glabrous: drupe 8-11 mm. in diameter.—(VELVET-SEED.)—Hammocks and pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)

2. *G. scabra* Vent. Shrub or small tree: leaf-blades thick, mainly elliptic, oval, or elliptic-ovate, 4.5-8 cm. long, or rarely smaller: corolla white or reddish; lobes mostly 6 or 7: style pubescent: drupe about 6 mm. in diameter.—(ROUGH VELVET-SEED.)—Hammocks and pinelands, Everglade Keys, Fla. and Fla. Keys, and coastal hammocks, pen. Fla.—(W. I.)—The pinelands are not the normal habitat for these plants. Where hammocks have been destroyed some of the trees become adapted to the conditions of the pinelands and persist in much reduced stature, the soil being scant and poor in plant foods.

12. *ERITHALIS* P. Br. Shrubs. Leaf-blades leathery. Flowers in terminal cymes. Sepals 5-10, short or obsolete. Corolla with a short tube and 5-10 narrow lobes. Stamens 5-10: filaments adnate to the base of the corolla-tube: anthers ellipsoid to linear. Drupe berry-like.—About 6 species, tropical American.

1. *E. fruticosa* L. Shrub with glabrous foliage: leaf-blades oval to elliptic-obovate, 2.5-5 cm. long, lustrous: sepals minute: corolla white; lobes elliptic, 3-5 mm. long: drupe subglobose, 3-4 mm. thick, dark-purple.—Sand-dunes and coastal hammocks, S pen. Fla. and the Keys.—(W. I.)—This, like many of the coastal dune plants thrive in the sands apparently devoid of nourishment. It often grows in large colonies. These vary much in height—in some the shrubs are knee high in others head high.

13. *CHIOCOCCA* P. Br. Shrubs or vines. Leaf-blades leathery. Flowers on axillary raceme-like cymes. Sepals 5, short. Corolla with a relatively short tube and 5 shorter lobes. Stamens 5: filaments long, essentially free from the corolla-tube and united around the base of the style: anthers linear. Drupe somewhat flattened, globular.—About 10 species, tropical American.—All year.—SNOWBERRIES.

Corolla-lobes about 3 mm. long: anthers about 3 mm. long: seed 4-5 mm. long.

1. *C. alba*.

Corolla-lobes about 2 mm. long: anthers about 2 mm. long: seed 2-2.5 mm. long.

2. *C. pinetorum*.

1. *C. alba* (L.) A. Hitchc. Large, erect, diffuse, or reclining plants: leaf-blades elliptic, oval, or ovate, 3-7 cm. long: corolla white, often becoming

yellow; tube 7-8 mm. long; drupe white, 5.5-6.5 mm. in diameter. [*C. racemosa* L.]—Hammocks, pen. Fla. and the Keys.—(W. I.)

2. *C. pinetorum* Britton. Small, trailing plant: leaf-blades elliptic or sometimes oval, broadest below the middle, 1-3 cm. long: corolla permanently white; tube 3.5-4 mm. long; drupe white, 4-4.5 mm. in diameter.—Pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)—On the lower Keys a form grows in the hammocks which is more robust than the typical form, but is here referred to this species. The Florida representatives of this genus need extensive study. Variations in the leaves, flowers, and fruits are frequent. Marked forms occur in the hammocks of the lower eastern coast, in the Big Cypress Swamp, and on the Florida Keys. *Chiococca alba* is rarely found in the form of a small tree on the upper Keys.

14. *STRUMPFIA* Jacq. Shrubs. Leaf-blades rigid-leathery. Flowers in axillary raceme-like panicles. Sepals 5, short. Corolla rotate, with a very short tube and 5 longer lobes. Stamens 5: filaments very short, scarcely adnate to the base of the corolla-tube, united: anthers adnate by their broad connectives. Drupe thick.—One species.

1. *S. maritima* Jacq. Much-branched pubescent shrub, the branches short-jointed: leaf-blades linear to linear-elliptic, 1-2.5 cm. long, revolute: sepals triangular to ovate-triangular, becoming about 1 mm. long, acute: corolla white, pubescent; lobes lanceolate to elliptic, 3-4 mm. long: drupe 4-6 mm. long, white or red.—Coastal sand-dunes, and hammocks, Florida Keys.—(W. I.)—All year.—Dried fruits have the fragrance of red-cedar wood.

15. *PSYCHOTRIA* L. Shrubs or trees. Leaf-blades thinnish. Flowers in terminal or axillary cymes. Sepals 4-6, short and broad. Corolla with a relatively short tube and 4-6 usually somewhat shorter lobes. Stamens 4-6: filaments adnate to near the top of the corolla-tube: anthers ellipsoid to oval. Drupe thick, often berry-like.—More than 300 species, tropical American.—Spr.-sum., or sporadically all year.

Inflorescence, twigs, and leaves pubescent: corolla-lobes as long as the tube: stone with high ridges.

Inflorescence, twigs, and leaves glabrous: corolla-lobes shorter than the tube: stone with flat ridges.

Cymes sessile: sepals very shallow.

Cymes peduncled: sepals deltoid.

1. *P. Sulzneri*.

2. *P. nervosa*.

3. *P. bahamensis*.

1. *P. Sulzneri* Small. Shrub, the branches pubescent: leaf-blades narrowly oblong, elliptic, or elliptic-lanceolate, 8-15 cm. long: corolla green; tube 2-2.5

mm. long: anthers ellipsoid: drupe 5-6 mm. long, scarlet, orange, or yellow. [*P. tenuifolia* Griseb. Not Sw.]—(WILD-COFFEE.)—Hammocks, S pen. Fla. and adj. islands.—(W. I.)

2. *P. nervosa* Sw. Shrub or small tree, the twigs glabrous: leaf-blades oval, elliptic, or elliptic-lanceolate, 6-15 cm. long: corolla white; tube 2.5-3 mm. long: anthers oval: drupe ellipsoid, 7-9 mm. long, red or rarely yellow.—(WILD-COFFEE.)—Hammocks, pen. Fla. and the Keys.—(W. I.)

3. *P. bahamensis* Millsp. Shrub or small tree, the twigs glabrous: leaf-blades lanceolate, elliptic, or oblanceolate, 3-12 cm. long: corolla white; tube 3-4 mm. long: anthers oblong: drupe oval or ellipsoid, 6-8 mm. long, bright-orange.—(BAHAMAN WILD-COFFEE.)—Hammocks, Fla. Keys.—(W. I.)

16. *PAEDERIA* L. Woody vines. Leaves opposite: blades broad, at least relatively so, entire. Flowers borne in dichotomous cymes. Sepals 4 or 5, narrow. Corolla campanulate: lobes 4 or 5, relatively short. Filaments almost wholly adnate to the corolla-tube: anthers narrow. Styles slender, united at the base. Berry rather dry, the outer coat brittle and early falling away. Seeds flat, margined.—About 18 species, mostly Asiatic.

1. *P. foetida* L. Stem twining, often slightly pubescent in lines: leaf-blades elliptic to elliptic-lanceolate, 3-11 cm. long, acuminate at the apex, rounded, truncate or subcordate at the base, slender-petioled: sepals acute: corolla pale-lilac, 7-9 mm. long; lobes about  $\frac{1}{4}$  as long as the tube, apiculate: berry obovoid, about 1 cm. long.—Thickets and fence-rows, pen. Fla. Nat. of East Indies.—Spr.-fall.

17. *MITCHELLA* L. Undershrubs with creeping stems. Leaf-blades leathery. Flowers in pairs, the hypanthia coalescent. Sepals usually 4, short. Corolla with a relatively long tube and usually 4 short lobes. Stamens 4: filaments adnate to the corolla-tube. Drupes paired.—Two species, the following and 1 Asiatic.

1. *M. repens* L. Stem and branches matted, 1-4 dm. long: leaf-blades ovate to orbicular, or elliptic, 8-30 mm. long: sepals deltoid, less than 1 mm. long: corolla white or pinkish; tube 9-12 mm. long; lobes ovate to elliptic: fruit globular, 7-10 mm. thick, red or white, aromatic.—(TWIN-BERRY. PART- RIDGE-BERRY.)—Damp woods, sandy hammocks, and shaded banks, often in acid soil, various provinces, Fla. to Tex., Minn., and N. S.—Spr.-fall.

**18. MORINDA** [Vaill.] L. Shrubs or trees. Leaf-blades rather thin. Flowers in capitate cymes, the hypanthia coalescent. Sepals usually 5, minute or obsolete. Corolla with a relatively short tube and usually 5 somewhat shorter lobes. Stamens usually 5: filaments adnate to near the top of the corolla-tube: anthers linear. Drupe united into a fleshy syncarp.—About 40 species, tropical.

**1. M. Roioi** L. Shrub or vine: leaf-blades elliptic to cuneate, 5–10 cm. long: flowers several in a head: corolla white or reddish; lobes elliptic or elliptic-lanceolate, 2.5–3.5 mm. long: syncarp 2–3.5 cm. long, yellow.—Hammocks and pinelands, pen. Fla. and the Keys.—All year.

**19. RICHARDIA** L. Annual or perennial diffuse herbs. Leaf-blades herbaceous. Flowers in contracted involucre cymes. Sepals 4–8, rather broad. Corolla with a relatively short tube and 4–8 shorter lobes. Stamens 4–8: filaments adnate to the top of the corolla-tube: anthers ellipsoid to oval. Mature carpels separating from each other. [*Richardsonia* Kunth.]—About 8 species, in the warm part of America.—Spr.—fall or all year.

Corolla 5–6.5 mm. long; tube about twice as long as the calyx: mature carpels 3–3.5 mm. long.

Corolla 3.5–4 mm. long; tube about thrice as long as the calyx: mature carpels 2–2.5 mm. long.

1. *R. scabra*.

2. *R. brasiliensis*.

**1. R. scabra** St. Hil. Annual, the stems more or less branched: leaf-blades elliptic, lanceolate, or ovate, 2–8 cm. long: sepals lanceolate to ovate-lanceolate, becoming 2–2.5 mm. long: corolla white; lobes less than  $\frac{1}{3}$  as long as the tube: anthers ellipsoid: mature carpels ellipsoid.—Sandy soil, especially in cult fields, Coastal Plain, Fla. to Tex. and N. C.; also in Ind.—(*Mex.*)—Nat. of Trop. Am.

**2. R. brasiliensis** (Moq.) Gomez. Perennial, the branches diffuse: leaf-blades elliptic, 1.5–4 cm. long: sepals ovate to elliptic-ovate, becoming about 1 mm. long: corolla white; lobes fully  $\frac{1}{3}$  as long as the tube: anthers oval: mature carpels obovoid.—Waste-places and pinelands, pen. Fla. Nat. of S. Am.

**20. ERNODEA** Sw. Diffuse or vine-like shrubs. Leaf-blades leathery. Flowers axillary. Sepals 4–6, narrow. Corolla with a long tube and 4–6 relatively long lobes. Stamens 4–6: filaments adnate to the top of the corolla-tube: anthers narrow. Drupe thin-fleshy.—About 6 species, tropical American.—The plants of the following species flower throughout most of the year.

Sepals about one-third as long as the corolla-tube: anthers linear.  
Sepals about one-half as long as the corolla-tube: anthers narrowly ellipsoid.

1. *E. littoralis*.

2. *E. angusta*.

1. *E. littoralis* Sw. Stem and branches prostrate: leaves fleshy; blades mainly elliptic, sometimes narrowly so, 2-3.5 cm. long: corolla white; tube mostly over 10 mm. long: anthers over 2 mm. long: drupe mostly globular.—Coastal sand-dunes and rocky shores, southern pen. Fla. and the Keys.—(*W. I.*)

2. *E. angusta* Small. Stem and branches more slender than those of *E. littoralis*: leaves firm; blades linear, 2-4 cm. long: corolla usually reddish; tube mostly less than 10 mm. long: anthers over 1.5 mm. long: drupe mostly oval.—Pinelands, Everglade Keys, Fla. and Florida Keys.—(*W. I.*)—Our two species occupy quite different habitats, but they are both sprawling or creeping vine-like shrubs. The first species grows in the poorest soil, the coastal dunes, where it completely covers large areas of sand with its wiry stems and myriad leaves.

21. **DIODIA** [Gronov.] L. Perennial creeping herbs. Leaf-blades soft-herbaceous. Flowers axillary. Sepals 2. Corolla white or pink, salverform, with a long slender tube and 4 narrow lobes. Stamens 4: filaments adnate to the top of the corolla-tube, the free portion elongate: anthers linear. Stigmas filiform. Drupe thin-fleshy, ribbed. About 20 species, mostly American.—Spr.-fall, or all year S.—BUTTONWEEDS.

Corolla-tube over 6 mm. long: capsule oval or ellipsoid: sepals ciliate.

Stem sparingly pubescent on the angles or nearly glabrous.

Capsules ellipsoid: leaf-blades narrowed at the base.

Capsules oval: leaf-blades truncate or subcordate at the base.

Stem hirsute.

Corolla-tube less than 5 mm. long: capsule globular: sepals eciliate.

1. *D. virginiana*.

2. *D. tetragona*.

3. *D. hirsuta*.

4. *D. Harperi*.

1. *D. virginiana* L. Stem branching, 1-15 dm. long, sparingly pubescent on the angles: leaf-blades thinnish, spatulate, to linear-elliptic, 3-8 cm. long, acute or acuminate: sepals linear to linear-lanceolate, 4-6 mm. long: corolla-tube 6-8 mm. long: fruit 7-9 mm. long.—Low grounds, swamps, and stream banks, Coastal Plain, Fla. to Tex., Mo., and N. J.

2. *D. tetragona* Walt. Stem branching, 2-10 dm. long, the angles often pubescent: leaf-blades spatulate to obovate, usually somewhat rhombic: sepals ovate to ovate-lanceolate, 4-5 mm. long: corolla-tube 6.5-7 mm. long: fruit 4.5-5.5 mm. long.—Damp sandy soil, Coastal Plain, Fla. to La. and N. C.

3. *D. hirsuta* Pursh. Stem branching, 1-8 dm. long, hirsute throughout: leaf-blades thickish, linear-spatulate to linear, 2-5 cm. long, somewhat acuminate: sepals subulate-lanceolate, 4-5 mm. long: corolla-tube 8-10 mm. long: fruit 7-9 mm. long.—Sandy soil, Coastal Plain, Fla. to N. C.

4. **D. Harperi** Small. Plant smaller than that of the three preceding species, glabrous throughout: leaf-blades spatulate to linear, 1-3 cm. long, acute, eciliate: sepals lanceolate, 3-4 mm. long: corolla-tube 3.5-4.5 mm. long: fruit about 5 mm. long.—Pond margins, Coastal Plain, S Ga.

22. **DIODELLA** Small. Annual diffuse herbs. Leaf-blades firm-herbaceous. Flowers axillary. Sepals 4. Corolla with a relatively short thick tube and 4 broad lobes. Stamens 5: filaments adnate up to the top of the corolla-tube, the free portions very short: anthers oval or ovoid. Stigma capitate or 2-lobed. Capsular fruit crustaceous, lobed. About 15 species, American.—**BUTTON-WEEDS.**

Corolla 4-5 mm. long: fruit hispidulous.  
Corolla 6-10 mm. long: fruit strigillose.

1. *D. teres.*
2. *D. rigida.*

1. **D. teres** (Walt.) Small. Stem or branches 1-4 dm. long, spreading or creeping, pubescent: leaf-blades linear or narrowly linear-lanceolate, 1-4 cm. long: sepals 4, acute, 1.5-2 mm. long: corolla white or pinkish, 4-5 mm. long; lobes broadly ovate to deltoid: fruit obovoid, 4-4.5 mm. long. [*Diodia teres* Walt.]—Stony soil, fields, roadsides, open woods, dry sandy banks, various provinces, Fla. to Tex., Kans., Mich., and Conn.—Sum.-fall.

2. **D. rigida** (Cham. & Schlecht.) Small. Stem and branches procumbent or prostrate, finely pubescent: leaf-blades thick, linear to linear-lanceolate, mostly 1-3.5 cm. long, acute, minutely rough-pubescent; stipules long-setose: sepals ovate to ovate-lanceolate, 1.5-2 mm. long: corolla white or pinkish, 6-10 mm. long or rarely larger; lobes ovate to ovate-lanceolate: fruit obovoid, 3-3.5 mm. long.—Pinelands, Everglade Keys, Fla.—(W. I.)—All year.

23. **BORRERIA** Meyer. Herbs or woody plants. Leaf-blades herbaceous. Flowers in compact axillary cymes. Sepals usually 2, sometimes 4, unequal. Corolla white with a short tube and 4 broad lobes. Stamens 4: filaments adnate to the top of the corolla-tube: anthers globular to oval. Capsule with each carpel open along the inner face.—About 90 species, in warm and tropical regions.—All year.—The following species are recognized as growing within our range. *Borreria ocimoides* appears in a multitude of forms, some of which may represent other species when more thoroughly studied.

Plant perennial: flowers in a dense terminal glomerule, and sometimes in supplementary glomerule in the upper leaf-axils: leaves fleshy; blades of the upper ones, at least, narrowly linear.

1. *B. terminalis.*

Plant annual: flowers in clusters in all or many of the leaf-axils: leaves herbaceous; blades not linear.

Sepals subulate, nearly or quite as long as the capsule.

2. *B. ocimoides.*

Sepals ovate, much shorter than the capsule.

3. *B. laevis.*

1. **B. terminalis** Small. Perennial, 0.5-3 dm. tall, the stems often in colonies: leaf-blades linear-spatulate to linear, often narrowly so, 1-3 cm. long, veinless:

corolla about 3 mm. long; lobes ovate, about as long as the tube. [*B. podocephala* (Fl. SE. U. S.)]—Pinelands, Everglade Keys, Fla. and lower Florida Keys.—A related species, *B. tenella* (H.B.K.) C. & S., has been collected at Pensacola, Fla. It has subulate calyx-lobes and a corolla about 5 mm. long, with the lobes much shorter than the tube.

2. *B. ocimoides* (Burm.) DC. Annual, 1-9 dm. tall: leaf-blades elliptic or linear-elliptic, 1-2.5 cm. long, veiny: corolla about equalling the calyx; lobes about 1 mm. long. [*B. parviflora* G. F. W. Meyer. *B. micrantha* F. & G.]—Pinelands, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A., O. W.*)

3. *B. laevis* (Lam.) Griseb. Annual, 2-6 dm. tall: leaf-blades elliptic or oval, 1.5-6 cm. long, veiny: corolla much exceeding the calyx; lobes about 2 mm. long. [*Spermacoce Chapmanii* T. & G.]—Woods and stream-bauks, Coastal Plain, Fla. to La.—(*W. I., Mex., C. A., S. A.*)

24. **SPERMACOCE** [Dill.] L. Herbs or woody plants. Leaf-blades herbaceous. Flowers in dense, axillary cymes. Sepals usually 4. Corolla with a short tube and 4 broad lobes. Stamens 4: filaments adnate at least to the lower part of the corolla-tube: anthers oval or globular. Capsule with 1 dehiscent and 1 indehiscent carpel.—Four or 5 species, American.

Stem and leaves glabrous or nearly so.

Plant perennial: corolla very villous in the throat.

Plant annual: corolla glabrous or slightly hairy in the throat. Corolla-lobes shorter than the tube; hypanthium bristly-pubescent.

Corolla-lobes longer than the tube: hypanthium not bristly.

Stem and leaves hirsute with whitish hairs.

1. *S. glabra*.

2. *S. tenuior*.

3. *S. keyensis*.

4. *S. tetraquetra*.

1. *S. glabra* Michx. Stem 1-6 dm. tall, glabrous or nearly so: leaf-blades elliptic, varying to broadest below or above the middle, 2-7 cm. long: sepals becoming 1.5 mm. long, ciliate or nearly so: corolla white; lobes elliptic-ovate: fruit about 3 mm. long.—River-banks and low grounds, various provinces, Fla. to Tex., Kans., and Ohio.—Sum. or all year S.

2. *S. tenuior* (L.) Lam. Stem 1-5 dm. tall, or prostrate: leaf-blades elliptic, or elliptic-lanceolate, 2-5 cm. long: sepals finely bristly-pubescent: corolla white; lobes ovate, shorter than the tube: fruit over 2 mm. long, coarsely hispidulous.—Hammocks, Coastal Plain, Fla. to La. and Ga.—Spr.-sum.

3. *S. keyensis* Small. Stem and branches prostrate, 1-4 dm. long, glabrous: leaf-blades elliptic, varying to broadest below or above the middle, or elliptic-lanceolate, mostly 1-2 cm. long: sepals minutely pubescent: corolla white; lobes ovate, longer than the tube: fruit 1.5-2 mm. long, minutely hispidulous. [*S. porto-*

*ricensis* (Fl. SE. U. S.)]—Open hammocks and sandy places, Florida Keys.—All year.

4. *S. tetraquetra* A. Rich. Stem 2–14 dm. tall, usually branched, hirsute, four-sided: leaf-blades elliptic, often narrowly so, varying to broadest above or below the middle, acute; flower-clusters dense: hypanthium hispid: sepals lanceolate to subulate-lanceolate, 1–1.5 mm. long; corolla white, 2–2.5 mm. long; lobes ovate, much shorter than the tube, pubescent at the base within: fruit ellipsoid, fully 2–2.5 mm. long, hispid.—Pinelands, Everglade Keys, Fla.—(W. I.)—All year.

25. *GALIUM* L. Perennial, or sometimes annual, weak spreading herbs. Leaves with blades and stipules about equal in size. Flowers in simple or branched cymes. Sepals usually obsolete. Corolla rotate, with 3–5 lobes. Stamens 3–5. Fruit globular or didymous. About 250 species, widely distributed.—BEDSTRAWS. CLEAVERS.

Fruit dry.

Plants annual.

Flowers in axillary cymes.

Fruit densely uncinat-hispid.

Fruit slightly granular or smooth.

Flowers solitary in the axils.

Plants perennial.

Fruit uncinat-hispid.

Leaves and stipules in 4's; blades not bristle-tipped.

Leaves and stipules in 6's; blades bristle-tipped.

Fruit smooth and glabrous or merely warty.

Corolla brownish or brownish-purple.

Corolla white or greenish.

Fruit fleshy.

#### I. APARINA

Plant with the long weak reclining stems retrorse-scabrous or prickly on the angles.

#### II. PARISIENSA

Plant diffusely branched, the branches minutely scabrous on the angles.

#### III. VIRGATA

Plant with slender stems and remote whorls of very short leaves and stipules.

#### IV. PILOSA

Flowers manifestly pedicelled.

Flowers sessile or nearly so.

Leaf-blades elliptic-ovate to oval: corolla pubescent.

Leaf-blades lanceolate or ovate-lanceolate: corolla glabrous or nearly so.

#### V. TRIFLORA

Plant fragrant in drying: leaf-blades bristle-tipped.

#### VI. LATIFOLIA

Leaf-blades broadly lanceolate, 3-veined: fruit smooth.

Leaf-blades narrowly or linear-lanceolate, mostly 1-veined: fruit minutely warty.

#### VII. TINCTORIA

Leaf-blades obtuse or merely acute.

Corolla-lobes 3, obtuse: stem scabrous.

Corolla-lobes 4, acute: stem smooth.

Stipules as large as the leaves or nearly so: fruits when didymous 3–3.5 mm. wide.

Stipules much smaller and narrower than the leaves: fruits when didymous 4–5 mm. wide.

Leaf-blades cuspidate.

#### VIII. BERMUDENSA

Leaf-blades linear or nearly so.

Leaf-blades elliptic to oval.

I. APARINA.

II. PARISIENSA.

III. VIRGATA.

IV. PILOSA.

V. TRIFLORA.

VI. LATIFOLIA.

VII. TINCTORIA.

VIII. BERMUDENSA.

1. *G. Aparine*.

2. *G. parisiense*.

3. *G. virgatum*.

4. *G. pilosum*.

5. *G. circaezans*.

6. *G. lanceolatum*.

7. *G. triflorum*.

8. *G. latifolium*.

9. *G. arkansanum*.

10. *G. Claytonii*.

11. *G. tinctorium*.

12. *G. filifolium*.

13. *G. asprellum*.

14. *G. uniflorum*.

15. *G. bermudense*.

1. *G. Aparine* L. Plant reclining, 1-15 dm. long, the stem retrorse-scabrous or prickly; leaves, and stipules, with linear-spatulate blades 1-8 cm. long, the upper side with short stout hairs (small-leaved, abundantly fruited, and with longer-hispidulous fruits in *G. Aparine Vaillantii*): corolla white; lobes ovate, 1-1.5 mm. long, acute: fruit 3-5 mm. thick, densely uncinat-hispid.—(GOOSE-GRASS. SPRING-CLEAVERS.)—Thickets, rich shaded soil, and waste-places, various provinces, Fla. to Tex., Alas., Ont., and N. B.—(*Eurasia*).—Spr.—sum.

2. *G. parisiense* L. Plant 1.5-3 dm. tall, the stem retrorse-scabrous on the angles: leaves and stipules with linear to linear-spatulate blades, 7-10 mm. long, scabrous: corolla white; lobes about 0.5 mm. long: fruit about 0.5 mm. thick, papillose-roughened.—Fields and roadsides, Blue Ridge to Appalachian Plateau, N. C. to Tenn. and Va. Nat. of Eu.—Sum.

3. *G. virgatum* Nutt. Plant 1-3 dm. tall, the stem hispid, with short internodes: leaves and stipules with linear-elliptic blades, 3-10 mm. long, very hispid on the margin and midrib: corolla white; lobes ovate, less than 1 mm. long, glabrous: fruit about 3 mm. thick, uncinat-hispid, (glabrous and smooth like the foliage, *G. virgatum leiocarpum*).—Dry soil, Coastal Plain and adj. provinces, Tenn. to La., Tex., and Mo.—Spr.

4. *G. pilosum* Ait. Plant 3-8 dm. tall, the stem hirsute, 4-angled above the swollen nodes (or internodes merely pubescent with uncinat hairs on the angles in *G. pilosum punctulosum*; glabrous in *G. pilosum laevicaule*): leaves and stipules, with oval-ovate or elliptic blades 8-10 mm. long, sparingly pubescent, pellucid-punctate beneath: corolla yellowish or purplish; lobes ovate to lanceolate, about 1.5 mm. long: fruit about 4 mm. thick, uncinat-hispid.—Open woods, shaded banks, fence-rows, and thickets, various provinces, Fla. to Tex., Kans., Ont., and Mass.—(*W. I.*)—Sum.

5. *G. circaeans* Michx. Plant 2-4 dm. tall, the stem glabrous or sparingly pubescent: leaves and stipules with elliptic-ovate or oval blades 15-30 mm. long, or more, sparingly pubescent: corolla greenish; lobes ovate, acute, less than 2 mm. long: fruit about 5 mm. thick, uncinat-hispid.—(*WILD-LIQUORICE*.)—Dry woods, thickets, and open banks, various provinces, Fla. to Tex., Minn., and Que.—Sum.

6. *G. lanceolatum* Torr. Plant sparingly pubescent in parts, the stem branched at the base, mostly 2.5-6 dm. tall: leaves and stipules shorter than the internodes, 30-75 mm. long; blades of the upper leaves lanceolate or ovate-lanceolate, acute or slightly acuminate, sparingly pubescent, especially on the veins beneath, 3-ribbed: flowers few, sessile on the spreading cyme-branches: corolla glabrous or nearly so, 3-5 mm. broad, greenish, or yellowish, becoming purple; lobes 4, slender-tipped: fruit as in *G. circaeans*.—(*WILD-LIQUORICE*.)—Dry thickets and rocky woods, various provinces, N of Coastal Plain, N. C. to Ky., Ont., and Que.—Sum.

7. *G. triflorum* Michx. Plant reclining, sweet-scented in drying, the stem 3-10 dm. long, sparsely hispid or rarely glabrous: leaves and stipules in 6's, with broadly linear to elliptic blades 1-8 cm. long, the margins and midrib hispid: flowers relatively few, 3 together on the ultimate peduncles: corolla

greenish or yellowish-white; lobes fully 1.5 mm. long: fruit about 3 mm. thick, uncinate-hispid.—(SWEET-SCENTED BEDSTRAW.)—Thickets and woods, various provinces, Fla. to Tex., Calif., Alas., Ont., and Newf.—(*Eurasia*.)—Spr.—sum.

8. *G. latifolium* Michx. Plant 3–6 dm. tall, the stem glabrous (hispid, like the leaves, in *G. latifolium hispidifolium*): leaves and stipules with broadly lanceolate blades 3–6 cm. long: corolla brownish; lobes ovate-lanceolate, acuminate, about 2.5 mm. long: fruit about 2.5 mm. thick, glabrous, slightly fleshy.—Woods, Blue Ridge to Appalachian Plateau, Ga. to Ala. and Pa.—Sum.—fall.

9. *G. arkansanum* A. Gray. Plant about 3 dm. tall, the stem glabrous below, retrorse-scabrous above: leaves and stipules with narrowly or linear-lanceolate blades 25–40 mm. long, scabrous on the margin and midrib, densely pellucid-punctate beneath: corolla brownish purple: lobes ovate-lanceolate, acuminate, about 2.5 mm. long: fruit 2–2.5 mm. thick, glabrous.—Dry soil, often in rocky woods, various provinces N of Coastal Plain, Tenn. to Okla. and Mo.—Sum.

10. *G. Claytonii* Michx. Plant more or less diffuse, 1.5–6 dm. tall, the stem retrorse-scabrous on the angles: leaves and stipules mostly in 5's or 6's, with linear-spatulate or spatulate-elliptic blades 8–15 mm. long, obtuse, with scabrous margins and midrib: corolla white; lobes about 1 mm. long: fruit about 1.5 mm. thick, glabrous.—Marshes and ditches, various provinces, N. C. to Tex., Nebr., and Que.—Spr.—sum.

11. *G. tinctorium* L. Plant 1.5–2.5 dm. tall, the stem glabrous or nearly so: leaves and stipules mostly in 4's, with linear-lanceolate blades 15–25 mm. long: (plants decumbent with linear-spatulate leaves, in *G. tinctorium floridanum*): flowers 2 or 3 in terminal clusters: corolla white; lobes about 1 mm. long: fruit, when didymous, 3–3.5 mm. wide, smooth.—Damp shaded places, swamps, and wet thickets, various provinces, Fla. to Tex., Ariz., Nebr., and Que.—Spr.—sum., or all year southward.

12. *G. filifolium* (Wiegand) Small. Plant 1.3 dm. tall, the stem and branches diffuse, more or less sprawling in age, glabrous: leaves and stipules mostly in 4's, with very narrowly linear blades mostly 1–1.5 cm. long: flowers in open cymes, filiform-pedicelled: corolla white, about 1 mm. long: fruit, when didymous, 4–5 mm. wide, glabrous.—Low pinelands, swamps, and stream-banks, Coastal Plain, Ga. to N. C.—Spr.—sum.

13. *G. asprellum* L. Plant reclining, the stem 3–16 dm. long, retrorsely scabrous or prickly: leaves and stipules in 6's, with elliptic-spatulate to elliptic blades 1–2 cm. long, the margins and midrib scabrous: flowers very numerous: corolla white; lobes fully 1.5 mm. long: fruit about 2.5 mm. thick, smooth and glabrous.—(ROUGH-BEDSTRAW.)—Open swamps and moist thickets, various provinces, N. C. to Nebr., Ont., and Newf.—Spr.—sum.

14. *G. uniflorum* Michx. Plant evergreen, about 3 dm. tall, the stem smooth and glabrous: leaves and stipules with linear blades 25–28 mm. long, acute, glabrous beneath: flowers solitary in pairs: corolla white; lobes broadly ovate, about 2 mm. long: fruit about 1.5–2 mm. thick, baccate, glabrous.—Dry woods, Coastal Plain and adj. provinces, Fla. to Tex. and S. C.—Sum.

15. *G. bermudense* L. Plant evergreen, diffuse, the stem 1–6 dm. long, hispidulous or glabrous: leaves and stipules oval or elliptic, 5–25 mm. long, cuspidate, pellucid-punctate and pubescent beneath: flowers 3–5 together: corolla greenish-white; lobes narrowly ovate, about 2 mm. long: fruit about 5 mm. thick, baccate, usually smooth and glabrous. [*G. hispidulum* Michx.]—Dry sandy soil, Coastal Plain, Fla. to La. and N. J.—(*W. I.*)—Spr.—sum.

*Sherardia arvensis* L. with the habit of *Galium*, but with funnelliform corollas, has been found in grass plots in northern Fla. and in Tenn.

## FAMILY 2. CAPRIFOLIACEAE — HONEYSUCKLE FAMILY

Shrubs, trees, vines, or perennial herbs. Leaves opposite: blades entire, toothed, or pinnate. Flowers mostly perfect, in terminal or axillary cymes, or axillary. Calyx of mostly 4 or 5 minute or foliaceous sepals. Corolla of 4 or 5 partly united petals, often irregular. Androecium of 4 or 5 stamens: filaments partly adnate to the corolla-tube. Gynoecium 2-5-carpellary. Ovary inferior. Fruit baccate, drupaceous, or capsular.—About 12 genera and 300 species, mostly in the Northern Hemisphere.

Corolla rotate to urceolate, regular or nearly so: stigma 3-5-lobed: style wanting or very short. Tribe I. SAMBUCEAE.  
Corolla tubular to tubular-campanulate or trumpet-shaped, often irregular: stigma capitate: style elongate. II. LONICERAE.

### I. SAMBUCEAE

Leaf-blades pinnate: drupe berry-like with 3-5 nutlets.  
Leaf-blades simple: drupe with one nutlet.

1. *SAMBUCUS*.
2. *VIBURNUM*.

### II. LONICERAE

Flowers axillary: herbs.  
Flowers in axillary or terminal clusters or open cymes: shrubs or vines.  
Fruit baccate.

3. *TRIOSTEUM*.

Corolla regular or nearly so; tube short or elongate: limb with ascending or spreading lobes.

Corolla short, more or less campanulate; tube short: stamens adnate up to the top of the corolla-tube.

Corolla elongate, nearly tubular; tube gradually enlarged upward: stamens not adnate up to the top of the corolla-tube.

4. *SYMPHORICARPOS*.

Corolla irregular; limb 2-lipped.

Flowers in pairs each of which terminates an axillary peduncle, accompanied by a pair of bracts and bractlets.

Bracts minute, very different from the leaves: corolla-tube gibbous at the base: upright shrubs.

Bracts foliaceous, resembling the leaves: corolla-tube not gibbous at the base: vines.

Flowers in whorls at or near the ends of the branches, the bracts and usually some of the upper pairs of leaves connate-perfoliate.

5. *PHENIANTHUS*.

Fruit capsular.

6. *XYLOSTEON*.

7. *NINTOOA*.

8. *LONICERA*.

9. *DIERVILLA*.

1. *SAMBUCUS* [Tourn.] L. Shrubs or trees, with pithy stems. Leaf-blades pinnate. Flowers white, in thyrsoïd or flat-topped cymes. Sepals small. Anthers ellipsoid or oval. Ovary 3-5-celled. Drupe with 3-5 nutlets—About 25 species, widely distributed.—Spr. or all year S.—ELDERS.

Cyme flat-topped or slightly convex: fruit dark-purple to black.

Lateral leaflets merely toothed, or the lower pair rarely with a lateral pinna.

Lateral leaflets, at least the lower pair, pinnately 2- or 3-foliate.

Cyme compact, rounded: fruit red.

1. *S. canadensis*.

2. *S. Simpsonii*.

3. *S. pubens*.

1. *S. canadensis* L. Shrub with soft wood and white pith: leaflets mostly 5-11, the blades of the lateral ones elliptic, lanceolate, ovate or oval, 3-14 cm.

long, serrate with incurved teeth: cyme merely convex: corolla 5-6 mm. wide: drupe 4-5 mm. in diameter.—(COMMON-ELDER.)—Open places, woods, river-banks, and swamps, various provinces, Ga. to Tex., Man., and N. B.

2. *S. Simpsonii* Rehder. Tall shrub or small tree with white pith: leaflets 5-9, the blades of the lateral ones elliptic or nearly so, 3-8 cm. long, serrate: cyme flat: corolla 5-7 mm. wide: drupe 5-6 mm. in diameter. [*S. intermedia* (Fl. SE. U. S.)]—(GULF-ELDER. SOUTHERN-ELDER.)—Hammocks and marshes, Coastal Plain, Fla. to La.—Forms vast thickets in the Lake Okeechobee region and the coastwise lagoons of southern Florida, where it blooms throughout the year.

3. *S. pubens* Michx. Shrub with brown pith: leaflets 5-7, the blades lanceolate, elliptic, or oblanceolate, or nearly oval, 5-15 cm. long: cyme thyrsoid: corolla 4-5 mm. wide: drupe 4-6 mm. in diameter.—(RED-BERRIED ELDER.)—Shaded hillsides and rocky woods, Blue Ridge and more northern provinces, Ga. to Colo., Calif., Alas., Ont., and Newf.

2. **VIBURNUM** [Tourn.] L. Shrubs or trees, the stems not pithy. Leaf-blades simple. Flowers in round-topped cymes. Sepals small. Corolla white. Anthers oblong. Ovary 1-celled. Drupe with a single stone.—About 100 species, widely distributed.—Spr.-sum.—ARROW-WOODS.

Cyme with some of the marginal flowers radiant and sterile: drupe red to scarlet.

I. ALNIFOLIA.

Cyme without radiant marginal flowers: drupe blue or dark-purple to black.

Leaf-blades palmately veined or palmately lobed.

II. ACERIFOLIA.

Leaf-blades pinnately veined, entire or toothed.

Filaments as long as the corolla or longer: leaves with manifest distinction between blades and petiole.

Leaf-blades with straight pinnate veins which terminate in the teeth: stone of the drupe usually grooved.

III. DENTATA.

Leaf-blades with curved veins which anastomose near the entire or toothed margin: stone flat and even.

IV. PRUNIFOLIA.

Filaments much shorter than the corolla: leaves without distinction between blade and petiole.

V. OBOVATA.

#### I. ALNIFOLIA

Shrub with diffuse or procumbent, sometimes creeping (rooting) branches.

1. *V. lantanoides*.

#### II. ACERIFOLIA

Leaf-blades with salient lobes, the teeth manifestly acute or flaring.

2. *V. acerifolium*.

Leaf-blades merely toothed or obscurely lobed, the teeth rounded or relatively blunt.

3. *V. densiflorum*.

#### III. DENTATA

Leaf-blades sessile or very short-petioled.

4. *V. Rafinesquianum*.

Leaf-blades decidedly petioled, sometimes relatively long-petioled.

Lower surfaces of the leaf-blades glabrous or merely with tufts of hairs in the axils of the veins.

Corolla 5-6 mm. wide: drupe globose-ovoid.

5. *V. dentatum*.

Corolla about 8 mm. wide: drupe oval or ovoid.

6. *V. bracteatum*.

Lower surfaces of the leaf-blades stellate-pubescent.

7. *V. semitomentosum*.

## IV. PRUNIFOLIA

Cyme peduncled.

Peduncles shorter than the cymes.

Peduncles as long as the cymes or longer.

Cyme sessile or nearly so.

Leaf-blades prominently acuminate, serrate.

Leaf-blades obtuse or merely acute, serrulate.

Petioles and leaf-surfaces glabrous or nearly so: stone of the drupe elliptic.

Petioles and leaf-surfaces more or less densely red-tomentose: stone orbicular or nearly so.

8. *V. cassinoides*.

9. *V. nudum*.

10. *V. lentago*.

11. *V. prunifolium*.

12. *V. rufotomentosum*.

## V. OBOVATA

Drupe 6-7 mm. long; stone turgid, suborbicular.

Drupe 10-11 mm. long; stone flat, elliptic-obovate.

13. *V. obovatum*.

14. *V. Nashii*.

1. *V. lantanoides* Michx. Straggling shrub: leaf-blades ovate to suborbicular, 9-20 cm. long, serrate: sepals ovate, about 1.5 mm. long, pubescent: corolla 5-6 mm. wide (those of the marginal ones larger), the lobes ovate: drupe 10-15 mm. long. [*V. alnifolium* (Fl. SE. U. S.)]—(HOBBLE-BUSH. MOOSEWOOD. WITCH-HOBBLE.)—Damp woods, Blue Ridge, and more northern provinces, N. C. to Mich. and N. B.

2. *V. acerifolium* L. Erect shrub: leaf-blades prominently 3-lobed, 4-10 cm. long: sepals reniform, about 0.5 mm. long: hypanthium glabrous or nearly so: corolla-lobes mostly reniform: drupe oval, 9-10 mm. long, black or purple-black.—Rocky hillsides, woods, and thickets, various provinces, Ga. to Ont., and N. B.

3. *V. densiflorum* Chapm. Erect shrub: leaf-blades undulate, shallowly toothed or sometimes slightly 3-lobed: sepals deltoid, about 0.7 mm. long: hypanthium pubescent: corolla-lobes mostly ovate: drupe ellipsoid, 8-9 mm. long.—Wooded hillsides, Coastal Plain, W Fla. (and Ala.?)

4. *V. Rafinesquianum* Schult. Shrub: leaf-blades ovate to elliptic or suborbicular, sharply serrate-dentate, 2-7 cm. long: corolla-lobes broadly ovate: filaments about equalling the corolla-lobes: drupe ellipsoid, 7-9 mm. long, black or nearly so. [*V. pubescens* (Ait.) Pursh]—Rocky woods, Blue Ridge and more northern provinces, Ga. to Minn. and Que.

5. *V. dentatum* L. Shrub: leaf-blades suborbicular, oval, or ovate, sharply dentate, 3-8 cm. long; petioles over 1.5 cm. long: corolla-lobes reniform: filaments much exceeding the corolla-lobes: drupe globose-ovoid, 5-6 mm. long, deep-blue or nearly black.—(ARROW-WOOD.)—Wet thickets, swamps, and meadows, various provinces, Fla. to Ont. and N. B.

6. *V. bracteatum* Rehder. Shrub: leaf-blades ovate, often broadly so, crenate-dentate, 5-12 cm. long; petioles mostly less than 1.5 cm. long: corolla-lobes obovate: filaments mostly longer than the corolla-lobes: drupe oval or ovoid, about 1 cm. long, bluish-black.—Banks of the Coosa River, Appalachian Valley, Ga.

7. *V. semitomentosum* (Michx.) Rehder. Shrub: leaf-blades suborbicular, broadly ovate or elliptic, crenate-dentate, 3-9 cm. long: corolla 5-8 mm. wide: filaments slightly exceeding the corolla-lobes: drupe globose-ovoid, 8-9 mm. long

deep-blue.—Low ground and swamps, Coastal Plain, Fla. to Tex. and Pa.—A counter-part of this species in the Blue Ridge province of Ga. and adj. Tenn. and N. C., with large coarsely-toothed leaf-blades in *V. carolinianum* Ashe. A plant with sparingly pubescent foliage and small leaves (2.5–6 cm.) in S Miss., has been described as *V. Ashei* Bush.—*V. molle* Michx., with ellipsoid fruits about 1 cm. long, ranges from Ky. to Mo. and La.

8. *V. cassinoides* L. Shrub: leaf-blades thickish, ovate-elliptic, ovate-lanceolate, or oblanceolate, undulate or crenate, 3–8 cm. long: corolla 4–5 mm. wide: filaments much exceeding the corolla-lobes: drupe ovoid or globose-ovoid, 6–9 mm. long, deep-blue or rarely pink.—(WITHE-ROD. WILD-RAISIN. SWAMP-HAW.)—Swamps and wet woods, various provinces, Fla. to Miss., Man., and Newf.

9. *V. nudum* L. Shrub: leaf-blades thick, oval-ovate, elliptic, broadly lanceolate, or oblanceolate (linear-elliptic or narrowly elliptic-lanceolate in *V. nudum angustifolium* = *V. nitidum*), undulate or obscurely toothed, 5–15 cm. long (up to 30 cm. long in *V. nudum grandifolium*): corolla often larger than that of *V. cassinoides* (smaller in *V. nudum serotinum*): drupe oval to subglobose, 6–10 mm. long, deep-blue.—(POSSUM-HAW. SWAMP-HAW.)—Swamps and low grounds, often in acid soil, Coastal Plain and adj. provinces, Fla. to Tex., Ky., and Conn.

10. *V. Lentago* L. Shrub or tree: leaf-blades ovate to obovate or rarely suborbicular, finely and sharply serrate, 4–10 cm. long: sepals mostly acute or acutish: corolla-lobes ovate: filaments twice as long as the corolla or nearly so: drupe oval, 10–12 mm. long, bluish-black.—(NANNYBERRY. SHEEPBERRY. WILD-RAISIN. SWEET-VIBURNUM.)—Woods and banks of streams, various provinces, Ga. to Mo., Man., and Que.

11. *V. prunifolium* L. Shrub or tree: leaf-blades thinnish, oval varying to ovate or obovate, or rarely suborbicular, finely, sometimes obscurely, serrulate, 2.5–5 cm. long: sepals obtuse: corolla-lobes suborbicular: filaments much less than twice as long as the corolla: drupe elliptic, sometimes broadly so, 7–9 mm. long bluish-black under the bloom.—(BLACK-HAW. STAG-BRUSH. SLOE.)—Thickets, woods and open banks, various provinces, Ga. to Ark., Kans., Mich., and Conn.

12. *V. rufidulum* Raf. Shrub or small tree: leaf-blades thick, elliptic, or nearly so, serrate, 4–10 cm. long: corolla 7–10 mm. wide: drupe broadly oblong, 10–14 mm. long, deep-blue under the bloom. [*V. rufotomentosum* Small.]—(SOUTHERN BLACK-HAW.)—Woods, thickets, hammocks, and bluffs, various provinces, Fla. to Tex., Kans., and Va.

13. *V. obovatum* Walt. Shrub or small tree: leaf-blades oblanceolate, cuneate, or obovate, 1.5–6 cm. long, entire or slightly toothed near the apex: corolla 5–6 mm. wide: filaments scarcely equalling the corolla-tube: drupe oval, 6–8 mm. long, black.—(SMALL-VIBURNUM.)—River-swamps and low hammocks, Coastal Plain, Fla. to Va.

14. *V. Nashii* Small. Shrub or small tree: leaf-blades suborbicular or broadly obovate to spatulate, 4–5 cm. long, more or less crenate: drupe ellipsoid, 10–12 mm. long, black.—(NASH'S-VIBURNUM.)—River-swamps, Fla.

3. **TRIOSTEUM** L. Herbs with simple stems. Leaf-blades entire, sometimes connate-perfoliate. Flowers axillary. Sepals foliaceous. Corolla yellow, greenish-yellow, or maroon. Filaments adnate to the lower part of the corolla-

tube. Anthers linear. Ovary 3-5-celled. Drupe leathery or fleshy. About 6 species, the following and 3 Asiatic.—Sum.—HORSE-GENTIANS. FEVERWORTS.

Leaf-blades narrowed to the sessile or slightly connate-perfoliate bases.

Leaves less than thrice as long as broad: corolla dull-red. 1. *T. aurantiacum*.  
 Leaves over thrice as long as broad: corolla yellowish. 2. *T. angustifolium*.  
 Leaf-blades with broadly dilated connate-perfoliate bases. 3. *T. perfoliatum*.

1. *T. aurantiacum* Bicknell. Similar to *T. angustifolium* in habit: blades of the upper leaves ovate-elliptic to elliptic-lanceolate, 15-25 cm. long: sepals 12-20 mm. long: corolla 14-20 mm. long: drupe 12-14 mm. long.—Rocky woods, sandy thickets, and rich hillsides, various provinces, rarely Coastal Plain, N. C. to Minn. and Que.

2. *T. angustifolium* L. Stem hirsute or softly hispid, 3-9 dm. tall: blades of the upper leaves usually narrowly elliptic, varying to lanceolate or oblanceolate, 3-15 cm. long: sepals 8-10 mm. long: corolla 12-15 mm. long: drupe about 10 mm. long.—Rich soil and edges of thickets, Coastal Plain and adj. provinces, Ala. to La., Mo., and Conn.

3. *T. perfoliatum* L. Stem softly pubescent: blades of the upper leaves ovate to broadly oval, 10-25 cm. long: sepals 11-15 mm. long: corolla 12-15 mm. long: drupe 8-12 mm. long.—(WILD-COFFEE. TINKER'S-WEED.)—Rich woods and thickets, various provinces, rarely Coastal Plain, Ala. to Nebr. and Mass.

4. **SYMPHORICARPOS** [Dill.] Ludwig. Shrubs with much branched stems. Leaf-blades entire, or lobed on shoots. Flowers in spikes or racemes. Sepals minute. Corolla white or red. Filaments adnate to the top of the corolla-tube. Anthers ellipsoid. Ovary 4-celled. Berry drupe-like, fleshy, with 2 nutlets. About 10 species, North American.—Sum.

Style glabrous: drupe white: corolla pale.  
 Style pubescent: drupe red or purple: corolla dark.

1. *S. albus*.  
 2. *S. Symphoricarpos*.

1. *S. albus* (L.) Blake. Shrub 1-2 m. tall, the twigs and leaves glabrous: leaf-blades elliptic or suborbicular, 3-6 cm. long: flowers short-pedicelled: corolla white or pinkish, 6-7 mm. long: drupe 6-10 mm. long. [*S. racemosus* Michx.]—(SNOWBERRY.)—Rocky woods and river-banks, various provinces, N. C. to Calif., B. C., and N. S.

2. *S. Symphoricarpos* (L.) MacM. Shrub 1-2 m. tall, the twigs and leaves pubescent: leaf-blades ovate, oval, or elliptic, 1-4 cm. long, or rarely larger: flowers sessile or nearly so: corolla greenish-red, 2.5-3.5 mm. long: drupe 3-4 mm. long. [*S. vulgaris* Michx.]—(CORAL-BERRY. INDIAN-CURRENT.)—Thickets, edges of woods, and roadsides, various provinces, Ga. to Tex., N. D. and N. Y.; naturalized eastward.

5. **PHENIANTHUS** Raf. Woody vines or diffuse shrubs. Leaf-blades entire, the upper pairs of bracts often connate-perfoliate. Flowers in sessile axillary clusters. Sepals very small. Corolla-elongate, bright-colored: tube slightly ventricose near the base. Berries subglobose, usually clustered.—About 6 species, mostly North American.

1. **P. sempervirens** (L.) Raf. Twining vine, the twigs glabrous: leaf-blades narrow or broad, mostly 2–9 cm. long, glaucous and often glabrous beneath: sepals very broad: corolla 3.5–4.5 cm. long, scarlet or red without, yellow within, or sometimes yellow throughout; lobes mostly 4–5 mm. long, obtuse, the lower lobe often narrower than the upper lobes: filaments 4–4.5 mm. long: berry red or orange. [*Lonicera sempervirens* L.]—(TRUMPET-HONEYSUCKLE. CORAL-HONEYSUCKLE. WOODBINE.)—Thickets, woods, swamps, and fencerows, various provinces, Fla. to Tex., Nebr., and Me.

6. **XYLOSTEON** B. Juss. Erect shrubs. Leaf-blades entire. Flowers in pairs at the end of an axillary peduncle, accompanied by 2 minute bracts and 2 bractlets, the hypanthia more or less united. Sepals minute or obsolete. Corolla relatively short: tube gibbous at the base. Berry distinct or didymous.—About a dozen species, in the north temperate zone.—HONEYSUCKLE.

Corolla funnelform, the lobes shorter than the tube.  
Corolla 2-lipped, the lobes as long as the tube.

1. *X. ciliatum*.  
2. *X. fragrantissimum*.

1. **X. ciliatum** (Muhl.) Pursh. Shrub 0.5–2 m. tall: leaf-blades thin, ovate or oval-ovate, 3–8 cm. long, ciliate: corolla yellowish, about 1.5 cm. long; tube prominently gibbous at the base: stamens and style included or style exserted: berry ovoid or oval-ovoid, 6–10 mm. long, red.—(FLY-HONEYSUCKLE.)—Rocky woods, Blue Ridge and more northern provinces, N. C. to Minn. and N. S.—Spr.

2. **X. fragrantissimum** (Lindl. & Paxton) Small. Shrub 3 m. tall or less with glabrous or nearly glabrous twigs: leaf-blades ovate, oval, elliptic, or obovate, 1.5–4 cm. long, pale beneath: corolla white or nearly so, about 1 cm. long; tube slightly gibbous at the base: berry 6–8 mm. long.—Roadsides and about gardens, Augusta, in the Piedmont of Ga. Nat. of China.—Wint.-spr.

7. **NINTOOA** Sweet. Woody vines. Leaf-blades entire, or pinnatifid on young shoots. Flowers in pairs terminating axillary peduncles, accompanied by 2 foliaceous bracts and 2 small bractlets, the hypanthia distinct. Sepals slender or subulate. Corolla relatively long: tube not gibbous: limb 2-lipped. Berries distinct.—Four or 5 species, Asiatic.

1. **N. japonica** (Thunb.) Sweet. Diffusely creeping or climbing vine: leaf-blades elliptic-ovate or orbicular-ovate, 2–5 cm. long: evergreen or nearly so: corolla white or pink, becoming yellow; tube about 2 cm. long: stamens and style exserted: berries subglobose or oval, 4–6 mm. long, black.—(JAPANESE-

HONEYSUCKLE.)—Woods, banks, sand-dunes, throughout the E U. S. Nat. of Asia. This species has a red-leaved, red-stemmed, and red-flowered form.

**8. LONICERA L.** Woody vines. Leaf-blades entire, or lobed on shoots. Flowers in sessile axillary clusters. Hypanthium short. Sepals minute. Corolla mostly 2-lipped: tube more or less gibbous at the base. Berries clustered. —About 80 species, mostly in the north temperate zone.—Spr.—sum.—HONEY-SUCKLES. WOODBINES.

Corolla-tube glabrous within.

Corolla-tube pubescent within.

Corolla-tube abruptly gibbous at the base.

Corolla glabrous without.

Corolla pubescent without.

Corolla-tube scarcely gibbous at the base.

Style pubescent: corolla pale-yellow: filaments pubescent at the base.

Style glabrous: corolla deep-yellow or orange: filaments glabrous.

Corolla-tube about 15 mm. long, copiously pubescent within: filaments as long as the corolla-lips.

Corolla-tube about 20 mm. long, glabrous or sparingly pubescent within: filaments shorter than the corolla-lips.

1. *L. Caprifolium*.

2. *L. dioica*.

3. *L. glaucescens*.

4. *L. Sullivantii*.

5. *L. flavida*.

6. *L. flava*.

1. ***L. caprifolium* L.** A twining vine, the twigs often pubescent: leaf-blades elliptic, oval, or obovate, 2–7 cm. long: corolla purple without; tube 2.5–3 cm. long; limb white within, fading yellow: berry red.—Thickets and woods, various provinces, Ga. to La., Mich., and N. Y. Nat. of Eu.

2. ***L. dioica* L.** A diffuse or twining vine, the twigs glabrous: leaf-blades elliptic, ovate, oval, or obovate, 5–12 cm. long: corolla yellowish-green tinged with purple; tube 10–12 mm. long. [*L. glauca* Hill]—(MOUNTAIN-HONEYSUCKLE.)—Rocky banks and dry hillsides, Blue Ridge and more northern provinces, Ga. to Mo., Man., and Que.—In the typical plant the swelling of the corolla-tube is close to the base. A form occurs in the mountains of N. Carolina with the swelling higher up, thus leaving a stipe-like base to the corolla-tube.

3. ***L. glaucescens* Rydb.** A twining vine, the twigs sometimes sparingly pubescent: leaf-blades elliptic, 5–12 cm. long: hypanthium glaucous (or glandular and more or less pubescent in *L. glaucescens dasygyna*): corolla yellow, becoming reddish; tube 8–10 mm. long.—Thickets and ravines, Blue Ridge and more northern provinces, N. C. to Okla., Sask., and Ont.

4. ***L. Sullivantii* A. Gray.** A twining vine, the twigs glabrous: leaf-blades elliptic, oval, or obovate, 2.5–8 cm. long: corolla pale-yellow; tube stout, as long as the lips or slightly longer.—Rocky woods, various provinces N of Coastal Plain, Tenn. to Wisc. and Ont.

5. ***L. flavida* Cockerell.** A trailing or twining vine, the twigs green: leaf-blades oblanceolate to elliptic or rhombic-ovate, 8–12 cm. long: corolla light-yellow; tube stout, longer than the lips. [*L. flavescens* Small not Dippel]—Bluffs and shaded banks, Interior Low Plateaus, Tenn. and Ky.

6. *L. flava* Sims. A twining vine, the twigs green, glabrous: leaf-blades oval or ovate, or rarely obovate or elliptic, 3–9 cm. long: corolla orange-yellow; tube slender, much longer than the lips.—Rocky woods, various provinces N of Coastal Plain, Ga. to Ala., Tenn., and N. C.

9. **DIERVILLA** [Tourn.] Mill. Shrubs. Leaves with mostly toothed blades. Flowers in dichotomous cymes. Hypanthium elongate. Sepals 5, narrow. Corolla unequally 5-lobed. Capsule elongate. Three species, as follows:—Spr.—sum.

Leaf-blades petioled, ciliate.

Leaf-blades sessile or nearly so, not ciliate.

Leaf-blades glabrous beneath or essentially so: capsule 9–12 mm. long.

Leaf-blades pubescent beneath: capsule 5–6 mm. long.

1. *D. Diervilla*.

2. *D. sessilifolia*.

3. *D. rivularis*.

1. *D. Diervilla* (L.) MacM. Shrub 5–15 dm. tall, the twigs terete: leaf-blades oval to elliptic-ovate, 3–15 cm. long: sepals 4–5 mm. long: corolla yellow, turning red or reddish: capsule gradually long-beaked. [*D. trifida* Moench.]—(BUSH-HONEYSUCKLE.)—Rocky woods, various provinces, in Coastal Plain only northward, Ga. to Mich., Man., and Newf.

2. *D. sessilifolia* Buckl. Shrub 5–18 dm. tall, the twigs pubescent in lines: leaf-blades lanceolate to ovate-lanceolate or sometimes ovate, 5–15 cm. long: sepals 2–3 mm. long: corolla greenish-yellow: capsule abruptly short-beaked, the body ellipsoid.—Mt. woods, Blue Ridge to Appalachian Plateau, Ga., to Ala., Tenn., and N. C.

3. *D. rivularis* Gattinger. Shrub 5–20 dm. tall, the twigs densely pubescent: leaf-blades ovate to elliptic-lanceolate, 3–8 cm. long: sepals 1.5–2 mm. long: corolla yellow: capsule gradually long-beaked, the body ellipsoid-ovoid.—Damp mt. woods and rocky banks, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., and N. C.

#### ORDER VALERIANALES — VALERIANAL ORDER

Caulescent or rarely acaulescent, succulent, coarse or woody plants. Leaves opposite: blades entire, toothed, or divided. Flowers mainly perfect. Calyx of partly united sepals, pappus-like, or obsolete. Corolla of 2–5 partly united petals. Androeceum of usually fewer stamens than there are petals. Gynoeceum 1–3-carpellary. Ovary inferior, 2 of the carpels commonly abortive. Fruit an achene, or nut-like.

Gynoeceum 3-carpellary, but with two of the cavities empty: flowers not in involu-  
crate heads. Fam. 1. VALERIANACEAE.

Gynoeceum 1-carpellary: flowers in dense involu-  
crate heads. Fam. 2. MORINACEAE.

#### FAMILY 1. VALERIANACEAE — VALERIAN FAMILY

Annual or perennial, caulescent, succulent herbs. Leaves opposite: blades entire or pinnately divided. Flowers in variously disposed cymes. Calyx of 3–5 sepals, or sometimes pappus-like, or obsolete. Corolla of 3–5

partially united petals: tube often swollen or spurred. Androecium of 1-4 stamens: filaments adnate to the corolla-tube. Gynoecium 3-carpellary but only 1 carpel fructiferous. Ovary inferior. Fruit a kind of leathery or crustaceous nutlet.—About 9 genera and 300 species, widely distributed.

Sepals becoming bristle-like or awn-like: fruit 1-celled: tall herbs often with divided leaf-blades.

1. VALERIANA.

Sepals minute or wanting: fruit 3-celled: low herbs with undivided leaf-blades.

2. VALERIANELLA.

**1. VALERIANA** [Tourn.] L. Perennial heavy-scented herbs or vines. Leaf-blades entire, toothed, or pinnatifid. Flowers perfect, in compact cymes. Calyx with an inrolled limb which ultimately expands and develops 5-15 plumose bristles. Corolla funnelform or salverform. Stamens 3 or fewer. Fruit 1-celled, the 2 abortive carpels appearing as 4 ridges.—About 175 species, most abundant in the cooler parts of the north temperate zone and the mts. of South America.

Corolla 1.5-2 mm. long: fruit pubescent: upper stem-leaves ternate. 1. *V. scandens*.  
Corolla 16-20 mm. long: fruit glabrous: upper stem-leaves pinnate. 2. *V. pauciflora*.

1. *V. scandens* L. Vine: blades of the basal leaves ovate, entire: bracts 1-2 mm. long: inflorescence open: corolla pinkish; lobes nearly  $\frac{1}{2}$  as long as the tube: fruit ovoid, 2.5-3 mm. long.—Thickets and hammocks, pen. Fla.—(*W. I., Mex., C. A., S. A.*)—All year.

2. *V. pauciflora* Michx. Plants 1 m. tall or less: blades of the basal leaves ovate or triangular-ovate, mostly toothed: bracts 4-8 mm. long: inflorescence congested: corolla pale-pink; lobes less than  $\frac{1}{8}$  as long as the tube: fruit oblong, 5-6 mm. long.—Stream-banks and rich woods, various provinces N of Coastal Plain, Tenn. to Mo., Pa., and Va.—Late spr.—These two species of *Valeriana* are of very diverse habits, the one a rampant vine with inconspicuous flowers, the other an erect herb with flowers showy.

**2. VALERIANELLA** [Tourn.] Mill. Annual, vernal, succulent herbs, the stems dichotomous. Leaf-blades entire, toothed, lobed, or pinnatifid. Flowers perfect, in clustered or corymbose cymes. Calyx shallowly lobed or obsolete. Corolla funnelform, white, pink, or blue. Stamens 3. Fruit with the abortive carpels more or less elongate. About 50 species, natives of Northern Hemisphere.—Spr.-sum.—CORN-SALADS. LAMB'S-LETTUCES.

Corolla blue or purplish: fruit about twice as broad as thick.

1. *V. Locusta*.

Corolla white: fruit about as broad as thick: species native.

Fruit with the fertile portion fully as wide as the sterile portion: fruit ovoid-tetragonal, with a broad and shallow groove between the sterile portions.

2. *V. radiata*.

Fruit with the fertile portion much smaller and narrower than the sterile portion.

Empty cavities broad, bladder-like by the infolding of the edges and forming a cross-shaped umbilication.

3. *V. umbilicata*.

Empty cavities never infolded so as to make a bladder-like body.

Empty cavities dilated and divergent, forming a saucer-shaped body notched at both ends.

4. *V. patellaria*.

Empty cavities contiguous, with an elliptic depression between them.

5. *V. Woodsiana*.

1. *V. Locusta* (L.) Bettke. Stem 1–4 dm. tall: blades of the stem-leaves elliptic-lanceolate: corolla 2 mm. long: fruit about twice as long as thick. [*V. olitoria* Poll.]—Stream-banks, thickets, meadows, and waste-grounds, various provinces, Ala. to La., Idaho, Ont., Me., and N. C. Nat. of Eu.

2. *V. radiata* (L.) Dufr. Stem 2–7 dm. tall: blades of the upper stem-leaves oblanceolate to elliptic or ovate: fruits obovoid-tetragonal.—Stream-banks, moist hillsides, and meadows, various provinces, Fla. to Tex., Minn., and N. Y.

3. *V. umbilicata* (Sulliv.) Krok. Stem 1–3 dm. tall: blades of the upper stem-leaves lanceolate; empty portion of the fruit with a cross-shaped umbilication.—Low grounds, various provinces N of Coastal Plain, Tenn. to Ohio, N. Y., and Pa.

