THE
JOURNAL OF HORTICULTURE,
COTTAGE GARDENER,
AND
HOME FARMER.

A CHRONICLE OF COUNTRY PURSUITS AND COUNTRY LIFE, INCLUDING POULTRY, PIGEON,
AND BEE-KEEPING.

CONDUCTED BY
ROBERT HOGG, LL.D., F.L.S.

Established

in 1848.

VOLUME VII. THIRD SERIES.

JULY TO DECEMBER, 1883.

LONDON
PUBLISHED FOR THE PROPRIETOR 171, FLEET STREET.

1884.

JOURNAL OF HORTICULTURE

1877

1877

LONDON:

PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE

171, FLEET STREET.

TO OUR READERS.

AGAIN it is our pleasure to convey our thanks—not merely as a stereotyped form of politeness to all who have aided us in the completion of our last volume, but in a very warm and earnest manner for the valuable communications that have enriched its pages.

Also we take this opportunity of acknowledging the many pleasant greetings of which we have been the recipients during the past fortnight, and to assure all our correspondents that their good wishes are appreciated and reciprocated.

A pleasant feature of the volume to which the accompanying Index refers is the active interest that is manifested in the future of horticulture by young men who are preparing themselves to become worthy representatives of the craft in which they are engaged.

Never during any similar period of time have we received so many letters from under gardeners—some conveying and others seeking information. We rejoice that such is the case, and we are still more glad to record that not a few of them indicate that there is good promise for the future of gardening and garden literature.

Our advice to all young men is, Strive to excel the skilful teachers of the present and the past; and our hope is that the old and experienced will cheerfully assist the young and deserving.

Amateurs continue working as busily and writing as instructively as ever. One of them sends us Apples far excelling any that were sent from the same county to the Apple Congress, and observes: “Entirely on information derived from the Journal have they been grown, and I take this opportunity of again expressing my obligations to it as an impartial encourager of honest effort, and as a scientific exponent of horticulture of the highest class. This is not for publication, except it can be of service as showing what can be done in small space with feeble health and no resident gardener.”

To aid such shall be our steady endeavour, and such results and letters as this from a country vicarage enable us to look into the past thankfully and to the future hopefully, cheerfully, confidently. May it be prosperous to all.

INDEX.

—0—

- ABUTILONS FOR WINTER**, 60; vitifolium, 51; for decoration, 194
- Acaëla grandis**, 223
- Achillea serrata**, 186
- Achimenes**, culture of, 82; good varieties of, 115
- Aconitum japonicum**, 239
- Actæa spicata fructu-rubra** (certificated), 77
- Adiantum tetraphyllum gracile**, 186; Weigandi, 324
- Alderminster**, Mr. Williams' garden at, 357
- Alecost** and its uses, 172
- Alicante Grapes** shanking, 240
- Allamandas**, culture of, 82, 453; starting, 519
- Alpine plants**, notes on, 224
- Amaryllis vittata** var. *Clovis*, 26; *Belladonna*, 356; culture of, 409
- American Blackberries**, 45
- American Vines and the phylloxera**, 313
- American Walnut**, 366
- American blight and scale**, destroying with oil, 526
- Amsterdam Exhibition**, lawns at, 137
- Anagallis tenella**, 267
- Anaphalis triplinervia**, 259
- Androsace lanuginosa**, 393
- Anemones**, 143; japonica and alba, 232, 436, 444, 484; for spring flowering, 355
- Anguloa eburnea**, 233
- Angræcum Scottianum** (certificated), 77
- Annuals for spring**, 148; sowing, 204
- Anthurium Schertzerianum** culture, 155; *Andranum*, 560
- Apples**—the Golden, 67; condemnation of Australian, 93; degeneration and improvement of cider, 132; Mr. Gladstone, certificated, 141; Mr. Gladstone, 159; for sandy soil, 171; for chalk soil, 172; early, for home use and market, 175; select main crop varieties, 222; Mr. Gladstone, 227, 246; proposed exhibition of, 228; in Sussex, 252; National Congress, 254; useful varieties of, *Bringewood Pippin*, 270; proposed congress, 274; American varieties at Congress, 357; curious varieties, confusion of names, 358; dinner of, 361; storing, 299; at the Chiswick Congress, 307; Mr. Gladstone, 315; Lord Derby, 329, 342; Grenadier, 321; National Congress at Chiswick, 316; large and richly coloured varieties at the Congress, 336; Bramley's Seedling, certificated, 337, 341; for planting, 352; Lord Grosvenor and Jolly Beggar, 354; proposed show at Manchester, Lord Derby in the north, 356; for market, 364; Grenadier and Bramley's Seedling, weights of, 364; not bearing, 387; work amongst trees, 400; *Onibry Pippin*, 398; late dessert, 410; Tyler's Kernel and The Sandringham, certificated, 421; Tommy Knight, 404; Lane's Prince Albert, 442; Stoup Leadington, 464; storing on straw, 485; scarcity of in America, 487; for shallow soil, 541
- Apples and Pears**, double grafting, 355
- Apples and the Appletons**, 399
- Apricot branches** dying, 114, 134; soil and climate, 114; cultivation, 134
- Aquatic plants**, a search for, 161
- Aralia papyrifera** and sea water, 418
- Arbutus Unedo** and var. *Croomi*, 462
- Artesian wells and Abyssinian pumps**, 410
- Artichokes**, Globe, 384; Jerusalem, 452
- Ash for railway embankment**, 172; trees, raising from seed, 498
- Ashton Court**, 162
- Asparagus**, treatment of, 384; forcing, 407; beds, making, 429
- Asters versicolor**, polyphyllus, *Amellus*, and *dumosus*, 290; selection of herbaceous, 312
- Auricula**, proposed show for Scotland, 11; seedling Alpine, 304; and woolly aphid, 532, 547
- Australia (South)**, plantations and fruits in, 251
- Australian Gum Trees**, 74
- Avenues in America**, 269
- Azaleas**, summer treatment, 60; maturing, 194, 196
- BARRON, PRESENTATION TO Mr.**, 361
- Batemannias**, notes on, 555
- Battersea Park**, 205
- Bauera rubioides**, 3
- Bean**, John Harrison (certificated), 77; forcing Kidney, 177; varieties of Broad, 294
- Bedding plants**, propagating, 211
- Beech**, large at Newbattle Abbey, 234; leaves and fungus, 292; manure and mould from, 436
- Bees**—the coming bee, clipping the wings of queens, 497; parasites on, 499; rood in hives, protecting, spring management, 519; theory for improving, 539; supering, 17, 38; straw Stewarton hives, 17, 38; covering bees, 17; British Bee-keepers' Association Show, vagaries of bees, 39; British Bee-keepers' Exhibition at Knightsbridge, 60; at York, 61; overstocking, 83; ejecting brood, 85; *Apis mellifica* in Java and Ceylon, 105; first preparations for winter, 127; show at Oldham, 128; driving, 129; hive-construction and honey producing, 148; fowl brood and salicylic acid, 170; stimulative feeding, Sadler's tablet candy, 195; brood in hives, uniting stocks, 197; hive construction, 216; transferring, 218; the stings of, 239; wintering stocks, 261; hive construction and management, 282; stings of, 283; hive construction and management, dimensions of hive, swarming in September, 303; seasonable notes, over-multiplication, "taking" September swarms, 325; hive construction and honey production, 344; Lincolnshire Bee-keepers' Association, 345; hive construction, 365; Garlic a cure for stings, swarms in September, bee-farming, 365; robbing and its remedy, 386; bee-farming, 408; pasturage, 40; irritable, 410; hive construction, covering quilts, 431; best time to sling honey, 432; practical management, 453; how far will they go for honey, 454; robbing, uniting, feeding, 475
- Bees v. gardeners**, 561
- Begonia fuchsoides** at Sna-dridge, 7; for winter, 60; three good tuberoses, 116; virginialis, 142; Madame Grody, 189; Novelty and The Queen, 232; *B. ulmifolia*, 271; as bedding plants, 288; *B. pieta*, 293; *B. Mons. Davivier*, 324; propagation of Tuberoses, 373; Froebel, 385; from seed, 405; wintering tubers of, 526; notes on Tuberoses, 543
- Benevolent Gardeners' Royal Institution**, contributions and pensions, 176, 277
- Bertolonias**, culture of, 126
- Biggs**, death of Mr., 71
- Bird scarers**, 72
- Blackberry**, the Parsley-leaved, 112; American, 5, 118, 136, 178
- Black Bryony**, 128
- Blinds waterproofing**, 345
- Bogs**, plants in, 144
- Boiler**, Deard's coil grate, 15; making a, 346
- Boltonia glastifolia**, 270
- Bonmeal**, Spratt's Patent, 549
- Book**, review of "Ferns of India," 157; Suttons' "Vegetables and Flowers," 429
- Border flowers**, white, in August, 136
- Border**, herbaceous plants flowering in, 165
- Borders**, shrubs and flowers in, 556
- Boronia polygalifolia**, 45
- Boswell's "English Botany,"** 137
- Botanic (Royal) Society's evening fête**, 12; report, 162; fixtures for 1884, 398
- Botanic stand**, Twining's, 314
- Bothy life**, 547
- Bougainvilleas**, starting, 519
- Bouvardia Thomas Meehan**, 529; culture of, 552; in winter, 441
- Bramble**, the Parsley-leaved, 72, 532
- Brassavola Ferrini**, 141
- Breeze for stoking**, 454
- Bridal wreaths**, ancient, 295
- Bristol gardens**—Stoke House, 369; Sneyd Park, 403; Old Sneyd Park, 424; Cote House, 517
- Brodiaeas**, notes on, 113, 133, 178
- Brussels Sprouts**, small, 549; large v. small, 548
- Bulbs and bulb culture**, 335
- Bunyard's**, Messrs. G., nursery, Maidstone, 397
- Burmese fruits**, 208
- Burning gardeu refuse**, 415
- CABBAGES** for autumn, 25; sowing, 59; history of, 98
- Cælogyne cristata**, 57
- Caladium argyrites**, culture of, 127
- Calanthes Veitchii**, 435; straight v. contracted bulbs, 529; notes on, 538
- Calceolarias**, culture of, 48, 215, 285; notes on shrubby, 403
- Calcutta Botanic Garden** report, 598
- Caledonian (Royal) Society's Show and Finances**, 549
- Calochorti**, notes on species, 504, 505
- Camellias** unhealthy, 40; shading and cleansing, 194; in winter, 466; unshaded, 484; propagation of, 552
- Campanula pyramidalis aurea**, 7
- Camphor trees** at Kanching, 419
- Canary moulting**, 264
- Candytuft Empress**, 189
- Caoutchouc**, gathering, 293
- Carnations and Picotees** at Chelsea, 58; in beds, 291; election of, 441, 548
- Carnations for winter**, 84; *Gloire de Nancy*, 93, 137; Mabel Morris, 93; good varieties of, 112; border varieties, 207; Old Crimson Clove, 331; forcing Crimson Clove, 372; for borders, 384; Souvenir de la Malmaison, 408; Mrs. Keen, 516
- Carrot fly and larvæ**, 536
- Carrots**, forcing, 537
- Carters' seed farms**, 138
- Cattleya marginata**, 252
- Cauliflowers**, Veitch's Foreign, 4; for spring, summer, and autumn, 132
- Cauliflower and Broccoli**, 438
- Celastrius scandens**, 487
- Celery**, ravages of fly, cutting down plants, 7; its culture, 92; earthing-up, 147; culture, 357
- Celery fly**, destroying, 262
- Celery fly and Cabbage caterpillars**, 353
- Celosias** in winter, 302
- Centaurea stricta**, 352
- Centropogon Lucyanus**, 538
- Cephalotaxus Fortunei**, 230; fruiting in Sussex, 422
- Ceylon**, exhibition at, 280
- Chalk as fuel**, 527
- Chamærops** out of doors, 388
- Cherries for market**, 364
- Chionodoxa lucilla** culture, 178; sardensis, 270
- Chiswick**, notes at, 115
- Chiswick**, how to reach, 274
- Chorozema**, culture of, 292
- Chou de Burghley**, 312, 462, 511, 531
- Choysia ternata**, 16
- Chrysanthemums**, cutting down, 2, 30; Mr. Udall's lecture on, 79, 100, 146; disbudding, 90; for market, 117; *C. coronarium* Aurora, 189; notes on, 291; effects of cutting down in June, 246; destroying mildew on, 269; protecting, 305; early-flowering, 310; Mons. Dufour, 324; forcing, 325; in Temple Gardeus, *Gloire Rayonnante*, 356; at Finsbury Park, 381; proposed National Society, 399; exhibiting, boards and cups, 400; new at Camberwell, 404; cutting down, new at Putney, 419; varieties certificated, 422; early, Mrs. Cullingford, and Lyon, 422; watering, 439; new varieties, Lord Alcester, 449, 470; Bendigo, 449; Roseum superbum, M. Astorg, Jeanne d'Arc, 450; at Slough, 461; out of doors, 433; Mrs. R. Eykin, 476; out of doors, 483; fixing sports, 484; classification of varieties, 485; Lord Alcester, 486; single, 487; Liverpool Show of and finances, 489; predisposing to sporting, 52; Taunton Show, 507; single varieties, 511; classification of, 515; South Shields Show, 517; Scur Melanie, 526; altering names of, 527; late white, Dunfermline Show of, 530; notes on exhibitions, 533; Snowball, 536; Lady Selborne, 558
- Chrysanthemum Shows**—fixtures, 373; Brighton, 419; Eastbourne, Brixton, 426; Stoke Newington, Lambeth, 427; Putney, 428; Southampton, Hawkhurst, 446; Lewes, Bath, 447; Croydon, Borough of Hackney, 443; Staines, Kingstou, 449; Winchester, Lindfield, 459; Lincoln, Manchester, Twickenham, 451; Ealing, 462; Chelmsford, 463; Jersey, 463; Wimbledon, 467; Worcester, Bristol, 468; Birmingham, 469; Nottingham, Northampton, 470; Shewsbury, Reading, 471; Tunbridge Wells, Liverpool, 472
- Cinchona** plantation in Bengal, 203; Ledgeriana, 511
- Cinerarias and Cyclamens**, 385
- Cinerarias**, culture of, 215; *C. acanthifolia*, propagating, 217
- Clay**, burnt, for Vine borders, 387
- Clematis coccinea**, 290
- Clerodendron fallax**, 60; *C. Bal-fourianum* culture, 82
- Clonmel Show**, 452
- Coburghia incarnata**, 293
- Cocoa-nut** refuse, references to uses of, 539
- Codonopsis rotundifolia**, 314
- Cælogyne cristata**, 4
- Colours**, complementing and harmonising, 21
- Composites**, yellow, 79
- Congo**, vegetation near the, 271
- Conifers** for bedding, 385; propagation of, 388
- Convolvulus scamoula**, 161; *C. cneorum*, 360
- Corcepsis tripteris**, 289
- Cotoneaster Simonsii**, propagation of, 387
- Cottage garden**, judging, 210
- Covent Garden** at Christmas, 549
- Cranberries**, 261
- Crassula alpestris**, 352
- Crataegus azarolus**, 395
- Crewe**, Rev. H. Harpur, death of, 228
- Crickets and cockroaches**, destroying, 460, 484, 527
- Crinum Hildebrandtil**, 272; *C. ornatum*, 324
- Crotons**, propagating, 170
- Crystal Palace**, Ferndell and fountain, 250
- Cuckoo-spit insect**, 235
- Cucumber houses** at Prescott, 18
- Cucumbers**, notes on, 25; setting and stopping, 96; for winter, 103; Epicurean and Suttons' Cluster, 119; raising plants for winter, 126; watering, 168; records of culture under old and "express" systems, 178; for winter, 215, 237, 260; history of, 381; in winter, 338, 495; for seed, 562
- Cultivation**, value of deep, 56
- Currant**, variegated, 345
- Cuttings**, change of, 223
- Cyathea microphylla**, 516
- Cyclamens**, culture of, 285; 384; culture of, 429, 492, 493; grubs on, destroying, 494
- Cymbidium affine**, 421
- Cyperus laxus variegatus**, 37
- Cypress** unhealthy, 345
- Cypripedium spectabile**, 30; *C. insigne*, 37; notes on, 459; *C. Spicerianum*, 435; eardnale and calurum, 516; notes on, 526, 529; *C. Röbelini*, 549
- Cytisuses**, culture of, 118, 122
- DAHLIAS**, Cetawayo, Dr. Moffat, Duchess of Westminster, Mrs. W. E. Gladstone, 232; Lady of the Lake, 234; exhibition varieties tabulated, 245; for garden decoration, 271; single, 312, 332; securing florets of with dextrine, 334; preserving, 431
- Dalkeith**, notes on, 280
- Darlugtonia californica**, 208
- Datura Stramonium**, 196; for asthma, 271, 433
- Delphiniums**, notes on, good varieties, 524
- Dendrobium nobile** culture, 176
- Deutzia gracilis** culture, 76
- Dextrine**, 409
- Dick**, Mr., presentation to, 398
- Dieffenbachias**, propagating, 170
- Dielytia spectabilis**, propagating and forcing, 76
- Dinner-table decorations**, 394, 410
- Dipladenia Brearleyana**, 415
- Dog's-tooth Violets**, planting, 410
- Doryopteris ludens**, 158; *D. piloselloides*, 159
- Dracoccephalum argunense**, 160
- Draining tools**, 466
- Drones** in autumn, 541
- Durlon**, the, 208
- EARTHWORMS**, sensitiveness of, 263, 290
- Earwigs**, destroying, 196
- Ecermocarpos scaber**, 355
- Echinocactus**, *Echinocereus*, and *Echinopsis*, distinguishing, 84
- Edinburgh gardens** criticised, 187
- Edwardsia grandiflora**, 527
- Eleagnæ edulis**, 93
- Endive** culture, 23
- Endive and Lettuce**, 146
- Eusilage** in America, 23
- Epacris**, culture and varieties of, 76
- Epiphyllum**, culture of, 18
- Ericas**, culture and varieties of, 76; treatment of, 385
- Ericas** and *Epacris*, propagation of, 552
- Erigeron speciosum**, 207
- Eriosteum**, culture of, 76
- Erythrinæ**, culture of, 76
- Erygium pandanifolium**, 233

GARDEN CHEMISTRY.

NOT long since a professional gentleman, than whom no one is better able to judge, in a public meeting gave it as his opinion that nine-tenths of the agricultural community were ignorant of the discoveries and teachings of agricultural science, and especially chemistry. He also expressed the opinion, that were agricultural chemistry generally understood, our agriculture would at once enter upon a period of prosperity from which it could not easily be brought down. Truer words were never spoken. In spite of evil times, bad seasons, and crushing competition, thoroughly educated cultivators not only manage to live, but thrive. Many, indeed, are doing well under the same skies and subjected to the same competitive conditions that send other men, less alive to the importance of applying scientific facts, to the wall. Among farmers there is both a "struggle for existence," and also "a survival of the fittest."

What is true of farmers in this respect is also true, perhaps to a greater extent, of gardeners. Much attention has, during late years, been devoted to the physiology and chemistry of plants and the chemistry of soils and manures; but it is only here and there that we meet a gardener well informed enough to be able to turn any of this kind of knowledge they may possess to practical purposes. Yet there cannot be any room for doubting that a knowledge of such subjects would pave the way for success by explaining the cause of many failures, as well as acting as a guide to success; and it cannot be doubted that such knowledge would, in a majority of cases, lead to real economy, not only in saving, but in wise spending.

Agriculture has a fairly good literature devoted to such subjects, horticulture has none worth the name. The energies of many eminent men in our own country, on the Continent, and in America, have been devoted to the discovery of facts in vegetable physiology and agricultural chemistry, with the consequence that now a very clearly illumined path is before the cultivator. It is with regret that we have to add that in the kindred domain of horticulture hardly anything has been done. Still the facts that have been discovered in agricultural chemistry are, to a large extent, available for gardeners; and, scattered here and there, for the gathering, are many facts that apply to the garden only. For years the writer of this has made garden chemistry his study, and has collected much information that he now proposes to arrange for the benefit of those who may choose to follow him. He believes that many young men are anxious to know something of the subject as a stepping-stone to future success, and to this class he chiefly addresses himself, though he ventures to believe that some of their elders may not peruse what he has to say in vain.

In introducing such subjects it is usual to begin by saying something about soils, manures, and the physiology of plants first; then to go on to the elements composing such plants, soils, and manures, their relation and chemical history, and to advance step by step. This plan, when text-

books are in question, is decidedly the best. But were such adopted in the present instance, it is feared that numbers, who may readily enough read papers on special subjects connected with the study, they might at first not be interested enough to wade through such details. It has, therefore, been decided to give papers on "Lime and Liming," "Phosphates," &c., to begin with, on each of which topics information is being continually sought, and which can be treated separately, though also as part of a whole.

LIME AND LIMING.

Lime exists under many different forms in the geological strata of the earth. Apart from limestones proper, marble, coral, chalk, marl, and shell sand must be regarded as limestones, and all used as manurial applications. All are, or have been, formed under water. Chalk, for instance, is only an agglomeration of shells not very compactly pressed together, as is the harder limestones, which, however, are only harder; and although sometimes formed of compacted corals, may be seen in other cases to be composed of minute microscopic shells mixed with larger ones. Marble is only limestone vitrified by internal heat. Marls are the remains of fresh-water shells which have settled in inland lakes and in time become covered up with silt, peat, or sometimes only mould. Shell sands are the wrecked remains of shells in modern seas which are cast up on our shores. Frequently corals are cast up on our shore, as in Bantry Bay, and such are found of value as manure.

Limestones are hardly ever pure. Being formed under water they generally contain sand and clay. This may vary from 0 up to 30 or 40 per cent. When present, this foreign matter detracts, of course, from the value of the limestone. Even in chalk much clay exists, as may be understood when it is remembered that the clay soils that cover the chalk in many places are but chalk remains from which the lime has been dissolved out and washed away by rain containing carbonic dioxide; but as limestones are the remains of minute animals, they almost invariably contain both sulphate and phosphate of lime. In some countries the sulphate is largely present, but in this it seldom amounts to more than four-fifths per cent., and is generally less in this country. In some samples, as in those from Carlisle (Lanarkshire), phosphate of lime is present to the extent of $1\frac{1}{4}$ per cent., according to Dr. Johnston. This, in the burnt lime, is equal to $2\frac{1}{2}$ lbs. in the hundred, and adds considerably to the value of the lime. In the magnesian limestone of Durham it seldom exceeds 0.15 per cent., and is generally only 0.07. In Cumberlandshire limestone containing 0.33 per cent. are found, but in other cases only the merest trace. Some of the limestones of the great oolite, as well as the Combrash and Stonefield slate, contain about 1 per cent. of phosphate.

Carbonate of magnesia is almost always present. In even the purest limestone it amounts to 1 or 2 per cent., and in impure varieties from 40 to 50. Many of the beds in the old red sandstone contain much magnesia. Mountain limestone, otherwise known as dolomite, contain, when tolerably free from clay or sand, as much as from 40 to 45 per cent.

Lime containing much magnesia possesses burning or scorching qualities; indeed, magnesia in whatever combination has this quality. Yet there may be instances when it may be wanting in the soil, and such lime made from magnesian limestone may be peculiarly valuable. Such lime is preferred on the hill pastures of the highlands of Galloway, but on ordinary soil it is well not to apply such either liberally or extensively. A portion sparingly dressed will tell in a year or two whether magnesia may then be given with advantage. If not, it will be better to procure the purest lime possible, for magnesian lime cannot be applied with safety in quantities sufficient to such soils as most need liming.

Lime is applied burnt and unburnt. Marls and chalk,

shell sand and corals, are generally applied unburnt, as their mechanical condition admits of their easy pulverisation and distribution, but hard limestones are generally burnt. Marls often contain as much as 95° per cent. of clay or other admixture. Such are hardly worth digging and applying, except to light soils, when the land gets a liming and is made heavier at one operation. This often benefits peaty land considerably. When applied to heavy land they often do mischief. Instead of opening, as liming is intended to do, they have quite an opposite effect, because of the clay they contain, and the lime given is too trifling to be of any consequence. Marl often contains, however, as much as 90° per cent. of carbonate of lime (calcic-carbonate), and such are very different from those of the other extreme. Gardeners—strangers in a locality—had better ask neighbouring farmers what the traditional value of this or that marl is before incurring expense in its use. Tradition in these things forms a very good guide.

Chalk is of a much more constant nature than marl, not often containing more than 20° per cent. of foreign matter, and seldom that. Oftener it does not amount to more than 1 or 2 per cent. Chalk and marl owe their efficacy to the presence of carbonate of lime. One ton of carbonate of lime contains nearly 8½ carbonic acid (dioxide), and, as near as may be, 11½ of lime, or, as it is expressed in chemical nomenclature,

Carbonic dioxide or anhydride (C O ₂)	44
Calcic oxide (Ca O)	56
	100

When limestones are placed in a kiln along with fuel and burnt, the carbonic dioxide is driven into the air, and only the calcic oxide—or calcined lime—remains behind. This has a great chemical affinity for water. When water is poured on lime shells, as the burnt lumps are termed, a violent action takes place—strong heat is evolved, and the calcic oxide becomes calcic hydroxide, which is not a mixture of water and lime, but a new compound made up of water and (quick) lime chemically combined. The new combination contains 76° per cent. of lime (nearly) and 24° of water. Were it only a mixture instead of a combination, the mass would be wet, but it remains quite as dry as before. When this compound is exposed to the air it combines with the carbonic dioxide ever present in the atmosphere, and in time assumes its original chemical condition by becoming calcic carbonate (carbonate of lime). This is perfectly insoluble in water, calcic hydroxide being soluble in 732 times its own weight of cold water. This solution is known as lime water. When a stream of carbonic acid is passed through this solution the lime is at once precipitated—it has become the insoluble carbonate. The easiest way is to pass one's breath through it by means of a straw or pipe-stem. Chemists generally pass the gas derived from the calcic carbonate by simply pouring acetic acid on chalk or limestone. This drives off the carbonic dioxide, which is conveyed by a simple apparatus through the lime water.

Newly slaked lime (calcic hydroxide) acts much more energetically when applied to land than either chalk, marl, or mild lime, as burnt lime is termed after having again assumed the form of the carbonate. But burnt lime after slaking becomes an exceedingly fine impalpable powder, and for this reason it is better than either chalk or marl, because of its being easier distributed even after it has taken its original chemical form. Chemically the same as when unburnt, it is mechanically very different, hence the reason for burning; but in the state of quicklime it acts with much greater rapidity than mild lime. When first applied it at once combines with any free acid it may find. The acid thus neutralised is in a sense removed out of the way, and the oxygen of the air reaches undecayed organic matter, and causes its more rapid decay and consequent liberation of the plant food it contains. Humic, carbonic, or nitric acids preserve organic matter from waste, and hence such organic

matter in soils deficient in salifiable bases become plant food very slowly. But when lime, especially quicklime, is applied, these acids at once become calcic salts, and the work of food-preparation goes on rapidly. Not only so, but sour soils are at once sweetened, heavy soils lightened, warmed, and made earlier. It is even said to materially forward the brairding of seeds, but whether wholly by direct action on the seeds themselves, such as removing the carbonic dioxide, or by providing them with a freer, drier, sweeter, warmer medium is not clear; probably in both ways.

The action of marl, chalk, or mild lime is very similar, only slower. Mild lime does not act with the same energy in organic compounds as caustic lime; hence it is more suitable for soils poor in humus. Caustic lime, by acting rapidly on humus and other vegetable remains, may with great advantage be applied to old garden soil rich in black mould. Such contains much plant food in an unavailible condition. The application of lime liberates it, and enables the operator to do without manure of any other kind for a time, while at the same time the soil is improved otherwise; but on very light soils, or on virgin loams in which humus is not abundantly present, quicklime should not be applied, or only sparingly, and along with plenty of ordinary manure. otherwise the humus will be dissipated, which is what should be guarded against, as the presence of a certain amount of humus is necessary for fertility. Heavy clays are much improved by quicklime. It curdles the clay and renders it free and open. On sour bog land it often works little short of miracles. On these and also on light sands and gravels a dressing will cause white Clover to appear, when sowing the seeds would not! This would indicate that on such soils it might prove beneficial to Peas and Beans.—SINGLE-HANDED.

(To be continued.)

CUTTING DOWN CHRYSANTHEMUMS.

THE note you published on this subject on page 538 of last volume is an important one, and undoubtedly refers to a practice that is not in general adoption. So far as I am aware the system of cutting down Chrysanthemums in June or early July originated in the neighbourhood of Manchester, and no doubt the plants that were referred to so approvingly in your report of the Manchester Show last November had been grown on the system under notice. It is the best of all methods of producing dwarf untrained plants with grand blooms.

If I am not mistaken some pains were taken for a time to prevent the practice being known. But the day of gardening secrets is past, and those who plume themselves on the exclusive possession of a method of culture do not now remain long "alone in their glory."

Having practised this method, in common with some other-growers in the south as well as the north, I may perhaps usefully give my experience.

This is a critical time to cultivators of the Chrysanthemum, especially where they are grown for exhibition purposes. Many varieties should be cut back without delay—indeed many have been cut down. Jardin des Plantes, Princess Teck, Hero of Stoke Newington, Novelty, John Salter, Eve, Nil Desperandum, Cherub, Princess of Wales, Mr. Brunlees, Lady Slade, Guernsey Nugget, Pink Perfection, Mabel Ward, and Angelina should be cut down at once; while within a few days the Beverleys, Queens, Alfred Salter, Mrs. Haliburton, Barbara, Prince of Wales, Lady Hardinge, Mrs. W. Shipman, the Venuses, Golden Eagle, Refulgence, Mrs. Bunn, Isabella Bott, Mrs. Heale, Emily Dale, Mr. Gladstone, Mr. Corbay, White Globe, Prince Alfred, the Rundles trio, Aurea Multiflora, Lord Derby, Beethoven, Vesta, and all very early flowering kinds should not be stopped later than the end of the first week in July.

The plants are cut back in some cases to within a foot of the pot, others even to within 6 inches of the surface. It will be seen by this that some judgment is required in the matter. The later-flowering varieties are cut down earlier, in order that they may break earlier and form their buds at the same time as the naturally earlier varieties which are cut down later. Another advantage gained by cutting down is that in many cases it will make quite 2 feet difference in the height of the plants, enabling the cultivator to make better use of them for furnishing or grouping.

Instead of three breaks, which is customary with plants grown without being cut down, five, six, and even more breaks are produced by the system recommended. I do not mean to suggest that it is always prudent to leave so many breaks as are produced. I have seen eight and ten grand flowers produced on Queens and Empress of Indias, but it has been under very high cultivation. The Beverleys, Randles, Lady Hardinge, Mrs. Shipman, and such varieties, will carry a dozen exhibition flowers. The crown buds must be taken after this treatment in most cases, yet in certain seasons some of the varieties, such as White Globe, come very quick, then the terminal bud must be chosen.

The plants, after they have grown about half an inch, should be placed in their flowering pots, taking care to use good soil, as this has much to do with the success that attends skilled cultivators, although no two men treat them exactly alike in this respect. I do not use artificial manures until the flowers show their colour. I have confined my remarks entirely to incurved varieties, as these have been under discussion. I will say something on Japanese on a future occasion, as a few remarks on them now will not be unseasonable.—GROWER AND EXHIBITOR.

PARAFFIN OIL IN VINERIES.

I WAS glad to see your note of warning at the foot of the article headed as above in your Journal of June 21st. Too great caution cannot be exercised in recommending paraffin oil for use as an insecticide. In the hands of men fully acquainted with its power no doubt it proves of benefit in clearing off insect pests; but where its application has to be trusted to persons who either have not the knowledge or fail to exercise the requisite amount of caution there is great danger that disaster may follow its application. Even when much care had been taken to impress those who were trusted with the use of this oil when syringing, it has been found by the writer that failure to keep the paraffin thoroughly mixed with the water has occurred. When this happens something is sure to suffer. Unless the most stringent rules are laid down and carried out to the letter danger will always attend the use of paraffin, more especially among enthusiastic amateurs, who, being troubled with some of the insects that annoy horticulturists, are eager to embrace any chance of easily ridding themselves of the pests. As in the case of painting the pipes with paraffin there is danger, so is there more or less danger attending the use of many insecticides, which are often freely recommended without a due amount of caution being given as regards their use.

It should be borne in mind by all that the best insecticide is after all only a necessary evil to the plants to which it is applied. Fumigation is good and safe for many plants, but when too strong or when used to certain plants it proves disastrous. Sulphur is of use in checking the ravages of red spider. This, though disputed by some, I have proved to my own satisfaction, and it is safe when simply put on the hot-water pipes; but I have heard of one case where ignorance led to its being burnt in the vinery, with the result of bringing all the leaves off the Vines. This case happened when the gentleman simply told his gardener—who was not one in the highest ranks in knowledge and intelligence—that “sulphur was recommended as good for killing red spider.”

Most of the insecticides which are sold now-a-days require to be very carefully used, and a word of caution such as you have appended to the paraffin-painting receipt is very much required when they are likely to be used by anyone not well acquainted with their composition and safe methods of application. “There is nothing like personal experience,” some say, but it is a pity when evil is done by wrong applications of compositions which are capable of being used in such proportions and under such conditions as render them not hurtful but beneficial. Therefore all who possess the requisite knowledge should freely impart it to others, giving words of warning when required, while words of commendation should in all cases be tempered with the most exact description of modes of application of insecticides and the quantities to be used.

Such words of warning apply not only to insecticides but to many matters. A friend of mine, a keen amateur gardener, though not possessed of much skill or knowledge regarding the numerous subjects claiming the attention of the gardener, has suffered largely in his kitchen garden through the unduly large amount of guano he gave his vegetables in the form of a top-dressing. Another case came under my notice, where a fine lot of Vines suffered the loss of many of their leaves through the dressing the inside border with guano. The guano had been very heavily spread on the surface, then hoed-in and watered. Care had not been taken to cover it sufficiently with the earth, and in addition far too much had been used. Danger might still have been averted had abundance of ventilation been provided, but this had not been done, the conse-

quence being great damage to the foliage. If it were always borne in mind that persons may use insecticides and manures who have not sufficient knowledge of their own to enable them to always escape disaster, writers recommending the use of various things would perhaps be more careful in giving exact details, and also words of warning.

Vendors of patent manures and insecticides should also make it their aim to guard against all mistakes. When sufficient instructions and warnings have been given, then carelessness on the part of the persons using such things can be the only way in which disaster can happen.—READER.

BAUERA RUBIOIDES.

It is surprising how many plants that possess far more than ordinary attractions, and qualities sufficient to amply entitle them to the attention of cultivators, are allowed to remain in comparative obscurity, being only preserved as rarities in a few botanical collections. *Bauera rubioides* is one of these neglected plants, which the following note and engraving are intended to bring a little more prominently into notice, for though it has now been in cultivation in a few gardens for about ninety years, it is very rarely seen, especially in nurserymen's collections. Yet the plant is of easy culture, floriferous in the extreme, the flowers being of a distinct form and

Fig. 1.—BAUERA RUBIOIDES.

pleasing deep rosy colour, the latter character alone being sufficient to recommend it strongly. The foliage, too, is pretty, the narrow dark-green leaves being arranged in whorls round the slender branches, resembling some of the Rubias, and not the Rubus, as was stated in the description accompanying the first coloured plate (an excellent one) in Andrews' “Botanist's Repository,” and subsequently corrected in 1804 by Dr. Sims in the “Botanical Magazine.” There is also some difference between the two above-named authorities respecting the introduction of the plant. Andrews states that it was “first raised at the seat of the Marchioness of Rockingham, Hillingdon, Middlesex in the year 1793.” Dr. Sims, however, states that it was first raised by Messrs. Grimwood & Wyke of Kensington. It was in the Kew collection early in this century, and is mentioned in Aiton's “Hortus Kewensis” as being originally from New Holland, introduced to this country by the Marchioness of Rockingham, thus corroborating or accepting Andrews' account.

The cultural requirements of this plant are few. A cool house such as a conservatory or greenhouse, or indeed a sheltered position out of doors in the southern counties, suit it well. Peat, a little turfy loam, and a small quantity of leaf soil form a good compost for it, draining the pots carefully and supplying water judiciously, as extremes are very

injurious to it. It can be readily increased by cuttings of the young wood inserted in sandy soil under a bellglass, preferably in slight heat.

NATIONAL ROSE SOCIETY, SOUTHAMPTON.

JUNE 28TH.

THE entrance of the Southampton Horticultural Society into their new home, Westwood Park, was signalised on Thursday last by the magnificent Show of the National Rose Society. The presence of the Prince and Princess of Saxe-Weimar as the guests of the Mayor and Corporation of Southampton lent additional interest to the proceedings; while from the fact of Thursday being the anniversary of Her Majesty's coronation the whole town was decorated with flags and banners, and the people turned out *en masse*, notwithstanding that the weather was most unfavourable, rain falling very heavily during the inspection of the Show by the Prince and Princess and their stay at luncheon, which was attended by about 400 of the principal inhabitants. Towards evening the rain abated, and the Show was visited by several thousands of persons.

In many classes the competition was not so keen as when the National Shows are held nearer the metropolis, but the quality was excellent. The stormy weather which preceded the opening day doubtless deterred many exhibitors from being present, while with others the blooms were scarcely advanced enough to take part in this contest. The blooms staged were large, bright, and of good form. Everything appertaining to the Show and the comfort of the exhibitors were well superintended by the Hon. Secretaries of the National Rose Society, the Rev. H. H. D'Ombraim and Mr. Mawley, and by Mr. Fudge, the energetic and courteous Secretary of the Southampton Horticultural Society.

Following in the order of the schedule for forty-eight distinct blooms, single trusses, Mr. Charles Turner, Royal Nurseries, Slough, was awarded the highest honours with a magnificent collection, consisting of Constantine Tretiakoff, Marguerite Brassac, Madame Gabriel Luizet, Louis Van Houtte, La France, Madame Hippolyte Jamin, François Levet, Victor Verdier, Auguste Rigotard, Innocente Pirola, Horace Vernet, François Michelin, Sénateur Vaisse, Marguerite de St. Amand, Magna Charta, Marie Baumann, Princess Beatrice, Fisher Holmes, Madame Montels (a Rose new to us in name), La Rosière, Charles Darwin, Madame Marie Verdier, Maurice Bernardin, Abel Grand, Duke of Wellington, A. K. Williams, Countess of Rosebery, Madame Margottin, Nardy Frères, Souvenir d'Elise, grand, with one or two others; the presence of several charming Teas in this collection greatly enhanced its beauty. Second honours was awarded to Messrs. Paul and Son, Old Nurseries, Cheshunt, for a collection which pressed very hard for first position, and contained, amongst others, extra fine blooms of Charles Lefebvre, François Michelin, Comtesse d'Oxford, Etienne Levet, A. K. Williams, and Monsieur E. Y. Teas. Messrs. Keynes & Co., Salisbury, received the third prize; their best blooms were Madame Gabriel Luizet, Général Jacqueminot Niphotos, Reynolds Hole. Messrs. Cranston, Hereford, and Curtis, Torquay, also exhibited in this good collection. In Messrs. Cranston's stand there were magnificent blooms of Lady Mary Fitzwilliam and Ulrich Brunner, a very large flower of a cherry red colour, and with deep cup-shape petals.

For twenty-four distinct, three trusses of each, it was a very close contest indeed between Messrs. Keynes, Turner, and Paul for first honours, so evenly matched were all these collections. Scarcely a faulty bloom was to be found in either, but chief honours eventually fell to Messrs. Keynes & Co., who doubtless were favoured with a position of better light than the other competitors. Mr. Charles Turner took the second place, and Messrs. Paul & Son the third. The first-prize collection comprised Madame Gabriel Luizet, La Rosière, Auguste Rigotard, Etienne Levet, Mons. Gabriel Tournier, François Levet, Duke of Cambridge, Duchesse de Vallombrosa, Dr. Andry, Marquise de Castellane, La France, M. Charles Wood, Duke of Teck, François Michelin, Alfred Colomb (magnificent), Général Jacqueminot, Centifolia Rosea, Dupuy Jamain, Ferdinand de Lesseps, Marguerite de St. Amand, and Madame Laurent. In the second-prize collection Camille Bernardin, Capitaine Christy, Mad. Gabriel Luizet, Devoniensis, Duchess of Bedford, and Marie Baumann were grand examples of culture. Etienne Levet, François Michelin, Marquis de Castellane, Marie Cointet were conspicuous objects of beauty in the third-prize collection.

In the class for thirty-six distinct, single trusses, Mr. Prince was worthily awarded the first prize with a collection in which many fine Teas were staged, most of them being magnificent examples. Amongst others were Duc de Magenta, Perle des Jardins, Mad. Lambard, Souvenir de Paul Neyron, Maréchal Niel, Anna Ollivier, Rubens, Madame Marie Finger. Messrs. Cross & Steer, Canal, Salisbury, were placed second, and Mr. J. House, Eastgate Nurseries, Peterborough, third. For eighteen varieties, three trusses of each, Mr. Prince was again to the front with a collection in which his far-famed Teas preponderate. Grand examples of Rubens, Marie Van Houtte, Comtesse de Nadaillac, Perle des Jardins, Niphotos, and Jean Ducher, A. K. Williams, and Ulrich Brunner were also very fine. Mr. House was placed second, and Messrs. Cooling, Bath, third. For twelve Teas or Noisettes, single trusses, there were six collections, first honours again falling to Mr. Prince. Messrs. Paul & Cant, Colchester, were placed equal second, and Mr. C. Turner highly commended. The best Roses in these collections were Souvenir d'Elise, Anna Ollivier, Alba Rosea, Madame Willermoz, Catherine Mermet, Francis Kruger, and Perle des Jardins.

The amateurs' classes were fairly represented, although in some cases the competition was not brisk; those that did compete were all well-known exhibitors, therefore all the collections were very level. For thirty-six distinct, single trusses, Mr. J. Ridout, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, Surrey, was awarded the first place with a very even collection, consisting of Marie Baumann, Pride of Waltham, A. K. Williams, François Michelou, Gloire de Dijon, Cheshunt Hybrid, Marie Finger, Duchess of Bedford, Louis Van Houtte, La France, Edward Morren, Thérèse Levet, Camille Bernardin, Marie Rady, E. Y. Teas, Baronne de Rothschild, Duke of Edinburgh, Général Jacqueminot, Annie Wood, La Havre, Marquis de Castellane, Comtesse d'Oxford, Madame Berard, Chas. Baltet, Auguste Rigotard, Lady Mary Fitzwilliam, Ferdinand de Lesseps, Louis Van Houtte, sport from Madame Clemence Joigneaux, Marie Rady, and E. Y. Teas. Mr. Moorman, gardener to Miss Christy, Coombe Bank, Kingston-on-Thames had a good

collection, losing the first place by only five points. Mr. Moorman's blooms were the largest, but one or two instances lacked the form of Mr. Ridout's. Harrison Weir, Charles Darwin, A. K. Williams, Charles Lefebvre, Etienne Levet, Nardy Frères, Edward Morren, and Maréchal Niel were among the best. Mr. Joseph Davies, The Square, Wilton, received the third place with a good collection.

In the class for eighteen distinct Mr. J. Ridout was again to the front with a collection in which the varieties were very similar to those described. The A. K. Williams in this stand was awarded the silver medal as the best Hybrid Perpetual in the amateur classes. Mr. Davies received second honours, and the silver medal for the best Tea or Noisette in the amateur classes was awarded to a fine bloom of Maréchal Niel in his box. Mr. W. Grant, Ledbury, was placed third. For twenty-four, distinct, in another division Mr. A. Evans, Marston, near Oxford, had a good collection, which placed him in the first position, Magna Charta, Marie Baumann, Miss Hassard, Nardy Frères, Le Havre, and Camille Bernardin being especially fine. Mr. T. Guider, gardener to Miss Watson, Taylor Headington, Westbury, and Mr. T. Hobbs, Lower Eaton, Brixton, were placed second and third respectively. In the class for eighteen distinct, single trusses, Mr. A. Evans, Mr. T. Guider, and Capt. Christy, Core Hill, Sidmouth, were placed in the order of their names.

The class for twelve distinct, single trusses, contained some very fine blooms in the several collections. Mr. J. T. Strange, Aldermaston, Reading, was awarded first honours with La France, Marie Baumann, Fisher Holmes, M. Victor Verdier, Marie Van Houtte, Capitaine Christy, Dupuy Jamain, Thomas Mills, Sophie Fropot, Abel Grand, Exposition de Brie, and Marie Van Houtte. Captain John Ramsay, Fareham, and Mr. G. Mount, Harbledown, Canterbury, second and third respectively.

The Rev. Alan Cheales, Brockham, Surrey, was deservedly placed first for six distinct with Madame Gabriel Luizet, Alfred Colomb, Marie Baumann, Charles Lefebvre, A. K. Williams, and the best bloom in the Show of Dr. Hogg. The Rev. C. Eddy, Bramley Vicarage, Basingstoke, and Mr. E. Mawley, Addiscombe, Croydon, shared the second and third positions. Teas and Noisettes were exhibited both plentifully and in good condition by amateurs, Mr. T. B. Hall, Rockferry, Cheshire, Rev. J. H. Pemberton, Havering-atte-Bower, Essex, and Miss Watson Taylor being placed first, second, and third respectively for good collections of twelve varieties. Mr. T. Hobbs, Mr. Mawley, and the Rev. Alan Cheales in the order of their names for six varieties. There were eight collections staged in the class for twelve single trusses of any dark Rose. Messrs. Paul & Son were placed first with magnificent blooms of Etienne Levet, Mr. Turner second with Camille Bernardin, and Messrs. Cranston third with Exposition de Brie. For the same number of pink varieties Messrs. Keynes took the lead with François Michelin, Messrs. Cant second with Madame Gabriel Luizet, and third Messrs. Paul for the last-named variety. Mr. Prince was awarded the first prize for twelve Teas or Noisettes with good blooms of Maréchal Niel, Mr. C. Turner second with Souvenir d'un Ami, and Mr. Evan third with Maréchal Niel.

Four classes were set apart for Roses grown in the district, and open to the members of the Southampton Horticultural Society. The principal prizetakers in these classes were amateurs—Mr. F. W. Light, Cornstiles, Twyford; Dr. Seaton, Rutland Lodge, Bitterne; Mr. William Bettridge, Old Basset, Southampton; C. M. Shipley, Esq., Winchester; Rev. R. R. L. Dashwood, Romsey; Mr. H. W. Stratton, Portswood; Mr. H. Guillaume; and Captain E. Gibbs, Red Thorn, St. Denys, Nurserymen—Messrs. W. & G. Drover, Fareham, and Mr. George Windybank, Southampton.

A few classes were provided by the Southampton Horticultural Society for groups, table plants, Pelargoniums, and Ferns. Mr. Wills, gardener to Mrs. Bassett, The Firs, Bassett, was far ahead in the groups. His collection was most tastefully arranged, and contained an exceedingly choice collection of plants suitable for decorative purposes. Second Mr. J. Kingsbury, nurseryman, Belvoir. Orchids were well shown in a collection of twelve, principally varieties of Odontoglossums, by Mr. Blandford, gardener to Mrs. Haselfoot, Moorhill, who had the first prize; Mr. T. Osborne, gardener to H. Buchan, Esq., J.P., Wilton House, Southampton; taking second award. Pelargoniums came from Mr. Osborne and Mr. Wills, who were placed in the order of their names for very creditable specimens. Table plants, Palms, and small Adiantums were numerous exhibited and arranged along the centre of each table between the ranges of Rose boxes, which had a pleasing effect, Messrs. Kingsbury, Wills, Windebank, and Osborne sharing the principal honours.

VEITCH'S EARLY FORCING CAULIFLOWER

I HAVE great pleasure in bearing my testimony to the benefit I have derived from this useful novelty of the season. The Snowball, although an excellent variety, is, in my experience, quite distinct from the above, inasmuch as it is larger and later, and folds its leaves over the flower, while in Veitch's Early Forcing the leaves stand upright around the flower, forming a shelter more than a shade. I sowed on the 6th of February in a cool frame, planted out in April between Asparagus beds, and in despite of a bleak situation and severe spring frosts I cut snow-white and compact heads measuring 4 and 5 inches in diameter a fortnight earlier than Early London. Wintered in a cold frame it has been pronounced delicious in flavour by the family, and is a great favourite with our French cook.—P. DAVIDSON, *Iwerne House, Shaftesbury.*

CELOGYNE CRISTATA.—Mr. Young in further note on above Orchid misquotes himself from page 467, changing the word feasible for his present impossible, which makes a much different sentence. If Mr. Young does not agree with the practice of cutting out what are termed spent pseudo-bulbs, which he terms feasible, he ought in the first case to have said so, and warned his amateurs against the practice, as he is now anxious to do so. But I contend the cutting-out practice is wrong altogether. If a large plant is desired, and the centre is full of leafless or spent pseudo-bulbs which are alive, or green, cut the root stems in the

same way as for a *Cattleya*, when the plant will quickly bristle with healthy growth in every part, to be followed in due course by flowers, instead of a bare centre, with flowers all on the outer parts.—ROBERT GRINDROD.

THE HERBACEOUS BORDER.

UNDER my charge, among other things, is a walk about half a mile long with borders on each side occupied with herbaceous plants, some of the most noteworthy of which I propose from time to time to remark on, and as the collection is only in its infancy I shall be obliged if any of your correspondents will assist in giving prominence to meritorious flowers in season by a record of their experience. I need not point out the great value and interest attached to hardy plants, nor enlarge on their general adaptability for the masses; but will at once proceed to notice some good plants that were flowering on June 21st.

PAPAVER NUDICAULE.—A yellow Poppy, forming very showy and highly decorative tufts, the flowers borne on slender stalks about 1 foot in height, continuing to produce blooms for a long time. The flowers are very pretty in a cut state, for though their duration is only short, and they close early they are still charmingly beautiful—quite a relief from the monotony of cut flowers generally.

PAPAVER NUDICAULE ALBUM.—A white-flowering variety of the species, quite as hardy, fully as free-flowering, and altogether a highly decorative plant, and the flowers are fine for cutting.

IBERIS GIBALTARICA.—This is unquestionably the finest of all the Candytufts, having very large heads of white flowers tinged with lilac. The plant forms a compact bush, and flowers over a lengthened period. It may be mentioned that this is very fine indeed for growing in pots in a cool house, or may be had in flower early by placing in gentle heat. It is not very hardy, and young plants should be raised from cuttings or seed yearly, so as to provide against the probability of loss in a severe winter. It is fine for sunny niches at the foot of rockwork.

ERODIUM MANESCAVI.—This forms tufts of graceful foliage 15 inches or more in height, and is the best of the genus. From the crown issue numerous flower stems, each bearing an umbel of large purple-red flowers 1 to 1½ inch across. It is well adapted for the base of rockwork, and does splendidly in the open border. The flowering is continued through the summer, and frost only seems to stay its flowering propensity. A very showy, and in fact handsome, species.

PHLOX CAROLINIANA VAR. OVATA.—A very useful plant of about 18 inches in height, having large corymbs of bright purplish red flowers in early summer, and very freely produced. It is fine for borders and valuable for cutting.

CENTAUREA MONTANA.—Of this there are two varieties—viz., alba, white, and rubra, red. The best of the trio is *C. montana* alba, but the species with its blue flowers is superb. They can hardly be called gay, but they form effective clumps of about 18 to 24 inches in height, producing in succession a great number of flowers over a lengthened period, and these are valuable for cutting, being so distinct from the run of cut flowers. The plants do best in sunny positions and well-drained soil.

AQUILEGIA CHRYSANTHA.—This has been in beauty since early June, and still keeps on, having many golden yellow flowers with long spurs. It forms in good specimens a bush a yard across and nearly as much high, and is very beautiful and effective.

TRADESCANTIA VIRGINICA.—Showy for borders, having large terminal umbels of bright blue flowers, freely produced through the summer. *T. virginica* alba is equally desirable, and there are several varieties, as red, double red, rose, pale blue, and deep violet. They are not particular about soil or situation, but an open one is most suitable. They grow 18 to 24 inches high.

AGROSTEMMA FLOS-JOVIS.—Forms a bush about 2 feet high, the foliage being soft and downy; the flowers bright scarlet, produced abundantly and for a long time, fine for cutting. It likes a light soil, and is readily raised from seed.

HELENIUM HOOPESII.—Large bright yellow flowers, having a peculiar appearance, very freely produced over a lengthened period, and very useful for decorative purposes. Although the majority of Heleniums are only fit for the back of herbaceous borders, or relegating to shrubberies, this and *H. pumilum* are fitted to take rank with the choicest. Its flowers are fine for large decorations such as in churches.

DRACOCEPHALUM RUYSCHIANUM.—Very pretty. Flowers about an inch long, borne in clusters, and as the stems are numerous it may be described as a very handsome summer-flowering plant. It likes a light soil. *A. R. japonicum* is more upright in growth, and the flowers in whorls quite an inch long are really charming, being of a light sky-blue colour.

CAMPANULA MACRANTHA.—A grand plant, forming a pyramid bush over a yard high, having numerous erect stems, producing large

purple-blue flowers. It is fine anywhere, as a back-row plant unequalled in the genus, and will grow in any ordinary fertile soil.

GILLENIA TRIFOLIATA.—Another fine plant, very showy, forming an erect bush about 3 feet high, with deeply cut foliage; the flowers being white, borne in panicles. Quite a gem, doing well in well-drained soil.

ERIGERON GRANDIFLORUM.—About 18 inches high, having a tufted appearance; the leaves large; flowers numerous, Aster-like, purple, and a couple of inches across. It requires a light soil, and does well in niches at the foot of rockwork.—G. ABBEY, *Paeton Park, Hunts.*

(To be continued.)

AMERICAN BLACKBERRIES.

I SEE you say at page 520, last volume, that these do very well in this country, but I am inclined to think that the instances of their successful culture are few and far between. My experience of them tallies with that of your correspondent "J. E. D., *Devon*," as ours have grown luxuriantly, but the fruit is miserable compared with the illustration and our own expectations. When the Kittatinny variety was brought in it was planted in rich soil and the best of positions to secure sunshine with shelter on all sides from destructive winds, and we expected to see the produce something better than that commonly seen in the hedgerows, but it has never been so, and now we only keep them to point out their deceptive qualities. I should have thought that they would have done in either Devon or South Wales, but it appears not, and it would be interesting to know the position in which they do succeed. Are the instances of the description so numerous as to warrant anyone advising their general culture? I think not. Probably some may grow them against a wall, and then I would say it is good space badly used. Nothing which can be said or shown in their favour will induce me to have anything further to do with them.—J. MUIR.

[Our correspondent should try the Parsley-leaved Bramble; we have seen it producing finer clusters of fruit near Sheffield than that represented in the engraving on page 409, last volume. Perhaps Mr. Woodcock will oblige with a note on this variety. We think Mr. Ward of Longford Castle has written approvingly of the Kittatinny.]

PRIZE PANSIES.

PANSIES are so beautiful in the spring and early summer that many admirers of these flowers will be glad to know the names of the varieties that won the silver medals at the Waverley Pansy Society's Show recently held at Galashiels.

SHOW PANSIES.—In the nurserymen's class for twenty-four blooms the silver medal was won by Messrs. Wm. Paul & Son, Paisley, with perfect flowers of Artemis, Andrew Miller, Patrick Barr, Harry Paul, J. P. Barbour, and Rev. J. Morrison, dark selfs; Gomer and Geo. Rudd, yellow selfs; Mrs. Dobbie and Mrs. Turnbull, white selfs; The Mede, Mrs. J. Miller, Mrs. J. G. Paul, Mrs. D. Wallace, Miss Meikle, Jessie Foote, and Nelly Corbet, white grounds; Try Me Oh! J. B. Robertson, Lizzie Bullock, D. Dalglish, A. Henderson, D. Robertson, and No. 1 Seedling, yellow ground. In the gardeners' and amateurs' class for eighteen Show Pansies, Mr. Jas. Skinner, Penicuik, won the silver medal. He had fine examples of A. Miller, Peter Lyle, and Mauve Queen, dark selfs; Gomer, yellow self; Agnes Fairgrieve, white self; Mrs. J. G. Paul, Miss Ritchie, Jessie Foote, Miss Barr, and Miss Meikle, white ground; R. Donaldson, J. Buchanan, and J. B. Robertson, yellow grounds.

FANCY PANSIES.—In this class the silver medal was obtained by Mr. J. Sutherland, Lenzie, with grand blooms of Catherine Agnes, D. Main, W. McIntosh, Mrs. J. Stewart, Mrs. McTaggart, J. Murray, Perfection, John Stewart, May Tate, Miss Reeve, General Grant, Mrs. Findlay, Ruby, Mrs. Murdock, Earl Beaconsfield, Miss Bliss, W. Dickson, Mrs. Duncan, D. Wallace, and seedlings. For eighteen Fancy Pansies the silver medal was awarded to Mr. Jas. Gowans, Hawick, whose lot included superb blooms of May Tate, Miss Bliss, Catherine Agnes, Jas. Gardner, A. McMillan, Perfection, Rev. J. Graham, Mrs. Jamieson, Mrs. Barrie, W. Cathbertson, and Miss Reeve.

The best flower (Show) in the Exhibition was awarded Mr. J. Black for Miss Bowie, a beautiful primrose self. The best flower (Fancy) to Messrs. R. B. Laird & Sons for Miss Bliss. The best white ground (Show) to Mr. J. S. Armstrong for Jessie Foote. The best yellow ground (Show) to Mr. Jas. Bowie, Galashiels, for David Dalglish.

The above list will be useful to those cultivators who desire to add good varieties to their collections.

SHADING.

NOTING the remarks of "Northern Gardener" on page 507, last volume, I am disposed to keep the ball rolling on the above subject. My remarks, however, will refer especially to Cucumbers. I am more and more convinced that if the roots are right as far as water is concerned very little shading is required. I do not say shading is not necessary at times. I know it is, but the less used the better; still it is a mistake to let the plant be exhausted before putting it on. These last few days of unsettled weather have been rather trying, so hot for a time, then cold and dull. No fixed law or rule can apply to individual cases or houses, an intelligent view and observation being the best guide.

Evaporation is good, but root-watering better; still in very bright weather damping the walls and pipes is very refreshing. I will leave plant-shading to plant-growers. As, however, I grow a few *Adiantums* I may say they luxuriate in my coolest vineries, and have an agreeable appearance in contrast with the Grapes.—CULTIVATOR.

RICHMOND SHOW.

JUNE 28TH.

By a carefully maintained progressive advance the Richmond Horticultural Society's Exhibition has been rendered one of the best in the neighbourhood of London, and with a continuance of the same judicious management there is little doubt that it will still further increase in popularity. The district is a good one horticulturally; and although really extensive gardens are few, there is a large number of moderate size in which examples of most skilful culture can be seen. The convenience of such a site as the Old Deer Park is another great factor in the success that has been attained, and the Society being powerfully and liberally supported by the local residents, has enabled the Committee to offer substantial prizes, the result being that in the majority of classes the competition is invariably keen. The Show for the present year was as good as its predecessors in many respects, but there was a noticeable falling-off in others, the collections and groups not for competition being scarcely so numerous. The fruit entries, too, we have seen more abundant. The plant classes were well filled, and some admirably grown specimens were contributed, Ferns, stove and greenhouse plants, Fuchsias, and others being in first-rate form. The weather fortunately proved more favourable than was expected in the morning, for with the exception of a few light showers the day was dry though not bright. Visitors assembled in considerable numbers, but the absence of the President the Duke of Teck, and Princess Mary, undoubtedly had a somewhat deterring effect.

ORCHIDS.

At previous shows these have not usually been adequately represented, but there was a decided change for the better last Thursday, as five good collections were staged in the class for six specimens, mostly of considerable merit. Mr. Child, gardener to J. Bell, Esq., Garbrand Hall, Ewell, was adjudged first honours for a very beautiful group, comprising some remarkable specimens. *Aerides Lobbi* with two branching spikes, one having five branches, was very noteworthy, as was also *Cypripedium Stonei* major, a grand plant with five spikes, having a total of twenty flowers; this is a fine variety of this beautiful species, and the plant is one of the largest and best in cultivation. *Aerides odoratum majus* with five spikes, *Vanda suavis*, and *Brassia maculata* were also of unusual merit. Mr. James, Castle Nursery, Lower Norwood, took the second position with several fine *Cattleyas*, *gigas*, *Mendeli* (eighteen flowers), and *Mossiae* (fourteen flowers), the new and distinct *Odontoglossum cordatum aureum* having fine spikes of its yellow-tinted flowers. Mr. Wiggins, gardener to H. Little, Esq., was third, showing *Vanda Dennisoniana* well flowered, but apparently several plants in a pot, *Dendrobium snavissimum*, *Thunia Marshallii*, and *Dendrobium Dearii* with eleven spikes, an extremely good example, for which a certificate of merit was deservedly awarded.

STOVE AND GREENHOUSE PLANTS.

A large display has been provided in these classes, but very rarely have the plants been in better condition both as regards health and floriferousness. Messrs. Jackson & Son, Kingston, were well to the front with nine specimens, as even and neat as could be desired. The *Ericas ventricosa*, *Bothwelliana*, and *ferruginea* major were especially notable as beautiful examples of culture and training. *Franciscea calycina* major, *Allamanda cathartica*, and *Statice profusa* were similarly fresh and praiseworthy. Mr. Child was a good second, his plants being very healthy, and including amongst the best *Bougainvillea glabra*, *Clerodendron Balfourianum*, and *Aphelexis macrantha purpurea*. The special prizes offered by F. Coleman, Esq., Cumberland House, Kew, for the best single specimen plant in flower brought a number of competitors, all showing very well. The chief struggle was, however, between Mr. Hinnell, gardener to J. Davies, Esq., Anglesea House, and Mr. Child, the former having a beautiful globular-trained specimen of *Phœnocomma prolifera Barnesi*, about 3 feet in diameter, in perfect health and well flowered; the latter showing a magnificent *Erica depressa* over 4 feet in diameter and very healthy. The Judges hesitated over these two plants, ultimately deciding in favour of the *Phœnocomma*, a decision that was generally approved, though the merits of the two were so nearly equal. In the local class for six stove or greenhouse plants Mr. Bates took the lead, showing an extremely fine *Impatiens Sultani* about 4 feet in diameter, and almost covered with its bright rosy-scarlet flowers.

Fuchsias were beautifully shown—tall conical-shaped plants, profusely flowered, and not too rigidly trained. Mr. T. Bond, gardener to Mrs. Evans, Beech Holme, New Hampton, was first with nine fine plants, Earl of Beaconsfield, Wave of Life, and Mrs. Lye being the best and brightest. Mr. Morrell secured the second position with smaller but similarly well-flowered plants. Messrs. Morrell and Prickett were the chief exhibitors in other local classes for Fuchsias, each staging good plants.

Show and Fancy *Pelargoniums* were shown by Mr. C. Turner, Slough, and Mr. Wiggins, who were placed respectively first and second in the two classes, the plants being similar to those staged at the *Pelargonium* Society's Show two days previous.

FINE-FOLIAGE PLANTS.

The general good quality of other exhibits was largely shared by these, especially in the class for the Duke of Buccleuch's prizes, in which Mr. Munro, gardener to Lady Chichester, Cambridge House, Twickenham, won the first position with six fine plants. The *Dracænas* were unusually good, vigorous, and handsomely coloured, *D. Youngi* and *D. Baptisti* being first-rate. *Areca lutescens*, too, was of considerable size, and several richly coloured *Crotons* were included. Mr. Gregory, gardener to J. F. Wigan, Esq., Bushy Bank, Twickenham, followed closely; *Caladium Belleynei*, *Corypha australis*, and

Croton variegatus being the most notable plants. Mr. Bates was third also with fine plants, his *Ananassa sativa variegata* being one of the best we have seen.

FERNS.

Several well-grown collections of Ferns were entered, though specimens of the gigantic dimensions sometimes seen at shows were absent. Mr. Morrell staged the best eight exotic species, *Davallia Mooreana* in the freshest health and with very large and handsome fronds forming the chief feature; *Gymnogramma peruviana argyrophylla*, *Adiantum gracillimum*, *A. concinnum latum*, and *Microlepia hirta cristata* constituting the best of the other plants. Messrs. Fromow & Son, Turnham Green, took the second place, their finest plants being *Davallia bullata* and *Dicksonia antarctica*. Mr. G. Stevens, Putney, was third with smaller plants. In the class for six specimens Mr. East, gardener to F. Wigan, Esq., Elm Lawn, East Sheen, won leading honours, followed by Messrs. Morrell & Prickett, gardener to Dr. Francis, Richmond, who were also the prizetakers for twelve hardy Ferns. Mr. East was also the most successful exhibitor of *Caladiums*, securing the premier award with six handsome plants.

GROUPS.

One of the leading classes provided in the schedule is that for a group of plants, in or out of flower, arranged for effect in a space not exceeding 100 square feet, the prizes being £5, £4, £3, and £2. Four competitors entered the lists, and their groups, though differing greatly in style, all possessed considerable merit. Messrs. Hooper & Co., Covent Garden, were adjudged the premier award for a free arrangement of Palms, *Aralias*, *Dracænas*, and the new *Spiræa palmata*, on a ground of *Adiantums*, *Begonias*, and *Caladiums*, the margin being formed of *Gynura aurantiaca* and *Isolepis gracilis* alternately, which had a very pretty effect. Mr. James took the second position with a choice collection of Orchids (the *Cattleyas* being very fine), Ferns, and *Selaginellas*; but it was rather too thin, the pots being unpleasantly prominent. The latter defect was most carefully avoided in the third-prize group from Mr. Brown, Richmond, who had a somewhat flat ground of *Adiantum cuneatum*, *Caladium argyrites*, *Asparagus plumosus*, *Crotons*, and *Coleuses*, from which arose taller Palms, *Dracænas*, *Crotons*, *Spiræa palmata*, &c. In general effect this was superior to the previous one, and many visitors thought it deserved the second place, in accordance with the terms of the schedule, though in value Mr. James' group was far ahead. Messrs. Fromow & Son, Turnham Green, were fourth with a mixed arrangement of Palms, *Kalosanthes*, *Liliums*, *Crotons*, *Gloxinias*, and other similar plants.

In the class for a group to occupy a space of 50 square feet the prizes were offered by C. Turner White, Esq., of Kew, and the competition was very keen. Mr. Hinnell won the chief prize with a very simple but tasteful group, consisting of a centre *Cocos*, a *Dracæna* on each side, two similarly placed *Aphelexes*, with a ground of *Adiantums* and a few *Gloxinias*. Mr. C. Waite, The Gardens, Glenhurst, Esher, followed, having a pretty combination of *Campanula pyramidalis alba*, *Begonias*, *Coleuses*, *Roses*, and *Gloxinias*, neatly margined with *Isolepis* and *Selaginellas*.

Gloxinias, *Hydrangeas*, *Tuberous Begonias*, table plants, and *Achimenes* were well represented, the first and last-named being very fine. The principal prizewinners were Messrs. Attrill, gardener to C. J. Freake, Esq., Bank Grove, Kingston; Sallows, Munro, Prickett, Bates, Hickle, gardener to W. Cunard, Esq., Lebanon House, Twickenham, Beckett, and Brown.

Cut flowers were shown in good numbers, especially *Roses*, which were remarkably fine. In the nurserymen's classes the blooms were fresh and bright. Messrs. C. Turner, Slough; Paul & Sons, Cheshunt; and Rumsey, Waltham Cross, securing the leading awards. Amateurs also showed well, especially Mr. Warwick, gardener to J. P. Kitchin, Esq., Manor House, Hampton, who took the principal prizes. Messrs. Moorman, gardener to Miss Christy, Coombe Bank, Kingston; Berry, gardener to the Countess of Melville and Leven, Roehampton House; and J. Rae, gardener to W. Furge, Esq., Roselands, Teddington, secured the most important of the remaining awards. Stands of flowers, bouquets, and buttonholes, &c., were numerous, Messrs. Brown of Richmond, and Chard of Clapham Common, winning chief honours. Mrs. Bown, Gunnersbury, also contributed some pretty stands, winning the Duke of Teck's prize.

FRUIT.

The leading class in this section was that for six dishes; Mr. Hudson, gardener to J. Atkinson, Esq., Gunnersbury House, securing the first prize; Black Hamburg and Foster's Seedling Grapes, both well ripened and of good colour, Lord Napier Nectarines, Condor Peaches, and Scarlet Premier Melon being also fine. Mr. J. Fry, gardener to L. J. Baker, Esq., Haydon Hall, Eastcote, Pinner, followed with Muscat of Alexandria Grapes, *Violette Hâtive* Nectarines, and *Grosse Mignonne* Peaches amongst the best dishes. Mr. Hopkins, gardener to R. Thornton, Esq., Highcross, Framfield, Sussex, was third. For three bunches of black Grapes Mr. Hudson won chief honours in a class of seven competitors with magnificent bunches of *Madresfield* Court, grand in shape, size of berry, and colour. These well deserved their position, though possibly a few days later they would have been in even better condition. Mr. P. Feist, gardener to R. J. Ashton, Esq., Bishopsgate House, followed, and Mr. G. Thomson, The Gardens, Croxby House, Hounslow, was third. In the white Grape class Mr. Cakebread, gardener to Sir Philip Rose, Bart., Keymers, was first with Foster's Seedling, Messrs. Feist and Wagstaff following closely, each with Muscat of Alexandria less perfectly ripened. In other local Grape classes Messrs. Munro, Barnes, Merry, Bates, and Wagstaff were the winners. Mr. Heckle was first with a dish of Strawberries, uncommonly fine examples of James Veitch large and well ripened.

Vegetables were represented by several good collections, very fresh and well grown. Messrs. C. Waite, Higginson, Morrell, Coombes, Munro, and Edy securing the principal awards. The prizes offered by Messrs. Sutton and Sons, Reading, and Carter & Co., High Holborn, for Melons and Cucumbers were well contested, the latter being very largely shown.

THE DOUBLE WHITE AND BLUE CAMPANULA.—The former for indoor vase or bouquet decoration, or for effect in mixed borders, remembering how very little trouble it gives and its continuous blooming habit

until winter comes, is one of the best outdoor white flowers we have. It has been in bloom here for the past fortnight, but the double blue has only just expanded. There is a rather disagreeable mixture of white in the petals that takes from its effect, besides the habit of not opening so fully and regularly as the white. However, both should be companions in every mixed border. The figure given in Mr. Ware's catalogue does not do justice to *C. roseiflora alba fl.-pl.* I saw better flowers at Hale Farm last autumn. Mine is as double as a white Camellia.—W. J. M., *Clonmel.*

THE WEATHER IN LONDON during the close of last week and the beginning of this has been excessively hot. On Monday the thermometer in the shade ranged from 87° to 89°. Yesterday (Wednesday) morning there was a steady rain, which was very acceptable.

— WE are informed that Mr. FOSTER of the firm of Foster and Pearson, Horticultural Works, Beeston, Nottingham retired from the firm on June 30th, after being forty-two years engaged in building greenhouses. The business will be continued by Mr. Pearson.

— A MARECHAL NIEL ROSE growing at Messrs. Dicksons & Co. of Edinburgh, is not unremarkable. Planted on the western side of the house, the tree branches out 60 feet by 20, and has often borne one thousand blooms and buds at the same time. The main stem is 5½ inches in circumference, and it has been eight years in attaining its present gigantic proportions. It blooms from April to November, and is the parent of many thousands of plants.

— MR. GILBERT of Burghley sent us last week a dish of WILSON'S EARLY ASHLEAF POTATO. He says it "may truthfully be described as a Myatt's for cropping, but is at least ten days earlier." The tubers resemble those of the valuable old Mouse-car Ashtop, and the flavour is very superior.

— A CORRESPONDENT states that the GOLDEN-LEAVED CAMPANULA PYRAMIDALIS is very attractive in the College Botanic Garden, Dublin, the foliage being of a fine golden hue that is striking amongst other occupants. This plant is not very well known in England, and it would be well worthy the attention of cultivators.

— WE also learn that NYMPHÆA ALBA VAR. ROSEA is flowering for the first time in Ireland at Kalcarragh, Wicklow, the residence of Mr. Acton. This is a charming variety of a beautiful plant, the colour being most soft and delicate.

— DR. STUART, Hillside Cottage, Chirnside, has sent us flowers of some of his SEEDLING AQUILEGIAS from crosses between *A. cærulea* and *A. chrysantha*. Some of these are in form peculiar, and in colour most pleasing, though unfortunately the flowers arrived in a much-dried state.

— AT a seasonable time we have received a copy of the "TOURIST'S GUIDE TO THE CONTINENT," edited by Mr. Percy Lindley for the Great-Eastern Railway Company. All travellers to Holland, Belgium, the Rhine, and Switzerland should possess this guide, which is printed on the dry-rolled American system, is attractive by its sepia plates and photo-etchings, is interesting, instructive, useful, and at its price, 6d., is marvellously cheap. This is the fifth annual issue of the Guide, and is a striking advance on the previous series.

— AT a recent meeting of the Sheffield Floral and Horticultural Society, Mr. J. Udale, gardener to H. E. Watson, Esq., Shirecliffe Hall, Sheffield, read an exhaustive paper upon the HISTORY AND CULTIVATION OF THE CHRYSANTHEMUM, which was greatly appreciated by the audience, and a desire was expressed that it be published.

— A CORRESPONDENT states that VEGETATION ABOUT SHEFFIELD is looking remarkably clean, strong, and healthy. There is promise of splendid crops of hardy fruits, especially Pears, Strawberries, and bush fruits, and he never saw Peas looking more robust and healthy than is the case generally this season.

— THE CELERY FLY is unusually prevalent in the neighbourhood of London, some of the market gardens in the valley of the Tham

being greatly infested with this pest. We hear that one method adopted to remove it is cutting the older leaves close down to the heart of the plant, the young growth being expected to come clean and uninjured. This appears to be an extreme measure, but it is said to prove efficacious, and that is sufficient to recommend it when a whole important crop is in danger of being destroyed.

— IT may be useful to some gardeners to know that a PLEASANT AND WHOLESOME BEVERAGE for the hot weather can be readily made by mixing a little fine oatmeal in water, adding if desired a little sugar or a lemon. Larger quantities of this can be safely drunk than either of water alone or beer, and in some public establishments around the metropolis where a large number of men are employed a considerable quantity is used.

— A CORRESPONDENT writes:—"The long DROUGHT IN SCOTLAND is now at an end. For some time slight showers have been prevalent, but only damping the surface. A steady downpour, however, followed, and with warm weather it will do immense good. The rain just came in time for Strawberries in the garden and Turnips in the field—indeed, for everything, as most crops were suffering."

— MR. W. TAYLOR'S work on the VINES AT LONGLEAT, as we have previously announced, has been translated into French by M. H. Fonssey, and published in the "Bulletin de la Fédération des Sociétés d'Horticulture de Belgique," and it is now issued in separate form of royal 8vo. size, containing seventy-four pages, bound in paper covers. We understand that Mr. Taylor's idiomatic English caused the translators considerable difficulty in some cases, but the meaning has been very truthfully rendered.

— MR. J. CROSSLING, The Gardens, Felton Park, Acklington, sends us fine branches of the beautiful PHILESIA BUXIFOLIA, of which we gave an illustration on page 493, vol. iv. The flowers were large, of fine colour, and borne freely on the branches, and they have lasted remarkably well, keeping fresh out of water for three or four days. It is a handsome shrub, and the durability of its flowers well entitles it to notice. Mr. Felton's plants are evidently exceedingly well grown, the fine foliage and vigour of the specimens being remarkable.

— SOME of the finest specimens of the bright and charming BEGONIA FUCHSIOIDES are in the handsome conservatory at Sundridge Park, the residence of Sir E. Scott, Bart., Bromley, Kent. They are trained to the pillars, forming dense bushes upwards of 20 feet high, and laden with their rich coral-scarlet flowers they have a magnificent effect. For such places this distinct Begonia is admirably adapted, and when trained on arches over a path the drooping clusters of bright flowers are very telling.

— IN the same house GLADIOLUS COLVILLI AND ITS VARIETY ALBUS are largely grown for decorative purposes, and they have a fine effect, also proving useful for cutting. Mr. S. Lyon finds the white variety very useful, and intends growing it much more extensively another season.

— A SCOTTISH gardener writes:—"Here is a curious fact in connection with PLANTING IN LEAF SOIL. We had a good deal of shrub-planting to do the past winter and spring. Several large clumps of Rhododendrons were also formed. The beds for these latter were covered 9 inches thick with rough leaf soil, and amongst this the plants were put out. It takes four men and two horses one to two days every week carrying and supplying water to the other shrubs in order to keep them growing. These Rhododendrons are producing strong young growths without having received any water. I examined them the other day and found the soil quite moist, and doubtless the roots of the plants are taking to it."

— FIGS IN THE OPEN AIR are still successfully cultivated in both Kent and Sussex, and nowhere probably better than in the garden of the Rev. Canon Jeffreys at Hawkhurst. Old slow-growing trees are the best, and in this state require and receive a liberal top-dressing of manure. The growth they make seldom exceeds 6 inches, and is very stout and short-jointed. Vigorous young trees are not hardy, and in districts where frequently cut down by frost they seldom form sufficiently ripened wood to produce fruit. To insure short-jointed prolific growth on comparatively young trees they should be planted in a rather poor compost, consisting of at least one-third old mortar rubbish. The hottest corner of the garden

walls is best suited for Fig culture, and where the trees are in full bearing no pruning other than occasionally cutting hard back a few main branches to secure sufficient growth to furnish the centre of the tree. The Brown Turkey is the heaviest cropper, and Brunswick also fruits fairly well.

— THE magnificent collection of HARDY FLOWERS FROM MR. WARE'S HALE FARM NURSERY, shown at Kensington last week, was generally admitted to be one of the finest that has ever been exhibited, which deserved an even higher honour than the silver medal awarded for it. Amongst the many specimens of fine plants included the following were conspicuous:—*Delphinium*, numerous hybrid varieties; *Inula oculus-Christi*, *Lychnis viscaria splendens plena*, new; *Spiraea aruncus*, *Campanula glomerata dahurica*, *Hesperis matronalis alba plena*, *Lathyrus grandiflorus*, *Lilium pomponium*, *L. colchicum*, *L. parvum*, *L. martagon*, *L. m. purpureum*, *L. m. candidum*, *L. longiflorum*, *L. auratum*, *L. pardalinum pumilum*, very rare; *Tropæolum polyphyllum*, *Onosma taurica*, *Cyclobothra pulchella* and *alba*, *Polemonium Richardsoni*, *Phlox ovata*, *Pyrethrum*, single and double forms; Pinks in all the finest forms, including the new white var. *Mrs. Sinkins*; *Antirrhinums*, many varieties; *Pentstemons*, many varieties; *Dictamnus Fraxinella* and *alba*; *Armerias*, gigantic varieties; *Sidalcea candida*, *Senecio japonicus*, *Campanulas*, many varieties; *Gladiolus Colvilli* and its var. *The Bride*; *G. ramosus* in variety; *Iris*, English and Spanish, a fine collection; *Ixias*, a choice collection; *Cypripedium spectabile*, *Orchis foliosa*, *O. maculata superba*, *O. hircina* (*Lizard*), rare; and many other varieties of fine herbaceous plants.

BROMLEY (WEST KENT) SHOW.

JUNE 30TH.

FOR several years past an attractive Exhibition has been annually held in the neighbourhood of Bromley, Bickley, and Chislehurst, the most recent Shows having had for their site the grounds of Camden House; this season, however, by the courtesy of Sir Edward Scott, Bart., the garden at Freeland House, Sundridge Park, was placed at the disposal of the Society, and the Exhibition was in consequence held there. The situation is a pretty one, and the weather proving very fine, though hot, a number of visitors assembled. The exhibits were well arranged, but the entries were not quite so numerous as we have seen at previous Shows, the not-for-competition groups, which were formerly so largely shown by metropolitan nurserymen, being much fewer. The majority of the plants were, however, very healthy and fresh, the fruits fairly good, and the vegetables first-rate.

STOVE AND GREENHOUSE PLANTS.—Well-grown specimens of these were shown by several exhibitors, Mr. Gibson, gardener to T. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, being first for six with even globular specimens of *Dipladenia reginae*, *Allamanda Hendersoni*, *Dipladenia amabilis*, *Stephanotis floribunda*, *Clerodendron Balfourianum*, and *Statice profusa*, all in fine condition. Mr. J. Mitchell, gardener to Mrs. Arbuthnot, Bexley, was second, his most notable plant being *Araucaria Bidwilli*, 6 feet high. *Fuchsias* were profusely flowered, especially in the collections from Messrs. Mitchell, J. Eggleton, gardener to The Mount, Shortlands, and James Wright, gardener to J. W. Perkins, Esq., Woodfield, Beckenham, who were the prizetakers. *Gloxinias* were well shown by Messrs. H. Turner, J. Sterry, gardener to J. Scott, Esq., Abbyfield, Bickley Park, and J. Neighbour, The Gardens, Bickley Hall.

A pretty display was formed by the Tuberous *Begonias*, Mr. Mitchell taking the lead with six handsome specimens bearing large and richly coloured flowers, healthy vigorous plants—seedlings raised by the exhibitor; one, *Pink Perfection*, with fine rounded flowers, being uncommonly good. Messrs. Stens and Neighbour were second and third in a class of eight exhibitors.

FINE-FOLIAGE PLANTS.—In the class for six specimens Mr. Mitchell took the lead with *Anthurium crystallinum*, *Croton Johannis*, *C. Queen Victoria*, *Maranta bella*, and *Pandanus Veitchii*, fresh, healthy, and most satisfactory generally. Mr. Gibson was a close second, having two grand plants of *Alocasia Lowi* and *metallica*. Mr. H. Turner, gardener to G. Phillips, Esq., Elmstead Lodge, Chislehurst, was third, *Alocasia albo-violacea* and *esculenta* being the best.

Fine-foilage *Begonias* were admirably shown by Mr. G. Spittles, gardener to W. A. Bradford, Esq., Elmstead Lawn, Chislehurst; Mr. J. Sharpe, gardener to F. Hatchett, Esq., Parkfield Grove Park; and Mr. R. Teal, gardener to A. M. Tapps, Esq., The Gables, Shortlands. Mr. Mitchell had the best four *Dracænas*—finely coloured specimens of *amabilis*, *Baptisti*, *Youngi*, and *voluta*, Mr. Sharpe following.

FERNS.—These are invariably well represented at the Bromley Show, and the present time was no exception to the rule. Mr. Mitchell had the best six, extremely vigorous plants of *Gymnogramma Wetenhalliana*, *Adiantum gracillimum*, *Neottopteris australasica*, *Platyterium grande*, *Adiantum cuneatum* and *A. macrophyllum*. Mr. H. Turner and Mr. T. Gearing, gardener to S. Williams, Esq., Blackbrook, Bickley, were second and third, each with fresh healthy examples. Hardy Ferns were finely shown by three exhibitors, Mr. J. Neighbour being first with six beautiful examples, *Athyrium F.-f. Victoriae*, *Adiantum pedatum*, and *Osmunda regalis cristata* being very noteworthy. Mr. Gearing was second, and Mr. C. Saunders, Barnes Wood, Bromley Common, was third. Mr. Mitchell had the finest specimen Fern—*Gymnogramma chrysophylla*, very large and healthy, about 4 feet in diameter. Messrs. Eggleton and Spittles were second and third with *Adiantum cuneatum*. Mr. Cooper, gardener to M. Yeatman, Esq., Shawfield,

Bromley, was first with six *Selaginellas*, very neat fresh specimens. Messrs. J. Neighbour and Mitchell followed with good but less fresh plants.

The groups were not remarkable for the taste displayed in their arrangement, though healthy well-flowered plants were employed. Mr. Mitchell was first with a collection of Palms, *Clerodendron fallax*, *Coleuses*, *Caladiums*, a few Orchids, and a pretty margin of *Adiantum cuneatum*. Messrs. Gibson and Teal were second and third, the latter having some fine *Hydrangeas*.

ROSE BLOOMS.—An extensive and beautiful display of Rose blooms was provided—quite an exhibition in itself, the flowers fresh, bright, and of good substance. Messrs. Paul & Son, Cheshunt, took the lead with forty-eight varieties (triplets), a remarkably handsome collection. Messrs. Banyard & Co., Maidstone, and Mr. W. Rumsey, Waltham Cross, were respectively second and third with fine blooms, very close to the others in merit. Messrs. Paul and Son were also the most successful with twenty-four varieties of similar quality, followed by Messrs. B. R. Cant (Colchester), and W. Rumsey. In the twelve Messrs. B. R. Cant, Paul & Son, and Rumsey secured the prizes in that order. For twelve of one variety Messrs. Banyard won chief honours with *François Michelin* in fine condition, Mr. Rumsey taking the second place with *Madame Gabriel Luizet*, fresh and good, Messrs. Paul being third with the same variety. The amateurs' classes were not quite so well filled as usual, nor were the blooms generally of the best quality. The principal prizetakers were Mr. A. Gibson, the Rev. J. M. Fuller, Bexley Vicarage, and Mr. J. Sharpe.

HARDY FLOWERS.—Two beautiful collections of these were staged, each including a large number of species and varieties. Mr. Maynard, gardener to J. Whitehead, Esq., Southwood, Brockley, was placed first with a very choice collection, but carelessly and inaccurately named, the spelling being very imperfect. Fine examples of *Geranium armenum*, *Onosma taurica*, *Armeria cephalotes*, *Stenactis speciosa*, *Inula glandulosa*, *Delphinium formosum*, and *Anchusa italica* amongst many others, seventy-six forms being shown. Mr. H. Cole, gardener to J. A. Mitchell, Esq., Woodlands, Chislehurst, was second with eighty-four varieties, including many beautiful plants, but less choice than the preceding, and comprising several that were not true perennials. In other cut-flower classes Messrs. Mitchell, G. Wynn, gardener to H. Morris, Esq., Hayes Common; J. Mumford, J. Wright, J. Neighbour, and T. Gearing were the prizetakers. Master Frank E. Wood, 10, Park Grove, Bromley, had a fine collection of Grasses, sixty species, very accurately and neatly named, both common and botanical names being given. First to Miss Yeatman, also 160 varieties of wild flowers.

FRUIT.—There was not a large display of fruit, but Strawberries were well shown. For a collection Mr. J. Neighbour was first with Black Hamburg and Royal Muscadine Grapes well ripened, Golden Perfection Melon, and good dishes of Nectarines and Melons. Mr. Tucker, gardener to J. L. Lovibond, Esq., Farnborough, was second, Early Alfred Peaches and *Violette Hâtive* Nectarines being the best dishes. For a dish of Strawberries of one kind Mr. G. Tucker, gardener to J. L. Lovibond, Esq., Farnborough, was first with *President*, large and well ripened. Mr. T. Spittles was second with *James Veitch*; and Mr. Turner third with the same variety. For three dishes Messrs. Neighbour and Cooper were the prizetakers, the first with Sir Joseph Paxton, *James Veitch*, and Sir Charles Napier. Mr. Gibson had the best three bunches of black Grapes (*Black Hamburg*), large in bunch and berry. Mr. J. Neighbour followed with the same variety, smaller, but well coloured. Mr. J. Mitchell was third, also with *Black Hamburg* in good condition. Mr. Mitchell was first with three bunches of *Muscat of Alexandria*, and one bunch of the same variety, all being well coloured. Mr. Waterman had the best Nectarines (*Elruge*), and Mr. Neighbour the best Peaches (*Royal George*).

VEGETABLES.—Several clean and satisfactory collections of vegetables were shown. Mr. Waterman, gardener to H. A. Brassey, Esq., M.P., Preston Hall, Aylesford, was first with nine kinds, including fine Telephone Peas, American Wonder Beans, *Vick's Criterion* Tomatoes, *Myatt's Ashleaf* Potatoes, and White Italian Onions. Mr. J. Neighbour and Mr. W. Gammon gardener to C. Boosey, Esq., The Pines, Bickley Park, were second and third, each with good collections. For six kinds Messrs. Cooper, Cole, and Humphrey were the prizetakers.

DINNER TABLE DECORATIONS.—As usual, some exceedingly tastefully arranged tables were entered in this section. For a table 10 feet by 5 feet Mr. Sentance, Merevale, Bickley Park, was placed first with three centre-glass globes filled lightly with varieties of Irises (blue, yellow, and white), *Adiantums*, and Grasses, side glasses being filled with Irises and *Aquilegias*, chiefly *chrysantha*. Twelve small glasses contained each a yellow Iris or *Aquilegia* bloom, with a few leaves of *Caladium argyrites*, *Coleus* leaves, *Adiantum*, and *Aira cœspitosa*. The general effect of this was most pleasing, simple but effective. The second prize was awarded to Mrs. J. Scott; and Mrs. T. A. Mitchell, Elmstead, Chislehurst, had an even more simple arrangement—a central bowl filled with blue, yellow, and scarlet *Aquilegias*, the last being round the base, with *Adiantum* fronds and a few Grasses. Two side stands were similarly filled, four small neat glasses being filled very lightly with Grasses, yellow *Aquilegias*, *Dracophyllum gracile*, and *Saxifraga* blooms. The Misses R. A. Tweedell and R. H. Alston, Bonnington and Fairfield, were third. The best table 5 feet by 5 decorated with foliage and flowers of British plants only was contributed by Miss A. Sentance, Merevale, Bickley Park, the flowers employed being chiefly Iris *pseud-acoris*, *Myosotis palustris*, single Roses, and Grasses. The second position was obtained by Mrs. Emily Wood, 10, Park Grove, Bromley, with a very tasteful arrangement, a central basket of *Nymphaea alba*, *Nuphar lutea*, *Myosotis*, *Centaureas*, and similar flowers, with Ox-eye Daisies and Grasses. The best bouquets and buttonholes were from Mr. H. Cole and Mr. J. Mitchell. Mrs. Scott showed the best basket of miscellaneous flowers; Messrs. Ponsford & Son, Bromley, contributed several bouquets and wreaths not for competition.

MISCELLANEOUS.—The following were the principal not-for-competition collections, for which extra prizes were awarded. Mr. B. S. Williams, Upper Holloway, exhibited one of the finest groups in the Show, comprising a great number of choice Orchids, Crotons, Ferns, and miscellaneous stove and greenhouse plants. A beautiful pan of *Anæctochilus*, *Goodyeras*, and *Sonerilas* was especially notable. Messrs. J. Laing & Co., Forest Hill, staged a showy and attractive group of fine-foilage and flowering plants, Tuberous *Begonias*

being especially well represented by a large number of the finest varieties in cultivation. Caladiums were similarly good. Messrs. H. Cannell & Sons, Swanley, contributed a beautiful collection of Pelargoniums, both flowers and plants, Verbena and Pansy blooms, and handsome spikes of Delphiniums, representing a number of superb varieties. The blooms in this contribution was greatly admired by the visitors. Mr. W. Pinyon, Chislehurst, exhibited a number of spikes of Foxgloves, Delphiniums, Campanulas, Pentstemons, Antirrhinums, and blooms of a clear yellow Picotee named Imperial Yellow. Mr. J. Mumford, Elmstead Grange, Chislehurst, staged a beautiful group of Orchids, stove and greenhouse plants, Ferns, &c. Several good plants of *Odontoglossum vexillarium*, *Aerides Lobbi*, and *Masdevallia Lindeni* were included; a central plant of *Anthurium Schertzerianum* with about three dozen spathes being conspicuous in the group. *Erica depressa* and *Gloxinias* were also well represented.

ROCKERY PLANTS IN FLOWER.

THE following plants were flowering in June, and are planted in various positions in the rock garden here. It will be seen that a very large number are natives of this country, nevertheless they will hold their own for beauty with many of the exotic kinds.—A. HARDING, *Orton Hall Gardens, Peterborough.*

Verbena Impératrice Elizabeth	Iberis corifolia
Allium Moly	Achillea tomentosum
Geutiaua acaulis	Papaver cambricum
Geranium cinereum	Dracocephalum Ruyschianum
" Robertianum	" japonicum
Astragalus hypoglottis	Spiræa filipeudula
Lychnis alpina	" plena
" Flos-Jovis	Lonicera flexuosa
" dioica rubra	Yellow Austrian Briar
" " plena	Asperula odorata
" chalcidonica	Erodium Manescavi
Physalis Alkekengi	Cerastium tomentosum
Polygonum Brunonii	" arvense
Columbine	Listera ovata
Erinus alpinus	Orchis maculata
Lycasteria formosa	" mascula
Wild Roses	" papilionacea
Hemerocallis flava	" pyramidalis
Foxglove	" conopsea
Pæonia tenuifolia	Aceras anthropora (Man Orchis)
Thalictrum minus	Ophrys apifera (Bee Orchis)
" majus	Gaillardia picta
Lilium tigrinum	" Lorenziana
" candidum	Campaula Medium, blue
" " variegatum	" " white
Vinca minor atro-purpurea	" " rose
" " alba	" " rhomboidalis
" " major	" " pumila

" " elegantissima	Stellaria graminea
Koniga variegata	Gnaphalium dioicum
Heuchera lucida	Iris pumila in variety
Helianthemum Innocenze	" " germauca
" " croceum	

JAMES VEITCH STRAWBERRY.

I WAS particularly struck to-day with fruits of the above Strawberry. In the first place they were large, the three heaviest weighing 4 ozs., then the flavour is good, yet not to be compared to either President or Sir Joseph Paxton, and lastly the plants are very prolific. I have taken no particular pains to make these especially good as I have not time, so should think on stiff cold soils James Veitch would do well. It is strong-growing, so will do with plenty of room. It is a capital Strawberry for travelling, being very firm. One fruit in each truss is cockscomb shape, and the fruitstalk so strong that I had to cut with knife,

though I generally find my fingers and thumb strong enough. The remaining fruit were in shape very much like Sir J. Paxton; the colour, however, is not very bright. I intend planting a good batch of this variety.—S. C.

CROYDON SHOW.

JUNE 27TH.

OWING to the postponement of the Cardiff Show this may be taken as the first Rose show of the season; and a very good commencement it was, the blooms being extremely fresh, brightly coloured, and mostly of fine substance, constituting the chief feature of the Show. Miscellaneous plants were, however, admirably represented by healthy well-grown specimens of moderate size generally, though some large specimens were staged in the classes for fine-foliage plants. Two spacious marquees were devoted to the exhibits—one to the Roses, cut flowers, table decorations, and fruit, the other to the groups and plants, which were arranged very effectively; indeed, the whole management of the Show was most satisfactory, and creditable to the energetic Secretary, Mr. A. C. Roffey, whose efforts to render the Exhibition successful have been so frequently crowned with success.

ROSES.

Prominence is given to these because they amply merit it, both on account of their numbers and quality. The leading class in the nurserymen's section was for forty-eight blooms, Mr. W. Rumsey, Waltham Cross, securing chief honours with handsome blooms of Horace Vernet, Souvenir de Spa, Ulrich Brunner, fils, A. K. Williams, Duke of Teck, La France, Marie Verdier, Gabriel Luizet, and Niphetos. Messrs. G. Bunyard & Co., Maidstone, were placed second; and Messrs. Piper & Son, Uckfield, third, each with good collections, the blooms rather smaller than the first. Five competitors entered the class for twenty-four, Mr. J. Mitchell, Piltdown, Sussex, winning first honours with good samples of Duchesse de Vallombrosa, Rubens, Madame Eugène Verdier, and Devoniensis amongst others. Messrs. Rumsey and Piper followed in that order. Mr. Mitchell was also first with twelve Teas, showing Perle des Jardins, Niphetos, Rubens, and Catherine Mermet very fine. Messrs. Piper were second, having Souvenir d'un Ami and Catherine Mermet excellent. For twelve blooms of one variety Messrs. Piper were first with Souvenir d'Elise fine and fresh; Mr. Rumsey following with a box of Le Havre, very handsome and highly coloured blooms.

The amateurs' classes were well filled, and the exhibits of good quality. For twenty-four blooms there were seven collections, Mr. A. Slaughter, Jarvis Villa, Steyning, securing the chief award for handsome specimens of Camille Bernardin, Etienne Levet, Marie Baumann, and Maurice Bernardin. Mr. J. Brown, gardener to A. J. Waterlow, Esq., Great Doods, Reigate, was a very close second, Auguste Rigotard, La France, Marie Baumann, and Dupuy Jamin being the most noticeable blooms in his stand. Mr. Budgen, gardener to G. Baker, Esq., Holmfels, Reigate, was third with a fair stand, including the best bloom in the open classes—a fine example of Charles Lefebvre, for which the National Rose Society's medal was awarded. Nine collections of twelve blooms were staged, Mr. Brown taking the first position; the Rev. Alan Cheales, Brockham Vicarage, Reigate, and E. Wilkins, Esq., Lyndhurst, Sutton, following as second and third.

Teas were represented by six stands of twelve, Mr. J. Brown winning the principal prize with handsome blooms of Madame Lambard, Innocente Pirola, Madame Welche, Jean Ducher, and Souvenir d'un Ami. Mr. Slaughter and C. E. Cuthell, Esq., West Humble, Dorking, took the remaining prizes. In other smaller classes R. E. West, Esq., Firth Dene, Reigate, and Penfold were prizetakers; E. Mawley, Esq., Addiscombe, being first with twelve and twenty-four in the district amateurs' classes. The best bloom in the local classes was Thomas Mills, shown by Mr. W. Jones, gardener to J. R. Bringham, Esq., Wallington.

GROUPS.

A considerable number of groups occupied a large portion of the plant tent, four or five classes being devoted to them. The largest were those in the class for nurserymen only, the group to occupy 100 square feet. Mr. A. W. Beedell, Wallington, secured the chief prize amongst these with a rich but rather formal arrangement of flowering and fine-foliage plants, such as Lobelias, Achimenes, Lilies, Ferns, Isolepis, and a central Cordyline. Mr. Chaff was second with a bright collection of Pelargoniums, Fuchsias, Heliotropes, &c.; Mr. Butcher, George Street, being third with a lighter arrangement of Hydrangea paniculata, Saxifraga pyramidalis, and Coleuses, with Adiantums and other foliage plants. For smaller groups the most successful exhibitors were Messrs. Elsey, F. W. Humc, King, Penfold, and Rodbourn, all contributing bright and pretty groups.

Orchids, though not in great abundance, were represented by several well-grown plants. Mr. King, gardener to Phillip Crowley, Esq., Waddon House, Croydon, staged the best six, comprising *Cypripedium vitellinum* with thirteen spikes, *Dendrobium suavissimum* with two spikes or about eighteen flowers, *Odontoglossum Alexandræ*, *Aerides Fieldingi*, and *Lycaste Deppei* were flowering freely, especially the last-named. Mr. Penfold, gardener to Canon Bridges, Beddington Park, took the second prize, having a good *Dendrobium densiflorum* and *Cattleya Mendelli*, the latter with nine flowers.

Stove and greenhouse plants were exhibited by Mr. Penfold in fine condition, his first-prize collection of six including *Dipladenia Brearleyana*, very healthy and bearing large flowers. *Rhynchospermum jasminoides*, *Kalosanthes coccinea superba*, *Dracophyllum gracile*, *Anthurium Schertzerianum*, and *Bougainvillea glabra* were also well-grown plants. Mr. King had the best single specimen *Clerodendron Balfourianum*, 4 feet high, globular, well trained, and freely flowered. In another class for stove and greenhouse plants Mr. Penfold was again first, a beautiful specimen of *Asclepias curassavica* 4 feet high, bearing some scores of flowers, being especially good.

Fine-foliage plants were rather more numerous than the preceding, Messrs. Penfold and King securing the leading prizes with handsome vigorous plants; the fine *Davidsonia pruriens* and *Thrinax elegans* from the former were particularly good, Mr. King showing a grand example of *Phyllanthus nivosus* 5 feet high. Ferns and Selaginellas were similarly well shown.

In the numerous other classes for Begonias, Petunias, Caladiums

FIG. 2.—RHODODENDRON EDINENSE.

Gloxinias, Achimenes, and Coleuses the principal exhibitors were Messrs. W. C. Stew, gardener to E. Parritt, Esq., Lower Addiscombe; Lover, gardener to W. Hodgson, Esq., Shirley; Rodbourn, gardener to Baroness Heath, Coombe House; Bruce, gardener to Mrs. Firth, Addiscombe Park; A. C. Roffey; Elsey, gardener to D. Cornish, Esq., Dagnal Park; and Welstead.

Fruits, cut flowers, and vegetables were chiefly shown by Messrs. Crouch, gardener to J. Cooper, Esq., Duppus Hill, Wellstead; Dobson, gardener to Miss Steyning, Addiscombe Road; A. Alderman, gardener to C. Czarnikow, Esq., Mitcham; Penfold, Miss Bishop, and Miss Cross, Addiscombe.

RHODODENDRON EDINENSE.

THIS very magnificent hybrid was raised several years ago by my friend Mr. Anderson-Henry of Hay Lodge, than whom there has been no more enthusiastic admirer and cultivator of the genus *Rhododendron*. It has the size and grandeur of *R. Nuttallii*, with a much better habit and more graceful foliage. Mr. Anderson-Henry was one of the first to hybridise with the splendid *Rhododendron* species discovered some thirty years ago in Sikhim and Bhotan. Between *R. Dalhousiæ* and *formosum* he produced *R. Henryanum*, figured in the "Botanical Magazine," and much admired. Using then the pollen of *R. Nuttallii* on his hybrid, he carried the mixture of species further, and produced the subject of the present figure, which is much below life size. At the first evening meeting of the Royal Horticultural Society this year I showed several very fine trusses. The great white Lily-like and scented flowers, well set off by the luxuriant foliage, attracted universal admiration, and the Editor of the *Journal of Horticulture* asked for a truss to figure, which I willingly gave, explaining that, although I had grown the plant for some years, my friend had raised and named it.

Of large, white, scented *Rhododendrons* there are undoubtedly already very many in cultivation, including true species and hybrids. Of the former *R. Maddeni* in various forms, *R. Edgeworthii*, *R. Veitchianum*, and, largest of all, *R. Nuttallii* may be specially mentioned. *R. Dalhousiæ* is generally more successful in a hybrid form than as a true species. Of hybrids, again, there are *R. Forsterianum*, most beautiful and delicate, and many others. Still, there is room for our present hybrid, which in some respects surpasses and differs from them all.

It furnishes, moreover, a curious example of breeding with a pure species (other than one of the parents) on a hybrid—an experiment very seldom successful among *Rhododendrons*. The pure species may in this case have been prepotent, but it has by no means entirely superseded the influence of the hybrid mother. Nor is the compound offspring apparently altogether sterile. I have induced it to ripen capsules and produce germinating seed under the influence of the pollen of a fourth species.

The plant from which my flowers were gathered for the meeting blossomed very freely during the month of April and the beginning of May in a cold house, where during the winter the thermometer frequently ranged only slightly above the freezing point. The flower buds, however, were entirely uninjured.—J. H. MANGLES, *Valewood, Haslemere.*

CANTERBURY ROSE SHOW.

THERE is no place where I would sooner commence my usual circuit of judging than the good old city of Canterbury—endeared to me by many associations, and bringing back my thoughts to a long-past time, before Rose shows were even thought of, and when none of those beauties on which we now feast our eyes were known. Hearty, too, is the favour which is accorded to our favourite flower, and kindly and brotherly the fellowship which is cultivated amongst its devotees; while some of its successful cultivators have made it famous in the Rose world. And I may at the outset say that it has well maintained its reputation by the Exhibition which was held to-day (the 29th)—not the first in the field, for the National took place at Southampton, and the Maidstone Show on the previous day (the 28th). I had to hurry away from a pleasant gathering at the former place in order to reach home, so as to be able to get down to Canterbury by an early train, for our southern lines are not very accommodating to the public; but, looking at the classes which were represented by amateurs at Canterbury and Southampton, I may say that the decided superiority rested with the former, and that the stands exhibited yesterday in eighteens, twelves, and sixes would have stood little chance with those shown to-day.

When I gave an account of my recent ramble among the Roses at Canterbury, I ventured to give as my opinion that of the three gardens which I visited—Mr. George Mount of Harbledown, Mr. Peckham of Hall Place, and Mr. W. Mount of Canterbury—would appear in the Exhibition lists in the order in which I have placed them, and it will be seen by the details of the prizes given below that my judgment was not far wrong. Again has the son of Vulcan forged his bolts with consummate skill, and, feeling his powers, has ventured into the higher classes, thus showing that he is as little wanting in courage as in skill. There are growers with twice his number of Roses who would be content to show in lower classes. Not so Mr. George Mount. With a consciousness of his powers, and with the flush of victory on him, he has ventured into the higher classes this year

and has carried off the highest honours. The Exhibition, with regard to another exhibitor, illustrated unfortunately the truth of the old saying, "There is many a slip between the cup and the lip." The Roses of Captain Bright at Bothing, which some of us had the pleasure of seeing last year, were in fine vigour, when a tremendous storm of hail cut off the greater portion of his blooms and riddled the foliage; so that he exhibited at a great disadvantage, and the wonder was that he exhibited in any form. On the other hand, the season and the day were both favourable to Mr. Peckham, whose beautifully situated residence at Harbledown nestles in warmth and shelter, and his best Roses have been generally over before the show day; but the early fixture this year just suited him. And now as to the awards.

In the class for eighteen blooms (amateurs) Mr. George Mount of Harbledown was first with a very fine stand, containing the following flowers:—*Etienne Levet*, very fine; *Ferdinand de Lesseps* (I think this ought to have been labelled *Maurice Bernardin*, according to the catalogue of the National Rose Society), *La France*, excellent; *Charles Lefebvre*, a very grand bloom; *Marquise de Castellane*, *Souvenir de la Malmaison*, a very beautiful three-quarter-expanded bloom; *Anna Ollivier*, *Star of Waltham*, *Fisher Holmes*, *François Michelon*, *Duke of Edinburgh*, a very grand dark bloom; *Marie Baumann*, very good; *Alfred Colomb*, *Duke of Wellington*, *Hippolyte Jamain*, *Xavier Olibo*, a very fine bloom; *Madame Eugénie Verdier*, and *A. K. Williams*. Mr. W. Wakley was a good second with *Baronne de Rothschild*, *Etienne Levet*, *Madame Gabriel Luizet*, *Senateur Vaisse*, *Marquise de Castellane*, *Capitaine Christy*, *Dr. André*, *Marguerite de St. Amand*, *Ferdinand de Lesseps*, *Maréchal Niel*, *Mdlle. Marie Rady*, *Marie Baumann*, *La France*, *Duke of Edinburgh*, *Souvenir d'Elise Vardon*, *Mrs. Baker*, *Thomas Mills*, and *Alfred Colomb*. In the class for twelves Mr. Peckham and Mr. Wakley were equal first, the former with *Etienne Levet*, *Charles Lefebvre*, *Madame Marie Finger*, *Marie Baumann*, *Le Havre*, *Maurice Bernardin*, *Gabriel Luizet*, *Fisher Holmes*, *Senateur Vaisse*, *Eugène Fürst*, and *Marie Rady*. In the class for twelve Teas Mr. George Mount was again first with a very nice box of blooms, containing *Rubens*, *Anna Ollivier*, *Souvenir d'Elise Vardon*, *Madame Camille*, *Devoniensis*, *Homère*, *Caroline Kuster*, *Jean Ducher*, *Maréchal Niel*, *Innocente Pirola*, and *Souvenir d'un Ami*. This was an excellent stand, and it is well to note that these were all from the open. Many Teas which are shown thus early in the season are cut from the house. In six varieties, trebles, Mr. W. Wakley was first with *Hippolyte Jamain*, *Duke of Edinburgh*, *Marquise de Castellane*, *Maréchal Niel*, a very fine triplet; *Capitaine Christy*, and *Dr. André*. In the class for twelve blooms Mr. Peckham was first with *Marquise de Castellane*, *Marie Baumann*, *Baronne de Rothschild*, *Etienne Levet*, *Marie Rady*, *Capitaine Christy*, *Duke of Edinburgh*, *La France*, *Charles Lefebvre*, *Maurice Bernardin*, *Madame Lacharme*, and *Dr. André*. In the class for nine Mr. W. Wakley was first with *Duke of Wellington*, *La France*, *Charles Lefebvre*, *Alfred Colomb*, *Etienne Levet*, &c. In the class for the best six of any one kind Mr. Peckham was first with *Marie Baumann*, Mr. J. Wakley second with *La France*, and Captain Bright third with *Devoniensis*. The prize for the best box in the Show was awarded to Mr. Peckham and Mr. W. Wakley, their stands being equal, so that each gained the National Rose Society's silver medal. The National Rose Society's bronze medal for the best bloom in the Show was awarded to Miss Hawksworth for a very fine bloom of *Anna Ollivier*, and it is worthy of remark that this was contained in a box of six—an encouragement to small growers, as showing what may be attained by those whose means of growing are limited. The other prizes in the amateurs' class were shared by Miss Straty, J. Wakley, the Rev. H. G. Rolt, the Rev. T. R. Buchanan, Mr. W. Collard, Mr. G. Moore, Mr. W. Mount, Mr. E. Marston, Mr. Foster, Miss Hawksworth, &c. There were some very fine stands of Teas exhibited in the open class, Mr. Prince taking first with a grand stand of *Comtesse de Nadaillac*, *Souvenir de Madame Pernet*, *Alba Rosea*, *Maréchal Niel*, *Catherine Mermet*, *Madame Lambert*, *Souvenir de Paul Neyron*, *Souvenir d'un Ami*, *Perle des Jardins*, *Madame Hippolyte Jamain*, *Homère*, and *Marie Van Houtte*. Mr. Cant's stand was also very fine, containing a grand bloom of *Comtesse de Nadaillac*, *Catherine Mermet*, *Hippolyte Jamain*, *Jules Finger*, *Maréchal Niel*, *Devoniensis*, *Caroline Kuster*, *Rubens*, *Niphetos*, *Adam*, and *Perle des Jardins*. In amongst the Hybrid Perpetuals exhibited by Messrs. Cant, Prince, Mitchell, and Kinmont & Kidd in this class were fine examples of *Duke of Teck*, very brilliant; *Violette Bouyer*, a very fine new light Rose, and likely to be a great favourite—more so than *Helen Paul*; *Charles Lefebvre*, *Duke of Wellington*, *Duchesse de Morny*, *La France*, *Le Havre*, *Louis Van Houtte*, *Général Jacqueminot*, and *Mrs. Laxton*. It will be seen that the name of my friend Mr. Biron does not appear. He has moved, and has not yet been able to feel his way; but I am quite prepared to think that, notwithstanding his difficulties, he will surmount them, and that we shall find him taking his usual place. He and his co-Secretary, Mr. Mount, were indefatigable in their endeavours to make all go smoothly; and, I hope, were rewarded as much by the attendance of visitors as they were by the gratitude of all of those who had anything to do with the Exhibition.—D., Deal.

AURICULA SHOW FOR SCOTLAND.

I WAS extremely pleased to see a suggestion relative to an Auricula Show in Scotland appear in the *Journal of Horticulture*, and I am sure that many others like-minded with your correspondent would be greatly delighted were such a show to be formed in our midst. However, as you remark, this could only be carried out successfully with the hearty support of those who are growers of the lovely alpine, and I believe that not a few could be found in Scotland who would assist in the object. In the first place, the thought suggests itself, Would it be advisable to form a separate society, or rather to ask to be taken under the protecting wings of one or other of our larger and more established societies? To my mind the latter would be most desirable if it could be carried out successfully. Perhaps others more conversant with this matter than I am will touch on this point. There are four places I would suggest, and either of them I think would be suitable for the exhibition to be held in—*Edinburgh*, *Glasgow*, *Paisley*, and *Falkirk*. The last-named place was at one time the most renowned of all for Auriculas; the name of the

late George Lightbody (whose memory now lives in what is undoubtedly the best grey-edged *Auricula* extant), being a sufficient warrant for that statement. Here also lives the raiser of Duke of Argyle and Marquis of Lorne, so much valued as crimson selfs. However, I believe either Edinburgh or Glasgow would be the most suitable place for all growers. The next thing I would suggest is, that a meeting be arranged for in some central place, where those interested in this matter could meet, talk it over, and see if arrangements cannot be made for a contest during the forthcoming *Auricula* season.—WM. MARSHALL, *Renfrenshire*.

NEW STRAWBERRIES.

KING OF THE EARLIES AND THE CAPTAIN.

I HAVE to-day forwarded in a small box for your critical consideration a few typical fruits of two seedling Strawberries, which I am modest enough to think are destined shortly to effect quite a fragarian revolution.

KING OF THE EARLIES was raised from Vicomtesse Hericart de Thury × Black Prince, a prolific sort which comes with me earlier than either of its parents, and quite as early as May Queen; but otherwise almost intermediate in character between those well-known and esteemed early market Strawberries.

THE CAPTAIN.—This was raised from Crown Prince × Forman's Excelsior. It is a handsome large-fruited variety, which comes in a few days after the preceding and before Marguerite, and continues pro-

Fig. 3.—The Captain.

ducing fruits of full size right on until September. Last season the same plants which had fruited early kept on bearing large richly flavoured fruits until the wasps in late autumn took possession, and necessitated the use of protectors—a requirement not often necessary, even in the case of the old small-fruited *Quatre Saisons* varieties.—THOMAS LAXTON.

[The fruit of King of the Earlies is of medium size, ovate, even and angular; skin bright red on the shaded side, and dark mahogany on the side exposed to the sun; flesh white with a tinge of red under the skin, solid, firm, and with a fine brisk and rich flavour. The Captain, as may be seen by the figure of it, is a large fruit, ovate, even on the surface, and regular in its outline; sometimes it is inclined to be cockscomb-shaped. Seeds even with the surface; skin bright red, glossy; flesh tinged with red throughout, hollow at the core, firm, and with a brisk flavour like Sir Charles Napier. If the perpetual-bearing character is maintained in various soils and seasons this Strawberry cannot fail to become very popular.]

ROYAL BOTANIC SOCIETY'S EVENING FETE.

JUNE 28TH.

THE Evening Fête in the Royal Botanic Society's Gardens, Regent's Park, is one of the events of the London season, and its popularity is well deserved, for it is unquestionably one of the prettiest sights and most pleasant gatherings that can be witnessed round the metropolis. The fête of last week was even more successful than usual, the evening proving extremely fine, and in consequence the number of visitors was very large, nearly 10,000 passing the gates. The picturesque garden was beautifully illuminated with lines and chains of coloured oil lamps, a number of French lamps being employed in various parts, especially upon the trees on the mound. The lake was particularly handsome, pyramidal and star-like floating designs having a most striking effect, while in one portion arches of lamps appeared by reflection to form a tunnel of brilliant diversely-tinted lights. At 10 and 12 P.M. the gardens were also illuminated with coloured fires, which had a charming

effect. Bands of the 2nd Life Guards, Royal Horse Guards, Coldstream Guards, and Scots Guards were stationed at different parts of the gardens, and performed a choice selection of music during the evening.

The floral decorations for tables, &c., with bouquets, button-holes, and baskets of flowers, were contributed by numerous exhibitors, Miss Annie Williams, Upper Holloway, being one of the most successful competitors, and staging a tastefully decorated table with fine bouquets, but many other contributions were far from satisfactory. Irises and *Gladiolus Colvillei* and alba were very prominent in the stands, being employed with Grasses and Ferns and a few other flowers in varying proportions, and in greatly differing degrees of taste. One of the most important exhibits was a magnificent group from J. Peacock, Esq., Sudbury House, Hammersmith, which comprised a large number of remarkably well-grown *Odontoglossum vexillarium*, *O. Alexandræ*, *Aerides*, *Dendrobis*, and a fine *Stanhopea tigrina*. These, with other choice Orchids, were arranged with small Ferns and fine-foliage plants, producing a most charming effect in the centre of the large tent.

SUNDAY WORK IN GARDENS.

THIS has been very properly alluded to by "Northern Gardener." Personally, having a due regard to the day of rest, the best of days, so refreshing after the week's toil, I do, and cause to be done, as little work as is consistent with the welfare of my charge; still, as I could not think of permitting anything approaching to neglect, I adopt shading to be on the safe side, and thus set myself and men at liberty. I must, however, say I believe more harm is done early on Sunday morning than all the week put together. Bed seems to have such an attraction. It vexes me, without being at all personal, to see young men rushing to their work at 7 or 8 o'clock, when their chief has been out at his usual hour and made things safe. I would strongly impress on young men to be up early, as it must be more satisfactory to them to see things right and happy than to take their ease while the foliage is burning and Grapes scalding on Sunday mornings.—STEPHEN CASTLE.

MAIDSTONE ROSE SHOW.

WHILE the great guns were booming at Southampton on 28th June there was a brilliant skirmish, though with lighter metal, at Maidstone. The severe weather of the previous few days left its mark upon many of the blooms, the Tea Roses especially suffering from the heavy rains and winds. Mr. R. L. Knight, who for years has held a high, if not the first, position as an exhibitor of Teas, was perhaps the greatest sufferer of all. In spite, however, of all hindrances, a very good exhibition was held; but a shade of gloom was thrown over the whole day by the absence, through severe illness, of the cheery veteran Mr. John Hollingworth, whose success in the cup class, after a very close fight with Mr. Wakeley, will, it is hoped, please him as much as it did the public. His box contained a very even set of blooms of the following varieties—Mons. Noman, François Michelon, La France, Madame Prosper Langier, Magna Charta, Souvenir de Mons. Boll, Marie Baumann, Charles Lefebvre, Etienne Levet, Madame Gabriel Luizet, Villaret de Joyeuse, A. K. Williams, Dr. Andry, Victor Verdier, Mrs. Baker, Marie Rady, Annie Laxton. Mr. Wakeley pressed him very close, showing amongst other good blooms a grand example of Madame Gabriel Luizet (bronze medal for best Rose in the Show), a superb Duke of Edinburgh, and very good specimens of Mrs. Baker, Cheshunt Hybrid, Henry Bennett, and Etienne Levet. Mr. Wakeley took the cup for twenty-four varieties, twelve Teas and twelve H.P.'s, his most noticeable blooms being Madame Marie Gonod, an exquisite old Tea Rose of the Rubens type; Madame Gabriel Luizet, Henry Bennett, Duke of Edinburgh, Madame Lambard (very good), and Dr. Andry. Mr. George Mount of Harbledown was second with very fresh but small blooms, the best in his box being A. K. Williams, Xavier Olibo, Duke of Edinburgh, Catherine Mermet (very good), Perle de Lyon (good), and Anna Ollivier. Mr. John Wakeley was third. For twelve, any varieties, Mr. John Wakeley was first; he also took the National Society's bronze medal for a box of six (Duke of Edinburgh), very fresh and clean—indeed "the Duke" was noticeable in many boxes. Mr. Austen Killick was second, Mr. Smythe third. For twelve Teas Mr. Hollingworth was first, but his blooms were hardly up to Turkey Court form. Mr. Killick and Mr. John Wakeley were equal second.

For nine Roses Rev. J. M. Fuller was easily first. His box contained fine examples of Marie Baumann, Duchesse de Caylus (very good), Louis Van Houtte, Capitaine Christy, Marquise de Castellane, and Etienne Levet. For six trebles of Teas Mr. W. Wakeley was first, Madame Bravy and Maréchal Niel being the best.

In the small classes Mr. West was first for six. He showed good specimens of Le Havre, Duchesse de Vallombrosa, Marie Baumann, Prince Camille de Rohan, and Marquise de Castellane. Mr. Foster was second, Mr. Peckham being third. Mr. George Mount was first for six Teas, Mr. Haynes being second. Mr. George Bunyard had some boxes of fine blooms, not for competition, and if he is in equal form on Tuesday at South Kensington he will take some beating.

The epergnes were not equal to those of former years, and, as usual, the Judges were wrong in the opinion of some, one lady being particularly vehement in her expressions of disapprobation; but if her taste as to the arrangement of an epergne is to be measured by the taste she displayed in her remarks to the Judges it is possible that their decisions were not very wide of the mark after all. The cup in this class was taken by Miss Cope; Miss Cutbush was second; Miss Lawrence, Miss Harwood, and Miss West following with the other prizes.

In the button-hole class Mrs. Knight was first, the other prizes being taken by Miss Wigan, Mr. Killick, Mr. G. Mount, and Mr. Peckham. It is to be hoped that the Committee will see their way another year to a somewhat later date for their Show.

CABBAGES FOR SEED.—I have a stock of Cabbage which will soon be exhausted unless I can save some seed. Can any of your readers tell

me how to proceed to do so? Should the hearts be cut out? if so, when?
—BRASSICA.

NATIONAL ROSE SOCIETY.
METROPOLITAN EXHIBITION, JULY 3RD.

FINE day favoured the annual Exhibition of the National Rose Society, which was again held at South Kensington, the large marquee employed for the summer Show being devoted to the exhibits, as well as the long approach tent. Both in number of exhibitors and the quality of the blooms it was unanimously decided to be the best Show yet held, no less than 120 competitors entering the lists, giving a

total of nearly 500 entries in the various classes, representing probably in round numbers about 10,000 blooms. As regards the quality, however, only those visitors who were fortunate enough to inspect the blooms immediately after the awards were made could form an adequate idea, as the heat of the tents caused the blooms to expand very rapidly, and some presented a very poor appearance in the afternoon that had been particularly fine earlier in the day. Exhibitors who cut young blooms had decidedly the best of it in the latter part of the Show.

Many magnificent blooms of Hybrid Perpetuals were staged in various classes, but in Mr. B. R. Cant's beautiful first-prize collection of 72 some particularly grand samples were notable. The premier bloom was Mons. Noman; but great difference of opinion respecting the accuracy of the award was expressed by many rosarians, for even in the same collection there were several that appeared finer and more deserving of the honour. Especially fine were two corner blooms of François Michelin and Xavier Olibo, which were greatly admired, the former being of grand size, substance, and form, though perhaps it would have been better if a little more advanced. There was, however, no dispute about the handsome Souvenir d'Elise, which was elected as the premier Tea in the nurserymen's class in the same collection. Mr. Cant certainly has good reason to be proud of his success, for securing the chief position in the seventy-two class three years in succession is no mean feat.

The Teas generally were superb, and it was remarkable what a number of stands nearly equal in merit were contributed; and the fact that in two classes, nurserymen's and amateurs' respectively, two equal first prizes were awarded is a sufficient indication of the difficulty the Judges experienced.

There was, however, one stand of Roses and one variety which attracted more attention and admiration than any other—namely, the magnificent blooms of Her Majesty, Mr. Bennett's grand new Rose, which was deservedly awarded the Society's gold medal as the best new seedling Rose, and also the first prize for twelve blooms of any variety. It was in superb condition, the blooms massive, full, quite of a majestic form, and of a most delicate, clear, bright pink hue.

The arrangement of the exhibits was quite a new departure, the stands being placed round the large marquee, the nurserymen's on the outer banks, and the amateurs' in the centre, all on tables as usual; and there was not that formality which often renders Rose shows rather monotonous.

NURSERYMEN'S CLASSES.

The leading class in the nurserymen's section was that for seventy-two single trusses, in which six collections were staged, at least three of these being so near in quality that the Judges had considerable difficulty in determining their positions. Mr. B. R. Cant, Colchester, won the much-coveted first honours with a magnificent collection, this being the third season in succession that he has obtained a similar position. There is always a most pleasing freshness and brightness of colour in the Colchester blooms that invariably render them very striking. The varieties were as follows—François Michelin, a grand corner bloom 5 inches in diameter; Constantine Tretiakoff, Souvenir d'un Ami, Madame Clemence Joigneux, Anna Ollivier, Duke of Connaught, Madame Gabriel Luizet, A. K. Williams, Clotilde Roland, John Hopper, Maréchal Niel, Dupuy Jamain, Duchesse de Vallombrosa, Madame Charles Wood, Marie Finger, Xavier Olibo, very handsome; Marquise de Castellane, Marie Van Houtte, Merveille de Lyon, Sultan of Zanzibar, Violette Bouyer, Madame Caillot, Souvenir d'Elise, very fine, of great size, and substance, selected as the best Tea or Noisette in the nurserymen's classes; Général Jacqueminot, Madame Vidot, Duke of Teck, Devoniensis, Boildieu, Madame Charles Kuster, Marie Van Houtte, Madame Eugénie Verdier, Penelope Mayo, Mdle. Marie Cointet, Madame Isaac Perrière, Reinc du Midi, Duke of Wellington, La France, Marchioness of Exeter, Madame Julia Dymonier, Duke of Edinburgh, Edouard Morren, Marie Rady, Baronne de Rothschild, Star of Waltham, Mons. Noman, a fairly good bloom, selected as the best Hybrid Perpetual in the nurserymen's classes; Marie Baumann, Niphotos, Dr. Sewell, Madame Willermoz, Ferdinand de Lesseps, Madame Marie Verdier, Madame Ducher, Capitaine Christy, Fisher Holmes, Marguerite de St. Amand, Vicomtesse de Vezines, Madame Lacharme, Souvenir de Mons. Boll, Innocente Pirola, Antoine Ducher, William Warden, Reynolds Hole, Comtesse de Nadaillac, Mons. E. Y. Teas, Madame Bravy, Duchess of Bedford, Souvenir de la Malmaison, Annie Laxton, Rubens, Alfred Colomb, Princess Mary of Cambridge, and Madame Prosper Laugier. Messrs. Paul & Son, Cheshunt, were second with rather smaller but very neat blooms very rich in colour. Fine examples of Duchesse de Caylus, A. K. Williams, Duchesse de Morny, Mons. Noman, and Sénateur Vaisse were very notable. Mr. C. Turner, Slough, was a good third with fresh handsome flowers, but some were a little rough. Messrs. Keynes & Co.,

Salisbury, were fourth, and the stand from Messrs. Cranston & Co., Hereford, was highly commended.

Six collections of thirty-six single trusses were staged, and the general substance was in this class also very satisfactory. Messrs. Paul & Son took the lead in this class with very creditable blooms, clean, of good colour and substance. The varieties were Madame Isaac Perrière, Madame Eugénie Verdier, Mons. E. Y. Teas, Emily Laxton, Prince Arthur, Marquise de Castellane, Madame Gabriel Luizet, Comtesse de Ludrie, Madame Victor Verdier, Maréchal Niel, La Duchesse de Morny, Duke of Teck, Julie Touvais, Duke of Edinburgh, Dr. Andry, Niphotos, Etienne Levet, Marguerite de St. Amand, Marie Van Houtte, Olivier Delhomme, Comtesse d'Oxford, Marie Cointet, A. K. Williams, La France, Caroline Kuster, Maurice Bernardin, Georges Morel, Marie Baumann, Charles Lefebvre, Duchesse de Vallombrosa, Souvenir d'Elise Vardon, Beauty of Waltham, Marie Rady, Catherine Mermet, Capitaine Christy, and Countess of Rosebery. Mr. B. R. Cant obtained the second place with blooms very close in merit to the first, grand examples of Madame Eugénie Verdier, François Michelin, and Duke of Teck being particularly notable. Mr. C. Turner was third, and Messrs. Keynes & Co., Salisbury, fourth, each with good collections.

The competition was keen in the class for forty-eight single trusses in Division B twelve stands being entered all close in merit. Messrs. Curtis, Sanford & Co., Torquay, were awarded the leading prize for fine blooms of François Levet, La France, Gloire de Ducher, Abel Grand, Barthelmy Joubert, Devoniensis, François Michelin, Madame Ducher, Star of Waltham, Marguerite de St. Amand, Louis Van Houtte, Maréchal Niel, Etienne Levet, Marie Cointet, A. K. Williams, Madame Hippolyte Jamain, Charles Darwin, Baronne de Rothschild, Magna Charta, Madame Lacharme, Marie Louise Pernet, Duke of Edinburgh, Marie Baumann, Jean Leliere, Charles Lefebvre, Jules Margottin, Horace Vernet, Egeria, Marie Rady, Eugénie Verdier, Victor Verdier, Marquise de Castellane, Alba Rosea, Alfred Dumesnil, Duchesse de Vallombrosa, Beauty of Waltham, Madame Gabriel Luizet, Gloire de Bourg-la-Reine, Princess Mary of Cambridge, Madame Charles Wood, Elie Morel, Antoine Ducher, Mons. Noman, Duke of Wellington, Marie Van Houtte, Duchess of Bedford, and Princess Beatrice. Mr. John House, Peterborough, followed very closely, having a grand bloom of A. K. Williams amongst many others of fine quality. Mr. James Walters, Exeter, secured the third position with smaller blooms, and Messrs. J. Jeffries & Son, Cirencester, were fourth.

Ten collections of eighteen triplets were staged, Mr. Frank Cant, Colchester, winning the chief award for fresh neat blooms of Mdle. Marie Cointet, François Michelin, Madame Margottin, Antoine Ducher, Mons. Noman, Rubens, Annie Laxton, Comtesse d'Oxford, A. K. Williams, Marguerite de St. Amand, Devoniensis, Marquise de Castellane, Etienne Levet, Maréchal Niel, Duchesse de Vallombrosa, Exposition de Brie, Emily Laxton, and La France. Messrs. J. Jeffries & Son, Oxford, were second with a most satisfactory collection, blooms of Madame Prosper Laugier being uncommonly fine. Messrs. Curtis, Sanford & Co. were third, and Mr. J. Walters was fourth.

In the class for twenty-four single trusses there were four boxes, Mr. J. Walters taking the lead with neat blooms of Capitaine Christy, Jules Margottin, Comtesse de Serenye, Charles Lefebvre, Jules Finger, Etienne Levet, Etienne Dupuy, Duchesse de Caylus, Madame Gabriel Luizet, Comtesse d'Oxford, Marie Finger, Anna Olivier, Mons. E. Y. Teas, Lyonnaise, Madame Marie Cate, Marquise de Castellane, Marie Baumann, Madame Lacharme, Avocat Duvivier, La France, Pierre Notting, Baronne de Rothschild, Felix Genero, and Marquise de St. Amand. Mr. John Mattock, New Headington, Oxford, was second; and Messrs. Kinmont & Kidd, Canterbury, were third. For eighteen Teas or Noisettes Messrs. Paul and Son and G. Prince were awarded equal first prizes for two very handsome collections of blooms, Mr. C. Turner following closely.

The best collection of twelve Teas in a class of six competitors was staged by Messrs. J. Mitchell & Son, Uckfield, who had beautiful blooms of Perle des Jardins, Jean Ducher, Maréchal Niel, Souvenir d'un Ami, Madame Margottin, Souvenir de Paul Neyron, Jean Pernet, Catherine Mermet, Souvenir d'Elise Vardon, Devoniensis, Comtesse de Nadaillac, and Madame Willermoz. Messrs. J. Bunyard & Co., Maidstone, had good blooms of Laurette, Adam, and Homer in their third-prize collection. Mr. J. Mattock was placed third, and Mr. E. W. Piper, Uckfield, was fourth.

For twelve single trusses in a class of eight competitors the Rev. Alan Cheales secured chief honours with handsome blooms of François Michelin, Marie Baumann, Baronne de Rothschild, Star of Waltham, Madame Gabriel Luizet, Etienne Levet, Magna Charta, Penelope Mayo, Madame Lacharme, Royal Standard, Alfred Colomb, and Charles Lefebvre. T. F. Burnaby Atkins, Esq., Sevenoaks, was second; J. Burton, Esq., Peterborough, third; and Alfred Tate, Esq., Roseleigh, Wootton, fourth.

In Class 8, for twenty-four, three trusses of each, there were six competitors, all showing collections of great merit. Mr. B. R. Cant secured the first honours with a fine collection, comprising Madame Marie Finger, Mrs. Baker, Mdle. Marie Cointet, Innocente Pirola, A. K. Williams, Edouard Morren, Duchesse de Vallombrosa, Souvenir de la Malmaison, John Hopper, Souvenir d'un Ami, Mons. Noman, Anna Ollivier, François Michelin, Star of Waltham, Madame Gabriel Luizet, Marguerite de St. Amand, Marie Rady, Madame Bravy, Annie Laxton, Xavier Olibo, La France, Marie Baumann, and Rubens. Some of these were of admirable form and substance. Mr. George Prince, Oxford, was a good second, his best blooms being Ulrich Brunner, Jean Ducher, Louise Van Houtte, Comtesse de Nadaillac, and Elie Morel. Messrs. Paul & Son were third, and Mr. C. Turner, Slough, fourth.

AMATEURS' CLASSES.

Class 9.—Thirty-six Roses distinct. There were eleven competitors, many of the collections running very close to each other. First honours were secured by A. Slaughter, Esq., Jarvis Villa, Steyning, for a magnificent collection, consisting of La France, Camille Bernardin, A. K. Williams, Jean Ducher, Maurice Bernardin, Souvenir d'un Ami, Etienne Levet, John Bright, Innocente Pirola, Le Havre, Devienne Lamy, Madame Gabriel Luizet, Fisher Holmes, Marie Baumann, Louis Van Houtte, Star of Waltham, Charles Lefebvre, Marguerite de St. Amand, Beauty of Waltham, Baroness Rothschild, Prince Arthur, Dr. Andry, Egeria, Marie Rady, Marie Verdier, Duke of Wellington, Souvenir d'Elise, Duchess of Bedford, Anna Ollivier, Auguste Rigotard, Marquise de Castellane, Général Jacqueminot, Madame Eugénie

Verdier, Alfred Colomb, and Duchesse de Vallombrosa: thus Mr. Slaughter will hold the champion trophy, value sixty guineas, for this year. Mr. Ridout, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate, was placed second with some very good blooms, one, François Michelin, being awarded the silver medal as the best Hybrid Perpetual in the amateur classes. Mr. T. W. Girdlestone, Sunningdale, Berks, received the third prize, and Mr. Baker, Heavitree, Exeter, the fourth; Mr. William Harrington, Corbets Tay, Romford, Essex, being highly commended.

Thirteen competitors staged in Class 10, twenty-four varieties. Mr. Brown, gardener to A. J. Waterlow, Esq., Great Doods, Reigate, received the highest honours with La France. A. K. Williams, François Michelin, Star of Waltham, Capitaine Christy, Henri Ledechaux, Madame G. Luizet, Comtesse d'Oxford, Fisher Holmes, Marie Rady, Abel Grand, Edouard Morren, Mons. E. Y. Teas, Mrs. Laxton, Baronne de Rothschild, Charles Lefebvre, Victor Verdi-r, Maréchal Vaillant, Marie Cointet, Catherine Mermet, Marie Finger, Etienne Levet, and Clotilde Rouillard. The Rev. Hugh A. Berners, Hawkstead Rectory, Ipswich, was placed second, his best being François Michelin, La France, Catherine Mermet, and Madame Margottin. Mr. A. Slaughter and the Rev. W. H. Jackson, Stagden Vicarage, Bedford, was placed third and fourth respectively.

For twelve distinct, three trusses of each, eleven collections were staged. Mr. J. Ridout was again to the front with Marquise de Castellane, Capt. Christy, Edward Morren, Madame G. Luizet, Comtesse d'Oxford, Baronne de Rothschild, François Michelin, Duchesse de Vallombrosa, Etienne Levet, Eugénie Verdier, Le Havre, and Madame Lacharme. Mr. Harrington took the second position, Madame Margottin being especially good; and Mr. R. N. G. Baker, Heavitree, the third.

In the class for twelve Teas in Division C twelve collections were staged. Mr. A. Slaughter was the winner of the piece of plate presented by C. E. Cuthell, Esq., with a wonderful collection, including Jean Ducher, Catherine Mermet, Maréchal Niel, Souvenir d'un Ami, Niphotos, Madame Lambard, Belle Lyonnaise, Madame Van Houtte, Anna Ollivier, Souvenir d'Elise, Amazon, and Rubens. Second honours fell to Mr. J. Brown. A magnificent bloom of Jean Ducher secured the Society's silver medal as the best Tea or Noisette in the amateur classes. Mr. Charles Davis, Grammar School, Aynhoe, Banbury, and George P. Hawtry, Esq., were placed third and fourth in the order of their names.

As many as seventeen exhibitors staged collections in Class 13, Division D, twenty-four distinct single trusses. Mr. John Sargeant, Reigate, was well ahead with blooms both large and bright and of good form. Duke of Wellington, very fine; Duchess of Bedford, Emily Laxton, Marie Baumann, La France, Capitaine Christy, Fisher Holmes, Henri Ledechaux, Madame Gabriel Luizet, Duchesse de Morny, Belle Lyonnaise, Baronne de Rothschild, Duke of Teck, A. K. Williams, Comtesse de Srenye, Horace Vernet, Marie Verdier, Madame Victor Verdier, and François Michelin, Marquise de Castellane, Duchesse de Vallombrosa. George Baker, Esq., Holmfels, Reigate, secured the second place, having some remarkable flowers, François Michelin, Edouard Morren, Duchess of Bedford, Madame G. Luizet, Duke of Edinburgh, La France, and Le Havre being especially fine. The Rev. J. W. Pemberton, The Round House, Havering-atte-Bower, third with a fine lot. W. H. Wakeley, Esq., Macklands, Rainham, fourth; and Mr. W. Grant, Ledbury, commended. For six distinct, three trusses of each, fifteen collections were staged, first honours being awarded to the Rev. J. H. Pemberton, The Round House, with Comtesse d'Oxford, A. K. Williams, Marquise de Castellane, Horace Vernet, La France, and Maréchal Niel. Mr. Wakeley secured the second position—and, indeed, very close on the first prize—with John Bright Madame Gabriel Luizet, Maréchal Niel, Mons. Noman, Marie Rady, and Capitaine Christy. George Mount, Esq., took the third position, and Miss W. Taylor the fourth.

For twelve distinct single trusses there were seventeen exhibitors. Miss W. Taylor, Manor House, Headington, (gardener Mr. Gurden), was deservedly awarded first honours with Madame Gabriel Luizet, Marie Baumann, Duchesse de Vallombrosa, A. K. Williams, Marie Verdier, Le Havre, Thérèse Levet, Duchesse de Caylus, Marie Cointet, Duke of Wellington, Maréchal Niel, and Sultan of Zanzibar. George Mount, Esq., was awarded the second prize; Julius Sladden, Esq., Badsey, Evesham, third, with grand blooms of Abel Carrière and Mr. A. K. Williams; A. Evans, Esq., Marston, near Oxford, was placed fourth.

In Class 16, twelve Teas or Noisettes, single trusses, there were fourteen competitors. Every collection, in an ordinary way, was worthy of a first prize. After this class must indeed have been very hard to judge, so many collections running so very close to each other. Equal first prizes fell to the Rev. A. Foster Mellairs, Forstock Rectory, Bury St. Edmunds, and the Rev. Page Roberts, The Rectory, Scole, Norfolk, whose collection consisted of Souvenir d'Elise, Comtesse de Nadaillac, Alba Rosea, Catherine Mermet, Maréchal Niel, La Boule d'Or, Hippolyte Jamain, Caroline Kuster, Jean Ducher, Marie Guillot, Madame Margottin, and Anna Ollivier. Mr. Foster Mellairs had magnificent examples of Souvenir d'Elise, Madame Margottin, Niphotos, Madame Bravy, Marie Van Houtte, Moiré, Innocente Pirola, Souvenir d'un Ami, Caroline Kuster, and Devonensis. The third award fell to Miss W. Taylor, Manor House, Headington; and fourth, Mr. George Mount, Harbledown, near Canterbury.

Class 18, nine distinct single trusses, there were ten competitors. E. Mawley, Esq., Addiscombe, Croydon, was first with Etienne Levet, La France, Dr. Andry, Baronne de Rothschild, A. K. Williams, Star of Waltham, Marie Baumann, François Michelin, and Alfred Colomb, all magnificent. The Rev. H. Cecil Fellows, Brighton Rectory, Norwich, second, having good Marie Rady and Marie Baumann. J. Tranter, Esq., Upper Assenden, was placed third; and E. Horne, Esq., Park House, Reigate, fourth.

In Class 19, six distinct single trusses, there were seven competitors, first honours falling to J. Burnside, Esq., Farningham, Kent, with fine blooms of La France, Mons. Noman, Jules Finger, Maréchal Niel, Catherine Mermet, Fisher Holmes. Second honours to the Rev. W. Wilks, Shirley Vicarage, Croydon. Third, Miss Alice M. Lucas, Wratten, Hitchin: and fourth, John E. Coleby, Esq., Rosenheim, Wimbledon.

For six Teas or Noisettes F. Burnside, Esq., was awarded the first prize with Comtesse de Nadaillac, Maréchal Niel, Catherine Mermet, Souvenir de Paul Neyron, Madame Margottin, and Jules Finger. E. M. Bethens, Esq., Denne Park, Horsham (Mr. H. Harris, gardener); Edward Mawley, Esq.; and

Edward Horne, Esq., Park House, Reigate, were placed second, third, and fourth respectively.

For six distinct single trusses, suburban-grown Roses, John Coleby, Esq., secured the first prize with Paul Neyron, Capt. Christy, John Hopper, Maréchal Niel, Dr. Andry, and Marie Verdier. Equal seconds were awarded to Mr. J. Balina, 72, Twisden Road, Highgate, and to Mr. Berry, gardener to the Countess of Leven and Melville, Roehampton. E. M. Nelson, Esq., Hanger Hill House, was placed fourth.

EXTRA CLASSES.

A class was provided for baskets of Roses, Hybrid Teas or Noisettes, and contributions were tastefully arranged round the centre of the tent. Mr. W. Narroway, Headington, Oxford, was adjudged the chief prize for a very tasteful combination of light and dark varieties. The Rev. J. H. Pemberton was second with a basket of Caroline Kuster; and T. B. Hall, Esq., third, with mixed varieties.

Fourteen competitors entered in the class for six single trusses, open only to amateurs who have never won a prize at an exhibition of the National Rose Society. The Rev. W. H. Jackson, Stagden Vicarage, Bedford, was placed first with beautiful examples of Comtesse de Srenye, Star of Waltham, Madame de Cointet, Madame C. Luizet, Madame de Montchauveaux, and Mons. Noman. Equal second prizes were awarded to W. E. Hall, Esq., Birkenhead, and the Rev. C. Felowes, Brighton Rectory, Acle, Norwich. H. French, Esq., Sutton, was fourth.

For six single trusses of suburban-grown Roses Mr. G. Berry, The Gardens, Roehampton House, was awarded the second prize for small blooms of Céline Forestier, Gloire de Dijon, Belle Lyonnaise, Souvenir d'un Ami, Comtesse de Nadaillac, and Madame Caroline Kuster; Mr. J. Bateman, Highfield Road, following with good blooms of Catherine Mermet, Alba rosea, and Devonensis. Three stands of six new Roses were staged. The first positions were assigned to the Rev. Alan Cheales for neat blooms of Dr. Hogg, White Baroness, Mrs. Jowitt, Helen Paul, Duke of Teck, and Reine Maria Pia. The Rev. J. H. Pemberton followed. For six trusses of any Rose the competition was very keen, sixteen stands being entered. G. P. Hawtreay, Esq., Slough, was first with Maréchal Niel. Charles E. Cuthell, Esq., second with Madame Gabriel Luizet, very handsome; and the same variety from Alfred Slaughter, Esq., was highly commended. The Rev. J. H. Pemberton, was third with Marquise de Castellane; and E. Horne, Esq., fourth with La France.

OPEN CLASSES.

In the class for twelve new Roses not in commerce previous to 1880 the chief prize was secured by Messrs. Paul & Son with Archduchess Elizabeth, Pride of Waltham, Comtesse H. Coomber, Violette Bouyer, May Paul, Ulrich Brunner, very fine: Merveille de Lyon, George Moreau, Etoile de Lyon, Tatiana Onique, Madame Cusin, and Madame Isaac Perriere. Messrs. Curtis, Sanford & Co. were second with Madame Montels, Madame Marie Roderer, Souvenir de Mons. Drouche, Souvenir de Madame Berthier, Pride of Waltham, George Moreau, Madame Isaac Perriere, Red Gauntlet, Violette Bouyer, Comte de Flandres, Madame Crosy, and Madame Marthe d'Hulloy. Messrs. Cranston were third with Ulrich Brunner fils, Guillaume Guillemot, Tatiana Onique, Violette Bouyer, Rosieriste Jacobs, Empereur de Brazil, François Levet, Gloire de Bourg-la-Reine, Souvenir de Mad. Berthier, George Moreau, Pride of Waltham, and Comte de Flandres.

Eleven boxes of twelve trusses of any white Rose were staged. Messrs. Paul & Son took the lead with Niphotos, very fine in form and substance. Mr. J. Mitchell was second with fine examples of Devonensis. Mr. F. Cant followed with Duchesse de Vallombrosa, good in form and substance.

For the best twelve trusses of any yellow Rose there were eight entries. Mr. B. R. Cant won first honours with Madame Caroline Kuster, very fine and beautiful; Mr. C. Turner followed with Madame Margottin, Messrs. Cranston & Co. were third with Madame Marie Van Houtte, and Messrs. Paul & Son were fourth with Perle des Jardins.

Eleven stands of twelve crimson Roses were staged. Mr. J. Walters was first with A. K. Williams, neat and of good colour. The second-prize stand was Duke of Edinburgh, very bright. R. N. G. Baker, Esq., Heavitree, Devon, was third with Duke of Wellington, large and richly coloured.

The competition was remarkably keen in the class for twelve trusses of any Rose, twenty-four stands being entered. Mr. A. Bennett, Shepperton, well won chief honours with grand examples of the handsome light pink variety, Her Majesty. Some of the flowers were over 5 inches in diameter, very full, and beautiful in form. The gold medal of the Society for the best new seedling Rose was also awarded to Mr. Bennett for the same variety, three grand blooms of great size and substance. Mr. Bennett well deserved this success, as the blooms were of fine quality. Mr. B. R. Cant secured the second prize for handsome blooms of Mons. Noman, of exquisite form and substance. Mr. G. W. Piper was third with fine examples of Souvenir d'Elise Vardon. Messrs. Paul & Son had a good stand of La France, which was highly commended.

SPECIAL PRIZES.

The prizes offered by Messrs. Sutton & Sons, Reading, for a collection of vegetables brought a number of competitors; Mr. S. Haines, The Gardens, Coleshill House, Berks, being an excellent first with Early White Naples Onions very fine, Stratagem Peas, Early London Cauliflowers, All the Year Round Cabbage Lettuces, Tender and True Cucumbers, Nantes Horn Carrots, Early Purple-top Turnip, Hicks' Hardy Cos Lettuce, and Canadian Wonder Beans. Mr. T. Miles, The Gardens, Wycombe Abbey, Bucks, was a very close second, his Telephone Peas, Canadian Wonder Beans, and Nantes Horn Carrots being extremely good. Mr. W. Meads, gardener to Viscount Barington, Beckett Park, Shrivenham, was third; and Mr. A. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, was fourth. Six collections were staged, all very close in merit.

Messrs. Suttons' prizes for a Melon were won by Mr. C. Herrin, The Gardens, Chalfont Park, first with a neat fruit of Chalfont Favourite; Mr. Mundell, The Gardens, Moor Park, second with Best of All; and Mr. C. Tyler, gardener to the Earl of Wicklow, Arklow, was third with a fine fruit of an unnamed variety. There were nine entries.

Messrs. J. Carter & Co., Holborn, offered several prizes for new Peas, twelve competitors entering the lists. Mr. J. Richardson, Boston, Lincolnshire, took the first place with Stratagem, Culverwell's Telegraph, Pride of the Market, and Telephone, all magnificent samples. Mr. Ward was a very

good second with fine pods. Mr. E. Beckett, gardener to J. P. Currie, Esq., Sandown House, Esher, was third. Mr. H. Marriott, The Gardens, Prospect House, Boston, was fourth, and Mr. G. T. Miles was fifth.

In the class for the best method of packing fruit four competitors entered for Messrs. Webber & Co.'s prizes. The first prize was awarded to Mr. Coleman, Eastnor Castle, Ledbury, who had large boxes of Peaches, the individual fruits wrapped in tissue paper and firmly packed in moss. The Grapes were closely packed in the centre of a narrow box, the sides being padded with moss and covered with tissue paper. The Strawberries were packed with their leaves on tissue paper and moss. All the fruit had arrived in excellent condition. The second prize was awarded to Mr. Allan, Gunton Park, Norwich, for good samples of Strawberries, Grapes, and Peaches packed in a similar manner.

MISCELLANEOUS.

Mr. T. S. Ware, Tottenham, contributed a magnificent collection of hardy flowers, Lilliums being strongly represented. Messrs. C. Lee & Son, Hammersmith, exhibited a most tasteful group of ornamental and variegated shrubs, with a margin of small Roses in pots, and an edge of variegated Ivies, Ferns, and small Ferns. Messrs. H. Cannell & Son, Swanley, showed four stands of Verbena blooms, and some good Petunias also. Mr. H. Bennett, Shepperton, Middlesex, exhibited four boxes of his beautiful pedigree Roses, Princess of Wales, Lady Mary Fitzwilliam in fine condition, Her Majesty, and several others.

Messrs. Wm. Paul & Son, Waltham Cross, contributed a fine collection of Rose blooms, about fifty boxes and baskets, representing a large number of handsome varieties. Large baskets of Antoine Ducher, Souvenir de la Malmaison, Firebrand, the Tea Perle des Jardins, the Perpetual Moss Rose Blanche Moreau, Marie Van Houtte, and Baroness Rothschild were especially good. Mr. G. Prince, Oxford, exhibited ten boxes of Roses, chiefly Teas, in fine condition. W. A. Richardson, being exceedingly fine; Jean Ducher, Perle des Jardins, Violette Bouyer, Devoniensis, and Amazone were similarly good. A. J. Lewis, Esq., Moray Court, Campden Hill, Kensington, sent a pretty collection of Rose blooms, arranged in pyramidal form. Mr. J. House, Peterborough, had several baskets and boxes of Rose blooms, the bronzy orange-coloured W. A. Richardson being very noticeable. Messrs. C. Lee & Son, Hammersmith, sent six boxes of richly-coloured Rose blooms, some being of considerable size and substance.

Messrs. J. Carter & Co., High Holborn, exhibited eleven baskets of Lettuces, representing a number of distinct varieties. A large number of Peas was also exhibited, including some curiosities.

HOW TO SAVE PEELED HOLLIES.

SOME years ago, during a severe winter, some valuable Hollies were badly barked, so much so, in fact, that it was feared the whole would die; but, with the exception of one or two, the whole were saved by the following means. Being of considerable girth it was found easy to slit up the bark all round as in crown grafting, and to insert long young rods, just as in crown grafting, but inserted under the upper bark as well as the bark below the base ring. From four to ten shoots were thus inserted according to the room for them round each bared stem, and after being carefully bandaged to keep out earth a mound was raised round each to keep out the air. On another occasion a large one in lifting had a very large piece of the stem accidentally barked. By grafting it in the manner described the damage was repaired, and an unsightly if not a dangerous wound covered.—A. H.

THE PRINCESS LOUISE COIL GRATE.

SOME few years ago we saw fixed and working most satisfactorily a fire grate that had been made by Mr. Ollerhead at Wimbledon House.

Fig. 4.

The bars of the grate were of inch piping, and these containing water formed a boiler to which 4-inch pipes were connected which heated a carpenter's shop. As obviously they would have warmed a greenhouse as well, a simple method was provided of heating such a structure from a kitchen or room fire.

It is on this principle that Mr. Deard of Harlow, whose larger coil boilers are well known and approved, has made and patented the Princess Louise Open Grate Coil, to which was awarded the first prize at the

Smoke Abatement Exhibition for giving the greatest amount of heat per pound of coal consumed. By the arrangement of dampers for regulating the draught, the patentee claims that the fire can be kept burning all night. The contrivance is thus adapted for warming greenhouses and conservatories, also staircases, halls, passages, and spare rooms from one fire. With an ordinary fire grate the only heat obtainable is from the front of the fire being reflected into the room, but by the plan

Fig. 5.

under notice, the coil completely encircling the fire, not only the heat from the front but the heat from the back and both sides of the fire is obtainable, and is extracted and carried wherever hot-water pipes can be conducted. Fuller particulars can be obtained from the maker and patentee, and the annexed sketches (fig. 4 coil, and fig. 5 section) will explain themselves, and we have only to add that the coil can be adapted to ordinary fireplaces. This is the best solution of the problem we have yet seen of heating a greenhouse from a kitchen fire, for, as above observed, the plan was working at Wimbledon most satisfactorily.

REIGATE ROSE SHOW.

ROSE Shows, like many other things, are subject to vicissitudes, and although the day was fine, yet a terrific thunderstorm the night before had destroyed the hopes of many an exhibitor. The Show was therefore robbed of many of its attractions, but nothing could exceed the whole *entourage*. The lovely grounds of Woodhatch looked, as ever, beautiful, and a large company met together to do honour to the Rose. There was an excellent contest for the highest class, Mr. Heywood taking first. There was an interesting contest for the class for twenty-four, Mr. Slaughter and Mr. Baker entering into close quarters. After a long examination the judgment, which was given by points, left the prize with Mr. Slaughter, but there was very little between them. Mr. Waterton was third. Again, too, did Mr. Waterton carry off the prize for the best box in the Show, thus winning the gold medal of the National Rose Society. Teas were shown in large quantity and in good form; in fact, the increase of the growth of this favourite section forms one of the great features of Rose-growing in the present day. Mr. Heywood, in whose grounds the Show was held, also showed very well, and Mr. Slaughter gave evidence of that prowess which he has shown in a larger field—in the National Society's grand Show. The silver medal of the National Rose Society was awarded to Mr. Heywood for the best bloom of Hybrid Perpetual in the Show.

The Exhibition was held on Saturday, June 30th, in the grounds of T. B. Heywood, Esq., President of the Association, who entertained the Judges, the Rev. H. H. D'Ombraim, Mr. George Paul, and Mr. Francis, with other friends on the conclusion of the judging. A large show was expected, 103 entries having been received, but for the reason above stated twenty-five of these were not sent in. The prizes were awarded as follows:—

Division A, open to amateurs of all England, thirty-five varieties.—First, Mr. Heywood; second, Mr. Harrington. Two competitors. In the winning box were fine specimens of Henry Ledechaux, Duchess of Bedford, A. K. Williams, and a very promising sport from Madame C. Joigneaux, also Lady Mary Fitzwilliam, Mr. Bennet's new Rose. Twenty-four varieties (eleven).—First, Mr. Slaughter; second, Mr. Baker; third, Mr. Waterlow; commended, Mr. Pemberton. Twelve varieties (seven).—The Roses in this class were particularly fine. First, Mr. Waterlow, winning also the N. R. S. gold medal as best twelve box and containing the best Hybrid Perpetual, Pride of Waltham; second, Mr. Slaughter; third, Mr. G. Mount; commended, Mr. J. D. Pawle. Twelve Teas (eight).—First, Mr. Harrington; second, Mr. Heywood; third, Mr. Mount. The best Tea or Noisette in the Show, Anna Olivier, was in this class.

In Division B, for members only, twelve varieties (nine).—First, Mr. Cheales; second, Mr. Horne; third, Mr. Stone. Nine varieties (six).—First, Mrs. Langton; second, Mr. Mawley. Six varieties (four).—First, Mr. F. Pawle; second, Mr. Mawley; third, Dr. Parr. Six Teas (ten).—First, Mr. Mawley; second, Mr. Cuthell; third, Mr. Horne. Six trusses of one variety (ten).—First, Mr. Stone; second, Mr. Mawley. Madame Gabriel Luizet was shown largely in this class, but the winning Roses were Fisher Holmes, very

clean and bright, and Charles Lefebvre. In the open class for twelve trusses of one kind the prizes were taken by—first, Mr. Harrington (La France); second, Mr. Slaughter; third, Mr. Wollaston.

CROWN-GRAFTING THICK LIMBS.

In crown-grafting thick stems large pieces of uncovered wood are generally left bare in the centre of the stem. This decays and often causes the death of the limb, or even the tree. Not long ago we saw some trees grafted in a way that obviated this difficulty in a simple yet ingenious way. The operator was a skilful surgeon, which fact may account for the method adopted. It was simply to split up long

Fig. 6.

grafts in this fashion:—Split up, as at *a*; 1 was inserted in the usual way, and 2 bent over the top of the stock, as at *b*, and the point inserted on the opposite side. At the angles the wood was considerably broken; but every graft grew, and as two or three were led over the otherwise bare stump it was rapidly covered with young growing wood. Numerous examples were in the garden referred to—that of Dr. M. Benny, Lockpark House, Denny, N.B., and all had been successful.—A. H.

KITCHEN GARDEN.

Vegetable Marrons.—These are now bearing freely; and as the majority of growers desire their plants to produce as long a succession of fruit as possible, they must not be overcropped, and constant attention should be given to thinning and training the shoots. Plants bearing now will continue to give a supply until November if all the fruit which form are cut off for use when they are about half grown.

Ridge Cucumbers.—As Cucumbers have now a strong inclination to grow and fruit freely, they should be restricted from going on to an injurious extent in either direction. Where Cucumbers of this kind were planted in frames early in the season they may now be less vigorous and fertile than younger plants; and if it is seen that they will not go on bearing satisfactory until cut down by frost in autumn, more plants should be inserted to produce fruit at the latter end of the season. Glass or hotbeds are not wanted for the young plants now, but mounds of good soil should be formed in a sunny spot. It may be necessary to watch that the snails do not eat the young plants over until they are large and hardy. In dry seasons Cucumbers do very well scrambling about the ground and resting on the surface, but throughout long periods of wet the fruits do not form well resting on the soil, and to get over this difficulty we advise a quantity of old peastakes to be put round each plant and allow the growths to rest on these. Moisture then passes freely from them, and a good crop may be secured.

Parsley.—The finest Parsley is always had from plants growing in rich soil and with plenty of space. From 6 inches to 1 foot apart is not too much in this way, and where spring-sown Parsley has not been thinned to this extent it should be done at once. Apart from its developing better afterwards, it will also become very hardy and stand the

severe weather in winter much better than the crowded rows. Now is the time to make another sowing of this useful plant to stand out all winter and come in next spring. Early-sown Parsley generally seeds as soon as the cold weather is over in spring. See that the ground for the present sowing is rich and free from all destructive insects. Prevention is always better than cure in their case, and a slight dressing of soot, lime, or salt should be dug into the ground before sowing.

Egg Plants.—These are now growing and fruiting in cool frames, but they require much syringing at this season to free them from green fly, &c., and as the fruits form they should be cut and used before they are too old. In exceptionally fine seasons we have grown these plants in the open air; but they are at all times surer in fruiting when kept in frames, and as there are plenty of these vacant now this is a very profitable crop to occupy some of them with.

Garlic and Shallots are now well developed, and they may be drawn up any dry day. They should be spread out on any pathway or dry place until they are quite dry and ripe, when they should be stored in the Onion or Potato shed.

Endive.—The first sowing of this should be made now. A small patch of the green-curled or Batavian may be sown in any odd corner, and as the plants become large they may be transferred to a border or bed, where they will be found very useful for early winter salads.

Onions.—Those of these sown last autumn and planted in rich soil early in spring are now gaining large proportions, and if left in the soil to grow after this time many of them will soon split underneath and lose much of their value. To avoid this all such should be drawn up and be dried off and used in this state. Amongst the cottagers for miles around us complaints are ripe of the maggot destroying the greater part of the crops, especially the spring-sown ones, but our half acre or so is escaping wonderfully, and this we chiefly attribute to the dressing of soot and kainit we gave them one wet day about a month ago. Many thin out their Onions to 6 inches or so apart, but the finest crops are secured where little or no thinning is done. Where crowded, the bulbs will be small and excellent for keeping for a long time, and the larger, which come where the plants are thin, may be taken for immediate and autumn use.

Turnips.—A good breadth of the Chirk Castle variety should be sown now for a winter supply. They may follow early Potatoes, Peas, &c. The rows should be 18 inches apart, and the seed sown very thinly.

PLANT HOUSES.

Pelargoniums (Zonals).—Young stock grown on for flowering during the autumn and winter should without delay be placed in 6-inch pots. Pot them as firmly as possible in good sound loam, to which is added a little bone dust, soot, and sand, which will insure a sturdy compact growth. Keep them close for a time after potting until they are rooting freely in the new soil, then gradually harden them, and stand them outside on a bed of ashes. To save the labour of frequently watering the pots can be plunged, but care must be taken to prevent them rooting into the plunging material. The only attention necessary after placing the plants outside is watering, feeding when their pots become full of roots, pinching the shoots, and the removal of all flowers as they appear. Give these plants a sunny position.

Show and Fancy Pelargoniums.—Cuttings of these varieties should now be rooted without delay for early flowering next year. Valuable cuttings can be obtained from the plants that were rooted for the earliest batch. Young vigorous shoots for cuttings are decidedly preferable to those from plants that have been exhausted by flowering, and of which the wood is hard and dry. Young plants are much better than cutbacks for purposes of decoration in 5 and 6-inch pots. If larger plants are in demand old plants must then be cut back and again started into growth. Those that flowered early will now be better outside than under glass, and can be brought to rest by keeping them drier at their roots.

Mignonette.—It is a mistake to allow plants intended to be grown into pyramids or to be trained on umbrella-shaped trellises to suffer by want of root room until they have been placed in the pots in which they are intended to flower. If they become checked through being root-bound their growths soon become hard. From seed sown as previously directed the plants should be growing vigorously in 5 and 6-inch pots, and some of the most forward will be ready for 9 and 10-inch pots, which are large enough for splendid specimens. If these plants are not already in cool quarters no time should be lost, because they soon draw up weakly in heat instead of being strong and robust. Use for a compost rich fibry loam, a little leaf soil, a 6-inch potful of bone dust, and the same quantity of soot, to each barrowful of soil, adding a good sprinkling of coarse sand. Pot them moderately firm when giving them their last shift. Sow a little more seed in small pots to succeed those, also a batch in 6-inch pots of Miles' Hybrid Spiral. Those in the last-mentioned pots should be placed in a cold frame and shaded until the seed germinates, and then afforded abundance of air day and night, or plunge the pots outside.

Choisya ternata.—This is a useful greenhouse plant in spring where sweet-scented flowering plants are in demand. It is of easy cultivation and thrives well in almost any soil; good loam and sand suits it admirably. Plants that have made their growth should be well hardened and plunged outside to thoroughly ripen their wood, which is essential to the production of a profusion of their Orange-like Hawthorn-scented flowers. In no stage of growth should this plant be allowed to suffer by the want of water, or its foliage soon turns yellow.

Cuttings strike readily in heat if half-ripened wood is employed, which

should be taken off close to where it springs from the old wood and inserted in sandy soil and covered with a bellglass.

Celosias are grand flowering plants for winter decoration, as they last in good condition for fully three months. Seed should be sown at once in heat, and the young plants afterwards encouraged to grow rapidly in gentle warmth until they are ready for 6-inch pots, when cooler treatment can be given them. While growing in heat light and air must be freely admitted to them, or they will soon grow weakly.

THE BEE-KEEPER.

STRAW STEWARTON HIVES.

In reading Mr. Pettigrew's remarks on "Straw Stewarton Hives" (see page 329), I do not quite understand him. Will he please say the size of his wooden runs, depth and width, and whether the under side of the runs should be grooved for the first rounded roll of straw? Should the runs be cut into shape or merely bent like a hoop? and ought the runs to be cut through their full width to let the bars down to the level of the runs, or only the inside cut, and the outside remain entire? Should the straw lid lie flat on the bars, or raised in the centre, so that the bees can walk over the bars? Are the bees sure to build on the bars?

Mr. Pettigrew says, "In feeding bees in hives such as I am now describing, how easy it will be, put on empty supers, lift off their lids and put what food we want to give them on the bars. Will he please make this clearer—detail the process?—A NOVICE.

SUPERING.

HONEY is now being collected in great quantities in many parts of the country, and there is every promise so far that 1883 will rank among the red-letter bee years. The flow of honey is, however, some fortnight or three weeks later than it has been in other productive seasons. All vegetation was backward this summer, but the genial combination of sunshine and showers has caused rapid development of leaves and flowers during the latter part of the last, and so far during the present month. Where stocks have had timely attention they are now rewarding the bee-keeper's care and outlay by an ample return either in the shape of extracted or super honey.

Many cottagers in our neighbourhood lost their stocks during April and early May, but the stronger which survived have done well, especially by throwing off very heavy swarms, and in the case of some nearly equally good casts. We try to impress on cottagers the mistake they make in considering the greater number of swarms and casts they can hive as a sign of the greatest gain. The man who can boast to his neighbour of having a stock which has given him a swarm and a cast, and perhaps a colt, and a virgin swarm from the first-hived swarm, and points out the five skeps—making, it must be owned, a grand display as the product of one hive—should have done better. He is not making his bees do their best for him. He will "take up," as he puts it, three or four light-weighting hives in autumn, and for the sake of a few pounds of honey destroy most likely a heap of brood, besides breaking up comb which it has taken the bees all the summer to build. In one way it is as well that the combs be broken up, for casts invariably build greater quantities of drone comb, and the presence of this would be detrimental to the success of the colony during the following season. But it would be far better to return the casts to their parent hive, and to give more room to the bees, so that they might store super honey for their owner. When once a man has used a bar-frame hive intelligently he will not wish again to keep his bees in skeps; but very much more might be done in the way of obtaining beautifully filled supers from skeps than is now generally attempted by their owners.

A small bellglass or a miniature skep, called a cap, are nearly always the receptacles placed over straw hives for the surplus. We have before pointed out how much inferior such supers are to wooden sectional supers. Hive-dealers are now springing up in all parts of the country, and the owners of bees can purchase from them these sections at such a nominal outlay that it would not be worth their while to make them themselves. Nor could they with any amount of patience and painstaking put together such neat, handy, and convenient little articles as those turned out by machines. We would, therefore, advise every bee-keeper to have a set or two by him. These sectional supers are made up of a number of little boxes without tops or bottoms, arranged

side by side, with their dividers of zinc or wood. These sections are held together in a rack, which can be placed either over the frames of the modern hive or on a straw skep. At the risk of repeating advice often given before we will again give directions for the arrangement of supers over skeps. Where the skep is flat-topped and has a hole worked in the centre of its crown the matter is simple enough. The rack of sections is set over the central opening at the proper time and well wrapped up to prevent all loss of heat. Unless the super be kept very warm the bees will not under ordinary circumstances enter it. When bees are in a state to be supered in a dome-shaped skep, a circular hole some 4 inches across should be cut with a sharp penknife, and when the piece of straw plait is withdrawn a puff of smoke will keep the bees from overflowing. Over this hole a piece of zinc may be placed for the moment. Some plaster of Paris should then be mixed with sufficient water to render it of the consistency of cream, and this should be poured all round the central hole in such a manner as to form a flat level surface on which the section crate can be stood firmly. A piece of excluder zinc may be used over the aperture, often with good effect, but it is seldom that the queen will remain in sections, even should she go up for a short time. We would rather do without the excluding zinc over such a small opening as the 4-inch entrance. The zinc is likely to embarrass the bees, and the opening might become choked. But we have had beautiful supers filled over straw hives both with and without the excluding zinc. When the plaster of Paris is ready for the reception of the super the covering placed over the hole is withdrawn, and the sectional rack pressed well down on the soft surface. This will soon harden, and form a capital platform on which to work supers during the summer, and in autumn it will be easily removed and the skep wrapped up in its reduced form to pass through the winter.—P. H. P.

(To be continued.)

COVERING BEES.

AN article in the Journal a fortnight ago has induced me to give you a description of the way I cover up my bees, and I hope it may be useful to other bee-keepers. I use a bec horse, which stands 9½ inches from the ground and holds four hives—quite enough for my small garden. On this I place the hives, over them I put a cover made of deal about a quarter of an inch thick and high enough to go over a super when required, or feeding bottle. Over all the hives I place a piece of tarred felt, such as you see in ironmongers' shops. I then get some galvanised iron wire, fasten it at one end to the horse, pass it over the top of the covers, and fasten to the other end of the horse. I find this a very good plan; the cost is not much, and it keeps the bees cool in summer and warm and dry in winter. Having had a good hive blown over, I have now no cause for anxiety, let the gusts of wind which do so much mischief in small gardens blow as they may.—CLIFTON.

TRADE CATALOGUES RECEIVED.

Barnart & Co., Vogelenzang, near Haarlem.—*Catalogue of Dutch Flower Roots.*

J. Backhouse & Son, York.—*Catalogue of Stove and Greenhouse Plants.*

W. Dobbie, 62, Preston Street, Faversham.—*List of Pelargoniums and Fuchsias.*

TO CORRESPONDENTS

** All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

PARSLEY (*Thomas Hallet*).—Although we have seen Parsley closely resembling yours, we are not sure that we have seen any with leaves quite so

finely divided. It is very elegant and Moss-like, quite worth preserving, and we advise you to save the seed, try the variety on a larger scale next year, and send us another sample. The colour is too pale, but this is, perhaps, not a character of the variety, as the leaves sent may have lost their freshness.

THINNING ASPARAGUS (*Cottage Amateur*).—We assume the seed was sown this year. We should dig up every alternate row next spring just when growth commences, and plant other beds if wanted. The plants in the rows may be a foot apart. A great number of useful heads may be had from plants in rows a foot apart, but to have large produce more space must be afforded. Rows 9 inches apart are too close.

BROCCOLI AND POTATOES (*Idem*).—Broccoli and plants of that nature planted between the rows of Potatoes now will do no harm to the crop, but the Potato haulm if it grows strong may interfere with the progress of the plants inserted. April is a good time for sowing seed of Thyme and Sage; but as you failed to sow then you may sow now in drills in the open air, thinning out the plants when large enough to enable them to assume a sturdy habit of growth.

WHITE STOCK (*J. W., Peshore*).—We have received your note asking for "an answer," but as we did not receive your former letter, and you do not state in the present one your object in sending the Stock, we have really no question to which we can reply. If you will send another spike and enclose a letter with it expressing what you desire to know it shall have our best attention.

GRAPES SCALDED (*Tom Firth*).—Slightly increase the night temperature with ventilation to prevent the condensation of moisture on the berries, giving more air very early and gradually in the morning. Keeping vineries closed too long then opening the lights too wide at once causes rapid evaporation, which is most injurious to Grapes. See "Work for the Week," page 547 of our last issue.

MISMANAGEMENT OF PLANTS (*L. B.*).—Undoubtedly you are right. The plants ought to have been moist, but not decidedly wet when repotted. No doubt they are seriously injured by neglecting to water them for two days, and in that state to place them in larger pots. Such a case of mismanagement as this has seldom been brought before us. You do not say whether you are under the foreman or over him. We presume the latter is the case, and you had better not follow his example.

MUSHROOM CULTURE (*Cantab*).—There is no doubt plenty of soil in all the counties you mention well adapted for Mushrooms, and plenty in the same counties not of the best character for the crop; judgment must be exercised in this matter, but any sound naturally rich and rather heavy loam will answer. Not having had experience with the markets in either of the localities you name, we are not in a position to answer your question on that point. The rate of conveyance is not uniform; it can only be obtained from the railway companies. Where there is competition it is low. It is not necessary to place the manure under cover before making the beds. We never recommend dealers. You had better first try their culture on a small scale where you are situated; you will then be in a better position to select another locality if required.

CUCUMBER HOUSES AT PRESCOT (*J. M. R.*).—The span-roofed houses to which you allude vary in length from 150 to nearly 600 feet, and are 9 and 10 feet wide. The height is 8 feet from the floor to the ridge, some a little more, but the majority less. The height to the furrow or eaves is 3 feet 6 inches to 4 feet, which will give a rafter of about 7 feet. The houses are built without side lights. The beds in which the Cucumbers are planted are supported by low inside walls. The houses have a very low appearance from the outside, most of them being sunk considerably. Some of them are built in blocks of four or five, and the furrows supported with pillars instead of a wall separating one house from another, but this is done for the sake of economy. The form of boiler in general use is an improved form of the saddle. The houses are of different sizes, aspects, and roof angles, so that it is not easy to be precise; but if you require further particulars relative to the structures we will endeavour to supply them, but we cannot recommend dealers.

MANURING POTATOES (*E. F. C. B.*).—The dressing you propose—1½ cwt. of nitrate of soda with 1 cwt. chlorate of potash—is good, and the best way of applying it is to sprinkle it between the rows before earthing up. In many districts, and probably in yours, an addition of superphosphate will do good. We have found a mixture of potassic chloride and guano very good. A mixture of nitrate of soda, half cwt., potassic chloride, one cwt., and three-quarters cwt. of superphosphate is as good as any. If the Potatoes are growing weakly you had better double the amount of nitrate, if moderately give a little more than you allow. Often, in the case of very strong-growing kinds, nitrates are not necessary, but in your climate they may be freely applied with nothing but benefit. Occasionally potash does no good, but generally it is the most important ingredient in Potato manure. If our hints help you we shall be glad to hear of the result.

TEA ROSES IN DECEMBER (*T. B.*).—The condition of the plants will suggest the treatment that should be accorded for inducing them to flower in the winter. Some plants cannot with any certainty be made to produce blooms freely at the time indicated. If strong plants growing freely in pots either in a light house or plunged in ashes outside are well supported, and the buds picked off until October, they will often produce a number of buds in November, and these in a moderate temperature and genial atmosphere will expand in December. But Roses to flower freely at the time indicated must be encouraged to make their growth early in the season in a very light house, then be ripened and rested in the summer, yet keeping the roots moist, pruned, and top-dressed in October, and placed in a moderately heated structure. Roses thus prepared and managed flower very freely in the winter, but can only be produced satisfactorily in very light houses that are well adapted for the growth and forcing of the plants; and it would be little use attempting their culture with the object in question in an ordinary greenhouse, and in a mixed collection of plants.

ZONAL PELARGONIUMS FOR WINTER (*Idem*).—Healthy plants now established in 3 or 4-inch pots, the leading growth stopped and just breaking, then placed in 5 and 6-inch pots in a good compost of loam, with

a little decayed manure and a fifteenth part of bonemeal, will flower freely in the winter if well attended to in the summer and the flower buds are picked off as they appear. They may be stood in the open air as long as the weather is favourable, then placed under glass. They must not be starved with the object of ripening them, but must be encouraged to grow freely under the full influence of the sun. If dwarf plants are required the tips of the shoots may be nipped off in August. Young plants generously grown produce the finest trusses; but old plants of such free varieties as Vesuvius cut down now, partially shaken out, and repotted when they have started into growth, then carefully tended and supported, will yield a profusion of moderate sized trusses during the winter months in a light house having a temperature of between 50° and 60°. They will not continue producing trusses freely in winter in a cold greenhouse.

EPIPHYLLUMS (*Idem*).—Cuttings should be inserted in spring in light open soil in a brisk heat, keeping moist, but avoiding watering more than to keep the soil in a moderately moist state, the cuttings being inserted around the sides of the pots, and when rooted potted-off singly in 3-inch pots. If the plants have filled the pots with roots, and have made, or are making, good top growth, shift into 4½-inch pots in May or June, and by the end of July or early in August the growth will be complete. They should then have a lessened supply of water, and the sprinkling overhead be discontinued, and have a light and airy position. A warm greenhouse or cool stove gives the most suitable temperature, but the plants may be grown very well by those having in addition to a greenhouse a vinery started in February or March, which from the moisture and heat will conduce to a vigorous growth, that being completed by the time the Grapes are ripening, when the plants may be removed to a light airy position in the greenhouse with water only to keep the growths fresh. The plants if kept in an intermediate house will commence flowering in November and continue until February. If they have a month to six weeks of this rest after flowering they subsequently grow much more vigorously. When growth commences the plants should be repotted, taking away as much of the old soil as possible without injuring the roots, and they may be returned to the same pots, adding fresh soil. The most suitable compost is light turfy loam, very fibrous, and chopped up moderately small, with an addition, in equal proportions, of dry cow dung, sharp or river sand, and crocks—or what is better, soft bricks broken into small pieces. The potting should be moderately firm and the drainage thorough. When in free growth and the roots active liquid manure may be given abundantly; a peck of cow dung to twenty gallons of water answers well, or one peck of sheep droppings to thirty gallons of water, one peck of soot to thirty gallons, or one pound of guano to twenty gallons of water, avoiding making the soil sodden, and leaving off the applications of manure water when the growth is complete. Useful and attractive as are plants on their own roots, those grafted on *Pereskia* stock (*Pereskia aculeata*) are infinitely superior both in vigour of plants and their ornamental character. If you require further details of culture you will find them in No. 780 of this Journal, which can be had if you send 3½d. in stamps to the publisher, quoting the number we have given.

LARCH TREES DISEASED (*John W. Kitson*).—We print your letter, as it refers to a subject of great importance, and as our reply will then be better understood. "Will you kindly give me any information you can as to a disease at present existing in Larch trees in Dartmoor at an elevation of 1000 feet? Soil rocky, with rotten granite sand. Fine young plantations of trees, with a growth of from 4 feet high, are attacked. They appear to die back with a red gummy sap exuding from the joints, giving them a cankerous look. Can the cause be frost or the work of an insect? and is it possible to apply a remedy?" The injury is the result of frost on trees which have been constitutionally enfeebled by being raised from seed produced in low-lying positions. The Larch is a mountainous tree, and the seed should always be obtained from specimens on high elevations. It thrives at an altitude of 1800 feet, and in its native habitats lives for 150 to 200 years; but trees grown in the lowlands speedily decay, and if seed is raised from these lowland trees and the produce planted in a high exposed position disease is almost sure to overtake them. Larches are no doubt attacked by insects, but immeasurably greater injury is the result of want of care in selecting the seed. The condition of the trees in question is not the result of frost during the past winter; it may have been done two or three years ago, and is only declaring itself now. There is no remedy, and the only method we can suggest of having healthy trees is to insist on them being raised from seed that has ripened on trees in a mountainous district. If this principle of procuring seed had been adhered to we are convinced there would not be half the Larch disease in the country that exists now.

MUSHROOM SPORES AND SPAWN BRICKS (*A. W.*).—It has been held by many investigators that it is necessary for the spores to pass through the system of an animal to acquire the power of germinating, and we believe the opinion is still entertained by some botanists. We have, however, heard of experiments by which it was, we understand, proved that the spores could germinate when taken direct from the Mushroom and placed in a suitable medium and temperature, but we cannot refer you to any published record of these results. The bricks are composed of horse and cow manure and sound loam, mixed, kneaded, and pressed into moulds. When the bricks are sufficiently dry pieces of spawn are inserted in them, and they are then kept warm by being covered with fermenting manure until the mycelium spreads through the mass. The covering is then gradually removed, the bricks dried and kept in a cool dry place, and it is not necessary to cover them with anything. It is almost impossible to teach a person how to make these bricks satisfactorily who has no knowledge of the work. He must see the process throughout, and even then he may fail. It is much better for amateurs to purchase spawn than to lose time in attempting to make it.

CUCUMBERS GUMMING (*G. Cole*).—The soil is probably too rich, and may be too wet, especially on the surface. Examine it by digging to the bottom of the bed, and if it is moist there lessen the water supply; if dry make some holes in the bed and pour water in. It is not possible to say how much water the plants should have, that depends wholly on the size and the conditions under which they are grown. We can only say that plants that show a tendency to gum should have no more water than will prevent flagging; and if the gumming be excessive shading must be resorted

to for a few hours in the middle of the day, so as to lessen the necessity for water in order to prevent flagging. The atmosphere must be kept drier and warmer, so as to allow of freer ventilation, which will cause more rapid evaporation and enable the plants to part with the superfluous moisture. Gumming is, however, better avoided than remedied. The soil should not be kept very wet in the early stages of growth; indeed no more water should be given than to keep the plants in steady progressive growth until the fruit is set and swelling, when copious supplies will be necessary. Encouraging a free growth in the plants in the early stages and up to the fruiting stage, and afterwards keeping the growths closely restricted, is likely to induce gumming, as are also large reductions of growth at one time and at distant intervals.

PRESSING AND PRESERVING FLOWERS (J. S. U.)—It is very difficult to preserve the forms of some flowers in drying them, and all that can be done is to spread the parts carefully and then press them heavily for some time. A little practice will soon enable you to accomplish this in the majority of cases fairly well; but in others you must be contented if the flower is recognisable when dried. Blotting paper will answer the purpose; but there is a special kind of botanical drying paper sold that is far better if you intend making a large collection. It can be obtained from wholesale stationers at a moderate price per ream. Employ boards a little larger than the paper, one at the top and one at the bottom of the specimens, distributing them evenly, and place heavy stones, weights, or similar substances upon the top. Examine the specimens frequently, placing them on fresh papers if necessary—that is if they are damp or any signs of mould be observed. When mounting the dried plants it is preferable to employ separate sheets for each specimen, either neatly securing it to the surface with thin gum or with narrow strips of gummed paper placed across the stems or branches. A collection of leaves alone would be comparatively useless; but an herbarium of well-dried and carefully mounted specimens would give you much agreeable and instructive employment. We do not know any book specially devoted to the subject, but in most works on botany some instructions are given that might be of use to you.

PHYLLOXERA ON VINES (W. S.)—There is no doubt whatever that your Vines are attacked with this destructive pest, as we found numbers of the sluggishly active insects on the roots. We have seen a case where phylloxera-attacked Vines were saved by saturating the border with ammoniacal liquor from gasworks. This was poured on the border until it passed through the drainage freely. It was not done with any confidence that it would have the effect it had. The Vines were doomed, and the gardener thought he would try the experiment indicated, thinking it might kill the insects, but feeling sure it would also kill the Vines. To use his own words, it "gave them a shaking;" but in the course of a week there were signs of fresh growth. On this account a respite was given to the Vines. Their growth progressed satisfactorily, the gas liquor evidently proving a good stimulant, and they are now as healthy as others in a very long range which were not attacked by the enemy. If you decide to try the experiment—and it would not be very costly, as you have gasworks in your neighbourhood—you must remember the saturation of the border must be complete. Water of itself appears in some degree an antidote, as the insects always increase the most freely where the soil is dry, and are sparingly found where it is wet; it has, in fact, been recorded on good authority that when some Vines that had been planted with the phylloxera on the roots were afterwards destroyed, no insects were found on the roots in the moist outside border, while they swarmed on the roots inside where the soil was much drier. If there are galls on the leaves as well as the roots there is no doubt the Vines must be destroyed and the house thoroughly cleansed. On this question you had better avail yourself of Mr. Bardney's experience, published in this Journal May 26th, 1881, and if you do not possess that number it can be had from the publisher in return for 3½d. in postage stamps. We are very sorry you have been overtaken with such a misfortune, for there is no doubt of the presence of the pest, and you must proceed at once to extirpate it. Mr. Bardney, as others have done, quite banished it from the vine in his charge; but it is for you to determine whether you will first try the effects of the gas liquor. If you do you had better dilute it with three or four times its volume of water, and we shall be glad to know the results.

GYMNOCLADUS CANADENSIS (J. Hartland).—We are not surprised that you were unable to identify the tree from the "shoot" you received and have sent to us, because it is not a shoot, but a portion of a pinnate leaf. Although much crushed and withered, we believe the above is the name of the tree, which has been described by Loudon as follows:—"The branches have almost always an upright direction; and the appearance of the head in the winter season is remarkable, from being fastigate, and from the points of the branches being few, and thick, and blunt, as compared with those of almost every other tree. They are also wholly without the appearance of buds; and this latter circumstance connected with the former gives the tree during winter the appearance of being dead, and hence the Canadian name of Chicot or Stump Tree. The leaves on young thriving trees are 3 feet long and 20 inches wide; but on trees nearly full grown they are not half that size. The leaflets are of a dull bluish green, and the branches of the petioles are somewhat of a violet colour. It is very hardy and flowers freely in the neighbourhood of London, but does not produce pods. The wood is hard, compact, strong, tough, and of a fine rose colour. In America it is used both in cabinet-making and carpentry, and, like the wood of the Robinia, it has the remarkable property of rapidly converting its sap-wood into heart-wood, so that a trunk 6 inches in diameter has not more than six lines of sap-wood, and may, consequently, be almost entirely employed for useful purposes. The seeds were at one time roasted and ground as a substitute for coffee in Kentucky and Tennessee; but their use in this way has been long since discontinued. The pods, preserved like those of the Tamarind (to which this genus is nearly allied), are said to be wholesome and slightly aperient. In Britain the only use of the tree is for ornamental purposes; and, considered as an object of curiosity and beauty, no collection ought to be without it. A rich, deep, free soil is essential to the thriving of this tree, and such a soil is never met with naturally in exposed situations. The tree is generally propagated by imported seeds; but it will grow freely from cuttings of the roots, care being taken in planting to keep that end upwards which is naturally so."

NAMES OF PLANTS (W. H.).—The flower arrived in such a crushed con-

dition that it was quite unrecognisable. (*G. C. S.*)—*Bromus erectus*. (*Castleford*).—1, *Heraclium Spondylium*; 2, *Torilus Anthriscus*; 3, *Rhinanthus crista-galli*; 4, *Hordeum sylvaticum*; 5, *Festuca pratensis*; 6, *Bromus sterilis*. (*W. McK.*)—1, unrecognisable without flowers; 2, *Kennedyia monophylla*. (*J. E.*)—*Stellaria graminea*.

THE SUSSEX BREED OF CATTLE.

THE Sussex cattle are the descendants of a very ancient breed, and have been continued with varying changes in their shades of red, being formerly of a very deep red, almost approaching black, but recently of a brighter or cherry red colour. The objects, too, for which changes have been made in the style and type of the cattle are considerable, for they were in the earliest records of the breed reared principally for the tillage of the land, and after having attained an age unfitting them for field labour they were fattened on the rich grazing pastures and marshes in Kent and Sussex, and sold to the butchers at heavy weights, frequently from 180 to 200 stone. But the system and style of breeding for working purposes seems to have been successful and well adapted to the period, as they were valued for their great size and muscular power; yet they were coarse in appearance and carrying much flesh, which gave them great power and capacity in tillage labour, especially as they were upstanding and lengthy animals.

Mr W. Housman, who is one of our greatest authorities on the subject of cattle and their types, states of the Sussex breed:—"The origin of Messrs. Stanford's herd is lost in the misty distance of the last century. Its acknowledged position in the front rank is due mainly to the judgment of the present proprietors, who are not veterans, but men in the prime of life. They farm altogether about 1100 acres, and breed, rear, buy, sell, and feed cattle, treating the pure Sussex cattle as plain-faring and rent-making stock. The grandfather of the present owners of the herd came to Eatons in 1779, bringing with him from beyond Horsham pure-bred Sussex cattle, ancestors of some families of the present herd. He soon afterwards bought Ledford Farm, where also pure Sussex cattle were bred. During his time and during the lifetime of his son, the father of Messrs. E. & A. Stanford, no systematic record of the breeding of the stock seems to have been kept. The offspring of the cows brought over in 1879 were known as the 'old sort' from generation to generation, so that their descent from the foundation stock was kept in remembrance by tradition. The cattle did all that was required of them for the dairy and the plough, and eventually fell under the butcher's axe heavy carcasses of beef.

As ploughing with oxen became a less common practice proportionally more attention was paid to the beef-points, until we have in the massive and symmetrical Sussex cattle of the Royal Agricultural Society of England, the Smithfield Club, and the Bath and West of England Society the results of continuously repeated selection, extending over many generations. The breed as it is now, its breeders maintain, is the old breed of the last century, and of time immemorial improved up to grazier's standard—improved, as any breed may be improved, by skilful breeding and good management within its own limits. It was always a breed of hardy active animals, kindly feeders, and only wanted a little care to translate the form from that of a draught ox to the butcher's model, and encouragement of the fattening propensity to cover the improved frame with prime beef in the most valuable parts. These desiderata have been supplied. Messrs. E. & A. Stanford's father, while keeping on the line here indicated, did not, as already stated, leave any record of his work, as step by step, link by link, it was continued from his father's time. He used pure-bred bulls, avoiding near relationship in animals paired; but their names and order of succession are not known. One remarkable sire, however, is remembered. In the year 1839, when the first meeting of the Royal Agricultural Society of England was held at Oxford, Mr. Rutland of Firl, near Lewes, sent his 'Brown Bull,' who walked all the way to Oxford, and carried off the first prize. Brown Bull was purchased by Messrs. Stanford's father and used in his herd."

We will now make a quotation from the account given by Mr. A. Heasman, an eminent breeder and exhibitor of the Sussex cattle, as stated in the Journal of the Royal Agricultural Society of England. He says:—"This breed of a deep red colour is fast becoming closely assimilated in character to the Devon. This useful class of stock was formerly bred principally for draught purposes, being converted into food for the public after they had cultivated the soil of the Weald of Sussex and Kent—some of the heaviest tilled land in the kingdom. Even in those early days the Sussex cattle were fully appreciated, and always possessed the finest quality of flesh, were never neglected by the grazier. Times have very much altered, and the Sussex beasts are no longer what they were, neither are they reared to the same extent or for the same purpose. They have given place to horse and steam power, and now take up the position as one of the useful and established breeds of the kingdom. The breed has been too well appreciated by the tenant farmer to be allowed to die out, and great pains and attention have been taken latterly in endeavouring to alter its style and type by breeding from the smallest bone with the greatest amount of flesh. This seems to have been successful when we compare the present animals with what may be called the old-fashioned sort, one of which, of enormous frame and weight, was fattened many years ago at Burton Park, near Petworth, Sussex, and called the Burton Ox."

The Sussex stock, which we have known and seen at the exhibitions of the Royal Bath and West, also Royal Counties, Agricultural Societies, are equal to the other best breeds as regards early maturity and weight for age, which has been proved by the weights of the animals shown at the Smithfield Club meetings, and are great favourites both of the butcher and consumer. At three years old well-fed steers will frequently weigh from twelve to fourteen score pounds per quarter. The Sussex men, however, do not often spoil their best animals by over-feeding. After having carefully looked over all the best exhibited at the various meetings for prizes during many years, we may be allowed to describe their general features and points as follows:—The nose rather wide, the muzzle of a rich yellow colour, thin between the nostril and eyes; eyes rather prominent; the forehead wide, especially of the bulls; horns of greater length than the Devon, fine, and rather turning up at the points; neck not over-long; sides straight, and not coarse at the shoulder point; full and wide at the breast, which should project at the front; deep in girth, legs not too long, chine bone straight, but they are often rather too narrow in the chine, which point may easily be corrected; ribs, too, are sometimes rather less arched than in some other breeds; loin full of flesh and wide; hip bones not too prominent, but well covered; rump long and quite flat; tail should drop perpendicularly, the outside of the thigh being flat, but full of flesh otherwise; the hair soft and silky, with a firm but mellow skin.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—Hay-carting both of field and meadow crops will now be going on, but in various localities the Clover and Sainfoin hay crops have been somewhat injured, for from the 15th to the 23rd of June rain

more or less occurred every day in various districts. This, however, has been favourable for early root crops, such as Mangold, Carrots, Cabbage, and Swedish Turnips, which have been horse-hoed and hand-hoed in favourable weather, and bid fair for the production of over an average crop. Common Turnips, too, which are best sown for winter feeding in the first and second week of July, may now be sown under favourable circumstances. The month of July is also the month for cutting grass for hay on the low-lying meadows, water meadows, and pastures of the midland districts, the work attending which, together with the tillage of fallows in the strong land districts, will keep both horses and men in full employment at all favourable opportunities; and we must call the attention of the home farmer to the advantage of cutting his grass crops earlier than is customary, in order to secure the first and best quality of hay, and to get rid of the work of carting and stacking before the harvest commences, it being difficult to cope with both these farming operations at one and the same time.

Hand Labour.—This consists of haying, Turnip and other root hoeings, and singling. In the latter work the women can assist the men; boys, too, can do the same, but these are now at school until after a period when they would not only earn money to the advantage of the family, but also be learning all sorts of farm work, without which various country districts will be denuded of skilled agricultural labourers in the future. It is operating at present day by day, and in the opinion of many experienced farmers is one of the principal causes of the agricultural depression now existing throughout the kingdom, whereby thousands of useful farms have been deserted by the tenantry, and is also the cause of serious difficulties to the managers of various landed estates. In another way the education of the working classes not only withdraws young people from the country districts where they are so much wanted, but on reaching the towns to which they resort for employment, instead of being employed as they expected, they find themselves in the midst of a crowd of applicants who cannot obtain office employments and such like opportunities for bettering their condition, and in consequence become a dissatisfied portion of the population.

Live Stock.—It is now the time when many farmers make purchases of their young stock, such as short-woolled lambs. Various important fairs will now shortly occur both in Hants and Sussex, where the west country and Sussex Down lambs, and also ewes for producing early lambs next year, are to be found, because those persons who buy the ewes to put to the ram on their arrival at the farm will find it answer a good purpose, although they will have to pay long prices; and we allude to this matter in the hope of purchasers possessing stock by which they will have not only the full advantage of carrying out their objects and stock requirements, but that they will be able to manage and care for them in their own way, as the animals will become fully accustomed to the climate of their new home before the lambing period arrives.

THE ROYAL COUNTIES AGRICULTURAL SOCIETY'S WINCHESTER SHOW.—The champion prize, value £10 10s., for the best ram in any of the Sheep classes, presented by Messrs. Sutton & Sons, was awarded to H.R.H. the Prince of Wales for a remarkably fine animal of the South-down breed. His Royal Highness expressed his gratification at winning this prize, and his admiration of the silver cup which constituted it.

OUR LETTER BOX.

INCUBATORS (Hal).—The different kinds have been described and the management detailed in the paper devoted to those subjects, "Poultry." If you send a shilling in stamps we will endeavour to send you the information you require. There is no more practical book on poultry than Mr. Cook's work, published at this office, price 2s. 2d. post free.

FOWLS IN CONFINEMENT (S. S. S.).—Plymouth Rocks, Minorcas, or Andalusians would probably suit you, but try to get a good laying strain. You may keep a cock and six hens, or even one or two more, provided you attend very strictly to cleanliness and renew the earth in the run occasionally.

REMARKS.

24th.—Dull at first, bright in afternoon, calm and close in evening.
 25th.—Thick and dull at first, bright at noon, heavy shower 5 P.M. and in evening.
 26th.—Showery and cool.
 27th.—Slight showers, bright intervals, heavy rain after 8 P.M.
 28th.—Dull at first; fine, calm, warm evening.
 29th.—Fine and hot; cloudy in evening; lightning at night.
 30th.—Violent thunder storm; very heavy rain from 0.42 to 0.49 A.M., 0.38 of rain falling in the seven minutes; lightning afterwards; oppressive morning; fine warm day.
 A hot week, hotter than any week either this year or last year.—G. J. SYMONS.

COMING EVENTS

12	TH	National Rose Society's Show, Sheffield. Braintree Show.
13	F	Ludlow (Roses).

15	SUN	8TH SUNDAY AFTER TRINITY.
16	M	
17	TU	Leek (Roses); Evesham Show.
18	W	Mottingham Floral Fête (2 days); Darlington (Roses); Loughborough.

COMPLEMENTING AND HARMONISING COLOURS.

JUDGING from the way colours are occasionally arranged, some gardeners must be specially defective either in the perception of colour, or have not put themselves to the trouble of observing what combinations are pleasing, or of studying how to avoid blundering in colour arrangements. Flowers are bright and beautiful things; the leafy colours of many plants are capable of producing pictures fit to rank as real works of art; but the brightness of the flowers and gaiety of the coloured leaves often enough—indeed oftener than is pleasant to educated eyes—illustrate how even the beautiful can actually be made hideous. Doubtless a greater number, especially among the younger members of the craft, will be glad of a few hints that may at least serve to call attention to a much-needed though neglected phase of a gardener's education.

Green is of itself naturally pleasing, and relieves the eye that is accustomed to brick-coloured streets, dusty smoky roads, or gaudy colours. Indeed, bright colours pain the eye, green soothes it, and relief has often to be found in green spectacles. It is not half so much the brightness of the flower, which Nature, indeed, furnishes with comparative scarcity, that is the charm of the country. It may be doubted if the best-planted parterre ever seen is capable of yielding so much soothing pleasure as a bright green smooth lawn on which handsome green shrubs are tastefully arranged, with a park well timbered with grand trees beyond. Nevertheless, colours properly arranged in pictures, in tapestry, dresses, or in gardens are capable of giving exquisite pleasure, and really do so to thousands. If only all were arranged according to correct principles, this pleasure could be greatly augmented, and the beholders and flower gardeners alike refined.

It is curious to see how popular anything red in a garden is, and how despised is yellow; though partly because of the necessity for variety, partly because of the ease with which many yellow-flowered and yellow-leaved plants are grown, yellow is very plentifully employed. The reason is that the red of the Pelargoniums, Coleuses, Iresines, Alternantheras, and even red Beet complements the green which everywhere so preponderates, while the yellow is really about the worst to associate with green, although it is often employed in beds as edgings next the green grass in the form of Golden Feather. But yellow separated from the grass with a good band of white, which is neutral and hardly ever wrong—and complemented with the shade of violet or plum that best complements the particular shade of yellow employed, really is as beautiful as the pleasing pink and scarlet that claim all the praise of those not possessed of an artist's eye and an artist's education. It is very seldom indeed that blue is properly employed, simply because it must be placed next white or orange to make a proper contrast, or beside a greenish blue or a bluish purple to make a pleasing harmony.

The colours and shades named are not a tithe of those at

the command of the garden artist, but all shades whatever are capable of being arranged pleasingly or otherwise, not only as contrasts but as harmonies. The rainbow is the most perfect example of a harmony, and it will be seen in studying its colour arrangements that the one shade passes gradually into the other, producing thus a most pleasing whole. To some tastes harmonies are most pleasing; to others contrasts afford most pleasure. Possibly the extent to which the beholder possesses the perception of colour determines which pleases most. One possessed with a keenly sensitive eye generally takes pleasure in gentle harmonies; when the perception of colour is not acute contrasts may be best. In this way gardeners have an opportunity of showing how much their desire to please is; but can only know how best to arrange the colours in the beds when they know what is most likely to please. Still, in a general way, it may be said that harmonies look best when close at hand; contrasts when some distance off. Much depends on whether the beds are close to the window or otherwise. Sometimes parterres may be planted on both principles. Even single beds and borders may be so planted.

The simplest way of ascertaining what colour is likely to best match any other colour is to consider that there are three colours only, and that the rest are the produce of these mixed in different proportions. Those who wish to be scientific might easily preach a long sermon to prove this statement wrong without anyone being the wiser; but the tyro will not go far wrong if he starts with such an assumption, especially if he knows nothing of the subject and blunders accordingly.

The colours, which will be here called primary, are red, blue, and yellow. The secondary colours are purple (formed by mixing red and blue), green (formed by mixing blue and yellow), and orange (formed by mixing yellow and red). There are also tertiary colours, such as scarlet, which is red with a tinge of yellow in it, and plum, which is blue with a tinge of red in it, and so on, but so deep into the subject we cannot at present go. Now, as an invariable rule, primaries always look bad beside each other and the secondaries derived from them. Thus, red beside blue, or blue beside yellow, is unbearable. Equally vulgar is yellow beside green or orange, both of which have yellow in their composition. But any primary makes a pleasing complement with any secondary formed from any of the other two primaries. Thus, red (a primary) is complemented with green, a secondary formed from yellow and blue, the other two primaries. Blue is complemented by orange, and yellow by purple or violet.

If the shade of orange should be nearer yellow than a real orange its complement will necessarily incline in the same degree to purple. If the red should have a tinge of yellow the green should be as dark as possible, or even have a tinge of blue in it, and so on. The subject is infinite. As a study in harmony the rainbow is perfection, and the nearer the approach to that the nearer perfection.

White is most useful in harmonising or clashing colours, which may often be made at least tolerable by having a band of white interposed between them, and is by itself a capital lightener of an otherwise too-heavy arrangement. While hints may be given, and are undoubtedly useful, only close study and observation can enable anyone to master the subject in order to apply the knowledge usefully. This paper may be thought unseasonable. Not so. The laggards may only have scarcely finished their arrangement, but the earnest men are just beginning them for next year. Now is the time to do this. In spring only such plants can be propagated as are in stock. Now notes can be taken and the proper stocks prepared, and entered in note books. Then visiting will shortly commence. Many pleasing beds will be viewed and forgotten, simply because the secret of the pleasing arrangement will not be understood. "Botched" beds will unthinkingly be passed, but beginners at least had better notice these. The successful ones will probably be noticed in some or other of the papers, and be referred to.

"How not to do it" may well be worth learning, for failures are not often pointed out, but now is the time to do it. If this paper does not afford a key to those who would know more about the matter we may refer them to what Mr. Thomson has to say in his standard "Hand-book of the Flower Garden;" and those who wish to go deeply into the subject will find an elaborate series of papers in Cassell's "Technical Educator," and really one must "dig deep to find the gold."—A. H.

STRAWBERRIES FOR FORCING.

As the time has now arrived when it is necessary to prepare Strawberry plants for forcing next season, perhaps a few notes on that subject might be helpful to some of the readers of the Journal. I think I could not do better than record the method adopted at Ardgowan by Mr. Lunt, the able superintendent of the gardens there. The Strawberries produced in that establishment are second to none, as those who have seen them can testify, and therefore justify the means adopted to procure them.

As early in July as strong plants can be had soil and pots are got ready, and all other necessary preparations attended to. The orthodox system of layering the runners is departed from, they being severed from the parent plant and potted singly in 3-inch pots in free but rich soil. In these pots no crocks are used, but a small piece of half-decayed leaves is placed over the hole to keep the soil from choking it. They are then placed in a shaded position and well watered. In about three weeks they are sufficiently rooted and are shifted into the fruiting pots, the earlier being potted in 6-inch pots and the later ones in a size larger. These pots are well drained, and the crocks covered with sphagnum moss, over which a little soot is dusted. The soot benefits the plants, and also acts as a check against the ingress of worms.

The soil used for the final potting is good fibry loam, which is further enriched by a liberal application of cow manure and a dash of crushed bones; a little sand is also added to keep the compost more porous. The plants are potted firmly, the soil being well rammed with a potting stick, and sufficient room is left to admit a liberal supply of water. After this operation they are again placed in a sheltered position and thoroughly watered; here they remain till they become established in their pots. They are then removed to a position where they receive every ray of sunshine—a matter of the greatest importance, as without properly matured crowns a satisfactory crop of fruit cannot reasonably be expected. They are now carefully attended to as regards watering, keeping all runners cut off and the surface of the pots clear of weeds. As soon as the weather becomes cold and frosty at night they are stored away in commodious frames, the pots being packed close together, but not plunged. There they remain till placed in the forcing pits, receiving protection when the weather is very severe, and full exposure when it is mild.

The varieties grown are Garibaldi, Keen's Seedling, President, and Bothwell Bank Prolific. The last-named variety was tried last season for the first time, and has, I understand, given very satisfactory results.—W. L.

GARDEN CHEMISTRY—LIMING.

BESIDES the effects mentioned in my last article (page) the application of lime supplies an indispensable plant food. It is hardly for this that lime is applied, but when it is wholly deficient, as it is apt to be where long manuring is practised, it acts as does ammonia or nitric acid in soils deficient in nitrogen. It is the missing link, and when supplied is frequently enough of itself. Mr. Taylor recently gave an instance where its absence caused failure in Vine-growing even in new loam. Mr. Speed of Chatsworth also chronicled the recovery of failing Vines through the application of lime alone. At Longleat it is said to act "like magic" on everything to which it is applied.

It is to be feared that sometimes it is imagined that lime is given where it is not. Most writers on the Vine recommend mixing lime rubbish with the soil when the borders are made up; but what lime rubbish is, is not defined. Recently the writer saw some borders made up and liberally mixed with lime siftings. These siftings (from lime intended for building purposes) had every appearance of being lime, but they were only stones coated with lime. About new places it is to be feared that this mistake is often made. Occasionally the opposite mistake occurs. Lime rubbish is taken from ancient buildings, probably pulled to pieces for the purpose. Oftener than is suspected this rubbish contains very little lime. Long ago it was dissolved out by rain charged with carbonic dioxide.

Lime favourably affects most plants. To some, however, it is death. Heaths, Rhododendrons, Azaleas, and other plants will not

bear its presence. Often when excluded from the soil it is supplied in the water, and the gardener cannot conceive what can be wrong with his plants. Getting just such treatment as others that thrive somewhere else, he is at his wit's end. If the water supplied turns immediately white when lime water is mixed with it, the plants are being poisoned by lime. (In a paper on Waters we will show how to soften and purify such water.)

Gaslime is a waste product, and may often be had for nothing. Farmers and gardeners fight shy of it "because it kills," as they will tell you. But this is because it is not properly used. It is chiefly composed of calcic carbonate and calcic hydroxide. But along with these there is a varying quantity of calcic sulphide, calcic hypsulphite, calcic oxysulphide, and other substances. These are very hurtful to vegetable life; in any considerable quantity certain death, in fact, as many have proved to their cost. But when exposed to the air these substances change to the sulphate, which is not only not hurtful, but a valuable addition to any soil. Spread thinly on dry ground in October or November gaslime is perfectly harmless by March. It is a valuable insecticide, and no better exists for destroying the insects that prey on Onions, and sometimes make the cultivation of the Cauliflowers an impossibility.

The quantity necessary for an application wholly depends on the soil to which the application is to be made. In the case of heavy sour clays as much as from 10 to even 15 tons have been applied with nothing but advantage; but in gardens it will not be good economy to give so much unless in extreme cases. Two tons of quicklime applied early in spring and afterwards forked in lightly will, in most cases, be enough. Too heavy applications on soil rich in humus will liberate more food than the current crop can assimilate, and this would cause loss. Again, too much lime frequently makes soil too light and loose. When small doses are given this can be guarded against. Lime disappears sooner or later, and in time even heavy doses have to be repeated. In such cases there is at one time more than is necessary, at another not enough. When gaslime is used only small quantities should be used. Chalk, marl, or shell sand may, however, be put on in much greater quantities and at wider intervals. Acting less rapidly they are less apt to cause a too rapid waste of humus.

When it is deemed necessary to apply lime to Vine or other borders which cannot be dug up, and when, notwithstanding, it is desired that the lime should reach every portion of the border, it should be watered in while yet soluble—that is, when in the form of the hydroxide. Of course in rich borders this will at once become insoluble, but as fast as the carbonic and humic acids are neutralised by the descending lime, a constantly increasing thickness of soil will be charged with lime. To completely impregnate a whole border at once would be a herculean task; but it will be found better only to saturate the surface soil. Every watering will take down some, and indeed under such conditions wash it away; for in carbonic dioxide lime is soluble, and where constantly decaying organic matter is there is no want of that. We are all familiar with the lime "icles" that hang from bridges through which the water drains. These are pure calcic carbonate. The rain which passed through the bridge contained some carbonic dioxide, and small as is the portion so carried, it gradually dissolved the lime of the mortar and carried it down through the brick or mason work; but when exposed to the air the excess of the carbonic dioxide immediately left the lime it had dissolved, which once more became insoluble, and settled down in the form with which we are familiar. In this way great caves have been filled with pillars of stalactites, as they are technically called. Now the same process goes on in the soil, but with greater rapidity, for the supply of the acid is much more constant and abundant. For this and other reasons lime should not be too liberally applied to soils heavily manured or rich in organic remains.

