at their meals; it is distasteful to Europeans, but as wholesome and healthful to those peoples as the betel is to the natives of India. The infusion of this root is at first of a sugary taste, like that of liquorice, but it soon becomes warm and stimulating in the stomach, causing a sort of intoxication or mental excitement. The root is acrid and aromatic, and is also chewed by the natives of those islands. In the Caroline Islands the fresh shoots of this plant are soaked along with the roots in water till they become soft, and the liquor is drunk before entering upon any matter of business or offering sacrifice; but by the influence of the missionaries these practices have been discontinued.

**Vines Unfruitful** (*D. L.*).—There are two causes that contribute to the condition in which your Vines appear to be—the one is immature wood, the other is deep rooting in ungenial soil. We advise you to promote the formation of roots near the surface of the border, for when roots are abundant there, forming quite a network of fibres, the laterals are usually short-jointed and fruitful in character. If the roots are few and straggling, and penetrate the soil deeply, long-jointed and luxuriant growth results that is essentially unfruitful. In all probability your Vines would be benefited by lifting them wholly or partially, placing the roots in fresh turfy loam, with a bushel each of crushed bones and lime rubbish, and two or three bushels of wood ashes to each cartload of soil. Bring the roots within about 5 inches of the surface, and give a mulching of manure to keep the soil moist; you will then soon have roots near the surface, and they can be easily kept there with good manure, with which the border should be covered in the summer. The roots of Vines are driven downwards because they do not find the moisture and food they need near the surface during the season of growth. The best time for lifting Vines is soon after the crop is cut and before the foliage falls, syringing freely, and shading if needful to keep the leaves fresh as long as possible. If your Vines borders are full of fibrous roots within 2 inches of the surface, then we can only advise you to remove a portion of the laterals so as to admit more sun to those remaining; this, with artificial heat if needful in the autumn, would ripen the wood and render the Vines fruitful. Assuming the Vines are 3½ feet apart, the luxuriant laterals ought to be 18 inches asunder on the rods or they cannot be matured.

**Fruit Trees for House** (*W. V. L.*).—The number of trees that your house will accommodate depends entirely on the manner in which they are grown. If they are in pots a greater number may be had than if planted out, as the former grow less strongly; but they require much attention and skilful treatment to keep them in a fruitful and satisfactory state. If the trees are trained in a conical form and kept closely pinched each may be managed in a space of 3½ to 4 feet square, and your house would hold two rows, or about eight trees. If planted out you would find a difficulty in confining them to the size indicated. If you require as much fruit as possible with the least amount of attention we advise you to plant three Peach trees in the front and train them on a trellis, which should be taken up to a convenient height and brought over in the form of a bow to within 2½ feet of the back wall, the edge of the trellis not exceeding half the height of the wall. This wall you could cover with Figs, planting them out, and they would receive light from above the trellis. Eventually the Peach tree in the centre of the trellis, which should be the Royal George, would cover the entire surface if desired, and the end trees could be reduced yearly to afford room for the other. One good tree filling the trellis would afford you more and finer fruit than any number of trees in pots or

planted in the body of the house and grown as bushes, unless indeed you are a very skilful cultivator. If you desire more than one variety you can manage the trees so as to retain each of the three in an equal amount of space. If you have a desire to indulge in the cultivation of trees in pots, the quantity or quality of the fruit not being of great moment, you may obtain a dozen trees to begin with, reducing the number as the growths extend; but trees trained on a trellis would be the most certain to afford good crops of satisfactory fruit. The pipes should be near the front, not at the back of the house, which is the worst possible position for them. Assuming the roots of the trees are inside the house, a wood trellis would be better than a bricked floor. A border 2 feet in depth will suffice; it should be well drained, but in all probability a concrete bottom can be very well dispensed with. You, however, give us no information relative to the character of the subsoil, and whether the site is wet or dry. If you need further advice, and will state your case and requirements fully and clearly, we will readily render you all the assistance we can.

**Budding Roses** (*Amateur*).—We have budded Briars, and the buds have commenced growing immediately, and flowers have been produced the same year; but the buds make the best growth when they remain dormant until the spring succeeding the budding. We do not think it desirable to force them into growth at this season by cutting back the stock, for the shoots cannot become well ripened, and in severe seasons they perish; if not, they mostly grow weakly in the succeeding year.

**Names of Fruit** (*P. C.*).—Owing to the fruit not having been packed securely it was much bruised in transit. We think, however, the Cherry is Governor Wood, which is an excellent variety.

**Names of Plants** (*A. Boyle*).—The plant with the large leaf is *Cineraria maritima*; the other is *Sautolina incana*.

**Buying Condemned Bees** (*J. R. V., Oswestry*).—It is preferable that the bees bought should have stood a mile at least from the position you intend them to occupy, but at considerably less than this distance the risk from loss is not worth considering if other things make the purchase desirable. We should, however, place half a mile in a straight as the limit. The disturbance of driving and mixing tends to attach the bees to their new quarters.

**Feeders** (*Buzz*).—The feeder exhibited last year is not purchasable. To feed at the hive door cut a piece of wood three-eighths or half an inch thick into a form resembling the front of a bootjack; over this place another with a 2-inch hole, which will be covered with perforated zinc as a stage for the food bottle. So place this on the alighting board that the entrance to the food bottle covers a part of the doorway. A third piece of wood may be needed beneath, this depending on the width of the alighting board. The bees soon learn to use this feeder, when it is only necessary to keep it constantly supplied with diluted honey. This plan will not pay for storing sections. It is only suggested for finishing them.

**Food for Bees** (*H. M., Southport*).—Honey is the food bees most relish, but it is not on that account necessarily the best to give. Its odour is exceedingly likely in times of scarcity to induce robbing. Loaf sugar syrup to which a small quantity of vinegar (a tablespoonful to about 2 lbs. sugar) has been added to prevent crystallisation answers all the ends of honey as a food. In the winter liquid food must not be given; use then barleysugar, but by good management all winter feeding is made needless. Your question on feeding in bad weather cannot be categorically answered. If the bees are poor feeding in bad weather is essential, and then nothing pays better than this attempt. Feeding does not make bees lazy. If feeding increases the well-being of the stock it increases the vigour and earnestness of the bees as honey gatherers. You ask further if bees can make honey from artificial food, such as sugar and beer. In the first place beer is not a food for bees, except as it contains a small quantity of sugar. The ferments of the beer are dangerous, the alcohol is damaging, and the caramel predisposes to dysentery. See issue January 13th last. Sugar (especially Grape sugar) is a true food, yielding when consumed by the bees heat force or wax in the same amount as honey itself, but it cannot be converted into honey nevertheless. After storing it remains sugar, slightly altered only by an animal acid secreted by the insect.

#### COVENT GARDEN MARKET.—AUGUST 3.

We have now passed through the bulk of the soft fruit, business being somewhat quieter. There is a steady demand for Peaches and Grapes, the prices of last week being maintained, with the exception of common samples, which are with difficulty cleared.

## POULTRY AND PIGEON CHRONICLE.

## THE FIELD CULTIVATION OF STRAWBERRIES.

*(Continued from page 94.)*

THE employment of steam power in the tillage of land for Strawberries was alluded to last week because deeper and more effective stirring of the soil may be made than can be done by horse labour. It is difficult to cultivate deeper than 18 inches with a full complement of strong horses, yet it is comparatively easy to thoroughly loosen the subsoil by steam power to the depth of 2 feet. When we consider that our success will mainly depend upon the depth at which the soil has been broken we are bound to take advantage of the assistance of steam. Cropping the land and its previous treatment before fallowing will also have to be considered. Some farmers advocate the cultivation of Potatoes as the means of partially cleaning and manuring the land. There is, however, one plan which we have not seen referred to by Strawberry cultivators which we can recommend. For instance, if an old lea, either of Saintfoin or Grasses, should be intended for culture, we would pare and stifle-burn the turf about  $1\frac{1}{2}$  inch in depth. This will yield a large quantity of ashes, affording an abundant supply of mineral manures, all of which are essentials in Strawberry culture. As soon as these ashes can be obtained and spread, which in ordinary seasons may be best done in May and June, the ploughing and subsoiling may be done immediately if the land is free from Couch Grass; if not, fallowing the surface should be continued until it is quite clean. We do not, however, by any means object to Potatoes being taken if the land is heavily manured at planting time, because the deep steam culture and subsoiling may be done in October, or as soon as the Potato crop is cleared off.

Before going any farther in the matters of tillage let us consider the situation and position of the farm; for although it is extremely important that it should be near a railway station, yet it is of still more consequence that we should be able to command the services of women, girls, and boys for picking. There will be less difficulty in the future, for the population is sure to increase in the vicinity of stations; still we must be certain of sufficient hand labour being available before deciding upon cultivating Strawberries, and this will be more likely to be secured in the neighbourhood of small towns and populous villages. If this industry should extend, as we think it will, there is no reason why the migration of labour should not take place in the same manner as hop-picking is provided for. The home farmer in the selection of fields must be guided by their position more than by the nature of the soil. Fields for the growth of this fruit if situated near the farmstead could be more easily provided with yard or box manure, which will be necessary, especially if the land is poor and dry. In the event, however, of the land being a good sound loam artificial manures will prove quite sufficient, and may be used with equal or more advantage, especially if the land is outlying. In choosing and laying out fields for Strawberry cultivation we should select land moderately level, and if sheltered in the distance by hills or woodlands so much the better, and the best aspect is south. The size of the fields may well vary from 4 acres to 8 acres, taking the latter where the most shelter is obtained by growing timber. In the absence of trees or hedges lay out the land into 4-acre pieces, and for shelter plant evergreen hedges, these to run the whole length of the field on

the eastern and western sides, because the east winds are the most damaging in winter and early spring, whilst the west winds are often so strong at blooming and fruiting time as to seriously injure the crop. As we recommend the lines of plants to run direct north and south in order to facilitate cultivation, manuring, picking, and removal of fruit, we advise that a roadway be retained under the hedges on either side at both ends, and if the field is 8 acres across the centre also. Thus a road made 8 feet wide will secure complete communication for all purposes, but especially the roadways under the hedges are advisable, because no good fruit can be grown near the hedges when they are allowed to run up to the height of 10 or 12 feet or more. These, however, should be closely trimmed on both sides, and topped at the required height.

On the home farm under varying circumstances as regards preparation of the land for planting, two periods only can be properly chosen for planting—viz., March or April, otherwise July or August, moist weather at the time being of the first consequence. In order that all the cultivation and tillage may be done without the use of the spade or fork, and also that the plantation may be retained in full bearing as long as possible, it is of the highest consequence that the distance between the rows should be wide. We find that growers who have planted at a yard apart between the lines have not only succeeded in obtaining large crops of first-class fruit, but have retained their plantations on the perennial system for a period of ten years or more with full profit and advantage. We therefore recommend the home farmer to set the plants 3 feet apart between the lines, and at 18 inches apart in the lines, and at the end of three or four years to remove every alternate plant, so that they shall afterwards stand at 3 feet apart each way. This will allow interculture by horse labour to be done both lengthways and crossways without injury to the stools: in fact, it must greatly benefit the plants, as it is chiefly from their having so much room for rooting, and the tillage, including subsoiling once a year, which has also the effect of root-pruning, that enables the stools to be retained for the longest period. It also allows this large space to be cultivated and subsoiled in the autumn of every year; for although it is not advisable to disturb or loosen the earth near the stools, yet it is of great consequence that the interculture should be complete, thus giving the home farmer the opportunity if it is required to continue the growth of Strawberries on the same land for a long series of years.

Strong well-rooted plants should be obtained if possible grown on beds for the purpose upon the farm, and thus save the expense of purchasing. When on a large scale it is important to have the plants ready to hand; at the same time the growth of plants of various sorts may prove an experiment, and to some extent indicate the sorts suitable for the soil and climate in which they are to be grown in the future. In manuring the soil for Strawberries plenty of long horse or box manure will be at hand, but this should be reserved for application in the month of April. In case of any deficiency half-decayed leaves obtained from the woodlands and shrubberies will answer the purposes of keeping the ground moist, encourage surface-rooting, and also assist in keeping the fruit clean. We advocate liberal dressings of artificial manures, such as bone superphosphate and kainit, the latter being a compound of salts and potash. The kainit should be applied at the time of ploughing between the rows, and the superphosphate in the furrow just before the subsoiling, in order that it may become mixed with the subsoil. We do not advocate guano, because we shall get enough ammonia from the dung.

We must now refer to the cultivation between the rows, and planting. When two rows are set out at 3 feet apart there will be a space for cultivation of about 18 inches, which gives room for two furrows to be ploughed by the one-horse plough, the subsoiler following in the track of each furrow drawn by two strong horses, and, as we have previously stated, this work should be done in October. In planting, instead of setting in holes made by the spade, draw a furrow with the plough 4 inches deep, spread out the roots of the plants in the furrow, and cover them by hand with the fine earth from the furrow side, to be trodden down firmly. The plants will then be somewhat below the surface, giving the opportunity for earthing-up a little with the plough every spring. In order that a clear course may be obtained for the autumn cultivation the runners should be cut away from between the plants, leaving, however, their foliage to protect the crowns of the stools during the winter months. By the adoption of these plans in winter and the following spring any exuberance of foliage will be checked, and more strength will consequently be thrown into the blossom buds. For the early soils, such as sands and gravels, the Early Crimson Pine variety will answer; but for the sound loamy soils Sir Joseph Paxton is a good firm

fruit, and will bear long carriage if required. For cold soils the latest sorts, such as Enchantress and Excelsior, may answer, and thus enable the home farmer to supply fruit for market during the whole season.

#### WORK ON THE HOME FARM.

*Horse Labour.*—Harvest work is now general in all but the latest districts, but this should not so much interfere with other work as to prevent the seeding and drilling of stubble Turnips, sowing Trifolium, Mustard and Rape mixed, or Thousand-headed Kale for spring feeding. During the first few days of harvest the horses which may not be required to work the reaping machines may well be employed in ploughing and preparing for seeding Turnips after the Pea crop. It is a good plan to remove the crop on to about half the land where it grew, and plough and drill Red Mammoth Turnip seed with 4 cwt. of superphosphate and ashes per acre. The land ploughed during the day should be worked fine and rolled down, then drilled every evening after four o'clock. In case the Peas are not fit to carry to rick or barn they may be removed on to the other half of the field, and thus allow the whole field to be seeded with Turnips. In nearly the same way Turnips may be sown after the early grain crops—Early White Canadian Oats for instance, or Rye. It will depend upon the date of seeding what sort of Turnip should be drilled, for it is only in the first week of August that we advise sowing the Red Mammoth; after that we prefer the White Globe or Early Stone varieties. If sown upon clean land free from Couch they come in very conveniently for spring feeding, and may be followed either by Lent corn or Mangolds. For the latter it is a capital preparation, especially when the Turnips have been fed off, the sheep eating hay, cake, or corn. Trifolium should now be sown as soon as the crops are cleared away, for unless this is sown early the slugs are liable to eat the young plants—in fact, this is almost the only enemy to this useful crop. In order to insure a succession of spring fodder all three sorts should be sown, the Early Crimson Blossom, the Second Early Pink, and the Late White Blossom. Reaping grain by the Wood's String Binder is advised, for if not in stock on the farm it may be hired by engaging it soon enough. Where the crops of straw are bulky the work is severe for the horses, and relays of fresh animals should be taken every four hours. The reaping may then be continued from daylight until dark when the weather is favourable and the straw dry. We like to cut and tie not only Wheat but also Barley, Rye, Oats, and drege if the straw is long enough; otherwise it may be cut with the mowing machine and harvested as loose corn.

*Hand Labour.*—Men, women, and their families are now fully employed in work connected with the harvest, and also in hoeing and singling the root crops, which may require attention. There is, however, a great mistake often made by small farmers, and where hand labour is scarce—namely, by turning the horses out to graze and employing the teammen and boys in work on the harvest field or ordinary labour of the farm. The mistake is this, that there is no time during the whole year when the labour of the horses is of more value than in the first week or ten days of harvest and until the carting and stacking of the corn is commenced, because ploughing for stubble Turnips is then requisite, and also the cross-ploughing of fallows on the strong soils is of importance. It is a sacrifice of valuable time and opportunities to allow horses to remain idle for the sake of making the manual labour available in other directions. During wet days, when harvest work may be interrupted, the men may be employed in drawing straw and piling it away in readiness for the thatchers.

*Live Stock.*—The stock lambs which are now being purchased should be shorn, without washing, not later than the 20th of August, for of whatever breed they may be, except mountain sheep, they will always winter very much better, and the farmer will not only obtain the value of the wool but also from 5s. to 7s. per head advantage when sold fat in the spring. The ram lambs should also be shorn a few days previously to being turned out with the ewes. Sheep on the pastures or parkland should be folded on the arable land if the weather is hot from ten to four o'clock, as it is almost the only mode of saving their manure and preventing them from taking to the shade under trees and hedges. Young cattle, too, both calves and yearlings, do best in hot weather to find shelter in a littered yard and shed with access to water, for the manure would then be dropped where it would be available instead of being lost, as is often the case when animals resort for shade to spreading trees in the pastures or parklands. We find there is, in feeding the salt marsh grass land formerly reclaimed from the sea, a point or matter which many farmers do not understand—viz., they are at a loss to account for the fact that cattle or horses put on the pastures in May and remain until the end of October prove to be in no better condition at quitting than when they first entered, and frequently are found to have depreciated. To avoid this turn out the cattle, &c., at the end of April, and continue the feeding until the second week of July; then withdraw them and lay the grass up for autumn feeding with in-lamb ewes or store sheep, commencing to feed off the grass the first week in October. The sheep do exceedingly well as stores by taking them to the arable land at night time, giving them a small portion of roots and hay in November if the weather is wet and stormy. After the grass has been eaten down any coarse herbage left is mown off with the scythe and the pasture laid up until April in the next year, when the grass will be young and fresh for the dairy cows, and on this food

they make better butter than when fed on meadows, dry pastures, or parklands. In the same way horses will get fat until July, whereas if allowed to remain on the marsh pastures until Michaelmas they would become poor. Again, as regards manure, we do not regard cake as of any value to this land if fed off by cattle, hence the practice of feeding store stock only or dairy cattle; nor is any yard manure of much service. An application of earthy materials, such as road scrapings, after being mellowed and turned in heap and laid out in the winter months, greatly improves the herbage and quantity of pasturage.

#### BATH AND WEST OF ENGLAND SOCIETY.

At the Council Meeting held in the Board-room at the Great Western Railway Station, Bristol, on Tuesday, July 26th, there were present Mr. J. C. Moore-Stevens in the chair; Messrs. Jonathan Gray and H. G. Moyses, Vice-Presidents; the Hon. and Rev. J. T. Boscawen, Col. Drewe, Col. H. A. F. Luttrell, and Messrs. J. H. Arkwright, J. C. Best, R.N.; C. Bush, R. H. Bush, Charles Edwards, W. Farthing, H. P. Jones, J. E. Knollys, Evan H. Llewellyn, R. Marker, C. J. Naylor, R. Neville, C. Pain, H. D. Skrine, E. W. Williams, and J. Goodwin, Secretary and Editor.

*FINANCE.*—Mr. Charles Edwards, as Chairman of the Finance Committee, reported that as the result of the unfavourable weather at the Tunbridge Wells Meeting there was a loss, involving the necessity of selling out £1000 of stock, and as consols now stand at par or thereabouts this was considered a favourable time to realise, and an order was made accordingly.

*CARDIFF MEETING.*—The Council, on the application of Colonel Luttrell, granted the sum of £2167 for stock prizes, the appropriation of part of the amount to be subject to any list of local prizes that may hereafter be offered for Welsh cattle and other stock.

On the application of Mr. R. H. Bush the sum of £200 was granted for poultry prizes. The usual amounts were also voted for the several departments of horticulture, music, and the Art Union.

A letter from the Secretary of the Glamorganshire Agricultural Society was read, asking, on behalf of the Committee of that Society, to be furnished with rules and specific terms by which they might be allowed to amalgamate with the Bath and West of England and Southern Counties Society on the occasion of the Cardiff Meeting, should it be deemed advisable by both Societies to do so. The letter was very cordially received, and it was resolved—"That with the view to the promotion of so desirable an object the members of the Glamorganshire Society be offered the same privileges in connection with the Cardiff Meeting, and on the same terms as conceded to the Worcestershire and other county societies within the district of the Society's Shows."

*IMPLEMENT TRIALS AT CARDIFF.*—The Stewards of Implements, considering that the ground offered by the Cardiff Local Committee for the trial of implements is too far distant from the show yard to render them generally accessible, it was proposed and resolved that arrangements be made, if possible, for obtaining about 14 acres of land in immediate proximity to the show yard, and that, with the exception of implements which can be worked upon this plot, the ordinary trials be abandoned.

*APPOINTMENT OF COMMITTEES, STEWARDS, AND OFFICERS.*—The various committees, stewards, and officers for the ensuing year were nominated, the only changes being that Colonel Drew is proposed to be added to the stewards of stock, Mr. Llewellyn succeeds Mr. Holdsworth as steward of exhibitors' gates, and Mr. Warre is nominated as an additional steward of the Arts department. It was also reported that Mr. Samuel Jones, who for a long term of years has discharged the duties of store-keeper much to the satisfaction of the Stewards of plant and the Council generally, has so far recovered from the results of his recent very serious operation, that it is hoped arrangements may be made whereby his future services may be facilitated and secured.

*TUNBRIDGE WELLS MEETING.*—The Council unanimously elected Mr. E. Durrant, hon. local secretary at Tunbridge Wells, an honorary life member of the Society, in consideration of the great energy, zeal, and courtesy displayed by him in promoting the success of the recent meeting.

#### VARIETIES.

*SELECTING CHICKENS.*—"It is particularly necessary," writes a good authority, "in a dry summer such as we have been having, continually to thin our broods of chickens if we desire to rear any to maturity and to fine size. Insect provender is scarce, and the ground is tainted from having had no thorough soaking for months past. In such a season it is good policy to kill off all but the very best and most promising chickens."

— *MOULTING HENS.*—The present is a good season to allow our best show hens to sit, and if not to rear broods, at least to sit a month on sham eggs. They will moult well and thoroughly after such a rest, and not drop their feathers, a few at a time, in the irregular and unsatisfactory way that fowls often do.

— **HEAT V. DUCKLINGS.**—Our ducklings have suffered much from the late great heat. A whole brood of Pekins which for two or three weeks did admirably, suddenly lost the use of their legs and rolled about as if paralysed. We at once put iron in their water, but with no effect. We should much like to know if any of our readers have found their ducklings suffer in a similar way, and if so whether any remedies have proved of use.—C.

— **THE MANCHESTER BEE SHOW.**—We extract the following from the "Bowdon Guardian":—"At the forthcoming great Show at Old Trafford, at which £2000 is being given in prizes, a most interesting tent will be devoted to bees and honey. It has been thought that this could be got up from Mr. A. Pettigrew's apiaries at Bowdon without competition; and with this end in view, to make bee-keeping a popular study, as also an interesting and remunerative occupation, the tent will be formed as stated. There will be four observatory hives with a queen in each, seen at a glance with a ribbon round her waist. On a black board, written with the fingers of the bees, will be the legend 'God Save the Queen.' This has been a work of the utmost difficulty, and will be a great novelty. On another black board, written in honeycomb, will be the words 'Industrial Exhibition.' Besides this there will be nests seen in various forms; the beginning and finishing of palaces of wax, supers in glass, wood, and straw of various dimensions will be seen, and practical bee-keepers will see how easy it is to fill them, as Mr. Pettigrew will exhibit skeletons, so as to show how easy it is to work upon them and how soon they may be filled. Other interesting exhibits will be on view." We regret to learn that, owing to serious illness, Mr. Pettigrew will not be able to carry out all that he hoped to do at the Show referred to, for his apiary has suffered considerably. Ten first swarms were lost and a number of second swarms; yet, as he is now in a convalescent state, we trust he will be completely restored to conduct the Show to a successful issue.

— **AGRICULTURAL PROSPECTS.**—The Wheats are standing in sheaf in many parts of the midland and southern counties of England, and their appearance in that position is not a bulky one. Before the close of the present week Wheat-cutting will be general south of the Trent. The recent rains will scarcely affect the result of the harvest, except in very late districts; but they have been very beneficial to the struggling root crops and to the aftermath grasses and Clovers. The latter are very short and in full blossom. Stock have done well hitherto on the scanty dry herbage, but now that is gone keep is again very scarce, and dairy districts are being hard pressed. Store stock markets vary with the localities in which they are held, but the level of prices is low everywhere.—(*Mark Lane Express.*)

— **THE TRADE OF NEW ZEALAND.**—The value of imports during the past year has decreased by over a million, while that of exports has increased by nearly three-quarters of a million—in fact they very nearly balance, whereas hitherto the value of imports has always been greatly in excess of that of exports. A proposal to establish a sugar refinery at Fiji meets with some favour at the hands of business men, but it is hardly likely the different cities will be induced to cooperate, although the establishment by New Zealand capitalists of such an industry would be greatly to the advantage of all. Graziers and others are strongly advocating the formation of a company to undertake the exportation of meat and other produce in a frozen state to England, and it is likely something tangible will result from this agitation. At present the occupations of farming and grazing hardly pay, the price obtained for stock being so low. New Zealand beef is equal, if not superior, to that grown in any part of the world, and it can be produced in almost limitless quantity. Stimulated by the offer of honours by the Government and by the severe depression in trade, people in various parts of the colony have started the production and manufacture on a large scale of articles largely consumed by our population; amongst these may be mentioned cement, starch, and arrowroot. The production of coal is greatly on the increase, valuable deposits having been discovered in fresh places. Paraffin oil is also likely to become one of our largest productions.—(*The Colonies and India.*)

### MY FIRST SHOW.

I AM afraid to say how many years it is since I first competed at a poultry show, and as my experience on that occasion was a somewhat mixed one it is perhaps better not to define the date precisely. I was a mere boy when the poultry mania first took possession of me. A setting of Duck eggs purchased by my father at a show, and supposed to be Rouen, began it. A hen had to be got to hatch them; and although the Duck eggs were a failure, "Polly" was such a wonderful layer that she could not be parted with, and a few more birds were bought to keep her company. These were nondescripts, partaking somewhat of Spanish characteristics, and soon gave way to a Silver-Grey Dorking cock and some farm-cross hens, purchased from my first poultry friend. That purchase formed the basis of an acquaintance with one of the truest and kindest fanciers it has ever been my good fortune to meet; acquaintance ripened into a friendship, which has been maintained with much pleasure and benefit to me ever since. A few visits to the well-kept yards of Miss — so far influenced me that I felt I must have a stock of pure-bred birds. The space at my command was very limited, so after some consultation Spanish was fixed on as the most suitable breed. Money also was limited; I had therefore to be content with purchasing a setting of eggs. There were thirteen of them, and to my great satisfaction they produced thirteen chickens. It was May when they were hatched, and the season being favourable they were all reared. They had, I remember, some difficulty in feathering, as Spanish will have, but with the aid of bread and ale and a little meat they got well through that critical stage. By the following March, when the spring show of the Royal — Society was approaching, the chickens had grown into such fine birds that I determined to exhibit them. In those days a pen of chickens consisted of a cockerel and three pullets. There were three prizes, so I must needs enter three pens, or twelve out of my thirteen chickens.

There was also a class for a cock and two hens over a year old, and I was desirous of making an entry in that class also. Miss — had a beautiful pair of early-hatched pullets, which she was willing to take £3 for, but I knew not where to find a mate for them. Just then there appeared an advertisement that Mr. X was going to give up Spanish, and had his entire stock to dispose of. Here was evidently my opportunity. Mr. X lived some five miles away, but I soon walked that five miles. Mr. X had an experienced poultryman, who confirmed the statement that Mr. X was giving up Spanish, and showed me the birds for sale. There was one very fine old cock. I was almost afraid to ask his price. It was, however, moderate, being only 25s. This surprised me a little, but the fact that more room was wanted for other more important breeds explained the matter. I made up my mind to have that bird, and, giving a glowing account of him to the home authorities, obtained the necessary funds. I could not do another ten miles that day, but I was off the next morning with a companion and a large carpet bag in which to carry home my purchase. I was not without anxiety lest some other purchaser should have been before me, but my fears on that score were soon removed, and completing the purchase I started for home with my carpet bag, propped well open to admit air to the inmate.

It was just time to enter for the Show, and my entries were duly made. This had hardly been done when upon going into the yard one day I was horrified to find the Spanish cock's face dreadfully lacerated on one side. He had a yard to himself, so I was completely at a loss to account for the disaster. Upon taking him up to examine his wounds I was almost sickened by a foul smell proceeding from his mouth. An examination showed that his throat was filled with cancerous ulcers, and having been neglected for some days he had torn himself with his spur in his efforts to relieve the irritation. I was in despair, and feared that all hope of exhibiting or curing the bird was over. Upon consultation with my ever-ready friend Miss — she recommended me to apply zinc ointment to the sear on his face, and to bathe the throat with vinegar and water three times a day—not with any hope of curing the throat, but simply to keep it from getting worse until after the Show. This treatment was successful; the wound on the face healed and the sear came off, and, although one side was shorter than the other, still it was manifestly the result of an accident. The throat became slightly better and free from offensive smell. Upon taking the birds to the Show I found that Mr. X had "gone out of Spanish" in a somewhat peculiar fashion by purchasing superior birds to those he had sold. He had his reward, however, in the fact that his new purchases were suffering

from scabby faces. The good condition of my old pen and the beauty of the young hens' faces carried the day, and Mr. X had the satisfaction of seeing the bird he had sold cheap to a beginner placed first while his new purchase stood second. My three pens of chickens stood second, third, and very highly commended, and I found purchasers for two of them at good prices; so that, although I was obliged soon afterwards to put the cankered bird out of his misery, I had on the whole no reason to be dissatisfied with my first show.—D. M.

#### THE POULTRY CLUB.

A MEETING of the Committee of the Poultry Club was held at the Charing Cross Hotel on Wednesday, 27th July, at 2 P.M. There were present the Hon. and Rev. F. G. Dutton (in the chair), Rev. J. D. Peake, Messrs. T. W. Anns, R. A. Boissier, A. Comyns, H. R. Dugmore, S. Lucas, and L. C. C. R. Norris.

ELECTION OF MEMBERS.—The following new members were elected:—T. McArthur, Stirling Street, Alva, N.B.; J. McArthur, Stirling Street, Alva, N.B. The following new associates were elected:—Mrs. Chandos Weatherley, Wayton Cottage, Beaminstor, Dorset; G. Nadin, 7, Well Street, Leek, Staffordshire; R. E. Roscorla, Treguissy, St. Austell, Cornwall.

RETIREMENT OF COMMITTEEMAN.—The Secretary read a letter from Mr. T. P. Lyon announcing his desire to retire from the Committee. The Secretary was directed to issue notices requesting nominations to the vacancy created by Mr. Lyon's retirement.

CLUB SHOW.—The question of holding a Club Show was discussed, and notice was given that the following resolution will be proposed by Mr. Norris and seconded by Mr. Lucas at the next meeting of the Committee:—

"That the Poultry Club do guarantee the expenses of, and give prizes at, one show in each year in localities changing from year to year, and in the first instance do open negotiations with the Committee of the Cambridgeshire Ornithological Society to hold a show in conjunction with theirs about the beginning of January, 1882."

DATE OF MEETING.—The next meeting of the Committee was fixed for Monday the 19th September, instead of the date previously announced.

#### RATS v. DUCKS.

FOR two years, in spite of traps and other contrivances, I lost all my young Ducks. A friend of mine never lost one, though living in the neighbourhood. "Why is it?" said I to him. "Cats," said he. I had two from him, and this year have not lost a single young Duck by rats. At the present time I have two good-sized kittens that have been brought up among the poultry and Pigeons. I will send either or both to anyone paying for the basket or baskets to put them in for travelling. I think in the poultry breeding there is nothing so hard to contend with as rats. They come from far and near in the night and kill whole broods at a time. It is dishcartening.—HARRISON WEIR.

P.S.—In my article "Fanciers v. Farmers" (page 72), the name Mr. Stringer was misprinted for Mr. Sturgeon, the correct name of the farmer referred to as having brought the Buff Cochins into notice.

#### SOME PRETTY TOY PIGEONS.

WE have almost exhausted the list of those Toy Pigeons which from their gradual improvement and from the attention paid by fanciers to their points of form, have emerged into a class intermediate between the so-called "high class" Pigeons and the mere Toys. There are, however, many other kinds of Toys little peculiar from distinctive form, yet very beautiful in feather, which must by no means be passed over. Some of them are peculiarly suited to a garden aviary or to fly at liberty; and being procurable at moderate prices, come within the reach of lovers of birds as distinct from professed fanciers. They require no lengthened description of points, but we will attempt to recount briefly their chief beauties.

*The Magpie.*—Sharp contrasts of white and colour are always beautiful in Pigeons. We have admired them in Turbits, but then Turbits to be of value must have many other points besides correct colour and markings. Magpies, on the other hand, provided their colour is really bright, and this it generally is, and their markings are well defined, are good of their kind. Fancy is content in their case with the original Pigeon form, and requires no great peculiarity of head or tail. The form of the Magpie is as nearly as possible that of the common dovehouse Pigeon. Some strains have been crossed with Tumblers, and in this case the Tumbler blood is apparent in the smallness of their heads and shortness of beak; such birds do not find favour with good Magpie judges. Their eyes should be pearl or light, and their beaks pink. The latter point is difficult to obtain in the black variety, birds of which,

otherwise good, are often disfigured by dark marks on their beak. The chief point, however, of the Magpie is accuracy of its feather markings; the wings, lower breast, and under parts are white, the rest of the body of some one colour, as red, yellow, black, blue or dun; the three former colours are to be had very good in the Magpie. Of course, the great beauty of the bird is to have the clearest distinction between the white and coloured parts; when these are sharply and accurately divided the bird is called in the language of fanciers "clean cut." There may be a little variation in the amount of colour. A bird in which the white predominates, and in which consequently the line of division is drawn high on the breast and wing, is said to be "high cut;" one with the opposite tendency "low cut." A flight of Magpies of all colours mixed is a charming sight, second in our opinion only to a flight of Turbits.

*Suabians* are a most beautiful and peculiar race, but one which to be appreciated should be kept in an aviary near the ground; their markings are too fine to be seen at a distance. The Suabian is a bird of dark ground colour, spangled throughout with pinkish white; the wings have two white bars; the tail of good specimens a white bar across them; the legs are clean, the eyes dark, and the heads peaked.

*Starlings* at first sight are not attractive, but nearer inspection shows them to be beautifully marked. We once saw a large flight of them which quite made us alter our former unfavourable opinion. Their good form is simply that of the dovehouse Pigeon, their plumage is black with white bars on the wing and a crescent of white on the breast.

*Crescents* have similar markings to Starlings; their colour, however, is far different and much prettier, the ground being a pinkish fawn or cream, and the wing-bars and breast-crescent a rich brown. We have seldom seen them really accurately marked, but even those with somewhat undefined crescents are so beautiful that we should think it well worth the while of any true fancier to breed carefully or to improve them.—C.

#### OUR LETTER BOX.

*Leghorn's Legs* (Old Subscriber).—Yellow is undoubtedly the proper colour.

*Pullets Roosting in Trees* (J. R., Rochdale).—If your poultry house be kept clean and well ventilated, we think it best not to allow the pullets to get in the habit of roosting out of doors. It would do them no harm now, but in winter it would interfere with their laying, and a severe frost might kill them.

*Chickens Dying* (J. P.).—The seeds of the Laburnum are violently purgative, emetic, and decidedly poisonous, and it may be that the deaths amongst your chickens are caused by picking up some of them. We think, however, that you are giving them too much grain for such young chickens, and recommend you to limit the grain to the last meal at night, and give some oatmeal or barley meal mixed with the middlings, seraps, &c., for the other meals. Feed only three or four times in the day, and see that no food is left lying about to get sour. Look also to the supply of fresh water and gravel. You might cut open the crops of some of those that die and see if they really have been eating the Laburnum seeds. We shall be glad to hear from you as to this.

*Salicylic Acid for Sheep* (C. M. M.).—Salicylic acid when added to water for animals to drink should be in the proportion of two table-spoonfuls to a bucketful, or say two and a half to three gallons of water. In powdering the tops or points of the hoofs of animals the powder to be used is the powder called salicylic acid, which can be obtained from a chemist.

#### REMARKS.

24th.—Dull, with slight rain at 0.45 P.M.; brighter in evening.  
 25th.—Cool and breezy; bright sunshine at intervals.  
 26th.—Morning bright and fine; afternoon overcast, with gusty wind; slight shower 6.30 P.M.  
 27th.—Cool, fair, bright at intervals.  
 28th.—Very bright cool morning; cloudy and gusty after part of the day; rain at 11 P.M.  
 29th.—Slight showers first part of morning, then fine, bright, and breezy.  
 30th.—Showery, generally overcast.  
 Considerably cooler than the previous weeks, and of near the average temperature.—G. J. SYMONS.

### YOUNG GARDENERS.

SOME two years ago, when I wrote a few lines of encouragement to young gardeners in the Journal, I had no idea they would be so kindly received by those to whom they were addressed. The result pleased me in more ways than one. I was glad to see the Journal is so much read and studied by young gardeners in so many parts of the country. They by their letters seemed quite eager to equal if not excel those who have gone before, and I hope they will succeed. I feel the subject is of so much importance that I am constrained to revert to it, the more so because there are many more young men now than there are vacancies for them, and this being so the selection is greater, and only the best can succeed. I wish to point out the requisite habits to be formed, and the course to pursue to enable young men to attain the end they desire, and become better and more successful gardeners than the old, as it is only on this being accomplished that the high character of British horticulture can be maintained.

Young gardeners occupy no mean position in the horticultural world; many of them would grace any calling, but, of course, there are exceptions in this as in all other pursuits. Many good young men may get disheartened from what may appear to them to be bad luck. Some may think there is no use in striving, and consequently relax their exertions in favour of others less worthy; but my firm conviction is, that gardeners, like others, ultimately find their level, and, if a deserving man is superseded by an unworthy one for a time, matters will be reversed in the end. I could name many instances of this; but in reality gardeners, and especially young gardeners, have their failure or success in life entirely in their own hands. Friendly influence is all very good, and indeed very desirable, but where the ability is wanting all this goes for naught. Where there is ability friends and influence are easily had. The first is the only true means of insuring the latter. Perseverance and consistency in all things will almost invariably secure both.

I have been looking over some back numbers of the Journal, and I have never seen better advice given to young gardeners than in a short paragraph from Mr. Gair at page 139, February 20th, 1879. It should be clipped out and fixed in the most conspicuous part of every young gardener's lodgings. First, "they must read." In their spare time no employment could possibly be better than this. In reading much will be immediately gained, and much saved in not devoting precious time to less worthy objects. Next, "give heed to what you are

told." This implies much. One who gives heed to what he is told generally remembers it, and this is storing-up knowledge, which is easily carried and always useful. But giving heed to what is said also includes obeying orders. This is what all gardeners should study to do from first to last. It is natural to suppose that head gardeners have more knowledge of their profession than under gardeners have; at least, if they have not, it is the under men's duty to do as they are instructed in their daily work, whether this may appear to them right or wrong. Many gardeners have their own particular ways in doing things, and as they are responsible let them be obeyed. Many head gardeners, too, find it to their advantage to pay attention to what is said to them from higher quarters, and here it is their duty to obey as implicitly as in the former case. This is a difficult matter to get over, as most men have certain ideas of doing certain things better than others; but keep those ideas in the background until asked for. Of course, where anyone, head or under gardener, is allowed to do things without being instructed in any particular way the case is different.

"Learn to be punctual to time." This is one of the main-springs of success. Those who keep no regular time are always behind with their work, and an idle or bad time-keeping man can never be trusted; like those with other careless habits, they must fall beneath those industriously inclined. "Do not mix play with work." This is excellent advice, and is needful, for undoubtedly there are those who indulge in the bad habit indicated; and this much may be said about it, that those who are always more ready for a "lark" than their duties may live to see their folly. By attending to a few of these simple rules at first it is surprising, and certainly very gratifying to all concerned, to see how young men become absorbed in their work, and the information they gather in connection with it.

Young gardeners who make anything else but gardening their first consideration would be much better out of the profession altogether, as in time they become a great burden to themselves and an annoyance to all connected with them. They are the kind of men who think others are getting on before them, and that they are not done justice to, when in reality it is only the fruits of their own conduct they suffer from. The young man who is punctual to his work at all times, goes about it smartly, attends to his day and night duties assiduously, and does his work when his superiors are not present the same as if they were, is the man who will soon win the confidence and esteem of all both above and beneath him. It is by such conduct as that, that stepping stones are being laid on the way to the best head gardeners' places in the country.

Foremen should be most particular in pushing forward everything entrusted to them, remembering that this not only qualifies them for further advance, but their success when once in charge for themselves depends a good deal on it. Above all, young gardeners should never be above their work, whatever this may be. Those who cheerfully take a rough or a dirty job only show their anxiety to improve themselves in all things. It has often been said, "All work and no play makes Jack a dull boy," and this is quite correct; but I do not ask anyone to have his nose continually on the grindstone, neither will any head gardener keep those under him so who do their work conscientiously. Such men have never any

difficulty in getting away a day to see a neighbouring garden or any sociable entertainment which may occur. In the summer evenings recreation may be properly indulged in; but remember this, Do not make any games a hobby—always keep them secondary. "Duty before pleasure" is an old rule, and a golden one.

In reading peruse gardening books and papers, such as the *Journal of Horticulture*, first, newspapers afterwards, and light literature only at intervals. Music practice, when kept in its place, is a harmless amusement, and young gardeners may be welcome additions to the choir; this will afford practice on one or two evenings a week, as well as bring up young men to a good and commendable habit on Sundays. The drunkard or debauchee of any kind will too soon find his mistake.

In concluding these remarks I may just remind young men that it is from personal observation and experience that I write—not from imagination; and I may say, as before, there is abundance of talent amongst young gardeners of the present day. Let those willing to use it for the good of the cause be brought to the front, and those who are inclined to be idle or careless must fall behind.—A KITCHEN GARDENER.

#### VALUE OF A NORTH WALL.

PLANTS and trees suffer most when exposed to extremes of temperature, and it is quite in vain that we plant our most cherished favourites by sunny walls and in cosy nooks if we are unable to screen them from alternations of excessive heat and cold. Foliage and blossom brought forth early under the influence of the sun's kindly rays are so tender that a single untimely frost will blast them, and the promise and hope of an entire year will be lost; there is, therefore, considerable risk of loss among the trees of a wall facing the sunny south unless ample means of protection are within reach.

Trees trained to a north wall are not subjected to such changes; the lower but more equable temperature of the wall surface and the air in which the branches grow render them more hardy and much less liable to suffer from sudden changes of weather, agreeable and most important evidence of which is afforded in the abundant crop of fruit that such trees usually produce. Late Plums, Cherries, and Currants are usually grown against this wall; but I have also planted three trees of Green Gage, and others of Purple Gage, McLaughlin's Gage, Reine Claude de Bavay, Transparent Gage, with Coe's Golden Drop and Blue Impératrice, and find all the Gages answer so well that the season of this delicious fruit is materially prolonged. Green Gage ripens its fruit first, then comes the delicious and larger fruit of McLaughlin, followed by the still finer Reine Claude de Bavay. Coe's Golden Drop and Blue Impératrice seldom fail to crop heavily upon this wall, and the fruit of both sorts is very valuable, not only when picked from the tree, but also for several weeks afterwards if kept in a warm dry room. Nobody who has tasted a Blue Impératrice that has been left hanging upon the tree till it became shrivelled is likely to forget its delicious richness.

Of Pears I have only been able to try Winter Nelis, Thompson's Marie Louise, and Williams' Bon Chrétien, all of which answer well, the fruit of Bon Chrétien being much valued because, like the Gage Plums, it ripens so late as to make a good succession to that of trees fully exposed to the sun. This fact is worthy of attention in relation to other sorts of Pears as well as this old favourite, for it is notorious how uncertain Pears are in the time of ripening, many of the later sorts often coming to maturity too early, which renders any means of prolonging the process of ripening doubly valuable. It will be well, therefore, next November to plant cordons of favourite sorts in every available space on the north side of walls and buildings, and thus turn to account many an out-of-the-way position that is but too often left unoccupied.—EDWARD LUCKHURST.

#### CHINESE PRIMULAS.

THERE are but few owners of small greenhouses and frames, or even the latter alone, who do not endeavour to grow a few Primulas; but I am afraid the majority fail to have them in perfection. This is to be regretted, seeing how when well grown they will brighten the houses and windows at the dullest time of the year. Although a rapid improvement has been effected with the strains of Primulas, probably in most instances among the classes for whom these hints are intended the only variety that can be afforded is what is obtained in a mixed packet, or a packet each of some-

body's unapproachable strains of red and white Primulas. In good time it is to be hoped a half-crown, or at the most five-shilling packet, will comprise all the undoubtedly novel, superior, and distinct varieties. Their culture is really not difficult, as beginners will discover if they strictly follow the advice invariably given in these pages at sowing time by various successful growers. It is of no use, however, to read the article at the time, losing sight of the number containing it, and gradually forgetting the primary details. Better by far file the number and refer to it when assistance is most required.

One of the greatest mistakes made in Primula culture—and this is not confined to amateurs, but is more often committed by professional gardeners—is sowing seed very early, say in February or March, the aim being to have strong plants in bloom early in the winter. No doubt in many instances fine plants are grown; but how much better is the result of sowing seed in May, and even in June, and growing on the seedlings without any check till blooming time. In the former case the blooms have to be pinched out once or twice as being premature, whereas this is unnecessary in the case of those late sown, thereby securing a splendid pyramid of bloom, the central truss always being the most vigorous. Then, again, early-sown plants often, unavoidably it must be admitted in many instances, become root-bound and impoverished, from which they do not readily recover when repotted. Those late sown are generally in a proper condition for their final potting at a time when other work is less urgent—viz., early in August.

Supposing some of the readers of these remarks have their plants in this stage of growth—that is to say, well rooted in 60-size pots, I should advise them to at once shift the plants into either 5-inch or 6-inch pots. This is the most critical operation, everything really depending on it. A great per-centage of plants annually die when they ought to be at their best, and this I am convinced is entirely owing to faulty potting. It is the stems that are usually affected by canker, the lower leaves first failing, then the flowers lose colour, flag during sunshine, and finally the plant fails entirely. All this is owing to high potting, and this must be apparent to those who, losing plants one season, pot high next season, thinking it the best remedy. By exposing the stems we invite the disease, and the only remedy is to pot deeply—that is to say, to bury the stems up to the base of the first strong leaf-stalks. This will obviate the use of pegs to steady the plants, and will also strengthen them, as the buried stems will emit roots freely. The orthodox compost consists of three parts of good turfy loam roughly broken with the hand, one of sifted well-decomposed manure and leaf soil, with a liberal addition of silver sand. If the loam is not turfy a greater proportion of leaf soil should be employed, and a little rather fine charcoal or broken crocks in order to keep the whole porous. The pots ought of course to be clean and well drained, covering the crocks with a little moss, especially if fine soil is of necessity employed. The soil ought to be in a moist state, and the fresh soil must be made somewhat firm about them.

The best place to grow Primulas is a frame sloping northwards, and the plants should be as near the glass as possible; keep them rather close till established, shading from bright sunshine, and water them as required. To grow them a long way from the glass and to shade heavily naturally draws and much weakens the growth. A sturdy healthy growth will produce blooms of the best quality. The temperature of the flowering quarters, if it can be avoided, ought not at night time to fall as a rule much below 50°, neither should the plants be crowded or the soil be allowed to become dry. Occasional moderate supplies of liquid manure will insure large blooms of the richest colour.—W. I. M.

#### NEW PEAS.

DAY'S SUNRISE PEA.—Observing the inquiry of "G. S., Sandbeck Park," as to whether there can be two varieties of the above Pea in commerce, I have forwarded by this post one each of pods containing severally four, five, six, seven, and eight peas in a pod. The average pod with me is the one containing six peas; the quality and size you will be able to judge of from the samples sent. The haulm averages 3 feet to 3 feet 6 inches, grown on rich soil sloping to the south with an inclination slightly to the east. Sown March 17th; first possible gathering July 12th. If "C. H. P." at Cardiff grew them 5 feet high, and gathered on June 20th, it is very evident that the query of "G. S." is a most pertinent one; and I would suggest that "JOURNEYMAN" should send some of his with nine and ten in a pod, and that "C. H. P." should also send you some of his pods to enable you to decide.

CARTERS' STRATAGEM.—This Pea is bearing well with us. It has fine large pods, the average height of the haulm being

18 inches. It seems to need rich soil, which may be a drawback to its adoption by market gardeners who can scarcely afford to apply manure heavily for Peas, otherwise it seems a most suitable variety.—CHARLES BARNES, *Lichfield*.

CARTERS' STRATAGEM PEA.—"CLERICUS" (page 69) asks for information about this Pea, and as we have grown it for three years I will gladly tell all I know of it. It was not offered to the public for the first time this spring as "CLERICUS" says, but it was sent out last year, and this must be the second season of its general cultivation. As a main crop Pea I value it very highly indeed. It grows from 2 to 3 feet high, and is very robust in character; the pods are produced in great numbers, each containing from eight to ten peas of a beautiful dark green colour. The flavour is very superior and quite in keeping with its other good qualities; the pods are very even in size, and they fill well. If fairly dealt with it is a Pea capable of giving every satisfaction, no matter by whom cultivated. Possibly the Pea which "CLERICUS" means as having been sent out this spring is Carters' Pride of the Market, and if so I may say it is in every way worthy of being associated with Stratagem.—J. MUIR, *Margam*.

THIS Pea will not disappoint your correspondent. It is an excellent variety, and will when well known probably be grown in every garden. It is dwarf, not more than 2 feet 6 inches high, remarkably strong, and laden with pods equal in size to Telephone or Telegraph. The pods with me have filled well, having from eight to ten peas in them; the quality when cooked is sweet and good, in fact all that can be desired to constitute a good Pea. Stratagem in every respect fully justifies the raisers in giving it a high character, which it really deserves. It is at least ten days earlier than John Bull, and a few days later than Telegraph. I sowed on April 28th, and Peas were ready for gathering about the end of July.—A LANCASHIRE GROWER.

#### SHADING CAMELLIAS.

YOUR correspondent Mr. Muir appears to be rather dogmatic in his views on this subject. The inference to be drawn from his article on page 75 is that he is right and everybody else is wrong. His idea concerning his own plants may justify his assertion, but a wider margin should be left for others than Mr. Muir appears disposed to allow. His plants may be doing well, but many cultivators, especially amateurs, have Camellias, perhaps, not in the best health and condition. Would Mr. Muir recommend such to be grown under the influence of a burning sun? or would he advise a little shade until the plants were restored to health and vigour? If shade only in this case would prove beneficial, then the remarks of your correspondent may mislead. I am no advocate for excessive shading so that injury will result therefrom; but with Camellias shade judiciously employed is beneficial, especially when they are making their growth, and again when the flowers are unfolding in spring, or the sun soon takes the colour from them. The young leaves are very tender when first developing, and if the direct rays of the sun are screened from them they are not so liable to injury. Your correspondent must not think he is the only cultivator who has tried growing these plants without shade. I have tried, and to my sorrow had a number of leaves burnt. Shading in the end had to be resorted to, and I found it safe and beneficial to the plants. When planting out a number of Camellias when growing your correspondent says they cannot be done without some injury to the roots: will not shading then be of service to the plants? or will they recover better under the influence of direct sunshine?

To prove that Camellias do well even under dense shade, I know a collection in large tubs always grown under the shade of Vines, and no plants could look better, and they never fail to flower profusely. Further, I have Camellias covering the back wall of two Peach houses. The Peach trees are trained close to the glass and nearly to the top of the house, so that very little sun reaches the Camellias. These never fail to do well, and I am convinced they would be worse rather than better if the Peach trees were removed. Again, the shrubs grown in the house devoted to them here, with the roof and front shaded, have foliage, I am sure, as fine in size, brightness, and colour as it is possible for your correspondent's to be. He contends it is impossible for them to have fine, dark, glossy foliage when grown in the shade. I can only say if those grown at Margam Park are finer in colour and foliage than the plants grown here, they are indeed really grand.

Now to the time of planting. Your correspondent recommends removal of Camellias when they are just advancing into growth. Their roots are then active, and it is next to impossible to turn them out of large pots or tubs without considerable damage to the

roots, which must affect more or less the growth. I consider there is no better time for lifting, planting, or repotting than when growth is completed and the flower buds have commenced to form. The roots are then less active, and consequently less liable to injury, than if in an advanced stage of growth. When planted after growth is completed and the flower buds are swelling, their roots are sufficiently active to enable the plants to get a good hold of the soil before root-action ceases. The plants are then ready, when the growing season arrives, to make a vigorous growth—much more so than if planted as growth commences and left unshaded, to get over the injury as best they can. It may be asserted that the buds are in danger of falling when the operation is carried out in the autumn of their growth, but if judiciously done before the buds are too far advanced a good crop of flowers is certain.

Mr. Muir objects to withholding water after the flower buds of Camellias are visible, and evidently has the same strong ideas on this phase of culture as he has on shading. It is necessary to keep them drier at the root if a second growth is to be prevented on young vigorous-growing trees, and I maintain it is necessary to prevent this second growth, which, according to Mr. Muir's idea, is an advantage, in order to obtain a succession of bloom. When second growth is made is it sufficiently ripened in many seasons to produce fine flowers? If this is so in Wales it is certainly not the case in many parts of England. A succession of flowers can readily be maintained by selection, and even a limited number of varieties. It is unwise to encourage a second growth in the cultivation of Camellias without size of the plant is the chief object and the blooms can be sacrificed.

I am sending, Mr. Editor, for your inspection wood of Camellias—No. 1 from beneath Peach trees, densely shaded; No. 2 from plants judiciously shaded; and No. 3 from a plant that has been much exposed to the sun. I should like to know how they compare with others that may be sent you from unshaded trees.—W. BARDNEY.

[We have no others to compare them with. No. 1 is remarkably fine, the foliage being deep green, glossy, and spotless. No. 2 has thick, leathery, very dark green shining foliage that we have never seen surpassed. No. 3 has large foliage, but it is thinner than that of the others, and lacks the rich glossy hue for which they are remarkable. All the growths are short-jointed, and have healthy flower buds.—ED.]

#### THE VAGARIES OF PLANTS.

HAVE any of your readers noticed the whims or vagaries of plants to grow from seed in the most unlikely or unwished-for places? Some years ago I carefully sowed some *Portulaca* seed in accordance with the best directions as to soil, silver sand, and the comforts of a hotbed, but with a lamentable result. The following year to my surprise I found some seedling *Portulacas* coming up of their own will amongst the cobble stone pavement of the enclosure or yard where I had my hotbeds. Since then I find that some plants will grow on my limestone-chipping garden walks from self-sown seed, whilst they decline to grow in the adjacent borders enriched by manure. I remember some thirty years ago going to an old garden not far from where I now live, and finding a man busy "paring" the *Gentianella* from the garden walks. It had left the borders where it had been planted as an edging, and had grown over the surface of the walks, and encroached so far that it had to be "pared" off to make the walks passable.

The inference I draw from the above is that we injure many of our garden pets by coddling and overnursing. I have no hesitation in asserting that the "Verbenas" have been lost to all practical purposes by the system of forcing for cuttings for the million. Herbaceous *Calceolarias* were in a fair way of following the Verbenas, but fortunately for them it has been found out that, instead of being coddled and treated as a consumptive patient in a sort of warm sanatorium, they do best in a cold bed, in a frame, or even with only the comfort of a handlight to protect them from extreme frost.—G. O. S.

SWARMS OF CATERPILLARS.—A correspondent of the "Entomologist" notes, that in various parts of the New Forest the Oaks appeared to be completely denuded of their leaves by the middle of June, the result of the presence of caterpillars principally belonging to the genus *Hybernia*. "The incessant rasping noise of countless thousands of jaws was distinctly and strangely audible." In the vicinity of London there has been observed this season an excessive number of the caterpillars of the Vapourer Moth (*Orgyia antiqua*), many of the larger boughs of the Limes

in St. James's Park being stripped by them. It is to be hoped the authorities will have a careful search made for the egg patches now being deposited. The abundance of the Yellow Underwing Moth (*Triphaena pronuba*) in many places indicates that the caterpillar must have been previously plentiful, and possibly this species has had to do with the failure of the Cabbage crops in some northern districts, as well as the fly *Anthomyia Brassicae*.—

BLANDFORDIAS.

THESE greenhouse plants are scarcely known by the young men in our gardens at the present day. This is scarcely to be wondered at, as in few gardens can any of the varieties be found. It would not be difficult to at once point to the principal cause of discarding such plants—namely, the rage for novelties. I am, however, inclined to believe that Blandfordias will probably ere long rank as popular plants.

The negligence in cultivating this genus is the more regrettable, because Blandfordias are suitable plants for amateurs who have only a greenhouse. The temperature usually given to a greenhouse suits them admirably, and their culture is easy. No one need fail in their management. The flower scape, which rises above the foliage from 1 to 3 feet, and then produces a terminal cluster of drooping flowers. The time of flowering varies according to the temperature given the plants in their various stages of development, but as a rule the flowers are produced about the end of June or during the month of July. After flowering they require attention, and the present is a good time. They are propagated by division and from seed. To obtain a stock by the former method would entail a considerable length of time, as suckers are produced very sparingly. When they are produced, however, they should be taken off after flowering, placed singly in small pots, and be given an intermediate temperature until established, and then wintered in the greenhouse. The stock can be obtained more readily by seed, which is produced freely if a little care is taken during the time the plants are in flower by keeping them where the atmosphere is moderately dry, otherwise artificial fertilisation is necessary. It is, however, wise to give this aid under any conditions. When the seed is ripe it should be sown at once in a small pan or pot well drained, covering the drainage with moss or other suitable material, and when the seeds are sown they should be lightly covered with soil, watered, and placed in heat. The pan should be covered with a square of glass and well shaded until the seedlings appear. When large enough they should be placed singly in 2 or 3-inch pots, and be grown in an intermediate temperature, finally transferring them to 5-inch pots, and subjecting them to the same treatment as established plants.

Blandfordias look well when well grown and flowered in 5-inch pots, which are large enough unless the plants are allowed to grow with more than one crown. When the object is to grow a good-sized plant the suckers should be allowed to remain instead of being removed to increase the stock. After the plants have flowered they should be repotted and divided if necessary, disturbing the roots as little as possible. If the roots have to be much disturbed in carrying out the operation it is wise to keep them close for a short time. I have potted these plants at different times, but find the operation best performed at this season of the year. A little care should be devoted to the supply of water after they are first potted, and as autumn approaches and the growth is completed less water will be needed. They should not be stored away under the stages or placed upon shelves to be neglected during winter. They will do in any place under glass

during winter where the temperature does not fall below 35° to 40°. During winter little water will be necessary, but it must not be entirely withheld. In spring they can be assisted with a gentle heat if convenient. But even this is not absolutely necessary. The plants here are only subject to a greenhouse temperature all the year, and flower profusely about July. When the pots are full of

roots and the plants are growing, stimulants may be given with advantage, as well as liberal applications of water.

The soil most suitable is good fibry loam and peat in equal proportions, with a few pieces of broken charcoal and plenty of coarse sand. I am confident if amateurs will only give these plants a trial they will not be disappointed with the results.

Fig. 21.—BLANDFORDIA PRINCEPS.

*Blandfordia nobilis* has rich orange-coloured flowers shading to yellow at the edge. *B. aurea* has golden yellow flowers; and *B. Cunninghamii*, which is a very beautiful variety, has flowers of rich coppery red, while the upper portion is yellowish green. *B. princeps* I have not yet flowered, but am informed it is a very fine species.—W. BARDNEY.

[*Blandfordia princeps* (represented in fig. 21, a block kindly lent us by Mr. W. Bull), is very handsome, and is thus described

by the introducer—"This strikingly handsome greenhouse perennial gained the first prize as the best new flowering greenhouse plant at the Royal Horticultural Society's Exhibition in the summer of 1875. The stiff, sub-erect, distichous leaves are narrowly linear, five to eight-ribbed, and with a serrulate border. The scape is a foot high, bearing a corymb of many flowers, which are 2½ inches long, pendent; regularly funnel-shaped, with a bright crimson tube, and deep golden yellow erect limb. It

must be regarded as the most beautiful of the Blandfordias yet known. It has been figured in the 'Botanical Magazine,' t. 6209." The coloured figure mentioned above by Mr. Bull faithfully represents the character of the plant.—ED.]

#### THE FRUIT CROP IN THE SOUTH OF IRELAND.

SPEAKING generally, and taking the gardens in this vicinity, the following is a pretty accurate summary of what came under my notice lately when walking or driving over much of this province.

*Strawberries*.—Although this crop is past, I may note that on the whole it was above the average. President still maintains its reputation as not only one of the largest but also among the earliest and best flavoured. At the Lismore Show it was, however, second to James Veitch from the adjoining gardens of the Duke of Devonshire, and was a week behind Marguerite at the gardens of Lord Donoughmore, Knocklofty. British Queen, La Grosse Sucrée, and Vicomtesse Hericart de Thury are still favourites, as well as Trollope's Victoria, the Old Pine, and Elton Pine at Rathronan, Marlfield, Minella, and Heywood.

*Gooseberries, Raspberries, and Currants*.—These, with the exception in a few cases of Black Currants, were more than an average crop. The amber Gooseberries came in first, and the large green, such as Thumper and Pike's Green, followed, but are now nearly over.

*Apricots and Nectarines*.—At Marlfield a few days since I saw a very fair crop of the former nearly ripe on a south wall unprotected. I note this, for as a rule for several years both these fruits failed, so far as I saw, in the open air in Ireland. If I remember aright this early Apricot was Blenheim or Shipley.

*Plums*.—At Glenview, Marlfield, Minella, and Lismore Castle there are more than average crops, specially noticeable being White Magnum Bonum, old Green Gage, Denyer's Victoria, Goliath, and Coe's Golden Drop. At the first-named garden, owing to careful pruning and judicious summer pinching, both wall, bush, and espaliers are more than a full crop. Too little attention often seems to be paid this fine fruit tree. Allowing it to take care of itself will not always conduce to success.

*Peaches*.—Of indoor Peaches that came under my notice the heaviest yield was at Knocklofty. So heavy was the set of fruit that the head gardener, Mr. Ryan, assured us, as we could see, that to prevent exhaustion a dozen was removed for every one allowed to remain. Of wall trees protected by glass during the setting period, Minella, the residence of Mrs. Malcomson (head gardener, Mr. Crehan), near this town, not only this year, but for the last dozen or more, outdistances anything I have seen in Peach-growing. The nearest approach would be that of Mr. Bracken, the very successful head gardener to E. P. Westley, Esq., Roebuck Castle near Dublin. Mr. Bracken assured me he used no glass. I specially mention those cases, as I am aware that at Woodstock Park, Co. Kilkenny, the residence of Lady Louisa Tighe, and many other typical gardens, outdoor Peaches have been for years a failure, and in numberless cases their culture has been wholly abandoned. Sashes, glass copings, and similar contrivances conduce much to success; but nothing will make old bare stems prolific, while a bad unprepared subsoil is, though not suspected, a frequent source of failure. Grosse Mignonne, Royal George, and Palmerston are still the favourites in most instances.

*Pears*.—Speaking within the limits of observation indicated, the crop as a whole is much above an average. At Marlfield and Summerhill I saw a few days since old trees that were destined for the axe producing enormous crops on walls 15 feet high; and this induces me to remark that one or two seasons' failure should not cause a fine old tree to disappear which may yet make amends. There are twenty varieties of Rivers' best, both standards, espaliers, and on walls at Glasnevin, and with few exceptions, probably not owing to variety or seasonal causes, all bear fair crops. And here I should like to ask why espaliers are so seldom seen: they take up little space, and, owing to full exposure and fresh open soil, the fruit is generally of fine size and quality.

*Apples*.—Of Lord Suffield there is an excellent crop. Mère de Ménage is also bearing heavily at Glenview. Hawthornden, good generally. Pearson's Plate and Ribston Pippin equally so. Sturmer as a bush at Minella is very fair; while the following are more than average—Keswick Codlin, Lemon Pippin, and Cox's Orange Pippin; and last, but in several instances the best, the Alfriston, which with the three first named are deserved favourites.

I must step aside to observe what every Irish well-wisher will be proud of—so far there is no Potato blight in Ireland.—W. J. M., Clonmel.

ANNUAL POPPIES.—These are well worth a place where they can be left undisturbed in any position. For the last six weeks

we have had some amongst Canterbury Bells. The colours range from dark purple and crimson to the lightest shades and white, and the forms of the flowers are varied and many of them extremely pretty and effective. The Dwarf French, Carnation-flowered, and Pæony-flowered are the sorts I bought and sowed, the latter being not so well worth growing as the others. When some old and very large Laurels which had become decrepit and unsightly were cut down a few years back, the ground underneath became covered with Poppies, evidently varieties of *Papaver somniferum*, and quite distinct from any I have bought. Many of the flowers are like Tulips in their markings and colours.—R. P. BROTHERSTON.

#### HERBACEOUS AND ALPINE PLANTS.

##### ACONITUMS.

THE Monkshoods must be reckoned amongst the old-fashioned flowers. They contain a powerful acrid poison in their juices, which has not been favourable to their increased cultivation. Their juices are used to poison arrows for offence and defence in various parts of Asia; in Britain, however, the roots have brought pain and death to many by being dug up by the ignorant and used as Horseradish. As a member of the Crowfoot family it is distinguished by its five petaloid sepals, the posterior one being large and developed into a hood or helmet covering the corolla, which consists of two large hammer-shaped petals hidden under the helmet, and of several other smaller and unequal ones which are quite inconspicuous; they have numerous stamens, and the fruits consist of from three to five sessile follicles, which are many-seeded.

Aconites are bold-growing plants, and when left undisturbed for several years attain goodly proportions, and then display their handsome panicles of flowers to great advantage; they also recommend themselves to the attention of the gardener and amateur, inasmuch as they thrive under the shade of trees as well as many, and far better than most other plants. In dividing the roots for increase, or simply to reduce the size of the clump, the pieces of root cut off should be at once burnt in order to prevent accidents by misadventure. There are a great number of species and varieties, the most desirable of which we include here.

*A. Anthora*.—This species belongs to the fibrous-rooted section, and is almost harmless, although we look upon them all with suspicion. It attains a height of about 18 to 20 inches. Root leaves multifid, with linear acute dark green segments; flowers pale yellow, produced in dense panicles. It blooms during July and August. Pyrenees.

*A. autumnale*.—A beautiful showy plant usually confounded with *A. japonicum*, from which, however, it is abundantly distinct as a garden plant. It is robust in habit, usually attaining a height of about 3½ feet. Leaves palmate and downy; spikes simple; flowers large, lilac, and white or lavender blue. It flowers during the autumn months. China.

*A. cammarum*.—A stately plant for the back part of the border. As an autumn decorator it grows some 3 to 4 feet high, the leaves being palmatifid and deeply divided. Flowers rich deep purple, produced on rather lax panicles. July to September. Austria and Switzerland.

*A. heterophyllum*.—In this plant we have an instance of the poisonous properties of the family being changed into a useful tonic, the root being used to promote digestion, &c., so that we may look upon it as a converted member of a dangerous family. It is a robust-growing plant, about 2 feet in height. Leaves petiolate below, sessile above, broadly cordate, coarsely toothed at the edge, and deep green; flowers large, numerous and dense, pale yellow, and deep blue in front. August. Himalaya Mountains, 8 to 13,000 feet elevations.

*A. japonicum*.—This is a somewhat slender plant, producing numerous branches, and seldom exceeding 2 feet in height. It is an old garden pet, having been introduced from Japan nearly a hundred years ago. Leaves palmate and bright shining green; flowers numerous and deep blue. We have seen a white variety of this species. Autumn. Japan.

*A. lycoctonum*.—This is the Wolfsbane of the merry Swiss boy when he descends to botanise. It is a common plant in the Alps of Switzerland, and forms a pretty object when grown in the border, where it makes itself equally at home as when on its native hills. It attains a height of from 2 to 3 feet, bearing palmately lobed hairy leaves, which are yellowish green; flowers numerous, borne in branching clusters, pale yellow. The shape of the upper sepal or hood is very peculiar: some imaginative minds have compared it to a Welsh lady's hat, others to an extinguisher with an extra development of knob. July and August. Alps of Switzerland.

*A. Napellus*.—The roots of this plant have in several instances been mistaken for Horseradish, the result of which has been too frequently fatal. This, however, should not banish the plant from the flower border, where it is highly ornamental, but all parts divided from the clump should be destroyed by fire to prevent the possibility of any mistakes. It usually reaches a height of about 3 feet. Leaves palmate, much and deeply divided, segments deep shining green; flowers large and numerous, produced in branching clusters, intense deep blue. It is the common Monkshood, so named from the shape of its large upper sepal. May, June, and July. Europe, Siberia.

*A. Napellus bicolor*.—A form of the preceding with parti-coloured flowers, blue and white. It is a somewhat more robust-growing plant than the normal type. There is also a pure white form of the species, *A. Napellus albus*.

*A. pyrenaicum*.—This is a little-known species, and still somewhat rare in gardens. It is a stately-growing plant, attaining a height of about 4 feet, and forms a beautiful object in the mixed border. The leaves are large, palmately divided, and pubescent; flowers large, with conical hood, yellow. June and July. Pyrenees.

*A. sinense*.—Found in many gardens under the name of *chinense*. It is a dwarf plant, seldom exceeding 2 feet in height, although the growth is very robust. Lower leaves stalked, upper ones sessile; all deeply tripartite, and deep green in colour. Flowers very large, dark violet. September. China.

*A. variegatum* is a handsome kind, growing some 4 to 5 feet high. Leaves large, with rhomboid segments, and producing panicles of flowers variegated with blue and white. July and August. South of Europe.

*A. versicolor*.—This species, although last, is by no means the least desirable of those here enumerated; indeed, where only one kind can be grown we should feel inclined to select the present. It is a bold-growing plant, usually about 3 feet high, with dense clusters of very large white flowers, which are broadly margined with blue. August and September. Siberia.—W. H.

#### GOOD CABBAGE LETTUCES.

As I have repeatedly observed, I am not a great admirer of Cabbage Lettuces, and always give the preference to the Cos varieties, so also do my employers, and for this reason I never attempt to grow the former, only for such times as it is impossible to have the Cos varieties in good condition. I have, however, for some time grown, and strongly recommended others to grow, the Early Paris Market Cabbage Lettuce for the earliest spring crops in frames and near walls, as from February-sown seed plants can be had which heart quicker than any other variety that may have been wintered in frames or in the open. Not only does this variety heart quickly, but the plants are extremely close in growth, excellent in quality, and are much appreciated at the table accordingly.

The one other variety which I can most strongly recommend was grown by me for the first time this season, and is called Suttons' Le Beuf. Sown on a warm border with the Early Paris Market and some good Cos varieties, it formed a good succession to the former, being earlier than the latter. It produces but few outer leaves and the heart is conical-shaped, giving the appearance of being a hybrid between the two kinds. With regard to the quality, I can truthfully assert it to be superior to any Cos variety grown here, being really the most crisp and succulent Lettuce I have yet tasted. I have given some of it to several connoisseurs, and all are of the same opinion as myself with regard to its superior merits.

"A GROWER OF SALADS" asks why I omitted Tom Thumb in my selection (page 74) of Cabbage Lettuces suitable for autumn sowing. As he suggests, I certainly do prefer Suttons' Commodore Nutt to Tom Thumb; as, good as the latter undoubtedly is, it is inferior in point of quality to the Commodore. The latter is very hardy, is deeper green in colour, close-growing, the heart being remarkably solid and crisp. Messrs. Suttons in their catalogue mention that the Commodore Nutt does not so readily run to seed as Tom Thumb, and my experience quite agrees with theirs. "A GROWER OF SALADS," if he gives the Commodore a trial, will not regret having done so.—W. IGGULDEN.

INDIGO, ITS CULTURE AND PREPARATION.—Indigo, as is well known, is a colouring matter which has attracted attention from very early times. Cloth dyed with indigo has been found in the old Egyptian tombs. The method of preparing and using this colour is accurately described by both Pliny and Dioscorides, and the early inhabitants of these islands were well acquainted with indigo, which they obtained from the European Indigo plant,

*Isatis tinctoria*, the Woad plant or Pastel. With this they dyed their garments and painted their skins. After the discovery of the passage to India by the Cape of Good Hope the eastern indigo, derived from various species of *Indigofera*, gradually displaced Woad as containing more of the colouring matter. But this was not accomplished without great opposition from the European growers of Woad; and severe enactments were promulgated against the introduction of the foreign colouring matter, an edict condemning to death persons "who used that pernicious drug called devil's food," being issued by Henry IV. of France. The chief source of Indian indigo is the *Indigofera tinctoria*, an herbaceous plant raised from seed which is sown in either spring or autumn. The plant grows with a single stalk to a height of about 3 feet 6 inches, and about the thickness of a finger. It is usually cut for the first time in June or July, and a second or even a third cutting obtained later in the year. The value of a crop depends on the number of leaves which the plant puts forth, as it is in the leaves that the colouring principle is chiefly contained. Both the preparation of the colouring matter from the plant, and its employment as a dyeing agent, are carried on at the present day exactly as they have been for ages past. The description of the processes given by Dioscorides and Pliny tally exactly with the crude mode of manufacture carried on in Bengal at the present day. Dioscorides says—"Indigo used in dyeing is a purple-coloured froth formed at the top at the boiler; this is collected and dried by the manufacturer; that possessing a blue tint and being brittle is esteemed the most."—(*Nature*.)

#### SECOND-CLASS FLOWERS.

FIRST-CLASS flowers are costly, and far too often more than ordinarily difficult to cultivate. The finest Scotch Pansies succumb before the burning sun, and such a July as has been experienced in the southern counties; and even in cool, moist, northern districts they require much skill to grow them to anything near perfection. The finest Auriculas, except in favoured localities, require glass coverings, and pots, and daily attention, in order that superior flowers may be produced. Carnations and Picotees, and even Pinks, need layering and nursing, and special soils and manures, in order to prevent those who grow them disgracing themselves by failing. We need not multiply instances, the facts are not denied. Then leaving out the question of skill and appliances necessary to produce first-class flowers (so-called) there is the, to many, serious matter of first cost: 6s., 12s., or 18s. per dozen for Pansies or Picotees or Roses may be only a trifle to hundreds—the more the better—who delight in their flowers, but to the greater number, who cultivate flowers for the love of them, these same shillings stand in the way of the millions growing first-class flowers. It is not everyone who can afford to buy a collection of Dahlias and find that the expenditure must be incurred annually if the stock is to be kept up. It is too often a felt loss to buy a couple of dozen Hollyhocks and find in a short time that the disease has claimed them, and so on.

We hope our remark will not be misconstrued. We say nothing against those who have skill and money enough to enable them to grow the very choicest gems, and we would feel very sorry were our remarks to lead to their abandonment by a single grower. And we do not expect they will. The florist proper has a way of his own, and is not easily moved by "uneducated" dabblers outside the circle. We wish to comfort those whose skill is small and purse short. It is a great mistake to suppose that flowers to be beautiful must be dear, tender, and ill to grow. The reverse is the fact. No bed of florists' Pansies ever produced such a quantity of beautiful blooms as that one in the artisan's little garden over the wall there, and we doubt if ever florist enjoyed his production more. To be sure he knows nothing of "Glenny's properties," and it is well, for if he did I fear he might enjoy his flowers less. Such is the perversity of human nature. Possibly he might "go in" for florists' varieties—and what then? Probably not more, and perhaps less, satisfaction. Now his wife and bairns can treat their friends to handfuls, and we all know how blessed it is to give.

I wish those who repine because they cannot afford to spend much money on "first-class" flowers could see our doctor's (not the Journal's Doctor) garden in springtime. All along the sides of the walks are hundreds of seedling Polyanthus and Auriculas growing with a vigour that florists' varieties never knew, and producing flowers in prodigal profusion of as fine colours as the named sorts. The doctor is immensely fond of his flowers and proud as well, and many a friendly dispute he used to have with Sandy Macfarlane, a village florist, now, alas! gone into the "silent land." Unless flowers of "florists'" kinds were up to the mark there was no pleasing good, honest, laughing-faced

Sandy. To "take a rise" out of the doctor he would walk round with him and listen to his praise of his beauties, and when they had finished Sandy would take the trusses gathered by the doctor one by one and point out that not one was fit to look at. I once was one of the party, when something like the following passed between them:—"Noo jist look at that; hoo ean ye ca' that 'first-class,' man? it's preen-e'ed." "Pin—what?" "Preen-e'ed." "I see neither eyes nor pins, and I don't want lessons in millinery. Where's the pin?" "That's hit, richt i' the middle." "That a pin! that's the pistil." "That a pistol!—it's a preen." "Pin be hanged!" "Pistol be hanged!" "Well, well, you florists never give in, so I must; but there is no pin in that one." "No, but it's no roond." "Is it square?" "It's neither roond, square, nor oval; it's a perfect fright." "Oh, get out now, that'll do." Such is a fair example of the never-ending bickerings between the good doctor and his florist friend; and such, in other words, is the gist of the dispute that has ever reigned since florists began to "improve" and to teach.

For a shilling anyone can buy a packet of *Polyanthus*, or *Auricula*, or *Pansy* seed, or indeed almost of any florists' flowers, and from that packet raise hundreds, it may be, of beautiful flowers. True, a few may be "pin-eyed," but the cushion may be none the less beautiful. The markings may be less regular, the form a little less perfect; instead of perfect smoothness there may be undulating edges, and they may not be perfectly "roond;" in a word, they may only be "second-class" flowers in the eyes of a genuine florist, but to you they may be all that is fair and lovely. Against any imaginary deficiency they may have in departing from the recognised standard we may place their cheapness, for sixpenceworth of seed will produce as many plants as could be bought for £5 of fine kinds; their strong constitution—for seedlings are generally much superior in this respect as well as in hardiness to fine named varieties—the profusion of flowers they produce as a consequence of their vigour, and the comparatively little skill necessary to produce them. These recommendations alone ought to commend "second-class" flowers to those who find that their skill or circumstances are not sufficient to enable them to succeed with other kinds.

These remarks apply to every florist flower that we know; but we may also remark that even by such means as we have indicated something approaching "first-class" flowers may be successfully attempted. When a grower has hundreds of plants selection is easy. Plants which have faults may be tossed to the rubbish heap without a pang when we have plenty to fill their places. Then we can save our own seed, and sow in big beds; and when we have thousands of seedlings we can afford to be fastidious, and may then make severe selections, and thus go on ever reaching higher and higher. Moreover, the raising of plants is one of the most fascinating pastimes anyone with a love for gardening can indulge in.

There are many ways of producing with ease "second-class" flowers other than by raising plants from seed. It often happens that named kinds possessing a vigorous habit may be had cheaply, and their culture successfully attempted, for often plants are dear simply because they are scarce, and scarce because they have poor constitutions. Those who have time and skill and an abundance of necessary appliances may go on nursing and coaxing small puny plants which produce particularly prized blooms; but we do not write for those who can afford to do all this, and so we advise them to avoid puny-growing plants of all kinds. It is very common at an exhibition of Pansies, Roses, or Carnations to see enthusiastic but unskilful amateurs taking the names of the most exquisite blooms; afterwards ordering, receiving, and planting the kinds, from which equally fine blooms are expected, but which only bring disappointment. Good constitution is being more insisted on now when plants, flowers, or fruits are presented for certificates; but even yet flowers and fruits are too often certificated on the presentation of an insufficient number of examples. So far as true florists are concerned the evil is perhaps not great, for they generally know what they are doing, but it is very different in the case of the general public. It is not every lover of flowers who has time enough, but those who have would consult their own interests by selecting their plants from the growers and choosing only those in robust health. Satisfaction instead of disappointment would then be the result, for most likely the grower would reap what he had sown.

Not only by these means may "second-class" flowers be made to prove satisfactory, but it would be well for unskilled growers to substitute hardy plants for tender and half-hardy ones, and robust growers for weakly kinds that are in the habit of dying out when extra hard winters visit us. A mere fraction of the expense, to say nothing of trouble required to make a display of Hollyhocks, which sometimes under adverse circumstances

disappear altogether, will produce an extravagant display of Fox-gloves, which are, we think, even more beautiful than Hollyhocks, and when once possessed of a good strain it is difficult to get rid of it: with Hollyhocks it is difficult to keep it. In districts where *Pelargoniums* and *Calceolarias* do badly, *Violas* of innumerable shades often prove greatly superior. For a dark crimson bedder in a cool moist climate we find that *Dianthus Napoleon III.* is very much more effective than any bedding *Pelargonium* whatever, that it strikes like a weed in September, and no frost—not even 36°—injures it. In our northern climate we are greatly adding to the quantity of the flowers and the effectiveness of the beds by dropping tender plants as fast as substitutes can be found. *Arabis alpina variegata* makes as beautiful a bed and a better edging, and it is more compact than any variegated *Pelargonium*, while it is "in form" two months longer than *Pelargoniums* in the nature of things can be, while no glass, not even a frame, is needed to protect it. *Dactylis glomerata variegata* surpasses in elegance and effectiveness any other variegated plant, and *Cerastium tomentosum* is not yet equalled. *Saponaria calabrica* on rich soil thinly sown surpasses by far the best bed of *Christine Pelargonium* ever seen. But what need is there to multiply instances? Lists we need not, they have been published in plenty. What we have named are common and are ranked as "second class," but they are not so. It is only fashion, and sometimes want of knowledge, which have put plants not so good as they before them. Slowly but surely we are finding our way back to simplicity and profusion. Slowly but surely we are finding out that lovely and loveable flowers may be had in abundance, even though they may be such as florists name "second class," and such as floral committees would refuse to certificate.—SINGLE-HANDED.

#### DOMESTIC FLORICULTURE.

VARIOUS agencies are established for promoting a love of flowers and encouraging a taste for gardening pursuits among the industrial classes—the brain and muscle-working population of our land. For the purpose of reporting progress and inciting to further effort in this laudable direction flower shows—domestic shows—are periodically held in different districts of London and other large populous centres. One of the prettiest shows of this nature, inaugurated and conducted under somewhat exceptional circumstances, was held in Shaftesbury Park last Saturday.

Let no one associate the idea with any nobleman's park, where the deer gambol and ancestral trees spread their tinted shadows on the grass. No; Shaftesbury Park is a suburb of London, a sort of model village that was opened by the late Lord Beaconsfield a few years ago, and was named in honour of Lord Shaftesbury, who has laboured so long and so well in the establishment of happy homes for working people. Shaftesbury Park, then, is a park of bricks and mortar, yet of trees and gardens; the latter exceeding a thousand in number. The character of the gardening on this estate was described in the issue of this Journal of October 11th, 1877; and it was stated there that prizes used to be offered for well-kept gardens, but the practice had fallen in abeyance, and much of the floral brightness of the district departed.

By a rather singular coincidence the representatives of three horticultural papers eventually either settled on the estate or near it. These individuals determined to do something to foster domestic floriculture, and they took an active part in establishing a Garden Improvement Society. They knew also of others who are earnest in the desire the promoters had in view, and valuable aid was secured. Sir Trevor Lawrence, Bart., M.P., consented to become President; the Royal Horticultural Society's medal was obtained as the "Champion Prize;" funds were collected, a show projected, and rules framed. For the Show, collections of plants and flowers were generously supplied by Messrs. Veitch & Sons, Chelsea; Turner, Slough; Osborn, Fulham; Laing & Co., Forest Hill; Cannell & Sons, Swanley; Ware, Tottenham; Neal & Sons, Wandsworth; and Roger, Battersea Park. Splendid *Liliums* were also kindly sent by Mr. G. F. Wilson; *Gladioluses*, &c., by Mr. J. C. Stevens; and a substantial gift from Mr. James McIntosh. In orthodox language it would be said these contributions added greatly to the effect of the Exhibition; but the fact is, they made it, and it is certain that no floral display in the district has ever equalled the one in question.

Prizes were given for garden and window plants. These consisted of nearly a hundred articles of ornament and utility, ranging in value from £1 downwards; also pottery ware from Mr. Matthews; wire-work from Mr. Thomas, and gardening books from various donors. Some of the gardens were marvellous examples of what may be done in a small space where taste and industry are combined and find expression. The question of economising space and rendering plain articles of utility ornamental about reached its climax in the case of the man who made his dust-bin a work of art, painted neatly, the lid being converted into a box for growing Mustard and Cress; yet even this worthy individual did not win the champion prize.

It may perhaps be well to dismiss the plants with the remark that, creditable as some of them were, it is to be hoped they will be better

next year; yet a show of this magnitude of course demanded high-class judges, and the services of Messrs. Barron of Chiswick, Baker, and Gordon were obtained. Mr. Barron was delighted with the Show, which was a great success, and everyone was satisfied save an eccentric individual—and whoever saw a show without one?—who appeared considerably insulted because he was awarded a first prize. Surely this is sufficiently rare to be placed on record.

Sir Trevor Lawrence delivered an admirable address; he noted with pleasure the aid rendered by the nurserymen, spoke words of encouragement to the local exhibitors, and hoped, what all will hope who read these lines, that horticulture will prosper and pervade all ranks of society, leaving its beneficent impress everywhere.

#### A POTATO GARDENER'S DILEMMA.

HAVING been in a somewhat similar state last season with Champion Potatoes as "F. S." is now with Magnum Bonum (see page 103), I would advise him to follow my example—viz., to let them remain as they are until say the middle of September, and then see what progress they have made. At about the same period last year my Champions had scarcely any tubers formed, but I let them remain to see what they would come to, and to my great surprise I had a splendid crop of fine Potatoes. In no case whatever should he cut out the haulm while it is green, as that will stop the growth of the tubers at once. I have some Magnum Bonum planted the same distance apart as "F. S.," and they too look very thick, but still I hope to have a good crop by the time they are ready to lift.—JOURNEYMAN.

ALL that "F. S." can safely do in regard to his overcrowded crop is to pull up some of the weakest growths, if weak growths are numerous. He had better let the strong growths alone and "take their chance;" indeed, unless the weak haulms are removed with great care the remedy may be as bad as the disease, as if the strong growths are injured the crop will be injured also. A mistake has been made in planting too thickly, and this against the advice of competent men, for it has frequently been stated in the Journal that the Magnum Bonum and Champion varieties cannot have justice done them unless planted nearly or quite 3 feet apart in the rows: and still your correspondent has ignored the advice and planted at Ashtop distances—2 feet. He may still, however, have a fair crop, but it cannot be of nearly the value it would have been had he taken the advice of experienced cultivators in the spring instead of in the autumn.—A PRIZETAKER.

WERE I in such a dilemma as your correspondent "F. S." (page 103), I should cut out every other row close to the ground, and be very careful not to injure in any way those left. Very few tubers will form under the present circumstances, and they will be very small. It will be no use stopping the haulm, because that will prevent the tubers growing. I should do as I have suggested at once, as there is yet a month for growing, and there will be some hopes for the Potatoes growing to a fair size. It is most difficult to get people to plant Potatoes right; all the early Potatoes that I have planted this year are 2½ feet apart; seconds, 3½ feet; and late varieties in the field, put in with the plough, 4 feet, and 15 inches from plant to plant; and now they are nearly touching each other and look well.—R. R. S. H.

#### CARNATIONS FROM SEED.

I CAN endorse all your correspondent "J. W." has said on this subject, and would advocate the raising of seedling Carnations where cut flowers are required and borders have to be kept gay. After being disappointed with the quantity of flowers the named varieties produced—one flower spike only being produced on each plant, the majority of the young plants having kept in pots during the winter—my attention was drawn to seedlings. My first lot proved a great success, and every season since I have sown a pan or more of seeds. The percentage of single flowers has been very small with me, not more than half a dozen out of a hundred plants, which was about the number of seedlings obtained out of my first batch. When ordering the seed the perpetual kinds should be obtained, as they are by far the best for flowering, many of them commencing before the named kinds expand, and continuing until cut off by frost.

I think your correspondent has considerably underrated the quantity of flowers each plant will produce raised by layers from strong seedlings. After seeing the notes on page 98, I counted with a friend flowers and buds on the first plant we came at, and it had upon it 233. Is not this the best way of obtaining Carnation blooms when quantities are wanted for cutting purposes instead of trusting to named kinds that produce from five to twelve flowers, beautiful in shape and form, but no better adapted than the others for filling vases?

When flowers are produced sparingly cultivators are almost afraid to waste the buds in cutting, and in consequence have to take them off with short stems of but little service for vase work; but with seedlings good stems can be cut with the blooms, thus sacrificing a few and benefiting the plants.—SCIENTIA.

#### CHOICE CAMPANULAS.

AMONG many other beautiful Bellflowers one of the newest and one of the best is that of which a flower is so well portrayed in the accompanying woodcut (fig. 22). *Campanula macrostyla*, so

Fig. 22.—*Campanula macrostyla*.

named on account of the extraordinary development of the style, is a native of mountainous districts in Asia Minor, whence a few years ago it was sent to this country. As to who was the fortunate discoverer I have not been able to learn, and if any of your numerous readers who are interested in hardy plants can give me the information I shall be greatly obliged. I think it probably came to England through some of the continental nurserymen, as I do not see any of our own nurserymen claim the honour of having introduced it. The flowers are of the open bell-shaped type, and are prettily veined with a purplish mauve or lilac, but very distinct from the hues characterising the majority of Campanulas. The large club-shaped style when mature expands at the summit into three white blunt lobes, which constitute the stigma. The plant is dwarf in habit, and is admirably suited for a rockery, where it flowers freely during July.—X.

#### FENNEL FLOWERS.

NIGELLA is a small genus of annual plants. They derive their name from the colour of their seeds, which are used somewhat largely in cookery as seasoning in continental cities; the seeds are also said to be used in the adulteration of pepper. The English

name of Fennel Flower is derived from their finely cut leaves, which bear a great resemblance to Fennel. Nigellas well deserve a place in every flower garden. They do not like transplanting, and therefore the seed should be sown in the open border. The first sowing should be made in the end of March, another about the end of May or beginning of June, and if required to flower in the early spring sow again in the middle of September. Thin the plants to about 6 inches apart, four to six being quite sufficient to leave in a group.

*N. damascena*.—A very handsome plant, bears the strangely conflicting names of Love-in-a-mist and Devil-in-a-bush. It attains a height of about 2 feet, with finely cut bright green leaves. Flowers large, terminal, blue, enveloped or surrounded by a mossy involucre formed with its Fennel-like leaves. There are also a white and double-flowered form of this species.

*N. hispanica*.—This is at once distinguished from the preceding by the absence of the peculiar involucre surrounding the flower; it is also dwarfer in habit by some 6 inches. Flowers terminal, large and showy, deep blue; the stamens conspicuous and blood colour. From Spain and Northern Africa.

*N. orientalis*.—Though decidedly inferior in beauty to the previously named kinds, both flower and carpels are curious and attractive. The plant is about 18 inches high. Leaves divided into long narrow segments, pale glaucous green. Flowers terminal, yellow spotted with red.

*N. sativa*.—The seeds of this kind are in great repute with the Egyptian ladies for improving the complexion. It is also supposed to be the plant alluded to by the Prophets Isaiah and Ezekiel by the name of Black Cummin or Fitches. Plant 12 to 18 inches high. Leaves much-divided, segments short. Flowers yellow. The least showy of all. Egypt.—W. H.

MR. CUTLER writes to us as follows relative to the simultaneous collection that has recently been made on behalf of the funds of the GARDENERS' ROYAL BENEVOLENT INSTITUTION—“As I feel certain that many of your readers take great interest in the success and progress of this movement, I beg to inform you that up to and including this morning, the 12th inst., I have received 206 responses to the appeal of the Committee, contributing the sum of £241 14s. 1d., being an average of £1 3s. 5d. each response.”

— THE INTERNATIONAL POTATO EXHIBITION to be held at the Crystal Palace, Sydenham, September 20th and 21st, is by its promoters expected to prove more than ordinarily interesting. The schedule contains some novel features, and arrangements will be made for cooking and tasting new varieties previously to any adjudication upon their merits. We advise intending exhibitors to select their samples when lifting their crops, this being far better than searching for them afterwards in the store. Schedules may be obtained of the Secretary, Mr. A. McKenzie, Tower Chambers, Moorgate Street; and moneys may be paid to the Treasurer, Mr. Shirley Hibberd, 15, Brownswood Park, London, N.

— MESSRS. JAMES CARTER & Co. have sent us a plant of their new Tom Thumb TROPÆOLUM EMPRESS OF INDIA. The plant possesses the excellent habit and small bluish green foliage of the King of Tom Thumbs, which is so well known and widely cultivated. But rich as that variety is in colour, the Empress of India is decidedly richer, being an intense crimson scarlet with a velvety gloss. The form of the flower is good and the petals stout. This new variety, which is to be sent out this season, will prove an acquisition for beds, borders, and balconies.

— “W. B.” writes confirming what Mr. Brotherston says on page 86 in relation to DIANTHUS NAPOLEON III. “It is,” he says, “a beautiful plant, but liable to go off when planted in the borders. It is a safe plan to keep a few in pots and winter them

in a cold frame. Napoleon III. does well in pots for decoration, and will flower well towards the end of June or early in July, if kept in frames during the early part of the season.”

— THE following GARDENING APPOINTMENTS have recently been made:—Mr. D. Williams, late foreman at Lockinge, succeeds Mr. Hinds as gardener to Lord Wimborne, Canford, Wimborne; Mr. G. Richards, late foreman at Gunnersbury Park, succeeds Mr. Chilman as gardener to the Earl of Normanton, Somerley, Ringwood; Mr. A. Mackellar, late foreman at Penryn Castle, succeeds Mr. Knight as gardener to the Duke of Roxburghe, Floors Castle, Kelso; Mr. H. Knight, late of Floors Castle, succeeds Mr. Brown as gardener to the Rt. Hon. W. H. Smith, Greenlands, Henley-on-Thames; Mr. Jno. Wilson, Belsize Court, Hampstead, succeeds Mr. Smith as gardener to Miss Sullivan, Broom House, Fulham; and Mr. A. Burgess, Roby, Sydenham Hill, becomes gardener to Frances Lady Hastings, Franklands, Burgess Hill.