4. *V. patellaria* (Sulliv.) Krok. Stem 1–4 dm. tall: blades of the upper stem-leaves similar to those of *V. radiata*: empty carpels of the fruits with a saucer-shaped body notched at each end.—Fields, meadows, and low grounds, various provinces N of Coastal Plain, Tenn. to Ohio and Pa.

5. *V. Woodsiana* (T. & G.) Walp. In habit and leaves resembling *V. radiata*: fruits about 2 mm. long, with the fertile portions much smaller and narrower than the sterile, the cavities of this latter contiguous, with an elliptic depression between them.—Moist banks and low grounds, various provinces, Tenn. to N. Y. and Pa.

## FAMILY 2. MORINACEAE — TEASEL FAMILY

Annual or perennial, often prickly herbs, or woody plants. Leaves opposite: blades entire, toothed, or dissected. Flowers perfect, each subtended by an involucl, commonly crowded on a receptacle and involuclate. Calyx a cup-like border or of several bristles. Corolla of 2–5 partially united petals, sometimes 2-lipped. Androeceum of 2–4 stamens: filaments adnate to the corolla-tube. Gynoeceum 1-carpellary. Ovary inferior. Fruit an achene crowned with a calyx.—About 7 genera and 150 species, natives of the Old World.

1. *DIPSACUS* [Tourn.] L. Coarse prickly herbs. Leaf-blades often connate-perfoliate. Flower-heads globular or elongate. Involucral bracts rigid. Calyx cup-like, sometimes 4-lobed. Corolla tubular-funnelform. Ovary enclosed in the involucl. Achenes 8-ribbed.—About 15 species, natives of the Old World.

1. *D. sylvestris* Huds. Biennial, 1–2.5 m. tall: blades of the stem-leaves lanceolate, entire: heads ovoid, 5–6 cm. long, the involucral bracts rough: calyx fully 1 mm. long: corolla 11–13 mm. long; lobes 4, lilac, broadly ovate: stamens exserted: achenes 5 mm. long.—(TEASEL.)—Fields and waste-places, various provinces, Fla. to Tex., Ont., and Me. Nat. of Eu.—Sum.

## ORDER ARISTOLOCHIALES — ARISTOLOCHIAL ORDER

Herbs, shrubs, or vines. Leaves alternate: blades mostly cordate or hastate. Flowers perfect, often conspicuous. Hypanthium mostly adnate to the ovary. Calyx regular or very irregular. Corolla wanting or rudimentary. Androecium of as many stamens as there are calyx lobes or more. Gynoecium of usually 6 united carpels. Fruit a capsule.

## FAMILY 1. ASARACEAE — BIRTHWORT FAMILY

Perennial herbs, shrubs, or vines. Leaves alternate: blades sometimes lobed, generally cordate. Flowers perfect, regular or very irregular. Calyx usually colored, the tube often bent or inflated. Androecium of 6—many stamens. Gynoecium of 4–6 united carpels. Ovary mostly inferior. Fruit capsular.—About 6 genera and 200 species, widely distributed.

Acaulescent herbs: calyx regular, persistent: capsule fleshy.

Ovary superior: filaments shorter than the anthers: styles distinct: leaves persistent.

1. *HEXASTYLIS*.

Ovary inferior: filaments longer than the anthers: styles united: leaves deciduous.

2. *ASARUM*.

Cauliscent herbs or vines: calyx irregular, deciduous: capsule dry.

3. *ARISTOLOCHIA*.

**1. *HEXASTYLIS* Raf.** Acaulescent gingerous herbs. Leaves 1 every year: blades lustrous above. Flower-stalk subtended by a bract. Hypanthium terete, glabrous without. Sepals green or purplish without, dark-purple, and sometimes blotched within, persistent. Capsule enveloped in the calyx and hypanthium. Seeds flattened.—Eight species, as follows.—Spr. or spr.—sum.—The leaves are evergreen with coriaceous blades.—HEART-LEAFs.

Leaf-blades of a broadly ovate type, varying to suborbicular or reniform, not hastate.

Hypanthium and calyx of an urceolate type in anthesis.

Hypanthium and calyx 3–4 cm. long, the lobes over 1 cm. wide.

1. *H. Shuttleworthii*.

Hypanthium and calyx 1–2 cm. long, the lobes less than 1 cm. wide.

Calyx-limb over 1.5 cm. wide in anthesis; lobes nearly or quite half as long as the tube.

2. *H. virginica*.

Calyx-limb less than 1.5 cm. wide in anthesis; lobes very short.

3. *H. Memmingeri*.

Hypanthium and calyx of a turbinate or turbinate-campanulate type in anthesis.

4. *H. heterophylla*.

Leaf-blades of a hastate type.

Calyx without any decided limb, the lobes erect or somewhat spreading.

Hypanthium and calyx ovoid-urceolate, the small lobes erect, the tube not constricted.

5. *H. Ruthii*.

Hypanthium and calyx campanulate-urceolate, the large lobes spreading, the tube constricted.

6. *H. callifolia*.

Leaf-blades predominantly of an ovate type.

7. *H. arifolia*.

Leaf-blades predominantly of a triangular-hastate type.

8. *H. speciosa*.

Calyx with a salver-campanulate limb surmounting the tube.

**1. *H. Shuttleworthii* (J. Britten) Small.** Leaf-blades orbicular, varying to ovate or somewhat rhombic, 5–8 cm. long, the sinus narrow: hypanthium and

calyx long-urceolate, 3-5 cm. long; lobes broad, ascending or spreading, and more or less incurved at the tip: anther-sacs 3 mm. long, exceeded by the broad blunt connective-tip: styles 5-5.5 mm. long: seed 3 mm. long.—Rich or somewhat acid woods, inner Piedmont to Appalachian Valley, Ala. to Tenn., and S Va.

2. *H. virginica* (L.) Small. Leaf-blades broadly ovate, varying to orbicular-ovate or deltoid-ovate, 4-9 cm. long, the sinus often narrow: hypanthium and calyx short-urceolate, 1-2 cm. long; lobes broad, somewhat spreading: anther-sacs 2-2.5 mm. long, scarcely exceeded by the minute connective-tip: styles about 4 mm. long: seed about 3 mm. long. [*Asarum virginicum* L.] Woods, often in acid soil, various provinces, especially Coastal Plain, S. C. to Tenn., W. Va., and Va.

3. *H. Memmingeri* (Ashe) Small. Leaf-blades suborbicular to orbicular-ovate or orbicular-reniform, 4-7 cm. long, the sinns often narrow or closed: hypanthium and calyx short-urceolate, 1-1.5 cm. long; lobes broad, erect or slightly spreading: anther-sacs 2.5 mm. long, not exceeded by the connective-tip: styles 2.5 mm. long: seed about 2 mm. long.—Acid woods, inner Piedmont to Appalachian Plateau, Ga. to W. Va. and S Va.

4. *H. heterophylla* (Ashe) Small. Leaf-blades orbicular-reniform to orbicular-ovate or triangular-ovate, 4-10 cm. long: hypanthium and calyx turbinate or turbinate-campanulate, 2-2.5 cm. long; lobes very broad, somewhat spreading: anther-sacs about 2.5 mm. long, slightly exceeded by the minute connective-tip: styles 2-2.5 mm. long: seed about 2.5 mm. long.—Woods, Piedmont, to Appalachian Plateau, Ga. to Ala., W. Va., and S Va.

5. *H. Ruthii* (Ashe) Small. Leaf-blades hastate, varying from individually ovate to broadly triangular in outline, 8-15 cm. long: hypanthium and calyx narrowly urceolate, with 3 short ovate, erect or converging lobes surmounting the narrow neck: anther-sacs 2-2.5 mm. long, much exceeded by the narrow connective-tips: seed fully 3 mm. long.—Rich woods, Blue Ridge to Appalachian Plateau, Ala. to Tenn. and S Va.

6. *H. callifolia* Small. Leaf-blades ovate, 5-9 cm. long: hypanthium and calyx broadly urceolate, with reniform, more or less spreading lobes surmounting a broad neck: anther-sacs about 4 mm. long, much exceeded by the broad connective-tip—Woods, N Fla.

7. *H. arifolia* (Michx.) Small. Leaf-blades hastate, varying from individually ovate to deltoid or reniform in outline, 5-1.2 cm. long: hypanthium and calyx urceolate, with 3 broad spreading lobes surmounting the constricted neck: anther-sacs 2.5 mm. long, slightly exceeded by the minute connective-tips: seeds about 3 mm. long. [*Asarum arifolium* Michx.]—Rich or sterile woods, various provinces, Fla. to Ala., Tenn., and S Va.

8. *H. speciosa* Harper. Leaf-blades ovate-hastate, 6-12 cm. long: hypanthium and calyx campanulate-salverform, calyx conspicuous, the hemispheric base surmounted by a cap-like limb with 3 broad spreading parallel-lined lobes: anther sacs 3 mm. long, the connective broadly rounded at the apex which slightly exceeds the sacs: styles 2-2.5 mm. long.—Rich woods, Autauga Co., in the Coastal Plain of Ala.

2. **ASARUM** [Tourn.] L. Acaulescent gingerous herbs. Leaves in pairs: blades not lustrous. Flower-stalks arising between the petioles. Hypanthium angled, pubescent. Sepals brown within, deciduous. Capsule inferior. Seeds turgid.—About 20 species, natives of the north temperate zone.—Spr.—The leaves are not evergreen, with thick-membranous blades.—WILD-GINGERS.

Sepals triangular, merely acute, about as long as the hypanthium or shorter.

1. *A. reflexum*.

Sepals lanceolate-acuminate, longer than the hypanthium.

2. *A. canadense*.

3. *A. acuminatum*.

Sepals slightly longer than the hypanthium, the tubular portion 4–8 mm. long: species mainly Alleghenian.

Sepals much longer than the hypanthium, the tubular portion 10–20 mm. long: species campestrian.

1. ***A. reflexum*** Bicknell. Leaf-blades reniform, 6–14 cm. wide, the sinus open: flowers smaller than those of the preceding species: sepals 8–10 mm. long, early reflexed, obtuse at the tip—Rocky hillsides and rich woods, various provinces N of Coastal Plain, N. C. to Kans., Ia., and Conn.

2. ***A. canadense*** L. Leaf-blades reniform, 6–15 cm. wide, the sinus closed: hypanthium thinly pubescent: sepals abruptly acuminate, the tubular portions curving upward.—Rich woods and rocky hillsides, various provinces, N. C. to Ark., (La.?), Ont., and N. B.

3. ***A. acuminatum*** (Ashe) Bicknell. Similar to *A. canadense*, but more pubescent: hypanthium densely pubescent: sepals gradually acuminate, the tubular tips recurved-spreading.—Woods, Blue Ridge and more northern provinces, Tenn to Minn.

***A. rubrocinctum*** Peattie is said to differ from *A. canadense* and *A. acuminatum* by its larger flowers and less pubescent leaf-blades, and also from the former by its longer sepals. It occurs in the mountains of N. C.

3. **ARISTOLOCHIA** [Tourn.] L. Caulescent herbs, shrubs, or vines. Leaves with narrow or broad blades. Flowers irregular, often S-shaped or resembling a “dutch pipe,” the calyx usually corolloid. Hypanthium often ribbed. Ovary inferior. Styles united into an angled column. Capsule pendulous.—About 200 species, in tropical and temperate regions.—BIRTHWORTS.

Erect herbs: flowers borne at the base of the stem: calyx-tube swollen at each end.

I. **HASTATAE.**

Twining vines: flowers borne along the branches.

Herbaceous vines: calyx-tube swollen at the base: calyx-limb expanded on one side: stamens 5.

Woody vines: calyx-tube swollen in the middle: calyx-limb expanded on all sides: stamens 6.

II. **PENTANDRAE.**

III. **MACROPHYLLAE.**

#### I. **HASTATAE**

Plant sparingly and indistinctly pubescent with soft hairs: capsule sparingly pubescent.

Leaf-blades hastate, delicate: capsule 5–6 mm. long or rarely longer.

Leaf-blades not hastate, membranous: capsule about 1 cm. long.

Plant manifestly pubescent with stiff spreading hairs: capsule copiously pubescent.

1. *A. hastata*.

2. *A. Serpentaria*.

3. *A. convolvulacea*.

## II. PENTANDRAE

Diffusely twining vine with fleshy leaf-blades and globular drooping capsules.

4. *A. pentandra*.

## III. MACROPHYLLAE

Young foliage densely tomentose: leaf-blades coriaceous: hypanthium tomentose.

5. *A. tomentosa*.

Young foliage minutely pubescent or glabrous: leaf-blades membranous: hypanthium glabrous.

6. *A. macrophylla*.

1. *A. hastata* Nutt. Plant light-green, 1-3 dm. tall: leaf-blades very thin, linear to lanceolate, hastate, 2-12 cm. long: flowers about 1.5 cm. long: hypanthium densely hirsutulous: calyx purple or greenish-purple: capsule 5-11 mm. in diameter: seed 3.5-4 mm. long, with minute scattered papillae on the face. [*A. Nashii* Kearney] — (SNAKEROOT.) — Damp woods, various provinces, Fla. to La. and S Va.—Sum.

2. *A. Serpentaria* L. Plant dark-green, 1-4 dm. tall: leaf-blades elliptic-lanceolate to oval-lanceolate, or rarely lanceolate, 4-15 cm. long; flowers 1-1.5 cm. long: hypanthium villous-hirsutulous: calyx purple; limb obtusely 3-lobed: capsule about 10 mm. in diameter: seed about 4 mm. long, with many approximate papillae on its face.—(VIRGINIA-SNAKEROOT.)—Rich woods, various provinces, Fla. to Tex., Mo., Mich., and Conn.—Spr.—fall.

3. *A. convolvulacea* Small. Plant bristly-pubescent, 1-3 dm. tall: leaf-blades broadly ovate to oval, 2-8 cm. long: flowers about 1.5 cm. long: hypanthium densely hirsute: calyx purplish; limb 3-lobed: capsule 6-8 mm. in diameter.—Woods, Piedmont to Appalachian Plateau, Ga.—Spr.—sum.

4. *A. pentandra* Jacq. Stem reclining and twining: leaf-blades ovate, 4-10 cm. long: hypanthium minutely pubescent: calyx nearly straight, greenish or purplish, the limb narrow, nearly erect: capsule globular, 15-20 mm. long, wing-angled: seed black, 5-6 mm. long.—Coastal hammocks, S Pen. Fla. and the Keys.—(W. I.)—All year.

5. *A. tomentosa* Sims. Stem woody, high-climbing, the branches downy; leaf-blades ovate to suborbicular, 10-18 cm. long, rounded at the apex: peduncle wanting: calyx abruptly bent above the ovary, the limb 2-2.5 cm. wide, yellowish or greenish-yellow, except the purple orifice, rugose: capsule 4-6 cm. long. (PIPEVINE.)—Woods, various provinces, Fla. to Okla., Mo., Ill., and N. C.—Spr.

6. *A. macrophylla* Lam. Stem greatly elongate, climbing, the branches glabrous or nearly so: leaf-blades suborbicular to broadly ovate, 5-25 cm. long, abruptly acute or obtuse: peduncles 1-2 cm. long: calyx abruptly bent above the ovary, the limb 2-3 cm. wide, brown or yellowish, veiny: capsule 5-6 cm. long. [*A. Sipho* L'Her.]—(DUTCHMAN'S PIPE.)—Woods, various provinces N of Coastal Plain, Ga. to Kans., Minn., and Pa.—Spr.—sum.

*Aristolochia maxima* L. of tropical America and cultivated, with large variegated flowers and capsules 1-1.5 dm. long, has escaped from cultivation into hammocks in S Fla.

## ORDER CAMPANULALES — CAMPANULAL ORDER

Herbs, or rarely shrubs or trees. Leaves mainly alternate: blades simple, entire, or divided. Flowers perfect, monoecious or dioecious, sometimes irregular. Hypanthium well-developed. Calyx of several distinct or partly united sepals. Corolla of several distinct or partly united petals. Androecium of 1–5 stamens. Anthers distinct or connate. Gynoecium of 1–several united carpels, the ovary wholly or partially inferior. Fruit capsular, baccate, or drupaceous.

Flowers variously disposed, but not in heads.

Flowers monoecious or dioecious: plant usually tendril-bearing vines: endosperm wanting.

Fam. 1. CAMPANUTACEAE.

Flowers perfect or mainly so: herbs or shrubs: endosperm present.

Corolla regular.

Fam. 2. CAMPANULACEAE.

Corolla irregular, split on one side:

Anthers united around the style: stigma naked: herbs.

Fam. 3. LOBELIACEAE.

Anthers separate: stigma surrounded by a cup-like indusium: succulent shrubs.

Fam. 4. BRUNNONIACEAE.

Flowers capitate, on a flat or elongate receptacle.

Fam. 5. CALYCERACEAE.

## FAMILY 1. CUCURBITACEAE — GOURD FAMILY

Vines, usually tendril-bearing. Leaves alternate: blades palmately or pedately veined, and commonly lobed. Flowers monoecious or dioecious. Calyx of 4 or 5, or rarely 6, distinct or partly united sepals. Corolla of 4 or 5, or rarely 6, distinct or partly united petals, sometimes adherent to the calyx. Androecium of 3 stamens (2 anthers 2-celled and 1 anther 1-celled), or rarely of 1, 2, 4, or 5 stamens. Filaments sometimes united. Anthers straight or bent. Gynoecium 1–several-carpellary. Styles united. Fruit a fleshy or partly dry berry (pepo).—About 90 genera and 700 species, mostly tropical.

Stamens distinct or with the filaments partly united.

Anther-sacs straight or merely curved.

Anther-sacs S-shaped or V-shaped.

Stamens united into a column.

Tribe I. MELOTHRIEAE.

Tribe II. CUCURBITEAE.

Tribe III. SICYOIDEAE.

## I. MELOTHRIEAE

Slender trailing or climbing, mostly monoecious vines.

1. MELOTHRIA.

## II. CUCURBITEAE

Ovules horizontal, numerous.

Corolla rotate.

Anthers distinct.

Calyx with 2 or 3 scales at the bottom within.

Calyx without basal scales within.

Staminate flowers racemose: fruit dry.

Staminate flowers solitary or in clusters: fruit fleshy.

Anther-sacs not surpassed by the connective: tendrils branched.

Anther-sacs surpassed by the connective: tendrils simple.

Anthers capitate.

Corolla campanulate.

Ovules erect or ascending: 1–4 in each cavity.

2. MOMORDICA.

3. LUFFA.

4. CITRULLUS.

5. CUCUMIS.

6. CUCURBITA.

7. PEPO.

8. CAYAPONIA.

## III. SICYOIDEAE

Corolla campanulate: fruit smooth.

Corolla rotate: fruit bristly or echinate.

9. COCCINEA.

Pistillate flowers mostly solitary: ovary 2- or 3-celled, with few ovules: fruit bladdery, few-seeded, opening at the apex.

Pistillate flowers clustered: ovary 1-celled, with one ovule: fruit succulent, indehiscent.

10. MICRAMPELIS.

11. SICYOS.

**1. MELOTHRIA** L. Slender perennial vines. Leaves with toothed or lobed blades. Flowers mainly monoecious. Hypanthium of the pistillate flowers relatively short. Corolla yellow, that of the pistillate flowers relatively short, about 8 mm. broad (in our species), that of the staminate flower smaller. Berry juicy, the rind tender. Seed flat.—About 70 species, natives of warm and tropical regions.—CREEPING-CUCUMBERS. MELONETTES.

Berry ellipsoid or oval.

Stem climbing: leaf-blades longer than wide, the lobes angular: berry dark-purple or blackish.

Stem trailing or creeping: leaf-blades wider than long, the lobes low and rounded: berry green and somewhat variegated.

Berry globose or subglobose.

Berry over 10 mm. in diameter: leaf-blades deeply lobed.

Berry less than 10 mm. in diameter: leaf-blades shallowly lobed.

1. *M. pendula*.

2. *M. crassifolia*.

3. *M. Nashii*.

4. *M. microcarpa*.

**1. *M. pendula*** L. Leaves glabrous or nearly so (or with hispidulous petioles and deeply lobed blades in *M. pendula aspera*); blades suborbicular to ovate in outline, 3–8 cm. wide, with 3–5 angular shallow-toothed lobes; petioles hispid: hypanthium glabrous or pubescent: berry ellipsoid or oval, 10–25 mm. long.—Swamps and thickets, various provinces, Fla. to Tex., Mo., and S. Pa.—(*Mex.*)—Spr.-fall.

**2. *M. crassifolia*** Small. Leaf-blades suborbicular, reniform, or ovate in outline, 3–8 cm. wide, with 3–5 angular shallow-toothed lobes: hypanthium glabrous or pubescent: berry ellipsoid or oval, 10–25 mm. long.—Hammocks, pen. Fla. and the Keys.—All year.

**3. *M. Nashii*** Small. Leaf-blades fleshy, suborbicular to triangular-ovate in outline, 2–3.5 cm. long, 5-lobed, the lobes entire or with 1 or 2 teeth or small lobes; petioles hispid: berry globose, 12–15 mm. in diameter.—Pinelands, pen. Fla.—Spr.-fall.

**4. *M. microcarpa*** Shuttlew. Leaf-blades thinnish, commonly as long as wide, 1–3 cm. long, 3–5-lobed, the lobes irregularly toothed: petioles hispidulous: berry globose, 7–9 mm. in diameter.—Thickets, Appalachian Plateau, Ala.—Spr.-sum.

**2. MOMORDICA** L. Annual or perennial vines. Leaves with entire, lobed, or pedately dissected blades. Flowers monoecious or dioecious. Staminodia of the pistillate flowers gland-like, or wanting. Stalk of the staminate flowers bracted. Style slender. Stigmas 3. Berry warty.—About 25 species, native of the Old World Tropics.—The plants flower most of the year.

Leaf-blades with obtuse or acutish teeth: bract entire, at the middle or base of the staminate peduncle.

1. *M. Charantia*.

Leaf-blades with acuminate teeth: bract toothed, at the apex of the staminate peduncle.

2. *M. Balsamina*.

**1. *M. Charantia*** L. Stem creeping or climbing, often greatly elongate: leaf-blades 4–12 cm. wide, 5–7-lobed, the lobes with acutish or obtuse teeth, villous

or glabrate: sepals oval or oval-ovate, 3-4.5 mm. long: corolla yellow about 2 cm. wide: berry 4-12 cm. long, golden-yellow: seed elliptic, 9-12 mm. long or rarely larger.—(WILD BALSAM-APPLE.)—Hammocks, thickets, and waste-places, outer Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)

2. *M. Balsamina* L. Stem mostly climbing, much-branched: leaf-blades 3-8 cm. wide, 3-5-lobed, the lobes with acuminate teeth; petioles usually puberulent: sepals elliptic, about 6 mm. long: corolla golden-yellow and dark or black at the center, about 2.5 cm. wide: berry 3-6 cm. long, orange: seed ovoid or oval, 10-12 mm. long.—(BALSAM-APPLE.)—Sandy soil, Coastal Plain, La. and Tex.—(W. I., Mex., C. A., S. A.)

3. *LUFFA* L. Annual vines. Leaves with 5-7-lobed blades. Flowers monoecious. Corolla yellow, pink, or whitish. Staminodia of the pistillate flowers 3. Style columnar. Stigmas 3, each 2-lobed. Berry elongate, ribbed.—About 7 species, all but 1 in the Old World tropics.

1. *L. cylindrica* (L.) Roem. Stem and branches ribbed: leaf-blades suborbicular in outline, mostly 1-3 dm. broad and 5-7-lobed, the lobes coarsely toothed: sepals lanceolate to triangular-lanceolate, those of the pistillate flowers about twice as long as those of the staminate: corolla yellow, that of the pistillate flower 10-12 cm. wide, that of the staminate flower smaller: berry cylindric or clavate, 2.5-6.5 dm. long.—(VEGETABLE-SPONGE. DISHCLOTH-GOURD.)—Roadsides, waste-places, and thickets, pen. Fla. Nat. of Old World tropics.—(W. I., Mex., C. A., S. A.)—All year.

4. *CITRULLUS* Schrad. Annual or perennial vines. Leaves with lobed blades. Flowers monoecious. Staminodia of the pistillate flowers prominent. Style short. Stigmas reniform. Berry smooth.—About 4 species, Asiatic and African.

1. *C. Citrullus* (L.) Small. Stem trailing, with spreading hairs: leaf-blades ovate in outline, 3-7-lobed: sepals linear or nearly so: corolla pale-yellow; lobes ovate or elliptic: berry globose to ellipsoid-cylindric, 1-6 dm. long, smooth, edible: seed flat.—(WATERMELON.)—Waste-places, woods, pinelands, and roadsides, various provinces, Fla. to Tex. and N. C. Nat. of tropical Africa.—Spr.-fall.—The watermelon plant is too sensitive to cold to become a permanent member of our flora.

5. **CUCUMIS** L. Annual or perennial vines. Leaves with toothed or prominently lobed blades. Flowers monoecious. Corolla rotate. Staminodia of the pistillate flowers obsolete or wanting. Style short. Stigmas obtuse. Berry rugose or echinate.—About 25 species, mostly Asiatic and African.

Corolla 3–5 cm. broad: fruit not prickly.  
Corolla 1–1.5 cm. broad: fruit prickly.

1. *C. Melo*.  
2. *C. Anguria*.

1. **C. Melo** L. Stem stout: leaf-blades reniform to suborbicular, 1.5 dm. long or less, merely toothed or shallowly lobed: corolla 3–5 cm. wide, yellow: fruit elongate or depressed, rugose.—(MELON. CANTALOUPE. MUSKMELON.)—Pinelands, cult. grounds, and waste-places, Coastal Plain, Fla. to Tex. Nat. of Asia and cult.—(*W. I., Mex., C. A., S. A.*)

2. **C. Anguria** L. Stem slender: leaf-blades mostly 5–8 cm. long, deeply 3–5-lobed: corolla 1–1.5 cm. wide, yellow: fruit oval to ellipsoid.—(BUR-GHERKIN. WEST-INDIAN GHERKIN. GOOSE-BERRY GOURD.)—Thickets and waste-places, Coastal Plain, Fla. to Tex., and Ga.—(*W. I., Mex., C. A., S. A.*)—These two species of *Cucumis*, although not permanently naturalized in our range, continue to appear.

6. **CUCURBITA** [Tourn.] L. Annual vines. Leaves with lobed blades. Flowers monoecious or rarely dioecious. Corolla rotate. Staminodia wanting. Stigmas erect, 2-lobed. Berry variable in shape, the rind smooth, woody.—One species.

1. **C. Lagenaria** L. Plant musk-scented, clammy-pubescent: leaf-blades ovate to triangular or orbicular-ovate, 1–3 dm. long, sinuate or denticulate: corolla white with greenish veins, 5–7 cm. wide; lobes broadened upward, erose-crenate: berry usually somewhat clavate. [*Lagenaria Lagenaria* Cockerell.]—(BOTTLE-GOURD. GOURD. CALABASH.)—Thickets and waste-places, Coastal Plain, Fla. to Tex. Nat. of Old World tropics and cult.—(*W. I., Mex., C. A., S. A.*)

7. **PEPO** [Tourn.] Mill. Annual or perennial vines. Leaves with toothed or lobed blades. Flowers monoecious. Corolla campanulate, typically large. Pistillate flowers with staminodia. Ovary 1-celled. Stigmas 2-lobed. Berry fleshy, with a tough rind.—About 10 species, American, African, and Asiatic.—PUMPKINS. GOURDS.

1. **Pepo okeechobeensis** Small. Annual with clammy pubescent foliage and unequally forked tendrils: leaf-blades suborbicular or orbicular-reniform in outline, 1–2 dm. wide, deeply cordate, shallowly 5–7-lobed, the lobes irregularly dentate: flowers pedicelled: hypanthium pubescent: sepals subulate or subulate-lanceolate: corolla cream-colored, campanulate, finely pubescent, the lobes erose-crenulate: berry (pepo) globular, 7–9 cm. in diameter, bright-green and usually flecked and somewhat streaked with whitish or dark-green spots: seeds obovate, 8–12 mm. long, thick-margined.—

(OKEECHOBEE-GOURD).—Hammocks, about Lake Okeechobee, Fla.—Spr.—sum.—Cultivated relatives, sometimes met with in the field are: the field-pumpkin (*Pepo Pepo* (L.) Britton.), with harshly pubescent foliage, bright-yellow or orange corollas and usually larger orange-colored fruits, nativity undetermined; the so-called crookneck squash, (*Pepo moschata* (Duchesne) Britton), with fruits of many shapes, known in Florida as the Seminole-pumpkin, may be found growing wild about Indian settlements and abandoned camp sites.

**8. CAYAPONIA** Manso. Vines. Leaves with toothed or lobed blades. Flowers monoecious or dioecious. Corolla rotate or broadly campanulate, relatively small. Pistillate flowers with staminodia. Ovary 3-celled, smooth. Stigmas dilated. Berry juicy, with a tender rind.—About 60 species, American.

Leaf-blade not decurrent on the petiole: anther free.

Berry oval, less than 1.5 cm. long: leaf-blades usually less than 1 cm. wide.

1. *C. Boykinii*.

Berry ellipsoid, over 1.5 cm. long: leaf-blades usually over 10 cm. wide.

2. *C. grandifolia*.

Leaf-blade decurrent on the petiole: anthers coherent.

3. *C. racemosa*.

1. *C. Boykinii* (T. & G.) Cogn. Stem finely pubescent: leaf-blades thickish, 5–10 cm. long, 3-angled or 3-lobed, sparingly pubescent beneath; petioles bristly villous: corolla greenish-white, the staminate 5–6 mm. wide: berry 12–14 mm. long: seed 6–7 mm. long. [*Trianosperma Boykinii* Roem.]—Along streams, Coastal Plain, Ga. to La.—Sum.

2. *C. grandifolia* (T. & G.) Small. Stem sparingly pubescent: leaf-blades thin, 12–18 cm. long, 3-lobed; petioles softly villous: corolla greenish-white, the staminate 7–9 mm. wide: berry 16–20 mm. long.—Bottomlands, Coastal Plain, Miss to La. and Ark.—Sum.

3. *C. racemosa* (Sw.) Cogn. Stem glabrous or nearly so: leaf-blades thick, 6–13 cm. long, 3-lobed, closely hispidulous beneath; petioles glabrous or nearly so: staminate corolla 8–10 mm. wide, greenish: berry ellipsoid to oval, 15–20 mm. long: seed 9–10 mm. long.—Hammocks, Everglade Keys, Fla.—(W. I.)—Spr.—sum.

**9. COCCINEA** W. & A. Perennial dioecious vines. Leaves with angulate or shallowly lobed blades. Corolla campanulate, relatively large. Pistillate flowers solitary, with 3 staminodia. Ovary smooth and glabrous. Berry smooth. Seeds numerous.—About a dozen species, natives of the Old World tropics.

1. *C. cordifolia* (L.) Cogn. Stem glabrous, climbing: leaf-blades ovate to orbicular in outline, 4–10 cm. long, 3–5-lobed, cordate, slender-petioled: sepals subulate or linear-subulate, 3–4 mm. long, reflexed: corolla white, 3–4 cm. wide: berry ellipsoid or obovoid, 4–5 cm. long, scarlet.—Hammocks, pen. Fla. Nat. of Asia.—(W. I., Mex., C. A., S. A.)—All year.

**10. MICRAMPELIS** Raf. Annual or perennial vines. Leaves with angulate or lobed blades. Flowers monoecious. Corolla rotate, relatively small. Pistillate flowers usually solitary, with staminodia. Ovary echinate. Stigmas lobed. Berry echinate, fibrous within, the rind tough. Seeds not filling the cavities.—About 25 species, American.

1. *M. lobata* (Michx.) Greene. Stem and branches tender: leaf-blades 4–15 cm. long, palmately 3–5-lobed; the lobes triangular-ovate to lanceolate: sepals 2–4 mm. long: corolla rotate, 7–9 mm. wide, white or cream-color; lobes lanceolate: berry inflated, ellipsoid to globose-ellipsoid, 3–4.5 mm. long, bursting at the apex. [*Echinocystis lobata* T. & G.]—(WILD BALSAM-APPLE. MOCK-APPLE.)—Stream-banks and thickets, various provinces, Ga. to Tex., Colo., Sask., and N. B.—Sum.

**11. SICYOS** L. Annual monoecious vines. Leaves with angulate or lobed blades. Corolla rotate, relatively small. Pistillate flowers clustered, without staminodia. Ovary and berry bristly. Seeds filling the cavity.—About 35 species, American and Australian.

1. *S. angulata* L. Stem and branches viscid-pubescent: leaf-blades 6–15 cm. wide, 5-angled or 5-lobed, the lobes distinctly toothed: hypanthium flattish: sepals of the staminate flowers triangular, 3–5 mm. long: corolla rotate, white, striped with green, 10–12 mm. wide: berries clustered, ovoid, 1.5–2 cm. long.—(NIMBLE-KATE. STAR-CUCUMBER.)—Thickets, stream-banks, and cult. grounds, various provinces, Fla. to Tex., Minn., and Que.—Sum.—fall.

## FAMILY 2. CAMPANULACEAE — BELL-FLOWER FAMILY

Herbs or woody plants. Leaves alternate: blades entire, toothed, or lobed. Flowers perfect, regular, sometimes dimorphous. Calyx of 5 sepals, or fewer in cleistogamous flowers. Corolla of 5 partly united petals. Androeceum of 5 distinct stamens. Gynoeceum 2–5-carpellary, the ovary more or less inferior. Fruit capsular.—About 40 genera and more than 1,000 species, widely distributed.

Style with pollen-collecting hairs: filaments free or nearly so: corolla usually valvate or induplicate in the bud.

Corolla campanulate or funnelform: inflorescence racemose or paniculate.

Corolla rotate.

Flowers axillary.

Flowers in spikes.

Style declined: flowers complete throughout.

Style straight: flowers various, the earlier ones cleistogamous.

Style without collecting hairs: filaments adnate to the corolla: corolla imbricate in the bud.

1. CAMPANULA.

2. ROTANTHA.

3. CAMPANULASTRUM.

4. SPECULARIA.

5. SPHENOCLEA.

1. **CAMPANULA** [Tourn.] L. Perennial or sometimes annual herbs. Leaf-blades entire, toothed, or lobed. Flowers perfect, all alike and complete. Hypanthium relatively short in age. Corolla campanulate to funnelform. Stamens included. Capsule opening by lateral or basal perforations or valves. —About 250 species, natives of the Northern Hemisphere.—**BELFLOWERS**.

Style shorter than the corolla or sometimes about equalling it: leaf-blades entire or slightly toothed. 1. *C. aparinoides*.  
Style exceeding the corolla: leaf-blades laciniately toothed. 2. *C. flexuosa*.

1. *C. aparinoides* Pursh. Stem 2–6 dm. long, prickly throughout: leaf-blades 1–3.5 cm. long, those of the upper leaves linear to lanceolate: sepals ovate to triangular-ovate, 1.5–2 mm. long: corolla white, pale blue, or pink, 5–8 mm. long: capsule globose-obovoid: seed about 0.5 mm. long, smooth. — (MARSH-BELFLOWER.) — Acid swamps, meadows and spring-runs, various provinces, Ga. to Ky., Colo., and Me.—Sum.

2. *C. flexuosa* Michx. Stem 2–10 dm. tall, smooth: leaf-blades 2–12 cm. long, lanceolate to ovate-lanceolate or elliptic: sepals subulate, 4–6 mm. long: corolla violet-blue or white, 6–8 mm. long: capsule turbinate-campanulate: seed fully 1 mm. long, wrinkled. [*C. divaricata* Michx.] — Cliffs and woods often in acid soil, Blue Ridge to Appalachian Plateau, Ga. to Ala., Ky., W. Va., and W Md.—Sum.—fall.

*Campanula persicifolia* L., a native of Europe, up to 1 m. tall, with spatulate to linear leaf-blades and large blue or white corollas 2–2.5 cm. wide, has escaped from gardens, W N. C.

2. **ROTANTHA** Small. Annual or perennial, smooth, diffuse herbs. Leaf-blades entire, or obscurely or shallowly toothed. Flowers perfect, all alike and complete. Hypanthium short. Corolla rotate. Stamens exserted. Capsule opening by perforations.—Two species, natives of Florida.

Corolla 14–18 mm. wide: sepals nearly or quite as long as the corolla-lobes: capsule obovoid.  
Corolla 7–8 mm. wide: sepals less than half as long as the corolla-lobes: capsule subglobose.

1. *R. floridana*.

2. *R. Robinsiae*.

1. *R. floridana* (S. Wats.) Small. Perennial: stems and branches diffusely spreading and often intertwined, 2–4 dm. long: leaf-blades narrowly elliptic-ob lanceolate, linear, or linear-lanceolate, 1–4 cm. long, obscurely toothed: hypanthium obovate-turbinate: sepals linear-lanceolate to linear-subulate, 6–9 mm. long: corolla violet; lobes narrowly lanceolate: anthers 3–4 mm. long: capsule obovoid, 3–4 mm. long. [*Campanula floridana* S. Wats.] — Grassy swamps and marshes, E Fla. and the pen.—All year.

2. *R. Robinsiae* Small. Annual: stem with several or many slender erect branches, 0.5–1 dm. tall: leaf-blades spatulate to elliptic, lanceolate, or ovate, or rarely narrower, 0.3–1.2 cm. long, entire or sharply few-

toothed: hypanthium subglobose: sepals lanceolate to subulate-lanceolate, 1-1.5 mm. long: corolla violet or blue; lobes elliptic; anthers 1-1.5 mm. long: capsule subglobose, 2-2.5 mm. in diameter. [*Campanula Robinsiae* Small]—Grassy slopes of Chinsegut Hill, near Brooksville, Fla.—Spr.-fall.

**3. CAMPANULASTRUM** Small. Annual or biennial herbs. Leaf-blades toothed. Flowers perfect and complete. Hypanthium elongate in age. Corolla rotate. Stamens exserted. Capsule opening by subapical valves. Seed flattish, broad, margined.—One species.

**1. C. americanum** (L.) Small. Plant 2-20 dm. tall, often widely branched: blades of the upper leaves usually lanceolate, 5-12 cm. long, acuminate: sepals linear-subulate, 6-10 mm. long: corolla blue or white; lobes 10-13 cm. long: capsule turbinate-clavate, 8-10 mm. long: seed oval, about 1.5 mm. long.—Rich woods and rocky river-banks, various provinces, Fla. to Ark., S. Dak., and N. B.—Sum.

**4. SPECULARIA** [Heist.] Fabr. Annual or biennial herbs. Leaf-blades toothed. Flowers dimorphous, the earlier ones with 3 or 4 sepals and undeveloped corollas, the later ones with 5 sepals and rotate corolla. Capsule prismatic, opening by lateral valves.—About 10 species, in the Northern Hemisphere.—VENUS'S LOOKING-GLASSES.

Leaf-blades clasping, usually fully as wide as long: capsule with the valves near the middle.

1. *S. perfoliata*.

Leaf-blades sessile, longer than wide: capsule with the valves at the top.

2. *S. biflora*.

**1. S. perfoliata** (L.) A. DC. Stem 1-5 dm. tall: leaf-blades suborbicular to triangular-ovate: corolla purple, 10-15 mm. wide: capsule ellipsoid-prismatic or obconic, 5-6 mm. long: seed oval, about 0.5 mm. long.—Woods, fields, and waste-places, various provinces, Fla. to Tex., Calif., B. C., and Ont.—(*W. I., Mex., C. A., S. A.*)—Sum.

**2. S. biflora** (R. & P.) F. & M. Stem 1-5 dm. tall: leaf-blades ovate to elliptic or lanceolate above: corolla purple, 15-20 mm. wide: capsule cylindric to fusiform, 6-9 mm. long: seed nearly 1 mm. long.—Fields and open places, various provinces, Fla. to Tex., Calif., Kans., and Que.—(*W. I., Mex.*)—Spr.-fall.

**5. SPHENOCLEA** Gaertn. Annual herbs. Leaf-blades entire. Flowers all alike, borne in a continuous dense spike. Sepals broad. Corolla short-

campanulate: lobes short. Stamens with very short filaments. Ovary depressed. Stigma nearly sessile. Capsule circumscissile, the lid and calyx adnate.—One species.

1. *S. zeylanica* Gaertn. Plant 2–13 dm. tall: leaf-blades mainly elliptic to almost linear, 3–12 cm. long, paler beneath than above: spikes 3–11 cm. long: sepals broadly ovate, 1.5 mm. long: corolla white or greenish, about 2 mm. long, the ovate lobes about as long as the tube: capsule 3–4 mm. wide.—Low grounds, Coastal Plain, La. to Ark. Nat. of the Old World tropics.—(W. I., Mex., C. A., S. A.)—Spr.-fall.

### FAMILY 3. LOBELIACEAE — LOBELIA FAMILY

Herbs, or rarely trees, the sap often milky. Leaves alternate: blades entire, toothed, or parted. Flowers perfect, or rarely dioecious, irregular. Calyx of 5 sepals. Corolla more or less 2-lipped, the tube open on one side. Androecium of 5 stamens, the filaments sometimes cohering. Gynoecium mostly 2-carpellary, the ovary more or less inferior. Fruit capsular or baccate.—About 20 genera and 600 species, widely distributed.

1. **LOBELIA** [Plum.] L. Annual or perennial herbs. Leaf-blades entire or toothed. Flowers in spikes, racemes, or panicles. Hypanthium mostly ribbed. Sepals entire or often glandular-toothed, sometimes with basal appendages. Corolla variously colored or white: upper lip 2-lobed: lower lip 3-lobed. Anthers in a ring around the style, 2 often smaller than the others. Ovary 2-celled. Capsule 2-valved.—About 225 species, widely distributed.—In the following descriptions cauline leaves are considered.

Corolla red (pink or white forms are rare).

Corolla blue or white, or blue variegated with white.

Flowers large (corolla-tube over 1 cm. long).

Stem not scape-like, leafy to the inflorescence.

Stem scape-like, leafy at the base, the upper leaves reduced and remote.

Flowers small (corolla-tube less than 1 cm. long).

Raceme secund.

Raceme not secund.

Blades of the cauline leaves sessile.

Upper cauline leaves with broad blades, at least not linear: raceme spike-like, continuous.

Upper cauline leaves with narrow, usually linear, or filiform blades: raceme relatively few-flowered, open.

Blades of the cauline leaves manifestly petioled.

#### I. CARDINALES.

#### II. SIPHILITICAE.

#### III. PALUDOSAE.

#### IV. APPENDICULATAE.

#### V. SPICATAE.

#### VI. NUTTALLIANAE.

#### VII. XALAPENSES.

#### I. CARDINALES

Perennial herb with offsets: raceme elongate, mostly 1-sided, very showy.

#### II. SIPHILITICAE

Sepals pinnatifid, the auricles hiding the hypanthium: leaves not at all or only slightly reduced above: blades pinnatifid-toothed.

1. *L. cardinalis*.

2. *L. brevifolia*.

Sepals entire or glandular-toothed, the auricles, if present, not hiding the hypanthium: leaves on the upper part of the stem much smaller than those below.

Sepals with deflexed or broadly rounded auricles at the base, the edges ciliate, not glandular-toothed.

Hypanthium hemispheric in anthesis: sepals strongly auricled at the base, erose and more or less irregularly toothed.

Hypanthium turbinate in anthesis: sepals slightly auricled at the base, merely ciliate.

Sepals without basal auricles.

Sepals entire, glandless.

Leaf-blades broad, usually bluntly toothed: sepals shorter than the corolla-tube.

Leaf-blades narrow, undulate or glandular-toothed: sepals as long as the corolla-tube or longer.

Sepals glandular-toothed.

Lower lip of the corolla glabrous: hypanthium glabrous: leaf-blades broad.

Lower lip of the corolla pubescent within: hypanthium bristly-pubescent: leaf-blades narrow.

3. *L. siphilitica*.

4. *L. puberula*.

5. *L. amoena*.

6. *L. elongata*.

7. *L. glandulifera*.

8. *L. glandulosa*.

### III. PALUDOSAE

Sepals not auricled at the base: anther-head about 2 mm. long: corolla-tube less than 1 cm. long.

Sepals auricled at the base: anther-head about 4 mm. long: corolla-tube over 1 cm. long.

9. *L. paludosa*.

10. *L. floridana*.

### IV. APPENDICULATAE

Sepals lanceolate, glandular-toothed, much shorter than the corolla-tube: corolla finely pubescent without: hypanthium turbinate in anthesis.

Sepals subulate, entire or merely erose: nearly or quite as long as the corolla-tube: corolla glabrous or puberulent without: hypanthium campanulate in anthesis.

11. *L. flaccidifolia*.

12. *L. Gattingeri*.

### V. SPICATAE

Capsule partly inferior: mature hypanthium hemispheric: sepals more or less auricled at the base.

Sepals lanceolate, with minute spreading auricles at the base, shorter than the corolla-tube.

Sepals slender-subulate, with long deflexed auricles at the base, quite as long as the corolla-tube.

Bracts elongate, nearly or quite surpassing the flowers: corolla copiously pubescent without.

Bracts short, not surpassing the flowers: corollas glabrous or slightly puberulent without.

Capsule wholly inferior: mature hypanthium obovoid, oval, or ovoid: sepals not at all auricled.

13. *L. spicata*.

14. *L. bractcata*.

15. *L. leptostachya*.

16. *L. inflata*.

### VI. NUTTALLIANAE

Pedicels mostly shorter than the bracts, shorter than the corollas in anthesis.

Sepals lanceolate: corolla less than 1 cm. long: mature hypanthium hemispheric or depressed-hemispheric.

Sepals linear-subulate: corolla mostly over 1 cm. long: mature hypanthium ellipsoid or turbinate-ellipsoid.

Pedicels much exceeding the bracts, longer than the corollas.

17. *L. Nuttallii*.

18. *L. Canbyi*.

19. *L. Boykinii*.

### VII. XALAPENSES

Pedicels long, over 1 cm. long in anthesis: capsule  $\frac{1}{2}$  inferior or less.

Corolla 4-6 mm. long: sepals lanceolate.

Corolla 8-10 mm. long: sepals subulate.

Pedicels short, less than 1 cm. long in anthesis: capsules  $\frac{2}{3}$  inferior.

20. *L. Clifflortiana*.

21. *L. homophylla*.

22. *L. Feayana*.

1. *L. cardinalis* L. Stem 3-12 dm. tall, simple, glabrous or finely hirsute: blades of the lower leaves elliptic to elliptic-spatulate, serrate or dentate:

raceme continuous, rather conspicuously bracted: sepals linear-attenuate to linear-subulate, entire: corolla-lobes on either side of the cleft linear-oblancheolate or nearly linear: anther-head 5-6 mm. long: capsule hemispheric, short-beaked: seed about 1 mm. long. — (CARDINAL-FLOWER.) — Wet ravines, swamps and stream-banks, various provinces, Fla. to Tex., Ont., and N. B.—Sum.—fall.

2. *L. brevifolia* Nutt. Stem 3-8 dm. tall, rather copiously and evenly leafy, sometimes branched: leaf-blades fleshy, spatulate or obovate to elliptic or linear-elliptic, 0.5-2.5 cm. long, pinnatifid-toothed, the teeth gland-tipped: raceme interrupted, not conspicuously bracted: sepals lanceolate to hastate-ovate, pinnatifid, each with 2 obtuse basal auricles which invest the hypanthium: corolla blue, pubescent without; lobes of the upper lip lanceolate: capsule 5-7 mm. long: seed about 0.5 mm. long.—Moist pinelands, Coastal Plain, Fla. to La.—Sum.—fall.

3. *L. siphilitica* L. Stem 2-10 dm. tall, sparingly pubescent, often branched: leaf-blades thin or thinnish, oblanceolate to elliptic or lanceolate, 2.5-20 cm. long, coarsely serrate or sinuate-dentate: sepals lanceolate, bristly ciliate, acuminate from a broad base, each with large acute basal auricles: corolla light-blue, or rarely white, straightened out, over 2 cm. long: anther-head fully 5 mm. long: capsule over 7 mm. wide, with the sepal-auricles reaching nearly or quite to the base: seed ellipsoid.—(GREAT-LOBELIA.)—Low grounds, meadows, and along streams, various provinces, Ga. to La., Colo., S. Dak., Ont., and Me.—Sum.—fall.

4. *L. puberula* Michx. Stem 3-10 dm. tall, softly fine-pubescent: leaf-blades thick, oblanceolate to obovate, elliptic, lanceolate, or ovate, 2-10 cm. long, finely toothed: sepals lanceolate, finely pubescent, each with small rounded basal auricles: corolla bright-blue, straightened out 2 cm. long or less; anther-head less than 5 mm. long: capsule less than 7 mm. wide, finely pubescent with the sepal auricles reaching to above the middle: seed linear-cylindric.—Wet woods, low grounds, and thickets, often in acid soil, various provinces, Fla. to Tex., Ga., and N. J.—Fall.

5. *L. amoena* Michx. Stem 3-12 dm. tall, glabrous or softly hirsute: leaf-blades thinnish, elliptic, varying to obovate or ovate, undulate to sinuate, or unevenly crenate: sepals narrowly linear-subulate, 7-8 mm. long, entire, slender-tipped: corolla bright-blue, straightened out 2-2.5 cm. long or sometimes less; anther-head 2-2.5 mm. long: capsule 5-6 mm. wide: seed linear-cylindric, fully 1 mm. long.—Acid swamps or moist hillsides, Coastal Plain, Fla. to Miss. and Va.—Sum.—fall.

6. *L. elongata* Small. Stem 3-12 dm. tall, glabrous: leaf-blades linear or nearly so, or narrowly linear-lanceolate on the upper part of the stem, 2-10 cm. long, undulate, serrate, or dentate-serrate: sepals elongate, linear-subulate or linear-setaceous, entire: corolla deep-blue, straightened out about 2 cm. long: anther-head about 4 mm. long: capsule about 5 mm. wide: seed narrowly ellipsoid, barely 1 mm. long.—Low grounds, Coastal Plain, Fla. to La. and Va.—Sum.—fall.

7. *L. glandulifera* (A. Gray) Small. Stem 3-7 dm. tall, glabrous or sparingly pubescent: leaf-blades narrowly elliptic to elliptic-ovate, 3-12 cm. long, irregu-

larly dentate or undulate: hypanthium glabrous: sepals narrowly lanceolate to linear-lanceolate, 7-9 mm. long, pectinately glandular-toothed: corolla deep-blue, straightened out 2-2.5 cm. long: anther-head 3-4 mm. long: capsule about 5 mm. wide: seed ellipsoid, about 1 mm. long.—Low grounds, meadows, and swamps, Coastal Plain, Fla. to Miss. and Va.—Sum.—fall.

8. *L. glandulosa* Walt. Stem 3-12 dm. tall, glabrous: leaf-blades linear-ob lanceolate to linear, 2-15 cm. long, repand or shallowly toothed, the teeth gland-tipped: hypanthium pubescent: sepals lanceolate or linear-lanceolate, 6-9 mm. long, prominently glandular-toothed: corolla deep-blue, straightened out 2-2.5 cm. long; lobes of the lower lip broadly ovate: capsule 6-7 mm. wide: seed ellipsoid, less than 1 mm. long.—Wet pinelands and swamps, Coastal Plain, Fla. to Va.; reported also from Miss.—Spr.—fall or all year southward.

9. *L. floridana* Chapm. Stem 8-15 dm. tall: leaf-blades linear or slightly linear-spatulate below, 10-40 cm. long, undulate or crenate-undulate: sepals hastate-lanceolate, 4-5 mm. long, coarsely toothed: corolla blue, sometimes pale, straightened out over 1.5 cm. long: capsule 4-4.5 mm. wide.—Swamps, and low pinelands, Coastal Plain, Fla. to Miss.—Spr.—fall.

10. *L. paludosa* Nutt. Stem 2-9 dm. tall: leaf-blades linear-spatulate, or rarely elliptic-obovate to linear, 3-25 cm. long, entire or sinuate-crenate: sepals lanceolate to linear-lanceolate, 3-5 mm. long, shallowly toothed or often entire: corolla light-blue or white, straightened out less than 1.5 cm. long: capsule 3-3.5 mm. wide.—Swamps, and low pinelands and ponds, Coastal Plain, Fla. to La. and Del.—Spr.—fall, or all year southward.

11. *L. flaccidifolia* Small. Stem 2-6 dm. tall: leaf-blades thin, obovate to elliptic-spatulate at the base of the stem, linear-elliptic or rarely linear-lanceolate above, 3-11 cm. long, undulate or crenate-undulate: hypanthium in anthesis turbinate: sepals lanceolate, 3-5 mm. long, glandular-toothed, auricled at the base: corolla 14-16 mm. long: capsule 5-8 mm. long.—River swamps, Coastal Plain, Fla. and Ga.—Sum.

12. *L. Gattingeri* A. Gray. Stem 2-4 dm. tall, glabrous: leaf-blades thick, obovate at the base of the stem, elliptic, oval, or ovate above, 1-4 cm. long, irregularly toothed or nearly entire: hypanthium in anthesis campanulate: sepals subulate, 4-6 mm. long, eciliate, not auricled at the base: corolla 8-9 mm. long: capsule 5-6 mm. long.—Cedar glades and limestone prairies, Interior Low Plateaus, Ala. and Tenn.—Spr. Plants, perhaps referable to *L. appendiculata* in which the ciliate sepals are auricled at the base, have been found in Ala.

13. *L. spicata* Lam. Stem 1-12 dm. tall, pubescent, at least near the base: leaf-blades spatulate, obovate, or suborbicular at the base of the stem, oblanceolate to lanceolate above, 1-10 cm. long, crenate-dentate or nearly entire: hypanthium in anthesis hemispheric: sepals lanceolate, 3-3.5 mm. long, with minute spreading auricles at the base: corolla blue, 6-9 mm. long: capsule 2.5-3 mm. long.—Woods, moist fields, and meadows, various provinces, Ga. to Tex., Sask., and P. E. I.—Sum.

14. *L. bracteata* Small. Stem 8-10 dm. tall: leaf-blades spatulate at the base of the stem, elliptic, lanceolate or elliptic-lanceolate above, 3-10 cm. long, glandular-toothed: hypanthium in anthesis somewhat depressed: sepals slender-subulate, 4-4.5 mm. long, with deflexed auricles at the base: corolla 8-9 mm. long: capsule 5-7 mm. long.—Woods, Piedmont, Ga. to N. C.—Sum.

15. *L. leptostachys* A. DC. Stem 3-12 dm. tall: leaf-blades obovate to oblanceolate at the base of the stem, elliptic to lanceolate above, 3-10 cm. long, entire or indistinctly toothed: hypanthium in anthesis depressed: sepals slender-subulate, 5-6 mm. long, with deflexed auricles at the base: corolla 6-8 mm. long: capsule 3-4 mm. long.—Dry soil, various provinces, rarely Coastal Plain, Ga. to Miss., Kans., Ohio, and Va.—Sum.

16. *L. inflata* L. Stem 1-10 dm. tall, finely hirsute: leaf-blades obovate to oval or ovate, 2-9 cm. long, crenate: hypanthium in anthesis campanulate: sepals linear, 2.5-3.5 mm. long, entire: corolla lilac, 6-8 mm. long: capsule 5-8 mm. long, inflated.—(INDIAN-TOBACCO. WILD-TOBACCO. EYEBRIGHT.)—Fields, woods, and thickets, various provinces, Ga. to Ark., Sask., and Lab.—Sum.—fall.

17. *L. Nuttallii* Roem. & Schult. Stem 2-7 dm. tall: leaf-blades obovate to ovate at the base of the stem, oblanceolate to linear above, 2-4 cm. long, entire or toothed: hypanthium in anthesis much depressed: sepals lanceolate, about 2 mm. long, entire: corolla light-blue, 6-7.5 mm. long: capsule 2.5-3 mm. long.—Low grounds or pinelands, Coastal Plain and rarely Appalachian provinces, Fla. to Miss., Pa., and S N. Y.—Spr.—fall.

18. *L. Canbyi* A. Gray. Stem 3-8 dm. tall: leaf-blades elliptic-linear to linear, 2-6 cm. long, glandular-denticulate: hypanthium in anthesis campanulate: sepals linear-subulate, 3-4 mm. long, obscurely glandular-denticulate: corolla bright-blue, 10-11 mm. long: capsule about 4 mm. long, wholly inferior.—Pineland swamps, local, Coastal Plain, S. C. to N. J.—Sum.—fall.

19. *L. Boykinii* T. & G. Stem 3-8 dm. tall, hollow, virgate, sometimes with few virgate branches: leaf-blades inconspicuous, linear-filiform to filiform, 1-3 cm. long or shorter, indistinctly glandular-toothed: hypanthium in anthesis turbinate: sepals slender-subulate, 3.5-4.5 mm. long, entire: corolla bright-blue, 8-10 mm. long: capsule 3-4 mm. long, half-inferior.—Pineland swamps and cypress-ponds, Coastal Plain, Fla. to S. C.—Spr.—sum.

20. *L. Cliffortiana* L. Stem 3-6 dm. tall, often finely pubescent: leaf-blades ovate to ovate-lanceolate, 2-10 cm. long, coarsely toothed or sinuate: sepals lanceolate, about 2 mm. long, entire: corolla 4-6 mm. long: capsule 5-6 mm. long.—Wet places, waste-places, and cult. grounds, Coastal Plain, Fla. to Tex. Nat. of Trop. Am.—(*W. I., Mex., C. A., S. A.*)—Spr.—fall.

21. *L. homophylla* F. E. Wimmer. Stem 2-6 dm. tall, glabrous or finely pubescent: leaf-blades ovate to suborbicular, 1-4 cm. long, rather closely and irregularly crenate or incised-dentate, cordate to truncate at the base: sepals subulate, 2.5-3.5 mm. long, entire: corolla 8-10 mm. long: capsule 6-7 mm. long. [*L. Cliffortiana xalapensis* (Chapm. Fl.). *L. xalapensis* (Fl. SE U. S.).]—Pinelands, fence-rows, and roadsides, pen. Fla.—Spr.—fall.

22. *L. Feayana* A. Gray. Stem 1-3 dm. tall, glabrous: leaf-blades reniform, suborbicular, or orbicular-ovate at the base of the stem, obovate to ovate above, 0.5-1.5 cm. long, entire or crenate: sepals lanceolate, 1.5-2 mm. long, entire: corolla 7-9 mm. long: capsule about 4 mm. long.—(BAY-LOBELIA.)—Pinelands, Fla.—Spr.—fall.

#### FAMILY 4. BRUNONIACEAE — GOODENIA FAMILY

Herbaceous or woody plants. Leaves alternate or sometimes opposite: blades entire, toothed, or pinnatifid. Flowers perfect. Calyx of 5 par-

tially united sepals, or rarely obsolete. Corolla of 5 equally or unequally united petals. Androecium of 5 distinct stamens. Gynoecium mostly of 2 united carpels, the ovary inferior. Stigma surrounded with an indusium. Fruit drupaceous, baccate, or capsular.—Twelve genera and more than 200 species, mostly Australian.

1. **SCAEOVOLA** L. Succulent herbs or shrubs. Leaf-blades mostly entire. Flowers irregular, in cymes. Calyx 5-lobed, or obsolete. Corolla-tube open to the base on one side, the lobes winged. Stigma with a ciliate indusium. Berry with a fleshy exocarp.—About 60 species, mostly Australian.

1. **S. Plumieri** Vahl. Plant 3–18 dm. tall: leaf-blades obovate to spatulate, 4–6 cm. long: calyx-lobes rounded: corolla white or pinkish, 22–28 mm. long, woolly within; lobes linear to lanceolate: berries oval to globular, 10–14 mm. long, black, very juicy.—Coastal sand-dunes, pen. Fla. and Florida Keys.—(W. I.)—All year.—Stems often spreading under the sand and forming large patches.

#### FAMILY 5. CALYCERACEAE — CALYCERA FAMILY

Herbs or partly woody plants. Leaves alternate: blades usually narrow, entire, toothed, or pinnatifid. Flowers small, in heads which are solitary at the end of each peduncle, or sessile, the receptacle short or elongate. Involucre of one or two series of distinct or united bracts. Calyx of 4–6 more or less accrescent sepals. Corolla elongate: tube slender, the throat shorter than the tube, the limb 4–6-lobed. Androecium of 4–6 stamens. Filaments adnate up to the throat of the corolla. Anthers erect, adnate around the style. Gynoecium of a single carpel. Ovary inferior. Style elongate. Stigma minute. Fruit an achene, often crowned with the calyx.—Three genera and 25 species, South American.

1. **ACICARPHA** Juss. Annual diffuse or procumbent herbs. Leaves varicus: blades of the basal ones usually petioled, those of the cauline leaves sessile or clasping, all entire or toothed. Heads sessile or short-peduncled, spiny at the base, the marginal flowers fruit-producing, the central flowers not fruit-producing. Receptacle elongate. Sepals erect, persistent. Corolla colored, with a long tube and a short throat: lobes narrow. Achenes more or less united to each other.—Three species, South American.

1. **A. tribuloides** Juss. Plant mostly 1–4 dm. tall, glabrous: basal leaves 3–11 cm. long; blades spatulate: blades of the cauline

leaves elliptic to lanceolate, clasping, all coarsely toothed: sepals about 1 mm. long, acuminate: corollas yellow, about 3 mm. long; lobes lanceolate: achene crowned with the accrescent subulate sepals, 4-5 mm. long.—Fields and roadsides, N Fla. Nat. of S. Am.—Spr.—fall.

# ORDER CARDUALES—CARDUAL ORDER

Herbs, shrubs, or rarely trees. Leaves mainly alternate: blades entire, toothed, or divided. Flowers perfect, monoecious, or dioecious, few or many aggregated on a receptacle and surrounded with an involucre, or the involucre rarely obsolete. Calyx one or two rows of bristles, scales, a mere border or crown, or obsolete, or wanting. Corolla of several more or less united petals, or wanting. Androecium of usually 5 stamens, the anthers converging, or united. Gynoecium mostly of 2 united carpels. Ovary inferior. Styles or stigmas mostly 2. Fruit an achene.

Flowers with tubular corollas, or those of the outer ones prolonged into ligules.

Stamens distinct, or the filaments sometimes united, the anthers merely converging about the stigma.

Fam. 1. AMBROSIACEAE.

Stamens united by their anthers, thus forming a tube around the stigma, except in *Kuhnia*.

Fam. 2. CARDUACEAE.

Flowers with each corolla prolonged into a ligule.

Fam. 3. CICHORIACEAE.

## FAMILY 1. AMBROSIACEAE—RAGWEED FAMILY

Annual or perennial herbs, or shrubs, the plants often coarse. Leaf-blades entire, toothed, lobed, or divided. Flowers in inconspicuous heads, the bracts of the pistillate heads distinct or sometimes united and accrescent into a bur. Fruit-producing flowers apetalous or with much reduced corollas. Achenes subtended by or enclosed in an involucre. Pappus wanting or obsolete.—Eight genera and about 75 species, mostly American.

Staminate and pistillate flowers in the same head, the pistillate marginal, fewer than the staminate, or rarely wanting: heads neither bur-like nor nut-like.

Tribe I. IVEAE.

Staminate and pistillate flowers in different heads, the pistillate flowers 1-7, enclosed in a bur-like or nut-like involucre, which also later encloses the achenes.

II. AMBROSIEAE.

### I. IVEAE

Plants with androgynous nodding heads and broad or narrow leaf-blades.

1. IVA.

### II. AMBROSIEAE

Bracts of the staminate involucre more or less united: receptacle flat or merely convex: filaments free.

Tubercles or spines of the pistillate involucres in a single series: fruit with a truncate or equally 3-5-toothed beak.

2. AMBROSIA.

Tubercles or spines in several series: fruit with a 2-toothed beak, the teeth incurved, the outer one the longer.

3. FRANSERIA.

Bracts of the staminate involucre distinct: receptacle elongate filaments united.

Leaves pinnately veined or lobed, the stipules simple or pronged stipular spines: bur with straight beaks.