Some years ago Professor Way drew attention to the double silicates which generally accompany clay. Double silicates are silicates of alumina in which part of the base has been displaced and its room taken by soda, lime, potash, or ammonia. These have been considered of great importance. Curiously, they may be altered—that is to say, if a silicate of alumina and soda exists the soda will be displaced if lime be applied, the lime taking its place. In the same way potash takes the place of lime, and ammonia that of potash, but only in the order we have named—that is to say, soda cannot displace ammonia. To this fact clay owes much of its value as a disinfectant as well as a deodoriser, and in this way for one ammonia becomes "fixed." How these double silicates are first formed is not very well understood, but it has been supposed that the application of quicklime is useful in originating them. The double silicate once formed easily passes through the form we have named. Lime water is frequently recommended for driving worms out of the pots, to cause them to come to the surface of lawns, bowling greens, tennis courts, and similar purposes. From what we have said it will be understood that it cannot be applied to all plants without harm, but

it may to the majority of what we may call loam plants. Indeed, although no worms exist, it may often prove beneficial to such, for it will remove acidity in the soil—a thing not unknown where large specimens are kept many years in the same soil. In some cases, where watering is not properly done, the soil even in small pots is sour more or less; and though a renewal of the soil is always the best cure, the application of lime water will remove the sourness and also add plant food to the soil.

Lime water is made by dissolving newly slaked lime in water. The idea some people have of the possibility of "making it strong" is wholly erroneous. Water can only take up in solution one part of lime to 732 of water. Weaker it may be, but not stronger. When much is wanted for applying to lawns, greens, &c., for the purpose of removing worms, it is not necessary to be particular whether the mixture is allowed to stand till clear, as the lime in suspension in the water will do good and not harm. When it is for anything more particular the water had better be skimmed of oily matter, allowed to stand till clear, and then decanted by means of a pipe bent to act as a syphon. If to be kept in jars or bottles it must be securely corked or the air will speedily precipitate the lime, when it will not be lime water, but a mixture of water and the mild carbonate. Hot lime made into whitewash is considered good for killing insects when applied to back walls of houses, brick pits, &c.; it certainly is effective in destroying moss or lichen on trees or walls. It may be applied for this purpose dry. Nothing will prove more effective for removing moss on lawns, and for this purpose it may be liberally applied in winter. On light soils such applications often cause a thick turf of white Clover to appear.

Cabbages of all kinds are greatly benefited by applications of lime. On the Continent, in this country, and in America it has been found to be almost a specific against Clubroot, and it is valuable for preventing finger-and-toe among Turnips. When liming is done on a small scale every year (the best plan), it should always be given to the land intended for Cabbages, Turnips, &c. The wild Cabbage grows best among shell sand by the seashore, and its ash yields 20 per cent. of pure lime (calcic oxide). The Vine has been rightly named a potash plant, but the ash of its wood contains from 30 to 45 per cent. of lime, and that of its fruit close on 20; and we all know how experienced gardeners prefer a calcareous soil or make one for their Vine borders. In well-manured soils from which the carbonic dioxide has dissolved and the rain washed out the lime, Peaches and Plums fail to set. The cure is new soil. A cheaper by far, and a thoroughly effective one, would often be a simple application of lime.—SINGLE-HANDED.

ENDIVE CULTURE.

As there are so many promising crops of Endive annually spoiled through being sown too early or too late a few brief notes on the subject now may be helpful. Endive is truly a winter salad plant, and although it is sometimes grown for summer use it is not worth cultivating to come in before October or November. We have had well-blanch heads ready to cut in August and September, but these were only for show, and where we secured half a dozen or so that were good, dozens in the same batch "bolted." This always happens with early-sown crops, hence our reason for objecting to them. Another reason is that when abundance of the best summer Lettuce can be had Endive is not valued as a rule, but in winter if well grown it may be said to be more valuable than Lettuce.

To secure a continuous supply from October until spring we would sow three times. First, at once; second, on or about July 20th, and again about the same time in August. The seed may be sown thinly broadcast or in drills. In any case do not cover it more than 1 inch deep, and let the soil be rich and not too dry or light. A very small piece will produce a great number of plants, and seed-sowing should be curtailed accordingly. When once the plants are seen above ground they will make rapid progress, and about three weeks after sowing will be ready for transplanting. Ground recently cleared of Potatoes, Peas, or Spinach is suitable. It is hoed and raked over, and then planted. The plants are dibbled in 1 foot apart each way, and the hoe is run between them to keep the surface of the ground free from weeds. Where varieties are grown which require tying up to blanch this is done when they have become good large tufts of luxuriant leaves, and a fortnight or three weeks before they are wanted for use. Subsequent sowings are all treated in the same way, and we never have any lack of the most useful Endive through the winter months.—A KITCHEN GARDENER.

CELOGYNE CRISTATA.—Mr. Grindrod has read my last note (page 531) like the first—rather hurriedly, or he would not have come to the conclusion he has. He will find that I do not use the word "impossible," but it is "possible." He appears to consider that cutting out useless crowded pseudo-bulbs from specimen plants altogether wrong; but plants

may be covered with growths, and still would be better if the crowded pseudo-bulbs were removed. Cutting out is done to give the principal pseudo-bulbs more room to develop, consequently finer flower spikes are obtained than from plants under the crowded system.—A. YOUNG.

SHOW AND DECORATIVE PELARGONIUMS.

THE present month being a good time to raise a supply for next year a few hints may be useful to beginners. I have learnt from experience that young plants every year give me better returns than old cut-backs, and occupy less space through the winter months when house room is scarce.

Propagation.—The cuttings should be taken from a clean healthy stock free from green fly. Strong young side growths are the best, and should be dibbled singly in small 60-size pots, the compost consisting of loam and leaf soil, with a good dash of silver sand, the soil to be made firm about each cutting. The pots may be arranged on ashes in a cold frame and the lights kept close, shading from bright sunshine. One good watering should be given to settle the soil. A slight damping after a hot day will be all that is required till roots are formed, after which they will require more air and water.

Potting.—Before the plants become root-bound transfer them into large 60-size pots, drainage being provided, on which some of the roughest of the compost should be placed. When the plants are sufficiently advanced shift them into 48-size pots, or, if very large specimens are required, another potting must be given into 32's, though I find with good attention plants in 48's are large enough for all practical purposes, either for the conservatory or for supplying cut flowers. For the final shift I prefer oyster shells as drainage, and a compost consisting of three parts strong loam to one of well-decomposed hotbed manure that has been kept dry and is free from worms, with sufficient sand to cause the water to pass freely through. Pot firmly, and allow sufficient room for watering.

Stopping.—The point of the shoot should be nipped out immediately roots are formed and growth has commenced, causing them to break close to the soil. Another stopping should be made when the young growths have formed three or four leaves. Some varieties will require stopping once more when grown strongly. I am quite content with from four to six growths, as these growths will throw side shoots and form a good head. I have some now from cuttings last summer 18 inches through in 48-pots; have been flowering since the middle of May, and will continue for some time, though the trusses are not so strong as at first. All flowers have been removed once a week.

Ventilating.—When roots are formed too much air cannot be given. The lights may be taken off to allow them the benefit of a warm shower or evening's dews. Drenching rains should be avoided. Keep them in cold frames while safe from frost, when no longer safe remove them to greenhouse or where space can be found. I winter mine on a suspended shelf near the glass in a span-roof house, where they get plenty of air. Being young plants they take up but little room.

Watering.—To grow Pelargoniums to perfection watering should be attended to carefully through all stages of their growth, watering just when the soil becomes dry and before the leaves flag. When the flower buds appear by no means allow them to flag, but supply water more copiously, as the pots being full of roots the soil will not become sour. Liquid manure should not be applied till they are well established in their flowering pots, when a little weak soot water may be given. When the flower buds appear it may be increased in strength and given every third watering, but not in excess, or they may east their foliage and the trusses will be weak. The point to be arrived at is strong short-jointed growth with plenty of healthy foliage. I also use liquid manure from the cow yard.

The varieties I grow are Dr. Masters, Sultana, Captain Raikes, Digby Grand, Madame de Clercy, Triomphe de St. Mandé, Claribel, Beauty of Oxtou, John Bright, Prince of Wales, Prince of Pelargoniums, Madame Thibaut, Sappho, Hesperus, Mons. Bollard, Lucie Lemoine, Madame Charles Koing, the last named being the best white I know; Duchess of Bedford, and Bridal Bouquet. All the above varieties are good and worthy of good cultivation. Besides being so pleasing to the eye they are useful for cutting, as they travel so well after being cut and gummed.—A. J. SANDERS.

VENTILATION.

I THOUGHT to have something more to say on this subject; but Mr. Taylor in his recent article on page 510, last volume, has so completely taken the wind out of my sails and expressed my ideas on the matter so

fully in a far better manner than I could possibly have done, that I really feel that I have nothing more to say. Mr. Taylor wishes for some information respecting the construction and aspect of Cucumber houses as used in this district. I am sorry I cannot give any definite information, for they are built in many forms and positions, and I cannot see any substantial difference in the results. As to the inclination on the roof, perhaps an angle of 45° is as good as any, and some of the largest growers use no putty in glazing, the glass being slipped down grooves in the rafters. Shading is pretty generally resorted to.

As to highest temperature that may be considered safe I cannot say, but have no doubt it will often range from 120° to 130°; but no grower expects too much heat will do any harm provided the moisture is in proportion.

In conclusion I may say that the only failures I have seen have generally been in houses that were too "airy," for they may be that without ventilators, those with least air space and closest construction and glazing being the most successful.—J. J., *Lancashire*;

TUNBRIDGE WELLS SHOW.

JULY 6TH.

THE annual summer Show of this well-supported Society was held, as usual, in the Public Hall and the beautiful grounds attached to the Calverley Hotel; and though in some classes, particularly for buttonholes, table decorations, and fruit, there was much less exciting competition than at many previous shows, the exhibits generally were numerous and of most satisfactory quality. This was particularly observable in the plant classes, a large number of the specimens entered being of remarkable merit, the flowering plants being bright and the fine-foliage plants most healthy and fresh. The arrangements were good, and the whole conduct of the Show was very creditable to the Secretary, Mr. E. F. Loof, who is ably assisted by an energetic Committee, the Messrs. Charlton taking a prominent part in the Society's management.

STOVE AND GREENHOUSE PLANTS.

The principal class in this portion of the schedule was for eight specimens, four fine collections being staged, as fresh, bright, and well grown as any that have been exhibited this season. Mr. T. Gilbert, Hastings, won the chief position with admirable examples of *Kalosanthes coccinea* over 5 feet in diameter and most profusely flowered; *Statice profusa*, magnificent; *Allamanda Hendersoni*, *A. grandiflora*, both large and beautifully flowered. *Aphelaxis macrantha rosea* was similarly fine, with several others. Mr. Tudgey, Waltham Cross, was placed second—an award that created some dissatisfaction, as the collection included three *Allamandas* and three *Ericas*, the former large, healthy, and well flowered, but the latter were poor. Messrs. Jackson & Son, Kingston, followed, their plants comprising three beautiful *Heaths*, the specimen of *E. Dennisoniana* being probably the finest in cultivation. *E. ventricosa Bothwelliana* was also in splendid condition. In the class for four stove and greenhouse plants the same exhibitors were the prizetakers—Messrs. Jackson, Gilbert, and Tudgey—in that order, with smaller but very neat plants.

Zonal *Pelargoniums*, both single and double, *Achimenes*, *Fuchsias*, which were especially well flowered, *Gloxinias*, *Caladiums*, and *Tuberous Begonias* all contributed considerably to the attraction of the Show, the chief prizetakers being Messrs. Allan, Wilkins, Scammell, Perkins, and Holland.

FINE-FOLIAGE PLANTS.

The exhibits in the classes for fine-foliage plants were some of the best that we have seen this year, their fresh vigorous condition being most pleasing. Mr. Rann, The Gardens, Handcross Park, Crawley, took the lead, having *Crotons* *Queen Victoria* and *C. Youngi* finely coloured, *Cycas revoluta* very fine, and *Gleichenia Mendelii* also being exceedingly vigorous. Mr. S. Pope, gardener to J. F. Barron, Esq., Holmwood Park, Langton, was a close second, the three best plants in his collection being *Beaucarnea longifolia*, *Croton angustifolius* beautifully coloured, and *Alocasia metallica* superbly grown. Messrs. Tudgey and Gilbert also were prizetakers, the latter having a magnificent *Kentia Fosteriana*. In the class for six plants Mr. Rann was again first, *Phoenix tenuis* and *Croton albicans* being notable. Mr. Pope second, with *Croton angustifolius* especially fine; and Mr. A. Waterman, gardener to H. A. Brasse, Esq., third, with *Acalypha Macaefiana* handsome.

Exotic Ferns were chiefly shown by Mr. Johnston, The Gardens, Bayham Abbey, and Mr. Pope, each of whom had fine examples of *Davallias*, *Cyatheas*, and *Dicksonias*. Messrs. Scammell and Allan were the prizetakers for hardy Ferns, fresh healthy plants of moderate size.

GROUPS.

One tent was devoted to the groups of plants arranged for effect, six being entered, differing greatly in the style of arrangement and in the plants composing them. Premier honours were awarded to Mr. Waterman for a high group of rather formal appearance, chiefly comprising foliage plants, the *Acalyphas* being very good, *Caladiums*, *Coleuses*, and *Adiantums*, with *Dracaenas*, *Palms*, &c. It was too heavy and stiff, representing a style that is usually discouraged by judges, preference being given to the lighter and more freely arranged groups. The second-prize group from Mr. Perkins, gardener to the Rev. R. W. Kinleside, was much preferred by many visitors and horticulturists, and the correctness of the awards in the class was much questioned. It was flatter than the others; but *Orchids*, such as *Cattleyas*, *Odontoglossum vexillarium*, and a few *Masdevallias*, were most tastefully arranged with *Adiantums* and other Ferns, so that a very bright yet informal effect was produced. The chief defect in this was that one of the sides had not been well finished, the pots being rather unpleasantly prominent, and but for that it would have been all that could be desired. This fault, however, was not sufficient to lower it to the second place. Messrs. Wilkins, Bashford, and Pope followed, each with groups of moderate merit, bright and effective.

Cut flowers, buttonholes, and bouquets were not in very strong force, but Rose blooms were well represented, especially in the nurserymen's

classes for forty-eight and twenty-four, in which Messrs. J. Mitchell & Son, Uckfield; B. R. Cant, Colchester; and Bunyard, Maidstone, secured the prizes with very brightly coloured blooms of good substance. The best collections from the amateurs were shown by Mr. Ridout, gardener to T. B. Haywood, Esq., Woodhatch Lodge, Reigate; Mr. H. Summers, gardener to the Rev. R. C. Hales, Woodmancote Rectory; R. Buston, Esq.; and Messrs. Slaughter and Allan. In the buttonhole and bouquet classes Miss Blanch Charlton, Mr. S. Cooke, gardener to D. B. Crawshaw, Esq., Sevenoaks, and Miss Ware were the most successful exhibitors.

FRUIT.

The collections of fruit were not so good as usual, but Mr. Waterman's first-prize lot included a great diversity of sorts, the Black *Hamburgh Grapes* being particularly fine. The best white *Grapes* were shown by Mr. E. Adams, gardener to W. H. Trigo, Esq., The Brokes, Reigate—Buckland Sweetwater, well ripened. Mr. Williams, gardener to C. Liddell, Esq., Peasmarsh Place, Sussex, had the finest black *Grapes*—Black *Hamburgh*, admirably coloured. *Strawberries* and other small fruits being exhibited by Messrs. F. Bridger; J. Allan, gardener to G. Hanbury Field, Esq., Ashurst Park; Waterman, and Hopgood.

A STRAWBERRY ENEMY.

GARDENING may, in one phase at least, be described as a constant warfare with a variety of enemies, and no amount of caution is always successful against their surprises. We have just lost a fine crop of *Strawberries* in a novel and mysterious manner, as yet a puzzle to my gardener and myself. Going to look at the bed to see if the fruits were beginning to colour, so as to necessitate their being protected by netting against the birds, I was horrified to find the green three-parts-grown berries lying on the ground beneath the plants, the stalks all cut or bitten through at exactly the same distance (about half an inch) from the fruit. Quarts upon quarts of fine promising berries thus wantonly ruined were lying around. What had been the perpetrators of this senseless mischief? It would have taken a neat hand a considerable time to have done it with a sharp pair of scissors, and it would have been difficult even then to have severed the stalks with so great a nicety. It was obvious that the birds were not the guilty parties, as they would have plucked off the berries unevenly, and, besides, would hardly have attacked them in a green state. Slugs and snails were also to be put out of consideration, for, thanks to the spell of dry weather, these pests have not been plentiful, and there were no apparent traces of them on the bed; nor could we find any beetles about, although I searched the plants to see if any were lurking among them. My gardener talked doubtfully of slow-worms, seeing a dead one lying on the path near at hand; but this explanation I at once scouted, and suggested field mice, and I suspect that these were the mischievous aggressors. But I should be glad to hear what your readers think upon the subject, as never before have I seen a *Strawberry* crop similarly destroyed.

Some six weeks ago, when our *Pelargoniums* were standing out on the paths to harden off before the operations of bedding-out commenced, we had several dozen of them ruined by their stems being eaten through just level with the ground, and on setting traps among them caught some mice, which no doubt had been devouring them; and as our garden has always been a bad one for mice, it is quite probable that they have also been the assailants of the *Strawberry* beds. But when describing the damage done I ought to have added that there was no injury to the fruit beyond the severance in an unripened state from the plants. The green berries were lying intact, and whatever enemy had cut them off had not thought them worthy of further notice.—MURRAY A. MATHEW.

CHISWICK AND TURNHAM GREEN SHOW.

JULY 7TH.

FAVoured by fine weather the above Society held their third annual Show on Saturday last in the gardens of the Royal Horticultural Society at Chiswick. Two large marquees were devoted to the exhibits, which were distinguished by considerable merit in all the principal classes; and the arrangement being well conducted, produced a display of great beauty, the fresh green turf upon which the groups and large plants were placed contributing greatly to the neat appearance of the Show. The Honorary Secretary, J. T. Musgrave, Esq., deserves much praise for his efforts to render this Exhibition worthy of a neighbourhood which gained world-wide fame in bygone days for its horticultural shows; and it need be scarcely said that, in the arrangement of the exhibits and practical management, he received every assistance from Mr. A. F. Barron and his willing staff.

GROUPS.

The entries in the class for a group of plants to occupy a space of 100 square feet nearly filled one side of a long tent, and the taste displayed by the exhibitors, together with the bright graceful appearance of the plants, rendered this portion of the Show particularly pleasing. Messrs. Fromow and Sons, Chiswick, took the lead with a very light arrangement of *Palms*, *Ferns*, and miscellaneous fine-foliage plants, with *Lilium auratum*, *L. longiflorum*, *Gloxinias*, &c., on a ground of *Adiantum cuneatum*, margined with tricolor *Pelargonium*, in very small pots. Messrs. Hooper & Co., Covent Garden, followed, also with a light graceful group somewhat similar in style, but with a distinct margin of *Adiantum*, *Gynura aurantiaca*, and *Isolepis*. It may be remarked that both these groups were very similar to those shown at Teddington a day or two previously. Mr. W. Brown, Richmond, was placed third, and Mr. James, Castle Nursery, Lewisham, was awarded an extra prize, both staging effective and bright groups. Another class was devoted to groups to occupy a space of 60 square feet, and several pretty collections were entered, the best being from Mr. A. Wright, gardener to

E. H. Wallis, Esq., Devonhurst, Chiswick, who had a due proportion of Cordylines, Crotons, Dracænas, and similar foliage plants, with Liliiums, Pelargoniums, Hydrangeas, and Gloxinias, neatly margined with Adiantums and Selaginellas. Mr. Buckland, gardener to H. Pearks, Esq., Heathfield Cottage, secured the second prize for a neat combination of Fuchsias, Lilies, Abutilons, Caladiums, with *Panicum variegatum* and *Selaginella* as a margin. Mr. Huckle, gardener to B. Hardy, Esq., Gordon House, took the third position with a fairly good collection of Begonias, Fuchsias, Coleuses, *Cissus discolor*, and others.

Stove and greenhouse plants were only represented by one collection, from Mr. H. James, Castle Nursery, Lower Norwood, which, however, comprised some very healthy and well-flowered specimens. Caladiums were well shown by Mr. Buckland; and Mr. Harding, gardener to J. R. Starling, Esq., The Chestnuts, Harwood Road, large well-coloured plants. Coleuses also were contributed by Messrs. Wright; Barker, gardener to C. Brown, Esq., Evasleigh, Harwood Road; and Hardy, who were the prizetakers. Mr. G. Wheeler, gardener to H. Irving, Esq., The Grange, Brook Green, staged six neat Coleuses of Mr. King's new varieties, such as *Ada Sentance*, *Edith Sentance*, &c., well coloured and praiseworthy, but too small to gain a position in the class. Gloxinias were well represented by Messrs. Prewett, Brown, and Hardy; table plants of a most suitable size being shown by Mr. Otto Hickle, The Gardens, Lebanon House, Twickenham, and Mr. Hardy.

Fine-foliage plants were large and vigorous, especially those from Mr. H. James, which gained the premier position in the class for six. *Pandanus Veitchii*, *Thrinax elegans*, and *Croton Wiesmanni* were remarkably good. Mr. W. Brown, who was second, also had a finely coloured *Croton Wiesmanni*, and a healthy *Ptychosperma Alexandræ*, Messrs. Hooper & Co. following with smaller examples. Six handsome exotic Ferns were contributed by Mr. A. Wright. *Gymnogramma ochracea*, *Adiantum decorum*, *trapeziforme*, and *farleyense*, with *Pteris serrulata cristata*, were uncommonly vigorous and fresh, well deserving the chief honours accorded them. Messrs. Fromow & Son had a similarly fine half-dozen, *Davallia Mooreana* and *Dicksonia antarctica* being good.

Fruit was very moderately shown, but two exhibits of Grapes were remarkable. These were from Mr. Baird, gardener to C. H. Daw, Esq., Holmfield, St. Stephen's Road, who was placed first in the classes for black and white Grapes. In the former two magnificent bunches of Black Hamburgs were staged, large alike in berry and bunch and finely coloured. In the other a superb bunch of Buckland Sweetwater, grandly ripened, with remarkably large berries, attracted much attention—as it well deserved, for it is one of the finest we have ever seen. A handsome bunch of Duke of Buccleuch was also staged, the berries being of enormous size and excellent flavour. Other prizetakers in these classes were Mr. Coombs, gardener to Sir H. Meux, Sheen House, Mortlake, and Mr. Huckleby, who had small Black Hamburgs and Muscats. Small fruits, such as Currants, Raspberries, Strawberries, &c., were contributed by Messrs. Coombs, Stanton, Stedman, and Hickle.

Vegetables were rather small, Messrs. Huckleby, Stanton, and Coombs taking the prizes; while Messrs. Carter's prizes for new Peas were won by Mr. G. Williams, gardener to C. Liddell, Esq., Peasmarsh Place, Sussex, and Mr. R. Phillips, The Gardens, The Deodars, Meopham.

Miscellaneous groups and collections of plants were numerous, one of the most notable being that from Mr. May, gardener to the Marquis of Butc, Chiswick House, which comprised handsome specimens of *Pandanus*, *Anthurium acaule*, *Adiantum farleyense*, and flowering plants. Messrs. C. Lee and Son, Hammersmith, had a tastefully arranged and beautiful collection of ornamental variegated shrubs and trees, together with Roses in pots and cut Roses. Messrs. Hooper & Co. had a collection of double *Potentillas*, choice hardy flowers, Dahlias, and Pinks; Mr. H. Howell, Hammersmith, having a large collection of Gold and Silver Tricolor *Pelargoniums*.

AUTUMN CABBAGES.

By these I do not mean the plants raised from seed sown in July or August and planted in September to head the following spring. The most valuable autumn Cabbages are those planted out at the present time, and which come in for use in October and November. Cultivators, more especially those having large demands for autumn vegetables, would find it profitable to put out a good plantation of Cabbages now. A piece of ground from which early Potatoes have been cleared would answer capitally for the crop. If rather poor it must be made rich with manure, which should be dug in; but if the soil is in good order it need not be moved, but simply levelled down, the surface cleaned and planted. Many persons will still have some small plants on hand which were left when the first spring-sown plants were selected and planted, and if these were thinned out or transplanted, and grown 2 or 3 inches apart, they will now be in excellent order for planting in the manner indicated. Savoys are frequently planted to become useful in autumn, but they are never really good until after the first frost, or about Christmas time, and all who can now be induced to grow Cabbages for an autumn supply will find an ample compensation for the labour and ground devoted to their culture.—A KITCHEN GARDENER.

FRITILLARIA MELEAGRIS.

THE Crown Imperial is one of the most common of garden flowers, though it was a "rare strange plant" in Gerard's time, and when bearing its majestic heads of blooms it has a very attractive appearance in borders amongst dwarfer plants. The "Chequered Lily or Daffodil," as *Fritillaria Meleagris* has been variously named, is quite as well known in most gardens, but as an old favourite a figure is now given of it to remind amateurs who are commencing the culture of hardy flowers that some of the best are to be found in the ranks

of the oldest. This *Fritillaria* is a native of Europe, but was early introduced to this country, and has now become naturalised, being found wild in some parts, generally in moist meadows or similar positions, but is rare. Phillips mentions that "it has been found between Mortlake and Kew, where the plant was formerly called Snakeshead; and on account of its growing plentifully in a particular pasture of that neighbourhood there is a field called Snakeshead Meadow." It is now found from Norfolk and Bedford to Sussex and in neighbouring counties. The flowers are usually of a yellowish or white ground, regularly barred with red or purple, varying in depth and richness.

The plant succeeds well in any moist light soil in a shady position

Fig. 7.—*Fritillaria Meleagris*.

and can be readily increased either by offsets or seed, the latter being sown immediately after it is ripe, and the seedlings subsequently planted out.

NOTES ON CUCUMBERS.

A BREAKDOWN OF THE "EXPRESS."

CONTINUING this subject from last week, I will now describe my culture in a lean-to house facing east. It is 14 feet high at the back, 5 feet 6 inches in front, giving me a 13-foot rafter, glazed with 12 by 20-inch squares. There are three rows of 4-inch pipes under the bed and two rows in front, and three rows down the path for heating the atmosphere. I planted intending to give the Express system a full trial. For the first month all went well, then I began to have great difficulty in preventing flagging and burning. For two very hot days I watched the plants, and did all I could in the way of watering, syringing, and keeping replenished forty evaporating troughs 3 feet long. The house is 80 feet. I then to my grief found after two unusually hot days I had lost all my first crop of fruit. They looked well before they were in bloom. In addition to losing the fruit I lost a quantity of good foliage, the thermometer registering 120°. Seeing the damage I procured some serim canvas and shaded as required, and the plants are now just coming round. Elliott's

Yorkshireman at the cool end of this house were not injured, the plants being also smaller. Perhaps your readers may fail to see why I am thus writing, but I will endeavour, without condemning the system, to give my experience as far as I can, as it may be useful to someone. I am now growing with moderate, not excessive, fire heat, no ventilation, plenty of water at the roots, moderate syringing once a day early in the afternoon, and there is no sign of red spider.

I said in my former paper that I did not think it possible to give too much water to Cucumbers grown with dry bottom heat; in fact, for the guidance of perhaps some who are afraid to apply water, I may say I have this week given the bed, which is 3 feet wide, six gallons to a length of 9 feet. Never forget, if the weather be dull and more fire used, to give the water all the same.

To make sure that all is right at the roots do as I have done—namely, with a trowel carefully dig down to bottom of the bed to ascertain its condition. Cucumbers can and will subsist, and apparently do well, more especially in dull weather, as far as regards their foliage, but if the fruit sets badly and is at all deformed be sure something is wrong at the roots. The severe burning of the plants was caused, I am sure, by root-dryness in part. I now have the pleasure of seeing straight fruit 6 and 7 inches long, with flowers yet to open. This is what I like. I used nothing but turf or loam, but am now giving them slight top-dressings of stable manure. I am pleased to say under my system I cut Cucumbers 2 feet long; yet quickly grown, thus tender and of a good colour, whereas without shading the fruit was very small and very deficient in colour. In my smallest house I endeavoured to cut a great quantity, but failed, and I cannot claim to have cut largely out of this house, but shall hope to do so presently. Still, if I make as much money by one good fruit as I did by two smaller grown in the same time I see little to commend in the Express system, nor do I think it very practicable in such light houses as these, with the wires only 14 inches from the glass; 2 feet is quite near enough. Then I am not sure whether shading would be necessary.

I shall be pleased for others to record their experience. I am quite sure if burning can be avoided, great heat and moisture combined are just what Cucumbers like, yet I do not believe in a high night temperature. One grower tells me he succeeds grandly with the Express system in a frame, on the same day another tells me he fails, so there are always two sides to a question, or two ways of carrying out a system.—STEPHEN CASTLE, *The Vineyard, West Lynn.*

AMARYLLIS VITTATA VAR. CLOVIS.

I AM very much surprised that so little attention has been given to the very beautiful varieties of *A. vittata* which were raised by my late lamented friend M. Souchet of Fontainebleau. More than once on my visits to him I had been struck with their beauty, and wished to try what could be done with them. So two years ago I obtained half a dozen of the best raised from M. Charles Verdier of Paris, and as they were perfectly hardy at Fontainebleau, where the winter temperature is so much lower than with us in the south-east of England, I did not see why they should not do as well with us as there. I planted them in the same position as the Belladonna Lilies—namely, in the front of a greenhouse on a warm border facing the south. Like all of the tribe they do not like removal, and so I did not expect much from them last year; but this season, after passing the two winters, I have been rewarded. Clovis (a flower of which our Editor saw at the Rose Show at South Kensington) is a dark crimson flower of large size and good form, with a white band in the centre of each petal, and is a remarkably striking flower. It has been said that we cannot do these Lilies here because of our wet and sunless autumns, and that the bulbs do not ripen. Well, we have not had much to ripen them the last two years, and yet they have with me succeeded well, the only protection given them being some ashes.—D., *Deal.*

WANDERINGS AT THE NATIONAL ROSE SHOW.

A DETAILED account of so extensive and interesting display as that of Tuesday, the 3rd inst., would probably occupy many pages of the Journal, but a short *résumé* of what I saw and did not see may help to place on record the effects of the Rose season, 1883. Although it must be admitted that the best was done to adapt the large tent of the Royal Horticultural Society to a Rose Show, it can hardly be said that cut Roses in boxes seemed there at home, and for purposes of comparison and judging it did not appear to me satisfactory, and exhibitors had some difficulty in alighting upon their allotted quarters. One of the most attractive and best features of the Show of Tuesday was the freshness and purity of the Teas, and perhaps at no time has a more regular display of such floral beauties been brought together, and the Committee when they projected a class for ornamental baskets of Teas could hardly have anticipated such a successful result. Jean Ducher in the stand of A. J. Waterlow, Esq., Mr. Cant's, and the Rev. W. H. Jackson's *Souvenir d'Elise*, and Innocente Pirola in several stands testify not only to what sort of a season it is for Teas, but what splendid Roses these are. By Innocente Pirola it would almost seem that *Niphotos* would be displaced,

and that the *Maréchal* must bend to the beautiful *Etoile de Lyon*, which is said to be a hardier and more generally shapeable yellow than the king of Teas. The amateur classes, and even that for suburban-grown Teas, were barely inferior to Cheshunt, Oxford, or Colchester, and the judging of the Teas generally must have been neither an easy nor an enviable task.

Amongst Hybrid Perpetuals I could not help noticing the important absence of really good darks and reds, good blooms of Alfred Colomb, Marie Baumann, and Charles Lefebvre, and many others of their colours being conspicuously wanting, whilst Roses of the Madame Gabriel Luizet, Mons. Noman, Julie Touvais, and Duchesse de Vallombrosa types were almost universally well shown. Marie Cointet and Madame Julie Dymonier (a fine light of good substance) were both finely shown by Mr. B. R. Cant; and Duke of Teck, a really hardy and fine red Rose, does honour to, if it has not enriched, Mr. George Paul, as it is a Rose, like Star of Waltham and Magna Charta of Mr. W. Paul, which has with the two latter improved upon acquaintance. François Michelin stood prominent in several stands as a model of the globular rose-pink type. Madame Isaac Pereire, Ulrich Brunner, Madame Eugène Verdier, and Georges Moreau seem promising Roses of recent introduction, the three first having good size and well-formed and arranged broad petals, and of different shades of peach and pink. Alfred Dumesnil a good red, and Comte de Flandres a dark of the Charles Darwin build and colour, will also probably be heard more of. Amongst the older bright-coloured Roses I ought to have excepted from the 1883 black list A. K. Williams, still the most perfect Rose shown. Comte de Raimbaud almost in as good form, and one very fine Marie Baumann, Xavier Olibo, and Sultan of Zanzibar were also fairly represented. Amazon and Madame Caroline Kuster, and Comtesse de Nadaillac and William Allen Richardson, have now all established themselves as beautiful and indispensable Teas, and were well shown.

Mr. Bennett has a promising novelty in Mary Bennett, and Mr. Waterlow's new break, a well-marked striped sport from Comtesse d'Oxford, in the absence of Her Majesty would have deserved the gold medal. The latter Rose, however, from the *atelier* of Mr. Bennett, appears likely to distance all other light H.P. Roses, and indeed to call it an improved and enlarged Baronne de Rothschild is almost to depreciate this magnificent variety, which in size equals the largest form of Edouard Morren, with the colour of the Baroness and the form and fulness of Marie Cointet at her best, whilst the scent which savours of its Tea parentage is in advance of that of the Baroness. Although shown largely by Mr. Bennett in both tents I did not detect a single malformed bloom, and the raiser will probably be able to point to the year 1883 as that of Her Majesty. It is a Rose that will do much to allay the hostility which some of Mr. Bennett's former productions have rightly or wrongly created in this country from their reported unsuitability to the climate.

Although it may be said that Roses upon the whole have been seen better at the National than on Tuesday, this may, I think, be considered a year for lights. So far as my own experience goes I have only on one occasion during the past quarter of a century seen in the eastern districts of England Roses after starting go straight on without a check, and I have never seen fewer confused and ill-shaped blooms, the exceptions being Roses of the Madame Boncenne and Jean Liabaud build and colour, which have come almost universally bad. Madame Gabriel Luizet as a contrast, which has rarely come good with me, has this season hardly shown a defective bloom.—T. LAXTON, *Bedford.*

I COUNTED all the boxes exhibited in competition at the National Rose Society's Show at South Kensington, and found that several hundred blooms were shown in excess of last year's Rose Show, making this the largest Show the National Rose Society has yet held. Considering how hampered up the Show was with the Fisheries Exhibition and the irregularities of the ground in the big tent and the unprecedented number of exhibits, the arrangements were admirable, and great credit is due to Mr. Barron for the way in which the marquee was made to look as well as it did.

The one drawback to the beauty of the Exhibition was the closeness of the weather during the previous night and on the morning of the Show. To my mind after the middle of the day at least one-half of the Roses were unpleasing objects to look at. Some varieties stood, however, remarkably well, and notably A. K. Williams. This as a crimson, and Madame Gabriel Luizet as a light rose, were very numerous exhibited, and are both grand flowers. A remarkable number of blooms (for a new variety) of "Her Majesty" were shown by Mr. Bennett, and were on all hands much admired. For several years past the Society's gold medal has been withheld, no Rose being shown considered worthy of it. "A first-class novelty," as the schedule has it, Mr. Brown's sport from Comtesse d'Oxford was a pleasing and interesting novelty. The challenge trophy was again won by Mr. Cant, who also, as last year, had the best Hybrid Perpetual and best Tea in his seventy-two. In the amateurs' class the best Hybrid Perpetual and also best Tea both came from Reigate. The other trophy was won by Mr. Slaughter, who only two years since secured a first prize in the class "open only to amateurs who have never won a prize at an Exhibition of the National Rose Society." Mr. Slaughter was also first in the chief class this year at Croydon and Reigate. No. 3 in the trophy class came Mr. Girdlestone, who last year showed for the first time, and on that occasion secured the first prize in the never-before-won-a-prize class just referred to. Both of these remarkable strides.

The baskets of Roses was a new and interesting feature, and broke the

monotony of the other exhibits. The Tea Roses were as a rule numerous and very good. The new exhibition label recommended by the National Rose Society were numerous used, and gave a finish to the boxes much better than written labels on white card.—ROSARIAN.

P.S.—It is very curious to notice how the successes or non-successes of exhibitors influence their view of a show as a whole. My own idea is that it was, taken as a whole, the finest show we have held since the St. James' Hall show—that is, judging of the flowers as the Judges saw them, and taking their average quality.

THE most striking feature of the whole Show appeared to me the high average quality of the blooms, there being scarcely a single really bad box, I should say, in the Exhibition. The weather shortly before the Show was too forcing to allow the plants to fully mature their flowers, and when cut many grand blooms must have everywhere been cast aside as useless at the last moment, owing to the heat of the previous day and night, and also of the morning of the Show. Had air been freely admitted all round the tents (it was a calm day) there can be no doubt the blooms would have stood better than they did. Then the dashing rains of the previous night were, of course, against the permanence of the Roses when cut, during their transit to the Show. I thought the Roses looked much better—the flowers uninjured by the heat and close atmosphere, I mean—under the subdued light under canvas than in the raw light from the windows of the arcades last year. There is one fact that might be noticed, and that is the unprecedented event of the "wolf" being filled to overflowing with cut Roses.

The nurserymen's exhibits will no doubt be better later on. Of my own few maidens only three or four plants have yet flowered at all, and most will not be in flower for about another week, I should say. As to the competition for the amateur grand challenge trophy, it is very difficult, owing to the forcing weather—and I did not see the flowers when first set up—to judge as to their position if compared with similar exhibits in former years; but the opinion I formed was that the Roses in the two leading boxes were not equal to those shown by Messrs. R. N. G. Baker and T. Jowitt in some of their contests for the Cranston challenge cup. Mons. Noman was, I noticed, frequently and well shown. It would be interesting to know what was thought of the Show by rosarians generally. Will those who can do so send a note to the Journal? —AN EXHIBITOR.

I HAVE been asked by one of the Honorary Secretaries of the National Rose Society to give you my impression of the great Show recently held at South Kensington. Your reporter's account was so very full and good that it would not have occurred to me to have tried to supplement it in any way. It is to me a matter of wonder and admiration how any reporter could, in the short space of time during which it is possible to take notes, furnish such a report. I am afraid that my impression of the Show as a whole is not a very favourable one. Being engaged in judging most of the time, I had very little opportunity of taking notes, but from what I saw of the Roses I should say that with regard to quality it was the worst Show the Society has held. With regard to quantity it was of course a very great success, but I do not think any of the exhibitors showed in their best form. This to me is quite accounted for by the very hot and stormy weather we had on the days immediately preceding the Show, particularly Monday. This day was very appropriately described by one of the amateur exhibitors as a "ghastly" one—the blooms were over before they had well nigh fully opened. The great amateurs that we are accustomed to see in such force at this Show were nowhere. Mr. Cant was the only nurseryman who showed in first-rate form, with the exception of Mr. Prince's Teas, which were superb, as were also Mr. George Paul's. Amateurs were principally noted for their Teas. My old friend, the Rev. A. Foster Melliar, had a most beautiful box, and so had his friend who was bracketed with him.

Mr. Paul's prize for baskets of Tea Roses turned out to be a very popular one. I would suggest that another year, for the sake of effect, he should allow Ferns to be introduced, then I think these baskets would prove to be the most delightful exhibits of all. The great drawback to the Show was the want of freshness discernible everywhere except in the Teas. It is wonderful what a much greater amount of heat these Roses will bear than Hybrid Perpetuals.

I found Teas doing well in the gardens at Kandy, Ceylon, side by side with Allamandas, Stephanotis, Gardenias, and Bougainvilleas. It is to be hoped that another year we may be able to have our Show in the arcades, for though Tuesday was by no means a hot day, yet the heat of the "Wolf" tent was very great.—WYLD SAVAGE.

BUCKLAND SWEETWATER GRAPE.

TALK about a sea of gold! These last few days in the bright sunshine I have been particularly struck with the grand appearance of three of the above Vines, which cover a fruiting space of 14 feet in length of rafter by 10 feet wide. One Vine, a single rod, has seventeen bunches; the second Vine, three rods, with forty bunches; the third Vine, with four rods, with forty-three bunches, making a total of just 100 bunches, which I estimate to weigh 120 lbs. As you will see by this weight the bunches are not over-large, but suitable for ordinary purposes, and they have a beautiful appearance. The single-rod wire is bearing the best bunches and berries. I can see no perceptible difference

in the three and four-rod Vines. The berries on the worst Vine measure $3\frac{1}{8}$ inches in circumference, and they have a fortnight yet to hang before they are ripe. I am very pleased with the size, as I find Mr. Barron gives the natural size of berry in his valuable book a full inch in diameter. Strange to say, under the same treatment Black Hamburgh falls, the berries being just under 3 inches in circumference. This, while, however, being the size given by Mr. Barron, does not please me, nor does it come up to Mr. Taylor's average. Still, as they have two or three weeks to ripen yet, and as I know they are swelling, hope to get them larger. The colour will be good. I have berries of Gros Colman quite as large now as the Black Hamburgh, so shall expect these to be full size according to Mr. Barron again, $3\frac{3}{4}$ inches.—STEPHEN CASTLE, *West Lynn*.

AT a General Meeting of the ROYAL HORTICULTURAL SOCIETY South Kensington, 10th July, James McIntosh, Esq., in the chair, the following candidates were unanimously elected Fellows—viz., V. F. Bennett-Stanford, Mrs. V. F. Bennett-Stanford, Hon. Mrs. Charles E. Bright, Joseph Parker, Miss Alice Edith Middleton, and Miss Jessie Caroline Middleton.

— WILLIAM PAUL & SON announce that their collection of ROSES is now in full bloom at the Nurseries, Waltham Cross, adjoining the Waltham Cross Station, G.E.R., half an hour's ride from London, and an inspection is invited by the proprietors, also of the hardy trees, which are now in full beauty.

— Mr. W. GODWIN, JUN. desires us to insert the following APPEAL TO ROSE-GROWERS:—"As one of the Committee of the Market Drayton Horticultural Society, I beg to ask the assistance of Rose-growers at our forthcoming Show. I know the time is rather advanced, and also that the prizes are not tempting; but we are most anxious to resuscitate a show that was a great success some fifty years ago, and we have strained our funds in the hope that some of the large Rose-growers may be induced to add to the attractions of our Show, and so help us to give more worthy prizes another year. I can only say that to all who do visit us we shall be greatly obliged, and we will endeavour to find them every accommodation."

— BY permission of the Dean of Westminster, who is President of the Association, the Society for Promoting WINDOW GARDENING amongst the Working Classes in the united parishes of St. Margaret and St. John, Westminster, held their seventh Annual Show on Tuesday afternoon in the Dean's Yard. There were fifteen general prizes open to working men and women, ranging in value from 10s. to 5s., besides 126 "local prizes" apportioned among the parochial districts, to be competed for by those not successful in the former division, Class 1 under this heading being devoted to adults, and Class 2 for children in parochial, national, infant, Sunday, and ragged schools. The flowers in pots and boxes, ranged on long stands, looked very well, showing evidences of considerable attention and skill in rearing and training, a result much to the credit of the Society's laudable efforts to encourage the working classes in taking advantage of every opportunity for brightening their homes. The Earl of Shaftesbury subsequently distributed the prizes.

— A BOUQUET OF LILIES was shown at Kensington on Tuesday which attracted much attention and received some condemnation also, although a vote of thanks was accorded it by the Floral Committee. It was chiefly composed of flowers of *Lilium candidum*, but some of these had been painted or stained pink and others blue—a piece of artificiality that was most displeasing. Nevertheless, the bouquet was greatly admired by one distinguished lady, who, we believe, carried it in triumph at a ball that evening.

— A CORRESPONDENT in Lincolnshire writes:—"THUNDERSTORMS in this district have been fearful, and the damage done most serious. On some farms there will practically be no harvest, and several farmers will be ruined. One man's losses are estimated at £3000. The hail or

pieces of ice, weighing from 1 to 6 ozs., have cut off the corn as if it had been reaped, and Potatoes the same."

— THE SOUTH SHIELDS CEMETERY (a local paper states) has a very pleasing appearance at the present time, the grounds being tastefully laid out and the flowers in full bloom. The Board, through their energetic Superintendent, Mr. B. Cowan, have recently effected some much-needed improvements and offered advantages for which there was pressing need. The usual summer bedding is just now near completion, and some of the spring flowers and plants, especially Stocks, are yet very attractive. Hardy carpet bedding in beautiful designs is being carried out, and the effect is very pleasing. Mr. Cowan intends to increase the geometrical designs in the flower beds between the churches by adding one in commemoration of the Sunderland calamity.

— "B." observes:—"Though it is now seven or eight years since the good qualities of the roots of strong-growing FERNS FOR ORCHID CULTURE were pointed out, it is only now, when peat seems to be getting scarce, that a few writers seem to have known about that material all the time. I would now like to call attention to another home-grown material of the greatest value for Orchid culture, this is the stems of such Ferns as *Lastrea Filix-fœmina* and *L. dilatata*. These are exactly like the stems of Tree Ferns, with this advantage, that a certain amount of fibrous material can be secured along with the stems. We employ them both with sphagnum and without it, and I am not sure but that a stem with a fair amount of roots to it is better than additions of sphagnum. At any rate, it may be relied on that these stems are admirably adapted as blocks for certain Orchids."

— IN an article printed locally upon MADAGASCAR PLANTS by the Rev. R. Baron, the following appears in reference to a well-known occupant of English gardens:—"Sóngosongo (*Euphorbia splendens*), with its brilliant scarlet and yellow bracts, which may be easily mistaken for petals or sepals, is perhaps the most attractive plant in all Imerina. Its beauty has gained for it a place in many conservatories in England. Its prickly stem gives it a resemblance to the *Cactaceæ*, but its flower and fruit show that it is a true *Euphorbia*. There are two varieties, one having bright scarlet bracts with leaves all along the stem, the other having yellow bracts and leaves, which are terminal and larger than those of the scarlet variety. The plants are monœcious, and not, as the Malagasy suppose, unisexual. The milky juice with which the plant abounds is sometimes used by the natives as birdlime. Another use the plant affords is this—the bark of the root is pounded, put in water, and given to calves to help them at their birth. The Sóngosongo is commonly employed for hedgerows and fences."

— IN a well-printed treatise entitled "ENSILAGE IN AMERICA" Mr. James E. Thorold Rogers, M.P., has produced a work of 160 pages that all who are interested in the subject under consideration may peruse with advantage. The character of the treatise cannot be better indicated than by citing the preface as follows:—"I have put together in this little work the result of my own observations on ensilage in the United States, and the comments on the system which have been made by those who had adopted the practice and recounted their experience to me in conversation. I have freely quoted from such papers, periodicals, and books as have been written on ensilage, and have copied such illustrations as seemed to me essential to a right understanding of the process, with the satisfaction, perhaps, of being able in a slight degree to adopt, retail and piecemeal, the wholesale practice of American publishers. I do not, however, fear the indignation of my authors, whose good feeling is no doubt extended to the Old Country. I have no fear that they will resent the use which is made of the facts which they allege because an English writer has recounted the advantages which they claim to have discovered, for the consideration, perhaps for the benefit, of English agriculturists." To that we need only add that the work is published by W. Swan Sonnenschein & Co., Paternoster Row.

— MR. W. BARDNEY writes as follows concerning the ORCHIDS AT MR. BULL'S NURSERY, CHELSEA:—"Few can form any idea of the effect Orchids have when grouped tastefully together, such as I saw in the above nursery a few days ago. Upon entering the house the wealth of beauty displayed by *Odontoglossum vexillarium* was really gorgeous, some being remarkable for the large size of their flowers or the dark rich colour. One form was particularly noteworthy, having on the labellum a dark crimson blotch. *O. Alexandræ* was also conspicuous, varying from pure white to the most lovely spotted varieties, some of the plants

having spikes of great length, and carrying as many as sixteen or seventeen flowers on each. *O. Halli* was grand, and the same may be said of *Oncidium macranthum*; but one form distinguished as *Aurea* was very striking. Varieties of *Cattleya Mossiæ* were very numerous, and amongst them some of the most beautiful flowers. *C. Mendelli* was equally as numerous and fine, one named *C. Mendelli Victoria* deserving special note; the sepals and petals being white, slightly suffused with lilac, while a good portion of the labellum was remarkable for its ivory whiteness, with a few faint yellow markings down the throat. *C. generense* attracted attention, being after the style of *C. intermedia*, and undoubtedly a variety, but without the dark purple-crimson blotch on the labellum. A good plant of *C. Skinnerii alba* was bearing two or three of its pure white flowers. Several grand forms of *Lælia purpurata* were staged, also of *L. majalis*; one plant bearing a single flower was particularly striking for its large size and high colouring. Some grand varieties of *Sobralia macrantha* were in flower, the flowers being larger and more highly coloured than are generally to be met with. *Cymbidium Lowianum* was represented by many plants, one form noticed being very much finer than the rest by having dark markings on the lip. *Cypripediums Parishii*, *Veitchii*, *Lawrencianum*, and others were also well represented. No attempt is made to note half the many beautiful species and varieties to be seen in flower."

— GARDENING APPOINTMENTS.—Mr. J. Cleare, previously foreman at Stoke Rochford, has been appointed head gardener to Lord Sudeley, Toddington, Gloucestershire. Mr. W. Milne, for the past six years foreman in the gardens, Wimbledon House, has been appointed gardener and forester on the Levens Estates, Westmoreland; and Mr. J. F. Davies, also of the gardens, Wimbledon House, has been appointed gardener at East Hill House, Wimbledon.

— A CORRESPONDENT of the *American Cultivator* has the following respecting the ROSE-CHAFFER IN MICHIGAN:—"The most obnoxious of all insect pests in the Michigan fruit belt is the rose-chaffer or rose-bug. They have scourged the country for several years, appearing in swarms early in June, and devouring vegetation in a manner as destructive as the western grasshoppers. They attack Grapes, Peaches, and Apples especially. Whole orchards have been every year denuded, in spite of the most persistent efforts to protect them. Grape-growers catch the beetles by knocking them off into pans in early morning. This practice cannot be followed on large trees, where absolutely no remedy has yet been devised to stay their ravages. Orchards are entirely stripped of leaves and fruit, and the grower is powerless to resist. Two or three layers of insects can often be seen on an Apple, sometimes as many as a hundred or more congregating on a single fruit. As soon as the day grows warm the beetles become very active and cannot be captured. The most astonishing experience is the fact that poisons have no effect upon the rose-chaffer. This has been so often verified by good experimenters as to be beyond dispute. Even arsenic has been applied with no effect. The damage to the fruit interests of western Michigan from the rose-chaffer has been very great, especially upon warm sandy soils, where the pests multiply with astonishing rapidity. The South Haven Pomological Society has lately invited Prof. A. J. Cook of the State Agricultural College to visit the fruit belt to study the habits of the insects."

ORNAMENTAL TREES AND SHRUBS.

OBSERVATIONS are proposed to be made occasionally on noteworthy objects in parks, on lawns, and shrubberies, and to diffuse a taste and interest in trees and shrubs any remarks furnished by our readers will be highly valued. Instead of shrubberies being planted with common Laurel, lawns with few kinds of trees, and the park displaying a great similarity, those objects that are calculated to give variety and the most interesting and effective enjoyment will be described.

New Golden Laburnum (Smith).—What the flowers of the Laburnum are to the park and garden in early summer—viz., a flowing mass of bright golden yellow, the foliage is afterwards—a mass of bright gold, forming a striking and conspicuous object at any distance within reach of the eye. It is the most beautiful golden-leaved tree known, and is the sort of small tree required in front of plantations in parks, telling most effectively amid the greenery of other trees, and in the mass must be extremely beautiful. Ours, however, are isolated, worked standard high, and are extremely attractive with a background of green formed by taller trees of the commoner kinds, chiefly Elms.

In the pleasure grounds it is the finest of pictorial trees. In any position it is simply lovely—bright gold from spring to autumn, and it appears quite as hardy as the common Laburnum. Its value for park and garden scenery is obvious at sight; once seen its merits are apparent.

Golden-netted-leaved Horse Chestnut (*Æsculus Memmingeri*).—A bold-foliaged Horse Chestnut, having an Australian sovereign tint, with the midribs of a deep green hue. It is very telling at a distance, and enlivens the sombreness of park tree verdure in a remarkable manner—with the sun upon it it appears to throw off golden rays. In growth it is as free as the Horse Chestnut, and apparently quite as hardy. I have not noticed its flowers. Contrasted with Purple-leaved Beech the effect is grand, the crimson purple being toned down through being associated with green, of which there is no scarcity in parks generally.

Variiegated Negundo (*Acer Negundo variegata*).—If we take the Purple Beech, the Golden-leaved Horse Chestnut, and the variegated Negundo, a trio of the finest and most beautiful of variegated trees is obtained for park scenery. The variegated Negundo is almost white in foliage, and, being cut or divided, contrasts in outline with entire-leaved trees. In contrast with a dark green background it is decidedly the most beautiful of all variegated trees of its colour—white. Unfortunately it is not very hardy, but it is quite as free and hardy here as the species (*Acer Negundo*), of which there are very large trees, the soil being light, an admixture of loam and alluvial overlying gravel on the oolitic formation.—G. ABBEY.

GRAPE DUCHESS OF BUCCLEUCH.

THIS unquestionably highly flavoured Grape has every good merit that a Grape should have, except size of berry, and in these days of "show" the popularity it should have attained to has been reduced to a minimum. When I gave this kind a first trial I was anxious to improve its size, and grafted several on Vines of a different character. On a West's St. Peter's the size of berry became equal to a small Muscat, which it was supposed by strangers to be. Flavour convinced them of the contrary. The Duchess partook of the form of the St. Peter's, was quite as large, and inherited in a measure the juicy nature of that kind. The size of bunches were less than those grown on its own roots, and more dumpy in form—qualifications which we did not object to.—M. T.

CARDIFF ROSE SHOW.

A GREAT change from Reigate, beloved of artists and dear to all who value the peculiarly English scenery of our home counties, to this busy bustling town, the centre of the coal trade of South Wales, with its rapidly increasing docks filled with the ships of all nations. A great change, too, from the intense heat of the last few days to a cool and pleasant atmosphere. Pleasant, too, for exhibitors, for Roses would not fly and fall as they did in the greater heat of the previous days. But in one respect they were both alike—there was the same hearty appreciation of the Rose and the same eager desire for success; and although Reigate is the oldest, I believe, of our Rose societies, and Cardiff one of the youngest, yet there is so much of zeal and earnestness that I should not be at all surprised if under the able secretaryship of Mr. Pettigrew, whose name is so well known to readers of the Journal by his many valuable contributions to its pages, that I should not be at all surprised if in a few years it will be found to equal any of our provincial shows. The climate of South Wales is so favourable for the Rose, and there are many wealthy supporters of the flower. As it is, it is the only Society which awards two gold medals—a sufficient proof that they are ambitious enough, and without ambition no person or society can prosper.

The Exhibition was held, as usual, in the Drill Hall, one of the best rooms I ever see Roses staged in. The light is all in the roof, the building is very lofty, and there is ample room for the company to move about without inconvenience, and the admirable way in which the staging was managed made everything pleasant for judging. I have rarely seen in any place so marked an improvement in amateur showing as here. The first year nothing could have been much worse either in the blooms selected and in the manner of setting up. The mistake which most young exhibitors make was made here. Blooms look beautiful on the tree and when cut, but before they come under the Judge's eye the colour is flown, and perhaps the eye shows; then foliage was added. Roses were set down on the moss without having the aid of the wire, which lifts them up and shows them off to advantage. Last year a great deal of all this was remedied, while this year a most marked improvement in every particular was shown. Doubtless still much remains to be done, and if the local exhibitors will only look at the open classes and see how such experienced exhibitors as Mr. Grant of Ledbury and Mr. Hobbs of Bristol set up their Roses they will still further improve. We have always need to remember that we should make good use of our opportunities and that we are never too old to learn.

The following were the awards. In the class for twenty-four the first prize and the National Rose Society's gold medal was won by Mr. Hobbs, Lower Easton, Bristol, with a very good stand, containing the following flowers: Annic Laxton, Mons. Noman, a very fine bloom; Auguste Rigotard, La France, A. K. Williams, Marquise de Castellane, Madame Lacharme, Edouard Morren, Madame Bravy, Mons. E. Y. Teas, Caroline Kuster, John Hopper, Anna Ollivier, Duke of Edinburgh, Marcellin Rhoda, Thérèse Levet, Duchesse de Vallombrosa, Mdle. Marie Cointet, Duchess of Bedford, Egeria, Star of Waltham, Devoniensis, and Belle Lyonnaise. Mr. W. E. Grant of Ledbury ran it very close, there being only a few points between the

stands. His blooms were La France, Countess of Oxford, Marquise de Castellane, Ulrich Brunner, large and promising new flower of the Etienne Levet type; Duchesse de Vallombrosa, Mons. Noman, Duchess of Bedford, A. K. Williams, Baronne de Rothschild, Horace Vernet, Madame Willermoz, Marie Rady, Sophie Fropot, Duke of Edinburgh, Marie Verdier, François Michelin, Duke of Wellington, Jean Pernet, Dr. André, Madame Gabriel Luizet, Devoniensis, and Devienne Lamy. In the class for twelve trebles the first prize was awarded to Joseph Pully, Esq., Lower Eaton, Hereford, for Gabriel Luizet, Madame Charles Wood, Marquise de Castellane, La France, Mons. E. Y. Teas, Duchesse de Vallombrosa, Madame Charles, A. K. Williams, Mons. Noman, Le Havre, Maréchal Niel, and Princess Béatrice. Mr. Grant was second with Marie Baumann, La France, Marie Rady, Mdle. Marie Cointet, Comtesse d'Oxford, Marquis de Castellane, François Michelin, Le Havre, Madame Gabriel Luizet, Xavier Olibo, Maréchal Niel, and Alfred Colomb; a very excellent stand. In the class for twelve Hybrid Perpetuals Mr. Grant was first with a fine stand of Le Havre, Marquise de Castellane, Baron Bonstettin, Madame Gabriel Luizet, La France, Marie Rady, Marie Finger, Etienne Levet, Dr. Andry, Duchesse de Vallombrosa, Xavier Olibo, and Marguerite de St. Amand. In the class for twelve Teas Mr. Grant again first with a finest stand of Souvenir d'un Ami, Jean Pernet, Madame Willermoz, Caroline Kuster, Niphotos, Madame Lambard, Amazone, Catherine Mermet, Marie Van Houtte, Souvenir de Paul Neyron, Homer, and Madame Faleot. In the class for twelve of one sort Mr. Grant and Mr. Pully were equal first with fine stands of Duchesse de Vallombrosa and Marquise de Castellane. The classes for local growers were, as I have said, well filled. In the class for twenty-four, with the National Society's gold medal, Mr. Pettigrew was first with a very fine stand containing Marquise de Castellane, John S. Mill, Duke of Edinburgh, Capitaine Christy, Cheshunt Hybrid, La France, Marie Rady, Comtesse d'Oxford, Camille Bernardin, Abel Grand, Dr. André, Miss Hassard (the finest bloom of this variety I have ever seen), John Hopper, Duchesse de Vallombrosa, Antoine Mouton (large, but not a flower for an exhibition stand), Madame Clemence Joigneaux, Baron de Bonstettin, Marquise de Castellane, Baronne de Rothschild, Prince de Portia, Princess Louise Victoria, a good bloom of a variety I have never before seen on an exhibition stand, and Charles Lefebvre. Mr. Pettigrew also won the five-guinea cup given by Messrs. Cranston & Co. with Baronne de Rothschild, Marquise de Castellane, Baron de Bonstettin, Duchesse de Vallombrosa, John Hopper, Princess Louise Victoria, Victor Verdier, La France, Charles Lefebvre, Madame Lacharme, Duke of Wellington. He was also first for twelve trebles with Hippolyte Jamain, Duke of Edinburgh, Capitaine Christy, Eugène Appert, Baronne de Rothschild, Richard Wallace, Dr. André, Duchesse de Vallombrosa, Marie Rady, and Madame Lacharme. The Marquis of Bute's prize for a box of York-and-Lancaster Rose brought together two fine boxes, not of York-and-Lancaster, but the Rose which is always known under that name, the true York-and-Lancaster being quite distinct, and were placed equal, Mr. Pettigrew, as before, showing them in fine condition, the other stand being equally good.

In the nurserymen's classes the Cranston Company carried off all the first prizes, Mr. Davison of Hereford being second. Amongst the best of Cranston's were Madame Gabriel Luizet, Constantin Tretiakoff, which has been very good this year; Star of Waltham, Marguerite de St. Amand, Alfred Colomb, Marie Baumann, Duke of Wellington, Duchesse de Vallombrosa, Louis Van Houtte, Captain Christy, Mons. Noman, Princess Mary of Cambridge, Duke of Edinburgh, Général Jacqueminot, Marquise de Castellane, Duchess of Bedford, La France, Fisher Holmes, A. K. Williams, Madame Charles Wood, John Hopper. His box of Teas comprised Anna Ollivier, Maréchal Niel, Marie Van Houtte, Rubens, Madame Willermoz, Madame Bravy, Catherine Mermet, Devoniensis, Souvenir d'un Ami, &c. He had also a very beautiful box of twenty-four Marie Cointet, a Rose one very seldom sees in the perfection shown here to-day.

Such is a brief record of this most creditable Show. The arrangements were well carried out, thanks to Mr. Pettigrew and his Committee.

My time was so hurried that I could not do more than have a rush through the houses at Cardiff Castle; but I did have time to see one of the most beautiful sights in the way of collections of Melons and Cucumbers I have seen for a long time, that well-known Cucumber, Cardiff Castle, being the only one grown here, and suitable for all purposes.—D., Deal.

EARLY PEAS—AMERICAN WONDER.

I AGREE with Mr. Smith that this is the most opportune time for comparing the merits and demerits of early Peas, as the subject will just now be uppermost in the minds of the majority of cultivators. I have tried everybody's earlies in order to find out the variety most suited for this locality. After repeated trials William I. was decided on as the best, although a few days later than Kentish Invicta and Veitch's Extra Early, preference being given to the former because of its excellent flavour when cooked, and secondly because the quantity of produce was much heavier than from the other two. If confined to these three and an early dish was an object, the last-mentioned would be grown, because it is dwarfier than the others and the earliest. Day's Early Sunrise, however well it may have done in some places, is here only a second-rate Pea as regards flavour; it is also ten days later than those enumerated above, but will carry the heaviest crop.

I now come to American Wonder. After three years' trial of it I believe it will prove a good field Pea for market purposes, and will prove the best of all early Peas yet raised. It is dwarf, the earliest in the market, and wonderfully productive; in short, my experience of this Pea coincides exactly with that of Mr. Smith. It is a little taller than usual with me this year, but the ground was rich and the crop is heavier than that recorded by Mr. Smith. I sowed about twenty short rows, and they have been, and are to-day, laden with pods. Hitherto I have planted them 18 inches from row to row, but the distance recommended by your correspondent is preferable. In future I shall grow no other early Pea here, as it has proved much more productive than the others. It requires no stakes; in fact old besoms after they have done service for sweeping

are ample to support it. It is also more suitable for growing on narrow wall borders than a Pea that will attain a height of 4 feet.—W. BARDNEY, *Liverpool*.

KINGSTON AND SURBITON SHOW.

THE nineteenth annual Exhibition of the Kingston Royal Horticultural Society was held on Thursday last in a well-wooded park-like enclosure, peculiarly adapted to an exhibition of this kind, for the fine densely foliaged trees afford shelter from the rain or shade from the sun, whichever may be needed; and it is almost always either too wet or too hot for somebody on flower-show days. Last Thursday, however, was one of those agreeable days with which it is difficult to find fault. The Show, like the weather, was in turn almost proof against adverse criticism. Plants, flowers, and vegetables were excellent, as also were table decorations, while some good fruit was staged. The weak point was the bouquets, but fortunately, considering their quality, there were not many of them.

In the large plant tent the semicircular groups were prominent. There were eleven of them; and when such an exhibitor as Mr. Henry James, The Castle Nursery, Norwood, was placed third in the open class it is evidence that the collections were good. Mr. Beckett, gardener to J. P. Currie, Esq., Esher, secured the premier prize with a beautiful group—bright without being gaudy, full without being crowded, and bold without being lumpy. Tuberous Begonias shone through a canopy of Palms, and the front was chaste yet cheerful, with Ferns and *Isolepis* pleasingly associated with *Gloxinias*, and sparingly with variegated *Panicum*. Messrs. Fromow & Sons, Turnham Green, were a close second, this group being striking by a margin of small Silver Tricolor *Pelargoniums*, which gave quite a bead-like finish to the group. The most valuable plants of all were those arranged by Mr. James. Only one 50-foot group was arranged—namely, by Mr. Waite, Glenhurst, Esher, who was awarded the first prize. The smaller—35-foot—groups were better, that of Mr. Brand, gardener to W. Clay, Esq., Grove Park, Kingston, being noticeable by the pleasing association of *Agrostis nebulosa* and *Lobelias*; the second-prize arrangement of Mr. Clark, gardener to A. Nagle, Esq., Kingston, being bright with *Kalosanthes*. With this fine summer-flowering greenhouse plant the same exhibitor secured the first prize in the single specimen class; and grand examples were staged by Mr. Beckett in his first-prize group of six plants; Mr. Child, gardener to Mrs. Slade, Claygate, Esher, being a good second in this class. Mr. Henry James, Norwood, was first with twelve specimens, his *Ericas Paxtoni* and tricolor *impressa* being particularly effective.

Fuchsias were very creditably shown, the first-prize six of Mr. Dorsett, gardener to Mrs. Welsh, Westcroft, being 4 feet high and 3 feet in diameter at the base, the pots being nearly veiled by drooping sprays and fine flowers. Mr. Beckett was a close second with very healthy plants. *Caladiums* were grandly staged by Mr. Gregory, gardener to J. F. Weymouth, Esq., Bushy Nook, Teddington, who also had the first prize for six foliaged plants, a *Caladium* among these being 6 feet in diameter, and in shape and colour faultless. Tuberous *Begonias* from Mr. Child were exceedingly bright and good. Excellent also were *Achimenes* and *Gloxinias* from Messrs. Brand, Waite, French, Slade, and Croxford, who secured the prizes in the classes. Mr. Watson's *Selaginellas* were fine, as also were *Hydrangeas* from Messrs. Atrill and Beckett, the last-named exhibitor having the best *Pelargoniums*. For Ferns the prizes were well won by Messrs. Gregory and Atrill, *Davallia pyxidata* being admirably shown by the last-named exhibitor.

In the cut-flower tent *Roses* were the chief attraction, and Mr. Moorman the chief prizewinner in the leading classes, Messrs. Starr, Orchard, Otley, and Waite being also successful exhibitors; but the majority of them might take a hint from Mr. Moorman in staging, at which he is an adept. Mr. Bennett sent magnificent blooms of the right royal *Rose Her Majesty* and other beautiful seedlings. Messrs. Veitch staged a grand collection, and Messrs. Lee of Hammersmith contributed boxes of handsome blooms. Messrs. Veitch also staged a group of *Roses* in pots, remarkable by their freshness and close compact growth. Messrs. Jackson & Son contributed effectively to the Exhibition by a choice assortment, the specimens being admirably grown and tastefully arranged; *Ericas*, *Dracophyllums*, and *Impatiens Sultani* being in superb condition, while *Orchids* imparted richness to this valuable collection of plants. It is wonderful what a pretty effect can be produced by arranging flowers in soup plates. There was great competition in the class for these, Mr. Orchard being the most successful exhibitor; and in dinner-table decorations Mrs. Clay secured *Lady Peck's* prize with charming stands, such indeed that we have rarely seen excelled.

Fruit was sparingly exhibited, but was generally good. The prizes for *Grapes* went to Messrs. Starr, Wilson, and Gregory; for *Melons* to Benson and Child; *Peaches* to Wilson, Croxford, and Atrill; *Nectarines* to Waite and Croxford; and *Strawberries* (fine) to Messrs. Waite, Gregory, and Beckett.

Vegetables were wonderfully fine, better collections of twelve dishes being seldom seen than those arranged by Messrs. Beckett, Waite, and Starr. The produce of the first-named exhibitors was of striking excellence and admirably staged. This is a very brief sketch of a very good Show, admirably conducted by the Hon. Secretary Mr. Clay and his skilled and industrious co-worker Mr. Moorman.

CUTTING DOWN CHRYSANTHEMUMS.

In your last two issues the reader's attention is drawn to the plan of cutting down *Chrysanthemums* at this time of the year that are intended for the production of exhibition blooms. Such was practised a few years ago, and I believe is still by some of the most successful growers around *Liverpool* with good results.

There is one good point in its favour which should not be overlooked. The plants are dwarf, and are quite as eligible for home display as the so-called pinched plants. With regard to the flower, I have found plants that have been topped generally carry the most perfect flowers; those, on the other hand, that

have been allowed to grow naturally may carry with some varieties larger flowers, but they will be coarse, and generally will be unsuitable for an exhibition table.

No doubt for the south the present would be a very good time for this operation, but here and far north I am afraid with many varieties it is rather late. However, I am trying a few, and will note the result. The northern growers have, as a rule, generally produced the finest flowers. They select the crown bud; in the south the terminal bud is taken, for the crown bud there would be too early. Mr. Harding has solved the difficulty. He simply retards his plants, works the crown bud. The flowers consequently are of equal substance to them grown in the north. Both are placed upon a more equal footing. The final issue will then rest with him who is the most clever with the tweezers. I should like to see this and disbudding thoroughly discussed, for I believe there is still room for improvement in the *Chrysanthemum*, not with soils, stimulants, or the time of propagation, but by the selection of buds.—C. WARING, *Liverpool*.

THE advice recently given on cutting down *Chrysanthemums* is so totally opposed to what has been advocated by recognised authorities hitherto, who always advised all who desired grand blooms to take out nothing but the extreme point of the shoot when stopping. I think, therefore, we may safely call the cutting-down system a new departure in *Chrysanthemum* cultivation, and one that if found workable will be largely followed by all growers, as dwarf plants must be so much easier to manage than tall ones. My own plants now range from 2 feet 6 inches to 4 feet 6 inches high, and some of the tallest will doubtless reach nearly 9 feet by the time of blooming. How much better 5 or 6 feet would be as a maximum height. The questions I should like answered, and doubtless many others will be glad of the information, are: When are the cuttings inserted? What size pots are they in now? What size pots are they flowered in? Are all varieties equally free to break after cutting down? I ask the question about the time of propagating, as mine are propagated in December and January and are in their flowering pots by the first week in June.—CORNUBIA.

CYPRIPEDIUM SPECTABILE.

OF all the hardy *Orchids* that are grown successfully in this country none can compare with *Cypripedium spectabile*. There are several other North American species that are well worth growing in gardens, but the colours of the flowers are not nearly so bright and showy. Although the species under consideration has been introduced to this country more than 150 years, yet how seldom do we see it in perfection in gardens, or how seldom do we see it at all. Plants are annually imported from North America, and from the quantity imported one would feel inclined to ask the question, What becomes of them all? This question can be answered in the following manner—that more plants are killed than are grown, for the simple reason that the plants are not studied, are planted in almost any situation, the consequence being they dwindle away and die right out. Yet *C. spectabile* is one of the easiest plants to cultivate if properly managed, and anyone desirous of giving it a trial will, I am sure, be satisfied with it. If this plant were of recent introduction, and a tropical species, it would no doubt cause quite a sensation amongst *Orchid* fanciers; but like many other plants that have been in the country for upwards of a hundred years, and comparatively easy to manage, is thought but little of, although at the same time it equals in beauty many of the tropical species which are purchased at enormous prices. It is greatly to be regretted that *C. spectabile* is not more generally cultivated, for this is one of the plants that will thrive where others will not; indeed, it should be cultivated in every garden where choice flowers are required in quantity.

At Messrs. R. Smith & Co.'s, nurserymen, Worcester, may now be seen in perfection a splendid bed of these beautiful *Ladies' Slippers*. The above firm have long enjoyed a very high reputation for fruit trees, Conifers, *Roses*, *Clematis*, &c., but on coming to Worcester some six or eight months ago I was most agreeably surprised to find herbaceous plants grown in such large quantities. I had often seen *C. spectabile* grown before, but never have I seen it better than it is at Worcester. I will describe the way in which it is so successfully managed. In the first place it must be understood that the best position that can be selected for it is behind a hedge or tree where the sun has little or no power, but at the same time it should have abundance of light. The position having been decided, the soil should be taken out about 15 or 18 inches deep, and filled in with a compost

consisting of half peat, the remainder part being loam, leaf soil, and a good sprinkle of sand, well mixed together. About 15 inches of soil should be placed in the bed, made moderately firm. Upon this the

autumn and through the winter, care being taken that the operation is not deferred too late in the spring. During the growing season the plants require abundance of water—in fact they should never be allowed

FIG. 8.—CYPRIPEDIUM SPECTABILE.

plants should be placed, with the remainder 3 inches of soil over them. Plants that have been grown and established in this country are far the safest, as imported plants sometimes fail to give satisfaction.

C. spectabile can be removed at any time during the latter part of

to become too dry, and after they have done flowering this should be particularly attended to. In favourable seasons the flowers commence expanding about the middle of June, and last several weeks in perfection. They are extremely useful for cutting, the fine, dark green

broad foliage contrasting admirably with the white and purple flowers. I find the flowers vary in colour, some being much darker than others. With this note I forward you a small box of flowers for your inspection to see the size and colouring of the flowers.—GEORGE WALTERS.

[They are very fine indeed, as may be seen by the engraving, in which the flowers and foliage are represented of their natural size.]

BATH ROSE SHOW.

JULY 5TH.

It was expected by those competent to form an opinion on the subject that the Rose Show at Bath would, providing the season was at all favourable, prove a great success, and such was the case. Roses of the best quality were very abundant, the weather was fine and warm, and the attendance of visitors large and fashionable. The prizes offered were sufficiently liberal, and this, coupled with the well-known love for Roses shared in by all classes of society of Bath and district, attracted exhibits from most of the leading professional Rose-growers—notably the Cranston Company, Hereford; Paul & Son, Cheshunt; Prince of Oxford, Keynes of Salisbury, and Curtis, Sanford, & Co., Torquay. The Hereford Roses are always late, but when they have attained to perfection are not easily excelled, and at Bath were invincible. Those shown by G. Paul & Son, however, were only very slightly inferior. Among the amateurs Miss Watson Taylor, Mr. A. Evans, Mr. John Scott, Mr. Joseph Hinton, Mr. R. B. Cater, Mr. T. B. Hall staged highly creditable stands of blooms in the different classes open to them.

NURSEYMEN'S CLASSES.

There were six competitors in the class for seventy-two single trusses, the whole forming an imposing array. After a most careful examination the Judges eventually awarded the premier prize to the Cranston Company. The majority of their blooms were very fine and fresh—notably Dr. Andry, Beauty of Waltham, Countess of Rosebery, Marquise de Castellane, Dupuy Jamain, Marie Baumann, Mons. E. Y. Teas, Star of Waltham, Jean Ducher, Général Jacqueminot, Etienne Levet, Madame C. Wood, Reynolds Hole, Countess of Oxford, Victor Verdier, Alfred Colomb, La Duchesse de Morny, Gloire de Bourg-la-Reine, and Mary Pochin. The last-named is in the way of but richer and brighter in colour than Thomas Mills, and was greatly admired. Messrs. G. Paul & Son were awarded the second prize for a collection a few points only behind the first; this, in addition to most of the above varieties, including fine examples of Edward André, Olivier Delhomme, R. N. G. Baker, Innocente Pirola, J. S. Mill, Niphotos, Duke of Teck, and Marie Rady. Keynes & Son took the third prize for a collection in which the most noteworthy blooms were Sénateur Vaisse, Duke of Edinburgh, John Bright, Ferdinand de Lesseps, George Moreau, Marie Baumann, and Star of Waltham. The Cranston Company were again first with thirty-six distinct triplets, and among these Marie Rady, Princess Mary of Cambridge, Abel Carrière, A. K. Williams, Countess of Rosebery, La France, Madame Lacharme, Marie Baumann, Mdlle. Marie Cointet, and Mdlle. Eugénie Verdier were strikingly good. Messrs. Paul & Son followed with, among others, grand examples of Alfred Colomb, Horace Vernet, Olivier Delhomme, Countess of Oxford, and Niphotos. Keynes & Co. were deservedly awarded the third prize.

With twenty-four distinct triplets the Cranston Company also took the lead, among these being brilliant examples of Richard Laxton, Duchesse de Vallombrosa, Pride of Waltham, Marguerite de St. Amand, Charles Lefebvre, and Duke of Edinburgh. The second prize was secured by Keynes & Son, who had Catherine Mermet, Dr. Andry, Fisher Holmes, Dupuy Jamain, and Niphotos in good condition. The latter was exceptionally fine, and one of the blooms was selected for the silver medal of the National Rose Society, to be awarded to the best Tea or Noisette in the Show. Curtis, Sanford and Co. occupied the third position, the competition in this and the preceding class being close and good. Eight lots of twenty-four distinct single trusses were staged, and the class was generally excellent. Mr. G. Prince had a very bright and even stand, and was deservedly awarded the first prize. His best blooms were, Teas Souvenir de Paul Neyron, Jean Ducher, Alba Rosea, Comtesse de Nadaillac, Louis Van Houtte, and Sultan of Zanzibar, Marie Baumann, and A. K. Williams, the last-named securing the silver medal of the National Rose Society for the best Hybrid Perpetual in the Exhibition. G. Cooling & Son, Bath, had among others good examples of A. K. Williams, Star of Waltham, Charles Lefebvre, and Bouquet d'Or, and secured the second prize, the remaining prize rightly going to Messrs. Cross and Steer, Salisbury. With eighteen Teas or Noisettes, distinct, Messrs. Paul & Son took the lead, and was closely followed, if not equalled, by Mr. G. Prince. Messrs. Paul's most noteworthy blooms were Etoile de Lyon, Madame Cusin, Innocente Pirola, and Souvenir d'Elise Vardon. In Mr. Prince's stand were good blooms of Madame H. Jamain, Amazone, Niphotos, and Souvenir de Madame Pernet. Mr. J. Mattock, Oxford, was a good third

AMATEURS' CLASSES.

The silver cup, value £5, offered for thirty-six single trusses, was well won by Miss Watson Taylor, this lady's stands including among others beautiful examples of Marie Cointet, Baron Adolphe Rothschild, Marie Rady, and Marie Baumann. Mr. T. B. Hall was second with a generally good lot, and Mr. T. Hobbs was deservedly awarded the third prize. For twenty-four distinct trusses Mr. A. Evans took the lead with a fresh and grand lot, noticeable among which were Madame Gabriel Luizet, Mrs. Baker, Marie Baumann, Charles Lefebvre, and La France. Mr. John Scott followed with an even lot, comprising Marquise de Castellane, Alfred Colomb, Dupuy Jamain, and Marie Baumann in good condition. The third prize was deservedly awarded to Mr. E. S. Cole, gardener to Mr. W. Pethick, and nine others staged very creditable collections. Mr. T. B. Hall took the lead with twelve distinct triplets, these including fine examples of Etienne Levet, Louis Van Houtte, Dupuy Jamain, and Dr. Andry. Miss Watson Taylor was second, and the third prize was gained by Mr. D. C. Powell, with six triplets, distinct. Mr. J. Scott and Mr. A. Evans were equal firsts, the former having, among others, good blooms of Edward Morren, Charles

Lefebvre, and Marie Baumann, and the latter A. K. Williams and Marie Baumann in good condition. Mr. E. S. Cole had the third prize. Mr. G. Tanner staged the best six distinct single trusses, these including capital blooms of Mons. Noman, John Hopper, and Louis Von Houtte. The second prize was awarded to Mr. H. Hooper, and the third to Mr. H. Hall. Miss Watson Taylor had the best twelve Teas or Noisettes, distinct, single trusses, the best of them being Alba Rosea, Niphotos, Belle Lyonnaise, David Pradel, Jean Ducher, and Souvenir d'un Ami. Mr. T. B. Hall was a good second, and Mr. T. Hobbs third. Mr. J. Hinton, Warminster, staged the best six Teas or Noisettes, distinct, single trusses, these consisting of good blooms of Madame Bravy, Innocente Pirola, Souvenir d'Elise Vardon, Marie Van Houtte, Souvenir d'un Ami, and Maréchal Niel. Mr. W. Garraway followed. The third prize was awarded to Mr. R. B. Cater, and several others in this and preceding classes exhibited very creditably.

OPEN CLASSES.

The competition was very keen in the classes for twelve single trusses of any Rose, and several grand lots were unplaced. The first prize was awarded to Mr. G. Prince for Catherine Mermet in good condition, G. Paul and Son following with splendid examples of Marie Baumann; and the third prize went to Mr. J. Jefferies, Cirencester, for a charming stand of Cannes la Coquette. Mr. Prince was again first for any yellow Rose with Jean Ducher, very fine, and was followed by Mr. J. Mattock with good examples of Marie Van Houtte. Twelve single trusses crimson Rose were also well shown, Messrs. Paul & Son and Mr. G. Prince being placed equal first with very fine stands of A. K. Williams, while Messrs. Keynes had rather coarse but richly coloured Duke of Edinburgh, and obtained the second prize. Messrs. Cooling & Son took the lead with beautiful examples of Madame Gabriel Luizet in the class for any pink variety, Mr. A. Evans following with La France; and Cranston's Company were third with the same variety. Mr. John Mattock arranged a very pretty basket of Teas, and secured the first prize, the second prize going to Mr. R. B. Cater for a much too formal arrangement.

LOCAL PRIZES (AMATEURS).

The exhibits in this section were creditable, and much interest was naturally taken by the visitors in the awards. For twenty-four single trusses, distinct, Mr. G. Campbell, gardener to Mr. S. P. Budd, was first, his most noteworthy blooms being Mons. E. Y. Teas and Madame Gabriel Luizet. Mr. H. Catley and Mr. G. Fluke took the remaining prizes in the order named, and others staged good collections in this class. With twelve single trusses, distinct, Mr. R. B. Cater took the lead, and was followed by Mr. J. Stuckey and Mr. G. L. Hobbs. The best six single trusses, distinct, were staged by Mr. W. Meddick, the second prize going to the Rev. C. C. Layard. Messrs. H. Catley, R. B. Cater, and Thomas Jelly were the successful exhibitors in the order named of nine Teas, single trusses, distinct. A considerable number of bouquets of Roses were entered, Messrs. Cooling & Son taking the lead with twelve, Mr. J. Mattock following, the third prize going to Mr. W. C. Drummond. Mr. H. C. Mayell was first for six, Mr. W. Pethick and Mr. W. Meddick being the other successful exhibitors.

There were two classes for plants, these being arranged so as to set off the Roses. The best twelve ornamental-foliaged plants were staged by Mr. E. Bryant, Mr. W. C. Drummond following, and Mr. T. Chandler had third place. Mr. W. C. Drummond staged the best twenty-five Ferns, and was followed by Mr. W. Meddick. Groups of cut Roses were presented by Messrs. Cooling & Son, and Mr. H. Hooper exhibited a considerable number of Carnation, Pansy, and Rose blooms.

FRUIT.

Three classes were provided for Strawberries, and a great quantity of fruit was shown. As a rule the awards appeared to have been affected by mere size of fruit, and in some cases of the dishes. But why encourage monstrosities in Strawberries? Mr. H. Scott exhibited the best six dishes, Mr. H. S. Dutton and Mr. W. G. Garraway following in the order named. Mr. G. Garraway was first with three dishes, Mr. J. Bullock second, and Mr. H. Scott third. Mr. Garraway was also first with one dish, and was followed by Mr. G. Bullock. The favourite varieties were Sir J. Paxton, President, Eleanor, and Sir C. Napier.

STRAWBERRIES FOR LONDON FIFTY YEARS AGO.

THE following narrative, written half a century ago, may possibly interest our readers. Times have changed since then, and different customs now prevail. Yet there are some who sigh for the return of the "good old times."

"The supplying of a large city with some of even trivial luxuries is often a curious operation, and of great importance to a number of persons to whom it affords employment and subsistence. There are not many of the inhabitants of London who do not every summer partake of the delicious Strawberries with which it is so abundantly and so cheaply supplied. Yet few of them, when they have before them a small portion of that fruit, are aware that some hundreds of persons derive their livelihood during the time they are in season from the various operations which the supplying London with them occasions. It may not, therefore, be uninteresting to take a view of the mode in which that city is supplied with Strawberries.

"Most of the Strawberries consumed in the metropolis are grown within ten miles of it, and by far the greatest number of Strawberry gardens are on its western side. The chief places at which they are situated are Isleworth, Brentford, Ealing, Hammersmith, Fulham, Deptford, Mortlake, Hackney, and Camberwell. The extent of land cultivated for Strawberries has been much increased within a few years, and has been estimated at more than a thousand acres for the supply of London alone. The greatest number of persons who derive employment in producing Strawberries for the markets are females, with the exception of those who dress the ground on which they grow. In the season in which

Strawberries are ripe, which is usually the end of May, the women who gather the fruit assemble in the Strawberry garden in the morning as soon as it is light, which at that time of the year is between three and four o'clock, and commence plucking the fruit. The best fruit, which is gathered earliest in the morning, is taken to the packing-room and carefully put in pottle baskets; fifty or sixty of these are placed in a large basket, and before seven o'clock in the morning a number of women are dispatched to the metropolis, each with one of these larger baskets, which she carries on the top of her head, with only a small cushion to make the pressure of the weight equal over the upper surface of the head. The weight of the baskets and fruit is from 30 to 40 lbs., and sometimes even more.

"A party of these carriers then set off with their burdens, walking at a quick pace, and occasionally running, so that they generally accomplish five miles in an hour during their journey. And it is pleasing to observe with what skill and address, from habit, they manage their head-loads, as they are called, seldom having occasion to hold them with their hands. The burden being placed at the top of the head makes it necessary for the carriers to keep a very upright posture in walking, so much so that young persons in higher ranks of life have been corrected of a bad habit of stooping by being made to walk with a small weight on their heads, without being allowed to touch it with their hands, in imitation of these poor women. When men occasionally carry the fruit they have a shoulder-knot similar to those used by porters, so that part of the weight rests on the shoulder and part on the head, but by this mode of conveyance the fruit is generally more injured than when carried by women.

"The carriers arrive at the principal fruiterers in London early enough for their customers to be supplied with fruit gathered the same morning. The same women sometimes proceed with a second load to London even when the Strawberry ground is situated seven or eight miles from the fruiterers. The employment of females as carriers of fruit is within the last three or four years greatly diminished by some of the largest Strawberry growers having established light kinds of cars, hung on very pliable springs, like those used for coaches, and drawn by a quick-paced horse; one of these cars carries about twenty baskets, each of which would be a load for a woman. Though this mode is a considerable saving of expense yet it does not convey the fruit in such perfection as when carried on the head. The fruit not sent by these two methods is conveyed in carts with springs during the night to London for the early markets, which commence at daybreak, and is sold wholesale by the gardeners to the various retailers of fruit.

"Connected with the supplying of Strawberries to the metropolis is a very ingenious manufacture, that of pottle-baskets. These are made by women and children. The women prepare the wood by steeping it in water and splitting according to the parts of the basket it is designed to form. Then the most skilful arrange the slips of wood, which form the upright supports of the basket, and fix them in their place by weaving the bottom part. The sides are woven by children with pliable strips of wood, and the top is bound over by the more accustomed workwomen. If any of our readers will take the pains to examine one of these baskets they will feel surprised that it has passed through several hands in making, and the wood been purchased and prepared, and yet that it is still supplied to the gardener at the rate of about 6*d.* the dozen. The baskets are formed of the wood of the Fir or Willow tree, the latter is the best. The manufacture of them is carried on by the poor at their own homes in the towns near the Strawberry gardens, particularly at Brentford.

"The women employed in gathering and conveying Strawberries to London cannot be estimated at less, during the time they are in season, than 2000 persons. Part of these are the inhabitants of the adjacent towns, but a great number of them are young women who migrate annually from Worcestershire, Shropshire, and Wales, and after the Strawberries, Raspberries, Currants, and Gooseberries are passed, return to the country in time to assist at the harvest, having usually during their migration saved enough to buy a good stock of clothes and to lay by some money towards their support during the following winter."

[Far more than 2000 persons are now engaged in gathering Strawberries for London, but they do not carry them to the market. Kent is now the great centre of production. Last Friday one grower alone sent 20 tons to London, and his daily consignments have since probably doubled that amount. This same grower, Mr. Vinson, in addition to his London trade, sent 117 tons to Manchester and Liverpool last year. We have seen crops near Swanley that have been sold by the cultivator this year for £60 per acre, the purchaser gathering them and incurring all risk. If any of our readers have not been to Swanley let them call at once on Mr. Cannell, and with the flowers in his nursery and the fruit all round it, they will see sufficient in a few hours to think about for years; but if the present hot weather continues (there has been no rain around Swanley) the Strawberry season must be very short this season, and the bulk of the crop will be gathered this week.]

ROYAL AQUARIUM ROSE AND STRAWBERRY SHOW.

JULY 4TH.

THE Royal Aquarium Company offered very liberal prizes for Rose blooms and Strawberries, which might have been expected to bring a greater number of competitors together than was the case, particularly as the date chosen for the Show was a most suitable one both for the flowers and the fruit. Two classes were devoted to Roses—one for seventy-two blooms confined to nurserymen, the other for forty-eight blooms to be shown by amateurs. Three prizes were offered in each class, those for nurserymen being £15, £7, and £5, while the amateurs' prizes were £10, £5, and £3. In the first-named the leading award was secured by Mr. C. Turner, Slough,

who had a collection of beautiful varieties, the blooms generally being of good substance, though a few weak examples were observable, which looked as if they had figured at Kensington on the previous day, and the same remark might be applied to each of the other stands. Some of Mr. Turner's best blooms were Duchess of Bedford, Star of Waltham, Mrs. Baker, A. K. Williams, Horace Vernet, Baronne de Rothschild, Edouard Morren, Alfred Colomb, Madame C. Crapelet, and Madame Gabriel Luizet. Mr. B. R. Cant, Colchester, followed, a magnificent bloom of A. K. Williams being very remarkable in his box. Innocente Pirola, Le Havre, Auguste Rigotard, and Mons. E. Y. Teas were nearly as fine. Messrs. Paul & Son, Cheshunt, were third with a neat collection that ran Mr. Cant very close for the second prize, as the blooms were fresh and bright. Several stands of Roses not for competition were also contributed by Mr. H. Bennett of Shepperton, who had fine examples of his new gold-medal Rose Her Majesty, Lady Mary Fitzwilliam, Mary Bennett, and Earl of Pembroke. Messrs. Cranston & Co., Hereford, exhibited boxes of Teas and Hybrid Perpetual Roses, the former being especially good.

In the amateurs' class there were four competitors, Mr. G. W. Girdlestone securing the chief honours with a beautiful stand, comprising Beauty of Stapleford, Prince Arthur, Marie Rady, Catherine Mermet in grand condition, Charles Lefebvre, Camille Bernardin, and A. K. Williams extremely bright. The Rev. E. Fellowes was a close second with fresh richly coloured blooms, Star of Waltham, Baronne de Rothschild, and the favourite A. K. Williams being the most prominently noteworthy varieties. Mr. G. Rushmore took the third position with smaller but clean and neat blooms.

Strawberries were contributed by six growers, the prizes being £3, £2, and 10*s.* for three dishes, distinct varieties. First honours were secured by Mr. C. Herrin, Gerrard's Cross, who had Sir Joseph Paxton very fine, some of the fruits $2\frac{1}{2}$ inches in diameter. President and Empress Eugénie also were large. Mr. J. Smith, Romford, followed with Sir Joseph Paxton, even and richly coloured; Dr. Hogg, good; and British Queen. Mr. Meadmore, Romford, being third with James Veitch, Sir J. Paxton, and Rifleman, even but scarcely sufficiently coloured. Mr. T. Sharpe, Chertsey, showed boxes of Prince Arthur, British Queen, and Comte de Paris, very good. Mr. Bennett, Potter's Bar, exhibited baskets of Strawberries, Peaches, Tomatoes, Nectarines, and Grapes.

SUTTON ROSE SHOW.

JULY 6TH.

It will not surprise anyone who has watched the vigorous proceedings of this young Society, that in writing of its second Show one should have to report that it had already made a very forward step towards not maintaining but also increasing its position. When a Society—knowing that the place in which its operations are carried on is of a peculiar character, that the soil is not a naturally good one for Roses—issues a pamphlet in which sound and practical advice is given by which these difficulties can be overcome: when, during the winter months, in order to keep the *esprit du corps* alive, the members meet together at a grand dinner at the Café Royal, under the presidency of that valued friend of horticulture Sir Trevor Lawrence, we may be sure that nothing would be wanting to insure success in their Show; and when to this it is added that a most liberal schedule is issued—sufficient to tempt amongst nurserymen Messrs. Cranston, Cant, Turner, Paul & Son, Piper, &c., and amongst amateurs such growers as Mr. Slaughter (the champion of the year), Messrs. Cutbush and Mawley, the Rev. Alan Cheales, &c., we might naturally expect a goodly gathering of Roses. And so it fell out. But as all things cannot be expected to go exactly right, so it fell out this year that the Show was too late for the local growers, and consequently they were not in the running, as they ought to have been, and there was not that improvement in the local classes which was so manifest at Cardiff, Mr. Ernest Wilkins, the indefatigable Secretary of the Society, who carried off the challenge cup last year, being hardly able to show at all; but, with this drawback, the Show was in every other respect a most excellent one. The day was very favourable, the hall in which it was held looked exceedingly well, and it was a great treat to all lovers of the Rose; and, if one may judge from the large number of visitors who thronged it during the afternoon, must have been a great success.

As the classes for amateurs are those which are most interesting to the general bulk of the readers of the Journal, I give in detail an account of most of the winning stands. Mr. A. Slaughter took the chief prize with an excellent stand containing some truly magnificent flowers. The varieties were La France, Dr. André, Charles Lefebvre, Le Havre, Capitaine Christy, Général Jacqueminot, Baronne de Rothschild, Camille Bernardin, Marquise de Castellane, Duchesse de Vallombrosa, Marie Rady, a grand bloom; John Stuart Mill, Madame Gabriel Luizet, Comtesse d'Oxford, Mons. E. Y. Teas, Madame Charles Crapelet, Anna Ollivier, Maréchal Niel, Duke of Teck, Belle Lyonnaise, Marie Baumann, a splendid flower; Souvenir d'un Ami, and A. K. Williams. This was a magnificent bloom—the finest I have yet seen anywhere this year, and deservedly gained the National Rose Society's silver medal for the best bloom in the Show. In the class for eighteen Mr. Stone of Reigate was first with fine blooms of Duke of Edinburgh, Capitaine Christy, Marie Rady, La France, Marie Baumann, Marie Finger, Madame Victor Verdier, Madame Lacharme, Madame Joigneaux, White Baroness, a very fine pure white flower; François Michelin, François Thuger, a good Tea Rose I do not remember to have seen; Madame Gabriel Luizet, Madame Lambard, Jean Ducher, Star of Waltham, and Maréchal Niel. In the class for twelve blooms Mr. Cuthell was well first with fine blooms of Etienne Levet, Marie Baumann, Alfred Colomb, Capitaine Christy, Sénateur Vaisse, Mrs. Baker, Marie Verdier, Royal Standard, Marquise de Castellane, Marie Rady, Gabriel Luizet, and Devienne Lamy. In the class for nine blooms the Rev. Alan Cheales was first with beautifully finished blooms of Marie Baumann, Capitaine Christy, Star of Waltham, Madame Victor Verdier, Charles Lefebvre, Madame Gabriel Luizet, Marie Baumann, William Kælle, and Dupuy Jamain. Mr. E. Mawley was second with a hardly inferior stand, consisting of Marie Baumann, Marquise de Castellane, Charles Lefebvre, Comtesse d'Oxford, Dr. André, Countess of Rosebery, Duke of Wellington, Madame Eugène Verdier, and Duc de Montpensier. In the class for six the first prize was withheld. The second was won by the Rev.

F. H. Gall of Hitchin, and had his flowers been better set up they would have been placed first. La France, Alfred Colomb, Prince of Portia, Marquise de Castellanc, Le Havre, and Jules Finger. In the class for twelve Teas Mr. Slaughter was first with Jean Ducher, Souvenir d'un Ami, Anna Ollivier, Madame Willermoz, Innocente Pirola, Maréchal Niel, Belle Lyonnaise, Madame Lambard, Catherine Mermet, Madame Bravy, Comte de Paris, and Caroline Kuster. Mr. George Mount of Harbledown, Canterbury, was second with Souvenir d'Elise, Maréchal Niel, a fine bloom; Innocente Pirola, Marquise de Lauria, Madame Willermoz, Niphotos, Catherine Mermet, Souvenir d'un Ami, Comtesse de Nadaillac, and Hippolyte Jamain. For six Teas the Rev. Alan Cheales was first with a beautiful stand of Souvenir d'un Ami, Maréchal Niel, Madame Bravy, Catherine Mermet, Souvenir de Paul Neyron, and Niphotos. In the class for eight varieties, trebles, the first prize was won by Mr. E. Pawle of Wray Park, Reigate, with a good stand of Alfred Colomb, Mdlle. Eugénie Verdier, Le Havre, Capitaine Christy, Camille Bernardin, Prince Arthur, three very fine blooms; Marie Finger, and Comtesse d'Oxford. For four varieties, three of each, Mr. E. Mawley—Madame Gabriel Luizet, Marie Baumann, Star of Waltham, and Baron Rothschild. For the best six of any one variety Mr. H. Slaughter was first with Maréchal Niel; the second was taken with Marie Baumann, and the third by Mr. Cuthell with Madame Gabriel Luizet. These comprised the open classes. Mr. H. H. French took the Ladies' challenge cup, and Mr. Samuel Wilkins the prize for English-raised Roses. Messrs. Paul & Son were first in the nurserymen's class with a good stand of fine flowers of many of the leading varieties.

There was a good display of stands composed of Roses and foliage. It may be considered a heresy to say it, but it is almost impossible to make a really pretty stand. The only pretty stand I ever really saw was one at Reigate some years ago, but then it was made of wild Roses. There is a heaviness about the Rose for such purposes that seems to require other flowers of a lighter character to set them off, and I do not think one ever sees in a private house vases of flowers so composed. Brackets of Roses were very pretty, and as only a few of these are required the case is different. Let me add that in one respect Sutton sets an admirable example: the room was ready for the Judges at the time specified, and there was nothing to hinder quiet and leisurely examination of the flowers. *O si sic omnia!* This was due to the favour and courtesy of the Secretary, Treasurer, and very effective Committee of the Society.—D., Deal.

CRYSTAL PALACE ROSE SHOW.

THIS was so far the Rose Show of the season, and I think it will be very hard for any future show to come up to it. Owing to the cool evening of Friday the blooms travelled beautifully, and the freshness of the boxes was delightful. Mr. George Paul had it all his own way at this Show. His boxes were very fine, particularly his seventy-two. I regret to say that Mr. Cant of Colchester was disqualified for forty-eight trebles for having four blooms of Mrs. Baker in his box. It was perhaps a rather hard thing to do, but I do not see what the Judges were to do. I sympathise with Mr. Cant very sincerely, particularly as it was my unpleasant duty to be one of the Judges. His boxes were, however, not nearly so fine as they were at the National, and Mr. Paul and Mr. Cranston were undoubtedly first and second in this great class. The Teas were very fine, particularly Mr. Mitchell's of Piltdown. Among the amateurs the Roses that made most impression on me were the Rev. Mr. Pemberton's. His trebles were superb. Mr. Whitwell had a hard fight with Mr. Slaughter for forty-eight singles, but the former was slightly smaller throughout, and the latter had a most magnificent bloom of Innocente Pirola, which carried immense weight. The classes for Roses of one colour did not fill so well as usual, and I fancy that many of the growers are not quite in yet.

The crowd was very great, and after the judging was over it was next door to impossible to get near any boxes that you wanted particularly to see. Mr. Bennett of Shepperton showed some very fine novelties. Her Majesty made a great sensation; and Mary Bennett, a new Rose, obtained a certificate. Some beautiful Irises and hardy flowers were staged by Messrs. Hooper of Covent Garden, and Mr. Rivers sent some splendid dishes of fruit, which made one long to be judging them.—WYLD SAVAGE.

BROCKHAM ROSE SHOW.

THIS Show was held on Saturday last in the beautiful grounds of R. Barclay, Esq., Bury Hill, near Dorking. One of the advantages that this Association possesses is the keen competition that exists among the gentry of the neighbourhood for holding the Rose Show in their grounds. The neighbourhood of Dorking can scarcely be second to any in Surrey for the beauty and picturesqueness of its country residences and estates, and Bury Hill certainly ranks very high amongst these. The Show is almost entirely one of Roses, and the blooms exhibited were for the most part of great excellence as regards form, and freshness, and size; and in the latter respect there were several specimens, such as La Rosière in Lady Mary Legge's box, M. de Castellane, Marie Baumann, Prince Camille de Rohan, and A. K. Williams that were almost as fine as blooms could possibly be. The number of boxes shown was very large, and in some cases the competition was exceedingly keen, but in no case did the Judges have any difficulty in arriving at an unanimous opinion.

In the twenty-four class the Rev. A. Cheales, the zealous and most excellent Hon. Secretary, was *facile princeps* with a box of almost faultless blooms, only two specimens being at all weak. The second prize was taken by C. E. Cuthell, Esq., who, it will be seen, was a very successful winner of prizes at this Show. His twenty-four was indeed a creditable box. In the twelves, for which three prizes were given, there was good competition. The palm was just snatched from Mr. Wollaston, who took second place, by Mr. Stone of Eastcote, Redhill, whose Roses throughout the Exhibition were very fine indeed. The third prize was carried off by Mr. E. Horne of Reigate, who came in an easy winner. Another successful exhibitor was Mr. Leopold Seymour of Brockham Park, who showed some fine blooms in the class for six distinct Roses. A. K. Williams in this box almost ran a dead heat for the best H.P. Rose in the Show with the La Rosière of Lady Mary Legge,

which actually carried off the medal of the National Rose Association. Mr. Parr's box of six were also worthy of mention.

The triplets at this Show were very strong in point of numbers and merit. Mr. Cheales, who showed his third in triangles, just won first honours by one point, Mr. E. Horne being well up for second place. The six Marie Baumans of Mr. Stone in the next class were almost perfect, and well deserved the gold medal awarded to them; while Messrs. Cuthell, Cheales, Horne, and Capt. Lang were well entitled to the honours they received.

The Tea Roses were, as they usually are at this Show, very good, both in the twelves and six class. A magnificent bloom of Jean Ducher in Mr. Cuthell's box carried off the silver medal for the best Tea in the Show, a fine bloom of Marie Van Houtte in Mr. Wollaston's box coming second. These two gentlemen took first and second places in the twelves class, while Mr. Leopold Seymour and Mr. Birket took similar honours in the six class; while the Hon. H. D. Rider took a first prize for a box of six for competitors who have been hitherto uncrowned.

It only remains to speak of the decorations, which were not well represented either in point of numbers or special merit. They consisted of dining and drawing-room devices, brace and buttonhole bouquets. The winners were Mrs. Benccke, Mrs. Mortimer, Miss Fuller, Mrs. Nicholls, Mrs. Cheales, and Mrs. Fowke. Miss Fuller showed much taste in her arrangement of a brace bouquet of Dipladenias and brown cut Japan Maple leaves, and in her buttonhole bouquets. The Committee and Judges were entertained at luncheon by the owner of Bury Hill (Mr. R. Barclay), and as the day was very fine a large number of visitors was present. The Committee are much to be congratulated on the success attending their Show.—A. B. A.

HITCHIN ROSE SHOW.

JULY 5TH.

WHEN Mr. Geo. Paul takes his A's to Hitchin and sends his B's to the great Show at Bath, it will be apparent that notwithstanding the concurrence of half a dozen other shows on the same day Hitchin was not the most despicable of trysting grounds. The perseverance of the Rev. F. H. Gall, whose quiet and kindly endeavours are always appreciated by exhibitors, was rewarded with a highly satisfactory show. Hitchin is always pleasant, and no grumbling is heard, as the unsuccessful exhibitor, whose temerity may have provoked a good thrashing for him, is unable to appreciate his defeat. This is largely owing to the simple, yet considerate, arrangements which are there carried out with a punctuality cheerfully concurred in by all. In the only open class for thirty-six blooms a good competition of six stands was secured. The two Hertfordshire houses of Messrs. Geo. Paul & Son of Cheshunt, and E. P. Francis & Co. of Hertford, being both at home, were on this occasion well-pitted antagonists. Messrs. Paul & Son were, however, in finest size, and being equally good in condition, were placed first, showing especially fine blooms of A. K. Williams, Comte de Raimbaud (of a similar type, and almost equally fine with its more recent but better known rival) also first-class flowers of Annie Laxton, Jean Sury, Comtesse d'Oxford, and Souvenir d'Auguste Rivière. Messrs. Francis & Co., who as lightland growers were remarkably strong, came in second, having A. K. Williams in most perfect form and colour; Prince Camille de Rohan, Georges Moreau, Devoniensis, Madame Marie Verdier, Emily Laxton, and Duc de Wellington were also prominent as clean and well-coloured flowers. Mr. John House of Peterborough (who on the same day was a large and highly successful competitor at Newark) was here a very good third, having amongst many others a fine bloom of Charles Darwin in his box. Mr. House also staged, but not for competition, an attractive stand of the pretty Noisette, William Allen Richardson, which cannot fail to become a favourite buttonhole Rose. In the open class of twenty-four blooms for amateurs Mr. J. L. Curtis of Charteris was first; the Rev. E. L. Fellowes of Wimpole Rectory, Royston, second; and the Rev. W. H. Jackson, Stagsden Vicarage, Bedford, third; all being very nearly matched in size and quality of blooms, but varying slightly in colour and freshness.

In the class for twenty-four blooms open to amateurs within twenty miles of Hitchin, Mr. Fellowes was first; Mr. Jackson, second; and the Rev. F. Jenyns, Knebworth, third. For twelve varieties Mr. Jackson was first and Mr. Fellowes second. In twelve Teas open to amateurs Mr. Jackson was again first, Mr. S. Tuke, second, and Mr. Curtis, third; and for six varieties Mr. Fellowes was prominently the winner, Mr. Jackson being second. Very good Roses were staged successfully by Mrs. Lucas and others in the local classes, and some tastefully arranged epergnes for dinner table were exhibited; in this class Mrs. Lucas being first, Mrs. Marlborough Pryor second, and Mrs. E. King of Madingley third. The Exhibition, on the whole, was a considerable advance on both predecessors, the competition being strong in most classes, although it is to be regretted only a select and limited company attended.—T. LAXTON, Bedford.

THREE SUBURBAN SHOWS.

THE great demand upon our space this week prevents us giving more than a brief outline of the following three Exhibitions, which were held in three widely separated districts, and equally well proved how admirably such local Shows are supported both by exhibitors and visitors.

WIMBLEDON.—JULY 4TH.

The eleventh annual Show of this Society was held in the beautiful grounds at Belvedere, Wimbledon, which were liberally placed at the disposal of the Society by A. Schlusser, Esq., the well-kept garden also being thrown open to the visitors. This proved almost as great an attraction as the Show itself, and numbers took advantage of the opportunity to enjoy the charming views obtainable from several portions of the garden. Two large marquees were occupied with the exhibits, plants being very well shown. Rose blooms also were a distinctive feature, and vegetables were fairly represented. The principal prizewinners for plants and groups were Messrs. G. Stevens, Putney; Bentley, Edgecombe Hall; Starr, Coombe Warren; Law, gardener to R. S. Dean, Esq., The Priory; Runnacles, gardener to Mrs. Schuster, Cannizaro; W. H. Cannon, Queen's Road; E. Collins, Pelham Road; and Smith, gardener to J. F. Schwann, Esq., Oakfield. In the Rose classes J. E.

Coleby, Esq., Rosenheim, and Mr. Moorman, gardener to the Misses Christy, Coombe Bank, Kingston, were the principal exhibitors, both showing fine blooms. Fruit was not largely shown, Messrs. Davis, Starr, Alderman, Bentley, and Gibson taking the chief prizes. Four very handsome Melons not for competition were staged by Mr. Lyons, gardener to A. Schlusser, Esq., Belvedere, the chief varieties being Scarlet Premier and Hero of Lockinge.

Miscellaneous collections of plants were staged by Messrs. J. Lang and Co., Forest Hill; Jackson & Son, Kingston; J. Veitch & Son, and D. S. Thomson, Wimbledon.

TEDDINGTON.—JULY 4TH.

For twelve years the above pretty district has produced an annual Exhibition of more or less merit, that held on Wednesday last week being entitled to a position amongst the best in the annals of the Society. The grounds of Bushey Park Cottage, the residence of E. P. Watson, Esq., were devoted to the Exhibition, which was remarkably well attended during the afternoon, as the weather proved very fine. Two marquees were occupied with the exhibits, and, as is often the case at local suburban shows, the groups formed one of the chief features. In the chief class for these Messrs. Hooper & Co., Covent Garden, took the lead with a pretty arrangement, light and graceful yet bright and effective, comprising Palms, Ferns, &c., in due proportion, with Gloxinias, Begonias, Achimenes, and *Chrysanthemum frutescens* and a ground of *Adiantum*. Messrs. Fromow and Son, Chiswick, followed with a similar arrangement, and nearly as light and pleasing, though a little more crowded. Mr. Brown, Richmond, was third, the other prizes being gained by Messrs. Sutton, gardener to W. J. S. Sassoon, Esq., Walton; J. Gregory, gardener to J. F. Weymouth, Esq., Teddington; and Stephenson, gardener to J. Bull, Esq., Redholme, Teddington.

Pelargoniums, Coleuses, stove and greenhouse plants, Caladiums, fine-foliage, and Ferns were exhibited by Messrs. Bates, The Gardens, Poulett Lodge; Stephenson, Gregory, Coombs, Brown, Sallows, gardener to J. Flack, Esq., Twickenham; and W. Bond, gardener to Mrs. Evans, Beccholme, Teddington. Dinner-table decorations were fairly well represented, but several exhibitors had laid their tables for six instead of eight persons, and were consequently disqualified. In the fruit classes Mr. Bates gained several honours, Mr. Charney, gardener to W. Howard, Esq., Teddington, also taking prizes in some of the principal classes.

HIGHGATE.—JULY 5TH.

Most fortunately the weather proved extremely fine for this Show, and thus gave the Society an opportunity to regain a substantial financial position, which has not been the case at shows in recent years. The Baroness Burdett Coutts again generously placed her beautiful garden at Holly Lodge at the service of the Committee, the visitors being allowed to wander unrestricted through the whole of the garden and houses—an advantage that was evidently greatly appreciated by the visitors. A marquee of considerable size was filled with the exhibits in competition for the numerous prizes offered, and as in most cases the entries were numerous a fine display was produced, to which we cannot do justice in the limited space at our disposal. There was a number of classes for distinct plants or stands of plants, and though so many were of excellent quality, there was not a particularly strongly marked character observable. Zonal Pelargoniums, Caladiums, Begonias, Ferns, fine-foliage plants, stove and greenhouse plants, were all well shown, the chief prizetakers being Messrs. C. Shephard, gardener to Mrs. Horwood, South Grove, Highgate; Aldous, gardener to J. Heriot, Esq., Cholmely Park; J. Osborn, gardener to J. N. Mappin, Esq., Southgate House; J. Tong, gardener to J. S. Law, Esq., South Lodge, Southgate; Brooks, gardener to W. Reynolds, Esq., The Grove, Highgate; and G. Tubbs, gardener to Basil Wood Smith, Esq., Hampstead. Fruit was shown in small quantities, and vegetables also. Messrs. Cutbush & Son, Highgate, contributed a beautiful group of miscellaneous plants, a fine collection of variegated Ivies being very notable. Mr. B. S. Williams, Upper Holloway, also had a group of Orchids and choice stove and greenhouse plants that occupied a position near that from Messrs. Cutbush, and was equally attractive.

THE INSECT ENEMIES OF OUR GARDEN CROPS.

No. 5.

THE Pea and the Bean are so nearly related to each other, and they are so frequently visited by the same insects, that the two may well be brought together in this series of articles. Probably, taking one year with another, the Pea, of the two, is the greater sufferer through insect attacks. Some of the insects that infest these plants are also found upon the Clover and allied species. It may be considered that about the worst enemies the cultivator of Peas has to contend with are certain beetles in the genus *Sitona*, for they direct their attacks upon the plants while these are yet young and tender, although they also occur later upon well-grown plants if they are not looked after, but then the injury is less perceptible. Several of these species are remarkably active amongst our leguminous crops from March to May, beginning business when there are the first intimations of approaching spring, and persevering until they have deposited their eggs. These, however, are not laid upon either the Pea or Bean, and the history of the grubs that produce these beetles remains yet to be discovered. It is possible they are subterranean in habit; and there emerges after, during the summer, a second brood at a variable period; but the attacks of this brood upon the plants are less important, because in that season they suffer comparatively slight injury. It is the survivors of a summer or autumn brood that trouble us in the earlier months, they having lived through the winter hidden in odd nooks and crevices, perhaps under the earth.

Specimens have been seen out on the wing upon mild days before they commence feeding, taking, apparently, a little healthy exercise. Could we hunt up and destroy these lurkers of the winter the species might be greatly reduced in numbers, but they are seldom observed save by chance.

Sitona lineata, the striped Pea weevil (fig. 9), called in the north the "cuddy," from its supposed resemblance, in miniature, to the patient ass (a name that has been brought southward by the Scotch gardeners), is the commonest species, and larger than *S. crinita*, which often occurs in its company. Both are greyish, with red horns and legs. *S. lineata* is the darker of the two. Along the wing cases in this species are ten punctured stripes; but *S. crinita*, instead of these, has blackish spots. The markings are caused by scales, and are best seen when the insects are fresh out; subsequently they present a mongrel appearance, owing to the scales being rubbed off. Their bites are made all round the leaves, and they, if left undisturbed, persevere till only the stalks are left where they have congregated. At night they leave the Peas and conceal themselves until daylight; yet though they feed during the day it is not easy to catch them in the act, as a voice or a heavy footfall sends them dropping to the ground, assuming the appearance of being lifeless. Some have tried the expedient of pressing the ground, so that the insects cannot enter it after dark, but this plan seems of small utility and hurtful to the growing Peas. A good dressing of lime and soot, the plants being previously wetted, makes them very unpalatable to the beetles, and this plan has been commended by many. Several gardeners have stated that they have

Fig. 9.—*Sitona lineata*.

Fig. 10.—*Bruchus granarius*.

escaped trouble from these insects by using turf or wood ashes when sowing. With Beans, as with Peas, it has been found that a crop which is growing slowly is much more liable to attacks than one in a vigorous and healthy condition. It is also bad to grow Peas season after season on the same spot. Taking advantage of the fact that the beetles seek the ground at night, some have applied to the soil round the Peas sand wetted with paraffin, or dressed it with diluted gas lime, so making them have an unpleasant or fatal journey back to their food plants in the morning. A correspondent of this Journal has informed us that he detected one of the species of *Sitona* in the act of attacking Peas that were sown in spring before they had germinated, but this is, I think, a rather unusual occurrence.

There are other beetles in the weevil group that prove injurious to Beans and Peas, and their speciality is the seed pods, hence the cook as well as the gardener frequently makes their acquaintance; for although other grubs may now and then be found, it is mostly the grub of a *Bruchus* that annoys the sheller of Peas by wriggling out of a proportion of the pods. *Bruchus pisi* is a little creature, about the same size as the small examples of the genus *Sitona*—that is, a sixth of an inch in length, of brown colour, with very fine serrated horns, and the wedge-shaped beak characteristic of many weevils. The wing-cases do not quite cover the body, so that a portion of the abdomen is exposed. For the perfect beetles, however, it is no good to search, though they occur upon flowers in spring before they resort to the Pea crops. Their eggs are laid upon the young pods, but one usually upon each that is visited. The young grubs pierce in and thrive on the contents, appearing as fat little creatures with black heads. So attached are they to the pods that they turn to chrysalids in them, burying themselves in a seed, so that they often escape notice when the Peas are gathered for seeds, and the sowing thereafter may be partly of beetles *in futuro*. But a proper examination will detect those Peas that are harbouring the pest, and all infected should be burnt, for if they are simply thrown away or buried the insects will afterwards come out. Spring is the season when they quit the chrysalis. There seems to be but one brood yearly. It is

doubtful whether there is any mode of dealing with this beetle by way of prevention. Small birds are believed to feed upon them, and toads.

The bean weevil is another in the genus *Bruchus*, rather less in size, and it has a greyish look until we examine one with a magnifier, and then we perceive it has wing-cases that are black, freckled thickly with white spots. This species (fig. 10), (*B. granarius* or *seminarius*), does not confine itself to the plants of the Leguminous order, but it also visits places where the cereals are stored, sometimes doing very considerable damage. In our gardens we observe this species is more partial to the Bean than to the Pea, and it is a curious fact that seeds containing the insects are not deprived of their power to sprout, therefore autumn-sown crops of Beans are more likely to show the effects of the pest, because its presence in the seed is not so easily seen then as in the spring. Of course such plants rarely fail to die off, their vitality being impaired by the destruction of the greater part of that substance in the seed which supplies the first nutriment to the germ. There is, however, a tiny circle cut by the grub, just within the husk, in preparation for its emergence as beetle; and in a close survey we may see that portion of an infected Bean is duller, and a trifle transparent in autumn. When the insect is ready to appear a bit falls like a lid, leaving a hole.

The beetles quit the seeds from February until May, in readiness for the season enabling them to deposit eggs upon the Bean pods. It is not uncommon to find several of the grubs lodged in a single pod, but Mr. Wood concludes that many of the eggs fail to hatch, perhaps because they are attacked by some minute insect parasite. No plan has been suggested for warding off the beetles, which would, indeed, be difficult, even if the Beans were constantly watched; but at the time of gathering for storage the seeds (so some advise) may be dipped into hot water slightly under the boiling point, and if they are removed in about a minute it is said their germination is not interfered with, though the immature beetles will be destroyed. Probably neither of these *Bruchi* are natives of Britain.—ENTOMOLOGIST.

ROYAL HORTICULTURAL SOCIETY.

JULY 10TH.

HARDY flowers were the great feature of this meeting, and together with the collections of plants from Chiswick a pretty display was formed in the conservatory.

FRUIT COMMITTEE.—Harry J. Veitch, Esq., in the chair. There were also present Messrs. Phillips, Crawley, J. Bunyard, A. W. Sutton, F. Rutland, and R. D. Blackmore. Mr. A. Faulkner, Inkpen, Hungerford, sent a dish of a fine seedling Raspberry, the fruits large and of good colour. Mr. Ernest Whitehouse, Kidderminster, sent a dish of a seedling Strawberry, some being large, flat, and dark in colour. Mr. Fitt, The Gardens, Cashiobury, Herts, also showed a seedling Strawberry, flat, large, over 2 inches in diameter, and remarkably dark red, nearly black. It was of poor flavour, and was thought to be *Empress Eugénie*. A cultural commendation was awarded to Mr. W. Carmichael, gardener to J. H. Porteus Oakes, Esq., Bury St. Edmunds, for six handsome fruits of *Bellegarde* Peaches, richly coloured and of good size. Mr. Carmichael also sent a fine fruit of a new Melon named *Captain Larks*, weighing 7 lbs., and of excellent flavour, the flesh being remarkably deep. New Melons were also sent by Mr. C. Herrin, Chalfont Park, Gerrard's Cross; Mr. Gilbert, Burghley; and Messrs. R. Veitch & Son, Exeter. A vote of thanks was awarded to Mr. Bloxham, The Gardens, Brickhill Manor, Bucks, for good close samples of Veitch's Superb White Cos Lettuce. Messrs. Veitch & Son, Chelsea, exhibited a large collection of Cabbage Lettuces, for which a vote of thanks was accorded.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. There were also present Messrs. T. Moore, J. Laing, W. Bealby, H. Bennett, James McIntosh, John Wills, J. James, J. Dominy, H. Ebbage, M. T. Masters, H. Cannell, H. Turner, and J. Fraser. Mr. T. S. Ware, Hale Farm, Tottenham, exhibited a magnificent collection of hardy flowers, forming by far the most important feature of the meeting. A great number of choice species and varieties were represented, *Gladiolus*, *Lilies*, *Carnations*, and single *Dahlias* being amongst the most notable. Fine clusters of *Spiræa aruncus*, with *Lilium candidum*, *L. colchicum*, and *L. auratum*, formed the background, the *Gladiolus*, *Antirrhinum*, *Veronica spicata*, *Campanula glomerata*, *Polemonium Richardsoni*, *Geum coccineum*, *Alstromeria aurea*, *Carnations*, *Pinks*, *Campanula persicifolia*, *Armerias*, *Stenactis speciosa*, *Pentstemons*, *Galega officinalis alba*, and innumerable others being arranged in front. Messrs. H. Cannell & Sons, Swanley, staged a handsome collection of *Delphinium* blooms, with *Campanula persicifolia coronata alba*, *Petunia Beautiful Star*, a striped form; *Pelargoniums*, *Lobelias*, and *Oenothera speciosa*. Mr. Vicary, gardener to J. T. Peacock, Esq., Sudbury House, Hammersmith, was awarded a vote of thanks for a collection of *Odontoglossum vexillarium* var. *Klabochorum*, which has small but deeply coloured flowers.

Messrs. Veitch & Sons, Chelsea, showed several new plants and a fine collection of varieties of *Iris Kämpferi*, for which a vote of thanks was accorded. Votes of thanks were accorded for plants of the fine *Lilium auratum platyphyllum* and *virginale*, the white and free *Escallonia Phillipiana*, and a neat double Stock—*White Gem*. A vote of thanks was accorded to Mr. J. Aldous, Gloucester Road, South Kensington, for a large bouquet

of *Lilies* nearly 2 feet in diameter. A vote of thanks was accorded to Mr. Noble of Bagshot for a beautiful group of *Spiræa palmata*, the trusses of rich rosy-coloured flowers being very large. A vote was also accorded for a flower of *Rose Duchess of Connaught*, a rich scarlet variety. A cultural commendation was adjudged to Messrs. Hugh Low & Co., Clapton, for a strong plant of *Grammatophyllum Ellisi* with a spike of thirty-two flowers. A vote of thanks was accorded to G. F. Wilson, Esq., Weybridge, for a grand spike of *Lilium giganteum* with sixteen flowers and flowers of *Iris Kämpferi*. Mr. W. Bealby, The Laurels, Roehampton Park, Putney, sent several fine double *Tuberous Begonias*—one, *Rosamonde*, with enormous globular rosy flowers nearly 4 inches in diameter; *Agnes Sorel*, pale pink, also full; and *Goliath*, scarlet, wonderfully fine. Handsome collections of *Achimenes*, *Tuberous Begonias*, and *Sweet Peas* were contributed from the Society's gardens.

First-class certificates were awarded for the following plants:—

Cattleya superba splendens (Mr. Ebbage, gardener to J. S. Bockett, Esq., Stamford Hill).—A most richly coloured variety, the sepals and petals warm purplish crimson, the lip intensely deep magenta.

Notospartium Carmichaelia (Veitch).—A hardy shrub from New Zealand of Rush-like aspect, the pinkish pea-like flowers being borne in small dense racemes near the apex of the leafless branches.

Oncidium nigratum (Veitch).—A very distinct species from British Guiana, with small flowers in a long compound raceme. The petals and sepals are narrow undulated, white, blotched with dark chocolate, the lip being triangular, yellow spotted with brown.

Davallia brachycarpa (Veitch).—An elegant Fern with fronds 2 feet long, 8 to 9 inches broad, graceful and feathery, tripinnate, the pinnæ and pinnules in the fertile fronds being very narrow, giving a feathery appearance to the frond.

Lilium Szovitzianum pallidum (Wilson).—A variety distinguished from the type by the pale delicate lemon-yellow colour of the flowers.

Begonia Goliath (Bealby).—An enormous double scarlet variety, the flowers globular and 4 inches in diameter.

Lilium Bloomerianum ocellatum (Ware).—A distinct and beautiful Lily, the leaves in close whorls, lanceolate, tapering; the flowers in terminal racemes, pendulous; the petals revolute, orange yellow ground, with numerous reddish brown blotches.

Milla biflora (Ware).—A novel form with two flowers on a scape, the divisions of the corolla elliptical, narrow, and white and spreading. The flowers are about 2 inches in diameter.

Lobelia speciosa Prima Donna (Carter).—One of the most distinct *Lobelias* that have yet been obtained. It is of dwarf habit, very free, the flowering being of a rich reddish-crimson colour, with a white dot in the centre.

Nemophila atomaria atro-cerulea (Carter).—Distinguished by the deep ultramarine blue of the flower. Much darker and richer than any others.

Lobelia Swanley Blue (Cannell).—A charming variety, the flowers exceedingly large, very bright blue with a white eye; the plants dwarf, compact, and remarkably floriferous.

Pelargonium Abel Carrière (Cannell).—One of the Ivy-leaved section, with fine trusses of glowing rosy double flowers.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker in the chair.

Pinus pinea, with "primordial" foliage on adult shoots.—Dr. M. T. Masters exhibited specimens showing the above conditions, and remarked that the young foliage was glaucous, provided with many stomata all over their surface instead of in lines.

Dimorphic Foliage of Juniperus and Retinospora.—The small adnate leaves are borne on the quick-growing terminal shoots. The broad free leaves do not occur on the leader shoots, and when the plant is variegated these free leaves (on the stem with arrested growth) are much more variegated than they are on the quick-growing leader shoot.

Rhododendron Maddenii.—Mr. Mangles showed a spray of this species with white, tubular, Lily-like flowers, which had been grown all through the winter under a canvas roof, proving it to be possessed of considerable hardiness.

Photographs of Mexican Scenery.—Mr. W. G. Smith exhibited three beautifully executed photographs, showing gigantic specimens of *Cereus*, having straight erect stems 35 feet in height. They were taken by Herbert Green, Esq., in the desert of Arizona. Mr. Loder reminded the Committee that Dr. Bell was the first to photograph these plants in 1867.

Phylloxera.—Mr. MacLachlan said that he had received specimens of Vines from houses in Accrington infested with this insect, and in reply to inquiries remarked that he believed it had not been discovered on any plants growing in the open air in this country. He recommended bisulphide of carbon or complete destruction by burning.

Plants Exhibited.—Mr. Loder brought the following plants:—*Eriogonum umbellatum* from the Rocky Mountains, *Morina longifolia* from the Himalayas, *Arnebia Griffithii* and *A. echioides*, plants with yellow flowers and a dark spot on each petal. This gradually disappears with age. Mr. Henslow inquired if it had been noticed whether this was the result of pollination, as the golden spot on the labellum of *Oncidium Roezlii* fades away in a few hours after artificial pollination. *Ligularia* sp., a tall Composite with spike of yellow flowers and cordate leaves; *Oxytropis Halleri* (?), *Campanula Hendersoni* (hyb.), *Papaver* sp. with orange petals (*crocea* ?), *Erigeron Roezlii* (?). These latter were referred to Kew for identification. *Masdevallia Carderi* and *Phalænopsis maculata*, two new species, were shown by Mr. Veitch.

Meconopsis sp.—Mr. G. F. Wilson showed a blossom with dark-coloured petals: the species was uncertain.

Puccinia arundinacea.—Mr. Plowright of Lynn sent leaves of *Rhubarb* artificially infected with this fungus, and which had given rise to well-defined patches of *æcidium*. He remarks that hitherto the *Rhubarb æcidium* had been thought to be due to *P. Magnusiana*, but this latter failed to produce any *æcidium*. He also sent leaves of *Medlar* infested with a *Pœstelia* (?) apparently not hitherto recorded in Britain. Its spores are smaller than those of *R. cornuta*, *penicillata*, or *lacerata*. He also sent specimens of *Puccinia poaxum* on *Poa trivialis*, showing its generic appearance in circles, as well as its *æcidiospores* on *Tussilago Farfara*.

Fasciated Pine Apple.—Mr. Nicholas, gardener to Earl Fortescue, sent a curious specimen of fasciation. The Pine Apple weighed 9½ lbs., and had about thirty small crowns at the summit.

Proliferous Double Begonias.—Mr. Laing exhibited several specimens of scarlet Begonias in a more or less proliferous state.

HARDY FRUIT GARDEN.

Young Trees—Training.—The midsummer growth is now advancing with even greater vigour than that of spring. No cold north-east winds now prevail. Clean, healthy, and robust as this second growth is, therefore, let us see that it is turned to best account by training it to the required form, and nipping it wherever it is necessary to induce lateral growth for the formation of spurs or to obtain enough shoots to fill vacancies. Rigid training is not often desirable; rather aim to secure clean straight growth with all the leading shoots of branch or stem pointing upwards, or at a sufficiently acute angle to maintain an equal freedom of growth in every part of the tree, and gradually impart the required form as the growth gains age and strength. Tie loosely but securely; never suffer swelling growth to be string-bound; never suffer the stem to rock in the soil, nor branches to chafe against supports and make unsightly bark wounds. All these apparent trifles tell in the end, and close attention to them is absolutely necessary in the rearing and development of a handsome healthy fruit tree.

Watering.—We have reason to fear that the object of watering fruit trees is not generally understood. Not merely to promote growth and aid the swelling fruit is it necessary, but also to assist the entire economy of the tree, the formation and perfect development of fruit buds, the free and regular action of the sap, the full expansion of blossom, the setting of fruit, and, above all, the prompt growth of the fruit as soon as it is set. Were this as well done as it ought to be we should no longer hear of premature fruit-shedding. Soil differs greatly, a cool alluvial deposit needs far less water than a thin warm sandy soil. Let, then, the fruit-grower become thoroughly acquainted with the nature and condition of the peculiar soil he has to treat, and adopt his measures accordingly.

Mulching.—As supplementary to watering the importance of mulching can hardly be overrated. It checks evaporation, keeps the soil moist in the most parching weather, and enables the tree to derive full benefit from watering. It promotes a free quick root-action, helps to insure abundant and regular crops of fruit, and exercises a beneficent action upon the general health of the trees. Our favourite mulching is the mixture of half-decayed leaves and stable dung which an old hotbed affords. We regularly apply this every year, not only to fruit trees but also to Raspberries and all bush fruit. The mention of this reminds us that another important effect of mulching is to attract the roots to the surface and to afford a supply of rich food, which the rootlets may now be seen laying hold of in every direction.

Strawberries—Making the Beds.—Well drain the soil, trench and thoroughly enrich it with manure. If it be at all of a close adhesive nature without many stones, and is liable to settle into an inert hard mass, cover the surface with 6 inches of coal ashes, or even more if you can procure them, before trenching, so as to mix the ashes with the soil as you proceed, and thus render it sufficiently porous to allow surface water to pass freely through it to the drains.

Planting.—The runners layered as was explained a fortnight ago are rooting freely, and will soon be ready for planting. Not a day should be then lost, because early planting in July insures a moderate crop of fine and early fruit next year. Plant 1 foot apart every way in view of securing a double quantity of fruit next year, and with the intention of removing each alternate row immediately after fruiting is over next year, so as to leave the permanent rows 2 feet apart. In districts where the rainfall is heavy it is desirable to go even further and remove every alternate plant in the permanent rows so that the plants may in the second year be 2 feet apart every way, and thus not only be more open to light and air on all sides, but that the fruit may all be raised from contact with soil, grass, or straw, and thus be kept from premature decay.

PLANT HOUSES.

Cypripedium insigne.—Plants started in a little heat early in the year to make their growth should now be placed in a cool house. A cool vinery is a good place for them if the roof is not too densely covered with foliage. They should remain under cool treatment until their flower sheaths are visible, when a little heat is again beneficial. An abundant supply of water is necessary. If root-bound weak stimulants given every alternate watering are beneficial.

Cyperus lawus variegatus.—Where dwarf plants in 2-inch pots are used for furnishing purposes this is a capital plant. Its striped variegated grass-like foliage renders it very attractive when associated with Ferns and other dwarf plants. It is easy and readily propagated by taking off the creeping side shoots, which are produced plentifully from strong plants, and which form roots from every joint. No handlights or frame are necessary in which to root the cuttings after insertion, as they

do equally well in any warm shaded place. Do not grow this plant in too much heat, or its foliage assumes a greenish hue and much of the plant's beauty is gone.

Fittonias.—Few plants are more useful for furnishing purposes than these, and they are easily propagated and grown, and very few dwarf plants where foliage is appreciated can be used to greater advantage. Where baskets, oval or other shaped, have to be filled with plants, Fittonias amongst Lycopodium and small Ferns for an edging have a charming effect. They can be established in small pots, pans, or boxes, and lifted out when required. When grown in the latter a number should be lifted out ten days or a fortnight before they are required for use, and a little moss tied round each ball of soil, so as to allow them time to become established in it, which answers equally as well as growing them in pots.

Imantophyllum miniatum.—This and its varieties are amongst the most serviceable plants for forcing during winter and spring. Large plants are noble when profusely flowered, but for decoration those in 6 and 7-inch pots are the most useful. Those required for early flowering and have been assisted by heat to make their growth must now be placed under cool treatment; the greenhouse or a cool frame is the place for them, the latter being preferable, as the lights could be thrown off frequently. When they remain in heat after their growth is completed they are very liable to be started, and in consequence push up their flowers. Give abundance of water, or the foliage will soon present a sickly appearance, and occasionally clear soot water, which quickly imparts a fine dark hue to their foliage.

Roses.—Hybrid Perpetuals that have been used for forcing purposes, and have been well hardened and stood outside after the completion of their growth, should have their pots plunged in a sunny position. Feeding should not be discontinued now the plants have done blooming, but should be persisted in, and the benefit of this practice will be seen next forcing season in the size and quality of their blooms. The foliage must be kept in a healthy condition by frequent syringing, which will, if thoroughly done, keep them free from red spider. If mildew attacks them syringe at once with softsoap water mixed as previously advised, and in which a little sulphur has been mixed.

Tea varieties that are planted out under glass require much attention at this season of the year to keep them free from spider. Thorough syringing twice daily during fine weather with water in which softsoap has been mixed is the only means of keeping them clean. Abundance of water will also be needed at their roots, or else they will soon become a prey to mildew. Those required for flowering during the winter and spring should have all flower buds removed as they appear from this date, and air should be admitted abundantly day and night. Those in pots required for flowering in the autumn should be stood outside, and if the plants are cramped in their pots for root room place them into a larger size without delay. They will become thoroughly established in these, and if flower buds are removed as they appear, and the wants of these plants properly attended to, some valuable flowers will be the result after those in beds and borders are cut off by frost.

Young plants from cuttings rooted in spring should now be in 6-inch pots, and be grown on under glass. Remove flower buds as soon as they can be seen, and strong shoots that spring from the base should be pinched when they are 6 or 7 inches high. This will be the means of inducing others to spring from the base, or, failing this, the shoots operated upon will branch freely, and compact little bushes that will flower profusely in autumn and winter will be secured.

FLOWER GARDEN AND PLEASURE GROUND.

Wallflowers and Sweet Williams.—Those sown for early blooming next spring are now in rough leaf, and if under glass should be gradually exposed and hardened off preparatory to pricking out. Sow more seed for later blooming, and in boxes recently used for the bedding plants in preference to risking the seeds in an open border. Sow thinly, protect from heavy rains, and shade from bright sunshine. This, in addition to the ordinary bedding Wallflowers, also applies to the large-flowering double German Wallflowers. Cuttings of double Wallflowers may be struck under handlights or a north wall, as advised for Pinks, and cuttings of Alyssum saxatile will root similarly to the Wallflowers.

Pelargoniums and other Bedding Plants.—The recent showery weather has been of service in establishing the late-planted batches of these, and in the case of Pelargoniums at least no further waterings will be required this season. If not already done the surface of all the beds should be well stirred with a small flat hoe and then be levelled down with a rake. This will destroy all the young weeds, and prevent cracking and undue evaporation of the moisture. A mulching of cocoa-nut fibre refuse or of grass from the mowing machine will also prove beneficial should we experience much hot weather. Pelargoniums where planted in masses or where very thin will cover the ground more evenly, and are also more effective when pegged down. Strong pegs may be cut from faggot wood or from the common-Bracken. We save all the winter thinnings of young growth from standard and large bush-trained Apple trees, and these are bent round the growths of plants to be trained, and the two ends thrust into the ground. Verbenas, Gazanias, Ivyleaf Pelargoniums, Alyssum, Iresines, and Heliotropes where disposed in the front rows, Gnaphalium, Phlox Drummondii, Petunias, and Cineraria maritima, should all be regulated and pegged down till they have covered their allotted spaces. Calceolarias if not planted uprightly can also be pegged down, but in every case everything depends upon the positions assigned to each. The bloom should be kept pinched off weakly plants of all

kinds, or they will make poor progress. Slugs where troublesome may be checked by nightly dustings of soot and slaked lime, or they may be trapped with Cabbage leaves. Wire netting only will keep off rabbits and hares, and this if unsightly may as a rule be taken up in the daytime.

Carpet Beds.—The Sedums and Pyrethrums in particular are growing rapidly and require frequent attention. The flowers are usually trimmed off the former, and it is kept in its place with the hand shears. If allowed to unduly extend, Sedums most injuriously affect the growth of any plants near. Pyrethrums, especially where employed for dividing purposes, should be kept closely pinched or plucked into shape, and on the first appearance of the flower stems these should be pinched hard back. When plucking only about half the leaves should be taken, the aim being to secure a fine line of yellow without the stalks being unsightly. Alternantheras ought to be pegged down, or if only too tall should be pinched back; Mesembryanthemums to be regulated and pegged down and have the seedpods pinched off. Cannell's Dwarf Ageratum is very effective and requires but little attention. Iresine Herbstii to be pegged down, and if growing too coarsely to have some of the roots severed on each side with an old knife. All blooms to be kept pinched off the Echeverias, as carpet beds are failures unless neat and regular. Mentha and other groundwork plants where too strong should be thinned out and well flattened with the hand. This pressing will also tend to establish and spread such plants where too thin.

Budding Roses.—When the young reserved growths on the Briars are sufficiently matured so as to admit of the bark opening or running freely, budding may safely be performed. If delayed later the bark may cling to the wood, especially if the weather be dry, and a difficulty may also be experienced in separating the buds from the Rose shoots. Those budded early frequently form strong growths the same season; but as a rule these do not equal those growths resulting from buds which have lain dormant till the spring. Much of our budding was performed late last season, and from the dormant buds we have secured exceptionally strong heads this season. In dry hot weather it is advisable to water the Briars a time or two prior to budding, and to shade the inserted buds with Cabbage leaves for about a week. Excellent directions, more especially with regard to budding dwarf stocks, are to be found on page 493 of the last volume of this Journal, and it only remains to be added that the buds in the case of tall Briars should be inserted in the young growths as near the main stem as possible, to which they then eventually become strongly united.

Selection of Roses for Present Budding.—The prize blooms we see at the shows are principally obtained from the first growth from the bud, or maidens. Those beginners who are ambitious to compete should be contented with a limited selection of varieties, budding annually a considerable number of Briars with each, the aim being to have a number to choose from. In any case it is a mistake to increase the stock of second-rate varieties, seeing how cheaply buds of superior varieties can be bought. No collection should fail to include Duke of Edinburgh, John Hopper, Mons. E. Y. Teas, Marie Baumann, Charles Lefebvre, Maurice Bernardin, A. K. Williams, Etienne Levet, Alfred Colomb, Dupuy Jamain, Hippolyte Jamain, Charles Darwin, Annie Laxton, Centifolia rosea, Capitaine Christy, Comtesse de Chabrilant, Duke of Connaught, Duke of Wellington, François Michelin, Général Jacqueminot, J. S. Mill, La France, Mabel Morrison, Madame Gabriel Luizet, Marquise de Castellane, Mrs. Baker, Prince Arthur, Sénateur Vaisse, and Sultan of Zanzibar.

THE BEE-KEEPER.

SUPERING.

(Continued from page 17.)

MANY beginners in bee-keeping fail to get their supers entered through not putting them on at the right moment. Either they are too precipitate or too tardy in applying them. If the super be put on too soon it often defeats the object in view, for it gives space into which the hot air from the hive can rise, and by lowering the temperature below causes the bees to cluster closer over the brood; and should showery weather approach, the likelihood is that the bees will either not mount into the super at all, or use it as a place to hang idle in, as heaps of brood hatch out and make every preparation to swarm at the first opportunity. Again, if the super be put on too late, the chances are that the bees have already started queen cells, and after clustering in the super for a few hours, or a day or two, they swarm, and give the novice bee-keeper much trouble in finding and excising royal cells and returning the swarm, should he determine on getting honey in preference to an increase of stock. The conditions under which a super may be put on, with the greatest number of chances in favour of getting it entered at once and successfully worked out, are, first, a plentiful flow of honey from natural sources; secondly, warm genial weather, which will generally accompany the former; thirdly, such a mass of bees in the hive as to cause evident want of extra room.

When bees crowd out on the floor-board or over the outside of the hive they are generally in a state to build comb. We

speaking of bees idling under such conditions, but we have often thought that they are in such a state that they cannot work, so far as to the in-gathering of honey, pollen, and water. The food they take, subjected to the high temperature of the hive, is rapidly converted into wax, and they are so overburdened with this secretion that they cannot fly far and wide. We noticed a few days ago that the large floor-board over which a huge cluster of bees had been hanging round a straw skep was covered with minute sparkling flakes of wax, which glittered like mica. We collected a quantity of these flakes, and also examined several bees from the heap, all of which had scales of wax exuding from the segments of the abdomen. These bees, according to our own ideas, could not work in the fields, whereas natural conditions were all in a ripe state for comb-building. Yet the cottager to whom the bees belonged was losing the valuable opportunity. They have neither built super combs nor swarmed, for during the last few days unsettled weather has drawn them into the hive again; the golden opportunity has passed (at least for the present), and their owner has neither surplus honey nor additional stock.

There are many ways of getting bees to enter supers when enticement is required to supplement natural conditions. A few pieces of fresh clean comb with a little honey in them will cause the bees to mount eagerly into the super; and, once there, they will be induced to commence operations instead of contenting themselves with carrying the honey down below. When putting on supers to bar-frame hives we extract as much honey as possible from the surroundings of the brood-nest. The bees at once set to work to repair the dilapidations, and by cleaning out the cells swallow much honey, which is rapidly converted into wax, and the foundation guides at once offer in the supers a suitable place on which to work and use up the newly-formed wax. When placing supers on skeps (all natural conditions as above mentioned being present) we have taken off the caps from as much stored honey as we could get at with a thin sharp knife, and this has had the same result as in the case of extracting from the frames in the modern hives.

When bees first enter supers and a sudden change in the weather brings wet and cold, unless supers are intended for exhibition, and therefore subject to rules as to the mode of filling, we have kept the bees at work on the combs by the application of a little syrup in a feeder placed over the super, giving access to the syrup only through three pin-holes. This has been employed in comb-building, and on more than one occasion tided us over two or three days, during which the bees would have certainly retired below. We have always found it difficult to get bees to re-enter a super having once deserted it. We would use a word of caution as to the syrup dodge of retaining bees in a super. The smallest quantity should be given at a time, or some might be stored, and the supply stopped at once when the return of warmth and sunshine renews the natural flow of honey. We have again sometimes drummed bees up from a skep into a super, and succeeded in retaining them there. Above all let two things be borne in mind—natural conditions, as stated above, must be present when the super is placed over the hive, and once the bees are in it, it must be kept as warm as possible. Glass, to our mind, should be avoided; bees show a decided disinclination to accept it, and its cold nature is in every way detrimental to comb-building.—P. H. P.

STRAW STEWARTON HIVE.

YOUR correspondent, "A Novice," does not quite understand the description given of the straw Stewarton hive, and seeks answers to the following questions:—

1. What is the width and depth of the rims? Hive-rim and super are all 15 inches wide inside. The rim is $1\frac{1}{2}$ inch deep, the straw sewed to the rim 12 inches, and the super $3\frac{3}{4}$ deep.

2. Are the rims grooved for the first roll of straw? No; they are bent and made like riddle rims, about three-eighths of an inch thick, pierced with holes an inch apart for cane-stitching. The bars are let into the rims just level with their tops, or, in other words, to the depth of the thickness of the bars, but quite across the edges to the outside of the bars.

3. Should the straw lid be flat on the bars or raised in the centre, so that the bees can walk over the bars? My lids are slightly rounded, though they were ordered to be made flat.

4. Are the bees sure to build on the bars? Twenty of these hives have been filled here with swarms, and in no one instance have we found the bars disregarded, or the combs built from the crown-lids, or any attempt made to cross the bars. In this respect all has gone well so far.

As the supers are of equal width with the rims and hives, and made to fit both top and bottom of the hive, it is easy to use a super for feeding purposes by slipping it in either above or below the hives. If used above a dish of syrup could be placed on the bars, and if used below the dish should be placed on the floor board. The Stewarton hives offer many facilities in bee-management, especially in supering. We like

them very much, but our carpenter declined to bar the hive and super at 6d. each, or rather undertake to do a second lot at that price.—A. PETTIGREW.

BRITISH BEE-KEEPERS' ASSOCIATION SHOW.

THE Show, which was held in the Duke of Wellington's Riding School from Thursday to Monday last inclusive, was the ninth Exhibition of bees and bee-keeping appliances which the central Association has conducted since 1874. The Committee is to be congratulated on the success which, since the first great meeting at the Crystal Palace, has attended their efforts to teach, through the length and breadth of the land, the more humane and more remunerative system of bee-keeping. The present season has been most favourable to bee keepers generally, and a beautiful display of honey, both in the comb and in glass jars, covered the tables in the building. The exhibits of hives and appliances was unusually good. We are pleased to see that hive-makers begin to recognise the fact that the more simple the construction of the hive, combined with facilities for easy manipulation, the more popular the hive will become. We will notice some of the leading features of the Show, beginning with the exhibits of honey, for the aim of all bee-keepers must be—whatever the hive used, whatever the appliances at their command—to make a harvest of surplus honey.

The specimens of honey in sections closely approached the standard of perfection, and the golden stores in other supers were most beautiful to look at. Our opinion, however, is that the time is past when prizes should be given for large glass supers. So long as the super is to serve as a mere ornament so long only is it of any utility. But the first plunge of the knife into its lovely contents can only render it a messy object. However, we suppose that many visitors like to see their crystal palaces of honey, and Mr. W. Woodley's bellglass, with its regularly worked combs and 48½ lbs. weight of well-coloured honey, well deserved to take first prize of the three allotted to the best glass super of honey. In Class 16, "for the best super of honey not being sectional supers," Mr. H. S. Heath's by far surpassed all other exhibits. He had judiciously used glass dividers, and more regularly built combs were never put on an exhibition table. These splendid slabs of comb were perfectly sealed throughout with the whitest of capping, and the cells filled with that peculiarly coloured nectar which tells of the proximity to the hives of an abundance of fruit blossom, particularly of the mellifluous Raspberry. This honey has rather a dark appearance in the mass, but no other kind can excel it in aromatic flavour. We believe that we are right in stating that this splendid super was filled by a swarm of the current year, and in fourteen days, the swarm weighing 10 lbs. As we have never yet had a swarm of such weight, nor known of any friend hiving the same, we should rather think that two swarms leaving their hives simultaneously had gone into partnership, and driven such a thriving business; but Mr. Heath may not have been aware of this fact if it did occur. The weight of this super was 35 lbs. In this same class, Nos. 90 and 88, to which were awarded second and third prizes respectively, were both good specimens of their kind.

Class 18 was for twenty-four sections of comb honey, each to hold 2 lbs. Mr. A. Rusbridge's group of twenty-four sections was all that could be desired as to regularity of building, finished sealing, and purity of taste and colour. A more beautiful display of sectional supers never competed for a prize, and the first prize was easily gained by them. They were also displayed to the very best advantage in a beautifully arranged show frame, and the combination was a picture of the highest finish to a bee-keeper's eyes. The palm was likewise borne off by the same competitor in Class 19 with twenty-four 1 lb. sections of equally superior finish. In this class the group of 1 lb. supers entered by the Cray Valley bee-farm proprietors, deservedly carried away the second prize; they were very neatly put up for the show table, and were an excellent example of what can be done by English bee-farmers. We need not fear American competition when such an article in such a taking form is placed before the public. No. 110 of this class, to which went the third prize, was a collection of supers sent by R. W. Davies, all well finished and taken off in the nick of time, thus preserving their snowy purity, yet having every cell well covered in. In Class 20, for a dozen 1 lb. sections, Mr. Rusbridge again carried all before him, followed by Miss Gayton with some nicely sealed combs neatly embellished with pink paper. Mr. W. Woodley obtained third prize.

Class 21 contained some chaste exhibits, and from the numerous entries the judgment of those who awarded the prizes must have been sorely tried to determine which was more deserving than its fellow. Mr. Rusbridge was, however, again in the van. Classes 22 to 25 were for run or extracted honey, and the competition was keen. The number of exhibits in these four classes were as many as forty, and again the Judges had hard work before them. The purity of the honey as to colour and quality has never been surpassed, and the employment of the extractor was shown by the exhibits to be rapidly increasing all over the country. We shall leave for another letter our remarks on these classes, also those which included hives and appliances.—P. H. P.

VAGARIES OF BEES.

ON Friday a swarm issued from a skep and I hived it. Very soon the swarm returned to the parent hive. On Saturday its swarm again issued and divided into two parts. I hived both separately. One part remained, the other went back to the parent hive. To-day the swarm again issued,

but did not settle at all, immediately returning to the parent hive. Can anyone tell me the cause and remedy? It has been supered ten days; super nearly filled. Last Tuesday week I hived a strong swarm in nine-bar hive. They are clustering very much at the entrance to-night, and also the last day or two clusters have been around the entrance. To-day I supered it. The stock hive had no comb foundation. It is not likely to throw a swarm, is it, so soon as this?—T. MAINOTT, *Sandback*.

ERRATUM.—In "Clifton's" article, on page 17 of this volume, for "bee-horse" read "bee house."

TO CORRESPONDENTS

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Grapes Scalded (*Inquirer*).—You can have no better reply that we are aware of than that given to "Tom Firth" on page 18 of our last issue. The large white Grape is Buckland Sweetwater, and the berries are very good.

Pelargoniums for Australia (*Novice*).—It is not likely that Pelargonium cuttings will keep good during a voyage to Australia. Why not strike them before sending, and let them go in the form of small plants with roots to them? Zonals would be likely to travel well.

Liquid Manure Water for Vines (*H. S.*).—Drainings from cow-houses, stables, &c., are much too strong for applying pure to vinery borders or anything else. As a rule we never use such stronger than one part of urine to six of water, and even weaker if the soil should be dry. It should be remembered that the active nitrogenous matter to which such manures owe their efficacy remains soluble after penetrating the soil, and is at once assimilable. This being the case strong doses prove destructive, and the maximum of good is best secured by supplying it abundantly but very weak. Plants really do not want large amounts of nitrogen or mineral salts, although they cannot thrive without them.

Pitcher Plants for a Cool House (*Idem*).—Presumably you refer to Sarracenias, all of which can be grown in such a house as you mention, where they are not too much exposed to the sun or to strong draughts of air. The pretty diminutive *Cephalotus follicularis* might also be grown under a bellglass, and if you wanted other curiosities, *Dionæa muscipula* (Venus's Flytrap), and several of the *Droseras* could be added. All these succeed in a compost of peat and sphagnum moss, the latter being planted so that it keeps fresh and continues growing on the surface of the soil. Supply water liberally, as any approach to dryness is most injurious to such plants, also shade them when the sun is powerful, as they are quickly injured in that way.

Grape Duchess of Buccleuch (*Idem*).—The berries are small, but not smaller than White Frontignan, while when well grown and the wood thoroughly matured the bunches are two or three times as large, and are profusely borne. Frequently it does not set well, but we fancy this is when lime is deficient in the border. In one case at least where it generally set badly a liberal application of lime was given, and ever since no Grape could set better. Probably the want of lime is often the cause of a bad set. See "Vines at Longleat."

Seedling Fuchsias (*J. Batchelor*).—We consider the varieties distinct and worthy of naming, as both of them will be useful and no doubt effective in either a large or small state. The white one, a seedling from Lord Beaconsfield, resembles that variety in character and in the colour of the corolla, but the long tube and sepals are white, and in this respect an improvement on the parent. The dark one, a seedling from Avalanche, resembles the parent in the leaves only, the flowers being single, with large barrel-shaped purple corolla and very long and broad coral-red sepals. This variety appears very floriferous. Although these seedlings are commendable we are not prepared to say they possess very great commercial value, still they are at least as good as many others that are sent out at more or less high prices.

Roses Unhealthy (*E. C. O.*).—There is no "blight" on the Rose leaves sent. The condition of the foliage is the result of poverty of soil, or, in other words, the trees are being starved to death, and, in fact, dying by degrees, and not very slow degrees either if you have sent us a fair sample. At once saturate the ground with liquid manure; diluted drainings from manure heaps, guano water, soot water, or even soap-suds will benefit

them; but a mere sprinkling is of no use, the ground must be almost flooded. In the winter remove the surface soil, and place a thick covering of rich manure over the roots, leaving it there to decay.

Large Parks (A. Z., Harlow, Essex).—We are not prepared to say "which is the largest park in England, public or private," but certainly not the one you name, which is small in comparison with many others, being only about 300 acres. If any of our readers can answer your question they are quite at liberty to do so through our columns.

Camellias Unhealthy (J. E.).—The root-action of your plants is undoubtedly defective, and cannot supply the foliage with moisture so rapidly as it escapes from the leaves. No doubt the roots were injured the first year you grew the plants by the change of treatment to which they were subjected. It is very difficult indeed to reinvigorate Camellias in the state yours are, and we know of no better means of doing so than as detailed in our issue of June 21st, page 508; you had better also read an article in the Journal of March 15th, both of the present year. Unhealthy plants need more shade than those do that are growing satisfactorily.

Tomatoes Unhealthy (A. S., Monmouth).—Although Tomatoes in pots need much support, it is easy to err in giving too much liquid manure and giving it too strong. Some time ago a gentleman had plants affected similar to yours and he feared he would have to destroy them; perhaps some of them did succumb to the effects of high living—unassimilated foods—but all of them did not do, for on limiting the supplies of liquid manure he had clean healthy growth, and sent us some of the finest fruit we have seen this year. We have very little doubt you have erred in the manner indicated, and you cannot do better than adopt the course suggested, and your plants that are yet unaffected will probably remain healthy and bear satisfactorily.

Bad Soil (J. R. H.).—The symptoms you describe are indicative of the presence of an excess of iron in the soil; but whether this is so or not, or what particular injurious ingredient it may contain, can only be determined by analysis. Since, however, you have found out that the soil is bad, and also where you can procure a supply that is good, you have only to avoid the one for the other to attain your object of growing plants or crops satisfactorily. You can have the soil analysed if you wish by paying the usual fee to an agricultural chemist.

Perennials for Rockery (Willesden).—There are great numbers of plants suitable for the purpose you name, but the majority would be much better purchased as established plants from any nurseryman who makes a speciality of such classes. The following may be named as especially good:—*Androsace sarmentosa*, *Anemone alpina* and var. *sulphurea*, *Anemone stellata fulgens*, *Antennaria tomentosa*, *Arnebia echioides*, *Campanula glomerata dahurica*, *C. pulla*, *C. turbinata*, *Centaurea montana*, *Delphinium nudicaule*, *Dodecatheon meadia*, *Gentiana acaulis*, *gelida*, and *verna*, *Iberis corifolia*, *Lithospermum prostratum*, *Eriogonum macrocarpa*, *Æ. taraxacifolia*, *Onosma taurica*, *Opuntia Rafinesquiniana*, *Polygonum alpinum*, *Primula rosea*, *Ramondia pyrenaica*, *Saxifraga longifolia*, *S. Wallacei*, *Sempervivum arachnoideum*, *Veronica gentianoides*, and *Vinca minor*.

Heaviest Bunch of Grapes (W. R. A.).—We have previously answered a similar question to yours, which is here reproduced. The heaviest bunch of Grapes we have seen, and so far as we know that has been officially recorded, was a bunch of the Calabrian Raisin, weighing 26 lbs. 4 ozs., grown by Mr. Curror, gardener to J. Douglas, Esq., Eskbank, Dalkeith, and exhibited in Edinburgh on September 15th, 1875. A bunch of Syrian grown by Mr. Dickson, gardener to J. Jardine, Esq., Arkleton, Langholm, weighed at the same show 25 lbs. 15 ozs. This appeared to be the larger bunch of the two, the berries having been more thinned than the former. Mr. Dickson has stated that the bunch when cut weighed 26 lbs. 8 ozs., so that either it must have lost weight before it reached the show or there was a difference in the scales employed in the two instances. This bunch is figured and Mr. Dickson's mode of culture described on page 297, No. 757, vol. xxix. of the Journal. Mr. Roberts, The Gardens, Charleville Forest, Tullamore, has grown a bunch of Gros Guillaume weighing 23 lbs. 5 ozs.

Propagating Eucharis (W. A.).—This is a very free-growing bulbous-rooted stove plant, and it increases at a very rapid rate. It is propagated by dividing the bulbs when they have increased too much for the size of the pot in which they are growing. Pot in turfy loam, a little leaf soil, and decayed manure, with sand added if the loam is of a clayey nature. The plants require considerable supplies of water when they are growing freely, and after blooming less water is required for about two months, when they may be started to grow again, and they will flower as freely as they did before their season of rest. The temperature best adapted to their wants is a minimum of 55° in winter and 65° during the summer months.

Tomato Disease (G. D., Southport).—Your plants are attacked by the fungus which causes the Potato disease, named *Peronospora infestans*, and for which there is no certain cure. Mr. Iggulden gives the following remarks upon the subject in his work on Tomatoes. "I have long been under the impression, and which was, and still is, shared by others, that the disease solely results from excessive moisture at the roots, with a corresponding absence of solar heat. The experience of this season, however, has taught me that the plants may be really dry at the roots and yet rapidly succumb to the disease. This was the case with a number of Tomatoes of sorts planted in a roughly constructed and uncovered pit, in soil in which Cauliflowers were previously grown. During August the Tomatoes were frequently watered, that last used at the end of the month being taken out of a large soft-water tank. This was in the evening, and, as it happened, was applied through a coarse rose, the tops of the plants being thoroughly wetted, without, as I found on examining the next day, soaking the bed. Before the next evening nearly the whole of the foliage was blackened, and in a short time much of the fruit remaining was as bad. On pulling up some of the plants the soil was found to be dust-dry. On two sides and within less than two yards were growing more plants, yet none of these were affected by disease, and remained almost free of it to the last. This seems to point to the necessity of keeping the foliage dry; and, for the future, if I can prevent it, those Tomatoes grown in frames or otherwise, where likely to be affected, will never be watered or syringed overhead when the crops are being matured." Some other particulars upon the same matter have also been published in this Journal.

Budding Manetti Stocks (X).—The stocks being in rows earthed up like Potatoes, take a hoe or spud and remove the earth from the stock, so as to insert the bud as low as possible. When this is done proceed to cut the bud just the same as you do for the Briars, and make an incision as low down as you possibly can; the lower down the better, as the fewer will be the suckers—indeed, you should almost bud on the roots, if possible. At any rate, strive to insert the buds as low as you can. Only insert one bud in each stock. Choose the same side of the stock all down the line, and also select a place as free from knobs or irregularities as you can find. Make the incision in the form of a T, and when the bud is safely in tie up well beyond each end of the bud with rough cotton or worsted. Ladies often use wool, and nurserymen bass or raffia or cotton. You must not replace the earth, but leave the bud showing, or rather the cotton, so that in the course of a week you can see whether the bud has taken or not. If it has not, bud the other side of the stock. Do not touch the Manetti shoots, but leave them to grow as luxuriantly as they will till the following spring; then remove the cotton and cut back the Manetti to the bud. The best time for budding the Manetti is after rain, and if you have no rain give the stocks a copious watering, and you will find the bark run. August is the best time for budding Manettis. All the kinds you have named do well on the Manetti; in fact, all Hybrid Perpetuals except *La France*, which, having some Tea blood, never does so well on this stock as on the Briar.

Names of Plants (J. W. A.).—1, *Inula glandulosa*; 2, *Chlorophytum orchidastrum*; 3, *Scrophularia aquatica variegata*; 4, *Veronica rupestris*; 5, *Sidalcea rosea*; 6, *Lychnis viscaria*. (*G. P., Hants*).—1, *Solanum jasminoides*; 2, *Torenia Fournieri*. (*Hortus*).—1, *Agrostemma coronaria*; 2 and 4, Too withered; 3, *Erigeron philadelphicum*; 5, *Alcea malvæflora*; 6, *Phytolacca decandra*. (*No Name*).—1, *Spiræa Aruncus*; 2, *Rhododendron hirsutum*; 3, Insufficient without flowers; 4, *Tradescantia virginica*. (*E. B. B.*)—The cut-leaved form is a variety of *Tilia europæa* named *laciniata*, and the broad-leaved form is simply a reversion to the ordinary type.

COVENT GARDEN MARKET.—JULY 11TH.

FRUIT still arrives in large quantities, and prices are low.

THE SUSSEX BREED OF CATTLE.

(Continued from page 20.)

AFTER a time the remarkable improvement in the Sussex cattle began to bear fruit in the best possible manner, for it was shown by the proposal to establish a Public Herd Book for Sussex cattle, the accomplishment of which dates from the year 1855. But for some years after its commencement various breeders although eminent in their calling, and possessing some of the choicest strains of the blood—like some of the Shorthorn and Hereford breeders in the early days of the Shorthorn and Hereford Herd Books respectively—could not appreciate the proper use and value of such important record, and failed to perceive that the publication of them promotes an extended interest in the several breeds. Even the Messrs. Stanford, we are informed, were at first among the lukewarm lookers-on, although they possessed and prided themselves upon the anti-

quity and purity of their herd; but eventually, as the results of their careful and judicious breeding and selection became more and better appreciated by breeders generally, and their great opportunities enabled them to furnish full particulars of pedigree, they decided to go with the stream, and for the past thirteen years their contributions to the Herd Book have been most marked and valuable, not only to themselves as breeders, but to all those who desired to possess the choicest animals of the Sussex stock, and whose history and pure breeding could be traced for the longest period in the traditions of the breed. We, however, cannot forget the Messrs. Heasman by their steady and persistent work in the establishment of the Sussex Herd Book, for which much credit is due to them, and also in consequence of their endeavours to improve the Sussex cattle separate prizes were given first at the Leeds meeting. Previously they had been classed with "other established breeds;" but at the Canterbury Show in 1860, where Messrs. Heasman took the first Royal prizes, it was seen that this breed was worthy of distinct classification, and since the Bedford meeting in 1874 it has always been granted.

This breed is found good for crossing with other breeds, generally improving them, especially when the Sussex male animal is used, as they are celebrated for imparting substance, compactness of form, and firmness of flesh; and through the influence of the male, as usual, the colour of the offspring is generally red, and of a very deep or dark shade. The Sussex stock are of themselves a very hardy race, and are noted for surpassing all other cattle in well doing on the poorest pastures of their native county. Their form has been levelled up to fair and comely proportion, so that the uninitiated observer may take them for Devons; and we do the latter no injustice by giving it as our opinion that they may be used for improving them, for the show Devons at present may be considered, when compared with other breeds, like the South Downs in the sheep classes are estimated by tenant farmers in general—as fancy stock, but which by crossing may be improved as rent-paying animals.

The Sussex cows are not, as a rule, good milkers, although producing sufficient to rear and fatten their own calves, but the worst milkers are often those with the heaviest calves. The most profitable way of breeding this stock is probably for them to calve in October and November, letting them suckle their own calves through the winter months, wean them in the spring, put another calf to the cow, and rear them for veal or stock as may be required. When managed on this plan each cow rears two calves, and the number of barren cows will, therefore, be greatly diminished, which is one of the greatest evils attending the fact of cows dropping their calves all the year round. It is, however, specially important in connection with the management of a herd of Sussex cattle, or any other breed prone to lay on fat internally and yield but little milk, which is quite peculiar to the Sussex stock. Some attempts have been made to use Sussex cattle for the dairy, but it has failed in their own native districts, and if dairying is attempted persons should use Shorthorn cows; and if good early beef-making steer calves are required use the Sussex bull, and these cross-bred stock will probably excel all others in raising baby beef.

In various other respects there is hope of further improvement in the Sussex cattle, for the attempt to raise them from good working animals on the land and make good butchers' bullocks afterwards, does not date back much more than twenty years. This circumstance leads us to expect that there are still latent capacities in the breed which will enable their advocates to raise them yet higher in the scale of excellence. Again, when we look to the fact that our other principal breeds are now past improvement—that is to say, the value and importance of the Shorthorns, the Herefords, the Scotch polled, and the Devons have not for a considerable period made any improvement as regards the leading herds of the kingdom. Indeed, it is a question if it be not possible to produce better animals, as a rule, than those which have graced the leading cattle shows during the past twenty years. Having been close observers we cannot see any improvement or advance in any direction except in numbers during that period, and we name one animal as an illustration of our meaning; for since the notorious bull Alaster Butterfly, bred by Colonel Townely, was exhibited at the Royal Agricultural Society's meeting at Chelmsford, if we recollect rightly, we have seen no such animal of the Shorthorned type, nor do we ever expect to see it matched in the future. In the other breeds we have named animals equally illustrative of our opinions may be selected. We, therefore, believe that the Sussex stock may be assumed as having in store for us in the future rare specimens, which

shall add further merit and importance to this already valuable breed.

We will notice for the information and guidance of intending breeders some of the most noted strains of blood introduced since the commencement of the Sussex Herd Book, taking first stock of the late Mr. Wm. Botting, at Westmeston Place, Hurstpierpoint, and Mr. Dennett's, of Woodmancote. We must also refer to the Messrs. Stanford's famous prize bull Dorchester (325), calved in 1871, by Volunteer (a home-bred bull of their father's old sort, of dark colour and iron constitution), introduced through his dam May Fern (1189). The strain of Mr. W. Martin of Ewhurst, in conjunction with that of Mr. Wm. Botting. Dorchester has an almost interminable prize list appended to his entry in the Herd Book. Besides several class prizes at the leading shows, including the "Royal," the Southern Counties, (Bath and West of England), and the Tunbridge Wells shows, he won the cup at the latter three years in succession; Messrs. Stanford's entries (a different animal each year from their splendid agricultural stud) winning also, three years in succession, the champion cup. These successes of Messrs. Stanford in the exhibition of their own bred animals should be remembered by all future breeders of cattle, and one of the great examples of the advantages of rearing cattle possessing an ancient pedigree which have by careful and judicious selection obtained for them a reputation which can be obtained in no other way or by any other means. Another noted bull, Tunbridge (374) by Dorchester, was bred at Eaton's in 1875, and in the following year Paris (357), who took some English prizes (including "Royal" honours), and the second prize and silver medal at the French International Show in 1878. In this bull the blood of Bedford is combined with that of Dorchester. Southampton (408), an own brother of Paris, won extensively at the leading shows 1878-9-80, and in 1881. Goldsmith (391) not previously exhibited, is the show bull of the herd; at Derby he took the first honours of the Royal A. S. E. He was bred by the late Mr. Geo. Smith, of Paddockhurst, and is the son of Young Hartley (444), the "Royal" prize bull at Kilburn, and second in the champion bull competition, but used afterwards by Mr. Alfred Agate. The dam of Goldsmith (391)—Young Golding by Lion—brings in a strain of blood which a veteran authority, who well remembers the cattle, describes as one of "the best that ever was in Sussex." The Sussex bulls, however, are not usually handsome. The oxen are grand and the cows stately; but the bulls, as a rule, look common or plain. But Messrs. Stanford's "Goldsmith" is an exception. His sirloin and steaks might make Devon breeders jealous, for as he appeared at the Reading meeting of the Royal, where he took first as a five-year-old bull, he was as good-looking as one could wish to see. Although he is this season one year older, we were present at the opening day of the Royal Counties Association's meeting at Winchester on the 26th June last, where "Goldsmith" was exhibited in all his grand outline, which we surveyed in detail as he appeared side by side with other magnificent animals during the time of the Judges' decision as they paraded in the cattle ring. And the judgment passed upon him was, that he not only obtained the first prize in the Sussex classes, but also the champion prize as the best bull of the show, in contest with the Shorthorns and the Devons then and there exhibited. This victory must have been highly satisfactory to the Messrs. Stanford, who certainly possess the stock which will enable them to maintain one of the foremost positions among the Sussex cattle breeders we may expect for years in the future. We have yet to notice the Sussex cattle belonging to other eminent breeders.

(To be continued).

WORK ON THE HOME FARM.

Horse Labour.—Horses are still employed in preparing the land for common Turnips, as the fallows in many cases were very foul with couch, in some instances owing to the land having been farmed on the four-course rotation of Wheat, roots, Lent Corn, and Clover. Now, as the Wheat in this rotation is sown out of lea, during the seasons for the past few years which have been unusually rainy and adverse to cleaning the land, it has been almost impossible to insure a clean fallow. Thus, especially in the hands of some tenants who neglect the various opportunities for forking out the couch, and attempt by horse labour alone to clean the land, they have been unsuccessful, for tillage by horse labour can only be accomplished with success in fine dry seasons. It is to this circumstance we wish to call the attention of the home farmer and others, but especially those who frequently say there is not couch enough to injure the next crop, and allow it to increase in the land, and then resort to the expensive process of a fallow carried out by costly horse labour. As compared with hand labour this is not economy in farming, for it must be remembered that forking out couch when there is but little is the cheapest method of keeping the land

clean, besides which it can be done at any time, in any weather except in frost, and when the corn is near harvest. Forking out we have always found not only the cheapest way of keeping the land clean, but also the most effective, for, in fact, it bids defiance to the weather, and enables the farmer to crop his land closer under the most profitable rotation. The attempt to clean land by horse labour before seeding for a crop is frequently abortive, not only in the object of cleaning the land, but is the forerunner of late seeding and failing crops; and in such seasons as we have had for some years past the attempt to carry out any system by horse labour alone has left a number of farms throughout the kingdom in a most deplorable and foul state.

Hand Labour is now of extreme importance, for hoeing and singling the roots must be done, ricks must be thatched, the straw drawn and piled in readiness, hedges must be trimmed, and border grass and weeds cut to prevent seeding, and to maintain the fences—especially of White-thorn—not only within bounds, but effective against live stock. The late cold meadows of certain districts will for some time yet require the hay to be made from them, which will employ all the hands which can be obtained; but in certain outlying and thinly populated districts the hand labour must be supplemented by machinery, such as the mowing machine, the tedding machine, and by no means forgetting the elevator, both in haying and harvest, which does by the use of the odd horse what was formerly the severest manual labour on the farm—pitching from the carts or waggons on to the stack.

Live Stock.—In some districts the dairy cows are almost frantic, being teased by the flies; in which case we like the animals to be taken to the stalls, receiving some green fodder in the racks, for in hot sunny weather the animals do not feed from about ten o'clock A.M. until four o'clock P.M., and will endeavour to obtain shelter under trees, where they are very uncomfortable and with nothing to eat, and also leave their droppings where it is entirely lost. Let the home farmer consider these points, and he will find it great economy in various ways, but especially in the gain of milk obtained from the cows. The time for the purchase of both ewes and lambs for stock is now arrived, and various fairs are being held in the different counties where the Down varieties and long-woolled breeds are sold. As the prospect for roots is good, stock will be dear, and not likely to pay for wintering on the arable vale farms, even if they get cake and hay in addition to the roots. But, we ask, why should a custom which yields no profit be followed in this blind way merely because it is customary, when green crops ploughed in will yield more profit, giving full crops at little cost? for it should be remembered that the only reason which can be given by the advocates of feeding roots on the land is that it enables the land to bear crops of corn. Granted; but the capital employed to carry out the system is great, and the cost of labour also connected with stock, to say nothing of risks and losses by disease, as well as the impediments at seed time, &c., arising from necessities attending the management of sheep.

A CHAT ABOUT MANURES.

If you think it worth while to allow the space I will try and estimate very roughly the relative positions of farmers and gardeners with respect to the all-important question of manures. Although it is desirable and necessary for farmers in most cases to use artificial manures more or less, particularly where cereal crops are intended to follow each other, such use should only be supplemental to the grand foundation of considerable applications of home-made manure from well-fed animals. Of the reasons why this is so we have, perhaps, a good deal to learn, notwithstanding M. Ville and other authorities to the contrary. One reason, I suppose, is that it supplies such a necessary and healthy strength in reserve owing to its so gradual absorption by the soil, and the way it enables the surface soil to retain moisture, so that we may apply the same manurial ingredients in almost any quantity in other forms to certain crops of the farm and the outdoor garden without obtaining such satisfactory results. A singular and suggestive example of this may be seen in the garden of Sir J. B. Lawes at Rothamsted, to whom, by the way, all who are in any way interested in agriculture owe a debt of gratitude, which I fear has not yet been adequately appreciated. On the lawn adjoining the mansion is a little and carefully guarded plot of common red Clover, luxuriant in growth and full in plant, yielding more than one cut per year, and it has so remained with no other attention than occasional partial resowings for, I think, thirty years or more. On adjoining soils of similar formation, although every possible treatment has been tried, red Clover will not grow for more than two years in succession in accordance with ordinary experience. The solution of the riddle is found in an old garden soil continually fertilised—perhaps for 300 years—with natural manure very largely in excess of the actual requirements of the growing crops. Well, then, the all-important foundation being laid and kept up, nothing is wanting but the artificial supplement. For the farmer, as compared with the gardener under glass, this is, as it seems to me, a comparatively simple matter, though of course one which even he can only satisfactorily cope with by much thought and care and experimental experience. At first sight it is delightfully simple, as he only requires three manurial ingredients in his artificial manures—namely, nitro-fen, phosphates, and lime, rarely more than the two former. Potash, important factor as it is (good soils differing from bad in nothing so much, perhaps, as in the presence or absence of potash), I do not mention amongst the necessary supplementals, because sufficient dressings of home-made manure will supply it in abundance. It is true that I have had remarkable results from its application in a specially soluble, and, I believe, rather unusual form

in exceptional cases, therefore I had had time to replenish exhausted soil in other ways. In such cases, and I am afraid there are some to be found, potash salts of the proper kind would, I feel sure, produce striking results, and I believe they are tried far too seldom.

The soil has a very strong power to retain potash near the surface when once applied in any form, so that one application will very perceptibly benefit two or more crops, hence the certain storage of this ingredient in sufficient quantities from liberal dressings of the manure from well-fed animals. Nitrate of soda, on the contrary, is here to-day and in the sub-soil to-morrow, and all dressings beyond the requirements of the present crop is at least wasted if it is so fortunate as to avoid absolute injury. In the first place, then, the farmer has only to buy his few ingredients separately or otherwise as cheaply, as pure, and as soluble as possible. So far there is no difficulty when the purchase is approached with a small but adequate knowledge of chemical properties, and the mind free from bias in favour of particular dealers and their ordinary or extraordinary compound formulas. Until both farmers and gardeners know much more of what they require, and exactly how they require it, in artificial manures, than the ordinary manure dealer can prescribe for them, they will be a long time obtaining the best results. Yet how often is the contrary principle acted upon. But I am trespassing too much on your space to say more on the purchase of manures, even if this were the place to say it, though there is much to be said. In short then, the farmer, given his few pure soluble chemical ingredients, has only to apply them economically, and that is, as I have said, a question only of comparatively simple experiment.

If I mistake not, however,—though here I am stepping into a much less familiar sphere—the gardener under glass must approach this subject in a much more guarded fashion. The intrinsic value per ton to him, greater or less bulk, are things of minor importance, except as guides for purchase. True, he also only wants the three ingredients named, with the addition of a fourth in potash, but that is only the veriest alphabet of his required knowledge. How he wants his ingredients is the difficult point for him to determine, rather than what he wants, and in the answer to this I cannot think that gardeners have more to learn even than farmers, because their lesson is so much more complicated, although, I believe, the extraordinary success many of them have achieved by patient intelligent attention to details in plant culture is a great lesson for farmers.

A discussion arose in this Journal some weeks since, in which the merits of night soil were discussed as a manure for Grapes. One of the correspondents endeavoured to prove an error in its use from the fact of its low intrinsic value—probably 30s. to 40s. per ton; whereas, if I am right in my premises, the mere intrinsic value, so long as the manure contained any fertilising properties, was no argument at all to the point. Manure in a form too concentrated and too soluble is, I imagine, for a gardener under glass, a thing of much danger and doubtful merit. It seems to me, then, that he has to determine first what he wants, secondly how much of it, and thirdly in what form, besides, perhaps, when to apply it, to produce the very best and safest results. On all these points theory to him, unfortunately, is of very little service, and practice everything; so that in the elucidation of these problems by patient experiment only he has indeed abundant scope for all his energies. How many gardeners, as well as farmers, use artificial manures of the composition of which they are ignorant? Whereas, surely the initial step for intelligent experimental comparison of each with the other, or either with other manures, is to know before the application of them, approximately at any rate, the composition of every manure with which experiments are made.

Your correspondent "Inspector" surprised me on page 533, last volume, by the prominent mention of my name, and he also appears to have been mistaken in thinking I expect a crop of seven quarters of Barley per acre. Although I hope I am of a somewhat modest temperament, that would not be a modest estimate for light land in an eccentric climate.—F. J. COOKE, *Flitcham Abbey, Lynn*.

STRAWBERRY CULTURE FOR AMATEURS.

THE Strawberry season of 1883 will long be remembered. I have never seen anything like the crops obtained in all directions, and the old men who have been employed in these gardens for thirty years assert they have not before seen such large quantities of fruit. The individual fruits, too, have been exceptionally fine, and the quality all that could have been wished for. All this is very encouraging to everybody, and those who have been most successful will continue their practice, while those who have partially succeeded will be stimulated to further exertions. Several amateurs especially, who will not object to be included in the latter category, were much impressed with the sight of our rows of fruit, and seemed to think it is impossible for them to be equally as successful. "Why not?" I asked. "Well, in the first place we could not afford so much space," is the answer. No other reason was forthcoming, nor could there be. My advice to all who have replied to me or may mentally reply to my written remarks is simply this—if they cannot give up more ground to the plants, then grow fewer plants. It is not a crop of leaves we should grow, but as many well-ripened fruits as can be secured, and this is best attained by allowing plenty of room to every plant. The foliage should be short and erect, and the fruit laying out in a circle all round the plant. Where the fruit is hidden with leaves it is proof positive of wasted vigour.

The mere fact of allowing the plants plenty of room, however, will not insure heavy crops of fruit. For instance, the ground may be too rich or too loose, the plants may be too old, the varieties not suitable to the soil, or the position may be too shaded. Amateurs need not be frightened into having the ground deeply trenched and freely manured for Strawberries, this expensive commencement from various causes seldom being attempted now-a-days. Autumn trenching—that is to say, just prior to planting—is a mistake, as in this case the ground is certain to be too loose. If trenching is resorted to let it be during the winter previous to planting in the autumn, the ground will then produce an extra good crop of early Potatoes, which may be cleared off, say, early in July. The ground being forked over as the Potatoes are lifted, all that is necessary is to clear off rubbish, level, make firm, and plant Strawberries. Our ground is not trenched for Strawberries or preceding crop, but they generally follow early Potatoes, and for these in this case solid manure is freely dug in, which is sufficient also for the Strawberries.

Our garden is situated near the bottom of a steep hill, and the upper part is utilised for early crops, the middle for successional, and the lower part for the latest crops. On the early ground the Strawberries invariably follow Potatoes, and between them are sown Tripoli Onions to stand the winter. The successional crops have hitherto followed Potatoes; but this season will be planted between spring-sown Onions, these being disposed in rows 10 inches asunder, and every third row is drawn early and followed by Strawberries. Those occupying the low heavy ground share the

site with late Lettuce, Turnips, and Spinach. Few amateurs are in a position to imitate this practice, but the digression may be of some service to a few young gardeners, and may also establish the fact that if we plant at apparently wide distances apart we may yet otherwise profitably employ the ground for the first season.

In some few instances old plants may still be remunerative; but as a rule three, or at the most four, crops only should be taken from one batch of plants. By planting well-rooted runners not later than the first week in August these will produce the earliest and finest fruit the first season. During the second season the most valuable crops ought to be had, while during the third and perhaps fourth seasons the heaviest crops, though of smaller fruits, are generally secured. Directly the last crop is gathered the plants should be cut off with a spade, and these and other rubbish be burnt, the mulching, however, being undisturbed. Between the old rows of Strawberries, and without digging the ground, strong plants of late Broccolis should be either planted with a trowel or crowbar according to the state of the ground, and these will grow to a good size and be much more hardy than any that have grown more luxuriantly on looser ground.

At one time we thought it necessary to layer the runners into 3-inch pots, planting out soon after separating them from the old plants. Now, we prefer to carefully lift with a trowel the strongest runners that have rooted into the mulching and soil, and find these are soonest established, especially in a dry season. If plants that have been root-bound in pots once become dry in the ground they are not easily moistened again, and consequently experience a check from which they do not quickly recover; whereas those lifted with a rough ball of soil about the roots and planted firmly seldom need but one watering, and soon become established. The plants are in rows 30 inches apart and 18 inches asunder in the rows; but if we did not crop between double the number of plants would go in each row, every alternate one being cut out after perfecting one crop. As before stated, the ground must be firm, and on good ground receive manure only as mulching, with rough fresh manure either late in the autumn or early in the spring. From the time the plants are put out till cleared off the ground is never dug nor deeply stirred, the object being to preserve the fibrous surface roots, which are so conducive to fruitfulness rather than leafage. Every season it is advisable to destroy a certain number of old beds and to plant as many fresh ones, and in this manner secure regularity in the supply. If open spaces cannot be devoted to them the next best place is on the borders in one or more lines near the paths, but they ought not to be heavily shaded.

In some districts where the Strawberries are liable to be killed by frosts late autumn mulching is advisable, especially in the case of such delicate varieties as Sir C. Napier and with us La Grosse Sucrée. In our case early mulching does not prove particularly serviceable, but frequently practise it, because it best suits our arrangements. The material we use is obtained from the farmyard, and consequently requires to be surfaced towards fruiting time with cleaner material, than which nothing is better than long grass cut from out-of-the-way banks and slightly hayed. Where the plants are mulched with fresh stable manure this is generally washed sufficiently clean. During dry seasons grass from the mowing machines may be employed for mulching or rather covering the manure, which Strawberries in full bearing especially require to be top-dressed or mulched with. Directly after the crops are secured, and sufficient runners are taken off, the plants to be preserved should have all remaining runners and old outer leaves trimmed off, and these with the weeds and roughest of the mulching burnt. To clean rake off the mulching, however, is a mistake, as this if left on materially benefits the surface roots. Many growers dig in a quantity of manure through the centre of the spaces between the rows. This may answer very well in

some cases, but is ruinous in others, simply because it encourages gross deep-running roots.

Amateurs, professional gardeners, or market growers ought not to cultivate many varieties. Their aim should be to discover which sorts are to their taste, and which also succeed in their particular garden. Black Prince is very early and prolific, but much too small to please most people. Vicomtesse Hericart du Thury on strong soils, as in our case, forms too much foliage, and though heavy cropping is comparatively late and small. On light soils it is profitable. The old Keen's Seedling is yet one of the best, and the flavour is very distinct and good. Sir Harry with us is a much heavier cropper, very early, bright and richly coloured, but rather sour. Sir Joseph Paxton grows luxuriantly, though not to such an extent as to militate against the production of very heavy crops of handsome firm fruits. President is in every respect an excellent main-crop variety, and where the delicate Sir C. Napier can be grown it is invaluable. La Grosse Sucrée is much liked by some as a second early variety, but we do not want it. For the later crops Dr. Hogg is unequalled, and probably has found more admirers during 1883 than ever before. It is sturdy in habit, wonderfully prolific, and the quality of the extra large fruit is superior to any with the exception of British Queen. The latter is very fickle, and is now but little grown. Eleanor or Oxonian is late and heavy-cropping, but the quality is seldom first-class. In another paper I may discuss which are the best varieties for pots, also the best travellers, and offer a few other seasonable notes upon Strawberry culture.—W. IGGULDEN.

FEATURES OF A PLAIN GARDEN.

AMONG readers of the Journal owners of plain gardens are undoubtedly numerous, so numerous as to merit the giving of especial attention to their peculiar wants, which are apt to be overlooked by those of us in enjoyment of the convenience of a well-appointed garden. To cater for their wants one must certainly run some risk of being accused by professional gardeners, of "writing about things everybody understands." Let me, therefore, bespeak the forbearance of my brother blue-aprons in this matter, or rather let me claim their assistance in so good a cause, by asking them to read what I shall now write, to note any omission which it is in their power to make good, and to do so quickly in the pages of the Journal, which are always open to every useful hint for gardens great and small.

"Plain gardens" is a suggestive as well as an elastic term, bound by no rules or recognised law, and which may be, and doubtless is, applied frequently as individual taste or fancy may prompt. But here it is intended to denote a small garden having a lawn, shrub groups, trees, a carriage drive, and paths with such adjuncts as may be added without requiring the subsequent supervision of a thorough gardener—precisely such a garden as is frequently to be met with at a country rectory, managed perchance by the church clerk, whose training "came by Nature," but who nevertheless is generally a painstaking trustworthy individual, taking much pride in his charge, which is a picture of neatness, and keeping his master's table well supplied with all such fruits and vegetables as come in the way of a plain man. Many such a garden have I seen, and many a lesson have they taught me. Did not "Old Wickings," gardener, coachman, and excellent manager of the rectory glebe, always astonish the natives at the little village show with such gigantic heads of Celery as seldom come within the ken of ordinary mortals? And shall I ever forget the chuckle of delight with which, as a special act of favour, I was shown a concealed gutter along which sewage trickled constantly to the roots of the special row of Celery? The worthy old fellow has long gone to his rest, but the finest garden of the land boasts of no Roses finer than those which used to hang in such rich profusion upon his huge Cloth of Gold, or can show better Grapes than were to be found every summer upon the one Vine in his solitary glass house. Nor will better crops of Apricots ever be had than those upon the old tree, which he used to boast grew nothing but wood till he root-pruned it and rammed a mass of hard stones beneath the soil in which it grew.

I recently saw one of these gardens surrounding the house hard by the village church, and with a public road passing its boundaries. A short drive led from the entrance gate to the door, in two curves like an elongated S, by means of which and

some judicious grouping of shrubs the house was hid to view from the road. A lofty Ash heavily clothed with its beautiful foliage overhung the gate; and near the house a fine Beech, the pride and glory of the garden, stood out upon the lawn, so as to show the full beauty of its graceful proportions, its lower branches sweeping the turf and its upper ones towering aloft above the housetop. A few other deciduous trees interspersed with Conifers, all bearing unmistakable evidence of careful selection and great care, were not untastefully dispersed about the garden. Circular flower beds of a size admirably in keeping with the position assigned them were arranged in parallel rows alongside a central walk; a more ambitious group of beds of a geometrical design filled a sunken panel, and another sunken panel was devoted to lawn games. Advantage had been taken of a raised bank, made to shut out some outbuildings, to make a fernery, the face of the bank being covered with pieces of rock with plenty of pockets among them for the Ferns. Parallel to this bank, but far enough from it to afford space for a path, another lower bank gave considerable scope for tasteful treatment; and this had been well turned to account by making many nooks and corners, all of which had become the home of one or more Ferns, of which a numerous collection had been gradually accumulated and named with much care. On the lawn side the inner bank followed no formal line, but advanced boldly into promontories at various points in graceful flowing curves, all much shaded by trees, but all agreeably clothed with greenery in the attractive guise of fine specimens of *Lastrea Filix-mas* and other familiar common Ferns.

It will thus be seen that this particular garden is undoubtedly a plain one, which, apart from trim keeping, might be almost left untended, and, perhaps, some will say uncared for. But its worthy owner really cares for it, and wishes for improvement, not of the too common kind which aims at instant transformation, but rather of a gradual nature, feature by feature, so that while the garden grows yearly in beauty it may not be regarded as a finished work to or from which nothing can be added or taken without spoiling the whole. So far his attention has been given to good purpose to the fernery and the trees, in both of which he has been so successful that it is reasonable to suppose other things taken in hand with caution and treated with care will answer equally well.

The first step towards improvement which appears to me most desirable is the introduction of dwarf flowering shrubs and choice perennials into the beds of the sunken panel garden, not necessarily to the entire exclusion of spring and summer bedding plants, but rather as a partial rich permanent clothing for the beds to render them attractive throughout the year, instead of only a month or two in autumn, as it is inevitably the case where small bedding plants scattered thinly over the surface take months to grow into beauty. Of shrubs which occur to me for such a purpose the *Spiræas* take a leading place, *Thunbergi*, *callosa alba*, *Billiardi*, *Douglasi*, *californica*, *ariæfolia*, and *Nobleana* being among the best. Then there are *Hydrangea paniculata*, *H. hortensis*, *Deutzia crenata flore-pleno*, *D. gracilis*, *Berberis Wallichii*, *B. dulcis*, *Gum Cistus*, the *Pernettyas*, *Escallonia macrantha*, *Mahonia aquifolia*, *Erica eodonoides*, *E. mediterranea*, *E. Alportii*, *E. vagans alba*, and the bright pink early-flowering *E. carnea*. The Japanese Rose, too, is admirably adapted for such a place. Of perennials all common kinds should be excluded, and only such treasures, rich and rare, allowed a place as *Hypericum patulum*, *Aquilegia chrysantha*, *Funkia Sieboldiana*, *Papaver orientalis*, *Anemone japonica alba*, *Spiræa palmata*, *S. japonica*, select kinds of *Pæonia*, *Phlox*, *Pentstemon*, *Pyrethrum*, *Potentilla*, and *Campanula*, to which subsequent additions might be made.

Flowering shrubs of all kinds ought to enter largely into the composition of such a garden, and for real interest and intrinsic beauty rock beds with alpine plants are an unfailing source of attraction and amusement; but such beds require much attention, and must, therefore, be limited well within the means of keeping them in order.—EDWARD LUCKHURST.

DO FLOWERS EXHAUST PLANTS ?

IN Mr. Stephen Castle's interesting account of Cucumber-growing at page 530, last volume, I observe one little mistake. It may be only a slip of the pen. He says that in the non-ventilating system his fruits would not set. If it is meant that fertilisation would not take place, then I must say that fertilisation is unnecessary in growing Cucumbers for the table, and that both plants and fruits are very much better without it. For this reason many growers, while the plants are not over-strong, pick off all the male blooms before they expand, and by

so doing their plants are enabled to carry double the amount of crop without suffering from exhaustion.

This subject is in some measure related to the important one Mr. Bardney writes on in the same number of the Journal—viz., "Do flowers exhaust plants?" and while I cannot say that they do not bring a certain amount of exhaustion, yet there is ample proof that the act of fertilisation is that which exhausts the most. Plants of a given species which do not produce seed freely will go on flowering for a much longer time with impunity than those which are productive of seed, and in nothing is this more observable than in the ordinary bedding Pelargonium, the free seeders not being worth growing for bedding purposes. We must allow, I suppose, that there is a certain amount of exhaustion with such flowers as Chrysanthemums, Roses, and Carnations, because we have proof every year that by disbudding freely we double the size and substance of our flowers. Azaleas, I think, being such free seeders are hardly to be taken into account as evidence when considering the question whether mere flowers are exhaustive. With Orchids, my experience has been so very small compared with that of Mr. Bardney, that I am not qualified to argue the point with him as regards this important class of plants. But when we consider how very little besides water an Orchid has to live on, we may be tempted to think that the exhaustion is probably owing principally to a deficiency in the supplies; and I well remember how some Stanhopeas I once had charge of thrived, and what strong flowers they produced from being treated during the growing season to some rather strong doses of liquid manure.

Plants of the great Amaryllis family show by the diminishing size of their bulbs that an abundance of blooms takes something out of them; but allow one of them to perfect seeds, and the bulb almost disappears for a time. This may, no doubt, be prevented to some extent by giving at that time an abundance of a particular kind of food, and points to a lesson with which we are not by any means perfect—viz., that the same plant at different stages of its growth requires the constituents of its food in different proportions. If there is abundance of all the elements in the soil at all times that may suffice, but as I have pointed out Orchids have very little besides water to depend on. I think these, as well as many other plants, might often be benefited and their flowering capabilities be increased by the judicious application of a little something else in solution.

To return to the subject of Cucumber-growing, I must say what a pleasure it is to be able to go on without the disease. I have never seen a trace of it since the time it was stamped out as described in this Journal. While for three years I could barely maintain a supply of inferior fruit for pantry use from two houses, I can now with one small house produce more than an abundance both for that purpose and also to use as a second-course vegetable. And what a delicious vegetable it is when simply cut into lengths and cooked Vegetable Marrow fashion! Indeed, I do not know who would trouble about Vegetable Marrows when he can get plenty of good flavoured Cucumbers. But apart from the comparison, we can have Cucumbers all through the winter, and Vegetable Marrows are not easy to produce during that season.—WM. TAYLOR.

AMERICAN BLACKBERRIES.

It was with regret that I read Mr. Muir's sweeping condemnation of American Blackberries on page 5, and I am quite sure that he will eventually find that his decision against "having anything further to do with them," was ill advised and hasty, for under good cultivation the Parsley-leaved variety has proved to be so excellent both in the size and abundance of its berries as to have a prominent position assigned it among our most useful fruits.

The common Bramble grows so luxuriantly and in such abundance here that when I received some plants of the Parsley-leaved American Bramble from Brocklesby Park in Lincolnshire, where I am told it is so flourishing as to attract the notice and admiration of visitors, they were planted in ordinary soil under the erroneous supposition that no special care was necessary to induce them to grow freely and bear fine fruit. The puny growth of the first season proved that I was mistaken, and in the following autumn a trench 18 inches deep and 3 feet wide was excavated and refilled with two-thirds of spent hotbed manure mixed with a third of garden soil, and the Brambles transplanted into it. Nothing could be more satisfactory than the result, for the growth that followed was so rampant that it was obvious an ordinary trellis would be useless, and a neat one 6 feet high of diamond pattern was made of stout poles thrust into the ground and crossing each other diagonally. This was

soon covered, and for some three or four years we have had an ample supply of fruit far surpassing anything ever seen on an English Bramble. No account has been kept of the actual quantity of fruit picked in a single season, but I know that from 6 to 8 gallons has been picked at one time, and this may be done repeatedly for several weeks from a row 60 feet long and 7 feet high. This season the crop promises to be even more abundant, for the row is just now one mass of blossom from bottom to top, borne in huge clusters upon stout lateral growths about 2 feet long, so that the row is in reality a thick hedge quite 4 feet through, and is probably at its best. Nor is there any fear of a cessation of vigour, for new main shoots have come freely from the bottom of the old ones, and are already from 6 to 8 feet long, and nearly an inch in diameter. The fruit is used chiefly for making jelly, which is so highly prized by connoisseurs that it must command a profitable and ready sale. Surely fruit-growers for market would do well to bestow some attention upon a fruit that is so hardy, so prolific, and so easily cultivated, and which, so far as my experience goes, is unaffected by blight or disease of any kind.—E. L. O.

BORONIA POLYGALIFOLIA.

COMPARATIVELY little known, but one of the most useful of the genus, is that of which a spray is shown in the woodcut (fig. 11). In

Fig. 11.—*Boronia polygalifolia*.

few gardens is it largely grown, but wherever it has been fairly tried the highest opinion is held of its merits as a greenhouse or conservatory plant. Perhaps the best examples of its utility can be seen at Kew in the greenhouse, where during the spring and early summer months plants with quite masses of flowers are very noticeable upon the side shelves. These are borne on corymbose heads, are of a bright rosy-lilac hue, and last a considerable time either upon the plant or when cut. The growth being very free, the plant will endure hard cutting, a valuable quality in these days when flowers are so largely in demand; and though the colour is not so brilliant or startling as that of some plants, it is a shade that can be readily associated with many others without producing any unpleasant discord. It requires similar treatment to other species of the genus.

ROSES—M^{lle}. EUGÉNIE VERDIER.—Judging from the general tenor of the reports, everything considered, I think we have better Roses in Ireland this year than you seem to have in England. Going through the Rose garden attached to the residence of George Gough, Esq., Birdhill, near this town, I had an opportunity of admiring some glorious blooms, and select the above to draw your attention to. If it can be grown generally, or even casually, as I saw it to-day, the wonder is that every exhibition stand. It is light silvery peach-coloured, with a rich

of warm crimson, with much in common, similar to La France, Duchess of Edinburgh, and Capitaine Christy; but with a deep satin hue, as the soft rain drops, sparkled on it to-day, far superior to any of them, not only in colour but in shape. The form seemed as perfect as A. K. Williams, which I have had very fine.—W. J. M., *Clonmel*.

WINTER LETTUCES GROWN ON RIDGES.

It is many years since we recommended the system of growing Lettuces on ridges about 4 feet high and 6 feet wide at the base, running north and south. They are planted thickly on both sides during September and October, and when they do well, as we have always experienced, they may be thinned out in March, the surface of ridge neatly broken over, and the thinnings planted on a rich well-prepared border for a succession crop. Last autumn we planted about 2000, and those which stood best were Hardy Hammersmith, Hicks' Hardy, and Bath Brown Cos. The latter kind is rarely found true, but when it can be procured it is of great value for winter, and blanches white and solid, and the flavour is nutty and pleasant. It has lasted long in use with us this season, and has not readily gone to seed. A succession of various kinds of Lettuces raised in a frame, and when well hardened were planted out in deeply drawn drills, in which was placed previous to planting a quantity of leaf soil. The plants took quickly to the soil and grew with great rapidity. They received shelter in the drills, and are now of the best quality. Rich free soil and plenty of moisture are essential requisites to finely blanched summer Lettuces.—M. T.

FANCY PANSIES.—No. 1.

THOSE of your readers who have not yet learned to look with favour upon the Fancy Pansy would scarcely have felt at home at the Scottish Pansy Society's thirty-ninth Show, held at Edinburgh on the 22nd ult., while those who have lost the prejudice would have found ample cause for confirming them in their new faith. Thousands of beautiful flowers of every conceivable hue were staged in about ninety classes, of which nearly sixty were confined wholly or in part to Fancies. Some of the combinations of colour were exceedingly harmonious, while in quality and form there was nothing to be desired. Size, too, although last in the Scottish standard of properties, was also there, some of the blooms measuring over 3 inches in diameter, and quite dwarfing their orthodox relatives the Show varieties.

When their endless variety, robust habit, continuous flowering, and hardiness are considered, it is no wonder that they are popular with gardeners, nurserymen, and amateurs. This increased favour is reflected in the catalogues, where the list of Show kinds is being rapidly cut down, while the Fancies are being cultivated in largely increasing numbers. I took pains to get to know from some of the leading florists at the Exhibition in what proportion the Show varieties are sold now compared with the Fancies, and the result is, that where one of the former is ordered three of the latter will be sold. This result has been obtained by steady improvement in the flowers themselves, which may be taken as the most reliable basis of favour. Some of the best kinds have undoubtedly come from promiscuous hybridisation, but systematic crossing is now being largely practised, and astonishing results may be confidently expected. Certain it is that by the latter course the proportion of rubbish is minimised, and the chance of obtaining what is wished increased.

I had the pleasure of a long conversation with Mr. John Downie, whose name is inseparably connected with Fancy Pansies, and he was good enough to give me some details of their introduction to Scotland and London. Above thirty years ago he obtained from France the first Fancy Pansy he ever saw, and he called it Dandie Dinmont. From this he raised one which he named Frapeola, and ultimately succeeded in getting six distinct varieties, inclusive of old Magpie, which latter, I have heard on reliable authority, was found by the late Mr. Fox, of Wetley Rocks, Staffordshire, growing in a hedge-bottom near his nurseries. Of these he took great care, but so much was he laughed at for his pains that he was compelled to hide them away to escape the ridicule of his friends, some of whom hesitated not to say that he was mad. Undeterred, however, he took his unique flowers to London, and exhibited them about 1852 at the Botanical Gardens. The judges, wedded, doubtless, to the old sorts, vouchsafed them no notice whatever. Not so the ladies, who crowded about the little strangers all day. The next morning Mr. Downie found himself complimented by the *Times* on his extraordinary exhibits, and other criticisms on the first band of Fancy Pansies ever shown in London were also favourable. Encouraged by the press comments and the favour his flowers received from the visitors, Mr. Downie persevered, and laid the foundation of a bright future for one of the most popular flowers we have either for exhibition or bedding purposes.

Even after this the Scotchmen would not have them, good florists like Mr. George Ross of Laurencekirk fighting shy for many years. The above-named gentleman, however, has so far changed his views that he is now one of the most successful raisers and exhibitors of his whilom *bête noir*. Messrs. Dickson and Co. of Edinburgh soon recognised the worth of the new flower, and have since done a great work in its improvement. Others soon followed suit, and now there is a race every year by raisers in Edinburgh, Paisley, Aberdeen, and elsewhere, who shall send out the best new varieties.

Next week, with your permission, I will try to enumerate and describe a few of the best varieties I saw in the winning stands.—M. H. MILLER, *Leek*.

THE NATIONAL ROSE SOCIETY'S NORTHERN SHOW.

SHEFFIELD.—JULY 12TH.

NOTHER fine Show we have to report. It was held in the Botanic Gardens, and there was a remarkable unanimity of expression relative to its merits, rosarians, both amateurs and professionals, regarding it as certainly one of the freshest and best exhibitions of the year. It was held in a capacious building ordinarily used as a tea and refreshment room, with a low-glazed ridge-and-furrow roof; and although the space was nearly large enough for the Roses it was quite inadequate to accommodate the thousands of visitors who struggled to get even a glance at the blooms. It

was under these circumstances perhaps a little fortunate rather than otherwise that the day was showery, as the greater the number who cannot see what they desire the greater is the disappointment. If the "National" again holds a show at Sheffield much more space must be provided, in case the weather should be favourable for a general turn-out of the inhabitants of this flower-loving town. At the date of this Exhibition cutback Roses in the south were going out of flower, while those in the north were coming into good bloom. This was shown by the amateur champion of the year (Mr. Slaughter) having, after carrying all before him at all the principal shows in the southern counties, to be content with third honours in the leading amateur class. So fine a collection of bouquets of Roses has seldom been seen, over 150 being exhibited for competition in the four classes open to them. District-grown Roses numerous and good, but as a rule their setting-up did not do them justice. Her Majesty again created quite a sensation, and will doubtless prove a great acquisition amongst the light Roses. The Show was well managed by Mr. Barron; and Canon Hole, the President, and the two Honorary Secretaries of the N.R.S. were present at the Exhibition.

NURSERYMEN'S CLASSES.

Class 1, seventy-two Roses, distinct.—To the first prize of £5 in this class was added a silver cup value ten guineas, presented by the Mayor of Sheffield, Michael Hunter, Esq., jun. This coveted prize was won by Messrs. Paul and Son, Cheshunt, with, as might be expected, a fine collection when the other competitors were Messrs. B. R. Cant and Cranston, who were placed in the order named. There was no very marked difference in the merits of the three collections. Mr. Cant's blooms were very fresh, but so also were those from Cheshunt, while they were also generally larger, and size appears more and more to gain favour at Rose shows. Some of the King's Acre blooms were a little injured by the weather, but the majority of them were worthy of the place and the man. In the cup stands the most prominent blooms were A. K. Williams, Maurice Bernardin, J. S. Mill, Reynolds Hole, Pride of Waltham, Senateur Vaisse, Dr. Andry, Madame G. Luizet, Duke of Teck, Niphotos, Charles Lefebvre, E. Y. Teas, Beauty of Waltham, Marie Raby, and Horace Vernet, all in superb condition. In the second-prize stand Gloire de Bourg-la-Reine was glowing, but a trifle coarse; Dr. Sewell, very rich; Dr. Andry, Maréchal Niel, the finest in the Show; Innocente Pirola, also fine; A. K. Williams, Reynolds Hole, very fine indeed; Star of Waltham, Niphotos, grand; Madame Margottin, Duchesse de Morny, and Xavier Olibo, were the leading varieties. The majority of them were also admirably represented in Mr. Cranston's collection, in which, however, the finest blooms were Madame G. Luizet and Duc de Montpensier, both splendid.

Class 2, thirty-six trebles.—Messrs. Paul & Son again secured the place of honour, staging in splendid condition among others Maurice Bernardin, Countess of Rosebery, Comte Raimbaud, Comtesse d'Oxford, Eugénie Verdier, Prince Arthur, Reynolds Hole, and Madame Lacharme. Mr. Cant, who followed closely, had A. K. Williams, magnificent, as also were Duke of Edinburgh, Reynolds Hole, Duke of Teck, and Duchesse de Morny. In the next class, twenty-four trebles, Mr. Cant was first and Mr. Prince, Oxford, second, the former repeating as the best blooms those enumerated in his other stands; the latter having very prominent Jean Ducher, Alba Rosea, Alfred Colomb, Princess Mary of Cambridge, Madame Isaac Perriere, Baronne de Rothschild, and A. K. Williams remarkably fine.

Class 4, eighteen Teas and Noisettes.—Mr. Prince was first with a grand collection, including Catherine Mermet, Madame Welch, Anna Ollivier, Comtesse de Naidailac, Alba Rosea, Madame Willermoz, Jean Ducher, Souvenir de Madame Pernet, Rubens, Souvenir de Paul Neyron,

Perle des Jardins, Innocente Pirola, Souvenir d'un Ami, Souvenir d'Elise Vardon, Amazone, Elise Sauvage, and Marie Van Houtte—a stand of almost faultless blooms. Messrs. Paul and Cant followed in the order named, Madame Cusin in Mr. Paul's stand, and Madame Lambard in both collections, being very rich and telling.

Class 5, Division A, thirty-six Roses, distinct.—Mr. House, Peterborough, was first with good, even, well-coloured blooms; A. K. Williams, J. S. Mill, Sir Garnet Wolseley, Duke of Connaught, Horace Vernet, and Catherine Mermet being admirably represented. Mr. Frettingham, Beeston, Notts, was second; Lord Macaulay, J. S. Mill, Mrs. Laxton, and Etienne Levat being conspicuous by their excellence. Messrs. Jefferies & Son, Cirencester, were a very close third, staging admirably Paul Jamain, Maurice Bernardin, Comtesse de Choiseuil, and Mrs. Jowitt. Mr. J. Mattoek, Oxford, had the remaining prize, Dupuy Jamain being very fine. Five collections were staged. In the next class for eighteen trebles the first three exhibitors were placed in the order named.

In Class 7, eighteen Teas and Noisettes, Messrs. Jefferys secured the first position with a very charming stand, in which Madame Lambard was in extraordinary colour, and Perle des Jardins very rich. Mr. Mattoek and Messrs. Cooling & Son, Bath, followed closely in the order named.

AMATEURS' CLASSES.