— “WE have to announce,” says the *Literary World*, “the death of MR. HEWETT COTTRELL WATSON, the eminent topographical botanist, which took place at Thames Ditton on the 27th ult., after a long and painful illness. Mr. Watson was the son of Mr. Holland Watson, a magistrate for the counties of Cheshire and Lancashire, and was born in May, 1804. Having completed his education at the University of Edinburgh, for some years he edited the ‘Phrenological Journal,’ but after his withdrawal from that position he devoted himself more exclusively to botany, on which he published many works. He was also the author of numerous pamphlets and papers, and among the best known of those is the ‘London Catalogue of British Plants,’ the sixth edition of which bears the date of 1867.” Mr. H. C. Watson was best known in scientific circles by his *New Botanists’ Guide* and *Cybele Britannica*.

— IT is announced that the annual Exhibition of the NORTHERN DIVISION OF THE NATIONAL CARNATION AND PICOTEE SOCIETY will be held on Wednesday, August 24th, in connection with the International Exhibition in the Botanical Gardens, Manchester. The Council of the Botanical Society have granted £10 towards the prize fund, exhibition space, and free passes to exhibitors. The Rev. F. D. Horner, Kirkby Malzeard, Ripon, is the Hon. Secretary and Treasurer.

— AT the last meeting of the Council of the Royal Agricultural Society of England Mr. Charles Whitehead, Maidstone, moved that PRIZES FOR VEGETABLES AND MARKET GARDEN AND FARM FRUITS be offered at the Reading meeting, and that it be referred to a Committee, which he named, to draw up a scheme for this purpose and report to the November Council. Mr. Whitehead said he was sure such a show would be immensely popular and prove of great advantage to the producers of vegetables and fruit, the growth of which he felt confident might be very largely increased, to the benefit not only of the growers but of the consuming public, many of whom were only able to obtain vegetables and fruit at almost prohibitory prices. The Royal Agricultural Society might do very much, not only to encourage an increase in the growth of fruit and vegetables, but also to help towards an improved preparation and distribution of them, and also, as he believed, to establish an export trade in these commodities to France, Holland, and Belgium. The details of his scheme were yet in embryo, but if the matter were referred to the Committee they would be in a position shortly to ask for the allotment of a sum of money, which, however, he was satisfied would be very small compared with the great advantage to be derived. Mr. James Howard, M.P., seconded the proposal, which after some discussion was adopted.

— AMONG the numerous beautiful HARDY PLANTS AT

MR. WARE'S NURSERY, TOTTENHAM, very noticeable a few days ago were the two attractive Lilies, *L. Leichtlinii* and *L. Batemannæ*. Flowers of these are now before us; and though they are considered as closely allied botanically, their appearance to casual observers would not suggest a very close relationship. They are both included in the sub-genus *Martagon*, the first-named, *L. Leichtlinii*, having neat flowers of moderate size, the petals strongly recurved, narrow, pale yellow, and spotted with very dark purple. *L. Batemannæ*, also a Japanese form, is of stronger taller growth than the preceding, with larger flowers of a reddish orange colour. It is very bright in colour and free in flowering. Another effective and useful plant is *Asclepias tuberosa*, which at this period of the year is scarcely excelled amongst herbaceous plants in the brightness of its scarlet or coral-tinted flowers. These are borne in dense umbels in the axils of the leaves near the upper portion of the stems. Among many pretty single Dahlias a white variety with broad oval petals and bright yellow centre is deserving of notice, numerous other choice plants contributing to the attractions of the nursery.

— MESSRS. CASSELL, PETTER, & GALPIN send us the current parts of the following periodical works now being issued by them, and to earlier numbers of which reference has been previously made. Part 12 of "Paxton's Flower Garden" contains coloured plates of *Jasminum gracillimum* and *Moutan officinalis* (*Pæonia Moutan*) var. *Salmonca*, the former (of which an excellent wood-cut was also published in this Journal, December 23rd, 1880), being admirably represented; indeed it is unquestionably one of the best plates that has yet appeared in the work. They are accompanied by descriptions and cultural instructions with a continuation of the "Gleanings." Part 30 of "Familiar Garden Flowers" gives coloured illustrations and full descriptions of *Coreopsis lanceolata* and *Adonis autumnalis*. Part 53 of "Familiar Wild Flowers" has coloured representations of *Fritillaria meleagris* and *Sisymbrium officinale*, which are also interestingly described.

— THE following paragraph appears in the *Gardener* relative to the QUALITY OF FRUIT:—"It cannot but have struck the frequenters of our summer flower shows during the past two or three years, that there has been an appreciable falling-off in the quality of the fruit exhibited—particularly Grapes. Pines, of course, have been few and poor, the supply of St. Michael's Pines having greatly reduced the interest in Pine culture in our gardens. It is not so with Grapes, however; and unless we are to attribute the inferiority of the examples that have been shown to the recent bad and untoward seasons we have experienced, it is difficult to assign a cause. It is not at all improbable that the cold and dull seasons following one another in succession for a number of years, as has been the case, may have impaired the constitution of Vines under glass. The agricultural papers say that the effect of the continued cold and sunless seasons has been to deteriorate the quality of the hay crops, and almost to destroy much of the finer and better herbage, whose place has been usurped by the coarser grasses; and it requires no stretch of the imagination to believe that permanently planted indoor subjects may have suffered in some degree also. The complaint of the fruiterers this season is that Grapes are unusually ill-coloured."

— "G. O. S." asks if any of our readers can tell him how to make "birdlime" from the bark of Holly trees recently cut down.

#### NOTES ON CIRCUIT.

THE summer assizes as far as concerns the Roses are over, and those who have been acquitted as well as those who have been condemned, the prizewinners and the defeated candidates, can now look back with doubtless very different feelings to the events of the past months. Some will recollect with what ease they won their position, others how close a matter it was, how very little between them and defeat; while many who think over their

failures will see where their weakness was, and endeavour to secure in another season that which they have failed to accomplish in the present one. Amongst these various encounters I have been busily employed. It is my holiday time, and a very pleasant although often a very laborious one it is. I have been present at sixteen Rose shows; at these, with the exception of those of the National Rose Society, where for obvious reasons I declined to act, I have officiated in the capacity of Judge; and as I could not annihilate the conditions of time and space, had to refuse requests to act from six other places. I have sometimes had to act single-handed, but generally with others; and having already given notices of some of the exhibitions that I have attended I shall in these notes refer to the remainder, noticing anything that has struck me as remarkable where a detailed account would be needless. My usual *résumé* of the Rose season I shall reserve for a little later period, when we have seen the result of the Manchester Exhibition and how Roses come out in the latter part of August.

On my way to Sheffield I was detained for a couple of hours at Nottingham, and on walking through the town I saw a placard up, "To the Rose Show;" and on inquiring of a policeman found that it was open that day. So I jumped into a bus, which brought me to St. Ann's; and here, then, was the famous show spoken of by Canon Hole in his "Book about Roses." On sending in my card I was courteously received by the Secretary, a major in a volunteer regiment, and consigned to the care of another gentleman who had been formerly a President of the Society. I was ushered into a large tent some 200 feet long filled with Roses, vegetables, Fuchsias, and stove and greenhouse plants, and as I was told that it was entirely an artisan show managed by themselves it certainly was at first sight very creditable. Nottingham is famous for its allotment gardens, there being literally miles of them, so that the artisan class have a good opportunity of employing their leisure time. I was about to expatiate upon the admirable result of this system, how it must tend to elevate them, &c., when my companion said, "I wish it were so. But I think this is such a Rose show as you have never seen before." They were not shown, I should say, in large stands; sixes, threes, twos, and single specimens being about the number; and when I saw sixteenth prize in the class for six blooms I must say I did not envy either the Judges who had to award or the grower who had won the prize. "But," said my companion, "look at this Rose," pointing me to a fine specimen of Charles Lefebvre; "you will see on this leaf a letter marked in ink." Sure enough there it was. I said, "What is the meaning of this?" "Well," he said, "we found that exhibitors were not very particular as to how or where they got their Roses for exhibition; and so, seeing that their ideas of the *morale* of exhibiting were rather hazy, the Committee deputed some of their number to go round the night before the Show, ask each exhibitor what Roses he is going to exhibit, and then mark them with his initial. But," he said, "even this was not enough. We found in one or two instances that the ink had been cleverly damped and transferred to another Rose. So you will see that here the man's name is put at full length. They are very angry at being thus marked out, but what could we do?"

All this was disheartening; but I must say examples of this kind are to be met with even amongst growers who cultivate a much larger number. I remember at a Crystal Palace show a grower (not an amateur) coming up with a Rose in his hand to one of our best exhibitors. "Is this so-and-so?" "Doubtless." "Then I have duplicates. Could you oblige me with one?" a request which was complied with thus—"If you don't be off I'll kick you out of the Palace." I have known an exhibitor in a collection of stove and greenhouse plants try to filch one from the next collection to make up his number. But these are exceptional cases, which are, I fear, to be met with in all exhibitions. In those for dogs, birds, poultry, horses, &c., false statements as to age, and other tricks to make them appear different from what they really are, are not unfrequent, but I never met with it in such a wholesale manner as at Nottingham. And then as to its elevating tendency. I grieve to say that my companion said some of the roughest and most intemperate of the artisans were amongst the successful exhibitors, and that one had to be turned out the night before for his foul and abusive language. "The truth is," he said, "The Society is going to the dogs. Everything has been done to get it out of the pothouse element. That will be its destruction. The coffee palace was given to them to hold their meetings in, the clergyman offered to help them; but no. Beer was their master, and hence everyone of respectability is withdrawing from it, and the whole thing must collapse." Now here is a Society where no "interfering parson" or "meddlesome squire" has come in to put things (as they sometimes aver that they do) wrong. It is an artisans' Society managed by artisans, and this is the result. It is a sad

proof, if more were needed, that the old Latin proverb is a fallacy, and that to have learned arts such as gardening neither softens men's manners nor makes them gentle. The affection that is to expel the old evil must be stronger than a love of flowers or art. It is, of course, a little hard on an honest exhibitor that he must suffer for the faults of his neighbours. We often find that a Rose which has been depended upon for exhibition is gone before the morning, and then in Nottingham a man's chance would go with it. Now in saying all this I have been only influenced by a desire to do good to our friends there. Let them recollect "faithful are the wounds of a friend," and if I have probed the wound it is in the hope that by so doing I may help to cure it. Let them not "think I am become their enemy because I tell them the truth." If they could but see how discreditable this is to the character of the class to which they belong I hope and think they would make a strong resolution to put an end to these practices.

But how did they exhibit? Well, I can truly say surprisingly well. Size is evidently more looked upon with favour than form or colour, and hence Paul Neyron is an especial favourite, they having given it the name of their favourite hero, that "unfortunate nobleman languishing in Dartmoor prison." Ah! I heard frequently from the lips of some begrimed horny-handed artisan, "Look at old Titch [Titchborne]. Is not he grand?" as they stood before a Rose large enough for a Cauliflower. Withal there were some grand blooms of our favourites Charles Lefebvre, Marie Baumann, Prince Camille de Rohan, and others, the few trees that they possess evidently obtaining that special and individual care in which all pets delight. Their vegetables were excellent, and, indeed, everything showed the mark of intelligent care. One grower, who I was informed was a petty tradesman but little removed from the artisan class, exhibited some excellent examples of such plants as *Eucharis amazonica*, *Dracenas*, &c., while *Fuchsias* were well-grown small plants. Many of these artisans have rented small houses for themselves, which are devoted to the cultivation of stove and greenhouse plants, and of which their owners are as proud—indeed prouder, for they are more part of themselves—than the owners of the long ranges of houses at Chatsworth, Trentham, or Eaton. They are attended to with most loving care, and the old story of the *Auricula* grower who stripped his own bed that he might put the blankets on his frame one cold winter's night, might be reproduced here. It is a great pity that all should be marred by this flavour of dishonesty which pervades the whole thing. If this evil were stamped out I am sure the St. Ann's Society would receive such encouragement as would make it one of the most interesting societies in the kingdom.—*D., Deal.*

## ROYAL HORTICULTURAL SOCIETY.

AUGUST 9TH.

GLADIOLI from Langport and *Petunias* from Swanley were the two special features of the meeting, though new plants were well represented by the Chelsea firms. The Council-room did not present a crowded appearance, nor were the duties of either Committee very onerous, but for the fast-advancing season the exhibits were good in quality and numbers.

FRUIT COMMITTEE.—Harry J. Veitch, Esq., in the chair. W. H. Dunnett, Esq., Stour House, Dedham, Essex, sent fruits of a new seedling Black Currant named Black Champion, for which a first-class certificate was granted. The individual fruits were of remarkable size, globular, and very black. The bunches also were unusually large, and, judging by the small branches exhibited, the variety must be an extremely prolific one. Both the members of the Committee and the horticultural visitors generally were unanimous in their praises of it, and several unhesitatingly affirmed it was the finest Black Currant that has been seen at Kensington. Mr. R. Phillips, gardener to Captain Jackson, The Deodars, Meopham, Kent, showed three handsome bunches of Duke of Buccleuch Grape, for which a cultural commendation was deservedly awarded. The berries were of remarkable size even for this variety, and the flavour was good. Fruit of Tomato Perfection, a cross between Trophy and Acme, were also shown. They were very even and globular in form, and of excellent colour. It is also said to be prolific. Mr. Record, gardener to Chas. Hanbury, Esq., Belmont House, East Barnet, was awarded a cultural commendation for three Queen Pine Apples, of good size, regular in shape, and of good colour. Messrs. T. Rivers & Son, Sawbridgeworth, exhibited a collection of Cherries, comprising eleven varieties, especially noteworthy being the handsome Bigarreau Noir de Schmidt. Several other varieties were also superbly represented. A vote of thanks was accorded. Mr. T. Bailey, The Gardens, Shardeloes, Amersham, sent a finely netted fruit of Victory of Bristol Melon, weighing 7 lbs. 2 ozs. Mr. J. Monro, The Gardens, Harefield Grove, Uxbridge, also sent a very large ribbed green-flesh Melon named Highfield Grove Melon, of moderately good flavour, but not great depth of flesh. Mr. J. Walker of Thame obtained a first-class certificate for Pea named Walker's Perpetual Bearer, a variety of moderate height

and prolific, the pods being about medium size and well filled. Mr. H. Eckford, gardener to Dr. Sankey, Sandywell Park, Cheltenham, also had a new Pea named Victor, a cross between Champion of England and Advancer, but which was not considered specially remarkable. Mr. Culverwell of Thorpe Perrow sent several seedling Peas that were thought very promising, and recommended to be tried at Chiswick. A collection of Apples and fruits of the Pear Bergamotte Auguste Jurie were contributed from the Society's Garden. Mr. Fleming, of Cliveden, Maidenhead, sent fruits of Dr. Hogg Fig in good condition, and the Committee requested that the variety should be tried at Chiswick.

Messrs. Hooper & Co.'s prizes for fruits of the green-flesh Melon Sirdar of Cabul were accorded to Mr. G. Williams, The Gardens, Peasmarsh Place, Rye, and Mr. G. Stiggles, gardener to H. W. Green, Esq., Faulknors House, Hadlow, Tunbridge, who were placed first and second respectively for fruits of good size, the former smooth and the latter ribbed. There was no exhibit in the class for Tomatoes.

FLORAL COMMITTEE.—James McIntosh, Esq., in the chair. Messrs. J. Veitch & Sons, Chelsea, staged a beautiful though small group of new plants including several fine Orchids, one of which was certificated and is described below. A *Solanum*-like plant named *Jasmonica Sodenia* (?) was noteworthy for its cymose panicles of white starry flowers; and hybrid *Cypripediums* were also well represented. Mr. Bull of Chelsea contributed a collection of new plants, several being honoured with certificates. Messrs. Kelway & Son, Langport, Somersetshire, had a handsome collection of Gladioli, over four dozen spikes being shown, the flowers large and the colours varied, either exquisitely delicate or strikingly rich and bright. Messrs. H. Cannell and Son, Swanley, contributed a fine display of double *Petunia* blooms, 160 being staged, representing many distinct and beautiful varieties. Some very pretty fringed forms were particularly noteworthy, and the tints ranged from white to pink of various shades, crimson, and purple, some being very rich. Several large Sunflowers, fine African Marigolds, specimen of the dwarf, free, brightly coloured *Tropaeolum Vesuvius*, and varieties of *Salpiglossis sinuata* were exhibited by the same firm, for all of which a vote of thanks and cultural commendations were awarded. Mr. A. Waterer, Knap Hill, Woking, had some fine examples of *Lilium Parkmanni* and *L. Mrs. Waterer*, the former being very handsome and well deserved the cultural commendation awarded for it. Baskets of *Erica vulgaris aurea* and *alba nana* were also shown, the last-named being very floriferous and compact in habit. A variegated *Abies* was certificated, and is described in another portion of the report. Messrs. Carter & Co., High Holborn, exhibited some good specimens of the deep orange-coloured Lily *L. Batemannæ*; flowers of a new bright rose-coloured *Eschscholtzia* named Rose Cardinal, very pretty; and flowers of the new dwarf *Tropaeolum Empress of India*, which were very bright in colour. Mr. T. S. Ware, Tottenham, staged a collection of single Dahlias. A white variety of good form named White Queen was noteworthy, as were also some yellow, scarlet, and purple forms. Mr. W. J. Cross, florist, Salisbury, sent a stand of blooms of a Carnation named The Governor, blush white, compact, full, even, and of good substance.

Captain Patton, Alpha House, Regent's Park, sent a plant of *Lilium auratum* with a peculiar fasciated stem, the numerous flowers being very closely clustered near the summit. G. F. Wilson, Esq., Weybridge, was awarded a vote of thanks for a spike of *Watsonia rosea*, the flowers possessing a very pretty shade of light rosy purple.

In the vestibule Messrs. C. Lee & Son, Hammersmith, had an interesting collection of hardy trees and shrubs, comprising ornamental and variegated forms of Oaks, Beeches, Elms, Alders, Horse Chestnuts, Maples, Elders, Dogwoods, and many others, all more or less attractive. Messrs. F. & A. Smith of West Dulwich also had a group of Balsams in pots, the plants of moderate size, but the flowers were of excellent form, very double, and good in colour. The Committee recommended that medals should be awarded to Messrs. Kelway for their Gladioli, to Messrs. Cannell for their *Petunias*, and to Messrs. Lee for the hardy plants.

First-class certificates were awarded for the following plants—

*Cattleya Chamberlainiana* (Veitch).—A beautiful hybrid between *C. Leopoldi* and *C. Dowiana*, the former parentage predominating. The sepals and petals are narrow, of a purplish crimson hue, the lip being fringed and rich purple in colour.

*Bouvardia Alfred Neuner* (Bull).—The double American *Bouvardia* which has been repeatedly described in these pages. Some of the umbels on the plant shown had over a dozen flowers of neat form.

*Adiantum aneitense* (Bull).—One of the pedate section of Maidenhair Ferns, the pinnules being oblong in shape and very closely placed, forming a neat frond of moderate size.

*Actiniopteris australis* (Bull).—A pretty but well-known little Fern with neat palmately divided fronds, the divisions being linear in form.

*Gladiolus Pelargo* (Kelway).—A handsome variety. Flowers large, of a rich scarlet colour, with a few darker streaks. The blooms are very closely placed in the spike, which is massive and imposing in appearance.

*Asplenium pteroides*.—Mr. C. Green, The Gardens, Pendell Court, Bletchingley, was accorded a first-class certificate for a Fern under the above name. It is a native of Lord Howe's Island, and has pinnate dark green fronds, the pinnæ having narrow tooth-like segments closely set on the stalks. In general outline the frond is acutely elliptical, 8 to 12 inches long, the pinnæ 1 to 4 inches long.

*Cereus pectinatus* (Croucher).—A species with peculiar barrel-shaped

stems, covered with reddish spines, form quite a close network on the surface.

*Cereus giganteus* (Croucher).—A strongly ribbed form with greyish or bluish spines, much larger than the last.

*Echinocactus Wistizenii* (Croucher).—Also strongly ribbed. The spines very strong and long, curved at the extremity. A few white filaments are distributed amongst the spines.

*Abies canadensis variegata* (Waterer).—A variegated form of the Canadian Abies, the young shoots being very prettily marked with white.

*Malva moschata alba*.—Messrs. H. Cannell & Sons were awarded a

first-class certificate for this plant, which is a beautiful variety of Mallow with pure white flowers. These are produced in great abundance, and the plant being quite hardy it is a really valuable addition to the list of border plants. No doubt the flowers would prove very useful for cutting.

#### PYRUS SPURIA.

ONE of the ornamental Pyruses, which well deserves a place in any garden where space can be devoted to such trees is that represented in the woodcut (fig. 23), for during the early summer

Fig. 23.—PYRUS SPURIA.

months its large clusters of white flowers are very attractive. The bright green variable leaves are also not deficient in beauty, and when in its best condition the tree would rank high amongst its numerous congeners. A specimen was very noticeable a month or two since in Messrs. Osborn & Sons' nursery at Fulham, where a good representative collection of the species is grown. This tree, from a small branch of which the accompanying engraving was prepared, well indicated the value of such Pyruses for planting amongst other trees of moderate growth as a background to shrubberies, or singly on lawns in suitable positions, not too prominent, yet where the specimen can fully develop and be seen to good advantage.

*Pyrus spuria* is known in gardens and nurseries under various

names, one being *P. hybrida*, which was given to the tree by Moench, and is scarcely less worthy of acceptance than Decandolle's name given above. The specific designation *hybrida* has the merit of being expressive, for the form is considered as a probable hybrid between *P. aucuparia* and *P. arbutifolia*, both of which species it resembles in several characters of foliage, flowers, and fruit. It came into cultivation at the close of the last or the commencement of the present century, and is now moderately well known, being included in most large collections of trees, though its culture must be largely extended before it can be considered so generally known as it merits. A weeping variety, by the name of *P. spuria pendula*, described by Loudon, is also occasionally seen. The type of this hybrid, or species, is assigned in

Decandolle's "Prodromus" to the section *Sorbus*, which includes in addition *P. auriculata*, *P. pinnatifida*, *P. microcarpa*, *P. aucuparia*, *P. americana*, *P. Sorbus*, and *P. lanuginosa*, several of which are inmates of our gardens.

#### SCHIZANTHUS PINNATUS.

At one time, like many other members of the gardening community, I was very much prejudiced against annuals for greenhouse and conservatory decoration. I thought they looked so common to be grown in houses, and perhaps many may think so now. But such is by no means the case. If we could form any reasonable objection to them on that score it would also apply to numerous other plants that are forced and grown for conservatory decoration. Take, for instance, the numerous bulbs that flower outside, such as Tulips, Hyacinths, Crocuses, Narcissus, &c. We naturally admire them when we see them in the herbaceous and shrubby borders; but when in full flower in the conservatory two or three months earlier they are admired much more. Take the Lilacs for another example. We all welcome them when they come into flower in our shrubberies; but if forced into flower a couple of months earlier are they not much more welcome?

*Schizanthus pinnatus* in all its various forms and colours is undoubtedly one of the most useful of the numerous annuals that are suitable for conservatory decoration. It is a very accommodating plant, and may be had in flower eight or nine months in the year; but the first batch cannot be expected to be so fine as those that come in later on. We have several specimens in flower in the conservatory now, and very useful they are. It is surprising what a display they make, forming quite a relief to the other occupants. From early spring to the present time we have not been without them in flower in the conservatory, and shall not be without them for some time to come, for we have two successive batches coming on to flower later in the year. The succession is maintained by sowing a pinch of seed in a 48-size pot rather thinly, place the pot in heat for a few days until the seed has germinated, then gradually harden the plants till they are transferred to the cold frame, as when they are grown cool they are much more dwarf and sturdy. When the seedlings are sufficiently large to handle they should be pricked off singly in large 60-size pots, or three plants may be pricked out into a 48-size pot. These may be grown on and flowered in that size. Very fair plants may be produced in 48-size pots if proper attention be paid to watering; but if specimens are required of a larger size, the plants that have been grown singly can have their final potting before they become too much root-bound. Three plants may be placed in a 32-size pot. The frame should be kept close for two or three days until the plants commence rooting into the new compost, after which they may be fully exposed, taking the lights off entirely, guarding only against heavy rains and cutting winds. *Schizanthuses* are by no means fastidious as to what soil they grow in. Any light rich soil will suit them well. A packet of seed yields numerous varieties differing both in colour and habit. Some of the plants that we have had this season have been extremely dwarf and bushy, whilst others are taller-growing. The taller plants generally have the largest and prettiest flowers.—W. K.

#### PORTRAITS OF NEW AND NOTABLE PLANTS.

*MELIANTHUS TRIMENIANUS*. (*Nat. ord.*, Sapindaceæ).—"Sir Henry Barkly, K.C.B., when Governor of the Cape of Good Hope, discovered this singular and beautiful plant during a visit to Little Namaqua Land, a district bordering the Atlantic to the northward of the Cape Colony, from whence he sent to Kew dried specimens and seeds, together with a drawing by Lady Barkly, as a new species of *Melanthus* with scarlet flowers. The seeds of *M. Trimenianus* germinated readily, but the plants kept in the conservatory at Kew made slow progress compared with one which was sent to Mr. Hanbury's garden at Mortola, near Mentone, on the Riviera, where it flowered for the first time and fruited in 1879. In its native country *M. Trimenianus* is an erect shrub, 2 or 3 feet high; but in the Cape house at Kew it is trained against a rafter, exactly as the long-known *M. major* is in the temperate house, and grows 6 or 7 feet high. The smell of the foliage is even stronger than that of the last-named plant, and exactly like it."—(*Bot. Mag.*, t. 6557.)

*PROTEA PENICILLATA*. (*Nat. ord.*, Proteaceæ).—"Protea penicillata is one of the least attractive of the whole genus, and is no encouragement to the cultivators of the tribe; its singular appearance and rarity being its only recommendation. The plant figured flowered in August, 1880, and was raised from seed sent by Mr. MacOwan, late Principal of Gill College, Somerset East,

an excellent botanist, to whom the Royal Gardens are indebted for many valuable seeds and bulbs, as well as herbarium specimens, and who has lately accepted the Directorship of the Botanical Gardens at Cape Town, which are to be established on a new footing. The seeds were collected on the Boschberg Mountains in Somerset East, at an elevation of 4000 feet."—(*Ibid.*, t. 6558)

*JASMINUM GRACILLIMUM*. (*Nat. ord.*, Oleaceæ).—"A very near ally of the well-known *Jasminum pubescens* of India and China, which is the type around which are to be ranged a good many closely allied species, differing in habit, in the amount of pubescence, and in the size and number of flowers and of the divisions of the corolla, all of them natives of Eastern Asia and its islands. Of these *J. gracillimum* is one of the most distinct in its graceful habit and in the abundance of its large sweet-scented drooping flowers, which are also more copiously produced, in which respects I know of none to compare with it. It appears to be a small species. The pot plant exhibited by Messrs. Veitch at the Royal Horticultural Society, and which was in full flower, was about 3 feet high, branched from the base, the long very slender branches springing from low down on the stem and curving over on all sides, weighted down by terminal globose panicles as large as the fist. *J. gracillimum* is a native of Northern Borneo, where it was discovered by Mr. Burbidge when collecting for Messrs. Veitch, with whom the plant flowered last December."—(*Ibid.*, t. 6559.)

*POTENTILLA (IVESIA) UNGUICULATA*. (*Nat. ord.*, Rosaceæ).—"A very delicate silvery plant, with pearly-white flowers, a native of the famous Yosemite Valley in California, where it grows in meadows at an elevation of 8000 feet above the sea level. In a young state and in dry weather it forms a really charming herbaceous border or rock plant, but when dashed by the rains of an English summer (an ordeal it is not exposed to in its native country), it presents a miserable and draggled appearance, its beautiful leaves being sometimes beaten down and almost buried in the soil. It belongs to a section of *Potentilla* which has been erected into a genus under the name of *Ivesia*, consisting of nearly a dozen species, natives of the mountains of Western North America, with usually small imbricating leaflets that give the leaf more or less of a cylindrical form. This character, combined with others appertaining to the first-discovered species, appeared to suffice to establish the genus as distinct from *Potentilla* and *Horkelia*. Subsequent discoveries, however, have invalidated the claims of *Ivesia*, and it was reduced to *Potentilla* in the 'Genera Plantarum.'"—(*Ibid.*, t. 6560.)

*CLERODENDRON TRICHOTOMUM*. (*Nat. ord.*, Verbenaceæ).—"A native of Japan, of which specimens have been obtained also from Loochoo Island, Formosa, and China, at Amoy and Shanghai, though whether it is a native of the latter countries may be doubted. That it is indigenous in Japan can hardly admit of a question; for it seems to be found from Hakodadi to Yokohama, and it was described by Kämpfer and Thunberg, the latter of whom states that the wood of the branches is inhabited by a larva which is used as a vermifuge for children. *Clerodendron trichotomum* was introduced into this country some years ago, and has proved hitherto quite hardy, flowering copiously in September, when it has a very handsome appearance, but whether it has stood the unusual severity of this present winter remains to be seen; its foliage is early cut by autumnal frosts, and it has not fruited at Kew. In native specimens the corolla-tube is always exserted, sometimes twice as long as the calyx, and slightly curved, but in the Kew specimens it is not exserted for more than a quarter of an inch. The whole plant has when bruised a peculiar heavy smell, which Thunberg likens to the poisonous odour of *Mandragora*."—(*Ibid.*, t. 6561.)

#### OBJECTS OF SEX AND OF ODOUR IN FLOWERS.

[Read by Mr. T. Meehan before the American Association for the Advancement of Science.]

STUDENTS of Nature, who have thoughtfully observed, must have noted at least two great objects in the creation of sex. The first and leading one is evidently to insure variation; the second to aid and assist reproduction. But our text-books say little of the first; while every behaviour of flowers is regarded as relating to the last, and hence we have so much said and written on the advantages of cross-fertilisation, as if reproduction were the sole end and aim of sex.

That reproduction is not the sole end of sex is apparent from the fact that reproduction by cell division is more common in vegetation than reproduction by seed. Bulbs, tubers, rhizomes, and other subterranean structures, with bulblets, runners, and other arrangements above ground, are familiar examples. Many plants with coloured corollas rarely seed, while some never do. Of these I might name *Ranunculus Ficaria*, *Lilium tigrinum*, the Horseradish (*Cochlearia Armoracia*),

&c.; and again are those which depend on insect or similar agency for pollenisation, and though apparently as a result bearing seed abundantly, yet rarely producing plants in nature from these seeds. Of these last I need only refer to *Yucca* and *Orchideæ* as the best known of the class dependant on insect-fertilisation. The terrestrial *Orchideæ* of the United States mostly fruit in great abundance, and there are many thousands of seeds in each capsule; yet my researches have rarely been rewarded by plants that I could believe to be seedlings, while in nearly all cases the relation by offsets from a parent plant was plain. On the other hand, *Orchid* locations are declining, and *Yucca* confines its species to comparatively limited locations, apparently raising a crop of seeds more for the sake of feeding the larvæ of the *Yucca* moth than as an aid in plant-distribution. So far as reproduction is concerned, it will not be denied that millions on millions of seeds are created in vain, that thousands of millions of flowers bloom uselessly, that volumes of odour and tons and tons of pollen are given to the winds and to the insects, without any possible benefit to the individual, which could be made to increase without any of these productions of no conceivable benefit to the race, except as might arise from some imaginary good from cross-fertilisation. We see from these simple considerations that sex can have but a very moderate relation to the good of the individual or the race; and we may reasonably look about for some more important service which sex is to render.

We find this in variety. This is essential to our present conditions of existence. Imagine the higher order of animals increasing by division! Each would be exactly like its parent. Mr. Smith could not tell himself from Mr. Brown. But the union of two distinct individuals, and each individual with varying powers of transmitting identity, leads to infinite variety, by which each can clearly distinguish that which is his from what is his neighbour's. Variety is a greater necessity to sentient beings than to inanimate things; hence we see that propagation through sex is imperative among them. But it can in this respect make no difference to a plant. It is of no consequence to one blade of grass that another blade should be or not be just like it, but it is of great consequence to the animal life that is to feed on them. Each kind is made to prefer some kinds of fruit and vegetables, which must have distinct characters in order to be easily recognised; and hence we have at once a good reason for form, colour, fragrance, and the infinite variety these productions give rise to. If this view be correct, and I cannot conceive that it can be controverted, it puts a new view on modern teleology. In all the discussions on the various arrangements of plants and animals, we hear only of what good is to result to the individual or to the race. This is the essential character of the doctrine of natural selection. But on the principle that I have sketched out—the principle of variation—we see plants and animals not working merely for their own good, although that is incidentally involved, but for the good of generations yet unborn, and in which they can have no interest. Indeed, following the inexorable law of variation, plants may be said to be labouring to make themselves distinct from each other, so that the various animals may be better able to recognise and consume them. They must necessarily be under the control and direction of an outside Power, which clearly foresees that there will be mouths, and judgment required to select the food which is to go into them; all of which would be useless unless plants were forced into a variety, which is thus to enable them to be the more easily sacrificed when the proper time arrives. Of course the selfish views embodied in the modern doctrines of teleology must be incidentally true. No individual would work unless it supposed it was working for its own good. Pleasure must be a condition of existence. This also must be a universal law, and "natural selection" so far to be conceded. But this law must of necessity be limited. It is not for the good of a plant that it should be eaten by an animal; but it is perfectly consistent with the law of universal good that it should have just enough of thorns, or bitterness, or some other measures of defence, to keep the race from being utterly annihilated.

May we not conclude from all this that variation and not reproduction is the one great law to which we are primarily to refer all sexual phenomena; that reproduction occupies only a place subservient to this law; and if so, may we not proceed to review the theories which have been established under a mistaken idea of the order of things?

I propose to examine, but I shall confine myself here to only one subject; indeed to but a part of that subject—namely, the relation which odour in flowers bears to modern theories of cross-fertilisation.

Mr. Charles Darwin in "Cross and Self-fertilisation," chap. 10, page 381, says—"We certainly owe the beauty and odour of our flowers, and the storage of a large supply of honey in them, to the existence of insects;" and Professor Asa Gray in his recently issued "Structural Botany," page 217, follows by observing, "Anemophilous flowers are mostly destitute of odour, and not nectariferous;" and further, page 218, "Nor do we know that fragrance or other scent, or that nectar subserves any uses to the flowers than that of alluring insects." You see that the idea uppermost in the minds of these authors is that some direct good to the plant must be inferred from its peculiar form, colour, fragrance, or secretions, and the absolute necessity of mere variation is wholly ignored. But we have colour and odour even in minerals. We do not look to any special benefit to them from these possessions, but we can understand why they should possess them under the universal law of variety. Besides,

odours and sweet secretions are not confined to flowers, but pervade all parts of the plant in various degrees.

The leading veins of the leaves of the *Catalpa*, as recently shown by Mr. John A. Ryder of the Philadelphia Academy of Natural Sciences, are furnished with glands which secrete nectar and furnish food for innumerable ants. We may agree with Dr. Gray that this nectar is for alluring insects, but where does the good in the *Catalpa* come in? Odour and colour abound in great variety among Mushrooms and fungi generally, and in Lichens and Seaweeds; have these been developed to make them attractive to insects for any purposes that we can conceive of in connection with individual good? They have separate sexes; but notwithstanding their colour and odour, cross-fertilisation is not effected by any insect agency. If, as Mr. Darwin says, we should not have any beautiful or odoriferous flowers had insects not existed, how did these lower orders of plants come by colour? We cannot understand it on any theory of natural selection, but we can understand it on the basis of the necessity for a universal variety in all things. Again, bright colour is not confined to flowers. In tropical countries coloured leaves abound, and of these the *Begonias*, *Crotons*, and *Dracenas* of our greenhouses afford familiar examples; and, strangely enough, most of these coloured-leaved plants belong to classes which are supposed to be anemophilous, or fertilised by the wind, and can therefore have no interest in making themselves attractive to insects.

(To be continued.)

#### WELLS'S SPRAY-DIFFUSER.

THIS, if we mistake not, is a "Yankee notion," and was in its original form used in American hospitals for disinfecting purposes. Mr. Wells, of the Earlswood Nurseries, Redhill, has by sundry alterations converted it into a horticultural appliance of considerable value. It is much less of a plaything than some spray-distributors that we have seen, and is used precisely the same as a pair of bellows. An insecticide of any kind, and of approved

Fig. 24.

strength, if placed in the reservoir can be distributed far more economically than through a syringe, and is often more effectual, as the spray adheres to the foliage like dew, which is not the case when liquid is applied through a syringe. Any insect-infested plant in a collection can easily be dressed with the aid of this implement, and it will be of even greater value in destroying thrips and other insects on Vines where the Grapes are colouring. For this purpose this spray-diffuser will be of substantial value, as a large vinery may be dressed in a very short time without injuring the Grapes by placing the nozzle between the bunches and covering the foliage with, to the insects, deadly dew. We know there are many vineries at the present time in which thrips are abundant, yet the Vines cannot be syringed because of the ripening fruit. We have, in answer to letters from correspondents, recommended that the foliage of such Vines be sponged; but the insects might in all probability be destroyed much more quickly by the aid of this simple yet strong and apparently useful contrivance that Mr. Wells has introduced and registered.

#### DIANTHUS HEDDEWIGII AS A BIENNIAL.

FOR cutting or show purposes, since the end of spring, out of a fairly large number of flowers in bloom, I cannot remember anything to exceed in beauty the single and semi-double varieties of *Dianthus Heddewigii*. I note the single and semi-double, for though larger I do not consider the perfectly double flowers at all bright and showy. The brilliancy of the inner petals is lost, and rain destroys the blooms sooner. My object, however, in writing is to advise those who have not yet grown this *Dianthus* to add it at once to their collections, and to treat it as a biennial—that is, not to allow it to flower the first year, but to grow it continuously in good, rich, firm soil. Although the plants are almost perfectly hardy, a slight protection easily improvised will bring them safely through the winter, and the following year you will have them blooming some two months before those grown

and treated as annuals; and not only that, but there is no comparison between the number of blooms. I may anticipate one objection in reference to remaking and manuring the beds and borders by saying I find the plants to lift in spring or autumn with a firm ball of earth, and grow uncheeked. Indeed this should be done if mulching is not applied in winter. I have been cutting bunches for the last six weeks, and the more you remove the better the remaining blooms expand. Eastern Queen and Crimson Belle are among the best of the single varieties for succession thus treated; but as I lost many during the last severe winter I cannot consider them so hardy. Enough of the above will, however, come single to meet the views of those who prefer the single form of this flower. If seed cannot readily be procured from any variety of superior merit I would recommend propagation by suckers. Treated as an annual, a few flowers on weak stems are your only reward; these I prefer picking off, so as to add vigour to plants intended to stand outside over the winter.—W. J. M., *Clonmel*.

#### KITCHEN GARDEN.

SOWING Tripoli Onions, also Priekly or Winter Spinach, ought now to be completed, the latter being allowed fully 18 inches between the rows, so as to admit of a properly developed growth. Lose no time in sowing Cabbage seed for the main crop, and see that earlier plants are pricked out as soon as large enough, so as to keep them sturdy. As ground becomes vacant plant Lettuces, Endive, and winter greens of the kinds most required, paying attention to a suitable rotation of crops. A good breadth of Turnips should be sown for late winter and spring use, choosing an open yet somewhat sheltered situation. Suitable varieties for this sowing are Veitch's Red Globe, Orange Jelly, and Chirk Castle Black Stone. There is yet time to plant Broccoli for late use, also Cauliflowers for affording heads in early winter should the weather prove mild. Late Celery may still be planted, taking advantage of suitable weather for earthing-up early crops, and supply later crops liberally with water or liquid manure. Late Peas, dwarf and runner Beans, should receive a liberal supply of water or liquid manure to keep them in bearing. A last sowing of Endive can now be made. If a sowing of French Beans be made in a pit to which heat can be given later on, a supply of Beans will be continued long after those outside have been cut off by frost. The lights should not be placed on until there is reason to apprehend danger from frost.

#### MUSHROOM HOUSE.

Preparation should be made of materials for forming beds in this structure to afford a supply of Mushrooms in autumn. The best materials are unquestionably fresh horse droppings collected daily and spread out in a shed or other place where they will be kept dry, and so thinly spread as to prevent heating, turning them over occasionally. When a sufficient quantity is collected for forming into a bed or beds 15 to 18 inches thick, throw them into a conical heap, and when a gentle heat has been produced turn the heap over and allow it to remain until moderate fermentation again takes place, when the beds can be made, it being important that the materials be rammed down firmly. If a third part of short straw be added it will prevent too speedy decay of the materials. Sawdust may be used in lieu of straw. Where means cannot be employed for collecting the droppings these should be shaken from the litter, forming beds at once. Insert a thermometer with the bulb about 3 inches beneath the surface, and insert the spawn when the temperature declines to 90°, or before it reaches 70°. Pieces of spawn not less than an inch square should be employed, placing them about an inch below the surface 9 inches apart, firming the material well around the spawn, and cover with the same material an inch in depth. In a week or ten days, when the temperature is 70° to 75°, the bed should be earthed, placing a covering of turfy loam 2 inches thick, and beating it down firmly and render it smooth with the back of a spade. The loam should be

moist, so as to form a close firm surface; if not, water must be employed. A covering of dry hay will tend to maintain the heat of the bed and prevent the surface cracking. The hay must only remain on until the Mushrooms appear, when the surface of the bed must be kept moist by sprinkling with tepid water. The Mushrooms will appear in about six weeks from the insertion of the spawn, and to insure their growth a temperature of 55° should be maintained.

#### FRUIT HOUSES.

*Vines*.—The present is a good time to renovate the borders of early houses, or, if necessary, to lift the Vines, it being of primary importance to keep the roots near the surface. In the case of lifting an opening should be taken out at the extremity of the border, working from this point towards the Vines, removing the soil from the roots carefully with a fork, and lightly covering them to prevent their drying. See that the drainage is perfect, and cover it with a layer of turves grass side downwards. The drainage should be a foot thick, and have drains with proper fall and outlet to carry off superfluous water. Turfy friable loam with one part in ten of old mortar rubbish, a twentieth of charcoal, and a fortieth of crushed bones thoroughly incorporated, form a suitable compost. The roots should be laid out carefully in the fresh material, keeping them near the surface, not covering them deeper than from 4 to 6 inches. The compost should not be very wet, but fairly moist and tolerably firm about the roots. Give a thorough soaking with water at 90° to 100°, and mulch with short manure. Whilst these operations are in progress the house should be closely shaded, the ventilators closed or very slightly opened, and the Vines damped occasionally. Syringe the Vines twice a day after the operation is completed, shading to prevent the temperature rising too high. In the course of ten days or a fortnight it will be seen by the growth appearing on the laterals that the roots are spreading in the fresh compost, when the shading should be removed, having it in readiness in case the weather should be very bright for an hour or two at midday. When the Vines have recovered from the lifting admit a free circulation of air, and be careful not to reduce the laterals too closely, or this may cause the principal buds to start. In the case of renovating the border without having recourse to lifting it is only necessary to remove the surface soil, carefully clearing the old soil from amongst the roots and putting in fresh compost, laying in the roots if necessary nearer the surface as above indicated, watering and mulching.

Early Vines merely needing the annual surface dressing may, if the wood is thoroughly ripe, have all laterals cut away and be partially pruned—*i.e.*, some of the longest shoots can be shortened, not pruning finally until the foliage has nearly all fallen. Vines in pots intended for very early forcing should be in the last stage of ripening, but any not so forward as could be wished should have fire heat applied at once; this with abundance of air will soon cause them to mature. Those now ripe will rest sooner if moved to a wall or fence outdoors, to which the canes can be secured, guarding against the soil becoming very wet by having needful protection at hand, also avoiding the other extreme—overdryness. Keep all lateral growths in check by pinching, the old foliage being carefully preserved. Vines that have crops which are colouring and swelling require free ventilation night and day, applying fire heat if necessary to admit of this, a dry warm atmosphere being essential to high finish. Grapes in any stage later than colouring should now be hastened forward, maintaining a night temperature of 65° to 70°, and 70° to 75° by day, in dull weather. Late Hamburgs need not be pushed forward unless there is danger of their not colouring before the end of this or the beginning of next month. As there has been great want of rain in some localities the outside borders must not be neglected, but be given thorough supplies of water or liquid manure in a tepid state. Where it is desired to preserve black Grapes as long as possible it is necessary, unless the foliage is good, to shade slightly.

*Melons*.—Give all possible attention to the last batch of plants, encouraging them in every way to make a quick and strong growth. A minimum temperature of 70° to 75° should be maintained, and a maximum of 85° to 90°, with a moist atmosphere, shading only to prevent flagging. Train with one stem only, allowing it to advance well up the trellis before stopping, pinching out all lateral growths

starting below the trellis or between that and the bed, and remove every alternate lateral above this, and if fruit does not show at the second or third joint pinch out the points at those, and fruit will be shown freely at the next break. Earth up those plants that have just set their fruit, having previously given a soaking with tepid weak liquid manure, securing a moist genial atmosphere, and keep the laterals well in hand by prompt stopping, and if necessary judicious thinning, for on no account must the principal foliage be allowed to become crowded. Late crops in pits and frames must have a steady bottom heat of 80° to 85°, and the top heat kept at about 70° at night, and 80° to 85° in the daytime from sun heat.

*Cucumbers.*—Bestow liberal attention upon the plants for autumn fruiting, and add a little fresh soil as the roots appear at the sides of the ridges. Syringe the plants about 3 P.M., closing the house at the same time, but being guided in this respect by the weather. In the case of robust healthy plants shading may now be almost dispensed with, and less atmospheric moisture will henceforth be needed; still, plenty of moisture, liberal feeding, and thinning crowded growths will be required.

#### ORCHARD HOUSE.

If it is desired to accelerate the ripening of the fruit it may be effected by closing the ventilators at 5 P.M., and opening them at 7 A.M. Syringe the trees every night, doing so sufficiently early to have the foliage fairly dry before night, but when the fruit commences ripening syringing must be discontinued. Peach and other trees swelling off their fruit, whether in pots or planted out, must have liberal treatment as regards surface dressings and liquid manure. Continue to stop or pinch back very luxuriant shoots, and as soon as the fruit is gathered from any tree syringe well until it is entirely cleared of red spider or other insects. If it is desired to retard the ripening of the fruit of any of the trees so as to prolong the season—which is often advisable with Peaches, Nectarines, Plums, and Pears—some of the trees may be placed outdoors, assigning them an open situation, but sheltered from winds, a few being placed on the north side of a fence or wall, so as to still further continue the season of supply. The pots in either case should be plunged in ashes to the rim, attending carefully to watering and syringing. When the fruit is ripening it is well to return the trees to the house until the fruit is gathered, as this in the case of the Peach, Nectarine, and Plum will enhance its quality; but in the case of Pears it is not advisable to return them to the house for ripening. When the fruit is gathered from Cherry, Apricot, and Pear trees they will be benefited by placing them outside, treating as advised above.

#### PLANT HOUSES.

*Greenhouse.*—Zonal Pelargoniums, both single and double, are indispensable for conservatory decoration and for cutting from through the summer, and are particularly valuable in late summer and autumn. Their continuity of flowering may be ensured by supplying them with weak clear liquid manure once a week. Fuchsias that flowered early and have had a rest may have the shoots shortened a little, cleansing with an insecticide if there is any trace of insects, and have an inch or two of the surface soil removed and apply some fresh and rich soil, placing the plants in a house or pit where they can be kept rather close and moist by syringing overhead morning and afternoon, and they will break freely. Cuttings of free growth should now be inserted for next season's flowering, inserting them in sandy soil, where they can be kept close and moist, potting off when rooted in 3 or 4-inch pots, employing good loam with a fifth of old cow dung, a similar quantity of leaf soil, and about a sixth of sand. The plants should be placed near the glass in a temperature of about 50° through the autumn, and in about eight weeks will need shifting into 6-inch pots.

*Pelargoniums.*—Cuttings of the Show varieties should now be taken if not already done, inserting them round the sides of 6-inch pots in sandy soil, and placing in frames or on shelves in the greenhouse. When they commence growing pot off singly in good yellow loam into 3-inch pots, with a sixth of well-decayed manure and sand sufficient to keep the soil open. Place near the glass, and be careful not to supply too much water. Bridal Bouquet and Duchess of Bedford should be grown in quantity for cutting, as they are very floriferous, early-flowering, and force admirably.

*Camellias.*—These will for the most part have set their buds, and any that need shifting into larger pots should be attended to in this matter before the buds are large, or they will drop if they have attained the size of a full-grown Pea. For compost there is nothing better than sandy loam full of fibre, but where this cannot be had it is better to employ the best fibrous peat without any admixture, in either case using the compost fresh, so as to afford the plants the benefit of the decaying fibre. Long-stacked loam or peat is not suitable. Do not disturb the ball further than to remove the crocks and the loose surface soil with any not occupied with roots, and ram the fresh compost so as to make it quite as firm as the old ball, leaving sufficient space to allow of copious watering, and above all things avoid overpotting.

#### UNFINISHED SECTION BOXES.

THE great value of Mr. Cheshire's communications must be my excuse for asking him through you to explain the following sentence more fully:—"This fact condemns the zinc queen-excluder as always reducing the honey yield." The fact alluded to seems to be, that if the space between the hive and rack is all open the boxes in the centre over the brood nest are sealed most quickly. Would not the same occur if a zinc excluder was used? Has Mr. Cheshire found it, as a matter of experience, that the zinc excluder lessens the honey yield materially? What size of sections does Mr. Cheshire use? Does he find that by leaving the space between the rack and hive all open without narrow queen-excluding slits that pollen and brood are not stored in the sections? I make this inquiry more particularly, as I am purposing using sections next year, and that I have had two shallow 4-inch 20-lb. supers spoilt this year by brood and pollen. The first was entirely open to the hive (a frame hive 12 inches deep, 14½ inches wide, ten frames—in fact, a Woodbury deepened; last year's swarm. The latter was on an old-fashioned Sadler's box hive with top side communications; a swarm of this year. A hive of Mr. Cheshire's (Crystal Palace Prize) gave me the largest amount of super honey—50 to 60 lbs.—of this year. The giving-way of the bench legs prematurely spoilt my honey harvest, precipitating six hives into the Potato bed, supers and all. Perhaps I should have added above that three years ago I found a queen in a super protected by a round-holed zinc queen-excluder. She had only utilised one bar of drone comb. I cannot therefore say if she was fertilised or not, but I conclude so. I thank Mr. Cheshire for his excellent articles, and hope he may long continue to contribute to our Journal, thereby making it the most valuable bee journal.—H. C. RIPLEY, *Minster Lovell Vicarage.*

#### ARTIFICIAL COMB FOUNDATIONS.

HAVING this year given these a fair trial in supering, I am happy in being able to add my mite of testimony to their value. The invention of artificial comb foundations is one of the greatest in apiculture—indeed, I can think of none equal to it, save, perhaps, the introduction of large hives, which cannot properly be called an invention. The use of the foundations in question make supering easy for both bees and bee-masters, and higher praise than this cannot well be given. With a view to give them a fair trial on a large scale I ordered many pounds of Mr. Raitt, but owing to my being in a very weakly state of health I was unable to carry out my intentions to their full extent; however, some of my neighbour bee-keepers used it up in their management with the greatest possible satisfaction and advantage; and so far as my efforts have extended, the foundations have been quite satisfactory. Without sagging, twisting, or curving, they have stood the test and strain in every experiment. I ordered twelve glasses 12 inches deep with lids, in which the foundations in full length skeletons were fixed before they were placed on hives. The bees in hives ready for supering adopted them at once, and commenced to elongate the cells at bottom and gradually worked up to the lids. The glasses are 5 inches wide at bottom, 7 inches at top, with a considerable swell or rotundity below the lids, and when well filled weigh 19 lbs. These glasses are handsome to look at, but from a profitable point of view they would be improved by having the lids 9 inches wide instead of 7 inches. Thus larger skeletons could be introduced, giving the bees less work in extending their combs to the circumference of the wider

part of the glasses. In every case of supering the use of the artificial foundations properly fastened will be found very advantageous, specially so in supers with perpendicular sides or in frames or sections. The larger the skeletons used in supers the sooner they are filled. The thicker kind of artificial foundations used for brood comb I have not tested. At the swarming season I was hardly able to do anything, but my neighbours who used up almost all the brood foundations I had in their apiaries speak well of it.

Natural comb is a costly material to both bees and their masters. Much honey is consumed by bees in order to secrete or manufacture wax. Baron Liebig calculated that 1 lb. of wax was obtained at the expense of 20 lbs. of honey. I cannot confirm or contradict this statement. I know that a great deal of honey is spent in the creation of wax, that hives engaged in building combs store up comparatively little honey, and that hives filled with combs store up honey very fast. Swarms on being cast into empty hives are placed at a great disadvantage for a few days, having no cells for eggs and no cells for honey. There is also the disadvantage of so few bees being able to work till the foundations of natural combs have considerably advanced. One "great bee" lays the foundation of the city, other bees build on it, but very few builders can be employed for a time. The introduction of a few sheets of good and clean foundations must be a very great advantage to swarms on first being hived. I heartily commend their use to the notice of our readers, and also the study of their application and advantages.—A. PETTIGREW, *Bowdon, Cheshire.*

#### BEE MANAGEMENT.

I SHOULD be glad if you could give me some advice as to my bees. I have a swarm hived in a Stewarton on the 27th May; two boxes and super are filled and sealed. I have added a fourth box where they are busy; I should think it weighs 50 or 60 lbs. Can I take any honey besides the top super box? if so, how may it be done? I have also a large straw hive of last year's second swarm which have not swarmed this year, but the hive weighs 50 lbs. or more. Would it be wise to drive the bees into a hive of the same size and feed them? if so, how should I feed them? I have only the parent stock of my Stewarton swarm, otherwise I would unite them; and the parent stock is a small straw hive, and is sufficient weight to stand the winter. Last year in taking a stock of the previous year I found much brood, and was much troubled to drain the honey. Can you recommend me to a good extractor—a cheap one? I have only read of them—have not seen one—and would it answer my purpose better than draining through sieves, which I find is tedious work, and where you have 50 or 60 lbs. to drain, it takes some time? If you would kindly oblige in your earliest issue I should feel greatly obliged.—A CONSTANT READER, *Salisbury.*

[As we understand the matter your swarm in a Stewarton hive has filled two body boxes, and has since had both a super and a nadir added. The super alone may be expected to be filled with virgin honey, but later in the season you may safely take also the upper body box, leaving the bees to winter in the remaining two. If there be brood in the upper body box leave it till hatched, and feed the stock to a good weight for wintering. If comb foundation has been freely used there will be little or no drone comb in the lower boxes; otherwise there may be too much to make it advisable to winter in them. In that case rather remove the nadir and leave both body boxes to the bees. Why did you not place supers on the large straw hive that has not swarmed and the honey of which you now desire to appropriate? Even a stock weighing 50 lbs. would scarcely yield honey to pay for the trouble and expense of feeding up again to a good weight. Old combs, brood, and pollen would probably reduce the nett weight of the extracted honey to 20 or 25 lbs. Our advice would be either to leave it alone as a keeping stock, or transfer it to a bar-frame or Stewarton hive—that is, save all the good empty comb and brood and take the best of the honey. Driven stocks fed up in autumn usually have too much drone comb to make good hives next year unless comb foundation be used.

We cannot recommend an extractor cheap enough to pay for the small quantity of honey you will have to drain, and as you have no bar-frames you might find that, even with an extractor, your troubles were not ended.]

#### DRIVING BEES FROM SUPERS.

ON cutting supers of comb from hive some honey cells are often broken, and thus the faces of the supers are disfigured with honey. Let me remind inexperienced bee-keepers that such supers should

be raised by wedges about three-eighths of an inch to let the bees clean out the broken cells. In less than an hour the bees should be driven from the supers. Formerly I used to give the bees a sniff of sulphur in the smoke of fustian rags, which makes them run from the supers into their hives as fast as they can. Instead of sulphur I now use powder or saltpetre. These are dissolved in warm water, and brown paper is dipped in the solution and dried. Mr. Addey calls it "touchpaper." A small piece the size of a watch rolled up, lit at one end, and the smoke of it blown into a super, will drive every bee out in a few minutes. Where practicable the smoke should be blown in from the top of supers. I removed some time ago a glass super with a wooden top weighing 19 lbs. I bored a hole through the top with a small gimlet, and applied the smoke through the hole. The work of ridding supers of bees is easily and speedily done, and this touchpaper will be useful in many operations in the apiary.—A. PETTIGREW.

#### FLOWERS FOR BEES.

I HAVE a flower in my garden which bees seem to be exceedingly fond of. Although I do not keep any, I never approach the flower without finding a large number of ordinary bees as well as the humble bee at work. The flower is an *Epilobium* or Willow Herb, and very much resembles the common Willow Herb found in ditches and damp places, but I believe it is the French Willow Herb. The flowers are produced in long spikes and have been unusually fine this year; some of the spikes nearly 3 feet in length, and have continued in bloom for the last five weeks or more. There is no trouble in propagating it, but on the other hand it spreads too rapidly to be grown in the flower garden, but if the cottager or bee-keeper could find an out-of-the-way corner for it I think it would be a valuable acquisition.—AMATEUR, *Cirencester.*

#### APIS DORSATA.

(Translated from the *Bienenzeitung*; Communicated by Mr. Alfred Neighbour.)

##### BEES FROM THE ISLAND OF CEYLON.

PROFESSOR FRANK BENTON sent me the other day from the Island of Cyprus a copy of the periodical the "Ceylon Observer." I noticed in this journal an article by him, marked in blue pencil, to which he evidently wished to direct my attention. As this article will doubtless interest most readers of the "Bienenzeitung" I have made a translation of it. The above heading of this article is followed by a second one as follows:—"Of *Apis dorsata*, the most marvellous bee of the world, a few colonies have been discovered and captured by Mr. Frank Benton. We are glad to find," the article continues, "that Mr. Benton has at last been successful in procuring *Apis dorsata*—called Bambara by the natives, which he describes as the most valuable bee of the world. Mudaliyar Jayetellike hired a few Cingalese bee-hunters, who accompanied Mr. Benton to the Bambaragala, a chain of mountains thirty English miles from Kurunegala, and there after an interesting journey attended with a good many difficulties, of which Mr. Benton will, no doubt, give an account later on, he was fortunate enough to procure two colonies of *Apis dorsata*. On account of the great interest that Mr. Benton takes in this bee, which he considers an excellent honey bee, he has decided to postpone his departure for Cyprus for a fortnight, and intends to return to Kurunegala once more. He left us a few workers of *Apis dorsata* preserved in spirits, which can be seen at the office of our editor. The Cingalese were greatly astonished at the way in which Mr. Benton handled these bees. If not properly treated they will sometimes get very savage, when they will pursue their enemy a long way. Mr. Jayetellike declares that as regards the management of bees he has learnt more from Mr. Benton in a week than from other sources in many years."—(Signed) C. J. H. GRAVENHORST.

##### LETTER FROM MR. FRANK BENTON.

"Steamer *Jupiter*, coast of Syria,  
"23rd May, 1881.

"I have encountered a great many adventures, and have learnt much concerning the bees of these eastern countries, of which I should like to give you a full account if it were possible, but you will soon understand why I have not written to you before.

"Leaving Java I proceeded to Ceylon *via* Singapore, and immediately after my arrival I started for the jungle—the mountainous or woody parts of the island—and with the assistance of a few natives I soon discovered a nest or colony of *Apis dorsata* in a tree about 60 feet high. This was the first time I got a sight of these wonderful bees, of which I did not see a single specimen during my five-weeks stay in Java. I made numerous excursions afterwards, during which I discovered not less than thirty-five nests of them, but mostly on

high rocks or trees, which made their capture all but impossible; nevertheless, with a great deal of trouble and at the risk of my life I succeeded in obtaining two colonies which had settled on the rocks at a height of at least 100 feet from the ground. I afterwards caught two more colonies in trees.

"The *Apis dorsata* ought to be classed among yellow-coloured bees (to which indeed all the three Indian species belong), as three of the rings under their wings are of an orange-yellow colour. This, and the contrast caused by the rest of the body being black and the wings bluish-black, accounts for their being very pretty bees. Their body in the live state is about seven-eighths of an inch long, but slender like the bodies of hornets. They are swift on the wing, and when angry they make a hissing noise exactly like angry hornets. Smoke causes them to leave their combs and frightens them very much. If you avoid shaking them or blowing against them it is possible to remove a handful of these bees from the cluster below without any danger of being stung; they leave the hand without doing any harm, and return to their combs. The least shaking, however, puts them into a rage, making them rush out like angry hornets in order to discover the disturber of their peace and to sting him. But they are rather clumsy in using their sting, and are therefore easily got rid of by a quick movement of the body. If a bee has stung, however, they appear in large numbers and pursue for a long distance, firmly determined to make use of their sting. Put into hives with moveable frames and removed to the place where I had taken up my abode they at once behaved like domesticated bees, and properly treated they never attempted to sting, although I applied no smoke to the stocks during the few weeks they were under my care. As a matter of fact I never employed smoke when I examined my colonies, which was done almost every day when I was well, every comb being then taken out of the hive and replaced. Their sting is not larger than that of *Apis mellifica*; in any case there is no appreciable difference between the two, and the sting of *Apis dorsata* is less painful. The tongue of the latter is only a little longer than that of *Apis mellifica*, although its body is half as large again. They appear to be industrious at their home in the forest, but they did not work so well in hives; they seemed to think that I would continue feeding them.

"The drones are very hairy, and of quite a light grey or brown colour without the dark-blue-looking wings of the workers. They are reared in the same cells as the worker bees, twenty to the square inch (English measure) by  $1\frac{1}{2}$  inch in thickness, and are therefore not longer than worker cells, though somewhat bigger. The bees do not commence their excursions until after sunset, and continue to fly out until it is quite dark, hence the belief of the natives that these bees collect honey during the night only. The queen is somewhat larger than the workers, but not extraordinarily large. I had much hard work and experienced some dangerous adventures in the attempt to obtain the four colonies. One day our company was attacked by a cheetah, which had been wounded by one of my men. A young lad who went to kill the beast with an axe sustained serious injuries inflicted by the teeth and claws of the enraged animal. We destroyed the cheetah, which otherwise would have killed the poor lad in a few moments. We had far advanced into the jungle where no surgical aid was obtainable, so I was obliged to dress his wounds as well as I could. The last news of him gave little hope of his ultimate recovery; the hot weather, too, was against him. On another occasion a wild elephant tore an umbrella out of a man's hand, and would have killed him if he had not quickly climbed upon a tree, where he remained a prisoner until the whole party arrived, when the elephant was frightened away by rifle shots.

"In order to secure the bees I had to climb upon rocks and into trees, which was very dangerous work. Two of my colonies were taken from 'Bambcragalle' or *Apis dorsata* rocks. We had to climb up perpendicular rocks by means of ladders improvised by tying together several poles and crosspieces until we were able to reach the highest point. The walls were perpendicular on all sides down to the base of the rock, more than 100 feet below us. Further down in the valley white clouds appeared, while the stars and the moon were shining above us. At this place, surrounded by semi-savages and half-naked men, I obtained these remarkable bees. After all this labour and danger I was attacked by fever, caused by having been exposed in the rain during a thunderstorm in the night while I was on a high tree in the forest for the purpose of catching bees.

"I may explain here that I consider the night the most suitable time to catch these bees. By applying a little smoke I soon made them manageable.

"When I was taken ill I was far away in the primeval forest. As I did not get better in the course of three or four days I was obliged to walk to the nearest road, a distance of several miles. Thence I travelled some miles on a cart until I reached a village, where I was able to take the mail coach, which took me to the nearest railway station at a further distance of twelve miles. I at length reached Colombo, having suffered greatly on the journey. When the fever left me a few days afterwards, after I had taken some powerful doses of quinine, I was in a very weak state. All this time my bees had been very much neglected, and when I went on board the French steamer they were not in a fit state for the voyage. In the Red Sea I had another attack of fever, but arrived in Beirut at last. Singularly enough the bees were still alive, although their number had decreased considerably. During my stay at Beirut, where I had to wait thirteen days for a steamer to take me across to Cyprus, they

dwindled away, and I have now only dead specimens left of *Apis dorsata*.

"I have, however, still one colony of *Apis florea*, which remain in good condition.

"From what I have seen of *Apis dorsata*, I am inclined to think it very questionable whether these bees are as productive as *Apis mellifica*, though I have found 40 to 50 lbs. of honey in one stock.

"I send you a bottle of these bees; please take some out for yourself and forward the remainder to Mr. E. Cori.\*

(Signed) "FRANK BENTON."

\* This letter is addressed to Mr. A. Schröder, jun. The Editor is very much obliged to Mr. Schröder for kindly sending it to him.

"All bee-keepers will regret with me Mr. Benton's failure. Even if *Apis dorsata* had not been of any immediate value to bee-keepers in Europe there can be no doubt it would have contributed materially to enlarge the theory of bee-keeping. The *dorsata* being a species of the genus *Apis*, the cross-bred of *dorsata* and *mellifica* would be real hybrids. The study of these hybrid bees would not only have enriched science, but from reasons easily to be guessed they would also have been of practical importance, producing larger bees, &c. At the meeting in Breslau I expressed myself decidedly against the expenditure of large sums of money for the purpose of procuring *Apis dorsata*, because I know positively that this bee does not prosper in our summer, and is quite unable to survive our winter. In the interest of science, however, I trust that no opportunity may be lost to procure *Apis dorsata* for us if it can be done without incurring heavy expense; for example, through a traveller, a missionary, &c. I shall be happy to give anyone interested in this matter full information as to how this bee may be introduced into our country and kept here.

(Signed) "W. VOGEL."

#### TRADE CATALOGUES RECEIVED.

W. Outbush & Son, Highgate, London.—*Catalogue of Bulbs.*

Hogg & Robertson, 22, Mary Street, Dublin.—*Catalogue of Hyacinths and other Bulbs.*

Todd & Co., 7, Maitland Street, Edinburgh.—*Catalogue of Bulbs.*

Dammann & Co., Portici, near Naples, Italy.—*Wholesale Catalogue of Vegetable and Flower Seeds, and Bulbs.*

**New Melon (W. S.).**—The fruit you have sent is a little over-ripe, and its flavour would have been better a few days ago. The rind is smooth, pale orange in colour, and very thin, the flesh being also pale. It is extremely juicy, sweet, and refreshing, but not of rich flavour. It will probably be a useful Melon, but is not likely to take high rank among the best varieties. Its fault is a deficiency of flavour and a too large seed cavity.

**Disfigured Maple Leaves (L. C.).**—These are covered with minute galls, produced by a mite allied to those described in the last article upon garden insects. The particular species attacking the Maple is named *Phytoptus myriadeum*; it is nearly allied to the species common on the Sycamore or Plane. A peculiar circumstance with these galls is, that they are crowded together in some of the leaves to a degree which checks their development.

**Cucumber Seed from Diseased Plants (H. Hoskins).**—Though we are not prepared to state positively that seed saved from diseased plants will perpetuate the disease so that it will appear in the progeny, yet we think it likely that seed saved from such plants will be imperfectly developed, and the plants resulting will be weak and more susceptible of attack by disease than plants from seed of healthful plants. We certainly should not save seed from diseased plants.

**Bouvardia Treatment (Idem).**—To grow these plants satisfactorily and have them flower in the winter they require an intermediate temperature, or  $55^{\circ}$  to  $65^{\circ}$ , and  $70^{\circ}$  to  $75^{\circ}$  from sun heat. Cuttings of half-ripened growths strike freely in spring in gentle bottom heat. Pot off the cuttings singly when rooted, growing them near the glass where there is a genial temperature. Stop them when a few inches high, and again when about 4 inches of growth has been made. When the plants are strong plant them in a bed of turfy loam in a frame, keeping them well supplied with water, and ventilating freely in favourable weather, withdrawing the lights about the middle of July until the middle of September, then lift the plants carefully, and pot in 7 or 8-inch pots in good loam.

**Paradise Stocks (B. J.).**—There are several stocks called Paradise stocks. They are all varieties of Apples of more or less dwarf and slender growth, and arrive at a blossoming state early. This precociousness they in a great measure transmit to the varieties of Apples that are grafted on them, and hence are used largely by nurserymen.

**Calceolarias Dying (H. B.).**—You will do well to obtain cuttings of Calceolarias from a healthy stock, and insert them in cold frames early in October. Your plants are exhausted and incurable. Further, your soil does not appear to be suitable for Calceolarias, and you will find trenching 18 inches or more deep, placing 6 inches in thickness of good manure at the bottom of each trench, beneficial. If the plants are well prepared this will sustain them throughout the season, and they will remain healthy.

**Roses Unhealthy (Idem).**—The spots and perforation of the leaves are the result of a shrinking of the tissue, and the cause of this is poverty of the soil and drought. The soil in which the Roses are trying to grow should be saturated with liquid manure now; and in the winter, if the surface soil can be removed and rich compost and a covering of manure added, healthier growth and finer blooms will follow—that is, if pruning is done properly and no insects are permitted on the plants.

**Strawberries** (*A. C. Wilkin*).—The whole of the pages you have quoted do not, we think, contain the articles you require. We presume you want those on Strawberry farming, of which there are five preceding those you have read, and the numbers containing them can be sent on receipt of 1s. 3 $\frac{1}{4}$ d. in postage stamps.

**Plums and Cherries** (*Hereford Reader*).—If we understand your question rightly you desire trees that will be profitable by the sale of the fruit rather than a number of different varieties for affording a succession of fruit in limited quantities at one time. We advise you, therefore, to plant six trees of the Victoria Plum and six of the Bigarreau Cherry. If you order the trees early, say in September, stating that you require them extra strong, the proper kinds will be sent to you at the right time for planting.

**Stands for Asters** (*Aspiro*).—Assuming the blooms are of large size, as they should be for exhibition, stands that are suitable for Chrysanthemums will answer your purpose. Those for six blooms are a foot long, for twelve blooms 2 feet long, for eighteen blooms 3 feet long, and for twenty-four blooms 4 feet long; the width in each case being 18 inches; height at the back 6 inches, and in front 3 inches. Stands of this size will also do for Roses, and you may therefore possibly find them convenient for other purposes than the one immediately in view.

**Old Pear Trees** (*Paddle*).—You do not give us any idea of either the size or age of the trees, nor are you certain what stocks they are on. Assuming they are on the Pear, as you suppose, we think the simplest method to adopt, and in the end the best, will be to thin out at once a number of the overcrowded branches, and then permit the trees to grow unchecked and form standards. In the spring, however, it will be wise to examine the trees and rub out any growths that may issue from the stems from where the branches have been severed. Beyond that, and thinning out an occasional branch, we should do no pruning. If the growths are left their entire length and are sufficiently thin for the sun and air to act on the foliage natural fruit spurs will form, whereas if you prune—that is, shorten the shoots—you will only produce a further growth of wood. Root-pruning such trees seldom results in the end desired, and is not profitable.

**Grapes Cracking** (*Idem*).—The variety you name is rather prone to crack on account of the thinness of the skin, which cannot resist the pressure of the sap that is supplied to the berries. Rather heavy cropping has a tendency to prevent cracking, so has cutting notches in the laterals on which the bunches are hanging, the same effect being produced by removing some of the leaves beyond the bunches. Keep the atmosphere of the house rather dry. Sow the *Suillax* seed in spring in light soil, and place the pots in a heated frame or propagating house, keeping the soil always moist; yet after all your care the seeds may not germinate.

**Gloxinias after Flowering** (*A. A. M.*).—Keep the foliage of the plants fresh as long as possible by applying water judiciously. For a short time the plants will need nearly as much as when they were flowering, but on the first signs of discoloration the supply must be gradually lessened, but at no time permit the soil to be dust dry. When the foliage has died the plants may be wintered in the warmest part of your greenhouse, keeping the soil nearly dry. They may be placed under the stage, but laid on their sides if drip falls from the plants above.

**Potting Cyclamens** (*Idem*).—Your plants that are just starting into growth should be turned out of the pots, and have as much soil removed as can be done without injuring the roots materially; then place them in perfectly clean and well-drained pots, using a compost of two-thirds of turfy loam, the remaining third being composed of peat, leaf soil, and dried manure, adding also silver sand and crushed charcoal freely to keep the whole porous. The soil should be in a healthy state as to moisture when it is used—that is, neither too wet on the one hand nor too dry on the other. This is important. After being potted the plants should be placed in a cold frame and kept rather close for a week or ten days, shading them if hot weather prevails. They must be watered carefully, as an excess of moisture until roots are produced for absorbing it is pernicious. Syringing daily except in dull weather is beneficial and lessens the necessity for saturating the soil. As soon as fresh roots reach the sides of the pots the plants will need more water, especially if, as they should be, they are in a house having a temperature of not less than 50°.

**Propagating Marguerites** (*An Old Subscriber*).—If you well drain some flower pots, protect the drainage with a little moss, fill the pots two-thirds full with a compost of unsifted turfy loam and leaf soil, and on this place an inch or two of lighter soil finely sifted and mixed with half its bulk of sand, pressing it rather firmly, then surface with a layer of pure sand, and water the pots thoroughly through a fine rose, they will be ready for the cuttings. These should be about 3 inches long, the leaves being divested for a little more than half the length of each cutting, removing any flower buds there may be, then insert the cuttings firmly an inch apart, and give another thorough watering. If the pots are placed in a frame and kept close for a week or so, shading to prevent the foliage flagging, nearly every cutting will emit roots. The plants must then have more air, and be removed to the vinery on the occurrence of frost. The present is the right time for inserting the cuttings. The yellow form is perhaps not quite so hardy as the white, but neither of them are difficult to strike and preserve, while both are of easy culture.

**Vine Unhealthy—Removing Laterals** (*Yorkshire Curate*).—There is no red spider on the leaf sent, but the Vine is evidently in an unsatisfactory state. The root-action is defective, but whether this has resulted from an excess of water or the reverse we are unable to say. Examine the border, and if it is at all dry at a depth of 2 feet apply water in sufficient quantity to penetrate the entire mass of soil. Surface roots should also be induced by placing fresh soil and wood ashes in contact with the roots, covering it with rich manure. As a rule amateurs err by planting Vines in inside borders, as only good cultivators can manage them well thus planted. A safer and easier course is to plant outside, and, the soil being good, the Vines are almost certain to grow if they have the right treatment inside. This consists in judicious ventilation, especially opening the lights early in the morning, maintaining a genial atmosphere by sprinkling the paths, walls, &c., of the house once or twice daily in hot weather, and keeping the foliage clean and thinly disposed, with moderate cropping. As a rule the principal laterals should be from 15 to 18 inches apart up each side of the rods; the points may be pinched out at one or two leaves beyond the bunches according as there is space for leaf-development. Those laterals that bear no bunches may be stopped at about the sixth leaf; the sub-laterals that follow should be pinched at the first leaf—that is, the moment a leaf is seen as large as a shilling pinch off the growth, leaving that leaf only. By continuing this practice throughout the season overcrowding is prevented and fruitful wood with fine foliage produced. Let the laterals on the sickly Vine, however, grow freely now, removing some of the bunches if they are numerous. If the laterals on the other Vines have been neglected they

must not be removed in large quantities at a time, but gradually, cutting a few off every day, and this only to admit the sun to the principal leaves. You will probably do well to train a young cane from a healthy Vine for providing a rod in place of the unhealthy Vine should it not recover, as a healthy Vine planted outside will support two rods as well as one. The spots are the result of not admitting air sufficiently early on the mornings of hot days.

**Socotrine and Barbadoes Aloes** (*Inquirer*).—The species supposed to yield Socotrine Aloes is *A. socotrina*, but some doubt still exists as to the true source; it is, however, well known that this plant grows abundantly on the island of Socotra, and about the Straits of Babelmandel, whence the supplies of the drug are obtained. The preparation is much the same as is practised at the Cape, but instead of being evaporated in iron pans by the aid of artificial heat, it is said to be performed by exposure to the sun. Barbadoes Aloes is procured from *A. vulgaris*; but *A. socotrina*, *A. purpurascens*, and *A. arborescens* are also cultivated for the purpose. This variety of the drug is obtained either by boiling the juice to a proper consistence, or by chopping up the leaves and forming a decoction with water, which is afterwards evaporated; in either case, when the proper consistence has been obtained, the substance is poured into calabashes and allowed to coagulate. A superior variety has been got by the spontaneous exudation and inspissation of the juice. The composition of a pure specimen of 100 parts of Socotrine Aloes consists of 85 of a bitter extractive substance called aloesin; 2 of nitrate of potassa; 2 of sulphate of lime; 0.25 of gallic acid; 8 of albumen and traces of carbonate of potassa, carbonate of lime, and phosphate of lime. Aloesin is very soluble in water and alcohol, but slightly soluble in ether, and quite unaltered in the fixed and volatile oils; and it possesses in an eminent degree the bitter taste and purgative property of aloes. Aloes is one of the most valuable remedies, being tonic, gently aperient, or purgative, according to the dose.

**Names of Plants** (*W. B.*).—1, *Campanula Rapunculoides*, Creeping Bell-flower; 2, *Fumaria officinalis*, common Fumitory—this plant was formerly considered a valuable antiscorbutic, and much used in obstructions of the viscera. (*F. J.*)—1, *Linum grandiflorum rubrum*; 2, *Leptosiphon roseus*; 3, *An Oenothera*, but as all the flowers had closed we are unable to determine the species or variety. If the plant is perennial it is possibly *O. Fraseri*. (*A. T.*)—*Rhus cotinus*, commonly called the Smoke Tree from the peculiarity of its inflorescence, of which you send a good example. (*E. E.*)—1, *Erythraea Centaurium*, common Centaury, not a Gentian; 2, *Chlora perfoliata*, Perfoliate Yellow-wort; 3, *Vicia sylvatica*, common Wood Veitch; 4, *Epilobium angustifolium*, Narrow-leaved Willow herb, certainly wild; 5, *Erigeron acere*, blue Erigeron, not a Thistle. There is little difficulty in determining specimens that arrive in such good condition as those you have sent. (*W. H. W.*)—1, *Ficus repens*; 2, quite withered; 3, *Asclepias curassavica*; 4, *Habrothamnus fascicularis*; 5, *Maurandya Barclayana*; 6, insufficient without flowers. (*W. A.*)—1, *Achillea Ptarmica flore-pleno*; 2, *Lilium Batemannæ*; 3, *Bryonia dioica*; 4, *Matricaria inodora*; 5, *Epilobium angustifolium*. (*R. P.*)—1, *Saponaria calabrica*; 2, *Mouarda didyma*; 3, *Sedum carneum*; 4, *Nerium Oleander*.

**A Hive without Honey** (*J. B. G.*).—Evidently something has been wrong in the stock hive or the management of it, seeing it yielded only 1 lb. of honey on being turned out twenty-one days after swarming. As the swarm, too, is at starvation point you think the queen is too old and lays drone eggs only. If the queen was a mere drone-breeder before swarming the hive would never have swarmed at all. If there is nothing but drone brood in the hive kill the queen and unite the bees to the turn-out. Possibly both swarms united would make a good stock for another year; but even if both swarms get young queens it would be difficult at this late season to build up two good stocks from the bees now, as you say, at starvation point. Young queens may be had from those who sell them, the prices usually ranging from 5s. to 10s. each.

**Driving Bees from Supers** (*Inquirer*).—This subject is practically and concisely treated by Mr. Pettigrew, whose communication in our present issue embraces the question you have submitted.

**White Bees Thrown Out** (*H. M., Southport*).—The bodies you enclose in your communication are, as you suppose, drone pupæ, and their ejection simply indicates that the honey yield has practically ceased, and that the bees have given up all idea of colonising for the season. The destruction of drones proves that the queen is all right, while it by no means indicates that the hive is deficient in store, but it is always wise to look within to ascertain the condition of things when these white bees are seen. The throwing-out of worker pupæ and the eating of eggs and young larvæ must, on the contrary, however, be always regarded as a certain indication that the larval is most unsatisfactorily furnished, if indeed it does not proclaim imminent starvation. If bees are constantly fed they will suffer their drones to live undisturbed until they form their winter cluster, when they simply turn them to the floorboard.

**Glucose as a Food, &c.** (*M. H. M.*).—Your queries cover much ground of general interest, and do not require an answer immediately, so that we purpose treating the question fully in a future issue.

**Transferring and Uniting Bees** (*Inquirer, Lindfield*).—It is certainly not too late to drive and transfer. The skeps, unless unusually large, will not half fill your Philadelphia hives, so that you may either put both lots into one Philadelphia hive or make two stocks of them, when feeding will be necessary. If the bees are helped until they have filled six or seven frames they will have done enough for successful wintering, but you must reduce your hive by a dummy. If you unite—and whether you should or not must be much determined by the position the hives are now occupying—take no trouble about the respective queens, as the bees will settle this matter for themselves.

#### COVENT GARDEN MARKET.—AUGUST 10.

OUR market is now quieter, the soft fruit being nearly finished, but best fruit is still in demand. Prices with few exceptions remain the same.

POULTRY AND PIGEON CHRONICLE.

THE ROYAL COMMISSION ON AGRICULTURE.

THE Blue Book lately issued upon this important subject contains a digest and appendix to Part I. Of the evidence taken before this Commission, together with Reports of the Assistant Commissioners, presented to both Houses of Parliament by command of Her Majesty, and is printed by Messrs. Eyre & Spottiswoode, and may be obtained at the reasonable price of 10s. 6d. Upon introducing this subject to the notice of landed proprietors, their agents, and home farmers, we repudiate and ignore any points or matters which are frequently made the subject of political controversy, and intend only to take up these Reports with the view of illustrating and recording all the most valuable information we can find connected with practical agriculture. At the same time we must congratulate all those having an interest in this Commission, not only upon the results, but also upon the fact of their having the opportunity of obtaining so easily and so cheaply a reliable work of such importance and extent affording information connected with agriculture and its present depressed position.

We have the reports from nine Assistant Commissioners, besides Sub-Commissioners, each of whom have taken evidence in every county and district in England, Wales, Scotland, and Ireland; at the same time we have valuable evidence taken by them in France, Belgium, the Netherlands, as well as excellent reports from America, Canada, California, &c. These Reports contain evidence given by some of the most practical and responsible landowners and tenant farmers to be found in each of the districts and countries to which we have referred; and in order to forward the object we have in view—viz., that of instructing the home farmer as well as the landowners generally upon the various systems of farming pursued all over the kingdom, as well as that of parts of the continent and America, we have to consider the difficult and depressed condition of agriculture in the United Kingdom, and the enormous mass of information taken under the Commission which goes to prove this. We must at the same time say that it also gives valuable evidence relating to the practical farming of every county and district, which is calculated to enable persons not only to understand the causes of this depression, but to enable them to successfully encounter them, so far at least as may be possible, barring adverse seasons. Amongst the various causes to which the present position of farming may be attributed we find that the question of high rents, defective tenures, and damage by game, &c., are placed in a prominent position by the tenant farmers. We must, however, discard these ideas in speaking of the position of

the home farmer, and also of occupiers who farm their own estates, and consider only the causes of depression in agriculture in its entirety, and free from extraneous or collateral issues.

A succession of unfavourable seasons which have prevailed with more or less intensity in different districts and counties in the United Kingdom since the year 1874 has unquestionably been the chief cause of the difficulties and losses of capital by the occupiers of land—assuming, however, unparalleled proportions in the year 1879. Hence the principal reason why so many farms having been thrown on the proprietors' hands, and from this cause the question of management of the home farm and land in hand has become of more consequence than at any former period. We have, however, to contend against charges on the land at present which are extremely heavy, such as the poor rates, road rates, education rates, and local taxation generally, some of which charges are new to us, and unknown formerly. There is, again, the prospects of the corn-grower in this country which call for grave consideration; for several influences exist and are extending which render the production of some of our former standard crops unremunerative, or insufficiently so. The most serious of these influences is the foreign supply. It is overwhelming as regards the prospects of our home growth for several reasons. In quantity it is more than equal to the necessities of this country, even with a short yield of our own crop; and referring especially to Wheat, the quality of a considerable proportion is even superior to much of our own, but above all it can be produced and sold in our markets at a price that is ruinous to our growers. We are prepared to admit that at the time free imports of corn became law, farmers were seized with apprehensions that had not been realised until within the past few years, but it is obvious that the causes which exist now were undeveloped then, and in the progress of time must greatly extend. The telegraph, in maintaining harmony between supply and demand, is seconded by universal steam communication both on sea and land. Already in every market in England the home farmer finds his corn brought into competition with that of foreign production. It is also certain that the great corn-growing districts and provinces of America and Canada, as well as some of the continental States, will rapidly increase in their production, for they are not slow in availing themselves of the best of our stock and implements, which matters are especially set forth in the information obtained through the evidence given and the researches made by the untiring industry and perseverance of the Commissioners under the Royal Commission on Agriculture.

The home farmer as well as landowner must be aware that we cannot increase our acreable produce in adverse seasons, nor increase our area of production under agricultural depression. With us it is a question of price to a very great extent. Such, then, is the position in which we find ourselves with our standard crop—Wheat, and which is after all the principal rent-paying produce upon all the strongest and best loamy soils. By taking warning, however, in time we may postpone for a while the fate which, in the opinion of many, awaits agriculture in England, especially as regards the growth of Wheat. It is a common mistake to suppose that the business of agriculture is capable of the same developments that appertain to manufactures or trade. The farmer's factory is the immovable land, and although the soil is grateful for help and yielding to the skilful management of the cultivator (except in unfavourable seasons), yet Nature, which presides over all his works, will not be forced. High farming, as it is called, is not necessarily the best farming; but the best criterion of good husbandry is profitable farming. We have often observed that farming is so unlike trade or manufacture, or capable of yielding to the same expedients, for we cannot shut up our shop and tide over a season of difficulty; we must go on to the end as the owners and occupiers of our own land, whether it yields prosperity or adversity. We have no desire, however, to discourage the home farmer, because it by no means follows if the growth of corn is unprofitable upon the systems previously advocated that we should not alter our rotation or change our crops, and grow those kinds of produce—whether of cereals, pulse, fruit, or vegetables—which will yield the most profitable return.

Again, what reason have we to fold our arms and be satisfied with what we have done previously in the way of rearing live stock? The opportunity of improvement is always open to the home farmer, who feels few of the impediments and difficulties of depression by loss of capital, &c., like the occupying tenants under lease; his is a position not only of great simplicity, but also encouraging him to adopt any of those expedients which are going on around him which promise the best results. In the purchase of the best of every kind of live stock he has great encouragement not only to rear the most valuable of each kind of animal, whether of horses, cattle, sheep, or swine, but also to spend his time and abilities in studying how to feed and fatten

them to the greatest profit. As our Blue Book contains a mine of information on matters connected with agriculture of every kind, contributed by the most intelligent and experienced men, we have only to explore the mine, and endeavour to turn its products to the best account; and in continuing the subject, by searching the pages of the reports of the Royal Commission we hope to bring out all the necessary information found therein to enable the home farmer to continue his business with advantage in whatever district he may be placed.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—Harvest work now predominates, and all other farming operations must in a great measure give way to cutting and carting the different crops. If, however, the weather should continue favourable we have no doubt that on many home farms Wheat, Peas, white Oats, &c., will be thrashed in the field; and it is a wise plan too, because it saves a certain amount of labour—that of stacking and thatching, by which expense is incurred if the corn is stacked in the usual way. During the operations of cutting the cereal crops it is not only important to cut them with the reaping machine, but the work should be done with the latest improved string-binding machine; because, although we have the advantage of the reaping machines without binding, yet in that case it is not done without some risk, unless we can find a staff of binders of sufficient number to keep pace with the reaping. We have noticed lately that large fields of Wheat have been cut and left on the land, which would employ the binders several days in tying and setting up in stooks. In the meantime, while work of this kind is going on, if heavy thunderstorms should occur followed by dull close weather the grain may sprout before it could be tied and set up. Herein lies the great value of the self-binding machine, for in the event of the corn being only cut when the straw is dry we incur no risk, such as occurs when the produce is allowed to lie on the ground.

We must not forget that at every opportunity when the horses do not or cannot work in the harvest field, that it is very desirable to employ them by ploughing and sowing stubble Turnips in the way in which we have often described in these columns—that is, by ploughing between the stooks of corn and drilling the seed and manure at the same time every evening as fast as the land is ready. In this manner we have grown crops equal in weight to those grown after green crops fed off, especially in such a favourable season as the present, when the temperature of the soil is not only high but the land in most districts moist, so that it can be worked fine with little labour, and thus insuring a quick vegetation of the seed. The odd horse or horses should be employed in horse-hoeing the crops of Swedes or Turnips which may require it. We have often driven the horse hoe with the knives set separately across the drills if hand labour has been scarce or otherwise employed. This plan will prevent the plants from becoming stunted, so that after a while the hand hoes may set them out. In some cases we have had this work done by the women in a satisfactory manner. In those cases where the Turnips are sown broadcast for any special reason, such as the failure of a first drilling, we have by sowing plenty of seed obtained a plant sufficiently thick to allow of the horse hoe cutting through them for the space of 18 inches and leaving a space of 9 inches, in which case we have preserved a regular plant, and they have been more easily singled than when the seed has been drilled.

As soon as the land intended for Trifolium is cleared of the crop previously grown sowing the three sorts should immediately take place, including the early, second early, and late white variety. The land should be clean and worked merely on the surface, obtaining only just loose soil enough to bury the seed, then leave the land rolled. This is the surest plan to succeed in obtaining a regular plant, and the likeliest way for the plants to escape the greatest and almost the only enemy—the little white slugs.

*Hand Labour.*—The work to which we have just alluded will employ all the men and women too, for when not engaged in harvest work singling root crops will find them full employment during the harvest period.

*Live Stock.*—Horses now engaged in harvest work, and making long days of severe and exciting labour, should be well cared for and accommodated in their airy loose boxes for the night. We do not approve of letting them lie out at night. For instance, on such nights as July 27th, when an unusual frost occurred, is it reasonable to suppose that horses during the daytime engaged in severe labour can be allowed to remain out on the meadows or parkland at night without sustaining injury either in the present or the future? We know the constitutions of valuable horses are often ruined without our suspicion or knowledge as to causes, the seeds of disease having been deposited by want of care and consideration in the management of the animals.

Sheep stock must not be neglected in harvest time, for on most farms the shepherd will be fully employed in tending the flock, especially of a breeding flock of ewes, and he should not under any pretext be asked to take part in the labour of the harvest field. At this time the rams will be turned in with the ewes, and these should have regular feeding with the most succulent food on the farm, such as Rape or second growth of Clover, and at the same time they may well be allowed a few cracked beans or cotton cake, as we find that when the ewes are well fed they are likely to bring more twin lambs.

Nor does this apply to any breed in particular. There has been great scarcity of grass, not only in the pastures for grazing the fattening cattle as well as for dairy cows; under any circumstances supplementary food has been required, and if no Vetches and Rape have been forthcoming the Mangolds or early Turnips may be resorted to, feeding not only the stock we have named but the fattening bullocks in the boxes also.

#### VARIETIES.

*MARKING FOWLS.*—Miss Kenrick desires to know the best method of marking fowls, so as to distinguish those of the same breed from one another. We shall be glad if our experienced poultry readers can supply the information.

— *THE DAIRY SHOW.*—We are glad that the Dairy Show will not this year clash with Oxford, or indeed come near it, as it is fixed for September 15th to 20th. The Judges for poultry and Pigeons are announced. Mr. T. C. Burnell takes Dorkings, Brahmas, and Langshans; Mr. Leno, Cochins, Leghorns, French, Plymouth Rocks, and the Variety class; Mr. S. Matthew, Game, Game Bantams, and Malays; Mr. Teebay, Spanish, Hamburghs, Polish, Minorcas, Andalusians, Silkies, and Bantams; Mr. Sainshury, Waterfowl, Turkeys, &c. The Pigeons are thus divided—Mr. Gresham takes Pouters; Mr. Esquilant, Tumblers, Archangels, Any variety, and Homers; Capt. Heaton, Carriers and Jacobins; Mr. Jones, Fantails, Nuns, Trumpeters, Magpies, and Runts; Mr. Gell, Barbs, Owls, and Swallows; and Mr. Ludlow, Turbits, Dragoons, and Antwerps. We are also glad to see that at the said Show Silkies, Minorcas, and Polish have classes to themselves.

— *PIGEONS FOR SHOWING.*—We would remind our readers that it is about time for those Pigeons which will be required for the great shows to be separated. We have, in common with many fanciers, often made the mistake of keeping our breeding birds too long at work. This impairs their health, especially that of cocks; they moult late and irregularly, are unfit for the autumn shows, and unfit again to be paired early in the spring. Of course it is vexatious to throw away a pair of valuable eggs, for often Pigeons breed so fast that before one pair of squeakers can possibly be taken from their parents another pair of eggs is laid; but if no common birds are kept to which they can be transferred, thrown away they must be. The cocks, as we have said, specially suffer from late breeding, for they continue to feed the squeakers after the hens; in fact, a good cock is constantly feeding for months, giving to successive pairs of birds not only all his own eaten nourishment, but all the digestive juices, and at the end of the time is sorely in need of care, rest, and good food himself.—C.

— *ILLUSTRATED BRITISH BALLADS.*—Part 7 of this excellent work, now being issued by Messrs. Cassell, Petter, & Galpin, contains Sir Walter Scott's "The Eve of St. John," Jamieson's "Fair Annie of Lochroyan," Thomas Hood's "Fair Ines," and the same writer's noted punning ballad "Faithless Nelly Gray," and Thomas Delone's "Fair Rosamond," each being illustrated by admirably executed engravings.