4. ACANTHOSANTHIUM.

Leaves digitately veined or lobed, the stipules not spiny: bur with curved or hooked beaks.

5. XANTHIUM.

1. IVA L. Annual or perennial, glabrous, strigose, or hispidulous herbs, or shrubs. Leaves, at least the lower, opposite: blades entire or toothed. Heads axillary to leaf-like bracts. Involucre turbinate to hemispheric: bracts 3-6,

or 5-9 in *I. imbricata*. Receptacle with large bractlets. Corolla of the pistillate flowers a truncate tube. Achenes slightly flattened, usually obovoid.—About 20 species, American.—MARSH-ELDERS.

Plants perennial: heads mostly peduncled: bracts of the involucre 5-9, or rarely 4.

Bracts of the involucre 6-9, imbricate in two series: leaf-blades entire.

Bracts of the involucre 5 or rarely 4, in one series and only slightly overlapping: leaf-blades toothed.

Plants annual: heads sessile: bracts of the involucre 3, or rarely 4 or 5.

Leaf-blades broad, coarsely toothed, petioled: those of the inflorescence different, sessile.

Leaves of the inflorescence with ovate to lanceolate short-acuminate blades.

Leaves of the inflorescence with linear or linear-lanceolate caudate-acuminate blades.

Leaf-blades narrow, entire or shallowly toothed, sessile or short-petioled; those of the inflorescence nearly similar.

Bracts of the involucre distinct: staminate and pistillate flowers three each: leaf-blades linear.

Bracts of the involucre partly united: pistillate flowers usually solitary: leaf-blades oblong.

1. *I. imbricata*.

2. *I. frutescens*.

3. *I. ciliata*.

4. *I. caudata*.

5. *I. microcephala*.

6. *I. asperifolia*.

1. *I. imbricata* Walt. Perennial with a woody base: stem 1 m. tall or less, smooth and glabrous: leaf-blades linear to linear-elliptic, linear-oblanceolate, or linear-subulate above, 2-5 cm. long, glabrous, entire or shallowly toothed: involucre subtended by foliaceous bracts, 3-4 mm. high or larger in age; inner bracts suborbicular: achenes 3-3.5 mm. long.—Coastal sand-dunes and rocky shores, Fla. to La. and Va.—(*W. I.*)—Sum.—fall.

2. *I. frutescens* L. Perennial with a woody base: stem 3.5 m. tall or less, pubescent, at least above: leaf-blades elliptic, linear-elliptic, elliptic-lanceolate or nearly linear above, 4-10 cm. long, pubescent, coarsely serrate: involucre 3.5-4 mm. high; inner bracts oval or obovate: achenes 2-2.5 mm. long.—(MARSH-ELDER. HIGH-WATER SHRUB.)—Salt marshes and margins, Coastal Plain, Fla. to Tex. and Va.—Sum.—fall.

3. *I. ciliata* Willd. Annual, 1.8 m. tall or less: stem copiously rough-pubescent: leaf-blades ovate, oval, or elliptic, 4-10 cm. long, acute or short-acuminate, serrate: heads contiguous, subtended by bristly-ciliate bracts: involucre 3-4 mm. high, rough-pubescent: achenes colored, about 3 mm. long, with faint tubercular-roughened ridges.—Moist soil, various provinces, La. to N. M., Nebr., and Ill.; extending as a weed E to Ala.—Sum.—fall.

4. *I. caudata* Small. Annual, 1 m. tall or less: stem rather sparingly hispidulous: leaf-blades ovate to elliptic, 4-15 cm. long, acuminate, coarsely and unevenly serrate: heads contiguous or approximate, subtended by coarsely ciliate bracts: involucre sparingly pubescent: achenes broadly cuneate-obovoid, 3.5 mm. long, with prominent even ridges.—Swamps and low grounds, Coastal Plain and adj. provinces, Miss. to La., Mo., and Ill.—Sum.—fall.

5. *I. microcephala* Nutt. Annual, 1 m. tall or less: stem glabrous or minutely pubescent especially above, often with numerous erect branches: leaf-blades narrowly linear, 2-5 cm. long, entire or shallowly toothed, glandular-punctate: heads contiguous or nearly so, subtended by subulate or linear-filiform bracts: involucre campanulate, about 2 mm. high; bracts obovate to suborbicular:

achenes narrowly obovoid, fully 1 mm. long, muriculate.—Low pinelands and prairies, Coastal Plain, Fla. to S. C.—Sum.—winter.—Sometimes a weed.

6. **I. asperifolia** Less. Annual, or perhaps sometimes perennial, 0.5 m. tall or less: stem sometimes decumbent, sparingly rough-pubescent at least above: leaves narrowly elliptic to linear-oblongate, 1–2 cm. long, entire, glandular-punctate: heads contiguous or approximate: involucre turbinate, about 3 mm. high; bracts cuneate to suborbicular: achenes obovoid, about 2 mm. long, granular-muriculate.—Waste-places, Pensacola, Fla. Nat. of Mex.—Sum.—fall.

2. **AMBROSIA** L. Annual or rarely perennial coarse caulescent branching herbs. Leaves alternate or opposite: blades toothed, lobed, or dissected, long-petioled. Heads in spikes or racemes, the staminate above the pistillate, with a usually saucer-shaped 5–12-lobed involucre. Pistillate involucre erect, nut-like, usually with a single series of tubercles or spines near the apex, the beak truncate or 3- to 4-toothed.—About 20 species, mostly American.—RAG-WEEDS.

Staminate heads spicate: involucre very oblique, produced on the side away from the stem into a lanceolate acuminate lobe: annuals.  
Staminate heads racemose: involucre slightly, if at all, oblique, not produced into an elongate lobe on either side: annuals or perennials.

I. CERCOMERIS.

II. EUAMBROSIA.

I. CERCOMERIS

A rough hirsute herb: leaf-blades of a lanceolate type, usually with a lobe on each side near the base.

1. *A. bidentata*.

II. EUAMBROSIA

Leaf-blades pinnatifid to tripinnatifid.

Leaf-blades green at least above: plants annual.

Fruit-body 2–2.5 mm. long, the beak 1 mm. long or less.

Fruits rugose.

Fruits smooth.

Fruit-body 3 mm. long or more, the beak more than 1 mm. long.

Blades of the lower leaves mostly bipinnatifid, the segments narrow: staminate heads about 3 mm. wide.

Blades of the lower leaves mostly pinnatifid, the segments broad: staminate heads 4–5 mm. wide.

Leaf-blades canescent: plants perennial.

Leaf-blades entire, toothed, or 3–5-lobed.

Leaves with winged petioles: fruits slightly if at all pitted between the ridges which end in short conic spines.

Leaves with wingless petioles: fruits pitted between the ridges which end in tubercle-like spines.

2. *A. monophylla*.  
3. *A. glandulosa*.

4. *A. elatior*.

5. *A. Rugelii*.

6. *A. hispida*.

7. *A. trifida*.

8. *A. aptera*.

1. **A. bidentata** Michx. Stem 1 m. tall or less, rough hirsute: leaf-blades lanceolate, linear-lanceolate, or elliptic-lanceolate, 2–8 cm. long, each with a sharp lobe-like tooth on one or both sides near the base: staminate involucre turbinate: pistillate heads solitary or two together in the axils: fruit 6–7 mm. long, the body much longer than the beak, the spines subulate, directed forward,  $\frac{1}{2}$  as long as the beak.—Prairies, Interior Low Plateaus and adj. provinces, Miss. to Tex., Nebr., and Ky.—Sum.—fall.

2. **A. monophylla** (Walt.) Rydb. Stem 1.5 m. tall or less, pubescent with lax more or less scattered hairs: leaf-blades deeply bipinnatifid, or those of the upper leaves pinnatifid or merely toothed, scabrous above,

strigillose beneath, the segments lanceolate, acute: staminate involucre broadly obconic, 1.5–2 mm. high: fruit 2.5–3 mm. high, the body obovoid, short-beaked, with 5–7 short conic spines.—Prairies, coastal dunes, pinelands, and waste-places, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)—All year.

3. *A. glandulosa* Scheele. Stem 1 m. tall or less, sparingly pubescent: leaf-blades bipinnatifid or pinnatifid, strigose on both sides, the segments linear to linear-lanceolate, acute or acuminate: staminate involucre saucer-shaped, 1–1.5 mm. high: fruit about 2.5 mm. long, the body broadly obovoid, short-beaked with usually 5 or 6 tubercle-like spines.—Low grounds, river-bottoms, and banks, Coastal Plain, W. Fla. to Tex.—Sum.—fall.

4. *A. elatior* L. Stem 1.5 m. tall or less; more or less hirsute: leaf-blades bipinnatifid or those of the upper ones merely pinnatifid, strigillose above, often hirsute beneath, the segments lanceolate to subelliptic, usually acute: staminate involucre saucer-shaped, 1–1.5 mm. high: fruit 4–4.5 mm. long, the body obovoid, often broadly so, rather long-beaked, with 5–7 short-subulate spines. [*A. artemisiifolia* Fl. SE U. S.]—(ROMAN-WORMWOOD. HOT-WEED. BITTER-WEED.)—Dry soil, beaches, prairies, pinelands, and cult. grounds, various provinces, N. C. to Tex., Calif., Wash., and N. S.—(*W. I.*)—Spr.—fall.

5. *A. Rugelii* Rydb. Stem 1 m. tall or less, densely hirsute: leaf-blades pinnatifid or partly bipinnatifid, hispidulous and strongly veined, the segments ovate to lanceolate: staminate involucre shallowly cupulate, 1.5–2 mm. high: fruit 4–4.5 mm. long, the body obovoid, short-beaked, with 5 or 6 short-subulate or tubercle-like spines.—Sand-dunes and pinelands, Coastal Plain, Fla. and Ga.—Sum.—fall.—The short-petioled or sessile leaves turn dark in drying.

6. *A. hispida* Pursh. Stem and branches prostrate, creeping, several m. long or less, white hirsute or hispidulous: leaf-blades tripinnatifid, broadly ovate in outline, the segments divergent, ovate to obovate, obtuse or merely acutish: staminate involucre cupulate, about 2 mm. high: fruit 3.5–4 mm. long, the body obovoid, veinly, glandular, short-beaked, with 1–5 unequal short-conic spines.—Beaches and coastal dunes, Fla.—(*W. I.*, *Mex.*, *C. A.*, *S. A.*)—All year.—Often efficacious as a sand-binder.

7. *A. trifida* L. Stem 5 m. tall or less, hispidulous or hirsute: leaf-blades except sometimes those of the upper ones, 3- or 5-lobed, mostly 1–3 dm. long; lobes ovate to lanceolate, serrate: staminate involucre saucer-shaped, about 1 mm. high: fruit 7–8 mm. long, the body broadly obovoid, with 6 or 7 ridges which end in short-conic spines, stout-beaked.—(GREAT-RAGWEED. HORSE-CANE.)—River-banks, cult. grounds, and waste-places, various provinces, Fla. to Tex., Colo., B. C., and Que.—Sum.—fall.—Plants whose juvenile main stem is cut off, produce unlobed leaf-blades.

8. *A. aptera* DC. Stem 5 m. tall or less, scabrous: leaf-blades, except some of the upper ones, 3- or 5-lobed, the lobes lanceolate to ovate, coarsely serrate or unevenly toothed: staminate involucre saucer-shaped about 1 mm. high: fruit 5–6 mm. long, the body obovoid, with 4–8 ridges which end in tubercle-like spines, short-beaked.—Low grounds and wet places, various provinces, Miss. to Ariz.—Sum.—fall.—In this and the next preceding species, the staminate involucre and corollas are black-streaked.

3. *FRANSERIA* Cav. Annual or perennial caulescent herbs, or low shrubs: leaves alternate or opposite: blades toothed or dissected. Heads in spikes or

racemes, the staminate with saucer-shaped or turbinate lobed involucre. Pistillate involucre of several fused bracts, nut-like, becoming a several- or many-spined bur, 2-lipped or 2-beaked at the tip.—About 25 species, American.—RAGWEEDS.

1. **F. confertiflora** (DC.) Rydb. Perennial, 2 m. tall or less, more or less strigose: leaf-blades bipinnately or tripinnately dissected, the segments lanceolate to linear, acute, the terminal one elongate: staminate involucre 2 mm. high or nearly so, hirsutulous: fruit ovoid or globose in outline, 2-3 mm. long, with a single beak and usually 6-18 spines.—Plains and moist grounds, various provinces, Tenn. to Tex., N. M., and Colo.—(Mex.)—Sum.—fall.

4. **ACANTHOXANTHIUM** Fourr.<sup>1</sup> Coarse monoecious annual herbs. Leaves alternate, with 3-pronged or simple stipular spines: blades pinnately lobed or entire. Staminate heads mostly in terminal capitate clusters: involucre of distinct bracts: corolla tubular-funnelform, 5-lobed: filaments monadelphous. Pistillate involucres axillary, closed, 1- or 2-beaked or sometimes beakless, the body cylindric-ellipsoid, 1- or 2-flowered, armed with numerous spines which are first bent backward and then hooked forward, the beaks straight, if two, unequal in length: corolla wanting: stigmas 2. Achenes 1 or 2 in each bur.—Four species, South American.

1. **A. spinosum** (L.) Fourr. Stem 3-10 dm. tall, in age stramineous, branched: leaf-blades lanceolate, entire or 3-5-lobed, strigose above, white-tomentose beneath, 5-10 cm. long; spines 3-pronged, up to 2.5 cm. long: bur with an ellipsoid body, 10-13 mm. long, pubescent, the prickles about 2 mm. long; the beaks up to 3 mm. long. [*Xanthium spinosum* L.]—(CLOTBUR.)—Waste-places, fields, and roadsides, various provinces, Fla. to Tex., Calif., B. C., and Me. Nat. of S. Am.—(W. I., Mex., C. A., O. W.)—Sum.

5. **XANTHIUM** L.<sup>1</sup> Coarse monoecious annual herbs. Leaves alternate: blades usually ovate to reniform in outline, more or less digitately 3-5-lobed, often cordate at the base. Staminate heads in terminal spikes or racemes: involucre of distinct bracts in 1-3 series: corolla tubular-funnelform, 5-lobed: filaments monadelphous. Pistillate involucre closed, 2- or 3-beaked, the body cylindric-fusiform, ellipsoid, or ovoid, 2- or 3-flowered, armed with spines which are hooked at the apex, the beaks nearly equal, more or less curved, 2-lobed, the outer lobe the longer and incurved: corolla wanting: stigmas 2. Achene

<sup>1</sup> Contributed by the late Per Axel Rydberg.

solitary in each cavity of the bur.—About 40 species, widely distributed.—  
Sum.—CLOTBURS. BURWEEDS. COCKLEBURS.

Body of the bur 1.5–3 cm. long.

Bur minutely glandular-puberulent, hispidulous, or glabrate.

Body of the bur broadly fusiform, nearly half as wide as long.

Body of the bur almost cylindric, about a third as wide as long.

Bur more or less coarsely hispid, especially on the lower part of the spines.

Body of the bur cylindro-fusiform, about a third as wide as long, less than 2 cm. long; spines 5–7 mm. long.

Body of the bur ellipsoid, half as wide as long or nearly so.

Body of the bur about 1.5–1.8 cm. long; spines 3–5 mm. long.

Body of the bur about 2.5–3 cm. long; spines 8–11 mm. long.

Body of the bur about 1 cm. long.

1. *X. americanum*.

2. *X. cylindraceum*.

3. *X. pennsylvanicum*.

4. *X. echinatum*.

5. *X. speciosum*.

6. *X. echinellum*.

1. *X. americanum* Walt. Plant glabrate or finely pubescent, 2–13 dm. tall: leaf-blades ovate to deltoid, 5–30 cm. long: body of the bur broadly fusiform, 15–18 mm. long, thickly beset with 100–200 slender, more or less hooked spines, which are 3–4 mm. long, and nearly equalling the beaks which are straight nearly to the apex. [*X. chinense* Millsp. & Sherff scarcely Mill. *X. glabratum* (DC.) Britton]—Waste-places, cult. grounds, and woodsides, various provinces, Fla. to Tex., Nebr., and Mass.

2. *X. cylindraceum* Millsp. & Sherff. Plant rough-puberulent, 5–15 dm. tall: leaf-blades deltoid-ovate, 8–10 cm. long: body of the bur almost cylindric, beset with 125–175 slender hooked spines about 3 mm. long; beaks 4–5 mm. long, strongly incurved.—Waste-places, old fields, and cult. grounds, Piedmont, N. C.

3. *X. pennsylvanicum* Wallr. Plant rough-pubescent, at least above, 2–6 dm. tall: leaf-blades ovate to reniform: body of the bur cylindro-fusiform, 15–20 mm. long, the spines 100–150, nearly as long as the diameter of the body; beaks 4–6 mm. long, often incurved.—Rich soil, various provinces, Fla. to Tex., Minn., Mass., and Va.

4. *X. echinatum* Murr. Plant rough-pubescent, 3–16 dm. tall: leaf-blades ovate to deltoid, or reniform: body of the bur ellipsoid, 15–18 mm. long, hispid, the spines 100–200, stout, more or less hooked; beaks 3–5 mm. long, stout, incurved.—River-banks, beaches, and waste-places, various provinces, N. C. to Nebr., N. D., and Me.

5. *X. speciosum* Kearney. Plant somewhat pubescent, 10–15 dm. tall: leaf-blades deltoid-ovate to somewhat reniform: body of the bur 25–30 mm. long, pubescent and closely beset with 200 or more incurved spines; beaks 8–10 mm. long, incurved.—Sandy bottoms, Interior Low Plateaus and adj. provinces, Tenn. to Tex., Mont., and Minn.

6. *X. echinellum* Greene. Plant sparingly hispidulous and the stem striate and reddish: leaf-blades broadly cordate, 5–18 cm. long and fully as wide, 3–

ribbed, 3-5-lobed: burs 3-8 together; body about 1 cm. long, about 5 mm. wide, sparingly glandular-puberulent, the spines 150-200, slender, about 3 mm. long; beaks stout, ascending, nearly straight, 4 mm. long.—Clay County, Miss.

## FAMILY 2. CARDUACEAE NECK.—THISTLE FAMILY

Herbs or rarely shrubs, or sometimes trees in tropical regions. Leaves opposite or alternate, sometimes all basal, without stipules; blades various. Flowers perfect, pistillate, or neutral, or sometimes monoecious or dioecious, aggregated on a receptacle, surrounded by an involucre. Receptacle smooth, pitted, or honey-combed, naked or with scales, chaff, fimbriae, or bristles subtending the flowers. Calyx of bristles, awns, or scales, or a crown or cup-like, forming pappus at maturity, or wanting. Corolla of 5 united petals, usually equally 5-lobed, or in the case of the marginal flowers of the head the corolla is often produced on one side into a ligule; when ray-flowers are present the head is said to be radiate, when wanting it is said to be discoid. Androecium of 5 stamens: filaments mostly adnate to the corolla-tube: anthers often appendaged at the apex and sometimes also at the base, united into a ring (syngeneceous) except in *Kuhnia*. Gynoecium 2-carpellary. Ovary inferior, 1-celled. Stigmas of the fructiferous flowers 2. Ovule solitary. Fruit an achene. Seed erect.—About 800 genera and 10,000 species, of wide geographic distribution. In the following figures the filaments and the anthers are not always shown in proper proportions.

Anthers not caudate at the base.

Heads discoid, but rarely with the corollas split on one side and thus ligulate: corollas varying from white to red or blue, never yellow or brown: stigmas half-cylindric.

Stigmas much elongate, acute, with stigmatic part on the inside, hispidulous without.

Achene not 4-angled, or if 4-angled not clavate: pappus-squamellae, if any, not with strong midribs.

Achenes 4-angled, clavate: pappus of elongate squamellae with strong midribs (*Palafolia* and *Polypterus* in)

Tribe I. VERNONIEAE.

Stigmas somewhat elongate, obtuse or rounded at the apex, with the stigmatic part on the inside only near the base, the upper portion, as well as the outside, hispidulous.

VII. HELENIEAE. <

Heads radiate, or, if discoid, the disk-corollas usually yellow or brown: stigmas either without appendages, truncate or rounded at the apex, or with acute appendages.

II. EUPATORIEAE.

Leaves or bracts, or both, with conspicuous resinous glands.

VIII. TAGETEAE.

Leaves and bracts without resinous glands (rarely punctate with oil glands).

Pappus of squamellae or stiff bristles, or coroniform, or wanting.

Involucral bracts not scarious-margined, usually green and more or less foliaceous.

VI. HELIANTHEAE.

Receptacle chaffy (paleaceous).

Receptacle naked or fimbriate in *Gaillardia*. Involucral bracts imbricate in several series.

III. ASTERAE. <

Involucral bracts in 1 or 2 subequal series.

VII. HELENIEAE.

Involucral bracts with dry scarious or hyaline margins or tips.

Pappus of squamellae: stigmas with acute or acutish appendages.

VII. HELENIEAE.

Pappus coroniform or wanting: stigmas truncate at the apex.

IX. ANTHEMIDEAE.

Pappus, at least in part, of many capillary bristles.

Stigmas flattened, with appendages, hairy on the outside: involucre imbricate.

Stigmas terete, truncate, or appendaged: involucre bracts in one series.

Anthers caudate at the base.

Stigmas without a ring of long hairs below.

Disk-corollas not 2-lipped.

Pistillate flowers with filiform corollas, without ligules.

Pistillate flowers with ligulate corollas.

Disk-corollas 2-lipped, the upper lip 2-lobed, lower 3-lobed.

Stigmas with a ring of long hairs at the base of the stigmatic portion: heads discoid or the ray-corollas actino-morphic and neutral.

#### I. VERNONIEAE

Corollas all alike, equal: bracts of the involucre unappendaged.

Pappus of 2 series: corollas regular: heads many-flowered, not glomerate.

Achenes ribbed or grooved: both series of the pappus persistent: perennials.

Achenes terete, ribless: inner series of the pappus deciduous: annuals.

Pappus simple: corollas irregular, split on the inner side: heads 2-5-flowered, in involucre heads of a second order.

Corollas of the marginal flowers enlarged, oblique: an inner series of bracts with pectinate-spinulose appendages.

#### II. EUPATORIEAE

Anthers truncate or broadly rounded at the apex, the connective without appendages: heads few-flowered.

Anthers with the connective produced into an appendage at the apex.

Achenes 3-5-angled.

Pappus of squamellae, sometimes cup-like or crown-like.

Leaves whorled: bracts of the involucre nerveless: corolla-tube abruptly dilated into the broad throat.

Leaves opposite, or alternate above: bracts of the involucre striate: corolla narrow throughout.

Pappus of elongate bristles or hairs.

Involucre bracts more than 4: flowers 4-many.

Receptacle of the flowers flat.

Involucre bracts leathery or coriaceous, in several series, striate.

Involucre bracts thin, membranous, in 1-few series, few-ribbed or ribless.

Receptacle conic or hemispheric.

Involucre bracts and flowers 4.

Achenes 8-10-ribbed or 8-10-striate.

Involucre bracts in several series, well imbricate.

Bracts not herbaceous, thin, striate.

Pappus-bristles scabrous or barbellate: anthers united: involucre bracts usually many.

Pappus-bristles plumose: anthers distinct: involucre bracts few.

Bracts herbaceous or partly colored, not striate: pappus of capillary or plumose bristles.

Receptacle chaffy: heads corymbose.

Receptacle naked.

Herbs: heads spicate or racemose: bracts of the involucre spirally imbricate.

Heads corymbose: basal leaves in depressed rosettes: blades rather broad.

#### III. ASTEREAE.

#### X. SENECINEAE.

#### IV. GNAPHALIEAE.

#### V. INULEAE.

#### XII. MUTISIEAE.

#### XI. CYNAREAE.

#### 1. VERNONIA.

#### 2. SENECIOIDES.

#### 3. ELEPHANTOPUS.

#### 4. STOKESIA.

#### 5. HARTWRIGHTIA.

#### 6. SCLEROLEPIS.

#### 7. AGERATUM.

#### 8. OSMIA.

#### 9. EUPATORIUM.

#### 10. CONOCLINIUM.

#### 11. MIKANIA.

#### 12. COLEOSANTHUS.

#### 13. KUHNIA.

#### 14. CARPHEPHORUS.

#### 15. LITRISA.

Heads spicate or racemose or rarely cymose: basal leaves not in rosettes, erect or nearly so: blades elongate.

Pappus in one series of equal bristles: leaves herbaceous: plant usually with a globose-woody root.

16. LACINIARIA.

Pappus in two series, the outer bristles shorter than the inner: leaves succulent: plant with an elongate fleshy root.

17. AMMOPURSUS.

Shrub: heads corymbose: bracts of the involucre imbricate in definite vertical ranks.

18. GARBERIA.

Involucral bracts subequal, little imbricate, not striate.

19. TRILISA.

### III. ASTEREA

Plants not dioecious.

Ray-corollas yellow or none or white in *Solidago bicolor*.

Pappus of squamellae or awns, or wanting, not of capillary bristles.

Heads small, few-flowered: involucre campanulate or cylindric, not more than 5 mm. high: ligules of the ray 10 or less, less than 5 mm. long.

Disk-flowers sterile: leaves with narrow entire blades.

20. AMPHIACHYRIS.

Disk-flowers fertile: leaves with cordate toothed blades.

33. BRACHYCHAETA

Heads larger, many-flowered: involucre hemispheric or depressed: ligules of the ray 12 or more, 1 cm. long or more (wanting in a few species): pappus of 2-8 deciduous stout awns.

21. GRINDELIA.

Pappus, at least in part, of capillary bristles.

Pappus double, at least in the disk-flowers, the inner of capillary bristles, the outer of short squamellae or short bristles.

Ray-achenes flattened, with well developed pappus.

Leaf-blades not grass-like, glabrous or pubescent, but not silky: achene somewhat turgid, turbinate, obovoid, or ellipsoid-obovoid, with no neck.

22. CHRYSOPSIS.

Leaf-blades grass-like, silky-tomentose: achene spindle-shaped, with more or less of a neck.

23. PITYOPSIS.

Ray-achenes turgid, with obsolete or coroniform pappus.

24. HETEROOTHECA.

Pappus simple.

Heads discoid.

Involucre narrowly turbinate; bracts more or less arranged in definite (usually 5) vertical ranks.

25. CHONDROPHORA.

Involucre broadly turbinate to hemispheric; bracts squarrose, imbricate, but not in definite vertical ranks.

26. BRINTONIA.

Heads radiate.

Leaf-blades pinnatifid or toothed; lobes or teeth spinulose-tipped.

27. SIDERANTHUS.

Leaf-blades entire or toothed, the teeth not bristle-tipped.

Pappus-bristles elongate, equaling or longer than the achenes.

Bracts of the involucre narrow, neither longitudinally ribbed nor striate.

Annual or biennial herbs.

28. ISOPAPPUS.

Perennial herbs or under-shrubs.

Ray-flowers not more numerous than the disk-flowers: recep-

- tacle alveolate or pitted.  
 Leaves with distinct depressions; blades veinless, entire: under-shrubs.  
 Leaves without depressions; blades veiny, usually toothed: herbs.  
 Ray-flowers more numerous than the disk-flowers: receptacle fimbriolate; heads corymbose.  
 Bracts of the involucre longitudinally ribbed or striate.  
 Pappus-bristles much shorter than the achenes.  
 Ray-corollas blue, purple, pink, or white.  
 Pappus a mere crown or of a few squamellae, or subulate bristles, or wanting.  
 Pappus of a mere crown or wanting.  
 Pappus wanting or obsolete: bracts of the involucre imbricate in 2 or 3 series.  
 Pappus a small crown: bracts of the involucre imbricate in few series.  
 Pappus of a series of short squamellae and usually also 2-4 slender bristles.  
 Pappus, at least of the disk-flowers, of numerous capillary bristles.  
 Ray-corollas conspicuous, longer than the pappus: ligules of the ray usually equaling or exceeding the disk, spreading.  
 Stigma-tips lanceolate to filiform.  
 Pappus-bristles not in two distinct series.  
 Disk-corollas as well as ray-corollas white or stramineous.  
 Bracts of the involucre leathery, with green thick tips.  
 Bracts not leathery, their green tips not thick (see *Solidago bicolor*).  
 Disk-corollas typically yellow, changing to red, brown, or purple: ray-corollas various: bracts of the involucre in several series, more or less foliaceous, at least at the tip: perennials with rootstocks.  
 Pappus distinctly double, the outer series of short subulate bristles.  
 Inner pappus-bristles clavate at the apex: bracts of the involucre thin-coriaceous, without herbaceous tips, shorter than the disk.  
 Inner pappus-bristles filiform throughout: bracts of the involucre equaling the disk.  
 Stigma-tips triangular or ovate, obtuse, rarely acutish: bracts of the involucre in 1-2, rarely 3 series.  
 Ray-corollas inconspicuous, not longer than the pappus: ligules of the ray short and erect: stigma-tips obtuse.  
 Plants dioecious: heads unisexual, discoid: pappus-bristles of the staminate flowers with clavate tips.
- IV. GNAPHALIEAE
- Receptacle not chaffy.  
 Involucral bracts not scarious: stigmas of the perfect (usually sterile) flowers elongate and acute.  
 Stem not winged by the decurrent leaves: involucral bracts persistent.  
 Caulescents herbs or shrubs: stem and branches not wiry.
29. CHRYSOMA.  
 30. SOLIDAGO.  
 31. EUTHAMIA.  
 32. OLIGONEURON.  
 33. BRACHYCHAETA.  
 34. ASTRANTHIUM.  
 35. APHANOSTEPHUS.  
 36. BOLTONIA.  
 37. SERICOCARPUS.  
 38. ASTER.  
 39. DOELLINGERIA.  
 40. IONACTIS.  
 41. ERIGERON.  
 42. LEPTILON.  
 43. BACCHARIS.  
 44. PLUCHEA.

Acaulescent herbs: scape and branches wiry.  
 Stem winged by the decurrent leaves: involucre bracts mostly deciduous.  
 Involucral bracts scarious or with scarious colored tips: stigmas of the perfect flowers short, truncate, distinct or sometimes united.  
 Plants dioecious or the pistillate heads with a few hermaphrodite flowers in the center: perfect flowers usually sterile.  
 Pappus-bristles of the pistillate flowers falling off in a ring: central perfect flowers none.  
 Pappus-bristles of the pistillate flowers falling off separate: central perfect flowers present in the pistillate heads.  
 Plants not dioecious: flowers pistillate or perfect, all fertile.  
 Pappus-bristles capillary, not plumose.  
 Pappus-bristles plumose.  
 Receptacle chaffy.  
 Receptacle subulate: perfect flowers fertile, their achenes with capillary pappus.  
 Receptacle hemispheric: perfect flowers usually sterile, their achenes without pappus.

## V. INULEAE

Achene not contracted at the apex into a short neck: pappus-bristles not united at the base into a cup.  
 Achene 4-angled: outer involucre bracts foliaceous.  
 Achene not angled: involucre bracts not foliaceous.  
 Achene contracted at the apex into a neck: pappus-bristles united at the base into a cup.

## VI. HELIANTHEAE

Disk-flowers perfect, but sterile.  
 Achene thick, not conspicuously flattened: pappus wanting.  
 Inner involucre bracts smooth, merely embracing the achenes.  
 Achenes strongly many-striate: leaves palmately lobed.  
 Achenes 3-5-ribbed or 3-5-angled: leaves pinately lobed.  
 Inner involucre bracts prickly, closely and permanently enclosing the achenes and falling off with them.  
 Achene conspicuously flattened.  
 Achenes falling free, wing-margined.  
 Achenes adnate to 2 or 3 bractlets (subtending as many sterile flowers), and falling away with them, wingless.  
 Ligules of the ray well developed, plane and exerted: receptacle flat.  
 Leaves opposite: pappus semicupulate, *i.e.*, with the crown developed on the outside only.  
 Leaves alternate: pappus wanting or of 2 short awns or teeth.  
 Ligules of the ray poorly developed, reduced to small lobe or 2 or 3 teeth, the marginal corollas reduced to a truncate or obliquely cleft tube.  
 Disk-flowers perfect and fertile.  
 Ray-corollas ligulate, persistent on the achenes and becoming papery in texture: ray-flowers fertile.  
 Achenes of the disk-flowers flattened or compressed, 4-angled; those of the ray-flowers often 3-angled: bractlets conduplicate around the achenes.  
 Achenes not flattened: involucre broad: receptacle convex or conic.  
 Ray-corollas ligulate, deciduous from the achenes, or heads discoid.  
 Involucre conspicuously 4- (rarely 5-) angled in the bud; bracts (outer) 4 or 5, foliaceous, valvate, connate at the base.

45. SACHSIA.

46. PTEROCAULON.

47. ANTENNARIA.

48. ANAPHALIS.

49. GNAPHALIUM.

50. FACELIS.

51. GIFOLA.

52. FILAGINOPSIS.

53. INULA.

54. VICOA.

55. CUPULARIA.

56. SMALLANTHUS.

57. POLYMNIA.

58. ACANTHOSPERMUM.

59. SILPHIUM.

60. CHRYSOGONUM.

61. BERLANDIERA.

62. PARTHENIUM.

63. ZINNIA.

64. HELIOPSIS.

65. TETRAGONOTHECA.

Involucre not 4-angled; bracts several or numerous, distinct.

Pappus consisting of a small crown or wanting, or of a few squamellae or awns on the angles of the achenes, and rarely some minute ones interposed.

Achenes, at least those of the disk, not obcompressed, *i.e.*, if compressed, arranged radially.

Paleae of the receptacle mere chaffy awns or bristles; disk-corollas 4- or 5-lobed; achenes of the disk compressed; those of the ray 3-sided.

Paleae of the receptacle concave or conduplicate.

Bracts of the involucre dry or papery; heads usually discoid; pappus of few, slender awns.

Bracts of the involucre herbaceous or foliaceous; heads usually radiate.

Receptacle high, hemispheric, conic, subulate, columnar, or globose.

Ray-flowers fertile; stigmas of the disk-flowers truncate; pappus an awn on one or more achene-angles, or none.

Ray-flowers sterile; stigmas of the disk-flowers with acute, hispid appendages.

Achenes 4-angled or terete, wingless.

Disk-corollas without a tube; ligules of the ray purplish, rarely white or yellow.

Disk-corollas with a manifest but short tube; ligules of the ray yellow or none.

Achene 4-angled.

Achenes quadrilaterally compressed, apex commonly covered with the corolla-tube.

Achenes equally 4-angled, apex not covered by the corolla-tube.

Achene terete.

Achenes compressed, winged, or wing-margined.

Receptacle columnar; bracts of the involucre numerous.

Receptacle globose; bracts of the involucre few.

Receptacle flat or merely convex, or rarely somewhat conic.

Achene not strongly compressed, not wing-margined.

Ray-flowers fertile.

Achenes turgid or those of the disk obscurely angled; herbs.

66. VERBESINA.

67. MELANTHERA.

68. SPILANTHES.

69. ECHINACEA.

70. VIGUIERA.

71. RUDBECKIA.

72. DRACOPIS.

73. RATIBIDA.

84. RIDAN.

- Pappus of several paleae partly united into a cup or ring.  
 Achene corky, tubercled, turgid, bluntly 3-angled: ligules of the ray mostly 3-toothed.
74. WEDELIA.
- Achene neither corky nor tubercled, compressed, unequally 3-angled; ligules of the ray mostly 2-cleft.
75. STEMMODONTIA.
- Pappus of several distinct paleae, and occasionally with 2 additional short awns.
76. PASCALIA.
- Achenes sharply 4-angled or those of the rays 3-angled: shrubs.
77. BORRICHIA.
- Ray-flowers sterile or wanting: achene more or less compressed, 4-angled.
- Pappus of several scales and awns; the scales persistent: involucre bracts in two distinct series.
78. TITHONIA.
- Pappus of few early deciduous awns: involucre bracts in 3 or 4 series.
79. HELIANTHUS.
- Achene strongly compressed.
- Receptacle flat or convex: bracts of the involucre numerous.
- Intermediate squamellae of the pappus present or the awns connected by their bases.
80. PHOEBANTHUS.
- Intermediate squamellae wanting, the awns distinct.
- Involucre flat; bracts elongate, spreading: annual herbs with petioled leaf-blades.
81. XIMENESIA.
- Involucre campanulate to hemispheric; bracts short, appressed: perennial herbs with decurrent or sessile leaves.
- Ray-flowers fertile: heads numerous, corymbose: achenes long-awned.
82. PHAETHUSA.
- Ray-flowers sterile: heads solitary or few together: achenes

- with short or obsolete awns.  
 Receptacle globose: bracts of the involucre few: leaves decurrent.  
 Achenes decidedly obcompressed, *i.e.*, flattened parallel to the involucreal bracts.  
 Involucre simple, of 1 or 2 herbaceous and several chaffy bracts.  
 Achenes of the ray with ascending marginal bristles.  
 Achenes of the ray without marginal bristles.  
 Involucre manifestly double, the outer one involucrellate.  
 Pappus a pair of fimbriolate squamellae, short awns, a minute crown, or wanting.  
 Pappus of 2-4 usually barbellate awns.  
 Achene beakless: ligules of the ray yellow or white.  
 Achene distinctly beaked: ligules of the ray purple or rose, or orange-yellow.
83. PTEROPHYTON.  
 84. RIDAN.  
 85. SYNEDRELLA.  
 85a. CALYPTOCARPUS.  
 86. COREOPSIS.  
 87. BIDENS.  
 88. COSMOS.
- Pappus of many similar squamellae.  
 Paleae of the receptacle conerected, forming alveoli, the receptacle resembling a honeycomb: ray-flowers neutral.  
 Pits of the receptacle with broad erose-toothed edges: head solitary: ray-flowers 20-30.  
 Pits of the receptacle with cuspidate and erose toothed edges: heads corymbose: ray-flowers 8-18.  
 Paleae of the receptacle distinct, thin.  
 Ray-flowers wanting: squamellae of the pappus nerveless.  
 Ray-flowers present, pistillate and fertile.  
 Squamellae of the pappus of the disk flowers with thick midribs and fimbriate margins.  
 Squamellae of the pappus aristate-acuminate, plumose-ciliate.
89. ENDORIMA.  
 90. ACTINOSPERMUM.  
 91. MARSHALLIA.  
 92. GALINSOGA.  
 93. TRIDAX.

## VII. HELENIEAE

- Achenes distinctly 3-5-angled, or if less distinctly so, then obconic.  
 Stigmas either short or with a distinct appendage, not hispidulous to or below the fork; either disk- or ray-corollas or both yellow, if purple the involucre not narrow.  
 Bracts of the involucre wholly herbaceous, or somewhat chartaceous at the base, without scarious margins.  
 Involucre companulate or hemispheric; bracts erect or ascending, not reflexed; outer bracts more or less united below.  
 Involucre rotate; bracts spreading, wholly or the tips reflexed.  
 Receptacle not bristly: pappus-scales thin and scarious, the midrib, when present, not becoming spine-like.  
 Receptacle bristly, fimbriate, triangular-fimbriate, or naked: pappus-scales scari-

94. HYMENOXYS.

95. HELENIUM.

ous, but becoming rigid, the midrib ex-current as a rigid spine.

Bracts of the involucre with thin, more or less scarious and colored margins.

Stigmas long and filiform, stigmatose to near the apex, hispidulous down to the fork or below; both disk- and ray-corollas rose-purple: involucre from elongate-turbinate to almost cylindric.

Throat of the disk-corollas short-campanulate or scarcely any, much shorter than the long linear lobes and the tube.

Throat of the disk-corollas cylindric, much longer than the lanceolate lobes and the tube.

Achenes 8-10-ribbed or -striate, linear or elliptic, terete or oval in cross-section: heads few-flowered and few-bracted.

#### VIII. TAGETEAEE

Stigmas of the perfect flowers elongate, appendiculate or truncate: leaves, if simple, not bristly-ciliate.

Squamellae of the receptacle few, 3-10, some of them, usually 1 or 2, longer, linear or subulate, acute, the rest broader and shorter, usually obtuse; bracts of the involucre united to near the apex.

Squamellae of the receptacle 10 or more, rarely less, each with 9 or more stiff bristles.

Stigmas of the perfect flowers short, elliptic: leaves simple, bristly-ciliate, at least towards the base.

#### IX. ANTHEMIDEAE

Receptacle with chaff, this consisting of usually membranous, concave, elongate paleae.

Achene more or less obcompressed, subrhombic or obliquely triquetrous in cross-section: tube of the disk-corollas more or less flattened: heads small: ligules of the ray few, short.

Achene terete, cylindric, obovoid, or ellipsoid: heads large and broad: ligules of the ray conspicuous or wanting.

Ray-flowers fertile: paleae of the receptacle membranous, or cartilaginous in *Ormenis*, subtending all the flowers.

Tube of the disk-corollas produced into a spur-like appendage at the base: ligules of the ray, in ours white with a yellow base.

Tube of the disk-corollas not appendaged at the base: ligules of the ray white or wanting.

Ray-flowers neutral: paleae of the receptacle subulate, stiff, subtending only the innermost flowers.

Receptacle without chaff, naked or hairy.

Heads radiate, with usually flat ligules: anther-tips deltoid, mostly obtuse.

Pappus of a more or less developed crown or margin.

Receptacle high, hemispheric, conic or subglobose: achene with 3-5 ribs on the inner half, and nerveless on the back.

Receptacle convex or nearly flat: achene equally 5-10-ribbed or 5-10-angled.

Pappus, at least of the disk-flowers, wanting.

Achenes all 10-ribbed or 10-angled: ligules of the ray white or pink.

Achenes of the ray-flowers 2- or 3-winged: ligules of the ray yellow.

Heads discoid or apparently so: pistillate ray-flowers, if present, without well-developed ligules.

Marginal pistillate flowers, if present, with corollas or sometimes wanting in *Artemisia*: achene not flattened.

Anthers with ovate obtuse tips: corollas of the marginal flowers oblique: pappus coroniform.

Anthers with subulate tips: corollas of the marginal flowers regular: pappus wanting.

Marginal pistillate flowers without corollas: achene flattened, obcompressed.

96. GAILLARDIA.

97. HYMENOPAPPUS.

98. POLYPTERIS.

99. PALAFOXIA.

100. FLAVERIA.

101. TAGETES.

102. BOEBERA.

103. PECTIS.

104. ACHILLEA.

105. ORMENIS.

106. ANTHEMIS.

107. MARUTA.

108. CHAMOMILLA.

109. MATRICARIA.

110. LEUCANTHEMUM.

111. CHRYSANTHEMUM.

112. TANACETUM.

113. ARTEMISIA.

Achenes not hairy at the apex, with thin flat wings: disk-corollas cylindric, without differentiation between tube and throat: anthers broad, rounded at the base.

114. SOLIVA.

Achenes villous at the apex, with thick corky wings: disk-corollas with a slender tube and elongate-funneliform throat: anthers narrow, somewhat sagittate at the base.

115. GYMNSTYLES.

## X. SENECEINEAE

Leaves opposite, but in our species all near the base.  
Leaves alternate.

116. ARNICA.

Stigmas filiform, elongate, acute: throat of the corolla cylindric.

Heads with no outer involucre: achene 5-angled.

117. EMILIA.

Heads with outer involucre present: achene 8-10 ribbed, terete.

118. GYNURA.

Stigmas short, truncate at the apex: throat of the corolla campanulate.

Heads discoid; corollas whitish or pinkish.

Marginal pistillate flowers wanting, the flowers all perfect.

Corolla-lobes longer than the throat: involucre bracts 5-8: center of the receptacle usually with a fleshy point.

119. MESADENIA.

Corolla-lobes not longer than the throat: involucre bracts 12-15: receptacle flat.

120. SYNOSMA.

Marginal pistillate flowers present, their corollas actinomorphic, 4-5-lobed, similar to but more slender than those of the disk-flowers.

121. ERECHTITES.

Heads usually radiate, if discoid the corollas yellow.

122. SENECIO.

## XI. CYNAREAE

Achenes inserted by their very bases or nearly so, not obliquely.

Bracts of the involucre hooked: leaves not with spinose lobes and tips.

123. ARCTIUM.

Bracts of the involucre not hooked: leaves with spinose lobes and tips.

Filaments papillose or pilose, free.

Receptacle bristly: pappus-bristles plumose.

124. CIRSIIUM.

Receptacle deeply honeycombed, the pits with a toothed margin: pappus-bristles scabrous or barbellate.

125. ONOPORDON.

Filaments glabrous, united into a tube: receptacles bristly: pappus barbellate.

126. MARIANA.

Achenes inserted obliquely on the receptacle.

Achene truncate at the apex: pappus of several series of short scales or bristles of different lengths, or none: head not subtended by several spiny leaves.

127. CENTAUREA.

Achene 10-toothed at the apex: pappus of 10 longer naked outer bristles and 10 inner fimbriolate ones: head subtended by several spiny leaves.

128. CNICUS.

## XII. MUTISIEAE

Heads heterogamous: marginal corollas ligulate.

129. CHAPTALIA.

1. **VERNONIA** L. Perennial, caulescent or scapose herbs. Leaves alternate: blades narrow or broad, mostly toothed. Heads not involucre. Flowers purple or white. Corolla-lobes lanceolate to linear. Anther-appendages lanceolate to elliptic. Achene 10-ribbed or -grooved. Pappus double, the outer series of scales or stout bristles, the inner of numerous capillary bristles, both series persistent.—About 500 species, most abundant in South America.—IRON-WEEDS.—Sum.—fall or all year S.

Plant caulescent: leaves mainly cauline.

Bracts of the involucre, at least some of them, with filiform or subulate tips.

Leaf-blades smooth above.

I. NOVEBORACENSES.

Leaf-blades scabrous above.

II. SCABERRIMAE.

Bracts of the involucre obtuse, acute, or acuminate.

Leaf-blades, at least above the base of the stem, narrow, mostly of a linear type.

III. ANGUSTIFOLIAE.

Leaf-blades broad, of an ovate, or lanceolate type.

Leaf-blades glabrous or thinly pubescent and scabrous beneath.

Leaf-blades tomentose beneath.

Plant scapose: leaves basal or mainly so.

IV. ALTISSIMAE.

V. INTERIORES.

VI. ACAULES.

#### I. NOVEBORACENSES

Pappus purple or tawny-purple.

Head with 42 flowers or less: bracts of the involucre mainly ovate, each abruptly narrowed into the tip.

Head with 55 flowers or more: bracts mainly lanceolate, each gradually narrowed into the tip.

Pappus stramineous.

1. *V. noveboracensis*.

2. *V. Harperi*.

3. *V. glauca*.

#### II. SCABERRIMAE

Leaf-blades broad, mostly 3 or 4 times as long as wide, prominently serrate, sometimes coarsely so.

Leaf-blades narrow, mostly 5-16 times as long as wide, entire or merely serrulate.

Bracts of the involucre closely appressed at the base, the tips recurved or spreading.

Bracts of the involucre loosely appressed at the base, the tips not recurved.

4. *V. pulchella*.

5. *V. recurva*.

6. *V. scaberrima*.

#### III. ANGUSTIFOLIAE

Leaf-blades scabrous above.

Leaf-blades linear; usually narrowly so, revolute.

Leaf-blades linear-lanceolate to elliptic, not revolute.

Leaf-blades smooth and glabrous or nearly so.

Heads about 13-flowered.

Heads about 21-flowered.

7. *V. angustifolia*.

8. *V. dissimilis*.

9. *V. concinna*.

10. *V. Blodgettii*.

11. *V. gigantea*.

#### IV. ALTISSIMAE

Head with 13 flowers or less.

Head with 18 flowers or more.

Pappus purple or purplish.

Bracts of the involucre rounded at the apex, abruptly tipped.

Bracts of the involucre acute or cuspidate.

Pappus tawny or yellowish, or stramineous.

Involucre 5-6 mm. high; bracts acute or cuspidate, often stramineous.

Involucre 3-4 mm. high; bracts obtuse or subacute.

12. *V. altissima*.

13. *V. ovalifolia*.

13. *V. ovalifolia*.

14. *V. flaccidifolia*.

#### V. INTERIORES

Bracts of the involucre with closely appressed tips: head with mostly 29 flowers or more.

Bracts of the involucre with spreading or reflexed tips: head 18-34-flowered.

15. *V. missurica*.

16. *V. Baldwinii*.

#### VI. ACAULES

Blades of the basal leaves elliptic, oblanceolate, spatulate, or obovate, 3-7 cm. wide.

Blades of the basal leaves lanceolate, 1-2 cm. wide.

17. *V. acaulis*.

18. *V. georgiana*.

1. *V. noveboracensis* (L.) Willd. Stem 1-3 m. tall, glabrous or thinly pubescent, branching above: leaves rather numerous; blades linear-lanceolate or elliptic-lanceolate, 1-2 dm. long, acuminate, finely serrate or nearly entire: corymb 1-3 dm. broad, commonly irregular: involucre hemispheric, 6-7 mm. high; bracts purple, ovate or ovate-lanceolate, prolonged into filiform tips, glabrous or sparingly ciliate: corolla about 10 mm. long: achene 4-4.5 mm. long, upwardly barbed along the sharp angles; pappus purple or tawny-purple.—Woods, thickets, meadows, and open places, various provinces, Ga. to Miss., Ont., and Mass.

2. *V. Harperi* Gleason. Stem 1 m. tall or more, puberulent, divaricately branched above: leaves numerous; blades lanceolate,

12-18 cm. long or smaller near the top of the stem, thin, acuminate, dentate-serrate: corymb 3 dm. wide or more, lax: involucre broadly campanulate, 7-9 mm. high; bracts green, with ovate or triangular-ovate bases and erect elongate tips, arachnoid-ciliate: achene 3.5 mm. long, pubescent on the ribs: pappus dull-purple.—Damp grounds and wet woods, in the Coastal Plain of Ga.

3. *V. glauca* (L.) Britton. Stem 1-2 m. tall, glabrous or nearly so, often widely branched above: leaves numerous; blades linear-lanceolate to elliptic or elliptic-oblongate, acute or short-acuminate, sharply and saliently serrate: corymb 1-3 dm. broad: involucre hemispheric, about 5-7 mm. high; bracts lanceolate to nearly elliptic, purple, the outer ones merely acuminate, glabrous or nearly so: achene 2-3 mm. long, with the sharp ribs barbed: pappus stramineous. [*V. noveboracensis latifolia* A. Gray.]—Wooded slopes and riverbanks, various provinces N of Coastal Plain, Ga. to Ala., Pa., and N. J.

4. *V. pulchella* Small. Stem 3-10 dm. tall, pubescent, branched above: leaves firm; blades elliptic-lanceolate or elliptic or sometimes narrower above, 2-10 cm. long, acute, serrate, often sharply so, somewhat crisped, revolute, sessile, but not at all cordate: corymb 1-1.5 dm. broad: involucre campanulate, 6-7 mm. high; bracts lanceolate to linear-elliptic, prolonged into soft linear-subulate spreading or recurved tips, often purplish: achene about 3 mm. long: pappus stramineous.—Sand-hills, Coastal Plain, Ga. and S. C.

5. *V. recurva* Gleason. Stem about 7 dm. tall, pubescent below, glabrate above: leaves firm, mostly near the base of the stem; blades elliptic-linear to linear, 5-7 cm. long, or shorter above, acute, revolute, entire or sparingly callous-toothed, scabrous, rounded at the base: corymb about 15 cm. wide: involucre cylindric-campanulate, about 8 mm. high; bracts lanceolate to elliptic-lanceolate, long-acuminate, appressed at the base, the long tips recurved or spreading: achene 3.5 mm. long, pubescent on the angles: pappus tawny.—Dry pine-lands, Coastal Plain, SE Ga.

6. *V. scaberrima* Nutt. Stem 3-8 dm. tall, glabrous or puberulent below, usually branched: leaves firm; blades linear to linear-elliptic, 1.5-8 cm. long, acute, entire or remotely serrate, sessile or nearly so, cordate or truncate at the base: corymb with comparatively few heads: involucre campanulate, 5-6 mm. high: bracts subulate-linear to elliptic, prolonged into rigid subulate tips: achene about 2 mm. long, with scabrous ribs: pappus purplish.—Sandy soil, Coastal Plain, Fla. to N. C.

7. *V. angustifolia* Michx. Stem 0.5-1 m. tall, glabrous or pubescent, often widely branched above: leaves numerous; blades linear, usually narrowly so, 5-15 cm. long, acute, revolute: involucre turbinate or turbinate-campanulate, 5-6 mm. high, acute or somewhat rounded at the base; bracts lanceolate to elliptic, acute or apiculate, with more or less spreading tips: achene 2 mm. long, or more, with scabrous ribs: pappus purplish.—Sandy woods, pinelands, and dry hillsides, Coastal Plain, Fla. to Miss. and N. C.—*V. texana* (A. Gray) Small, with tawny pappus and lower leaf surface pitted, has been reported from Meadville in S W Miss.

8. *V. dissimilis* Gleason. Stem stout, 8-11 dm. tall: leaves numerous; blades linear-lanceolate to elliptic, 10-15 cm. long, firm, acuminate, sharply serrate, except the smaller upper ones, not revolute, scabrous above: corymb rather dense: involucre campanulate, about 4 mm. high; bracts ovate or ovate-lanceolate, obtuse or obtusish, or the outer ones acute, arachnoid-ciliate, appressed: achene 2.5 mm. long, with hirsute ribs: pappus bright-purple.—Dry banks and woods, Piedmont, E Ala.

9. **V. concinna** Gleason. Stem 1 m. tall or less, green, glabrous: leaves numerous; blades narrowly oblanceolate to elliptic-linear, 10–12 cm. long or less, thin, acute, entire or with minute callous teeth, glabrous above, minutely pubescent beneath, flat: corymb rather lax: involucre turbinate-campanulate, 6–7 mm. high; bracts elliptic-lanceolate, broader than the slightly spreading outer ones, acute or mucronate, glabrous or slightly ciliate: achene about 3 mm. long, minutely pubescent: pappus purplish-tawny.—Hammocks, M pen. Fla.
10. **V. Blodgettii** Small. Stem often branched near the base, 2–5 dm. tall, glabrous or nearly so, corymbose above: leaves mostly near the base of the stem; blades linear or nearly so, 2–4.5 cm. long, obtuse or acutish, entire, erect or ascending, slightly revolute: involucre campanulate, about 5 mm. high; bracts elliptic to linear-elliptic, acute or apiculate, slightly pubescent: achene 2.5 mm. long, with pubescent ribs: pappus stramineous, slightly roughened.—Low pinelands and adj. Everglades, S pen. Fla. and the Florida Keys.—The general trend of migration of native Florida plants, through the agencies of man has been southward. The range of this ironweed, however, has been extended northward. Occasional specimens have recently been found nearly half way up the eastern coast.
11. **V. gigantea** (Walt.) Trelease. Stem 1–2.5 m. tall, glabrous, often widely branched above: leaves numerous; blades mostly elliptic, 0.8–3 dm. long, acute or acuminate, sharply serrate: corymb 1–4 dm. broad: involucre cylindric, 4–5 mm. high, narrowed at the base; bracts elliptic-lanceolate to narrowly elliptic, rounded on the back, the outer acutish, the inner obtuse, lax or loosely spreading at maturity; achene 3 mm. long, with scabrous angles: pappus purplish. [*V. oligantha* Greene.]—Low grounds, river-bottoms, and swamps, Coastal Plain and rarely adj. provinces, Fla. to Ala. and S. C.
12. **V. altissima** Nutt. Stem 1–3 m. tall, glabrous, branching above: leaves rather numerous; blades narrowly elliptic to lanceolate or narrowly lanceolate, 1–3 dm. long, acuminate, sharply serrate: corymb 1–4 dm. broad; involucre hemispheric-campanulate, 4 mm. to almost 5 mm. high, rounded at the base; bracts ovate to elliptic, nearly flat, acute or mucronate, appressed, ciliate; achene 3 mm. long, with barbed ribs: pappus light-purple or deep-purple. [*V. maxima* Small.]—Low grounds, alluvial banks, bottoms and fields, various provinces N of Coastal Plain, Ga. to Ala., Mo., and Pa.
13. **V. ovalifolia** T. & G. Stem 1–2 m. tall, glabrous or puberulent, branching above: leaves rather numerous; blades elliptic, or the upper elliptic-lanceolate, all acute, or short-acuminate, rather coarsely toothed, abruptly or sometimes gradually contracted at the base: corymb 1–3 dm. broad: involucre campanulate, 5–6 mm. high; bracts lanceolate to elliptic, acute or cuspidate, mainly appressed: achene 2.5–3 mm. long, slightly barbed along the ribs: pappus stramineous or pale-purplish.—Rich woods and sandy stream-banks, Coastal Plain, N Fla. to Ala. and Ga.
14. **V. flaccidifolia** Small. Stem 1–1.5 m. tall, glabrous, glaucous, with slender branches above: leaves rather numerous; blades thin, elliptic to narrowly lanceolate, 0.8–2 dm. long, acuminate, sharply serrate, sometimes doubly so, short-petioled: corymb 1–2 dm. broad; branches slender: involucre hemispheric, 3–4 mm. high; bracts ovate to elliptic, light-green or deeper at the tip, obtuse or subacute, ciliate, not spreading: achene 3 mm. long, with sharp barbed ribs: pappus pale stramineous.—Rich woods, stream-banks, and wooded hillsides, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., and S. C.
15. **V. missurica** Raf. Stem 1–2 m. tall, tomentose, branching above: leaves numerous; blades elliptic to elliptic-lanceolate or lanceolate, 1–3 dm. long,

acute or short-acuminate, sharply and coarsely serrate: corymb usually 1-4 dm. broad: involucre campanulate to cylindric-campanulate, 7-8 mm. high; bracts ovate to elliptic, acute or apiculate: achene 4-5 mm. long, with smooth and glabrous ribs: pappus tawny or tinged with purple. [*V. Drummondii* Werner not Shuttli.]—Low woods, ravines, and rich sandy soil, various provinces N of Coastal Plain, Ala. to Tex., Kans., and Ont.—*V. fasciculata* Michx., with subacute or rounded involucre scales, has been reported from Starkville in NE Miss.

16. *V. Baldwinii* Torr. Stem 1-1.5 m. tall, tomentose, branching above: leaf-blades elliptic to ovate, 1-2 dm. long, short-acuminate, sharply serrate: corymb 1-3 dm. wide, irregular: involucre campanulate to hemispheric, 5-7 mm. high; bracts closely imbricate at the base, spreading or reflexed at the glandular acuminate tips: achene 3 mm. long, pubescent and resinous: pappus tawny or purplish.—Dry woods and hills, Interior Plateaus, Tenn. to Okla. and Mo.

17. *V. acaulis* (Walt.) Gleason. Scape minutely pubescent, 2-7 dm. tall: leaves basal; blades elliptic, oblanceolate, spatulate, or obovate, mainly 1-3 dm. long, obtuse or acutish, serrate or dentate, sometimes doubly so: involucre campanulate, 7-8 mm. high; bracts linear to linear-lanceolate, narrowed into subulate tips: achene 3 mm. long, barbed upward in the ribs: pappus pale-stramineous. [*V. oligophylla* Michx.]—Dry woods or pinelands, Coastal Plain, Fla. to N. C.

18. *V. georgiana* Bartlett. Scape puberulent, 2-10 dm. tall: leaves basal; blades lanceolate, 5-15 cm. long, acute or obtuse, denticulate, narrowed at the base, scabrous above: involucre campanulate, 6-7 mm. high; bracts narrow, subulate at the tip, glabrous or obscurely ciliate, the outer with spreading tips: achene 3 mm. long, pubescent: pappus pale-stramineous.—Dry pinelands, Coastal Plain, Ga. and S. C.

2. **SENECIOIDES** Post & Kuntze. Annual, caulescent herbs. Leaves alternate: blades broad, toothed. Heads corymbose. Flowers pale-purple or white; nearly as in *Vernonia*. Achene terete, ribless. Pappus double, the inner series deciduous.—About 12 species, natives of the Old World.

1. *S. cinerea* (L.) Kuntze. Stem corymbose above, 1 m. tall or less, cinereous-pubescent: leaf-blades ovate to elliptic-ovate, mostly 2-8 cm. long, shallowly toothed, paler beneath than above: peduncles slender: involucre 4-5 mm. high; bracts subulate to linear, acuminate: corolla about 4 mm. long: achene about 1 mm. long, terete or nearly so: pappus white. [*Vernonia cinerea* L.]—Hammocks, Florida Keys. Nat. of Asia.—(W. I., Mex., C. A., S. A.)—All year.

3. **ELEPHANTOPUS** [Vail.] L. Perennial, scapose or caulescent herbs. Leaves alternate: blades shallowly toothed. Heads involucreate. Flowers lilac-purple. Corolla-lobes linear-lanceolate. Anther-appendages deltoid to ovate. Pappus single, of several rigid bristles terminating scale-like bases.—About 15 species, native of tropical and warm regions.—Sum.—fall.—ELEPHANT-ROOTS.

Stem leafy: leaves mainly cauline, all of the same type. I. CAROLINIANI.  
Stem naked or with few bract-like leaves: leaves mainly basal. II. TOMENTOSI.

## I. CAROLINIANI

1. rather coarse, softly hirsute herb, with thinnish leaf-blades. 1. *E. carolinianus*.

## II. TOMENTOSI

Longer bracts of the involucre 8 mm. long or less: pappus bristles 3.5–5 mm. long; midrib of the leaf pubescent beneath with appressed hairs.

Stem with spreading rather than reflexed hairs: leaf-blades closely and softly pubescent: scale-like base of the pappus gradually narrowed into the tip.

Stem with appressed rather than spreading hairs: leaf-blades glabrous or sparingly pubescent: scale-like base of the pappus abruptly narrowed into the tip.

Longer bracts of the involucre 9–12 mm. long: pappus-bristles 6–8 mm. long: midrib of the leaf pubescent beneath with spreading and reflexed hairs.

2. *E. elatus*.3. *E. nudatus*.4. *E. tomentosus*.

1. *E. carolinianus* Willd. Stem 3–9 dm. tall, rather hirsute: leaf-blades elliptic or oval, 5–15 cm. long, crenate-serrate or repand: inner bracts of the involucre 8–10 mm. long, acute: achene 3.5–4 mm. long.—Woods and thickets, various provinces, Fla. to Tex., Kans., and N. J.

2. *E. elatus* Bertol. Stem 7–12 dm. tall, mainly hirsute: blades of the basal leaves spatulate to ovate-elliptic, 10–25 cm. long, crenate-serrate: inner bracts of the involucre obtuse: achene 2.5–3 mm. long: bases of the pappus-bristles minute.—Dry soil, Coastal Plain and adj. provinces, Fla. to Ark. and S. C.

3. *E. nudatus* A Gray. Stem 2–8 dm. tall, mainly strigose; blades of the basal leaves oblanceolate to spatulate, crenate-serrate: inner bracts of the involucre acuminate or abruptly pointed: bases of the pappus-bristles shorter than the breadth of the achene.—Sandy soil, Coastal Plain, Fla. to La., Ark., and Del.

4. *E. tomentosus* L. Stem 2–7 dm. tall, mostly hirsute above: blades of the basal leaves elliptic, oval, or elliptic oblanceolate, crenate-serrate: inner bracts of the involucre acuminate: bases of the pappus-bristles as long as the breadth of the achene.—Pinelands and dry woods, various provinces, Fla. to Tex., Ky., and Va.

4. **STOKESIA** L'Her. Perennial, stout, pubescent herbs. Leaves alternate: blades spinulose-ciliate near the base, elongate. Heads large, showy, bristly, solitary or few in a corymb, many-flowered. Involucre broad and depressed: bracts foliaceous, the outer entire, lax, the inner with a large pectinate-spinulose appendage on a small base, the innermost, narrow, entire. Receptacle flat, naked. Corollas various, the inner ones tubular, with 5 narrow lobes; the outer ligulate, the marginal ones radiate, the blade prominently lobed. Anther-appendages ovate. Achene stout, 3- or 4-angled. Pappus of 4 or 5 slender caducous awns.—One species, remarkable in its group on account of the ligulate marginal corollas.