Class 8, thirty-six Roses, distinct.—To the first prize of £5 in this class was added a silver cup value ten guineas, presented by the Master Cutler of Sheffield, A. A. Jowitt, Esq. This was won by the great and good Darlington rosarian, E. R. Whitwell, Esq., with bright, fresh, full, symmetrical blooms. Madame Hippolyte Jamain was magnificent, while François Michelin, Avocat Duvivier, Marie Baumann, Prince Arthur, and Belle Lyonnaise were splendid. The Rev. Canon Hole was second, staging grandly Marie Rady, Charles Lefebvre, Thomas Mills, Madame Victor Verdier, and Mons. Boncenne. T. B. Hall, Esq., Larchwood, Roek Ferry, was a close third, staging splendidly A. K. Williams and Le Havre; Mr. A. Slaughter, Steyning, being a good fourth in this fine class. In the following class for twelve trebles the prizes were won respectively by Mr. Whitwell and Canon Hole, both with stands of great merit.

Class 10, twelve Tea and Noisette Roses.—Mr. Slaughter was here in the premier place with charming examples of Souvenir de Paul Neyron, Catherine Mermet, Belle Lyonnaise, Souvenir d'un Ami, Amazone, Madame Willemoz, Rêve d'Or (extra fine), Marie Van Houtte, Homère, Madame Margottin, and the new Tea Francisca Kruger. Canon Hole was an extremely close second; Innocente Pirola, Marie Van Houtte, Souvenir d'un Ami, Madame Lambard (pale), and Rubens surpassing any in the first-prize box, but some others had been injured by the weather. Mr. Whitwell was third, his finest blooms—aud fine they were—being Comtesse de Nadaillac and Anna Ollivier.

Class 11, twenty-four Roses, distinct.—The piece of plate presented by Messrs. Walker & Hall, Sheffield, was awarded in a close contest of thirteen boxes to Rev. J. H. Pemberton, Havering, Essex, with undoubtedly a remarkably fine stand, in which were prominent Duchess of Bedford, A. K. Williams, Madame C. Crapelet, Duchesse de Morny, Horace Vernet, Devienne Lamy, La France, and Beauty of Waltham. Mr. C. Davies, Aynhoe, Banbury, was placed second. We should not give a faithful report of the proceedings if we failed to state that this award did not meet with anything like general approval. It must be remembered, however, that the criticism occurred an hour after the judging, and then Mr. Davies' stand was almost beyond question the best, and was not excelled by any box in the Show. In colour, especially, Marie Rady, Comtesse d'Oxford, Sultan of Zanzibar, Fisher Holmes, Duc de Rohan, Alfred Colomb, Hippolyte Jamain, Madame G. Luizet, Le Havre, and Louis Van Houtte have probably never been surpassed. Rev. E. N. Pochin was placed third with good blooms; and Mr. M. J. Radford, Nottingham, fourth. In the next class—eighteen Roses, distinct—Mr. Davies was unquestionably first, staging magnificently Louis Van Houtte (which won the silver medal as the premier bloom in the amateurs' classes), Harrison Weir, rich; E. Y. Teas, Camille Bernardin, Devienne Lamy, and La France. Mr. Burrell of Darlington was second with truly admirable blooms, and Mr. Pochin third, eleven stands being in competition.

Class 13, nine Tea and Noisette Roses. Miss Watson Taylor, Headington, Oxford, was placed first with a beautiful stand, which contained the premier Tea bloom in the Show—a magnificent Catherine Mermet, to which the silver medal was awarded. Niphotos, Marie Van Houtte, Souvenir d'Elise Vardon, Alba Rosea, Homère, Climbing Devonensis, and Perle des Jardins were also in admirable condition. Mr. C. Davies was an excellent second, Madame Lambard being very rich; and Mr. Julius Sladden a close third, with amongst others superb examples of Innocente Pirola, Perle des Jardins, and Amazon. There were seven competitors.

Class 14, twelve Roses, distinct. The first prize was awarded to Mr. John Howe, Nottingham, who staged large yet fresh blooms; the second to Rev. J. A. Williams, Stratford-on-Avon, light varieties predominating; third to Mr. C. Hutchings, Crapenhall, Warrington; and fourth to Mr. Ismay Fisher, Scawby, Brigg, with blooms six hours too young, but beautifully staged. Mr. F. Burnside, Farningham, Kent, was first; Mr. Mawley, Croydon, second; and Mr. Brown, Heaton Mersey, third, all with fresh and good examples. In the class for six Tea or Noisette Roses Rev. J. A. Williams was first with charming blooms of Souvenir de Paul Neyron, Marie Van Houtte, Maréchal Niel, Souvenir d'Elise Vardon, and Comtesse de Nadaillac, from plants, we believe, that were not inserted until March of the present year. Rev. Alan Cheales was second, Triomphe de Rennes and Madame Lambard being good, the others somewhat despoiled by the weather. We failed to obtain the name of the winner of the third prize in this class. In the extra class for twenty-four Tea or Noisette Roses in eighteen varieties, Mr. Davis, Aynhoe, won the piece of plate provided by Mr. Prince with an even and splendid stand, almost every bloom a model. Rev. J. H. Pemberton was second with blooms altogether good; and Mr. Slaughter third with an excellent stand, five lots being staged. Another extra class was provided for six new Roses not in commerce previously to 1880. The first prize was won by Mr. T. B. Hall with Madame Montel, Madame Isaac Perrière, Duke of Teck, Rosieriste Jacobs, Comtesse de Camond, and Julius Finger; Rev. J. H. Pemberton being second, and the Rev. Alan Cheales third.

OPEN CLASSES.

In Class 19, for twelve new Roses not in commerce previous to 1880. Messrs. Paul & Son were first, the most attractive blooms being Duke of Albany, deep crimson; George Moreau, George Baker, Rosieriste Jacobs, Pride of Waltham, Ulrich Brunner, and Madame Isaac Perrière. Messrs. Cranston & Co. were second, the best blooms being Souvenir de Madame Berthier, reddish crimson, good; Guillaume Guillemot, shell-like, fiery crimson; and Ernest Prince. Third, Messrs. Jefferies & Son, Comte de Flandre, dark, tinged with violet, and Duke of Albany being the most noticeable.

In the class for any yellow Rose Mr. Prince won first honours with beautiful examples of Perle des Jardins, Messrs. Cranston and Cant following respectively with Maréchal Niel. The last-named exhibitor was first in the Any white Rose class with massive and spotless examples of Niphotos, Mr. Prince following with Alba Rosea, third honours going to Messrs. Paul for Niphotos. The class for any crimson Rose brought out nine collections. Messrs. Cranston & Co. securing the first position with grand examples of Marie Baumann, but somewhat faded in colour; Messrs. Paul followed with fresh and brilliant specimens of A. K. Williams, Messrs. Jefferies being third with larger but less bright blooms of this fine Rose. The next may be termed the conquering class, being for twelve blooms of any variety. Mr. Bennett now has the satisfaction of knowing that his new Rose, Her Majesty, is, like the free and bearded Barley among cereals, the monarch of them all—the real queen of Roses, as his stand of this variety won the coveted prize, some of the blooms being quite 6 inches in diameter. Messrs. Paul & Son followed with La Duchesse de Morny, fine and beautifully fresh, Mr. Cant being third with Marie Baumann. For the prize offered for any new seedling Rose, to be known as the Rose of Sheffield, there was no claimant.

DISTRICT-GROWN ROSES.

In both the open classes of thirty-six and twenty-four blooms grown within twenty-one miles of the Sheffield Town Hall, Messrs. Fisher, Son and Sibray won the premier honours with really good, fresh, and bright blooms from their great nursery at Handsworth, the first prize in the larger class being a silver cup, value ten guineas, presented by Edward Tozer, Esq., President of the Gardens in which the Show was held. In the class for twenty-four Mr. Hiram Shaw secured the second prize with a creditable stand. The prizewinners in the remaining twenty-one-mile-radius class were Messrs. Mallender, Worksop; Bevers, Rotherham; W. G. Jackson, Mansfield; and W. Jackson, Heeley, all exhibiting well.

In the six-mile-radius class for six blooms a very serious question arose when it was pointed out that the first-prize blooms were almost exactly similar to those staged by the exhibitor Mr. Barratt, Eccleshall, in the preceding class, in both cases securing first honours; the boxes, too, were of the same pattern, the names of the Roses written by the same hand and with the same mistakes in spelling in both stands. When all these peculiarities were found in a prize stand in another class, set up by another exhibitor hailing from another town, the whole matter was undergoing a searching investigation when we left the Show. We learn that subsequently both the stands were disqualified, Messrs. H. R. Beardshaw (Norton Woodseats) and H. Urton being placed first in the two classes.

HAND BOUQUETS.

Although this was probably the finest display of the kind yet seen, there is yet room for improvement in selecting and grouping Roses tastefully for the purpose in question. As before mentioned 150 bouquets were staged, Mr. Mattoek, Oxford, winning the first prize with twelve in the open class, followed by Messrs. Paul, Cheshunt, and Cooling, Bath. The Oxford examples were mostly Teas, a little packed, and not enough foliage, yet they were the best. In the Cheshunt arrangements dark Roses predominated, and there was too much foliage, while in the Bath bouquets several of the blooms were too large and globular. If about half the foliage had been taken from the second-prize bouquets and added to the first both lots of bouquets would have been much improved. In the class for six bouquets Miss Watson Taylor was undoubtedly first, and with twelve bouquets of district-grown Roses Messrs. Fisher, Son & Sibray; Mr. Proctor, Chesterfield; and Mr. Cooke, Handsworth, were awarded the prizes in the order named, most of the examples being too flat and formal. In the local amateurs' class for six bouquets the laced collars surrounding the flowers were much too large, incongruous, and obtrusive.

MISCELLANEOUS.

Mr. Julius Sladden's stand of old English Roses was much admired, as were Mr. Prince's fine extra contribution of Teas and curious Roses, including the Green Rose, Japanese Roses, &c. Messrs. Fisher, Son and Sibray arranged on the lawn an attractive group of Roses in pots, very fresh and dwarf, and a particularly noteworthy background of pyramidal purple Beeches, Fisher's plicated variety, and Golden Yews. We were scarcely prepared to see such large deciduous trees as these dug up at midsummer, planted in baskets, and stood in the full sun with scarcely a leaf flagging, yet we did see this, and the result must be pronounced a triumph in the preparation of trees for removal.

Mr. W. H. Beeson, Carbrook Bone Mills, Sheffield, had on view samples of his Rose manure, of which Mr. Fisher speaks in terms of marked approval. Messrs. Crowley exhibited their celebrated lawn mowers, and Messrs. Primrose & Co., Sheffield, had examples of their Eclipse system of glazing—a simple method of affixing glass without putty—portable, light, and durable. A house glazed on this plan in the Handsworth Nurseries gives great satisfaction, and anything must be good there to do that.

THE BOTANIC GARDENS.

A word of praise as emphatic as possible must be recorded on the attractiveness and excellent condition of this undulated enclosure—the almost overpoweringly gay mixed beds of hardy plants, the magnificent beds of Imperial Blue Pansy, the ehaste and cheerful carpet and Succulent beds, the order under glass and outside, all testifying to the skilful supervision and excellent practice of Mr. Ewing, who has been the Curator for a quarter of a century. The gardens are pleasantly situated in one of the best parts of Sheffield at a considerable elevation, an admirable site

for a flower show, and when the weather is favourable visitors usually assemble in great numbers.

CULTURE OF CALCEOLARIAS.

THAT the Calceolaria is an effective and most useful greenhouse flowering plant, everyone having a knowledge of it will readily admit. It makes a good succession to the Cineraria, its time of flowering being April, May, and June; and, if necessary, the flowering period may be extended by sowing a pinch of seed at intervals of a week or ten days from the middle of July to the middle of August, and also by retarding the flowering of the plants raised from the last sowing. Although the Calceolaria is of easy culture it not unfrequently happens that amateurs, and gardeners too, experience difficulty in the matter of raising a sufficient number of young plants from seed to satisfy the demands. Therefore, as I have hitherto been successful in raising and growing the Calceolaria, and with a view to render assistance to those of your readers who may have been less fortunate, I will briefly detail the particulars of the treatment.

Obtain a packet of seed from a good strain, and sow part of it now and the remainder a week or two hence in a pan, having a couple of inches of crocks in the bottom, and over them a little dry moss to render the drainage perfect, and filled to the rim with light fine soil, the same being rammed firmly together and watered through a fine rose about twenty minutes before the seed is sown, which should be covered with a dust of silver sand, over which place a piece of glass and damp moss, and then stand the pan on coal ashes in a frame occupying a north aspect. As soon as the seedlings appear through the soil, which, if all goes well, will be in a fortnight or three weeks from the time of sowing, remove the moss gradually until they are inured to the light. Water, not having been applied in the meantime, should be given sparingly through a fine rose as soon as the soil in the pan becomes a little dry; and when the seedlings are large enough to handle they should be pricked out in pans and returned to the frame, watered, shaded from bright sunshine until their roots have taken to the soil, and protected against the attacks of slugs by encircling the pans with a mixture of new soot and lime, repeating the application as a precautionary measure twice a week, and dew the plants overhead with the syringe in the afternoon, closing the frame at the same time.

Potting.—Before the seedlings become crowded in the pans into which they have been transplanted they should be taken up carefully with as much soil as possible adhering to their roots, and placed singly in small 60-pots in a compost consisting of three parts light loam and one of leaf soil, with a good dash of sharp silver sand, which should be pressed moderately firm, keeping the stems of the plants the same height out of the soil as they were before; and this is a point that should be rigidly observed every time the plants are potted. The plants when potted should be stood on sifted coal ashes in a frame near the glass, watered through a fine rose to settle the soil among the roots, shaded for four or five hours on bright days, and damped with the syringe when the shading is removed; thus, in addition to immediately refreshing the plants, producing a moist and cool atmosphere for the night—conditions under which the Calceolaria flourishes in every stage of its growth, excepting, perhaps, its flowering period, when a cool and somewhat dry atmosphere would be more congenial. As soon as the plants have partly filled the 3-inch pots with roots they should be shifted into 5-inch pots, ramming the soil between the sides of the pot and the ball of the plant with a flat stick, and when the plants have partly filled these pots with roots they will require to be shifted into 7-inch pots, and again, if larger specimens are required, into 9-inch pots, using coarser and richer soil in potting, and take care that the drainage is both ample and perfect, as the welfare of the plants in a great measure depends upon the manner in which this is performed. Therefore a large piece of potsherd should be placed over the hole in the bottom of the pot, then several pieces of smaller ones, and finish off by filling in the clinks with pieces which have been through a small sieve, altogether a little less than one-third the depth of the pots, and over all place a handful of sphagnum moss, thus securing a perfect drainage.

Supplying Water.—The plants having been thoroughly watered a few hours before being shifted into larger pots will require very little water at the roots for some time afterwards—not until they have pushed well into the new soil; but they should be damped with the syringe late in the afternoons of bright days, so that the foliage may remain covered with moisture the night through. As the plants fill their largest pots with roots they

should be watered alternately with diluted liquid manure, which will greatly assist the plants in the formation and development of sturdy flower-spikes. According to the judgment exercised in the application of water to the plants so also will be the floriferous result thereof. Bearing this in mind there should be no indiscriminate waterings; but when the pot produces a hollow sound in response to a sharp knock water should be given two or three times, then allow the soil to become moderately dry before watering again.

Ventilation and Situation.—The Calceolaria, like the Cineraria, may in every stage of its growth be termed a fresh-air-loving plant, but, like them, does not like it when admitted in currents. Pits from which frost and excessive damp can be excluded are suitable. A minimum temperature ranging from 35° to 50° during the winter and spring months will be congenial to the plants, which, if subjected to a high temperature and close atmosphere, especially during their flowering period, become infested with aphides, to destroy which the plants should be fumigated with tobacco paper two nights in succession. Ventilate freely the following days, weather permitting. When the plants are in flower the flower-spikes should be supported with sticks and matting. The Calceolaria is not a good plant to cut from, as the flowers do not keep well; but as a decorative plant which comes within the reach of everyone possessing garden frames and a greenhouse it has few equals.—H. W. WARD, Longford Castle, Salisbury.

HULL FLOWER SHOW.

THERE are probably few places in the kingdom more suitable for an exhibition of garden produce than the Botanic Gardens are at Kingston-upon-Hull, and the district surrounding being fertile, with good gardens scattered everywhere, owned by wealthy proprietors and managed by competent gardeners, there should be little difficulty in providing annual gatherings of the kind under notice which would rank amongst the best in the provinces. The present Exhibition was the first that has been held in the new gardens, and as regards the products was most encouraging. The opening day was unfortunately showery, yet as two others followed it is hoped the attendance of visitors would result in a financial success. The Show was inaugurated by the skilled and energetic Curator of the gardens, Mr. P. McMahon, who, in conjunction with his co-Secretaries, Messrs. James Dixon, E. T. Sharp, and the members of the Committee, laboured indefatigably in the commendable work which they voluntarily undertook to accomplish.

The schedule, without being extravagant, was sufficiently liberal to induce Mr. Cypher of Cheltenham to put forth his strength, and consequently some of the finest examples of plant culture to be found in any country were placed in competition. This great exhibitor, though he achieved a splendid success, did not quite carry everything before him, a fact which shows conclusively that there are first-rate local cultivators—such, for instance, as Mr. Lawton, gardener to Col. Broadley, M.P., Welton House, Brough; Mr. Cartwright, gardener to A. Wilson, Esq., Iranby Croft, Hull; and Mr. Jarvis, gardener to B. Whittaker, Esq., who were the most successful exhibitors in the plant classes.

In the class for sixteen plants, ten to be in flower, Mr. Cypher won chief honours with a noble group, including *Erica Parmentieri rosea*, 6 feet in diameter, magnificent; *E. obbata*, *E. Dennisoniana*, *E. ventricosa tricolor*, *Allamandas*, *Ixoras*, with a *Dracocephalum*, *Anthurium*, and *Clerodendron*. The foliage plants were also fine. Mr. Lawton was a most creditable second, his noteworthy plants being a splendid *Stephanotis*, the good old *Pleroma elegans*, and *Erica Paxtoni*. Mr. Cypher was also first with ten fine-foliaged plants, very remarkable being *Lomatia filicifolia*, *Crotons Sunset* and *Victoria*, *Cycas circinalis*, and *C. revoluta*. Arthur Wilson, Esq., was an excellent second, staging among others a grand *Latania*, and capital examples of *Kentia australis* and *Cordyline indivisa*. Mr. J. C. Padman, Boston Spa, Tadcaster, secured the third prize, his most striking plant being a fresh and vigorous *Stevensonia grandifolia*. In the class for ten plants, six at least to be in bloom, Mr. Cypher was in his accustomed position, staging amongst others a *Stephanotis* densely covered with waxy flowers, excellent *Ericas Bothwelliana* and *Aitoniana*, with a beautiful but not large plant of *Croton Warreni*. B. Whittachew, Esq. (Mr. Jarvis, gardener), Cliffe House, Hessle, was worthily awarded the second prize for large well-grown specimens. In the class for four plants in bloom Mr. Cypher was first with not large but superbly finished examples of *Ixora Williamsii*, *Erica Parmentieriana rosea*, *Aphelexes macrantha rosea*, and *Anthurium Andreanum* with twenty fine spathes. Mr. Jarvis was again second with *Clerodendron Balfourianum*, very fine indeed; *Statice Holfordi*, *Anthurium Schertzerianum*, and a *Hydrangea* about 5 feet in diameter. In the single-specimen class Mr. Cypher sustained his first defeat, being second with a very fine plant of *Erica Shannoni* 4 feet in diameter, Mr. Lawton winning the first place with a wonderfully fine, fresh, and free example of *Phenocoma prolifera* Barnesii 5 to 6 feet in diameter.

In the class for four Palms the competition was extremely good and close, Mr. Lawton securing the first position with *Verschaffeltia melanochætes*, *Cocos Weddelliana*, *Pritchardia filamentosa*, and a splendid specimen of *Kentia Balmoreana*. Mr. Cartwright was second with a grand *Latania borbonica*, *Thrinax elegans*, *Pritchardia pacifica*, and a *Kentia*. Mr. Cypher had the third prize. Ferns were of striking excellence, Mr. Lawton securing the first position in the class for six with *Gleichenia speluncæ*, 5 feet in diameter; *G. rupestris glaucescens*, 6 feet; *Pteris scaberula*, 5 feet; *P. Tyermani*, 3 feet; and *Leucostegia immersa*, 5 feet, all splendid. Mr. Cartwright, who followed, had *Davallia Mooreana* and *Adiantum cardiochlæna*, each 8 feet across. In the class for three ornamental-foliaged plants Mr. Lawton, who was the chief exhibitor, staged a fine example of

Croton Kingianus, with enormous leaves; Mr. Simpson, Selby, having the second prize. The last-named exhibitor was decidedly first in the arrangement of a group occupying 200 square feet. It was square in form, with a very broad flat margin, broken thinly with tall Palms, &c., the centre being a free, bright, and informal cone. Mr. Cartwright was second also with a cheerful and well-arranged group. We failed to obtain the winner's name of the third prize, also the exhibitors in the smaller groups, which groups, however, were not invested with marked artistic merit.

Orchids were not numerous, but they were good and greatly admired. Mr. Cypher was first for six with *Cattleya Gaskelliana*, with three grand flowers; *Dendrobium Dariai*, with twenty flowers; *Odontoglossum citrosimum roseum*; *Aerides Lobbi*, a grand spike; *Disa grandiflora*, with ten flowers; and *Dendrochilum filiforme*, very fresh and fine. Special certificates were also granted to the first two plants named. Mr. Cartwright was an excellent second, his most noteworthy plant being *Saccolabium Biumei majus* with three fine racemes.

Mr. E. P. Dixon contributed a large miscellaneous collection of choice plants and Conifers, which materially added to the interest of the tent in which they were arranged.

A considerable number of Roses were staged in the three classes devoted to them, by far the best blooms coming from Mr. Pennell, nurseryman, Lincoln. Lady Du Cane, who was second for twelve, was far ahead of other competitors in the class for thirty-six blooms, Niphotos, Duchess of Bedford, and La France being in superb condition. Mr. Ridsdale, gardener to the Marquis of Ripon, and Mr. W. T. White, Hedon, had the remaining prizes in the class, Mr. J. Wade, Woodside, being highly commended. In one of the boxes a dispute arose over two yellow blooms, opinions being about equally divided as to whether they were both *Maréchal Niels* or one of them *Perle des Jardins*. There are flowers of these varieties that it is almost impossible to distinguish one from the other, but the stems of the latter and the leafstalks are of a reddish tint, those of the former being green. In the Rose tent were table decorations and bouquets, those from Mr. Cypher showing the greatest taste in arrangement.

Some stands of cut flowers of Tuberous Begonias were sent by Messrs. Laing & Co., Forest Hill, London, and were greatly admired by visitors to the Show.

Fruit was not largely exhibited, but was as a rule good. Mr. Lawton secured first prize for white Grapes with medium-sized bunches, good, even, and beautifully finished berries of Buckland Sweetwater; Mr. J. Allsop, gardener to Lord Hotham, Dalton Hall, being second with the same variety, the berries being wonderfully fine but not quite ripe. William New, Esq., Walkhouse, Barrow-on-Humber, was third with grand examples of Foster's Seedling, but not perfectly ripe. In the class for black Grapes the first prize, so far as we could learn, went to admirable examples of Black Hamburgs from the Marquis of Ripon's gardens; Henry Briggs, Esq. (Mr. Stanley, gardener), Cottingham Hall, following very closely with the same variety; Mr. Allsop being third with Black Prince, the berries being unusually large but not quite ripe. The prizes for Peaches went to Mr. D. Melville, Grantham, and Mr. Cartwright for very good dishes. No prizes were offered for Nectarines and Strawberries, but splendid dishes of the latter were exhibited by Rev. C. J. Wall, Sproatley (Mr. Culling, gardener), and an extra prize was awarded. Mr. E. V. Dixon exhibited a quantity of the new Baumforth Seedling Raspberry, fine bright, very bright in colour; and Mr. Browshaw, Beverley, exhibited a peck or more of his seedling Strawberry Ne Plus Ultra, very fine fruit, somewhat resembling President in shape but much darker in colour. Fruit in the minor classes was of average quality, but we cannot particularise the exhibits, as there was some confusion in the attachment of the cards.

Vegetables, like fruit, were comparatively few, but generally very good. The most striking exhibits were the collections, the first prize going to Mr. Cartwright, who staged nearly everything in season of excellent quality; Mr. Cook, gardener to Lord Auckland, Edenthorpe, Doncaster, being a close second, the Mushrooms being the finest we have seen at this season of the year. Mr. Ridsdale won the remaining prize with excellent produce. Good vegetables were also staged in the minor classes, but it is too soon to offer prizes for Parsnips and Savoys.

Sufficient has been said to show the character of the Exhibition, and it is certain that if adequate support is afforded, Mr. McMahon and his supporters will be able to provide future shows worthy of the important town and district that has, in the matter of exhibitions of this kind, been too long neglected.

It should be added that G. Bohn, Esq., C.E., was so satisfied with the Show that he empowered the Judges to award a special prize—a silver cup—for the most meritorious contribution to the Exhibition, and there was no difficulty in determining this point in favour of Mr. Cypher.

The Botanic Gardens are in excellent condition, the borders being strikingly attractive with Foxgloves, Canterbury Bells, Sweet Williams, Pansies, &c., and the grounds of 35 acres are particularly enjoyable.

MIGNONETTE IN POTS.

MIGNONETTE is a great favourite with most people, and it is generally most appreciated during the spring months, though it is often found in anything but a satisfactory condition. Seed may be sown now for early blooming during the winter, but for early spring September is the best time for sowing. There are several good strains, but I think the preference is given to Miles' Hybrid Spiral. The most useful size pots are 48's. They should be well drained and have some well-decayed cow manure pressed firmly into the bottom; then fill up with two parts fibry loam and one of leaf soil, with a little silver sand to keep the soil open. Press the soil very firmly into the pot, sow the seed thinly on a smooth surface, and cover lightly with fine soil. Plunge them in a cold frame until the seed germinates, thin the plants out to about six or eight, place them close to the glass, giving little water, and ventilate well. The best place to winter them is on shelves in a cool airy house. From the commencement of November to the middle of February scarcely any water should be applied, which will prevent the plants becoming weakly and

drawn. Water should then be carefully applied. About the middle of March they succeed best plunged in an elevated cold frame. As the plants advance in growth and show their bloom spikes they will be greatly benefited by applications of liquid manure made of cow manure and soot, and should be shaded from bright sun.—A. Young.

ZEPHYRANTHES TREATIÆ.

THE Atamasco Lily, *Zephyranthes Atamasco*, has been long known in gardens, being one of the earliest North American plants introduced to this country, and has now been an inhabitant of these islands for about 250 years. That shown in fig. 12 is, however, a comparative stranger, having only been cultivated in this country a few years, though it will soon become a favourite when better known. It is suitable for culture in pots, and in northern or exposed positions this is the best method of growing it, as out of doors it is very likely to prove unsatisfactory, except in warm sheltered positions, where it might be safely

Fig. 12.—*Zephyranthes Treatiæ*.

tried in borders. Its beauty is certainly seen to better advantage when it is grown in a pot, any ordinary light soil and a cool house suiting it. It is named in honour of the discoverer, Mrs. Treat, who found it flourishing in damp positions in Florida, a fact which will give a good hint as to the treatment required. The blooms are long funnel-shaped, frequently with the lobes more reflexed than is shown in the figure; they are white or tinted with pink, which becomes deeper as they grow older.

FARNINGHAM ROSE SHOW.

It is not an easy matter, when one is judging day after day and rushing about to catch trains, to write reports of the exhibitions one is present at.

After all the anxiety and labour of the National at South Kensington, I had to start for Cardiff on the express, get there at night, judge the next day, and get back to London again. It is, therefore, from no lack of interest in the success of the Farningham Show that I was unable to give any account of it in last week's Journal; for I have not more thoroughly enjoyed any Rose show this year. The day was very fine, and, as everyone who has been to Farningham knows, the surroundings of the Show are very charming—the grounds so well kept, the river flowing briskly past, the grand foliage of the trees—never more beautiful than this season, the bright appearance of the Show ground, the excellence of the flowers, and the courtesy and kindness of all connected with the Exhibition made it a real enjoyment; and so restful did I feel it after the hurry-scurry of the previous day that I lingered so long, sitting under the trees and chatting with Rose friends, as to find myself so late in reaching my kind friend Mr. Ernest Williams at Sutton as to make me quite ashamed of myself—and, I may add, of the railways, for it took me as long getting from Farningham to Sutton as it did from London to Cardiff (four hours)!

The Exhibition at Farningham is not by any means confined to Roses, although they form the *pièce de resistance*. Plants, fruits, vegetables, and honey are all shown well; indeed, of the latter there was the best exhibition by cottagers—Messrs. Skinner—that I have seen this season. The stove and greenhouse plants exhibited by Mr. Burnaby Atkins were really fine specimens of cultural skill, and what shall I say to Mrs. Seal's very beautiful table decorations? Anything more chaste and elegant can hardly be conceived, and done with comparatively few flowers, and these by no means rare or expensive; but the arrangement was so tasteful and suitable for its purpose that it would be well nigh impossible to excel it. The chief centre of attraction, however, both to the larger number of visitors and to myself—and, perhaps I may add, to the readers of the Journal—was the Rose tent; and it was well worthy of attention, for it was filled with a fine and most excellent collection of, in most cases, first-class blooms: and here, again, I may notice how very great is the improvement in the local exhibitors. They have evidently learned much from previous exhibitions, show better and more correctly, and are more particular as to names and mode of setting up, and many stands that two or three years ago would have stood a good chance this year were nowhere. The nurserymen's classes were well filled by Mr. B. R. Cant of Maidstone, Messrs. Bunyard & Son, Maidstone, and Mr. Jefferies of Westerham. Mr. Cant's stand contained excellent blooms of Marie Cointet, Adam (Tea), Horace Vernet, La France, Annie Laxton, Duchesse de Morny, Etienne Levet, Maréchal Niel, Victor Verdier, Penelope Mayo, Mdlle. Eugénie Verdier, Innocente Pirola (Tea), Madame Welch (Tea), Madame Ducher, Marie Van Houtte, Baronne de Rothschild, Marie Baumann, and Louis Van Houtte. He was also first in Teas with a very fine box containing Devoniensis, Souvenir d'Elise, Souvenir d'un Ami, Caroline Kuster, Madame Jules Margottin, Comtesse de Nadaillac (a very fine bloom), Madame Bravy, Jean Ducher, Niphotos, Moiré, Madame Angèle Jacquin. Two stands of Teas were disqualified for having Reine Marie Henriette included amongst them.

The classes for amateurs were exceedingly well filled, and some excellent blooms were staged. In the class for twenty-four varieties Mr. Gray, gardener to Earl Stanhope, was first. His box contained Capitaine Christy, Marie Baumann, La France, Charles Lefebvre, Etienne Levet, Marie Rady, Baronne de Rothschild, Alfred Colomb, Countess of Rosebery, Horace Vernet, Gabriel Luizet, Duke of Teck, François Michelin, Duke of Edinburgh, Marquise de Castellane, A. K. Williams, Star of Waltham, Marguerite de St. Amand, Madame Victor Verdier, Jean Liabaud, Louis Van Houtte, Marie Cointet, Dr. Andry, and Baron Bonstettin. Mr. Burnaby Atkins was a good second. Dr. Ardent of Farningham was first in twelves with good blooms of Star of Waltham, La France, Bessie Johnson, Baronne de Rothschild, François Michelin, La Rosière, Beauty of Waltham, Capitaine Christy, J. S. Mill, and Gabriel Luizet. In the class for nines Mr. Frank Burnside was first with a grand box containing Louis Van Houtte, La France, Marie Baumann, Marguerite de St. Amand, Catherine Mermet, and Innocente Pirola. In the class for six the first prize was awarded to Mr. J. Dalton for Alfred Colomb, La France, Pierre Notting, Louis Levêque, Princess Beatrice, and Marie Rady. These classes were restricted to the neighbourhood of Farningham. In the open class Mr. G. Chert of Buckhurstledge, Westerham, was first with Thérèse Levet, Charles Lefebvre, Marquise de Castellane, Madame Prosper Langier, Mons. Noman, Jean Soupert (an extra good bloom), Marie Rady, Marguerite de St. Amand, Emily Laxton, La France, Maurice Bernardin, Marie Finger, A. K. Williams, Duchesse de Vallombrosa, Alfred Colomb, Marie Baumann, Madame Willermoz, Horace Vernet, Dupuy Jamain, E. Y. Teas, Capitaine Christy, and Louis Van Houtte. In the class for twelves Mr. W. H. Wakley was first with Mons. Noman, one of the grandest blooms of it I have ever seen; Thomas Mills, Marie Baumann, Capitaine Christy, Princess Mary of Cambridge, Marie Rady, Maréchal Niel, Henry Ledechaux, Gabriel Luizet, John Bright, Alfred Colomb, and Fisher Holmes. In the class for nine Teas Mr. G. Mount of Harbledown, Canterbury, was first with Anna Ollivier, Jean Ducher, Catherine Mermet, Alba Rosea, Innocente Pirola, Maréchal Niel, Souvenir d'un Ami, Souvenir d'Elise, and Caroline Kuster. In the class for six of one variety the Rev. E. H. Pemberton was first with six of the finest blooms of Horace Vernet I ever saw. Mr. W. H. Wakley was second with a fine stand of Capitaine Christy, and Mr. J. Wakley third with Alfred Colomb. Dr. Tucker exhibited a fine stand of Baronne de Rothschild. The silver cup for the best box amongst amateurs was awarded to Mr. Frank Burnside for his beautifully finished box of nine. I find I have no note as to whom the medals of the National Rose Society were awarded.

In this, as in most of the shows I have as yet attended, the excellent character of the lighter-coloured flowers has been very apparent. Such blooms of Mons. Noman, Capitaine Christy, and others have not been seen for years. I suppose the dryness of the atmosphere was congenial to them.

This well-supported Society has, I hope, a long lease of prosperous times before it, and all lovers of the Rose must wish it well.—D., Deal.

A STRAWBERRY ENEMY.

At page 24 a correspondent rightly guesses at mice being to blame for cutting off his Strawberry fruits. Last year we had quantities of

fruit destroyed in the same way, and found great difficulty in destroying any of the mice. Feeding as they did on the seed pips of the fruit, they had small inducement to accept the bait offered. Poisoning is dangerous. President seemed to be the favourite with our mice. Thus far we have not seen them the present season, but in the adjoining park voles are swarming, and these promise to be mischievous. Various methods of trapping have been tried, but they become too knowing to enter. Poisoned food they also reject, and the only way we can get the better of them is to turn a eat occasionally into a vinery.—B.

I HAVE no doubt the conclusion arrived at by your correspondent, Mr. Murray A. Mathew, that field mice are the destroyers of his Strawberries in the strange manner described by him on page 24, is quite correct. I happened to meet with a case recently which, if not quite in point, will illustrate another of the habits of these little animals. A neighbour near here had six bunches of good Muscat Grapes quite spoiled by these little animals in one night. In some cases the berries were bitten off the bunch, dropped, and left, in others carried off. Two or three bunches had every berry cut away, leaving stem and shoulder stalks, as neatly as though done by the most expert of Grape-thinners.—ROBERT GRINDROD.

YOUR correspondent anent the above subject is perfectly right in his conjecture that mice are the cause of his Strawberries being nibbled off. We had a similar case here in a late vinery containing a quantity of Sir Joseph Paxton on the upper shelves; these troublesome vermin most effectually thinned out all the smallest of the fruit, leaving fortunately the largest untouched, for this reason—that they could not reach down to where the best fruit were hanging. We found from twelve to twenty fruits collected in many of the pots, but none of them seemed to have been eaten. It is a variety of field mouse, very difficult to trap; it is in the habit of making a strange sound, like that of a young bird, in fact some call them the singing mice. We saw the mice run up and down the sash lines, so there is no mistake about the depredators.—W. CHISHOLM, Oxon Heath.

IN reference to what your correspondent (page 24), says concerning a Strawberry enemy, there is no doubt but that mice are the depredators. They have done the same for me at times in a less degree. As a rule it is the unripe fruit they eat off, sometimes making a heap under the foliage of the plants. Some fine fruits of Sir Charles Napier have this season been shaved over, as it were, when ripe by the mice, to all appearance for the sake of getting the seeds, which are rather prominent on this variety. I have also had the stems of Pelargoniums gnawed in the manner described.

If your correspondent has any Melons in frames I would advise him to be on the look-out, or the mice will find them also, and soon begin operations on the fruits when ripening.—JAS. HARDING.

DURING last April (latter end), when I had a batch of Sir Charles Napier and another sort just commencing to change colour, I missed some of the fruit. My first thought was that it was birds, as I had frequently seen robins in the house, but during the night I heard a rustling amongst the plants which caused me to set some traps for mice. I managed to clear them out in two nights. I afterwards found a lot of fruit hidden and all the seeds picked out of the fruit. They only took Sir Charles Napier, which has its seeds set very prominently on the surface of the fruit. The other sort (of which I do not know the name) has its seeds sunk in the fruit. Did Mr. Mathew notice if the seeds were taken off the fruit in his case?—J. GORE.

THE severe THUNDERSTORMS of Saturday and Sunday last have severely injured trees, plants, and crops generally in many parts of the country. Trees appear to have suffered very much in many parks. At Hampton Court and Windsor especially we are informed that much damage has resulted. Flower beds, too, were severely cut about, the large hailstones that fell on Saturday cutting the flowers off and beating the plants to the ground in numerous cases. Carpet beds seem to have also suffered considerably.

— THE Show of the CARNATION AND PICOTEE SOCIETY at South Kensington on Tuesday next promises to be a very successful one. Fine groups of Begonias are also expected. The Show will be held in the tent, and the Committees will meet in the picture gallery adjoining.

— MR. WILLIAM TAYLOR is retiring from the management of the gardens of the Marquis of Bath at Longleat, and has entered into an

engagement with Mr. Alderman James Chaffin, J.P., ex-Mayor of Bath. The last named gentleman is an enthusiastic horticulturist, who frequently takes the first place at the local competitions. He has invented and patented a simple and excellent system of glazing, which he is anxious to put to a much larger and more thoroughly practical test than he has hitherto done, and for this purpose will immediately build some large new houses. Mr. W. Pratt, who has been for seven years gardener to Lord Hill at Hawkstone, succeeds Mr. Taylor at Longleat, and as he is an excellent gardener we have every reason to hope that Longleat will not suffer by the change of management. Singularly enough, though personally unknown to each other, this is the second time Mr. Pratt has succeeded Mr. Taylor, they having both at different times acted as foremen in the gardens of Lord Derby at Knowsley. We believe Mr. Pratt is succeeded at Hawkstone by his foreman.

— MR. ISAAC BUNTING of Yokohama, Japan, in forwarding his list of JAPANESE LILIES AND ORCHIDS, states that "News has just come to hand that freight will not exceed one halfpenny per pound from Yokohama to London, and perhaps less on large shipments."

— MR. JOHN BOYD, Balbriggan, Dublin, sends us a handsome truss of the DOUBLE ZONAL PELARGONIUM MARIE TALLANDIER, which contained over fifty very full flowers. He remarks:—"The above variety is worthy of a notice in the Journal, as it bears a remarkably compact truss and of great size. In a situation near the glass the foliage comes of a light green colour. It is of spreading habit."

— WE rarely remember seeing anything more striking in the way of hardy flowering shrubs than that presented by arborescent specimens of ABUTILON VITIFOLIUM in full flower in the shrubbery at Old Conna Hill, Ireland, the residence of Mr. Riall, D.L. A background of lofty trees and thick foliage served to bring out into more pronounced relief the soft, pale, Vine-like leaves and the marvellous clusters of almost pure white bells which hung from every branchlet, as many as two dozen of these elegant bells being numbered in a single cluster. Except the faintest tinge of azure, the bells mimicked those of the favourite Abutilon Boule de Neige, and might be mistaken for them. The flowers of the latter are borne singly, while, as will be perceived from what is said above, its hardy relative bears them in clusters.—(*Irish Farmers' Gazette.*)

— GARDENING APPOINTMENT.—Mr. George Benning, late foreman in the gardens of the Dowager Countess of Ellesmere, Burwood House, Cobham, Surrey, has been appointed head gardener to Captain Parker, R.N., Ware Park.

— THE handsome collection of HARDY FLOWERS staged by Mr. T. S. Ware at South Kensington last week, was, we learn, subsequently awarded a silver medal, which was well merited. The Liliums were exceedingly fine, and a large number of species was represented, the charming bloom certificated, *L. Bloomerianum ocellatum*, being especially notable. The collections that have been recently staged by Mr. Ware are undoubtedly the best of the kind ever exhibited, and have done much good in attracting attention to the most beautiful hardy plants.

— MR. G. THOMPSON, The Gardens, Croxby House, Hounslow, referring to the AMERICAN BLACKBERRY mentioned by Mr. J. Muir, observes—"We have here a variety named Lawton; it is planted in the kitchen garden in the same way as Raspberry, but not cut back. The fruit come very large like Mulberries, come in directly after Raspberries are over; it proves very useful; it is very handsome when it is in bloom with its large white flowers, but it does not produce suckers very freely."

— IN reference to a recent query concerning the HEAVIEST BUNCH OF GRAPES, the following quotation from Mr. A. F. Barron's work may be interesting:—"1. Trebbiano: the largest bunch on record was that grown by Mr. Currer of Eskbank on a Vine of this variety; its weight was 26 lbs. 4 ozs. 2. White Nice: bunches reputedly of this sort have been shown from Arkleton weighing 25 lbs. 15 ozs. and 19 lbs. 5 ozs.; and from Castle Kennedy weighing 17 lbs. 2 ozs. 3. Gros Guillaume: Mr. Roberts, Charleville Forest, Ireland, has grown the largest bunches of this variety, one of which weighed 23 lbs. 5 ozs. 4. Syrian: Speechly's famous bunch of this variety, grown at Welbeck, weighed 19 lbs. 5. Black Hamburg: Mr. Hunter of Lambton exhibited one bunch of this weighing 21 lbs. 2 ozs., and another weighing 13 lbs. 2 ozs."

— PART 84 of the ENGLISH BOTANY, by Dr. T. J. Boswell, is now issued by the publishers, Messrs. G. Bell & Son, York Street, Covent

Garden, and commences with the flowerless plants, giving the Marsileaceæ, Isoetaceæ, Selaginaceæ, Lycopodiaceæ, and Ophioglossaceæ. Each species is represented by a most faithfully executed coloured plate, the descriptive matter being very full and correct. This series will conclude a most beautiful work on English Botany, and will no doubt be welcomed by many interested in the subject.

— MR. GILBERT MCDUGALL recently read before the Stirling Horticultural Society a long and interesting paper on the RARE NATIVE PLANTS of the district. He referred at length to a large number of plants, mentioning their chief peculiarities and the situations in which they are principally found.

— A CORRESPONDENT writes:—"THUNBERGIA ALATA IN MIXED COLOURS forms an appropriate edging to a stage full of Gloxinias. Large vases in conservatories are also very effective when filled with Gloxinias and edged with Thunbergias, the pendent growths of the latter bearing a profusion of their striking flowers produce a very pleasing effect."

— VISITORS to the National Rose Society's Exhibition, South Kensington, recently greatly admired Mr. H. Bennett's handsome NEW ROSE HER MAJESTY, which obtained the high, but well-deserved, honour of the Society's gold medal. Amongst light varieties this is likely to obtain a most prominent position, rivalling that of La France, and growers will eagerly look forward to its being sent out. As far as we could ascertain there was only one opinion respecting it—namely, that it was a most charming Rose, and further experience of its merits appears likely to strengthen this favourable impression. As will be seen from the report of the Sheffield Rose Show on another page, still further success was there achieved by this variety.

— MR. G. ALLIS states that the AMATEUR STRAWBERRY has proved a very superior variety for forcing; it is a free bearer and of a good colour (a very important point); the fruits are of good size, many of those forced this season weighed over an ounce each, and another point in favour is it bears carriage well.

— THE nineteenth annual Exhibition of the EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY was held on the 11th inst. in the garden of the Royal India Asylum, Elm Grove, Ealing, and as usual proved a great success. There were over 1000 entries in the numerous classes provided; and though the prizes were not large, the competition was very keen in the majority, plants, flowers, fruit, and vegetables being alike well shown. The cottagers' produce was uncommonly good, some of the exhibits being most creditable—quite as good as is seen in open classes at many shows. The two chief features were the handsome specimen plants staged by Mr. Hudson, gardener to H. J. Atkinson, Esq., Gunnersbury House, Acton, which secured for him the leading prizes, the magnificent *Gleichenia flabellata* and *Alocasia metallica* being without doubt two of the finest examples in cultivation. The other most notable exhibits being in the fruit classes—namely, the superb bunches of Duke of Buccleuch and Buckland Sweetwater Grapes from Mr. Baird, which were previously shown at Chiswick, and the grandly finished bunches of Madresfield Court Grapes from Mr. Hudson. The general management of the Show was most satisfactory and creditable to the Honorary Secretary, Mr. R. Dean, who has worked most energetically on the behalf of the Society.

DOUBLE-FLOWERING PELARGONIUMS.

NOT many years ago double-flowering Pelargoniums were considered by me as the most worthless of all our show flowering Pelargoniums, but now I regard them as the most valuable. In past times, within the recollection of most of your readers, the double-flowering varieties commonly cultivated were more noted for producing a dense mass of foliage than a profusion of blooms; but this character has been completely changed, as many of the recently introduced sorts grow and bloom with as much freedom as any Zonal. The finest doubles I have ever seen were at Chiswick twelve months ago, and there the plants were so fine, the flower heads so abundant, and the colours so rich and varied, that I decided at once to grow some. From cuttings last autumn they have become good-sized bushes in 8-inch pots, and the blooms we cut from them in one week would pay for twelve months' cultural attention; and much as they are valued for home decoration, they are doubly valuable for sending away for short or long distances. For some time we have given up

the practice of packing single Zonals, as, no matter how fresh and well packed they might be here, they exhibited a shaken and blemished aspect after travelling a hundred miles, but in the case of the doubles all this is reversed, and they might be packed in a box and sent across the English Channel without losing a petal. This is a character which should secure for them the most extended cultivation, and I would advise all who are interested in packing and sending away flowers to make a note of this.

In cultural requirements they do not differ from the old or best known single-flowering sorts. When the large heads of bloom are much exposed to wet they will soon decay in the centre, but this is nothing more against them than others, as all Pelargoniums are the same. If bedded-out this would no doubt be a charge soon brought against them, but it is not as bedders I value them or recommend them. It is for pot culture and greenhouse and conservatory decoration at all times they are most suited, and for this kind of furnishing I feel sure a few of them have only to be tried to insure the introduction of a general collection. Cuttings rooted at once would bloom throughout the winter, and plants which are now in 6-inch pots will do the same if shifted into 8-inch or 9-inch pots in August, and grown on in a warm rather dry atmosphere. The stock for next year may be rooted in August, and these need only be treated like any ordinary bedding variety to insure success. It will hardly be necessary to tell those in possession of a limited number of the best kinds to increase their quantity at once, as this they will no doubt do fast enough, but to those who are yet without the best new double varieties I would urge their being procured at the earliest opportunity. The following are all fine varieties:—

Purple.—Charles Darwin, Souvenir de Carpeux, Magenta King, Colonel Flatters, and Aglaia.

Orange.—J. C. Rodbard, Lord Cecil, and Richard Brett.

Salmon.—Carillon, M. A. Dupins, Ministre Constans, and General Farre.

White.—Madame Léon Dalloy, Nymphé, and Heroine.

Crimson.—Circe, Cæsar Borgia, and M. Pasteur.

Scarlet.—W. E. Gladstone, H. Cannell, and F. V. Raspail.

Rose.—Attraction, Loveliness, and Sensation.

Pink.—The Lord Mayor, Mrs. Arthur Lattey, and Sylvia.—
J. MUIR.

AUTUMN-SOWN ONIONS.

ABOUT the 24th of the month will be a good time to make the first sowing of Onions to come in for use in April and May next, and again about the middle or 20th of the next month for use in June and July. In order to obtain the best possible results, a piece of ground occupying a dry rather than a damp situation, and well exposed to the influence of the weather, should be selected for the crop. The ground should be liberally manured and deeply trenched, and then trodden all over, roughly raked, and after receiving a surface-dusting of soot, it should be again raked, this time evenly and with a finer rake, and the drills drawn 12 or 15 inches apart and 1 inch deep. The seed should be sown somewhat thickly, and be covered and finished off in the same manner as spring-sown Onions are, the after treatment being the same as with that given to the latter. The young plants can be thinned out when necessary, as required for salading in the autumn, leaving them, however, sufficiently thick in the rows to make allowance for mishaps during the winter months, as also for transplanting in spring if necessary.

The Queen and Early White Naples are two of the earliest and cleanest skinned Onions in cultivation, and also of mild flavour. They are the best varieties for this sowing, as they come into use in the order in which their names appear; and if we had to recommend a third variety it would be the Red Flat Tripoli, as being a large well-formed Onion. The result of this sowing will, in addition to forming an indispensable and prominent dish in collections of vegetables on the exhibition tables during the summer shows, fill the blank that would otherwise most probably occur between the bulbs of the preceding and current year's growth, through that of the former becoming flabby, and consequently of little value for culinary purposes, from the bulbs starting into growth in May and June.

Early in March the plants should be thinned to 6 inches in the rows, subsequently drawing every alternate one for use; and should the demand for the bulbs during the summer be such as to necessitate an extension of the crop, transplant in rows the same distance apart as stated above, and 1 foot from plant to plant in the rows, in ground prepared the same way as recommended for the reception of the seed. While preferring rather light and somewhat dry ground for sowing the seed in, we should give preference to ground the reverse of this for the growth of transplanted bulbs, as they attain a greater size in soil of this description; although if the seeds were sown in

stiff soil a greater percentage of the young plants would be more likely to perish during the winter months than would be the case in lighter soil.—H. W. W.

HOLLYHOCKS.

FEW outside flowering plants are more attractive than the towering spikes of Hollyhocks when in full bloom. It is to be regretted that they have very nearly gone out of cultivation in the majority of gardens, and this through the disease which has played such sad havoc amongst them during recent years. I am acquainted with many who were compelled on that account to give up their culture, and others refrained from trying them for fear the care and attention devoted to them would be in vain.

I do not in these notes intend to advise intending cultivators to purchase a stock of plants to commence with, because they might be affected with the disease; but on the contrary, to raise them from seed, which is decidedly the most reliable way of obtaining a stock of clean plants, and seedlings are quite as good for the embellishment of beds and borders as named varieties are. Some persons would, no doubt, sooner battle with the disease than grow unnamed varieties, but this is not the case with the majority, who admire them for their effective beauty in the garden, and are anxious to have healthy plants.

Some of the finest Hollyhocks I have ever seen were raised from purchased seed two years ago, and the plants have continued clean up to the present time. Last year I raised a number of plants, and they are perfectly vigorous and promising well.

In order to have strong healthy plants to flower next year seed should be sown at once in boxes or pans or under handlights outside. We practise the former method. After the seed is sown the pans or boxes should be placed in a cold frame until the seed has germinated and the young plants are ready for planting outside or potting. Although these plants are hardy and will pass ordinary winters safely they may perish if the weather proves very severe. They should have 3 or 4-inch pots when ready for taking out of the seed pans or boxes, and can then be stood outside until the approach of frost.

The majority of our plants last year grew vigorously, and were before autumn placed in 5 and 6-inch pots, in which they remained in a cold frame during the winter until they were planted out in spring. In the future we intend to winter the plants in 5-inch pots, and as soon as they commence growth in spring to place them in pots 2 inches larger, and then finally plant them out from these. By this treatment they can be kept a little longer under frame treatment without becoming root-bound, and will make greater progress afterwards than if planted out earlier or become checked by want of root room.—SCIENTIA.

PETRÆA VOLUBILIS.

TROPICAL climbing plants comprise many species of great beauty, such as the Allamandas, Dipladenias, and Bignonias, but none can be considered to surpass the lovely *Petræa volubilis* in delicacy of colouring and elegance of habit. Large specimens trained up the roofs of such houses as the stove at the Regent's Park Botanic Gardens, or the Palm house at Kew—both of which establishments contain fine examples—have a grand effect, their lilac and rich blue flowers being produced in such profusion that the plants appear to be perfect clouds of bloom. The colour, too, is very distinct from that of most other stove climbers. Yellows, scarlets, and crimsons we have in abundance, but blue and lilac or lavender shades are comparatively scarce, and in this we have a peculiar combination of the two that renders the plant even more striking and interesting. As shown in the engraving (fig. 13) the flowers are borne in long pendulous racemes, frequently nearly a foot long on vigorous plants. The corolla is five-lobed; the lobes roundish, expanded, and rich deep blue; the calyx also has five lobes, but these are considerably larger than those of the corolla, being frequently half an inch or more in length, and oblong in form. These also spread out parallel to the petals, or at right angles to the axis of the flower; moreover, they increase in size, remaining attached for a short time after the corolla falls. The colour is lavender or lilac, much darker in some plants; indeed, it appears probable that there are two varieties, one with a light or nearly white calyx, and the other with the same portion of the flower almost as dark as the corolla. Both are, however, charming plants, though the one presenting the contrast of shades, which is that shown in the woodcut, has general preference.

The history of *Petræa volubilis* is brief, but interesting in some degree. It was first discovered by Houston at Vera Cruz, but has also been found at Martinique and elsewhere. On the authority of Aiton's "Hortus Kewensis" it seems that seeds were first sent to the

Chelsea Botanic Garden before 1733, but from these Miller states only two plants were raised, flowers not being produced until 1802, when a specimen bloomed in Mr. Woodford's collection at Vauxhall. From this a coloured plate was prepared for the "Botanical Magazine" (plate 628), but the variety there shown is distinct from that we give, the corolla lobes being larger, the calyx lobes more narrow, and the colour a uniform purplish-lilac. Houston named the plant in honour of Lord Robert James Petre, who, it has been said, was "the worthiest of men, whose death was the greatest loss that botany or gardening ever felt in this island." A very large collection of plants was formed by this nobleman, large stoves and conservatories being erected for the tropical species, while the outdoor collection was also extremely large, the total number of individuals being said to be about 219,925.

The culture of the plant is easy. Given an ordinary stove tem-

perature, a good compost of turfy loam and peat, with a small proportion of well-decayed manure, and little difficulty will be experienced in both growing and flowering the plant, providing it be kept clear of insects, mealy bug being its especial enemy. Supply water liberally when growth is advancing, syringing freely to keep the foliage fresh and clean. It can be increased by layers, but the best way is to graft young shoots upon pieces of the root in April or May, when if treated like other root cuttings, placed in heat and shaded, young vigorous plants can usually be readily obtained. When first introduced, and for some years afterwards, it was thought that the plant could only be increased by imported seeds, and because seeds were not produced or perfected in England

it was thought the plant was either monœcious or dioecious. Miller, indeed, attributes the fact of only two plants having been raised from the seed sent by Houston, to the supposed circumstance that "the seeds were either gathered at a distance from the male tree, or from such parts of the tree as were remote from the male flowers." There does not appear to be any substantial grounds for this opinion, for many tropical plants fail to perfect seeds in England, even though they grow vigorously and flower most freely.—L. CASTLE.

WARMINSTER ROSE SOCIETY.

JULY 11TH.

THE above Society doubtless has been frequently eclipsed this season with regard to the extent of exhibitions by kindred societies, but in point of

FIG. 13.—PETREA VOLUBILIS.

perature, a good compost of turfy loam and peat, with a small proportion of well-decayed manure, and little difficulty will be experienced in both growing and flowering the plant, providing it be kept clear of insects, mealy bug being its especial enemy. Supply water liberally when growth is advancing, syringing freely to keep the foliage fresh and clean. It can be increased by layers, but the best way is to graft young shoots upon pieces of the root in April or May, when if treated like other root cuttings, placed in heat and shaded, young vigorous plants can usually be readily obtained. When first introduced, and for some years afterwards, it was thought that the plant could only be increased by imported seeds, and because seeds were not produced or perfected in England

enthusiasm and real love of the Rose they are pre-eminent. Better shows, owing to the lateness of the fixture this season, have been held at Warminster; yet, considering the difficulties with which the growers have to contend, and the comparatively small value of prizes offered, the competition must be considered highly creditable. No exhibitor is allowed to take more than one prize, although he may be adjudged a prizewinner in several classes, the value of the prize going to the next on the list. As a consequence every subscribing exhibitor is encouraged to persevere instead of being disheartened at the prospect of some highly successful growers annually carrying all before him, and the Society remains flourishing when others more ambitious collapse. Mr. John Scott, Warminster, well known in the west of England as a very successful Rose-grower, as may be imagined, is very seldom beaten by his neighbours; and another enthusiastic gentleman well known to the readers of the *Journal of Horticulture* in connection with the annual Rose elections—viz., Mr. J. Hinton, also exhibits well and successfully. The principal class was for twelve triplets, distinct, and here Mr. Scott

took the lead with a beautifully arranged stand, which included fine blooms of Alfred Colomb, Devoniensis, Duke of Connaught, Fisher Holmes, Catherine Mermet, Marie Baumann, and Marquise de Castellane. Mr. James Smith was a very good second, his best blooms being Marie Baumann, La France, Alfred Colomb, and Maréchal Niel. Mr. C. A. Bleech took the third prize. Mr. Scott was also first with twelve single trusses, distinct, among these being good examples of Duke of Edinburgh, A. K. Williams, Charles Lefebvre, Captain Christy, Louis Van Houtte, and Devoniensis. In the second-prize stand, exhibited by Mr. P. Gruff, were fine blooms of Marie Baumann, Maréchal Niel, and Louis Van Houtte. Captain Helme occupied third place, but his blooms were too forward. In the class for six trusses, distinct, Mr. J. Hinton staged good blooms of Captain Christy, Maréchal Niel, Triomphe de Rennes, Duke of Connaught, Marie Baumann, and Baronne de Rothschild, and was awarded the first prize. Mrs. Tarrance followed with a creditable stand, which included good examples of François Michelin and Marie Baumann. The best six Teas were staged by Mr. Hinton, these consisting of beautiful blooms of Madame Bravy, Triomphe de Rennes, Marie Van Houtte, Jean Ducher, and Niphotos. Mr. J. Scott was a close second, his best blooms being Catherine Mermet, Maréchal Niel, and Souvenir d'un Ami. Captain Helme won the first place for twelve single blooms, any one variety, with large fresh blooms of Edward Morren, and in the corresponding class for six blooms Mr. P. Grubb was first with Marie Baumann in good condition.

Messrs. Keynes & Co., Salisbury, exhibited, not for competition, several excellent stands of Roses, of which the most noteworthy were Beauty of Waltham, A. Colomb, Marie Baumann, Auguste Rigotard, Marie Van Houtte, La France, Reynolds Hole, Penelope Mayo, Star of Waltham, Dr. Andry, François Michelin, and Duchesse de Vallombrosa. Mr. Wheeler, Warminster, also staged stands of fairly good Roses, and Dr. Hitchcock some excellent Carnation blooms also, not for competition. Strawberries, both for size and quality, were extensively shown. The weather proved favourable, and the attendance of visitors good.

GARDEN CHEMISTRY—PHOSPHATES.

(Continued from page 23.)

GARDEN crops, almost without exception, make large demands upon the phosphates in the soil, but garden manures (those that come from the stables or are made out of collected leaves) are anything but rich in these. Owing to this very much larger quantities of manure have to be used than would be necessary were phosphates applied. Nearly always they are the weak link in the chain, and were this link alone made stronger much less ordinary manure would give results equal, if not superior, to what many gardens now produce. When a Vine or Peach border, or the mixing of potting soils are in question, phosphates are generally given; but in the case of vegetable quarters or flower beds this is seldom the case. The reason for this is, that bones—for it is in this form phosphates are generally employed—are lasting manures, and the good they do is attributed, not to the chemical virtues, but to the fact that they last. That they are not more generally employed otherwise is because for other purposes less lasting manures are supposed sufficient. It is not because ordinary manures are not lasting enough, but because they are wanting in what they should be rich, and rich in what is not so much wanted, that so much is required.

Combined with readily available nitrogenous matter phosphates alone have a wonderful effect on the members of the Brassica tribe. Cabbages, Cauliflowers, Turnips on any ordinary soil thrive wonderfully on such applications alone. Even without the nitrogen the Turnips do well; if they do not make such a rapid growth they make firmer bulbs of a finer quality, which keep better than if "forced" by too much nitrogen. While the leaves of the Cabbage family contain from 10 to 15 per cent. of phosphoric anhydride, the heart of the Cauliflower has as much as 25. This will partly explain the wonderful effect of phosphates in the production of fine Cauliflowers. Grapes (the ash of) contain from 17 to 23 per cent., and the finest Grapes invariably show the higher per-centage; the ash of the wood contains 15 to 19, the ash of Grape stone as much as 27, which fact may throw some light on the setting of Grapes. But experience proves that the application of phosphates to these and other garden crops has an effect quite beyond what such figures indicate, very probably because of their being scarce in the soil. When this happens the addition of phosphates alone may be quite equal to a heavy manuring of ordinary manure.

As chemistry demonstrates what materials best act on given crops, so she points out when best to find the materials. Among ordinary manures night soil ranks first in being rich in phosphates. Fowl dung, that from doves or from rookeries, is also rich, not only in phosphates but in nitrogen. For this reason the ammonia they contain when only partly fermented and the nitric acid afterwards formed often prove destructive where these manures are employed undiluted or in too large quantities; but if dry loam or clay be liberally used in deodorising and drying them, there will be no difficulty in distributing them evenly and profitably. One hundred parts of the ash of human excreta contain 37 of phosphoric acid. This is fully equal to phosphates from which phosphatic manures are made, and only second to the ash of bones themselves. But while these are considered worth quarrying and carrying from distant lands, and there-

after ground by powerful and expensive machinery, and, finally, dissolved by sulphuric acid, that nearest our hand, although it contains other valuable fertilising properties and requires neither carrying nor manufacturing, nor to yield profits on the way to numerous classes, is generally got rid of as if useless. Nay, more; we pollute our waters with it, and leave the plants that are in want of just such to starve still; and so we are punished by half crops, half rewarded labour, half return for capital, in addition to having a polluted land.

When bones were first used they were found to produce a wonderful effect on land from which the phosphorus had been carried away in the bones of generations of sheep and cattle and in the milk of the cows. Just so they acted when applied to land from whence the phosphorus had been carried in the grains and dissipated, ultimately in the sea, and just so they act in vegetable crops, and for the same reason.

At first they were applied crushed, but it was soon found that when ground to meal the effect was more rapid, and, in one sense, economical. A great advance was made when, over forty years ago, the late illustrious Baron Liebig discovered that by treating them with sulphuric anhydride (vitriol) they could be rendered soluble, and so to act with still greater rapidity. Very shortly after Mr. (now Sir) J. B. Lawes made a more important discovery still, when in 1842 he showed that "superphosphate" made from mineral phosphates was identical and of equal value with that from bones. Later still Mr. Jamieson has shown that very finely ground phosphates are, under certain circumstances, equal to dissolved phosphates and considerably cheaper.

Phosphates exist in bones, bone ash, coprolites, and in apatite in the form of tricalcic diphosphate ($2\text{PO}_4\text{Ca}_3$). In this form it is only very sparingly soluble in water. The manufacturers render it soluble by treating it with sulphuric anhydride, whereby it becomes "dissolved bones." This term is, however, incorrect. Perhaps the following table will render what takes place intelligible. But first let us premise that the terms tribasic phosphate and monobasic phosphate so commonly used are wrong. All phosphates are tribasic. But soluble phosphate is monocalcic, while ordinary phosphate is tricalcic—in other words, three-limed. Phosphates in a raw state consist of—

In the case of monocalcic—or soluble phosphate—it is as follows:—

The change has been brought about by bringing the phosphate into contact with the vitriol. This strong acid has taken the part of the lime from the phosphoric acid, which has had to content itself with water instead. The vitriol now in combination with lime has become calcic sulphate (gypsum or plaster of Paris—"plaster" of the Americans).

The soluble phosphate, although soluble and fit for ready absorption, is a very acid salt, and when applied to soil is either precipitated by the alkalis present, such as lime or potash, or oftener ferric peroxide, and thus becomes at once insoluble, or proves by its very acidity to be hurtful to vegetation. The present manner of valuing phosphates causes manufacturers to strive to have as much of this soluble acid salt as possible, for it is allowed a very much greater value by chemists than what is insoluble. Yet precipitated phosphate is more valuable, being equally fit for use by the plants and less hurtful. Indeed, as we have said, the soluble phosphate is at once precipitated or remains hurtful.

Precipitated phosphate differs from either monocalcic or tricalcic phosphate. Monocalcic phosphate has one part of lime and two of water for its base. Precipitated or bicalcic phosphate has two of lime and one of water. When "superphosphate" lies for some time much of the monocalcic salt changes into the bicalcic; but a better way of bringing about this result is to add bone dust to the superphosphate. This gives up one part of its lime to the monocalcic salt, and both become bicalcic. Bicalcic phosphate, though not very soluble in water, is readily attacked by plants.

There is another way whereby tricalcic phosphates are made readily available by being converted into bicalcic phosphates. When to ordinary soils bone dust or ground phosphates are applied the carbonic acid attacks the phosphate, and though unable to displace two molecules of the lime, it is capable of stealing one. With this it forms carbonate of lime (calcic carbonate), and the remnant of the phosphate becomes ready for use. This will give more satisfactory results than the more soluble salt.

Fermenting bones causes them to assume the form of bicalcic phosphate; and gardeners who study economy and have bones at command will find this way of preparing them well suited to their purpose. If the bones are crushed or broken with a hammer and

mixed with horse droppings—if the heap be large the droppings will not be necessary—and an equal weight of loam or clay to absorb the resulting ammonia, and the whole moistened with urine, the heat will soon rise, and the bones become softened and made readily available as plant food. Those who have bones and wish to prepare them more rapidly for use than Nature would do will find this a cheaper plan, and ultimately as effective as preparing them by means of vitriol. Doubtless finely ground mineral phosphates would be rendered more available for the current crop if they were sprinkled among ordinary manure when put up to ferment. While carbonic acid renders phosphates more readily soluble, solutions of salts have the same effect. Common salt acts in this way, so does ammonia sulphate. But the roots of plants have the power of dissolving mineral substances, and have been found to corrode even dolomite. Strong-growing plants have this power in an enhanced degree, and very probably whatever adds to the vigour of a plant aids it indirectly in dissolving not only phosphates but other minerals as well.

It is impossible to meet the demand for phosphates by the supply of bones; but, luckily, there exist in various quarters of the globe apparently inexhaustible supplies of mineral phosphates, from which superphosphates of the first quality may be manufactured. At home coprolites have been dug up and largely used for this purpose. The less of matter other than tri-calcic phosphate the more valuable they are. The more foreign matter, such as calcic carbonate, ferric oxide, or alumina, the greater the quantity of sulphuric acid uselessly expended, for the acid combines with these and the product is of little value.

Cambridge coprolite was for long considered the best native phosphate, but it is now hardly so rich as it once was, containing as it does less phosphate and more other matters. Buckinghamshire coprolite is also much valued; it contains as much as 64 to 66 per cent. of phosphate. Those found in Bedford and Suffolk contain much iron, which makes them less valuable than the above; the best samples yield about 56 per cent. of phosphate, the red and black Wicken from 40 to 50. Among the best of foreign phosphates are those from Bordeaux, but they seem to be getting scarce. The best samples contain as much as 76 per cent. of phosphate, but others no more than 50, much clay and iron being present.

South Carolina phosphate is largely used, and as it contains little iron or lime it does not "waste" so much acid in its reduction. Although containing about 55 to 60 per cent. only of phosphates, the bulk of the other matter is sand, which does not combine with the vitriol as does lime or iron. Curaçoa phosphate is the purest phosphate imported with the exception of bone ash. It contains as much as 88 per cent. of pure phosphate. Many other phosphates are imported, but these are the principle ones in the market. Lately, however, phosphates containing alumina and iron in place of lime have been used, and although prejudice was against them, they have been found nearly, if not quite, equal to calcic phosphate. The chief kinds are Alta Vela and Rhedonda. In 1881 a mixture of 2 cwts. of the former mixed with an equal quantity of kainit produce 15 tons of Potatoes to the acre on Munster farm, as against considerably less produced in some instances by more favoured phosphates. In some other instances better results were produced by Curaçoa and American phosphates, but not in all. The phosphates naturally present in soils are generally phosphates of iron and alumina, and soluble phosphates artificially applied very often assume these forms. Although less soluble than calcic phosphate, the plants seem to be able to use them. As Alta Vela phosphates are often considerably lower in price than Curaçoa phosphates, it may sometimes be real economy to use such.

In South America, where cattle are killed for the hides, horns, and fat, the bones and dried flesh are used for fuel. The ash from the fires is imported under the name of bone ash, and is a source of superior superphosphates, for though not often containing more than 60 per cent. of tri-calcic diphosphate, the matter with which it is mixed does not contain anything worth mentioning possessing the power of neutralising the acid.—SINGLE-HANDED.

(To be continued.)

WIRRAL ROSE SHOW.

JULY 10TH.

THE above Society held their fifth annual Exhibition in St. George's Hall, Liverpool, instead of in the Archery Ground, Birkenhead, as in previous years. The Exhibition, as far as the quality and quantity of the exhibits were concerned, was a great success, but we fear this was not the case financially, as the thin attendance of visitors must have been anything but gratifying to the Committee of the Society. This is to be regretted, for never before were such a large and beautiful display of Roses brought together in the city. The blooms were very numerous, and on the whole much superior to what the most sanguine anticipated after the recent heavy rains. The dark varieties were in the best condition, while the lights displayed unmistakably the effects of the weather. Tea varieties were more numerous than at any other of the Society's previous exhibitions; they were also larger and of superior quality.

In the nurserymen's class for seventy-two blooms Messrs. Cranston

and Co., Hereford, took the lead, followed closely by Mr. B. R. Cant, Colchester, and Messrs. Paul & Sons, Old Nurseries, Cheshunt. In the premier collection some handsome blooms were staged of Mrs. Baker, large and full; Beauty of Waltham, very fine; Mdlle. Eugénie Verdier, Victor Verdier, Dingee Conard, in splendid form; Tea Niphotos, large; Horace Vernet, Pride of Waltham, superb; George Moreau, Princess Beatrice, Madame Montel, large and beautiful; Jules Finger, and Madame Vidot, amongst many others. Mr. Cant's boxes contained grand blooms of Abel Carrière, Tea Catherine Mermet, Devienne Lamy, Mrs. Baker, Countess of Rosebery, Madame Ducher, Etienne Levet, Boildeau, Gloire de Vitry, and Reynolds Hole. In the third collection R. N. G. Baker, William Koelle, May Quennell, Mons. E. Y. Teas, and Duke of Teck were grand. For thirty-six blooms Mr. G. Prince, Oxford, took the lead with a grand lot. Mr. J. House, Peterborough, was a good second; and Messrs. James Dickson & Sons, Newton Nurseries, Chester, were third with good, even, fresh flowers. Those shown in this class by Mr. Frettingham, Beeston, Notts, Messrs. Perkins & Sons, Coventry, and G. Davison & Co., Hereford, are also worthy of mention, as these collections contained some remarkable flowers. In the class for thirty-six triplets Messrs. Paul & Son, Cheshunt, were deservedly placed first, followed by Mr. B. R. Cant and Messrs. Cranston & Co. In the class for eighteen triplets four competitors staged some remarkably fine blooms. The awards were accorded to Mr. G. Prince, Messrs. James Dickson & Sons, and Messrs. Perkins & Sons, Coventry.

For twelve new Roses there were three competitors, and the first and second prizes were awarded to Messrs. Paul & Sons and B. R. Cant in the order as named, both exhibitors staging really first-rate blooms; the former having good Ulrich Brunner, George Moreau, Mrs. Harry Turner very bright and full; Guillaume Guillemot, Mrs. Jowitt, Merveille de Lyon, Souvenir de Madame Alfred Vy, and Madame Isaac Perrière. The latter staged Tea Etoile de Lyon, bright yellow; Violette Bowyer, a beautiful white bloom; Madame Montel, Helen Paul, Masterpiece, and others similar to those staged in the first collection.

Tea varieties were of superior quality, and the competition was keen. Mr. B. R. Cant was deservedly awarded the place of honour, followed very closely by Mr. G. Prince; Messrs. Paul & Sons being third. Messrs. F. & A. Dickson & Sons, Chester, amongst others, also staged a remarkably fine collection. The first collection contained large well-formed blooms of Paul Neyron, Madame H. Jamain, Devoniensis, Bougère, Niphotos, very large; Adam, superb; Souvenir d'Elise, grand; Caroline Kuster, Rubens, large; Madame Lambert, good; Madame Welche, Comtesse de Nadaillac, Souvenir d'un Ami, La Boule d'Or, and Moiré. Mr. Prince had remarkably fine blooms of Jean Ducher, Innocente Pirola, Alba Rosea, Perle des Jardins, Rubens, and Niphotos. In the third collection Madame Casin, Perle de Lyon, Madame Angèle Jaquier, and Belle Lyonnaise were the best. Six competitors staged blooms in this class.

In the class for any new seedling Rose not in commerce Mr. Frettingham, Beeston, Notts, was awarded the Society's gold medal for blooms of Lord Frederick Cavendish, which is bright in colour, full, and much after Duke of Edinburgh and Prince de Porcia in the wood. It has the appearance of being a robust grower, judging from the grand plants exhibited.

There were eleven classes open to all amateurs, and the whole of the classes were filled, some grand blooms being shown. In the class for thirty-six varieties E. R. Whitwell, Esq., Barton Hall, Darlington, was well ahead, showing bright well-formed flowers of Lord Macaulay, Mons. Boncenne, Alfred Colomb, Général Jacqueminot, Madame Lacharme, Avocat Duvivier, Xavier Olibo, E. Y. Teas, Louis Van Houtte, Madame Prosper Langier, La France, Abel Grand, Mdlle. Eugénie Verdier, and Duchesse de Vallombrosa. C. J. Day, Esq., Rowton, Chester, was a good second; and Mr. T. B. Hall, Larchwood, Rock Ferry, third with fresh but smaller blooms. For twenty-four blooms the Rev. L. Garnett, Christleton, Chester, was first, followed by Miss Massey, Chester, and R. Tanner, Esq., Onibury, Salop, in the order named. Mr. Garnett staged good blooms of John Bright, Abel Carrière, A. K. Williams, Charles Lefebvre, Madame Clemence Joigneaux, and President Willermoz. For twelve blooms Mr. C. Hutchings, Warrington, was first, having good Duke of Wellington, Charles Lefebvre, Mdlle. Marie Rady, and Madame Victor Verdier; Mr. T. Griffiths, Oxtou, second with smaller blooms; and Mrs. Watts third. In the class for twelve triplets E. R. Whitwell, Esq., took the lead; Mr. T. B. Hall second, having some splendid light flowers in his collection. For twelve Tea varieties C. J. Day, Esq., was first with creditable blooms. Mr. T. B. Hall was second with very neat flowers, and R. Tanner, Esq., third. For six blooms Messrs. Hall and A. Tate were the successful exhibitors.

For twelve blooms of any pink Rose Mr. Garnett was first with a very fine box of La France; Mr. T. B. Hall second with Mdlle. Marie Finger; and Mr. T. Griffiths third with Eugénie Verdier. For twelve crimson blooms of any one Rose the last-named exhibitor was the only competitor, and was awarded the first prize for bright flowers of Charles Lefebvre. For six new Roses Mr. T. B. Hall was first. In the remaining class for six Tea and six H.P. Roses the prizetakers were Messrs. Day, Hall, and Tanner.

The next section provided two classes, which were open only to local amateurs, for twenty-four varieties. Mr. T. B. Hall was deservedly awarded the gold medal, and Mr. Griffiths was placed second. For eighteen varieties the same exhibitors were again successful, and were awarded the prizes in the same order; Mr. Griffiths being awarded the prize for the premier bloom in this section, which was accorded for a perfect bloom of Duke of Wellington. The next section of the schedule was also devoted to amateurs, from which exhibitors in the above classes were excluded. For eighteen blooms Mr. W. Mease, gardener to C. W. Newmann, Esq., Wyncote, Allerton, was well first with very fine blooms for this locality, and for which the silver medal was awarded. Mr. G. Churton, Parkgate, was placed second; and Mr. Barker, gardener to J. T. Raynes, Esq., Rock Ferry, third; and Mr. Waterman, gardener to A. Tate, Esq., Woolton, fourth. For twelve blooms the first-named exhibitor was again first, Mr. Waterman second, Mr. Barker third, all staging flowers very creditable to the growers.

In competition for the bronze medal, and from which the previous exhibitors were excluded, some good flowers were staged, and the competition in most instances was keen. For twelve blooms Mr. H. G. Tippett, Rock Ferry; Mr. C. K. Hall, Oxtou; Messrs. W. Gaman, Rock Ferry, and

D. McIver, Mr. P. Bromborough, were the prizetakers in the order named. For six blooms Joseph Armstrong, jun., Esq., Lower Bibbington, was the principal prizewinner. For twelve varieties of Teas Mr. T. B. Hall was the only exhibitor, and was awarded the first award for a grand collection of blooms. Mr. E. Claxton, Allerton, and Mr. A. Tate were the prizetakers in the class for nine blooms, the former staging fine blooms of Marie Sisley, Adam, Alba Rosea, Belle Lyonnaise, and Comtesse de Nadaillac; the latter good Devoniensis and Madame Willermoz. Messrs. G. Tippett, W. E. Hall, and J. G. Churton were the prizetakers in the class for six blooms.

The remaining classes were devoted to cottagers, and very creditable blooms were staged. Messrs. H. Mercer, J. Hazelby, and A. Molyneaux were the principal exhibitors. The classes devoted to bouquets need no comment.

Miscellaneous Exhibits.—Messrs. W. Paul & Son, Waltham Cross, Herts, contributed very largely to the beauty of the Exhibition, some thousands of blooms being staged from these nurseries, entirely filling the side, one table extending the whole length of the hall. The way in which this mass of Roses was grouped was striking and attractive. In the front, boxes were arranged the entire length, each box in many instances being filled with blooms of one variety, and in others the whole of the varieties were distinct. At the back of these, round hampers or baskets about 18 inches over were slightly elevated and filled alternately with Tea and Hybrid Perpetual Roses. Some of the most striking baskets of Teas were Devoniensis, Safrano, Madame Falcot, Jean Pernet, Homère, Perle des Jardins, Souvenir d'un Ami, Souvenir d'Elise, and Niphotos. American Banner was also in good character and striking. Amongst Hybrid Perpetuals Queen of Queens was well shown, Madame Alfred Rougemont, Baronne de Rothschild, Alfred Colomb, Star of Waltham, Rosieriste Jacobs, Charles Lefebvre, E. Y. Teas, Crown Prince, Duchess of Bedford, and many others. Another striking Hybrid Tea seedling, cherry-red in colour—said to be a good climber—was also noticeable. Mr. J. House, Peterborough, exhibited a box of William Allen Richardson, which was much admired, also a seedling light in colour named Alpha; Messrs. F. & A. Dickson & Sons several boxes of Roses in excellent condition; Messrs. James Dickson & Sons a small collection of Japanese Maples; The Horticultural Company (Mr. John Cowan), Garston, a collection of Roses in pots, Begonias, Caladiums, and a general assortment of flowering and foliage decorative plants. T. Griffiths, Esq., Oxtou, sent boxes of Capitane Christy and Paul Neyron Roses in capital condition.

The arrangements of the Show were good, and the Committee and gentlemen who assisted them deserve the warmest congratulation.

PANSIES AND VIOLAS FOR BEDDING.

HAVING had these for a number of years all that I could desire, both in warm southern districts and in cool northern localities, I find it is more a matter of cultivation than mere latitude or climate. It is often a mistake to insert the cuttings too early in the autumn, and coddle them too much during the winter. When they are thus induced to flower early they do not stand the summer well. We do not remember having them do much better than the present season. The cuttings (about 5000) were inserted towards the end of October last. The ground was a piece where Cabbages were cleared off, well broken, mixed with sand and light soil on surface. The cuttings were inserted a few inches apart, and frames were placed over them, the lights tilted up at all times except when frosty. The surfaces were frequently stirred, and in April the plants were strong and vigorous and planted out in full flower. The ground for blooming them on was turned up deeply and heavily manured from the cowyard. Though till lately little rain fell since the plants were put in the ground, they have grown well, have been a mass of flower all the time, and we expect them to continue to the end of the season.—M. T.

THE VALUE OF DEEP CULTIVATION.

THE full value of trenching is only seen in summer, and the hotter and drier it is the more apparent are the advantages of deeply worked soil. A great saving in summer labour results from deep cultivation in winter. Here all ground bare in winter is trenched. The result is that in hot weather I find other people either applying water continuously or, where there is a deficient water supply, have withering crops. In our case we have not given a gallon of water to any crop during the late dry weather save Celery, which was watered when planted out, yet the crops flourished as I never saw them. The reason is not difficult to find. Instead of a depth of 9 or 10 inches of soil, into which most of their roots are crammed, we have a depth of 2½ to 3 feet for the roots to travel in, and these deeper roots keep crops going in a season of drought. I have had subsoils, too, to deal with, but these can be, and are, made into deep feeding ground by liberal admixture of decayed vegetable refuse. Then stable manure is used in as fresh a state as possible. Every particle of these is penetrated by the roots and appropriated, while manure that has lain in heaps decaying is little better than the soil it is surrounded by.

Gardeners employing artificial manures will in dry weather find them of no use whatever. Were we in a position to irrigate certain crops thoroughly, we should do so occasionally in order to bring these manures into action; but there is no use in watering unless we can saturate the ground at a rate equal to, say, 3 inches of rainfall.

The Potato crop shows, perhaps in as striking a manner as any other, the great importance of thoroughly working and pulverising the soil to a good depth. In well-worked soils greened Potatoes will be rare, for the simple reason that the tubers can work downwards.

Without earthing up our Potato crops we find very few greened tubers. In soils which are worked to an insufficient depth, and consequently hard below, the tubers, despite earthing up, will be forced through the surface and greened.

In planting out crops such as Lettuces and Brassicas we invariably do so when the plants are young. When they are lifted the roots are drawn through a mixture of soil and water of the consistency of paint. A broad drill is drawn with a hoe where the plants are to be set out—this in order to clear the dried surface soil back. Then a man goes quickly along each row, saturating it with water through a coarse rose. Another man follows and puts in the plants. A run over with the Dutch hoe completes the work. In special cases small pots are placed one over each plant for a week. We do this in preference to watering, but it is only in cases of badly rooted plants we find protection necessary.—B.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

JULY 11TH.

THIS was the first summer Exhibition held by the above Society since 1880. It was held in the Waverley Market, Edinburgh, and was a one-day Exhibition, the competition not being so keen as is usual at Edinburgh. This applies more particularly to plants in pots, which were rather limited as to number and deficient in size. In fruit, however, the competition was fairly good, much of it being of superior quality, which was more especially noticeable in the case of black Grapes, Peaches, Melons, Strawberries, and Cherries. Roses were a good feature of the Exhibition. In the gardeners' and nurserymen's sections alike the competition was good and the blooms generally fresh and fine.

AMATEURS' CLASSES.

For a table 20 feet by 5 feet arranged for effect the best prizes were offered. Only two competitors staged, that of Mr. R. Grossart, gardener to P. Buchanan, Esq., Oswald Road, being easily first, while to the other, from Mr. Paul, Gilmore Place, the second prize was awarded. Rare and fine Orchids were freely employed in both arrangements. Mr. Paterson, Millbank, was the only exhibitor of six stove and greenhouse plants in flower, and was awarded the first prize for these. Very few Orchids were shown. Mr. Paul staged the only four distinct sorts, and was awarded first prize, Mr. Curran being in the same position for two sorts. To Mr. Paterson the first prize for one Orchid was awarded for *Disa grandiflora*. Ferns were in general small though fresh. In the first-prize lot of six sorts exotic Ferns Mr. Paul staged a good pair of *Leucostegia immersa* and a couple of *Todeas*. Mr. Paul was the only exhibitor of *Gleichenias*, and received the first prize. *Adiantums* were poor. British Ferns were well shown, Mr. Leyden, Whitehill, being first for six, and Mr. Anderson, Pilrig Model Buildings, taking the same position for six small-growing varieties. Plants for table decoration were numerous, and effectively placed down the centre of one of the fruit tables, Mr. Grossart being awarded the first prize for six sorts. Well-bloomed large Fuchsias were staged, the best being from Mr. Kerr, Fountain-hall Road. Zonal Pelargoniums were not very large nor overtied-in, and were fresh and well bloomed. For these Mr. Johnston, Woolmet, Dalkeith, took the premier position. Some very fine *Gloxinias* attracted notice, those from Mr. Bowman, Pittendreich, being the finest.

Fruit.—Two collections only were in competition for the prizes offered for eight kinds. Mr. Johnstone, Glamis Castle, was easily first. The sorts were Black Hamburg Grapes, extra fine, and Alicantes; a Pine Apple and Melon, a dish of good Brown Turkey Figs, Hunt's Tawny and Elruge Nectarines, and a dish of Peaches. Mr. Boyd, Callander, was second with a good collection. Mr. Murray, Culzean Castle, Ayrshire, had the best Pine Apple. Numerous examples of Black Hamburg Grapes were staged, all of which were of fine quality. The first prize was won by Mr. Johnstone, the berries being large, black, and with the densest bloom. Any other kind of black brought a couple of good bunches of Madresfield Court from Mr. Boyd, which gained him first, and good specimens of Muscat Hamburg from Mr. Dow, Newbyth, to whom the second prize was awarded. Mr. Dow also had first for Muscat of Alexandria in the white Grapes, and Mr. Wilson, King's Meadows, Galashiels, second with Buckland Sweetwater. For the following fruits the undernoted took the first prizes:—For six Figs, Mr. McIntyre, The Glen; for six Peaches, Mr. McKinnon, Melville Castle, with fine fruit; six Nectarines, Mr. Young, Taymouth Castle, with extra fine Elruge, also for Melon with Breadalbane, a fine 7 lb. fruit of the Victory of Bath type; for Cherries, Mr. Methven, Blytheswood; for four dishes of Strawberries, Mr. Dow; and for a basket of Strawberries, Mr. Brotherston, Tynninghame, with large fruits of President.

Vegetables.—Mr. Potter, Seacliffe, North Berwick, had the best collection of eight sorts. Good Cucumbers and Tomatoes were also staged among a quantity of commoner vegetables.

NURSERYMEN'S CLASSES.

Messrs. Ireland & Thomson had the premier position for a table of plants—a rich arrangement of fine-foliage and flowering plants, such as *Dipladenias*, *Ixoras*, and various Orchids. Messrs. R. P. Laird & Sons took the second prize with a bold and conspicuous group, and Messrs. Dickson & Co. were third. Messrs. Ireland & Thomson had in addition to above first prizes for four Palms and for six *Dracenas*, and second prizes for twelve table plants and two Tree Ferns. Messrs. R. P. Laird & Sons had first for six table plants and six *Dracenas*; Messrs. Dickson & Co. first for two Tree Ferns; The Lawson Company first for twelve Coniferae; Mr. Sutherland, Lenzie, first for twelve table plants; Mr. Wilson, Kendal, receiving a first prize for two pot Roses, and a second for six table plants; and Mr. Bryson, Helensburgh, first for four pot Roses; while Mr. Robertson Munro, Portobello, was the only exhibitor of alpine and herbaceous plants, and received the prizes for these.

Roses.—Taking the nurserymen first, for forty-eight distinct kinds Mr. Hugh Dickson, Belfast, was first, Mr. C. Turner, Slough, being a remarkably

close second, and Mr. Bunyard, Maidstone, third. Dickson's Roses were in a slightly more advanced stage than the others, consequently were not quite so fresh as the half-opened buds of the others. For twenty-four blooms Mr. Bunyard was first, Mr. Turner again second, and Mr. Dickson third. In the twelves the competition was slight, Mr. Dickson being easily first, and Messrs. D. & W. Croll, Dundee, second. In the gardeners' section the chief prize was for thirty-six blooms. Mr. R. Fergusson, Clermiston, was awarded first prize for these with a very good lot, though several of the blooms were *passée*. Mr. W. Parlane, second, with a fresh and well-coloured lot of buds; and Mr. McIntosh, Paxton, Berwick, third. For twenty-four blooms, excluding Teas, Mr. Kirk Allon was first and Mr. Fergusson second; and for twelve blooms Mr. Sheack, Lauriston Castle, was first and Mr. J. Bowman second. For twelve Tea Roses Mr. Parlane was first and Mr. McIntosh second; Mr. Bowman being first for six Teas; these were small.

In addition to competition produce an assortment of hardy shrubs was noted from Messrs. Ireland & Thomson; also a table of decorative plants from Messrs. T. Methven & Sons; another from the Lawson Company, who also staged a collection of cut branches of a hundred deciduous trees and shrubs, and many spikes of cut herbaceous plants. From the Royal Botanic Gardens an interesting collection of insectivorous plants was contributed. Mr. Turner sent a collection of blooms of Picotees and Carnations, which attracted much attention, while a large number of excellent cut Roses were set up by Messrs. Ireland & Thomson, and a smaller lot from Messrs. J. Cocker & Sons, Aberdeen. In a box of seedling Pinks exhibited by Messrs. Dickson & Co. were blooms of a lovely white variety, like a Gardenia, named Mrs. W. Welsh.

THE ROSE ELECTION.

WITH the consent of the powers that be, I propose that the election this year shall consist of the newer varieties. I propose to ask for the best six, second best six, and next best twelve exhibition Roses introduced since 1877, including that year. Then as some of our gardening friends contend that we are always talking of Roses as "exhibition" flowers, and exhibitions are nothing to them, I propose to ask for "garden" Roses in the same way—best six, second best six, and next twelve. I shall tabulate results after August 31st.—JOSEPH HINTON, *Warminster*.

STOKE BISHOP HORTICULTURAL SOCIETY.

JULY 12TH.

A HIGHLY creditable Show held under the auspices of the above Society was arranged in the grounds adjoining the residence of E. P. Wills, Esq., Hazlewood, Sneyd Park. The district comprising one of the most fashionable suburbs of Bristol, no difficulty is experienced as regards securing an abundant display of all kinds of fruits, flowers, and vegetables; but unfortunately on each occasion, including that under notice, the weather proved wet and unfavourable. Roses were well shown, more especially by Mr. Cole, gardener to W. Pethick, Esq.; H. Derham, Esq.; Mr. G. Howe, gardener to Lewis Fry, Esq.; Mr. T. Hobbs; Mr. H. K. Ward, gardener to W. H. Budgett, Esq.; Mr. W. E. George; Mr. F. Edwards, gardener to J. Lysaght, Esq.; and Mr. G. Davis, gardener to H. Fedden, Esq., all of whom secured one or more first prizes in the various classes provided. The best collection of thirty-five Ferns was arranged by Mr. H. K. Ward, who was closely followed by Mr. W. Bye, gardener to J. Derham, Esq., the third prize going to Mr. Cole. Gloxinias were well shown by Mr. F. Edwards; pot Roses by Mr. Cole; ornamental-foliaged plants for dinner-table decoration by Messrs. Prideaux, E. G. Cole, and H. K. Ward; plants in bloom, suitable for drawing-room decoration, by Messrs. E. G. Cole, W. Rye, and H. K. Ward; and twelve bunches of cut flowers by Messrs. W. Rye, E. G. Cole, and H. G. Cole, the prizes being awarded in the order named in each instance.

Mr. Cole staged the best black Grapes, and was followed by Mr. W. Rye, while Mr. H. K. Ward had the best white Grapes, and was followed by Messrs. Rye and Cole; the exhibits in each instance being of great merit. The best three dishes of Strawberries were shown by Mr. W. Rye; and Messrs. F. Edwards, Cole, T. Pease, and W. F. George were also successful exhibitors of Strawberries. Mr. W. F. George had the only Melon, and was adjudged the first prize. Peaches were well shown by Mr. E. P. Mills and H. K. Ward. Mr. Rye took the lead with six dishes of hardy fruits; Mr. C. Thomas and Mr. J. Harris taking the remaining prizes. Mr. Cole was first with a collection of vegetables, Messrs. Ward and Rye following. Messrs. Parker & Sons contributed several stands of Roses, Ferns, and other plants, and Messrs. Garaway, Clifton, sent a considerable number of cut Roses, also not for competition, which were much admired. The arrangements were most satisfactory and reflect great credit on the Secretaries—H. Fedden, Esq., and Mr. H. K. Ward.

CÆLOGYNE CRISTATA.

As a last word on my part on this subject, allow me to assure Mr. Young I do not consider the cutting-out from specimen plants of useless crowded pseudo-bulbs altogether wrong. What I do maintain is that if the said pseudo-bulbs are alive they are not useless, or spent, to use Mr. Young's word. Now to meet his feasible or possible plan your correspondent brings up an imaginary plant, for to such, I contend, his description applies. In my experience I have met with plants 5 to 6 feet across crowded with leafless pseudo-bulbs in centre and a very few stray weak growths, but never one in which any part was crowded with spent bulbs, and also in the same part covered with healthy growth requiring room for development. To the plant I have described I would take out from the middle in three different places sufficient leafless pseudo-bulbs to the extent I considered requisite for room; pot them up for growing on, and cut the root-stems of the remaining parts, when I should expect the plant to refill the pit. Most gardeners know that the habit of this plant is to grow away from the centre as I have described, leaving it almost

barc of leaves, not to mention healthy growth. To prevent this either the plan as above is requisite, or more careful potting than Mr. Young described. I am sorry if I have in any way appeared to Mr. Young not to wish to understand him, and must leave the matter to your readers. I consider his second note was necessary to make plain the full meaning of his first; and the third serves to draw my attention to a printer's error, as in my copy I quote him to say "possible," and not "impossible," as I am printed. I do assure him my conclusions are not the result of hurried reading.—ROBERT GRINDROD.

THE HERBACEOUS PLANT BORDER.

Continued from page 5.

ANCHUSA ITALICA.—Free in growth and flowering the whole of the summer, forming a pyramid 3 or 4 feet high, somewhat branching. Flowers deep sky blue with white eye. Fine for back rows.

POTENTILLA FORMOSA.—Height about 2 feet. Flowers bright cherry red, very pleasing, produced in great profusion and for a long time. The foliage is very pretty, and the whole plant taking. It likes a sunny situation.

SILENE MARITIMA FL.-PL.—This is a beautiful rock plant, where it shows to great advantage from its prostrate habit. It forms spreading tufts scarcely a couple of inches in height, having glaucous foliage, very free-flowering; flowers large, double, and white. It is of free growth, doing well in the herbaceous border; but it does not show well in such a position from its prostrate habit, but in rockwork is very telling.

HEMEROCALLISES.—These are just now very beautiful, alike from their bold, handsome, long, and broad leaves, and clusters of yellow flowers—Lily-like, which are delightfully fragrant and fine for cutting. They do best in deep moist soil, but will succeed almost anywhere, and ought to be grown in quantity where cut flowers are in request. The best is perhaps *H. disticha* fl.-pl. with double flowers of a deep bronzy yellow. *H. japonica* is pale yellow and dwarf. *H. Thunbergi*, clear yellow and somewhat less in growth than *H. fulva*, which it much resembles; indeed all the *Hemero-callises* are similar. *H. fulva* has dull orange flowers, and the strongest-growing of the lot, *H. Kwanso* fl.-pl., has large double flowers, bronzy orange, and shy. The variegated form of the last—viz., *H. Kwanso* fl.-pl. fol. var. is very beautiful in foliage, and is not nearly so hardy as the species. *H. flava* is the old bright gold Day Lily and very fragrant.

SPIRÆA ARUNCUS.—A noble border plant, doing well in most any position, but best in a deep damp soil. Its ample foliage and long feathery panicles of innumerable small white flowers are particularly striking and very graceful. It grows to a height of 3 to 4 feet.

SYMPHYTUM OFFICINALE VARIEGATUM.—In the spring and early summer months this is very striking from its long large leaves, which are beautifully variegated with yellow. It is a tall-growing plant, 3 feet or more, and is just now in flower; but the flowers are not so beautiful as those of Prickly Comfrey, which for the wild garden and shrubbery border is well worth place. The plant is more remarkable for its foliage than its flowers. It is one of the most striking of hardy variegated plants.

FUNKIA SPECIOSA.—The flowers of this are pure white, freely produced, and are very useful for cutting, being borne in long graceful spikes. It does best in moist soil and increases rapidly. The foliage is bold and handsome.

FERULA COMMUNIS.—Probably the finest hardy-foliage plant in cultivation, its finely cut leaves gracefully arching, bright deep green in colour, and its gigantic proportions render it particularly striking in the wild garden or shrubbery: indeed where there is room it is one of those plants that are certain to make an impression. Moist, rich, deep soil is essential. Its foliage for large vases is very valuable.

GERANIUM ARMENUM.—The purple-crimson flowers of this are very effective, the plant being of neat growth, about 2 feet high, and flowers very freely. It does well in any soil, best in light, and requires sun.

GERANIUM ENDRESSI.—Flowers bright rose, very freely produced, having a very bright cheerful aspect. It likes light soil, flowers a very long time, and forms a compact bush 12 to 18 inches high.

GERANIUM IBERICUM.—Rather strong-growing, 2 to 2½ feet high; large flower heads of a purplish blue, the flowers the size of a penny piece. This is one of the best of the strong-growing sorts.

GALEGA OFFICINALIS ALBA.—Grows 3 or 4 feet high, and produces a vast profusion of flowers successively, pure white, pea-shaped, in cymes. It is not only fine as a decorative plant, but affords flowers for cutting in abundance.

EULALIA JAPONICA.—A beautiful Grass with long narrow leaves of considerable length, bearing long heads of inflorescence 9 inches or more in length, with long "horns" of a bright purple shade, very

beautiful; height 3 feet. Does best in light soil and not too moist, as it is not very hardy in wet positions.—G. ABBEY, *Paxton Park, Hunts.*

CARNATIONS AND PICOTEES AT CHELSEA.

PERIODICAL displays of certain classes of plants, together with the never-failing standing attractions, maintain a constant interest for visitors to Messrs. J. Veitch & Sons, Chelsea Nursery. Amaryllises, Orchids, Gloxinias, and many others, each in their turn provide a special feature, the Carnations and Picotees, of which such a large collection is grown, being at the present time the prevailing attraction. A number of beds near the Brompton Road entrance to the nursery are devoted to these plants, which are now fast approaching their best condition, as, although the weather has been unfavourable to them, they have suffered very little, and some varieties are quite uninjured, the flowers clean and the colours bright. Several beds of self Carnations are exceedingly beautiful, proving the value of such varieties for massing where a bold effect is desired. The flaked varieties are also beautiful, the bizarres requiring rather closer inspection to duly appreciate their beauty; while of the Picotees the heavy-edged varieties are far bolder and striking bedded out than the light-edged forms, though the exquisitely delicate beauty of the latter must always render them favourites. So many of the best varieties in each class being seen together visitors have an excellent opportunity of comparing their respective merits and selecting those most suited to their taste or requirements; and during the present and following week will be the best time to inspect them.

The following is a selection of the most noteworthy, though necessarily in so large a collection many fine forms are omitted:—

CARNATIONS.

Selfs.—Virgo (new), a charming variety, pure white, very even and neat in form, one of the best. Milner is another grand white, exceedingly free and pure. The Bride, a well-known variety, also white and useful. Gloire de Nancy, a pure white, is distinguished by the great size and substance of the flowers.

Yellows are now represented by several beautiful varieties, very clear in tint and admirable in the form of the flowers. Florence is a floriferous yellow self, certificated last year; Stanstead Beauty, Chromatella, Canary Yellow, and Sulphur King being also charming varieties, differing slightly in depth of tint. All are good, but the first two are especially so. Niphetos and Lady Rosebery are also clear shades of yellow.

Scarlets are abundant, many extremely rich and bright varieties being included in the collection. Robert Burns (new), dwarf and useful for marginal rows in large beds, rich deep scarlet, and exceedingly free; forty to fifty buds on a plant. Magnum Bonum is a very free and beautiful variety, the bloom of good size and substance. Amethyst (new), dark crimson-scarlet, almost maroon, handsome, bold, and striking. Coroner is a fine true scarlet; Sir Archibald Grant of a crimson-scarlet hue, being similarly good. Heaton Bank Scarlet is one of the best of its class. James Wilkins (new), of a very bright light shade, most effective. Other fine scarlet selfs are Duke of Wellington, Fireman, Fire-eater, and Dan Godfrey.

Purple and rose selfs possess considerable attractions, the richness of the former and the delicacy of the latter being highly pleasing. One of the best of the purples is Royal Purple, a grand variety of excellent habit, very free, and the blooms warm crimson-purple; a most valuable variety for bedding. Auctioneer is another superb variety of the same class, very free, and of a rich crimson-purple hue. Walter Ware is a deep blue purple, quite distinct from the preceding, but equally good, the blooms being of exquisite form. Perhaps the best of the rose selfs is Mary Morris, which was certificated last year, and has been repeatedly mentioned in these columns; its large clear rose-coloured blooms are produced in great profusion. Lothair is a pale delicate pink, but pretty. Gertrude Teigner has small pink flowers, but freely produced. Mrs. Teigner, very similar in colour, but larger. The Governor is a charming blush self, the bloom of great size and substance. Blush Clove, a charmingly tinted variety of the old Clove, possessing all its fragrance, is also notable in this class.

Bizarres.—The best of these are as follows:—*Crimson.*—Albion's Pride, Gracilis, Lord Milton, Rifleman, Sir John Falstaff, Thomas Moore, and Young Milton. *Pink and Purple.*—James Taylor, Princess Beatrice, and Sarah Payne. *Scarlet.*—Admiral Curzon, Arthur Medhurst, Ben Simonite, Duke of Grafton, George, and Mars' Son.

Rose Flakes.—Mrs. Laxton, Rosa Ann, Sybil, Mary Ann, John Keats, and James Merryweather. *Purple Flakes.*—Squire Trow, Mayor of Nottingham, James Douglas, and Doctor Foster. *Scarlet Flakes.*—Miss Bateman, Lord Lyon, Jupiter, Thomas Tomes, John Bull, and Dan Godfrey.

PICOTEES.

Though these are not so numerously represented a careful selection of the best varieties in cultivation are grown, and so well have they been chosen that nearly all the varieties possess merits of equal value. The following are the most notable for their good habit and floriferousness. *Crimson heavy edge.*—J. B. Bryant, Picturata, Lothair, Hilda, and Ensign. *Medium edge.*—Queen of Summers and Lord Valentia. *Light edge.*—Rev. F. D. Horner, Mrs. Keynes, Grosteen, and Emily. *Purple heavy edge.*—Rev. J. B. M. Camm, Medina, and Mrs. H. Chancellor. *Medium edge.*—Princess Dagmar, Rival Purple, and Mrs. May. *Light*

edge.—Clara Benson, Baroness Burdett Coutts, Her Majesty, and Mrs. Langtry. *Rose heavy edge.*—Miss Gibbs, Royal Visit, and Mrs. Rayner. *Medium edge.*—Mrs. Summervale and Louisa. *Light edge.*—Beauty of Plumstead, Lucy, Lady Boston, and Mrs. Fordham.

All the above, both Carnations and Picotees, have been selected chiefly with regard to their effectiveness as border plants, the most floriferous the brightest or clearest colour, and those of best habit being only named. The whole collection is in fine condition, and very creditable to Messrs. J. Veitch & Sons' trusted manager of this department, Mr. Swift.

WEST OF ENGLAND ROSE SHOW.

THE seventeenth annual Exhibition of this Society was held as usual in the Shire Hall, Hereford, on Tuesday, July 10th, and in spite of the counter attractions of two highly popular Rose shows, which kept away some of the leading professional exhibitors, must be pronounced as quite up to the average of recent years. Your correspondent had not the happiness of being present this year at the National Rose Society's Exhibition at South Kensington, but he cannot here refrain from adding his mite of testimony to the truth of his friend "Wyld Savage's" remark, "that Roses this year are shown as a rule deficient in quality." Some few blooms, doubtless, are unusually large, but the majority are decidedly undersized. Colour, likewise, though occasionally brilliant, mostly is dull and lustreless; while a general coarseness and lack of smoothness runs through most of the best collections. But surely these results are only what might have been expected from unseasonable cold weather, especially at night, retarding the development of early blooms, and more recently in the trying ordeal vegetation has experienced in fitfully passing through an almost tropical atmospheric humidity, to be suddenly varied with cold boisterous currents of wind. It is a fact, however strange, that Tea Roses have undoubtedly thrived the best, and are making such strong wood that a grand autumn bloom may be confidently expected.

Messrs. Cranston & Co., whose maiden blooms are later even than usual this year, exhibited grandly at home quarters, and, as might be expected with so late a fixture, carried all before them, winning six first prizes, and only losing the first prize in the open Tea and Noisette class (not a very meritorious class), which an amateur, Mr. Grant, won. Mr. G. Davison took second prize with noticeable blooms of Abel Carrière (grand colour), Xavier Olibo, Duke of Wellington, Alfred K. Williams, &c. For thirty-six varieties, three trusses, Messrs. Cranston & Co. were first, Messrs. Keynes & Co. second, and Messrs. Cooling & Son third. For twenty-four varieties Cranston & Co. were first, Messrs. Keynes & Co. second, and Mr. W. Grove third. For eighteen varieties, three trusses, Mr. C. Whiting was first, Messrs. Cooling & Son second, and Mr. W. Grove third. For twenty-four varieties Mr. T. Griffiths was first, Mr. C. Whiting second, and Messrs. Cooling & Son third. In this class Mr. Griffiths, Tillington Nurseries, exhibited a bloom of H.P. Constantin Tretiakoff of unusual size and perfect symmetry, smoothness and colour, quite unique, and the premier bloom in the exhibition hall.

In Class D, collection of new Roses sent out by English nurserymen, and not in commerce previous to 1880, the most promising blooms appeared to be in the three competing hands ranged in the order given, Messrs. Cranston & Co., Messrs. Curtis, Sanford & Co., and Mr. G. Davison. H.P. Ulrich Brunner fils., already alluded to as useful and most promising; Pride of Waltham, a veritable duplicate of Marie Finger; Lady Sheffield, of good size and bright colour; Comte de Flandre, useful colour, and Helene Paul, a variety with which Messrs. Cranston & Co. took first prize for twelve trusses of any new Rose. Messrs. Curtis, Sanford & Co. second prize with Eridc of Waltham. Not competed for third prize. For twenty-four trusses of any Rose, first Messrs. Cranston & Co. with glorious blooms of Alfred Colomb, second prize Mr. G. Davison with small but symmetrical blooms of Mons. E. Y. Teas, and third Mr. Grant with bold but small blooms of Alfred Colomb.

In Class B, thirty-six varieties, open to the United Kingdom, Miss Bulmer, Broadlands, Hereford, won the first prize, which carries with it the distinction of the National Rose Society's silver medal. Miss Bulmer also won the first prize given by J. G. Woodhouse, Esq., for the best amateur single bloom, H.P. Marie Rady. In this collection, which was admirably staged, and of good size and substance, the choicest blooms were Ulrich Brunner fils., Marie Rady, Mdle. Eugénie Verdier, Edouard Morren (smooth and splendid), Comtesse d'Oxford, Duke of Edinburgh, and Mdle. Gabriel Luizet. Mr. Grant, Ledbury, was second with fresh and compact blooms, and Mr. J. H. Arkwright, Hampton Court, Leominster, third. For twenty-four varieties, Mr. Grant, first; Mr. J. H. Arkwright, second; Miss Bulmer, third. For twelve varieties, three trusses, Mr. J. H. Arkwright, first; Mr. Grant, second; Miss Bulmer, third.

Class C, restricted to Herefordshire, was well filled, and the collections both in staging and in the freshness and general quality of the blooms, show a marked improvement.

It is not usual, neither is it courteous, to criticise special prizes. The public, as well as competitors, do well to receive the good things offered them in silent gratitude; but a special offered two years running which fails to secure a single entry, to say the least of it is a puzzle, and an unattractive puzzle. Such, however, is the special prize offered by Cranston Company to the West of England Rose Society, which runs thus: "Collection of twenty-four English-raised Roses, not in commerce previous to 1879." Now it may be seen by the "Amateur Rose Exhibitor's Text Book" issued this year by the National Rose Society, enumerating considerably over one hundred exhibition varieties, only five can be included as introduced into commerce since 1879. Could not Mr. Cranston prevail on the Company he so ably represents to give a cup, as individually he generously did, to the winner of the chief amateur prize in the schedule? and there would be no lack of entries then. The competition in the floral decoration division was very keen, but hardly up to the mark of last year. The first prize for the drawing-room decoration, given by the Marquis of Bute, was artistically won by Miss Rachael Clowes, Burton Court; and second prize by Miss Alice Watkins, Willcroft. Miss Cypher, Cheltenham, obtained first prizes for both bridal and opera bouquets. The Judges were (over professional

division) the Rev. C. H. Bulmer, Credenhill Rectory, Hereford, and Mr. W. J. Grant, Hope End, Ledbury. Amateurs, Messrs. Sandford and Burch. Floral decorations, Mrs. Arbutnot and Mr. Henry Leslie, with Mr. J. H. Arkwright.—HEREFORDSHIRE INCUMBENT.

LEE, BLACKHEATH, AND LEWISHAM SHOW.

JULY 11TH AND 12TH.

THE above Society held their sixteenth annual Exhibition of plants, fruits, and vegetables in a field adjoining the charming residence and grounds of Mrs. Penn, The Cedars, Lee, by whom the field was kindly lent for the occasion. The weather on the first day was most propitious; the afternoon of the second day, however, proved less fortunate, rain falling. Notwithstanding this, however, the Show was a fairly successful one, the general arrangement being satisfactorily. The plants exhibited, too, were above the average, being remarkably well grown and healthy examples. Some very effective and artistically arranged groups of plants were contributed, not for competition, by Messrs. Laing & Co., Forest Hill; B. Maller and Sons; W. North & Son, Lee; Jones & North, Lewisham; W. J. Todman, Eltham Nurseries, and others.

In the competition classes, open to members—Class 1, eight stove or greenhouse plants in flower, Mr. S. Reece, gardener to J. Whyte, Esq., Old Road, Lee, was first with well-grown and trained plants of *Echites bolivensis*, *Dipladenia Brearleyana*, *Ixora Williamsi*, *Erica Cavendishi*, with a beautifully trained and flowered *Plumbago capensis*. Mr. H. James, Castle Nursery, Lower Norwood, was a close second with good plants of *Erica depressa*, *Paxtoni*, *Anthurium Schertzerianum* and *Andreanum*, &c. The third prize went to Mr. J. Wakeham, gardener to H. B. Barrett, Esq., N. Dulwich. In this exhibitor's collection were large well-grown plants of the old but effective *Vinca rosea* and *oculata*. For six plants of ornamental foliage Mr. S. Reece again secured first honours with fine plants of *Phyllotænum Lindeni*, *Croton undulatus*, *Pandanus Veitchii*, &c. Mr. J. Lambert, gardener to H. W. Segelcke, Esq., Herne Hill, was second, and Mr. H. James, Castle Nursery, third. For six exotic Ferns, distinct, stems not to exceed 2 feet in height, Mr. S. Reece was again first with capital plants of *Davallia Mooreana*, *Cibotium regale*, and *Microlepia hirta cristata*. Mr. R. Sholdice, gardener to R. P. Barron, Esq., Blackheath Park, second with well-grown plants, especially *Alsophila excelsa*; Mr. J. Wakeham being third, and Mr. W. Jeffery, gardener to J. Young, Esq., Blackheath, fourth. For four *Lycopodiums* Mr. J. Wakeham was first with well-grown plants of *Selaginella apoda*, *stolonifera*, *cæsia*, and *Willdenovi*. Mr. H. Martin was first with six *Caladiums*, large plants of *Meyerbeer*, *Lepeschkinea*, *Leplay*, and Dr. Lindley being notable; Mr. S. Reece following with good specimens, including a well grown example of *argyrites*. Tuberos-rooted *Begonias* were well shown by Mr. S. Reece, Mr. R. Sholdice, and Mr. W. Jeffery. Mr. S. Reece was first with six Cape Heaths, good plants of *Erica ventricosa*, *Bothwelliana*, *gemmifera*, *elegans*, &c. *Fuchsias* were chiefly shown by Messrs. J. Sharpe, W. Jeffery, W. Steward, gardener to H. Paine, Esq., Blackheath, E. Smith, gardener to the Rev. E. E. Jenkins, and Mr. W. Steward.

In the gardeners' and amateurs' classes the competition was generally keen, the majority of the exhibits being distinguished by their good quality. The principal prizetakers were Messrs. R. Fullerton; P. Wright, gardener to F. Knott, Esq.; J. Mullins, gardener to J. Strong, Esq.; Holden, gardener to J. White, Esq., and many others.

In the divisions devoted to cut flowers were some excellent exhibits. In the class for Roses (open) there were not many competitors, probably owing to the heavy storms recently having spoiled so many blooms. For forty-eight single blooms there was only one competitor, Mr. J. W. Todman, Eltham Nursery, who was placed first. Some very fine blooms were shown in this collection, especially Alfred Colomb and Baroness Rothschild. A collection of twenty-four single blooms was shown, not for competition, by Mr. J. W. Todman, also a stand of twelve by Mr. James. For twelve single blooms Mr. Boatwrite, gardener to Mrs. Black; Messrs. J. Sharpe, and S. Reece were the prizetakers. Table decorations were well represented, Miss F. Dent winning first (special) prize for epergne of cut flowers for table.

The fruit division was meagrely represented. We, however, note a few of the leading exhibits. Mr. W. Jeffery was first with a collection of fruit, six dishes, including Grapes, Melons, &c. In the class for three bunches white and three black of Grapes Mr. W. Jeffery was again first. Very poor examples of Grapes were shown in the classes assigned exclusively to them. A few Strawberries, single dishes, were staged, Mr. R. Fullerton being first and Mr. Stockwell second. In the class for Strawberries in pots Mr. W. Davies was first with six well-fruited plants, and Mr. R. Fullerton second. Mr. G. Cole was first with a good brace of Cucumbers.

There were but few exhibitors in the vegetable division for gardeners. Mr. Jeffery was first for collection of vegetables, and Mr. H. Cole second. Mr. E. Smith was first for two dishes of Potatoes, distinct, and Mr. Ball first for two dishes of Peas. Mr. W. Jeffery also won the special prize offered for collection of vegetables and salad.

Mr. S. Reece is the winner of the silver memorial cup, which is offered annually to those exhibitors who win the largest amount of money.

the Potato rows has been practised, the stems will be disposed to overgrow the greens; but they must not be allowed to do this. We have just gone over all our rows and drawn the stems close in, and where they had exceeded all bounds they have been twisted together and placed on the top of the ridge. This, we have proved, does not really injure the tubers.

Winter Turnips.—More of these should be sown as soon as possible; in fact, the main winter crop should be got in without delay, as it is an advantage when the bulbs have gained fair proportions before November. As Peas, Potatoes, early Turnips, and many crops are now being cleared off the land, there is plenty of vacant ground where the Turnips may be sown. The drills should be 18 inches apart, and sow thin. As this sowing will give a supply from October until next April, a large quantity should be sown where the demands for winter and spring Turnips are great. Those sown a fortnight ago are now in the rough leaf, and they should be thinned out to 6 inches apart, and 12 or 15 inches from plant to plant ultimately, and before they are so crowded as to injure each other. After each thinning run the Dutch hoe between the rows to prevent the spread of weeds.

Leeks.—These, if grown for exhibition, will be forward in growth, and they must be earthed up every fortnight or three weeks to produce a pure blanched stem; but where this useful winter vegetable is only grown to supply the kitchen, good useful produce may be raised without much trouble. Young plants placed out in the main quarters now will be of good size by November, and they will then remain good until the following May, being much hardier and less liable to seed prematurely than the more tender early-forced plants. The easiest way of treating them is to throw out a number of small trenches about 9 inches deep and 18 inches apart, dig plenty of manure into them, and afterwards dibble in the plants.

Another good way is to manure a piece of ground thoroughly, and after digging it over dibble the plants out in it 9 inches apart each way. A thick pointed dibble should be used, which will make a hole from 2 to 3 inches in diameter and 3 inches deep; drop the plant into this, only putting a very little soil over the roots, and allow the hole to remain open, when the stems will have plenty of space to develop freely. Rich ground is the main requirement in the production of fine Leeks.

Autumn Onions.—The Onions which were raised from seed sown last autumn are now from 12 inches to 20 inches in circumference, but they have almost ceased growing, and some of them are beginning to split, which spoils them in a great measure, especially for keeping; and we would suggest that the whole of them be drawn up now and harvested. They should be taken from the soil and be spread out on a gravel pathway or somewhere that they may be kept dry. When they have large juicy stems these should be partially twisted off close to the neck, as this will prevent them from decaying in a manner prevalent in the case of thick necks.

Young Carrots.—We find Carrots are more valued when quite young, sweet, and tender than when large, old, and tough, and a batch of the little ones if sown now to come in during the autumn months will be found most useful. The Horn varieties only should be sown in any good ground where grubs are not plentiful. They should be sown in rows a foot apart, and thin sowing where the seed is good will be found most satisfactory.

Autumn Lettuce.—Seed of these should now be sown. We always sow them in small beds, where the plants are allowed to stand until they are 2 or 3 inches high, when they are transplanted to the main quarters. Those varieties noted as good summer kinds may still be put in, and in late districts a pinch of some of the winter sorts may also be sown. Keep on transplanting out any young plants in store.

Autumn Cabbage.—From the middle of July to the middle of August is the time to sow Cabbage seed to produce those plants which are planted out in autumn and head in the early spring months. In late districts a good sowing should be made now, but in early situations there will be no hurry in sowing for a week or two yet, as the seed germinates freely at this season and the plants grow fast afterwards. This crop, however, is rather a variable one, as if sown too early the plants are so liable to bolt, particularly in spring; and if sown late it may throw them back in becoming ready for use. The plan we always practise, and which invariably succeeds, is to sow a little seed at three different intervals during the time named above, and one or other of the batches is sure to be right. In sowing the seed a very good piece of ground should be selected for its reception, and we always think it preferable to sow in rows rather than broadcast, as the plants which will remain in the seed rows throughout the winter can easily be kept clean, and they grow more dwarf and hardy in rows than when crowded together in narrow beds. The rows should be 12 inches apart and about 2 inches deep. Sow rather thinly, and never allow any weeds to interfere with the free and hardy growth of the plants.

Late Greens.—Where it is doubtful if the supply of winter greens will be sufficient, Savoys, Brussels Sprouts, &c., may still be planted out in the ground being cleared of early crops. Although plants put in now will not come in for autumn use they will be found most acceptable in spring and about that time.

FRUIT-FORCING.

Vines.—The temperature in late houses in which the Grapes have not yet passed the stoning process must not be allowed to range too high at night. Continue a little fire heat if necessary to maintain the temperature at about 70°. Commence increasing the ventilation early in the

KITCHEN GARDEN.

Greens between Potatoes.—Potatoes are now growing strongly, and where planting winter Broccoli, Brussels Sprouts, and Savoys between

day, and maintain at 80° to 85° through the day, closing at 80° with plenty of moisture. When Muscats are ripening they should have fire heat to maintain a temperature of 85° to 90° by day, and 70° at night, with a free circulation of air, affording sufficient moisture to prevent any undue maturation of the foliage. Occasionally the berries of Muscats are scalded from exposure to the direct rays of the sun, especially where the panes of glass are large; and in this case the laterals should be given more play than usual, and if shading be deemed expedient it should be very light, herring netting being sufficient. Consequent on the cold weather in spring and early summer and the great amount of firing necessary, red spider has been very troublesome, and as the health of the foliage is essential to full crops another season the usual remedies against its spread must be applied, which is also quite essential to the perfect finish of the present crop, which cannot be expected to finish well, especially in colour, if this pest be allowed to exist. The border must have due attention in mulching, and be given copious supplies of water both inside and outside. Vines from which the fruit has been cleared should be well washed with the syringe or engine on fine evenings, and have free ventilation day and night. To encourage the Vines to make surface roots and to plump the eyes weak liquid manure should be given occasionally, especially to inside borders. Vines in pots now ripening their wood and intended for early forcing will require less moisture and more air; but these must not be too dry at the roots, or it will cause the premature ripening of the foliage, and an occasional syringing will be necessary to keep the foliage healthy until the buds are developed.

Peaches and Nectarines.—Early-forced trees from which the fruit has been removed must have attention in watering the internal borders, and syringing the trees to keep them free of insect pests until the flower buds are properly formed and ripened. In succession houses trees that have a large surface of leaves exposed to the direct rays of the sun will require large supplies of water both inside and outside the house, which should be given at somewhat higher temperature than that of the house. Syringe well twice a day until the fruit commences ripening, when it must be discontinued over the trees, but moderate moisture maintained by damping the borders occasionally. Let the fruit have full exposure to the sun, seeking to insure flavour by admitting air to the fullest extent on hot dry days. Mulch inside and outside borders, and give abundance of water to trees in late houses, which are now stoning. In order to effect the thorough ripening of the wood keep it well thinned and tied in, not allowing it to become crowded, and remove gross growths, which are not likely to ripen well, and are otherwise destructive of an equal diffusion of the sap. Mark trees which from their vigorous growth are likely to require lifting and curtailing at the roots, also those which, from enfeeblement, require the borders renovating, and provide the requisite supply of strong loam, which should be of a calcareous character, or made so by the addition of tenth of lime rubbish or chalk broken up small.

Strawberries in Pots.—Where early runners have been layered in small pots they will now have rooted, and should, before they become root-bound, be transferred to the fruiting pots. For very early work 5-inch are suitable, and 6-inch is quite large enough for any but the very strongest growers that are not to be forced until late in the season. The pots should be well drained, and the compost good turfy loam with a fifth of well-decayed manure in a moderately moist condition, only so as to admit of its being rammed firmly into the pots. Sufficient space should be left for watering, and a mulching of short horse dung given so as to encourage surface roots. Stand the pots on ashes in the full sun, but if possible sheltered from winds, allowing sufficient space between each for the full development of the foliage. Where layering has not been proceeded with it will be advisable to layer into the fruiting pots at once, as it is hardly possible to detach plants in small pots without some check, and this, when the season is advanced, is of considerable importance.

PLANT HOUSES.

Clerodendron fallax.—Young plants that have been raised from seed should be placed in 6-inch pots, and if likely to come into bloom before they are wanted pinch out the points and allow them to branch. From seed sown now some useful plants in small pots will be produced; in fact, to maintain a succession of this useful plant a little seed should be sown at intervals of a few weeks. Those plants that are just going out of bloom will, if the old flowering spikes are cut away and the plants placed in pots a size larger in brisk heat, soon break again into growth, and in due time flower freely. Plants from which seed is required should stand while in bloom in a drier atmosphere than in the stove.

Abutilons.—Where these plants are appreciated this is a good time to strike the tops and strong side shoots for the batch to flower first. It is preferable to insert the cuttings singly in small pots, as nearly every one will root if placed in heat and kept in a close frame. As soon as the small pots are full of roots transfer the plants into pots in which they are intended to flower, and gradually harden them. By the insertion of good cuttings, and treated as advised, some well-furnished plants will be produced by autumn, which will flower freely when about 9 inches high. For purposes of decoration constant propagation must be resorted to, for when the plants become tall half their beauty is gone.

Begonias.—Where these plants have been kept in heated structures up to the present time, and are intended for autumn and winter-flowering, they should be gradually hardened and placed in cold frames without delay. This applies to such kinds as *Ingramii*, *Weltoniensis*, *nitida*, *manicata*, and others which do much better under cool treatment during the summer months than in heated structures. Any plants in a backward state should be encouraged until they are established in their

flowering pots, and should then be treated as above. *B. semperflorens grandiflora* raised from seed is most useful, but should not be pushed on too rapidly after they are once established in small pots, for this useful *Begonia* is a strong and rapid grower. While in cold frames these plants must have shade from strong sun, be aired judiciously, and closed early in the afternoon while the sun is upon the frames.

Chrysanthemums.—Stopping must be discontinued after this date, and the plants intended for decoration and to produce flowers for cutting should be allowed to grow naturally. Staking must be pushed on as rapidly as possible now the whole of the stock are in their flowering pots. Plants intended for exhibition will be showing what is called the July bud, which must be removed, and the shoots not required that form near its base. All lateral growths must be removed from these plants as soon as they appear. Cuttings can now be rooted of Pompon as well as large-flowering kinds from plants that were planted out for the purpose. The large-flowering kinds should be inserted singly in 3-inch pots. A number of the others should be placed together in 5-inch pots and allowed to grow together afterwards. The dwarf plants for decorative purposes will be found most useful, and will root readily in a cold frame kept close, moist, and shaded.

Azaleas.—Plants that were assisted early by heat to make their growth in Peach houses and vineries will by this time have formed their buds and be ready for placing outside or in a cool structure. The plants are better for being outside, except where the locality is very wet, as they ripen up their growths and are brought afterwards into flower easier than when kept the whole season under glass. At first they should have a position slightly shaded from direct sunshine, but at the same time the plants must have abundance of light, and should by no means be placed where the drip from trees and buildings will fall upon them. In a short time the plants may with safety be fully exposed to the sun, but their pots must be protected, or much injury will result if the sun strikes directly upon them. It is wise to plunge the pots, but when in this condition the watering of the plants must not be left in the hands of the careless, or else the plants will soon suffer and much injury result. Syringing should be well done during bright weather twice daily.

Deutzias that have been grown indoors to make their growth ready for early forcing should now be turned out and plunged in a sunny position in a warm border. If the pots are full of roots feed liberally for some time until the wood is thoroughly ripe and the flower buds plump.

Scented Pelargoniums are amongst the most useful plants that can be grown for the supply of greenery for associating with cut flowers. A good stock should now be rooted and grown on until they are placed in 6-inch pots. They root quickly on a shelf in a little heat, and if the cuttings are strong and good to start with, a quantity of useful material for cutting is soon produced.

THE EXHIBITION AT KNIGHTSBRIDGE.

WE will now proceed with our remarks on the British Bee-Keepers' Association's Show. In our last letter we concluded our report of the honey exhibits so far as super honey was concerned, and we mentioned that the run and extracted honey exhibited was of a superior kind. This leads us to say a few words about the extractors which were entered in Class 39; 260 to 263 were machines which have long been before the public. They were not for competition, but placed by their inventor, T. Cowan, Esq., who has repeatedly carried off the first prizes at various shows. Mr. Blow took the first prize with a handy instrument, No. 259. The same exhibitor obtained third prize with a machine which was priced at 8s. more than the former. The good points in the one to which the preference was given were—1st, The bar and all mechanism was easily lifted out by the removal of two screws, thus giving facility for thorough cleansing; 2ndly, A cover was also provided, which is requisite with all extractors, since it is not always convenient to draw off honey into another vessel for ripening; 3rdly, This useful article was put at a low price—two guineas, and we doubt not will meet with a large demand. No. 266, to which the second award was made, had its own peculiar advantages. It was conical at bottom, and thus allowed all honey to drain out, and it was constructed so as to hold a great quantity of honey before it became necessary to draw off, the cages being placed well above the bottom of the cylinder.

Messrs. Abbott Bros. exhibited a very neat handy article, No. 257, and to all appearance, but for one fault, might be called a "Perfect Extractor." It was offered at the low price of 30s. There was no multiplying apparatus, but the action of the hard wooden spindle working in a box-wood socket was most easy and pleasant to manage. The one fault was the metal employed for the cylinder; zinc would undoubtedly be highly prejudicial as a receptacle for honey. Doubtless we shall see this useful article brought forward again with another kind of cylinder. We must not omit to notice that Mr. Blow had admirably arranged the structure of No. 258, but £2 10s. is a long price to pay for an extractor, and only the well-to-do amateur can buy at such prices.

Class 40 contained some exhibits of wax of the purest quality. It is a pity that such pure wax is not always obtained in the manufacture of foundation. Classes 41 and 42 were for glass jars, in which liquid honey

could be sent to market. We are approaching the desired standard for such useful articles. Unless the pure English honey be offered in a clear, neat, prettily labelled receptacle, it has a chance of being pushed out of the market by foreign produce of far inferior quality when offered in a more inviting form. The eye first requires to be pleased, the palate has the second chance. First displease the eye, and the taste is unlikely to be called into the arbitration. We must therefore congratulate Mr. Blow and other exhibitors on the success which has attended their efforts to obtain such inviting receptacles for run honey.

We always approach the table set apart "For any New Invention Calculated in the Opinion of the Judges to advance the Culture of Bees" with some amount of excitement and much expectation. We cannot say that our expectations were realised by this year's exhibits. Mr. Cowan has invented an ingenious contrivance for ripening honey. It consists of a number of shallow trays arranged one over the other, and placed at such angles as to allow the honey when poured into the top tray to gradually run from tray to tray until it reaches the bottom, traversing in its course some 50 feet of surface. These trays are traversed by metal tubes, which would become a miniature system of hot-water pipes when in use, and the heat from these would cause sufficient evaporation of surplus moisture from the honey to render it fit for bottling in a short period of time. Another ingenious contrivance which we noticed consisted of a small cage made of excluder metal, to which was fastened a calico bag about the size of a pillow case. This was said by the inventor to be an apparatus for enabling the novice to capture the queen bee readily. The swarm, after being hived in a skep, was to be shaken into the bag, and by constantly shaking this bag the worker bees were expected to all pass through the wire cradle, while the queen would be left. We should conceive that the bee-keeper would after all have some trouble in capturing the queen, where many drones had joined the swarm. In some cases the cradle would be filled with them. A long narrow horsehair brush might be useful, which was among these exhibits; but we always find a goose-quill or bunch of asparagus quite equal to the occasion when brushing bees from combs. All these little luxuries can be purchased by those who make bee-keeping a mere hobby, but our aim should ever be to render bee-keeping such an inexpensive undertaking that the cottager may take up the more humane and modern system and gain thereby.

We must now leave this part of the Exhibition and examine the exhibits of hives. In Class 5 Mr. Hooker, in the opinion of the Judges, showed the best hive for winter and summer use. This was his well-known Alexandra hive, which first appeared in 1876. Some slight alterations and improvements had been added. As a specimen of the elaborate and expensive class of hives it is certainly an excellent one, and would doubtless give pleasure to the amateur who does not care much about cost of appliances. Mr. Thompson and Messrs. Abbott took second and third prizes respectively in this class. Class 6 was to contain hives adapted to the same purposes as those in Class 5, but the price was not to exceed 40s. There were eight entries, all priced at £2 each. Nos. 19 and 18, exhibited by Messrs. Baldwin and Abbott respectively, were excellent hives of the class, and secured first and second awards. We think it would be better for ease of manipulation when changing sections to have the rows in the rack separated by a strip of wood, which could be easily lifted out and replaced. The sections on No. 18 fitted closely together, and in the height of the honey harvest would give some trouble to the bee-master. Mr. Baldwin also gave us a little more for the money by having his hive nicely painted and fit to stand any weather. Messrs. Neighbour's twin hive, No. 24, deservedly had the second prize. It was a very cheap hive considering the great amount of work in it, and there is no reason why two stocks of bees should not winter well in it. It is a pity that hive-makers will fasten on the covers to hives with immovable butts. It is next to impossible to open a hive on a windy day with such an arrangement. The lid could be hinged on pivots, which would allow of its being either folded back or on windy days lifted off altogether without running the risk of a gust of wind upsetting the hive altogether.

In Class 7, for hives not exceeding 30s, were some excellent exhibits. Who would wish for a more serviceable, solid, well-made hive, replete with every convenience for wintering and for honey-harvesting, than Messrs. Abbott's "Combination?" Mr. Baldwin's "Universal No. 2" was also a similarly useful hive, and Messrs. Neighbour's formed with the others a good trio. Mr. Overton had evidently expended much trouble in rendering the exterior of his hive sound and weather-tight, but did not give us so much for the 20s. within.

In Class 8 we come to hives nearer the price which a poor man could afford to give. Mr. Howitt's combination hive was a most useful one. The frames might be made to hang more accurately, but that is a matter easily rectified. The hive was good and solid, and would last for many years with the outlay of the cost of a little paint each summer. No. 40 was almost equally cheap and substantial; and No. 37, which was awarded a prize at Bridgewater, was very solid and good. Although only three prizes were awarded to this class there were other hives of great merit, especially those exhibited by Messrs. Abbott, Overton, Hooker, and Walton. All cheap useful articles, and such as a cottager with fair practice would soon pay for by the extra honey his bees would give him through using such appliances.

We now come to the cottagers' hives in Class 9, at the low price of 15s. 6d., and here, without doubt, there was keen competition. In this class we saw a decided improvement on former exhibits of equal value. A great advance has evidently been made by manufacturers towards solving the difficulty of placing a really useful hive before cottagers at a price within their means. Such articles as those which took prizes in Class 9 are comparatively far cheaper than skeps, and the amount of pleasure the owner

of such a hive would derive, let alone the greater facility for obtaining surplus honey, would soon compensate him for the extra outlay. Messrs. Dines & Son took first honours with a solid, well-made, well-fitted hive, with a broad frame of sections inside, fourteen sections on top, dummy, &c.—a hive, which in the hands of an intelligent man could be made to do anything practicable in bee-keeping. No. 49, Baldwin's Bridgewater prize hive No. 2, was another excellent piece of workmanship at the price. In this hive two frames of sections were placed in the body box, ten frames for brood nest, and a set of ten sections over. There were other hives almost equally cheap and good. Mr. Stothard's, No. 58, gained third prize, a wonderfully cheap hive at the low price of 7s. 6d., for which low sum was given a well-made body-box, eight frames, a dummy, and 15 lb. sections. No. 48, a section of a tree hollowed out, and so arranged as to contain bars and frames, was exhibited by Messrs. Abbott. A similar section could be used as a super. This hive would be a pretty ornament on a lawn or in a shrubbery, but we should be doubtful as to its utility as a bar-frame hive. The wood could hardly fail to swell with wet or crack with dry weather, and the greater objection would be the fact that the frames being of various lengths are not interchangeable. A minor objection is the zinc roof, which would not do for a winter covering on account of condensation and drip, nor as a summer cover to the super, as the combs would melt beneath it.

We have now exhausted our remarks on this year's exhibits, excepting that one must not fail to notice Mr. Drinkwater's hive—the only exhibit in Class 10. This was an amateur's praiseworthy effort to show a useful hive of his own make. So far as the workmanship went there was room for improvement. Some little difficulty was experienced in moving and replacing the various parts of the hive. A more simple contrivance for giving the bees access to the side sections could be arranged. Again, the cover was fixed to the hive—a drawback in a windy spot. Some good straw hives were exhibited in Class 11; and Mr. Blow, the only exhibitor in Class 12, showed a good specimen of the Stewarton hive. Altogether the Exhibition was a decided success, and will doubtless help to increase the knowledge of bee-keeping and to encourage its humane culture in the United Kingdom.—P. H. P.

BEES, HIVES, HONEY, &c., AT THE ROYAL AGRICULTURAL SHOW AT YORK.

At the recent annual Exhibition of the British Bee-Keepers' Association, held in the Duke of Wellington's Riding School, Knightsbridge, the Bishop Suffragan of Nottingham in distributing the prizes called special attention to the fact of a tenant farmer, residing in Lincolnshire, being well known to his lordship, having made a profit of £100 from bee-keeping during the preceding year. Many other instances of success in bee-keeping may also be recorded. The Council of the Royal Agricultural Society of England may, therefore, feel highly gratified at the success which has attended their efforts to promote bee-keeping in connection with their annual exhibitions during the last five years. The bee department of the Royal Show at York is, as in previous years, under the management of the British Bee-Keepers' Association.

The Show opened on Monday, the attendance being somewhat limited owing to the high fee, 5s., which is charged for admission on the first day. The department for bees was, however, well patronised, and the sales for surplus honey very brisk, good prices being realised. Prizes were awarded as follows:—

For the best hive for observation purposes—first, Mr. S. J. Baldwin; second, Mr. T. B. Blow; third, Messrs. Neighbour & Son. For the best hive not exceeding 15s.—first, Messrs. Dines & Son of Maldon, Essex; second, Mr. T. B. Blow, Welwyn; third, Mr. S. G. Baldwin, Bromley, Kent. For the best hive not exceeding 10s. 6d.—first, Mr. S. G. Baldwin; second, Dines & Son; third, Mr. T. B. Blow.

Messrs. Neighbour & Son of Regent Street, London, were awarded first prize for the best collections of bee-keeping appliances, the second prize going to Mr. Blow. The collections of these two exhibitors were an exhibition of themselves, and were well worthy of inspection.

In the classes for comb honey the prizes were awarded—first to Mr. J. Garratt, Hockenden, St. Mary Cray, Kent; second, Mr. E. Gulston, King's Langley, Herts; and the third to the Rev. T. B. Garland of Ranby, near Retford, Notts. Prizes for run or extracted honey are only offered in one class, the prizes being gained by first, Mr. Garratt; second, Mr. R. R. Godfrey; third, Mr. W. Martin. Practical instruction in the art of bee-keeping and the manufacture of comb foundation is given at intervals on each day of the Show.

PEAT AS A FUEL FOR SMOKERS.—Many bee-keepers have had trouble in procuring a good article for use in smokers—one that will light easily and last well. It has been so with myself, until, seeing it suggested that peat was a good thing, I found that it produces volumes of smoke, is easily lit, and keeps alight well if broken in pieces the size of a walnut. The Tramways Companies use peat-moss for bedding, and this peat is used somehow to stiek the corners of the bales, and can be had for very little. I use Clarke's smoker, and think it would be an improvement if fuel could be added as needed at the top of fire-box; the latter should be same diameter top and bottom, and with a longer, narrow chimney, which would give a sharper draught on applying the match. What enterprising firm will manufacture one on the cold blast principle with these improvements?—JOHN C. LAMBERT (in the *British Bee Journal*).

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (T. F. B.).—Particulars concerning the culture of the Rose are given in "Florists' Flowers for the Many," published at this office, price 4d.; post free, 4½d. This is the cheapest work we know upon the subject. (De Smet and H. C.).—We do not know any work giving coloured plates of carpet beds. Mr. Graham's "Guide to Hampton Court" gives numerous diagrams that would be useful to you. It can be obtained from Mr. Graham, Superintendent, Hampton Court Gardens, and we think the price is about 1s.

Grapes Spotted (Subscriber).—The berry sent appear to have been punctured by some insect, causing slight exudation of the sap.

Names of Peas (C. B.).—The specimen labelled No. 2 is the true William I., the other resembles Sangster's No. 1.

Caterpillars on Roses (E. C. O.).—The best plan is to frequently examine the trees, removing and destroying all the caterpillars that can be seen.

Roses Affected by the Orange Fungus (F. J. D.).—Your Roses are attacked by this injurious fungus, and the reply to "A Young Beginner" above will indicate what had better be done.

Tragopogon porrifolius (Henden).—The plant can be found in many parts of Great Britain, chiefly in damp positions, and usually flowers about May. We cannot tell you where you can purchase plants in flower now.

Vines and Azaleas Injured (W. J.).—There is no doubt but that the fumigation was the cause of the injury, and there is no remedy except removing the foliage and shoots that are past recovery and wait for fresh growth.

Hose-in-Hose Gloxinia (H. S.).—We have seen similar varieties to that of which you sent a specimen, but are not aware that there is any further name than that given above. In point of beauty it is inferior to the ordinary "single" forms, though it is interesting as a curiosity.

Tropaeolum Flowers (R. & S.).—The flowers were much faded through being closely packed in cotton wool, but as far as we can judge they are of a deep rich colour and neat in form, and if free and of good habit is doubtless a useful variety.

Currant Leaves Falling (J.).—Probably the bushes have been suffering from drought, which the recent rains would no doubt assist materially in remedying. If the bushes are old and weak a mulching of manure or a good supply of liquid manure would prove beneficial.

New Pelargoniums (J. P.).—The flowers you sent were rather shattered, but the pink variety appears to be very clear in colour, and the scarlet bright, but there are many others equally as good, though of course we cannot judge respecting the habit and floriferousness of the plants from single trusses.

Tomato Leaves Curling (E. D'Olier).—The most probable cause of the leaves curling is too dry an atmosphere and an insufficient supply of water at the roots, but the old leaves usually curl more or less, and some plants are more given to it, as you note, than others. Mulch with short manure, supply water abundantly at the roots, and keep the house a little closer.

Vines Infested with Thrips (W. S.).—There is no question about the insects on the Vine leaves being thrips. Fumigate the house on two or three consecutive evenings and repeat in the course of a week. Probably the insects have passed from the Ferns to the Vines.

Marshall Niel Rose Leaves Diseased (A Young Beginner).—The leaves appear to be attacked by orange fungus, to destroy which dissolve 2 ozs. of blue vitriol in hot water, and then add 3 gallons of cold water, and with this sponge the leaves or syringe the tree; and as the fungus is chiefly on the under side of the leaves care should be taken to wet them there with the solution. Supply liquid manure, and if planted out mulch with partially decayed manure. Soft soap at the rate of 4 ozs. to the gallon is also good against the parasite, but not nearly so effectual as the vitriol water.

Nectarines Diseased (J. H.).—In the absence of information as to the condition of the tree and the soil of the border in which it is growing we have some difficulty in arriving at a correct solution of the cause of the disease which has attacked your fruit. The probability is that it arises from an impaired constitution of the tree, and we are led to this supposition because of the small size of the fruit. This want of vigour may have been caused by successive attacks of red spider, which destroy the functions of the leaves. Perhaps you may have observed the leaves looking sickly, and the young wood after the leaves have fallen destitute both of fruit and leaf buds;

if so the trees have suffered from this pest. Has the house received sufficient air? These disease spots are often produced by inattention to this. Look to the border and see that the drainage is perfect, and the soil open and porous, with a proper admixture of calcareous matter.

Strawberries Eaten by Slugs (J. P., Dublin).—We do not know what you can now apply to prevent the fruit being eaten by the slugs; but you may raise the fruit above the ground or mulching material by some forked sticks thrust into the ground, and place the trusses so that they rest in the fork of the sticks. This will save the majority of the fruit. Securing the trusses of fruit to small stakes will answer nearly as well, but is more tedious. We use crinolines formed of galvanised wire, which answer perfectly, not a fruit so far as we have observed being eaten by slugs.

Watercress in Shallow Boxes not Succeeding (W. J. N.).—There must not be any shade but full exposure to the light, an open situation, yet sheltered from cold winds, so as to accelerate the supply in spring. We cannot account for the plants dying in winter, as they are perfectly hardy. Any good loam will suit Watercress well, and if manure of any kind be added it should be cowdung, but it is best to put in the plants—i.e., rooted cuttings, in good soil and afterwards dress with cowdung. The water over the soil should not be deeper than 3 or 4 inches at most. Straw shutters or a good thickness of mats supported by a framework of lathes so as to just keep them clear of the plants is sufficient protection in winter, and should only be used in severe weather, continuing the protection over the plants during the prevalence of frost and upon a thaw until the plants are thoroughly thawed. We have grown Watercress at 500 feet above sea level.

Vines on the Long-rod System (H. S.).—The Vines should have the eyes rubbed off so that the bearing shoots (not laterals) are 15 to 18 inches distance apart. This is essential to admit light and air to the bearing shoots to insure the proper development and finishing of the crop. The most probable cause of the shoots having in some cases more vigour than others is their taking the lead and exhausting the stored-up sap in the rod, and though the three most vigorous canes have been detached, the remaining ones having no such supplies to draw upon are comparatively stationary. Another reason is that the flow of sap is most abundant at the upper part of the cane or rod, and the shoots are consequently most vigorous. The Grapes are scalded, which is due to the sun or heat acting on the berries whilst covered with moisture. When Grapes begin colouring they should have a little ventilation constantly.

Packing Plants for Tasmania (H. J. G.).—Wardian cases are the best for packing plants in to travel a long distance, especially when they are choice or delicate. They can be purchased of various sizes of some nurserymen and dealers in horticultural sundries, the prices differing considerably according to the size and finish. The plants should be thoroughly watered before being packed, but the superfluous water must be allowed to drain off previous to placing them in the case. They should be stood upright and packed very closely and securely with moss and hay, afterwards standing the cases in the open for a time before screwing the tops on. Treated carefully in this way plants will travel a long distance safely without receiving any attention during the voyage.

Useful and Injurious Insects (A. R. Cox, Wavertree).—Your No. 1 is certainly the grub or larva of that very valuable but insufficiently appreciated species of beetle, the two-spotted ladybird, *Coccinella bipunctata*. No. 2 is the caterpillar of a moth called the buff ermine (*Arctia lubricipeda*). The perfect insect appears in June about gardens and fields, and lays its eggs upon a great variety of plants. More commonly the caterpillars occur from July to September upon those of low growth, but they are sometimes found upon shrubs and trees. They rarely do any appreciable amount of injury, as it is easy to discover and remove them, since they feed conspicuously.

Perennials from Seed (Willesden).—Seeds of most of those previously named can be obtained from the chief firms, and the following can also be obtained in the same way, enabling you to raise a good variety of plants for the spring:—*Anchusa italica*, *Aquilegia cœrulea* and *chrysantha*, *Aubrietia deltoidea* and *græca*, *Calandrinia umbellata*, *Campanula carpatica* and *turbinata*, *Couvolvulus mauritanicus*, *Delphinium nudicaule* and *hybridum*, *Gentiana acaulis*, *Geum atro-sanguineum*, *Gnaphalium Leontopodium* (*Edelweiss*), *Lupinus polyphyllus*, *Myosotis dissitiflora*, *Oenothera macrocarpa* and *taraxacifolia*, *Helianthemum*, *Sedum cœruleum*, and *Veronica spicata*. If you desire to do so, spores of the hardy Ferns can also be obtained and raised with the others.

Uses of Water Lilies (J. H.).—The leaves and stems of these plants and their relatives are generally astringent and bitter, the roots possessing these qualities very strongly developed. The rootstocks of *Nymphæa alba*, the common white Water Lily, contain a quantity of starch and mucilage, with tannin and a narcotic principle that is removed by washing, the roots being then used as food in some countries, particularly in Sweden. We do not, however, think the petals would be very beneficial for the purpose you name. The flowers of the yellow Water Lily, *Nymphæa lutea*, are said to possess a narcotic property, and in some parts of England they are called Brandy Bottles, from the resemblance of their odour to brandy. In Turkey a cooling drink is prepared from them.

Melons not Setting (W., Herts).—Plants growing in frames placed on manure are not unfrequently very vigorous from the roots of the Melons passing through the soil into the rich compost below, and over-luxuriance is not favourable to the setting of the fruit. The only course we can recommend you to pursue is to remove some of the strong growths, so that those remaining are so thinly disposed that the sun can shine on every leaf. Tread the soil very firmly, being very careful not to injure the foliage, and do not give any water for some days, or only just sufficient to prevent the foliage flagging. If the ends of the main shoots are cut off when they reach nearly to the sides of the frame, the axillary growths following will produce pistillate flowers, to which pollen should be applied from the staminate an hour after the frame has been opened in the morning. The fruit-bearing laterals should be pinched at one leaf beyond the flower immediately the latter is seen, and before it expands.

Ginger-beer Plant (E. M. C.).—The fungus you have observed is pro-

bably either the Yeast Plant or the Vinegar Plant, though we cannot determine which it be without seeing a specimen or being furnished with a full description. Both these fungi have been regarded as peculiar forms of species of Penicillium. The Rev. M. J. Berkeley in his "Introduction to Cryptogamic Botany" says—"It is quite clear that yeast is merely an abnormal state of a fungus, very different in habit and forced into a peculiar mode of development by its submerged position." Again, in another portion of the book he observes—"Yeast is in fact nothing more than a peculiar condition of Penicillium, which is capable of almost endless propagation without ever bearing perfect fruit." Under the microscope the Yeast Plant is seen to consist chiefly of small globules, while the Vinegar Plant consists of delicate interlaced threads.

Names of Plants (*J. W.*).—*Euonymus europæus*. (*H. B.*).—1, *Lychnis chalconica*; 2, *Veronica spicata*. (*F. T. A.*).—The blue flower is *Trachelium cœruleum*. The Fern is *Adiantum macrophyllum*.

COVENT GARDEN MARKET.—JULY 18TH.

LARGE supplies, with trade quieter, have considerably reduced prices all round. Crops of soft fruit generally good, and prices in favour of buyers.

THE SUSSEX BREED OF CATTLE.

(Continued from page 41.)

THE Sussex cattle exhibited at the Royal Show at Kilburn gives us the opportunity of bringing to notice the stock of the most successful breeders in the year 1879, the year in which the show was held. It was particularly noticed that the large frames of the Sussex animals, evenly covered with firm flesh; their freedom from the lumps and patchiness of fat which is but too common in showyard specimens of some other breeds; their wonderful formation on the loins and ribs, there being no space left unfilled between the hip and the rib; their uniformity and excellence of colour; and their evident constitutional power and hardiness, mark them out as one of the most valuable beef-producing breeds. At this show the class for old bulls was very good, most of the entries were noticed by the judges. The champion prize for the best male was awarded to a very good yearling, entered by Mr. Hodgson, Lythe Hill, Haslemere, Surrey. The Right Hon. the Speaker wins the second in this class from his estate at Glynde in Sussex. Messrs. Heasman of Angmering, Sussex, win the first and second prizes for calves. The cow class was considered of remarkable merit. Mr. Braby's "Bouncer," the champion female, was greatly admired; she had a great level table-like back, and was excellent on the ribs. Mr. Braby's first-prize heifer, together with Messrs. Heasman's yearlings, are of great merit.

We have been rather particular in naming the winners upon the occasion of the great International Exhibition in London,

because we desire to lay before our readers the names of the breeders of those specimens which indicate the promise of maintaining animals of a large outline and great muscular frame. In the future we not only wish to preserve the size of the Sussex stock for the production of animals capable of tillage of the land as working cattle, but also to prevent the anxiety shown by breeders for exhibition causing too great a diminution in the size of their choicest animals, and to a certain extent reduce them in the estimation of the tenant farmers as rent-paying animals.

We cannot now refer to breeders of Sussex stock whose names figured at the meeting of the Bath and West of England Association held at Tunbridge Wells in 1881, although 126 Sussex cattle were entered for prizes upon that occasion, and which was certainly the greatest number of the breed ever exhibited at any meeting yet held in this country. It occurs to us, however, that it will be well to make some observations relating to Mr. Braby's herd, to whom we have just referred as the owner of the champion cow "Bouncer," for it may be of some importance to know that the Maybank herd contains much that is worthy of attention at the present time. In connection with Mr. Braby's herd is the offshoot herd belonging to his son, Mr. Ernest Braby, at Drungwick. The Maybank and Drungwick herds are now worked together, one bull bought by Mr. E. Braby at Messrs. Heasman's sale doing duty for both. "Never sacrifice constitution for symmetry." These were Mr. Braby's own words, and they seem to strike a keynote and to suggest the main line of his own practice as a breeder. Not that his animals want symmetry; of that they have quite as much as animals bred for symmetry regardless of constitution; but constitution is of primary importance, and it is easier to control the forms of animals sound in their vital organs and of robust health than to restore lost vigour or to purge away hereditary taint. It would be well if breeders of the live stock of the farm generally, of whatever kind, thought more than they usually do of the paramount importance of good constitution.

The Maybank herd, as a first-rate breeding herd, may be said to date its commencement as far back as 1865, and within the sixteen years of its existence its representatives in the show yard have brought home in round figures sixty first and second prizes (some of them representing two, as prize and medal or prize and cup), inferior honours not counted. These prizes were won from 1867 to 1881 inclusive, at the Shows of the Royal Agricultural Society of England, the Smithfield Club, the Bath and West of England, the Royal Counties, and various local societies. During these sixteen years, too, the health of the herd has been remarkably good, no infectious diseases having broken out, illness of any kind having been extremely rare, and quarter-evil unknown. This disease—common in Sussex and Kent—is in both counties called puck—a name derived from former times and traditions. Pedigrees were not so much attended to by Sussex breeders sixteen years ago as they are now, and do not now receive nearly so much attention, as breeders will find to their advantage, if their cattle are ever to draw foreign and colonial buyers.

The Maybank foundation dams were drawn and selected from stocks of known purity and acknowledged excellence, and bulls of superior character and breeding were obtained. A notable sire, Jonah (187), of the strain of the late Mr. Thomas Child, was used in the herd with excellent results. Jonah, when slaughtered, weighed 200 stone (of 8 lbs.) dead weight, and had 24 stone 6 lbs. of internal loose fat. The family which has most distinguished itself in Mr. Braby's hands is that descended from Beauty (1151), a cow by Mr. Thomas Child's Blackstone (68), who, besides other produce, gave birth to Bouncer (1472) by Jupiter. The long list of prizes won by Bouncer includes the champion prize for the best female in the Sussex classes at Kilburn, as above stated, and the reserve number for this championship was that of Rival (1813), Mr. Braby's first-prize heifer.

We will again quote from a paper by Mr. Wm. Housman as given in the *Agricultural Gazette* in November, 1881, when on his visit to the county of Surrey. He says:—"Two herds are selected as representing the Sussex cattle in the county of Surrey—those of the Earl of Onslow at Clandon Park near Guildford, and those of Mr. James Stewart Hodgson of Lythe Hill, Haslemere. The bulk of the herd of the Earl of Onslow's herd is kept at the home farm at Dedswell, about four miles from Guildford. Here are, in a lot of twelve, four of six animals purchased at Mr. James Braby's sale at Rudgwick; Princess, conspicuous by reason of her great length and size, good outline, and fine pair of true Sussex horns; she is six years old, and traces through the Maybank's herd to the strains of Mr. C. Child and the late Mr. W. Botting; and

Empress, short of four years old, have noticeably soft moss-like and thickset hair, on which the light mist drops of a drizzling autumn morning hang like dew on the blades of grass. The majority of the Sussex cattle seen hitherto had not yet put their rough coats on. These a little in advance of their companions show the sort of winter hair they can grow. Turning at length from the Rudgwick purchases to the eight other cows and heifers in the yard, we have Fanny Fern 2nd, Cherry, Dahlia 2nd, and Young Strawberry, all from the herd of Mr. Alfred Agate—Young Strawberry, one of the grandest lot of cows that filled the ring at the Bath and West of England Show in June last, a fine large cow, in character and size a suitable companion for Princess to make a pair.

At Dedswell Farm, about two miles from Temple Court, are the cows in milk, the stock bull, and the "young things." Here, too, is the dairy. But what has the dairy to do with a herd of Sussex cattle? Why, here a good deal. The system of management differs from that of Sussex herds in general. The calves are suckled for a fortnight only, then weaned and brought up on skim milk, linseed, and Mr. Bowick's lactina—the latter found to answer well. The cows when parted from their calves are treated as dairy stock. Some are fairly good milkers, others not very good. Whether Sussex cows are the best for this purpose, and whether this is the best way of treating Sussex cattle, may be questionable; but it is the system which has been carried on here for some years, and the present bailiff, Mr. M'Farlane, is mostly continuing the practice established before the herd was committed to his charge. His experience, so far, has favoured the belief that the Sussex, trained for milk, may be made a good dairy cow; and although subjected to such a drain, the cow herself must look light and poor beside the cow whose only duty beyond bearing a calf is to moderately keep it for four or five months, yet Mr. M'Farlane holds that deterioration of the breed for beef-making would be no necessary consequence of its great improvement for the dairy. He points to the Shorthorn. No doubt prime steers are often bred from first-rate dairy cows; but it is questionable whether extraordinary dairy properties can be perpetuated in a family without some sacrifice of flesh and of the flesh-carrying form, or extraordinary flesh growth become hereditary without loss in milk and butter." We do not think it can be done as a rule. There will, of course, be exceptions.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour is still employed in tillage for root crops, such as late Turnips, Thousand-headed Kale, and Rape. Intervals, however, will be claimed and used for the carting of hay in the irrigated meadows and in the late cold meadows near to brooks, and especially where the pastures lie beneath the level of night fogs, and also in various counties in the north midland and north-western districts where pastures prevail in extent beyond the arable and cultivated districts. In these it is very seldom that the hay harvest can be completed before the commencement of the corn harvest, particularly where winter Oats, winter Beans, and early sorts of Peas are cultivated, and in some districts a sufficiency of agricultural labour is not located, and much work is to be done by casual and travelling labourers. This should really be made a matter to be provided for by the tenantry or the home farmers of the district, or the commercial advantages which should be attached to agriculture must suffer, and the oftener the land changes hands by the introduction of new tenants, any measures likely to meet the pressing requirements of harvest, the more the subject will be neglected, and farming carried on to a disadvantage. Horse labour will for some time be required on the fallows in preparation for the next year's Wheat crop; but we wish to again remind the home farmer that as soon as the fallows can be more than half made it is well to consider the advantage of seeding the land with Mustard at the rate of a bushel for three acres, but it should be done upon any really heavy, cold, clay soil before the 20th of July, otherwise the bulk to be ploughed-in will be too light, or the ploughing-in be too long delayed. In either case it will prejudice the preparation for seeding with Wheat. It is, however, a capital plan upon soils in general where the Mustard seed can be sown in reasonable time, for during the growth of Mustard until it comes into bloom it is increasing the supply of manure for the next Wheat crop, and in various instances when the work is properly carried out in due season the value of the manure contributed by the death and decay of the Mustard ploughed in may be estimated at from £3 to £5 per acre for the Wheat crop. At the same time the indirect advantages are many and great. For instance, after the Mustard is sown no more labour is required upon that land until ploughed-in, whereas if it had remained a naked fallow it would have required tillage during the harvest period, or the twitch would have increased at a time of year when adverse weather would probably prevent the completion of the fallow, and the application of either yard or box manure at seed time. We are of opinion that the Mustard, especially where it grows strong, that quite irrespective of the

smothering influence of the Mustard it has a deleterious effect upon the remaining couch. In addition, at any rate the horse labour is free for other work for a considerable period, say five or six weeks, during which time a lot of important horse labour may be completed, such as scarifying or ploughing and cleaning the Wheat stubbles, or sowing the same with stubble Turnips, Rye, Trifolium, and winter Vetches, each being of great consequence whether these crops are used by ploughing-in or feeding with sheep. The odd horse or horses whose work it is to horse-hoe the root crops may now continue to prepare them for singling and hand-hoeing. It is, however, frequently the case in a growing root season like the present hand-hoers are not to be obtained in numbers sufficient to do the hoeing and singling in time, but especially in harvest, when the greatest difficulty often occurs; but when there is a full and regular plant of Turnips in the rows we have frequently used the horse-hoes across the rows. This will save the roots against injury from being too thick, and women or lads may then single them without difficulty. We have often saved very fine crops of Turnips in this way when it has been quite impossible to save them in the ordinary manner for want of hoers.

Hand Labour.—Thatting the hayricks must be attended to, and it is difficult to get this work done in proper time if we trust to professional or journeymen thatchers, who often suit their own engagements before our interest, instead of which we prefer to learn one of our staff of men on the farm to do the work, and then it may be done immediately the stacks are ready, whether of hay or corn. Now this is a matter of great consequence in the management of labour, for workers on the farm can always in showery weather find time for drawing and piling the straw ready for use at short notice or for immediate requirements. The hand-hoeing of the Mangolds, Carrots, and all root crops should be done in due season, and the number of workmen and women required provided accordingly; but the live fences must all be clipped or trimmed, together with the banks and borders, before harvest if neat and effectual fences against stock are required.

Live Stock.—Upon the best grazing farms where fattening bullocks are kept instead of dairy cattle, they should be so managed as to have a frequent change of pasture. We also object to large numbers being fed together on the same pasture. It should, however, be made a matter of calculation as to the numbers required to consume the grass in due season, and the change of pasturage should be carried out even if the stock of each field be made to succeed each other in turn occasionally, in preference to grazing large numbers in one herd. In some pastures it is necessary to supplement the grazing by allowing the animals some cake and bean meal mixed, but to prevent waste the cake and bean meal should be mixed with a little cut Mangolds and placed in skeps, one for each animal, got ready previously for the animals to partake upon their change and entry from one pasture to the other. Where sheep are kept as an established custom on a breeding farm this is the time for the sale of the offgoing ewes and lambs, but a provision should be made for wintering the usual quantity of stock, for while sheep are selling at such prices the advantages of selling as many as can be spared, having regard to the usual stock of the farm, are obvious.

THE AGRICULTURAL SHOW AT YORK.—At the extensive Show opened this week we are desired to state that Messrs. Sutton & Sons, Reading; Messrs. James Carter & Co., High Holborn; and Messrs. Webb & Son, Stourbridge, and others have large stands of roots and seeds very tastefully arranged.

REMARKS.

- 8th.—Fine and warm, overcast at times; heavy rain with lightning and thunder 10.15 P.M.
 9th.—Dull and rainy in early morning; fine day.
 10th.—Very bright early; changeable during day and gusty winds; fine calm evening.
 11th.—Cloudy at first; bright afternoon; high gusty wind all day.
 12th.—Dull and squally; rain in afternoon; fine cool evening.
 13th.—Squally and showery; bright morning and fine evening.
 14th.—Fine morning; thunder storm began 11.45 A.M., lasting till 0 15 P.M., with very heavy rain between noon and 0.5 P.M.; another storm between 3.45 and 4.5 P.M.
 Cooler than the previous week, but temperature still above the average. Noteworthy chiefly for the very heavy rains of 14th, nearly an inch falling in half an hour in the first storm and 0.40 inch in twenty minutes in the second.—G. J. SIMONS

FIRST-RATE ONIONS IN A SECOND-RATE LOCALITY.

WHEN this appears in print the gardener's year will just be commencing; indeed, in some senses will have already begun. Not very much can be done now towards securing good crops of fruits or vegetables or a display of flowers for the current season; but now or never must the foundation be laid for next year's Strawberries, Cabbages, Onions, Roses, Carnations, bedding plants, and all or nearly all else beside. That being so, a few words on Onion-growing will be seasonable.

Onions are sown at two very distinct seasons of the year—in July and August, and from February to April. The exact time depends greatly on the climate. In the north of England or in Scotland the middle of July is not too early, especially in cold seasons; but in the south of England the seed may or may not be sown a week or two later. When sown too early there is a tendency in the crop to run to seed in spring, especially on hot poor soils. When sown too late the plants do not gain strength enough to stand over severe winters.

While first-rate Onions cannot be grown on poor soil, rich soil is not suitable for sowing in at this season, as the plants are on such soil certain to grow much too strong, with the certainty of perishing during winter should the weather prove severe. Heavy clay grows the best Onions; but if the seed is sown in autumn on light soil well firmed down, and in spring the plants are transferred to heavy rich soil, the best results may confidently be looked for. If a choice of soils cannot be had, and the soil be only heavy clay, the beds should be partly raised in order to secure dryness, and some light material incorporated with the surface.

Freshly applied manure is not good for autumn-sown Onions. A far better way of preparing the soil is to apply manure liberally for some early crop such as Potatoes, Cauliflowers, Turnips, Lettuces, &c., and to simply fork up the soil after these are removed, pulverising it thoroughly and afterwards firming it moderately before sowing. Onions will not do well on a loose soil. Decidedly the best way is to sow in rows, although many good growers sow in beds 4 or 5 feet wide with alleys between. When in rows weeds are much more easily kept under, and alleys are dispensed with.

In the case of spring-sown Onions the soil should be very thoroughly prepared. It should be dug two spades deep at least. In a good climate manure should be incorporated with the upper 18 inches of soil if the very finest Onions are wanted. When the climate is wet, northern, cold, not more than the upper 6 inches should be made rich, and for reasons which will be given. In a good climate there is little fear of the plants not bulbing, in which case the better the feeding the finer the Onions. In a wet cold climate a rich soil combined with continual damp and a deficiency of sun will cause a rank growth of "thick necks," which often fail to bulb at all or produce bulbs that will not

keep. When the upper 4 inches only is made rich under such climatic conditions the plants start vigorously, but afterwards, when the roots get beyond the manure, halt and begin bulbing.

Too often the reverse of this is seen. Manure is dug or trenched in deeply, and the surface soil is poor. Seeds sown on this germinate well enough perhaps, but the resulting plants stand long and make little progress. This is true of all kinds of plants. In consequence of this lingering some precious weeks early in the season are lost. But by-and-by the roots reach the manure, and the plants go in for a spell of growing just when those better managed have made their growth and are beginning to form bulbs. Under such conditions the hardy and beautiful little Queen Onions are seldom bigger than Cherries; but when the first young roots find food in abundance, the moment they push from the seed, instead of being obliged to spend their strength making long roots to go in search of it, they develop into useful Onions.

When by reason of the climate we dare only manure the very surface, so that we may induce rapid spring growth followed by a kind of premature bulbing, useful, but not what may be called first-rate Onions, may be produced. To do so requires that some out-of-the-way plan should be tried. The climate must be assisted, and as many weeks as possible added to the growing season. The summer heat is sufficiently high even in the most northern parts of these islands to grow the best of Onions in ordinary seasons, but north of the Trent summer is too short; hence the necessity for securing what we have called premature bulbing by a judicious placing of the manure, so securing not large but very useful Onions of good quality, or Onions as good as can be grown anywhere by a lengthening of the summer, or practically so.

For long it has been the habit to sow in autumn and transplant to rich deeply dug soil in spring. By this means large Onions are produced which ripen early. Such, however, are almost always very coarse, and cannot be regarded as first-class. The cook despises them, and they will not keep. One reason for autumn-sown Onions being coarse is that hitherto only such coarse kinds as the Rocca and Tripoli have been sown in autumn under the impression that these alone were fit for the purpose. But this is not so; for many, indeed most of our finer Onions which are usually sown in spring, may with confidence also be sown in autumn, and much better Onions thereby be the result. Still, autumn-sown Onions are coarse. Sometimes, too, an exceptionally severe winter kills them, and spring-sowing must be resorted to.

A good old plan, not now so much practised as it with benefit might be, is to sow ordinary varieties thickly on poor soil in May or even June. The crowding and the poverty cause these to ripen off in autumn when not much larger, often, indeed, smaller, than peas. Planted in spring as Shallots are on firm rich soil, these often grow into splendid bulbs which ripen early. Even the Onions which are too small for use from the ordinary crops may be so planted, especially when severe weather has damaged or destroyed the winter Onions. They will then be of service in the kitchen before spring-sown Onions are ready; but they seldom make good bulbs for keeping, being almost certain to run to seed. True, if the seed stems are pinched out bulbs will form but not of the finest kind. Sometimes, however, they are invaluable, especially on light soils, for neither maggots nor mildew touch them.

These methods of stealing a march on time, as it were, have been practised for generations, and success more or less certain has followed the practice. More recently, in Scotland, the plan of sowing in heat has been adopted with splendid results. Those of your readers who have visited the international exhibitions held in the north in recent years will doubtless have wondered at the Scotch Onions as much perhaps as at Scotch Leeks. These Onions have been nursed on, in pots probably, but certainly under glass. It is the

custom with exhibitors to sow in boxes kept very near the glass, as early as January and not later than the beginning of February. The soil used is very rich. Often enough hotbeds are used, and the young plants forwarded on these under frames. A good heat is maintained, and airing is attended to, to prevent drawing as much as possible, though that is not greatly feared, for after transplanting the old leaves disappear in a short time as others are made. A dozen or two are generally pricked off when the second leaf is forming into thumb pots, from which they can be easily and without injury transplanted. Oftener, however, they are pricked out in other boxes, though they are often left alone. When the soil in the boxes is filled with roots liquid manure is given every time water is wanted. By such means the plants are frequently stronger by April than are those sown in the autumn.

Such preparation is by no means so laborious as it may seem. In a really cold climate, in fact, a much greater weight of Onions may be raised with a certain amount of work thus than in the ordinary way. Sown on a hotbed or in boxes not a great deal of labour is involved in this nursing, and the dibbling-in of a few thousands is hardly more work than is involved in the sowing, hoeing, thinning, and weeding needed by a breadth of Onions that will produce an equal weight by autumn, for a much smaller piece of ground and a much less number of plants will suffice. Nay, it often happens that those sown in the ordinary fail wholly or partially by maggot, mildew, or even want of sun, which is seldom the case with transplanted Onions; and, above all, the produce is very much finer, and such as one can look at with pride instead of humiliation. Let it be understood, however, that it is only in backward localities that we consider such a plan the best.

Maggots often ruin spring-sown Onions. It is seldom that this occurs if soot is very plentifully used when the Onions are sown or planted, and again when fairly growing. Wood ashes are also capital preventives, and so is charred garden rubbish. These are also capital manures. For heavy soils ordinary manure well made is the best, and for light soils cow manure. But thoroughly decayed hotbed manure which has been under frames or in pits, and so has not had its virtues washed away, spread over the surface and very lightly forked in, is the best dressing that can be given. During winter urine may be poured over the ground with great benefit, and at midsummer the same well diluted will prove of immense service.

Onions often fail to keep after wet seasons because they are not properly dried. Unless really dry weather occurs at harvest time a good plan is to spread the Onions thinly in vineries, Peach houses, Melon pits, and other structures which are kept dry and airy. A Melon pit from which the plants have been removed is a capital place, for then the Onions may have heat, sun, and arid air, which cannot fail to dry them.

Among the best growers that we know of it is hoped that no offence will be given if we name the following in the hope that this may catch their eye, and that they may further enlighten your readers on this subject:—Mr. Neil Glass, Carbrook, Larbert; Mr. Donald Macbean, Johnstone; Mr. G. Potter, Seacliff, North Berwick; and last, but by no means least, your esteemed correspondent, Mr. Murray, Culzean, Maybole, whose Onions were, we are told, comparable to "gas-globes."—A SCOTCHMAN.

SEASONABLE HINTS ON VERBENA CULTURE.

MANY people of late have expressed regret that they cannot grow Verbenas satisfactorily in their flower beds, and as these plants do well with me visitors frequently conclude that there is something in our soil which especially suits them; but as I grew them equally well in at least two places before coming here I do not think the soil or the climate ought to have all the credit.

The Verbena when well grown, and more especially the variety known as Purple King, fills a place in the flower garden for which

no perfect substitute can be found; but it must be grown properly or not at all, for there is scarcely anything so miserable-looking as badly cultivated Verbenas, and to grow them properly requires a considerable amount of attention. Purple King is not supposed to be a strong grower, but mine are planted about 15 inches apart, and they will fill this space by the middle of August, which is quite as soon as they are wanted here, and last in full beauty till late in the autumn. If there is a secret in their cultivation it is this: They must be kept growing always—not necessarily fast during the winter months, but they must be kept growing. Let them once become stunted and hard, and it takes a considerable amount of coaxing to induce them to start again freely.

They are liable to mildew more or less towards late autumn. Cuttings taken then will not strike freely, and those which do strike do not grow kindly. It is a good plan to take a few cuttings as soon as the plants get into a thoroughly vigorous growth after they have been planted out—say by the end of July—to grow these cuttings briskly, and then, if they are likely to become too large to keep them for stock through the following winter, they will furnish by September better cuttings than can be had from the beds.

A cold close frame is suitable for them to strike root in during July; but in September, if the weather becomes chilly, they do better in a little warmth, such as is afforded by a gentle hotbed. I use boxes 32 by 12 inches for them, and lay panes of glass over these boxes in addition to the covering afforded by the sashes. Very small cuttings are preferred, taken from vigorous shoots fully exposed to the light. They are simply cut off half or three-quarters of an inch below the first pair of moderate-sized leaves, and have the flower bud picked out, if there is one. We do not want many for stock; fifty or sixty plants of a sort are ample to keep through the winter. We can then afford to give them plenty of room, and they are all the better for it.

Rather light soil is placed in the box to the depth of 2 or 3 inches, and a little sand or road grit is scattered over the top. The cuttings are then inserted with as little delay as possible, so that they may not commence flagging, for if they do they will certainly be a day or two longer in striking. A sharp-pointed dibber should never be used, as it is apt to leave a cavity below the cutting, which should always rest on a solid bottom, and the leaves should always stand up clear of the soil. Immediately a box is finished it should be watered rather copiously with a fine rose, covered with the panes of glass and placed in the frame, where it will need no more attention besides shading till the cuttings are rooted.

When this stage is reached one of the panes of glass (I have either two or three to cover a box) is shifted about a quarter of an inch, so as to admit a little air, and in a couple of days from this the panes are removed altogether. In three or four days more the sashes may be opened an inch, and so on a little at a time till the young plants will bear complete exposure. They are then transplanted to other boxes filled with moderately rich soil, and allowed a space of 6 inches from plant to plant. If they are likely to grow too large before winter we start afresh by taking cuttings off them, and proceeding again in a similar manner. A few healthy young plants is all we want for stock. Keep them gently growing throughout the winter, and an almost unlimited number of thousands can be raised from them in the spring. If there is any suspicion of insects I dip all cuttings in the softsoap and petroleum mixture recommended some time ago in this Journal, and plants, when we are transferring them, are subjected to the same treatment if necessary.—WILLIAM TAYLOR.

CLEANING STONWORK.

THE paths and curbs in plant and fruit houses are not unfrequently formed of stone, and this in many gardens is by no means the limit of the stonework that has to be kept perfectly clean. In order to accomplish this severe scrubbing is resorted to very frequently, yet it is almost impossible to keep flags and stonework free from green. In plant and other houses where water is continually thrown about, scrubbing becomes an arduous and laborious operation, and the stonework in spite of this retains a green appearance. They cannot be kept clean by this means, however determined a man may work at them, as I have ample proof. Some years ago I had charge of a number of houses in which the floors were formed of Yorkshire flags, and I worked at these with a will, first in the hope of getting them clean, and then keeping them in that condition afterwards. During the two years I had charge of these houses days and weeks, if not months, of valuable time were wasted in scrubbing, and with results anything but satisfactory.

Another plan is to scour the stonework by means of other coarse-grained stone and water, which will, without doubt, accomplish the object in view by grinding down and reducing the stone until it is perfectly clean. To grind down soft sand-

stone in order to make it clean does not take up very much time, but this would require to be repeated very frequently, and soft stone in a very few years would be greatly worn. Try this stone-rubbing system on material of a very hard or flinty nature, and it requires a lengthened period of time to thoroughly reduce the stone until it is as clean as when new. This, too, if worked at as well as the scrubbing system, will prove an operation that will not only waste time but prove exhausting and laborious.

It must not be understood that I am an advocate for green and dirty curbstones and floors in the houses or about the grounds; on the contrary, I delight in seeing them as clean as the day they were new. This can, as I hope to show, be safely and readily accomplished with a minimum of labour and cost in comparison to the system too frequently employed in gardens for cleaning stonework.

Chloride of lime, if judiciously used, may be employed to clean stonework in houses where the most delicate plants or fruits are grown without the slightest injury. On the other hand, if the inexperienced are allowed to use it carelessly much damage to both fruits and plants may result. I have always found when injury to any particular plant has resulted from its use that the cause has been traceable to negligence on the part of those entrusted to carry out the operation. Even with young men that have never used it—all that have come here never having used it before—one or two lessons are ample in initiating them. The careless should have a certain quantity mixed for them to cover a certain quantity of stonework. A very little of the lime mixed in a pail with water will clean the whole flags and curbs in a house of good size. When applied with an old hand or hair broom the floor should have the appearance as if a quantity of milk had been brushed over it, a little stronger if the floor or stones are very green. After being applied it should be continually moved about the flags by means of the old brush by which it was applied—scrubbing is not necessary—until the chloride of lime forms a froth, which it will soon do, and when in this state the work of removing the green is rapidly going on. It should be allowed to remain upon the floor about ten minutes after it reaches this stage, and can then be well washed off, when the flags will be thoroughly clean.

Some attention is needed in washing it off, for if not well done the stonework assumes a white appearance, which is not the case when well washed. The chloride of lime, whether employed indoors or out, should never be allowed to dry upon the stones or flags, or some hard scrubbing will be necessary to remove it.

When employed indoors it is decidedly safer to use it during early morning, at night, or on dull days, as it is then less liable to injure anything than when the sun is shining with force upon the house. From the time the lime is first laid upon the floor the house should be well ventilated. In applying the lime attention is needed that it is not splashed upon the doors or other paint in the house, as it destroys the paint and turns it a rusty colour that no amount of washing afterwards will remove. The only objection that can be urged against its use for the purpose indicated is the odour, or "disagreeable smell," that some call it, that is left for a short time in the house after its use. It will smell for a few days, but it is by no means disagreeable; in fact, is not half so objectionable as the smell arising from applications of strong liquid manure that are so liberally poured upon Vine and Peach borders in many gardens. However, if the odour arising from the lime is objectionable, and the house requires cleaning while the family is at home, spirits of salts may be used. This is more expensive, but will, as far as my experience goes, injure nothing, will clear off every particle of green, and leave no offensive smell. It should be diluted with water, the quantity entirely depending upon the strength of the acid. I have frequently used this when the family has been here, but in spite of the slight smell arising from the chloride of lime we most decidedly prefer it. The last-mentioned, if used with care, is an easy, inexpensive, and effectual plan of thoroughly cleaning floors formed with flags and other stonework in the garden and grounds.—W. BARDNEY.

THE GOLDEN APPLE.—Mr. Ronald McLeod, Mount Tröodos, Cyprus, writes to a daily contemporary as follows:—"It will, I think, be a subject of interest to know that the identification of the fruit which in the Old Testament and in ancient Greek writings is called the 'Golden Apple' has become possible. 'The three Golden Apples given by Venus to Meilanion, whereby he won the race with Atalanta, were plucked, it is said, either from the Garden of the Hesperides or from an orchard in Cyprus.' Any proof helping to establish the identification of this fruit will come naturally with greater weight from Cyprus, the home of

Aphrodite. In Cyprus at the present day in early summer almost every garden has trees laden with 'ta chrysomela,' 'Golden Apples,' and the bazaars of the towns are filled with the fragrant fruit. The modern Greek name for the Apricot is 'to Berykokkon,' but the Cypriote still calls it by the ancient name 'to chrysomelo,' since he knows no other, thus carrying the mind back to the distant past when Cyprus was the Garden of the Eastern Mediterranean, and fit to be the favourite residence of the Goddess of Beauty. The 'Golden Apple' of the Book of Proverbs is also, doubtless, the Apricot. The references in the Old Testament apply, in all respects, to this fruit tree alone. It has been abundantly cultivated in Palestine from early times; its foliage forms a 'delightful shade,' and is bright and pale like 'pictures of silver,' while it bears 'Apples of Gold' of 'fragrant smell' and 'sweet to the taste.' Dr. Clarke says that the Apricot tree appears to be indigenous to Cyprus. If this be so, the 'Apples of Gold' of Proverbs xxv. 2 are certainly Apricots. If, on the other hand, as is also asserted, the Apricot is a native of Armenia, then both the tree and probably its name were thence introduced at some early period into Cyprus. When the constant intercourse of Cyprus with the Eastern mainland in all ages is borne in mind, together with the fact of the particular commercial dealings which existed between the Israelites and the Phœnicians at a time when Cyprus was largely colonised by the latter, and when, for a while, it owned allegiance to Hiram, King of Tyre, there is the strongest probability for the assumption that the fruit which the Greek afterwards called the 'Golden Apple' is identical with that which in King Solomon's time was known by the same name; and that both names were derived from a common source."

GARDEN CHEMISTRY—PHOSPHATES.

(Continued from page 55.)

SOME guanos, though containing little nitrogen, are especially rich in phosphates. Those from Mejillones contain as much as 71 per cent., and make the best of superphosphates or dissolved guanos. Dissolved Peruvian guano is one of the most active artificial manures in existence, as it contains ammonia (nitrogen equal to) 12 per cent, and phosphoric anhydride equal to 22 per cent. of tricalcic diphosphate.

In recent years a more than usually active phosphate has been before the public under the name of "fimur," which is manufactured from the sewage of the midland counties by what is known as "Scott's process." It is "an ammoniacal phosphate of magnesia," but contains potash and other fertilising matter in addition. At Easter Ardross, applied to Turnips, it gave 27 per cent. over the next best crop produced by other combinations of phosphoric anhydride and nitrogen, the next best being from a mixture of undissolved coprolites, bone ash, and ammoniac sulphate; although in the latter case twice as much phosphoric anhydride was given as in the case of "fimur," the nitrogen in each case being the same. In other cases on different subjects its effects have proved equally striking; and when a quick return is desired it will doubtless prove a useful manure.

Among numerous experiments with dissolved pitted against undissolved phosphates, the balance of results are in favour of dissolving not only mineral phosphates but even bones. But most of these experiments have had reference to the current crop alone. In farming practice, so long as the law does not provide for "unexhausted improvements," this is perhaps enough; but in the case of the garden, when in the hands of the proprietor, or even in the case of market gardeners who are generally protected by leases, it is doubtful if the use of soluble phosphates is at all to be recommended. Garden soils have a dissolving power over such that enables the plants grown to use the applied phosphates soon enough. Then phosphates are by no means liable to loss; and though the current crop leave an unused residue, it will be taken up by a succeeding one. Dissolved cost one-third more than undissolved phosphates, and often have a hurtful power on soils already containing acids. Of course this can be prevented by the use of lime, or by precipitating the soluble phosphate by adding bone dust. Still it may be doubted if in gardens even mineral phosphates are the better by being dissolved. Moreover, in the case of fruit borders something lasting is of positive benefit, and in such tricalcic and monocalcic phosphates alike speedily assume the same form—the bicalcic. True enough, phosphates, soluble in water, can be much more thoroughly diffused through the body of the soil, and a given quantity will present a greater surface than will an equal quantity of even impalpable powder produced by mechanical means. No grinding can produce an equal state of fineness with what chemical means can; but then the same money will buy more of the ground phosphate, and the distribution difficulty is no difficulty compared with what it is with the farmer who is tenant at will or near the end of his lease.

But Mr. Jamieson's experiments make it doubtful if dissolved phosphates are really so superior after all. In Aberdeenshire it was found that a mixture of steamed bone flour and coprolite produced, in two instances out of five, results identical with the same substances rendered soluble; in two cases the results were inferior, but only

about 10 per cent. ; and in one case actually superior crops resulted. In the case of the soluble phosphates the quantity given was equal to 100 lbs. of phosphoric anhydride per acre, in the case of the insoluble 150 lbs. were given ; these quantities costing about the same sum. Thus, while the crops in the first instance were nearly equal, the phosphate remaining in the soil would be much greater in the case of the insoluble than the soluble, and would affect the after crop to a much greater extent. Indeed, this was found to be the case. Not only so, it was found that the Turnips were much more prone to disease after dissolved than undissolved phosphates. It appears that the fungus which causes the disease feeds more particularly on the pungent oil found in Turnips and other members of the order ; that this oil is rich in sulphur, and that the sulphuric acid present in dissolved phosphates favour the disease by promoting the production of the oil in question. Whether this theory be correct or not, there can be no doubt as to the facts ; and as the Brassica order have to follow each other in closer rotation in the gardens than in the field, the danger will be the greater ; for it is found that when Cabbages or Turnips follow in too rapid succession finger-and-toe, clubroot, and other diseases often decimate, if not totally ruin, the crop. But when bones, fowl or pigeon manure, and human excreta are used to supply the phosphates demanded, superphosphates will hardly be wanted. Space here does not permit, otherwise we would refer at length to the experiments with soluble *v.* insoluble phosphates in Sussex ; but the conclusion arrived at after elaborate experiments under a variety of experiments was, that a mixture of bone flour and ground coprolite was the most economical manure to use so far as phosphates were concerned. Owing to the greater solvent power of garden soil they will, doubtless, prove even superior in the garden to what they have in the field.

As the manufacturers of superphosphate derive most of their profit, not from the phosphates, but the vitriol necessary for their reduction, and as those who make their own superphosphate at home must at least buy this, it does not pay to make it at home where the appliances are necessarily rude. Still, many people like to make their own, and especially those who have collected a quantity of bones. For these who are anxious to reduce these we may describe an easy inexpensive method of doing so. A large wooden trough or tub in which to mix the materials, and a wooden spade is necessary. Iron tools are worse than useless. A coating of pitch will be an improvement, as it will preserve the tub from being charred by the acid. Even this may be dispensed with, as the process may be conducted on the bare ground if a close firm spot is chosen into which the acid will not seak. To prevent the liquids running away a rim of ashes will be necessary. The finer the bones are broken, or the mineral phosphates ground, the more rapidly will the transformation take place. In the operation three things are necessary—phosphate, acid, and water. There are many kinds of phosphates, as we have pointed out, and an extra allowance must be made for those which contain a considerable amount of calcic carbonate, ferric oxide, alumina, &c. There are three kinds of acids—white, brown, and chamber : 64 lbs. of white (specific gravity 1.845°), 82 lbs. of brown (specific gravity 1.700°), and 114 lbs. of chamber acid (specific gravity 1.450°) are the quantities required to convert 100 lbs. of insoluble phosphate into soluble. Brown acid is usually used because it is considerably less expensive than the purer white. Except when it is manufactured chamber acid is seldom used, the cost of the carriage of mere water making it less economical than brown, which is cheapest, unless when the distance from the manufactory is great, when the white may be used. The amount of water employed is about 3 in 40. Half of this is commonly used for thoroughly moistening the phosphates and half for diluting the acid. Afterwards the acid is poured on the bones, &c., and the whole thoroughly mixed. When mineral phosphates are used it is well to have more acid than enough rather than less, and to add bone dust afterwards. By so doing most of the phosphate will be dissolved, which is not usually the case. The addition of bones afterwards will reduce the amount of soluble matter, yet not the value of the compound, but the reverse.

At a manufactory in our neighbourhood the following rule is observed in the manufacture of a mineral superphosphate guaranteed to have from 25 to 28 per cent. of soluble phosphate (this term usually misleads ; soluble phosphate is not meant, but tricalcic phosphate rendered soluble, which is of course very different) :—One ton of Cambridge coprolite, 17 cwts. of brown acid, and 3 of water. For "dissolved bones" 7 cwts. of half-inch bones, 13 of coprolite, 16 of brown acid, 3 of water, and (afterwards for drying) 2 of plaster of Paris. This gives about 24½ per cent. of soluble phosphate as well as fully 1 per cent. of (nitrogen equal to) ammonia. Other proportions are used, but these will sufficiently indicate to the beginner the proportions of the different materials wanted.

Soluble phosphates soak into the soil and so are thoroughly distributed. When precipitated by lime they are readily used ; when, as on rusty ground deficient in lime, iron oxide precipitate them they are not considered so available ; but it is considered that the iron

ultimately takes the place over of the lime. In such cases it may be well to precipitate them beforehand, otherwise lime in any form, except the sulphate, should not be used for drying or diluting the newly made superphosphate. Bone dust is best, but ashes, sand, or dust will suit. The better they are dried and the more finely pulverised the more easily are they distributed with uniformity.

While for long bones have been used in the construction of Vine and other borders and for trees and plants in pots, it is to be regretted that anything like scientific experiments with phosphates in the garden as in the field are unknown. We may reason from analogy ; we may point out that garden crops demand phosphates largely, and that garden manures supply them sparingly ; we may instance numberless cases where bones and other forms of phosphates have been used, and success has attended ; but, compared with what has been done for agriculture, we gardeners have not yet made a beginning. Indeed, but for the rays reflected from agricultural chemistry, garden chemistry would still be obscured in darkness. What we know of the solvent power of soils, and the facility with which roots in general attack other mineral substances, we can hardly be wrong in supposing that a liberal addition of ground or even broken coprolites to borders, which are "made to last a lifetime," would prove a lasting and satisfactory source of the phosphoric anhydride Vines, Peaches, and other fruits need. We can hardly doubt but many an acre of orchard soil could thus be cheaply improved ; but nobody has proved it, and we want proof, without which we must found our hopes of success on what is likely rather than on what is certain.

Phosphates can hardly be applied wrongly to very old soils, or indeed any, for the reasons already given. All garden crops require them. Old worn-out lawns greatly benefit from such, especially when applied a year after a dressing of lime has been given to kill moss and sweeten the under soil. Grasses, and especially the finer kinds, depend for their very existence on finding phosphates ; when these fail in the soil other plants that do not so much depend on phosphoric anhydride usurp their place. In cases of extreme poverty an addition of some nitrogenous manure will help the action of the other ; but finely ground bones, preferably steamed bone flour, is perhaps the best either for encouraging fine grasses on inferior soils or renovating these on old turf. From 5 to 8 cwts. per acre may be regarded as a good dressing ; for kitchen garden or flower ground from 5 to 10 cwts. suffice for Cauliflowers or Cabbages, 2 or 3 cwts. for Potatoes, but none when these follow Cabbages which have been liberally dressed the year before.

As illustrating the effect of carbonic dioxide on the solubility of different phosphates, and as a guide to the solvent power of the soil, we may add that Mr. C. P. Williams found that the following, when suspended in water through which the gas was passed, became soluble in the degrees indicated below :—

	Parts of water.
Calcic phosphate in apatite is soluble in...	222-222
" " " finely ground apatite ...	140-840
" " " bone ash ...	5-678
" " " burnt bones ...	8-020
" " " South Carolina phosphate...	4-122
" " " same finely powdered ...	6-554
" " " in phosphatic guano from Orchilla ...	8-009

From this it will be seen that some phosphates are very much more soluble in the soil than others. Apatite we may mention is the form known by the name of Canadian and Norwegian phosphates.

—SINGLE-HANDED.

(To be continued).

A STRAWBERRY ENEMY—BIRDS.

MR. ROBERT GRINDROD in blaming mice for biting Grape berries clean off the bunch (see page 50), gives these mischievous little animals a character they do not deserve. Voles and common rats do so, but mice content themselves with eating a little out of each berry. The garden here is so placed as to bring us a perfect scourge of animals ; rats, mice, squirrels, hedgehogs, pheasants, partridges, blackbirds, and sparrows congregate together round it as to a common centre, and make themselves at home as much as they can. Rats take to fruit very readily. Not only are Grapes eaten, but I have occasionally had to watch the Pear trees and shoot the rats when eating the fruit. Beans they prefer to Peas, and when hard pressed for food will eat growing Potatoes. Mice like Peas better than Beans, and will destroy the produce in the pods as well as when lying as seed in the ground. I do not think mice are so fond of fruit as rats are, they seem to prefer grains and seeds. Last fruit season squirrels were very bad ; very unwillingly they were shot down, sometimes as many as five or six in a day. Plums are apparently their favourite fruit.

Pheasants are very tame here, and are strictly preserved even in the garden. As a consequence Peas have not only to be protected before the plants appear, but occasionally they have to be kept netted until the pods are ready for picking, when sparrows and chaffinches attack them. Pheasants are extremely fond of some yellow flowers, notably *Doronicum*

caucasium and Crocuses. They also eat the Crocus bulbs during summer. They attacked Lettuces and Cabbages last winter for the first time in my experience, and kept up the taste for them till the arrival of summer. Blackbirds are comparatively harmless in a wet season; slugs and worms are then plentiful, and they are not pressed for food. During the drought of the present season Currants had to be netted five weeks before ripening. Birds were so hard pressed that they were glad of anything. It is interesting to see blackbirds throwing themselves against nets protecting wall fruits; they soon find out that the net will give sufficiently to allow them to get their beak into the fruit, provided they throw themselves with sufficient force against the net. The only remedy is to keep the net well off the trees by means of forked sticks, and to stretch the net as tightly as possible when it is put up. I am very averse to killing if it can be at all avoided. Blackbirds and finches are partially defeated by gathering fruit as quickly as possible when it is sufficiently ripened.

Three years ago some of us had a lesson from wasps on the proverb, "Not to leave till to-morrow what can be done to-day." A gardener noticed a few wasps in a vinery one Saturday. The necessity of protection was obvious, but he left it till the Monday. The intervening Sunday was a hot day, and on the Monday morning there were absolutely no Grapes left to protect. Another case I knew where the gardener went to pick his Gooseberries, but when the nets were removed he found the bushes quite bare.—B.

TWO PRETTY ROSES.

In few gardens are any of the numerous species of Roses now grown. The abundant and handsome progeny which have been obtained by

Fig 14.—*Rosa alpina*.

cultivators of the Rose in the past fifty years have ousted the typical species, some of which possess a modest beauty that is gradually becoming more recognised and appreciated. These so-called "single" Roses are, however, rarely seen except in botanic gardens, and two of these which have been so preserved are represented in the accompanying woodcuts—namely, *Rosa alpina* and *R. sericea*, attention being specially called to them as charming, free, and graceful plants.

R. alpina (fig. 14) is the first of Lindley's tribe Pimpinellifoliæ, which also includes such pretty species as *R. stricta*, *R. sulphurea*, and *R. myriacantha*. It is a native of Europe, and was known to and mentioned by most of the old authors under an alarming number of names, all of which have given way in favour of that adopted by Linnæus. It attains a height of 8 feet as the maximum, but is usually much less, the flowers being solitary and of a bright rosy-blush colour. Several varieties of this are known, differing in unimportant characters, such as the depth of shade in the flowers and peculiarities of the fruit. The specimen figured was grown in the Trinity College Botanical Garden, Dublin.

R. sericea (fig. 15, p. 73) is one of the Caninæ group, and was well figured in Lindley's "Monographia." Our specimen, however, repre-

sents a variety with much larger flowers than that, and is rather closer and more sturdy in its habit. It forms a kind of connecting link between the European and Indian Roses, having *R. canina* on the former side, and *R. indica* on the latter; but it belongs more distinctly to the Asiatic species, being itself found at Gossam Than, whence it was some time ago introduced to England. The flowers are slightly cupped, pale pink or blush, almost white in the centre; and the leaflets are small, with several deep serratures at the apex.

MR. LAXTON'S NEW PEA EVOLUTION.

I HAVE sent for your inspection a sample of Mr. Laxton's new Pea Evolution, and which, in my opinion, promises to be a first-rate midseason variety, and being a robust grower and of branching habit the individual peas should be sown 1 foot apart, otherwise the haulms, which are from 4 to 5 feet high and heavily cropped with large well-filled pods of the Pride of the Market type, will not have sufficient room to develop themselves. As an instance of this, I may state that when I received my packet of Evolution on the 11th of March I resolved to make the most of the hundred which it contained, and therefore two days later sowed them in small pots filled with light mould (putting one pea in each pot) and put them into heat, and so soon as they came up and attained a height of 6 inches a short stick was put to each plant for support. A couple of weeks later these Peas, having been gradually hardened off, were transplanted in rows 6 inches apart in the row, and although they looked very thin in the rows for some time, it is obvious enough now that the result would have been better if the young plants had been 6 or 9 inches further apart. And as a proof of this assertion, several ranks of that excellent variety, Culverwell's Giant Marrow, in other parts of the kitchen garden are everything that could be desired, and these, which in some cases transplanted and in others sown in the drills, were allowed 12 inches in the rows. Therefore the results of these sowings of expensive Peas points to a practical conclusion—viz., that no matter how cheap the seed, providing it be good, do not on that account sow it too thickly, as by so doing the seed is not only unnecessarily wasted, but the object aimed at—a good crop, is reduced to a minimum.—H. W. WARD.

[The Pea Evolution appears to be a good variety, the pods of moderate size, containing eight to ten peas, but the specimens sent were too advanced to test their quality satisfactorily. Culverwell's Giant Marrow, also received, is a very fine variety, the pods of great size, and containing nine to eleven large peas of good quality.]

HISTORY OF THE FANCY PANSY.

It is evident that the Fancy Pansy is now firmly established in popular favour, and as there is evidently a still growing popularity for it, I think it will be as well if the early history of this flower is given at once, so that in the future it may be known when this form was introduced and who first took it in hand. Mr. Miller in the *Journal* of the 19th inst. (page 46), clears up a little of the fog which has hitherto surrounded the Fancy Pansy, and shows us that Mr. John Downie exhibited some six kinds at the Botanic Gardens, Regent's Park, in 1852, but from that time until about 1858 this type of Pansy was an unrecognised and almost unknown flower amongst florists.

In the *Journal of Horticulture* of June 28th (page 539), in your notice of the meeting of the Scottish Pansy Society in the Waverley Market, Edinburgh, the following paragraph appears:—"At the dinner in connection with the above Society, Mr. Ross, Laureneekirk, replying to a vote of thanks to the Judges, spoke of the high quality attained by Fancy Pansies, as demonstrated by those shown in the Waverley Market that day. When he first got them he thought so slightly of their qualities as to throw the entire lot out, and for years he had disliked them; but now they were quite as good in all qualities as the English (Show) Pansy, and eclipsed them in size of bloom, richness, and variety of colouring. It may be stated that the Fancy Pansy is of Belgian origin, and was taken in hand first of all by Mr. Downie." As there are misconceptions existing as to the early history of this flower, and as no other person can speak with greater authority on the subject than myself, I venture to trouble you with a few remarks.

I believe it was in 1858 that Mr. Andrew Henderson of the Wellington Road Nurseries, London, wrote to me when I was residing in Shipley, to say that on a recent visit to France he had met with some new forms of blotched Pansies, but as he could not grow them in London, asked if I would undertake to grow them, and his firm would take all the plants I could raise. We agreed as to terms, and I took them in hand. To Mr. Andrew Henderson, who is now the proprietor of the Pine Apple Place Nurseries, therefore, belongs the credit of first introducing the improved forms to English growers. The experience of the first year decided me in going on with their culture; but many of my old florist friends, amongst them my old friend Mr. Downie, ridiculed me for growing

them, saying they would spoil our race of Show Pansies, and in fact, they thought, as Mr. Ross says he did, "slightly of their qualities." I began raising seedlings, and sent out the first English-raised seedling, Princess Alice, at that time a wonderfully fine white with an immense blotch.

In the "Florist and Pomologist" for February, 1862, in a paper on the Fancy Pansy written by me, I stated that "the old familiar stereotyped forms of Pansies, consisting of white ground, yellow ground, and self varieties, with which we have been familiar, were running a great risk of finding a powerful rival in public opinion in the new and pleasing forms of Fancy or Belgian Pansies. These are now fast approaching the circular form, combined with texture and substance, which the stern law of the florists demand before they can be admitted into their circle. Whether florists will ever recognise the Fancy Pansy remains to be seen, so completely do they set at defiance all recognised rules with regard to colouring; but as all do not view flowers with a florist's eye, and look more to a diversity of pleasing colours combined with form, I venture to predict for Fancy Pansies a large amount of popularity, and their recognition as a florist's flower on the exhibition table." I wrote these words at a time when the feeling of my brother florists generally were dead against the Fancy Pansy. In the same article from the "Florist" I gave the following information—"To the French florists belong the merit of effecting a marked improvement in this class of Pansies. For four years since their best kinds were Eva, Bobo, Floribunda, Cerberus, Cœrulea alba, Eckard, and others, which are now (*i.e.*, in 1862) worthless. These were followed by Prince Imperial, Ali Bey, Parpaillot, Mirael, Agnes Sorrel, Napoleon III., and Masaniello. These kinds showed plainly that considerable headway was being made, and these were followed in 1860 by Belle Esquemoise, Louise Miellez, Distinction, and others, all raised in France. Here, however, the mantle of the French growers seemed to fall, for with the exception of Octavie Demay and Noemi Demay, none others were introduced from France or Belgium in 1861, and these two varieties were more remarkable for novel colours than an advance in form. This probably arose from the death of M. Miellez of Lille, who died about two years since."

It will be as well to state here that the varieties I have enumerated, with the exception of Princess Alice, were obtained from M. Miellez, at that time a celebrated French florist, by Mr. Andrew Henderson, and were sent on to me. My first batch of English-raised seedlings sent out by me were Princess Alice, Donald Beaton, Etoile du Nord, Tiger, and other fine kinds. In the "Florist" for December, 1862, is a coloured illustration of three of my seedlings—Princess Alice, Leotard, and Mrs. Moore, and in an accompanying notice of the Fancy Pansy the following extract will be found:—"We quite recollect two or three varieties being brought into notice some twelve or fourteen years since, but being regarded as unwelcome intruders they were speedily discarded. We believe Mr. Downie of Edinburgh was one of the first raisers, and about twelve years since introduced Dandie Dinmont and one or two others. Mr. Salter also took them in hand, but the kinds being generally small and unattractive the flower did not make headway in popular opinion. The French florists, especially M. Miellez of Lille, afterwards followed in the same track, and succeeded in producing Mirael, Belle Esquemoise, Princess Mathilde, and other kinds, which were first introduced into England by Messrs. E. G. Henderson & Son, and were placed in the hands of Mr. W. Dean, Shipley, for cultivation, the colder climate of the north being more suitable than that of London. In the hands of Mr. Dean the flower soon made rapid progress, and Princess Alice, Etoile du Nord, and other advanced kinds were introduced by him in the autumn of 1861." In the "Florist" for July, 1863, my brother, Mr. Richard Dean, under the signature of "Quo," gives a lengthened description of the new Fancy Pansies of that period, the greater portion of which were seedlings of mine. These included Her Majesty, Harlequin, Attraction, King of Italy, Impératrice Eugénie, Prince of Wales, Princess of Wales, and several other fine kinds. These were figured in the "Florist" and the "Floral Magazine," and the Belgian Pansy, as it was at first called, was fast rising into popularity. I believe I may claim the credit of first using as a distinctive name for the new class of Pansies the term Fancy Pansy in contradistinction to the Show class; and although that veteran amongst our florists, Mr. John Downie, introduced the Fancy Pansy years before—sorts which were almost discarded, I think also that I may be awarded the place of honour as the father of the modern Fancy Pansy.

I believe I am correct in stating that the first Scottish florist who took the modern Fancy Pansy in hand was Mr. John Laing, formerly of Dysart Gardens, and of the firm of Messrs. Downie, Laird and Laing, and now of the Forest Hill Nurseries, London, who cultivated them for at least two years before the other Scotch florists would grow them. In fact, I have Mr. Laing's authority for stating that even then Mr. Downie was very reluctant to take the Fancy Pansy in hand. Mr. Laing's first seedling of note was a bright-coloured variety named Professor Berkley, a Marigold-coloured flower, which was lost. Then soon after Mr. Laing introduced a batch of new kinds, his own seedlings, amongst which was Earl of Rosslyn, a very fine flower. Then Mr. Downie took the flower in hand, and during the long number of years since then no man living or amongst those who have passed away has done more to improve this lovely race of Pansies and to make it popular. It is very far from my wish to rob him of any of his hard-earned honours, for I esteem him too much for that; but had I not taken the flowers in hand in 1858 it is just possible that the Fancy Pansy would not be what it now is. Our Scottish florists have made the flower their own; it has now reached a very high standard of per-

fection, and it is much to be deplored that so much seed of foreign origin is sold and grown as Fancy Pansies; for although many of them possess lovely shades of colour, they are invariably very faulty in form, and fall so very short of the fine qualities our home-raised varieties possess. Mr. Miller is quite right in stating that the demand for our Show Pansies is very limited compared with the demand for Fancy Pansies. But we must never let our Show Pansies with their stern points of quality so dear to old florists pass into oblivion, and young growers will learn more about the properties of the Pansy by the culture and study of the Show varieties than from the Fancy section. I am in no way wishful to under-rate the Fancies, but rather to encourage more attention to our glorious Show varieties. It would greatly interest the younger Pansy growers of the present day if they could see what varieties we had to work with fifty years since. I have now before me coloured plates of some of the leading Pansies known at that period, and were figured in Harrison's "Floricultural Cabinet" of November and December, 1833. These kinds are Skyblue and Yellow, Allen's Queen Adelaide, Appleby's William the Fourth (which was regarded as a great improvement, but has a very butterfly appearance now), Maid of Athens, Prince George, and Thompson's Favourite. I remember all these varieties, and it would be very interesting to trace back through the pages of the "Floricultural Cabinet" the early history of the Show Pansies.

Since writing the above I have received from Mr. Alfred Salter through Mr. Richard Dean further valuable information respecting the first varieties of Fancy Pansies known in England. Mr. Alfred Salter is the son of a very old and highly esteemed horticulturist and florist, the late Mr. John Salter, who died several years since. In his letter he writes—"I am sorry for the delay in replying about Fancy Pansies, but I have had to refresh my memory and look through old catalogues and note-books to find the information you require. My father was through all his life fond of Pansies and used to grow them at Shepherd's Bush, as an amateur, many years before he went to Versailles, when he left England. He then took all the best varieties with him to France, but the hot summers and cold winters did not suit them; but he continued to grow many seedlings, and amongst these he noticed (I think it was in 1847, the year before he left Versailles) some curious striped and blotched colours, and seed was saved from these, and when he returned to England in 1848 the seed was sowed by my father at the Versailles Nursery, Hammersmith, where they attracted the attention of the late Mr. Donald Beaton and others. The flowers were exhibited at the Horticultural Society, and many florists laughed at them and called them French rubbish.

In 1851 three varieties were offered for sale, and the stock of these soon sold out, and each succeeding year novelties were raised, and I think one of the first orders for these came from Messrs. Downie and Laird of Edinburgh, but they had nothing to do in originating them. Dandie Dinmont was introduced by them, and I find it in our catalogue for 1854. We continued to cultivate these Pansies extensively at Hammersmith until 1859 or 1860, when we gave them up, or rather they gave us up, as we found they would not grow so near London. They were called Belgian Pansies in my father's time. I keep all our old catalogues, and enclose a few extracts and dates as follows. In 1851 my father offered three new varieties for sale—*viz.*, Cœrulea striata, white and blue; Mars, bronze and yellow; and Novelty, yellow striped with maroon. In 1852 sixteen new varieties were sent out, all raised by my late father. In 1853 twelve more were sent out, and in 1854 other new varieties were introduced, and the following is an extract from our catalogue of that year. "*Fancy Pansies.*—This class was first brought into notice in 1850 by John Salter, and were not then offered as Show flowers, but for their fantastic colours. Since that time they have been greatly improved in form, and the new varieties of this season will be found larger, more regularly striped, and a great addition to this distinct and attractive class, which promises to become as popular as the 'Fancies' of any other flower. In 1855 and 1856 new varieties were raised by English and French growers, and M. Miellez of Lille sent out one or two very fine varieties. In our catalogues of 1857 and 1858 a long list is given, and includes Magpie, giving as synonyms of this variety Mazeppa, Paul Pry, Wonderful, and La Pie, but who raised it is, I believe, unknown."

All Pansy growers will thank Mr. Salter for this information, and I think we shall now have set at rest the question of who first took this flower in hand.—WILLIAM DEAN, *Florist, Walsall, Staffordshire.*

[Mr. Dean's varieties, Her Majesty, King of Italy, Impératrice Eugénie, and Harlequin, as figured in the *Florist*, December, 1862, far surpass the majority of varieties that are raised now from foreign seed.]

NEW BRIGHTON ROSE SHOW.