— *PACKING EGGS AND DEAD POULTRY.*—At the meeting of the Council of the Royal Agricultural Society, at which a Committee was nominated for drawing up a scheme for offering prizes for fruit and vegetables, as referred to in our gardening columns, the above subject was discussed; and on the motion of Mr. Jacob Wilson the Committee were empowered to extend the scope of their scheme so as to include dead poultry and poultry management, Mr. Wilson remarking that in the matter of packing eggs and dead poultry England is very much behind her foreign competitors.

— *NEW WHEAT IN SUFFOLK.*—At the Bury St Edmunds market last week several samples of new Talavera Wheat were offered, and in one case changed hands at 53s. per quarter. This sample was in very fair condition, and of good average weight. The mildew will, it is expected, seriously affect the late-sown Wheats, but the early crops will not be much deteriorated by it.

— *THE VALUE OF LAND.*—The *Estates Gazette* says there have been a considerable number of estates put up by auction during the past two or three months chiefly by order of the mortgagees, but very

few sales have been effected, the biddings not even reaching the amount of the mortgage. Amongst the many instances that could be given we may mention the Tiptree Hall property, the farm of the late Mr. Mechi; £3750 was the utmost that was offered for the estate, on which a mortgage of £4500 existed. We know of another case where £5000 was advanced on an estate, and when it was subsequently put up for sale, £3000 was the extent of the bidding. A property would be supposed to be worth £7000 or more on which to raise a mortgage of £5000. This shows how land has fallen in value, whether permanently or not no one can say for certain. In our results of country sales the amount reached in our last issue is only £644,617, whereas last year it was £1,013,464. We find estates bought in far more frequently than sold. Land is now a drug in the market—a fancy place may sell, but nothing in the way of an investment is looked at. A very melancholy state of things indeed.

— THE AMERICAN WHEAT CROP.—A cablegram sent from New York last Sunday states that the best judges say that the winter Wheat crop is about 20 per cent. short. It is difficult to get an accurate estimate of the spring Wheat. In some localities the yield will be very heavy, from 20 to 25 bushels per acre. Placing last year's yield at 100, this year's in these sections will be 105. In others it will be as low as 89, and in others 93. The most competent authorities place the crop at 15 per cent. short of last year's.

— A LARGE LANDOWNER.—Mr. Hamilton Dession, a Philadelphia manufacturer, appears, says a daily paper, to be a gentleman whom destiny has assuredly marked out for immortality. He has just concluded a contract by which he secures four millions of acres from the Board of Internal Improvement of the State of Florida. He has thus made the largest purchase of land ever effected by one person. His intention is to work out a great emigration scheme, which will have agencies in England, Germany, and France. America can now boast that among her citizens is not only the richest man but also the largest landowner in the world.

— THE ENGLISH HARVEST.—Harvest, says the *Mark Lane Express*, is now in rapid progress all over the southern and midland counties of England, and the weather has been very favourable. The high temperature of the latter portion of last week has enabled farmers to secure a considerable acreage of Wheat in the more forward districts, and has afforded exceptional facilities for thrashing in the fields wherever the exigencies of harvest work and the availability of traction engines rendered such policy practicable. There have been a few samples of the new crop of provincial exchanges, but they have been too exceptional to afford any trustworthy index as to probable harvest results. It is noteworthy, however, that the quality of these early samples has been variable, and that the yield in such cases is not reported to have been more than an average. It remains to be seen to what extent premature ripening, general thinness of plant, and the appearance of parasitical fungi at the eleventh hour, will detract from what has hitherto been very generally spoken of as an average crop of Wheat. It is also noticeable, as bearing somewhat on the subject, that the first results of the Wheat harvest in France and Italy are causing considerable anxiety and disappointment, the climatic influences of the season having been practically the same all over western and southern Europe; in eastern Europe, especially in southern Russia, the Wheat harvest is likely to prove both large and good. So far as the United Kingdom is concerned the position appears to be that, if the Wheat crop in England reaches an average, the actual quantity grown will be comparatively small, inasmuch as the acreage is known to be smaller than usual; in Scotland the Wheat crop has not, of late, been favourably reported on; whilst Ireland—where all cereal crops are said to be good—is not, to any great extent, a Wheat-growing country.

— PEAT CHARCOAL.—Messrs. Wells & Co., Barton-on-Humber, have sent us from their trial grounds specimens of Wheat and Turnips that have been grown solely by the aid of the above fertiliser, which was used at the rate of 5 cwts. per acre. The Wheat is a wonderful sample, exceeding 5 feet in height, with large heavy heads; indeed, a full crop of such heads would afford a yield of 7 or 8 quarters per acre, and this we should very much like to see

in field culture. The Turnips are remarkably large and clean, and we are informed they were never attacked with the fly, against which the charcoal is recommended as a specific. Have any of our readers had experience with this manure in ordinary field culture?

— LINCOLNSHIRE BEE-KEEPERS' ASSOCIATION.—We have received the schedule of prizes of this Association's Show, which is to be held at Louth on September the 8th. There are twenty-seven classes, and several special prizes, also a silver cup for local exhibitors. Mr. Godfrey, the Secretary, is indefatigable in his efforts to improve and extend bee-keeping in the county in which he resides, and he merits support and success.

— NEW HOPS.—The first pocket of this year's growth arrived in the Borough Market, London, on Tuesday morning last, consigned to Messrs. W. H. & H. Le May, Hop-factors. The quality and management were exceedingly good. It is grown by Mr. Amos Luck, Paddock Wood, Brenchley, Kent, and realised £15 per cwt., and has been forwarded to Messrs. Kitchin & Simpson, Hop merchants, Leeds.

#### POULTRY NOTES.

We have frequently endeavoured to impress upon such of our readers as keep poultry for the sake of the eggs they lay, that no hens should be kept over after their second laying season. Many people who complain of a deficient supply of eggs would find matters mend if they paid attention to this point. Hens, as a rule, lay about an equal number of eggs in their first and second seasons, but after that the produce rapidly decreases. Every autumn one-half of the laying stock should be killed or disposed of, and their places filled up by pullets of the year. Now is the time to see to this. As the two-year-old hens show symptoms of going into moult, let them be put up to fatten for a short time, if necessary, and then be killed or sold. If chickens have been reared at home, the best of the pullets can be selected to fill up the vacancies in the laying stock. If it be necessary to purchase pullets, the sooner it is done the better, as when the season is further advanced it is not easy to make sure of what the age the pullets is. March and April pullets are best for winter laying, and at this season well-bred chickens which are not up to the exhibition standard can generally be purchased at moderate prices.

A CORRESPONDENT of an American contemporary writing from Petaluma, California, gives an account of poultry keeping in the Far West. The long dry summers, and the consequent deficiency of grass, are somewhat against the rearing of chickens except in the early months of the year; but the writer has found that by giving an abundant supply of green stuff from the lawn and garden he has been able to overcome this difficulty. Within the range of vision from the writer's farm about a dozen other farms can be seen at which from four hundred to eight hundred laying hens are kept, and flocks of smaller numbers are almost innumerable. Not much attention has hitherto been paid to the raising of pure-bred poultry, but now some advance is being made. Breeders are adding fine birds to their stock, incubators are being introduced, and there are marked indications of "a new era of poultry-raising on that coast." The writer has devoted his attention to Plymouth Rocks and Brown Leghorns, and has raised this season 1800 chickens. Next year he hopes, or rather "calculates" to raise more thousands than his hundreds number this season. We trust that Mr. Byce's calculations will be realised, and as he promises further particulars we shall await them with much interest.

THE same number of the *Poultry Bulletin*, which contains the particulars we have quoted above, also contains a letter headed "Farmers as Poultry-keepers." At the present juncture the views of an American writer upon this subject may be of interest; we therefore quote the following passages—"A farmer should keep standard breeds of fowls, because such poultry is more profitable than mongrel stock, and if hens are kept at all one might just as well keep the best as the worst; but I would advise a practical farmer to keep out of what is known as the business of breeding

fancy fowls." "That it will pay an ordinary farmer, so far as money is concerned, to breed for fancy points I dispute most emphatically. It will pay him indirectly, but not in cash. Such poultry-breeding is for the mechanic in village or suburb, who attends shows and knows all the ins and outs of 'strains' and 'breeds' and premium birds. Our leading fanciers are not farmers; thousands of farmers take a keen interest in fine poultry, but are not known outside of their towns as poultry breeders." The writer proceeds to recommend the wives and children of farmers to go into poultry breeding, and become fanciers on the ground that it will do them good in a hundred ways and may bring in a few dollars of pocket money, and concludes—"But to the practical granger who cares nothing for horses but for their ability to pull, nothing for cows but for the milk they give, and nothing for poultry except for its market value—if he asked me if I thought it would pay him to keep standard fowls as leading fanciers do, I should reply emphatically, 'No.'"

THE *Live Stock Journal* of last week contains an interesting account of poultry farming as carried on by a Mr. Wells of Barnston, Dunmow, Essex. This establishment is not, however, exclusively or even mainly a poultry farm. It is an ordinary farm of five hundred acres, of which about 150 are under grass, and upon which on the average some six thousand chickens are kept. These are intended for killing, and some twelve to fifteen dozen are sent off daily to the London market. During autumn and winter the chickens necessary to keep up this supply are raised at home by means of incubators and artificial mothers. Mr. Wells prefers a cross between Hamburgs and Dorkings, because the fowls are vigorous and plump. In spring and summer the chickens are purchased from the farmers and cottagers of the district at from 8*d.* to 10*d.* apiece. The chickens are kept until ready for fattening in moveable poultry houses, such as old showman's vans, &c. There are twenty of these, and each holds three hundred chickens. They are frequently moved about from place to place, and it is found that the presence of the chickens on the grass does not in any way interfere with the grazing of the cattle, while their manure increases the quantity and improves the quality of the pasture. When ready for fattening the chickens are taken into the feeding shed, where there are tiers on tiers of small cages, each capable of holding ten or a dozen fowls. As the chickens are in good condition before being put up to fatten, a few days only are necessary to finish them for market. Barley, maize, barleymeal, and toppings constitute the staple feeding in the fields, some horseflesh boiled, Mangold, &c., being given twice a week. Meal of one sort or another mixed with milk is used in the feeding shed. The plucking and dressing is done by piece work at a cost of 9*d.* per dozen, and against this there is to be set the value of the feathers, which is about 6*d.* per dozen birds. The carriage to London costs 9*d.* per dozen. The capital employed in the business is some £500, and the monthly balance sheet shows a profit of from 25 to 30 per cent. on this sum. The concern has not as yet been a year in operation, but the results so far are of a satisfactory character.

#### OVERFEEDING.

THERE are few evils fowls suffer more from, or are more subjected to, than this. It is a matter not exclusively confined to the inexperienced. I think the most practical often commit the mistake, and it happens oftenest with those who are preparing fowls for particular purposes, such as showing, laying, or killing. When such objects are in view the general impression seems to be that they are soonest and best secured by continual feeding. In poultry books and poultry papers no warning is more often given than to avoid too frequently feeding fowls generally and young chickens in particular. But how long most of us are in putting this sound advice into practice! We adhere to the idea that the oftener we can induce them to eat the sooner will they gain a healthy maturity, and at first we feel confident that we are succeeding, but there soon comes a time that proves us mistaken.

Very young chicks may require to be supplied with food four, five, or six times a day; but at this season of the year there is no necessity for such frequent feeding, as all young stocks are now advanced in growth, and feeding must be regulated accordingly. We have offered food four times a day to birds four months old, and at times some of them would not come near it, while others would look at it as if it was bad, until at last they seemed to have no appetite for food at any time. It is when they are like this that they are most provoking, and it is then that readers trouble Editors with doleful tales of their fowls not taking food and

moping about from indigestion although this is hardly ever admitted.

The advice given is generally "to feed less," and in many mysterious cases this has a most wonderful effect. I have observed it with much gratification amongst my own birds and can speak from experience. I readily own to occasional over-feeding, and also to the efficacy of the simple remedy. Sometimes when I have had late-hatched chicks which I wanted to get up for certain occasions, I have tried frequent feeding on every variety of food, but in no single instance had this the desired effect, and the improvement which took place in their flesh, feather, and carriage when the supply of food was reduced was surprising.

All other things being right a fair supply of food will bring all kinds of fowls on fast enough for any purpose, and by a fair supply I may say I mean giving them as much as they will eat twice daily and no oftener. If fowls are fed say at 7 A.M., and again at 4 or 5 P.M., there will none of them wait to think which bit they should select for the next, but all will be taken with a relish, and it is then condition is gained. To observe them taking one meal under this regulation will please the young fancier far more than when only a very little of his frequently given dainties are taken and the remainder left to be devoured by pests of the poultry yard, or, worse still, to be mixed up with fresh food or taken later on in a sour state.

Apart from cleanliness, if I wanted to keep fowls, no matter of what age, in the best of health, I would begin and end by always keeping them on the hungry side, and if a distaste for food became apparent a meal now and again would be withheld altogether. If this is done at supper time an extra handful of meal will be wanted next morning, and care must be taken that it is not overdone. Of course these remarks do not apply to fowls being crammed for the pot, but only to such as are being kept for any other purpose. Some of the quick-fattening processes are apt to end in loss of appetite, and then, even in the case of birds that are being fattened, skipping over a meal now and again gives more gain than loss.—J. MUIR.

#### OUR LETTER BOX.

**Feeding Times for Fowls (Alice).**—A good meal in the morning, a very moderate one at midday, and another good one two hours before dark will be sufficient. The appetite of the birds must be your guide as to quantity.

**Earth Floor for Stables—Oilcake for Cow (S. G.).**—Ordinary clay soils will do well for placing at the bottom of stables and boxes if made perfectly dry and then broken down fine and passed through a half-inch ash screen. There are, however, some very tenacious and putty-like clays which will require about 20 per cent. of sand or ashes mixed with them to be effectually absorbent. If a cow at grass is allowed 4 lbs. of oilcake per day as supplementary food, it should be given at twice at the time of milking.

**Hydrophobia (Leal).**—It is utterly impossible for us, however willing we may be to do so, to advise you satisfactorily on the case submitted. There may be circumstances connected with it of considerable importance that no one can fully appreciate from a briefly written description of the event. Your only proper and safe course is to consult a medical man on the points you have submitted to us.

#### METEOROLOGICAL OBSERVATIONS.

#### REMARKS.

31st.—Very wet morning; slight rain nearly all day and high wind; heavy shower at 7.15 P.M.

1st.—Hazy but fine until 5.45 P.M.; rain until 7 P.M.

2nd.—Fine, calm, hazy.

3rd.—Dull cool morning; slight shower at 9.15 A.M.; fair rest of the day.

4th.—Very warm, fine, and bright.

5th.—Hazy at first; very warm fine day; solar halo at 6.30 P.M.

6th.—Cooler; bright and fine throughout.

Sunday was wild and wet, and Friday was very warm; but on the whole the temperature was near the average, and calls for no special remark.—G. J. SYMONS.

### PEACH-GROWING FOR AMATEURS.

IT is to be feared that outdoor Peach-growing has received a great check during the last two or three seasons, and that many have given it up as a hopeless task. It is true that fruit has been comparatively scarce, and that many trees have actually succumbed to the inclemency of the climate. Let me distinctly state, however, that the evil has not been caused by the severity of our winters, but summer frosts, summer deluges, and the want of summer sun have been the great destroyers, more especially the weather of what should have been the summer of 1879. That the Peach is sufficiently hardy for our winters is proved by the fact that on a wall containing some three dozen trees not a single branch was injured during the last winter, although many a monarch of the forest which has stood the greater part of a century has been unable to obey the summons of spring. Lombardy Poplars especially, which have served as landmarks for ages, may be seen all over this part of the country as bare as in midwinter; and even the common tree Box, which I have never thought was a tender plant, has in one part of our grounds, situate near the lake called "Half-mile Pond," lost all its lower growth in a line varying from 2 to 4 feet from the ground. There are, perhaps, fifty or sixty large plants in this situation, and all have their lower branches killed, while the upper part is unscathed.

That there is much interest attending outdoor fruit culture no one will deny, and amongst outdoor fruits none will bring so much credit as a well-clothed and well-cropped Peach wall. But, unfortunately, though we have to a great extent disposed of toy fruit trees which were very pretty but failed to fill the fruit-rooms, and even banished the fan-trained and most of the other unscientific forms of Pear tree, our grandfathers' notions that the Peach tree must be five years in making its backbones, and yet another five years in covering its allotted space, still linger. The consequence is, that whenever we experience an untoward season or two, professional gardeners talk of discontinuing outdoor Peach-growing, and amateurs are afraid to commence; and as the latter generally cannot afford the time to look after Peach houses, even if they can afford the money to build them, Peaches remain the luxury of the few. That this need not be so I will endeavour to show.

First of all throw away the old form of tree which figures so beautifully on paper but always fails to do so on a wall, the reason for which is not far to seek, its principle being wrong

according to all our notions of physiology. In the standard works on gardening we are first lectured very properly on maintaining a balance between the growths, and it is shown clearly that elevating a branch will produce comparative vigour, while lowering it will check luxuriance; but then, strange to say, we are recommended to spend five years in merely producing the outlines of a form which is the very opposite of all this teaching. You cannot have fan-training without having some branches nearly horizontal and others which are nearly perpendicular. The horizontal ones, moreover, are of necessity at the lower part of the tree, where vigour is wanted if anywhere. As this kind of tree cannot be produced by fair training recourse must be had to severe pruning, and even this in the end will fail to regulate the branches, which will ever burst out here and there violently, like a boy with a bad temper who has had all cuts and no coaxes. Correction is necessary for both trees and boys, but the necessity for applying it in a severe form generally arises from some neglect of "nipping in the bud."

I have said that fan-training is wrong in principle, it is also a difficult mode of training to teach. You cannot teach it to a labourer be he ever so sharp under one whole season's practice, and there are seven-eighths of the men brought up in gardens who never could be trusted to attend to fan-trained Peach trees had they ever so much tuition on the subject. It is not so with any other fruit, and it need not be so with the Peach if we follow either a more natural or a more scientific method. Some of the forms of cordon are more scientific and are fairly successful, but the method I have to recommend is the more natural. The outline is like that of the horizontal-trained Pear, excepting that the branches instead of being horizontal have an elevation of about 30°. We begin in November with maiden plants—*i.e.*, plants which have made one simple growth from the bud about a yard long. There should be no difficulty in finding plants with well-ripened growth after such a season as the present one, and remember that ripened wood on a young clean stock is of far more consequence than strong growth. You must expect to pay for having them selected. Supposing ordinary maiden plants to be 1s. 6d., selected ones are worth 2s. 6d., and if you order them now any good nurseryman will be pleased to select them for you at once, and fasten your name on them ready for removal at the first suitable time, whereas if the order is deferred till the busy season when everybody wants to be first, little customers especially can scarcely expect to be so well served.

The plants as soon as they arrive are to be planted upright, and 4 feet apart against a south wall. The knife is not to be used at all the first winter unless it is to cut off a small side shoot or two which may have formed; but this is not really necessary, and I generally leave them on and tack them to the wall. When the plants have made growths 2 or 3 inches long in spring, which they will do in abundance, some of these must be selected along each side of the stem at intervals of about 9 or 10 inches, which must be carefully looked after and trained outwards with about the same slope as the roof of a slated house; the other shoots where crowded may be carefully thinned by taking some of them off close to the stem, but leaving as many as there is room for to clothe the stem and assist circulation, merely stopping them to four or five leaves. The second year will see the wall nearly covered and bearing a few fruits; while the third, should the season be

favourable, will bring a full crop, and every other tree will require removal. I have a good length of wall at present in this happy condition, and I must confess that I am not a little proud of it.

We have been gathering Early Beatrice since the end of July; Early Louise in quantity, and better in quality, about a week later. Hale's Early and Early Rivers have a few fruits sufficiently ripe to gather, while Early Asect Peach and Lord Napier Neetarine promise to be not far behind. The bearing space of our wall is about 9 feet high, each tree has a lateral space of 4 feet, and bears from thirty to fifty fine fruits. The only protection used in spring was a board coping a foot wide which has remained on, and a bird net of an inch mesh, which was removed at the end of April. We had several rather sharp frosts at the end of March; on one occasion the thermometer at 4 feet from the ground went down to  $22\frac{1}{2}^{\circ}$ , and on another to  $23^{\circ}$ .—WM. TAYLOR.

#### CLIMBING PLANTS.

OFTEN have I written about hardy climbers, and yet the subject is far from being exhausted, for they become more beautiful every year, fresh charms becoming developed with advancing age—charms that would probably remain unnoticed upon solitary specimens, but which are rendered prominent by association with others. Early in the year a pair of Clematis montana were very beautiful. Planted originally to cover the massive stone piers of a gateway, they have climbed over the tops of the piers along a wall on each hand, one running onwards to the top of a gabled roof along the edge of which a fringe of its long branches hang down for several feet, no pruning knife ever being suffered to touch them, and nothing can be more striking than this huge old plant when laden with its pure white flowers. The pendant branches half screen and mingle charmingly with the growth of a Bignonia radicans, a Ceanothus azureus, and a Periploea græca. Later on the Bignonia will give us large clusters of its brilliant flowers, some nestling among the Clematis, and others standing out boldly from the mass of foliage in striking contrast to the soft clustering spikes of the pale blue Ceanothus. The Periploea has been in bloom several weeks and its flowers will soon be gone, but its foliage is so ornamental, clothing the wall with such dense masses of green, that we regret it is deciduous. The other Clematis has climbed up the end of a building full 30 feet high, twining about among the branches of a Virginian Creeper, among the foliage of which its white blossom is very pretty, and not unfrequently proves somewhat puzzling when seen for the first time. Near the Virginian Creeper a Honeysuckle (Lonicera brachypoda) has hitherto been highly ornamental, but I am sorry to say the severe weather of last winter killed many of its branches. Several others have suffered, and among them I am sorry to have to include the fine old specimen of L. flexuosa growing upon my house, which has lost all its upper branches.

We have now had three consecutive winters of unusual severity, and it is curious to see that the effects upon some of the old climbers is very similar to that of repeated attacks of illness upon old people—debility, disease, and sometimes death. For the first time in my experience Berberidopsis corallina lost most of its foliage last winter, the only branches not denuded being close to the wall or sheltered by the dense sturdy growth of a Cotoneaster. I am glad to say new foliage has come, but neither is it so stout in texture nor so large as usual. I may note that the two specimens growing here of this fine climber have hitherto been remarkable for robust health and extraordinary vigour. Myrtles too were cut down, and an Aristolochia Siphon lost much of its growth.

Ampelopsis Veitchii grows in our favour. No building appears too high for it. Once established it requires no further care but to keep it within bounds, which is not often required, for it makes its way behind the branches of other climbers and mingles its growth with theirs most charmingly. One huge plant of it has covered two storeys of a lofty building, and is rapidly advancing upwards over a third. It is spreading laterally among the branches of a Climbing Devonensis Rose on one side, and a Maréchal Niel on the other. At its base are several other climbers, the most conspicuous just now being Clematis Jackmanii laden with its rich violet purple flowers made more than usually attractive by their setting off the Ampelopsis foliage. The Ampelopsis bore seed abundantly last year, but very little of it proved fertile, only about a dozen seedlings having been raised from a considerable quantity of seed.

Not far from the Ampelopsis is another very attractive group

of climbers. The loftiest is a Solfaterre Rose, one of my especial old favourites. All its lower branches are covered by a white Jessamine, which, too, is rapidly mounting upwards past one of the windows of a drawing-room to those of a boudoir upon the next floor, for which purpose it was planted. Up among the Rose branches a Prince of Wales Clematis has climbed, and its deep purple flowers are now in full beauty, and the last scarlet flowers of Lonicera sempervirens are falling among the branches of the Jessamine.—EDWARD LUCKHURST.

#### HOW TO INDUCE EARLY FERTILITY IN SEEDLING FRUITS.

ONE of the great drawbacks attending the raising of seedling fruits such as Apples, Pears, and Plums, is the long period that must elapse before they produce fruit and can be proved. A seedling Apple or Plum will rarely bear in less than from eight to ten years, and a Pear in less than from sixteen to twenty years. A Cherry, on the other hand, will sometimes bear fruit in from four to six years. Fertility may be frequently hastened, however, by tying or ringing the bark of a branch. This is done by removing a thin ring of the bark, or by tying the branch tightly round with wire, by which means the sap is checked in its descent, the branch becomes swollen above the tie or ring, and fruit buds are formed. I have recently had a noticeable instance of the success attending this plan, which I tried on an unfruited seedling Apple, a branch of which I tied round last year with wire, and I find that not only is this the single branch which has fruited, but the only one on the tree which blossomed.

Another mode of obtaining the same end is to tie down the branches where practicable. Planting in a warm or shallowish soil, or removal to such a position from a deeper or richer soil, will also usually tend to early fertility. I also recommend that buds be carefully taken from the yearling fruit and inserted in a stock which induces precocity in fruiting. If an Apple, on the Doucin or French Paradise, a Pear on the Quince or Whitethorn, or a Plum on the Myrobalan or Sloe. By adopting one or all of these means the ordinary fruiting period may be advanced, and raisers may hope to live to taste the fruits of their labour.—T. LAXTON, Bedford.

#### PREPARING FOR WINTER.

(Continued from page 75.)

##### TOMATOES.

HAVING written previously and at considerable length upon this subject I have some diffidence in recurring to it. The importance of the subject and the knowledge that there are many fresh subscribers to the *Journal of Horticulture* must be my excuse. Given a suitable house, or a suitable position in a house, and there is nothing to hinder the merest tyro from growing Tomatoes in winter. When well grown they are decidedly ornamental, and there are but few establishments, even supposing the proprietors have no special liking for them, where they will fail to put the fruit to a good use. Those who are great admirers of the Tomato will find house-grown fruit much superior in quality to any they may have ripened in the open during the majority of our seasons. It is rather amusing to note the great divergence of tastes with regard to Tomatoes, some being inordinately fond of the fruit, while others have a positive aversion to them. Some on first tasting do so with a firm conviction they will not like them, and this was the case with a farmer whom I recently tried to convert. He seriously affirms he could taste the Tomatoes I gave him for a fortnight, and makes a wry face at those growing whenever he pays us a visit. The relish for them is undoubtedly an acquired one, and for this reason more than one attempt to eat them should be made. If considered insipid when sliced up and eaten with vinegar, oil, and pepper, they may yet be found palatable when baked. According to some authorities Tomatoes possess medicinal properties, and are especially recommended for those afflicted with a disordered liver. This is good news to me and probably many others, as I have no objection to such agreeable remedies.

After this brief attempt at the conversion of some of our readers I will now offer a few remarks on the winter culture of the Tomato. The plants will not succeed in a greenhouse temperature, but require to be grown in a house under the same conditions as ordinary stove plants. Bottom heat is not absolutely necessary, but if properly attended to they will succeed better with it. I have grown profitable crops in 12-inch pots, these being thinly disposed on a staging over hot-water pipes and among small decorative plants, growing in a low span-roof house. The Tomatoes were trained up the wires previously used for the Melons. In a high-fronted house the Tomatoes might be grown in the same

size pots and supported by strong upright stakes. Where there are houses specially arranged for Melon-growing—that is to say, with enclosed bottom heat and good top heat, the Tomatoes may occupy the positions previously filled by the Melons. In this case all that will be necessary will be to mix a little good decayed manure with the loam in which the Melons previously grew. In whatever fashion the plants are to be grown no time should be lost in preparing them for the start. If sturdy and tolerably well seasoned young shoots can be had, these may be made into cuttings and struck, either by placing them thinly round the sides of 6-inch pots or singly in 3-inch pots. A light sandy soil should be employed, and the pots of cuttings be placed in heat and shaded; but if they be kept very close and damp they will fail. The cuttings obtained in the open will this season be much too succulent to strike well, and, where available, cuttings should be taken from house-grown plants. Seedlings I find succeed equally as well as plants from cuttings, but they are rather more trouble and more liable to become drawn and weakly. This is to be guarded against in either case. The seed will germinate freely with or without heat, and should be sown thinly in light soil. Cover with glass and shade till the seed has germinated, then remove both shading and glass, and elevate them to near glass in a frame or on a shelf in house. When the rough leaves are formed pot off the plants singly, burying the stems up to the seed leaves in either 5 or 6-inch pots, and keep them rather close till established. Afterwards give abundance of air on all favourable occasions; and before the plants become much rootbound shift into the fruiting pots, or plant in the fruiting quarters. The treatment of the plants in cutting pots to be the same as advised for the seedlings. The soil recommended consists of two parts of turfy loam to one of sifted decomposed manure. It should be broken somewhat finely for the first potting, but for the final potting it ought to be employed in a much rougher state. Failing turfy loam add a little hone manure and a few broken bricks, which will serve to keep the whole porous, and the former is, besides, a good fertiliser.

In all cases it is recommended that the plants be grown to a single stem, all side shoots being kept closely rubbed out. This strengthening the plant results in the formation of much larger bunches of bloom than would otherwise be the case; and what is of still greater importance is a good preventive of crowding, than which nothing is more injurious. When growing among other plants the Tomatoes should be disposed at least 2 feet apart, and where the undergrowth has not to be studied they may be placed about 18 inches apart. The fruits do not always set well in a moist heat, and for this reason my aim has been to have the plants well established in the pots with the first strong bunch of fruit set prior to transferring to the winter quarters about the middle of September. If any difficulty is experienced in setting a crop, maintain for a time a warmer temperature and give air freely. In this manner a drier atmosphere will result, and this will admit of the pollen being distributed with a camel's-hair brush. It is not advisable to syringe the plants overhead at any time, at the same time a moist atmosphere appears to favour the growth. A temperature ranging from 60° by night or 70° by day will suit them well, but no harm will result at occasional lower temperatures.

An occasional top-dressing of equal parts turfy loam and manure will benefit them, and for this reason it is a good plan to only about three parts fill the pots when finally potting. The first top-dressing may be given the plants or pots when the fruits are swelling. The soil for top-dressing should be warmed, and the soil in the pots be watered if required prior to top-dressing. When watering do not be misled by the fact of the new soil being in a moist state, but carefully examine the old soil, as dryness at the roots induces premature ripening. As they are gross feeders, liquid manure ought often to be administered. Stop the leading stems one joint beyond the third developed bunch of bloom. In the case of plants in pots three heavy bunches of fruit will be a sufficient crop; and as a rule the plants, when they have perfected these, may be thrown away, it being more profitable to raise more plants in September and grow for succession. Where the plants have a good bed of soil to root in, they, after the stopping beyond the third bunch, may be allowed to form a fresh leader, and one of the many shoots that are constantly springing up from near the base of the plant may be laid in. The old foliage need not be retained after the fruits are ripe. If the haulm be occasionally thinned and fresh growth laid in, as well as giving top-dressings and carefully watering at the roots, plants may be maintained in full bearing for years. In this case a few widely disposed plants only should be grown. I prefer younger and more vigorous plants.

Taken on the whole I consider Earley's Defiance the most profitable variety to grow, and I find others are of the same opinion.

Conqueror is equally as heavy-cropping, but the colour, a rich glossy vermilion, is against it. Both have corrugated fruit, and are not so liable to crack as the round-fruited kinds. Fruit that has a tendency to crack should be cut when changing colour, and be ripened on a dry shelf in the house where grown, or in other warm structures.—W. IGGULDEN.

#### PLANTING HOLLY.

PERHAPS no time in the whole year is more suitable for planting or removing Hollies than the month of August. It is even more suitable than the month of May, which is considered one of the best of the year in which to carry out the operation. When large specimens have to be replanted there can be no doubt that the present month is preferable. Hollies have completed their first growth, and can be removed with success and with much less labour than if lifted during May. When lifting is practised during this month, unless the weather is very hot and dry, the specimens require but little attention afterwards in the way of watering. If the soil be dry when carrying out the operation a good soaking of water should be given, and again when placed in their positions. This in the majority of cases will prove sufficient, but in May much labour is often occasioned if the weather proves hot and dry. After the first growth is completed the roots are active and soon take to the soil after removal, and become partially established before winter. Lifting after the first growth often prevents a second being made, and this is rather an advantage than otherwise. Second growth in Hollies is not very desirable at any time in the northern counties, as seldom in the most favourable seasons is the growth thoroughly matured to withstand the severity of our winters. In many instances the growths when made late not only lose all their foliage, but are frequently killed back to the wood made early in the season. I do not wish to convey the idea that Hollies cannot be lifted with marked success during any other month of the year than August, as I have long since concluded that the majority of evergreens can safely be removed any time during the year providing they are lifted and replanted immediately. The case is very different if the plants have to be sent from a distance. I would much rather remove evergreens from the middle of July onwards to the end of September than during the winter months, when the roots are inactive and the plants have no chance of taking to the soil before being subject to severe weather. I am perfectly aware that more shrubs of different kinds are removed and replanted from the end of October through the winter than at any other time, and from many reasons that appears the most convenient time. This undoubtedly has become the practice, and shrubs in consequence are often planted when the ground is in a very unsatisfactory state. Death in many cases is the result, which is too frequently attributed to any but the right cause. I have from time to time been engaged in removing evergreens when most gardeners and cultivators would not have considered the time judicious. The results were always satisfactory, and I think the lifting of large Hollies and Rhododendrons cannot be performed at a better time than the present, nor with a greater degree of certainty and success.

A short time ago I had the pleasure of seeing some noble specimens of *Ilex Hodginsii*, and was much struck with the rapid growth the plants had made. Only a very few years ago they were comparatively small, planted as single specimens on grass, and pruned-in to keep them in shape as they grew. They are now noble plants, varying from 10 to 12 feet high, and perfect pyramids. The lower branches rest upon the turf, and are as far through at the base as the plants are high. They have grown very thick, so that it is almost impossible to see through them, and their fine dark foliage is beautiful. This I consider the finest dark-green-leaved Holly that can be grown, and hope in future it will be planted in greater numbers. It is very hardy, for last winter was sufficient to test it, and although cut a little in very exposed places, the plants now look none the worse.—W. BARDNEY.

#### CABBAGE LETTUCE.

I WISH to thank Mr. Iggulden for his reply to my inquiry on this subject. I did not question what he had written, as I have always found his writings on kitchen garden subjects reliable. Cos varieties are not appreciated here, and in consequence good Cabbage kinds have to be grown. Hardy Hammersmith I have discarded, as it so quickly runs to seed with me early in the season. I have grown Commodore Nutt, or what was sold me for that variety, first in 1880, and again this year. The seed of it and Tom Thumb were sown together on a warm border early both seasons side by side, in order to test the superior quality of the

Commodore over Tom Thumb, but found no difference. The seed of the two had evidently come out of the same bag, and upon making inquiries I was informed the seed had been obtained direct. I will, however, obtain seed from those who sent it out.—A GROWER OF SALADS.

#### ROSES IN SMOKY DISTRICTS.

To achieve success in growing Roses in the neighbourhood of smoky districts, it is necessary to select and plant only those varieties likely to flourish and give satisfaction, though I do not say much success as exhibitors can be attained by growing Roses in such districts, however judicious the selection. Three comparatively new Roses I shall refer to, one of which was only sent out last year, appears much hardier and flourishes much better than many other older kinds I am acquainted with. Sultan of Zanzibar, a fine dark Rose, somewhat in the way of Reynolds Hole, endured the severe weather of last winter well on a standard, and grows vigorously in this smoky climate. Duke of Edinburgh, a superb Rose, rich velvety crimson, is also very hardy and has endured the past winters bravely on the standard, but really flourishes the best in this neighbourhood as a dwarf on the seedling Briar or on its own roots. Mrs. Jowitt, a new Rose of last year, a strong and vigorous grower and of hardy constitution, will, I believe, prove a valuable Rose for smoky districts. I obtained plants early last year which were remarkably strong. They were planted at once, and stood the severe weather unmulched all winter, and not one portion of the wood was turned black. This season they have grown more vigorously than any other Rose I have. It has with me every tendency to be a late-blooming variety, and if it continues to display that characteristic will be very valuable. My plants are on the Manetti. It may be premature to decide upon all the good qualities of this Rose, but we might naturally conclude that it should be good when it has such parentage as Mdllc. Marie Rady and Duc de Rohan.

Two light Roses for smoky places which prove invaluable are La France and Madame Gabriel Luizet, the former being the most useful light Rose in cultivation, and should be grown as a dwarf—it is soon killed when grown as a standard—and well mulched during winter. It grows fairly well on any stock, but better and safer on its own roots. If the roots are killed during winter when on its own roots, it will with certainty spring freely from the base and flower continuously and profusely. The other variety is very hardy and grows vigorously with me, and blooms well.—LANCASTRIAN.

#### A POTATO GROWER'S DILEMMA.

FUNDAMENTAL principles, whether in growing the Potato or in making or mixing paint, cannot be set aside with impunity, and one of the most important points in the successful cultivation of the Potato is, or ought to be, a sufficiency of space between the plants to allow the air and sunshine to have full play around each individual plant. Without the beneficial effects of these success in the cultivation of flowers, fruits, and vegetables need not be looked for. It is fair to infer that "F. S.," (page 103) has previously tried the Magnum Bonum Potato, and it has pleased him; he now plants a whole square of it in his walled-in garden, filled with tall fruit trees, and the soil a literal hotbed of manure. These rows are only 2 feet apart under conditions conducive to "drawing," whereas it has been clearly demonstrated that 30 inches between the lines is little enough for such varieties as the Old Ashleaf, Myatt's, and Rivers' Prolific, which are not half so much given to the production of haulm as Magnum Bonum. The last-named cannot be grown in the open fields in this humid district at a less distance than 3 feet between the lines and 2 feet between the sets, and they should have more room in "F. S.'s" walled-in garden.

The preparation of the sets in a great measure has apparently been neglected, for which there is not much excuse, as they might have been spread in a light and cool place, and all the superfluous and weakly eyes removed; this would have effectually obviated the growth of six or seven stalks to one plant. Two years ago I saw Magnum Bonum tried in a garden similar to that of "F. S." The sets had been properly prepared and the land had also. They were planted 3 feet apart between the lines, and 2 feet between the sets; and even that was found to be too little room for the monstrous growth of haulm made in the dull summer of 1879. When lifted they yielded nevertheless a fair crop, but of very bad quality, although the gardener's employer liked them, and said they were exceedingly good. If they had been tried again they would have been planted at 4 feet between the lines, and 30 inches between the sets. In the present case it is very doubtful whether

with any pinching, pruning, or thinning the haulm would be of any avail. The only thing that appears likely to be of any real value is fine weather and letting the crop stand as long as possible for the maturation of such tubers as form. Last year the writer saw a field of Champions in much the same condition, but not quite so bad: and at the end of August there was not a tuber the size of a Bantam's egg, yet when ploughed out in October the crop averaged eight tons an acre. Magnum Bonum on the same farm did not succeed, and to the best of my knowledge is not grown this year at all.

However anxious "F. S." may be to grow Magnum Bonum, it is doubtful whether he will ever succeed in growing it well under the conditions at his command; to say the least of it, it is not a garden Potato, at least in this northern district.—PETER FERGUSON, *Mere Knolls, Monk Wearmouth.*

#### CARNATION AND PICOTEE SHOW.—AUGUST 9TH.

ON account of the lateness of the fixture (24th August) for the National Carnation (Northern Section's) Show, the principal growers decided to hold an Exhibition on the 9th inst. R. Gorton, Esq., kindly acted as Secretary, and under his direction one of the finest shows ever held in the north took place in the Town Hall, Manchester. The flowers were all good, and it is unnecessary to particularise individuals. The numerous good seedlings were noteworthy. The premier Carnation prize was awarded to a seedling rose flake very deep in colour, a flower of grand form and substance, exhibited by R. Gorton, Esq. The premier Picotee was a seedling, heavy purple, named Muriel, a fine flower with bright purple edge. Generally the named flowers were past their best, though the seedlings were superb, and for quality never before excelled. The following is a list of the awards.

Class A, for twelve Carnations, dissimilar, first, Mr. B. Simonite, Rough Bank, Sheffield, with Robert Lord, S.B.; James Douglas, P.F.; Sarah Payne, P.P.B.; Seedling, R.F.; J. B. Sharp, P.F.; Crimson Banner, C.B.; Seedling, S.F.; Admiral Curzon, S.B.; John Simonite, C.B.; Seedling, R.F.; and Jas. Taylor, P.P.B. Equal first, Mr. R. Gorton, Eccles, Manchester, with Tim Bobbin, R.F.; Seedling, P.P.B.; Tim Whittaker, S.B.; Rob Roy, R.F. (premier Carnation); Jas. Cheetnam, S.F.; Seedling, R.F.; William Skirving, C.B.; Seedling, P.P.B.; Seedling, C.B.; Admiral Curzon, S.B.; Clipper, S.F.; and Robin Hood, R.F. Second, Mr. J. Booth, Failsworth, Manchester, with Sportsman, S.F.; Jas. Douglas, P.F.; William Laing, R.F.; Clipper, S.F.; Eccentric Jack, C.B.; John Keet, R.F.; Earl of Wilton, P.F.; Seedling, C.B.; Admiral Curzon, S.B.; Falconbridge, P.P.B.; Annihilator, S.F.; and Garibaldi, S.B. Third, Mr. T. Bower, Bradford, York. Fourth, Mr. E. Booth, Moberley, Cheshire. Fifth, Mr. Jno. Beswick, Middleton, Manchester; and sixth, Mr. Geo. Rudd, Undercliffe, Bradford.

Class B, for twelve Picotees, dissimilar, first, Mr. B. Simonite with Mrs. Niven, P.P.; Mrs. Gorton, S.R.; Fanny Helen, H.R.; Mary, L.P.; Miss Wood, L.R.; Morna, H.R.; Violet Douglas, L.R.; J. B. Bryant, H.R.; Seedling, H.R.; Tinnie, H.P.; and Seedling, H.R. Second, Mr. R. Gorton, with John Smith, H.R.; Mrs. Summers, H.P.; Edith Dombrain, H.R.; Zerlina, H.P.; Seedling, L.R.; Ann Lord, L.P.; Mary, L.P.; Miss Horner, H.R.; Alliance, H.P.; Seedling, H.R.; Fanny Hellen, H.R.; and Rosy Queen, H.S. Third, Mr. J. Booth; fourth, Mr. Geo. Rudd; fifth, Mr. E. Booth; and sixth, Mr. John Beswick.

Class C, for twelve Carnations, not less than nine dissimilar varieties, first, Mr. Wm. Hewitt, Chesterfield, with Falconbridge, P.P.B.; Admiral Curzon, S.B.; James Merryweather, R.F.; Seedling, S.B.; Seedling, S.B.; Jno. Ball, S.F.; Master Fred, C.B.; Seedling, S.F.; Albion's Pride, C.B.; Seedling, S.B.; E. S. Dodwell, C.B.; and Seedling, S.F. Second, Mr. John Fletcher with Seedling, S.F.; John Keet, R.F.; Seedling, P.F.; Rifleman, C.B.; Unexpected, P.P.B.; Seedling, S.B.; Seedling, S.F.; Seedling, R.F.; Robert Lord, S.B.; Seedling, P.F.; and Lord Napier, S.B. These were the only exhibitors in the class.

Class D, for twelve Picotees, nine dissimilar varieties, first, Mr. Thos. Bower with Her Majesty, L.P.; Juliana, H.S.; Mrs. Dodwell, H.R.; Edith Dombrain, H.R.; John Smith, H.R.; Tinnie, H.P.; Mrs. Small, H.R.; Master Norman, H.R.; Zerlina, H.R.; Wm. Summers, R.; Mary, L.P.; and John Smith, H.R. Second, Mr. Jno. Fletcher with Mrs. Dodwell, H.R.; Ann Lord, L.P.; Royal Visit, H.R.; Her Majesty, L.P.; Mrs. Small, H.R.; Seedling, H.P.P.; J. B. Bryant, H.R.; Seedling, M.P.P.; Edith Dombrain, H.R.; and Minnie, L.P. Third, Mr. W. M. Hewitt with Muriel, H.P. (premier); Miss Lee, H.R.; J. B. Bryant, H.R.; Mrs. Niven, H.P.; Zerlina, H.P.; Ann Lord, L.P.; Mary, L.P.; Minnie, L.P.; and Master Norman, H.R.

Class E, six Carnations, dissimilar, first, Mr. E. Schofield, Jubbergate, Wortley, near Leeds, with Mars, S.B.; James Merryweather, R.F.; Sportsman, S.F.; Jenny Lind, C.B.; Admiral Curzon, S.B.; and Jno. Keet, R.F. Second, Mr. John Whittaker, Royton, Rochdale.

Class F, six Picotees, dissimilar, first, Mr. E. Schofield with Rev. F. D. Horner, L.R.; Miss Horner, H.R.; Mrs. Bowers, L.R.; Zerlina, H.P.; Mrs. Nicholls, L.R.; and Lady Holmesdale, M.R. Mr. R. Gorton was the only exhibitor in Class G for twelve selfs or other varieties, and was awarded the first prize.

CARNATIONS (single blooms).—*Scarlet Bizarres*.—First, third, and fifth, Mr. B. Simonite with Seedling 209, S.B., Admiral Curzon and Garibaldi; second and sixth, Mr. J. Booth with Admiral Curzon

and Mercury; fourth, Mr. R. Gorton with Admiral Curzon. *Crimson Bizarres*.—First and fifth, Mr. R. Gorton with Black Diamond and Saturn; second, Mr. J. Booth with Eccentric Jack; third, Mr. G. Rudd with J. Hextall; fourth and sixth, Mr. T. Bower with Milton. *Pink and Purple Bizarres*.—First and sixth, Mr. J. Booth with Jas. Taylor; second and fifth, Mr. B. Simonite with Sarah Payne and J. Taylor; third, Mr. G. Rudd with Sarah Payne; fourth, Mr. R. Gorton with Saturn. *Scarlet Flakes*.—First, second, and third, Mr. J. Booth with Sportsman, Annihilator, and James Cheatham; fourth, fifth, and sixth, Mr. B. Simonite with Frank Simonite. *Rose Flakes*.—First and second, Mr. R. Gorton with Robin Hood and Tim Bobbin; third and fourth, Mr. T. Bower with John Keets; fifth and sixth, Mr. Booth with James Merryweather and Sibyl. *Purple Flakes*.—First and third Mr. G. Geggie with Dr. Foster and Lord Milton; second, Mr. Booth with James Douglas; fourth and sixth, Mr. B. Simonite with J. Douglas and J. P. Sharp; fifth, Mr. Bower with the former variety. *PICOTEES* (single blooms).—*Heavy-edged Red*.—First and fourth, Mr. R. Gorton with John Smith; second and third, Mr. Booth with the same variety and Brunette; fifth, Mr. G. Rudd with Mrs. Dodwell; and sixth, Mr. T. Bower with J. Smith. *Light-edged Red*.—First and sixth, Mr. B. Simonite with R. Gorton and Violet Douglas; second and third, Mr. G. Rudd with Thomas Williams; fourth, Mr. John Beswick with Violet Douglas; fifth, Mr. Bower with Wm. Hewitt. *Heavy-edged Purple*.—First, second, third, and fourth, Mr. B. Simonite with Mrs. A. Chancellor, Mr. Niven, and Zerlina; fifth, Mr. R. Gorton with Mr. Summers; sixth, Mr. G. W. Schofield with Norfolk Beauty. *Light-edged Purple*.—First and sixth, Mr. Booth with Ganymede and Mary; second, Mr. G. Rudd with Minnie; third and fourth, Mr. G. Schofield with Mrs. Nichols; fifth, Mr. G. Geggie with Mary. *Heavy-edged Rose or Salmon*.—First, Mr. G. Geggie with Miss Horner; second, third, and sixth, Mr. G. Rudd, and fourth Mr. Booth with the same variety; fifth, Mr. R. Gorton with Fanny Hilton. *Light-edged Rose or Salmon*.—First, third, and fifth, Mr. G. Geggie with Miss Wood; second and fourth, Mr. R. Gorton with Mrs. Nichols and a seedling; sixth, Mr. G. Rudd with a seedling. *Premier Carnation*.—Rob Roy, R.F., shown by Mr. R. Gorton. *Premier Picotee*.—Muriel, H.P., a seedling shown by Mr. Hewitt of Chesterfield.

#### RASPBERRIES IN TRENCHES.

SOME years ago an account appeared in your columns of how a gardener formed a most fruitful Raspberry bed, by opening trenches and burying a large quantity of vegetable refuse I think. Will you kindly repeat the advice as an appendix to the article on Raspberry culture last week?—J. E.

[The following is an extract from the article referred to, which was communicated by Mr. Luckhurst. We saw the Raspberries in question when in full bearing, and the canes and crop were remarkable—

“Having had occasion to pay more than ordinary attention to the culture of this fruit, a few words concerning a failure and its remedy may prove useful to others. In planting a few rows about four years ago no particular care or preparation of stations was thought necessary, although the soil was obviously the reverse of rich. Unbroken success had very likely given me an impression that the Raspberry would thrive anywhere and in almost any kind of soil, and this feeling was strengthened by the sight of a bed of ‘wild’ Rasps growing luxuriantly in an Alder swamp within 100 yards of the garden. The soil was therefore simply trenched, manured heavily as for vegetables, and the Raspberries planted. A tolerably vigorous growth yielding fruit in due course was the result. But I was not satisfied; the fruit was neither so large nor plentiful as was required, and I resolved to start afresh, reserving the old plants for present exigencies.

“In making the new bed particular attention was given to ensure a robust growth, which in the Raspberry implies an abundance of fruit, and to arrange the whole so as to make it an easy matter to protect the fruit from the ravages of birds. This was managed successfully by making the rows side by side 5 feet apart, and with the plants 1 foot apart in the rows. Trenches a yard wide, 2 feet deep, and filled with the soil—leaves and dung of some old hotbeds well chopped and mixed, being prepared for each row. Large fruit and plenty of it was the object in view, and Prince of Wales was chosen as the best kind for culinary purposes, its fruit being very fine; but as it is not so sweet as some it would probably not be generally liked for a dessert fruit.

“It was reasonable to suppose that this careful preparation of the bed would produce proportionate results, but I must confess I certainly did not expect to see anything like the extraordinary vigour of the first year’s growth. Not only did the roots spread over the trenches, but they quickly met and became interlaced in the alleys, the entire surface soon bristling with suckers, which could only be kept under by repeated hoeings. The canes left to grow in the rows were wonderfully robust; and the old canes, which had been shortened to about a foot at the time of planting, put forth some shoots bearing such good fruits as to cause one to regret having shortened them so much. I do not, however, think it good practice to leave the canes of a new bed unpruned as is sometimes done, but would always reduce them to 1 or 2 feet. In autumn when the leaf had fallen two wires were strained along each row, one 2 feet from the ground,

and the other about 3 feet 6 inches; the canes were then pruned a uniform height of 4 feet, tied upright to the wires, and the work was complete.

“The bed has now been in full bearing for two seasons, the fruit being both abundant and fine. A heavy annual top-dressing of manure is given to the alleys. The soil is never disturbed, but remains intact just as it was left after the planting. As the fruit ripens the bed receives one or two thorough soakings of water or some liquid manure, which proves very beneficial to the crop, making the latest pickings of fruit quite equal to the first in size and colour.”]

#### COREOPSIS LANCEOLATA.

A METROPOLITAN correspondent, who has all the difficulties to contend with which beset town gardening, sends us a spray of *Coreopsis lanceolata* (fig. 25), accompanied by the following re-

Fig. 25.—*Coreopsis lanceolata*.

marks upon the plant, which he justly describes as one of the best in the genus.

“Amongst the not very numerous plants that I can regard as satisfactory in my town garden, which, though elevated in position, is yet exposed to the influence of far more smoke than is beneficial to plant life generally, is the lance-leaved Bug-nut, of which I send a specimen. This plant grows vigorously and flowers freely during the summer months, and I find its bright yellow flower heads attractive both upon the plant and when cut and arranged with other simple flowers in a vase. One valuable character it possesses is that it succeeds in almost any description of fairly good garden soil, and where the facilities are limited for studying the peculiarities of plants in respect of position and soil such an absence of fastidiousness is of much importance. I am aware that this *Coreopsis* is far from being a novelty, and possibly there are few readers of the Journal who are unacquainted with its

merits; still this brief record may induce some who are situated like myself to find a place for it.—URBAN.”

### ANTWERP INTERNATIONAL EXHIBITION.

BELGIUM, while being admittedly a kingdom of industry, is also a land of fêtes. Long days of labour—much longer than in England—appear to necessitate compensatory periods of rest, or rather of change; and the people, if they know how to work with assiduity, certainly know how to enjoy themselves. About the 15th of August the annual communal fêtes are held at Antwerp, these being of a character which have no analogy in England, and it is but fitting in a nation of horticulturists that an Exhibition such as the one under notice should be a prominent feature of the holidays that are held at given intervals in the great centres of population. During the last and the present year the demonstrations have been on a larger and more elaborate scale than usual, as commemorative of a distinct epoch in the history of the nation, last year having been the jubilee of its independence, the celebration of which has extended at intervals to the present time, more particularly as regards the ancient city that has made such rapid strides in artistic and commercial progress during the past half century. In something like the time named the population has increased from 65,000 to 200,000 within the fortifications, and the increase of wealth has at least been proportionate. A large portion of this wealth has been devoted to public improvements, and in developing the resources of a town than which few others on the Continent enjoy such a favourable position. Not long ago it was cramped and quaint, but now scope is afforded for a variety of attractions. Quaint, indeed, it remains, and it is hoped will continue, as this forms one of its most striking features. Its ancient character is as marked as ever, perhaps even by the contrast afforded by modern additions more marked; and every year Antwerp is being rendered more agreeable, not only to its resident population, but as a great emporium of trade and pleasure, in which other nationalities participate. Its boulevards are becoming matured, and its beautiful park, squares, and gardens under the skilful superintendence of M. Henri de Bosscher are increasing in attractiveness yearly. Its Zoological Garden alike in design and condition is one of the finest in Europe; and education, music, and the fine arts are cherished, promoted, and flourish as of yore. Horticulture receives its share of encouragement, and the latest results were seen in the fine Show that was arranged last Saturday and closed on Tuesday.

The Exhibition was organised by the Royal Horticultural and Agricultural Society of Belgium, which is composed of some five hundred subscribing members, and substantial state and municipal aid was rendered by a contribution of some 12,000 francs to the prize fund. No such advantages are conceded to horticulture in England. In arrangement and ceremonial, too, the Show, as all great Belgian exhibitions are, was essentially different from our English exhibitions. The custom of devoting the day prior to the Show for judging, and the night for arranging the plants artistically, was adopted. This precludes the necessity of hurry and bustle, and the work is performed deliberately and pleasurably.

On Saturday morning the Jury, which included representatives from England, France, and Spain, in addition to Belgian horticulturists, assembled in the hall of the Society of Harmony. After an address of welcome of the Vice-President of the Society, Baron Osy de Wycken, the roll was called, and about fifty answered to their names—Messrs. Manning, Chelsea; Prince, Oxford; and Wright forming the English contingent. Divided into nine sections, with a President and Secretary to each, the work of adjudicating the prizes proceeded, and this completed, nearly a hundred members of the Society and officials of the Show occupied the remainder of the day at a bountiful luncheon, Baron Osy presiding. The plants during this time were placed in groups throughout the building, yet in positions where each group could be turned to the best account with a minimum of labour. This task devolved on M. Fuchs, the eminent landscape gardener from Brussels. Under his directions the plants were disposed in the most tasteful and effective manner, and a beautiful garden—or rather three or four gardens—were arranged. With the exception of new and very small plants, Orchids, and cut flowers, the collections were arranged on the ground, the smaller flowering plants forming borders to the larger masses of foliage plants and beds. The result of the arrangement was so satisfactory that a gold medal was awarded to M. Fuchs for the talent he had displayed in the work.

The schedule contained 142 classes, and a hundred medals were offered as prizes. Among the chief of these were the Queen's gold medal for Orchids, won by M. Louis Van Houtte; the 500 franc gold medal of the Federation of the Belgian Horticultural Societies, won by Madame Le Grelle-Dhanis; the gold medal of the President of the Society, Baron de Caters, for the stranger who contributed most to the embellishment of the Exhibition, won by MM. Jacob Makoy and Co., Liège; and the Vice-President's medal for the most successful amateur Belgian exhibitor, won by Madame Le Grelle-Dhanis; and the King's gold medal for a hundred stove and greenhouse plants, distinct, won by M. Louis Truymen.

The Show was held in the great hall of the Society of Harmony, and three other large rooms in connection. In the entrance corridor were garden requisites of various kinds, and admirably executed plans of parks and gardens lined the walls. The first room contained

works of art, for which medals were awarded, these chiefly consisting of large and beautiful framed oil paintings of flowers, of which there was a great number. On the side tables were the fruit and vegetable collections, which were very much inferior to English exhibits of the same nature. Ascending the staircase the next, a very fine room, was devoted chiefly to new and rare plants. On the side tables groups of excellent Crotons, &c.; on the floor a magnificent collection of Marantas from Madame Le Grelle-Dhanis occupying the post of honour at the end. The broad corridor, which may be described as the third room leading to the Grand Hall, was similarly occupied—new plants on tables, and valuable groups of plants disposed on the floor. Thus far the Show was very beautiful, but the effect culminated in the Great Hall, the auditorium of which is reached by a wide and deep staircase. The bright flower beds in the centre of this hall, and the noble groups and beautiful borders of plants of almost every kind pleasingly associated, had a most imposing and picturesque effect as seen from the standpoint some 20 feet above them. This hall contained the principal general collections—Palms and other fine-foliaged plants, Ferns, Lilioms, Pelargoniums, Fuchsias, Petunias, Asters, Dianthus, Verbenas, Phloxes, and miscellaneous groups. In the side galleries were cut Roses and Gladioluses, also collections of Gloxinias, Begonias, Sarracénias, Bromeliads, Cannas, Aspidistras, and too many Coleuses. The whole of the space was occupied, yet there was room for visitors to enjoy the Exhibition, especially as these, owing to wet weather that unfortunately prevailed, were not so numerous as was desirable.

Only some of the leading exhibits will be referred to, as a detailed notice of the exhibits in many of the classes, and an enumeration of the winners of the prizes, would not be of interest to the majority of readers. In Class 1, six plants of recent introduction in or out of flower, M. Van Houtte was awarded the first prize, the remaining honours going to MM. Jacob Makoy & Co. The first-prize collection included *Dracæna Lindenii*, a variegated form of *D. fragrans*, with the drooping leaves of the species, but the prevailing colour being greenish orange, with a clearly defined ribbon of green down the centre of each leaf. As exhibited the plant was highly attractive, but it appears to lack vigour, and it is a question whether the colour will prove constant and the plant retain its health and freshness under ordinary cultivation. *Alocasia Thibautiana*, very healthy and fine foliage; *Aralia Chabrieri*, a plant of great elegance, and in all probability will prove of substantial merit as a room and general decorative plant; the leaves are narrow, very rich green, and the plant is very attractive; it is almost certain to become highly popular. The same group contained *Dieffenbachia splendens*; *D. Leopoldi*, fine; *Schizmatoglossis crispata*, small; *Heliconia aurea vittata*; *Amorphophallus lacoure*, as if splashed with whitening; *Phrynium Lubbersi*, *Paulinia Hooibrenki*, and a small plant of *Aralia Massangeana*. The notable plant in M. Makoy's group was *Dracæna Massangeana*, exactly the reverse in marking of *D. Lindenii*, the central stripe being yellowish and occasionally divided, the remaining portion of the leaves green. The plant is decidedly more vigorous than *D. Lindenii*, if less bright, and will be useful both as an exhibition and decorative plant. *Eugenia Glazioviana*, an evergreen of compact yet elegant habit, and with very small leaves, showed with great distinctness in this group. M. Linden, Ghent, exhibited a group of new plants not for competition, and was awarded a medal of 100 francs. Amongst them we noticed *Kentia Luciana*, with large handsome leaves; *Heliconia triumphans*, a fine Maranta-like plant, with large darkly-veined leaves; *Ronbergia Morreniana*, *Piper eburnea*, *Pothos aurea*, *Ficus decora*, very large leaves, *Lycopodium squarrosum*, and *Aspidium Rodigassiana*, an elegant hardy Fern of bold growth. The chief medal for twelve new and rare Palms was won by Messrs. E. Vervæet and Co. with fresh healthy plants as follows:—*Kentia Luciana*, *K. Lindenii*, *K. gracilis*, *K. robusta*, *Calamus viminalis*, elegant, with spiny stems; *C. lanatus*, *Pritchardia macrocarpa*, *P. aurea* with yellow stems, *Acanthopanax Herbsteri*, *Thrinax tunicum* very dwarf, and *Ravenia Hildebrandtii*. M. Van den Wouwer received the silver-gilt medal for a very excellent group. Both the prizes offered for a plant of recent introduction, remarkable for its inflorescence, were awarded to M. Jacob Makoy & Co. The first for *Tillandsia Leiboldiana* with three dense spikes of blue flowers, leaves small, and habit of plant dwarf; and the second for *Vriesia incurvata*, of no particular merit. The same exhibitors took the three medals in the corresponding class for a fine-foliage plant—first with *Dracæna Massangeana*, above described; second with *Crinum Verschaffeltii*, with large striped foliage; and third with *Anectochilus Memerti*, with large leaves richly coloured. In the class for a new hardy plant, remarkable for the beauty of its foliage, the first-prize medal was granted to M. Charles Van Geert, Antwerp, for *Abies commutata argentea*. It has shorter leaves than *A. Englemanni*, and the distinct silvery blue tint that pervades the plant renders it extremely attractive. This new Conifer is also fortunately of proved hardiness, for while *A. Englemanni* and many others were killed by the frost that was so intense in Belgium last winter, every plant of *A. commutata argentea* passed the ordeal without injury, and it must be regarded as a valuable acquisition. The medals for new flowering plants raised from seed went to M. Van den Wouwer for *Anthurium Scherzerianum* Van den Wouweri, with a twin spathe; and to M. Van Houtte for *A. Rothschildianum*. In the class for a new foliage plant from seed the first prize medal was won by M. de Smet-Duvivier with *Dracæna medio-picta*, a variegated form of *D. indivisa* or an allied

species—the prevailing colour is soft yellow, and the plant appears of free growth; the second by M. Constat Lemoine with *Dracæna La France*, a stately form with rose-tinted leaves; and third to M. Alexis Dallière, with a new narrow-leaved *Croton*, resembling *C. interruptus aureus*.

In the amateurs' class for thirty stove or greenhouse plants the gold medal of 200 francs was won by M. Florent Pauwels. The rarely seen and nearly hardy climbing plant *Physianthus albus* was included in this group in the form of a trained pyramid. This plant has the characters of three others—it has the growth and habit of the *Clematis*, the flowers of the *Jasmine*, and the odour of the *Privet*; it is very free and pretty. Another old plant, *Eucomis punctata*, was in fine condition. It was producing ten strong spikes 18 inches long of its powerful *Gardenia*-scented flowers. *Pleroma elegans* was dwarf and well-flowered. *Agapanthus umbellatus albus* was very fine, and *Attaccia cristata* vigorous, bearing a strong spike of its singular nearly black flowers. In the corresponding class for nurserymen the gold medal was granted by acclamation to M. Jacob Makoy and Co. with a choice and rich group principally composed of *Orchids* and *Nidulariums*, conspicuous among which were *N. Innocenti* with scarlet leaves and white flowers, and *N. fulgens* with similar leaves and blue flowers.

The Queen's gold medal for the finest collection of *Orchids* was easily won by M. Louis Van Houtte, who staged sixty-five plants, not large but healthy examples, in 5 and 6-inch pots—a varied and choice collection considering the lateness of the season for plants of this nature. The Queen's gold medal for a hundred stove and greenhouse plants was awarded to M. Louis Truymen for a very meritorious collection.

The great prize of the Exhibition, a gold medal of 500 francs, offered by the Federation of the Belgian Horticultural Societies for fifteen grand examples of ornamental plants, brought out two of the finest groups that have ever been arranged at any exhibition. After much deliberation and close examination that very successful exhibitor, Madame Le Grelle-Dhanis secured the prize by one vote. The collection was composed principally of *Palms*, which were large in size and in superb condition; there were, however, splendid examples of other plants, notably *Marantas* and a striking specimen of *Anthurium Hookeri*, with leaves about 5 feet long and 18 inches broad. M. Van den Wouwer also staged a magnificent collection. The *Palms* lacked the rich gloss of those in the premier group, but of the other foliage plants were superior, notably the *Cycads*, a fine *Croton*, *Vriesia Glazouana*, and *Dieffenbachia Bausei*. This exhibitor secured the chief honour for twelve *Cycads* with rare and excellent examples, also that for twelve specimen *Palms* with plants of remarkable merit. In the front of this group was a plant of *Acalypha macrophylla* with leaves 18 inches long and nearly a foot across, and finely coloured. It was a most conspicuous object, and decidedly a credit to the cultivator. Ferns were by no means equal to the *Palms*, and superior specimens of both hardy and tender kinds are often seen at the leading English exhibitions. *Marantas* were magnificent, the twenty specimens from Madame Le Grelle-Dhanis being granted the chief medal by acclamation. The plants were from 3 to 5 feet in diameter, grand in foliage and colour. Such fine examples of culture are never seen at our English shows. The same exhibitor secured chief honours for *Bertolonias* and *Crotons*, both of which were good, but the last not equal in colour to the best English-grown plants. *Dracenas* from M. Ad. D'Haene represented superior cultivation, the plants being dwarf with fine foliage, in good colour. MM. Vervaene and Dallière were granted medals for *Crotons*, which were good in colour and in choice varieties, two of the most striking being *C. Frank Selliere*, with large creamy waved foliage, 18 inches long by 3 inches wide; and *C. latimaculatus*, resembling *C. Hawkeri*, but the centre portion of the leaf deep orange. *C. magnoliæfolius* from M. Vervaene had enormous leaves. The best coloured *Croton* in every group in which it was staged was *C. Williamsi*, and in M. Dallière's gold-medal miscellaneous group *C. Prince of Wales* in superb condition. *Caladiums* were poor; *Agaves*, *Yuccas*, and *Phormiums* from M. Benoit Van Mieghem good, and *Bromeliaceous* plants excellent; Messrs. Makoy, Van den Wouwer, and Van der Mersch-Mertens exhibiting remarkably fine collections, and received the honours in the order named. Striped and variegated-foliaged plants both hardy and tender, also *Arundos*, made effective classes that showed to advantage among the richer and darker foliage plants. The chief prize-winners were Comte de Bergeyck by acclamation, M. Vermeulin, and M. Pynaert-Van Geert. The last-named exhibitor was successful with *Aucubas*, *Sedums*, &c., and M. Van den Wouwer with *Echeverias*, which were very good. Baron de Caters exhibited the best specimen *Colcuses*, but not equal to the best English-grown plants; and M. Pynaert-Van Geert had the principal medal for new varieties. *Pelargoniums* imparted brightness to the Show, and many good examples of culture were staged. The leading exhibitors were M. Everaerts, Baron de Caters, and Comte de Bergeyck. *Fuchsias* were poor; *Tuberous Begonias* good, but not equal to the best at the English shows; and the same remark applies to *Gloxinias*. The best plants were from M. Everaerts, but his varieties were not equal to those of Baron de Caters. Single specimen plants were not as a rule of commanding merit. The most remarkable beyond doubt was a specimen *Abutilon* resembling *A. vixillarum*. It was grown as a foliage plant, and was about 8 feet high and 7 feet in diameter—a dense close bush, perfect in outline, and a very striking object. In most of the other

classes the first prizes were withheld, and the plants therefore do not call for comment.

**CUT FLOWERS.**—These were neither numerous nor of superior quality. The Rose season has doubtless passed for the best blooms, but those that were exhibited, except M. Van Houtte's gold-medal collection of a hundred varieties, were by no means shown to the best advantage, as the blooms rested in the moss instead of being raised a few inches above it. In most of the classes three to five blooms were grouped of each variety, and their appearance was the reverse of imposing as compared with the magnificent boxes that are staged at home. A prize was offered for the greatest number of *Roses*, and the gold medal of 200 francs was won by MM. Ketten, frères, who staged apparently about five hundred varieties. *Gladioluses* were far below Mr. Kelway's standard, and *Dahlias* were rough and irregular.

Several groups of plants were not in competition, yet medals were awarded for them. Some of these exhibits have been referred to, but the most noteworthy was the grand miscellaneous group of choice plants from M. Dallière, for which a gold medal was granted.

On the first day of the Exhibition a congress was held of the members of the Circle Floral, a young, strong, and flourishing Society. Papers were read at intervals throughout the day by experienced horticulturists. Belgian courtesy is proverbial, and it has been experienced on every hand by strangers during the present week, and of which the grand banquet given in connection with the Show on Monday night was a characteristic expression. It was as great a success as the Show, and more need not be said.

## TWO GOOD VEGETABLES.

**STRATAGEM PEA.**—This very superior quality Pea has and is still doing excellently. The plant is very robust, and notwithstanding the dry weather has not shown any trace of mildew. It produced in my case its first pods on the main stem 1 foot 9 inches from the ground, and on this part of the plant were nine pods, with an average of seven large "green" peas in each out of a possible nine or ten. It branched 10 inches from the ground, doing so from five joints, the five branches bearing eleven pods of five peas each. The full height of the haulm is 2 feet 10 inches. For cropping and good quality it is very desirable for main crop, and especially so in gardens of limited extent, in which the taller-growing kinds cannot be accommodated.

**LEVIATHAN BROAD BEAN.**—I am delighted with this Bean, and so are all that see it. Its sturdy branched growth and long pods have an attractive appearance. The pods are borne in pairs commencing at 12 to 15 inches from the ground, the pods in this instance being 10 to 14 inches in length, and containing six large beans of good colour, being "greener" than the ordinary Longpod and Windsor section. The pods invariably fill well, not one that I have opened contains less than six beans. The number of pods on a stalk is six, and the beans are the size of Windsor, though it is evidently of the Longpod section, and is very much in advance of Seville Longpod, or indeed any other. The total height of the haulm, 2 feet 9 inches, renders it admirably adapted for small gardens, not the least of its merits being its earliness.—G. ABBEY.

## THE CHESTER NURSERIES.

APPROACHING the ancient city of Chester I inquired of a fellow traveller, evidently a Cestrian, what he considered the staple industry of the place. "Well, sir," he replied, "if it is celebrated for one trade more than another it is the nursery trade, for the Dicksons have some three hundred acres of land there and employ hundreds of men. Mr. James Dickson's nursery is not much more than five minutes' walk from the station, and Mr. Arthur Dickson's a little further on, and if you are interested in such places you had better go and see them. We are rather proud of these gardens, and the owners are most estimable men; they are smart business men no doubt, but real gentlemen, hospitable and kind." It so happened my chief object in visiting Chester was to see those nurseries, and my anticipations were not rendered the less pleasurable by the opinion recorded. I found my informant's account quite accurate, for the nurseries are certainly very extensive, and their owners and assistants were most courteous. As these two establishments have been frequently and fully described in the Journal, a brief reference to them will suffice now. The nearest, as is natural, was entered first, this being

MESSRS. JAMES DICKSON & SONS, NEWTON NURSERY.

The extent of nursery ground belonging to this firm is 250 acres, considerably more than half being included in the nursery under notice. The soil is variable, in some places being of a sandy nature, in others sound strong loam; hence it is that the produce is as varied as it is good. In one part we find *Coniferae* decidedly at home, and *Rhododendrons* and *American* plants generally

flourishing; in another fruit trees are growing in the most satisfactory manner, and in stronger soil still Roses are luxuriating. A great acreage is devoted to each of these classes—for there nearly everything is grown in thousands—indeed Conifers, including Larch, Spruce, and other Firs, are grown in millions, as also is “deciduous stuff,” which term includes all kinds of ornamental trees, forest trees, and hedge plants, such as Quick. The nursery, in fact, is as interesting to the forester as to the gardener. The seedling beds of the Firs most in demand, and that demand must be enormous, form a striking feature of the nursery. There are undoubtedly several millions of trees there, and scarcely a weed to be seen amongst them. Evergreens, old and useful, new and rare, are also grown extensively; but the winter has done much damage in many of the quarters, especially amongst common and Portugal Laurels. Standard Roses have also suffered severely, and Japanese Privet. It is gratifying to notice that while Deodars have been much cut, the most rare and ornamental Conifers—Cupressuses, Thuias, Retinosporas, &c., have endured the wintry ordeal well, and the hardiness of those that are now so healthy has been firmly established. Many acres are devoted to fruit trees; almost every popular variety of fruit is represented, and every form of tree that is required in gardens is provided.

The glass structures are numerous, and all are fully and usefully occupied. Vines in pots are grown largely and well by Mr. Fancourt, and Figs in pots command attention by their numbers and quality. There are hundreds of trees in 6-inch pots as healthy as it is possible to conceive Figs to be. Many of these raised from eyes in January are now showing fruit, and others a little older are ripening crops of from six to twelve fruits each. These miniature trees are models of good culture. Some large structures are filled with stove and greenhouse plants, of which there is a good collection. One house resembles a vista in an antipodean forest, as it is filled with Tree Ferns, many of the trunks being very fine; on the back wall Camellias are trained, the demand for such plants being considerable for covering the back walls of vineries. Camellias in pots, home-worked, are very numerous and in fine healthy condition. Several conically trained specimens of Azaleas are both large and fine, and one of these plants yielded flowers this spring that realised £11; at that rate Azalea-growing is lucrative. “Bedding plants are going out of fashion” is a somewhat hackneyed cry now-a-days; but a few are yet sold at Chester, a stock of 250,000 having been disposed of at this nursery during the spring of this year, and the demand, I was informed, increases yearly. Succulents of all kinds, from Agaves to Sedums, are largely grown. Florists’ flowers have a large share of attention, Dabbias, Carnations, Auriculas, &c., being numerous and the varieties choice. Of herbaceous and alpine plants there is a large and well-cared-for collection, all the favourite old forms, with not a few rarities, being included; in fact there appears to be something, or rather a great deal of everything, in this nursery, which is in telephonic connection with the establishment in Eastgate, more than a mile distance, and conversation between the two stations can be conducted with the greatest ease and with a great saving of time and labour. Mr. Ferguson, the manager, and the heads of the respective departments, add much by their intelligence and courtesy to the pleasure of a “run round” the extensive and interesting grounds and houses of the Newton Nursery.

#### MESRS. FRANCIS AND ARTHUR DICKSON & SONS, UPTON NURSERY.

No wandering horticulturist finding himself in Chester would think of leaving the city of antiquities without also inspecting this establishment. So well known does this nursery appear to be that the stranger may find it even without mentioning the name of Dickson, for not in the city only but in a wide district surrounding, its abbreviated title, “F. & A.’s,” is well understood. This is a very large and beautiful nursery; the extent is about 175 acres, every portion of which is well stocked and every part clean. The most striking feature on entering the grounds are the long and highly attractive borders of choice Conifers. The plants are arranged ribbon fashion, and the effect of rows 200 yards long of gold and green and glaucous Conifers is unquestionably beautiful, the borders being as clean as a flower garden. In the grounds nursery beds of Firs of various kinds show the extraordinary demand that must exist for these trees at Chester, and deciduous forest and ornamental trees of all kinds are grown on a scale of great magnitude, while evergreens, such as Hollies, Rhododendrons, &c., are grown by the acre. Great attention is devoted to Roses, but the frost of last winter had a ruinous effect on the standards. Out of thirty thousand planted not a thousand was saved. The fashion for standard Roses has been severely shaken of late, especially in cold localities, and the demand for dwarfs is

correspondingly increasing, and probably will increase. Fruit trees form a great branch of business in this nursery, some forty acres being devoted to them, and the stock is remarkable for its cleanliness and health. All kinds of trees are grown, and all forms of training represented.

The glass structures are numerous. Several houses were filled with Tea Roses in pots. The plants are mostly worked on the standard Briar, the growth being free, clean, and in the most satisfactory condition. Camellias and Azaleas are represented in great numbers and superior quality; in fact all kinds of stove and greenhouse plants are well and largely grown, as also are herbaceous alpine and bedding plants, the sale of the latter being on the same large scale as above mentioned, so that half a million are raised at Chester and sold yearly. Fruit trees in pots command attention by their excellent form, cleanliness, and health, and in one house some conical specimens of Acer Negundo variegata were remarkable for the purity of the foliage. Thus grown it is a question if there is any variegated plant equally effective for decorative purposes.

This is but a mere outline sketch of these nurseries, which together cover over three hundred acres, and both firms have other nurseries at Chester and elsewhere. Those who desire a more detailed account of the Chester establishments will find the same in the Journal of last year, and there is therefore no need for unnecessary repetition here. They are fine establishments, and my fellow traveller was justified in regarding horticulture as a staple industry of Chester, and the citizens have reason to be proud of such fine “gardens.”

Both firms have extensive establishments in the city—seed and implement warehouses and every convenience for conducting trade in horticulture and agriculture on a large scale. Nothing could exceed the courtesy of the heads of the firms and the chiefs of their respective departments, and my first visit to Chester and its fine nurseries will be a “sunny memory” for years to come—indeed until I have the privilege of seeing the old city again.—VISITOR.

#### GRAPE-GROWING AS A PASTIME FOR AMATEURS.

As some encouragement to amateurs who would like to commence Grape-growing, and are afraid to make a start owing to doubts and difficulties which are conjured up in their minds, I have thought it might be useful if I relate the experience of an old retired gentleman in this district, who at my suggestion some years ago was induced to make a small beginning. This has proved to him a great boon in many ways, but chiefly, as he firmly believes, in prolonging his life by many years, in consequence of the agreeable occupation and moderate exercise which the Vines have occasioned him. He attends to them entirely himself, including staking, thinning the Grapes, and supplying water. Many people are under the impression that because they live in a town the luxury of Vine-growing must be denied to them; but this is quite a delusion, as I hope I shall be able to prove. There is no reason whatever why every householder who may have a fair-sized back or front garden to his house cannot have a vinery or two and plenty of good Grapes also, if he plants the right sort of Vines and sees that the preliminary work of border draining and making is properly carried out.

This gentleman’s residence is in a town of about eight thousand inhabitants; at the back of his house he has a small yard walled in. Against a portion of this wall with a south-west aspect he built his first very small vinery—a rough-and-ready structure built by himself and a carpenter at a trifling cost, obtaining a small second-hand boiler with two rows of piping, a flow and return. A border 3 yards wide and 1 yard deep was made with a compost of turf cut into not too small pieces, and into which had been previously mixed a little half-inch bones and a sprinkling of old mortar rubbish, and in connection with which a drain had been laid to take away all stagnant water. His Vines grew luxuriantly the first year and soon reached the top of his house, and by a little firing in the autumn to harden the wood and ripen the buds of the Vines, he had the satisfaction of seeing in about twelve months after planting a good show of bunches on all the Vines as the result of his own attention and care with an occasional hint from me. The Vines were not allowed to carry more than three bunches each the first year, but were cut back as is usual, leaving them about 2 feet long. The second year they also grew well and ripened the Grapes they carried finely. In the autumn as before they were assisted with a brisk fire heat for about a month or six weeks (from the end of August to the beginning of October), to help to harden and ripen the wood of the Vines. This is of much more importance than many are aware. The want of attending to it is more often the cause of failure

(especially in the case of young Vines) than anything else I know. The Vines were again cut back in the winter, this time to 4 or 5 feet, and carried the next year from five to seven bunches of Grapes each. The year after (third year of bearing, four years after planting) his house was full of good plump Grapes which would have done credit to any professional man, and of which I assure you the gentleman was very proud.

Encouraged by his first success he built another vinery against a higher wall and rather longer in the same yard, which he planted with Black Alicante, and which has succeeded even better than the first, and which returns to him annually for surplus Grapes sold the handsome sum of from £25 to £30. The old gentleman declares that he has no property (and he has a variety including house property) which returns him anything like the interest on the amount expended as this vinery does.

I hope what I have narrated above will encourage others to try and do likewise. There are few districts to be found in which there are not gardeners who would be willing to assist gentlemen in this matter with suggestions and directions how to proceed. To those who have not this channel of information, with your permission I shall be glad to give more detailed directions in a future paper.—DRUID.

#### CHOICE CAMPANULAS.

TURNING to another and distinct section of the genus, one species that is especially worthy of notice now is *C. Vidalii* (fig. 26), concerning which a note was published recently. It is a semi-shrubby or woody species from the Azores, where it was found growing upon a rock on the east coast of Flores by Captain Vidal, in honour of whom it is named. It has narrow somewhat spatulate leaves with serrated margins, the flowers being white, glossy, and bell-shaped, but curiously contracted in the middle. It is best suited for culture in pots, and its value for this purpose is admirably shown at Kew, where in the Cape House a number of plants have been flowering profusely; indeed, for a cool house the plant is one of the most ornamental of its genus.

The following account of it appeared in this Journal nearly twenty years ago:—"A half-shrubby maritime Bell-Flower, probably half-hardy or requiring a greenhouse. It is described to us by a gardener well acquainted with English flower-gardening as a very ornamental species. The plant forms a roundish mass 2 feet high, with dichotomous thickened branches, terminating in a rosette of leaves of half-succulent half-leathery texture, smooth, spatulate-oblong, with revolute crenated margins. The few leaves which occur on the flowering stems are lance-shaped and nearly entire. The flowers grow in terminal racemes, which shoot out from the centres of the leafy rosettes; they are nodding, bell-shaped, and contracted in the middle, white or cream-coloured. Mr. Watson describes the leaves and branches as recalling to mind some species of *Saxifraga* or *Sempervivum*; in his dried specimen, shown in our figure, on which about three flowers were developed, several flower buds appeared abortive, or else would have been developed later and irregularly. It requires a mixture of two parts sandy loam and one part leaf mould. It increases freely from seed, but the seedlings do not bloom until the following year. It does well upon rockwork, but is rather tender, and the colour of the flowers is rather dingy. The whole plant has so little the appearance of a *Campauula* that it has been questioned whether it belongs to that genus, and it is suggested that it is nearer related to the genus *Musschia*."—X.

#### NOTABLE PEACHES AND NECTARINES.

EARLY BEATRICE.—A Peach that ripens in an unheated house the first week in July, and three weeks later upon an open wall, ought not to be condemned lightly, as I fear it has been by many who have not given that attention to its culture which it merits. In an early Peach house where the ventilators are not opened wide during the growth of the fruit it is so poor in flavour as frequently to be positively insipid; but in a late house under the influence of a free strong circulation of air, and also upon open walls, its flavour is full, rich, and delicious.

It has always been satisfactory here in a late house, and is this

year bearing a good crop of high-coloured fine-flavoured fruit out of doors, where there are two trees of it, one against a west wall and the other in a snug nook facing the south.

EARLY RIVERS PEACH.—A large tree of this Peach growing against a south open wall has a full crop of fruit, the first dish of

Fig. 26.—*Campanula Vidalii*.

which was ripe on August 8th. The fruit is large and good, but many of them have the objectionable stone-splitting peculiar to this variety, and which Dr. Hogg says, in the "Fruit Manual," "probably arises from imperfect fertilisation, the pistil protruding so far beyond the stamens. This stone-splitting not unfre-

quently causes the fruit to crack at the bottom, so that it breaks asunder easily, displaying an imperfect kernel, often mouldy. In such fruit the halves of stone are firmly attached to the flesh and often break in pieces when pulled out; split fruit is therefore never sent to table for dessert, but is used for stewing and tarts.

**ADVANCE NECTARINE.**—This delicious little Nectarine is certainly worthy of a place. I picked the first ripe fruit of it on the 5th of August from a tree which had to be transplanted late in spring after growth had begun, and therefore the date is not to be taken for a guide. I believe trees well established in the soil produce ripe fruit by the middle of July. The fruit is very juicy, very sweet, and richly flavoured. Early as is the better-known Lord Napier, it is not really fit for table before the first week in August at the earliest, so that by means of Advance the season of this deservedly popular fruit is lengthened by two or three weeks.

Several other sorts of Nectarines are in a flourishing condition, and have a nice crop of fruit on open walls this year. The best are Lord Napier, Balgowan, Rivers' White, Downton, Pitmaston Orange, and that delicious late Orange Nectarine Pine Apple. It is really pleasing to see trees on open walls once more without a trace of blister. There was a little scathed foliage in spring, but that has disappeared, and nothing can be better than the green clean healthy appearance of the leaves now.—E. L. O.

#### RABBITS AND PYRETHRUMS.

I HAVE seen it asserted that rabbits will not attack Pyrethrums. They will do so, and devour them, much sooner than many other plants to which they have generally a peculiar liking. They attack them greedily after the plants have flowered and have commenced producing their young shoots, also in the early part of the season when the shoots and leaves are tender. As the plants develop and the foliage matures the rabbits leave them to devour something more tender. After considering for some time as to the best mode of protecting the plants, I decided to syringe them with paraffin oil at the rate of a wineglassful to four gallons of water. This kept the rabbits away for a time, until all trace of the paraffin had disappeared. Two or three dressings in the spring, and again after flowering, might have the desired effect. I shall be glad to see the experience of other Pyrethrum growers on this subject recorded in the Journal.—L. D. W.

Now that the chief event in the horticultural exhibiting world in the present year—the INTERNATIONAL HORTICULTURAL EXHIBITION AT MANCHESTER on the 24th to 27th of August—is fast approaching, some of the chief points in the schedule may be again briefly referred to. Two hundred and thirty-seven classes are enumerated, of which those devoted to fruits—namely, seventy-three, form a large comparative proportion, vegetables and plants being also well provided for; while cut flowers, bouquets, table decorations, implements, and cottagers' productions are all likely to be well represented judging from the prizes offered. Special prizes of considerable value are also offered for plants, vegetables, and fruits by the Veitch Memorial Trustees, the General Horticultural Company (John Wills) limited, and Messrs. Sutton and Sons; Dickson, Brown, & Tait; Dickson & Robinson, and G. and W. Yates. Some of the chief classes in the several divisions are the following:—Fruits—for collections of fifteen and twelve kinds, £20, £15, and £10; £15, £10, and £5 as first, second, and third prizes respectively in the two classes; ten varieties of Grapes, one bunch each, £12, £8, and £5. Many other liberal prizes are also offered for Grapes, Peaches, Nectarines, Pine Apples, Pears, Apples, &c. One section of this class is confined to fruiterers, and another to fruits of foreign growth. In the latter France, Italy, Germany, Holland, Belgium, America, Turkey, and Egypt being represented. The most important special prizes for fruits are those offered by the General Horticultural Company—namely,

two of thirty guineas, and two of twenty guineas each. Among vegetables the highest prize is £10 for twenty varieties, while the principal amounts in the plant classes are £20, £15, and £10 for twenty miscellaneous plants. A remarkably fine display is confidently expected, as it is said that over five hundred intending exhibitors' names have been received. The President of the Society, the Right Hon. the Earl of Derby, will open the Exhibition at 2 P.M. on the 24th inst.

— MR. E. R. CUTLER, Secretary of the GARDENERS' ROYAL BENEVOLENT INSTITUTION, sends us the following—"I beg to inform you that up to and including this date (August 11th) the number of responses to the appeal on behalf of the Pension Augmentation Fund is 301, and the amount contributed is £364 9s. 4d., being an average of a trifle over £1 4s. each response. I take this opportunity of stating that I purpose attending the Great Fruit Show at Manchester on the 24th inst., where I shall have an office, and I shall be happy to receive subscriptions, collecting cards, &c., to enrol new members, to see many old friends, and I trust make many new friends, and to afford any information as regards the Institution that may be required."

— THE forty-second anniversary meeting of the ROYAL BOTANIC SOCIETY was recently held at the Gardens, Regent's Park, Mr. G. J. Symons, F.R.S., in the chair. The reports from the Council, Auditors, and Secretary gave a very favourable account of the condition of the Society. The year's subscriptions, £4250, had only been exceeded in two of the forty-three years of the Society's life, and the receipts from exhibitions, fêtes, and other sources had been good, and, after deducting the whole expenditure for the year, left some £600 to the credit of the Society. The liberality of the subscribers enabled the Society to maintain a special department for furthering the study of botany and its application to the several sciences, the arts, and manufactures, and the pressure upon this department was year by year increasing. During the session 710 free tickets of from one month to six months each had been issued to medical and other students, including forty-one artists.

— ONE of the most notable plants at the present time in the beds devoted to Malvaceous plants at Kew is a specimen of KITAIBELIA VITIFOLIA, which is about 5 feet in height, forming a close bush. The leaves are five-lobed, not unlike those of the Vine, as the name implies, but they are not quite so deeply cut. The flowers are large and white, the petals spreading widely, and being reversely ovate in form. The blooms are produced in considerable numbers, clothing the upper portion of the stems thickly, and imparting an effective appearance to the plant. Clumps at the back part of borders or in the foreground of shrubberies are attractive during the summer.

— MR. PETER HENDERSON recently read a paper in Ohio upon "Market Gardening Around New York," in the course of which he made the following remarks upon SPECIAL MANURES:—"The question of fertilisers for the use of the market garden is now becoming a very serious one for the market gardeners in such cities as New York, where the manure from the stables does not increase in the ratio of the increase of the lands cultivated, as perhaps half of all the products grown are shipped to adjacent towns and cities. Still there are few market gardeners who do not use stable manure, which costs when fit to go on the land from 2 dols. to 3 dols. per ton. This is put on in spring, at the rate of from fifty to seventy-five tons per acre, to which is often supplemented half a ton of Peruvian guano or bone dust, which is sown on and harrowed in on the land after the stable manure has been ploughed in. A great variety of fertilisers are used besides Peruvian guano and bone dust, such as fish guano, dry blood fertilisers, together with the various brands of phosphates;

but the majority of cultivators prefer pure bonemeal or Peruvian guano to all others. I saw a list the other day, wherein were enumerated no less than sixteen separate kinds of special fertilisers for thirty different crops, with the chemical elements of each split down to even one-half of 1 per cent. Now, I know nothing whatever about agricultural chemistry, and it may be presumption in me to criticise such a list; yet when I am told that one kind of fertiliser is needed for Cabbage and another kind for Turnips, one for Sugarcane and another for grass plants, if not of the same family, at least of the same natural order—I am forced to the conclusion that science, so-called, is taking the place of common sense, and is in direct opposition to the experience of the practical farmer or gardener in his operation in the soil. In our market gardening and greenhouse operations we cultivate largely nearly every known family of plants, and in my long experience I have yet to see a fruit, flower, or vegetable crop that was not benefited, and nearly in the same degree, by a judicious application of pure bone dust; and I would here suggest to the advocates of special fertilisers that in their experiments they try equal weights of pure bone dust to the half of the crops of Wheat, Potatoes, Cabbage, or Strawberries, being experimented on by the "specials," and note the results. I do not mean to be understood that these so-called special fertilisers do not answer the purpose of the crop to which they are applied; but what I protest against is the hair-splitting distinctions claimed for them, confusing and troublesome to the cultivator, if of no practical value."

— PART 18 of "LETTS'S POPULAR ATLAS" contains two sheets of the Watershed Map of England and Wales, representing Westmoreland, Cumberland, parts of Lancashire and Northumberland, and the Isle of Man in one, and North Wales in the other. Two sheets of the general and statistical map of India are also given, showing Sindh, Cutch, Guzerat, Berar, Malwa, and Khandeish. All are beautifully executed and very clear in the details.

— AN amateur writes—"I am always interested in reading your articles and correspondence on the subject of STRAWBERRIES, and have been surprised not to see among the varieties recommended any mention of *Le Sabreur*, which I have grown for three years past side by side with President, Sir Joseph Paxton, Dr. Hogg, and eight or ten other varieties, and it is with me the favourite. I received it with a strong recommendation from Mr. Lovel of Weavertorpe, York, and have found it a superior sort well worth cultivating. It is hardy, and has produced in each year an abundant crop of fine, rather large, handsome, conical fruit of good flavour and nearly of uniform size. It comes in with or just before Sir Joseph Paxton, and continues to bear throughout the season. A neighbour of mine who sells his surplus fruit, to whom I gave some plants two years since, is this year planting a new piece of ground principally with *Le Sabreur*, which he decidedly prefers."

— AT the last meeting of the Royal Horticultural Society a first-class certificate was awarded for *CANNA IRIDIFLORA HYBRIDA* from the Chiswick Garden. It is a very handsome variety, with large rich crimson flowers; indeed, it is scarcely equalled by any other form of the genus in the peculiar depth of colour.

— A CORRESPONDENT of the American "Gardeners' Magazine" gives the following notes upon *PORPHYROCOMA LANCEOLATA*—"This is an old hothouse plant of rare beauty, belonging to the natural order Acanthaceæ. It is a perennial hothouse plant, attaining a height of about a foot, with dark green opposite lanceolate leaves, the leaves being slender at the base, producing its flowers in terminal and axillary spikes. The flower

spikes are of a rich purple colour, and are deeply four-angled. The corolla protrudes far beyond the bracts, and thus gives the plant a rather singular and attractive appearance. It requires for its successful cultivation a compost of two-thirds turfy loam and one-third well-decayed manure and good drainage, a temperature of 55°, and during its season of growth a moist atmosphere and an abundance of water. Its period of growth is during the winter months, and the beautiful tufts of flowers are produced about the first week in February, and continue in perfection for two or three weeks. After the flowering season is over do not water so freely, and about the middle of May turn the plant out of its pot; reduce the ball of earth about one-half, and plant out into a partially shaded well-prepared border, from whence it should be taken up and potted about the middle of September. Propagation is readily effected by seeds, which are freely produced, and it could also be increased by cuttings. If the seeds are sown as soon as ripened in a pot or pan of well-drained light sandy soil, and the young plants liberally treated, fine flowering specimens will be obtained for another season."