1. *S. laevis* (Hill) Greene. Stem 2-5 dm. tall, woolly, permanently so above: leaves few; blades various, those of the basal and lower cauline elliptic to narrowly elliptic-lanceolate, narrowed into petiole-like bases and dilated at the base, those of the upper cauline lanceolate to elliptic-lanceolate or ovate-lanceolate, clasping; heads solitary at the ends of stem or its few branches: involucre bristly: corolla purplish-blue or rarely white, the lobes all linear-lanceolate: achene narrowly obovoid, about 5 mm. long, the angles callous-thickened. [*S. cyanea* L'Her.] —Moist pinelands, Coastal Plain, Fla. to La. and S. C.—Spr.—sum.—Rare east of Ala. Much more showy than its relatives, the ironweed and the elephant-foot. Widely cultivated.

5. **HARTWRIGHTIA** A. Gray. Perennial, glabrous, slender herbs. Leaves alternate: blades elongate, entire. Heads rather small, smooth, inconspicuous, loosely corymbose, few-flowered. Involucre turbinate: bracts herbaceous, entire. Receptacle elevated, with few bractlets near the edge. Corolla with a very short tube and a funnelform throat, the lobes broad. Anthers unappendaged. Achene enlarged upward. Pappus of several slender bristles or wanting.—One species representing a group of genera otherwise mainly tropical American.

1. *H. floridana* A. Gray. Stem 4-15 dm. tall, branched above: basal leaves elongate; blades spatulate, elliptic, or elliptic-lanceolate, long-petioled: blades of the cauline leaves narrowly lanceolate to linear: branches of the inflorescence with small clavate scales: bracts of the involucre linear to linear-lanceolate, 4-5 mm. long, obtuse: corollas white or purple, 3-3.5 mm. long; lobes ovate: achene obpyramidal, 4.5-5.5 mm. long.—Swamps and marshes, N Fla. and N part of the pen.—Sum.—fall.—One of the rarer Florida plants. The basal leaves resemble those of *Limonium*.

6. **SCLEROLEPIS** Cass. Perennial, stoloniferous herbs. Leaves whorled: blades narrow, entire. Heads solitary, not showy. Involucre broad, many-flowered: bracts narrow, appressed. Receptacle conic, naked. Corollas with a very short tube and a funnelform throat, the lobes broad. Anther-appendages ovate. Achene narrow, sharply angled. Pappus of 5 broad scales.—One species.

1. *S. uniflora* (Walt.) B. S. P. Stem 2-7 dm. long, often decumbent: leaves 4-6 in a whorl; blades linear to narrowly linear-lanceolate or linear-filiform, 1-2.5 cm. long: heads slender-peduncled: bracts of the involucre ciliate, lanceolate or with a lanceolate or narrowly ovate tip above a thicker base, acute or acuminate: corolla rose-purple or pink, nearly 2 mm. long, the tube shorter than the throat: achene slightly broadened upward, 1 mm. long, excluding the stipe-like base: pappus-scales broad, shorter than the achene, blunt. [*S. verticillata* Cass.]—Bogs and pine-

land ponds, Coastal Plain and New England coast, Fla. to Ala. and N. H.—Spr.-fall.—Usually growing in water or at least in soft mud. Sometimes very densely matted and then striking on account of the very numerous whorled leaves and the numerous stems each with an erect small head.

**7. AGERATUM** L. Annual or rarely perennial, stiff herbs or partly woody plants. Leaves usually opposite: blades toothed. Heads corymbose. Involucre campanulate. Receptacle elevated. Flowers blue, purple, pink, or white. Corolla-lobes erect, deltoid. Anther-appendages ovate. Achene 5-angled short. Pappus of several short blunt or long slender-tipped scales, or cup-like or crown-like.—About 30 species, tropical American, several widely cultivated.—**AGERATUMS.**

Pappus cup-like or crown-like, the scales very short: achene glabrous: foliage glabrous: leaves succulent.

Pappus of distinct scales as long as the pubescent achenes or longer: foliage pubescent: leaves herbaceous.

1. *A. littorale*.

Involucre over 4 mm. high; bracts long-tipped; pappus decidedly longer than the achene.

2. *A. Houstonianum*.

Involucre less than 4 mm. high; bracts short-tipped: pappus about as long as the achene.

3. *A. conyzoides*.

1. ***A. littorale*** A. Gray. Stem 2-7 dm. tall, glabrous, often branched at the base: leaf-blades ovate, 1-5 cm. long, crenate-serrate, usually cuneate at the base: corymbs terminating long peduncle-like branches: involucre 4 mm. high in anthesis; bracts merely ciliate: corolla about 2.5 mm. long: achene 2 mm. long: pappus very short.—Sand-dunes and shore hammocks, Florida Keys and Cape Sable.—All year.—An exceedingly showy plant both on account of the bright-green succulent leaves and the numerous blue flower-heads. Only cultivated locally.

2. ***A. Houstonianum*** Mill. Stem 3-11 dm. tall, rather copiously pubescent with crisped hairs, sometimes branched: leaf-blades ovate to deltoid mostly 4-7 cm. long, crenate, thick: involucre about 5 mm. high in anthesis; bracts subulate to linear-lanceolate, copiously pubescent: corolla nearly 3 mm. long: achene about 2 mm. long, stout: pappus-scales nearly 2.5 mm. long, the slender tip less than twice as long as the body.—Pinelands and cult. grounds, Fla. Nat. of Mex.—(*W. I., C. A.*)—Sum.-fall.—Commonly cultivated for ornament. The flowers are very fragrant.

3. ***A. conyzoides*** L. Stem 1-9 dm. tall, sparingly pubescent or nearly glabrous, often branched: leaf-blades ovate to deltoid-ovate, 1.5-4 cm. long, crenate, thinnish: involucre about 3 mm. high in anthesis; bracts subulate to linear-subulate, sparingly pubescent: corolla nearly 2 mm. long: achene 1.5 mm. long, slender: pappus-scales about 1.5 mm. long, the slender tip fully twice exceeding the small body.—Waste-places and cult. grounds, Coastal Plain, Fla. to Miss. and N. C. Nat. of trop. Am.—Sum.-fall.—Has smaller heads than the preceding species and is less commonly cultivated.

**8. OSMIA** Sch. Bip. Shrubs or perennial herbs, with much-branched stems. Leaves opposite: blades broadest below the middle, often coarsely toothed. Heads borne in corymbs, relatively few-flowered. Flowers lilac, pale-purple, bluish-purple, or white. Involucre narrowly ovoid or stout-cylindric:

bracts in several series, chartaceous, the outer very short, the inner long and narrow. Corolla-lobes ovate or rounded. Anther-appendages triangular. Achene elongate, angled. Pappus of capillary bristles.—More than 50 species, tropical.

Tips of the involucrel bracts spreading, bluish, much thinner than the body: inner bracts broadened upward: achene wing-angled. 1. *O. ivaefolia*.

Tips of the involucrel bracts appressed, light-green or dark-green: inner bracts pale, linear, each with a minute colored tip: achene not wing-angled.

Bracts of the involucre 5-7-ribbed, the inner acute: involucre less than 8 mm. high.

2. *O. frustrata*.

Bracts of the involucre 3-ribbed, the inner obtuse: involucre over 8 mm. high.

3. *O. odorata*.

1. *O. ivaefolia* (L.) Small. Stem 3-15 dm. tall, finely pubescent or sometimes slightly hirsute: leaf-blades lanceolate, elliptic-lanceolate, or nearly linear, 1-7 cm. long, acute, with short petiole-like bases: involucre about 6 mm. high; bracts striate and azure-tipped: corollas purplish-red or bluish-purple: receptacle small, flat-topped: achene 2-2.5 mm. long. [*Eupatorium ivaefolium* L.]—Prairies, pinewoods, and fields, Coastal Plain, Miss. to Tex.—(W. I., Mex., C. A., S. A.)—Sum.-fall.—One of several tropical plants that occur in our range only in or near the lower end of the Mississippi drainage basin.

2. *O. frustrata* (B. L. Robinson) Small. Stem 5-20 dm. tall, minutely pubescent, with mostly ascending branches: leaf-blades ovate, deltoid-ovate, or ovate-lanceolate, 2-5 cm. long, acute or obtuse, with rather slender petiole-like bases: involucre about 7 mm. high; bracts sometimes slightly green-tipped: corolla pale-purplish or bluish, about 4 mm. long: achene stoutish, less than 4 mm. long. [*Eupatorium heteroclinum* Chapm. not Griseb.]—Hammocks, S pen. Fla. and the Keys.—All year.—An endemic species. It is particularly abundant in the Cape Sable region and in hammocks of the Ten Thousand Islands.

3. *O. odorata* (L.) Sch. Bip. Stem 6-28 dm. tall, pubescent, with divergent branches: leaf-blades ovate to lanceolate, 4-12 cm. long, acuminate, with long slender petiole-like bases: involucre 9-10 mm. high; bracts decidedly green-tipped: corolla white or pale-lilac, about 5 mm. long: achene very slender, over 4 mm. long. [*Eupatorium conyzoides* Vahl.]—Hammocks, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—All year.—The largest of our three species, often forming dense thickets on the Florida Keys.

9. **EUPATORIUM** [Tourn.] L. Shrubs or caulescent herbs. Leaves alternate or opposite: blades entire, toothed, or dissected. Heads borne in corymbs. Involucre campanulate, turbinate or cylindric: bracts appressed. Corollas white, pink, lilac, red, or purple. Corolla-lobes ovate or triangular. Anther-appendages ovate. Achene angled. Pappus of capillary bristles.—More than 500 species, mostly in warm and tropical region.—The leaves are sometimes whorled.

Herbs: mostly temperate plants of various habitats.

Leaf-blades dissected or pinnatifid, the segments narrow.

I. CAPILLIFOLIA.

Leaf-blades entire, toothed, or merely incised.

Leaves alternate or merely opposite, sometimes whorled on individual plants.

Involucre of closely imbricate unequal bracts in several series.

Leaf-blades petioled or merely sessile.

Leaf-blades petioled, often long-petioled.

Head 10-15-flowered: involucre campanulate: leaf-blades of a lanceolate type, borne horizontally.

Head about 5-flowered: involucre cylindrical: leaf-blades of an ovate type, borne vertically.

Leaf-blades sessile or essentially so.

Leaf-blades narrowed at the base.

Bracts of the involucre acute, acuminate, or mucronate.

Bracts of the involucre obtuse or individually mucronulate.

Leaf-blades broad at the base.

Leaf-blades connate-perfoliate or connate-clasping.

Involucre of nearly equal bracts in one row, or a few outer ones shorter.

Leaves in whorls of 3-6.

Shrub: tropical plant of hammocks.

#### I. CAPILLIFOLIA

Leaf-segments filiform.

Inflorescence-branches secund-recurved: inner involucral bracts prominently scarious-margined, gradually long-aristate.

Inflorescence-branches fastigiate: inner involucral bracts obscurely scarious, abruptly short-aristate.

Leaf-segments linear, linear-filiform, or lanceolate.

Leaf-blades 1- or 2-parted.

Inflorescence paniculate or thyrsoid.

Heads 3-6-flowered, not glomerate on the inflorescence-branches: bracts of the involucre punctate and viscid.

Heads 6-9-flowered, glomerate or clustered at the ends of the inflorescence-branches: bracts of the involucre neither punctate nor viscid.

Inflorescence corymbose.

Leaf-blades mainly pectinately pinnatifid.

#### II. SEROTINA

Tall, rather coarse, herb with coarsely toothed long-petioled leaf-blades not placed vertically.

#### III. CRASSIFOLIA

Low, somewhat fleshy, herbs, with repand or crenate-dentate petioled leaf-blades placed vertically.

#### IV. ALBA

Blades of the upper cauline leaves linear or of a linear type.

Blades of the upper cauline leaves ovate, lanceolate, or elliptic.

Bracts of the mature involucre copiously fine-pubescent, not scarious-margined, the inner ones 5.5 mm. long or less.

Bracts of the mature involucre glabrous or with scattered hairs, more or less scarious-margined, the inner ones 7 mm. long or more.

Inner bracts of the involucre not petaloid, long-acuminate, linear-subulate.

Inner bracts of the involucre petaloid, short-mucronate, linear-spatulate.

#### V. HYSSOPIFOLIA

Leaf-blades linear, often narrowly so or linear-filiform.

Inner bracts of the involucre over 4 mm. long, outer bracts lanceolate: achene 2.5-3 mm. long.

#### II. SEROTINA.

#### III. CRASSIFOLIA.

#### IV. ALBA.

#### V. HYSSOPIFOLIA.

#### VI. ROTUNDIFOLIA.

#### VII. PERFOLIATA.

#### VIII. URTICAEFOLIA.

#### IX. PURPUREA.

#### X. VILLOSA.

1. *E. leptophyllum*.

2. *E. capillifolium*.

3. *E. compositifolium*.

4. *E. Eugenei*.

5. *E. pinnatifidum*.

6. *E. pectinatum*.

9. *E. leucolepis*.

10. *E. anomalum*.

11. *E. album*.

12. *E. petaloideum*.

13. *E. hyssopifolium*.

Inner bracts of the involucre less than 4 mm. long, outer bracts ovate; achene about 2 mm. long.

Leaf-blades broader.

Inner bracts of the involucre linear; leaf-blades entire or coarsely toothed, but the teeth not salient.

Inner bracts of the involucre 4 mm. long or more.

Leaf-blades typically or predominantly narrowed upward.

Leaves spreading; inner bracts of the involucre broadly linear; achene about 3 mm. long.

Leaves reflexed; inner bracts of the involucre narrowly linear; achene about 2 mm. long.

Leaf-blades typically or predominantly broadened upward.

Blades of the cauline-leaves entire or nearly so; achene about 3 mm. long.

Blades of the cauline leaves coarsely toothed; achene about 2.5 mm. long.

Inner bracts of the involucre 3.5 mm. long or less.

Inner bracts of the involucre elliptic; leaf-blades stiff, prominently ribbed, usually saliently toothed.

17. *E. tortifolium*.

18. *E. cuneifolium*.

19. *E. semiserratum*. —

20. *E. altissimum*. —

#### VI. ROTUNDIFOLIA

Leaf-blades crenate, serrate-crenate, or dentate-serrate or somewhat incised; bracts of the involucre acute or acuminate.

Branches of the inflorescence alternate; blades of the upper leaves coarsely few-toothed.

Branches of the inflorescence opposite; blades of the upper leaves more finely and evenly toothed.

Leaf-blades about as wide as long, the upper ones of a deltoid or suborbicular type, truncate or subcordate at the base.

Leaf-blades longer than wide, the upper ones of an ovoid type, rounded or broadly cuneate at the base.

Involucre over 6 mm. long; achene nearly 3 mm. long.

Involucre less than 6 mm. long; achene about 2 mm. long.

Leaf-blades sharply serrate; bracts of the involucre obtuse.

21. *E. verbenaeifolium*. —

22. *E. rotundifolium*. —

23. *E. pubescens*. —

24. *E. scabridum*.

25. *E. sessilifolium*. —

#### VII. PERFOLIATA

Leaf-blades connate-clasping; bracts of the involucre mostly less than 12; head more than 15-flowered.

Involucre cylindric-turbinate, over 4 mm. high, acute at the base; inner bracts linear, acuminate.

Involucre campanulate, less than 4 mm. high, rounded at the base; inner bracts elliptic, abruptly short-pointed or obtuse.

Leaf-blades connate-perfoliate, except in *E. perfoliatum truncatum*; bracts of the involucre mostly more than 12; head less than 15-flowered.

26. *E. Chapmanii*.

27. *E. cuneatum*. —

28. *E. perfoliatum*.

#### VIII. URTICAEOFOLIA

Corolla pink to pale-purple, wholly glabrous.

Corolla white, the lobes pubescent, sometimes very slightly so.

Leaf-blades sharply or saliently toothed, the upper cauline-leaves slender-petioled, with petioles nearly or quite one-half as long as the blades.

Large-leaved plants; blades of the leaves of the stem typically nearly or quite 1 dm. long, of an ovate type.

Involucre mostly less than 20-flowered, 3 mm. wide or less at maturity; bracts mostly 13 or fewer.

Involucre mostly more than 25-flowered, 4 mm. wide or more at maturity; bracts mostly 16 or more.

Small-leaved plants; blades of the leaves of the stem typically less than 6 cm. long, of a hastate or deltoid type.

29. *E. incarnatum*. —

30. *E. urticaefolium*. —

31. *E. roanensis*. —

32. *E. jucundum*.

Leaf-blades crenate, the teeth blunt or rounded, the upper cauline leaves short-petioled or sessile.

Involucre sparingly pubescent; inner bracts nearly linear or spatulate, glabrous or sparingly ciliate, scarious-margined.

Involucre copiously pubescent; inner bracts spatulate or narrowly cuneate, copiously ciliate, not scarious-margined.

33. *E. aromaticum*. —

34. *E. latidens*.

#### IX. PURPUREA

Stem hollow, very glaucous: leaf-blades elliptic-lanceolate, crenate-serrate.

Stem normally solid, green or slightly glaucous: leaf-blades of an ovate type, sharply serrate.

Stem very purple at the nodes: leaf-blades very thin: flowers not ill-scented: corollas light-purple.

Stem not purple at the nodes: leaf-blades thickish, rugose: flowers ill-scented: corollas crimson.

35. *E. maculatum*. —

36. *E. trifoliatum*.

37. *E. purpureum*. —

#### X. VILLOSA

Shrub with ovate or deltoid-ovate leaf-blades.

38. *E. villosum*.

1. *E. leptophyllum* DC. Stem 4–13 dm. tall, glabrous, with recurved-second branches above: leaf-blades with filiform segments: bracts of the involucre long-tipped, the inner between 3 and 4 mm. long: corolla white, about 3 mm. long: achene fully 1.5 mm. long.—(FENNEL.)—Low grounds, margins of ponds, and swamps, Coastal Plain, Fla. to Miss. and S. C.—Sum.—fall, or all year S.

2. *E. capillifolium* (Lam.) Small. Stem 9–30 dm. tall, pubescent, fastigate above: leaf-blades with filiform segments: bracts of the involucre short-tipped, the inner between 2 and 3 mm. long: corolla white, about 2 mm. long: achene fully 1 mm. long.—(DOG-FENNEL.)—Hammocks, old fields, roadsides, and banks, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and Del.—Sum.—fall.

3. *E. compositifolium* Walt. Stem 6–12 dm. tall, puberulent to finely pubescent, paniculate above: leaf-blades with linear or nearly linear segments: inflorescence plumose: bracts of the involucre mucronate, the inner 3.5–4 mm. long: corolla white, 3 mm. long: achene 1.5–2 mm. long.—(DOG-FENNEL.)—Dry soil, especially in pinelands, Coastal Plain and adj. provinces, Fla. to Tex., and N. C. Sum.—fall.

4. *E. Eugenei* Small. Stem 6–14 dm. tall, pubescent: leaf-blades with linear, entire, or toothed segments, or those of the upper leaves merely toothed or incised: inflorescence not plumose: bracts of the involucre mucronate, the inner 3–3.5 mm. long: corolla white, 2.5–3 mm. long: achene less than 2 mm. long.—Pinelands and woods, Coastal Plain and adj. Piedmont, Fla. and Ala.—Fall.

5. *E. pinnatifidum* Ell. Stem 6–12 dm. tall, finely pubescent: leaf-blades with linear or nearly linear segments: involucre about 3 mm. long: bracts cuspidate, the inner about 3 mm. long: corolla white, about 2 mm. long: achene fully 1 mm. long.—Dry soil and damp borders of thickets, Coastal Plain and adj. provinces, Fla. to Ala. and N. C.—Sum.—fall.

6. *E. pectinatum* Small. Stem 9–20 dm. tall, finely pubescent, corymbose above: leaf-blades elliptic in outline, or broadest above or below the middle: involucre 4–5 mm. long: bracts obtuse or retuse-aristulate, the inner 3.5–4 mm. long: corolla white, 3 mm. long: achene fully 1 mm. long.—Sandy soil, Coastal Plain, Fla. and Ga.—Sum.—fall.

7. *E. serotinum* Michx. Stem 8–20 dm. tall, finely pubescent, corymbose above: leaf-blades herbaceous, lanceolate to ovate-lanceolate, 5–25 cm. long, acute or acuminate, coarsely serrate: involucre less than 5 mm. long; bracts linear to linear-elliptic, broadened upward, rounded at the apex, white-margined, the inner 3–3.5 mm. long: corolla white, 3 mm. long: achene less than 2 mm. long.—Rich woods, banks, and wet grounds, various provinces, Fla. to Tex., Ia., and Md.—Sum.—fall.
8. *E. mikanioides* Chapm. Stem 5–11 dm. tall, tomentulose, at least when young: leaf-blades vertical, fleshy, deltoid-ovate to hastate-ovate, or sometimes elliptic, 3–6 cm. long, obtuse or acutish, repand or crenate-dentate: involucre over 5 mm. long; bracts linear, abruptly pointed, green-margined, the inner 4–5 mm. long: corolla white or pinkish, nearly 4 mm. long: achene fully 1 mm. long.—Low sandy soil, damp, sandy or marly pinelands, and salt marshes, Fla.—Sum.—fall.
9. *E. leucolepis* T. & G. Stem 3–8 dm. tall, rough-pubescent, or tomentulose above; leaf-blades linear to lanceolate, 3–8 cm. long, remotely serrate or nearly entire: involucre tomentulose; bracts slenderly acuminate: involucre ones broadly linear, 6–6.5 mm. long: corolla white, about 3.5 mm. long: achene 2.5 mm. long. [*E. Mohri* Greene.]—Pinelands, and acid, sandy bogs, Coastal Plain, Fla. to La. and N. Y.—Sum.—fall.
10. *E. anomalum* Nash. Stem 8–15 dm. tall, tomentulose: leaf-blades ovate-lanceolate to ovate, 3–7 cm. long, coarsely and sharply serrate: involucre finely pubescent; bracts acute or short-acuminate, the inner narrowly linear, 5–5.5 mm. long: corolla white, about 3.5 mm. long: achene 2–2.5 mm. long.—Sandy soil, Fla.—Sum.—fall.
11. *E. album* L. Stem 3–9 dm. tall, harshly pubescent: leaf-blades elliptic to lanceolate, or those at the base of the stem ovate to obovate, 3–10 cm. long, serrate: involucre cylindric-turbinate, the inner bracts linear-subulate, 8–9 mm. long, abruptly pointed: corolla white, about 5 mm. long: achene about 3 mm. long.—Dry, acid, sandy soil, in pinelands and deciduous woods, Coastal Plain and adj. provinces, Fla. to La., Tenn., and N. Y.—Sum.—fall.
12. *E. petaloideum* Britton. Stem 3–7 dm. tall, rough-pubescent: leaf-blades elliptic to ovate or ovate-lanceolate, or the lower ones oval or obovate, 2–8 cm. long, bluntly serrate or crenate-serrate: involucre trumpet-shaped, the inner bracts spatulate, 10–11 mm. long, or sometimes shorter, mucronate: corolla white, 4 mm. long: achene about 3 mm. long.—Pinelands, Coastal Plain, Fla. and Ala.—Sum.—fall.
13. *E. hyssopifolium* L. Stem 3–8 dm. tall, puberulent: leaf-blades linear, 2–6 cm. long, sometimes undulate: involucre 5–6 mm. high; inner bracts narrowly linear or linear-lanceolate, ciliate, obtuse, the inner 5–5.5 mm. long: corolla white, 3.5–4 mm. long: achene 2.5–3 mm. long.—Woods, banks, and thickets, various provinces, Fla. to Tex., Ky., and Mass.—Sum.—fall.
14. *E. lechaeafolium* Greene. Stem 3–7 dm. tall, puberulent or finely pubescent: leaf-blades narrowly linear, 1–8 cm. long, entire: involucre 3–4 mm. high; inner bracts elliptic, ciliate at the mucronate apex: corolla white, 2.5–3 mm. long: achene about 2 mm. long.—Sandy soil, Coastal Plain, Fla. to Ga. and Ala.—Sum.—fall.
15. *E. Torreyanum* Short. Stem 4–12 dm. tall, finely pubescent: leaf-blades broadly linear to narrowly lanceolate, coarsely and sharply serrate to lacinate: involucre turbinate: bracts broadly linear, ciliate, the inner 5–5.5 mm. long:

corolla white, 3 mm. long: achene 3 mm. long.—Low woods and wooded hill-sides, often in acid soil, various provinces, Fla. to Tenn., Ky., and Pa.—Sum.—fall.

16. *E. recurvans* Small. Stem 4–9 dm. tall, finely pubescent: leaves more or less reflexed; blades narrowly elliptic to lanceolate, 1.5–4 cm. long, coarsely and bluntly toothed: involucre cylindric: bracts narrowly linear, slightly ciliate, the inner about 4 mm. long: corolla white, 3 mm. long: achene about 2 mm. long.—Pinelands, Coastal Plain, Fla. to Ala. and Ga.—Sum.—fall.

17. *E. tortifolium* Chapm. Stem 3–7 dm. tall, tomentulose above: leaf-blades spatulate, oblanceolate, or nearly linear, 1–3 cm. long, entire or shallowly and remotely toothed: outer bracts of the involucre ovate; inner bracts linear: corolla white, about 3 mm. long: achene about 3 mm. long.—Sandy ridges and dry pinelands, Coastal Plain, Fla. to Ala. and S. C.—Sum.—fall.

18. *E. cuneifolium* Willd. Stem 4–8 dm. tall, tomentulose above: leaf-blades cuneate, elliptic-cuneate, or linear-elliptic, 1–3 cm. long, serrate, or the upper ones individually entire: outer bracts of the involucre oval; inner bracts narrowly elliptic: corolla white, about 3.5 mm. long: achene about 2.5 mm. long.—Rich woods, Coastal Plain and adj. provinces, Fla. to Ala. and S. C.—Sum.—fall.

19. *E. semiserratum* DC. Stem 5–12 dm. tall, tomentulose: leaf-blades elliptic-spatulate to elliptic, 3–10 cm. long, sharply serrate: involucre nearly cylindric; bracts obtuse, ciliate, not pale-margined, the inner linear, 3–3.5 mm. long: corolla white, 2–2.5 mm. long: achene about 2 mm. long.—Sandy soil, wet places, and pond-margins, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—Sum.—fall.

20. *E. altissimum* L. Stem 8–20 dm. tall, hoary-tomentulose: leaf-blades linear-lanceolate to linear-elliptic, mostly 4–12 cm. long, sharply serrate: involucre campanulate; bracts ciliate, obtuse, pale-margined, the inner elliptic, 4.5–5 mm. long: corolla white, about 4 mm. long: achene 3–3.5 mm. long.—Dry soil, various provinces, Miss. to Tex., Ia., Pa., and N. C.—Sum.—fall.

21. *E. verbenaeifolium* Michx. Stem 6–12 dm. tall, finely pubescent: leaf-blades ovate to lanceolate, 2–12 cm. long, coarsely serrate: bracts of the involucre abruptly short-pointed, the inner mostly linear-elliptic or narrowly elliptic, 4–4.5 mm. long: corolla white, 3 mm. long: achene about 3 mm. long.—Sandy soil, moist grounds, and acid swamps, Coastal Plain and adj. provinces, Fla. to La., Tenn., and Mass.—Sum.—fall.

22. *E. rotundifolium* L. Stem 3–12 dm. tall, tomentulose: leaf-blades sub-orbicular to orbicular-ovate, 2–4 cm. long, crenate or crenate-dentate: intermediate bracts of the involucre acuminate, the inner ones 5.5–6 mm. long, narrowly linear: corolla white, about 3 mm. long: achene fully 2 mm. long.—(FALSE-HOARHOUND.)—Dry woods, pinelands, and swamps, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and R. I.—Sum.—fall.

23. *E. pubescens* Muhl. Stem 3–15 dm. tall, canescent-tomentulose: leaf-blades ovate, 2–10 cm. long, serrate or incised-serrate: intermediate bracts of the involucre acute or abruptly pointed, the inner ones 5.5–6 mm. long, linear-elliptic: corolla white, about 3 mm. long: achene 2.5–3 mm. long.—Rocky woods, acid, sandy banks, and thickets, Coastal Plain and adj. provinces, Fla. to Miss., Tenn., and Me.—Sum.—fall.

24. *E. scabridum* Ell. Stem 4–12 dm. tall, canescent-tomentose: leaf-blades elliptic to ovate-elliptic, 2–8 cm. long, serrate or incised-serrate: bracts of the

involucre abruptly pointed, the inner 4-5 mm. long, linear-elliptic: corolla white, 2.5-3 mm. long: achene fully 2 mm. long.—Low pinelands, Coastal Plain, Fla. to S. C.—Sum.—fall.

25. *E. sessilifolium* L. Stem 4-15 dm. tall, tomentulose above: leaf-blades lanceolate, 8-25 cm. long, acuminate, sharply serrate, sessile, sometimes slightly clasping: bracts of the involucre obtuse, the inner linear-elliptic, 4.5-5 mm. long: corolla white, 3 mm. long: achene 3-3.5 mm. long.—Thickets, open woods and rocky banks, various provinces, rarely Coastal Plain, Ga. to Ala., Mo., Vt., and Mass.—Sum.—fall.

26. *E. Chapmanii* Small. Stem 4-12 dm. tall, tomentulose above: leaf-blades elliptic to elliptic-ovate, or narrowly ovate, 2-10 cm. long, crenate; inner bracts of the involucre acuminate, linear, 4-4.5 mm. long: corolla white, 3 mm. long: achene about 1.5 mm. long.—Sandy woods, Fla.—Sum.

27. *E. cuneatum* Engelm. Stem 5-16 dm. tall, tomentulose above: leaf-blades lanceolate to elliptic-lanceolate, 9-20 cm. long, finely crenate-serrate: inner bracts of the involucre abruptly short-pointed or obtuse, elliptic, 3-3.5 mm. long: corolla white, 3 mm. long: achene 1.5 mm. long.—Low grounds, Coastal Plain and adj. provinces, Ala. to La., Mo., and N. C.—Sum.—fall.

28. *E. perfoliatum* L. Stem 3-12 dm. tall, tomentulose above: leaf-blades lanceolate, 8-25 cm. long, crenate-serrate, connate-perfoliate (or truncate in *E. perfoliatum truncatum*): inner bracts of the involucre cuneate-spatulate, acuminate, 6-6.5 mm. long or shorter: corolla white, 3-4 mm. long: achene 2 mm. long, or mostly shorter.—(BONASET. THOROUGHWORT.)—Moist meadows, and swamps, various provinces, Fla. to Tex., N. D., and N. B.—Sum.—fall.

29. *E. incarnatum* Walt. Stem 5-12 dm. tall, minutely pubescent: leaf-blades thin, ovate to deltoid, and usually somewhat hastate, 2-6 cm. long, acute or acuminate, coarsely serrate, on long and slender petioles: involucre narrow; bracts linear or nearly so, or the outer subulate, often ciliate at the apex, the outer ones often pubescent, especially near the base, the inner 4-4.5 mm. long: corolla lilac, about 3 mm. long: achene 2-2.5 mm. long.—Rich sandy woods, Coastal Plain and adj. provinces, Fla. to Tex., Ind. and Va.—(Mex.)—Sum.—fall.

30. *E. urticaefolium* Reichard. Stem 4-12 dm. tall, puberulent or glabrate: leaf-blades thin, ovate or rarely ovate-lanceolate, 4-12 cm. long, acuminate, coarsely serrate, long-petioled: involucre turbinate: bracts narrowly linear, ciliate at the apex, the inner 3-5 mm. long, acuminate: corolla white, 3-4 mm. long: achene slender-fusiform, 2-2.5 mm. long.—(WHITE-SNAKEROOT. WHITE-SANTICLE.)—Rich woods and thickets, various provinces, Ga. to La., Okla., Ont., and N.B.—Sum.—fall.

31. *E. roanensis* Small. Stem 1 m. tall or less, finely pubescent at least above: leaf-blades ovate, often broadly so, 7-14 cm. long, acuminate, serrate, rather coarsely so, long-petioled: involucre campanulate; bracts broadly linear or somewhat spatulate, minutely pubescent, the inner 5-6 mm. long, acute: corolla white, 3-4 mm. long: achene stout-fusiform, about 2.5 mm. long.—Woods, Roan Mt., in the Blue Ridge, N. C. and Tenn.—Sum.—fall.

32. *E. jucundum* Greene. Stem 4-12 dm. tall, glabrous or minutely pubescent above: leaf-blades thin, ovate, often broadly so or deltoid, or somewhat hastate, 1.5-6 cm. long, obtuse or acutish, coarsely crenate-serrate or incised-serrate, slender-petioled: involucre cylindric or nearly so; bracts acute or acuminate, the inner narrowly linear, 3-3.5 mm. long: corolla white, about 4 mm. long: achene about 2.5 mm. long.—Hammocks and pinelands, N and upper pen. Fla.—Fall-wint.

33. *E. aromaticum* L. Stem 3-15 dm. tall, puberulent or minutely pubescent: leaf-blades thickish, ovate or orbicular-ovate to ovate-lanceolate, 2-10

cm. long, obtuse or acute, crenate, sessile or short-petioled: involucre cylindric or turbinate-cylindric: bracts narrow, linear, or the inner ones spatulate, ciliate, 4-4.5 mm. long: corolla white, 4.5-5 mm. long: achene 2.5-3 mm. long.—(WILD-HOARHOUND).—Dry, acid, woods, thickets, and pinelands, Coastal Plain and adj. provinces, Fla. to Miss., Tenn., Pa., and Mass.—Sum.—fall.

34. *E. latidens* Small. Stem 7-12 dm. tall, finely pubescent often closely so above: leaf-blades deltoid-ovate or orbicular-ovate, or suborbicular or reniform-orbicular on the lower part of the stem, 4-11 cm. long, obtuse or acutish, coarsely toothed, usually crenate, sessile or short-petioled: involucre campanulate; bracts broad, elliptic, or the inner spatulate or narrowly cuneate, all copiously ciliate, obtuse or acute: corolla white, 3-3.5 mm. long: achene about 2 mm. long.—Woods, Appalachian Valley, Tenn.—Sum.—fall.

35. *E. maculatum* Justineus. Stem glabrous, 2-5 m. tall, usually mottled: leaves in whorls of 4-7, usually of 5 or 6; blades elliptic-lanceolate, 1-3 dm. long, acuminate, firm: corymb more or less elongate, round-topped: involucre usually 6- or 7-flowered: corolla 3.5-5 mm. long.—(JOE-PYE-WEED. SMOKEWEED).—Moist soil, often in thickets, various provinces, Fla. to Tex., Ohio, and Me.—Sum.—fall.

36. *E. trifoliatum* L. Stem glabrous or sparingly pubescent, 1-2 m. tall: leaves in whorls of 3-5, mostly in fours; blades lanceolate to elliptic-lanceolate, 1.5-2 dm. long, acuminate: corymb convex: involucre usually 5-7-flowered: corolla 5.5-7.5 mm. long.—(JOE-PYE-WEED).—Open woodlands, various provinces, Ga. to Okla., Nebr., Wis., and N. H.—Sum.—fall.

37. *E. purpureum* L. Stem more or less pubescent, scabrous, 0.5-2 m. tall, purplish-tinged: leaves in whorls of 2-5, usually in threes or fours; blades firm, ovate, 0.5-2 dm. long, sharply-serrate, 3-ribbed: corymb somewhat convex: involucre usually 6-9-flowered: corolla 4.5-5.5 mm. long.—(JOE-PYE-WEED).—Moist soil, often in swamps, Coastal Plain and adj. provinces, S. C. to N. H.—Sum.—fall.

38. *E. villosum* Sw. Stem 5-20 dm. tall, woody, tomentulose: leaf-blades ovate to deltoid-ovate, 1.5-7 cm. long, obtuse, entire or repand: heads in small clusters: involucre campanulate: bracts obtuse, or the inner acute, 3-4 mm. long: corolla white or pinkish, barely 3 mm. long: achene 1.5-2 mm. long.—Hammocks and pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)—All year.

10. *CONOCLINIUM* DC. Perennial caulescent herbs. Leaves opposite: blades toothed or lobed. Heads in open or compact peduncled clusters. Involucre campanulate or hemispheric, many flowered: bracts narrow, imbricate in several series. Corolla regular, blue or violet, very narrowly funnelform: lobes ovate or deltoid. Androecium included. Anther-appendages ovate. Achene narrowly obpyramidal or somewhat ellipsoid, angled. Pappus of few capillary bristles.—Eight or ten species, mostly tropical. Plants, and flower-heads, often resemble *ageratum*.

1. *C. coelestinum* (L.) DC. Stem 2-11 dm. tall, appressed-pubescent, branched: leaf-blades ovate, deltoid, triangular or triangular-lanceolate, 3-12 cm. long, crenate or serrate-crenate, sometimes coarsely so, those of the lower leaves, at least, long-petioled: involucre about

4 mm. high; bracts subulate or linear-subulate, ribbed, pubescent: corolla about 2.5 mm. long: achene barely 1.5 mm. long. [*Eupatorium coelestinum* L. *C. dichotomum* Chapm.]—(MIST-FLOWER.)—Stream-banks, marshes, and thickets, various provinces, Fla. to Tex., Kans., Mich., and N. J.—(*Cuba.*)—Sum.—fall or all year S.—Sometimes cultivated and used in place of species of *Ageratum*.

11. **MIKANIA** Willd. Herbaceous vines. Leaves opposite, herbaceous: blades of a hastate or deltoid type, mostly toothed. Heads borne in corymbs. Involucre cylindric. Corolla pink or white, with a campanulate throat: lobes lanceolate to triangular-ovate. Androecium exserted: anther-appendages ovate. Achene angled. Pappus of many capillary bristles. [*Willugbaeya* Neck.]—About 150 species, American.—CLIMBING HEMPWEEDS.

Bracts of the involucre acute or acuminate.

Bracts of the involucre scarcely 4 mm. long.

Bracts of the involucre over 4 mm. long.

Bracts of the involucre obtuse.

1. *M. batatifolia*.

2. *M. scandens*.

3. *M. cordifolia*.

1. *M. batatifolia* DC. Plant glabrous: leaf-blades deltoid to hastate-ovate, 1–3 cm. long, entire or repand: heads in small irregular clusters: bracts of the involucre 3–4 mm. long: corolla about 3 mm. long. [*W. heterophylla* Small.]—Hammocks, low pinelands, and Everglades, S pen. Fla. and the Keys.—(*W. I.*)—All year.

2. *M. scandens* (L.) Willd. Plant finely pubescent or nearly glabrous: leaf-blades deltoid-ovate to hastate, 5–8 cm. long, undulate or angulately lobed: bracts of the involucre 5–5.5 mm. long, acuminate or abruptly pointed: corolla about 4 mm. long: achene 2–2.5 mm. long.—(CLIMBING HEMP-VINE.)—Woods, thickets, and swamps, various provinces, Fla. to Tex., Ont., and Me.—Sum.

3. *M. cordifolia* (L.) Willd. Plant densely pubescent: leaf-blades ovate to hastate, 6–15 cm. long, coarsely toothed, or lobed, cordate at the base: corymbs rounded or rather flat-topped: heads numerous: involucre narrow, but rather stout; bracts elliptic to linear-elliptic, 7–8 mm. long, obtuse: corolla about 6 mm. long.—Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—All year.—The most vigorous of the three climbing-hempweeds. Well-developed vines produce prodigious inflorescences. The flowers are very fragrant.

12. **COLEOSANTHUS** Cass. Perennial, branching herbs or woody plants. Leaves opposite or alternate: blades usually broad and toothed. Heads borne in corymbose cymes. Involucre cylindric to campanulate: bracts ribbed. Corolla-throat narrow, scarcely wider than the tube; lobes ovate to deltoid. Anther-appendages ovate, obtuse. Achene ribbed or striate. Pappus of many capillary bristles. [*Brickellia* Ell.]—About 70 species, mostly American.

1. *C. cordifolius* (Ell.) Kuntze. Stem 6–12 dm. tall, puberulent or tomentulose: leaf-blades ovate to deltoid-ovate, or nearly lanceolate above, 5–10 cm. long, crenate-serrate: heads many-flowered: involucre

campanulate, lax: outer bracts linear-subulate; inner bracts linear, obtuse, 9–10 mm. long: corolla pale-purple: achene slender, about 6 mm. long, sparingly pubescent: pappus purplish.—Rich<sup>1</sup> soil, woods, and pinelands, Coastal Plain, Fla. to Ala. and Ga.—Sum.—fall.

**13. KUHNIA L.** Perennial, pubescent herbs. Leaves alternate: blades narrow, or rarely of an ovate type, resinous-dotted. Heads in open or compact corymbose or paniculate clusters. Involucres cylindric, often narrow. Corolla cream-colored or nearly white, narrowly funnelform, the tube and throat scarcely distinguishable: lobes triangular to lanceolate. Anther-appendages ovate, obtuse. Achene columnar, striate. Pappus of many capillary bristles.—About 10 species, North American.—FALSE-BONESETS.—Sum.—fall.

Peduncle and involucre finely close-pubescent: bracts of the involucre slenderly and not very prominently ribbed, the inner ones narrowly linear.

Leaves, at least those of the stem, with linear or nearly linear blades: blades thick, entire or obscurely toothed. 1. *K. Mosieri*.

Leaves, at least those of the stem, with blades predominantly of a lanceolate type: blades thin, the larger coarsely toothed. 2. *K. eupatorioides*.

Peduncle and involucre villous-tomentose: bracts of the involucre broadly and prominently ribbed, the inner ones broadly linear. 3. *K. glutinosa*.

1. ***K. Mosieri* Small.** Plant 3–11 dm. tall, slender, deep-green: leaves 1–3 cm. long, usually spreading or reflexed; blades linear or nearly so, entire or obscurely toothed: mature involucre 8–9 mm. high; inner bracts narrowly and sharply ribbed: corolla mostly over 6 mm. long: pappus pale-brown or whitish. [*K. paniculata* (Fl. SE. U. S.)]—Pinelands, Everglade Keys, Fla.—Specimens from as far west as S Ala. may be referable to this species.

2. ***K. eupatorioides* L.** Plant 15 dm. tall or less, stoutish, often pale-green: leaves 3–10 cm. long, ascending; blades lanceolate, sometimes narrowly so, coarsely toothed, or entire above: mature involucre 9–10.5 mm. high; inner bracts with prominent rounded ribs: corolla mostly less than 6 mm. long: pappus tawny.—Woods and stream-banks, Coastal Plain and adj. provinces, Fla. to Miss., Ind., and N. J.

3. ***K. glutinosa* Ell.** Plant 12 dm. tall or less, stoutish, gray or grayish: leaves 1.5–7 cm. long, erect or ascending; blades lanceolate to ovate, coarsely toothed: heads often conspicuously glomerate: mature involucre 8–9 mm. high; inner bracts coarsely ribbed: pappus tawny.—Dry prairies or plains, various provinces, Ala., to Tex., Mont., and Ill.

**14. CARPHEPHORUS Cass.** Perennial, simple-stemmed herbs. Leaves alternate; blades narrow, flat, or acerose, entire. Heads in a terminal corymbose cyme, this sometimes cluster-like. Involucre hemispheric to campanulate: bracts in several series. Corolla rose-purple: throat narrowly funnelform, longer than the narrower tube; lobes lanceolate to deltoid. Androecium included: anther-appendages mostly notched. Achene fusiform, sharply ribbed. Pappus of many pale capillary bristles.—Four species, as follows:

Basal leaves with elongate acerose blades: outer bracts of the involucre lanceolate.

1. *C. Pseudo-Liatris*.

Basal leaves with broader or linear-spatulate blades: outer bracts of the involucre, especially the median ones, broad.

Bracts of the involucre with lax or spreading thick acute or acutish tips.

Bracts of the involucre with thin or scarious erect rounded or retuse tips.

Heads in a cluster-like cyme: stem copiously pubescent.

Heads in an open slenderly branched cyme: stem glabrous or nearly so.

2. *C. tomentosus*.

3. *C. corymbosus*.

4. *C. bellidifolius*.

1. *C. Pseudo-Liatris* Cass. Stem 3-9 dm. tall, finely crisped-pubescent: leaf-blades acerose, involute, reduced to narrow scales above: outer bracts of the involucre lanceolate; inner 7-8 mm. long, broadly linear: bractlets (chaff) linear: achene about 3 mm. long.—Moist pinelands, Coastal Plain, Fla. to La. and Ga.—Fall.

2. *C. tomentosus* (Michx.) T. & G. Stem 3-7 dm. tall, copiously crisped-pubescent or often hirsutulous below: leaf-blades linear-spatulate below, to obovate to elliptic-oval above: outer bracts of the involucre ovate; inner narrowly linear, 9-12 mm. long, entire: bractlets narrowly linear or linear-spatulate: achene about 4 mm. long.—Pinelands, Coastal Plain, Fla. to N. C.—Sum.—fall.—Rather rare.

3. *C. corymbosus* (Nutt.) T. & G. Stem 3-9 dm. tall, pubescent: leaf-blades spatulate or elliptic-spatulate below to cuneate, elliptic, or ovate above: bracts of the involucre scarious-margined, erose-ciliate; outer ovate; inner 6-8 mm. long, cuneate: achene stout, about 3 mm. long.—Pinelands, Coastal Plain, Fla. to N. C.—Sum.—fall.

4. *C. bellidifolius* (Michx.) T. & G. Stem 3-5 dm. tall, glabrous or obscurely pubescent: leaf-blades linear-spatulate to linear: bracts of the involucre not scarious-margined, ciliate, 8-9 mm. long, obtuse: achene slender, about 4 mm. long.—Pinelands, Coastal Plain, and adj. provinces, Fla. to N. C.—Sum.—fall.

15. *LITRISA* Small. Perennial somewhat succulent caulescent herbs, the stems single or clustered from short, branched, knotty rootstocks. Leaves alternate, the basal ones larger than the cauline: blades fleshy-leathery, entire, parallel-veined. Heads corymbose. Involucre campanulate, few-flowered; bracts few, relatively broad, pubescent. Corolla brightly purple, with a short tube and a cylindric throat. Androecium included. Auther-appendages ovate, nearly entire, obtuse. Achene cuneate, ribbed. Pappus of many barbellate bristles.—One species.

1. *L. carnososa* Small. Stem 3-8 dm. tall, finely pubescent; basal leaves in a rosette; blades mostly 2-8 cm. long, linear, varying

to lanceolate or spatulate, acute; cauline leaves remote; blades sessile; involucre erect; bracts mostly acute or mucronate, purple-tinged, the outer ovate, the inner elliptic or broadly linear, about 4 mm. long; achene 2-2.5 mm. long, pubescent.—Prairies and low pinelands, pen. Fla.—Sum.—fall.

**16. LACINIARIA** Hill.<sup>1</sup> Perennial, typically simple herbs with thick roots. Leaves alternate, often numerous; blades narrow, entire. Heads in spikes, racemes, panicles, or rarely in cymes. Involucre ovoid to cylindric or turbinate: bracts few or many, imbricate, rarely petaloid. Corolla rose-purple: throat narrow-funnelform, much longer than the slightly narrower tube: lobes lanceolate. Anther-appendages entire or notched. Achene short, ribbed. Pappus of many barbellate or plumose bristles.—About 40 species, North American.—**BUTTON-SNAKEROOTS. BLAZING-STARS. RATTLESNAKE-MASTERS.**

Pappus bristles plumose.

Bracts of the involucre with dilated or petal-like, rose, (or white), apical appendages.

I. ELEGANTES.

Bracts of the involucre not petal-like at the apex.

Heads many (16-60) -flowered: corolla-lobes pubescent within.

II. SQUARROSAE.

Heads few (3-6) -flowered: corolla-lobes glabrous.

III. PUNCTATAE.

Pappus bristles barbellate.

Bracts of the involucre acute, acuminate, or mucronate at the apex.

Bracts with recurved-spreading tips.

IV. PYCNOSTACHYAE.

Bracts with erect or appressed tips.

Heads secund-spreading on the rachis.

Heads not secund, erect or appressed.

V. PAUCIFLORAE.

Bracts of the involucre obtuse or rounded at the apex (except in No. 17).

VI. TENUIFOLIAE.

Involucre campanulate, nearly cylindric, or turbinate; few-flowered.

VII. SPICATAE.

Involucre hemispheric; many-flowered.

VIII. SCARIOSAE.

#### I. ELEGANTES

Petal-like tips of the involucre bracts much longer than wide, serrulate, acuminate.

Petal-like tips of the involucre bracts about as broad as long, rounded and erose-denticulate.

1. *L. elegans*.

2. *L. flabellata*.

#### II. SQUARROSAE

Stout plant with approximate cauline leaves and large heads: involucre bracts with rigid, acuminate, spreading tips.

3. *L. squarrosa*.

#### III. PUNCTATAE

Slender plant with very narrow leaves: involucre bracts with slightly petaloid tips.

4. *L. Boykinii*.

#### IV. PYCNOSTACHYAE

Involucre bracts with strongly recurved, small petaloid tips.

Involucre bracts with slightly recurved, green tips.

5. *L. pycnostachya*.

6. *L. chlorolepis*.

#### V. PAUCIFLORAE

Stem and rachis glabrous: involucre bracts not glandular punctate.

Stem and rachis pubescent: involucre bracts glandular punctate.

7. *L. pauciflora*.

8. *L. secunda*.

#### VI. TENUIFOLIAE

Leaves gradually decreasing in length from the base of the stem to the inflorescence.

Bracts of the involucre linear or nearly so, usually long-acuminate.

Bracts of the involucre, ovate-lanceolate, usually mucronate.

9. *L. Chapmanii*.

<sup>1</sup> Contributed by Edward Johnston Alexander.

Bracts numerous, about 20, glabrous or sparingly ciliate: stem and rachis glabrous.  
 Bracts few, about 10, pubescent with crisped hairs: stem and rachis pubescent.  
 Leaves abruptly smaller near the base of the stem, the lower ones very much elongate.

10. *L. regimontis*.  
 11. *L. Garberi*.  
 12. *L. tenuifolia*.

## VII. SPICATAE

Involucre campanulate; heads sessile.  
 Involucral bracts with broad petaloid margins.  
 Involucral bracts with merely scarious margins.  
 Involucre turbinate: heads sessile or peduncled.  
 Stem and rachis copiously pubescent.  
 Stem and rachis glabrous or nearly so.  
 Involucre 8-12-flowered.  
 Pappus-bristles nearly or quite as long as the corolla-tube.  
 Involucre nearly cylindric.  
 Involucre -turbinate, sometimes broadly so.  
 Involucre over 9 mm. long.  
 Involucral bracts rounded at the tip.  
 Involucral bracts pointed at the tip.  
 Involucre less than 8 mm. long.  
 Pappus-bristles about half as long as the corolla-tube.  
 Involucre about 20-flowered.

13. *L. spicata*.  
 14. *L. laxa*.  
 15. *L. microcephala*.  
 16. *L. graminifolia*.  
 17. *L. Smallii*.  
 18. *L. gracilis*.  
 19. *L. Helleri*.  
 20. *L. pilosa*.

## VIII. SCARIOSAE

Involucral bracts with broad, petaloid margins and tips.  
 Involucral bracts with merely scarious margins or not margined at all.  
 Involucres usually 1 cm. or more high.  
 Involucral bracts only ciliate margined or glabrous, often with a few scattered hairs: leaves glabrous or scabrate-margined.  
 Involucral bracts densely puberulent: leaves scabrous.  
 Involucre usually less than 1 cm. high.  
 Leaves narrowly linear, scabrous all over.  
 Leaves elliptic to linear-elliptic, smooth, or scabrate merely on the margin.

21. *L. aspera*.  
 22. *L. scariosa*.  
 23. *L. Shortii*.  
 24. *L. Tracyi*.  
 25. *L. Ruthii*.

1. *L. elegans* (Walt.) Kuntze. Stem 3-12 dm. tall, finely pubescent: blades of the lower leaves linear to linear-spatulate; upper leaves reflexed: involucral bracts densely pubescent, the petaloid tips glabrous; tips of the inner ones irregularly serrulate.—Pinelands and dry, sandy woods, Coastal Plain, Fla. to Tex. and S Va.—Sum.-fall.

2. *L. flabellata* Small. Stem 3-6 dm. tall, lanuginous: blades of the lower leaves linear or nearly so: upper leaves reflexed: involucral bracts sparingly pubescent, except the outer bracts which are densely pubescent; tips of the inner bracts erose-denticulate.—Pinelands and open woods, St. Helena Id., S. C.—Fall.

3. *L. squarrosa* (L.) Hill. Stem 3-8 dm. tall, pubescent: blades of the lower leaves linear to linear-elliptic: bracts of the involucre spatulate with abruptly acuminate, spreading tips, heavily ciliate-margined, with some cilia on the bract-body (rarely glabrous, only the outermost slightly ciliate); inner bracts linear, acute, 15-22 mm. long: corollas about 15 mm. long: achene about 6 mm. long, short-pubescent.—Dry sandy soil, various provinces, Fla. to Tex., Mo., Ind., and Va.—Sum.-fall.—The constituents of this species are rather difficult to interpret at present. The following divisions may help understanding the group. *L. squarrosa intermedia* (Lindl.) DC., with

heads more narrow and bracts erect or little spreading, less prolonged, has the same range as the type. *L. squarrosa alabamensis* Alexander, with heads more narrow, bracts glabrous except the outermost, abruptly short-acuminate and very squarrose, is in Ala. and Miss.

4. *L. Boykinii* (T. & G.) Kuntze. Stem 3-6 dm. tall, glabrous or nearly so: blades of the lower leaves narrowly linear: heads loosely spicate-racemose, slender-peduncled: inner bracts of the involucre linear, 9-12 mm. long, acuminate, glabrous or nearly so: corolla 6-7 mm. long: achene 4-4.5 mm. long, or sometimes shorter.—Dry or sandy soil, Coastal Plain, Ga.—Sum.—Perhaps a hybrid between *L. elegans* and *L. tenuifolia*.

5. *L. pycnostachya* (Michx.) Kuntze. Stem 6-15 dm. tall, more or less pubescent, especially above: blades of the lower leaves linear: involucre bracts ciliate-margined, often heavily so; inner bracts 9-11 mm. long, acuminate: corollas 10-11 mm. long: filaments less than half as long as the anthers: achene 4.5-5 mm. long. [*L. macilenta* Small]—Dry soil, various provinces, Tex. to Nebr., Minn., Wis., Ky., and Miss.—Sum.-fall.—*L. Langloisii* Green, distinguished by its woolly stem and involucre, may be distinct.

6. *L. chlorolepis* Small. Stem 3-6 dm. tall, hirsute-tomentulose: blades of the lower leaves narrowly linear: involucre bracts pubescent, with short recurved green tips; inner bracts 6-7 mm. long, obtuse, long-ciliate: filaments fully half as long as the anthers: achene 3-3.5 mm. long. [*L. Garberi* Small, not Kuntze.]—Sandy pinelands, near Tampa, Fla.—Fall.

7. *L. pauciflora* (Pursh) Kuntze. Stem 2-9 dm. tall, glabrous: blades of the lower leaves narrowly linear: involucre bracts glabrous; inner bracts 12-13 mm. long, abruptly pointed or somewhat acuminate: achene 4-4.5 mm. long.—Dry sand, Coastal Plain, Fla. to S. C.—Sum.-fall.

8. *L. secunda* (Ell.) Small. Stem 3-8 dm. tall, densely short-pubescent: blades of the lower leaves linear, often narrowly so: inner bracts of the involucre linear, broadened upward, 7-10 mm. long, acuminate, scattered, short-pubescent: achene 3-5 mm. long. [*L. carinata* Small.]—Sandhills and pinelands, Coastal Plain and Piedmont, Fla. and Ala. to N. C.—Fall.

9. *L. Chapmanii* (T. & G.) Kuntze. Stem 2-6 dm. tall, tomentose: blades of the lower leaves narrowly linear, mostly less than 10 cm. long (or those of the basal and lower stem-leaves longer in *L. Chapmanii longifolia*); involucre bracts glabrous or nearly so; inner bracts 11-13 mm. long, linear-acuminate: achene 5.5-6 mm. long. [*L. Deamii* Lunell.]—Pinelands, Coastal Plain, Fla. and Ga.

10. *L. regimontis* Small. Stem 3-9 dm. tall, glabrous: blades of the lower leaves narrowly linear: involucre bracts glabrous or sparingly ciliate; inner bracts cuneate, 8-9 mm. long, acute: filaments less than half as long as the anthers: achene about 4 mm. long.—Wooded slopes, outliers of the Blue Ridge in the Piedmont, also in adj. provinces, Ga. to N. C.—Sum.-fall.

11. *L. Garberi* (A. Gray) Kuntze. Stem 2-5 dm. tall, hirsute: blades of the lower leaves narrowly linear: involucre bracts broadly elliptic, ciliate and viscid, and abruptly acuminate; inner bracts 8-9 mm. long, ciliate, viscid and glandular-punctate: achene 2.5-3 mm. long. [*L. Nashii* Small.]—Pinelands, pen. Fla.—Sum.-fall.—Unusual on account of its clustered fleshy tuberous roots.

12. *L. tenuifolia* (Nutt.) Kuntze. Stem 6-12 dm. tall, glabrous: blades of the lower leaves linear-filiform: involucre bracts minutely ciliate; inner bracts 5-6 mm. long: corollas 6-7 mm. long: filaments pubescent, less than half as long as the anthers: achene 3.5-4.5 mm. long. [*Liatis laevigata* Nutt. *L.*

*laevigata* Small.]—Pinelands, Coastal Plain and adj. provinces, Fla. to Ala. and N. C.—Sum.—fall.

13. *L. spicata* (L.) Kuntze. Stem 6–15 dm. tall, sometimes sparingly hirsute: blades of the lower leaves linear: involueral bracts glabrous; intermediate bracts oblong-ovate; inner bracts 8–9 mm. long, broadly linear: corollas 6.5–7.5 mm. long; lobes glabrous: achene 4–5 mm. long.—Moist woods, prairies, low-pinelands, and low grounds, various provinces, Fla. to La., Minn., and Mass.—Sum.—fall.—*L. spicata montana* Gray, with broader leaves and larger heads occurs in the Blue Ridge from Ga. and S. C. to Va.

14. *L. laxa* Small. Stem 4–6 dm. tall, thinly tomentulose: blades of the lower leaves linear: involueral bracts finely and densely ciliate; inner bracts narrowed at the tip, 4–5 mm. long: achene mostly over 3 mm. long. [*L. gracilis* Fl. SE U. S.)]—Coastal sand-dunes, Fla. to Ala. and S. C.—Spr.

15. *L. microcephala* Small. Stem 3–7 dm. tall, glabrous: blades of the lower leaves narrowly linear, often elongate: involueral bracts glabrous, nearly cylindric; inner bracts 7–8 mm. long: corollas 1.5–2.5 mm. long: filaments fully half as long as the anthers: achene clavate, 4 mm. long. [*L. polyphylla* Small.]—Sandy soil, Blue Ridge to Interior Low Plateaus, Ga. to Tenn.—Sum.

16. *L. graminifolia* (Walt.) Kuntze. Stem 2–12 dm. tall, glabrous: leaves ciliate near the base; blades of the lower ones linear: involueral bracts narrowly linear elliptic, minutely ciliate; the inner ones 7–8 mm. long, linear: achene 4–5 mm. long. [*L. vittata* Greene.]—Arid fields open woods, and damp savannas, Coastal Plain and adj. provinces, Fla. to Tenn. and N. J.—Sum.

17. *L. Smallii* Britton. Stem 1–8 dm. tall, glabrous: leaves ciliate near the base; blades of the lower ones broadly or narrowly linear: involueral bracts ciliate margined, broadly linear and bluntly often dark-tipped; inner bracts broadly linear, ciliolate all around, 8–9 mm. long: corolla-tube scarcely longer than the pappus: achene 4–5 mm. long.—Mt. slopes, Blue Ridge, Ga. to Va.—Sum.—fall.

18. *L. gracilis* (Pursh) Kuntze. Stem 4–10 dm. tall, glabrous: lower leaves with long, linear or narrowly elliptic blades: bracts of the involucre narrowly linear-elliptic, glabrous (sometimes puberulent), finely ciliate, the inner 4–5 mm. long: achene very coarsely ribbed, 2–3 mm. long.—Dry, open woods, fields and slopes, Coastal Plain and adj. provinces, Fla. to Miss. and Ga.—Late sum.—fall.—Probably *L. elegantula* and *L. elongata* of Greene belong here.

19. *L. Helleri* Porter. Stem 1–4 dm. tall, glabrous or nearly so: blades of the lower leaves linear: involueral bracts minutely ciliate: inner bracts narrowly linear, 7–8 mm. long: corolla-tube twice as long as the pappus: achene about 4 mm. long.—Rocky soil and cliffs, Blue Ridge, N. C. and Va.—Sum.—fall.

20. *L. pilosa* (Ait.) Heller. Stem 2–7 dm. tall, glabrous: blades of the lower leaves broadly linear or linear-oblong: involueral bracts narrowly linear-elliptic, glabrous; inner ones linear, 8–10 mm. long: achene fully 5 mm. long.—Dry rocky or sandy slopes, various provinces N of Coastal Plain, Ga. to Ala., W. Va., and S Va.—Sum.

21. *L. aspera* (Michx.) Greene. Stem 3–15 dm. tall, densely pubescent: blades of the lower leaves narrowly elliptic: involueral bracts with only the central portion herbaceous, the entire tip and sides being so broadly scarious as to appear winged, the tip usually concave, and spreading, purplish-tinged or stramineous: achene 4–5 mm. long.—Prairies and plains, various provinces, Ark. and Okla. to Nebr., Minn. and Ind.—Sum.—fall.—*L. aspera sphaeroidea* (Michx.) Alexander, a variety with glabrous leaves occurs on mountain slopes

and rocky soil, in the mountains of Ga., N. C. and Tenn., and in various provinces, to Minn. and Mich.—Sum.—fall.

22. *L. scariosa* (L.) Hill. Stem 3–10 dm. tall, usually very closely pubescent: blades of the lower leaves linear to elliptic, often very broadly so: inner bracts of the involucre 10–15 mm. long in typical plants, shorter in some small mountain forms; glabrous or nearly so, linear with slightly spatulate tips, becoming definitely spatulate in the intermediate bracts and nearly ovate in the outer ones, apices varying from rounded in the inner bracts to nearly acute in the outer, the margins erose or ciliate, sometimes foliaceous with only a slight scarious margin, at other times markedly scarious-margined but still foliaceous and thick: achene 4–6 mm. long. [*L. squarrolosa* Michx.]—Plains, hillsides, and open woods, various provinces, Fla. to Ill., Mich., and Mass.—Sum.—fall.

23. *L. Shortii* Alexander. Stem 6–9 dm. tall, densely pubescent: blades of the lower leaves elliptic, very short-pubescent: bracts of the involucre with a very narrow scarious margin, otherwise quite herbaceous, densely short-pubescent, very spatulate, the inner nearly linear, 10–12 mm. long: achene about 5 mm. long.—Dry or rocky soil, various provinces, Miss. and La., to Ark. and Ohio.—Sum.—fall.

24. *L. Tracyi* Alexander. Stem about 4 dm. or more tall, densely pubescent: blades of the lower leaves linear, very scabrous: bracts of the involucre rounded at the tip, somewhat spatulate, pubescent; inner ones 7–8 mm. long: achene about 5 mm. long.—Baldwin Co., in the Coastal Plain of Ala.—Fall.

25. *L. Ruthii* Alexander. Stem 3–16 dm. tall, pubescent: blades of the lower leaves linear to elliptic glabrous or nearly so: involucre bracts rather narrowly spatulate, usually green, lightly pubescent, narrowly if at all scarious-margined, the inner bracts 8–11 mm. long: achene 4–5 mm. long.—Woods and thickets, various provinces chiefly the Blue Ridge and Appalachian, Ga. to Tenn. and N. C.—Sum.—fall.