WHILE London was mourning over a thunderstorm which by its violence stopped the Eton and Harrow match, a beautiful though somewhat cold day gladdened those who had been instrumental in getting up this pretty little Show on the banks of the Mersey, especially Dr. Bell, who had organised it for the purpose of assisting the Wallasey Cottage Hospital, and who kindly gave the use of his grounds for the purpose. These grounds are very picturesque, and the more pleasing as they are quite unlooked for in the midst of a somewhat populous suburb of Birkenhead. As it was held in a tent, and was associated with a lawn tennis tournament, it may readily be conceived that unfavourable weather would have very seriously damaged its prospects. The grounds are very pretty, and when they have been improved, which Dr. Bell proposes, will be still more so. This being the object of the Show, of course large tempting prizes were not to be looked for, yet they were sufficient to

bring Messrs. Cranston from Hereford and Messrs. J. Dickson & Co. from Chester, while the Wirral amateurs contributed largely by their beautiful blooms to the success of the Show. It will be memorable to me this season for the very best bloom of Marie Baumann I think I ever saw; it was exhibited in Messrs. James Dickson & Co.'s stand. Larger blooms I have seen, but I have never seen one more perfect in form or so brilliant in colour. In the latter point it was more like a good bloom of A. K. Williams. The blooms exhibited by Mr. T. B. Hall of Larchwood, Rock Ferry, and by Mr. Griffiths, were very good, and the superb trusses of Madame G. Luizet, Marie Cointet, Baronne de Rothschild, and Capitaine Christy exhibited by Messrs. Cranston and Dickson were decidedly admired; and altogether Dr. Bell may be heartily congratulated on the success which has attended his efforts to combine the love of the Rose with the advancement of so good an object as a cottage hospital.—D., Deal.

PIGEONS ATTACKING PEAS.

BEING a subscriber from the commencement of your valuable periodical, I am desirous of inquiring if you, or any of your numerous readers, know of a parallel case to that decided by Judge Stevens at the last court day held at the Boston County Court. I am a grower of the best varieties of Peas for seed, such as Pride of the Market, Stratagem, Telephone, &c. They are scattered about in a nursery ground 4 acres in extent, between young trees. Some hundreds of cottages abut on the west side, and several of the occupants keep poultry and pigeons. The poultry I have occasionally caught, traced them home, and told the owner if I caught them again I should sue them for damage, and they have at once been kept in. The pigeons, however, continued destroying crops partly or wholly. I gave orders to my people to tell all who kept pigeons that the birds would be liable to be shot if they continued destroying my crops; but as the annoyance did not cease, a gun and licence were procured, and a pigeon was shot by my son. An action was entered against him for this. He was sued in the County Court for £8 for the pigeon, and £1 costs. My solicitors assured me that the case was so good and the law so strong on my side that I needed no one to defend it. However, the case was gone into before Judge Stevens, who unfortunately is a pigeon fancier, and would not allow the pigeon to be brought into court to be fairly valued by a competent person we had for the purpose. Because the bird has taken prizes at a show held at a public house, the Judge told the plaintiff without seeing it he had no doubt it was a very valuable bird, and gave a verdict for the plaintiff for £5. When I asked that the case might be tried by a jury, I was told there is no appeal.—T. B. DOLLY.

SO great has been the demand for Mr. Wright's TREATISE ON MUSHROOMS that, although a very large edition was prepared, it is quite exhausted, and the publisher is unable to immediately execute many orders that he has received during the past week. Another edition will be published as quickly as possible, and the orders in hand will then be executed.

— MR. J. GEORGE, who has been gardener to Miss Nicholson, Putney Heath, for the past thirty years, has, we are informed, resigned his situation, and taken premises at 10, Victoria Street, Putney, with the intention of extending his business in horticultural sundries. It is well known that Mr. George has rendered good service in improving the Abutilons, having reared many beautiful varieties. Ivy-leaved Pelargoniums have also received much attention from him with excellent results.

— RELATIVE to the PRINCESS LOUISE COIL GRATE that was illustrated on page 15 of our issue of the 5th inst., and described as patented by Mr. Deards of Harlow, Essex, Mr. Robert Renton Gibbs, Mill Street, Liverpool, states that he "has had the grates in use and has been fixing them for the past fifteen years." We never before heard of the "Gibbs' Hot-water Grate" (which, according to the illustration before us, appears similar to the Princess Louise), nor, we venture to say, have the vast majority of our readers. Mr. Gibbs does not say that he patented his grate; but Mr. Deards informed us that he patented the apparatus to which we referred.

— THE EVENING FETE held by the Chiswick and Turnham Green Horticultural Society in the gardens of the Royal Horticultural Society at Chiswick on Thursday last proved very successful, a large number of visitors assembling, as the evening was fine and clear though

rather cool. The gardens were very tastefully illuminated with coloured lamps, about 4000 being employed in festoons and arches over the chief walks and around the Council-room. The Horse Guards' band, under the leadership of Mr. C. Godfrey, performed a choice selection of music, including a new walse, "Camille," composed by the Honorary Secretary of the Society, Mr. J. T. Musgrave, which was greatly admired.

— THE third part of the serial work on "HARDY PERENNIALS AND OLD-FASHIONED FLOWERS" (170, Strand) continues the description of species from *Helleborus colchicus* to *Lathyrus latifolius*. The matter both cultural and descriptive is correct and good, but several mistakes occur in the names, capital initial letters being used for the specific titles as in previous issues. Several woodcuts are given, one of *Hydrangea paniculata grandiflora* being a most unsatisfactory representation of a beautiful and useful plant.

— "A PRACTICAL TREATISE ON THE FUCHSIA" is the title of a little work just issued (E. W. Allen, 4, Ave Maria Lane), which gives a brief outline of the general culture needed by this popular plant. The author is Mr. F. Buss, whose experience as a grower and exhibitor should render his production worth perusal.

— A CORRESPONDENT asks if any of our readers can give the name of the light pink Clove that is now being sold in a cut state in Covent Garden. The flowers are nearly the colour of C. Souvenir de la Malmaison, and about as large as a good-sized Pink.

— MR. A. PAUL of Gilmore Place, Edinburgh, informs us that he was the winner of the first prize for six stove and greenhouse plants at Edinburgh on the 11th inst., and not Mr. Paterson as stated in our report on page 56, last week.

— MESSRS. J. JEFFERIES & SONS, Cirencester, send us a choice collection of HARDY FLOWERS, including examples of many useful plants. Very noticeable is *Lilium testaceum* with pale orange or creamy yellow flowers, exceedingly fragrant and free. *Campanula Trachelium album plenum*, a double white full-flowered form, is not very commonly seen, but is pretty and well worth notice. Several other dwarf species and varieties of Campanulas were also included, all attractive and useful.

— A CORRESPONDENT writes that "the PHYLOXERA has been discovered in the vineyard of Mr. Alderman Lightfoot, Mayor of Accrington. It is feared that the Vines will have to be destroyed."

— MR. H. JAMES, Castle Nursery, Lower Norwood, writes:—"Having constantly to reply to questions relating to VANDA TERES, I thought a note of what I have recently seen might interest those of your readers who are anxious to succeed with this lovely Orchid. In a house at Mr. Alexander Durce's garden, Dulwich, there is now in bloom a small plant with three spikes of twenty-one of its lovely flowers—seven on each spike. The plant is about 3 feet above the piece of cork to which it is wired. Mr. Bachelor, the gardener, informs me it has never been taken out of the stove, in the centre of which is a large water tank; but during the winter months is hung near the glass. So it is not a necessity to take it out to the stokehole to dry it in the winter months, as we are sometimes told."

— WE regret to record the death of MR. WILLIAM BIGGS, Sandsfield Park, West Derby, Liverpool, age 51 years. He had been in the service of the late Mr. Arnold and his widow for twenty-one years, and was one of the first, if not the first, to exhibit dwarf-trained Chrysanthemums in St. George's Hall. Mr. Biggs was a good practical gardener, and a man highly respected by all who knew him. He leaves a widow and six children.

— MR. JOHN NIXON writes:—"I am disposed to think that many writers take a great deal more trouble in STRIKING ROSES than they have any need to do. I strike mine in the same manner as Gooseberry or Currant cuttings, and all grow equally well."

— A HITHERTO unknown form of the POTATO DISEASE, which had been making slow but steady progress near Stavanger during the last ten or twelve years, has recently begun to show increased energy. The stalk of the plant is the part affected, and Herr Anda has discovered small white fungoid growths, which after a time assume a greenish, and finally a black, colour, after attaining the size of a small Bean. While the fungus is rapidly increasing at the expense of the plant, the interior of the stem is first reduced to a pulpy condition, and next shrivelled and hollowed out, until nothing remains but a mere outer

shell, which breaks down on being touched. When the ripe black germs of the fungus have remained in the earth through the winter, they are found after the return of the next year's warmth to have developed small stalked fruits filled with minute spores, which penetrate into the young plants before they appear above the ground. The end of July or beginning of August is the time when the ravages of the fungus are most conspicuous, and at those periods whole fields of Potato plants are often rapidly reduced to the condition of withered straw.—(*Nature.*)

— "B." writes:—"In light soils like that we have to do with the only way to obtain large STRAWBERRY FRUIT is from young plants. Now is the time to see about planting. This we do by going over the youngest plantation and placing a stone over each runner, so as to keep the young plant steady and the soil moist. In a few weeks they can be lifted with a mass of roots, and if planted by the first week of August a good crop is certain the next season. As our ground is trenched regularly in the winter season, when Potatoes or other crops not long in the ground are removed, we can plant out at once without any further preparation. The rows are 3 feet from each other, and the plants 2 feet apart in the row. Our best kinds are President, which colours well when young, and Vicomtesse Hericart de Thury. Crops of Lettuces can be taken between the rows, both in autumn and spring, without doing harm to the Strawberries."

— AN Australian paper thus describes PINE APPLE CULTURE IN QUEENSLAND—"Very few people have any idea of the possible yield with Pine Apples where the climate and soil favour their production. It has been recently stated by a Mr. Rodda, after an inspection of a Pine Apple patch, that an acre of soil would yield over 10,000 fruit in the season, and where a plantation is well established and the plants in their prime this is not an over-estimate. On an average of 5 feet from plant to plant an acre would carry 1750 plants per acre. The first year two to each plant would be a good yield, the second year four or six, and after that strong plants will often give from eight to twelve Pine Apples in the year, if not all at one time at intervals during the season. So, then, the first year's yield would be 3500, the second year from 7000 to 10,000, and the third year, if eight or twelve fruit were produced on each stool, the yield would be 14,000 or 21,000. Startling though these figures may appear, they are quite within reach with good cultivation. With the neglect so frequently attendant upon Pine Apple and Banana culture, however, the half of this is a high average; but taking 10,000 as an average crop, and the low rate of 1s. per dozen as the market value, one acre of Pine Apples would realise over £40, which is a good return for the labour and outlay necessary to produce them. It has always been a matter of surprise to us that the cultivation of this delicious fruit has been so much neglected, especially when the fact, so frequently brought to light, that Queensland-grown Pine Apples are equal, if not superior, to those grown in Florida or elsewhere, is taken into consideration. The cultivation necessary for a 5-acre plantation, and everything to be done efficiently, could be easily compassed by one man breaking the land up deeply in the first instance with the plough followed by the subsoiler. Coast lands in Southern Queensland are very well adapted for this fruit if the soil is deep, rich, and drained thoroughly."

THE PARSLEY-LEAVED BRAMBLE.

At page 391 of the Journal for October 26th, 1882, you inserted a note from me on the above-named valuable autumn fruit as grown at Oakbrook, Sheffield, which note elicited inquiries from a number of correspondents in different parts of the country as to the origin of this variety and where it could be procured, as it appears to be not generally grown in the nurseries.

It seems to be commonly supposed that it is one of the numerous varieties of American Blackberries, a list of which may be found in most fruit catalogues, and a somewhat sweeping condemnation of which was given by Mr. J. Muir at page 5 of your issue for July 5th. I am told by Mr. Sibray of the Handsworth Nurseries that it first originated as a chance seedling (deposited most probably by the birds) in their nursery grounds many years ago. He believes it to be a seedling from an American cut-leaved variety, which they cultivated at that time, named *laciniatus*. He says that when it was first noticed they were so much struck by the distinctive character of its foliage, &c., it was decided to grow it and test its fruiting

capacities, which proved to be so exceptionally good that its propagation was at once commenced. They do not, however, appear to have done much towards making the merits of this truly valuable fruit generally known, and I believe that it is still very little grown except locally. I am strongly of opinion that it is one of the most valuable of hardy fruits, and ought to be cultivated in every fruit garden.

My notes in October last as to the quantity of fruit we had then gathered were not in any way exaggerated, and we continued to gather fine fruit for several weeks afterwards. At the present time our stock is growing very vigorously, and promises even better results than last season. The clusters of fruit produced on our canes are certainly much finer and the fruit larger than the engraving of Kittatinny shown on page 519 of last volume. I have been measuring the fruiting spurs or racemes, which are now just expanding their first blooms, and find they average 2 feet in length from their junction with the cane. There is also an average of fifty bloom buds to each spur, and forty spurs to each cane, which are about 12 feet in length. As we grow an average of four canes to each root or stool, we have a total average of 8000 bloom buds from each root, and nearly every bloom may be relied upon to produce a fruit fully as large as the largest and best Raspberries; and coming in as they do after Raspberries and all other bush fruits are over they are highly esteemed.

We grow a single row of them on a south border 22 yards long. The roots are planted 5 feet apart in the row, and the canes are trained more or less horizontally over a row of wood stakes, which are 9 feet high and 2 feet 6 inches apart. They require an open sunny position to ripen the fruit properly, coming in as it does in the comparatively dark damp days of October. Our system of cultivating them is very simple, and consists in cutting clear away at pruning time most of the old canes which have borne fruit, to make room for the young canes made during the previous summer. If sufficient young canes have not been made to fill the space, some of the best of the old ones are left and have their fruiting laterals pruned off close to the cane. They are then again all trained to the stakes, and have a liberal dressing of decayed manure given to their roots.

During the summer they require very little attention, as the young canes are left to grow pretty much as they will till the regular autumn pruning and tying. I feel sure your correspondent Mr. J. Muir cannot have seen this variety of Bramble, and that if he did see it fruiting as it does with us in September and October he would gladly alter his opinions concerning Brambles, at least in so far as regards the Parsley-leaved variety.

I would also wish to strongly advise "J. E. D., Devon," to give it a trial on his deep rich soil, and if it proves as satisfactory with him as it has done here (and I have little doubt but that it would do), providing it receives the little attention it requires as to pruning, training, &c., he would not afterwards feel suspicious of tall talk in the matter of praise bestowed upon it.

In October, 1879, Prince Leopold was staying at Oakbrook for a day or two on the occasion of his visiting Sheffield for the purpose of opening Firth College. The Bramble was then (Oct. 22nd) in fine condition, and received very high praise from His Royal Highness both for its qualities as a choice dessert fruit upon the table and for its free-fruiting character. Messrs. Fisher, Son & Sibray tell me they afterwards had the honour of supplying his gardener with a stock of plants.—W. K. W.

BIRD SCARERS.

MANY devices have from time to time been invented to scare birds, which from being stationary and having a similarity of sound are, after the birds become accustomed to the form and sound of the intended scarer, of little practical value. Even live scarers, unless capable of inflicting injury on the depredators, are treated with indifference. A pinioned hawk attracts more than it drives away; the birds join in chorus in tormenting their powerless adversary. A chained cat is of no use. We have some half dozen, their domicile in the centre of the garden, having the freedom to go in and out as they like and where they like, but are mostly, at least in the daytime, at home. We have no mice, no rats, and birds are exceedingly wary, except sparrows, which seem to be as thoroughly domesticated as the cats.

It is as a scarer that I wish to mention the cat. When at the Rev. H. L. Ewen's, the Rectory, Offord D'Arcy, Huntingdon, some time ago, I was struck with the novelty of both cats and kittens being employed as bird scarers, not by tethering, as is sometimes done, with string or chain to a particular place, but by a sort of continuous running line. In this particular instance the cats, adults or kittens—the one as far as I could see being as good as the other—were employed to protect Strawberries from thrushes and blackbirds. The Strawberry

beds were 4 to 6 feet wide, with an alley between. At each end of the alleys a peg was driven into the ground, and between these pegs galvanised wire, I think No. 10, was stretched about an inch from the ground, though it rested on the ground in some places. Before securing the wire to the pegs a piece of small chain about 12 inches long was secured to the wire by passing the wire through a ring at one end of the chain, and at the other end of the chain was a swivel ring, such as is used for dog chains, only both the chain and rings were smaller. The cats were secured to the chain by small collars, and the cats could run the whole length of the Strawberry beds without let or hindrance, and that they answered completely their purpose was evident by the fine fruit, principally President, being unmolested. It is necessary to state that at each end of the "run" a drain tile (about 9 inches diameter) was laid on its side in the line of the run, and slightly sloping to it, and the end furthest from the run in both cases was closed with a board, whilst those next the run were left open, thereby forming a good shelter for the cats in inclement weather. Saucers replete with milk and other evidences of food being supplied, rendered the arrangement complete.—G. ABBEY.

DISHONEST ROSE-SHOWING AT SHEFFIELD.

As you have alluded to this case, which was *sub judice* when your reporter left, I should like to give the details, for a more barefaced attempt at fraud was never made. Attention was first attracted by the

Fig. 15.—*Rosa sericea* (Lindley. Hort. Kew). (See page 69.)

remarkable character of the blooms, which were said to have been grown within six miles of Sheffield, and also by the fact that the labels on these and on another stand which came from a town famous for its Rose-growing were in the same hand-writing, and the same errors were observable in each. It was mentioned to me, and I was requested as Secretary of the National Rose Society to take action in the matter. My reply was that I could not act on "suspicion," and that a charge must be made and evidence adduced. This was done, and one of the offenders came into the Rose tent, where our President Canon Hole, Mr. Whitwell, and others were. In an evil hour for himself the man offered to show anyone his garden. This was just what we wanted. A gentleman present who was desirous of unearthing the whole matter offered to pay the cab hire; a competent person agreeable to both parties was selected; I directed the box to be taken out of the Exhibition and carried off to compare with the trees from which the blooms were said to be cut. In an hour's time they returned. The culprit walked coolly into the tent and said as calmly as possible, "They were not my own growing; two or three of us thought we could manage it!"—a piece of cool effrontery I certainly never saw equalled. He received a suitable lecture from our President, but I think some of those whom he had befooled to go four miles were much more inclined to apply stronger measures. I need not say the boxes were disqualified, and a card was put on each "Disqualified for dishonest showing;" while the person who supplied the blooms, and who had got a prize in another class, was informed his prize money would be withheld. As these prompt measures were adopted I do not think it well to give the names; but assuredly these persons will never be allowed to exhibit at any future exhibition of the National Rose Society. The decision gave general satisfaction, as the parties had been long suspected; and it was fortunate that this occurred at an

exhibition of a society which was independent of all local influences, and shows the valuable influence exercised by the National Rose Society.—D., Deal.

DARLINGTON ROSE SHOW.

WHEN some time ago I drew attention to the liberal schedule offered by this newly-formed Society, I ventured to prophesy that it would be sure to attract a goodly number of exhibitors, and that its promoter, my excellent friend Mr. Whitwell, might look forward to a good show, although the date fixed, July 18th, was somewhat late for the southern amateurs. I say amateurs, because they are mostly dependent on cutbacks, while the nurserymen with their large quantities of maiden plants are just as able, in fact better able, to show at the later as well as the earlier dates. My prophecy was amply fulfilled, and an extensive and excellent display of Roses was the result of the exertions that had been made; in fact, I think the Exhibition was quite equal to that held at Darlington last year by the National Rose Society.

The Exhibition was held in the same place, Southend Park, close to the town of Darlington, and in a larger and better tent than that used last year. The park had been kindly placed at the disposal of the Society by the Misses Pease, and was most suitable for the purpose. Of course, in such an Exhibition everything depends on the weather. A Rose show in a tent pitched on grass is a dreary thing in wet weather, and happily, although the weather had been very threatening and showery during the few previous days, yet it held up wonderfully until the evening, when a heavy shower fell. There was one circumstance that militated against the attendance, and that was the Royal Agricultural Society's Meeting at York, and on this day the ever-popular Prince of Wales was to lay the foundation stone of a new institute. This attracted a large number of the country gentry who had been attracted there, while there were excursion trains from all directions. This prevented the same amount of success as last year, still upwards of £150 was taken at the gates—a very notable result when compared with some other exhibitions which have been lately held. I have been at a good many Rose shows, but I may, without hesitation, say that a better managed one I never assisted at. Mr. Whitwell took the entire arrangement upon himself; he was not hampered with a committee, and having an excellent staff of clerks at his disposal, all ran as smoothly as possible. Mr. Byers, the Assistant Secretary, had everything arranged in excellent order. The boxes were placed in the position in which they remained until the close of the Exhibition, the classes commenced at one end of the tent and went round in consecutive order to the other end, a numerous staff of Judges assisted, and at the appointed hour the public were admitted, the most difficult class to judge, the seventy-two, being the only one over which the Judges had to linger so long as not to be quite ready when the hour for admission came. The innovation introduced at Sheffield of appointing lady judges was again carried out, and Mrs. Whitwell ably discharged her duty—the critical eye and practised judgment, which so materially help in her home flowers, were invaluable in deciding on the merits of others, and in no case did I hear any complaint of the judgment.

In going over the principal awards I proceed, as in duty bound, to the amateurs first; and here, as might be supposed, Mr. Whitwell, being at home and being able to cut his flowers in the morning, exhibited in magnificent style. I question if his box of thirty-six has been equalled this year, and, as far as my judgment goes, was much in advance of that which won the challenge cup at South Kensington. I have mentioned a bloom of Marie Baumann at New Brighton which seemed to me the best I had seen this year, but it was eclipsed by one shown to-day by Mr. Whitwell in this stand—equalling that in colour and form, but excelling it much in size. He had besides in this stand La France, Etienne Levet, Thomas Mills, Marguerite de St. Amand, François Michelin, a grand bloom; Alfred Colomb, Baron Hausmann, Madame George Schwartz, two excellent blooms of varieties not often seen now; Dupuy Jamain, Capitaine Christy, a splendid bloom; Camille Bernardin, Madame Gabriel Luizet, Louis Van Houtte, Duchesse de Morny, Ernest Prince, Comtesse de Serenye, A. K. Williams, very fine; Sultan of Zanzibar, a grand highly coloured flower; Charles Lefebvre, Duc de Rohan, very good; Marquise de Castellane, Senateur Vaisse, Annie Wood, splendid (I know no one who shows this variety as Mr. Whitwell does); Duke of Wellington, Le Havre, Mons. E. Y. Teas, Emilie Hausberg, very good; Madame Victor Verdier, Paul Neyron, a moderately sized bloom and very good—not at all the monster that he usually is; Madame Charles Wood, and John Stuart Mill. Mr. T. B. Hall of Rock Ferry was a good second; but he was handicapped, as the expression is, by the fact of his having had to cut his flowers the day before and bring them a long and tedious journey by rail. The third stand was disqualified for having no less than five Marie Baumans in it. In the class for eighteen Mr. Whitwell was again first with Marguerite de St. Amand, Duke of Wellington, Duc de Rohan, Baronne de Rothschild, Thomas Mills, Alfred Colomb, Dupuy Jamain, Madame Victor Verdier, Capitaine Christy, Annie Wood, Eugène Verdier, François Michelin, Etienne Levet, Marie Baumann, La France, Madame Hippolyte Jamain, a splendid flower; and Charles Lefebvre. Mr. Hall was again second, and Mr. Hanlin third. In the class for twenty-four Mr. J. Burrell of Heighington, Darlington, was first with an excellent stand of Devienne Lamy, Louis Van Houtte, Madame Gabriel Luizet, Le Havre, Duchesse de Vallombrosa, Jean Liabaud, Etienne Levet, Beauty of Waltham, Comtesse de Serenye, Duchess of Bedford, Marguerite de St. Amand, A. K. Williams, Marquise de Castellane, Madame Victor Verdier, May Quennell (coarse), Marie Baumann, Comtesse d'Oxford, La France, Marie Baumann, Madame Hippolyte Jamain, Duke of Wellington, Eugène Verdier, Horace Vernet, and Countess of Rosebery. The Rev. J. H. Pemberton was second, and the Rev. J. Garnet, Christleton Rectory, third. In the class for twelve Teas or Noisettes Mr. C. Davies, The Grammar Schools, Aynhoe, was first with Souvenir d'un Ami, Souvenir de Paul Neyron, Madame Lambard, Alba Rosea, Anna Ollivier, Souvenir de Madame Pernet, Maréchal Niel, President, and Marie Van Houtte. Mr. Hall was second, Mr. Pemberton third, Mr. Whitwell fourth, and Mr. Mawley extra. The chief local prizes were won by Mr. McLachlan, and Mr. A. Pease, M.P.

In the open classes the prize for twelve single trusses of any dark Hybrid Perpetual was won by Mr. G. Prince, Oxford, with a splendid box of A. K. Williams; Messrs. Paul & Son were second with fresh but small blooms of

Duke of Teck; and Messrs. Cranston third with Duke of Edinburgh. In the class for any twelve light Roses Messrs. Cranston were first with Baronne de Rothschild, Mr. Cant second with the same, and Mr. Prince third with Capitaine Christy. In the class for twelve blooms of any Tea or Noisette Mr. Prince was first with Perle des Jardins, Mr. C. Davies second with Marie Van Houtte, and Mr. Cant third with Souvenir d'un Ami. The National Society's silver medal for the best box in the amateurs' class went to Mr. Whitwell, and in the nurserymen's class to Messrs. Paul & Son. Had there been a medal for the best Rose in the Show it would unquestionably have been given to Mr. Whitwell for his grand bloom of Marie Baumann.

In the nurserymen's class the first prize in seventy-two was taken by Messrs. Cranston, the second by Messrs. Paul & Son, and the third by Mr. Cant, Colchester. In the class for twenty-four trebles Messrs. Paul & Son were first, Messrs. Cranston second, Mr. Cant third. In the class for thirty-six singles Mr. B. R. Cant was first with Mdle. Eugénie Verdier, Beauty of Waltham, Duchesse de Morny, Xavier Olibo, Général Jacqueminot, Marie Baumann, Mdle. Marie Verdier, Abel Carrière, Marguerite de St. Amand, Maurice Bernardin, Elie Morel, Madame Charles Wood, Comtesse de Serenye, Prince Arthur, Baronne de Rothschild, François Michelin, Etienne Levet, Fisher Holmes, Horace Vernet, Mons. Alfred Dumesnil, Duke of Wellington, Capitaine Christy, Duke of Teck, John Hopper, Princess Beatrice, Niphotos, A. K. Williams, Alfred Colomb, Countess of Rosebery, Reynolds Hole, Marie Finger, Star of Waltham, Victor Verdier, Charles Lefebvre, Madame Hippolyte Jamain, and Duke of Edinburgh. In the class for eighteen trebles Mr. J. House of Peterborough was first with Baronne de Rothschild, Alfred Colomb, Marquise de Castellane, A. K. Williams, Helene Paul, Mons. E. Y. Teas, Marie Baumann, Victor Verdier, Sénateur Vaisse, Madame Eugénie Verdier, Dr. Andry, Mdle. Marie Verdier, Elie Morel, Sir Garnet Wolseley, Etienne Levet, Dupuy Jamain, La France, J. S. Mill. In the class for twenty-six Teas and Noisettes, not less than eighteen varieties, Mr. G. Prince was first with a beautiful stand of Catherine Mermet, Alba Rosea, Maréchal Niel, Innocente Pirola, Jean Ducher, Souvenir de Paul Neyron, Souvenir de Madame Pernet, Souvenir d'Elise Vardon, Perle des Jardins, Comtesse Riza du Parc, Madame Van Houtte, Madame Hippolyte Jamain (Tea), Comtesse Nadaillac, Souvenir d'un Ami, Niphotos, Adam, Mdle. M. Amand, Anna Ollivier, Madame Lambard, Amazon, Marie Guillot, and Mons. Furtado. In the class for thirty-six varieties Messrs. Hawkins & Son were first; Mr. May, Bedale, second; and Mr. J. House, third. It will thus be seen that the main prizes amongst amateurs were won by northern growers, while the southern nurserymen carried off the chief prizes in their class; indeed the northern and midland men were generally conspicuous by their absence. Messrs. Mack & Son did not put in an appearance, and neither did Mr. Frettingham or Mr. Merryweather, and I think one can only say, More's the pity. It was believed that the time fixed would especially suit them, but I suppose it did not. Notwithstanding, a brilliant and highly successful Show was the result of all the care and thought bestowed on it by its promoters—I hope the first of a long series of successful exhibitions.—D., *Deal*.

MELONS UNDER CUCUMBER TREATMENT.

For several reasons I have been much interested in Mr. Stephen Castle's narration of his failure to grow Cucumbers under the "express" system, and beg to thank him for manfully publishing his failure. With me a great failure is always a great lesson, and have no doubt Mr. Castle considers himself amply repaid for the loss sustained in the valuable experience gained. He commenced the experiment during a very trying season, the change from dull cold weather to sudden excessively hot and bright weather being too much for those plants and growers unprepared for it. How did the "express" system work, or how is it working at Prescott this season? Perhaps Mr. Bardney will kindly oblige us with information on the subject, and we shall then be better prepared to form an opinion upon the soundness of the non-ventilation theory generally.

I must also confess to a partial failure with Cucumbers and Melons, the crops at one time in each instance being at one time lighter than anticipated. Both are similarly treated with regard to soil, training, moisture, and ventilation; in fact, since we have fully mastered the system which I have previously described as being long adopted at Longleat, I find that Melons are as easily grown as Cucumbers. By way of excuse for the partial failure I may state that, owing to alterations having to be made early in the year, the ordinary work has been thrown much later than usual, and among other things we were unable to give the Melons and Cucumbers the first shift they really required when the first crop had commenced to rapidly swell off. It may be remembered that the Melons are grown in raised pits formed with loose bricks, and in order to maintain the vigour of the plant one or more shifts as well as top-dressings are given to each. Some of ours did not get this shift when needed, and as a consequence of this and not having any manure to root into as used to be the case, and in spite of receiving two good waterings per day, the plants flagged twice, and the foliage was slightly burnt during the few hot days experienced late in May. This check deformed many of the embryo Cucumbers and caused the Melons to be much smaller than would otherwise have been the case. If we had slightly shaded during the hottest part of the day the check would have been less apparent, but considering the root run, the plants were large, and the foliage quickly evaporated all the available moisture, and burning naturally resulted.

In another earlier house the plants had received the proper attention in the shape of a shift and top-dressings, and here we had and still have famous crops. One plant of an excellent variety raised by

Mr. Austin of Ashton Court ripened seven large fruits, has four more ripening, and six more now of the size of Lemons. Another plant of Carters' Emerald has five large nearly ripe fruits averaging 5 lbs. each, two still larger later fruits, two others three parts grown, and a late crop reduced to six in number. By this it will be seen, if the plants are strongly grown, allowed to extend, and receive liberal treatment at the roots, Melons will set of themselves and swell off in a manner similar to Cucumbers; and what is more to the point, seeing that the foliage and growth is always vigorous, the fruit when ripe must be of the best quality. Farmyard liquid manure in preference to dressings with fertilisers is given twice a week, and in common with the Cucumbers the Melons are only lightly though frequently top-dressed with rough turfy loam. Into this they quickly root—in fact the surface of the heaps are frequently matted with fibres. With plants in this state and kept well supplied with moisture, burning, provided a small amount of air is given during the brightest weather, is out of the question. But if either badly rooted, rooted deeply into cold rich manure, or allowed to get dust dry at the roots, then flagging and perhaps burning are certain to result. We have studied Mr. Taylor's air-giving theory, and readily admit that not only in the case of Vines, but also with Melons, Cucumbers, and plants generally, that a little air given early is much safer and better than a larger quantity given when the atmosphere has nearly reached a scalding point.

Although we have on the whole every reason to be satisfied with the progress we have made with Melons this season, we are yet surpassed by an amateur and his gardener living in Frome. This gentleman devotes the central pit of his plant stove to Melons, and with these on the trellis overhead Stephanotis trained across the glass end of the house, Bougainvillea glabra in two corners, Tomatoes on the roof on one side, and Cucumbers on the other, all growing in pots or boxes, the two former flowering splendidly, and the two latter fruiting abundantly, besides a number of Caladiums, Ferns, Coleuses, and other plants, he has one of the prettiest and most profitable houses imaginable. The Melons, four in number, or one in each corner of the pit, are grown Cucumber fashion, and very fine they are. The variety is the Eastnor Castle, as grown by Mr. Taylor, and some of the fruits are now near the size of footballs. Our heaviest fruit of Eastnor Castle weighed 5 lbs. These, by comparison, will weigh at least 8 lbs., and, what is more, are certain to be of fine quality, as nothing but loam is given to the roots. Here again the fruit are of different ages, and a good succession will be secured from these four plants. I wonder how many professional gardeners will supply their employers with such a valuable lot of Melons as will be grown in this ordinary plant stove.—W. IGGULDEN.

THE AUSTRALIAN GUM TREES.

RIVAL vegetable giants, though in widely separated portions of the globe, are the Wellingtonias of North America and the Eucalypti of Australia, for both tower far above their neighbours, reaching and even exceeding 400 feet in height, constituting a phase of vegetable growth of which those who are familiar only with the comparatively modest altitude attained by European trees can form little idea. Wellingtonias it is true are in some localities in England fast advancing, and may probably in future years reach a height of 100 feet or more, but we cannot expect to see Eucalypti in anything like their true proportions in this latitude, as unfortunately the hardiest yet tried out of doors occasionally succumb in severe winters.

In favourable counties such as Devonshire and Cornwall Eucalypti have a chance of making more vigorous growth not so likely to be checked or injured by very low temperatures. This seems to be particularly the case in the gardens at Powderham Castle, Kenton, Devonshire, where there is an exceedingly fine specimen, probably the largest and most handsome in cultivation. It is 60 feet high, and has a trunk 9 feet in circumference; this fine specimen has lately flowered, and from sprays kindly forwarded by Mr. D. C. Powell, the gardener, the accompanying woodcut has been prepared. The chief beauty of the flowers resides in the stamens, which are very numerous, white and crowded densely, forming pretty little tufts; the flowers, too, are associated in dense clusters, and have a pleasing effect. Like other species, the corolla is combined with the woody calyx, the upper portion of which falls off, carrying the corolla with it, so that, as with the Mimosas and Acacias, the stamens are by far the most conspicuous portion of the flower. In reference to this plant, Mr. R. A. Rolfe, Kew Herbarium, writes:—"It is the true Eucalyptus coccifera, *Hook. f.*, from the mountains of Tasmania, where it grows at the summit at an elevation of 3-4000 feet. This specimen is probably from the identical tree from which the figure in the "Botanical

Magazine" was prepared (tab. 4637), as, though the source does not appear in the description under that figure, I find on reference to the Herbarium that it was from a specimen which flowered at Powderham Castle, near Exeter." The species does not seem to be well known in cultivation, for it is rare that even small plants are seen, which is the more regrettable, as it is one of the most ornamental.

In the temperate house at Kew several large specimen Eucalyptus

Though *E. globulus* is commonly used in a small state for subtropical bedding in the parks, it cannot be safely left unprotected except in very warm or sheltered localities, as it is almost invariably injured even by moderate frosts. A specimen of *E. Gunni*, another very ornamental species, has, however, been out of doors on a mound near one of the museums at Kew for a number of years, and although it has been occasionally injured it has apparently recovered, and has

Fig. 16.—EUCALYPTUS COCCIFERA.

are grown, such as *E. corynocalyx*, *E. globulus*, *E. citriodora*, *E. amygdalina*, *E. eudesmioides*, and *E. cordata*, which range from 20 to 30 feet high, and some of them have been repeatedly cut down. *E. globulus* especially advances very rapidly under glass, trees there having made a growth of 16 feet in one year after being cut down. It is the rapid growth and the antiseptic or anti-malarial properties possessed by this and other species which have rendered them so useful for planting in unhealthy districts in India and elsewhere.

now three or four large stems in good health. This was long known as *E. polyanthemos*, but has now been definitely referred to the above species, the small rounded glaucous leaves being very distinct from most of the others. Much confusion exists in the names of the Eucalypti, and seeds of many apparently different forms are sent to England under the same name, and *vice versâ*, giving rise to many errors that cannot be corrected until the plants flower. This some seldom do until of considerable size, though such

species as *E. globulus* flower more frequently; the latter, indeed, occasionally perfects its seeds, and at Kew young plants have been raised from the home-grown seeds.

E. cudesmioides, incidentally mentioned above, is represented at Kew by a specimen believed to be nearly thirty years old, and has quite a substantial trunk. It is a very distinct form, with long narrow leaves on drooping branches, and the bark peels off in large flakes somewhat like the common Plane. *E. cordatus* is another species worth a note, for plants of moderate size are very attractive, the leaves being small, heart-shaped, and very glaucous. *E. Risdoni* is one of the most distinct of all, the leaves being perfoliate and surprisingly suggestive of *Lonicera scmpervirens*. *E. citriodora* has rough tapering leaves, not remarkable in form, but possessing a powerful fragrance resembling the well-known *Aloysia citriodora*. *E. amygdalina* is known to the colonists as the Peppermint Tree, *E. Gunni* as the Cider Tree, from a liquid which exudes from the bark when injured in spring, and several others have similarly distinctive names, derived from some property possessed by the trees.

LEEK ROSE SHOW.

If, as we are told, the sight of a brave man struggling with adversity is a sight for the gods, then surely a society which amidst many adverse influences still maintains its position, and is determined to do and conquer, is deserving of all praise; and such has been the case with Leek. I have now been there for several years, and I have never been there but before the Show and on the Show day it has been wet; and as the Rose exhibitors there are amateurs who do not grow on a very large scale, it may be imagined that it is fighting under very adverse circumstances to carry on their Show. Yet they "have not despaired of the republic," and so from year to year, hoping for better times, have continued their operations. The present year has been no exception to the rule. Heavy rain fell on the night before, and cold showers were prevalent on the morning of the day; still, withal that, a larger and better class of exhibits was shown on this occasion than on any previous one at which I have been present. Some alterations were made this year—the open classes had been done away with, as they involved considerable expense, and, indeed, only one exhibitor (Messrs. Jas. Dickson & Co. of Chester) used to show in the class, so that it was deemed advisable to do away with it and give more prizes in the other departments of the Show. The Exhibition was held, as usual, in the West Street School-room, in some respects well adapted to the purpose, although the approach to it is not very good and difficult for those who bring large plants to the Exhibition. These plants, mainly of stove and greenhouse plants, Ferns, and Fuchsias, were placed about the room, and were filled by the productions of Mr. Glover, Mr. Crusoe, &c. In the class for fifteen stove and greenhouse plants Mr. E. Cliff Glover (gardener, Mr. Roberts) contributed a fine collection, consisting of *Allamanda cathartica*, *Croton Weismannii*, *Aphelaxis macrantha*, *Vinca alba*, *Kentia australis*, *Anthurium Schertzerianum*, *Rhynchospermum jasmynoides*, *Croton pictus*, *Latania rubra*, *Acalypha macrophylla*, *Lapageria alba*, *Erica ventricosa eximia*, and *Dieffenbachia Bausei*. From the same gardens come six very fine Ferns, including excellent examples of *Todea superba*, *Alsophila australis*, and *Platynerium alciorne*.

In Roses Mr. S. Eye was, as usual, foremost in the class for twenty-four. His box contained fine blooms of Marie Baumann, E. Y. Teas, François Michelin, La France, Jean Cherpin, Royal Standard, a very good bloom; Le Havre, Camille de Rohan, Alfred Colomb, &c. In the class for eighteen Mr. Arthur Johnson was first with La France, Mons. Boncenne, Sophie Fropot, La Rosière, Charles Lefebvre, Marquise de Mortemart, &c. In Class 3, for twelve varieties, Mr. Roberts was first with Mdlle. Eugénie Verdier, Marquise de Castellane, Général Jacqueminot, Fisher Holmes, Gabriel Luizet, Duke of Wellington, Dr. Andry, Madame Berard, &c. In the class for six Mr. James Gilmore was first with La France, Madame Victor Verdier, Elie Morel, Dupuy Jamain, and Marquise de Castellane. In the class for six light Roses Mr. Roberts was first with Eugénie Verdier, Marquise de Castellane, Peach Blossom, La France, Egeria, and Duchesse de Vallombrosa. In the class for six dark Mr. Gilmore was first with Mons. E. Y. Teas, Dr. Andry, Louis Van Houtte, Mons. Boncenne, Charles Lefebvre, and Dr. André. In the class for six of one colour Mr. A. Johnson was first with fine blooms of La France, and Mr. Kemp second with good blooms of Marie Baumann. The bronze medal of the National Rose Society was awarded for the best bloom in the Show to Mr. Kemp for a fine bloom of La France. There were also some Pansies, a few bouquets, and a very pretty dinner-table stand contributed by Mrs. Johnson not for competition.

Situated as Leeks amongst the Staffordshire hills, and attracting a considerable amount of rain, the Society has had to fight its way against many obstacles; but if the Rose-growers of Leek will go on with the courage they have done, I look forward to seeing a prosperous Society and a good exhibition. They have made experiments, are not above taking hints, and so deserve, even if they do not achieve, success.—D., Deal.

THE GREENHOUSE AND ITS INMATES.

(Continued from page 35.)

DEUTZIA GRACILIS.

DEUTZIA GRACILIS is a very sweet hardy plant, well worth growing in the greenhouse. After flowering is past all the old shoots should be cut out and the strong young growths from the base encouraged. Potting should be done after flowering, but comparatively small pots will be sufficient to grow very fine plants in if liquid manure be given

occasionally. We have had plants for six years in 6-inch pots which annually made shoots 2 feet long and flowered most profusely. Loam and leaf soil or decayed manure suits them. To obtain an abundance of flowers the plants should be grown all summer, or at least until the shoots are ripe, under glass—in a frame, a vinery, the greenhouse, or anywhere else where the temperature is a little higher than an ordinary summer temperature out of doors. This will insure a fine display. By August the plants should be put out to rest until January, when they may be brought into the house.

DIELYTRA SPECTABILIS

This is another very fine hardy plant suitable for making a display in early spring with very little trouble. All that is wanted is to lift the roots any time after October and pot them and place them in any kind of glass house, hot or cool, and in due time beautiful specimens will be produced covered with flowers. In spring the plants should be planted out again. Should an increase of stock be wanted a plant should be lifted (not a forced one) just as the young buds are pushing, and each bud detached with a piece of root and planted out in rich soil. In one year these plants will be fit for potting and forcing.

EPACRIS.

Epacris are very ornamental Heath-like plants which deserve to be more commonly grown than they are. Some people consider them to be difficult of cultivation, but such is not really the case. Some particulars must be carefully attended to, however, if success is to be insured. For soil good fibry peat must be provided, and sharp silver sand mixed with it to keep it open. Efficient drainage, efficient watering, and firm potting are also necessary. When once plants which are firmly potted in peat become dry ordinary waterings are not sufficient to moisten the soil thoroughly. They must be watered again and again until the water pours from the hole in the bottom of the pot. Indeed if the dryness is allowed to go too far there is nothing for it but steeping the pot in the cistern until the air balls, which are displaced by the water, cease bubbling up. After the ball is thoroughly soaked no more water should be applied until necessary, when a thorough supply should be given. This is one of the secrets in successful Epacris-growing. Another, as we have said, is firm potting. Another consists in growing them in an airy greenhouse, where as little fire heat as possible is used, and where a constant circulation of air is kept up on all favourable occasions.

After the flowers have faded the young growth should be cut back. Erect kinds should be cut close back to the old wood, and drooping kinds scarcely so far back. After they are cut back they should be kept rather close until they begin to grow again, when, if necessary, they should be potted into larger pots. After they have fairly recovered from cutting back and potting they should be plunged in ashes out of doors for the summer. By the end of September they should again be housed. They are rather difficult to raise with ordinary appliances, and raising plants from cuttings is hardly worth an amateur's trouble, for young flowering plants may be purchased very cheaply.

The amateur should purchase his plants when in bloom so as to suit his taste, or a respectable nurseryman will generally advise him as to the best kinds to buy: we, however, name a dozen good varieties. *E. Butterfly*, *E. campanulata* and *campanulata alba*, *E. Fireball*, *E. hyacinthiflora fulgens*, *E. Ingramii*, *E. impressa*, *E. Lady Panmure*, *E. Lowii*, *E. miniata splendens*, *E. odorata alba*, *E. Sunset*, *E. Vesta*.

ERICAS.

Almost all that we have said in regard to Epacris applies to Heaths, except pruning. Most Heaths require very little pruning, and some do not require it at all. Such free-growing popular kinds as *E. hyemalis* should, however, be treated exactly as advised for Epacris.

Sometimes mildew appears on these plants. This is caused by a too damp and stagnant atmosphere. The cure is dusting with flowers of sulphur and a circulation of dry air. At the same time too much fire heat must not be given. A winter temperature of from 40° to 45° is quite sufficient for these plants, and it is better to be below these figures in very hard weather than to employ fire excessively. If scale appear it should be removed with a pointed stick, but they are by no means subject to insects of any kind.

Potting should be done after growth has commenced, and must be done firmly. Our remarks on Epacris as to soil, watering, and standing out apply here, so they need not be repeated. The following dozen are good, but we may add that the varieties are very numerous, and no more attractive feature of a garden can exist than a house of well-grown Heaths. *Erica Aitoni Turnbulli*, *E. Archeriana*, *E. aristata Barnesi*, *E. Austiniana*, *E. bruniades*, *E. Cavendishiana*, *E. grandiflora*, *E. hyemalis* (very valuable for ordinary decoration), *E. McNabiana* and *rosea*, *E. Shannoniana*, *E. tricolor Turnbulli*. In making the above selection we felt at a great loss what to select, for many of the very best kinds are not included. Some, such as *E. Massoni*, are very subject to attacks of mildew, which soon ruin them, and others are weakly growers.

ERIOSTEMON.

This is a genus of neat, graceful, hardwooded plants which require to be treated very much like Heaths. The same soil and temperature which suit Heaths will suit them. They are all spring-flowering plants, and should be cut pretty well back after flowering if they are to be kept within bounds. If large plants for exhibition are wanted cutting-back should not be practised, but they do not make very effective exhibition plants, although in a small state they are very sweet and furnish very elegant sprays for glasses and other purposes. Instead of plunging these

plants out of doors, as advised for Heaths it is better to keep them in a frame, as they are rather tender. Nevertheless, an ordinary greenhouse temperature is quite sufficient for them. The sorts usually grown are *E. buxifolius*, *E. cuspidatus*, *E. linearifolius*, *E. myoporoides*, *E. neriiifolius*, *E. pulchellus*, *E. scaber*.

ERYTHRINAS.

Erythrinæ are very handsome easily grown plants, and we strongly recommend them to those whose accommodation for growing plants is limited, because they may be kept all winter in any kind of place where frost does not penetrate, and after they are started in spring may be wholly grown outside, and only removed to the greenhouse as they come into flower. They are remarkably handsome flowering plants, and their wants are few. A mixture of loam and leaf soil, with a good dash of sand and a few pieces of charcoal, suits them admirably for soil. An annual potting just as they start will be sufficient for ordinarily large plants, and an annual pruning—which consists in cutting off all the summer's growth down to the mouth of the pot—coupled with such summer's and winter's treatment as we have hinted at will insure success. We advise a little heat for starting them in, though, because they start more regularly than if left outside. If started in a warm temperature we advise careful hardening-off and placing outside early in June; their removal inside when the first flowers show themselves. After they are cut down they should be kept rather dryish and away from frost. *E. Crista-galli* is the best known, and a fine plant it is. It is hardy in the warmer districts of England and Ireland, but must rank as an easily grown greenhouse plant in the less favoured districts of these islands. In addition to *E. Crista-galli* we have a form named *E. ruberrima*, quite as good, only dwarfer than *crista-galli*.—A. H.

ROYAL HORTICULTURAL SOCIETY.

JULY 24TH.

A COMBINATION of attractions was provided at Kensington on Tuesday, the long tent being well filled with the numerous exhibits. In addition to several new plants, fruits, and vegetables submitted to the Committees, there was a magnificent display of Tuberous Begonias, probably the finest that has ever been seen at a show, both in quantity and quality, Messrs. J. Laing & Co. having a superb collection. Ferns, Gloxinias, and the vegetables in competition for the special prizes offered were also extensively shown.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. There were present Messrs. A. W. Sutton, J. Willard, John Burnett, S. Lyon, Thomas Laxton, G. Goldsmith, R. D. Blackmore, Lewis A. Killick, Sidney Ford, Phillip Crowley, James Smith, and J. Roberts.

Mr. J. Roberts, gardener to Baroness L. de Rothschild, Gunnersbury Park, Acton, showed three superb bunches of Madresfield Court Grapes, grandly coloured, the berries large and the bunches even. Three good bunches of Foster's Seedling were also shown well ripened. A silver medal was recommended for this exhibit. Mr. J. Bowerman, Basingstoke, sent three dishes of Tomatoes, the fruits large, scarlet, even in form, and well ripened. It is said to be very prolific, and is of good flavour, a first-class certificate being awarded for it under the name of Bowerman's Prolific. Melons were shown by Messrs. J. Hughes, Eydon Hall, Byfield; S. Ford, Leominster; H. W. Ward, Salisbury; and C. Ross, Welford Park. Mr. D. Brown, Linthorpe, Middlesborough-on-Tees, was awarded a first-class certificate for a large Strawberry named Duchess of Edinburgh, raised from a cross between Sir Joseph Paxton and Oscar. The fruits were extremely large, wedge-shaped, and dark scarlet in colour. Mr. Ford showed ripe fruits of *Monstera deliciosa*, for which a letter of thanks was accorded. Mr. A. Faulkner, Hungerford, showed a large seedling Raspberry, with some preserve prepared from it. A vote of thanks was accorded, the opinion of the Committee being that it was very good for preserving. Mr. J. Hughes sent samples of a seedling kidney Potato named Earliest of All, the tubers being even in shape and of regular size. Mr. Mortimer, Purley Park, Reading, showed fruits of Purley Park Hero Cucumber, very even and good. This was highly approved for market purposes, and is to be tried at Chiswick. Mr. Laxton exhibited fruits of a new early hardy longpod Bean named John Harrison, for which a first-class certificate was awarded. The pods were of great length and the beans large. Messrs. Cannell and Sons, Swanley, sent a basket of a good curled Parsley, Beauty of the Parterre. Messrs. J. Veitch & Sons showed a very large collection of Cabbage and Cos Lettuces.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. The following were present—Messrs. J. McIntosh, H. Bennett, John Wills, John Dominy, James Hudson, J. James, H. Eckford, J. Cutbush, J. Laing, G. Duffield, Shirley Hibberd, H. Ridley, H. Turner, and H. Ebbage. Mr. Buxton, gardener to Sir Trevor Lawrence, Bart, M.P., Burford Lodge, Dorking, exhibited several handsome and curious Orchids, two large specimens of *Renanthera Lowii*, one with four and the other with six long spikes of chocolate-blotched flowers, with a few yellow ones at the base. The spikes on one of the plants exceeded 6 feet in length, and bore about thirty flowers each. This remarkable Orchid was figured in this Journal, page 109, vol. iii., the plant shown in miniature being a good representation of the Burford plants. A wonderfully strong plant of *Grammatophyllum Ellisi* with five enormous spikes of glossy brown and yellowish flowers was shown. *Dendrobium McCarthiae* was in fine condition, with about three dozen of its delicate drooping purple-tinted blooms. Handsome pitchers of *Nepenthes Mastersiana* and *N. sanguinea* were exhibited, the former holding 14 ozs. of water and the latter 17 ozs. Both were of a fine dark red hue. Cultural commendations and a gold medal were awarded for the Orchids and *Nepenthes*. Mr. Cummins, gardener to A. Smee, Esq., the Grange, Wallington, was awarded a vote of thanks for a distinct species of *Trichopilia* with a pale lemon-yellow lip. Mr. Child, The Gardens, Garbrand Hill, Ewell, was awarded a cultural commendation for a fine specimen of *Cypripedium Stonei* with five spikes of flowers.

Messrs. W. Paul & Son, Waltham Cross, exhibited two seedlings from *Gloire de Dijon*, one deep rose and the other scarlet, both extremely fragrant and pleasing. These varieties attracted much attention, as they are likely to prove very useful. Messrs. G. Bunyard & Co., Maidstone, Kent, exhibited a dozen boxes of Rose blooms, representing a great number of handsome varieties, fresh, bright, and good.

Messrs. J. Carter & Co., High Holborn, exhibited an interesting and beautiful collection of Sweet Peas, for which a vote of thanks was accorded; and a similar recognition was adjudged to Mr. H. Eckford, The Gardens, Boreatton Park, Shrewsbury, for a similar collection. Messrs. J. Veitch and Sons, Chelsea, sent a number of seedling forms of *Iris Kæmpferi* very diverse in colours and forms. Messrs. H. Cannell & Sons, Swanley, contributed a collection of double Balsams, the flowers extremely large and full, white, cream, pink, salmon, scarlet, and purple; and collections of Carnations and Picotees were also staged, representing a selection of the best varieties. A silver Banksian medal was awarded to Messrs. J. Cutbush and Sons, Highgate, for a large collection of Ivies, nearly 60 varieties being represented.

The Society offered several prizes for plants, Tuberous Begonias, Ferns, and Gloxinias, which contributed greatly to the beauty and extent of the Exhibition.

Tuberous Begonias.—A grand display of these was formed on one side of the long tent, a perfect blaze of scarlet shades being produced, slightly toned down by a judicious admixture of white, yellow, and pink varieties. Messrs. J. Laing & Co., Forest Hill, were deservedly awarded the first prize for a magnificent group, the flowers being extremely large and the plants vigorous. Many superb new varieties were included, and several of the best were certificated. A central plant of Magenta Queen in a basket elevated 3 feet above the group, was most noticeable, the richly coloured flowers being borne in great profusion and drooping round the sides of the basket. Mr. H. Coppin, Shirley, Croydon, followed with a smaller but beautiful group; a fine collection being also contributed from the Society's gardens at Chiswick. In the amateurs' class for twelve Tuberous Begonias Mr. Tong, gardener to J. S. Law, Esq., South Lodge, Southgate, was placed first with well-grown and profusely flowered plants. Mr. J. Weston, gardener to D. Martineau, Esq., Clapham Park, was third; and an extra prize was adjudged to Mr. Child for a fine collection not in competition.

Ferns.—In the open class for these Mr. J. Child was awarded the first prize for grand specimens of *Phlebodium aureum*, *Davallia Mooreana*, and *Microlepia hirta cristata*. Mr. G. Stevens, Putney, was placed third with smaller but healthy plants.

Gloxinias.—Mr. J. Child had the best twelve plants, the flowers large and richly coloured. Mr. Stevens being placed second with plants that had evidently suffered considerably in transit.

First-class certificates were awarded for the following plants:—

Coleus Ellen Terry (King).—A very distinct variety. The midrib crimson, the lateral veins white, and the body of the leaf green. The leaves are broad and neatly crenated.

Coleus Henry Irving (King).—Very handsome, ovate, tapering leaf, regularly crenated; centre dark crimson maroon, margined with yellow and green.

Spiræa palmata alba (Veitch).—A charming companion for the well-known rose-coloured type, the large plume-like cymes of flowers being pure white. A most valuable acquisition.

Odontoglossum eugenes (Stevens).—This was exhibited as a supposed natural hybrid between *O. Pescatorei* and *O. triumphans*, and the appearance of the plant seemed to justify the opinion. Sepals and petals spreading, the latter slightly broader, pale yellow, nearly white in the centre, blotched chocolate. The lip is creamy white, with an irregular band of chocolate across the centre.

Angræcum Scottianum (Baxter).—A charming little Orchid with white flowers; the sepals and petals very narrow and small; the lip heart-shaped, broad, $1\frac{1}{2}$ inch in diameter; the spur being yellowish and 4 or 5 inches long.

Ficus elastica alba variegata (R. P. Ker & Sons).—A handsome variety, the leaves broad and irregularly but broadly margined with creamy white. Very effective.

Tuberous Begonia Stanstead Surprise (Laing).—A grand scarlet variety, with enormous flowers nearly 6 inches in diameter, the petals almost 3 inches across.

Tuberous Begonia Mrs. Anson (Laing).—A magnificent variety, petals extremely broad, of a warm scarlet colour. The flowers are remarkable for their fine form and great size.

Tuberous Begonia Miss Turner (Laing).—Similar to the above in size and form, but bright clear rose in colour. Very handsome.

Tuberous Begonia Countess of Rosslyn (Laing).—Flowers very large and round; the petals broad and bright orange yellow in colour.

Clematis Jackmanni alba (C. Noble, Bagshot).—A seedling variety from Jackmanni, with white flowers. Very robust and free, a fine companion to the ordinary blue form.

Aetæa spicata fructu-rubro (Ware).—A neat bushy plant with bipinnate foliage and dense clusters of bright scarlet berries.

Calochortus macrocarpus (Ware).—A new Californian species with large mauve-purple flowers, the petals very broad, with a few yellow hairs at the base.

Lilium pardalinum Warei (Ware).—A variety with fine yellow flowers, much dwarfer than the type, and very floriferous.

SPECIAL PRIZES.

For Messrs. Sutton & Sons' prizes for six dishes of early Potatoes there were twelve collections staged, all of great merit and very close in quality. Mr. W. Ward, The Gardens, Longford Castle, Salisbury, was adjudged the first prize for clean samples of Reading Russet, Schoolmaster, International, Prizetaker, Vicar of Laleham, and Early Border. Mr. J. Hughes, gardener to Col. Cartwright, Eydon Hall, Byfield, was a close second with Wonderful Red, Earliest of All, Early Border, Prizetaker, Myatt's Prolific, and White Emperor. Mr. F. Miller, gardener to J. F. Friend, Esq., Northdown, Margate, was third. For a dish of round Potatoes Mr. W. Meeds, The Gardens, Beckett Park, Shrivvenham, was first with Henderson's Prolific, eleven dishes being shown. For one dish of kidney Potatoes Mr. H. E. Gribble, Canon Hill, Maidenhead, was first with Cosmopolitan, eight dishes being shown.

Messrs. Suttons' prizes for three early Cabbages were won by Messrs. Meads with Wheeler's Imperial; G. Summers, The Gardens, Sandbeck Park, Rotherham, with Suttons' All Heart; and J. Millen, The Gardens, Hamstead Park, Newbery, third. There were fourteen competitors.

One collection of six dishes of Tomatoes was staged by Messrs. J. Carter and Co., Holborn; Mr. K. Phillips, gardener to Dr. Baker, The Doodars, Meopham, being awarded the first prize for fine examples of Vicks' Criterion, Large Red, Green Gage, Perfection, Dedham Favourite, and Trophy.

THE HERBACEOUS PLANT BORDER.

(Continued from page 58.)

Sidalcea candida.—This has an erect spike or stem about 2½ feet high, the upper portion of the stem being clothed with pure white flowers about an inch across. It blooms very freely, continues fresh a long time, and is in every respect a first-class perennial. It is from Colorado and quite hardy. It does best in moist but well-drained loamy soil, and is in every way a desirable plant.

Eurotia Youngi.—A first-class plant, and one of the most effective of the genus. Flowers bright deep yellow, very profusely produced, attaining to a height of 24 to 30 inches. It does well in any soil, but preferably a well-drained loam, where, if it does not grow so vigorously, it is hardier.

Lycchnis chalcidonica.—This grand old plant is still one of the best border plants in cultivation. Flowers bright scarlet, borne in heads. Light soil. *L. chalcidonica flore-pleno*, the double variety of the preceding, is quite as showy, but the flowers are not so freely produced. This is one of the finest for cutting, and is more durable than the single form. *L. chalcidonica alba flore-pleno* is also a fine companion plant to the scarlet double form. They do best in light soil.

Achillea Ptarmica flore-pleno.—Fine masses of this a yard and more across are very effective, and for cutting purposes it is one of the very best in perennials. It has many erect stems 2½ to 3 feet high, forming branching terminal heads bearing a profusion of pure white flowers, very double—not only continuing a long time, but the flowering is extended over several weeks. Where cut flowers are in request (and where are they not?) it should be grown in quantity. It prefers a light or well-drained soil, but will grow almost anywhere except in shade.

Coreopsis lanccolata.—Very showy. Flowers large, bright golden-yellow, very freely produced. This is probably the finest of the perennial *Coreopsis*, and is exceedingly useful for cutting. It does well apparently in any soil in a sunny position, and grows to a height of 3 feet.

Campanula Hendersoni.—The flowers of this are very numerous, of a deep purple colour, very bright. It continues to flower through the summer. Although very vigorous in growth it does not attain to a height of more than 18 inches.

Campanula grandiflora pumila.—This is a very beautiful Bell-flower, having large blue flowers, the rigid stems being covered with them. It attains to a height of about 12 inches.

Spiraea Filipendula plena.—Though old and common there are none finer, its pretty Fern-like foliage and very numerous corymbs of white double flowers being very effective. It likes a moist soil, and attains to a height of 2 to 3 feet.

Malva moschata alba.—For freedom of flowering and continuancy through the summer this has much to recommend it, the flowers being 2 inches or more across, pure white, and very sweet. Though a perennial it is perhaps best continued by seed, treating it as a biennial. It ought to find a place in every garden, attaining to a height of 2½ to 3 feet, or even more in good soil.

Catananche bicolor.—Flowers blue and white, about 2 inches across, borne solitary, and though somewhat antique it is very effective, and a free-growing plant that ought to be given place, as its flowers are very useful for cutting. This is perhaps best treated as a biennial.

Campanula Van Houttei.—One of the largest flowers in the genus, the flowers being very fine, deep blue, borne on erect stems about 2 feet high. It is one of the most distinct of the family, and is very showy. *C. Van Houttei pallida* has lavender-coloured flowers, and is very interesting and effective.

Campanula persicifolia alba plena.—A free grower in good soil, having stems 3 feet high, the stems or spikes covered with pure white very double flowers, and will grow anywhere, except, perhaps, in very wet soil and in shade. It is useful for cutting.

Helianthus multiflorus plenus.—A very vigorous perennial Sun-flower, growing 4 feet or more high, producing deep yellow double flowers from now to autumn. It is very useful for cutting, and forms very effective masses or single specimens. Any good soil suits it.

Scotymus grandiflorus.—This has deeply divided Thistle-like

foliage. The veins being white give it a variegated appearance, and the several divisions are terminated with white rigid spines. The flowers are bright golden-yellow, Centaurea-like, borne solitary at the end of the stems. It grows about 2 feet high, and is very distinct and effective.

Polemonium Richardsoni.—The flowers of this are bright light blue, the plant growing about 15 inches high, having many stems, at the extremities of which the flowers are borne very profusely, the plant having a neat compact habit. This is the best of the *Polemoniums*.

Geum coccineum plenum.—Few plants can vie with this for the brilliancy of its flowers—bright scarlet, the flowers being more profuse than in the single variety; double, or, more correctly, semi-double, and, lasting a long time, is useful for cutting. It comes freely from seed, and is best treated as a biennial.—G. ABBEY.

NATIONAL CARNATION AND PICOTEE SOCIETY'S SOUTHERN SHOW.—JULY 24TH.

MODERATE both in extent and general quality was the Exhibition of Tuesday last at Kensington, and the sanguine expectations of some lovers of these popular flowers were by no means fully realised. Notwithstanding this, however, blooms were contributed from Great Gearies, Oxford, and Slough which amply maintained the credit of their respective growers both in substance, form, and refinement. Loose or weak examples were observable in nearly every stand; but the leading exhibits in all the chief classes were highly satisfactory, and have, perhaps, been seldom surpassed. Mr. J. Douglas was very successful, but the honours were nearly equally shared between himself, Mr. C. Turner, and Mr. E. S. Dodwell, the competition being extremely keen between these exhibitors in several cases. The premier Carnation was, after a careful examination of the blooms, selected from the single specimen pink and purple bizzars, Mr. C. Turner's first-prize bloom of Squire Penson being the one thus honoured. The premier Picotee was found in Mr. J. Douglas's first-prize stand of twelve, a very pretty, even, and refined bloom of Mrs. Gorton.

Seedlings were not very largely shown, and amongst these Mr. J. Douglas was again the most successful exhibitor. He was awarded two first prizes for T. Moore, jun., a brightly coloured crimson bizarre, very clean, and with the colours well defined, and for Squire Whitbourn, a purple flake of good substance and fine petal. He also secured a second prize for Robin Hood, a rose flake with a broad even petal, brightly and clearly coloured. In the latter class Mr. C. Turner was first with Jessica, a charming rose flake, large and of good colour.

CARNATIONS.

In Class A, for twenty-four blooms, not less than twelve varieties, Mr. E. S. Dodwell, Stanley Road, Oxford, took the lead with an even beautiful collection, several of the blooms of fine substance and form. The varieties were James Douglas, Mr. Carter, Robert Lord, Sybil, Master Fred, Henry Cannell, Sarah Payne, Samuel Brown, J. Merryweather, Delicata, John Keet, J. McIntosh, Tim Bobbin, Edward Adams, and Rifleman. Mr. C. Turner, Slough, was second with a handsome collection, including fine blooms of Rob Roy, Squire Llewellyn, Sporting Tom, John Bull, and Sarah Payne. Mr. Douglas, gardener to F. Whitbourne, Esq., Great Gearies, Ilford, was awarded an equal second prize for substantial blooms; Sybil, Sarah Payne, Admiral Curzon, John Keet, and Squire Llewellyn being very noticeable. Mr. H. Hooper, Widcomb Hill, Bath, was third; and Mr. J. Hines, 81, Bramford Road, Ipswich, was fourth.

In Class B, for twelve, Mr. Dodwell was again to the fore with neat examples of Sarah Payne, P.F., E. S. Dodwell, James Douglas, Master Fred, Robert Lord, Samuel Brown, J. McIntosh, Sybil, Admiral Curzon, Sarah Payne, P.P.B., Florence Nightingale, and Mrs. Matthews. Mr. Douglas was a close second. J. Laeken, Esq., Temple Cowley, Oxford, was third; Mr. Gibson, gardener to J. F. Burnaby Atkins, Esq., Halstead Place, Sevenoaks, fourth; Mr. J. Hines fifth; and Mr. J. Buxton, 27, Manor Street, Clapham, sixth. Seven entries.

In Class C, for six Carnations, there were three competitors, Master Stanley Dodwell, St. Mary's Road, Oxford, taking the first prize, followed by M. Rowan, Esq., Manor Street, Clapham, and Mr. W. Maddick, 7, Hampton Row, Bath.

SINGLE SPECIMENS.—*Scarlet Bizzars*.—Mr. C. Turner first with Phillip Thomas, Mr. Douglas second, third, and fourth with Admiral Curzon, and Mr. E. S. Dodwell fifth with James McIntosh.

Crimson Bizzars.—Mr. C. Turner first and second with E. S. Dodwell, and fourth with Rifleman. Mr. E. S. Dodwell third with J. D. Hextall.

Pink Bizzars.—Mr. C. Turner first with Squire Penson; Mr. Douglas second and fourth with Sarah Payne; and Mr. E. S. Dodwell third with Sir Garnet Wolseley and fifth with Sarah Payne.

Purple Flakes.—Mr. Douglas first with J. Douglas, third with a seedling, and fourth with Florence Nightingale; Mr. E. S. Dodwell was second with James Douglas.

Scarlet Flakes.—Mr. C. Turner was first with Clipper; Mr. Douglas second, third, and fifth with Sportsman; Mr. E. S. Dodwell being fourth with a seedling.

Rose Flakes.—Mr. E. S. Dodwell first with Sybil, Mr. C. Turner second and fifth with Rob Roy, Mr. Douglas being third with John Keets and fourth with Sybil.

PICOTEEES.

In Class E, for twenty-four Picotees, twelve dissimilar, Mr. C. Turner was the most successful exhibitor, taking the chief position with handsome blooms of Clara Penson, Constance Heron, Mrs. Bower, Daisy, Mrs. Norman, Mr. Tutton, Dr. Abercrombie, Cynthia, Henry, Louisa, Monarch, Lucy, Princess Dagmar, Picturata, Empress Eugénie, Dr. Epps, and Her Majesty. Mr. Douglas was a close second, the best flowers being Princess of Wales, J. B. Bryant, Edith D'Ombra, Mrs. Bower, and Jessie. Mr. Dodwell was third, Mr. H. Hooper fourth, and Mr. J. Hines fifth.

In Class F, for twelve Picotees, Mr. Douglas won chief honours with a fresh even collection, comprising fine blooms of Mrs. Bower, Mrs. Payne, Mrs. Chancellor, J. B. Bryant, Mrs. Gorton, Ethel, Her Majesty, Constance Heron, Nymph, Princess of Wales, Zerlina, and Mrs. Allcroft. Mr. Dodwell took the second place, John Smith, Novelty, Miss Gorton, and Edith D'Ombra being notable. Mr. J. Hines was third, and Mr. J. Buxton fourth, with much smaller and rougher examples. For six Picotees the prizetakers were Master Dodwell, Mr. J. Laeken, Mr. Gibson, and Mr. M. Rowan.

In Class I, for twenty-four Fancy Picotees, Mr. C. Turner had the best collection, an extremely bright and diversified collection, comprising the following varieties—Rufus, Enchantress, Duchess of Connaught, Matador, Lady Cathcart, Robert Lord, Janira, Arthur Medhurst, Edith, Elegante, Rosa Bonheur, Whipper In, W. P. Milner, Thos. Moore, Jessica, Conqueror, and Egyptian. Mr. J. Laeken followed also with beautiful flowers very richly coloured, Brilliant, Ernest Wilkins, Lord Wolseley, William IV., Crimson King, and Sarah Payne were especially fine. Mr. H. Hooper was third, and Mr. H. Catley, Claverton Buildings, Bath, fourth. Mr. J. Douglas was awarded an equal third prize for a charming collection, including several handsome blooms, The Bride, Sportsman, Sybil, Julia, Florence, Juno, and Snow Queen being the most noteworthy. For twelve Fancy Picotees Messrs. E. S. Dodwell and Stanley Dodwell were the prizetakers in that order.

SINGLE SPECIMEN.—*Red Heavy Edge.*—Mr. C. Turner first and second with Picturata, Mr. C. Turner third with Dr. Abercrombie, and Mr. J. Douglas fourth and fifth with John Smith and Princess of Wales.

Red Light Edge.—Mr. E. S. Dodwell first with Mrs. Gorton, Mr. C. Turner second with Clara, third and fourth with Mrs. Bower, and Mr. Douglas fifth with Mrs. Gorton.

Purple Heavy Edge.—Mr. J. Douglas first, second, and fourth with Mrs. H. Chancellor, and fifth with Norfolk Beauty; Mr. C. Turner third with Zerlina.

Purple Light Edge.—Mr. C. Turner first with Ann Lord, third with Evelyn; Mr. Douglas second and fourth with Baroness Burdett Coutts, and fifth with Nymph.

Heavy Rose Edge.—Mr. C. Turner first and second with Mrs. Payne, fourth with Louisa; Mr. Douglas third with Mrs. Payne; and Mr. E. S. Dodwell fifth with Edith D'Ombra.

Light Rose Edge.—Mr. C. Turner first, second, and fourth with Lucy; Mr. Douglas third with Mrs. Allcroft; and Mr. E. S. Dodwell fifth with L'Elegante.

Yellow Grounds.—Mr. Douglas first, second, and fifth with Prince of Orange; Mr. C. Turner third and fourth with Janira.

In Class L for twelve blooms, yellow-ground Picotees, Mr. C. Turner was first with neat blooms of Jessica, Coronation, Lady Biddulph, Bullion, Lady Mary Lascelles, Grandis, Plato, and Flavius. Mr. H. Hooper was second and Mr. H. Catley third.

Plants were not very largely shown, but were well flowered and attractive, all of them being shown without the paper collars to the blooms as is usually the case. Mr. C. Turner had the best nine specimens—Dr. Abercrombie (Picotee), Guardsman, Duchess of Connaught, Miss Erskine Nightingale, Lady Cathcart, Miss E. Wemyss, Her Majesty (Picotee), Jupiter, and Dr. Cronin. Mr. Douglas took the second position with good examples of Sarah Payne, The Bride, The Queen, and Florence amongst Carnations, and Norfolk Beauty amongst the Picotees.

Messrs. J. Veitch & Sons, Chelsea, exhibited eight boxes of Carnations and Picotee blooms, including a large number of varieties, many of which were enumerated last week. The collection was highly commended. Mr. H. G. Smyth, 21, Goldsmith Street, Drury Lane, showed a box of three dozen blooms of his handsome self Carnation Mary Morris, the fine clear rose tint being particularly bright.

First-class certificates were awarded to Messrs. J. Veitch & Sons for Carnations.

Sir Beauchamp Seymour.—A noble fancy bizarre variety, with a peculiar combination of scarlet and buff. Very effective and distinct, the blooms large, and of great substance.

Royal Purple.—A grand self variety, with magnificent blooms of an extremely rich deep purple hue. Very free, and useful for borders.

YELLOW COMPOSITES.

PERENNIAL SUNFLOWERS.

AMONGST Rudbeckias, Heleniums, Heliopsis, and Helianthus there is abundance of material from which to select yellow Composites for autumn flowering. The name Sunflower is no longer associated only with those handsome and huge yellow annuals most commonly known in gardens. Of these, indeed, there are now many forms and varieties, some of them exceedingly handsome where room can be found for them. I have this year, besides the bright golden double flowers, some of a pale lemon colour, which have been much admired. There is another annual which I have grown this year for the first time, called *Helianthus cuneifolius*, with flowers of the size of those of an Ox-eye Daisy, and a central disc of the deepest black—a very handsome kind. But I am going to speak now of the perennials of the genus *Helianthus*, which I grow in my garden at Cheshire. Some of them I have been unable to identify with certainty, and in the case of others I can discover no characteristic distinctions either in the flower or the leaf, and yet when grown side by side the plants seem different; but when some botanists tell us that the limits of the species *H. tuberosus*, commonly known as the Jerusalem Artichoke, are so indefinite as to include some ornamental and free-flowering garden varieties, I may be excused for expressing some uncertainty about the name. *H. rigidus* is the earliest, and perhaps the best, of the genus, and is known also by the names *Harpalum rigidum* and *Pascalia glauca*, though I suspect that the latter name more properly belongs to a

different plant, which I have never seen. The only objection to this Sunflower is its erratic habit. The runners should be detached as soon as they show themselves above ground, and planted close to their parent, as they sometimes appear at a distance of 3 or 4 feet.

The next to come into flower is generally *H. doronicoides*—I give the name with some doubt. It is a slender very floriferous plant, with large rough leaves and large elegant flowers, with long rays and a small centre; the stalks grow 6 feet high. *H. pubescens* is one which flowers later, which I can hardly distinguish from the kind last described, which probably includes several varieties. Both the kinds flower so well, increase so fast, and are so accommodating about soil and situation, that they will be an acquisition to any garden not already possessing them.

H. decapetalus comes into flower with me about the end of August. According to the name it ought to have ten petals, but it generally has from eleven to fifteen. It is about 5 feet high. The flowers are pale yellow, nearly 3 inches across, and produced from the top of the stalk to within 2 feet of the ground. It is a very useful plant.

H. giganteus is the tallest of all, growing with me in some situations to a height of 10 feet. The species is rather variable, but the flowers are very neat, having long, slender, pointed rays, enclosing a dark centre, and making an elegant curve upwards from their base. It has no fault as a garden flower except its great height, which makes it better to plant it as far back as convenient.

H. Maximiliani bears a strong resemblance to the last-named, but has a thicker stalk, and though of rather coarser growth is not so tall. The two plants are quite distinct when grown side by side, but might be mistaken for one another. I now come to the most ornamental as well as the most generally grown of the later Sunflowers, *H. multiflorus*. This is thought to be a garden species, and an improvement from some less showy wild form. As might be expected in such a case, it varies much. Three forms are recognised in nursery catalogues, two single, one distinguished as major, and a double-flowered kind. It is not uncommon to see double and single flowers growing apparently on the same plant. That which is called *multiflorus major* bears flowers 6 inches across, and so arranged as to display them to great advantage, as they are seldom either crowded or hidden. The double kind is the only perennial Sunflower I have ever seen with double flowers, and keeps up a long succession, the individual flowers being very durable.

H. lætiflorus is a tall kind, 7 or 8 feet high, with small flowers, smaller than but resembling those of *H. decapetalus*. The typical plant has handsome broad leaves and black stalks, though there is an inferior variety with green stalks, differing but little in other ways, though it bears rather larger flowers.

H. divaricatus has flowers not unlike those of *H. doronicoides*, to which the whole plant bears considerable resemblance. It flowers later, and though evidently distinct from it is inferior to it as an ornamental plant.

H. angustifolius has narrow leaves like those of a Willow. It flowers so late that in backward summers the flowers are usually destroyed by frost before they are over. It is a low-growing kind, not exceeding 4 feet in height, and from its lateness suited only for warm forward gardens.

H. orgyalis is grown more for its foliage than its flowers, which are small and poor. The plant is very tall, and bears a curious tuft of leaves at the top like a small Palm tree.

The Sunflowers are desirable for the great ease with which most of them may be cultivated, and for their freedom of flowering. They increase rapidly, and should be adjusted every spring as soon as the tufts appear above ground, in order to make them flower in compact masses. Though they vary little in colour they have many forms and sizes, and as they last long in water are very useful for mixing with cut flowers of other colours. Warm sunny positions suit them best.—C. W. DOD.

THE CHRYSANTHEMUM.

[A paper read before the Sheffield Floral and Horticultural Society, June 6th, 1883, by Mr. J. Udale, gardener to J. Watson, Esq., Shirecliffe Hall, Sheffield.]

The genus *Chrysanthemum* is included in the natural order Compositæ, an order which is represented in all parts of the world, and contains between 9000 and 10,000 known species, the medicinal qualities of which are chiefly tonic, stimulant, bitter, aromatic, or narcotic; whilst from a floricultural point of view we are also indebted to the same order for many of our most beautiful garden flowers. Besides the *Chrysanthemum* there are the *Ageratum*, *Eupatorium*, *Michaelmas Daisy* (*Aster*), *China Aster* (*Callistephus*), *Golden Rod* (*Solidago*), *Zinnias*, *Gazanias*, *Sunflowers* (*Helianthemum*), *Helichrysums*, *Dahlias*, and others of a less showy character; but for diversity of form, delicacy of tint, and harmonious colouring the *Chrysanthemum* is unexcelled.

Which of the foregoing will equal the purity of the common Ox-eye Daisy (*C. leucanthemum*)? or the pearly whiteness of some of the exotic forms, such as *White Venus*, *Mrs. Rundle*, *Elaine*, and *Fleur de Marie*? the

primrose of Golden Empress, the golden hue of Mrs. Dixon and Mr. Bunn, or the delicate tints of Princess Teck and Princess of Wales? the rich pinks of Hero of Stoke Newington and James Salter, the glowing crimson of The Cossack, or the deep claret colour of Refulgens? though, perhaps, the next most varied and beautifully coloured flower is its near ally, the Dahlia. The single forms of it are very beautiful indeed, *D. imperialis* and *D. coccinea* especially so; but the *Chrysanthemum* is with us in its most exalted type, forming the last link in the floral chain that begins with the *H. patiens*, Snowdrops, Crocus, Hyacinths, and Tulips, passes on through Roses, Lilies, to Asters and Dahlias, the immediate precursors of the *Chrysanthemum*.

There has been some difference of opinion as to the botanical limits of *Chrysanthemum*, *Pyrethrum*, and *Matricaria*. Sweet, in his "Hortus Britannicus," places *C. indicum* and *C. sinense* under the genus *Pyrethrum*; but the only distinction between *Pyrethrum* and *Chrysanthemum* is that the seed vessels of the latter are more prominently ribbed than those of the former; and Mr. Bentham, being of opinion that the distinction in question is not of sufficient importance to constitute a distinct genus, relegates *Pyrethrum* to a section of *Chrysanthemum*. The genus so constituted comprises a large number of species, some annual and others perennial.

It may be desirable to mention a few of these relatives of our cultivated Chinese *Chrysanthemums*, as they are of more or less interest to all horticulturists. No one will deny the beauty of our own herbaceous Ox-eye Daisy, *C. leucanthemum*—the purity of its white petals and its striking yellow disc; or the brilliancy of our annual Corn Marigold (*C. segetum*). Then we have the pretty single and double varieties of *C. coronarium* from Sicily, and *C. carinatum* from Barbary, which are all favourite garden annuals. Under the name of *C. roseum* are included the many forms of the *Pyrethrum* of gardens, with their finely cut foliage and gay flower heads—a native of the Caucasus. There are one or two fine hardy perennials which ought to be mentioned in this connection, such as *C. lacustre*, very like our common Ox-eye Daisy but with thicker and more fleshy leaves, and *C. uliginosum* from Hungary.

The Paris Daisies or Marguerites, of which the French and many English of cultivated tastes are so fond, is a variety of *Chrysanthemum frutescens*, a native of the Canary Islands, which was introduced as far back as 1699. Of several varieties now in cultivation, the best for greenhouse culture are *Halleri maxima*, *Comte de Chambord*, *Etoile d'Or*, *frutescens*, and *miniatum*. *Etoile d'Or* is a beautiful sulphur-yellow colour, and was in cultivation as long ago as 1844, and was raised from seed from the ordinary white variety by M. Gontant in the south of France.

We have next the Golden Feather, commonly called *Pyrethrum aureum*, which is really a variety of *Chrysanthemum Parthenium*, also a native of this country. The Golden Feather is a natural golden variety of the foregoing, and was picked up by a gardener named Ebenezer Seward in his own cottage garden whilst gardener to Rev. G. Pindar of Harford, and who suggested that he should dispose of it to Messrs. Henderson, by whom it was distributed, and is now to be found in almost every garden throughout the kingdom. Though it is the fashion to pick the flowers off, yet their small, white circular discs are probably familiar to everyone present, and I wish especially to draw attention to them, because it is said the flowers of the original wild plants of *C. indicum* and *C. sinense* are similar in size and form. What a contrast to the gigantic globular flowers of the present cultivated forms of Chinese *Chrysanthemums*! This brings us to the principal part of our subject—viz., to the flower that brightens our greenhouses during the dullest months of the year, that is cultivated and admired by all classes. It has drawn the public by tens of thousands to the Temple Gardens, and more recently, through the wisdom of the authorities, to the public parks of the metropolis, amongst which Finsbury Park stands pre-eminent for *Chrysanthemums*. Exhibitions have been established within the past fifteen years in almost every large town in the kingdom, whereas previous to 1868 the number of places holding *Chrysanthemum* shows could in all probability have been counted on the fingers of one hand.

The history of the Chinese and Japanese forms has been frequently referred to, but it may be mentioned that the present races seem to have descended from *C. sinense* or *C. indicum*, or from the crosses between these species. *Chrysanthemum sinense*, a native of Japan and China, has glaucous leaves and white flowers, while *C. indicum* has green leaves and yellow flowers. Japanese and Chinese horticulturists have exercised their skill, perhaps for centuries, on these forms, and their efforts, seconded by the Europeans, have made the *Chrysanthemum* what it now is.

The introduction of the Chinese varieties into European gardens is attributed to M. Blanchard of Marseilles, who in 1789 introduced three varieties, white, purple, and violet, into France, though before that time—viz., in 1764, a plant of the small yellow-flowered variety, *C. indicum*, was in cultivation in the physic garden at Chelsea. Of all the varieties nearest to the original type is the small-flowered variety known as the "Chusan Daisy," introduced from China by Mr. Fortune in 1846, a variety which, from its small size, met with little favour here, but which was more highly thought of in France, where it became the origin of all the Pompon varieties now in cultivation. Mr. Fortune was also instrumental in introducing the fantastic yet beautiful Japanese forms at a more recent date, several plants of which fell into the hands of the late Mr. Salter of Hammersmith, who, perhaps, did more than any other man in this country to improve upon the first varieties introduced. The late Mr. John Gould Veitch sent home some plants of the Japanese section in 1861, and these, as compared with the best Japanese of the present day, show a marked difference in favour of the latter.

Though we are greatly indebted to hybridisers in general and the late Mr. Salter in particular for many of our most beautiful winter-flowering *Chrysanthemums*, yet some of our very best kinds are sports from slightly inferior—if I may use the term—kinds, though of the same blood and character, some of the best being Golden Empress, Golden Queen of England, Mr. Bunn, George Glenny, Mrs. Dixon, Jardin des Plantes, Venus, Lord Wolseley, Golden Beverley, Angelina, Emily Dale, and Mr. Corbay, and the Japanese section produce varieties in the same way quite as freely.

It would not be safe to say how many varieties there are in cultivation at the present time, but in 1808 there were ten varieties, which increased to over forty in 1827, the numbers increasing so rapidly afterwards that in 1860 there were no less than 750 varieties of all kinds growing in a single garden. The Rev. G. Henslow in his lecture on the *Chrysanthemum* at South Kensington, Nov. 16th, 1880, says:—"With regard to the origin of the variations

(that is from the single forms), they are due to changes undergone by the disc or centre florets, naturally tubular with a regular border, for the wild original forms were not larger than a sixpence, and with 'ray' and 'disc.' When a disc floret becomes like a 'ray' floret it not only enlarges but suppresses two petals, and splits all the way down, so that the 'ligulate' or strap-shaped florets have only three petals. When they are rather broad they give rise to the incurved and reflexed forms, according as they show the under or upper side of the florets. When they are narrow the flower resembles the Japanese original form with slender tapering petals. On the other hand, if the tube elongates without much splitting we get the tasselled, quilled, and dragon forms. In the first the tube splits only for a short distance into a broad flat piece at the end, in the second the border is reduced, but in the third it is enormously enlarged, with the teeth increased in number. This last resembles the ray florets of the Cornflower, which is much enlarged under cultivation, and has its teeth increased in number also."

Classification of the Chinese and Japanese Forms.—In arranging the large-flowered Chinese varieties it is difficult to decide what to admit and what to exclude; but generally they are classed as incurved, reflexed, Anemone-flowered, Pompon, and Anemone-flowered Pompons.

Section 1 consists of those having their florets incurved and their tips meeting in, or pointing towards, the centre, the flowers varying from hemispheres to complete spheres; Mrs. Rundle, Princess of Wales, Venus, Beverley, Empress of India, Lady Harding, and Prince Alfred being types of this section.

Section 2 comprises those having flowers which reflex, and although seldom seen on the exhibition table (not being admissible in incurved stands), they are some of the most profuse-flowering and brightest-coloured of the whole genus. Amongst others are Julie Lagravère, Crimson Velvet, Dr. Sharp, Chevalier Domage, and Progne, all being excellent varieties for conservatory decoration.

Section 3.—The Japanese.—As a rule these are very readily distinguished from any other kind; but of late, varieties have been introduced which, to say the least, are doubtful. This section may be divided into sub-sections, as many have distinctive characters—for instance, Elaine has decidedly reflexed and flat petals, Peter the Great and Bismarck incurved, the former having long and narrow petals, the latter short and broad; James Salter and Fair Maid of Guernsey curl and twist, and eventually resemble balls of paper shavings; Bouquet Fait, The Cossack, and Meg Merrilees have petals long and slightly twisted.

In section 4 I place the Anemone-flowered varieties. These are very beautiful flowers, possessing brighter colours than any other section—simple in outline, having only an outer fringe of broad flat florets and a centre of closely arranged quilled florets approaching to nearly a hemisphere in form. This section is well represented by Fleur de Marie, King of Anemones Gluck, and Princess Louise.

The Pompon is placed in section 5, and needs no description; but the true Pompon is small and something like a double Daisy; Snowdrop, Bob, Drin-Drin, and Pablo being good examples.

Section 6 is composed of the Anemone-flowered Pompons. Mr. James Douglas says, "This is probably a break from the true Pompon, and the flowers are very distinct as a class. They differ from the corresponding large-flowered section in having in most instances a double or treble fringe of outer florets. The centre florets should form a half sphere, as in the other section. A good example of an Anemone Pompon is to be found in Antonius. *Cedo Nulli* and its varieties are hybrids. At one time all the foregoing sections used to be represented at exhibitions, classes being provided for them in the schedules. Some of the Societies, such as the Borough of Hackney, do so now, and it is very desirable that all the classes should be maintained in their integrity. Each has its admirers, and it is a pity to allow of their standing still for want of someone to improve each class or section by raising seedlings.

The seventh section is the summer-and-autumn-flowering one, but which really belongs to the class for Pompons. They are very precocious, profuse, and persistent in their blooming habits, flowering all through the late summer and autumn months: are very useful for massing in beds or for furnishing boxes for windows and balconies. *Precocité*, *Chromatella*, *Frederick Pelé*, *Cassy*, *Golden Button*, and *Scarlet Gem* are a few of the best.

(To be continued.)

HARDY PLANTS AT TEDMORE.

The charming garden belonging to the Rev. F. M. Bulkley Owen of Tedmore, is within easy distance of Rednal station on the Great Western main line *via* Shrewsbury from London. Most delightfully situated is Tedmore, and particularly so Mr. Owen's residence. Looking from the building towards the south and south-west are the towering Welsh mountains clad with a most peculiar light in some parts, and on all sides as far as the eye can scan is the most pleasing scenery. There is a most natural taste in the garden arrangement; nearly everything of a formal nature is deprecated, and, with the exception of a few beds in the front of the house, such arrangement is entirely absent. Great encouragement is given to herbaceous plants; in fact perhaps more attention is given to them than anything else, unless it be hardy shrubs, of which there is a very rich and large collection, many of which have occupied their happy situations, while novelties and rarer subjects are being constantly added. It will be utterly impossible for us to notice even a tithe of what is good in this garden.

Starting with the herbaceous and alpine plants, the first thing to strike one is the absence of any rule in the form, size, and arrangement of the beds and borders, these varying materially in every respect, and the whole are happily associated with shrubs, which at times greatly enliven the surrounding with the charming if not always attractive flowers. Natural effect, with a good distribution of colour to secure that end, seems to be the chief desideratum at Tedmore, and most happily is the idea carried out. Thus everywhere are masses of *Delphiniums*, some of which are 7 or 8 feet or even more in height; *Spiræas*, *Mule Pinks*, *Lilies*, *Fox-*

gloves, Canterbury Bells, Sweet Williams, and a host of similar flowers while the intermediate spaces are occupied with a multitudinous collection of species and varieties far too numerous to mention, but some of the more useful and effective I will describe.

Lathyrus Drummondii is without doubt one of the showiest perennial Peas, of vigorous growth and crowded with red flowers. In large masses it is most conspicuous, and valuable alike for cutting and prominent display. It is very rarely seen, but there is no reason why it should not be more frequently seen, as it is readily increased from seed.

Spiraea Aruncus, although a very old inhabitant of our gardens, is not half so abundant as it should be. The whole horticultural world would fall in love with it if seen at the present at Tedmore—in large masses with immense plumes of white flowers; and if arranged with a dark background, or between masses of Delphiniums, how charming is the effect! What can surpass it?

Creeping about a Rhododendron bed most copiously is the beautiful *Tropaeolum polyphyllum*, with its trailing shoots covered with glaucous foliage and deep yellow flowers—a most desirable and showy plant; and hard by is its more fastidious congener *T. speciosum*, scrambling over shrubs with its pleasing green foliage and scarlet flowers in such profusion. Mr. Owen told me how difficult it was to establish, but he added, "It is getting quite a nuisance." So we have heard from others, but it does not make itself so familiar with everybody.

Dictamnus Fraxinella is represented by a specimen quite a yard through, thickly set with its most distinct-looking and scented flowers. This and the white variety are most handsome plants. Fuchsia procumbens was happily trailing on a small rockery and is quite hardy with Mr. Owen, coming up every season. Near by was the pretty *Houstonia cœrulea*, verily quite a pale blue, which in my experience is very unusual; and indeed I remember Mr. Curtis making a point of this when it was figured in an early volume of the "Botanical Magazine." He says, "The colour scarcely warrants the term cœrulea," or something having the same meaning. It delights in a cool situation in peat, leaf soil, and sand.

Primula obconica, recently introduced by Messrs. Veitch, is quite hardy in a sheltered shady spot among the hardy Ferns. It is a very pretty plant, well represented by an engraving in the Journal, vol. vi., page 10.

Cortusa grandiflora is perhaps a large form of the old *C. Matthiola*. It produces large downy leaves and tall scapes of pendulous flowers of a deep reddish pink colour; evidently very floriferous, and at least quite hardy at Tedmore. I think it was introduced by Dr. Regel of St. Petersburg to the notice of British plant-growers.

A mass quite a yard across of *Geranium armenum* thickly covered with its large purple-red flowers was particularly striking, and convinced us that it is one of if not the best border Cranesbills known in our collections. A near neighbour to it was as large a mass of *Mertensia sibirica* with its multitude of drooping porcelain-blue bells—a most meritorious hardy plant, coming into beauty much later than the grand old Virginian Lungwort, *M. virginica*.

Digitalis grandiflora is very abundant, distinct, and showy, and withal perennial, producing large terminal spikes of dull yellow flowers with or minus brownish spots. There were two Rhenns very striking—viz., *R. palmatum taughetiense* and *R. officinale*, both of which are extremely effective when arranged amongst shrubs, the towering panicles of flowers revealing a differentiation most desirable.

A very noble-looking plant, too, is *Ligularia macrophylla*, from Eastern Asia I believe, or it may be from *A. minor*, with large oblong leaves and tall dense spikes of bright yellow flowers, and regarded as a solar or floral ornament it is well worth having.

Numerous Lilliums were in excellent form. The old *L. croceum* with large broad heads of orange-yellow flowers. *L. Szovitzianum* has evidently established itself, one stem being particularly strong and nearly 6 feet high and proportionately stout, with an immense head of bright yellow flowers quite free from spots, a peculiarity it has assumed since its stay at Tedmore, as when first planted five or six years since it was freely spotted. I have never known a bulb of this Lily to exist so long without splitting up or dying. Undoubtedly the soil has something to do with the life period of this as well as many other Lillies. *L. Martagon* and its white variety were evidently at home. The white form was particularly interesting, and a most attractive plant it is, although comparatively rare.

L. auratum are coming up well. Some of the bulbs have been planted for several years. Many are very healthy-looking, but others are diseased; or the ailment may not be a disease at all, as I am inclined to think it is caused by sudden outbursts of bright sunshine, especially after showers. Many of mine have gone just in the same way without any apparent cause whatever.

Iris ochroleuca is a very distinct and showy species, growing 3 feet or more high. Standards white, about 3 inches long; falls rather longer, reflexed, and broader, white, with a very large yellow blotch on each.

Glossocoma ovata is a pretty Campannoid, with pendulous bell-shaped flowers rather more than an inch long, of a very pale blue colour. It is quite perennial and hardy at Tedmore, although I have known it to succumb in ordinary winters elsewhere.

Thalictrum aquilegifolium is a very robust species, with large Columbine-like foliage and terminal corymbs of pure white flowers. *T. flavum* grows quite 6 feet high, with large heads of sulphur-yellow flowers. Both good plants for the back part of the border or for massing among shrubs. The Welsh Poppy (*Meconopsis cambrica*) was plentiful everywhere; seedlings of it self-raised lit up the borders with their rich yellow flowers.

Spiraea marylandica is similar to *S. Aruncus*, but perhaps more slender

in growth, producing plumose heads of white flowers. *S. Pallasii* Mr. Owen regards as the handsomest. It is very rare, but was not quite out. The individual flowers are comparatively large and pure white. *S. trifoliata* is a very chaste subject, with trifoliate leaves and solitary, pure white, irregularly shaped flowers.

Several *Brodiaeus* were very showy, *B. coccinea* being perhaps the handsomest with its deep scarlet tubular flowers, the limb-segments of which are green. This is quite hardy, having been undisturbed for some years, and it looks extremely pretty mixed with *B. congesta* and *B. lactea*, the former purple and the latter white. These are all excellent border plants. Among many ornamental Grasses special mention must be made of the annual

Hordeum jubatum with its elegant purple-tinged feathery spikes. This seeds freely, and annual colonies appear without any trouble whatever; and it is astonishing what a pretty effect it and the following presents among flowering plants. *Briza maxima* also comes up after the same fashion, and I never saw it finer. *Carex riparia variegata* is a very handsome white variegated Sedge, of dwarf dense growth and very serviceable.

The collection of hardy Ferns is rather extensive: a great assemblage of species and varieties in excellent condition, some of them, especially the forms of the Lady Fern (*Athyrium Filix-fœmina*), developed to an unusual extent. One variety of it particularly struck me as being very distinct; it was named pulcherrima, and was collected upon Cador Idris. It is certainly distinct from the ordinary pulcherrima, being more dwarf and dense and not so finely divided. The Ostrich Fern (*Struthiopteris germanica*) is very finely developed.

From the numerous notes made upon hardy shrubs I can only transcribe a few.

Escallonia philippensis is quite hardy here, have stood for some years unprotected. It is a lovely shrub, with gracefully arching branches thickly studded with pure white flowers about one-third of an inch across, the unexpanded buds being pink, which materially adds to the beauty of the spring. This is one of the prettiest shrubs I have ever met with.

Aralia Mawimoniezii has a bold appearance, of dense growth with shining digitate leaves—quite hardy. *A. papyracea*, *A. japonica*, *A. californica*, and others are well represented. *Rosa rugosa*, an unusually deep-coloured variety, was covered with fine flowers, and the lovely variety alba was just coming into character. What a beautiful subject this is! The yellow Austrian Briar was well in bloom, also the good old York-and-Lancaster Rose, so very rarely seen in our gardens now-a-days, although it richly deserves attention.

Acanthopanax variegata, a shrub usually coddled up in artificial heat, but good specimens exist, and have been fully exposed for three years, and it is one of the finest variegated shrubs extant. Several varieties of Japanese Maples are planted out, which in time will no doubt make a fine feature. *Lonicera tomentella*, crowded with a multitude of small, white, tubular, pendulous flowers, the whole shrub presenting a very elegant appearance. A species of *Abelia*, hard by which, I think, was *A. triflora*, was also showy with terminal clusters of white flowers. The elegant *Spiraea arifolia*, thickly covered with its drooping panicles, is very striking. *Rubus odoratus* forms a dense mass of bold foliage, and produces reddish pink flowers about 1½ inch across, very rarely succeeded with large fruits. *Crataegus orientalis* is a very distinct with ashy-grey foliage and calyces. *Salix argentea* is very effective when planted with copper-foliage trees, the narrow silvery white leaves bearing a striking contrast to the latter, and indeed the whole tree is very charming in any position. I have only to add that the hospitality of Mr. Owen made the visit to Tedmore one of the most enjoyable days ever spent in a garden.

—RAMBLER.

HARDY FRUIT GARDEN.

PEACHES AND NECTARINES.—*Healthy Foliage*.—Trees that suffered from blister in spring ought now to be entirely free from it, and be well clothed with clean healthy foliage, for without healthy leaves the swelling fruit cannot come to perfection either of size, colour, or flavour, nor can the wood growth be either so vigorous or its buds so well developed as they ought. Red spider is apt to attack crowded foliage now, and much harm be done if it is not promptly got rid of by careful syringing with clean water, taking especial care to force the water well among the foliage so as to thoroughly wash both sides of it. This requires more than ordinary time and care, and we recently overcame objections taken to the extra amount of pains insisted upon, by having only a couple of trees done daily till the whole of them were gone over and the pest destroyed.

PEARS.—*Early Fruit*.—The fruit upon the upper branches of Citron des Carmes and Summer Doyenné is fast ripening, and should be closely watched, for its duration in perfection is so brief that it is spoilt in a day or two. The condition of the fruit upon the lower branches or the bottoms of cordons is therefore not a safe guide, but the upper fruit must

be examined and picked at once when the stalk parts readily from the branch as the fruit is lifted. Care in this matter affords a nice succession of several dishes of fruit from a cordon, it not being uncommon for the last dish from the bottom spurs to be a fortnight later than the first from the top.

STRAWBERRIES.—*Planting.*—Due care must be given to the selection of suitable positions for the new beds—a sunny gently sloping bank for the early sorts, an airy open part of a garden square for the intermediate or main crop, and a north border for the late ones. To render the supply of fruit unbroken, plant a few rows of an intermediate sort in a warm place near the early beds, and some of the late sorts fully exposed to the sun, so as to accelerate the ripening and insure a supply of each sort before that which it follows is exhausted. For treatment of the soil and distances for planting see our note published a fortnight ago.

Varieties.—In purchasing plants for a new garden do not confine yourself to, say, three sorts—early, intermediate, and late, but rather try several of proved merit, and watch closely how they answer, so as to ascertain which are best suited for your particular soil. If we were choosing for ourselves we would take Keen's Seedling, Sir Joseph Paxton, James Veitch, and Helène Gloede for our main successional crops, with Black Prince for very early fruit, Dr. Hogg for special treats, and Cockscomb for some sensational fruit. To these excellent sorts add for trial Vicomtesse de Thury, President, Lucas, Sir Charles Napier, Samuel Bradley, and Loxford Hall Seedling.

FRUIT-FORCING.

FIGS.—*Second Crop on Early-forced Trees.*—Trees from which the first crop were gathered in May will now be ripening their second crops, and will need to have free ventilation and full exposure to sun and air. If the weather be dull and wet a little artificial heat will be necessary to insure a circulation of air—in fact, a circulation of rather dry warm air is essential to the perfect ripening of the fruit. If the trees are in pots the surface must be mulched and well supplied with water, as syringing to keep down red spider is practically useless if the soil is allowed to become dry. Fig trees in pots should be plunged to the rim, and surface roots encouraged by placing turf grass side downwards round the rim and top of the pots, interspersing it with some well-decayed manure and old mortar rubbish, for lime is imperative in the cultivation of the Fig.

Trees in Borders.—Trees planted out are less liable to suffer from sudden checks than trees in pots, yet they must be kept well mulched and be copiously watered to insure full crops of fine fruits. Trees that are planted against the walls, as also those planted in front and trained to trellises beneath the roof, should have turves placed at the collar, and be supplied daily with liquid manure.

Late Houses.—Attend regularly to stopping, thinning, and tying out in late houses, being careful not to overcrowd, as it is important that advancing crops have the full benefit of sun and light, and the border must be well mulched with manure. Syringe forcibly twice a day, and close the house with sun heat at 80° to 85°.

Very Early Houses.—If the weather be bright and hot the moveable lights may be drawn off, and when the second crop is gathered the trees may be allowed to gradually rest, only giving sufficient water to keep them clean and healthy. If there be any doubt as to the ripeness of the wood the lights should be continued over the trees until this is thoroughly effected, which is best done by a free circulation of air, and moderate moisture only both at the roots and in the atmosphere. If the trees are infested with scale it must be removed by washing the trees with an insecticide applied with a brush or sponge.

Trees in Pots for Early Forcing.—Young trees that have been grown on in a warm house to induce them to ripen early may, when the growth is completed and the wood become firm, be placed outdoors in a warm place, as that in front of a south wall, where they will ripen off and go to rest. For growing under glass there are no Figs that equal the Brown Turkey, yet Negro Largo is very fine, and equally eligible, especially for pots.

MELONS.—*Watering.*—Plants having their roots in a comparatively small space, and are now swelling off their crops, should have copious supplies of weak liquid manure two or three times a week, and if the plants are in pits or frames it must be done without wetting the foliage or fruit more than can be helped. Be careful not to water too near the stem of the plants, as this is liable to cause canker. Should this appear rub quicklime well into the affected parts. Directly after applying liquid manure to plants in frames sprinkle over the foliage with clean water through a rose watering pot.

Training.—Train the growths regularly over the allotted space, not stopping the leading shoots until they have grown two-thirds of the limit, and rub off every alternate lateral when quite young, which is essential to prevent overcrowding, and do not have the main shoots closer than 18 inches. Stop one joint beyond the fruit at the time of impregnation, which should be daily attended to as the blossoms expand, and keep subsequent growths closely stopped to one joint, and thin out where necessary so as to insure the free access of light and air to the principal foliage.

Fruit Ripening.—Where Melons are ripening increase the ventilation with a gradual decrease of atmospheric moisture, and water only at the roots to prevent flagging. Should the weather prove dull a little fire heat will be necessary to insure the perfect ripening of the fruit.

Succession Crops.—In the case of plants that have set their fruit too

thickly thin them out to three for weakly plants, four for the moderately vigorous, and five or six for the luxuriant plants, which should be done as soon as it can be ascertained which fruit takes the lead in swelling, making selection of the best shaped fruits, distributing them as evenly over the plant as possible. Fruit on trellises will need to have supports before becoming very heavy, whilst those in frames or pits should have some pieces of slates placed under them in a slanting direction to keep them clear of the soil.

Atmospheric Moisture.—Damp the houses in which Melons are swelling off their fruit twice a day during bright weather, closing early in the afternoon at from 3 to 4 P.M., according to the weather, and at the same time syringe the plants overhead moderately, watering those in pits or frames through a fine-rose watering pot.

Late Crops.—Where fruit is required late another planting may now be made, but it must be in a light structure, where there is command of both bottom and top heat by means of hot-water pipes.

CUCUMBERS.—*Stopping and Thinning.*—In order to insure continuity of bearing it is necessary that stopping and thinning be attended to frequently, otherwise the plants soon become a thicket of wood, which wastes the energies of the plants and renders them unfruitful, as much of it must necessarily be cut away, and some time must elapse before they are again in a fruitful condition. Plants judiciously stopped, the old wood where practicable cut out, and young growth trained in its place, can be kept continuously bearing over a very lengthened period, it being a great mistake to allow the foliage to become too crowded, and equally disastrous is overbearing. It is also essential to encourage surface roots by top-dressing with good loam and thoroughly decayed manure, along with occasional copious supplies of liquid manure, alternating with water, which at this season will be required two or three times a week, or it may be daily if the plants are in pots or in very limited borders.

PLANT HOUSES.

Allamandas.—These should now be growing vigorously, also flowering profusely, and liberal supplies of water and stimulants will be needed almost daily. Plants trained under the roof of stoves will require considerable attention in keeping the shoots tied as they extend, or they soon reach the glass and become injured. Side shoots will also be freely produced, and these must be freely thinned out or the roof will become too crowded and injure the plants growing beneath. To maintain an even and regular supply of flowers some of these side shoots must be judiciously selected and tied along the trellis in order to produce flowers near the base of the plants. This is easily accomplished by constantly thinning-out and laying in fresh shoots. Do not overshadow these plants, or the growths, instead of being short and flowering freely, will run to a great length before flowers are produced. A little shade only is beneficial for a few hours during the hottest part of the day. Plants in pots trained upon trellises may be gradually hardened and used for the decoration of the conservatory for a time. While in this position watering must be carefully performed, or the plants will soon discontinue flowering and become unhealthy.

Stephanotis floribunda.—Plants that flowered early and have made a good vigorous growth in a moist rather close atmosphere will need attention in order to bring the growth made to a thoroughly ripened condition, or else the next season's supply of flowers will be limited. If shade has been employed gradually reduce it until the plants bear full light and sunshine; also maintain a drier atmosphere and give more air, which is essential to ripen the wood sufficiently to produce flowers in abundance. If the shoots trained to wires or small cord are crowded thin them out, or, better still, dispose them evenly and thinly over the roof, so that every possible chance will be given for the proper maturation of the wood. Nothing is gained by crowding plants of this description; but, on the contrary, more flowers will be produced from the same space where the roof is moderately covered with good wood than would be the case from a densely crowded plant covering double the space. Liberal feeding should be resorted to if the plants are in any way confined at their roots, but care must be taken that they are not saturated, or injury will soon result.

Clerodendron Balfourianum.—The remarks given above apply with equal force to this plant—in fact, those that have flowered and are making or near the completion of their growth. Thorough ripened wood is the secret of success, and this accomplished under the influence of light, air, and a drier atmosphere. If prematurely ripened, as is too often the case, by allowing the plants to become dust dry, they suffer in consequence. Plants ripened under such adverse conditions either fail to start into growth when wanted, the wood dies back, or the plant flowers imperfectly.

All plants in active growth must have every encouragement to ripen their wood as early as possible, especially those required for early forcing. Those still in flower should afterwards be pushed forward rapidly, as it is impossible to ripen the wood well when the days are short and the sun but little power.

Achimenes.—Root another batch of cuttings in 4 or 5-inch pots, which will come in most useful for decoration. Feed those now flowering in the conservatory with weak stimulants every time watering is needed, which will help them wonderfully and prolong their season of flowering. Plants produced from cuttings rooted early in the season are still compact balls of flower, and are superior in every way to those grown without being topped from the dried tubers. This system has much to recommend it, and in future whether the plants are to be

grown in pots, pans, or baskets, will all be produced by means of cuttings. The plants from cuttings are dwarf, and flower more profusely than those produced in the ordinary way.

Isolepis gracilis.—This is most useful for various purposes of decoration, either for using in the dwelling-house or for the edge of the stove or greenhouse stage. To have them in fresh and good condition abundance of water is needed in all stages, and they must be divided and repotted frequently. This is a good time to prepare a batch by dividing a number and repotting them in 4-inch pots, which will under cool treatment take the place of those now doing duty, which by autumn will have become unsightly. By dividing a number of plants three times during the year a supply of healthy plants will be maintained; but this can be done more frequently if the demand is great.

THE FLOWER GARDEN AND PLEASURE GROUND.

Lawns and Walks.—These if kept trim and neat, as they should be, add to the appearance of and contribute greatly to the enjoyment of a place by its proprietor and friends. The lawns should be mown and the edges cut at least once a week, and if there are any "bents" or flower stalks of weeds or grasses which the machine will not cut, these should be cut with a scythe. Where the grass is thin the collecting box may with advantage be left off the mowing machine. Gravel walks should not be hoed, but all coarse weeds are best pulled up, and if there are many small weeds appearing one of the simplest methods of getting rid of them is to dress the walks with rough salt obtained from manure dealers. This should be applied during hot sunny weather, and in sufficient quantities to just whiten the surface. Crude carbolic acid used at the rate of one ounce to a gallon of water and liberally applied with a rose watering pot, is both a cheap and effective remedy. Whatever destructive agent be employed, care must be taken not to let it touch either the roots and tops of Box and other edgings, nor the lawn grass.

Clipping Hedges.—The summer trimming of the hedges of Box, Yews, and other Conifers should at once be completed. If delayed later the young growth following will not have time to become sufficiently hardened before the winter. This summer cutting is essential in many prominent positions, otherwise it is advisable to cut the hedges once only during the year, and that during the late winter or early spring months. Treated in this manner they are hardier and retain their vigour longer than those more frequently clipped. Banks of Laurels should not be closely cut at this time, but all strong irregular growths may be shortened back or removed with the knife. For cutting the broad Yew and Box edges which form part of the flower gardens arranged in the Italian style, Ridgway's hedge-clippers prove to be of great service, as with these they may be cut very quickly and neatly.

Propagating Roses by Cuttings.—In all gardens not exceptionally cold and heavy Roses succeed best on their own roots. The Hybrid Perpetuals especially are easily struck both during the late summer months and again in the autumn months. Cuttings may be made of shoots that have just flowered, taking these off with a heel or thin slice of old wood attached, and dibbling in either singly in 3-inch pots or thinly in larger pots. The soil employed should consist principally of loam and a little leaf mould, to which sand or road grit has been freely added. The cuttings should be fixed firmly, be placed in a cold frame, and shaded for about three weeks, when they will have callused, and ought then to be placed in a mild bottom heat to root. They ought never to become dry at the roots, neither should they be saturated. When rooted, those in single pots may either be given a small shift or hardened off. Those struck in large pots should be potted off singly and returned to the frame till established, then gradually hardened and placed in a cold frame or pit for the winter. Later on strong well-ripened lengths of Hybrid Perpetuals may be rooted in the open ground, but in the case of the more delicate Teas, Noisettes, China, and Bourbon Roses the above method of striking in heat is the best method of propagating by cuttings.

Layering Roses.—Many will have bought the set of Bennett's new Hybrid Teas, and doubtless will be anxious to increase the stock. In most cases the plants will have been received with long and fairly strong flowerless shoots. If not already done, turn them out of the nursery pots, carefully pick off any sour unoccupied soil, and shift into larger pots, the soil employed to be loamy and gritty. Plunge the pots in a bed of good firm soil. Slice off the bark lengthways under every other bud, and peg these down firmly into the soil. Cover with a frame. Keep the plants watered, and when rooted detach the young plants and pot-off singly as in the case of the other sorts.

sections finished I returned it, and since then on examining the hive I discovered foul brood in it, which has been very prevalent in the district this year. I shall feel greatly obliged if any of your able apianian correspondents would tell me if it is curable, and if so how I can cure it. All my stocks are very strong, and I would not like to destroy them if there is any way to save them. I trust some kind apianian will be able to help—A YOUNG BEE-KEEPER.

OVERSTOCKING.

THE range of the honey bees' flight is limited. The number of honey-producing flowers within that range is also limited as well as the capacity of the flowers to secrete honey. Granting these assertions, overstocking becomes a possibility. Does this possibility ever become a fact? Let us examine the subject a little. First, how far do bees fly? Not what is the extent of their flight under peculiarly favourable circumstances, as, for instance, when they are following a receding honey flow on higher land, but how far do they fly on the average profitably in quest of surplus honey? If we permit those of most ample experience to answer, they will tell us that forage must be within two miles of the hive in order to secure much gain in the surplus apartments of the same, and that it will be most profitable to have it within one and a half mile. Then we may place our apiaries three miles apart, giving to each one the pasturage of nine square miles, or about 6000 acres. I believe Mr. Quinby preferred to place his yards no nearer than this, and thought about sixty colonies in each apiary gave the best results. Mr. C. Root places a still smaller number in many of his yards. Mr. Adam Grimm noticed that when as many as 100 stocks were kept in a place there was a diminution in the number of swarms, and that surplus honey was made per colony. He concludes by saying that "if not more than fifty colonies are kept in a place and the yards are placed three miles apart there will be no danger of overstocking in ordinary seasons." These are spring numbers, and it will be remembered that all the authorities quoted were in good localities.

If fifty stocks are kept in a place and the number doubled it will require 2500 lbs. of honey for their winter stores; nearly double this or 5000 lbs. for brood-rearing and summer consumption. Therefore about 4 tons of honey will have to be gathered before any surplus can be stored. A yield of 25 lbs. surplus per swarm, old and young, will require 2500 lbs. more, or a total of 10,000 lbs. This is on the supposition that the comb is already built in which to store the honey. If comb foundation is furnished instead, we will consent to call it one-half more, or a total of 11,000½ lbs. If the bees have to construct the whole comb, unless the hives contain too small a quantity of old bees in proportion to young, we shall have to double the first amount, making a total of 12,250 for a surplus of 25 lbs. of comb honey per hive. In the above I have purposely made a liberal estimate of honey consumed in the hive, but even then it figures up but little over 2 lbs. of ripened honey per acre; while many an acre will not contribute a pound of honey it may still be granted that in the average season many more pounds will be produced than gathered. What is the objection, then, to stocking heavier and permitting less to go to waste? The period of greatest scarcity in most sections is in the spring. A honey dearth then is detrimental to brood-rearing, and is felt through the whole season. Feeding may be resorted to, but it was demonstrated last spring that nothing but natural resources or fresh honey and pollen from the flowers will stimulate sufficiently. I do not refer to early feeding, now abandoned by most beekeepers, but to stimulating after the first brood hatches, when brood should be reared most abundantly. Again, if the field be overstocked in the fall, brood-rearing ceases too early, and it is the belief of many that this is one drawback to successful wintering. It is very certain that artificial feed at this season of the year will not take the place of natural supplies for securing brood. Then, again, when crowded on a range, even in flush times, bees lose much time in searching for honey from flower to flower when they have already been emptied, and they will even condescend at such times to gather honey before it is sufficiently ripened in the flowers as well as other poor honey, including aphid honey and honeydew, all of which injures the quality of surplus and winter stores, making it almost impossible to winter bees under such conditions.

It may be asked what proof we have that bees gather too thin a honey and such is not sufficiently evaporated in the hive after being gathered. I answer that the proof is found in honey gathered in wet seasons, which is still thin after being sealed. Sugar may be substituted for honey in wintering, but it is a Herculean task to extract and feed after honey-gathering ceases, and after a little experience in feeding with grape sugar, white earth, and the other adulterants of sugar, it may be concluded that poor honey is even safer than this. It will be found that a guarantee of purity does not always imply purity. This last winter I observed bees to drop down by the quart as if poisoned in a few sugar-fed swarms, and I noticed in the fall that it took much less water to melt some sugar guaranteed to be pure than it did of another brand containing no such guarantee. It is certain that grape sugar takes little water to melt it. We may, therefore, reasonably conclude that it is easy to overstock a range, and that overstocking often means not only the loss of surplus honey, but also the loss of the bees as well.—P. H. ELWOOD (in *The American Apiculturist*).

THE BEE-KEEPER.

FOUL BROOD.

I HAVE some hives of bees which have done remarkably well, especially one hive which has given me twenty-six 1½-lb. sections, and has thirty-five more on it almost complete. It is an ordinary Woodbury hive, and threw off a very large swarm; but being anxious to have all the

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Seedling Raspberry (*John Coombe*).—Your seedling Raspberry is a very good one, large and prolific, but it does not surpass some other varieties already in cultivation, such as Carter's Prolific and Northumberland Fillbasket.

The Parsley-leaved Bramble (*J. N.*).—We think you will find all the information you require in the interesting article of "W. K. W." in another column of the present issue. If you need any further particulars we will endeavour to supply them if you state your requirements. We are very glad to hear from you. No one need apologise for seeking information.

Dismissal of Gardener (*Sussex*).—The case you mention where one month's notice is required for the dismissal of a gardener occupying a cottage on the premises refers to one in which a yearly hiring existed. In the case of a weekly hiring and weekly payment only a week's notice is required.

Garden Register (*C. L.*).—We have no work published under the above title, nor do we know exactly what you mean, or we might perhaps be able to assist you in procuring what you want.

Storing Bulbs (*J. B. W.*).—Bulbs stored in such large quantities as your letter indicates cannot be considered safe, the Crocuses especially. Large dealers spread them 2 or 3 inches thick on shelves tier above tier, and even then find it necessary to move them occasionally for keeping them in a sound state over the longest period.

Echinocactus, Echinocereus, and Echinopsis (*Trike*).—The most easily observed characters which will enable you to distinguish these genera is the position of the flowers, those in Echinocactus rising from the crown of the globular fleshy stem, while in the other two genera the flowers are produced from the side of the stem. Echinocereus is distinguished by the short flower tube as compared with Cereus, the first bearing at its summit the persistent remains of the flower, and the seeds are rough. In Echinopsis the flowers have a very long tube, covered with bristles or hairy scales. All have thick globular or rounded fleshy stems, and with the Melocactus are readily recognised at a glance as compared with the majority of allied plants. The genus Cotyledon has flowers with five sepals, a tubular five-cleft corolla, and ten stamens, while Crassula has all the parts in fives, sepals, petals, and stamens. Articles upon the subject you name will shortly appear in these pages.

Ivy on Trees (*Sussex*).—There is no question but that Ivy is injurious to trees against which it grows, as is evidenced by the diminished vigour of the trees as compared with those that are not mantled with Ivy; but there is no disputing the fact that when trees have been long and so much covered with it as to be very much enfeebled thereby, that the removal of the Ivy acts prejudicially by exposing the long-protected bark to the direct influence of the atmosphere. Ivy ought never to be allowed to grow on trees that are intended for profit, but should be cut or removed before it has made much headway. Trees covered with Ivy in a young state will never make profitable timber, and aged trees are better felled when covered with it, unless it be desired to retain them as ornaments.

Clematis Shoots Dying (*A. M.*).—There is nothing on the leaves and stems sent indicative of disease. The growth is evidently very weak, as may be anticipated from the second growth, the first having been destroyed when 6 or 8 feet long. The "white place on the stems about 3 inches from the base" is no doubt the cause of the mischief, and is, we think, caused by slugs eating off the bark, which prevents the flow of the sap, and causes the shoots to collapse for want of nutriment. Dust around the collar of the plant with quicklime, and search for the pests after dark with a lantern, particularly in moist weather.

Zonal Pelargoniums not Thriving (*C. A. L.*).—We do not know that any kind of cement is injurious to plants, but the floor is probably formed of concrete—i.e., asphalt, into which gas tar enters largely, and the effluvia given out during "hot sunny weather, and in winter when artificial heat" is employed, is highly injurious to plant life, especially plants that have hairs on the leaves, such as Pelargoniums, Gloxinias, Achimenes, &c., and will

cause the leaves and flowers of Fuchsias to drop. We should remove the floor if there is tar in it, and replace it with stone, which is certainly quite as economical in your locality as cement. We have had houses with cement floors, and they have never caused any injury to the plants. What are the hot-water pipes coated with? Is there anything in the painting of the wood-work calculated to give off offensive effluvia?

Tree Carnations—Lifting Roses (*J. F.*).—We have frequently grown tree Carnations for two years and more, selecting healthy sturdy plants, shifting such as could be conveniently placed in larger pots, removing a portion of the soil from the others, and adding fresh rich compost. During the summer they were plunged in ashes in the open air, and accorded generally the same treatment as Chrysanthemums as to syringing and watering. Many plants that have been much drawn under glass during the winter are of little further use; and as a rule young plants raised early from stout cuttings and grown generously through the summer, produce the finest blooms over the longest period. But everything depends on the skill of the cultivator, and a person growing these Carnations for the first time would not act prudently by throwing away all his old plants before he had young plants thriving satisfactorily. You must not disturb the Tea Roses now, but take them up and pot them in the autumn.

Soil for Fruit Trees (*Idem*).—Healthy and fruitful trees and excellent crops of Strawberries are grown in soil much inferior to that of which you have sent us a sample. Assuming that water passes freely through it, and that there is not a stagnant subsoil, we fail to see that anything beyond ordinary farmyard manure is needed for growing Strawberries, and surface-dressings for fruit trees. A good Strawberry for your purpose is Sir Joseph Paxton.

Disbudding Vines—Ventilating (*H. S.*).—Usually there are far too many growths left on Vines, whether they are grown on the long-rod or short-spur system. On young rods 18 inches apart the laterals ought to be thinned to at least that distance asunder along each side of the cane. This should be done immediately the bunches are visible in the spring, removing the superfluous growths by degrees until the requisite number having the best bunches alone are left. Your question on ventilating cannot be answered categorically, the direction and force of the wind and the state of the weather must always be taken into account. The top ventilators may be left open from 2 to 6 inches provided rain is not admitted and the temperature of the house does not fall lower than 65°. The front lights may be opened an inch or two on calm nights when the Grapes are colouring.

Vines Unhealthy (*W. P., Somerset*).—We have the satisfaction of informing you that the condition of the Vine you have sent is not the result of phylloxera. Two causes appear to have contributed to its unsatisfactory state. First, the interior of the ball of soil was as dry as dust, and by no ordinary watering could it be made moist. This is the result of shifting when the soil in the pot from which the Vine was removed was too dry. That is one cause of the evil. The other is mixing too much of the fertiliser you name in the soil and poisoning the roots. Where we found those in the interior as dry as wool and most of those near the sides of the pot corroded, we were surprised that the Vine did not succumb before and more completely. If you have other Vines showing the same symptoms of collapse you had better immerse the pots in a pond for an hour or two, and cut the canes down to a healthy lateral; they may then perhaps make a fresh start and produce useful rods.

Carnations for Winter—Tuberose (*L. I. K.*).—Unless the plants make strong and healthy growth during the summer they will not flower satisfactorily in the winter. They are better in a frame or even outdoors at this season of the year than in a greenhouse, where they almost inevitably become drawn, making thin growth and leaves. Old plants which crowd the pots with roots require much water and weak liquid manure once or twice a week; young plants must have the soil always moist, but not saturated. As a rule plants that have not filled the pots with roots have too much water, while those that are root-bound do not have sufficient. If your plants are too large for a frame stand them outdoors in a shaded place for a week or ten days, but not under trees, then assign them a more sunny position. They perhaps need fresh soil. See our remarks to another correspondent. Tuberose may be potted as soon as you can obtain bulbs in the autumn. It is a good plan to bury them in cocoa-nut fibre refuse, like Hyacinths, until they commence growing; but they require more heat than Hyacinths afterwards, and a very light position. Your letter has been forwarded.

Names of Fruit (*J. M. C.*).—Owing to imperfect packing, the fruits not being made firm, they were perfectly unrecognisable. We can only say that the foliage of the Strawberry resembles Dr. Hogg. Try it another year, the weather in your district may have been unfavourable for this variety this season.

Names of Plants (*J. P.*).—*Lonicera sempervirens* Brownii. (*W. Cranswick*).—1, *Festuca duriuscula*; 2, *Alopecurus pratensis*; 3, *Cynosurus cristatus*; 5, *Melica uniflora*; 6, *Lysimachia Nummularia*. Miss Plue's work, "British Grasses," published by Lovell, Reeve, & Co., may perhaps suit you. (*F. T.*)—*Populus tremuloides*; 2, *Thuja orientalis*; 3, *Abies canadensis*. (*L. B.*)—*Sweet Sultan* (*Centaurea moschata*). (*W. E. B.*)—1, *Tradescantia virginica*; 2, *Potentilla argrophylla*; 3, *Doronicum pardalianches*; 4, flowers all faded; 5, *Astrantia major*. (*J. McN.*)—1 and 3, *Sedum album*; 2, *Sedum spurium*. (*E. C., Birmingham*).—1, *Campanula Trachelium*; 2, *C. rapunculoides*; 3, *C. glomerata*; other specimen insufficient. (*E. Kenrick*).—1, *Salix aurita*, the Eared Sallow; 2, *Salix argentea*, the Silvery Willow; the bud-like formations are the cases of insects that feed upon Willows, and are very general; 3, *Trientalis europæa*, Chickweed Winter Green, a very rare and most interesting plant, and the only British species that belongs to the seventh class (Heptandria) of the Linnean arrangement of botany. We see no reason why the Sundew should not be found in Aberdeenshire, for the plants are generally distributed and grown among sphagnum from the sea level to 1000 feet or more high. The specimens arrived in very bad condition, and you may consider yourself fortunate in having them identified. Plants for naming should not remain in the post office over Sunday, but should be posted early in the week. (*A. F., Bedale*).—*Phlomis fruticosa*.

Jars for Honey (G. C.).—Mr. Blow's address is Welwyn, Herts, and he will no doubt give you the information you need.

Bees Ejecting Brood (A Notice).—We answered the same question under the same signature four years ago as follows:—It is not an uncommon thing for bees in continued bad weather to east out brood such as you describe. Drone brood is usually first got rid of. It is a sign of pauperism; and we fear that your experience will be found to be no uncommon one this year. Mr. Pettigrew, in his "Handy Book on Bees," says:—"Bees that are kept on the point of starvation wisely refuse to set eggs. Their combs become empty of brood; their numbers decrease; their bankruptcy blights them for a month, if not for a whole season." Feeding immediately with syrup is the obvious remedy. A pound of refined sugar boiled in a pint of water makes good food for starving bees.

COVENT GARDEN MARKET.—JULY 25TH.

TRADE heavy. Prices of soft fruit inclined to give way.

time of exhibition only about four years and a half old, was in her prime.

This style and type of the Sussex breed is extremely well adapted for breeding, not only show animals, but animals for working purposes, because the large and muscular frame is eminently adapted for the power required in the tillage of the land, and instead of using four or six animals in drawing the plough, two only may be used in summer and four in the winter. They should, however, be kept up and in full condition, instead of being poor and grazed only upon inferior grass land. When well bred and well kept, instead of being sold away for fattening into other districts, about eighteen or twenty weeks' good feeding in the stalls would answer the purpose of both working animals and fattening animals, and a less number are or may be kept, and effectually displacing a certain number of horses, which, so far as working and the capital required to maintain, are a dead weight upon the resources of the farm. The two bulls for use in Mr. Hodgson's herd were two sons of the Royal Oxford Champion bull, and both of great substance. Young Oxford, first at the Bath and West of England Show, and second at the "Royal" Shows; and the other, Lord Oxford second, famous in the calf class in the year of exhibition.

The herd of the Right Hon. The Speaker is well worth our attention, and has been well described by Mr. William Housman, from which we have obtained important information respecting this herd, which has been in existence since the year 1858, when it was founded at Glynde in Sussex, a district rendered famous by the improvement effected in the Sussex or Southdown sheep many years ago by Mr. Ellman. Mr. Housman says—"The poor rushy field, flat and exposed, in which the cows and heifers are scraping up their living, looks a most miserable pasture on a November day. If cattle can live on that they can live on anything. But the well-furnished backs and ribs of the cows and heifers here met with bear evidence that Sussex cattle can more than live, they can thrive on such land. There is no pampering except, of course, the usual extra feeding of cows prepared for show. Of course it is not pretended that Glynde cattle grow fat on rushes, but the fields in which the first lots of cows, heifers, and steers are seen is not untrue index to the general character of the farm in hand; but as the proprietor's object is to maintain a pure bred and high-class herd of the distinctive breed of the county, the breeding cattle were introduced and retained under disadvantages already mentioned. This herd has from the first been, and to the present time is, under the management of the Speaker's agent, Mr. T. Colgate, and of his son, Mr. T. Colgate, jun. Most of the original cows were purchased from the herds of Messrs. Henry Catt of Firlie, and Jenner of Framfield. The principal bulls first used, Garibaldi (106), calved in 1860, bred from the stock of the Rev. J. Gould and Mr. J. Noaks, and latterly Stanford (367) has been in service. This bull was bred in 1877 by the Messrs. E. and A. Stanford, whose prize-winning herd has been noticed. The number of cows in the Glynde herd—that is to say, grown-up breeding cows, alone is about twenty; the full muster of all ages is about forty three, and the best cows, amongst which was "Gentle," descends remotely from the stock of Mr. Catt, crossed with one of Mr. G. Berry's bulls. "Polly Jones" was one of the noblest-looking cows in the herd, and also "Julia II." a handsomer, or, for beef-production, a more useful sort of stock cow is not often to be found. These cows exhibited at the Tunbridge Wells Show in 1881 were greatly admired as fine specimens of hardy, sound breeding, and rent-paying animals.

We cannot in this good company fail to notice the very successful prize-winning herd of Mr. A. Agate of Broomhall, Horsham, whose herd now stands very high in the estimation of approvers in Sussex cattle. As an instance of early maturity we will notice Mr. Agate's first-prize bull "Frankenstein II.," which took the first prize for the best bull over one and under two years old, which we so much admired when we viewed him at the late Royal Counties Show at Winchester last June, and being aged only one year, nine months, one week, and six days, we were induced to estimate his dead weight if slaughtered. In making this estimate we could not refrain from making a comparison with his weight had he been castrated and shown as a steer at that age, and we thought that although he weighed in the showyard a dead weight of 140 stone (of 8 lbs.), that he would not have exceeded 150 stone had he been steered. To our mind this idea is worth the notice of the rent-paying farmer, because in raising baby beef we ask, Is it worth while castrating any of the male animals when, at two years old and under although they are as well fed, and kept in boxes separately they will not weigh so much as entire animals by 10 stone? And, again, in a prize-winning herd, if all the male animals are allowed to remain entire and exempted from stud service until

THE SUSSEX BREED OF CATTLE.

(Continued from page 64.)

MR. HODGSON'S herd, of Lythe Hill, near Haselmere in Surrey, was only founded in 1878, but as Mr. Purkis the steward does nothing by half measures, but proceeds upon the system of what is worth doing is worth doing well; and both the land in hand and the cattle upon it bear evidence of the will and skill of the manager. Although this herd has been so lately commenced it was the very next year winning showyard honours, including the championship of the Sussex bull classes at Kilburn. The best animals which could be purchased were obtained for laying the foundation of the herd. The system adopted is to keep the stock generously, partly for the sake of the animals, and partly from the benefit to be derived by the land, as the cake consumed fattens the land as well as the cattle. One practice is worth notice—namely, that the calves are generally suckled longer than the usual period in Sussex herds, and the stock of the future derives much benefit, enabling them to make more size, weight, and completeness of form.

The first cow in the herd deserving the chief notice is a very grand animal bred by Mr. S. Clifford Gibbons, and exhibited by him in the extraordinary cow class in the Bath and West of England Show at Tunbridge Wells named "Ruby." She is large, broad built, and massive, and in some points seldom surpassed. She has a big midrib, yet none of the hollowness behind the shoulder blades so often found where ribs and shoulder are especially good and well covered; in fact there are great cushions of flesh packed in behind the blades. Altogether she is a cow of great substance, and being at the

twenty or twenty-four months old, there will be a better opportunity for selection of stock or stud animals, because it is quite impossible, other than by blood and parentage, that the best stud animals can be selected for certainty at the early age of castration. We have consulted many first-rate business men, both as butchers and dealers, and they have confirmed our estimate of difference in weight of the steer or entire animal, and at the same time they have alluded to the fact of consumers complaining that baby beef is flavoured too much like veal, whereas by raising and fattening the entire animal the meat would be flavoured more like that of a ripe ox of full age.

We cannot refuse to notice Mr. Agate's beautiful cow taking the first prize at the Royal Counties Winchester Meeting, called Daisy 4th, aged four years, five months, and two days. This we considered one of the handsomest cows we had ever seen of any herd, so even in all her points, large and lengthy, with one of the handsomest head and horns of a style quite peculiar to the Sussex breed, but absent in the same requirements in the second-prize cow belonging to Messrs. E. & A. Stanford, although as a type of early beef-making animal the latter could not be exceeded, although her head and horn denoted anything but beauty. At the Royal Show at York on 16th of this month, however, Mr. Agate's first-prize cow only took third prize, Mr. Hodgson's, Laura the 5th, not noticed at Winchester, being placed first by the Judges at York; but there is no accounting for taste and judgment, although this important decision does not meet our approval. We note that Messrs. Stanford's celebrated bull "Goldsmith" took the first prize at the Royal York Meeting, thus completing his victories, having been first at the Royal Derby Meeting as well as at Reading last year. Two more first-class breeders of Sussex cattle only remain to be noticed—namely, Mr. T. Vickness of Slinfold, and Captain P. Green of Lamberhurst. Both of these breeders were successful in obtaining prizes at the meeting of the Royal Agricultural Society of England held at York, July 16th, 1883.

WORK ON THE HOME FARM.

Horse Labour.—Horses are still employed in carting hay, the produce of the late low-lying meadows; but in various districts in the midland and northern counties the cutting of grass in the pastures has only for a short time been commenced. Some horses will be employed by working the mowing machine, tedding machine, and horse rake, and also in working the elevator at the rick's side—a most important adjunct to the farm labour, as it removes the severest labour the men have previously had to undergo. We note that in our own case the Trifolium crop has lasted out well this year for horse and cattle-feeding at the stables and stalls, and was only finished as a food supply through the effect of sowing both early and late varieties on the 18th of the present month. This land will now be in cultivation for about ten days, and will be prepared for Turnip-seeding by being raftered or half ploughed, and then scarified across the rafters, which will effectually comb out the couch left in the land by neglect of the outgoing tenant last Michaelmas, and in consequence it may even require a cross ploughing before the ridging or last ploughing, seeding, and manuring is done simultaneously. In cases where the land will be required for cropping with grain after a green crop is ploughed-in, the Turnip seed and manure may both be sown broadcast, for it is not desirable to produce large bulbs, for these are maintained and perfected by manure and fertility existing in and abstracted from the soil, whereas if the Turnips are sown broadcast either alone or in admixture with Cole seed (not dwarf Rape), these will plough in readily without the labour of grinding or chopping the bulbs, and will also have been produced chiefly from nitrogen supplied by air and rain, which gives a clear gain to the land to a greater extent than a root crop allowed to come to full maturity. We have now an instance of this on a farm we have in hand. The previous tenant having a very foul Wheat eddish fallowed it, and sowed Turnip and Rape seed with a light dressing of artificial manure. The roots were never hoed and were a poor crop. After ploughing in this weak and light crop the land was, as fast as ploughed, sown with Morton's red-strawed white Wheat in December, and where the Wheat came up a full plant, an extraordinary crop both in bulk and size of ear is now advancing towards harvest most satisfactorily; and in some parts where the plant is hardly thick enough, yet the deep green and luxuriant growth is very remarkable, considering the land being previously in a low condition from bad farming, proves that the green crop which was ploughed-in is the only cause of the fine and satisfactory Wheat crop, now so much admired by all those who have seen it. We shall, therefore, during the early part of the harvest, instead of putting the teammen to harvest work, employ the horses daily in ploughing and sowing Turnips as fast as the corn is cut, and where the land is free from couch, the Turnips and Coleseed may now be sown with advantage, and ploughed-in early in the spring ready for seeding with white Oats of an early variety, or otherwise dredge, in order that the fullest crop possible may be obtained for sale or feeding farm horses. If for sale the white Waterloo Oats and Barley mixed will prove a more valuable produce than Barley alone, especially when sown after green crops ploughed-in, as the crop becomes too bulky and injures the sample of grain for malting purposes.

Hand Labour, where the hay crop has been stacked and thatched, will now consist of hoeing the root crops and singling, in which work the women and lads can assist; preparations and anticipating the harvest should now prevail. Hedge-trimming and border-cutting should always be finished before the harvest commences, couching and burning on the land, as fallows for Wheat will employ the odd horse and some hands; and if the weather should prove unfavourable for the burning couch in small heaps, it is best to cart it away to large heaps for stifle-burning; the land will then be ready for the next ploughing without delay, and the ashes produced may be of considerable bulk, and valuable for laying out as a sufficient dressing for the Wheat crop, as far as they will go, at the rate of about 300 bushels per acre. All the carts, waggons, implements for reaping, should now be overhauled in order that they may be equal to accomplish the heavy work of securing the grain crops during the harvest. If it is intended to hire steam power for work in cultivating the land after the grain or pulse crops are removed, it is well to bespeak the power required beforehand, otherwise delay, which may be serious, will occur and prevent the steam power being of the benefit required.

Live Stock.—Sheep are still extremely dear, and this reminds us that the great Hampshire fair for the Hants and Wilts down breeds of sheep is being held while we are writing (July 18th), and with the present prospect for roots and grass, of which the greatest abundance either prevails or is promised by appearances, must yet tend to keep up a price for sheep which can give little profit to the grazier. There is, however, some advantage in this state of things to the hill farmers who breed and sell their sheep at these fairs; but we have a word of caution to say to these farmers, for if they get a high price for their stock they must examine their accounts at the end of the year, and if commercial profits are absent they must not be deluded into the idea that sheep even on the hills are a necessity, and that stock is the only means whereby a commercial benefit can be obtained. Again, this may be the case if the old system is retained, and to see farming matters in a true and profitable light the sheep system should be compared with other projects which are recommended in farming; for it is by comparison only that we can ascertain the true value of anything in connection with farming, and we close these notes with a truth, that thousands of sheep farmers have succumbed to the times.

YORKSHIRE FARMS.—We are informed that the whole of the prizes, value £300 (and commendations), given by the Royal Agricultural Society at their annual meeting last week for the best cultivated farms in Yorkshire, were awarded to customers of Messrs. Webb & Sons, the Queen's seedsmen, Wordsley, Stourbridge. Class 1.—For grazing or dairy farms above 150 acres in extent, with at least two-thirds in permanent grass, first prize, £75, Mr. R. E. Turnbull, Twyers Wood, Hedon, Hull; second prize, £25, Mr. W. H. Davies, Holme House, Gargrave; commended, Mr. H. Holden, Halton East, Skipton. Class 2.—For arable farms above 150 acres in extent, with less than two-thirds in permanent grass, first prize, £75, Mr. T. H. Hutchinson, Manor House, Catterick; second prize, £25, Mr. J. Watson, Wood House, Brough; commended, Mr. W. Coverdale, Lund Cote, Kirby Moorside. Class 3.—For farms under 150 acres in extent, first prize, £75, Mr. B. Beevers, Clay Shed Farm, Escrick; second prize, £25, Mr. Joseph Horner, Morton, Bingley.

PHYLLOXERA IN ROSSENDALE.

ASSUMING that individual experience of the phylloxera on the Vine may be interesting to gardeners as well as their employers, I shall without further apology, with your permission, trouble your readers with our experience in the Rossendale Valley, in the hope that it may waken up others who, like us in this "cold unfertile region," may have been sadly vexed in trying to find out what ailed their Vines.

The Rossendale Valley, a thriving manufacturing glen in N.E. Lancashire, describes a half-circle to the north and west of Manchester, and may roughly be said to run from Summerseat (a short distance from Bury) to Bacup. The soil, with slight exceptions, is of that adhesive nature which forms a good material for puddle. It is also strongly impregnated with iron. The bottom is for the most part grit rock or shale, and numerous quarries and coalpits with the cotton and woollen mills form the staple industries. We have as a matter of course the usual amount of smoke and cloud inseparable from Lancashire. About six years ago when I came here I was told by neighbouring gardeners some of their difficulties, the principal of which under glass was the Vine weevil, which attacked the Vine roots, Azaleas, Primulas, and other plants. The first spring I had abundant proof of the presence of the weevil in the maggot and perfect state. Looking at the Vine border I could see on the surface bare snags of roots, having no connection with the soil, the points having decayed and looking as if burnt. Those below the surface were found much the same, having no fibres, but running along black and naked, the bark decayed, and in numerous places eaten half through into the wood. The Vines in most cases started weakly, but towards setting time became moderately strong, and continued healthy till the stoning process commenced. Then the large leaves began to show warts thickly—a dark green at first, changing to brown; the few young shoots appeared to be riddled with yellow spots, as if half-eaten through. I say the few young shoots, because one stopping of the Vine is sufficient here. The fruit was under-sized in bunch and berry, and much given to shanking. At this period the red spider commences to increase vigorously, and to keep it in check it is often necessary to continue syringing.

All this has been known for something like fifteen years, and has been laid to the charge of the Vine weevil, and to an indefinable "something in the soil." A few of us, seeing there was abundance of oxide of iron in the soil, thought it might have caused canker, especially as the roots presented a similar appearance to those of the Rose, Cherry, and Plum outside. Acting on that conviction, several gardeners have obtained soil from the limestone quarries at Clitheroe, a distance of twenty miles; but in the case of one of those who renewed his border in the end of last year, and who replanted his old Vines between the young ones, I find the same symptoms on the leaves, and as far as could be seen on the roots. The Vines are of course more robust, and what is here considered a fair crop has been taken off. Our experience here is that

Vines in newly made borders do moderately well till four or five years old, the foregoing symptoms appearing early. Some Vines have been renewed twice in seven years, others are from nine to twenty years old, the crops from poor to moderate, all having the same symptoms.

A few weeks ago a statement appeared in a Manchester paper announcing the presence of phylloxera in a gentleman's garden at Accrington, six miles from here. Never having seen the pest I went over there for that purpose. In a large span-roofed house used as a vinery, with inside border, I could see something was wrong. I told the gardener the object of my visit, adding that I hoped I was not too late. "No," said he, "we have pulled out the Vines, but have lots of roots yet." He showed me some of them. "Why your roots look the same as ours in Rossendale," I said, "but it is the weevil we have." "Oh, yes," he replied, "we have the weevil too, but we've summat else you'll see presently." With a lens we examined a few roots, and I was rewarded with the first sight of the dreaded phylloxera—the small lemon-coloured insect was there in nests and of all ages. As I retraced my steps I felt convinced our Vines had the same complaint, and after submitting specimens to a gentleman, a naturalist in Rawtenstall, this was found to be certainly the case.

Now, there are six gardens in my immediate neighbourhood infested by the phylloxera, and there are as many more which I have reasonable grounds for believing have it also. What I wish to point out to your readers is the fact that the phylloxera has been in this valley for fifteen years at least, and that there appear to be but few places clear of it, yet if it had not been for this case at Accrington being published there is no saying when it would have been discovered. I am firmly convinced there are scores of people who have had it in their vineries for years, and who like us have been fighting the wrong "animal," and calumniating the poor weevil. To such I would say, If you find warts on the under surface of the large leaves, if the young leaves of the laterals are dotted with light spots partially eaten through, then raise a few roots, apply a strong glass, and look carefully along the surface while the root is damp. If you find the lemon colour with the oval form you have the phylloxera; and upon closer examination you will find lines running lengthwise and across, giving the insect the appearance of being tuberculated.

As I am not at present prepared to say what we shall do with the Vines, I must leave the "curing process" to others; but if your readers feel interested in this phylloxera-stricken district, I may at some future time let you know what measures have been adopted.—J. S., *Newchurch-in-Rossendale, Manchester.*

[We shall be very glad indeed to know what measures have been adopted in this phylloxera-infested district, and especially to learn of any means that have proved successful in banishing this great and much-dreaded enemy of the Vine. Since it seems probable, if not certain, that many Vines must be destroyed, the opportunity does not seem unfavourable for making a few experiments, in the hope that something perchance may be found that will destroy the insect without injuring the Vines; and even if these should be killed in the experiments no great loss will be involved, for if the insects cannot be extirpated the sooner the Vines and border are removed the better.

As we remarked a few weeks ago, a nobleman's gardener saturated a phylloxera-infested border with ammoniacal liquor from gas-works in almost the full expectation that it would kill the Vines. It did not kill them, but killed the phylloxera, and the Vines have since borne many fine crops of Grapes. This liquor, we may remark, should be diluted with from four to six times its volume with water. We are not aware that petroleum has yet been tried as a remedy against the phylloxera, and we think it worth trying. It may be fairly mixed in soapsuds in which a little soda is dissolved. An ounce of oil dissolved in a gallon of water

has been applied to Onions, Lettuces, and Kidney Beans without injury to the plants, but resulting in the death of all insects with which it came in contact. On page 332 of our issue of April 28th, 1881, Mr. Witherspoon enforces the value of hellebore as an insecticide, and suggests that it be tried on phylloxera-infested Vines, firmly believing it would prove effectual, as he observes that "in soil saturated with hellebore no insect can live, and yet plants are not injured." The method of using it is to dissolve 2 ozs. of the powder in a gallon of water, but first mixing a small portion in a little hot water to the consistency of cream, then adding the quantity of cold water required. This is worth trying, as also doubtless will be several other preparations that will suggest themselves to those specially interested in the matter.

There is little doubt that while many persons whose Vines do not flourish are needlessly alarmed by the supposed presence of the phylloxera, there are yet other Vines seriously attacked with this destructive pest, of the existence of which the owners are ignorant. Gardeners and amateurs should as far as possible make themselves acquainted with the appearance of the root and leaves when attacked, and this they may do by referring to the illustrations on page 167, vol. i., of this Journal, the issue of August 19th, 1880. The attacked specimens were taken from the vineries at Norris Green; and on page 413, vol. ii., the issue of May 19th, 1881, Mr. Bardney detailed the method he adopted in clearing the borders from this terrible scourge of the Vine. By an attentive perusal of the articles referred to we think few persons will fail to determine whether their Vines are attacked with the phylloxera or not. One thing is certain—namely, that it is too plentiful in this country, and quite recently Vine roots from three districts have been sent to us seriously attacked with this destructive insect.]

TOMATO CULTURE.

I HAVE of late observed many inquiries in the pages of the *Journal of Horticulture* on the subject of Tomato culture, and as I think my experience in the matter may be of some service to many who grow that most valuable fruit, I am tempted to place it at your disposal, and more especially because I have proved in years gone by that what applies to the Tomato applies exactly in the same way to the far more important Potato.

I this year planted a row of Tomatoes in the centre of a newly planted vinery 180 feet long. One half were planted in loam and horse droppings prepared for a Mushroom bed, the other half in the same pure maiden loam, with no nitrogenous manure of any kind. I used a manure rich in phosphates and potash. The former grew far more rapidly than the latter, but when both came to fruit the latter produced the most splendid crop of the finest fruit I ever saw—some 1 lb. in weight; one was 21 ozs. The former produced much inferior fruit both in size and quality, and all are attacked by the *Peronospora infestans*, while not one of those that received the phosphates and potash have been attacked. I send you samples of both, and I think you will agree with me that the case is proved against farmyard manure as a manure for Tomatoes.

I in the same manner and as conclusively proved last year that exactly the same results followed a similar experiment with Potatoes. No farmyard manure should ever be used for growing any of the *Solanaceæ*. I might add much more, but have said enough to lead others to make similar experiments, which I am certain, if fairly carried out, will confirm mine.—
W. THOMSON, *Clovenferls*.

[The large fruits are grand, large, smooth, and spotless; the small fruits are miserable and blotched with disease; the quality of the former, too, is far superior to the latter. The result of the two methods of culture is very striking, and the experience recorded valuable.]

GARDEN CHEMISTRY.

(Continued from page 68.)

THE SOURCES AND USE OF NITROGEN.

WHILE plants must have nitrogen in the soil or fail to thrive, it contains no store naturally, nor yet will it retain one long, though artificially supplied. True, all fertile soils contain it in the form of nitrates, ammonia, or in the remains of organic matter; but there can

be little doubt that this has all originally been derived from the atmosphere. Every lightning flash produces some hydric nitrate; and though in our country the amount thus produced is not great, in tropical countries, where thunderstorms are not only much more frequent but much more violent, considerable quantities are thus formed and washed into the earth by the descending rain. Ammonia, again, is largely present in the gases discharged from volcanoes; and though the annual amount thus thrown into the atmosphere is not great, the quantity after long centuries, and even thousands of years of accumulation in the soil, will form no inconsiderable supply; for, though under our methods of cultivation nitrogen is lost from our fields and gardens, vegetation under natural conditions prevents this loss.

The amount of nitrogen which the soil gains from the air under ordinary circumstances is by no means inconsiderable. At Rothamstead, according to the authorities there, the soil gains nearly 7 lbs. of combined nitrogen from the air, being washed thence by rain. This is chiefly in the form of ammonia, but about a ninth is in the form of nitric acid. In some districts more is thus gained by the soil, and in others less. In "Air and Rain," by Angus Smith, it is stated that in the rain water at Glasgow there are 9.1 parts of ammonia and 2.436 of nitric acid in 1,000,000 parts of water. In the rain water of Manchester the proportions are considerably less, and in London very much so. At Valencia, on the coast of Kerry, where the air is very pure, it is very small. The following table will serve to illustrate the varying amounts. Taking Valencia (county Kerry) as a standard and representing one part, the other figures will show how much nitrogen exists in the air in the vicinity of towns, and especially manufacturing ones:—

	Ammonia.	Nitric acid.
Valencia (Ireland)	1.00	1.00
Inland parts of England	5.94	2.02
Sea-coast places in Scotland	1.10	1.01
London	19.17	2.27
Manchester	35.94	2.79
Glasgow	50.55	6.72

On the Continent it has been estimated that the soil at Kuschen (Posen) benefits to the amount of nearly 2 lbs. per acre, but at Proskau (Silesia) the gain is calculated to be over 20 lbs.

Nitrogen exists to a greater or lesser extent in what we have named "garden manures," but it is only in manures that contain much pure droppings, and which have been carefully made and protected, that it exists to any extent worth mentioning. Even good leaf soil seldom contains a quarter per cent. of nitrogen, and an ordinary sample of farmyard manure gives something like a half per cent. When properly made and cared for, manure containing even more than the usual quantity of straw will often contain 1½ per cent., or even more, and is, of course, three times the value of that only containing half per cent. Stableyard manure from stables where horses are "hard fed," and where abundance of straw is used, when thrown together in a heap heats with extreme violence, and this causes "firing," or "fire-fanging" as it is called in different parts of the country. This excessive heat drives off the ammonia as fast as it forms into the air, and the residue is of very little value. That which gave it its value is gone; "its spirit has fled." When, on the other hand, the heap is made thoroughly moist, but not wet, with urine preferably, and occasionally turned to prevent it heating too much, the ammonia formed is absorbed by the mass, and in time becomes converted into nitric acid. Even when this is done it is frequently lost. During the fermentation organic acids (humic, ulmic, carbonic, &c.) are formed and combine with the ammonia. The resulting salts are very soluble and are easily washed away. Indeed, there are few even well-cared-for manure heaps from which a rich brown liquid may not be seen draining away. This liquid is largely impregnated with the valuable nitrogen in different forms. Heaps of manure spread thinly, especially in wet districts, frequently have all that is worth retaining washed out of them by rain. Careful building will reduce this waste to a minimum, but thatching, covering with soil placed ridge fashion, or, placing under cover, is better still. Manure so managed is at least worth double that which is first "fired" and then "washed."

Urine is especially rich in nitrogen. Of course the bulk of urine is water, but when pure a ton of it is worth from two to three times as much as an equal amount of ordinary manure, even though it is deficient in phosphoric anhydride. The nitrogen in urine is present in the form of urea, which is a substance as valuable as ammonia. It is soluble in water, cannot be precipitated by ordinary means, and can be utilised at once by plants instead of requiring to be converted into nitric acid, as ammonia has, although it also assumes that form. It is a very different substance from ammonia, but is readily converted into it by fermentation. Its composition will be easily understood from the following arrangements of their constituent elements. Ammonia has this formula— NH_3 ; urea $\text{CH}_4\text{N}_2\text{O}$. To those not

well up in chemistry this looks as if the difference were considerable ;

but rearranged this way the similarity is seen:— $\left. \begin{array}{c} \text{H} \\ \text{H} \end{array} \right\} \text{N}$ is one

molecule of ammonia, or $\left. \begin{array}{c} \text{HH} \\ \text{HH} \end{array} \right\} \text{N}$ is a double molecule. Each of these

atoms of hydrogen may be replaced by a variety of elements and so form many differing compounds. In the case of urica CO replaces

HH, and we have $\left. \begin{array}{c} \text{HH} \\ \text{CO} \end{array} \right\} \text{N} = \text{urea}$, which is thus seen to be as rich

in nitrogen as is ammonia. Of this highly nitrogenous manure horse urine contains 3.1 per cent., and that of the cow 1.8 when the animals are well fed ; but something depends on the feeding, exercise, and amount of liquid consumed. Urine is best employed for moistening manure heaps or for making manure water. For the latter purpose it is especially valuable, needing no preparation except dilution with water. Applied to wet soils six parts of water to one of urine will be sufficiently weak to be safe, but for pot plants, for application to dry soil, or for watering overhead, as must be done in the case of application to lawns or other grass plots, eight or nine parts of water is not too much. It is always best to err on the safe side with such a powerful manure. For starting plants that are fairly rooted, for feeding stunted crops in poor soil, for stimulating pot plants, helping overloaded trees to finish their crops, or for instantaneously renovating poverty-stricken lawns, such manure is invaluable.

Fowl, pigeon, rook, and such manures are very rich in nitrogen, containing from 1 to 4 per cent. of ammonia (nitrogen equal to) per cent. in the fresh state, and resembling guano when dried. Very much the same may be said of night soil. All these are also rich in phosphates.

Being very concentrated and apt to clog into adhesive lumps, dried loam or clay should always be used in the cots, coops, closets, &c., where these are deposited. This will keep the air sweet, for no better disinfectant or deodoriser exists. It will prevent the nitrogen escaping, and will produce an easily pulverised manure, which can be distributed thinly and evenly where its presence will tell very beneficially when applied to gross-feeding crops.

The superiority of bone dust over coprolites or other phosphates is that nitrogen equal to from $3\frac{1}{2}$ to $4\frac{1}{2}$ per cent. is present in fresh bones. When boiled the amount is generally from $2\frac{1}{2}$ to 3 per cent., but rather less in steamed bones. As steamed bones can be ground to a finer powder than fresh or even boiled bones, the effect is often equal or even superior to the more nitrogenous bone meal.

As a source of nitrogen gardeners have drawn on guano perhaps as much as anything. For making manure water it has been used very largely, and with reason, for it is rich in not only nitrogen but in every other plant food, notably phosphates. Not that a real liquid manure can contain phosphates to any appreciable extent, but few gardeners have hitherto distinguished sufficiently between waters containing matter in solution only, and that containing matter in suspension as well. Indeed, most desire water containing solids—something that can be seen. Because of this, guano which has not only much nitrogen easily dissolved, but also fine matter easily suspended, has been a favourite.

There are many kinds of guano, but the best known and the most reliable is that termed Peruvian. This is found in several small islands off the coast of Peru, and is the remains of vast deposits of the droppings of sea-fowls. In some places beds 100 feet thick are found, and in some years as much as 200,000 tons have been imported into the United Kingdom. Although the supplies are exhausted in some of the islands enormous quantities still remain. In ancient times the aboriginal Peruvians used this manure largely, and set so high a value on it that they punished with death those who were found disturbing the birds whose excrement it is.

It is only in hot and rainless (or nearly so) countries that deposits of highly nitrogenous guano are possible. These conditions exist in the latitude and longitude of Peru, and as the guano is only dried excrement from which ammonia has not been driven nor nitrates washed, it is rich in nitrogen. Average samples should contain about 12 per cent. of ammonia (nitrogen equal to) ; but as these guanos are less uniform in quality than what they were formerly, it is well not to purchase largely without a satisfactory guarantee, for few articles have been so much "doctored" as guano. Ordinary samples should contain not under 25 to 27 of calcic phosphate. Dissolved Peruvian guano has been largely used of late years. In ordinary guano part of the nitrogen exists combined in guanine. This is insoluble. But when guano is treated with sulphuric anhydride this is rendered soluble, as well as are the phosphates, while the ammonia is "fixed" by being converted into the sulphate. Dissolved guano (known also as ammonia-fixed guano) is wonderfully constant in composition. Sometimes, however, the ammonia present

is barely over 8 per cent., and sometimes it is as high as 12. This makes a great deal of difference in the values of the samples.

Ichaboc guano frequently contains 13 per cent. of ammonia, but only 11 of phosphates. On the other hand, Mejillones contains only 0.75 per cent. of ammonia, but 71.16 of calcic phosphates. It is a capital article for treating with vitriol in the making of super-phosphate, but may be used alone, being of easy distribution. Sometimes it is sold mixed with nitrate of soda.—SINGLE-HANDED.

(To be continued.)

DISHONEST SHOWING.

WHAT a pity it is that the pleasure of flower shows should be marred by such disgraceful incidents as that recorded in your last week's impression as having occurred at the Sheffield Rose Show. An exhibitor who has toiled late and early for weeks to bring his exhibits up to the requisite standard of perfection is often sorely disappointed when fairly defeated ; but it must be galling indeed to suspect that they have been imposed upon, and still be powerless to prove it, as is the case many a time. Managers of shows should use every means in their power to prevent honest exhibitors from being driven out of the field by men whose pleasure in gaining prizes may be compared to those experienced by a clever burglar upon getting clear off with his booty. I think a little more publicity would have a healthy effect. If the names of both the exhibitors implicated in the Sheffield affair had been published, would it not have been more effectual in preventing others from trying the same? One of the best means of stamping out dishonest exhibitors would be for all societies to take action together, and establish a "black list," by publishing the names of those who have been found guilty of dishonesty in either showing what they have not grown or supplying others with plants or flowers for that purpose. With such a published list of offenders, and combined action on the part of managers of shows in so framing their rules as to be able to prevent those exhibiting who have been disqualified at home or elsewhere, I think some little check would be given to this degrading practice.

For several years I have taken much interest in local shows in the neighbourhood in which I have resided, and during those years so many little things came to my knowledge in the way of begging, borrowing—not to say stealing—that I had to considerably alter my opinion as to the amount of good done by the promotion of flower shows in the mining districts of the north of England. I could give not a few instances of how societies have been imposed upon, and honest men deprived of prizes which they were worthy of receiving and honestly entitled to. I will only refer to one. Some years ago I was one of the committee of a good local show. We had a "thorn in the side" in the shape of a local amateur, who often carried off first honours with plants which we suspected he did not honestly grow. The bone of contention was a prize for six stove and greenhouse plants in bloom. It was resolved to put him under the supervision of a visiting committee, for which the rules of the Society provided. After this we found he could not do quite as well, and sometimes failed to make up a six at all. This occurred on the occasion I am about to refer. About ten days after the date of our local show a friend and I were starting on a journey to Carlisle to see the International held there in 1877—memorable for the unpropitious state of the weather ; and on drawing up at a certain station our attention was attracted by a well-bloomed plant of *Clerodendron Thomsonii* on the platform, which was promptly placed in the van by a gardener living close by, well known to us both. Ere the train reached its destination we had occasion to change, and we had the curiosity to peep into the van, and found this plant addressed to our friend the amateur at the next station. From this we concluded it was intended for a local show which was to come off next day some forty miles distant. The day after our return from Carlisle the daily paper was eagerly scanned, when we found that our enterprising amateur had shown "sixteen plants in bloom" in three classes and obtained a prize in each class ! We were also a little surprised to find that the gardener—a gentleman's gardener, to his shame be it said—who placed the plant referred to in the van acted as one of the judges on this occasion.

These are bare facts which need not be enlarged upon. I would fain hope that such cases are rare, and that the great majority who take their productions to the exhibition table do so honestly. There are few pursuits from which a greater amount of pleasure can be had than in cultivating plants, flowers, and fruits with the ultimate object of comparing them at a flower show with the produce of our neighbours, and I think it is not right that a few "black sheep" should be allowed to spoil that pleasure.—A WORKING GARDENER.

FRUIT AND CHOLERA.—I am sorry to find that in connection with the alarm of an approach of cholera (for which there seems little foundation) a variety of very ridiculous assertions are now getting current amongst the public, which may prove prejudicial to the interests of market gardeners. People are being cautioned against eating vegetables and fruit generally, and some kinds are specially denounced with no show of reason. We all know that stale vegetables, and unripe or over-ripe fruit, are bad at any time ; but there is really no evidence that a renunciation of these "fruits of the earth" wards off any epidemic ; in fact, a moderate use of them in the form of the customary mixed diet, is rather beneficial than other

wise, and it cannot be wise in endeavouring to get up a "cholera scare."
—J. R. S. C.

DISBUDDING CHRYSANTHEMUMS.

CHRYSANTHEMUM-GROWERS—those at least who have been accustomed to win prizes for the grand flowers they have produced and are hoping to win more—will now begin to watch their plants intently with the object of "taking" the buds. Other growers who have not yet been successful at exhibitions, but who are strenuously endeavouring to produce blooms of the first exhibition quality, are similarly watching for signs of the coming flowers, but not with that equanimity peculiar to the veterans, who know what to do under certain circumstances, while the young growers have to feel their way, and are often greatly in doubt as to how to proceed in the work in question. Not a few persons who are giving special attention to Chrysanthemum culture for the first time this year not only do not know which buds to take and when to take them, but the very terms employed by the cognoscenti are more or less enigmatical. In the interests of those, then, who are seeking knowledge, it will be well at the outset to explain the terms that are employed in this question, and especially to endeavour to show what a "crown" bud is and why it is so called,

crown bud also. If breaks, mostly three, push from around it, it certainly comes under that designation. If breaks issue from the base of a bud that bud is a crown bud, because it crowns the shoot surrounded by other breaks for continuing the growth of the plant.

A "terminal" bud is so termed because the growth of the plant terminates in it—that is to say, no other breaks or growths issue from it, but other flower buds cluster round it. Terminal buds are therefore always later than the crown buds, and the blooms produced by the former are rarely so large as those perfected by the latter—the crowns.

Let us now look at the illustrations. Fig. 17 represents the shoot of a Chrysanthemum with the crown bud not "taken"—i.e., not fixed, hence it is abortive, the three breaks having appropriated the strength of the plant, the crown bud, which might have made a good flower, being of no use.

Fig. 18 represents a terminal shoot—that is, the end of what one of the three "breaks" above mentioned produce usually, if not invariably. The bud at the extremity is larger than the others, and if these smaller buds are removed the end one, the true terminal, often forms a good, solid, and compact bloom suitable for the front row of a stand.

Fig. 19 represents a crown bud "taken"—that is to say, the three breaks in fig. 17 were timely removed and the strength of the plant

Fig. 17.—Natural Growth of Chrysanthemum with Breaks, and Crown Bud not set.

Fig. 18.—Terminal Growth of Chrysanthemum not Disbudded.

and what a "terminal" bud is and the reason for its designation. Even to some experienced growers information on this matter will not be unacceptable, for it is undoubtedly a fact that in one district, if not more than one, what are really crown buds are regarded as terminals, and *vice versa*.

The technical terms to be made clear on the subject under notice are "taking" the buds, "crown" buds, "terminal" buds, and "breaks."

The term "taking" has here a meaning the direct opposite of that often conveyed by the word. Instead of taking a bud off the plant, it means leaving it on. The bud which is intended to develop into a flower is taken possession of, secured, fixed. In this sense the term is not a misnomer. If the bud were left unaided to take its chance it will either dwindle away or form an imperfect flower; whereas by being taken in hand by the cultivator, all other buds and growths being removed from the stem, it develops under favourable circumstances into a magnificent flower.

A "crown" bud means the first bud that forms in the end of the growth of a Chrysanthemum, but does not terminate that growth. The bud forms in the crown of the shoot, but if left alone, not "taken," the plant will still extend by producing "breaks"—young shoots breaking away just below the bud for continuing the growth. When the crown bud forms early and is not taken the second bud may be a

concentrated in the bud, which has increased as shown, instead of being deprived of support by the surrounding breaks and left, as it appears in the centre of the growths, worthless; or in other words, if the crown bud had not been taken it would appear as in fig. 17; but, being taken, it is in the condition shown in fig. 19, and on the way for making a grand bloom.

Having made the question of buds clearer than it was before, the time and method of taking them may be described. It may be stated as a rule that blooms from crown buds are larger than those produced by terminals. Nearly all the grandest blooms exhibited are from crown buds, but unfortunately the crown buds of some varieties appear too early and terminal buds have to be taken. The system of cutting down the plants as lately described has the effect of retarding the appearance of the crown buds of the earlier varieties and bringing them at the right time for taking, say about the second week in August. If such varieties as Mrs. Rundle, Mrs. Dixon, George Glenny, Prince Alfred, Mr. Bunn, Prince of Wales, White Globe, the Beverleys, Lord Derby, St. Patrick, Beethoven, Lord Wolseley—indeed all that flower naturally early, form their crown at the end of July or the first week in August, and these buds are taken, the flowers are almost certain to be too early; and it is a good plan to push on the plants to the terminal buds and take them—that is, remove the others from them, towards the end of the month.

Except the earliest varieties it will be, in ordinary seasons, safe to take the buds of Chrysanthemums towards the end of the first week in August, and if they are crown buds so much the better. From the 7th to the end of August, then, the work should be completed, taking the late sorts first, leaving the earlies, especially the Mrs. Rundlc type, until the last.

The method of taking the buds is deserving of attention. It is a question if injury has not been done to many flowers by the operator searching into the points of the shoots, crushing the leaves, and injuring the flower stem by removing the incipient growths from the crown buds and the superfluous buds round the terminals too soon. The slightest injury to the stem of the bud taken, or the bud itself, results in a malformed flower.

In taking crown buds great care and judgment are required. The shoots formed around the bud, which, as before said, are usually three in number, should not be removed until an inch in length, then removing two only at the first, leaving the other shoot for a week, or sometimes a fortnight, according to the strength of the bud, the object

Fig. 19.—Crown Bud of Chrysanthemum "set."

being not to remove this shoot until the bud is as large as a small Pea. By this time it will be easy to discern whether the bud is well formed or not; and if not, the bud should be removed, allowing the shoot that was left of the three to extend and produce a terminal bud. This is a safe plan for beginners, and old practitioners need no instructions. When terminal buds are taken a steady hand is required in removing the small buds that are formed round the central one that is intended to produce a flower. A very small sharp-pointed penknife should be used, but not too soon, or the stem invariably becomes crippled, causing the bud to curl, and consequently the flower does not come to maturity. A good time for taking buds is early in the morning before the dew has dried from the plants. When removing them the stem of the plant should not be touched with the knife, but leave, if possible, a portion of the stem of the flower attaching to it. It is quite as well to leave some of the back shoots until the buds attain a good size, which will be about three weeks after they are taken. Then all should be removed to throw all possible strength into the bud for producing the flower.

The subject is by no means exhausted, and any information on special points and varieties communicated by old growers cannot fail

to be acceptable to those young cultivators who are endeavouring to become proficient in the production of this grand autumn flower.

THE COLOURING OF GRAPES.

EARLY Grapes are ripe and eaten, midseason fruit is now in, but the autumn and winter supplies are yet to ripen and colour; and as all who aim at the highest excellence are anxious to put on the thickest bloom on the finished fruit the experience of some of your more successful contributors on two opposite practices may be of service. I am told that one grower, the intense colour of whose black Grapes is the admiration of all who see them, puts himself to much trouble to keep the air of his vineries moist while the Grapes are finishing, and that shading is resorted to in sunny weather. Now in most calendars and in the best books a dry atmosphere is recommended. The grower in question does not live in either an arid or sunny locality, but in one inclining to the opposite, and it is not a question of mitigating extreme dryness or excessive sunshine.

But it is only the black Grapes that are thus brought to perfection. White Grapes are never of the golden tint we wish to see. Not far off in the same locality is another grower, by no means even a fair one, whose black Grapes are never more than rusty, but (and this point is worth noticing) his inferior Muscats—inferior, that is, as a crop and in bunch and berry—are generally beautifully golden. He practises extreme dryness. Now we have personally always had the finest-coloured blacks in wet almost sunless seasons, but the worst whites. When dryness and bright sunshine prevailed the whites were better and the blacks worse. Sunshine and dryness spoil black Grapes, shade and moistness white.

If this be so, then the dry air and borders aimed at in finishing black Grapes is a mistake, and the sooner this is understood the better. Personally we have found it so. Even in a damp dull climate the attempt to secure dry air we have found not good for black Grapes, and we suppose it must be worse in dry climates. But what do the majority say? Messrs. Thomson, Johnstone, McIndoe, Dickson, Taylor, and others too numerous to mention could doubtless throw some light on the matter.—DUNEDIN.

THE HERBACEOUS BORDER.

ON page 5 of this volume your able correspondent, Mr. Abbey, enumerates a list of some flowering plants suitable for the herbaceous border. I think it has been generally acknowledged in your columns that this part of the garden has been much neglected during the last twelve or fifteen years, the geometric and showy style of bedding having replaced it, but there are not wanting many signs that herbaceous plants will be sought after quite as much as in years gone by. It is quite certain that Pelargoniums and carpet beds, good though they are, will not supply cut flowers for decoration and bouquets, and many of our nurserymen, notably Mr. Ware of the Hale Farm Nurseries, Tottenham, deserve great praise in their endeavour to keep and collect these old occupants of the garden. To Mr. Abbey's list I would like to name a few others that no gardener, if he has them, need regret having planted.

Chelone barbata.—This grows 3 or 4 feet in height, having numerous Pentstemon-like spikes of bloom of a reddish-orange colour, very suitable for cutting, and is easily raised from seed or division in the spring.

Acanthus candelabrum.—A very handsome plant with dark green shining foliage, the spikes of pink flowers rising well above the foliage. Even if the plant were flowerless it would be worth a place in any garden on account of its handsome foliage.

Oenothera macrocarpa, *O. fruticosa*.—These two North American plants are well worth a place in the herbaceous border on account of their continuous flowering. Although both have yellow flowers they are very distinct. The first-named has a dwarf procumbent habit, and should be planted near the edge or in the front row. The flowers of it are large and of a beautiful primrose colour. It is often called the Evening Primrose. *O. fruticosa* grows 2 feet high or more, and the flowers are produced more abundantly. Both these kinds are very suitable for the rock garden.

Veratrum nigrum, often called Black Hellebore, but quite distinct from the Hellebore family. It is a very conspicuous and unique plant, the spike of nearly black flowers rising 3 to 6 feet high. A good soil and open position suits it best, and good isolated clumps of it on the grass look very well.

Aconitum versicolor.—Very much the habit and style of *A. napellus*, but the flowers are showy and pretty, of a blue and white colour, the white predominating. A good middle or back-row plant.

Coreopsis lanceolata.—A good hardy perennial, growing 2 feet high or more; large yellow Daisy-looking flowers, very acceptable for cutting on account of their long stalks. Should be

in every collection. *C. Drummondii* and *C. tinctoria* are annuals, but from their free and continuous flowering should also find a place where cut flowers are wanted.

Linum flavum, *L. perenne*, *L. perenne album*, *L. grandiflorum rubrum*.—The last named is annual, but one of the very best. Its rich red colour, and produced in such quantity, makes it very showy. Plants should be raised from seed in April and well thinned out. *L. perenne*, blue, and *L. perenne album*, white, are also very graceful and showy. *L. flavum* has yellow flowers, and, like the preceding kinds, produce them in great abundance. In the four named *Linums* we have four distinct colours—yellow, white, red, and blue, a circumstance not met with in every genus of plants. I have them all four in bloom at the present time in clumps on a rockery, and their well-formed flowers, though single, are objects of attraction and admiration. A soil of a lightish tendency suits *Linums* best.

Centranthus ruber.—This plant should find a place in every border where herbaceous plants are grown. Its red flowers, lasting as they do for several weeks, make it very desirable to cut from. It grows from 1 to 2 feet in height, is readily increased by cuttings or seeds, and will grow well on rockeries or old ruins, I have lately seen a quantity of it a foot in height growing on the top and out of the sides of an old wall. A British plant.

Delphinium formosum.—One of the grandest of plants for the border. It will produce flowers for three months in the year—July, August, and September. For the latter date young seedling plants should be used; or another way I have had them is to cut down an old plant in May when the young stalks are about a foot in height; the following shoots will produce late flowers. It will grow 5 and 6 feet in height if the soil is deep and rich, and as a border plant with blue flowers it has few equals. There are numerous varieties of *Delphiniums* with different shades of blue flowers. One of the best is *D. Hendersonii*, with large flowers of a pale Cambridge blue colour.

Lychnis chalcidonica, *L. Flos-Jovis*, *L. dioica rubra plena*.—These three are easily cultivated. The first-named is a very old occupant of gardens, and was introduced from Japan in the sixteenth century. It likes a rich soil, and the plants come much finer if the stools are divided every third year. It is very hardy, and its bright scarlet flowers are very attractive in July. *L. Flos-Jovis* is a little more tender. The hard winter of 1880 damaged my stock of it very much, but as it seeds freely it is a good plan to save a little every year in case the plants get killed. The stems and foliage have a downy or silvery appearance, and when in bloom, with its pink flowers about a foot in height, it is one of the most attractive plants that can be seen. A native of Italy. *L. dioica rubra plena* is the double form of our British species, and well worth a place in gardens.

Papaver cambricum (syn. *Meconopsis cambrica*).—This is the Welsh Poppy, and its bright canary-yellow flowers, produced in such profusion, about 9 inches in height, render it one of the best of border plants. It is easily increased by seeds or division.

Polemonium caeruleum.—A British plant which is not grown so much as it deserves to be. The foliage and flowers are neat, the stalks rise well above the foliage to about 18 inches high, and its blue flowers are produced in profusion. There is a variegated form of this plant, very pretty for employing with carpet-bedding plants. A few years ago I remember seeing it used in one of the London parks, and with very good effect. A rather dry and well-drained situation is best for it.—A. HARDING.

CELERY AND ITS CULTURE.

THERE is, perhaps, no vegetable to which a larger breadth of ground is devoted than Celery. A good crop of Potatoes may be more profitable to the poor man, and during the summer months Peas occupy more space in the gardens of the opulent; but as the autumn advances Celery begins to show itself, and we are all alike friendly to its successful cultivation; and as the time has now arrived when it ought to be planted in good quantity for winter use, a few general remarks on that subject may not be out of place, especially as the late dry weather renders it necessary for all who suffer from the want of moisture to take due care and be prepared to plant out their crops when rain does set in; and Celery especially likes the ground prepared for it some time before planting.

I may here observe that the old-fashioned mode of planting or growing Celery, by digging a deep trench and adding raw dung, to be dug up with the subsoil to be planted upon imme-

diately, was certainly bad in principle as well as in practice, more especially in such soils as had not previously been trenched pretty deep, and that recently; for it must be borne in mind that all soils require a certain amount of exposure to the open air before they are in a condition fit to receive the various crops they are to be sown or planted with, otherwise for a time the progress they make in growth is very slow. Hence the impropriety of planting Celery in a medium so much at variance with its well-being. In fact, the digging of deep trenches for Celery ought to be abandoned in all cases where there is not a deep and good soil to work upon; neither ought manure in a raw state to be used for this crop, for its action is expected to be immediate; consequently the mixture in which its roots are to ramify ought to be at once good and suitable for them; and where necessity or the taste of the cultivator insists on Celery being planted at the bottom of a deep ditch, let that ditch be made at least 10 inches or a foot deeper than is wanted, and that space filled up with the good surface soil mixed with fine well-decomposed dung, and on this plant your Celery in single rows about 8 inches apart, or still wider if very large heads are wanted; but if moderate-sized heads will do, and a greater number be requisite, then plant a little closer. The result will be in most cases more satisfactory; for although very large Celery is certainly noble-looking, there is a rule in many private families of reducing it to a certain size, by which means very large Celery is no better than medium-sized.

The time of planting Celery varies much with the latitude of the place, local advantages or disadvantages, as well as the season, more especially that part of it in prospect, of which we have but little foreknowledge. However, generally, July may be set down as a good month for planting the main crop, and the earlier the better for late places, and *vice versa*; only as some favoured situations have the disadvantage of suffering from drought in September, and consequently a cessation of growth takes place, there is, perhaps, as much certainty in obtaining good Celery in a cold and late situation as in a dry and early one, as it is a known fact that Lancashire and other moist counties produce the best Celery, not even excepting the vale of the Thames, both above and below London, where very excellent Celery is certainly obtained; but it is as much the result of the liberal use of manure as anything inherent in the soil or situation. One thing is certain—that the mode of managing it about London cannot well be improved upon; and as the natural habitat of the plant is in wet ditches and similar marshy places, it follows that the plant cannot well be expected to thrive and do well in a dry medium; therefore, where circumstances render it necessary to plant it in such places, let it be liberally watered at the fitting time, and this watering must be repeated at all times when wanted; not regular daily dribbling, but a sound good watering once or twice a week, and the hardened surface of the soil disturbed next day, if it had not previously been covered over with short dung or other substance that would not cake and harden at top; and as we often have very dry weather in August and September, it would be better at the setting-in of such dry periods to cover the ground by the side of each plant over with leaf mould, short dung, or a something that will allow the water to pass freely through, and at the same time arresting its evaporation, or the hardening of the ground underneath. Liquid manure may be occasionally given.

Amongst the many names we have there are, in reality, very few distinct varieties of Celery, good solid Red and White being perhaps the best and most suitable name that can be given; but there is certainly a little distinctive variety in the kinds originating in the old White Silver Celery, with its broad leaves and stalks, remarkable for their solidity, but short, and not many of them; but other kinds have their merits as well, and the amateur had better not depend on one kind alone, unless it be proved to be a good one. This, however, has been adverted to before; and it is only necessary here to say, that in planting out Celery for good, it is prudent to have all the plants in one row as nearly alike in size, &c., as possible, as there is a danger of choking up a small one where large ones have to be earthed up at each side of it. Another plantation may be made of smaller plants.

Where the ground consists of a very shallow soil, and a large quantity of Celery is wanted, and size not a particular object, it might be prudent to plant one or more broad beds, say 6 feet wide, and as long as desirable. In this the plants are to be placed in rows across, each plant occupying about a foot square, which might be done by allowing about 16 inches between the rows and 9 inches from plant to plant. This description of plantation might be on the ground surface, and earth or other material might be brought to blanch them, if sufficient cannot be had around them. The advantage of this plan is, that a

greater number of plants can be grown on the same spot of ground than by any other; and though it would be wrong to say they are individually as large as those planted in single rows, yet they are often of a nice useful size for ordinary purposes.

While on this head, I may observe, that where Celery trenches are prepared in the early part of summer, the tops of the ridges might be planted with a summer crop of some kind or other—Lettuces, Cauliflowers, or early Potatoes are all suitable—taking care, however, that they must not remain to the detriment of the Celery crop.—J. R.

“J. W. B.” writes, in reference to CLOVES IN COVENT GARDEN, that “the variety Gloire de Nancy is one of the best.” It may not be the variety the name of which was sought by a correspondent last week; but it is nevertheless worthy of culture, as the flowers are very fine, white, and deliciously perfumed.

— RELATIVE to MR. BUNYARD’S ROSES exhibited at South Kensington last week, we are informed that the Floral Committee awarded a silver Banksian medal for them, which is sufficient testimony of the excellence of the blooms. This award was not made when our reporter left the Exhibition.

— THE blooms of MABEL MORRIS CARNATION shown by Mr. H. G. Smyth, 21, Goldsmith’s Street, Drury Lane, W.C., at the last meeting of the Royal Horticultural Society, were highly commended by the Committee. They were remarkably even, fresh, and bright, fully maintaining the high character this variety has already obtained amongst cultivators.

— WE learn from the AUSTRALIAN MUSEUM REPORT for 1882, just received, that the burning of the Garden Palace caused the almost entire destruction of the Museum, which was intended to hold a similar position in the colony to the South Kensington Museum and its branches at London. The total loss is estimated at nearly £11,000. Space was obtained at the Agricultural Hall for such specimens as could be preserved, and that is being filled up for the purpose.

— A SUNDAY FLOWER SHOW may be considered as a somewhat surprising innovation in England, but that held on the 30th ult. at St. Jude’s, Whitechapel, had so much to recommend it that it might be advantageously imitated in other similar districts. The Vicar, Mr. Burnett, fully recognising the humanising and innocent pleasure that can be derived by the most humble and illiterate from contemplating bright and beautiful flowers, organised a Show to be held in the playground near the above-named church, and his efforts being well responded to by numerous friends, a pretty and effective display of fine-foliage plants and flowers was produced. The inhabitants of the district visited the Show in large numbers, all appearing to thoroughly enjoy the treat so liberally provided for them. Amongst those who contributed, the principal exhibitor was Mr. Holmes of the Frampton Park Nursery, who had some attractive groups of plants and cut flowers. No prizes were awarded.

— MR. J. GIBSON, The Gardens, Brentrey House, Westbury-on-Trym, Bristol, writes:—“I send for your inspection TWO SEEDLING DIPLADENIAS. The small flowers are from a plant which flowered last season when about 9 inches high; this season it has thrown out four shoots about 15 inches, and flowering on three of them. The plant is quite of a shrubby habit, the other is of the same habit as Amabilis, but a stronger grower.” Both are extremely beautiful varieties, and well worth preserving, as they are undoubtedly distinct. The larger flowers are very handsome, of a pale soft delicate pink shading to nearly white in the centre of the lobes, but darker in the throat. The colour of the other is bright rich rose, with quite a tinge of scarlet, the colour very evenly distributed, and the flower neat in form.

— AN amateur writes:—“As a warning to others respecting the danger of FUMIGATING VINES I may briefly describe a serious disaster I have recently experienced. A vinery containing Gros Colman and

other varieties had been occupied with miscellaneous plants until quite recently, and when these were removed it was found that aphides, red spider, and similar pests were far too abundant. We at once decided to fumigate strongly, employing a cheap and coarse tobacco paper for the purpose. Very shortly afterwards the foliage of the Gros Colman Vines was observed becoming brown, dry, and eurred, and now, after the lapse of a week, the whole of the Vines of this variety present a most discouraging aspect, and the crop, which is a good one, cannot be expected to finish satisfactorily. I suppose the fact of the variety suffering so much is due to the well-known tenderness of the foliage.”

— MR. H. W. WARD, The Gardens, Longford Castle, sends us samples of the LONGFORD CUSTARD MARROW, and observes—“It is very much appreciated here by everybody who has partaken of it, and who (gardeners among them) pronounce it as distinct from any other Marrow they had hitherto tasted. I shall therefore be glad to have your opinion of it.” The variety is an excellent one, of good flavour, and well merits notice. The fruits are not so flat as most Custard Marrows, being ellipsoid in form, of moderate size, and clear shining yellow in colour.

— IN “Notes on the Trees and Shrubs of North Europe and Asia,” by Mr. Charles Gibb of Abbotsford, Quebec, is the following respecting ELEAGNUS, THE WILD OLIVE:—

“This is a race of bright silvery-leaved trees and shrubs of great ornamental value. In the grounds of the Pomological School at Proskau we find a shrub 3 feet high, with grey silvery leaves 3 inches long and an inch or more wide. We saw it again in the Botanic Garden at Moscow apparently hardy. It was not named. This is very ornamental, and should not be lost sight of. *E. angustifolia*.—In moderate climates this grows to a large size. At Warsaw we find a tree 2 feet in diameter of trunk and 30 feet high, old, and on its decline. In the cold climate of Orel we saw a tree 35 feet in height, but I do not remember it farther north. It has long narrow leaves, white on under side, bright and pretty. Of its blossom and fruit I cannot speak. *E. longipes* of Japan we saw at Kew, a shrub 6 feet high, bearing large quantities of spotted red berries like oblong Cranberries. At Verrieres, in the garden of M. Henry de Vilmorin, we again see this plant bearing heavily; fruit red, a nice acid, fully equal to Cranberries, and as free from seed. It seems a very abundant bearer, and well worthy of culture as a fruit-bearing plant—a plant likely to yield quite as much of a fruit as good and as saleable as Cranberry. In many nurseries this is known as *E. edulis*.”

— AT the last meeting of the Royal Horticultural Society at Kensington Mr. T. S. Ware of Tottenham, exhibited specimens of this ELEAGNUS EDULIS and a preserve prepared from the fruits. This was tested by the Fruit Committee, and considered by the majority as of good flavour. It contains a slight acid, and previous to being fully ripe there is a rather unpleasant astringency that is, however, removed when more advanced.

— THE annual Exhibition of the Sandringham Cottage Garden Society was held on Thursday afternoon in the Park, and was attended by large numbers of excursionists from all parts of the country, special trains having been run for the purpose. Prince Albert Victor of Wales, accompanied by the Rev. J. F. Hervey, chaplain to the Queen and the Prince of Wales, and Mr. E. Beck, visited the Show and appeared much interested in the various displays. Besides the cottagers’ exhibits there was a tent containing some fine flowers and plants from the Royal estate. The whole of the gardens and grounds were open to the visitors.

— GARDENING APPOINTMENTS.—W. W. Brown, late foreman in the New Gardens, Whitby, has been appointed head gardener to Frederick Priestman, Esq., Elleron Lodge, Pickering. Mr. Thomas Gardiner, late of Owston Park, Doncaster, desires us to say that he is now head gardener to Sir Abraham Woodiwiss, The Pastures, Derby.

— ON Saturday afternoon Mr. Edwards, the Sanitary Officer of the Vestry of St. George, waited upon the Magistrate sitting at Southwark Police Court, with a request that he should condemn twenty boxes of AUSTRALIAN APPLES which had been found to be rotten throughout and quite unfit for food. He stated that about an hour previously he was passing through Butchers’ Row, St. George’s Market, when his attention was called to twenty boxes of Apples from which a fearful stench was issuing, and on opening the boxes he found all the fruit completely rotten. Mr. Bridge proceeded to the yard, and on his return to the bench expressed his surprise that anyone could be found to buy such fruit. The stench from them was enough to disseminate disease. A poor hard-working man came forward and stated he purchased the twenty boxes of Apples from a wholesale firm near Billingsgate. Some small Apples were shown him, and he was given to understand that the contents of the boxes were of the same character. He had no idea that

they were in such a state. Mr. Bridge condemned the Apples and ordered them to be instantly destroyed, advising the purchaser to sue the salesman for his money.

— MR. JOHN FORBES, Buccleuch Nurseries, Hawick, N.B., sends us several dozen handsome PANSY BLOOMS, chiefly varieties of the Fancy type, but including some of the ordinary Show section. All are good, but we can only name a few of the most distinct. First, however, the superb new Viola Bronze Queen deserves notice, as it is a variety of great promise, the flowers large, rich bronzy-purple in colour—a most distinct shade, with a gold eye; the flowers are borne on stout footstalks well above the foliage, and the habit is dwarf and compact. Some of the best of the Pansies were Prince of Orange, rich golden orange ground, three lower petals dark maroon edged with orange; Mrs. Barrie, clear bright yellow ground, lower petals exceedingly dark crimson-purple; Miss Berry, white or pale sulphur ground, lower petals rich violet; Rev. Robert Young, white ground, lower petals violet margined with white, upper purple; Jubilee, very distinct, violet edged with purple, large; and Conquest, bright violet, shading to light purple, edged with white.

— IN the rare and singular species, MASDEVALLIA ROEZLII, just now in flower in the Glasnevin collection, we have in the size of its flowers, quaintness of form, strange colour and texture, a rival to the aptly named *M. chimæra*, than which there are few productions more singular among the grotesques of plant life as set forth in so many species of this most interesting genus. The triangular divisions of the flowers of *M. Roezlii*, including their curious tail-like extensions, measure a span of fully 6 inches, the colour and membranous aspect being like that of a bat's wing, while the little exquisitely moulded shell-like lip is rosy-tinted. This is a recent introduction, and as yet rare even in the choicest collections.—(*Irish Farmer's Gazette*.)

— MR. T. S. WARE, Tottenham, sends us a choice selection of BORDER CARNATIONS, remarkable for the rich, delicate, and pure colours which distinguish the blooms; the floriferousness of some of the varieties is also very noticeable. Illuminator is one of the richest and brightest scarlet selfs in cultivation, free, and of good habit; Sambo is a dark crimson scarlet self, exceedingly profuse; Corsair, a lovely soft rose self; Mrs. Reeve, a pink and purple bizarre of good substance; John Allum, a very distinct and finely formed flower streaked with dark crimson on a lighter ground; Zuleika, dark scarlet with a few darker streaks, flower well formed; Cinderella, a very delicate and pretty variety, pale pink or blush dotted with crimson, bloom full; Perdita, grand colour, white margined with dark crimson in streaks and dots; Redbraes, a charming variety, a heavy purple-edged Picotee, colour bright, and flower good in substance and form. Three beautiful white varieties were also represented—namely, W. P. Milner, one of the best, pure, neat in form, and free; Gloire de Nancy, very large, full, pure and fragrant like the Clove; and White Clove, clear white, fragrant and profuse. All are admirable for borders, and furnish a most bountiful supply of blooms.

— MISS ORMEROD'S REPORT UPON THE INJURIOUS INSECTS that were particularly noticeable during the year 1882 has much of its space devoted to the wireworms (*Glater lineatus* and *obscurus*), which did considerable harm to cereals, also to Swedes, Turnips, Potatoes, and in a few instances to Hops. It is shown by various observations how important it is, after any crop has been infested, to adopt methods of cleansing and manuring the land which are likely to starve out the species, and prevent any further deposition of eggs. The Pea weevil, *Sitona lineata*, destroyed some very promising crops of Peas; and the Apple blossom weevil, *Anthonomus pomorum*, was more mischievous than usual in some districts of Kent and Middlesex. From several districts there were also reports of harm done to Apples by the caterpillars of the winter moth, *Cheimatobia brumata*; but the most damaging insect of the season seems to have been the aphid of the Hop. The report contains many interesting facts concerning other insects of our gardens.

— MR. LEO H. GRINDON gave a lecture at the Manchester Botanical Gardens last week upon POISONOUS PLANTS. Of the 100,000 known flowering plants it was stated that ten thousand might be considered deleterious, all being more or less energetic in their action, and of these probably fifty were deadly. The famous Upas Tree of Java does not affect the atmosphere as is commonly supposed, but its juice is the part which does the harm. Large tracts of land in Java are barren owing to

certain poisonous vapours rising out of the earth, and the early Dutch settlers attributed the barrenness to the influence of the Upas Tree, which was of course a mistake. The Manchineel, a plant of the West Indies, gives off a vapour which is poisonous, and in consequence is never cultivated in this country. The Dumb Cane, also of the West Indies, is very energetic in action, and will produce lockjaw on being applied to the lips. Some of the other poisonous plants described by the lecturer were Aconite, Atropa Belladonna, Veratrum viride, Ricinus communis, and Manihot utilitissima. It was incidentally mentioned by the lecturer that it was the intention of Mr. Findlay to have in the gardens a house specially set apart for poisonous and other economic plants. This would certainly be an advantage to students of botany, and a still greater advantage would be to have a museum like the one at Kew for the reception of the products of plants from various parts of the world.

— THE last issue of *L'Illustration Horticole* contains an excellent coloured plate of *DIPLADENIA PROFUSA*, a most charming variety, which it will be remembered was introduced to this country by Mr. B. S. Williams a few years since. It is regarded by some botanists as a variety of *Dipladenia splendens* or *Echites splendens* of Hooker, but is unquestionably one of the brightest-coloured and most freely flowering forms we have. In the same periodical are coloured plates of *Vriesia heliconioides*, a striking Bromeliad, with large bracts, rosy-crimson at the base and yellowish green at the upper part; and *Panax fruticosum* var. *Deleauana*, which has digitately divided leaves, and is compact and sturdy in growth.

ORNAMENTAL TREES AND SHRUBS.

Magnolia tripetala.—This is a low-growing tree, ours being about 15 feet high and evidently aged, flowering freely from the points of the current year's growth; the flowers being white, large, and deliciously scented. It is deciduous, the leaves very much resembling those of *M. grandiflora*, and is very striking from its bold foliage and conspicuous flowers, which are produced during July, when few other trees blossom. As a lawn tree of moderate proportions it is worth note.

Populus canadensis aurea Van Geerti, The Golden Canadian Poplar, has very beautiful golden foliage effective at a distance, and is amply clothed, growing quickly, soon forming a handsome specimen. It does well in moist soil, like all Poplars, but this does not preclude its growth in any good soil. The head is spreading, ours being worked standard high, which enables a better and quicker head to be formed than when worked low. It is highly probable that this, like the other Poplars, would do well in smoky districts.

Cornus siberica variegata, The Variegated Siberian Dogwood, has small acuminate leaves deeply margined with creamy white, the centre of the leaves being green gives this shrub a very striking appearance. Indeed, it is one of the most beautiful variegated plants, and being of close compact growth is very suitable for lawns, forming beautiful pyramids. It has bright yellow flowers early in spring, borne abundantly.

Cornus mascula variegata.—This has bolder foliage than the Siberian Dogwood, is even more beautifully variegated, forming really handsome pyramids, and will grow anywhere, but prefers a moist soil. Bearing pruning well, this and the preceding can be kept of any desired form without much increase of size, and are therefore suitable for positions where unrestricted trees are undesirable. Both do well in smoky districts, and are, of course, deciduous, which ought not to be any drawback to their employment, as shrubberies and lawns are now stereotyped with evergreens to the exclusion of many light, flowing, and changing forms presented by the deciduous.

Sambucus nigra aurea.—This is very much more golden than the old Gold-variegated Elder (*Sambucus nigra variegata*), being quite yellow in the matured growths, and which it retains to the close of the season. It is of very free growth, and though Elder may be common it is fit to take rank with the choicest of variegated shrubs, not the least of the merits of Elders being that of their thriving in the vitiated atmosphere of manufacturing localities, and they do well near the sea; in fact, screens of Elder are the best as screens or shelter from sea breezes for choicer plants—choicer simply because less free-growing and less common. The Silver-variegated Elder (*Sambucus nigra argentea*) is not nearly so effective as this; still it is a desirable shrub or small tree, and especially as it will grow anywhere.

Acer colchicum rubrum and *Acer virginicum rubrum*.—These are very handsome, having bold Plane-like foliage, making

vigorous growth, the young leaves being bright red, which is not confined to the spring growths only, but is equally prevalent in those made at midsummer, which give the trees a very striking appearance. They are of moderate growth, and as the trees become aged their colouring is more marked.—G. ABBEY.

NEWCASTLE SHOW.

THE Summer Show of the Durham, Northumberland, and Newcastle-on-Tyne Horticultural and Botanical Society was held in Leazes Park, Newcastle, on the 25th, 26th, and 27th ult. under circumstances anything but propitious as regards the weather. Rain poured down during the greater part of the opening day, and note-taking was utterly impossible. The second was a very fine day, but on the third the rain fell at frequent intervals. Leazes Park, which has been described in the Journal, is steadily improving each year. Band stands have been erected, increased floral decorations have recently been added, while the lakes abound in varieties of aquatic birds, that render it suitable for a flower show and equally so for the holiday maker.

The Show as regards entries was the largest the Society has ever had, while the merit of the exhibits was on the whole superior, with the exception of fruit, which showed a falling-off in quantity, although some of the exhibits were good, and Roses were considerably fewer in number than they hitherto have been. The Exhibition was held in a series of tents with the sides open, thus forming one large rectangular marquee 150 feet long by 60 broad. Thus the whole effect of the Show was seen at once when the visitors entered the tents.

OPEN PLANT CLASSES.

For eight plants in bloom, dissimilar, the first prize of £12 was won by Mr. J. Cypher of Cheltenham with an excellent group, his best plants being *Erica Parmenteriana*, 6 feet through, in prime condition and colour; *Clerodendron Balfourianum*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Anthurium Schertzerianum*, *Dracophyllum gracile*, and *Erica Shannoniana*, all in good condition. Mr. E. H. Letts, gardener to the Earl of Zetland, Aske Hall, Richmond, was a good second, his best specimens being *Allamanda Hendersonii*, *Erica Shannoniana*, *æmula insignis*, and *ampullacea*, *Ixora Williamsii*, and *Stactis profusa*, all fit competitors for those in the first-prize collection. Mr. W. R. Armstrong, nurseryman, New Bridge Street, Newcastle, was third, showing an excellent *Rondeletia speciosa* major large in truss; his other best plants were *Erica opulenta* and *Bougainvillea glabra*. There were four collections, which filled one side of the tent.

Fine-foliage plants were, as usual, very good. Mr. Hammond, gardener to Sir Wilfrid Lawson, Bart., M.P., Brayton Hall, Carlisle, was first. *Macrozamia Fraseri*, *Crotons majesticus* and *Weismannii*, *Bonaparteia juncea filamentosa*, *Cycas revoluta*, *Phoenix dactylifera*, and *Latania horbonica* were all fine and had an imposing appearance. Mr. Nohle, gardener to Theodore Fry, Esq., Woodside, Darlington, was second with, among others, a fine *Croton Veitchii*, *Dasylyrium serratifolia*, *Cycas revoluta*, and *Seaforthia elegans*. There were two other collections in the class.

For a group of miscellaneous plants 20 feet by 10 feet there were five competitors, all of which produced creditable groups, any one of which would easily have been placed first at Newcastle a few years ago. Mr. McIntyre, gardener to J. Pease, Esq., Darlington, was first with a graceful arrangement of foliage and flowering plants, all effectively carpeted with Ferns. *Dracænas*, *Crotons*, *Pandanuses*, *Dieffenbachias* were also tastefully employed, the latter with telling effect. Mr. Hammond was second with a good group, in which *Acalyphas* and *Eulalias* were employed most effectively. Messrs. Clarke Bros., nurserymen, Carlisle, were third; Mr. Jas. Nohle was fourth; and Mr. Neil Black, gardener to the Misses Pease, Southend Park, Darlington, was awarded an extra prize.

For six Orchids Mr. J. Cypher was first with *Saccolabium Blumei majus* Dayi, five spikes, very fine; *Odontoglossum vexillarum roseum*, eight flowers; *Cattleya Gaskelliana*, two blooms; *Aerides Lohii*, *Dendrobium Dearii*, and *Dendrochilum filiforme*. Orchids were not largely shown. For six exotic Ferns Mr. Henry Johnson, gardener to J. B. Hodgson, Esq., Darlington, was first. He had a good *Davallia Mooreana*, six flowers; *Gleichenia Speluncæ*, *Adiantum farleyense*, *Gleichenia Mendeli*, and *Microlepia hirta cristata*, all good. Mr. Hammond was placed second with excellent plants. For three *Crotons* Mr. Hammond was first with very fine-coloured specimens, Mr. Neil Black being second with larger plants, but lacked that fine rich colour so essential to a good *Croton*.

For three *Dracænas* Mr. J. Nohle was first, Mr. J. Hammond second, and Mr. J. McIntyre third. For the six tuberous-rooted *Begonias* Messrs. Little & Ballantyne, nurserymen, Carlisle, were first with two-year-old plants, having good foliage and very large flowers. For four *Ericas* the competition was good. Mr. J. Cypher was first with *Erica Parmenteriana rosea*, *E. Dawsoniana*, *E. obhata*, and *E. Hingstoni*. Mr. E. H. Letts second with good plants; and Mr. H. Bulmer, gardener to W. Watson, Esq., Lintz Green, third. In this division bedding plants, alpine and hardy succulent plants were well and largely represented. Messrs. Clark Bros. were disqualified for showing *Echeveria metallica sanguinea* and *Pachyphyton Browni* amongst the hardy succulents.

CUT FLOWERS AND TABLE DECORATIONS.

For forty-eight Roses, dissimilar, E. R. Whitwell, Esq., Barton Hall, the popular northern amateur, added to his former triumphs by being placed first. Very fine in his stand were *La France*, *Madame Hippolyte Jamain*, *Annie Wood*, *Alfred Colomb*, *Baronne de Rothschild*, *Mr. Jowitt*, very good; *Duc de Rohan*, *Etienne Levet*, *Elic Morel*, very large; *Duchesse de Morny*, *Madame Charles Wood*, *Horace Vernet*, *Prince Camille de Rohan*, *Charles Lefebvre*, and *Duke of Wellington*. Messrs. Cranston, nurserymen, Hereford, were second, but much behind the northern grower, Countess of Rosebery being very fine in this stand. Messrs. Mack and Son, Caterick, Darlington, were third. Their best blooms were *Etienne Levet*, *Comtesse de Nadaillac*, *Bartholomew Joubert*, *Comtesse de Serenyi*, *Marie Finger*. For thirty-six Roses Mr. Whitwell was again first with

very fine blooms; and Messrs. Cranston second, showing a superior lot than in the forty-eights. For twelve yellow Roses and twelve Roses of any colour Messrs. Mack & Son were first in the latter class with fine blooms of *Alfred Colomb*. This firm was also first for Tea-scented Roses.

Herbaceous plants were well shown by Mr. Thos. Battersby, Axwell Park. He had *Delphiniums* *Hermine Stenger*, hybridum and azureum, *Sida malvacea*, *Erigeron speciosum*, *Spiræa Filipendula*, and *Verbascum nigrum*. This stand was very effectively arranged.

Table plants were as usual largely shown. Mr. J. McIntyre was first with six even plants, consisting of *Cocos Weddelliana* and *Aralia Veitchii*, *Croton picturatus*, *Aralias elegantissima* and *gracilis*, and *Dracæna gracilis*. Mr. Irvine was second, and Mr. Whiting, 126, Rye Hill, third. There were six lots staged. Table epergnes were very fine. Mr. J. Cypher was awarded the first prize with a charming arrangement of Orchids, stove plants, and Ferns. Mr. Irvine was second, and Mr. Webster third. Mr. Cypher was first for both bridal and hand bouquets. The bridal bouquet was a magnificent example of the bouquetist's art; it combined *Stephanotis*, white *Lapageria*, *Eucharis*, *Pancratium*, all gracefully draped with *Adiantum cuneatum*. Mr. Hutchinson, Toward Road, Sunderland, was a good second. Mr. John Embleton was first amongst a number of competitors for a buttonhole bouquet, in which *Bouvardias* and *Forget-me-not* were most effectively used.

FRUIT.

For a collection of fruit, eight dishes, Mr. J. Edmonds, gardener to the Duke of St. Albans, Brestwood Lodge, Notts, was a superior first. He had a good Queen Pine nearly 4 lbs., Muscat of Alexandria and Black Hamburgh Grapes, splendid Royal George Peaches, much admired for their fine colour, Elruge Nectarines, Brown Turkey Figs, and Eastnor Castle Melon. Mr. Neil Black was second with a small Queen Pine, good Black Hamburgh and Muscat Grapes, a Banana, and Hero of Lockinge Melon. Mr. Edmonds was also first in the collection of fruit, Pines excluded, with excellent produce. Mr. Lawson, gardener to Rev. H. Williamson, Whickham, was second, Royal George Peaches and McIndoe's Melon being very good, and Mr. McIntyre third. For a Vine bearing in pot, Mr. J. Pringle, Benton Hall, was first with Foster's Seedling. For bunches of Grapes, not less than two varieties, Mr. Edmonds was first with Muscat of Alexandria and Madresfield Court; second, Mr. R. Westcott, Rahy Castle, with the same varieties; Mr. G. Douglas, gardener to Mr. J. Harvey, Cockermonth, having the third prize. Melons, green and scarlet flesh, were well and numerous represented. For Peaches Mr. Edmond took the first prize, Mr. N. Black having a similar award for Nectarines. Strawberries were very good, Mr. Lawson, gardener to Sir J. Ianson, Brough Hall, was first with President. Very good Golden Queen Grapes were shown by Mr. Westcott.

DIVISION B, OPEN TO ALL EXCEPT NURSERYMEN.

In the class for six plants in bloom Mr. Edward Adams, Swalwell, was first, *Ericas*, *Stactis profusa*, and *Phœnocomma prolifera* being very large and finely bloomed. This gentleman is a licensed victualler and a well-known amateur. Mr. Methven, gardener to E. Lange, Esq., Heathfield House, Low Fell, was second, his best plant being *Erica Exquisite*, which was very good. For six foliage plants Mr. E. H. Letts was awarded premier honours with *Dasylyrium acrotichum*, *Croton Johannis elegans* and *majesticum*, all finely coloured, *Encephalartos villosus*, and *Seaforthia elegans*. Mr. J. Hammond was a good second, and Mr. Neil Black third. For six Ferns Mr. Johnston was first with *Dicksonia antarctica*, *Gleichenia Mendeli*, *Goniophlebium subauriculatum* fine, *Gleichenia rupestris*, and *Adiantum excisum*. Mr. J. Nohle was second with creditable plants. For table plants Mr. McIntyre was first with superior examples. *Coleuses*, *Fuchsias*, and hardy Ferns were extensively shown in this division and of very good quality.

For twenty-four Roses in the same division Mr. Whitwell was again first; Mr. Burrell, another well-known northern amateur, being second with Roses fine but smaller than the first. For twelve Mr. Burrell secured the first prize. For six bunches of cut flowers Mr. Bollow, gardener to Sir H. A. Clavering, Axwell Park, was first with *Stanhopea insignis*, *Bougainvillea glabra*, *Allamandas*, *Ixoras*, and the old *Pentas carnea*. For an epergne Mr. E. H. Bradley was the premier exhibitor; he was also first for the bridal bouquet amongst eight exhibits.

Not for competition was a large stand of stove and greenhouse plants from Messrs. Ireland & Thompson, Edinburgh: these were much admired. In the collection we noticed *Nepenthes Mastersiana*, the pitchers being 11½ inches long by 9 in circumference. *Nepenthes Harryana* was also striking, and *Anthurium Veitchii* had leaves 4 feet long; and in fine condition were *Phyllotæium Lindeni*, *Bertolonia superbissima*, *Calanthes mascula*, *Odontoglossum Roczii*, and *Adiantum Luddemannianum*. Messrs. Fell & Co., nurserymen, Hexham, showed a grand stand of hardy *Coniferæ* suitable for the district. Mr. J. Watson, nurseryman, Fenham, Newcastle, showed also a similar stand to the above. Messrs. Little & Ballantyne, Knowfield, Carlisle, exhibited a collection of stove and greenhouse plants, conspicuous amongst which were a fine lot of double Ivy-leaved *Pelargoniums* and *Begonia Moonlight*, the latter not much known in the north.