— A CORRESPONDENT of the *Mark Lane Express* writing from Christchurch, Hants, on Saturday, states that on the evening of the 6th he saw dug in an amateur's garden a row or two of AMERICAN ROSE POTATOES. Their yield was the best known about the neighbourhood this year, there being on an average seven or eight to a root, and their size also being remarkable. Six Potatoes were taken from the crop and weighed, the largest weighing 1½ lb., and the six together weighing 4¾ lbs. These had grown well, the green tops having only just peeped out of ground, when that severe frost was on the 10th May, and were then not out enough to be injured.

— WE understand that the following additions have been made to the NATIONAL ROSE SOCIETY'S SCHEDULE for Manchester on the 24th inst. Class 5a (nurserymen), eighteen distinct single trusses, £1 10s., £1, and 10s. Class 13a (amateurs), nine trusses, £1 10s., £1, and 10s. To be grown within twenty miles of the Town Hall, Manchester.

— WE are informed that the WESTON-SUPER-MARE HORTICULTURAL EXHIBITION held last week was very successful, and as regards the number of exhibits it was the largest yet held by the Society. There were 165 exhibitors, and nearly two thousand collections staged, plants, fruit, and vegetables being all well represented. The Show was well attended by visitors.

#### CARNATIONS AND PICOTEES.

AMATEURS or others who grow these will now find them in a suitable state for propagating by layers. For the past two or three years I have been late in having this very necessary work done owing to the lateness of the growth in the plants, and had to root many in a warm temperature during the winter months, but this year I shall have them well rooted by autumn. The finer kinds have been grown in pots for the last two or three years; but, although I obtain fine blooms in this way, it is not a system that will recommend itself to the majority of gardeners. This is the only way I have been successful with the finer Carnations and the charming Picotees. When grown in beds or borders they invariably wither and are dead before the middle of summer. As I expect to have extra strong plants this autumn, I will try some planted out to stand over the winter. Some surplus plants of *Souvenir de la Malmaison* treated in that way last autumn not only lived through the past winter but are now the healthiest examples of that variety I have.

The stronger-growing sorts of the above, with Clove Carnations and *Anne Boleyn Pink*, are occasionally left in the borders two seasons without being disturbed except by taking the strongest layers. I do not find them do well after the second year, though on stronger soils they may probably be left longer without loss. In preparing soil for layers I merely place some old Mushroom manure round the plants; this is worked in to the depth of 5 or 6 inches, and after being firmed the layers are pegged down. In preparing the layers a slit is made 1 to 1½ inch up the stem,

cutting under a leaf joint. None of the leaves are removed, as I find this unnecessary. The layers are then pegged firmly into the ground. Plants lifted and potted are given a rich compost to grow in. The soil is pressed in very firmly, and there is no danger of the plants making a quick tender growth, as they would do were the soil loose. Our plants are plunged amongst ashes in cold frames, and keep moist enough in this material through the winter without having to water them. About February they begin to require attention in the way of water, and have then a mass of feathery roots. In March they are either shifted into larger pots or planted out in beds or borders.

The most useful of all summer-flowering Carnations are doubtless those known as Cloves. Ours are of two kinds of white, a purplish crimson variety, and two dark crimsons, one with fimbriated petals, the other plain. Later, we have one of the finest of hardy flowers in the Duke of Wellington, a scarlet dwarf variety, and a most profuse bloomer. I believe there is a rose-coloured companion to this named Countess of Manvers, but I have not seen it. The large-flowering Souvenir de la Malmaison is a good border variety. I have also a pink variety which some like better than the cream-coloured sort, and there is also one with the pink and white in stripes on the same flower; it is named Lady Middleton, and is yet very scarce. I do not think it so good as either of the two first named varieties. Autumn-layered plants of these we find useful in  $4\frac{1}{2}$ -inch pots in spring. They are kept growing gently through the winter. After flowering they are planted out and the young growths layered.—R. P. B.

#### HONG KONG.

HAVING in an Anglo-American tour spent some time at Hong Kong and found the Journal has penetrated even there, some notes, although not exclusively botanical or horticultural, may be acceptable for its pages. Even gardeners require a change of literary fare occasionally; and I will not therefore limit myself to the mere gardening aspects of this in many respects strange and interesting dependency of the British Crown, but will assume that the narration of what proved interesting to me may have at least a measure of interest to others.

At a time like the present, when there is such an outcry being raised against the imperialistic policy of the late administration, and a tendency to renounce all the so-called "white elephants" with which they are accused of having burdened the country, it will be encouraging for English people to know that there is at least one "white elephant" of the past which has really turned out a success and a credit to the nation. It is very remote, and still labours under the false imputation originally thrown upon it; but it is truly very beautiful and by no means fatally unhealthy; so I think I cannot do better than try to dissipate some of the ignorance that exists about it at home, and thus do justice to us and to the memory of those who are responsible for its acquisition.

Persons of middle age will probably remember that when they were in their teens there was a certain phrase borrowed from a song called "The Gay Cavalier" which was in almost everybody's mouth, and was used politely to intimate to another that you preferred his room to his company. In that song the heroine, annoyed at the persistence of an unwelcome suitor, and being denied the gratification of giving him his *congé* in language of masculine vehemence, contents herself with relegating him to Hong Kong, that being according to the notions of the time the nearest earthly equivalent of a place we all have heard about but never hope to see. "You may go-o, you may go-o, you may go to Hong Kong for me," was the euphemism to which I refer; and its discontinuance is, I believe, less due to a better knowledge of Hong Kong than to the decay of the political excitement which forced Hong Kong into notice, and to a belief that after all the good round Saxon terms are the best for securing the end desired by that periphrasis.

Hong Kong was the Cyprus of that period, and to judge from its rocky barren nature and limited extent must have seemed then a very much less promising place for a European colony than Cyprus does now. Accounts written thirty-five years ago describe it as looking gloomy, bare, desolate, and as being terribly unhealthy. These accounts, after making some allowance for the writer's bad spirits at finding himself in such then remote parts with a damp relaxing climate, were no doubt tolerably correct; but to one who now takes his stand by the City Hall at Hong Kong and looks around him they appear strangely like libels. The difference, however, between then and now is, I believe, a real one, and it must be as thorough a transformation as if an enchanter's wand had been waved over the quondam pirate's lair, over the discoloured unsightly excavations, the scattered timbers, and the tiny tents at the foot of those bleak hills round which in 1844 a

few men of war and merchantmen were watching. The magic power which has effected the transmutation is that same Anglo-Saxon energy which during the same period has built up Melbourne and San Francisco, assisted by an unlimited amount of Chinese labour. For the number and nature of its population Hong Kong is inferior to its two contemporaries; but in solidity of construction, in the perfection of its finish, and in the precipitous beauty of its site it is superior. Probably for Europeans it will never possess the same interest that these other towns do, as it lies in tropical climes and is mainly inhabited by that race which inclines least to the Caucasian. Possibly it will be quite outstripped by its contemporaries, but the beauties of its situation and construction will always be undeniable, and the consideration of its rise astonishing among the many marvels of a wondrous age.

Hong Kong, the island of "Fragrant Streams," or, as some will have it, "Good Harbour," was ceded by China to the British Government after the opium war in 1841 to serve as a vantage point from which to invade the Celestial Empire with our goods, and, if any protection were necessary for these, with our arms as well. Seventeen years later, when Sir John Bowring picked a quarrel with Governor Yeh, it served for this latter purpose; and afterwards in 1861, at a general patching-up of old sores, in consideration of China consenting to renew amicable relations with us, we took as an earnest of its sincerity the small peninsula of Kowloon facing Hong Kong from the mainland. Tennyson sings, "Saxon, and Norman, and Dane are we;" and our dealings with China show that if we still possess the stubbornness of our Saxon and the fierce enterprise of our Danish ancestors, the strain of Norman blood in our veins has lost none of its spirit of high-handedness by transmission through thirty generations. However, if our action has not been unimpeachable, it may be fairly urged that it has redounded even more to the advantage of the people who resisted us than it has even to ourselves. At the time we took it Hong Kong was a perfect Alsatia, round which all the disreputable and restless spirits of the neighbourhood used to lurk and make piratical descents upon the Chinese and European shipping far and near. Now it is a magnificent emporium, almost entirely inhabited and kept going by the Chinese themselves, but governed and garrisoned by the irresistible naval power of England, which is the terror and repressor of evildoers along the whole length of the Chinese coast.

In its reputation Hong Kong has suffered a peculiar fate. Before it was reclaimed—when it was unkempt, undrained, and uninviting—it was thrown to the attention of an excited English public, distracted with the vague romantic hallucinations provoked by the opening-up of the Flowery Land, and intoxicated with expectations which were never destined to be realised. The report went abroad that Hong Kong was a deadly pestilential place, and insurance offices forthwith put up their premiums on the lives of those unfortunates ordered thither, and perplexed uncles hastened to apprise shiftless nephews of the golden opportunities which the newly opened region afforded to young men of energy and enterprise. Now, when it is magnificent, a model of finish and cleanliness, and not less unhealthy than Manchester, the English public know of it only as a detestable place, at the very name of which their parents and grand-parents used to shudder.

The mortality which originally gave Hong Kong such a bad name arose, as in the case of Cyprus lately, among the naval and military forces hurried in to take possession of it. Soldiers and sailors were in those days the most heedless and ignorant of men, and what the soldiers and sailors were in ordinary affairs their officers were in sanitary matters. They did not reflect as to the safety of disembarking their men upon a strip of steamy soil soddened with the water of the numerous streams tumbling down from the overhanging hills; still less did it occur to them that the soil, like other soils in hot climates, when broken up everywhere for building purposes might become ten times more deadly and malarious in its effects. Such, however, was, and is even now, the tendency of newly-disturbed soil in Hong Kong, and this, combined with the reckless habits of the troops and tars, caused the decimation of whole regiments and ship's companies; consequently many valuable lives were sacrificed, as the obelisks in the cemeteries still show, and Hong Kong acquired a reputation for unhealthiness which it is far from deserving.

The island is about the size of Jersey—eleven miles in length by from two to five in breadth, and some twenty-seven in circumference. It is as rugged as many of the western isles of Scotland, which it somewhat resembles, and is composed entirely of igneous rocks—viz., granite, felspar, and a very little trachyte. In shape it is not so very unlike the model of a gouty foot viewed laterally, with the instep swollen and knotty, and a cleft extending from the direction of the shank-bone towards the heel. It lies with its

toe towards the west, its heel towards the east, its sole turned towards the Chinese mainland on the north, and its upper side facing out south to the broad ocean. All around it seawards are rocky uninhabited islets, which interrupt in the most pleasing manner the wide surface of the water, and in sunny weather offer in their dark green hue a charming foil to the expanse of rippling blue by which they are surrounded. From the mainland towards the island extends for some two miles the peninsula of British Kowloon, so as to come within ten minutes' ferrying distance of the town of Victoria. This peninsula forms a very pleasant suburban resort, from which the best view is obtained of

the white handsome frontage of the town nestling beneath and embracing the base of the great sombre green peak and its prolongations.

The hills of the island and those of the mainland run abreast of each other in slightly converging lines at a distance of some eight miles, rising to heights of from 600 to 1800 feet, and forming a sort of amphitheatre, within which stretches the strait or harbour for a distance of nine miles, seeming from the centre to be quite land-locked, and amply protected from almost every wind that blows. So short is the distance from highland to highland across the strait, so ample and placid the water-way, and so numerous

Fig. 27.—ARBUTUS ANDRACHNE.

the points from which a bird's-eye view of the surroundings for twenty miles can be obtained, that Hong Kong might be aptly designated the "naval colosseum" of the power which possesses it. All the navies of Europe could find convenient anchorage in its harbour, while nowhere as in its neighbourhood could a naval review be more successfully planned and viewed, and more imposingly carried out.—A WANDERER.

(To be continued.)

#### ARBUTUS ANDRACHNE.

THOUGH one of the old inhabitants of British gardens the

oriental Strawberry Tree is yet an ornament of no mean value in shrubberies, and is certainly far from being too common. In many establishments where such old favourites are treasured specimens may be found sometimes of considerable size, but comparatively few modern gardens contain examples of it.

Arbutus Andrachne is an evergreen, and occasionally attains the height of 30 feet, though specimens varying between 12 and 20 feet are much more frequently seen than those of the extreme dimension given above. The leaves are oblong or oval in form, smooth and slightly notched at the margin; they are also thick and leathery in substance. The flowers are similar in form to those of other Arbutuses—namely, what is botanically termed

ureolate; they are white sometimes with a greenish tinge, and are borne in terminal erect panicles. The fruit bears some resemblance to that of the well-known Strawberry Tree, *Arbutus Unedo*, but is not frequently matured in England. One peculiarity of the tree is the reddish colour of the bark in winter, the outer layer separating from the other portion in spring, falling off as in the Plane, though not under precisely the same conditions.

A moderately sheltered position is best suited for this species, as when much exposed, if not positively injured the foliage often assumes a brown appearance that is far from satisfactory.

#### RHUBARB—A HINT TO AMATEURS AND COTTAGERS.

LAST spring at the beginning of April I sowed six-pennyworth of Rhubarb seed in a bed on a warm border facing the south. As soon as the seedlings were large enough to handle I transplanted them temporarily into another quarter of the garden, which had been previously manured and dug, in rows 2 feet apart and 2 feet between the plants in the row. The result now is (August 12th) that I have two hundred strong plants, many having from six to ten sticks on, some of them measuring 18 inches long and half as thick as a man's wrist, and this in four months from time of sowing.

Many people are under the impression that Rhubarb can only be increased in the usual way by division of the roots. Let me advise all who may read this, and who have not a good stock of this useful plant, to procure a packet of seed of each of the early and late sort and sow them at once in a warm corner of their garden, leaving the young plants in the bed until spring, when they should be taken up as soon as growth commences and planted in well-manured soil, where they are intended to permanently remain. By sowing now instead of in spring you steal a march on time, and your plants will be much stronger and better.—D. THOMAS.

#### FAIRY ROSE THE PET.

THIS is a charming Rose with its small lovely white flowers, which are produced in a large truss on the top of each shoot. Its habit is dwarf, and, best of all, it is a most continuous bloomer. This miniature Rose cannot fail to become a general favourite with ladies, and gardeners too who do not ignore and condemn all that are not suitable for exhibition. I do not doubt when once grown it will soon become highly appreciated and popular. For room decoration in small vases it is a great acquisition, and the most suitable Rose for that purpose I have yet seen. Capital plants can be grown in 4 or 5-inch pots; in fact it would almost be lost in a much larger size. Its shoots do not extend more than from 7 to 9 inches before they flower. It grows freely and does well treated in every respect similar to other Roses in pots, but should have a little more leaf soil in the compost than is necessary for Hybrid Perpetuals. Cuttings strike readily, and no better system can be adopted than that recommended by Mr. Wm. Taylor in this Journal. It also appears to do well when grafted on the seedling Briar.—ROSE-GROWER.

#### SINGLE v. DOUBLE FLOWERS.

WHEN I wrote the paper bearing on the subject named above, I had a definite object in view; but I fear I have failed to convey my meaning. I have never said, and yet every one of my critics infers, that I hate double or cultivated flowers. I never yet proposed the banishment of a single garden flower; yet Mr. Shirley Hibberd in his lecture on the Carnation goes out of his way to say that it has been proposed to abolish them all. It is certain, either that that gentleman has not read my paper or has done me injustice in misrepresenting me. Others have honestly differed from me, or rather from what they have fancied my ideas to be. Indeed, I do not know but that some of them are prepared to go further than I am.

The idea that I have condemned double flowers *in toto* is a mistaken one. I have said, and I hold, that single flowers are, as a whole, more beautiful than double ones. Those who have joined issue with me have admitted that certain double forms are not so beautiful as the single kinds. For instance, there is a wonderful unanimity of opinion about *Petunias* and *Fuchsias*, and that opinion is that the singles are best. It is the same with *Pyrethrums* and *Campanulas*. Indeed the kinds which the champions of double flowers declare to be better than single flowers are comparatively few, while there are hosts of generally admired single flowers. This is exactly my position, and it is, after all, theirs; for our differing is much more seeming than real.

I treated the matter generally, as was only possible in one or two short papers. There are few rules without exception, and I never

for a moment intended that my rule should be considered absolute. I never did consider single Stocks equal to double ones, nor the finer forms of double *Camellias* to be inferior to single. I protested against the undue exaltation of double flowers, but at the same time cultivate and admire double flowers as well as single. I said that double *Hollyhocks* were neither so effective nor so beautiful as *Foxgloves*; and it seems that I have been understood to say that double *Hollyhocks* are neither beautiful nor effective! And so on.

But Mr. Brotherston puts some questions which had better, perhaps, be answered. Speaking of *Hollyhocks*, he uses the following words—"Why should we examine everything closely?" The answer is that beautiful, really beautiful, flowers must be examined closely in order to realise how beautiful they are; and when such a question is asked, the interrogator himself has no great admiration for his favourites. Again, "Though *Hollyhocks* are not particularly beautiful under close inspection, then 'let distance lend enchantment to the view.'" Mr. Brotherston's defence of double *Hollyhocks* is such as might be made of a flower garden, the beds of which were filled with paper *Roses* and milliner-made foliage. If any fault could be found of such a flower garden on close inspection, why, "let distance lend enchantment to the view!"

Mr. Brotherston asks if I would expel "Mule Pinks, double Pinks, laced Pinks, Picotees, Clove Carnations, and florists' Carnations from gardens." No. There are not many flowers that I would expel from gardens, and those named are among my special favourites. Then he gives another list of double flowers, and asks if I would place the double forms in the background and substitute the single forms. As far as regards double *Primulas* and *Azaleas* I certainly would place them in the background, for they are, I think, inferior to the single forms.

In the last paragraph but one of your correspondent's communication he criticises the bouquet, the composition of which lately formed the burden of a few remarks. In that paper I endeavoured to show that a charming bouquet might be culled from any hedge-side, and because your correspondent can produce a better by searching the whole world over for flowers to compose one, he imagines he has made out a case against me. He thinks the substitution of "cultivated" flowers for "wild" ones has proved wildlings to be worthless. It is not often a critic so effectually defeats himself as Mr. Brotherston has done in this case, for he has triumphantly proved exactly the opposite of what he intended. What is a cultivated and what a wild flower? Is an unaltered wild flower less a wild flower because it grows in a pot or under artificial conditions? If so, then the mere fact that most wild flowers have been cultivated some time or other, places even them under the category of "cultivated" plants. But all will agree with me that all flowers that are in the state that Nature presented them, and are unaltered from Nature, are wild flowers. Certainly *Eucharis* is better than *Horsegowan*, and *Paneratium* than *Woodruff*, *Odontoglossum* better than *Gueldres Rose*, *Epidendrum vitellinum* better than *Dandelion*, and *Aquilegia ehrysantha* better than the little *Lotus* or *Lady's Bedstraw*, but all are alike wild flowers, with this difference—the whole world has been ransacked to furnish the one, a few square yards of a hedgeside have furnished the other. Before *Eucharis* can be enjoyed stoves have to be built, and *Orchid* houses to grow *Odontoglossum*, to say nothing of the collectors needed to obtain the plants, the ships to convey them home, and the expense necessary for their cultivation. The others may be had for the collecting at the side of any country road in summer-time, and they are not so very much less beautiful; perhaps what they want in colouring may be made up in gracefulness, and that to a cultivated taste is even better than mere gaudiness, though we do not mean our readers to understand that we regard the *Orchids* named as gaudy, or the others either. I grow most of the plants named by Mr. Brotherston, and am critical enough to select forms of *Odontoglossum* possibly on the same lines as he would. I do not regard all wild flowers equal, as, I am assured, he will not regard all cultivated ones; but, when I escape to the glens and the hillsides I never fail to experience a pleasure ever fresh, though I also take great delight in our cultivated plants. My object has all along been to direct attention to the wealth of beauty which is "born to blush unseen, and waste its sweetness on the desert air." Far be it from me to limit the improvement of flowers, and farther still to throw cold water on the cultivation of the many gems, brought from far, at how much cost! My observations have been misunderstood; but if I succeed in showing to even a few how they without gardeners, hothouses, gardens even, may nevertheless indulge their love for flowers, my purpose will be served.—SINGLE-HANDED.

ROSES FROM CUTTINGS.—Having taken some *Rose* cuttings according to the directions given in the first article of July 21st

in the Journal by Mr. Wm. Taylor—will he kindly say what next should be done? Having no glass save a small cold frame, I desire to know if the cuttings should remain in the box where they are and the glass be lifted, or should they be planted in a border or placed in pots?—L. T., *Putney*.

CHAPTERS ON INSECTS FOR GARDENERS.—No. 27.  
NEW SERIES.

It is not, perhaps, easy to persuade the individual who, having taken a bite out of a juicy Peach, perceives in the portion which he holds in his hand the wriggling half of a centipede, and is therefore forced to the conclusion that the other half of the said creature is in his own mouth, that something may be said in favour of centipedes and millipedes. The gardener certainly has many worse enemies if he has also more important friends amongst the insect tribes. The fact is that this group is simply divisible into two sections, each having special habits, the insects of the one being generally harmful in our gardens, those of the other are mostly harmless or actually beneficial. An estimate of the two, in so far as we can make it, would lead us to think well of the myriapods as a whole, but as yet the habits of some of the species are very little known. All our native species are small compared to the bulky and formidable centipedes or millipedes of hotter countries, a bite from which has proved as troublesome as one from a snake or a scorpion.

The myriapods are readily distinguishable from the majority of insects by the absence of any evident separation of the body into thorax and abdomen, and by their possession of a large and variable number of legs, though "hundred legs" is an exaggeration, and "thousand legs" also—appellations sometimes given to the two groups referred to, because one has usually a pair of legs to each segment of the body, and the other two pairs. Of course the segments are numerous, giving much flexibility to the body. The mouth resembles that of biting insects, having mandibles, and an upper and lower lip. There are no distinct transformations, but juvenile myriapods have fewer feet and segments.

The Julidæ or "Thousand-legs" have mandibles and jaws suited to the ordinary operations of biting; and so far as we have ascertained these species feed chiefly upon vegetable substances. The short and plump *Glomeris marginata*, commonly called the Pill Millipede, is exceedingly like a woodlouse, and it rolls up in the style of that crustacean, though it may be readily distinguished by its appearance when crawling. When a woodlouse is moving along the feet are seen to project beyond the sides of the body; in the millipede they are hidden from view. Probably this insect lives by preference on decaying roots or bulbs, but is not restricted to them, and it has been suspected of doing damage in Orchid houses. It is not, however, so frequently noticed as are the snake-like species of the genus *Julus*, not literally thousand-legged, if possessing in several instances one or two hundred, possibly more. These have often been discovered in the act of eating small insects and molluscs; thus far they are of use, but much more frequently there has been found unpleasant proof of the injury they do to growing plants, especially to the delicate fibrils of herbaceous species. They will also bore deeply into bulbs, necessarily destroying the plants, liliaceous species being much infested by them in some seasons. Traps, such as scooped-out Potatoes and Apples, placed in suitable spots have been tried with some success under glass structures; in the open ground soot and lime water not so successfully, their vitality defying these and similar applications, while more powerful ones kill probably the plants and insects together.

*Julus pulehellus* was, it may be, so named because it is a pretty object under the microscope, being delicately formed, having the pale surface of the body marked with crimson spots. To the horticulturist it has no attractions, since it appears to be the most troublesome of the genus, though almost the smallest species in it. Not only does this millipede attack various garden or greenhouse flowers, it has been discovered by Curtis and others in the act of perforating the roots of Cabbages and Beans. The next species is considerably larger—*J. terrestris*, about an inch in length, and with similar habits; it occurs amongst decaying vegetable substances very often, but does not limit itself to these. As a root-eater it is apt to escape notice, for it will go down to some depth. *J. londinensis* is not so common; this is supposed to have a preference for the roots of Wheat. There are other species of the genus varying in size that are seldom met with in gardens. Sir John Lubbock has described, with a friendly appreciation of its services, a small millipede he calls *Pauropus Huxleyi*, which occurs amongst dead leaves and similar accumulations of vegetable matter, which this creature busies itself to disintegrate, and it seems to be in a condition of activity all through the year. He

states that it is "a bustling, neat, and cleanly little insect, with a look of cheerful intelligence, which forms a great contrast to the dull stupidity of the Julidæ and the melancholy ferocity of the Scolopendridæ."

The Scolopendridæ or centipedes have fewer legs, and mandibles peculiarly formed, having a point at the end of a hollow tube which communicates with a poison gland placed in the head. The presence of this apparatus is sufficient proof that these are intended to subsist upon living creatures; it is therefore to be concluded that, when centipedes are unearthed, even amongst plants which have been suffering from the visitation of some insect species, they are not the real offenders but have been preying upon them. A small *Scolopendra* having occurred in several instances amongst diseased Potatoes a few years ago, led Messrs. Curtis and Hope to assume that the species had to do with the mischief—an idea which the better knowledge we now have of the habits of centipedes leads us to set aside. But I am hardly prepared to admit that the centipedes which insinuate themselves so dexterously into our wall fruit have only done so with the laudable object of killing other and smaller insects that have previously made entry. The attitude of a centipede curled round the stone of an Apricot, Peach, or Plum certainly implies an appreciation of the sweet fluid by which it is surrounded; and though many centipedes may be found in partially damaged fruit that has the marks of other insects, centipedes also appear in sound fruit—sound until they had worked their way in, which they usually do

Fig. 28.—*Julus terrestris*.

Fig. 29.—Section of body.

close to the stalk. The majority of our native species have no eyes, therefore the sense of touch must be very acute, or some sense that we are unacquainted with. Female centipedes have been observed in the act of watching over their brood of eggs; these are placed in a small cell underground. *Geophilus longicornis*, the largest British species, is the one that most frequently visits fruit, I fancy; it is very slender, and pale yellow in colour or whitish. The name of the "electric centipede" has been bestowed upon *G. subterraneus*, from its property of emitting a phosphoric light in spring and autumn. This was at first supposed to have been caused by the insects having been in contact with some decaying substance that was phosphorescent, but it is evidently inherent, like the light of the glow-worm. Moreover, in crawling, this centipede when thus endowed leaves a shiny track in its path for a foot distance or more. This species undoubtedly destroys slugs, small worms, and insects above or below ground, as do its brethren in the genus, probably killing more than they devour. *Lithobius forficatus* is a stouter centipede, about an inch long, common in gardens and also predatory.—J. R. S. C.

ROSE MADAME PLANTIER.

THE Hybrid China Roses are principally employed for covering walls and training to poles for pillar Roses, and for this purpose are best known amongst cultivators. Seldom are these Roses seen grown in pots, and their value for this purpose is not known to the majority. Where Roses in pots have to be forced Madame Plantier should have a place and be largely grown. Its flowers are small but pure white, and are produced in clusters at the end of the young shoots. The flowers of this variety are admirably adapted for bouquet-making or for buttonholes, also for vases in rooms. It can be readily forced, and nearly every slender shoot produces a fine truss of flowers. I have not tried it on its own roots yet, but no doubt it would do well. It, however, flourishes on the Manetti and seedling Briar. When on the Manetti the stock must be buried beneath the soil in the pots, as if exposed the stocks will not last long. When trained to a pole or against a wall little pruning is necessary, only removing the weak growths and slightly shortening the strong ones; but when grown in pots a different system of pruning must be followed. The shoots

must be well cut back to one or two eyes, much the same as when growing Hybrid Perpetuals. It then flowers on shoots varying from 1 foot to 18 inches in length. Well-furnished little specimens can be grown in 6, 7, and 8-inch pots.—W. B.

#### MANCHESTER FRUIT AND VEGETABLE MARKETS.

[A SOMERSETSHIRE correspondent requests that we publish the following concluding portion of a paper that was communicated to the "Royal Agricultural Society's Journal," previous extracts from which we published last year.]

THERE are yet growers bringing their goods to the Manchester market who can remember the time when they had no foreign fruit to compete with. Oranges, Lemons, and the dried fruits of the "sunny south" were merchandise that never excited their jealousy; but it would be difficult to say in these days what kind of fruit is not imported and pitched in our markets alongside and in competition with the home grower. If we had to depend solely upon the British grower now, however, I fear fruit would be a luxury out of the reach of the working class of the community. Up to the 16th of August, 1838, the duty on imported Apples was 4s. per bushel, and in that year but 20,502 bushels were imported. The duty was then reduced to £5 per cent. *ad valorem*, and the very next year 120,000 bushels were imported into the port of London alone, and the average price they were sold at was 4s. 9d. per bushel. The importation of Apples went on steadily increasing up to the year 1846, when it received a great impetus by the total abolition of the duty. Yet the price of good Apples is higher now than when the maximum duty was exacted. I learn from evidence given before a Select Committee of the House of Commons which sat in 1839, "to inquire in the Fresh Fruit Trade," that the reduction of the duty had driven the Kentish growers to despair, and that they talked of grubbing up their orchards. That did not take place, however, to any great extent; but where Apple trees were removed Cobnut trees and Raspberry canes were put in their place, and both these pay much better than common Apples. Home-grown fruit has, and must always have, a great advantage over the imported by being delivered in our markets fresher and in a generally better condition. It is the better sorts of Apples that are imported, such as the French "Royal Russet," and the incomparable "Newtown Pippin" from America, that the English grower has most to fear from. Five other sorts of Apples, beside the "Newtown Pippin" and "Ribston Pippin," are now sent from America, some only fit for culinary purposes, and all far inferior to the Pippins named. The cost of bringing them from New York to Liverpool last season was 2s. 3d. per barrel, weighing upon the average 1 cwt. 1 qr. nett, and 10d. from Liverpool to the Manchester market. In 1877 there was shipped from the United States to this country 336,565 bushels of Apples, and from Canada 44,295 bushels. I cannot give last year's importation, but I know it was much in excess of 1877.

This market also receives large quantities of Apples from Belgium, in casks which contain about 4 cwt., and last year they were brought from Antwerp to Goole for 9d. per cask; conveying them from Goole to Manchester cost 15s. 10d. per ton. Probably the growers of the common sorts of culinary Apples in Lancashire and Cheshire would find their account in superseding them with Raspberries, which always command a good price, and which will never be subject to the competition of foreigners, owing, from their soft nature, to the difficulty of transit.

Excellent Pears are imported from France and Jersey.

French-grown Strawberries now reach our markets before the English are ready; they are shipped from Brest in small boxes. About 7000 per week came to Manchester for three weeks this year. They are followed by large supplies from Cornwall, Worcestershire, Kent, and Cheshire, in the order named, and lastly from Scotland. Upwards of 3000 packages of this fruit were disposed of by one salesman one day this year, the cost of carriage by railway for which was between £60 and £70.

The first Cherries also came from France. It takes three days from their starting to their delivery here, consequently considerable loss is occasionally experienced from their changed condition. Ripe fruit put on the railway at mid-day in Cornwall is delivered here early next morning. Put upon the railway in Kent or Worcestershire at five o'clock in the evening, it reaches Manchester by three on the following morning. This is a splendid service, and leaves nothing to be desired. When we consider that these fruits are gathered one day and sold over the retail counter to consumers before the ordinary dinner-time on the next, 250 miles away, it must be allowed that the acme of accommodation has been reached. It takes a longer time for carts to

reach the market from the distant parts of the adjoining county of Chester.

Vast quantities of Currants are sent here from Kent; 20 tons have been sold in one hand in one day. Gooseberries are received from Worcestershire, Cambridgeshire, Cheshire, and the north-west of Lancashire. From the first and last named places they are not marketed until ripe; from the other two they are stripped from the trees in a green and hard state, and come to market in sacks like grain. The neighbourhood of Preston, in this county, is celebrated for the excellence of its Gooseberries.

The trade in German Bilberries is an important one. About 10,000 baskets of 12 lbs. each per week are received here during the season; they are sold at from 1s. to 3s. per basket, and cost 10d. each carriage. Many are sent also in small kegs from the banks of the Rhine, and the cost of conveyance is 4d. each. The very best Bilberries, however, are gathered on the Welsh hills; they are much superior in flavour, and reach the market fresh and in blooming condition. From Germany come large importations of Plums also, "Violets" and "Winesours," the latter in great abundance; they are a well-flavoured Plum, and their German name is "Zwetchen;" rate of carriage, £4 per ton. From the north of France come "Violets," "Black Orleans," and "Green-gages;" rate, £6 per ton.

The greatest number of baskets of fruit pitched in the Manchester market in one week, from 1870 to 1879 inclusive, has been as follows:—

1870.	1871.	1872.	1873.	1874.	1875.	1876.	1877.	1878.	1879.
68,000	72,000	51,100	82,700	73,500	86,250	81,450	77,200	102,250	90,000

To enter into further details, and refer separately to all the other kinds of fruit which are covered by these figures, would require more space and time than it would be desirable to occupy, and as I have mentioned all the principal sorts there seems to be no necessity for doing so.

Whether the promoters of this inquiry will consider that the writer has sufficiently obeyed their instructions in other respects he can only conjecture. "The sources of supply" are pretty fully indicated; it is absolutely impossible to obtain with any degree of accuracy "the average quantities that arrive by road and railway;" and as for "the advantages and disadvantages of the local grower from climate and seasons," I feel that it is too obvious that the former are far outweighed by the latter. That the local grower has some advantage over the distant as regards transit it cannot be denied, but even this is somewhat modified by the low rates charged for carrying foreign produce by the railway. I think that an examination of the figures I have quoted upon that subject will show that there was some ground for its being recently stated in both Houses of Parliament that the importer was more favoured in this respect than the home producer. As regards the market tolls, they apparently are on an equality; but, in fact, inasmuch as all foreign produce is packed in much smaller parcels than the home grown, the toll on the foreign is more than double that on the home-grown. A hamper of fruit as packed by the home-grower, and for which a toll of one penny is charged, will contain six times the quantity as packed in small baskets by the foreigner, which are charged one halfpenny each.

It will be seen that I have spoken of but one Manchester Fruit and Vegetable Market, and for the simple reason that it has but one that need be referred to for the objects of this paper.

There is still a Market upon the ancient site opposite the Exchange, which gave the name to "Market Stead Lane," now Market Street. In the spring, and through the summer, the old "Stead" is full of flowers, plants, shrubs, and trees; it is very picturesque, and strikes the eye like an oasis in the brick-and-mortar and sooty desert. There were formerly several retail markets scattered over the town; but their usefulness having departed, they themselves no longer exist.

The time is not far distant when retail markets will everywhere become things of the past—and why should it not be so? The system so long in vogue in London of the housekeeper being supplied by the "coster" is rapidly spreading in the provincial towns, and shops are now opened in almost every street for the sale of fruit and vegetables. That this must be far more economical than the retail market system can be easily shown. The market, for the sake of convenience, must occupy a central situation, and in such situations land in large towns has become valuable, and necessitates the payment of a heavy rent from the stall-keepers, and this, of course, falls upon the customer. And it does not require a large amount of perspicacity to see that it must be infinitely less costly for one dealer to convey goods to a hundred consumers than for a hundred customers to resort to a distant market for the supply of their daily wants. But these arguments tell in the opposite direction as regards a wholesale

market. There must be a great central depôt to which the retailers of the surrounding districts can repair in full confidence of procuring all they may require to satisfy the demands of their customers, and such a place is that which I have herein attempted to describe—"The Fruit and Vegetable Market at Manchester."

#### HARDY FRUIT GARDEN.

WHEN the Raspberries have all been gathered the old bearing wood should at once be cut out, and the young canes thinned to four or six of the strongest and best situated to each stool, securing them loosely to stakes until the growth is quite finished and the wood ripened. There must not be any further delay in netting Morello Cherries or Red and White Currants, which if against a north wall will keep much longer than in the open, and even improve in quality, whilst those in the open will deteriorate in quality. Red Warrington and other late Gooseberries should also be netted, but they do not keep very long without losing flavour. Hexagon netting is the most suitable material, as it excludes wasps and bluebottle flies as well as birds, at the same time admitting air. Apples of the early kinds should be gathered as they become ripe, or rather before they are dead ripe, or most early dessert kinds will be mealy, juiceless, and without flavour. The crop of this useful fruit is in most places abundant. Early Pears also should be gathered before they are quite ripe, or they are liable to become similarly deteriorated in quality. Apricots, early Peaches, Nectarines, Pears, and Plums ripening on trees against walls will require daily attention, the fruit when ripe being detached by gently raising or moving it, handling each carefully, as any injury will result in the speedy decay of the fruit. Prepare ground for fresh plantations of Strawberries, the present being a good time to plant. Select deep rich soil if possible, and an open situation. It is advisable, however, to plant a few of an early sort and some of a late kind on a north border to insure as prolonged a succession as possible. Let the ground be heavily manured and deeply trenched, as the Strawberry, being a deep-rooting plant, withstands drought much better than when the soil is shallow or not deeply stirred. It is not, however, advisable to bring up much bad soil, as that would only cause the plants to make very indifferent progress. The plants, which should have been well established in 3-inch pots, may be planted in rows 2 feet 6 inches asunder, and 2 feet apart, allowing such varieties as President 6 inches more space each way. If a full crop be desired the first season the plants may be put out at half the distance in the rows, every alternate plant being removed as soon as the fruit is gathered. The following varieties afford a good succession—Pioneer, Keens' Seedling, President, Lucas, Dr. Hogg, Unser Fritz, and Loxford Hall Seedling, a grand late sort. In light soils we find Pioneer, Sir Harry, and President succeed better than most others.

#### FRUIT HOUSES.

*Figs.*—The second crop will soon be removed from early-forced trees, and when this is the case attention must be directed to the proper ripening of the growths, for unless those are well matured success will be doubtful, especially as regards early-forced trees. Attention having been given as indicated in former calendars to thinning and regulating the growths, little will be required now beyond regulating the supply of water and the ventilation. The crop having been removed and the growth completed the trees will not require so much water, yet sufficient must be given to keep the borders moist, discontinuing syringing, or only resorting to it occasionally to eradicate red spider. The ventilation must be attended to as before, a free circulation of warm dry air being maintained until the foliage commences falling, when a colder atmosphere, but well ventilated, will be suitable. Trees that are crowded with wood from inattention to thinning must at once have the shoots thinned to insure the maturation of those retained. Trees that ripened a crop in June will now

be perfecting another, and may be encouraged with liberal supplies of water or liquid manure, and as the ripening of this crop will extend over a considerable time a circulation of warm dry air must be afforded to obtain the fruit in good condition. Trees in pots are not so vigorous as those planted out, and ripening the growths more freely will be benefited by exposure outside after the crop is gathered and the growth matured, but on no account must they be exposed if there is any doubt respecting the maturation of the wood. They should be returned under cover before heavy rains and cold weather are experienced.

*Peaches and Nectarines.*—Some of the leaves of the trees in the earliest house are now changing colour and falling, and if any renovation of the border be deemed necessary it should be attended to. The surface soil may be removed down to the roots, being careful not to expose these very long. Lay them in carefully in fresh compost, and firm the whole well. If the wood is gross and does not ripen well the trees should be wholly or partially lifted, the house being shaded and kept rather close, the trees well syringed two or three times a day, and the operation performed with little delay. The drainage must be made as complete as possible, and when this is effected a layer of turves grass side downwards will prevent it becoming choked. About a foot depth of compost may be placed in and well rammed, and the roots spread out over it, cutting back any strong roots devoid of fibres. It is important that the soil be made quite firm. Strong fibrous loam taken off about 3 or 4 inches thick forms a suitable material without any admixture, especially if it has overlain limestone. Soil not of this description may have a tenth part of old mortar rubbish incorporated, with a fortieth part of half-inch bones, the soil (which must be strong, or if light have a third of clayey marl mixed with it) being no more than moderately moist when used. Give a soaking with water at a temperature of 90°, and mulch with 2 or 3 inches of short manure. Continue shading and damping the trees for a few days, and they will soon be established in the fresh material, when the shading must be removed and the house ventilated fully. Trees so treated invariably set their fruit well, and fine crops are obtained. To assist the ripening of the wood in succession houses the trees should have all the wood not necessary for next year's crop cut out, syringing the trees forcibly after the fruit is gathered to dislodge red spider, not allowing the borders on any account to become dry.

*Pines.*—In most instances the suckers produced by the early summer fruiters are now started, the treatment having been indicated in our last calendar under this head. Continue the treatment advised until growth is perceptible, when shading should be gradually discontinued, and the houses more freely ventilated on favourable occasions. Avoid crowding, allowing space for a sturdy growth, as weakly attenuated plants seldom produce fine fruit. When the weather is favourable to Pine Apple plants they will make luxuriant growth, and must be well attended to in ventilation; and in houses or pits, with the plants near the glass and the panes large, a slight shading for an hour or two at mid-day when the sun is powerful is very beneficial in May, June, and July; and where it has been continued up to this it should now be gradually withdrawn, providing free ventilation when the temperature stands at 85° to 95°, which is suitable alike for succession as fruiting plants, those having 70° to 75° at night, and the others 65° to 70°.

#### FLOWER GARDEN.

Endeavour to keep the flower garden gay and attractive as long as possible, being particular in removing every decaying leaf and flower as soon as perceived. Pelargoniums are especially liable to suffer when crowded; it is advisable to thin them and insert the cuttings. The plain-leaved varieties do well in a sunny position in the open ground, the soil being rendered firm, and by the end of September they will be ready for potting. Those grown for the beauty of their leaves should be placed in a frame where they can have protection from heavy rains, otherwise full exposure, and inserting the cuttings must not be longer delayed to have them well rooted before winter. Carpet beds well repay attention in keeping the lines and divisions well defined by pinching, indeed their effectiveness depends on their being well kept. Propagation must be proceeded with, but it is not

necessary to provide a large quantity of *Ageratum*s, *Alternanthera*s, *Alyssum*s, *Mesembryanthemum*s, *Lobelia*s, *Petunia*s, or *Verbena*s, nor of *Coleus*e, *Iresine*s, &c., as these are best propagated in spring, so that a few pots or pans of these for stock are all that are required.

Roses promise to be abundant and fine this autumn, and the trees should be well syringed if dry weather prevail, also supplying liquid manure. If aphides attack them a prompt application of tobacco water will be needed, and if mildew appear dust whilst damp with sulphur and wash it off in a few days. Climbing Roses, such as *Maréchal Niel*, *Cloth of Gold*, and others, should have all the old flower-bearing wood cut out, and sufficient medium-size young shoots laid in to replace them for next season. All climbing Roses flower much better treated in this way than when spurred or pruned closely in, which only induces strong growth. *Phloxes* continue fine, especially where planted in deep moist rich soil, which with liberal watering induces large heads of bloom. Choice varieties may now be increased by cuttings or division, and the propagation of such *Primroses*, *Polyanthuses*, border *Auriculas*, *Daisies*, *Myosotises*, and *Gentians* may readily be effected in the same way.

#### PLANT HOUSES.

*White Roman Hyacinth*.—In order to have this useful plant in flower by early November the bulbs should be potted at once, three or four in a 5-inch pot, and five or seven in a 6-inch pan, leaving a space of about an inch between the bulbs. Employ good loam with a fourth of well-decayed manure or leaf soil and a little sand, firming the soil well around and over the bulbs, just leaving their necks clear. Stand the pots on ashes in a cold frame, and cover the pots with the same material. The lights need only be used for throwing off heavy rains. By the beginning of October the bulbs will be well rooted, and should be removed from the ashes and placed on shelves in a house with a temperature of 50° artificially, and when the spikes are appearing they may be further accelerated by placing them near the glass in a house where a temperature of 55° to 65° by artificial means is secured. Double Roman and Paper White *Narcissuses* require similar treatment, and are equally desirable where fragrant flowers are required for cutting or conservatory decoration.

#### THE PHYSIOLOGY OF THE HONEY BEE NOT EXCEPTIONAL.

WE bee-keepers as we watch and study the little insect that has given to so many of us so much delight, are in no little danger of coming to believe that we are contemplating the very masterpiece of Nature, and that we have before us a concentration of wisdom and of wonder for which we should look elsewhere in vain. It has by example almost become a fashion to tell us, as a modern manual does in reference to the production of queens, that we have here a fact "which has *no parallel* in natural history," but a broader view will show that not only is this untrue, but that quite as surprising and unlooked-for methods of sexual differentiation not unfrequently occur. And should not the fact that the things which at first we think little we afterwards discover to be great, and that the more we study the more we find there is to learn, rather prove to us the unwisdom of supposing we had unfolded the greatest of all wonders, teaching us that as yet we only discern few marvels where there are many, and that did we know Nature as she is we should see neither less nor greater, but fulness of beauty everywhere, the exponent of a wisdom past finding out? Already, indeed, we get glimmerings that this will be the goal of science, for she has been lately opening up to us that not only have animals and plants their wonders, but that the very atoms of the universe are miracles of form and force alike.

It is now well known by all observant bee-keepers that the eggs which produce drones are unimpregnated, and in these days of the microscope an explanation of the manner in which this fact can be ocularly verified may be interesting to many of the readers of the *Journal of Horticulture*. I am induced to look at this matter in consequence of some remarks made by Mr. Pettigrew in drawing attention to the theories of Berlepsch and Dzierzon, which in their main lines are too well established to be questioned.

Although there are strong physiological grounds for supposing that the capacity for pain in insects is at most exceedingly small, I would be the last to suggest any experiment which could offend the sensibilities of any, and so state that our surplus queen to be examined is at once put to the quickest death—at which all sensibility must cease—by cutting off the head with a pair of fine scissors. The subsequent and unconscious movements of the legs and bending of the abdomen are but reflex, depending upon the nerve irritation which the section has promulgated along the nerve track, first to the large thoracic ganglia and then onwards to the extremities. We have previously prepared for the dissection now to be made thus: We take two very wide and shallow but perfectly similar pill boxes and place these and their lids, the latter removed, in a saucer in an oven along with some bee's wax in order that they may by soaking be waterproofed. We now fix one of the lids upside down upon a slip of thin wood or glass, 3 inches by 1 inch, to go upon the microscope stage, and similarly fix the other lid upon a piece of wood large and heavy enough to keep all steady as we work. Let the pill boxes be now filled with melted wax to within a good quarter of an inch of the top, and place one mouth upwards in the lid already fixed upon the heavy wood in order that our work may be firmly held when cemented upon the wax, which is now left to cool. The abdomen is next separated by scissors from the thorax. A piece of wire is made hot, and a little bed of wax in the centre of the box just referred to is by its means melted. Upon this the abdomen is placed back downwards, and the wire being reheated completes the operation of fixing, if necessary, by touching the points of contact between the wax and the abdominal plates. Of course the heat must be kept from the abdomen itself as much as possible. Water now is added to cover the abdomen, and we are ready for the operation. The scissors cut through the plates at the sides, and by degrees we tease them off with a pair of needles. We find at the part of the abdomen next the thorax two relatively large almost pear-shaped bodies, consisting of a multitude of parallel tubes (the oviduct tubes) in which the eggs are constantly undergoing maturation. These pear-shaped bodies (the ovaries) each end in a single tube, which by joining its fellow constitutes the oviduct, which opens outside the body just under, but as we have the abdomen inverted, over the sting. By the side of this oviduct and in contact with it is a small pearly white body about the size of a millet seed—the spermatheca, the contents of which can in minute quantities be discharged into the oviduct through a tiny channel (the sperm duct). This should now be separated carefully (those who use properly made dissecting instruments will have a great advantage) and placed upon a glass slip with a drop of water, a cover-glass is added, and it is examined by the microscope (of course every microscopist will understand that the live-box or compressorium will be best). If very slight pressure be put upon the glass cover a quarter-inch objective (even a good inch) will show countless myriads of spermatozoa issuing from the injured sperm duct and covering everywhere the field of view. They are all in rapid twisting dancing movement, and cannot be seen for the first time without exciting extreme astonishment. Each one in form can be compared to a minute eel with a disproportionately large head, while the tail (flagellum) lashes from side to side with extraordinary quickness.

These spermatozoa have been received by the queen from the drone, and during the whole of her life they are nourished and aerated, and maintain the vitality and power of movement which they originally possessed. These last statements admit of ready proof, for if a virgin queen be anatomised, as already explained, the spermatheca is found of small size, and but partially filled with a fluid which has no trace of structure. If, on the other hand, the drone be similarly treated the testes upon being crushed yield spermatozoa, the fac-similes of those found in the queen and in numbers which must reach millions. Let me remark in passing that it has been questioned whether drones, the produce of fertile workers, are virile, but there can scarcely be a reasonable doubt here. I have examined these frequently, and found spermatozoa in no distinguishably less numbers in their case than in normal drones.

If a virgin queen lays eggs they are of one kind, producing drones only, but a mated queen deposits eggs that may become drones or workers or queens. The reason is fully proved. The eggs to form drones are not brought into contact with the sperm duct. They have mothers but not fathers, and the creature resulting is said to be produced parthenogenetically (by or as by a virgin). There should be no difficulty in receiving this doctrine, of which examples in nature are even common, but of which we must speak more presently. The eggs destined to produce workers are, however, on the contrary, in the act of deposition brought into contact with the sperm duct, spermatozoa are then received, and

females fully or partially developed are the result. A microscopic examination of the egg shows that it has been formed for this method of impregnation. The whole surface is covered by a most beautifully reticulated membrane (chorion), the lines of which lead up in pattern towards the larger end of the egg, where they all terminate by joining a ring, reminding one of the cordage over a balloon which leads up to the string ring at the top. In the centre of this ring we find an aperture (micropyle) very minute, but passing through the egg coats and giving an opportunity of entrance to the spermatozoa, whose rhythmical movements, as though guided by intelligence, bring them to the micropyle, when they pass within, are absorbed into the germ, and effect the resulting sex as we have already seen. The question has been asked whether the queen is conscious of the sized cell in which she is laying and impregnates the egg or not accordingly. It is difficult to theorise here, but the cause is probably reflex in its character.

The fertile worker plays an important part in the normal state of many insects. Amongst bees she is a cause of ruin; but here she is of service, as she completes our argument. She is incapable of impregnation, but is capable of depositing eggs which produce drones only. Some three months since I attempted to make a swarm of the whole of the bees of a colony, in order that they might be sent to a distance. From a hundred to two hundred bees remained in the hive, which was returned to its old stand. Intending to give them a patch of hatching brood so soon as such was seen, I did not disturb them. In a few days, opening the hive, I found hundreds of eggs, ten or twelve in a cell, and covering a circle of about 3 inches in diameter. Amongst this little lot a fertile worker had appeared. But these things are not without their parallel. For instance, amongst wasps we find the counterpart to it all. The *Polistes gallica*, which builds its nest in bushes, is an interesting example. A mother or queen fertilised in the autumn passes into complete dormancy until aroused by the spring sun; she then with great industry builds a few cells, furnishes them with eggs, and feeds the resulting larvæ, all of which turn into females, but females which cannot be impregnated since males do not survive the winter. These virgins in turn add to the nest by ovipositing, and all their eggs produce males parthenogenetically, as in the case with the drone egg of the queen or fertile worker. Females of larger size than the rest produced by the mated mother late in the year, and probably differentiated by peculiar feeding as in the case of the queen bee, meet males of the same year; the former survive the winter, and so the race is continued.

It is curious to the naturalist that in other creatures this rule is sometimes reversed; for instance, in rotifers, females are generated by virgins, and males by mated individuals; and amongst moths there are known instances, of which space forbids particulars, of twenty generations of females succeeding each other without one male specimen having presented itself, or one case of impregnation having occurred. Indeed amongst some moths the male is at present altogether unknown, nor have we here at all exhausted our knowledge of these surprising variations, for amongst other similar cases *Cecidomyia* produces a larva which is itself fertile, not laying eggs but evolving living larvæ like to itself within its own body. This may remind us of the sexless budding-aphis passing through several generations until perfect sexual winged aphides are brought into existence, upon which seems to be laid the task of continuing the race to the succeeding year. Nor is this parthenogenesis amongst plants quite unknown. Dr. Asa Gray gives us as an example *Coelebogyne*, respecting which he adds, "Parthenogenesis is thus confirmed, and is shown to occur in most polyembryony."

So far my object has been to point out that in studying bees we have no monopoly either of the wondrous or beautiful, but that even the material works of the Creator are everywhere infinitely beyond us all.

In conclusion I must just mark one point in which I do not see with Mr. Pettigrew, if, indeed, I understand his meaning. The determination of the impregnated bee egg into a queen or worker is the result of treatment or feeding so far as we know; but he speaks of dwarfing the worker and interfering with its development. But this does not meet the case, since in some respects the worker is more highly developed and organised than the queen—*e.g.*, its tongue, its mandibles, its legs, the hind pair especially. It is rather a question of diversion of nutrition, but in what way this is brought about we know not. The organs of flight of the worker, again, are more perfect, as indeed they need be. The large air sacs, so important when distended for long flights, as decreasing the specific gravity of the body and bracing up its muscular attachments, and as increasing the possible aëration of the circulating fluids, give place in the queen to the ovaries, and so on throughout. It is neither a dwarfing nor a development

merely, but an adaptation most minute in its details. The worker for honey and pollen-gathering, wax-secreting and comb-building, nursing and cleaning, with every tool she can need; the queen for the duties of maternity, and for these alone, with generative organs fully equipped for the enormous work demanded of them, but that at the expense of all those parts which minister nothing to her proper functions.—FRANK R. CHESHIRE, *Avenue House, Acton, W.*

### STRONG HIVES.

DURING the hot weather at the end of June and beginning of July bees in this neighbourhood gathered honey very fast from white Clover. For fifteen or sixteen days we had a great honey glut. The month of May this year was more favourable for honey-gathering than any corresponding month for some years past; but during the last three weeks or more the weather in this locality has been so unfavourable that breeding in most of the hives is discontinued. What with loss of brood and the great consumption of honey, hives are becoming much lighter in weight; and, as the Clover season is apparently over, those who do not take their bees to the moors should take at once what honey they want from their hives. The present is the best time to make stock hives strong for another year. Possessing strong hives in autumn, hardly anybody who gives a moderate amount of attention to his bees will fail to be successful. We hold that hives cannot be too strong in young bees in autumn if they contain food enough for the population during the winter and early spring months. The difficulties and dangers of bee life in winter should be well understood. As bees live nine months only, many reach the span of life and die in the winter months. Only those born in August and September can be depended on for the necessary work of April and May, as cold weather in early spring may prevent an early hatch of brood. Great losses by chills during winter dances are frequent. Sometimes the ranks of the community are thinned by dysentery, sometimes by mice gaining access to hives and eating the heads of the bees, sometimes whole communities are destroyed by mice. Small communities are often killed by cold. Strength in autumn goes far to promote health and safety in winter, activity and prosperity in spring.

There are two ways of making hives strong in bees in autumn. One is by giving them additional swarms from honey hives; the other is by treating bees so that late hatches of brood are obtained, and of course this is done by artificial feeding. If six patches of brood the size of the crown of a man's hat are safely hatched in a hive at the end of August or in the month of September, the hive will be a strong one, able to bear and survive the difficulties of a severe winter. If this lesson be well understood and carried into practice by the bee-keepers of England, their success will be more general, and bee-keeping will very likely become more popular than it has been hitherto. As to the time of feeding-up stocks for winter, it should be known that early feeding, say in August, is better than late feeding, say in September. In August more flowers are in bloom, and pollen, so necessary for breeding, is plentiful. In September the weather, generally speaking, becomes colder and less favourable for breeding and hatching and comb-building. In late feeding there is, too, the greater danger of losing bees when they fly about during the excitement of feeding and in fetching water for the brood. It may be laid down as an axiom that early feeding is preferable to late feeding. One year I was so engaged that my bees were neglected till October, when they were fed-up with winter stores, which caused them to breed pretty extensively, as the weather was mild at the time. Before the brood came to maturity a severe frost killed it. Feeding and breeding should be over before autumnal frosts come. Bees naturally prepare beforehand for times of rest and quiet in autumn and winter. If they have a little sunshine and a winter dance now and then, and their dead cast out, the quieter they remain from September to February the better. Excitement in winter is not good for bees. Whatever feeding is necessary let it be done as soon as the honey season ends.

Bee-keepers are pretty well acquainted with sugar-feeding, and therefore little need be said about it here. Everyone carries out his own plan, and considers it the best. I do the same, and find no fault with the plans and modes of other bee-keepers. In spring and summer syrup unboiled, mixed at the rate of 1 lb. of sugar to a pint of water, is used. In autumn our syrup is mixed at the rate of 6 pints of water to 7 lbs. of sugar, and boiled. A slight boiling improves it in taste and appearance, and we think makes it keep better. Summer feeding is resorted to merely to keep bees alive, not for storing-up. Food in autumn is given to be stored up for winter and early spring, and therefore the quality of the food should be considered. Good sugar, mixed at

the rate indicated above and boiled, is excellent food for bees; and swarms wholly fed by it are healthy all the winter. This is well known, but it has been said that boiling is quite unnecessary. It may be so, though we think differently.

One word here about crude and perfect honey. It is well known that I believe bees have something to do in the perfecting of honey; that the crude material gathered from flowers undergoes a change—call it a sweetening and thickening process—in the bodies of bees after it is gathered; and that without the bees it cannot, by any process of evaporation, become honey proper. During the last discussion in the *Journal of Horticulture* I expressed my intention of extracting some crude honey this year and sending it to the Bee-keepers' Association for examination. The honey was extracted, a full basin of it, but instead of sending it to London I kept it for the Manchester Show, to let bee-keepers taste and examine it there. It was, when taken, a pure and beautiful sample of crude honey, gathered from white Clover. Standing on the shelf of a cupboard in the kitchen it began "to change." It will not keep. If I had boiled it, it might have kept longer; as it is, it will be at the Show, and probably those who see and taste it will need no more evidence to convince them that perfect honey is not to be found in our fields and forests.—A. PETTIGREW.

#### TRADE CATALOGUES RECEIVED.

Dickson & Robinson, 12, Old Millgate, Manchester.—*Catalogue of Bulbs.*

Jules de Coek, Faubourg St. Lievin, Ghent.—*General Plant Catalogue.*

Louis Van Houtte, Ghent.—*Catalogue of Bulbs.*

B. Fadderjahn, 16, Retter-Strasse, Berlin.—*Illustrated Catalogue of Bouquet Papers.*

\* \* All correspondence should be directed either to "The Editor" or to "The Publisher." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Vine Leaves Curled** (*A Reader*).—There is no mildew on the leaves nor insects of any kind, and no sulphur is needed. The appearance of the foliage is peculiar to the variety, and your conjecture is probably correct. Since the days are less bright no material harm will be done, but should the heat be again excessive you had better sprinkle a little whitewash on the glass where there are signs of the foliage scorching or curling.

**Carpet Bedding in the Parks** (*Agent*).—If you are meditating a visit to the metropolis you ought certainly to see all the principal parks, as they are very convenient of access and display some varying styles of bedding. In the south of London Battersea Park is especially worthy of a visit, not only for the carpet bedding but also for the subtropical department. In the west Hyde Park, in the north Regent's and Finsbury Parks, and in the north-east Victoria Park, may all be seen with advantage, especially the last named, as there the designs in which you take particular interest receive considerable attention with very admirable results.

**The Cucumber Disease** (*W. P.*).—The Cucumber roots you sent are infested with the minute creatures termed Anguillas, which form the small tubercles upon the root. Illustrations of the disease, with a magnified section of a root, are given in No. 720 of this Journal, which may be obtained from the publisher for 3½d. in stamps. The only remedial plan you can adopt is to destroy the plants, remove the old soil, and thoroughly cleanse the house. When making up fresh beds obtain the soil from a different locality if possible, and be careful that none of the old compost becomes mixed with it.

**Seedling Pelargoniums** (*T. C.*).—The truss was much crushed in transit, but so far as we could judge the variety appears to be a very good one. The truss is large, the flowers even in outline and very rich scarlet in colour, and if the habit is compact the plant is well worth preserving. It is certainly not better than many of the finest now in commerce, and you would doubtless experience much difficulty in obtaining a suitable recognition of its merits at an exhibition, yet it is well worth your attention, and would probably prove useful for culture in pots.

**Potatoes Diseased** (*S. C.*).—The tubers you sent are affected with what is termed the scab, which is generally considered to be the result of the plants being grown in soil that contains corrosive or deleterious substances, or an excessive amount of manurial agents. The Tomato is certainly a very poor sample, but with the exception of the two small blotches does not appear unhealthy. Is the foliage injuriously affected?

**Euryale ferox** (*R. S. T. M.*).—The aquatic which you describe is *Euryale ferox*, an East Indian plant that is well worth a place in any garden where tropical aquatics can be accommodated. The leaves are orbicular in form, somewhat resembling the *Victoria regia* but smaller, and bearing upon both surfaces numerous large spines. The flowers are bright violet in colour. It can be grown in a pot, pan, or basket plunged in the water, the soil consisting of turfy loam, a small proportion of manure, and coarse river sand.

**Culture of Colax jugosus** (*W. R., Hants*).—This attractive little Orchid is by no means difficult to grow if attention be paid to its very moderate requirements. It is an ally of the *Maxillarias*, but requires a higher temperature than the majority of those in cultivation. The *Cattleya* house is a very suitable position for the plant, a compost of peat and sphagnum being required, and above all particular care in insuring good drainage in the pot is necessary to obtain the species in its best condition. The spikes of purple-striped flowers are very pretty, and are always greatly admired.

**Trichomanes reniforme** (*Stella*).—The small frond you sent is that of the above distinct species, the name of which is derived from the form of the fronds. It is one of the prettiest of the genus, and if you bestow proper care upon the plant it will well repay you. A Wardian case is best suited for it as for most other *Trichomanes*, peat in large pieces as rough as possible and sandstone constituting the best compost.

**Globe Thistles** (*J. Rogers, Sussex*).—These very distinct members of the Compositæ family are included in the genus *Echinops*, and are well suited for planting in large borders or where a subtropical effect is required. As you only require a few forms the following would suit you, as they thrive in almost any soil that is not excessively heavy:—*Echinops sphaerocephalus* with pale blue flower-heads, *E. Ritro* with purplish blue flower-heads, and *E. ruthenicus* with bright blue flower-heads. The two last are usually about a yard high when fully grown, but the first-named reaches the height of 6 feet.

**The Manchineel Tree** (*X., Chester*).—The tree respecting which you inquire is the *Hippomane mancinella* of botanists, and is related to our common Spurge. It is a native of the West Indies, South America, and Arabia, on the seacoast, and receives its name from the Spanish word *mancinilla*, signifying a small Apple, its fruit having that resemblance. It has been reported by various writers that, so volatile and virulent is the poison of this tree, persons have died from merely sleeping under its shade. This, however, is an exaggeration, as it has been frequently proved beyond a doubt that no more danger arises from sleeping under that tree than from any others inhabiting the same localities as those in which the Manchineel grows. Ricord Madhava says he has travelled two leagues under its shade without experiencing any inconvenience. It nevertheless possesses highly poisonous qualities. All its parts, even the green fruit, are charged with a milky juice, which contains a considerable quantity of caoutchouc. This juice has the odour of wormwood and tansy bruised, and if this odour is inhaled for some time it causes a pricking feeling all over the person, and a choking sensation in the throat. The juice is so acrid and corrosive that the natives poison their arrows with it, and it is said that negro-drivers dip the lash of their whips in it to render the punishment of their victims more severe. The ripe fruit is the size of a small flat Apple, with many deep furrows on the outside, and an agreeable odour of citron, which perfumes the whole air; the flesh is at first quite mild, but afterwards causes burning in the mouth. On account of this insipidity at first some animals eat the fruit and die, having the stomach inflamed and even perforated with black spots like the grounds of coffee. Bruce asserts that when it falls into the sea fish and crabs that eat it are not injured, but those eating these animals are poisoned.

**Oxalis elegans** (*Inquirer*).—The following particulars concerning the plant and some of its allies respecting which you desire information are from the pen of Mr. Thompson of Ipswich, and therefore thoroughly reliable. "In the case of this genus the new tubers annually formed require to be dug up after flowering, as they are produced at such a distance from the surface that, unless this precaution is adopted, they will eventually be lost. In the case of *O. Bowiei* and other autumn-flowering nearly hardy species it is advisable to defer the removal of the tubers until spring, as in severe winters they would be safer at a depth of some inches; and from the late period at which the blossoms are produced the young tubers would suffer from being disturbed in their immature state. As they do not commence their growth until the following summer, the month of April will be sufficiently early to replant them. The bulbs of the *Oxalis elegans* do not penetrate the soil so deeply as some of the other species; but they should, notwithstanding, be replanted every autumn after the decay of the leaves. The soil best suited to this and most of the *Oxalises* is a light sandy loam with an admixture of peat or leaf mould. A dry sunny situation should be chosen, for the blossoms expand only under sunshine. *Oxalis elegans* is a very free flowerer, even the small bulbs will generally produce several umbels. The trusses will need the support of a small rod to prevent them from being dashed to the ground by heavy rains; and for this purpose nothing is better than the top of a slender unpeeled osier. These supports are commonly employed by professional florists, but they are not so generally in use among amateurs as they deserve to be. Their pale bark renders them very inconspicuous, and their freedom from knots or roughness, and tapering form, makes them, in our opinion, far more desirable than the brittle hazel rods or painted sticks ordinarily used for these purposes. The hardiness of the present species has already been adverted to. It will be prudent, however, to afford the roots some protection in very severe weather; but the covering should not be suffered to remain too long, or the bulbs would be forced into premature growth. All the *Oxalises* may be cultivated in pots, and when thus treated they can easily be preserved through the winter in a dormant state. Considering the great interest attaching to this pretty genus, and the showy character of their blossoms, we are really surprised that they are not more frequently met with. A bed of mixed species, planted in clumps of eight or ten bulbs each, forms in sunny weather one of the most attractive objects imaginable. All the half-hardy species which flower in summer and autumn may be thus grown, and their tubers may be dug up after the leaves are withered, and preserved in dry sand."

**Culture of Pieroma elegans** (*N. R. M.*).—Established plants must be cut in closely after flowering, and kept rather dry and cool for about three weeks, and then rather close and moist, being careful not to overwater; and when the young shoots are an inch long turn the plant out of the pot, remove most of the old soil without disrooting much, and repot in the same size pot. Keep rather close, moist, and shaded for a few days, then admit air moderately, and keep the plants in a light airy position during the winter. In April shift into a pot 2 to 4 inches larger in diameter, and the plant will be the better of placing in a Peach house started to ripen the fruit in June, the moisture from syringing and the well-ventilated atmosphere securing a stiff vigorous growth. Failing this convenience, keep it in the warmest part of the greenhouse, but well ventilated, and syringed twice daily. In July keep it in a cool airy house shielded from midday sun. In September return it to the greenhouse, assigning

a light airy position. The shoots if growing irregularly may be stopped, but not after June, and they should be tied in autumn after the manner of Azalcas. If the plants are young they may be potted in June, in addition to spring potting. The plants will therefore have a season to grow in and another to flower, so that two sets of plants will need to be grown to have flowers every year. Sandy fibrous peat four parts, very fibrous sandy loam one part, and one part in equal proportions of pieces of charcoal, broken pots, and silver sand, well mixed, and used rather rough, will constitute a suitable compost.

**Name of Fruit (Mrs. B.).**—The Apple was in such an immature state that its name could not be determined.

**Names of Plants (J. M.).**—The leaves sent were much crushed, but are undoubtedly those of Clematis montana. (W. J.).—1, Lasiandra macrantha; 2, Maurandya Barclayana; 3, Davallia canariensis; 4, A strong shoot of Selaginella esesia. (O. L.).—1, Malope trifida; 2, Kitaibelia vitifolia; 3, Campanula carpatica. (J. F.).—2, Hypericum perforatum; 4, Malva moschata alba; 6, Aeonitum napellus autumnale; 7, Campanula Traehelium; 8, Jasminum officinale; 11, Allium globosum. The others were too withered to be recognised.

**Comb Foundation.**—Mr. T. Varley desires information concerning the methods and cost of manufacturing comb foundation.

COVENT GARDEN MARKET.—AUGUST 17.

MARKET quiet, and prices generally lower. Large arrivals of Grapes from Channel Islands. Supplies of all classes of fruit in excess of the demand.

attachment thereto. From various evidence this system of securing farm labourers is said to answer, the men being constant workers by an agreement for the year's service. This is, however, quite the exception to the rule of management connected with farm labour, and it is not likely to extend beyond those districts. There is no doubt in the rural districts, since education amongst the agricultural labouring classes has prevailed, that the young men and lads aspire to other work, and the best capable and most enterprising migrate into the towns, thus leaving the farmer the least capable and the indolent portion of the rising generation.

The importance of labour-saving machinery now claims our notice, and with all the practical value attached to its use, such as the value of time saved in the operations; yet it is found from evidence obtained by the Royal Commission, and particularly in the south and south-eastern counties, that after charging a fair and usual per-centage on the cost and maintenance of labour-saving machinery the whole cost of the labour on the best-managed farms has increased more or less during the last few years as compared with any former period. Nor, under the special circumstances by which agriculture is surrounded is it easy to see without further inquiry how the home farmer is to improve the position. He should not be discouraged by his present difficult position, but pursue his calling with diligence and industry, so that he may avail himself of every change in conducting his business which promises increased advantages, whether it be in connection with the management of his live stock or the rotations of cropping the land.

The report of the Royal Commission gives us a large amount of information relating to the stocking and cropping of the farms throughout Great Britain as well as in different countries abroad; we shall therefore introduce such changes as we may consider most likely to yield a profit. In order that the labour required on the home farm, as well as farms in hand, may be available, especially upon the outlying farms away from towns or populous villages, one of the first points to be considered is the cottage accommodation for a sufficient staff of workers, to include the labourers' families and young men as lodgers. It never answers the purpose to depend upon casual labour, as it is seldom available at the time required, or efficient when obtained. In considering the future of practical farming, in order to anticipate the position, owners of land should first proceed with a determination to make the land more valuable as it comes to hand, or on the home farm to maintain and also improve its previous capacity for production. In doing this ample and convenient homesteads with covered courts must be provided or maintained. In setting out the land on the estate, in order that it may be either let off or held in hand according to circumstances, it will frequently be necessary to appropriate a portion of the poorest and least eligible land for cultivation for planting with Larch Firs. In order to obtain a quick return for the outlay they may be planted as thick as Cabbages, or otherwise at intervals with underwood, so that after a crop of timber has been taken underwood may be left for future profit. These methods of planting will be suitable for nearly all soils beneath a certain annual value however situated. For a detailed statement on this point we must refer the reader to an article in this Journal of the 22nd of April, 1880, under the heading of "Management of Woodlands." Another important matter to which we will direct the home farmer's attention is the laying down into permanent pasture all soils adapted for it, and in suitable situations; for it is often the case that when farms come to hand after a previous letting, that various questions of importance arise which probably were viewed by the proprietors with little concern whilst held by a tenant. A statement in detail of laying down land into permanent pasture will be found in this Journal, dated February 5th, 1879.

We must now allude to another way of utilising the poorest

POULTRY AND PIGEON CHRONICLE.

THE ROYAL COMMISSION ON AGRICULTURE.

(Continued from page 142.)

IN considering the position and condition of the business of farming, in which the home farmer will find his share of the difficulties, we reckon the labour question as it now exists as a serious matter. The causes of which he may have to complain are for the most part beyond his control. They consist chiefly of the increase of wages that have to be paid to farm labourers, the inefficient labour rendered for the wages paid, and the fact that farmers are obliged to employ men to do the work of boys in consequence of the latter being kept at school through the operation of the compulsory clauses of the Education Act. In various counties and districts it is also found that women are not available for field work as formerly. The questions of labour, together with the increase in the amount of tradesmen's bills, make up a formidable item in the account when we take the cost of production of corn, &c., into consideration. The only exception we can find in some of the costs of labour is that which prevails in some of the northern counties, where the men and boys are provided for in the establishment of the farmer, either in his house or an

land often inaccessible for cultivation. It is reasonable to suppose that landowners possessing estates of large or considerable extent will require to preserve game for their own amusement, in which case the land whereon it is reared should not be let, but held in hand to a sufficient extent both of woodland and pasture, and wire-fenced-in to prevent ground game from roaming. Certain soils under adequate management can be made by the rearing and sale of rabbits not only a source of amusement, but also of profit. A competent shepherd keeper will be enabled to rear game enough (rabbits especially) to realise a higher rental or value of sales than can be obtained from the best-managed farm upon an estate. Few farmers are aware of the extraordinary number of rabbits which may be reared and sold as an aereable produce if they are encouraged keeping the right sort, easting up mounds, and planting Gorse in which they may breed and take shelter, and also by cultivating crops available for feeding them at all times. It is not necessary at present to enlarge further upon the subject of warrens for rabbits, or breeding and feeding them, as we purpose at a future time to fully consider this subject.

How far it may be desirable to grow timber round the fields and retain wide hedgerows is also worth consideration, for it will often improve the value of land, whether in hand or let to a tenant, to remove both timber and fences, in order to facilitate the use of steam cultivation, and improve the chances of securing the crops both at hay time and harvest. Again, we must consider in the future the advantage of paying more attention to the planting of orchards, and also how far the growth of Pear, Apple, and Plum trees can be made to take the place of the Oak, the Ash, and the Elm. We have no doubt this may be done with profit by planting fruit trees on the borders and banks after the removal of timber upon the farm road and pasture boundaries and such places, and at the same time improve the selling or letting value of the property without destroying its ornamentation; in other words, to benefit cultivation, instead of its being depreciated by the growth of timber for the advantage of future generations, believing, as we do, that timber should be grown chiefly in the woodlands, or a few trees for ornament only on parklands or upon land suitable and likely to be required for building sites, &c., in the future. In the report of the Royal Commission evidence will be found of great consequence as to the amount of capital which should be employed upon the home farm or farms in hand, for when farms fall in on the estate the knowledge of the capital required for working them is essential in deciding the question or policy of letting or resuming the occupation. This point with others will engage our attention hereafter.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—Horses are chiefly employed in connection with harvest work, for either the reaping machine or the carting and stacking of corn affords them nearly constant employment. On one home farm in a southern district both Barley and Wheat had been carted and stacked on the 27th of July. We also noticed that all the land required had been seeded with Turnips, and the young plants were well up and growing on the 6th of August; and having received a liberal dressing of superphosphate, we expect on such light forward land that the crop of Turnips will be abundant. The land generally has been so dry that the seed on large tracts of land after fallow and green crops could not vegetate earlier than when sown out of corn stubble. Backward fallows after Peas, Winter Beans, and seed Vetches may now be cultivated with advantage, for in many districts the land is quite foul with couch and weeds. The weather has been and is still favourable, so that the labour of horses will have full effect towards preparing the land in time for Wheat. Much of the Clover land intended for Wheat is also foul with couch, but we hesitate before making what is called a bastard fallow after Clover, preferring to plough and press after the dung has been laid out in October, up to which time the lea should be fed close by the ewe flock or backward lambs, because they will eat close a great portion of the couch. If, however, there should be too much to be fed close and ploughed in, we prefer to use the scarifier or Howard's self-lifting drag with the points on only, which will comb out the couch and leave the Clover roots nearly entire—an object of great importance, because they supply on their decay an abundance of food for the Wheat plant. If the number of horses kept on the home farm should be found insufficient for autumn fallowing—that is, cleaning the stubbles and land intended for roots next year, we advocate hiring the steam tackle, and break up the land 8 or 9 inches in depth by working first lengthways and then crossways. This will lay the land up rough and give the horses the power of harrowing, rolling, &c., and clearing off the couch; the land may afterwards be ploughed a good depth to lie for the winter. If there should be a little couch left a small amount of labour in spring will suffice to clean the land entirely, and this is the best practice also with land to be sown with Barley in the spring, as it not only allows the Barley to be sown early, but the land is sure to be kind and mellow after the autumn fallowing. Upon those farms, however, where oxen had been bought

in for work in the months of June or July they would go far to supply the place of steam power, because they work constantly on the land previous to and during harvest or afterwards. This forwards the tillage very much, and when well fed at the same cost as a horse they will improve in condition during the working period, and make capital animals to go into the boxes for winter fattening after the Wheat sowing is done and other work, which they will assist in accomplishing, such as finishing the fallow or winter ploughing.

In cutting the Lent corn we prefer to cut and tie the crop instead of harvesting it as loose corn, because after being tied the carting goes off very easy; besides which, especially as relates to Barley, it is advantageous, for as loose corn while lying in the field in the grain is sure to become discoloured more or less, whereas if tied only a portion can be discoloured, and the fodder also, for only a portion of the straw can be much injured. The same observations also apply to drege corn or white Oats. In making ricks in the field we prefer to make all our ricks round, whether of Wheat, Barley, or Oats. Even when the Lent corn is carted loose we prefer the round stack, as there is less outside to the rick, and it requires less thatch, which is also not so likely to be torn off by the wind. We, however, approve of ricks no bigger than can be thrashed by steam power in half a day, and when placed in pairs the two can be thrashed without removal of the tackle, and the straw from both ricks made into one as fodder or for sale.

*Hand Labour.*—Men will still be required chiefly in assisting at harvest work and ricking. Every opportunity should, however, be taken by both men and women for hoeing and singling the late Turnips, which have latterly grown almost like magic. Whenever they are likely to be damaged for want of hoeing, we find it answer if the roots are thick enough to run the horse hoe through them crossways with the rows, cutting a space about a foot wide; this will save them from present injury if they are singled out in good time afterwards.

*Live Stock.*—Previous to the late rains keeping for sheep had been very bare. Latterly, however, the grass in most instances has made great progress, and this together with the second growth of Saintfoin and Clover, and in some cases the early Turnips and Rape, are fit for folding off, in which case we may assume that the breeding flocks at least are well provided for during the autumn. The cattle in the pastures where they are very bare, and they are generally so, should be assisted with cake given mixed with early Turnips cut in troughs. The dairy cows in the same way may be fed at the stalls at milking time—morning and evening. The young cattle should also be assisted if intended for baby beef in the same way, but these the sooner they go into the boxes for their winter feeding the better, because well-kept young cattle, if allowed to lie out at night time, especially in low foggy meadows, are quite likely to be attacked with the fatal complaint of quarter evil, or ill, as it is variously called in certain districts. We know no cure, so the value of preventive management ought to be valued. With regard to horse keep or fodder for them in the stable, it is nearly exhausted except in the case of late-sown summer Vetches sown on purpose for their autumn feeding. When this is exhausted a little hay chaff with Oats and Maize, and early Turnips or Carrots pulped and mixed, is the best food; but we object entirely to turn working horses out to graze at night time for various reasons which we have often alluded to in these columns, but more especially to avoid accidents and to save the manure.

#### VARIETIES.

*WEST OF ENGLAND APIARIAN SOCIETY.*—On the occasion of the Weston-super-Mare Horticultural Exhibition last week the above Society held a Bee and Honey Show. The entries were not very numerous, but the quality of the honey was generally good. Some of the chief exhibitors and prizetakers were Messrs. Abbott and Son of Southall, A. L. Perrett, J. Cox, G. Lovell, G. Dyer, F. Parks, and J. Shorney.

— *THE HOP CROP.*—Having thoroughly inspected the whole of the Hop-growing district in Kent and Sussex, we are now in a position to give an approximately correct idea of the prospects of the Hop crop of 1881. Our observations embrace nearly all the principal Hop-growing parishes. East Kent, and notably the Canterbury district, is good. In the best gardens the drought has interfered somewhat, causing blind bine, and there are still indications of mould in some gardens; but it seems probable that Canterbury, Rainham, Selling, Faversham, Newington, Sittingbourne, and Rochester will produce an average of 12 cwts. of first-rate quality Hops per acre. At Rainham lice were very numerous in some gardens. The next favoured district is South Sussex, comprising Battle, Robertsbridge, Ticehurst, Wadhurst, Bodiam, and Etchingham, and here a yield equal in quantity to that of East Kent may be expected, but of course the quality will not be so good. The north part of Sussex, notably Tunbridge Wells and Frant, are not so good, and here we should not

estimate the growth at more than 5 cwts. per acre. In the majority of the gardens from Paddock Wood to Ashford, with Cranbrook, Newendon, Benenden, Rolvenden, Biddenden, and other parishes—usually a heavy cropping district—we were much disappointed, as slackness of bine prevails to a considerable extent, and it does not seem probable that the average will be more than 6 cwts. The neighbouring parishes of Goudhurst, Horsmonden, and Lamberhurst are more fortunate, and seem likely to produce 9 cwts.; and Brede, Winchelsea, and Rye district about 6 cwts. Maidstone, Chart Sutton, Yalding, and the Farleighs, Malling, and Barming show some good bine, and, if mould does not interfere, a growth of 10 cwts. may be anticipated. West Kent again is decidedly slack of bine. The gardens in and around Chevening, Brasted, Westerham, Shoreham, Otford, and Sevenoaks cannot produce more than an average of 7 cwts. per acre, while Edenbridge, Penshurst, Chiddingstone, and adjoining parishes cannot grow more. Mould does not seem likely to be very serious, except in the district around Maidstone, and the cultivation, we may add, is in nearly all cases all that can be desired.—(*The South-Eastern Gazette.*)

— AMERICAN WHEAT.—According to the official statistics, the Wheat area of the United States is upwards of 32,000,000 acres, or ten times that of the British Islands. The area of the crop of 1875 was 25 per cent. greater than that of 1877, while during 1879 a further increase was made of fully 3 per cent.—an increment of 28 per cent. under two years. Even with this rapid augmentation the Wheat area of the States is stated by Mr. Finlay Dun to be only equivalent to the dimensions of the single State of Alabama, or in other words only one forty-fourth of the total area of the United States. The principal districts of the United States in which Wheat is produced in the greatest abundance, and where it forms a leading article of commerce, embrace the States of Illinois, Minnesota, California, Ohio, Michigan, Indiana, Iowa, Missouri, New York, Pennsylvania, Wisconsin, Kansas, Nebraska, and Oregon. The first three States enumerated produced in 1880 over 40,000,000 bushels of Wheat each; the next five States enumerated produced over 30,000,000 bushels each; and the remaining six States yielded over 10,000,000 bushels each. The chief varieties cultivated in the northern and eastern States are the White Flint, Tea, Siberian, Bald, Black Sea, Egyptian, and Italian Spring Wheat. In the middle and western States the varieties grown are the Soule, Mediterranean, Virginian, Bluestem, Indiana, Kentucky, Old Red Chafet, and the Talavera. The yield varies in the numerous States from ten to forty bushels and upwards per acre, weighing from 58 to 67 lbs. to the standard bushel. It is known that Wheat contains water in greater or lesser quantities, and that its amount is larger in cold countries than in warm. For instance, in Wheat from Alsace the proportion of water varies from 16 to 20 per cent.; in that from England from 14 to 17 per cent.; in that from the United States from 12 to 14 per cent.; whilst in that from Africa and Sicily it amounts only from 9 to 11 per cent. The superiority of one kind of wheaten flour over another is shown by its greater ability to absorb water, and in general American flour may be put down to absorb from 8 to 10 per cent. more of its own weight of water in being made into bread than English Wheat. The English Wheat is usually fuller and more round than the American owing to its being puffed up with moisture.—(*The Miller.*)

— THE COSTS OF LAND TRANSFER.—A "Land Agent" writing to the *Times* states that great hardships have been inflicted on tenants who purchased their holdings from the Irish Church Temporalities Commission, and suggests that rules should be made to prevent similar hardships from being inflicted on tenants purchasing under the new Land Act. He says, "The first hardship to which I allude was the absence of a map of the lands from the conveyance which the Commissioners gave to the tenants. In a case which I know, a tenant, after purchasing a title over an acre for about £30, spent about £20 more in litigation with a neighbour about the boundary of the acre he had purchased from the Commissioners. Had there been a map on his conveyance he would have saved this £20. The second hardship to which I refer was the extremely high charge demanded for preparing the mortgage when a portion of the purchase money was allowed to remain as a charge on the land, and

for this the tenant appeared to have no remedy, as, if I remember rightly, the Commissioners insisted on the mortgage being prepared in their office. For example, I received from the solicitor to the Irish Church Temporalities Commission a demand for £12 12s. costs for preparing a mortgage for £400 for a tenant for whom I was acting. I put the matter in the hands of my solicitor, who succeeded in reducing the amount by £7 7s., so that £5 5s. was accepted as payment in full of an account for which £12 12s. had been demanded."

— EMIGRATION TO SOUTH AFRICA.—While South Africa is slowly forging ahead the sister colonies are supplying her markets with commodities. In every store or grocer's shop, or general *winklet*, the Cape colonist will find tins of Australian beef, and not only does he find it, but he buys it and eats it, and probably finds it more palatable than the round of *trek* ox he last dined off. Butter also is imported in enormous quantities, and spread on bread made from foreign flour or meal. America supplies nearly all the pork that is consumed. To meet its great wants in the way of population and production the Cape is contented to import annually a very few hundreds of immigrants, the majority of whom are non-producers. It retains the services of one hydraulic engineer, where it might well employ a staff as numerous as that of the railway engineers. There are fifty-two millions of acres of waste land, a large proportion of which might probably be turned to profitable account were a hundredth part of the water stored which now runs annually to waste. The settlers of 1820 had everything against them for many years, but to see what they have effected should convince the most sceptical that South Africa is capable of maintaining a thriving population many times larger than its present one. Yet there are people there who persist in asserting that South Africa would succumb under an influx of 10,000 inhabitants.—(*The Colonies and India.*)

## POULTRY AND PIGEONS

### FANCIERS v. FARMERS.

MR. O. E. CRESSWELL, in reply to my remarks on this subject, takes umbrage at what I wrote with regard to fanciers. I did not attack the true and real fancier, but those who call themselves so, when, perhaps, they have only purchased a few fowls or Pigeons of good quality for the purpose of dealing in them, and sheltering themselves behind the term "fancier" because of their position in life. These are they that I do not consider to come within the true description of the term "fancier." Not, of course, but what they are at liberty to deal just the same as any other dealer or dealers, and do so, and are dealers in every sense of the word, but still they wish to be thought amateur fanciers when they keep their birds more for profit than love.

For example, I consider Mr. O. E. Cresswell a true fancier, and I have always looked on him as such, but there are very many others that only keep poultry, and exhibit them to gain prizes, for the purpose of profit. They buy and sell, they advertise their birds and eggs, and quote their prizes as an inducement to the public to deal with them. A reference to the advertising columns of the papers will prove the correctness of my statement. Whatever they may think of themselves cannot, of course, be known to me, but I have the knowledge of what others think of them.

Mr. O. E. Cresswell says he is astonished and indignant. If he be so I cannot help it. He must know when he read what I wrote that I did not attack such as he, a well-known and a recognised fancier, and I for one believe in him greatly, however poor an opinion I may have of what I may designate the spurious fancier, and it is to these principally that the muddle of the Dorking is in my opinion to be partly attributed. Through a misprint of one word in my article I am made to say, "I have three uncles who were most partienlar." The word "have" was written "had"—I had, &c. These relatives have long passed away and their farms are occupied by others, or else I for one should not have far to seek for the true Grey Dorking. Mr. Lewrey bought some of his best birds, not his dark-coloured ones, of two of them; and this I can truthfully say, I never saw a sooty-footed bird amongst the whole of their birds, nor even a dark toe nail, and I have seen some hundreds, all of which were clear and white in their legs and feet.

From various experiments I have made I am clear in my own

mind how the sooty feet and legs have been produced in the Dorking, and if the fancier only went the right way to work he might doubtless in a few years get rid of it. But he awards prizes to birds with dark toe nails and sooty feet instead of making a decided stand against them, and so the evil becomes more and more widespread. I deny most emphatically that the Grey Dorking was a delicate bird. I have seen it thrive under the most adverse circumstances, and I never saw in the old stocks any bumble feet nor any of the leg-weakness that is so prevalent with the exhibition Dorking. The way this last is forced to get size has decidedly weakened its strength of bone. Judging at a show this week I had ocular demonstration of the fact added to my former knowledge. But whilst noticing these birds I may mention that every one in the class had more or less sooty feet and legs, and I therefore disqualified the whole. I shall do the same again whenever I judge under the same conditions. I am determined that as far as I possibly can to prevent the true old white-legged Dorking from being lost; and I will strive by argument, by my pen, and by offering prizes from my own pocket to resuscitate it, and prevent its being overwhelmed by the size, coarseness, and colour of a dark-legged mongrel. With regard to a new "standard of excellence," there is the old one laid down by the old true Dorking fanciers. To me it only shows that the modern fancier has got into such a muddle he cannot any longer breed to it.

With regard to what Mr. Meall says I shall notice this on another occasion, when I shall be able to show by extracts of books the value of much that is printed. In my opinion, whether a farmer keeps an animal or a bird, he had better keep a pure breed. Of course I am open to conviction, and if I find I am wrong from actual observation and facts I shall not be slow to acknowledge it, and I have a very good field here in which I may gain much information on the subject, as there are poultry farms that I know of at which fowls are raised for commercial purposes only. As regards the words "Fanciers *versus* Farmers" there cannot be two opinions respecting it. Whatever the writer might have in his mind, the impression on others was certainly not what he (according to his own showing) intended. Would it not have been better to have used as heading "Fanciers and Farmers?" It would have been much more pleasing to the latter.—HARRISON WEBB.

### FAMOUS POULTRY YARDS.

TRUMPINGTON (L. C. C. R. NORRIS, ESQ.)

WE had before seen and admired Mr. Norris's yards, but it was each time under the chilling influence of a wintry wind. Superb stock there was in them—Dark Brahma cocks with dense black fluff, and hens of matchless pencilling; but we could not do justice to them when seen under such auspices. The birds, too, were mostly too well known in the show pen to need description. We have now been more fortunate, and on a sunny August afternoon have seen the same yards teeming with a multitude of growing and promising chickens, all, save one or two, hatched since we saw their homes in the beginning of February. It is true that the greater portion of the adult stock has gone for change of air to some country runs, but chickens are to us always the most interesting part of the poultry yard. They suggest the hopes of the coming season, and certainly Mr. Norris's chickens must fill him with many hopes. Singularly different have been the "famous yards" we have described—some tenanted by almost every known breed; others, like that at Trumpington, renowned for but one or two varieties.

We must confess that our own fancy for poultry is somewhat general, and that we have by no means restricted ourselves to one or two breeds; yet we have come to the conclusion that the fancier who does so derives the maximum of pleasure from his pursuit. He masters the peculiarities of his favourite kind, he knows the individual birds better, remembers or registers all their pedigrees, and consequently breeds more scientifically. Different premises have different capabilities, and the occupations of fanciers lead them to keep poultry on different scales. To one who, like Mr. Norris, keeps them as a relaxation from intellectual labour, nothing can be more charming than to have a couple of breeds brought to the highest perfection, and all close at hand, where they can be seen in a few minutes.

We will describe the Trumpington yards in the order we saw them on our last visit. The breeding yards came first, now all tenanted by chickens. These are away from the house, in a paddock bought for the special benefit of the poultry. An acre of more of grass land, with here and there a fine tree, is divided into about a dozen runs; in each is a well-roofed house, and attached to it a dry shed—the picture of neatness and cleanliness, with a nice flooring of grit. Here, when we arrived unexpectedly, Mr. Norris was busied in making selections of the more promising cockerels from a mixed multitude, to be drafted to select runs. As usual, the faithful custodian of the poultry was with him—a veritable walking dictionary of the dates of every bird's birth. Every run was full of young stock, almost fuller than we should care to keep our own at this season; but the grass is constantly swept, and so they are kept sweet. In the first we found a score or

more of Dark Brahma cockerels of pullet-breeding strains; certainly their female relations are more beautiful than themselves. Then came yard after yard of Dark and Light cockerels mixed, of various ages and sizes. The latter breed has only of late been added to the Trumpington yards, and we shall expect to see Mr. Norris continue to hold the place which he has already taken in the first rank of its exhibitors from his experience in breeding Darks. Certainly we never saw more shapely and promising birds than some of the Light cockerels—so square and deep in body, and so densely feathered; indeed, what struck us most through all the yards was the fineness of foot and leg feathering in both breeds, combined with absence of vulture hocks. Most careful breeding alone can have brought this about, for usually in yards whence well-feathered birds come they are the very few selected from troops with vulture hocks; but not so here. We saw no underfeathered birds, and scarcely any with stiff hocks. Another point, too, has been gained by selection. We examined several half-grown cockerels of the Dark variety, and saw their young hackles coming through of the purest silver, and quite free from the yellow sap, which we once thought inseparable from this stage of growth.

From cockerels we came to yards of pullets. Dark Brahmas showing wonderful pencilling, even in their chicken feathers, down to their very feet; and Lights with extraordinarily black neck hackles and splendid feathering. One in particular took our fancy—very short on the legs, densely fluffy, and broad in body. She is now in perfect show condition, and will assuredly run the risk of being called a hen by-and-by; such sometimes is the reward of much care bestowed on early chickens! Younger Light pullets, too, were there, promising at least as well for some day to come, but still in the leggy stage of chickenhood. Last in this row of runs came the earliest cockerels, scarcely so forward as they generally are in this yard, yet one or two Darks should come to the fore at the Palace. The earliest of the lot unfortunately died after winning early honours at a show. We must not omit to mention that all this wealth of chickens, in a somewhat exposed position, is guarded by the finest of Mr. Norris's St. Bernard dogs (for in these he excels as much as in poultry)—a noble fellow indeed.

From this collection of runs we retraced our steps to the pretty shady lawn of the house, and inspected the few of the adult birds which are still at Trumpington. These are chiefly Dark cocks. There are rows of small houses for them round the garden. Each has a covered wire run in front with boarded sides. Nothing could be more suitable for the moulting of single birds. Then we came to other larger runs, the inmates of which roost in portions of a dry barn. All is beautifully kept, the floors sanded and the yards swept, and thence we passed to the famous Rose garden. In a shed with wired run was a beautiful early Light Brahma cockerel, and here we saw packed away the coops which we had once before seen filled with a tribe of chickens fresh from the incubator, pecking away where Roses now bloom. Everything is good of its kind here—a great merit in our eyes.

Last, but not least, we saw the kennel. All St. Bernard's of the highest pedigree, reaching back to the dogs of the Hospice, but far finer than anything we have ever seen there. Doubtless this climate suits their development, for one of the Trumpington favourites, which we specially admired on a former visit, was no longer there, having been purchased for a Swiss kennel. Thus passed a pleasant afternoon. We believe that many of our less fortunate readers are glad to learn something about famous yards, and of the pains and science which have made them famous.—C.