17. **AMMOPURSUS** Small. Perennial, succulent, caulescent herb, the stem from a long, perpendicular, fleshy tap-root. Leaves alternate, fleshy: blades narrow, entire, punctate, sessile. Heads solitary or in panicles, showy, not radiate, erect. Involucre cylindric-campanulate, many-flowered: bracts broad, in six or more series, appressed, fimbriolate-ciliate. Receptacle naked, honey-combed. Flowers perfect. Corolla rose-purple: tube slender-cylindric: throat thicker than the tube, more or less urceolate: limb slightly zygomorphic: lobes 5, spreading, about as long as the throat. Stamens included: filaments filiform-subulate: anthers linear, rounded or emarginate at the apex, cordate at the base, the lobes rounded. Style filiform. Stigmas filiform, usually longer than the style. Achene fusiform, 10–12-ribbed, pubescent. Pappus of numerous capillary barbellate bristles in two series, the outer shorter than the inner, the inner as long as or longer than the achene.—One species.

1. *A. Ohlingerii* (Blake) Small. Stem 2–11 dm. tall, solitary or several from the top of the root, usually paniculately branched above, minutely pubescent with pale crisped hairs: leaves fleshy, narrowly linear or linear-clavate, acute, glabrous: involucre about 2 cm. long;

bracts numerous, the outer orbicular-reniform, thence gradually longer and narrower to the linear-spatulate inner ones, all obtuse, the body deep green, punctate, the scarious margins pale: corollas bright rose-purple, about 2 cm. long: tube slender; throat cylindric-urceolate; lobes lanceolate, 5-6 mm. long, acute: achene fusiform, 8-9 mm. long, about 10-ribbed, densely pubescent with spreading hairs: pappus whitish, much shorter than the corolla, barbellate. [*Laciniaria Ohlingerii* Blake.]—Scrub, S end of lake region, Fla.—Sum.

18. **GARBERIA** A. Gray. Much-branched shrubs. Leaves alternate, evergreen: blades broad, entire. Heads in rather dense corymbose cymes. Involucre narrowly turbinate. Corolla rose-purple: throat campanulate, rather shorter than the much narrower tube: lobes ovate to lanceolate. Androecium conspicuously exserted: anther-appendages notched. Achene long, sharply ribbed. Pappus of scabro-barbellate capillary bristles in 2 or more rows.—One species.

1. *G. fruticosa* (Nutt.) A. Gray. Plant 1-2 m. tall, the twigs scurfy: leaf-blades spatulate to obovate, 2-3 cm. long: involucre 10-12 mm. long; bracts narrow, the outer lanceolate, the inner linear-cuneate, all acute or acuminate, scurfy-puberulent: achene slender-fusiform, 7-8 mm. long or sometimes longer, pubescent.—Scrub and coastal dunes, pen. Fla.—Spr.-fall.—Conspicuous in the scrub in winter from its persistent brown pappus.

19. **TRILISA** Cass. Perennial caulescent herbs; the stem from short rootstocks. Leaves alternate, the basal ones much larger than the cauline: blades leathery, entire or shallowly toothed, sparingly pinnate-veined. Heads thyrsoid-paniculate or corymbose. Involucre turbinate, few-flowered: bracts few, relatively narrow, glandular. Corolla rose-purple, with a short tube and a cylindric throat. Androecium included. Anther-appendages ovate. Achene fusiform, sharply ribbed. Pappus of many capillary barbellate bristles.—Two species:

Stem viscid-pubescent: heads thyrsoid-paniculate: involucre bracts with stalked glands.

1. *T. paniculata*.

Stem glabrous or nearly so: heads corymbose: involucre bracts with sessile glands.

2. *T. odoratissima*.

1. *T. paniculata* (Walt.) Cass. Stem 2-17 dm. tall, sparingly hirsute: basal leaves mostly 5-20 cm. long; blades elliptic to almost linear: blades of the cauline leaves narrow, sessile: inner bracts of the involucre less than 5 mm. long: corolla-lobes rather ovate: achene fully 3 mm. long.—Low pinelands, Coastal Plain, Fla. to La., and N. C. (or S Va.?).—Fall-wint.

2. *T. odoratissima* (Walt.) Cass. Stem 5-15 dm. tall, somewhat glaucous: basal leaves mostly 10-30 cm. long; blades elliptic, cuneate or spatulate: blades of the cauline leaves broad, slightly clasping: inner bracts of the involucre over 4 mm. long: corolla-lobes rather lanceolate: achene 2-3 mm. long.—(VANILLA-PLANT. DEER'S-TONGUE. HOUND'S-TONGUE.)—Low pinelands, Fla. to La., and N. C. (or S Va.?).—Sum.-fall.—The leaves contain coumarin and have been used as a flavoring agent.—Extreme

forms often indicate the possibility of two species being involved. One with a strong coumarin odor, broad, clasping, coarsely toothed upper leaf-blades and slightly viscid involucre, the other with only a faint odor, narrow entire upper leaf-blades and very viscid involucre.

**20. AMPHIACHYRIS** DC. Annual or perennial, glabrous herbs. Leaves alternate: blades narrow, entire. Heads small. Involucre campanulate to cylindric, the bracts obtuse. Ray-flowers with small ligules. Disk-corollas with a cylindric-campanulate throat. Anthers narrow. Stigmas pubescent. Achenes of the ray with a crown-like pappus, those of the disk abortive, with bristle-like pappus-scales.—Two species, North American.

1. *A. dracunculoides* (DC.) Nutt. Stem 3–7 dm. tall: leaf-blades narrowly linear or linear-filiform, 1–5 cm. long; bracts of the involucre lustrous, the inner 4–5 mm. long; ligules yellow, 3–4 mm. long; achene about 1 mm. long.—Dry soil, various provinces, N of Coastal Plain, Ala. to Tex., N. M., Kans., and Mo.—Sum.—fall.

**21. GRINDELIA** Willd. Perennial or rarely annual or biennial herbs, or woody, often glutinous plants. Leaves alternate: blades mostly spinulose toothed. Heads large. Involucre hemispheric or depressed, the bracts slender-tipped, eciliate. Ray-flowers with conspicuous yellow ligules, or rarely wanting. Disk-corollas with a narrowly funnelform throat longer than the tube. Anthers linear; appendages lanceolate. Stigmas linear. Achene ribbed. Pappus of the disk of 2–8 smooth awns or stiff bristles, caducous.—About 30 species, western American.—GUM-PLANTS. STICKY-HEADS.

Leaf-blades coarsely spiny-toothed: achene 2-lobed at the apex.  
Leaf-blades finely spiny-toothed: achene truncate at the apex.

1. *G. lanceolata*.  
2. *G. squarrosa*.

1. *G. lanceolata* Nutt. Stem 5–8 dm. tall, glabrous, usually sparingly branched above: blades of the cauline leaves lanceolate to linear-lanceolate or almost linear, 2–8 cm. long, more or less acuminate: bracts of the involucre with spreading tips: achene 3–3.5 mm. long, 2-lobed at the apex, rather bluntly ribbed.—Dry soil, barrens, prairies and waste-places, various provinces, Ala. to Tex., Kans., and Tenn.—Sum.

2. *G. squarrosa* (Pursh) Dunal. Stem 3–10 dm. tall, glabrous, more or less branched above and sometimes also branched at the base: blades of the cauline leaves elliptic to linear-elliptic or somewhat broadened upward, 2–5 cm. long, obtuse or acute: bracts of the involucre with recurved tips: achene 2.5–3 mm. long, truncate at the apex, rather sharply ribbed.—Dry soil, prairies and plains, various provinces, Tex. to Ariz., Nev., Sask., and Minn.; widely naturalized on roadsides, railroad banks, and fields in the E states.—(Mex.).

**22. CHRYSOPSIS** Nutt. Biennial herbs, with villous, hirsute, floccose, cottony, or arachnoid pubescence. Leaves alternate: blades narrow or broad, but neither nervose nor gramineous, mostly entire. Heads in a terminal corymb.

Involucre ovoid to hemispheric, the bracts narrow. Ray-flowers with conspicuous yellow ligules. Disk-corollas with a narrow funnelform throat. Anther-appendages lanceolate. Stigmas subulate. Achene somewhat turgid, ellipsoid or obovoid, 3-5-nerved. Pappus double, of numerous bristles, the outer series very short and scale-like.—About 20 species, North American.—Mostly sum.—fall.—GOLDEN-ASTERS.

Plant perennial: achene 3-5-nerved.

Bracts of the involucre glabrous.

Bracts of the involucre glandular or cobwebby.

Bracts of the involucre copiously glandular, without cobwebby hairs.

Bracts of the involucre with cobwebby hairs.

Plant annual, with a tap-root: achene 10-nerved.

#### I. TRICHOPHYLLAE.

#### II. MARIANAE.

#### III. PILOSÆ.

#### IV. NUTTALLIANÆ.

#### I. TRICHOPHYLLAE

Bracts of the involucre prolonged into subulate tips.

Bracts of the involucre acute, mucronate, or short-acuminate.

Cauline leaves, at least the lower ones, with spatulate, elliptic, or elliptic-lanceolate blades.

Bracts of the involucre acute or short-acuminate.

Bracts of the involucre abruptly pointed or mucronate.

Cauline leaves with narrowly linear blades.

1. *C. subulata*.

2. *C. trichophylla*.

3. *C. gigantea*.

4. *C. hyssopifolia*.

#### II. MARIANÆ

Pubescence deciduous: foliage rough-glandular.

Pubescence persistent: foliage smooth or soft-glandular.

Bracts of the involucre 1 mm. wide or less.

Stem and leaves cobwebby-pubescent.

Stem and leaves white cottony-lanate.

Peduncles cottony-lanate and with some glands under the involucre.

Peduncles only glandular.

Bracts of the involucre acuminate recurved: inflorescence conspicuously glandular.

Bracts of the involucre acute, erect: inflorescence inconspicuously glandular.

Bracts of the involucre 2 mm. wide or more.

5. *C. scabrella*.

6. *C. mariana*.

7. *C. arenicola*.

8. *C. lanuginosa*.

9. *C. floridana*.

10. *C. latissuama*.

#### III. PILOSÆ

Peduncles glandular: bracts of the involucre sparingly cobwebby.

Peduncles densely villous-cobwebby: bracts of the involucre densely villous-cobwebby.

11. *C. decumbens*.

12. *C. pilosa*.

#### IV. VILLOSÆ

Plant pubescent, the stem simple below the inflorescence or sometimes branched throughout.

13. *C. Nuttallii*.

1. *C. subulata* Small. Stem 3-11 dm. tall, short cobwebby: blades of the basal leaves narrowly spatulate, those of the cauline leaves spatulate to linear, usually entire: involucre 6-8 mm. long; bracts with curved or bent caudate tips: achene 1.5-2 mm. long.—Pinelands and scrub, pen. Fla. and rarely N Fla.—Spr.—fall or all year.

2. *C. trichophylla* Nutt. Stem 3-11 dm. tall, more or less long cobwebby, at least when young: blades of the basal leaves broadly spatulate, those of the cauline leaves spatulate to elliptic-obovate, linear, or lanceolate, entire or sometimes sparingly toothed: involucre 7-9 mm. long: bracts acute or short-acuminate, often with slightly spreading tips: achene about 2 mm. long.—Pinelands, Coastal Plain, Fla. to S. C. and Miss., (La.?).

3. *C. gigantea* Small. Stem 8–15 dm. tall, sparingly cobwebby-pubescent, at least when old: leaves numerous, the basal and lower cauline with spatulate, to oblanceolate or oblong-oblanceolate blades; upper cauline leaves with oblong to oblong-lanceolate blades, often obscurely serrulate, sometimes apiculate: involucre 7–9 mm. high; bracts linear-lanceolate to linear, acute to slightly acuminate, glabrous: achene 2–2.5 mm. long.—Pinelands, Fla.

4. *C. hyssopifolia* Nutt. Stem 3–9 dm. tall, glabrous or sparingly cobwebby when young: leaves numerous, the basal in a dense rosette, white cottony, with spatulate or linear-spatulate blades, cauline leaves often crowded; blades narrowly linear to linear-filiform, 1–6 cm. long: involucre 6–8 mm. long; bracts rigid, acute, often abruptly so with erect tips: achenes 2–2.5 mm. long.—Dry pinelands, Coastal Plain, Fla. and Ala.

5. *C. scabrella* T. & G. Stems 3–12 dm. tall, more or less rough-glandular: leaves rather numerous, the basal in a very dense rosette, white-cottony, with spatulate, often coarsely toothed blades: blades of the cauline leaves linear-spatulate to linear, acute, entire, more or less glandular-scabrous acute, sessile: involucre 6–9 mm. high; bracts linear-subulate to linear, rigid, acute, often abruptly so: achene 2.5–3 mm. long.—Pinelands, prairies, and scrub, Coastal Plain, Fla. to Miss.

6. *C. mariana* (L.) Nutt. Stem 1–6 dm. tall, more or less cobwebby; and glandular in the inflorescence: blades of the cauline leaves spatulate to elliptic or oblong, 2–12 cm. long, often acute, entire or remotely toothed, the lower ones narrowed into petiole-like bases: heads showy: involucre 8–10 mm. long, bracts linear, acute, glandular, ciliolate: achene about 2 mm. long.—Dry woods and hill-sides, various provinces, Fla. to La., Tenn., and S N. Y.

7. *C. arenicola* Alexander. Stem about 3 dm. tall, white cottony: blades of the cauline leaves various, the lower ones slightly broadened upward, 1–3 cm. long, the upper ones oblong-lanceolate to linear-lanceolate, auricled at the base, sessile, all white cottony-lanate: bracts of the involucre rather rough-glandular, the inner bracts narrowly linear, acuminate: achenes about 2 mm. long.—Sandhills, near Hartsville, S. C.

8. *C. lanuginosa* Small. Stem below the inflorescence, white-woolly, finely glandular above and in the inflorescence, 2 dm. tall or more, sometimes branched near the base: leaves white-cottony, basal and lower cauline leaves with spatulate blades mostly 1 dm. long or less; blades of the upper cauline cuneate-spatulate or cuneate, entire: involucre about 1 cm. high; bracts linear or nearly so, except the recurved or spreading slender green tips, finely, softly, and copiously glandular-pubescent.—Grassy places, near Lynn Haven, N. Fla.

9. *C. floridana* Small. Stem usually branched at the base, the branches curved, 2.5–4 dm. long, white-cottony below, glandular above: leaves white-cottony; basal and lower cauline leaves with spatulate blades mostly less than 1 dm. long; blades of the upper cauline entire: cuneate to oblong-cuneate, 1.5–2.5 cm. long, obtuse, partly clasping: peduncles inconspicuously glandular: involucre 6–8 mm. high; bracts firm, glandular, often sparingly so, acute or slightly acuminate.—Scrub, sand-dunes and pinelands, pen. Fla.

10. *C. latisquama* Pollard. Stem 3–7 dm. tall, copiously cobwebby below, glandular above, the branches often elongate: basal and lower stem-leaves with spatulate or oblanceolate blades; upper cauline leaves smaller; blades oblong to linear-oblong or broadly linear, serrulate or undulate: involucre 7–8 mm. high;

bracts mostly broadest above the middle, not woolly, glandular, deep-green, the outer rather foliaceous, usually acute.—Pinelands and hammock-borders, pen. Fla.

11. *C. decumbens* Chapm. Stem decumbent, 6–12 dm. long, white-cottony or cobwebby-cottony; blades of the cauline leaves spatulate to oblong or oblong-lanceolate, obtuse or abruptly acute, entire, sessile: involucre 8–10 mm. high; bracts sparingly cobwebby, acuminate.—Pinelands, Coastal Plain, Fla. to N. C.

12. *C. pilosa* (Walt.) Britton. Stem 3–7 dm. tall, lanate: blades of the cauline leaves spatulate, oblong, or oblong-spatulate, obtuse or apiculate, entire or sparingly toothed, often partly clasping: involucre about 1 cm. high; bracts densely villous-cobwebby, acute or acuminate. [*C. gossypina* Nutt.]—Sandhills, woods, and pinelands, Fla. to Ala. and N. C., (Va.?)

13. *C. Nuttallii* Britton. Stem villous or softly hirsute, 3–8 dm. tall, simple below the inflorescence or sometimes branched throughout: leaves few or numerous, 1.5–4.5 cm. long: blades oblong to linear-oblong, entire or distantly or coarsely toothed, acute, sessile, or the lower ones oblong-ob lanceolate and commonly incised: heads showy: involucre 8–10 mm. high; bracts linear or linear-subulate, acuminate: ray-flowers with ligules 10–15 mm. long: achenes 10-nerved.—Rocky open woods, sandy hills, prairies, and oak-woods, Miss. to Tex., Kans., and Mo.

23. **PITYOPSIS** Nutt. Perennial herbs with silvery or lead-colored, silky pubescence, or rarely glabrate. Leaves alternate: blades elongate, nervose or gramineous, entire. Heads terminating irregular peduncles or corymbose. Involucre campanulate to turbinate: bracts narrow. Ray-flowers with yellow ligules. Disk-corollas with a narrow funnelform throat. Anther-appendages ovate to lanceolate. Stigmas lanceolate. Achene compressed-fusiform. Pappus double, the outer series very short and scale-like. About 10 species of eastern North America.

Cauline leaves numerous, filiform; glabrous or nearly so.  
Cauline leaves few, linear, silky-lanate, sometimes narrowly  
so, or linear-lanceolate.  
Peduncles, branches, and stem woolly-tomentose.  
Peduncles, branches, and sometimes the stem, glandular.

I. PINIFOLIAE.

II. GRAMINIFOLIAE.

III. ASPERAE.

## I. PINIFOLIAE

Slender plant with linear-filiform leaves and not very numerous heads of flowers.

1. *P. pinifolia*.

## II. GRAMINIFOLIAE

Stem conspicuously zigzag.

2. *P. flexuosa*.

Stem strict or essentially so.

Involucres 10–12 mm. high.

Inflorescence-branches few or several: ligules of the ray-flowers mostly over 1 cm. long.

3. *P. Tracyi*.

Inflorescence-branches many: ligules of the ray-flowers less than 1 cm. long.

4. *P. graminifolia*.

Involucres 4–7 mm. high.

5. *P. microcephala*.

## III. ASPERAE

Lower cauline leaves not markedly longer than the upper.

6. *P. Ruthii*.

Lower cauline leaves conspicuously longer than the upper.

Stem-leaves numerous, approximate; blades narrow: ligules of the ray-flowers less than 1 cm. long.

7. *P. aspera*.

Stem leaves mostly 2–4, distant: blades relatively broad: ligules of the ray-flowers over 1 cm. long.

8. *P. oligantha*.

1. *P. pinifolia* (Ell.) Nutt. Stem 2-4 dm. tall: blades of the cauline leaves linear-filiform: inner bracts of the involucre 4-5.5 mm. long, glabrous: ligules 6-7 mm. long. [*Chrysopsis pinifolia* Ell.]—Sandhills, Taylor County in the Coastal Plain of Ga.—Fall.

2. *P. flexuosa* (Nash) Small. Stem 2-4 dm. tall, zigzag: blades of the cauline leaves narrowly linear-lanceolate to linear: inner bracts of the involucre 10-12 mm. long: ligules 8-10 mm. long: disk-corollas 7-8 mm. long. [*Chrysopsis flexuosa* Nash].—Dry sandy pinelands, M Fla.—Sum.—fall.

3. *P. Tracyi* Small. Stem 3-5 dm. tall: blades of the cauline leaves narrowly linear, the lower ones greatly elongate: inner bracts of the involucre 7-9 mm. long, long-ciliate ligules 11-12 mm. long. [*Chrysopsis Tracyi* Small.].—Pinelands, pen. Fla. and the Keys.—All year.

4. *P. graminifolia* (Michx.) Nutt. Stem 3-9 dm. tall: blades of the cauline leaves linear-lanceolate, linear or linear-subulate: inner bracts of the involucre 7-11 mm. long: ligules 7-9 mm. long: disk-corollas 7-8 mm. long [*Chrysopsis graminifolia* (Michx.) Nutt. *C. argentea* Pers.]—Sandy, often acid, soil, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and Md.—(W. I.)—Sum.—early wint. or all year S.—*P. graminifolia latifolia* Fernald, distinguished by the upper cauline leaves nearly the same length as the lower, grades into the typical form.

5. *P. microcephala* Small. Stem 4-7 dm. tall: blades of the cauline leaves linear-lanceolate: outer bracts of the involucre broadly lanceolate, not glandular; inner bracts 5-6 mm. long: ligules 3-4 mm. long: filaments shorter than the anthers. [*Chrysopsis microcephala* Small].—Sandy soil, Coastal Plain and adj. provinces, Fla. to Tex. and S. C.—Sum.—fall.

6. *P. Ruthii* Small. Stem 1-3 dm. tall: blades of the cauline leaves linear to narrowly linear-lanceolate: outer bracts of the involucre subulate, glandular; inner bracts 6.5-7.5 mm. long: filaments longer than the anthers. [*Chrysopsis Ruthii* Small.].—Rocks, Appalachian Valley, Hiawassee Valley, Tenn.—Fall.

7. *P. aspera* (Shuttlw.) Small. Stem 3-7 dm. tall: blades of the cauline leaves linear to narrowly linear-lanceolate: outer bracts of the involucre lanceolate, glandular; inner bracts 6-8 mm. long: disk corollas 4-5 mm. long: filaments much shorter than the anthers. [*Chrysopsis aspera* Shuttlw.].—Dry soil, mostly in pinelands, Coastal Plain, Fla. to La. and Va.—Sum.—fall.

8. *P. oligantha* (Chapm.) Small. Stem 3-6 dm. tall: blades of the cauline leaves linear to elliptic: outer bracts of the involucre lanceolate, glandular; inner bracts 7-9 mm. long, strongly ciliate: disk-corollas 7-8 mm. long: filaments as long as the anthers or longer. [*Chrysopsis oligantha* Chapm.].—Pinelands, Coastal Plain, N Florida and SE Ala.—Spr.

24. **HETEROTHECA** Cass. Annual or biennial, pubescent herbs. Leaves alternate: blades entire or toothed. Heads rather large. Involucre

hemispheric or campanulate, the inner bracts ciliate. Ray-flowers with conspicuous yellow ligules. Disk-corollas with a funnelform throat about as long as the tube. Anther-appendages lanceolate. Stigmas lanceolate or triangular. Achenes of the ray thickish, those of the disk flat. Pappus of the disk of many bristles, those of the outer series shorter and stouter than those of the inner.—About 6 species, North American.

1. *H. subaxillaris* (Lam.) Britt. & Rusby. Stem 3–12 dm. tall, hirsute or hispid; blades of the stem-leaves elliptic to elliptic-lanceolate, 1–7 cm. long, serrate: involucre 7–8 mm. high; outer bracts glandular-pubescent: achene about 2 mm. long. [*H. Lamarckii* Cass.].—(CAMPHOR-PLANT.)—Pinelands, sand-dunes, and waste-places, various provinces, Fla. to Tex., Ariz., Kans., and Del.—(*W. I., Mex., C. A., S. A.*)—Sum.—fall, or all year S.—A weedy plant, very variable in habit and with a great variety of leaf-forms.

25. *CHONDROPHORA* Raf. Perennial, glabrous, slender, virgate-stemmed herbs. Leaves alternate: blades very narrow, entire. Heads in terminal corymbs, or rarely thyrsoid. Involucre narrow, few-flowered: bracts narrow, abruptly or gradually narrowed at the apex. Ray-flowers wanting. Disk-corollas yellow, with a broadly funnelform throat about as long as the tube or longer: lobes lanceolate. Achenes 1–2-ribbed on each side. Pappus of 1 series of bristles.—Two species.—Sum.—RAYLESS-GOLDENRODS.

Stem-leaves with linear or linear-spatulate blades.  
Stem-leaves with filiform blades.

1. *C. nudata*.  
2. *C. virgata*.

1. *C. nudata* (Michx.) Britton. Stem 2–6 dm. tall: blades of the basal leaves spatulate to linear-spatulate, 3–12 cm. long: inner bracts of the involucre linear-oblong or linear-elliptic, 4.5–5 mm. long, acute or acutish.—Pinelands, Coastal Plain, Fla. to Tex. and Va. (or N. J.?).

2. *C. virgata* (Nutt.) Greene. Similar to *C. nudata* in habit: blades of the basal leaves filiform: inner bracts of the involucre lanceolate, 4–4.5 mm. long, acuminate.—On rocks, rocky creek-banks, open woods and prairies, Coastal Plain and adj. provinces, W Fla. to Tex. and Ga.—The greenish-yellow very numerous flower-heads of these species, when the plants grow *en masse*, especially on prairies, shows a color not usually seen in this family.

26. *BRINTONIA* Greene. Perennial pubescent, leafy-stemmed herbs. Leaves alternate: blades broad, coarsely toothed, with wide petiole-like bases.

Heads many, racemose. Involucre campanulate, several-flowered: bracts rather narrow, the inner ones broader than the outer. Ray-flowers wanting. Disk-corollas with a funnelform throat and a somewhat shorter tube: lobes ovate. Anthers longer than the filaments: appendages lanceolate. Stigmas lanceolate or ovate. Achene ribbed. Pappus-bristles numerous, the inner clavate at the tip.—One species.

1. **B. discoidea** (Ell.) Greene. Stem 8–15 dm. tall, finely hirsute: leaf-blades oval, ovate, or elliptic-ovate, 4–9 cm. long: involucre 6–8 mm. high: corollas about 4 mm. long, white or whitish, and often purple-tinged.—Dry soil, borders of woods, and thickets, Coastal Plain, Fla. to La. and Ga.—Sum.–fall.

27. **SIDERANTHUS** Fraser. Annual or perennial, more or less widely branching herbs, or shrubs. Leaves alternate: blades spinulose-toothed, lobed, or pinnatifid. Heads terminating the branches. Involucre hemispheric or campanulate, many-flowered: bracts narrow, usually acuminate. Ray-flowers yellow, several. Disk-corollas with a narrowly funnelform throat and a shorter tube: lobes deltoid to triangular. Stigmas lanceolate. Achene pubescent, mostly 8–10-nerved. Pappus of 1–3 series of bristles.—About 20 species, American.

1. **S. megacephalus** (Nash) Small. Stem 8–12 dm. tall, finely pubescent: leaf-blades lanceolate to linear-elliptic, 2–7 cm. long, distantly toothed: outer bracts of the involucre 10–12 mm. long, acute, ciliate.—Coastal dunes and waste places, Coastal Plain, Fla. and Tex.—Sum.–fall.

28. **ISOPAPPUS** T. & G. Annual or biennial, virgate-stemmed herbs. Leaves alternate: blades narrow, some of them coarsely toothed. Heads in open panicles. Involucre narrow: bracts subulate to linear or lanceolate. Ray-flowers few or several: corolla with a long tube and a yellow ligule. Disk-corollas with a narrowly funnelform throat and a very short tube: lobes deltoid. Anthers as long as the filaments or shorter: appendages ovate. Stigmas subulate. Achene terete, short. Pappus a series of rough capillary bristles.—Three species, North American.

1. **I. divaricatus** (Nutt.) T. & G. Stem 3–12 dm. tall, hispid and glandular: leaf-blades linear-ob lanceolate to narrowly linear,

2-10 cm. long: involueral bracts ciliolate near the tip, the inner as well as the outer glandular: filaments longer than the anthers.—Dry soil, sandy fields, and roadsides, various provinces, Fla. to Tex., Kans., and S. C.—Sum.—fall.

**29. CHRYSOMA** Nutt. Shrubs or partly woody plants. Leaves evergreen, alternate: blades narrow, fleshy-leathery, conspicuously fine-pitted. Heads numerous, thyrsoïd, or somewhat corymbose. Involueres narrow, few-flowered: bracts narrow, the inner much longer than the outer. Ray-flowers 1-3: corollas with a long tube and a yellow ligule. Disk-corollas with a funnellform throat and a tube of about equal length: lobes lanceolate. ovate. Anthers longer than the filaments. Stigmas of the disk-corollas lanceolate. Pappus of 1 or 2 series of brownish capillary bristles.—One species.

**1. C. pauciflosculosa** (Michx.) Greene. Stem 3-9 dm. tall: leaf-blades grayish-green, linear-spatulate to linear-oblong, 3-6 cm. long: involueres 4-6 mm. long, the inner bracts linear-lanceolate: ligules of the ray-corollas 4-6 mm. long: achene 3-4 mm. long.—Sandy soil, Coastal Plain, Fla. to Miss. and S. C.

**30. SOLIDAGO** L.<sup>1</sup> Perennial caulescent herbs, with long horizontal stolons often well-developed. Leaves alternate, the basal ones often in very large and conspicuous tufts (rosettes). Blades various, mostly toothed. Heads usually relatively small, sometimes medium sized or even large, paniculate or thyrsoïd, or umbellate. Involucre campanulate, turbinate, or cylindric, few—many-flowered: bracts (tegules) in several series, the inner narrow, at least relatively so, and longer or much longer than the outer. Ray-flowers few to many: corolla with a slender tube and a yellow or very rarely a white ligule. Disk-corollas with a tube which is usually abruptly dilated into a funnellform or campanulate throat nearly or quite as long: lobes lanceolate, spreading. Anthers nearly or quite as long as the filaments. Stigmas mostly lanceolate, rarely elongate-lanceolate. Pappus of 1 or 2 series of capillary bristles.—About 125 species, mostly North American.—GOLDENRODS.

Stigmas several times as long as wide: heads large or very large, not unilaterally racemose (not secund): plant without long horizontal stolons: leaf-blades not triple-ribbed: achene sparsely silky above.

I. MACROPHYLLAE.

Stigmas lanceolate, 1-3 times as long as wide.

Achene glabrous at maturity, sometimes sparsely hairy when young: plant without long horizontal stolons: heads not unilaterally racemose (not secund): leaf-blades not triple-ribbed.

Main lateral veins of leaf-blades on the lower side elevated: leaf-blades not coriaceous.

Involucral bracts, at least the outer ones, with spreading tips.

Involucral bracts with tips not spreading.

Main lateral veins of leaf-blades on the lower side imbedded: leaf-blades coriaceous.

Achene permanently hairy, or if (rarely) glabrate, the heads unilaterally racemose (secund).

II. SQUARROSAE.

III. HISPIDAE.

IV. CONFERTAE.

<sup>1</sup> Contributed by Kenneth Kent Mackenzie.

Plant without long horizontal stolons.

Thyrse spicate or umbel-like, the heads not unilaterally racemose (not secund).

Thyrse paniculate, usually with many of the heads unilaterally racemose (secund).

Leaf-blades strongly pellucid-punctate.

Leaf-blades not pellucid-punctate.

Basal rosettes wanting; stem-leaves gradually reduced upward.

Basal rosettes usually present, very large and conspicuous: lower stem-leaves much larger than the upper.

Larger leaf-blades cordate at the base, triple-ribbed from near the base: petioles amplexicaule.

Leaf-blades not cordate at the base: petioles not amplexicaule.

Leaf-blades not triple-ribbed.

Longer petioles not or scarcely clasping at the base: dry ground plant.

Longer petioles strongly clasping at the base.

Leaf-blades crenate-serrate or serrate, not coriaceous: plants of swamps.

Leaf-blades thick and coriaceous, entire: plants of sea-beaches or salt-marshes.

Leaf-blades, at least partially triple-ribbed.

Plant with long horizontal stolons.

Basal rosettes and basal leaves conspicuous, the blades much larger than the abruptly reduced upper leaves.

Leaf-blades with the veins not impressed, serrate or crenate-serrate.

Leaf-blades with impressed veins, entire or shallowly crenate-serrate.

Basal rosettes wanting or very inconspicuous.

Thyrse with the lower heads in axillary clusters, the upper spicate: leaf-blades not triple-ribbed.

Thyrse paniculate, the heads unilaterally racemose (secund), at least on the lower branches: leaves very numerous, gradually reduced upward.

Leaf-blades not triple-ribbed.

Leaf-blades triple-ribbed.

#### I. MACROPHYLLAE

Plant with basal rosettes large and conspicuous: heads 10-15 mm. high, the lower ones in clusters, the upper forming a spike-like thyrse: stigmas much elongate and conspicuous, somewhat flattened.

1. *S. glomerata*.

#### II. SQUARROSAE

Plant with heads medium-sized or large, 6-12 mm. high, borne in a narrow terminal thyrse, which is sometimes much contracted, more or less interrupted below: involucrel bracts, at least of the outer ones with spreading tips: stigmas strongly flattened, 2-3 times as long as wide: achene glabrous, dark-brown or yellowish-brown or blackish at maturity, more or less compressed, sometimes sparingly hairy when young.

Basal rosettes conspicuous: blades of the lower stem-leaves and those of the basal rosettes 6-12 cm. long, 3-5 cm. wide, their petioles as long as or longer than the blades. Basal rosettes usually wanting: blades of the lower leaves 2-12 cm. long, 0.8-5 cm. wide, their petioles very short (up to 6 mm. long).

Leaf-blades thick, oblong-oval, firm, shallowly crenate-serrate, the larger mostly 6-8 cm. long, 1.5-2 cm. wide: stem closely short hispid above: involucrel bracts loose.

Leaf-blades thin, oblong-obovate or oblong-oblancoelate, strongly crenate-serrate the larger mostly 8-12 cm. long, 2.5-5 cm. wide: stem pilose above: involucrel bracts closely appressed.

## III. HISPIDAE

Plant with heads medium-sized or smallish to large, 4–11 mm. high, borne in a dense narrow terminal thyrses, only the lowermost (rarely more) in axillary clusters: involucre bracts with tips not spreading; stigmas strongly flattened, 2–3 times as long as wide: achene linear or linear-cylindric, or cylindric-clavate, glabrous at maturity, dull or blackish in color, not compressed.

Involucre bracts obtuse.

Stem copiously pubescent.

Ligules of the ray cream-color, veinless or obscurely veined: achene columnar.

Ligules of the ray orange-yellow, strongly veined: achene broadened upward.

Stem glabrous or minutely puberulent.

Involucre 4–5.5 mm. high: bracts minutely puberulent: achene yellowish.

Involucre 5–7.5 mm. high: bracts strigillose: achene blackish.

Involucre bracts, at least the inner, acute to acuminate.

Stem closely puberulent or short-pubescent: involucre bracts with the midrib obsolete or obscure.

Blades of the leaves about the middle of the stem oblong-obovate, hispidulous above all over: inner involucre bracts gradually narrowed, oblong-lanceolate, nearly 1 mm. wide.

Blades of the leaves about the middle of the stem oblanceolate, strongly hispidulous above on midrib, slightly so elsewhere: inner involucre bracts rather abruptly narrowed above middle, very narrowly lanceolate, about 0.5 mm. wide.

Stem glabrous or sparingly loosely pubescent: involucre bracts mostly 3-ribbed.

10. *S. pulverulenta*.

11. *S. roanensis*.

## IV. CONFERTAE

Plant with heads medium-sized to large, 6–10 mm. high, borne in a narrow or large terminal thyrses: involucre bracts appressed: stigmas strongly flattened, 2–3 times as long as wide: achene linear or linear-oblong, slightly dilated upward, glabrous and dark-tinged at maturity, truncate at the apex.

Inflorescence-branches hairy: basal leaves with narrowly to broadly lanceolate to obovate blades: leaf-blades with main lateral veins conspicuous: rootstocks not forming hard ligneous masses.

Involucre cylindric: bracts narrowly linear-oblong, obtuse to acutish: achene as long as pappus.

Involucre campanulate: bracts oblong, very obtuse: achene half length of pappus.

Ligules of the ray light-yellow: thyrses large and broad, not strict: involucre bracts with midvein little thickened, strongly dilated, minutely hispidulous: leaf-blades 2.5–10 cm. wide: basal rosettes conspicuous.

Ligules of the ray deep-yellow: thyrses narrow or broad, strict, or not strict: involucre bracts thick, with conspicuous thick central oil-tube, glabrous: leaf-blades 1–3 cm. wide: basal rosettes usually inconspicuous.

Inflorescence-branches nearly glabrous: basal leaves with linear-spatulate blades: rootstocks forming very hard ligneous masses.

12. *S. Harperi*.

13. *S. conferta*.

14. *S. rigidiuscula*.

15. *S. plumosa*.

## V. VIRGA-AUREAE

Plant with heads medium-sized or large, 5–10 mm. high, usually not very numerous, often few, borne in a thyrses (sometimes markedly corymbiform): involucre bracts appressed: stigmas strongly flattened, 2–3 times as long as wide: achene narrow, pubescent, often dilated upward, truncate at the apex.

16. *S. spithamea*.

## VI. ODORAE

Plant without long horizontal stolons: basal rosettes wanting or very inconspicuous: leaves very numerous: blades not triple-ribbed, entire, pellucid-punctate, anise-scented, sessile or slightly petioled: heads unilaterally racemose, usually numerous, 4 mm. high, few-flowered: involucre cylindric: bracts thin, narrow, acute: stigmas flattened, longer than wide: achene hairy, dilated upward, truncate at the apex.

Stem pubescent in lines: leaf-blades linear-lanceolate or linear: pappus not exceeding the involucre at flowering time.

17. *S. odora*.

Stem usually pubescent all over: leaf-blades oblong-ovate, lanceolate, or linear-oblong: pappus markedly exceeding involucre at flowering time.

18. *S. Chapmanii*.

#### VII. ULMIFOLIAE

Plant without long horizontal stolons: basal rosettes wanting or very inconspicuous: leaves gradually reduced upwards; blades not triple-ribbed, not pellucid-punctate, the larger serrate or crenate-serrate, prominently ribbed and veined beneath, sub- or very short-petioled: heads unilaterally racemose, on widely spreading branches, small or medium sized, 4-6 mm. high: involucre bracts very unequal: stigmas flattened, longer than wide: achene hairy, cylindric, obconic, conspicuously ribbed, rounded at the apex.

19. *S. ulmifolia*.

#### VIII. NOTABILES

Plant without long horizontal stolons: leaf-blades triple-ribbed, the stem-leaves strongly amplexicaule: inflorescence with rather few widely spreading branches or the branches sometimes short and inflorescence contracted: heads not secund, small, 4 mm. high, few-flowered: achene linear-cylindric, enlarged upward, grayish, hirsutulous, strongly about 10-ribbed, the pappus rather sparse, as long or somewhat shorter.

20. *S. notabilis*.

#### IX. ARGUTAE

Plant without long horizontal stolons: basal rosettes often very large and conspicuous: leaves much reduced upward; blades not triple-ribbed, not pellucid-punctate, not grayish-canescens, thin, prominently ribbed and veined beneath, the larger serrate or doubly serrate and long-petioled: heads small or medium sized, 4.5-8 mm. high, unilaterally racemose, on widely spreading branches or rarely the branches erect: stigmas flattened, longer than wide: achene pubescent, sometimes sparsely so or glabrate in age, ribbed, truncate at the apex.

Inflorescence-branches glabrous: achene not blackish, 1.5 mm. long: (leaves of basal tufts with ovate-lanceolate or obovate-lanceolate blades).

Inflorescence-branches pubescent: achene 1.75-2.5 mm. long.

21. *S. juncea*. ✓

Achene not blackish: basal tufts of leaves often poorly developed, blades lanceolate, oblong-oval, ovate-lanceolate, oval-obovate or ovate, singly serrate or crenate-serrate.

Stem glabrous beneath the inflorescence.

Involucre 2-4 mm. high.

Leaf-blades glabrous below, glabrous or sparingly pustular-hairy above, thickish, firm, serrate.

22. *S. Boottii*. ✓

Leaf-blades pustular-hairy on both sides, especially on the veins, thin, shallowly-serrate.

Involucre 5-6 mm. high.

Stem strongly and closely short-pubescent: leaf-blades glabrous (or strigillose above).

23. *S. strigosa*.

24. *S. yadkinensis*.

Achene blackish, 2.25 mm. long: basal tufts of leaves very strongly developed, their blades ovate, more or less doubly serrate.

25. *S. brachyphylla*.

Leaf-blades much lighter-green beneath than above, thin: mature achene glabrate: pappus 3-4 mm. long: involucre 3-4.5 mm. high, 2-2.5 mm. thick; inner bracts linear-oblong.

26. *S. arguta*.

Leaf-blades little lighter-green beneath than above, firm: mature achene hairy: pappus 2.5-3.5 mm. long: involucre 4-6 mm. high, 2.5-4 mm. thick; inner bracts oblong-obovate.

27. *S. Harrisii*.

#### X. ULIGINOSAE

Plant without long horizontal stolons: basal rosettes very large and conspicuous: leaves much reduced upwards; blades not triple-ribbed, not pellucid-punctate, not grayish canescens, thin or moderately fleshy, prominently ribbed and veined beneath, the larger serrate or crenate and long-petioled: the petioles strongly clasping at the base: heads small or medium-sized, 4.5-8 mm. high, unilaterally racemose on widely spreading branches or sometimes the branches erect: stigmas flattened, longer than wide: achene pubescent, sometimes sparsely so, ribbed, truncate at the apex.

Internodes of the stem terete or essentially so: leaf-blades not very rough (retorsely scabrous) above.

Leaf-blades serrate with conspicuous callus-tipped teeth.

Involucre narrowly campanulate: pedicels and inflorescence-branches usually more or less hairy.

28. *S. uniligulata*.

Involucre broadly campanulate: pedicels and inflorescence-branches usually glabrous.

29. *S. austrina*.

Leaf-blades crenate-serrate.

30. *S. flavovirens*.

Internodes of the stem prominently angled below the leaves, (the leaves being decurrent) : leaf-blades very rough (retroscarsely scabrous) above.

Involucre broadly campanulate, 4.5-5 mm. high, about 3 mm. thick : achene two-thirds length of the pappus.

31. *S. rigida*.

Involucre campanulate to narrowly campanulate, 4 mm. high, 2.5 mm. thick ; achene equalling the pappus.

32. *S. salicina*.

#### XI. SEMPERVIRENTES

Plant without long horizontal stolons : basal rosettes large and conspicuous : leaves gradually much reduced upwards ; blades not triple-ribbed, not pellucid-punctate, not grayish-canescens, thick or fleshy, glabrous on both sides, entire, the midrib prominent, the lateral largely obscure, the veins prominent, the lower petioles 1-3 times length of blades, strongly clasping at the base : inflorescence large, the branches spreading, the heads unilaterally racemose, small to rather large, 5-9 mm. high : stigmas flattened, longer than wide : achene silky-pubescent, obscurely or obsoletely ribbed, gray, or at maturity blackish, truncate at the apex.

33. *S. mexicana*.

#### XII. NEMORALES

Plants without long horizontal stolons : basal rosettes conspicuous : leaf-blades at least partially triple-ribbed : heads small or middle-sized, 3-8 mm. high, unilaterally racemose : stigmas triangular-lanceolate flattened : achene hairy at least above.

Stem glabrous : branches of inflorescence glabrous : achene about equalling the pappus.

Cauline leaves abruptly smaller from near the base of the stem : involucre bracts with obscure midribs or ribless : involucre narrowly campanulate.

34. *S. Gattingeri*.

Cauline leaves not abruptly smaller above the base of the stem : involucre bracts with conspicuous midribs : involucre cylindric.

35. *S. pinetorum*.

Stems closely pubescent : branches of inflorescence pubescent : achene little more than half the length of the pappus.

Upper leaves with oblanceolate or spatulate blades : involucre campanulate, the pedicel little bracteolate : involucre bracts rather thin : veins of leaf-blades little anastomosing beneath ; the hairs little pustular.

36. *S. nemoralis*.

Upper leaves with oval, ovate, or obovate blades : involucre turbinate, the pedicels strongly bracteolate : involucre bracts thickish : veins of leaf-blades strongly anastomosing beneath ; the hairs strongly pustular.

37. *S. radula*.

#### XIII. VERNAE

Plant with long slender horizontal stolons : basal rosettes conspicuous : blades of the lower leaves with ovate or ovate-cordate blades ; not triple-ribbed, not pellucid-punctate, firm, serrate or crenate-serrate, the veins not impressed : inflorescence paniculate, the branches nearly naked below, the lower heads more or less unilateral : heads small to rather large, 5-8 mm. high : ligules of the ray bright-yellow, conspicuous : style not or but little exerted : stigmas flattened, triangular : achene somewhat dilated upward, appressed-pubescent.

Leaf-blades tomentose beneath ; petioles strongly margined : involucre 4-4.5 mm. high.

38. *S. verna*.

Leaf-blades glabrous ; petioles margined above only ; involucre 5-7 mm. high.

39. *S. tarda*.

#### XIV. PETIOLATAE

Plant with long slender horizontal stolons : basal rosettes conspicuous, the leaves much the larger : leaves abruptly and very conspicuously reduced upward ; blades of the lower leaves with linear to spatulate blades : all blades firm, glabrous, not triple-ribbed, not pellucid punctate, entire or shallowly crenate-serrate, the lateral veins beneath scarcely impressed : inflorescence spike-like or narrowly paniculate with the heads unilateral on long and widely spreading branches, glabrous or nearly so : heads small to rather large, 5-9 mm. high ; style not or but little exerted : stigmas flattened, triangular : achene linear, sparsely pubescent.

Heads numerous to very numerous : involucre bracts thin, except at the midrib, glabrate : blades of the basal leaf linear to oblong-elliptic or spatulate or lanceolate, the petioles not markedly uneven.

Heads in a narrow terminal thyrses and secund at the end of 2-5 very long branches : blades of the lower stem-leaves shallowly crenate-serrate : ligules of the ray one, or wanting.

40. *S. gracillima*.

Heads in a narrow thyrses, the lower branches short, sometimes recurved or spreading : blades of the stem-leaves entire, or shallowly crenate-serrate : ray-flowers several with conspicuous ligules.

41. *S. petiolata*.

Heads few (5-15): involucre bracts firm, thickish, strigillose: blades of the basal leaf spatulate to oblanceolate, the inner much shorter-petioled than outermost.

42. *S. pulchra*.

#### XV. FLEXICAULES

Plant with long slender horizontal stolons: basal rosettes wanting or very inconspicuous: leaf-blades gradually reduced upward, not triple-ribbed, not pellucid-punctate, the lateral veins well developed: lower heads in axillary clusters, the upper spicate; all small, medium sized or rarely rather large 4-8 mm. high: stigmas triangular-lanceolate: achene silky-pubescent.

Involucre bracts one-ribbed or essentially so (the lateral ribs wanting or developed towards base only).

Stem, inflorescence-branches, and involucre glabrous or nearly so.

Stem and branches bluish-gray and more or less glaucous (before too old), the stem terete, or very obscurely angled, not zig-zag: leaf-blades usually more than twice as long as wide: achene slenderly about 10-ribbed.

Leaf-blades round-tapering at the base, firm, 0.5-3 cm. wide: petioles 1-2 mm. long: involucre 3.5-4 mm. high, 1.5-2 mm. wide.

43. *S. caesia*.

Leaf-blades cuneate-tapering at the base, thin, 1.5-5.5 cm. wide: petioles 1-5 mm. long: involucre 4-4.5 mm. high, 2.5-3.5 mm. wide.

44. *S. latissimifolia*.

Stem and branches green, not glaucous, the stem strongly angled, usually zig-zag: leaf-blades broadly ovate, 2.5-10 cm. wide, less than twice as long as wide: achene with ribs concealed by pubescence.

45. *S. flexicaulis*.

Stem, inflorescence-branches, and involucre pubescent: upper part of the thyrses spike-like: involucre 3-4.5 mm. high: stem terete below, not glaucous.

46. *S. pubens*.

Involucre bracts 3-5-ribbed.

Involucre narrowly campanulate, 3-4.5 mm. high.

47. *S. Curtisii*.

Involucre broadly campanulate, 5-6 mm. high.

48. *S. lancifolia*.

#### XVI. ALTISSIMAE

Plant with long slender horizontal stolons: basal rosettes wanting or very inconspicuous: leaf-blades not triple-ribbed, often conspicuously veined: heads small to rather large, 3.5-8 mm. high: at least the lower heads unilaterally racemose: stigmatic appendages triangular-lanceolate: achene pubescent, not strongly ribbed.

Leaf-blades narrowly linear-oblong, linear-lanceolate, or oblong-lanceolate, channeled, with the lateral veins usually very obscure, those of the lower leaves at least recurved-spreading or recurved, and more or less twisted at the base.

49. *S. tortifolia*.

Leaf-blades wider, neither markedly channeled, recurved-spreading, or twisted at the base, with the lateral veins very prominent.

Leaf-blades oblong-ob lanceolate or oblong-lanceolate, sessile, with a broad, somewhat clasping base, with few teeth or entire: stem strongly white-hirsute above.

50. *S. fistulosa*.

Leaf-blades oblong-ob lanceolate or elliptic or broader, petioled or sessile, not clasping, with many teeth.

Heads mainly in a strict thyrses and not secund, but sometimes all except upper ones secund on strongly developed widely spreading branches.

51. *S. dispersa*.

Heads strongly secund on widely spreading branches.

Stem strongly hairy above: dry-ground plants.

Leaf-blades not cordate, short-petioled, acute or acuminate, mostly over thrice as long as wide: the pubescence of pustular hairs: involucre cylindric, the pedicel moderately bracteolate.

52. *S. altissima*.

Well-developed leaf-blades shallowly cordate, sessile or very short-petioled, obtuse or short-acute, mostly about twice as long as wide, the pubescence on the stem of weak not or scarcely pustular hairs: involucre turbinate-cylindric, the pedicel usually very strongly bracteolate.

53. *S. celtidifolia*.

Stem glabrous below the inflorescence or sparingly hairy above: wet-ground or damp-ground plants.

Leaves somewhat fleshy: involucre nearly cylindric, the bracts thick, the outer ovate, the inner with erect tips.

Leaves not fleshy: involucre broadly campanulate or cylindric, the bracts thin or chaffy, the outer lanceolate or ovate-lanceolate.

Involucre broadly campanulate, 5 mm. high; bracts thin, but firm, the outer ovate-lanceolate, acutish, the inner with erect tips.

Involucre cylindric, 6 mm. high; bracts thin and chaffy, the outer lanceolate, acuminate, the inner with inflexed or incurved tips.

54. *S. Elliottii*.

55. *S. Edisoniana*.

56. *S. mirabilis*.

#### XVII. SEROTINAE

Plant with long horizontal stolons: basal rosettes wanting or very inconspicuous: stem closely leafy, the leaf-blades triple-ribbed, usually serrate: heads very small to medium-sized, 2-7 mm. high, unilaterally racemose in our species: stigmas triangular-lanceolate: achene pubescent.

Branches of the inflorescence glabrous.

Branches of the inflorescence pubescent.

Stems glaucous, glabrous (minutely pulverulent): head 4.5-6 mm. high.

Stems not glaucous.

Involucre 2-3 mm. high: achene about the length of the pappus: main stem glabrous or hairy.

Involucre 3-5 mm. high: achene half the length of the pappus: main stem conspicuously hairy at least at the bases of the petioles.

Larger leaf-blades narrowly lanceolate or oblanceolate: stem pubescent below the petioles.

Larger leaf-blades of a lanceolate or oblong-lanceolate type: stem pubescent all over.

57. *S. glaberrima*.

58. *S. serotina*.

59. *S. canadensis*.

60. *S. Leavenworthii*.

61. *S. hirsutissima*.

1. *S. glomerata* Michx. Stem stout, 3-11 dm. tall, glabrous, conspicuously angled: blades of the basal leaves thin, 8-15 cm. long, 2.5-5 cm. wide, ciliate, sharply serrate, the petiole about as long: stem-leaves reduced; blades contracted into a petiole-like base, the upper less serrate: involucre bracts firm, thickish, hispidulous, the midrib conspicuously dilated at apex: disk-corollas 6.5-7.5 mm. long.—Cliffs and rocky woods, high altitudes, Blue Ridge, N. C. and Tenn.—Sum.—fall.

2. *S. squarrosa* Muhl. Stem stout, 4-15 dm. tall, white-pubescent above: basal rosettes conspicuous, their leaves with thin but firm blades, 6-12 cm. long, 3-5 cm. wide, crenate, hispidulous above, sparsely pubescent beneath, the petiole as long or longer: stem-leaves reduced, the lower more sharply serrate, the upper entire or nearly so: heads 10-12 mm. high: involucre bracts lanceolate, pubescent, acute, all except inner with strongly squarrose tips.—Rocky woodlands and hillsides, various provinces N of Coastal Plain, "Ga." and N. Car. to Ind., Ont., and N. B.—Sum.—fall.

3. *S. Milleriana* Mackenzie. Stem 3-12 dm. tall, strict, closely short-hispid above, glabrate towards base: basal rosettes wanting: leaf-blades oblong-oval, the larger mostly 6-8 cm. long, 1.5-2 cm. wide, scabrous-hispidulous above, sparsely pubescent beneath, thick, firm, those of the lower leaves shallowly and sparingly crenate-serrate, those of the upper ones with entire blades: petioles 1-2 mm. long: heads 7-8 mm. high: involucre bracts lanceolate, acute, appressed-pubescent, all except the inner with spreading tips. ["*S. petiolaris* Ait."]  
—Sandy pinelands, acid soils, mostly Coastal Plain, Fla. to Ala. and N. C.—Sum.—fall.

4. *S. Buckleyi* T. & G. Stem 6-12 dm. tall, strict, strongly pilose above, sparsely so below: basal rosettes wanting: leaf-blades oblong-obovate or oblong-oblancheolate, mostly 8-12 cm. long, 2.5-5 cm. wide, hispidulous on veins above, sparingly pilose below, thin, those of the lower leaves strongly crenate-serrate, those of the upper entire or nearly so; petioles 1-5 mm. long: heads 7-8 mm. high: involueral bracts oblong-lanceolate, acute or acutish, hispidulous and ciliate, the tips of the outer only spreading: achene blackish, somewhat compressed.—Dry woodlands in limestone regions, Appalachian Plateau, Ala. to Ill. and Mo.—Sum.—fall.

5. *S. bicolor* L. Stem usually 5-8 (2-12) dm. tall, white-hirsute; lower leaves with ovate or oblong-ovate blades 5-10 cm. long, 2.5-5 cm. wide, crenate-serrate, white-pubescent or -hirsute on both sides; petioles  $\frac{1}{2}$  to length of blades: heads 4-6 mm. high; involueral bracts oblong, chartaceous, nearly smooth, usually whitish-yellow with the greenish midrib conspicuously dilated above.—Dry banks, woods and thickets usually in acid soils, various provinces, Ga. to Mo., Ont., and N. B.—Sum.—fall.

6. *S. hispida* Muhl. Similar to *S. bicolor* in habit, but with the heads usually slightly larger: involueral bracts narrowly oblong, firm, strigillose, subherbaceous, usually greenish-stramineous, with the green midrib obscurely to strongly dilated above.—Rocky banks and dry hillsides in limestone soils, various provinces N of Coastal Plain, Ga. to Ark., Man., and Newf.—Sum.—fall.

7. *S. erecta* Pursh. Stem usually 5-10 (3-13) dm. tall; lower leaves 6-9 cm. long, 1.8-3 cm. wide, the blades broadly oblanceolate, essentially glabrous on both sides, shallowly crenate: heads 8-10 mm. high: involucre campanulate: achene columnar, narrowly linear.—Dry open woodlands, acid soils, various provinces, Ga. to Miss., Wis., and Conn.

8. *S. Porteri* Small. Stem 6-14 dm. tall, glabrous below, sparsely pubescent above, short-pubescent in the inflorescence: leaf-blades oblong-oblancheolate, 8-18 cm. long, 2.5-4.5 cm. wide, crenate-serrate, sparsely hairy on both sides: involueral bracts oblong; achene linear-clavate, blackish.—Dry woods, Piedmont of Ga.—Sum.—fall.

9. *S. puberula* Nutt. Stem 3-10 dm. tall: basal rosettes conspicuous, their leaf-blades spatulate, 3-10 cm. long, 1.5-2.5 cm. wide, crenate-serrate, sparsely hispidulous-puberulent on both sides; petioles as long or longer: involueral bracts thin, the midrib obsolete: ligules of the ray rarely white: achene olive-green, slightly dilated upward.—Dry open woodlands, acid soils, various provinces, Fla. to Miss., Tenn., Que., and P. E. I., most common near the coast.—Sum.—fall.

10. *S. pulverulenta* Nutt. Stem 4-12 dm. tall: lower leaf-blades oblong-obovate or oblanceolate, 3-8 cm. long, 1.2-2.5 cm. wide, crenate-serrate, the petiole as long or longer: involueral bracts thin, with the midrib obscure: achene somewhat dilated upward.—Dry pinelands, acid soils, Coastal Plain, Fla. to Ala. and N. C.—Sum.—fall.

11. *S. roanensis* Porter. Stem 2-8 dm. tall, pubescent above and in the inflorescence only, or sparingly loosely pubescent: basal rosettes conspicuous: lower leaf-blades oblong-obovate or obovate, 3-10 cm. long, 2-5 cm. wide, crenate-serrate or serrate, hispidulous above and pubescent beneath mostly on the veins; petiole usually shorter: involueral bracts glabrous: achene linear, obscurely ribbed. [*S. monticola* T. & G. not Jordon *S. Mazoni* Pollard *S. alleghaniensis* House]—Dry woods, in acid soils, Blue Ridge to Appalachian Plateau, "Ga." to "Ala.," W. Va., and Md.—Sum.—fall.

12. *S. Harperi* Mackenzie. Stem 10–15 dm. tall: lower leaf-blades oblong-elliptic, 6–12 cm. long, 1.5–2.5 cm. wide, glabrous, entire, dull-green above, lighter beneath: thyrses narrowly ovoid, 2–3 dm. long, 8–12 cm. wide, its branches hirsutulous: heads 7–9 mm. high: involueral bracts minutely ciliate, thickish, firm, not keeled.—Dry woods, Coastal Plain and more northern provinces, Ga. to E Tenn.—Fall.

13. *S. conferta* Mill. Stem 8–20 dm. tall: lower leaf-blades oblong-obovate or oblanceolate, 1.2–2.5 dm. long, crenate or crenate-serrate; petioles usually somewhat shorter: branches of the thyrses hirsutulous: heads 7–10 mm. high: involueral bracts ciliate. [*S. speciosa* Nutt.]—Dry woodlands, various provinces N of Coastal Plain, N. C. to Okla., Minn., and Mass., and introduced northeastward.—Fall.

14. *S. rigidiuscula* (T. & G.) Porter. Stem 6–12 dm. tall: lower leaf-blades narrowly lanceolate to ovate-lanceolate, 5–10 cm. long, entire or sometimes crenate; petioles short: thyrses with hirsutulous branches: heads 6–8 mm. high: involueral bracts ciliate.—Dry sunny places, various provinces, Ga. to Tex., S. Dak., and Minn.—Sum.—fall.

15. *S. plumosa* Small. Stem 4–10 dm. tall: lower leaf-blades linear-spatulate, 4–10 cm. long, 7–14 mm. wide, glabrous, sparingly crenate-serrate above, dull-green on both sides: thyrses oblong, 1.5–3 dm. long, 5–10 cm. wide, its branches nearly glabrous: heads 8–10 mm. high: involucre campanulate; bracts glabrous, thick, linear-lanceolate, obtusish: achene half the length of the pappus.—Crevices of rocks, at the junction of the Coastal Plain and the Piedmont, Yadkin River, N. C.—Sum.—fall.

16. *S. spithamea* M. A. Curtis. Stem 0.5–3.5 dm. tall, pubescent especially above: lower stem-leaves with blades narrowly oblong-obovate, 4–10 cm. long, 1.2–2.5 cm. wide, sessile, crenate-serrate or serrate, sparingly hairy on the veins: heads 7–9 mm. high, in a flat-topped or rounded corymbiform thyrses: involueral bracts lanceolate, acute, thin, ciliate, hispidulous.—Sunny exposures, high altitudes, Blue Ridge, N. C. and Tenn.—Sum.—fall.—A very well marked species. Our only representative of a most widely distributed group of golden-rods, which is abundant northward, especially in alpine localities.

17. *S. odora* Ait. Stem 5–13 dm. tall: leaf-blades linear-lanceolate or linear, the larger 4–16 cm. long, 4–16 mm. wide, the margins ciliate: heads 4–5.5 mm. high, 2 mm. thick: involueral bracts yellow, glabrous, not exceeded by the pappus at flowering time.—(SWEET-GOLDENROD)—Dry acid woodlands, especially in pinelands, various provinces, Fla. to Tex., Okla., and Me.—Sum.—fall.—Sometimes erroneously referred to *S. suaveolens* Schoepf. which is apparently *Euthamia graminifolia* (L.) Nutt.

18. *S. Chapmanii* T. & G. Stem 2–14 dm. tall: leaf-blades linear-oblong, lanceolate, or oblong-ovate, the larger 3–6 cm. long, 1–1.8 mm. wide, the margins revolute, ciliate: heads 6–7 mm. high, 2–3 mm. thick: involueral bracts light-yellowish, glabrous, ciliate, markedly exceeded by the pappus at flowering time.—Pinelands and sandy hammocks, Fla. to S. Ga.—Sum.—fall.

19. *S. ulmifolia* Muhl. Stem 6–15 dm. tall, glabrous or nearly so below inflorescence: leaf-blades ovate or obovate or narrower, the larger 6–14 cm. long, 2–4.5 cm. wide, serrate, thin, sparsely hairy especially below: inflorescence-branches few, widely spreading, the longer not flower-bearing towards base: heads 4–6 mm. high: involueral bracts narrow, acute, the inner lanceolate or oblong-lanceolate: achene 1.5 mm. long, slightly enlarged upward.—Dry or rocky soil, open woods and thickets, various provinces, rarely Coastal Plain, Ga. to Tex., Minn., and N. S.—Sum.—fall.

20. *S. notabilis* Mackenzie. Stem 3-8 dm. tall, closely short white-pubescent: lower leaf-blades ovate or cordate, 4-8 cm. long, 3-5 cm. wide, sharply serrate, closely hispidulous above, closely short white-pubescent beneath, the petiole about length of blade, the larger strongly cordate: upper stem-leaves oblong-lanceolate or oblong-ovate, frequently entire, strongly amplexicaul, often abruptly contracted below the middle: inner involucre bracts much the longer, narrowly linear, acute. [*"S. amplexicaulis* Martens."]  
—Dry woodlands, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Tenn.—Sum.—fall.

21. *S. juncea* Ait. Stem 4-15 dm. tall, glabrous: larger leaf-blades ovate-lanceolate or obovate-lanceolate, 8-15 cm. long, 3-6 cm. wide, glabrous, sharply serrate, the upper gradually reduced: panicle-branches flower-bearing to much below the middle: heads usually strongly secund, 4.5-6 mm. high: involucre bracts linear-oblong, acutish, the midrib conspicuous: achene 5-ribbed, brownish, finely short-pubescent.—Dry fields and open woodlands, various provinces, Ga. to "Mo." "Sask." Que., and N. S.—Sum.—fall.

22. *S. Boottii* Hook. Stem 5-15 dm. tall, glabrous below the inflorescence: larger leaf-blades of an oval-obovate type, 5-10 cm. long, 2.5-3.5 cm. wide, serrate, thickish, firm: inflorescence-branches widely spreading, the longer ones flower-bearing towards the end only: heads about 6 mm. high: involucre bracts thin, linear-oblong, obtuse or acutish: achene 1.75 mm. long, dilated upward.—Dry woodlands, various provinces, Fla. to Tex., Tenn., and Md.—Sum.—fall.

23. *S. strigosa* Small. Stem 6-12 dm. tall, glabrous below the inflorescence: larger leaf-blades of an oblong-oval type, 10-18 cm. long, 5-8 cm. wide, hispidulous or strigose especially on the veins, thin, sharply, but shallowly singly serrate: inflorescence-branches several, widely spreading, the longer ones flower-bearing above the middle: heads 4.5-5.5 mm. high: involucre bracts thickish, oblong, obtuse or acutish: achene 2.5 mm. long, strongly clavate, conspicuously ribbed.—Dry woodlands, Coastal Plain, Ga. to La., Ark., and SE Mo.—Sum.—fall.