The Committee and their Secretary, Mr. Gillespie, were indefatigable in their exertions to make the Show a success, and it is very much to be regretted that the weather militated so much against their efforts. After the Show the Committee and Judges dined together, the President of the Society, Mr. Hodgkins, presiding, supported by the Treasurer, Councillor Thomas Grey, and the great rosarian, the Rev. H. D'Ombrian. Loyal patriotic toasts and the welfare of the Society were given and received with much enthusiasm. Mr. D'Ombrian made a humorous and pleasing speech, which was much applauded.—B. C.

POULTRY AND PIGEONS IN GARDENS.—Seeing a complaint from Mr. T. B. Dolly in the last issue of your Journal respecting the Pigeon nuisance, I enclose an extract bearing on the subject:—"A farmer need not so fence his field that a neighbour's poultry cannot get into it. It is the duty of the owner of the poultry to fence them up, so that they cannot trespass on other people's land. If the farmer finds your fowls on his land he can sue you for trespass as often as they actually

do trespass; but if he stones them, or traps them, or lays down poisoned grain for them on his own land, he becomes the offender, and can be prosecuted therefor. If you can prove that he places the poisoned grain on his own land you need not wait until some of your fowls eat it and die, the offence is completed as soon as the grain is laid on the ground, and he can be summarily convicted for so doing by the magistrates in petty sessions and fined £10."—W. GALLINAGH.

NOTES ON PROPAGATING.

THE beginning of August is generally looked upon as the orthodox period to commence propagating bedding plants as stock for the following summer's use. Those who are in a position to take cuttings from Pelargoniums now or at an earlier period, have every advantage in securing strong well-rooted plants capable of passing in safety those few weeks in midwinter so trying to plants which have been coddled. Cuttings taken at present root quite freely under very ordinary conditions. Nothing suits them better than to dibble them in light soil out of doors, to be afterwards lifted and potted or boxed in time to be established before winter. I cannot cut from beds until September, consequently propagation is not so simply managed. But just now we like to insert cuttings of Verbenas, Konigas, Iresines, &c.; boxes are preferred for these. A layer of coal cinders is placed for drainage, then a sound compost of loam and manure, and on the surface a slight layer of sea sand. Beginners must note that all these ought to be planted directly they are removed from the parent plants, and then transferred to the frame before they have time to flag or droop. It may also be pointed out that large cuttings are not so good as those which are smaller and healthy. Growing points $1\frac{1}{2}$ to 2 inches in length make very good cuttings. They are not given to droop under the same conditions as do those which are longer. Moreover, they strike root more quickly and grow more rapidly afterwards. A cold frame kept close and moist is a very good place in which to root the cuttings. Later, I have found it necessary to place them where a little heat could be given. A little air during the night will help to prevent mildew appearing; shading from bright sunshine is, of course, very necessary. Where it seems to me that most failures arise with such plants as Lobelias and Verbenas is not so much at the time of rooting as in keeping the plants healthy after they are rooted. Over-dryness is specially to be guarded against; a slightly moist state of the soil all through autumn and winter, and a temperature during the latter period sufficient to keep the plants growing, is the treatment they like. Pentstemons make fine bedding plants, but in order to get them large enough to produce a good display not a day should be lost in striking the cuttings; July is the better month. We dibble the cuttings out in a cold frame and afterwards pot them thereafter, plunging the pots deeply among ashes, and protecting with a cold frame during cold weather. Mrs. Sutherland Walker is one of the best bedding kinds.

When the Pelargonium cuttings are taken in September, instead of selecting small points, as with Verbenas, strong and large growths are selected. At that time the beds require thinning in order to keep damp away and procure a late bloom, should the autumn prove warm and dry. Consequently the plants are carefully thinned. These thinnings are then made into plants for the next year's supply. As the men who thin out the shoots cut each carefully beneath a leaf joint, all that requires to be done in preparation is to remove a few leaves and any flower trusses that are showing. I have found it of great advantage to allow the cuttings to lie for a day or two on the floor of a shed before placing them into the cutting boxes. I always have old sashes ready to place over the boxes should wet weather set in, and during winter I do not object to keeping the plants growing slightly.

As regards Violas, for the last few years I have dispensed with cuttings altogether. Plants divided into pieces with roots in spring make very good stock; but what I like is to lift a sufficient number of plants in October or later—when the Calceolarias are inserted is a good time. These plants are then divided into single shoots with a few roots attached, and are planted in leaf soil with an underlayer of horse droppings to root into. These can be lifted in the following March.

Calceolarias do well in the same material. I have never lifted better plants than those of last season. Without pricking out they were lifted from the place they were put in as cuttings in April, and in the end of June were well in bloom. I saw a number of plants during the summer, most of which had died. Their treatment had been a little very sandy soil to root in, and consequently nothing like a ball to lift with. The hot dry summer very soon killed them. September is a good time to strike cuttings of herbaceous plants. These do well in the open ground with a sash over them for protection.—B.

SETTING AND STOPPING CUCUMBERS.

NOTING Mr. Taylor's remarks on page 44, I emphatically say now, as at page 530 last volume, that the cause of my failure in Cucumbers was too much moisture in the air and too little in the soil. I, however, should like to define what I mean by setting. I may be wrong, but certainly I do not call setting fertilisation. My Cucumbers in the same house with a west aspect to which my remarks refer are now a pleasant sight, a prettier lot of fruit I would not wish to see, but I did not fertilise one; how could I when I carefully remove all male blooms before they expand? If I am correct, a fruit, either Cucumber or Grape, will set and grow without

fertilising. In the case of the Cucumber I have good useful fruit for market purposes, quickly grown, but never so large as the fertilised fruit. It is the same with the Grape. Strong growths ahead of the fruit will starve the embryo Cucumbers and cause them to damp off at the ends, which I say is not setting.

I must tell you all I know now I am writing. I have found it a very good plan to rub the laterals out at the fruit joint. This prevents much overcrowding, and I am sure strengthens the fruit. I have noticed beforetimes in many cases after stopping, the side or sub-laterals rob the fruit and cause some to go off. Mr. Taylor is correct in stating the benefit of non-fertilising, the crop being much larger. What, however, I want to know is this—a fruit grows, it cannot be fertilised for the reason stated, therefore am I correct in saying this fruit is "set?" I might state, in early work I believe the fertilising of, say, a few of the first fruits very beneficial, after then I let them please themselves. As to the question, "Do flowers exhaust plants?" I should say they do; the simple fact of having a quantity of male flowers exhaust the Cucumber plant; these would have a tendency to fertilise the fruit naturally—another exhausting process. It may not be a very great loss, which loss can be readily remedied by top-dressing or feeding. I hope I have made my case clear. I have not used the words "artificial fertilisation" until now, but this will show what I mean.—STEPHEN CASTLE, *West Lynn*.

CULTURE OF PERPETUAL STRAWBERRIES.

THE seed should be sown as soon as it is ripe. Small seed boxes answer better than pots or pans, especially if covered with glass and placed in some shaded place. Prick out the young plants as soon as they can be handled, and be careful to protect them from frost. If transplanted, a single-light frame will be a good place for them. In June or July transplant them to any part of the garden where they can be attended to until they are large enough to plant out in beds or rows, about 6 inches from plant to plant, and there they may remain until they produce fruit. Select the best and destroy all others. For more than forty years I have made a point of such as had good flavour, giving preference to those which partook more or less of the aroma of the Hautbois or Queen Pine Apple. In this I am pleased to say I am allowed, if required, to make use of the names of several gentlemen who have honoured me with their approval of the following among other varieties—1, Jet Black, flavour of the Hautbois. 2, Universal, flavour of the Pine Apple. 3, Lady Dickson, flavour of the Hautbois. 4, Canon Kingsley, very aromatic. 5, Count Mataxa, very sweet and rich Pine Apple flavour; excellent for preserving whole. 6, Countess Mataxa, the richest Pine Apple flavour of any.—W. PRESTON.

NARTHECIUM OSSIFRAGUM.

MEN like large things. "The mighty Helvellyn" is voted a toadstool by the mountaineer who has stood "the most elevated man in Great Britain" on snow-capped Ben Nevis, and the bens are regarded as molehills by him after he has tried to climb Mont Blanc. Some people will even despise the Alps after having seen, perhaps from afar, the cloud-piercing peaks of India or America. Large empires, armies, navies, down to large oxen, babies, and the proverbial big Gooseberries have their charms for most. Into the very domain of horticulture we carry the idea of having something large, and grow large-bunching varieties of Grapes that are confessedly inferior; Cabbages that make exhibition visitors gape, but which cannot be eaten without dyspepsia; and large Potatoes that the very pigs despise. The cube contents of the Roses and Dahlias which win prizes have much to do with determining their position, and in the north they cannot tell you whether a Pansy is fit to look at or not till the foot-rule and the callipers have been applied.

A few men are eccentric. With that few beauty is not so much a matter of arithmetic. Form, colouring, sweetness are what concerns them most, and if a plant is graceful, or even neat only, it can be enjoyed. If the colouring is beautiful it is admired whether big or little. To the eccentric few we commend the very beautiful, though little, Lancashire Bog Asphodel. It can only be seen in bogs. But a bog may be had anywhere, even on the window sill. For a bog only a hollow and plenty of moisture are wanted. It can be big or little according to circumstances. We once had one some 4 yards by 2. The soil was naturally stiff, and the miniature bog was made simply by taking out a few inches of the soil and filling in with very fibry turf from a peaty moor. This was turned upside down, and covered with growing sphagnum kept green and growing by the water which was spilt at the garden pump.

In that "bog" we transplanted many wildings, and none that looked more beautiful than the Asphodel. Its transference from the bog cost little trouble. A good-sized square was isolated by a hedge knife and carried off bodily. Fitted into the surface of the bed it did beautifully for many a year till the ground was wanted for a house. It will also grow on loam kept wet, but we have never seen it so good as when growing under the conditions which cause sphagnum to thrive.

Many choice plants could be grown in such artificially created swampy spots. The rather strong-growing but very beautiful *Menyanthes trifoliata* does well in such, as well as the *Myosotis palustris* and all the *Droseras*. In favoured spots *Sarracenias* thrive and many Orchids, than which few more lovely flowers exist, small though they be.

Such should always be constructed with one side sloping, so that different requirements may be met. On such slopes many of our neatest and smallest Ferns would thrive. Indeed, with a little labour and loving

skill such a spot might be made the most pleasing, because most natural and novel, spot in the garden.—WEB FEET.

SCUTICARIA DODGSONI.

SEVERAL species of *Scuticaria* are grown in collections of Orchids, but they are not very generally known, except perhaps *S. Steeli*, which is one of the standard curiosities, its long narrow terete leaves giving it a very peculiar appearance when suspended from the roof of a house. *S. Hadweni* is another species so much like the preceding that it might be readily mistaken for it, the chief difference being that the flowers of the last-named are more erect. That, however, of which a plant is shown in the woodcut, fig. 20, is not so common, though it is one of the most distinct and striking. Our engraving represents one of Mr. B. S. Williams' plants, and

I mean first or second earlies. I should feel inclined to place it in the former class. In many respects it resembles *Snowflake*, but I have found the quality superior, and with me it is ten days earlier and just a week in advance of *First Crop Kidney*, all planted the same day. *Early Vermont* and *Early Rose* run it close in maturing, but the last is inferior in quality to several others I grow. It is an enormous cropper, increasing fiftyfold.—W. J. M., *Clonmel*.

A HORTICULTURIST'S HOLIDAY.

THE old Romans used to say of any day that had been peculiarly happy and fortunate that it ought to be marked with white chalk, and I am quite sure that any of those who joined in the excursion made by the Horticultural Club on Friday last will agree with me that it ought to be marked with the very whitest of white chalk. Everything conspired to make it a success. A fine day, interesting spots to be visited, a goodly company who could appreciate the various spots of interest, and last

Fig. 20.—SCUTICARIA DODGSONI.

respecting the species he writes in the "*Orchid Growers' Manual*" as follows—"This is a very distinct and handsome species. The leaves are terete, some 12 or 15 inches long, and dark green; flower spike short, bearing two flowers; sepals and petals light brown inside, darker at the base, and blotched with light yellow; lip white, beautifully streaked with light rose and yellow." This so exactly describes the plant that it need not be supplemented, except to state that a first-class certificate was awarded for it by the Royal Horticultural Society, April 24th of the present year.

COSMOPOLITAN POTATO.—This was raised by Mr. R. Dean, and, as I saw by the *Journal* at the time, received a first-class certificate from the Royal Horticultural Society and the silver medal at Birmingham last year. It was put in commerce by Messrs. Carters, Holborn, London, and from them I obtained it. I am anxious to hear the opinion of any of your readers who may have grown it as compared with others—

but certainly not least, the presence of ladies (without whom an excursion of this kind is apt to be solemnly priggish), for it was determined that this element of enjoyment should not be wanting; and the feeling, I believe, which pervaded all, that while it was not possible to get on without eating or drinking, that yet this should not be made, as it too often is, the *raison d'être* of a picnic, and "all went merry as a marriage bell," not a hitch occurred, and I think that as the objects of interest visited were of general interest, I may, on leaving all matters connected with it personally on one side, just give a slight sketch of the day's proceedings.

The trysting place was at Slough, where between thirty and forty met, and the first spot of interest was Mr. Charles Turner's nursery, through which a rapid run was made, and where the marvellous collections of Carnations and Picotees in their full bloom was a revelation to some and an immense treat to others. To myself it was especially so, for owing to parochial engagements I knew that I should be unable to attend the great gathering of florists which is to take place on Tuesday next to do honour to the king of florists, for as such I think Mr. Turner must be looked upon; and I must confess that to me it is an infinitely greater treat to see them growing than to behold them laid out on their

cards after having endured the torture of the dresser, without whose aid it is not considered possible that they can be fit for the exhibition table. Wonderful indeed is the collection grown here. Thousands upon thousands of plants of all kinds, occupying three or four houses, and others in the open air, the grass in the perfection of health, and the varied hues of Carnation and Picotee bright and beautiful. Over the other wonders of this beautifully kept nursery there was no time to linger; a long day's work was before us, and so off we started for Dropmore, passing on our way the Burnham Beeches. As we reached these a slight shower made some of the least hopeful dread a wet day, but it only lasted a few minutes, and then cleared off for a lovely afternoon. The greater number of our friends had never seen this remarkable place (it must have been twenty years since I visited it), and need I say how its marvellous Conifers delighted them? The Araucaria and Douglas Pine, the Deodar insignis, and a host of others, of which "the grand old gardener," Mr. Frost, had many a story to tell, and on all of which he could look as his children, for he had planted them all; and while I could mark how since my last visit the Conifers had grown older and bigger, Frost himself was not a bit older in appearance and vigour than he was then. After having had a two-hours walk through these delightful woods and enjoyed the beautiful views which are to be had from various points in them, we went on to Cliveden, and probably no greater contrasts in gardening could be seen than those presented by these two places. In the one Nature's wildness, in the other the perfection of artistic arrangement. In the one the great interest centres in particular objects; at Cliveden it is the *tout ensemble* that is so delightful. Standing on the broad terrace and looking down on the great masses of bedding-out in the sward beneath, flanked by fine trees, one sees how much can be done by skilful use of materials. Here, of course, bedding-out is in place, and no one can quarrel with it. The conservatories and houses were all in excellent order, and the only regret was that we were not able to have the efficient guidance of Mr. Fleming. Some of the views of the Thames from the grounds here are perfectly enchanting; and with the slanting rays of the evening sun lighting up the woods and making the river glisten like silver, there was something very enticing about it, leading many of our party to say, "Yes, Dropmore is very lovely, but if I had my choice I should prefer Cliveden." An hour and a half was pleasantly spent here, and then we drove on to the Bear at Maidenhead. Here dinner was provided, and in the evening all returned to London.

It was impossible, perhaps, in one day to take a wider grasp of gardening than was given to us on this ever-to-be-remembered day. At Slough we had the perfection of florist-flower gardening, at Dropmore an unequalled example of forestry, while at Cliveden there was the most perfect example of modern gardening that could well be seen; and as not a hitch occurred, and the arrangements were carried out according to the plan that had been arranged, we all agreed that it was especially a *dies cretâ notanda*.—D., Deal.

AUTUMN-SOWN ONIONS.

"A LITTLE LATE" was my remark when I saw the 24th of July recommended on page 52 as "a good time to make the first sowing of Onions to come in for use in April and May next." Yet I do not say it is a bad time, for seed sown on or about that date will undoubtedly give an early and useful crop; but I have for so many years invariably obtained such excellent results from seed sown on the 15th that I am bound to say, as I have done more than once in the Journal, that then and not later should the seed be sown. To those who have sown later, now I would advise careful attention to watering to accelerate the germination of the seed and frequent stirring of the soil between the rows when the plants are visible. This particular crop merits all possible care, for it is the connecting link between spring-sown Onions, and should be so managed that the supply of winter-stored bulbs overlaps it sufficiently for the earliest "Queens" to be of a useful size when they are wanted, and for the Tripolis to be in perfection till the summer crop is ready for the store house. It may be well therefore to give briefly the few cultural details which go to insure success, and first of all comes the

Sowing.—This is done thickly upon any border that is fairly sound and rich, but no special preparation is given or required other than is usual for any similar seed bed such as Lettuce, Radish, or Cabbage. At this season of the year the garden is crowded with successional summer crops, and every piece of ground that is cleared of a crop is at once turned to account for autumn and winter crops of Celery, Cauliflowers, Broccoli, &c. It is not, therefore, often found possible to spare a large breadth of ground in July for an Onion bed. I cannot often do so, but apart from that I prefer having the seed bed in as close a compass as possible in order to facilitate watering, and a dozen rows across a narrow border afford me an ample supply of plants, which are quite ready by the time ground is available for them upon one of the squares, and then comes the

Transplanting.—This is never left till spring, but is done as soon as possible after the plants are large enough to handle. Early Potatoes or second early Peas or Cauliflowers are the crops which are exhausted or ready to be cleared from the ground by the time the Onions are ready for it. Whatever the first crop may have been its clearance is followed by an ordinary dressing of manure, which is dug in, and the surface is broken down finely for the Onions, for which trenching is never considered necessary in soil that is under thorough cultivation. The plants are lifted in the seed bed with a steel digging fork, and are replanted with a trowel, due care being taken to injure the roots as little as possible in the pro-

cess, to press the soil firmly about the plants as they are planted, and to water thoroughly at once, and so frequently afterwards as to prevent flagging, and to promote a free strong growth. The rows are a foot apart, and the plants 6 inches apart in the rows. "Queens" that are wanted early may be planted 3 inches apart in the rows, and by drawing every alternate plant for early use the remainder will attain to an average size of 4 inches in diameter, and keep good well into autumn.

Varieties.—The Queen for its valuable habit of early bulbing must be regarded as quite indispensable for every garden, and if managed as I have shown no other variety is necessary. It does not run to seed like the Tripoli, grows large enough for all practicable purposes, comes early to maturity, and may be cleared from the ground and harvested when older and later sorts are only half grown. It has frequently and erroneously been described as a useful little early variety. Why its handsome white bulbs should be termed "little" I am at a loss to understand, unless its extreme earliness has led to its being used before more than half-grown. To those who have not grown it I would say, Do not trust to it entirely at first, for soils differ, and it may not answer equally well everywhere; but give it a fair trial for two seasons alongside whichever other sort you have been accustomed to grow, and thus prove its superiority for yourself. Of other sorts I agree with "H. W. W." that Red Flat Tripoli is best, for it has repeatedly proved so here when tried with Globe Tripoli, Giant Rocca, and others.—E. LUCKHURST.

THE HANDSWORTH NURSERY.

MESSRS. FISHER, SON, & SIBRAY'S nursery, distant only about four miles from the smoke, soot, and sulphur of Sheffield, is one of the largest and most celebrated in the kingdom. Perhaps in no nursery is there a larger collection of Hollies, upwards of a hundred varieties being grown, from the common sorts to the Handsworth Silver-striped, a most beautiful variety, with a broad pure silver stripe round the edge. Among the green Hollies we also noticed a very fine large-leaved sort which is not yet in commerce. But almost unique as is their collection of Hollies, their Golden Yews and Golden Irish Yews are even more remarkable. There are a thousand or more specimen plants in one enclosure surrounded by high hedges, every one with foliage of a rich golden colour, the effect of which was heightened by the darker foliage of the trees and hedges in the neighbourhood.

Another feature of the Handsworth Nursery is the large *Stephanotis floribunda*, which is probably the finest in this country. It is growing in a house without any artificial heat, and where the temperature during the winter fell to very near the freezing point on several occasions. It is trained to wires near the glass, and covers a space of 28 feet by 11. Last year we saw it in bloom when there were 1450 expanded and unexpanded trusses on the plant, besides a large number that had been cut. It was growing in a small pit or border, 18 inches square and 18 inches deep, in a mixture of peat and loam, and top-dressed with cow manure.

The greenhouse Rhododendrons form another speciality, and many large houses are filled with a grand stock of all the leading varieties. That Roses can be satisfactorily grown, even in the neighbourhood of large towns, is abundantly apparent when at this nursery. Many acres are devoted to them, and the firm was successful in winning some of the prizes at the National Rose Show held in Sheffield a few days previous, and which appeared very little inferior to the exhibits of some of the most successful Rose-growers.

The special purpose of my visit was, however, to see the splendid collection of Pelargoniums, and I was amply rewarded for my trouble. The house contained about 1200 plants in 150 varieties. The house was 100 feet long, 10 feet wide, a path down the centre 2½ feet wide, and the stages on each side 3 feet 3 inches wide. It had recently been built by Messrs. Primrose & Co. of Sheffield, and was glazed on their new eclipse system. As the glass is fastened by small bars of prepared tin and lead, the minimum of obstruction is offered to the sun, and putty and paint are alike dispensed with.—VISITOR.

HISTORICAL JOTTINGS ON VEGETABLES.—No 6.

THE CABBAGE GROUP.

AMONGST the vegetables commonly sold in our markets and shops a place of primary importance belongs to the Cabbage and its allies. Perhaps, indeed, this has a right to be ranked above all the rest except the Potato, for there is not a month in the year when a Cabbage of some kind, large or small, may not be procured, and with the bulk of Britons, English, and Scotch, this group of vegetables is very much in favour. I is certain that Cabbages and Coleworts have been cultivated in this island from the time of the Saxons, for they called February by a name that meant "Sprout-cole," evidently because the young sprouts were not gathered then, I think, as some have supposed, but noticed to be growing upon the old stems that had stood out the long hard winter; and it is likely the garden history of these vegetables goes back to the Roman period, for the first conquerors of Britain introduced several vegetables, though they were outnumbered by the fruits previously unknown here. The Cabbage, in fact, still discoverable wild upon our coasts, is a native species that must have grown

there in the times when a race with painted skins had sole possession of Britain. Possibly the Romans cultivated and improved the wild *Brassica oleracea*, but we rather incline to the theory that they brought seeds or young plants from Italy.

Both Greeks and Romans were acquainted, as the histories show, with several varieties of the Cabbage. They allude to kinds with a compact head, and to others of a looser growth belonging to the Colewort tribe; their style of description, however, renders it difficult to identify these. The Greeks were eloquent in praise of the culinary and also the medicinal value of such vegetables, and commended them as remedies for various diseases as well as aids towards good health and longevity. To their wholesomeness the Romans do not seem to have demurred, but they were scarcely choice enough for the palates of the citizens of imperial Rome, who left them to be eaten by the freedmen and slaves. Pliny notices several kinds named from places where they chiefly grew, and one mentioned as produced in the vale of Aricia was a large Cabbage with a close heart, predecessor, it may be, to our Whiteheart Cabbage. It does not appear that the ancients were acquainted with the edible flower-heads of Broccoli and Cauliflower. This author gives his readers exact cultural directions how to obtain good Coleworts: he advises that they should be sown after the autumn equinox in ground that had been first well dug, then manured. Afterwards he suggests the judicious cutting away of part of the early sprouts, while the earth is gradually raised round the roots.

The numerous varieties of this esculent are easily classed. All those that form hearts of different degrees of compactness are properly Cabbages, an appellation said to be derived from an old French word that meant a "head" or close centre; such were certainly not much grown even in the metropolis until the times of the Stuarts. Cauliflowers and Broccoli present the second group, also deemed rarities till about the same period; they are distinguishable by the firm succulent flower head set on a short stem. The name "Cauliflower" has been explained in several ways; presumably it is merely a new spelling of Gerard's old "Cole-floury"—i.e., a Colewort with a flower-top which is conspicuous. As to "Broccoli," it is, perhaps, a corruption of *Borecole*. This, though it has a stem slightly longer, less flower-heads, and more variety of colour than the Cauliflower, differs not from it botanically, and the method by which both these types were developed out of *B. oleracea* has been forgotten, as well as the names of the men who accomplished the feat.

Then we come thirdly to what are in common parlance "Bunch Greens," "Broccoli Sprouts," Coleworts, or Kale—all varieties of the Colewort familiar to our ancestors in the middle ages and earlier. These have the leaves expanded, and mostly coloured, whatever may be their size, there being no compact heart. So greatly did the Wars of the Roses affect England, that the cultivation of even such common vegetables as the Colewort was greatly interfered with, but under the Tudors gardening speedily revived. Still for some time Cabbages continued to be brought from Holland and France as rarities; and Ben Jonson has a joke in one of his plays, which represents a character receiving intelligence from abroad in Cabbages, and possibly letters were sometimes placed in the heart of one of these vegetables for secret transmission from abroad to England.

A story which seems to have quite as much in its favour as the like traditions generally have, attributes to Sir Anthony Ashley, an official person of some importance in the reigns of Elizabeth and James I., the introduction to our garden of some close or summer Cabbage. Mr. Glasspoole thinks it not improbable there was a rivalry amongst the courtiers of Elizabeth to see who could obtain most foreign roots and plants, and as a Clerk of the Council he would be in frequent communication with the continent. Besides, there was a jest current concerning him, that he got more by Cales than he did by Kale, the allusion being to a command he once held at Cales or Cadiz, where he enriched himself unfairly. Add to this the fact that upon his monument at Winborne St. Giles, Dorsetshire, there is sculptured a round object which might be taken for a Cabbage. True, there have been those who asserted this is no Cabbage, but a cannon ball, "ornamented with reticulations," intended to keep in remembrance the knight's warlike performances, not his horticultural ones.

We are at all events certain that Gerard was the first English author who discoursed upon Coleworts and Cabbages. He grew them and studied them; was specially interested in several of the varieties, amongst these one he calls the Rapecole, having the excellent qualities both of the Colewort and the Turnip. The seed of this he had sent him from Germany, and he says the young plants received the same careful attention he gave to

Cucumbers and Melons. After comments upon several varieties he remarks, "The swollen Colewort of all others is the strangest. This I received from the worshipful London merchant Nicholas Lete, who brought the seed out of France, one who is greatly in love with rare and fair flowers and plants." Was this a kind identical with the Kohl-Rabi of the present day, which is classed amongst Broccoli, and has a stem singularly globose, but which is seldom sent to table? It does not appear that Gerard was acquainted with the cultivation of the Cauliflower or "Cole-floury." This variety is referred to by him as the best of all, the white Cabbage being next; but he would see foreign samples as Cauliflowers, were imported from the Netherlands somewhat stale, and sold early in the seventeenth century at a rate equivalent to about 3s. each as money goes now.

Whether Sir A. Ashley was the introducer of summer Cabbages, as remarked above, may be doubtful. Hartlib's evidence is tolerably positive that the Flemish emigrants who had landed in Kent, and who towards the end of the sixteenth century moved nearer to the metropolis, began to grow Cabbages and Cauliflowers for the markets, chiefly on the Surrey side of the Thames. Then under the Georges these vegetables began to be grown freely in Middlesex. "Cabbage Lane" appears here and there on old maps as the name of a byeway amongst fields of vegetables, in which such plants had a prominent place.

Scotch Kale is famous both north and south of the Tweed, and although some folks have tried to give us English the credit of having introduced it to Scotland after the Union, Kale-yards or gardens possess a longer history than that; probably they date back to the time when parties of German fishermen settled on the eastern coast. So notable a dish is "Kale-brose," that it has given Scotland a title to be called the "land o' Kale" as much as the "land o' cakes," the open Coleworts getting the preference over the close Cabbages. The thrifty Scots have been in the habit of eating what southerners reject, the stem of the Winter Cabbage, peeling off the fibrous portion and boiling the centre, called "custock."—J. R. S. C.

CARNATION AND PICOTEE SHOW AT SLOUGH.

JULY 31st.

THERE was a peculiar appropriateness in the site chosen for the supplementary Southern Show of the National Carnation and Picotee Society on Tuesday last, for the Royal Nurseries, Slough, have a history closely connected with the special objects of this Society, and extending over a period of forty years, during which time Mr. C. Turner has, together with Mr. E. S. Dodwell and later with Mr. J. Douglas, worked most assiduously to improve his favourite flowers and render them more popular. Both objects have been most satisfactorily accomplished, and since the Exhibition held at Slough in 1851 great advances have been made, especially in extending the taste for florists' flowers amongst the multitude. After a lapse of thirty years there was especial interest in a similar gathering on the same ground, affording an opportunity for a retrospect of the Society's labours, and as a signification of appreciation of the valuable assistance received from Mr. C. Turner.

As was expected a great number of visitors assembled to honour the occasion, particularly as no fees were charged for admission; and though exhibitors were not so numerous as might have been desirable, sufficient stands were entered to constitute a very pretty display, the quality of the blooms being extraordinary, especially those shown by Mr. Turner and Mr. Dodwell; indeed, some of the blooms were uncommonly fine both in size, substance, refinement, and colour. They were arranged in the large conservatory near the entrance to the nursery, being placed on the side and cross stages with a few miscellaneous plants between the lines of boxes to relieve the monotony that otherwise too frequently prevails at such shows. In addition to the blooms in competition Messrs. J. Veitch & Sons, Chelsea, contributed three boxes, representing about 120 varieties of Carnations and Picotees, forming a most interesting and valuable feature in the Exhibition. From the Slough Nurseries also six boxes of fresh and bright Roses were staged, including a great number of the best varieties in cultivation; and Mr. R. Dean, Ealing, showed some blooms of a new Clove Carnation Violet King, very rich in colour, and exceedingly free.

Several new varieties of Carnations were awarded prizes and certificates in the classes for seedlings, all those so honoured being of great merit, well deserving the distinction accorded them. Mr. Dodwell was particularly successful, securing certificates for the following four:—

Dorothy.—A charming rose flake, the blooms large, pale rose, petals broad and clear. First prize and certificate. Mr. Turner also obtained a second prize for Mrs. Bridgewater, a pretty rose flake, clear, and of good substance.

Squire Whitbourn.—A purple flake, rich clear purple, with the best-formed petals of all the varieties in this class. Certificate.

Samuel Barlow.—Crimson bizarre, very large flowers, outer petals large and shell-like; colour rich crimson, flakes broad and clear in colour. First prize and certificate.

Mrs. Anstiss.—Pink and purple bizarre, a very beautifully formed flower rich purple and deep clear purple. First prize and certificate.

New Picotees were represented by only one variety, a fine corner bloom in Mr. C. Turner's first-prize twenty-four—namely,

Mrs. Webb.—A heavy rose-edged variety, flowers very large and extremely handsome, the substance being very notable. The colour is light and delicate, but very pleasing.

After careful comparison of a number of fine blooms the premier Carnation was selected from Mr. Turner's first twenty-four, a charming example

of Robert Lord, a very even flower of rich colour. Mr. Dodwell showed the premier Picotee, Mrs. Payne, in his second-prize collection of twenty-four, an exquisite flower that was greatly admired.

CARNATIONS.

A pretty display of these was provided, the majority being of excellent quality, and Mr. Turner's blooms were especially remarkable. The principal class was for twenty-four blooms, not less than twelve varieties, first honours being secured by Mr. C. Turner, Slough, with a superb collection of blooms, large, bright, and clean, the substance remarkable. The varieties were Jessica, Matador, William Skirving, John Ball, E. S. Dodwell, Robert Lord, Mrs. Bridgewater, Rob Roy, Figaro, Thomas Moore, Juno, Mrs. Matthews, George, Sporting Lass, Master Stanley, and Sarah Payne. Mr. E. S. Dodwell, Stanley Road, Oxford, was adjudged a second position with blooms but slightly inferior to the preceding. The varieties were Sam Barlow, Mrs. Anstiss, Robert Lord, Dorothy, Henry Cannell, William Skirving, Master Fred, S. Brown, Florence Nightingale, Tim Bobbin, and Squire Llewellyn. Mr. J. Douglas, Great Gearies, Ilford, was placed third with fresh even blooms very bright in colour.

For twelve blooms, dissimilar varieties, six collections were staged, all differing but slightly in quality. Mr. E. S. Dodwell was again first with a beautiful even collection, comprising handsome blooms of Dorothy, Sam Barlow, Florence Nightingale, Henry Cannell, Sarah Payne, P.F., John Keet, Master Fred, Arthur Medhurst, E. S. Dodwell, Robert Lord, Squire Whitbourn, and Sarah Payne, P.P.B. Mr. J. Douglas was second with fine blooms of John Keet, Squire Penson, Clipper, Earl Stamford, and Sarah Payne. Mr. J. Lakin, Temple Cowley, Oxford, was third. Mr. W. Slack, Queen Street, Chesterfield, fourth. Mr. J. F. Burnaby Atkins, Halstead Place, Sevenoaks, fifth; and Mr. J. Buxton, Manor Street, Clapham, sixth.

In Class C, for six blooms of dissimilar varieties, there were also six competitors. The premier prize was obtained by Mr. T. Austin, Brill, Oxon, for fresh, bright, and clean blooms of T. Moore, Alfred Hudson, Sarah Payne, Mayor of Oxford, J. Bayley, jun., and Master Stanley. Master Stanley Dodwell was second with fine examples of James Douglas, Squire Llewellyn, Unexpected, E. Adams, Scarlet Keet, and Master Fred. Mr. W. Rowan, Manor St., Clapham, was third, a corner bloom of Arthur Medhurst being very fine. Mr. W. Meddick, 7, Hampton Row, Bath, was fourth; J. P. Sharp, Esq., Perry Bar, Birmingham, fifth; and Mr. G. Wynn sixth.

Single blooms were well shown in all the classes.

Scarlet Bizarres.—Mr. J. Douglas was first with Fred, and second with Stanley Hudson, Mr. C. Turner third and fourth with George, and Mr. E. S. Dodwell fifth with Master Stanley.

Crimson Bizarres.—Mr. E. S. Dodwell was first and second with J. D. Hextall, third with H. K. Mayer, and fourth with Rifleman; Mr. C. Turner being fifth with Rifleman.

Pink and Purple Bizarres.—Mr. E. S. Dodwell was first with Mrs. Anstiss, and third with Sarah Payne; Mr. C. Turner being second and fourth with William Skirving, and fifth with James Taylor.

Purple Flakes.—Mr. C. Turner was first and fourth with Sporting Lass, Mr. E. S. Dodwell second and fifth with Sarah Payne, and third with Squire Whitbourn.

Scarlet Flakes.—Mr. E. S. Dodwell was first and second with Henry Cannell, Mr. C. Turner third with Matador, and fourth and fifth with Matador.

Rose Flakes.—Mr. C. Turner was first and second with Jessica and fourth with Rob Roy, Mr. E. S. Dodwell third with Robin Hood and fifth with John Keet.

PICOTEEES.

Handsome blooms of great merit were included in all the leading stands, the Slough contributions being again very fine. For twenty-four blooms, not less than twelve varieties, the leading award was secured by Mr. C. Turner with magnificent examples, the size and substance being surprising. The varieties were Mrs. Webb, Mr. Tutton, Dr. Epps, Her Majesty, J. B. Bryant, Baroness Burdett Coutts, Mrs. Chancellor, Mrs. Payne, Muriel, Mrs. Bower, Monarch, Morning Star, Dr. Abercrombie, Zerlina, Edith D'Ombraim, Exhibition, Thomas Williams. Mr. E. S. Dodwell was a close second, some of his best blooms being Brunette, Clara Penson, Mrs. Payne, Mrs. Chancellor, Dr. Epps, Royal Visit, and Zerlina; and Mr. J. Douglas was third.

In the class for twelve blooms, dissimilar varieties, Mr. E. S. Dodwell took the lead with an even collection of blooms, comprising Mrs. Chancellor, Mrs. Payne, Mr. A. Medhurst, Royal Visit, Muriel, Ada Hannah, Zerlina, Mrs. Rudd, Edith D'Ombraim, Countess of Walton, Daisy, and Novelty. Mr. J. Douglas was a good second, Mr. J. F. Burnaby Atkins third, and Mr. J. Buxton fourth.

The competition was keen in the class for six blooms, six collections being staged. Master Stanley Dodwell was first with Zerlina, Mrs. Payne, Dr. Epps, Mrs. Chancellor, Morna, and Royal Visit. Mr. J. Laken was second with Clara Tinnie, Edith D'Ombraim, Brunette, Mrs. Wilson, and Medina. Mr. J. Austin was third, Mr. W. Slack fourth, Mr. W. Rowan fifth, and Mr. J. P. Sharp sixth.

Like the Carnations, the single blooms were numerous and generally good.

Red Heavy-edged.—Mr. C. Turner first with Dr. Epps, second with Dr. Abercrombie; Mr. E. S. Dodwell third with Mrs. Dodwell and fifth with Brunette; Mr. J. Douglas being fourth with J. B. Bryant.

Red Light-edged.—Mr. C. Turner was first and second with Thomas Williams; Mr. E. S. Dodwell fourth and fifth with the same variety, and third with Mrs. Gorton.

Purple Heavy-edged.—Mr. C. Turner was first, second, and third with Mrs. H. Chancellor; Mr. J. Douglas being fourth and fifth with the same.

Purple Light-edged.—Mr. C. Turner first with Mr. Tutton, third with Her Majesty, fourth with Clinthya, and fifth with Baroness Burdett Coutts, with which variety Mr. J. Douglas was also second.

Rose or Scarlet Heavy Edge.—Mr. C. Turner secured all the prizes in this class, being first and fourth with Mrs. Payne, second with Edith D'Ombraim, third with Fanny Helen, and fifth with Constance Heron.

Rose or Scarlet Light Edge.—Mr. C. Turner was first with Lucy, Mr. Dodwell securing the three following prizes with L'Elegante and the fifth with Miss Lee.

Yellow Grounds.—Mr. J. Douglas was first and third with Princess Beatrice,

Mr. C. Turner second with Bullion, and Mr. Dodwell fourth with the same variety, Mr. C. Turner being fifth with Princess Margarita.

MISCELLANEOUS.

Classes were devoted to Selfs, Fancies, and Yellow Ground Carnations and Picotees, the stands entered being very bright and telling. For twenty-four blooms (not less than twelve varieties) Mr. C. Turner was adjudged chief honours for a varied collection of Selfs and Fancies. The best were Mary Morris, Virgo, Mrs. Bridgewater, Mrs. Llewellyn, Rufus, Autolycus, Flirt, Jessica, Thomas Cathcart, Whipper-in, Field Marshall, and Albert. The second position was gained by Mr. J. Lakin, followed by Mr. J. Douglas, both of whom showed good blooms of the best varieties in cultivation.

For twelve blooms Mr. E. S. Dodwell was awarded the first prize with a charming stand, the bloom large and exceedingly bright. The varieties represented were Saturn, Mrs. Carter, Titania, E. S. Dodwell, Florence, Cardinal, Mrs. Dodwell, T. Moore, The Bride, and Florence Nightingale. Master Stanley Dodwell was the only other exhibitor in this class, being placed second with Titania, Henry Cannell, Sarah Payne, Arthur Medhurst, King of Yellows, The Bride, Clipper, Florence Nightingale, Dandie Dinmont, Mrs. Erskine Wemyss, and Hector.

A special prize of a case of silver spoons was offered by the inhabitants of Slough for a collection of six Carnations and six Picotees, open to amateurs not competing in the leading classes. Mr. J. Laken was the only exhibitor, and secured the prize with neat but small blooms of Edward Adams, Sarah Payne, P.F., J. Douglas, Friar Tuck, Mrs. Tomes, Tinnie, Mrs. Payne, John Smith, Dr. Epps, Edith D'Ombraim, and Zerlina.

During the afternoon a luncheon was held in one of the large span-roofed houses, a company of between sixty and seventy guests assembling. In the unavoidable absence of J. T. D. Llewellyn, Esq., the chair was taken by G. F. Wilson, Esq.; the vice-chair was occupied by Mr. Shirley Hibberd, side tables being taken by Messrs. E. S. Dodwell and J. Douglas. A number of toasts were proposed, the principal, in addition to the usual loyal toasts, being "The Floricultural Societies," "The Royal Horticultural Society," "Mr. C. Turner," "The Exhibitors and Judges," and "The Horticultural Press." Messrs. S. Hibberd, Barron, Turner, Hewitt, Dodwell, and Douglas responded in suitable terms, the first-named making an exceedingly humorous speech in reviewing the progress of the Carnation and Picotee Society.

The weather proved very fine in the morning, but a heavy shower in the afternoon considerably marred the pleasure of the visitors; however, they had abundant opportunity of inspecting both the Exhibition and the attractions of the nursery, which was in admirable condition both outside and under glass. Three or four large houses were filled with some thousands of vigorous and well-flowered Carnation and Picotee plants representing all the best varieties in commerce, and proving by their fine healthy appearance how well their requirements are understood. Outside, the Roses and miscellaneous hardy plants were the chief features, the Dahlias that will in a few weeks produce such a fine display being in grand condition. The meeting on the whole proved a most enjoyable one, and the visitors separated late in the afternoon well satisfied with their outing.

THE CHRYSANTHEMUM.

[A paper read before the Sheffield Floral and Horticultural Society, June 6th, 1883, by Mr. J. Udale, gardener to J. Watson, Esq., Shirecliffe Hall, Sheffield.]

(Continued from page 80.)

PROPAGATION.

THIS is effected by seeds, cuttings, layers, and division. The first method is rarely adopted, except by hybridisers or for raising the annual and sub-shrubby sections. The Chinese and Japanese kinds rarely perfect their seeds in this country, and the late Mr. John Salter used to send his seed-bearing plants to a warmer climate, from whence the seed was returned to him, and he was thus enabled to proceed successfully with the important work he had in hand.

Any of the species may be raised from seed by sowing in moderately light soil composed of loam, leaf soil, and silver sand in equal proportions, and covering the seed with one-eighth to one-quarter inch of soil, after which the soil should be gently watered by means of a fine rose and kept constantly moist. The pots, pans, or boxes in which the seed is sown should be placed in a mean temperature of 60° until the young plants appear, when they should be moved to a cooler place, kept close to the glass, and treated according to their respective kinds and the object in view.

The most general method of propagation is by cuttings. There has been much controversy amongst good cultivators as to the best time, some preferring November, others February and March; but in the case of some varieties most of us are glad to take the cuttings as soon as we can get them—at all events, it is a safe rule to secure the November cuttings, more especially where there is not proper accommodation for preserving the old stools through the winter. My practice is to commence propagating in November, and if necessary continue it even till April; but I prefer to have all cuttings in by the beginning of February. Where space can be spared it is an excellent plan to keep the old plants till the end of January, and exposed to full light and plenty of air, frost being excluded, all shoots and suckers to be thinned out to three or six according to the strength of the plant. These suckers or offsets will make the strongest plants during the coming summer, and produce first-class blooms in the autumn.

In selecting cuttings in a general way those should be chosen that are moderately strong, short-jointed, possessing good foliage, and without embryo buds at their points. Having secured them, the next step will be to prepare pots for their reception. The size most suitable are 60's, but any size may be used, and as many cuttings inserted as there is room for; but I will assume that the cultivator's object is to produce the best possible results by the best practical method, and for a definite purpose. Whether that purpose may be for the decoration of the greenhouse, for specimen plants, or for extra large flowers it is essential to make a good beginning. That being so, it is advisable to insert the cuttings singly into small pots, so that when rooted they may be transferred into larger without mutilation of the roots, which latter it is hardly possible to avoid when there is more than one plant in a pot, and it is necessary to divide them. Therefore take

as many small pots as you require, place a crock or inverted oyster shell over the hole of each, then a few smaller crocks according to their sizes, the larger at the bottom and smallest at top; over these place a little moss, cocoa-nut fibre, or the more fibry portion of loam, to prevent the fine soil being washed down and stopping up the drainage, and so prevent the free exit of superabundant water, any hindrance to which is speedily followed in all manner of cases by sourness of soil, partial, and eventually total, suspension of root-action, and consequent sickness or death of the plant. Too much stress cannot be laid upon the necessity of efficient drainage for any class of cultivated plants, more especially for those requiring copious supplies of water; and the Chrysanthemum is one of these, particularly so when the pots are filled with roots, and the plants are rapidly evaporating the moisture they contain under the combined influences of a scorching sun and parching wind of a day in July or August.

The pots being crocked they should be filled with a compost consisting of one part mellow loam, one of leaf soil, and two of silver sand or river sand. A surfacing of sand may be given, the whole pressed down to within half an inch of the rim, watered, and allowed to drain. The cutting is inserted firmly in the centre of the pot by means of a small dibber. When all the cuttings are inserted place them close to the glass in a greenhouse from which frost is excluded, never shade them, but keep the soil constantly saturated with water until the pots are nearly filled with roots, when they should be transferred to larger pots, and watering must be carried out with more care. I am aware that some good Chrysanthemum growers place the cutting pots in cold frames and leave them without further protection; but such a system does not commend itself to me for various reasons, consequently I do not recommend it to others.

Layering is generally adopted in summer and autumn, more for the purpose of obtaining miniature plants for special purposes than for increasing the stock. This is readily effected by bending the selected shoots down to the soil or pots in which it is desired to root them, and securing them therein, keeping the soil constantly moist until rooted, when they should be severed from the old plants and placed in a shady position for a few days and syringed several times a day until recovered from the check they have received, when they should be exposed to the full influences of sun and air.

Propagation by division of old stools is so simple as to require no particular instructions thereon, except that the plants in all cases should be treated similarly to rooted layers.

Having secured young plants, the next step is to decide which shall be grown for ordinary greenhouse decoration, which for specimen plants, and which for cut flowers for exhibition. In selecting for the first purpose the free-flowering varieties have precedence; for the second, quality as well as quantity is of the utmost importance; for specimen blooms size and quality must be considered.

PLANTS FOR GREENHOUSE DECORATION.

The soil for the first potting should be rather heavier and richer than for cuttings. A good compost is formed of one-third fibry loam, one-third leaf mould, and one-third sand. The pots suitable for this shift are 6-inch ones; these should be drained and the drainage secured as directed for the cutting pots. The soil in which the plants are growing should be moist at the time of potting, and the same rule applies to all subsequent operations. All being ready, place as much soil in the pot as will leave sufficient space between the surface of the old ball and the rim as will hold sufficient water to saturate the whole mass at one watering. Next fill in all around in equal proportions, and press the new soil as firmly as the old, leaving the new soil exactly level with the surface of the old ball. After potting place them in a cold frame or other structure from which frost can be excluded, keeping them near to the glass. Little ventilation should be given till root-action recommences, when more air may be given, and their leading points nipped out to enable them to develop lateral branches, the process being repeated until as many branches are obtained as desired, but in no case to be continued after the middle of June, as the growth made after that time sometimes fails to produce flowers of a satisfactory character.

About the beginning or middle of May they may be transferred to the pots in which they are to flower, those 10 inches in diameter being quite large enough. The soil should be of a strong and rich nature, three parts fibry loam, one of leaf mould, one of sand, and one part old manure. The potting should be performed as previously directed, with the addition of a sprinkling of soot over the drainage, which will serve as a stimulant and assist in keeping worms from entering. The potting should be performed as previously directed, taking care to make the new soil as firm as the old ball. The plants afterwards should be placed on a bed of ashes in an open situation, but at the same time where they may be partly sheltered from strong gales. In the case of amateurs and others who are not able to attend to the watering in the middle of the day it is a good plan to plunge the pots in coal ashes or any other suitable medium three parts of their depth, taking care to place the plants sufficiently far apart that each may be exposed to sun and air.

Water must be unsparingly applied when required, and their wants in this respect should rather be anticipated than allow them to suffer in the least degree. As growth proceeds and the pots become filled with roots weak manure water may be applied at every alternate watering, and after a hot day a sprinkling overhead is very beneficial. The Chrysanthemums should be boused the first week in October, and placed where they can have unobstructed light and a free circulation of air, with a temperature of 40° to 50°. About the end of the month the buds will commence to show their colour, and from the middle of November to middle of December will be in their full beauty. After flowering they should be cut down and kept in a cool light place until a fresh stock has been secured.

SPECIMEN PLANTS.

The general treatment of specimen plants for exhibition is very similar to that for ordinary decorative plants, but some of the details are necessarily different. Having selected from the general stock the most suitable for the purpose and the number required, as soon as they are well rooted they should have their points pinched out. This will cause them to throw out two, three, or more shoots, and as soon as these have made one or two leaves they should be transferred to 5-inch pots, using the same compost as before described, and kept growing as rapidly and robustly as possible. As soon

as the three shoots have attained sufficient size, and whilst they are pliable, they should be trained horizontally and equidistant, at the same time removing the extreme growing point. After growth has recommenced the plants should be potted into 8-inch pots, using a compost of three parts turfy loam, one of manure, one of leaf soil, and one of sand. The shoots should be kept tied outwards and downwards in order to furnish a good foundation for the future specimen, and as soon as these have made three or four joints their points should again be removed. After growth has recommenced the plants will be ready for placing into the pots in which they are to flower. These need not be larger than 12 inches in diameter (inside measure), a size in which plants measuring 5, 6, and 7 feet across may be grown.

Having drained the pots place some fibry turf over the crocks, and a handful of soot over that. Let the compost consist of four parts loam, two of decayed horse manure or old Mushroom bed, one of sand, and one of soot. Having thoroughly mixed the whole proceed with the potting, ramming the soil quite firm. When potting is completed place them in an open but moderately sheltered position on a bed of coal ashes, taking care to let each plant stand apart from its neighbour. Syringe them in the evening after a hot day, and be careful with the watering until root-action has commenced. About the second week in June let them receive their final pinching, after which the plant will be furnished with from fifty to eighty flowering shoots. As growth progresses these should be staked out at equal distances apart, or otherwise trained as the cultivator prefers. As the pots become filled with roots liquid manure may be given, and occasional waterings with weak guano water will be beneficial, but this must be used with great caution.

As the flower buds are formed they should be thinned out if fine blooms are desired. In some cases buds are developed for a considerable distance down the stems, and most of these should be removed, as it is impossible for them to develop into good flowers, and their presence is detrimental to the quality of those that remain. In all cases of disbudding the central or best-formed bud should be left, although occasionally the central bud is deformed through accidents. When that is the case the best secondary bud should be chosen. A dozen incurved varieties most suitable for specimen plants are Barbara, Beverley, Hero of Stoke Newington, Lady Harding, George Glenny, Mrs. Heale, Mrs. Dixon, Prince Alfred, Prince of Wales, Princess of Wales, Venus, and White Venus. Japanese.—Elaine, Fair Maid of Guernsey, James Salter, The Cossack, La Charmeuse, and Bouquet Fait. Pompons.—General Canrobert, St. Michael, Lady Margaret, Cedo Nulli, and Mr. Astie.

I ought to add that good specimen plants may also be grown from two-year-old plants; but unless they are exceptionally well managed the individual flowers will not be so fine, and they are more difficult to train.

(To be continued.)

EASTBOURNE SHOW.

JULY 26TH.

A MORE unfortunate day could not have been chosen for the above Show as regards the weather, but a more appropriate place than Devonsbire Park could not have been selected.

Plants were well shown. In the open class Mr. Gilbert, Springfield Nursery, was first with eight admirable specimens in bloom, the most notable being *Statice profusa*, *Kalosanthes coccinea*, *Erica Cavendishiana*, quite fresh; *E. cerinthoides*, and *Aphelaxis macrantha rosea*; Mr. Tudgey of Waltham Cross being second with *Allamanda Hendersonii*, *Anthurium Schertzerianum*, and *Erica ferruginea major*. Mr. Rann, gardener to J. Warren, Esq., Handcross Park, was third. In the amateurs' class for six Mr. Dennis, gardener to C. H. Woodroffe, Esq., Silver Hill, Hastings, was a good first, having *Anthurium Schertzerianum*, *Clerodendron Balfourianum*, *Statice profusa*, &c., in good condition; second Mr. Jupp, gardener to G. Boulton, Esq., Torfield, Eastbourne. Mr. Rann was to the fore with fine-foliage plants, having amongst others *Crotons Challenger* and *Youngi* very handsome, *Gleichenia Mendelli*, and *Pritchardia pacifica*; Mr. Tudgey being a close second, having *Croton Queen Victoria*, *C. Johannis*, *Cocos Weddelliana*, &c., in fine condition. Mr. Gilbert was third. In the amateurs' class for six Mr. Jupp was first. For eight exotic Ferns Mr. Gilbert was first, Mr. Jupp being second, Mr. James, Lower Norwood, third. Mr. Tudgey was easily first for six *Ericas*. For groups arranged for effect Mr. Jupp was placed first with a very bright effective group, well arranged, and not a bare pot to be seen. *Fuchsias*, *Achimenes*, *Begonias*, &c., were fairly shown. Messrs. J. Veitch and Sons of Chelsea exhibited an interesting and varied collection of plants not for competition, which attracted more notice and admiration than anything else in the Show; they also exhibited stands of *Roses*, *Carnations*, and *Picotees*.

Cut flowers were not in strong force. There were only two exhibitors in the open class for *Roses*, thirty-six trebles; Mr. Piper, nurseryman, Uckfield, being first and Mr. Mitchell, Piltown Nursery, Uckfield, a close second. Both these exhibitors showed well. Mr. Knight, Hailsbam Nursery, also put up a very good stand not for competition, and a bunch of flowers of *Rhus Cotinus*, which attracted attention. For twenty-four bunches of cut flowers Mr. Gilbert was first with a very good stand, Mr. James second, and Mr. Jupp third. There were other prizes for cut flowers, but these were restricted to members of the Society, and no one is eligible to become a member unless he resides within the parish of Eastbourne.

Fruit was rather sparingly shown, but some of the exhibits were good and some were otherwise. For collection of eight dishes Mr. Gore, gardener to Capt. Taylor, Glenleigh, was first, very closely pressed by Mr. Williams, gardener to C. Liddell, Esq., Peasmarsh Place, whose Grapes were excellent, the former having a little advantage in the small fruit. Mr. Williams obtained three first prizes in the classes for black Grapes, white Grapes, and single bunch of any kind, being followed closely by Mr. Booth, gardener to W. Yates, Esq., Buckham Hill, Uckfield, in black varieties, and Mr. Gore in white varieties. Buckland Sweetwater was exhibited by Mr. Williams very fine, the berries being particularly large. Mr. Jupp had very good Peaches and Nectarines, and was first with both. Mr. Booth was first for scarlet-flesh Melons, Mr. Williams first with green-flesh. All the classes for vegetables were confined to members except one, Messrs. Carter & Co.'s special prizes, and there were complaints about that, Mr. Williams being

an easy first, Mr. Rollisson, Eastbourne, being the principal prizetaker in the other classes.—J. G.

THE NEW PARCELS POST.

As the new Parcels Post, which has just come into operation, forms an epoch in the history of the Postal Service, and as there is scarcely one of our readers but who will be affected by or influenced in the new arrangement, but many who will not have the information they require at their elbow, we publish the regulations that have been issued on this important subject.

The Inland Parcels Post commenced on Wednesday the 1st of August, and parcels *not exceeding 7 lbs. in weight* are now received at any Post Office for transmission between places in the United Kingdom.

In order that a packet may go by Parcels Post, it must be tendered for transmission as a parcel, and should bear the words "Parcels Post"—which should be clearly written in the left-hand top corner.

Every Post Office will be open to the public for Parcels Post business on week days during the same hours as for general postal business. No Parcels Post business will, as a rule, be transacted in England or Ireland on Sundays, Christmas Days, and Good Fridays; nor in Scotland on Sundays and Sacramental Fast Days.

The following are the principal conditions and regulations:—

The size allowed for an Inland Postal Parcel will be—
 Greatest length 3 ft. 6 in.
 Greatest length and girth combined 6 ft. 0 in.
 For example—
 A parcel measuring 3 ft. 6 in. in its longest dimension may measure as much as 2 ft. 6 in. in girth, *i.e.*—round its thickest part; or—
 A shorter parcel may be thicker; thus—if it measure no more than 3 ft. in length, it may measure as much as 3 ft. in girth—*i.e.*, round its thickest part.

The most convenient mode of measuring will be by means of a tape 6 ft. long, having the length of 3 ft. 6 in. marked thereon. So much of the tape as is not used in measuring the length will be the measure of the maximum girth permissible. Such a tape, if provided by stationers, might conveniently be marked in one colour up to 3 ft. 6 in., and the remaining portion in another colour.

The rates of postage will be—for a parcel:—

Not exceeding 1 lb. in weight	3d.
Exceeding 1 lb. and not exceeding 3 lbs.	6d.
" 3 lbs. " " 5 lbs.	9d.
" 5 lbs. " " 7 lbs.	1s. 0d.

No parcel will be accepted which weighs more than 7 lbs., or is not sufficiently paid. The postage must, in all cases, be paid *in advance*, and by ordinary postage stamps, which must be affixed by the sender before tendering a parcel for transmission by Parcels Post at a Post Office.

Posting of Parcels.

Parcels must not be posted in a letter box, but must be taken into a Post Office and handed over the counter. Care must be taken that every parcel bears a clear address.

If a parcel be posted in a letter box it will not be forwarded by Parcels Post, but will be treated as a letter, or as a book packet if it can pass under Book Post regulations.

The address of a parcel must be clearly written, either on the outer wrapper or on a separate address label securely fastened to the parcel; and the necessary stamp or stamps to prepay the postage must in all cases be placed (as in the case of letters) close above the address.

Forbidden Articles; Treatment of Perishable and Dangerous Articles; and Parcels which must be refused.

Parcels which bear on the outside any writing or drawing of an indecent or offensive nature, or within which any contents of a like nature may be observed, and parcels containing gunpowder, cartridges, lucifer matches, or anything explosive or liable to sudden combustion, bladders containing liquid, live animals, grossly offensive or filthy matter, and anything in a condition likely to injure other parcels, or any officer of the Post Office, are prohibited.

If any such parcel be tendered for posting, it will be refused, or, if detected in transit, it will be detained.

Parcels containing fish, game, meat, eggs, &c., or razors, scissors, needles, knives, forks, or other sharp instruments, will not be accepted unless securely packed so as to guard against risk of injury to other parcels. Liquids or semi-liquids, such as jellies, pickles, paint, varnish, &c., will not be accepted unless in bottles or cans securely stoppered; nor powders unless so packed that they cannot escape in transmission. Bottles, or glass in any form, will be accepted only when so packed as to be secure from breakage. If a parcel be tendered in a damaged or insecure condition, or in a condition likely to injure other parcels or any officer of the Post Office, it will be refused. If a parcel in such condition should be observed in transit it will, if possible, be made secure and sent forward; but if it cannot be so secured it will be detained.

Parcels known to contain a letter, packet, or parcel intended for delivery at an address other than that borne on the parcel itself, are prohibited.

Parcels to and from the Channel Islands and the Isle of Man.

Parcels addressed to the Channel Islands (Jersey, Guernsey, Alderney, Sark, and the adjacent inhabited islets) will be received from the public under the same general conditions with regard to weight and size, and at the same rates of postage, as parcels for all other portions of the United Kingdom; but as the Channel Islands, in relation to the Custom laws of the United Kingdom, are subject to the same restrictions as foreign countries, such parcels will be liable to Customs examination at the port of arrival, and the sender will be required to make a declaration of contents upon a special form provided for the purpose at the office where the parcel may be posted.

Goods intended to be warehoused in the Channel Islands, or on which it is intended to claim "drawback" of duty on subsequent exportation from the Channel Islands, will not be accepted for transmission by Parcels Post.

Parcels for the Isle of Man will be treated in all respects in the same way as parcels for places in the United Kingdom generally. They will be liable to examination by the officers of Customs, but the sender is not (as in the case of the Channel Islands) called upon to furnish a declaration of contents.

The Customs Laws of the United Kingdom do not admit of the use of the Parcels Post for the introduction into Great Britain of tobacco in any form.

Parcels Addressed to a Post Office to be Called For.

To those Post Offices to which letters may be addressed to be called for, parcels may also be addressed to be called for.

There is no private box delivery of parcels; but parcels may be obtained as follows on application at a Post Office, provided the Postmaster is satisfied of the identity of the applicant:—

1. By persons having parcels addressed to a Post Office.
2. By persons not residing within a free delivery.
3. By persons residing within the free delivery of a Head Office, or of any rural post, so far as regards parcels for which there is no immediate delivery by the usual means.
4. By members of the military, naval, constabulary, and coastguard services, under the same rule as applies to the delivery of their letters.

Parcels addressed to a Post Office to be called for, or to a person residing beyond the free postal delivery, will be kept three weeks.

Parcels addressed to a ship will be kept one month.

If, however, such a parcel contains perishable matter it will be kept only forty-eight hours; and should it become offensive it may be disposed of at any time as the Postmaster General may direct.

Parcels Liable to Demurrage.

Parcels addressed to a Post Office "to be called for," and only such parcels, are liable to a demurrage (detention) charge, if not called for within a certain time, at the rate of 1d. a day after they have remained in the office one clear day, counting as a day the period during which the office is ordinarily open to the public.

Thus a parcel arriving after the opening of the office on a Monday becomes liable to demurrage if not called for before the closing of the office on Tuesday night, and if delivered on Wednesday the charge will be 1d., one penny being added for each succeeding day, or part of a day.

No charge will be made in respect of Sundays, Christmas Days, Good Fridays, or Bank Holidays in England or Ireland; nor in respect of Sundays, Bank Holidays, and Sacramental Fast-days in Scotland.

No demurrage will be charged on parcels addressed to persons residing outside the limits of the free delivery, or to persons on board ship.

Re-direction of Parcels.

On receipt of a properly signed authority a parcel may be re-directed under the following regulations:—

If the re-direction be from one place to another within the same delivery, the parcel, not having been delivered, and being re-directed by an officer of the department, is liable to no charge for re-direction; but if re-directed by any person other than an officer of the department, or to an address in another delivery, it is liable to additional postage at the full prepaid rate for each re-direction. If it has not been delivered and is re-directed by an officer of the department, prepayment for re-direction is not compulsory, but a parcel which has been delivered as addressed will not be accepted for re-transmission unless the postage for re-direction be prepaid.

Returned Parcels.

In order to facilitate the return of parcels which cannot be delivered, it is most desirable that the name and address of the sender should appear on the outside of every parcel.

If a parcel which cannot be delivered bears on the cover the name and address of the sender, a printed notice will be sent to him by post, informing him that the parcel (if not claimed in the meantime by the addressee) will be given up to him or to any person whom he may direct to call for it, or will be returned to him by post.

If the parcel should be called for by the sender or his agent, or if it should be returned to him by post, it will be liable to a charge of 1d. for each day or part of a day after the expiration of two clear days following that on which the notice has been sent.

If the sender should elect to have the parcel sent back to him by post, he must return the printed notice, with stamps sufficient to cover new postage at the full rate and also to cover any other charges to which the parcel may be liable, including the charge of 1d. a day described above. The parcel will then be forwarded to him prepaid by stamps affixed thereon.

If no reply be received within six days after the date of the notice, or if the Postmaster should have reason to believe that application is made for the parcel by a person who is neither the sender nor the addressee nor duly authorised by either, or if the sender fail to pay the charges due on the parcel, the parcel will be sent to the Returned Letter Office.

If a parcel which cannot be delivered does not bear on the cover the name and address of the sender, it will be sent to the Returned Letter Office, where it will be opened and examined.

If upon such examination the name and address of the sender are ascertained, a printed notice such as is described above will be sent to him, and the parcel will be treated in the same manner as a parcel upon the cover of which the name and address of the sender appears.

If the name and address of the sender cannot be ascertained from the examination of the parcel, the name of the addressee of such parcel, and the Post Office at which it was posted will be entered on a list, which will be exhibited in a conspicuous position at the Returned Letter Office of the District for inspection by the public.

Personal applications for parcels entered on such lists will be enter-

tained for three months from the date of entry, after which the parcels will be finally disposed of.

Parcels without Address.

Parcels found without addresses will be sent at once to the proper Returned Letter Office.

Parcels found to contain dangerous or offensive matter will be detained.

Rural Carriers Forbidden to Collect Parcels from the Public.

Rural Letter Carriers on foot are forbidden to collect parcels from the public. Mounted Rural Carriers are also forbidden to collect parcels from the public except under special authority.

Delivery of Local Parcels by Mounted Rural Carriers.

A parcel handed by the public to a Mounted Rural Carrier authorised to collect parcels, will be delivered either on his outward or inward route, provided it shall first be taken to a Sub-office in order that the stamps may be defaced.

Parcels above Weight or Size, or Insufficiently Paid.

Should a parcel exceeding the prescribed limits of weight and dimensions be accepted by a Mounted Rural Carrier or Mail Driver authorised to collect, it will be stopped at the office at which he hands it in, and returned to the sender by the person who accepted it. Should a parcel be accepted with insufficient postage, stamps for the amount of the deficient postage will be affixed to the parcel, which will be sent on to its destination, and the amount will be charged against the person who so accepted it, and who will have to collect it from the sender.

Parcels not to be Accepted near a Post Office.

Mounted Rural Carriers or Mail Drivers, even when authorised to collect, may refuse to accept parcels tendered to them close to a Post Office.

Rural Letter Carriers not to Carry Parcels on their own account.

Rural Letter Carriers or Parcels Carriers on foot are forbidden to carry parcels of any kind on their own account. In certain exceptional cases, in which special permission has been given to carry newspaper parcels, this rule will not be enforced as regards such parcels.

Newspaper Parcels carried by Horse Posts.

Mail Cart Contractors or their Drivers, and Mounted Rural Carriers may carry on their own account parcels of newly published newspapers, addressed to a news-agent, without restriction of weight, so long as the carrying of such parcels does not interfere in any way with the due performance of the Mail Service; but they are not allowed to carry on their own account parcels of any other description except in cases where they hold a special authority to do so, and such authority will in no case include parcels which are within the limit of weight prescribed for Postal Parcels.

Parcels by Passenger Conveyances.

Contractors for the carriage of Mails by passenger conveyance are not subject to any restriction as to the parcels they may convey.

Detention of Parcels under special circumstances.

The Postmaster-General has power to delay parcels when it is necessary to do so in order to secure the due despatch of the Letter Mails, or when it is expedient for the safety and protection of Parcels Mails. When, therefore, a Postmaster is satisfied that the despatch or delivery of letters would be delayed by the despatch or delivery of parcels, such parcels, or any of them, may be detained until the following despatch or delivery; or if it be necessary for the safety and protection of parcels that any of them should be forwarded or delivered by a later despatch or delivery than that for which they were intended, a Postmaster may delay such parcels, or may make some special arrangement for the despatch or delivery thereof, such as he may deem necessary or expedient in the circumstances of the case. In no case, however, must the delay exceed 24 hours.

Private Bags.

Postmasters are not prohibited from enclosing parcels in private bags, but under no circumstances will the restriction as to the weight of a private bag when empty be relaxed.

A Parcel not to be Given Back to the Sender.

The rule forbidding that a letter should be handed back to the sender applies equally to a parcel.

Bankrupts' Parcels.

The Post Office rules which apply to bankrupts' letters apply equally to bankrupts' parcels.

Deception as to Place of Posting.

Postmasters are forbidden to be parties to deceiving the addressee of a parcel in regard to the place of posting.

If a parcel reaches a Post Office under cover with a request that it may be posted, it will be endorsed according to the rule applicable to a letter similarly received. If the parcel bears the necessary postage it will be forwarded as addressed. Should the postage not be prepaid, the parcel will be sent to the Returned Letter Office.

Damaged Parcels.

A parcel found open, or in a torn or injured condition, will be refastened as carefully as possible and secured with an official seal, or by means of a label similar to those provided for securing torn letters, and initialled by the responsible Officers.

Non-Liability of Postmaster-General.

The Postmaster-General is not liable to make good any claim in respect of lost or damaged Parcels.

Gratuities.

The Post Office regulations, which apply to the solicitation of gratuities from the public by persons employed in the postal service, apply to persons engaged in parcels work.

Suggestions.

(a) Mercantile firms and others who may have to post a large number of parcels at one time, will facilitate the despatch of the Parcels by sending them to the Post Office in batches, and as early as possible.

(b) The risk of delay in the transmission of parcels will be largely obviated if senders of parcels in large quantities (whether it be the intention to post the parcels daily or at regular or irregular intervals) will so far as possible notify their intentions to the nearest Postmaster or Sub-Postmaster as early before-hand as convenient. It is not essential that the number and weight of the parcels and the frequency of posting should be specified with absolute precision: it will be sufficient if a general idea be given so that some provision over and above the ordinary means available may be arranged for in advance.

(c) The Public will greatly assist the work of the Post Office, and help towards the safe delivery of Parcels, by taking care that they are in all cases strongly and securely packed, especially those with fragile or perishable contents. It must be borne in mind, although of course every care will be taken by the Officers, that such a Parcel must be several times handled before it reaches its destination, and will probably have to be packed with many others of a different kind and shape, or more weighty and bulky.

(d) It is not intended to apply to postal parcels the practice which obtains of adding to the address, in the case of letters for the Metropolitan District, the Postal District Initials, and such initials should not be used in addressing a parcel to London or the Suburbs.

By Command of the Postmaster-General,

S. A. BLACKWOOD,

Secretary.

General Post Office,
July, 1883.

KITCHEN GARDEN.

Endive.—For autumn and winter salads there is nothing more useful than this, and now is the time to sow seed to produce plants which will come in for use from October until after the new year. Endive does not grow much after the first frosts, and it is best to have it well advanced by November at the latest, and plants which are full grown by that time may be kept good for some months afterwards. The Broad-leaved Bata-vian and French Moss-curler are excellent varieties. The seed should be sown in drills $1\frac{1}{2}$ inch deep and 1 foot apart. Thin sowing should be the rule. As soon as the plants have a few rough leaves and are large enough to handle they should be thinned out of the seed rows and be planted on the south borders, where they will have a good soil and be well exposed to the sun. If a plant is left every 6 inches or so in the seed rows these will be ready for use some time before those transplanted.

Sowing Onions.—Onions of the Rocca and Tripoli types should now be sown, and as this sowing will supply young Onions throughout the winter and many plants for transplanting and growing in the spring, they cannot have too much attention. The ground for the reception of the seed should be in good condition, and if a heavy coating of soot or a light sprinkling of salt is dug in with the manure it will prevent grubs doing damage to the plants. In market gardens where thousands of plants are wanted it is a common practice to sow broadcast, but in all private gardens we like to see them in rows, and these should be from 12 inches to 15 inches apart. The seed must not be more than 2 inches below the surface, and when it is in and covered over it may either be very firmly trodden or rolled. When the plants are showing hoe between the rows and keep them free from weeds.

Winter Cucumbers.—As yet it may appear early to speak of winter, but we can never be too well prepared for it; and in the case of many things, particularly Cucumbers, there is always much advantage in having the plants well established, strong and healthy before the weather becomes sunless and the days short. By sowing seed now the plants will be well up in a month hence, and by October they will be capable of bearing fruit. Cardiff Castle is a kind most suitable for fruiting in winter, and after this comes Telegraph. The seed should be sown singly in pots of moderately rich soil, and they may be plunged in a gentle bottom heat near the glass. Where old Cucumber plants are showing signs of exhaustion young plants had better be obtained to secure a heavy crop through the autumn.

Chicory.—Early-sown plants of this are always liable to seed prematurely and become worthless, but if seed is sown now a quantity of young roots will be produced by October, which will be of the utmost use for lifting and blanching throughout the winter as an excellent addition to our salads.

Earthing up Celery.—Much of this is ready for earthing up, but it should only be done when the leaves and soil are dry. If left too long without earthing the stems are apt to bend over and break; but there is no reason that this should happen, as it will always pay well to earth up and give timely attention in every way to it. Before the first earthing

some of the short outer leaves should be drawn off, then one person should break up the surrounding soil with a spade, and another hold one hand around the plant and with the other place the soil about the stems. In doing this care should be taken that none of the soil goes down to the centre of the plant. Where worms are plentiful a dusting of soot may be thrown over the plants before earthing begins.

Spinach.—More seed should be sown to keep up the supply in autumn. Through lifting Potatoes and clearing off other vegetables there is now plenty of empty space for such crops.

Late Peas.—Where it is seen that any of these are likely to be too early cut the tops off below the first bloom, and this will cause them to produce side shoots, which will bloom very much later than the main stems. Where a number of rows of Peas are grown a long succession may be had from them in this way, as those allowed to go on will form pods soon, and the others will follow.

Saving Seed.—Wherever any kind of vegetable seed is being saved attention must be given to the plants, as they may become too dry for the proper development of the seed, or the stems may fall over with the weight, and a check and deterioration may take place in this way. We always prefer to allow some of the very finest of the produce to mature for future stock. This is the only way to retain the true character of any variety, and it is always an advantage when seeds can be matured on the plants through the assistance of plenty of air and sunshine. Seeding plants which are pulled up and taken indoors in autumn to ripen in a green immature state will neither benefit the cultivator nor improve the race of the plant.

FRUIT-FORCING.

Vines in Early Houses.—The Vines from which the Grapes were cut in April and May must still have attention in watering and syringing, so as to preserve the foliage in a clean healthy state until all the buds are fully matured, when, if the lights are moveable, they may be taken off for a few week and painted. If it is necessary to make any alterations or additions to the border the needful compost should be prepared, so that it may be proceeded with promptly as soon as the foliage shows indications of ripening.

Vines in Pots for Early Forcing.—These will now be ripe in wood and buds plump, when they should be placed outdoors in a warm airy situation, protecting the pots from the sun by wrapping some canvas around them. Supply water moderately, and stand the pots on slates to prevent worms entering.

Ripe Grapes.—These should be kept cool and the atmosphere rather dry, but there must not be any extreme dryness at the roots, moderate moisture being essential to the health of the foliage; and great aridity in the atmosphere is not essential, but to some extent prejudicial to the keeping of the Grapes, and is absolutely so as regards the foliage, which should be maintained in good condition as long as possible. Houses of ripe Hamburgs will need slight shade over the glass to prevent loss of colour. Herring netting will be sufficient to break the force of the sun's rays, and as the netting will not exclude too much light it may remain until the Grapes are cut. Keep the laterals within bounds, though moderate extension will be beneficial, particularly in the case of weakly Vines.

Late Vines.—These now swelling off their crops will need especial attention in watering, it not being possible when the crops are heavy to give too much tepid liquid manure to the inside borders. Similar attention will need to be given the outside borders if the weather be at all dry, and a good mulching. The Vines being started early the Grapes will be well advanced, and their ripening ought not to be accelerated by sharp firing. Give air abundantly and early, and close with sufficient sun heat to raise the temperature to 90° in the early part of the afternoon, admitting a little air before nightfall at the top of the house, as also in front, a very little being sufficient to cause a circulation of air. Syringe the walls, paths, and borders every evening without wetting the Grapes, and an ammonia-charged atmosphere will be beneficial in keeping down red spider, in addition to benefiting the Vines. Perhaps there is no better means of supplying ammonia than by introducing a few pecks of fresh horse droppings at frequent intervals, spreading these on the borders thinly. The tendency of ammonia, along with proper nourishment at the roots, is to encourage a vigorous growth of leaves and laterals, and the laterals should be encouraged, only thinning and stopping so as to prevent overcrowding.

PEACHES AND NECTARINES.—*Watering.*—One of the most important elements in the treatment of late houses is the liberal employment of water alike to the roots and foliage. In properly constructed and thoroughly drained borders the Peach will take almost any amount of water, and in hot weather the inside and outside borders will need thoroughly soaking twice a week where there is no mulching; but as a mulching of well-decayed manure is essential in keeping the roots near the surface and the soil uniformly moist, all borders inside and outside should not be neglected in this matter one moment later than the trees have passed the stoning process. More failures in Peach cultivation are attributable to moderate, or partial watering, than any else, as it induces red spider, and the present crop, as well as the buds for the future, do not attain to that development they otherwise would were the supply of water adequate to the requirements of the trees, which during hot weather is very considerable from the large extent of evaporating surface of the leaves exposed to the sun.

Syringing.—Trees in late houses must be syringed twice a day, but discrimination must be made of trees which, from being gross, do not become dry between the intervals, for it is essential that the foliage do

not remain for any length of time "dripping wet." The foliage should become fairly dry before nightfall; but when this does not take place, the trees being wet in the morning, it is obvious that the morning syringing must be omitted, but instead of following this precedent the evening syringing should be discarded, and the trees syringed in the morning only. Be very particular about the water employed for syringing. It ought to be clear, soft, or rain water, or, if of necessity spring water must be used, it must be free from lime.

Training, Exposing the Fruit, and Thinning.—Keep the young shoots tied down to the trellis, train them in thinly so that the foliage will be acted on freely by sun and air, stop all laterals at one joint of growth as made, and remove or shorten back any gross shoots likely to interfere with an equal distribution of sap, and consequently vigour throughout the trees. The leaves where they overhang the fruit must be turned aside or shortened, so that the fruit will be fully exposed to the sun. Fruits on the under side of the trellis should be turned round, so that their apices face the light, keeping in position by laths placed across the wires of the trellis. If the crop when the fruit is taking the last swelling be too heavy thin it without delay, removing the smallest and worst placed. One fruit to a square foot of trellis covered by the trees is ample to have really fine highly flavoured fruit.

Gathering the Fruit.—To have Peaches of the best flavour they ought to be gathered before being dead ripe, as if allowed to remain too long they lose juice, becoming more or less mealy, and this is more particularly the case if the fruit has to be packed for travelling. The fruit should be gathered in the morning. Great care is necessary in handling Peaches, as the slightest pressure leaves an indent and the fruit is spoiled in appearance. In some of the large kinds which swell considerably round the wood it is advisable, when practicable, to remove the wood with the fruit, clasping the fruit in all cases with a pad of cotton wool in the hand.

PLANT HOUSES.

Ferns.—Plants that have become rootbound will be much benefited by the application of weak stimulants occasionally. These plants, in the majority of instances, receive little but water after they reach this stage, but it is surprising what noble specimens can be produced in small pots by judicious feeding. Nothing will be found more satisfactory than liquid made from cow manure and clear soot water, applied alternately or together. Adiantums and Davallias include those most useful for cutting purposes, and should have free exposure to air and light to harden their growths. Fronds from plants that have been well prepared for the purpose last much longer than those from plants that have been grown in a close moist heat; in fact, Ferns grown under the latter conditions are useless for cutting.

Polystichum proliferum.—Although hardy, this is one of the most useful Ferns that can be grown indoors for purposes of decoration. Small plants form a very effective edging for the greenhouse stage, and when grown in from 2 to 5-inch pots, are unsurpassed for the decoration of rooms. Being hardy, and grown under cool conditions, they last much longer than any other Fern. Another advantage, and one that most highly commends it to notice for this purpose, is the ease with which a large stock of small plants can be produced. One fair-sized specimen will produce hundreds, which form along the entire length of the older fronds. The fronds should be pegged down on a pan or over a bed of soil until the young plants form roots and are independent of the parent, when they can be placed in small pots, or, to save labour in watering, in pans or boxes, until they attain a larger size and are ready for placing in the sizes they are intended to be used in for decorative purposes. These plants can be grown in cold frames, or can be plunged outside during the summer months in any shady position where plenty of water can be given them.

Small Ferns for Decoration.—It is surprising how easily a stock of small Ferns can be maintained if a few plants are allowed to establish themselves naturally in the walls of plant or fruit houses. Where the stock is raised by sowing spores we would strongly advise cultivators to endeavour to establish a few plants from which thousands of seedlings can soon be obtained. A few plants have been established in our Cucumber house on the top of the back wall, and the wall beneath has been left unlimewashed since early spring, and is now a mass of small Ferns, and the same may be said of lumps of loam that have been undisturbed for a time on the Cucumber bed. By means of this system a continual supply of young Ferns can be maintained with but little care or trouble.

Selaginella Kraussiana (denticulata).—One of the most useful species that can be grown for furnishing purposes, either in dwelling-rooms or any of the many decorative purposes this plant is useful for. Where large quantities are in constant demand all the year round successional batches must be provided according to the demand, but where only required largely during the winter and spring the present is a good time to prepare a large batch. We find this plant the most useful in 2 and 3-inch pots, and in shallow pans not more than 1 inch deep; those prepared in the last mentioned are the most serviceable, as they can be used for surfacing the soil in the pots used in dwelling-rooms. It is wise to prepare the pans in time, so that the Selaginella becomes a dense mass. Any light soil will suit it, and when the pans are filled they can be placed amongst other plants in the stove or under the shade of late Vines, or in any shady position until they commence growth, and afterwards are better in a cool house than in heat.

Chrysanthemums.—The majority grown for the production of large blooms will now be showing a flower bud, which is known as the "July bud." This must be removed at once with the point of a knife, and the

best of the three-growth buds nestling round it selected to extend again in an upright direction. The plants must be pushed out of this stage as rapidly as possible, and all side shoots removed directly they can be seen until the plants form another flower bud, which will be towards the end of next month. Feed liberally from this time, and keep the shoots tied to the stake used to support them, or else the shoots may be broken in windy weather.

Staking must be pushed on rapidly with all bush plants intended for decorative purposes, and the shoots afterwards secured to the stakes as they extend. Stimulants must also be freely applied to these, and care must be taken that the plants never suffer by want of water, or they will become seriously checked and their lower foliage be much injured.

Heliotropes.—Plants intended for autumn and winter flowering should now be bushy little specimens in 3 and 4-inch pots, and ready for transferring into others 2 or 3 inches larger. Good loam, a seventh of manure, and a little sand will grow them well. After potting stand the plants outside, and attend to the pinching of the shoots as they require it from time to time to keep them compact and bushy.

THE BEE-KEEPER.

APIS MELLIFICA IN JAVA AND CEYLON.

(Translated by Mr. Alfred Neighbour from the "Bienenzeitung," No. 7, 1st April, 1883.)

THE gentleman in charge of the Imperial German Consulate of Batavia, who has for years past been kind enough to keep me informed of all that takes place in the island of Java as regards bee-keeping, sent me recently a cutting from a native paper which contains some notices of the bees introduced into Java by my friend Mr. F. Benton. Thinking that any information on the acclimatisation of bees in Java may be of interest so far as the history of bee-keeping is concerned, I have translated the article referred to, of which the following is an extract:—

"An American bee-keeper, Mr. F. Benton, who visited Java in order to study *Apis dorsata*, and, if possible, to introduce this bee into Cyprus, and thence into Europe and America, brought nine colonies of bees with him, seven being from Cyprus and two from Palestine. New hives were procured in order to try once more to acclimatise bees in Java after the first attempt to introduce the European bee, which was made in 1878, had proved a failure. The trial was made at Tjikeumeuh under the direction of Mr. Messink.

"The bees were placed in the Botanical Gardens under the superintendence of Mr. Benton, who looked after them personally for twenty-five days. When he left four queens had commenced laying eggs, and the other colonies, including their queens, were in tolerably good condition considering the long voyage they had made. During the first fortnight after their arrival the bees were fed with sugar dissolved in water. After this time the workers from four hives began to fly out and returned laden with honey. The queens continued depositing eggs for about three months after their arrival in Java. After that egg-laying diminished, and at last the bees quite ceased to leave the hive.

"The number of worker bees became smaller and smaller, and finally some of the colonies dwindled down so much that only the queen and a few worker bees were left. With a great deal of trouble one colony was kept alive till the end of the year. But when the western monsoon set in in 1881 the population of this stock also dwindled away, and the workers flew out no longer, probably on account of the dampness of the atmosphere.

"It is to be regretted that the second attempt to acclimatise the bee in Java has also turned out a failure, in spite of all the precautions that had been taken to make the experiment a success. The loss of all the colonies was probably caused by the worker bees not finding sufficient food during the hot season, the consequence being that the queens did not receive the proper amount of food, and therefore discontinued laying eggs.

"The experiment to domesticate the East Indian Bee (*Njirean*) has given a better result than a previous attempt in 1877 and 1878. For the last eight months there have been two colonies of these bees in Tjikeumeuh with very large populations. The bees fly out and collect a great deal of honey. Eggs are deposited regularly and without interruption. The honey of this bee is generally considered inferior in flavour, while the wax is said to be of excellent quality.

"A swarm given off by one of the colonies a short time ago has been secured, but it was no easy task. In Europe a swarm generally settles on a branch of a tree near the apiary, from which it is easy to remove the bees; but the Indian bees fly high up into the air, and do not settle till some time after.*"

* It may be assumed that *Apis indica* is the bee referred to above. The indigenous *Apis indica* of Java was described by Latreille ("Annales du Muséum d'Hist. Nat.," v., p. 170, No. 4) as *Apis Peronii*. It is hardly to be supposed that experiments should have been made to domesticate the small East Indian bee, *Apis florea*.—THE EDITOR.

Mr. Benton's attempt to acclimatise *Apis mellifica* in Java has unfortunately proved a failure, and I fear there is but little prospect of this bee becoming domesticated there, although I consider it quite possible if the bees after their arrival in Java are made to raise young queens, because the vitality of the imported queens becomes impaired during the long voyage. It would be necessary in that case to increase the population of the colonies and their stores quickly by feeding.

In Ceylon the bees that were imported by Mr. Benton have been more successful than those in Batavia. During the rainy season from May till September the colonies were supplied with food, but in the remaining months of the year the bees collected sufficient honey from the flowering Palm trees and other tropical plants for their own wants, and had even some to spare for their master. One stock swarmed three times, but unfortunately, during the absence of the bee-keeper, the bees had been left in charge of the servants, who neglected to attend to them, so that all the three swarms flew away and settled in the jungles, where they probably perished during the rainy season.

For the last few years experiments have been made to acclimatise the Vanilla in Ceylon, but only by artificial fertilisation was it found possible to get these plants to produce mature fruit. The "Tropical Agriculturist" calls special attention to the numerous visits of *Apis mellifica* to the Vanilla blossoms, and adds that the owner of the plantation has for this reason entirely discontinued the fertilisation of the Vanilla flowers by artificial means. In case the cultivation of Vanilla in Ceylon should prove successful the importation of *Apis mellifica* will have largely aided to bring about this result, and it would be quite worth while for this purpose alone to keep bees in Ceylon, even if they had to be supplied with food during the rainy season.—(Signed) A. SCHRÖDER, Trieste.

TO CORRESPONDENTS

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Seedling Strawberry (*H. S.*).—The "weed" you sent appears to be a young seedling Strawberry plant, but it was so much crushed that we cannot determine it with certainty. Of course, if you wish, these could be easily pulled up and destroyed.

Shooting Pigeons (*T. B. Dolly*).—We have not yet obtained the information you desire, but will endeavour to do so. Anyone shooting a pigeon "wantonly" is liable to a penalty of £2 above the value of the pigeon.

Seedling Carnations (*Sigma*).—There are no prominent points of merit, considered from the florist's standard, in any of the varieties you have sent. No. 1 is undoubtedly the most distinct; it is novel in colour, and would be effective in borders. Nos. 2 and 4 are also good border varieties; but 6 is a nondescript colour, and a variety that we should not perpetuate.

Rose Election (*A. H. P. and L. D.*).—As you may see by reference to page 57 of our issue of the 19th ult. the election this year will consist of the newer varieties—namely, the best six, second best six, and next best twelve exhibition Roses introduced since 1877, including that year; and the same as regards the new Roses best adapted to garden decoration.

Dressing for Rhododendrons (*S. J.*).—It is questionable if there is anything better for mulching the surface of the soil amongst Rhododendrons than a thick covering of leaf soil, scattering a little heavier soil over it to prevent its being displaced. A correspondent a short time ago pointed out that some shrubs mulched with leaf soil had made far better progress than others, and required no watering. A thickness of 4 inches will not be too great in your gravelly soil.

Climbing Cinerarias (*Z. Z.*).—We do not know any true species of *Cineraria* of climbing habit. Possibly you refer to some of the *Senecios*, especially those which, like *S. macroglossa*, have leaves resembling the Ivy. These are of climbing or, more strictly, trailing habit.

Lycoperdon giganteum (W. E.).—The fungus is a small example of the Giant Puffball, *Lycoperdon giganteum*, which is common in some pastures and meadows near London and a few other districts. It is edible, and esteemed by some fungologists as a great delicacy when cut in slices, peeled, and fried in butter after dipping them in yolk of egg. They should be gathered young for this purpose, whilst the substance is white and pulpy. When yellow stems appear it is unfitted for eating.

Prunella vulgaris (T. L.).—The weed is popularly known as Self-heal, and botanically as *Prunella vulgaris*, being a member of the family Labiate. The best mode of destroying it is by forking it up now and removing from the land, also hoeing frequently in the spring. It often appears in lawns, and if very abundant the only course that can be adopted is to dig it up, relevel the ground, and sow fresh well-cleaned seed. The name Self-heal is derived, according to Parkinson, from the fact that "in France and Germany it is a common proverb that they need neither physician to cure the inward diseases, nor chirurgeon to help them that have *Prunella* at hand to use."

Pit for Melons (J. T. S.).—As we understand your case, the flue you name will be in the pit and under the bed for affording bottom heat, the sides of the return flue being intended to supply top heat. We do not think you would have sufficient atmospheric heat by this plan. Perhaps, however, you mean that the flue is to be in the centre of the pit for giving top heat, the sides of the return flue being intended to heat the bed. In this case there would not be sufficient bottom heat. In a case of this kind a plan of the house drawn to scale, the position of the flue being indicated, is requisite for the matter to be clearly understood. Melons can be grown very well with the aid of flues, but the flues must be well constructed, and sound judgment exercised in the management of the plants both as regards moisture in the soil and atmosphere.

Propagating Tropæolums (Idem).—The variety Ball of Fire is very good and most easily propagated. Cuttings inserted in pots of sandy soil in August, kept moist, close, and shaded for a time to prevent flagging, will speedily emit roots. The young plants may either be potted off, one in the centre of a 3-inch pot, or three round the sides of a 4½-inch, or they may remain in the store pots until spring. A shelf in a greenhouse from which frost is excluded will be suitable for them in the winter. When growth commences in the spring the plants may be topped and the cuttings rooted in heat, any required number being provided in a very short time. Until the cuttings are rooted the soil must be constantly moist, but in winter only sufficient water should be given to prevent flagging. Avoid, however, mere surface sprinklings while the roots may be dry below, or the plants will inevitably decay. Choose short-jointed firm growths for cuttings, which may be about 4 inches long, pinching out all flower buds as they appear after the cuttings are inserted.

Raspberries Luxuriant (J. R.).—You do not say that all the canes have branched in the manner you describe, and if they have not retain the most promising of those that are short-jointed and essentially of a fruit-bearing nature, cutting the exuberant growths away. If all the canes are as you describe, then you must thin-out the laterals, retaining the best, as if you cut them all off you will seriously impair your next season's crop. It is not the best plan to secure growths of this kind vertically to stakes and shorten the canes to the orthodox height of 4 feet, as by this practice the best fruit-bearing portions are cut away. It is far better to train the canes thinly, so as to form a hedge by securing them obliquely to stakes driven between those now supporting the plants. The finest crop of fruit we have seen this year was on canes trained as described, and from 8 to 9 feet long. Had they been shortened to half that length there would not have been half so many Raspberries.

Cropping under Trees (Idem).—In the fruit gardens in the Thames valley the land is constantly cropped with vegetables and flowers, and by the free use of manure the fruit trees continue in a healthy free-bearing state for generations. If you had grown early instead of late Potatoes they would have been cleared in time for sowing grass seeds, but as you have grown late kinds you cannot sow until the spring—the end of March or beginning of April. It is for you to consider whether to take crops of early Potatoes next year, or have strong Cabbage and Lettuce plants ready for planting as soon as the Potatoes are cleared off, manuring for these crops, which would be off the ground in time for sowing grass seeds in August. Had you stated the size of the trees and the distance they are planted our reply might perhaps have been more satisfactory.

Peaches under Glass (P. C.).—You ask if we "consider that trees in full bloom in a house without heat are liable to be affected by frost, so as to cut off all promise of a crop of fruit." Undoubtedly they are so liable, and we have known great losses incurred under the circumstances indicated. It is possible in a measure to mitigate the evil by retarding the trees as much as possible by free ventilation in winter and early spring; but as a matter of fact when glass is erected either the owner or the gardener in charge desires to protect plants of some kind, and thus keeps the house close on their account, forgetting that he is exciting the trees and causing the expansion of the blossom at a dangerously early period. Even when every precaution has been taken we have known Peach blossom under glass totally destroyed by frost when there were no means of excluding it. As a rule we consider that if it is worth while going to the expense of building a Peach house, it is worth while also to afford the means of excluding frost and securing crops of fruit; at the same time we know that in some districts, and with judicious treatment, good crops are usually obtained in unheated houses.

The Moss Campion (D. W. H.).—The little plant of which you sent a specimen is *Silene acaulis*, popularly known as the Moss Campion. It is a native of Great Britain, being found near the summits of the highest mountains, generally growing upon rocks. The plant is abundant on Snowdon, Ben Lomond, and most of the Scottish mountains, and it is said to have been the last flowering plant observed by Saussure when ascending Mont Blanc. The habit is dwarf, and as Parkinson remarks, it has a "number of heads of small green leaves thick set together, tufts in this manner spreading over much ground and covering it like moss." To this resemblance it owes its popular name, and by Gesner it was named *Muscus floridus* for the same reason.

Duke of Buccleuch Grapes not Ripening (F. J. M.).—We are very sorry indeed to see such fine Grapes in the condition of those before us, and in the absence of details of culture we can only attribute their state to some rather severe check the Vines have received. If the leaf you have sent is a fair sample, the Vines are scorched; and if all the leaves are like the one before us, that would be sufficient to impede the swelling of the fruit. The only suggestion we can offer is, that it would be well to encourage the growth of laterals and to keep the roots amply supplied with water. It is just possible the border may be too dry. Examine it, not on the surface, but 2 feet below, and act accordingly.

Vine Leaves Infested with Insects (Ignoramus).—The leaves are not affected with mildew. The black matter on the upper surface of the foliage is due either to the presence of mealy bug or scale, but we found no bug on the leaves and only one scale. Those you can do little with now, only to search for and remove the pests; but when the Grapes are all cut syringe the Vines and house with petroleum, employing a wineglassful to three gallons of water, syringing into the watering pot and on to the trees alternately, to keep the petroleum mixed, otherwise it will rise to the surface. There are also traces of thrips, against which fumigate on a calm evening and repeat in a week, being careful to have the foliage dry; and there is evidence of red spider, against which syringe thoroughly with clear rain water in the evening, ventilating the following morning before the sun acts powerfully upon the house. The bunches that are "going withered" are unquestionably shanked, which is due to a variety of causes, the most general being inactivity at the roots through their being deep in a cold wet border, the best remedy for which is lifting the Vines and laying in the roots nearer the surface, providing thorough drainage, with a proper compost.

Tydæas Unhealthy (Beta).—The rusted and shrivelled appearance that these plants, also Gloxinias and Achimenes, often assume is frequently the result of diseased corms or tubers. The disease is aggravated by injudicious watering and keeping the plants in a house in which the atmosphere is too dry. Sulphurous fumes, and even fumigation with tobacco smoke, are injurious to most kinds of Gesneriaceous plants. Apparently you have a very unhealthy stock, and you will do well to procure fresh plants that have no signs of disease, and give them somewhat different treatment from that which the example before us has received. We feel sure there has been some error in culture, but are unable to point it out, since you do not state the conditions under which the plants were grown. Is there an excess of iron in the soil? if so, that would in a great measure account for the condition of the plants.

Australian Apples (T. W. H., Auckland).—Your letter is unanswerable. It is quite impossible for anyone to say what price would be given for Apples next April, May, and June; but in all probability the price then will be lower than would have been obtained for good samples in the corresponding months of this year. Last year there were practically no Apples in British orchards; this year the trees are mostly bearing heavily, and there is the contingency of consumers becoming "almost tired of Apples" before the season is over. It is a question if April consignments would be lucrative. High-class produce arriving in the best condition later might meet with better demand. There is only one way of proceeding practically in this matter, and that is by sending samples to a respectable fruiterer, and if the varieties are such as find favour in the market, and the fruit arrives in good condition, no loss may attend the experiment. A trade of this kind cannot be established by correspondence alone, nor in a season. Some varieties of Apples may not be worth sending over at all, while others may possess considerable value. Named samples should be sent with the view of ascertaining the varieties that can be the most profitably sent in quantity. If you send produce for which there is a demand fruiterers will be very glad to receive it, and will send you a fair price for it, or it can be sold by auction, as many tons of French Plums have been sold in London this week at good prices, because there is next to no English Plums this season. You will see in another column reference to a consignment of Australian Apples, which is not encouraging. We have, however, seen fruit from the Antipodes arrive in the most perfect condition. The method of packing you propose is good. If you send samples to Mr. Webber, Central Avenue, Covent Garden, he will give you his opinion on them, which, from a commercial point of view, will be entitled to consideration.

Hydrangea paniculata (Subscriber).—This plant can be readily propagated by cuttings of half-ripened wood taken from the plant after flowering, and inserted under handlights placed on the shady side of a wall or hedge. Younger growths can also be employed for cuttings, and these will root quickly if inserted either singly in pots or a number together (the first method being preferable), and placed under handlights or in a close frame until they are rooted. If propagated in heat give a good watering after insertion, and keep the cuttings close and well shaded afterwards until they are rooted; cuttings possessing two joints—one to be in the ground and the other just above the soil—will suffice. The chief secret of flowering this *Hydrangea* well in a pot is the thorough maturation of the wood. After flowering the plant should be hardened and placed outside, then in autumn or early spring should be closely pruned back; if one pair of eyes is left on the new wood that will be ample. By giving your plant greenhouse treatment after the new year you will be able to have it in flower by the end of the month of June. If required earlier it must be subjected to forcing; an intermediate temperature is best for this purpose, where a fair amount of air can be given daily when favourable to maintain a dwarf sturdy growth. If forced in a close warm house its growths will be weakly, and may fail to flower; but they flower freely under a more judicious system of forcing.

White Pinks for Forcing (Idem).—There is no difficulty in obtaining a stock of the old white Pink for forcing, provided you possess plants that are planted out in beds and borders. Slip off a number of strong growths, and insert them as cuttings thickly together in 4, 5, or 6-inch pots, whichever will be most serviceable for you. The cuttings require but little making, and if the shoots are short they may be inserted as slipped off from the parent plant, removing the lower leaves. They root much better if a portion of the old wood is left attached to them. This may be carried out any time towards the end of this month. Any ordinary soil will do for them in which a little leaf soil and coarse sand has been intermixed. After insertion give a good watering, keep them close in a frame, and shade from bright sun until

rooted. By following this plan the majority will strike root. Another good plan—and perhaps the best for you, as it is by far the easiest—is to slip off portions consisting of a handful of growths from plants that are fully exposed and pot them in a similar manner as if they were small bushy plants lifted from the outside. The size of the clumps entirely depends upon the size of the pots you wish to place them in. After potting give a good watering, place them in a cold frame, and keep them close for about a fortnight, when they will be rooted, and can then be stood outside until the approach of frost. They should again have the protection of a frame until Christmas, when the first batch may be introduced into the forcing house.

Constructing Garden Wall (A Soldier).—The wall ought to be built hollow, as such are drier and warmer, besides not taking so many bricks. Stone is not suitable for a garden wall, and is more costly than bricks, as the stone, however cheap, will entail much expense in dressing to make it available for fruit trees; besides, it is not so absorbent of heat as bricks are, and remains wet longer. We have not only had walls built hollow, but used hollow bricks except the external headers, which, of course, to have an even surface on the face of the wall must be solid. A good base should be formed by excavating to the ground; and if there be any doubt about the foundation it should be concreted, putting in 6 inches in thickness of gravel and lime, enough lime being employed to form a mortar-like mass. The foundation ought not to be less than 2 feet from the intended surface level, and the wall up to that level should be taken up solid. You do not mention the intended height of the wall. If 9 or 10 feet above the ground level 14 inches will be proper, but if 12 feet or more it should be 18 inches in thickness, being respectively a brick and a half and two bricks thick. It is best built, if hollow, in Flemish bond in exposed localities, but as this will only give a very partial hollowness we have in sheltered situations three bricks on the face and then a header, and on the opposite side of the wall a course of bricks on face without any headers. In the next course it is simply changing sides. That without headers is laid so that the headers cross those first laid or on the opposite side of the wall, and the parallel course has no headers. In this way the wall is taken up to within the top two courses, which should be more solid, by introducing the true Flemish bond. You will have in this way a 4½-inch cavity.

Names of Fruit (Inquirer).—The Gooseberry sent is either the Crown Bob or Monarch. It is not easy to determine which without knowing the habit of the bushes. Both varieties are largely grown for market purposes, and both are good. We have mislaid your letter, but you will recognise this reply.

Names of Plants (Flos).—As we have many times stated, we cannot undertake to name varieties of florists' flowers, which are far too numerous and too much alike for identification. They can only be properly named by comparing them with others in a large collection, and florists from whom the plants are obtained will usually give the names of flowers that are sent to them. We only name distinct species of plants, not garden varieties. (W. McK.).—As you might have anticipated, the flowers placed loosely in a box without any packing of any kind arrived in a very shrivelled state. So far as we can identify them the names are as follows:—1, Impatiens Noli-me-tangere; 2, Justicia speciosa; 3, Campanula fragilis; 4, Echeveria scaber. (R. C., Flaneswood).—We have received your letter, but no flowers to which it refers. (C. T. A. M.).—Flowers sent in a dry box, with no packing to keep them fresh and firm, usually arrive in a shrivelled condition like those before us. No. 1 is Francoa ramosa; 2, Funkia ovata; 5, Oxalis corniculata rubra; the others are too withered for identification.

Bees (R. W.).—The term you mention refers to the condition of the combs and whether the honey is ready for extracting. If they are filled with honey and sealed over they are in the condition indicated.

COVENT GARDEN MARKET.—AUGUST 1ST.

VERY heavy supplies of fruit to hand, with prices lower all round.

HORSE LABOUR IN FARMING.

THIS subject, to be fairly treated, must be considered commercially in the interest, not only of the home farmer, but also in that of tenant farmers generally. Omitting the value of the necessary implements of husbandry, it is found that the value of those horses employed in farming the arable lands is nearly equal to the annual rental of the land cultivated by them, and also that the annual cost of keeping these is little less, if any, than their average value. These facts are sufficient to exhibit the importance of the subject. In manufacturing operations and in locomotive travelling steam power has, from its superior economy, effectually supplanted animal power, but it is only in the supplementary form that steam has economised the tillage of the land by assisting the horse power, especially at certain important periods of the year. Therefore, it is found that horses must be kept for various purposes. It is, nevertheless, of the utmost importance to adopt the best and most economical methods of managing them.

The amount of horse power required on the farm will require great judgment and experience, for upon large farms containing above 600 acres and upwards steam power may be used to a greater extent, and justify the farmer in the purchase and use under his own supervision either of a single or double set of steam tackle, according to the extent of the arable land and the size of the field; whereas upon farms of from 300 to 500 acres of tillage land, and the hiring of steam power within reach, the employment of horse labour must be based and regulated. Somewhat in the same way economy may be practised by supplementing horse power by working bullocks, but this cannot easily be done with true economy by making working oxen a part of tillage power for the whole year, in consequence of their not being available for all kinds of work at all times like horses. We, therefore, propose, as a matter of economy and commercial benefit on the home farm where no steam power is obtainable or can be kept, bullocks may be used in tillage for a period by a system which will be noticed further on.

The number of horses which can be profitably employed on the arable land will vary in a great measure according to the nature of the soil, and the course of cropping and tillage adopted. A very common and practical way of reckoning is to take the number of horses required at per 100 acres on the farm, with a moderate portion of meadow or pasture land. In this way four horses is considered sufficient for the cultivation and other work on the farm for each 100 acres. But even then it will vary according to the size of the farm. Thus it may vary from three to four per 100 acres, but not forgetting that very much will depend upon the size, breed, and power of the horses, as well as the implements used; for in a general way we believe that much horse power is frequently wasted, not only through the want of power in the animals, but through bad management and insufficient food.

It is of the greatest consequence to determine which is the best style and type of cart horse; but this is somewhat difficult, and certainly requires much intelligence and judgment on the part of the farmer, for we find the Clydesdale and the Shire horse prevailing favourites where the question has received the necessary attention. The size, however, and activity of the animal are of the utmost importance, and more so than is generally supposed, for unless we have horses of 16½ or 17 hands high, with substance in proportion, we are unable to avail ourselves beneficially of various improvements in the farm implements. Take, for instance, the use of the double and treble furrow ploughs; and to use these with effect in the ordinary operations of ploughing every horse should be enabled to turn a furrow; thus we use two horses only for a double-furrow plough, being of the height and power named. On our light-land farms we may well choose lighter and more active animals; but, like the Suffolk breed, still we contend for height as one of the leading points requisite. It is not our intention to enlarge upon the merits of different breeds of horses or the breeding and rearing of them, for we have done this in two numbers of this Journal, dated the 30th of January and 6th of February in 1879.

The next point to be considered is keeping the animals,

whether in stable or in the open air; for during eight months in the year—viz., from October to June, there can scarcely be a doubt that it is far more desirable in every respect to keep working horses in the stable. The effect of exposure to cold and wet throughout this period of the year is, in fact, tantamount to the waste of so many quarters of oats. To have full regard to the health of the animal is a matter of necessity as well as economy; we therefore contend for the keeping of horses, when in full work, in the stable for rest, shelter, and feeding, as of actual necessity if the stable accommodation is sufficient and properly arranged for the health of the animals, requirements for which are set forth in detail in our article in this Journal, dated November 10th, 1881. We must also refer the reader to an article in this Journal dated May 29th, 1879, upon the subject of "shoeing," for this is really the foundation and basis of the ability of the horse to perform its work either in tillage or road work; besides which, in many country districts the shoeing of horses is left entirely in the hands of the local smith, and thousands of horses are annually ruined and useless for labour in consequence of bad shoeing.

Nearly all the points have now been enumerated which enable the farm horse to perform the work of tillage with effect and with economy to the farmer, except that of feeding, which certainly demands attention. That the subject has not yet been exhausted is clear from the frequent and continued discussions of it at the meetings of local farmers' clubs, and from the attempts of writers in every new work on agriculture to throw some additional, if not new, light upon it. The cost of horse power is, moreover, a subject of particular moment at present when steam power in its various agricultural purposes and uses is being declared cheaper than horse power. This declaration and contention alone ought to furnish the grounds for a detailed inquiry by the farmer; but is it worth while in the first place to consider their relative positions as between animal and mechanical power? Prizes have been awarded at the various annual meetings of the Royal as well as local Societies for using steam power in the field for tillage and cultivation, which is said to be an economical substitute for the horse-drawn plough. We use the word "alleged" instead of "proved" in order to suggest the need of some further explanation of it; and as the essay in the Journal of the Royal Agricultural Society of England, contributed by Mr. J. C. Morton, contains the best and fullest information upon this part of our subject we quote from it. He says, "The cost of the competing steam power on the occasion of the trial was fully analysed and specified. It was stated in the official report under the heads 'Engineer,' 'Plough and Anchor,' 'Men,' 'Boys,' 'Water-cart,' 'Coals,' 'Oil,' and 'Interest on Capital;' while that of the competing horse power was merely estimated. It was 'estimated' that the light land could not have been so well ploughed by horses under 8s. an acre, nor the heavy land under 12s. 6d. It would have been more satisfactory had this estimate been justified by a detailed analysis instead of being merely declared, for it is not too much to say that while under one man's management the cost of horse culture might have been as much as 10s. an acre, under another it would not have been 7s. 6d. But it is plain that a decision of the narrow question of immediate cheapness cannot be made by comparison of actual cost on the one side with mere 'estimate' upon the other."

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—Horses will still be employed in preparing the land for late Turnips and occasional ploughing and other tillage, such as scarifying, harrowing, and rolling on the Wheat fallows. Should the land, however, work rough and coarse, and the couch and weeds be destroyed without rolling, so much the better, for the rougher and more cloddy the land remains for another month or six weeks the better, or until it is requisite to lay out the yard or town manure, in which case the land may be rolled to facilitate laying on the dung. In the southern, eastern, and some of the home counties the harvest has commenced on the early crops like Rye, winter Oats, winter Barley, Early Victoria White, and Canadian Oats, early Peas, &c., and as these crops will be the first to harvest, carting and stacking will now be going on. It will also be necessary, or at least it will be advantageous, to cultivate and sow such land, if clean, with Turnip seed, Trifolium, Mustard, and Rape. If the land should be foul with couch it may with benefit be immediately rafter-ploughed and scarified as the first attempt at cleaning the land. As the general harvest will be upon us very quickly, let every possible preparation required for furthering the work during the harvest period be made immediately. Obtain the manure for stubble seeding for Turnips, and as fast as the corn is cut and stooked let the horses proceed to plough between the stooks, sowing or drilling both manure and Turnip seed every evening as fast as the ploughing is done. Let all the tackle and implements required for use during the harvest be overhauled and put into repair in order that no time may be lost during

the busiest period in connection with the farming business. Above all things take care to provide sufficient manual labour in advance, because men engaged for harvest work may be set to hoe Turnips and various other kinds of work in order to retain a sufficient staff of men for the harvest work. Again, it frequently occurs in some districts on small farms that the teams are set to work in the harvest field while the horses are turned or are idle in the stables. It is, however, bad policy to allow the horses to remain idle during the early part of the harvest before the carting and stacking of corn commences. In fact, speaking commercially or economically, nothing can justify such a proceeding, for we hold that any horse labour which can be done during the harvest period besides actual harvest work must be of great importance if judiciously set out, and will be found of more value than at many other periods of the year, especially if steam power or extra animal power can be made available for the harvest month independent of the ordinary horse power of the farming establishment.

After a succession of bad seasons there is now more couchy land in the country than we have seen before. It is, therefore, desirable that, as early as possible after crops are removed either an autumn fallow should be made, or otherwise fallow crops, catch crops, green crops for ploughing-in, &c., should be sown and tilled for without a day's loss. When the season is favourable, the land not being too hard, the land may be scarified and freed from the couch, without the cost and time employed in ploughing, and without any delay in the seeding also of various seeds, such as Trifolium. When the autumn seedings are completed the autumn fallows, and also lea ground, can be taken in hand, leaving the autumn tillage until after the Wheat is sown. Now, to obtain these desirable objects we maintain that they are of so much importance that an extra outlay upon steam power may be incurred with benefit. We must now consider the policy of stacking Wheat, Oats, and Barley. We, for many years, have preferred to fill our barns with fattening cattle rather than with corn, excepting a small portion required for threshing early for seed. Ricks made in the field where the corn is grown are a great saving of labour. We make all our corn ricks round as a saving in many respects, and we prefer to put two ricks near each other, so that the building of each rick shall be made in half a day, and threshed the same, which will be an advantage in the short days of winter, or in anticipation of changeable weather. The cutting and binding reaper is now so perfect that in all but the smallest farms it is available for work by possession or on hire.

Live Stock.—In purchasing the Irish Shorthorns which are now imported we notice them as generally being in good fleshy condition, and when they arrive at the home farm, if the animals are only two years old or under, they should not during the first few days be put on the low-lying meadows or irrigated meadows; but when they do feed on such pasturage they should be removed at night to high and dry pasture land, and there receive their allowance of cake, which at first may be 2 lbs. of cake and 1 lb. of Beans, both in meal, per day each, and to prevent waste we like to mix the meal with cut Mangolds or Cabbage in the troughs. In case of purchasing sheep stock, as they are at present so high in price for grazing or fattening on the root crops during the winter months, it requires very serious consideration before deciding upon the outlay of so much capital at a venture so uncertain merely because we have made it part of the system of farming or rotation of cropping.

OUR LETTER BOX.

Cow Unhealthy (R. C.).—Your cow is suffering from some internal inflammation and should have a purging drink at once. *Recipe.*—Take Glauber salts, one pound; ginger in powder, two ounces; treacle, four ounces. Put all the ingredients into a pitcher, and pour three pints of boiling water upon them. When new-milk warm give the whole for one dose. If the symptoms return repeat the dose at the end of two days.

REMARKS.

22nd.—Cool and overcast; much wind in morning; calm evening.
 23rd.—Dull and cool all day; rain in evening.
 24th.—Fine and much brighter, but still cool.
 25th.—Fine throughout but cool.
 26th.—Fine and pleasant, a little cloudy in morning.
 27th.—An unsettled day; some bright sunshine and a couple of very slight showers, not enough to measure.
 28th.—Fine, bright, and warm.
 A cool and rather dull week, with a generally small range of temperature. Decidedly warmer than the preceding week, but the mean temperature about 3° below the average.
 —G. J. SYMONS.

THE FUCHSIA.

THIS old favourite is not grown in many parts of the country either so extensively or so well as it deserves. Scarlet Pelargoniums and Tuberos Begonias are very well in their way, imparting a blaze and providing a show not perhaps attainable without their use; but mere glare and gaudiness in a greenhouse, especially at a season when there is glare enough and to spare outside, has not the soothing influence of the grace and quiet beauty of the Fuchsia when well grown.

True enough, skill of the commonest sort will provide a display of Zonals and Petunias, while little skill will provide Balsams and other plants which find their way to the rubbish heap sooner or later; but good culture is required to produce Fuchsias from 6 feet high and upwards perfectly furnished with growths, so that no stem or twig is seen, and so densely covered with flowers that 2 inches without blooms could not be found in the whole plant.

Yet it is not so much skill that is wanted as love for the plant, for where love is there will be attention; where love is not there will be inattention and failure. The raisers are partly to blame. Grand flowers have been produced of late years; but the tree-like habit of Guiding Star and Rose of Castile have gone, or are only forthcoming as the result of consummate skill and untiring pains.

The soil is the main item in Fuchsia culture. It needs something solid and good. No natural loam is half good enough or rich enough; but one-year-old turf from off a medium loam may be taken as the best basis; still, as it is only what is artificially supplied that is to be depended on, that rather than the medium ought to be most thought of in preparing the compost.

The Fuchsia requires nitrogen, phosphates, and potash. We have never found a better way of giving these than by laying up good loam months before it was wanted with layers of cow manure between, and then a soaking of urine. Under cover no rain washed the manure out, the soil fixed the potash and the phosphates, and turned the urea to nitrates. Meanwhile the cow manure had become soil—not the greasy fermented soil of a dungbed, and not the acidulated humus manufactured by worms—but sweet, light, wholesome, nutritious soil, gifted with root-producing, root-feeding powers. Soil so prepared would produce luxuriance in anything—for a time.

But “nothing in this world can last,” and nitrates speedily leave a soil through which water runs as it usually does in pots. Manure is not so rich in phosphates as one might think, and potash and phosphates are soon exhausted when only a small pot holds the rooting ground of a large Fuchsia. When the loam is chopped up for using at potting time then we sprinkle a little bonedust to yield future supplies of phosphates and also ammonia. The main supply of nitrogen we leave to the future, and other minerals (over and above the phosphates and potash) are supplied in the merest sprinkling of wood ashes. When the loam is very heavy or fibreless a

little sand is given—only then. So far as at present can be done a perfect soil is thus secured.

In the matter of raising plants the only beginning is with cuttings. Of course only those who have old plants from which to take cuttings can thus begin. Those who have not cannot get their young plants in too small a state. As usually treated plants of any great size have a check, and are not worth having. We cannot tell what time of the year is best for striking cuttings, but prefer January. Cuttings taken then and properly treated will be three, four, five, six-foot-high bushes, and beautifully furnished the same year. A heat of 60° is needed to do the cuttings justice, and moisture to prevent flagging is necessary. If this can be given, an open bed is much to be preferred to a close case. Open porous loam with just the suspicion of sharp sand at the base of the cuttings is the best medium to strike them in, and it should be on a bed or in a box. The single-pot system is the plan to be avoided.

If the soil is kept warm—about 70°, and the cuttings never flag, they will speedily root and commence growing. If the soil is such as we have described they will grow vigorously. If only ordinary loam is used, and the orthodox leaf soil and sand added, do not be disappointed if they fail to move. When the growth is started the plants should be transferred into 4-inch pots. The loam should be made friable and porous, and only moderately firm. The crush of roots will make it too firm by-and-by. Moreover, we want the present roots to multiply rapidly to seize in the nitrates and pass them up to the leaves to be manufactured into plant tissue. One crock in the bottom of the pots, which must be without a suspicion of clogging dirt, will be enough. The soil should be warm. Returned to their warm quarters, given plenty of room, and all the air and light possible, they will grow very rapidly, and in a few weeks will take another shift.

Long before shifting is necessary, for we prefer a pot pretty well filled with roots, we are not sure but the nitrogen in the soil may be getting scarce. As soon, therefore, as the surface of the pot is white with roots, as it will surely do in open wholesome loam kept properly moist, yet never so wet as to induce souring, we begin to give liquid manure. Nothing surpasses urine. The water is just tainted with this, and the result justifies the practice. The urea in it as well as the potash are directly assimilable, and so long as every drop of water contains both the plants never want. Anything above a taint under such conditions is too strong.

Staking always requires attention, and also pinching. When rapidly grown in a temperature of from 55° to 65° and well fed pinching is hardly wanted, except with the “improved” varieties. Varieties of good habit grow the shape of a Spruce Fir naturally, and that form is the best. One stake is sufficient up the centre. A leader must be kept for training to this. If it grows freely and furnishes side shoots plentifully let it grow. If it fails to furnish these, or if it shows flowers, the top must be pinched and repinched, and a new leader selected continually. The side growths should be similarly treated, and tied in to furnish a pyramid as perfect as possible.

In repotting keep the soil rather low in the pots, and when the pots are filled with roots top-dressing and mulching can begin. The roots always come up, and must both be fed and protected. Large pots are not advisable. If such soil as we have recommended, and such manure be applied as advised, plants from 6 to 7 feet high, half covering the pot, and 3 to 4 feet through at base, may be grown in robust health in 10-inch pots. But they must never once become dry. By continually syringing, occasionally putting a little soft soap in the water, green fly and red spider will never be seen, and by judicious shading the flowering period may be kept up for months. If urine dare not be used because of the smell, nitrate of potash will make a capital substitute, better than sulphate of ammonia.

Fuchsias so fed may be kept in good health for years in

the same pot. But we can do better: we can repot them and give them fresh soil, which acts like a charm. Not at the usual time, though. Some good man invented repotting in spring after the growth had started, and everybody knowing the doer to be successful have unquestionably followed. But that was before root-pruning was understood. Why it is the right thing to root-prune fruit trees in autumn and flowering shrubs in pots in spring we cannot guess. Perhaps Apples and Pears would be better root-pruned after the growths are started in spring, but we do not know, never having tried. But we know it gives Fuchsias a great check.

Fuchsias grown in the liberal way here recommended require a check in October. A proper drying-up accomplishes this, or a touch of frost will do it; the frost is dangerous; the drying gives a check that weakens much. It is successful, though. The sap goes out of the branches, they are pruned, and in a month or two push again, though very weakly. The drying killed the roots, and only slowly the plants recover. But they are in that way when they are shaken out of their pots root-pruned and repotted. A check follows a check, both unnatural, dead branches, feeble growths, and eyesores being the result.

A better way is in autumn to pinch all growing shoots, then a week after to turn the plants out of the pots, reduce the balls, and repot. The soil is kept moderately moist. Under this treatment the tops grow no more. The leaves, instead of falling desiccated and dried to death, ripen off, deliver their essence to the stems, which, instead of being sent to rest unprovided with a store to start the plant in spring, is stored full. The roots, instead of being dead, grow into the new soil, and in thus growing take off the surplus energy of a plant eager to advance. Such a plant not only starts with very much greater energy in spring, but gets no check afterwards, and instead of dead shoots and paltry growths becomes a huge shrub or small tree.

Space forbids particulars about pruning, training, and routine treatment. But we have pointed out the points where would-be Fuchsia growers err. The soil, potting, feeding, repotting, and root-pruning are the salient points, and when these are rightly attended to training and pruning are secondary points that the judgment alone can guide in.—
CULTIVATOR.

GARDEN CHEMISTRY.

(Continued from page 89.)

THE SOURCES AND USE OF NITROGEN.

BEING composed of exactly what garden plants most demand—nitrogen and phosphorus—what garden soils are deficient in, as well as other fertilising matter, guano when good is perhaps the best natural-artificial, if the term be allowed, in the market. For most garden crops it is very specially suited. For Vines and other fruit trees needing assistance it has been proved of extreme value. Nothing better exists for Cabbages, for ordinary flower beds, or top-dressing grass plots of all kinds, from the close-shaven bowling green to the pasture field.

Nitrate of soda (sodic nitrate) furnishes nitrogen to plants in a very concentrated form. Some samples are very impure, often, but not always, the result of being adulterated with common salt. Even "pure" samples contain from 3 to 4 per cent. of foreign matter. The nitrogen in nitrate of soda exists to the extent of 15 or 16 per cent., so it will be seen that it takes nearly 3 lbs. of it to be equal to 2 lbs. of sulphate of ammonia.

Except in the case of the Leguminosæ this salt has a telling effect on vegetation, especially on poor land. Wherever nitrogen is wanted it may be applied, but only in summer or spring. In wet seasons it is inferior to sulphate of ammonia, very probably because it is very easily washed beyond the reach of the roots and away altogether; but in seasons of drought it is better than ammonia salts, which remain on the surface unchanged. Some agricultural chemists consider that its presence favours the utilisation of phosphates by rendering the latter more soluble; but it may as reasonably be supposed to favour their absorption by giving the plants greater power to attack them.

It makes a good liquid manure, but as it affords nothing but nitrogen it will not long sustain the vigour it creates unless other essentials are applied. When dissolved in water the temperature of the latter is rapidly lowered. This should be borne in mind, for the

cold may often do mischief when the water is applied to plants in a high temperature.

Ammonia is familiar to most persons as smelling salts—ammonia carbonate. In this form it is said to be effective as an insecticide when diluted in water. An ounce of it is sufficient for a gallon of water. While it is death to green fly in Roses, it promotes their luxuriance. According to Professor Johnston a piece of it laid on a plate in a plant house evaporates slowly, and "adds greatly to the green and healthy appearance of the plants."

It is chiefly in the form of the sulphate that ammonia is to be had. This is manufactured from gas liquor—till lately a "waste product." Unlike the nitric acid of sodic nitrate, it is not readily washed from the soil, hence it is more valuable in wet districts or seasons; but, before being used, it changes to nitric acid and is then easily lost.

The sulphate is generally to be had nearly pure, when it contains from 23 to 25 per cent. of nitrogen. Sometimes a small quantity of ammoniac sulphocyanide is present, and as this is very injurious its presence should be sought for. If a solution in water turns blood red on the addition of a little ferric chloride (Fe_2Cl_6) the sulphocyanide is present.

Sal-ammoniac (ammoniac chloride) is occasionally used, and is a very powerful manure, containing, as it does, 31.78 of ammonia when pure; this and the preceding salt have solvent powers on phosphates. Some have thought that steeping seeds in solutions of ammonia salts hastened their germination and added vigour to the resulting plants. Wheat has been benefited this way; but with ordinary garden seeds the reverse is the case, or the writer has been unfortunate in his experimenting.

Ammoniac salts may be applied to everything for which nitrate of soda is suitable, and is even better for making liquid manure than the latter. It has no smell, and may therefore be used in houses where evil-smelling compounds would not be tolerated.

Nitrogen exists in a great many substances which are employed for manure, but which we need only name here. Flesh has been employed in gardens as manure, but not often, and will be even less in the future. Oftener fish has been likewise employed near the sea, when over-abundance has been landed. For the grosser-growing vegetables it proves effective. Soot owes its efficacy as a manure to ammonia, and while it is also a deterrent on worms and other insects, is often thrown away. Seaweeds are rich in nitrogenous matter, and are valued for manure whenever they can be had. In East Lothian, according to Johnston, 16 cwts. are considered equal to 20 of ordinary manure, and in the western Highlands are considered of double value. In Fife Clover is said never to fail after the application of seaweeds, but whether this is owing to any peculiarity in the way the nitrogen is combined or to the potash they contain is not clear. As most seaweeds contain much sulphur, possibly that may help Clover; and if so, the effect on Peas and Beans should prove similar. Brewers' grains, malt dust, chaff, and bran have all been used as manure, and are valuable chiefly because of the nitrogen they contain; but, unless damaged, they may be much more economically employed for feeding animals. Rape, hemp, poppy, cotton, and cocoa-nut cakes are oftener employed, but more by the farmer than the gardener. Blood dried and ground to powder is a manure containing nitrogen equal to from 12 to 16 per cent. of ammonia. Blood may be made into compost with soil or ordinary manure; it is a powerful stimulant. Horn dust is a capital article for mixing with potting soils or for fruit trees. Buffalo horn shavings were introduced a few years ago. We seldom hear of them now. Ordinary horn dust contains from 15 to 17 per cent. of ammonia (nitrogen equal to).

While the soil gains nitrogen from the rain, the rain also is the cause of heavy loss, more especially on heavily manured ground, such as that of gardens, in localities where the rainfall is great. At Rothamsted nitrates equal to fully 40 lbs. of nitrogen per acre appeared in the drainage from a bare unmanured fallow. This was the average of five years, and is equal, or very nearly so, to what is removed in 30 bushels of Wheat. Garden soil contains much more nitrogen than ordinary field soil; and though it is hardly likely, ground, even though rich, when under crop will lose as much from this cause as fallow soil does, still there is hardly room to admit a doubt that the loss is very considerable.

Ammoniac is not subject to being washed away as is nitric acid, neither is nitrogen in an organised form; but in the soil these are speedily converted by an invisible bacterium into nitrates. This transformation proceeds rapidly or slowly according to the heat in the soil. In winter it goes on slowly, in summer rapidly. While at Rothamsted some 6 lbs. appeared in the drainage during the quarter beginning April and ending in June, in October to December no less than 15 lbs. were lost. In summer the growing plants utilise the nitrates as fast as they are formed; but when in autumn the crops are removed the rapidly forming nitrates are at the mercy of the rain which passes through the soil. It was till lately supposed

that soil held the ammonia applied; but although this is true enough, it is only recently that it has been demonstrated that ammonia speedily changes its form. One way of saving the nitrates is by keeping the soil filled with active roots. On fallow ground Rape, Mustard, Turnips, Ryegrass, or other quick-growing crop, will gather up these valuable nitrates and convert them into forms less liable to be washed away. Such, turned under, will then be equal to fresh manure, though costing less—only a little trouble. These growing crops are serviceable for evaporating water, and prevent rain passing through the soil to an extent equal to what it does on bare fallow. Leaving the ground firm and undug till spring, thus causing the body of the rain to find its way into the drains by means of cracks, worm-tunnels, &c., will also do much to save them; but attention will be more particularly directed to this under another head.

In dry seasons applications of ammonia salts frequently have no effect. This is because the soil does not afford the necessary conditions for their being changed to nitrates. It must be in a moist condition for this. Under such conditions nitrates are often better, but neither is of much value unless water enough be applied to keep them in solution.

Sulphate of ammonia is generally applied at the rate of 100 lbs. an acre; nitrate of soda at the rate of 150. For some garden crops considerably more may be given, but not at once. All plants grown for their foliage alone, whether in the flower garden or in the vegetable quarters, are greatly benefited by these salts. In the case of flowering plants flowerlessness is sometimes induced, especially in wet seasons. They cause luxuriance at the expense of floriferousness. It is only on very poor soils, rich in the mineral food of plants, that they are of any benefit to plants grown for their fruit. When depended upon for such plants as Melons grand leaves are produced but poor crops of fruit. They are frequently used with mineral phosphates on various crops with success.—SINGLE-HANDED.

(To be continued.)

STRAWBERRIES IN POTS.

IN all establishments where Strawberries are extensively forced or are grown in small quantities only, two points to be considered are which are the most profitable varieties, and how best to secure strong early plants, and a few remarks upon the subject may be seasonable and acceptable. It appears to me that Strawberry forcing is not considered so difficult of accomplishment as was the case at the commencement of my gardening career. Better houses, more suitable varieties, and a better acquaintance with, or at any rate a closer attention to, the few cultural details necessary, all contribute to the marked improvement to be observed generally. A good batch of well-fruited Strawberries in pots always commands admiration, but is now-a-days considered common enough. At the same time, at the outset I wish to disavow all intention of encouraging amateurs or the proprietors of comparatively small gardens to commence or persevere in the pot culture of Strawberries. Unless well grown or appreciated to their full value they must be considered unsatisfactory and unprofitable, besides being a nuisance to most already overworked gardens, and a source of danger in crowded houses, as they are almost certain to leave a legacy of red spider or other pests. If there are no suitable shelves or stages that can be wholly devoted them, and plenty of manual labour, few or no early Strawberries ought to be expected.

At one time we layered all the requisite runners into small pots, later on shifting them into their fruiting pots, and this practice still finds favour with the majority of cultivators. However, I discovered that Mr. Bardney secured better plants than I had by layering direct into the fruiting pots, and the next season I adopted the same plan with very satisfactory results. I find it is the least laborious; the work is performed more thoroughly, as the soil can be rammed down evenly and firmly before the runner is fixed to the surface with a stone, with the result of easily securing grand early plants. They soon fill the pots with roots, and then unless separated will, as a friend once observed, contribute to the vigour of the parent plant, a by no means desirable reversion. Before this takes place they should be separated, placed thinly on ashes in the full sunshine, and kept carefully watered.

Most gardeners are well aware that the youngest plants yield the earliest and strongest runners. In large gardens the best plan is to annually plant the requisite number of rooted runners in a convenient spot, specially and exclusively for an early crop of runners the next season. Even where space is limited a portion of an early border might be devoted to this purpose, the plants in this case perfecting an early crop of fruit in addition to the runners, and then the same season be destroyed. As I have recently asserted, Strawberries require to be kept constantly rooting in firm ground, but I do not like the heavy trampling incidental to layering the runners in large or small pots and the subsequent waterings. This is another reason why I prefer to have two rows of plants alongside a walk and very near

a good supply of water. These plants, not being allowed to fruit, are available for the production of early runners during two seasons before being destroyed.

We are not particular as to the size of the fruiting pots, but the majority are fruited in 7-inch pots, and that size answers well for both early and late crops. It is all-important that suitable varieties be selected. In most cases, in addition to being free-setting, heavy-cropping, and good in quality, they must also be good travelling sorts. Much depends upon the convenience for forcing Strawberries. If grown on shelves near the ventilators nearly any variety will set well and be of fairly good flavour, the air admitted whenever the weather permitted materially contributing to these results. In some instances it is necessary to shift the earliest-forced plants when in flower to a more airy house to set, or to artificially impregnate the blooms with a camel's-hair brush, the latter being the most simple method. Then again, all early varieties with one exception are sour if ripened in a strong moist heat, and the plants must be shifted to a cooler house to finish off properly. The one exception is Vicomtesse Hericart de Thury, and this variety being also vigorous and heavy-cropping we consider it advisable for two-thirds of the stock for forcing to consist of it. Others may perfect larger individual fruits, but with us it is the heaviest cropper tried, and decidedly the most superior in point of flavour. La Grosse Sucrée, Sir C. Napier, President, and Sir J. Paxton are all suitable for later crops, the latter perhaps being the best traveller.

At one time varieties with the seeds to a certain extent embedded in the pulpy matter were preferred, at any rate this was the case when the old soft-fruited Trollope's Victoria was introduced. This variety was one of a batch of about thirty seedlings raised by Mr. Trollope, Bradford-on-Avon, Wilts, and was selected by a horticultural and medical acquaintance of mine. The remainder of the seedlings were thrown away, but it is very probable, if varieties that would travel were valued then as now, other good sorts would have been selected from them. Princess Alice Maud, better known by the abbreviation, "Alice Maud," was also raised by Mr. Trollope, and is still extensively grown for market. Mr. Laxton's new Strawberry The Captain, figured on page 12 of the present volume of the *Journal of Horticulture*, did not exactly please the above-mentioned medical gentleman, simply because the seeds were too prominent, but he readily admitted that surface-seeders are the best travellers, and therefore the most liked by gardeners. We do not want fruit partaking of the character of Raspberries, such being the worst of travellers, and would in reality be no better for the seeds being covered with pulp.—W. IGGULDEN.

JUDGING COTTAGE GARDENS AND THEIR PRODUCE.

As there are several cottage garden shows about to take place in this neighbourhood, a great favour would be conferred on many competitors if experienced judges and correspondents would (through the *Journal of Horticulture*) give a few hints on judging gardens and garden produce. An impression prevails among some persons that a tastefully arranged flower garden should receive more points than a well-stocked and nicely kept kitchen garden, while others express a contrary opinion. A few hints on vegetable-judging would be very acceptable; as, for instance, would Red Cabbage go before White Cabbage, Peas before Beans, Cauliflower before Potatoes, or Celery before Carrots, supposing them all to be as good as it is possible to grow; or which of the above vegetables should be entitled to the first place? Others might be named, such as Onions, Beet, Parsnips, Turnips, Leeks, &c. Information on those matters would be very useful and greatly appreciated.—READER.

[We shall be glad if those of our correspondents who are interested in this subject, or are willing to help those who are endeavouring to help themselves by cultivating their gardens profitably, and making the surroundings of their dwellings attractive, will send us their views on this matter. On the principle that that which is useful and serviceable is of greater importance to the cottager and artisan than that which is merely ornamental, we anticipate that the majority of persons will be of opinion that a "well-stocked and nicely managed kitchen garden" should receive more marks of approval than a "tastefully arranged flower garden;" still the skill that is exercised in the cultivation of flowers, and the taste displayed in arranging them, should not be overlooked, as the time spent in this work is commendably occupied. Some societies, we believe, often separate prizes for the best managed vegetable garden and the most attractive and enjoyable flower garden, and the plan is worthy of consideration.

As to the relative merits of vegetables, that is a point not

easy to determine, and cannot, in fact, be properly determined without considering the time the shows are held. On the score of utility Potatoes stand before all vegetables; and on the same principle, if White and Red Cabbages were staged of equal excellence in collections, the majority of judges would probably give the greater number of points to the former. Similarly, too, we presume, they would place Peas before Beans, and Onions, Carrots, Parsnips, and Turnips before Celery; except, perhaps, in August, when fine Celery always scores well, because of the labour and attention that have been involved in producing it. Really good Cauliflowers would, we presume, be quite on a level with Cabbages, and Leeks would rank before Beet. In judging produce from gentlemen's gardens the same relative value of the dishes would not obtain. Collections of vegetables are so numerous at cottagers' shows, and the judging occasionally so erratic—that is, not founded on any established rule—that it is no wonder competitors are perplexed and anxious for information that will enable them to stage their produce to the best advantage. Local gardeners also, and occasionally clergymen, who award the prizes at the shows in question, would not find their labours more difficult if they had a few general rules to guide them in their adjudications.

We by no means desire any of our correspondents to simply confirm what we have said on this subject, but would prefer that they consider the matter on its merits, and express their views, whether they are in accordance with our own or not.

GOOD CARNATIONS AND PICOTEEES.

SELECTIONS of good varieties of these beautiful flowers are always being wanted, especially by those who have not had the privilege of inspecting the shows or examining large collections of flowering plants. The following are very good:—

CARNATIONS.

Scarlet Bizarres.
Admiral Curzon(Easom).
Edward Adams(Dodwell).
Fred(Dodwell).
Lord Napier(Taylor).
Mercury(Hextall).
William Spoor(Adams).

Crimson Bizarres.
Harrison Weir(Dodwell).
John Harland(Adams).
J. D. Hextall(Simonite).
John Simonite(Simonite).
Master Fred(Hewitt).
Lord Milton(Ely).

Pink and Purple Bizarres.
Falconbridge(May).
James Taylor(Gibbons).
Unexpected(Turner).
Sarah Payne(Ward).
Stanley Hudson(Dodwell).
William Murray(Adams).

Purple Flakes.
Dr. Foster(Foster).
Juno(Baildon).
James Douglas(Simouite).
Mayor of Nottingham ..(Taylor).
Squire Meynell(Brabbins).
Squire Trow(Jackson).

Scarlet Flakes.
Annihilator(Jackson).
Clipper(Fletcher).
Dan Godfrey(Holmes).
John Bayley(Dodwell).
Sportsman(Hedderley).
Thomas Tomes(Dodwell).

Rose Flakes.
Apollo(Fletcher).
James Merryweather... (Wood).
John Keet(Whitehead).
Mrs. Dodwell(Lord).
Sibyl(Holmes).
Sporting Lady(Fletcher).

PICOTEEES.

H, heavy-edged; L, light-edged; and those not marked medium-edged.

Red Picotees.
Brunette (Kirtland) H.
Clara (Bower) L.
Dr. Abercrombie (Fellows) H.
Elsie Grace (Dodwell) L.
J. B. Bryant (Tugram) H.
John Smith (Bower) H.
Master Norman (Norman) H.
Mrs. Fuller (—) H.
Mrs. Gibbons (Taylor) L.
Thomas William (Flowdy) L.
Violet Douglas (Simonite) L.
Winifred Esther (Dodwell) L.

Purple Picotees.
Alliance (Fellows) H.
Alice (Lord) L.
Anu Lord (Lord) L.
Her Majesty (Addis) L.
Isabella (Matthews) H.
Mary (Simonite) L.
Minnie (Lord) L.
Mrs. A. Chancellor (Turner) H.
Master Nichol (Schofield) L.
Rev. J. B. M. Camm (Fellows) H.
Tinnie (Dodwell) L.
Zerlina (Lord) H.

Rose and Scarlet-edged Picotees.

Charles Williams (Norman) H.
Edith D'Ombraiu (Turner) H.
Ethel (Fellows) L.
Fanny Hellen (Niven) H.
Lady Louisa (Abercrombie) H.
Lady Holmesdale (Schofield) H.
Louisa (Addis) H.
Miss Horner (Lord) H.
Miss Wood (Wood) L.
Mrs. Adams (Adams) L.
Mrs. Allcroft (Turner) L.
Mrs. Payne (Fellows) H.

—GEO. RUDD, *Undercliffe, near Bradford.*

BEST DOUBLE IVY-LEAVED PELARGONIUM.—There must be a number of your readers who are fond of basket plants for suspension in conservatories, sunny windows, open verandahs and corridors. I have tried quite a number of the above plants in this way, single and double, with plain, variegated, and zonal foliage, but find Comtesse Horace de Choiseul, raised by Lemoine and issued by Messrs. Cannell last year, the best. The colour of the flowers is soft crimson-rose, produced in large trusses, and of wonderful staying powers. My trusses are fresh after three weeks; but they have been slightly shaded during the midday sun and suspended in a sitting-room window, which is not closed at night when the tem-

perature is above 60° Fahr. Many of the drooping Begonias do well similarly.—W. J. M., *Clonmel.*

NOTES ON PEAS.

CULVERWELL'S Paragon and Giant Marrow, Laxton's John Bull, Carter's Pride of the Market, and Telephone have been on trial with me this year. Paragon is described as being from 3 to 4 feet high, but with me on poor gravelly soil well manured it has grown to 6 feet. The pods are not curved but are straight, containing about nine fine peas, which are of good quality. Giant Marrow is what its name implies, the pods being very large, containing as a rule ten or eleven fine peas of very good quality. It is a great bearer and first-class exhibition variety. Height 7 feet. John Bull is a shorter variety, with good dark green pods tightly packed with large peas. It is fairly productive of robust growth, and no doubt will become a favourite with those who do not want to use long stakes. I consider this variety preferable to Pride of the Market, which is a good Pea of first-class appearance, but with me it has not been a good cropper. Telephone is now well known, and I need hardly describe it. I should like it better as an exhibition variety if the pods were of a deeper colour. Its rival Telegraph has a far better appearance.—H. S. E., *Great Totham.*

AMERICAN WONDER.

I have grown the above Pea with great success. It has proved a large cropper and of excellent quality and has required no support. Having cleared the crop, they would in the ordinary course of things have been pulled up and thrown away; but the ground not being wanted immediately they were left, and in two or three weeks I found to my astonishment that they were breaking at every joint, and that fresh bloom was appearing. They have now five or six pods on every plant, and will supply me with abundance of seed for another year.—C. J.

NE PLUS ULTRA.

Notwithstanding all the improvements in Peas, is there yet one more useful or of better quality than this old favourite? For late use especially I have not found one to equal it, as it continues growing and bearing for weeks, while some others produce one great flush of pods and are over in a fortnight. As to quality this is very much a question of palate; but lately I have been assisting in a family engaged in testing the quality of a few varieties of Peas when cooked. The result was as follows—Ne Plus Ultra first unanimously, Telephone second, Telegraph third, Pride of the Market fourth, Stratagem fifth, and Culverwell's Giant Marrow sixth. The peas were all alike fresh, in the best condition for table, and all were prepared by the same cook, who did her best with each. Perhaps other seven judges would place some of them differently, but I think Ne Plus Ultra would have a high position.—AN OLD FOGIE.

VIOLAS.

I NOTICE that Pansy Blue King is still announced by several persons as the best blue bedding Viola or Pansy known. I have for three or four years past discarded this variety in favour of Viola True Blue, which in my opinion is in every respect the best Viola or Pansy of that shade of colour we have. It is not a rambling grower, but has a compact, sturdy, short-jointed habit, and begins flowering very early in spring, and is a continuous bloomer. The flower is free from a central blotch, and stands wet weather well. This variety when more known will be everybody's Viola. Mrs. Gray, sent out by Mr. B. S. Williams, is at present our best cheap white. It is of a clear paper-white colour, and of good habit and a free bloomer. We have other whites—viz., Lady Polworth, and a new one of Downie & Laird's—Countess of Hopetown, which are fine, especially the latter. Of the yellow-coloured section, Viola Queen of Spring is very beautiful, entirely free from blotch, and a very free bloomer; but two of my seedlings from this variety—viz., Golden Queen of Spring and Yellow Dwarf, are improvements; the last-named is a very great acquisition. In the lilac-coloured class Elegans and Duchess of Sutherland are both admirable. Archie Grant is a very fine blue violet-coloured kind, and Lord Darnley is of a rich velvety dark violet-blue colour. Queen of Lilacs is of a blue-lilac colour, a wonderful bloomer, and of good habit. Two of our finest coming popular Violas, which will be obtainable at cheap prices this autumn, are Countess of Kintore and Mrs. Dr. Hornby, two lovely varieties of a pale purple colour tipped with white. Violas should be largely used in all gardens, but planting in October or November to get them established before winter sets in. These can be used with Hyacinths, Tulips, &c., for spring blooming, so that a continuous spring bedding display can be kept up.—WILLIAM DEAN, *Walsall.*

[A choice selection of Viola flowers accompanied this communication. True Blue quite excels Blue King, and we agree that Mrs. Gray is the best white for bedding. Lord Darnley, maroon shaded purple, is the best of that class sent, and is very fine indeed. A dwarf form of the useful Cliveden Purple is an improvement on the type; and Holyrood, violet and maroon, is very rich. At Hampton Court Violas are employed with great effect amongst variegated Pelargoniums.]

PARSLEY-LEAVED BLACKBERRIES.

I HAVE grown these for years, and they are very beautiful so far as foliage is concerned, but, what is much more satisfactory, loaded with

rich luscious fruit every season. My soil is tolerably strong, and the requisite number of the previous year's shoots are pegged-in to an unsightly wall during the spring. They often make 4 or 5 yards' growth of very strong wood. In September, 1881, I sent bunches of fruit to the Journal, which were favourably noticed.

Being a late fruit it is essential that the plants should be grown in a sunny aspect. I daresay every soil would not grow them satisfactorily, but with me the difficulty would be to get quit of them. Keighley station is a mile and a half from my Willow Bank nurseries, and I shall be pleased to show these beautiful plants to anyone who may think it worth while to call and see them. I have tried Lawton and several other Blackberries, but I do not find any equal to the Parsley-leaved.—JOHN CARTER, *Keighley*.

BRODIAEAS.

I AM induced to write a few remarks upon these lovely bulbous plants at the present time chiefly because they are a source of great pleasure to me, having had not less than ten species and varieties in flower at the same time, for the most part in pots, also examples of each kind are planted out and flowering equally as well. They are, indeed, very showy plants, especially the Vegetable Fire-cracker, which, I believe, is the Yankee name for *B. coccinea*. This species is so distinct from all other flowers that when once known it is not easily forgotten. These Brodiaeas, although closely resembling various species of *Allium* and *Triteleia*, nevertheless have a distinctness which renders them very desirable. They are easily cultivated either in

Fig. 21.—*Brodiaea coccinea*.

pots or in the border. A few of them increase abundantly in their favourite spots, and they are extremely pretty in masses. *B. coccinea* is perhaps the most tender of all, but it will stand outside all the year if the position it occupies is well drained and facing south or west. The precaution, of course, can be taken of lifting the bulbs and potting them, so that they can be put in a place of security for the winter. It richly deserves such a small amount of attention. Most of the other species here mentioned require little attention if planted out in moderately rich light soil; in fact, every lover of hardy flowers should have a special border prepared for the reception of choice hardy bulbs. In preparing such a border it is necessary to insure drainage and a good depth of soil, which of course can be qualified to suit the several and variable requirements of any particular set of plants. The Brodiaeas are all natives of North America, confined for the most part to the western States. I have carefully considered the synonymy of the species here described, since the trade of American bulbs is being largely increased, and such may be of service to some buyers, as all these synonyms are often quoted as species.

B. capitata, Benth.—Leaves slender, smooth. Scapes from 1 to 2 feet high, smooth, terete, umbellate. Flowers half inch to 1 inch long, broadly funnel-shaped, light purple, the segments rather longer than the tube. Known also under the name of *Milla capitata*, Baker. Native of California, in many parts of which it is very beautiful, extending to Utah. This is also a very handsome species, growing

very freely if treated like *B. laxa*, as it is not at all fastidious as to soil, enjoying a warm sunny position. Flowering in July and August with us.

B. coccinea, Gray (fig. 21).—A very handsome species, with narrow, channelled, slightly glaucous leaves, from 6 to 10 inches long. Scape from 1 to 3 feet high, umbellate at the top, with a few reddish bracts at the base of the pedicels. Flowers from four to sixteen in number, tubular; the tube from 1 to 1½ inch long, about half an inch through, of a deep red-crimson colour; limb segments ovate, slightly reflexed, of a pale green colour, not more than a quarter of an inch long, and less in width; anthers as long as the perianth limb. This is a most distinct and handsome species, and very freely flowers. Well adapted for pot culture or for a warm border. It is not quite so hardy as most of the other species, but if the bulbs are planted deep and the surface of the soil slightly covered during the winter it will stand all right. It is so rich in colour and unique in appearance that it richly deserves some care being bestowed upon it. It is known as *B. Ida Maia*, Wood. Sereno Watson, the celebrated American botanist, adopts the name of *Brevoortia coccinea* after Wood, but as the plant is more generally known in this country under the name of *Brodiaea* I have adopted it. It flowers in the open in our climate from June to August, and I recently saw at Messrs. James Dickson & Sons of Chester a quantity of plants in bloom at the same time, and the effect was simply charming. It is a native of Northern California, extending from Humboldt to Shasta counties.

B. congesta, Smith.—Leaves narrow, glaucous, channelled. Scapes 1½ to 4 feet high, densely umbellate or sub-capitate at the top. Flowers numerous, half an inch to three-quarters of an inch long, half funnel-shaped, with the segments nearly or quite as long as the tube. The former not reflexed, of a clear purple-blue colour, or rarely white, as in the variety *alba*, which is by no means so plentiful as the typical form. They are both very free-growing border plants, quite hardy, and readily establish themselves in most positions, increasing in strength yearly, and *en masse* they produce a very pleasing effect. The normal form approaches very closely to *B. multiflora*, Benth., but there are structural differences which keep them apart. Native of regions from San Francisco to Washington territory. Flowering in this country from the end of May to July.

B. gracilis, Watson.—Leaves solitary, very narrow, one-sixth of an inch to a quarter of an inch broad, slightly glaucous. Scape 3 to 4 inches high, slender, scabrous, purplish, umbellate at the top. Flowers few, half an inch or rather more in length, on slender pedicels equally as long or longer, of a bright yellow colour, the segments equalling the tube in length. A very scarce species, which I have never flowered. Found on the Spanish Peak, Plumas County. The bulbs of this species seem to travel badly after being collected, as on more than one occasion I have received bulbs in a very poor condition.

B. grandiflora, Smith (fig. 22, p. 115).—Leaves very narrow, nearly round. Flower-scape from 5 to 12 inches high, rarely reaching more than 10 inches in height, umbellate at the top. Flowers few, or rarely more than from eight to ten in number; the perianth about an inch long, sub-campanulate; the tube shorter than the segments of the limb, of a purplish-blue colour; flower-stalks somewhat lengthened and slender. It is a very handsome, free-growing, and hardy species, flowering in July and August, rapidly increasing by bulbils when once established. Abundant in all the regions from the Mohave River to British Columbia.—J. T. R.

(To be continued.)

PEAS—THIN VERSUS THICK SOWING.

MR. WARD, on page 69, gave a striking instance of the advantages of sowing Peas thinly. His plants of *Evolution* were placed 6 inches apart, in single line presumably, and not only made a good row, but he considered the plants were too thick by half. Recently I have been examining some Peas, and at the end of a fine row of Culverwell's Giant Marrow is one plant standing alone, from a scattered seed no doubt, but it has been secured to the stakes. The vigour of this plant is extraordinary. It has branched freely, and the side growths are as strong as any of the main growths in the thick portion of the row. This vigorous plant is bearing thirty-seven pods of great size, whereas the other plants grown thickly have only from seven to nine pods. I could not find one with ten, and the pods are much smaller than those produced by the branching plant.

In the same garden a long row of John Bull is growing. It appears that in sowing the seed was at first used too liberally, and to sow the whole length of drill it was necessary to sow thinly towards the end of the drill opposite to where the sowing commenced—near the extreme end of the row very thinly indeed. For a time it was feared the row at the thin end would be a failure, but now if there is a failure at all it is at the other end, where at the least thrice the quantity of seed was used per yard. Where the plants are thin they are extraordinarily strong, have branched freely, and are bearing distinctly the finest crop and the largest pods.

Several years ago when that useful Pea Veitch's Perfection was new, and consequently more expensive than it is now, I remember some rows that I have not seen equalled since. The seeds were dibbed in a double row at the same distances that Broad Beans are usually put in. The plants were luxuriant, the row full, the crop abundant, and the pods splendid.

This thin sowing would not answer so well in the autumn nor in inclement weather in early spring, but as the season advances, the land becomes friable, and the weather improves, it is questionable if the plan is not the best that can be adopted in deeply trenched and well-manured ground. What do the exhibitors of Peas say? They know which is the best method, and would do no harm by stating it.—A PLAIN GARDENER.

ROSES AT BERKHAMPSTEAD.

MOST readers of the horticultural papers have heard of the splendid Muscat Grapes grown at the nurseries of Messrs. Lane & Son, but it is not of Grapes but of Roses I wish to make a few remarks. I may state in passing that it is not from a showman's point of view that I name some of the many really good varieties of Roses grown in these nurseries. It is those only that took my fancy as free bloomers and vigorous growers that I shall name in this brief notice. Here are to be found a large collection of all the newest and best, besides a large general collection of tried varieties worthy of cultivation, some as dwarfs and some as standards. All are in the most vigorous health, with hardly any trace of mildew or any other disease to which Roses are sometimes liable. My visit was a hurried one, and I had no time to follow the catalogue arrangement, but jotted down a few of those which seemed worthy of growing. Many are grown by the hundred, and at the time of my visit, 18th July, were flowering profusely. I feel certain anyone who has not grown the following varieties will not be disappointed by adding them to their collection:—

Capitaine Christy, blush, large, and good; Duke of Connaught, velvety crimson, good; Sultan of Zanzibar, very dark; Mrs. Baker, crimson, large, and fine; Dupuy Jamain, bright rose; Henry Bennett, velvety crimson, good in bud, but petals thin; Marguerite Brassac, deep carmine, good; Mabel Morrison, as seen there one of the very best whites, like Baronne de Rothschild; Madame Lacharme, white, tinged with rose, good; Countess of Rosebery, large, carmine rose, vigorous grower; Duchess of Bedford, scarlet, good; La Rosière, crimson, large and fine; Mons. E. Y. Teas, red, fine form; Red Gauntlet, very bright red; Abbé Brammerel, dark red, good; Etienne Levet, rose, fine; Duchesse de Vallombrosa, light pink changing to white, large and good; Marguerite de St. Amand, fleshy pink; Hippolyte Jamain, rose, large and good; Mdlle. Eugénie Verdier, large, rosy pink, with large petals like Peony Rose; Madame Gabriel Luizet, pink, one of the best; Dr. Andry, red, very good; Madame Victor Verdier, good; Marie Baumann, rosy crimson, very fine; La France, lilac rose, very large and good; Louis Van Houtte, dark, rich, and good; Countess of Oxford, good; Elise Boëlle, creamy white; Paul Neyron, rose, very large and showy; Queen of Waltham, Star of Waltham, Glory of Cheshunt, and Brightness of Cheshunt, all good; Pride of Waltham, dark red; John Hopper, rosy crimson, good; Pierre Notting, vermilion, good; A. K. Williams, good. This hurried list might be considerably extended with equally good varieties, but those named especially attracted my attention.—J. SMITH, *Mentmore*.

POULTRY AND PIGEONS IN GARDENS.

MR. T. B. DOLBY'S case as he has stated it on page 71 appears a peculiarly hard one. He asks if a parallel case is known. There is probably no such case on record. I am told persons cannot claim damages for injury done by pigeons the same as for poultry, and if the birds cannot be shot when they are caught at their destructive work it follows that the Pigeons are our masters. If this is law it is not justice. In my district game is strictly preserved, yet anyone is permitted to shoot wood pigeons, as they are so destructive in fields. Domestic pigeons where they abound are equally voracious and work ruin amongst Peas. Has there not been an error of judgment in the case in question? If so the Judge, being a pigeon fancier, ought to be the first to assist in granting a new trial. The case as it stands is most unsatisfactory, and the verdict may have far-reaching and very serious consequences. I see by a reply last week the Editor is endeavouring to obtain information on the law affecting Pigeons. This is well, but it would almost appear as if they were above law.—A SEED-GROWER.

[So far as we have ascertained the following cases represent the law

on this subject, and we commend them to Mr. Dolby and his solicitor. "If pigeons come upon my land I may kill them, but I have no remedy against anyone for breeding them."

"If domestic pigeons come upon land sown with corn and eat up the corn, the occupier of the land is justified in shooting them, as he has no other means of taking them damage feasant."—(*Dewell v. Sanders*, Cro. Jac., 490; *Hannam v. Mockett*, 2 B. & C., 939.)

"Killing, wounding, or taking any house dove or pigeon wantonly is an offence punishable summarily by fine of £2 above the value of the bird."—(24 & 25 Vict. c. 96.)

APRICOT BRANCHES DYING.

(Continued from page 515 last vol.)

Soil and Climate.—Soil exerts a great influence on the growth, health, and prolificness of Apricots, and should be calcareous on soils overlying the limestone formation; but as oolite, lias, and even lime are not on the surface (though the latter is often only covered with a shallow stratum of soil) these formations exert but small influence on the growth of trees. This should be taken into consideration in forming fruit tree borders, and where the lime is at such depths as to be beyond reach of the roots of the trees it should be furnished in some form. Old mortar rubbish answers well, and being readily accessible will commend itself, whilst chalk broken small is equally serviceable. Chalk marls are also available, coprolites, shellsand, and even gypsum being capital additions to soils deficient in calcareous matter; but these, except the chalk marl, are best given as surface dressings. As a rule, one-tenth that of the loam employed in making the borders for Apricots should be chalk or lime rubbish, or where the soil is alluvial, or a loam having but a very small proportion of lime, for it exists more or less in all soils except it be peat and bog soil, the proportion of lime rubbish or chalk may equal a sixth of the whole, and in all cases be thoroughly incorporated. Lime is essential to the successful cultivation of the Apricot and all stone fruits. A calcareous soil best suits the Plum on which the Apricot is worked, and the nutriment it affords to the scion or Apricot tree is calculated to give solidity to its growth and the perfection of its stones, few fruits being cast in stoning in a calcareous soil as compared with those in a soil not containing more than a small per-centage of lime. Even a dressing of quicklime applied to the surface and forked in has a marked effect for the better on trees in an unsatisfactory state, a couple of bushels per rod not being too much for soils that have long been under crops of vegetables on fruit borders heavily manured.

The border should be well drained, and the depth of soil not more than 2 feet, as the Apricot, or rather its stock—the Plum—is a surface-rooting tree, and the roots should be encouraged and kept at the surface, but this is practically impossible if the border is to be used for early vegetables, and the heavy manuring and deep digging resorted to. It is only courting failure by causing the roots to strike deeply into the soil; and this, with the richness of the soil, tends to gross growth and the immaturity of the wood, which only needs severe weather to result in gum and ultimate dying off of the limbs.

The materials constituting the border should be put together firmly, as this tends to cause a steady growth in the trees, and is not conducive to that luxuriance characteristic of trees in a loose and rich soil. Once made the border ought not to be dug, but as south borders are so valuable, there are few, if any, gardeners that could avoid cropping them; nor, indeed, are such wide borders as we now employ for fruit trees necessary. It would be well if the trees were not given more than one-third the space now allotted, 5 or 6 feet width of border being ample for a wall 10 feet or even 12 feet high, and less in proportion, and this part ought to be kept exclusively for the trees. With the trees in such borders they are almost as much under command as when grown under glass. They can be mulched, and the roots fed, if necessary, with liquid manure when carrying heavy crops, the mulching encouraging surface roots, and only moisture in addition is necessary to keep them there.

Climate.—The Apricot is a tender exotic, and indigenous to a country with a drier climate in spring than ours, if not more genial in summer; yet the fruits in this climate have come safely through the ordeal where proper means of protection have been given. Not very long ago I read in the Journal a statement by Mr. Pearson that Apricot blossom and the trees really did not require protection in spring, advancing in proof the good crops obtained from the walls of cottages, where the trees were seldom if ever protected. This is incontestable as regards the trees against cottages in the firm and comparative poor soil, causing a much less and consequently ripened growth. But what of such advice for trees in the rich soil of gardens? Herring nets,

bands of straw or hay, and branches of evergreens, are only apologies for efficient protection—viz., canvas covering, or better still, Nottingham wool netting, quarter-inch mesh. The late Rev. W. F. Radclyffe was very successful with Peaches outdoors, attributing his success to thorough protection for the blossom, tender fruit, and young easily injured foliage; and I know the old gardeners were very successful with Apricots, and all wall fruit for that matter, and they employed efficient protection from the opening of the blossoms until the danger from frosts in May was past. But of late years the culture of wall-fruit trees has been very much neglected.

As aids to climate there is the warmth of the wall, but in the case of a fixed protection it obstructs the sun's rays considerably, and the wall absorbs very little, the case being very different when the protecting material is withdrawn in the daytime and replaced at night. Projecting copings to the walls are also of value. They to some extent prevent the passing off of the heat upward, increase the heat by day and retain it at night, as well as prevent the descent of cold and wet. A great improvement has of late years obtained in glass copings, which with stout scrim canvas in front, and readily moveable, are practically all that our climate requires for the successful cultivation of the Apricot against walls.

The copings should be moveable, not being fixed until the blossoms show generally white, as until this stage the blossoms are comparatively safe from frost; but when the blossoms show the corollas they need dryness and warmth. After the beginning of June the trees are best exposed to the full influence of the atmosphere, and the coping should remain off until the fruit is ripening, when they should be returned and continued over the trees until the leaves are falling, then they should be removed and not used again until the time above indicated. Keeping them over the trees in winter affords unnecessary warmth, and induces undue swelling of the buds in warm sunny periods.—G. ABBEY.

(To be continued.)

NOTES AT CHISWICK.

BOTH under glass and outside there is now much to interest a visitor to the Royal Horticultural Society's Gardens, Chiswick, and probably a better opportunity could not be selected for a journey thither. The recent rains have refreshed the flower beds and vegetable quarters considerably, and the fruit crops are fairly satisfactory, except the Pears, which are very scarce. Small fruits, particularly the Gooseberries, are abundant. Strawberries have been good, Black and Red Currants plentiful, but Cherries and Plums are few. Several trials have been taken in hand this season, including Peas, Potatoes, Tomatoes, Verbenas, Zonal bedding Pelargoniums, Pansies, Violas, and others, each of which possesses considerable interest. It is, however, a misfortune that the results of these trials are so rarely published now, for the advantage that would be otherwise derived from them is practically lost to the majority of cultivators. So much careful labour is expended upon the reports of these trials, that it is very regrettable they should be permitted to remain in manuscript stored in the archives of the Society, and accessible to few even of the Fellows, especially those living at a distance, and who might fairly claim an equal right to the benefits derivable from the Society's work. Those, however, who have the opportunity of visiting Chiswick can always find both instruction and interest, as they are most readily assisted by the courteous Superintendent, Mr. A. F. Barron, and his able subordinates. It is therefore an especial pleasure to have a run through the grounds and houses, and as I have recently had that pleasure I may briefly state a few of the features that most attracted my attention in the short time at my disposal.

ACHIMENES.

In one of the warm houses an excellent collection of these is grown, including both the best of the old varieties, together with the most notable of the more recent productions in this useful class of plants. The value of Achimenes is generally acknowledged and understood, as either in baskets, pots, or pans they are exceedingly attractive, easily grown, and profuse in flowering. Perhaps, however, the most satisfactory mode of growing them is in baskets suspended from the roof of a house, as their beauty is seen much more readily and advantageously than otherwise. The magnificent examples thus grown at Chatsworth may almost be considered unique, and can only be compared to gigantic balls of flowers when in their best condition. They are, or were a year or two since, grown in the tropical Water Lily house, and suspended round and over the central tank, from which a warm humidity is continually rising, they appear grand, and thrive most satisfactorily. At Chiswick, however, the object is not so much the production of wonderfully large specimens as to show the relative merits of the different varieties, for which purpose

the plants are carefully and liberally treated to ensure vigorous health and floriferousness. This is well accomplished by growing them in a moderate temperature, excessive heat and moisture having with them, as with many other plants, too great a tendency to produce a long weak comparatively flowerless growth. The varieties are numerous, but the following may be taken as the best of their respective types:—

Mauve Perfection.—Large handsome flower, rich bluish purple, clear colour; free, and of good habit.

Sir Treherne Thomas.—An exceedingly free-flowering variety, with bright crimson blooms of moderate size.

Ambroise Verschaffelt.—A well-known form with flowers of medium size, white ground streaked with purple; free and good.

Dentonia.—A very distinct variety, with delicately tinted pale lavender flowers.

Harry Williams.—One of the brightest coloured forms in cultivation; flowers moderate in size, neat in form, extremely bright scarlet. Very free and effective.

Carl Woolforth.—A useful variety, remarkably floriferous; compact in habit, and of a fine purple colour.

Dazzler.—An old but attractive variety, bearing abundant small bright scarlet flowers; dwarf and compact, being especially suited for culture in pots.

Mauve Queen.—One of the largest flowers of all, a really grand bloom; flat, and of great substance; colour, a clear purplish mauve.

Margarita.—Flowers rather small, but white, and useful for contrast with the brighter-coloured varieties.

IMPATIENS PLATYPETALA ALBA.

In the same house as the above a number of plants of this charming

Fig. 22.—*Brodiaea grandiflora* (see page 113).

Balsam are grown, and it deserves especial notice now that the rosy scarlet *Impatiens Sultani* is becoming so popular, as it would form a most valuable companion to that lovely species. It is of easy culture, and succeeds in any house with an intermediate temperature, producing its pure white-spurred flowers very freely, and though these are undoubtedly of short duration, the continual succession renders the plant attractive during a long period. It is chiefly increased by seeds, though probably, like the other named above, it could be also propagated by cuttings.

ZONAL PELARGONIUMS.

A most brilliant display of Zonal Pelargoniums is formed in another house, both single and double varieties from all the most celebrated growers of these useful plants being represented in the collection. When seen in a mass, as is the case there, the effect is dazzling, and the eye seems to seek for relief in quieter tints. The momentary effect is very striking, but one seems to tire quickly of such overwhelming colour when not moderated by an admixture of green or soft hues. When these plants are flowering in the profuse manner which characterises them they seem to need something more than their own foliage, and a few taller Palms, Ferns, and similar plants introduced at intervals in the bed would render the effect more pleasing without detracting from the value of the collection for purposes of comparison. Varieties of these plants have been so frequently named in these pages that it is unnecessary to

enumerate many now. A few of particular merit may, however, be mentioned. Amongst the single Zonals were :—

Kleber.—A pretty and distinctly coloured variety, violet scarlet, if such a term is admissible, for the tint is so peculiar that it can be scarcely described in any other way, there being an admixture of the two colours that has a singular effect in bright sunshine.

Constance deserves notice for its merits as a pink variety—a shade that is much prized amongst these plants when really clear and bright, as it is in the case of the one named, which is also of compact vigorous habit, with fine neat trusses of blooms.

Mrs. Hetley.—A profuse-flowering variety, with fine trusses and well-formed bright orange scarlet blooms.

Hettie.—Remarkable both for the size of the truss and flowers, the latter being of a scarlet-cerise shade, very clear and pleasing.

Two double varieties only specially attracted my attention—namely, the following :—

Sylvia.—A handsome pink form with large trusses, and

Edouard André.—Rich scarlet, with a magnificent truss of large flowers.

TUBEROUS BEGONIAS.

The collections of these plants at Chiswick have long since obtained a high degree of fame, and most deservedly too, for they have been grown in the best possible manner, and by careful nursing and selection many superb varieties have been raised that have from time to time been honoured with certificates at South Kensington. By this means the whole strain has been so greatly improved that it is found scarcely necessary to name varieties, and many fine unnamed seedlings are noticeable there now that a few years ago would have been thought most valuable acquisitions. Single and double scarlet, crimson, pink, yellow, and white are represented by numbers of fine forms, the single varieties being by far the best in a decorative point of view, as the colours seem to be much richer, brighter, and clearer, and the flowers have not the heaviness, or, indeed, the deformity, that distinguishes the others much too frequently in all collections. Amongst so many that are good it is not easy to select a few that are pre-eminently worthy of notice, but the following four may be taken as possessing characters of sterling merit :—

Nellie May.—A lovely variety with beautifully formed pink flowers ; large, but by no means coarse, and produced very freely.

Queenie.—Also a charming bright pink variety, but possessing a little history that renders it noteworthy. It bears the pet name of a little lady in the neighbourhood, who has been also immortalised by Mr. Musgrave in his charming musical production bearing that name.

Souvenir de Chiswick is now known to many growers, being distinguished by its exceedingly brilliant scarlet colour of the finely formed and large flowers.

GLOXINIAS AND FERNS.

The small stove near the long vinery is now very bright and pleasing with a drapery of Gloxinias arranged with small plants of *Adiantum cuneatum*, the stage being margined with a long fringe of *Panicum variegatum*. The real value of Gloxinias can be at once perceived when arranged in this manner, and the groups that have been occasionally staged from these gardens at the Kensington meetings and shows are invariably greatly admired for the taste manifested in this style of arrangement. The Gloxinias are of a good strain ; the flowers large, mostly erect, rich and varied in colour. The habit, too, is good, the large handsome leaves recurving round the pots and quite concealing them.

ALNWICK SEEDLING GRAPE.

In the long house devoted to Gros Colman and Alicantes in almost equal numbers a few Vines of Alicante Seedling are also grown, two being particularly notable, both having good crops of fair-sized bunches. One has had all the flowers set with pollen from Alicante, and the other has had half the bunches so treated, and the others at the upper portion of the Vine have been fertilised with their own pollen. The bunches are equally good, the berries swelling as freely and regularly in both cases ; and it is only regrettable that a few had not been left unfertilised for the purpose of comparison.

Quitting the houses, the beds in the walk leading to large vinery are the first which call for notice, amongst them being a fine collection of

DOUBLE POTENTILLAS.

Most of these have been received from Mr. Parker of Tooting for trial, and the results are greatly in their favour. The flowers in all cases are large, full, and richly coloured, and their value as hardy plants cannot be over-estimated, though probably the most ardent advocates for "single" flowers would expel them with great exclamations of dissatisfaction. Four especially worthy of notice are those mentioned below.

Escarboueh.—Flowers large and full, extremely dark red, and very freely produced.

William Rollisson.—A showy variety with dark orange-scarlet flowers ; large, full, and neat.

California.—Very bright yellow ; one of the best of its colour.

Velours Pourpré.—Colour extremely dark maroon, of velvety texture and handsome.

LOBELIAS.

Several good varieties of these have been tried this season, and though Lobelias are now numerous the following two are worthy of note.

Mrs. Tom Corbett.—Very free, dwarf and compact ; the flowers large, extremely bright clear blue with a white eye. This is an admirable

variety, the plants appearing quite balls of the brightest blue, and would be most useful for bedding purposes.

Blue Beard.—This is somewhat similar to the preceding, sharing all its good qualities, but it is rather taller in growth, with darker blue flowers.

HARDY FLOWERS.

The rockery and beds of hardy plants are exceedingly attractive. The former has now become well clothed with Sedums, Saxifrages, Campanulas, and similar plants, amidst which the choicer and taller species and varieties arise in a free natural manner, having quite a different appearance from that they possess in formal arrangements where the material employed is bare and unpleasantly conspicuous. This rockery, though modest in its pretensions and almost diminutive its extent, is yet one of the most natural and pretty, and might furnish a lesson for many a more elaborate production. Very notable is

Campanula Hendersoni alba, which forms dwarf clumps bearing a great number of pure white large bells, an agreeable contrast to the blue-flowered *C. carpatica* and *C. turbinata*.

Coreopsis tenuifolia is another thoroughly useful plant, its bright yellow flower-heads being borne very freely, and the whole plant, owing to its slender stems, has a very graceful aspect.

Lychnis chalcedonica alba plena.—The old scarlet form of this *Lychnis* is widely known and much appreciated in gardens still. This variety is, however, comparatively rarely seen, and yet is well worth notice, as the flowers are very double and white, thus forming a good companion for its older relative.

Nicotiana affinis.—A bed of this plant near the rockery has been quite a feature for some time past, and on the occasion of the Evening Fête recently held there it was greatly admired. The large white flowers are abundantly produced in succession, and in the evening they are in their best condition, diffusing a powerful fragrance that is perceptible for a great distance. For beds near a house this plant is most valuable, and its use for culture in pots was specially referred to when an engraving of it was given in this Journal, page 295, last volume.

VERBENAS.

The beds of Verbenas will shortly be very handsome, as a large number of varieties, chiefly from Messrs. Cannell & Son of Swanley, are being grown for trial. Already some of the most forward are flowering well, producing a very pretty effect by the mixture of bright colours. A few of these may be noted now, but the general collection will deserve further attention later on.

Lustrous is a fine scarlet variety, the centre of the flower white, free.

Stars and Stripes.—Mauve and white in alternate stripes, radiating from the centre of the flower.

Blue Beauty.—Very fine blue-purple variety, profuse and vigorous.

Statgartner Swartz.—Bright rosy pink, very effective, and useful for bedding purposes ; the truss large and compact.

Madame Anna.—An effective purple variety with a white eye ; truss large.

Melandris spectabilis.—An old variety, but still unsurpassed in brilliancy of the scarlet flowers, though they are somewhat small.

Mahomet.—A most distinct dwarf creeping form with divided leaves and small flowers, deep rosy pink with white lines radiating from the centre, and somewhat suggestive in form of the *Saponaria calabrica*.

In addition to the above a fine collection of Tomatoes is being grown for trial in pots, and some notes upon these may be useful later in the season. Some bedding Pelargoniums are also being tried, and these too will be worth attention.—L. C.

THE Rev. F. D. Horner informs us that the NORTHERN SHOW OF THE NATIONAL CARNATION AND PICOTEE SOCIETY will be held on Tuesday, August 14th, at the Botanical Gardens, Manchester. The Botanical Council kindly grant £10 to the prize fund, and free passes to the exhibitors in the Society.

— THE Meeting of the Fruit and Floral Committees of the ROYAL HORTICULTURAL SOCIETY at South Kensington, on Tuesday, the 14th inst., will be held in the Conservatory, on which occasion Messrs. F. Smith & Co., West Dulwich, Surrey, state it is their intention to exhibit a collection of Balsams.

— THE Rev. H. H. D'Ombra writes :—" I see in last week's Journal that I am credited with having made 'a pleasing and amusing speech' at the NEWCASTLE SHOW. I must deny the soft impeachment, for I was 200 miles away, and I did not, even if I had the power, communicate it by telephone !"

— "J. E." wishes to know if the "perpetual Strawberries" alluded to in the Journal last week by Mr. Prestoe are merely improved Alpines, and whether the pollen of the Alpine or Hautbois Strawberry will fertilise pistillate flowers of the commonly grown sorts.

— A CORRESPONDENT writes—"I have just cut a BROMHAM HALL MELON 16½ lbs. in weight. Several gardeners told me this is a very remarkable size. Will your readers kindly tell me the weight of the largest they have heard of?"

— A CHARMING little plant that is far too seldom seen in gardens is GALIUM RUBRUM, which might be applied to many uses in decorative purposes, particularly for bouquets and stands of flowers. It is dwarf, and produces such a number of small dark red flowers on slender feathery inflorescences that the plant appears quite a cloud of bloom, the foliage not being visible. The panicles or cymes of flowers are so light and graceful that their value is apparent at a glance, the stems being quite fine and hair-like. Any ordinary garden soil suits the plant, which at this time of year is in its best condition. It is a native of Italy, but has been an occupant of English gardens for something like 300 years.

— THE extent to which CHRYSANTHEMUMS FOR AFFORDING CUT BLOOMS FOR MARKET are grown is perhaps not fully appreciated by the public. A correspondent, who called on Mr. Stevens of Putney the other day, found some 3000 plants in pots, 500 of them being Elaine, in splendid condition, dwarf free-branching examples that are sure to produce fine blooms. Mr. Mahood of Putney, it is said, grows quite as many, and those who have seen the groups of plants arranged by both these cultivators at metropolitan shows know that they grow them well. In Mr. Stevens' collection are many seedlings, some of which are expected to prove valuable, and are being propagated accordingly. These are only two out of dozens of growers of Chrysanthemums for market, and the demand for white blooms especially must be enormous.

— THE Waterloo, Seaforth, and Crosby Horticultural Society held their eighth annual Exhibition in grounds adjoining the station, instead of the Hydropathic Establishment, as in previous years. The Exhibition on the whole was a gigantic success, and the exhibits much superior to those staged at previous exhibitions. The most successful exhibitors, amongst others, were Mr. Woolham, gardener to Colonel Blundell; Mr. E. R. Muspratt. Mr. J. Evison, gardener to the Hydropathic Company, was awarded the premier award for a group of plants arranged for effect. The first-named exhibitor was awarded the silver cup for the best model flower garden shown in the two classes provided for these in the schedule.

— HOPS FROM AUSTRALIA.—A parcel of 900 cwt. of hops arrived in London from Australia last week, and as they are the first shipment exported much interest has been created on the Hop Market. Although they have not paraded the matter much before European farmers, Australian agriculturists have for some years been devoting their attention to Hops, and the season which closed in March last has been a very successful one, the crop weighing about 19,000 cwts. The hops that have recently arrived were grown in several parts of Australia, also in Tasmania and New Zealand; they are described as being of fair quality and well suited for brewing. Much attention is now being given to hop cultivation in the Antipodes, the climate and soil being admirable, and vermin never destroying the plant. The harvest season is very different from ours, lasting, as it does, over two months, February and March.

— A CORRESPONDENT writes—"I have recently seen some of the finest and best-grown specimens of LILIUM SPECIOSUM ROSEUM which have ever come under my attention before. They are in one of the houses at Shirecliffe Hall, Sheffield, the residence of J. Watson, Esq., and under the charge of Mr. J. Udale, who has evidently carefully studied the requirements of these handsome Lilies, and with the most satisfactory results. The majority of the plants are 6 to 7 feet high, and bear from forty to sixty blooms, some of the flowers being 8 to 9 inches in diameter from tip to tip of the petals. The colour, too, is extremely rich, and the beauty of this Lily can be most fully appreciated when seen in this condition. Many of your readers would undoubtedly be glad if Mr. Udale would record the treatment he has found so successful."

— THREE additions to the excellent little HOLIDAY HANDBOOKS

by Mr. Percy Lindley (125, Fleet Street) have reached us, which are well worthy of the attention of intending tourists on the Continent. One is devoted to "The Moselle from the Franco-German Battlefields to the Rhine," liberally illustrated and containing an abundance of historical and miscellaneous useful information with regard to the chief attractions of the leading towns, hotels, conveyances, &c. A second is entitled "A Trip to the Ardennes," briefly describing the towns that can be seen in a fortnight's holiday, including Antwerp, Brussels, Namur, Dinant, Spa, Liege, Chaudfontaine, &c. The third is devoted to "The Amsterdam Exhibition and Dead Cities of the Zuyder Zee." This is in a similar style to the preceding, and equally useful. The extremely moderate price—one penny—at which these handbooks are issued must render them very popular, and the semi-official character of their contents renders them fully reliable—a most valuable recommendation.

— MR. T. MOORE, Sutton, Surrey, sends the following additional note on STRAWBERRIES ATTACKED BY MICE:—"In the Journal of July 12th, page 24, Mr. Mathew relates an instance of losing his crop of Strawberries by field mice. I can also give an instance, which occurred last summer. On some land I used for kitchen garden I had a plantation of Strawberries (about two roods), which produced a great amount of foliage, the soil being all clay. I intended gathering the fruit for preserving, but to my surprise I found the best of the ripe fruit already gathered, and on my searching the bed I found the fruit had been plucked with a short portion of stalk and hidden in small heaps of from a handful to a pint in each heap in various parts of the bed, which I at once concluded had been done by mice, and further on searching I saw two large field mice making their escape by leaping above the foliage, as it was too thick for them to get through easily. I have not in nearly forty years' experience ever noticed such an occurrence before."

— A COLONIAL paper states that THE TARO PLANT, which constitutes the principal article of diet amongst the natives of many of the South Sea islands, has been cultivated for years on many of the sugar plantations of Queensland for the use of kanakas. It has not come into general consumption amongst the white population, although it is said to be a very healthy vegetable, equal, if not superior, to the Sweet Potato. It has recently been introduced into some of the Southern States of America, where it is not only relished as a vegetable, but has been found a most excellent food for horses and cattle. The Taro grows to greater perfection in the island of Tanna than in any of the other islands, on account of the great depth and freeness of soil in that island. The natives cultivate it, like the Yams, on the tops of mounds of finely pulverised earth. When grown on land cultivated by the plough, it is usual to plant it on the tops of large drills prepared by hilling up together three or four furrows. A very good starch and a very fair arrowroot are made from the bulb. It can only be cultivated with success, however, on fine alluvial soil such as is to be found along the banks of rivers.

— IN an interesting article on FOREST RAMBLES IN MADEIRA, by Mr. H. G. Guillemard, published in the "Journal of Forestry" for the present month, occurs the following passage describing the scenery and vegetation:—"Leaving Funchal on a brilliant morning in early November, on a tour round the island, my hammock-men bore me steadily up one of the numerous steep paved roads leading up to the main mountain range, which bisects the island. The city lay round its blue bay, bathed in glorious sunshine, which sparkled in the dew-drops on the lovely clusters of Maidenhair Fern on the old walls, and showed up the full beauty of the crimson and purple Bougainvillea, which covered verandahs and trellises with superb masses of colour. The mountain peaks were still wrapped in fleecy clouds as the morning mists rose slowly from the ravines and lower slopes, whose terraced gardens, tiny fields of Sugarcane, groves of Bananas and Oranges, and spreading vineyards pleased the eye with a hundred varying shades of green; and over the entire amphitheatre of hills the prismatic colours of the morning mist-bow, which forms one of the attractions of the mountain view from Funchal, shone in perfect beauty. Down the side of the steeply graded road a mountain rill of the clearest coldest water was rushing, white with foam; over the walls of the numerous quintas hung trailers of the heavenly blue Ipomæa, bright Plumbago and gorgeous Passion-flower, above which the feathery fronds of the Date Palm and the exquisite light-green leaves of the

Banana drooped gracefully side by side with the luxuriant foliage and purple fruit of the Fig, the yellow Mango, and pale green Custard Apple, whilst here and there the glowing scarlet bracts of tall trees of Poinsettia appeared in vivid contrast with the creamy-white trumpet-shaped flowers of the Datura."

TOMATO CULTURE.

I HAVE read with interest Mr. W. Thomson's remarks (page 88) as to his success in the one instance and non-success in the other in the cultivation of the Tomato, but his observations would perhaps lead some to discontinue the use of horse manure. I have been accustomed for many years to grow Tomato plants on the back walls of our vineries, as I cannot get the fruit to ripen outside on our hills. Latterly I have devoted a small three-quarter span-roofed house to this fruit with very good results. My object has always been to give the plants a very rich soil—*i.e.*, loam and horse manure in equal parts with a small quantity of sharp sand. Our loam is of a heavy nature, but good in quality. We also give them a good supply of liquid manure; still, I never found they had too much.

Mr. Thompson tells us he has had one fruit 21 ozs. in weight, but unfortunately he does not tell us the variety he grows. I have grown several varieties, even the Trentham Fillbasket. By-the-by, is this the old friend we used to grow twenty years ago under the name of Large Red? It very much resembles that variety. Criterion is a very good Tomato, but I do not like the colour of the fruit. So far as my practice goes there is none at present for general purposes so good as Hathaway's Excelsior. This is without doubt a most beautiful fruit both in size and colour.

We potted the plants in the middle of last March—about sixty plants in 11-inch pots. Twelve of these we placed inside a small house (span-roofed) and trained up the wires like Vines, growing them on the long-rod system—*i.e.*, the leading shoot is allowed to grow on, but all laterals are stopped at the first joint. I have cut from these twelve plants (in pots) 150 lbs. of good ripe fruits, and there are several pounds more to cut; indeed, my own idea is that if these plants were cut down to within 1 foot of the pot and allowed to grow on again, 100 lbs. more fruit could be cut from them.

I remember some years ago reading in the Journal that no insect would attack the Tomato plant. For some years I found this to be quite true; but during the last two or three years we have been troubled with a small white fly. Perhaps some of your correspondents can tell us the best way to destroy this pest. I have tried various means, but cannot entirely get rid of it.—H. CAKEBREAD, *Rayners*.

WILL Mr. W. Thomson, whose letter on this subject appears on page 88 of the Journal (August 2nd), kindly add to the value of the information he gives by stating the nature of the "manure rich in phosphates and potash" which he found so successful?—R. M., *Swanley*

NOTES ON WEST OF SCOTLAND PANSY SOCIETY'S SHOW.

SELDOM have I had the pleasure of witnessing such a pleasant and enthusiastic gathering as that at the West of Scotland Pansy Society's Show, which took place in Glasgow on the 25th ult. Pansies are the main feature, and in spite of grub and insect enemies which are telling sorely on many good collections, the general character of the exhibits was very good indeed. The Fancy Pansy takes the lead. The progress this class has made during the last few years has been very remarkable, while the degree of excellence attained has doubtless far surpassed the most sanguine hopes of the introducers. A great mistake in connection with this Show, and which was also a cause of complaint at Edinburgh, is that few of the flowers are named. The reason given by some of the exhibitors was that the lists were generally lifted. Well, then, why not try some other plan? Neat strips of gummed paper placed over the top of each flower would not look amiss—unless, indeed, there be some truth in the remark which I overheard by one whom I set down as an unsuccessful exhibitor, that the Judges were very much influenced by the popularity some of the sorts had obtained without paying much attention to the quality of the blooms. For my own part I do not think there is much in that, as the Judges who award the prizes at this Show are generally men to whom most of the varieties brought together are well known, and who, I believe, would deem themselves far above any such paltry charge as the above. However, the benefit of having all the flowers brought forward to the competition table named is quite obvious. Let us trust that the Committee will see their way to form a bye-law causing all exhibits to be named as correctly as possible.

A few of the best varieties selected from those that had lists attached are the following—Catherine Agnes, Mrs. Jamieson, Robert Goodwin, May Tate, Mrs. Scott Plummer, Wm. Dickson, Lord Beaconsfield, A. McMillan, Mrs. F. McCoombe, Miss Bliss, Perfection, and Craigforth. The best Fancy in the Show was a splendid bloom of Catherine Agnes shown by Mr. Storrie of Lenzie. Show Pansies were neither so numerous nor so well shown as the Fancies, and as they were also void of names I merely give two of each class, which are indispensable in the smallest collections. Dark Selves.—D. Malcolm, Robert Watt; White

Selves.—Mrs. Dobbie, Mrs. Cadzow; Yellow Selves.—Gomer, G. Rudd; Yellow Grounds.—J. B. Robertson, D. Dalglish; White Grounds.—Miss Barr, Miss Jessie Foote.

Pinks were well shown, Messrs. Paul and Dickson of Paisley being the chief exhibitors. A good dozen selected from these are Modesty, La Petite Myra, Norma, Nellie, Rival, Volunteer, Emily, Tottie, Bertram, Lord Herbert, and Ada Louise. Next to the Pansies, however, I believe the Roses attracted most attention. Some excellent blooms were staged. Messrs. Hugh Dickson of Belfast and Alexander Dickson & Sons of Newtonards, Co. Down, deservedly shared the chief honours between them. Mr. Smith of Stranraer also exhibited some excellent flowers. Altogether it was a most enjoyable Show, and very encouraging to all those interested in its success.—WM. MARSHALL.

AMERICAN BLACKBERRIES.

MR. MUIR's communication, together with your editorial remarks, respecting these at page 5 of the current volume of the Journal, had quite escaped my notice until visiting a friend a few days since, who kindly drew my attention to the subject, remarking that "knowing how well the American Bramble does here he was, had he not then seen me, going to say a few words in its favour himself." In reiterating my former opinion of the subject in hand, I would remark that as Mr. Muir, according to his own showing, has not only failed in the culture of the Kittatinny variety of Blackberry, but has also made up his mind "to have nothing more to do with it, however much may be said or shown in its favour," I do not suppose that anything I may say respecting it will alter his opinion of it. Still, hoping that Mr. Muir, like the generality of mankind, gardeners in particular, is open to conviction, I will say that here the Kittatinny Bramble not only does well, but the fruit is highly appreciated when fully ripe. I may point out, in conclusion, that to attain success, even in the culture of Blackberries, it is necessary to observe a few practical details in their treatment—*viz.*, to plant the canes in rows 4 or 5 feet apart in the same situation as that given to autumn-bearing Raspberries, and treat and train them similarly to the summer-bearing ones, removing as much as possible of the over-luxuriant-growing shoots, so as to concentrate the flow of sap, not only to the development of the weaker-growing and next year's fruit-producing canes, but also the clusters of fruit now ripening.—H. W. WARD, *Longford Castle Gardens*.

CULTURE OF THE CYTISUS.

THE Cytisus must rank amongst the most useful of winter and spring-blooming plants, both for house or conservatory decoration. When employed for the former purpose it is most useful when grown in 48-size pots, in which we have had plants 18 inches in diameter. By striking a few cuttings annually there is no reason to retain the plants after their second season of blooming. Those that bloom the first year in spring we use for winter work the next winter, when they are best thrown away, unless very large plants are required, they are then re-potted. Cuttings may be struck in the autumn or spring. We prefer the former time, as they have a longer season of growth, consequently more flowers are obtained. September is the best month to strike them in. Take the half-ripened side shoots with a heel attached, and insert them in sandy soil pressed in firmly. They will strike quite readily if plunged in a cold frame for a short time, then introduce them to a little bottom heat. When rooted the points should be taken out, and they can be potted singly in 60-pots in two parts fibry loam and one of peat, with a good sprinkling of sand. Keep them close until established, when they should be wintered on a shelf in a greenhouse.

In the spring they should be placed into 48-size pots. After they are well established and the weather is mild and warm plunge them in the open air. The points should be kept pinched back until the end of August. We manage this by drawing the plant through the hand as often as they require stopping, and cut the tops off, then the plants are obtained of a uniform shape. They must be well attended to with watering. Before there is danger of frost place them in a well-ventilated greenhouse. After the plants have bloomed in the spring, cut them well back and repot, when they will bloom the following winter if placed in a temperature of 50°.—A. YOUNG.

SWAINSONIA OSBORNI.

ONE of the best known members of this genus is the old *S. galegifolia*, which at one time often appeared as an exhibition plant, but is now rarely seen except in gardens where these old favourites are prized. A charming variety of it is, however, more commonly shown now—*viz.*, *S. galegifolia albiflora*, and at the Southampton Show on Saturday last a beautiful specimen was staged in one of the collections. The flowers of this form are pure white, and contrast finely with the fresh green foliage. *S. Osborni*, of which a vigorous shoot and large raceme are shown in the woodcut (fig. 23), is also regarded by some as a variety of the above species, but it is practically quite distinct, and is undoubtedly the finest of all those in cultivation. When thoroughly well grown, as it is at Kew, this is one of the most handsome plants for the roof of a greenhouse or conservatory that can be

had, its long racemes of rich purplish flowers being produced very freely, and if the shoots are not too rigidly secured to the rafters, but allowed a little freedom, the effect is much better. Good turfy loam and peat suit it well as a compost, an occasional supply of very weak liquid manure increasing the vigour of the plant considerably. It requires little care, and is deserving of more popular attention than it receives at present.

In reference to the nomenclature of this plant, Mr. W. Watson of the Royal Gardens, Kew, has obligingly furnished me with the following information:—

“So far as I can ascertain from dried specimens and various figures Swainsonia is as variable as *Lathyrus odoratus* both as regards colour and size. In the “Flora of Australia” Bentham puts under *S. galegifolia*

the name of a gentleman (Mr. Isaac Swainson) who formerly resided at Twickenham; and having made a large fortune by the sale of a medicine known as Vello's Vegetable Syrup, formed a botanic garden, which contained a very good collection of plants, early in the present century. This was occasionally mentioned in some of Loudon's works, but is now almost forgotten except by few veteran horticulturists.—L. C.

EPICUREAN AND SUTTONS' CLUSTER CUCUMBERS

I AM fond of trying novelties, and this year, seeing a description of the new Cucumber Epicurean, I thought it would be worth a trial. In the seedsmen's list it was highly recommended for productiveness, and I can safely say it has come up to its character. My four plants have been crowded with fruit of very good quality. Some have attained a

Fig. 23.—SWAINSONIA OSBORNII.

both white, purple, and pink forms, among them being *S. elegans*, *S. albiflora*, and *S. Osborni*. According to Bentham's description typical *S. galegifolia* is *S. Osborni* of gardens. *S. coronillæfolia* he makes a variety of that species. [See 'Bot. Mag.' t. 1725, and also t. 792.] *S. Osborni* was figured under that name in a book not at Kew—viz., the 'Gardener's Companion.'—*T. Moore*. Moore named the plant after Osborn in 1851, who raised it from seeds sent from Australia. I have seen the figure and a note in another place, but the colours are altogether different from, and the leaves much smaller than in the Kew plant. Notwithstanding all this, *S. Osborni* is a good well-known garden plant, and for gardening purposes the name is sufficient."

It may be incidentally mentioned that the genus *Swainsonia* bears

large size, but most of the fruit have been of medium size. All grow well-shaped, with small neck, and colour rather deeper than Telegraph. I am much pleased with it, and shall grow it again. I forgot to add that this variety is almost seedless, but I have fortunately been able to ripen off one seedy fruit.

Suttons' Cluster is another variety I have on trial. It is a great cropper, and the Cucumbers being of a deep green, are very pleasant to the sight, as, indeed, they are to the palate, as I found on trial. They grow from 9 to 12 inches long, and are very clean-looking in appearance. I consider this and Epicurean to be a pair well worth growing.—*H. S. E., Great Totham*.

DO ASHLEAF KIDNEY POTATOES FLOWER?—Is it usual for any of the varieties of Ashleaf Kidneys to produce seed apples or plums, as they are

variously called? I bought and planted this year half a stone of the old Ashleaved Kidney, at least the seedsman said they were. On four of the plants apples have appeared. I have been planting Ashleaved Potatoes for forty years and never saw seed apples on them in all that time.—X., *Loughgall*.

LIVERPOOL SHOW.

AUGUST 4TH TO 6TH.

SINCE the resuscitation of the Liverpool Horticultural Association five years ago no such Exhibition, taking it in all the sections, has been provided in the beautiful Sefton Park as the Show under notice. Perhaps the large marquee has been more crowded on some future occasions, but if what are termed "foreign" exhibits were less numerous than before, the gardeners of the locality compensated abundantly by the excellence of their products. To say that the usually redoubtable competitor, Mr. Cypher of Cheltenham, was defeated in two classes is sufficient to indicate the high character of the Show in specimen plants; while the fruit was in all probability the finest display that has been held this year, the vegetables being both superior and staged in large quantity; and cut flowers, generally speaking, very fine indeed, those in the collections being of extraordinary quality. In every department it may be truly stated that only the growers of the very finest produce could obtain a place; while not a few exhibitors, though staging admirably, had to be content with the honour of contributing to the general display.

PLANTS.

In Class 1, for twelve stove and greenhouse plants, open to all, prizes to the aggregate amount of £30 were offered; the first prize £15, second £10, and third £5. Mr. W. Mease, gardener to C. W. Neumann, Esq., Wyncote Allerton, secured the premier place with a grand collection, which included some enormous specimens, several of them, no doubt, the finest of their kind in the country. In the back row Crotons Queen Victoria and Weismanii were 8 to 9 feet across and in splendid colour; *Latania borbonica* and *Areca lutescens* between them being of noble proportions. In the front row were *Statice profusa* rather thin, *Allamanda Hendersonii* a 5-foot globe, *Bougainvillea glabra* of the same size, *Clerodendron Balfourianum* larger, *Gleichenia Mendelli* 6 feet, *Vinca alba* equally large, and *Erica retorta major* about 3 feet in diameter. Mr. Cypher of Cheltenham was placed second; *Pritchardia pacifica* grand, *Erica æmula* superb, *Dipladenia amabile* telling, *Clerodendron Balfourianum* very good, and splendid examples of *Cycas circinalis* and *Dasylirocn acrotrichum*. Perhaps Mr. Cypher did not stage in his best style, but at any rate he probably never had a more formidable antagonist. Mr. Leadbetter, gardener to H. Tummins, Esq., Aigburth, was an exceedingly close third, and could only have lost the second position by the comparative weakness of his fine-foliaged plants, as his flowering specimens were fresher and generally better than the Cheltenham plants. *Ixora Dixiana*, *Stephanotis*, *Clerodendron*, and *Dipladenia amabilis* were unsurpassed in the Exhibition; while Crotons Disraeli, Weismani, and Queen Victoria, also *Gleichenia dichotoma*, *Alocasia macrorhiza*, and a *Dicksonia* were admirably shown. This exhibitor undoubtedly possesses the skill, and only requires time and space to become a still more powerful competitor.

In Class 2, for ten stove and greenhouse plants (local), several highly creditable collections were staged, the first position being secured by Mr. B. Cromwell, gardener to Thomas Moss, Esq., Aigburth, with admirable examples of *Ericas æmula* and *Irbyana*, *Alocasias metallica* and *crystallina*, a *Kentia*, *Dicksonia*, *Croton Weismanii* 5 to 6 feet, and a *Bouvardia*. Mr. A. E. Cox, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, was a close and excellent second; *Dicksonia antarctica* being in grand condition, as also were the flanking Crotons *angustifolius* and *Queen Victoria*, with an effective globe 4 feet in diameter of the good old *Plumbago capensis*. Mr. Finnigan, gardener to W. Burnyeat, Esq., was third, his striking plant being *Acalypha musaica* 7 to 8 feet high and 4 to 5 feet in diameter.

Class 3, six stove and greenhouse plants, was open, and here Mr. W. Mease repeated his feat of defeating Mr. Cypher. The first-prize plants comprised *Allamanda nobilis*, a globe of 5 to 6 feet; *Statice Butcheri*, 5 feet; with fine *Bougainvillea*, *Stephanotis*, *Allamanda Hendersonii*, and an *Erica*. The best of the Cheltenham plants was *Anthurium Andreanum* with twelve spathes. Mr. Leadbetter was third. In the class for four plants (local) the prizes were won by Messrs. Cromwell and Leadbetter with creditable collections. In the specimen plant class the last-named exhibitor was first with *Dipladenia Brearleyana*, not large but very fresh; Mr. Mease following with *Allamanda grandiflora* 6 feet in diameter. In the specimen greenhouse plant class Mr. Gowen, gardener to J. Cunningham, Esq., Mossley Hall, was first with a model example of *Kalosanthes coccinea* 4 feet in diameter and a sheet of flowers. Mr. Wright, gardener to E. Lawrence, Esq., Aigburth, second with an umbrella-shaped specimen of *Lapageria alba*, which will be fine some day if it has good treatment.

Ferns.—In the class for eight plants Mr. Cromwell was first with remarkably fresh and fine examples of *Pteris scaberula*, *Adiantum Veitchianum*, *Gleichenia flabellata*, *Nephrolepis davallioides* *furcans*, *Lomaria zamioides*, *Adiantum farleyense*, and *Asplenium Nidus-avis* ranging from 3 to 5 feet in diameter. Mr. Stevenson, gardener to Mrs. Horsfall, Grassendale, was second with very healthy plants, *Adiantum Sanctæ-Catherinæ* being the most noticeable. For six exotic Ferns the first prize was won by W. Rathbone, Esq., M.P., Wavertree; *Alsophila excelsa*, *Cybotium Scheidei*, and *Davallia Mooreana* being large and fresh. Mr. A. R. Cox was a close second, *Nephrolepis exaltata*, and a seedling form of *Gymnogramma peruviana*, being very fine; and Mr. Hurst, gardener to W. B. Browning, Esq., Aigburth, third. Mr. Whitfield, gardener to J. T. Cross, Esq., Aigburth, was first in the single specimen class with *Goniophlebium subauriculatum*, fronds 8 feet long; Mr. Cromwell second with a grand example of *Adiantum farleyense*, and Mr. Finnigan third with *Gleichenia spelunca*. Hardy Ferns were small, Mr. Wright being first, and for *Selaginellas* Mr. Hurst.

Fine-foliage Plants.—In the open class for eight plants Mr. R. Cubbon, gardener to Mrs. Alison Johnson, Woolton Heys, was in the premier place with excellent examples—*Cibotium princeps* 10 feet across and in fine colour, *Dicksonia antarctica*, *Cycas revoluta*, *Areca lutescens*, *Alocasia macrorhiza variegata*, and two Crotons, very good. In the local class for

six plants Mr. W. Mease was first with a magnificent group; *Croton Princess of Wales*, a grand weeping pyramid 5 to 6 feet high and a basal diameter of 4½ feet, being probably unsurpassed in Europe. Crotons Disraeli and Williamsi were still larger, *Alocasia macrorhiza variegata* superb, *A. metallica* fine, and a good specimen of *Thrinax elegans*.—Mr. F. Jellico, gardener to J. H. Gossage, Esq., Woolton, was a worthy second, his best plants being *Croton variegatus* 7 by 6 feet, *Davallia Mooreana*, and *Pritchardia pacifica*.

Ericas were not numerous. In the open class for four plants Mr. Cypher was first with young and fresh examples of *maidstoniensis*, *æmula*, *savilleoides*, and *tricolor profusa*; in the local class for three plants the prizes going to Messrs. W. Mease and Cromwell. The prizes for *Caladiums* fell to Messrs. Mease, Warrington, gardener to Tyndall Bright, Esq., Aigburth, and Stevenson, the first-prize group being of remarkable excellence, the specimens as fine probably as have ever been seen anywhere, and the others good. Zonal *Pelargoniums* were a great improvement on former years, prizes being offered for both pyramid and flat-trained plants. The former were 4 feet high and 2½ feet in diameter at the base, excellently trained, with good foliage and capital trusses of good flowers, the prizes being won by Messrs. Whitfield, and Evans, gardener to Mrs. Lockett, Grassendale House. The flat-trained plants were also admirably shown—not so large as at York, yet large enough for all decorative purposes. For six plants the prizes fell to Messrs. Stevenson, Whitfield, and Hurst, Messrs. Whitfield and Finnigan winning the chief honours in the class for three plants.

Orchids were only sparingly exhibited. First in the class for six plants was Mr. Edwards, gardener to Dr. Shadford Walker, Liverpool, with *Saccolabium Blumei majus*, *Cattleya Mossiæ*, *Odontoglossum Alexandræ*, and *Aerides suavissimum* with four spikes; Mr. Wilson, gardener to J. E. Reynolds, West Derby, being the only other exhibitor, and receiving the second prize. For one specimen plant Mr. Mease was first with *Saccolabium Blumei majus* with three very fine spikes; Mr. Cubbon second with *Cattleya Leopoldi* with two spikes and over twenty of its very dark blooms; Mr. Anderson, gardener to J. M. Heap, Esq., Claughton, secured the remaining prize with seven spikes. There were several exhibitors in this class.

Achimenes were better than we usually see them now-a-days, the prizes for four pairs going in the order named to Messrs. Mease, Gowen, and Bustard. *Gloxinias* were splendid, the finest we have ever seen staged, the prizes for six plants going respectively to Messrs. Gowen, Mease, and Agnew. The foliage was excellent, and the fine flowers, twenty or thirty on a plant, neatly staked.

Tuberous *Begonias* made a brilliant display, a great number of admirably grown specimens being placed in competition. In the class for nine plants Mr. Hurst was first with the finest examples we have ever seen staged by a gardener, the plants being 2 to 4 feet in diameter, good varieties with fresh healthy foliage and large blooms. Messrs. Stevenson and Evans followed in the order named. Mr. Mease staged the best specimen plant, a wonderful example of *Vesuvius*, 5 feet in diameter. We failed to obtain the awards in the minor classes, in which, however, the competition was good. In *Fuchsias* there is plenty of room for improvement, yet the winning collections of Messrs. Hurst, Wilson, Bustard, and Whitfield were fairly good. Mr. Warrington staged the best *Coleuses*, which were fresh and well coloured; Messrs. Stevenson and Hurst securing the prizes for single and double *Petunias*; and Messrs. Leadbetter, Agnew, and Gowen for *Cockscombs*, with plants in both classes of average quality.

Groups.—These were fairly represented, and filled the centre of a large tent. The arrangement of Messrs. K. P. Ker & Sons in the open class was decidedly the best in the Exhibition, and was not only more tastefully arranged, but the plants on the whole were of a choice description. A large well-grown *Dracæna* formed the centre, which was well elevated and surrounded with choice Ferns and *Begonias*. The groundwork throughout was formed of Ferns and *Grevillea robusta*, amongst which were most judiciously disposed small Crotons, *Dracænas*, hardwooded plants in flower, *Amaryllis*, and Fancy *Pelargoniums*. *Dracænas*, Crotons, Palms, and *Lilium auratum* formed the chief of the plants that rose from the groundwork. This was the only exhibit in this class, but well deserved the first prize awarded to it. In the local class for a circular group to cover a space of 150 square feet six were arranged for competition. They were much after the same style as the one described, but none was equal in effect to it. Mr. W. Mease took the lead with decidedly the best, followed closely by Mr. A. R. Cox, and Mr. G. Leadbetter, gardener to W. H. Watts, Esq.

Table Plants.—These were well shown, and the competition was keen for the prizes offered. The whole of the exhibits were good, and very even in size throughout. Mr. G. Leadbetter took the lead with a really beautiful lot of plants, comprising *Pandanus Veitchii*, *Croton interruptus aureus*, *Dracæna gracilis*, and *Aralia gracillima*. Mr. Q. Warrington, gardener to Mrs. Watts, was a good second with similar choice well-grown examples, and Mr. Joseph Wood third. Eight or nine collections were staged, and the whole were creditable to the exhibitors.

ROSES AND CUT FLOWERS.

Roses on the whole were of superior quality and numerous considering the number of classes devoted to them. In the open class for forty-eight Messrs. Perkins & Sons, Coventry, well deserved the premier position accorded them. Messrs. Cranston & Co., Hereford, followed closely, and Messrs. R. Mack & Sons, Catterick Bridge, in the order named. The first contained grand blooms of Louis Peyronny, Devienne Lamy, Star of Waltham, Emilie Hausburg, Mdle. Annie Wood, Madame Marie Verdier, Marie Baumann, and a grand bloom of Harrison Weir. A few of the best and most striking in the second collection were Teas Jean Ducher, Comtesse de Nadaillac, and Madame Lambard. Amongst H.P.'s Helen Paul, Lady Sheffield, John Stuart Mill, Prince Camille de Rohan, and Mdle. Marie Rady. The third collection contained grand blooms of Lady Sheffield, E. Y. Teas, Madame Gravielle Mouville, Beauty of Waltham, and Niphetos. In the corresponding local class for twenty-four blooms Mr. Gittens, gardener to T. B. Hare, Esq., Rock Ferry, was the only exhibitor and staged a box of beautiful flowers, amongst them being good blooms of Glory of Cheshunt, Marie Van Houtte, Alfred Dumesnil, Magna Charta, A. K. Williams, and Alfred Colomb. Messrs. Cranston & Co. took the lead in the open class for twelve Tea or Noisette blooms, amongst them being fine examples of Jules Finger, Comtesse Riza du Parc, and Madame Lambard. Mr. Gittens was a good second, having

good flowers of Comte de Paris, Jean Pernet, and Adrienne Christophe. Mr. E. Claxton, Allerton, was the remaining prizewinner.

In the local class for twelve blooms, distinct, six collections were staged, and the successful competitors were Messrs. Gittens, W. E. Hall, Higher Bebbington, and W. Mease. Seven or eight exhibitors entered the open class for twelve blooms of any dark Rose, and the exhibits in every collection were superb. Messrs. J. Dickson & Sons, Newton Nurseries, Chester, took the lead with Alfred Colomb, and, strange to say, in every instance the remaining three awards were made in favour of the same variety. Messrs. R. Mack & Sons and Perkins & Sons were placed second and third respectively, and Messrs. Cranston & Co. were also placed equal third. In the open class for twelve bright blooms of any one variety Messrs. James Dickson & Sons were again first with a capital box of Comtesse de Serenye, and Messrs. R. Mack & Sons second with the same variety. For the best and most tastefully arranged box of Roses, not less than twelve varieties, in box 3 feet by 18 inches wide, prizes given by Messrs. Cranston & Co., Hereford, there were three competitors. The premier award was made in favour of Mr. E. Claxton for a beautiful box of Tea blooms carrying splendid foliage, and rose out of a light groundwork of *Adiantum cuneatum*, which was relieved by a few sprays of *Selaginella cæsia*. Mr. Waterman, gardener to A. Tate, Esq., was a close second with a box of Hybrid Perpetuals, good flowers rising out of a groundwork of *Adiantum cuneatum*. The stand was most effective, but scarcely so light as the first-prize box. Mr. Gittens was the remaining prizewinner.

