A RECORD OF THE FUNGI NAMED BY J. B. ELLIS

PART I

Edith K. Cash

Special Publication
Number 2: Part 1

June 15, 1952.

During his long career, the American mycologist J. B. Ellis (1829-1905) described a large number of fungi, chiefly from North America, in widely varied groups, Basidiomycetes, Ascomycetes, and Fungi Imperfecti. While many of these names were published in well known and readily available journals, citations to other species, particularly those which occur in articles by other authors, are difficult to locate. The present list of references represents an effort to accumulate as complete a list of Ellis names of fungi as possible and is issued in the hope that it may prove useful to mycologists interested in the fungi which he described, particularly since his species include a most important segment of the fungi of this country involved as causal agents of plant diseases and otherwise of economic significance.

In addition to the validly published names, the nomina nuda and unpublished herbarium names that have come to the attention of the compiler are included. No doubt additional unpublished names given by Ellis exist in many other herbaria. Names are listed in alphabetical order, the citation to the original publication being followed by additional references found in the writings of Ellis and to the exsiccata specimens which he issued. The more important synonymy is added, indicating the subsequent disposition of the species by later authors. In instances where Ellis recombined a species in a different genus or under one or more different names, references are grouped under one name, usually the last one which Ellis used, with cross references to the others. No attempt has been made to revise the host nomenclature, which

is as given in the original publication except for the addition of scientific names in parentheses where common names are given in the original. A bibliography will be appended at the conclusion of the list.

Grateful acknowledgment is made to the staffs of the Farlow Herbarium where records from the Seymour index cards were consulted for completing and verifying references, and of the New York Botanical Garden for supplying a copy of the specific index to Ellis' exsiccati compiled at the Garden and for other data. Records of unpublished herbarium names from Washington State College were obtained through the kindness of Dr. Wm. Bridge Cooke.