24. *S. yadkinensis* (Porter) Small. Stem 5-14 dm. tall, glabrous except in the inflorescence: lower leaf-blades ovate, 8-15 cm. long, 6-9 cm. wide, thickish, singly serrate, minutely hispidulous, otherwise glabrous; petiole much shorter than the blade: inflorescence with ascending stiff branches, flower-bearing to the base: heads 7-9 mm. high: involucre bracts oblong, obtuse: achene linear-clavate, ribbed. [*S. arguta caroliniana* A. Gray *S. Vaseyi* Heller]  
—Woods and low grounds, Coastal Plain and Piedmont, Fla. to Ala. and N. C.—Sum.—fall.

25. *S. brachyphylla* Chapm. Stem 5-13 dm. tall, closely short pubescent, closely leafy throughout: larger leaf-blades oblong-oval or oval-obovate, 3-7 cm. long, 1.2-2.5 cm. wide, crenate-serrate: branches of inflorescence much elongate, often not flower-bearing on lower part: heads few-flowered, 5 mm. high: involucre cylindric; bracts oblong, obtuse, firm: achene 2.25 mm. long, strongly dilated upward, 8-10-ribbed. [*S. pallescens* C. Mohr]  
—Dry woodlands, Coastal Plain, Fla. to Miss. and S. Car.—Sum.—fall.

26. *S. arguta* Ait. Stem 6-12 dm. tall, glabrous except in the inflorescence: lower leaf-blades ovate, 8-15 cm. long, 5-8 cm. wide, thin, sharply more or less doubly serrate, deep-green above, much lighter-green beneath, the petioles as long as the blades or longer: inflorescence large and loose, the branches flower-bearing at the ends: involucre 3-4.5 mm. high, 2-2.5 mm. thick; inner bracts linear-oblong: stigmas strongly exserted, conspicuous in the disk: achene glabrate or nearly so; pappus 3-4 mm. long.—Dry woodlands, various provinces, N. C. to "Ala.," "Miss.," Ky., and Me.—Sum.—fall.

27. *S. Harrisii* Steele. Stem 6-12 dm. tall, glabrous except in the inflorescence: lower leaf-blades ovate, 6-18 cm. long, 3-9 cm. wide, firm, sharply more or less doubly serrate, little lighter-green beneath than above; petioles as long as the blades or longer: inflorescence large and loose, the branches widely spreading, flower-bearing at the tips: involucre 4-6 mm. high, 2.5-4 mm. thick; inner bracts oblong-obovate: stigmas partially exserted, inconspicuous in the disk: achene hairy: pappus 2.5-3.5 mm. long. [*S. Vaseyi* (Fl. SE. U. S.)]—Dry woodlands, Blue Ridge and adj. provinces, "Ga." and "Ala." to Ky. and W. Va.—Sum.—fall.

28. *S. uniligulata* (DC.) Porter. Stem 6-15 dm. tall, glabrous below the inflorescence: leaves numerous, strongly decreasing in size upwards; blades of the larger ones lanceolate or oblong-lanceolate, 1.5-3 dm. long, 1-3 cm. wide, shallowly serrate, firm or thickish, glabrous: heads very numerous to few, in a large to small thyrses, the lower branches hirsute, spreading, usually short, with the upper heads closely bunched: heads 6-8 mm. high: involucre bracts oblong, obtuse, with a conspicuous midrib: achene 1.5-2 mm. long, linear, dilated upward, ribbed. [*S. neglecta* T. & G.]—Acid swamps and bogs, various provinces, N. C. to Wis. and Newf.—Sum.—fall.—A related species, *S. uliginosa* Nutt., was apparently erroneously recorded from N. C. in Fl. SE. U. S. 1194.

29. *S. austrina* Small. Stem 8-15 dm. tall, glabrous usually even in the inflorescence: leaf-blades lanceolate, 6-10 cm. long, 1-2 cm. wide, glabrous, firm, serrate, tapering to a margined petiole which is usually shorter than the blade: thyrses narrow, elongate, the branches short-spreading, flower-bearing to base or nearly so: heads 7-8 mm. high: involucre bracts oblong, acutish or obtuse: achene 2.5 mm. long, ribbed.—Swamps, sometimes brackish, Coastal Plain and Piedmont, Ga. to Va.—Sum.—fall.

30. *S. flavovirens* Chapm. Stem 5-20 dm. tall, glabrous even in the inflorescence: larger leaf-blades oblong-ovate or oblanceolate, 1-2 dm. long, 2-5 cm. wide, glabrous, firm, thickish, crenate-serrate, tapering to a margined petiole, which varies from much shorter than the blade to nearly as long: thyrses narrow, long, the branches short, spreading, flower-bearing to base or nearly so: heads 7-9 mm. high: involucre bracts narrow, acutish: achene 2-2.5 mm. long, ribbed.—Brackish marshes, Apalachicola, Florida.

31. *S. rigida* L. Stem 5-20 dm. tall, stout, glabrous except in inflorescence: lower leaf-blades oblong-ovate, 1.2-2 dm. long, 5-9 cm. wide, firm but not thick, closely crenate-serrate, very rough above with minute retrorse hispid hairs, smooth and glabrous beneath: inflorescence elongate and loose, the branches recurved-spreading or occasionally erect, the heads often crowded towards the ends: heads 6-8 mm. high: involucre broadly campanulate; bracts oblong, obtuse: achene 2.5-3 mm. long, 10-ribbed, sparsely pubescent. [*S. patula* Muhl.]—Swampy woodlands and thickets, various provinces, Ga. to Mo., Ont., and Me.—Sum.—fall.

32. *S. salicina* Ell. Stem 6-15 dm. tall, scarcely stout, glabrous, except in the inflorescence: lower leaf-blades oblong-ovate to oblong-lanceolate, 0.5-2 dm. long, 1.5-3 cm. wide, thin but stiff, crenate-serrate or serrate, dull-green and strongly retrorsely scabrous above, smooth and light-green beneath: inflorescence elongate and narrow, the heads in few-flowered clusters or short racemes, not at all secund: heads 6-8 mm. high: involucre campanulate to narrowly campanulate; bracts linear-oblong, acute to obtusish: achene 2.5 mm. long, obscurely ribbed, sparsely pubescent.—Low grounds, Coastal Plain and adj. provinces, Fla. to La. and N. C.—Sum.—fall.

33. *S. mexicana* L. Stem 8-20 dm. tall, stout, glabrous below the inflorescence: lower leaf-blades oblong-lanceolate to linear-lanceolate, 1-2.2 dm.

long, 1.2–3 cm. wide, obtuse or acutish, hispid-ciliate, entire: heads 5–7 mm. high, in an elongate narrow panicle, the branches short: involueral bracts narrowly oblong-lanceolate: rays 7–10, the ligules 2.5 mm. long, oblong-oval: achene 2.5 mm. long,  $\frac{2}{3}$  length of pappus, not narrowed above or scarcely so.—Salt-marshes, beaches, coastal sand-dunes, and banks of tidal rivers, coastal Fla. to Tex. and Del.; S Calif. (*W. I., Mex.*)—Sum.—fall or all the year S.—This species replaces *S. sempervirens* L. of northern regions, in the SE States.

34. *S. Gattingeri* Chapm. Stem 6–15 dm. tall, smooth and glabrous throughout: lower leaf-blades oblanceolate or narrowly spatulate, remotely shallowly serrate or entire: upper leaf-blades much smaller, linear-oblanceolate, entire: panicle ample, the branches widely spreading, glabrous, flower-bearing above the middle: heads 4–5 mm. high: involueral bracts thick, narrowly oblong: achene sparingly silky above.—Limestone barrens, various provinces N of Coastal Plain, Tenn. to Tex. and Mo.—Sum.—fall.

35. *S. pinetorum* Small. Stem 4–11 dm. tall, smooth and glabrous throughout: lower leaf-blades narrowly oblanceolate, crenate-serrate above the middle: upper leaf-blades smaller, narrower and entire: panicle medium-sized, the branches widely spreading, glabrous: heads 4–5 mm. high: involueral bracts linear-oblong, the midrib dilated at apex: achene sparingly silky.—Pinewoods, Piedmont, N. C.—Sum.—fall.

36. *S. nemoralis* Ait. Stem and rest of plant grayish-green, 1–9 dm. tall, erect, depressed, or rarely prostrate, closely short-pubescent: lower leaf-blades oblanceolate or spatulate, 4–15 cm. long, 1–2.5 cm. wide, thick, crenate or crenate-dentate, rough grayish-pubescent on both sides, the petiole longer than the blade: upper leaf-blades much smaller, narrower and entire: panicle medium-sized, the branches spreading or recurved: peduncles sparingly bracteolate: heads very numerous, 3–4 mm. high, 1.5 mm. thick: involueral bracts rather thin: ligules of the ray short.—Dry sunny situations, roadsides, banks, open woodlands, and especially in fields, various provinces, Fla. to Tex., Sask., and N. S.—Sum.—fall.—One of the most widely distributed and abundant species of *Solidago*.

37. *S. radula* Nutt. Stem 3–11 dm. tall, erect or ascending, roughly short-pubescent: lower leaf-blades oblong-obovate, oblanceolate, or oblong-lanceolate, 4–8 cm. long, 1–2.5 cm. wide, firm, rough-hairy on both sides, not at all hoary, strongly reticulate-veined beneath, crenate-dentate, usually shallowly so, or nearly entire: upper leaf-blades moderately smaller: inflorescence narrow to ample, the branches short, erect to recurved-spreading: heads 4–6 mm. high: involueral bracts narrow, obtuse, firm; ligules of the ray short.—Dry limestone ledges, various provinces, N. C., La. to Tex., Mo., and Ill.—Sum.—fall.

38. *S. verna* M. A. Curtis. Stem 5–9 dm. tall, softly pubescent, sometimes almost villous: lower leaf-blades 4–9 cm. long, 2–5 cm. wide, tomentose beneath, hispidulous above, acute, closely serrate; petioles as long as the blades or twice or thrice as long, strongly margined: inflorescence very lax, the heads conspicuously peduncled: involucre broadly campanulate, 4–4.5 mm. high; bracts linear, acutish: ray-flowers 10–12, the ligules linear-oblong, bright-yellow.—Pinelands, Coastal Plain, E N. C. and NE S. C.—Spr.—A very local species; rarely collected.

39. *S. tarda* Mackenzie. Stem 5–9 dm. tall, glabrous below the inflorescence: lower leaf-blades 4–9 cm. long, 3–5 cm. wide, acute, glabrous on both sides, dull-green above, lighter-green beneath, closely crenate-serrate, inequilaterally rounded at the base; petioles as long as the blades or up to thrice as long, margined above only: inflorescence typically somewhat lax, sometimes con-

gested, the heads rather short-peduncled: involucre campanulate, 5-7 mm. high; bracts oblong, acutish: ray-flowers 8-10, the ligules oblong, bright-yellow.—Pinelands, Coastal Plain, Ga.—Sum.—fall.

40. *S. gracillima* T. & G. Stem 4-10 dm. tall, slender; lower leaf-blades oblanceolate or spatulate, 2-8 cm. long, 8-12 mm. wide, dull-green above, lighter beneath, shallowly crenate-serrate except near base; petioles equalling or 2-3 times as long as the blades: stem-leaves numerous, much reduced; blades entire or nearly so: inflorescence with a terminal narrow spike-like portion, and 2-5 very long and slender spreading branches with the heads secund on the upper third only: heads 5-6 mm. high, few-flowered: involucre bracts short, oblong, obtuse: ray-flowers mostly wanting, sometimes solitary: achene linear, short-pubescent, dark-colored.—Sandy soil, Coastal Plain, Fla. and Ga.—Sum.—fall.—Rarely collected.

41. *S. petiolata* Mill. Stem 2.5-20 dm. tall, strict, slender: lower leaf-blades narrowly linear-oblanceolate to lanceolate, 6-15 cm. long, 0.6-2.5 cm. wide, entire or shallowly crenate-serrate; petioles one-fourth as long as the blade to as long: stem-leaves abruptly much reduced, very numerous, entire, sessile, appressed or spreading: heads in a strict spike-like thyrse, or sometimes the lower branches short spreading and the heads unilateral, 6-7 mm. high: involucre turbinate-campanulate; bracts linear, acute, thin, erose ciliolate: ray-flowers several; ligules elliptic, conspicuous: achene linear-obconic, silky, dark-colored. [*S. stricta* Ait. *S. virgata* Michx. *S. angustifolia* Ell. *S. Chrysopsis* Small]—Wet pinelands, acid soils, Coastal Plain and rarely adj. provinces, Fla. to La., Tenn., and N. J.—(*W. I.*)—Sum.—fall.—A very variable species southward. Possibly representing more than one species, as here interpreted.

42. *S. pulchra* Small. Stem 2.5-4 dm. tall, glabrous, very slender: lower leaf-blades spatulate or oblanceolate, 2-5 cm. long, 8-14 mm. wide, entire, obtuse, glabrous, even the edges eciliate; petioles margined above, one-half to three times length of blade: stem-leaves abruptly much reduced, appressed, sessile, mostly 5-10 mm. long and 1-2.5 mm. wide: heads 5-15 in a simple narrow somewhat one-sided thyrse 2-8 cm. long, strongly peduncled, 6-8 mm. high: involucre campanulate or turbinate-campanulate; bracts oblong, acutish, strigillose: ray-flowers 5 or 6, the ligules ovate, bright-yellow, 4-5 mm. long: achene linear obconic, appressed silky.—Moist sandy soil, Coastal Plain, E N. C.—Fall.

43. *S. caesia* L. Stem 3-11 dm. tall, slender, straight, terete, with a bluish-gray glaucous bloom which is often obscure in age: leaf-blades oblanceolate, lanceolate, oblong-oblanceolate, or oblong-lanceolate, 0.5-1 dm. long, 0.5-3 cm. wide, glabrous, sharply shallowly serrate, firm, long-acuminate, round-tapering at base; petioles 1-2 mm. long: heads 4-6 mm. high: involucre 3.5-4 mm. high, 1.5-2 mm. wide; bracts obtuse: achene linear, 10-ribbed.—Woodlands, usually dry but sometimes damp soil, various provinces, Fla. to Tex., Wis., Ont., and Que.—Sum.—fall.

44. *S. latissimifolia* Mill. Stem 5-13 dm. tall, slender, straight, terete or sometimes obscurely angled, glabrous below, sparingly pubescent above, with a slight bluish-gray glaucous bloom: leaf-blades broadly oblanceolate to obovate, 6-20 cm. long, 1.5-5.5 cm. wide, thin, strongly acuminate, very sparingly hirsutulous, sharply and deeply serrate, cuneate-tapering at base; petioles 1-5 mm. long: heads 4.5-5.5 mm. high: involucre 4-4.5 mm. high, 2.5-3.5 mm. wide: bracts obtuse: achene oblong, enlarged upward. [*S. flaccidifolia* Small *S. asterifolia* Small]—Dry woodlands, Coastal Plain to Appalachian Plateau, Ga. to La.—Sum.—fall.

45. *S. flexicaulis* L. Stem 3-10 dm. tall, slender, strongly angled, usually zigzag, glabrous, not glaucous: leaf-blades broadly ovate, rather abruptly acumi-

nate, 0.5–1.8 dm. long, 2.5–10 cm. wide, thin, very sharply and deeply serrate, glabrous above, sparingly pubescent beneath, abruptly narrowed at the base, many times the length of the short margined petioles: heads 6 mm. high: involueral bracts acute or obtusish: achene hirsute-pubescent.—Deep woods especially among loose rocks along small streams, various provinces, Tenn. to Kans., S. Dak., and N. S., and Va.—Sum.—fall.

46. *S. pubens* M. A. Curtis. Stem 4–15 dm. tall, slender, pilose; leaf-blades narrowly oblanceolate to broadly oblanceolate, 6–16 cm. long, 2.5–4.5 cm. wide, sharply serrate, thin, hirsutulous above, pilose beneath on the veins; petioles 1–3 mm. long: heads 5–6 mm. high, in short or even long axillary racemes, the lower racemes much exceeded by the leaves, the upper aggregated and forming a short thyrse: involuere 3–4.5 mm. high; bracts hispidulous, ciliate, obscurely few-ribbed at the base: achene appressed-hirsutulous.—Rich woods, Blue Ridge, Ga. to Tenn. and N. Car.—Sum.—fall.

47. *S. Curtisii* T. & G. Stem 5–14 dm. tall, slender, glabrous below, pubescent above: leaf-blades narrowly oblanceolate to broadly oblanceolate, 8–20 cm. long, 1.5–4 cm. wide, thin, sharply serrate, glabrous or nearly so, long-acuminate, long-tapering at the base; petioles 1–10 mm. long: heads 5–6 mm. high, in axillary clusters or short racemes, all except the uppermost exceeded by leaves, even the uppermost scarcely forming a spike: involuere narrowly campanulate, 3–4.5 mm. high; bracts narrowly oblong, ciliate, strongly 3–5-ribbed: achene appressed-hirsutulous.—Rich dry soil in open upland woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., Ky., and Va.—Sum.—fall.

48. *S. lancifolia* T. & G. Stem 8–15 dm. tall, stoutish or stout, glabrous below, sparingly pubescent above: leaf-blades lanceolate, 8–20 cm. long, 2–3 cm. wide, thin, sharply and deeply serrate, glabrous to very sparingly hirsutulous, long-acuminate, strongly cuneate-tapering at the base; petioles 2–6 mm. long: heads 6.5–8 mm. high, in elongate axillary racemes, the upper forming a narrow terminal thyrse: involuere broadly campanulate, 5–6 mm. high; bracts oblong, obtuse, ciliate, granular-puberulent or hispidulous, strongly 3–5-ribbed: achene appressed-hirsutulous.—Rich woodlands, slopes and summits, Blue Ridge, Ga. to Tenn. and N. C.—Sum.—fall.

49. *S. tortifolia* Ell. Stem 3–11 dm. tall, closely roughly short-pubescent: leaves very numerous; blades narrowly linear-oblong, linear-lanceolate, or oblong-lanceolate, 1.5–8 cm. long, 2.5–6 mm. wide, channeled, those of the lower leaves, at least, recurved-spreading and slightly twisted at the base, shallowly serrate above the middle, hispidulous on the midvein and margins, sessile, with the lateral veins usually obscure: thyrse 6–15 cm. long, nearly as wide, the branches widely spreading: heads secund, 3.5–4.5 mm. high: involuere cylindric: achene sparsely and minutely pubescent.—Dry sandy soil, pinelands, Coastal Plain, Fla. to Tex. and Md.—Sum.—fall, or all year S.

50. *S. fistulosa* Mill. Stem 6–20 dm. tall, strongly white-hirsute above, glabrate towards the base: leaves very numerous; blades oblong-lanceolate or oblong-oblanceolate, 5–12 cm. long, 1.7–2.5 cm. wide, sparingly and shallowly crenate-serrate or entire or nearly so, sessile, thin, prominently veined, pubescent at least on the veins, with the broad base somewhat clasping: thyrse 0.5–2 dm. long, the branches numerous, spreading, usually flower-bearing nearly to the base: heads 5–7 mm. high, secund, long-peduncled: involuere cylindric-campanulate; bracts linear-lanceolate, acute, thin: achene pubescent. [*S. aspericaulis* A. H. Moore]—Moist sunny localities, low pine-lands, acid soils, Coastal Plain, La. to Fla. and N. J.—Sum.—fall.

51. *S. dispersa* Small. Stem 7–12 dm. tall, glabrous or sparingly hirsutulous especially in the inflorescence: lower leaf-blades oblong-ob lanceolate, 8–15 cm. long, glabrous or sparingly hairy on the veins, strongly crenate-serrate, shining green above, duller beneath, tapering to a margined petiole-like base; upper leaves much reduced: thyrses long and narrow, the heads little secund, or with a few long widely spreading branches, flower-bearing towards the end and the heads secund: heads 6–7 mm. high: involucre turbinate-campanulate; bracts linear-oblong, firm, obtuse: achene short-pubescent, obscurely ribbed.—Low sandy open woods, Coastal Plain, Miss. to Tex.—Sum.—fall.

52. *S. altissima* L. Stem 3–25 dm. tall, strongly pubescent above, with the hairs stiff, pustular, glabrate towards the base, closely leafy: larger leaf-blades oblanceolate or oblong-lanceolate, 5–10 cm. long, 1.5–2 cm. wide, sharply-serrate, acute or acuminate, thin, prominently veined and sparingly hairy beneath, not cordate: thyrses variable, 0.4–3 dm. long, the branches few to many: peduncles moderately bracteolate: heads small, 3–4 mm. high: involucre cylindrical: involucre bracts few, rather thin, the inner linear, mostly obtusish: achene appressed-hairy, obscurely few-ribbed. [*S. rugosa* Mill. *S. Earlei* Small]—Thickets, fields, and woodlands, dry soil, often very abundant, various provinces, Fla. to Tex., Mo., Ont., and Newf.—Sum.—fall.—One of our most abundant and widely distributed species of *Solidago*.

53. *S. celtidifolia* Small. Stem 6–20 dm. tall, closely leafy, closely and densely short pubescent above, glabrate towards base, the stem-hairs weak, not or scarcely pustular: larger leaves with oblong-ovate to ovate blades, 3–8 cm. long, 1.5–2.5 cm. wide, crenate-serrate, obtuse or short-acute, shallowly cordate, sessile or very short-petioled, very conspicuously veined especially below, the petiole somewhat glandular: thyrses variable, usually very large: peduncles usually strongly bracteolate: heads small, 4–5 mm. high, involucre turbinate-cylindric; bracts few, firm, the inner linear, acutish: achene hairy, obscurely few-ribbed.—Sandy soil or dry woodlands, Coastal Plain, Fla. to Tex., Ark., and Ga.—Sum.—fall.

54. *S. Elliottii* T. & G. Stem 8–18 dm. tall, glabrous, striate or striate-angled, usually simple below the inflorescence: cauline leaves numerous; blades elliptic or nearly so, 5–10 cm. long, acute or slightly acuminate, bluntly serrate, thick, glabrous, sometimes scabrous on the margins, somewhat veiny, sessile or nearly so: thyrses rather crowded, the branches glabrous or nearly so, with broad, entire or obscurely toothed, acute, foliaceous bracts among the second heads: peduncles glabrous or nearly so: involucre nearly cylindrical, 5–6 mm. high; bracts thick, the outer ovate, obtuse or acutish, the inner linear or slightly linear-spatulate, with obtuse erect tips: ray-flowers about 8; disk-flowers about 4, usually 2 or 3, fewer than the ray-flowers; achenes very sparingly hispidulous, sharply ribbed.—Damp rich soils, Parris Island, S. C., and doubtless at other points along the southern Atlantic coast.—Fall.—This species seems to be known only from the original specimen from Parris Island, S. C. Specimens ranging all the way from eastern Georgia to eastern Canada have been erroneously referred to it.

55. *S. Edisoniana* Mackenzie. Stem 12–50 dm. tall, glabrous below, often sparingly pubescent and rather prominently ridged above, often irregularly branched: cauline leaves very numerous; blades elliptic, sometimes elliptic-ob lanceolate on the lower part of the stem and elliptic-lanceolate above, 5–17 cm. long, usually acuminate, shallowly serrate, glabrous above, pubescent with scattered hairs beneath, finely veined, sessile: thyrses densely flowered, the branches closely fine-pubescent, with rather narrow finely toothed and scabrous-margined acute bracts among the second heads: peduncles minutely pubescent: involucre broadly campanulate, 5 mm. high; bracts thin but firm, the outer ovate-

lanceolate, acutish, the inner narrowly linear, with obtuse erect tips; ray-flowers about 10: disk-flowers about 7: achenes sparingly hispidulous, ribbed.—Hammocks, near Ft. Mead, Fla.—Peculiar among our goldenrods of this and the next group in that it holds its lower cauline leaves throughout the growing season.

56. *S. mirabilis* Small. Stem 15–30 dm. tall, glabrous, ridged or rather sharply angled, simple or nearly so below the inflorescence: cauline leaves numerous; blades narrowly elliptic, varying to elliptic-oblongate or elliptic-lanceolate, 6–15 cm. long, acuminate, sharply serrate, except often the acuminate tip, thin, hispidulous on the veins and veinlets beneath, rather veiny, somewhat narrowed at the ciliate base, but sessile: thyrses usually ample, but not crowded, the branches hispidulous, with narrow, serrate, acuminate bracts among the second heads: peduncles hispidulous, involucre cylindric 6 mm. high; bracts thin, the outer lanceolate, acuminate, the inner narrowly linear, with minute, acuminate, inflexed or incurved tips: ray-flowers 5–7; disk-flowers 3–5, usually 2 or 3 fewer than the ray-flowers: achene sparingly hispidulous, sharply ribbed.—Low hammocks, E coast of Fla., N of Cape Canaveral.—Sum.–fall.

57. *S. glaberrima* Martens. Stem 5–15 dm. tall, glabrous, rather slender, very leafy: middle leaf-blades narrowly lanceolate, 5–10 cm. long, 6–12 mm. wide, firm, rigid, thickish, acute or acuminate, sessile, narrowed and long-tapering at the base, remotely shallowly serrate or entire, reticulate-veined beneath; lower leaf-blades more spatulate, petioled: thyrses rather short, broad, the branches usually spreading or recurved, sometimes erect, glabrous: heads usually second, 4–6 mm. high: involucre bracts thickish, oblong, obtuse: achene silky. [*“S. missouriensis* Nutt.”]—Dry open places, prairies, and barrens, calcareous districts, various provinces N of Coastal Plain, Tex. to Minn. and Tenn.—Sum.–fall.

58. *S. serotina* Retz. Stem 6–25 dm. tall, appearing glabrous below inflorescence, but minutely pulverulent, glaucous-tinged, closely leafy: larger leaf-blades lanceolate, 6–12 cm. long, 1–2 cm. wide, firm, acuminate, very short-petioled, tapering at the base, sharply closely serrate, glabrous throughout, or hairy on the veins beneath: thyrses large, the branches spreading or recurved, hairy: heads 4.5–6 mm. high, second: involucre campanulate; bracts narrowly linear, acute: achene sparsely silky. [*S. gigantea* Ait.]—Moist thickets and woodlands, various provinces, Fla. to Tex., Ore., B. C., Ont., and N. B.—Sum.–fall.—One of our most widely distributed species of *Solidago*.

59. *S. canadensis* L. Stem 5–20 dm. tall, slender, glabrous or pubescent below, strigillose above, and strigose in inflorescence, closely leafy: larger leaf-blades linear-oblongate or linear-lanceolate, 5–10 cm. long, 7–15 mm. wide, thin but firm, sharply acuminate, sharply remotely shallowly serrate, glabrous or pubescent, deep-green above; petioles 3–15 mm. long: thyrses large, the branches spreading or recurved: heads 3.5–4 mm. high, second: involucre cylindric-campanulate; inner bracts narrowly lanceolate, acute, thickish: achene appressed-pubescent. [*S. rupestris* Raf.]—Rocky banks, various provinces N. of Coastal Plain, S. C. to Tex., N. Dak., and Newf.—Sum.–fall.—As here treated the species includes plants varying widely in pubescence, but all having very small heads.

60. *S. Leavenworthii* T. & G. Stem 5–12 dm. tall, glabrate towards the base, pubescent above in lines below the petioles, closely short-pubescent in the inflorescence, closely leafy: larger leaf-blades narrowly oblongate or lanceolate, 6–18 cm. long, 5–12 (typically about 8) mm. wide, triple-ribbed, but sometimes with the lateral veins little developed, long-acuminate, sessile, sharply serrate or crenate-serrate or nearly entire, short-hispidulous on the midvein above, otherwise glabrous, dull-green above: thyrses large, the branches widely spread-

ing, flower-bearing nearly to the base: heads 5–6 mm. high, secund: involueral bracts linear, thickish: achene minutely appressed-pubescent. [*S. Nashii* Small]—Damp soil, Coastal Plain, Fla. to S. Car.—Sum.–fall.

61. *S. hirsutissima* Mill. Stem 8–30 dm. tall, stout, closely hirsute or pubescent, closely-leafy, much-branched above: larger leaf-blades lanceolate or oblong-lanceolate, 4–10 cm. long, 8–15 mm. wide, strongly triple-ribbed, acute or acuminate, hirsutulous above, pubescent also beneath, sharply but not closely serrate, subpetiolate or sessile: thyrses large, the branches widely spreading, not flower-bearing at the base: heads 4.5–6 mm. high, secund: involueral bracts narrowly linear, acute or obtusish: achene appressed-hairy. [“*S. canadensis* (Fl. SE. U. S.). “*S. altissima* L.”]—Dry sunny places, fields, woodlands, and banks, various provinces, Fla. to Tex. and Me.—Sum.–fall.—One of our most widely distributed, abundant, and variable species of *Solidago*. As here treated both it and *S. canadensis* are probably aggregates.

31. *EUTHAMIA* Nutt. Perennial, herbaceous plants. Leaves alternate: blades elongate, herbaceous. Heads many, in corymbs. Involucre narrow, few-several-flowered: bracts various, the outer ones linear or nearly so. Ray-flowers more numerous than those of the disk: corolla yellow, with a slender tube and a very small ligule. Disk-corollas with a funnellform throat, and tube of about equal length: lobes lanceolate. Anthers as long as the filaments or longer. Stigmas lanceolate. Pappus of capillary bristles.—About 10 species, North American.

Leaf-blades manifestly 3–5-ribbed: ray-flowers 15–20.

Leaf-blades 1-ribbed: ray-flowers 5–12.

Leaf-blades mostly over 3 mm. wide: disk-flowers 3 or 4, the corollas 5–5.5 mm. long.

Leaf-blades mostly less than 3 mm. wide: disk-flowers 5 or 6, the corollas 3–3.5 mm. long.

1. *E. graminifolia*.

2. *E. leptcephala*.

3. *E. minor*.

1. *E. graminifolia* (L.) Nutt. Plant 13–14 dm. tall: leaf-blades linear, mainly over 4 mm. wide: heads in dense clusters: involucre campanulate, the inner bracts 3.5–4 mm. long: achene pubescent.—Rich soil, fields and thickets, various provinces, Fla. to Miss., Sask., and N. S.—Late sum.–fall.

2. *E. leptcephala* (T. & G.) Greene. Plant 4–11 cm. tall: leaf-blades linear, mostly over 3 mm. wide: involucre turbinate, the inner bracts 5.5–6 mm. long: filaments shorter than the anthers.—Moist soil, Coastal Plain and adj. provinces, Miss. to Tex. and Mo.—Sum.–fall.

3. *E. minor* (Michx.) Greene. Plant 2–8 dm. tall: leaf-blades narrowly linear or linear-filiform, mostly less than 3 mm. wide: involucre cylindric to turbinate-cylindric, the inner bracts 4.5–5.5 mm. long.—Moist sandy soil and low-pinelands, Coastal Plain, Fla. to Tex. and Va.—Sum.–fall, or all year S.

32. *OLIGONEURON* Small. Perennial herbs, pubescent at least in the inflorescence. Leaves alternate: blades entire or nearly so. Heads in a terminal corymb. Involucre campanulate, several-flowered: bracts broad, rounded at the apex, the inner much longer than the outer. Ray-flowers few: corollas

with a very long tube and a yellow ligule. Disk-corollas with a funnellform throat and a shorter tube: lobes lanceolate. Filaments nearly as long as the anthers or longer. Stigmas elliptic or ovate-elliptic. Achene stout, glabrous ribbed. Pappus of many capillary bristles.—About 6 species, North American.—Sum.—fall.

Involucre over 5 mm. thick: achene about 3 mm. long.  
Involucre less than 5 mm. thick: achene about 2 mm. long.

1. *O. grandiflorus*.  
2. *O. Jacksonii*.

1. *O. grandiflorus* (Raf.) Small. Stem 4–15 dm. tall, rough-pubescent: leaf-blades thick, those of the upper stem-leaves elliptic to ovate, 2–13 cm. long, closely pubescent, shallowly toothed or essentially entire: bracts of the involucre pubescent, the outer ovate: disk-corollas 5.5–6.5 mm. long: achene 12–15-ribbed. [*Solidago rigida* authors not L.].—Dry sandy soil and gravelly banks, various provinces N of Coastal Plain, Ga. to Tex., Man., and Md., and extending E to Mass. Nat. of W N. A.—Fall.

2. *O. Jacksonii* (Kuntze) Small. Stem 3–12 dm. tall, glabrous or nearly so below: leaf-blades thinnish, those of the upper stem-leaves elliptic to ovate, 2–9 cm. long, serrulate, somewhat scabrous above: bracts of the involucre glabrous, the outer elliptic-ovate. [*Solidago corymbosa* Ell.].—Dry banks and stony soil, Appalachian Plateau and adj. provinces, Ga. to Ala. and Ohio.

33. **BRACHYCHAETA** T. & G. Perennial herbs, resembling species of *Solidago*. Leaves alternate: blades broad, toothed. Heads numerous, thyrsoid. Involucre narrow, few-flowered: bracts various, the outer ones broad, the inner longer and relatively narrower. Ray-flowers few: corollas with a very slender tube and a small yellow ligule. Disk-corollas with a campanulate throat and a tube nearly as long as the throat: lobes triangular-lanceolate. Anthers about as long as the filaments: appendages slender. Stigmas lanceolate. Achene 8–10-ribbed. Pappus of scale-like bristles shorter than the achene.—One species.

1. *B. sphacelata* (Raf.) Britton. Stem 6–15 dm. tall, pubescent: leaf-blades orbicular-ovate to ovate on the lower part of the stem, ovate to oval or elliptic above: involucre 3.5–4 mm. long. [*B. cordata* T. & G.]—(FALSE GOLDENROD).—Woods, various provinces N of Coastal Plain, Ga. to Ala., Ind., and S. Va.—Sum.—fall.

34. **ASTRANTHIUM** Nutt. Annual or perennial, caulescent herbs. Leaves alternate: blades commonly broadened upward, entire or toothed.

Heads solitary or several terminating branches. Involucre broadly campanulate or hemispheric, many-flowered: bracts in 2 or 3 series, rather broad. Ray-flowers numerous: corollas with a very short tube and a white, pink, purple, or violet ligule. Disk-corollas yellow, with a funnellform throat and a very short tube: lobes deltoid. Anthers longer than the filaments. Stigmas triangular. Achene nerved near the margins. Pappus wanting or obsolete.—About 7 species, in Mexico and SC. United States.

1. *A. integrifolium* (Michx.) Nutt. Stem 0.5–4 dm. tall: leaf-blades spatulate to elliptic, 1–4 cm. long, entire: bracts of the involucre elliptic-lanceolate, 2.5–3 mm. long, or 4 mm. long at maturity: ligules of the ray pale-purple or pale-violet, 6–14 mm. long. [*Bellis integrifolia* Michx.] —(DAISY.)—Low grounds, various provinces N of Coastal Plain, Ala. to Tex., Ark. and Ky.—Spr.—sum.

35. *APHANOSTEPHUS* DC. Annual or biennial, or probably perennial sparingly branched, aster-like herbs. Leaves alternate: blades narrow, some of them toothed or pinnatifid. Heads few, terminating branches. Involucre hemispheric, many-flowered: bracts in few series, rather narrow. Ray-flowers several: corollas with a very short tube and a narrow white, violet, or purple ligule. Disk-corollas yellow, with a cylindric-funnelform throat and a short tube: lobes deltoid. Anthers longer than the filaments. Stigmas obtuse. Achene ribbed. Pappus an entire, toothed, or ciliate crown.—About 5 species, North American.

1. *A. skirrobasis* (DC.) Trelease. Stem 1–4 dm. tall, cinerous-pubescent: leaf-blades spatulate to elliptic or linear, 1.5–6 cm. long, sharply toothed or incised below: larger bracts of the involucre 5–6 mm. long, acuminate.—(WHITE-DAISY.)—Dry soil, various provinces, Tex. to Kans.; also Fla.—Spr.—sum.

36. *BOLTONIA* L'Her. Perennial tall, aster-like herbs. Leaves alternate: blades entire, sessile or decurrent. Heads many, widely paniced. Involucre broadly campanulate to hemispheric, many-flowered: bracts narrow or sometimes partly dilated. Ray-flowers often numerous: corollas with a short tube and narrow ligules. Disk-corollas with a narrowly funnellform throat and short tube: lobes triangular. Anthers as long as the filaments or longer. Achene flattened, broadest above the middle, the margins sometimes winged. Pappus a series of short scales usually accompanied by 2–4 bristles.—About 5 species, North American.

Disk about 4–5 mm. broad at maturity: corolla-tube very short.  
Disk 7–12 mm. broad at maturity: corolla-tube nearly as long  
as the throat.

1. *B. diffusa*.

2. *B. asteroides*.

1. *B. diffusa* Ell. Plant 1–2 m. tall: blades of the upper leaves linear to linear-subulate, 2.5–8 cm. long: outer bracts of the involucre subulate, about 1.5 mm. long, the inner linear, about twice as long: ligules linear-elliptic to spatulate, white or purplish, 5–7 mm. long, white: disk achene about 4–5 mm. wide: corolla 1–1.5 mm. long, the throat 2–3 times longer than the tube: 1.5 mm. long. — (DOLL'S-DAISY.) — Low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Ill., and S. C.—(Mex.)—Fall.

2. *B. asteroides* (L.) L'Her. Plant 1–2 m. tall: blades of the upper leaves oblong to linear, 3–12 cm. long: outer bracts of the involucre linear-lanceolate, 2–3 mm. long, the inner slightly longer: ligules linear, white or pale, 5–6.5 mm. long: disk 7–12 mm. wide: corolla about 2 mm. long, the throat about as long as the tube: achene about 2 mm. long.—Stream-banks, and sandy or gravelly shores, various provinces, Fla. to La., Minn., and Conn.—Sum.—fall.

37. **SERICOCARPUS** Nees. Perennial low, aster-like herbs. Leaves alternate: blades entire or toothed. Heads in corymbs. Involucre campanulate to cylindric, several-flowered: bracts broad, or the inner ones sometimes rather narrow. Ray-flowers several: corollas with a long tube and a narrow, white or pink ligule. Disk-corollas with a narrowly funnelform throat and a long tube: lobes lanceolate. Anthers slightly longer than the filaments or shorter: appendages lanceolate. Achene flattened, 1-nerved. Pappus of numerous scabrous bristles.—Four species as follows.—WHITE-TOPPED ASTERS. RAGGED-ASTERS.

Leaf-blades entire.

Foliage glabrous or nearly so.

Foliage manifestly pubescent.

Bracts of the involucre obtuse, firm: peduncles rigid, stout.

Bracts of the involucre acute, lax: peduncles weak, slender.

Leaf-blades toothed.

1. *S. linifolius*.

2. *S. bifoliatus*.

3. *S. acutisquamosus*.

4. *S. asteroides*.

1. *S. linifolius* (L.) B.S.P. Stem glabrous or nearly so, 2–7 dm. tall: blades of the upper leaves linear, 2–6 cm. long: involucre 4–6 mm. long; inner bracts often crose at the green tips: disk-corollas 4–5 mm. long: ligules 5–6 mm. long: pappus whitish. [*S. solidagineus* Nees.] — Acid, sandy thickets and dry banks, various provinces, Ga. to La., Ohio, and Me.—Sum.—fall.

2. *S. bifoliatus* (Walt.) Porter. Stem 3–7 dm. tall: blades of the upper leaves spatulate to obovate, 1–3 cm. long: involucre about 6 mm. high; inner bracts linear-elliptic: disk-corollas over 6.5 mm. long: anthers longer than the filaments. [*S. tortifolius* Nees.]—Dry pinelands, Coastal Plain and rarely adj. provinces, Fla. to La. and Va.—Sum.—fall, or all year southward.

3. *S. acutisquamosus* (Nash) Small. Similar to *S. bifolius* in habit: blades of the upper leaves elliptic-spatulate, 1–3.5 cm. long: involucre longer than that of *S. bifolius*; inner bracts linear: disk-corollas less than 6.5 mm. long: anthers shorter than the filaments.—Pinelands, Fla.—Sum.

4. *S. asteroides* (L.) B.S.P. Stem pubescent, 3–8 dm. tall: blades of the upper leaves ovate, elliptic-ovate, or lanceolate, 1.5–4 cm. long: involucre 6–9 mm. long; inner bracts broadly linear, rough-edged above: disk-corollas 5–6 mm. long: ligules whitish, 6–8 mm. long: pappus brownish. [*S. conyzoides* (Nees).]—Rocky or sandy, usually dry, woods and thickets, various provinces, Fla. to Miss., Ohio and Me.—Sum.

38. **ASTER** [Tourn.] L.<sup>1</sup> Perennial herbs, various in habit, or rarely annual, occasionally shrubby or spinescent. Leaves alternate: blades broad or narrow, often enlarged and cordate at the base, entire or toothed. Rootstock often horizontal and bearing for several years a subterminal tuft of leaves. Lower, middle and upper cauline leaves often gradually transitional to each other in form, often of dissimilar types. Heads with both tubular and radiate flowers, either corymbed, racemed, or panicled and borne on erect, spreading or secund ultimate branchlets. Involucre hemispheric, campanulate, cylindric, or turbinate: bracts imbricate in several series: the outer usually smaller or shorter than the inner, and somewhat herbaceous or otherwise much modified at or toward the apex. Receptacle flat or convex, alveolate and often delicately fimbriate. Ray-flowers pistillate, with white, pink, purple, blue, or violet ligules. Disk-flowers perfect, consisting of a tubular base (the tube), swollen above into a throat and 5 short lobes: disks typically yellow, usually changing to red, brown, or purple. Achenes columnar or more or less flattened nerved or ribbed. Pappus-bristles usually numerous, slender, in one series or rarely in two series, the tips of the inner ones sometimes thickened.—About 250 species, mostly North American.—**ASTERS.**

Blades of the basal and lower cauline leaves cordate and definitely petioled: those of the upper cauline leaves shorter petioled or even sessile or cordate-clasping.

Blades of the leaves petioled or sessile, not clasping.

Ligules of the ray white or occasionally roseate.

Ligules of the ray violet, purple, or blue.

Radical leaves coarse: the blades larger than those of the cauline: foliage (except in *A. mirabilis*) glandular.

Radical leaves with blades smaller than those of the cauline: foliage not glandular.

Blades of the upper cauline leaves sessile and cordate clasping.

No leaves at once with cordate and definitely petioled blades.

Blades, at least of the lower leaves abruptly narrowed or constricted below the middle, the base clasping.

Plant herbaceous, neither woody nor vine-like.

Plant a woody, trailing or climbing vine.

Blades of the leaves not abruptly narrowed or constricted below the middle, either clasping, sessile or wing-petioled.

Blades of the cauline leaves with cordate or auriculate-clasping bases.

Chief involucre bracts rigid, closely appressed unless at the tip.

Stem glabrous below the inflorescence (sparsely pubescent in No. 46): leaves firm, sleek or subsucculent.

#### VI. CAROLINIANI.

#### VII. LAEVES.

<sup>1</sup> Based on the treatment of the late Edward Sandford Burgess, revised in part for the present work by Edward Johnston Alexander.

Stem and leaves pubescent with short hair.  
 Chief involucrel bracts thin, loosely appressed  
 and at least the upper half spreading.  
 Blades of the cauline leaves gradually narrowed or  
 rounded at the base, but not clasping.  
 Leaves not fleshy or succulent.

Basal and lower cauline leaves not grass-like.  
 Inflorescence paniculate, racemose, or ter-  
 minating elongate branches.

Leaf-blades silky or canescent on both  
 sides, short, entire or nearly so.

Leaf-blades glabrous or pubescent, but  
 not silky or canescent.

Blades of the basal leaves nar-  
 rowed to winged petioles.

None of the leaf-blades petioled.

Inflorescence widely and loosely  
 paniculate, the heads scat-  
 tered and not arranged uni-  
 laterally on the branches.

Involucrel bracts acute or  
 acuminate.

Plants relatively tall,  
 spreading by stolonif-  
 erous rootstocks.

Plants relatively low, not  
 stoloniferous.

Outer involucrel  
 bracts with acu-  
 minate, green tips.

Outer involucrel  
 bracts with obtus-  
 ish or merely acute  
 tips.

Involucrel bracts very ob-  
 tuse, bristle-pointed.

Inflorescence much branched,  
 but the heads in unilaterally  
 racemose arrangement.

Inflorescence in a terminal, umbellike  
 corymb.

Leaf-blades usually entire, linear-lance-  
 olate; thick.

Leaf-blades coarsely toothed, broadly  
 oblanceolate to broadly elliptic, acu-  
 minate; thin.

Basal and lower cauline leaves grass-like.

Leaf-blades entire or sparingly hack-  
 serrate above.

Leaf-blades with several spinuliform  
 teeth, especially near the base.

Leaves fleshy or succulent.

Stem solitary, herbaceous, its base not woody:  
 plant unarmed.

Plant perennial: heads mostly over 12  
 mm. wide.

Plant annual: heads less than 10 mm.  
 wide.

Stems rush-like, several from a woody base:  
 plant spine-armed.

#### I. DIVARICATI

Dominant leaves with long-acuminate blades, the teeth  
 very sharp: inflorescence broadly corymbose.

Blades of the dominant leaves incurved-acuminate, the  
 teeth very salient, curving backward.

Blades of the dominant leaves ovate-lanceolate,  
 those of the upper axile leaves short or not  
 greatly prolonged.

Blades of the dominant leaves more elliptic, larger,  
 darker, those of the upper axiles or some of them  
 greatly prolonged.

Blades of the dominant leaves straight-acuminate, the  
 teeth straight-backed.

Dominant leaves not long-acuminate.

Inflorescence-clusters convex.

Sinus (of cordated leaves) deep, enlarged: leaf-  
 blades elliptic-lanceolate, curvessent-serrate: disk  
 often crimson.

1. *A. divaricatus*.

2. *A. tenebrosus*.

3. *A. stiletiformis*.

4. *A. excavatus*.

Sinus usually absent: leaf-blades ovate-lanceolate, slit-serrate: disk often chestnut color.  
 Inflorescence narrow, irregular or scant.  
 Involucral bracts very broad and short, scale-like.  
 Involucral bracts narrowly linear.  
 Leaf-sinus broad, enlarged: leaf-blades chiefly elliptic-acuminate.  
 Leaf-sinus sharp: leaf-blades ovate-acute.

5. *A. castaneus*.  
 6. *A. chlorolepis*.  
 7. *A. Boykinii*.  
 8. *A. flexilis*.

## II. MACROPHYLLI

Plant not very rough: leaf-blades not very thick: glandular hairs minute-tipped.  
 Blades of the lower leaves serrate; sinus deep, narrow.  
 Blades of the lower leaves coarsely dentate; sinus shallow, broad.  
 Plant extremely rough: leaf-blades very thick: glands broadly capitate.  
 Leaf-sinus strongly developed: involucral bracts neither squarrose nor slender.  
 Sinus usually absent: involucral bracts squarrose.  
 Bracts acute.  
 Bracts obtuse.

9. *A. multiformis*.  
 10. *A. riciniatus*.  
 11. *A. macrophyllus*.  
 12. *A. commixtus*.  
 13. *A. mirabilis*.

## III. HETEROPHYLLI

Leaf-blades entire or chiefly so, thick or firm.  
 Involucre broadly campanulate: bracts mainly linear, thin: leaf-blades dull and scabrous above.  
 Involucre cylindric-campanulate; bracts mainly linear-subulate, rigid: leaf-blades lustrous and smooth above.  
 Leaf-blades serrate or otherwise toothed, at least the lower ones.  
 Leaf-blades not rough, or not rough on both sides, membranous.  
 Involucral bracts linear-obtuse or obtusish (acute in a variety of No. 17).  
 Leaves with smooth firm blades and the chief petioles winged; inflorescence loosely narrow-panicled.  
 Leaves with thin blades rough above and the chief petioles not winged: inflorescence broad panicled.  
 Involucral bracts linear-acute or subulate.  
 Leaf-blades downy-pubescent or glabrous.  
 Plant 6–15 dm. high: blades of the chief leaves ovate-lanceolate, thin, the sinus open: heads compound-racemed.  
 Plant about 3 dm. high: blades of the chief leaves falcate-lanceolate, the sinus obsolescent: heads thyrsoid.  
 Leaf-blades canescent or hispid above, velvety-hispidulous beneath.  
 Leaf-blades rough on both sides, of a spongy crumbling texture.  
 Blades of the chief leaves elliptic-lanceolate, shallow-serrate.  
 Blades of the chief leaves grass-like.

 21. *A. azureus*.  
 22. *A. poaceus*.

## IV. DIVERSIFOLII

Polymorphous leaf-forms present, no one type strongly dominant.  
 Leaves not delicate, pubescent beneath, rough when dry: inflorescence broad, divergently compound.  
 Leaves delicate, firm, rough, with little hair: inflorescence narrowly racemose.  
 Some dominant leaf-form present.  
 Blades of the dominant leaves broad, not greatly elongate.  
 Blades of the dominant leaves tomentulose beneath, ovate-elliptic, thick and rough, diminutive.  
 Blades of the dominant leaves sparse-pubescent beneath, petioled, short-cordate, thinnish.  
 Blades of the dominant leaves elongate.  
 Blades of the dominant leaves triangular-attenuate.  
 Slender plant: leaf-blades chiefly petioled and clasping.

23. *A. undulatus*.  
 24. *A. Proteus*.  
 25. *A. asperifolius*.  
 26. *A. sylvestris*.  
 27. *A. truellius*.

- Robust plant, when fully developed: leaf-blades chiefly sessile.  
 Leaf-bases broad: leaf-axils usually foliose.  
 Leaf-bases narrow: leaves very rough.  
 Blades of the dominant leaves not triangular.  
 Blades of the dominant leaves ovate-elliptic to elongate-lanceolate.  
 Leaf-blades firm, crisp: stem bearing stalked glands: inflorescence irregular, narrow, often clavate in outline.  
 Leaf-blades thinnish: plant without glands: inflorescence somewhat thyrsoïd.  
 Blades of the dominant leaves linear-elliptic with straight sides.  
 Leaf-blades soft, thinnish, many with long strap-like petioles: inflorescence usually racemose.  
 Leaf-blades very rough, thick, usually sessile: inflorescence compound.  
 Plant not glandular: leaves strap-shaped or thong-like.  
 Plant somewhat glandular: leaves grass-like, narrow.

## V. PUNICEI

- Leaf-blades entire.  
 Leaf-blades sharply serrate (except the basal and lower cauline of No. 36).  
 Inflorescence irregularly congested or corymbed: pubescence often scanty.  
 Upper leaves little clasping: bracts of the involucre with linear-elliptic or linear subulate tips.  
 Upper leaves sheathing the axils: bracts of the involucre with deltoid tips.  
 Inflorescence broadly panicle, diffuse, leafy: heads somewhat remote.  
 Leaves contracted into a broad petiolar portion: hair present in lines on the upper stem.  
 Leaves with nearly straight sides, little constricted below.  
 Tubercular-based hair scattered over the stem.  
 No tubercular-based hair on the stem.

## VI. CAROLINIANI

- A woody vine with trailing or climbing stems and branches, flowering the year round.

## VII. LAEVES

- Involucre campanulate.  
 Leaves glabrous except the edges.  
 Involucral bracts elliptic-linear with broad rhomboid or deltoid green tips.  
 Cauline leaf-blades elliptic, oblanceolate, or ovate: inflorescence tending to the racemose panicle.  
 Cauline leaf-blades linear to elongate-lanceolate: inflorescence tending to the corymbose panicle.  
 Involucral bracts linear, their green tips narrowly lanceolate.  
 Cauline leaves linear or narrowly lanceolate.  
 Cauline leaves very narrowly linear: heads very small.  
 Leaves glabrous above, often with minute hair beneath.  
 Leaf-blades entire, short, elliptic, remote.  
 Leaf-blades often coarsely toothed, prolonged, linear in type.  
 Involucre turbinate: leaf-blades scarcely clasping.

## VIII. PATENTES

- Stem low: leaves rough: inflorescence broad.  
 Involucre turbinate-campanulate or turbinate.  
 Heads 3-4 cm. broad, few and scattered: involucral bracts pubescent, thick.  
 Leaf-blades thinnish: heads 6-8 mm. high.  
 Leaf-blades very thick: heads 10-12 mm. high.  
 Heads about 2 cm. broad, numerous, crowded: involucral bracts merely ciliate, thin.

28. *A. corrigiatus*.  
 29. *A. triangularis*.

30. *A. claviger*.

31. *A. gracilescens*.

32. *A. linguiformis*.

33. *A. loriformis*.

34. *A. Mohrii*.

35. *A. puniceus*.

36. *A. Elliottii*.

37. *A. conduplicatus*.

38. *A. prenanthoides*.

35. *A. puniceus*.

58. *A. novi-belgii*.

39. *A. carolinianus*.

40. *A. laevis*.

41. *A. concinnus*.

42. *A. purpuratus*.

43. *A. attenuatus*.

44. *A. ursinus*.

45. *A. falcidens*.

46. *A. turbinellus*.

47. *A. continuus*.

48. *A. georgianus*.

49. *A. fontinalis*.

Involucre campanulate;  
 Bracts linear-elliptic: branches divaricate.  
 Bracts narrow-linear or linear: branches diffuse.  
 Stem tall: leaves soft pubescent beneath: inflorescence narrow.

## IX. SQUARROSI

Heads less than 2.5 cm. broad.  
 Stem closely set with small scale-like leaves: involucre bracts but slightly spreading.  
 Leaves erect and adnate to the stem and its branches.  
 Leaves more or less reflexed, not adnate to the stem.  
 Cauline leaves not markedly, if at all scale-like, not closely set: involucre bracts very squarrose.  
 Heads over 2.5 cm. broad.  
 Inflorescence widely branched: stem leaves reflexed, not elongate, very small.  
 Inflorescence compact: stem-leaves not reflexed, elongate.  
 Leaves soft-pubescent: broadly clasping: plant little branched below the inflorescence.  
 Leaves not soft-pubescent: but slightly clasping: plant much branched.  
 Stem rigid: leaves lanceolate, elliptic-lanceolate, or linear-lanceolate.  
 Stem weak: leaves bayonet-like, narrowly linear.

50. *A. patens*.  
 51. *A. tenuicaulis*.  
 52. *A. phlogifolius*.

53. *A. adnatus*.  
 54. *A. Walteri*.  
 55. *A. oblongifolius*.

56. *A. grandiflorus*.

57. *A. novae-angliae*.

58. *A. novi-belgii*.  
 59. *A. elodes*.

## X. SERICEI

Heads corymbose-paniculate: outer bracts of the involucre elliptic, ovate-lanceolate, or lanceolate: achene glabrous.  
 Heads virgately racemed: bracts linear-elliptic to linear-lanceolate: achene pubescent.  
 Involucre bracts erect.  
 Cauline leaves with elliptic or narrowly elliptic blades.  
 Cauline leaves with linear-elliptic to linear-lanceolate blades.  
 Involucre bracts loosely spreading or recurved.

60. *A. sericeus*.

61. *A. concolor*.

62. *A. simulatus*.  
 63. *A. plumosus*.

## XI. SPECTABILES

Upper cauline leaves with broad, chiefly ovate, blades.  
 Upper cauline leaves with narrow, narrowly elliptic, varying to oblanceolate, lanceolate, or linear blades.  
 Involucre hemispheric, campanulate, or turbinate-hemispheric.  
 Tips of the involucre bracts foliaceous.  
 Tips of the involucre bracts merely spreading or squarrose.  
 Bracts of the involucre glandular.  
 Involucre bracts mucronate or obtuse: cauline leaves numerous.  
 Involucre bracts tapering to acutish tips: cauline leaves few.  
 Bracts of the involucre glabrous or merely ciliate.  
 Involucre bracts mucronate.  
 Involucre bracts acute.  
 Stem rigid: leaves narrowly elliptic-lanceolate.  
 Stem weak: leaves narrowly linear.  
 Involucre narrowly turbinate.

64. *A. Curtisii*.

65. *A. Smallii*.

66. *A. spectabilis*.

67. *A. surculosus*.

58. *A. novi-belgii*.  
 59. *A. elodes*.  
 68. *A. gracilis*.

## XII. PANICULATI

Heads over 16 mm. broad.  
 Ligules of the ray white, often fading pink or purplish.  
 Leaves glabrous or nearly so.  
 Leaves and stem pubescent.  
 Ligules of the ray lavender or violet.  
 Rameal leaves with elliptic, rather broad blades: inflorescence crowded.  
 Rameal leaves with narrowly linear to subulate blades: inflorescence widely branched, the heads usually solitary.  
 Bracts of the involucre obtuse.  
 Bracts of the involucre acute.

69. *A. Lamarckianus*.  
 70. *A. missouriensis*.

71. *A. salicifolius*.

46. *A. turbinellus*.  
 72. *A. Simmondsii*.

Heads less than 16 mm. broad.

Ligules of the ray white, often fading pink or purplish.

Cauline leaves with oval or elliptic blades.

Cauline leaves with narrow blades.

Heads abundant, closely paniced.

Heads remotely paniced or sparse.

Ligules of this ray lavender or violet.

73. *A. spatelliformis*.

74. *A. Tradescanti*.

75. *A. agrostifolius*.

76. *A. pinifolius*.

### XIII. RAMOSISSIMI

Ligules of the ray white, sometimes becoming purplish.

Heads numerous, 8–15 mm. broad.

Upper cauline leaves with linear-subulate blades: plant glabrous or nearly so.

Upper cauline leaves with linear to narrowly elliptic blades: plant more or less villose.

Heads more scattered, 12–18 mm. broad.

Branches divaricate, rigid, prolonged: rameals subulate.

Branches often upturned or subcorymbose: rameals flat, linear.

Ligules of the ray violet, purple or reddish (rarely white).

77. *A. ramosissimus*.

78. *A. pilosus*.

79. *A. juniperinus*.

80. *A. Faxonii*.

81. *A. Priceae*.

### XIV. DUMOSI

Rameal leaves merely firm: most peduncles not over 3 cm. long.

Rameal leaves rigid, very conspicuous but minute: peduncles often 10 cm. or more long.

Rameal leaves spreading or somewhat recurved: blades obtuse.

Rameal leaves erect and usually appressed; blades acute.

82. *A. dumosus*.

83. *A. coridifolius*.

84. *A. gracilipes*.

### XV. MULTIFLORI

A much branched low-growing plant, with very numerous white-liguled heads of flowers.

85. *A. ericoides*.

### XVI. DIFFUSI

Cauline leaves with linear to linear-lanceolate, often minutely hack-toothed blades.

Involucral bracts very short, not exceeding the achenes.

Involucral bracts exceeding the achenes.

Plant sparsely branched, and with few heads.

Plant profusely branched: heads very numerous.

Cauline leaves with elliptic or lanceolate, more or less dentate or serrulate blades.

Stem and branches sparingly pubescent or glabrate.

Stem and branches villous, as also the midrib of the leaf-blades beneath.

86. *A. brachypholis*.

87. *A. racemosus*.

88. *A. vimineus*.

89. *A. lateriflorus*.

90. *A. hirsuticaulis*.

### XVII. PTARMICOIDES

Plant with narrow, entire leaf-blades and a flat-topped corymbose inflorescence.

91. *A. ptarmicoides*.

### XVIII. ACUMINATI

Gregarious plant with thin, deeply toothed leaf-blades, appearing as if whorled, and a somewhat corymbose-paniculate inflorescence.

92. *A. acuminatus*.

### XIX. PALUDOSI

Involucral bracts long-ciliate and pubescent: inflorescence branches densely pubescent.

Involucral bracts glabrous, the margins merely scabrosciliate: inflorescence-branches sparingly pubescent if at all so.

Outer involucral bracts linear to narrowly elliptic but not acuminate: leaf-blades linear to narrowly elliptic.

Plant from a woody, corm-like rootstock, not stoloniferous.

Outer involucral bracts usually longer than or at least as long as the inner bracts, elongate linear-lanceolate, only the innermost abruptly acute: bracts numerous.

Outer involucral bracts somewhat shorter than the inner, all bracts except the outermost abruptly acute: bracts few.

Plant from a stoloniferous, wiry or woody rootstock. Outer involucral bracts narrowly linear-acuminate: leaf-blades nearly filiform from a triangular base.

93. *A. paludosus*.

94. *A. pedionomus*.

95. *A. Gattereri*.

96. *A. hemisphericus*.

97. *A. verutifolius*.

## XX. ERYNGIIFOLII

Heads sessile and subremote in the upper axils.  
Heads terminal, solitary or clustered.

98. *A. spinulosus*.  
99. *A. eryngiifolius*.

## XXI. TENUIFOLII

Ligules of the ray 5–7 mm. long: heads 4–6 mm. high.  
Ligules of the ray 10–20 mm. long: heads 6–8 mm. high.  
Involucral bracts broad: ligules of the ray violet:  
leaves chiefly basal.  
Involucral bracts linear: ligules of the ray pale-violet  
or nearly white: leaves scattered.

100. *A. Bracei*.  
101. *A. Chapmani*.  
102. *A. tenuifolius*.

## XXII. SUBULATI

Involucre campanulate to broadly turbinate.  
Inner bracts of the involucre 5–6 mm. long, acuminate:  
rays fewer than the disk flowers.  
Inner bracts of the involucre 3–5 mm. long, acute or  
short acuminate: rays more numerous than the disk  
flowers.  
Involucre cylindric to narrowly turbinate.

103. *A. exilis*.  
104. *A. inconspicuus*.  
105. *A. subulatus*.

## XXIII. SPINOSI

A rush-like, much branched plant with scattered, white-  
rayed heads of flowers, the stem and branches spinescent.

106. *A. spinosus*.

1. *A. divaricatus* L. Stems tufted, 4–6 dm. tall, flexuous, brittle, terete, glabrate: leaf-blades thin, smoothish, slender-petioled, ovate-lanceolate, closely and saliently dentate with sharp teeth, in-curved-acuminate, the basal sinus moderately large, broad and deep: leaves of the inflorescence (*bracteals*) typically small, sessile, short, ovate-acute to short-oval, nearly entire: corymb broad, flattish, repeatedly and widely forked, the slender branches long, divergent: heads 18–25 mm. broad: ray-flowers chiefly 6–9; ligules white, or rarely roseate or slightly crimson: young involucre short-cylindric; bracts broad, ciliate, the rounded or subtruncate tips with a broad green spot: disk turning reddish brown.—Rich woodlands and thickets, in rather dry soil, various provinces, Ga. to Ala., Man., and N. S.—Fall.

2. *A. tenebrosus* Burgess. Stem glabrate, striate, wide-branched: leaf-blades large, very thin and smooth, broadly elliptic and conspicuously cut with coarse remote acuminate curvesscent teeth, then abruptly long-acuminate and entire; most leaves with a broad rounded sinus and slender petiole; those of the inflorescence prolonged, lanceolate, subentire and sessile: inflorescence broadly corymbose, often proliferously branched: rays usually 9–12: disk pale-yellow, turning purplish-brown: outer bracts green, acute, elongate-triangular, the others linear, obtusish.—Moist, shaded places, Blue Ridge and more N provinces, N. C. to Ohio and Mass.—Late sum.—fall.—Resembles *A. divaricatus*, but differs in being larger and thinner in all its parts, and in having a different leaf-form.

3. *A. stilettiformis* Burgess. Stem greenish, slender, weak and often decumbent: predominant leaf-blades deep-green, often roughened above, linear-elliptic and long-acuminate, with subtruncate base and short petioles, and closely set with conspicuous sharp straight-backed teeth; some lower leaves broader, ovate-acuminate with moderate sinus and with double-curved or couchant teeth; axile leaves divaricate, straight-tapered from a sessile truncate base, everywhere closely slit-toothed, suggesting a barbed stiletto: inflorescence

remotely diffused, but with short pedicels: bracts lingual, nearly uniform, green or mostly so: rays often 7; ligules sometimes reddening at the tips: disk turning brownish-red.—Shaded banks, Blue Ridge and more N provinces, S. C. to Tenn. and Mass.—Fall.—Differs from *A. divaricatus*, especially in stem, leaf-form, and bracts.