Cut Flowers.—The collections of these were altogether excellent. In the open class for eighteen stove and greenhouse varieties Mr. Mease was first with grand and neatly arranged bunches of from 4 to 6 inches in diameter of *Clerodendron Balfourianum*, *Bougainvillea*, *Cattleya crispata*, red and white *Lapagerias*, *Disa grandiflora*, *Dipladenias*, *Miltonias*, *Phœnocomas*, *Bouvardias*, *Plumbagos*, *Eucharis*, and *Erica Fairrieana*—a splendid stand. The second-prize stand was extremely bright and good, no exhibitor's card; Mr. Warrington being third, also with a neat and excellent stand. Mr. Mease was also first with twenty-four trusses of hardy flowers with a magnificent collection, in which finely represented were *Liliums candidum*, *auratum*, and *excelsum*, *Gladioli brenchleyensis* and *The Bride*, *Alstrømeria aurea*, *Phloxes coccinea* and *Rose of Castile*, *Matricaria inodora fl.-pl.*, *Potentilla Garneriana* and *maculata*, *Gaillardia hybrida splendida* very fine, *Lychnis chaledonica*, *Campanula Hendersoni*, *Achillea Ptarmica fl.-pl.*, *Helenium pumilum*, *Spiræas venusta* and *Ulmaria*, *Telekia speciosissima* with long gold thread-like ray florets, *Dianthus Napoleon III.* very rich, *Oenothera Youngi*, *Veronica corymbosa*, and *Agrostemma coronaria*. Mr. Bostock, gardener to E. Harvey, Esq., Aigburth, was an excellent second with a stand that would have been first at many exhibitions. In the class for twelve trusses there was close and excellent competition, Mr. Waterman, gardener to A. Tate, Esq., Roseleigh, Woolton, securing the first position with fine bunches of *Liliums excelsum* and *croceum*, *Phlox Hercules*, *Eryngium amethystinum*, *Potentilla formosa*, *Chrysanthemums Souvenir d'un Ami* and *Précocité*, *Campanula Hendersoni*, *Centranthus ruber*, and *Bupthalmum salicifolium*. Mr. Bustard was a good second, and Mr. E. R. Cox a close third with extremely neat and clean stands.

Bouquets, with the exception of a few that were too stiff and formal by too apparent wiring, were good. In the open class the prizes went to Messrs. Cypher, Downes, and Fryer; and in the local class to Messrs. Leadbetter and Whitfield. The best Pansies were shown by Mr. Mease, and the best Carnations by Mr. Brownhill, Rock Ferry. Special prizes were offered for stands of single Dahlias, but evidently some mistake was made in placing the cards, which were Agnew first, Mease second, and Waterman extra; whereas, if we mistake not, the Judges' awards were—Waterman first, Mease second, and Agnew third, no extra prize being granted. Such mistakes as these are inherent to the system adopted of showing under numbers and writing the prize cards after the judging—a tedious and laborious plan that is not often adopted at important exhibitions.

FRUIT.

The display of fruit as above mentioned was without doubt the finest ever seen in Liverpool. In the open class for eight distinct dishes, not more than two varieties of Grapes, the premier position was deservedly awarded to Mr. J. Edmonds, gardener to the Duke of St. Albans, Bestwood Lodge, Notts. This exhibitor staged capital examples of Black Hamburgh and Muscat of Alexandria Grapes, large in bunch, berry, and fairly well finished; Best of All Melon, a good Queen Pine, *Violette Hâtive* Nectarines, splendid Chancellor Peaches, and a good dish of Figs. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was a close second, and staged good examples of Black Hamburgh and Muscat of Alexandria Grapes a little smaller in the bunch than in the first collection, good Black Eagle Cherries, Rivers' Orange Nectarines, a good dish of Brown Turkey Figs, and Luscious and Melting Melon. Mr. Joseph Ward, gardener to T. H. Oakes, Esq., Alfriston, Derbyshire, was a good third with Grapes and Melons of the same varieties, and a grand dish of Green Gage Plums. Mr. R. Hedge, gardener to Thomas Sykes, Esq., Cheadle, was awarded an extra prize for a very creditable collection. Seven collections were staged for the prizes offered. In the corresponding local class for six dishes Mr. W. Mease was well to the front with grand well-finished bunches of Black Alicante and Muscat of Alexandria, Barrington Peaches, Pine Apple Nectarine, and Masterpiece Melon. Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., was second, being rather behind in Grapes, but staged superior dishes of Bellegarde Peaches, Elruge Nectarines, and Brown Turkey Figs. Mr. Thomas Ferguson, gardener to Mrs. Paterson, Rock Ferry, was the remaining prizetaker.

Pines.—In the open class for two Pine Apples Mr. J. Wilson, gardener to J. E. Reynolds, Esq., Sandsfield Park, West Derby, took the lead with a pair of fine Queens. Mr. J. Stevenson, gardener to Mrs. Horsfall, The Priory, Grassendale, was second with smooth over-ripe Cayennes, and Mr. Goodacre, third with a pair of even well-ripened Queens, little inferior to the first fruits, their position being due either to an oversight of the Judges or the misplacing of the prize cards. In the local class for one Pine Mr. Wilson was again first, followed by Mr. S. Whitfield, gardener to J. T. Cross, Esq., Beechwood, Aigburth, and Mr. T. Elsworthy.

Grapes.—Eight or nine collections were staged in the open class for four bunches of Grapes. Mr. J. Ward was placed first with Muscat of Alexandria,

fair in size of bunch and berry, but scarcely finished; and the same applies to the bunch of Black Hamburgh. Madresfield Court was very creditable, as also was Buckland Sweetwater. Mr. C. Young, gardener to J. Evans, Esq., Hurst House, Prescot, was second with larger bunches of the same varieties except Foster's Seedling, which were all larger in the bunch than the preceding, but not so well finished. The third was awarded to Mr. W. Elphinstone, gardener to H. H. Mundy, Esq., Shipley Hall, Derby, for the four best coloured bunches in this class. These exhibits were smaller in size of bunch and berry, but the finish was perfect; and the bunch of Muscat Hamburgh was without doubt the premier bunch of black Grapes in the Exhibition. The competition was close and keen in the open class for two bunches of Black Hamburghs, and twelve exhibitors staged for the three prizes offered. Mr. Barker, gardener to A. Raynes, Esq., Rock Ferry, was deservedly placed first with large bunches and splendid berries. Mr. W. Wilson, gardener to H. Cunningham, Esq., was second with bunches and berries nearly as large, but not quite equal in colour. Mr. Goodacre was a good third with better examples, but not so large or shapely in the bunch. Mr. Ferguson well deserved an extra, which was awarded him. In the open class for two bunches of Muscat of Alexandria some twenty-two bunches of splendid Grapes were again staged. Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, St. Helens, took the lead with fair-sized bunches possessing large berries. Mr. W. Mease was a good second with equally good Grapes that had been a little rubbed. Mr. C. Young was third. An extra was awarded Mr. Elphinstone, who staged the best finished of the whole, but much smaller in the berry. For two bunches of black Grapes (local) six lots were staged, and Mr. Barker secured the first position with remarkably fine Black Hamburghs. Mr. C. Young followed with Madresfield Court, and Mr. J. Warrington was third with smaller but well-finished bunches of Black Hamburgh. In the local class for two bunches of white Grapes, Muscats excluded, seven competitors staged. Mr. C. Finnigan was first with Buckland Sweetwater, Mr. J. Hurst, gardener to W. B. Bowring, Esq., second with the same variety; and Mr. Young third with Foster's Seedling.

Peaches and Nectarines.—These were numerous and well shown. In the open class for one dish thirteen exhibitors competed. Mr. J. Dilworth, gardener to W. G. Holland, Esq., New Brighton, was well first with large well-coloured fruits of Bellegarde; Mr. Elsworthy second with the same variety; and Mr. J. Stoney, gardener to Sir Thomas Earle, Bart., Allerton Towers, third with good examples of Grosse Mignonne. In the corresponding local class nine dishes were exhibited. Mr. J. Harrison, gardener to E. F. Hollins, Esq., Firwood, Formby, was well first with the best Royal Georges in the Exhibition. Mr. Warrington and Mr. Elsworthy second and third. In the open class for one dish of Nectarines Mr. J. Wallis, gardener to the Rev. Walter Sneyd, Keele Hall, was well first with large well-coloured fruits of Hunt's Tawny; Messrs. J. Hurst and T. Elsworthy second and third respectively, both showing Pine Apple. In the local class for one dish the last two exhibitors were again first and second in the order as named above, both showing the same variety. Mr. C. Copple, gardener to T. Stanley Rogerson, Esq., The Priory, third.

Melons.—The two classes devoted to Melons were open only to local exhibitors, and a large number of good fruits was shown. For one green-flesh variety eleven fruits were staged, Mr. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, was first with Best of All, a handsome fruit; Mr. M. Wood, gardener to Lieut.-Colonel Wilson, The Hermitage, second with Dell's Hybrid; and Mr. Ferguson third with Best of All. For one scarlet-fleshed kind Mr. G. Mease, gardener to Wm. Nicol, Esq., was first with a fine fruit of Burghley Pet; Mr. W. Mease second with Masterpiece; and Mr. C. Finnigan third with Malvern Hall.

Hardy Fruit.—This on the whole were good, and the prizes offered were well contested for considering the earliness of the season. For one dish of Strawberries only the second and third prizes was awarded to Messrs. Ferguson and Elsworthy, and need no further mention. For one dish of Cherries Mr. W. Illisley, gardener to T. S. Tinnis, Esq., Allerton, was first with good fruits of May Duke; Mr. White, gardener to J. H. Robinson, Esq., second; and Mr. W. Wright, gardener to E. Lawrence, Esq., Aigburth, third. There were ten competitors in the class for a collection of six dishes of fruit. Mr. J. Jellico, gardener to F. H. Gossage, Esq., was well first, and staged a good dish of Gooseberry Drill, Jefferson Plum, Morello Cherries, Red Currants, Strawberry James Veitch, and Prince Englebert Plum. Mr. Goodacre was a good second; and Mr. J. Lambert, gardener to Col. Wingfield, Onslow Hall, Shrewsbury, third.

VEGETABLES.

The vegetables were both numerous and of superior quality, a greater or better show of them being seldom brought together. In the open class for twelve distinct dishes seven collections were staged, and the competition was very close. Mr. J. Richardson, Boston, took the lead, having good Globe Artichokes, Improved Early Horn Carrots, Seville Long-pod Beans, Canadian Wonder Beans, International Potatoes, Climax Cucumbers, and good dishes of Onions, Turnips, and Peas, the three latter being unnamed. Mr. J. Lamhart was a close second, showing well Telephone Peas, Telegraph Cucumbers, good fine Red Celery, Early London Cauliflowers, Schoolmaster Potatoes, good Vegetable Marrows, and Negro Long-pod Beans; and Mr. W. Mease a good third. In the corresponding local class for twelve dishes Mr. W. Mease was well ahead, and staged a grand dish of Tomatoes, International Potatoes, Negro Long-pod Beans, and good Vegetable Marrows. Mr. R. Ball, gardener to Mrs. Jones, Heatherfield, Magull, second, his best dishes being Tomato Conqueror, Walcheren Cauliflowers, Telephone Peas, and Woodstock Kidney Potatoes. Mr. A. R. Cox was third, having good Carrots, Beet, Turnips, and Globe Artichokes. Some eight or nine collections were staged in this class. For six distinct kinds seven lots were staged, Mr. G. Condin, gardener to W. Chambers, Esq., The Grange, Wallesley, being first, followed by Messrs. G. Mease and J. Jellico, all staging creditable collections.

In the open class for six dishes of Peas seven excellent collections were staged, Mr. S. T. Turner winning first honours with Pride of the Market, Telegraph, The Baron, Giant Marrow, and Telephone; Mr. W. Mease second, having good Stratagem, Laxton's Fillbasket, and other varieties the same as the first exhibitor. Mr. T. Lambert was awarded the remaining prize. Forty dishes were exhibited in the local class for four varieties, and Mr. A. R. Cox was the successful competitor with staged Telegraph, The Baron, Telephone

and Stratagem in the best of condition. Messrs. Joseph Stoney and Mr. S. Whitfield were the remaining prizetakers, and staged the same varieties as the first exhibitor.

Potatoes were clean and magnificent, the competition being very close in the classes devoted to them. Four lots were staged in the open class for six dishes (three round and three kidney varieties). Mr. J. Lambert was awarded the premier position with grand examples of International, Vicar of Laleham, Porter's Excelsior, Blanchard, and Beauty of Hebron. Mr. W. Mease followed closely with good examples of Grampion, Myatt's Prolific, and Holborn Favourite; and Mr. J. Richardson third with a very creditable collection. In the corresponding local class for the same number of varieties Mr. T. Mason Green, Hale, Liverpool, was first, having good Reading Abbey, Beauty of Radstock, and Woodstock Kidney. Mr. S. T. Turner was a good second, and staged a splendid dish of Covent Garden Perfection. Mr. J. Stoney was the remaining successful exhibitor.

For the six prizes offered for Tomatoes twenty-two excellent dishes were staged. For three dishes Mr. W. B. Upjohn, gardener to the Earl of Ellesmere, Worsley Hall, Manchester, was first with Orangefield, Stamfordian, and an excellent dish of Dedham Favourite, which was decidedly the finest in the Exhibition. Mr. G. Condin was a good second with Conqueror, Trophy, and Wallesley Surprise, very fine. Mr. C. Finnigan was awarded the remaining prize. For one dish Mr. W. Mease was first with Stamfordian, good and even; Mr. W. Ball second with Trophy, very smooth; and Mr. G. Condin third with a good dish of Conqueror. Twelve brace of Cucumbers were staged, but only the first-prize pair of Mr. Porter, Bankfield Nursery, Freshfield, were of first-rate quality. These were model fruits of Telegraph, about 20 inches long, straight, and carrying their flowers. The remaining prizes went to Mr. Lowndes, gardener to T. S. Parker, Esq., Aigburth; and Mr. G. Mease, gardener to W. Nicol, Esq., St. Michael's Mount, Liverpool, with the same variety.

CONIFERS.

Only one competitor staged for the Society's gold medal in the open class for the best collection of hardy trees and shrubs. The gold medal was awarded Messrs. J. Dickson & Sons for their choice and effective group, which included all choicest Thujas, Retinosporas, Junipers, Yews, and Hollies, intermixed with Japanese Acers, Hydrangea paniculata grandiflora, and Vitis heterophylla variegata well coloured.

MISCELLANEOUS EXHIBITS.

These were very numerous, and contributed wonderfully to the beauty and effect of several of the large tents. Messrs. R. P. Ker & Sons, Aigburth Nurseries, had a very choice collection of flowering and foliage plants, a few of the most noticeable being Aralia Chabrieri; Croton Novelty, a new beautiful bright-coloured variety with bold foliage; Ficus elastica alba variegata, Adiantum Pacotti, a dense form; Davallia fijiensis, Dracæna Lindenii, as well as a general assortment of choice Crotons, Dracænas, Palms, and others. Messrs. F. and A. Dickson & Sons, The Upton Nurseries, Chester, contributed a similar collection of plants, which were most tastefully and effectively arranged. These included a great variety of the best Crotons and Dracænas both in a half-specimen and small state, which were intermixed with all the best double-flowered Begonias. This firm also staged a group of Clematis, dark-flowering varieties, intermixed with Acer Negundo variegata, and the effect was most striking; also boxes of Roses. The Horticultural Company (John Cowan), Garston, added largely to the Exhibition by contributing a large circular group of Tea Roses in pots, which were in the best health and condition, being clean and well bloomed; also a large group of specimen foliage plants, as well as a general assortment of small choice stove and greenhouse decorative plants and a number of well-grown pot Vines. Mr. J. Gore, gardener to I. Holden, Esq., Elmfield, Princess Park, a very fine group of exotic and hardy Ferns, which were highly creditable to him. Amongst the hardy varieties staged were some very beautiful seedlings. Messrs. J. Laing & Co., Forest Hill, London, exhibited a box of fine Tuberous Begonia blooms.

On Monday morning two hampers of Cattleya Eldorado arrived, containing two dozen plants in superb condition, with upwards of sixty expanded lovely tinted blooms, including the white variety, from Mr. J. Dovey, gardener, Saighall, Eccleshall, Staffordshire. These quite eclipsed the whole of Orchids entered for competition.

Altogether, as may be gathered from the report, the Show was of great magnitude and excellence, and it is worth consideration as to whether it would not be wise to make more open classes. It is clear the local growers have little to fear, and the honour of winning in an enlarged constituency would be the greater; also it would appear desirable in the interests of many excellent gardeners who have not the means for growing large specimen plants to provide classes of plants, say, in 8-inch pots, and this also would admit newer plants to be staged than in the elephantine classes, where the plants, being large, must be more or less old, the more recent and fine varieties of such plants as Crotons, Dracænas, and other both fine-foliage and flowering being necessarily excluded. These suggestions are respectfully commended to the consideration of the excellent practical Committee of the Association.

HORTICULTURAL REQUISITES AND APPLIANCES.

There was an imposing assortment of structures, boilers, seats, wirework, and other requisites of the garden. Messrs. David Lowe & Sons, Manchester and Edinburgh, had substantial, well-arranged, and efficiently arranged houses and capital frames. The next stand was of American inventions and articles for the garden and home exhibited by Messrs. Glassey & Co., Liverpool, including steps, seats, and other articles; also the simple, serviceable, and efficient domestic refrigerators of Mr. W. H. Hilton, Bristol, which appears to win medals everywhere. Mr. Webster, Prince Alfred Road, Wavertree, had very useful, excellent, and well-made houses and frames; Messrs. Wright & Holmes, Moseley Road, Birmingham, portable span-roof and lean-to frames of great service in gardens; Mr. Joseph Bramham, Dale Street, Liverpool, fine examples of wirework, for which he is famed, and the powerful and popular Allerton Priory boiler in various sizes; and Mr. Mee, Wood Street, Liverpool, had on view his capital sectional saddle boilers, one of which in operation was interesting, as each section—dome, back, and waterway fire-bars—had separate flow and return

pipes attached. It was particularly observable that the heat given by the hollow bars was very great, showing that these bars are really a valuable and important addition to the boiler. Messrs. Wm. Wood & Son exhibited samples of Orchid and Azalea peat from Hampshire, which appears sweet, clean, and well adapted for the plants for which it is provided.

Mr. Richardson, the Chairman of the Committee, and other officials were active and diligent, and their labours deserve and it is hoped will insure success.

[We hear that £250 taken at the gates on Monday places the finances in a satisfactory condition.]

THE GREENHOUSE AND ITS INMATES.

(Continued from page 77.)

CYTISUS.

THESE are well-known, indispensable, sweet-scented, Broom-like, greenhouse plants which are favourites with everybody. They bloom during winter and early spring when flowers are scarcest and most valued. Small plants are very ornamental either in the greenhouse or in the window, and they furnish an inexhaustible supply of elegant, yellow, sweet flowers for glasses. They are not particular as to soil, although good loam and leaf soil with a little sharp sand suit them best. They, moreover, thrive satisfactorily outside during summer. Large plants may be grown in comparatively small pots, and they may be trained as climbers up the wall or on flat trellises, so that they may not interfere with the other occupants of the greenhouse. At the same time handsome bushes or pyramids are easily produced if such plants are wanted. We, however, prefer small plants in small pots, or plants trained to cover the back or other wall. Spring-struck cuttings make attractive little plants for rooms or front rows in the conservatory.

Cuttings of the young wood 3 or 4 inches long with a heel strike freely on a hotbed in March or April. After that they should be grown on in a frame till June, when they should be placed outside. Plants grown outside flower more freely than those kept under glass during summer. *Cytisus racemosus* is most commonly grown, and it is the best. *C. racemosus elegans* is similar but is of more compact habit, while *C. r. superbus* grows stronger. *C. filipes* is of drooping habit, and grafted on stems of Laburnum, as is sometimes done, makes a beautiful "standard" for conservatory decoration. *C. Everestianus* is another fine sort, rather deeper in colour than the others.

FUCHSIA.

Fuchsias are deservedly popular. Few greenhouse plants are more ornamental, and few are more easily grown. Cuttings taken in spring (when the young shoots have pushed 3 inches or so) with a heel of the old wood strike very readily if potted in sandy soil, placed on a hotbed, and carefully shaded and watered. After they are rooted they should be potted in a mixture of good loam, well-decayed manure, and a good sprinkling of bonemeal. Use the smallest-sized pots, and after potting is done return the small plants to the hotbed to root anew. These cuttings should be struck about April, and by the time they are rooted, potted, and hardened somewhat in the warm frame the weather will be mild enough for their transference to a cold frame. As fast as the roots fill the pots a larger size should be given.

The tops will require pinching off in order to make young shoots start from the sides. When secondary shoots start the top one must be tied to a stick and trained straight up, while the other shoots are encouraged to make horizontal growth. The pinching and training process must be repeated as often as may be necessary in order to form pyramidal-shaped plants. Should flower buds form in the points it will also be necessary to pinch out the points, for after flowering commences no more branching-out need be expected.

Syrings of pure water should be given every evening, especially after a hot day, and occasionally soapy water to keep down aphides and red spider. As soon as the plants attain an ornamental size they should then be removed to the greenhouse. Liquid manure once or twice a week will do much to promote continuous growth and continuous flowering. While in the greenhouse syringing must not be neglected, or insects will attack and soon spoil the plants. After flowering is past the plants should be placed for the winter in any cool house or frame from which frost is excluded. No more water will be necessary than is enough to keep the roots from perishing, and if they are stood on a damp bottom enough moisture will rise to do this. In spring they should be partially shaken out of the old soil, the roots slightly pruned back, and the plants repotted into the same sized pots in fresh soil. The tops should also be pruned back at the same time. When the pots are filled with roots repotting should be done and training followed out as in the case of the young plants. With attention good plants will soon be the result. Amateurs with small houses may be as well to only grow small plants, as these are of greater use and cost much less trouble than large plants. For exhibition, however, large specimens—the larger the better—are necessary. Among whites Mrs. Marshall and Rose of Castile, although old kinds, are perhaps the most useful. Among darks Try Me O and Avalanche are excellent. There are, however, a great number of varieties to select from, and those who require larger collections should consult the catalogues of the chief nurserymen.

HYACINTHS.

Hyacinths are much-admired, easily grown, bulbous plants. The bulbs, which are annually imported from Holland, require to be bought

every year, for they never flower satisfactorily a second time. September is the best time to buy and pot the bulbs, although they may be potted at any time till November or even December, but we advise beginners not to be later than October. Loam, leaf soil, or decayed cowdung and a little sand suit them admirably. The pots should be drained in the usual way and filled loosely with soil to the rim. A little sand should then be placed on the surface of the soil in the middle of the pot, and the bulb placed in the soil so that only the top is exposed. The soil should then be rendered firm and the potting is completed. Six-inch pots are quite large enough for single bulbs, and 7-inch ones will do for three bulbs. We, however, recommend potting the bulbs singly, as sometimes they do not flower all together, and then the effect is spoilt.

The pots should be arranged on a firm base where worms will not reach them, and where they will be cool but safe from frost and wet. Cover the pots with ashes, leaf soil, or sawdust. In this position they may stand for a month or two until the pots are filled with roots and the tops are showing. They should then be removed to a cold frame and the pots plunged near the glass. During hard frosts the frames must be protected, and when the weather is fine ventilation is necessary. They may also be removed at once to the greenhouse to develop, but the extra heat and distance from the glass, although causing them to bloom earlier, will induce a more weakly growth than in the cold frame. At the same time this gentle forcing may add to the number of flowers very early in the year, when they will be more appreciated. A little liquid manure applied occasionally after the leaves have grown somewhat will aid materially in producing well-developed spikes. Failing either a frame or greenhouse they may be grown in the window.

In Glasses.—This is an elegant way of growing this popular flower. When the bulbs are being purchased the purpose should be stated to the vendor, so that sound ones may be secured. The glasses should be filled with water so full that only the base of the bulbs may touch the water, for if it fall short of this they will not root freely; if the bulbs are immersed they may decay. The glasses can be stood in a dark cool place until they are filled with roots, when they may be placed in the light—a greenhouse or a window will suit them. If at a window care should be taken not to allow a cold draught to blow on them, or the spikes will not unfold. At all stages of their growth care should be taken to keep the water pure or the roots will decay. For this reason the water should be changed occasionally, and each time a small piece of charcoal added for the purpose of absorbing any unwholesome gases which may be generated.

Two dozen names of good old cheap varieties are appended, also with some of the newer and more expensive kinds. The best way for an amateur to make a selection is to visit a good spring show and note the leading kinds. The prizewinners are almost invariably new expensive varieties, but for ordinary purposes such varieties as are named here are almost as good.

Old Cheap Varieties.—*Red:* Dr. Livingstone, Gigantea, Homerus, Lord Derby, Macaulay, Madame Hodson, Queen of Hyacinths, Von Schiller. *White:* Alba Maxima, Alba Superbissima, Baroness Von Tuyl, Grandeur à Merveille, Hercules, Marie Stuart, Queen Victoria, Vesta. *Blue:* Czar Peter, Grand Lilas, King of the Blues, Lord Melville, Lamp-lighter, Prince Albert, Porcelain Sceptre, and Voltaire. All the above are singles. The doubles are not so good as the singles.

Newer Varieties.—La Grandesse, Koh-i-noor, King of the Blues, De Candolle, Kent Blue, Primrose Perfection, and Vuurbaak.—A. H.

(To be continued.)

SOUTHAMPTON SHOW.

AUGUST 4TH AND 6TH.

THE twenty-first anniversary of the Royal Southampton Horticultural Society was fittingly celebrated by an exhibition of more than usual merit—one, indeed, that both in extent and quality of the exhibits could be favourably compared with the best on the Society's records. Such a long period of energetic labour must have exerted a great influence upon the horticulture of the district, and the effects were manifested in the plants, flowers, fruits, and vegetables so largely and so well shown on this occasion. The fame of the Show is, however, more than local, and brings contributions from many distant counties, which always impart an additional interest to competitions, besides really proving beneficial to growers in the district, who thus have an opportunity of noting the success achieved by some of the most distinguished cultivators in the kingdom. Such champions, for instance, as Messrs. Jackson & Sons, Kingston; Tudgey, Waltham Cross; Cypher, Cheltenham; and C. Rann, Handcross Park, Crawley, amongst the plants; Messrs. Ward, Longford Castle, Salisbury; F. Thomson, Norman Court; Dean, and Molyneux, Swanmore Park, in the fruit classes; and the last-named with Mr. Iggulden, Marston Garden, Frome, with vegetables, would alone render an exhibition of considerable value. These with many others all showed exceedingly well generally, and the few defects noticeable in particular classes might be more traceable to weather influences than to want of skill on the part of the exhibitors. So numerous were the entries, that almost on the eve of the Show additional tent accommodation had to be obtained from London, five enormous marquees being well filled. Three were devoted to plants, one to fruit and flowers, and the fourth to vegetables, each department constituting an important feature. Great care was displayed in the arrangement of the exhibits, and the best effect was produced, all the plants being seen to excellent advantage, the spaces well filled without any crowding, the fine-foliage plants judiciously disposed to soften the brilliancy of the flowering plants, and the latter to brighten the display where needed.

The Show was held in Westwood Park, which it will be remembered the Society has now obtained possession of for a period of fourteen years on

lease, the grounds to be devoted to the usual horticultural exhibitions, musical and other entertainments. The site is elevated and beautiful, commanding pleasing views, and being in close proximity to the picturesque and extensive common. The distance is not more than an agreeable walk from the town, and tramcars run very near, so that the popularity of the gardens may be considered insured. On the occasion of this Show the weather both on Saturday and Monday was very favourable, the visitors on the latter day assembling in great numbers to enjoy the Exhibition and miscellaneous sports and entertainments so liberally provided after the style of the York Floral Fête.

PLANTS.

An admirable display of these was contributed, the chief class being that for twelve stove and greenhouse plants, six in flower and six fine-foliage, the prizes being £20, £15, and £10. Three beautiful collections were staged, the champion being Mr. J. Cypher, Cheltenham, who deservedly secured the premier award with exceedingly fresh, even, and well-grown plants, the most notable of which were *Erica æmula* of moderate size, but in grand health and superbly flowered—indeed quite a model plant; other good specimens were *Bougainvillea glabra*, *Stephanotis floribunda*, *Dipladenia amabilis*, *Croton angustifolius*, *Allamanda nobilis*, and *Encephalartos villosus* very large. Mr. C. Rann, gardener to J. Warren, Esq., Handcross Park, Crawley, followed closely also with fine specimens, several *Crotons* being especially richly coloured, the handsome *C. Warreni* and *C. Hendersoni* attracting much attention. Cycads and Palms were represented by vigorous and gigantic examples. Mr. Tudgey, Waltham Cross, was placed third, his two most remarkable plants being *Croton Johannis* beautifully coloured, and *Cycas revoluta* very large. These three collections were close to each other in merit, and were each highly creditable to their respective growers.

Next in importance were the classes for eighteen miscellaneous plants, not less than six to be in flower. One was devoted to nurserymen, Messrs. Jackson & Son taking the lead with an excellent collection of healthy plants, mostly of moderate size, but as fresh as could be desired. Such well-known exhibition plants as *Statice Butcheri*, *Allamanda cathartica*, and *Bonapartea juncea* were shown in grand style, a fine globular *Rondeletia speciosa* major well clothed with its large richly coloured flowers, and a seedling *Erica* with very dark red flowers, for which a certificate was awarded, being two other specialties in a most praiseworthy collection. Mr. J. F. Mould, Pewsey, was placed second with very even and healthy but smaller specimens; Mr. J. C. H. Ranson, Hill Lane, and Messrs. Oakley & Watling, St. Mary's Road, taking the third and fourth positions. The competition was also keen and the exhibits good in the amateurs' corresponding class, Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, being awarded first honours for beautiful examples of *Erica Parmentieriana* var. *rosea*, *Alocasia metallica*, *Statice profusa*, *Davallia Mooreana*, and *Microlepia hirta cristata* amongst many others also of great merit. Mr. S. Amys, gardener to the Hon. Mrs. Eliot Yorke, Hamble Cliff, Netley, was placed second with well-grown specimens, *Statice profusa* and *Croton interruptus* well coloured, being two of the best in the collection. Mr. J. Blandford, gardener to Mrs. Haselfoot, Moor Hill, West End, was third with *Lygodium scandens* well trained, *Microlepia hirta cristata*, and *Cyanophyllum magnificum*, the latter a tall, vigorous, handsome plant.

There were five groups arranged for effect as suitable for the centre of a conservatory, the first prize of £7 being presented by the Mayor and Corporation of Southampton. In all these, however, there was too much formality, rigid pyramids with evenly banked sides, and in some instances the plants were far too much crowded to produce a good effect. As examples of tastefulness in the arrangement of plants these were of little value, and there is unquestionably much room for improvement in this class. Mr. Wills was placed first with a bright group prettily edged with *Adiantum* and *Panicum*. Mr. Amys took the second position, followed by Mr. J. Kingsbury, Bevois Valley, and Messrs. Oakley and Watling.

Ferns were staged in first-rate condition generally, especially in the open class for six plants, the premier award being secured by Mr. Amys with most creditable examples of *Lygodium scandens*, a globularly trained plant in vigorous health and one of the best specimens of this Fern we have ever seen. *Adiantum Sanctæ-Catherinæ*, *Gymnogramma ochracea*, *Dicksonia antarctica*, and *Adiantum concinnum latum*. Mr. Wills was adjudged second honours, his finest plants being *Adiantum cardiochlaena*, *Nephrolepis davalloides furcans*, and *Adiantum concinnum latum*. In the gardeners' class for four Ferns, Mr. Peel, gardener to Mrs. Todd, Sidford Lodge, Shirley, was the most successful, having *Gymnogramma chrysophylla* and *Davallia Mooreana* very handsome. Messrs. Allen and Budd followed in that order. Messrs. Jackson & Son took the lead in the nurserymen's class for the same number of Ferns, having a good *Platycerium grande*, *Nephrolepis davalloides furcans*, *Lomaria zamioides*, and *Dicksonia antarctica*.

Zonal Pelargoniums were shown in fine condition by several exhibitors, the flowers and trusses large, and the colours rich and clear. Mr. Allen, gardener to J. Bailey, Esq., Elmfield Hall, secured the principal prizes both with single and double varieties; and the same exhibitor had the best *Fuchsias*, tall, conical, and profusely flowered specimens, suggestive of the grand examples seen in the neighbourhood of Bath.

Orchids formed a small class, and it is surprising that these popular plants do not receive more attention in the district. Mr. Osborne was first with a collection comprising some well-flowered plants of *Dendrobium bigibbum*, *Odontoglossum Uro-Skinneri*, *O. Alexandræ*, and *Epidendrum vitellinum*. Messrs. Jackson & Son were second, and Mr. Blandford, gardener to Mrs. Haselfoot, Moor Hill, West End, was third.

For the best specimen stove or greenhouse plant in flower the competition was good, several fine *Allamandas* being entered; but a large example of the beautiful *Impatiens Sultani*, from Messrs. Jackson & Son, was selected by the Judges as the premier. This specimen, which is 4 or 5 feet in diameter, globular in form, and profusely flowered, is probably the largest in the country, and has already gained honours at several other shows.

Miscellaneous small classes for plants were well filled, especially for *Celosias*, of which a great number of small but pretty specimens were shown. Cockscombs were also represented in fine condition, the heads large and richly coloured. *Achimenes*, *Gloxinias*, and *Tuberous Begonias* all contributed materially to the extent of the Show, many of the exhibitors already mentioned gaining fresh honours amongst them.

Cut flowers were not very largely shown, the Roses and Dahlias from Messrs. Keynes & Co. of Salisbury being amongst the most noticeable. The Dahlias in particular were remarkably good, quite of the high standard distinguishing the Salisbury blooms. Epergnes and table decorations were in good force, Mr. J. Cypher being as usual foremost in both classes with very tastefully arranged stands and tables, in both of which flowers of *Francoa ramosa*, *Gloriosas*, and *Aquilegia chrysantha* were freely employed with excellent effect, sufficient Grasses and Fern fronds being used to impart lightness to them. The bases of the stands were very handsome, being filled with large white Water Lilies, *Dipladenias*, and *Allamandas*.

FRUIT.

Sixteen classes were devoted to fruit, and the majority were very well filled, the competition being extremely keen in all the most important. The principal was that for eight dishes, distinct varieties, the first prize of five guineas being presented by the Southampton Tramways Company, which was gained by Mr. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, with a good collection, comprising a magnificent Charlotte Rothschild Pine Apple, large, even, and finely ripened, which formed the strongest point in the lot; large Goshawk Peaches, Brown Turkey Figs, Moorpark Apricots, Lord Napier Nectarines, a green-flesh Melon, with Black Prince and Muscat of Alexandria Grapes; the last-named were rather green, but the other Grapes were fairly coloured. The Pine Apple, however, was greatly admired by all, as it amply deserved, for rarely is such a grand example seen at exhibitions, and Mr. Ward certainly merits great praise for it. Mr. F. Thomson, gardener to W. Baring, Esq., Norman Court, Dean, was adjudged second honours, an award that did not give satisfaction to some experienced and disinterested growers, and the above two collections were subjected to considerable criticism. Mr. Thomson had very fine Barrington Peaches beautifully coloured. His Madresfield Court and Muscat of Alexandria Grapes were good, Melon, Pine Apple, and Figs fair, but his weakest point was a dish of Greengages that appeared to be very unripe. After carefully considering the respective merits and defects of these two collections, several distinguished horticulturists came to the conclusion that they were equal, but it was undoubtedly the Pine Apple which gave Mr. Ward's collection such weight. Mr. Miller, gardener to W. H. Long, Esq., M.P., Rood Ashton Hall, Ironbridge, and Mr. J. Budd, gardener to F. G. Dalgety, Esq., Lockerby Hall, Romsey, were third and fourth respectively, each showing well, though Grapes all through were of rather indifferent finish.

For six dishes, distinct varieties, Mr. Molyneux, gardener to W. H. Myers, Esq., Swanmore Park, won first honours with a collection that well deserved its position, though the competition was even keener as regards general quality than in the preceding class. Mr. Molyneux's dishes were Madresfield Court Grapes; good Muscat of Alexandria, rather green, but fine in bunch and berry; Hero of Lockinge Melon, finely netted; Violette Hâtive Peaches, Pine Apple Nectarines, and Morello Cherries. Mr. Jones, gardener to Lord Calthorpe, Elvetham Park, Winchfield, was a close second with fine Bellegarde Peaches amongst others. Several other fairly good collections were also staged and secured prizes.

Melons were largely shown, about two dozen being entered in the two classes. The scarlet-flesh varieties were of good size and well netted, but rather poor in flavour, much the best being a handsome fruit of Blenheim Orange, with which Mr. Iggulden, gardener to the Earl of Cork, Marston, Frome, obtained the first prize. This was greatly admired, the flesh being very deep, the fruit of beautiful form and grandly netted. Messrs. Thomson, Cox, and Oxford followed in that order. The green-flesh Melons were of fine flavour, especially Mr. Ward's Cox's Orange Gem, which was placed first in the class; it was admirably ripened, very rich and sweet. Mr. Richards, gardener to the Earl of Normanton, Somerley House, Ringwood, was a good second with a fine fruit of Hero of Lockinge well ripened. Mr. Hills was third with Eastnor Castle fairly good.

Peaches were represented by a dozen dishes, Mr. Thomson taking the lead with large and richly coloured fruits of Barrington, exceedingly handsome. There were also twelve dishes of Nectarines staged, Mr. Ward being first with Pine Apple, large but rather poor in colour, and apparently not quite ripe. Mr. Richards was placed second with Humboldt, well ripened and of good colour, and this again occasioned some little dispute, as in the opinion of many the second dish was more worthy of the premier position than the other.

Grapes were not of remarkable quality, the best being Mr. Molyneux's premier bunches of Black Hamburg, which were well ripened and coloured. In white Grapes Mr. W. Hills, gardener to Viscount Gort, East Cowes Castle, took the lead with Muscat of Alexandria, large in bunch and berry and well ripened.

VEGETABLES.

One tent was entirely devoted to vegetables, a very fine display being provided, and of good quality, both in the gardeners' and cottagers' classes. Ten collections of twelve varieties were staged, Mr. Molyneux winning chief honours with handsome Giant Rocca Onions, Trophy Tomatoes, Champion Scarlet Beans, Nante's Horn Carrots, Long White Marrow, Globe Artichokes, Cucumbers, International Potatoes, Sulham Prize Celery, Peas, Cauliflowers, and Turnips. Mr. W. Iggulden was awarded the second prize, but the Judges had some difficulty in determining the position of these two exhibitors, as their collections were very close in merit. Mr. Iggulden's most telling dish was Phillip's Perfection Tomatoes, a beautiful variety, with very even brightly coloured fruits. His other best dishes were Negro Mammoth Long-pod Bean, Nantes Horn Carrots, Telegraph Cucumbers, Culverwell's Giant Marrow Peas, Turnip-rooted Beet, and Schoolmaster Potatoes. Messrs. A. Miller and Sanders were second and third. In the class for nine varieties the competition was also good, Mr. Amys taking the chief position amongst nine exhibitors, followed closely by Messrs. Pope and Budd. Potatoes and Onions were largely shown, the latter being very fine, and most of the Potatoes were also clean and neat.

Collections of flowers and plants not for competition were contributed by several firms, Messrs. Jackson & Son having a group of Palms, Ferns, Ericas, and miscellaneous plants. Mr. W. H. Rogers, Red Lodge, Southampton, had a striking group of Conifers, Ivies, and ornamental shrubs and trees.

Messrs. Elcombe & Son, Romsey, sent a group of Zonal Pelargoniums, comprising many fine varieties remarkably well grown and freely flowered.

HABENARIA BIFOLIA.

SOME plants are grown because they are handsome in form, some because they produce handsome flowers, and others because of the fragrance they emit from leaves or flowers. Among the many orders of plants cultivated perhaps few yield more handsome-leaved plants than the Orchideæ, none finer flowers, and none more delightful odours. The somewhat common British plant noted here cannot boast of anything particularly striking in habit, though it is neat-growing and upright. Nor are its flowers particularly handsome, being of a not very pure white, although in that it would not suffer in comparison with not a few cherished plants. But for filling the evening air with delightful odour not many plants, native or foreign, are superior to *Habenaria bifolia*.

In some places, as in the sub-alpine districts of Stirling, Perth, and Dunbarton, it thrives, and, indeed, all over the country it is frequently the commonest of wildings. On the moor, by the side of the bogs, at the roadside it is to be found frequently; but nowhere in such profusion nor in such vigour is it to be seen as on ground that has been once cultivated but long laid down to pasture. Frequently to be found where the ground is wet, it thrives best where once wet land has been laid dry by draining. These facts will afford a clue to the most successful mode of cultivating it.

It is not difficult to cultivate. Though lifted from its "native heath" at the worst time—when in full bloom—we have always had it as vigorous condition the year following as when lifted, when the precaution was taken of removing the flower spikes, otherwise it is sure to come up weakly the second year. A porous soil suits it to perfection when in the open ground, and a carpet of *Sedum* not only keeps the soil shady and cool, but prevents thundershowers from spoiling the flowers by splashing soil on them.

But in order to enjoy it thoroughly it should be grown in pots. When this is done very tough loamy turf pulled to pieces and mixed with bits of porous sandstone, is perhaps the best compost that could be chosen.

Although in pots it must not be grown under glass at any season. Orchids all the world over have one peculiarity—they will not force. Given a soil open enough, porous enough, and sweet enough it does not matter what the materials are; but make the air too wet or too dry, and especially too warm, and the plants will rapidly go wrong. This is as true of the loveliest British Orchid as of the most delicate *Odontoglot* or *Phalænopsis*. Though the *Habenaria*, then, will grow splendidly in pots, forwarding it in heat, or rather the attempt to do so, or with the idea of being kind to it, will slowly but surely work its ruin.

They do well in the full sun, but much better when only the morning or evening sun reaches them; and though they do not care about too much moisture at the root, its presence in the air produces great luxuriance. A damp surface, therefore, should be kept up in arid quarters.

Not to be bought—at least not that we are aware of—it is often to be found by tourists. Lifting injures most plants much when in bloom, unless all the soil about them is retained, which is burdensome. But most Orchids can be lifted when in full flower with impunity; indeed, only then can they be lifted, being undiscoverable at any other time. But if the plants are lifted carefully and no roots broken, no earth need be removed. They may then be planted very closely together in little boxes or baskets, and will do well, even though kept thus for a few days or even a week or two; but the leaves should be kept fresh and not hid from the sun. The flower spikes should also be removed. Sphagnum moss, soil, or even damp sawdust will do very well for planting them in temporarily, but it must be kept moist. In this way large numbers may be carried far.

Unless the gatherer is a botanist he might not notice it, but there are two common forms, and a third not so common. The handsomest and most robust has been called *H. chlorantha*. The distinguishing feature of this form botanically is that the column is short, stout, and very broad, the anther cells being much wider apart at the base than at the top, and curving downwards. Another, and always, so far as we have observed it, smaller and more delicate plant, has a much narrower column, and the anther cases are close together and not diverging. This used to be regarded as *H. bifolia* proper. The other form with which we are acquainted is intermediate between these, the anther case being considerably separated, and the lower ends curving upwards. Then there are two forms—a British and a foreign—of *H. chlorantha*, the foreign having green flowers. These variations need not bother the amateur. He will not err if he groups them, and consider that his observations have led him to observe how species originate; but these peculiarities, after being observed, will give the observer an insight into the mysterious evolution of species,

though indeed *Habenaria bifolia* shows few variations compared with the countless variations of some species, some of them British.—H.

NORTHAMPTONSHIRE HORTICULTURAL SOCIETY.

THIS Society, which is strong and well supported financially, held its second annual gathering in Delapré Park, Northampton, on Monday and Tuesday last, and the large attendance of visitors on the first day fully justified the choice of the Committee in selecting the August Bank Holiday for their Exhibition, and thus affording wholesome recreation for the numerous unemployed residents and visitors at this industrial centre. The Show was a large one, but a material falling off in the number of competitors in comparison with last year's display, which was held in connection with the County Agricultural Exhibition, was apparent. The arrangements were good, and the comfort of visitors and the protection of exhibitors was well considered by the provision of a large amount of tent accommodation.

The Exhibitions of the Northamptonshire Bee-Keepers' Association and the Seedling Potato Show were also held in connection with the Meeting, and a good deal of interest, especially for professionals, seemed to centre in the work of the local Committee, which has energetically attempted to carry out on a limited scale the recommendations of the Committee of the House of Commons on the Potato disease, but whose endeavours only serve to illustrate the great difficulties and cost of carrying out in a thorough and satisfactory manner the practical tests requisite for the work of advancing the cultivation of that important and necessary portion of the food of civilised races—the Potato. Prizes were offered by the local Committee for the best seedling white and coloured kidney and white and coloured round varieties, and a champion prize (instituted last year) for the best after a three-years trial under the supervision of the Society. This work has been carried out by Mr. W. Farr, gardener to Sir Chas. Knightley, Fawsley Park, with great labour and care, some ten varieties having been selected by the Judges on the last occasion for this test; but unfortunately, as the conditions required that the whole of the produce should be lifted for examination at this Exhibition, which, with a backward season, has been held much too early, several of the varieties tried were not fully developed and nearly all sufficiently ripened, the test for this season can hardly be considered a satisfactory one, but on a future trial the Committee will do well either to lift only half the crop in August, or to leave the whole for a late autumn examination. No signs of disease appear to have been present in the produce, and the crops were reported by the Committee as entirely free from it. Seven pounds of each variety were planted on the 16th of April, the crop was examined by the Committee on the 5th of July, and all were lifted on the 3rd inst. The following will show the careful scrutiny of the Committee and the Judges; and as some of the varieties tested last year, which were then prominently placed for quality when cooked, were this year at the bottom of the list, it is apparent that the test of a single season is totally insufficient to determine quality; soil, climate, and season being all material factors in the development of the Potato.

Name and address of Exhibitor.	Name or Description of Seedling.	Height of Haulm.	Gross Weight of Produce.		Remarks as to Appearance and Quality.	
			cwt.	qrs. lbs.	Appearance.	Quality.
Mr. E. Simons, Harleston, Northampton ..	Round red	2½ feet	1	2 11	8th.	9th.
Mr. W. Kerr, Dargavel, N.B.	Sir Garnet, red kidney	3 feet	1	3 17	7th.	10th.
Mr. Jno. Waugh, Castle Hill, Lochanaber, N.B.	Flat round red	3½ feet	2	0 18	10th.	5th.
Mr. C. H. Hill, Durdward's Witham, Essex	{ Rivenhall Champion, large round white, but few small .. }	1½ foot	1	1 25	3rd.	6th.
Mr. E. Cole, Althorp Gardens, Northampton ..	{ Cole's Favourite, long, flat, white }	2½ feet	2	1 15	1st.	7th.
Mr. W. Horley, Toddington, Beds	{ Roundish, flat, white, from Giant King.. }	2½ feet	1	2 11	9th.	3rd.
Mr. J. Hughes, Eydon Hall Gardens, Byfield..	Coloured kidney, No. 4.	2½ feet	1	2 1	2nd.	4th.
Mr. J. Hughes	{ White kidney, No. 4, Beauty of Hebron by Myatt's Prolific }	1 ft. 8 in.	1	1 24½	6th.	1st.
Messrs. F. & C. Myatt, Offenham, Evesham ..	{ White kidney, King Offa.. }	1 ft. 8 in.	1	3 20	5th.	2nd.
Mr. R. Fenn, Sulhamstead, Reading.. ..	Pink kidney	Not given	1	2 17	4th.	8th.

Prizes were awarded for seedlings exhibited for the first time at this Exhibition as follows:—

Class A, White Kidneys, sixteen entries.—First, Mr. Ross, gardener to C. Eyres, Esq., Welford Park, Newbury, for Robt. Fenn, a handsome flat oval seedling from Woodstock Kidney; good in quality and shape. Second, Mr. Thomas Watson, East Haddon, Northampton, for a seedling from Black Walnut-leaf. Third, Mr. Jas. Dunkley, Kingsley, for a flat oval seedling from Woodstock Kidney. Fourth, Mr. John Hughes, Eydon.

Class B, Coloured Kidneys, two entries.—(Third prize only awarded.) Third, Mr. Henry Hopewell, Berry Wood, for a seedling from Paterson's Victoria, but quite unlike that variety.

Class C, White Rounds, seven entries.—First, Mr. C. Ross; seedling M. P., a large shallow-eyed, smooth white round of the Schoolmaster type, but from Paterson's Victoria. Second, Mr. H. Hopewell; a seedling from Victoria, somewhat flatter, and yellowish skin. Third, Mr. Hopewell; similar, but with whiter skin. Fourth, Mr. Richard Farmer, 16, Albany Street, Northampton, for a medium-sized, flattish, yellow-skinned seedling from Paterson's Victoria by Fluke.

Class D, Coloured Rounds, five entries.—(Third prize only awarded.) Third, Mr. Richard Rowe, Sheep Street, Northampton, for a small but handsome smooth round seedling of the Lye's Favourite type, but with whiter flesh, and probably suitable for strong land. It will be seen by the

entries how satisfactorily the proportion of new white sorts is becoming to that of coloured, the number of the former being twenty-three, and of the latter seven.

The show of plants in flower, foliage, and Ferns, were principally local, none of the great growers putting in appearance. The first prize, however, in the open class A, for twelve stove or greenhouse plants, six in and six out of bloom, was secured by very creditable specimens from Mr. Jno. Day, gardener to A. Seymour, Esq., Norton Hall, Daventry, whose collection included fine examples of *Statice profusa*, *Corypha australis*, *Clerodendron Balfourianum*, and *Ixora Dixiana*. Messrs. Ball & Son of the Bedford Road Nurseries, Northampton, were second, and Mr. W. Farr of Fawsley Gardens, third. For the group of miscellaneous plants in the same class, Mr. Miller, Whittlebury Gardens, was first, having a very clean and well-grown collection. Mr. Thomas, gardener to Lord Overstone, Overstone Park, was second, and Messrs. Ball & Son third. For six exotic Ferns, Mr. Miller, and Mr. Holland, gardener to W. Jeffery, Esq., Northampton, were placed equal first, and Messrs. Ball & Son third. All the collections were good, Mr. Holland's collection containing a fine *Cibotium regale*, *Asplenium Nidus-avis*, and *Adiantum cuneatum* well grown. Mr. Miller had robust specimens of *Blechnum corcovadense*, *Lygodium scandens*, and *Adiantum gracillimum*. For six ornamental foliage plants Mr. Day was first, Mr. Farr second, and Mr. Holland third. Mr. Day showed *Areca Baureri*, and a very handsome seedling *Gymnogramma*. The show of Roses in this and the other classes, to some extent, perhaps, owing to the weather, was almost a total failure, and will hardly call for further comment.

Fruit was not largely shown. In the open class Mr. Day was placed second for the collection of nine varieties, and first for nine varieties in the gardeners' local class, and Mr. Thomas second, but the Grapes and other specimens were not equal to those in the special classes. In the class for three bunches of white Grapes Mr. Day showed very fine and well-ripened Buckland Sweetwater, and was placed first, Mr. Thomas coming second with Foster's Seedling. For three bunches of black Grapes Mr. Day was first with Black Hamburgh, and Mr. Thomas second. For Peaches, which were good, Mr. Miller was first with *Violette Hâtive*, and Mr. J. Harlock, gardener to Lord Lilford, Lilford Hall, Oundle, was second with *Late Admirable*, large, but not highly coloured. Other fruits were only meagrely shown.

In the gentlemen's gardeners' classes for ten stove and greenhouse plants, five in and five out of flower, Mr. Day was first and Mr. Holland second. Mr. Day had *Cycas circinata* very fine, and Mr. Holland a good *Yucca aloifolia variegata*; and for six plants Mr. Thomas and Mr. Farr were awarded first and second prizes respectively. In cut flowers the only noticeable exhibits were two attractive stands of single and Cactus Dahlias shown by Messrs. Ball & Son, one containing twelve blooms of the beautiful *Juarezii* surrounded by *White Queen* was very showy.

Vegetables as usual at Northampton were in fine condition and largely shown, especially in the cottagers' division, where the competition for the valuable prizes offered by Messrs. John Perkins & Son was very strong, no less than twenty collections being entered, and almost as many staged, the first prize falling to Mr. W. Hopewell, Berry Wood. Potatoes were very clean and fine, *International* and *Mr. Bresee* being especially remarkable for size and beauty. *Snowdrop*, a very handsome and good-quality early white-skinned variety, an improvement on *Snowflake*, was numerously exhibited, and almost as frequently good. For six varieties Mr. Geo. Harrison, Duston, Northampton, was first with fine examples of *Mr. Bresee*, *Snowdrop*, *Mammoth Pearl*, *Radstock Beauty*, *Carter's Eight Weeks*, and *International*.

In the gardeners' class for fifteen varieties Mr. Ingram, gardener to W. Butlin, Esq., Duston, was first, having fine *Purple Globe* Artichokes and *Orangefield* Tomatoes. Mr. Day was second with an almost equally good lot, including splendid *International* Potatoes, *Nantes* Carrots, and *Cauliflowers*. For the collection of eight varieties Mr. Allen, gardener to L. Pritchard, Esq., Abington, was first, and Mr. Thomas second. For three dishes of white Kidney Potatoes Mr. Allen was placed first with *International*, *Snowdrop*, and *Jackson's Improved Kidney*. For three dishes of coloured kidneys Mr. Allen was also the winner with *Mr. Bresee*, *Beauty of Hebron*, and *Trophy*. For three dishes of white rounds Mr. Allen was again first with *Bresee's Prolific*, *Felton White*, and *Porter's Excelsior*; and first also for three dishes of coloured rounds with *Red Emperor*, *Reading Russet*, and *Radstock Beauty*.

A fine brace of *Telegraph Cucumbers* was shown by Mr. J. J. Watkin of Duston. Mr. Laxton of Bedford also showed large, handsome, and well-corned specimens of his new early Longpod Bean *John Harrison*, for which a first-class certificate was recently awarded by the Royal Horticultural Society, and also examples of his new Runner Bean *Girtford Giant*, evidencing its great size and fertility. Messrs. John Perkins & Son of the Billing Road Nurseries, Northampton, had a special tent erected on the ground for their exhibits not for competition, and amongst these were many well-grown and attractive plants and flowers. Double and single *Zonal Pelargoniums* were well done, and so good and well-flowered doubles are rarely seen as those from Messrs. Perkins' establishment. *Guillon Mangilli* was a model specimen double; and amongst singles *New Life* (striped), *Eurydice* (carmine-rose), *Bacchus* (vermilion), and *Constance* (bright carmine) are evidently very taking sorts. Early-flowering *Chrysanthemums* *Lucinda* (tinted white Pompon), *Précocité* (yellow half Pompon), and *Sonvenir de Ramport* seem useful acquisitions in this class.

The Show was contained in about ten marquees of great capacity, and, considering that most of the classes only are open to the county of Northampton was a horticultural success even in a gardening district, and will probably prove so financially, as the subscription list is a liberal one, and it would be no injustice to the local exhibitors if a few more prizes were in future offered in the open division A.

NEWPORT AND COUNTY HORTICULTURAL SOCIETY.

THE ninth annual Exhibition of this popular Society took place on Thursday, the 2nd inst., in the beautiful grounds at King's Hill, kindly lent by F. Primavesi, Esq., and was a great success, the exhibits being of the finest order. We would not omit to mention the splendid collection of Mr. S. Cordes (R. Wattie, gardener) in the open class, who showed a magni-

ificent *Erica retorta* major quite 6 feet through, a grand *Anthurium*, and a *Stephanotis floribunda* nearly 7 feet in diameter covered with bloom; in fact this was one of the finest plants ever exhibited. *Allamanda Schottii* was also a mass of bloom, also *Dipladenia Brearleyana*, and a splendid plant of *Statice profusa* grandly bloomed. For this collection he was deservedly awarded the first prize. Mr. J. Cypher, Cheltenham, was second with a good collection, and amongst other plants we noticed a fine *Clerodendron Balfourianum* well flowered. Mr. W. Jones, nurseryman, Maindee, was awarded the third prize for a very fair collection.

For eight fine-foilage plants there was a keen competition between Mr. Wattie and Mr. Cypher; but the Judges justly awarded the former the first prize, as his plants were of a very fine character, being fresh and of a good colour. Mr. Cypher took second prize, and Mr. E. A. Lee, The Coldra, the third prize.

In the amateur class Mr. Wattie was again to the fore, staging a very fine collection of fair plants, including a grand *Stephanotis* and a beautiful *Dipladenia* called *Wattyana*; E. A. Lee, Esq. (R. Giddings, gardener), was second; G. J. Jones, Esq. (S. Bishop, gardener) was third. E. Fowler, Esq., Pontypool, was awarded first prize for a fine collection of Orchids.

The competition for the prizes for fruit was very keen, and, considering the wet weather we have had, the collections were very fine.

The day being fine the *elite* of the neighbourhood and county attended, and we are pleased to hear that financially as well as in every other respect the Show was a decided success, and amply repaid the great efforts of the Committee and Secretaries.

HARDY FRUIT GARDEN.

Fruit-protection.—Late Cherries must now be thoroughly guarded from the attacks of wasps and birds. To do this effectually there is nothing equal to Nottingham netting bound with tape to which rings are sewn, so that it may be put over the trees, or taken down easily and quickly by slipping the rings over hooks or nails driven into the wall, and thus avoid the wear and tear which is unavoidable when the tedious process of driving nails through the netting is followed. Do not wait till the fruit is ripe before doing this, for blackbirds and thrushes clear it off as soon as it softens slightly and begins to colour. Gooseberries require a light framework of poles to keep the netting from contact with the bushes. The best way of keeping off birds as well as insects is to put closely woven garden mats round the sides of the bushes and Nottingham netting over the top; or if a rectangular enclosure be made around several bushes, then 6-inch strips of half-inch deal put on edge round the bottom of the framework, fastened to its supports, and having nails or hooks for the rings of the netting, answers perfectly, and is preferable to the mats because it is less costly and more durable. It is quite useless to trust to netting thrown over framework and only fastened to the ground with pegs, for the blackbirds then inevitably find a way under the netting, even if it is double. Red and White Currants required to be kept for late use should be closely covered with garden mats both on walls and in the open plantations.

Strawberries.—The picking of the last fruit should be promptly followed by a clearance from between the rows of all superfluous growth, and the application of a heavy dressing of manure to all beds that are to be kept and the hoeing-up of the plants of old exhausted beds. To do this is simply to obey a fundamental law of gardening, or rather to follow the dictates of common sense, which tell one that no plant should ever be suffered to exhaust the soil unnecessarily. Concerning the digging-in of manure between the rows now there is a considerable difference of opinion, but it is a matter with which mere opinion has nothing to do. In a close heavy soil liable to settle into an inert mass and to become sodden with rain the digging-in of manure now is necessary, not only to feed the plants, but to preserve them through winter from the destruction to which they are then so liable in a water-logged soil. But in a free, light, open, thoroughly porous soil through which rain water quickly passes to the drains a top-dressing of manure without digging will suffice. These are precious items of dear-bought experience, purchased by us many years ago at the cost of a large Strawberry bed before we had learnt to test all theoretical opinions by the light of practice. Make a reserve bed of runners dibbled in a few inches apart in any spare border or nook. Such plants are useful to fill gaps in new beds in spring, and also for planting or potting next spring or summer. On the 17th of April we planted two large beds of several new sorts on trial from a reserve bed. The bloom was kept picked off, and they are now magnificent plants quite certain to afford a full crop of fruit next summer, and thus enable us to ascertain the relative value of each sort in productiveness as well as in size and flavour.

FRUIT-FORCING.

CUCUMBERS.—*Raising Plants for Winter Fruiting.*—Now is a good time to make a sowing of some good-constituted and free-bearing kind, there not being any better than Rollisson's Telegraph, whilst Pettigrew's Cardiff Castle and Verdant Green are capital sorts. The seed is best sown singly in 3-inch pots in light and not very rich soil, plunging in a Cucumber or other frame where there is a gentle heat and as

the plants require more root room shift them into larger pots as required, until they become large enough for planting out either in beds with hot-water pipes for furnishing bottom heat, or they may be fruited satisfactorily in pots or boxes. A suitable compost for winter-fruited Cucumbers may consist of three parts good light fibrous loam, one part peat, and about a sixth of charcoal, which is useful in keeping the soil sweet. Any feeding required is best given as surface dressings or in liquid form. The young plants will need securing to small sticks as they advance to keep them from snapping, rubbing off all laterals whilst quite young, until they have sufficient stem to reach the trellis.

Stopping, Tying, Syringing, and Watering.—Stopping must be attended to frequently. Plants in good health need only have one joint left beyond the show of fruit, but weakly plants may be allowed more spread of growth with a view to encourage root-action. Thinning must not be allowed to get into arrear, removing superfluous shoots, also mis-shaped fruits, and do not allow anything like overcropping or the fruit to remain longer on the plants than they are fit to cut. Tie the shoots evenly over the trellis. Syringe twice a day in bright weather, and close early in the afternoon, 3 or 3.30 P.M., according to the power of the sun. Be careful not to allow the plants to want for water at the roots, but do not over-water, and when it becomes necessary apply it or liquid manure in a tepid state thoroughly.

Insects.—Woodlice are often very troublesome, the best remedy for which is to make the soil firm around the sides of the bed, placing a little hay there, and in the morning pour boiling water along the sides and ends of the structure where the hay is placed. If done judiciously the water will not injure the roots of the plants. Should red spider appear heat the hot-water pipes to 160° or over, and coat them whilst hot with sulphur made into a thin wash with skim milk. If mildew appear dust the plants with flowers of sulphur. Green and black aphides are sometimes troublesome at this season of the year, for which there is no better remedy than careful fumigation with tobacco paper on two or three consecutive evenings, being careful to have the foliage dry, and not to give an overdose.

PINES.—*Treatment of Young Plants.*—Young stock under the conditions that naturally prevail at this season, combined with proper attention, will make quick and vigorous progress, which so long as solar influences are favourable should be encouraged. Ventilation must be carefully attended to, commencing to ventilate from 80°, maintaining the heat about the plants through the day at from 85° to 95°, closing at 85°. By this time the plants will have become inured to sunshine so as to be able to resist its effects without injury, in which case shading should be dispensed with; and anything impeding the free access to the plants of the solar influences must be removed. With a view to promote speedy growth in recently potted plants the heat at the roots should be maintained steady at 95°. Carefully water such plants, as, until roots are formed, only a small quantity will be required, but when the soil in the pots is permeated with healthy roots plentiful supplies of water are needed, with some stimulating agent in a weak state.

Fruiting Plants.—The night temperature should be kept at 70° to 75°, and the maximum by day 95° from sun heat, closing the house at 90° when the sun begins to wane in the afternoon. Damp the floor at closing time, and the plants also two or three times a week.

MELONS.—*Stopping, Thinning, and Tying.*—Stopping the growths to one joint as made after the fruit is set and swelling will need frequent attention; and not less important is the removal of growths where they become crowded so as to interfere with the access of light and air to the principal foliage. The shoots should be disposed even on the trellis, so that light and air will have free access.

Moisture.—The atmospheric moisture in both houses and pits or frames will need to be regulated according to the weather and the stage of growth at which the occupants of each structure have arrived, damping requiring to be done very carefully in pits and frames where hot-water pipes are not at command. Frames will be the better of having the linings made up moderately in which the plants are swelling off their fruit, and those setting will need a little air constantly to insure a good set.

PLANT HOUSES.

Tradescantia marginata variegata.—This entirely supersedes the old zebrina for furnishing purposes, and its beautiful foliage is very attractive and useful for associating with cut flowers, and can be used in a variety of ways with great effect. Where a continual supply is required cuttings should be inserted at intervals of two or three weeks. Every cutting inserted will root in a stove or intermediate temperature without either being shaded or kept in a close frame. This plant is most serviceable when about four or five cuttings are established in 2-inch pots and used for furnishing when the plants are about 3 inches high. The beautiful foliage of this plant associated with small Ferns and Lycopodiums for edging groups of plants have really a charming effect. It need scarcely be said this plant is easy to grow, and in no way particular about soil or treatment, and in consequence is invaluable for the purpose for which it is recommended.

Bertolonias.—However select a collection of stove plants may be, a few plants of these where foliage is appreciated should find a place. Their foliage is so beautiful and distinct that few fail to admire them when well grown. These plants are easy of cultivation, but to grow them to perfection require a close frame or to be under bell-glasses. They will do well without if the house in which they are grown is kept close. In order to keep them in the best of condition through the winter a number of cuttings should be rooted without delay. If the cuttings

are good and strong insert them singly into 2 or 3-inch pots in a mixture of equal parts of fibrous peat, sphagnum moss, and silver sand. A good dash of the latter should be placed in the centre of the pots for the base of the cuttings to rest upon. Give a good watering after insertion, and keep them in a close, moist, well-shaded frame until rooted. If these directions are followed every cutting will root, as these plants are not difficult to propagate. *Bertolonias* can be used with much effect for room-decoration, but, unfortunately, they are not adapted to withstand rough treatment, and will not last long for such purposes; in fact, we could not recommend them as useful plants for that purpose, but, on the contrary, they are better adapted for the purpose of rendering a plant stove attractive.

Caladium argyrites.—This is decidedly the most useful *Caladium* that can be grown, and stands in the foremost rank as a decorative plant. Few plants are more dwarf or compact in habit, and none possesses more beautiful foliage. To have these in the best of condition for autumn and winter decoration a number of plants should now be split up and potted into 4-inch pots. After potting keep them close until the young plants commence rooting afresh, and then gradually expose them to more air, and grow them under ordinary stove conditions. Any ordinary soil will suit this *Caladium* providing it is moderately light and rich, and a good supply of water should be given while the plants are in active growth; in fact, they should not be allowed to become so dry as many varieties of these plants even while at rest, or detrimental results will ensue. Before using these plants in rooms or other decorative positions give as much air as the plants will safely bear, so as to bring them into as hardened a condition as possible, and they will last nearly double the length of time as would otherwise be the case if taken directly from close heated structures.

Gardenias.—Young stock that have become thoroughly established in 4 or 5-inch pots, and are rather cramped for room at their roots, should without delay be placed in others 2 inches larger. Young plants will grow rapidly for some time to come, and be much benefited by receiving a shift at this season of the year; in fact, they can be managed so as to produce flowers after the general stock has done blooming, which is important where a supply of these blooms is in request during the spring months. Stock that has been cut back should have more air from this time than has been given in the past, which will be the means of bringing their growth to a standstill, and the result will be flowers in autumn and through the winter instead of being produced only in the spring. These, if thoroughly root-bound, should receive occasional doses of Standen's manure or stimulants every alternate watering made from cow manure and soot water. In case mealy bug infests these plants syringe with paraffin oil and water at the rate of an ounce to the gallon of water, which should be repeated again in the course of four or five days if the first application fails to eradicate the whole of the insects. Care should be taken to shade the house or pit in which the plants are growing after syringing with paraffin, or in bright weather the plants will suffer.

THE BEE-KEEPER.

FIRST PREPARATIONS FOR WINTER.

If we wish to take time by the forelock it is not a bit too early to begin preparations for passing our bees safely through the winter. Already the first tinges of autumn are appearing on the forest foliage, the honey harvest is failing, and bees have to fly wider in order to add to their stores. It is only in favoured districts where the purple Heather begins to brighten up the moorland or to glow on the mountain side that there is yet another golden harvest to be reaped by our merry labourers. Where the supply of honey has to be drawn only from the early fruit blossoms, or later on from the Clover and an occasional avenue of Limes, the time of profit is waning, and the bee-master must be alert to do his best to prepare for another season's ingathering. We have before pointed out how much the amount of that next ingathering depends on the condition of the stock in autumn; but at the risk of being accused of repetition we must again try and impress on the owners of bees, more especially on beginners, the great necessity for careful preparation at this time of the year.

We would first speak of bees in the neighbourhood of Heather. Where they are kept in bar-frame hives a heavy return of honey may yet be obtained should the present weather continue. We are now writing from the wild and beautiful moorland of North Devon, and the sight of thousands of acres of rapidly opening Heather flowers, while it gladdens our eyes, impresses us with the great fact that tons of honey are being wasted in a country which imports its principal stock from other lands. Doubtless our friend Mr. Griffin and his fellow workers have done and are doing much to encourage the cottagers of Devonshire to learn how to pay their rents from the produce of the Heatherbells; but very much more can be done, and no doubt in time will be

done, to apply this free gift of Nature to a profitable purpose. Now, those who keep bees in such a neighbourhood should extract all the honey they can from the combs and make the bees start afresh. This will act as a stimulus both to the bees to store the greatest possible quantity obtainable of Heather honey, and it will also cause the queen to lay more rapidly and later on into the season. This is exactly what must happen to insure strong stocks composed almost entirely of young bees to go into winter quarters. With fair weather ordinary-sized hives will also fill many sections of Heather honey. The consistency of this kind of honey is such that it cannot be extracted from the combs, and therefore the introduction of sections into the body of the hive, as well as around or above the brood nest, is commendable. So long as the queen has room beyond what she requires for forming a strong brood nest every available part of the hive should be filled with sections.

Heather honey, from its natural density, is the very best to travel and also to be kept for long periods after gathering; whereas fruit blossom and Clover honey is the best for extracting from the combs by means of the slinger and storing in glasses and jars. Heather honey does not candy in the comb like Clover honey, and is therefore preferred by many to the latter kind. The honey gathered from Heather, again, does not require so long a time to ripen, and supers are therefore quickly sealed and finished off ready for withdrawal from the hive. With straw skeps the management is, of course, more difficult than with bar-frame hives. If we had skeps near Heather we should certainly cut away the outer slabs of honey on each side of the brood nest if they did not contain brood. This would cause increased energy among the bees, and they ought to rebuild and fill these combs as well as working in sections above the hive. The same result would thus be obtained as in the bar-frame hive, so far as the obtaining of plenty of young bees for the winter was concerned.

Where the honey harvest ends with the cutting of the Clovers and the flowering of Limes, &c., we must use other means to obtain the same results. More trouble must be taken in such cases, but the result will well repay for the extra amount of work given to the bee keeper. From bar-frame hives we have extracted nearly all the honey obtainable, and replenished the hive by giving sugar syrup. This syrup should be of a greater density than that recommended for spring feeding; 4 lbs. of best lump sugar to three half pints of water, a pinch of salt, half a wineglassful of vinegar poured in when the syrup boils, allowed to boil gently for ten minutes, and then a table-spoonful of salicylic acid solution added, makes a good autumn food. This should not be applied too rapidly, so arranging the feeder that some 2 or 2½ lbs. of the food can be taken down in the twenty-four hours for the first week, and about 1 lb. per diem afterwards. This will carry us on well through August before the hive has become sufficiently heavy to pass through the winter, when the supply should be gradually diminished, and the bees will likewise gradually quiet down and complete their wintering arrangements. The effect of this system if regularly carried out will be that the stocks so treated will be in like manner strong and full of lately hatched bees, to bear the brunt of the spring-tide battle. All stocks should, of course, be kept equally strong. Where one outsteps the others to any great extent it is well to take a slab or two of brood from it and give them to a weaker neighbour, substituting sheets of foundation for the combs abstracted. By keeping all the stocks equally strong the chances of robbery will be reduced to a minimum. Woe be to the weak stock in a neighbour's garden. Where such powerful colonies are near, weak stocks, especially where left to take care of themselves, are certain to come to grief. But it is no fault of the careful and provident bee-keeper if the neglected stock of a neighbour be cleaned out. The remedy is in the owner's hands: he should keep his bees as well, or so protect them that they cannot be robbed, by narrowing the entrance so that only one bee can pass at the time.

We advise that all supers be taken away the moment they are sealed up. This will not only preserve their beauty of appearance, but in the event of a sudden breaking-up of the weather often save them to the bee-keeper, instead of having them uncapped and partly carried below. As the season approaches its end, and the finished supers have been removed, care should be taken to know what amount of real stores the bees have left in the body of the hive for their winter consumption. The weight of the hive is not a safe thing to determine this by. Brood is heavy, and half the weight may consist of brood, bees, and pollen. Sealed honey to the amount of from 15 lbs. to 20 lbs. or more must be present if the bee-keeper wishes to leave his bees unmolested, as they should be, until March, after once putting them up for the winter. If, after

taking away all super honey, there be not sufficient store remaining, syrup should be given to make up the requisite amount, after which the bees should be prepared for wintering. A few words as to the methods we adopt for putting our bees comfortably to rest must be left until another letter.—P. H. P.

BEE AND HONEY SHOW AT OLDHAM.

EXHIBITIONS like this are very unusual. The Corporation of Oldham have just opened a grand building in the centre of the town, which has cost £10,000, and in it are now having a Fine Art and Industrial Exhibition, opened by Sir John Lubbock on the 1st of August. It appears that the Corporation resolved to have a Bee Show in connection with those of industry and art, and employed Mr. Pettigrew of Bowdon to furnish the exhibits, and they charge 2d. for admission to the bee room.

The exhibits are interesting, but badly hung—much too high. The two principal exhibits are two large black boards with letters that read "God Save the Queen" on one board, and "Fine Art Exhibition" on the other. The letters are distinctly formed in pure white wax by the bees, and is considered a marvellous achievement by all who examine it. Such work has been seen at one other Show only—viz., the great horticultural one at the Manchester Botanical Gardens two years ago. The black boards are hung on opposite walls in the bee room at Oldham, the supers of various forms and sizes are placed on a shelf on one side of the room, and five observatory hives are placed on the other. In the bee room all is evidently for exhibition, not for competition. The Show is, we believe, to remain open three months.

PAPER ROOFING.

I SHALL be glad if any of your readers can give the receipt for making paper roofing. I think I saw it some time since in the *Journal of Horticulture*. I would also like to know where it can be purchased, and if it is considered suitable for covering bar-frame hives, I mean for covering the wood. I have four hives I have made from instructions that have appeared in the *Journal*, from which I have gathered many valuable hints.—SUTTON.

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (*W. G., Sligo*).—The following are works of permanent value, and likely to be useful for reference in your library:—Thompson's "Gardener's Assistant," Hogg's "Fruit Manual," Johnson's "Cottage Gardener's Dictionary," Brown's "Forester," Morton's "Cyclopædia of Agriculture," Mr. B. S. Williams' works on stove and greenhouse plants, Orchids, and Ferns; and Mr. F. W. Burbidge's "Propagation and Improvement of Plants." These works can be obtained through a bookseller, who will inform you of their price. The collection will probably somewhat exceed the amount you name.

Grubs in Strawberry Bed (*A. W.*).—The insects sent are the grubs or larvæ of one of the crane-flies, or "daddy-longlegs," seemingly the species called *Tipula paludosa*. An extensive list of applications has been suggested for the destruction of these grubs, which lurk at the roots of a variety of plants, though specially partial to the Cruciferae. Their vitality, however, is so strong that any compound which will kill them is almost certain to injure the plants. As it appears your bed is already ruined, the only measures you can adopt would be those likely to check any further appearance. The thorough breaking-up of the soil, and the free application of gas-lime or rich manure, which the insects dislike, and attention to drainage, may be recommended. It is a curious circumstance that while some of the grubs you forward are nearly adult, others are very small, and therefore must represent a different brood.

Black Bryony, *Tamus communis* (*Bromesden*).—This conspicuous plant, of which you sent shoots, is a member of the Yam family, the Dioscoreaceae, which is chiefly tropical; the Black Bryony is, however, well known in English hedgerows and throughout Europe generally. The tuberous roots contain a viscid acrid juice, which was at one time used for plaisters, and

such are even now used occasionally in country districts to restore the colour of the skin when bruised. The fruits steeped in gin are recommended as a remedy for chilblains, while the young shoots are eaten in Greece like Asparagus, which they are said to resemble. There is more or less of an acrid principle in the whole of the plant, and it would certainly be exceedingly unwise to eat the fruits.

Sunday Work in Gardens (*G. A. B.*).—Your letter has been attentively read, and the subject of it well considered. We are convinced that its publication would not be of service either to yourself or to any other gardener, old or young. The majority of young gardeners are attentive to their duties, but all are not alike in this respect. Head gardeners also vary in the mode of discharging their duties, and your reproaches as applied generally are not well founded. Work must be done in gardens on Sundays, and those men who are not willing to do it will never excel. At the same time it should be, and we believe usually is, reduced to a minimum. Even then it must often be more or less exhausting to the man in charge, since he often has the work of two or three men to do in watering, syringing, shading, and ventilating, and he must endeavour to do it. It is proverbial that much injury has been done in gardens by the young men in charge rising late on Sunday morning. If it is part of a young man's duty to attend to vineries, for instance, at 5 A.M. he must be there at the time, and he has no right to retort that the head gardener is not seen for some hours later. If a head gardener has a suspicion that his assistants are negligent, then it is his duty to ascertain the facts of the case by being in the houses before them, and if he finds the neglect general then his further duty would be to discharge them. Undoubtedly an under gardener must "do as the head gardener wants," and if a young man cannot do this his plain duty is to resign. You will recognise the truth of this when you have had another twenty years of experience, and we hope long before, for your letter indicates that you either are or will be a good and attentive gardener.

Voles (*J. N. F.*).—You are not alone in your want of knowledge of these animals, as others have sought for information as well as yourself. Field vole (*Arvicola agrestis*), is the name of the short-tailed field or meadow mouse; a species which subsists exclusively on vegetable productions; and being, like the rest of the rat tribe, extremely prolific, multiplies occasionally to such a degree, even in this country, as to become the most injurious of our wild quadrupeds. "After having followed the labours of the reaper, and taken their share of the harvest," the field voles, says Mr. Bell, "attack the newly-sown fields, burrowing beneath the surface, and robbing the husbandman of his next year's crop, and at length, retreating to the woods and plantations, commit such devastations on the young trees as would scarcely be credible were not the evidence too certain to be doubted. In the years 1813 and 1814 these ravages were so great in the New Forest and the Forest of Dean, as to create considerable alarm lest the whole of the young trees in those extensive woods should be destroyed by them." A timely and assiduous attention to restraining the increase of this pernicious species, by the aid of terriers, ferrets, and traps, is imperative on those who have the charge of young plantations; but when the numbers of the field vole have surpassed the usual bounds, then it is recommended to dig holes about a foot in depth and the same in diameter, taking care to make them much wider at the bottom than at the top, so that the animal once in cannot easily get out again. In holes of this kind, Mr. Jesse states that at least 30,000 field voles were caught in the course of three or four months in Dean Forest plantations, that number having been counted out and paid for by the proper officers of the forest.

Lawn Tennis Ground (*F. G.*).—The following particulars on this subject were published in this *Journal* a short time since from a Liverpool correspondent:—"A full-sized court for four players is 26 yards long by 12 yards wide. As much play takes place at the extreme ends or "back lines" of the court, a considerable margin is required at each end; the total length of the tennis ground should therefore, if practicable, be not less than 33 or 34 yards. My own tennis ground is at present only 18 yards wide, but it would be preferable to have it considerably wider than this, so as to allow of the position of the court being moved a little one way or the other, and thus obviate wearing out the ground unduly. It is generally a good plan to have a little drainage material laid under the turf, so that the ground will not be so liable to play "dead" after rain. If a wire fencing about 6 feet high is placed at each extreme end of the ground, and a lower fencing about 3 feet high running along each side, this will be found to save a great amount of superfluous muscular exercise in "fielding" the balls. If neatly put up and painted dark green this wire fencing does not appear too prominent in the grounds. The ground should be as nearly level as possible, as uphill or downhill playing is undesirable." After repeating the above regulations, another correspondent observed:—"It is much better if the ground is kept a little higher in the centre, say 4 or 5 inches, so that when a heavy rain occurs much of it passes off to the sides and ends, and the ground is quicker dry and fit to play upon sooner than when made perfectly level, and the greater part of the rain having sunk into the ground. It is very essential to have a firm surface; and for this reason, where the soil is clay or is wet, it is a good plan, after having levelled and consolidated the ground, to spread about an inch of clean coal ashes over it before laying down the turf. In addition to this it should be previously well drained. On light dry soils less trouble is necessary to have a fair tennis lawn; indeed, it may be played for "home practice" on any lawn where there is a little less room than is required for full-sized courts, and although it is not quite level."

Zonals for Winter Flowering (*Idem*).—There are now so many handsome varieties of these to select from that it is easy to form a very fine collection, which will afford a supply of flowers during many months. The following twelve, selected from the great collection of Messrs. H. Cannell and Sons, Swanley, are especially recommended for the purpose you name:—Favourite, Mr. Teesdale, Edith George, Crimson Gem, P. N. Fraser, Ferdinand Kauffer, Kate Farmer, Imogene, Eurydice, Eureka, Mrs. Miller, and Mrs. Moore.

Names of Fruit (*J. Cope*).—An individual berry of one variety and two berries of another, with no intimation as to the shape of the bunches and time of ripening, are quite insufficient for anyone to determine with accuracy the names of Grapes. We can only say that in the crackling nature of the

flesh No. 1 resembles Royal Ascot, the berries being large, and No. 2 is probably Black Morocco, also a fine berry.

Names of Plants (F. B.).—*Senecio Jacobæa*. (Reader).—1, *Veratrum viride*; 3, *Gentiana asclepiadea*; 5, *Sedum spurium*; 6, *Centaurea Cyanus*. All the specimens were greatly crushed, the box being quite flattened; 2 and 4 were quite unrecognisable. (S. L.).—The white flower resembles *Hydrangea arborescens*, the other is *Eucharidium grandiflorum*. (*Bromesden*).—*Tamus communis*. See reply above. (G. M.).—*Pyrus torminalis*. (*Subscriber*).—*Godetia Whitneyi*. (W. C., *Horncastle*).—*Malva moschata alba*, a perennial plant.

Driving Bees (R. Stoke).—In a case of this kind we can only say drive the weaker into the stronger hives, leaving, however, the strongest of all untouched. You will then have three instead of five hives. You can after a time, if you choose, reduce them to two by again uniting the two weaker. The work of driving is simple and easily done. First blow some smoke from fustian or calico rags amongst the bees, turn up the hives and place them on their crowns upside down, put empty hives over them, roll a table cover or piece of cloth of any kind round the junction of the hives, and drive the bees up by drumming on the bottom ones for fifteen or twenty minutes. This drumming shakes and disturbs the bees below, and causes them to run up for safety. Give the bees 2 lbs. of sugar made into syrup every night for twelve days, and you will have healthy stocks. It is well before uniting to sprinkle the bees in both hives with a syrup to which a little peppermint has been added, and little or no fighting will then occur. Is there not a practical bee-keeper in your neighbourhood who would help you in the work and advise you generally on the management of your bees?

[Replies to a number of letters are unavoidably postponed until next week.]

of them is imaginary, not one of them is a mere scheme or proposal, every one of them is actually adopted and in use on farms, many of them in whole districts, in this country. The differences of cost in the weekly food, according to the modes of feeding specified in Table 1, are very considerable, more than 100 per cent. in the cost of summer feeding, which averages 8s. per week, and varies from 5s. to 11s.; 70 or 80 per cent. in the cases given of autumn feeding, which costs on the average about 9s. 6d., and varies from 7s. 6d. to 12s.; more than 100 per cent. in the cost of winter feeding, which averages about 6s. 4d., varying from 4s. 9d. to 12s.; and 30 per cent. in the cost of spring feeding, which averages nearly 10s. a week, varying from 7s. 6d. to 12s. The annual cost in some of the cases named is, however, brought out more accurately in another table, where the average annual cost of thirty-five selected instances comes out as equal to £21 15s., being 8s. 4d. weekly throughout the year."

As we cannot here find space in a tabulated form for the information given we have made the above quotation from the best essay ever written on the subject, and valuable it must be by reason of the wide-spread sources from which the information is obtained. It is, however, dated December, 1858. We therefore must endeavour to ascertain the cost of feeding most in use at the present period. Some differences of opinion will doubtless be found, yet they may be justified in some cases by surrounding and peculiar circumstances. In giving our opinion and practice we will divide the year into four periods of thirteen weeks each. The first thirteen weeks, commencing on the 1st of May, each horse may be fed as follows:—1½ bushel of Oats, 4s. 6d.; green fodder, 3½ rods, 2s. 11d.; total, 7s. 5d. The second thirteen weeks, commencing in August, 1 bushel of Oats, 3s.; green fodder 4 rods, 3s. 4d.; total, 6s. 4d. The third period commencing in November, 2 bushels of Oats, 6s.; 1 peck of Beans 1s. 3d.; 1 cwt. of hay, 3s. 6d.; 70 lbs. of Carrots, 7d.; total, 11s. 4d. The fourth period, commencing in February, 2 bushels of Oats, 6s.; 1 peck of Beans, 1s. 3d.; straw, 2s.; 70 lbs. of Mangold, 6d.; total, 9s. 9d. Thus the average cost of keeping farm horses per week per annum will, we reckon, amount to 8s. 8½d. per week by estimating the green and root food at consuming value. As the practice of feeding horses differs so much in different districts of this country some remarks will be necessary. As our first period of feeding begins on the 1st of May and green fodder is used, *Trifolium* may not be ready in some districts, but Rye and Italian Rye Grass will be, except in the northern districts, and where it is not obtainable the Mangold feeding may be continued until green fodder is available. Again, at the conclusion of the second thirteen weeks green fodder may not always be available up to November, but if Rye and Vetches or Italian Rye Grass are not to be obtained up to that date the feeding may be regulated by commencing feeding with Carrots or other roots when the green crops cease to be available. We set great value upon the root-feeding in the autumn and winter months; in fact, to fill up the vacant period after green fodder goes out until it comes in for use again. Maintaining the supply of green or vegetable food throughout the year is a matter of the utmost consequence in the feeding of horses, for in the autumn and winter months, if allowed dry food only, the animals are sure to show a long, thick, and rough coat, this being one of Nature's resources to counteract the effect of injudicious feeding, and when horses are worked with such an external covering they sweat readily and profusely in consequence, and are faint and weak after very moderate exertion.

In referring again to the large number of cases in feeding of horses, as shown by the numerous correspondents and the results of farmers' club meetings, being the authority on which the calculations are made and the weight consumed per week of hay, Oats, Beans, roots, Clover, and straw by horses, and the calculated cost of so maintaining them. The cost is calculated at the rate of 3s. a cwt. for hay, 3s. a bushel for Oats, 4d. a cwt. for Turnips or Mangold, 6d. a cwt. for Carrots and Clover, and with or without charge for straw. It is, however, not attempted to justify the prices here adopted, but they will suffice to illustrate the mode of calculation adopted, and no figures could be substituted for them to which exception might not be taken. The prices adopted in calculating the cost of food are, it will be found, the ordinary market prices of the grain consumed; and in the cases of the hay, roots, and green fodder, the value which it is estimated they might produce if given to other kinds of live stock on the farm. It is, however, rather remarkable, as we find in one case the horse keep is only charged at 5s. per week, and that its food consisted of Oats just as they were harvested and passed through the chaff cutter, straw and corn just as they grew in the field. We fail, however, to see how this calculation can be justified, because the yield of grain cannot always be found in proportion to the bulk of the straw.

HORSE LABOUR IN FARMING.

(Continued from page 108.)

THE most important part of our subject is feeding in different seasons. This can only be properly accomplished by combining effect with economy, so that when dividing the year into four parts of thirteen weeks each, and making use of the food produced on the farm, and available at certain periods, in order that a full amount of nutritious substances may be consumed at each period and of the least value for sale, so that the most benefit may be derived by the animals in consuming a given quantity of articles of the least value commercially to insure the greatest economy. We find most valuable information on the cost per week for keeping farm horses, as stated by Mr. J. C. Morton in his essay on the cost of horse power, in the Journal of the Royal Agricultural Society of England, wherein it is stated, "There are no fewer than 115 cases named in Table 1 (p. 442). If any of the methods of feeding here described should seem whimsical—any of their differences merely fanciful—the excuse which must be taken for their appearance is that not one

We consider that one of the leading points in corn-feeding is that these ought always be bruised or crushed to obtain the full nutriment to be found in them, besides which, some horses have defective teeth; others, especially when fed in stalls side by side, often eat so fast that proper mastication becomes impossible, and, therefore, as they are not ruminating animals, the whole grain passes them without contributing that support to the system which is necessary. We notice, too, that in some cases bran or millers' offal of some kind is advised in the feeding of horses. We, however, repudiate and object to it entirely, for we have seen the results and fatal cases of animals after being fed with bran for a considerable period. Only last week that we noticed exhibited in a market hall where the farmers were in attendance, four stones or kind of concrete which had been found in horses which had died. Our attention was called to them, and it was stated that they were taken from two horses, each of them owned by millers in the county of Middlesex, whose habit was to feed their horses principally upon bran. We also recollect various instances of the same kind, one of them which occurred within our knowledge sixty years ago, when a whole team of millers' horses died from the same cause, stones weighing from 6 lbs. to 24 lbs. being found in their intestines. We, therefore, name these cases to put horse-keepers on their guard against using millers' offal except in moderation. Another reason why we object to bran is that machine-crushed Wheat would be cheaper, and at the same time would be free from the millstone grit, which is the principal cause of mischief.

The value of the horses' labour cannot be calculated entirely upon the animals' weight, height, &c., but must also be reckoned on by condition; for the chief benefit arising from keeping horses in good condition is that two horses well fed and cared for properly will do the labour of three horses badly kept and otherwise ill provided for, so that two to a plough will be sufficient during the busy periods of the year. In corroboration of the advantages of liberality in feeding farm horses, we will state the observations of a railway contractor upon the subject. He was asked whether he reduced the food of his horses when the cost of the food consumed was unusually dear. He replied, that he had been sorely punished by extravagant prices at certain periods, notwithstanding which he gave the same amount of food to his horses, which, in fact, was almost unlimited, averaging three bushels of Oats and half a bushel of Beans each horse per week, and the best hay *ad libitum*. On being again asked if he was quite sure that he could not reduce the amount of corn with advantage, he rejoined that he tried the plan, but was convinced that the system he adopted was the cheapest in the end, particularly when his horses worked hard for twelve hours in a summer's day.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—This is still being required and continued on the land where Trifolium has been removed and now in preparation for Turnips, as the land required rafter-ploughing and scarifying to comb out the couch; so it will require harrowing to dispose of it by either burning if weather is dry; if not, carting it away must be done, for time and season wait for no man. Turnip-sowing cannot be delayed many more days without lessening the prospect of a full crop; still the Greystone sort will grow very fast with manure under and favourable weather above them. We, however, have not yet decided whether to drill the seed with manure or sow both broadcast, for in the event of the crop being required for ploughing-in for Wheat we shall not require bulbs, but a thick and regular plant as luxuriant as can be obtained, for a matted crop of gross greens is better for ploughing in as a green crop than bulbs which require labour of reducing before being ploughed under. Thus the labour of hoeing and singling the plants is also saved, and a greater amount of fertility left in the land if the plants do not bulb, for the bulk of food produced will be derived from the air and rainfall. Hay-carting will still be going on in all the latest districts and in the water meadows where they were fed by sheep in the spring and the growth of grass gathered late; but to this date the weather generally has been very fickle and but ill adapted for producing hay of good quality, in fact we can scarcely remember a more difficult period for haying than has persistently occurred ever since the first week in June. Working on the fallows for Wheat will be required for some time yet, as so much couch has been left on various farms by outgoing tenants for several years past; that in passing through the various districts we cannot travel far in any direction without seeing farms lying neglected in a foul state, but especially in the heavy land districts, and these foul fields must now be cleared or allowed to run to waste. On some estates much land not tenanted has been allowed to run waste or growing rough grass and weeds; the only thing being done is keeping a few Scotch sheep, which it is said is all profit, but it must prove a very small rental obtained, if any. The aftermath in the meadows and Clovers will be very productive if the showery weather continues, and which now prevails. Weeds everywhere are growing in an extraordinary manner, and the only way to be free from them is not to wait and kill them, but to horse-hoe between the drills of

root crops before they make much growth, because moving the ground is quite enough on a dry day to destroy young weeds, but stronger ones may be cut up without getting rid of them. It is therefore a mistake to say it is no use to hoe the weeds, as they do no injury yet. Just so; but it is the time to destroy them in their infancy and early leaf.

Live Stock.—The second growth of grass in the meadows will now afford a good pasture for cattle, but it will require great care, especially with sheep, for although the same irrigated or other meadows may be fed by sheep in the spring, yet it must not be attempted now, or the sheep may take the entozoa of the fluke and produce the rot. It has also been stated that cattle are affected in the same way, but it seldom happens to them unless the animals are kept very short of grass food, and also without cake or other feeding stuffs. The dairy cows will require a constant change of pasture with a full bite of grass, and if with 3 lbs. of cotton cake each per day at the stalls when they come in to be milked, so much the better, for it is a matter of immense importance that the milk should not fall off early, or that the cows should go dry at all until about a fortnight before they are due to calve. It is letting the cows go dry for several months before they are due to calve which is the principal cause of nearly all the disorders which they suffer from usually at calving time, but more especially is this the case with any well-bred high-conditioned animals; in fact, it is in consequence of accumulations of internal fat which causes the most serious complaints which the dairy cows suffer from. This matter should be especially attended to when heifers drop the first calf, for if heifers are allowed to go dry for any period before calving, it will be with great difficulty they can be prevented from doing so as older cows; we therefore prefer heifers should suckle calves for veal during their first season before going into the dairy herd for milking. The foals may now soon be weaned where they fell early. It is important, too, that if turned out it should be in company with others, and the paddock well fenced; otherwise, which, in fact, was our own plan, give them a shed and yard in front, 12 feet by 15 feet, well littered, and let them have green fodder, such as the team horses may be receiving, with a moderate quantity of crushed oats, to be increased as they grow up as may be required. In this way we have reared valuable animals, which have been sold when two years of age at from £40 to £60 each, never having been off the straw.

BATH AND WEST OF ENGLAND SOCIETY AND SOUTHERN COUNTIES ASSOCIATION.—At a Council Meeting held at Bristol on the 31st ult., the Finance Committee reported that the Society's prizes awarded in the various departments at the Bridgwater Show had been paid, and that the Maidstone Local Committee had paid the sum of £800 to the Society's Treasurer, in accordance with their agreement with the Society. A communication was read from the Mayor of Brighton stating that at a public meeting of the inhabitants of the borough of Brighton, held at the Town Hall on Thursday the 17th day of May, 1883, to consider the propriety of inviting the Society to hold their annual Meeting for 1885 in Brighton, and to adopt such resolutions with reference thereto as might be deemed expedient, the Deputy Mayor, Henry Davey, Esq., in the chair, it was resolved, "That this Meeting on behalf of the inhabitants of the Borough hereby requests His Worship the Mayor to invite the Bath and West of England Society and Southern Counties Association to hold their Meeting and Exhibition for the year 1885 in Brighton." In accordance with the resolution the Mayor invited the Society to hold their 1885 Meeting at Brighton. On the motion of Mr. Gray, seconded by Sir J. Duckworth, the invitation was unanimously accepted, and it was agreed that after the August Council a deputation from the Society should visit Brighton at a convenient time to the Mayor and Corporation to inspect the sites, exchange signed conditions, &c.

REMARKS.

29th.—Bright and warm in the morning; cloudy latter part of day; rain at night.
 30th.—Dull day with frequent showers, one at noon very heavy.
 31st.—Bright morning; heavy rain with thunder after 3.30 p.m., lightning at 4.5 p.m.; fair evening.
 1st.—Fine bright day, cloudy evening, with a few spots of rain.
 2nd.—Cloudy nearly all day.
 3rd.—Fine, and on the whole bright.
 4th.—Fog in morning; fine afternoon and evening.
 Temperature equable and very near the average; rainfall slight except in afternoon of 31st.—G. J. SYMONS.

BULBOUS IRISES.

SOME time ago a correspondent asked me several questions about bulbous Irises. I was prevented from giving any answer at the time owing to the press of other duties; but I may perhaps be allowed to say a few words now.

The bulbous Irises naturally fall into certain groups. The best known group perhaps is that which includes the popular so-called Spanish (*I. Xiphium*) and English (*I. xiphoides*) Irises. These are too well known to need description, and I may only say that while they both like light but rich open soil which is not too wet in winter, the English Iris needs much more water when it is growing in the spring than does the Spanish Iris. In dry localities, as on the barren hill which I with great irony call "my garden," where the Spanish Iris does remarkably well, the English Iris withers up and goes "blind" if, as often happens, the rainfall in May is scanty.

Very closely allied to, though quite distinct from the Spanish Iris, is *I. filifolia* from the south of Spain and north coast of Africa, with flowers more funnel-shaped than the Spanish Iris, of a reddish purple colour with a golden blotch on the fall to serve as the insects' signal. *Iris tingitanum*, on the other hand, also from North Africa, I am inclined to regard as more nearly parallel to the English Iris, and this is also a very handsome plant. Though both these Irises are fairly abundant in their native home, it seems, as in so many other cases, impossible to persuade anyone to bring or send them over to this country in any quantity, so that they are both very rare. *I. tingitana* appears to be common amongst us here, but this is chiefly in name only, for by some means the typical wild form of the English Iris has been distributed under the name of *I. tingitana*. Both of them seem more difficult of culture than the Spanish or English Iris, for they are even still more susceptible to the baneful effects of our wet English winters, and appear to need a cold frame. At least this is Mr. G. Maw's experience.

Of *I. Fontanesii*, apparently allied to the above, and also from North Africa, I can say nothing, as I know nothing. I have for years past been endeavouring to get living bulbs of it, but neither bribes of money nor the most flattering and insinuating appeals have hitherto been of any use. To my best charms there has been always turned the deafest ear. It is really very curious to reflect how determined the world in general is that a gardener's hobbies should not be satisfied. Your friend, who would be ready to sacrifice himself to any extent for some of your other interests, absolutely refuses when on his travels to go half a mile out of his way to dig up a root for you; and it is a mournful truth that, while many of us at home are hungering and thirsting for the beautiful flowers which abound in Palestine (and in particular for some most lovely Irises), hundreds of our countrymen go there every winter and spring, and will not bring these things back. But to return. Belonging to this same group, and coming also from South Spain and North Africa, is the charming *I. juncea* with its graceful bright golden

yellow flowers of a delightful fragrance—to my mind by far the loveliest and best of all the bulbous Irises. This, like the English Iris, needs a rich but light soil, which, while fairly dry in winter, must have ample moisture while spring growth is taking place.

Somewhat allied to the above, and yet deserving to be placed in a group by itself, is the charming *Iris reticulata*, which blooms so early in the year that it may almost be spoken of as a winter bulb. Of this two varieties are already known so distinct as almost to deserve separation as species—viz., *I. reticulata* var. *Krelagei*, with plum-coloured flowers having broader segments, and the typical *I. reticulata*, with deep blue-purple flowers of narrower longer segments. Of the two the former is the earlier, and the one which takes most readily to diverse conditions. The colour varies a good deal in both forms, and when the raising from seed has been carried on a few more years we shall probably have some very striking flowers. Closely allied to the above, and certainly belonging to the same group, is the still rare *I. Histrio* from Palestine, which flowers even before *reticulata* itself. I say still rare, for the price in catalogues stands at something like 7s. 6d. a bulb, though any enterprising person might if he like make it almost as common as now is the once rare *Chionodoxa Luciliae*. These Irises of the *reticulata* group do not seem to need any special care. It is true that they are capricious, and bought bulbs often disappear after the first year; but I have seen them flourishing equally well in sandy peat, in loam, and in clay. They cannot bear being waterlogged, and, like all bulbous Irises, they object to being kept out of the ground; but beyond this they will, if they see fit, do almost anywhere.

Of all the bulbous Irises the most widely spread is the little *Iris Sisyrinchium*. It stretches from Spain and north-west Africa right away to eastern Asia. It is very pretty, but the flowers are terribly short-lived, and the plants do not take kindly to our English climate. Our wet winters confuse them so, that planted in the open they sooner or later, according to my experience, vanish, though they may be managed in a frame where they can be kept dry in winter.

Intermediate between *I. Sisyrinchium* and the *reticulata* group comes the charming little *I. Kolpakowskiana*. As far as a short experience will enable me to judge this charming little Iris will adapt itself readily to our climate, and I believe that a considerable future is before it. As yet, however, it is very rare.

All the above bulbous Irises may be spoken of as Xiphions. That will distinguish them from a wholly different group of bulbous Irises often spoken of under the name of Junos. The most common and best known of these is the little sweet-scented *Iris persica*, flowering with us in early spring. All these Junos are distinguished from the true Xiphions both by the form and characters of the flower, and by the fact that the bulbs are not only different in structure from Xiphion bulbs, but also possess permanent large spreading fleshy rootlets, not unlike those of *Hemerocallis*. With *I. persica* itself in a light soil and a sunny situation, where there is thoroughly good drainage in winter, no great difficulty will be found; but another common Iris of this group, *I. scorpioides*, also called *I. alata*, is a very troublesome plant. This, which comes from South Spain and North Africa, flowers in late autumn and early winter, and makes its foliage, like many other bulbous Irises, after it has done flowering. Hence the difficulty, for it wants to be growing fast in our dark and short winter days when we rarely see the sun. Moreover, when growing it needs abundance of water, and how can water be supplied freely in midwinter? Hence as an outdoor plant, save in some few favoured spots, it seems to be hopeless. Still it is so handsome with its large blue flowers of varied tint, and oftentimes pleasingly fragrant, that it is worth growing in pots or in a frame.

Very different in its power of resisting our climate is another plant of this group, *I. caucasica*, from Central Asia. This, especially the variety known as *I. caucasica major*,

with its spike of yellow, often golden, flowers, is really worth growing, and as far as my experience goes needs no special care. It does not push until winter is nearly over, and it has the early spring before it in which to expand its leaves busy with the task of making next year's bulb. An Iris of recent introduction known as *I. orchoides splendens* is closely allied to *I. caucasica major*, but yet both in foliage and flowers is sufficiently distinct to deserve a separate, perhaps a specific name; but my knowledge of this is slight.

These are the more common forms of the Juno group; but besides these are many forms growing in the East, especially in Central Asia, already known, and probably many more yet to be discovered and, let us hope, introduced. *I. Palæstinæ* from the Holy Land belongs to this group, but is hardly handsome enough to be much desired for our gardens. This, however, cannot be said of *I. Aitchisoni* from the Punjab, especially a variety with bright full golden-yellow flowers. And I have just received from a generous friend a bulb of a new Juno with bright blue flowers from Bokhara. But of these rarer forms there is not much to be said, save perhaps to reiterate the lamentation that our travellers in Persia, in Beloochistan, in Afghan, and nearer home in Palestine and Syria, think so lightly of the desires of gardeners such as we whose circumstances compel them to stay at home.—M. FOSTER.

THE HEREFORDSHIRE ORCHARDS.

WOOLHOPE CLUB.

To the many benefits the Woolhope Club has rendered to the district in which it exists, it has added another, which in our opinion far exceeds in importance and lasting good to the country any of its former achievements, important and useful as these may have been. It is an old cry that the varieties of cider Apples which made the reputation of the Herefordshire orchards had died out, and that even their progeny had so far partaken of the senility and effete-ness of their parents that they, too, had lost all the vigour that was necessary even to existence. This is an idea which we have always fought against; we have denied over and over again that there was any truth in the theoretical views that have from time to time been propounded by those who professed to base them on what they vaguely term scientific and physiological principles. We are glad to know that the Woolhope Club have discarded such views, and have entered upon the work of restoring to the Herefordshire orchards the old orchard fruits which have added fame and fortune to the county. Since the Club has engrafted pomology on their constitution attention has been given to this all-important subject, and willing hands and sound heads have not been wanting to help in furthering the good work. There have always been in the country a few trusting men, firm in their own convictions, who either disbelieved the prevalent error, or were so sceptical on the subject that they have been silently doing their own work and perseveringly preserving some of the best sorts of cider Apples, grafting and re-grafting from young and vigorous trees, till they have established and fixed a progeny which possesses all the vigour and health of the original trees. Witness, for instance, what has been done by Mr. John Bosley of Lyde in the case of the Foxwhelp. He has proved conclusively that these old varieties can be restored; and although the cider from young trees cannot be expected to be of a quality equal to that made from old and matured ones, any more than fine wine can be obtained from a young vineyard, still every year these trees live they are approaching nearer maturity, and every year becoming of greater value. We are convinced that landowners who will now set to work and plant orchards of Foxwhelp and Skyrme's Kernel Apples and Taynton Squash Pears of the true sorts, such as are being supplied by the Woolhope Club, will add greatly to the value of their estates—a value which will every year increase with wonderful rapidity.

We have been led to make these remarks from having received the following circular from the Secretary of the Woolhope Club:—

SPECIAL NOTICE TO MEMBERS OF THE CLUB.

The Pomona Committee have the great satisfaction to inform the members that the experiments they have caused to be carried on during the last four years for the restoration of those valuable orchard fruits, the Foxwhelp and Skyrme's Kernel Apples and the Taynton Squash Pear have completely succeeded. They have now upwards of 800 young trees in vigorous health—viz.,

	Foxwhelp.	Skyrme's Kernel.	Taynton Squash.
One-year maidens, about 3 feet high ...	500	100	30
Two-years-old trees, 4 to 5 feet high ...	80	30	18
Standard Foxwhelp trees, 5 to 6 feet high	100

The prices of these trees are 2s. 6d. each for maidens, 3s. 6d. each for two-year-old trees, and 5s. each for the Standard Foxwhelp trees. They are offered, in the first instance, to members of the Club, who will be allowed a reduction of 10 per cent. on these prices.

Members desiring to have any of these trees should apply immediately to Mr. Theo. Lane, the Secretary, who will register the list for the Committee in the order of application up to the end of August, when the list will be closed. The trees will be sent out in October.

The Committee are very desirous that every care should be taken to maintain the vigour of the young trees. They beg therefore to suggest:—

1. That the trees should be planted on fresh ground, well drained, and deeply trenched.
2. That holes 1 yard square, or trenches 1 yard wide, be dug at once in readiness.
3. That the loam from the ground be mixed with turf parings and a little lime rubbish to fill the holes, and be firmly trodden down.
4. That the roots be carefully spread out immediately below the surface, and covered with fine soil, thus avoiding the error of deep planting.
5. That the young trees be firmly staked when planted; and lastly,
6. That a thick layer of rotten manure be placed on the ground above the roots to preserve moisture and keep out frost.

CAULIFLOWERS FOR SPRING, SUMMER, AND AUTUMN.

THESE by many persons are sown too early. In the southern part of the kingdom, as far as my experience goes, the first week in September is the most suitable time. Small plants have many advantages over large ones for standing the winter, and not the least of which is that a greater number can be protected in a frame of a given size.

I sow the seed broadcast on a south border where the soil is light. The plants as soon as they have made one rough leaf are pricked out 4 inches apart each way in a frame slightly raised above the ground level by means of a little litter or rubbish, more to secure perfect drainage than anything else, about 6 inches of light soil being placed inside the frame. The variety preferred for this purpose is still a good selection of Early London. This Cauliflower seems almost as hard to surpass as the old Ashleaf Potato. The said Potato was raised or sent out in 1804. Reputed earlier and better varieties have been brought out almost annually ever since, but still the old Ashleaf holds its ground, and it is not only a week earlier than any other variety, but as a new Potato to be used fresh from the ground and before it is quite ripe it is still very far in advance of any other.

If it is fine autumn weather when the Cauliflowers are pricked into the frame they will be best with the lights off night and day during the continuance of such weather. We merely want them to become a little established before winter. They will have to remain in their present quarters from four to five months, and at the end of that time we do not want their leaves to be so close together that we cannot see the soil between them. It is plain, then, that this must not grow fast. Moreover, small plants are decidedly preferable in February for planting out permanently, but still they must not become stunted. Stunted plants will button—*i.e.*, will make small insignificant premature heads, and so will large ones from the check they receive by removal. What we want is just to have them sufficiently large that the ball of earth we are able to take up with them may be able to support them without flagging, and if the soil is suitable all the 4 inches in breadth as well as 4 inches in depth may be carried with them.

Handlights are expensive, and I expect are becoming less used than they were formerly. What I have used for many years to transfer the plants to in February or early in March is simply two boards supported by a few stakes driven into the ground with some old lights laid across. In the severest weather they have an additional covering of some shutters, but all through winter as well as spring they are covered only sufficiently to prevent injury by frost. For the final planting the soil should contain abundance of vegetable matter, such as old Mushroom-bed manure, or from a hotbed previously exposed to the air and sweetened, or good leaf soil, such as was described in this Journal by Mr. Wright some time ago. Plants are placed about 20 inches apart, and some are cut while the heads are very small, so as to admit light and air to the remainder.

In the event of the autumn-sown plants failing seed may be sown at almost any time during winter in an intermediate house. The treatment as to temperature and airing which will suit bedding Pelargoniums will suit young Cauliflowers admirably. If the sowing is deferred till February a pinch of Veitch's Forcing Cauliflower should be sown at the same time; for although this variety can hardly be said to be equal in quality to Early London, it comes in very much quicker, and for that reason it is a decided acquisition. It requires to be kept growing freely and pricked out very early, otherwise the heads will be too small. It will do well if pricked out on a slight hotbed any time during February, and by this means it may be made to come in as early as an autumn-sown crop of Early London. We generally have sufficient plants from the autumn sowing to allow of

a few being planted on a south border in addition to those placed where they can be protected with lights, and these form a succession.

A second batch of Early London is always sown early in February either on a hotbed or in an intermediate house, is pricked off into a cold frame, and after the plants become established they are only slightly protected in order that they may become perfectly hardened before they are planted out. A few of Walcheren and Autumn Giant are treated in the same way. A third sowing of the same three varieties takes place under slight protection in March, a fourth and a fifth consisting of Walcheren and Autumn Giant outside in April, a sixth of Walcheren only the first week in May, and a seventh consisting of Walcheren and Early London during the third week of the same month. This arrangement furnishes us with Cauliflowers from the middle of May to the middle of December, and overlaps the season of Broccoli at both ends.

The reason for sowing Autumn Giant as early as February is, that in a hot dry season it is an advantage to have some plants established as early as it is safe to get them out, otherwise the months of July and August might find us without a supply, or with a very indifferent one.—WM. TAYLOR.

GARDEN CHEMISTRY—MAGNESIA.

(Continued from page 111.)

MAGNESIA is seldom used in practical agriculture as a manure, and the effects following its use in scientific experiments seem to indicate that in ordinary soils the fact that it is an essential plant food may be ignored, as almost all soils contain enough of it. That it is essential may be regarded as proved, for plants grown in calcined sand from which it was excluded and everything else supplied, failed, and from the fact that it is never absent from ordinary plants, more especially their seeds. M. Ville, though his experiments were conducted on soil to which the application of potash was necessary, found that applications of magnesia were without effect. In looking over the tables of the Rothamsted experiments we do not find the plots to which magnesia was supplied giving more favourable results than those from which it was withheld. In the experiments by the Sussex Association it does not appear to have exercised any favourable influence, and though the fimus plots at Easter Ardross gave much better results than the other series, it cannot be certain whether this was brought about by the magnesia or not. The likelihood is that the peculiar form in which the phosphoric anhydride was presented was the cause. The late lamented General Scott, whose opinion was the result of long study and observation as well as experiment, put much value on it; and the late Professor Johnston mentions instances when magnesia sulphate (Epsom salts) increased the yield of corn. Beyond the fact that fimus—ammoniacal phosphate of magnesia—exercises a very favourable influence on garden crops generally, I am not aware of any trials with any particular form of magnesia in the garden, and am, therefore, unable to refer to its use, beneficial or otherwise.

Though constantly present in plants, it is not so to the same extent as lime, potash, soda, or phosphates. In the ash of ordinary garden vegetables it is only occasionally above 10 per cent., and is often as low as 1. It is removed from the soil to the extent of one-eighth of the amount of potash in an ordinary rotation of kitchen garden crops. Many ornamental plants, however, remove it in large quantities comparatively. According to Ivison Macadam of Edinburgh, it is sometimes present in the ash of certain Fuchsias to the extent 16 per cent., and in Ficus elastica to 11. In greenhouse mould, which before being used contained 0.248 of magnesia, only 0.182 remained after use. In fruits it is not largely present; in Grapes there are nine grains of potash present for every one of magnesia. In the ash of white Mustard 11 per cent. of magnesia occurs and only 9 of potash.

In most soils magnesia is as plentiful as is potash, and in a few even more so. In consequence of this, where there are equal supplies of both, if there be enough potash for ten years there will be enough magnesia for a hundred, even when no ordinary manure is given. In ordinary manure, when 0.446 of potash is present, 0.047 magnesia is generally present. Yet, according to Liebig, the ash of horse droppings contains as much as 36 per cent. of phosphate of magnesia. According to the same authority it is largely present in sewage. In cowdung Liebig gives 10 per cent. as the figure representing the quantity, and phosphate of lime as the same. Much, of course, depends on what the animals are fed on; but some samples of meadow hay, in the ashes of which potash was present to the extent of 2 per cent. only, magnesia amounted to 8 per cent., 60 of the whole being silica, and 16 phosphate of lime. It is

largely present in Oats, Wheat, Wheat straw, and some feeding stuff, also in the ashes of Pine leaves and Beech bark.

It is always present in large quantity in dolomite, in many mineral waters, in sea water, especially that of the Dead Sea; in most rocks which contain lime, and (in manure) in kainit as sulphates and chlorides. In kainit it occurs to the extent 13 per cent. as sulphate, and 14 as chloride. It may be had as pure Epsom salts (magnesia sulphate) at about 10s. per cwt., and in an impure form much cheaper. When used it should only be sparingly, especially in the chloride form, and even then only when plenty of lime is present. Some waters contain it to a destructive extent, and we have heard of Vines being ruined by using such too plentifully. The inexperienced, therefore, had better use it cautiously or not at all, till someone shall have experimented with it and proved its worth.—SINGLE-HANDED.

(To be continued.)

BRODIÆAS.

(Continued from page 113.)

B. Howelli, Watson.—This is closely related to *B. lactea*, resembling large forms of that species. Scapes 1 to 2 feet high, stoutish, smooth, umbellate. Flowers very numerous, turbinate-campanulate; the tube rather longer than the segments, of a pale purple colour. Native of Washington Territory. I have only once flowered this rather scarce species, as imported bulbs have frequently succumbed to the effect of

Fig. 24.—*Brodiaea laxa*.

removal from their native habitat. They are thickly coated with a fibrous tunic, and it is likely that after being planted this causes the bulbs to decay. I have found it a successful plan to place the bulbs singly in small pots, covering them with sand, and when root-action is resumed plant them out or shift into larger pots.

B. ixioides, Watson.—This is usually cultivated in our collections as "Pretty Face" (*Calliprora lutea*, Lindl., *Bot. Reg.*, t. 1590); but structurally it belongs to the same section of Brodiaeas as *B. lactea*. Mr. Baker has named it *Milla ixioides*, while in Aiton's "Hort. Kew," 2, 257, it is named by no other name than *Ornithogalum ixioides*, and the writer recently received it from North America as *Bloomeria aurea*, which is, however, a distinct plant. *B. ixioides* produces scapes from 6 to 18 inches high, umbellate at the top. Flowers few or numerous, with a short tube and spreading segments from three-quarters to an inch across the top, golden yellow, with a distinct brown midrib; upon slender pedicels. It is an extremely pretty plant, easily grown, quite hardy, and one of the oldest denizens of our gardens, flowering in June and July. Native of the country from Santa Barbara to Oregon.

B. laxa, Watson.—Leaves one-quarter to one-third of an inch broad, slightly glaucous. Scapes from 6 to 20 inches high or even more, usually smooth, umbellate. Flowers definite, usually few in number, 1 to 1½ inch long, funnel-shaped, blue-purple; the narrow tube equally as long as the acute segments. This is also known as *Triteleia laxa*, Benth.; and *Milla laxa*, Baker; and is well figured in "Lindl. Bot. Reg.," t. 1685. Like *B. congesta* it has a wide distribution, affecting the coast from San Fran-

cisco to Washington Territory. It is a very charming and easily grown species, flourishing well in a warm border of light rich soil, its sparsely flower umbels being particularly striking and durable. The woodcut (fig. 24) represents a fine truss of the natural size.—J. T. R.

APRICOT BRANCHES DYING.

Cultivation.—We very often attribute failure to soil and climate where it is sometimes more traceable to error in cultivation. I have before alluded to the practice of encouraging a too vigorous growth in the first few years after planting, with a view to cover the allotted space as quickly as possible and to secure profitable returns speedily. The extension system, or rather the long-growth principle, is more likely to succeed under glass than in the open; but even under glass periodical lifting becomes a necessity in many cases—indeed, it enters largely into the practice of the most successful cultivators.

Since 1875 the seasons have been very unfavourable to outdoor fruit culture, but before this Apricot trees had suffered from the branches dying, yet it increased of late years, simply because the seasons were more unfavourable to ripen the growths, and the disasters were more marked. It is no use grumbling about the soil or climate if the cultivation be of such a kind as not to counteract its baneful tendencies. Too rich and loose soil induces a strong soft growth, and so does a dull wet summer. The soil ought not to be of this description, but sweet and firm, and the tendency to over-luxuriance checked by judicious root-pruning. This latter is practically of no use in preventing either gum, canker, or dying of the branches if performed after a strong growth has been made in late autumn, nor indeed at all if such growth is allowed to remain; for although it may ripen somewhat it never does so thoroughly, succumbing to the first severe weather; and though the evil may not then show itself, the sap vessels are so much ruptured that the sap can only rise by the internal layers, and the branch collapses when the tree is in full growth, and perhaps laden with fruit. The mischief was done irreparably during the year of the formation of the wood, that at some future time cankers, gums, or withers.

Young trees must be commenced with if a remedy is to be found, and they usually grow freely in their early stages. Any trees, even the first year after planting, that exhibit a tendency to make wood not likely to ripen thoroughly should be operated on early in August, as they will then have completed the main growth, and any further effort may be counteracted by taking out a trench about one-third the height of the tree from the stem, cutting off all roots, filling it again, and making the soil thoroughly firm. If the weather be moist and dull it may not be necessary to water and shade, but if bright it will be advisable to give water if the leaves become limp, and shade for a few days from bright sun. If the late summer be favourable the wood will ripen to the point and the prospect of fruit insured; but if the autumn be cold and wet it is possible the wood may not ripen to the extremity, and must be cut back to firm, brown, well-ripened wood. This procedure should be continued year by year until the tree has filled its allotted space.

Trees that are full grown often produce much breastwood, and as this is strong it should be removed, and that reserved for laying-in ought to be of moderate vigour and short in the joints. This will to a certain extent equalise the sap and throw more support into the short stubby shoots, spurs, and shoots of moderate growth trained in, and allow sun to have access to the wall, thereby securing more warmth to the growths, resulting in their more perfect maturation. Yet this, good as it is, will fail to effect the object in view unless the supply of nutriment be proportionately lessened. This can be done most safely, as the Plum stock is a most prolific rooter, and emits roots freely from the root-stem abundantly, especially if encouragement be given by mulching and keeping the soil moist. The best time to operate with trees that are fully grown or nearly so is as soon as all the fruit is gathered, or if there be no crop it may be performed during the first fortnight in August. A third the distance from the stem that the growths extend is a safe distance to take out a trench and there to detach all roots, and if the weather be dull and moist the trench may remain open, which will cause roots to be emitted freely in the part undisturbed; but it must be filled again if the weather be dry or upon a return to bright weather, the undisturbed part thoroughly watered if it becomes dry, and the tree shaded from powerful sun, as it is important the foliage be retained. At the time of operation all useless spray and long spurs should be cut back. If a mulching of short manure be given over the undisturbed part it will lessen the necessity for water and encourage surface roots; but it must be borne in mind that "dry-as-dust" mulchings are as

impotent for that purpose as a baked surface soil. The value of mulching consists in its being kept moist, especially where surface-rooting is a desideratum, as it unquestionably is in fruit culture.

I have purposely avoided making allusion to the "borer" (as advanced by Mr. Crossling in your Journal some years ago) being the cause of Apricot branches dying. I have been on the look-out for this destroyer of Gooseberry and Currant bushes ever since, but in no instance have I found any evidence of the drill hole in the branches that have died too often on Apricot trees.—G. ABBEY.

ZONAL PELARGONIUMS.

"ONCE upon a time" Fashion made its way into the flower garden, and said that the beds were to be ablaze with bright colours in summer, and that scarlet Pelargoniums were to predominate. The fickle tryant's word was law for the moment in this as in all other matters; and although her fiat induced much vulgar display, yet the rage which it created for a class of plants of such easy culture "meant money," and the idea was seized upon, and promptly turned to account by many a shrewd clever man of business. The annual demands for Pelargoniums by the tens of thousands led to an improvement in the guise of new varieties, which also became an annual event, and may be said to have become permanent, for it has continued ever since, till a degree of excellence has been attained that is far beyond the conception of the originators of the work. In proof of this I may refer to the "Floricultural Cabinet" for 1850, which contains a coloured plate published in July of that year of a pink variety called Tom Thumb's Bride, described as "a very lovely variety, and merits a place in every greenhouse, dwelling-room, window, or flower bed," but which is a mere weed in comparison with any of the best sorts now in cultivation.

The fashion for glaring masses of scarlet Pelargoniums is now a thing of the past. Good taste soon led to the introduction of quiet tones and softer tints; yet never were Pelargoniums more valued or turned to better account than now, nor were really good sorts ever so numerous. I have lying upon my desk a catalogue of the present year containing nearly five hundred varieties offered for sale by an enterprising firm of nurserymen. Many of them are doubtless too much alike in colour, but the majority possess distinctive features calculated to please individual taste, and all of them are undoubtedly of considerable merit. A certain proportion of Pelargoniums are still, and probably always will be, valued for flower beds in summer, but they are of even greater use for culture in pots throughout the year, making as gay a show at Christmas as at midsummer if a suitable glass house can be spared for them, as is done now in every garden where it is possible. Plants potted now and brought on slowly in the open air or in a spare pit where the lights can be put on during much rain, are removed to a light span-roofed house in autumn, and a temperature of 55°, say from the end of September, keeps them in full bloom till spring. It is not, however, my purpose to enter upon such familiar details of culture, but rather to call attention to the merits of a dozen or two varieties good either for pot culture or beds selected from a considerable number which I have tried. Of these the first place is worthily taken by

Eureka.—Quite indispensable for its pure white flowers, free from blotch or tinge of any other colour, and with compact handsome trusses of well-formed flowers. This is a great acquisition, and quite supersedes all other single white sorts.

Right Ahead.—Very bright glowing scarlet, with a bold white eye. The truss of medium size is compact, and very useful for cutting.

J. C. Musters.—Has a grand truss of large circular flowers, deep scarlet in colour, with a charming delicate bluish tinge on the edges of the lower petals.

Apple Blossom.—Grown under shade this lovely variety has white flowers delicately tinged with pink, but in a light sunny position the colour deepens to a charming bright pink that is very attractive. It makes a neat compact plant, is very free flowering, and is so choice as to be worthy of a place everywhere.

Mrs. Pearson.—Has very handsome flowers, large, and of an attractive soft shade of orange scarlet.

Evening Star.—This is so distinct and lovely that everybody should grow it. Its well-formed white flowers with a bold pink eye are quite unique. It should not be fully exposed to the sun, but is best in a soft light.

Laura Strachan.—A fine sort with salmon-coloured flowers, very large handsome trusses.

Louise.—A deep rich glowing scarlet, very striking and attractive, with large flowers, and a very large truss.

Lady Eva Campbell.—Handsome flowers, of a delicate salmon tint, light near the edge and shaded inwards to a much deeper hue.

Henry Jacoby.—A deep rich scarlet, sometimes described as a

dark crimson; very effective. It is as good in beds as in pots, very free flowering, and distinct from all others.

Captain Nares.—Of a soft light shade of scarlet, with large handsome trusses. A useful variety for cut flowers.

Mrs. Mellish.—An old but very good variety, with large flowers, so elegant in form and so richly coloured as to surpass many newer sorts.

Guinea.—Bright orange scarlet flowers, elegantly shaped and very handsome trusses. A very good variety, bright and attractive, but not yellow as it has been fancifully described.

Dazzler.—Large handsome flowers, of a deep rich shade of scarlet; a fine variety.

Circulator.—A very useful pot plant, with abundant trusses of a soft rosy hue.

Fanny Catlin.—This is a lovely salmon-coloured variety, of a deep hue in the centre of the flowers, shaded to a much lighter hue outwards, and the petals have a pretty pencilling of a dark salmon colour.

Sophie Birkin.—Flowers "like a picture," so charmingly varied are the tints of salmon, and so handsome are they in form. I know none of its colour equal to it as a pot plant.

Edith Pearson is another lovely variety, having a tinge of salmon on a rosy red ground.

Mrs. Leavers.—Pink varieties are so numerous and so good that selection is not easy. This old sort still holds a leading position for pot culture, for which purpose I have frequently heard it pronounced to be the best. It is somewhat dwarf in habit, and bears a profusion of its handsome richly coloured flowers.

Mrs. Wright also continues to hold a high place; its shell-like petals so elegantly disposed, its compact truss, and colour of a bright pleasing shade of pink combine to render it very valuable.

Mrs. Turner.—Has very large trusses somewhat loose, but of a distinct shade of pink, and worthy of a place.

Mrs. Lancaster.—Very deep pink flowers of medium size, in large trusses of from seventy to eighty flowers in each.

Lady Sheffield.—A peculiar shade of colour, described in the catalogues as a violet purple, but commonly termed pink; the flower truss is very large.

Mrs. Strutt.—This has very large flowers of pale pink, is of stout and compact growth, and very free flowering.

Mrs. Parker.—This is a remarkable variety, with large green leaves having a broad white margin. The flowers are double, of a light, delicate, yet most pleasing shade of pink; the trusses are of medium size, are freely produced, and blend charmingly with the foliage.

Dr. Denny is distinct by having purplish flowers with a bold scarlet blotch at the base of the upper petals.

Hettie.—A large truss of somewhat small flowers of a soft rosy scarlet, very freely produced.

Candidissimumplenum.—An excellent variety with pure white double flowers, which proves very useful both for pot plants and cut flowers.

Wonderful.—A bright orange scarlet, with semi-double flowers and small trusses; very attractive and useful.

Jewel.—This old and well-known variety has proved so extremely useful to me this year, both for plants in pots and cut flowers, that it must have a place. As the plants gain age and size they become crowded with the pretty little trusses that are rich in colour and neat and compact in form. The cut flowers are most useful for a variety of purposes; they pack closely, travel well, and keep fresh for a long time. The plants had liquid manure regularly after the first flowers appeared, and they were certainly much benefited by it, for the abundant flowers were remarkably handsome.—E. LUCKHURST.

JUDGING COTTAGE GARDENS AND THEIR PRODUCE.

FROM time to time in these pages I have tried to draw the attention of gardeners and other interested persons to the want of some definite rules for the guidance of both judges and exhibitors, and it is with pleasure that I notice the editorial remark about a few general rules. I would go for more than this: I would have the rules specific and definite. They are already too few and too general, without being at all binding or calling for close observation or adherence; in fact, instead of any binding rule, judges are, in a measure, left to their own whim and caprice, thus placing the exhibitor entirely at the mercy of the local dignitary in the gardening world or the parish priest; not that I would not willingly place myself in the hands of either of the gentlemen named, as far as honour or integrity is concerned, but for the simple reason that they are not bound by any specific rules of guidance, their prejudices in favour of this or that particular "fad" guide or misguide them, and we are told that "Prejudice squints when it looks,

and lies when it speaks." A "Reader's" question came at an opportune moment for us in this north country, where we are just entering upon the flower show campaign, and the remarks that it is hoped will be elicited will be read with interest.

Respecting the first portion of "Reader's" question, I am decidedly in favour of the "well-stocked and nicely managed kitchen garden." In this utilitarian age, when our leading politicians and public orators are impressing upon our minds that the number of the population is continually pressing against the verge of existence, how can we get away from the fact that to the cottager or the artisan his garden should be a source of profit? I do not by any means despise the flower garden of the cottager; on the contrary, I would encourage him by awarding prizes for that also, but there cannot be any degree of comparison set up between the two. It ought not to be thought of, and the judge who would pass a good kitchen by in favour of a flower garden, however good, which both belong to cottagers, would, in the opinion of the writer, commit a gross error.

The easiest and the safest solution of the "collection" difficulty would be to name the number and the varieties of articles to be exhibited. This applies to the large as well as small shows. Nothing that I know of causes so much dissatisfaction at flower shows as the "collections" either of fruit or vegetables. At a local show a splendid collection of vegetables was disqualified because it contained a dish of Tomatoes. The winning collection had in it two Cucumbers. In one lot the Tomato was called a fruit, in the other Cucumber was allowed to be a vegetable. Definite rules would prevent all this; simplicity and perspicuity in the wording of the rules and the prize list would obviate many difficulties; all ambiguous words and sentences should be eliminated, and nothing left that could be construed into anything else than what it was really meant for. The parish priest would be of great service here, and would, by use of vigorous Anglo-Saxon, so simplify the local schedule that grumbling would soon be an unheard-of quantity. Nothing tends so much to accentuate the acerbities of exhibiting as the ambiguity of some of the flower show schedules. Indefinite terms like "collection," "dish," "basket," and many others, only create confusion and bring about differences. Lay down some good and safe definite rule to be universally applied and followed; let it be done by some competent authority, and then, once for all, we shall have the question of exhibiting and judging put upon a sound basis. The Royal Horticultural Society ought to do this. If it will not, or cannot, it still ought not to be difficult to formulate a set of good and efficient rules for the guidance of both interested parties; at any rate, the scheme is worth a trial.—PETER FERGUSON, *Mere Knolls, Monk Wearmouth.*

I HAVE long been convinced that in districts where cottage garden shows are held a marked improvement has been effected both in the appearance of the gardens generally, and also in the quality and quantity of the vegetables grown. Whether the chance of winning a small sum, or the rivalry, not always very friendly, existing, are the all-powerful factors in the matter, is immaterial, the result is highly satisfactory. Men who take great interest in their gardens deserve encouragement, as such are seldom to be found wasting the hours of daylight, at any rate in a beer-house. Judging their handiwork, however, I am not fond of. It is really an unthankful task, especially when the society for whom the judges are acting is niggardly with prizes, particularly with regard to the number offered. All cannot have prizes, but many more deserve them who do not get them.

In many cases the societies comprise a large district, and the last time I assisted to judge we had to go through fourteen parishes. In such cases, if funds are available, prizes should be offered in each parish, and a champion class may well be provided. It is scarcely possible to fairly judge many gardens without some agreement at the outset among the judges acting, or by directions from the committee as to the number of points to be given. For my part, I would not interfere with the liberty of the subject. Every man ought to be allowed to grow what best suits himself, whether it be Cauliflowers, Celery, or Red Cabbage. If it does not pay them to grow such we may safely trust them to discontinue their culture. For vegetables of all kinds, if very good all round, I would give a maximum of three points, if fairly good two points, and one point for a serviceable crop. I would take into consideration the extent of each crop, and not give the highest number of points to a few overgrown or unduly favoured specimens. Encourage them to grow a proportionate number of each serviceable vegetable, and this will, of a certainty, result in superior culture and double cropping.

After taking the crops singly, their proportionate arrangement, the cleanliness of the garden as well as the fruit trees

and bushes, should be noted. Superior arrangement and cleanliness should each receive a maximum of four points, and a garden stocked with well-managed fruit trees and bushes I would give a maximum of six points, a less number to be given in each case according to merit; the flower garden, or border devoted to flowers, to be judged similarly to the fruit trees. It may be a mistake to encourage large flower gardens; but here, again, we may suppose the cottager to be the best judge of his own circumstances. If by any chance the total number of points be equal in two or more cases, it may be necessary to settle the matter by comparison, but I never found it necessary to remember anything about the gardens inspected. The gardens ought to be judged not later than August.—W. IGGULDEN.

AMERICAN BLACKBERRIES.

It is very good of Mr. Ward (page 118), to give information about these, but the cultural details he mentions represent the treatment to which the plants have been constantly subjected here, and the results have not been satisfactory. Being captivated with the grand-looking picture which accompanied the solicitation for our order, and the prospects of securing such a splendid addition to our dessert fruits, led us to give these Blackberries more attention than our best and most fertile Raspberries ever had, and then only to be rewarded with a quantity of hedgerow-like fruit is, I think, enough to prevent us jumping again at any bait of the kind. Ever since I can remember American Blackberries have from time to time been glowingly pictured and praised, and by this time it might have been expected they would have been found in at least every parish, as anything really good is never long in being generally cultivated; but instances of their successful culture are still as rare as the song of the nightingale. Speaking of autumn-fruiting Raspberries, I may say they are most useful and deserve to be generally grown.—J. MUIR.

WHITE BORDER FLOWERS IN AUGUST.

THE following are a few white flowers blooming in my flower borders that I think, for decorative purposes inside or outside, should have a place in every garden.

HYACINTHUS CANDICANS.—A noble flower with handsome pendulous bells, cream-coloured, with a shade of green, and reaching with me about 3 feet high. Single bulbs in 10-inch pots reach close on 4 feet high, with twenty-five perfect blooms on an average to each flower stem. Those outside not yet fully expanded I do not expect to be so good.

MATRICARIA INODORA FL.-PL.—This beautiful double white Camomile should have been placed first if purity of colour, perfectness of bloom, or persistency in flowering until frost comes, be taken into consideration. I should hardly have mentioned frost, as even that it defies, and has been planted in the same bed for the past three years with me. I cut it down in October, taking cuttings in September, and its handsomely cut foliage in rosettes forms the brightest green tufts through winter and spring, except *Saxifraga atro-purpurea*.

ACHILLEA PTARMICA FL.-PL.—Another deserving favourite for cutting purposes, and as perfect a double and persistent a bloomer as the last, and, like it, merely requires to be cut down in autumn and top-dressed.

CAMPANULA PERSICIFOLIA ALBA FL.-PL.—This combines all the qualities named in the last two, with this qualification—it produces no seed; so when the first flowers show signs of degeneracy cut it down, and it will bloom again by the aid of liquid manure at least three times. Many have not the true flower. It must be of the purest white, as double as a white Camellia, and fully 1½ inch in diameter, with a number of blooms produced along the stem. Possibly by allowing only one stem to each plant blooms much larger could be produced, but liquid manure must be used. I have a number of Campanulas including the double blue, but none can compare with this.

PHLOX PANICULATA ALBA.—A real satin-white beauty, but does not last like the foregoing. Except the first these can all be propagated by division, and now is a good time to do it.

THALICTRUM AQUILEGIFOLIUM.—Handsome in foliage and pretty in flower, and no border should be without it. Like most perennials it should be lifted and receive something to feed on for the coming season either in late autumn or spring.

SPIRÆA FILIPENDULA FL.-PL.—Of this double Dropwort it is not easy to decide whether foliage or flowers are most deserving admiration. It increases rapidly, and once had is not readily lost. Planted alternately with the hardier of the new pink kinds the contrast is very effective.

CATANANCHE ALBA.—Handsome and effective for cutting, as the flowers, which resemble the single *Aeroclinium* and single white *Helichrysum*, last a long time in water.

PYRETHRUM PARTHENIUM FL.-PL.—This gives perfect little balls of white flowers, some of them shaded yellow. Wherever cut flowers are much required a small bed should be wholly given to it.

LILIES.—Among the white species and varieties I may include *L. candidum*, *L. longiflorum*, and *L. lanceifolium album*. Noble flowers, but the two last I grow in pots. I am sure they would do well in a deep bed of peat loam.

SINGLE DAHLIAS (White).—I have Cannell's *Avalanche*, Ware's *White Queen*, and Kelway's *Alba*, all splendid, and to my mind all alike. The one shortcoming they seem to have as compared with the fine hardy perennials mentioned is that the petals drop quickly; but then the flowers are produced in profusion.

GLADIOLUS COLVILLI ALBUS [THE BRIDE].—This has opened within the past week, and of the white outdoor flowers named for bouquet or vase decoration with a mirror or dark background, I cannot think any can compare with it. The flower is wonderfully large for the size of the bulb, and the comparatively slender stem and sparse foliage contrasted with the hybrids of *gandavensis*.

MALVA MOSCHATA ALBA and NICOTIANA AFFINIS.—The former a pure white Mallow, and the latter night-blooming and sweet-scented. I have had these for two years, and grow them potted inside, though a friend of mine has them outside.—W. J. M., *Clonmel*.

A VINE MYSTERY.

I SHALL be very glad if any of your readers can suggest a cause for my Vines being in the following unsatisfactory condition. The leaves of the leading shoot while they are small become shaped almost like an umbrella, their edges look as if they were scorched, and in time the foliage drops off; the point of the shoot also seems as if it was scorched, and the points of the tendrils too. Yet the Vines seem to be in good health as regards making good canes. The *Madresfield Court* seems to be most affected, next *Lady Downe's*, and then *Bowood Muscat*. *Black Hamburg* is very little affected, and *Buckland Sweetwater* not at all. In consequence of the state of the leading shoot I have allowed the laterals to grow a little. They do not seem to be affected except when I allow a lateral to take the lead, and then it becomes affected in the way I have named. I have a number of Vines growing in pots (fruiting and otherwise) that are not the least injured. The border is composed of sods roughly broken up, lime rubbish, fresh lime, charcoal, inch bones, and a little stable manure. The Vines, one year old, were planted at the beginning of March last, they are making good canes, and yet I feel anxious about this shrivelling, and any information about the cause and cure will be greatly appreciated.—R. H. R.

WE learn that an INTERNATIONAL HORTICULTURAL EXHIBITION is to be opened at NICE on the 1st of December next in connection with an agricultural exhibition.

— "B." writes:—"Those who had not known of the cleaning qualities of CHLORIDE OF LIME ought to be grateful to Mr. Bardney for calling attention to it. My way of applying it is somewhat different from that recommended in his article. Whatever is to be cleaned is moistened with water, and the chloride dusted over it; but edges of steps require painting. I find the best way to purchase it is in jars which contain 9 lbs. each. These are hermetically sealed, and the chloride turns out of them in a dry powdery state. We have had it in 1 lb. packets almost worthless."

— A NORTHERN correspondent writes:—"DOUBLE ZONAL PELARGONIUMS were recommended a few weeks ago as being better adapted for travelling than the singles. I find no difficulty with single varieties when gummed and packed in single layers in flat wooden boxes. Doubles at the best are "dumpy" unattractive flowers, though some people are fond of them. To such allow me to recommend the double Ivy-leaf varieties. These are now numerous, and some of them are decidedly pretty. The trusses are looser than in the Zonal doubles; they grow very rapidly, bloom profusely, and are of the easiest cultivation."

— MR. THOMAS S. WARE, Hale Farm, Nurseries, Tottenham,

writes:—"Accompanying I have the pleasure of sending you a box of the beautiful and white CLOVE GLOIRE DE NANCY, which is at present making my beds very gay. It is remarkably free-flowering, of a strong vigorous habit, producing grass very similar to that of the old Crimson Clove. The flowers you will observe are very strongly Clove-scented." They are both beautiful and sweet, and this variety can scarcely fail to become popular.

— MR. H. YOUNG writes:—"At page 92 Mr. A. Harding calls attention to *POLEMONIUM CÆRULEUM VARIEGATUM*; and in reference to it I may state that when at Holme Lacy, Hereford, we used it with excellent effect for edging the beds of Tuberous Begonias, and found that a damp season suited it, but the plants were lifted in November and placed thinly in an old frame. The lights were removed, except in very bad weather, for although the plant is moderately hardy, it was killed in such winters as 1880 and 1881. About the commencement of April the crowns were divided and planted on an east border, where they grew to a suitable size for the flower garden by the end of May."

— MONDAY was one of the hottest days of the season in and near London. The thermometer stood at 73° in the shade at nine in the morning at the Royal Observatory, Greenwich, and rose during the afternoon to 83.3°. In the sun's rays the mercury rose to 148.2°. From York southwards the weather generally appears to have been very fine. In Scotland and the north of England, on the other hand, the day was wet and cold, though improving towards evening.

— WE are informed that the whole of the grounds round the AMSTERDAM INTERNATIONAL EXHIBITION buildings were sown with Sutton's grass seeds. The result has been most satisfactory, and Messrs. Sutton have just received the announcement that the highest recompense—viz., the *Diplome d'Honneur*, has been awarded them. It will be remembered that in connection with the recent Melbourne Exhibition the Reading firm received a special gold medal for lawns produced from their seeds.

— MANY visitors to the Southampton Show last week expressed their admiration of the handsome example of CHARLOTTE ROTHSCHILD PINE APPLE, shown by Mr. H. Ward of Longford Castle Gardens, Salisbury, in his premier collection of eight dishes of fruit. In shape, colour, size, and general appearance this was one of the finest fruits we have seen this season, and the weight—viz., 6 lbs. 2 ozs., was similarly satisfactory. Writing respecting this variety Mr. Ward observes, "It should be included in every collection of Pines, but being shy in producing suckers it is therefore not so extensively grown as it deserves to be. As regards flavour The Queen stands first with us, but for size and handsome shape Charlotte Rothschild is unequalled."

— AN extremely fine variety is PHILLIPS' PERFECTION TOMATO, which is at present known only to a few gardeners, but is likely to become a great favourite wherever this fruit is in request. It was raised by Mr. Phillips, The Gardens, Deodars, Meopham, Kent, and has been several times exhibited at Kensington both in competition and before the Fruit Committee, and on every occasion it has been greatly admired. One of the finest dishes of it, however, that we have yet seen was that shown by Mr. Iggulden at the Southampton Show, for in shape, colour, and flavour these fruits were admirable. The fruits are of moderate size, very even, of a rich deep red colour, and the flavour is excellent.

— WE are glad to hear that the WARMINSTER COTTAGERS' GARDEN SOCIETY is in a flourishing condition, and the recent Exhibition proved very successful, the competitors being numerous, and the exhibits of creditable quality. Plants, flowers, fruits, and vegetables were provided for in numerous classes, in addition to numerous others of local interest. In reference to the prizes for wasps' nests and queen wasps, Mr. J. Horsefield writes:—"Prizes were given for the greatest number of queen wasps taken this year, the first prize being won with 510. Last year the same exhibitor was awarded first with the astounding number of 1265. The total this year from all exhibitors was 732, as against 2083 of last year. Taken altogether, the money given away in prizes for queen wasps is deservedly earned by the prizewinners. Would that other societies could be induced to encourage the same thing."

— PART 85 of Boswell's "ENGLISH BOTANY" gives a continuation of the Cryptogamic plants, being occupied with the Ferns, of which very full descriptions are given, together with carefully determined

synonyms and coloured plates. These represent the following species, —*Phegopteris Robertiana*, *P. polypodioides*, *Lastrea thelypteris*, *L. oreopteris*, which, by the way, is spelled *L. orespteris* under the plate, *L. Filix-mas*, *L. rigida*, *L. remota*, *L. cristata*, *L. uliginosa*, *L. spinulosa*, *L. glandulosa*, *L. dilatata*, *L. æmula*, *Polystichum lonchitis*, *P. lobatum*, *P. angulare*, *Woodsia ilvensis*, and *W. hyperborea*. All these are beautifully executed, and mostly with enlarged representations of fertile pinnae or pinnules, and magnified sori or sporangia. Of the small-growing Ferns whole plants are shown, but of the large ones a frond or a characteristic portion is depicted.

— MR. JOSEPH MALLENDER informs us that the mean temperature for July at Hodsock Priory, Worksop, was 58.1°, which is colder than any of the previous eight Julys except 1879, when the mean temperature was 0.1° lower. The minimum temperature is also the lowest recorded since 1877. The warmest day was the 2nd, 75.7°; the coldest night was the 24th, 34.5°. Mean temperature of air at 9 A.M. 59.1°, mean temperature of soil 1 foot deep 59.9°. Total duration of sunshine in the month was 149.4 hours, or 30 per cent. of possible duration. Maximum duration in one day was the 1st, 12.9 hours. Sunshine shows a decrease on the last two years. In the four months, April to July, we have had this year 609 hours of sun against 709 last year, and 718 in 1881. The total rainfall of the month was 2.34 inches. Maximum fall in twenty-four hours on the 20th, 0.74 in. Rain fell on nineteen days.

— IT is surprising that in such an enthusiastically horticultural district as that around Southampton ORCHIDS do not receive more attention than appears to be the case, judging by the very moderate competition at the recent Show, when only three collections were staged, and one of these was from Kingston-on-Thames. It is true that the season was not the most fitting for such plants, yet there are many fine Orchids in flower now that would have greatly improved the display. The premier group from Mr. Osborne, gardener to H. J. Buchan, Esq., Wilton House, Southampton, was indeed praiseworthy, and Mr. Buchan deserves much praise for so perseveringly endeavouring to educate the local growers in a taste for these charming plants. His collection was distinguished throughout by the health of the plants comprising it, and several were flowering extremely well. No doubt other gentlemen will take these plants in hand, and the display will be ultimately much extended.

— GARDENING APPOINTMENT.—Messrs. J. Laing & Co., Forest Hill, inform us that the following appointment has been recently made through them:—Mr. Geo. Dickson, late of Farnborough Park, Hampshire, to be head gardener to Henry Lamson, Esq., J.P., Colley Manor, Reigate.

— THE ASTWOOD BANK (WORCESTERSHIRE) HORTICULTURAL SOCIETY'S SHOW, held last week, was brought to an abrupt termination. A few moments after the Judges had commenced their duties there was a heavy fall of rain, and the wind rose to such an extent that a sudden gust blew the tents down and damaged the exhibits to a considerable extent. A number of dishes, plates, glass, and other stands were also broken. The whole collection was thrown into such confusion that the Committee decided that the Show could not be held, and the fruit, flowers, and vegetables were taken away. Thus a very excellent exhibition was virtually destroyed, and for the first time in the history of a flourishing Society the Committee had to forego their annual Show. The Society was started ten years ago, and ever since they have been most successful in their annual gatherings. The exhibits were this year both more numerous and better in quality than in any previous year—everything was good, but the vegetables were particularly fine, and there is no doubt that had the elements been favourable the Exhibition would also have been more successful than any previous one from a monetary point of view, whereas they are now appealing to "kind-hearted persons to help them in their calamity." Mr. J. Hiam is the Secretary. Among the curiosities of the Show he exhibited a dish consisting of two "White Elephant" Potatoes, one weighing 2 lbs. 2 ozs., the other 1¼ lb.

— UNTIL the DEATH of DR. MOFFAT the great missionary and father-in-law of Livingstone, it was not generally known that he commenced his career in a garden. When he was about twelve years of age he was ambitious to become a sailor, and at the request of a ship's captain his father consented that he should accompany the skipper on a coasting voyage. He did not find much to enchant him on board or during the voyage, and so the youngster returned to school, and began

the study of botany and horticulture, in order to qualify himself for the position of a skilled gardener. Some time after this his father removed to Inverkeithing in Fifeshire, and the young man obtained employment in the gardens of the Earl of Moray, at Donibristle House, in the same county. There he remained for some time, and then accepted a situation in Cheshire which had been offered him, continuing there two or three years, all the time pursuing his botanical and horticultural studies with the greatest avidity. But while so engaged a desire came upon him to become a missionary to the heathen, and in October, 1816, he (with eight other young men accepted as missionaries by the London Missionary Society) was ordained in Surrey Chapel, Blackfriars Road. With four of these eight he sailed to the Cape on the last day of the month. Ultimately settling at Kuruman (New Lattakoo), Dr. Moffatt commenced what was his great life-work. He thoroughly mastered the Bechuana language, reduced it to written characters, compiled a grammar, school books, and a dictionary, finally translated the Bible into what was practically a new tongue, and as printers were scarce volunteered himself to compose the type at the Government Printing Office, the type being kindly placed at his disposal by the Governor. He proceeded with his task, and before he had completed it had the pleasure of receiving from England a supply of type, a press, paper, and ink, which had been forwarded for his use by his friends in the mother country. These, with the newly acquired skill to use them, he returned with to his home at Kuruman, thus possessing the means of supplying the long-needed knowledge to the natives. After some fifty years' labour in South Africa Dr. Moffatt was compelled by ailing health to leave Kuruman and to return to England. To smooth his declining years his friends presented him in 1873 with a sum of £5800 in recognition of his services, and some two years later, on St. Andrew's Day, 1875, to show the great respect in which he was held by other communions, he, at the request of the late broad-hearted Dean Stanley, lectured in the nave of Westminster Abbey on African Missions. On December 20th, 1877, he was presented with the freedom and livery of the Turners' Company, and on May 7th, 1881, a crowning honour was offered to him in a banquet at the Mansion House, given by Lord Mayor McArthur, and attended by the late Archbishop Tait and a large number of Bishops. He was born at Ormeston near Haddington, East Lothian, on December 21st, 1795, and died at Leigh, Kent, on the 9th inst., having thus attained the ripe age of eighty-eight years. This remarkable career of a "garden boy" deserves record in our columns.

TOMATOES.

In reply to Mr. Cakebread and "R. M., Swanley," on page 118, let me say that the Tomato we grow is Hathaway's Excelsior. They will find a compost made up of, say, two good barrowfuls of maiden loam, one large shovelful of bone ash, one of dissolved bones, half the quantity of finely ground bones, and 2 lbs. of muriate of potash, or, instead of the latter, a shovelful of wood ashes, will grow splendid Tomatoes, far finer than can be produced by horse manure or any nitrogenous manure; at least such is my experience. I send by this post to Mr. Cakebread two Tomatoes, one weighing about 1 lb. from a cluster of fine fruit, and one from a plant grown in the loam and horse droppings, which he will find diseased, and small compared with the other. The fruit that weighed 21 ozs. had all the others cut from the cluster except itself. We have had scores about and over 1 lb. weight from those grown with phosphates, but not one half that weight from the other compost.—WM. THOMSON, *Clovenfords*.

A GIGANTIC FLOWER GARDEN.

THE extensive seed farms of Messrs. J. Carter & Co. at Dedham and St. Osyth, in Essex, have during the summer months an appearance which well entitles them to the above designation, and the present season is no exception to the rule, for brilliant masses of colour are distributed most liberally over an estate of about 1500 acres, forming a flower garden of surprising dimensions and beauty. Scarlet, crimson, pink, yellow, blue, and purple are all represented in courtless varying shades, and, set in a framework of rich green meadows, fields of waving grain, and a charmingly picturesque landscape, the effect is most impressive. It has, too, the additional recommendation of comparative novelty to the floriculturist, who may be, perhaps, in some degree wearied of the monotony of conventional flower gardens, and who gladly welcomes any departure from the prevailing combinations of Zonal Pelargoniums, Calceolarias, and Lobelias. But of course this beautiful effect which is so striking to the visitor is unstudied; the object of this "flower garden" is more utilitarian than is usually the case, and the magnificent beds of annuals and other plants have a value which to the uninitiated would appear enormous. Hundreds of acres of the best and most carefully selected varieties or strains, each as true as unwearying attention and skilled experience can render it, the plants vigorous and the flowers large, giving reliable promise of bountiful crops of well-developed and matured seeds that will possess a monetary

value that it would be difficult to estimate. But flowers are by no means the only occupants of these farms, as standard vegetables, especially Peas, are grown in large quantities, and amongst the general farm crops Wheat and other cereals form an important feature—fine selections being grown very extensively. Flowers, however, were the most conspicuous, and we may therefore briefly point out some of the best of those which contributed chiefly to display at the various farms visited.

TROPÆOLUMS.

Uncommonly brilliant were these, and one of the first indications we had of the proximity of the flower beds was a grand band of a dwarf scarlet variety upon the side of a hill, which proved to be the Tom Thumb Scarlet, a most floriferous form, glowing in colour, and when seen covering a space of nearly 1½ acre it was positively dazzling. Elsewhere Tom Thumb Spotted was a notable variety, the flowers bright yellow spotted with maroon. Spotted King is another magnificent variety, wonderfully free, dwarf and compact, the flowers brilliant clear yellow with rich maroon blotches. King of Tom Thumbs is perhaps the finest of the dark scarlet varieties, intensely rich in colour, and with very dark green foliage; this is an established favourite, and can be safely recommended as thoroughly reliable and satisfactory. But a superb selection from this is being grown, and as a later-flowering variety is undoubtedly superior: this is denominated Empress of India, and has even darker flowers than its parent. Golden King of Tom Thumbs, Crystal Palace Gem, and other favourites are similarly largely grown; but one of the most remarkable of all was a novelty named cæruleum roseum, a dwarf, free and beautiful variety, with bold flowers of a curious and striking combination of ruby and scarlet, the former having a slight tendency towards "cærulean," almost sufficient to justify the title.

GODETIAS.

Very beautiful were the beds of these upon the St. Osyth farm, where they are grown in great numbers. They are charming plants, and it is not surprising that they are fast becoming so popular wherever the really handsome annuals are appreciated. Easily grown, not particular as to soil or site, they are both accommodating and attractive as border plants, and should have a place in every garden. The lovely Satin Rose, which was deservedly certificated last year, was in grand condition, and amply proved that too high an opinion had not been formed of its merits. It is very compact in habit, and for this reason is admirably adapted for culture in pots, the flowers being large and of a bright rose colour, possessing quite a satin-like gloss, as the name implies.

Godetia Spotted Carpet is a distinct novelty, very dwarf and free, with large white flowers spotted with scarlet, which produces a most peculiar but pleasing effect when viewed in a mass. This variety is likely to become a great favourite, and should be certainly added to every collection of hardy plants. Godetia Whitneyi striata is an exceedingly pretty form of a well-known type, the flowers of great size, very freely produced, pale rose with rich crimson stripes. The charming pure white Godetia Duchess of Albany, which is already so popular, is grown in large quantities, and well deserves the attention it receives, for it is one of the best of the group.

SWEET PEAS.

Another telling feature was formed by the broad patches of Sweet Peas, that not only presented a great number of varied soft and brilliant shades, but also loaded the air with a most delicious perfume that was noticeable at a considerable distance, though in this respect they were outvalled by the beds of bright flowering Stock, *Mathiola bicornis*, the fragrance of which is perceptible at a distance of half a mile or more; indeed, the whole village of St. Osyth seems as if it had been converted into a Rimmel's manufactory when this plant is in flower and the wind is the right direction to carry the perfume over the houses. The Sweet Peas, however, possess a most pleasing fragrance, and the careful attention that has been paid to selection has resulted in obtaining a series of superb varieties that cannot be excelled. The Invincible Black, really a very dark purple, and the Invincible Scarlet are still to the fore as leading varieties, the latter being one of the brightest coloured and most floriferous forms in cultivation. Adonis is a newer one, with soft pure pink flowers of great size, and very free—a charming delicate variety, with everything to recommend it to favour. Painted Lady presents an agreeable combination of pink and white, which has a fine effect in a mass, a good companion for this being found in Butterfly, the flowers of which are blue and white and as freely produced as the others. There are a few only, for the unnamed varieties, which are kept in separate beds, representing nearly every imaginable shade of colour from pure white to the darkest purple, are very handsome, as was recently proved by the collection staged by Messrs. Carter at South Kensington, when they were admired by all who saw them.

ESCHSCHOLTZIAS.

Large space is devoted to these beautiful and showy annuals, and the effect they produced fully equalled that of many others already noted. Particularly handsome was Rose Cardinal, a lovely variety with bright rose-tinted flowers, large and profuse, perhaps the most charming of all. Mandarin is, however, a grand variety, with rich orange-red flowers, the outer surface of the petals being much darker than the inner, and having a peculiar appearance when some of the flowers are partly turned on one side. The ordinary yellow crocea and californica are grown in proportionate quantities, as the demand is very great for them, and they seem to thrive remarkably well at St. Osyth.

MISCELLANEOUS PLANTS.

It would fill a volume to enumerate in detail all the beautiful flowers

grown upon these wonderful farms, and for the majority a passing reference only can be afforded. Double Rockets of a score shades are grown by acres, both dwarf and tall in habit, while Rhodanthes of most approved strains are in similar force. Petunias are very abundant, very strong and very sweet, a strain of hybrid blotched varieties being especially noteworthy, and Messrs. Carter have gained much well-deserved fame for these amongst many other plants. Virginian Stocks are another feature. Pygmy, very dwarf, as the name implies; Fairy Queen, rosy scarlet, exceedingly bright and constant, and a white variety are the best amongst a fine collection. Lupins, such as *L. nanus*, *L. coccineus*, *L. bicolor*, and *L. luteus*, are grown in broad bands occupying several acres, their brilliant blue tints, especially the first-named, being unrivalled. Clarkias are again very striking. Mrs. Langtry, with rose and white petals, dwarf and free, is one of the most beautiful. The double white *C. elegans*, *C. integripetala* Tom Thumb with fine rosy purple flowers, a *C. integripetala* limbata also being most effective. Poppies, Nemophilas, Mignonette, Corn-cockles, the blue Woodruff (*Asperula azurea setosa*), Saponarias, Sweet Williams, Silenes, and dozens of other established favourites are all in superb condition, and reflect the greatest credit upon the care with which they are grown and selected.

GARDEN PEAS.

A brief commendation must be accorded to the Peas so extensively grown at St. Osyth, for the name of this firm is inseparably connected with some of the varieties that have already obtained a world-wide fame. The redoubtable Telephone is especially prominent, and the quarters devoted to them had magnificent crops of handsome well-filled pods. Stratagem is another thoroughly useful and most valuable variety, extraordinarily prolific, with even and regularly filled pods, the flavour being all

to form spurs, instead of their being removed in disbudding. Great care, however, was taken to prevent overcrowding, and young growths were secured to the trellis at intervals for bearing on the young wood.

In the formation of spurs it is usual to top the growths when they have made four large leaves, not counting the incipient leaves that have no buds in the axils, and as further growths issue they are stopped at one or two leaves. The process is shown in the engraving. In this figure it is easy to distinguish how the four leaves of the first summer stopping have fared. In either shoot only the point-bud has made a second growth, which has been stopped to two leaves, and a third growth, which has been stopped at one more leaf. The junction-buds (where the point-bud burst) appear full and healthy. One of them, in the right shoot, even shows a disposition to become a cluster-spur. This specimen was drawn from nature, and well illustrates the subject of spurring Peach trees.

FANCY PANSIES.—No. 2.

MR. WILLIAM DEAN'S contribution to the, as yet, imperfectly written history of the Fancy Pansy was of exceeding interest, and with the data in his possession he must be able to make still more valuable additions. I was glad to find that in many particulars he corroborated the story I reported from the lips of Mr. John Downie, but I must leave the divergences to be

Fig. 25.—SPURRING PEACH TREES.

that could be desired. Pride of the Market is also a variety distinguished by its great prolificness and good constitution, indispensable to all who are largely engaged in the culture of Peas.

CURRENT BLACK CHAMPION.

Last, but by no means least, comes the grandest Black Currant in cultivation, which, unlike many novelties, improves on further acquaintance with it. When branches were first shown at Kensington, the great size of the berries and their number was thought by some to be due to superior cultivation and not to any inherent qualities possessed by the variety. The Fruit Committee, however, thought otherwise, and awarded a first-class certificate for it. Now, too, after many years' trial the plants at the Dedham farms amply prove the grand character of the variety, for some dozens of bushes there have the branches loaded with large black fruit almost like small Plums, in large bunches, and surprisingly regular both in berry and bunch. The flavour, too, is peculiarly soft and agreeable, and altogether the variety is superb—one that well deserves popularity.

—VISITOR.

SPURRING PEACH TREES.

A CORRESPONDENT, Mr. A. Higgs, asks "if Peaches will really bear on spurs the same as Apricots and Pears; he has been told they will do so, but cannot credit the story." The "story" is true, nevertheless, but the system of forming spurs is not general, neither is well adapted to Peaches in the open air in this country. Under glass we have seen some of the finest fruit borne on spurs; indeed, we are not sure that the finest crop we have seen this year was not produced on a tree on which several growths had been pinched

made straight by the veterans themselves, and remain perfectly satisfied with having raised the subject in such a way that an authoritative solution appears probable. Perhaps Mr. James Grieve, who is recognised as one of the best authorities in Scotland, could throw some useful light on the subject.

In making a selection of the best Fancy Pansies exhibited at the Scottish Society's late Show, it ought to be remembered that I saw them at their very best. Never before had there been so many stands of undoubted excellence shown at Edinburgh, and never before had the judges had so much trouble in awarding the prizes. To this must be added the consummate skill of the exhibitors in dressing their blooms. I saw many a refractory flower subjected to a few minutes' manipulation, with the result that the crooked was made straight and the rough smooth. It is all very well for the uninitiated to condemn dressing, but I fail to see why a flower should not be improved after it is cut. While growing, all is done that is possible to improve it, and surely it cannot be wrong to give it a few finishing touches in the way artists do at the Royal Academy. I saw a second-prize stand of eighteen which would assuredly have been first if it had been dressed by the same hands. I do not for one moment advocate the flat appearance which we sometimes see attained in England, but prefer the convex form which a Pansy naturally takes when fully blown. Frequently the bottom petal is stubbornly curled, and requires most delicate touching to cause it to recurve like its fellows. In doing this the petal will frequently split, but I have found it advisable to leave such blooms out of water for an hour or so before setting them up, as the slight flagging which is caused

makes them pliant and amenable to treatment. By the time the judges see them they will have fully recovered their quality, while the added smoothness is all in their favour.

No attempt has yet been made to divide the great family of Fancies into classes, but some regulation of the kind will soon have to be adopted. At present it is bewildering to have no arrangement other than alphabetical order, and the sooner selfs, narrow-edged, broad-margined, laced or picotee-edged, and bizarres are grouped, the better for all concerned.

In compiling the following list I have been guided only by beauty and distinctiveness, and only hope that when the shows again come round I may be able to stage good representative blooms of the varieties named.

Capt. Houstoun, mulberry blotches, upper petals crimson shaded with violet, golden margins, fine eye; large and very showy. Charlie Stansell, large dark blotches, edged pure white, upper petals rosy purple, laced white; large and extra fine. James Gardiner, deep rosy crimson; extra fine form. Mrs. Jamison, beautiful deep golden yellow self, with large solid black blotches. Evelyn Bruce, dense mulberry blotches, good eye, centre of upper petals yellow, with broad crimson margins; of finest form. Bob Montgomery, large solid black blotches edged with yellow, upper petals rosy purple, edged white. Mrs. W. M. Welsh, large violet blotch, edged carmine, upper petals yellow; smooth and very distinct. Mrs. M. H. Miller, large mulberry blotches, margins and upper petals carmine, narrow gold edge round all the petals; smooth and beautiful. Mrs. R. K. Mitchell, maroon blotches, edged white; a remarkably smooth and beautiful flower. Earl Beaconsfield, yellow self, dense dark blotches, and very smooth. Robert Conglaton, dark indigo blotches, edged white, upper petals deep purplish crimson; large and extra fine. Happy Thought, neat eye, claret self, violet purple blotches; large and fine. David Malcolm, lemon, rich solid maroon blotches, distinct pink edge round all the petals; very large and smooth. Perfection, mulberry blotches edged yellow, upper petals violet purple flaked with yellow; very smooth. Mrs. General Grant, deep golden yellow; very smooth, and fine form. Agnes Mitchell, large dark blotches, edged pure white, upper petals white banded with clear purple. R. S. Milne, chocolate blotches, edged clear yellow, upper petals yellow, banded with narrow crimson and edged yellow. Jubilee, violet blotches, upper petals mulberry; large and fine. G. O. Trevelyan, claret self, violet blotches, Picotee edge of white all round. Conquest, crimson self, very dark blotches, broadish Picotee edge of white; very distinct.

Nellie Black, very dark purple blotches, margined yellow. Lady Falmouth, lemon, yellow, and bronze. Catherine Agnes, purple blotches, edged white; a gem. Mrs. Taylor, belted with yellow. Dreadnought, large crimson self, with immense dark purple blotches. Mrs. Barrie, golden yellow self, black blotch; one of the very best. Mrs. Hugh Hunter, beautiful cream self, with very large solid blue blotches; of perfect form. Mrs. Forrester, deep bronzy crimson, edged with yellow and red. Mrs. Geo. Wood, claret, dense black blotches, all the petals surrounded with neat yellow wire edge; large and very fine. Mrs. J. Thomson, fine eye, upper petals flaked violet, Picotee edges; very pretty and distinct. James Grieve, one of the best claret selfs, with beautiful purple blotches. J. H. Stratton, orange buff, shaded with red. May Tale, yellow, shaded with red; a large bold flower. Telephone, maroon blotches, fine eye, velvety crimson margin. Walter Houldsworth, upper petals and margins yellow, flamed crimson; very attractive. Mrs. Russell, dense dark blotches, edged with white and veined with pink. Wm. Robinson, black velvet blotches, edged crimson, lemon margin round all the petals. William Cranston, rosy lilac, mauve blotches, edged white. Countess of Holme, yellow and bronze. Geo. Wyness, maroon blotches, edged with a ring of bright crimson with an outer ring of gold round all the petals. John Emslie, chocolate blotches, edged yellow, upper petals banded with violet purple. Tom McComb, rich dark crimson, with dense violet blotches. T. C. Fulton, dark blotches, edged with bright crimson.

It would be easy to add many beautiful varieties to the above forty, but no greater mistake can be made than to grow too many kinds. I have had upwards of 400 at one time, but I have found more pleasure and success from growing largely of about half the number. "Find out good sorts that will thrive and stick to them till they are distinctly improved upon," was the advice given to me by an old florist, and I am bound to say, after running after the new ones as they came out, that the advice was sound. Pansies are like Roses, they like certain soils and situations, and to grow them elsewhere is labour thrown away. Some good varieties I have never been able to grow

well, while others do better with me than where they were raised.—M. H. MILLER, *Leek*.

THE LINCOLN NURSERIES.

NOT great in the same sense as such establishments as Messrs. Veitch of Chelsea, Smith of Worcester, the Dicksons of Chester, Fisher & Sibray of Handsworth, Rivers of Sawbridgeworth, the Pauls, Cranston, Backhouse, and some others are, yet the Lincoln Nurseries are of a respectable size—approaching altogether 80 acres, and, what is more, appear to be growing healthily. The home nursery in the ancient city appears to have been entirely remodelled and greatly enlarged during the past few years, while the proprietor has erected a handsome and commodious residence and formed a pleasant approach. Thus all around bespeaks prosperity. New seed warehouses, large, well arranged, and substantial, have also been erected to meet the demands of this important branch of the business, and Potato stores formed, for the trade connections of the firm of Pennell & Son extend far beyond the bounds of horticulture, agriculture receiving a large share of attention, as might be expected in a district so noted for its high farming and for the excellent custom of tenure which practically renders such disturbing influences as agricultural holdings bills works of supererogation. A nurseryman and seedsman who can live and flourish amid a constituency so critical and discriminating must have something in him, and there is; indeed there are few representatives of commercial horticulture who combine greater business capacity with a more thorough and practical knowledge of the various branches of their calling than does Mr. Charles Pennell of Lincoln.

No attempt will be made to enumerate the contents of this nursery, as the result would simply end in a catalogue of almost any other provincial nursery, doing as provincial nurseries must do, a mixed business. They must possess a little of everything to meet local demands, and there certainly seems something of most things in the houses and frames in the nursery under notice. The roof of one large structure is covered with Roses, and in season there must be a splendid display of blooms. The roofs of other houses are utilised by Vines in pots, producing excellent canes both from eyes inserted this season and cutbacks from last year. The houses in which those Vines are grown are pattern erections either for nurseries or private gardens, being strong, light, durable, and economical. They are sunken span-roofs with very low sides, the glass being affixed to horizontal bars and covers all the wood-work, thus dispensing with external painting. Where the sides of the squares join each other narrow strips of glass, an inch wide or so, overlap the edges of both squares, thus excluding all the rain that falls, while admitting all the light; and it is not easy to conceive what more can be expected in any glazed roof.

Outside the houses, of which there are a considerable number, Chrysanthemums are prominent. The Chrysanthemum fever has only lately spread to Lincoln, a society having been formed to encourage the cultivation of this flower, and the first show will be held in the ensuing autumn. Evidently there is a great and good assortment of varieties in this nursery, but the plants were not taken in hand soon enough either for forming grand specimens of noble blooms of the character of those seen at the leading shows; but with generous culture, no more topping, and careful disbudding they will make a good display arranged in groups; and it is hoped the first Lincoln Chrysanthemum Show will make a good beginning, and, like the Lincoln Nursery, go on improving. A good assortment of hardy plants are grown, one of the most effective being the free and vigorous border Carnation Lord Beaconsfield.

Fruit trees, forest and ornamental trees, shrubs, Conifers, and Roses are grown at a distance of some two miles from the city, about 65 acres of good land being devoted to them and to seed-growing, and the position being exposed the trees assume a sturdy habit of growth. In the increase of fruit trees the wise plan is adopted of giving prominence to those varieties that long experience has proved thrive best in the locality and the counties surrounding, and sorts that flourish in Lincolnshire, Yorkshire, Nottinghamshire, and Leicestershire will succeed almost anywhere. Roses are very extensively grown, all the best varieties being included, and their blooms figure prominently at local exhibitions.

But though everything is flourishing now, Mr. Pennell has had difficulties to combat. He has been the victim of noxious gases from brick kilns, which swept across his nursery like a plague, leaving destruction in their track. Yet, if a victim, he proved a conqueror, and gained an injunction against the transgressors, one of the first in a case of this kind, and thus conferred a benefit on the trade. Because of his experience in these matters he was summoned as a witness for Mr. Foster, who won a case of the same nature last year for injuries done in his nursery at Stroud; and a formidable witness Mr. Pennell must always be in similar cases, in which, however, he has no desire to figure, being better employed in the conduct of his business at home; but with precedent on precedent against them, kiln-owners will be more careful in future in injuring other men's property and taking their chance of escaping the consequences in actions that may be brought against them.

Horticulturists passing through the old city, the Lindum of the Romans, who have a few hours to spare will find a genial host in Mr. Pennell, who is a worthy member of the craft and one of the most competent and respectable of English nurserymen. If during the same visit they would like to see one of the most interesting of fruit gardens in the country they will find it at Bracebridge (Rev. C. C. Ellison's); and if they want to see one of the best town gardens in England they may call at East Cliffe House, the residence of N. Clayton, Esq., whose gardener,

Mr. Wipf, grows the Duke of Buccleuch Grape so splendidly and does everything else well that he takes in hand.—A TRAVELLER.

P.S.—An omission may be noted. In Mr. Pennell's seed shop in the city a brisk trade is being done in "Inga" seed as a wholesome and nutritious food for cage birds. Failing to obtain the botanical name of the plant that produces this seed the manager, Mr. Buffham, raised plants and flowered them. An example submitted and examined at Kew has resulted in the following simple solution of the problem, and if synonyms are an indication of merit this "Inga" seed certainly ought to be good. The names of the plants are *Anthemis mysorensis*, *Herb. Madr. ex Wall.*; *Bidens Ramtilla*, *Wall.*; *Bupthalmum Ramtilla*, *Hamilt.*; *Guizotia abyssinica*, *Cass.*; *Helianthus oleifer*, *Wall.*; *Jageria abyssinica*, *Spr.*; *Parthenium luteum*, *Link.*; *Polymnia abyssinica*, *L.*; *Polymnia frondosa*, *Bruce*; *Ramtilla oleifera*, *D.C.*; *Tetragonotheca abyssinica*, *Led.*; *Verbescina sativa*, *Rowb.*; *Heliopsis platyglossa*, *Cass.* As Mr. Buffham can scarcely be expected to write them all on the seed packets he may content himself with *Guizotia oleifera*, which is now the accepted name of the plant in question.

BRASSAVOLA PERRINI.

EARLY in the present year Sir Trevor Lawrence, Bart., exhibited at South Kensington a plant of the above Orchid from his grand collection at Burford Lodge, Dorking, and from a drawing of that plant taken at

Fig. 26.—BRASSAVOLA PERRINI.

the meeting the woodcut (fig. 26) has been prepared. The specimen was remarkable for the number of flowers it bore; and though these individually are by no means showy, yet collectively they had a most striking appearance, as can be judged from the engraving. The lip is broad and somewhat heart-shaped, as in other species of *Brassavola*; it is pure white, and the narrow green sepals and petals spread regularly round it. When grown upon a block, a mode of culture that suits all the members of this genus, it has a pleasing appearance, the large narrow green leaves drooping gracefully with the abundant flowers. It is related to *B. nodosa* and *B. cordata*, but is readily distinguished by its smaller flowers, which are generally borne singly, by its more slender leaves, and a branching stem. Under the figure in the "Botanical Register" in 1833 it is stated that the plant was introduced from Rio Janeiro by Mrs. Arnold Harrison of Aigburth, after whose gardener it was named; but in the "Botanical Magazine," 1839, it is said that plants were sent from Brazil to the Glasgow Botanic Gardens. The first account, however, appears the most probable.

ROYAL HORTICULTURAL SOCIETY.—AUGUST 14TH.

THE conservatory was on this occasion devoted to the exhibits, which were, however, not very numerous, the Gladioli and Dahlias forming the

most conspicuous features. The former were very fine, both from Messrs. Kelway and Vilmorin, while the Slough and Swanley Dahlias were similarly attractive.

FRUIT COMMITTEE.—H. Webb, Esq., in the chair. The following were present: Messrs. G. Goldsmith, S. Lyon, J. Burnett, J. Willard, G. Bunyard, A. W. Sutton, L. A. Killick, F. Rutland, W. Denning, J. E. Lane, R. D. Blackmore, J. Smith, and T. Woodbridge. Messrs. Lane & Son, Great Berkhamstead, sent several Apples, comprising Red Juneating, Eve, and Duchess of Oldenburgh. For *Apple Mr. Gladstone* a first-class certificate was awarded. It is a small Apple, very bright red on the side exposed to the sun, and plentifully streaked all round. It is globular in form and of excellent flavour. Messrs. Cheal & Son, Crawley, sent fruits of a seedling Apple named *Early Lowfield*, a neat conical fruit dull red in colour. Mr. J. Bolton, Coombe Bank, Sevenoaks, sent samples of a white Gooseberry named *Bolton's Prolific*, which is said to be very early and always very free. The branches sent were heavily laden with fruits. The Committee expressed a desire to see the variety again earlier in another season. Mr. J. Hardeman, Lynne Hall, Stockport, sent a green-flesh seedling Melon; and new Melons were also sent by Mr. A. Taylor, Apperley Bridge, Leeds, Mr. Burnett, and Mr. Jackson, Putney Heath, London, but none was sufficiently distinct to merit notice. Mr. Rutland, The Gardens, Goodwood, Chichester, exhibited a fruit weighing 21 lbs. of a *Melon* named *Goodwood*, raised from seed sent from the Cape of Good Hope. It was large, with greenish-white flesh, very evenly netted, but of poor flavour, yet a first-class certificate was awarded.

Mr. A. Faulkner, Inkpen, Berks, sent fruits of a very large *Raspberry*,

Lord Beaconsfield, which was much admired, the flavour being very rich and the colour good. A first-class certificate was awarded for it. Mr. L. Killick, Maidstone, exhibited a collection of Apples in very good condition, comprising *Duchess of Oldenburgh*, *Golden Spire*, *Yorkshire Beauty*, *Early Julien*, *Mr. Gladstone*, *Ecklinville*, *Weaving Apple*, *White Transparent*, and *Emperor Napoleon*.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. The following were present:—Messrs. J. McIntosh, H. Bennett, H. Cannell, J. Wills, J. Dominy, J. Hudson, J. James, J. Laing, F. R. Kinghorn, W. Bealby, J. Douglas, G. Duffield, A. Ballantine, A. Turner, J. Cutbush, and Shirley Hibberd. A silver Banksian medal was awarded to Mr. C. Turner, Slough, for a large and beautiful collection of *Dahlia* blooms, comprising *Show*, *Fancy*, *Pompon*, and single varieties, and representing a great number of shades. Of the *Show* varieties some of the best in colour, substance, and form were the following:—*Cardinal*, scarlet; *James Vick*, crimson purple; *Mr. Saunders*, pale yellow; *Mrs. Harris*, pale mauve; *Harry*, rich crimson; *Mrs. Henshaw*, white; *Prince Bismarck*, rosy crimson; *Drake Lewis*, scarlet; *Bessie*, lilac pink; *Duke of Albany*, bright scarlet. Of the *Fancy* varieties the most conspicuous were *Grand Sultan*, crimson streaked on a yellow ground; *Magic*, fine scarlet streaks on a yellow ground; and *Peacock*, purple-crimson tipped with white. The *Pompons* were exceedingly beautiful, the most distinct varieties being *Garnet*, scarlet; *Lady Blanche*, Fair Helen, and *White Aster*, white; *Little Arthur*, orange scarlet; *Little Princess*, pale mauve; *Prince of Lilliputians*, dark maroon; *Lewis Rodani*, bright purple; and *Titania*, yellow buff. Single varieties were similarly well represented, the brightest and most effective varieties being *Benedick*, purple; *Glory*, scarlet; *Yellow Queen* and *Morning Star*, scarlet; *Olivette*, orange red; *Alba*, white; *Duke of Teck*, rosy purple; *Rob Roy*, rich maroon, and the well-known *Paragon*.

A silver Banksian medal was deservedly awarded to Messrs. Kelway and Son, Langport, for a superb collection of Gladiolus spikes comprising some very handsome varieties. Especially fine were Ball of Fire, large flower and spike, rich scarlet; Pritum, bright salmon, very beautiful; Queen May, white, with the lower petal purple; Belgica, streaked with rose on a lighter ground; Victory, bright scarlet; Admiral Willis, dark scarlet; Lady Aberdare, blush pink with a few crimson streaks. An extensive collection of single and double Pyrethrums was also staged, including a large number of superb varieties. The best were the following—Single: Democrates, rich crimson; Hadrianus, pale pink; Laon, rosy crimson; Pan, white; Pelope, bright rose; Flaccus, rich crimson; Abantis, white; Nearchus, dark rich red; and Halia, blush white. Double: Capt. Boyton, dark crimson; Madame Benary, white; Le Dante, soft pink; Jeanette, white; and Capt. Nares, dark crimson.

Messrs. H. Cannell & Sons, Swanley, exhibited a collection of Show and Fancy Dahlias, some large Sunflowers, and Fuchsia Phenomenal, an enormous double purple-flowered variety. A vote of thanks was accorded. Messrs. J. Carter & Co., High Holborn, had a fine collection of Petunias, for which a vote of thanks was accorded. They were chiefly single varieties, comprising Stars and Stripes, white and crimson; Queen of Roses, bright rose; White Pearl, white; King of Crimson, rich crimson with a white eye; Cerise Brilliant, crimson-purple; Mrs. Sharman, white tipped with crimson; and Blue Perfection, rich purplish blue. A vote of thanks was also accorded for *Hæmanthus puniceus* with a dense head of scarlet flowers. Mr. H. James, Castle Nursery, Lower Norwood, sent a flower of a new *Cattleya* named provisionally *Jamesianum*. It has pale lilac sepals and petals, the lip white blotched with yellow in the centre, and tipped with pale purple. A vote of thanks was accorded to G. F. Wilson, Esq., F.R.S., Weybridge, for a spike of *Lilium Batemanniæ* cut from the open ground, and several *Gentians*. Similar recognitions were awarded to Mr. J. Douglas for a fine spike of *Calanthe sylvatica*; and to Mr. Noble, Bagshot, for flowers of *Clematis Jackmanni alba* and *Duchess of Connaught Rose*. A cultural commendation was awarded to Mr. Humphrey, The Gardens, Nash Court, Faversham, for a number of extremely handsome *Lapageria rosea* flowers, some being 5 inches long and 2½ inches broad at the mouth. A cultural commendation was also accorded to Mr. Hudson, The Gardens, Gunnersbury House, Acton, for a plant of *Gloxinia Lilian* in a small 60-size pot and bearing six fine flowers.

Mr. T. S. Ware, Tottenham, sent a beautiful collection of single Dahlias, for which a vote of thanks was accorded, also a fine plant of *Francoa ramosa* with about three dozen spikes of white flowers. A vote of thanks was accorded to Mr. Todman, gardener to J. Connell, Esq., Bushy Down, Tooting Common, for several seedling Zonal *Pelargoniums* with large trusses of scarlet and salmon flowers, and a free-flowering *Fuchsia* named *Condor*. Messrs. Francis & T. Smith, West Dulwich, were accorded a vote of thanks for a group of double Balsams, the flowers large, well formed, and varied in colour. A large group of *Achimenes*, *Begonias*, *Tydæas*, and *Ferns* were sent from Chiswick.

First-class certificates were awarded for the following:—

Lilium Wallacei (Ware).—A pretty Lily in the way of *L. elegans venusta* and *L. elegans Batemanniæ*, but better than either of them. The flowers are bright orange with a few dark spots at the base of the petals. They are clustered near the summit of the stem.

Gladiolus Duke of Teck (Kelway).—Pale blush streaked with rich crimson; flower very large, and spike massive.

Gladiolus Her Majesty (Kelway).—A lovely variety, very delicately tinted with purple, almost white, streaked round the margin with purple; flower of great size, and spike also.

Begonia Virginalis (Bealby).—A tuberous variety, with large double pure white flowers.

Pelargonium peltatum Jeanne d'Arc (Bealby).—Flowers very full and good in form, white faintly tinged with purple.

Gladiolus Grand Rouge (Vilmorin).—Very handsome; flower of great size, colour a brilliant scarlet, spike massive.

Gladiolus André Leroy (Vilmorin).—Deep rose, with a white central streak in each petal; flower and spike large.

Sweet Pea Carmine Rose (Hurst & Co.).—A delicately coloured variety, very pale rose, clear and good.

ROSES ON THEIR OWN ROOTS.

THIS subject has often been written upon in your pages, but I wish to add a few remarks. It is not, I think, generally known that most of the Teas do well on their own roots. I have grown plants and cut blooms from them fit for exhibition in less than a year. Cuttings of short-jointed well-ripened wood were inserted in September under bell-glasses, and the young plants so obtained were planted out the last week in March or the first week in April (choosing a showery day, if possible) into deeply dug light soil, with a moderate quantity of manure. Water is supplied in dry weather until they are well established, a mulching of long stable manure being of great assistance to them. They succeed best in light soil where the Briar will not grow.

Some of the advantages to be gained by growing Roses from cuttings are—no time is lost or room taken up in preparing stocks. Starting both together you have flowering plants from the cuttings by the time you can bud the stocks, gaining thus one clear season; less manure is required by own-root Roses, and they are easier to manage in winter, a shovelful of cinder ashes being all they require to keep the frost from the roots.

The following are some of the varieties I have found succeed in this way. *Hybrid Perpetuals*.—Abel Carrière, Baronne de Rothschild, Charles Lefebvre, Capitaine Christy, La France, Le Havre, Mons. Boncenne, Rosy Morn, Penelope Mayo, Richard Wallace, Dupuy Jamain, and Cheshunt Hybrid. *Teas*.—Catherine Mermet, Devoniensis, Gloire de Dijon, Madame Berard, Madame Lambard, Madame Falcot, Marie Guillot, and Souvenir d'un Ami. I have more Teas on trial,

but the buds are not quite open, and I cannot say what they will be, although they promise well.—H. E. M.

THE GREENHOUSE AND ITS INMATES.

(Continued from page 123.)

IMANTOPHYLLUM MINIATUM.

THIS is one of the first plants which an amateur with a greenhouse should possess, because it grows freely if potted in turfy loam, well drained, and kept in the greenhouse, and because it flowers in the spring. Even when not in flower the plant is ornamental. It is grand for exhibition, and should be grown by all amateurs who exhibit in spring.

KALOSANTHES COCCINEA.

This is a good old-fashioned plant which is not so much grown as it deserves. Cuttings are easily rooted, and if these are potted, using sandy loam and leaf soil as may be necessary, handsome plants may be produced in one year. Repeated pinching during summer to produce a bushy habit should be practised, but must be discontinued by August, so that flower-buds may form in autumn. During winter the plants should be kept very dry in order to induce the formation of firm flower-producing wood. This plant is of a succulent nature, and, like all other succulents, must be kept dry while resting. It, however, should not be dried off, but a little moisture kept in the soil just to prevent shrivelling. If large plants are wanted they may be pruned back lightly after flowering is over, and after growth has commenced shifted into larger pots. Like other succulents, large plants may be grown in comparatively small pots, and care must always be taken not to overpot. Liquid manure will prove very beneficial to root-bound plants which are making growth. If small plants only are wanted cuttings can be struck annually.

LACHENALIA TRICOLOR.

This is a neat, attractive, bulbous Cape plant, well worthy the attention of amateurs. If growing plants are bought they should be simply placed in the greenhouse and supplied with water in moderate quantities until the foliage begins to wither, when it must be gradually withheld until the bulbs ripen, which they do in the manner of Onions. They may then be placed in a cool situation without being removed from the soil until potting time.

If they are wanted to flower in early spring pot them in fresh soil about the end of July or beginning of August. Shallow pans 6 inches in diameter are very suitable for growing them in, as 2 or 3 inches of soil is better than a greater depth. Drain well, and use sandy loam and manure, and press the large bulbs an inch apart into the soil, so that only the apex of the bulbs remains above the soil. The pans should then be placed in a cold frame and carefully watered until the bulbs begin growing, when water may be more freely given. In October the pans should be removed to a shelf in the greenhouse near the glass to prevent "drawing" as much as possible. If it is desirable to increase the stock any bulbs which may be too small for flowering should be planted in a shallow box in quantity, and treated in the same way as the other. They will make fine flowering bulbs by another season. The plant increases rapidly. *L. luteola*, *L. orchioides*, *L. pendula*, and *L. quadricolor* are also well worth growing.

LAPAGERIA.

No greenhouse should be without these charming climbers. They rank among the very best plants ever introduced, and they are by no means difficult of cultivation. For training over back walls or up rafters or on trellises for exhibition this is the first plant we would mention. For bouquets, epergnes, or vases the flowers are specially suitable. We do not know whether the rosy or the pure white variety is the more beautiful, but we are quite certain that both are indispensable. If plants are bought it is economy to secure plants with strong breaks—recent growths—for stunted ones are much trouble, although the plants cost a shilling or two more. After securing plants the next thing to do is to see if there is any mealy bug or scale on them. If they are obtained from respectable nurserymen there will be none, for they are by no means liable to these pests. Still, we have seen them on the plants; and if any are to be seen we strongly urge their instant and careful destruction with sponge and warm soapy water. Spring, just as the plants start, is a good time for buying, for then they should be potted, or at least repotted. The best soil to use is light, rough, tough, turfy loam, with the fine soil shaken out of it; and we would strongly advise the amateur to secure this, although it should cost a special pilgrimage or a special order to the seedsman. Many persons grow this plant well in peat, or in peat, ordinary loam, and pieces of sandstone; but we would urge everybody to grow, not ordinary plants, but vigorous plants, with strong shoots and flowers twice or three times the ordinary size, and this needs loam such as we have described mixed with pieces of bone and charcoal instead of the orthodox sandstone.

Drain well, and water carefully; train each shoot on a wire or thin cord by itself, and cut out all wood as it gets over three or four years old. Should green fly appear on the growing shoots sponge them off. Pot on every spring, at least if the previous pots are well filled with roots, and in a very few years your plants will be worth more sovereigns than they cost shillings, besides furnishing you with untold wealth in the shape of gorgeous blossoms.

LILIUM.

This is a very extensive genus, but in the present place we only

mention two species, with their varieties, for cultivation in pots for the decoration of the greenhouse. They are the indispensable *L. auratum* and *L. speciosum* and vars. As the amateur gains skill and experience others may be added, but the above are quite enough for a beginner to commence with. The bulbs are generally to be had during winter and early spring. As soon as they come to hand they should be potted in rough lumpy loam and well-decayed manure, with some broken charcoal or sandstone and a little sharp sand. Comparatively large pots should be used, as they are strong rooters. A little sand may with advantage be placed around each bulb, which must be covered with soil about an inch. The pots need not be too full of soil, but room should be left for a top-dressing afterwards. As soon as the bulbs are potted they should be stood in a cool place (a shed or cellar) from which frost is excluded. When they commence growing in spring they may be removed to a cold frame, and still protected from frost. Up till this stage no more water need be given than just to keep the soil a little moist; but after the tops make some progress, and the roots take possession of the soil, water must be given more freely, and once a week a weak dose of liquid manure should be given. Meanwhile ventilation must be freely given on all favourable occasions. By the end of May the plants will thrive better out of doors, and should be plunged in ashes in a sheltered spot. When young roots appear at the base of the shoots a little rich loam may be placed over the roots, and over and around that a good dressing of rich cow manure partly, but not over, decayed. As the shoots run up stakes should be put to each, and before the flowers open the plants should be removed to the greenhouse. At this stage liquid manure will be of great service to them.

After they have flowered they should be removed to a cold frame or other glass structure to be carefully ripened off—not dried, that is the mistake which kills so many Lilies yearly; but as the foliage ripens water should be gradually withheld until after it has decayed. No more must be given than just to keep the soil moist and the bulbs fresh and plump.

Repotting should take place about December. In performing this operation care must be taken not to injure a single root, but at the same time all inert soil may be taken away and fresh material supplied. Pots slightly larger should be given year by year if the plants are in a thriving condition, for then they double themselves yearly. Until growth commences the soil must be kept just moist, after that the routine we have laid down should be followed.

NERINE.

Nerines are easily grown bulbous plants, somewhat resembling *Amaryllises* and belonging to the same order. Good loam, decayed manure, and a dash of sand through it suits them as far as soil is concerned. When growing the plants may be kept near the light, and well supplied with water, and occasionally with liquid manure. When the foliage turns yellow the supply of water must be diminished gradually until no more is given than will merely keep the bulbs from shrivelling. While resting the plants should be kept dryish and cool. When the flower-stems appear more water should be given, and the plants removed to a warm corner of the greenhouse again. The best time to pot is just as the plants push up fresh leaves. In potting all inert soil may be removed, but no roots should be injured. Overpotting must be avoided. *N. Fothergillii* and *N. F. major* are the forms most commonly grown, and next to that *N. sarniensis* (the "Guernsey Lily"), but *N. coruscans*, *N. flexuosa*, *N. undulata*, and *N. venusta* are well worth growing.—A. H

NATIONAL GOOSEBERRY SHOW.

THIS was held in the Royal Botanic Gardens, Old Trafford, Manchester, on the 6th inst. The respective prizewinners, with the names and weights of the varieties that were exhibited, are as follows:—

PLATE OF TWELVE RED BERRIES.

John Boot	Lord Derby.
James Bower.....	Lord Derby.
E. Salsbury.....	Bobby.

—CHARLES LEICESTER (Secretary), Nurseryman and Florist, Macclesfield.

ANEMONES.

HARDY spring flowers are favourites with most people, and in the spring they seem to have a special charm. The Anemone is a great favourite; the flowers also last a long time when cut. Like many more old-fashioned flowers there are named varieties, called florists' Anemones, and these as the foliage decays are lifted and kept in a dry place, being again planted in November. The beds should consist of good friable loam, with a little sand about the roots. Anemone fulgens has beautiful bright scarlet flowers with a dark centre, well adapted for clumps in the herbaceous border, on the margins of the shrubberies, in grassy nooks, and woodland walks. At Holme Lacy, Hereford, we had a beautiful variety, which I preferred to *A. fulgens*, but found it succeed best when the roots were lifted as the foliage decayed, and planted again in November. The double and single varieties have bright and varied colours.

In the cottage gardens around Hereford numbers of fine single and double self varieties of almost every colour are grown, and some have not been disturbed for years. I remember seeing a beautiful bed of the double scarlet variety in a cottager's garden. The occupier informed me that he lifted them up every year when the foliage had decayed. Seeds may be gathered from all the varieties, and may be sown in pans or in the open ground in spring. If sown in pans the plants should be kept growing as long as possible, as the foliage decays. Keep them dry, and plant them out singly in November. *A. apennina* is a very pretty little blue-flowered species, and the Wood Anemone (*A. nemorosa*) should not be despised.—A. Y.

IN THE BOGS.

It was with pleasure that we read in the Journal of the wild Orchids grown by the Marchioness of Huntly's gardener, and we can only hope that the example may be copied. Foreign lands in every latitude and longitude and at every altitude are ransacked for the plants they produce, while those of our own country are overlooked. To-day I gathered a bouquet of bog flowers of beauty no way inferior to those of numbers of plants imported at great expense.

The first and most conspicuous was the *Orehis maeuiata*, and this was growing not only in wonderful profusion, but in endless variety, from almost pure white to deep red-purple. Some were banded transversely, some longitudinally, the majority in both ways. Numbers were not banded at all, but simply speckled and spotted. Some had leaves deeply barred and blotched with black, and others, again, were nearly green. A dozen or two of the best of these I gathered and basketed in sphagnum moss. Interspersed with these are some of the greenish-tinted white *Orehis*, gathered from a damp bank. Though not very showy, this white scents our room when the shades of evening fall with an odour not surpassed by that of the most exquisite exotic. And darkening all are a few spikes of the velvety *O. pyramidalis*. It would be difficult to surpass that rustic basket with its sphagnum-lined, Sundew-carpeted, Orchid-stocked profusion of blended colours and odours.

Almost past now, but when in bloom one of the handsomest of flowers, "decked with frills and furbelows," and beautifully coloured with faintest pink on a snowy ground, is the Bog Bean, and on the banks near by grows the most lovely of British Forget-me-nots (*Myosotis palustris*). Bewildering in variety, with every change of position, are these Forget-me-nots; but no variety and no species in any position is so lovely in its tender blue as is the one whose home is in the bogs.

These are not glowing, glaring beauties; but, as if providing for all tastes, early in spring the wet marshes seem almost as if on fire by their display of Marsh Marigold. Even now the moss beneath the feet seems tinted with the dull red of smouldering embers, but it is only a profusion of that little plant with a history—the *Drosera rotundifolia*. Near by, where a bank of mud has been deposited by the mountain stream that just now sings dreamily in the hot sunlight, when overfed with pouring rains and melted snow on the heights above, another neat little "Beef-eater" swings its Violet-looking flowers in the June air—the Butterwort (*Pinguicula vulgaris*).

Here in the dry trench dug to drain the bog, are patches of the Ivy-leaved *Ranunculus*; and near by, in the stream, is its near relation, the aquatic *Ranunculus*, forming "trout beds." And here, where earlier the Bluebell or wild Hyacinth tried to make amends for the fading glory of the Wood Anemone, and where the towering Foxglove rears his head are now indescribable myriads of graceful Grasses and wild Ferns, forming a garden, wild and unkempt it is true, but yielding a soothing influence that hard-drawn lines, hard-cut lawns, formal shrubs, and foreign flowers crammed in masses, banish. We might speak of the handsome Heaths and shining Stitchworts, the Bluebells, Queen of the Meadows, Valerians, numerous Woodruffs, Golden Saxifragas, and hundreds beside, but that would only be a matter of multiplication. By the wayside, the hillside, the side of the brook, in the pools and in the bogs of our own land are growing beauties that have too long blushed unseen; but the time is coming soon, as we hope, when many of the now neglected British plants shall find a place in cultivated gardens.—S. H.

MECONOPSIS WALLICHII (THE BLUE POPPY).

THIS handsome *Meconopsis* is remarkable as being one of the very few plants, if not the only one, of the order with blue flowers. It was discovered in the Sikkim Himalaya by Dr. J. D. Hooker, who sent seeds to the Royal Gardens, which produced flowering plants in June, 1852. The plant attains the height of 2½ to 3 feet, and is everywhere of a pale glaucous green, covered with long reddish bristle-like hairs. The root-leaves are very large, often 12 to 18 inches or more long, stalked, and much lobed and cut. The stem-leaves are small and without stalks. The flowers are rather numerous produced from the axils of the upper

stem-leaves, on short drooping peduncles, and are of some size; the ring of yellow stamens round the seed vessel contrasts charmingly with the blue colour of the petals. The seed vessel is more elongated than in the true Poppies, and is densely clothed with erect bristle-like hairs or setæ; the stigmas are elevated on a thick cylindrical style as long as the ovary, as shown in our figure.

In *Meconopsis Wallichii* and the other species of this genus the capsule opens when ripe by six or seven valves at the top of the style, which appears to be rather a mere elongation of the ovary than what is generally understood to be a true style. The numerous seeds are arranged on thin membranaceous plates, radiating from the inner walls of the capsule.

It is regrettable that this beautiful plant has been found so difficult of culture in England, and if it could be obtained in similar proportions to some shown in one of Miss North's admirable paintings at Kew it would be a grand ornament for our gardens.

A LONDON GARDEN.

"PLANTS and flowers will not flourish in London" has almost become an established fallacy, and would have been entirely so had it not been for the splendid examples of flower gardening in the parks and the most beautiful window boxes in the kingdom that may be seen every day in the summer in some of the prominent thoroughfares in the metropolis, where the affluent locate themselves during the butterfly season.

There are also some attractive gardens in London, necessarily not

Fig. 27.—*Meconopsis Wallichii*.

large, yet undeniably enjoyable, and most creditable to the owners and their gardeners. One of the best of these undoubtedly—if not, so far as regards keeping, the very best—is the enclosure at Alpha House, the residence of Captain A. L. Patton. This is a true town garden, as it is within rifle-shot of Baker Street station on the Metropolitan Railway, and it may be said without fear of contradiction that there are few gardens, even in the country, more variedly attractive, enjoyable, and more admirably kept. The lawns and walks are as perfect as they can be, the herbaceous border richly furnished, the flower beds bright, the Grapes excellent, and not a weed can be found in the enclosure.

The enclosure is an oblong of about 2 acres, the central portion lawn with splendid Weeping Ash and a few other deciduous trees; the side borders, of a length of from 200 to 300 yards, and from 10 to 30 feet wide, being occupied with herbaceous plants, brightened with summer flowers, and margined with Golden Feather. The end, an oblong of some 60 by 20 yards, is a bulb garden, and how many thousands of bulbs are planted there he would be a bold man to estimate. The beauty of these are, of course, over, the only flowers being a bright residue of a splendid named collection of English and Spanish Irises; but flowers can be cut from the mixed border in basketfuls, and it is quite certain that plants well managed will thrive in London.

Shrubs are also planted in the border for effect in winter; but there are only four or five kinds that succeed the best in towns—namely, Aucubas, Rhododendrons, Hollies (mostly variegated), Rhododendrons, and Variegated Box, with a few of the pretty green upright-growing Hands-

worth variety. All these grow well, and may be regarded as the best shrubs for smoky districts.

Flowers are too numerous to enumerate, but Carnations are prominent, the leading named varieties in pots, and Cloves and free-growing sorts in the borders. These must rank among the very best of town plants, and are as fresh and fine as in the country. Foxgloves thrive well in towns, and their stately spikes are most effective earlier in the season in the background. Helianthus appear to luxuriate, as do Pyrethrums, Potentillas, Japanese Anemones, Sweet Williams, Campauulas, Michaelmas Daisies, Enotheras, summer and autumn Chrysanthemums, Verbascums, Clematises, Fuukias, Pentstemons, Achilleas, and Spiræas, *S. lobata* being very beautiful. Robust and brilliant, too, is *Lobelia cardinalis ignea*, showing that these effective herbaceous Lobelias are well adapted for town decoration. Grown for affording elegant foliage for cutting as a substitute for Adiantums are *Thalictrums*, *T. adiantoides* being worth growing everywhere for this purpose; and also most elegant and valuable for vases are the slender sprays of *Gypsophila paniculata*. Stocks and Asters succeed well in towns, but not better than *Phlox Drummondii*, of which, from Veitch's seed, there are some splendid varieties. Nearly all kinds of annuals succeed—Sweet Peas, *Eschscholtzias*, Candytuft, and Mignonette being particularly fine, the latter, indeed, extraordinarily vigorous. Beautiful in this border are Fuchsias, bushes and standards. Old plants were kept as dry and cool as possible in winter, and were planted in late spring or early summer just when commencing growth. It is not often Fuchsias under glass are seen growing so sturdily and flowering so freely as these are, and plants might with advantage be similarly treated in other gardens. They may be wintered in any dark or light place from which frost is excluded. *Aralia elata*, a noble and stately species, is very handsome by its robust growth and grand spreading leaves. It was obtained from the Continent, and is distinctly ornamental.

All the above flowers show to advantage by the ample relief afforded by the comparatively great extent of smooth lawns. The greater part of these were obtained by sowing seeds, and the advantages of thick sowing are apparent. On one portion the seed was sown of twice the thickness recommended by Messrs. Carter, who supplied it; and on this portion the lawn in six weeks was excellent, and in seven resembled old turf. The seed was sown in April. The other portion, sown thinner, was some weeks longer in forming a close surface, but both portions are in the best possible condition now.

There is but little glass, but what there is is well utilised. As before remarked, the Grapes are excellent; the berries of the first size and quality, but imperfect in colour. Of Lilliums there is a great collection, these plants being fine for towns. In frames are massive Cockseombs, the Scotch variety (McLachlan's) and Young's variety; the former is the brighter, but the latter is very close and compact. It has been grown by Capt. Patton's gardener for forty years, and ought not to be lost. In another frame is the finest stock of young plants probably to be found in the country of *Lisianthus Russellianus*, and some small plants are flowering. Mr. Young is an adept at growing this plant, which so few persons seem to manage well. He has small plants flowering, but has grown specimens bearing upwards of 500 Tulip-shaped purple blooms, and they were grand, such as have probably never been surpassed, if equalled. He is undoubtedly a first-rate cultivator, and the garden in his charge is a credit to him, both his employer and himself having good reason to be proud of it, and they have certainly shown in the most conclusive manner that plants and flowers *can* be grown in London.—INSPECTOR.

CULTURAL NOTES ON ORCHIDS.

Rooting Material.—Kentish peat, brown, fibrous, and lasting, with healthy-growing sphagnum moss, surpasses every other material I have seen or tried; but unfortunately we do not all live in the midst of Kentish peat, and when we order it we are not sure of securing the real article. Half peat and half moss, with a liberal admixture of charcoal nodules, form a compost which the great majority of Orchids will grow in. One of the best substitutes for brown peat is the roots of our strong-growing native Ferns. This material is practically peat. When I first employed it some eight years ago the roots were pulled in pieces by the hand; I now chop it into pieces. It is also necessary to employ more sphagnum with this than Kentish peat. Coarse turf from heathy soil is very commonly used, but it is greatly inferior to either of the above materials, as it is wanting in those lasting properties so necessary for Orchid culture. I have seen plants do well in ordinary black peat and sphagnum, but in this instance they were very large, and were carefully watered by a skilful cultivator. For *Vandas*, *Acrides*, *Saccolabiums*, and *Phalænopsids* I use only sphagnum and charcoal. Then there are kinds like the winter-flowering *Calanthes*, which thrive in ordinary turfy loam; but these and others which succeed in loam may be satisfactorily grown in a peat and sphagnum compost. I have seen very grand examples of *Calanthe Veitchii* growing amongst charcoal and corks alone. Plenty of water and a Pine-stove temperature were the main factors of success. Many sorts do best on blocks, while a large number which are grown in pots or baskets grow equally well on these. The best kind of "blocking" material is Fern stems, and the best kind of Fern stem is found in our own woods. The stems in these are covered with a thick matting of fibrous roots, which may be shaved off as closely, or left as rough, as the cultivator considers best.

Mode of Potting.—Much depends on the way an Orchid is potted. In mixed collections of limited extent we occasionally find examples of

such bad potting that none of the other conditions necessary to the plants thriving have any good effect, through the potting being so badly done. I have tried experiments with several kinds of Orchids as to whether any difference would follow from the mode of potting. As examples, *Lycaste Skinneri* and *Odontoglossum grande* may be named as having been tried potted like ordinary plants. The surface of the soil was kept slightly convex, but everything was beneath the level of the rim of the pots, at the edges half an inch or more. They succeeded very well thus, but not so well as when kept well above the rim, and for most kinds that is the best plan. The usual mode of potting is to fill the pot to within an inch or two of the rim with drainage, then place a layer of the potting material, and on that the roots of the plants. I find it a great mistake to bury any surface roots. It is much the better plan to keep these out of the ordinary potting material altogether, and work them in amongst the living sphagnum moss, which forms a top layer. It may be noted as a safe plan to keep any young growths just clear of the compost; if the moss touches the base of the growths that is sufficient. A better root-growth will be made when the young growths are clear of the compost than when they touch it, or, worse still, are covered in some degree with it. I like to make the compost firm. If a plant when being repotted shows signs of being unsteady when moved it should be staked at once. Two stakes put down the sides of the pot opposite to each other is the best way of securing the plant. Of course more stakes may be necessary, and when they are they must be given. Plants put on Fern stems must also be made quite steady. This may either be done by tying with wires, or in the case with strong-bulbed plants by staking with stout galvanised wire. One end of the wire is pushed into the Fern stem, and the pseudo-bulb is tied firmly to the wire.

Time to Repot.—A simple and good rule is to repot when root-action commences, no matter whether that time is spring, summer, or early autumn. If the roots lay hold of the compost as soon as potting is over there is slight danger of anything going wrong if ordinary care is taken. In the case of *Odontoglossum Alexandrae*, plants of which are coming into flower at all seasons, it will be necessary to pot at the different times fresh root-action commences with the various plants. This fact may be pointed out to beginners, that this Orchid and very many others have two periods of root-growth in one season—one when fresh roots are protruded from young growths, and another later, a set of roots being formed about the time the flower spike commences to elongate. The time to repot is when the first set of roots are made. A surfacing of fresh moss is sometimes advantageous at the time of the second root. It is quite possible to repot too often. Small plants doubtless require to be shifted annually—that is, if they require more root room, as most small plants do; but good-sized established plants, so long as they continue in vigorous health, are better without potting. In the case of *Vandas* the old sphagnum requires removing and the drainage washed clean with tepid water, but in doing that there is no occasion to interfere with the roots.

Watering.—This is a matter of very great importance. I find among young men very hazy ideas on the subject. Some of them will water plants until serious mischief is apparent, or, on the other hand, will dry them up, and on scientific principles too. Common sense and experience, however, point out the necessity of watering Orchids much like other plants. If a plant is newly potted it will be safe to err rather in allowing the compost to become overdry than to water too often. On the other hand, a plant well established in a pot, and roots filling every particle of available space, dryness will be just as dangerous. Liquid manure is advantageous to root-bound Orchids.

Insects.—Orchids suffer extremely from these. A *Cattleya Skinneri* and a *Lælia* fell into bad condition with us, and it was only on a close examination that the cause was found to be a minute scale, which, hiding underneath the loose upper skin, had almost killed the plants. Green fly on some young *Odontoglossums* has been very troublesome this year. A simple mode of getting rid of any intruder is to remove it at once with the finger and thumb. I do not know any better means of destroying slugs than to search for them at night and morning and on wet days.

Various Remarks.—Orchids seem to like an early start; a long season of growth, in which term is included the period of ripening, which is, perhaps, of more importance than many think it to be; and a definite period of resting. The matters of air-giving, shading, and damping are questions of locality. With new hothouses our own practice has materially altered. Far less ventilation is required, more shade, and also more moisture, though in that, again, it may be explained that very often damping is only performed in the evening, and never oftener than twice a day.—B.