### REMARKS.

- 7th.—Very fine and bright throughout.  
 8th.—Overcast and dull; rain at 4 P.M., and heavy rain during the evening, and much wind.  
 9th.—Wild, dull morning; still breezy, but fine bright afternoon; clear moonlight night.  
 10th.—Overcast, slight rain in forenoon; fine, bright, breezy afternoon; moon.  
 11th.—Bright and cold in early morning, overcast at intervals during the day; high squally wind; rain at 10.15 P.M.  
 12th.—Rain throughout, and very misty.  
 13th.—Fine and bright at first, afterwards cloudy.  
 Temperature below the average, and the coolest week since the middle of June. Rainfall rather large.—G. J. SYMONS.

### THE MANCHESTER INTERNATIONAL SHOW.

**B**EFORE these lines are in print the International Jubilee Exhibition will have opened in the Royal Botanical Gardens at Old Trafford, and horticulturists from every part of Great Britain will have met and inspected the greatest fruit show of the year. In no other country of the world could an exhibition of equal magnitude and quality be arranged; and foreign visitors, we feel sure, will be the first to acknowledge the superior skill of British gardeners in the cultivation of fruit. There are, no doubt, many gardeners who have not been offered the opportunity of visiting the Show in question because its importance has not been appreciated by their employers; and it may be well, therefore, to remind all those whom it may concern that the Show does not close until Saturday night, and there is, consequently, yet time for arrangements being made for a visit.

Nothing has a greater stimulating effect on the mind of a gardener than such evidence of the skill of others as a really great show affords, and there can be few men who would not benefit considerably by a close and intelligent inspection of the products, not only in the fruit classes, but also in those for plants, flowers, and vegetables. There are gardeners who seldom have the opportunity of travelling beyond their county or district, who rest firmly in the opinion that they have the best of its kind that is producible; but a visit to a great gathering of the kind indicated will in all probability take the conceit out of them, and leave them the gainers, impelling them also to greater efforts, and thus rendering their services the more valuable.

An event such as the one under consideration is not of yearly occurrence. It is exceptional by its scope and magnitude, and it will be to the advantage of all who are interested in maintaining the high position of British horticulture if the fewest possible number of those to whom the care of our gardens are entrusted are prevented from enjoying a day at Manchester during the present week. In any case little can be lost by a day's cessation from labour, and in most instances much would be gained in consequence of the instruction that an intelligent and earnest man would inevitably gather by a critical examination of the exhibits in this great Show.

The period of the year, too, is favourable for a short holiday, and it is easy, even in small gardens, to make provision so that nothing can suffer during the gardener's absence. During the spring and early summer the case is very different, and hourly watchfulness is then necessary for the prevention of

accidents that might, if they occurred, have serious results. There is no such danger now. Any garden may safely be left for a day or two in the charge of an intelligent apprentice or an obedient painstaking labourer, and if these carry out their instructions there is no risk whatever of anything sustaining even temporary injury. We mention this because we know there are proprietors of gardens who are animated with the best feeling towards their *employés*, but who fear something may be neglected when they are absent from their duties. An occasional break in a long period of monotonous labour is desirable both in the interests of master and man. This is the best time for a gardener to have a short holiday, and the great and variedly interesting Show that is now being held affords one of the best opportunities that can occur to enable him to employ a leisure hour enjoyably, instructively, and profitably.

We learn by a telegram that has been sent to us since the opening of the Show that the Exhibition is one of extraordinary magnitude and merit, and we strongly advise all who have the opportunity of doing so to inspect such a display of garden products as may not soon occur again in a position so easily reached from various parts of the country.

### THE FRUIT CROP.

At last we are once more blessed with a year of great abundance. Crops of all kinds have thriven; premature decay, blight, and disease are almost unknown, our only complaint being of some untimely fruit-shedding, caused by the drought of early summer, which in some instances seriously thinned a good crop of Cherries, but generally did good by usefully relieving Pears and Apples of a small proportion of the superabundant fruit, which even now appears likely to be somewhat undersized—another and more serious result of the hot dry weather. Peaches and Nectarines on open walls are pictures of health, and almost all of them have a full crop of fruit, of which Early Beatrice upon various aspects was finished by the second week in August. Early Rivers will soon be over, and Lord Napier Nectarine is fast approaching maturity. Later varieties will form an admirable succession to the trees under glass.

Of Plums many varieties have a heavy crop, notably Early Rivers, Prince Engelbert, Victoria, Mitchelson's, White Magnum Bonum, Gisborne's, Pond's Seedling, Lafayette, and Coe's Late Red, all which are large pyramidal trees in an orchard. Early Rivers has been in use about three weeks, and there is enough good fruit of it remaining to last till the end of the month. It is a very useful sort, being highly valued as much for all culinary purposes and for the excellent jam it makes as it is for its earliness. No garden should be without this Plum, and growers for market must assuredly find it a very profitable investment. There are four pyramids 12 feet high of it here side by side, and they are remarkable for uniformity in vigour, general appearance, and fruitfulness. Since they came into bearing they have not failed, and last year the crop was as abundant as it is now.

Pears are perhaps more abundant than any other fruit. Cordons, palmette verriers on walls and fences, and pyramids are with few exceptions fruiting well. Citron des Carmes and Summer Dojenné are already over; Beurré Giffard is now in use; Jargonelle comes next, followed by Williams' Bon Chrétien and Beurré d'Amanlis. I am glad to say very few traces of cracking are perceptible among the delicate-skinned

Doyennés, and I hope to have some perfect fruit of Red Doyenné and Doyenné Defais, two of the most difficult Pears to bring to perfection. I hope to give a detailed account of the Pears later on.

Apples are also plentiful upon trees trained and untrained, pruned and unpruned, so that no merit can be claimed on the score of culture; the palm for quantity being certainly borne away by many a huge old standard with its twenty or more bushels of fruit. Joanneting is now in use for dessert, and Duchess of Oldenburgh for cooking. There are plenty of Quinces and Medlars, both of the large Dutch Medlar and the better-flavoured little Nottingham variety. The trees of Siberian Crab, too, are very attractive with a heavy crop of the bright-coloured clusters of fruits.

Bush fruit of all kinds is in profusion. The Raspberries in trenches, mentioned on page 149, have a magnificent crop, which was much benefited during the excessive heat by heavy soakings of sewage water, which was also given freely to Gooseberries and Currants. Why is not that remarkable Red Currant Raby Castle more generally grown? It is an abundant cropper, the fruit is large, hangs late, and the bunches are so long as to be singularly ornamental. A bunch now beside me on my desk is almost 8 inches long, and it has upwards of two dozen fruit upon it. The American Blackberry, always abundant, appears to be unusually so this year. Even where its fruit is not cared for for making jelly, a place should be afforded it for the sake of its ornamental appearance.

The Walnut trees here have a heavier crop of nuts than they have had for nine or ten years. Filberts, too, are very plentiful, Pearson's Prolific as usual having a much heavier crop than any other, not even excepting Kentish Cob, which in comparison appears to have only half a crop, so heavily are all the trees laden of Pearson's most valuable seedling.—  
EDWARD LUCKHURST.

#### DEATH AND FUNERAL OF MADAME VAN HOUTTE.

HORTICULTURISTS in all lands will regret to learn of the death of this estimable lady, which occurred under peculiarly sorrowful circumstances on Thursday last, the 18th inst., at the Royal Nurseries, Gendbrugge, Ghent. Madame Van Houtte descended from a Flemish family of honourable position, and was the second wife and fellow labourer of her husband, who founded the great business, which she has, since his death on May 9th, 1876, assisted by her family and skilled foremen, so successfully conducted.

The deceased lady combined with a singularly kind and sympathetic disposition an extraordinary capacity for business, and for twelve hours every day she laboured unceasingly in the conduct of the establishment, and with her accomplished daughters gave to everything, including business and foreign correspondence, personal attention, the practical management of the nursery devolving on her son, Mr. Louis Van Houtte, and the highly skilled and confidential foreman Mr. Charles Van Eecheute. Still, Madame Van Houtte was the head of the family, and the mournful blank caused by her death is felt as a calamity throughout the establishment.

A few weeks ago—the deceased lady being then in her usual health—two men employed in the establishment were drowned in the river that skirts the nursery. Immediately on the occurrence of the fatality, a man who had witnessed the accident rushed into the room of his mistress in a state of terror, and the shock to her system, consequent on the manner in which the lamentable news was communicated, was so great that it ended in her death in the 71st year of her age. The nursery on the day of our visit was a scene of woe that cannot be described, as a great bond of sympathy has always existed between employers and employés in the establishment. This is evident by the fact that there are twelve men there occupying positions of trust whose united term of servitude amounts to four hundred years—a circumstance sufficiently rare to merit record.

The funeral took place on the following Saturday, and as it was so different in its ceremonial from English interments it may be briefly described. We must premise that Belgium is a Catholic country. The entrance hall of the residence was transformed into a chapel, adorned with rich hangings, and the coffin was surrounded with tall tapers, and floral crowns were arranged at the foot. These so-called crowns are offerings of the family and friends, and are really huge wreaths, mostly oval in form and 3 to 4 feet high. There were a great number of them, and some

were extremely beautiful. Nearly every crown had what may be termed a framework of leaves of *Cycas revoluta*; the base of two leaves are secured together, and the tops being also brought together, form a natural and most elegant oval. When the leaves were not long enough for this, they simply formed a cross in the centre of the crown; but it is quite evident that they are considered indispensable in ceremonies of this kind, and the result is that, in Germany especially, the demand for large plants of this *Cycas* is always great, as the leaves can be readily sold by those who possess them at remunerative prices. Attached to each crown is what is termed "the ribbon." This is a ribbon of silk, about 3 inches wide and perhaps 4 feet long, each ribbon containing some motto in ornamental letters—an expression of regret or sentiment of esteem of the contributor in memory of the deceased. These ribbons are preserved by the family and cherished.

On the coffin being brought outside, the crown-bearers, two to each floral tribute, were arranged around it, and addresses were delivered by Messrs. Auguste Van Geert and Rodigas. The procession then formed; three acolytes, boys in scarlet and white, bearing a large silver cross and banners, then three priests in black velvet robes trimmed with silver, with their servitors in black and white. Boys bearing the smaller crowns preceded the coffin, and men bearing the larger followed, with the relatives, friends, and attendants, the whole forming an immense cavalcade. The priests chanted the service as they proceeded through the nursery, and at the gate a brass band lent its accompaniment. This then headed the procession and performed funeral marches to the cemetery. It should be said the ladies of the family left in carriages before the coffin was removed from the house—not funeral coaches, as with us, nor at what we understand as a "funeral pace," but ordinary carriages, the horses starting at a brisk trot. The whole ceremony was strange to English eyes, and imposing, especially by the great concourse of followers. The 150 nurseries of Ghent must have been represented, and 160 men from the establishment besides other friends were there. Had the funeral been postponed for another day or two the assemblage would have been much larger, for not in Ghent only, but in Brussels and Antwerp, the one theme on the lips of all horticulturists was the death of Madame Van Houtte, accompanied with expressions of deep regret at her loss, and sympathy with the family, which is evidently held in great esteem by all.

Such is a brief description of the funeral ceremony of the lamented head of a great establishment, and the record of it may not be unacceptable to the readers of this Journal, in consequence partly of its novelty, but especially in having reference to a name that is "familiar as household words" in this country, and proportionally respected.

The business of the Royal Nursery will, it is expected, be conducted as usual, Mr. Van Houtte having foremen of more than twenty years' standing in every department, acting under the experienced supervision of Mr. Van Eecheute who has been engaged for thirty-seven years in the establishment. He is still in the prime of life, and is devoted to the business as if it were his own possession; therefore little if any change from a trade point of view can be expected to occur.

#### AUTUMN PROPAGATION OF BEDDING PLANTS.

*Pelargoniums*.—One of the effects of the past dry summer—I say "past," as it does not appear we are to have much more real summer weather—will be to delay the propagation of a stock of plants for next season's display. *Pelargoniums* in most districts, and especially where the soil is very poor consequent upon being constantly occupied by either winter or summer bedding plants, without fertility being restored by either manure, leaf, or other soils, *Pelargoniums* have made but little growth, and will yield but few cuttings without disfiguring the beds. The growth then made was, however, of the best description for either flowering or propagating purposes. That formed since the commencement of the showery season is of a very succulent character, and will not easily strike. The undergrowth, which we are naturally inclined to cut out, will be altogether unfit, and the most exposed shoots should be selected if a stock of really good plants be desired. In either case, unless there is a very marked improvement in the weather, the cuttings, after they are made, should be allowed to flag for two or three days, as much of the superabundant moisture they contain is thus evaporated. How they are to be stored, or rather in what they are to be struck, must depend entirely upon the facilities for wintering them. Where there are plenty of houses containing dry roomy shelves, or where there are well-heated pits, and which are also in good condition, then shallow well-drained boxes may be employed, the cuttings

being at once inserted in them. If unheated frames or pits have to be depended upon, then I should recommend striking and wintering the cuttings in 6-inch and 8-inch pots, these being at the least half filled with drainage. If shelves in a small greenhouse are the only available positions (and on these are often wintered a fine stock of Pelargoniums with much less trouble and more certainty than in frames), then I recommend striking and wintering in 4-inch, 5-inch, and 6-inch pots, according to the shelves.

Any ordinary light gritty soil may be employed—such, for instance, as may be obtained from the surface of old hotbeds or seed beds, adding to two baskets of this one of sifted leaf soil and either sharp sand or road grit in liberal quantities. Suitable soil may often be obtained by sifting an old heap of soil from the potting bench. This being in a somewhat moist state when used, no water should be given the cuttings till they are callused and give signs of recovery. The season being late, it is absolutely necessary to place the boxes or pots of cuttings in a bright sunny position, and, if the weather be showery, to cover with lights or a frame, especially in the case of the more delicate golden and silver-variegated varieties, and these will also invariably pass the winter better in pots than boxes. The cuttings may be inserted in boxes about 2 inches apart each way, about five in number in 5-inch and seven in 6-inch pots. The cuttings should always touch the bottom of the holes made by the dibber and be fixed firmly. It should be borne in mind the less growth the Pelargoniums make prior to and during the winter the better. They require but little water, only sufficient to keep them from shrivelling. Being kept in this semi-dormant state they are far less liable to damp off or be injured by frost, and will also break more freely when pinched back a few days previous to potting in the spring. If insufficient cuttings are struck, or if the stock of any choice varieties is limited, the old plants should be lifted before being seriously injured by frost and potted. The roots may be trimmed and many of the old leaves removed; they may then be worked in thickly and placed in a dry position under glass, sufficient water only being given to keep them from shrivelling. Both for these and the young plants the frames especially should be kept as dry as possible, air being freely given on all favourable occasions.

*Verbenas.*—In the few gardens where these are grown they prove more beautiful and durable than the Pelargoniums. Unfortunately they are not, as a rule, so easily grown. The whole secret lies in the fact that healthy cuttings for spring propagation are absolutely necessary, and unless a good start is made in the autumn these cannot be had. Early in August is considered the best time to propagate the winter stock, as at this time they strike without heat, and are all the better accordingly. At the present time healthy bloomless young shoots should be selected, cutting these below the third joint and trimming off the lowest pair of leaves. Prepare 5-inch or 6-inch pots for them, drain carefully, cover the crocks with rough soil, then half fill with tolerably rich soil and fill up with fine sandy soil, finishing off with a layer of sand. The cuttings must be dibbled in rather more than an inch apart, and watered through a fine-rose pot. Place the pots on a slight hotbed or in gentle heat, and shade carefully till the cuttings are struck, when they should be hardened off and wintered in a cool house, or, better still, in a cold frame. The soil should never be allowed to become dry at the roots, and carefully guard from slugs, as these soon render the young plants worthless. Those struck early in August are sometimes with advantage potted off in the autumn; but this is unnecessary in the case of those struck later. From plants thus treated good cuttings in abundance can be had in the spring. Stock plants wintered near to hot-water pipes seldom produce healthy succulent cuttings, and these only will strike.

*Iresines.*—A few pots of autumn-struck plants will, if wintered on shelves in an ordinary stove temperature, yield a great quantity of cuttings in the spring. Five-inch or six-inch pots are suitable, and these should be well drained, some rough soil disposed over the crocks, and nearly filling the pots with light sandy soil, finishing off with a layer of sand. About six strong cuttings in the largest mentioned pots would be sufficient, watering these in; place in heat and shade from bright sunshine. Cuttings of these and all descriptions of plants will always strike more readily when disposed close to the sides of the pots. Never allow the soil to remain dry, and fumigate with tobacco or cleanse with an insecticide if the foliage is infested with green fly. If cuttings fail to strike, pot a few old plants before they are injured by frost.

*Coleus and Alternantheras.*—These require treatment very similar to Iresines, the Alternantheras, however, not being quite so easily wintered. Cuttings will strike freely in heat at the present time, and old plants lift readily. When potted, use pots

as small as is consistent with the size of the plant, as they endure reduction of the roots; and the Alternantheras especially are more easily preserved in 4-inch pots. When well established a warm shelf in an ordinary plant stove is the most suitable position to winter them.

*Heliotropes, Ageratums, and Lobelias.*—These require treatment similar to the Verbenas. The young growths may now be struck in gentle heat, or plants may be taken up and potted. The only difficulty in this will be experienced with the Heliotrope, and this is also less hardy than the two others. When lifting the Lobelia select some of the smaller plants, as thick bushy plants are apt to damp off, commencing in the centre. Heliotropes and Ageratums will succeed through the winter in an ordinary greenhouse temperature, the Lobelia being best in frames.—W. J. M.

#### ABOUT THE POTATO DISEASE.

ALTHOUGH the Potato crop is considerably lighter this year, we were congratulating ourselves upon the soundness and extra good quality of the tubers. The American varieties are invariably good during a hot dry season, and on all sides among the cottagers we hear the wish expressed that more "Roses" (American Rose) had been planted, so good are they this season. In early gardens, the soil of which as a matter of course is light, the crops of this variety are matured and beyond injury by disease. A very different tale, however, is told by the owners of later gardens, as these will lose fully one-half of their crop by disease. I anticipated the disease after the heavy rains immediately following the spell of hot dry weather, and I strongly advised all Potato growers with whom I had any conversation on the subject to at once either lift the crops or draw the haulm of all varieties approaching maturity. "We have tried that dodge before," said they, "and prefer to let them take their chance;" their idea being that it was of no practical value, believing it preferable to leave the crops in the ground, so as to be able to separate the sound from the unsound. I quite agreed with them that it is unpleasant work separating the good from the bad when in heaps, but in my conceit thought to prevent the disease. So I have to a certain extent, but not among those I valued most—viz., a large breadth of Myatt's Ashleaf. Immediately after the first heavy rains I had the whole of the tops of these drawn, there being at the time not the slightest sign of disease in the comparatively green haulm. To my surprise this appears to be labour in vain, for quite one-half of the crop is diseased.

Another large breadth, principally of second early varieties such as Snowflake, Triumph, Woodstock Kidney, Holborn Favourite, and some of Fenn's new seedlings, were too vigorous to be drawn, although almost ready for lifting, and the tops of these were cut off near to the ground. In this instance I believe I have saved the crop, as I find but few diseased tubers; at the same time, after my experience with Myatt's I shall not be surprised to find many more in a few days. If the crops are safe it will be simply owing to the haulm being of a more woody nature, the disease not being so readily transmitted to the tubers. As a very practical friend once pointed out to me when I was endeavouring to convince him that the disease owed its origin to a collapse at the roots, the sole reason of the Magnum Bonum being a good disease-resister was the fact of its forming a remarkably woody stem.

Our Myatt's Ashleaf were, when just out of the ground, completely blackened by a late frost, this resulting in the formation of a number of weakly growths instead of one sturdy one; the consequence being a later and a lighter crop very susceptible of disease, and is another proof, if proof is wanted, in favour of carefully preparing the seed tubers. Thinly preserved, they do not start so early and need not be planted so early. This spring, it must be admitted, was unusually unfavourable to the Potato crops, the late frosts being most destructive. I thought I was rather "smart" this season. Next year I hope to be more so, as should we have a spell of dry weather near the time of the maturing of the Potato crops, I shall watch the barometer closely, and should it give signs of rain up will come my Potato tops. If this prove a success, as I have no doubt it will, I shall urge all Potato growers to obtain a barometer and anticipate the time for Potatolifting.—W. IGGULDEN.

*CHEIRANTHUS ALPINUS.*—This is a useful spring-flowering plant that should be grown in all gardens whether large or small. It is a capital plant for the mixed border or for a front line. A large bed of it in spring is very pleasing. Its flowers are lemon-coloured and very fragrant. It only grows about 9 inches high. Plants that flowered last spring and were left in the same position have now abundance of shoots suitable for cuttings. At this season of the year they root readily and quickly, and should be

propagated in large quantities. It will be found upon examining the plants that many of the shoots have produced roots. These shoots should be slipped off and dibbled in on the north side of a wall in rather sandy soil, where they quickly become established. The unrooted shoots can also be taken off in the same way and placed thickly together under handlights. They should be well watered, and the handlights kept close until roots are formed.—SCIENTIA.

#### RIPENING THE WOOD OF VINES AND PEACH TREES.

THE need for the thorough ripening of the wood of fruit-bearing trees as a means of securing crops of fruit is so generally recognised, that it appears almost unnecessary to call attention to the subject. It is one of those points which everybody is supposed to make sure of, and yet it is one in which we may sometimes fail. I presume everyone who cultivates the soil occasionally makes mistakes, and he who is also engaged in the culture of plants and fruits under artificial conditions may well have mistakes considerably augmented.

We have four Vines of Gros Guillaume, and these have refused this year to carry more than the sixth of a crop, and I have no doubt that want of thorough ripening last autumn was the main cause of the comparative fruitlessness of these Vines this season. Acting on that belief the two vineries in which they are growing are having a two-months course of high temperature. It will not do the other Vines any harm, and I think it will cure these of their tendency to become barren. The degree of heat depends greatly on the weather. At the end of September this hard firing will be stopped. The Vines were started in February, and if they are not sufficiently ripened by the time stated they never will be. Every sub-lateral growth and leaf has just been removed, so that the aid of the sun will be obtained as much as possible. I always make a point at this season when the fruit has coloured to remove lateral growths. I imagine the fruit keeps much better; certainly in old and not very watertight vineries we very seldom have to remove bad berries, even in that most trying of months for late Grapes, November. To support a heavy crop year after year on old Vines all the foliage it is possible to expose to the light is required, but after they are coloured the foliage may be thinned out to the greatest advantage. A house of Black Hamburgs which is started in April has given greatly improved Grapes this year as a result of two weeks' hard firing last September.

Those who have unheated Peach houses to deal with in the north know somewhat of the difficulty, nay, the impossibility, of inducing an average state of fruitfulness in the trees. We have a Peach house here which is kept open night and day after the cold winds have gone in the early part of the season, our aim being to keep the fruit as late as possible. In 1879 the middle of November was reached before the last fruits were eaten, and yet by the application of heat for two weeks or a little more every autumn these trees have never failed with us to bear heavy crops. Our best late Peach is Thames Bank. On the walls we have this year very marked instances of the necessity for ripeness of the wood. Plum trees on south-western and south-eastern exposures are bearing large crops; on the west and east exposures they are almost a failure. One tree looked as well ripened as another, but results show it was not so; and so it is with trees under glass. To outward appearance everything may be first-rate, and yet failure ensues. In fact these Peaches are occasionally quite green in the bark, yet they never fail.—B. P. BROTHERSTON.

[An example of green wood bearing fine fruit accompanied this communication, also excellent Grapes, and sprays of Camellias in superior health grown under Vines, other sprays from plants in the open air being much less healthy.—ED.]

#### TAUNTON DEANE HORTICULTURAL SOCIETY.

AMONGST those societies which hold on through various vicissitudes the even tenor of their way, that of Taunton stands amongst the foremost. Nowhere do we see a better collection of plants, a more varied exhibition in the various departments of fruit, vegetables, and flowers; nowhere a larger gathering of people in comparison with the size of the place, and certainly no show where all classes of people enter more thoroughly into the excitement of the day. The country gentry make a point of being at home for the exhibition day, while from the country round persons of all grades fill the town (which is quite *en fête*), and as the time for cheap admission arrives flock into the grounds of the Vivary Park, where the Show is held. And, to their credit be it said, no meretricious attractions are needed to draw them there; it is simply the Show itself, and it may be the excellent music which is always provided for them, for the

fireworks in the evening involve a separate charge, and there is nothing else provided to draw them. Many reasons, perhaps, conduce to this, but chief among them must certainly be placed the fact that they have a Committee which works harmoniously and with a good will, and that they have always been able to secure the services of an active and courteous Secretary. I have been there for many years. There have been four changes in the secretariat, but of all of them one may say that the gap has always been well filled, and the mantle of the previous Secretary seems to have fallen on his successors.

The Exhibition this year was certainly equal in many respects to any that have preceded it. When I say that in stove and greenhouse plants Mr. Cypher and Mr. Tudgey had to give way to Mr. G. Cole, gardener to Mr. Lawless, readers may readily believe that the plants exhibited were of a high order of merit. It were needless to enumerate the plants shown, but the best of those of Mr. Cole may be interesting. His collection included *Eucharis amazonica*, the finest bloomed and best grown specimen I have ever seen exhibited; *Erica Austiniana*, *E. Marnockiana* very fine, *Dipladenia amabilis*, *Bougainvillea glabra*, *Clerodendron Balfourianum*, *Allamanda Hendersonii*, *Ixora Prince of Orange*, *Ixora Dixiana*, *Erica Jacksonii*. Mr. Cypher, who was second, had fine plants of *Stephanotis floribunda*, *Allamanda nobilis*, *Ixora Fraseri*, &c. In the class for fine-foliaged plants Mr. Cole and Mr. Cypher were placed equal first. The former's plants included *Alocasia intermedia*, *Croton variegatus*, *Latania borbonica*, *Croton undulatus*, *Gleichenia rupestris*, and *Livistonia altissima*. Mr. Cypher had a fine *Latania borbonica*, *Thrinax elegans*, *Cordyline indivisa*, &c. In the class for amateurs' flowering plants Mr. Lawless had *Ixora Colei*, *I. Williamsii*, *Lapageria alba*, *Dipladenia amabilis*, *Bougainvillea glabra*, *Erica ampullacea*, *Dipladenia Brearleyana*, *Allamanda Hendersonii*, &c. The other exhibitors showed very well. Indeed, in looking back upon the exhibitions of some years ago one may safely say that the third prizes in the amateur classes would have safely been first. Pelargoniums were exhibited in large numbers and in their usual excellence.

Amongst cut flowers Roses were very indifferently shown, but Mr. Keynes' Dahlias were very fine. His stand comprised *Lady Chelmsford*, *John Butler*, *Herbert Turner*, *Hon. S. Herbert*, *Goldfinder*, *Duke of Connaught*, *John Dobbs*, *Mr. Dawkins*, *Seedling Yellow*, a fine flower: *Empress Mand*, *Picotée*, *Prince Bismarck*, *J. C. Read*, *Alexander Cramb*, *Lady Gladys Herbert*, *Rev. S. Geddes*, *Mrs. Hodgson*, *Prince of Denmark*, and some seedlings. Mr. Dobree exhibited some fine *Gladiolus*—amongst them *Queen of Taunton*, a seedling very much in the style of *De Mirbel*; *Pictus*, *Camille*, *Madame Desportes*, *Miss M. Dobree*, seedling; *Painted Lady*, *Ball of Fire*, *President*, *Agrius*, *Aster*, *La Perle*, &c.

Fruit was exhibited in large quantities, and was, especially the Grapes, excellent in quality; while of vegetables both in the amateurs' and cottagers' classes there was a very large and excellent display. The table decorations were not superior, owing in a great measure to their being confined to ladies resident in the county. This is a mistake which will not be repeated. The exhibition of such stands as Miss Cypher's has a most beneficial effect as showing the manner in which it should be done, that which obtained the prize having that elegance and lightness for which she is so well known. Fashions and taste change. Thus, one lady with whom I talked about that exhibited said she liked to see tables decorated with all of one colour—yellow at one time, blue at another, &c. I objected that yellows would look white, and blue a dirty black under artificial light, and that certainly a little more variety would be pleasing; but I believe this is the fashion now, although doubtless after a time we shall reach to the style which has obtained so much praise wherever examples of it have been exhibited.

The day was not so fine as those with which the Taunton Show is generally favoured, but a large company assembled, and I hope it was financially a success. The Committee worked with their usual energy; and there is no exhibition where more activity and courtesy is exhibited, and where the comfort of all—exhibitors, visitors, and Judges—is more studiously considered; while their new Secretary, Mr. Sampson, is a worthy successor of those who have preceded him in the office.—D., Deal.

#### JOTTINGS FROM THE NORTH.

NOTWITHSTANDING the continued prevalence of cold and wet weather since May, Roses have done well, especially the darker varieties. I never cut more good flowers of the latter than I have done this season. My losses from the severity of the winter amounted to two standards, and a few dwarfs were injured. Close pruning at the end of April was followed by excellent growth and fine flowers. But that dreadful pest, orange fungus, has as usual attacked my plants, and in a very short time has rendered some almost destitute of foliage. On observing it I picked off the leaves affected, and syringed the trees with a strong solution of soft soap mixed with flowers of sulphur. Now there appears something like a check to its progress, but still it spreads. Can nothing be recommended by any of your readers as a preventive or remedy?

I have a few of the newer Roses that have succeeded well with me, and which I have not observed in the show reports. *Duchesse*

d'Aremberg, Louis Spath, Souvenir de Madame Robert, and Leon Renault have given me great satisfaction. Indeed the last named as a dark Rose, and Souvenir de Madame Robert as a light variety, I consider among the best I have. Both are highly fragrant.

Gladioli have been as unreliable as usual. I lost a large number of corms this spring. On some, procured from different houses, I observed a sort of freckle, the corm assuming a somewhat livid colour thickly dotted with minute white spots. This rapidly developed into a decay which was quite new to me in Gladioli. Whether they had been affected by frost before reaching my hands (I am certain they did not afterwards) I do not know, but as frost causes a softening of the roots I assumed such to be the case. All when purchasing should see by baring the corms so far that nothing of this freckle exists. Outwardly they appeared quite sound. As usual, too, some promising plants have withered, and there are plenty of weaklings from fine-looking corms. I am inclined to think that the remarks of "G. O. S.," on page 123, about "coddling" are appropriate here. All, however, is not unsatisfactory. Some grand varieties promise exceedingly well, and we are looking forward to the appearance of well-known old friends and some illustrious strangers with more than usual eagerness. If the weather continue such as we have had for upwards of two months many will not bloom at all, but it promises better at present. Only a few of the earlier sorts as yet show the flower stem. I fancy we must look south in a week to catch a display of those from a more favoured clime.—A NORTHERN AMATEUR.

#### THE ART OF COLOURING GRAPES.

I READ with interest the article at page 112 by Mr. Taylor on this subject. The rules he lays down are those by which I am guided always in endeavouring to produce well-finished Grapes, yet I cannot say that I succeed as I would wish, and probably many of your readers are in a similar position. Indeed, on reflection, it is plain there is nothing in Mr. Taylor's article but what has appeared scores of times—in different forms, perhaps—before. His directions about cropping, watering, heating, airing, are such as every Grape-grower who has paid any attention to the literature of the subject is familiar with, and, as far as possible, carries out. Of course, it is quite possible to imagine we are carrying out such directions and yet do nothing of the kind. As Mr. Taylor well says, the manual strength—if we dare say so—of any given amount of foliage-surface is by no means always equal to any other equal surface somewhere else. I believe that this fact alone is the cause of many failing to colour Grapes really well. We must be familiar with the condition of the Vines, the borders, the leaves, the water, the treatment, before it is possible to calculate how much fruit Vines are able to perfect; and for want of attention to this many fail. Still, the fact remains that comparatively few people are able to colour their Grapes as they would like. It is not because the Vines are over-cropped—that is the general apology even when the crops are year by year ridiculously small. It is not by want of water; cultivators generally are awake to the wants of Vines in that respect. It is not because there are no good borders, nor because manure is wanting. I think it is too often the want of air. The ventilators are never closed, yet I think it is the want of air.

My experience is somewhat peculiar, and may perhaps, if repeated, throw some light on the subject. I am not particularly favoured in the matter of soil; but, by the aid of semi-scientific manuring I have so far overcome that difficulty that year after year such crops are produced as make the wise prophesy that no Grapes next year will be the result—prophecies which are never fulfilled. The Vine rods are too close—they are only 2 feet 9 inches apart. To overcome this difficulty the Vines are let down a foot from the wires, and the shoots trained V-like upwards, which allows room for a more than ordinary amount of foliage. We take never less than 30 lbs. (but often near 50 lbs.) from each rod. Few bunches are under 2 lbs., and many are over 5 lbs. of such kinds as Black Hamburgh, Foster's Seedling, and others. This is a heavy crop, but the Vines are very vigorous; the foliage is ample and the feeding ample; the top and bottom ventilation is ample, and in summer they are never closed. Our command of heat is all that can be desired; but we maintain cold pipes and a current of air during darkness, no matter what the weather may be.

Some of our black Grapes colour to perfection. The smaller bunches near the top and near the bottom never fail to finish in a satisfactory manner. The smaller about the middle of the house finish fairly well, but the larger are always reddish. They are not deficient in flavour, and those most concerned praise them. Still we feel chagrined at the redness. If it is overcrop-

ping, why do the top and bottom bunches colour so well? If it is overcropping, why do they maintain unimpaired their fertility?

The glass is in large panes and the laps puttied, hence it may be concluded that want of ventilation is the evil. Near the ventilators the fruit is always black, far from the ventilators the fruit is red. The incoming air is exhausted long before reaching the middle of the house, and the middle spurs languish in consequence. True, each part of the plant is in sympathy with every other part; were it otherwise matters would be worse.

Another thing—the largest bunches are generally reddest. Does this teach that big bunches make greater demands than the local foliage is able to meet? It looks like it; and more than one prizetaker has won his laurels by reducing the size of his bunches. I was once told by one who should know, that the grower who has been styled "Champion of the North" in his palmy days habitually "shouldered" his large bunches, and these reduced bunches always produced the largest best-coloured berries, and secured the prize at many a southern show. This may be so, but I never can find heart to "shoulder" our best bunches. The big panes and the puttied laps might perhaps be remedied, however.—SINGLE-HANDED.

#### ROGIERA GRATISSIMA.

ONE of the prettiest species of the genus *Rogiera* is that of which a small lateral shoot and flowerhead are shown in fig. 30. It is admirably suited for a greenhouse, and with ordinary careful

Fig. 30.—*Rogiera gratissima*.

attention to its cultural requirements it flowers freely during the summer. The only objection that can be urged against the plant is that it is slightly straggling in habit, but a little judicious pruning will go far to obviate this disadvantage. The flowers are of a soft pinkish white tint and wax-like texture, and, moreover, possess a most agreeable fragrance, rendering them pleasing either on the plant or when cut.

The culture, though not difficult, requires the care of a judicious plant-grower. One point of particular importance is, that the soil and pot be sufficiently well drained to permit the free passage of the water, as stagnant moisture soon produces a most injurious effect on the plant. A compost of light turfy loam, a little peat, and a good proportion of sand is the most suitable, exercising care to avoid overpotting.

It was found some years since on the mountains of Guatemala by M. Ghiesbreght.

THE PHYLLOXERA IN FRANCE.—From a report on the means employed in France for protecting the Vine from destruction by the

Phylloxera, by Mr. C. H. Perceval, H.M. Consul at Bordeaux, we take the following interesting extract:—"The information which I have gathered on this subject from official and other sources tends to reduce the methods used to the following three:—Firstly, submersion of the vineyard when practicable; secondly, by employing insecticides; and thirdly, where the vineyards have been destroyed, by the plantation of American varieties of Vines whose roots offer more resistance to the attack of the insect. M. Armand Lalande, the President of the Chamber of Commerce of Bordeaux, proprietor of extensive vineyards in the Médoc, a gentleman to whom I am much indebted for the information and assistance which he has been kind enough to afford me in drawing up this report, addressed a meeting of that body held in March last on various topics, and I translate the following from his remarks regarding the Phylloxera:—"The Chamber of Commerce has not ceased to show the extreme importance which it attaches to all the means employable in combating this dreadful scourge. Of the 2,200,000 hectares which composed the vineyards of France, 500,000 are destroyed, 500,000 others are greatly attacked; it is a loss of more than three milliards to the country. The Gironde is one of the departments which has suffered most; one-third of the vineyards are destroyed, another third is badly attacked. We must admit with sorrow that the very sources of our commerce and of the well-being of our southern population are most seriously compromised. Still we have great hopes that, by energetic and intelligent efforts, we may be enabled gradually to arrest and repair the evil. For the very important vineyards of the Gironde, where submersion is possible, it is a sure remedy, which is generally employed, and with invariable success. In the cases of vineyards already destroyed, the remedy seems to be to reconstitute them by planting American Vines as stocks for grafting French cuttings on, which plan has been the subject of satisfactory and conclusive experiments for the last few years, especially in Languedoc. Where the Vines are not too far gone, a judicious use of sulphur of carbon is a certain means of preservation, and, in most cases, practicable, owing to the moderation of the cost." He then states that he bases his opinion on astonishing and conclusive results, which he has observed in immense vineyards in Languedoc, and also in others of the Gironde, and proposes that steps may be taken to hold an international congress on Phylloxera in the autumn." The Congress is to open on September 5th. As we intimated last week, another Viticultural Congress meets in Milan next week. Mr. Perceval gives some valuable details on the various methods of treating the disease."

#### DISBUDDING CHRYSANTHEMUMS.

CULTIVATORS of the Chrysanthemum might safely be divided into two classes: the one grows for cutting and decoration, the other for exhibiting. Some of the former are very careless in many respects in relation to disbudding, while the latter is and must be most anxious and careful, as upon this depends to a large extent the success of his labours. The two have in view very dissimilar objects, and follow two distinct systems of cultivation. In gardens where these autumn flowers are grown little or no heed is given to disbudding, or it is carelessly performed, and perhaps at a stage when the plants would receive no benefit from the operation.

Chrysanthemum cultivation has increased considerably during the past few years, nevertheless the plants are only poorly grown in many establishments. If these growers would follow in some details the system pursued by exhibitors they would profit considerably. Disbudding to a certain extent is as necessary when growing for decoration as for exhibition, only the former need not disbud so severely and devote all the energy and strength of the plant to the production of one or two blooms. The exhibitor desires size as well as other qualities, and the strength of the plant must be concentrated, therefore careful and judicious disbudding is necessary. It is equally so with the other if he requires a good bush carrying a number of flowers. It must be early decided how many shoots the plant is to carry, pinching the points out of the shoots in its early stages until the required number are formed, say from six to twelve, or as many more as the cultivator considers essential. These shoots must be allowed to extend, and all side growths from the axils of the leaves be removed as they appear as well as suckers. When the plant has one or two stems they often show a bud during the month of May; this must be removed.

The month of July is rather a critical stage, and many, especially beginners for whom these notes are intended, fail to produce fine flowers. The plants during that month show what is known to Chrysanthemum growers as the July bud. This bud is useless. Chrysanthemum experts glancing through the plants

about that season of the year quickly form an idea if they are right for producing good blooms provided all goes well afterwards. When the bud alluded to is appearing the points of the shoots should at once be removed, and all the side shoots except the most promising one, which should be encouraged.

If the plants have not sufficient shoots they can form two or three shoots from this bud to flower eventually on the crown bud, which is the next that appears. Remove the three shoots that would spring from beneath and grow some 6 or more inches in length, and then form other buds which are known as the terminal bud. If the flowers are taken from this bud the centre one must be selected, and the small buds surrounding it must be removed. When growing the plant with one or two stems (incurved varieties are alluded to), it is not always wise to select the crown bud recommended by many. If the plants are very strong and the varieties inclined to be coarse and the crown bud is selected, the flowers are sure to be coarse, or what has been termed overgrown. Some may be ready to contest this point and assert that the crown bud produces the finest flowers. I am willing to grant that many fine well-shaped flowers are produced from the crown bud of the Mrs. George Rundle type, and it will with many other varieties produce deformed, ragged, and worthless blooms. An intimate knowledge of the plants and whether the blooms they produce are liable to be coarse or naturally come well-shaped is requisite in attaining successful results. The cultivator should also grow the same variety in both ways and then note the difference. It is difficult in this, as in many other operations connected with gardening, to lay down minute rules for guidance, which can only be attained by experience and intelligent observation.—W. B.

#### SHROPSHIRE FLORAL AND HORTICULTURAL SOCIETY.—AUGUST 17TH AND 18TH.

THE above Society held their annual Exhibition in the Quarry Grounds, Shrewsbury. The morning of the Exhibition was fine, but rain fell heavily before noon, yet the public thronged into the grounds to inspect the Show. In few provincial towns is an horticultural society so popular with the people as at Shrewsbury. The inhabitants of the town look upon the day as a general holiday, and the stranger is surprised to see the main streets leading to the Show grounds decorated with flags. The Society is in a very flourishing condition, and has during the present year erected some handsome gates at the entrance to the Quarry Grounds. Some idea of the magnitude of the Exhibition will be formed when it is stated the number of entries was over 1400.

The stove and greenhouse plants, considering the lateness of the season for many flowering plants, were shown in grand condition. The open class is specially alluded to, and the plants this year are much better than any we have hitherto seen at this Society's Show. In the open class for twenty plants, flowering and foliage, two fine groups were staged by Mr. J. Cypher, Cheltenham, and Mr. Tudgey, gardener to J. F. G. Williams, Esq., Worcester. The two collections were so nearly equal in point of merit that it was a difficult matter for the Judges to decide which was most worthy of the premier position. After much consideration they decided in favour of Mr. Cypher, who had fine plants of *Latania borbonica* 8 or 9 feet through, *Gleichenia flabellata*, *Cordyline indivisa*, good; *Thrinax elegans*, *Pritchardia pacifica*, *Croton Disraeli*, 5 feet through and well coloured; *C. majesticus*, very large; *C. Queen Victoria*, flat but remarkably well coloured; *Ixora Cypheri*, *Lapageria alba*, well flowered; *Allamanda nobilis*, and *A. Hendersonii*, both superbly flowered; *Bougainvillea glabra*, *Stephanotis floribunda*, and *Ixora amabile* were flowering well. Mr. Tudgey was also strong in fine-foliage plants, and his flowering plants were remarkably satisfactory. *Croton Andreanus* with its large bold foliage was very fine; *Anthurium Schertzerianum*, large and very attractive. The specimen of *Dipladenia Brearleyana* was one of the finest plants we have seen of this variety, and it was flowering profusely. In the class for nine plants with not less than five in bloom five collections were staged. Mr. F. Perkins, Leamington, took the lead with creditable plants of *Bougainvillea glabra*, *Statice Blucherii*, *Dipladenia boliviensis*, and a good specimen of the *Gloriosa Plantii* superba. Mr. Farrant, gardener to Mrs. Juson, was second, having a good *Cocos Weddelliana*, and a fresh but rather small plant of *Erica æmula*. Mr. W. Pratt, gardener to Lord Hill, Hawkstone, obtained the remaining prize, showing a good *Nepenthes Hookeriana* among others. In the class for six plants, not less than four in bloom, open only to amateurs, Mr. H. Owen, Shrewsbury, and Mrs. Wace obtained the prizes in the order as named.

*Ericas* were not shown in large numbers, but the quality of those staged was all that could be desired. Mr. J. Cypher took the lead in the class for six plants, and staged fresh and well-flowered examples of *E. Aitoniana*, *E. Marnockiana*, *E. Irbyana*, *E. Austiniana*, *E. æmula*, and *E. Turnbulli*. Mr. Tudgey was second, having a very good plant of *E. ampullacea Williamsii*, the other plants being rather uneven in size.

Ferns were not numerous, but the exotic species were in excellent condition, while the class for hardy Ferns was represented by very small plants that need no further comment. For nine exotics there

were only two competitors, Mr. Cypher and Mr. Tudgey, who took the prizes in the order named. The plants in the first-prize lot were healthy and well grown, and amongst them were good specimens of *Alsophila australis*, *A. elegantissima*, *Davallia Mooreana*, *Adiantum cardiochæna*, *A. trapeziforme*, *Gleichenia speluncæ*, *G. dichotoma*, and *Dicksonia antarctica*. Mr. Tudgey's plants were larger but not so fresh, the best being *Cibotium regale*, *Gleichenia Mendelli*, and *Microlepia hirta cristata*, very fine. In the corresponding class for six plants Mr. Warrender, gardener to Sir T. C. Meyrick, Bart., took the lead with good well-grown plants of *Alsophila excelsa*, *Microlepia hirta cristata*, and a good *Neprolepis exaltata*. Mr. Pearson, gardener to Lord Berwick, and Mr. Farrant obtained the remaining prizes, both showing well. Messrs. L. Burd, H. Owen, and Mrs. Wace were the prizetakers in the class for four plants.

Palms were well shown, some good and fresh specimens being staged. The competition was keen in the class for six distinct varieties; Messrs. Tudgey, Cypher, and W. Pratt taking the prizes in that order. The first-prize collection was much smaller than those shown in the second, but in much better condition; Mr. Tudgey's best plants being *Geonoma gracilis*, *Kentia australis*, *Geonoma princeps*, and *Cocos Weddelliana*.

In the class devoted to *Dracænas* only two collections were staged by Mr. Pratt and Mr. Warrender. The first-prize plants being good, and included well developed specimens of *D. regina*, *D. Taylori*, and *D. Baptistii*, fine. Mr. Warrender's examples were a little smaller but in equally good condition. *Caladiums* were fairly represented, but the plants were small. Mr. Farrant staged creditable plants of Prince Albert Edward, Napoleon III., Edward Andry, and Princess Royal. Messrs. Jones & Sons followed with small but neat plants; Mrs. Shuker being third. *Coleuses* showed a marked improvement over those staged at the Society's previous exhibitions. The majority of the plants were of pyramidal form, but rather too closely trained. The first prize was obtained by Mr. Pursar, gardener to J. Watson, Esq., for good plants of Lord Falmouth, Ajax, and Exquisite. Mrs. Shuker was a good second, and Mr. Salter, gardener to G. D. Lees, Esq., third. In the amateurs' class for three plants Messrs. H. Owen, L. Burd, and Major Palchett were the prizetakers. The classes devoted to *Fuchsias* were well filled, but the plants were not in first-rate condition, the only creditable collection being that shown by Messrs. Pritchard & Sons, Shrewsbury. These plants were not large but well flowered, the best being Lucy Mills, Blushing Bride, Charming, and Crimson Globe. The plants staged in the amateurs' class were better than the second and third lots in the class referred to, Messrs. Owen, Burd, and Mrs. Wace obtaining the prizes. The competition was good in the classes devoted to *Begonias*, and considerable improvement has been made in their culture round Shrewsbury during the past two years. The Rev. J. H. Charter, Mr. R. Milner, gardener to the Rev. J. D. Corbett, and Mr. Bremmell, gardener to Col. Forestier, were the successful exhibitors in the class for six plants. In the class for three the same exhibitor was again first, followed by R. W. Withers, Esq., and R. Blythe, Esq.

Zonal *Pelargoniums* were very satisfactory, and were staged in good numbers. In the class for six double varieties, distinct, Messrs. Oldroyd & Sons obtained the premier award, having good plants of *Wonderful*, *Asa Grey*, *Raspail*, and *Madame Thibaut*. Messrs. Jones and Sons were second with *Leamington Lassie*, *L'Année Terrible*, *Prince Alfred*, and *Madame Thibaut*. Mr. J. R. Jones was awarded the remaining prize. Messrs. Owen and J. B. Hudson took the prizes in the class for three plants. For six Zonals with single flowers Messrs. Jones & Sons staged the best plants, the most notable being *La Belle*, *Beauty of Wilts*, *Mrs. Findlay*, and the Rev. F. Atkinson. Mr. J. R. Jones was second, having good plants of *John Gibbons*, very bright, and *Lady Sheffield*. Messrs. Oldroyd & Sons were third with smaller but neat specimens. In the class for three plants the same exhibitors and in the same order obtained the prizes as in the corresponding class for three doubles. The classes devoted to *Achimenes*, *Gloxinias*, *Balsams*, and *Petunias* need no special note further than the prizes offered were well contested for; Messrs. L. Burd, Shuker, R. W. O. Withers, R. J. Niven, and H. Owen being the principal prizetakers.

Table plants are always well represented at Shrewsbury, and this year the seven collections in the class for twelve plants were especially fine. The Judges found some difficulty in making the awards. They finally decided in favour of Mr. Cypher being first. The plants were not more than 10 inches or a foot high, the best being *Croton elegans*, well coloured; *C. mutabilis*, *C. angustifolius*, bright; *C. majesticus*, *Grevillia robusta*, *Cocos Weddelliana*, *Aralia Veitchii*, *Aralia gracillima*, *Geonoma gracilis*, and *Phœnix rupicola*. Mr. Pratt was second with excellent specimens about the same size, and Mr. Warrender was third with larger plants.

In the class for fifty miscellaneous plants grown in 5-inch pots, not less than thirty in bloom, four collections were exhibited, and arranged on low staging about 3 feet 6 inches wide. Messrs. Jones and Sons took the lead with a neat and choice assortment of *Crotons*, *Palms*, *Begonias*, foliage and flowering; *Gloxinias*, *Ericas*, *Ferns*, and many other plants. Messrs. Pritchard & Sons were second with a neat lot, differing only in having a number of *Vallota purpurea* and *Lilium auratum* intermixed, which stood well out of the more dwarf plants, and imparted to the collection a pleasing effect. Mr. Farrant was third.

Groups arranged for effect were a new feature, and attracted much

attention. The space covered was 100 square feet, and the groups were arranged in nearly square form down the side of a long tent. The whole of the collections sloped gradually from the back to the front, and were very effective, and a great success considering it was the first attempt. Seven or eight groups were arranged, and the first and second were nearly equal in point of merit. The premier position was, however, at last adjudged to Messrs. Pritchard & Sons. The groundwork was composed of *Adiantum cuneatum*, *Coleus*, *Heaths*, *Zonal Pelargoniums*, with light *Palms*, *Dracænas*, *Aralias*, *Crotons*, and other suitable plants rising above the groundwork, the front and sides being edged with *Lobelias*, *Gloxinias*, small *Adiantums*, and *Coleuses*. The second-prize group, belonging to Mr. Pratt, was a good one, and not many points behind the first. It was rather short of *Ferns* in the groundwork, the arrangement being much the same as the first, only *Pancretiums* and *Lilium auratum* were freely mixed through the group. Some *Cockscombs* near the front was objected to by the Judges, otherwise this group would have been placed first. The third prize was obtained by Mr. F. Perkins, Leamington, and its most striking feature was the well-grown plants of *Rhodanthe Manglesii*. Messrs. J. Dickson & Sons and Messrs. Jones & Sons also staged creditable groups.

#### CUT FLOWERS.

These were shown in large quantities and in good condition. In the class for twenty-four cut *Roses* three collections were staged; the blooms were not large, but fresh and even. Mr. G. H. Catlin, gardener to W. Henderson, Esq., took the lead, followed by Messrs. J. Dickson & Sons, and Mr. J. H. Berrington, Ludlow. For eighteen single blooms Mr. Davies, Ludlow, and Mr. J. Lambert, gardener to C. G. Wingfield, Esq., were the successful exhibitors, both staging fresh but small blooms. Three classes are devoted to *Dahlias*, and the blooms staged were large, bright, and beautiful. In the class for thirty-six two collections only were staged by Mr. W. Shaw, Blakebrook; and by Mr. Lawrence, gardener to J. Brodenham, Esq. The first collection contained good flowers of *Burgundy*, *Alexandra Cramond*, *Victory*, a bright yellow flower; *James Service*, good dark; *Peacock*, *Julia Wyatt*, *John Bennett*, *Captain Webb*, *James Cocker*, and *Countess of Pembroke*. The same exhibitor was again first for twenty-four blooms, having good flowers of the Rev. J. B. M. Camm, *John Lamont*, and *Clara*. T. Speake, Esq., Bradenheath, was second, having good blooms of *Monarch* and *Henry Walton*; Mr. A. Meyers being third. For nine blooms C. M. Cambell, Esq., was awarded a first prize. Mr. W. Shaw was the only exhibitor in the class for thirty-six spikes of *Gladioli*, and staged an excellent assortment, for which he was awarded the first prize. Messrs. Pritchard were the only exhibitors in the class for eighteen spikes, and the collection well deserved the first prize awarded for it. *Asters* were good, the principal prizetakers being Messrs. Meyers, Milner, W. Shaw, Cambell, R. E. Warren, and Mrs. Shuker. *Stove* and *greenhouse* cut blooms were well shown, some six boxes being staged. Mr. F. Perkins was first for twelve, Pritchard & Sons second, and Mr. Salter, gardener to G. D. Lees, Esq., and Messrs. Jones & Sons equal third. The first-prize box contained some good bunches of *Dipladenia amabilis*, *Lapageria alba*, *Eucharis*, *Ixora Williamsi*, *Bouvardia elegans*, and *Erica obbata*. Messrs. R. C. Withers and G. Townsend took the first and second prizes for twelve trusses of herbaceous plants; Messrs. Perkins, Jones & Sons, and W. Shaw securing the prizes for *Phloxes*. *Stoeks* were very fine, and grand spikes of flowers were shown. Messrs. G. Townsend, Pritchard, and Jones & Sons obtained the awards for twelve distinct varieties; Messrs. G. H. Berrington, Ludlow, Townsend, and W. H. Harrison for nine spikes. Mr. Edwards, gardener to Sir F. Smythe, took the lead for *Pentstemons*, and staged handsome examples of twelve varieties. The cut blooms of *Zonal Pelargoniums* were bright, especially those shown by Messrs. Pritchard & Sons, including Dr. Denny, Commander-in-Chief, *Henry Jacoby*, and *Rigolette*. Mr. S. Rudge, gardener to T. S. Eyton, Esq., was second; and Mr. J. R. Jones third.

The bouquets were remarkable for their freshness and beauty, Mr. Cypher taking the lead for one ball or hand bouquet, closely followed by Mr. J. R. Jones and by Messrs. Jones & Sons. The same exhibitor was successful for one bridal bouquet, Mr. J. R. Jones being third. The prizes for three buttonhole bouquets were secured by the same exhibitors, and in the same order. Mr. Cypher obtained the first prize for a stand of cut flowers suitable for table decoration; the arrangement was very light and neat. Miss Weeks was second, and Messrs. Jones & Sons third.

#### FRUIT.

The show of fruit was large and the quality good. For six bunches of black *Grapes* in three varieties Mr. W. Pratt was first with well-coloured and highly finished large bunches of *Lady Downe's*, *Black Hamburgh*, and *West's St. Peter's*. Mr. Hannagan, gardener to R. G. Naylor, Esq., Hoolton Hall, Cbesire, was a close second with large berries and bunches of Mrs. Pince and *Black Hamburgh*, but scarcely finished. Mr. W. Earp, gardener to F. Stainer, Esq., also showed well, and was awarded an extra prize. For four bunches of white *Grapes*, two varieties, Mr. Earp was first with highly finished *Foster's Seedling* and *Buckland Sweetwater*. Mr. F. Hawkesford, gardener to Sir V. R. Corbett, Bart., was second with good bunches of *Muscat of Alexandria* with large berries but not quite ripe. For two bunches of black *Grapes* (amateurs) Major Palchett and T. Soutbam, Esq., secured the prizes. For the collection of twelve dishes of fruit, not

more than two varieties of Grapes, Mr. Pratt was first with some splendid fruit. Mr. Hannagan was a good second, only being a point or two behind. Mr. Milner was third. The best dishes in the first collection were the Black Hamburg and Muscat of Alexandria Grapes, Pine, Apricots, Brown Turkey Figs, Elruge Nectarines, and a good dish of Pears.

The Grapes in the second collection were very good, and with large berries; Pitmaston Nectarines large, and good Royal Charlotte Peaches. In the collection of nine dishes (Pine excluded) Mr. Pratt was again first, having fine Grapes. Mr. Lambert was a close second with a fine dish of Apricots and good Grapes, but scarcely ripe. Mr. Warrender was third. The competition in this class was very keen. Mr. Pratt was the only exhibitor in the class for one Pine, and staged a good Queen. Mr. Shaw, Kidderminster, and Mr. Warrender obtained the prizes for one dish of Peaches. The same exhibitor was first for a dish of Nectarines, and Mr. Lawley, gardener to A. Darby, Esq., second, and Mr. Milner third. Messrs. Earp, C. Taylor, gardener to R. C. Cholmondeley, Esq., and Mr. R. Cooper, Bridgnorth, were the prizetakers for Apricots. Mr. S. Jones, gardener to W. Hayledine, Esq., took the lead for green or yellow and purple or red Plums. Messrs. Owen, Hannagan and Pratt were the prizewinners with green-fleshed Melons; and Messrs. W. H. Harrison, Owen, and Earp with scarlet-fleshed Melons. Messrs. Hannagan, Pearson, J. McLean, gardener to Lady Cotes, were the principal exhibitors of Cherries.

#### VEGETABLES.

These were of superior quality, and the competition was keen in the several classes. In the class for a collection of eight dishes thirteen lots were staged, and all good; the premier prize being awarded to Mr. Lambert, who staged a good dish of Brussels Sprouts, Conqueror Tomato, Canadian Wonder Beans, good Autumn Giant Cauliflowers, Veitch's Black-leaved Beet, International Kidney Potatoes, very fine, Telegraph Peas, fine James's Intermediate Carrots, and capital Major Clark's Red Celery; Mr. Milner second, and Mr. Pratt third, with nearly equally meritorious collections. There were twenty entries in the class for six dishes of Potatoes, and the examples were clean, large, and well-shaped. Mr. Milner was first with Gloucester Kidney, Vicar of Laleham, International, Centennial, Beauty of Hebron, and Trophy. Mr. Bremmell was a close second, showing Porter's Excelsior, Blanchard, and others similar to the first-prize varieties. Mr. A. Myers was third. For three dishes over twenty collections were again staged, Mr. G. Berrington, Ludlow, being first; Mr. Pursar, gardener to J. Watson, Esq., second; and Mr. S. Bremmell third. Mr. J. Bain, gardener to Sir C. R. Broughton, Bart., was first for a dish of Tomatoes; Mr. Pursar and Mr. Pearson second and third. Mr. Bain took the lead for Peas with Ne Plus Ultra; Mr. Bremmell second with Telephone; and Mr. W. Davies third, an enormous quantity of Peas being staged. Onions were grand, Mr. Hawkesford taking the lead for spring varieties, and Mr. Pearson for autumn varieties. Mr. Lambert was first with Cucumbers, showing a fine pair of Carter's Model. Mr. Myers and Mr. Davies were second and third. Messrs. H. Cross, Lambert, and Lawrence were the successful exhibitors for Cauliflowers, and Messrs. Milner, McLean, and Nevin for Celery. For French Beans, Parsnips, Carrots, and Turnips the chief prizewinners were Messrs. J. Watson, Lambert, Pursar, and Brown. A special prize was awarded to Mr. R. Wildhood for a good dish of Pride of America Potatoes.

*Miscellaneous Exhibits.*—Messrs. F. and A. Dickson & Sons, Upton Nurseries, Chester, exhibited a good collection of small decorative stove and greenhouse plants and a very fine group of young Conifers, principally choice kinds. Messrs. J. Dickson & Sons, Newton Nurseries, Chester, sent some Vines in pots, which were remarkable for strength, short-jointed wood, and plump eyes, also a number of fine young Figs in 6-inch pots. Many of the little bushy plants had a dozen or more fruits, though only about seven months old. Messrs. Pritchard & Sons staged an assortment of small stove and greenhouse plants. Mr. A. Myers, Sutton Lane Nursery, Shrewsbury, had a similar collection of plants; and Messrs. Jones & Sons also contributed a variety of plants to the Exhibition.

A large tent was devoted to the productions of cottagers, the side stage being well filled with vegetables, and the centre with cut flowers, window plants, and hardy fruits. The vegetables were especially worthy of note, and the soil in the neighbourhood of Shrewsbury must be particularly favourable. It is stated there were over eight hundred entries for the classes devoted to cottagers, and this is considerably under the number of last year, owing to the entrance fee of 1s. being now required. It is to be hoped that this Society will encourage the cottagers' portion of their fine Exhibition by again allowing a free entrance.

Great credit is due to the exertions of the Hon. Secs., Messrs. H. W. Adnitt and W. W. Naunton, and the able Committee, for the business-like manner in which the work of the Society is carried out.

#### TOMATOES UNDER VINES.

FULLY a year ago there was some discussion in the Journal as to whether Tomatoes could be grown profitably on the back walls of lean-to vinerics, some correspondents holding that it could not be done, others taking the opposite view. Some time ago we had fine crops from plants against our back walls. The Vines were only a year or two planted, and hence, before the canes had

time to reach the top and obstruct the sun's rays, the Tomatoes were in good health, had a crop of fruit set and swelling off, and there was no great trouble in ripening fine Tomatoes, even after the light became obscured. So long as matters were in that state we felt inclined to think Mr. Muir right and his opponents wrong, although his remarks were rather too disparaging in tone. Now, however, the roof is covered densely, and we find the Tomatoes on the back wall, elevated as they are near the roof, are a complete failure. To be sure we have in Scotland, at least in the mild and counties, had but little sun, but we do not think matters would have been very different if we had been favoured with bright sunshine, for little of it could possibly reach the Tomatoes.

Whether the impression be right or wrong (we have mislaid some numbers of the Journal and cannot, in consequence, speak with certainty), we still have the impression that Mr. Muir attributed his success to keeping the foliage so thin on the roof that light enough penetrated to secure the well-being of the Tomatoes underneath. Not being a believer in sacrificing even a problematical amount of Grapes for even a good crop of Tomatoes, and believing that Vines are benefited by being allowed to carry as many leaves as possible without absolute crowding, we allow the Vines to fill all available space. The consequence of this is no Tomatoes. But, according to Mr. Muir's directions, we are led to believe that he, too, covers his roof densely in order to secure well-coloured Grapes. Are our impressions incorrect? Does Mr. Muir grow good crops of Tomatoes under a roof densely shaded with Vine leaves? We are concerned about the answer; for we find that employers, our own among the number, who believe but do not understand what they read, think that Tomatoes can be grown under the dense shade of robust Vines, and are disappointed when they read of others doing it and find that their gardener has not capacity for the—shall I call it, feat?—A SCOTCHMAN.

#### EWENNY PRIORY.

THIS estate, the seat of Col. T. Picton Turberville, is situated near Bridgend, one of the most beautiful and fertile agricultural districts of South Wales. Unlike many parts of Glamorganshire, the land around Ewenny is all of an arable character, and no better part could be found in which to gain a knowledge of Welsh farming operations, and the widely respected owner of the Priory is a gentleman well known for the substantial support he gives to all the leading agricultural societies in the country. But it is not to these alone that he devotes his time and money, as his practical knowledge is well shown in the excellent state of the land, farm houses, cottages, &c. As one instance of the owner's thoughtful care, we may notice that the weather forecast for the day is telegraphed from London every morning and posted up in the most accessible part of the estate. During the hay and grain harvests this cannot fail to be of much benefit to those engaged in these operations.

In proceeding towards the Priory the road is a truly historic one of the old English description, with beautiful hedgerows, abundance of wild flowers, and a good footway. Long before the Priory is reached there are two erections seen of a widely different kind. The one is the modern mansion, the other a grand ruin of the old Priory. History says the latter was built in 1111, and the church connected with it, which is still that of the parish, is being judiciously restored by the present owner. The ruins and the mansion are almost in one, and must be highly interesting to those of an antiquarian or archaeological turn of mind.

Our chief object was, however, the garden, and, above all, the orchard houses, for which Ewenny is justly celebrated. One large span-roofed house and another lean-to are filled with fruit trees in pots, and these were just at their best at the time of our visit. The trees are chiefly Nectarines, Peaches, Plums, and Pears. They are mostly about 5 feet high. The pots are from 10 to 15 inches in diameter, and they altogether number about fifty. The first glance at the trees proves them to be in excellent health—not a spotted leaf or an insect being visible, and the crops are surprising. On a small tree of Rivers' Early Alfred Peach there were six dozen of good fruits, and Mr. Hawkins, the skilled grower, speaks highly of the variety as a sure cropper. Next to this there was one of Rivers' Purple Gage Plums which had sixteen dozen fine fruit on it last year, and this season they number ten dozen. This is considered the finest flavoured of all Plums. Pears were equally fine, a small sprig of a tree of Brockworth Park bearing fourteen fruit, each more than 8 inches in circumference; Louise Bonne of Jersey had forty fine fruits. These are finer than we have seen in the open air against walls or in any other position. Some samples of Pears were extremely fine. Three varieties were especially noteworthy—Doyenné du Comice, five fruit of which weighed 4 lbs. 3 ozs.; Pitmaston Duebess, and Duebess d'Angoulême, one

fruit of each weighing 1 lb. 15 ozs.; and Beurré Diel, five fruits making a total of 4 lbs. 12 ozs. The trees from which these were gathered are very small, but, like all the others, they are in excellent health. Beurré Hardy was also fine in pots, the fruits being remarkably clean.

Against the back wall of the lean-to orchard house three Peach trees are trained. Barrington is very fine, also Prince of Wales and the Oldenburgh (Elruge) Nectarine; and the trees in pots are on a par with those in the other house—clean, healthy, and fruitful. We may look in vain for such fruit out of doors in our walled gardens; and yet these trees are not expensive to grow, as they have little fire heat and they do not need much training, supplying water at this time being the heaviest part of the labour. After the fruit has been gathered the trees are moved out to the open air, and any which require potting are shifted a little time before the leaves fall. Gritty soil from the roadside is employed, and one barrowload of horse droppings is added to every four of soil. Old bones from the house are broken up and used as drainage. The trees in pots are not forced, but start into growth naturally under glass.

In this system of growing trees Mr. Hawkins has the very highest confidence, and well he may, as everyone must envy those in his position with such large crops from small trees in a fruitless season out of doors. The same trees have been fruiting for fourteen years, and they have no appearance of being exhausted. A short time since Mr. Rivers of Sawbridgeworth informed us that the trees with which the late Mr. Rivers originated this excellent system of fruit-growing twenty-eight years ago are still fruiting in the same pots, and this year they are as vigorous as ever. The orchard house at Sawbridgeworth is 100 feet long by 24 feet in width, and from this over four thousand fine fruits are gathered annually, and these are widely different and superior to what can be had from the open walls at the same place.

Besides the interesting orchard houses at Ewenny there are some good lean-to vineries and span-roofed plant houses in the same garden. The crops of Grapes are very heavy, and the Muscats finer in colour than any we have seen for a considerable time. Stove plants are also well grown, and, like the fruit, are great attractions at the local shows. The vegetable quarters are clean and well stocked. The flower garden, which mostly surrounds the house, is very tastefully arranged; the beds are chiefly cut out on the grass.

To the east of the mansion there is another kitchen garden, and here there are some very old glass houses which may well be associated with the old abbey.—M. M.

#### A HINT FOR ROSE-GROWERS.

IT is generally known that nearly all standard Roses were killed by the frost of last winter, and in many places nearly all the dwarf Roses were either killed or much injured. By a very simple expedient we have for years saved ours; and last spring, when Mr. Fisher of the Worcester Nurseries saw our Roses being uncovered and pruned, he said, "Had we fallen on that simple plan it would have been worth £1000 to my employer." We have no standard Roses; ours are grown for cut blooms, and are mostly on the Manetti stock. In October, when the wood is ripe, we take a handful of common Bracken (*Pteris aquilina*) by the stalks and tie them round each bush, the Fern stalks upwards, and draw a very little earth round to keep them in their place during windy weather. When the buds begin to swell we remove the Bracken and prune the Roses. We had 42° of frost here last winter, and of some eight hundred bushes did not lose one that was properly covered as I have attempted to describe, while a few that were in detached parts of the ground and were not covered were killed in every case.

I have seen instances where earth was drawn up around the bushes to save them, but it failed, while for the last three excessively severe seasons we have lost none that were properly sheltered by the Bracken.—WM. THOMSON, *Tweed Vineyard*.

#### MITRARIA INODORA FLORE-PLENO.

PURE white flowers are always welcome for various decorative purposes, and they are certainly not over-plentiful amongst hardy plants during the months of July and August. Two of the most useful of border plants for affording white flowers during the period named are the very old *Achillea Ptarmica* flore-pleno, and the comparatively new *Mitraria* represented in the annexed engraving (fig. 31). Flowers of the latter produced by young plants in not over-rich soil are somewhat disappointing, being semi-double and having a ragged appearance, but under more favourable conditions the blooms are as large and symmetrical as Pompon

*Chrysanthemums*. Of this character we recently saw them in a large bed in the princely establishment of the Duke of Westminster at Eaton Hall. Mr. Selwood spoke in terms of great approval of the usefulness of this plant for affording cut flowers that prove acceptable for various purposes of decoration, and he consequently had a large number for maintaining the supply. For producing fine flowers the plants need good soil, and this being afforded they may be left pretty much to themselves, so freely do they grow and flower. All who desire a large supply of

Fig. 31.—*Mitraria inodora* flore-pleno.

white flowers during the summer can scarcely err by growing largely the two hardy plants alluded to. We give prominence to the *Mitraria*, as being less known than the *Achillea*.

#### CHOICE PEAS.

FROM what follows it will be seen that the varieties of dwarf or medium height are not much valued here, and this I may observe is due to their not being so satisfactory as the taller varieties, which for one reason have the pods at a considerably greater height from the ground, and are consequently safer from pheasants. Another reason is that the tall varieties afford a better and more certain return than the others, withstanding drought quite as well and excessive wet very much better. For first early the dwarf and medium-height Peas cannot well be dispensed with, as to have Peas early they must be grown in quarters that preclude the tall varieties.

To insure a daily supply of Peas from as early to as late a season as possible, which I have to do, it is not essential to grow many varieties, a few good sorts will do this much better than a number; yet it is not advisable to rely entirely upon one kind, but to grow two at least of each of the sections into which Peas are generally divided—viz., earliest, second early, general, and late crops. In each of these I shall name two varieties, and shall be glad to know if other gardeners have found any superior for free cropping and good quality.

*Earliest Varieties.*—Dicksons' First and Best and William I., both cropping well, are of fine quality, and have hardy constitutions. If there is a preference it should be given to the latter on account of colour, but this only pleases the eye. These require sticks with me of  $3\frac{1}{2}$  feet above ground, 4 feet between rows.

*Second Early Varieties.*—Laxton's Alpha, a blue wrinkled Marrow of the finest quality; and Dr. Hogg, a green wrinkled Marrow highly flavoured. These need sticks 5 feet in height.

*General or Main Crop Varieties.*—Criterion, a splendid cropper, after the type of Ne Plus Ultra, and a grand Pea in every respect; and a companion is found in Huntingdonian, which is a form of Champion of England. It is of little consequence which is grown, as they are as near alike as two Peas well can be, and they are both of excellent quality. I have found a fault in the latter which I have not noticed in Criterion, dry as the season has been—viz., in being subject to mildew, and soon becoming too "old." They need sticks 6 feet in height, which despite the drought have been overtopped. Telephone is probably the finest quality tall Pea ever raised. Telegraph is a fine tall Pea and of better colour, continuing longer in season than Telephone. The Baron, which I have grown this season for the first time, promises to be a grand main crop variety; it is certainly a capital cropper, bearing a dozen pods mostly in pairs, containing nine to a dozen peas of good size and fine green colour, being in fact a green Marrow of good quality. The pods are about 5 inches long, in some instances an inch more, filling well. The plant is of moderately strong growth, and needs sticks 6 feet high.

*Late Varieties.*—Ne Plus Ultra is well known, being an abundant bearer, with peas of a deep green colour and delicious flavour, affording a supply for some time successively. This is the very best of the late Peas, requiring sticks 7 feet high. Emperor of the Marrows, which may be classed as a fine form of British Queen, is of strong growth, having fine pods filled well with large peas of superior quality. It requires sticks not less than 7 feet above ground.

Of the "medium-height" varieties there is none better as first early than those already named—viz., Dickson's First and Best and Laxton's William I. Second Early—Eley's Essex Rival, a large good Pea; and Advancer, a green wrinkled sort, good both in quality and cropping. Main Crop.—Dr. Maclean, a blue wrinkled Marrow; a capital cropper and of good quality. Marvel, which was sent to me in 1874 by Mr. Laxton for trial, is a good white wrinkled Marrow, producing its pods in pairs, usually with nine or ten large peas of exquisite flavour. Veitch's Perfection is still unsurpassed in its class; and Stratagem promises to be good alike for the main and late crops. Late.—Maclean's Best of All, a fine green wrinkled Marrow, hardier than Veitch's Perfection and of superior quality. Maclean's Premier, a wrinkled Marrow, good alike in cropping and quality. Blue Scimitar in an unfavourable season and locality for late Peas often does well when those named only do moderately.

Of the very dwarf Peas I am not enamoured. They are useful for growing in pots, boxes, or in pits to afford a few early dishes, and may be used for the same purpose at the base of walls with south aspect. Little Gem is good, Early Premium better, and Blue Peter to my mind the best of all in this section.—G. ABBEY.

#### COMPARISONS—ROSES.

COMPARED with the springs of 1879 and 1880, that of 1881, severe though it proved in the early part of the season, has not on the whole been so adverse to Roses as might have been expected. Much good steady growth was made through the whole genial month of May, but much of this progress was checked by a cold and unkindly June, and the trees became infested by the little green insect, whose frothy surroundings were to be found not on Rose trees only, but on Gooseberries and Currant trees and on the grass even, and in one county on the Hops. The Rose trees suffered severely from their visitation, the shoots of the first bloom being damaged and the blooms turned black and disfigured. Many standards had already succumbed to the frosts of winter or had died off after pruning, but the dwarfs generally came out well, nor in my small collections have I lost any Tea Roses. Reine Marie Henriette, planted last autumn near a south-west wall, has grown and spread with remarkable vigour, the bloom being very early, vivid cerise, like Madame Boutin, and highly fragrant. Cheshunt Hybrid, too, is a strong grower with showy flowers, but wholly wanting both in flower and foliage in the delicacy which distinguishes the true Tea.

Amongst the newer Hybrid Perpetuals A. K. Williams appears a most satisfactory Rose, of excellent shape, size, and substance, rich foliage carrying grand blooms of an intense vivid red, which retained their freshness unscathed through three days of the

almost tropical sunshine of July. Souvenir de Spa is darker and more velvety red, somewhat shallow in the cup, still a fine Rose and of exquisite fragrance. Sir Garnet Wolseley is a fine and very effective Rose, in colour like Madame Annie Wood. Beauty of Waltham never fails. Star of Waltham has not yet been sufficiently tested by me, but of certain old favourites which have made themselves so at home in our light soil I cannot speak too highly. La France and Capitaine Christy have been of great size, and the former always preserves its perfect outlines. While generally securing a few of the most promising of the newer varieties, I love to add to the old and tried favourites. For richness of colour and perfume Prince Camille de Rohan can hardly be surpassed, but with me the blooms are small. Pierre Notting is very large, and Reynolds Hole has given me some medium blooms, but of an almost unique richness, the scarlet shading of the maroon being very beautiful.

As to the gaps which the gradual decay and loss of the standards have occasioned, we in the first place lifted quantities of blue Nemophila (*Nemophila insignis*), besides planting numbers of the *Anemone japonica alba*. The first is not yet over, the last are beginning to make a display, and both are refreshing to the eye amongst the many red tints, which are always easy to obtain. Petunias, too, are now very large and showy, and in a somewhat shaded bed a few choice Pansies are at this moment flowering well. Amongst others Duchess of Edinburgh, Mrs. Felton, Queen of Yellows, Rev. John Taylor, Senator, and Corbie.

Nothing can really compensate for the loss of the standard Roses, grand, beautiful, and attractive as they were; but we must admit that amateurs with small gardens in exposed situations must, for the present at least, give up growing them, save here and there in sheltered spots. The Rose will still be the Rose whether high or low-growing. We must accept our fate, cherishing all old tried favourites, and welcoming the new additions as we have space and inclination.—A. M. B.

MR. RICHARD GORTON requests us to state that the ROSE-FLAKE CARNATION TIM BOBBIN was the variety selected by the Judges as the premier Carnation at the recent Manchester Exhibition, and not Rob Roy, as recorded on page 149 of this Journal.

— IN reference to the PENSION AUGMENTATION FUND of the Gardeners' Royal Benevolent Institution, Mr. Cutler states that "The number of responses I have now received to the appeal to this fund is 339, contributing the sum of £406 11s. 10d. The average remains the same as recorded last week—viz., £1 4s. each response."

— IN reply to "G. O. S." respecting the method of making BIRDLIME FROM HOLLIES, Mr. H. Ritchie sends the following note—"I remove the bark immediately after the trees are cut down, as it can then be easily separated. It is then boiled for some time until the outer layer will peel off. When this is done place the bark on a flagstone and thoroughly beat it to fragments with a hammer, then provide a tub with water and take a small portion of bark and wash it to remove the fibre and refuse. When this has been effected put the cleansed portion in a tin box, and it will keep good for twelve months."

— "R. P. B." observes—"With regard to the controversy respecting the relative success of SHADED AND UNSHADED CAMELLIAS, I send some specimens of the growth our plants have made, all with one exception grown under shade. Colour and size of foliage so far have very little to do with the blooming qualities of the plants. There may be of course a small dwindling growth with foliage of a corresponding type, but plants in perfect health I imagine will give quite as good returns as those with larger leaves and which possess the peculiar glossy dark green hue noticeable in some collections. I have also sent some

specimens to show how blooms may be cut with attached stems without injury to the flower-producing qualities of the plants."

— "L. D. W." in referring to the IVY-LEAF PELARGONIUM GLOIRE D'ORLEANS says—"The flowers are very double, and it is a great acquisition. Its flowers are bright and much deeper in colour than any other variety I am acquainted with. They are produced very freely while the plant is in a small state. This plant will be valuable for baskets and for decorative purposes in pots."

— "D., Deal," writes—"After several unsuccessful attempts I have at last succeeded in establishing that most lovely climber, TROPÆOLUM SPECIOSUM. I have planted it at the north side of my greenhouse, and placed a piece of wire netting against the brick wall. It has run up and nearly covered this, and although planted only last autumn is now as full of bloom as ever I saw it in Scotland; and as we look on the greenhouse from the sitting-room windows, it forms a very pleasing and conspicuous object. I had previously tried it in various aspects, but in none of them had it succeeded well, but here it is quite at home; and although we have had so much dry weather this year, and the moist climate of Scotland was supposed to be the cause of its doing so well there, it could not be more satisfactory than it is, and hence we must conclude that it is aspect more than soil we have to consider down south. In Scotland I have seen it growing in all aspects and under various conditions."

— REFERRING to the much-admired Orchid, DISA GRANDIFLORA, the same writer observes—"This has been quite a success with me this year. I had a large pan of it which threw up five spikes of bloom, one with five flowers upon it. I have treated it as I described before in the Journal, as a bog plant, and have grown it quite close to the door of my greenhouse, where it has abundance of air. It is syringed several times a day, and is certainly a most lovely plant, while the length of time that the flowers remain in bloom is remarkable."

— "W. B." writes that "the Corporation of the city of Liverpool have recently purchased from the Continent a number of fine PYRAMIDAL and STANDARD BAYS. They are placed in the front of St. George's Hall and round the fountain recently erected. The plants are handsome specimens, some 7 or 8 feet high, and the heads of the standards some 3 to 4 feet through. The public will undoubtedly much appreciate this improvement to this imposing portion of the city, which all Liverpoolians are proud of. The Walker Art Gallery, which is in close proximity to the Hall, is neatly bedded with Ivy and Pelargoniums, with large specimen plants of the latter arranged round the front of the building. It is surprising how these few flowers add to the cheerfulness of the place. It is to be hoped the Council will carry out further improvements of this nature as was contemplated some time ago. All townspeople enjoy and highly appreciate a few flowers, and it would be well if other large towns followed in this respect the example set them by Liverpool."

— WE have previously referred to Messrs. J. Carter & Co.'s CROWN JEWEL STRAIN OF TUBEROUS BEGONIAS, and a box of flowers now before us fully maintains the opinion then expressed. The blooms are of good size and neat form, the colours being considerably diversified; from white, through pink to various shades of crimson there are many gradations of tint, all clear, and many extremely brilliant.

— WE are requested to announce the following GARDENING APPOINTMENT:—Mr. J. J. Lowry, late gardener to W. Gascoigne Roy, Esq., Byams, Marchwood, has been appointed gardener to James Macandrew, Esq., Belmont, Mill Hill, N.W.

— MR. W. ROBERTS sends the following note upon the FRUIT

CROP IN WEST CORNWALL. "There is one of the best crops of fruit known for many years in this district, which has raised the spirits of the market gardeners. Apples are abundant, the principal sorts being Keswicks and Lord Suffields. A few of the American varieties, such as Newtown Pippin, &c., are on trial. Pears are very good, Medlars and Plums also good generally. Bush fruits are on an average abundant. Raspberries would have yielded an enormous crop, but that many canes were killed last winter: however, the crop was excellent."

— WHITEWASH FOR GLASS.—I wish to shade a glass house with whitewash during the ensuing winter. Can any of your readers recommend something to mix in the whitewash to make it sufficiently adhesive to resist rain and frost until February, when it will need to be washed off for the following spring and summer? I shall be glad to have a reply through the Journal.—S. E.

— IT is announced that a portion of the COLLECTION OF YUCCAS, AGAVES, AND BONAPARTEAS AT THE CHATEAU DE VOSSELAERE, near Ghent, will be sold on the 1st of September of the present year. Some of the principal species and varieties that will be offered are the following—Agave appanata, A. dealbata, A. ferox, A. Ghiesbreghtii, A. heteracantha, A. Kerchovei, A. Millerii, A. mitriformis, A. Salmiana, A. univittata, and A. Verschaffeltii; Bonapartea glauca, B. gracilis, B. histrix, and B. stricta; Yucca aloifolia fol. var., and Y. quadricolor.

— "C. C." writes—"I was amused by the article in a recent issue of the Journal about the 'VAGARIES OF SEEDS.' I can add an instance which seems to me quite as curious as those mentioned. I have cultivated my present garden four summers, and have always grown a large number of Lobelias in the flower borders. At the approach of winter the Lobelias have been consigned to the rubbish heap, and in the spring of 1880 the rubbish heap was 'dug in' in the vegetable garden. This year to my surprise an enormous quantity of Lobelias have appeared among Potatoes, Peas, &c. I think this proves that Lobelia seed at all events is hardly what can be called tender. While I am writing, please let me caution your readers against mulching their Strawberry quarters in summer with lawn cuttings. I did it last year, and this year have had a splendid crop of fine lawn grass among my Strawberries!"

— "AN OLD SUBSCRIBER" will be obliged if any of our readers can give two good receipts—one for making Coltsfoot wine, the other for making Horehound beer.

— WE are informed that Messrs. J. Weeks & Co.'s new invention—the HYDRO-CALORIC WARMING AND VENTILATING COIL, that was figured and described in our issue of March 21st of the present year—has obtained a first-class award at the Medical and Sanitary Exhibition at South Kensington. It is now fairly before the public; and those interested in sanitary matters will have a good opportunity of judging of its merits, as it is being fixed at some very extensive works, among others the New Medical Schools, Charing Cross Hospital, the Bishop's Down Grove Sanitarium at Tunbridge Wells, and the Stockton Road Schools at Sunderland, and at numerous private mansions in the country.

— THE Directors of the ROYAL BOTANIC INSTITUTION OF GLASGOW having been enabled to reconstruct the "Kibble Palace" within their garden as a temperate plant house or winter garden, and to commence the erection of a new range of plant houses to replace the existing ones, have resolved, in view of the furnishing of these houses, that the practice of selling plants and flowers and of supplying plants for decorative purposes from the garden shall, after 1st August, 1881, be discontinued. In taking

this step, the Directors are confident of having the support of the shareholders, subscribers, and the general public. By the system at present carried on the garden is continuously deprived of its choicest flowers and finest plants to meet the demands of purchasers, and the hiring-out of decorative plants leads to very serious injury to the specimens. The Directors believe that the announcement of this resolution will materially benefit the garden, and they anticipate that it will lead to increased liberality in the way of donations of plants and seeds from those interested in the institution. Moreover, as the institution will now cease to compete in the market with nurserymen and florists, the Directors trust that the characteristic generosity of these gentlemen towards public gardens will be extended to this institution, and that it will receive from them specimens not only of known and familiar plants, but also of novelties, as they are from time to time introduced. Contributions of plants and seeds are at all times gratefully acknowledged by the Directors, but at the present juncture will be especially welcomed, and the Directors earnestly solicit donations from those who have it in their power to give. So far as practicable, the Directors are prepared to make exchanges of plants and seeds, and they confidently look for increased support from the public in their endeavours to make their grounds a botanic garden worthy of the city.

#### SINGLE v. DOUBLE FLOWERS.

IF "SINGLE-HANDED" has been misunderstood he has himself to blame. The tone of his communications has been to exalt single forms at the expense of those that are double, the normal types of flowers as opposed to those which have been improved under culture. When a man affirms that in ninety-nine cases out of every hundred the addition of more petals to a perfectly formed flower has been to destroy beauty—when he unhesitatingly says that "the simple wild flowers are more lovely by far than even our favourite garden varieties"—when he writes an article in praise of a bouquet of weeds, and winds up by saying that "altogether it would be difficult to match our bouquet with all the wealth of the garden from which to choose"—has he a right to say that his "observations have been misunderstood?" With regard to Hollyhocks, though I would not say the individual flowers are beautiful singly, yet the Hollyhock is as a decorative plant unique in the effect it produces, double varieties being more showy than single ones. Now, might I ask why your correspondent prefers the double forms of Pinks, Picotees, and Carnations to those that are single? and why are double Primulas and Azaleas inferior to single forms?

Is not the answer to the query "What is a cultivated and what a wild flower?" rather puzzling? I grow a great many native plants in our border; they are doubtless wild flowers, and as certainly cultivated. I do not object to their being called wild flowers even in that position; but it is rather strange to place cultivated exotics in the same category. The term "wild flowers" has certainly a meaning, and embraces a defined number of plants, but few apply that term to *Eucharis*, *Pancreatium*, *Odontoglossum*, *Epidendrum*, or *Aquilegia chrysantha*. The reference to the cost of collecting and cultivating these and other tender exotics is quite beside the mark, and does not affect the question of beauty in any way. Either these are more beautiful—as your correspondent in his last communication allows they are—than the native flowers of which the bouquet was composed, on their own intrinsic merits, or they are not. As to selecting *Odontoglossum* on the same lines as myself, if he does he will go contrary to his previously expressed ideas on this matter, as at page 392 of last vol. the practice of selecting *Odontoglossum Alexandrae* in the forms which approach nearest to the circular is condemned as being "false" and "bad in taste." I decidedly prefer a broad-petalled variety.—R. P. BROTHERSTON.

AT page 158 of your much-respected Journal a writer signing "SINGLE-HANDED" mentions my name in an improper manner. He says, "I never yet proposed the banishment of a single garden flower, yet Mr. Shirley Hibberd, in his lecture on the Carnation, goes out of his way to say that it has been proposed to abolish them all. It is certain either that that gentleman has not read my paper or has done me injustice in misrepresenting me. Others have honestly differed from me, or rather from what they have fancied my ideas to be." It may be matter of opinion

whether I went in my way or out of my way in vindicating the theory of floriculture in a lecture on the Carnation; but as a matter of fact, your correspondent was not in my mind when I deplored the folly of those who profess to regard florists' flowers as ugly lumps. Your correspondent may be sufficiently conscious of his own importance to suppose it impossible for anyone to discourse on the subject without referring to *him*. I really did not refer to any existing individual of any size or shape, but only to a mythical Caliban, the child of Nature, who loves water with berries in't. For me and my purpose he is an abstraction, and I deny the right of your correspondent to appropriate to himself the characterisation.—SHIRLEY HIBBERD.

#### ROYAL HORTICULTURAL SOCIETY.

AUGUST 23RD.

FALLING on the eve of the Great International Show at Manchester, this could not be expected to be a large meeting; nevertheless, though comparatively small it was a very interesting gathering, both fruit and flowers being well represented, and the prizes offered by Messrs. Ewing & Co. of Norwich for collections of twenty-four varieties of sprays of hardy trees and shrubs were competed for.

FRUIT COMMITTEE.—Harry J. Veitch, Esq., in the chair. Three very handsome bunches of white Grapes of a new variety were sent by Mr. Ollerhead, gardener to Sir H. W. Peek, Bart., Wimbledon House, named Ollerhead's White; the bunches were massive in size and the berries fairly large. In appearance the bunch is not unlike Foster's Seedling, but with Muscat-shaped berries. The Committee considered it a very promising Grape, and desired to see it again later in the season to test its keeping qualities. We are informed that the Vine that these Grapes were cut from carried a crop of fourteen similar bunches. Mr. Woodbridge, The Gardens, Syon House, sent a dish of Cherries named St. Margaret, an intensely black fruit, and particularly sweet, for which a letter of thanks was awarded. Southwood Gem Melon was exhibited by Mr. R. Roper, gardener to W. Hughes, Esq., Southwood House, Highgate, but the Committee passed it as unripe. Mr. Wilkinsou, gardener to Viscount Gage, Firlie Place, Sussex, sent several Melons, which were also passed. From Mr. Thos. Rivers, Sawbridgeworth, came a dish of Pears named The Beacon, of the Windsor type, but wanting in flavour. Potato Multum in Parvo was sent by Mr. Nesbit, gardener to Sir Thos. Whichcote, Bart., Aswarby Park, Sleaford, which the Committee recommended for a trial at Chiswick. A very fine box of Ecklinville Seedling and Duchess of Oldenburgh Apples, also some Tomatoes, were exhibited from the Royal Horticultural Society's Gardens, Chiswick.

FLORAL COMMITTEE.—James McIntosh, Esq., in the chair. Mr. T. Riches, The Grove Nursery, Tooting, staged about fifty varieties of hardy herbaceous plants, including *Statice latifolia*, *Artemisia procera* Fisheriana, *Stenactis speciosa*, *Dactylis glomerata* elegantissima aurea, *Rndbeckia Newmanni*, *Centranthus rubra* and *Centranthus rosea*, *Campanula ranunculiflora* flore-pleno, *Campanula carpatica* and *carpatica pelviformis*, *Helianthus multiflorus*, *Dracocephalum Ruprechtii* and *D. peregrinum*, *Asperula hirta*, *Gypsophila paniculata*, and *Castilleja indivisa*, &c., for which collection a vote of thanks was deservedly awarded. Two pots of a new white *Lobelia* named compacta Bella came from Mr. James McKenzie, Wensley Rectory, Bedale, York, to which a vote of thanks was awarded. A cultural commendation was awarded to Mr. Balchin, Hassocks Gate Nursery, Keymer, Sussex, for *Reseda odorata* prolifera alba, previously certificated—a white-flowering Mignonette bearing innumerable panicles of flowers. Mr. Ware, Hale Farm Nurseries, Tottenham, sent a single *Dahlia* White Queen, which is very valuable for border decoration and for affording cut flowers. Messrs. Hugh Low & Co., Clapton Nursery, sent two plants of *Odontoglossum Alexandrae* to show the branching character of the spikes, which were produced in the cases in transit as imported from abroad. A vote of thanks was awarded. From Messrs. Veitch & Son came *Lælia Sedeni*, the result of a cross between *Cattleya superba* and *C. Devoniensis*, with six flowers; *Ixora Chelsoni*, a garden hybrid of a salmon buff colour; also *Ixora Westii* hybrida odorata amboynensis, almost white when the flowers first open, but changing to pink; good habit and very distinct. From the Society's gardens came a large collection of Dahlias principally of the Pompon type, a collection of *Ceanothus*, and *Begonias ascotensis* and *Martiana*.

Certificates were awarded for the following plants—

*Mascarenhaisia Curnowiana* (Lowe).—A *Rhynchospermum*-like plant with rosy pink star-shaped flowers, and apparently a free grower.

*Mormodes armenaicum* (Bull).—In colour a salmon orange, and carrying twenty-four flowers.

*Lilium auratum cruentum* (Bull).—A very fine form, having the shape of the flowers of *L. auratum*, with the markings of *L. lancifolium*.

*Centaurea ragusina Russellii* (Russell).—A compact form of the *ragusina* type, but less divided in the foliage.

*Coleus Edith Sentance* (King).—A most striking variety, with dark velvety serrated edges and bright maroon centre.

A second-class certificate was awarded to *Gloxinia Mrs. Rapley* (Rapley).—Rich crimson, of velvety texture.

For the prizes offered by Messrs. Ewing & Co., Eaton, Norwich, for a collection of shoots or twigs of twenty-four varieties of trees and shrubs hardy in British gardens, the degree of hardiness to be taken into consideration in awarding the prizes (first prize £2, second £1), there were only two competitors. Mr. J. W. Moorman, gardener to Miss Christy, Coombe Bank, Kingston-on-Thames, secured the premier award with the following collection:—*Comptonia asplenifolia*, *Retinospora obtusa aurea*, *Abies nigra*, *Mahonia aquifolia*, beautifully fruited; *Retinospora plumosa aurea*, *Osmanthus ilicifolius*, *Thuja borealis*, *Aucuba japonica*, *Cedrus atlantica*, *Picea Nordmanniana*, *Hydrangea paniculata grandiflora*, *Cercis siliquastrum*, *Sambucus laciniatus*, *Taxodium distichum*, *Acer Negundo variegata*, *Cydonia japonica* in fruit, *Spiraea arifolia*, Variegated Sycamore, Waterer's Holly, Variegated Snowberry, Golden Yew, *Thuja gigantea*, Japanese Privet, and the Fern-leaved Beech. Mr. Morse, nurseryman, Epsom, secured the second prize, and exhibited *Retinospora pisifera*, *Corylus Avellana purpurea*, *Ericas vagans* and *vagans alba*, *Rosa rugosa*, *Retinospora leptoclada*, *Ligustrum ovalifolium robustum*, *Spiraea Douglassi*, *Acer colchicum rubrum*, *Acer Negundo variegata*, *Catalpa syringæfolia alba*, *Spiraea Fortunei*, *Veronica Traversii*, *Hydrangeas paniculata* and *paniculata grandiflora*, *Magnolia grandiflora*, *exoniensis*, &c.