4. *A. excavatus* Burgess. Stem as in *A. divaricatus* L.: leaf-blades thin, smooth, all nearly alike, elliptic-lanceolate with the rounded base abruptly excavated into a deep narrow sinus; their margins continuously low-serrate with curvesscent teeth; petioles very short and slender, shorter than the leaf-breadth, replaced by short broad wings at the principal axils; the upper axils often clasped by divaricate triangular-linear bracteals: heads forming convex clusters borne on long suberect branches or reduced to a few distant enlarged heads: bracts ciliate, smooth-backed, pale and thin, short-oblong and obtuse on some subsolitary heads, narrow and acutish on the smaller clustered heads, the inner attenuate and without green tips: ligules of the ray white, or sometimes reddened: disk broad, turning usually purplish-crimson.—Mountain or hillside woods, Blue Ridge and more N provinces, Ga. to N. Y.—Early fall.—Resembles *A. divaricatus*, but the narrower, less-attenuate, more uniform leaf-blades differ in outline, sinus, and teeth.

5. *A. castaneus* Burgess. Stem glabrate, terete, graceful and wandlike, reddish-brown or greenish, with about 12 delicate straight darker striae, and becoming sinuous in the inflorescence: predominant leaf-blades dull-green, remote, very thin, of a dense and hard texture, minutely granular-roughened when dry, ovate-lanceolate, closely slit-serrate, often unequally decurrent upon the short slender petiole; the lowest leaves much shorter, ovate-acuminate, coarsely serrate and with a moderate sinus; rameal leaves lanceolate-attenuate or often all crescent-like and decurved, sessile by a short cuneate base: inflorescence nearly naked, narrow, composed of several upcurved slender unequal branches bearing close convex clusters, all in flower at once and very short-lived: pedicels long, filiform, upcurved, sometimes bearing small circular bracteals or discules: bracts narrow, linear-obtuse, pale, with bright-green tips: rays often 9; ligules linear, snow-white, excessively thin, and soon pendulous: disk soon turning to rose-brown, sienna, or chestnut-color.—Clayey spots in swamps, various provinces N of Coastal Plain, N. C. to Ohio, also SE N. Y. and Conn.—Early fall.—Resembles *A. divaricatus*; differs in all the above characters, especially in the leaves, bracts, and inflorescence.

6. *A. chlorolepis* Burgess. Stem strong, glabrate, brownish, terete below, angulate-striate above: leaf-blades large, smooth, very thin, brownish-green, pale beneath, ovate-acute, very coarsely serrate with outflung teeth; sinus deep and sharp; petioles short, slender: axile leaves also large, elliptic-lanceolate, serrate with long forward-directed teeth, the upper ones sessile: inflorescence loose and irregular: heads large, long-peduncled, inclined to be widely separated: ligules of the ray nearly twice the length of the involucre: bracts quite uniform, thick, broad, short and scale-like, with very little ciliation or hair, chiefly golden brown with a short dark-green rounded tip: disk turning crimson.—Mt. woods, Blue Ridge and more N provinces, N. C. to W. Va. and N. Y.—Fall.—Resembles *A. tenebrosus* in the large heads, leaves, teeth, and bracts; differs especially in having the sinus sharp and the bracts rounded, and in the absence and greatly prolonged entire bracteals.

7. *A. Boykinii* Burgess. Stem slender, greenish and glabrate, much flexed; leaf-blades ovate to elliptic-acuminate, with broad enlarged sinus, set with strong and somewhat outflung teeth; petioles slender: inflorescence lax and irregular, of short branches given off at a wide angle, often continued in clusters among the lower axils; the upper axils often conspicuous with ovate

or subcircular sessile bracteals: disk turning reddish brown: ligules of the ray shorter than in its ally, *A. divaricatus* L., from which it differs especially in its more straggling habit, narrow irregular inflorescence, and less-coarsely toothed less prolonged leaves.—Mt. slopes, Blue Ridge, Ga.—Sum.

8. *A. flexilis* Burgess. Stem low, slender, smooth, and virgate: leaf-blades small, short, thin, dull, dark-green, ovate-acute with the broad double-rounded base bisected by a deep sharp sinus; margins crenate-serrate with low obscure teeth; petioles short: inflorescence scanty, tuft-like, or of a few slim-peduncled heads: bracts narrowly linear, obtuse, quite uniform: plant almost destitute of hair (under lens); otherwise much as *A. divaricatus* L.—Mt. woods, Blue Ridge, Ga.—Sum.—Differs from *A. Boykinii* (with which it grows), especially in its smaller, shorter dull leaf-blades, the sharp sinus, crenate margins, and the obtuse bracts.

9. *A. multiformis* Burgess. Stem 3–6 dm. high, minutely glandular, erect, slender, terete, or angular-striate in drying: radical leaves usually 2, their blades large, cordate-oblong; cauline leaves of several forms, their blades sharply serrate, rough above, minutely puberulent beneath, those of the lower ones ovate, acuminate, usually with a narrow sinus, those of the upper oval to ovate-lanceolate, petioled, the uppermost elliptic-lanceolate, serrulate, sessile or nearly so: corymb small, its branches upwardly directed: heads 30–40 mm. broad: ray-flowers about 13: ligules rounded and refuse at the apex: bracts green: inflorescence-glands few, almost hidden by the minutely strigose pubescence of the peduncles.—Moist, shaded places, various provinces N of Coastal Plain, N. C. to Pa. and Me.—Sum.—fall.—Resembles *A. macrophyllus*; but its leaves thinner, narrower, more polymorphous, with narrower sinus, and much less harsh; glands fewer, smaller, pale, less continuous down the stem: inflorescence more level-topped, obconic when past: rays bluer, though fading out early.

10. *A. riciniatus* Burgess. Stem smooth, red, terete, often 3 dm. high: radical leaves usually two, unequal; blades deltoid-cordate or ovate-cordate, with long low curvesscent or crenate teeth; basal leaf smaller, the blade orbicular-ovate, without sinus; lower cauline leaves ovate in type, with slight broad open sinus; the others lanceolate or elliptic, with sessile tapered base; leaf-margins dentate below, becoming sharp-serrulate above; petioles slender or with narrow strap-like wings: inflorescence a small loose terminal tuft, with slender ascending pedicels: bracts uniform, lingual: ligules of the ray rose-purplish and then transiently violet, soon turning whitish, linear-biacuminate.—Moist mountain woods, Blue Ridge, N. C.—Late sum.—Plant very smooth and pale; much purplish-red occurs on stem and veins and especially along the bracts: glandular-pubescence very short, with small capitate glands, continuing down the stem to the base; strigose pubescence discoverable by lens on the upper leaves. Resembles *A. multiformis*, but the whole plant smoother and paler, with more red and less violet; leaves smaller, shorter, and often dentate; bracts narrower and more uniform; its colors neither sharp nor dull, but as if seen through a veil.

11. *A. macrophyllus* L. Stem 6–9 dm. high, reddened, angular: radical leaves developed in large colonies, usually 3 to each rootstock, larger and coarser than the similarly shaped lower cauline leaves (which are developed a subsequent year from the same rootstock); blades broad, cordate with a large irregular sinus, rough above, harsh, thick, the teeth broad, curved, somewhat crenate: upper stem-leaves with oblong blades and short broadly winged petioles, those of the uppermost sessile, acute: inflorescence strigose and glandular, broadly corymbose, irregular: heads 15–30 mm. broad: peduncles short, rigid, thickish: ray-flowers about 12–16; ligules 10–14 mm. long, chiefly lavender, sometimes violet, or rarely pale: bracts conspicuously green-tipped, the outer acute, the inner elliptic, obtuse: disk turning reddish-brown.—Moderately dry, sterile

soil, in shaded places, various provinces, rarely Coastal Plain, N. C. to Minn. and N. S.—Sum.

12. *A. commixtus* (Nees) Kuntze. Stem 5–6 dm. high, rather robust, glandular-pubescent over the upper half and strigose above: leaf-blades rough, thick, dull-green, paler beneath, ovate-acute in type, low-serrate or with curvescens teeth, and with slender petioles; only the basal leaves, if any, slightly cordate: upper leaves diminished, finally lanceolate and sessile; bracteals oval, small and few: inflorescence loosely corymbose, with long-ascending pedicels: bracts narrow and acute or subulate, ciliate and minutely puberulent, the apex squarrosely recurved: ligules of the ray pale-violet becoming white: disk becoming copper-brown.—Dry woods, Appalachian provinces, Ga. and Ala.—Late sum.—fall.—From its congeners *A. mirabilis* and the northern *A. Herveyi*, this is distinguished by the long acumination of its squarrose bracts; and from *A. mirabilis* by its capitate glands.

13. *A. mirabilis* T. & G. Stem 3–7 dm. tall, sparingly branched above, manifestly pubescent, the branches and especially the branchlets closely and finely pubescent: leaves various, the basal and lower cauline little known, the upper cauline rather remote; blades ovate to oblong-ovate, 2.5–9 cm. long, or those on the branchlets smaller, mostly acute, firm, serrate with appressed suberentate teeth, mainly sessile, rough-pubescent, with appressed scattered hairs, those of the upper surface fewer, shorter, often spinescent: heads solitary or few in terminal clusters: involucre 8–10 mm. high; bracts firm, linear-elliptic to linear, pubescent without and ciliate, the recurved herbaceous broadly obtuse tips pubescent on both sides: ray-flowers about 20; ligules violet, 1.5–3 cm. long: achene about 3.5 mm. long, glabrous or nearly so, shorter than the tawny pappus whose inner bristles are thickened at the apex.—Near Columbia on the line between the Piedmont and Coastal Plain, S. C.—Fall.—Resembles *A. multiformis* Burgess, but the bracts squarrose and leaves hispidulous above; cordation seems wanting but will probably yet be found on some basal leaves.

14. *A. Shortii* Hook. Stem 6–12 dm. high, roughish or smooth, slender, paniculately branched above: leaf-blades thick, glabrous or nearly so above, finely and sparingly pubescent beneath; those of the basal and lower cauline leaves ovate or ovate-lanceolate, cordate, rounded or even acuminate at the base, often wholly entire, 5–15 cm. long, dull and scabrous above, borne on slender naked petioles; those of the upper cauline leaves lanceolate, entire, sessile or with short petiole-like bases, not cordate, those of the branches small and scale-like: heads numerous, 25–30 mm. broad: involucre broadly campanulate: bracts mainly linear, acute, puberulent, their green tips appressed: ray-flowers 10–15; ligules linear, violet, 10–12 mm. long: pappus tawny.—Banks and edges of woods, various provinces N of Coastal Plain, Ga. to Ala., Tenn., Ill., and Pa.—Fall.

15. *A. Camptosorus* Small. Stem 4–8 dm. tall, simple and glabrous below the inflorescence, slightly flexuous: leaf-blades lanceolate, attenuate, 6–16 cm. long, resembling those of *Camptosorus rhizophyllus*, entire, undulate and sometimes crisped, dark-green, smooth and lustrous above, paler and hispidulous beneath, those of the lower cauline leaves deeply cordate at the rounded auricled base, slender-petioled, those of the upper cauline subcordate or truncate at the base: heads relatively few, 25–30 mm. broad: peduncles minutely scaly, scabrous-pubescent: involucre cylindric-campanulate and more or less constricted at the middle, or turbinate when dry; bracts mainly linear-subulate, incurved, the middle and the acute tip deep-green: ray-flowers numerous; ligules deep-purple, about 1 cm. long.—Open woods, Coastal Plain and adj. provinces, Ga. to Ala. (Miss.)? and Tenn.—Fall.—Resembles *A. Shortii*, but leaf-blades narrower, darker, and shining.

16. *A. Lowricanus* Porter. Stem 3–12 dm. tall, glabrous or nearly so throughout, branched: leaf-blades thickish, firm, a little succulent, those of the basal leaves slender-petioled, ovate to ovate-lanceolate, cordate, acute or obtusish, serrate, 5–15 cm. long, those of the cauline leaves ovate to elliptic, often cordate, contracted into winged petioles, the uppermost lanceolate: heads usually not very numerous, 15–25 mm. broad, loosely panicle: involucre turbinate; bracts obtuse or obtusish, appressed: ray-flowers 12–20; ligules light-blue, 6–8 mm. long, but variable in length.—Woods, various provinces N of Coastal Plain, Ala. to Ky., Ia., Conn., and N. C.—Fall.—Resembles *A. cordifolius*, but leaf-blades smooth and glabrous, more wing-petioled, and inflorescence less pubescent.

17. *A. cordifolius* L. Stem 3–15 dm. high, glabrous or nearly so, much-branched and bushy: leaf-blades thin, rough mainly above, pubescent, sharply serrate, acuminate, those of the basal and lower cauline leaves slender-petioled, broadly ovate-cordate, 5–12 cm. long, those of the upper cauline leaves short-petioled or sessile, ovate or lanceolate: heads very numerous, small, 12–18 mm. broad, handsome: involucre turbinate to cylindric; bracts elliptic-linear, obtuse or obtusish, green-tipped, appressed: ray-flowers 10–20; ligules 6–8 mm. long, blue or violet, sometimes pale, rarely white: pappus whitish.—Rich woods and thickets, various provinces, rarely Coastal Plain, Ga. to Miss., Minn., and N. B.—Late sum.—wint.—*A. cordifolius albearius*, ranging from N. C. and Tenn. to Mass., has the thin leaf-blades usually smoothish, cordate, triangular-lanceolate or broader: inflorescence dense, thyrsoid, not leafy, in form resembling that of the lilac: bracts linear, acute: heads medium-sized: ligules blue.

18. *A. sagittifolius* Willd. Stem rather slender, 6–15 dm. high, strict, glabrous, or sparingly pubescent above, the inflorescence tall and paniculate with ascending branches: leaf-blades thin, glabrous above or but slightly roughened, usually glabrate beneath, those of the basal and lower leaves ovate-lanceolate to lanceolate, with cordate or rarely sagittate base, sharply serrate, acuminate, 7–15 cm. long, with slender naked or narrowly margined petioles; blades of the upper cauline leaves lanceolate, sessile, or on short and usually margined petioles, serrate or entire, those of the branches very much smaller, linear-subulate: heads 16–20 mm. broad, numerous, crowded, racemose: involucre turbinate; bracts linear-subulate, glabrous or nearly so, their tips green and slightly spreading: ray-flowers 10–15; ligules light-blue or purplish, 6–8 mm. long: pappus whitish.—Dry soil, various provinces N of Coastal Plain, Ala. to Miss., Kans., N. D., N. B., and N. C.—Late sum.—fall.—Resembles *A. cordifolius* L.; but its bracts narrower, subulate-acuminate, and its inflorescence almost without leafiness, the axile leaves being reduced, narrowed and stringy rather than foliaceous.—*A. sagittifolius dissitiflorus*, ranging from Fla. to Miss., Okla., and N. Y., differs from the typical form in its broader looser pyramidal inflorescence, its somewhat larger and longer-peduncled heads, and less serrate leaf-blades none of which may be cordate.

19. *A. plumarius* Burgess. Plant about 3 dm. high, chiefly composed of the dense plume-like violet inflorescence: stem smooth, zigzag: leaf-blades very smooth and firm, thickish, chiefly lanceolate-acuminate and slit-serrate, inclined to be strongly falcate at apex and unequal at the slightly cordate broadish base, measuring 7 x 1.5 cm. or less; veins strongly incurved; petioles narrow-margined; lower axile leaves conspicuous, but rapidly diminished, soon becoming narrowly falcate-lanceolate and entire, sessile by a taper subcuneate base: inflorescence otherwise naked, ovate-lanceolate in outline: bracts narrow, acute, their distinct enlarged green tips chiefly spatulate.—Mountain tops, chiefly on balds at 4,800–5,000 ft., Blue Ridge, N. C.—Fall.—Resembles a dwarf *A. sagittifolius*, but differs in leaves, bract-tips, and absence of bracteals.

20. *A. trigonicus* Burgess. Plant profusely branched, with rigid glabrate brownish stems and long flagellate ascending branches, which are closely short-branched or are spiciform and beset with small remotish subsessile heads: stem 8 dm. high or less: leaf-blades thick and heavy, somewhat canescent or hispid above, velvety-hispidulous below; leaf-form elongate triangular; the truncate base slightly rounded at the corners, and sometimes a little subcordate; leaf-blades 3 x 1 cm. or more, acute or obtusish, the sides straight, serrate or crenate; petiole short, forming a narrow cuneate wing: rameals stiff, very numerous, overlapping and appressed, linear-elliptic: heads small, hardly 2 cm. broad: bracts linear-acute, the green tip lanceolate.—Plains and prairies, various provinces, Ala. to Tex. and Kans.—Fall.

21. *A. azureus* Lindl. Stem 3–12 dm. high, slender, stiff, rough, with numerous ascending or patent branches: leaf-blades thick, of a peculiar crusty texture when dry, scabrous on both sides, those of the basal and lower cauline leaves cordate, ovate to elliptic-lanceolate in type, shallow-serrate, usually acute, 5–15 cm. long, with slender often pubescent petioles; those of the upper cauline leaves with short petiole-like bases or sessile, lanceolate or linear, entire; those of the branches reduced to small appressed scales: heads numerous, 20–25 mm. broad: involucre turbinate; bracts glabrous, linear-oblong, abruptly acute, imbricate, their broad sharp green tips appressed: ray-flowers 10–20; ligules bright-blue, 6–8 mm. long: pappus tawny.—Prairies and borders of woods, various provinces, rarely Coastal Plain, Ga. to Tex., Kans., Minn., and N. Y.—Sum.—fall.—Resembles *A. undulatus* L.; but leaves hispidulous on both surfaces: flowers smaller; rays darker and bluer; pubescence scanty.—*A. azureus scabrior*, ranging from La. to Mo., Minn., and Ont., has an extremely rough stem with more erect branches and principal leaves with elliptic-lanceolate, entire, long-petioled, noncordate blades.

22. *A. poaceus* Burgess. Stem diffusely and repeatedly much-branched, 8 dm. high or less: leaves very rough and stiff, of grass-like form; chief leaf-blades linear-elongate or falcate, often 13 cm. long, 0.5 cm. in uniform breadth, usually also with a narrow-margined petiole of 2–5 cm., apt to be erect, and with stout papillose-based bristles; radicals elliptic, measuring 8 x 1 cm. or less: inflorescence irregular, on very long and straggling branches, which are often for 1.5 to 3 dm. clothed with minute subulate sub-appressed bractlets: heads small, little over 1 cm. broad: bracts of the involucre linear, with long sharp tips.—Plains and prairies, various provinces, Ala. to Tex., Okla., and Mo.—Sum.—fall.—Represents the extreme of attenuation among the kindred of *A. azureus*.

23. *A. undulatus* L. Stem stiff, 3–10 dm. high, closely rough-pubescent, divaricately branched above: leaf-blades usually thick, rough on both sides when dry, pubescent beneath, dentate, undulate or entire, acute or acuminate, those of the radical leaves small, orbicular to ovate, soft-downy; the lower cauline leaves ovate, with cordate base, 5–12 cm. long, the naked petioles expanding into a clasping base, at least in some leaves; middle cauline leaves similar, lanceolate or elliptic; upper cauline leaves sessile or clasping, chiefly lance-elliptic; branch-leaves subulate, small and suddenly reduced: heads numerous, racemose and somewhat secund on the spreading branches, 16–20 mm. broad: involucre broadly turbinate: bracts of the involucre linear-elliptic, slightly pubescent, acute or acutish, their broad green tips appressed: ray-flowers 8–15; ligules usually pale-violet, 6–10 mm. long: pappus whitish.—Dry soil, various provinces, Fla. to Miss., Ark., Ont., and N. B.—*A. Baldwinii* T. & G., based on the upper part of a specimen of one of the undulatus group, cannot definitely be placed under any species on account of the absence of lower leaves, so that the name is best dropped from this treatment.

24. *A. Proteus* Burgess. Plant small, racemose, with many cordate leaves, of firm roughish texture but with little hair: stem slender, apt to be glabrate, and 3 dm. high, sometimes 7 dm., virgate and little branched, but sometimes forking near the base: leaves somewhat remote; blades delicate, polymorphous, not thick or thin; radicals numerous, resembling violet leaves, 4.5 x 2.5 cm. or less, cordate-ovate, almost acute, finely suberenate, often nodding on their prolonged and very slender petioles: cauline leaves tend to assume about 4 types; the first, or basal, all similar to the radical, but with straighter sides, narrowly cordate-triangular and acutish, minutely serrulate, soon becoming entire; second form, triangular-lanceolate, sloping into a distinct winged petiole; third, narrowly linear or lanceolate, sessile by a short broad taper base; fourth, elliptic-acute, sessile by a broad base or with very short broad wing, numerous, much-reduced and disappearing among the middle axils: inflorescence nearly nude, a simple open raceme with spreading heads, or each head replaced by a racemose subsecund branch: ligules of the ray violet: disks not so dark as in related species: bracts linear, briefly acuminate, closely imbricate, the green tips conspicuous, narrow diamond-form or narrow lanceolate.—Dry ground, Coastal Plain, Fla. to Miss. and N. C.—Sum.—fall.

25. *A. asperifolius* Burgess. Plant small, racemose, minutely tomentulose throughout, very rough and heavy in texture: stem often but 3 dm. high: leaves subcoriaceous; blades hispid, subentire, obtuse, ovate-elliptic and longer than their short petioles; rameal leaves minute, adnate, subulate-filiform; radical leaves and chief caulines sometimes subcordate; petioles slender, naked or narrowly margined; amplexicaul dilation absent or rare: inflorescence a loose simple or compound naked raceme, or several racemes which may become more short-peduncled and leafy: heads smaller than in *A. undulatus*: bracts of the involucre fewer, slightly pubescent, appressed, linear-elliptic, acute, with distinct rhomboid green tips. [*A. asperulus* T. & G., not Wall.]—Dry or sandy soil, Coastal Plain, Fla. to La. and S. C.—Fall.—The most hispid-pubescent and rounded-leaved of the southern correlatives of *A. undulatus*.

26. *A. sylvestris* Burgess. Stem slender, scabrous, erect, pale-green, usually 4 dm. high, minutely pubescent: leaves resembling *A. undulatus*, but blades broader, shorter, thinner, deeper-green, more uniformly petioled; predominant leaf-form broadly short-cordate, acute, with rounded basal lobes, deep or excavated sinus, broadly crenate or entire margin: petioles narrow, long and numerous, dilated at the base, seldom otherwise winged: upper leaves elliptic-acute, soon sessile; rameals uniform and spreading as in *A. undulatus*, oval to linear-elliptic; radicals small, orbicular, short-petioled; pilose and webby hair present on the leaves beneath but not velvety: inflorescence irregularly spreading or ascending, of long racemose branches: heads rather few: pedicels distinct, often 3 cm. long: ligules of the ray violet: bracts of the involucre linear, triangular-acute at apex, with large and broad rhomboid green tips.—Open woodlands, various provinces N of Coastal Plain, S. C. to Ala. and N. Y.—Fall.

27. *A. truellius* Burgess. Plant small, erect, with little hair: stem erect, strong but slender, rough: leaves subentire 5 x 2 cm., thickish, firm, rough, typically triangular-lanceolate with sides straight-tapered from the prominently shouldered truncate or cordate base, in form suggesting a mason's trowel: plant remarkable for its numerous short narrow petioles with large basal dilation, and above these, its strap-like petioles with slight basal dilation; radicals cordate-orbicular, crenate, somewhat velvety; axiles often deflexed, narrow-ovate; rameals spreading: ligules of the ray short, purplish-blue: disks soon reddish-brown: bract-tips diamond-shaped, broad and bright-green.—Sandy thickets, various provinces, rarely Coastal Plain, Ga. to Ala., Ky., and Vt.—Fall.

28. *A. corrigiatus* Burgess. Plant tall, robust, rough, with little hair, with predominantly narrow spearhead-shaped much-ruffled sessile leaves, foliose in the

axils, and with long and high inflorescence, small blue-violet heads and lozenge-tipped bracts: stem about 12 dm. high, or more, brown, terete-striate, rough, with short scattered strigose hair above: leaves tending to be narrowly lanceolate and broad-based, slanting straight both ways from near the base, tending to the form of an acute narrow spearhead, about 7 or 12 x 2 cm., very slowly diminished through the inflorescence; radicals small, short and broad, somewhat cordate-oval; a very few lower cauline leaves develop obscure cordation and a narrow petiole; rameals not conspicuous, linear-acute, somewhat appressed: inflorescence irregularly compound-racemose, long and rather narrow, disproportionately large for the plant; its branches tend to be spreading and short, its peduncles long or at least distinct, its heads medium-sized or less, its rays much darker than in typical *A. undulatus*.—Dry hillsides, various provinces, Ala. to La., Ohio, N. Y., and Conn.—Fall.—Peculiar in its strong tendency to become corrugate, or cross-tied, by developing two conspicuous divaricate narrow-lanceolate leaf-blades (branch-form leaves) in the lower or middle axils of the cauline leaves.

29. *A. triangularis* Burgess. Plant cinereous green, tall, robust, very rough, with little or no obvious hair, like *A. corrigiatus*; but with leaves ovate-triangular-acuminate, thicker and with very pronounced acumination: stem dull reddish-brown, somewhat terete, 9 dm. high or more: leaves very numerous, sometimes foliosely corrugate in the axils; blades not ciliate, beneath with slight short scattered strigose hair, on the upper surface close-set with pale slender rigid aculei pointing away from the midrib and thickened at the base; leaf-form ovate-triangular, long-acuminate, suddenly contracted at the sessile base, subclasping only: inflorescence rather narrow, of loosely-ascending branches with a brushy top, uniformly close-set or catenate with conspicuous appressed overlapping elliptic chain-like bracteals: heads small: ligules of the ray purple-blue: bracts of the involucre linear-elliptic, their tips apt to be of broad diamond form. [*A. undulatus triangularis* Burgess]—Open sandy slopes, various provinces, S. C. to Ala. and N. Y.—Fall.

30. *A. claviger* Burgess. Plant wand-like, apt to spring several from a common base, with glandular pubescence along the middle of the stem, and with leaves of a crisp firm texture: stem greenish, moderately and finely pubescent, or glabrate, smooth to the eye, about 6 dm. high or more: leaves quite uniform; blades ovate-elliptic, thickish sub-entire or crenulate, acute, chiefly with a short strap-like wing broadest at its base; the slight pubescence becoming a little rough in drying and the leaves spongy-coriaceous; a very few basal leaves cordate: inflorescence irregular and narrow-elliptic or clavate, sometimes narrowly pyramidal: heads rather small: ligules of the ray violet or purplish-violet: bracts linear-acute with the medium-sized tips broad-lanceolate to diamond-form; scattered capitate glandular hairs are mingled on the stem with dry strigose hair and also with broken down strigose hairs which become irregularly glandular-thickened; the definitely formed capitate glands are colored violet, only slightly thicker than their stiff stub-like stalks.—Wood borders, various provinces N of Coastal Plain, Ala. to N. Y. and Conn.—Fall.

31. *A. gracilescens* Burgess. Plant slender and less pubescent, less rough and more thyrsoid than its congener *A. undulatus*: stem slender, often 6 dm. high and somewhat arching: leaves quite uniform; blades large and conspicuous, thin, soft, elongate-lanceolate, chiefly sessile, 12 x 4 cm. or less, scantily soft-pubescent, not velvety like *A. undulatus*, only a little rough when dry, subentire, pale-green with paler midrib; axiles narrow-ovate, rameals elliptic-linear or spreading; cordation of leaf-base and dilation of petiole-base usually little developed; radicals sagittiform-cordate with acute sinus: inflorescence loose, ovoid or thyrsoid, with distinct pedicels 3 cm. long or less: heads larger and remoter than in its relative *A. undulatus*: bracts of the involucre linear-elliptic,

suddenly acute, the tips chiefly conspicuous, short, incurved-triangular-aculeate. —On “balds,” in half-shade, or edges of rich woods, Blue Ridge and more N. Provinces, S. C. to N. Y. —Quite common and rather showy. —Late Sum. — Fall.

32. *A. linguiformis* Burgess. Small racemose plants with little hair, or cordation, of soft thin texture, tending to great development of elongate linguiform leaves, partly with long strap-like winged petioles, and the upper ones sessile by a broad auricled base; stem 4–5 dm. high, minutely pubescent only; leaves tend to be remarkably entire and obtuse, sage-green, closely approximate; radicals few, narrowly ovate-elliptic, but slightly cordated, with rather long slender petioles; lower caulines lance-elliptic, 7 x 2 cm. or less, abruptly rounded and obtuse at base and apex, often surpassed by the strap-like petiole; other caulines and branch-leaves sessile-auriculate, prolonged linear-oblong or pandurate-elliptic, often rounded-truncate at apex; axiles linear-acutish; inflorescence usually a loose and nearly simple raceme with small distinct long-pedicelled heads: bracts of the involucre lax, linear, acute, the green tips rhomboid. — Dry, fertile thickets, near Jacksonville, Fla. — Sum. — Fall.

33. *A. loriformis* Burgess. Plant rough, with but little hair, tall, narrow, with strap-like leaves seldom developing petioles or cordation: stem somewhat purple, terete, erect, brittle, slender, and 4–6 dm. high, or stout and even 12 dm. high; leaves dull-green; blades thick, rigid when dry, rough, only minutely pubescent beneath, their type linear-elliptic and obtuse, with sides nearly straight from a sessile clasping base; margins apt to be much ruffled, often minutely and closely erose, occasionally gashed with a few coarse remote blunt protruding teeth; petioles slightly developed, though often a few lower leaves slope into a strap-like petiole; radicals apt to be oval-elliptic, with little or no cordation; upper caulines and axiles linear-lanceolate, acutish, more contracted at the base: as in *A. corrigiatus*, the inflorescence is tall and narrow, the heads smaller than in *A. undulatus* and the ligules of the ray a more blue-purple: bracts of the involucre narrower, the green tips diamond-form or lanceolate. [*A. undulatus loriformis* Burgess] — Sand-barrens, Coastal Plain and adj. provinces, Fla. to Ala. and Mass. — Fall.

34. *A. Mohrii* Burgess. Plant profusely and flagellately branched with very naked bushy inflorescence: stem rough, rigid, with many small dark capitate slender-stalked glands intermixed among strigose hairs; many of the latter are viscid, becoming broken down and irregularly incrassate: leaf-blades long, narrowly linear and grass-like, thickish, harsh, of uniform breadth, minutely rugulose above, or slightly acute; petioles obscure, slender or winged; occasional radical or basal leaves are shorter, broader, somewhat cordate-lanceolate, and at the slightly shouldered base are contracted into a distinct petiole; with but obscure or rare sinus and amplexicaul enlargement; axile leaves and rameal chiefly linear-oblong, clasping by a broad base: heads small, long-peduncled (5–7 cm.) racemously compounded: bracts of the involucre linear-elliptic, acute, green-tips prominent, lance-elliptic; ligules of the ray reddish-purple, 12–15 or less. [*A. Baldwinii* β T. & G.] — Sandy soil, Coastal Plain, Fla. to La. and Ga. — Fall. — Fine strigose tomentum extends down the peduncles and much of the stem. Represents the extreme attenuation of the *A. undulatus* types.

35. *A. puniceus* L. Stem 9–25 dm. tall, usually stout, purplish, broadly corymbosely or racemously branched above, hispid with rigid hairs rising from a reddened tubercular base: leaf-blades lanceolate to elliptic-lanceolate, 7–15 cm. long, acuminate, sessile and clasping by a broad or narrowed base, sharply serrate (or some upper ones entire), usually very rough above, pubescent on the midrib beneath: heads generally numerous, 2–4 cm. broad: involucre nearly hemispheric; bracts linear or elliptic, attenuate, imbricate in about 2 series.

glabrous or ciliate, green, loose, spreading, nearly equal, sometimes broadened: ray-flowers 20-40; ligules light-violet (sometimes purplish or pale), 10-14 mm. long, showy: pappus nearly white: achene pubescent.—Swamps and ditches, various provinces, Ga. to Ala., Minn., Ont., and N. S.—Sum.—fall.

36. *A. Elliottii* T. & G. Stem 5-11 dm. tall, glabrous or pubescent in lines, corymbosely paniculate above: leaves rather numerous; blades thickish, various, those of the basal and lower cauline elliptic to oblanceolate, 2-3 dm. long, with shallow appressed or rounded teeth, narrowed into broad petiole-like bases, those of the upper cauline elliptic to elliptic-lanceolate, appressed-serrate, acute or acuminate, sessile or with petiole-like bases: heads numerous, chiefly crowded at the end of each branch: bracts of the involucre very narrow, lax and often recurved, their tips linear-elliptic or linear-subulate, and spreading: ray-flowers numerous; ligules narrowly linear, 9-11 mm. long, bright-purple: achene glabrous or nearly so.—Swamps, Coastal Plain, Fla. to N. C.—Fall.—Resembles *A. puniceus*, but inflorescence more corymbosely crowded and level-topped: bracts more attenuate and more spreading: ligules of the ray deeper-colored: hairs tubercular at the base or wanting.

37. *A. conduplicatus* Burgess. Stem purple-red, nearly smooth, but with some lines of straggling thick-based bristles; branches short, rigidly spreading, congested toward their ends with irregularly crowded heads: leaf-blades sessile, spatulate-linear, thick, smooth beneath, very rough above, without obvious veins except the pale-green midrib, entire or remotely crenulate-serrulate above the middle; axils sheathed by the conduplicate bases of the upper leaves: rameal leaves short, crowded, spreading and irregular: heads almost sessile: ligules of the ray blue or violet, fading whitish: bracts of the involucre linear, with triangular-acute apex, white scarious edges and bright-green conspicuous deltoid tip.—Moist soil near Biltmore, in the Blue Ridge of N. C.—Fall.—Allied also to *A. novi-belgii* and *A. puniceus*.—Plant chiefly pale-green and smooth.

38. *A. prenanthoides* Muhl. Stem 3-6 dm. high, glabrous below, pubescent above, flexuous, much-branched: leaf-blades thin, elliptic to ovate-lanceolate, 7-15 cm. long, sharply and coarsely serrate, scabrous above, glabrous or nearly so beneath, acuminate, abruptly narrowed below into a broad-margined entire petiole, the base dilated and auriculate-clasping: heads usually numerous, 25 mm. broad or more: involucre hemispheric; bracts linear, acute, green, spreading, imbricate in 3 or 4 series, the outer shorter: ray-flowers 20-30; ligules violet, 8-12 mm. long: pappus tawny: achene pubescent.—Moist soil, various provinces N of Coastal Plain, Tenn. to Ia., Wis., and Mass.—Sum.—fall.—Unlike other asters in its leaf-form, characteristically a suborbicular base and an ovate-acuminate tip, connected by a strap-like middle.

39. *A. carolinianus* Walt. Stem shrubby, widely or diffusely branched, 1-4 m. long, arching or climbing, finely and softly more or less grayish pubescent: leaves relatively few, those of the stem and main branches with elliptic or elliptic-lanceolate entire blades 4-11 cm. long, acute or acuminate at the apex and usually somewhat sagittate and clasping at the base, minutely pubescent: heads solitary or clustered at the ends of spreading conspicuously leafy branches: involucre hemispheric, 6-8 mm. high; bracts narrow, the outer more or less spatulate, the inner linear, all with spreading or recurved and more or less foliaceous dark-green tips minutely pubescent within and without: ray-flowers numerous; ligules pale-purplish or pinkish, 1.5-2 cm. long: achene glabrous.—In and about swamps, Coastal Plain, Fla. to S. C.—Fall, continuing in flower the year round.

40. *A. laevis* L. Stem 6-12 dm. high, usually stout, glabrous, often glaucous, branched or simple: leaf-blades thick and almost leathery, very smooth, entire

or serrate, slightly rough-margined, the upper all sessile and strongly cordate-clasping elliptic-lanceolate, oblanceolate or ovate, acute or obtusish, 2-10 cm. long; those of the basal and lower cauline leaves gradually narrowed into winged petiolar bases, those of the branches often small and scale-like: heads usually numerous, about 25 mm. broad: involucre campanulate; bracts of the involucre rigid, acute, appressed, broadly green-tipped, imbricate in several series: ray-flowers 15-30; ligules blue or violet: pappus tawny: achene glabrous or nearly so.—Dry, or stony soil, various provinces, Ga. to La., Kans., N. D., Ont. and Me.—Fall.—Remarkable among asters for its smooth, cool, polished surfaces.

41. *A. concinnus* Willd. Similar to narrow-leaved forms of *A. laevis* in habit, the stem glabrous or sparingly pubescent above, 3-9 dm. high, paniculately branched: leaf-blades elongate-lanceolate to linear, entire (or sometimes serrulate), 2-7 cm. long, those of the upper cauline leaves sessile, somewhat clasping, those of the basal and lower cauline leaves spatulate, or elliptic, narrowed into margined petiole-like bases: heads usually numerous, about 25 mm. broad: bracts of the involucre with rhomboid acute herbaceous tips: ray-flowers with violet to purple ligules.—Open woods or dry soil, various provinces N of Coastal Plain, N. C. to Ark. and Conn.—Fall.—Resembles *A. laevis*, but more corymbed, the heads smaller and leaves narrower.

42. *A. purpuratus* Nees. Stem 4-12 dm. high, slender, glabrous, simple, or branched above, the branches sometimes puberulent: leaf-blades firm, glabrous, dark-green, entire, the upper sessile and clasping at the base, elongate-lanceolate or long-linear, 5-12 cm. long, acuminate; basal and lower cauline leaves petioled, elliptic-lanceolate, obtusish; those of the branches very small: heads rather few, loosely racemose, 16-25 mm. broad: involucre broadly campanulate: bracts coriaceous, lance-acuminate, appressed, imbricate in several series, the green tips lanceolate: ray-flowers 5-10, their ligules blue or violet, 6-10 mm. long: pappus tawny: achene glabrous.—Dry soil and open woods, various provinces, Ga. to Tex., Ark., and Va.—Late Sum.—Fall.—Resembles *A. laevis*, but its heads more racemed, apt to be solitary on long branches, the bracts narrower-tipped, the leaves greatly narrowed, the blades long-linear.

43. *A. attenuatus* Lindl. Stem glabrous, 6 dm. high or less: leaf-blades very narrowly linear with straight sides almost from the sessile base to the acute apex, very smooth but with hispid revolute margin, 1.5 dm. long or less, about 1 cm. broad, mostly sessile: inflorescence spicate-racemose, attenuate: bracts as in *A. purpuratus* in form, from which it differs in its leaves, its smaller heads, more narrowed inflorescence of short branches, and somewhat squarrose lower bracts which pass gradually into spreading bractlets on the pedicels. [*A. virgatus*  $\gamma$  T. & G.]—Dry soil, Coastal Plain, Ala. to La.—Fall.

44. *A. ursinus* Burgess. Stem stout, smooth, glabrous below the inflorescence, very peculiar in the crowded nodes of its base and inflorescence, there 1 cm. or less apart, and in the abruptly remote nodes of the stem between, nearly 10 cm. apart: leaves elliptic, chiefly fascicled at the base and there often short-lanceolate or spatulate, sometimes serrulate and 1-2 cm. broad, with ciliate petioles; minute stubby pubescence covers some even of the larger leaves beneath, and occurs on the main stem and branches throughout the inflorescence, which tends to ellipsoid and broadly racemose type: heads chiefly solitary on virgate branches, twice the size of *A. attenuatus*, 3 cm. broad, 1 cm. high: pedicels shaggy with conspicuous uniform closely-imbricate bractlets, which are 1 cm. long, each appressed half-way and with outcurved tip; upper bractlets more spreading and furry and passing indistinguishably into the bracts of the involucre; involucre loose, broad and short; bracts chiefly linear-attenuate, tapering from the base, their green tips large, lanceolate, and conspicuous. [*A. virgatus*  $\beta$  T. & G. not Banks]—Mountain slopes, Blue Ridge, Ga.—Late sum.—fall.

45. *A. falcidens* Burgess. Plant of firm smooth texture like *A. laevis*, with similar rays and bracts: stem slight or delicate, not rigid, generally arcuate, terete, reddened, usually under 5 dm. high; leaf-blades very thin, of linear type, apple-green, glaucescent, of dense opaque texture, remarkable for the absence of veins (unless under a strong lens), varying from exceedingly smooth and glabrous (even with the margin without ciliation or roughness) to leaves with minute hair beneath and some scabrous hair at the margins: radical leaves very pale and glaucous, with oval or obovate blades, the apex rounded or obtuse, a few acutish, their petioles narrow and longer; lower cauline leaf-blades lance-elliptic, entire, 7 x 2 cm., equalled by the narrow petiole (and resembling *Pogonia ophioglossoides*); middle caulines linear, often 2 dm. long by only 1 cm. broad, sessile, short-acuminate, frequently with several large projecting teeth which are nearly opposite or remotely scattered; these notches may be increased till the leaf is pinnatifid, or reduced to many shallow crenations, or may be replaced by prolonged oblanceolate-linear entire leaves: upper cauline leaves often numerous, 10-15 or more, ascending or spreading entire, linear, straight-sided, tapering slightly to each end but not acuminate, 15 cm. by 1.5 cm., finally becoming short, linear-acute and erect, until 5 cm. long: axiles subulate, rapidly reduced, leaving the inflorescence nearly naked: rameals minute, mostly erect-appressed, almost overlapping, broadly subulate or setaceous; branches ascending, short and filiform, reaching 5 cm. and bearing a single head, or 10 cm. and bearing several: heads often few, forming a short raceme: ligules of the ray pale-blue: disks early turning deep-crimson: bracts of the involucre linear-elongate, suddenly acute, their green tips rhomboid. [*A. gracilentus* T. & G., not Banks.]—Upland woods, Blue Ridge and more N provinces, Ala. to Ark., Pa., and N. C.—Fall.—Differs from the allied *A. laevis*, *A. concinnus* and close relatives, in its longer linear straight-sided leaf-blades and the coarse teeth.

46. *A. turbinellus* Lindl. Stem 6-9 dm. high, slender, paniculately branched, glabrous below, puberulent above: leaf-blades firm, lanceolate, or elliptic-lanceolate, 5-7 cm. long, entire, ciliate, acute or acuminate, those of the basal and lower cauline petioled, those of the upper sessile, those of the branches much smaller: heads about 25 mm. broad, mostly solitary at the ends of the branches: involucre turbinate; bracts elliptic, coriaceous, obtuse, appressed, imbricate in 5 or 6 series, their tips green only at the apex: ray-flowers 10-20; ligules 6-10 mm. long, violet: pappus tawny: achene finely pubescent.—Dry soil, especially on prairies, various provinces, La. to Ark., Kans., and Ill.—Sum.—fall.

47. *A. continuus* Small. Stem 5-11 dm. tall, pubescent, much branched above: leaf-blades spreading, more or less fiddle-shaped or oblong, 2-5 cm. long, acute, shallowly serrate or nearly entire, ciliolate, scabrous-pubescent on both sides, sessile and clasping at the base: heads showy, solitary or clustered at the end of the spreading closely pubescent branches: involucre turbinate-campanulate or turbinate; bracts numerous, linear or nearly so, erect or with slightly spreading green tips, acute, passing into the numerous scales of the peduncle: ray-flowers 12-15; ligules violet, 1-1.5 cm. long: achenes pubescent. Resembles *A. patens* Ait., but its bracteals closer; the involucre narrowly turbinate.—Dry soil, often in open woods, various provinces, Ala. to Tex., Kans., and Ark.—Fall.

48. *A. georgianus* Alexander. Stem 4.5-8 dm. tall, rough-pubescent, sparingly branched: leaf-blades sessile, elliptic to obovate, rough pubescent and very thick, stiff-spreading, auriculate-clasping at the base, entire, acute or obtuse, 3-7 cm. long; leaves of the branches much smaller, sometimes bract-like: heads 3-4 cm. broad, solitary at the ends of branches or branchlets; involucre turbinate-campanulate; bracts linear, somewhat acute, pubescent, the elliptic green tips spreading: ray-flowers 20-30; ligules violet, about 15 mm. long: pappus tawny.—Dry or open woods, inner Coastal Plain and Piedmont, Ga. and S. C.—Fall.

49. *A. fontinalis* Alexander. Stem 3-9 dm. tall, pubescent, much branched: leaf-blades sessile, linear-elliptic, rough-pubescent, stiff-spreading, auriculate-clasping at the base, entire, abruptly acute, 1.5-3 cm. long; lower cauline and radical leaves not seen, those of the branches small and bract-like: heads about 2 cm. broad, or more, at the ends of the numerous branches and branchlets; involucre turbinate-campanulate; bracts linear, with narrowly spatulate, green tips, remarkably thin for this group, but closely appressed and not at all spreading, glabrous, and ciliate margined: ray-flowers 15-30; ligules purplish-blue, 7-9 mm. long: pappus whitish.—Damp, wooded slopes, and moist soil, Fla.—Late fall.

50. *A. patens* Ait. Stem 3-9 dm. tall, slender, rough, divergently branched: leaf-blades sessile, ovate-elliptic or oval, rough-pubescent, thick and somewhat rigid, strongly auriculate-clasping at the broad base, entire, acute, or the lower ones obtuse, 2.5-7.5 cm. long, those of the branches much smaller and bract-like, their margins rough-ciliate: heads 25 mm. broad or more, solitary at the ends of the branches: involucre campanulate; bracts linear-elliptic, finely pubescent or scabrous, often somewhat glandular, imbricate, their green acute tips spreading: ray-flowers 20-30; ligules purplish-blue or deep-violet, 8-12 mm. long: pappus tawny: achene pubescent.—Dry, open places, often in acid soil, various provinces, Fla. to Tex., Minn., and Mass.—Sum.—fall.

51. *A. tenuicaulis* (C. Mohr) Burgess. Resembles *A. patens*; but its branches long and slender, flagelliform and diffuse when well developed: leaves and heads smaller: pedicels longer, often 1-4 cm.: bracts and their tips much narrower, narrowly linear; bractlets mucronate-acute, catenate or forming a chain-like series along the pedicels, appressed or slightly spreading. [*A. patens gracilis* Hook. *A. patens tenuicaulis* C. Mohr.]—Dry soil, Coastal Plain and adj. provinces, Ga. to Tex., Okla., and Ky.—Sum.—fall.

52. *A. phlogifolius* Muhl. Similar to *A. patens* in habit, but when well developed, much taller, more slender and soft: leaves larger; blades lanceolate to elliptic-lanceolate, entire, thin or membranous, acuminate at the apex, strongly auriculate, clasping at the base, roughish above, pubescent beneath, usually narrowed below the middle, sometimes 15 cm. long: heads usually numerous, 3-5 cm. broad, paniced or somewhat racemose on the branches: involucre campanulate; bracts lanceolate, glabrate, rather loose, with herbaceous tips: ray-flowers numerous; ligules purple-blue.—Woods and thickets, various provinces N of Coastal Plain, Ga. to Tenn., Ohio, and Mass.—Late sum.—fall.—Resembles *A. patens*, but less harsh and taller; heads larger: inflorescence narrow: leaf-blades elongate.

53. *A. adnatus* Nutt. Stem 2-8 dm. tall, hispidulous, virgately more or less branched, especially above: leaves various, the basal few, with obovate thinnish blades 1.5-2.5 cm. long, the cauline very numerous, approximate on the lower part of the stem, more or less imbricate above and on the branches; blades elliptic to lanceolate, 3-12 mm. long, firm, scabrous, erect and partly adnate to the stem and branches, sessile: heads relatively few, scattered, singly terminating the scaly branchlets: involucre 4-6 mm. high; bracts linear or slightly broadened upward, the dark-green tips slightly spreading: ray-flowers numerous; ligules 7-10 mm. long, violet: achene glabrous.—Dry pinelands, Coastal Plain, Fla. to Miss. and Ga.—Fall.—Remarkable among asters in its minute adnate scale-like leaves.

54. *A. Walteri* Alexander. Stem 2-6 dm. tall, loosely branched above or throughout, nearly glabrous: leaves very numerous, the basal spatulate to cuneate, entire, the cauline approximate or contiguous, rigid, reflexed; blades elliptic-lanceolate to ovate or subulate-ovate, 2-9 mm. long, ciliate, serrate, closely sessile: heads few, widely scattered, terminating scaly branchlets: involucre 5-6

mm. high; bracts broadened upward, the dark green acute or acutish tips slightly spreading: ray-flowers 14-24; ligules 6-9 mm. long, violet: achene glabrous. [*A. squarrosus* Walt.]—Dry pinelands, Coastal Plain, Fla. to N. C.—Fall.

55. *A. oblongifolius* Nutt. Stem much-branched, 3-7 dm. high, hirsute-pubescent, smooth with age, the branches divaricate or ascending; leaves numerous, often crowded; blades elliptic or elliptic-lanceolate, sessile by a broad or slightly clasping base, usually rigid, entire, mucronulate at the apex, rough or hispidulous on both sides, rough margined, those of the stem 3-5 cm. long, 4-8 mm. wide, those of the branches gradually smaller: heads corymbose, nearly 25 mm. broad: involucre hemispheric; bracts much imbricate, glandular-aromatic, linear or linear-elliptic, the acute green tips spreading: ray-flowers 20-30; ligules violet-purple, rarely rose-pink, 6-10 mm. long: pappus becoming light-brown: achene canescent.—Prairies and bluffs, often in calcareous soil, various provinces mostly N of Coastal Plain, Ala. to Tex., N. D., and Pa.—Sum.-fall.—*A. Kumleinii* Fries is not known in the east, the eastern specimens having been referred to *A. oblongifolius*.

56. *A. grandiflorus* L. Stem 3-7 dm. high, rather stiff, divaricately much branched, hispid with short hairs: leaf-blades elliptic, linear, or somewhat spatulate, rigid, sessile by a broad sometimes slightly clasping base, reflexed, entire, obtusish, hispid, the larger 5 cm. long, those of the branches very numerous 4-10 mm. long: heads about 5 cm. broad, terminating the branches: involucre hemispheric; bracts very squarrose and foliaceous, imbricate in 5-7 series, linear, or linear-elliptic, glandular, the outer obtusish, the inner acute: rays very numerous; ligules deep-violet, nearly 25 mm. long, 3 mm. wide: pappus becoming brownish: achene ribbed, canescent.—Dry soil, Coastal Plain and adj. provinces, Fla. to Va.—Sum.-fall.—Resembles *A. oblongifolius*, but heads larger and fewer, more glandular.

57. *A. novae-angliae* L. Stem stout, 6-25 dm. high, hispid-pubescent, corymbosely branched above, very leafy: leaf-blades elliptic-lanceolate, entire, acute, pubescent, 5-12 cm. long, 12-25 mm. wide, each clasping by an auriculate base: heads numerous, 3-5 cm. broad, clustered at the ends of the branches: involucre hemispheric; bracts linear-subulate, somewhat unequal, green, spreading, pubescent and more or less glandular-viscid: ray-flowers 40-50; ligules linear, 10-16 mm. long, violet-purple (typically a royal-purple, rarely replaced by rose-color, or white): achene pubescent: pappus becoming reddish-white.—Fields and neutral soil swamp margins, various provinces, rarely Coastal Plain, S. C. to Miss., Ark., Colo., Alta., and Que.—Sum.-fall.

58. *A. novi-belgii* L. Stem slender, 3-9 dm. high, usually much-branched, glabrous or slightly pubescent above: leaf-blades lanceolate, elliptic-lanceolate or linear-lanceolate, 5-12 cm. long, firm, entire, or slightly serrate, glabrous or very nearly so, acuminate at the apex, narrowed, sessile, and more or less clasping at the base, those of the lower ones petioled: heads corymbose-paniculate, usually numerous, 2-3 cm. broad: involucre hemispheric to campanulate; bracts linear, acute, green, somewhat spreading, in 3-5 series, the outer shorter: ray-flowers 15-25; ligules violet, 8-10 mm. long: pappus whitish: achene glabrous or nearly so.—Swamps and acid bogs, Coastal Plain and adj. provinces, Ga. to Ala. and Newf.—Sum.-fall.—Several forms have been distinguished: *A. novi-belgii litoreus* with low and spreading, more or less fleshy, much-branched stems: leaf-blades shorter and broader, thicker, acute, 3-6 cm. long: principal bracts of the involucre obtuse, loose, spatulate, ranges in salt-marshes, from Ga. to E Can. *A. novi-belgii atlanticus* with lanceolate leaf-blades tapering from the middle to an acuminate apex and base: heads usually fewer: inflorescence racemose-corymbose, ranges in swamps, from N. C. to Mass.

59. *A. elodes* T. & G. Stem up to 7 dm. tall, slender, smooth, little-branched, terete, pale and reddened: leaf-blades narrowly linear, entire, shining and firm, smooth and coriaceous when dry, 5–15 cm. long, often not more than 1 cm. broad, scarcely clasping by the contracted sessile base, divaricately spreading and becoming deflexed; rameal leaves very numerous, approximate, elliptic-oval to linear, divaricate-recurve, with abruptly contracted base and apex, diminished to 1 cm. long on the pedicels: leaves (especially the rameal) with their margins hardened, thickened, minutely spinulose and revolute: inflorescence loosely paniced, with domed, flattened or irregular top: heads often approximate; chief bracts of the involucre closely imbricate, rigid, erect, their tips lanceolate, erect or spreading, with pale or purple margin; some green spreading foliaceous outer bracts occur, but they are usually few or inconspicuous.—Swamps, especially in pinelands, Coastal Plain and adj. provinces, N. C. to Mass.—Sum.—fall.
60. *A. sericeus* Vent. Stem 3–6 dm. high, slender, paniculately or corymbosely branched, stiff, glabrous, leafy: basal and lowest leaves oblanceolate, narrowed into margined petioles; cauline leaves sessile, with a broad base, elliptic, entire, mucronate, 1–4 cm. long, erect or ascending, with a dense silvery-white silky pubescence on both sides: heads numerous, about 35 mm. broad: involucre turbinate; bracts elliptic, or the inner lanceolate, canescent, imbricate in 3 or 4 series, their tips green, acute, spreading: ray-flowers 15–25; ligules reddish-violet, becoming violet-blue, 12–16 mm. long: pappus tawny: achene glabrous.—Dry, open soil, various provinces N of Coastal Plain, Tenn. to Tex., Man., and Ill.—Late sum.—fall.
61. *A. concolor* L. Stem 3–7 dm. high, leafy, simple, or with few erect branches: leaf-blades elliptic or linear-elliptic, finely and densely canescent on both sides, or the lower glabrate, sessile, obtuse or mucronate, 4–5 cm. long: heads in an elongated narrow raceme resembling that of species of *Laciniaria*: involucre broadly turbinate; bracts linear or linear-elliptic, appressed, canescent, imbricate in 4 or 5 series, their tips green, acute, the outer shorter: ray-flowers 10–15; ligules lilac, drying violet-blue, 6–8 mm. long: pappus tawny: achene villous.—Dry sandy, often acid, soil, Coastal Plain and adj. provinces, Fla. to La., Tenn., and Mass.—Late sum.—fall.—Resembles *A. sericeus*, but more wand-like and spicate, and more canescent than silky.
62. *A. simulatus* Small. Stem 2–15 dm. tall, wand-like or with few virgate branches, pale-pubescent, the branches, especially near the tips, villous-silky: leaf-blades linear-elliptic to lanceolate or linear-lanceolate, 1–2.5 mm. long or somewhat scale-like and smaller above, more or less silky, acute, entire, sessile; heads in virgate racemes or panicles, showy: involucre turbinate-campanulate: bracts broadly linear to linear-lanceolate, imbricate in several series, the outer with deltoid green tips, the inner 6–7 mm. long, with lanceolate green acute tips, all appressed, copiously pubescent with appressed white hairs; ray-flowers 10–13; ligules violet, 6–7 mm. long: pappus whitish: achene copiously silky.—Pinelands, Everglade Keys, Fla.—Fall-wint.
63. *A. plumosus* Small. Stem 1 m. tall or less, branched above, finely pubescent, the branches more closely pubescent than the stem, villous-hirsute near the tips: leaf-blades various, those of the lower part of the stem not seen, those above linear or nearly so, those of the branches linear-elliptic to lanceolate, mostly 1 cm. long or less, acute, all sessile, finely pubescent on both sides: heads showy, in loose racemes; involucre turbinate-campanulate; bracts linear-acuminate to narrowly linear-lanceolate, imbricate in several series, the inner 6.5–7.5 mm. long, the loosely spreading or recurved green tip with copious long white hairs: ray-flowers about 10; ligules violet, 7–8 mm. long: pappus tawny: achene silky-villous.—Dry woods, Apalachicola River region, Fla.—Fall.

64. **A. Curtisii** T. & G. Stem 4–18 dm. tall, glabrous, at least below the inflorescence, angled, corymbose or paniculate above, the panicle sometimes raceme-like: leaves various, sometimes all with linear or nearly linear blades and entire or partly serrate, sometimes the lower cauline with lanceolate, elliptic, oval or ovate sharply serrate blades and petiole-like base and the upper cauline linear and less toothed, occasionally all of them relatively broad, all thickish, dark-green and glabrous: heads solitary or clustered at the end of the stem or its branches: involucre hemispheric, 6–9 mm. high, conspicuous; bracts often slightly ciliolate, pale below the more or less dilated dark-green spreading, or reflexed tips: ray-flowers 18–28; ligules violet-purple, often brilliant, 1–3 cm. long: achene glabrous, shorter than the sordid pappus.—Mountain woods, Blue Ridge and Appalachian provinces, Ga. to Tenn. and N. C.—Fall.—Resembles *A. spectabilis*, but leaves more polymorphous: stem taller: head more diffused: glands lacking.

65. **A. Smallii** Alexander. Stem 5–6 dm. tall, glandular-pubescent, especially above, unbranched below the rather compact inflorescence; leaves rather numerous 5–12 cm. long; blades glabrous but rough-margined, oblanceolate, the cauline ones tapering to a wing-petioled base, the upper ones sessile at the broad base, all, even the floral bracts sharp-serrate and acutish: heads borne in a dense, somewhat corymbose cluster: involucre campanulate: bracts glandular, especially the outer, broadly linear, abruptly mucronate or obtuse, the tips recurved: ray-flowers purplish: pappus pale-tawny: achene pubescent.—Dry woods, Blue Ridge, N. C.—Fall.—Resembles *A. surculosus*, but differs mainly in its glandular involucre bracts and numerous approximate leaves.

66. **A. spectabilis** Ait. Stem stiff, 3–6 dm. tall, simple, or corymbosely branched above, puberulent, or rough below, more or less glandular above: leaf-blades firm, thickish, those of the basal and lower cauline leaves oval, acute or acutish, 7–12 cm. long, 2–4 cm. wide, sparingly serrate with low teeth, narrowed at the base into slender petioles; blades of the upper cauline leaves sessile, entire or very nearly so, acute, linear-elliptic: heads several or numerous, about 35 mm. broad, corymbose, very showy: involucre nearly hemispheric; bracts linear-elliptic or slightly spatulate, glandular, imbricate in about 5 series, the acute or acutish tips spreading: ray-flowers 15–30; ligules bright-violet, 12–20 mm. long: pappus whitish: achene slightly pubescent.—Dry, often acid, sandy soil, Coastal Plain and N. E. Coast, N. C. to Mass.—Late sum.–fall.

67. **A. surculosus** Michx. Stem 2.5–4.5 dm. tall, slender, from elongate-filiform rootstocks, minutely scabrous-pubescent, corymbosely branched above: leaf-blades firm, lanceolate or linear, those of the lower cauline petioled, 5–7 cm. long, rough-margined, slightly scabrous above, sparingly dentate, those of the upper narrower, sessile, entire: heads few, or sometimes solitary, about 3 cm. broad: involucre turbinate-hemispheric; bracts coriaceous, imbricate in about 5 series, ciliate, but scarcely glandular, their green tips spreading: ray-flowers 15–30; ligules violet: pappus whitish: achene nearly glabrous.—Sandy or gravelly soil, various provinces, Ga. to Ala., Ky., and N. C.—Sum.–fall.

68. **A. gracilis** Nutt. Stem slender, 3–4 dm. highly, finely puberulent and scabrous, corymbosely branched above: leaf-blades minutely scabrous, those of the basal and lower cauline leaves elliptic, acute or obtusish, 5–7 cm. long, toothed, narrowed into slender petioles, those of the upper leaves linear, linear-elliptic, or slightly oblanceolate, acute, entire, sessile or a little clasping: heads usually numerous, 12–20 mm. broad: involucre narrowly turbinate; bracts coriaceous, glabrous or very nearly so, imbricate in about five series, their tips green and spreading, obtusish: ray-flowers 9–15; ligules violet, 6–9 mm. long: pappus nearly white: achene minutely pubescent.—Dry, often acid, sandy soil, various provinces, N. C. to Tenn., Ky., and N. J.—Sum.–fall.

69. *A. Lamarckianus* Nees. Stem 6–25 dm. high, glabrous or nearly so, paniculately much-branched: leaf-blades lanceolate to elliptic-lanceolate, 7–15 cm. long, acuminate at the apex, narrowed to a sessile or slightly clasping base, glabrous, thin, roughish margined, those of the cauline leaves sparingly serrate in the middle, or sometimes very nearly entire, the upper and those of the branches gradually smaller: heads numerous, 16–20 mm. broad: involucre nearly hemispheric, 6–8 mm. high; bracts narrowly linear-lanceolate, acute or acuminate, appressed, green-tipped, imbricate in 4 or 5 series: ray-flowers numerous; ligules white (or faintly tinged with violet), 6–8 mm. long: pappus white or nearly so: achene minutely pubescent. [*A. paniculatus* Lam.]—Moist soil, various provinces, Fla. to La., Mont., Ont., and Va.—Late sum.–fall.—A very variable species. A form ranging from N. C. and Tenn. to Kans., and Man., with narrowly linear entire or remotely appressed-serrate leaf-blades acuminate at both ends and numerous rather densely clustered heads on ascending inflorescence-branches, is *A. Lamarckianus bellidiflorus*.

70. *A. missouriensis* Britton. Whole plant pubescent, much-branched: stem 6 dm. high or more: leaf-blades thin, oblanceolate and acute in type, dull or cinereous-green, sharply serrate above the middle, with long-tapering entire sessile base, finely pubescent beneath: heads irregularly paniced or scattered along leafy branches: bracts of the involucre linear, acute, closely imbricate.—Moist places, various provinces, Tenn. to Tex., S. D., and Mich.—Fall.—Differs from *A. Lamarckianus* Nees. especially in its pubescence.

71. *A. salicifolius* Lam. Stem 6–15 dm. high, rather slender, paniculately much-branched, usually very leafy, glabrous, or somewhat pubescent above: leaf-blades somewhat firm, lanceolate or linear-lanceolate, 5–10 cm. long, rough-margined, acute or acuminate, narrowed and sessile or slightly clasping at the base, entire or sparingly dentate with low teeth, glabrous or nearly so, those of the lower leaves sometimes with petiole-like bases, those of the branches gradually smaller: heads numerous, 16–25 mm. broad: involucre broadly turbinate; bracts linear-elliptic, appressed, imbricate in 4 or 5 series, their green tips acute or obtusish: ray-flowers numerous; ligules violet, or violet-purple, or sometimes white, 6–8 mm. long: pappus white: achene minutely pubescent.—Moist soil, various provinces, Miss. to Tex., Mont., Ont. and Me.—Late sum.–fall.—The following form may be distinguishable: *A. salicifolius subasper*, with scabrous stem and leaves, ranges from La. to Tex., Mo., and Md.

72. *A. Simmondsii* Small. Stem 1–12 dm. tall, minutely pubescent, usually with erect or spreading branches: leaf-blades linear, oblanceolate, or elliptic, glabrous, sessile; those of the lower leaves serrate; those of the upper serrate or entire, the rameal ones narrowly linear, entire: head solitary or paniculate: involucre campanulate to campanulate-turbinate; bracts linear with spatulate green tips and scarious margins below, acute or acutish, the inner 4–7 mm. long: ligules of the ray 7–11 mm. long, pale-lilac or pink-purple: achene finely pubescent: pappus cream-color. [*A. Sulznerae* Small.]—Moist or dry soil, pen. Fla.—Fall.–wint.—A very variable species which may contain one or more distinct species.—As in the case of related species the Seminoles use an infusion of the plant to bathe victims of sunstroke.