THE INSECT ENEMIES OF OUR GARDEN CROPS.

No. 6.

NOT a few of our cultivated plants have to endure the visitations of a variety of insects all through their season of growth, so that the gardener has hardly had time to congratulate himself upon the removal of one enemy before he has to be upon his guard against the attacks of another. Thus Peas and Beans, after having their young leaves nipped by beetles of the genus *Sitona*, when they have arrived at full foliage and are coming into flower become the abiding place of swarms of aphides. It is a common remark amongst growers that the Pea suffers from the green fly, and the Bean from the black

kind; but it has been observed in several districts that a largish green species of aphid, the same as the Pea species, or perhaps a near relative to that and to the Rose aphid, occasionally infests Beans. Of all the varieties of Bean the Broad Bean suffers most, and, both in fields and gardens, the plants are during some seasons so severely attacked (should the first appearance of the insects have been unnoticed) that it is needful to pull them up ere they are turned into a festering mass, with scarcely a sound shoot or leaf discoverable. Dry summers are believed to be particularly conducive to the multiplication of the Bean aphid, and to an extent it is the case with all varieties of the fly. Rains, especially if heavy, wash them off the plants, to which many of them cannot afterwards return.

The Bean aphid, *A. Rumicis*, also called the "Collier" or Black Dolphin, often swarms upon the Curled Doek—hence its Latin name—and upon Thistles. As Beans cannot, like other plants or trees that are infested with aphides, furnish a suitable place for the eggs of the species to winter, it is plain these creatures must arrive upon the plants in the early summer. Wingless females of *A. Rumicis* have also been observed clustering upon Furze about April or May; and the foundation of the colonies that try to smother our Beans is laid by winged females, descended from these, I believe, though it may occasionally happen some wingless aphides are carried by the winds and effect the same end. Now and then the plants escape attack until July, only to suffer more severely if left to themselves. When they are in "full play" we see upon the Beans a mixed multitude, made up of the greyish young, the black wingless females, and other females also black, but with yellowish-brown wings. Towards the end of the season there appears a sprinkling of male flies, winged, and slimmer in the body than their female companions.

Since the first indication of an attack of the fly is shown by the drooping of the tops, a good remedy is the prompt cutting-off these, which must be at once destroyed with the insects on them. Later on a dry dressing—say of soot—is sometimes used, but most gardeners prefer to drench the Beans with some one of the numerous solutions recommended and approved for killing aphides. Miss Ormerod advises the application of a little liquid manure wherever an irruption of the "Collier" is imminent, because strong-growing Beans suffer much less from them than stunted feeble plants. One of the correspondents of the Journal advocates mixed cropping in fields, as is often done in gardens, his experience being that when Beans and Peas are drilled together, if one plant is attacked by the fly the other generally escapes.

With the Pea it is seldom of advantage to cut away the tops, although in this case, as in that of the Bean, the aphides quarter themselves amongst these at first; and if it happens to be just at the period of flowering, neither syringing nor any other method can be relied upon to save the crop. What one might designate the middle-flowering Peas receive most damage from the fly. Early kinds may in a good season have advanced beyond this stage before the aphides arrive, and late kinds have been noticed to be seldom affected. Several species of "green fly" may visit the Pea, that which is believed to be its particular foe is *A. ulmaria*, the "Green Dolphin" of some, which to the unassisted eye looks similar to those attacking the Rose or Hop, and in habit is kindred to them. Some have recommended the application of quassia water to Peas troubled by this "fly," but others prefer compounds of soft soap and tobacco. Whatever applications are selected it is inevitable that they should kill both our friends and foes. This cannot be helped, but all encouragement possible should be given to the various insects which make aphides their prey. Our Peas in the summer months will be found to have "ladybirds upon them. These insects, the *Coecinellæ*, are great devourers of "flies," firstly while they are in the grub or larval state, and then as mature beetles. About May *Hemerobius perla*, a pretty fly, with golden green eyes and netted wings, settles upon the Peas to deposit its eggs, and the larvæ subsequently hatched help to thin out the aphides. Many of the "Colliers," or black flies upon Beans, may be seen to have a tiny hole in their bodies; from these has emerged a small ichneumon fly, which makes their plump carcasses the abiding place of its eggs, and the maggot dwells within until ready to appear as a winged insect.

In addition to those beetles of the genus *Bruchus* that destroy Peas while in the pod, the plant is liable to the attacks of the caterpillar of a small moth which has been called the Pea Moth, or *Grapholitha pisana*. The expansion of the wings is about half an inch; these are shiny, of a greyish brown, with white streaks along the upper edge, and near the hind margin of the fore wings is a silvery ring enclosing some black lines. When full fed the maggots quit the pods and descend to the earth, upon which, or just beneath, they form silken cocoons, from which the moths issue in June, perhaps earlier if the season is forward. Some continental entomologists have watched these moths in the act of egg-laying. They enter upon this work after sunset, one to three eggs being put upon each young pod visited by the moths. A portion of them might be easily captured by a small gauze net used with a lantern; and it has been suggested that

the Peas might be sprinkled with an insect-deterrent, dry or wet, so as to repel the moths just at the time when they are led by instinct to the deposition of eggs upon the Pea bloom. The maggot, which we not unfrequently eat without intention, is rather stout, slightly hairy; head brown or black, and body yellowish, having a few brown dots. I fancy this species seldom visits field Peas, in most districts seeming to prefer those under cultivation within gardens, where, the crop being gathered green, excepting the pods left for seed, only a few of the caterpillars can live to become moths. Turning up the soil well during winter brings to the surface many of the grubs, and it is probable they will then be eaten by birds. Of course to sow the crop each year on new ground is advantageous, because the moths that may emerge will not have the Peas handy to them.

Although we propose to give the full history of the troublesome grub of the *Tipulæ* in connection with other plants, it may be fittingly mentioned here that they will sometimes seriously injure Peas and Beans. As a specimen of what they can do I note that in November, 1879, a gentleman resident at Maldon, Essex, sowed about twenty acres of Peas for early podding, which went on very well till April. In that month a number were killed and all weakened by a severe visitation of a *Tipula*, presumably *T. olivacea*. The grubs gnawed round the young stem just below the surface, four often occurring at a single plant. And to add one more foe, both vegetables are liable to be attacked by millipedes in autumn or spring, which eat the seeds while they are germinating.—ENTOMOLOGIST.

THE CHRYSANTHEMUM.

[A paper read before the Sheffield Floral and Horticultural Society, June 6th, 1883, by Mr. J. Udale, gardener to J. Watson, Esq., Shirecliffe Hall, Sheffield.]

(Concluded from page 101.)

SPECIMEN BLOOMS.

THE plants to produce these should be potted in the same way as detailed for specimen plants; but they should not be pinched more than once, after which they should be encouraged to make solid and sturdy growth, leaving as many shoots as the number of blooms required. Some varieties can only develop two or three first-class blooms: others may be able to bring four, five, or six to perfection. Therefore in this matter it is not possible, nor would it be judicious, to lay down a hard-and-fast rule, so much does it depend upon the varieties and the strength of the individual plants; but a safe average is from three to five, although I have occasionally cut good exhibition blooms from plants carrying considerably more than that number.

Assuming, then, that the plants have been potted as required and placed out of doors at the end of May, they will make rapid progress through the months of June and July, when we arrive at the critical time of bud-formation. Some varieties will produce buds about the end of July; but these as a rule are worthless, and when attended by a ligulate leaf are termed "strap" buds. Occasionally a first-class flower is obtained, but it is the safest plan to allow the three shoots at its base to grow, and these will produce well-formed flowers. It is a good plan to stop them or shorten them back in the month of June, provided they have not been pinched previously. As soon as the centre bud is well formed those around it should be carefully removed, along with all incipient and lateral growths, so that the whole strength of the plant may be concentrated in developing and perfecting the buds that remain. Watering must be carefully attended to and liquid manure administered three or four times a week. Look carefully after caterpillars, aphides, and leaf-borers, or the season's labour will be partly or entirely lost. Nor must vigilance be relaxed after the plants are placed in their winter quarters at the beginning of October. A light and well-ventilated structure heated by hot water is the best place for them, with a temperature between 40° and 50°, the flowers being brighter and the petals finer if expanded in a warm and buoyant atmosphere. Should it be necessary to cut flowers that are required for exhibition some time previously, they may be kept in a dark cellar until required. They keep very well for six or seven days.

PLANTING OUT.

This effects a great saving of time and labour, and where extra fine blooms and specimen plants are not required it may be practised with advantage. In such cases it is a good plan to excavate trenches, as for late Celery, fork in some well-decayed manure, then spread 2 or 3 inches of the surface soil on the top. Plant the Chrysanthemums about 20 inches apart and give them a thorough watering. An occasional drenching in hot dry weather is all the watering they will require. The points of the shoots should be pinched out to keep them bushy, as in the case of those grown in pots. Ten days or a fortnight before it is desired to lift them for placing into pots or boxes it is advisable to run a sharp spade down each side of the plants at distances from the stem according to the size of the pots, &c. They will then bear transplanting with a smaller sacrifice of foliage. A dewing with the syringe or watering pot several times a day will be beneficial until the roots have taken to the new soil, after which time it may be discontinued. Useful plants and cut flowers may be grown in this way with little trouble, and should cut flowers only be required valuable space may be saved by planting them moderately closely together in deep brick pits, such as are sometimes used for Pine-growing.

INSECTS.

Chrysanthemums are frequently infested by aphides, caterpillars, and leaf-mining insects, which latter is the pupæ of a fly called *Phytomyza nigricornis*. This little pest eats the interior green portion of the leaves, thus not only disfiguring but actually eating away the very life of the plant. This insect in embryo should be carefully watched for and crushed between finger and thumb; but should it get a firm foothold before it is observed

the safest and most certain cure is to remove the infested leaves and burn them.

Caterpillars can only be kept in check by careful hand-picking. The large green-and-yellow ones quickly denude a shoot of its most healthy foliage, and are very partial to a fine plump exhibition bloom when expanding, completely disfiguring it in a night. The small brown caterpillar, if not equally voracious, is certainly quite as injurious—getting into the points of the shoots as soon as the buds are formed, and either destroying them entirely or taking a portion of the bud, and so spoiling the whole. Tobacco powder is distasteful to them, but I have not observed that it has killed them, and the only effective remedy I have yet found is to catch them by hand. Green fly is more easily dealt with, and may be kept entirely in check when the plants are under glass by means of fumigation, but when they are out of doors other preventives and remedies must be used. Frequent syringings with soapsuds is very beneficial, and soft soap dissolved in rain water at the rate of 2 ozs. to the gallon will effectually destroy them. Tobacco powder is an efficient remedy when the former is not practicable. This should be applied to the parts infested whilst the shoots are wet, so that it may adhere more readily.

MILDEW.

This is very troublesome at times, and in bad cases almost deprives the plants of foliage, and as it spreads very rapidly under certain atmospheric conditions flowers of sulphur should be applied on its first appearance; but as it is invariably developed on the under side of the leaves there is some difficulty in applying the sulphur in its dry form. Therefore a weak solution of soft soap and sulphur is recommended, which may be applied by means of the syringe. If only a few leaves are affected it may be entirely destroyed by sponging them with the soap-and-sulphur solution. Sulphur dusted on the hot-water pipes after the Chrysanthemums are housed is of great service in preventing mildew or holding it in check, but it should not be allowed to remain on the pipes (if they are likely to become very much heated) till the flowers expand, or their colour is liable to be affected.

VARIETIES.

The best thirty-six varieties of Chrysanthemums for exhibition as cut blooms, arranged alphabetically, are Angelina, Alfred Salter, Barbara, Beverley, Bronze Jardin des Plantes, Beauty, Cherub, Emily Dale, Empress of India, Golden Empress of India, Golden Queen of England, Hero of Stoke Newington, Inner Temple, Isabella Bott, Jardin des Plantes, John Salter, Le Grand, Lady Harding, Lord Wolseley, Mr. Bunn, Mr. Brunlees, Mr. Corbay, Mr. George Glenny, Mrs. Dixon, Mrs. G. Rundle, Mrs. Heale, Nil Desperandum, Novelty, Prince Alfred, Prince of Wales, Princess Beatrice, Princess of Wales, Princess Teck, Refulgence, Venus, and White Venus.

Twenty-four good Japanese are Agrément de la Nature, Bismarck, Bouquet Fait, Baronne de Prailly, Bronze Dragon, Comte de Germany, Curiosity, Comtesse de Beauregard, Dr. Masters, Elaine, Ethel, Fair Maid of Guernsey, Fulgore, Garnet, Gloire de Toulouse, James Salter, La Charmeuse, Lady Selborne, La Nympe, Madame Andignier, Magnum Bonum, Mons. Ardene, Peter the Great, and The Cossack.

Eighteen good Pompons are Aigle d'Or, Brunette, Champs Elysees, Ernest Benary, Cedo Nulli, Lilac Cedo Nulli, Madame de Vetry, Mdle. Marthe, Marabout, Pablo, Polycarp, Princess Mathilde, Proserpine, Rose Trevenna, St. Justia, St. Michael, Salomon, and Snowdrop.

Twelve good Anemone-flowered are Bijou, Fair Margaret, Fleur de Marie, Georges Sands, Gluck, Lady Margaret, L'Africaine, Miss Eyre, Mrs. Pethers, Prince of Anemones, Princess Louise, Princess Marguerite, and Virginal.

The foregoing lists may be considerably lengthened or altered according to tastes and opinions. I have only made a selection. I have not attempted to name all the varieties enumerated or said to be good in catalogues, but have mentioned such varieties as I know to be of sterling merit. Much more might be written and said upon the genus Chrysanthemum, as the subject is a comprehensive one, and I have endeavoured to cover as great an area as would be consistent with a general review and history of some of the species. In conclusion I may say that, as in most other things, there is no royal road to the successful culture of the Chrysanthemum; but there are at least three things essential—First, a liking for the flower; second, an object aimed at; and, third, steadfast purpose to attain it. Given those three things, a fourth point—viz., attention to details, will follow in natural sequence.

KITCHEN GARDEN.

Lifting Potatoes.—Second early and midseason Potatoes are now full grown and fast gaining maturity, and lifting them from the ground should be no longer delayed. So far we have been remarkably free from disease, and the crop is much above an average one in quantity and quality. Much, however, depends on how they are harvested, and this should have the best of attention. No greater mistake could be made than lifting the tubers when the soil is pasty and wet, as they do not come out of it clean when in this condition, and they are a long time in drying, which is all against their long and successful keeping. We always allow at least two fine days to occur before attempting to lift any quantity of them, and then the soil falls away from them and leaves them clean and dry. They should be taken up in the early part of the day, and should be allowed to remain on the ground until the evening,

when they may be placed under cover. It is in collecting them from the ground that they can be most easily sorted into their sizes, and this we always do by selecting the large tubers first and housing them for eating, then the second-sized tubers are collected for seed, and the very small tubers are gathered for pig-feeding. A dark airy shed is the best place in which to store the largest tubers, and the seed Potatoes may be kept anywhere, as light does them no harm, but the "greening" process to which many are subjected is treatment we do not approve of to any extent. This consists in allowing the seed tubers to remain out in the open and on the ground until they are quite green or almost black, and then they are thought to be hardier for wintering and planting again; we have known great quantities of fine Potatoes spoiled through doing this, as strong sunshine blisters and softens them, and then they will not keep.

Autumn Turnips.—These are now growing fast, and they must have timely attention in thinning. From the time the first four rough leaves are formed they should never touch each other. Our latest batch has just been thinned to 3 inches apart; in a week or so they will be thinned again to 6 inches, and finally to 1 foot apart, and after each thinning the hoe should be run between the rows.

Winter Radishes.—A large patch of these should now be sown. The best variety for winter use is the China Rose. We always have this variety in fine condition from October until April, and we do not grow any other. The seed may be sown after any Potato, Pea, Bean or other crop. The rows should be 1 foot apart. Sow thinly, and thin out the plants when large enough to 3 inches apart.

Runner Beans.—These are now in full bearing, and where the produce exceeds the demand the pods should be gathered when about half grown and salted in jars for the winter. We annually about this time preserve some bushels of them, and find them most acceptable during the winter. The process of salting is quite simple, and is done by placing layer after layer of the Beans or pods in the earthenware jars with a little salt on each layer until the jar is full, when it is corked and made airtight.

Endive and Lettuce.—More seed of those may be sown, and any plants large enough for handling should be planted in their bearing quarters. As they may have some backward weather to contend with in late autumn and winter their position should be a sunny one, such as that afforded on a south border. The rows should be 1 foot or so apart, and the plants 8 or 10 inches asunder.

Celery.—Many of these plants require earthing up, and for the next month or more the best of attention must be paid to the crop. Good Celery is always appreciated in winter, and no labour should be spared which will produce it. The best plants can easily be spoiled through careless or negligent earthing, the main point being to prevent the slightest particle of the soil from finding its way into the centre of the plants. This, however, will seldom occur if one person holds the plants while another banks up the soil; or a piece of matting tied firmly round each until earthing is finished answers the same purpose.

FRUIT-FORCING.

FIGS.—Early-forced Trees in Pots.—When these have been cleared of the second crop of fruit the foliage should be thoroughly cleansed from red spider and dust by the free use of the garden engine. A soaking of tepid liquid manure may be given to the roots, and if the roots at the surface become exposed a little short manure may be laid on them as protection. After destroying all insects, which must be effected, if necessary, by the use of an insecticide, a rather dry warm atmosphere with free ventilation is best calculated to effect the complete maturation of the wood intended to produce fruit next season. Fig trees in this stage are benefited by a reasonable amount of heat, and with this the young shoots may be allowed to make growth whilst the glass is over the trees, but when the foliage shows signs of going to rest the roof lights should be removed.

Planted-out Trees.—Where Fig trees are planted out for filling large houses the roots should be restricted and the borders thoroughly drained. Surface or stem roots should be encouraged by surface mulching, as the best results are obtained when the trees root into rough moist calcareous matter, as that of old wall rubbish kept well supplied with liquid manure through the growing season; but though the Fig is a gross feeder and will take large supplies of water, a water-logged sour soil is even more fatal to the crop than the want of water, as in the latter case the roots may be abundant in materials that are not very dry.

STRAWBERRIES IN POTS.—All plants that are potted and are growing fast must be well supplied with water, keeping them free from runners and weeds, and the plants should be thinned out if they are at all crowded, it being important to accord the foliage room for development with full exposure to light and air, and do not change the position of the plants, but keep the same side to the sun throughout the season. If worms are troublesome dislodge them with lime water, free the drainage if it has become clogged, and stand the pots on slates or boards.

Unpotted Plants.—From observations extending over many years we have invariably found the plants that are moved into their fruiting pots early in August are the best fruiters, doing better than those transferred to those pots a fortnight or three weeks earlier, as, from making and ripening an early growth, they are often influenced by a warm and moist autumn to start into second growth, which, if not fatal to a good show of fruit after being introduced to heat, is more or less wasteful of the energies of the plant and disastrous to the ensuing crop. All plants should be transferred to their fruiting pots with as little further delay as possible, but any weakly plants should be left attached to the

parents until they are well rooted, when they should be potted, and every possible encouragement given them. In potting, the size of the pots should be proportioned to the condition of the plants, strong plants requiring more root space than those that are only moderately vigorous.

Autumn Fruiterers.—Plants that have been retained for autumn fruiting should be taken to a warm sheltered situation, encouraging a fruiting condition as the requirements demand. Any that have the fruit set and swelling should be encouraged with liquid manure, and when the fruit gives indications of colouring it will be greatly improved in flavour if the plants can be accommodated in a light airy position in a cool house, being careful to exclude birds by netting over the apertures. Later batches of plants should be still kept in cool quarters, so as to continue the succession, transferring them at intervals to warm sheltered situations preparatory to accommodating them under glass when the cold autumn rains set in.

PLANT HOUSES.

Roman Hyacinths.—Where these are appreciated as early in the season as it is possible to obtain them, no time should be lost in having a number potted. For purposes of decoration five bulbs placed in 5-inch pots are the most useful for the majority of purposes. In addition to these, where baskets and vases of various shapes have to be filled with plants, it is a good plan to place a number thickly together in pans or boxes, and then lift them out as they are required. The pots should not be overcrooked for these bulbs, one fair-sized piece placed at the bottom being ample. The soil should be light yet rich, and nothing being better than a mixture of old potting soil, good loam, leaf soil, and a little coarse sand. In potting place a little dry cow manure over the crocks, and just leave the top of the bulbs above the soil. After potting place them outside and cover them with 3 or 4 inches of ashes.

For succession pot another batch in about three weeks, and in a few weeks afterwards the main stock can be potted. These, after they are taken out of the ashes, can be forwarded or retarded at will. The last batch should be potted late in October, and will be found most valuable, as no Hyacinths are so useful to supply flowers for cutting.

Large-flowering Hyacinths for Early Forcing.—Two of the earliest are La Tour d'Auvergne, double white, and Homerus, single red. The former is about three days earlier than the latter, and is one of the most valuable that can be grown. It produces a good spike and large double pure white bells, which are useful for bouquet and buttonholes. The last-named is only valuable on account of its earliness and of the useful side shoots, which are generally and freely produced. For general purposes it is not one of the best, because its colour fades very soon after the flowers are fully expanded. There is no difficulty in having these two Hyacinths in full bloom before Christmas without hard forcing if the bulbs are obtained as early as possible. The remarks given about potting Roman Hyacinths apply with equal force to these.

Narcissi.—Where these are appreciated pot them without delay, placing five or six bulbs into a 6-inch pot, and treat them as advised for Hyacinths. Paper White and double Roman are both very useful for early flowering, and will with little trouble yield abundance of flowers. The single flowers are valuable when wired for bouquets. It is generally believed that the Paper White is the earliest of all Narcissus, but the double Roman is fully ten days earlier. These can be succeeded by States General and Newton, the best of the yellows, and then Grand Monarque and Grand Primo will follow.

Early Single Tulips.—Where these are in demand as early as they can be produced they should be potted as soon as they can be obtained, which is in most instances towards the end of this month. The varieties of Duc Van Thol are the earliest, and the scarlet one is much superior to any other; it is sweet, a good flower, and the earliest of all. A few of the yellow and white may be potted for early forcing, but they are poor in comparison with the scarlet. Canary Bird, yellow, and White Pottebakker are two of the best that can be grown to succeed the few yellow and white Duc Van Thols used for early forcing. The flowers of the two last named are grand for bouquets when about half expanded. Four bulbs of these should be placed in a 4-inch pot when used for early work. A good plan, and by far the most preferable where these are required for decorative purposes in dwelling rooms, is to place the bulbs in pans or boxes and then lift them when forced into flower, and make up pots according to the size required. Early in the season these bulbs often flower irregularly, and it is difficult to obtain creditable pots of Tulips without this system is adopted. It should not be carried out when the season has fairly well advanced.

Lilium candidum.—This is the most useful and beautiful of all Lilies for cultivation in pots to flower in the spring. A good batch should now be obtained and placed in 6-inch pots without delay. Good loam, a seventh of manure, and sand will suit them well. After potting stand them outside, and in a very short time they will commence producing foliage and roots. They can stand outside until the approach of cold nights, when they should have a temperature of 45° to 50° at night.

THE FLOWER GARDEN AND PLEASURE GROUND.

Sowing Annuals for Flowering in Spring.—There are several kinds of hardy annuals available for growing in the flower garden in spring, and which, grouped in conjunction with a few perennials, are really more pleasing than the summer occupants of the beds. The time for sowing depends upon the position, some gardens being fully a fortnight earlier than others in the same locality. As a rule sowing is deferred too long, and the seedlings resulting are not sufficiently strong to stand through a severe winter. The first to be sown are the white and rose forms of *Silene pendula compacta*, which in late districts or

gardens ought already to be growing. Those, therefore, who have not sown ought to sow in handlights or boxes and cover with glass, taking care to harden and prick out before the seedlings become drawn and weakly. *Eschscholtzia* in variety should be similarly treated, or they will be too late to be serviceable. About the middle of this month sow *Saponaria calabrica* and the white variety, also the white, crimson, and purple Candytufts, *Gypsophila elegans*, and *Alyssum maritimum*. At the end of this month Venus's Looking-glass, *Nemophila insignis*, *Limnanthes Douglassii*, *Lasthenia californica*, *Collinsia bicolor*, *Calandrinia speciosa* and *umbellata* should also be sown. A light soil is necessary, and an open yet sheltered spot should be selected. Sow thinly in shallow drills drawn about 10 inches apart. To check the ravages of slugs dust the plants with soot and slaked lime when the dew is on them.

Sweet Williams, Wallflowers, and Myosotis.—Seedlings and rooted cuttings of these should be pricked off or hedged out before they become crowded. All are serviceable and effective when grown on sheltered borders, more especially for providing flowers for cutting, and in these positions they are much more hardy than when disposed in the flower beds. A light rich soil best suits them, and they may be pricked out in rows 6 inches apart and about 6 inches asunder, every other row and every other plant in the reserved rows being eventually lifted with a trowel and replanted in the flower garden.

East Lothian and Brompton Stocks and double German Wallflowers may be pricked out in a manner similar to the preceding. In the case of the former, half of the stock may well be potted during September, or planted out in frames or warm well-drained borders to flower during the winter. None of them will succeed in cold badly drained positions. Seedlings of any kind when first pricked out are liable to be damaged during bright sunshine, and should be lightly shaded with branches of trees or evergreens, and watered occasionally during the evenings till established.

Newly planted Trees and Shrubs.—Many of those transplanted during the winter and spring months with small balls of soil attached must still be closely examined, as if dry the trees will make no progress and may yet die. If the old soil prove dry remove that near the stem so as to form a basin, then pierce the ball with a sharp iron rod, and repeatedly soak with pond water if available. Shrubs, more especially Rhododendrons and Belgian Azaleas, that have been transplanted from a peaty soil to a site in which loam prevails, are particularly liable to perish before becoming established. Any of these presenting a sickly yellow appearance should be examined, and if the soil around the roots prove very dry lift and soak them in a tub of water, and replant as firmly as possible in a compost consisting principally of either peat or good leaf soil. On the other hand, if sickly owing to the old soil being too wet and sour, it is advisable to nearly free the roots of this and replant in good gritty and peaty compost.

THE BEE-KEEPER.

HIVE-CONSTRUCTION, HONEY-PRODUCING, AND PRACTICAL MANAGEMENT OF BEES.—No. 1.

IN penning a few notes on each of the above subjects the writer is aware that he enters on debatable ground, and that what new light he may be able to let in will be taken for exactly what it is worth and no more. This is as it should be; so while endeavouring to add to the knowledge sought after by all earnest bee-keepers, it is desirable to bear in mind a few important facts in considering the construction of a bar-frame hive.

First, then, it is impossible for anyone, be his experience ever so great, to design a hive that will be equally well suited to all the various conditions under which it may be worked. Locality, pasture and season, as well as the capacity of the apiarian, his system of management, and his opportunities of carrying that system out, all exercise such an influence over final results that to attempt to lay down a fixed rule is simply impossible. It will be acknowledged that of late years a wonderful impetus has been given to the art of bee-keeping, and the various associations established throughout the country have done excellent work in spreading abroad information on the subject. So general has been the interest taken in the work of these associations, and so rapidly the knowledge acquired, that most of the feats of Wildman and others in the olden time, which were then considered little short of miracles, can now be performed by numerous experts, while the manipulating tents at the various shows have probably done more than anything else in arousing a desire for apiarian knowledge among those who have witnessed the ease with which bees can be handled by the skilled bee-master.

The first exhibition at which the manipulation of living bees was made a special feature was that held at the Crystal Palace in 1874, and we well remember the surprise with which the operations were watched by a crowd of astonished spectators.

We had kept bees for some years prior to this, and had driven hives in the usual way, but to see the bee-master unprotected by either veil or gloves, drive his bees and watch them ascend, capturing the queen, tossing them about with his naked hands like so many peas, and apparently able to do as he pleased with them, was a new revelation to us in bee-management. Now, however, we suppose there is hardly an association in the country which does not number among its members several who can do the same thing with the greatest ease. Hive-making soon became quite an important industry. Manufacturers increased rapidly, and the fact that many makers were not practical bee-keepers themselves had the effect of placing some ill-constructed and almost unmanageable hives on the market. Later on, as bee exhibitions received more encouragement from horticultural and agricultural societies, prizes were offered for hives, &c., and the competition became very keen. The amateur bee-keeper, with more zeal than knowledge, entered the lists as a competitor, and designed hives in his study or workshop, some of them "fearfully and wonderfully made," but nearly useless in practical operation. Strange to say, hives of this description have not seldom been awarded prizes to the exclusion of really good and useful ones, made by men who are accustomed to work among bees regularly, and who should be supposed to know what is required. The evil did not end here, for in some instances men of great experience as apiarists, who were bee-dealers and hive-makers, but from the very nature of their business could not be honey-producers, actually made and sold hives which were most defective from the honey-producer's point of view.

Bee-dealing may be, and most probably is, the most profitable branch of apiculture, especially when combined with the manufacture and sale of hives and appliances. On no other ground can we explain the fact that nearly all our most prominent apiarists, who make a business of it, end by becoming bee-dealers and not honey-producers; while many who manufacture and sell hives have never been either one or the other.

Now we take it that the great object of bee-keeping is, or ought to be, the production of honey in the greatest quantity and in the most saleable form, and all we have to say on the subject will be from the honey-producer's point of view. We should give up bee-keeping altogether if success in the pursuit necessitated our giving up the pleasure of honey-harvesting. At the same time we hold a very decided opinion that bee farming for the production of honey in the United Kingdom will not pay him who depends on it entirely for a means of livelihood. Newly-fledged bee-keepers (they are invariably novices) who become enthusiastic, and fancy they have discovered a mine of wealth after a good season with a profit of £3 or £4 from a single hive, generally become wiser men after the experience of a few years. They find out that our climate cannot be depended on; that our honey season is too soon over; and that the weather in June and July, upon which everything depends, is so unreliable. In short, they find their best-laid schemes "gang aft aglee," and that a very delightful pursuit, as bee-keeping undoubtedly is, may become a delusion and a snare if depended on as a sole means of subsistence.

Having relieved our mind of this conviction, let us say how strongly we are convinced that intelligent working men, whose occupations lead them to reside in suitable localities, will before long find out that they may make the keeping of a few stocks of bees very profitable in some seasons. While gardeners are rapidly acquiring a knowledge of apiculture, these latter possess unusual facilities for bee-keeping, and have a ready market for their honey if it is produced in a form fit for their employer's table. The great bulk of bee-keepers, so far as our experience goes, who keep bees on modern principles, consist of the upper middle classes, whose means and tastes lead them to welcome anything which will add to the pleasures of their gardens, and yet who are sufficiently utilitarian to hope for a balance on the right side of their bee account. We comparatively seldom see one of these bee-keepers who is not ready to welcome any improvement either in hives or appliances. He visits shows, and as his experience is generally somewhat limited he allows the hive-maker to guide him in selecting the best. He is shown one which works like clockwork—on the show bench, and purchases it, only to find a vast difference when the hive is peopled with bees and encumbered with all the accompaniments of a stocked hive. He becomes nervous, gets stung, and the thing is voted a nuisance. There is hardly a pursuit in which the avoidance of hitches in manipulating is more necessary than bee-keeping. The comfort of working with hives and appliances of the right kind is beyond expression, while the annoyance, indeed the disastrous results which sometimes occur through inexperience coupled with faulty materials, are not pleasant to think of.

This brings us to consider how a hive should be constructed so as to be of the most practical use to the ordinary bee-keeper. By the latter term we mean nine out of every ten who keep bees. It is well known that the greatest divergence of opinion exists even among high authorities on the subject. One ignores the use of distance guides of any kind, preferring to space frames with his fingers; another advocates the use of close-ended frames of the Giotto type instead of the ordinary open-ended ones; a third prefers the Stewarton hive to any of a later type; a fourth goes in for the most elaborate and costly article; while a fifth makes simplicity and cheapness desideratum, a sixth thinks that nothing can compare with straw skeps, &c. Of course there may be much to say in favour of each one's opinion, but we think the greatest weight should be attached to those emanating from honey-producers, because honey is after all the object every bee-keeper has in view.—W. B. C., *Higher Bebington, Cheshire.*

TRADE CATALOGUES RECEIVED.

Louis Van Houtte, Ghent, Belgium.—*Catalogue of Bulbs and other Flower Roots.*

Wm. Paul & Son, Waltham Cross.—*Catalogue of Bulbs.*

Dickson, Brown, & Tait, 43 and 45, Corporation Street, Manchester.—*Catalogue of Bulbs.*

Dickson & Robinson, 12, Old Millgate, Manchester.—*Catalogue of Hyacinths and other Bulbous Roots.*

Edmond Van Coppennolle, Meirelbeke-lez-Gand, Belgium.—*General Catalogue of Plants.*

TO CORRESPONDENTS

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (J. W. A.).—Ville's work on artificial manures is published by Messrs. Longmans, Green & Co., and can be obtained through a bookseller. Its price is, we think, about half a guinea, but we have not seen it advertised.

Transplanting Evergreens (H. W. M.).—All the kinds you name grow well, when the work of removal and replanting is properly done, towards the end of October or early in November. They may be transplanted early in October if the weather is dull and showery.

Indian Muslin for Shading (J. M. C.).—Judging from samples we have seen, we have no doubt this material would be suitable for shading greenhouses, as it would subdue the rays of the sun without seriously obstructing the light. We scarcely know what you mean by "draperies." You had better procure samples of the muslin, and you will then be able to judge for yourself as to the suitability for that purpose, which we apprehend is very much a question of taste.

Mildew on Rose (H. E. B.).—Your Maréchal Niel is infested with mildew, and, if you do not destroy it, it will kill the plant. We never saw a worse example than in the spray before us. You will find the method to adopt described in answer to another correspondent. See that the roots are well supplied with water, and probably liquid manure would be of service; but on this point we cannot advise, as you have not stated any particulars about the plant, not even indicating whether it is in a pot or planted out.

Rose Exhibitors' Text-book (J. E. H.).—This is a designation that has been applied to the catalogue of Roses issued by the National Rose Society, and is sold by the Secretaries of that Society. We do not know of any horticultural society in the vicinity of Child's Hill or Hampstead, except the Highgate Society, with which you are acquainted. Still, we do not assert that there are no other local societies in the district referred to.

Potato Tubers on Stems (G. M.).—We have frequently observed similar productions to that you send, and they can only be regarded as malformations. The tuber itself when under ground is simply an enlarged stem, which serves as a storehouse for nutriment to perpetuate the plant another year, and possibly these axillary tubers might be used in the same way.

Black Hamburgh Grapes (H. S.).—Your bunches are scarcely of the average size. Mr. Barron, in his "Vines and Vine Culture," gives the

average weight of the bunches from 1 lb. to 2 lbs., and the berries from 1 inch to 1½ inch in diameter. The crop you describe is not too heavy, or the fruit would not have finished so well. We like to see the best bunches at the bottom of the Vines, and we are glad to hear of your success with Madresfield Court.

Twin Vine Leaves (*Birkenhead*).—The leaves sent show a case of duplication or multiplication of organs similar to what occurs when the stamens of flowers are increased above their normal numbers, or when the petals become so numerous as to constitute a double or semi-double flower. Such cases are common under cultivation, and it appears as if the richer and more abundant food provided for plants artificially induces these malformations or departures from the natural growth; as a check to the growth is often followed by deformed productions, the sap being forced to take a different course.

Growth of Young Vines (*Cauld Kale*).—Assuming the canes are short-jointed and have prominent buds in the axils of the leaves you may consider them of average quality. They will still improve, and if you ripen the wood well each Vine may safely be allowed to carry one bunch of Grapes next year. The canes we should shorten to within 3 feet of the base of the rafter as soon as the leaves have fallen in the autumn. Heat and air, with only sufficient atmospheric moisture for keeping the foliage fresh and healthy, are the chief essentials for ripening the wood.

Double Poppies (*J. D.*).—The flowers you sent are fine examples of what are frequently termed double French Poppies, but yours are much fuller, more compact, and of better colour than is usual. The garden races of Poppies have been raised by crossing several species, but the two chief are *P. bracteatum* and *P. somniferum*. Crosses have also been obtained between *P. bracteatum* and *P. Rhæas*, between *P. orientale* and *P. somniferum*, and between *P. bracteatum* and *P. orientale*. They are readily increased from seed, and soon produce double flowers under cultivation. The Golden Elder flowers as freely as the common form when it reaches a moderate size, bushes of 3 or 4 feet high being frequently covered with bloom.

Black "Rust" on Myrtle (*F. R.*).—The condition of your plants is the result of insects. The scale insect probably is established on the under sides of the leaves and on the stems, and until you destroy them the plants will never be clean. Sponging such small leaves is a tedious process, and they may be cleansed with a solution of soft soap and paraffin made and applied as described in a reply to another correspondent under the head of "Orange Fungus on Roses." But you must follow the instructions with exactitude, both as regards mixing the solution, preventing it saturating the roots, and shading the plants afterwards. You may possibly have to repeat the syringings, using pure water forcibly half an hour after each application of the insecticide. In using this a syringe should be forced alternately in the vessel and on the plants, to insure as far as possible the mixing of the oil with the soapy water, the former having a natural tendency to float on the surface.

Rose La France (*Idem*).—There is no reason whatever for supposing this excellent Rose is "dying out." We have them equally fine on standard Briar stocks and as dwarfs from cuttings; but they do not thrive so well in a cold heavy soil as in ground of medium texture, yet fertile. Perhaps your Roses are young and not yet established. In such a case a mistake is often made in allowing them to bear too many blooms. If they are not young, then copious applications of liquid manure would probably be advantageous.

Mushrooms in Vinery—Potash for Vines (*Torbay*).—You have misread the paragraph. It is not stated the 800 lbs. were grown in a vinery "without manure." They were grown in beds of manure made as described in Mr. Wright's treatise. Mushrooms cannot be grown in beds without the aid of some fermenting medium. They are grown at Sheffield successfully in the German moss litter after it has been used in stables, and we know of a very able gardener who intends mixing wood shavings with manure for producing the crops. Tree leaves are also suitable for the same purpose—that is, mixing with manure from stables. "Potash in the form of kainit" is very suitable for Vines needing the assistance of the manure indicated. About half an ounce to each square yard of border is a sufficient dressing.

Pansies Injured by Insects (*J. H. H.*).—The Pansies and other plants you mention have been attacked by one of the centipedes (*Geophilus electricus*) in an immature condition. Although they feed upon animal substances they are apt to infest the roots of many species, especially after a mild or damp winter and spring. Some have recommended trapping them by laying on the soil, or just beneath its surface, partly decayed apples or potatoes, into which the insects will burrow numerously. Others have advised watering the plants with clear lime water, or under some circumstances sprinkling soot upon the soil, but they will frequently defy these remedies. More efficacious is a mixture of a fluid ounce of paraffin in 3 gallons of water, thoroughly agitated. This, however, must be cautiously used, first trying it on a few plants of little or no value, and if it does not injure them it can be applied to the others. You will find the particulars you require of the cultivation of Pansies in beds and pots in our manual on "Florists' Flowers," which you can have post free in return for 4½d. in stamps sent to the publisher.

Strawberries for Market (*A Dublin Subscriber*).—We doubt if there is a better early market variety than Vicomtesse Hericart de Thury, which is grown in Kent under the name of Garibaldi. We believe, however, that the most profitable variety this year in Kent was Sir Joseph Paxton, which is undoubtedly a valuable Strawberry. President is very good on some soils. You had better try all these varieties and prove which is the best adapted for your soil and district. For late use Eleanor is grown rather extensively in Kent; the fruits are very large, but the variety is not so prolific as some others. Dr. Hogg is one of the finest-flavoured Strawberries grown, and produces large fruits. In some soils it bears good crops, in others it is not so productive, and generally speaking it is not nearly so prolific as the three varieties first mentioned, but is indispensable in gardens where it will flourish. It is later than President, and just precedes Eleanor, Elton, and Frogmore Late Pine in ripening.

Vine Roots too Deep (*J. T. S.*).—It was rather a strange oversight your covering the roots so deeply. They are too deep by half, but this

alone does not account for the state of the foliage. You have, we suspect been using the syringe too freely and keeping the house too moist; then on some particular morning have not opened the ventilators soon enough then opened them too widely at once, as if to atone for the previous delay. This would cause sudden and extreme evaporation, and leave the foliage as if rusted and browned, especially near the edges of the leaves. Generally you appear to exercise care in ventilation, and your mode of procedure is sound; still we feel convinced there has been a mistake of the nature indicated. The temperatures are right. Unless there are signs of red spider one syringing a day will be ample; this should be very early in the afternoon, as soon as the house can be safely closed, and so that the Vines become dry before night. This is more than we do, our Vines not needing syringing oftener than once a week for keeping the foliage clean, as we provide sufficient moisture in the atmosphere for keeping it healthy.

Flue for Melon House (*J. T. S.*).—We think your plan of conducting the flue will answer provided there are no sharp angles in it. All the turns must be smooth and rounded, as every jutting corner will be an impediment to the transit of the smoke and heat. The flue for bottom heat should be in a chamber, the slabs that support the earth being raised an inch or two above the flue and supported on pillars, the chamber to be nearly of the width of the bed. The heat will then be diffused much more equally on the under surface of the bed, and there would be far less danger of burning the roots than by having the flue in immediate contact with the slab that supports the soil. With the front flue perfectly clear—that is, neither resting against the side wall of the pit nor the side of the bed, it would in all probability afford sufficient top heat without the back flue; this, however, will depend on the size of the flue. Too much dry heat from flues favours the increase of red spider.

Melons Failing (*J. E.*).—As we understand your letter the heat for your Melons is supplied wholly by fermenting materials, the manure being enclosed in a brick pit, and round this pit is a pigeon-holed wall. If this is so there would be very great difficulty in supplying the requisite heat—indeed, in any case, while it is comparatively easy to maintain sufficient bottom heat for Melons in a brick pit, it is almost impossible to maintain a night temperature for the plants of 65° with the aid of fermenting materials alone, especially when the plants are raised early in the season. With strong healthy plants inserted in June good crops of Melons may be had from brick pits, but such pits are quite unsuitable for early forcing. If you had stated the temperature that has been maintained (and we presume there is a thermometer in the pit) we should have been better able to have indicated the cause of failure. It is not improbable it may be as you suggest—too little heat and too much water; but even if this is so, the pit, so far as we understand it, is as much at fault as the man who may have been impelled to raise the plants too soon to be grown satisfactorily in a structure of the kind indicated. Perhaps you may obtain a hint about sewage that may be useful in our little manual, "Manures for the Many," which can be had from the publisher in return for 4½d. in postage stamps.

The Potato Murrain (*J. K. R.*).—In a case of this kind, the varieties being late and very unripe, we doubt if you can adopt any measure that will be of substantial value in preventing the spread of the disease. In the case of early varieties we have proved the great value of early lifting. On the first suspicion of disease we have taken up the crops when the foliage was quite green and the tubers unripe; then, by spreading them thinly in sheds have had sound and good produce. We have also seen the practice successfully adopted with second early varieties, but only where provision was made for storing the tubers thinly and where they would not be greened by too much light, as slight greening, though not injuring them for planting, spoils them for table use. When we could not take up the crop quickly enough we have pulled up the tops; and the tubers, though they have not afterwards increased in size, have kept sound. Cutting off the tops we found quite ineffectual; indeed, pulling them up is of no use unless done before the disease has been established in the plants. The late sorts to which you refer are not usually attacked seriously, and there is the probability of drier weather occurring that will prevent the spread of the murrain. If you have not ample convenience for storing the tubers as indicated we should not dig them up, especially as they cannot have attained nearly their full size and are yet in a very soft and unripe state. In certain seasons we have found the crops all alike ruined whatever manures were used, and even without any manure having been applied at all. This also, in a measure, appears to be your experience, but we do not anticipate the ruin of your crop. The root of the evil in your case is, we presume, undrained soil.

Orange Fungus on Roses (*Idem*).—Your plants are attacked with this unsightly and injurious parasite. There has been some mistake in management, either in watering or ventilating or both. The plants, we presume, are in pots. Remove them from the greenhouse, lay them on their sides on clean flags or mats, and syringe them freely with a solution of soft soap—2 or 3 ozs. of the soap dissolved in each gallon of water. Apply this at a temperature of 120°, especially to the under sides of the leaves where the fungus abounds, and while wet dust the leaves freely with sulphur. If this fails add half a wineglassful of petroleum to the soap solution, but do not then apply it at a temperature above 100°, and shade the plants afterwards or stand them in a shaded place in the open air. The oil must be well incorporated with the water by constant and violent agitation. We shall be glad to hear if either of these remedies prove effectual, and which. If they fail we can name another plan of destroying the fungus, but it is tedious. The plants will be better in the open air than in the house. If they are not in pots, and thus cannot be removed, you must syringe them where they are; but cover the ground with mats, on which spread some sawdust to prevent the soapy water saturating the soil and injuring the roots of the Roses.

Vine Roots Decayed (*G. E. L.*).—We have examined the three parcels of roots and there are no insects on them, nor do we consider their condition is the result of insects, neither are we of opinion that the roots in the subsoil have affected the newer roots near the surface. We have known the lower roots of Vines to decay wholly, while the surface roots in suitable soil have grown satisfactorily, supporting healthy Vines and fine crops of Grapes. There is either something in the soil and manure you have used that is injurious to the roots, or the border is not efficiently drained.

Abundance of stones placed at the bottom of a Vine border in themselves afford no proof of good drainage. We have seen concreted and so-called "drained" Vine borders positively waterlogged because there were no free outlets for the water, and we have seen drains and outlets provided, and these allowed to be silted up, rendering them useless. You had better look carefully into the question of drainage, and if you find any defects apply the remedy promptly. Your Vines have been also overcropped, and this would affect the roots injuriously. The foliage, too, may be overcrowded. On the important matter of disposing and managing the laterals you say nothing. Overcropping is a relative term. On some Vines such a crop as you name would be light, but considering the condition of yours it is too heavy, and the fruit could not receive adequate support. You must provide healthy roots, even if this involves making a new border, and with good foliage you will have satisfactory Grapes.

Heating Small Houses (D. H. H.).—As you have been twenty years in the same situation you will in all probability find out the best method of building and heating, as no one can understand your own peculiar circumstances so well as yourself. We, however, most willingly aid with such suggestions as occur to us. In the first place, as you have a wall partly built by all means turn it to account, as the aspect is suitable. You may also lessen the necessity for a high wall by sinking the path in the house. As to heating, a portable boiler and pipes fixed with indiarubber rings will be the best, but more costly at the outset than a flue; and a flue well constructed will answer—has, in fact, answered in your existing house. Probably the cheapest flue is formed with sanitary pipes, but the first few feet ought to be of firebricks. At Sedbury Park this mode of heating is adopted, and the Grapes grown there we have seen remarkably fine. The plan was described in this Journal three years ago, as follows: "The vineries are span-roofed, running north and south, the shed walls forming the north end. They are 26 feet long, 22 feet wide, and 13 feet high. The furnace is in the back shed, and the fire is carried on one side of the house in a brick flue 18 inches deep and 12 inches wide, inside measure; then two rows of sanitary pipes 8 inches in diameter are inserted in the flue and carried across the south end. In the opposite corner I built a hole about 18 inches square and 2 feet deep; into one side I inserted the pipes crossing the end into the other, the pipes running up the other side (this arrangement is for cleaning out the pipes expeditiously), which enter the chimney in the shed wall. The pipes are laid one row upon the other, and the heat is equally dispersed through them; the pipes farthest from the fire are warm as soon as the bricks on the side where the fire enters. The pipes are connected with cement. We always keep a small galvanised wire laid through the pipes, and when they require cleaning the corner covers are removed and a bunch of Holly tied to the wire and drawn through; the wire is then drawn back to its place with a piece of string. The fuel used is principally cinders from the Hall. One house was completed in 1870, the other in 1871. The Grapes are ripened in one house in July, the other in September. There are now three cracked pipes which require removing; that is all the repairs that have been needed." Mr. Matthews of Weston-super-Mare, who is a good authority on the subject, subsequently stated that "unglazed sanitary pipes made of fire clay are better than glazed pipes for forming flues, as they produce a better heat and are not so liable to crack as are glazed pipes." The provision above described for cleaning the flues is worthy of particular attention. Perhaps this reply may be of some assistance to you.

Names of Fruit (E. J. B.).—The small red Apple is Margaret; the other is the Sugarloaf Pippin. The former is a very old Apple, and is without doubt the Margaret of Rea, Worlidge, Ray, and all our early pomologists, except Miller. The latter is called Hutching's Seedling by some persons, from being grown by a man of that name at Kensington. (*J. Cheal & Sons*).—Sugarloaf Pippin. See above.

Names of Plants (G. L. R.).—1, *Coronilla varia*; 2, *Lychnis coronaria*; 3, *Chelidonium majus*; 4, *Corydalis lutea*; 5, *Digitalis lutea*; 6, *Ononis spinosa*. (*E. K.*)—1, *Pyrola rotundifolia*; 2, a variegated form of the common *Cytisus Laburnum*; 3, *Alchemilla vulgaris*. The specimens sent crushed into a small cardboard box, without any pains having been taken to keep them fresh, cannot be expected to arrive in very satisfactory condition, and yours were again almost unrecognisable, and it was only by long and tedious examination that we were able to determine their names. (*M. E.*)—*Begonia semperflorens*. You could ascertain the price from any nurseryman, but it is not expensive, as it is readily increased both by seeds and cuttings. (*R. C.*)—1, *Spiraea venusta*; 2, *Spiraea Filipendula* fl.-pl.; 3, *Spiraea arifolia*; 4, *Oenothera missouriensis*; 5, *Lysimachia thyrsoflora*; 6, *Centranthus tuber*. (*Flora*).—*Eutoca viscida*. (*Meopham*).—Perhaps the fungus is a small specimen of *Bovista nigrescens*, but it appears to be more like an immature *Lycoperdon giganteum*, which after it has been growing in the same place for some time produces very small specimens.

COVENT GARDEN MARKET.—AUGUST 15TH.

A GOOD business doing, with prices of soft fruits improved.

HORSE LABOUR IN FARMING.

(Continued from page 130.)

THE home farmer may feel assured that keeping his horses in good condition throughout the year is good policy, because it will enable him without injury to the animals to exact some extra labour during the busy periods. At the same time he may also feel assured that anything, whether inefficient feeding or excessive labour, will have a tendency not only to produce diseases in the constitution but eventually to shorten the life of the animals. The latter point is rarely considered sufficiently in the management of farm horses, but is very important, and the cost of it; for in the purchase of horses, or even if they are bred on the farm there are many risks to run, particularly as to the temper and capacity of the animals when they come to take their part in the work of the farm. It is therefore desirable to have as few changes and as few purchases as possible. When it is considered that as a rule a horse will in farm work, when fairly fed and treated, continue in work about nine years, taking four years of age as the starting point, proves that under ordinary management the horse will diminish about £4 in value annually. This at once shows how desirable it is that treatment tending to shorten the animals' capability for work should be carefully avoided.

As farm horses are usually kept upon food produced on the farm we must here observe that food must certainly be regulated by the description of farm, for in some instances pasture or water meadow hay may be very abundant, and in other cases very scarce. In some the amount of straw is enormous, in others being no more than sufficient for the cows or young cattle. However much the quantity and quality of hay and straw may vary, it may be asked, Have we any substitute that will supply the place of Oats? To this the only answer is, No. If a horse is required to be kept in working condition he must have a certain amount of concentrated food, and nothing is more suitable for the stomach or more conducive to health than Oats. To justify this statement let us consider the construction as well as the functions of the stomach of the horse as compared with that of the ox, an animal which is capable of subsisting on a large amount of innutritious food. The stomach of the horse is comparatively small, holding about three gallons, while the ox possesses no less than four stomachs, the first of which is considerably larger than that of the horse. This difference shows, what indeed the habits of these animals also demonstrate, that whilst the ox is so constructed as to consume a large quantity of food at a meal, the horse is adapted to consume a moderate quantity and often. Bearing these facts in mind, we consider the smallness of the stomach of the horse. It appears evident that he was intended by Nature to consume concentrated food, such as grain, principally. Under these considerations, although we have for many years advised the use of Carrots for feeding in the winter months, yet it must be with moderation, and not exceeding 10 or 12 lbs. per day per horse. Under any and every system of feeding we recommend that rock salt be always placed within reach of every horse.

With regard to the medical treatment of horses out of health, there is no better plan than to employ a respectable and certified veterinary surgeon, and pay him a moderate annual composition to attend and find medicines for all the horses on the farm. There is no more dangerous plan than is very frequently pursued of employing the village farrier to attend slight illnesses, with the intention of calling in a veterinary surgeon only in difficult and dangerous cases. It is important that the stabling of farm horses be comfortable, without being too close and hot

and well ventilated without being draughty. In addition to ventilation, there ought to be sufficient light afforded by means of swing windows made to open so as to be used in summer for keeping the stable cool. They should, however, be provided with shutters or lattices to exclude the light, for after horses have been hardworked during a summer's day the sooner they can be induced to lie down and rest by the stable being darkened the better, after they have been fed and curried. In the economy of a stable it is bad policy to stint the room for each horse. A dozen horses may be rendered uncomfortable, being unable to take their proper rest, merely for the sake of making room for one additional animal. Boxes for each animal are much better than stalls, in order not only to avoid accidental injury to the animals, but also to enable them to feed and rest undisturbed. For any further information on this part of our subject we refer the home farmer to our articles on "Farm Horse Management" in this Journal, dated the 10th and 17th January, 1878.

We must now refer to the policy of contracting not only with the farrier as before stated, but also the blacksmith for shoeing and the saddler for repairs of harness. But with regard to implements, it comes hardly within the bounds of a contract, consequent upon the great increase of machinery in farm use; still it may by specification of items for repairs, such as ploughs, including shares and other irons, be a matter for contract; and where possible it is very well, for the charges for labour, not only by the blacksmith but the carpenter also, have been so much increased during the past twenty years, that repairs to implements are a serious item in the farm expenditure, and over which we have no control except by contract.

Before concluding the subject we must refer to a practice of economy which we can recommend to the home farmer. That is, for tillage purposes to employ oxen instead of a certain number of horses, in the proportion of two oxen for one horse. To illustrate our proposal we will take a farm usually working sixteen horses, and reduce the horses to twelve instead of sixteen for the year, and introduce eight oxen for six months' tillage labour only, commencing by the purchase of oxen of the Hereford, Sussex, or Devon breed in good fleshy condition, at four or five years old, and broken into work, in the middle of the month of April, to continue in constant work on the land until the middle of the month of September, the oxen to be fed at the same cost per head per week as the horses, and kept upon suitable food, and stable management as required by them in their labour of tillage. Each pair of oxen will cost to purchase about as much as one four-year-old horse of the breed and size we have before described, say £28 each for the oxen, and the horse at £56. Looking at the value of tillage labour done by the oxen during the period of six months above named as the most important period of the whole year for tillage work, the oxen will not only do work equal to the horses, but will improve in condition and value during the six months quite 30s. each, whilst the horses if continued in work would have depreciated in value for the year £4 each. Thus in every way which this matter can be viewed by a practical farmer it exhibits not only an equality of work done both in effect and value, but also an important gain in money, and leaving the home farmer in possession of valuable animals to go into the box for fattening during the winter months. By using two oxen to the plough and in other summer tillage four horses will be displaced for a year by eight oxen employed for six months. In conclusion, the superiority of steam power is so great when applied at the overcrowded seasons of horse labour, that a much smaller number of horses kept throughout the year will suffice for the annual work of the farm, when a portion of the labour of the spring and autumn months may be thus taken from them—a direct advantage in various ways. Steam power will insure its continued use to a certain extent, quite irrespective of its cost per acre.

WORK ON THE HOME FARM.

Horse Labour.—Turnip seed may now be sown after Oats, Winter Barley, Early White Oats, upon some of the light kind and early soils of the southern, south-eastern, and home counties. Still every day will make a difference, and therefore as fast as the corn is cut and put into shocks or stooks the land may be ploughed between them and seeded by the drill set close, say 14 or 15 inches, between the lines for the purpose of horse-hoeing between the rows. If the plants grow well they may be hand-hoed and singled, leaving them very close, say 12 inches apart, as of course the bulbs are not likely to come a large size, therefore the crop of bulbs must depend upon numbers only. It is, however, a plan now becoming recognised that the plants should not be set out by singling, but be left to produce as much foliage as possible for the purpose of ploughing in as green manure, and which, if done the first opportunity after Wheat-sowing is finished, the land will be found in excellent condition as regards not only manure, but also gives a stale

furrow for Barley at the earliest seed time in the spring. If, however, the roots are required for sheep-feeding very fine crops have been grown where properly manured and singled. We have grown on certain occasions, especially when the harvest has been early after White Canadian Oats fed off with ewes and lambs, and the land sown again with Canadian Oats, each crop of which proving from 9 to 9½ quarters per acre. The latter crop, being seeded with Clover, has frequently produced a full crop for cutting up and soiling cattle, and horses after harvest, continuing until the frost came in November, and we would sooner cut up Clover in autumn than feed it with sheep or cattle, for these are apt to bite out the crown buds of the Clover plants, when they will often die off in consequence.

The Wheat fallows should now be got forward by the necessary tillage in order that the manure may be laid out in fine weather and ploughed in; but in case of the weather proving adverse the dung may be laid out on the Clover leas instead, and the fallow Wheat manured with artificials. This in some cases is advisable, particularly when a long lain of Wheat has to be seeded, for it is well that we should not forget the serious losses of plant of Wheat which occurred last autumn by late sowing; in fact, there really was no Wheat season available on our strong land and best Wheat soils between the 20th of October and the 20th of February. The first opportunity should be taken after the grain crop is removed to sow Trifolium. Let the land be shallow scarified or dragged with Howard's excellent implements, the self-lifting drag. Sow some early Trifolium and some of the latest variety, for ours held out until July 15th this year. In case, however, it is intended to be cut for hay, either wholly or in part, it is well to have some Italian Rye Grass sown with it, as it opens the hay and favours the making, also improves the quality of the hay, and fills up vacancies or failures in plant which may occur.

Horses will now be required attached to the reaping machine, and it is best to make a relay of horse power by not working them for this purpose more than five hours at a time. The weather still continues adverse for the early harvest while we are writing (August 9th), nor do we as yet see any prospect of settled fine weather; in fact, with the wind varying from south to north-west as a rule we never get a continuation of good harvest weather. The crops of Clover to be ploughed in for manure should now be done, and the ploughing to bury a full crop of second-growth Clover should not be done at less than 6 inches in depth. As to the policy of ploughing-in there is no method of disposing of the second growth of Clover profitably comparable with it, for if it is fed off by sheep we cannot obtain so good a crop of Wheat afterwards as after cutting for hay or seed; but in either case we run a great risk in saving for hay or seed, but there is no risk in ploughing-in if the work is properly done, for it is equal to a full dressing of yard manure for the succeeding Wheat crop, at the same time the land becomes settled and mellow in prospect of an early seed bed for the Wheat.

Live Stock.—Abundance is everywhere found for the cattle and dairy cows in the vale farms, and grass and green crops on the hill farms for sheep. The open downs on the chalk formation never has afforded a better bite for sheep than at present; but it will be necessary to carefully avoid feeding the stock ewes in the water meadows, for in all those cases where there is at all times a sufficiency of water for irrigation the feeding by sheep cannot be attempted with safety, but with the water turned off the land they may be safely fed with dairy cows, horses, &c. Sheep are extremely dear, which is in favour of the breeding flocks on the hills; but farms in the vales may be shortly stocked where the usual plan is to buy in ewes and feed the lambs fat in the spring; and in such a case with an abundance of roots the advantage of ploughing in the roots as against feeding may be ascertained by experiment, for in case of full crops of roots 13 tons per acre ploughed in is quite sufficient to produce a full crop of Barley, Oats, or Wheat, and the remainder may be disposed of for feeding cattle, in the boxes; but to bury them well the roots should be passed through an old Gardener's Turnip-cutter to distribute them as manure with regularity.

REMARKS.

5th.—Slight rain in early morning; dull oppressive day.
 6th.—Overcast; little sunshine at times; slight shower 4.30 P.M.
 7th.—Fine, with bright hot sunshine.
 8th.—Fine early, afterwards dull and rainy, with high wind. Lightning and thunder at 6.15 P.M. with heavy rain.
 9th.—Fine, bright, and windy.
 10th.—Squally and rough; slight shower at noon.
 11th.—Fine throughout.
 An unusually windy week for the time of year. Temperature slightly below the average.—G. J. SYMONS.

GARDEN CHEMISTRY—POTASH.

ALL soils need the application of nitrogen, most of them need phosphates, but whether potash is also required depends to a great extent on the nature of the soil cultivated, some having abundance, others being destitute of that necessary compound. Most fertile clays contain a practically inexhaustible supply of potash. In the Carse o' Gowrie, for instance, it exists to the extent of 2 per cent. in the soil. Supposing the roots of plants never to penetrate deeper than 9 inches, a supply of 45,000 lbs. is thus within their reach in an acre ; but gardeners would not rest satisfied till by trenching and the addition of manures the staple was at least 18 inches. Not including the potash added by the manuring as usually done, this would bring a supply of potash within reach of the roots calculated to afford sufficient for the wants of 700 crops of Potatoes of 10 tons each crop, and this crop takes up more potash than any other—certainly more than the usual average rotation of a garden. Even when only 0.1 is present more than enough for all requirements exists, but only when present in an available form, which it often is not, and may then be nearly as well absent. Caustic lime liberates potash from some of its compounds, and thus renders it of use to the growing plant. M. Ville maintains that it should always be present in artificial manures ; but his experiments, and those of others on which he bases his assumption, have evidently been conducted in soils peculiarly deficient in potash, or only containing it in an unavailable form, for with the same crops others have found the application of potash not only quite unnecessary but perfectly ineffective.

In addition to what we have termed fertile clays, loamy soils on the old red sandstone, and often on the new, are generally rich in potash. Experience has proved that for the most part such soils are peculiarly well suited for the cultivation of fruit trees, and especially Vines. The Vine requires, above all things, potash, phosphoric acid, lime, and nitrogen. Lime rubbish is universally added to vinery borders, and occasional supplies given as top-dressings from time to time—or should be. With potash plentifully present, only bones are wanted to supply phosphates and nitrogen ; while a continued supply of the last is kept up by applications of liquid manure and dressings of soot, guano, and other rich manures. In such soil Vines must thrive if the atmospheric conditions are right ; but if the potash should be absent, and it frequently is, they could not possibly do so. The soil would then be blamed, but that would not help matters. It is just in such difficulties that science steps in and puts matters right.

Most trap soils contain an abundance of potash, and such are always found to produce very excellent Potatoes, Clover, and other leguminous crops. But even some traps are by no means rich in this. Granite is almost always very poor in everything else, but rich in potash. For this reason fine Potatoes are grown in districts north of the Grampians that refuse to grow corn till lime and phosphates are added, and

for this reason fine Grapes are not uncommon in such soils. Trap rocks are generally composed of felspar and hornblende, the felspar yielding much potash, the hornblende much lime ; hence trap soils are rarely benefited by applications of either lime or potash.

Potash almost always requires to be applied to poor sandy, gravelly, chalky soils, as well as to peat, and also clays derived from shales of the carboniferous strata. In the Carse of Falkirk occurs a clay rich in potash, but here the clay is the silt carried down by the Firth, Carron, Teith, Allan, and Bonny from the degrading traps and old red sandstones over a very wide area. Here the farmers contemn the use of potash. A few miles to the south-west barren shale clays abound—barren, that is, except where redeemed by the application of manures, potash included, and then the barren clay becomes notably fruitful, proving that barrenness depends, not on texture or even on geological peculiarities, but on the presence or absence of required plant foods. Gardeners will thus see that soil need be no hindrance to the best results.

Plants possess very different powers of attacking the compounds of potash in the soil. Thus a plant which requires a great quantity may not be benefited by its application, while others which require very little may be greatly benefited. If present at all, for instance, that excessively robust Potato Scotch Champion will almost certainly find and utilise it. On such soils applications would do little good. If absent, however, the case is quite altered. Then a hundredweight or two per acre will produce startling results compared with undressed ground ; but the weakly growing varieties of precisely the same species, with weaker foraging powers, apparently are unable to attack the potash compounds, and hence manures rich in potash help such immensely. Thus, though a knowledge of the mineral constituents of a plant will afford no certain index of that plant's foraging powers or ability to attack certain substances, the fact that any given plant demands any given compound largely is proof positive that that peculiar compound must be plentifully present, and that making plentiful provision is always the safe side to err on. It also points the way to a rational system of rotation of crops, and indicates the value of the ashes of any given plant.

Among fruits Grapes (the ash of) head the list with over 60 parts in the hundred, and as other eight compounds are present the preponderance of potash will be apparent. Apples follow next, with a varying amount of something between 35 and 68. Plums follow with 59, Pears 54, Cherries 51, Pine Apples 49, Cucumbers 47 (a detailed analysis of the Melon I have not been able to find, but the fruit and seeds are peculiarly rich in potash and phosphoric acid), Gooseberries 38, Figs 30, Strawberries from 21 (when soda partially takes the place of potash) to 49 (when soda is absent). Other fruits contain less than 30 per cent., and for the purposes of the cultivator may be "lumped."

Among vegetables Potatoes come first with an average per-centage of fully 50, but rising to 73 in some soils with some varieties, and going as low as 42 with others ; Rhubarb, the stalks of which give 59, French Beans 49, Broccoli 47, Beans (Windsor) 45, Artichokes 44, Beet and Onions 39, Cabbages from 31 to 39, Celery 37, Peas 36, Leeks 33. Some authorities give 44 as the per-centage in the ash of Spinach, but others give soda as being largely present and potash only sparingly so—the soda replacing the potash apparently. The same thing occurs with the Strawberry.

The rule is very general that potash and phosphoric acid are always largely present in plants that are used for food by men and animals, and in those parts that are especially used. In poor foods they are less plentifully present than in more nourishing ones. The starch of the grains and roots and the cellulose of green vegetables, with the sugar and pectose of fruits—substances all chemically allied—is always associated with potash, and their formation depends on its presence ; while the gluten of Wheat, avenin of Oats, legumine of Peas and Beans, the albuminoids generally that occur in vege-

tables—nay, even in such allied animal substances as eggs and milk, are always associated with phosphates. Nitrogenous compounds and phosphates are always linked together, non-nitrogenous substances—fit for food—and potash.

While, therefore, phosphates and potash are largely demanded by plants grown for food, ornamental plants demand these in notably smaller quantities. *Dracenas*, *Lobelias*, *Cyclamens*, *Heliotrope*, *Primula*, *Fuchsia*, *Acacia*, *Aralia*, *Ficus*, *Grevillea*, *Yucca*, *Liliums*, *Hydrangea*, *Coleus*, *Verbena*, *Aloysia*, *Petunia* all contain less than 30 per cent. in their ash, and most of them considerably under 20. Potash is found in much greater abundance (from three to four times as much) in the white of variegated leaves than in the green parts. Potting soils and flower beds, therefore, require less potash than fruit borders or vegetable quarters. In fact only the poorest soils will need special provision in this respect when flowers are in question.

SOURCES OF POTASH.

Where urine can be had—and it ought to be forthcoming wherever animals of any kind are kept in houses—a plentiful supply of potash in the best form for all special purposes is at hand. Every ton provides from 30 to 40 lbs. of potash salts, or a great deal more than an equal weight of produce. It contains nitrogen equal to ammonia in about equal quantity, and both in an available form. In winter it may be freely applied among plantations of trees, bushes, Strawberries, &c., in a pure state, and in summer when plentifully diluted with water. It then forms a manure water of unsurpassed excellence for assisting the swelling-off of fine fruits and the production of succulent, juicy, highly digestible, and enhancedly nutritious vegetables. Indeed, it improves vegetables in every desirable way.

Failing urine much may be made of garden and other rubbish. There is not a stick or a twig, an old mat or a Cabbage stump, that does not contain potash as well as other necessary mineral plant foods. While we are against the burning of all soft leaves, straw, &c., which readily decompose (because thereby the precious nitrogenous matter is dissipated in the air), we approve of the burning of sticks and twigs (which when buried frequently spoil the soil with the fungus they produce), and thereby securing a more or less plentiful supply of potash, lime, and phosphoric acid. In suburban districts no great supply can be thus obtained; but on large landed estates large quantities are frequently to be had. It ought also to be remembered that the more vegetables remove from the soil, the more will the same vegetables—or the waste parts—return if used as manure.

Failing either of these sources there is nothing for it but to go into the market; but where stable-yard manure with every scrap of vegetable matter is economised this extreme step will not be necessary, unless for very particular purposes or on very poor soils. This will be necessary when artificial manures are chiefly depended on, and everywhere—failing the two former-named sources—for such special objects as fruit-cultivation. In straining after perfection it is best to make sure that nothing is wanting; and though the soil be ever so good, it takes such a small quantity of potash annually to prevent the store from decreasing, that in the case of a Vine or Peach border, or for trees in pots, that the question of expense—a matter of primary importance to the farmer—is hardly worth naming. In ordinary farmyard manure potash is present to the extent of from 0.3 to 0.5 per cent.

For applying on a large scale kainit is largely used. It is almost always used for Potatoes at from 1 to 4 cwt. per acre. Where manure is scarce and hardly enough can be afforded a half-manuring of ordinary manure, supplemented by 1 cwt. of kainit and 1 cwt. of superphosphate, will frequently give results equal and sometimes surpassing a full application of ordinary manure alone. From 2 to 3 cwts. are as much as should ever be given even in the absence of any other manure. There is a danger in using too much because of the presence of magnesium salts in the kainit.

Potassic sulphate, or, as it is more generally called in the

trade, sulphate of potash, is the potash salt on which the value of kainit (kainite or kianite) depends, and should be present to the extent of 24 per cent. There is generally 30 per cent. of common salt, 14 of magnesian chloride, and 13 of magnesian sulphate, with some calcic sulphate and other matters present.

In rectified samples the potassic sulphate amounts to 50, 72, and 80 per cent. Of ordinary commercial kainit it takes 800 lbs. to yield 100 lbs. of potash, or about two-thirds as much as is removed from the soil in an acre in a good crop of Potatoes. The 50 per cent. grade should give 100 lbs. for 364 of the material bought, the 72 for 250 lbs., and the 80 for 228 lbs. For garden purposes the purer it is the better. These purer salts are known as sulphate of potash.

What is known as muriate or chloride of potash (potassic chloride) is more commonly employed as a potash salt, especially by experimentalists. 200 lbs. of it should be equal to 100 lbs. of potash. These figures will enable anyone to calculate how much potash is being applied. On soils quite deficient in humus Mr. Jamieson found that this salt proves destructive when applied by itself. With nitrate of soda, however (which seemed to neutralise it), or where humus was present, it was perfectly harmless. Gardeners have seldom to do with soils in which no humus is present; still, it is well to sound the warning note. Ville, in France, seems not to have discovered its hurtful qualities, yet he used it in the same way as Mr. Jamieson.

Though potash is necessary very small quantities are perfectly sufficient. For dressing vinery or other borders half an ounce to the yard is all that should be given as an annual dressing of the chloride and higher grade of the sulphate, and only that when there is reason to suspect a deficient supply. When absent Ville found that Vines produced no fruit and scarcely could be kept alive. It is best applied during winter, when it should be very lightly forked in.

If lime is present, if phosphates are present, if plenty of nitrogen is given, and abundance of water supplied, and no sourness exists, and if still Vines grow weakly, bear inferior fruit, do not throw out laterals vigorously and persistently during summer, and the leaves are light-coloured and given to fall prematurely, then suspect the want of potash and supply it, unless red spider is the cause of the mischief. When potash is deficient, so is chlorophyll, and little plant food is elaborated in the leaves. When plentiful the foliage should be dark, the chlorophyll dense, and an abundant supply of food be elaborated. Boussingault was of opinion that potash favoured the growth of the Vines, phosphates the production of Grapes.

Potash generally has a very beneficial effect on members of the Leguminosæ; Peas, Beans, and Clover benefiting largely from applications of the sulphate, the chloride, but especially the nitrate. The nitrate is very dear, and can on that account only be used on a small scale. When a little bonemeal is mixed with potting soils liquid manure made with nitrate of potash is very effective, and no better can be recommended for those in search of a smell-less stimulant for room or conservatory plants. Some dispute the place assigned to the chloride, asserting the sulphate to give superior results, but as the consensus of opinion is the other way it may be regarded as the superior form.—SINGLE-HANDED.

STRIKING PELARGONIUMS.

Now that the time for propagating the desired number of the different varieties of Pelargoniums for the flower garden next year has arrived, a few remarks on the subject will probably be of assistance to not a few of your amateur readers, whose numbers are being annually increased by fresh devotees to the fair goddess Flora. We propagate all our bedding Pelargoniums excepting the bicolor and tricolor sections (the cuttings of which are inserted singly in 3-inch pots), in boxes. These, to economise space, are made of uniform size—about 2 feet 6 inches long, 9 inches wide, and 4 or 5 inches deep. A few holes made

for drainage, and covered respectively with large pieces of crocks and a few handfuls of leaves. The boxes are then filled with any waste soil that may be at hand, which is pressed firmly together with the spade; a surfacing of sand being spread on they are then ready for the cuttings, forty or fifty of which will be sufficient (according to their size) for each box. The cuttings may be taken off the plants as soon as their removal will effect an improvement in the appearance of the bed or border. This object should never be lost sight of, and sufficient can usually be obtained without in any way detracting from the symmetry of the beds or borders from which they are taken.

Every man undertaking the execution of a plan of operations on a small or large scale should be able to see the completion of his work before beginning it, and the process of taking off cuttings—simple though it be—is no exception to that rule. Those engaged in the work should have a clear idea of the number of cuttings of the respective varieties that are required before commencing the work, due allowance to be made for any mishaps that may occur during the interval from August to May. The cuttings when taken off should be put down in scores, and the number of each recorded for future reference. It is a good plan to spread the cuttings in the sun for a few hours to consolidate them. They can be inserted in the boxes just as they were taken off, as “trimming” of any kind is unnecessary and time wasted. The boxes should then be placed in a sunny situation on strips of wood, and the cuttings damped with the syringe every bright afternoon. Those in pots can be placed in a similar position. In the event of heavy and continuous rains ensuing it will be advisable to place some old sashes or shutters over the cuttings to prevent them suffering from excessive damp.

In the course of a few weeks from the time the cuttings were inserted they will form roots, when any yellow leaves that may happen to be attached to them can easily be removed with advantage to the appearance of the young plants.—H. W. WARD.

DESTROYING THE PHYLLOXERA.

It is not necessary to destroy Vines in order to get rid of the phylloxera. Carbon bisulphide and sulpho-carbonate of potassium have been, and continue to be, very extensively and successfully used in vineyards where the phylloxera has appeared. Carbon bisulphide is used where water is scarce. There are two objections to its use—it is explosive, and it checks the Vine to which it is applied. Sulpho-carbonate of potassium is used where water is plentiful; it destroys the phylloxera without checking the Vines, and it acts as a manure. For 1 square yard of soil the application should be 1½ oz. dissolved in 5 gallons of water; this mixture should be poured on gradually, so that it may sink evenly into the soil. For this country sulpho-carbonate of potassium has been manufactured wholesale by Messrs. Wm. Bailey & Son of Wolverhampton.—G. T., *Oporto*.

JUDGING COTTAGE GARDEN PRODUCE.

YOUR correspondent, “Reader,” has started a difficult subject, and one that is certain not to be answered quite satisfactorily to him. I hardly venture to comment on it; but having for the last fifteen years been connected with a large cottage garden exhibition as Committeeman, Steward of a department, and for ten years as its Honorary Secretary, and also occasionally as Judge in some of its branches, I am not giving a theoretical reply.

Firstly, then, it must be remembered that judges are, after all, only human, and therefore, like others of the race, liable to err. Then, also, it can hardly be expected that in everything brought before them they are in all classes equally good. Where it is possible it is best to have three judges, and I really think that one judge is better than two. In the latter case, if they differ they are apt to settle it thus: “I give in to you this time, as you gave way to me in the last class.” Where there are two, and differences arise, another should be called to decide.

In judging cottagers’ produce greater age of the exhibited articles is allowable, as quantity has to be looked for, whilst for the tables of the affluent young and quickly grown vegetables are required. Where a number of vegetables of different kinds are pitted against each other, I fancy the safest rule is to give the prize to those that are most brilliant examples of growth and quality, without laying down any hard-and-fast rule as to this vegetable taking precedence over another. In exhibiting garden produce there is the same difficulty as in all other exhibitions—the owner can rarely see impartially, and as rarely allows the judge to have any predilection for this or that vegetable. It is a very great blessing to be able to lose cheerfully. Exhibitors, too, need to recollect that good judges have an

insight into exhibits denied to many growers, and that often when apparently the worse-looking specimen is ticketed “First prize” there may be abundant cause. I recollect a case in point. Many years since I exhibited a brace of Cucumbers, and, with the keen feelings of ownership, thought them decidedly A1. Finding them unnoticed I said to the leading Judge, one to whom we are often deeply indebted in the columns of our Journal, “I thought I was going to win with Cucumbers.” “Did you?” said our friend with a roguish smile, “which are yours?” I pointed to the dish. “Ah, yes,” says the Judge, placing my finger and thumb on one spot, “Press; hollow!” He looked as though he would like to have added, “like your noddle!”

As regards gardens a cottager may say, “If I grow choice flowers I can make my garden pay better than if I raise vegetables.” Now, if so, surely his case is one in which, even in a cottager, he ought to stand as good a chance of success as a vegetable garden. Several points need attention in garden judging—as, for instance, whether the garden, be it devoted to vegetables or flowers, is made the most of; then, Do the growing plants show care and consideration? Are there any weeds about, and, if not visible, is there any trace of their being dug in? I will not deny the value of decaying vegetable matter for manure, but unless the weeds are young and free from flower the practice of digging them in is very reprehensible. All the Dandelion and Thistle tribe, if in flower and the flower buried, would so far perfect their seed underground that when the earth is again turned up and the seed exposed to warmth, most of them would germinate. It certainly is better to divide these two kinds of gardens, but where this cannot be afforded I should say that evidences of care and interest bestowed by the owner are the great points for a judge to look at. One of the great objects, to my mind, of these exhibitions is to show labouring men that there is pleasure as well as profit in a garden, and that he will be better occupied in his garden than in many places where both pocket and health may suffer, and the mind may be unrefreshed in spite of these resorts being considered places of pleasure.—Y. B. A. Z.

HAVING often to act as a Judge of cottage gardens, I will try and describe how we proceed. The Judges agree before starting the number of points that we are to give a fair crop—say six or eight points as that allows us either to go up or down. Having the Secretary with us to act as clerk, we take every vegetable by itself, and award the points, either less or more as the case may be. Every vegetable gets one point, although it is very bad, if only to show it was in the garden. Then for keeping and arrangement we say ten or twelve points, as there is often more difference in the keeping than in the crops. If there is a flower border, points are given for quality and arrangement. Where there is a flower garden there should be a separate class, then all that the Secretary has to do is to record the prizes. We find the book a great help to us, as when we see a vegetable of the same in quality as we have seen in another garden, the clerk can tell us what number of points was given. I should be glad if others would record their experience.—J. S., *Forfarshire*.

CULTURE OF ANTHURIUM SCHERTZERIANUM.

EITHER for exhibition or home decoration the above excellent plant stands unrivalled where brightness is required, and almost everyone who has a stove or intermediate house procures a plant and endeavours to grow it. For those who have not succeeded in growing this Anthurium into a healthy specimen these few remarks are offered. If any plant dislikes a high steaming atmosphere and close sodden soil this is the one. The temperature best suited for it is that of a moist intermediate house that is ventilated freely yet judiciously, anything like sharp currents of air soon proving injurious, if not fatal. There should be heat in the pipes to prevent the temperature falling below 55°. The soil should consist of lumpy fibrous peat, sphagnum, charcoal, and crocks, the pots to be about three parts filled with crocks and the plant to be well elevated above the rim. Abundance of water is required at the roots during the growing season, and they must not be kept dry at any time, or the foliage will turn yellow.

The present is a good time for repotting, or a little earlier would have been better. Any plant that is in soil at all sodden or is unhealthy should be turned out of the pot and the ball placed in a tub of water, then gently work the soil from amongst the roots with the hand, after which place it in another tub of clean water and well wash the roots. It should then be repotted, working the soil carefully amongst the roots without breaking any. Place the plant in the house where it can be kept close and shady, and be lightly syringed four or five times a day until the roots work well in the new soil and the plant gets established. If a plant is in good health and the soil in sweet condition, yet the plant requires a shift, repot it

without disturbing the roots. This Anthurium is not only a most telling plant for exhibition, but can usually be depended on, as it is almost sure to be in bloom for the early summer shows and lasts a long time in beauty; but it is better not to allow the spathes to remain too long on the plants, as this weakens them considerably.—A. YOUNG.

ALNWICK SEEDLING GRAPE AND MELONS AT OSBERTON.

DURING a recent visit to the gardens at Osberton, Hall, Worksop, I was much struck with the splendid crop of Alnwick Seedling Grape growing there. After having seen this Grape grown and exhibited on several occasions, I venture to say the Osberton examples rank amongst the finest in the kingdom. Some of the bunches are upwards of 5 lbs. in weight, having very large berries, none of them stoneless, and all of them perfect in colour; in fact, it has set as freely as an Alicante. On inquiring of Mr. Woods how he succeeded in setting them so freely, he informed me that at the flowering period he carefully went over them in the early morning with a fox's "brush" to take the moisture off the stamens, then at midday he went over the Alicantes and Hamburgs that were in flower with the same "brush," finishing off with the Alnwick Seedling. The result is a most splendid set. Gros Guillaume and Black Hamburgs are also very good. Most of the Vines have all been planted within the past four years, and are making a very strong growth.

Melons are also well grown. These are in span-roofed houses. Mr. Woods' treatment differs somewhat from that practised by some good growers. He allows the plants to grow at will, taking up five or more shoots from each plant, not stopping them in any way until the crop of fruit is swelling. By this method he obtains very heavy and successional crops of fine fruits.—G. S.

TEA ROSE BEDS.

THE difficulty of growing Tea Roses, and their value and beauty when obtained, makes it a duty to chronicle success when achieved. This has been achieved to a very remarkable extent by Mr. H. Appleby of the Box Hill Nurseries, near Dorking. He seems to me to a very great extent to have solved the problem. A well-known Scotch adage, speaking of some excellent highland roads, remarks—

"Had you known these fine roads before they were made
You would lift up your hands and bless General Wade."

I knew Mr. Appleby's gardens long before they were made. He took possession of an open corn field, and has made it into one of the show gardens of the neighbourhood. He had certainly no special advantages for growing Tea Roses. The spot was swept by winds in all directions; the soil is light and rather poor; it is also sufficiently in the valley of the Mole to be liable to our terrible winter frosts. The main feature of the garden now is one long walk, containing 1200 standard Roses. The usual houses and glass fill up the front of it. The three Tea Rose gardens, of which I wish to speak, are on either side of the main walk.

In three instances a spot, about 22 poles long by 6 wide, has been planted with Arbor Vitæ. The young trees are now about 10 feet high. A narrow walk runs up the middle, on each side of which are the rows of Tea Roses. They had no protection through the winter except manuring, they were not mulched until the beginning of July, and they have flowered incessantly (being constantly cut from), besides throwing up strong shoots. At this date, August 10th, they look able to supply as good a box of twelve or eighteen as need be wished for at any of our greatest Rose shows. I never saw Roses that seemed more fully to enjoy themselves. The contrast to my own Teas under south and east walls, and what I consider favoured nooks, is most depressing. These Roses are perfectly free from the mildew, which has been worse this year than I have ever known it, and are as vigorous as heart could wish; indeed, Gloire de Dijon and its offspring, Madame Berard, shows a robustness which will lead, I apprehend, to their speedy expulsion. Madame Lambard is blooming as I have never seen it this year. Catherine Mermet and Madame Bravy are in the rudest health, and that beautiful red Aline Sisley, with Marie Van Houtte, are also very conspicuous for their abundant foliage and blossom. How the Teas will fare when the trees surrounding are three or four years older and help themselves to soil is perhaps a question, but at present no greater success is conceivable.

Mr. Appleby calculates the outside Arbor Vitæ bordering at about £5. The protection seems exactly what these fickle beauties like. They get the air they require, but it comes filtered through to them in softened proportion.—A. C.

PIGEONS IN GARDENS.

I HAVE noticed in your Journal a correspondence relative to the above subject. It appears Mr. Dolby is a grower of the very best qualities of Peas for seed, and that for a considerable period his crops have been mutilated, and indeed rendered comparatively worthless, by trespassing pigeons. A short time ago his son shot one whilst in the act of uprooting the Peas, and the owner instituted proceedings in the County Court for its presumed value, and was awarded by the presiding Judge a sum thought by many persons to be ridiculously wide of its worth.

I will draw your attention to the following matter. I have many splendid pigeons in confinement, and some common birds at liberty. A

short time ago I sowed some seeds in my garden, and as they did not germinate as anticipated, others were sown; this lot was likewise faulty. I blamed birds and slugs, and immersed the next seed in some poisonous Wheat-dressing, and then found out the culprits, for four of my own pigeons lay dead on the beds. Will you tell me whether if these birds had belonged to another person I should have been pecuniarily responsible? I cannot think so.

For the past twenty years I have (like many other chemists) sold arsenic, vitriol, and other poisonous preparations for dressing Wheat to prevent the ravages of the slug, grub, and wireworm, and if a farmer were drilling Wheat so dressed and a neighbour's pigeons came and followed the drill and ate the seed, would the farmer so sowing be subject to the neighbour for any fictitious value put on the trespassers? I regret to say that the verdict given in Mr. Dolby's case has provoked great censure, as it is thought by so many people to be very unnecessarily harsh.—JNO. QUEENBORO'.

[The statute governing this case is that of 26 and 27 Vic., cap. 113, which imposes a penalty not exceeding £10 (recoverable before two Justices of the Peace) for selling poisoned grain, seed, or meal, and a like penalty for sowing the same, but also provides (section 4) that "nothing in the Act shall prohibit the offering or exposing for sale, or selling, or the use of any solution or infusion or any material or ingredient for dressing, protecting, or preparing any grain or seed for *bonâ fide* use in agriculture only, or the sowing of such last-mentioned grain or seed so prepared.]

TOMATOES.

ON reading the note on Tomatoes at page 118, I referred back to the Journal of the week previous to the note from Mr. Thomson. Though our Tomatoes are planted in loam without any other addition, we have them later, when in full bearing, growing in almost half horse droppings. This is added in the form of surface mulchings, which are applied every ten days. Each mulching is about 1½ inch in thickness. These Tomatoes are growing on the shelf of a vinery. They also receive a little guano in the water every time water is applied. Others planted out in a lean-to pit after Melons, and in the same soil, have done perfectly well without any mulchings, while in a span-roof pit with a few inches in depth of soil we have the largest crop of all. Under these last named Maidenhair Ferns are grown, and to obtain large fronds of these the atmosphere was kept rather moist, with the result that about ten days ago signs of the disease were apparent amongst the Tomatoes. However, a change to a dry airy atmosphere has stayed the plague. This is the first time I have noticed the disease indoors, and to overmuch moisture and a too stagnant atmosphere I attribute the cause. The variety of Tomato is the "Drumlanrig," the most profitable in a market point of view I have yet obtained. We have been cutting from 50 to 60 lbs. weekly of late from this sort alone. Neither Trentham Fillbasket, Criterion, Excelsior, nor any other kind I have tried approaches this as a heavy producer.

Potash is without doubt the best manure for Tomatoes. Our earliest crop last season was grown in a root space of about 9 inches wide by about the same depth. The same manure the Potatoes were dressed with was supplied to these Tomatoes, and they perfected a good crop. Potash was the dominant manurial agent it contained, though both phosphates and nitrogen were present.—B.

SINCE I last wrote on this subject, on page 118, I have received from Mr. W. Thomson of Clovenfords two Tomato fruits, the larger one weighing 15 ozs., perfect in shape and colour, indeed a beautiful fruit of Hathaway's Excelsior. The smaller fruit, weighing about 3 ozs., is to me a mystery, and after careful examination I must confess I am at a loss to comprehend why this fruit should show such a peculiar appearance. Generally speaking, so far as my own experience goes, the Tomato when diseased from cold and wet seasons begins to decay at the stalk of the fruit, but this small fruit looks as if it had been simply peeled or injured in some way.

Is it possible that Mr. Thomson has many fruits on his plants like the one sent to me? It has the appearance of a young tree damaged by cattle eating off the bark. If not entirely barked all round the tree will each season grow or form new bark until it has clothed or covered the wound. The Tomato would not do this because of the nature of its fruit being liable to decay, but certainly it has the appearance of having overgrown the wound as if it had been skinned. I can only add that I never saw a fruit on any of our plants like the one Mr. W. Thomson sent to me.

I beg also to thank Mr. Thomson for giving us a recipe at page 139 for growing the Tomato well. Another season I hope to try the compost described, and if I can grow Tomatoes similar to the large one sent me without the help of stimulants I shall be satisfied.—H. CAKEBREAD, Rayners.

AN EASY METHOD OF DESTROYING WASPS' NESTS.

GARDENERS have many foes to contend with in the shape of birds, animals, and legions of insects, and are often puzzled to discover the easiest and most effectual method of destroying those troublesome pests of the garden. Among the gardener's most annoying of enemies, especially during the fruit season, are wasps. Grapes seem to be the most tempting to their palates of all fruits, and in some districts unless precautions are taken to exclude them crops suffer heavily from their ravages. Many

are the methods adopted to check these pests, but the most effectual one is to destroy the nests. The plan usually adopted to destroy them is that of making a squib of gunpowder and brimstone; but as this involves no small amount of trouble, and is not always effectual in action, besides being attended with danger, it is not to be recommended as being easy of application.

The simplest and most effectual method is that recommended by a correspondent of the *Times* some time since, and which we have recently practised with great success. It is as follows:—Take one or two tablespoonfuls of well-pulverised cyanide of potassium and place it near the mouth of the hole by day. As the pure cyanide is a powerful poison it must be handled with great caution. We would advise experienced persons to procure the commercial cyanide of potassium and get the chemist to pulverise it for them. Two tablespoonfuls of this form of cyanide will be found as effective as one of the pure, besides being less dangerous. In a few hours the wasps will become suffocated by inhalation of the fumes, and in six hours the nest may be safely dug out. In refilling the hole take care to first throw in the remaining cyanide that exists to prevent fowls or other domestic animals coming in contact with it.—T. W. S., *Lee*.

THE STRAWBERRY SEASON.

THE Strawberry season now just over has been one of the most productive I have ever known, but the weather at times was too showery, and some of the fruit was injured in consequence. I have at last decided to do away with a bed of Keens' Seedling, which has been down for a great number of years; I am afraid to say exactly how many, but I believe it was made in 1868. The crop was as good as ever in quantity, but the size of the fruit showed evident signs of falling off, and some couch grass is troublesome to eradicate. I am frequently asked how often I make fresh beds. My reply is, When the old ones cease to be profitable. I have already made a new bed of Keens' Seedling, and do not expect to be troubled with another for the next ten years at least. Sir J. Paxton and others I cannot keep going quite so long, but they generally continue for seven or eight years. Perhaps in other situations where the drainage of the soil is not as good they may require renewing oftener. Sir J. Paxton was not so good as usual this year from the rain and absence of warm sunshine, but I fortunately put out a good bed of Elton Pine the year before last, and they were excellent. I intended them for preserving, but they were the best I had for dessert at the time they came in. The plants came from Messrs. Lovel & Son; and I take this opportunity of observing that there is not a more profitable investment than sending to a good grower for your plants if you do not happen to have just what you want of your own, for the extra crop of fruit you obtain the first year more than pays for the cost of the plants. I have tried many Strawberries, but not grown every Strawberry under the sun yet. This year I have Alice Maud (not a new one), and find it answers very well. Forman's Excelsior, too, I have tried; the fruit is of good flavour and fair size, but I have not grown it long enough to decide about its cropping qualities. I have also tried another, which I believe to be either James Veitch or Sabreur; perhaps some of your readers can tell me which it is. The fruit is large, of good flavour, and pinkish in colour; the leaves pale green, and the stems of the leaves and the stems of the runners of a dull reddish hue, which is decidedly peculiar. There was some confusion in the names. I ought to have had two sorts, but they were all one, and I do not know which.—AMATEUR, Cirencester.

PETUNIAS IN POTS.

THOSE who have appliances, skill, and time prefer to grow plants that become more valuable as they increase in bulk, and for greenhouse work indulge in specimen plant-growing more or less, and for such many valuable hard and softwooded plants exist in plenty. Those who lack the appliances, or the skill, or the time to devote to certain plants are equally well provided for, especially in the way of easily grown Pelargoniums, Begonias, Petunias, and lots of other showy decorative kinds. Petunias, like Zonals, are not subject to any insect pest, and that is a great point in their favour. Another is that they are continuous bloomers, unless by sheer starvation they be stopped. Easily propagated and easily grown, showy and highly useful either as small decorative plants, as large specimens, or as screens, they have many points in their favour.

For early summer work, to come in after the Azaleas, the Hyacinths, Tulips have gone, autumn is the best time to strike them. For soil, ordinary potting soil such as we use for Roses, Fuchsias, and Pelargoniums will do, only it should be open, so that the delicate roots may move freely. A good admixture of flaky leaf soil secures this.

For many decorative purposes the bright-coloured doubles are best. In order to have such well furnished it is necessary to begin pinching and staking from the very first. When these are wanted pretty large for conservatory decoration it is necessary to go on pinching continually and removing the blooms till these are wanted. The shoots should never be allowed to grow into each other, as the leaves are very sticky and the stems very brittle. For doubles the bush form is best, and there is no

excuse for having the plants not covered with bloom from the pot upwards. It is only a question of feeding and pinching.

The singles are far best on flat trellises and make capital floral screens—better than anything else that could be named, perhaps, for covering back walls or shutting out unpleasant views. For this purpose trellises made of a stout galvanised wire to form the circumference; and galvanised wire netting, such as is used for poultry runs, if neatly manipulated is as good as anything. These stout stakes with protruding ends to insert in the pots give the necessary rigidity. According to the positions they are to fill they may be made with a surface of from 10 to 30 square feet.

It is very easy to cover such a surface with leaves. A few growths trained round and round the trellis will do that; but the sole beauty of the Petunia lies in the mass of colour they present when well grown. To succeed in having an unbroken sheet of bloom all over the trellis from the pot upwards pinching must be commenced when the plants are not over 3 inches high, and every shoot must have the point taken out when it has grown from 2 to 3 inches. If this treatment is persevered in, and a proper distribution made of the resulting shoots, there will be at least one growing flowering shoot for every square inch on the trellis.

Petunias must not be placed in too large pots or in greasy mixtures that are supposed to be rich. For decorative plants 4 or 5-inch pots are sufficient, and to maintain the supply repeated batches can be brought forward. When young and vigorous too rich soil causes a too rapid growth, and the flowers, especially those blotched with white, are muddy in colour. Moderately grown the purity of the white is untarnished, and its proportion is greater than when too great vigour is maintained. Moreover, under such conditions the plants do not become so rapidly ungainly in appearance.

After flowering for some time, however, signs of exhaustion show; the growths fail to lengthen, the leaves turn sickly yellow, and flowering fails. This should be anticipated and prevented by judicious applications of liquid manure. For sitting-rooms nothing equals nitrate of potash. It is cheap, a first-rate stimulant, and gives out no evil-smelling or unwholesome gas. In glass houses not adjoining living-rooms, guano water, or any stimulant made from animal manure or soot, is good, none being cheaper, because taking neither money nor time, than weak sewage or urine, and none is more satisfactory. Judiciously applied such feeding will keep Petunias growing a whole summer in pots apparently far too small.

Large plants on trellises of course require larger pots, but "the more hurry the worse speed" if it is tried to get up large plants quickly by giving large shifts into rich soil. Petunia roots do not take well with such, and greater progress will be gained by giving small shifts, using sweet open material enriched either beforehand—that is, by loam enriched long before use—or at the time with only very fine bonemeal or Standen's manure. An 8-inch pot will sustain a densely covered trellis of 12 square feet, a 10-inch 20 square feet, and a 12 over 30 feet. Strong-growing varieties should be used for the larger plants, smaller growers for the lesser size.

And what an ado about a plant that grows everywhere like a weed! It grows much too well, and hence it is neglected or half grown. As too often seen Petunias are not half nor quarter the ornaments they ought to be. In one case they are grown strongly and the colour ruined; unpinched, and few blooms the result. In another they are starved and unsatisfactory. When properly grown they are green and neat before blooming, and solid with colour when in bloom.—SCOTIA.

REVIEW OF BOOK.

Handbook to the Ferns of British India, Ceylon, and the Malay Peninsula. By COL. R. H. BEDDOME, F.L.S. Calcutta: Thacker, Spink, and Co. London: W. Thacker & Co.

INDIAN Ferns comprise many of the most beautiful of those now so largely cultivated in England; and though there is not a very great number restricted to that portion of Asia known as British India, a large proportion of the tropical species from the Old World have been introduced to England directly from India owing to the frequent intercourse with this country. They, therefore, have considerable interest in what may be termed an historical point of view, and when to this is added the fact that the really elegant and beautiful species are so abundant, it can be imagined that a work devoted solely to them must possess a large share of value and utility. The author of the work now under consideration is well qualified for the task he has undertaken, having, during a long residence in the Indian peninsula, become familiarly acquainted with the native Ferns, and he has proved by the works previously issued by him—viz., "The Ferns of British India," "The Ferns of Southern India," and the "Flora Sylvatica of Southern India,"

that he has acquired, in a considerable degree, that accuracy of discrimination and observation which distinguishes the best practical botanists. In reference to these, however, it is remarked in the preface that they were "compiled in India without access to libraries or to any herbarium with typical specimen. He has now had the advantage of going thoroughly through the Wallichian Ferns at the Linnæan, the large collections at Kew and in the British Museum, and of comparing his own collections with typical forms, and he is besides indebted to Messrs. Baker & Clarke, especially in the determination of all critical forms, so that he has been able, he believes, to clear up many doubts and to correct many errors." This last production may therefore be taken to be as reliable as the careful labour of a competent observer can make it, and after full examination of it we can only express our unqualified approval of it in this respect.

About 700 species and varieties are fully described, 500 pages being

Diplazium, Anisogonium, and Hemidictyum are separately treated in one work, while they are arranged under Asplenium in the other; similar instances occurring with the Polypodiums, which, according to Hooker and Baker, include Goniopteris, Dictyopteris, and Goniophlebium, while Beddome raises these to distinct genera. This is a matter perhaps of small moment, and possibly is an advantage rather than otherwise in a work of this character, especially where the number of species is small in the several sections, and often the difference in habit is very great and striking when the characters of the fructification are so nearly alike that they can be scarcely separated.

The geographical limits assigned to the work comprise British India, Ceylon, and the Malay Peninsula—a most extensive and fertile portion of the globe, and which in certain portions and to great elevations abounds in members of the great family Filices. Not only are the strictly native Ferns abundant, but we there find many of our own British species sharing the soil with their tropical allies, and strange indeed it must seem to the traveller from England who first observes the common Bracken growing as vigorously under the torrid zone as in our temperate climate. Many other well-known British Ferns also appear in these regions, and among them the following may be briefly noted:—*Adiantum Capillus-Veneris* is found in the Madras Presidency on the west side, and is common on banks of rivers, in the plains, and up to 5000 feet on the mountains, also in Ceylon and Northern India. Several *Aspleniums* are similarly abundant. *A. Trichomanes* is found at Kulhatty, on the Nilgherries, in the Himalayas from Kashmir to Kumaon at 5000 to 10,000 feet elevation. *A. septentrionale* grows in Northern India at Kashmir from 9000 to 12,000 feet above the sea level, and at Gurwhal at 8000 feet. The Wall Rue, *A. Ruta-muraria*, is found in Kashmir, as also is *A. Adiantum nigrum* up to 8000 feet. *Athyrium Filix-fœmina*, with seven varieties, is chiefly confined to the Himalayas at elevations varying from 6000 to 15,000 feet. The Male Fern, *Lastrea Filix-mas*, is found throughout the Indian region, but generally confined to the mountains at great elevations. The Royal Fern, *Osmunda regalis*, is, says Colonel Beddome, chiefly wild in "South India, common on the western mountains at the higher elevations, North India, Kumaon, Bhotan, and Khasya at 4000 to 6000 feet elevation. It is usually small, the fertile and barren fronds separate." Lastly, the Adder's Tongue *Ophioglossum vulgatum*, is a native of Sikkim, Goke, at 4000 feet above the sea, at Runjait Camp and below Darjeeling, at 2000 feet elevation.

Genera typical of India are not numerous, but some are strongly represented, and amongst them *Asplenium*, *Cheilanthes*, *Davallia*, *Hymenophyllum*, *Lastrea*, *Nephrodium*, *Pleopeltis*, *Pteris*, and *Trichomanes* are the most notable. Eleven *Hymenophyllums* are enumerated, and of these several, such as *H. parvifolium*, *tenellum*, *exsertum*, *Simonsianum*, and *Levingii*, are confined to the districts included in the scope of this work; others that are more widely distributed are *H. polyanthos*, *H. javanicum*, and *H. ciliatum*, the two latter being also found in New Zealand. Nineteen *Trichomanes* are described as natives of India, the principal indigenous species being *exiguum*, *nilgherrense*, *Henziaenum*, *Kurzii*, *intramarginale*, and *birmanicum*. Thirty-eight *Aspleniums* are mentioned, twenty *Diplaziums*, twelve *Aspidiums*, forty-six *Lastreas*, nineteen *Nephrodiums*, eighteen *Polypodiums*, thirteen *Nipholobolus*, and thirty-five *Pleopeltis*. The charming little *Cheilanthes* may almost be considered typical Indian Ferns, the former comprising twelve species, of which *mysorensis*, *fragilis*, *varians*, *subvillosa*, *albo-marginata*, *rufa*, and *argentea* are either solely Indian or at least confined to Asia. Several of these are most graceful and attractive with their delicately powdered silver and golden fronds, but unfortunately they are found very difficult to manage satisfactorily under cultivation.

As already stated the illustrations are admirable, most accurately and delicately executed, with enlarged representations of fertile pinnæ or pinnules and the sori. A defect, however, is noticeable—namely, that the proportion of the figure to the plant is not stated, though of course this can be ascertained by reference to the descriptions where the size of frond and height of the plant are mentioned;

still it would have been an advantage if it had accompanied the plates, as most of them are greatly reduced. As examples of the descriptions and plates we have selected two—namely, *Doryopteris ludens* and *Drymoglossum piloselloides*, both interesting and curious species.

DORYOPTERIS (*J. Smith*).

(*Dory*, spear; *pterus*, form of the fronds.)

Fronds small, sub-pedate or sagittate, in texture and colour like *Pellaea*; veins copiously anastomosing, without free included veinlets; the rest as in *Pteris*.

1, *DORYOPTERIS LUDENS* (*Wall.*).—Rhizome creeping, furnished with linear adpressed brown scales which have white margins; stipes solitary distant, polished, sometimes with a few scales, and often with dusky subtomentose pubescence at base and apex; barren frond on a stipe 3 to 4 inches long, triangular with two slightly deflexed basal lobes, to hastate with two

Fig 28.—DORYOPTERIS LUDENS.

devoted to this and 300 excellent plates (woodcuts), which would alone render the book a most welcome addition to the pteridologists' library. It is modestly described as a digest of the information in Sir W. Hooker's "Species Filicum" and "Synopsis Filicum," Mr. J. Smith's "Historia Filicum," and the other works of Col. Beddome himself and Mr. Clarke. The descriptions of sub-orders, tribes, and genera are mostly the same as those in the "Synopsis Filicum," and the characters of the species are also only slightly modified, a few being original, and some having been taken entire from the "Synopsis" above mentioned. The general order of arrangement is also the same, with the exception that most of the sections of genera or sub-genera are raised to the rank of genera. For example—*Humata*, *Leucostegia*, *Microlepis*, and *Stenoloma* are all described by Col. Beddome as genera; while in the "Synopsis Filicum" they are merely sections of the genus *Davallia*. Again, *Athyrium*,

basal and two large spreading lateral lobes, the margin entire; fertile frond on a stipe often 12 inches long, 4 to 6 inches each way, cut down into five linear-lanceolate or lanceolate lobes, one erect, two spreading and two deflexed, of which all except the last are sometimes again forked; texture coriaceous; costa polished; veins hidden; sori continuous all round the margin. *Wall. Cat. 88. Hook. Syn. Fil. 166. Clarke, F. N. I. 470. Litobrochia ludens and pedata, Bedd. F. N. I. t. 26 and 27.*

Chittagong Hills up to 1000 feet elevation; Orissa, on the Balasore Hills; Birma. (A specimen in Wight's herbarium of this or an allied species is supposed to be from the Dindigul mountains in the Madras Presidency; but it has never been found there of late.)

Also in the Philippine islands.

DRYMOGLOSSUM (Presl.).

(*Drymos*, wood; *glossa*, tongue.)

2, **DRYMOGLOSSUM PILOSELLOIDES (Presl.).**—Rhizome long filiform, wiry, clothed with adpressed, diamond-shaped, peltate, lacinated scales, which are sometimes hair-pointed; stipes about 2 lines long in the sterile, often about 1 inch long in the fertile fronds; fronds dimorphous, the barren ones roundish or obovate, half to 2 inches long, three-quarters of an inch broad, very thick and fleshy, and when young more or less covered with stellate hairs; the fertile ones 2 to 4 inches long, one-eighth to one-fourth of an inch broad; veins immersed, areoles with copious free veinlets; sori in broad continuous marginal lines, often at length confluent and covering the whole under surface; capsules mixed with a few stellate paraphyses. *Presl. Tent. Pterid. 227, t. 10. Bedd. F. S. I. t. 55 and F. S. I. t. 186 (Niphobolus nummularifolius).*

Bengal Plains; Birma; Ceylon; South India, common in the Malabar plains (Calicut, &c., on trees) also on the mountains, up to about 2000 feet elevation (Anamallays, Wynad, Coorg, &c.)

Also in Java, Philippines, and Japan.

With regard to the last-named plant, it may be remarked that a specimen at Kew differs widely from the figure, the fronds being much larger, more ovate in form, and decidedly less ornamental in appearance. Probably, however, this is due to cultivation, which often destroys the typical characters of plants. It may be further added that a variety distinguished by stellate hairs and more pointed scales has been named *Beddomei* by Mr. Clarke in honour of Col. Beddome.

As regards printing, paper, type, binding, and general finish the work is all that could be desired, and will undoubtedly be welcomed by many lovers of Ferns both at home and in our Indian empire.

APPLE MR. GLADSTONE.

CAN any of your readers inform me through the Journal who was the raiser of the Apple Mr. Gladstone? I was not aware but what it was sent out some time ago. We have a tree of it from Messrs. Charles Lee & Son, Hammersmith, two years ago. Having been at the Royal Horticultural Society's Gardens last Tuesday I saw it there, and could see it was exactly the same kind as mine. I could have exhibited a much better sample than I saw there, and if I had done so who would have had a right to the certificate?—G. T.

[We do not know the origin of this Apple, which we suspect has been in cultivation for some years. Perhaps Mr. Bunyard or Mr. Killick, both of whom grow it, may be able to give information on the point. If our correspondent had staged better fruit than that exhibited at the meeting in question he would presumably have had a certificate. Can any of our correspondents inform us who named this Apple "Mr. Gladstone."]

PEA EVOLUTION.

I HAVE grown this new Pea of Mr. Laxton's during the present season, and it appears to me to well keep up that character of *multum in parvo* which is one of the chief characteristics of Mr. Laxton's seedlings. As Mr. Ward said the other week, Evolution is essentially a Pea that must be sown thinly, partly from its branching habit, and partly from its broad strong foliage. I am of opinion that we often breed weakness in our Peas, and by so doing invite disease, as mildew—to say nothing of the waste of valuable seed—by our habit of sowing too thickly. Now Evolution and Omega, and indeed most of Mr. Laxton's Peas, must be sown thinly, or mischief will follow. Evolution grew with me this year 3½ to 4 feet high. It produced flowers soon followed by stout and straight well-filled pods, containing eight and nine peas in a pod. This very characteristic of strong and well-filled pods will enhance its value materially in a market point of view, as peas with thin and flabby pods with knocking about soon look bruised and unsaleable at good prices. Summing up, it does not require much consideration to predict a useful future for Evolution, it having all the good qualities already mentioned, which we may now tabulate thus:—

1, Economy of seed, by thin sowing; 2, Shortness of haulm, not re-

quiring high sticks; 3, Quickness of produce, soon ready; 4, Strength and fulness of pod and pea; and 5, Pleasant flavour when cooked.—N. H. POWNALL, *Lenton Hall Gardens.*

THE GLAMORGANSHIRE SHOW.

THIS Show was held at Cardiff on August 15th. The exhibits were displayed in six or seven large tents, which were erected in a field adjoining the Sophia Gardens, and although rather a strong wind was blowing the day was a very enjoyable one. As a rule this Show is largely supported by exhibitors, sightseers, and subscribers from all parts of South Wales and Monmouthshire; and this year's Show fortunately proved no exception to its predecessors, as the patronage was very good, the exhibits numerous and of high quality generally, and the management was all that could be desired, as Mr. H. F. Lynch Blossie, the Hon. Sec., and Mr. J. G. Jones, the Assistant Sec., are unremitting in their attentions to all the details which concern the well-being of the Society and Show. In times gone by the weather has occasionally interfered with the harmony of the proceedings, but the

Fig. 29.—*DRYMOGLOSSUM PILOSELLOIDES.*

perseverance is constant and we have no doubt success will be the ultimate result.

The finest of the plants were shown in the largest tents and formed highly attractive features. Owing to the absence of distant exhibitors, such as Mr. Cypher and others of equal note, the smaller local exhibitors had a good time of it and secured the chief plant prizes; but as they have been striving for this for some years many of their specimens richly deserved the highest distinction. This was especially the case with the eight distinct exotic Ferns shown by Mr. Woodward, gardener to C. Luard, Esq., Llandaff House, Cardiff, who had some grand specimens, including *Gymnogramma chrysophylla*, *Davallia Mooreana*, *Adiantum tenerum*, and *A. farleyense* 6 feet

in diameter and as much in height. This was a noble magnificently furnished specimen, and undoubtedly the best plant in the Show. The £15 prize for twelve stove and greenhouse plants was taken by Mr. Hemming, gardener to James Howell, Esq., Cardiff, who had well-grown examples, including some finely bloomed plants of *Dipladenia hybrida*, *Allamanda Schottii*, and *Ixora Williamsi*. Most of the other fine-foliaged plant prizes were secured by the same exhibitor, and Fuchsias were shown in splendid order by Colonel Hill, Rookwood, Cardiff. Hardy Ferns were exhibited in grand form from the garden of Sir George Walker, Cardiff, and in the same tent the Zonal Pelargoniums made a most effective display. The double-flowering varieties especially had an astonishing number of massive heads of the richest colours.

In the nurserymen's Rose class the premier position was taken up by Mr. Stephen Treseder, Ely Road Nurseries, Cardiff. Mr. Earl, Newport, won the second prize. In Mr. Treseder's stands there were many really fine well-developed perfect blooms. Louise Doré, Madame Eugène Verdier, Horace Vernet, Marie Baumann, Alfred Colomb, Mrs. Jowitt and A. K. Williams being of the very highest merit. In the open class for Tea Roses Mr. Treseder was again to the fore with a rich selection. Near to these Mr. Crossling, of the Penarth Nurseries, Cardiff, exhibited a splendid stand of Tea Roses, and considering that the whole of them were open-air blooms his soil and situation must be most favourable to the development of the Rose. Dahlias, Gladioli, and Phloxes were shown extensively. Gloxinias and Balsams were very poor, but Achimenes were good. Hollyhocks might very well be left out of the list, as the competition here is always weak.

Fruit always form an interesting section, but this year the Grapes, Pines, and Melons were not up to former excellency. The judging, too, was very unsatisfactory, as, for instance, three bunches of Black Alicantes which should have been shown in the Any variety black class were placed with the Black Hamburgs, and were awarded first prize in the Hamburg class. Noted florists are no doubt useful among florist flowers, but the Cardiff Committee might profit by remembering that practical fruit and vegetable growers are best able to adjudicate on productions of this kind. The first prize-collection of Grapes from Mr. F. Case was strong in variety but poor in quality, all the bunches being small and the majority of them barely ripe; but there was worse than them there in several exhibits of Madresfield Court, which were really perfectly unfit for either showing or eating. For three bunches of Muscat of Alexandria, Mr. Hawkins, gardener to Colonel Turbeville, Ewening Priory, Bridgend, was first with excellently coloured bunches. The best Pine Apples came from Mr. Crawshay Bailey, and the first prize, nine dishes of fruit, from the Misses Rous, Colonel Page being second and Mr. Hawkins third. Good Grapes, Peaches, Nectarines, Figs, and Plums were the leading dishes in all these collections. Melons were numerous, the fruits being chiefly of average size and rich colour. Carter's Blenheim Orange was very conspicuous. For the best of any kind, Colonel Lee, Dinas Powis, was first, and Mr. J. Ayres, Cardiff, second, with William Tillery. We have seen the Apples, Pears, and Plums much better at this Show, and Peaches and Nectarines more numerous, but the fruiting Vines in pots from Mr. C. Thomson and Colonel Page were grand.

The Vegetable section was well filled as usual, the open class for nine dishes being the centre of attraction and contention. Here Mr. J. Muir, Margam Park, Taibach, was first with excellent produce, the kinds being Defiance Celery, Muir's new hybrid Vegetable Marrow, Snowball Cauliflower, Giant Marrow Pea, Glamorgan Tomato, Porter's Potato, Suttons' Champion Runner Bean, Stumprooted Carrot, and Giant Zittau Onion—a grand dish, two dozen bulbs weighing 24 lbs. Mr. Moor, Coedriglan, was second with some fine produce, and Colonel Page third. The single-dish classes of vegetables were well filled, and the cottagers' vegetable tent was highly creditable to this class, both in quantity and quality.

The dinner-table decorations had many admirers. Many of the vases of cut flowers were exceedingly pretty, and the most charming of all were those filled chiefly with common flowers and wild grasses.

WE may remind those of our readers who are interested in the DAHLIA that the grand annual Show of this queen of autumn flowers at the Crystal Palace is near at hand, Friday next, August 24th, being the last day fixed for sending in entries. The Show itself opens on the 31st inst., and, as Dahlias are blooming well and early this season, a good display may be anticipated on this occasion. We note that over £100 are offered in prizes, and that the schedule makes provision for the exhibition of all kinds and conditions of the flowers—Show varieties, Fancies, pompons, and singles—so that we may look for a thorough and complete illustration of the different types which have been evolved since the Dahlia came into the hands of the florist. The Dahlia is an autumn flower which none of us can afford to spare whatever type may be preferred by each; and we therefore trust that this second "Grand National" Show may be thoroughly worthy of its object, and serve to bring the flower again into more general notice; the more so, in that every possible taste may now be fully satisfied. We understand that the Committee have made arrangements by which town and country friends and admirers of the Dahlia may meet and enjoy a social

chat over a modest luncheon. May they each carry away pleasant recollections of the *réunion*.

— A CORRESPONDENT describes *MICROSPERMA BARTONIOIDES* as one of the prettiest of annuals for greenhouse decoration during the summer months. It is neat and dwarf, and though it branches freely it never looks untidy. The leaves are not unlike those of the Chinese Primrose, though they are rough with stiff hairs, as are also the stems. The flowers are extremely elegant, and somewhat resemble *Bartonia*. They are of the most lovely lemon colour imaginable, and have the centres filled with a thin brush of stamens. It is found to be valuable for the purpose above mentioned by Mr. Lynch at Cambridge.

— CHARMING as a greenhouse climber in the Cambridge Botanic Garden is *LOASA LATERITIA*. Its habit is most graceful for this purpose, and the red flowers are uncommon-looking, while the twisted fruits are also interesting. Several of the *Loasæ* are good for greenhouse culture. *Loasa vulcanica*, which is one of the best with white flowers, and *Microsperma bartonioides* are in company with the above, and *Bartonia aurea* is used for the spring. *Loasa vulcanica* is very fine if planted out and taken up when the flowers appear.

— AS growing upon the rockery in the same garden *DRACOCEPHALUM ARGUNENSE* appears to be one of the best of the kinds. It is a perfect perennial, and grows in a tuft about a foot high. The leaves are narrowly lanceolate, and the flowers, which are whorled in terminal racemes, are of large size with bellied throats and of purplish blue colour. It is a Siberian species.

— NOT by any means common, yet very distinct, is *GLADIOLUS PURPUREO-AURATUS*, which appears to be quite hardy in a sheltered position. The flowers are more bell-like than those of other cultivated kinds, and are of greenish yellow colour, with bands of purple on the three lower segments. Though not showy it is handsome in its way, and is worth growing for the character it affords among commoner-looking plants. It was introduced from Natal about ten years ago.

— AN experienced cultivator recommends *SILENE SHAFTA* as valuable for every rockwork, being extremely pretty with red flowers at various times of the year, and because when once planted it is sure to take care of itself. It is, however, by no means rampant or coarse in habit, but, on the contrary, forms a neat tuft of some few inches only in height. The stems are slender and bear small obovate pointed leaves, and the flowers are rather larger than a shilling. It is easily increased by division or seeds. A native of the Caucasus.

— AMONG decorative plants *SALVIA GRAHAMI PURPUREA* is one of the large collection of kinds which just now attract attention. It is like *S. Grahmi* in every particular but that of colour, which is precisely the crimson lake of the artists, and is very rich and good. Sprays are very elegant for mixing with other cut flowers.

— A CORRESPONDENT sends us the following note on the FRUIT CROPS IN FIFESHIRE:—"For many years the fruit crops have been inferior both in quantity and quality in the above county. Indeed, since 1870 no really heavy crops of first-rate fruit have been had. This year, however, the crops of almost everything are extremely heavy. Gooseberries in most places almost broke down the bushes. Raspberries and Strawberries have been particularly fine, and other small fruits good. In Ramornie Gardens, Ladybank, the Apple trees under the care of Mr. George Blyth are loaded with fruit in almost every instance, and the Plum crop is good both on standards and the walls. Pears are, in some instances, very good, and Cherries were very fine. All that is wanted is a good autumn to fill the fruit-rooms and the cooks' jars. At present the Apples are rather small, partly owing to the enormous crop, partly to the rather backward season; but it is hoped the fine weather now being enjoyed will continue."

— REFERRING to the EFFECTS OF LIME ON VINES the same correspondent observes:—"In the garden above alluded to the Vines have very considerably improved, chiefly in consequence of the application of lime. The soil is very light and sandy. Bones have been given to supply phosphoric acid. In consequence of former heavy applications of urine and ordinary manure, potash and humus are plentifully present. As is well known, these applications tend to cause even a large amount of lime to disappear. When the soil, as in this case, contains none, it is easy to foretell that the application of lime to such a lime-loving plant will cause rapid improvement. The Vines in question were very much

exhausted, but already very marked improvement can be seen, and this season a very heavy crop of useful well-finished fruit is being used."

— DR. MOHN, in describing Jan Mayen Island, which is in the North Atlantic Ocean, off the coast of Lapland (lat. 71° north) gives the following LIST OF PLANTS that were "collected by Dr. Danielsen on the isthmus south of Mary Muss Bay, and which are examples of sub-arctic flora:—*Saxifraga cæspitosa*, *S. nivalis*, *S. oppositifolia*, *S. rivularis*, *Halianthus peploides*, *Cerastium alpinum*, *Draba corymbosa*, *Cochlearia officinalis*, *Oxyria digyna*, and *Catabrosa algida*. This is a very meagre flora, but bright herbage is not wanting. The green carpet of moss in places of considerable extent forms a striking and pleasing contrast to the black, brown, and red of the surrounding rocks."

— THE "Proceedings of the LIVERPOOL NATURALISTS' FIELD CLUB" for the year 1882-83 is now issued, and contains an account of the numerous excursions and evening meetings held during the year, together with the names of all who have gained prizes, and a list of books and scientific apparatus useful in the pursuit of natural history. The address of the President, the Rev. H. H. Higgins, M.A., is also given—namely, "Notes on Grange-over-Sands by an Invalid Field Naturalist," which contains a great amount of interesting information respecting the natural history of the district, especially the botany, which is ably dealt with. The Society has a large number of members, and the financial account for the year shows a balance in their favour of £82 8s. 5d.—convincing proof that the objects are well appreciated.

— IN the course of the above address occurs the following interesting passage respecting a search for AQUATIC PLANTS:—"In the water just below the margin, and amongst the grass on the bank, are two plants which as well deserve to be considered interesting as the tower-like trees of the Yosemite. The water-plant looks to be a tuft of tiny Leeks, 2 inches in length and growing on a stock; it is the Quillwort, *Isoetes*. The other in the mossy grass close by is like a single upright stem of a Moss; it is the Lesser Club-moss, *Lycopodium Selaginella*. These two little herbs have been dropped by the wayside out of the great imperial procession of the plants along the ages, from the green vegetation of the coal fields to the gorgeously painted flora which now adorns our world. They increase in the same primitive way with most of the coal plants. Each of them has two kinds of spores, a large and a little kind, and these indicate the small beginnings of that magnificent, phanerogamic, twofold arrangement of anther and pistil, in which the animal and vegetable kingdoms have been associated to cover field and forest with beauty. The two kinds of spores in *Selaginella* are at the base of bracteal scales on the stem, but in the Quillwort they are in the rootstock. The coal vegetation was chiefly of two kinds—Ferns and the like of Club-mosses. The Ferns seem already to have attained their climax, and to have ceased progressive development. Their type had gone as far as it was fitted to go. Ferns were probably at least as various and as beautiful then as they are now. But the Club-mosses and their allies were then large trees, *Sigillariæ* 60 feet in height. Their type has gone on through the Cycads to develop into our glorious horizon of flowering plants, whilst the *Sigillariæ* themselves have so ill prospered as to have few better representatives than our two little plants on the borders of the rivulet."

— ONE of the illustrated London periodicals contains the following respecting GLOUCESTERSHIRE GARDENING ORTHOGRAPHY:—"With all the fuss that has been made of late years about education, the schoolmaster seems to have been strangely absent from a little town in Gloucestershire which boasts a Mayor and Corporation, and where the following notice has recently been put up by a gardener:—Plants for Zale Hin Heere Kalliflour, Brokaler, Weentur Greene, Raggit Jak, Kottigurs Cale, Brussels Sprowts, Sprouting Brokla, Sallery Plants for Zale."

— BESIDES being interesting by reason of its economic and medicinal value, the SCAMMONY (*CONVOLVULUS SCAMMONIA*) commends itself as a hardy ornamental climber. Anyone visiting the College Botanic Garden, Dublin, just now will be inclined to agree with this estimate of it on seeing a plant of it growing in one of the grass plots, and wreathing the dry bush provided for it to ramble over with its pretty deep green arrow-head-like leaves and abundance of small white *Convolvulus*-like flowers. Near it is growing in the same way, but not yet in flower, the kindred Jalap plant, *Convolvulus Jalapa*.—(*Irish Farmers' Gazette*.)

— A CORRESPONDENT writes that the EASTBOURNE FLOWER

SHOW was held on August 15th by the kind permission of Mr. and Lady Howard in the park adjoining the grounds of Compton Place, which were also open to the public. The Show was a great improvement on last year in everything except the large plants, which, although as good in quality, were not so numerous, owing, no doubt, to a reduction in number of prizes. There were about 100 bunches of Grapes exhibited in the various classes provided for them. In the plant classes Mr. Gilbert, nurseryman, Hastings; Mr. Rann, The Gardens, Honduras Park, Crawley; Mr. Jupp, gardener to G. Boulton, Esq., Torfield, Eastbourne; Mr. Matthews, gardener to G. Matthey, Esq., Rosemount; Mr. Gore, gardener to Captain Taylor, Glenleigh; and Mr. Martin, gardener to J. G. Langham, Esq., Westdown, were the principal prizetakers. But the great feature in the Show was the beautiful group of Ferns arranged for effect in a most pleasing and natural style by Mr. McBean of the home for Maidenhair Ferns, Cooksbridge. In the smaller classes Mr. Huggett, gardener to Dr. Jeffreys; Mr. Siggs, gardener to Lady Superior, Connalescent Home; Mr. Gilbert; Mr. Gore; Mr. Gregory, gardener to Admiral Maxse, Avolon House; Mr. Piper, nurseryman, Uckfield; Mr. Mitchell, Piltdown Nursery; Mr. Woollard, Cooksbridge; and Mr. Edwards, Three Bridges, were the most successful. In the fruit classes Mr. Williams, gardener to F. Liddell, Esq., Peasmarsh; Mr. Gore; Mr. Dixon, gardener to Sir S. M. M. Wilson, Uckfield; Mr. Hopkins, gardener to R. Thornton, Esq., Framfield; Mr. A. McBean, gardener to C. P. Wragge, Esq.; and Mr. Chatfield, gardener to J. Holman, Esq., secured the principal prizes with creditable produce.

— IN reference to TREE-PLANTING IN MEXICO the *Times* gives the following note:—"The Mexican Government has concluded a contract with Mr. Oscar A. Droege to plant 9,000,000 of trees in the Valley of Mexico within four years, commencing March 15th, 1884. Half a million trees a year are to be planted in such places as the Government shall decide. The contractor pledges himself to establish a number of nurseries, and to have in them each year at least 80,000 *Asb*, 35,000 Willows, 120,000 *Poplars*, 60,000 *Eucalyptus* trees, 60,000 Mountain Cypress Cedars, 60,000 *Acacias*, and 120,000 of miscellaneous varieties. The trees must be in plantations of from 50,000 to 100,000 each, and Mr. Droege has to maintain them for two years after planting. He is not compelled to plant trees along the highways, however. Three graduates of the School of Agriculture are to be received into the nurseries each year, there to study the science of forestry. He is also to raise fruit and other useful plants for free distribution. There is to be translated from the German every year a work on arboriculture of recognised merit. An inspector is to superintend, and Mr. Droege is to receive annually 40,000 dols. till the sum reaches a total of 200,000 dols."

— THE twenty-fourth annual Exhibition of the KEEVIL DISTRICT HORTICULTURAL SOCIETY was held on August 15th at Eood Ashton Park, Trowbridge, the beautiful seat of W. H. Long, Esq., M.P. The site chosen was an extremely pretty one, and the grounds also being thrown open to the visitors, formed an additional attraction. The primary object of the Society, which comprises several parishes, is the encouragement of industry, cleanliness, and good gardening among cottagers, and in this they have been most successful. The cottagers' tent was filled with vegetables of all kinds, which were really generally superior in quality to those shown by professional gardeners. A fairly liberal amount in prizes is offered for plants and fruit to be shown by amateurs and gardeners, as without the exhibits resulting the Show would not be sufficiently attractive. *Fuchsias* are always to be seen in fine condition at any Wilts or Somerset Show, and the present was no exception to the rule. The best six staged by the gardener to Dr. Hitchcock consisted of fine well-bloomed pyramids. The best six stove and greenhouse flowering plants were exhibited by Mr. G. Tucker, gardener to Major W. P. Clarke, Devizes. The best six fine-foliaged plants were staged by Mr. C. N. May. The first-prize group of twelve Ferns were shown by Mr. G. Tucker, and were healthy, even, and well grown. Messrs. G. Cooling & Son, Bath, exhibited a considerable number of cut *Roses* and *Dahlias*, the former being for the time of year exceptionally good. Fruit was shown in rather small quantities, but included many fine examples. Mr. A. Miller obtained the first prize for a collection of six varieties with fairly good Black Hamburgh and Foster's Seedling Grapes, a Queen Pine Apple, Melon, Peaches, and Nectarines. The same exhibitor was first with black Grapes, having Lady Downe's well ripened, Peaches and Nectarines being also well and successfully shown by him; Apples by Mr. A. T. Hall, Bath, and Mr. E. Wall, Bath; and Plums by

Messrs. Morris and A. T. Hall. The best collection of nine varieties of vegetables were shown by Mr. Miller, Mr. Jordan being second; and the best six varieties by Mr. Shadwell, Mr. Jordan again being second, the produce in each instance being most praiseworthy. Mr. J. I. Watts is the Honorary Secretary of the Society, and to his exertions much of the success is due.

— THE forty-fourth annual meeting of the ROYAL BOTANIC SOCIETY was held on the 10th in the gardens, Regent's Park, Mr. J. P. Gassiot, Vice-President, in the chair. The annual reports of the Council and Auditors were read, from which it appears that the Society has fully maintained the position occupied during so many years. The total receipts for the year amounted to £6651 18s. 4d. The summer exhibitions continue to maintain their standard of excellence, that of June being particularly rich in Orchids, and the large and ever-increasing number of new plants, or new horticultural varieties of old favourites brought forward for certificates of merit, illustrates the value of these exhibitions. The Chairman called the attention of the Fellows to the great public benefit conferred by the Society in the gratuitous assistance which it renders to a large number of students engaged in the scientific pursuit of botany. During the last year nearly 60,000 cut specimens of plants were distributed for the purposes of study, and tickets of free admission were granted to 836 students and artists for periods of from one to six months.

ASHTON COURT.

WE took the opportunity when in Bristol lately of paying a visit to Ashton Court, which is in its immediate vicinity. This fine place, which is the principal seat of Sir Greville Smyth, Bart., has long enjoyed a reputation for its beauty and attractiveness in the west of England, and its name has been rendered familiar by the success of Mr. Austen, the head gardener, as a competitor with fruit and vegetables at the principal shows in the kingdom. Ashton Court is very pleasantly situated on the western or Somerset side of the Avon, almost immediately opposite the famous Clifton Suspension Bridge. Few situations are more picturesque. The grounds are very extensive, comprising in all about 1100 acres enclosed in a ring fence about seven miles in circumference. They are beautifully diversified, swelling up to ridges which have the dimensions of little hills, and sloping down to flat levels in the direction of the river. Plantations have been skilfully planted to serve the purpose of ornamentation and supply cover, and in the wide range of the park are to be seen splendid specimens of forest trees which grow here most luxuriantly. Noteworthy amongst them are a number of grand Elms growing in individual majesty, and also in a beautiful avenue formed of these noble trees. Picturesqueness is imported to the park by groups of deer, of which there are some 600 or 700. In the neighbourhood of the home farm are to be seen some of the valuable prize cattle which have won a name for Sir Greville Smyth's herd amongst stock-raisers. The whole aspect of the place gives an idea of richness and luxuriance arising from a happy combination of good soil, situation, and climate, with skilful and judicious management.

The mansion stands on a medium elevation overlooking the valley of the Avon, with a fine outlook from its southern front, embracing to the right the whole range of the nearer Mendip Hills crowned by the conspicuous form of Dundry Church Tower, and to the left the terraces of Clifton and a part of Clifton Downs. The building is large and imposing. Its southern front extends to about 200 feet or more in length, and the elevation shows two principal storeys with a line of small circular windows above. It has a central tower with two turrets. The portion of the building to the right of this tower is evidently the more ancient. In the other portion to the left, while a general similarity of style has been preserved, certain alterations have been made to conform it more to modern ideas.

Sloping gently downwards from the southern front of the mansion is a large and tastefully laid out flower garden, enclosed at each side by a low ornamental stone wall and sunk fence, which separates it from the lower-lying ground beyond. The centre bed in this flower garden forms a cross with equal sides, which terminate in sharp points. It measures 45 feet either way, and is planted in the centre with a group of *Dahlia alba*, the dark-leaved *Canna Adriani* Rohina. On the outside portion are four circular groups of *Lobelia cardinalis* and *Salvia patens*. The edging consists of a band of *Cerastium tomentosum*, immediately inside of which is a single row of *Festuca glauca*, the intervening spaces being filled with yellow *Calceolaria*. At right angles to this are two Maltese crosses and two Catherine wheels. The two former have centres of scarlet *Pelargonium Ferdinand de Lesseps*, and the four cross sections the pink variety *Lady Bockworth*. The spaces intervening between the pink and blue *Lobelia* edging are filled (in two of the sections) with *Centaurea* and *Leucophyton Brownii* mixed, and the other two with *Iresine*. The divisions of the Catherine wheel are planted with *Centaurea* and bronze *Pelargoniums*, interspersed with yellow *Violas* and *Iresines*. On each side, at the end of the garden next to the park, is a large bed, the same in shape and dimensions as the cross in the centre, having groups of *Dahlia Paragon* and green-leaved *Cannas* for centres. Scarlet *Vesuvius Pelargonium* is the predominating colour here.

Besides this the beds have two bands of *Ageratum* and an edging of *Cerastium tomentosum*. Running parallel with the walks are a series of beds of various shapes and designs, such as *Fleur de Luce*, rams' horns, shells, ovals, &c., devoted to carpet bedding. Two shields with raised sides, about 6 inches above the turf, have a broad edging of *Sedum glaucum*; the centre and groundwork is *Veronica repens*, and is perfectly flat. The design is worked out with *Alternanthera amœna* and *aurea*, *Antennaria tomentosa*, *Kleinia repens*, and divided with various kinds of *Echeveria* and *Sempervivums*, which have a charming effect. Adjoining are two oval beds slightly raised in the centre, with a groundwork of *Alternanthera*, in which are arranged *Mesembryanthemums*, *Sedums*, *Spergula pilifera aurea*, *Antennarias*, *Echeverias*, and *Sempervivums* in great variety. The *fleurs de Luce* are also worked out in various designs, one in particular with varieties of hardy succulents, which are attractive and interesting both in summer and winter. Close to these are four large scrolls planted to match each other. Two are filled with *Mrs. Mappin Pelargonium*, *Kleinia repens*, *Tradescantia multicolor* and *discolor*, and the other two with *Coleus Verschaffeltii*, *Leucophyton Brownii*, and various *Sedums*, all being edged alike with *Echeveria secunda*.

Passing along a broad gravel walk which skirts the bottom of the flower garden, and descending a flight of steps, we find on the right and in a line with the flower garden a piece of very finely planted pleasure-ground, having in the centre an ornamental fountain and basin, on the waters of which are floating the white and yellow *Water Lilies* and other choice aquatic plants. Near to this is a large aviary, containing in separate, roomy, netted enclosures four splendid eagles of different varieties. Some of the ornamental trees in this portion of the ground are about the finest of their kind we have ever seen. Amongst them may be mentioned a specimen of *Cupressus funebris* 30 feet high, which is said to be the largest in this country. Several trees of *Thuja Lobbii* were more than 50 feet high. Standard *Roses*, which grow here most luxuriantly, were skilfully interspersed amongst the trees, giving an impression of great richness and beauty.

Beyond this pleasure ground, and still on the same line with it, we come to a range of glass houses forming two sides of a square. The lawn in front of the main range is laid out with flower beds, in which a freer method of floral arrangement has been followed than in the flower garden proper. The houses are tastefully painted, and have a very elegant appearance. Entering a narrow chamber at the further end, which serves as a sort of vestibule to the range, we found *Lemons* growing in it very luxuriantly, and in the successive houses which we passed through there was much to interest and to suggest skilful management. The first we entered was a lean-to early vinery, 40 feet by 16 feet, and about 14 feet high. The *Grapes* were all gathered some time before our visit. The foliage was clean and healthy, and the *Vines* promised well for future crops. The next vinery is of the same dimensions, and was planted three years ago with *Madresfield Court*, a cane of *Mrs. Pince*, and a seedling white *Grape* grafted on *Pearson's Golden Queen*. Mr. Austen is testing the merits of this *Grape* thoroughly before venturing to give his opinion of it to *Grape-growers*. It is a cross between *Black Hamburgh* and *Muscat of Alexandria*. The bunches and berries are medium-sized, the latter round and of a beautiful straw colour when ripe, with a brisk *Muscat* flavour. It is an early free-bearing variety with a vigorous constitution; and, if we mistake not, it will make a good companion early *Grape* to *Black Hamburgh*. All the *Vines* looked clean and healthy. They have made strong short-jointed canes from 10 to 12 feet in length, were bearing a good crop of large bunches, and the berries of *Madresfield Court* were free from cracking. Mr. Austen, like many others, adopts the plan of giving this variety a thorough watering shortly before the berries commence colouring, and all the lateral shoots are allowed to grow and ramble about as they please. The *Vines* are not watered again till the *Grapes* are all cut, and it is seldom that any of the berries crack when thus treated. A division is formed between the second and third vinery by a small house, in which *Palms*, *Ferns*, and *Lycopodiums* are grown. The back wall is covered with moss, and *Adiantums* and other *Ferns* grow luxuriantly in it. The third vinery is planted entirely with *Hamburghs*, and the fourth with *Muscats*. Though the *Vines* in both houses were carrying good crops of medium-sized bunches, the berries of which appeared to be about the stoning period, yet the leaves were small, and there seemed to be a want of vigour about the *Vines* which Mr. Austen could not account for. They had borne fine crops last year, had ripened their wood well, and their present condition seemed a mystery to him. The roots of the *Muscats* were lifted some four years since, and the *Grapes* grown in this house took the first prize at the Manchester International Fruit Show in a class where there were no less than forty competitors, which says a great deal for the condition the *Vines* were in then, and also for the management of them.

Since the above notes were written we have received a letter from Mr. Austen informing us that a few days after our visit to Ashton Court he made a thorough examination of the roots in both vineries, and found them to be covered with what he thought to be *Phylloxera*. He forwarded a quantity of them to Dr. Hogg, and the next morning he received the following telegram—"It is a bad attack of *Phylloxera*, destroy the *Vines* at once." We cannot but feel sorry for Mr. Austen's misfortune in being compelled to destroy *Vines* that were so promising a few months ago in order to stamp out a dreadful pest which has devastated thousands of acres of *Vines* on the Continent. Mr. Austen has faced the task with characteristic energy and determination, his method being to burn the *Vines* and saturate the border with a chemical substance which is calculated to destroy the insect, before removing the soil to top-

dress pasture land at some distance off. This, we believe, is the best, if not the only means of eradicating the worst of all Vine pests. Curiosity might lead some to ask the pertinent question, "How did the phylloxera get introduced to these Vines?" If this could be satisfactorily answered it would be of great service to others in enabling them to guard against it, but we are afraid the outbreak of the pest cannot be satisfactorily accounted for.

Leaving these Vines and passing on, we enter a small division between the Muscat house and plant stove, in which were some large clumps of Orchids, fine plants of Caladiums, Anthuriums, Crotons, and others. The back wall is covered with moss, and fine healthy plants of the old favourite Begonia Rex are growing in it, and cover the wall from top to bottom, giving this small but neat apartment a charming aspect. The plant stove is large and commodious, and contains a well-grown collection of plants. Conspicuous in baskets suspended from the rafters were large specimens of some of the choicest of Orchids, which looked in the best condition possible. They require no further comment from us, as a notice of them appeared in the pages of this Journal a short time ago. The roof is draped with Passifloras, Allamandas, and other climbing plants. Besides the large permanent specimens in this house, great quantities of small bushy plants of different varieties are grown for table and room decoration, amongst which are large quantities of well-coloured Crotons and Dracænas. We felt a lively interest in examining a large number of seedling Dracænas growing here, some of which appeared to be quite

the different garden departments to each other and to the mansion. In this department also there is a great quantity of glass in houses, pits and frames, and a finely arranged fruit-room and store-rooms. The forcing-houses were all in excellent order, and there were indications at every point of the most careful and intelligent attention to details. Mr. Austen is evidently a man who thinks for himself, and has been guided by his own experience and observation to selections of varieties and methods of treatment which have been rewarded by a great measure of success. After an inspection of the fruit-room, store-rooms, &c., we were conducted through the forcing-houses. The first range consists of four narrow lean-to Peach-houses about 260 feet in length. In the early division the varieties are Hales' Early, Royal George, and Lord Napier Nectarines. The trees covered the back wall and a portion of the roof, and are trained on what is called the "extension system." The Nectarines, though only three years old, had a crop of sixteen dozen fruits on it. Mr. Austen spoke very highly of Hales' Early. He said it was quite three weeks earlier than Royal George. In the second division there are Vines and Peaches planted in the borders, and Peaches and Nectarines growing in pots in the front. The back wall is covered with Peach trees, and the Vines are planted at the back, led up the wall, and trained down the rafters in front at a good distance from each other. Those who say that Peaches and Grapes cannot be grown satisfactorily in the same house, we would advise to go to Ashton Court and see. Mrs. Pinee and Black Hamburg Vines were carrying a heavy crop of large bunches

Fig. 30.—ASHTON COURT.

different from any variety we had seen before, while others kept true to the characteristics of their parents as if they had been true species. From the stove a door conducts to the conservatory. It is a large lofty structure, in which were Palms, tall Tree Ferns, Camellias, and other plants bedded out, and a great variety of smaller flowering plants filled the stages round the sides. Amongst these we observed a good strain of Canterbury Bells in a blaze of flower. This makes a good conservatory plant when mixed with others, and lasts for a long time if not allowed to seed. Mr. Austen grows great quantities of it, which he uses in various ways for decoration. The plants are first grown in beds outside, and lifted and potted some time before they show signs of blooming. *Taesonix eximia*, *Bougainvillea glabra*, and *Habrothamnus elegans* hang down from the roof in large festoons of flower, adding grace and beauty to the whole building. Attached to the back wall of the conservatory, and entered from it, is a long narrow plant house devoted to the growth of cool Orchids. The first division contained a collection of *Cypripediums* and Ferns, and the second *Odontoglossums*, *Lycastes*, *Calanthes*, and *Azaleas*. This, to lovers of Orchids, is a most interesting house, and we feel sorry that time did not admit of our noting more fully the contents of it. Off the conservatory is an elegant smoking-room furnished with sofas and all that is essential to the enjoyment of the weed.

Leaving the portion of the ground immediately adjoining the mansion we proceeded to the kitchen garden department, which is within easy reach. In fact one good feature of the place is the close contiguity of

that would average 3 lbs. each, beginning to colour; and there were good crops of Peaches and Nectarines also, the leaves of which were as clean and healthy as possible. The trees in the third division are trained to trellises across the house and on the back wall, and were carrying good crops of medium-sized fruit. In passing we may say that we gave our opinion of this method of growing the Peach in these pages some time ago, and we adhere to it still. In our opinion there is no better method for getting good crops of the best quality than training the trees all over the roof at a proper distance from the glass. The fourth division is trellised half way up the front, and trees are trained on it and on the back wall. The sillstone in front in each division was filled with Sir Charles Napier Strawberry in pots, and we never saw a better crop or finer fruit. At the end of the range is a Peach wall case, in which the trees are doing well.

The next range consists of two large vineries and a Fig house. Muscats are grown in the first division, Figs in the second, and late Grapes in the third. The Muscats were planted some seven years since. The Vines are strong, clean, and healthy, and were bearing an average crop of beautifully shaped bunches, which were taking their final swelling. Three large trees planted in the border (one at the back and one at each side) filled the Fig house. They are trained on the back wall, sides, and roof, and were bearing a heavy crop of Figs, such as we have seldom seen anywhere. Here Negro Largo was bearing as freely as Brown Turkey. The varieties in the late vinery are Lady Downe's

Seedling, Black Alicante, and a single rod of Alwick Seedling grafted on Black Hamburgh. The Vines are all in fine condition and were heavily cropped. Alwick Seedling we thought extra good. It had six large bunches on the cane perfect in shape and size of berry, and real models of thinning. Mr. Austen informed us that he drew his hand down the bunches when in flower, and a quantity of the viscid fluid that came off them adhered to his hand. To this simple mode of clearing the stamens he attributes in a great measure the success attending the setting of the berries.

The next range comprises four low span-roofed pits with walk up the centre, in which Tomatoes, Melons, Vines, and Pine Apples are grown. The bed on one side of the first division was planted with Tomatoes, and the other side was occupied with Melons growing in pots. The Melon plants were clean and healthy, and had from five to six fruits on each plant about half grown. The second division was devoted to succession Melons on one side and pot Vines on the other, and the division next to it to Pine Apples. Besides these, there are a great quantity of pits and frames for growing plants, fruits, and vegetables. We had only time for a passing glance at the kitchen garden. The crops of all kinds looked well, and everything was neat and orderly in it. We would only say in conclusion that we derived great pleasure from our visit to Ashton Court, and are glad to bear testimony to the taste and skill which are manifest in every department of its garden arrangements.—A. PETTIGREW, *Castle Gardens, Cardiff.*

VINES IN AN INEXPENSIVE BORDER.

THE Vines from which the enclosed few berries are cut were planted seven years ago in a span-roof house facing north and south, borders inside and out, heated with a brick flue running down the centre, 30 feet long, outer walls on arches. When planted the young Vines had 2 yards wide of turf sods to start in; the other part of the border inside and out is made with common garden soil, lime, and cowdung, with a good sprinkling of half-burnt bricks broken up. The subsoil is shelly marl resting on red sandstone. I apply liquid manure after the fruit is set, made from dung and lime. I write this simply to say passable-looking Grapes can be grown without making rich expensive borders. I began to start this house on the first day of February last.—J. C.

[With one exception the Grapes as represented by individual berries are excellent. Gros Colman is small and imperfect in flower, Madresfield Court is very fine indeed, while Buckland Sweetwater and Waltham Seedling are above the average of these varieties—far better, indeed, than many we have seen growing in expensively made borders.]

READING SHOW.

AUGUST 16TH.

THE second Exhibition of the year at Reading is almost invariably highly satisfactory as regards the number of the competitors and the quality of the produce staged. On the present occasion, however, there was a lamentable falling-off in all the principal sections, and the Show as a whole was little more than a shadow of its predecessors. In such a fine horticultural district as that of Reading this deficiency was not only more regrettable, but was also difficult to understand; for though a few of the larger exhibitors were absent, surely scores of others might have been found who would have been willing to contribute. It is true that, except in the leading classes, the prizes are of small amount, but the number offered might be expected to compensate for that in some degree.

PLANTS.

Comparatively few collections of these were shown, and in this respect this Exhibition was one of the most unsatisfactory that the Society has held, which was the more regrettable as the weather proved very favourable. The chief falling-off was in the number of competitors, as the plants actually staged were distinguished by their fresh healthy condition, which was especially noticeable in the case of the Ferns and fine-foliage plants. The groups, too, were quite up to the usual standard, and without them the Exhibition would have been exceedingly weak. The plants usually shown by Mr. Lees were absent owing to his having discontinued exhibiting, and this made a great difference; one or two others that generally contribute were also not showing, and so the prizes were divided amongst very few growers.

For six fine-foliage plants Mr. Mortimer, gardener to Major Storer, Purley Park, was awarded the first prize for exceedingly vigorous examples of *Alocasia macrorhiza variegata*, *Maranta rosea lineata*, *Encephalartos villosus*, *Croton majesticus*, *Alocasia metallica*, and *Pandanus Veitchii*. The *Alocasia* was in remarkably good condition, 4 or 5 feet in diameter, and with fine glossy foliage. Mr. Elliott, gardener to J. Hibbert, Esq., Maidenhead, had the best three fine-foliage plants, *Pandanus Veitchii* and *Cordyline indivisa* being especially fine. Mr. Jones, Henley-on-Thames, showed six small but richly coloured Coleuses, for which the chief prize was awarded in that class. Mr. E. Phippen, Reading, was first with three Palms, well-grown examples of a *Phoenix*, *Latania*, and *Seaforthia*. The premier collection of six Ferns was from Mr. Mortimer, and the plants were, as usual, characterised by their healthy vigour. *Davallia Mooreana* was in good condition, *Adiantum cardiochæana*, *Dicksonia antarctica*, *Davallia bullata*, and *Adiantum cultratum* being similarly fresh. Mr. Bennett, gardener to M. Lonergan, Esq., Cressingham, was a good second, his best plants being *Davallia Mooreana* and *Adiantum formosum*. Mr. G. Phippen was third with healthy plants.

Prizes were offered for a group of plants arranged for effect in a space of 12 feet by 10 feet. There were three competitors; Mr. Sumner, gardener to J. H. Millard, Esq., Reading, being first with an exceedingly bright and tasteful group, having a groundwork of *Gloxinias*, Ferns, *Begonias*, and

Coleuses, with taller *Crotons*, *Liliums*, *Fuchsias*, and *Dracænas*, and a background of *Acacias*. Mr. Phippen, Reading, was a close second with a rather heavier but good group, the fore part chiefly consisting of *Hydrangea paniculata grandiflora*, with Ferns, *Selaginellas*, and *Isolepis*. Mr. Mayne, gardener to Miss Moon, Reading, was placed third with a diversified collection of *Achimenes*, *Begonias*, *Pelargoniums*, and Ferns. *Fuchsias* were not largely shown, but the plants were fairly well flowered. Mr. E. Jones, Henley-on-Thames; Mr. Mayne, gardener to Miss Moon, Reading; and Mr. Sumner, gardener to J. H. Millard, Esq., Reading, were the principal prizetakers. In smaller classes Messrs. Mortimer and Mayne were also exhibitors. Mr. Mortimer had the only collection of four stove and greenhouse plants, *Ixora Williamsi* being the best of them, with sixteen or eighteen fine trusses of flowers. The first prize was awarded for them. Zonal *Pelargoniums* were fairly well shown, Mr. Sumner taking the chief position with six even well-flowered specimens, Mr. Mortimer following closely with larger but rather looser plants. Mr. Sumner also had the best six tricolors. Mr. Ashby, gardener to W. Fanning, Esq., Whitchurch, and Mr. Mayne being respectively second and third.

Three pretty collections of table plants were shown, Mr. Ross, gardener to C. Eyre, Esq., Welford Park, being placed first with neat little specimens in 6-inch pots, comprising a seedling *Croton*, *Yucca aloifolia variegata*, *Croton Eyrei*, *Pandanus Veitchii*, *Dracæna elegantissima*, and *D. Guilfoylei*, Mr. Gribble, gardener to Miss Cary Malins, Maidenhead, and Mr. Elliott, followed in that order. Mr. Bridge, gardener to J. F. Hall, Esq., Erleigh Court, was the only exhibitor of six *Liliums*, being awarded the first prize for well-grown plants in 8 and 9-inch pots, and bearing three or four dozen flowers each. The same exhibitor had the best three *Liliums*, followed by Mr. Mortimer with healthy plants, the latter also staging six good *Achimenes*, which secured the first prize. The best single specimen plant was a *Vanda tricolor* with one spike, from Mr. Pound, Mr. Mortimer being second with *Alocasia Thibautiana* in excellent health. Three fine collections of *Cockscombs* were shown, Mr. Bridge and Mr. Gribble securing the chief prizes.

Cut flowers were fairly well represented, Dahlias, Roses, and miscellaneous collections being staged. The most successful exhibitors were the following:—Mr. Gurden, gardener to Miss Watson-Taylor, Headington (single Dahlias), Messrs. Cheal & Sons, Crawley, Sussex, and Tranter, Assenden (Show and Fancy Dahlias), Mr. Sumner (hardy flowers), Mr. Phippen (miscellaneous), Mr. Howe (stove and greenhouse flowers), Mr. Gurden (Roses), and Mr. Tranter (Phloxes). For table stands, bouquets, and buttonholes Mr. and Miss Phippen were as usual the most successful exhibitors. Several handsome bushes of Ferns and Palms were also shown by the same firm, and were greatly admired.

FRUIT.

By far the most interesting portion of the Exhibition was that devoted to the fruit, as in nearly all the classes the competition was very keen and the quality of the fruit highly satisfactory. Black Grapes, Peaches, and Nectarines were especially good, but white Grapes, except in the leading stands, were rather unripe. The principal class for fruits was that for eight dishes, for which a silver cup value five guineas was offered by Messrs. Sutton & Sons as the first prize. Mr. Howe, gardener to Sir R. Sutton, Bart., Benham Park, succeeded in winning this substantial honour with very large bunches of Muscat of Alexandria Grapes, good Black Hamburgs, Suttons' Masterpiece Melon, Queen Pine Apple, Royal George Peaches, Moorpark Apricots, Pine Apple Nectarine very fine, and good Figs. Mr. Wills, gardener to R. Ravenhill, Esq., Winkfield, was a good second, having large bunches of Cooper's Black Grapes well coloured, a good Queen Pine, Hales' Early Peaches finely coloured, and a well-netted Hero of Lockinge Melon. For six dishes of fruits Mr. Goodman, gardener to C. Hummersley, Esq., Bourne End, was first with well-coloured Black Alicante Grapes, moderate Foster's Seedling Grapes, good Belgian Purple Plums, Dryden Nectarines, Royal George Peaches, and Earl of Beaconsfield Melon. Mr. Mortimer was second with large but scarcely ripe Black Hamburg and Muscat of Alexandria Grapes, but very good Washington Plums.

Black Grapes were fairly well shown, Mr. Ashby taking the first prize with three fine bunches of Black Hamburg Grapes beautifully coloured. Mr. Cakebread, gardener to Sir P. Rose, Bart., Penn, was a close second, also with fine bunches; Mr. Howe, third; and extra prizes went to Messrs. Moore and Robinson. Seven lots of three bunches of Muscats were staged, Mr. Howe being first with large well-ripened Muscat of Alexandria but slightly rubbed; Mr. Ashby second with the same variety, also well ripened; and Mr. Ross, gardener to C. Eyre, Esq., Welford Park, third with Bowood Muscat rather green. In the Any other black variety class Mr. Ashby was the premier exhibitor of three grand bunches of Madresfield Court, bearing a fine bloom, but one of the bunches was scarcely ripe. Mr. Heath, gardener to R. Ovey, Esq., Henley, and Mr. Pound were awarded equal second prizes, the former with Black Alicante very large and well coloured, and the latter with Madresfield Court rather small. Mr. Mortimer was third with Trentham Black. The Any other white variety class was not well filled, Mr. Ashby being first with Golden Hamburg, Mr. Wells second with Buckland Sweetwater, and Mr. Howe third with Foster's Seedling.

Peaches were well shown by Mr. Gribble, who was first with Bellegarde in a class of ten competitors, Messrs. Jones and Robinson being second and third. Nectarines were represented by eight dishes, Mr. Maher taking the first position with Pitmaston Orange, Mr. Gribble second with Elruge, and Mr. Goodman third with Dryden. Plums were also well shown by Messrs. Bridgman and Goodman. The principal exhibitors of Melons were Messrs. Elliott, Howe, and Maher. Mr. Howe was awarded a first-class certificate for *Melon Benham Beauty*, a cross between William I. and Hero of Lockinge, a fruit of delicious flavour, deep flesh, and moderate size. It is one of the best scarlet-flesh Melons we have tasted.

VEGETABLES.

Messrs. Webb & Sons, Stourbridge, offered prizes for collections of vegetables, and eleven were staged. Mr. Howe was first with a very even and creditable collection, comprising Negro Longpod Beans, Early Round Potatoes, Early Shorthorn Carrots, Challenge Cucumbers, All the Year Round Turnips, and Telephone Peas. Mr. Ross was a close second, Mr. Bradford third, and Mr. Elliott fourth. Potatoes, Beans, Vegetable Marrows, and Onions were all largely and well represented. Eight dishes

of Tomatoes were staged, Mr. Bradford being first with Ne Plus Ultra, Mr. Elliott second with Dedham Favourite, and Mr. Harman third with Large Red, all fine even fruits. Messrs. Mortimer and Elliott secured the prizes offered by Messrs. Carter & Co., High Holborn, for a brace of Model Cucumbers, both showing even well-grown fruits.

Miscellaneous collections of plants and flowers were not very largely shown, but Mr. C. Turner, Slough, exhibited a great number of handsome Dahlia blooms, representing all the best varieties in cultivation. Messrs. Sutton & Sons, Reading, also contributed a fine collection of Gladioli spikes, very large and richly coloured.

THE HERBACEOUS PLANT BORDER.

(Continued from page 78.)

Matricaria inodora fl.-pl.—The flowers of this are pure white, double, about 2 inches in diameter, and very freely produced from June until the season is well advanced. It grows about 2 feet high, and is especially valuable for cutting. It succeeds best in light soil, and is best treated as a biennial.

Echinops persica.—A peculiar plant, having long Thistle-like leaves, very spiny, stout and strong in habit, attaining a height of 4 feet or more. It bears abundance of large globular heads of flowers, which have a fine silvery appearance, the flowers being blue, but are comparatively inconspicuous. E. Ritro is equally interesting. They do well in light soil, and have a good appearance at the back of borders. Is easily increased by seed or division.

Asclepias tuberosa.—The stout erect stems terminated with large yet compact umbels of bright orange-pink flowers are very showy. It grows freely in any good soil, and attains a height of 3 to 4 feet. Its first flowers are only just now (August 3rd) open, and continues a long time, being really a fine back-row plant for late summer flowering. Increased by division.

Thalictrum adiantifolium.—The Maidenhair Fern of the herbaceous border, having delicate Adiantum-like foliage, very beautiful, and is particularly valuable to afford sprays for cutting to set up with flowers or even for bouquets. It grows best in a light soil, but may be grown in an ordinary border where water is not stagnant. It attains to a height of a foot or a little over. The flowers are very small and greenish-yellow, although in combination with the sprays they tell wonderfully.

Diclytra eximica.—Though a spring-blooming plant this has now (August 3rd) several racemes of its graceful drooping reddish-purple flowers, which, with its ample spread of pale green Fern-like foliage, is a conspicuous object. Both the foliage and flowers are useful for cutting. Good open moist soil in well-drained borders suits it perfectly. It attains a height of 18 inches.

Corcopsis tenuifolia.—A very pretty slender-growing plant about 2 feet high, the leaves being much divided and borne in whorls. The flowers are very freely produced, being over an inch in diameter and of a very rich golden yellow. It does well in light soil.

Helenium pumilum.—This plant attains a height of a couple of feet, has large flowers (2 inches or more across), bright yellow, and very freely produced, and are very useful for cutting. It will grow in almost any soil.

Harpalum rigidum.—Usually 3 to 4 feet in height, and produces an abundance of golden-yellow flowers with black disc, and are very large. As a back-row plant it is one of the most attractive from August onward.

Helianthus multiflorus major.—A very vigorous-growing perennial Sunflower, attaining a height of 4 to 6 feet. The flowers are very large, deep yellow, having two rows of florets around the disc, which give it a very telling appearance, and it flowers from July to autumn. This, in my opinion, is the finest of the perennial Sunflowers, very useful for cutting, and attractive as a specimen in a back row. Good light soil suits it.

Gaillardia grandiflora.—Three feet or more in height, producing a great number of brilliant flowers—crimson, yellow, and orange, with some black or very dark brown—3 inches across, and come in in June or July and continue up to frost. It is one of the finest border plants, but is not very hardy. Plants are readily raised from seed, treating it as a biennial; or it may be raised from cuttings inserted in sandy soil under a handlight in July or August, wintering in a cold frame after potting off, plunging the pots in ashes.

Achillea serrata fl.-pl.—This grows 18 to 24 inches high, bearing very fine heads of pure white double flowers, very beautiful, and the leaves are very deeply cut, thereby rendering it very effective. It likes a light soil, but will grow in any well-drained soil. It continues a long time in flower, commencing in July, and the flowers are valuable for cutting.

Cyclamen europæum.—On the margin of the herbaceous border this is very pleasing, its bright deep rose-coloured flowers having a chaste appearance. It does best in partial shade in light soil, and the corm covered a few inches deep with light or vegetable soil, such as decayed leaves.

Acorus japonicus fol. variegatis.—Although a bog plant this does well in moist borders, but not in shade, and is one of the most beautiful of variegated plants, the leaves being striped with bright red, yellow, and white, having a very telling effect; its Iris-like foliage being very fine indeed. It is readily increased by division.

Bambusa Falconeri.—Leaves bright green and the habit graceful, and is here introduced to notice as very distinct amongst border plants. It likes a moist soil, but well drained, and a sheltered situation.

PLANTS FOR WALLS.

As we have a wall over 100 yards long at the back of a part of the herbaceous border, and having a south aspect, I should like to give a few notes occasionally about some of the plants trained to it, and shall begin with

Ceanothus Gloire de Versailles, which produces long corymbs of deep lavender-blue flowers, and commences to bloom in June or so soon as any growth is made, and continues until stopped by frost. A few cuttings may be struck in late summer for wintering in pots in a cool house, so as to make sure of its continuance, as it is not very hardy, needing protection in severe weather. It is fine as a pot plant, grows freely, and flowers most profusely.

Jasminum officinalis major.—Larger flowers of more substance distinguish this plant from the old Jasmine, and it grows even more freely and blooms splendidly. Its flowers are quite as sweet and more lasting.—G. ABBEY.

SHROPSHIRE HORTICULTURAL SOCIETY.

AUGUST 15TH AND 16TH.

THE annual Exhibition of the above Society was held in the Quarry Grounds, Shrewsbury. These grounds have been materially improved and beautified during the past few years by a judicious expenditure of the surplus funds of the Society. There is no difficulty for any stranger visiting the quaint old town to find the Exhibition, as the main street leading from the station to the grounds is always densely draped with festoons and banners, which indicates the interest taken by the inhabitants in the Exhibition; in fact, the occasion is regarded as a partial or general holiday, and thousands find their way to the grounds, especially on the second day. We know of no other society—Manchester excepted—that is in such a flourishing financial condition.

The Exhibition on the whole was a great success, and was decidedly superior to any previous gathering. Vegetables and cut flowers have in past years been equally fine, but never more numerous, while plant-growing has extended most rapidly, and the quality and quantity of the specimens staged were very much in advance of what they were two years ago.

STOVE AND GREENHOUSE PLANTS.

In the open class for twenty plants, ten flowering and ten foliage, there were three competitors. Mr. J. Cypher of Cheltenham was well to the front, followed by Mr. C. Roberts, gardener to E. C. Glover, Esq., Highfield Hall, and Mr. E. Tudgey. The first collection contained the usual grand examples. Mr. Roberts staged a splendid *Cycas revoluta*, *Ixora Williamsii*, *Croton angustifolius*, *Gleichenia rupestris*, and *Croton Johannis*. Mr. Tudgey's plants were rather irregular. In the corresponding class for nine plants, open only to the counties of Shropshire and Montgomeryshire, five to be in bloom, there were four exhibitors. The premier position was accorded Mr. Farrand, gardener to Mrs. Juson, who staged fair plants of *Ixora Williamsii*, *Ixora coccinea superba*, and *Dipladenia hybrida*. Messrs. Pritchard & Sons second, having good specimens of *Allamanda Hendersonii* and *Ixora superba*. Mr. R. L. Burton secured the remaining prize for neat well-grown examples. In the amateurs' class for six plants, not less than four in bloom, H. Owen, Esq., was well ahead, and staged splendid well-bloomed, moderate-sized specimens of *Stephanotis floribunda* and *Begonia metallica*. Mrs. Wace was placed second, and Mr. L. Burd, third, both having creditable plants, four collections being staged.

Palms.—These were not numerous, three collections only being staged, but the majority of the plants were large and healthy, occupying considerable space down the centre of the tent. Mr. J. Cypher took the lead with very large plants; Mr. E. Tudgey was second with rather smaller and a less even collection; Mr. C. Roberts was the remaining prizetaker.

Dracenas.—Although the plants in this class were more numerous than last year, there was a slight falling-off in quality. Messrs. Pritchard and Sons won the premier position with six plants, the collection including good specimens of *amabilis*, *Mooreana*, *Baptistii*, and *Robertsoniana*. The same exhibitor was also second with smaller and less even plants; Mr. C. Roberts third with rather poor examples.

Caladiums.—There was a marked improvement in this class, the plants being in every respect more numerous and better grown than on previous occasions. For six plants Messrs. Pritchard & Sons took the lead with good specimens, followed closely by Mr. Farrand; Mrs. Shaker was placed third, her plants being smaller, but very compact and neat.

Groups.—Four groups were staged in the class for miscellaneous plants arranged for effect, to occupy 100 square feet. Messrs. Pritchard & Sons staged three of these groups, and were awarded the first and second awards. There was no competition, and the groups were less bright and striking than we have before seen them. Three exhibitors staged plants in the class for fifty miscellaneous plants in 5-inch pots. These were arranged on tables about 3 feet wide, and were very effective. Messrs. Pritchard & Sons were successful in obtaining the first and second prizes. These two collections contained some neat well-grown small decorative plants, both flowering and foliage. The first-prize lot contained plants in flower of *Odontoglossum Alexandræ*, which gave it a rather choice appearance compared with the other collections. Mr. Farrand was the remaining prizewinner. In the amateurs' class for twenty-five plants, not less than fifteen in bloom, four

very pretty collections were staged. Mrs. Wace took the lead with a very neat lot, followed closely by the Rev. J. H. E. Charter.

Table Plants.—In past years the table plants have generally been a marked feature in the Exhibition, and we are sorry to record a great falling-off in this very interesting class. There were only two exhibitors of twelve plants—Messrs. Pritchard & Son and Farrand, who staged very creditable examples.

Ferns.—These were fairly numerous, and on the whole very creditable. In the open class for nine exotic Ferns four collections were staged. Mr. J. Cypher was placed first with his well-known good plants. Mr. R. Burton was a good second, having fine examples of *Adiantum formosum*, *Asplenium Belangeri*, *Asplenium bulbiferum*, and *Gymnogramma Laucheana*. Mr. C. Roberts secured the remaining prize with healthy specimens. For six plants, distinct, four lots were staged. Mr. Farrand took the lead, followed by Messrs. Pritchard & Sons and Mr. Watson. The first collection contained good plants of *Adiantum formosum*, *A. farleyense*, and *Dicksonia antarctica*. For four plants the prizetakers were Messrs. R. Cooper, J. Brown, and G. Burr. Six collections were staged, and the plants throughout were creditably grown.

For six hardy Ferns Mr. J. W. Harding was first with neat small plants, and Messrs. G. Burr and Pritchard & Sons second and third.

Gloxinias and Achimenes.—The former were remarkably good, some six competitors staging for the three prizes offered. Mrs. Wace took the lead with splendid plants, and Mr. H. Owen the remaining two prizes with plants very little inferior. The *Achimenes* were poor and need no comment. *Petunias* and *Balsams* were only moderately represented. Messrs. Owen, Fox, and Shuker were the prizewinners for the former, and Messrs. Shuker and G. Fox for the latter.

Ericas.—These were not of average quality. Mr. J. Cypher's collection was the only one that contained creditable specimens, and he staged good plants of *McNabiana*, *Irbyana*, *æmula*, and *ampullacea Barnesii*. Mr. E. Tudgey and Mr. C. Roberts were second and third with rather small uneven plants.

Begonias.—There is plenty of room for improvement in the cultivation of these plants, scarcely a really good example being staged in the four collections of six plants. The prizetakers were Messrs. J. Watson, H. Myers, and the Rev. J. H. E. Charter. The plants in the amateurs' class for three plants were superior to the above. The prizetakers were Mrs. Shuker, first; Messrs. L. Burd and C. W. Campbell second and third, five collections being staged.

Coleuses.—These plants displayed a very marked improvement in their condition in both classes devoted to them. For six pyramid plants some grand examples of cultivation were staged. Mr. J. Watson gained the premier position with superb specimens of *Ajax*, *Royal Purple*, *Zanzibar*, *Delier*, *Mrs. G. Simpson*, and a most beautiful coloured plant of *Lady Burrel*; Mrs. Shuker was a very good second. For three plants (amateurs only) Mr. L. Burd was first with a good even lot, a plant of *Mrs. G. Simpson* being very fine; H. Owen, Esq., was second, and had a remarkably fine plant of *The Queen*; Mrs. Shuker was third with scarcely less inferior plants.

Fuchsias.—These were numerous and generally large and well bloomed. For six plants Messrs. H. Owen and A. Myers were placed equal first, both staging well; Messrs. Pritchard & Sons were placed third with larger but scarcely such well-flowered plants. Four lots were staged. For three plants Mrs. Wace and Mr. L. Burd and R. J. Niven were the prizetakers.

Zonal Pelargoniums.—These were staged in much better condition than they have ever been seen before at this Society's exhibitions. In the class for six double varieties Messrs. Oldroyd & Co., Shrewsbury, staged large well-flowered plants; in fact, we have never seen double varieties in better condition or more profusely bloomed, *Candidissima plena*, very fine; *Prince Noir*, *Wonderful*, *Asa Grey*, and *Madame Thibaut* were all superb. The same competitor was awarded the second for smaller but equally well-grown plants. In the amateurs' class for three plants Messrs. H. Owen and L. Burd were the only exhibitors, and were awarded prizes in the order as named. For six single varieties five collections were staged, and Messrs. Oldroyd & Co. were again successful, and obtained the whole of the three prizes offered. It must be understood that each exhibitor was allowed to take as many prizes as he could in each class. Some of the most noteworthy varieties were *Hettie*, *Guinea*, *Lady Sheffield*, *Mrs. Vickers*, *Laura Strachan*, *Constance*, *Nelly Thomas*, and *Jessie Moir*. For three plants the successful exhibitors were Messrs. G. J. Fox, H. Owen, and L. Burd, all staging very neat specimens.

CUT FLOWERS.

Roses.—These were by no means numerous, but much better in quality than we anticipated, considering the unfavourable weather of late. In the class for twenty-four blooms Messrs. Perkins & Sons, Coventry, and Messrs. J. Dickson & Sons, Newton Nurseries, Chester, were awarded the prizes in the order named, the former having good blooms of *Countess of Rosebery*, *Duchesse de Caylus*, *Madame Victor Verdier*, *Lady Sheffield*, *Sir G. Wolseley*, *Mdlle. Annie Wood*, and *Marie Baumann*. Mr. R. Tanner was placed third. For eighteen blooms the prizetakers were Messrs. T. W. Wood, E. W. Pritchard, and Mr. Lambert. In the smaller Rose classes the principal prizetakers were Messrs. Campbell, Tanner, and Roberts.

Dahlias both single and double were remarkably fine. Mr. W. Shaw was the only exhibitor in the open class for thirty-six blooms, and was awarded the first prize. This collection contained large flowers of *Hon. Mrs. Wyndham*, *Chang*, *Lady Herbert*, *Monarch*, *Gaiety*, *Peacock*, *Woman in White*, *Goldfinder*, *Helen Macgregor*, and *Walton*. For twenty-four the same exhibitor was again first with larger and finer blooms than in the collection of thirty-six. Messrs. T. Speake and R. J. Niven were second and third. Messrs. Niven and Groves were the successful exhibitors of stands of nine blooms. Nine stands of twelve single varieties were staged, and the successful were Messrs. Biddles & Co., Campbell, and Pritchard & Sons. Mr. W. Shaw was the only exhibitor of thirty-six *Gladioli* spikes, and staged a very fine collection; and Mr. Lambert, the only exhibitor, was awarded the first prize for twenty-four spikes. Mr. J. B. Jones was successful in the remaining class.

Asters, **Marigolds**, **Stocks**, and **Pansies** were numerous and good, and the most successful exhibitors were Messrs. Biddles & Co., C. M. Campbell, G. Townsend, E. W. Pritchard, G. Mitchell, and R. J. Niven.

Stove and Greenhouse Cut Flowers.—These were much better than we have

before seen them at Shrewsbury. For twelve bunches Messrs. Jones and Sons took the lead with *Allamanda*, *Stephanotis*, *Erica*, *Bougainvillea*, *Gardenias*, *Gloxinias*, *Odontoglossum Alexandræ*, *Rhododendron Princess Royal*. Messrs. Pritchard & Sons were placed second, and Messrs. Biddles & Co. third. Mr. C. Roberts' collection was arranged differently from the rest, and was awarded an extra prize. For twelve bunches of hardy herbaceous flowers eight collections were staged. Messrs. Biddles & Co. were placed first, and Messrs. Pritchard & Sons second and third.

The blooms of *Zonal Pelargoniums* were not so good as usual, two lots only being staged. Messrs. Pritchard & Sons took the lead, and were awarded the second prize. The same exhibitors were first in the class for twelve bunches of *Show* or *Fancy Pelargoniums*. This contained grand bunches of *Triomphe de St. Mandé*, *Robert Green*, *Duchess of Bedford*, *George Sands*, *Jewess*, *Marie Lemoine*, and others. Messrs. Show and Speake were successful for *Verbenas*, and Messrs. Biddles & Co. and C. Chandler for *Phloxes*. Mr. Speake took the chief prize for *Carnations*, and Mr. Fox for *Picotees*.

Bouquets.—These were really magnificent. For one bridal bouquet Messrs. Perkins & Sons were awarded the premier position. This bouquet was all that could be desired, being of fair size, light yet full, and the flowers were by no means crowded. It was principally composed of *Eucharis*, *Pan-cratiun*, *Stephanotis*, *Bouvardias*, a few white *Rose buds*, and the young fronds of *Adiantum cuneatum*. Mr. J. Cypher was second, and Messrs. Jones & Sons third, both firms showing remarkably well. The prizewinners were the same, and in the same order as above for one ball or hand bouquet. For three buttonhole bouquets, which were good, the same exhibitors were successful, only Messrs. Jones & Sons were second, and Mr. Cypher third. The principal exhibitors in the three corresponding classes were Messrs. E. W. Pritchard, A. Myers, G. Townsend, and R. Tanner.

The stands of cut flowers for table decoration, base not to exceed 18 inches, were remarkably well shown, and the competition was keen and close. Throughout these vases were light, elegant, and beautiful. Mr. J. Cypher was placed first, the base being formed with *Adiantum cuneatum*, which was allowed to hang freely over the edge, and amongst this were dotted flowers of *Allamanda*, *Dipladenia*, *Ixora*, *Lapageria alba*, and a few *Grasses*. The three branches and the centre were filled with *Orchids*, *Begonias*, and a flower or two of *Gloriosa superba*, freely mixed with *Fern fronds* and *Grasses*. The second-prize one was equally beautiful, only of a slightly different style. A round dish or tin formed the base, and from it rose a small *Palm* out of a groundwork of *Selaginella*. Amongst this were dotted white *Camellias*, *Ixoras*, *Allamandas*; and rising above these, flowers of *Masdevallias* and good spikes of *Odontoglossum Alexandræ* and *O. cirros-um*. Messrs. Jones & Sons were also third with an arrangement very similar to the one staged by Mr. Cypher. Mr. J. C. Rose was awarded an extra prize. In the amateurs' class Mr. E. W. Pritchard was the leading competitor.

FRUIT.

The schedule provided fifteen classes, and these were, on the whole, well filled with really good fruit. For a collection of twelve dishes, to include one *Pine*, there were four exhibitors. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, was well first, and staged good dishes of *Muscat of Alexandria* and *Madresfield Court Grapes*, a *Conqueror of Europe Melon*, *Stirling Castle Peach*, good; *Brown Turkey Figs*, *Violette Hâtive Nectarine*, and *Rivers' Early Favourite Plum*. Mr. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall, Chester, was a good second, having splendid examples of *Golden Champion* and *Madresfield Court Grapes*, the latter scarcely finished; a good *Conqueror of Europe Melon*, *Grosse Mignonne Peach*, *Pond's Seedling Plum*, and a good *Queen Pine*. Mr. R. Milner, gardener to J. D. Corbett, Esq., was third with good *Grapes*, *Peaches*, and *Pears*. For nine dishes Mr. J. Watson took the lead, having good *Muscat of Alexandria* and *Black Hamburg Grapes*, *Reid's Scarlet-flesh Melon*, *Bellegarde Peaches*, *Green Gage Plums*, and *Jargonelle Pears*. Mr. Lambert, gardener to Col. Wingfield, was a good second, having fair *Grapes* and good *Peaches* and *Nectarines*. Lord Berwick received the remaining prize. Four collections were staged.

Grapes.—For six bunches of black *Grapes*, three varieties, Mr. Goodacre secured first honours with good *Muscat Hamburgs*, *Madresfield Court*, and very fine *Black Hamburgs*. Mr. W. Elphinstone, gardener to E. M. Mundy, Esq., Shipley Hall, Derby, was a close second, and with bunches superbly coloured of *Black Hamburg*, *Madresfield Court*, and *Muscat Hamburg*. Mr. R. Milner was placed third, and staged splendidly finished bunches of *Lady Downe's* and *Black Alicante*. The Hon. C. H. Whynn and Mr. C. Roberts were awarded extra prizes for their collections.

In the class for three bunches of black *Grapes*, open only to the two counties referred to above, some five or six lots were staged. Mr. Lambert was deservedly placed first with rather small bunches with good berries and well finished. Mr. E. T. W. Wood was second with larger bunches than the first, but not so well finished. Messrs. J. Watson and F. L. B. Laden were third and fourth in the order named.

Eighteen bunches were staged in the amateurs' class for two bunches of black *Grapes*. Mr. W. W. Humphreys was first with not large but well-finished *Black Hamburgs*; Rev. J. H. Charters second with the same variety well finished, the third prize going to the first-named exhibitor. For two bunches of whites (amateurs) Messrs. G. Barr and E. Lea were first and second respectively, both staging *Foster's Seedling*; Mr. H. H. Treasure securing the remaining prize, five collections being staged. Forty-eight bunches were staged in the open class. Mr. R. Milner was accorded the premier position with really fine *Muscat of Alexandria*, large in the bunch and berry, but scarcely finished. Mr. Elphinstone was a good second with the same variety, finished in his usual good style, but rather small in the berry; Mr. Hannagan, the remaining successful competitor, and had very fine *Golden Champion*.

Peaches and Nectarines.—These were not largely shown, as only two classes were provided for them. Mr. Goodacre took the lead with splendid fruit of *Bellegarde*, followed closely by Mr. Elphinstone with the same variety, and Mr. Shaw third with *Grosse Mignonne*, good; ten dishes were staged. Only six dishes of *Nectarines* were staged, and the Hon. C. H. Whynn was first with fair fruits of *Pine Apple*, Messrs. Lambert and R. Milner second and third in the order named. For six *Apricots* four dishes were exhibited, and the prizewinners were Messrs. J. B. Jones, T. Glowes, and R. Milner.

Melons, Plums, and Cherries.—The first named were plentiful, and for one

green-fleshed variety Mr. R. Milner was first with a beautiful fruit unnamed, Sir V. R. Corbet, Bart., second, and Mr. Farrand third. For one scarlet-fleshed fruit Mr. F. L. B. Sladen took the lead with Blenheim Orange, and Mr. Milner second, no name being placed on the third-prize fruit. For twelve fruits of any green or yellow Plum the prizewinners were Messrs. Elphinstone, Lord Berwick, and Messrs. Biddles & Co. For twelve purple or red Plums Messrs. W. F. Hazeldine, W. H. Harrison, and Mr. Farrand were successful; and Sir V. R. Corbet, Bart., Lord Berwick, and C. Chandler, Esq., were the successful exhibitors for Cherries.

Vegetables.—These were very good, and staged in large quantities, in fact they filled the tent prepared for them. In this department there was a great absence of names, and any attempt to give a detailed account of the various exhibits is thus frustrated. Six collections were staged in the class provided for a collection of twelve dishes. Mr. R. Milner took the lead with superior dishes of Celery, Leeks, Onions, Tomatoes, Potatoes, Beans, Peas, Carrots, and a capital brace of Cucumbers. Mr. Lambert was a good second, and Messrs. Biddles & Co. third with large and rather coarse examples. Six dishes of Potatoes were exhibited. In the class for a collection of six dishes Mr. Milner was again to the front with clean even tubers; Messrs. A. Myers and J. Watson were second and third. Sixteen competitors staged three dishes, the whole very fine. Mr. A. Myers was a good first, Mr. Lambert second with Reading Russet, Vicar of Laleham, and Woodstock Kidney; Mr. Milner was placed third. For the best dish of nine tubers seventeen dishes were exhibited. T. Wood, Esq., was placed first with grand tubers of Woodstock Kidney, Mr. Watson second with the same variety, and Mr. Lambert third with Covent Garden Perfection. Nine or ten dishes of Tomatoes were staged for the three prizes offered. Mr. Hannagan was well to the fore with fine fruits of Stamfordian, and admirable produce was staged in all the minor classes.

MISCELLANEOUS EXHIBITS.

These were numerous, Messrs. F. and A. Dickson & Sons, Upton Nurseries, Chester, staged a very large collection of Crotons and a great variety of small decorative plants, which were clean and well grown. These were decidedly the most striking collection of small plants in the Exhibition. They also contributed boxes of Roses, Clematis, Vines in pots very strong, Figs in pots from eyes this season, which were bushy healthy plants fruiting freely. A collection of Conifers came from the same nurseries, as well as a number of dwarf Apple trees on the Paradise stock fruiting freely. Messrs. James Dickson & Sons contributed Conifers, Roses, and a group of miscellaneous stove and greenhouse plants; Mr. House, Peterborough, box of Roses, including William Allen Richardson; Mr. J. Walton, Murrivance, a collection of Pears in pots carrying a very heavy crop, said to have been fruiting for several years in an orchard house. Messrs. Jones & Sons, Messrs. Oldroyd and Co., and Mr. A. Myers, Sutton Lane, Shrewsbury, exhibited large collections of stove and greenhouse flowering and foliage decorative plants, which added materially to the beauty of the Exhibition.

Messrs. E. Webb & Sons, Wordsley, Stourbridge, staged a very large collection of vegetables, including a fine new Pea, said to grow about 3 feet high and very early; the pods exhibited were well filled. Stourbridge Marrow and Electric Light Peas were in the finest of condition. Some fine tubers of Surprise Potato were also exhibited, as well as varieties of Carrots, Beans, and other vegetables.

The arrangements of the Exhibition were never carried out better, and the Secretaries, Messrs. Adnitt and Naunton, with the Committee, deserve congratulation.

LUXURIANT PEACH TREES.

WE planted a Peach house with trees eighteen months ago, and now the trellises are covered, and the question arises, What is to be done in order to make the strong growths of this season fruit-bearing shoots next year? Others may have rampant-growing young trees to deal with, and have a difficulty as to the best means of turning this superabundant vigour to account. Drying the soil will have the effect of stopping the growth, but it will also have the effect of debilitating the tree without inducing fruitfulness. Our plan is to raise the younger roots by means of a fork, and thus give a check to the growth of wood. With sufficient heat in the atmosphere and moisture in the soil a plentiful formation of strong and healthy fruit buds will follow. Older trees which have borne or are bearing heavy crops of fruit should be very freely watered. In good soils it is difficult to supply healthy Peach trees with too much root-moisture in the autumn. The chief points to see to in order to make sure of a crop the following season are these:—Thin out all shoots not wanted, keep the roots working and well supplied with food, and maintain a warm temperature. Open ventilators are all very well in hot weather, but on cold days and raw nights over-much air is an evil and will not ripen the wood, but the contrary.—B. T.

THE READING SEED-TRIAL GROUNDS.

MESSRS. SUTTON & SONS' grounds at Reading, which are chiefly devoted to testing the quality of the seeds sent out by them, and for obtaining stock of the choicer varieties of popular and florists' flowers, are now exceedingly gay and worthy of a visit. The beds of outdoor plants either annuals or perennials are now at their best, and in the houses is a magnificent display of Begonias and Gloxinias that would alone constitute an exhibition of considerable interest. These grounds afford most satisfactory evidence of the care exercised in growing the main stocks of seed which are raised in various farms in England and on the Continent also, for the samples selected by chance from the consignments indicate not only quality of very high degree, but are distinguished by another great recommendation—they are surprisingly true, a fact which in itself is of inestimable value. Further, all the popular races or varieties of plants are being continually improved, the slightest advance in any desirable character being at once perceived and perpetuated, so that while variations are being

steadily increased, the general quality is advanced in similar proportion. A few of the most prominent features may be briefly described, and will serve to convey some idea of the character of the business as a whole.

GLOXINIAS.

Three or four of the useful glass houses are filled with Gloxinias, and though the plants have now been flowering for some weeks the display is still one of great extent and beauty, comprising the most varied colours, rich, bright, delicate, and pure. At Reading the chief attention is paid to improving the strain generally; and though new and beautiful varieties are being constantly selected they are not named, but serve only to increase the merits of the stock by the introduction of new shades of colour, increased size of flower, greater floriferousness, or more vigorous habit. One of the latest additions in this way, which will doubtless give rise to a very distinct progeny, is a variety with most intensely rich scarlet flowers, by far the brightest and finest coloured form we have seen, and which in the sun is quite dazzling by its brilliancy. This is a decided acquisition, and will be carefully looked after, as in contrast with the lighter tints and handsome pure white, the purples and blues, it is most effective. All the other numerous standard shades that have been yet obtained in the Gloxinia are represented in unexcelled purity and brightness, the majority of the plants being of the erect-flowering type which is the favourite now, though the horizontal and drooping varieties are also kept to supply demands. One extraordinary fact worthy of notice is that nearly all the plants are now grown in 60-size pots, whereas at one time 48's and 32's were employed for the same purpose. It has been found, however, that with liberal treatment in supplying liquid manure quite as satisfactory results can be obtained from plants in small pots as from those in a larger size; and when it is stated that some of the former have borne as many as a dozen or fourteen flowers and hundreds eight or ten, it can be readily imagined that nothing more could be desired. The flowers, too, are equally as large and the colours as rich as under the other system, while the saving in labour is an important item. Mr. Hudson of Gunnersbury House Gardens exhibited recently at Kensington a Gloxinia in a small 60-size pot which had half a dozen fine flowers, and a cultural commendation was deservedly awarded for it, the plant being greatly admired by the members of the Committee and the visitors. This small-pot system is indeed one that commends itself to notice, as the plants can be so readily employed for decorative purposes, especially for placing in vases or for table decoration.

TUBEROUS BEGONIAS.

Like the Gloxinias and Calceolarias these have for some years been special objects of attention at Reading, and similar success has been achieved with each class of plants. Several remarkable varieties have been raised from time to time, but one that is now being increased is of uncommon interest and beauty. It is said to be the result of a cross between a variety of the Davisi type and a white-flowered fibrous-rooted form of the natalensis habit, the latter being the seed-bearing parent. It is, however, totally distinct from both parents, and but for the fact that so much care is exercised in hybridising it might be reasonably supposed that some mistake had occurred. The flowers are small, but of a rich rose colour, and are produced most freely in slightly drooping clusters; the leaves are roundish, small, very dark, with a few whitish dots, while in habit the plant is remarkably dwarf and compact. It will unquestionably become a great favourite when sent out, as it has everything to recommend it, and is moreover expected to be a winter flowerer. For general decorative purposes it will be invaluable. Another very distinct variety is Meteor, a cross between Phosphorescent and Pearcei, which has small orange-yellow flowers, curiously shaded and varying in hue; the petals round, habit compact yet vigorous, and one of the most floriferous of the section. Fine strains of white, orange, yellow, buff, scarlet, crimson, rose and blush-coloured varieties are also represented by some thousands of plants, all flowering grandly and constituting a rich floral display that for brilliancy could not be excelled. In connection with these, it may be observed that one house is filled with plants six months old from seed, fine bushy specimens in 48-size pots, bearing an enormous number of large flowers, and proving what a comparatively brief time suffices to obtain plants of good size. Better and more useful plants could not indeed be desired.

CYCLAMENS.

Some houses occupied with these plants were interesting, though not in flower, for when in vigorous health Cyclamens are attractive at all times, their foliage being so handsomely marbled. In this department, again, is a good example of what can be done in a short time under a good system of culture, for the plants, which are giving such good promise of a magnificent show of flowers later on, were raised from seed last November, and are therefore not yet a year old, though the size of the corm, the vigour of the plants, the grand foliage and general condition, would lead one to suppose they were much older.

OUTDOOR PLANTS.

It would be difficult to enumerate in detail all the attractions in the beds outside, and only a passing glance can be given to the majority. Hollyhocks are making a grand display with their tall stems of many-coloured flowers—purple, scarlet, and white. Ten-week Stocks are uncommonly vigorous, of pyramidal habit, and bear very large full flowers. Carnations from seed, too, are very noticeable, the proportion of doubles being about 80 per cent., the colours varied, and some of the flowers equal to named varieties. Zonal, Bronze, Ivy-leaf, and Decorative Pelargoniums are similarly grown from seed, handsome plants being obtained in a few months; and as the seed is always selected from the best-named varieties in cultivation, there is the pleasing excitement of possible novelties of

sterling merit appearing amongst the seedlings; this is a great recommendation to amateurs, from whom the demands are very large. Verbenas are very beautiful, and, like most of the preceding, they are sold either mixed or in separate colours—a very convenient regulation. White, scarlet, blue, and purple are represented by beds as true to colour as if the plants had been increased by cuttings. Antirrhinums, too, are another feature, especially the Tom Thumb section, which is very dwarf and profuse-flowering, surprisingly distinct from the ordinary type, and possessing as many varied tints. Petunias, selfs, fancy-coloured and striped, have a large space devoted to them, and produce fine trusses of colour and load the air with perfume for hundreds of yards around. Then there are beds of Dianthus, *D. diadematus*, *nanus*, *atrosanguineus*, and *D. Heddeewigi*, all beautiful and bright. Portulacas, yellow, white, rose, crimson, and striped, form other interesting beds. Balsams, Zinnias, Pansies, Penstemons, and scores of others are similarly creditable.

Especially noteworthy is that portion of the grounds devoted to the varieties of Phlox Drummondii which are flowering superbly, the colours exceedingly rich, bright, clear, and the shades numerous. Cinnabarina, Chamoise Rose, Snowball, hortensiflora and Victoria are only a few of many grand varieties, selfs, bicolors, tricolors, and striped. It is surprising what advances have been made with these plants in recent years, for there are now few annuals that are more appreciated either for mixed borders or ordinary beds in the flower garden. A bed of these varieties in Hyde Park is this season one of the most pleasing of all, and is a striking example of their value for such purposes. In addition to these flower trials considerable space is devoted to a trial of Tomatoes, all the varieties obtainable being grown out of doors for comparison, but they are not at present sufficiently advanced to be satisfactorily judged, though they are giving promise of fine crops.

It need only be further added that the same methodical and excellent system of management which distinguishes Messrs. Suttons' admirable seed warehouses is also seen in the trial grounds, no effort being spared to secure the best possible results—a principle of obvious value to both purchaser and purveyor.—X.

TAUNTON DEANE HORTICULTURAL SOCIETY.

THE last, but by no means the least pleasant of my judicial visits, is that which I pay to the beautiful county town of Somerset. To meet friends whom one knew and travelled with in the salet days of forty-three years past in scenes which can never be forgotten, to go amongst those whom one has been associated with for many years, and to come to an exhibition of a first-rate character and see the enthusiasm which pervades all classes—if all these do not combine to make a visit a pleasant and happy one, why one must be very hard to please; and so to me this Taunton visit is always a pleasant one. We have to go to the West to see what is really thought of a flower show, and in no place that I know of is it so great a success as here. The whole town is *en fête*, business is pretty well high suspended, the neighbouring gentry flock in and make it a point of being at home at the time of the Show, and a few items from their last published account will evidence the favour with which its operations are viewed. I should say that in explanation of the very large amount of gate money, that an exhibition of fireworks, ever popular, takes place at night. This costs about £60, and produces generally a clear profit of £70 or £80. The subscriptions last year amounted to £241, and the gate receipts to £348, and so successful was the financial condition, that they were enabled to erect a new band at an expense of £116. One thing must, however, be added, that they have generally been favoured with fine weather, and have had a succession of able Secretaries, not the least able one being their present one, Mr. C. H. Samson.

I have been here now for the last ten years an annual visitant of the Taunton shows, and I unhesitatingly say that this was, without exception, the finest one I have ever seen. All the productions were of good quality, plants, flowers, fruit, and vegetables, and I never anywhere saw such a bank of flowering plants as that which filled the long tent from one end to the other. Mr. Tudgey was not there, but his place was worthily taken by a new exhibitor, Mr. Cleam of Crediton, whose plants displayed great skill in cultivation; while Mr. Cypher surpassed himself. Mr. John Marshall of Belmont reappeared as an exhibitor with plants of great excellence, and Mr. Lawless showed that his gardener, Mr. Cole, could keep up his well-earned reputation. Mr. Cypher's collection of twelve stove and greenhouse plants, for which he gained the premier prize of £20, was equal to any that even he has ever shown. They were *Ixora regina*, *I. amabilis*, *I. Williamsii*, *Clerodendron Balfourianum*, *Allamanda nobilis* and *A. Hendersonii*, *Erica æmula*, *E. Marnockiana*, *E. Austiniana*, a magnificent plant, and *E. ampullacea Barnesii*; *Stephanotis floribunda*, very fine; and *Dipladenia amabilis*. Mr. Lawless (gardener, Mr. G. Cole) was second with a beautiful lot not quite so massive, comprising *Stephanotis floribunda*, *Clerodendron Balfourianum*, *Ixora Prince of Orange*, *Erica Marnockiana*, *E. Farmeri*, *E. Jacksonii*, and *E. æmula*; *Eucharis amazonica*, *Allamanda Hendersonii* and *A. nobilis*, and *Lapageria rosea*. In the class for six stove and greenhouse plants in flower Mr. J. Marshall of Belmont was first with fine plants of *Bougainvillea glabra*, *Allamanda Hendersonii*, *Dipladenia amabilis*, *Stephanotis floribunda*, *Ixora Prince of Orange*, and *Stative profusa*. J. H. Mould, Esq., was third with *Bougainvillea glabra*, *Allamanda nobilis*, *Allamanda Hendersonii*, *Ixora Williamsii*, and *Erica Irbyana*. In the class for eight foliage plants the contest was so sharp that the Judges were obliged to give the two first collections equal first, Mr. B. N. Cleam and Mr. Lawless being the exhibitors. The former's plants were *Croton Williamsii*, *Areca lutescens*, *Cycas revoluta*, *Croton Disraeli*, *Lantana borbonica*, *Croton Johannis*, *Alocasia intermedia*, and *Seafortia elegans*. The colouring of the Crotons in this collection was something unusually grand. Mr. Lawless' were *Croton undulata* and *Croton Warneri*, *Thrinax elegans*, *Kentia Belmoriana*, *Nepenthes Rafflesiana*, *Croton Disraeli*, and *Livistonia altissima*. In the class for eight Ferns Mr. B. W. Cleam was again first with *Cibotium princeps*, a grand plant; *Cyathea dealbata*, *Nephrolepis davallioides*, and *Davallia Mooreana*, *Gleichenia Speluncæ*, *Adiantum trapeziforme*, *Marattia Cooperi*, and *Davallia polyantha*. Mr. Lawless was second with *Microlepia hirta cristata*, *Davallia polyantha*,

Gleichenia rupestris, *Gleichenia Mendeli*, *Nephrolepis nidus-avis*, *Gleichenia Dicksonii*, *Davallia Mooreana*, and *Nephrolepis davallioides* and *fareana*. In the class for new flowering plants Mr. Cypher was first with *Dendrobium Dearii*. In the classes confined to the county of Somerset Mr. Mould was first with the curious *Attacia cristata*, *Clerodendron Balfourianum*, *Dipladenia amabilis*, *Ixora Williamsii* and *I. regina*, *Stephanotis floribunda*, *Ixora Dixiana*, *Bougainvillea glabra*, and *Erica retorta major*. In Class 31 Mr. Marshall was first with *Curcuma Roscoeana*, *Dipladenia Brearleyana*, *Ixora Regina*, *Dipladenia profusa*, and *Erica Verdii*.

There was an excellent display of cut flowers, Dahlias, Gladiolus, Roses, Asters, &c. Mr. Kelway staged a splendid lot of his choicest flowers, while Mr. Dobree of Wellington, who has for years held the first place as an amateur in the west of England, had a stand of seventy seedlings, in addition to those staged for competition, among which were some very fine flowers. Like everyone who has tried their culture he complains of sad losses, even amongst his seedlings; and, in truth, Gladiolus-growing is a very expensive hobby. I give the names of Mr. Kelway's flowers, as they comprise some of the best of his immense stock. Pelargo, dark red, Veronica, Hercules, Lillianis, Princess Charlotte, creamy buff, a novel flower, Callippon, Lady Aberdare, Rev. H. D'Ombraim, ex., ex., (of course!) Mrs. Eyton, Jessica, Accacia, CEsopus, Ella, Dr. Woodward, Lord Leigh, Countess Craven, Rev. J. M. Berkeley, Marica, Cleobula, Belgare. Of these Pelargo, Princess Charlotte, and Lillianis obtained certificates. Mr. Keynes of Salisbury exhibited Roses as I have rarely seen shown in August, fresh, of good form and substance. His stand of forty-eight contained Charles Lefebvre, Helen Paul, Alfred Colomb, Capitaine Christy, Sir Garnet Wolseley, Madame Verdier, very bright and pretty; George Moreau, Elie Morel, Ferdinand de Lesseps, Etienne Dupuy, Beauty of Waltham, John Hopper, in excellent form; Star of Waltham, Madame Lambard, Xavier Olibo, Duke of Edinburgh, Marie Van Houtte, Reynolds Hole, La Reine, A. K. Williams, Triomphe de Rennes, Bride of Waltham, Marie Rady, Duchesse d'Orleans, Wilson Saunders, Eugénie Verdier, Duc de Rohan, Madame Eugénie Verdier, Paul Neyron, Mrs. Jowitt, Marguerite de St. Amand, Charles Dawson, Baronne de Rothschild, William Kœlle, Baron Gonella, Madame Victor Verdier, La France, Duchess of Bedford, Comtesse d'Oxford, Beauté de l'Europe, Madame Charles Wood, Catherine Mermet, Souvenir de Spa, and Duchesse de Morny. Mr. John Mattock was second. In twenty-four trebles Messrs. Keynes were again first with Alfred Colomb, Elie Morel, Charles Lefebvre, Madame Marie Verdier, Duke of Edinburgh, Eugénie Verdier, Marie Van Houtte, Beauty of Waltham, Triomphe de Rennes, Ferdinand de Lesseps, Helen Paul, Lord Macaulay, Madame Victor Verdier, Marguerite de St. Amand, Xavier Olibo, Capitaine Christy, Marie Baumann, John Hopper, Baronne de Rothschild, Baron Gonella, Mons. Boncenne, Madame Lambard, and William Kœlle.—D., Deal.

WATERING CUCUMBERS.

I NOTE there seems to be a standing difficulty in keeping the beds well watered. I have adopted a plan by which I can do it effectually and with half the labour of the usual way. I have a series of 4-inch drain pipes (upright) passing through the bed to the hot flue, a 9-inch pipe from the boiler under, which pipe is laid in a hollow chamber. By these first series I water the flue, raising a steam underneath the bed; also by covering or uncovering the tops of these pipes I regulate the heat of the bed at will. The second series of pipes I put on at the first earthing upright on the bed. That and each successive earthing after is put in around them. Their tops are open to the house. By these I can pour water direct to the middle of the bed, which fully saturates to the bottom. The top of the bed, with which there is no difficulty, I do in the ordinary manner. I daresay the idea, although original to me, is as old as our Devonian formation, but it may be useful to amateurs.—TORBAY.

WESTON-SUPER-MARE SHOW.

AUGUST 14TH.

THE eleventh annual Exhibition of this popular Society was held, as usual, in the Rectory Ground, and was in every respect a great success. Much of this success is due to the energy of Mr. Frampton, the Secretary, and the Committee generally, who work hard, first to secure a good sum of money to offer in prizes, and again in arranging the thoroughly good representative display resulting. Among the plant-exhibitors Mr. Cypher of Cheltenham was highly successful, and probably a much better group of flowering plants than his were never before exhibited. Mr. Mould of Pewsey also staged well and successfully, and among the amateurs H. Pethick, Esq., was deservedly awarded several first prizes. Mr. Austen, gardener to Sir Greville Smyth, staged a considerable quantity of fruit and vegetables in his well-known excellent style, and obtained a number of first prizes.

Mr. Cypher's remarkable group of twelve flowering plants in the open classes consisted of *Erica Marnockiana*, *E. æmula*, *E. Austiniana*, *E. ampullacea Barnesii*, *Ixora regina*, *Allamanda nobilis*, *Anthurium Schertzerianum*, *Clerodendron Balfourianum*, *Dipladenia amabilis*, *Allamanda Hendersonii*, *Ixora Williamsii*, and *Stephanotis floribunda*, all fresh and beautifully flowered. Mr. Mould's second-prize group included good specimens of *Bougainvillea glabra*, *Erica insignis*, *E. Iveryana*, and *E. Lindleyana*. The third prize was awarded to Mr. W. Hughes, gardener to H. Pethick, Esq.; and the fourth to Mr. D. Bloodworth, both exhibiting creditably. Mr. Cypher also took the lead with six plants in bloom, and was followed by Messrs. Mould and Bloodworth, and the same positions were occupied in the class for fine-foliaged plants. Mr. Mould staged the best six Ferns, and was closely followed by Mr. S. Brown and Mr. P. Cassell, both of Weston-super-Mare. Mr. Pethick's first-prize group of *Adiantums* were very good, and Mr. G. Lane, gardener to F. Taylor, Esq., was a good second. *Lycopodiums* were well shown by Mr. G. Matthews, gardener to S. T. Knyfton, Esq., Uphill, and Mr. F. Taylor; *Pelargoniums* by Messrs. S. Brown and W. Adams, gardener to W. Smith, Esq., Weston-super-Mare; *Clematisses*, *Fuchsias*, and *Liliums* by Mr. S. Brown, Mr. W. Pain, and Mr. Partridge Cassell; while Mr. Pethick had the best *Achimenes* and *Begonias*, and Mr. H. C. Mayall, Bath, the best *Gloxinias*.

The amateurs in the classes reserved for them made a very effective display. With flowering stove and greenhouse plants Mr. G. Pain, gardener to W. Ash, Esq., Weston-super-Mare, took the lead, and the second prize was awarded to Mr. T. T. Knyfton, Uphill, the specimens being good in each instance. Mr. Pain also took the lead with fine-foliaged plants, and was followed by Mr. F. Taylor and Mr. H. Pethick. Exotic Ferns were well shown by Mr. J. Davey, Chilton Polden, and Messrs. H. Pethick and F. Taylor; Adiantums by Messrs. F. Taylor and T. T. Knyfton; Geraniums by Messrs. J. Wright and S. T. Sayce, both of Weston-super-Mare; Balsams by the Rev. J. A. Yatman and Mr. J. Matthews, Weston-super-Mare; Coleus by Messrs. W. Smith and J. Wright; Gloxinias also by the last-named exhibitors; and Begonias by Messrs. H. Pethick and W. Ash, the exhibits being highly meritorious, and were awarded the prizes in the order named in each instance.

There were a considerable number of classes both open and for amateurs provided for cut flowers, and throughout the competition was very close and good. Messrs. Paul & Son, Cheshunt, had the best stand of twenty-four varieties of Roses, three blooms of each, these including large and fresh examples of Alfred Colomb, Comte de Raimbaud, Etienne Levet, A. K. Williams, Maréchal Niel, Maurice Bernardin, Jules Finger, Madame Victor Verdier, Mrs. Jowitt, Harrison Weir, Marie Rady, Capitaine Christy, E. Y. Teas, and Marie Baumann. Messrs. Keynes & Co. were a close second, and in their turn were closely pressed by Messrs. G. Cooling & Son, Bath. Messrs. Paul & Son were also first with twelve Teas, among these being very good blooms of Catherine Mermet, Souvenir d'Elise Vardon, Jean Ducher, Madame Lambard, and Anna Ollivier. Messrs. Keynes & Co. were second, and Mr. J. Mattock, Oxford, third, both staging excellent blooms. Among the amateurs Mr. S. P. Budd took the lead with twelve varieties of Roses, these including very good blooms of E. Y. Teas, Duke of Wellington, and Alfred Colomb. Mr. D. Shellard, Hanham, was deservedly awarded the second prize. Double Dahlias were shown by Messrs. Keynes & Co. in their well-known fine style, and Mr. A. Hill, Bower Ashton, was a very creditable second. Mr. A. A. Walters, Bath, had the best lot of single Dahlias, and which were very bright and good. Mr. S. Dobree, Wellington, had by far the best stand of Gladioli spikes. Verbenas were well shown by Mr. W. Smith, Kingswood; French Asters by Mr. Isaac Burgess, Bristol; Quilled Asters by Mr. A. A. Walters; herbaceous Phloxes by Mr. W. Luton, Twerton-on-Avon; and Hollyhocks by Mr. A. A. Walters, and several others exhibited well in each of the same classes. Mr. Cypher had the best hand bouquet, and was also successful with buttonhole bouquets.

Fruit was extensively and well shown, the Grapes especially forming an attractive feature. For a collection of eight varieties of fruit Mr. Austen took the first place, this consisting of fine well-finished bunches of Muscat of Alexandria and Black Hamburg Grapes, a good Smooth Cayenne Pine, Ashton Seedling Melon, Violette Hâtive Peaches, Pine Apple Nectarines, Negro Largo Figs, and Morello Cherries, all in excellent condition. Mr. W. Iggulden, gardener to the Earl of Cork, Frome, was a good second, his collection including good Black Hamburg and fairly good Muscat of Alexandria Grapes, a good Blenheim Orange Melon, and well-coloured Bellegarde Peaches. Mr. W. T. Crossman was awarded the third prize, his best dishes being Black Hamburg and Muscat of Alexandria Grapes. Mr. Austen was first with one Pine Apple, and was followed by Mr. W. Weaver, Hereford. Most of the bunches of Muscat of Alexandria were coloured indifferently. Mr. Austen's were much the best, the second and third prizes going respectively to Mr. G. Shelton, gardener to W. Wait, Esq., Clifton; and Mr. W. Ash for creditable exhibits. Mr. Austen's first-prize bunches of Black Hamburg Grapes were large and spotless, but were a little wanting in colour. Mr. Iggulden had smaller bunches and well-coloured, and took the second prize, the third going to Mr. W. Carpenter, gardener to J. G. Livingstone, Esq., Westbury, nine others also staging creditably. With any other kind of black Grapes Mr. W. Duffurin, gardener to Mrs. Walker, Weston-super-Mare, took the lead, and was followed by Mr. H. O. Wills, Clifton, both staging Madresfield in fairly good condition. The best green-fleshed Melon was a good fruit of Earl of Beaconsfield, staged by Mr. W. Bower, Weston; the second prize going to Mr. A. Harris, gardener to Major Law, Banwell, for Best of All in good condition. Mr. Iggulden took the lead with a scarlet-flesh Melon, winning with a large heavy fruit of Blenheim Orange; Mr. E. Thomas, Bishopstowe, following with Hero of Bath. Mr. Duffurin had the best dish of Peaches, the variety being Grosse Mignonne in good condition; and Mr. E. Trotman, gardener to H. O. Wills, Esq., followed with large well-coloured fruit of Vanguard. Mr. Austen had the best Nectarines, the variety being Pine Apple, Mr. Duffurin following with Elruge, the examples in both instances being highly coloured. Mr. Austen was also first for Figs and Red and White Currants, Mr. Iggulden first for Apricots and Cherries, Mr. J. Davey for culinary and dessert Apples, and Mr. Crossman for Plums.