These contributions made a very interesting display, and were a rather important feature of the meeting.

#### CUCUMIS PROPHETARUM (GROSSULARIOIDES).

THOUGH not by any means a novelty, the Gooseberry Gourd is seen in few gardens, and is known by few gardeners except where such old and interesting plants are valued. To most botanists it is indeed well known, at least by name, for it was one of those which Linnæus described in his terse but graphic style. Thus the plant is invested with some historical interest; but in addition to that it possesses some beauty, especially when well grown and tastefully trained.

The aptness of the popular name is at once perceived when the fruit is examined, for the small oval or globular gourds are studded with short spine-like protuberances exactly suggestive of some hairy varieties of Gooseberry. In size, too, they are nearly equal, and when the fruits are not fully ripe there is a further resemblance in the peculiar green tint. The longitudinal and regular streaks

Fig. 32.—CUCUMIS PROPHETARUM.

are, however, a great mark of distinction if there were any danger of confusing the two, which is scarcely possible even by the most superficial and unbotanical observer. When the fruits are fully matured the streaks are alternately dark green and yellow, the comparative difference in hue being well indicated in the woodcut, the lighter streaks representing the yellow ones.

Like most of its race this *Cucumis* requires a stove temperature to ensure its success, and being an annual seeds must be sown every year, preferably early in the spring, to obtain plants for fruiting in the summer. Moderately light and rich soil is needed, with abundant supplies of water during growth. One of the most effective modes of training is to take a clean stem to the height of 18 inches or 2 feet, and then train the shoots horizontally either along a string or so as to cover a flat trellis, from which the fruit will hang, and can then be seen to the best advantage.

#### HONG KONG.

(Continued from page 157.)

¶ [ON entering the harbour by either the eastern or western of its islet-studded approaches the first impressions made upon a new arrival are neither so deep nor so favourable as those which succeed after a period passed in quiet residence and circumspection. In

this respect, however, I do not believe that Hong Kong is peculiar. The "globe trotter," the transitory visitant scouring from place to place with a circular ticket, putting his head inside each and glancing round, and then posting on to the next stage with his head whirling from the jumble of undigested impressions he has received, is about the last person whose word should be accepted regarding the comparative merits of the spots he has touched at. The natural and social features of a place must be known, distinguished, and assorted before an opinion of their value as compared with those of another can be reliably formed.

The aspect of the surroundings of Hong Kong strikes you at first as being a little lowering and sombre on the island side and harsh and bare on that of the mainland, where the yellow soil of Kowloon peninsula and of the neighbouring foot-hills glares obtrusively forth with but a very partial alleviation of verdure. This, however, is a defect to which the eye becomes accustomed, and from the Hong Kong side is much tempered by the blue sea which lies between. Before landing, too, no idea can be formed of the true extent of the town, its endless winding roads, its hanging gardens, and its labyrinthine Chinese quarters, where 160,000 Celestials are by dint of British authority kept in a condition of, to them, quite unnatural cleanliness. The general aspect is of a long frontage of imposing white Italianesque warehouses, running for a distance of about two miles along the edge of the water;

while over them the other houses seem to rise in ever-narrowing terraces, until at a distance of about 200 feet above the harbour level they break up and disperse into scattered shining bungalows perched upon arduously hewn sites, and straggling up the peak in solitary or duplicate grandeur. Supreme over all towers the sombre green peak, in height about 1800 at the point where the signal-staff can perhaps be seen flying—the intimation of some approaching mail steamer; and more towards the centre of the island, where the hills sink to a height of from 12 to 1400 feet, may be perceived, like tiny toy houses, the residences of those who prefer the cooler and mistier regions of the upper air. Should the new-comer, however, arrive during the season of the south-west monsoon which blows from April to September, it is possible that a heavy combination of mist, clouds, and rain will for a while conceal from his view not only the peak and its adjacent hills, but even the higher residences of the town, and he may perhaps have to disembark in such a downpour of rain as will almost wash holes through his umbrella.

The first act of the stranger is to commit his baggage to two, or, if necessary, four Chinese coolies, each wearing little besides a loin cloth and an enormous pagoda-crowned hat the size of a small umbrella. One striking feature about them is the extraordinary dimensions to which their calves have been developed by the exigencies of their calling of carrying great weights. The burdens these toilers will transport up gradients which an unencumbered European very reluctantly scales are something quite astounding, while on level ground they are proportionately heavier. Whatever luggage our traveller may have is very quickly slung upon a thick bamboo pole by these experts, who trot off with it through the grimy ugly throng of people on the quays, leaving its owner to follow in a light bamboo sedan chair, painted green, and borne on the shoulders of two other coolies of less stalwart dimensions and more abundant raiment.

The "chair," as it is locally termed, is a great Hong Kong institution, and one with which a new arrival cannot fail to make a speedy acquaintance. It stands to the Europeans, and indeed to everybody, in place of every other kind of conveyance, as it is the only one of which the hilly nature of the town admits, and though often needlessly used by persons who would do better to walk, is occasionally quite a necessity. Every lady has a private chair, so have most married men; and self-indulgent bachelors, particularly fat ones, are not ashamed to own them. On Sundays the cathedral is beset with chairs and couples of attendant coolie boys wearing the distinctive uniforms of their employers, whom they have deposited and are waiting to carry away when service is over. There is, perhaps, no other place where a small society of Europeans are to be seen in a more orientally foreign environment and amid more beautiful natural surroundings than at the meeting and dissolution of that congregation of chairs on a Sunday in the summer season. There are Chinese, there are tall dusky red-turbaned Sikhs policemen, there are English naval and military officers in tropical uniform, civilians in white, civilians in black, civilians with bell-topper hats, low felt hats, mushroom hats and helmets, ladies in every degree of clothing from black silk to airy tarlatan; while around all is intense sunlight, moisture-dripping trees, white-gleaming buildings, soft green sward, a smiling harbour covered with shipping of every nation, and the solemn strains of the old sacred home music pouring through the doors and windows of the cathedral. But though useful as an aid to religion, the chair is much more indispensable as a means of transport to the halls of pleasure. Such is the nature of the Hong Kong climate for five months of the summer, that to walk any distance in dress clothes, even on level ground, would result in your presenting yourself before your host or hostess with woefully limp shirt cuffs and shirt front, while to scale 300 feet or more to the higher residences of the town would be utterly destructive of any conventional stiffness of linen. Hence for such expeditions the services of two hired coolie boys and a chair are absolutely necessary. You are at first very much struck by these Alpine ascents on the shoulders of natives, especially if they wheeze a little, as they do to impress and excite the liberality of new comers; but in time, as the muscles of your legs soften your heart hardens, and you view the panting coolie with equanimity. The mystery to me is how these coolies can struggle up such heights with a mere moderate 150 lbs. specimen of humanity like myself without breaking their hearts. When, however, you see four of them jogging up to the peak, a height of 1200 feet on two mules, and bearing some 220-pounder incarnation of ponderosity, reason and physiological knowledge fail in explaining the constitution of the Chinaman, and you can scarcely help wondering whether he is a part of the organic creation at all, but not rather some marvellous automaton cunningly devised by Providence for the special benefit of the European.

It is over the "prayas" or quays that the newly disembarked visitor must approach the better parts of Victoria. These, like the rest of the town, are composed of solid granite, and here and there at low tide may still be seen the wreck of the old praya torn up in the great typhoon of 1874. In that convulsion, among innumerable other casualties on sea and shore, two steamers were dashed by wind and wave almost upon the warehouse fronts, and their shrieking occupants drowned under the very windows and within earshot of the cowering inhabitants. For days afterwards dead bodies were picked up everywhere, and it has been roughly stated that at least eight thousand of the Chinese boating population then perished. Now the praya is restored, and the boating population swarms along the edge in more than its pristine vigour. There you can see countless sampans each containing a family consisting of a haggard old father or mother or both, and from two to four children. In that cramped and unstable household contrivance they eat, drink, sleep, have their being, and will probably die if another typhoon does not first overtake and tumble them out into a watery grave.

Along the prayas for a distance of a mile and a half there is nought but hurry and bustle: great steamers coaling or discharging cargo, coolies running hither and thither with enormous bales of merchandise swinging between them, and a heaving mass of sampans bumping against each other under the stone parapets of the quays, from which proceed the high-pitched metallic tones of the owners asking in broken English if you "wantehee saampaan." Up and down the roadway passes an ever-moving throng of squalid wrinkled-looking men and women with garments singularly alike, consisting of very loose-fitting jackets and trousers of a dirty blue or brown colour, the women being distinguishable from the men by having their hair not "in queue," but plastered down and flattened out into two stiff protuberant waves on each side of their faces. Here and there are groups of Chinese urchins, fit subjects for the London School Board, playing at marbles, which they throw by placing the stone before the second finger of the right hand and drawing it back with the first finger and thumb of the left like a catapult. "One touch of nature makes the whole world kin," and I have often felt the contempt with which I regarded these sinian-looking little creatures relax on viewing the childish gaiety, eagerness, and altercations with which they pursue their sports.

A great feature on the prayas, and indeed in all Chinese streets, are the confectionery stalls, where are displayed peculiar small variegated cubes or slabs of what appears to be a mixture of sugar and paste, and covered with hieroglyphics, which may possibly attract a European to try the experiment of putting them into his mouth and out again. Itinerant or localised restaurants, too, are visible at very short intervals, where the most extraordinary-looking soap-shaped kinds of white and yellow batter are vended, after having been split up and fried in a bubbling pan of liquid fat. At other points are kitchens, where whole or divided fish, fowl, rabbit, and especially sucking pig, are to be seen hanging up ready for direct transport to the family tables of their patrons. The Chinaman seems to desire none of that privacy at meal times which Europeans prefer. If he is of the poorer class he will squat down at an eating stall or at the corner of the street, and ply his chopsticks regardless of a whole crowd of admiring Europeans. If he is well to do he still sits down with the male portion of his family and his employes round a circular black table in the middle of his shop, leaving the door wide open to the street. The operation of the chopstick is very disappointing, being by no means of that rapid juggling nature which one has been led to expect. The eater takes up a small dish or bowl full of rice, arranges some pieces of meat upon it, and then, lifting it close to his mouth, shovels the contents in with the chopsticks. Women of the better and reputable classes are never seen eating and but rarely walking in public. They appear to be a repressed and spiritless class, looking at everybody and everything out of doors with a stupid stolid gaze, which contrasts remarkably with the piquant genial demeanour of the few Japanese women that are to be seen around. Occasionally you will meet a China woman in her blue jacket and trousers and starched coiffure coming hobbling along on what looks exactly like a donkey's two hind hoofs. These are the tiny feet we have so often heard about, and are one of the most hideous of the many sacrifices which female vanity and tyrannical custom have offered up at the altar of Fashion. The practice is, I am told, decaying.—A WANDERER.

(To be continued.)

PETRIFIED FORESTS.—In 1871, when the writer of this spent some weeks in the Rocky Mountains, the petrified remains of a forest of Redwood, Oak, and other trees petrified, thrown up from

a lower level by volcanic action, and deeply imbedded in tufa, still with many portions of trunks some feet above the surface, were still to be found midway between Golden Pass and the Ute Pass, near Pike's Peak. It is now said to have disappeared, at least so far as anything is to be seen above the surface. It is said that another of these wonderful pre-historic series of remains in Sonoma, California, is fast disappearing before the zeal of relic hunters. It is to be regretted that these wonderful remains of the mysterious past could not be preserved, and it may not yet be too late for the State governments in which they are to be found to do something towards that end. The one in Colorado must have been buried very deep by the volcanic dust, as at the time the writer refers to one of the trunks was hollow, and a string and a stone at the end was let down and found to go many feet beneath the surface. No doubt if this old forest could be dug out to the original surface of the ground many interesting relics of plants and animals might be brought to light. Some exposed strata near, thrown up at the time the trees were destroyed, exhibited numerous skeletons of fish, showing that life at least of a high order of creation existed when these Redwood trees were growing there. There are now no Redwood trees living in Colorado, nor any Oaks beyond one shrubby species, *Quercus undulata*.—(*American Gardeners' Monthly*.)

#### WINTERING SUMMER-STRUCK ROSES.

IN answer to "L. T." who, having inserted Rose cuttings as directed, requires information concerning wintering them, I have to say that summer-struck Roses require some protection during such winters as the last two, about as much as is given to autumn-sown Cauliflowers being quite sufficient. If they do not show much sign of growth by the middle of September they will not be likely to become much crowded where they are, and may be protected in very cold weather by means of a few stakes and some litter or a mat, making the bearers so secure that a snow storm will not break them down. If they show signs of vigorous growth they may be either planted out in the cold frames, or potted in small pots and plunged in ashes with the rims half an inch below the surface. The lights should be kept off except in frosty weather, when they may have some litter thrown over them; and if covered in this way for a month at a time, so long as frosty weather continues, they will take no harm.

In the absence of glass any kind of protection may be made to answer the purpose, so long as not more than 8° or 10° of frost can reach the young plants, and they can be freely exposed on all occasions except when the weather is severe.—WM. TAYLOR.

#### WHAT PLANTS USE.

(Continued from page 84.)

THE MINERAL MATTERS.—We have seen that plants require carbon to build their structures, and that they find it in the air. It is probable also that some enters the roots of plants also in the form of carbon dioxide, either in combination or by itself, for all fertile soils containing the decaying remains of vegetable or animal matters constantly produce it. We have seen that plants need hydrogen and oxygen, and that these elementary gases are found in and manufactured by the plants from water. Other two gases are required—nitrogen and chlorine. Nitrogen is largely present, 0.29 per cent. of the whole bulk in the air in a pure form, and intimately mixed with the oxygen, which it serves to dilute. In this form it is of no use to plants. It is only when in combination with other elements that it becomes of use. For instance, ammonia—say as sulphate of ammonia, which is a common manure—is found partly in the air, and also in all fertile soils in different combinations. Ammonia is composed of nitrogen and hydrogen; 17 lbs. of ammonia contain 14 lbs. of nitrogen and 3 lbs. of hydrogen.—(*Agricultural Chemistry and Geology*, ninth Edition, page 29). Nitrogen is also available as plant food in the form of nitric acid. This is generally in combination with some alkali, such as potash, soda, or even ammonia. Nitrate of soda is a common manure, which owes its chief value to the nitrogen it contains. Saltpetre or nitre (nitrate of potash) is another familiar form. Nitric acid is composed of nitrogen, hydrogen, and oxygen. Nitrates are very soluble in water, and when dissolved enter plants by the roots readily. Nitrogen in some such form is necessary to plants. Out of them the plants form their nitrogenous or flesh-forming compounds.

Plants find ammonia in the air and in the soil. Many physiologists consider that the amount taken from the air is so small as to be of no consequence. We think they are wrong in this, for although the amount in the air is small the amount required is small; at the same time nitrogen in some form in the soil

promotes not only a rapid growth, but the formation of a greater per-centage of flesh-forming matters in the plants to which it is applied. The per-centage of nitrogenous compounds in Cabbages, Cauliflowers, Wheat, &c., varies a little, but the greatest per-centage is always obtained when the plants are growing on soils which contain plenty of nitrogenous manures. There is one exception to the rule in the case of the Leguminosæ—Peas, Beans, Vetches, and Clover, although containing more nitrogenous matter in themselves than any other plant almost, yet leave the soil richer in nitrogen than they find it, and are not benefited but the reverse by an application of ammonia. Indeed they fill the soil with ammonia to such an extent that it becomes "Clover-sick" or "Pea-sick," and they refuse to thrive on the same soil till the ammonia is removed by a different crop.

There is another fact worth mentioning in connection with manures rich in nitrogen. The nitrogen of nitrate compounds is much more easily washed out of the soil than that of ammonia compounds. Acids are very easily washed out of the soil while alkalis are retained. Soil manured with sulphate of ammonia—the value of which depends on the ammonia—will part with the sulphuric acid and retain the ammonia. In the case of nitrate of soda—the chief value of which depends on the nitric acid—the nitric acid will go and the soda remain if the ground is subjected to washing rains; nitrates should therefore be applied in moderately showery weather to growing plants. The showers will carry them to the roots, when they will be used up at once and before the season is done. Chlorine is the only other gas we have mentioned. It exists chiefly as a chloride of something, such as common salt (chloride of sodium), which is a compound found in greater or lesser degree in all plants.—SINGLE-HANDED.

(To be continued.)

#### CLAY CROSS FLOWER SHOW.

AUGUST 16TH.

THE twenty-fourth annual Show was held in the park adjoining the residence of C. Binns, Esq. This Show well deserves the patronage that is bestowed on it by people in the immediate neighbourhood, and the excursion trains from Sheffield, Nottingham, Derby, and other towns showed the estimation in which it is held. In the cottagers' class the vegetables were remarkably good and the competition keen, five prizes being given in each class. In the amateurs' class also the exhibits throughout were very good, Grapes especially. The Black Hamburgs from Mr. Ashmore would have taken at least second honours in the gardeners' class. The exhibits in the open class were, on the whole, of fair quality, particularly the plants.

Plants.—The five substantial prizes offered for twenty plants—consisting of six foliage plants, six Ferns, and eight in bloom—brought out five competitors, Messrs. Cole & Sons of Manchester being first with a meritorious group. The flowering plants, which were all very good, were *Erica amula*, *E. Marnockiana*, *E. Turnbulli*, *Allamanda nobilis*, *A. grandiflora*, *Ixora Fraserii*, *Vinca alba*, and *Dipladenia amabilis*. Mr. Ward, gardener to T. H. Oakes, Esq., Riddings House, Alfreton, was second, staging good plants of *Dicksonia antarctica*, *Cyathea Smithii*, *Gleichenia rupestris glaucescens*, *Kentia Fosteriana*, *Dasylium glaucum*, a fine plant of *Croton Challenger* well coloured, *Croton Johannis*, *Ixoras Fraseri* and *Dixiana*, *Erica Thomsoni*, *E. Austiniana*, *Statice profusa*, *Clerodendron Balfourianum*, and *Kalosanthes coccinea*. Mr. Cypher of Cheltenham was third; Mr. Dore of Clay Cross fourth, the latter with very healthy plants, though rather small; and Mr. Anderson, gardener to W. Walker, Esq., Cromford, being fifth. These hundred plants were all staged in one large circular group, and they had an imposing effect. For six flowering plants Mr. Haslam of Hardstoft was first, followed by Mr. Lyon, gardener to Lady Ossington, Newark; Mr. Swanwick being first for three with healthy plants of *Eucharis amazonica*, *Allamanda nobilis*, and *Bougainvillea glabra*. For six foliage plants Mr. Lyon obtained chief honours, closely followed by Mr. Swanwick. The same order was obtained for six Ferns. Fuchsias, Balsams, Begonias, and Geraniums were not very good. Mr. Anderson was first with six Gloxinias, Mr. Webb with six table plants. Mr. Ward was first with four Palms; and Mr. Proctor, nurseryman of Chesterfield, first with herbaceous plants and bedding plants. Four groups for effect were staged, Mr. Ward being first with a bright arrangement, Mr. Lyon a good second, Messrs. Dore and Webb third and fourth.

Fruit.—The fruit was generally good, though the prizes were small. For collection of eight dishes Mr. Ward was first with good Muscat of Alexandria and Madresfield Court Grapes, a Queen Pine, a Colston Basset Melon, Barrington Peaches, Elruge Nectarine, Black Turkey Figs, and Jefferson Plum. Mr. Webb was a close second, having a very good Pine and Peaches with fair Grapes. Two Pines only were staged, Mr. Webb being first; the other was not considered worthy of a prize. Amongst seven collections of black Grapes Mr. Ward was first with well-finished bunches of Madresfield Court; Mr. Lyon second; and Mr. Egg'estone, gardener to C. Binns, Esq., third, both with fair Black Hamburgs. Five collections of white Grapes were staged, all Muscats, which were in better condition than the black

Grapes. Mr. Swanwick, gardener to Col. Seely, Sherwood Lodge, first, Mr. Ward second, and Mr. Frith third. The latter had the best Melon, Mr. Ward being second. Mr. Lyon was first with Peaches and Nectarines, the former very fine. Messrs. Webb and Ward each received a second prize. Mr. Lyon was also first with a collection of hardy fruit, followed closely by Mr. Webb.

Cut flowers were not very good. Mr. Proctor secured most of the chief prizes for Dahlias, Roses, Gladioli, and Hollyhocks; Mr. Ward being first with eighteen bunches of stove and greenhouse flowers, and for eighteen bunches of herbaceous flowers. Mr. Dorc was first for a bouquet, and Mr. Haslam held a similar position for a bouquet of Everlasting Flowers and Grasses.

An interesting and attractive group of plants was sent from Chatsworth; several plants of *Disa grandiflora*, *Pancreatiums*, and well-flowered *Ericas* being especially noteworthy.—J. G.

#### PORTRAITS OF NEW AND NOTABLE PLANTS.

**HYMENOCALLIS HARRISIANA.** (*Nat. ord.*, Amaryllidaceæ).—“This is a very distinct species of *Hymenocallis*, remarkable for its dwarf habit, few-flowered umbels, and leaves not truly petioled, as in *H. speciosa* and *H. guianensis*, but narrowed gradually from the middle to the base. It was originally described by Dean Herbert from specimens imported from Mexico about the year 1840, by T. Harris, Esq., of Kingsbury, after whom it was named. It was never figured, and appears to have been soon lost from cultivation; but Herbert's description is so full and clear, that when we received specimens at Kew in the summer of 1879, almost simultaneously from Colonel Trevor Clarke and Mr. Elwes, there was no difficulty in identifying it. A plant which has been distributed under the garden name of *Hymenocallis uniflora* is clearly a mere form of the same species.”—(*Bot. Mag.*, t. 6562.)

**HYPERICUM CORIS.** (*Nat. ord.*, Hypericaceæ).—“In a very early volume of the ‘Botanical Magazine,’ published in 1792 (and in other works), a plant is figured under the name of *Hypericum Coris*, which has been rightly distinguished by Willdenow and all subsequent authorities as a different species from the Linnæan plant of that name, and called *H. empetrifolium*. This and the fact that the two plants are frequently confounded in gardens, both being now commonly cultivated, renders it very necessary that a good figure of the true *H. Coris* should appear in this magazine. The differences between these plants consists in *H. empetrifolium* being a more shrubby though not a bigger plant, with very short sepals which are spreading in fruit, and in having broader and less oblique petals. They have further a very different geographical distribution, *H. Coris* being dispersed from the South of France to the Tyrol, and occurring in many parts of Italy, whereas *H. empetrifolium* is confined to the Grecian Archipelago and neighbouring shores of Greece and Asia Minor. With regard to the fact that the Crimea is assigned to *H. empetrifolium* in this magazine, it is unquestionably an error, as neither of the two species extends into the Russian dominions. The late Mr. Lee, who is the authority for this statement, probably received the seeds from some voyager who, on returning from the Crimea, had collected them in the Greek islands. The true *H. Coris* was introduced into England as early as 1640, and is figured in Parkinson's *Theatrum*.”—(*Ibid.*, t. 6563.)

**NARDOSTACHYS JATAMANSI.** (*Nat. ord.*, Valerianaceæ).—“This interesting plant is unquestionably one of the Spikenards of the ancients, the history and identification of which have been much complicated by the long prevalent opinion that the word Spikenard referred to but one vegetable substance, and by the fact that Sir William Jones in his learned essay on the present plant was misled into referring its root to the foliage, &c., of a very different plant, which proved to be a species of *Valeriana*. Royle, who has summed up the history of the Spikenard of India with his usual care and learning, observes that Dioscorides described four kinds of Nard—the Syrian, the Indian (also called Gangites, from the river near which is the mountain which produces it), the Celtie, and the mountain Nard; and that a reference to the old Arabic and Persian works on the subject shows that the Spikenard or Narden is synonymous with Sumbul, of which four kinds are described, and that of these four the Sumbulhindee is the Himalayan *Nardostachys*, being the Sumbulool-teeb, or fragrant Nard of the Arabs, the Narden of the Greeks, the Nardoom of the Latins, the Balcher of the Hindoos, and the *Jatamansi* in Sanscrit. *Nardostachys Jatamansi* abounds in the loftier regions of the whole Central and Eastern Himalaya, extending from Kumaon to Bhotan, at elevations of 11,000 to 17,000 feet, inhabiting stony places, and varying in stature and amount of odour according to the elevation, specimens from low levels attaining 28 inches in height, with larger leaves and flowers and faintly scented rhizomes, whilst the more alpine forms are dwarf, more slender, smaller flowered, with very strongly scented

rhizomes. The odour of the plant is heavy, but not wholly disagreeable, and though, like similar semioctid drugs, highly appreciated by Orientals, it could never find favour amongst the Western nations of Europe. The rhizomes are collected in abundance by the natives of the hills, and used throughout the East in a dried state in unguents and as a drug; no allusion is, however, made to it in Drury's ‘Useful Plants of India.’ The species figured flowered in the herbaceous ground of the Royal Garden in September, 1878, for the first time in Europe.”—(*Ibid.*, t. 6564.)

**ÆCHMEA LINDENI.** (*Nat. ord.*, Bromeliaceæ).—“Next to *Billbergia*, *Æchmea* may fairly be considered the most effective genus of Bromeliads for decorative purposes. Of late years our knowledge of it has rapidly increased, and several fine new species have been brought into cultivation. Taking the genus in a broad sense, so as to include *Hoplophytum*, *Echinostachys*, *Pothuava*, and *Canistrum*, as it is treated in my Monograph in the ‘Journal of Botany’ above cited, we know now not less than sixty species, so that next to *Tillandsia* it is the largest genus in the natural order. The present plant was distributed by Linden in 1865, and was received by him from M. Libon, who discovered it in the province of Santa Catherina in South Brazil.”—(*Ibid.*, t. 6565.)

**CUSCUTA REFLEXA.** (*Nat. ord.*, Convolvulaceæ).—“Though seldom seen in cultivation, this curious plant was first introduced into England in 1823, when it was raised in Colvill's then celebrated nursery from seeds sent from the Calcutta Botanical Gardens, and figured in Sweet's ‘British Flower Garden’ as *Cuscuta verrucosa*. In the following year it flowered in Edinburgh Botanical Garden, from seeds sent from the Madras Presidency, and was figured and described in the ‘Flora Exotica’ under its proper specific name. It is a very common Eastern Asiatic plant, occurring in China, Japan, and throughout the Peninsula and the Gangetic valley, in Ceylon and the whole length of the Himalayas, ascending to 9000 feet in Sikkim, attaching itself to a great many different plants, and varying much in the stoutness of the stem, the most slender forms inhabiting the lower levels. On the banks of the river Soane in Bengal it has been seen clothing small trees with a beautiful web of golden cords studded with white sweet-scented flowers. *C. reflexa* is very easily cultivated. Sweet points out that the more juicy the plant is to which it attaches itself the stronger it grows, and says that the strong-growing species of *Pelargonium* suit it admirably. He adds that a plant raised in spring began flowering in September, and soon became entirely covered with flowers of a most delightful fragrance, somewhat resembling a mixture of Cowslips and Violets; and that a plant which had taken hold of the Ivy by Mr. Colvill's shop soon covered a great part of it, where it continued in flower till the very severe frosts, and ripened its seeds. The specimen referred to was obtained from Mr. Lynch of the Cambridge Botanical Gardens, who finds it flourish on *Pelargoniums*, and in contact with a bed of Tree Ivies it formed a mass 23 feet long and 12 broad, which was all killed by 6° of frost.”—(*Ibid.*, t. 6566.)

#### KITCHEN GARDEN.

CAULIFLOWER seed for producing plants to be pricked-out under handlights or frames on warm borders must at once be sown in an open situation, and not very thickly, so as to secure sturdy plants. Veitch's Early Forcing is a very desirable variety, and this year with us it was a fortnight in advance of any other, being very dwarf and compact, with beautifully white and delicately flavoured heads. Early London and Walcheren form a good succession. Young healthy Cauliflower plants may yet be placed out in good ground in a sheltered situation; they prove very useful if the early winter be mild. Onions and Spinach may still be sown, but the earlier after this the better. Continue planting Endive and Lettuce for successional crops, taking advantage of suitable weather to tie Cos Lettuce, which has a tendency even in the close-hearting varieties to become open at this time of year and onwards. Early Endive will also need tying; and in dry weather give a good earthing to early Celery, closing the soil well about the plants and keeping it from the centres. Afford liquid manure copiously to successional crops of these, and earth a little—only to induce a close growth of the heads—until the plants

are well advanced in growth. Sow Lettuce for transplanting to stand the winter for spring and early summer use. Stanstead Park is a good Cabbage variety, Lee's Hardy Green being also fine, and in Cos varieties Brown Bath (black-seeded) and Hicks' Hardy White are suitable.

Any spare ground should be planted with Coleworts, and preparation be made for planting early Cabbage. Ground that has been occupied with spring Onions answers well for this crop, and being in good condition no manure need be applied, merely pointing it over to secure an even surface, giving a dressing of two parts lime to one each of soot and salt, applying the mixture at the rate of half a peck per rod. This will induce a sturdy growth in the plants. They should be placed out as soon after this as possible, planting them about 15 inches apart in rows 18 inches asunder, or, if large heads are wanted, the distance must be increased by 4 to 6 inches each way. Globe Artichokes that have been two or three years on the ground have now ceased bearing and should be removed, and if young plants were planted early in spring they will now be bearing and will give heads for some time, yielding a good early crop next season as well as furnishing suckers. A supply of herbs should be cut when thoroughly dry and hung up in a dry airy place. Tomatoes must have all growths short of the flowering stage removed, keeping all lateral growth closely pinched or removed, so as to concentrate all the energies of the plant on the swelling of the fruit, that giving indications of ripening being detached from the plants and placed in a dry warm place under glass to accelerate the ripening process. Second early as well as the earliest varieties of Potatoes have completed their growth, and should be lifted at the first favourable opportunity, selecting those required for seed, which should be placed thinly in a cool airy shed, storing those required for use in a dark cool place. Varieties for winter use are not much grown in gardens, and very properly, as, owing to the richness of the ground required for the growth of high-class vegetables, the growth of the haulm is so rank that unless planted much wider apart than is necessary in poorer soil and more open situations they do not afford good results, and are sooner affected by disease. The crop should be lifted directly the disease appears in the haulm, for if left until this is much affected the mischief will be done.

#### FRUIT HOUSES.

*Vines.*—Late Grapes are well advanced in ripening where attention has been paid to starting them in good time, and assisting them at the starting and during growth, as indicated in former directions. Instead of having to maintain sharp firing in the dull short days of late September and October, as will be the case with houses that were started late in the spring, atmospheric moisture may now be gradually reduced, and well-ripened wood with highly finished fruit will be secured by the employment of sufficient artificial heat to maintain a circulation of dry warm air. Those Grapes about colouring must have a temperature of 70° to 75° constantly, advancing to 85° or 90° by day in favourable weather, giving a good soaking of tepid liquid manure to inside borders in the early part of the day, so as to allow of surplus moisture passing off before night. From this time until the Grapes are perfectly ripened a circulation of air must be secured day and night. Late Black Hamburgh Vines, the fruit of which is colouring, must not lack moisture at the roots, though the supply must be carefully regulated as the season advances. A temperature of 65° at night and 70° to 75° by day, with 10° to 15° rise from sun heat, will be all that is needed to ripen them. Give frequent attention to stopping lateral growths, but Vines carrying heavy crops may have a little freedom given the laterals to keep the roots active, which is one of the best preventives of shanking, but in no case must the laterals interfere with the due exposure of the principal foliage to light and air. Houses of ripe Grapes, the wood of the Vines being mature, need only have a little fire heat by day to admit of a change of air, examining the Grapes frequently, and remove decayed berries, and keeping the border in a moderately moist condition.

Vines from which the Grapes have been cut must not be neglected, but the laterals be closely pinched, and if there is any doubt about the maturity of the wood a warm dry atmosphere must be maintained until the wood is completely ripened. To insure the preser-

vation of the old foliage until this is effected an occasional syringing may be resorted to, to cleanse it from red spider. The Vines for early forcing must have the outside border protected from heavy rains; if ventilation has been fully provided for some time and the laterals have been kept well back the leaves will now have fallen, or, if not, shorten back some of the shoots, and by the middle of next month they may with safety be pruned. Any top-dressing or renovation of the border must not be delayed. Young Vines intended for fruiting next season should have a moderate shortening of the laterals, providing a circulation of dry warm air, especially if the wood is not already brown and hard, but on no account must the ripening of the wood be induced by a parchingly dry condition of the soil at the roots.

*Melons.*—Continue attention to former instructions as regards general treatment. Young growing plants, and those with the fruit swelling, should be syringed in houses facing south at about 3 P.M. and the lights closed, the temperature not advancing much over 90°, but in span-roofed houses facing east and west the operation may be deferred half an hour later. Shading can, if the plants are able to bear the sun without flagging, be dispensed with, but on no account must the plants be allowed to flag. As the days become shorter and the nights colder less atmospheric moisture will be necessary. If the latest plants are weakly supply liquid manure twice a week, but if they are vigorous do not apply any stimulant until the fruit is set and swelling, then earth-up with a good compost, and feed liberally until indications of ripening appear. Fire heat will be necessary to secure a temperature of 70° to 75° by day and on cold nights, falling to 65° in the morning. Persistent attention must be paid to fertilising the blossoms, maintaining a dry condition of the atmosphere to insure a good set, and if the weather be dull allow a circulation of dry warm air. Pits and frames must be closed early, and damp the plants lightly at that time on fine days, raising the fruits on pots so as to expose them to the sun when advanced for ripening. The last batch in these structures have set their fruit, and to encourage their swelling freely linings will be necessary to secure a bottom heat of 80° to 85°, and top heat of 70° to 75°, placing mats over the lights on cold nights. A much lessened degree of moisture will be necessary now that the weather is becoming colder, and this applies both to the soil and atmosphere. Fruit ripening can hardly be kept too dry, and a circulation of warm air secured by lining will improve the quality.

*Cucumbers.*—The autumn fruiters must have liberal treatment, adding a little fresh soil as the roots extend, encouraging surface roots, and preserving a firm condition of the bed. Syringe at 3 P.M., and close the house at the same time. Fire heat may be needed to insure a night temperature of 65° to 70°, and 75° by day, with an advance from sun heat to 80°, 85°, or 90°. Other plants require similar treatment as regards heat and moisture, keeping the growths fairly thin, and regularly stopped at one joint beyond the fruit, removing bad leaves and exhausted growths. In pits and frames be careful not to overcrowd the foliage, stopping the shoots a joint or two beyond the fruit. Be careful to avoid a cold moist atmosphere, which results in the fruit damping at the point. Afford linings to allow of ventilation to dispel damp.

#### PLANT HOUSES.

*Cinerarias.*—Plants raised from seed sown early must now be finally potted, 6-inch pots being most useful for general decoration, 7-inch pots for large specimens. Turfy loam with a fifth of thoroughly reduced manure is a suitable compost. Place the pots on ashes in a pit or frame, supplying water freely, and when the pots are filled with roots afford weak liquid manure. The plants should be near the glass, and have air freely, with slight shade from bright sun for a few hours at mid-day. Aphides must be kept under by fumigating moderately. Pot-off later seedlings, transferring to larger pots before they become rootbound. Detach suckers from named sorts, also double varieties, and pot singly in 3-inch pots, standing them on ashes in a cold frame, shading them until established.

*Primulas.*—Those from seed sown early must be transferred to 6 and 7-inch pots. Good fibrous loam, with a fifth of well-decayed cow dung and a sixth of sand, form a good compost. Afford good drainage, and pot them firmly. Place them on ashes in a pit or frame, and afford a slight shade from bright sun, ventilating freely, and

removing the first trusses of bloom. Later plants will need to be potted at intervals, not allowing them to become rootbound.

*Cyclamens*.—Old plants that have been in a cold frame on coal ashes will soon be starting into growth and should be turned out of the pots, removing any old soil not occupied with roots, and repot in the same size or a slightly larger pots, providing good drainage, and a compost of turfy yellow loam, a fourth of old cow dung or leaf soil, and a sprinkling of sand. They will do for a time longer in cold frames kept rather close, affording a slight shade from hot sun. Seedlings should be shifted into larger pots as they require it, being careful not to overpot, and in case of plants well advanced for bloom instead of shifting assist with liquid manure.

*Pelargoniums*.—Cut down the plants that flowered latest, having previously allowed the soil to become dry. They should be placed in a pit or frame, and not allowed much water until after fresh growth has been made. The earliest cut-down plants will be ready for shaking out, and should be attended to before the young roots are much advanced, and be careful not to have the soil very dry, or in reducing the balls there is danger of removing too many of the roots. Young plants will not require much reduction of the roots, but old plants as large as required may have about half their roots cut off. Turfy loam is the most suitable soil, a fifth of thoroughly decomposed manure being passed through a quarter-inch sieve and thoroughly incorporated with the loam, with about an eighth of sharp sand. For fancy varieties a little more sand may be added with a fourth of sandy peat. They can hardly be potted too firmly. Place them in a light pit or house, damping with the syringe every afternoon, giving plenty of air, and keep them clear of aphides by fumigation.

*Chrysanthemums*.—The plants must have supports and be attended to in tying to prevent their being damaged by wind. They require to be liberally supplied with liquid manure, or they cannot be expected to flower satisfactorily. The early varieties are now coming into flower, and if grown in 7-inch pots they are very useful for decorative purposes and conservatory decoration.

*Violets*.—If runners have been removed the plants of such varieties as flower in autumn and onwards may now be lifted and planted in the frames or pits they are to occupy during the winter. Give a good supply of water and they will become established in their quarters before the flowers are produced, not receiving so great a check as if moved when the blooms are appearing. Keep the lights off until frost.

*Orchids*.—Now the weather has become cooler the East India house must be kept moderately close. If the weather be dull reduce the moisture and have recourse to fire heat to maintain the night temperature at 65° and 75° by day, syringing the blocks and damping the house at three o'clock. *Aerides*, *Phalænopses*, *Saccolabiums*, and *Vandas* must still receive every encouragement, as any check will result in stunted growth. The shading must be withdrawn as soon as all fear of the sun scorching the foliage is past. Be careful that the sphagnum in which *Phalænopses* are grown in pots or baskets does not become sodden, or the leaves will soon be diseased. Dispense with shading on the *Cattleya* house, as light is of the greatest importance in ripening the pseudo-bulbs. Such plants as *Barkerias*, *Cattleyas*, *Dendrobiums*, *Epidendrums*, *Lælias*, *Oncidiums*, and many others produce weak deformed flowers if the growth is not well matured. *Calanthes masuca* and *veratrifolia* may now be repotted; and if the soil has become sour they should be shaken out, washing every particle from the roots in tepid water, repotting in a compost of equal parts turfy loam and peat, adding a little decayed cow dung and some charcoal the size of nuts well incorporated, affording efficient drainage.

## THE BEE-KEEPER.

### DRIVEN BEES FED INTO STOCKS.

A CORRESPONDENT, "J. M.," is rather unsettled on this question, having read lately in the Journal "that driven bees fed up in autumn usually have too much drone comb to make good hives next year, unless comb foundation be used;" and he wants to know if Mr. Pettigrew still thinks that the feeding-up plan is a good one. My opinion on this point remains unchanged. Generally speaking,

the most prosperous and profitable stocks I have had or seen have been fed with sugar. Many other bee-keepers, remarkably successful in reaping large harvests of honey, have a growing confidence in such stocks after many long years of experience. I know a very clever and intelligent apiarian—and who is nearly always first in his neighbourhood in the weight and health of his hives—who takes the honey from all his hives every autumn, and creates fresh stocks by feeding his bees. All this has been done without the use of artificial comb foundations. Such foundations if properly used would doubtless be helpful and profitable, but the facts mentioned now show that the practice of creating stocks in autumn by sugar-feeding is a good one, and will not be abandoned by bee-keepers of experience. Yesterday I obtained 2 cwt. of sugar to feed late swarms and driven bees, and I confidently expect that the driven bees lately hived will be my best stocks next season.

Now let me notice the fact that bees during the feeding process have a tendency to build too much drone comb. This tendency is common to all bees in hives not filled with combs. During times of great honey-gathering on the Clover and Heather, and especially before swarming, bees in such hives build far too much drone comb. Drone combs have larger cells than worker combs, and therefore in building them the bees have less work, fewer partition walls to erect; and hence, while gluts of honey are to be had, the bees instinctively build cells that give them the least trouble and that hold most honey. In hives not full of combs in spring bees usually build far too much drone comb; in doing so they anticipate the advent of young queens, and make full preparations for it. In the hives of second swarms less drone comb is built than is usual in the hives of first swarms, and this is doubtless owing to the fact that there is no likelihood of drones being needed in second swarm hives till the year following. Second swarms and turnouts are generally the most free from drone combs, and therefore are best for stocks, but often sugar-fed stocks have as little drone comb in them as second swarms, and therefore are unexceptionable for keeping as stocks. In creating them in autumn it is possible to glut and injure them by giving them too much syrup at once. If this be done drone and dumpy combs will be built, cells to hold honey will be built twice their usual depth, and thus the combs will be short and thick.

Our correspondent also wishes to know the size of hives used for sugar-fed stocks. The size of swarms to be fed should determine the size of the hives to be used. If a swarm or two united weigh 5 or 6 lbs., a hive 16 inches wide and 12 inches deep may be used. As it is desirable to have the hives nearly full of combs by autumn feeding, we advise our friend to err on the safe side by using hives not too large. The danger of having too much drone comb is very great in hives only half filled in autumn. The best ways of uniting bees and the houses that sell hives have been often noticed in this Journal.—A. PETTIGREW.

### LIGURIANISING—A CAUTION.

I HAVE had some experience of late with the above that I think may prove interesting to many apiarian readers. The first of this breed I procured was in May this year, which I united with a swarm composed of flyers from an old straw skep. In course of time I took another swarm from the straw skep, and sixteen days after I took another, but too soon as it afterwards proved, for the young queen from the straw hive had not been mated, and had left no eggs nor grubs. She being in a bar-frame I soon discovered she was not laying, and therefore had left the old skep desolate. So I began to mend matters in the following way, with these results. After my queen (black one) had been eight or ten days in the new hive and not laying, I took her out and put her back into the parent hive, and took my Ligurian (mentioned above) out of her colony and gave her to the newly-made hive, caging her for two days. At first the bees accepted her kindly enough, but on looking two hours afterwards they had "balled" her, and she was dead! During her confinement they had formed queen cells, and therefore did not require her services. I procured another Italian, and gave her to the same bees, with all care, cutting out all queen cells; and as the eggs were then too old I thought they would be glad of my offering, and to all appearance they were, and for about twenty-four hours all seemed well, but to my dismay she was found dead on the ground the next morning. Undaunted, I again sent for another Ligurian queen; but I determined not to give her to the queen-killing swarm, so I made one for her in the following way, which proved successful. I took five bars from different hives with all the bees attached. I came to the conclusion that the old bees would return to their respective homes and leave only young bees and brood. It was three or four days before there was any traffic out or in the hive;

but very soon it proved a strong hive with a laying queen. This, I believe, is one of the best and safest plans I have heard of.

To come to the caution, and to return to our hive without a queen, which would not accept either queen cells or eggs. I had, as a last resort, given them a comb of eggs, and I was every day looking for queen cells to be formed, but none was formed. At last I was much struck by seeing numbers of eggs in the cells. I then began to search for a fertile worker; but instead of that I found a fine young black queen. How came she there? I will try and theorise. The eight or ten days she had been in the bar-frame she had gone out on a trip, and returned to the bar-frame that she had before returned to from similar excursions. She was in the bar-frame when I gave my last queen, and had only met with her after some twenty-four hours, for the bees themselves seemed to be perfectly friendly towards the strange queen all day. I might have seen the black queen sooner, only I did not take out any frame but the one I gave them with the eggs, as I looked upon it as the source of all hope. So again I would say, Be cautious!—COMBER, *Co. Down*.

#### REVIEW OF BOOK.

*British Bee-keepers' Guide Book.* By THOS. WM. COWAN, F.G.S., F.R.M.S., &c. Illustrated, 135 pages. London: Houlston and Sons, Paternoster Square.

THIS volume is a fitting sequel to the little manual of the British Bee-keepers' Association, which is necessarily of an elementary character. It is designed to meet the requirements of those who use moveable comb hives, and, by ignoring the skep system entirely, dispenses with many chapters usually found in bee books, thus affording a great amount of instruction in the bar-frame system within comparatively small compass. Its numerous excellent illustrations render the text perfectly plain to ordinary readers.

The style of the "Guide Book" is rather closely didactic, rendering it of comparatively little interest to non-bee-keepers, but assisting greatly in the condensation of its real matter. Throughout Mr. Cowan speaks as one having authority, pouring forth his mandates without often condescending to give his grounds for the same, and seldom quoting the authority of others. This is refreshing after some of the many scissors-and-paste bee books in circulation. The name of Mr. Cowan is so well known as that of an advanced and successful bee-keeper, that it is with hesitation we venture to offer anything like criticism of the matter of this volume. It strikes us, however, as presenting modern bee-keeping in the light of rather a complicated and expensive pursuit. The illustrations alone set before us an array of appliances quite formidable to beginners, and unfortunately it is that class who are generally least able but most anxious to become possessors of every vaunted improvement in the way of machinery. The more experienced the bee-keeper becomes, the more simple will be his hives and the fewer his mechanical appliances. It is, therefore, right we should warn beginners against the notion that all the articles described in the "Guide Book" are absolutely necessary. As Mr. Cowan is no dealer in apparatus he ventures without hesitation to describe such of these appliances as are more particularly connected with his own name. Of these we instance his form of hive and extractors as possessing features of very great merit. His winter ventilator we regard, however, as of little importance, and we think two pages might have been better employed than in describing and illustrating Mr. Cheshire's method for the prevention of robbing.

The real interest of the book lies, however, in the insight it gives us into the methods practised by so successful an apiarian as the author, and we venture to commend these to the attention of its readers, particularly the references to artificial swarming, spreading the brood, surplus comb honey, and doubling for the extractor. These are really the pith and marrow of the book, and deserve a much larger share of its space. We are not at all sure we can recommend the author's method of treating foul brood, as, having failed to cure it with salicylic acid, we almost believe it impossible to cure diseased combs in any other way than by consigning them to the melting pot. On the whole, however, we welcome the volume as a book up with the times, though we believe there is still room for another devoted entirely to the practical work of the apiary.

#### TRADE CATALOGUES RECEIVED.

James Veitch & Sons, King's Road, Chelsea.—*Catalogue of Bulbs.*  
Sutton & Sons, Reading.—*Illustrated Bulb Catalogue.*  
Webb & Sons, Wordsley, Stourbridge.—*Illustrated Bulb Catalogue.*  
George Templeman, Prestwich, N.B.—*Catalogue of Selected Roses.*  
F. C. Heinemann, Erfurt.—*General Bulb and Plant Catalogue.*

**Roses from Cuttings** (*W. Land*).—The information you desire is given by Mr. W. Taylor on another page of the present issue.

**Budding Fruit Trees** (*H. I.*).—The work may still be performed if the buds and stocks are in proper condition. The buds will remain dormant until the spring.

**Drying Everlastings** (*T. A. N.*).—Cut the flower-heads on a dry day, and place them on shelves in a house where they will be exposed to the sun and air freely. When dried they may be kept in any cool dry place.

**Heating Greenhouse and Conservatory** (*Idem*).—If you arrange for the pipes under the gravel path to have a slight rise from the greenhouse to the conservatory there is no doubt the apparatus would work satisfactorily, but if you intend the pipes beneath the walk to dip from the greenhouse and then rise again in the conservatory we doubt if it would work efficiently. The plan most likely to answer would be to have separate flow and return pipes from the boiler, having the latter so low as to allow of the flow for the conservatory being taken beneath the pathway with a slight rise from the boiler. The pipes from the boiler to the conservatory may be 2-inch, and with this arrangement they would be heated efficiently. We could not give an estimate of the cost.

**Establishing Mushrooms in Pasture** (*L. F.*).—The best plan we have known was inserting pieces of good spawn about 2 inches square in holes 3 inches in depth, filling up the holes with the loam removed, making it quite firm over the spawn. It is necessary that a dry time be selected with a prospect of its continuance to admit of the spawn spreading. The early part of June is the most suitable time, and with favourable weather Mushrooms will appear in six to eight weeks.

**Weeds on Lawns** (*R. B.*).—The small weed simply enclosed in a letter was so much dried as to be totally beyond identification. In all probability it cannot be eradicated except by drawing out the plants individually. If the weeds are numerous you might, however, try Watson's lawn sand on a small plot at first by way of experiment. It may be had from the leading nursery-men and seed merchants, and must be used in exact accordance with the instructions that accompany each packet.

**Holly Hedge** (*J. G.*).—Unless the hedge is protected there will be great risk of its being much injured by the animals, and possibly it may be destroyed. It is a matter of common prudence to prevent animals having access to all newly planted fences. One or two rails or stands of stout wire affixed to posts will render a fence safe from horses and cattle, the fence of course being placed at a proper distance from the hedge.

**Select Hybrid Perpetual Roses—Mildew on Roses** (*W. Booth*).—Alfred Colomb, Baronne de Rothschild, Charles Lefebvre, Duke of Connaught, François Michelin, John Hopper, La France, Madame Lacharme, Marquise de Castellane, Pierre Notting, Prince Camille de Rohan, and Sénateur Vaisse are good varieties, and will probably suit you. The mildew has been induced by a deficiency of moisture at the roots, and is very prevalent where water has not been freely supplied, and mulching over the roots has not been resorted to, along with syringing during the droughty weather. Dust whilst damp with flowers of sulphur.

**Eucharis amazonica** (*J. E., Kenilworth*).—As your plants are strong and healthy they will no doubt flower well next year, as the pots, we assume, are now well filled with roots. Keep them in a light position, and continue watering them as usual until the approach of winter, then gradually reduce the supplies, but at no time permit the soil to become really dry. Your object should be to obtain thick dark leathery foliage, and preserve it, without encouraging growth during the winter. If in the spring you can plunge the pots in a little bottom heat and then increase the supply of water the plants will flower freely: indeed healthy plants flower freely without bottom heat after they have had a period of rest. They will not need re-potting.

**Propagating Evergreens and Roses** (*The Captain's Man*).—About the middle of September, or when the growths are partially matured, is a suitable time for inserting cuttings of Laurels and Aucubas. Choose short-jointed growths, securing a little of last year's wood at the base of each, and insert them rather deeply and firmly in sandy soil. If the weather proves dry they will need watering occasionally. An admirable method of striking Rose cuttings was described by Mr. Taylor in our issue of July 21st of the present year. We tried the plan after reading the article in question, and now have a number of well-rooted plants. Cuttings will also strike if inserted in the open ground at the present time, choosing tolerably firm wood, and making the cuttings about 6 inches long, removing all the leaves except the top pair, and inserting the cuttings quite up to these leaves in a rather shaded position. They must be made quite firm, and be sprinkled as often as is necessary to keep the foliage fresh. Read also what Mr. Taylor wrote on keeping the cuttings fresh and moist. This is a matter of the greatest importance.

**Judging at Shows** (*W. G.*).—Nothing brings horticultural societies into greater disrepute than employing judges who are not experienced in the work of making awards. All good gardeners are not good judges, and we have not infrequently seen some of the best of cultivators in a state of nervousness that led to bewilderment when endeavouring to make the awards when there has been close competition. As a rule it is a wise course to secure judges who do not reside in the district in which a show is held, and it is extremely desirable that they be fairly remunerated for their services. The show to which you allude appears to have been unusually ill-judged. We have seen mistakes made occasionally; but after having visited, say, five hundred exhibitions, we have not been so unfortunate as to witness one where "all the worst plants and vegetables had the best prizes." We presume economy has been exercised, and it has proved false. The remedy we have indicated.

**Propagating Carnations** (*Reader*).—If you have a little bottom heat, such as a bed of fermenting materials, we should convert the pipings into cuttings by severing them close under a joint, removing, slipping off, the lowest pair of leaves, and shortening those above them. These, if inserted in moist sandy soil and covered with a handlight, will root more quickly than slips inserted in the open ground. For the open air slips are preferable to cuttings,

the lower leaves being removed before the pipings are inserted. Your Grapes ought to be in good condition in from eight to ten weeks after they commenced colouring. Cannot you test them yourself?

**Walcheren Cauliflower (K. C.).**—The information you seek has been frequently given in our "Work for the Week." Your district being late you ought to have sown still earlier than the date given, as, unless the plants produce heads in the autumn, they will be useless, as large plants of this variety are nearly always killed in the winter. If your plants are strong and the autumn is mild they may afford heads in October and early November; if they do not, and the plants are dug-up and laid-in closely together in frames, covering the roots with moist soil, and are protected from frost, they will form heads in the winter. It depends entirely on the weather as to whether your plants will form heads in the open air this autumn; they may do so in a sheltered position, and if not you must not expect them to stand the winter uninjured. We do not consider the advice you quote as sound and satisfactory, and we are sorry you did not write to us before. We are always ready to impart information, and we think it is reliable. The period from July 10th to 20th is too late for sowing for producing plants for use the same season, and too early for those intended to pass the winter without protection.

**Lifting Vines (Craven).**—The proposed plan of lifting the roots in the outside border will succeed if performed carefully and with as little delay as possible after the wood is mature. The soil should be removed carefully from the roots so as to preserve them from injury, they should also not be exposed to the drying influence of the atmosphere any more than is absolutely necessary. Remove every portion of the soil down to the concrete, and then see that there is a 3-inch tile drain laid with proper fall and outlet. One drain will be sufficient for a 6-foot border. Place in a foot depth of rubble, stone, brickbats, or other material, the coarsest portion at bottom. If there is depth so as to leave 27 to 30 inches of space over the drainage for soil the drainage may be increased, but should not be less than 1 foot. Cover the drainage with a layer of turves grass side downwards, and then place in the compost, laying out the roots according to their inclination, keeping them as near the surface as possible. Those from the collar should be laid out 4 to 6 inches beneath the surface. The compost must be made moderately firm about the roots, and any dead or decayed parts may be cut away. Give a slight supply of water at a temperature of 90° to 100°, and mulch over the roots with 4 to 6 inches thickness of rather short manure. The lights should be placed over the borders so as to throw off cold autumn rains. The surface 3 inches of a pasture over limestone will be suitable, a tenth of old mortar rubbish being added to it, with a fortieth part of half-inch or crushed bones, and the same proportion of charcoal and wood ashes may be added. Reserve horse droppings for surface dressings.

**Bridal Bouquets (Improve).**—It should be 9 to 10 inches in diameter, the surface slightly convex, broken occasionally by a raised flower or spray of Maidenhair Fern, Selaginella caesia, or Pelargonium filicifolium odoratum. Three or four stems may be left long enough to reach to the bottom of the bouquet-holder, but all the others should be shortened to an inch or two, enveloped in damp cotton wool, which is bound on securely with fine brass wire, enough wire being left on to form an artificial stem. Prepare sufficient flowers and spray beforehand, and also have ready a handful of damp cotton wool; then proceed from the centre outwards, not with formal circles, each of one kind of flower, but with a skilful, tasteful blending of form with form sufficiently to impart relief and variety. Or there may be a grouping of three or four flowers of each sort without any approach to heaviness. Prevent crowding and confusion by pads of the damp cotton wool between the flowers, drawing out the wool of each pad at the bottom sufficiently to enable you to twist it two or three times around one of the wire stems, so that there may be no risk of any being shaken out while the bouquet is being used. The damp wool also serves to keep the flowers fresh and unwithered. If the bouquet has to be made some hours before it is used avoid all flowers that shed easily—white Jasmine is very prone to shed its flowers soon after they are cut. Twist the wire stems securely together so that no flower can be displaced, and make the bottom of the bouquet level, so that the bouquet paper may easily be slipped up close under the flowers and kept there by sewing it to them with a needle and white cotton.

**Plants for Stocking Borders (G. A. D.).**—The border near the Laurel hedge we should plant with herbaceous and bulbous plants, so as to give a succession of flowers over a lengthened period. Plants suitable for such a border are Anemone japonica alba, A. fulgens, Anthericum Liliastrium, Antirrhinum vars., Aquilegia vars., Arabis alba variegata, Aster Amellus, Aubrietia grandiflora, Daisies (double), Borago laxiflora, Calochortus luteus aculeatus, Calla palustris plena, Campanula isophylla, Convallaria majalis, Corhularia Bulhocodium, Cyclamen hederifolium, Delphinium Belladonna, Dianthus neglectus, D. Napoleon III., Mule Pinks, Dodecatheon Meadia and var. alba, Erythronium Dens-canis, Fritillaria Meleagris, Fuchsia corallina, Gentiana acaulis, Geum coccineum flore-pleno, Gladiolus vars., Helleborus niger and var. maximus, Hemerocallis lutea, Hepatica triloba vars., Hyacinthus candicans, Iberis coraeifolia, Iris germanica vars., Lilium vars., Muscari hotryoides, M. comosum, Myosotis dissitiflora, Narcissus Ajax, N. bicolor, N. incomparabilis vars., N. minor, N. poeticus and var. plenus, N. Pseudo-Narcissus, Ncpeta Mussini, Oenothera macrocarpa, Omphalodes verna, Paeonia humilis, P. sibirica, P. tenuifolia plena, Penstemon vars., Phlox divaricata, Primula aculis vars., Alpine Auriculas, Pulmonaria azurea, Pyrethrum (double) vars., Ranunculus alexicaulis, Saxifraga longifolia, Scilla sibirica, Sedum atropurpureum, Senecio pulcher, Sisyrrinchium grandiflorum, Spirea japonica, S. palmata, Trollius europeus, Triteleia uniflora, Veronica prostrata. To these may be added such bulbs as Crocuses, Tulips, Colchicums, Snowdrops, and such plants as Pansies, Carnations, &c. The border near the low hedge we should devote to Roses, dwarfs, on the Manetti or on their own roots, with sweet-scented annual or showy low-growing annuals. The borders near the house we should fill with bulbs in winter, and with flowering bedding plants in summer.

**Properties of the Carnation (R. Martin).**—You will find our manual on "Florists' Flowers" very useful, and it can be had from this office in return for 4½d. in postage stamps. The following extract from it will answer your inquiry:—"The Carnation has the marks on its petals from the centre to the edge, and through the edge in flakes, or stripes of colour. The Picotee has its coloured mark only on the outer edge of its petals. *Properties of a good Carnation.*—Carnations are divided into five classes, namely:—1, Scarlet Bizarres; 2, Pink or Crimson Bizarres; 3, Scarlet Flakes; 4, Rose Flakes; 5, Purple Flakes. Bizarre is a French word, meaning odd or irregular; the flowers in these classes have three colours, which are irregularly placed on each petal. Scarlet Bizarres have that colour predominating over the purple or crimson, but the Pink or Crimson Bizarres have more of these colours than the scarlet. Scarlet Flakes are simple white grounds with distinct stripes or ribbons of scarlet. Rose and Purple Flakes have these two colours upon a white ground. The properties in other respects are—1, The flower should be not less than 2½ inches across. 2, The guard or lower petals, not less than six in number, must be broad, thick,

and smooth on the outside, free from notch or serrature on the edge, and lapping over each other sufficiently to form a circular Rose-like flower; the more perfectly round the outline the better. 3, Each layer of petals should be smaller than the layer immediately under it; there should not be less than five or six layers of petals laid regularly, and the flower should so rise in the centre as to form half a ball. 4, The petals should be stiff, free from notches, and slightly cupped. 5, The ground should be pure white, without specks of colour. 6, The stripes of colour should be clear and distinct, not running into one another, nor confused, but dense, smooth at the edges of the stripes, and well defined. 7, The colours must be bright and clear, whatever they may be; if there be two colours, the darker one cannot be too dark, or form too strong a contrast with the lighter. With scarlet the perfection would be black; with pink there cannot be too deep a crimson; with lilac, or light purple, the second colour cannot be too dark a purple. 8, If the colours run into the white and tinge it, or the white is not pure, the fault is very great, and pouncy spots or specks are highly objectionable. 9, The pod of the bloom should be long and large, to enable the flower to bloom without bursting it; but this is rare. They generally require to be tied about half way, and the upper part of the calyx opened down to the tie of each division; yet there are some which scarcely require any assistance, and this is a very estimable quality. 10, Decided superiority of perfume should obtain the prize when competing flowers are in other respects of balanced merit. *Properties of a good Picotee.*—Picotees are divided into seven classes. 1, Red, heavy-edged; 2, Red, light-edged; 3, Rose, heavy-edged; 4, Rose, light-edged; 5, Purple, heavy-edged; 6, Purple, light-edged; 7, Yellow grounds, without any distinction as to the breadth of the edge colour. The characteristics of good form are the same as for the Carnation; but with regard to colour—1, It should be clear, distinct, confined exclusively to the edge of the petals, of equal breadth and uniform colour on each, and not running down (called sometimes feathering or harring), neither should the white ground run through the coloured border to the edge of any one of the petals; 2, The ground must be pure white, without the slightest spot. *Disqualifications of a Carnation or Picotee.*—1, If there be any petal dead or mutilated; 2, If there be any one petal in which there is no colour; 3, If there be any one petal in which there is no white; 4, If a pod be split down to the sub-calyx; 5, If a guard petal be badly split; 6, Notched edges are glaring faults, for which no excellence in other respects compensates.

**Name of Fruit (G. P., Hants).**—It is apparently the Bryanston Gage, but a little young wood and a few leaves are necessary for the satisfactory determination of the names of Plums.

**Names of Plants (J. C.).**—The specimens sent in an envelope arrived completely crushed and withered, and were consequently quite unrecognisable. (*W. N.*)—*Oxalis corniculata rubra*; it is often used as an edging plant in flower gardens, and is quite hardy. (*A. A. M.*)—The single flower spike is *Lavandula vera*; the other is *Lavandula dentata*. The leaf resembles *Aralia reticulata*. (*Ros.*)—*Eucomis punctata*, a native of the Cape of Good Hope.

**Removing Supers—Feeding Bees (E. S. W.).**—Unless in exceptional localities where late flowers such as Heath abound, there is almost no prospect of getting supers finished off now. You had better remove the glass super at once, on the principle that "half a loaf is better than no bread." At the same time all empty supers should be removed. Such as contain a little sealed honey, but too little to render it worth while breaking up the comb, should have the cells unsealed with a knife and be replaced for a few days to allow the bees to carry down the contents. If the supers be then carefully wrapped in paper and stored in a dry place they will be valuable helps towards early storing next season. As your hives appear to be sufficiently supplied for wintering, we do not see any necessity for autumn feeding. Generally, stocks have this season kept up breeding later than usual, and it will be enough to see that those only that are light should now be fed up quite rapidly, leaving stimulating feeding till early spring.

**Holy Land Bees (An Old Subscriber).**—The queens were brought from Palestine by Mr. D. A. Jones of Canada. They were each packed in boxes 7 or 8 inches square with ample ventilation at the sides, the openings being covered with wire gauze, which admitted of a thorough draught of air. In order to provide the necessary sustenance for the queen and the two or three hundred bees that accompanied her, candied sugar was run in at one corner of each box. This requires moisture to be edible by the bees, and Mr. Jones frequently supplied a small quantity of water during the journey. Some consignments of queens that have since arrived unattended were furnished with a small bottle of water, the liquid being allowed to ooze out at a slit cut in the cork. This plan, however, does not appear to have fully answered for so long a voyage, very few queens arriving alive. For shorter distances of transit queens are frequently sent successfully with the latter provision.

**Brood Comb—Diluted Honey—Old Queen (F. J.).**—The comb sent has not anything about it that is noticeably peculiar. It is drone comb containing healthy pupae, which are scattered, and so show conspicuously the rounded sealing which covers them. The comb has evidently been built where there has been scarcely room to accommodate it, as the cell walls are hardly so much elongated as is usual. In diluting honey for feeding, boiling water is more convenient than cold, and about equal quantities of water and honey will bring the food to the right consistency. Hives rarely suffer from the natural decay of queens when the bees have no power to replace them, as they quite usually supersede decaying queens by raising young ones. Possibly this has been the case in the hive in question, which is evidently doing too well to give occasion for anxiety.

#### COVENT GARDEN MARKET.—AUGUST 24.

LARGE quantities of Grapes still arriving from the Channel Islands are keeping down the price of home-grown. A good supply of Apples has reached the market during the last week, but clearing at very low prices.

POULTRY AND PIGEON CHRONICLE.

THE ROYAL COMMISSION ON AGRICULTURE.

(Continued from page 166.)

IN proceeding with the subject it is requisite that the amount of farm capital to be employed should be considered. In justice to both landlord and home farmer we may assume that anything relating to the improvement or maintenance of the buildings, house and homestead, cottages, roads and fences, including draining and expenditure upon other improvements invested for the purpose of enhancing the letting or occupation value, should be considered as landowners' fixed capital as when invested in a purchase. The working or moveable capital on the home farm, however, may be said to consist of, first, the live stock, whether kept for fattening purposes for the production of meat, for milking purposes, or merely as store for breeding animals for the production of wool, &c., or as furnishing the means for cultivating and marketing of produce. Second, the corn growing or in stock, hay, straw, fodder, and roots as the food stored for animals, or the natural or artificial Grass, Clover, Saintfoin, or other green fodder crops growing for their consumption. Third, the machinery required for cultivation, or for preparing and marketing the produce. Fourth, cash required to meet the charges connected with the labour of preparation of the land—the manuring, seeding, harvesting, thrashing, and marketing the corn and pulse crops—the tradesmen's and other bills required to keep everything in repair and working condition, also to pay the Government and parochial rates and taxes, and the tithe rent charges.

We have been rather particular in enumerating the different items as above named, because it is usual and desirable for proprietors who undertake the occupation of their land to place themselves in the position of tenants by separating the accounts and charging the amount of rent which might be obtained if the farms were let. The amount of landowners' capital cannot be stated, for the value of land and its appurtenances will vary greatly on account of soil, situation, and climate. The working capital on the home farm we can estimate by approximation, for in our own business we have found that upon the large outlying hill farms the required capital would vary from £10 to £12 per acre. Upon smaller farms, under new and improved systems of stocking and cropping, it would vary from £15 to £18 per acre, or even more in some instances, because it will be found under certain circumstances that the best systems, and those which yield the greatest money returns, will require an investment of money far beyond anything known in ordinary farming, especially if market garden farming is carried out.

In the evidence obtained by this Commission a frequent cause

of failure and agricultural depression in various districts is stated to have occurred through an insufficiency of capital employed. It also shows the fact of the strongest soils not only requiring much costly labour in working, but suffering also more than drier soils from the effect of wet and unpropitious seasons. This fact leads us to the cultivation and rotation of cropping; and as the clay soils have suffered most, we will endeavour to show the home farmer the late-t and most approved changes recently made in the management of these soils. Much has been said by various advisers of the home farmer, recommending to his notice the policy of laying strong clay land down to permanent pasture, especially where it is flat-lying. But when we consider the serious losses by the rot in sheep, and in various instances of cattle also from feeding on cold flat-lying pastures, there is not much encouragement to be found for extending the acreage of permanent pasture upon such land. We prefer to cultivate such land upon a rotation whereby the crops may be—first fallow, followed by Wheat, seeded with Clovers and pasture Grasses to lie two or three years, then to be followed by part Oats or drage, and part Beans. The benefit of this rotation is, that during the six years we may obtain pasturage from half the arable land, and yet have the advantage of a change in cropping if cereals should become dearer from unforeseen causes, because the two years of old lea may then be omitted in the rotation, but resumed at any time to meet certain contingencies and emergencies. Nor must we lose sight of the fact that under this rotation half the farm would be not only in grass of more value than any permanent pasture on similar soil, but for the purpose of the growth of either cereal or pulse crops, as the land will have received the benefit of rest for three years, with an accumulation of manuring elements during that period.

Before we proceed further on the questions of stocking and cropping we must call the home farmer's attention to his unfettered and unbiased position, except through matters entirely relating to the profits of the farm, for his business will suffer to a certain extent through the depression in agriculture which prevails, as represented by the evidence given before the Royal Commissioners. In this evidence we find it roundly asserted by some of the most experienced farmers that they could not grow Wheat with profit at the prices now obtained, and in consequence numerous farms throughout the kingdom have been thrown upon the owners' hands. Yet the arable farms of Messrs. Prout and Middleditch, where corn and straw are almost the only saleable products grown, have been conducted with more or less profit up to the present time, and with scarcely any live stock kept either for working purposes or for the production of meat by fattening animals. Fertility has been maintained for a series of years and valuable crops produced almost entirely by the aid of steam power in cultivation and the application of artificial manure; and as Mr. Prout has published a pamphlet describing his position as owner and occupier from the time he purchased the land up to the present, it must be accepted as truthful, because all his crops have been sold annually as they stood in the field, both straw and corn together, by public auction, the results of which sales have always been published in the agricultural papers of the time. On the perusal of this pamphlet both landed proprietors and home farmers will be enabled to understand how agricultural depression has been evaded, or only slightly felt, by Mr. Prout, either as landlord or tenant. The consideration of the comparative position of the home farmer who cultivates and produces stock and corn combined in somewhat the usual manner and the system adopted by Mr. Prout, is of the highest importance, whether we view it as a matter of theory or a practical method of agriculture, for under any circumstances in which either the landowner or home farmer can be placed it is full of interesting matter of the highest value, and we highly commend it to their perusal and serious consideration.

Endeavouring to advise the rotation of crops for corn-growing chiefly will be rather difficult, but not so upon land in hand or set apart from the home farm proper; for upon most home farms attached to pasture and park land a certain amount of the various sorts of live stock are almost a necessity, and frequently entirely so. We must therefore consider what can be done by feeding and fattening stock on the home farm in the face of agricultural depression and the rotations required, leaving the subject of corn-growing only upon outlying land in hand for consideration hereafter. In case the home farm is situated on the hill districts we see no better rotation than the five-course, especially on the lightest land—viz., Wheat, green crops and roots, Lent corn and grass seeds to lie down two years, the Clovers to be mixed with Timothy and Perennial Rye grass. If in the second year of grass the land should become foul pure and burn before the Wheat is sown, for this insures a clean Wheat stubble. On the vale or

strong loamy parts of these farms a three-course may be adopted for the produce of sale crops only—viz., Wheat, Lent corn, pulse, Rye, April Wheat or Potatoes, Beans, Peas, or seed crops of various sorts in most demand, such as Turnip, Mangold, Clover, Vetches, Trifolium, &c., for we have frequently seen some of these seed crops make more money than any cereal crop per acre. Irrespective, however, of the rotation of crops above named a portion will, of course, always be in Saintfoin, also some of the land before roots will be sown with winter Oats, Rye, forward white Oats, or April Wheat, to be either fed off as spring food, or cut for straw, or used like American Oat hay, and followed by Mangolds, Swedes, Rape, and Turnips. Any of these modes of close cropping will not be entirely dependant upon horse labour for cultivation, because we have steam power, which takes so little time in its work is particularly well suited for cleaning the land between the crops. We have also the advantage as regards manure of the sheep in consuming root crops on the outlying land, which supersedes the dung cart entirely. In the same manner artificial manures applied to those crops on the vale land taken in quick succession proves very satisfactory, for their application is quickly done without hindrance.

(To be continued.)

#### WORK ON THE HOME FARM.

*Horse Labour.*—When the weather is fine the horses will be employed in working the reaper and mower, the new string binding machines being the best, as reported by the Judges at the trials in Derbysire connected with the meeting of the Royal Agricultural Society. These trials were made on crops of Wheat and Oats upon Mr. Hall's farm, Thulston, Derby. The result has been decided according to the value of the work done. The gold medal to the M'Cormick Harvesting Machine Company for their reaper and binder; two silver medals, Messrs. Samuelson & Co., and the Johnston Harvester Company; highly commended, Mr. H. J. H. King for principle of tying and separating sheaves. For some time past the weather has been very variable, and where cutting corn took place without binding much of it has laid on the land, taking damage by the late rains, especially Barley in those cases where the binders did not follow the reaping machine and keep pace with it while the straw was dry. The rains we had, however, have proved very beneficial to the root crops, and our first sowing of stubble Turnips are now nearly fit for hoeing. Nevertheless, where stubble Turnips are required it is not too late to drill the seed now. As the land is moist the seed will vegetate immediately, and the young plants will grow fast, especially when drilled with a generous supply of superphosphate and ashes; it is also favourable for the sowing of Trifolium, Vetches, and Rye. The land after Peas and seed Vetches if intended as a backward fallow for Wheat should, if foul with couch, either be ploughed shallow or rafter-ploughed, so the scarifier or Howard's self-lifting drag may pull through the land and comb out the couch. We often use only a strong one-horse cultivator, such as an ordinary horse-hoe with the plain tines on set wide apart; this is only light work for one horse, and two of them would scarify four acres and a half in a day, and do the work well if driven across the ploughed furrows, and afterwards the land may be harrowed and rolled, and the couch carried away to a heap; it will then require but little labour as compared with burning, and can be done also in showery weather, and the land be quickly ready for the next ploughing. The lea ground after Clover on the hill farms may now have the dung laid out and ploughed in and the land pressed, there to remain and become mellow for the sowing and drilling of Wheat in the early part of October.

*Hand Labour.*—Men will be required for harvest work for some time yet tying Barley behind the mower, except on those farms where the home farmer has the self-binding machine in use. The women can follow and set up the sheaves, and when making up the stooks care should be taken to have them settled in close together at the top to keep out the wet; the crop will then take a deal of rain without staining the colour of the grain, as is done when the crop lies on the land ready for harvesting as loose corn. Turnip-hoeing, and the second hoeing of Swedes, Carrots, and Cabbage should now be finished at the first opportunity. If the land is too wet for hoeing filling the dung carts will be going on, also hedge-trimming.

*Live Stock.*—All the sheep required on the farm may now be purchased; if ewes to breed early lambs the rams should be obtained and placed with them, the ewes being fed with generous diet, including cake on pasture grass or lea ground at daytime, with a folding of Rape and Turnips or Mustard for night. This management generally induces the ewes to be early, especially if some cotton cake is given in addition to the grass and roots. Throughout the country, both north and south, east and western districts, the fine rains which have fallen have improved the growth of grass immensely, and both sheep and cattle when feeding on the pastures will be greatly benefited. Those which are feeding for the butcher will soon be ready or far advanced towards maturity, whilst those kept as store stock will be got forward in condition ready for future fattening. This has been a fine season for sheep kept on the strong soils, where they are often fed upon summer Vetches entirely as green food, but daily

receiving a liberal allowance of cake, in which case the animals make good proof; and the land if intended for Wheat will be in good condition for seeding without any dung carting—a matter of immense importance upon the outlying fields of the home farm. All the young cattle, both heifers or steers, whilst grazing in the low-lying meadows should be taken at night into some dry pasture, unless there are dry patches in the meadows, of which they will not be slow to avail themselves as a night lair. We are rather particular in naming this, because it is the best way to avoid the quarter-evil which often attacks young cattle, especially the heifers, for we find the steers more hardy and often resist diseases of this nature. The fattening cattle in the boxes should now have early Turnips cut and mixed with oilcake; and in seasons like the present, when both hay and straw are scarce, a more liberal allowance of crushed Maize should be given with sweet Oat straw chaff in addition to the usual allowance of cake, which may be decorticated cotton cake for a month or two, but afterwards changed to best linseed cake. The dairy cows have this year during the summer months been very short of grass on all dry pastures and parklands; but in those cases where a supplementary allowance of cake or bran and Maize, or such like substitutes has been given, they will have held on well in condition and giving a good supply of milk, for the cost of extra food will have been money well expended, because now the autumn grass is come in abundance the cows will continue to yield a full supply of milk, so that the milking capacity which has been maintained during the summer will also enable the cows to continue yielding milk for a longer period in the autumn months.

#### VARIETIES.

*THE LINCOLNSHIRE BEE-KEEPERS' ASSOCIATION.*—We are informed that the inquiries for entry forms for this Show are numerous, and several entries have already been made. Much interest is being shown in the north division of this county where Louth is situated, and there is every indication of a successful exhibition.

*— EGG PRODUCTION IN THE ORKNEY ISLANDS.*—These islands appear to be good egg-producing districts, as from trustworthy statistics it has been ascertained that during the last twelve months more than 11,000,000 have been sent by steamers and sailing vessels to southern markets. From the various ports in Orcadia 7023 boxes of eggs were exported. These boxes contained from 120 to 160 dozen each; and taking the average at 140 dozen, this gives 983,220 dozen, or 11,798,640 eggs. A fair estimate of this enormous number is got by an average of 8d. per dozen, which is rather under than over the real value here. This gives a total value of £32,774—more than half the free rental of the county, and equal to 20s. per head of the entire population.—(*British Mercantile Gazette.*)

*— EGGS FROM DIFFERENT BREEDS OF POULTRY.*—A correspondent of an American newspaper gives the following as the result of extended observations—

	No. per annum.	No. to lb.
Light Brahmas .....	130	7
Dark Brahmas .....	120	8
Cochins .....	125	8
Plymouth Rocks .....	150	8
Houdans .....	150	8
La Flèche .....	130	7
Spanish .....	140	7
Leghorns .....	160	9
Hamburgs .....	150	9
Polish .....	125	9
Bantams .....	90	16

*— HOW THE FIRST WHEAT WAS SOWN IN AMERICA.*—Now that our American cousins are reducing the British farmer to despair by their enormous exportations of Wheat, it may be interesting to recall the fact that until about the end of the first quarter of the seventeenth century—that is to say, 250 years ago—England supplied the North American colonies with most of their Wheat. Since that time, however, North America has been gradually growing more independent in the matter of the supply of bread stuffs. Wheat was first sown in those colonies in 1592, Gosnold, the traveller, scattering the first seeds on the Elizabeth Islands, in Massachusetts, during his exploration of that coast. It is curious to reflect that it was English energy and daring which first of all supplied America with the means of entering, nearly three centuries later, into a disastrous competition with the mother country.—(*Lan.*)

*— PRODUCE OF MEAT FROM AN ACRE OF GRASS.*—It is stated on good authority that an acre of the best Lincolnshire grazing land—and it is a county famous for its grass—will carry an ox and a sheep from New Mayday till Old Michaelmas, and that while grazing

during this period the former will gain 280 lbs., and the latter 40 lbs. in nett weight of meat when slaughtered. The acre will thus yield 320 lbs. of meat. Its produce of grass may be 16 tons, perhaps more. This is 1 lb. of meat for every hundredweight of grass; but we must remember that the grass of such land differs from the average in the quality as well as the quantity of its product.—(*Irish Farmers' Gazette*.)

— EXPERIMENT IN POTATO GROWING.—An experiment has been tried by Mr. Tom King, Lion Hotel, Llanymynech, in producing a large crop of Potatoes from a comparatively small quantity of seed. Mr. King took a pound of Potatoes, second early variety, and allowed these to sprout freely. From each sprout a spirt, the total weight being half an ounce. He then planted the Potatoes and sprouts in separate rows. The latter appeared to grow more uniformly, and to be in a more healthy state than the growth of the former. The following is the result of the experiment:—From the half ounce of sprouts he has obtained 5 lbs. 5 ozs. of sound Potatoes, and from the pound of Potatoes 5 lbs. 4 ozs., showing a larger yield from one sprout than from a single Potato. The two lots will stand a good comparison. Those grown from sprouts are evidently earlier, firmer, and more regular in shape and size than those obtained from the seed Potatoes. There is in this case a total yield of nearly elevenfold by weight.—(*Coventry Advertiser*.)

## POULTRY AND PIGEONS

### POULTRY NOTES.

THE following extracts from a letter published in *The Field* are of interest in reference to the recent discussion in these columns and elsewhere as to the relative merits of the Dorking of the past and the Dorking of the present. The writer says—

“My first recollection of Dorkings is now more than forty years old. I remember some birds being brought from Sussex in 1840 or 1841, into a district in Norfolk, which even then enjoyed a reputation for fattening prime poultry.”

“I remember that not on one farm only, but on several adjoining ones, the use of the Sussex-bred cocks was followed by so great an improvement in size and early fitness for spring chickens that the local higglers remarked on it and scrambled for the produce.”

“The ordinary run of well-fed chickens in that district in autumn and winter used to be about 4 lbs. to 5 lbs. per bird when dressed for table. The use of the Sussex cocks increased the weight fully to 6 lbs. to 8 lbs.; and I remember a special case of a pullet—bred from the Sussex stock on both sides—being sent as a present at Christmas to a friend taking pride in poultry, which weighed 9 lbs., dressed for table. It thus will be seen that genuine Dorkings, before a single specimen of the Cochin had been imported, were not small. Still less were they tender. I remember that, having heard of the wonderful new-comers, a skilful poultry woman obtained a cockerel and two pullets. I remember, somewhere about 1841 or 1842, these birds being brought home, and then rearing large broods the first season, which roosted on the trees. I recollect finding, one Christmas morning, an early pullet of their produce sitting upon a stolen nest of eleven eggs in a woodstack, and that every egg produced a chicken, and that all were reared.”

“I remember that, although the two original pullets purchased were both of the markings which were then called ‘brown-spangled’ (they were selected from a large yard as being as much of a match as was possible to find), not all their chickens were brownish, like themselves. Some were so; others were grey, grey and white; but the cockerels were mainly black-breasted, with here and there a few white feathers on the breast and in the tail and wing. There were both single and rose-combs among them.”

“My poultry experience came to an end in 1843 or 1844, and I had none, and saw few, till about 1853-4. By this time shows had begun, and Capt. Hornby had made himself prominent among exhibitors of Dorkings. The poultry upon the homestead—where in 1838-40 there had been such success—had dwindled into comparatively poor things, rumpish and thin. I determined to go, as I thought, to the fountain head, and I gave Capt. Hornby four guineas for a dozen eggs. I remember that I wished to recover the old brown-spangled sort, and asked for eggs of that kind, and that I was cautioned that ‘Capt. Hornby would not warrant his birds breeding true to feather.’ Nor did they. I had greys, spangled, and at least two with only four toes; but they were all fairly close-feathered (not like Game, yet quite unlike the modern loose-framed, loose-plumaged birds); they all were clean-legged, white-footed.”

The writer next comments upon the good useful qualities of the

pre-exhibition Dorking, and upon the want of uniformity in colour and even in number of toes amongst the birds first exhibited, and concludes with the following paragraph—

“I have thought it worth while troubling you with these recollections because, as it seems to me, poultry-breeding on farms may be much improved by bearing in mind what is constantly being done with sheep and cattle. There are tup and bull breeders who take infinite pains with their flocks and herds, in order to obtain sires capable of conveying to cross-bred produce the points those cross-bred shearlings and bullocks are wanted to possess. The men who take the lead in breeding bulls and tups do not tolerate cross-breeds, although they look forward to their animals being used for cross-breeding. Poultry keepers should do the same. For winter laying one cross is most suitable, and another is best for early spring chickens. For table poultry, to be consumed in autumn and winter, yet another type is preferable. But to produce any of these, pure-bred sires are highly necessary, and these must have the special points required concentrated by close breeding. But the modern show Dorking is not at all the best possible sire for this purpose. It may be doubted if it be equal to its predecessor for any purpose. And it may be doubted if any better breed than the old Dorking for table poultry early in the year ever existed anywhere. The Houdan, its main rival, seems an offshoot from it. But cross-breeding is not my present subject. I would maintain that the Dorkings to encourage at the shows are not those whose eggs, feet, feathers, and legs indicate a cross; but those whose shape, skin, and thick flesh argue an unmixed descent from our valuable old English breed, which had all those points good. Such birds could be had even now by judicious selection; but one must not go to prize-winning yards to make the selection.”

THAT Mr. Harrison Weit may have the full benefit of “PLASTIC’S” testimony upon his side of the question, we add another extract which we had at first passed over from this interesting letter—

“I may, however, once more be allowed to state that, although the modern stamp of Dorking retains size, this size is accompanied by bigger bone, loose feathering, sooty feet, and tinted eggs—a combination of phenomena which point the minds of all who are not resolutely bent on resisting evidence to an inevitable conclusion that the Dorking of the period is a cross with the darker variety of Cochin.”

In a footnote to “PLASTIC’S” letter, the Editor of *The Field* states that the large coloured Dorkings first shown by Mr. J. Douglas were the result of a cross with a cock of a large coarse-boned Malay, or Kulm breed, sent to the Zoological Gardens by an officer in India.

WHILST content to leave the discussion of the Dorking question to others, we desire to say a word or two as to the laying qualities of the breed. We know that the general concurrence of testimony goes to show that Dorkings are not good layers. We do not know whether the old breeders allege any falling-off in this respect as one of the demerits of the modern Dorking. Some of the supporters of the modern Dorking claim credit for having effected an improvement in the laying qualities of the breed. We shall be very pleased to have particulars, from those of our readers who keep Dorkings, as to the average number of eggs per annum which their birds produce. Not very long ago one of our readers recorded a case in which white Dorkings produced 160 eggs per annum each. We once had some Silver-Grey pullets which were exceptionally good layers. We cannot give any precise figures as to the number of eggs each laid in the year, but we well remember that one of them laid thirty-six eggs in thirty-five days, and then after a few days’ rest started laying again. That took place some fourteen or fifteen years ago, and we have long since lost the strain; but we were speaking a few days ago to the lady from whom we got these birds, and who still keeps up this family of Silver-Greys. She showed us a pullet of this year hatched on the 7th March, which commenced laying on the 23rd July, and has laid six eggs each week since then. She further informed us that her Dorking pullets invariably commenced to lay under or just at six months old, and that, as a rule, they lay six eggs per week. The hens do not lay quite so well, but still are above the average as layers. This information we know to be absolutely reliable; and even this one instance shows that Dorkings are not necessarily bad layers. The strain is one which has won many prizes, and, although the birds are not very large, they are very good in points.

THE actual laying qualities, not only of the Dorking but of our other breeds, are of much interest, especially when we have before us such figures as those which appear in the Board of Trade returns recently issued. These returns relate to the seven months ending July 31st, and they show that in the first seven months of the year 1881 there were imported into this country no less than

4,009,844 great hundreds of eggs (120 to the great hundred), of the value of £1,471,006. These figures show a considerable increase over the imports during the corresponding period of last year, but are not so large as those for 1879. The value of the dead poultry and game imported is given as 165,707 in 1881, as against 137,997 in 1880 and 173,840 in 1879. We find, then, that we are paying no less a sum than £7000 per diem to foreign countries for our eggs and nearly £800 per diem for dead poultry and game. Such figures as these demand attention, and ought to lead us to consider whether some portion of this money might not with profit be retained in the country. Apart from regular poultry farming, cannot our farmers and cottagers see their way to increase the number of birds they keep, and give more attention to their poultry than they have hitherto done? We have no doubt that it would pay them even though they only obtained the price set down as the value of the foreign eggs—namely, about 7s. 3d. per great hundred. In many places more might easily be obtained for some of the produce as “fresh eggs,” and the profit would then be considerable. We shall return to this subject before long, and meantime shall be glad to have information from our readers as to the average cost per head per annum of their fowls’ food, the number of eggs per annum they obtain from each hen, and particulars as to the sort of fowls they keep.

### THE DORKING CONTROVERSY.

THE kind and courteous tone towards myself of Mr. Harrison Weir’s letter in your last week’s issue requires me again to trouble you with a few lines. I am extremely glad to learn from it, as I have learnt from a private communication from Mr. Weir, that he does not consider us fanciers all in the same boat, but excepts some of us from the list of those who have done harm to the Dorking fowl. There is really, then, little difference between us as to the present state of the breed. I will, if I may, briefly recapitulate what at different times I have given (for what it is worth) as my opinion on the subject.

1, The Dorking was formerly a more uniformly square-shaped, short-legged, round, deep-breasted, and white-footed bird than it now is. How far that race was a purely bred one I cannot pretend to say, for my memory only reaches back to the time when it was being partially superseded by birds of a different type; but anyhow, its purity must have been rather a long descent of uniformity in shape than in feather, for its admirers all confess to great diversity in the plumage of good specimens of both sexes. This breed I always understood to be, at least in chickenhood, a very delicate one. My small early experience confirmed this opinion, which all the writers of the older poultry books seem to have held. Mr. Weir believes it to have been a hardy race.

2, When exhibitions became frequent breeders found that judges of poultry gave great weight to size and weight in Dorkings; indeed, at the Birmingham Show they used to weigh them, and in spite of the well-known rule about “purity of breed, &c.,” being rather taken into account “than mere weight,” seemed to ignore many of the old points. Every tyro in breeding knows that a first cross gives increased size and weight; naturally, therefore, breeders—some through utter ignorance of the effects of crossing and of the years it may take to eradicate a taint; others from mere selfishness, caring alone for their own present success—began to try crosses. Their birds so produced won prizes, were bought as prize birds, and spread far over the country; hence long legs, dark feet, want of breast, and many defects which have long been the trouble of the real Dorking fancier. Here I quite agree with Mr. Weir, and I wrote similar words in your columns years ago before the present controversy arose.

3, It must not, however, be forgotten that all the time these spurious birds were being foisted into Dorking yards some fanciers saw and deplored the evil, wrote and spoke against it, exhibited better birds, and were beaten by worse. Some even changed their strains to suit the times; others, like myself, preferred to be defeated for awhile, and to wait for better days. Time has shown that we were wise. That at which I took umbrage was an apparent confusion under the term “fancier,” of us the latter class, whom Mr. Weir is now good enough to term “true fanciers,” with the former class of breeders and exhibitors for mere gain, or rather, I should say, an ignoring of the fact that there has been and is such a class of true fanciers.

This is, I believe, a rough outline of the modern history of the Dorking; the controversy concerning it is explained by its history.

There are other minor points worthy of amicable discussion which arise from it. They are not to be decided in an off-hand manner, but an opinion can only be formed from the experience of the majority.

1, Confessedly nearly all our yards have some trace of the modern crosses in them, however much we may try to keep to the old form, and though we may have quite succeeded in re-establishing it. Has this very small drop of some foreign blood given no increased hardihood in the Dorking and absence of bumble foot? I certainly believe it has.

2, A grand and hardy fowl being in our yards, how far ought we, as judges, to vigorously insist upon such “fancy” points as white legs and feet? or rather, how far is such a point a “fancy” point. I believe that it is not a “fancy” point, but is always found to go with the shape desired, and with superior flesh, and other useful qualities. It is not, however, for those who write with little responsibility to dictate to those in a position of great responsibility, as are judges at shows, exactly what value they should give to such points.

On the latter two I should sincerely like to hear the opinions of some true Dorking fanciers who are also judges.—O. E. CRESSWELL.

### OUR LETTER BOX.

**Vulture Hook (F. J.).**—The long feathers on the thigh you ask about are very common amongst feather-legged fowls. They are known as vulture hooks.

**Marking Chickens (Inquirer).**—When quite young chickens may be distinguished by marking their fluff with Judson’s dyes of various colours. Afterwards woollen threads may be tied round their legs. They can also be marked by snicking the beak over the nostril with a scissors on one or both sides, or by passing a red-hot wire through the web of the wing. Some breeders punch small holes in the web between the toes. We prefer the first and second methods, as being painless.

**Ptarmigan Fowls (A Youngster).**—These at first were also called “Grouse-legged Polands.” They are rather larger than Bantams, pure dead white, with white topknots, or rather crests, for these resemble somewhat that of a Cockatoo’s in disorder; legs well feathered and vulture-hooked; combs cupped; cock’s tail well sickled. They are very light and agile in their movements, and are pretty; but we know of no other merits.

**House for Ducks (J. E.).**—Any easily built wooden house with a tiled or felted roof will do for your Ducks. If you have a spare corner where two walls join, a lean-to house may easily be put up at small cost; if not, a low-roofed moveable house with the roof made of light materials and hung on hinges, so that the interior may be easily accessible and thoroughly cleaned, or with one side made as a double door for the same purpose, will be cheapest. A house 6 feet long, 4 feet wide, and 4 feet high in front, running off to 2 feet high at the back, will be a convenient size, and hold from eight to ten Ducks. The floor should be raised above the level of the surrounding ground, so that it may keep dry. We use sand or dry earth to cover the floor, and bed the Ducks on straw or hay, which is shaken up daily and changed about once a week.

**Spanish Cock Ailing, &c. (K. C.).**—We can hardly tell from your description whether it is obstruction of sight or vertigo that your Spanish cock is affected with. If the eyes are closed up by the pressure of the white under the eye, the part pressing upon the eyelid may be cut off with a sharp pair of scissors. If, on the other hand, the sight is obstructed by the white over the eye, this can only be dealt with by putting a piece of thread through a small portion of it on each side, and fastening the two pieces of thread together behind the comb just tightly enough to keep the white from pressing on the eye. If the cock’s sight is sufficiently clear for him to see to eat it is probably vertigo which causes the symptoms you describe. In that case you must give a dose of castor oil or salts, and feed sparingly on non-stimulating food. The corns or lumps on the hens’ breasts are probably caused by the roost being narrow and sharp. Bathe them daily with vinegar, and remove the hard matter from time to time. Keep the hens lying upon clean straw until the corns are better. The roost should be 3 inches wide, and have the corners carefully rounded off.

### REMARKS.

14th.—Fine, cool, overcast at intervals.  
 15th.—Bright in early morning; occasionally dull, slight rain 4 P.M.; dull evening.  
 16th.—Fair until 4 P.M., afterwards slight showers.  
 17th.—Fine in morning; heavy shower 2.5 P.M., and rest of the day.  
 18th.—Very fine bright day.  
 19th.—Wet close morning; fine, bright, and breezy after 2 P.M.  
 20th.—Overcast at times, but generally fine and bright; solar halo 5.40 P.M.  
 Showery and damp atmosphere, damper than the previous week, although that had three times as much rain as the week just passed.—G. J. SYMONS.