Large quantities of vegetables were shown, the quality throughout being very good. With a collection of eight dishes Mr. Austen was a good first, the varieties being Hathaway's Excelsior Tomatoes, James's Intermediate Carrots, Snowball Turnips, Veitch's Autumn Giant Cauliflower, Sion House Kidney Beans, Woodstock Kidney Beans, White Leviathan Onions, and John Bull Peas. Mr. T. Tilley, gardener to Col. Cotgrave, was a good second, and Mr. E. C. Law third. Mr. J. Coles took the first place in a large class of round Potatoes with Rector of Woodstock, and was followed by Mr. E. C. Law; but there were several much better dishes passed over. Messrs. W. M. Baker and W. Iggulden were respectively second and third for kidney Potatoes, the variety in both cases being Woodstock Kidney. Messrs. Austen and Iggulden had the best Cauliflowers; Messrs. W. Duffurin and T. Tilley Onions, autumn-sown; Messrs. J. Davey and W. Duffurin spring-sown Onions; and Messrs. Austen and E. C. Law the best Peas. A considerable number of Tomatoes were shown, Mr. Iggulden being a good first with a handsome dish of Phillips' Perfection; and Mr. Howe, gardener to Lewis Fry, Esq., M.P., a good second. The Rev. A. Yatman and Mr. Hall took the prizes for Cucumbers, Mr. H. Pethick and Mr. Jas. Davey for a basket of salad, and Mr. J. Coles and Mr. J. Davey for Lettuces. A grand lot of vegetables of all kinds were also shown by the cottagers.

Mr. J. Matthews, The Royal Pottery, Weston-super-Mare, exhibited a large assortment of his new and extremely pretty style of terra-cotta vases, flower stands, and window boxes. Some of the patterns are very good imitations of the trunk, stems, and bark of trees, with Ivy and other trailers

running over them. The large and deep half-round boxes or pans should eventually find a place in the fronts of many houses or in conservatories, being ornamental yet well adapted for the reception of choice climbers and other plants which could not well be planted out. The pedestals of the vases are also made in rustic patterns, the whole being really works of art, and reflect much credit on the manufacturer and his designers.

HARDY FRUIT GARDEN.

Lateral Growth.—If the weather is cool and showery it will be advisable to discontinue removing lateral growths earlier than usual this year, in order to induce full maturity and not waste the strength of the trees upon the production of worthless spray unfit either for the development of blossom or wood buds. For the next three weeks, therefore, shoots already several inches in length will be left to grow unchecked, and in our next calendar we will call attention to the important operation of twisting lateral growths to check the flow of sap in part so as to make the buds plump at the base without causing them to start into growth this autumn.

Preparations for Planting.—Early planting is so important a factor in the culture of young fruit trees, that wherever much planting is to be done this autumn the drainage of the land and making the stations should be begun soon enough for all to be in readiness for the planting by the first week in November, which is only ten weeks from the present time. If a plot of land is to be devoted entirely to the growth of fruit, first make the drains 30 feet apart and from 2 feet 6 inches to 4 feet deep, according to the nature of the soil—deep for light porous soil, shallow for a heavy tenacious one. In a deep rich loam specially prepared stations are unnecessary, but in poor thin soil the stations must be 6 feet square and 2 feet 6 inches deep, each station to be drained by a branch drain laid across the centre of the bottom and connected with the drain nearest to it. Six inches of broken stones or bricks is then put in the bottom of the station, care being taken not to move any of the drain pipes, and the remaining 2 feet is filled with the best soil obtainable, such as the top spit of a meadow with the turf and a slight admixture of wood ashes, charcoal, coal ashes, and mortar rubbish mixed with lime or gritty road scrapings. Those additions are not mentioned as indispensable for fruit trees, but rather as useful substances to which planters beset with the difficulties of a poor soil turn most gladly to account. If inferior meadow soil is only to be had, then mix a small quantity of old farmyard manure with it and a liberal sprinkling of crushed bones, and do not forget that at best your stations only contain sufficient fertility for the requirements of a small young tree; and that subsequently in the course of three or four years, if the soil around the stations has not been enriched and made thoroughly fertile, most of the fruit trees will suffer, canker will attack many, and the fruit will be inferior in size and flavour. This method of preparing stations applies to all sorts of tree fruit, both upon walls and in the open.

FRUIT HOUSES.

VINES.—*Grapes Colouring.*—If the bright weather that now happily prevails continues, take especial care that inside borders especially are well supplied with water. Both root and atmospheric moisture are often unduly limited at this season when the fruit is ripening, and red spider and other insects are afforded a favourable opportunity to spread, and they never fail to make the most of it. With early and ample ventilation a moderately moist atmosphere in no way impairs the colouring of Grapes, but, on the contrary, often assists it; and so does liberal moisture at the roots, particularly when the Vines are heavily cropped. Hesitate in removing laterals from black Grapes now, as they almost invariably colour the best under a rather thick canopy of foliage.

Pines.—Suckers obtained from the summer-fruiting plants will soon be ready to be potted. Transfer the strongest to pots 10 and 11 inches in diameter according to the variety, affording the plants a position near the glass in a light airy house, keeping them gradually growing throughout the winter months, under which conditions they start into fruit readily about the following May or June, and afford a good supply of early autumn fruit. The remaining portion of the plants above referred to should be wintered in 7 or 8-inch pots, and placed in larger pots in spring. These, with suckers of Smooth-leaved Cayenne and Charlette Rothschild started last March, will without much difficulty provide a successional supply of ripe fruit throughout the winter months, and be supplemented by Queens and other varieties which were started at the same time.

Melons.—The weather for the past few days has been all that the grower can desire, good fruit consequently being very plentiful. Before the fruits are very ripe they should be cut with a good portion of stem, and placed in a dry cool place so as to prolong the season of supply. Fire heat may safely be dispensed with during a continuance of such weather, closing the house early and maintaining a moist atmosphere to all plants other than those setting or ripening fruit. Under ordinary circumstances the houses, pits, and frames may be closed and the plants

syringed at 3 P.M., but span-roofed houses should not be closed for half an hour later. For healthy and robust plants shading may almost be dispensed with, and less atmospheric moisture will be now required, especially by plants in frames. If the last batch of plants are weakly afford liquid manure about twice a week, but do not apply it very freely until the fruits are set, after which earth-up the roots with good lumpy compost. The last batch of plants in pits and frames will be setting the fruit, and must have a dry atmosphere with a little ventilation at night, stopping each lateral one joint beyond the fruit. Continue to support fruits that are becoming heavy by means of tables placed beneath the trellis, and those in frames should be kept from the soil by slates, and when ripening may be elevated on small pots.

Cucumbers.—The general treatment for these continues the same. Plenty of atmospheric moisture, liberal feeding at the roots, free stopping and training the young growth, and thinning out the old being the chief points. Encourage the plants for autumn fruiting to make a strong growth, adding a little fresh soil as the roots penetrate through, abundance of surface roots being a true indication that the plants are doing well, maintaining a firm condition of the bed so as to induce short-jointed wood. A little fire heat should be employed on cold nights to prevent the temperature falling below 65°. Take advantage of every opportunity to collect and prepare soil for the winter plants, clearing the house of exhausted plants, remedying any defect in the heating apparatus, thoroughly cleansing the interior and exterior of the house.

PLANT HOUSES.

STOVE.—*Crotons.*—There is but little risk in cutting down any plants that are likely to become too large before they are wanted for decoration. Good tops taken off now and inserted according to their size in the centre of 5 or 6-inch pots will make handsome plants in a very few weeks. These tops strike with much freedom at this season of the year in a close frame and with the aid of bottom heat. Labour is saved when they are rooted in the pots in which they are to remain. Careful watering for a time is necessary until they are established. Gradually harden them to succeed in the more airy conditions of the house in which they are to be grown after they leave the propagating frame, or they are liable to be checked and stand still for a long time, or probably lose their lower foliage, which detracts materially from the beauty of the plants. A little *Selaginella* placed on the surface of the soil will be thoroughly established by the time the plants are wanted. A few sprays of *Panicum* or of a variegated *Tradescantia* are also very effective when established among the moss.

Dieffenbachias.—Strong tops do not root so readily without losing their foliage as *Crotons*, and when a few extra large plants are required in moderately small pots the old plants should be placed in strong moist heat, and mossed round the stems. Under the leaves make incisions on each side of the stems with a sharp knife before mossing, and in a short time roots will be formed and the tops can then be taken off and established in pots. Young plants are readily raised from portions of stem, and a few should be inserted at once and kept growing until they are large enough for purposes of decoration. The most compact plants are those which are grown slowly and under the influence of as much air as the plants will bear without injury. When grown rapidly in strong heat they soon become tall, and thus possess but little beauty for decoration when employed as single specimens.

Dracænas.—These are amongst the most beautiful plants that can be used for the decoration of rooms. Young plants now growing in 4, 5, and 6-inch pots should be encouraged to develop as much good well-coloured foliage as possible before the days become short and dark. To accomplish this, grow the plants near the glass and begin gradually to discontinue shading, and no more than is absolutely necessary should be employed. If the plants become root-bound give them at intervals of about three weeks a little Standen's manure in preference to repotting them. Later batches should now be transferred according to their size into the size pots referred to, and, if grown rapidly, will be useful when the earlier plants by employment in rooms have been rendered useless except for stock. Grow green forms, such as *congesta*, *rutilans*, and others, as cool as possible either in the greenhouse or frames, as when kept in an intermediate temperature they soon grow too tall, especially the first-named, and become unsightly.

Primulas.—Where these are grown to flower towards the end of October or early in November, no time should be lost in placing them in 5 and 6-inch pots. Drain the pots liberally, and make the plants secure at the collar by placing them sufficiently deep in their pots. It is a mistake to have them loose at the collar, as it is no preventive against decay, while they are liable to injury by shifting from place to place, and a greater per-centage damp off than would be the case if potted deeply and made secure. The case of damping during the winter is due in the majority of cases to irregularity in watering. For decorative purposes in the dwelling house a few of the smallest plants of this batch may be kept in 3 or 4-inch pots, in which they will flower most profusely and be found very useful for associating with small Ferns and other dwarf plants. Later batches now in pans and thumb pots should be placed into 2, 3, and 4-inch pots. A compost consisting of good fibry loam, a seventh part of decayed manure, and about the same quantity of leaf soil, a little soot, bone dust, and coarse sand, will grow these plants well. Keep them close for a time after potting, then admit air liberally, and shade only when necessary to prevent the foliage flagging.

Clematises.—Plants used for forcing in spring should now be outside, and some attention is needed at this season of the year in supplying them liberally with water. They should, if root-bound, have stimulants

in a weak state every time watering is needed. These plants, if carelessly treated at this season of the year, cannot possibly be expected to flower satisfactorily when required to do so in spring. The best plan is to grow them after flowering under glass until their growth is thoroughly completed, and then place them outside, but convenience does not always exist for carrying out this system; but where time and room can be devoted to the plants under glass they more than compensate for the care and labour bestowed upon them.

THE BEE-KEEPER.

FOUL BROOD.

A CORRESPONDENT some time ago sought information on this subject. So far as I know no more valuable hints and instructions have appeared than in the columns of the Journal, and especially I would direct attention to what has been written by Messrs. Cheshire and Cowan. From these writings I will cite. Mr. Cheshire observes—"When foul brood breaks out it attacks grubs only, and for a fortnight or so no actual difference is effected, but as it spreads population is reduced from two causes: Young bees do not all hatch out, some die prematurely, and the odour generally diffusing itself takes all heart and energy out of the workers; the brood-nest gets by degrees choked, and the laying energy of the queen is thus repressed. The general effect is the gradual weakening of the colony it is true; but all can see that time is required for the destroyer to accomplish his purpose, and despite his sad work making havoc within, the bees may appear to be in the full swing of unhindered progress until the disease has a firm hold of every comb.

"The curability of foul brood is the next point upon which I wish to insist. While we feel sure that the doctor can do us no good we will not take his medicine, and while bee-keepers believe that foul brood must run its course and work out devastation and ruin nothing will be done to arrest it. I assert its curability because I have again and again cured it, and in this position I am pleased to be able to refer to one of the most prominent, certainly one of the most scientific and successful, apiarians of our day—T. W. Cowan, Esq., Chairman of the Committee of the British Bee-keepers' Association, whose experience in the treatment of this malady has been great, but not greater than it has been successful. Mr. Cowan, in reply to a request that he would permit a publication of his methods, has favoured me with a lengthened letter, in which he says, 'I am quite, I think, of your opinion as regards foul brood, that is to be cured if attacked in earnest. You know I had it in my apiary, and it was a source of great trouble to me, but I stamped it out with salicylic acid. My proceeding was to excise any very bad places, and when I found cells affected here and there I merely uncapped them and sprayed the combs with the solution of which I send you the recipe. I found generally in mild cases one application was sufficient, but in more severe ones two or three doses produced a complete cure. I found that if the cells were uncapped before they were punctured and sprayed with the solution, injecting a larger quantity into the affected cell so as to eject the viscid mass, there was no fear of the disease appearing again. In this state the viscid fluid in the cell is of a light brown, and is not permeated with spores to such an extent as when it is allowed to remain until it becomes highly coloured and the covering much depressed. I doubt very much if in this stage it is very contagious. I have no doubt the acid acts on the spores and destroys their vitality. So far so good. Now as regards the honey that is in the hive and which is supposed to contain the spores (although I must say I have never been able to detect any by the microscope), how are we to insure their being destroyed? Simply by uncapping it and feeding the bees on syrup containing the acid, which they will store with the uncapped honey, or uncap it and give it a good spraying with the acid solution. I have done both, but cannot say if it was really required; but as I think prevention is better than cure, and as it is not much trouble, there can be no harm done.

"All my hives are scalded, and so is everything that has had anything to do with the hive, and afterwards everything is washed over with the solution. I believe the germs of the disease are carried in the air, and we can never feel safe; I therefore always put acid in all the food I prepare. I examined six of my hives and all were healthy but one, and that I thought was also healthy. It was an early swarm. This year I had thrown off a swarm and a cast, and had given me six small 1 lb. sections nicely filled. I looked on the ten frames and found no queen and no brood. There was one cell covered, but not

punctured, but I at once recognised as a foul-broody one. Now the hive had not been queenless very long, as about ten days ago I saw the queen; and although she was not laying, there was a small quantity of brood hatching out, and all did hatch out except this one cell; it was uncapped and injected with the solution, and the other combs and bees sprayed with it. I have no doubt it will prevent its spreading in the future, as I shall not hesitate in using these combs in uniting if I require them.

"I have examined six hives to-day, fearing to find foul brood, but have not detected a single cell in any of the other hives. Now, how did this appear? It seems to me probable that it was brought there by some of the bees from outside, or a spore might have been lurking in some of the corners of the hive and had escaped the solution. This proves to me that it is impossible to tell when it may break out in an apiary; and as we know from experience that salicylic acid destroys the spores, I think it not only beneficial but important that a certain quantity of this acid should be in all the food given to the bees. Two years ago I tried feeding the bees on syrup containing a strong dose of acid without spraying the combs, and I found that the disease gave way to this treatment; but I find the other plan, that of uncapping and spraying, the most rapid. I do not mean to say if a hive is neglected, so that all the brood is rotten, it can be cured; but if taken in time, as every apiarian would do, it has been and can be cured.—THOS. WM. COWAN."

The table of recipes Mr. Cowan encloses will explain themselves.

TABLE.

Salicylic acid solution for mixing with syrup for feeding bees, painting over hives, and spraying combs, &c., for the prevention of foul brood.

Salicylic acid	1 oz.
Soda borax	1 oz.
Water	4 pints.

Spring and summer food for bees:—

White lump sugar	10 lbs.
Water	7 pints.
Vinegar	1 oz.
Salicylic acid solution	1 oz.
Salt	½ oz.

Boil for a few minutes.

Autumn and winter food for bees:—

White lump sugar	10 lbs.
Water	5 pints.
Vinegar	1 oz.
Salicylic acid solution	1 oz.
Salt	½ oz.

Boil for a few minutes.

Mr. Cheshire has written much more on this subject, but I have not time to make further extracts. I can only say that his experience has proved valuable to more than one—BEE-KEEPER.

TRADE CATALOGUES RECEIVED.

- James Carter & Co., 237 and 238, High Holborn, London.—*List of Bulbs and Seeds for August and September.*
- W. Leighton, 89, Union Street, Glasgow.—*Catalogue of Dutch Flower Roots.*
- Sutton & Sons, Reading.—*Catalogue of Bulbs (Illustrated).*
- Edmund Phillip Dixon, Hull.—*Catalogue of Bulbous Roots.*
- Wrench & Sons, St. Lawrence Works, Ipswich, and 57, Holborn Viaduct, London.—*Lists of Greenhouses and Hot-water Apparatus (Illustrated).*
- W. & S. Deards, Harlow, Essex.—*List of Heating Apparatus (Illustrated).*
- N. Davis, 66, Warner Road, Camberwell.—*Catalogue of New and Old Chrysanthemums.*

* * All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

Books (*H. W. M., Sheerness*).—"Orchard Houses," by J. R. Pearson, published at this office, may perhaps be of service to you. Its price is 1s. 6d., post free 1s. 7d. (*T. D.*).—Our Greenhouse Manual, price 10d. post free, contains concise instructions on the majority of plants that are grown in greenhouses.

Begonia Flowers.—We have received some very good flowers of Tuberous Begonias by post, but nothing to indicate by whom they were sent nor with what object.

Seedling Carnations (*A. B.*).—Your Carnations do not possess any special merit, and are surpassed by scores of others already in cultivation.

Meconopsis Wallichii (*A. G.*).—There are few dealers from whom you could obtain seed of the above plant, but perhaps Mr. Thompson, Ipswich, could supply it. The other address you require is Messrs. Fisher, Son and Sibray, Handsworth, Sheffield.

Oncidium Marshallianum (*R. F.*).—Your previous letter was not received or it would have been answered at once. This Orchid requires the temperature of the Cattleya house or the warmer of two divisions in an ordinary Orchid house. It succeeds upon a block, and should be placed in a light position, supplying water liberally while growth is advancing.

Peaches for an Unheated House (*S. W.*).—Six excellent Peaches ripening in succession are Alexander, Rivers' Early York, Dr. Hogg, Grosse Mignonne, Noblesse, and Barrington.

Apples and Pears for a Sandy Soil (*Idem*).—Dessert Apples.—Irish Peach, Margil, Cox's Orange Pippin, Adams' Pearmain, King of the Pippins, Hubbard's Pearmain. Kitchen Apples.—Keswick Codlin, Duchess of Oldenburg, Golden Noble, Warner's King, Small's Admirable, Striped Beefing. Pears.—Williams' Bon Chrétien, Colmar d'Été, Fondante d'Automne, Comte de Lamy, Doyenné du Comice, Knight's Monarch, Urbaniste, Thompson's, Huyshe's Victoria, Comte de Flandres, Winter Nelis, and Madame Millet. Plant early in November, and see this week's hardy fruit garden calendar for hints about preparation for planting.

Pink Bedding Pelargonium (*M. B. D.*).—It is impossible to name one variety as the best for all sizes of beds and positions. One of the best beds we have seen this year is planted with Mrs. Leavers. Reference will shortly be made to some of the beds in the London parks, and the most effective varieties will be enumerated.

Ridgway's Hedge-clipper (*J. R.*).—This excellent implement will remove the young growths from Thorn, Privet, and other hedges more easily and far more expeditiously than the hedges can be trimmed with the ordinary garden shears. If you order one of the articles in question it will be certain to reach you in good condition, but it may be probably too large for the parcels post. The lawn edge-clipper referred to has been found serviceable by several persons who have used it. Whether it will answer in your case or not can only be ascertained by experience. You had better write for a list of testimonials and judge for yourself as to its adaptability for your garden.

Freesia refracta (*C. D.*).—When the plants are showing signs of growth water may be given in small quantities at first, gradually increasing the supply as growth advances. They are best in a greenhouse when the flowers are expanding, but they will do very well in the frame at present if they are protected from heavy rains. The offsets of the Imantophyllums may be removed if you desire to increase the stock, and also if you wish the older plants to grow more vigorously. These when potted will soon become established and form useful plants in a few years.

Melons Cracking (*T. B.*).—Making the soil very firm, reducing the supply of water, yet not to such an extent as to cause the foliage to shrivel prematurely, and cutting a notch in the stem to check the rapid flow of sap to the fruit, are methods that are adopted with more or less success by gardeners. When Melons have been kept too dry during the swelling period, and then given a heavy watering when the fruit approaches the ripening stage, cracking is very likely to occur.

New Apples (*J. C. & Sons*).—The fruits when examined were so far overripe as to render it impossible to estimate the merits of the variety—they were, in fact, quite soft, mealy, and flavourless. We recommend that all new fruits be sent to the meetings of the Royal Horticultural Society to be examined by the Fruit Committee.

Helianthus orgyalis (*J. C. & Co.*).—The plant you have is a North American species of Sunflower bearing the above name. It is of easy culture, succeeding in any ordinary rich garden soil, and is, when growing vigorously and flowering freely, an extremely ornamental border plant. It can be increased by division of the roots.

Analysing Soil (*W. K.*).—There must have been some misunderstanding. It is impossible that we can undertake to analyse soil, and this we have previously stated in these columns. The soil, however, shall be examined, your letter considered, and a reply given in a future issue. A spray of a plant from you was left at this office, but has been inadvertently mislaid. If you can send another by post we will endeavour to name it if it arrives in a sufficiently fresh state.

Child's Hill, Hampstead, and West-End Floral and Horticultural Society (*J. E. H.*).—Mr. Williams, The Gardens, Frognaal Rise, Hampstead, sends us a schedule of the above Society, that has been established ten years in answer to your inquiry on the subject last week. The Society appears to be well supported, and the Committee will be glad no doubt to accept you as a member.

Primulas (*Angus Park*).—It is not injurious to sprinkle Primulas through the fine rose of a watering pot in the afternoon after a scorching hot day

provided the water is pure and does not contain lime or other matter that stains the foliage; at the same time, syringing is not essential to success in cultivating these plants, and it is easy to err by a too free use of the implement. Nothing is more invigorating to Primulas that are established and growing freely than exposure to the dew, and it is a good plan to remove the lights from frames containing plants during clear nights at this period of the year. Plants thus exposed become very sturdy.

Cucumber Leaves Withered (T. B.).—The condition of the leaves indicates poverty of soil, insufficient supplies of water to the roots, a too dry atmosphere, and the presence of red spider. If all the leaves are like those sent the health of the plants cannot be restored; if only a portion are affected remove all the worst, syringe the plants freely twice a day, saturate the soil with weak liquid manure in a tepid state, cover the bed with an inch or two of fresh soil to encourage the production of surface roots, maintain a moist genial atmosphere, and a night temperature of 60° to 65°. If this treatment will not result in healthy growth nothing will.

Mildewed Peas (A. L. M.).—You ask if the mildew is in the soil. Our reply is, that the spores appear to be everywhere, and germinate when the conditions are favourable. A damp atmosphere and dry subsoil render the plants liable to be attacked with the parasite. By all means sow on another plot of ground deeply worked and well manured, also obtain fresh seed from a nurseryman or seed firm of repute, and you may have better rows next year. Mildew may perhaps be generally prevalent in your district, in which case you will find it difficult to prevent it attacking the Peas.

Weak Vines (J. A., Dublin).—If the growths you have sent are fairly representative of the condition of your Vines you will lose time and waste money by dressing them with any manure. If the young shoots and leaves are quite fresh, not scorched, their dark colour is a favourable sign rather than otherwise. They reached us perfectly dried and shrivelled, and the growths are the weakest we have seen for years.

Violas and Pansies (H. C. M.).—There is no botanical difference between these. All Pansies are Violas or varietal forms of *V. tricolor*, and have large, handsome, and often clearly belted flowers. Violas have smaller and nearly always self-coloured flowers, and continue producing them over a longer period. They have been raised by intercrossing such species as *Viola cornuta*, *V. lutea*, and their progeny with small Pansies, and a dwarf floriferous race of what may be termed small, free, continuous-blooming, self-coloured Pansies has been established. The varieties of these are designated Violas, as indicating their adaptability for planting in lines and masses for producing a rich effect in flower gardens.

Apples and Pears for Chalk Soil (B.).—A gardener who has had great experience in growing fruit on the chalk formation, and not far distant from your locality, confidently recommends the following varieties. Apples.—King of the Pippins, Cox's Orange Pippin, Blenheim Pippin, Keswick Codlin, Cox's Pomona, and Warner's King. These will afford a succession of fruit for table and culinary purposes. Pears.—Jargonelle, Williams' Bon Chrétien, Comte de Lamy, Marie Louise, Beurré Bachelier, and Doyenné du Comice. The small Fern is the Oak Fern, *Polypodium Dryopteris*, and the large one the Royal Fern, *Osmunda regalis*.

Adiantums Unhealthy (Subscriber).—Undoubtedly your plants require more support than they have received. If the pots are crowded with roots sufficient water has not been given. A little perfectly clear soot water given twice a week or water coloured with fresh cowdung would be of great advantage, also any plants very much root-bound would be benefited by being placed in saucers of water in hot weather, or at least the base on which the pots stand should always be moist. The "brown specks" on them do not indicate anything so "serious" as you imagine; they are simply spore cases, and many growers who raise Maidenhair Ferns by the thousand for market purposes would rejoice in having such a fine prospective harvest of spores.

Potatoes Sweet (W. J. J.).—From your description of the seed tubers it is not unlikely they had been injured by frost, but their sweet taste at the present time is not the result of that. On some soils the tubers of *Magnum Bonum* are slightly sweet at this season of the year, but as they ripen the sweetness vanishes. The Scotch Champion is not a sweet Potato when matured, neither is it when boiled "very yellow;" on the contrary, it is nearly white, and on some soils, not all, of excellent quality. Potatoes for planting should always be procured from a reliable source, as there is no certainty that those sold in the markets or from the holds of vessels are the varieties represented. With favourable weather for maturing the crops your Potatoes are almost sure to improve in quality. Whether they are true to name or not they are evidently late sorts, and not in good condition for table when dry and used in a green state.

Roses Failing (A Lover of Roses).—The soil you have used is evidently unsuitable, and considering that only the strong growers have succeeded it is in all probability too cold and heavy; the site, too, may also not be efficiently drained. Excavating in itself, without making due provision for drainage, not infrequently amounts to making water traps, and neither Roses nor fruit trees can flourish under these circumstances. We have seen many Rose gardens most attractive and enjoyable, and thousands of blooms that are exhibited are cut from established plants. A quantity of wood ashes or burnt refuse of any kind mixed with the soil of your Rose beds would no doubt be beneficial, but particular attention must be given to draining the land. It must be remembered that digging a hole and casting in any quantity of stones and broken bricks is not drainage, unless ample provision is made for the outlet of water from the bottom of the excavation.

Scale on Vines (W. N. B., Northallerton).—We cannot refrain from expressing our surprise that you should place a few Grapes in a box large enough for holding ten times the quantity without any packing to keep them firm, and yet expect they would reach us in good condition. The surprise is that they reached us at all through the parcels post, for the berries being dashed to and fro were smashed, the leaves and letter (which latter ought not to have been enclosed), saturated, and the juice escaping from the box. The filthy condition of the Vines is owing to the presence of the scale insect on the leaves, and it cannot be removed without sponging them with a warm solution of soft soap. After the Grapes are cut you might add half a wineglassful of petroleum to each gallon of the soapy water, and syringe the Vines; but even this would only be partially effectual, as the

insects are mostly on the upper surface of the leaves. The house and Vines must have a thorough cleansing in winter, and no plants with insects on them must be permitted in the house. If the Rose is in a pot place it in the open air; if planted out, syringe it as above suggested thoroughly, and shade it if the weather be bright. Petroleum applied to Roses in the sun is injurious.

Peas (H. Hutchison).—The "new unnamed Pea" we have seen before, or one so closely resembling it that we are unable to perceive the difference between samples sent to us last year and the year previous from the north of England and those now before us. There is no waste of pod room in this variety; the ends of the pods, instead of tapering and recurving, as is common, being quite square. The pods are of medium length, the majority containing eight peas of equal size, a few contained nine peas, and still fewer seven, of good size and colour. Of the quality we are unable to judge, as the peas are quite too old for cooking. If the variety is a heavy bearer and the produce of superior flavour it will be useful, but there are others larger and of more imposing appearance staged at exhibitions. We recently saw a variety of this blunt-ended type named the "Perfect Marrow," the seed of which was sent to a gardener for trial by Mr. House of Peterborough. This variety we tasted, and it was excellent, the peas being decidedly larger than in the sample you have sent; but whether this was owing to the richer soil in which they were grown we cannot tell. Varieties having pods of this shape are usually very productive.

Planting the Slopes of an Embankment (W. M., L.C.D.R.).—A blue clay with a thin coating of soil is certainly not adapted for fruit-culture, otherwise your plan for turning the sheltered slope of an embankment to account for such a purpose is highly commendable, and without good soil any hints from us as to culture and varieties would be useless. But your wish to render the slopes profitable may be realised by planting them with Ash for hop poles, which, as you are doubtless aware, are always in demand near your embankment, and Ash answers admirably in such a soil. We are intimately acquainted with an excellent gardener who, some years ago, had the management of land only a few miles from the place you mention, and he sold good Ash underwood uncut for from £40 to £50 per acre about every eighth year. Stout young Ash plants of 4 to 5 feet high cost 50s. per 1000, and are planted soon after the fall of the leaves 6 feet apart, or at the rate of 1210 plants per acre. In the winter of the second year from the time of planting, which in your case would be the winter of 1885, they are cut down to within 6 inches of the ground, and in the following year the stools throw up on an average four stout shoots, some more, some less, which attain a height of from 5 to 7 feet the first season. In deep cool soil they continue growing annually with so much vigour as to be large enough for hop poles a year or two sooner than growth of the same age from older stools; but by leaving them uncut till the usual time most of the poles become large enough to split for hurdles and for wooden garden baskets, and are proportionately profitable, such articles being largely made in the district in question.

Lilium auratum (H. S.).—Many causes will induce the shrivelling of the old bulbs. Late-imported bulbs often shrivel. Excessive flowering and the production of seed have the same effect, also keeping them too dry in winter. Planting the bulbs too shallow often results in failure; and when in pots sufficient space should always be left for a good top-dressing when the stems are advancing in growth, as the encouragement of the stem-roots is an important item in the success of the plants. The old bulbs will live for many years if preserved from these dangers and from the decay that is caused by badly drained soil or an excessive supply of water. Young bulbs are, however, annually produced, and if it is desired to increase the stock these can be removed when potting or lifting the clumps. Both with *L. auratum* and *L. lancifolium* it is important that the surface of the soil over the bulbs and around the base of the stems be not fully exposed to the sun, as much injury is often caused in that way. For this reason when in borders outside these bulbs, especially the former, should be planted with small shrubs, such as *Rhododendrons* or others, that will afford the requisite shade. In pots, of course, the top-dressing suffices for this purpose. Flowers of 6 inches in diameter are about the average size. The time at which young bulbs flower depends entirely on their size. If as large as walnuts, and the plants are liberally cultivated, flowers are freely produced the second year.

Alecost or Costmary (R. Coles).—The plant which has puzzled "all the cooks and gardeners of your neighbourhood" has been long known in England under the above names, though it was originally a native of Italy, whence it was sent to this country about 1568. The plant is a member of the family Composite, the botanical name being *Balsamita vulgaris*, and it is also known as *Pyrethrum Tanacetum*, under which it was described by Linnaeus. It is a hardy perennial with creeping roots and fragrant leaves, which were formerly placed in ale by country people, and at one time it was very commonly cultivated in cottage gardens. In France it is sometimes used in salads. It formerly had a great reputation as an antispasmodic, and macerated in oil it formed oil of balm, so much used for applying to wounds, and particularly contusions. It was quaintly described and its uses recorded as follows by Parkinson 250 years ago:—"Costmary or Alecost is a sweet herbe, bearing many broad and long pale green leaves, snipped about the edges, every one vpon a long foote-stalke; among which rise vp many round greene stalks, with such like leaues on them, but lesser vp to the toppe, where it spreadeth it selfe into three or foure branches, every one bearing an vmbell or tuft of gold yellow flowers, somewhat like vnto Tansie flowers, but lesser, which turne into small heads, containing small flat long seede: the roote is somewhat hard and stringy, and being diuided, is replanted in the Spring of the yeare for increase. Costmary is of especiall vse in the Spring of the yeare, among other such like herbes, to make Sage Ale, and thereupon I thinke it tooke the name of Alecost. It is also vsed to be put among other sweete herbes, to make sweete washing water, whereof there is great store spent. The leaues haue an especiall vertue to comfort both the stomack and heart, and to warme and dry a moist braine."

Sunday Work in Gardens (G. A. B.).—It is perfectly true that you did not in your former letter denounce Sunday work in gardens; on the contrary, you said it ought to be done the same as on week days: but the greater part of your letter was devoted to discussing the manner in which head gardeners discharge their duties. Your remarks had a much wider application than

you appear to have been aware of, and they certainly would have been read in a manner you did not intend. It is gratifying to us to perceive you speak in such high terms of the gardeners under whom you have served, and to whom you are indebted for valuable information. Our experience with gardeners, old and young, is not very limited, and we have usually found that the manner in which a head gardener discharges his duties is an indication of the character of his subordinates. A young man ought to feel complimented rather than otherwise when he finds he is trusted, and that his chief does not feel it necessary to be ever on the watch early and late lest any work he has entrusted to another should be neglected. We shall be very glad to hear from you on the subject you mention. On this you ought to be able to write acceptably; but long experience both in working and writing are requisite before anyone can discuss with credit to himself and advantage to others the much greater question into which you entered in your former communication. You allude to early ventilation; there are more Vines injured and more characters lost through the late rising of young men on Sunday mornings than through any other mistake in gardening, but in stating this truth we do not imply that the majority of young men are thus negligent. The exact time for opening the ventilators of a vinery depends entirely on circumstances, and you may rely on it that there are vineries that cannot on some mornings be kept closed after 5 A.M. without injury to the Vines. With these you do not appear to be acquainted; we know of at least a hundred of such structures. You may possibly have one to manage some day, but we do not apprehend you will be caught napping.

Names of Fruit (J. C.).—As an example of the difficulty of naming Grapes from a mere fragment, the three berries you sent were examined by a few of the most competent Grape-growers and members of the Fruit Committee of the Royal Horticultural Society, and opinions were equally divided as to the name of the variety. From the character of the Vine as described in your letter we think it is Gros Maroc, very imperfect in flavour; but a typical bunch is needed for the name of a Grape to be satisfactorily determined.

Names of Plants (W. W. W.).—1, *Lastræa Filix-mas*; 2 and 3, varietal forms of *Scolopendrium vulgare*; 4, *Polystichum angulare latipedes*; the other is quite too shrivelled for identification. (W. J.).—1, *Phlebodium aureum*; 2, *Goniophlebium appendiculatum*; 3, *Nephrolepis davallioides*; 4, *Asplenium Veitchianum*; 5, *Lygodium scandens*, fertile frond. It is a pleasure to name such good specimens so carefully packed as these. (Bedale).—*Deutzia scabra*. (J. H., Crawley).—*Lasiandra macrantha*. (C. A. R.).—The specimen sent is a very poor one, but it resembles *Tragopogon pratensis*. (Amateur).—*Campanula Portenschlagiana*. (J. W. D.).—Specimen quite insufficient. (Sussex).—*Tradescantia zebrina*. (Inquirer).—The fruit is that of *Rubus Chamæmoris*, the *Canna* was not recognisable.

COVENT GARDEN MARKET.—AUGUST 22ND.

BUSINESS is now very quiet, the supply of soft fruits being almost over, a good supply of foreign Pears arriving realising high prices.

MOUNTAIN BREEDS OF SHEEP.

VARIOUS circumstances have arisen during the past few years, and especially since the year 1879, which have brought the mounta

breeds of sheep more prominently before the public. The large number of farms untenanted throughout the kingdom, many of which have reverted to a state nearly approaching that called "waste," have been allowed in various instances to become unfitted for any stock except some variety or other of the mountain sheep. Again, it is the fact, now mutton is so high in price, that the smaller and lighter-weighting animals are those which afford joints for the consumer of a small size, and in consequence meet a free sale. These, with other points, have tended to give a demand for mountain sheep which has never occurred before to the same extent. It must be remembered that the circumstances to which we have referred have also obliged many landowners to fall back upon those varieties of sheep which cost the least money, and in consequence require less capital invested for stocking the lands untenanted. Various owners of mansions and park lands have also turned their attention to the keeping of mountain sheep in consequence of their light weights and small joints for the table, which they yield for gentlemen's establishments. The various points combined have influenced so many proprietors that these kinds of sheep are now much in request and higher in price than they made five or seven years ago, still there is a great demand for both lambs and wethers when fed for the butcher, which justifies the fact of being more costly to purchase than formerly.

We notice that at the present time all the light weights make a price previously unknown. The market report of sales in a southern county gives the price for fat Scotch lambs at 32s. to 42s. each; Scotch shearing sheep, 48s. to 56s.; extra fed Scotch wethers, 69s. to 72s. 6d. These are for the most part black-faced horned heath sheep, such as are usually sold at the Falkirk tryst in Scotland. In some cases, however, there are cross-breeds of Cheviot blood in admixture with other varieties, and where these crosses are well made they are sure to meet with numerous purchasers. We have thus prefaced the remarks which we propose to make as to the value and capacity for breeding and feeding of different varieties of the hill or mountain breeds of the different districts of the kingdom, the distinction being the result of difference in soil and climate in which they are reared and fed. We hold that the various denominations of sheep are worth the attention of flock-masters in various districts of the kingdom, and may therefore be selected by the graziers in accordance with the history and character of the animals which have been found suitable for fattening in the districts where this kind of sheep are grazed for the market as fat stock.

As we shall have to describe the different breeds of mountain sheep, especially those which are natives of Scotland, we will give the respective terms used for sheep in Scotland particularly, and as they are well described by Mr. Henry Stephens in "The Book of the Farm" we cannot do better than cite them:—"When new born it is called a 'lamb;' if male in Scotland, a 'tup lamb;' when castrated it is called a 'hog lamb;' if female, a 'ewe lamb.' In England a young sheep retains the name of a 'lamb' till it is eight months old. In Scotland, after the weaning and before the first clipping, a 'tup lamb' is called a 'tup hog.' In England, lambs after they are eight months are called, till the first shearing, 'ewe' and 'wether teds,' according to sex. In Scotland, a 'ewe hog' after the first clipping is called a 'gimmer;' a 'tup hog' a 'shearling tup;' and a 'wether hog' a 'dinmont.' The animal corresponding to the name of 'gimmer' in Scotland is called in England a 'thcave' until it bears the first lamb, after which it is termed a 'ewe of four teeth;' the year after a 'ewe of six teeth;' and after that a 'full-mouthed ewe.' The 'dinmonts' in Scotland answer in England to the title of 'shear hogs' till they are deprived of the fleece, after which they are called 'two-shear wethers,' and afterwards 'wethers.' In Scotland the second shearing brings another change of names—thus, the 'gimmer,' if she is in lamb, is called a 'ewe;' if barren a 'barren gimmer;' and an 'eild gimmer' if she is not put to 'tup' or 'ram.' A 'shearling tup' is changed to a 'two-shear tup;' a 'dinmont' becomes a 'wether.' When three times shorn a ewe is called 'winter ewe;' a 'tup' a 'three-shear tup;' a 'wether' undergoes no change of name, but still continues to be called by that name. After the fourth shearing a 'ewe' is a 'three-winter ewe' or an 'aged ewe;' a 'tup' is known as an 'aged tup.' When a ewe fails to be with lamb a second time she is called a 'tup ewe' or 'barren ewe;' when she ceases to give milk a 'yeld ewe;' when removed from the breeding flock, at whatever age, she is called a 'draft ewe;' when put aside unfit for breeding, a 'gimmer' is called a 'draft gimmer;' and when drafted out of the fat or young stock, lambs, dinmonts, or wethers are called 'sheddings,' 'tails,' or 'drafts.'" We have thought it right to quote these distinctions and eognomens, for young men or students in agriculture may be a little puzzled at times on the subject of sheep nomenclature.

The Cheviot sheep are the choicest variety of mountain sheep, and are, in fact, peculiar to those hill districts in Scotland where

fertile vales, usually in grass, but frequently under cultivation, which circumstance has made them a valuable breed, as they fare better than other mountain sheep which may have to live as best they can on the heather-covered mountain sides and glens both in summer and winter, many being lost and buried in the snow during severe winters. There is a distinction of character in the Cheviot breed from most of the other mountain sheep, because even when pure bred they are of quiet habit and docile and easily managed, and thus they are more easy to keep within bounds, a matter of some importance when introduced for feeding upon farms partially run to waste. There are not, however, so many pure Cheviots to be obtained as formerly, for the flocks in various instances have been crossed with the Leicesters or other long-woolled sheep, after which they have been often purchased for fattening, not only in the best arable districts of the Lothians, but also in Northumberland, Westmoreland, and other northern counties, where they as a cross-breed have been found to answer a good purpose for fattening on arable farms. In fact, those hill districts previously fed only by the black-faced heath breed are now frequently stocked either with pure Cheviots or cross-breeds, but more care is required and taken in their management than formerly occurred when stocked with the black-faced heath sheep; and are more sought for by the dealers to go south who attend the Falkirk trist and other Scottish sheep fairs.

How long this state of things as regards stocking the hill districts may continue we cannot say, but there is a strong feeling and disposition existing in the minds of the farmers to keep and rear animals of more weight and value than the pure mountain sheep both in Scotland, England, and Wales. By a judicious style of management of the cross-breeds this may be done; but provision must be made for them in the winter months, not only by shelter in the vales, but also a certain amount of good feeding on hay and roots, with the addition of artificial feeding stuffs and corn, such as bean and barley meal, which will enable the animals to withstand the northern climate, and attain heavy weights of mutton if fed with the judgment displayed by many of the long-woolled breeders and feeders in the north and north-midland counties of England. We must, however, suppose that many of the mountain districts of Scotland will still be stocked with the pure mountain breeds, unless these districts should be appropriated to a greater extent in the future only for shootings and deer pastures, which idea seems greatly on the increase at present; and as far as rent is concerned, if it pays more than the tenant farmer can make of the land by sheep-breeding, it may eventually tend to alter the management of the hill districts of various counties in Scotland and other mountain ranges.

(To be continued.)

WORK ON THE HOME FARM.

Horse Labour.—Harvest is now in full progress in all the early districts of the kingdom. Preparations, too, should be made in cold and north-western counties in order that everything necessary to the progress of the work may be ready when the grain is ready for cutting. Horses now not required in actual harvest work should still be employed on some kind of tillage work, such as ploughing on the stubbles of the early grain crops which have now been cleared for some little time, such as early white Victoria Oats, Winter Oats, Rye, Winter Vetches, and early Peas. Stubble Turnips may now be sown or drilled with 3 cwt. of bone superphosphate per acre, and as they cannot be expected to yield large bulbs they may be drilled at 15 or 18 inches between the lines, and thereby obtain a fair weight of hulbs by leaving more plants in the lines; or if required for ploughing-in as manure for the next crop of corn there need not be any expenditure either in hoeing or otherwise, as the best state for ploughing-in is when the plants are too thick for bulbing, and yet obtain a full and luxuriant foliage growth which is valuable for manuring purposes.

Some work will still be going on in forwarding the Wheat fallows. We are also ploughing-in a fair crop of second growth of Clover and grass, which is buried under furrow in a satisfactory manner by the use of the drag chain, and although the ground works very hard and requires four horses to the plough, yet it is all the better for the future Wheat crop. We have known those who dislike ploughing-in a Clover crop preferring to take the crop for hay, and this may be the case if the land is in a high condition as regards manure, and we could be sure of a good quality of hay; but let this matter be compared with a crop of hay reckoning the cost of cutting, making, carting, stacking, and thatching, cutting out and selling with delivery, which makes a serious charge even when $1\frac{1}{4}$ ton per acre has been obtained and well made, especially if we consider the risk of being injured by rain. Ploughing and pressing or rolling not only manures the land sufficiently for a full crop of Wheat at one operation, but gives the land time to become stale and mellow, so essential for the successful growth of Wheat. The value of the crop of Clover ploughed in will prove equal to the application of 14 tons of good yard dung, irrespective of which there is the carting and spreading of the dung to be considered. Those who have not tried the plan may

take courage in so doing, and reap the advantage by the crop of Wheat succeeding next harvest.

Some horses will now be used in working the reaping and binding machine. These should be worked in relays for not more than four or five hours in succession, and when the corn is dry at reaping time, a large staff of men will be required as soon as it is fit to stack. We approve of making round ricks, especially in out-lying fields, the ricks to be moderate-sized and built in pairs, so that the threshing machine may thresh the two without removal; also, the ricks being made in about half a day may each be threshed in half a day in winter time. In this way we frequently avoid the difficulty and loss consequent upon a sudden change to rain when the rick only contains half a day's work either in making or threshing.

Hand Labour.—This must be so arranged that the root crops do not suffer from want of hoeing during the harvest time. By employing the reaper and self-binding implement fewer men will be required, and may be spared for work which is often neglected in the absence of machinery. Women, too, ought to be available in the harvest field, but they are not so generally obtained for harvest work as formerly, much to the disadvantage of themselves and families, for we have known women in the harvest work earn as much in some cases as the men. It is, however, much to be observed that since the men under ordinary farm labour have received higher wages the women have struck work on the farm. The drawback to the farm in many districts is very serious, for such work as weeding the corn is not done, and the corn fields are showing large growths of docks, thistles, and other weeds, committing great injury in many cases.

Live Stock.—This is now the season when the ewes of all the down and polled breeds of sheep are expected to have the rams running with them, and while that is the case a little extra change of food, such as rape and summer tares besides their Clover or pasture, is desirable, especially in those flocks where a large number of twin lambs are required or desired. This is especially the case in the best down and long-woolled flocks where flock-masters feed high, which enables the ewes to maintain their twin lambs.

The best pastures in various districts of the kingdom will have made the hullocks now nearly fit for the butcher, and as the price is high they should be sold or retained to the Christmas period, because when we reach the month of October and early part of November the markets are generally crowded with oxen coming out of the pastures, and sometimes not in high condition, which in fact is the feeder's time to buy and not to sell. We have frequently bought to great advantage bullocks just beneath the butcher's quality in October, and done well by feeding them in the boxes for sale either at Christmas or later on, when they seem to be required. The early horned ewes of the Dorset and Somerset breeds are this year forward in lambs, and will no doubt be selling very high at the October fairs at Appleshaw and Weyhill in Hampshire, where they are bought by dealers in large flocks. Although they were very dear last year, we know they gave a better return for their food than any other sheep, and were soon off the land.

OUR LETTER BOX.

Egg-producing Fowls (M. C. B.)—Minorcas or Plymouth Rocks, or a cross between the two, would probably suit you; but laying is more a matter of strain or family than breed. The feeding is fairly right, but we should substitute oats, buckwheat, and dari fed separately for the mixture. The laying is decidedly bad. Do you supply crushed oyster shells, or other similar shell-making material?

REMARKS.

- 12th.—Bright morning; dull afternoon and evening.
 13th.—Very fine hot day.
 14th.—Fine and warm, but very rough.
 15th.—Gusty in morning; occasionally slight showers.
 16th.—Fine and calm.
 17th.—Close damp morning; fine afternoon and evening.
 18th.—Rather dull at first; fine bright day.

Although both Monday and Tuesday were hot days, the average for the whole week is by no means high. The most noticeable feature was the strength of the wind on the 14th and 15th.—G. J. SYMONS.

COMING EVENTS

30	TH	
31	F	Crystal Palace Dahlia and Fruit Show (two days).
1	S	Lille International Horticultural Show (nine days).
2	SUN	15TH SUNDAY AFTER TRINITY.
3	M	
4	TU	
5	W	Glasgow Autumn Show; Bath Show (two days); Brighton (two days).

THE APPLE CROP—EARLY APPLES.

THIS year every Apple tree worthy of cultivation ought to be in bearing. It will, therefore, be a good time for the grower to visit some adjacent nursery, or better still, if possible, the plantations of a good market grower, where he will be able not only to see the fruiting properties of the tree, but its general habit, mode of growth, and liability to canker. At the same time he will be able to study the soil to see whether it resembles that in which he intends planting. Having made a few notes during the last few weeks of different varieties that succeed in most soils that are at all suitable for Apple-cultivation, I purpose in the first place to allude chiefly to the earlier sorts, so that intending planters may have the opportunity of seeing them.

There is one difficulty in many nurseries in studying the fruit, and that is the predatory habits of the boys of the district necessitating the removal of the fruit at an early stage; but the appearance of the fruit spurs will always give an idea of the fruitfulness of the trees. Many nurserymen have a quarter devoted to fruiting trees, so that the purchaser after inspecting the stock can see the tree in bearing. This is the case at Messrs. Lane & Sons, Berkhamstead, where all the most noteworthy varieties can now be seen in full bearing. I think if I were limited to one tree of an early sort I should select the Early Julien. It is useful both for kitchen and dessert. You can begin to use them when the size of walnuts, and, having been twice over the trees for culinary purposes, you can leave some good yellow fruit with a pleasant brisk flavour for dessert. It is very suitable for a pyramid or bush tree, its heavy-cropping properties being against it as a standard, although there are many good orchards of it in cultivation.

The Red Joaneting is still popular, but I believe we have in a new dessert Apple, Mr. Gladstone, a formidable rival. It makes a good bush tree, and is also a constant bearer. Its appearance is also in its favour, having a bright crimson colour when ripe. An equally handsome Apple, but one now well known, is the Worcester Pearmain. It has a remarkably clean and healthy growth, and is an annual bearer. It makes a good bush, and if grafted on an old tree makes a very handsome standard. There are few Apples that can rival it in appearance on the table, and the flesh is more mellow than that of an old favourite, the Red Quarrenden, which is still very popular, but of too firm a texture to suit every palate.

A good contrast to the Worcester Pearmain, and an equally good Apple, is the Yellow Ingestre. This is usually a good bearer, and the texture and flavour are equally good. Another Apple that should be also grown is the Irish Peach. This is handsome in appearance and suits every taste. I wish some of your readers would state if they have found it liable to canker. The Oslin, to those who like an Apple with a distinct flavour of an aromatic kind, will be found desirable. I am not sufficiently acquainted with the habit of the tree to say more about it. The Duchess of Oldenburg with its upright growth and general cropping tendency is also

desirable, although I do not consider the quality of the first class. There is a very pretty Apple grown in Middlesex, Duchess's Favourite (called also Duchess of York and Duchess of Gloucester). This has something of the habit of growth of the Worcester Pearmain, and equals it in colour, but in shape is like the Golden Knob. I have no doubt it will become popular as it becomes known away from its locality. The Kerry Pippin for a small garden is always suitable and of good flavour.

I think I have mentioned sufficient early dessert Apples, and if grown for home use I should recommend the following:—Early Julien, Mr. Gladstone, Worcester Pearmain, Irish Peach, and Yellow Ingestre; and if for market purposes Early Julien, Worcester Pearmain, Yellow Ingestre, Duchess of Oldenburg, and Red Quarrenden. There are many other good Apples, and no doubt in different localities they would be more suitable. If your readers would give their experience it would be welcomed, I have no doubt, by many.

For kitchen use Lord Suffield will always be popular where it can be grown, but in many parts of England it is a failure. Many growers have found their plantations destroyed by canker and other causes. The Codlins, Keswick and Manks, will always be grown on account of their cropping annually. The latter makes a compact pyramid, full of fruit spurs, and often producing fruit as handsome in appearance as Lord Suffield; but on account of its heavy-cropping properties deficient in size. It is advisable to go over the trees twice, the latter picking then producing good fruit.

An Apple now becoming a great favourite on account of its freedom from the diseases that Apple flesh is heir to is the Ecklinville Seedling. This tree makes a good pyramid, compact in growth, and a constant bearer. To show the rapid strides this Apple has made in public estimation, Messrs. R. Smith & Son of Worcester have now more quarters of this variety than any other excepting their equally popular Worcester Pearmain. Lord Grosvenor (Jolly Beggar) makes a handsome tree with bold foliage, and the fruit hangs on the branches like ropes of Onions; but I believe in unsuitable soil the fruit becomes misshapen. There are two varieties that should be grown by everybody—Stirling Castle and Small's Admirable. The former is the popular favourite at present, and perhaps advisedly so, on account of its more compact growth; but where space is available I prefer the latter. This year it is laden with fruit wherever I have seen it growing. Golden Spire has an upright growth and would be suitable for a garden or shrubbery, and I believe it would be a good plan to plant it round a walk. Potts' Seedling is a fine-foliaged tree, but I have not yet found all the good qualities in it that many growers in the north have awarded it. I think with Warner's King and Stone's Apple (Loddington) I have named sufficient cooking varieties for early cultivation. Warner's King has a dark green foliage and a very large and handsome fruit, but I am afraid it is liable to canker. The Stone Apple especially, grafted on other trees, will always be a favourite. I think I may say for both purposes—home use and market cultivation—Manks Codlin, Ecklinville, Small's Admirable, and Loddington will never fail. I will give a few more notes on later varieties in a week or two.—L. A. K., Maidstone.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.

I WANT to ask what is to me, and probably to many others, a very serious question. If, as I am about prepared to do, I take up a life membership of £10 10s. in the "Gardener's Benevolent," may I look upon it as an investment positively returnable to me or my wife in yearly pension on either I or she in course of time becoming incapacitated from active work by increasing years? From what appears from time to time in the gardening papers (notably in a contemporary last week), some writers seem to throw discredit on the Society and its mode of working. Such insinuations—for they are not direct statements of charges that anyone

could meet very well, though they read disagreeably and raise doubts—make it difficult for a country gardener, who knows nothing of the inner workings of any of the London gardening societies, to make up his mind whether to enter this Society, which from its name ought to be his best friend, and that at a time when he may need friends the most. Will you come to my assistance by publishing this note? as it may perhaps elicit a reply that will encourage other country gardeners to put their savings into the Society.—P.

[We readily publish this letter, and commend it to the notice of the Secretary of the Institution in question as the person best qualified to give an authoritative and explicit reply.]

DENDROBIUM NOBILE.

MUCH has been written about Orchids of late years, and about none more than *Dendrobium nobile*. When thoroughly well done no Dendrobe is more beautiful, not even *D. Wardianum*, although for long many persisted in believing the latter to be the better of the two. If it did come to a question of having only one I certainly should prefer *D. nobile*. The lovely shading of claret that tips the segments of the perianth is wanting in *D. Wardianum*. In size, too, when well grown it is not behind the latter.

That question of growing it well has something mysterious in it apparently. First-rate Orchid-growers fail with it, or only partially succeed. Others, again, not claiming to have anything more than a partial acquaintance with Orchids in general, their knowledge practically being confined to a few dozen species grown for the value of their bloom for cut flowers, frequently find it easier grown than Potatoes or even Cabbages. Under certain conditions it grows and multiplies exceedingly, under other conditions it dwindles and disappears.

Once I bought a few plants at a sale. A few months later they flowered. Some of the blooms were submitted to a well-known connoisseur and it was pronounced a poor variety. Two years later blooms were submitted to the same gentleman from the same plants: these were pronounced good, and the grower was advised to make away with the first lot. Yet one year more and other blooms were submitted. These caused raptures of delight. The possessor was assured he had the finest nobile for many a mile, and an offer was made to exchange a piece of *D. Ainsworthii*, then even dearer than now, for one! The same thing happened with *Lycaste Skinneri*, and, doubtless, many readers will recall how *Odontoglossum Alexandræ* improves as the plants strengthen. The only thing that caused the metamorphosis in the *D. nobile* was that when obtained they were leafless, almost lifeless; at the end of three years they were strong and flourishing. So much for varieties.

Rather than attempt to set up old half-dead plants with impaired constitution, or even to establish imported pieces, if immediate blooms were not an object I should greatly prefer the small growths that issue in spring from old flowering shoots. My first attempt at Orchid-growing was with one such, and as exceptional success followed the attempt the method of cultivation will be detailed. Considerable experience has been gained since then both in the way of succeeding and also of failing. The very fact that I "succeeded" in both may, perhaps, be not without use, for as different results followed different ways of treatment it points out what course to avoid as well as what course to follow.

The piece in question, about 4 inches long and about as thick as an ordinary cedar pencil, was procured in spring. Four years later that small bit had developed into a plant with between twenty and thirty leading growths as thick as one's thumb, and from 2 to 3 feet long. It was placed in the smallest sized pot among fresh charcoal and fresh sphagnum only. It was kept moist, and placed in an ordinary plant stove. It broke double, and the growths were twice as long at least as the first. The usual thing to do when growths of *D. nobile* are made is to first ripen them off by keeping them rather dry, then resting. In this case neither was done, and the consequence was the new pseudo-bulbs broke double before the first were full grown. When this happens it is supposed that the second growth must needs be weakly. With many Orchids, especially with *Lælias* and *Cattleyas*, as well as with some *Dendrobiums*, this is the case, but we never found it so with *D. nobile* unless an unsuccessful attempt at "ripening" by withholding water had been practised. The four growths in question were twice as strong as their predecessors, and all were covered with thick green leaves, while the pot was filled

with healthy roots. By the succeeding spring each new stem broke double, and the plant was shifted into a 5-inch pot, the same compost, fresh sphagnum and charcoal only, being used. No attempt was ever made at what was called ripening and resting, with the result of a huge plant in the time we have stated, with numerous small ones on the way.

But, up till then, no flower had been produced. Instead of one crop of pseudo-bulbs and one crop of flowers, there had been a double crop of pseudo-bulbs of increasing strength annually. But Orchids are grown for their flowers, and ripening is necessary to secure these. The usual way to succeed in this is secure a rest for the plants. This often occurs through weakness, as in the case with a very large majority of plants, whether through their being in a rootless condition, the result of improper soil, and often of improper watering, or by the withholding of water at a certain stage. In all such cases there is shrivelling, more or less, and when that occurs strong plants and flowers in anything like their proper character are an impossibility.

The way I adopted of ripening the large plant in question was to move it in September to a Melon pit and to expose it to the full sun. Water was not withheld, but only enough was given to keep every leaf and growth plump and fresh. Because of shady conditions under which the plant had been previously grown a few of the youngest leaves were scorched at their apex, but not to an extent calculated to be markedly injurious. The great majority remained fresh, only taking in a bronzy green and gaining in substance. Despite the very dry air and clear sunshine to which it was exposed it broke afresh, such was its vigour. Knowing that if the new growths were allowed to develop they would probably be weakly under such conditions, and that probably there would still be no flowers, every one was pinched when 2 or 3 inches long. The stump healed and remained fresh, while the buds plumped up so strongly at their base that it was feared they would start again. They did not, possibly because of the now low temperature of the house in which they were grown. In the February following the plants flowered. A few on the recently formed shoots appeared, but the older shoots were perfectly covered. After flowering the plants broke from the pinched shoots strongly, and made up shoots fully equal to the strongest. Again it was ripened as before, and this time no attempt was made to start again. The flowering habit was now induced.

All this appears very simple, yet after succeeding with dozens of such plants and in the same manner, with appliances of what would be pronounced of an inferior kind—only a small stove to grow Melons, raise Vines, and force flowering plants, and a smaller Melon pit—yet with a couple of good Orchid houses, a warm and a cool, I failed and did much mischief to good plants. But both experiences are valuable, the failure most so, especially as I came to understand what was wrong. How the mischief happened, and how I determined its cause, would be a long story. Lately I have been visiting a good number of gardens, and have observed where and how failure occurs, and coupling my experience and observation, it may be better, rather than write any more histories, to point out what conditions are best and what worst in the culture of *Dendrobium nobile*. The history already given will best explain how to produce a lot of fine healthy plants; the remarks to follow, how to avoid spoiling them.

In the first place *Dendrobium nobile* is almost always grown too far from the glass and too shady, whereas the plants should be kept as near the glass as possible, and the shading should be thin and only put on during the hottest part of the day. The sun before ten and after four on a house facing south should not be kept off at all. The air should be warm, but not close, moist, and motionless, as is too often the case. These conditions bring on damping and destruction. By August no shading should be given at all, or only for an hour at mid-day. By October the plants should be in a cool place, and should remain there till wanted for flower.

The root conditions are also of importance. The first is to keep the plants in comparatively small pots. A quantity of material not crowded with roots very soon gets unhealthy and contaminates the whole mass, then the roots fail to thrive. I have never found anything so good as fresh sphagnum and fresh charcoal, but they must be fresh, otherwise the fibre of peat and clean new potsherds are the next best. If proper material and small pots are used there is no need for half filling the pots with crocks as is usual. Better have the pots wholly full of roots, as when yearly potting is necessary to dispose of inert potting material the plants will certainly be in poor health and the flowers puny.

The pseudo-bulbs should never on any account be embedded in the slightest degree. This almost universal practice among

gardeners who are not Orchid-growers is by itself sure to prevent success. The young growths come from the base. If the base be covered the eyes push weakly. At any rate the new growths are pushed up the stem from buds that would otherwise have remained dormant, and such very seldom indeed produce vigorous growth. Plants so treated get weaker yearly, even though other conditions be right. A layer of green growing moss is almost an essential in successful Orchid culture. When the bases of the pseudo-bulbs are kept clear of the surface, as is absolutely necessary in the case of most Orchids, the roots start above the surface. This is the right place for them to start, and where they always do in nature. If the surface of the pot is covered with dead matter, however, the roots will hardly enter it; indeed, such will likely be covered with slimy matter, and when the roots touch it they will decay. When the surface is growing sphagnum the roots enter it readily and branch in all directions.

Dendrobium nobile neither wants to be soaking wet when growing, nor parchingly dry when resting. A healthy moisture is the best state for the material at all stages. When pots are full of roots it is easy watering. A little too much is not injurious, especially when the plants are exposed to plenty of light and air; but when the material is in too great quantity and the roots too few, when the tops are shaded and the air still and moist, watering becomes a task needing no common skill.—A. H.

FORCING KIDNEY BEANS.

THOSE who have to maintain a perpetual supply of French Beans will soon need to be preparing for their late autumn and early winter crops. November is a very important month in most large establishments. Outdoor Beans, if not then cut off by frost, are either tough or tasteless, and the change from a plentiful supply of the choicest vegetables to one of scarcity is not a pleasant one to contemplate.

The first or second week in September is a good time to make a first sowing, and there is nothing gained by adopting half measures and sowing outside or in makeshift sort of frames, as plants brought on this way, even if sown a month earlier, do not flourish as well as those which are sown in heat and grown well at once. Most of the French Beans which I see forced are too much starved. They are either crowded too closely together or they have not a sufficiency of soil, and consequently the Beans are not so good as those which are produced outside in summer. If well grown the French Bean is considerably improved by forcing, and even at midwinter it may be said to be of superior quality to those which are produced in an average garden at midsummer; but to secure this quality it must be grown quickly and vigorously in a very light house and without insects.

To half fill an 8-inch pot and insert three to five beans in the handful of soil it contains, to place the said pot on a high and dry shelf, and then do all you can to wash the nutriment out of the soil by watering it once or twice every day, is a prolific way of growing red spider, but it is not the system best calculated to produce a plentiful supply of good succulent Beans. If pots must be used at all they should be filled to within an inch of the rim at first, for it is important to get a good strong start, and as heavy retentive soil cannot be used, some good manure should be placed in the bottom of the pots and pressed down rather firmly, so that the water cannot run away too quickly. Beans do not emit roots from the stems when earthed up, and although when they are starved out at the bottom of the pot some of the roots find their way upwards, and also some of the manurial properties of the soil may be washed downwards, yet the plants do not, I think, get as much support from surfacing as is generally supposed.

But I have not used pots for this purpose for many years, and should never think of using them again, for I have found there are great advantages in having a good mass of soil. It does not get washed out so quickly for one thing, and perhaps that is the principal advantage. For supplying a rather large establishment I have found that sowing six or eight boxes about every three weeks and keeping them in a good light position would yield a continuous supply, say a couple of dishes a week all through the winter and spring. The boxes are 32 inches long, 12 inches wide outside, and 8 inches deep inside. A layer of half-decayed dung is spread on the bottom about a couple of inches thick, and the remaining space is filled with rather rich material slightly lighter than that which would be suitable for ordinary bedding plants. If new loam can be had it may be used, and old Mushroom-bed refuse, or something similar, in equal proportions, and it will suit them perfectly; but my French Beans have not had the luxury of new loam, and to make amends for that I have added a little stronger manure, say an eighth part of soil from a dry earth closet and a pinch of bone dust.

The boxes after being filled are placed in the house (or if it is hot sunny weather they will do in a good position outside), a day or

two before sowing to get the soil thoroughly aired and warmed, and then about a dozen beans are sown along the centre of each. "What a waste of space and soil!" your economical man will say, but I have seen both ways tried, and have proved that we get greater weight and better quality from the liberal treatment I recommend than from the starvation plan.

As it is all-important to keep them growing vigorously throughout their existence a little extra stimulant is given before flowering commences. If I had the washings from a cattle shed I should prefer that, but in the absence of liquid manure I give a slight dressing of Standen's or Crown Manure, a level tablespoonful being ample for each box. A few twigs are placed along each side of the row to keep the plants from falling about, and they very soon reach the sides of the box, and the twigs are hidden. Osborn's Forcing is the variety preferred. I tried the new Ne Plus Ultra, but although it is a very good Bean, equally early and rather larger, it is also rather taller, and that is an objection. I daresay those who grow their supply in pots, and consequently not so vigorously, would like this Bean very much.

The French Bean requires a night temperature not lower than 60°, and when well supplied at the root it revels in a sun temperature of 90° to 95°.—WM. TAYLOR.

PHYLLOXERA AT ASHTON COURT.

IN the Journal of August 23rd you give an account of Ashton Court, and remark that a letter had been received (along with samples of a pest that had been found in the roots) from Mr. Austen. This you say is nothing less than the dreaded phylloxera. It would be extremely interesting to all connected with Grape-growing if Mr. Austen would say if he had received young Vines or cuttings from anyone within the last year or two. If he has not it must be thought that the phylloxera is capable of spreading itself without being actually conveyed on the Vine. This is a point of much interest, and I hope Mr. Austen will kindly say if he can account for the introduction of this dreaded pest, or if he thinks it has been conveyed by other means than the transfer of Vines or Vine cuttings. It has hitherto been the comfort of many Vine-growers that the phylloxera can only be spread by means of the Vine; but if it can transfer itself in a winged state, or by other plants than the Vine, to other places where Vines are grown, then the danger is increased a hundredfold. Any information that Mr. Austen can give on the matter will be much prized by—A VINE-GROWER.

USEFUL HARDY PLANTS.

A FEW notes on some good herbaceous plants may be of interest, preference being given to those that are very effective or useful for cutting.

Rudbeckias Newmanni and *purpurea* are in fine condition. The colour of the former is orange yellow with dark maroon centre, and the latter deep reddish purple with dark centre. They are amongst the most useful and effective hardy herbaceous plants either for the border or the shrubbery. *Senecio pulcher* has flowers borne on tall stems; colour reddish purple with golden yellow centre. It blooms during the autumn months.

Thalictrum adiantifolium—the foliage of this useful plant resembles Maidenhair Fern, and is very useful for cutting. The old *Rockets* seem to be coming into favour again. Like many other old plants they are useful for cutting. *Aquilegias* are valuable, being effective, light, and elegant for table decoration. *A. chrysantha*, *A. glandulosa*, and the beautiful hybrids *A. californica hybrida* and *A. cœrulea hybrida* are amongst the most useful.

Delphiniums are amongst the most stately of all herbaceous plants. There are dozens of beautiful varieties of different colours, but blue predominates. *Verbascums* are very showy plants; they reproduce themselves very freely from seed, and they can be divided easily. *Pyrethrum uliginosum*, a very stately plant, growing to the height of 5 or 6 feet, is very effective in the autumn. Large white flowers, yellow centre. *Anthericum Liliastrum major* does well in the borders, but prefers well-drained soil. It is also very effective as a pot plant for the conservatory. Flowers large, white, almost like a Lily, and fragrant.

Potentillas are very useful. There are several beautiful varieties, but *Le Vesuve* is one of the best. *Hemerocallis flava* is very good for forcing in pots for the conservatory. The *Tigridias* are not grown so much as they ought to be, their colours being brilliant. The individual flowers only last one day, but the stems produce a succession of blooms. *Geum coccineum plenum* has bright scarlet flowers that last a long time. *Helianthus multiflorus* is very effective for the shrubbery border: it increases very fast. *Anemone japonica Honorine Jobert* and the rose-coloured forms are very handsome. *Campanula persicifolia alba* and the double form are fine plants. Another good old plant is *Anomatheca cruenta*, a bulbous plant, which is best in a warm nook near a wall. If it is not disturbed it does not

require any care except a top-dressing with light sandy soil after the foliage dies down. One more useful plant is *Hookeria latifolia*, which has beautiful dark bronzy foliage. It is most striking in the spring and early summer for cutting purposes.—A. YOUNG.

DUKE OF BUCCLEUCH GRAPE.

WHEN at Drumlanrig lately I had an opportunity of seeing some fine samples of the Duke, and also of noting a fact that interested me not a little. The Vines were growing in a partially sunk three-quarter-span house, some of them planted outside, others confined entirely to an inside border. The inside and outside Vines were alternate, and the spectacle was presented of beautiful bunches and splendid spotless berries on those Vines planted outside, and side by side bunches that had every berry badly spotted, these being on the inside Vines. Generally the reverse has been the case, but here we have a striking example of the very opposite. The Duke is much appreciated by the noble owner whose name it bears, and its cultivation has been largely extended at Drumlanrig. Notwithstanding that it has a delicate constitution and requires special care and attention, the Duke, when obtained in such perfection as exhibited on some of the Vines at Drumlanrig, well repays its cultivator.

What the reason is for the spotting of those planted inside it would be interesting to discover. Generally, the writer has seen the Duke finest on Vines confined to borders where perfect control could be exercised in regard to moisture. When planted in outside borders and exposed to much wet cracking has often been a source of trouble, but at Drumlanrig this does not seem to be the case.—VISITOR.

CUCUMBERS.

As no one has yet noticed Mr. S. Castle's request on page 26 to give their experience on the old system of culture, I venture to trouble you with a few remarks showing how we have succeeded this year. Our practice is to give sufficient air to prevent scorching of the foliage, ventilation being liberal in the morning if the weather is very bright, and gradually reduced in the afternoon when the temperature declines inside, and at length the lights are closed, syringing at the same time freely, so as to give a rise to 95° if possible, but not higher. Fire heat is afforded if required to prevent the temperature falling below 65° to 70°, but is not used unless really necessary. The shoots are well thinned, tied, and stopped, and the foliage is kept as clean as possible. Shading is practised in very bright weather, just enough to prevent injury to the foliage. Soil consists of a good turfy loam used moderately rough, so as not to bind together, with about a fourth part of coarse leaf soil added. Plenty of water is given to keep the soil always thoroughly moistened, at the same time guarding against saturation and consequent canker, liquid manure being used when the condition of the roots, crop, and weather show it to be advisable. Owing to circumstances beyond control at the time of sowing no bottom heat was used.

The house is a span-roof running from east to west. It is 30 feet long inside by 12 feet wide; the angle of roof is 22°; the bed on which the plants were grown is in the centre of the house, and as a path 2 feet wide runs round both sides and one end it is only 28 feet long by 8 feet wide. The trellis does not extend over the path, and is 15 inches from the glass.

The seeds were sown on April 19th, two seeds being placed in each hill of soil, of which there were ten, five on each side of the bed, the weakest plant in each hill being eventually removed. Some seed was also sown in pots at the same time in case any of the seeds failed to grow. This proved to be the case with some, and as others had to be planted in their places this gave them a check for a time, which accounts for one plant fruiting fourteen days before the others. This one, not having been disturbed, grew where it was sown, and yielded the first fruit on June 4th. On June 18th several of the others had fruit ready, the numbers cut on that date and after being as follows:—Total quantity of fruit cut up to June 12th, 13; 18th, 36; 20th, 73; 27th, 153; 30th, 223; July 7th, 328; 12th, 406; 16th, 435; 23rd, 500. Thus nearly 400 were cut in the month from June 18th to July 18th. The greatest quantity cut in one week was 148, from June 27th to July 3rd; and on July 10th fifty were cut. These were all large full-grown fruit, such as would fetch the best price in the market.

And now comes a partial failure, which is only mentioned in the hope of preventing others from making the same mistake. Up to this time the plants could not have done better, but they now required another top-dressing, and, our stock of good turfy loam having run short, we were obliged to use the remains of an old turf pit which had been lying at least five years. This, although mixed with leaf soil as usual, soon ran close together owing to the fibre having perished; then the supply of fruit diminished to about half what it was previously, and some of the plants began to canker. This was prevented extending by careful attention, and the plants are now (August 18th) still healthy, and if we could spare the house for them

would probably continue bearing a long time. The total number cut up to August 18th is 654. They have never got over the close soil, and their roots have never appeared on the surface since.

And now a word as to the variety. I have already stated there are ten plants in the bed. Six of these are Veitch's variety of Rol-lison's Telegraph, which I can truly say I have never seen equalled yet for general purposes by any other variety. The remaining four plants are from home-saved seed which unfortunately got crossed, and these have not borne so freely as the others by a long way. I should think, taking a plant of each, the proportion would be three of Telegraph to two of the other variety. Thus it will be seen the total quantity cut would have been much greater had all the plants been of the best variety.—W. H. DIVERS, *Burghley*.

SEVERAL of your correspondents have written on the subject of Cucumber-growing without ventilation, and I should like to add a short account of my experience to that already given.

About a month back I tried the plan of growing the plants without ventilation, by simply not opening any of the ventilators. The houses were from 90° to 100°, and very wet and humid; the result was that the constant wet and condensation kept the blossom on the young fruit in such a saturated condition that they damped off, fruit and all. I was again obliged to open the sashes, or I should not have secured any fruit.

Again, nine days ago I wanted an extra lot of Cucumbers, and I tried the same plan with the same result of damping off. I now go on with plenty of fresh air all day, giving a large supply of water to the roots of the plants, and I never syringe the leaves. My plants are particularly healthy and the admiration of all who see them.—T. E. ROBERTS, *Denbigh*.

P.S.—I may add that I think the reason of failure is, that my houses are very well constructed and almost air-tight when closed. The Prescott houses, on the other hand, are roughly built, and very well ventilated through the chinks between the glass.

CHIONODOXA LUCILÆ.

THIS is a charming early spring-flowering bulbous plant, and as the time for planting is not far distant a few remarks may not be out of place. The bulbs should be planted as early as they can be obtained, and the best way to display the full beauty of the *Chionodoxa* is to plant them in good clumps or masses. No conception can be formed of its true character when single bulbs are dotted about, but the contrary is the result when planted in masses, and credence can readily be given to the accounts of it in its native home. Good patches are delightful amongst rockwork or in borders of mixed plants, but is more lovely still rising out of the grass in close proximity to trees where it will not be overshadowed. Well may it be termed the "Glory of the Snow," for it is indeed delightful when in flower and the ground is covered with snow, as we were able to see it last spring. It is not injured by severe frosts, even when in full bloom.

It has been recommended for pot culture indoors, but judging from my experience it will never become popular for this purpose. It appears naturally even outside to flower rather irregularly, and this is even more marked when grown in pots. From its earliness we might conclude that it would prove equally as serviceable for decoration in pots as *Scilla siberica*, but this is not the case, as the slowest system of forcing proves detrimental. Even under cool-frame treatment in pots, as we grew it here last year, it was most unsatisfactory, while the other bulbs flowered profusely outside. Its cultivation will not again be attempted here in pots.—SCIENTIA.

AMERICAN BLACKBERRIES.

I WISH Mr. Muir could visit the garden at Ellough Rectory, near Beccles in Suffolk. He would see American Blackberries there which form really a splendid sight; the plants are loaded with fruit, all of them so fine that when ripe they look very much like Mulberries. The rector, Mr. Earnshaw, tells me that they have been planted for four years, and that it is important that they should not be moved nor unnecessarily disturbed. As he is a bee-keeper the flowers of his berries were all fertilised, and unless Mr. Muir has given his plants the same chance I venture to submit that as yet they have scarcely had fair play. At all events so impressed were the party with me with what we saw in Mr. Earnshaw's garden (I had never seen Blackberries cultivated in this way before), that some of us certainly intend to follow his example, and if there is any spare space introduce the cultivated American Blackberry.—E. BARTRUM, *Berkhamsted, Herts*.

BRODIÆAS.

(Continued from page 134.)

Brodiaea lactea, Watson (fig. 31).—Leaves narrow, slightly glaucous. Scape from 1 to 2 feet high, smooth, terete, umbellate at the top. Flowers usually numerous, the umbels of my plants measuring nearly 4 inches across, and thickly set with flowers upon very slender pedicels from 1 to

2 inches long. Colour pure white, with a green midrib half an inch or more across. Sereno Watson describes forms with sparsely flowered umbels with flowers of a pale purple colour, but such I have never seen. This plant has evidently been a bone of contention among our scientists, for it is burdened with many synonymes, among which are the following—*Hesperoscordum lacteum* and *hyacinthinum*, *Lindl. Bot. Reg.*, t. 1639; *Allium lacteum*, *Benth.*; *Milla hyacinthina*, *Baker*, &c. It is a very pretty species, the umbels lasting a long time in beauty, flowering in June and July. Native of the coast regions from Monterey to British Columbia.

B. multiflora, *Benth.* (Fig. 32). A handsome species, with long narrow leaves. Scape from 1 to 2½ feet high, terete, roughish, umbellate. Flowers crowded, about three-quarters of an inch across, the obtuse segments longer than the tube, of a blue-purple colour. This is closely

Fig. 31.—*Brodiaea lactea*.

related to *B. congesta*, but from which it is easily distinguished if specimens are examined carefully. It is synonymous with *B. parviflora*, *Torr & Gray*, and a good figure of it is given in *Bot. Mag.*, t. 58, 89. Found in the regions from the Sacramento Valley to Oregon, also plentiful in many portions of the Sierra Nevada. Flowering with us during June and July. Free-growing, and quite hardy.

B. terrestris, *Kellogg*.—Leaves nearly terete, narrow, longer than the scape; the latter is from 4 to 8 inches high, slender, terete, pedicellate at the top. Flowers three-quarters to 1 inch long, broadly funnel-shaped, of a bluish purple colour, with yellow staminodia; pedicels from 3 to 4 inches long, very slender. This very pretty species is synonymous with *B. Torreyi*, *Wood*, also with *B. grandiflora* var. *macropoda*, *Torr*; and although it is very scarce under cultivation, it is not by any means difficult to grow, flourishing where the rest thrive. Native of the regions from Monterey to Mendocino County.—*J. T. R.*

JUDGING COTTAGE GARDENS AND THEIR PRODUCE.

I AM very glad indeed to see this subject brought out so prominently in your pages, and I trust the result may be a multiplication of cottage garden societies conducted under the best possible rules and regulations. As yet societies of the kind are far too few, and if all your readers who are capable of starting and conducting them would only consider the good they are capable of doing I feel sure we should soon hear of a beginning being made in all parts of the country. As it is they are creeping into existence, and it only requires help, such as you can give, to sow them broadcast.

I never had anything to do with such a cottage society as that mentioned by Mr. Iggulden (page 135), which embraced fourteen parishes, but I fancy the limits of these must have been more circumscribed than those in Wales, as a judge could not go through more than one parish here in a day, and he would require a fortnight's holiday to go over fourteen. One, or two parishes at most, would, I am inclined to think, be enough to be worked and properly managed by any small society such as I am most in favour of.

When the first show of the Cottage Garden Society was begun here six or seven years since we could have taken the exhibits from a number of other parishes into our 300-feet-long orangery, but now the produce from the parish of Margam alone crowds the building, and that a society answers and pays when confined to one parish there need be no doubt. As for instance, the first year we only gave £13 in prize money, but at our late sixth Show we gave over £40 besides

some valuable specials. Again, on our first show day the receipts at the door were only £9, while on the last they were £26, and throughout we have been able to prepare for a rainy day, as our reserve fund in the bank is something over £50. This has, of course, nothing to do with judging produce, but it may enable some to judge of how a society may be worked up by degrees with advantage to all parties.

In coming to "Reader's" questions on judging, we would always have a rule in the prize list that those gardens containing the best crops suitable for a cottager would be preferred by the Judges. First in importance we would take Potatoes, then white Cabbage, Onions, Turnips, Carrots, Leeks, Beans, Peas, Cauliflower, Celery, Parsnips, Vegetable Marrow; and winter greens would receive more marks and stand higher in our estimation, either as seen growing in a garden or shown in a collection, than such crops as Asparagus, Globe Artichokes, Beet, Endive, Salsafy, Seakale, or Spinach. Those "fancy" articles are properly grown in a gentleman's garden, and as such count at exhibitions; but they cannot be cultivated or cooked with profit by an ordinary cottager, and I hold that societies should offer prizes for nothing but that which can be produced with the greatest profit to the cultivator. In our prize list, a copy of which I beg to enclose, the highest prizes are offered for crops most suitable for a cottager, and this is what I would always advocate. Flowers are undoubtedly very attractive, and the cultivation of them is always a good sign; but I think it would be a great mistake to place them before vegetables in a cottager's garden. In the first place, their extensive culture would be sure to interfere with the supply of vegetables for use, and in the winter time, when these are often expensive to buy, the summer-flower-growing cottager would sadly miss his Onions, Parsnips, Carrots, Potatoes, and other crops. A well-filled old-fashioned flower bed or a beautiful lot of window plants should have a strong mark of encouragement, but a superabundance of flowers should be checked, and the exuberant taste and energy shown here should be partially diverted to other productions. The great aim of cottage garden societies is to encourage high cultivation, profitable cropping, and home comforts generally, and with those objects in view all prize lists should be so framed as to develop these qualities.—*J. MUIR, Margam Park, South Wales.*

[Assuming that the relative merits of vegetables for cottagers are indicated by the value of the prizes, they stand as follows according to the Margam schedule:—Potatoes head the list with four classes, red and white rounds and red and white kidneys of equal value.

Fig. 32.—*Brodiaea multiflora*.

Next follow spring-sown Onions, Peas, and Parsnips (equal); then a step lower are Cabbages, Carrots, Leeks, and Broad Beans (equal); then in the third rank are Kidney Beans, autumn-sown Onions, Red Cabbages, Turnips, Vegetable Marrows, Rhubarb, and Cucumbers (equal); and last, as adjudged of least importance, Lettuce and Parsley. Cauliflowers are not included in the cottagers' classes, nor are the "fancy" vegetables enumerated by our correspondent. Cauliflowers rank as of fourth-rate importance in the amateurs' classes; and one of the rules particularly states, "The Committee shall decide who are cottagers and who are amateurs;" and another rule provides that "Cottagers may compete in the amateurs' classes by paying 2s. 6d.; but no amateur can compete in the cottagers' classes."

A GRAPE WITHIN A GRAPE.

THIS morning (August 23rd) I cut a berry from a Black Hamburg bunch to ascertain if they were quite ripe or not. When I bit the berry I discovered another berry inside it. It partook of the shape of a Grape

seed, but was at least four times larger, had a perfect skin, but was not so well coloured as the parent berry. When held up to the light there was no appearance of seeds in it, but the flesh was exactly the same as an ordinary berry. There were three seeds in the parent berry in addition to this curiosity. On showing this freak of Nature to my father he remarked that he had seen a berry inside another before, but not one partaking so exactly of the shape of a seed. I do not think such a thing is very often met with, however, and after many years' close connection with Grapes I have only this once seen such a curious growth.

Have any of your readers ever met with anything of the kind? I have seen two berries united like Siamese twins, have seen them so much united that they were almost one berry to all appearance, have seen a little one growing out of the top of a big berry, and a berry growing directly out of the main stem of the Vine, but have never met with one like this. Though not of any practical value, still a note of any such freaks of Nature will, I am sure, be acceptable to all who grow Grapes and take an interest in anything relating to the history of that noble fruit.—JOHN THOMSON, *Clovenfords*.

THE LONDON PARKS.

An annual tour through the metropolitan parks has become a regular portion of the year's routine with many gardeners who, by the liberality and good sense of their employers, are enabled to note all the most recent additions to useful bedding plants, the most tasteful carpet designs, and the most effective of the general beds. The knowledge thus gained can be utilised to good purpose in the following season's arrangement, and hundreds of gardens have been thus greatly improved of recent years with increased satisfaction to both employer and employed. In these great parks every care is exercised to procure the very best results; and the public, indeed, have a right to expect something out of the common, for great expense is naturally incurred in propagating and growing so many hundreds of thousands of plants, preparing and planting the beds, and the general attention required. It may, however, be taken as a most pleasing indication of the care bestowed upon the management, that as a general rule the London bedding is unsurpassed in effectiveness and beauty; and though mistakes are occasionally notable they are quickly rectified, and what appears as an error of judgment at times is really due to an unavoidable lack of necessary material to complete previously formed designs. Further, there are some who would judge the combinations of colour in beds by hard-and-fast theoretical artistic rules, and thus introduce a sameness that it is most desirable to avoid. These can always find abundant material to cavil over, but fortunately the general public taste can appreciate a judiciously employed discord or striking contrast as well as the most delicate harmony, and it is satisfactory to observe that the park superintendents are doing their best to promote originality of design by introducing diversity of arrangement; and in several cases this season some of the most admired beds are quite at variance with the stereotyped rules on the arrangement of colours. An additional interest is thus imparted to the display, and visitors will find abundant food for reflection by inspecting any of the parks, which are now in their best condition, and should be seen, if possible, while the present fine weather continues.

HYDE PARK:

This is essentially "the" park of London in extent, beauty, and popularity, and during the early summer months presents on fine afternoons a scene such as probably no other could equal. The widely famed Rotten Row and the Drive may be seen thronged with the *élite* of London fashion for hours; but as August wanes the stream lessens, there is a general flight to country estates, watering places, and the Continent, pedestrians taking the place of the riders and imparting a new but scarcely less animated phase to the scene. It is these that may be daily observed thronging round the numerous flower beds which extend from Stanhope Gate to near the Marble Arch by Park Lane, and what may be termed the habitual frequenters of the Park scarcely remain long enough to witness its floral maturity.

Invariably a visit to Hyde Park in August is time well spent, but this season it would be a valuable investment, for rarely have the beds looked better, or the arrangements been more original and varied. This is no mean degree of success, as of recent years bedding-out has seemed to be growing more stereotyped, and it has become an urgent necessity that efforts should be made to resene it from such degradation. Valuable assistance has been afforded in this respect by the superintendents of the parks, and the results so far obtained give good promise of still further successes in the same direction. There is an increasing favour for the mixed style of planting—that is, several distinctly coloured variegated or flowering plants are arranged in oblique lines, so that when viewed from one side there is either an effective contrast or an agreeable combination of tints. Variegated Pelargoniums and Veronica Andersoni variegata, with Violas and Verbenas, are great favourites for this purpose; but one of the most effective beds that we have seen is the following, which is near Park Lane. It is of oblong form, with three rows of Lobelia cardinalis, the plants in the centre row alternating with Golden Treasure Fuchsia, those in the two outer each alternate with Sunray Fuchsia; all these are on a ground of Gazania splendens, and edged with bands of Iresine Lindenii, Pelargonium Golden Harry Hieover, and Lobelia Porcelain Brilliant next the grass. Here we have a strange contrast of colours, the dark-red foliage and brilliant scarlet flowers of the Lobelia next the golden and variegated foliage of the Fuchsias, Sunray having also rosy

purple flowers. These, again, are contrasted with the dark-green leaves and rich yellow flowers of the Gazania framed in dark-red Iresine, yellowish Pelargoniums, and bright blue Lobelias next the grass. This might appear almost alarming to a rigid colourist, but its very boldness renders it irresistible, and the observer will notice that it awakens far more admiration from the majority of the visitors than most of the others. It has, indeed, the merit of novelty to recommend it, and however it might be criticised it yet is pleasing.

Another "mixed" bed stands out prominently from all the rest, and deserves especial attention—namely, that planted with varieties of Phlox Drummondii, and margined with Gnaphalium lanatum, Iresine Herbstii, and Golden Feather. The Phlox has grown very strongly, but compact and even, and the colours are very evenly mixed, so that a charming combination of shades is produced. Crimson, lilac, purple, scarlet, rose, pink, blush, and pure white are abundant, with many intermediate tints. There is too much diversity in the marking of the flowers. Some are selfs, others are bicolors with a light centre and a darker margin, or *vice versa*; others, again, are tricolors, having a distinct zone of colour between the centre and the margin; the latter are very pretty, and some bear a surprising resemblance to Cinerarias. When a good strain is obtained, such as that represented in the above bed evidently is, Phlox Drummondii is a most valuable bedding plant, as the flowers are large, most freely produced, and brilliantly or softly coloured.

Carpet beds are well represented, several exceedingly pretty designs being notable amongst them. Alternanthera versicolor grandis, A. paronychioides aurea, A. amabilis, A. magifica, and A. amœna are largely employed, the golden variety being especially good, and appears to have coloured exceedingly well in most places this season. Sedum glaucum, S. acre elegans, and the indispensable Echeveria secunda glanca and Mesembryanthemum cordifolium variegatum, with Leucophyton Browni and Antennaria tomentosa furnish the neutral tints, while the favourite ground plant is the dark Herniaria glabra, which is used much more largely and generally with better effect than Mentha Pulegium gibraltarica. In a few beds Lamium maculatum aureum has been introduced, and as it has assumed a brighter golden colour than usual this year it appears very well, and if it were always as good it might be safely recommended. Unfortunately, in a wet season or in rich soil it often becomes of a dingy greenish yellow that is far from satisfactory. Two large oblong beds near one of the small gates, about half way to the Marble Arch, are very telling, and though it is almost impossible to convey an adequate idea of a carpet bed by description the chief features may be briefly pointed out. The centre plant is an Agave americana, which is surrounded by Alternanthera aurea. Then there is a scroll design in A. amœna in a neat ground of Herniaria glabra, a few clumps of Sempervivum arachnoideum, and large Echeverias encircled with the Golden Spurrey (Spergula pilifera aurea), which is of good colour, and seems preferable for small designs to the Golden Stitchwort. The margin is composed of bands of Alternanthera aurea, A. magifica, and Echeverias. Opposite to this bed is another of similar size and shape, but with a centre of Alternanthera versicolor, surrounded with Mesembryanthemum cordifolium, a bold chain of A. paronychioides major with bands of A. aurea and Herniaria glabra, margined with Kleinia repens, Alternanthera magifica, and Echeveria secunda glanca.

In the ordinary bedding a large number of Pelargoniums are employed, and as they include most of the best varieties for that purpose some of the leading and most distinct may be noted advantageously. Taking the scarlet Zonals first, the following are the chief varieties:—C. Smith, brilliant colour, large flower and truss, vigorous; Ernest, very bright, truss large but scarcely high enough above the foliage; Henry Jacoby, extremely dark, a most useful free variety; Mrs. Schwind, cerise scarlet, distinct and floriferous; C. Schwiud, deep shade, large compact truss, strong habit; Mr. Plimsoll, bright clear shade, very effective; Sir H. S. Stanhope, glowing colour, dwarf, compact, and free, a good variety; Rev. F. Atkins, brilliant, grand truss; Princess of Wales, salmon scarlet, small flower, but very free and distinct; Miss Maud Holden, rich shade, beautiful variety; Mout Rouge, one of the best scarlets, very showy, large dense truss, and extremely rich in colour; Dr. Rawson, a grand dark variety, flower and truss large, most effective; Johu Gibbons, brilliant true scarlet, truss fine, moderately vigorous; Col. Wright, good colour, showy; General Outrara, dark, few flowers, but showy; and Mrs. Gordon, handsome flower and truss, clear rich scarlet, with a white eye. Good pink varieties are not so numerous. The following are, however, reliable as seen at Hyde Park. Mrs. Leavers, one of the best dark pinks, very rich and clear in colour, flower and truss fine, habit compact but vigorous; Lucy Bosworth, a strong variety, with large flowers and truss, clear light pink, white eye; Lady Bailey, light pink, small truss, but free and early; Olive Carr, not very free-flowering, but the blooms are of good colour; and Lucy, fine bright pink, tall, but free, good truss and small flowers. The only white Zonal is La Vestale, which, however, is not very satisfactory, the flowers being few. The best salmon is Mrs. Clifton, which has large flowers shaded lighter on the margin, very distinct. The variegated forms employed are Rosamond Wright, silver-edged, pink flowers, pretty; Robert Fish, gold foliage, scarlet flowers; Queen of Queens, silver edge, very clear and good; Golden Fleece, golden variegated; and the old Manglesi variegata.

Starting from Stanhope Gate the visitor should take the right hand path nearest to Park Lane; he will then have on his left hand a series of circular and oblong beds alternating, some planted in the ordinary style and others with carpet designs. On the right also are a number of beds, chiefly of oblong form, which are continued the whole distance. On the left, however, the single row is succeeded by two rows also in the

turf, the opposite beds mostly corresponding, the centres being either Pelargoniums or mixed Blue King. A few of these beds may be briefly enumerated, and in most cases the names alone will suffice, commencing with the centre plants. Pelargonium C. Smith, edged with Gnaphalium lanatum and Lobelia Blue Stone; Pel. Lney Bosworth, Iresine Lindeni, and Lobelia pumila magnifica; Pel. Ernest, Ageratum Cannell's Dwarf, and Lobelia pumila Ingrami, white, free, and good; Pel. Henry Jacoby, Iresine Lindeni, and Lobelia pumila magnifica; Pel. Mrs. Schwind, Iresine Lindeni, and Koniga maritima variegata; Pel. Rosamond Wright, mixed with Iresine Herbstii, edged with a scarlet dwarf Tropæolum and Fuchsia Cloth of Gold pegged down, a distinct and pleasing bed; Pel. C. Schwind, Veronica Andersoni variegata, and Lobelia pumila magnifica; Pel. Mrs. Leavers, Coleus Verschaffelti, and Mesembryanthemum cordifolium variegatum; Dracæna congesta, Pel. Lady Plymouth and Heliotrope Jean d'Amour mixed, edged with Iresine Wallsi, a very dark variety of the Herbstii type, and Lobelia Omen; Acacia lophantha, Pel. Manglesi variegata, Iresine Wallsi, and Lobelia Omen.

A series of oblong beds, with rounded ends, are all edged alike with Golden Feather and Iresine Herbstii, the best being the undermentioned. Verbena Ariosto Improved with Veronica Andersoni variegata; Pel. Lady Bailey and Gnaphalium lanatum; Phlox Drummondii and the last-mentioned edging plant; Pel. Sir H. S. Stanhope and the Gnaphalium; and white Verbenas edged with Veronica Andersoni variegata. In the first double row of beds the following were good:—Pel. Olive Carr with Iresine Lindeni and Lobelia Porcelain Brilliant, a free-flowering, rather tall variety, bright blue, with a white centre; Grevillea robusta, a few Iresine Lindeni, ground of Mesembryanthemum cordifolium variegatum edged with Pel. Robert Fish and the same Lobelia; Abutilon Thompsoni, with a ground of Iresine Lindeni and Heliotrope Jean d'Amour edged with Golden Harry Hieover and the above Lobelia, this is a very good combination and extremely pleasing; Melianthus major mixed with Veronica Andersoni variegata and purple Violas, edged with Iresine Lindeni, Pel. Robert Fish, and Lobelia Porcelain Brilliant. In the second series of double beds the edging is uniform—namely, Lobelia Blue King next to the grass; Pel. La Vestale and Pel. Robert Fish; Pel. Princess of Wales and Pel. Queen of Queens; Verbena venosa mixed with Pel. Ariosto and edged with Golden Fleecy; Pel. Mont Rouge and Golden Fleecy; Verbena Nemesis and Veronica Andersoni variegata mixed, and Pel. Verona.

Many others are planted in a similar style, but the above are the most distinct and will serve as a guide to the method adopted. Several good groups of succulent plants impart considerable diversity to the effect, while some beds have been devoted to the Tuberous Begonias; these, however, are not very notable, except a circle of Lady Stanhope, a large-flowered bright pink variety, which is in capital condition. Most of the others seem to have suffered very much by the storms we experienced a short time since. Around the fountain in the small dell near the above beds single Dahlias are planted freely and have a good effect, while subtropical plants are placed near the carriage drive on the Kensington side and near the head of the Serpentine, several good beds being there observable; but that form of bedding is not very largely practised in Hyde Park, which, from its exposed position, is not so well fitted for it as those in lower situations. It may be remembered that this Park is now under the superintendence of Mr. Brown, formerly at Regent's Park, who has well maintained the reputation he had previously gained.

THE RANELAGH AND HOSPITAL GARDENS, CHELSEA.

Visitors who are making a tour of the parks should by no means omit this from their list, as, though there is nothing on a very pretentious scale, the gardens and shrubberies are well kept. The flower bedding arrangements are possibly a little too dazzling for some tastes—scarlet Pelargoniums, Calceolarias, and yellow Violas being very freely employed, especially on the terrace in front of the Hospital; these, however, at least possess the merit of brightness. Some of the central beds are planted with white Dahlias, and these have a striking effect in contrast with the rich colours surrounding them. Two large conical mounds of variegated and Zonal Pelargoniums in alternate bands are also conspicuous features in that portion of the garden. A few tastefully designed carpet beds are observable in various parts, but the extremely neat lawns, the dense shrubberies, and number of single specimen weeping trees—such as Elms, Willows, Ashes, &c.—are the most pleasing features. The turf is in excellent condition, and the surface is considerably varied, sloping up to the margins of the shrubberies, which are raised several feet above the level of the paths in some cases.

In front of the Hospital are two very distinct and attractive carpet beds which deserve particular notice. One is termed the Crown bed, the design being a representation of a royal crown well depicted and appropriately planted. The ground is of Alternanthera amœna edged with Mesembryanthemum cordifolium variegatum and Echeveria secunda glauca. The upper outline of the crown is in Alternanthera paronychioides aurea and Golden Feather, with a margin of Echeveria glauca metallica. The interspaces are filled with Alternanthera versicolor grandis, the base being Herniaria glabra and Cerastium tomentosum, Mentha Pulegium gibraltarica being used in a few places. This bed, being raised and sloped towards the Hospital, has a good appearance from the terrace. The other carpet bed is a geometrical design chiefly of interlacing bands of Echeveria secunda glauca, the enclosed spaces being filled with Iresine Lindeni in the centre, around this Mesembryanthemum cordifolium variegatum, Alternanthera magnifica, A. versicolor grandis, A. paronychioides major, and A. amœna, the edging being of Echeveria secunda glauca with a band of Golden Feather on each side. The ribbon border above noticed is about 300 yards long, and is

planted with Cerastium tomentosum next the grass, and the following in rows:—Viola lutea grandiflora, Pelargonium Vesuvius, P. Daybreak, P. General Outram, P. Lucius, and dwarf Sunflowers.

In the Ranelagh Gardens is a carpet bed termed the Grecian Honey-suckle, which has been much admired by many persons, and is unquestionably distinct in design and effect. It is formed of a series of serpentine bands, which radiate from the base of the bed and curve inwards at the apex. These bands are of Echeveria glauca metallica filled in with Sedum glaucum (centre). On each side are bands of Mesembryanthemum cordifolium variegatum and Alternanthera aurea, the interspaces being filled with A. versicolor grandis, A. magnifica, and A. amœna. The general management is very creditable to Mr. Gibson, under whose charge these gardens have been for several years, and that they are greatly appreciated by the residents in the neighbourhood is abundantly proved by the numbers which daily assemble there at this time of year.

In connection with the above the Pensioners' Allotment Gardens deserve notice, and alone are well worthy of the visitors' attention, for just now they are particularly gay. It is known to many that some scores of plots of ground adjoining the Hospital are placed under the care of the pensioners, who cultivate them to the best of their ability and sell the produce, chiefly to visitors. At one time Musk was very largely grown there, and quite a brisk trade was done with the roots and plants; but much less attention seems to be paid to that now, and æstheticism appears to have even invaded this quiet spot, for Sunflowers and Dahlias are most powerfully and almost painfully in the ascendant. One very advanced æsthetic hero has indeed a large central patch of white Dahlias, surrounded by a dense hedge of Sunflowers; but pleasing as this may possibly be it is doubtful if the results are so substantially useful as when the more humble, but popular and saleable, Musk was grown. A few plots are devoted to diversified collections of old-fashioned plants, Carnations being great favourites, and still fewer decidedly utilitarian cultivators have their land occupied entirely with vegetables. One very pleasing feature is the cleanliness distinguishing the whole of the ground. Scarcely a weed can be seen—most satisfactory evidence of the attention given to them by the white-bearded veterans, who can be daily seen engaged in work which evidently brings them both pleasure and profit.—L. C.

VINES IN AN INEXPENSIVE BORDER.

A CORRESPONDENT, "J. C.," appears to have afforded one more proof that good Grapes can be grown without great expense having been incurred in making borders; still "2 yards wide of turf sods" for the Vines to "start in" ought to have done something. The question is whether the Vines would have done equally well with half the quantity of sods, and the remainder of the soil treated as directed (page 164). In all likelihood there would have been no difference in the results; indeed it is not improbable that good Grapes would have been produced without any "sods" at all, as the natural soil with the additions mentioned would have provided all that was requisite for success.

I have seen many excellent houses of Grapes where very much less expense had been incurred in border-making than in the example referred to. One of the most striking is in a garden near London, once famed for grand Azaleas as grown by Mr. George Baker. The estate, Sisters House, Clapham Common, has changed owners somewhat frequently, and the vinery in question has been devoted to different purposes. It is a span-roofed structure upwards of 100 feet long and 25 feet wide, not more than 9 or 10 feet high at the apex, and about 5 feet at the sides. It was erected by Mr. Lucas, the great London builder, and then occupier of the Sisters estate, for an orchard house and Peaches with other fruits in pots and planted out were grown in it. Subsequently the property passed into the hands of Mr. Basset, a great patron of Orchids and plants generally, and which his gardener, Mr. Baker, grew so splendidly. The house under notice was then devoted chiefly to the fine specimen Azaleas that were sold a few years ago. A few Vines appear to have been planted at intervals for affording a little shade to the plants, and not with the object of producing superior Grapes.

The present owner of the Sisters House estate is Thomas Wallis, Esq., and as there were no plants in the house when his gardener, Mr. Holmes, took charge, he thought he would try and make something of the Vines. No border whatever was made. The inside of the house was floored with gravel, in fact resembled, as the greater part of it does yet, a hard carriage drive. This was for standing the plants on. On each side of the house the gravel was broken up to a width of something less than 5 feet, and the young Vines that were planted had a little fresh soil placed over their roots, the same as in planting any ordinary fruit tree, and the broken-up narrow border was thickly surfaced with stable manure, neither lime, bones, nor anything else was added. Seeing the Vines progress, the gardener roughly affixed some wires at a good distance from the roof, arching them over from

side to side, and now that the crop of fruit is hanging, the house resembles a tunnel of Grapes. How many hundreds of bunches there are it would be difficult to estimate, but when ripe they are cut often at the rate of forty or fifty a day for giving away to friends of the family and hospitals, and at this rate the supply is maintained over many weeks. The bunches are medium-sized, berries good, well-coloured, and not a shanked bunch to be seen. It is not an exhibitor's crop—that is, a few very large bunches, but rather what might be termed a first-rate market and family crop, consisting of a vast number of bunches ranging from 1 to 2 lbs. in weight, yet sufficiently meritorious to win prizes at the Crystal Palace fruit shows. The varieties are chiefly Black Hamburgs, but Black Alicante and Mrs. Pince are well represented. They are not, however, ripe enough for exhibiting at the Palace this year.

The roots of the Vines have no doubt found their way into the kitchen garden, which is naturally well drained, the soil resting on gravel, and fertile by good cultivation. Yet the fact remains that the Vine border cost nothing in the formation, and all that is done to support the Vines is a heavy annual dressing of manure on the narrow strips inside the house. This is no mere sprinkling, but a covering quite 6 inches thick, always kept moist, and in this the roots multiply and feed. They also penetrate the gravel, and if flower boxes or pots stand there for a time, thus keeping the gravel moist, they form on the surface like a network. This is a hint for those who practise digging their borders to keep them light and open, thus effectively preventing the increase of surface roots which it is desirable to encourage.

Observing the cleanliness of the foliage of the Vines in question, the gardener was asked how often he syringed them. His reply was significant; he observed, "I have been here seven years, and they have never been syringed yet; with all the work in this garden I can spend my time better than in syringing Vines." It is certainly only by extraordinary industry that all the "work" can be done so well, and it is equally clear that the Vines have not been neglected. The floor of the house is kept moist, and the practice of damping does not cease when the Grapes commence colouring. One Vine, and one only, has been slightly attacked with red spider during the very hot weather. This rod was less vigorous than the others and will be cut out, another cane having been provided from a stronger Vine for taking its place. This is an excellent practice—that is, removing any weak Vines and taking additional rods from others that are strong and vigorous, as such Vines will support from three to six rods as well as one. Very few of the Vines in question are limited to one or two rods, and they are trained where there is room for them, the plan obviously being not to waste any roof space yet never to crowd the foliage. At one end of the house Mrs. Pince is thriving admirably, but all the bunches are not filled equally well. Those at the bottom when in flower were dusted with Hamburg pollen, and these are all that can be desired, but those at the top that it was thought needed no such assistance contain a few small berries.

That good Grapes can be grown where the soil is naturally well drained and fertile without expensively made borders is quite evident, for there is little doubt that at the least five thousand bunches have been cut from Mr. Wallis's vinery during as many years, while not a pound was spent in making the border.—J. W. R.

THE GREENHOUSE AND ITS INMATES.

(Continued from page 143.)

PASSIFLORA.

No plants are more easy to grow than Passion-flowers. They may be grown in pots, but we decidedly advise the amateur to plant them out. If a hole can be made anywhere in the greenhouse floor and a pailful of soil placed in it, or even outside the house, by all means do so and put the plants out. If the roots are to be outside, a hole must be made through the wall and the stem introduced to the inside through it. During hard frost the part of the stem which is exposed should be covered with some straw and a mat over it. The shoots should be trained up the rafters to the top of the house, along the apex, and down the back wall, until a main rod is attached to the apex of the house and down each rafter. From these main rods young shoots should be allowed to grow in spring, and to the leading stems all growths should be pruned in autumn, for during winter the spray would obstruct too much light. The shoots should be allowed to festoon the roof and hang perpendicularly. When so allowed to ramble the effect is charming. Some trimming and tying may be necessary, but the less the better. Tying the shoots up in neat bundles is bad taste. They are not quite suitable for small houses, as they are robust growers, but where room can be afforded them they should always find a place.

P. caerulea racemosa is the commonest species, and is a very strong grower. *P. Campbelli* and *P. cinnabarina* are more moderate in growth,

and are, therefore, better fitted for small houses. *P. edulis* is strong and produces eatable fruit. *P. Innesi* is a very beautiful free-flowering variety, and perhaps the best for a small greenhouse. *P. Lawsonii* and *P. Munroi* are also fine greenhouse Passion-flowers.

PLEROMA.

Pleroma elegans and *P. sarmentosa* are very beautiful, easily grown blue-flowered plants, which thrive well in an ordinary greenhouse. Fibry loam, peat, and sharp sand suit them well. While growing pinching should be attended to, so as to cause the plants to assume a dense pyramidal form. Pinching should cease by midsummer, and the plants will bloom in autumn. Before they start into growth in spring any necessary pruning should be done, but if pinching has been properly attended to this will only consist in cutting the growth regularly back.

POLYANTHIUS NARCISSUS.

These Narcissi are very sweet flowers, which may be had in bloom at the same time as the Hyacinth, with exactly the same treatment. The bulbs may be potted more closely together than Hyacinths, say three in a 6-inch pot. The following half-dozen varieties are the best grown:—*Whites*: Bazelman major, Gloriosa superba, and Queen of the Netherlands. *Yellows*: Bathurst, Newton, and Prince Albert.

PRIMULA SINENSIS.

Amateurs with few appliances for raising annual greenhouse plants which are rather tender, such as the one at the head of this note, will be cheaper to buy plants when only a dozen or so are wanted than to buy seed and undergo the trouble of raising seedlings; indeed, the Chinese Primrose requires more heat than is afforded by a common greenhouse or cold frame, though they may be very successfully raised where there is a Cucumber frame on a hotbed. At the same time small plants fit for potting are to be had by post from those who make Primulas a speciality almost as cheaply as seed can be bought. We, however, will give directions whereby they may be raised from seed. It should be sown about April or May in pans or pots of light, rich, fine soil, and very slightly covered, and then placed in a warm house or on hotbed; failing these, in the warmest corner of the greenhouse. Watering must be carefully done and the soil kept moist, for if it once becomes thoroughly dry after the seeds have commenced germinating they will be destroyed. To prevent excessive evaporation a square of glass should be placed over the mouth of the pot, and the pot placed where it is not exposed to the direct rays of the sun. After the plants have made four leaves they should be pricked off into a box into soil composed of light rich loam, leaf soil, and enough sharp sand to make it porous. The box must be placed in a warm atmosphere until the plants are growing, when it may be removed to a cold frame facing north. Too much air should not be given, and the frame should be closed rather early in the afternoon. Of course the plants may be kept in the greenhouse if no frame is to spare, but they will do better in such a frame.

By the time the plants are crowded in the boxes they should be transferred into 3 and 4-inch pots according to their strength. As soon as these pots are filled with roots potting into 5 and 6-inch pots should be done. Owing to the thinness of the necks of the plants the latter are somewhat liable to fall. This tendency may be overcome by deep potting, which is better than supporting the plants with three short stakes inserted in a triangle close to the collar of the plants. By the beginning of October it will be necessary to take the plants inside, as they do not thrive in a low temperature. It is this which causes damping during winter. To counteract this tendency a little artificial heat should always be kept in the house and careful waterings given. By careful waterings we mean thorough soakings when the plants require it, and not a drop when they do not.

Double varieties require to be propagated by means of cuttings. This should be done in spring where there is a warm hotbed at work. The different crowns should be cut singly with a sharp knife, and one or two of the lower leaves cut off, so that a small piece of stem may be bared for insertion in the soil. Then each cutting should be fastened to a short stake and potted into a small pot in sandy soil. They should then be plunged into the bed and shaded when necessary. Water should be given carefully. When they are rooted they should then be treated as advised for seedlings.

PELARGONIUMS.

Pelargoniums of the Zonal type are known and appreciated everywhere, so we do not need to say a word for them by way of recommendation. Two small houses of yearling plants are best. The best time to insert cuttings is in August, using boxes, and light sandy soil. They will at this season strike readily out of doors. During winter they may be kept in the boxes, where they will require very little room at a season when every available inch is valuable. In March they should be shaken out of the boxes and potted in small pots. Compost of loam and leaf soil, with a good sprinkling of bone meal, will suit them well. The centres should be pinched out when the plants are quite small to induce the plants to branch freely. Potting when necessary and ordinary greenhouse treatment otherwise are all that is wanted to insure success in the cultivation of this class of Pelargoniums.

The Show or Fancy varieties should be raised from cuttings in July, which should be potted as soon as rooted into soil similar to that recommended for the other class. They should then be grown as sturdily as possible in a cold frame until October, when they should be removed indoors. An occasional syringing with soapy water will keep green fly from appearing, and it is necessary to keep it down, or there is no reason to expect the plants to flourish. Fumigating may be necessary

if the plants are affected, but soapy water will prevent its appearance if timely and repeatedly applied. Pinching should be attended to in order to induce a bushy habit. After the plants have done flowering they should be gradually ripened by being placed out in the full sun, and water gradually withheld until the wood is quite brown. They should then be cut well back and allowed to start into growth, when they should be shaken out of the old soil and repotted into fresh, and then put into a cold frame and kept close until new roots have formed, when ventilation must be liberal until it is time for removing them indoors. By this treatment very large plants may be produced, but for an ordinary greenhouse small plants are preferable. All classes will be much benefited while they are flowering if they receive an occasional supply of liquid manure.—A. H.

THERE is every likelihood that this will be an ABUNDANT YEAR FOR APPLES, and it is not improbable that, judging from past experience, we shall have a vast number sent to us to be named. The experience has already begun, and we shall do our best to supply our correspondents with the information they require. At the same time we must inform them that the naming of fruits requires a great deal of time and patience given to it. It is not like naming plants, where the botanist has large herbaria and profusely illustrated works to refer to for the identification of his plants. The pomologist has no such resource, and is dependant almost wholly on a good memory, actual comparison, and past experience to carry him through. We hope, therefore, that our readers will be lenient towards us, and we shall do the best we can to enlighten them; but patience must be exercised, and they are not to expect that we can relinquish work of great importance and of a more pressing nature to attend promptly to their requirements. We say our readers, for it is only to them that we extend this privilege of naming fruit. At no time shall we be able to name more than six varieties out of any consignment, however large it may be, nor can we possibly reserve the surplus for naming in future issues. We draw special attention to this, as a disposition exists to send fruit by the peck, and even by the bushel, on the assumption that the whole will be named in a series of issues. The reservation of all the surplus fruit that is sent to us would render our office quite uninhabitable.

— THE proposed FRUIT SHOW of the Royal Horticultural Society this autumn will probably be held at Chiswick, as the projectors, it appears, have been unable to come to terms with the Committee of the Fisheries Exhibition to hold the Show at South Kensington. As at present arranged, it is not intended to issue a schedule or to offer prizes, but to invite all the principal growers to assist in forming a thoroughly practical and instructive exhibition of fruits. The Apple crop being so good this season a particularly fine display of these useful fruits may be expected, and under the energetic management of Mr. L. A. Killick, who has taken such an active part in the scheme, together with Mr. A. F. Barron, a Show that will be fully creditable to the Society will undoubtedly be provided.

— WE are glad to learn that our correspondent "SINGLE-HANDED" has completely recovered his strength after his serious illness of last year, and, as may be seen by our advertising columns, is seeking a situation. We trust he will succeed in obtaining an appointment where he will have scope for the exercise of his undoubted ability as a gardener. His writings are familiar to our readers, and his work, which we have seen, is equal in merit to his literary productions. More need not be said. We observe, too, that a further supply of his Auricula seed, for which there was such a great demand last year, is now available.

— A BATH correspondent desires to thank Mr. Pettigrew for noticing the existence of the PHYLLOXERA in his excellent description of Ashton Court. He thinks all cases should be made known, as no fault whatever can attach to a gardener who has the misfortune to have to contend with the destructive pest. Mr. Austen goes further than this, for he writes—"I think it is much to be regretted that similar cases are not made public, as they certainly ought to be. There can be

no doubt that the phylloxera is much more common than is generally supposed. It ought to be made compulsory that anyone having their Vines so affected should destroy them at once. Unless something of this kind is done it will never be stamped out." We quite agree with Mr. Austen on this matter.

— THE INTERNATIONAL POTATO EXHIBITION, to be held at the Crystal Palace on the 13th and 14th of September, is the subject of much inquiry as regards its objects and the terms of competition. In respect of such matters we refer inquirers to the Secretary, who will afford every needful information. But it gives us pleasure to announce that in compliance with the requests of many friends and supporters of the movement the Executive Committee have enlarged the plan of the luncheon, which will henceforth be graced by the presence of ladies. Single tickets for gentlemen only will be issued at 6s. each, and double tickets for gentleman and lady at 10s. These charges will not include wines.

— THE following SELECT GLADIOLI were shown by Messrs. Sutton & Sons at the recent Reading Show, and comprise some very distinct and excellent varieties:—Ambroise Verschaffelt, Carnation, Célimène, Eglantine, Horace Vernet, L'Unique, Madame Desportes, Madame Furtado, Mons. A. Brongniart, Mons. Legouvé, Merveille, Pasquin, Princess Mary of Cambridge, Rosa Bonheur, Rossini, Shakspeare, Aréthuse, Africaine, André Leroy, Archduchess Marie-Christine, Atlas, Baroness Burdett Coutts, Dalila, Dumont d'Urville, Flamboyant, Flamingo, De Lesseps, Hesperide, La Candeur, Mdle. Marie Mies, Pericles, Rayon d'Or, Victor Jacquemont, and Zampa.

— MR. W. BULL states that the rare and handsome LILIUM PHILIPPINENSE is now flowering in his nursery, King's Road, Chelsea; also the new Liliium speciosum carminatum and the white Easter Lily of Bermuda.

— THE new scarlet-flesh MELON BENHAM BEAUTY, shown and certificated at Reading recently by Mr. Howe, gardener to Sir R. Sutton, Bart., Benham Park, is one of great promise, and well merits the honour accorded for it. As remarked in our report, it is said to be a cross between William I. and Hero of Lockinge, both well-known favourites, and is remarkable for the great depth of flesh, the rich and delicious flavour, and its moderate size, all qualities calculated to recommend it to notice. Mr. Howe has for some years paid great attention to the culture of Melons, and with more than ordinary success; but the variety he has now obtained will still further increase his fame.

— A CORRESPONDENT writes:—"The fruit at TAUNTON SHOW was wonderfully good, and staged in great quantities. Mr. Austen won the first prize for ten dishes, and Mr. Iggulden for eight." We may add the omission of the fruit classes from the report of the Show, published last week, was not designed, but caused by an accident, the result of which was that only a portion of the report arrived at this office.

— A "DUBLIN SUBSCRIBER" desires to know through the Journal "the names of a few ORNAMENTAL WATERFOWL suitable for a large pond, the prices of the birds, and where they could be obtained; also if there is a catalogue of waterfowl published, and by whom." Can any of our correspondents give the information?

— SOME unknown correspondent has sent us flowering and fruiting clusters of ROSA RUGOSA, showing, we presume, the ornamental character of this useful species. The fruits, bright scarlet in colour, almost resemble small Tomatoes, with the addition of very long calyces growing from the centre of each. There are several varieties of this Rose having flowers varying from rich crimson to pure white, and all are beautiful to those who delight in single flowers. A flowering and fruiting spray of Rosa rugosa is well represented on page 293, vol. iii, the issue of September 29th, 1881.

— THE annual LONG ASHTON EXHIBITION, which was held on August the 21st, bids fair to become the most popular among the many held in the neighbourhood of Bristol. The Society owes much of its success to the liberality of its President, Sir Greville Smyth, and his gardener, Mr. J. Austen, the former allowing the tents to be erected in the beautiful park at Ashton Court, the flower garden being also open to all visitors, while the latter works hard and successfully in arranging the numerous exhibits. The Treasurer, T. Dyke, Esq., also takes great interest in the Society. Ostensibly a cottagers' Show, there are yet a sufficient number of classes open to amateurs and their gar-

deners, and the whole being well filled a good and varied display is the result. In the plant classes the most successful exhibitors were Mr. Miller, gardener to G. Corner, Esq., Portishead; Mr. H. K. Ward, gardener to W. H. Budgett, Esq., Stoke Bishop; Messrs. Pease and Harris; and Messrs. Parker & Sons, Bristol. Cut flowers generally were a great feature in the Exhibition, the Roses especially being well shown by Mr. E. S. Cole, gardener to W. Pethick, Esq.; Mr. J. Burgess, Bath; Mr. J. Howe, gardener to L. Fry, Esq., M.P.; and H. Derham, Esq. The Gladioli shown by Mr. H. K. Ward were particularly good, as also were the Asters shown by Messrs. Burgess, H. K. Ward, and A. R. Tanner. Dahlias were also well represented, the prizes going to Messrs. A. Hill, H. Derham, and E. S. Cole. The fruit generally was good, and many of the examples would have won at larger shows this season. The best collection of six varieties was staged by Mr. J. Vallance, gardener to J. C. Wall, Esq. Other exhibitors were Messrs. Howe; E. T. Hill, gardener to T. Pease, Esq.; E. S. Cole; R. Symes; H. O. Wills, Esq.; J. Leech; Bannister, gardener to H. St. Vincent Ames, Esq.; A. M. Otway; A. M. Edwards; and S. Otway. About twelve creditable collections of vegetables were shown. Mr. Bannister was awarded the first prize for an even well-selected lot. Messrs. Virgo (gardener to the Rev. C. A. Fowler), Hood (gardener to J. Leech, Esq.), and E. T. Hill (gardener to T. Pease, Esq.), followed. Plants, cut flowers, fruit, and vegetables were shown in great quantities by amateurs and cottagers, and all gave signs of improved culture. The cottagers' gardens are also remarkably well cultivated.

— PART 36 of "PAXTON'S FLOWER GARDEN" contains the usual letterpress and coloured plates of the following plants:—Three-tongued Oncid (*Oncidium trilingue*), a comparatively dull but curious species with yellowish-pink flowers, from Peru. Accompanying this plate are descriptions of thirteen species of *Oncidium* allied to *O. trilingue*, and grouped as *Oncidia microchila*—*i.e.*, the small-lipped *Oncids*. *Pentstemon azureum*, which is described as possessing "bright azure blue" flowers, these, however, being represented in the plate of a dingy lavender. The Gleanings and Original Memoranda contain notes upon *Anthurium splendidum*, *Billbergia Porteana*, *Dracæna Lindenii*, *Lælia Crawshayana*, *Microglossa albescens*, and *Odontoglossum tripudians Harryanum*. Part 77 of "Familiar Wild Flowers" [also with the following from Messrs. Cassell & Co.] gives plates of *Polygonum aviculare* and *Colchicum autumnale*, with descriptions of the characters and history. Part 54 of "Familiar Garden Flowers" has plates of *Camellia japonica* and *Heliotropium corymbosum*, which appears to be an error, for the common *H. peruvianum* is represented, and, moreover, the other plant has flowers which are not fragrant, though they are larger.

— AMONG the more remarkable of the ORCHIDS NOW IN FLOWER AT GLASNEVIN we give the foremost place, by reason of its novelty, to that beautiful pure white *Dendrobe*, *D. Dearii*. The peerless purity, except a faint shade of green in the throat, of its flowers makes it quite remarkable, and it will no doubt become a great favourite with Orchid growers. Another notable Orchid, and a pretty one too, is *Epidendrum nemorale*, with flowers of pale delicate lilac, the lip only being prettily streaked with rosy purple. *Oncids* are represented by the old but pretty yellow *Oncidium flexuosum*, the yellow and chocolate *O. crispum*, the curious and pretty *O. dasystylum*, its flowers mimicking a bee, and *O. Wentworthianum*, and *O. obrysatum*, remarkable for the great length and floriferousness of their flower spikes. Of *Odontoglossum* the most conspicuous are the lovely *Odontoglossum Roezlii*, and its perhaps still more lovely white variety; also *O. Lindleyi*, *O. tripudians*, and *O. hastatum*. A remarkably fine variety of *Brassia bracteata* impressed us very much as being a great advance on the normal form, each division of the perianth being fully a span long, and we thought the raised bosses of olive green on the lips and the black dots on base of the sepals much more pronounced than in the more familiar form, *Aerides odoratum*, *A. quinquevulnerum*, and *Saccolabium Blumei*. Among Slipperworts (*Cypripedia*) *C. Roezlii*, remarkable for the lateral petals being distinctly banded and margined with crimson, Veitch's fine var. of *C. superbiens*, noteworthy for its dark, almost black, lip and the lateral petals being, as in the preceding (but not so pronounced), banded with crimson; *C. Dominicanum*, with its curious tail-like appendages, *C. Reichenbachii*, and several others. Numbers of *Disa grandiflora* serve to make the various shelves gay, and the rarer and less showy waxy white *Disa megaceras* is also in flower; and for last, but by no means least, we reserve what we felt inclined to regard as the gem of the whole, an

exquisite specimen of the lovely little *Dendrochilum filiforme*, with no less than a dozen of its minute and exquisitely graceful flower scapes, challenging an amount of admiration which the more showy aristocrats of the tribe fail to win.—(*Irish Farmers' Gazette*.)

— IN a notice in the *Journal of Forestry* of Newbattle Abbey, the residence of the Marquis of Lothian, situated some seven or eight miles from Edinburgh, and near Dalkeith, it is stated that in front of the mansion stands a HANDSOME BEECH, which surely deserves to be named "The Pride of the Lothians." It has a circumference of branches of 140 yards, and at 8 feet up the bole the girth is 20 feet. In 1798 this tree was measured and found at the same height (8 feet) from the ground to be 16 feet in circumference.

— WRITING in the "American Gardener's Monthly" respecting the MANETTI ROSE, Mr. H. B. Ellwanger has the following:—"Since the Manetti became known as a desirable stock on which to graft Roses our firm has made use of them, importing or growing a considerable quantity each year. This June we will have 55,000 Roses in flower that are on Manetti roots, and we have planted out for July budding upwards of 90,000 Manetti stocks and 10,000 Grifferaie stocks. This is one-third of our entire stock of Roses, and will show in what estimation we hold the Manetti. Now, as to the qualities, good and bad, of the Manetti as a foster-parent. It throws out suckers from the roots, which, if undisturbed, ultimately choke the variety it has been budded with. This is certainly an objectionable feature, but it will not weigh much when placed in the balance and compared with the qualities which commend it for use. By budding Roses on a stock like the Manetti or Grifferaie we propagate many varieties which cannot be grown from cuttings, at least not without great loss; such kinds are Baroness Rothschild, Abel Grand, Marguerite de St. Amand, Crested Moss, Gracilis, Persian Yellow, &c.; we also propagate varieties of somewhat feeble habit, like Horace Vernet, Louis Van Houtte, Marie Baumann, Xavier Olibo, &c. These sorts are among the most beautiful Roses, but they need the vigour of growth which another stock can alone supply. The matter may be summed up thus: Persons who know nothing of Roses should obtain varieties which are on their own roots, and be content with kinds like Général Jacqueminot, La Reine and Paul Neyron. Amateurs who are capable of discriminating may be safely trusted to plant budded Roses of such kinds as are improved by being worked; the suckers of the Manetti are easily cut off and give very little annoyance to those who know Roses." [Manetti stocks rightly prepared do not produce suckers in England.]

— A NEVADA correspondent writes to *Vick's Magazine* as follows relative to LILIUM WASHINGTONIANUM at home:—"The Lily stalk comes up through the Manzanita and Madrona shrubs, and is cool at the root. The deep snow, leaves, and the shrubs cover it in winter and keep it cool in summer, and it likes the sun when in bloom. I think it should do well among shrubbery. It is never very warm where it grows; the nights are generally cool. It grows around Lake Biglar, Tahoe, and high up in the mountains, some miles from here, but I have never seen it in the foot hills on this side (eastern slope) of the Sierras. It is certainly a hardy plant, and I think just wants putting in the ground and letting alone."

— FROM the same publication we cite the following relative to FLOWERS IN MIDDLE FLORIDA:—"Florida has been well named 'The Land of Flowers.' Its wonderful climate seems to be especially adapted to the growth of every blooming tree and shrub and plant, from the hardy natives of colder latitudes to the most tender and delicate blooms found elsewhere only in conservatories and hothouses. From majestic Century Plant, which blooms but once in its long life of about twenty-five years, to the tiny Violet, there is a wealth of perfection in colour and perfume throughout the greater portion of the year, that would make the fortune of a florist who could possess them in sufficient proximity to a good market. Among the blooming trees and shrubs which adorn the woods and fields of middle Florida, without the aid of cultivation, are the stately Magnolia, whose powerful fragrance fills the air for miles in the early spring; the Red Bay, with its Magnolia-like flowers, more delicate in perfume than the Magnolia; the Snowdrop Tree, with drooping pure white blossoms; the Sparkle-berry, the Dog-wood, the Clove Tree, the Red-bud, the wild Crab-apple, the Swamp Willow, and a hundred others of greater or less beauty. The wild Vines, too, are a brilliant feature of every hedgerow and thicket. Earliest and sweetest is the yellow Jasmine, with its golden bells, filling the air with the most

delicious fragrance. The Woodbine, with crimson clusters; the Virginia Trumpet Creeper; the family of Honeysuckles; the Cherokee Rose, and many others, known and unknown, grow and clamber and thrive along the roadsides and in the depths of the forest with a luxuriance seen nowhere else in America. The numerous varieties of the Water Lily inhabit every pond and lagoon, all more or less beautiful; many remarkably and peculiarly fragrant, and many so rare as to be found wild in no other locality on the continent. The cultivated flowers, as may well be imagined, are almost infinite in variety and incomparable in perfection. The *Camellia japonica* is apparently at home here, and attains, with age, an immense size. Several in Tallahassee are from 10 to 16 feet in height; and Quincy, in Gadsden, the adjoining county, boasts of two which are nearly or quite 25 feet in height. Roses bloom the year round, and the bushes become trees; the stem of one here measuring, at the height of 4 feet, 12 inches in circumference. Eight varieties of the Jessamine are found here, and the Cactus family flourishes astonishingly. It is too great a task and would require too much space to name more; suffice it to say that probably in no other region on this continent can be found or cultivated in the air so great a variety, or such magnificent specimens of the several kinds, as may be found in the numerous flower gardens and private collections of the middle Florida towns. The ladies of Tallahassee especially excel in the gentle art; and as there is but one greenhouse for trade purposes, and not a single professional florist in all middle Florida, the name the Capital City has fairly acquired as 'The Flower City of the Land of Flowers' is a distinction of no common significance."

VIOLA ARDWELL GEM.

WHEN on a visit to Castle Kennedy last September I saw this fine bedding Pansy for the first time. I was so pleased with the effect it produced in the flower garden, where it is extensively grown, that I asked Mr. Fowler to favour me with a few cuttings of it later on in the autumn, a request he most kindly granted. I learned that it was a great favourite with him, and as far as my experience goes I consider it is the best light yellow self in cultivation. It is a hardy variety, has a compact dwarf habit, and when planted it soon covers the ground. The flowers are large and of good substance; they stand erect on a strong flower stalk, and are produced in great abundance from early in spring till late in autumn. Mr. Fowler informed me that it was originated at Ardwell, a gentleman's seat in Wigtonshire not far from Castle Kennedy, and that it is scarcely known out of the immediate district. I find that it grows and flowers as freely here as I saw it do at Castle Kennedy, and it is greatly admired for its close dwarf habit and the size, shade, and productiveness of its flowers.—A. PETTIGREW, *Castle Gardens, Cardiff.*

SEASONABLE NOTES ON FRUIT TREES.

THIS is a most important month both as concerns the produce of the present year and that of succeeding crops; and although we have all been somewhat disheartened as to certain crops of the present year, we must still hope on, even as our ancestors did in their day. If we cannot always wage war successfully against inclement springs, we can at least put in requisition all those modes of practice which, being based on a knowledge of Nature's laws, can alone be depended on.

The remarks I intend to offer will refer principally to trained trees. It is quite unnecessary here to go farther. Any principle which will apply to trained trees will apply, in degree, to the most ordinary standard or espalier, modified, of course, by degrees of hardihood and modes of training.

One of the first objects to be considered at this month is the ripening of the wood; a second is the equalisation of the sap, so as to produce a due equilibrium in the trees; and lastly, to accommodate fruits hastening towards ripening.

And let not the ripening of wood be deemed a mere cuckoo-cry because it is brought forward almost periodically. It is of so much importance in the eyes of those who try to remind the less-informed, that they feel it a duty to keep the subject alive; and such must be the case until these principles are, to all concerned, familiar as "household words." On this thorough consolidation depend the health, character, and utility of tender fruits. And what does all this mean? Why, that the tree has been treated according to its requirements, that by the fall of the leaf all Nature's processes have been fully carried out—nothing left in arrears. As there happen to be many late growths in fruit trees of healthy habits, it becomes us so to control these as to sustain a proper equilibrium in the trees. This we call equalising the sap.

Then we have to consider the immense value of a free access

of sunshine to the would-be fruit-blossoms of the succeeding year. I begin to think that we have hitherto underrated the importance of this matter; and that the various processes of disbudding, stopping, &c., might be carried still further without in any way deranging the system of the tree. As for being so nervous about incipient fruit-buds losing their balance and "going to wood," I can only say it is a somewhat morbid fancy. Certainly, in very gross trees we may meet with such things; but sorry is the condition of that operator who is afraid to act in the face of this bugbear. Such forget that, admitting this trivial affair, we obtain an equivalent of ten times the value. I have a lot of Pears which, having a thin crop, have been in the habit since May of producing much spray. I have had this stripped away entirely, or nearly so, this season; and on examination I find the fruit-buds exceedingly profuse, and in a most decided and advanced condition. Besides this, we want some sunlight to the fruit. This is admitted on all sides. So that here we have four or five reasons of high consideration for securing sunlight and subduing grossness. The reasons against such are as nothing in the scale; certainly must be allowed no preponderance. I may now point to a few of our fruits by way of illustration.

THE PEACH AND NECTARINE.—Of what possible benefit can it be that so many shoots are usually nailed to the wall during summer, as is the practice with many? Some cannot find pluck enough to do away with supernumeraries. Where rods or young shoots are required as leaders, or to fill given spaces, by all means let them be reserved. The rest may be cut back to about three leaves. This, of course, is approaching a spur system; but I have tried it for two or three years, and feel assured that it is the good plan after all. Of course there will have been a liberal disbudding in spring; and where there is a profusion of shoots, and the disbudding is duly performed, the rest during summer may be fairly pinched back. Such spurs on growing trees will, of course, produce bunches of small spray afterwards; and this must be closely pinched early in September; after which, little more will be produced. But what about the terminal points of such trees? These may all be pinched on the spray, merely removing the growing points. In all cases of pinching, however, let this be an exception:—Wherever any shoots are poor or show leanness, pinch not, but suffer spray and all to grow to the end.

THE APRICOT.—The habit differs much from the Peach, and a somewhat different handling is required. One thing may be observed, that complete sunlight from midsummer until October is indispensable in securing the organisation of perfect blossoms for the ensuing year. Pinching back of fruit-spray must, therefore, be constantly resorted to. But with regard to the leading shoots a different policy should be observed. These should never be pinched, unless for two reasons:—First, as robbers, or leaders, exceedingly gross—such may have their points pinched about midsummer, or, indeed, earlier. Secondly, when they are over-topping their bounds.

THE PEAR.—Here we have a most unruly subject. If any novice were to form a judgment of all Pears and their habits, modes of fruiting, and various vagaries that Pears are heirs to by merely having grown Louise Bonne of Jersey and a Beurré d'Amanlis he would think that folks made too much fuss about Pears. But their habits differ more, perhaps, than those of any one family of fruits. I alluded to severe operations on this fruit previously; and I can but repeat that, at this period above all others, it is necessary that sunlight be secured to all portions of the trees. All rambling leaders of trained Pears may be pinched immediately; many, it is to be hoped, have received this treatment before.

Still there remains another material consideration as concerns September; and I would here put the question—"Have you any trees still infested with insects?" The Peach, above all, deserves particular attention at this period. Red spider is very apt to get ahead whilst the wood is ripening; and at such period so robs the trees that the buds are imperfect, and the following year we hear lamentations about blossoms not setting and fruit falling. Insects of whatever kind must not be played with but destroyed at once by the best means at disposal, or no one has a right to expect healthy and productive trees.—R. E.

HERBACEOUS PLANTS AT WOOD LAWN.

THOUGH the majority of hardy plants for the decoration of borders and rockwork have either finished their flowering or are past their best, there are still many that have yet to contribute to the display. The tall perennial Phloxes (the garden varieties of *P. acuminata*, *P. paniculata*, and *P. pyramidalis*) are more conspicuous in this respect than any other class of hardy plants

that are expected to come into bloom for the next few weeks. Of those fairly open at the present time Harrison's Seedling is the most effective. Its bold leathery foliage and its fine trusses of white bloom, which have a faintly tinted pink eye, recommend it strongly. It is a grand variety for forcing either as an exhibition plant or otherwise. Apart from this and one or two other forms, the greater portion of the varieties grown here have yet to flower.

Pinks have been very showy and continue so; for though the great masses of the common white form are past their best, John Ball and numerous allied sorts come forward to take their place, and a further succession will be kept up with the Carnations and Picotees, of which a number of varieties are represented here.

LYCHNIS (AGROSTEMMA) CORONARIA var. *ATRO-SANGUINEA* is very showy and useful. Its dark red flowers are abundantly produced, very persistent, and exceedingly useful when cut for decorative purposes. It commences to flower in early summer and continues till autumn. It is, however, a somewhat delicate plant, and succumbs to severe frost in a wet winter. It grows $2\frac{1}{2}$ or 3 feet high, and produces seeds in abundance, which germinate readily either in a frame or outdoors; and if the young plants are placed in 60-size pots, kept in a cold frame for the winter, and planted out in spring, its absence from the flower border never need be conspicuous. There are several varieties of this plant all well worth growing. The type has ordinary red flowers not nearly so dark as the above. The variety bicolor has white flowers with a red centre, and alba is pure white.

ACHILLEA PTARMICA FLORE-PLENO is a well-known old occupant of the flower border, and its rambling habit may have caused it to be less grown than it used to be. It varies in height according to soil and situation, ranging from $1\frac{1}{2}$ to 2 feet, loaded with innumerable double pure white flowers fully half an inch in diameter disposed in compound corymbs. The flowers are very useful for bouquet work. Though this plant has an unpleasant intruding habit it may be kept in subjection by cutting round it with a spade or trowel once a year, say every autumn when the borders are being forked.

ACHILLEA SERRATA, Retz.; *PTARMICA SERRATA*, DC.—This is a beautiful and interesting plant, 10 to 12 inches high. The leaves are more deeply notched than those of *A. Ptarmica*, and of a beautiful green resembling those of a Pink. Flowers white, larger than those of *A. Ptarmica*, and disposed in a similar fashion. It is not very common outside of botanical gardens, and its native country is uncertain. It is a plant well adapted for the rockery, and equally so for the border, lasting a long time in flower.

LYCHNIS CHALCEDONICA.—One of the best and most showy of the taller-growing herbaceous plants. Three feet may be given as its average height, and it is admirably adapted for planting in the back row of the herbaceous border in a line with such plants as *Liliums*, *Delphiniums*, *Aconitums*, &c. it prefers a deep rich soil like the rest of the genus. The flowers are of so intense a scarlet and so useful as to rank it as one of the very best of herbaceous plants.

LYCHNIS PYRENAICA.—A rare species inhabiting the Western Pyrenees at an altitude of 3000 to 4000 feet. It is a low-growing plant, making dense rosettes of glaucous spatulate leaves of a leathery texture. The flower stems are sub-erect or inclined, very wiry, and bearing numerous pure white flowers about half an inch across. It might be described as bearing great resemblance to a much-reduced *Silene inflata* with its inflated or bladder-like calyx wanting. It is thriving remarkably well with us. We grow it in a pan containing good loam and lumps of limestone plunged in a cool part of the garden; but its most suitable situation would be on the rockery in crevices of limestone, and we intend to have these as soon as it is deemed desirable to divide the plant. It blooms more or less throughout the whole summer.

ENOTHERA FRASERI.—A very showy and also useful plant, as it flowers at the time when the earlier summer-flowering plants are past. If a border is expected to be gay from spring till autumn this is a plant to give valuable help. It produces its orange-yellow blossoms in profusion, and grows to the height of $1\frac{1}{2}$ foot. It likes good retentive soil, and should not be grown in a dry corner or on a dry bank, or disappointment will be the result. We have it represented here in clumps every few yards in the front portion of the borders, and it is very effective. We grow another somewhat allied species under the name of *Æ. fruticosa*, but whether this appellation be correct or not I cannot say. Be it what it may it is a handsome species, and I slightly prefer it to Fraser's *Enothera*. It grows 2 feet high; the leaves lanceolate, with a slightly toothed margin, and under three-quarters of an inch diameter in the broadest part. Flowers pure

yellow with a green calyx. The leaves of *Æ. Fraseri* are shorter but broader, more irregular in outline, with but rudimentary serratures, and its green calyx striped with purple. Both are very good plants for pot culture, but under such conditions they should be supplied with abundance of water.

ENOTHERA PUMILA.—This we grow on the rockery. It is a diminutive plant, 6 to 9 inches high. The stems are thin and wiry, furnished with small pure yellow flowers a quarter of an inch across, and has been in bloom for two months. Its situation in a garden should be on rockwork, as in this position it looks more in place. Seeds are freely produced, which readily germinate and make plants. The perennial *Enotheras* are best increased in autumn by dividing the plants.

MORINA LONGIFOLIA.—This is worth mentioning, inasmuch as it is both handsome and, unfortunately, as yet much too uncommon in gardens, although it was probably the first species introduced into cultivation. It is readily raised from seed, and will grow in ordinary garden soil if it can only have a moderately light position. Some clumps are growing here in partial shade, and have not flowered so freely as those in positions exposed to the sun. It is a vigorous Thistle-like plant, with dense crowns of radical leaves a foot in length and about 2 to $2\frac{1}{2}$ inches broad, quite smooth, lanceolate in form, undulate and acutely lobed, with the margins spinose. Flower stems 2 to 3 feet high and quite erect. The leaves in whorls of fours, becoming smaller upwards and ultimately bracteate, supporting whorled capitula of fifty or more flowers. Each spike produces from eight to twelve of these whorls, and in robust plants the lower capitula are supplemented by additional heads of flowers on stalks 2 to 3 inches in length. The flowers at first are white, about half an inch across, slightly irregular, funnel-shaped, with the long slender tube not more than one-sixteenth of an inch in diameter and over an inch in length. They are rather fugitive, and a somewhat singular phenomenon is that the flowers change from white to a carmine colour on the approach of falling. The short duration of the flowers is compensated for by the number successively produced in each capitulum. As a matter of curiosity it may be well to add that some of the flower stems have the leaves in whorls of threes, and this symmetrical arrangement applies equally to the bracteate ones throughout the entire inflorescence. It is a native of the Himalayas, our plants being from seeds sown two years ago last April; they commenced flowering at the end of June, and their season is not likely to terminate for several weeks.—T. ENTWHISTLE, *Wood Lawn, Didsbury*.

DESTROYING WASPS' NESTS.

I NOTICE in your impression of the 23rd inst. that "T. W. S., Lee," calls attention to the above subject. Until the 24th inst. we scarcely knew we had any wasps to deal with, but since the above date they have made such a raid on nearly all kinds of fruit, that it is distressing to see the havoc they have made in such a short time on late Grapes. To prevent their entering the vineries we have fixed some hexagon or Nottingham netting in front of the ventilators. We have used tiffany, but we found it too close—it did not admit air enough. The simplest way I have found for dealing with wasps' nests is as follows. When we find a nest we mark it with a stick, and a piece of white paper on the top of the stick. This is to show its whereabouts without much difficulty. After dark we take a lantern, procure some turpentine and cotton waste or rags, saturate them with the turps, then push it in the hole, and place a piece of turf or some soil over it to make it airtight. If there are no other outlets this application is almost sure to kill them; no digging-out is necessary. A few wasps may be seen about the nest next day, because some will remain all night in the trees when the weather is fine and warm. We have adopted the above plan for several years, and have found it simple and effectual. Sometimes we have adopted the following plan, which is very clean and simple—We procure a half-pint or a pint beer or soda-water bottle, pour two or three tablespoonfuls of turps into it, push the neck of the bottle into the hole, and press the soil or a piece of hemp firmly round the neck to make it as nearly airtight as possible. If, however, there are other outlets from the nest, they must be treated in a similar way.—G. R. ALLIS.

TROPICAL AMERICAN MAIDENHAIR FERNS.

THE American continent, and particularly that portion of it included between Mexico and Peru, possesses a large number of beautiful native Ferns, amongst them being several of the most handsome species of *Adiantums* cultivated in English gardens. Such distinct and well-known forms as *A. lunulatum*, *A. peruvianum*, *A. trapeziforme*, *A. polyphyllum*, *A. macrophyllum*, *A. concinnum*, and *A. tenerum* are all found in this district, though necessarily confined to it. As is common with many other Ferns, some are widely distributed throughout other portions of the globe. The one to which special attention is called in these notes—viz., *A. tetraphyllum*, is extremely variable in different parts of

America, and as it extends from Mexico through the West Indies to Brazil, and is also found in Tropical Africa, it can be readily imagined that the climatic conditions alone would produce much diversity of aspect in such a Fern. A notable and elegant variety is that shown in the woodcut (fig. 33), *Adiantum tetraphyllum gracile*, which was introduced by Mr. W. Bull of Chelsea through one of his collectors in Colombia a few years since, and it was thus described in the list of new plants for 1880:—"A handsome stove Fern. It is of moderate stature, and remarkable for the beautiful reddish tint assumed by its fronds when first developed, and continuing until they are fairly expanded. The fronds are bipinnate, on slender black stipes, arching over elegantly at the top, and dividing into from four to six linear pinnae. The red colour of the young fronds adds very much to the ornamental aspect of the plant, which is, moreover, of an elegant mode of growth."

EDINBURGH GARDENS.

FOR open spaces, wide streets, splendid architecture, and unrivalled situation, "mine own romantic town," as Sir Walter Scott wrote it,

the Waverley Market, at the extreme east end of the valley, level with the street above, is a regular parterre of flower beds and cement walks. To break the monotony of the level roof, which few would suppose other than *terra firma*, at present there are many fine specimens of Sweet Bays from 5 to 10 feet high, pyramidal shape, in tubs. These are in the finest health. But there are no others. Sweet Bays, and nothing but Sweet Bays, are surely not in good taste. In the nurseries of Edinburgh are to be found specimens of coniferous plants that would lend variety by furnishing grace in form and different tints of green, and not in summer only, but in winter, when everything seems bare and dreary. We understand that Edinburgh people are proud of their Waverley Market garden and prize their Bays, not altogether because of their beauty, but because of their cost!

All things considered, the plants that fill the beds are in pleasing health, and no expense is spared in keeping the gardens neat and clean. For a town garden the grass is wonderfully fresh, and, being well kept, is a very pleasing feature, affording relief to eyes tired out with the glare of masses of stone.

Though praise is given for the condition of the garden, conscientiousness compels us to add that it is not deserved for the floral arrangement. Criticism is not always pleasant, but it is often useful, and we think that it is our duty to the public to point out what to avoid as

Fig. 33.—*ADIANTUM TETRAPHYLLUM GRACILE*.

stands pre-eminent among not only the towns of Great Britain but of the world. Prominent in all of these respects stands Prince's Street, with its long line of splendid buildings on the north side of the street, and its noble expanse of lawns, trees, flower beds, and monuments in the immediate front, with the grim, old, historical castle crowning the beetling rock to the right hand, and Old Edinburgh stretching before far to the left, between the castle and Holyrood, while New Edinburgh lies to the back. The space between the old and new towns is named in old maps the North Loch, but it is now dry. In what was once the bottom runs the North British Railway—at once a landscape nuisance and a travelling necessity. As an eyesore, however, it is not so very objectionable, as it runs at the bottom of a cutting, while steep on either side rise high banks, vying in some instances with Highland scenery in ruggedness of aspect. The slopes in front of Prince's Street have been formed into magnificent terraces, on the top and at the bottom of which are flower beds and shrubs arranged in a style that does great credit to those who designed and carried out the work; nay, more, on the top of

well as what to follow. Public gardens exercise an educational power, and the masses are apt to follow what is either praised or even not mentioned, whether right or wrong. It is not often that arrangements are so constantly wrong as they have been, and are, in the case of the Edinburgh gardens; and had this year given us the first examples, we might have supposed that in future the defects would be remedied, but as the mistakes of the past are perpetuated this hope cannot be indulged in. Without further taking up space in generalities we will point out how most of the arrangements clash with all recognised rules of good taste.

Let us begin with the garden over the Waverley Market. Two-thirds of this garden are in walks, and the walks are cement of a greystone colour. The edgings of the beds are light stone mouldings. Three-fourths of the beds are edged with *Lobelia St. Martin's Blue*, a beautiful plant with dark foliage and blue flowers, with a line of much dwarfier *Echeverias* second. On a sunny day the glare of the pavement makes this almost, if not quite, invisible, and the effect is not superior to what

common coal dust or even wet mould would be. With such a wilderness of pavement one would have thought nobody would ever have dreamed of anything but a good green band to relieve the eye, and the last thing St. Martin's Blue Lobelia. Next to the Lobelia comes a row of Echeverias in flower (an orange red), then yellow, then blue—the three primaries, the one combination every small boy is, in every good garden, taught to avoid. The body of the beds are a curious mixture of odd plants. Here and there are dotted nice plants of *Centaurea ragusina* surrounded by the only colour that could make this handsome plant look ill—a slaty *Ageratum*, which hides its grace and spoils its colour.

A few beds are planted on the carpet system, and here, as elsewhere, are noticeable traces of lavish care. As far as high keeping and satisfactory material are concerned there is nothing left to be desired; but here also the same faults in arrangement occur. Next the stone edging a green band of *Saxifraga* is placed, and beside the green the primary from which it is derived in the form of Golden Feather. Indeed, there is hardly a discoverable instance where correct arrangements of colour are seen.

Cut out of the grass banks facing north and south, in conspicuous positions near Waverley Bridge, are two star-shaped beds with eight diamond-pointed rays. We had supposed that everybody knew that red was the complement of green, and that contrasts were the proper thing for beds which had to be viewed from a distance as these are, a pretty wide space intervening between them and the nearest view point. The powers that be in Edinburgh hold different views, or at least act as if they did—though it may be doubted if any views at all are held on the matter. As a matter of fact these stars, which might have been made to arrest the attention, are as nearly invisible as possible, but that is something the public—or at least the portion that is not colour-blind—have to be thankful for, for their colours are so arranged as to pain. Of all things in the world the edgings here, as elsewhere on the grass, are Golden Feather. It is not a single instance of this that occurs, it is universal; and to make matters worse, just inside the yellow—where it is as bad as yellow next the green, or St. Martin's Lobelia next the stone—is a band of red. With unconscious kindness, however, the railway company by means of numerous engines have nearly obliterated this discord, and toned down the clashing colours with soot. How very different would the effect have been if the red had been next the green grass, and if a band of white had been used to separate it from the yellow, affording a contrast on the one hand and a harmony on the other, coupled with, in one instance at least, with a pleasing and attractive complement. The material was there, the rules also exist—indeed are well known, or should be by those who essay to be public teachers; but though the material was to hand every rule has been broken.

In the north Violas are favourites because they thrive. Moreover, they present shades of colour that make very pleasing complements; oranges and blues, yellows and purples. The merest tyro in colouring knows that any primary colour is complemented by the secondary formed of other two primaries; thus yellow is a primary and is complemented by purple, purple being a blending of blue and red. Again, blue is complemented by orange, blue being a primary, but orange a secondary formed from red and yellow. With Violas how difficult to go wrong, how easy to be right! At Edinburgh they have got over the difficulty. Nowhere in our search could we find complementary colours beside each other. Yellow and blue Violas we could see, the one making the other as had-looking as possible; oftener blue Lobelia and yellow Violas or Golden Feather; but purple and yellow, orange and blue—never!

Between the Scott monument and the galleries on the Mound there is a long bed filled in the ribbon style. Evidently a grand attempt at effect has been made here. It is big enough to be a garden in itself, and its expense cannot have been small. And what is the result? We will give the arrangement, and then ask a question. It is surrounded by turf. The first line on the south side next the grass is the inevitable Golden Feather, then blue Lobelia, then *Ageratum*, then variegated (white) *Pelargonium*, then scarlet ditto, then *Centaureas*, then pink *Pelargonium*, then scarlet *Pelargonium*, then yellow Violas, then *Ageratum*, then bronze *Pelargonium* and red Beet, then Lobelias, then Golden Feather, blue Lobelia again, *Cerastium* as an edging, then the turf. Such is the arrangement. The question is; Could any arrangement be more displeasing? Those who have studied colour arrangement in flower gardens will mostly answer, No. But this would be too fast, for worse arrangements exist in the same garden. Difficult as that may seem, it is a fact. One would have thought that the example and the teaching of a Thomson would have been more far-reaching. At all events, in the capital city of the country, famous for its gardeners as well as its doctors and soldiers—indeed, everything else, one would have expected something better.

Our criticism has been severe, but not too much so. We feel it our duty to the public to do what in us lies to improve matters and to secure the best gardening possible, and hope what we have had to say may be regarded as the first step towards better things. It must not be supposed that prejudice or personality has in any way influenced us. To show that national prejudice has nothing to do with the matter, it may be well to say that the writer is exactly what he signs himself; and that personality is not the cause, by saying that he does not know a single member of the staff in these gardens that he is aware of. We like to see things right, and dislike to see them wrong; that, and that alone, has impelled the penning of this paper.—A SCOTSMAN.

FREESIAS.

AMONGST the bulbs of recent introduction there are none more interesting and valuable, I think, than these. I have not grown *F. refracta*,

but *refracta alba* and *Leichtlinii major* are most delightful, and apparently of easy culture, as they have flowered and seeded with me very well. The former I had from Colchester, the latter from Messrs. Sutton & Sons, Reading, in whose catalogue it is figured this year. The flowers can be hardly said to form a spike, as the flowering stem runs out horizontally, and the large flowers are produced perpendicularly on this horizontal stem. As many as nine blossoms from 2 to 3 inches in length are produced; they last a long time, and are of a delicate French white with an orange throat. The odour they exhale is something very peculiar and most delicate; indeed, I hardly know anything in flowers like it, and it is very valuable for cutting, as the unopened buds expand when cut and placed in water. *F. Leichtlinii major* is a cross probably between *Leichtlinii* and *refracta alba*. The bulbs which Messrs. Sutton have to offer are grown in the Channel Islands, that paradise for Cape bulbs, and everyone ought to grow it who possesses a greenhouse, however small it may be.—D., Deal.

EFFECTIVE PLANTS IN SUBURBAN GARDENS.

CAMPANULA TURBINATA.—This charming species thrives and flowers exceedingly well with us. We employ it in many different ways—in groups on rock beds, and in masses on large beds. In whatever position it is used it succeeds, and is a decided acquisition on account of its dwarf and floriferous habit.

PRIMULA CAPITATA.—We have half a dozen plants of this charming species of *Primula* growing strongly on one of our rock banks. Each plant carries from two to three trusses of lovely blooms. They are planted in a warm position, using plenty of old mortar and decayed Kentish ragstone in the soil.

DIANTHUS GLACIALIS.—An exquisite little gem, so dwarf and floriferous. It does well here planted out in shady nooks of the rockwork. It is now going out of flower. Similarly dwarf and pretty is the chaste little *Erinus alpinus*. This grows well in little corners of the rockwork with a few pieces of ragstone around it. *Androsace villosa*, *Saxifraga lantoscana*, *Rubus arcticus*, and *Helianthemum* in variety have adorned the nooks and crannies of our rock banks and beds for some time past.

LILIUMS.—These are flowering well with us now. *Auratum* is now opening with splendid buds. A large quantity of fine bulbs were planted out here a couple of years ago, but their number and quality decrease considerably each season. We find the easiest method of obtaining fine plants and blooms is to take up the bulbs after flowering and place them in pots, growing them until April, then planting out in the border. We adopt the same plan in regard to *longiflorum*, *lanceifolium*, *Fortuni* and *candidum*. *Thunbergianum*, *tigrinum* and *bulbiferum* grow very freely in masses in the borders. These were planted out some years ago.

DICTAMNUS FRAXINELLA.—A handsome plant both in flower and foliage. It succeeds well with us in the centre of a small bed. *Senecio puleher* will soon be in flower. Grown either singly or in clumps it is effective. The old *Francoa ramosa*, with its long graceful racemes of white flowers, plunged out in the rockwork looks charming.

Small beds filled with masses of single *Petunias*, German Asters, Indian Pinks, and a very fine strain of double *Tagetes* are lovely. The latter makes a most effective and showy plant for bedding out. It is uniform in growth, and, given a good strain, its flowers cannot be surpassed for beauty and variety of colour. Still smaller beds of *Tuberous Begonias* are flowering well, and also of *Bouvardias* in the following varieties—*jasminoides*, *flava*, *Hogarth*, and *longiflora*. These succeed very well bedded out, and are flowering freely too. The little nooks and crannies of the rockwork contain groups of seedling *Mimulus*, *Zinnias*, *Lobelias*, and *Alternantheras*.

Rock beds are far more interesting and pleasing to the eye, if skilfully arranged and planted with masses of showy plants, than endless lines and intricate designs of form and colour. Geometrical designs are very well if used with taste, but in many gardens this is often sadly wanting. Again, on the other hand, we may carry rockwork gardening too far. A skilful eye will, however, always discover the happy medium.

We grow a number of small plants of *Agapanthus umbellatus* in pots. These are plunged in the rock banks and beds. They are now flowering and are very effective. We also use *Hydrangea Thomas Hogg* and *hortensis* similarly. Our blooms are deep blue in colour: this is attained by mixing a small quantity of sulphate of iron with the soil, mostly peat, when potting. An occasional watering is given with a weak solution of the latter too. We have had a grand show of *Roses*. Standards and half-standards will not succeed with us: we grow only dwarfs. In a garden like ours we have to make the best of everything, therefore grow most of them in borders on the margins of the shrubberies. A little *Mignonette* seed is sown broadcast amongst these in early spring, thus affording a bright green and highly perfumed carpet to the *Roses*. Beds of *Hydrangea paniculata* are coming in flower. This is a grand plant. The mixed borders are gay with groups of single *Dahlias*, *Delphiniums*, *Antirrhinums*,

Carnations, Marguerites, Phloxes, and many others too numerous to mention.—SUBURBANUS.

ROYAL HORTICULTURAL SOCIETY.

AUGUST 28TH.

THE conservatory was again devoted to the exhibits before the two Committees, but comparatively small space sufficed to contain the plants, flowers, and fruits staged.

FRUIT COMMITTEE.—L. A. Killick, Esq., in the chair. The following members were also present:—Messrs. W. Denning, J. Roberts, H. Howcroft, G. Bunyard, J. Lee, R. D. Blackmore, and Dr. R. Hogg. Mr. Taylor, gardener to J. McIntosh, Esq., Duneevan, Weybridge, was awarded a cultural commendation for three fine well-ripened bunches of Foster's Seedling Grapes. Several Melons were sent from Messrs. R. T. Veitch & Son, Exeter; Mr. Cross, The Gardens, Hotham House, Yorkshire; and Mr. J. George, Victoria Road, Putney. Mr. L. A. Killick, Mount Pleasant, Langley, Maidstone, was awarded a letter of thanks for a collection of early Apples—Duchess of Oldenburg, Red Joanneting, Worcester Pearmain, Irish Peach, Yorkshire Beauty, and Ecklinville Seedling. Messrs. J. Carter & Co., High Holborn, showed specimens of their Purple-top Yellow Dutch Turnip, which is of moderate size and very even. From the Society's garden at Chiswick a collection of thirty-six Tomatoes in pots was sent, representing a large number of varieties from different firms. The plants were in excellent condition, and mostly bearing good crops of fine fruits. A cultural commendation was awarded for them. Mr. Eckford showed samples of the new large-podding and free Peas—Victory, Progress, and Magnificent. Mr. C. H. Pearse, Grey's Court, Henley-on-Thames, also sent samples of Reading Giant and Latest of All Peas.

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair. The following members were present:—Messrs. J. McIntosh, H. Cannell, H. Bennett, J. Wills, W. Bealby, H. Ballantine, J. Dominy, W. B. Kellock, Shirley Hibberd, and George Duffield. Messrs. J. Carter & Co., High Holborn, showed a group of 140 Asters, mostly dwarf, compact, and floriferous, some having as many as a dozen flowers in 48-sized pots, and six or seven in small 60-sized pots. The chief sections or varieties were the dwarf Chrysanthemum-flowered, the Dwarf Bouquet, New Crown or Cockade, Pyramidal German, French Pæony-flowered, New Glohe German, Quilled German and Victoria. A bronze Banksian medal was awarded. A silver-gilt Banksian medal was awarded to Messrs. Kelway & Son, Langport, for a large and choice collection of Gladiolus spikes, including a great number of varieties, richly, brightly, and diversely coloured; the flowers large, and the spikes massive. G. F. Wilson, Esq., F.R.S., Weybridge, exhibited a choice collection of Lilies representing several very beautiful varieties of *L. auratum*, *rubro-villatum* being especially noteworthy, having broad dark red bands down the centre of each petal. *L. Leichtlini* and *L. tigrinum splendens* were also shown from the open air, with *L. speciosum rubrum* very richly coloured from an orchard house. A medal was recommended for these flowers.

Mr. T. S. Ware, Tottenham, London, was awarded a silver Banksian medal for an extensive and beautiful collection of single Dahlias, including some scores of fine varieties. A few of the most distinct and effective were the following:—Rosalind, rose edge, white at base; Mauve Queen Improved, rosy mauve; Victory, white; Buffalo, orange buff; Francis Fell, crimson; Darkness, maroon, very dark; Rachael, orange scarlet; Lutea grandiflora, large yellow; and Christine, bright pink. Mr. Eckford, gardener to Dr. Sankey, Boreatton Park, Shrewsbury, sent flowers of several pretty varieties of Sweet Peas—Blue Beauty, blue and purple; Grandeur, scarlet; Princess, blush; Meteor, scarlet; Blue King, rich blue; and Fascination were the chief varieties, the last-named having a pink standard and blue wings and keel. Mr. C. Turner, Slough, showed a stand of two dozen handsome blooms of Show and Fancy Dahlias, the following being of excellent quality:—Cecilia, bright yellow; Mr. Harris, dark scarlet; Flag of Truce, pure white; Clara, bright pink; George Rawlings, maroon; and Drake Lewis, rich scarlet.

Messrs. H. Cannell & Sons, Swanley, were awarded a vote of thanks for a box of handsome double Zinnia blooms, scarlet, orange, yellow, rose, and crimson. A pretty stand of single Dahlias was also shown, including a small white Cedo Nulli, Crimson Star, Yellow Boy, and Nora, dark maroon. Mr. Heims, gardener to F. A. Philbrick, Esq., Q.C., Oldfield, Bickley, was awarded a cultural commendation for a small plant of *Angræcum Ellisi* in a basket, with a raceme about 18 inches long, bearing twenty-one fine white flowers with long spurs. A similar award was also granted to Mr. J. Barnard, gardener to W. Vanner, Esq., Camden Wood, Chislehurst, for a plant of *Dendrobium secundum* with about fourteen spikes of small rosy flowers. Mr. C. Bennett, Shepperton, Middlesex, was awarded a vote of thanks for a small but pretty collection of Gloxinias, all unnamed seedling varieties, ranging in colour from pure white through blush, rose, crimson, scarlet, and purple. Some, too, had a central bright colour margined with white, or, *vice versa*, with the throat dotted. The flowers were large and of good form. A vote of thanks was accorded to Mr. Cummins, gardener to A. Smee, Esq., The Grange, Wallington, for a plant of *Lycaste Smeana*, a charming species, with flowers rather smaller than *L. Skinneri*, the sepals white, petals white dotted with purple, and the lip of similar colour. A vote of thanks was accorded to Mr. E. Noble, Bagshot, for flowers of *Clematis Jackmanni alba*, which were very faintly tinted with purple.

First-class certificates were awarded for the following plants:—

Zygopetalum maxillare (Heims).—An old and well-known species with a rounded dark blue-purple lip, with a toothed projection at the base, bearing a fancied resemblance to the jaws of an animal. The sepals and petals are greenish with brown blotches. The flowers are borne in racemes of six to eight, and Mr. Heims' plant had about a dozen racemes.

Tuberous Begonia Madame Grody (Bealby).—Flower very double, large and full, white with a yellow streak in the centre of the petals. Very delicate and distinct in appearance.

Gladiolus Lady Cavendish (Kelway).—Very handsome; large flower and spike, bright rosy mauve with darker streaks.

Gladiolus Duke of Edinburgh (Kelway).—Distinct and effective; warm scarlet, centre of lower petals white.

Gladiolus Sir Trevor Lawrence (Kelway).—Massive spike and large flowers, brilliant clear scarlet with a dash of purple in the lowest petal.

Dahlia Bedding Gem (Ware).—One of the star-shaped single type, orange-scarlet, and very free.

Dahlia Negress (Ware).—Also a single variety, with large deep maroon flowers, the centre rich yellow.

Candytuft Empress (Biddle & Co., Loughborough).—A grand variety, with spikes 3 or 4 inches long, the flowers of great size, and pure white.

Double Marguerite Aurora (Cannell).—A form of the Chrysanthemum coronarium type, with rich yellow double flowers and finely divided leaves.

Dahlia Midget (Cannell).—A diminutive single scarlet variety, rich colour. Small, but free and effective.

Gloxinia Alabaster (Bennett).—A variety with large, well-formed, pure white flowers. Very clear and good.

MEETING AT CHISWICK.—At a meeting of the Floral Committee held in the Society's Gardens, Chiswick, on Thursday, August 23rd, 1883, G. F. Wilson, Esq., in the chair, the following first-class certificates were awarded:—

VERBENAS.

Swanley Gem (Cannell).—Fine compact habit; the trusses and pips very large; white, shaded and edged with pale blue. Very effective.

R. F. Schule (Cannell).—Good dwarf habit, very free-flowering; trusses and individual flowers large, of a fine, warm, rosy pink with white eye.

Marion Baker (Cannell).—Close compact growth; the trusses of medium size, the pips large with white eye, light rosy carmine—a very pretty shade of colour.

Faust (Cannell).—Habit very close, very free-flowering; the trusses large, individual flowers large, of a very rich fiery carmine. Very pretty.

Beethoven (Cannell).—Dwarf habit, remarkably free-flowering; trusses and pips of large size, of a deep rosy lake colour. An excellent bedding variety.

PELARGONIUM AS A BEDDING VARIETY.

Dr. Orton (Pearson).—Very close and compact habit, free-flowering; the trusses large, holding on well; individual flowers large, of good form, intense crimson scarlet. A good bedding variety.

PELARGONIUM AS A POT PLANT.

White Perfection (Eckford).—Plant of vigorous growth; the trusses of medium size, freely produced; individual flowers large, of fine rounded form, pure white.

SWEET PEAS.

Orange Prince (Eckford).—Flowers very large, of a beautiful shade of salmon pink. Very distinct and pretty.

Invincible Carmine (Laxton).—A very fine self-coloured carmine variety; flowers very large and of good substance.

Invincible Striped (Carter & Co.).—A very distinct and pretty variety; very lively carmine, boldly striped.

Blue Edge (Carter & Co.).—Very showy variety, having the standards very light rose; the wings white with distinct edge of blue. Very showy and effective.

New Carmine Rose (Hurst & Son).—This variety in the cut state was certificated at South Kensington on August 14th, and the Committee on seeing it growing unanimously confirmed the certificate then awarded. This is a very pleasing and distinct variety both as regards growth and colour of flowers, and is well worth cultivation.

TYDÆAS.

Venosa.—Plant of tall habit, the tubes bright carmine-magenta shaded, beautifully veined and dotted with purple.

Robert le Diable.—Flowers very large, freely produced, of a most intense, almost black, crimson. Distinct and showy.

Harlequin.—Plant of somewhat tall habit; the flowers large, the tube shaded with magenta and veined and dotted with purple.

Podalyre.—Flowers of medium size, the tubes of a pleasing cherry red veined and speckled with purple. Showy.

Esculap.—Flowers of medium size, the tubes bright scarlet, richly spotted and veined.

IMPATIENS SULTANI.—A first-class certificate was also awarded to this now well-known Balsam.

In regard to the Sweet Peas the Committee considered the variety *Bronze Prince* (Eckford) to be superior to *Invincible Black*. Those named together in the following list were considered identical:—

Princess (Eckford), *Butterfly* (Benary), and *Butterfly* (Carter & Co.).

Duchess of Albany (Eckford) and *Captain Clark* (Benary).

Purple Striped (Carter) and *Black Purple* (Benary).

Red and White (Benary) and *Painted Lady* (Carter).

Scarlet Striped (Carter) and *Red Striped* (Benary).

Emperor (Eckford) and *Grandeur* (Eckford).

Dark Red (Benary), *Scarlet* (Carter), and *Invincible Scarlet* (Benary and Carter).

Black Purple (Benary), *Purple* (Carter), and *Light Blue and Purple* (Benary).

HISTORICAL JOTTINGS ON VEGETABLES—No. 7.

THE ONION.

SAYS a modern author concerning the Onion, "There is supposed to be a prejudice against this vegetable. I rather think it is a cowardice with regard to it. I doubt not all men and women love the Onion, but few confess their love—affection for it is concealed. Happy is said to be the family which can eat Onions together: they have a harmony of aspiration. There is a hint here for the reformers. In the Onion lies the hope of universal brotherhood. Let them become apostles of the Onion; let them eat and preach it to their fellows, and circulate tracts of it in the form of seeds." It is a well-known fact that even the lovers of Onions seldom care to have the

aroma of this vegetable wafted to them upon the breath of their dearest friend; but our good ancestors were untroubled with squeamish sensibilities of the kind. They consumed unhesitatingly at any meal when it liked them, not only Onions and Leeks; they also patronised the still stronger Garlic, though it was never much favoured by English dames. The modern Italian ladies, however, are said to be fond of those mixed dishes in which Garlic and its allies figure as flavouring; and some think, although it is impossible to decide the point, that from Italy we received the Onion early in the Christian era. No distinct reference to it can be discovered until the reign of Edward III. Chaucer in one line joins Garlic, Onions, and Lettuce, doubtless so eaten as a salad.

The common Onion of our gardens (*Allium Cepa*) has been too long under cultivation for us to ascertain its native country. Dr. Kitto suggests it is a Persian plant, that land, and other countries lying adjacent, being prolific in species of *Allium*. From authentic records we know that the Onion was a familiar vegetable to the ancient Egyptians at the time the pyramids were built, and probably before that. The migrating Israelites indulged in lamentations over the savoury plants of Egypt, the Onion among them, which they deemed so far superior to their insipid food in the wilderness (Numbers xi., 5.). Herodotus, father of history according to some people, father of lies according to others, speaks of the large consumption of Onions by the Egyptian labourers, and his statement, which does not stand alone, has been thought irreconcilable with the statement of some authors, that they worshipped the Onion. Pliny, however, only attributes to the people of Egypt a custom of swearing by the Garlic plant and the Onion, or it may have been that a reverence for these was confined to a certain class, such as the priests. Modern Egyptians afford proof of their attachment to this bulb, and many tourists have noticed the superior flavour of the Onions grown upon the soil of Egypt; and under higher temperatures generally the bulb is milder and more succulent than in Britain.

It is very curious to note the differences of opinion that are shown by old authors as to the dietetic or medical qualities of the Onion. Some of the Greeks said the plant was good for the complexion, and increased the strength of the body and mind. By some the Onion was accused of being hurtful to the digestion as well as injurious to the eyesight. Gerard, the diligent herbalist and gardener of Elizabeth's reign, makes more than one attack upon the Onion, while his condemnation of the bulb when eaten raw (in which state he says it is innutritious and tends to cause drowsiness) implies that persons did occasionally eat Onions uncooked. Then, as to the tear-producing effect of smelling them, although several had said that this "clarified" the organ of vision, Gerard questioned the supposed fact. The Spanish Onion is supposed to have been first seen in England about the time of Gerard, but it is doubtful whether it then came from Spain. In oldish books on gardening four varieties are mentioned—the Spanish, Portuguese, Strasburgh, and Welsh. We have been unable to ascertain positively at what date English folks began to eat the young plants as "Spring Onions;" Abercrombie and other gardeners of Georgian days have no allusion to the gathering of the plants when green.

That the English public of three hundred years ago were not of the opinion of Gerard appears from the steady sale of Onions along the streets of London, and probably in smaller towns also, which is indicated by the mention of this vegetable as a part of the stock of the early costermongers. Indeed there were those who dealt in Onions alone, and a seventeenth century print shows us one of these: able to buy a horse and cart, he is represented as bawling, "Buy my white St. Thomas's Onions!" Why St. Thomas was supposed to have to do with any sort of Onions is a question. They could not have been left in the ground until his December anniversary, nor hardly sown at that time. Another author gives the cry as "Ropes of hard St. Thomas's Onions," a test of quality certainly, as softness would prove incipient decay. Onions were made up into ropes by the growers or dealers when there were those living who had seen William Shakspeare, and this usage has continued to the present time. Fields of Onions were in existence near London City while the great civil war was raging between King Charles and his Parliament: these were in districts now covered with houses on the north and east of London, such as St. Luke's, Whitechapel, and Shoreditch; and in the latter direction, but farther out, quantities of Onions are still grown, as in the neighbourhood of Barking in Essex, for instance.

Bradley, who wrote of the Onion in the reign of George I., declares that it was considered to be the most important vegetable for kitchen use, although consumed in less quantities than others. He might have backed his assertion by a reference to the witty and erratic Dean of Dublin, who has said—

"This is every cook's opinion,
No savoury dish without an Onion."

The market gardeners of a century ago or longer had a plan of growing Onions and Leeks together. The former were pulled during July

and August, and the space left allowed the latter to attain to a greater size. Another method they had was to plant broad rows of Onions and Leeks 5 or 6 feet wide; the "alley," or space between, was about 18 inches across. Cucumbers were planted out in these spaces, and allowed to spread amongst the Leeks as the Onions were taken up. A notion prevailed in some quarters that it was always desirable to sow Onions during the increase of the moon. "Let the condition be precisely the same," writes Sir Francis Bacon, "as to soil and moisture, yet the difference in growth, when they are planted before the full moon and after it, would astonish anyone unaware of the reason." A similar idea appears to have held possession of many gardeners with respect to various seeds and roots; and as we cannot think there could be any foundation in fact for such a theory, we must attribute it to a superstition powerful enough to persuade men contrary to their own senses.

It has been stated that upwards of a thousand persons are employed through a considerable portion of the year in selling Onions about the metropolis, and they are certainly consumed more by the poor than by the middling class. From its containing sulphur the Onion may serve to check the spread of some diseases.—J. R. S. C.

FALKIRK HORTICULTURAL SOCIETY'S SHOW.

THE fifty-second annual Exhibition of the above Society was held in the Town Hall, Falkirk, on Friday and Saturday last under very favourable auspices as regards weather. The Show itself was one of the best held of late years, the large Hall being well filled with exhibits mostly of a superior character, while not a few were of very special merit. In the class for four foliage plants Mr. T. Boyd, Callendar House Gardens, was first with healthy well-grown specimens, conspicuous among which was a very fine plant of *Yucca aloifolia variegata*. In the class for two stove plants Mr. James McMurrich, Westbank, Falkirk, was placed second with a good *Eucharis* well bloomed and a magnificent *Pancreatum*. Mr. Boyd was first with a well-bloomed *Clerodendron Balfourianum* and a handsome *Begonia metallica* in capital form; but many were of opinion that the Judges might have placed Mr. McMurrich first without their judgment being called in question. For two greenhouse plants there was only one entry, but seldom have we seen a better plant of *Statice profusa*, while the other—an *Oleander*—was a fine healthy plant of large size. Two pictures handsomely framed were offered for this, and were worthily awarded to Mr. Wm. Murray, Parkhall, Polmont. Roses were fairly well shown; but cut flowers generally, with the exception of *Pelargonium* trusses and bouquets, were rather poor. Mr. McMurrich took the lead with all of these. Two very nice plans, very neatly filled, of model flower gardens gained first and second prize to Mr. Peter Newton, Callendar House, and Mr. W. Sorley, Powfoulis, Grange-mouth, though the Judges had some difficulty in awarding the prizes, the two being very nearly equal.

Vegetables we have seen better at Falkirk, but Mr. Boyd's first-prize collection was up to par. Vegetables were very creditably shown by the cottagers; indeed, those in the classes for Leeks, Shallots, Onions, Parsley, Cabbages, Beet were decidedly superior to those in the gardeners' division. Mr. Boyd took first for Tomatoes with six very handsome Hathaway's Excelsior weighing 3 lbs., one weighing 15 ozs.

In the fruit classes Mr. Boyd showed splendidly. His collection of eight kinds would have been difficult to surpass anywhere. The two bunches of Black Alicante Grapes were perfect models in every respect, while his Royal George Peaches and Elruge Nectarines were of good size and splendidly coloured. The same may be said of the dishes of Brown Turkey Figs and Black Heart Cherries, both of which were in the best condition possible. In the collection and also in the single competition he showed Best of All Melon in a style that gained universal admiration, and also a fine Queen Pine. The hardy fruit was very backward, everything shown being very green. It is not possible for us to name a tithe of even what is worthy of notice in a provincial show, but among amateurs Messrs. Watson and Chisholm deserve mention for the fine Fuchsias they showed, and the collection of Potatoes, six varieties, six of each, with which Mr. McMurrich gained first prize. We understand that the Society's funds are in a flourishing condition, and that the drawings at the Show in question were fully up to the average of recent years. In closing this notice we ought to mention the excellent way the Show was managed by the Secretary, Mr. Haing of Glebe Street.

PIT FOR MELONS.

I AM much obliged to you for your advice through your correspondence columns. Your further assistance will be of great service to me. I suggested that slabs be placed a few inches above the flue so as to form a chamber; but do not slabs retain too much heat for the earth to rest on? An idea of mine is that earth should be heated downwards, not upwards. I have had Melons on slabs, the slabs about 3 feet from the ground, the space below being filled with horse dung; it heated the stones, but the earth next them was dust-dry which I could not moisten, the consequence was that generally the Melons failed before the crop was ripe. The conclusion that I have come to now is to have a lean-to house erected instead of a pit, and to have it as high as will allow me to train the Melons to a fixed roof. The height of the front wall, as I formerly proposed, is 4 feet, and I wish to have a doorway at the end 3 feet wide. Queries.—Should there be any glass in front? What height should the back wall be? What width should the bed be to grow the Melons in? How will it be ventilated? I intend to make it 20 feet long. I want to utilise it for boxes of cuttings in winter and spring.—J. T. S., *Thurso*.

[However good the idea is, as suggested by Nature, of heating the earth downwards, it cannot be successfully carried out in affording

bottom heat for Melons that are required to ripen early in the season. For cutting in August and September we have for years grown Melons without the aid of either flues or hot water for affording bottom heat. A start is given to the plants by a few barrowfuls of leaves and manure, and the heat of the pit does the rest. We should not think, however, of covering the manure with slabs. We placed the soil on it, and had the roots become too dry, causing the plants to fail before the crop was ripe, the fault would have been ours, either by not having prepared the fermenting material properly or by watering inefficiently afterwards. Thin slabs do not materially obstruct the heat, but a flue may be surrounded with rubble if preferred, placing on this fermenting material, then soil with no slabs intervening. By this plan, if the Melons fail through drought at the roots it will be the fault of the cultivator and not of the system. A correspondent described on page 168 last week how the base of a bed might be kept moist if it cannot be done by other means. And now to the queries. Mr. Luckhurst appears to have answered them in anticipation, and has at the same time given a choice of three structures in one figure.

Fig. 34 shows sections of three houses: A, a snug little lean-to—propagating, Melon, or Cucumber house. B, a semi-span possessing all the advantages of A with the important additional one of a stage for stove plants and Orchids; or it could be turned to account for a variety of useful purposes, especially the early forcing of Roses, flowering shrubs, such as Deutzias, Weigelas, Lilacs, as well as Lily of the Valley and bulbs, or for wintering bedding plants. This house would also answer

vourite, Charming, and Elegant, were from 10 to 12 feet in height, and well furnished throughout. H. Pocock, gardener to G. P. Haden, Esq., was placed third, and an extra prize was awarded to Mr. J. Matthews, gardener to W. R. Brown, Esq., both exhibiting several fine specimens. Mr. Pocock was first with four Fuchsias, having fine specimens of varieties included in the sixes. Mr. Lye was a good second, and Mr. J. Matthews a close third. Fuchsias were also well shown by amateurs and cottagers.

All the classes for stove and greenhouse flowering and fine-foliaged plants and Ferns were filled, and many noteworthy specimens were included in the long array of plants. Mr. J. F. Mould, Exotic Nursery, Pewsey, had the best nine flowering plants, these being *Ixora Regina*, *I. Colei*, *I. Williamsi*, *Erica Austini*, *E. cerinthoides coronata*, *E. Iveryana*, *Allamanda nobilis*, *Dipladenia Brearleyana*, and *Clorodendron Balfourianum*, all well flowered and fairly fresh. Mr. J. Matthews was a creditable second, his group including *Erica Marnockiana*, *Allamanda nobilis*, *Dipladenia amabilis* and *Ixora aurantiaca* in good condition. The third prize was awarded to a good collection staged by Mr. H. Pocock. Mr. Tucker was placed first with six flowering plants, the best of these being *Lapageria rosca*, *Ixora Williamsi*, and *Bougainvillea glabra*. Mr. Matthews was a creditable second. The best three plants, consisting of well-flowered specimens of *Stephanotis floribunda*, *Dipladenia Brearleyana*, and *Bougainvillea glabra*, were staged by Mr. H. Pocock, the remaining prizes going to J. Matthews and G. Tucker.

The first group of fine-foliaged plants staged by Mr. Mould included good examples of *Cycas revoluta*, *Croton Andreanus*, *C. Victoriae*, and *C. Warreni*, the second and third prizes going respectively to Mr. J. C. Drummond, Bath, and Mr. A. Shadwell, gardener to T. Chandler, Esq., Devizes, both exhibiting creditably. The latter was first with a single specimen, showing a handsome

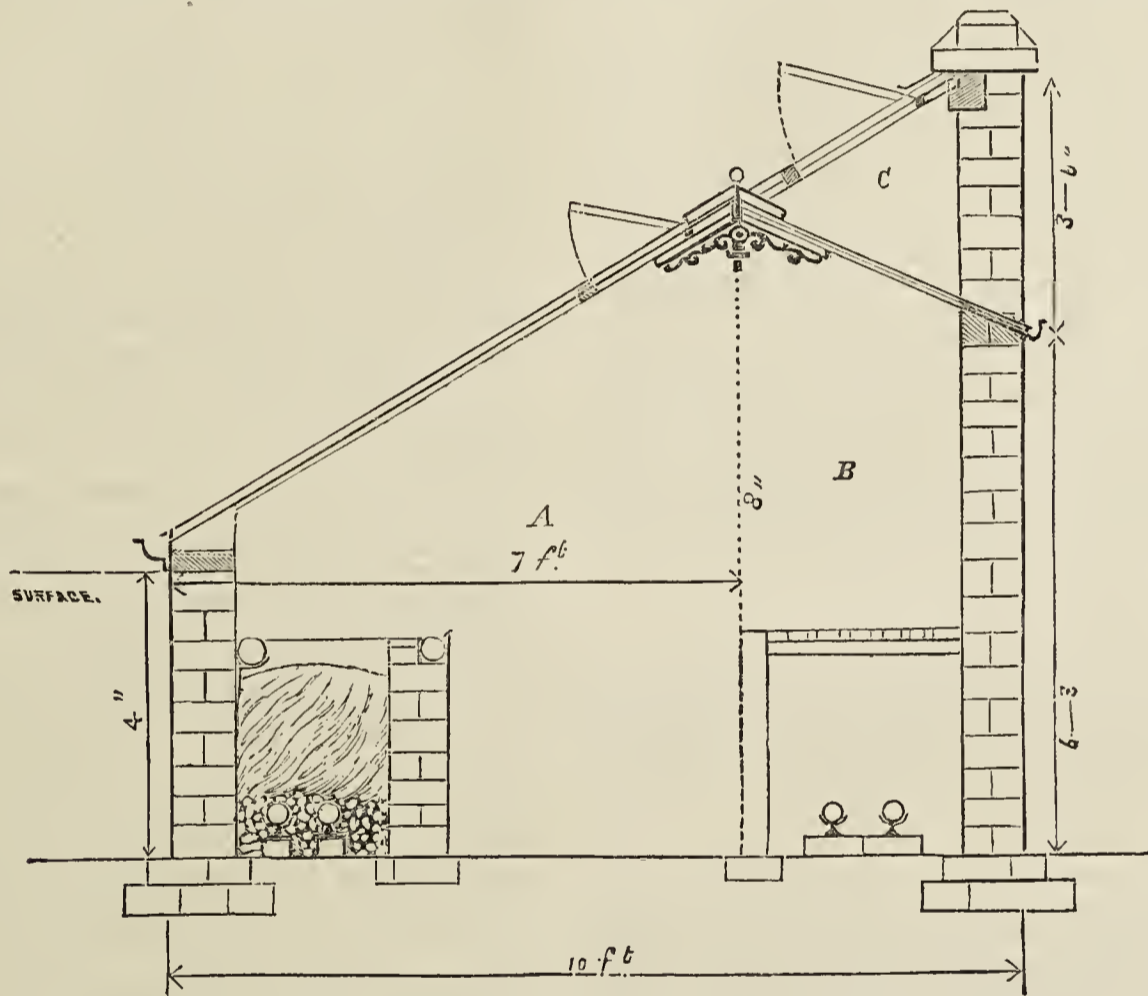

Fig. 34.—COMBINED SECTION OF PROPAGATING PIT, MELON HOUSE, AND VINERY.

admirably for Vines in pots and Kidney Beans. C shows a section of a loftier elevation—a lean-to, forming the most simple style of vinery as well as the most efficient. Sweep away all internal fittings—the stage, the inner wall, the soil and rubble; put plenty of pipes near the floor, not on it, but just elevated a few inches upon pipe stands, so as to turn all the heat to account and let none of it be wasted by absorption into walls and floors, as is too often the case; pierce the front wall and plant Vines in the soil, and we do not see what more a skilful Vine-grower would require, or what advantage a more elaborate state of things would confer upon a non-skilful one.]

TROWBRIDGE SHOW.

AUGUST 22ND.

FLOWER shows have been annually held in Trowbridge for thirty-four years, and to all appearance the great interest taken in them by the general public is still unabated. Many thousands of people visited that last held, and a more generally successful exhibition could not well be arranged.

Fuchsias are always a great feature, not only here, but at other Wiltshire exhibitions, and this season they appear to be better than ever. The veteran Fuchsia grower, Mr. J. Lye, gardener to the Hon. Mrs. Hay, was awarded the first prize for six specimens, but Mr. G. Tucker, gardener to Major Clarke, had still finer plants, although scarcely forward enough. Mr. Lye's immense pyramids consisted of Bountiful, Lye's Favourite, Hon. Mrs. Hay, Mr. Bright, Emily Lye, and Doel's Favourite. Many of Mr. Tucker's finely grown pyramids, and which consisted of Arabella, Bountiful, Doel's Fa-

plant of *Croton majesticus*, Mr. Mould following with a large *Allamanda*. Mr. Mould was first with *Ericas*; Messrs. J. Matthews, J. Lye, and W. C. Drummond being the other prizewinners. *Caladiums* were successfully shown by Messrs. J. Matthews, and G. Pymm, gardener to Mr. J. Gouldsmith; *Gloxinias* by Messrs. H. C. Mayall, Bath, and A. A. Walters, Bath; *Begonias* by the same exhibitors and Mr. J. L. Graham; *Pelargoniums* by Messrs. J. Lye and A. S. Hall, Bath; *Coleuses* by Messrs. J. Matthews and G. Pymm; *Petunias* by Messrs. A. T. Hall and W. C. Drummond; and *Cockscombs* by Mr. G. Tucker and Mr. J. Jane, Chippenham, the specimens in every instance being very creditable.

Ferns are quite a speciality at Trowbridge, and several fine groups are arranged by local growers. Mr. G. Tucker took the lead with, among other noteworthy specimens of *Gymnogramma peruviana cristata*, *G. sulphurea*, *Adiantum gracillimum*, *A. farleyense*, and *A. concinnum latum*. Mr. H. Pocock took second honours, and Mr. Jas. Coke, gardener to Mr. A. P. Stancombe, and Mr. W. Plyfield, gardener to J. Kemp, Esq., were awarded equal thirds.

Cut Roses were wonderfully fine for this time of year, and although Messrs. Keynes & Co. succeeded in defeating Messrs. G. Cooling & Son, Bath, the stands were nearly equal in merit, those shown by the latter being the freshest in the afternoon. Among Messrs. Keynes' twelve triplets the most noteworthy blooms were of Reynolds Hole, C. Lefebvre, Helen Paul, Xavier Olibo, A. Colomb, and Capitaine Christy. Among Messrs. Cooling's were beautiful blooms of Madame Victor Verrier, Madame Swartz, May Quennell, C. Lefebvre, and Maurice Bernardin. Messrs. Cross & Steer, Salisbury, were a creditable third. The best blooms in Messrs. Keynes and Co.'s premier stand of twenty-four singles were of A. Colomb, Marie Baumann, J. S. Mill, Beauty of Waltham, John Hopper, Rosieriste Jacobs, Marie Van

Houtte, Etienne Levct, and C. Lefebvre. Several of these were in Messrs. Cooling's stand, and also Madame Victor Verdier, E. Y. Teas, Madame Hunnibell, Bouquet d'Or, and François Michelin. Mr. M. A. Durban, Bath, took the third prize. The amateurs also showed Roses in grand condition, Miss Watson Taylor being especially successful. Among Miss Taylor's fine stand of eight triplets the best blooms were of Jean Ducher, Marie Baumann, A. Colomb, Horace Vernet, and Mrs. Jowitt. Mr. J. Campbell, gardener to S. P. Budd, Esq., Bath, and Mr. J. Davis, Wilton, took the remaining prizes for very creditable exhibits. Miss Taylor was also first for twelve singles, these including Belle Lyonnaise, Sultan of Zanzibar, Marie Rady, Souvenir d'Elise Vardon, and Catherine Mermet. Mr. Budd and Mr. T. Hobbs were placed equal seconds, both following the premier stand very closely. Dahlias were also particularly well shown by Messrs. Keynes & Co.; and Messrs. G. Humpbries, Chippenham, J. Wheeler, Warminster, A. A. Walters, Bath, were all successful exhibitors, while Messrs. G. Cooling & Son had a great variety, including singles and new semi-doubles, but not for competition. Mr. S. Bishop, gardener to G. S. Jones, Esq., Mr. S. Frances, Weston, and Mr. C. Bailey, Bath, had the best boxes of twenty varieties of choice cut flowers, and took the awards in the order named. Mr. H. S. James, gardener to Mr. A. Taverton, Farleigh, was the most successful exhibitor of vases, wreaths, and bouquets; and Messrs. Cross & Steer, Salisbury, was also a winner of prizes in the same line. Mr. M. Hookings displayed great taste with bouquets, wreaths, and vases filled with hardy flowers, and several others exhibited creditably.

There was rather less fruit than usual, and that may have influenced Mr. King, gardener at Devizes Castle, when he staged such enormous dishes of fruit in competition for the prizes offered for a collection. At any rate he made a very effective display, and the fruit, too, was of first-class quality. The collection included six fine bunches of Black Hamburg and a similar number of Muscat of Alexandria Grapes, large heaps of Pine Apple and Prince of Wales Nectarines, Exquisite and Barrington Peaches, Jefferson and Green Gage Plums, and Eastnor Castle Melon. Mr. A. Miller, gardener to W. H. Long, Esq., M.P., Rood Ashton, took the second prize, his collection including good Lady Downe's and Foster's Seedling Grapes, Belle Beauce and Barrington Peaches, and Best of All and Premier Melons. Mr. King was first with Black Hamburg Grapes; Mr. W. J. Coles, Devizes, second; and Mr. A. Miller third. The best Muscats of Alexandria were staged by Mr. W. Shelton, gardener to W. K. Waite, Esq., Mr. A. Shadwell being second, and Mr. A. Miller third. Mr. J. Jordan took the lead with Any other white variety, staging fairly good Buckland Sweetwater, Messrs. Miller and W. J. Loosemore taking the remaining prizes. Mr. J. Jordan was awarded a first prize for Black Alicante Grapes. Melons were well shown by Mr. W. J. Weston, gardener to the Rev. C. C. Layard, Combe Hay, Mr. T. King, and Mr. A. Miller; Plums by Messrs. G. Kitchen and W. J. Morris; Peaches by Messrs. J. Palmer, gardener to Miss Jarrett, and G. Pymm; Nectarines by Messrs. J. Palmer and T. King; Apples (dessert) by Messrs. A. T. Hall and G. Pymm; Apples (culinary) by Messrs. F. Smith, Salisbury, and W. J. Smith, Bath; and Pears by Messrs. Hall, Bath. Large quantities of vegetables of all kinds were shown, including single dishes. The collection which best pleased the Judges was staged by Mr. M. Burnfield, Bath, Mr. A. Miller being placed second for decidedly the best lot.

JUNIPERUS SABINA.

DWARF-GROWING Conifers are not numerous, and particularly those of low spreading habit, hence the value of the Savin for clothing rocky slopes, in which the larger members of the family could not make headway. It does not do well in all soils; indeed, I have not seen it thrive in soils other than gravelly, doing remarkably well in the gravel soil of the oolitic formation. As I am interested (and who is not?) in the growth of plants, I desire to ask for particulars of specimens of this useful Conifer, with a view to arriving at a record of the largest in the British Isles. I may state that we have an isolated specimen here (Paxton Park, St. Neot's) 6 feet 6 inches high in the centre, 18 feet across, and 54 feet in circumference. It forms a beautiful symmetrical bush, and is very healthy, of a deep green colour. Judging from the growth made this season it will evidently attain to very much larger dimensions.—G. ABBEY.

THE LEAVES OF PLANTS.

MR. G. THOMPSON asks for "full particulars of the leaves of plants and their functions." This subject is too large and important to be discussed, and the question too comprehensive to be answered in the ordinary form through our correspondence columns; in fact, we cannot answer it fully here, but the following article by a very able writer may perhaps be worth attentive perusal:—

The leaves are highly vascular organs, in which are performed some of the most important functions of a plant. They are very general, but not absolutely necessary organs, since the branches sometimes perform their offices; such plants, however, as naturally possess them are destroyed or greatly injured by being deprived of them. The duration of a leaf is, in general, but for a year, though in some plants they survive for twice or thrice that period. These organs are generally of a green colour. Light seems to have a powerful influence in causing this, since, if kept in the dark, they become of a pale yellow, or even white hue, unless uncombined hydrogen is present, in which case they retain their verdure though light be absent, hence their blanching would seem to arise from their being unable to obtain this gas, under ordinary circumstances, except when light is present. Now, the only source from which they can obtain hydrogen is by decomposing water; and how light assists in the decomposition may perhaps be explained by the disoxygenising power with which it is gifted. The violet rays of the spectrum have this power in the greatest degree; and Sennebie

has ascertained by experiment that those rays have the greatest influence in producing the green colour of plants.

Sennebie has observed that, when plants are made to vegetate in the dark, their blanching is much diminished by mixing a little hydrogen gas with the air that surrounds them. Ingenhousz had already remarked that when a little hydrogen gas is added to the air in which plants vegetate, even in the light, it renders their verdure deeper; and he seems to think, also, that he has proved by experiments that plants absorb hydrogen gas when so circumstanced. M. Humboldt has observed that the *Poa annua* and *compressa*, *Plantago lanceolata*, *Trifolium arvense*, *Cheiranthus cheiri*, *Lichen verticillatus*, and several other plants which grow in the galleries of mines, retain their green colour even in the dark, and that in these cases the air around them contains a quantity of hydrogen gas. This philosopher concludes, from his observations, that the white colour of blanched plants is occasioned by their retaining an unusual proportion of oxygen, and that this is prevented by surrounding them with hydrogen gas. This may, perhaps, be true in certain cases; but the experiments of Mr. Gough are sufficient to prove that the retention of oxygen is not the only difference between green and blanched plants.

The green colouring matter of plants has been shown by Rouelle to be of a resinous nature. From this, and from the circumstance of its being formed only in the light, Berthollet has inferred that the leaves of plants have the property of decomposing water as well as carbonic acid when exposed to the light of the sun. The oxygen emitted, according to him, is derived partly from the decomposed carbonic acid and partly from the water, while the carbon and hydrogen enter into the composition of the inflammable parts of the plant. This ingenious theory, though sufficiently probable, is not susceptible of direct proof. From the experiments of Saussure we learn that when plants are made to vegetate in pure water, in atmospheres destitute of carbonic acid gas, the quantity of their fixed matter does not increase; but when their atmospheres contain this acid gas the increase of weight which they receive is considerably greater than can be accounted for by the carbon and oxygen derived from the carbonic acid absorbed, hence it is clear that a portion of the water must enter into their composition. It is more likely that the elements of this portion arrange themselves in a different way than that they still continue in a state of water. These facts certainly strengthen the hypothesis of Berthollet; indeed, if we consider the great quantity of hydrogen contained in plants, it is difficult to conceive how they should obtain it, provided the water which they absorb does not contribute to furnish it.—(*Thomson's Vegetable Chemistry*.)

When the leaves are of any other hue than green they are said to be coloured. This variegation is often considered to be a symptom either of tenderness or debility; and it is certain, when the leaves of a plant become generally white, that that individual is seldom long-lived. Mr. Knight, however, has demonstrated that variegation is not a certain indication of a deficiency of hardihood.

All organs exhibiting or assuming a green colour are found to be capable of decomposing the carbonic acid of the sap or of the air when exposed to the action of solar light. In this operation the oxygen of the acid is exhaled into the atmosphere, and its carbon fixed in the vegetable tissue, whence it seems to follow that the green colour of the leaves is owing to the fixation of carbon, for where the decomposition of carbonic acid is not going on the organ remains colourless. The brightness of the green seems to depend upon the degree of light to which the organ is exposed, and yet solar light is not indispensable. De Candolle gave the green colour to some plants of *Lepidium sativum* merely by the light of a few Argand lamps, but they did not give out oxygen when placed in water.

Still the deposition of carbon caused by the action of solar light does not affect the membranous tissue, still this tissue retains its original colour and transparency, so that it is only the chromule which assumes the green colour. But how does carbon, which is black, yield a colour which is green? Sennebie solved the problem as follows:—Carbon is, in strict propriety of speech, not a black, but a very deep blue; and vegetable tissue is not absolutely a pure white, but rather a pale yellow, hence the green is formed by a mixture of a yellow and blue. This explication, *quoique un peu meccanique*, De Candolle regards as likely to be the true one, yet we cannot help entertaining some doubts with regard to its validity. Surely the membranous tissue of many plants assuming a green colour has nothing in it of a yellow; but wherever we turn to look for an explication there is doubt, and the solution of the problem may be said to be a chemical puzzle. One attributes it to the presence of an oxide of iron, another to the predominance of an alkali, and neither solution is satisfactory. Yet plants placed in the dark do not lose their green colour if the atmosphere in which they grow contains a certain quantity of hydrogen or of azote. Humboldt found the leaves of *Poa annua* and *Plantago lanceolata* still green though growing in the galleries of the mines of Freyberg. It should be recollected, however, that they must have been occasionally exposed to the light of the miners' lamps. Leaves, bracts, calyces, ovaries, are the organs that are most generally green, though you may find exceptions to the rule, both in organs which it includes and in organs which it excludes. The bracts of *Bartsia coccinea* are scarlet, and the embryo of the Mistletoe is green.—(*Keith's Lexicon*.)

The functions of the leaves appear to be a combination of those of the lungs and stomach of animals; they not only modify the food brought to them from the roots, so as to fit it for increasing the size of the parent plant, but they also absorb nourishment from the atmosphere.

The sap, after elaboration in these organs, differs in every plant, though, as far as experiments have been tried, it appears to be nearly the same in all vegetables when it first arrives to them. The power of a leaf to generate sap is in proportion to its area of surface, exposure to the light, and congenial situation.

Leaves throw off a very considerable quantity of water. Dr. Hales found that a Cabbage emitted daily nearly half its weight of moisture; a Sunflower, 3 feet high, perspired 1 lb. 14 ozs.; and Spearmint exhales $1\frac{1}{4}$ times its weight in the same period. But of all the plants, the diurnal perspiration of which has been ascertained, the Cornelian Cherry (*Cornus mascula*) transpires the most, the exhalation amounting to nearly twice the weight of the plant in twenty-four hours. This aqueous expiration takes place chiefly during the day, is much promoted by heat, and checked by rain or a reduction of temperature. On the free performance of this function of plants their health is dependent in a very high degree, and we believe that half the epidemics to which they are subject arise from its derangement.

Evergreens transpire less moisture than deciduous plants, which would lead to the expectation that they are more capable of living in dry situations, which in general is really the case.

The matter transpired by a healthy plant is nearly pure water, 5000 grains of it never containing more than one grain of solid matter, and this is constituted of resinous and gummy matter, with carbonate and sulphate of lime. It appears to be nearly the same in all plants. The quantity, however, varies in every species, probably in every individual—and is greatly influenced by the quantity of water applied to the roots. Under precisely similar circumstances Senneber obtained the following results:—

	Gr.	Gr.
A Peach branch, imbibing	100	35
" "	210	90
" "	220	120
" "	710	295

We have found the branch of a Pelargonium, that, whilst growing on the parent stem, exhaled only twenty grains in twenty-four hours, more than trebled that quantity in the same time when cut from the stem and placed with the divided end in water. This increased transpiration is attended by a proportionate reduction of temperature; for a collection of Pelargoniums, in the midst of which Fahrenheit's thermometer stood at 55° fell to 48° within two hours after a plentiful watering to their roots only, though the water was of the same temperature as the greenhouse.

For the purpose of ascertaining the composition of the liquid transpired by plants, M. Senneber collected 13,030 grains of it from a Vine during the months of May and June. When evaporated 2 grains of residuum were left, composed of nearly $\frac{1}{2}$ grain of carbonate of lime (chalk), $1\frac{1}{2}$ th grain of sulphate of lime (gypsum), $\frac{1}{2}$ grain of matter apparently gum, and $\frac{1}{2}$ grain apparently resinous. He analysed 60,768 grains of a similar liquid collected from the Vine during July and August. The residuum after evaporation weighed $2\frac{1}{8}$ grains, composed of $\frac{3}{4}$ grain of carbonate of lime, $\frac{1}{4}$ grain of sulphate of lime, $\frac{1}{2}$ grain of gum, and $\frac{1}{2}$ grain of resin. The liquid transpired by *Aster Novæ-Angliæ* afforded precisely the same ingredients.—(*Encyc. Meth. Phys. Veget.*, 287.)

As the season of growth advances the transpiring power of leaves decreases. Under similar circumstances Senneber found the transpiration much greater in May than in September.

The transpiration of plants decreases with that of the temperature to which they are exposed as well as with the period of their growth. This explains why the gardener finds that his plants do not require so much water in cold weather, nor during the time that elapses between the fall of their blossom and the ripening of their seed. During this period they do not transpire more than one-half so much as during the period preceding and attending upon their blooming.

The transpiration takes place from the upper surfaces of the leaves, and if these surfaces are coated with varnish the leaves gradually decay and fall, and the growth of the plant ceases until fresh leaves are produced; hence arises the benefit which plants derive in rooms, greenhouses, and other confined enclosures from keeping those surfaces cleansed with the sponge and syringe. The advantage derived by plants from having their leaves cleansed was exemplified by the following experiment:—

Two Orange trees, weighing respectively 18 ozs. and 20 ozs., were allowed to vegetate without their leaves being cleansed for a whole twelvemonth; and two others, weighing 19 ozs. and $20\frac{1}{2}$ ozs. each, had their leaves sponged with tepid water once a week. The two first increased in weight less than half an ounce each, whilst of the two latter one had increased 2 and the other nearly 3 ozs. In all other respects they had been treated similarly.

It must be remembered, however, in using the sponge and the syringe that the under side of the leaves is an absorbing surface, benefited by being kept clean and by the application of moisture. The Kidney Bean, Sunflower, Cabbage, and Spinach absorb moisture equally by their under and upper surfaces; the Cockscomb, purple-leaved Amaranth, Heliotrope, Lilac, and Balm absorb most freely by their upper surfaces; and the Vine, Pear, Cherry, Apricot, Walnut, Mulberry, and Rose absorb most by their under surfaces.—J.

MADRAS AND ITS VEGETATION.

THE gentleman who was deputed from India to report on the forests of Ceylon thus gives his impressions of Madras in the *Indian Forester*:—
There can be no doubt that Madras is in process of becoming one of the handsomest towns in India. Were it not for its great area and want

of local municipal funds it would long ago have been undoubtedly one of the finest as it is one of the healthiest of them. A great feature in Madras is the number of large buildings, mostly public, built in the oriental style of architecture. Most prominent of all these is the Chempauk Palace, an old palace of the Nawabs of the Carnatic, largely added to and now used by the Board of Revenue. Here I found the Forest office, with a fine verandah looking out to sea over a pretty grass lawn adorned with fountains and young Poon trees. Near it is the grand new University Senate house, which seems to the uninitiated to be a mixture of Gothic and Saracenic architecture. Behind these and other neighbouring large buildings are the grounds of Government House, in process of transformation into a botanic garden, and a very pretty garden it will be when completed, for besides the sea frontage and the broad mouth of the Coom river, there are large tanks and the Buckingham Canal, pretty bridges and groups of trees of various kinds. The summer avenue trees of Madras are the Nim, the Casuarina, and the Odina Wodier, the latter most remarkable, as Dr. Brandis has pointed out, for retaining its leaves the whole year round, while only a few miles into the country it may be found in its usual cold-weather leafless state. Hedges, principally of *Inga dulcis*, surround the large compounds of the houses, while in places groves of Cocoa-nut Palms remind us of the first impressions of India we gained on landing in Ceylon. A special feature in Madras, and most of all in the more aristocratic quarters of Nangumbaukum, Chetputu, Egmore, and Adyar, is the immense size of the house compounds. Some of them would make a not inconsiderable park for an English squire, and the houses are generally large, airy, and comfortable. The gardens seem to keep themselves. Ferns, and especially *Adianta*, thrive most luxuriantly in the shade, while the magnificent growth of *Crotons*, which in Calcutta one is chiefly accustomed to see carefully tended in small pots, is in Madras a most striking feature, and makes gay the lawns and shrubberies with every shade of red and yellow and orange and purple. Here they are not small plants in small pots, but, either in the ground direct or in huge pots, they show tall masses of column often 10 to 15 feet high and proportionately broad. The great number of Nim trees is very noticeable, while the yellow pods of *Albizia Lebbek* keep up their ceaseless rattle at every puff of sea breeze which shakes the roadside trees. The public gardens, besides the new one which is being made near Government House, are the Peoples' Park and the Agri-Horticultural. The former, near the handsome Madras Railway station, is not very well kept, and possesses very few trees of any size, but the latter has, though of small area, a particularly fine collection of trees and interesting plants. The curious *Kigelia pinnata* with spreading branches and huge Pumpkin-like fruits hanging at the end of long strings from the branches attracts attention at once, and there is a Baobab which gives a very good idea of what a strange object it must be in a Central African landscape. The Mahogany seems to thrive, and so do numerous species of *Diospyros*, while among the specimens of Palms are some which I do not remember even to have seen in the Palm house or the palmetum at Calcutta. A rather longer excursion may be made to Guindy Park, which lies away to the west behind the model farm of Sydapet. Guindy Park is the hot-weather residence of the Governor, and the shrubberies present specimens trees of almost everything curious that can be thought of. But to the forester there is nothing so interesting as the Casuarina, and indeed I expect that the Madras Presidency can in its coast plantations of Casuarina rival the work done on the dunes of Gascony with the Maritime Pine.

KITCHEN GARDEN.

Globe Artichokes.—Under ordinary cultivation the heads are mostly too old for use now, and some of them that were not required may have been left on the plants. These are no good for any purpose, but rather injurious, and should all be cut off at once. Most of the stems, too, may be cut away close to the soil, and all decayed leaves removed at the same time. When this has been done if the soil is very dry the plants should receive a thorough watering, afterwards mulching with some short manure, and then fine healthy crowns will be matured for fruiting next year.