### THE MANCHESTER INTERNATIONAL SHOW.

**L**AST week we directed attention to the great horticultural event that has since been held at Manchester, and advised as many as possible of our readers to embrace the opportunity of inspecting what was predicted would be one of the greatest exhibitions of fruit that has been held in any country. Our prediction was fulfilled, and our advice was accepted, as letters before us testify. One very experienced cultivator writes as follows—

"I hardly know whether to thank you or not for inducing me to visit Manchester. With the Show itself I was delighted beyond measure, but I was depressed exceedingly by the cruelty of the weather. That such great efforts and such splendid results should have been made and produced under such unfortunate circumstances is a source of general regret, and sympathy cannot be withheld from the Council of the Society and Mr. Bruce Findlay. The Show was indeed grand, but the weather on the whole was miserable."

Another correspondent writes—

"I received the Journal on Thursday afternoon and went to Manchester on the Friday. I was glad I did not go sooner, or I should have been swamped in the deluge. I was, however, soon enough to have the 'conceit taken out of me' in some respects; but on reflection I do not think that I ought to be expected, or that any gardener ought to be expected, to produce everything as good as was seen there. I shall be glad, Mr. Editor, to have your opinion on this point, as I think there is at least a chance that some gardeners may be the victims of what I may term too great expectations on the part of employers, who may expect what it is impossible can be produced by the resources of their establishments, however competent their gardeners may be, and however earnestly they may labour to make the most and the best of the means at their disposal."

This is a new aspect in which horticultural shows may be regarded, and we confess it would not have occurred to us. But we have no difficulty nor hesitation in giving an opinion on the point that has been submitted. Not only is it utterly impossible for any man to produce everything as good as was staged at Manchester last week, but it is to us equally impossible to suppose that anyone would be expected to do so. It were as reasonable to expect that any one artist could equal the best portraits and landscapes that are exhibited at the Royal Academy, as to suppose that any gardener could do what has been suggested. No one gardener can possibly be expected to compete at a given day with all other gardeners and their specialities, and the very supposition of such an unequal contest is utterly unreasonable, not to say absurd. The best products that are staged at the leading exhibitions show what can be accomplished by competent men under favourable circumstances, and it becomes the duty of all cultivators who

inspect those products to turn the resources at their own command to the best possible account with the view of approaching as nearly as is possible, and if possible to excel, the examples that have commanded the approval of the Judges by their conspicuous merit. If a gardener who is skilled in his calling "earnestly labours to make the best and most of the means at his disposal," he does his duty, and no more can reasonably be expected from him.

Another letter before us treats of exhibitions generally in a still different aspect, and one on which a great number of horticulturists often express similar opinions privately, if not publicly. The writer of the letter in question, who is a gardener of great experience and an exhibitor of some note, says—

"I seldom go to a show but I find it marred by some bold plan of advertising that is alike obtrusive and disagreeable to a great number of visitors. At a great show that I could name cards as large as a moderate-sized window sash were placed on several collections of plants, informing the public that the said plants had been 'grown by so-and-so's boiler!' The absurdity of the statement, added to the unsightliness of the unwieldy cards, imparted to those parts of the Exhibition a shoppishness that was quite out of place. It appears to me, and I know to many others, that if private business cards are permissible in the classes for competition they should be in some degree proportionate to the character of the exhibits. Judging by the efforts made by certain exhibitors to direct attention to their wares, it would appear as if they were under the impression that the visitors were blind. It is still worse when incongruous 'trophies' are erected, as was the case in one conspicuous instance at Manchester. Such 'trade enterprise' cannot be admired. It may be said the managers of shows should prevent obtrusive trade exhibits. This is easier said than done. A manager of an exhibition necessarily hesitates to incur the disfavour of those whom he looks to for support; on the contrary, in his desire to oblige he will at times strain a point and grant a favour if he is conscious that he will not prejudice others. The result is too often an exemplification of the existence of the spirit of the old proverb 'Give an inch take an ell.' The fact is, the council and directorate of shows as a body should decide on matters of this kind, and not place on an individual the responsibility of rendering himself liable to the charge of being disagreeable by the refusal of favours that he ought not to be requested to grant."

We publish the above letter, trenchant though it may be, because it has reference to a practice that the public certainly do not approve of. At the same time the principal contributors to the leading shows incur considerable cost in the conveyance of their exhibits and the deterioration to which they are subjected, and it is only natural that they should endeavour to turn the opportunity to account with the object of recouping themselves for the outlay and extending their trade. The question then arises whether this cannot be done as effectually in a more quiet and appropriate manner, as by such methods as have been referred to by our correspondent.

With regard to the extent of this magnificent Exhibition, the statement of a few simple facts will convey the best idea to those who were unable to inspect it. In the 250 or 260 classes, which included those of the National Rose and Carnation Societies, there were over 3500 entries, and the produce staged necessarily required considerable space. The glass exhibition building and the permanent iron marquee usually suffice for the exhibits at the Whitsuntide Show that are extensive in no ordinary degree, but on this occasion a great addition was required. A marquee 327 feet long was occupied with fruit and vegetables, the central table being devoted to the former, and presenting such a display as few have seen before. From this long marquee three annexe tents, each

nearly 100 feet long, were taken at right angles, being occupied chiefly with cut flowers, Roses, Carnations, Picotees, and miscellaneous exhibits; while at the extremity of one of these was another of similar dimensions devoted to the cottagers' productions and Bee Show.

The terrace and lawns were adorned with the numerous handsome collections of Conifers, and, to accommodate the Potatoes and some other vegetables that were strongly represented, wooden stages were erected of a total length of several hundred feet, and yet there was scarcely sufficient room.

It may be well to remind our readers that the chief object of this Jubilee Exhibition was to raise sufficient funds to rebuild the range of glass houses, which are now becoming so old and dilapidated that considerable difficulty is experienced in preserving the plants in healthy condition. Strenuous efforts have been made to forward this design, a large proportion of the prize money has been raised by subscription, so that the visitors' fees might be entirely appropriated to this special object. Unfortunately the adverse weather has to a great extent defeated the intentions of the projectors, for though we are informed that £500 were taken on Saturday, and the Show remained open on Monday, the amount must fall far short of that needed to execute the work in a satisfactory manner. Perhaps, however, the necessary funds will be forthcoming from other sources; and it is desirable that this may be so, for a handsome range of glass would be one of the best monuments of the Society's long successful career. The following is a full report of this memorable Exhibition:—

#### FRUIT.

The show of fruit on the whole was magnificent and of high-class quality. There can be no doubt that as far as this portion of the Exhibition was concerned it was a splendid success, and it may be a long time before finer examples of some kinds of fruit are again placed on the exhibition table. The first-prize collection of twelve dishes shown by Mr. Coleman was indeed worthy of the high reward it obtained. The collection had few if any weak points. The Grapes staged by Mr. Elphinstone throughout his exhibits indicated high-class culture, especially those shown in the class for six kinds of Grapes. This stand was the admiration of all, and will not be soon forgotten by those who saw it. The bunches staged of Muscat Hamburg for the Veitch Memorial prize were grand indeed, and also the bunches of Madresfield Court staged in the same class by Mr. Roberts, Gunnersbury; and in the class for white Grapes, those staged by Mr. Hudson and highly commended were of marked excellence. Peaches were remarkably fine, especially Bellegarde and Princess of Wales. Amongst Nectarines of superior quality Lord Napier, Elruge, Pitmaston Orange, and Pine Apple ranked amongst the finest. The Pines throughout were most creditable, especially the Smooth Cayennes. The competition with hardy fruits was keen, and large quantities were staged of superior quality. The various exhibits in this department shown from Maidstone by Mr. C. Haycock were remarkable for their superiority and brightness.

#### COLLECTIONS.

In the class for "fifteen kinds of fruits, not more than four kinds of Grapes, two kinds of Pine Apples, and two kinds of Melons," four collections were staged. Mr. W. Coleman, gardener to Earl Somers, Eastnor Castle; Mr. McIndoe, gardener to F. W. Pease, Esq., M.P., Hutton Hall, Guisborough; and Mr. J. Roberts, gardener to Baroness L. de Rothschild, Gunnersbury Park, were awarded the prizes in the order named. Fruit of high-class culture were staged. Mr. Coleman's collection being as near perfect as possible. The stand contained Muscat of Alexandria Grapes of a rich golden colour, fine in berry and bunch; Black Hamburgs, equally fine; Gros Maroc, a fair-sized bunch with very large berries, and could not have been finished better; Madresfield Court in fair condition; two Pines, a Queen and a Smooth Cayenne, both good specimens; Blenheim Orange and Eastnor Castle Melons, both fine fruit; capital dishes of Chancellor and Bellegarde Peaches, the fruit very large and well coloured; Elruge and Lord Napier Nectarines, both wonderfully good, especially the latter, which were very large; good Brown Turkey Figs; splendid Moorpark Apricots; and a fine dish of the Pitmaston Duchess Pear, the fruit being of large size and fine in colour. Mr. McIndoe staged good Muscat of Alexandria Grapes, scarcely so fine in the berries as those shown by Mr. Coleman; Gros Guillaume, a large bunch, fine in every respect; Black Hamburg, large bunches, well finished, but rather small in the berries. Trebbiano was well shown. The Melon, McIndoe's Premier, was a fine fruit, as was Sutton's Best of All. Of Peaches, Stirling Castle and Princess of Wales were pale but large; the fruit of Pine Smooth Cayenne was good, but the one of Queen was small in size; a dish of Humboldt Nectarine was very fine, as also was the dish of Beurré Superfin Pear. Good Brown Turkey Figs and two dishes of Plums completed the collection. The Grapes in the third-prize collection were the weakest part. The Pines were very fine, and a fine fruit of William Tillery Melon was

splendidly netted. Barrington Peaches were of good size and rich colour for that variety; the dishes also of Violette Hâtive Peach, Downton Nectarine, Brown Turkey Figs, and Williams' Bon Chrétien Pears were highly creditable to the cultivator.

In the class for twelve kinds of fruit four collections were again staged. Mr. J. Austen, gardener to Sir Greville Smythe, Bart., Ashton Court, Bristol, took the lead with fine Grapes of Muscat of Alexandria, good alike in bunch, berry, and colour, and equally good Black Hamburg. The two Pines, Smooth Cayenne and Queen, were both splendid fruit. Noblesse Peaches were large and well coloured. Elruge Nectarines, Moorpark Apricots, Negro Largo Fig, Jargonelle Pears, Morello Cherries, and Apple McLean's Seedling, all indicated high-class culture. Mr. G. T. Miles, gardener to Lord Carrington, Wycombe Abbey, Bucks, was a close second, having good Grapes of Gros Maroc, not large in the bunch, but with very fine and highly finished berries, also fine Muscats, but scarcely finished; two good Pines; Dr. Hogg's black Fig, small, and of a deep purple colour; and the dishes of Bellegarde Peaches and Lord Napier Nectarines were all that could be desired. Mr. A. Bander, gardener to Sir Henry Allsopp, Bart., Hindlip Hall, Worcester, took the third prize, having good Muscat of Alexandria and Madresfield Grapes, Blenheim Orange and Colston Bassett Melons, with a very fine dish of Brown Turkey Figs and Rivers' Orange Nectarine.

For the prizes offered for nine kinds of fruits four collections were once more staged. Mr. J. Edmunds, gardener to His Grace the Duke of St. Albans, Bestwood Lodge, Notts; Mr. J. H. Clayton, gardener to F. Fielden, Esq., Grimston Park, Tadcaster, and Mr. W. Wallis, gardener to Sir H. W. Thompson, Bart., Kirby Hall, Yorkshire, were the successful competitors. In the first-prize collection the Black Hamburg Grapes were very good; the bunches of Muscat of Alexandria being rather short of colour. The Smooth Cayenne Pine was good, and equally so the Melon Best of All. The Peaches included a good dish of Gladstone, a fine light-coloured fruit of good size, and Noblesse also good. Splendid Moorpark Apricots and well-finished Pitmaston Nectarines, but rather small, completed the collection. Mr. Clayton staged fine Muscat of Alexandria, but, like the first-prize lot, a little wanting in finish; the Black Hamburg Grapes and Bellegarde Peaches were excellent. The remaining good dishes being Balgowan Nectarines, Brown Turkey Figs, and Hybrid Chasmer Melon. The Pine was rather small. Mr. Wallis's best dishes were Buckland Sweetwater Grapes, not large in bunch but fine in the berry and splendidly finished; good Grose Mignonne Peaches, and the finest fruit of Brown Turkey Figs that was staged in any of the collections. The seedling Melon in this collection was rather a coarse fruit.

In the class for six kinds of fruits there were six competitors. Mr. D. Wilson, gardener to Earl Fortescue, Castle Hill, Devon, received the premier position, followed closely by Mr. J. Austen and Mr. J. Blair, gardener to Sir G. W. B. Middleton, Bart., Shrubland Park, Suffolk. The former staged some remarkably fine fruit of Black Alicante Grapes, a large well-ripened Smooth Cayenne Pine, Dymond Peach, very large for this variety; Good Pitmaston Nectarines, and Figs. The fruit of William Tillery Melon was not well netted. The second-prize collection contained some superior bunches of Muscat of Alexandria, and well-finished Black Hamburgs and a good Pine. In the third collection Golden Queen Grapes were very fine in every respect, and the dish of Barrington Peaches was all that could be desired.

#### GRAPES.

The prizes offered in these important classes were in every case well contested for. In the class for ten varieties, one bunch of each, some splendid examples of culture were staged, and on the other hand a few were quite of the contrary character. Mr. J. Hunter, gardener to the Earl of Durham, Lambton Castle, Durham, secured the first honours, some of the bunches weighing from 4 to 10 lbs. Gros Colman was remarkable both for size of bunch and berry, but scarcely finished; Muscat of Alexandria was excellent in the size of the berries and colour, and the bunch very symmetrical; Alicante was very fine and well finished; Gros Guillaume, large and well coloured, but rather small berries; Lady Downe's, all that could be desired; Trebbiano, large and very fine; Aramon, large in bunch but small in berry; Calabrian Raisin, a wonderful example, very fine in berry, and a large well-finished bunch. The bunches of Black Hamburg and Foster's Seedling were the weakest in the stand. Mr. McIndoe was second. The bunches throughout were of a smaller size than those in the first-prize collection, yet sufficiently large; they were also well shaped, and many of them even better finished than the Lambton Grapes. The most noticeable bunches were Gros Colman, very good; Duke of Buccleuch, a fair-sized bunch with large berries; Gros Guillaume and Trebbiano, both very good; Black Alicante was large in bunch and berry, but defective in colour; Golden Champion, of fair quality; Black Hamburg, superbly finished but small in the berry; Duchess of Buccleuch being weak, and West's St. Peter's. Mr. J. Hamuond, gardener to Sir Wilfrid Lawson, Brayton Hall, Carlisle, obtained the third prize with fine Grapes but scarcely ripe. The bunches of Buckland Sweetwater, Alicante, and Duke of Buccleuch were good in size of bunch and berry; Gros Colman, fair; Lady Downe's, well finished; Muscat of Alexandria, Calabrian Raisin, and Golden Queen large but not ripe. Eight collections were staged.

In the class for six varieties of Grapes, one bunch of each, fifteen

lots were staged in competition for the prizes. Mr. Elphinstone, gardener to E. M. Mundy, Esq., Shipley Hall, Derby, took the lead with magnificent Grapes, the cream of the Exhibition. The bunches were smaller than many others, but the berries were enormous, and their finish remarkable. Madresfield Court, Alicante, Muscat of Alexandria, Gros Colman, and Golden Queen have never been surpassed; the only faulty bunch was the Muscat Hamburg. Mr. J. Austen was second, the Muscat of Alexandria and Black Hamburgs being very fine; Venn's Seedling, in fair condition; Madresfield Court, good; Mrs. Pince and Mrs. Pearson being rather deficient in finish. Mr. J. Hammond was awarded the remaining prize, and staged remarkably good examples of Duke of Buccleuch, Alicante, and Lady Downe's, and a well-coloured bunch of Buckland Sweetwater.

Twenty-two competitors staged fruit in the class for two bunches of Black Hamburg Grapes. Mr. F. Boyd, gardener to W. Forbes, Esq., Callendar Park, Falkirk, N.B., took the lead with good examples of high-class culture and well finished. Mr. Barker, gardener to T. S. Patterson, Esq., Rock Ferry, was second with well-finished bunches a little smaller in the berry; and Mr. Wm. Coleman third, also with highly finished bunches. For two bunches of Muscat of Alexandria twenty lots were staged, including some of the best Muscats that have ever been exhibited. The first-prize bunches of Mr. Austen were remarkable, the bunches and berries being large and the finish superior. Mr. J. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House, Acton, was second with equally fine examples, but a trifle behind the first in that finish that is so desirable in Muscats. G. Middleton, Esq., Romford Hall, St. Helens, Lancashire, was third with excellent produce. Many good Grapes to which no prizes were awarded were highly creditable to the competitors, as may be supposed when so many competed for three prizes. In the class for two bunches of Muscat Hamburg Grapes over a dozen lots were staged, Mr. Boyd taking the lead with highly finished examples. Mr. Wallis was a close second with bunches scarcely inferior in any respect, and Mr. G. T. Miles third with equally well finished bunches but rather loose. The competition was not so large in the class for two bunches of Madresfield Court. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, took the first prize with grand examples; Mr. Roberts was a close second with superbly finished bunches; and Mr. A. Barber was an excellent third. Seven exhibitors staged in the class for two bunches of Alicantes, Mr. W. Elphinstone securing the first position with the two finest bunches of this variety in the Show, they were very large and nearly perfect in colour. Mr. Forbes, gardener to J. Harris, Esq., Derwent Lodge, Cocker mouth, was second with fine well-finished bunches; and Mr. R. Elphinstone, gardener to J. Heywood, Esq., Stretford, third with equally well finished but smaller bunches. Mr. W. Elphinstone was first in the class for two bunches of Gros Colman, and staged almost faultless examples. Mr. Forbes, Derwent Lodge, was second with well-coloured bunches, but smaller in the berry; and Mr. McIndoe third with good bunches but a little short of colour. Eight lots were staged for the prizes offered for two bunches of Lady Downe's. Mr. W. Bannister, gardener to H. St. Vincent Ames, Esq., Cole House, Westbury-on-Trym, was first, showing superior produce. Mr. W. Elphinstone followed closely with a little smaller bunches but equal in other points; and Mr. Hunter was third, also with capital bunches. In the class for two bunches of Duke of Buccleuch there were four competitors. Mr. McIndoe, Mr. J. Morton, gardener to J. Fieldes, Esq., Chorltoncum-Hardy, and Mr. J. Farquharson, Acton, Wrexham, took the prizes. The first-prize Grapes being very beautiful, the second small bunches but well finished, and the third large but deficient in colour. Mr. McIndoe was first for two bunches of Golden Champion, showing well-finished bunches, examples without spot or blemish. Mr. J. Roberts was second, his bunches having very large berries; and Mr. J. Morton was an excellent third.

In the class for the heaviest bunch of Black Grapes Mr. Roberts, gardener to the Countess Charleville, Tullamore, Ireland, was first with Gros Guillaume weighing 20 lbs. The berries were small, and the bunch anything but well coloured. The same exhibitor also staged two bunches of Trebbiano, weighing 28 lbs. the two. Mr. W. Burnyeat, Hyn-ton, was awarded the second prize for a large bunch of Gros Guillaume, no weight being given. Mr. Dickson, gardener to J. Jardine, Esq., Arkleton, was third. For the heaviest bunch of white Grapes the same exhibitor was again first, showing Trebbiano, weighing 20 lbs. 3 ozs. Mr. Dickson was second with a bunch 11 lbs. 9 ozs. in weight. No name was attached to the third-prize bunch.

*New Grapes.*—One prize was offered for the best seedling Grape, and six competitors appeared, the prize being secured by Mr. Ollerhead, gardener to Sir H. W. Peck, Bart., M.P., Wimbledon, for Ollerhead's Seedling, a white Grape, said to be a cross between Muscat of Alexandria and Foster's Seedling, and has been previously described. Mr. Hunter had a black Grape raised last year, the berries were round but with rather thick skin. Mr. Allan of Gunton and Mr. Horsefield of Heytesbury showed the Chatsworth, also a black Grape of fairly good flavour.

#### PINES.

In the class for six Pine Apples, not less than three varieties, Mr. McIndoe was first and the only exhibitor, showing well two Queens, two Charlotte Rothschilds, and two fine Smooth Cayennes. For two Pines of any kind Mr. D. Wilson was first with a pair of Queens, very fine fruit; Mr. D. Murray, gardener to the Marquis of Ailsa, second with the same variety; and Mr. Faulkner, gardener

to F. R. Leyland, Esq., Woolton Hall, Liverpool, a close third. Mr. D. Wilson was also awarded the first prize for one Smooth Cayenne weighing 6 lbs. Mr. J. Ricks, gardener to Sir G. Chetwode, Bart., Oakley Park, Market Drayton, and Mr. Hutton, gardener to W. Bellhouse, Esq., Southport, being second and third respectively with very good fruits. For one Queen Mr. S. Whitfield, gardener to F. F. Cross, Esq., Aigburth, was first, Mr. Faulkner second, and Mr. J. Austen third, all exhibiting well, six lots being staged. In the class for one Pine Apple, any other kind, Mr. J. Muir, gardener to C. R. M. Talbot, Esq., Ma'gam Park, was first, followed closely by Mr. Ricks.

#### PEACHES AND NECTARINES.

Peaches were well and numerous shown, Mr. Hunter taking the lead in the class for three dishes of six fruits, followed closely by Mr. Milne, gardener to Lord Delamere, and Mr. W. Coleman. The first-prize dishes contained fine fruit of Hale's Early, Royal George large and well coloured, and Early Grosse Mignonne very good. In the second (Mr. Coleman's) Red Magdalen was in good condition, the other varieties being the same as in the first-prize collection. Bellegarde and Alexandra Noblesse were large and very fine in the third-prize lot. The Judges had some difficulty in deciding in this class, as the majority of the twenty-two dishes that were staged were all of first-rate quality. Some thirty dishes were staged in the class for twelve fruits, and Mr. Coleman was awarded the premier prize with Bellegarde, which he staged in splendid condition throughout the Exhibition. Mr. C. Ross, gardener to C. Eyre, Esq., Welford Park, Newbury, was second with Princess of Wales, very large and in fine colour for that variety; Mr. J. Hunter being third with Royal George, highly coloured and very large. In the class for one dish of six fruits there was about the same number of competitors as in the preceding class. Mr. Bland, gardener to Mrs. G. Smith, Cranbourne Court, Windsor, was awarded the first prize for extra large fruit of Princess of Wales. Mr. D. Abbott, gardener to C. H. Firth, Esq., Sheffield, was second with Violette Hâtive, very fine; and Mr. McKelvie, gardener to the Dowager Duchess of Roxburgh, Broxmouth Park, third with excellent fruit of Royal George.

*Nectarines.*—The competitors in these classes were as numerous as in the classes devoted to Peaches. For twelve fruits Mr. W. Coleman took the lead with large and very fine examples of Lord Napier. Mr. J. Malcolm, gardener to the Marquis of Cholmondeley, was second with large fruits of Pine Apple, but rather deficient in colour. Mr. J. Hunter third with Violette Hâtive, large and well coloured; between thirty and forty lots being staged. In the class for six fruits Mr. R. Gilbert, gardener to the Marquis of Exeter, Burghley, Stamford, was first with nearly green but large fruits of Victoria. Mr. G. Masters, gardener to Col. Leigh, High Leigh Hall, followed with Prince of Wales, a variety much resembling Victoria, and nearly green. The third fell to Pitmaston Orange, exhibited by Mr. W. G. Gaiger, gardener to S. F. Whitehead, Esq., Bakewell; over twenty lots being staged. For three dishes, Messrs. Hunter, W. Coleman, and R. Milne took the prizes; the two former both showing Elruge well, while the latter staged fine fruits of Violette Hâtive.

*Apricots.*—These were generally very good, the competition was also good in the several classes. For twelve fruits Mr. R. Gilbert was first, Mr. W. Wallis second, and Mr. J. Ridsdale, gardener to the Marquis of Ripon, third. For one dish Messrs. G. Malcolm, G. J. Barton, Oxtou, and J. Ricks took the prizes in the order named.

*Melons.*—Some twenty pairs were staged in the class for two green-fleshed kinds, Mr. G. T. Miles obtaining the first prize, and Mr. W. Coleman the second, staging respectively Dickson's Exquisite and Eastnor Castle. Messrs. J. Cheal & Sons, Crawley, Sussex, were third, showing their new Melon Shepherd's Perfection, a large well-netted and fine fruit of the Cox's Golden Gem type. For two scarlet-fleshed kinds Mr. W. Pratt, gardener to Viscount Hill, Hawkstone, Salop, was first with Hawkstone Seedling, a useful-sized, well-netted, and good-flavoured variety. Mr. W. Coleman followed with Blenheim Orange, a well-netted fruit, and Mr. J. Blair secured the remaining prize with a fine example of Royal Ascot. In the class for one Melon, green-fleshed, Mr. H. W. Cordale, gardener to W. Boulton, Esq., Worcester, was first with Hero of Lockinge, Mr. G. T. Miles second with a variety not named, and Mr. W. Coleman third with Eastnor Castle. Seventeen fruits were staged. In the class for any scarlet-fleshed kind Mr. T. Bailey, gardener to T. T. Drake, Esq., Shardeloes, Bucks, was first with Victory of Bristol; Mr. Goldsmith, gardener to Sir W. Farquhar, Bart., Dorking, second with Bloxholm Hall; and Mr. G. Malcolm third with a fine netted variety with no name. One class only being devoted to Figs it was surprising what a number of dishes were staged. For twelve fruits Mr. W. Allen, gardener to Lord Suffield, was first with fine fruit of Brown Turkey; Mr. A. Barber was second with the same variety, and Mr. W. Wallis third.

For the best specimen of Suttons' Hero of Lockinge Melon Mr. J. Malcolm was first with a handsome fruit, followed by Mr. Upjohn, Worsley, and Mr. R. Gilbert.

The special prizes offered by Messrs. Dickson, Brown, & Tait for their Best of All Melon were won by Mr. G. Wilkes, gardener to Mrs. Tambaci, followed by Mr. J. Roberts, Acton, and Mr. D. Abbott.

#### LEMONS, ORANGES, &c.

In the class for the finest collection of Lemons, Citrons, Oranges, Limes, and Shaddocks (open to all countries) there was only one

exhibitor—Mr. J. Muir, who had a collection which was greatly admired and was deservedly awarded the gold medal. It is questionable if such a fine assortment could have been staged from any other private establishment in the kingdom. The fruits were well arranged on dishes edged with sprays and flowers of the shrubs, which added materially to their embellishment. The following were some of the most prominent varieties of this remarkable collection:—Citrus Aurantium sinense, C. Limonum racemosum, C. vulgaris, C. Decumana, C. A. fructu-depresso, C. Limonum Bignetta, C. A. melitense, C. A. rugosum, C. A. microcarpum, C. A. ilicifolium, C. Limonum oblongum, C. A. nicæense, C. A. lusitanicum.

#### HARDY FRUIT.

This made a fine display. In the class for a collection of twelve kinds in a basket or tray some eight collections were staged. Mr. C. Haycock, gardener to R. Leigh, Esq., M.P., Barham Court, Maidstone, and Mr. William Faye, gardener to J. Dereham, Esq., Sneyd Park, Bristol, took the prizes as named. The first-prize collection contained a very fine assortment including a good dish of Williams' Bon Chrétien Pear, large and of good colour; a dish of Cob Nuts, Red and White Currants, Morello Cherries, Devonshire Quarrenden Apples, large and fine; Golden Gage Plums, Warrington Gooseberries, a good dish of Dr. Hogg Peaches, and Rivers' Orange Nectarine. The second collection contained good dishes of Prince of Wales Peach, Worcestershire Pearmain Apple, Green Gage and Jefferson Plums, Mother Apple, and a good dish of Baronne de Mello Pear. The third lot contained good Red Astrachan Apples, Elruge and Pine Apple Nectarines, Washington Plums, and a good dish of Filbert Nuts.

**PLUMS.**—These were of first-rate quality, and the competition was keen. In the class for twenty fruits, five kinds, Mr. W. Gibbon, Sedford Grange, Pershore, Mr. J. Hunter, and Messrs. Smith & Sons, Cheltenham, were the prizetakers. Good fruit was staged in the first-prize lot of Diamond and Victoria, very fine, Cox's Emperor, Jefferson, and Belle de Louvain. For twelve fruits of any kind Mr. Upjohn, gardener to the Earl of Ellesmere, Worsley, took the lead with Green Gage; Mr. Grant, gardener to Mrs. B. Glegg, second with Jefferson; and Mr. J. Gibbon third with Victoria.

**PEARS.**—Mr. Haycock took the premier award in the class for a collection of twelve varieties of Pears, two fruits of each, ripe or unripe, the best fruits being Van Mons Léon Leclerc, Duchesse d'Angoulême, Souvenir du Congrès, Beurré d'Amanlis, Doyenné Boussoch, and Maréchal de Cour. Mr. W. Wildsmith, Heckfield, was second, showing good fruits of Pitmaston Duchess; Brockworth Park, Beurré Clairgean, and Beurré Sterckmans. Mr. J. Austen was a good third, having excellent dishes of Beurré Hardy, Urbaniste, and Beurré de l'Assomption. For twelve Jargonelles Messrs. Smith & Sons, Cheltenham, were first with good fruit; Mr. John House, Peterborough, second; and Mr. Haycock third. For six fruits, two kinds of each, Mr. McIndoe was first with Souvenir du Congrès and Beurré de l'Assomption; Messrs. Smith & Sons second, having good fruit of Williams' Bon Chrétien; and Mr. Douglas, gardener to F. Whitbourne, Esq., Loxford Hall, third, having Beurré Giffard, fine. In the class for the six heaviest fruits Mr. McIndoe took the lead with Pitmaston Duchess; Mr. W. Crump, Blenheim, second, and Mr. Hannagau, Hooton Hall, third, both staging the same variety.

**APPLES.**—Some fine fruits were exhibited in the class for twelve baking kinds, two fruits of each. Mr. Haycock was first, and Mr. C. Ross second. The first comprised good examples of Lord Derby, Bedfordshire Foundling, Warner's King, Loddington Seedling, Merc de Ménage, Emperor Alexander, Lord Suffield, Ecklinville Seedling, and Belle Dubois; the second good Golden Noble, Grand Duke Constantine, Peasgood's Nonesuch, and Dutch Codlin. Mr. G. T. Miles was third, having good White Transparent, Grenadier, and Beauty of Kent. For six baking kinds L. A. Killick Esq., Mount Pleasant, Maidstone, was first with Loddington Seedling; Mr. Haycock followed with Lord Suffield, and Mr. John Barnes, Hucclecote, with the same variety. Mr. Haycock was the successful exhibitor in the class for a collection of twelve kinds of dessert Apples, two fruits of each, and staged Devonshire Quarrenden, Cox's Orange Pippin, Emperor Napoleon very fine, Irish Peach, Duchess of Oldenburg, Red Astrachan, White Transparent, Lady Derby, and Ribston Pippin. Mr. J. Roberts was a close second with good Duke of Edinburgh, Worcestershire Pearmain, Golden Pippin, and Cox's Orange Pippin. Nearly thirty dishes were staged of six dessert kinds suitable for table; Mr. J. O. Cooper, Calcot, Berks, was first with very fine Red Astrachan; Mr. D. Roberts second with Duchess of Oldenburg, and Mr. W. Faye third with the same variety.

Red Currants were rather numerous staged, the prizetakers being Messrs. W. Wallis, J. Austen, and J. Edmunds. For White Currants Messrs. W. Pratt, McIndoe, and Edmunds were the prizetakers.

**Fruit Trees in Pots.**—This division of the schedule was only poorly represented. The pot Vines were anything but good, and the fruit badly rubbed in travelling. For two Vines Mr. G. Park, gardener to R. A. Farrington, Esq., Wigan, was first with by far the best. Mr. McGaw was second; and Mr. G. Smith, gardener to J. Rylands, Esq., Stretford, took the remaining prize. The Figs in pots were poor, and need no further comment.

#### PRIZES FOR HORTICULTURAL SOCIETIES AND FRUITERERS.

Gold medals were provided for fruit and vegetables exhibited by

horticultural societies in any part of the world, the produce being grown in their respective districts. For the collection of fruit the Bristol Chrysanthemum Spring Show Society staged the only collection, and was awarded the gold medal and prize. The fruit staged was good, and comprised a large and varied collection, and well deserved the award given. Some of the principal dishes were Grapes. Gros Colman good, Mrs. Pince fair, Madresfield Court fine, Lady Downe's rather defective in finish, Buckland Sweetwater well finished. Other Grapes were staged, but those enumerated were the best. Good Queen and Smooth Cayenne Pines were staged. Apples—Lord Suffield very large, Alfriston fine, and Early Harvest. Pears—Beurré d'Amanlis good-sized fruit, Jargonelle, and others. Nectarines—Rivers' White, Pitmaston Orange, and Violette Hâtive, with good Gros Miguonne Peaches. The collection also included American and Siberian Crabs, good Apricots, Plums in variety, and Gooseberries.

**Prizes for Fruiterers.**—In the class for the largest and most meritorious collection of fruits, including all kinds, Mr. Mason, Victoria Buildings, Manchester, was awarded the premier award for a large and very fine display of fruit, including baskets of Duke of Buccleuch Grapes of superior quality, and remarkably fine Muscat of Alexandria, black Grapes of every description, Pines, Melons, Plums, Pears, Apples, Passion fruit, Tomatoes, and many other kinds, all of great excellence. Great credit is due to Mr. Mason for such an elaborate collection of fine fruits; it was a great feature in the Exhibition. Mr. Bradshaw, fruiterer, Bolton, also staged in this class, and was awarded the second prize. This was a good assortment, but much inferior to the preceding collection. For a collection of ten kinds Mr. F. Stevenson, Altrincham, was the only exhibitor, and was awarded the first prize. His collection comprised some good Black Hamburgh, Muscat of Alexandria Grapes, and Royal George Peaches. In the class for the finest collection of hardy fruits, ripe or unripe, the same exhibitor was again first, staging good Williams' Bon Chrétien and Beurré d'Amanlis Pears, Apricots, Magnum Bonum Plums, and Citron des Carmes Pears. Mr. John Barnes, Hucclecote, was a good second.

#### SPECIAL PRIZES.

**THE GENERAL HORTICULTURAL CO.'S PRIZES (JOHN WILLS, MANAGER).**—Some grand fruit was staged for these. In the class for twelve dishes including two Pines, two kinds of Grapes, two Melons, and six other kinds of fruit, the first prize was thirty guineas, and the second twenty guineas. Mr. W. Coleman took the lead, and perhaps never staged fruit in finer condition. The Muscat of Alexandria and Black Hamburgh Grapes were superb in every respect; the Smooth Cayenne and Charlotte Rothschild Pines were models of perfection; the Melons Blenheim Orange and Eastnor Castle were both handsome fruit; the Bellegarde Peaches were large and well coloured, and the Lord Napier Nectarines were of the first quality. Good Pitmaston Duchess Pears, Morello Cherries, Washington Plums, and a fine dish of Brown Turkey Figs completed the collection. Mr. Goodacre, Elvaston, was placed second, and staged a grand lot of fruit, although several points behind those shown by Mr. Coleman. Canon Hall Muscat was very fine in berry, bunch, and colour; the Melons were also fine fruit, Luscious-and-Melting, and Sydnope Favourite; the Pines were both good, and only differed from the others in a Queen being staged instead of a Charlotte Rothschild. Violette Hâtive Peach, and Pitmaston Nectarine were both fine dishes; Moorpark Apricots were also good; the Jargonelle Pears, Jefferson Plums, and Brown Turkey Figs were creditable dishes.

In the class for the best six bunches of white Grapes and six of black, two or four kinds, for prizes of the same value as above, some grand and finely finished Grapes were staged, and we were sorry to see many fine examples that competed in this class for the two prizes passed over without an extra award. Mr. Hunter, Lambton Castle, was the successful exhibitor, and staged some splendid examples of Trebbiano, three bunches, large and finely finished; Muscat of Alexandria, fine colour, large in bunch and berry; Black Hamburghs, superb, and the Alicantes were monsters and good. Mr. Loudon, gardener to T. Barnes, Esq., Chirk, was the other successful exhibitor, and staged white Grapes in the first-prize collection, but a little smaller in size, good Black Hamburghs; and neat well-finished bunches of Madresfield Court.

**THE VEITCH MEMORIAL PRIZES.**—For three Pines, English-grown fruit, Mr. Wilson, Castle Hill, Malton, was awarded the prize of £5 and the Veitch Memorial medal for very fine fruit. For ten kinds of English-grown fruit Mr. Goodacre was awarded the Memorial medal and £5. He staged good fruit of Muscat of Alexandria and Black Hamburgh Grapes, two good Pines, Royal George and Violette Hâtive Peaches, Plum Transparent Gage, Jargonelle Pears, Moorpark Apricots, and a Conqueror of Europe Melon. For three bunches of black Grapes W. Forbes, Esq., Falkirk, N.B., was awarded the prize and Memorial medal for perfect examples of Muscat Hamburgh. Some good Grapes were staged for this prize, and without doubt the finest bunches of Madresfield Court in the Show were staged in this class by Mr. J. Roberts. In the class for three bunches of white Grapes Mr. Raffil, gardener to Lord Tredegar, obtained the medal and prize for well-coloured large bunches of Muscat of Alexandria. Mr. Hudson also staged bunches of the same variety, and was only one or two points inferior to those that obtained the medal, Mr. Hudson being highly commended for his collection.

The prize presented by Messrs. Paul & Sons, Old Nurseries, Ches-

hunt, for the best dish of Strawberries was won by Mr. J. M. Smith, gardener to the Earl of Crawford, with large unnamed fruit.

#### PLANTS.

As regards the comparative importance of the several sections in the Exhibition pre-eminence must undoubtedly be accorded to the fruit and vegetable classes, the plants occupying a second-rate position both in numbers and excellence. This was principally due to the fact that it had intentionally and judiciously been the object of the projectors to give special encouragement to the exhibitors of fruit, as the season selected was one at which that important portion of garden produce could be most largely and best represented. Plants,

especially those grown chiefly for the beauty of their flowers, are shown in their prime at earlier periods of the year, and the end of August is somewhat late to expect an imposing display. Many of the handsome specimen stove and greenhouse plants which grace the exhibitions of May, June, and July have now lost their principal charms, and consequently anything like a great floral display could not reasonably be expected. Notwithstanding this, however, flowering plants were sufficiently numerous to impart that much-needed richness and variety of colour without which a horticultural exhibition is comparatively tame and uninteresting to the general visitor. Fine-foliage plants, and particularly Crotons, were in strong force and grand condition, the fine yellow and crimson tints that distinguish the last-

Fig. 33.—MR. BRUCE FINDLAY. (See page 206.)

named being extremely well developed, thus contributing an additional and magnificent attraction to the Show.

The large permanent iron-framed marquee and the handsome glass buildings that are usually employed for the Society's celebrated Whitsuntide shows were completely filled with the 164 entries in the forty-six classes devoted to plants, the numerous groups and collections not for competition, staged by nurserymen and others, adding very largely to the extent of the Exhibition. The large marquee chiefly contained the competing groups and some of the smaller classes, while the exhibition house was occupied with the Crotons, Dracænas, Ferns, new plants, Orchids, and general collections, which, being very taste-

fully arranged, constituted in themselves a display of remarkable beauty. As they formed the most important portion of the Show in the section now under consideration it may be well to first notice the classes devoted to

#### FINE-FOLIAGE PLANTS.

Not only were Crotons well shown, but Dracænas, Palms, and Ferns were also healthy, fresh, and beautiful; but as the first named were especially remarkable they deserve attention first.

*Crotons.*—Two classes were appropriated to these plants—namely, one for nurserymen and the other for amateurs, ten specimens being required in the first, the prizes being £5, £4, and £3, one pound less

in each prize being offered for six in the other class. Four collections of ten were staged, all very close in merit and nearly equally well coloured. Messrs. Ireland & Thomson of Edinburgh were deservedly awarded premier honours for specimens such as are seldom seen, for in symmetry, health, and colour they could scarcely have been surpassed. Some of the smallest did not exceed 3 feet in height, while others reached 8 or 9 feet, and 4 or 5 feet in diameter. The varieties were *C. majesticus*, *C. Disraeli*, *C. Princess of Wales*, *C. Etna*, a handsome and richly coloured form; *C. fasciatus*, extremely fine, foliage large and brightly coloured; *C. Weismanni*, a grand example; *C. angustifolius*, *C. interruptus aureus*, *C. pictus*, and *C. Queen Victoria*, a well-known variety, superbly represented. Mr. B. S. Williams, Upper Holloway, London, and Mr. J. Cypher, Cheltenham, were awarded equal second prizes for collections that were very little inferior to Messrs. Ireland & Thomson's handsome group, and their respective merits were such that any other disposition of the awards would have been unjust to one of the exhibitors. Mr. Williams' plants were of good size and beautifully coloured, the best being *C. Warreni*, *C. Truffautianus*, *C. Johannis*, *C. Williamsi*, and *C. Stewartii*. Mr. Cypher had excellent specimens of *C. Queen Victoria*, *C. Sunset*, very bright; *C. Johannis*, and *C. Weismanni*. An extra prize was awarded to Messrs. R. P. Ker & Sons, Liverpool, for moderate-sized specimens of *C. Disraeli*, *C. Hanburyanus*, *C. undulatus*, and *C. Mortii*, all beautifully coloured. Only two collections were contributed in the amateurs' class, Mr. W. Lingard, gardener to H. Samson, Esq., Bowdon, securing the chief award for well-grown specimens of *C. pictus*, *C. Queen Victoria*, *C. Weismanni*, *C. angustifolius*, *C. Disraeli*, and *C. majesticus*; Mr. C. Paul, gardener to S. Schloss, Esq., Bowdon, being placed second with well-coloured but not such even specimens.

**Dracenas.**—Two classes were also devoted to *Dracenas*—for twelve and six specimens—the first from nurserymen the second from amateurs, the prizes being £8, £5, £3, and £5, £3, and £2. The best dozen plants were staged by Messrs. Ker & Sons, the specimens being healthy, of moderate size, very even, fresh, and bright in appearance. The varieties were *D. picta*, *D. Hendersoni*, *D. amabilis*, *D. nigrescens*, *D. recurva*, *D. speciosa*, *D. regina*, *D. Bausei*, *D. Goldiana*, *D. Salmonea*, and *D. Gladstonei*. Mr. B. S. Williams followed closely, having admirable specimens of *D. Thomsoni*, *D. Goldiana*, *D. albo-marginata*, *D. recurva*, *D. Duke of Connaught*, and several others. Messrs. Ireland & Thomson took the third position with very satisfactory examples of attractive varieties. The best amateurs' six were from Mr. W. Pratt, gardener to Lord Hill, Hawkstone, all good and satisfactory specimens—healthy, brightly coloured, and of moderate size, Mr. J. Hammond, gardener to Sir Wilfrid Lawson, Bart., M.P., Brayton Hall, securing second honours with very similar specimens but not quite so bright; while Mr. Beard, gardener to J. G. Adams, Esq., Ashton-on-Mersey, was placed third for creditable plants very close to the preceding in merit.

**Palms.**—Though not shown in large numbers some good specimens of these were staged, and were very effective in the general arrangement. In the nurserymen's class for six Mr. B. S. Williams had the premier collection, large handsome specimens of the useful and handsome *Chamaerops Fortunei*, *C. humilis*, the almost indispensable *Cocos Weddelliana*, *Geonoma Seemanni*, *Kentia australis*, and *K. Belmoreana*, both graceful forms. Mr. Cypher was second with very large specimens, but not quite so even and compact as the first-named. *Kentia Fosteriana*, *Thrinax elegans*, *Pritchardia pacifica*, and *Areca lutescens* were the most noteworthy. Messrs. J. Dickson & Sons, Chester, followed with healthy well-grown plants. In the amateurs' class for four Palms the prizetakers were Mr. Lingard, Mr. J. Hammond, and Mr. E. Tudgey, gardener to J. F. G. Williams, Esq., Worcester, who all contributed satisfactory specimens, mostly of good size, and differing but slightly in their respective merits.

**Ferns.**—In the one class for ten exotic Ferns from amateurs three handsome collections were contributed, the plants being equally remarkable for their size and vigorous health. Several *Gleichenias* and *Davallias* were particularly well shown, and they all reflected considerable credit upon the exhibitors. Mr. Paul was adjudged the principal honours for meritorious specimens, that had evidently received intelligent and careful treatment. The finest plant was an example of *Gleichenia dichotoma*, 6 or 7 feet in diameter, and as fresh as could be desired. *G. flabellata*, *G. Mendelli*, and *G. rupestris* were also of considerable size and equally healthy, while the fine exhibition Fern *Davallia Mooreana* was admirably represented. Mr. W. Lingard proved a formidable competitor, but after careful consideration on the part of the Judges he was awarded the second prize. *Gleichenia dichotoma*, *G. spelunca*, *G. Mendelli*, 6 feet in diameter, *G. dicarpa*, and *G. rupestris* were the chief features in the collection, being of great size and healthy. Mr. J. Hesketh, gardener to Arthur Birley, Esq., Woodbank, Pendlebury, followed with clean, fresh, and vigorous plants, *Cibotium princeps* and *Cyathea medullaris* being the best.

The Tree Ferns were placed in the large marquee, being arranged at intervals in front of the groups, and thus producing a pleasing break in the view. Two classes were reserved for them, but the competition was confined to nurserymen. Mr. B. S. Williams gained the most important award for half a dozen beautiful specimens, very even in size, each about 10 feet high; *Cyathea Smithii*, *C. dealbata*, *C. Burckii*, *Alsophila australis*, *A. Williamsi*, and *Dicksonia antarctica*

were the species shown, the *Cyatheas* being especially noteworthy for their gracefulness. Messrs. J. Dickson & Son, Chester, had the second prize for healthy specimens, one *Dicksonia antarctica*, about 9 feet high and with a handsome crown of fronds, being scarcely surpassed in the Show. *Cyathea dealbata* was also admirably represented among several other species of that genus and of *Alsophila*. Mr. Cypher had a less regular collection, and was accordingly adjudged the third position, though in the beauty or rarity of the kinds shown and the quality of the plants he was little behind the other competitors. *Alsophila elegantissima*, *Cibotium Schiedei*, and *Cibotium regale* were the most noteworthy.

Filmy Ferns are comparatively rarely seen at exhibitions, at least in any quantity. A few specimens are occasionally shown amongst the specialities of nurserymen's groups, but as a rule they are confined to two or three of the most common and best known species and varieties. There is one good reason for this customary absence—namely, that Ferns with fronds of such delicate texture are quite unsuited for the rather severe ordeal of being exposed in ordinary exhibition tents even for a single day, and plants of considerable value may be injured beyond all hope of recovery in a very short time after their arrival at the show, even though they may be conveyed thither safely. The advantages of the close glass house at the Manchester Botanic Garden, however, induced four exhibitors to send collections of these charming little Ferns, about twenty specimens being staged, mostly in good condition. In the nurserymen's class for eight specimens Mr. B. S. Williams was the only exhibitor, and was deservedly awarded the first prize for the following: *Trichomanes maximum*, *T. humile*, *T. auriculatum*, the delicately pretty *T. trichodeum*, *Todea superba*, *T. intermedia*, *Hymenophyllum hirsutum* and *H. demissum*, some of the best forms in each of the three genera. The plants were mostly growing upon stumps of Tree Ferns, one end of which was plunged in a deep pan of fine spar, the delicate kinds being covered with a bellglass. Though Mr. Williams won uncontested honours, the amateurs' class was better filled, as three collections of four plants each were staged, and the plants generally differed very slightly in merit. Mr. C. Goodall, gardener to Mrs. Leech, Stalybridge, was first with *Todea pellucida*, healthy; *T. superba*, fine; *Trichomanes radicans*, and *Hymenophyllum demissum*. Mr. Tudgey was a close second with similar kinds to the first-named, healthy and fresh. Mr. G. Smith, gardener to John Rylands, Esq., Stretford, was a close second, having *Todea hymenophylloides* and *Hymenophyllum tunbridgense* very fine.

#### NEW PLANTS.

The new plants that had not been previously exhibited were few, but most of the best introductions of the past year were represented in the four classes provided. Several plants which are likely to prove of sterling value were shown, but, taking the classes generally, there was an absence of striking novelties.

For twelve new plants in or out of flower three collections were entered, Mr. B. S. Williams being placed first with healthy and neat specimens of the following—*Delabeckia rupestris*, an elegant plant with palmate leaves; the leaflets narrow, divergent, and dark green. In a small state it is well suited for table decoration. *Encephalartos Frederici Gulielmi*, a very distinct Cycad with rigid pinnate leaves; the pinnæ being narrow, closely set, and slightly woolly beneath. *Cycas undulata*, also a distinct Cycad, having leaves much less rigid than is usual in the genus, pinnate, somewhat short; the pinnæ bright green and with slightly undulated margins. *Aralia spinulosa*, a handsome form with pinnate leaves; the leaflets oval-elliptical, bright green, and distantly placed upon the petioles. *Alocasia Thibautiana*, a very fine plant, having heart-shaped leaves 2½ feet long by 2 feet broad, with a very dark green ground colour, the veins being strongly marked and white. *Croton Stewartii*, one of the section with leaves of moderate breadth, elliptical lanceolate in form, possessing rich tints of crimson and yellow, which in the specimen exhibited were very finely developed. *Aralia spectabilis*, a noble *Aralia*, certainly one of the most distinct and imposing in the genus. The leaves are pinnate, 2 to 3 feet long, with long pinnæ very deeply and irregularly cut. It is of spreading habit, and has a fine effect among other plants of more slender appearance. *Dracena Lindenii*, very distinct from the majority of *Dracenas*; the leaves are elliptical, broadly streaked with light and dark green, and a peculiar shade of yellowish white. *Philodendron elegans*, a form with pinnately divided leaves about a foot in length, the divisions being narrow and bright green; and *Aralia Chabrievi*, an extremely graceful plant and likely to become a general favourite, especially for table decoration, as it possesses a most pleasing lightness and elegance of appearance. The leaves are very narrow, linear or tapering, extremely dark green, with deep red midribs.

Messrs. R. P. Ker & Son secured the second position with neat and well-grown specimens of the following among others—*Zamia Watzleri*, a peculiar spiny-leaved Cycad, suggestive of *Encephalartos horridus* without the fine characteristic glaucous hue. *Dracena Bella*, a dark crimson narrow-leaved *Dracena*, well suited for table decoration. The margins of the leaves are a very bright shade of crimson. *Pelargonium Gloire d'Orleans*, one of the Ivy-leaved section which has been repeatedly exhibited and certificated in the neighbourhood of the metropolis. It is remarkable for the bright pink hue of the neatly double flowers. And *Croton Warreni*, a handsome *Croton*, with spirally twisted leaves of a rich crimson and yellow tint. Mr. J.

Cypher was third with smaller plants, mostly similar to those already mentioned, but containing in addition the following well-known plants—*Microlepia hirta cristata*, *Crotons Mortii* and *albicans*, *Thrinax elegantissima*, *Sabal cœrulescens*, *Ixora regina*, and *Rhododendron Taylori*, the last-named being scarcely correctly classed as a new plant.

For six new plants in or out of flower, introduced into Europe by the exhibitor, and not in commerce, there was no competition, Mr. B. S. Williams being the only exhibitor, and securing the premier award for an admirable collection comprising the following—*Sansevieria aureo marginata*, a peculiar variegated *Sansevieria*, the leaves being a foot long, 2 to 2½ inches broad in the middle, tapering to the apex; the centre is greenish, and the margins light yellow, very clearly defined. *Anthurium Dickii*, somewhat suggestive in habit of *Anthurium acaule*, but with narrower and stiffer leaves. These are 2 to 3 feet long and 5 to 6 inches broad, tapering, and of a bright shining green; petioles very short and broad. *Heliconia nigro-punctata*, a Musa-like plant with dark green leaves, ribbed, margined, and tinged with deep red. *Croton Bruce Findlay*, a handsome new *Croton*, having ovate elliptical leaves 9 to 15 inches long, 3 to 4 inches broad, dark green with bright yellow veins. *Kentia cristata*, a neat and graceful pinnate-leaved Palm; and *Dracæna Williamsi*, a distinct and peculiar form with tapering leaves irregularly streaked with green and crimson.

For one new plant in flower and not in commerce there were two competitors—namely, Mr. B. S. Williams, and Mr. E. Mitchell, gardener to Dr. Ainsworth, Cliffe Point, Lower Broughton, who were placed first and second respectively. Mr. B. S. Williams showed a pretty Orchid, *Angræcum amabile*, of dwarf habit and having short leaves. The flowers are small, creamy white in colour, wax-like in texture, and very fragrant; the petals and sepals being narrow, acute, and strongly recurved. The flowers are borne on a spike about 6 inches in length. Dr. Ainsworth's plant was also an Orchid, *Cypripedium Ainsworthii*, the result of a cross between *C. Sedeni* and *C. Roezlii*, and partaking of the characters of each, that of the former predominating.

For a new fine-foliage plant not in commerce there were three exhibitors, Messrs. Ireland & Thomson securing chief honours with *Croton Thomsoni*. This is a handsome *Croton* with leaves indistinctly lobed, somewhat like *C. Disraeli*, about a foot long and 4 inches broad at the widest portion, tapering to the apex. The ground colour is green, the midrib and veins being bright yellow. Judging by the specimen shown the variety appears to colour extremely well, and is likely to become a favourite. Mr. B. S. Williams was second with *Asplenium horridum*, a distinct and effective Fern with pinnate fronds 2 feet or more in length, the pinnæ deeply lobed. The frond is triangular in outline, and has a brown stipes. Messrs. R. P. Ker and Sons were third with *Lomaria obtusata*, a New Caledonian Fern of neat habit, the fronds 6 inches long and 1 inch broad, with pinnatifid segments.

In addition to the above plants in competition large numbers of new and choice plants were shown by Messrs. Veitch & Sons, Chelsea, and Mr. B. S. Williams, and as several of these were certificated they may be fittingly mentioned here. Messrs. J. Veitch were awarded certificates for the following—*Cypripedium porphyrospilum*, a distinct and pretty form of Ladies' Slipper, which has previously been certificated at Kensington and described in these pages. *Cypripedium albo-purpureum*, a hybrid between *C. Schlimii* and *C. Dominii*, with pinkish flowers and spirally twisted petals. It evidently partakes of the characters of each parent. *Cypripedium selligerum majus*, a fine form of *C. selligerum*, the flowers large and colours good. *Davallia elegans polydactyla*, a variety of this graceful Fern with long crisped points to the fronds. *Heliconia aureo-striata*, leaves elliptical, green veined with yellow, distinct and pretty. *Rhododendron Duchess of Connaught*, one of the most attractive of the greenhouse hybrid *Rhododendrons*, with neat, wax-like, coral-scarlet tubular flowers in compact beads. *Asparagus plumosus nanus*, a charming gauze-like plant of dwarf habit, the leaves being most delicately and finely divided, imparting an indescribably graceful appearance to the plant. *Yucca filamentosa elegantissima*, a neat and brightly coloured form of this pretty *Yucca*. *Sarracenia melanorhoda*, a small *Sarracenia* with short dark red pitchers, which has been previously described when certificated at Kensington some months ago. *Pachystoma Thomsonianum*, a pretty little Orchid with white and purplish-violet flowers. *Lilium auratum platyphyllum* and *L. speciosum gloriosoides*, two handsome and distinct Lilies which have been frequently referred to. *Sarracenia formosa*, a hybrid between *S. psittacina* and *S. variolaris*, combining some of the most attractive characters of each. *Croton Hawkeri*, the neat form figured in these pages a short time since. The plant was in good condition, and evidently well merits the honours that have been accorded it. *Nepenthes bicalcarata*, the large-pitched form now familiar to most visitors to metropolitan shows. *Quercus cuspidata variegata*, a very distinct Variegated Oak with small leaves prettily marked with green and white. *Lastrea Richardsii multifida*, an elegant Fern with neat fronds, dark green, and divided at the apex. *Ixora Westii*, a beautiful hybrid, the result of a cross between *I. odorata* and *I. amboynensis*. The corolla tubes are long, bright pink, the lobes being of a lighter shade; and *Lælia Sedeni*, stated to be a hybrid between *Cattleya Sedeni* and *C. devoniensis*, with purplish sepals and petals, and a very rich crimson lip.

Mr. B. S. Williams' certificated plants were the following—*Nepenthes*

*bicalcarata*, noticed above; *Delabechia rupestris*, *Alocasia Thibautiana*, *Dracæna Lindenii*, *Aralia Chabrièri*, *Croton Bruce Findlay*, *Heliconia nigro-punctata*, *Asplenium horridum*, and *Asplenium novæ-caledoniæ*, which are described in the winning collections already mentioned; *Begonia Williamsi*, a very free-flowering variety of the Tuberous section, with large white flowers of good form. Mr. J. Anderson, Meadowbank, obtained a certificate for *Cattleya gigas superba*, a handsome variety with large flowers, the sepals and petals broad soft crimson purple in hue, with an extremely rich crimson-tinted lip. Messrs. Ireland & Thomson were accorded a certificate for *Croton Thomsoni*, a handsome form with partly lobed leaves a foot to 15 inches long, and 4 inches broad at the widest part; dark green veined with bright yellow. Messrs. Osborn & Sons received a similar award for *Hedera Helix madeirensis albo-marginata*, the handsome variegated Ivy already described; Messrs. Ker & Son for *Dracæna Lindenii*, *Lomaria obtusata*, and *Aralia Chabrièri*; Messrs. H. Waterer for *Abies canadensis pendula* and *Abies canadensis variegata*, recently shown at Kensington; and to MM. Chantrier, frères, for *Croton Bergmanni*, *C. Mortefontaineensis*, and *C. mosaicus*, described elsewhere in this report.

#### GROUPS AND COLLECTIONS.

The large marquee presented a spectacle such as horticulturists and visitors to exhibitions seldom have the opportunity of beholding, and when viewed from the upper part of the slope at the end near the principal entrance the effect was grand in the extreme. All the groups in competition were staged there, together with many of the miscellaneous collections; and not only was considerable taste displayed in the arrangement of the groups individually, but judicious care had also been exercised in their disposition, so as to produce as fine a general effect as possible. Handsome banks of foliage and flowers were relieved at intervals by clumps of Lilies, while the noble Tree Ferns already referred to were like living columns amidst this palatial wealth of beautiful plants. There was but one exhibit that seemed out of harmony with the arrangements—namely, a so-called "trophy," a large polygonal stand of vegetables and fruit, which received a very general condemnation from both exhibitors and the public.

Two classes were provided for groups of plants arranged for effect, one for amateurs and the other for nurserymen, the prizes in each being liberal—namely, £20, £15, £10, and £5. The first was to occupy a space not exceeding 20 feet by 10 feet, and in this class there were six entries. Mr. G. Smith, gardener to J. Rylands, Esq., Stretford, was placed in the foremost rank of the exhibitors for a highly satisfactory group, which was not only remarkable for the admirable quality of the plants composing it, but also for the artistic taste manifested in the arrangement. No great efforts were made in the direction of originality or elaborateness of design, but the plants appeared to have been placed together with easy freedom and with the endeavour to render it as diversified as possible with moderate materials. The fine-foliage plants comprised good examples of Palms, Ferns, *Crotons*, *Dracænas*, and *Yuccas*, while among the flowering plants Lilies, *Eucharises*, and *Ixoras* were the most striking, various smaller plants being employed to fill up with. Mr. C. Paul, who followed closely, also had a group which was noteworthy for the number of well-grown specimen plants it contained; but it was less effective in general arrangement, and to this fact, no doubt, was due the second-rate position accorded it. Some of the specimens, too, such as the *Lapagerias*, which were trained on globular trellises, though highly creditable as regards their condition, were unsuited for associating with other more graceful or less formally trained plants. *Ixoras*, *Dipladenias*, *Coleuses*, Tree Ferns, Palms, *Crotons*, and Lilies were the chief components of the group, all being in fine healthy form. Mr. J. Hammond secured third honours for a neat little group, but scarcely full enough. The plants were placed upon the turf slopes at the side of the marquee in step-like form, rising in successive semicircles. The plants were chiefly of moderate size, much smaller than those in the two preceding groups, but representing similar kinds, the most noteworthy feature being the margin of *Adiantum cuneatum* and *Panicum variegatum*, which was very pretty. Mr. G. Wilkes, gardener to Mrs. Tambaci, Cheadle, was placed fourth with a fairly good group that would have obtained a much higher position at many exhibitions that have been held this year. *Ericas*, *Bougainvilleas*, *Caladiums*, *Roses*, Lilies, and *Pelargoniums* were the principal plants employed, and these were judiciously disposed. One other group in this class deserves notice, though no prize was awarded for it, namely that from Mr. J. Hill, gardener to George Hardy, Esq., Timperley, for the plants composing it were of unusually good quality, the *Ixoras*, *Stephanotis*, Ferns, and *Crotons* being in admirably healthy condition.

In the class reserved for nurserymen the group was to occupy a somewhat large space—namely, 30 feet by 15 feet. There were five entries, and the competition was fairly keen and interesting, as the exhibits were very close in merit. Messrs. R. P. Ker were adjudged premier honours for a very pleasing group, in which the principal design had apparently been to afford as much diversity of surface as possible, much in the style of Messrs. Wills' or Hudson's groups, which are so much admired at metropolitan shows. If there was any defect it was a slight approach to overcrowding, and some of the plants could have been advantageously dispensed with, as the really handsome specimens might have then been seen to the best advantage. The groundwork was composed of *Adiantums*, from which

arose the Palms, Crotons, Lilies, Dracænas, and numerous other plants employed with such excellent results. Mrs. E. Cole & Sons, Withington, took the second place, staging a rather more formal but brighter group than the first, as flowering plants were more freely employed, Zonal Pelargoniums contributing a large share of colour. Dipladenias, Ericas, and *Lilium auratum* were also well represented, the usual fine-foliage plants being included with numerous small examples of the charming little *Caladium argyrites* near the fore part of the group. Messrs. W. G. Caldwell & Sons, Knutsford, were third, having a collection of remarkably well-grown plants, but mostly a little too formal in outline to admit of successful or effective arrangement. A great diversity of plants was included, Petunias, Gloxinias, Ericas, and Bougainvilleas being some of the most noteworthy among the flowering plants, Palms and Ferns among the fine-foliage contingent being generally large. Mr. R. Simpson, Selby, secured the fourth prize, and Mr. T. Pope, Astley Bridge, an extra prize, both contributing meritorious groups, the former containing a large proportion of softwooded flowering plants, and the latter a similar proportion of fine-foliage plants. The numerous other handsome groups not in competition are described in another portion of the report.

The only class for a collection of specimen plants in which arrangement for effect was not required was that for twenty miscellaneous plants, eight in flower and twelve fine-foliage, which was open to all competitors, the prizes being £20, £15, and £10. There were four entries, Mrs. E. Cole & Son and Mr. Tudgey contesting keenly for the first place, which honour was finally adjudged to the former, who had their well-known handsome specimens in excellent condition. The following were included in Mrs. Cole's collection:—*Croton Weismanni*, a grand example, 6 feet high and superbly coloured; *Croton Disraeli*, also large and richly coloured; *Cocos Weddelliana*, 7 feet high, and very healthy; *Gleichenia Mendelli*, 5 or 6 feet in diameter, fresh and vigorous; *Latania borbonica*, large; *Pritchardia pacifica*, a noble specimen; *Kentia Fosteriana*, *Cibotium Schiedei*, *Cycas revoluta*, *Phormium tenax variegatum*, and *Gleichenia rupestris glaucescens*, all large and handsome, were the best of the fine-foliage plants. Among the flowering plants were neat specimens of *Dipladenia amabilis* and *D. Brearleyana*, the flowers being abundant and bright in colour; *Ixora coccinea* and *I. Fraseri* formed another pretty pair, compact and well flowered; *Erica Eweriana superba*, *E. Marnockiana*, *E. Turnbulli*, and *Allamanda nobilis* were the others in that section, and were of similarly good quality to those already mentioned. Mr. E. Tudgey had smaller specimens, but very compact, well trained, and as fresh and healthy as could be desired. *Croton Queen Victoria* was remarkably bright, *Gleichenia rupestris* was large and vigorous, *Cycas circinalis* and *C. revoluta* both handsome, *Latania borbonica* of enormous dimensions, *Allamanda nobilis* beautifully flowered, *Francisca calycina major* good, and *Anthurium Schertzerianum*, fair, were the most notable among the plants. Mr. G. Smith was third with meritorious specimens, his *Lapageria rosea* and *alba*, globularly trained and very healthy, being two of the best. *Alocasia Lowii* and *Croton variegatus* were also handsome.

#### VARIOUS SMALL PLANT CLASSES.

Several of these, though not individually large or imposing, proved of great utility in the general arrangements of the Exhibition, the Heaths, Lilliums, Achimenes, Petunias, Balsams, Fuchsias, and Pelargoniums being employed to great advantage as small groups in the recesses between the larger collections in the marquee. The Orchids, Nepenthes, Sarracenias, and medicinal plants were placed in the glass house, the dinner-table plants and Cockscombs forming a line down the centre of the fruit table in the large marquee.

*Orchids*.—Those who have seen the magnificent displays of Orchids at the Whitsuntide shows of this Society would probably be a little surprised that a larger number of plants was not contributed on this occasion. Certainly the end of August is not a favourable season for such plants, as comparatively few are in flower, yet many more might have been reasonably expected. Two classes were provided, one for amateurs the other for nurserymen, eight plants being required in each, and the prizes were equal—namely, £8, £5, and £3. Only two competitors appeared in the nurserymen's division—Mr. B. S. Williams and Mr. Cypher, who secured first and second honours in the order named. The collection shown by the former included *Dendrobium Pierardi* with eight growths and bearing a large number of flowers; a brightly coloured variety of *Vanda suavis*, the plant very healthy; *Oncidium prætextum* with seven panicles; *Oncidium macranthum* having a large panicle of its fine yellow flowers; *Lælia elegans Turneri*, beautiful soft crimson; *Saccolabium Blumei*, handsome, with six spikes; *Cypripedium Harrisianum* in excellent condition with thirteen flowers; and *Cattleya crispa* with seven spikes, a handsome plant and perhaps the most attractive in the collection. Mr. J. Cypher's specimens were smaller but clean, fresh, and healthy, one example of *Disa grandiflora* being remarkably noteworthy, having eight spikes bearing together about two dozen flowers. *Cypripedium Sedeni*, *Saccolabium Blumei*, *Odontoglossum Uro-Skinneri*, and *Epidendrum vitellinum majus* were also well shown.

In the amateurs' class there were three competitors, who exhibited neat plants but no specimens of unusual size or especial rarity. Mr. James Hill, gardener to George Hardy, Esq., Pickering Lodge, Timperley, was the most successful, being placed first with *Lælia Dayana*, well flowered; *Cattleya crispa superba*, good; *Cattleya Loddigesii*, very pretty, the pale pink sepals and petals contrasting agreeably.

*Miltonia spectabilis superba* and *Oncidium prætextum* were attractive among several other smaller plants. Mr. W. Perry, gardener to H. C. Miles, Esq., Penpole, Bristol, was a good second. *Disa grandiflora*, *Pilumna fragrans*, and *Epidendrum cochleatum majus* were the best plants, the *Pilumna* being in very satisfactory condition as regards the number of flowers. The third position was accorded to Mr. E. Mitchell, gardener to Dr. Ainsworth, Cliffe Point, Broughton, for neat but not particularly large plants.

*Pitcher Plants and Sarracenias*.—In the nurserymen's class for the best collection of the above Mr. B. S. Williams was the only exhibitor, but his group was of great merit, and included most of the best forms both of *Nepenthes* and *Sarracenias* in commerce. The plants, too, were in a very healthy fresh condition, and it was surprising to observe what a proportionately large number of pitchers some small specimens were bearing. It would be unnecessary to give the names of all, but the following were some of the most noteworthy. *Nepenthes bicalcarata*, *N. ampullacea*, *N. Hookeriana*, *N. Outramiana*, *N. sanguinea*, *N. Rafflesiana*, and *N. Courtii*. The *Sarracenias* were *S. Drummondii* and varieties, *S. flava* and varieties, *S. purpurea*, *S. rubra*, *S. variolaris*, and others all good. In the amateurs' class two collections were staged, the premier by Mr. A. Williams, gardener to Joseph Broom, Esq., Wood Lawn, Didsbury, and the second by Mr. J. Morton, gardener to Jas. Fildes, Esq., Chorlton-cum-Hardy. The Didsbury plants were very healthy, indeed they form one of the specialities in Mr. Broom's garden, and receive every attention requisite to ensure their success. The *Nepenthes* were the chief represented, *N. phyllamphora*, *N. Hookeriana*, *N. robusta*, *N. Laurenciana*, *N. Rafflesiana*, *N. gracilis*, and *N. Dominiana* were particularly fine. The *Sarracenias* *purpurea* and *flava* were also in good condition. The other plants were smaller but carefully grown, and represented some of the best forms known, including several of those named above.

*Economic and Medicinal Plants*.—Though these were represented by only one collection—namely, that from Mr. B. S. Williams, the premier award secured was well deserved, as twenty plants were shown, including examples of many useful and interesting plants. They were also sufficiently developed to fairly indicate their respective characters. Some of the most remarkable were *Theobroma Cacao* (Cocoa), *Arenga saccharifera* (the Sugar Palm), *Maranta arundinacea* (Arrowroot), *Phytelephas macrocarpa* (the Ivory Nut Palm), *Coffea liberica* (Liberian Coffee), *Salvadora persica* (the reputed Mustard Tree of the Scriptures), *Areca oleracea* (the Cabbage Palm), the African Mangosteen, Pepper, the Traveller's Tree, Tapioca, the Balsam of Peru, and several others made up this very interesting group, which attracted much admiration and attention from the general visitors, who have not often the opportunity of seeing such plants at horticultural shows.

*Dinner-table Plants*.—In the two classes devoted to these the competition was keen, the plants staged forming a central line on the fruit table. In the nurserymen's section for twelve plants Mr. B. S. Williams was an excellent first with even plants of moderate size, but healthy, graceful, and well selected. The kinds shown were *Aralia elegantissima*, *Rhaphis humilis*, *Pandanus Veitchii*, *Delabechia rupestris*, *Croton Weismanni*, *Aralia Veitchii gracillima*, *Dracæna Ernesti*, *Geonoma gracilis*, *Croton Prince of Wales*, *Aralia spectabilis*, and *Aralia Chabrieri*. They were all in 48-sized pots, and therefore appeared light and elegant, well suited for the purpose for which they were intended. Messrs. Ireland & Thomson followed closely, also with useful plants, Messrs. Jones & Son, Shrewsbury, taking the third place. The amateurs' exhibits in the class for half a dozen plants were neat and well grown generally, but in some of the collections the pots were slightly too large. Mr. W. Plant, gardener to R. P. Gill, Esq., Wood Hayes Hall, Ashton-on-Mersey, was adjudged chief honours, his best plants being *Cocos Weddelliana*, *Croton Disraeli*, and *Pandanus Veitchii variegata*. Mr. H. Beard, gardener to G. D. Adams, Esq., Ashton-on-Mersey, was a close second, and Mr. H. German, gardener to F. B. Cutts, Esq., Nottingham, followed.

*Ericas*.—In the nurserymen's class for six Heaths Mr. J. Cypher was accorded chief honours for plants of moderate size, but well flowered and healthy. Mrs. Cole & Son followed with fairly good specimens, but not remarkably profusely furnished with flowers. Mr. Thomas Pope, Astley Bridge, took the third position for similar plants very little inferior to the preceding collection in merit.

Lilliums, Pelargoniums, Balsams, Petunias, Coleuses, Yuccas, succulent plants, and Achimenes were all small classes, and, except the first-named, do not require special mention. Mr. C. Turner of Slough had a collection of *Lilium auratum*, which was very fine, and well merited the chief prize which was awarded it in the class for six plants. The specimens were bearing fine heads of flowers, and being arranged around the Tree Ferns the effect was very satisfactory. Several groups of *Lilium lancifolium* were also contributed, the plants generally being in good condition. Mr. B. S. Williams' group of variegated Yuccas was especially noteworthy at one end of the large marquee. It was the only collection staged in the class for eight specimens, and was awarded first honours.

#### CONIFERS AND JAPANESE PLANTS.

These were arranged in groups outside the Exhibition house and large tent, and on the terrace in the front of the house. Some of the large Conifers were remarkable for their bright colour. For the

best collection of Japanese plants, Maples and others, Messrs. J. Standish & Co., Royal Ascot Nurseries, took the lead with several fine groups very tastefully arranged, including some very fine species and varieties of Maple, with *Lilium auratum* freely employed. Mr. John Waterer, American Nursery, Bagshot, was second with a very choice collection. In the class for twelve hardy evergreens, trees and shrubs, Messrs. John Waterer were awarded the first prize for a fine example of Golden Yews, Piceas, Retinosporas, Abies, and other remarkably developed specimens of large size. Messrs. Paul & Sons, Cheshunt, were placed second with a similar group. In the class for six Golden Yews Messrs. Caldwell & Sons were first with some grand golden specimens of *Taxus elegantissima*. Messrs. John Waterer and Sons were second with a nearly equally good lot. In the class devoted to Hollies Messrs. John Waterer & Sons were first with magnificent plants highly coloured, the standard plants having remarkably clean stems.

#### THE VEITCH MEMORIAL PRIZES.

Fifty pounds in ten £5 prizes, accompanied by a Veitch Memorial medal, were offered to amateurs and gentlemen's gardeners by the trustees of the above fund, the competition being good in most classes.

In the class for one specimen Orchid, a single plant, a made-up specimen not being admissible, there were several exhibitors, but except the winning plant from Mr. John Roberts, gardener to Baroness L. de Rothschild, Acton, there was not anything remarkable. The premier specimen was *Saccolabium Blumei majus*, very healthy and bearing two fine spikes of flowers.

For one stove plant in flower Mr. Tudgey was accorded the prize and medal for a very handsome example of *Dipladenia hybrida*, one of the finest specimen plants in the Show. It was about 4 feet in height, trained in a globular form, the foliage being very healthy and the flowers numerous and richly coloured. In the same class F. Tagart, Esq., Bristol, showed a specimen of *Eucharis amazonica* which, though not considered sufficiently good to entitle it to precedence over the *Dipladenia*, was highly commended, and attracted equally as much attention and admiration. It was about 5 feet in diameter, very evenly trained, and bore over one hundred spikes, each with from three to five flowers.

For one greenhouse plant in flower several handsome specimens were staged, Mr. Tudgey again securing the prizes with a very beautiful well grown and well-trained example of *Erica Uhria superba*. It was about 5 feet in diameter, very even in form, and flowering most profusely. E. Adams, Esq., Swallow, Gateshead, staged a remarkably fine *Phœnocomma prolifera Barnesi* in excellent health and flowering well. Mr. J. Pigg, gardener to J. Forshaw, Esq., Fulwood, Preston, also exhibited a plant of *Lapageria alba*, healthy, even, and flowering freely.

For the best collection of hardy Ferns, not less than twenty varieties, there were several entries. Mr. Robert Tyldesley, Worsley, securing the prize and medal with a pretty collection of *Scolopendriums*, *Lastreas*, *Athyriums*, *Polystichums*, &c., very fresh and healthy. These were especially interesting, as being the production of a working man who has had but little spare time to devote to his favourites.

In the class for fifty herbaceous and alpine plants W. Brookbank, Esq., Brookhurst, Didsbury, was the successful exhibitor with an interesting collection, although the season is advanced for such plants. Some of the most noteworthy were *Liatris spicata*, *Campanula Sibthorpi* with long spikes of small purplish flowers with narrow petals; *Veronica longifolia subsessilis* in first-rate condition; *Androsace lanuginosa*, *Statice Gmelini*, and *Anemone Honorine Jobert*.

#### MISCELLANEOUS PLANT EXHIBITS.

A large and important addition was made to the Show by the groups and single plants contributed by nurserymen and others not in competition, indeed they would have constituted an exhibition alone. The collections from Messrs. Veitch and Williams, which occupied equal spaces on a central stage in the glass house, have already been incidentally referred to, and most of the remarkable or specially noteworthy plants have been briefly described, therefore it is unnecessary to enter into details. Suffice it that they were two of the finest groups of new, choice, and valuable plants that have been seen in England for some time. Another handsome group from Mr. Williams occupied a prominent position near the entrance to the large marquee. It consisted largely of well-coloured Crotons, *Liliums*, Palms, among which the noble-leaved *Phœnicophorum seychellarum* was notable, Ferns, numerous examples of *Hydrangea paniculata grandiflora* and *Ixoras*, with a neat margin of *Rhodanthes* and *Adiantums*. Immediately opposite this group, also near the entrance, was a similarly beautiful contribution from Messrs. Cutbush & Son, Highgate, which contained a large proportion of ornamental foliage plants, such as Palms, *Cordylines*, *Grevilleas*, *Ericas*, *E. McNabiana* being well represented, *Dracaena Goldiana*, an interesting little group of medicinal and economic plants, including the Camphor Tree, Mahogany, Allspice, Coffee, Pepper, Balsam of Peru, and Cinnamon; but the chief feature was the collection of forty-six varieties of Ivy, representing all the best varieties in commerce, the newest and probably the finest as a variegated form being *Hedera madeirensis variegata*, the specimens shown possessing the clear and distinct variegation well marked.

Upon the sloping bank at the end of this marquee The General Horticultural Company (John Wills), Limited, Regent Street and Anorley, had a group that for effectiveness and artistic beauty was not surpassed in the whole Exhibition. It was composed of Crotons, superbly coloured; *Dracaenas* also well coloured and healthy, Palms, *Nepenthes*, and *Adiantums Bausei*, *cuneatum*, and *gracillimum*. The Ferns, chiefly the first named, formed a soft groundwork, among them being tastefully disposed the Crotons and *Dracaenas*, which were of moderate size though so bright in hue, and ceded the elegant specimens of *Kentia Fosteriana*, *Cocos Weddelliana*, and other Palms to impart a diversity to the appearance. At the corners were two fine *Nepenthes* upon pedestals about 3 feet high, around the stems of which some of the graceful forms of *Asparagus* of the plumosus type were twined, effectually concealing the stands and pots. A large number of grand Crotons were represented, but the following were some of the best—*C. Williamsii*, remarkably rich; *C. Mortii*, *C. Challenger*, *C. Disraeli*, *C. Warreni*, *C. Hawkeri*, *C. triumphans*, *C. Rodeckianus*, *C. Evansianus*, *C. Sunset*, *C. mutabilis*, and *C. Chelsoni*. Of the *Dracaenas*—*D. Gladstonei*, *D. Fredericki*, *D. Wilsoni*, *D. alba marginata*, *D. Leopoldi*, and *D. Berkleyi* were notable. At the lower portion of the same marquee a group of fine *Bouvardias* from Mr. J. Hooley of Stockport and Fallowfield, was noteworthy, numerous varieties being shown, and the plants were in vigorous health, flowering profusely.

The Tea Roses in pots from Messrs. Paul & Son, Cheshunt, were, however, the great attraction at that end, and as they were arranged in a circular group in the centre of the path they could be seen and admired by all. The pots varied in size, the plants being proportionate in dimensions, and a healthier or more satisfactory collection could scarcely be desired. The most notable varieties were *Alba Rosea*, *Madame Angele Jacquier*, *Perle des Jardins*, *Madame Willermoz*, *Catherine Mermet*, *Niphetos*, *Devoniensis*, *Madame Margottin*, *Souvenir d'un Ami*, *Duchess of Edinburgh*, and *Caroline Kuster*. Many visitors, especially the rosarians, freely expressed the opinion that there was no finer exhibit in the Show than this handsome group of Roses.

Messrs. Fisher, Son & Sibray, Handsworth and Sheffield, had a collection of greenhouse *Rhododendrons*, with several new plants in the fruit tent. The *Rhododendrons*, for which the firm is noted, were in very satisfactory condition, astonishingly vigorous in growth, and bearing fine trusses of their bright and delicately tinted flowers. *Duchess of Edinburgh*, *Princess Royal*, *Prince Leopold*, *Taylori*, *Duke of Connaught*, and *Princess Alexandra* were the principal varieties. Plants of a new white Glove named *W. P. Milner* were also shown. It appears to be a promising variety; the flowers large, full, and pure white. An attractive *Pelargonium*, termed *Princess*, was shown, being particularly noteworthy for the brilliant pink hue of the compact trusses of flowers. *Begonia corallina* is a handsome form of the *B. coccinea* type, which it nearly resembles, having pendulous panicles of coral red or scarlet flowers freely produced. Many other handsome plants were also included in this collection.

Among numerous other miscellaneous exhibits were two remarkably handsome collections of Crotons, one from MM. Chantrier, frères, Mortefontaine, France, who were the only foreign exhibitors in the plant section, and the other from Messrs. Ireland & Thomson. The first named included fine specimens of some of the best broad-leaved and distinct continental varieties of Croton, such as *President Chereau*, very broad, dark green, veined with bright yellow; *Baronne J. de Rothschild*, leaves obovate or elliptical in form, yellow, green, and crimson, very bright; *Baron Franck Selliere*, leaves 15 to 18 inches long, 3 to 5 broad, very distinct, green, veined broadly with yellow, and a light shade almost white; *Carrieri*, almost entirely yellow, bright and effective; *Mortefontaine*, somewhat of the *Disraeli* form, but larger and richly coloured; *Mosaicus*, broadly elliptical leaves veined with yellow and crimson, distinct and pretty. Several other fine varieties were also represented. Messrs. Ireland and Thomson's varieties were also handsome, including *Interruptus aureus*; leaves narrow, bright yellow centre; *Duke of Buccleuch*, slightly lobed, yellow colour, abundant and bright; *Hawkstoni*, narrow elliptical leaves, green, yellow, and crimson, rich tint, handsome; *Houldsworthi*, leaves elliptical, the yellow and crimson tints especially brilliant; and *Whittoni*, with narrow leaves, green, streaked with crimson and yellow.

Messrs. H. Cannell & Sons had an extensive collection of cut flowers, *Dahlias*, *Verbenas*, *Asters*, and innumerable others, with fine *Cockscombs* as a background, and an edging of *Alternantheras*. Messrs. C. Lec & Son, Hammersmith, had a collection of twigs of ornamental shrubs and trees; and Messrs. Laing & Co., Forest Hill, several boxes of fine *Tuberous Begonia* blooms.

Messrs. John Waterer & Sons exhibited some fine specimen Conifers, some of them being from 10 to 12 feet high. Mr. Anthony Waterer, Knap Hill Nursery, Woking, also staged a very fine group, that included fine specimens of many choice kinds; the Golden Yews being very bright, especially *Taxus baccata elegantissima*, more distinctly striped than the old varieties. *Abies Renaulti* was shown well, being very fine and a close thick grower. *Abies Pattoniana* was also good. Amongst *Cupressus* *Lawsoniana crecta viridis* stood out boldly, as also did the very fine golden variety. Many choice *Retinosporas*, *Thujas*, *Pines*, and *Junipers* were arranged with other good old kinds of the several classes and looked effective and well.

Messrs. Paul & Sons, Old Nurseries, Cheshunt, also staged a fine group of healthy and well-coloured plants, especially the Golden Yews, Thuja George Peahody, good; Abies Alcockiana, very fine; and Picea concolor. Messrs. Caldwell & Sons, Knutsford, staged a large group, which included magnificent specimens of Ilex Hodginsii, Golden Queen, and I. madeirensis nigrescens. Messrs. Osborn and Sons, Fulham Nurseries, exhibited their new variegated Ivy, Hedera Helix madeirensis variegata, a splendid variety with a very light clear variation; they also staged a small choice collection of Conifers. Messrs. Birkenhead, Sale, Manchester, had a large and handsome group of Ferns, comprising many choice species and varieties. Messrs. Dick Radelyffe & Co., High Holborn, exhibited a number of imperishable flower wreaths, and an ornamental fountain in the large marquee. Messrs. J. Dobbie & Co., Rothesay, Bute, had a fine collection of Pansy and Marigold blooms; and John Parshaw, Esq., Fulwood, showed two pans of Dionæa muscipula, the plants being in extraordinarily vigorous condition; the leaves very large.

#### CUT FLOWERS.

Ample provision was made for these, prizes being offered by the Society in thirty classes in addition to those of the National Rose and Carnation and Picotee Societies. Two long annexe tents, each nearly 100 feet long, at the end of the fruit marquee were filled with the exhibits in these classes, and in several the competition was very keen, this being particularly the case in the classes for bouquets, considerably over a hundred being staged. The great feature of the display however, especially as regards quality, was the

*Dahlias*.—Rarely have larger and better-formed examples of these popular flowers been seen at horticultural exhibitions, certainly not this year. Even those who object to great size in such blooms on the score of the usually attendant coarseness could scarcely have advanced this plea against the blooms in the leading collections, for massiveness and substance were united with refinement and symmetry. The colours, too, were very clear and bright in most cases. The principal class was that for thirty-six blooms, in which there were about eleven entries, though scarcely more than five or six staged collections. The premier honours were accorded to Mr. H. Harkness, Bedale, Yorkshire, for magnificent examples of the following varieties among others:—Criterion, Hon. Sydney Herbert, Harry, John N. Keynes, John Standish, Thomas Goodwin, John Kirby, Bessie Ford, Yellow Boy, Burgundy, Perfection of Primroses, George Smith, John W. Lord, Prince Arthur, Mrs. J. C. Quennell, Delicata, Perfection, Flag of Truce, Duke of Connaught, Royal Purple, Prince Bismarck, Countess of Pembroke, and Flora Wyatt. This stand was greatly admired by all, but especially by florists, who could appreciate the qualities so well developed. Messrs. Keynes & Co., Salisbury, were placed second with a collection of great merit and very slightly inferior to the first, though on careful examination the judging appeared correct. The colours of these blooms were remarkably fine—so clear and brilliant. Some of the most notable varieties were Lady Gladys Herbert, Earl Radnor, Shirley Hibberd, Frederick Smith, and Thomas Goodwin. Messrs. Cannell & Sons, Swanley, Kent, took the third position with good and carefully selected blooms, a large number of handsome varieties being represented. In the class for twenty-four the same exhibitors competed, and were accorded precisely similar positions. With twelve Messrs. Keynes, Cannell, and Harkness were again the prizetakers, but this time in a different order—as named here. For twenty-four Fancy Dahlias Messrs. Keynes & Co. gained the chief prize with handsome blooms of Annie Pritchard, Lizzie Leach, Egyptian Prince, Frederick Smith, and Henry Glasscock among others of considerable merit. Mr. H. Clark, Leeds, followed closely, and Messrs. Cannell secured the third prize. Messrs. Keynes were again first with twelve Fancy varieties, Professor Fawcett, Hercules, and Gaiety being noteworthy. Messrs. Cannell and Turner followed in that order, both showing good blooms.

*Gladioli*.—Another feature in the display of cut flowers were the collections of Gladioli in competition, but though some of the spikes were large and massive the general quality was not so good as we are accustomed to see at South Kensington occasionally. For the best collection of spikes, number not stipulated, Messrs. Kelway were to the fore with stands of nearly two hundred spikes, representing a large number of varieties. Messrs. John Thomson & Son, Newcastle-on-Tyne, were the only other exhibitors in the class, and staged a much smaller collection, though both flowers and spikes were fine. Messrs. Kelway had the only stand of twenty-four spikes, including excellent examples of the following varieties:—Countess of Craven, Agrius, Helen, Orontes, Robert Ker, Wm. Paul, J. Douglas, Mr. Ashbury, Roht. Tait, J. Downie, and Queen Mary. For twelve spikes Messrs. Thomson secured the first prize with perhaps the finest spikes in any of the classes, the flowers being of great size and substance, and closely placed in massive spikes. Mr. Harkness was a very good and close second, the colours being remarkably bright.

*Herbaceous Cut Flowers*.—Several pretty stands of these were contributed in the two classes devoted to them. For thirty-six bunches Mr. F. Perkins, Leamington, was the successful exhibitor, securing the chief award for an interesting collection, including Phlox John Laing, Pyrethrum Miss Kelway, Gypsophila paniculata, Yucca filamentosa, Achillea Ptarmica flore-pleno, Potentilla Don Quixote, Veronica longifolia subscissilis, Anemone Honorine Jobert, and many others of more or less beauty. Messrs. Thomson were second with

a similar stand, in which were some specimens of a white Mallow named Malva speciosa alba, closely resembling Malva moschata alba. In the class for twelve bunches Mr. Faulkner, gardener to F. R. Leyland, Esq., Woolton Hall, was placed first, having good specimens of Matricaria inodora fl.-pl., Galtonia candicans, Aconitum cæruleum, Amaryllis Belladonna, Stenactis speciosa, Dahlia coccinea, Lilium auratum, Campanula pyramidalis, and numerous others. Mr. F. Perkins and Mr. W. Plant followed in the order named with pretty collections.

In addition to the above, which can only be considered as the most striking features, there were classes for Stocks, Hollyhocks, Asters, French and African Marigolds, Phloxes, Pelargoniums, Verbenas, Pentstemons, and Pansies, all of which were well represented.

*Bouquets*.—As has been already noted, these were shown in large numbers, and some very tasteful examples of floral arrangement were contributed. For six wedding bouquets Messrs. Jones & Son were first with light and pleasing examples, chiefly composed of Eucharises, Paneratiums, Bouvardias, white Lapagerias, and Stephanotis, sufficient Fern fronds being employed to impart a gracefulness to them without rendering them dull. Mr. W. Brown, St. Mary's Grove, Richmond, was an admirable second, the bouquets containing some first-rate flowers well disposed. Mr. F. Perkins was third with carefully made examples. For the same number of ball-room bouquets Messrs. Jones & Son were again to the fore, having bright and elegant arrangements of Orchids, with other brightly coloured and choice flowers; Ixoras, Lapagerias, Disas, Oncidiums, Stephanotis, Masdevallias, and Forget-me-nots figuring conspicuously. Messrs. Turner Bros., Liverpool, were very good seconds; and Mr. Stephenson, Timperley, was a close third. Single bouquets were well shown by Messrs. Henry Cypher, Perkins; J. Kellett, Manchester; and J. Mason, Manchester.

*Dinner-Table Decorations*.—There were five entries in the class for a dinner-table laid for twelve persons, Mr. J. Cypher carrying off the principal prize with one of his most tasteful arrangements, lightness and brightness being the chief objects aimed at and attained. The central plant was a Cocos Weddelliana, which was surrounded by Orchids, Lilies, and Ferns, two side stands being gracefully decorated, and the fruit represented was Melons, Grapes white and black, Pines, Peaches, and Apricots. Mr. Mason followed with a pretty design but rather heavy in the centre; while Messrs. Jones & Son, who were third, had scarcely sufficient diversity in the arrangement, the vases being too low.

#### VEGETABLES.

An enormous quantity of vegetables of all descriptions was staged in the various classes devoted to them. A great per-centage were of excellent quality; and, what is rather unusual, no blank spaces were to be seen when the tents were cleared for the Judges to commence. At the same time, if one-half of the intended exhibitors, notably in the Potato classes, had fulfilled their engagements, the confusion would have been great, space being limited and the localities hard to find. The staff had laboured hard and well to arrange everything satisfactorily, but a few large placards notifying each class would be far preferable to "Stewards" to indicate the respective localities. Owing to the stringent rules necessitating staging on the day prior to opening, an early clearance was made, and the Judges, of whom there appeared to be an unusual abundance, easily completed their duties by the appointed time for opening.

#### COLLECTIONS OF VEGETABLES.

In the premier class for twenty distinct varieties there were thirteen competitors, but no great difficulty was experienced in awarding the prizes. Mr. G. T. Miles secured the first prize with a very even lot, consisting of Tender and True Cucumbers, Stamfordian Tomatoes, Canadian Wonder Beans, Large Rouen Leeks, Walker's Exhibition Onions, Early Munich Turnips, Green Glohe Artichokes, Telegraph Peas, Nantes Horn Carrots, Moore's Cream Vegetable Marrows, Carter's Incomparable Crimson Celery, Green Glohe Savoys, Heartwell Marrow Cabbage, Stott's Red Beet, Carter's Giant Runner Beans, Covent Garden Perfection Potatoes, all very good; Maltese Parsnips, Walcheren Cauliflowers, Carter's Perfection Sprouts and Mushrooms being the only weak dishes. Mr. Muir, gardener to C. R. M. Talbot, Esq., Margam Park, very closely followed Mr. Miles, his Drumlanrig Tomatoes, Dickson's Eclipse Cauliflowers, Webb's Improved Banbury Onions, Intermediate Carrots, Beet, Culverwell's Giant Marrow Peas, and Wheeler's Cocoa-nut Cabbage being remarkably good. The third prize was awarded to Mr. J. Turk, Cheltenham, whose generally creditable collection included good Early Market Carrots and Artichokes. Fourteen exhibitors competed in the class for ten dishes. Mr. J. Snowdon, Thirsk, secured the first prize with a very good collection, consisting of Eclipse Cauliflowers, Giant White Celery remarkably good, None-such Peas, Moore's Cream Marrows, Tender and True Cucumbers, Canadian Wonder Beans, International Kidney Potatoes, Excelsior Tomatoes, and Intermediate Carrots. Mr. W. Iggulden, gardener to the Earl of Cork, Marston, Frome, obtained the second prize with a collection but slightly inferior. His best dishes were Livingstone's Perfection Tomatoes, Nantes Horn Carrots, Suttons' Reading Exhibition Sprouts, Eclipse Cauliflowers, and Woodstock Kidney Potatoes. Mr. Crump, gardener to the Duke of Marlborough, Blenheim, was awarded the third prize, staging, among others, good examples of

Banbury Onions, Reading Exhibition Sprouts, Excelsior Tomatoes, and Intermediate Carrots.

POTATOES.

Eleven collections of twenty-four varieties of Potatoes were staged, the list of exhibitors including many of the leading Potato growers. Mr. J. Millen, gardener to the Marquis of Donegal, Hampstead Park,

Newbury, staged a very even clean lot of tubers, and was rightly awarded the first prize. The varieties consisted of Porter's Excelsior, Washington, Magnum Bonum, Schoolmaster, Late Rose, Mona's Pride, Covent Garden Perfection, Triumph, International, Beauty of Hebron, Red Emperor, Beauty of Kent, St. Patrick, Vicar of Laleham, Snowflake, Lye's Favourite, Pride of Ontario, Purple Ashleaf, Woodstock Kidney, Fenn's Bountiful, Radstock Beauty, Heather Bell, Suttons'

Fig. 34.—*DENDROBIUM SPLENDIDISSIMUM*. (See page 209.)

Fillbasket, and Trophy. Mr. D. Lumsden, gardener to Lady M. Hamilton, Bloxholm Hall, followed with, among others, good examples of Prince Arthur, International Kidney, Scotch Blue, Schoolmaster, Edgeott Seedling, and Washington. The third prize was awarded to Mr. W. Kerr, Dumfries, with a creditable but over-polished collection. There were twenty-three collections of eighteen varieties of Potatoes, and Mr. Millen was again the most successful exhibitor;

but his best tubers were undoubtedly in the larger collection. The varieties consisted of Covent Garden Perfection, Garibaldi, Beauty of Kent, Favourite, Early Bird, Pride of Ontario, International, Salmon Kidney, Reading Abbey, Late Rose, Schoolmaster, Trophy, Magnum Bonum, Vicar of Laleham, Beauty of Hebron, Snowflake, and Radstock Beauty. Mr. McKinlay, Headley Lodge, Penge, was a close second, his dishes of Shelbourne, Beauty of Hebron,

King of Potatoes and others being particularly good. The third prize was awarded to Mr. Wildsmith, gardener to Lord Eversleigh, Heckfield, for, among others, creditable examples of Cosmopolitan, Woodstock Kidney, and Blanchard. There were no less than fifty entries of twelve varieties of Potatoes. Of this number about one-half failed to stage. The prizes in this class went to Mr. Gilbert, Burghley; Mr. Wildsmith, Heckfield; and Mr. Ross, Newbury, in the order of their names. There were forty-five entries in the class for twelve varieties of Potatoes, and of these about forty fulfilled their engagements. The first prize was awarded to Mr. R. Gilbert for a meritorious collection, among which were good examples of Radstock Beauty, Porter's Excelsior, Vicar of Laleham, Lapstone Kidney, Beauty of Hebron, and Grampian. Mr. Wildsmith and Mr. Ross, Welford Park, received the second and third prizes respectively, both staging very even good examples of popular varieties.

The tubers in the majority of cases were much too large to meet with the approval of properly qualified Judges, and those who intend competing at the forthcoming National Potato Show will do well to select smaller and perfectly even examples.

Messrs. Dicksons, Brown, & Tait were awarded a certificate for a seedling Potato, "Early Ebor," a smooth well-shaped variety; also for their new Tomato "The Queen."

#### VARIOUS SMALL CLASSES.

There were four classes for Onions, but the schedule was ambiguously worded, and the awards were unsatisfactory to many of the exhibitors accordingly. In a large class for spring-sown Onions Mr. Walker, Thame, and Mr. G. T. Miles secured the first and second prizes in the order named, both staging Walker's Exhibition, and Mr. R. Gilbert secured the third prize. Mr. R. Lloyd, Woking, Surrey, Mr. J. Ridsdale, gardener to the Marquis of Ripon, Lincoln, and Mr. J. Smith, Cheltenham, received the awards in the order named for Tripoli Onions. For red Onions Mr. J. Royle, Swinton, was placed first with good examples of a real red Onion, the second prize going to Mr. H. Marriott, Boston, for fair examples of Giant Rocca, and the third prize to Mr. R. Fitton, Ashton-under-Lyne. Messrs. J. Walker, Fitton, and Bolas, gardener to H. C. Pole Gell, Esq., received the prizes in the order, all staging varieties of the White Spanish, the real white Onions being passed over. Vegetable Marrows as a rule were shown much too large, the prizes being rightly awarded to comparative small examples. Mr. G. Jacob, Headington, C. H. Firth, Esq., Sheffield, and Mr. J. Dean, Altrincham, were the respective prizewinners. Four Cucumbers in two varieties were largely and well shown, all the prizewinners coming from Stretford. Mr. A. Fallows staged good examples of Stretford Defiance and a seedling, and was placed first, being closely followed by Mr. W. Brundritt and Mr. S. Barrett. For one brace of Cucumbers Mr. Fallows was again first with Stretford Defiance, Mr. Brundritt second, and Mr. J. Carrick third. Celery, in two classes, was shown in remarkably good condition. Mr. G. C. Jarran, Loughborough, Mr. J. Biddles, Loughborough, and Mr. R. Murray, gardener to Captain Turner, Stockport, staged the best red Celery, receiving the awards in the order named. Mr. Jarran also staged the best white Celery, Mr. J. Wilding, Walton-le-Dale, following, the third prize going to Mr. Biddles. Messrs. Biddles, J. McIntyre, Darlington, and J. Casson, gardener to E. Goodall, Esq., Altrincham, were awarded the prizes as named for Gourds, but the class was far from being a good one. Cauliflowers were exhibited in large numbers and were large and close, but in many instances of bad colour. Mr. J. Harrop was placed first, Mr. J. Wilding second, and Mr. T. Taylor, Preston, third, the two former staging Veitch's Autumn Giant. Many large coarse Cabbages were staged in the class for early white varieties. Mr. G. Summers, gardener to the Earl of Scarborough, Sandbeck Park, was awarded the first prize for small neat examples, the second prize going to Mr. Sherwin, Altrincham, and the third to Mr. J. Wilding for very coarse specimens. The best red Cabbages were staged by Mr. J. Wilding and Mr. A. J. Skinner; Mr. G. Wilkes, gardener to Mrs. Tambaci, Cheadle, following with good specimens. The best Savoy Cabbages were staged by Messrs. J. Wilding, J. Heywood, Stretford, and D. Wilson, Manchester. Early white Turnips were largely and for the season well shown. Messrs. G. Bolas, W. Boulton, Ulverston, and Messrs. Biddles were the respective prizewinners. The best yellow Turnips in another good class were staged by Messrs. Dobbie & Co., Rothesay, G. W. Skelton, Thursby, and J. Counce, Garstang. With Altrincham Carrots Mr. J. Counce was first, being followed by Mr. Ridsdale and Mr. G. Ashley, Irlam. In the class for Early French Horn Carrots the prizes went to examples of Nantes Horn, this proving unsatisfactory to those who staged the right kind. Messrs. J. Smith, G. Bloxham, and Mr. Foster, gardener to D. Greenham, Esq., were the prizewinners.

Peas were extensively shown, Mr. J. McIntyre securing the first prize with McLean's Best of All; the second prize going to Mr. R. Beale, Thursby, for Premier; and Mr. A. Harris, Kirby Lonsdale, followed with Telephone. In a large class of Kidney Beans Mr. Millen was placed first with White Advancer, Mr. Lumsden and Mr. J. McIntyre securing the remaining prizes. Messrs. G. Wilson, G. Wallis, Kirby Hall, and J. Woolam, gardener to Col. Blundell, Crosby Hall, were the prizewinners in a large class of Runner Beans. The best Broad Beans were staged by Mr. J. Jardine, Langholm, N.B., and was followed by Mr. G. Coulson, Didsbury; and Mr. E. H. Bradley, Sunderland. Parsnips as shown were not particularly good, Mr.

C. Smith, Cheltenham, had the best, and was followed by Messrs. J. Ridsdale and J. Wildsmith. Beet was not superior; the best roots were staged by the last-named, he being followed by Messrs. G. Summers and J. Millen. But few good Leeks were shown, the first-prize lot from Mr. H. Sutherland, Thornliebank, near Glasgow, being a long way ahead of the remaining exhibits. The prizes for Cos Lettuces were awarded to Mr. J. Counce, Sir P. Dunscombe, and Mr. A. G. Skinner. The best Cabbage Lettuces were shown by J. G. Adams, Esq., Ashton-on-Mersey; Mr. S. T. Whitehead, Bakewell; and Mr. J. Counce, Garstang.

There were a considerable number of Tomatoes shown in the class for twelve fruits in four varieties. The first prize was awarded to the ugliest examples imaginable, and stated to be Excelsior, Trophy, Large Red, and Orangefield. These were staged by Mr. J. Keeling, gardener to D. Ward, Esq., Sheffield. Mr. A. Jamieson secured the second prize, the third going to Mr. S. Castle, West Lynn, Norfolk, medium-size creditable examples being staged in both instances.

#### SPECIAL PRIZES.

Thirteen collections were staged in competition for the prizes offered by Messrs. Sutton and Sons, Reading, for twelve varieties of vegetables. Mr. Wildsmith was awarded the first prize (five guineas) for a creditable collection, consisting of Intermediate Carrots, Ne Plus Ultra Peas, Snowball Turnips, Improved Reading Onions, Suttons' Exhibition Sprouts, Schoolmaster Potatoes, Student Parsnips, all very good; and fair examples of Cole's Defiance Celery, Dwarf Erfurt Cauliflowers, Duke of Connaught Cucumbers, and Hathaway's and Excelsior Tomatoes. Mr. G. T. Miles was awarded the second prize (four guineas) with far the best collection; his Tender and Truc Cucumbers, Globe Artichokes, Walker's Exhibition Onions, Carentan Leeks, Prince Albert Marrows, Intermediate Carrots, Telephone Peas, Stamfordian Tomatoes, Carters' Incomparable Crimson Celery, and Schoolmaster Potatoes were all of good quality, but the Cauliflowers and Parsnips were poor. Mr. R. Milner, gardener to J. D. Corbett, Esq., Shrewsbury, secured the third prize (three guineas), staging among others good examples of Telegraph Peas, Snowball Turnips, Matchless Red Celery, and Beet. The fourth prize (two guineas) was awarded to Mr. D. Abbott, gardener to C. H. Firth, Esq., Sheffield.

Messrs. Dickson & Robinson offered valuable prizes for the best six heads of their Eclipse Cauliflower. The first prize in a strong competition was awarded to Mr. J. McIndoe, the second to Mr. J. Edmonds, and the third to Col. Cross. For the best six bunches of Dickson, Brown, & Tait's Queen of Tomatoes there was good competition; but the remarkable examples staged by Mr. Hunter, Lambton, were very superior to the others. The second prize was awarded to Mr. D. Wilson, and the third to Mr. W. Elphinstone, Derby, for creditable examples. There were twelve collections of vegetables staged for this firm's prizes for twelve varieties. Mr. G. Summers, Sandbeck, staged the premier collection, consisting of good Eclipse Cauliflowers, Red Valery Carrots, Bliss's Perfection Tomato, Snowball Turnips, Grove White Celery, Bassana Tripoli Onions, Lapstone Kidney Potato, Pine Apple Beet, Marvel Peas, Telegraph Cucumbers, and Heartwell Marrow Cabbages. Mr. O. Arbrell, gardener to A. J. Skinner, Esq., Cheltenham, was placed second with a collection which included good Ne Plus Ultra Peas, Eclipse Cauliflowers, mixed Tomatoes, and Incomparable Crimson Celery. The third prize was awarded to Mr. W. Iggulden for a creditable collection.

For the prizes offered by Messrs. Webb & Sons, Wordsley, Stourbridge, for six varieties of vegetables there were twelve competitors. Mr. Crump, Blenheim, easily secured the first prize with good examples of International Kidney Potatoes, Excelsior Tomatoes, Pride of the Market Peas, Carter's Long-sword Kidney Beans, and Cucumbers. Mr. R. Milner was a good second, his International Kidney Potatoes being very creditable. The third prize was awarded to Mr. G. Bloxham, gardener to Sir T. Duncombe, Brickhill Manor; the Kinver Marrow Peas, Trophy Tomatoes, and Matchless Celery in this collection being very superior.

Messrs. Dickson & Robinson filled the tables at the end of fruit tent with a great variety of well-grown vegetables. The Tomatoes, Beans, Turnips, Peas, Onions, Beet, and Cauliflowers were very good examples of the sorts catalogued by this firm. Conspicuous among the Potatoes was a heap of a distinct new variety in the way of the Hundredfold Fluke.

#### MISCELLANEOUS FRUIT AND VEGETABLES.

Amongst the varied exhibits not for competition Messrs. Webb and Sons, Calcot Gardens, staged a fine collection of Cob Nuts, the finest of all being one named Cannon Ball, a round and very large Nut, the other principal varieties being Webb's Prize Cob, Duke of Edinburgh, Improved Cosford Cob, remarkably fine; Kentish Cob, Spanish Fillbasket, Berkshire Early, and Marquis of Lorne. Messrs. Paul & Son, Old Nurseries, Cheshunt, exhibited a large and varied collection of kitchen and dessert Apples. The following were amongst the finest specimens—Counsellor, Wellington, Hollow Crown Pippin, Warwickshire Pippin, Forge, St. Alban's Pippin, President de la Fays, Lemon Pippin, Cheshunt Pippin, Lord Suffield, Summer Noncuch, Bess Pool, Herefordshire Pearmain, Cellini, Small's Admirable, Golden Noble, Lord Derby, New Hawthornden, Pearson's Plate, Warner's King, Lewis's Incomparable, Kerry Pippin, Dumelow's Seedling, Poor Man's Profit, Lord Grosvenor, Mother Apple, and many others.

Messrs. James Dickson & Sons, Newton Nurseries, Chester, also staged a similar collection, but from trees about three years old. Some of the fruit was very large and fine. Messrs. J. Cheal & Sons, Crawley, Sussex, staged examples of their new Melon Shepherd's Model and Shepherd's Perfection, both large fruits, weighing 8 or 9 lbs.; a new Cucumber, Cheal's Prolific; a new dessert Apple of fine quality and a good colour called Early Snowfield, and is said to ripen in July; they also staged an assortment of other well-known varieties of Apples. Messrs. Dickson, Brown, & Tait, Manchester, contributed a good collection of fruits and vegetables; the monstrous Cucumber that was staged—Sooly Qua, 5 feet long, excited considerable attention. The collection of Grapes, Peaches, and Nectarines were good, but the vegetables were the most noticeable feature. The Potatoes were very fine, and included a very good dish of a new seedling variety called Early Ebor, a smooth rather fine-shaped Potato. Eclipse Cauliflower was shown in excellent condition, also a fine variety of curled Parsley called Dickson's Triple-curved. They also staged good examples of a small new Tomato called The Queen, much in the style of Green Gage, but a bright red colour; one bunch contained twenty-five fruits. Pot Vines fruiting, Roses, Gladioli, and Conifers were also arranged by this firm. The Liverpool Horticultural Company (John Cowan) staged an assortment of fine pot Vines from eyes this year, strong and short-jointed. Messrs. James Dickson & Sons of Chester also staged excellent pot Vines, Figs, and Conifers.

#### IMPLEMENTS.

The display of these was not so large as was anticipated, nevertheless a good general assortment was exhibited. The gold medal for the best boiler was awarded to Mr. Joseph Bramham for his Allerton Priory boiler. This combined saddle and tubular boiler is capable of doing much work, and is undoubtedly an excellent boiler. Many other forms of boilers were staged—for instance, Watson's Patent Wedge boiler, "The Clipper," and Ben's Patent boiler, that were described in the Royal Horticultural Society's Show. Messrs. Richardson and Co., horticultural builders, Darlington, exhibited their Hooded Tubular boiler, and were awarded a special certificate. They also exhibited their wall-protector and a general collection of houses, boilers, and valves. For a house suitable for a smoky climate they were awarded the gold medal. The house was specially built and designed for the purpose. It was span-roofed, light, and well ventilated on the most improved system, the top air being admitted through a small lantern, and when open a screen made of light copper wire places itself in the open space, thus preventing any soot from entering. The idea is rather novel. Messrs. Foster & Pearson obtained a gold medal for their greenhouse, which is a light and durable span-roofed structure, that has been previously described; they also exhibited other good houses, and their patent span-roofed frame is now in use in many gardens. Mr. R. Holiday was also awarded a gold medal for a general collection of houses, boilers, and other appliances. This exhibitor made a fine display with some of his large houses suitable for conservatories and nearly every other purpose.

Messrs. McKenzie & Moncur, Edinburgh and Glasgow, exhibited a light and strong span-roofed house suitable for a small conservatory. Messrs. Wright & Holmes, Moseley Road, Birmingham, exhibited their improved Cranston's patent house, glazed without putty. Messrs. D. Low & Sons, Edinburgh and Manchester, exhibited some very substantial houses of good workmanship and design, with boilers, valves, and many other garden implements. The assortment was large, varied, and good. Mr. Henry Inman, Stretford, Manchester, exhibited a very large collection of rustic summer-houses, chairs, garden seats, bridges, and others. The whole was a very creditable exhibit. Bailey's tube wells were in working, and also Deverill's Patent Irrigator. Messrs. Elliott, Alston, & Olney, Manchester, exhibited a very fine collection of garden seats; Mr. J. Armatage of Manchester a general assortment of vases; Messrs. Such Brothers, Milgate, Manchester, a large collection of iron garden seats, boilers, rollers, and other similar exhibits; Messrs. Mathews, of Weston-super-Mare, a large and excellent collection of garden flower pots, Orchid baskets, and other rustic articles suitable for Ferns. Messrs. Griffiths & Hughes had a stand of their fir tree oil, a valuable insecticide; Messrs. Green & Sons a collection of mowing machines; Mr. Henry Cesar had a greenhouse; Messrs. Chadborn & Coldwell exhibited their patent "Excelsior" lawn-mower and the Pall Mall lawn-edger; Messrs. Graham & Fleming, Halifax, a collection of boilers and valves; and Mr. Harlow, Macclesfield, a quantity of boilers and other heating apparatus suitable for warming dwelling-houses, &c.; Mr. C. H. Harris, Birmingham, a variety of garden seats; Messrs. Dickson and Son of Chester a number of garden implements; and Mr. Thomas Bradford, Manchester, a number of garden seats. Lastly, but not least, Mr. Bramham, 104, Dale Street, Liverpool, was the only exhibitor who contributed wirework. His display consisted of an elaborate rosery, which has been much improved since it was shown at Liverpool some time ago. Some of the medals were not granted when our reporter left the Exhibition, and we have since failed to obtain the awards.

The Exhibition was opened by Lord Derby with an appropriate speech on Wednesday, the 24th ult. His Lordship also presided at the elaborate and elegant banquet held on the evening of the opening day, and which was attended by a large number of eminent horticulturists.

We may further add that there was a department not referred to in

the preceding report—namely, the cottagers' productions, which occupied considerable space in one of the tents, the fruit and vegetables being in quality highly creditable to the exhibitors.

#### THE NATIONAL ROSE SOCIETY'S SHOW.

THE experiment of holding an exhibition of Roses in connection with the International Show thus late in the year met with fully as much success as could have been anticipated. In several of the principal classes the competition was fairly good, though the blooms were generally small. The chief nurserymen's class was for forty-eight single trusses, and in this Messrs. R. Mack & Son, Catterick Bridge, Yorkshire, were accorded the leading honours for an even collection of bright fresh blooms. Messrs. Paul & Son followed extremely closely, and Messrs. Cranston & Co. secured the third position with neat examples. With twenty-four triplets the same firms secured the prizes in similar order, all staging good blooms. The best twenty-four single trusses were from Mr. J. Hone, Eastgate Nurseries, Peterborough; the second position being accorded to Mr. J. Walker, Thame, Oxford. Twelve triplets of Teas or Noisettes were shown by Messrs. Mack, Paul & Son, and Prince of Oxford, who gained the awards in that order. In the premier collection good blooms of Madame Hippolyte Jamain, Adrienne Christophle, Maréchal Niel, and Madame Bravy were included. For twelve trusses of any Rose Messrs. Mack, Prince, and Cranston were first, second, and third with Alfred Colomb in admirable condition; while for six trusses of any variety the same firms carried off the prizes, Messrs. Cranston with Mrs. Jowitt, Mack with Marie Banmann, and Prince with Duke of Edinburgh.

The amateurs' classes were not strongly represented, but good blooms were shown by the Rev. Canon S. Reynolds Hole, Cauntton Manor, Newark; E. Mawley, Esq., Addiscombe, Croydon; T. B. Hall, Esq., Rock Ferry; Ecroyd Claxton, Esq., Wavertree, Liverpool; and H. Grendon Tippet, Esq., Woodham, Rock Ferry. Among the exhibits not for competition were boxes of blooms from Messrs. Cranston & Co., Rose Crimson Bedder being remarkably bright in colour. Some fine examples of Clematises were also shown by the same firm.

#### THE NATIONAL CARNATION AND PICOTEE SHOW.

THE National Carnation and Picotee Society (Northern Division) held their annual Show in connection with the Great International Exhibition. Considering the lateness of the season the display was very fine, and such a clear bright lot of flowers are seldom seen at the end of August. Allowing for the extraordinary attractions afforded by the International Show the Carnations came in for rather more than their share of admiration, and seemed to be especial favourites with the greater number of visitors. The Newcastle growers were in good force with an exceedingly fine lot of clean and fresh blooms; but the palm went to Mr. Robert Lord, Todmorden, who was the most successful exhibitor. In seedlings there were a few very fair flowers, but nothing to call for special attention. In named varieties some of the old sorts were shown in good character to remind one how they can sometimes be caught at a late season. The premier Carnation, Admiral Curzon, shown by Mr. Lord, was a fine flower with wonderful petals, the colour bold and well laid on; the only defect being the white, which was not of a very clear character. The premier Picotee, Thomas Williams, shown by Mr. Robert Scott, Newcastle, a light-edged red, was a perfect model of a flower; in fact the variety was notably good throughout the Show.

The following is the prize list—

CLASS A, TWELVE CARNATIONS, all dissimilar, open to all.—First, Mr. Robert Lord, Todmorden, with Lord Milton, Admiral Curzon, the premier Carnation; Mrs. Dodwell, a very fine rose flake; Raynor Johnson, Clipper, Shirley Hibberd, Earl Wilton, Fox Gardiner, Sportsman, Robert Lord, Mrs. Tomes, and George. Second, Mr. Thomas Flowdy, Gateshead, with Sarah Payne, extra fine; Admiral Curzon, Sporting Lass, a fine purple flake; James Harland, William Haslam, Rose of Stapleford, James Flowdy, Rifleman, Falconbridge, very good; James Wilkinson, Eccentric Jack, and Warrior. Third, Mr. William Taylor, Middleton, with Admiral Curzon (2), Apollo (2), Annihilator, Fanny Peel, Sportsman, Lovely Ann, James Taylor, Lord Milton, Warrior, a fine flower, seldom seen so good; and Clipper. Fourth, Mr. Benjamin Simonite, Sheffield, with John Simonite, J. P. Sharp, Admiral Curzon, Graceless Tom, Esther, and seven seedlings. Fifth, Mr. John Beswick, Middleton.

CLASS B, TWELVE PICOTEEES, all dissimilar, open to all.—First, Mr. Robert Lord, with Zerlina, very fine; Minnie, Mrs. Summers, a neat sweet bloom; Thos. Williams, fine; Miss Horner, Brunette, Mrs. Allerof, good; Ann Lord, Medina, John Smith, extra fine; Elsie Grace, and Fanny Ellen. Second prize to Mr. Thomas Flowdy, with Thomas Williams, fine; Fanny, Mrs. Dodwell, Robert Scott, Zerlina, very good; Edith D'Ombain, J. B. Bryant, Mrs. May, Minnie, Miss Wood, extra fine; Amy Robsart, and Northern Star. Third to Mr. John Beswick, with Zerlina, fine; Edith D'Ombain, Ann Lord, Linnie, Miss Harland, Daisy, Dr. Abererombie, Rosy Queen, Mrs. Summers, J. B. Bryant, Mary, and Wm. Summers. Fourth to Mr. Geo. Rudd, Undercliffe, Bradford, for Zerlina, Mrs. Allerof, Her Majesty, Mrs. Niven, J. B. Bryant, and seven seedlings. Fifth to Mr. Benjamin Simonite, with Morna, Mrs. Allerof, Medina, Alliance, Sylph, Miss Gorton, Ann Lord, Mary, and four seedlings.

CLASS C, TWELVE CARNATIONS, nine dissimilar.—First to Mr. Thomas Bower, Bradford, with John Keats (2), Lord Milton (2), very good; Dreadnought (2), Maid of Athens, Squire Meynell, Clipper, Falconbridge, Sybil, and Rifleman. Second to Mr. Robert Scott, Newcastle-upon-Tyne, with Mr. Harland, James Flowdy, Sarah Payne (2), very fine; Eccentric Jack (2), Rose of Stapleford, Mars, Rifleman, Dan Godfrey, Falconbridge, and Mayor of Nottingham. Third to Mr. George Rudd, with Lord Napier, Falconbridge, Lord Milton (2), John Keats, Admiral Curzon, and six seedlings. Fourth to Mr. George Thornley, Middleton, with Earl Wilton (2), Sportsman, Dr. Foster, William IV.,

Clipper, Admiral Curzon, Lord Milton, James Merryweather, and Eccentric Jack. Fifth to Mr. Thomas Mellor, Ashton-under-Lyne; and sixth to Mr. Joseph Chadwick, with a lot unnamed.

CLASS D, TWELVE PICOTEES, nine dissimilar.—First to Mr. Robert Scott, with Thos. Williams, the premier Picotee, and a most exquisite flower; Miss Wood (2), fine; J. B. Bryant, Minnie, Mary, Zerlina, Mrs. Dodwell, Northern Star, and Mrs. Summers. Third to Mr. Geo. Thornley, with John Smith, Miss Wood, Zerlina (2), Nymph, Ann Lord (2), Miss Horner (2), Brunette, Alice, and Lucy. Third, no name stated, with J. B. Bryant (2), Zerlina (2), Wm. Summers, Mary, Mrs. Summers, Beauty of Plumstead, Mrs. Alleroff, Ann Lord, and two seedlings. Fourth to Mr. Thomas Bower; and fifth Mr. Thos. Mellor.

CLASS E, SIX CARNATIONS, dissimilar.—First, Mr. Edward Pohlman, Halifax, with Lord Milton, Sportsman, John Keats, Dr. Foster, Fanny Gardiner, and John Simonite, good. Second to Mr. James Whitham, Hebden Bridge, with Fanny Gardiner, James Merryweather, James Douglas, Purity, Sportsman, and Admiral Curzon. Third to Mr. James Whittaker, Royton, with Admiral Curzon, Sybil, Earl Wilton, William IV., Lovely Ann, and James Taylor. Fourth, Mr. Sannel Barlow, Stakehill, near Middleton.

CLASS F, SIX PICOTEES, all dissimilar.—First to Mr. J. Whitham for Zerlina, Fanny Ellen, Thos. Williams, good; Minnie, Alliance, and J. B. Bryant. Second to Mr. S. Barlow, with Morna, Zerlina, Ann Lord, Fanny Ellen, Dr. Epps, and Norfolk Beauty. Third to Mr. E. Pohlman, with John Smith, Thos. Williams, Zerlina, Cynthia, Alice, and Minnie. Fourth to Mr. James Whittaker.

EXTRA PRIZES FOR TWELVE SELFS, Yellow or other Flowers.—First, Mr. Robert Lord, with a lot of rrm bizarres, that looked anything but selfs. Second, Mr. Samuel Barlow, for twelve flowers, all selfs, both lots being well grown.

CLASS G, SINGLE BLOOMS.—*Scarlet Bizarres*: First, second, third, fourth, and fifth, Mr. R. Lord, with Curzon. Sixth, Mr. S. Bower, with same. *Crimson Bizarres*: First, second, third, fourth, and fifth, Mr. R. Lord, with Lord Milton (3), Rifleman, and Unexpected respectively. Sixth, Mr. T. Bower, with Rifleman. *Pink and Purple Bizarres*: First, Mr. T. Bower, with Sarah Payne. Second, Mr. R. Lord, with Shirley Hibberd. Third, Mr. T. Bower, with Falconbridge. Fourth and fifth, Mr. R. Lord, with Albion's Pride and Eccentric Jack. Sixth, Mr. B. Simonite, with a seedling. *Scarlet Flakes*: First, Mr. Thos. Flowdy, with Wm. Harland. Second, third, fourth, and fifth, Mr. R. Lord, with Sportsman (2) and Clipper. *Rose Flakes*: First and second, Mr. R. Lord, with Lovely Ann and Mrs. Dodwell. Third, Mr. T. Bower, with John Keats. Fourth, Mr. R. Lord. Fifth, Mr. T. Bower, with the same varieties. Sixth, Mr. W. Taylor, with Apollo. *Purple Flakes*: First, second, and fifth, Mr. R. Lord, with James Douglas. Third and fourth, with Earl Wilton. Sixth, Mr. Wm. Whittaker, with Lady Peel.

PICOTEES.—*Heavy-edged Red*.—First and second, Mr. R. Lord, with John Smith. Third, Mr. T. Flowdy, with J. B. Bryant. Fourth, Mr. R. Lord, with John Smith. Fifth, Mr. T. Flowdy, with J. B. Bryant. Sixth, Mr. G. Rudd, with John Smith. *Light-edged Red*: First and third, Mr. T. Flowdy, with Thomas Williams. Second, fourth, fifth, and sixth, Mr. R. Lord, with same. *Heavy-edged Purple*: First, Mr. R. Lord, with Zerlina. Second and third, Mr. J. Beswick, with same. Fourth, Mr. E. Pohlman, with Miss Summers. Fifth and sixth, Mr. J. Beswick, with same. *Light-edged Purple*: First and second, Mr. T. Flowdy, with Minnie. Third, Mr. G. Thornley, with Ann Lord. Fourth, Mr. B. Simonite, with Mary. Fifth, Mr. R. Lord, with Minnie. Sixth, Mr. J. Beswick, with Ann Lord. *Heavy-edged Rose*.—First and second, Mr. R. Lord, with Miss Horner and Fanny Ellen. Third, Mr. J. Chadwick, with Miss D'Ombra. Fourth, Mr. W. Taylor, with Edith D'Ombra. Fifth, Mr. R. Lord, with Miss Horner. Sixth, Mr. G. Rudd, with Edith D'Ombra. *Light-edged Rose*: First, second, and fourth, Mr. T. Flowdy, with Miss Wood. Third, Mr. J. Beswick, with Teresa. Fifth, Mr. S. Barlow, with Unknown. Sixth, Mr. W. Taylor, with a seedling.—WILLIAM BOLTON, Warrington.

#### TROPÆOLUM SPECIOSUM.

UNDOUBTEDLY "D., Deal," has selected the right aspect—north—for growing this gorgeous plant in England. In Scotland it will grow anywhere, at least in the south where the rainfall is great, and perhaps in other parts also. I have seen it in Dumfriesshire rambling over shrubs and making them look like bushes of fire, and the gardener's cottage at Arkleton was, a few years ago, covered from the ground to the roof—a veritable blaze of beauty. I have never seen anything in England so brilliant as this plant is in Scotland, and attempts should certainly be made to establish it in gardens in the south. This is no easy task, as I know from experience. I have planted it many times and oft in Lincolnshire, but always failed; my successor, however, succeeded. He planted it on the north side of a mansion where there was either a leak or a stoppage in the spout above, and the ground, by the constant trickling of the water whenever it rained, was always wet. In fact it is the wettest and coolest place in the garden, and it suited the Tropæolum, for there it grew, and is probably flowering at the present time at Branston Hall. About three years ago I saw it growing and flowering freely at Holme Laey near Hereford, and there, too, it was on the north side of a wall and in a cool and moist position. When once the plant is established it is no trouble. It will grow if it is let alone. Its fleshy roots are extremely liable to be injured when disturbed, or in transit when sent from the north. If some nurseryman could establish a number of plants in pots, like so many pots of Musk, they would no doubt sell readily, and it is quite certain if they became established in English gardens and flowered the same as they do in Scotland that the vendor would leave behind him a monument brilliant and durable.—J. W.

MATRICARIA INODORA FLORE-PLENO.—With respect to the Matricaria inodora flore-pleno being comparatively a new plant as is stated last week, I have known it growing in gardens in the neighbourhood of Prestwich more than twenty years ago. It is no doubt one of those good old plants that has long been neglected

and is now brought to light again. The name of Mitraria was, I presume, simply a misprint.—JAMES PERCIVAL.

[Yes; the name was an obvious misprint, which escaped our notice in time for correction.—ED.]

#### TURNIP-ROOTED BEET.

AFTER reading the notes in the Journal last year respecting the high quality of this Beet I determined to give it a trial this year. I have known the variety for years by having occasionally seen it in gardens, but in some strange manner I could never help feeling it was a mistake to grow the round black Turnip-like roots, when there were, as I thought, so many better varieties with handsome tapering roots. So much for prejudice. This year for the first time—and I have been growing Beet for thirty years—I tried the globular Egyptian, and I must now say that it is not only the earliest of all, but is the sweetest and best flavoured I ever tasted. There is scarcely a suspicion of the earthy taste that is present more or less in all the long-rooted varieties, and I hope never to be without the Egyptian Beet again. A few of the roots are pale in colour, but the great majority of them are as dark as Nutting's. My employer, I think, has a prejudice against it, the slices, he says, being too large. The quality is of little moment with him, as I believe he seldom touches this vegetable, though he likes to see it on the table. This is all the better for me; and as I am entitled to all the vegetables I require, I shall reserve the round Beet for myself, and supply "the house" with Nutting's as usual. Those who grow Beet to eat should try this sweet and excellent variety, for in quality it is the best of all.—AN OLD HAND.

#### MR. BRUCE FINDLAY.

ON the occasion of the publication of the report of the Jubilee Exhibition of the Manchester Royal Botanical Society, the portrait of the highly skilled and successful Curator and Secretary of that Society (see fig. 33, page 197) will not be inappropriate, and we feel sure it will be acceptable to our readers.

We extract the following particulars relative to Mr. Findlay, subject to some slight corrections, from a Manchester paper—

"In all Manchester there is not a steward of the public welfare to whom the community is more indebted, or to whom we should be more grateful, than the excellent Curator of the Botanical Gardens at Old Trafford, to which during the last dozen years or so the shilling visitors have amounted to probably fully 800,000. The gardens are purely private property. They are not, like our magnificent public parks, open to any who like to enter. This makes it so much the more agreeable to remark that the gates are open so often, and at so low a rate of charge for admission. If we are not very profoundly mistaken it is to Mr. Findlay that such of the Manchester people as do not subscribe or call themselves 'proprietors' owe the chance now so often afforded of contemplating and enjoying what they have to offer.

"The original proposal to establish botanical gardens in Manchester, so we verify by reference to the copy of the celebrated old *Manchester Iris* at the Hulme branch of the Free Library, appeared in 1822. There were then very few establishments of the kind in England, but there was one at Liverpool, and it was in order to be on a par with the last-named that the proposal for a Manchester garden was issued. But the project was mooted before its time. Nobody cared to take it up, and not until about 1829 was it started anew. A Botanical and Horticultural Society was then established. Dr. Dalton went all round the suburbs of the town testing the comparative cleanliness of the leaves of the trees with a cambric handkerchief, so as to be sure of the purest atmosphere, and this being found at Old Trafford, the existing site was chosen. In 1831, exactly fifty years ago, the gardens were ready, and about midsummer that year there was a grand procession and an opening exhibition. The men employed in the grounds wore a rather fancy uniform, designed, it would appear, after the legends of classical Arcadia. With the original Curators we need not here concern ourselves. They were most estimable men—Mr. Findlay's immediate predecessor, the late Mr. Campbell, was one of the most genial gardeners that ever lived. Mr. Findlay himself came upon the scene in 1858. He was born at Streatham in Surrey. His father was a Scotchman, but as regards his horticultural education he is certainly a Londoner. Some of his earliest experience, we believe, was gained in Rollisson's nurseries at Tooting. When he received the appointment he has now held with so much credit for twenty-three years he was only twenty-three years of age; he has thus spent just half of his life in his present position. Flower shows, when Mr. Findlay came to Manchester, were for the select few, the connoisseurs in plants, the fashionable and the wealthy. Taking up with his accustomed promptitude the capital idea set forth in the Great International Show at South Kensington in 1866, he determined that with proper support Manchester, through his personal effort, should be the first to follow suit. In Whitsun week 1867 began, accordingly, those splendid flower festivals we now

look forward to as an integral part of the year's enjoyment. Mr. Findlay has been instrumental in promoting public enjoyment in a rational manner to a degree it would be difficult to over-estimate. That he does his work in the calm and business-like way that best commends a man to his friends is proved by the way in which they constantly and uniformly rally round him. There is never any 'uncertain sound' in the voice with which he speaks. He says what he means, and means what he says. There is never any disguise, and he has no idea of what half-heartedness is. He is renowned among his brother gardeners for his sincerity and courtesy. He is a friend to every man who loves gardens and gardening, and is always ready to lend a helping hand; and, best of all, he does not know what it is to have an opponent or to hear unkind words."

Mr. Pettigrew also pays the following deserved tribute to his friend—

"Mr. Findlay is a gentleman of calm demeanour, sound judgment, extensive knowledge, great professional attainments, and never fails to accomplish what he undertakes. From the time he came to Manchester he has gradually risen in public esteem and confidence—both rich and poor respect him. Amongst friends and acquaintances he is very social, and an excellent conversationalist. His society is coveted and sought by the wealthy around him. He is interested in the progress of horticulture, willingly writes and reads papers to help in the formation of small societies of gardeners, is always anxious and willing to help respectable gardeners seeking situations, and is very frequently applied to for gardeners to fill vacant places. He is enthusiastic in his profession, and in all respects is an excellent man."

Such testimony as the above leaves us little to say. Mr. Findlay's last triumph has been his greatest, and we trust he will live to achieve similar results under more favourable circumstances. A man of such energy will not be checked in his course by a rainy day or rainy week; he will produce success at last, and, as Mr. Pettigrew says, will "accomplish what he undertakes." We will only add that we hope he will accomplish it soon, as such earnest labour deserves its reward.

#### STANDARD CURRANTS.

If standard Roses are going out of fashion standard Currants ought to come in, for they are not only beautiful objects grown at intervals by the sides of the walks in kitchen gardens, but are extremely profitable and valuable for late use. The birds always leave them until the last, and when they do attack them the head of each tree can be easily enveloped with hexagon netting, and the fruit is then safe. These standards do not usually grow so luxuriantly as bushes and they bear prodigiously, the fruit hanging like swarms of bees. True, they need stakes to support them, and they are worthy of them—quite as worthy of such aids as Roses or Raspberries are. If standard Red and White Currants were generally grown they would not only add to the attractiveness of most gardens, but, what is more, the period of the fruit supply would be considerably lengthened, for it is certain that the fruit keeps better on standards than on bushes. Standard Currants are easily formed, but it is a question of time to produce fine heads; these, however, when once produced continue fruitful for many years. Select straight cuttings, and do not stop them until they are 3 feet high, but all the lower buds must be scrupulously removed or suckers will be troublesome. Secure the leading growths to stakes and pinch the side shoots, and in due time fruitful miniature trees will be produced that will be both useful and ornamental. The best variety for this mode of culture is—RABY CASTLE.

#### ROSE RÊVE D'OR.

AMONGST Noisette Roses Rêve d'Or occupies a prominent position. It is a most desirable variety with its rich golden flowers, which are of moderate size and full. It is a vigorous grower and a good climbing Rose, and when planted out in suitable soil soon covers a good space.

I have recently been looking over some back numbers of the *Journal*, and was struck with the lamentable tale many cultivators have recorded against that most beautiful of all Noisette Roses, Maréchal Niel. When we read of the difficulties growers have to contend with in trying to cultivate this Rose, and failure results after the utmost care and good management, it is almost sufficient to cause them to abandon further experiments. I would not advise such a course to be pursued, as I have found in several instances brilliant success result after repeated failures in trying to grow this Rose. But where Rose blooms are required and must be produced cultivators cannot afford to wait year after year, and the result of their labours be a failure, therefore I advise a trial of Rêve d'Or. The blooms of a rich orange yellow will be produced with certainty, and the plant will grow and flourish luxuriantly.

It will not produce shoots quite so long as the Maréchal, and in consequence will take a little longer time to cover a certain space.

Like Gloire de Dijon the Rose under notice is rather inclined to branch from its shoots instead of producing leaders branchless for perhaps 20 feet. If the end of the young leading shoot once turns down and remains in that position for a time a number of side shoots are certain to be produced. I have, however, had growths some 12 feet long without a side shoot on plants in pots. When strong shoots are left their entire length at pruning time they will flower as freely along their entire length as the Maréchal or "Old Glory."

I do not trouble myself as to what particular stock is best suited for this Rose, as I am certain it cannot grow better nor bloom more profusely upon any stock than upon its own roots. I have had failures enough with growing Noisette Roses on stocks, and long since devoted my attention to growing such varieties as I require on their own roots. Success has been certain, and the production of blooms considerably larger.

Cuttings root readily at any season of the year when half-ripened wood is employed, and this variety strikes as freely as any Rose I am acquainted with if only a judicious system is practised in carrying out the operation. To be brief, I shall say, Follow out the details given on striking Roses some short time ago in the *Journal*, and success will be sure. If rooted at once splendid plants can be produced by the end of next year that will carry on an average twenty blooms each if the plants are kept in pots. To accomplish this they must be repotted as often as they require it until they are placed in 10-inch pots. The plants should be grown upright or close under the glass during the summer, and not crowded too thickly together if a good quantity of blooms are expected. When the growth is made and ripened it can be trained round stakes placed round the side of the pot, and will break from nearly every joint and produce a flower. This Rose will force very well, and if ripened early can be had in bloom by the end of February or early the following month.

Those who have not grown Rêve d'Or will, I am sure, if they give it a fair trial, be delighted with it.—SCIENTIA.

#### STRATAGEM PEA.

HAVING grown this new Pea for two summers, I have great pleasure in answering "CLERICUS" (page 98) respecting its merits. It grows some 3 or 3½ feet high, and it is particularly suitable where sticks are dear or where the situation is exposed. The pods and peas are truly magnificent, quite green, the latter of a delicious flavour. The constitution of the plant is excellent, and not subject to mildew. I can promise that whoever grows this Pea well will not be disappointed. While I am on the subject of Peas I may mention that the plan followed here is to make the first sowing of Peas on or about the 1st of February, and every ten days till the 1st of July. This plan enables us to gather Peas every day for four months.—J. RUST, *Eridge Castle*.

#### LACHENALIAS.

FOR spring decoration no dwarf-growing plants are more brilliant than these, and few are more useful. They are valuable for associating with Lilies, Cyclamens, Spiræas, Hyacinths, &c., from all of which they are distinct both in form and colour; yet Lachenalias are absent from many gardens, and in some others where they are seen they are not satisfactory, because they were not potted until the Hyacinths and other bulbs were obtained. The right time for potting Lachenalias is in August, but bulbs potted now—at once, will make brilliant masses of scarlet and yellow next April. They are of most easy culture. I place seven bulbs in a 5-inch pot, using a light, rich, gritty compost, and plunge the pots in cocoa-nut fibre in a frame. Growth soon commences, and the pots are removed to a shelf in the greenhouse, where they remain until they flower. We have no plants more useful than these in the spring, and none more certain to grow and flower freely. I have read of their being grown in hanging baskets, and can quite understand how beautiful they must be; however, such baskets are not wanted here, but a few dozen pots of these elegant and brightly coloured flowers could not be dispensed with. The variety we grow is named *L. tricolor grandiflora*.—A CONSERVATORY FOREMAN.

POTATOES FROM SINGLE EYES. — The following facts were communicated to me a day or two ago by my friend Mr. Cole of Tower House, Bexley Heath, and as I think they may be of interest to the readers of the *Journal of Horticulture* I send them to you. "This season, by way of an experiment, I took three Potatoes—Early Rose—weighing ¼ lb. each, and cut them into thirty sets with a

single eye to each piece; the sets (averaging in size not larger than a walnut) were planted the last week in April. They all came up well, and grew vigorously. I lifted the crop the second week in August. The  $\frac{3}{4}$  lb. of seed has produced 33 lbs. weight of handsome tubers, being uniform in size and shape, and all perfectly sound. Despite the dryness of the season there were remarkably few small tubers, and no chats, twenty-four of the largest weighing 16 lbs.—READER.

#### MUSHROOMS IN PASTURES.

FROM notes and replies that occasionally appear in the Journal, a somewhat widespread disposition would appear to exist to establish Mushrooms in the open air. This is not easily accomplished at any time, and in some soils it is impossible. I have made many experiments, nearly all of which proved failures; still I succeeded in one instance, and this not because of any special management, but because the weather happened to be favourable at the time the spawn was inserted, and the soil was suitable for the growth of the Mushrooms. Towards the end of June is about the time when the temperature of the soil is suitable for the spread of the spawn, but should drenching rains follow on the one hand, or extreme drought on the other, there will be no results. Again, in some soils, if a few Mushrooms follow the insertion of the spawn, they prove the first and the last crop. This is the case in very wet pastures where the soil is stagnant during the winter.

I am satisfied that, on dry soils at any rate, salting the land is favourable for Mushrooms. I am well acquainted with a small farm in a large agricultural district on which Mushrooms grow freely both in the pasture and arable land. I have seen many bushels gathered from amongst Potatoes and Turnips, in some places Mushrooms springing up as thick as they could stand for yards together. It is on this farm only that Mushrooms grow. The soil of the surrounding fields is of precisely the same nature—medium hazel loam well drained; in fact, first-rate Potato and Barley land, growing also good crops of Wheat. The only difference in the management of the land is that on the farm where the Mushrooms grow the farmer has been in the habit of sowing 2 cwt. of salt per acre for a number of years, so that the land is thus impregnated with salt. I once inserted some lumps of spawn in a pasture on this farm, and the same day another portion in an adjoining field that had not been salted. The weather being favourable Mushrooms followed in both instances, but they were both much finer and more numerous in the field that had been regularly salted than in the other. The district is, however, a dry one, and similar results might not follow in a wet locality.

Mr. Abbey, I think, has advised that salt be mixed with water for applying to Mushroom beds. It would be well if he would allude to this subject more prominently, and state his reasons for the practice and the quantity of salt he recommends.

In inserting lumps of spawn in pastures the condition of the soil is of far more importance than any mere date in the calendar. September is as good a time as June, provided the ground is neither too wet nor too dry for the spread of the mycelium and the growth of the fungus.—A GARDENER AND BAILIFF.

#### PELARGONIUM PRINCESSE STEPHANIE.

A PRETTY and novel Zonal Pelargonium was sent out last May under the above name by MM. Pynaert van Geert of Ghent. It is especially remarkable for its dwarfness of habit, the plants when fully grown rarely exceeding 5 inches in height, and, being very compact and free in flowering, it is well adapted for culture in pots or for the margins of flower beds, for which purpose it is especially recommended by its introducers. It is totally distinct, both in foliage and flowers, from any other form of Zonal Pelargonium grown in England, and well merits attention.

The flowers are very double, but the petals are not crowded and are of a bright rose colour, lighter in the centre, being borne in trusses of moderate size. These, however, are produced in such numbers that the plants appear to be literally balls of flowers, and lines or margins of such would undoubtedly have a beautiful effect in the flower garden. The annexed woodcut first appeared in the "Revue de l'Horticulture Belge," where, in describing the plant and referring to its floriferousness, it is stated that a small

specimen with only three branches had nine trusses. We have seen plants in M. Pynaert van Geert's nursery, and can recommend the variety for a trial in English gardens.

#### EARLY PEACHES.

EARLY BEATRICE appears to have taken the leading position among Mr. Rivers' seedlings, and is now more largely grown than any other early variety. Early Albert, Early Louise, and Early Rivers do not appear to have become popular, although the last named especially is an excellent Peach; the other two do not appear to be wanted, as ripening too near Early Beatrice. The variety last named is planted in nearly all collections where Peaches are required at the earliest possible moment. It is a good grower, great bearer, and free setter, and although the fruits are small in all probability the crop that a tree will carry would equal in weight the produce from the same space of most other varieties; yet notwithstanding its size tells against, and it is grown simply because no other variety that has yet been widely cultivated will ripen so early, but not because of its merits as a fruit.

Early Rivers is larger and a little later, affording a good succession, and the fruit is mostly of excellent quality, yet it is not seen in one Peach house in ten. This is a little surprising, as it is a decidedly early Peach, and as such is valuable. Its pale colour is no doubt an obstacle to its extended culture, it inheriting this

Fig. 35.—Pelargonium Princesse Stephanie.

character from its parent the Early Silver, which in turn was raised from the white Nectarine. Those who do not object to a pale skin should give Early Rivers a trial.

Hale's Early ripens about the same time as the preceding, or perhaps a little later. It is of American origin. It is not larger than Early Rivers, if as large, neither is it better if as good in quality; but it is better in colour, its crimson-tinted cheek marked with dark streaks giving it a warm and rich appearance that is acceptable on the dessert table. It is of very good and not unfrequently of excellent quality, and decidedly ranks as the best second early variety. In not a few gardens it is relied on for the earliest fruit, Early Beatrice being dispensed with. Early Ascot follows, and is a very useful variety.

How far these varieties will maintain their position when the American variety Early Alexander becomes better known remains to be proved. I am informed by an American friend that this is clearly the finest and most valuable early Peach in cultivation, and on that account is being grown largely in the southern States. "Early Amsden is," he says, "almost if not identical with it; and if the two varieties are offered in England choose the former, and do not buy the latter." Early Alexander I have seen but not tasted. Can any readers of these notes give information respecting it, both in regard to its period of ripening as compared with Early Beatrice, its quality, and its colour when ripe? If it is as

good in appearance and quality as Hale's Early, and as early as Early Beatrice, it will be a decided acquisition.

To all who are erecting Peach houses and those who intend planting in the ensuing summer it is important to have the latest reliable information on the subject of these notes; indeed, they have been suggested by a gentleman who is seeking information, as he desires to have the best early Peaches he can obtain, and wishes to avoid planting trees that in two or three years' time he may have to dig up again.—T. S.

THE Secretary of the Tavistock Horticultural Society asks if any of our readers can suggest a solution of a difficulty—namely, the practice of some competitors entering for certain prizes, and then at the last moment not putting in an appearance for all the things entered. There are no entrance fees, and there are almost insuperable objections to making any, as the Society is supported very liberally by the noblemen and gentlemen of the district.

— COLOURED PLATES OF FLOWERS are so numerous now-a-days, that it is only when one of striking excellence appears that it merits notice. Such an one was issued last week with the *Gardeners' Chronicle*, representing truthfully and artistically the three beautiful *Odontoglossums* *vexillarium*, *Alexandrae*, and *cirrhosum*. We congratulate our contemporary and their artist on this very chaste and beautiful work of art, which so many Orchid admirers will be glad to possess.

— A NEW MILTONIA of singularly chaste appearance has expanded in Mr. B. S. Williams' collection during the present week. Its labellum is pure white, with three or four short, bold, and clearly defined stripes of purplish magenta radiating from the centre of the flower. This variety, which has not yet been named, is much prized in the nursery.

— IN the same establishment, noticeable by its very free growth and fine flowers, is *IXORA PILGRIMI*, which promises to rank amongst the most useful for decorative purposes in this fine genus, especially as it succeeds admirably in a temperature of 10° to 15° lower than is suitable for *I. coccinea*.

— WE have received from Messrs. G. Cooling & Sons, Bath, two plants of their NEW DWARF KIDNEY BEAN, NE PLUS ULTRA, which they sent out this season. The plants are extremely productive, of dwarf habit, and have large and fine pods. The vendors recommend it especially as a forcing kind, as it proves to be as productive indoors as out, and is very early. It is certainly a very fine Bean, but how far it is distinct from Fulmer's can only be determined by a fair trial of the two varieties. Have any of our readers tried them together, and if so with what results?

— AMONG the numerous hardy plants exhibited by Mr. Riehes at South Kensington last week, two very pretty forms were noteworthy—namely, *CASTILLEJA INDIVISA* AND *DRACOCEPHALUM RUPRECHTII*. The former is a bright and attractive ally of the *Scrophularias*, with spikes of scarlet flowers and bracts; and the other is *Labiata*, with soft yet bright purple flowers that are produced very freely, clothing the upper part of the stems. They may be both grown upon a rockery that has been suitably prepared.

— "ONE of the most interesting aquatic plants in flower at the present time," writes "A. W.," "is *ORONTIUM AQUATICUM*. The graceful drooping foliage, from which rise charming umbels of flowers, renders it a very suitable plant for shallow waters."

— A GOOD cultivator writes as follows relative to the MADRESFIELD COURT GRAPE—"This fine Grape does not now get so bad a character for cracking, as its culture is getting better understood. Formerly one-half of the berries were lost through cracking, now but several instances have within the last fortnight come under my observation where, thanks to a dry buoyant atmosphere coupled with ample ventilation, scarcely a berry has to be cut out."

— MR. W. R. GLEAVE sends the following RECEIPT FOR MAKING COLTSFOOT WINE—"Take three gallons of water and one quart of Coltsfoot flowers, boil them well for half an hour, then strain through a sieve; add 9 lbs. of good moist sugar, boil again for half an hour, then remove to a cool place; when lukewarm add seven Oranges pared and sliced, two Lemons sliced, and a little yeast. Let it stand for about a day, then put in a cask for two or three months, then draw off into bottles." Perhaps someone else will be kind enough to give the other receipt that has been asked for Horehound beer.

— IN reply to "S. E." Mr. Peach recommends the following method of preparing WHITEWASH FOR GLASS—"The whiting should be mixed with old milk instead of water, and have a third part of fresh slaked lime mixed with it, and to every gallon add one pint of strong paste or starch. If this mixture is put on in a dry day, especially if there is a little sun to harden it, it will stand much wet weather and frost before it is washed off. The quantity of whiting used must depend on the amount of shade which is required and the size of the glass in the house." Another correspondent states that—"If 'S. E.' mixes some boiled glue with whiting it will withstand several months of rain and frost, and can easily be removed by hot water and a flannel."

— THE COLLECTION OF POTATOES GROWN AT CHISWICK this year was examined by the Fruit and Vegetable Committee on August 19th, P. Crowley, Esq., in the chair; the following varieties being highly approved for cropping qualities and handsome appearance—*Lye's Prolific*, *Garnett's Seedling*, *The Druid*, No. 1 (Fenn), No. 3 (Fenn), *Avalanche*, *Alderman*, No. 6 (Fenn), *Surrey Gatepost*, *Beauty of Kent*, *Farren's No. 1*, *Foster's Seedling*, *Standard* (Fenn), *Lord Mayor*, *American Seedling*, *Bedfont Prolific*, *Matchless*, *White Emperor*, *Criterion*, *Manhattan*, No. 5 (Fenn), *Mr. Bresee*, *Alpha*, *Triumph*; No. 30, *Rand's Seedling* (Bliss). On being submitted to the test of cooking the following were awarded first-class certificates—*Garnett's Seedling*, a large flat white kidney; *Standard* (Fenn), a medium-sized round white; *Lord Mayor* (Dean), a very handsome rough-skinned white; *Foster's Seedling*, a large white round rough; *No. 5* (Fenn), a large, very handsome, pale red kidney, resembling *Mr. Bresee*, remarkably fine in quality; and *Matchless* (Bliss), a half round, very handsome, pale pink American variety.

— WE are informed that the following GARDENING APPOINTMENTS have been recently made—Mr. Joseph Turner, late foreman at Poulett Lodge, Twickenham, has been appointed gardener to R. H. Coombe, Esq., Pierrepoint, Farnham, Surrey; and Mr. Thomas Gardiner takes charge of the gardens of P. B. Davis Cooke, Esq., Owston Park, Doncaster.

#### DENDROBIUM SPLENDIDISSIMUM.

HYBRID Orchids are now by no means scarce, although confined to a few genera, and many beautiful forms have been added to our collections within the last ten years, not a few having originated in Messrs. Veitch's nursery. One of the best of these that appears destined to obtain a high position in the esteem of Orchid growers is *Dendrobium splendidissimum*, of the habit and flowers of which the woodcut (fig. 34, p. 203) gives a faithful representation. Though evidently the result of a cross between two species, the exact parentage is not certainly known. *D. heterocarpum* is certainly one, being the seed-bearing plant, but whether *D. nobile*

or *D. macrophyllum* was the other cannot be determined, as both crosses were made about the same time. The probability is, however, in favour of the *D. macrophyllum* parentage, as will readily be perceived on careful examination of the plant when flowering.

The habit of the plant is compact, and it flowers very freely, being remarkably handsome when in its best condition. The sepals and petals are creamy white tipped with purple, the lip being pale yellow, and the centre an intensely rich crimson hue. The contrast between the light and dark shades of colour is most pleasing, and renders the plant remarkably attractive.

Some plants in the Chelsea Nursery were extremely handsome early in the present season, and one of these is portrayed in the engraving. It was growing in one of the shallow pans that have been so frequently mentioned, and with others was thriving grandly in one of the warm compartments of the Orchid range.

#### CRYSTAL PALACE FRUIT SHOW.

ON Monday and Tuesday last the annual Fruit Show was held at Sydenham, proving satisfactory and successful in the number of exhibits and the quality of the fruit shown. Black Grapes and Peaches were admirably represented, some fruits of the latter being of great size and beautifully ripened.

The chief interest, however, usually centres in the collections, and these were very creditable to their exhibitors. Mr. Goodacre, gardener to Earl Harrington, Elvaston Castle, Derby, won chief honours for twelve dishes with Muscat of Alexandria and Black Hamburg Grapes, good bunches of each, especially the latter, which were remarkably well coloured. *Violette Hâtive* Nectarines, Moorpark Apricots, and a Luscious-and-Melting Melon were, with handsome Smooth Cayenne and Queen Pines, the chief features in the collection. Mr. Roberts, gardener to the Baroness Rothschild, Gunnersbury, Acton, was a good second, his Queen and Smooth Cayenne Pines, Golden Perfection Melon, and Downton Nectarines being very fine. Mr. Mann, gardener to Mrs. R. Hornsby, St. Vincent's, Grantham, held the third position with well-grown examples of *Violette Hâtive* Nectarine, Royal George Peaches, and a Smooth Cayenne Pine among others. The best collection of eight dishes was contributed by Mr. Ocle, gardener to the Marchioness of Lothian, Blickling Hall, Norfolk, who was followed by Mr. G. T. Miles, Wycombe Abbey Gardens, and Mr. C. J. Goldsmith, Sandhills, Bletchingley.

The most important Grape class was that for ten kinds, and Mr. Goodacre was again the successful competitor with good bunches of Foster's Seedling, Madresfield Court, and Black Alicante, and fair examples of Venn's Muscat, Canon Hall Muscat, Muscat of Alexandria, Lady Downe's, Gros Colman, Golden Queen, and Black Hamburg. Messrs. Lane & Son, Berkhamstead, also had a fine collection, very close in merit to the preceding. Classes were also provided for Black Hamburg, Muscat of Alexandria, Gros Colman, Madresfield Court, and Alicante, in most of which the competition was keen and the fruit of good quality. The most numerous entries were, however, in the class for five kinds, two bunches of each, ten collections being staged. Mr. W. Nash, gardener to the Duke of Beaufort, Badminton, Chippenham, was adjudged chief honours for well-ripened bunches of good size of the following varieties—Muscat of Alexandria, Black Hamburg, Black Alicante, Muscat Hamburg, and Lady Downe's. Mr. Miles was second, having fine bunches of Gros Maroc and Trebbiano; Mr. Woodbridge, gardener to the Duke of Northumberland, Syon House, being third with Golden Champi, Madresfield Court, Alwick Seedling, Foster's Seedling, and Muscat of Alexandria of fair quality.

Peaches and Nectarines were extremely fine in the classes for three dishes of distinct kinds. Mr. Goodacre's Noblesse, Royal George, and Bellegarde Peaches, Elruge, Pitmaston Orange, and Lord Napier Nectarines, were grand in size and colour. Melons, Plums, and Pine Apples, were also numerous, especially the two former, the quality being quite up to the average.

Cut flowers, bouquets, and table decorations were well represented, some very tasteful arrangements being contributed in the last-named class.

#### SCHIZANTHUSES.

A SHORT time ago a correspondent directed attention to the beauty of these plants when grown in pots for the greenhouse, the plants, if I remember rightly, being raised from seed sown in the spring. Let me advise him and all others to grow some plants in pots from autumn-sown seed, and in early summer of next year they will with good cultivation have something worth looking at. My plants are now an inch high and sturdy. They are in 4-inch pots, about five plants in each pot, in a frame with the Mignonette, the lights being removed whenever the weather is

fine. There they will remain until November, when they will be placed close to the glass in a very light greenhouse. In the spring they will be repotted, and in May and June they will be fine bushes, covered with their gay butterfly-like flowers. Seed may still be sown, sprinkling it thinly in small pots, and thinning the plants out quickly. Overcrowding them in a young state is fatal to success. The pots should be plunged in ashes and receive the same treatment as Mignonette, than which, however, they are much easier to manage, and equally certain to be admired when they are in good condition and flowering freely. The varieties I grow are *S. retusus* and *S. papilionaceus*, both of which are extremely gay and very beautiful. If kept sturdy the plants do not need stopping, as generously grown they branch naturally.—J. D.

#### PLANTING HOLLIES AND RHODODENDRONS IN AUGUST.

MR. BARDNEY has stated that the month of August is the best time of the whole year for removing Hollies, for he says that "when large specimens have to be replanted there can be no doubt that the present month is preferable." From many years' experience in lifting trees and shrubs, I am far from being prejudiced against any month of the year provided climatical influences are favourable, and should not be afraid at any time or season to transplant evergreen shrubs that had been previously prepared, as by judicious attention with the waterpot, &c., in dry weather, sufficient assistance can be given until new rootlets are formed, except when piercing east or north-east winds are blowing for days or sometimes weeks together, and this frequently happens during March; then watering is very little use, as the winds dry up the sap after the manner of a fire.

My object in writing is not so much to advocate any particular season for replanting, as that too frequently has to be regulated by circumstances, but to call attention to the great assistance rendered to large specimens by digging a trench around them and preparing them beforehand for the trial they are about to undergo, as well as to illustrate as clearly as I am able the difference between specimens purchased from well-managed nurseries and those growing in the ordinary manner in gardens. The latter have possibly been left undisturbed for several years, the roots being sometimes intermixed with those of Elms and other deciduous forest trees. In such a case there is great risk in removing large specimens and transplanting them without any former preparation, whether it be August or any other month. In well-established nursery grounds where specimens of all kinds are being constantly sold and kept for sale, each shrub is dug around at least once in every two years and some rich light soil placed around the damaged roots, into which new white rootlets readily penetrate, so that in a little time there is a mass of small feeders which can be secured with sufficient soil to form a compact firm ball, and in this manner trees and shrubs are frequently removed long distances and transplanted.

It is frequently the case that in laying out new gardens, especially of limited extent, the shrubs, through too close or injudicious planting, in a few years form a crowded mass, or it may be that some valuable variety has been planted too close to a walk—a point to be always avoided—and requires removing. In cases of this kind, and they are numerous, I strongly advise that soon after their first growths have become tolerably firm a trench be dug around the shrubs, completely severing the roots both around and underneath, and filling in the trench with leaf soil or other light material. This will check any further growth, and in time they can be lifted even in the poorest of situations with good balls without scarcely any risk compared with specimens that are lifted under the same without preparation.

Localities and circumstances must, however, always be considered in connection with this work. I am writing from experience gained on poor sandy and gravelly soil in Surrey. Mr. Bardney may have the benefit of better soil. But even in this poor soil it is surprising how shrubs will grow when the ground has been deeply broken up, mixing the better soil with the poorer. Rainfall, too, exerts a great influence on the work in question. In this locality the average yearly rainfall during the past ten years has only been 23 inches. Possibly with Mr. Bardney at Liverpool it has been twice that amount; if so, the extra rain will have been of great benefit to his early removals.

I thoroughly endorse all that your correspondent has said in favour of *Ilex Hodginsii*. This variety has the grandest foliage of all Hollies. I would also advocate the planting of weeping Hollies as single specimens. There is a variegated kind called Perry's Weeping, and a green variety somewhat similar to the common form, both of which are admirably adapted for single specimens.

On the subject of Rhododendrons I must differ from Mr. Bardney. October I consider is the best month of the year for lifting and transplanting them, as in most localities in August the flower buds are not developed. Rhododendrons are well adapted for lifting. I have seen them lifted with balls as large as three or four men could lift, but it would be impossible to carry them far with such masses of soil attached; therefore the paring and shaving they often receive to render them portable would be detrimental to their young growths if the lifting were done in August and the weather subsequently set in hot and dry, which is frequently the case during September and October. The year of 1881 possibly may be an exception to this, as the spring and summer months have mostly been very dry and hot.

Rhododendrons make their new growths after the blooming period at the end of May or during June, but this year we have but very little growth owing to the drought, and they require time to develop their bloom buds before being lifted.—J. W. MOORMAN.

#### LOBELIAS FOR THE CONSERVATORY.

I MADE a great "hit" last year with these plants in the easiest possible manner, and I intend trying the simple plan again. Early in September I cut the flowers of a number of rather small plants in the border with the object of securing some healthy cuttings. I did secure them. In October the plants were so tempting by their fresh healthy growths that I took up three dozen of them and potted them in small 48-size pots. These plants were placed in a well-sheltered brick pit, and there they remained all the winter, at one time being covered up with straw and snow for a month. Only six of these plants died, and six others were injured, twenty-four of them being in fine condition in the spring. When they had fairly commenced growth they were shifted into 7-inch pots, and in the months of May and June they were masses of flowers 18 inches in diameter, and, as placed at intervals round the margin of the conservatory, had a most pleasing appearance and were admired by all who saw them. The varieties were *pumila* *magnifica* and *Paxtoni*. They were stood in saucers of water and were well supplied with liquid manure. The result was so satisfactory, and the means employed so simple, that I mention the circumstance, as the record may be useful to others.—EXPERIENTIA DOCET.

#### HYDRANGEA PANICULATA GRANDIFLORA.

Is this grand hardy shrub as extensively cultivated as it ought to be? It is certainly one of the most valuable additions that have been made to our shrubberies of recent years. Its huge heads of flowers are at the present time most imposing, and arrest the attention of all who see them. Its hardiness, too, has been proved during the last two winters, which it has passed through unscathed in the southern counties; but in a garden in a cold district in the north it was injured, and as it looked rather unsightly was cut down by the gardener under the impression that he would secure stronger growth from the base. He has secured such growth, and also, what he did not expect, grander heads than the plant ever produced before. This he regards as a lesson, and he is so convinced of its value that he intends cutting the plant down again, as he is convinced this is the best method of managing it, or, in other words, growing it as an herbaceous plant.

There are now many plants of this distinct and fine *Hydrangea* grown in different gardens, and it would be well if some of them could be cut down by way of experiment. There can be little to lose and may be much to gain, for certainly the heads of flowers alluded to are extraordinarily fine. Grown on the cutting-down system, and in richer soil than is usually found in shrubbery borders, it is fair to suppose that the heads would be still larger, and large beds of this plant with a background of shrubs would form a striking feature at this period of the year in any garden.

Those who have not yet planted this *Hydrangea* in their shrubbery borders can scarcely err by obtaining it, as it is undoubtedly one of the most effective summer-flowering shrubs in cultivation.—A TRAVELLER.

**SINGLE DAHLIAS.**—The value and beauty of these Dahlias is admirably shown in the Liverpool Botanic Gardens, where they are freely employed in large oblong and oval beds and long narrow ribbon borders. The charmingly graceful *D. glabrata* is especially noteworthy, for, though its flowers are small, they are produced in such large numbers and possess such a soft pleasing mauve tint that they are very attractive. *D. coccinea*, *D. lutea*, and *D. Paragon* are more brightly coloured forms that can be employed with the others to great advantage. The display also proves how admirably these Dahlias are adapted for town gardens,

the gardens referred to being situated in a part of the city where the smoke is a great impediment to growth of many plants and flowers. Those named with the white variety, the Queen, which is now so fine in Mr. Ware's nursery at Tottenham, should be included in all collections.—L.

#### MANCHESTER BEE AND HONEY SHOW.

THIS formed a section of the Great International Exhibition which took place at Old Trafford last week. It appears that the Committee of Management arranged to have no competition in the bee tent, and requested Mr. Pettigrew of Bowdon to provide an attractive and interesting display of bees and honey from his own garden. He consented to do so, believing that an exhibition of this kind would go far to popularise bee-keeping. At Manchester it is believed that monotony is very undesirable in exhibitions of all kinds, and that the element of novelty is necessary to attract the masses of the people. Mr. Pettigrew, on undertaking the work entrusted to him, resolved to make this Show a novel one by introducing a new form of observatory hives, and to exhibit legends on black boards done in honeycomb by bees, and sets of icicles of honeycomb under glass shades. The state of his health prevented him from doing all he intended and desired to do. The icicles were not done. However, the Exhibition was evidently a great success. The honey tent was crowded with visitors every day, and no one could enter it without hearing expressions of wonder and gratification from all classes of visitors. Amongst the exhibits on the tables were eleven glasses of elegant shape with lids, well filled. Their weight ticketed on them ranged between 16 and 21 lbs. each. They appeared to be model supers, very pleasing to the eye; a few smaller glass supers seen at one corner of the table were well filled. There were three straw supers, one marked 30 lbs., and two 10 lbs. each, not quite finished, and two wood supers 12 lbs. each. A stock hive with one of these supers half filled with combs and bees. A stock hive with a large super on it, half filled with white combs and black bees, stood at the far end of the tent to attract attention and draw the people away from more interesting exhibits placed nearer the door.

The observatory hives, four in number, were of cheap and simple construction, with bees and glass on one side only of each super. The queen of each super had a white woolly cotton thread tied round her waist, which enabled the spectators to see her at a glance, and watch her movements as she wandered amongst the community. But the most conspicuous and novel exhibits of the bee tent were two black boards 6 feet 6 inches long, and 2 feet broad, with two legends on them done in honeycomb—viz., "God Save the Queen" and "Industrial Exhibition." The letters being 5 inches long or thereabouts were easily read, and seemed to delight all classes of visitors. Both boards were labelled "Our First Efforts in A B C."

Honey of different kinds and of the highest quality in glass dishes were on the tables, beside bone spoons, for visitors to taste; and honey in glass bottles—4 lbs. in each—was there for sale. The demand for run honey was extraordinary, and all was speedily sold at 1s. 4d. per lb. Three bottles of crude honey were on the tables for the purpose of showing, in the exhibitor's opinion, that honey proper and fit for use on the breakfast table is not found in field or forest, but is made by bees at home from the crude materials found in flowers.

Messrs. Stansfield, who now possess and occupy the nursery at Sale lately in the possession of Mr. Pettigrew, sent a large and beautiful assortment of hardy Ferns, which were placed amongst the bee and honey exhibits, and which contributed largely to the general effect of the whole.

[We propose in our next issue to publish the portrait of Mr. Pettigrew, accompanied with a sketch of his gardening and apian career.—ED.]

#### TRADE CATALOGUES RECEIVED.

- Francis and Arthur Dickson & Sons, 106, Eastgate Street, Chester.—*List of Dutch Flower Roots.*
- Barr & Sugden, 12 and 13, King Street, Covent Garden.—*Catalogue of Bulbs.*
- Strike & Hawkins, 62, High Street, Stockton-on-Tees.—*Catalogue of Bulbs.*
- J. Carter & Co., High Holborn.—*Catalogue of Bulbs (Illustrated).*

E. G. Henderson & Son, Maida Vale, London.—*Catalogue of Bulbs.*  
Thos. S. Ware, Hale Farm, Tottenham, London.—*Catalogue of Bulbs and Hardy Perennials (Illustrated).*  
George Templeton, Prestwick, N.B.—*Catalogue of Selected Roses.*  
Edmund Philip Dixon, Hull.—*Catalogue of Bulbs.*  
Osborn & Sons, Fulham.—*Catalogue of Bulbs.*

\* \* \* All correspondence should be directed either to "The Editor" or to "The Publisher." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

**Early Nectarine** (*H. A. R.*).—Lord Napier is the earliest variety in cultivation; the fruit is also very fine and of excellent quality. It will be suitable for both the objects you have in view. One of the best of the older Nectarines for forcing is the Elruge; but if you only want one variety, and that the earliest, choose the former, and order your trees early, good examples not being easy to obtain late in the season.

**Brood of Caterpillars** (*W. Thomas*).—Those received are examples of the common species, *Pyraea bucephala*, also called the buff-tip moth; about a fourth of the size they would reach at maturity. Though very partial to Elm and Lime, they are often discovered on various fruit trees, and they appear indeed to be rather promiscuous feeders. The conspicuous moths may be detected laying their eggs in July.

**Reine Marie Henriette Rose** (*W. R. G.*).—We have no doubt this Rose will succeed out of doors in your district, assuming the soil and aspect are suitable. The only doubt we have of the position you name being suitable is that it may be too hot and dry, and in all probability the plant would grow more freely in a cooler aspect.

**The Phylloxera** (*Philodendron*).—The insect attacks the roots and leaves of the Vine and not the bark in the manner you suppose. You will find illustrations of a leaf and roots when attacked by this pest in our issue of August 19th, 1880, also notes on the history of the insect. If you do not possess this number it can be had in return for 3½d. in postage stamps sent to the publisher.

**Prize Gooseberries** (*C. Freeman*).—We are unable to give you the information you seek; but if you write to Mr. Charles Leicester, nurseryman, Macclesfield, and enclose a stamped directed envelope for a reply, he will no doubt be able to answer your inquiry.

**Report of Show** (*H. E. Monk*).—We have waited some time before noticing your letter in case the report to which you allude came to hand. We have not received anything from you in addition to the letter which is referred to in another column.

**Select Greenhouse Adiantums** (*O. O.*).—In addition to those you name you might grow the following—*A. affine*, *A. conicum latum* (in a warm corner), *A. hispidulum*, *A. reniforme*, *A. pubescens*, and any varieties of *A. Capillus-Veneris*. *Adiantum cardiolobum* is a stove Fern, and is described in the "Synopsis Filicum" of Hooker and Baker under the name of *A. polyphyllum*, a native of South America. It was introduced nearly twenty years ago.

**Pruning Budded Briars** (*F. B.*).—The Briar growths in which the buds are inserted are best left unshortened until the spring. If they are shortened now the buds often start into growth, and as that growth cannot be firm and matured before winter it is in extreme danger of being killed by the frost. It is better for the Rose buds to remain dormant through the winter, when they produce strong growths in the spring, and often afford fine exhibition blooms.

**Strawberries and Vines** (*A. Sankey*).—It is impossible for us to recommend dealers in plants or garden appliances of any kind, as if we were to advise you to apply to any particular nurseryman we should cast an unmerited slight on twenty others who could supply you as well, and this, as you will perceive, would be obviously unfair. Write to any of those nurserymen who advertise in our columns, and if they do not possess every variety you want they will probably obtain it for you. All nurserymen of standing keep true stocks of Vines and Strawberries, otherwise they would soon lose their reputation.

**Polyanthuses** (*P. A.*).—We are not aware that a cross similar to the one you name has been effected, at least we have not seen any plants that have indicated the parentage of such an alliance. We would not, however, say such a cross is impossible, as we remember a saying of a celebrated statesman that "nothing is so certain as the unexpected." Certainly take care of the plants and hope for the best, but do not be disappointed if they do not equal your expectations.

**Sawdust for Rhododendrons** (*A. B., Perthshire*).—The article to which you refer may be found on page 446, the issue of June 2nd of the present year; but it was subsequently stated on page 495 that "when Mr. Cuthbert Johnson made his Rhododendron bed he used fresh sawdust mixed in equal proportions with common garden soil, and to this he added a good dressing of bone superphosphate, but we are unable to state in what proportions."

**Arranging Pipes** (*Eighteen-years Subscriber*).—Your proposed mode of arrangement will certainly impede the circulation; indeed if the dip is not well above the return opening in the boiler, say 18 inches, you will have no circulation at all, and even then if you have to fire very hard the water may be forced out of the supply cistern. It is always undesirable to have sudden dips in flow pipes, and they should not be adopted except on the advice of a competent hot-water engineer who has examined the apparatus and the whole of the connections.

**Seedling Petunia** (*J. Ribbons*).—In consequence of the flowers having been placed in the box loosely—that is, without any packing to render it firm

and immovable, it had been so shaken in transit that the outer petals by coming in contact with the sides of the box were quite crushed and spoiled. So far as we can see the flower appears to be very compact, the colours good, and the edges of the petals frilled to a rather unusual extent. Judging by the much-injured flower before us, we think the variety is a promising one and worthy of preservation. The value of Petunias, however, depends greatly on the habits of the plants and their free-flowering character.

**Vines in Stove** (*J. E., Leves*).—By all means retain the Vine, the growth of which will enter a cooler house. It may start a little earlier on account of its stem being in the stove, but not, we think, so early as to prevent your maintaining the growth. We presume you will not permit any growths to extend from that portion of the stem in the warm compartment of the structure. If the Vine does not answer your expectations you can remove it afterwards, but we should certainly give it a trial. A saddle boiler 2 feet long will be large enough for heating the pipes you name, or a conical boiler of the same height, to be fed with coke, would answer the same purpose; the question is simply one of fuel.

**Keeping Grapes** (*S. F.*).—When Grapes are kept in water a good portion of the bunch-bearing laterals are severed from the Vine and the ends inserted in bottles of water, such as ordinary wine bottles, a little charcoal being placed in each bottle to keep the water pure. The bottles are fixed in a slanting position in a fruit room or other suitable place, so that the Grapes hang clear of them, and a steady temperature is maintained between 40° and 45°. The room in which they are placed should be kept dark or nearly so, much light being disadvantageous to the keeping of the fruit.

**Dahlia Blooms Imperfect** (*Reader*).—Early blooms often come faulty, and they should be removed. Some varieties are also more liable than others to produce imperfect flowers, yet by selecting round and smooth buds good flowers can generally be secured. Superfluous growths should be removed from the plants, and also a portion of the flower buds from the growths remaining, and then by supplying the plants with liquid manure if they need it you may expect some good flowers if you have good varieties. Soil that will grow Chrysanthemums well will also grow Sparmannias, and soil that will grow Fuchsias will be suitable for Eupatoriums.

**Grapes**.—A correspondent has sent us some Grapes placed so loosely in a tin box that they arrived completely crushed, and the juice from them had converted the letter accompanying them into its original pulp. They were white Grapes, and this is all we can say about them. Unless ripe fruit and flowers are packed so as to be immovable whilst travelling, they never arrive in anything like the condition they were when sent off, and the senders necessarily fail in their object. (*R. O., Aberdeen*).—The Grapes sent were far from being ripe, and it is impossible to name them with certainty in their present condition. Further, it is desirable that a fair sample of the foliage accompany the fruit for the purpose of identification. The white Grape appears to be a Muscat, and the other resembles Madresfield Court in appearance, but the fruit being quite sour deprives us of an important test in determining the name with accuracy.

**Hardy Azaleas** (*R. C. D.*).—We have seen hardy Azaleas flourishing admirably in soil that did not contain any peat. Unless the soil of your garden contains much lime, or is thin with a dry rocky subsoil, we have no doubt the plants will flourish if you add liberally leaf soil or vegetable matter of any kind, including cocoa-nut fibre refuse or sawdust. If the soil is heavy you cannot add too much vegetable matter, and it will be well also to mulch the surface with material of the same nature or much-decayed manure, and the roots must not be injured by digging among the plants. The mulching is particularly essential during the summer, and in addition to it copious supplies of water in dry weather will be very advantageous; the roots of those plants being very fine, almost hair-like, soon suffer by a deficiency of moisture.

**Peach Tree Unsatisfactory** (*W. T.*).—Without having more particulars of the condition of your tree it is difficult to answer your letter satisfactorily. The falling of the fruit may result from various causes—namely, overcrowded growth in summer, and consequently immature wood, red spider extracting the juices of the tree, too dry soil, or too close an atmosphere. If you are certain that the management has been correct in all these respects we advise you to lift the roots and place them in fresh loam. The lifting may be done as soon as the buds are prominent, syringing the foliage and shading it slightly if needful to maintain its freshness for inducing fresh roots at once. Some people we know have advised that Peach trees cannot be safely lifted until the foliage has fallen, but this only indicates that they have not had experience in the matter. We shall shortly publish notes on the culture of greenhouse Rhododendrons that will be of service to you.

**Vines in Pasture** (*J. B.*).—We are pleased to learn that you have profited so well by our instructions. We have numbers of correspondents from whom we receive similarly gratifying testimony of the utility of our pages. We have seen excellent crops of Grapes when the roots of the Vines have been turfed over, the soil of course having been suitable. Trench the soil, but not so deeply as to bring up much of the sour subsoil, and add bones and wood ashes liberally, also drain the site if it is wet. If you could leave the soil exposed for a week or two and turned up as roughly as possible it would be an advantage. Take the turves off as thick as possible and make the soil firm, or the animals will injure the roots. You can give copious supplies of liquid manure in the summer. The method you propose is an experiment, yet one well worth trying, and we shall be glad to learn the results of it.

**Names of Fruits** (*Ramallo*).—The variations in character of the specimens you have sent are so great that it is not surprising different names have been given when individual specimens have been submitted for identification. Not one of those before us is identical in all respects with Early Margaret, yet they show more of the characters of that Apple than any other. Soils and positions exert a great influence on fruit. We think it is the variety we have named, and had the colour been deeper we should have had no doubt about it. (*Sussex*).—It is the Amire Joannet, and is known in Sussex and some other counties as the Harvest Pear.

**Names of Plants** (*Mac*).—The Hieracium to which you allude is certainly *H. boreale*, and the one in flower appears to be *H. sylvaticum*. The other two plants are *Atriplex patula* and *Chenopodium album*. (*A. H. T.*).—The shrub appears to be a *Staphylea*, possibly *S. pinnata*. (*Winchester*).—If you send us a specimen securely packed in a small box we will endeavour to name your plant; the leaf and flowers simply enclosed in a letter were crushed beyond identification. (*J. G.*).—A small flower of *Pancreatium fragrans*. (*St. Asaph*).—1, *Arcaea lutescens*; 2, *Nephrolepis pectinata*; 3, *Davallia elegans dissecta*; 4, a variety of *Gymnogramma chrysophylla*. (*W. H. L.*).—If your plant is a perennial it is *Linaria purpurea*, but if an annual *Linaria hybrida*; 2, *Lycium barbarum*, Willow-leaved Box Thorn, a valuable plant for covering naked walls,

arbours, &c., making shoots 5 or 6 feet long in a season. Cuttings strike freely at any time of the year. 3, *Rubus odoratus*, Flowering Bramble or Barren Raspberry, a very suitable shrub for planting in backgrounds and woods, flowering freely in late summer, but seldom indeed producing fruit, hence one of the English names. (*Anxious*).—*Physalis Alkekengi*. (*Young Gardener*).—*Bartsia odontites*. (*Reader*).—*Limnanthes grandiflorus*, a hardy annual, suitable for sowing at the present time for flowering in the spring. (*G. P.*).—*Hedychium Gardnerianum*.

*POULTRY AND PIGEON CHRONICLE.*

THE ROYAL COMMISSION ON AGRICULTURE.

(Continued from page 190.)

AS we have taken up this subject with the view of advising the home farmer by the evidence of eminent and practical men as given in the report of this Commission, as well as from other sources, we shall continue to refer to those practices and systems of cropping and stocking which are most likely to yield a good profit, and to notice also what changes can be made with advantage in many of the ordinary operations in agriculture.

In the future, and under the effect of low prices for corn upon the hill farms in some cases, where railway stations are near, and towns contiguous, instead of merely depending upon breeding flocks of sheep and the growth of cereals, &c., as formerly, it will be advisable to crop the land to some extent with vegetable produce, such as Cabbage of different sorts, so as to maintain a constant supply to be used as food for stock or be sold as food for the people. Potatoes also may be largely grown with advantage, because on the dry hill land they are not likely to suffer from disease, and especially when they are produced by artificial manures only, and using only tubers for seed of the latest propagated sorts which are known to have hitherto avoided the disease, especially the seed which is obtained from Scotland or the northern counties of England; they will then be almost certain to turn out profitably, except in the recurrence of seasons like 1879. The land will then be well prepared for Barley, which crop, together with the Clover also in succession, will both succeed better than after roots fed off by sheep, and if the Clover succeeds well it is the very best preparation for the following Wheat crop.

We must again ask the home farmer to consider that he is not in the position of a tenant farmer, who is frequently clogged with unreasonable restrictions of a lease; therefore he has every opportunity to avail himself of any specialities both in stocking and cropping, for on such farms in the future sheep will still be kept, but probably in less numbers. They may then be all bred and fattened upon the farm, instead of being kept as breeding animals in only stock condition. Stocks of the purest breeds, whether of Downs or Longwools, may be kept for the rearing of rams for sale, a matter when conducted with care and intelligence frequently proves highly advantageous; when, however, the animals are bred only for sale at the fairs we suggest that cross-bred animals are sure to attract customers, it being known that all the Down breeds bring an increased number of lambs when crossed with either the horned or long-woolled stock. Some of these farms contain strong soils in the vales and also irrigated meadows, in which case Shorthorn or other well-bred cattle may be reared and kept with advantage, both for milking and fattening purposes.

We will now call attention to what may be done on the vale farms in various counties as shown in evidence before the Commission, in order to meet the difficulties arising from agricultural

depression. These farms usually consist of mixed soils, such as strong loams, also sandy and gravelly land. In the enclosed districts these farms are generally found to vary in size from 100 to 300 acres, and when situated within a reasonable distance of towns or railway stations must in the future, if profitably conducted, be expected to undergo great changes in the mode of cropping. Although many of them have been proved capable of yielding valuable crops of grain, pulse, roots, &c., yet changes to some extent will be necessary, for we find that other productions besides Mangold and Swedes will be grown as a substitute, especially some of those usually cultivated by the market gardener, and which may often be sold as food for man instead of cattle. These consist principally—subject, however, to any local demand—of Potatoes, Cabbages of sorts, Broccoli, Carrots, Parsnips, Turnips, and Onions. Nor do we find that it is necessary, as is often supposed by the market gardeners, to use large quantities of town or stable manure. If the land contains a sufficiency of chalk or lime the artificial fertilisers, such as guano, nitrate of soda, bone dust, superphosphate, &c., are sure to answer, for we know when genuine that these contain all the elements of first-class manure without the bulk and costly carriage of town or stable dung. We know of instances in which both Cabbages and Broccoli have been frequently sold into the towns at a considerable distance for delivery which paid over £20 per acre above all expenses, and grown entirely in ordinary field culture and by artificial manure only; besides which the stumps of Broccoli have been passed through Gardner's Turnip-cutter, and being mixed with meal have been given to fattening bullocks, which have improved upon them equally well as they had previously done upon root crops. The crops of vegetables best adapted for growth on the farm according to soil and climate are Potatoes, Cabbages, red Carrots, Parsnips, and Broccoli. All of these can be eaten by cattle if the price of either should be too low for selling off the farm. The great and important point seems to be to have some of these always ready when the necessities of the people require them. Early Broccoli sold very high up to Christmas last year; late sorts were, however, much injured by the severe frost and snow, still this fact served to raise the value of late Savoy Cabbages.

The cultivation of fruit may with great advantage be extended in certain districts, especially after the question of extraordinary tithe charges are arranged, more particularly Strawberries, Raspberries, Currants, and Gooseberries. There need be no limit to their growth, in consequence of the demand from jam factories in London, Liverpool, Manchester, Glasgow, and other large towns. Some of these factories make 15 tons daily, and it is calculated that at least 400 tons are made daily throughout the fruit season, including all parts of the kingdom. The Board of Trade returns show that the raw fruit imported into this country in 1876 amounted to 9,372,779 bushels, valued at £1,218,625. Why should we not grow, as far as our climate will allow us, a large portion of the fruits required in the future?

WORK ON THE HOME FARM.

*Horse Labour.*—This will at all intervals of fine weather, when the straw of the corn is dry, be employed in the draught of the reaping or mowing machine. Whether the crop is tied at the time of cutting or not, carting may proceed simultaneously to the stack, barns, or threshing machine advantageously if the straw is dry and free from green Clover or weeds. When the horses cannot be employed in harvest work, yard or town dung may be drawn out for Wheat on to the Clover or Saintfoin leas to be spread immediately, in order that successive rains may settle the dung close to the land, and that the richness of the manure may be washed into the ground with regularity; besides this, when the land comes to be ploughed and pressed the dung is buried under the furrow more easily and effectually. Land also after green crops or Peas intended for Wheat may now be ploughed and worked down in order to vegetate weed seeds, and thus destroy them when ridge-ploughing. If, however, the soil is foul with couch the land should either be rafter-ploughed or only clean-ploughed 3 inches deep, so that when the scarifier is set to work crossways it may move all the ground and comb out the couch grass and weeds. If the land is light and dry Howard's self-lifting drag will do the work as well or better than Coleman's scarifier, and certainly with much less horse power. Whenever the land is dry enough horse-hoeing the Turnips must be done, and if too thick in the lines the hoc may be run across the rows if the hand-hoers cannot be obtained or busy with other work. A great breadth of land seeded to Clover and grasses has unfortunately failed in plant owing to the extreme drought which prevailed in the spring and summer months. It is well, therefore, to sow Trifolium and Italian Rye Grass seed wherever vacancies occur, and be harrowed in with several tines of the iron harrows, but finishing off by using the heavy roller. The early and late winter Vetches may now be both sown before the seeding of Wheat and the tillage preparation requisite is commenced. Stubble Turnips may still be sown, for although they will not give much bulb, yet when the plants are left thick on the land, and

occasionally dragged or harrowed in fine weather, they will make up very useful food in the spring when throwing up a seed stem, and when fed off by sheep eating cake a capital preparation is made for a crop of Mangold, as every portion of roots or stems not consumed serve to manure the land when ploughed under and decayed.

*Manual Labour* will as yet be engaged in harvest operations in nearly every district in the kingdom more or less; at other times it will be required in hoeing late root crops, the women assisting in singling the plants. Dung-spreading and filling manure into carts will also engage some of the men, except in the case of using the new farm implement for spreading the manure at the time of laying out. As this implement is attached to the dung cart the laying-out and spreading is done at one operation. This can be recommended, especially on farms of considerable extent, and in those districts where labour is scarce and dear. This brings us into contact with the labour question, which is one of great significance, and which if we cannot control we must endeavour to utilise as far as possible. We hear great complaints of the quantity and quality of the work done, especially in the southern and eastern parts of the kingdom; and in comparing the amount of wages given in various districts, we find those in the northern counties much higher than in other districts, and probably in the future farmers may discover that it is in consequence of the low wages paid, with but little piecework, that induces the best men to migrate into other districts or go into towns for employment. In the interest of gentlemen having home farms these are serious matters for future consideration, and may well induce them to maintain a sufficiency of cottages on the farm, so that a sufficient number of men and lads may always be available.

## POULTRY AND PIGEONS

### THE POULTRY OF THE FARM.\*

It must be satisfactory to everyone who recognises the value of poultry-keeping as a branch of national industry to know that the Royal Agricultural Society of England is sufficiently alive to its importance to publish a pamphlet on the subject. The author of this pamphlet now before us is the Rev. W. G. Pope, an old fancier of the old English Dorking, and therefore well qualified for his task. Mr. Pope not inaptly prefaces his essay with some remarks upon the peculiarity of the days as regards agriculture in which we live, and observes, "Such a competition is going on between us and the foreigner that all our resources must be looked into carefully, or the weakest will soon go to the wall. Our energies must be employed to prevent the loss of anything either worth keeping or capable of conversion into something useful and valuable; and so the stray corns on a farm and the scraps from a house are to be duly utilised by poultry-keeping." Another point upon which he lightly touches is one which from experience we know to be a really important one—viz., that the poultry yard may be "a school for the youth, wherein he may acquire habits of regularity, or carry on such a cultivation of the eye as may enable it to take in readily the condition, points, and requirements of "the live stock of the farm." Such it has often been to our knowledge, and many a breeder of prize poultry in younger and poorer days has by degrees become a lover and successful cultivator of shorthorns and other pedigree stock. In coming to the more practical part of his subject—viz., advice as to the selection of a breed, Mr. Pope divides the possible requirements into four headings: 1, Eggs; 2, Chickens; 3, Chickens and Eggs; 4, Appearance.

1, He properly dismisses "mongrels" as unsatisfactory. For the production of eggs he recommends Minorcas, Blue Andalusians, Leghorns, and Hamburgs. We quite endorse his recommendations, though there is nothing novel in them, for they are those of every good poultry book. 2, For the production of chickens, Dorkings pure or Dorkings crossed with either Game or Brahmas are recommended. We have repeatedly in these pages suggested the same crosses. Mr. Pope is well known as a stickler for the white foot in the Dorking, and naturally insists upon it here. 3, For the production of both eggs and chickens the Brahma-Dorking cross is suggested, and pure Plymouth Rocks. 4, "On the point of appearance" Mr. Pope justly observes, "I will only say that it is a pity to sacrifice our best table varieties, whilst so many beautiful breeds afford a chance of indulging the fancy." "Having decided on our breed of fowls, we put ourselves in the hands of some breeder of good repute, from whom we obtain at a moderate price well-bred, but not exhibition birds, likely, however, to breed really good chickens."

\* *The Poultry of the Farm.* By the Rev. W. G. POPE, Godmanstone Rectory, Dorchester. London: Royal Agricultural Society of England. 1881.