73. *A. spatelliformis* Burgess. Stem much-branched, glabrous, 6 dm. high or more: leaf-blades dull-green and crenate, thickish, glabrous, the upper surface usually finely impressed with reticular veins: leaf-form suggesting a small rounded spatula, oval with a rounded apex, tapering into a short entire cuneate-winged petiole; basal and rameal leaves as well as cauline all of nearly the same type, 5 x 3 cm. or less; the axiles half as large and oval-elliptic, with a short cuneate base; the rameals half as large as the axiles, but very uniform. numerous and characteristic: heads small, scattered along the prolonged or

sarmentose branches, usually short-pedicelled: bracts of the involucre rigid, linear, with whitish sides and acute apex, the narrow dark-green tips lance-triangular.—Swamp margins, Jacksonville, Fla.—Fall.

74. *A. Tradescanti* L. Stem 6–15 dm. tall, slender, paniculately branched, the branches usually ascending and often pubescent in lines: cauline leaves numerous; blades linear-lanceolate or lanceolate, 7–15 cm. long, acuminate, narrowed to the sessile base, glabrous or nearly so on both sides, commonly thin, sharply serrate in the middle with low teeth, or sometimes entire: heads very numerous, racemose but not secund on the branches, 10–16 mm. broad: involucre hemispheric to broadly turbinate, 4–6 mm. high; bracts linear, acute, appressed, green-tipped, imbricate in 4 or 5 series: ray-flowers numerous; ligules white or nearly so, 4–6 mm. long: pappus white: achene minutely pubescent.—Fields and swamps, various provinces, Fla. to Miss., Minn., N Y Terr., and Ont.—Late sum.—fall.

75. *A. agrostifolius* Burgess. Stem terete, greenish or stramineous, 6 dm. or often 8 dm. high, slender, erect or straggling, sparingly but widely branched: leaves grass-like, dull-green above and beneath; blades very thin, chiefly entire, linear-acuminate, tapering to the sessile base and especially to the apex, 10 cm. or even 15 cm. long, by 1 cm. wide; some lower cauline leaves become broader, lanceolate or oblong and slightly appressed-serrate; axils generally corrugate or occupied by two little divaricate branch-leaves: heads very small and pale, about 1.5 cm. broad: bracts of the involucre linear-acuminate, very pale, with narrow linear green tips: ligules of the rays whitish.—Low grounds under light shade and about copse-borders, Coastal Plain and adj. provinces, Fla. to Ark., and S E Mass.; also river banks, Knoxville, in the Appalachian valley of Tenn.—Fall.

76. *A. pinifolius* Alexander. Stem 6–12 dm. tall, glabrous or sparingly pubescent, with more or less erect branches: leaf-blades linear to subulate, glabrous, sessile; those of the lower leaves narrowly linear, entire or sparingly hack-serrate; those of the upper linear-subulate, the rameals subulate: heads few or many, paniculate: involucre campanulate-turbinate to turbinate; bracts linear, acutish, the inner 5–7 mm. long: ligules of the ray 7–11 mm. long, pale-violet: pappus cream-color: achene finely pubescent.—Moist soil, Fla.—Fall.—wint.—A variable species which may contain one or more distinct species.

77. *A. ramosissimus* Mill. Stem 3–9 dm. tall, usually glabrous, paniculately branched, usually bushy, the branches racemose, and the branchlets often somewhat secund: leaf-blades firm or rigid; those of the basal leaves spatulate, obtuse, dentate, narrowed into margined petioles, glabrous or ciliate; those of the cauline leaves narrowly linear, acute, entire, 2–7 cm. long, those of the branches linear-subulate, numerous: heads usually very numerous, 8–12 mm. broad: involucre campanulate to hemispheric; bracts coriaceous, closely appressed, lanceolate or linear-lanceolate, abruptly acute or acuminate, green-tipped, imbricate in about 3 series: ray-flowers 15–25; ligules white or purplish-tinted: pappus white: achene finely pubescent. [*A. ericoides* (Fl. SE. U. S.)].—(SPRAY-ASTER.)—Dry soil, various provinces, Fla. to Miss., Wis., Ont., and Me.—Fall.—wint.

78. *A. pilosus* Willd. Stem up to 1 m. tall, pubescent, very much branched and bushy, the branchlets somewhat secund: leaf-blades firm, typically with long scattered hairs on both surfaces; those of the basal leaves spatulate or oblanceolate, obtuse, somewhat dentate, pubescent; those of the cauline leaves linear to elliptic, acute, entire, 2–8 cm. long; those of the branches linear to narrowly elliptic: heads typically numerous, 10–15 mm. broad: involucre campanulate to hemispheric; bracts linear to linear-lanceolate, with coriaceous,

acuminate, green tips: ray-flowers with ligules typically white, but sometimes pink or purplish-tinged: pappus white: achene pubescent. [*A. ericoides pilosus* (Willd.) Porter, *A. ericoides villosus* (Michx.) T. & G., *A. ericoides platyphyllus* T. & G.]—Dry soil, various provinces, Ga. to Miss., Mo., Ia., and Pa.

79. *A. juniperinus* Burgess. Stem robust, brittle, glabrous, pale brown, about 6 dm. high, the branches numerous, prolonged, chiefly horizontal and parallel, sometimes 4 dm. long: cauline leaves dull-green; blades thin, linear-acuminate, 10 x 1 cm.; rameal and ramular leaves subulate and all nearly alike, wide-spreading, juniper-like, greatly reduced and very numerous and crowded, diminishing rapidly on the elongate pedicels and passing insensibly into the small spreading green outer bracts of the broad hemispherical head; the other bracts longer and broader, linear with triangular-acuminate summit, coriaceous and very smooth, bright-white except the broadly deltoid, sharp-angled, green tip: heads small: ligules of the ray white: disk turning reddish-brown.—Loose sandy soil, in sunny places, various provinces, Ala. to Md.—Late sum.-fall.—Unlike *A. Faxonii* in its tendency to divaricate, not corymbose, branching. Unlike its congener *A. ramosissimus* in its numerous heads solitary on long branches or branchlets.

80. *A. Faxonii* Porter. Stem 6–15 dm. high, glabrous throughout, paniculately or corymbosely branched, rather stout: cauline leaves various; blades lanceolate or linear-lanceolate, 5–12 cm. long, acute or acuminate, narrowed to a sessile base or those of the lower ones into margined petioles, entire or nearly so, firm, those of the branches gradually smaller: basal leaves with elliptic to spatulate, obtuse, dentate blades: heads 12–18 mm. broad: involucre hemispheric, nearly 8 mm. high; bracts linear-lanceolate, acute or subulate, green-tipped or green on the back, imbricate in about 3 series, the outer shorter: ray-flowers numerous; ligules bright-white, 6–8 mm. long: pappus white: achene minutely pubescent.—Rocky river banks, and moist cliffs, Blue Ridge and more N provinces, Ala. to Wis., Vt., and Mass.—Late sum.-fall.—*A. ericoides Reevesii* A. Gray is probably best considered as the southern form of this species.

81. *A. Priceae* Britton. Stem 3–7 dm. high, pubescent, widely branched: basal leaves with oblanceolate obtuse or acutish entire petioled blades, 3–7 cm. long, the petioles ciliate, broad: cauline leaves relatively few; blades linear-lanceolate, sessile, ciliate, acuminate, 2–5 cm. long, those of the branches similar but smaller: involucre nearly hemispheric, about 6 mm. high; bracts linear, the outer gradually acuminate, green, the inner a little broader, abruptly acuminate, acute, or obtusish: heads about 2.5 cm. broad: ray-flowers numerous; ligules bright crimson-purple or pink.—Dry soil, Blue Ridge to Appalachian Plateau, N. C. to Ky.—Fall.

82. *A. dumosus* L. Stem 3–9 dm. high, glabrous or very nearly so throughout, paniculately much-branched: leaf-blades firm, those of the stem linear or linear-lanceolate, 2–7 cm. long, entire, acute or obtusish, roughly margined, often reflexed, those of the branches very numerous, small and scale-like, those of the basal leaves spatulate, dentate: heads 8–14 mm. broad, terminating the usually divergent slender branches and branchlets, usually numerous: involucre broadly campanulate; bracts linear-subulate, appressed, imbricate in about four series, obtuse in type, with green spatulate tips tapered at their apex: ray-flowers 15–30; ligules white (rarely pale-pink or pale-violet), 4 mm. long: pappus white: achene minutely pubescent.—Sandy woods or swamps, often acid, various provinces, Fla. to La., Mo., Ont., and Me.—Late sum.-fall.—The following forms may be distinguished: *A. dumosus subulaefolius*, more rigid and long straggling branches: heads somewhat larger: rameal leaves with linear blades subulate at the apex, rigid and sharp, even pungent, erect or slightly spreading: bracts acute, their narrow green bracts lanceolate to spatulate,

ranging in pinelands and cypse borders from Fla. to Tex. and S. C.: *A. dumosus strictior*, with few ascending branches often aggregated above: leaf-blades acuminate and entire, ranges in moist thickets from Tenn. to Mass.

83. *A. coridifolius* Michx. Resembles *A. dumosus*, but the stem more rigid, diffusely decompound with slender flagellate branches and branchlets; cauline leaves as in *A. dumosus*; rameal and ramular leaves uniform, and minute, greatly and abruptly reduced from the cauline, spreading or divaricate or reflexed, linear, usually not over 1 cm. long, very numerous, crowded and bract-like, giving the plant its characteristic aspect: heads small, many of them solitary on prolonged branchlets: bracts of the involucre more rigid, obtusish, their tips broad-spatulate, rounded and then apiculate.—Pinelands and sandy barrens, Coastal Plain and adj. provinces, Fla. to La. and Mass.—Sum.—fall.

84. *A. gracilipes* (Wiegand) Alexander. Stem 3–8 dm. tall, glabrous or nearly so, with erect-spreading branches and branchlets: leaf-blades firm, those of the stem narrowly linear, 2–15 cm. long, entire and rough-margined, the margins usually inrolled, those of the long, spreading branchlets not very numerous, but short, erect or appressed, acute or acutish, those of the basal leaves spatulate, often sparingly dentate: heads 10–15 mm. broad, solitary at the ends of the long branchlets, fairly numerous: involucre broadly campanulate; bracts linear-spatulate, appressed, acute or acutish with spatulate green tips: ray-flowers 14–20; ligules white, or rarely pale-violet or pinkish, 5–7 mm. long: pappus stramineous: achene sparingly pubescent or nearly glabrous. [*A. dumosus gracilipes* Wiegand].—Pinelands, sandy barrens, and moist places, Fla. (to La.?).—Fall.

85. *A. ericoides* L. Stem 3–20 dm. high, strict, much branched and bushy, the branches ascending or spreading: leaf-blades rigid, linear, entire, mostly obtuse, sessile or slightly clasping at the base, strigose or glabrate, those of the cauline leaves 1–2.5 cm. long; those of the branches very small and crowded: heads 6–8 mm. broad, densely crowded, nearly sessile: involucre turbinate, 4–6 mm. high; bracts coriaceous, pubescent, in 3 or 4 series, their short green tips obtuse or mucronate, spreading: ray-flowers 10–20; ligules white, 3–4 mm. long: pappus becoming brownish-white: achene puberulent. [*A. multiflorus* Ait.].—Dry, open places, various provinces, Ga. to Tex., S. Dak., Ont., and Me.—Late sum.—fall.

86. *A. brachypholis* Small. Stem 5–6 dm. high, finely pubescent especially above, with few, spreading branches: leaf-blades thin and fragile, as is the entire plant: those of the stem linear, fairly numerous, 2–7 cm. long, blades entire, those of the branchlets exceedingly numerous, mostly reflexed, acute, those of the basal leaves narrowly elliptic-spatulate, dentate: heads 8–10 mm. broad, secund on long, spreading branches, numerous: involucre narrowly campanulate: bracts linear, very short (no longer than the achenes), 0.5–1 mm. long, obtuse, ciliate, without green tips: ray-flowers about 12: ligules white or whitish, 3–4 mm. long: disk-flowers becoming purple: pappus white: achene elliptic, pubescent, about 1 mm. long.—Wooded slopes, often on damp rocks, Apalachicola River bluffs, Fla.—Fall.

87. *A. racemosus* Ell. Stem apparently tall, somewhat scabrous-pubescent on the ascending rather slender branches: leaves firm; blades linear or nearly so, relatively small, acute, the upper entire: heads not very numerous, racemosely or spicately disposed, rather crowded toward the ends of the branches, distant below: involucre about 4 mm. high; bracts firm, subulate to narrowly linear, acuminate: ray-flowers few; ligules purplish, 2–3 mm. long: achene minutely pubescent.—Beaches and sandy woods, Coastal Plain, Fla. to La. and S. C.—Sum.—fall.

88. *A. vimineus* Lam. Stem 6–15 dm. high, glabrous or nearly so, slender, divergently branched: cauline leaves linear-acuminate, 7–12 cm. long, regularly minutely hack-serrate, slightly narrowed at the sessile base, those of the branches much smaller: heads very numerous, 6–10 mm. broad, generally densely racemose-secund, short-peduncled: involucre broadly turbinate; bracts linear, acute or acutish, green-tipped, appressed: ray-flowers numerous: ligules about 4 mm. long, narrowly linear, white, often roseate in fading: pappus white: achene minutely pubescent.—Moist soil, various provinces, Fla. to Ark., Kans., Minn., and Mass.—Late sum.—fall.

89. *A. lateriflorus* (L.) Britton. Stem 3–15 dm. tall, puberulent or nearly glabrous, slender, divergently branched, often bushy: basal leaves few; blades ovate, short-petioled; cauline leaves numerous; blades broadly lanceolate or elliptic-lanceolate, 5–12 cm. long, mostly acuminate, serrate, those of the branches smaller, elliptic or linear-elliptic: heads 6–10 mm. broad, racemously unilateral on the branches, short-peduncled or sessile, usually numerous and crowded: involucre turbinate; bracts linear-elliptic, obtuse or acutish, imbricate in about 4 series, their short green tips appressed or slightly spreading: ray-flowers numerous; ligules short, whitish or pale-purple, rounded at the apex: disk-flowers purple: pappus white: achene minutely pubescent. [*A. diffusus* Ait.]—Dry or moist soil, various provinces, Ala. to Tex., Ark., Ont., N. S., and N. C.—Late sum.—fall.—The following forms may be distinguished: *A. lateriflorus glomeratus*, with the stem chiefly unbranched: leaves hispidulous above, the blades elliptic-lanceolate, dull green, with sharp straight teeth: heads glomerate in the axils or spicate above, or scattered on short branches, ranges in woodlands, from N. C. to N. Y.: *A. lateriflorus thyrsoides* with ashy-puberulent ascending branches which bear crowded or thyrsoid-paniculate heads: leaf-blades ovate to lanceolate, ranges in open thickets from Tenn. to Ill., Ont., and N. Y.: *A. lateriflorus horizontalis*, with long divaricate branches: leaves firm succulent, those of the branches very small, mostly entire: heads very numerous, ranges from Va. to Ark., and S. N. Y.: *A. lateriflorus pendulus*, with long slender, horizontal or drooping branches and drooping leaves, the blades narrowly linear-elliptic, remotely appressed-serrulate: heads long-peduncled, ranges in thickets from Ala. to N. C. and N. Y.

90. *A. hirsuticaulis* Lindl. Stem 4–9 dm. tall, slender, erect, pubescent, nearly or quite to the base; branches usually short spreading or ascending: leaf blades thin, glabrous above, usually densely pubescent on the midvein beneath, serrate with a few appressed teeth, or entire, of linear type, sometimes 15 cm. long, sessile or the basal ones spatulate and petioled: heads more or less secund on the branches, chiefly loosely clustered, often also solitary or few in the lower axils: involucre narrow; bracts in 3 or 4 series, linear-lanceolate, acuminate or acute: ray-flowers several; ligules white, about 4 mm. long, narrow.—Woods and thickets, various provinces N of Coastal Plain, Tenn. to Pa. and Me.—Late sum.—fall.—Unlike *A. lateriflorus* in its hirsute stem and its long linear straight-sided leaf-blades which are hirsute on the midrib beneath.

91. *A. ptarmicoides* (Nees) T. & G. Stem tufted, 3–6 dm. high, slender, rigid, usually rough above, corymbosely branched near the summit: leaf-blades linear-lanceolate, 3-ribbed, entire, or with a few distant teeth, firm, shining, rough-margined or ciliate, sometimes scabrous, acute, narrowed to a sessile base, or those of the lower leaves petioled; the lowest and basal ones 7–15 cm. long, the upper smaller, those of the branches linear subulate: heads 16–25 mm. broad, terminating the branches of the corymb: involucre nearly hemispheric, 4–6 mm. high; bracts linear-oblong, obtuse, appressed, nearly green, imbricated in about 4 series: ray-flowers 10–20; ligules snow-white, narrow, 6 mm. long: pappus white, achene glabrous.—Dry or rocky soil, various provinces, Ga. to Ark., Colo., N. W. Terr., Ont., and Mass.—Sum.—fall.—Remarkable among asters for

its profuse linear shining, rough-edged leaf-blades and small level-topped white heads.—A usually taller form from Ga. and Ark., with lower leaves 15–18 cm. long, and often denticulate, and smaller heads, is *A. ptarmicoides georgianus*.

92. *A. acuminatus* Michx. Stem 3–9 dm. high, pubescent or puberulent zig-zag, corymbosely branched, often leafless below: leaf-blades thin, broadly oblong or elliptic, 7–15 cm. long, acuminate at the apex, narrowed to a cuneate sessile base, sharply and coarsely dentate, strongly pinnately veined, glabrous or pubescent above, pubescent at least on the veins beneath, in low shaded plants often approximate above, and appearing whorled: heads several or numerous, 25–37 mm. broad: involucre nearly hemispheric; bracts subulate-linear, acuminate, the outer much shorter: ray-flowers 12–18; ligules narrow, 12–16 mm. long, white or slightly purplish: pappus copious, soft and fine, very white: achene pubescent.—Moist woods, often in acid soil, Blue Ridge and more N provinces, Ga. to Ont. and Lab.—Sum.—fall.—Remarkable for its soft-pubescent, limp subviscid leaves and its decurved buds becoming erect and fragrant in flower. The rootstocks are very slender.

93. *A. paludosus* Ait. Stem 3–7 dm. tall, roughish or rough-pubescent, especially above, slender, virgate and simple, or somewhat branched above, pale or purplish: leaf-blades linear-acuminate or nearly so, 5–15 cm. long, entire or sparingly hack-serrate, glabrous or nearly so, rather rigid, mostly 1-veined, acute, the lower part either narrowed and sheathing or somewhat auriculate, the margins rough or ciliate: heads few or several, paniculate, 3–5 cm. broad: involucre broadly campanulate; bracts imbricate in about 3–4 series, ciliate and pubescent, the upper half more or less foliaceous; the inner bracts very thin, varying from linear to spatulate, sometimes on the same plant; the outer bracts lanceolate, acute, usually exceeding the inner, often thickened-subulate at the tip: ray-flowers 20–30; ligules deep blue-violet, 10–15 mm. long: pappus tawny: achene glabrous or nearly so.—Moist, sandy soil, Coastal Plain and Piedmont, Ga. to N. C.—Fall.

94. *A. pedionomus* Alexander. Stem 3–8 dm. (rarely 1 m.) tall, from a woody corm-like rootstock, glabrous or sparingly short-pubescent above, slender and simple, but branched above, pale or purplish: leaf-blades linear to narrowly elliptic, glabrous, scabrate-margined, rigid, mostly 1-veined, acute, but slightly narrowed at the sessile or sheathing base: heads few or several, paniculate, 3.5 cm. broad: involucre nearly hemispheric; bracts imbricate in several series, the upper half squarrose, somewhat leathery in texture, the outer very long and linear-lanceolate, the inner linear or slightly spatulate: ray-flowers 20–30; ligules deep-violet, 10–20 mm. long: pappus tawny: achene somewhat pubescent.—Hard, dry soil, prairies, hillsides and woods, various provinces, Fla. and Ga. to Tex., Kans., and Tenn.—Fall.

95. *A. Gattingeri* Alexander. Stem 3–6 dm. tall, from a woody corm-like rootstock, glabrous, or sparingly short-pubescent above, slender and simple, pale or purplish: leaf-blades linear, 4–12 cm. long, entire, glabrous, scabrate margined, rather rigid, 1-veined, acute, narrowed to a sheathing base: heads sessile or short-peduncled, in a racemiform inflorescence, 3–4 cm. broad: involucre nearly hemispheric; bracts imbricate in 4–5 series, the tips spreading scabrous-ciliate, the outer foliaceous above, somewhat shorter than the inner, the inner very thin, purple tipped, as wide as the outer: ray-flowers 20–30; ligules violet, 10–12 mm. long: pappus tawny: achene slightly pubescent.—Dry, sandy soil, Coastal Plain and adj. provinces, Ala., and Miss. to Tenn.—Early fall.

96. *A. hemisphericus* Alexander. Stem 1–7 dm. tall, from a long-stoloniferous, wiry or woody rootstock, which usually forms colonies; glabrous, or sparsely pubescent above; slender, simple or sometimes branched in the inflorescence,

pale or purplish: leaf-blades linear, linear-elliptic or oblanceolate, usually scabrate on both sides, the margin especially so, acute, somewhat narrowed to a half-clasping base: heads few to several, somewhat racemiform (rarely spiciform or racemo-paniculiform), 3-6 cm. broad: involucre hemispheric or nearly so; bracts imbricate in several to many series, only the tips spreading, leathery or foliaceous, the inner much the longer, each outer series gradually becoming shorter, the outermost linear, acute, the remainder abruptly acute, the innermost very narrow: ray-flowers 15-30; ligules blue-violet or violet, 15-25 mm. long: pappus tawny: achenes somewhat pubescent.—Dry soil, hillsides, woods and prairies, various provinces, Ala. to Tex., Kans., and Mo.—Fall.—Markedly distinct from *A. pedionomus* in its gregarious habit.

97. *A. verutifolius* Alexander. Stem up to 9 dm. tall, glabrous or nearly so, slender and sparingly branched, purplish: leaf-blades most unusual for an *Aster*, with a triangular, half-sheathing base, abruptly contracted to a nearly filiform, rapier-shaped blade, 8-10 cm. long, or longer, glabrous, entire, not very rigid: heads principally on long peduncles in a loose panicle whose branches begin far down the stem, with a few short-peduncled heads in the leaf-axils, 3-4 cm. broad: involucre nearly hemispheric; bracts imbricate in about 5 series, scabrose-ciliolate, the outer narrowly linear-acuminate from a broad base, the inner rather oblong or narrowly elliptic with acuminate tips: ray-flowers 20-25; ligules violet, 12-15 mm. long: pappus tawny: achene not seen mature, but probably slightly pubescent.—Moist soil near Ocean Springs, Miss.—Fall.

98. *A. spinulosus* Chapm. Plant nearly or quite smooth to the touch, and almost without hair: stem pale, slender, 5-6 dm. high, from a short erect tuberous rootstock shaggy with marcescent leaf-bases: basal leaves tufted, very numerous, long and slender, linear and attenuate below, often 3 dm. long, with occasional long slender teeth; stem-leaves bract-like, erect, 4 cm. long or commonly half that: axile leaves upcurved, stiff and pungent: heads sessile and subremote in the upper axils, each subtended by an upturned carinate pungent involucre: leaf: ligules of the ray violet, little over 1 cm. long, broader, the disk-flowers fewer and the bracts paler-margined than in *A. paludosus*, which this otherwise resembles: pappus tawny, becoming ferruginous.—Wet pinelands. Apalachicola River region, N Fla.—Sum.—Unlike *A. paludosus* in its smaller spicate heads, longer narrower basal leaves, more pungent upper cauline leaves and less conspicuous teeth.

99. *A. eryngiifolius* T. & G. Plant nearly smooth to the touch, sparsely villous above: rootstock tuberous-thickened: stem rigid, erect, 3-7 dm. high, unbranched, with one terminal head or sometimes several large heads closely approximate: leaves grass-like, linear-acute with narrowed base, the numerous basal leaves spreading chiefly 1 dm. long or less, the others soon reduced to one-third the length, suberect, subulate-linear, sessile and bract-like; both set below the middle with long slender subremote subulate teeth: involucre broadly hemispheric; bracts nearly of the same length but of many series, linear-subulate, flat, and appressed, the upper third slender, bristle-like and spreading: ligules of the ray 3 cm. long, tapering below, light violet, blue or white: disk-flowers very numerous: pappus becoming ferruginous in the herbarium: alveolae deep and pronounced.—Low pinelands, M Fla., and adj. Ga.—Sum.

100. *A. Bracei* Britton. Plant perennial: stem rather wiry, 2-9 dm. tall: upper leaves more or less spreading; blades narrowly linear to linear-subulate: heads corymbose: involucre campanulate-turbinate; bracts stout, the inner ones not reaching to the top of the disk—Low hammocks, Florida Keys.—Fall to Spr.—(*W. I.*)

101. *A. Chapmani* T. & G. Plant perennial: stem rigid, arising from a short caudex, glabrous, usually with few slender or nearly filiform branches above: leaves mainly crowded on the caudex, 1-3 dm. long, glabrous, the linear or linear-spatulate blades longer or shorter than the slender petiole-like base, entire, obscurely veined in drying; lower cauline-leaves nearly like the basal, the upper gradually reduced to subulate-filiform erect scales, and subulate on the branches: heads few, solitary at the ends of the branches; involucre campanulate, 7-8 mm. high; bracts firm, elliptic-lanceolate to broadly linear and linear-ob lanceolate, erect, acute, sometimes abruptly pointed: ray-flowers numerous; ligules 1.5-2 cm. long, violet: achene glabrous.—Pineland swamps, Apalachicola River region, N Fla. and rare in peninsular Fla.—Fall.

102. *A. tenuifolius* L. Plant perennial, glabrous and fleshy. Stem 3-6 dm. tall, flexuous, striate, at least when dry, sparingly and loosely branched: cauline leaves linear, 5-15 cm. long, entire, sessile, or slightly clasping at the base, the lowest lanceolate-linear, those of the branches minute, scale-like, appressed: heads rather few, 12-25 mm. broad, terminating the branches: involucre turbinate, about 8 mm. high; bracts lanceolate, acuminate or mucronate, glabrous, green on the back or tips, appressed, imbricate in about 5 series, the outer shorter: ray-flowers numerous; ligules longer than the pappus, pale-purple or nearly white: pappus tawny; achene hispid-pubescent, 5-nerved.—Salt marshes, coast of Fla. to Miss. and Mass.—Sum.-fall.

103. *A. exilis* Ell. Plant annual, glabrous, fleshy: stem 3-12 dm. tall, slender, usually much-branched, the branches usually divergent: cauline leaves linear to linear-lanceolate, 2-10 cm. long, entire, sessile, acute or acuminate, or the lower narrowly elliptic, 6-8 mm. wide, usually petioled, those of the branches subulate: heads numerous, panicled, about 1 cm. broad: involucre campanulate, about 6 mm. high; bracts linear-subulate, appressed, imbricate in 3 or 4 series: ray-flowers mostly fewer than those of the disk; ligules purplish, about 4 mm. long, longer than the pappus: achene somewhat pubescent.—Moist or wet soil, especially in saline situations, various provinces, Fla. to Tex., Kans., and S. C.—Sum.-fall.

104. *A. inconspicuus* Less. Plant annual, glabrous or obscurely glandular in the inflorescence: stem mostly 1 m. tall or less, rather copiously branched above, the stem and branches flexuous: cauline leaves mostly 1-1.5 dm. long; blades elliptic or nearly so, varying to broadest above or below the middle, acute, shallowly toothed, those of the branches much narrower: heads much smaller than those of *A. exilis* and *A. subulatus*: involucre campanulate, 3.5-5 mm. high; bracts linear-lanceolate to narrowly linear: ray-flowers 20-30, more numerous than the disk-flowers; ligules mostly pale-lilac, about 2 mm. long.—Edges of hammocks or salt-marshes, Key West, Fla.—(W. I.)—Fall-wint.—Differs from *A. exilis* in the numerous ray-flowers with small ligules and from *A. subulatus* in the broad toothed blades of the cauline leaves.

105. *A. subulatus* Michx. Plant annual, glabrous and fleshy: stem 3-18 dm. tall, paniculately branched, flexuous above, slightly angled, sometimes 25 mm. in diameter at the base, but usually smaller: cauline leaves linear-lanceolate, 5-8 cm. long, acute, entire, sessile by a broad or slightly clasping base, those of the branches very small and subulate: heads numerous, 6-10 mm. broad: involucre cylindric to narrowly turbinate, 4-6 mm. high; bracts linear-subulate, green, imbricate in 3 or 4 series, the outer shorter: ray-flowers 20-30, more numerous than the disk-flowers; ligules purplish, scarcely exceeding the nearly white, soft, copious pappus: achene compressed, minutely pubescent.—Salt marshes, coast of Fla. to Ala., and N. H.—Sum.-fall.

106. *A. spinosus* Benth. Stem woody at the base, divided into striate pliable bright-green branches, 1-2.5 m. tall, these branches paniculate: leaves incon-

spicuous, those of the main branches linear or linear-spatulate, mainly 2–4 cm. long, those of the branchlets reduced to subulate scales or obsolete, all or some of them with soft subulate spines in or above their axils: heads scattered: involucre turbinate, 4–4.5 mm. high; bracts lanceolate-subulate, attenuate: ray-flowers few; ligules about 4 mm. long, white: achene glabrous.—Sand flats, river valleys and moist soil, various provinces, La. to Tex., and Calif.—Late sum.–wint.—(*Mex.*)

**39. DOELLINGERIA** Nees. Perennial, relatively tall, aster-like herbs. Leaves alternate: blades relatively broad, veiny, entire or nearly so. Heads in a terminal corymb. Involucres campanulate to hemispheric, several-many-flowered: bracts various, the inner scarcely wider than the outer but much longer. Ray-flowers few or several: corollas with a long tube and a white or cream-colored ligule. Disk-corollas with a funnelform throat and a long tube: lobes lanceolate. Pappus of 2 distinct series, the outer series of short bristles or scales, the inner of elongate capillary bristles.—About 5 species, eastern North American.—WHITE-TOPPED ASTERS.

Ray-flowers with linear ligules over 10 mm. long: inner bracts of the involucre acuminate. 1. *D. reticulata*.

Ray-flowers with oblong ligules less than 10 mm. long: inner bracts of the involucre merely acute or obtuse.

Achene nearly terete, ribless, less than 1 mm. wide.

Involucral bracts acute or acutish, the inner linear, ciliate at the tip.

Involucral bracts obtuse, the inner elliptic, eciliate.

Achene much flattened, ribbed, over 1 mm. wide.

2. *D. umbellata*.

3. *D. humilis*.

4. *D. infirma*.

1. *D. reticulata* (Pursh) Greene. Stem 3–12 dm. tall, fastigiate-corymbose above: blades of the upper leaves elliptic to obovate, obtuse or merely acutish, reticulate: inner bracts of the involucre 6–7 mm. long. [*Aster reticulatus* Pursh.]—Low pinelands, Coastal Plain, Fla. to S. C.—Spr.–sum.

2. *D. umbellata* (Mill.) Nees. Stem 6–25 dm. tall, corymbose above: blades of the upper leaves membranous, elliptic, usually narrowly so, or linear-lanceolate, usually acuminate: inner bracts of the involucre 3–4 mm. long: pappus soft. [*Aster umbellatus* Mill.]—Shaded banks and in thickets, various provinces, Ga. to Ia., Sask., and Newf.—Sum.–fall.

3. *D. humilis* (Willd.) Britton. Similar to *D. umbellata* in habit, but more stocky: blades of the upper leaves shorter, firm, elliptic, ovate, or oval, acute: inner bracts of the involucre 4–5 mm. long: pappus soft. [*Aster amygdalinus* T. & G.]—Stream-banks and acid swamps, Coastal Plain and adj. provinces, Fla. to Tex., Pa., and N. J.—Sum.–fall.

4. *D. infirma* (Michx.) Greene. Stem 4–12 dm. tall, often widely branched: blades of the upper leaves elliptic to oval, varying to broadest above or below the middle, short-acuminate: inner bracts of the involucre 3–4 mm. long: disk-corollas 3–4 mm. long: pappus rigid. [*Aster infirmus* Michx.]—Dry woods and banks, various provinces, rarely Coastal Plain, La. to Ala., Tenn., and Mass.—Sum.–fall.

**40. IONACTIS** Greene. Perennial, low, rigid, widely creeping herbs. Leaves alternate: blades narrow, entire. Heads few in a corymb or rarely solitary, conspicuously radiate. Involucres campanulate to turbinate, many-flowered: bracts narrow, the inner ones several times longer than the outer. Ray-flowers several, with bright-colored elongate ligules. Disk-corollas yellow, with a slender tube and a longer funnelform throat, the lobes deltoid. Pappus of slender bristles in 2 indistinct series, the outer bristles the shorter.—Three species, North American.

**1. I. linariifolius** (L.) Greene. Stems tufted, 1.5–6 dm. tall, rough-pubescent: leaf-blades linear-spatulate to linear, 1.5–3 cm. long, scabrous-margined: inner bracts of the involucre narrowly linear, 6–8 mm. long: ligules bright-violet or rarely white, 8–15 mm. long. [*Aster linariifolius* L.]—Exposed hillsides, dry acid woods, sand-plains, and pinelands, various provinces, Fla. to Tex., Minn., and Me.—Sum.—fall.

**41. ERIGERON** L. Annual, biennial, or perennial, caulescent, aster-like herbs. Leaves alternate, sometimes mostly basal: blades entire or toothed. Heads solitary or numerous, conspicuously radiate. Involucres broad, many-flowered: bracts narrow, the inner broader than the outer ones. Ray-flowers numerous: corollas with a slender tube and a narrow pink, violet, purple, or white ligule. Disk-corollas with a funnelform throat and a usually shorter tube: lobes deltoid. Anthers usually as long as the filaments. Stigma short. Pappus of numerous capillary bristles or bristles and scales.—About 130 species, widely distributed, but most abundant in America.—**FLEABANES.**

Plant perennial often with rosulate offsets; pappus single.

Heads with 30 ray-flowers or fewer: stem scape-like.

Heads with 50 ray-flowers or more: stem leafy.

Ray-flowers less than 75; ligules narrowly linear.

Ray-flowers over 100; ligules linear-filiform.

Plant annual or biennial: pappus double.

I. VERNI.

II. PULCHELLI.

III. PHILADELPHICI.

IV. ANNUI.

#### I. VERNI

Plant glabrous, with a corymb terminating the scape.

1. *E. vernus*.

#### II. PULCHELLI

Plant pubescent, with one or several large heads terminating the stem.

2. *E. pulchellus*.

#### III. PHILADELPHICI

Longer involucral bracts less than 4 mm. long: ligules of the ray-flowers less than 5 mm. long.

Longer involucral bracts over 4 mm. long: ligules of the ray-flowers over 5 mm. long.

3. *E. quercifolius*.

4. *E. philadelphicus*.

#### IV. ANNUI

Upper stem-leaves with sharply toothed blades: ray-flowers with pink, or rarely purplish or white ligules.

Upper stem-leaves with entire blades: ray-flowers with white or rarely pale pink ligules.

5. *E. annuus*.—

6. *E. ramosus*.

**1. E. vernus** (L.) T. & G. Stem 1–6 dm. tall, glabrous or nearly so: blades of the basal leaves spatulate, elliptic or oval: ray-flowers 20–30, white or

pink. [*E. nudicaulis* Michx.]—Moist pine-lands and shallow ponds, Coastal Plain, Fla. to La. and Va.—Spr.-sum.

2. *E. pulchellus* Michx. Stem 1-5 dm. tall, villous or hirsute-villous: blades of the basal leaves obovate, spatulate or elliptic: outer bracts of the involucre finely pubescent; inner bracts acuminate, 5-5.5 mm. long: ray-flowers 50-65; ligules violet or bluish-purple: disk-corollas 4-4.5 mm. long. [*E. bellidifolius* Muhl.]—(ROBIN'S-PLANTAIN.)—Woods and banks, various provinces, Fla. to La., Ont., and N. S.—Spr.

3. *E. quercifolius* Lam. Stem 1-7 dm. tall, pubescent: blades of the basal leaves spatulate, oblanceolate, or oblong, pinnatifid or sinuate-pinnatifid: involucre manifestly pubescent; inner bracts prolonged into slender tips: ray-flowers numerous: disk-corollas 3.5-4 mm. long.—Pinelands, grassy banks, and open woods, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and S. C.—(W. I.)—Spr.-sum.

4. *E. philadelphicus* L. Stem 1-12 dm. tall, softly hirsute: blades of the basal leaves spatulate to oblong, coarsely toothed: outer bracts of the involucre minutely hispidulous; inner bracts acute, 2.5-3 mm. long: ray-flowers 100 or more; ligules pink or rose-purple: disk-corollas 1.5-2 mm. long.—Thickets, fields, and low pastures, various provinces, Fla. to Tex., Calif., B. C., Ont., and Lab.—Spr.-sum.

5. *E. annuus* (L.) Pers. Stem 3-12 dm. tall, loosely pubescent: blades of the basal leaves oval, elliptic, or lanceolate, coarsely toothed or incised: bracts of the involucre with few long hairs: ligules of the ray pink, purplish or rarely white: disk-corollas less than half the length of the larger involucre bracts.—(DAISY-FLEABANE. SWEET-SCABIOUS.)—Waste-places, in fields, and thickets, various provinces, Ga. to Miss., Mo., Man., and N. S.—(W. I.)—Sum.—Often a weed.

6. *E. ramosus* (Walt.) B.S.P. Stem elliptic, 2-10 dm. tall, appressed-pubescent: blades of the basal leaves spatulate to elliptic, shallowly toothed: bracts of the involucre with many short hairs: ligules of the ray white or rarely pale-pink: disk-corollas over half the length of the larger involucre bracts. [*E. strigosus* Muhl. *E. strigosus* *Beyrichii* A. Gray.]—(DAISY-FLEABANE.)—Woods, fields, and roadsides, nearly throughout N. A.—Spr.-sum.—Commonly a weed.

42. **LEPTILON** Raf. Annual or biennial, weedy herbs. Leaves alternate: blades narrow, entire or sparingly toothed. Heads several or numerous, inconspicuously radiate or discoid. Involucre usually campanulate or cylindric, few-flowered: bracts very narrow, the inner much longer than the outer ones. Ray-flowers few: corollas with a very slender tube and a minute ligule. Disk-corollas with a campanulate or a cylindraceous throat and a long tube: lobes deltoid. Pappus of many brittle capillary bristles in 1 series.—About 20 species, American and Asiatic.

Inner bracts of the involucre glabrous or nearly so.

Stem usually simple below the inflorescence: ray-flowers with white ligules.

Stem-leaves with mainly entire or merely few-toothed blades.

Plant glabrate or hirsute: involucre bracts green throughout.

1. *L. canadense*.

Plant glabrous or nearly so: involucre bracts purple tipped.

Stem-leaves with mainly pinnatifid or pinnatifid-toothed blades.

Stem diffusely branched at the base: ray-flowers with purple ligules.

Inner bracts of the involucre copiously pubescent.

2. *L. pusillum*.

3. *L. bonariense*.

4. *L. divaricatum*.

5. *L. linifolium*.

1. *L. canadense* (L.) Britton. Stem 3–20 dm. tall, paniculate above, pubescent or sparingly hirsute: leaf-blades spatulate to linear or nearly so, ciliate near the base: longer bracts of the involucre 3–3.5 mm. long: disk-corollas 2.5–3 mm. long. [*Erigeron canadensis* L.]—(HORSE-WEED. BUTTER-WEED.)—Common, fields and waste-places, nearly throughout the U. S.—Sum.–fall.

2. *L. pusillum* (Nutt.) Britton. Stem as in *L. canadense*, but glabrous or nearly so: leaf-blades narrowly spatulate to linear; petioles sometimes ciliate: longer bracts of the involucre 3–4 mm. long: disk-corollas 2.5–3 mm. long.—Fields, roadsides, and waste-places, Fla. to La., Tenn., and Mass.—(W. I., Mex., C. A., S. A.)—Sum.–fall.

3. *L. bonariense* (L.) Small. Similar to *L. canadense* in habit: leaf-blades finely pubescent: longer bracts of the involucre 5–6 mm. long: disk-corollas 3.5–4 mm. long.—Waste-places, Fla.—Nat. of S. Am.—Spr.–fall.

4. *L. divaricatum* (Michx.) Raf. Stem 1–3 dm. tall, diffuse, hirsute and somewhat cinereous: leaf-blades narrowly linear to subulate, 1–4.5 cm. long, entire: disk-corollas less than 3 mm. long. [*Erigeron divaricatus* Michx.]—Dry soil, waste-places, meadows, and fields, various provinces, Ala. to Tex., Minn., and Ill.—Sum.–fall.

5. *L. linifolium* (Willd.) Small. Stem racemose or paniculate above, 2–7 dm. tall, hirsute: leaf-blades narrowly spatulate to linear, 1.5–10 cm. long, those of the lower ones incised or lacinate: disk-corollas mostly over 3 mm. long. [*Erigeron linifolius* Willd.]—Waste-places, Coastal Plain, Fla. to Miss. and S. C.—(W. I., Mex., C. A., S. A.)—Spr.–fall.

43. **BACCHARIS** L. Shrubs with much-branched, sometimes fastigate stems. Leaves alternate: blades leathery, entire or toothed. Heads dioecious, often clustered, discoid. Involucres ovoid to campanulate, many-flowered: bracts of the staminate involucre smaller than those of the pistillate. Corollas greenish, various, those of the staminate with a funnellform throat and a long tube, the lobes lanceolate: those of the pistillate flowers filiform or slightly enlarged upward. Pappus of the staminate flowers shorter than that of the pistillate. Achenes nearly terete, many-ribbed, glabrous.—About 300 species, American.

Leaf-blades broadest above the middle.

Leaf-blades entire.

Leaf-blades mostly toothed.

Inner bracts of the pistillate involucre acute: heads in peduncled panicle clusters.

Inner bracts of the pistillate involucre obtuse: heads in sessile or nearly sessile axillary clusters.

Leaf-blades narrowly linear.

1. *B. dioica*.

2. *B. halimifolia*.

3. *B. glomeruliflora*.

4. *B. angustifolia*.

1. *B. dioica* Vahl. Shrub 8–25 dm. tall: leaf-blades spatulate, often broadly so, to obovate-spatulate, 1–3 cm. long: pistillate involucre with ovate-obtuse outer bracts and linear-lanceolate acuminate inner bracts: achene 1–1.5 mm. long.—Hammocks, Everglade Keys, Fla.—(*W. I.*)—All year.

2. *B. halimifolia* L. Shrub 9–40 dm. tall, resinous: leaf-blades suborbicular to elliptic or linear-elliptic, some of them, at least, coarsely toothed: pistillate involucre about 6 mm. long; inner bracts linear: achenes 1.5 mm. long.—(GROUNDSEL-TREE. SILVERLING.)—Shore-hammocks, sea-beaches, and salt-marshes, and low grounds inland, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Mass.—(*W. I., Mex., C. A.*)—Sum.—fall.

3. *B. glomeruliflora* Pers. Shrub 8–30 dm. tall, barely resinous: leaf-blades spatulate to cuneate-obovate, 2–5 cm. long, often sharply toothed: pistillate involucre 5–6 mm. long; inner bracts oblong-spatulate: achene 1.5 mm. long.—Salt-marshes and swamps, Coastal Plain, Fla. to N. C. and hammocks in the interior of the Fla. peninsula.—(*W. I.*)—Fall-wint. or all year S.

4. *B. angustifolia* Michx. Shrub 5–25 dm. tall, resinous: leaf-blades narrowly linear, 1–8 cm. long, entire or nearly so: pistillate involucre 4–5 mm. long; inner bracts elliptic: achene 1–1.5 mm. long.—(FALSE-WILLOW.)—Salt marshes, brackish swamps, and low hammocks, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)—Fall or all year S.

44. **PLUCHEA** Cass. Herbs with often conspicuously pubescent and camphor-scented foliage, or shrubs. Leaves alternate: blades usually toothed, often prominently veined. Heads borne in corymb-like or glomerate cymes. Involucre turbinate, campanulate, or hemispheric, rather many-flowered: bracts unequal, the inner much longer and much narrower than the outer. Flowers pink to rose-purple. Pistillate flowers marginal: corollas filiform. Perfect flowers central: corollas with a funnellform or campanulate throat: lobes triangular lanceolate. Pappus a single series of capillary bristles.—About 35 species, in warm and temperate regions.—MARSH-FLEABANES.

Plant perennial.

Leaf-blades entire: stem woody.

Leaf-blades toothed: stem herbaceous.

Plant annual.

Leaves not decurrent, the stem terete, not winged.

Leaves decurrent, the stem thus winged.

I. ODORATAE.

II. FOETIDAE.

III. CAMPHORATAE.

IV. SUBDECURRENTES.

#### I. ODORATAE

Shrubby much-branched plant with heads in erect rather dense corymbs.

1. *P. odorata*.

#### II. FOETIDAE

Outer bracts of the involucre acuminate.

Leaf-blades broad at the base, and cordate-clasping.

Leaf-blades acute or merely rounded at the base, not clasping.

2. *P. foetida*.

3. *P. tenuifolia*.

Outer bracts of the involucre obtuse or merely acute.

Pappus white: upper stem-leaves little shorter than the lower.

4. *P. longifolia*.

Pappus buff: upper stem-leaves much shorter than the lower.

5. *P. imbricata*.

## III. CAMPHORATAE

Bracts of the involucre thin, sparingly pubescent.

Bracts of the involucre thick, densely pubescent.

Involucres 4-5 mm. high; inner bracts abruptly acuminate.

Involucres 6-8 mm. high; inner bracts long-acuminate.

6. *P. petiolata*.

7. *P. purpurascens*.

8. *P. camphorata*.

## IV. SUBDECURRENTES

Erect herb with corymbosely branched stem, the branches winged as well as the stem: leaf-blades shallowly toothed.

9. *P. Quitoc*.

1. *P. odorata* Cass. Plant mostly 1 m. tall or less: leaf-blades elliptic or nearly so, 8-15 cm. long: inner bracts of the involucres 3.5-4 mm. long, obtuse. Hammocks and waste-grounds, S Pen. Fla. and the Keys. Nat. of Tr. Am.—(*W. I., Mex., C. A., S. A.*)—Spr.-sum.

2. *P. foetida* (L.) DC. Plant 3-10 dm. tall, the stem usually scurfy-tomentulose: leaf-blades cuneate to elliptic, ovate-elliptic or ovate, 3-8 cm. long, thick, rather coarsely veined, denticulate or serrulate with prominently gland-tipped teeth: inner bracts of the involucre mostly 4-5 mm. long. [*P. bifrons* DC.]—Low grounds and shallow ponds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. J.—(*W. I., Mex.*)—Spr.-sum. or all year S.

3. *P. tenuifolia* Small. Plant 4-11 dm. tall, the stem thinly pubescent: leaf-blades elliptic to elliptic-lanceolate, 4-12 cm. long, thin, finely veined, sharply and coarsely serrate with slightly glandular teeth: inner bracts of the involucre 5-6 mm. long.—Pinelands, Coastal Plain, Fla. to La.—Sum.-fall.

4. *P. longifolia* Nash. Plant 6-10 dm. tall: leaf-blades elliptic, 5-16 cm. long: inner bracts of the involucre 7-19 mm. long: staminate corollas 6.5-7.5 mm. long.—Swamps, Fla.—Sum.

5. *P. imbricata* (Kearney) Nash. Plant 9-25 dm. tall: leaf-blades ovate-elliptic to triangular-ovate, 3-6 cm. long: inner bracts of the involucre 6-7 mm. long: staminate corollas 5-6 mm. long.—Swamps and pond-borders, Coastal Plain, Fla. to Ga. and S. C.—Sum.-fall.

6. *P. petiolata* Cass. Plant 5-12 dm. tall: leaf-blades mainly elliptic, 8-25 cm. long: outer bracts of the involucre ovate; intermediate bracts acuminate. [*P. foetida* DC.]—Stream-banks, swamps and ditches, various provinces, Fla. to Miss., Kans. and S Va.—Sum.-fall.

7. *P. purpurascens* (Sw.) DC. Plant 3-14 dm. tall: leaf-blades ovate-lanceolate to elliptic, 4-10 cm. long: outer bracts of the involucre ovate, acute; intermediate bracts abruptly pointed.—Hammocks and moist sandy thickets, Coastal Plain, Fla. to Tex. and Ga.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

8. *P. camphorata* (L.) DC. Plant 3-15 dm. tall: leaf-blades elliptic or lanceolate, 3-15 cm. long: outer bracts of the involucre elliptic, acute: intermediate bracts acuminate.—Salt marshes, Coastal Plain and adj. provinces, Fla. to Tex. and Mass.—(*Mex.*)

9. *P. Quitoc* DC. Plant 7-20 dm. tall: leaf-blades oblong, elliptic, lanceolate or linear-lanceolate, 4-16 cm. long: outer bracts of the involucre obtuse.—Marsh places, W Fla.—Nat. of trop. Am.—Spr.-fall.

**P. adnata** (H. & B.) C. Mohr, Mexican, with winged stem and branches: narrowly lanceolate leaf-blades; lanceolate-acuminate involueral bracts; and said to have a perennial rootstock has been reported as adventive on ballast in Ala.

**45. SACHSIA** Griseb. Perennial, inconspicuously pubescent, slender herbs. Leaves alternate, mostly basal: blades toothed. Heads scattered in open corymbs. Involucres campanulate: bracts very unequal, the inner much longer and somewhat narrower than the outer. Flowers yellow, the pistillate marginal: corollas filiform. Perfect flowers central: corollas narrowly tubular-funnelform: lobes ovate. Pappus a single series of very slender bristles. —Four species, West Indian.

**1. S. bahamensis** Urban. Plant 1-6 dm. tall: blades of the basal leaves firm, spatulate, 3-7 cm. long, those of the stem-leaves much smaller: involucre peduncled; bracts various, the outer membranous, the inner chaffy, 5-6 mm. long, very narrowly linear: achene 2.5 mm. long.—Pinelands, Everglade Keys, Fla. and Florida Keys.—(W. I.)—Spr.-sum.

**46. PTEROCAULON** Ell. Perennial, tomentose or woolly, stout herbs. Leaves alternate: blades entire or shallowly toothed, decurrent. Heads borne in contiguous or separated glomerate cymes. Involucres rather narrow, densely flowered: bracts unequal, the inner narrower than the outer. Pistillate flowers marginal: corollas filiform. Perfect flowers central: corollas with a funnelform throat and a long tube; lobes linear or lanceolate. Anthers shorter than the filaments. Pappus a single series of capillary bristles. [*Chlaenobolus* Cass.] —About 12 species, mostly American.

**1. P. undulatum** (Walt.) C. Mohr. Plant 2-7 dm. tall: leaf-blades elliptic to lanceolate, 4-12 cm. long, undulate: involucre 3.5-4 mm. high: flowers whitish or cream, lobes of the staminate corollas linear.—[*P. pycnostachya* (Michx.) Ell.]—(BLACK-ROOT.)—Pinelands, Coastal Plain, Fla. to Miss. and N. C.—Spr.-fall.—The thick black root gives this plant its common name.

**47. ANTENNARIA** Gaertn. Perennial woolly, stoloniferous herbs. Leaves alternate, those of the short caudex different from those of the flowering stem: blades entire. Heads in a terminal cluster, or rarely solitary. Involucres turbinate to campanulate, many-flowered: bracts with petaloid tips, those of the staminate involucres larger than those of the pistillate. Flowers whitish, dioecious or polygamo-dioecious. Pappus-bristles united at the base.—

About 50 species, natives of the north temperate zone and southern South America.—Spr.—EVERLASTINGS. LADIES'-TOBACCOS.

Heads corymbose or racemose: stolons more or less ascending and distantly leafy, their leaves gradually increasing in size towards the ends, with oblanceolate or spatulate blades.

Pistillate heads 6–8 mm. high: staminate heads 5–7 mm. high.

Blades of the basal leaves obovate or oval.

Blades of the basal leaves oblanceolate.

1. *A. plantaginifolia*.

2. *A. caroliniana*.

Pistillate heads 9–12 mm. high: staminate heads 6–8 mm. high.

Blades of the basal leaves broadest below the middle, in age subcoriaceous: pistillate heads rather long-peduncled, in age often racemose.

Blades of the basal leaves mostly broadest above the middle, thin: pistillate heads short-peduncled, corymbose.

3. *A. calophylla*.

4. *A. fallax*.

Heads solitary: stolons prostrate, their leaves, except those of the terminal rosette, with small or inconspicuous linear blades.

5. *A. solitaria*.

1. *A. plantaginifolia* (L.) Richards. Basal leaves 5–9 cm. long; blades about equalling the petioles, 1.5–4 cm. wide, loosely floccose, but in age glabrate above, white-tomentose beneath, obovate or nearly oval, distinctly 3-ribbed: blades of the stem leaves linear-lanceolate, acuminate: flowering stem of pistillate plants 6–20 cm. tall, of the staminate 5–12 cm. tall: pistillate heads corymbose, 6–8 mm. high, floccose at the base; bracts linear-lanceolate, acute, bright olive-green or brownish at the base, white at the tip; staminate heads more loosely clustered, 5–7 mm. high, their bracts somewhat darker at the base with elliptic, obtuse, white tips. [*A. plantaginea* R. Br. *A. decipiens* Greene *A. arkansana* Greene]—Dry soil, various provinces, Fla. to Tex., Minn., and Me.—Spr.—*A. nemoralis* Greene from E Tenn. with thinner more rounded leaf-blades may belong here; pistillate plant unknown.

2. *A. caroliniana* Rydb. Basal leaves 4–8 cm. long; blades often longer than the petioles, 1–2 cm. wide, loosely floccose, but soon glabrate above, white-tomentose beneath, oblanceolate, rounded to acutish at the apex, gradually tapering at the base, distinctly 3-ribbed; blades of the stem-leaves linear-lanceolate, acuminate: flowering stem 1–1.5 dm. tall: heads corymbose, short-peduncled; the pistillate 6–7 mm. high, their bracts linear-lanceolate, acute, greenish or brownish below, white at the tip; staminate heads about 5 mm. high, their bracts yellowish, with elliptic, obtuse, white tips.—Dry soil, Coastal Plain and Piedmont, Ala. to S. C.—Spr.

3. *A. calophylla* Greene. Basal leaves 5–10 cm. long; blades usually as long as the petioles, 2–5 cm. long, loosely floccose above, but glabrate in age, finely and densely white-tomentose beneath, broadly ovate or oval, usually broadest a little below the middle, rounded or mucronate at the apex, abruptly contracted at the base, subcoriaceous in age, distinctly 3–5-ribbed: blades of the stem-leaves linear-lanceolate, acuminate: flowering stems of pistillate plants 3–4 dm. tall: heads 10–12 mm. high, corymbose or in age often racemose, the peduncles 1–3 cm. long: bracts of the involucre linear-lanceolate, acuminate, brownish at the base, white at the tip: staminate heads densely corymbose, 7–8 mm. high, dark-brown below, with elliptic or oval white tips.—Wooded hills, various provinces, La. (or Ga.?) to Okla., Ill., and Ky.—Spr.

4. *A. fallax* Greene. Basal leaves 5–9 cm. long; blades sometimes shorter than the petioles, 2–4 cm. wide, loosely floccose and glabrate above, densely and closely white tomentose beneath, obovate-spatulate, rounded and mucronate or acutish at the apex, abruptly narrowed at the base, distinctly 3–5-ribbed: blades of the stem-leaves linear-lanceolate, acuminate: flowering stem of pistillate plants 2–4 dm. tall, that of the staminate 1–1.5 dm. tall: pistillate heads 9–12 mm. high, corymbose, the peduncles rarely 2 cm. long; bracts of the involucre linear-lanceolate, acuminate, brownish below, white at the tip: staminate heads 6–7 mm. high, corymbose, their bracts light-brown or greenish-brown below the elliptic obtuse white tips. [*A. ambigens* (Greene) Fernald.]—Woods and fields, various provinces, rarely Coastal Plain, Ga. to Mo., Minn., and Me.—The leaf-blades are broader and more rounded at the apex in the southern form than in the northern.

5. *A. solitaria* Rydb. Basal leaves 4–10 cm. long; blades much longer than the petioles, 1.5–4 cm. wide, somewhat floccose above when young, in age minutely tomentulose beneath, obovate to oblanceolate-spatulate, rounded at the apex, distinctly 3-ribbed; blades of the stem-leaves linear to elliptic: flowering stem of the pistillate plant 1–2 dm. tall, that of the staminate 0.5–1 dm. tall: heads solitary, the pistillate one about 1 cm. high; bracts linear-lanceolate, attenuate, purplish-brown except the very tips: staminate heads smaller; bracts often wine-colored, except the brownish-white spatulate tips.—Wooded slopes, often in rather acid soil, Coastal Plain and adj. provinces, Ga. to La., Ind., and Pa.—Spr.

48. *ANAPHALIS* DC. Perennial, conspicuously pubescent, erect herbs. Leaves alternate: blades narrow, entire. Heads in a terminal corymb. Involucres broad, turgid, many-flowered: bracts pearly-white, obtuse. Flowers whitish, dioecious, the staminate with a slender or filiform corolla. Pappus-bristles of the fruit-producing flowers distinct, that of the sterile flowers not thickened at the apex.—About 35 species, natives of the north temperate zone.

1. *A. margaritacea* (L.) Benth. & Hook. Plant woolly, 2–8.5 dm. tall: leaf-blades linear or nearly so, 5–15 cm. long, attenuate: involucre pearly white; outer bracts elliptic, the inner spatulate: staminate corollas 3.5–4 mm. long.—(PEARLY-EVERLASTING.)—Dry woods, hillsides, and clearings, in sterile and often somewhat acid soil, various provinces, in Coastal Plain only N, N. C. to Alas., Ont., and Newf.

49. *GNAPHALIUM* L. Annual, biennial, or perennial, pubescent herbs. Leaves alternate: blades entire, sometimes decurrent. Heads in open or glomerate cymes, panicles, or corymbs. Involucres ovoid to cylindric, several-many-flowered: bracts various, the inner longer and usually narrower than the outer. Flowers white or cream. Pistillate flowers marginal: corollas filiform. Perfect flowers central: corollas with a cylindric-funnelform throat and a slender tube: lobes ovate to deltoid. Anthers mostly longer than the filaments. Pappus a series of capillary bristles.—About 120 species, widely distributed.—Sum.—CUDWEEDS. EVERLASTINGS.

Pappus-bristles distinct, falling away separately: achene glabrous.  
Pappus-bristles united at the base, falling away together: achene pubescent.

## I. OBTUSIFOLIA.

## II. PURPUREA.

## I. OBTUSIFOLIA

Leaf-blades merely sessile.

Foliage pubescent, not viscid.

Foliage glandular-viscid.

Leaf-blades decurrent on the stem.

1. *G. obtusifolium*.2. *G. Helleri*.3. *G. Macounii*.

## II. PURPUREA

Leaf-blades manifestly more pubescent beneath than above, spatulate, sometimes broadly so.

Leaf-blades thin: stem cobwebby: involucre-clusters copiously woolly.

Leaf-blades thick: stem densely woolly or felty: involucre-clusters sparingly woolly.

Leaf-blades almost equally pubescent on both sides, linear-spatulate below, linear or mostly so above.

4. *G. spathulatum*.5. *G. purpureum*.6. *G. falcatum*.

1. *G. obtusifolium* L. Plant 2-6 dm. tall: cauline leaves 2-10 cm. long; blades elliptic-linear to linear, the upper surface glabrous or glabrate: heads corymbose-paniculate: involucre 6-7 mm. high; inner bracts glabrous. [*G. polycephalum* Michx.] — (RABBIT-TOBACCO.)—Woods, fields, and thickets, various provinces, Fla. to Tex., Man., and N. S.—Sum.—fall.

2. *G. Helleri* Britton. Plant 2-9 dm. tall: leaf-blades linear to elliptic, 3-11 cm. long: involucre 5-6 mm. high; outer bracts obtuse.—Sandy woods, various provinces, Ga. to Miss., Ky., and N. J.—Sum.—fall.

3. *G. Macounii* Greene. Plant 2-9 dm. tall: leaf-blades linear or slightly broadened upward, 6-12 cm. long: involucre 4-5 mm. high; outer bracts acute. [*G. decurrens* Ives., not L.].—Dry soil, edges of woods and clearings, Blue Ridge and more N provinces, Tenn. to Tex., Ariz., B. C., N. S., and Pa.—Sum.—fall.

4. *G. spathulatum* Lam. Plant thinly gray-pubescent, 2-4 dm. tall: leaf-blades spatulate, 2-8 cm. long: outer bracts of the involucre broadly linear.—Waste-places, cult. grounds, roadsides, and pastures, Coastal Plain and Piedmont, Fla. to Tex.—(W. I.)—Spr.—fall.

5. *G. purpureum* L. Plant white-woolly or silvery, 1-4 dm. tall: leaf-blades spatulate to linear, 2-8 cm. long: heads in sessile axillary clusters, these in virgate panicles: outer bracts of the involucre elliptic.—Woods, cult. grounds, and waste-places, various provinces, Fla. to Tex., Kans., and Me.—(W. I., Mex., C. A., S. A.)—Spr.—fall

6. *G. falcatum* Lam. Plant more slender than in *G. purpureum*, densely white-woolly, 1-4 dm. tall: leaf-blades linear-spatulate to linear, 2-6 cm. long: outer bracts of the involucre elliptic-ovate.—Pinelands and cult. grounds, Coastal Plain and adj. provinces, Fla. to Tex. and Tenn.—(S. A.)—All year.

*G. uliginosum* L. related to the species of group I in its distinct pappus-bristles; differing from them in its low diffuse habit and the congested or capitate inflorescence, has been reported from Tenn.

50. **FACELIS** Cass. Annual, small, pubescent herbs. Leaves alternate: blades narrow, entire. Heads borne in the axils or in terminal clusters. In-

volucres ellipsoid to ovoid, few-flowered: inner bracts much narrower and longer than the outer. Flowers whitish, the pistillate flowers marginal: corollas slender, truncate or nearly so. Perfect flowers central: corollas with a cylindric throat and a long tube. Anthers longer than the filaments. Pappus of numerous very long capillary bristles concreted at the base.—About 3 species, South American.

1. **F. apiculata** Cass. Plant 2–20 cm. tall, lanate: leaf-blades linear-spatulate to linear, 0.5–1 cm. long: involucre narrow; inner bracts 5–7.5 mm. long: achene long-hairy.—Roadsides and waste-places, Coastal Plain and Piedmont, Fla., Ala., and Ga.—Nat. of S S. Am.—Sum.–fall.

51. **GIFOLA** Cass. Annual, caulescent herbs resembling *Gnaphalium*. Leaves alternate: blades narrow, entire. Heads discoid, in small dense, sometimes proliferous, clusters. Involucres narrow, sessile: bracts scarious, in several series. Receptacle subulate to conic, chaffy. Flowers whitish, the pistillate marginal, fruit-producing, with filiform corollas and rudimentary or no pappus. Perfect flowers central, few, with tubular corollas and capillary pappus. Anthers sagittate at the base. Achene terete or slightly flattened.—About 10 species, in warm and temperate regions.

1. **G. germanica** (L.) Dumort. Plant silvery-pubescent, 5–35 cm. tall, the stem or branches usually proliferous above: leaves numerous, erect; blades lanceolate to linear, 1–2 cm. long, acute: involucre 3–3.5 mm. high; bracts ovate-lanceolate to elliptic-lanceolate, acuminate or cuspidate: achene about 0.8 mm. long.—(HERBA-IMPIA. COTTON-ROSE.)—Dry fields and waste-places, various provinces, Ga. to N. Y.—Nat. of Eu.—Spr.–fall.

52. **FILAGINOPSIS** T. & G. Annual or sometimes perennial woolly herbs. Leaves alternate: blades entire, commonly narrow. Heads in dense involucre clusters, discoid. Involucre broad: inner bracts longer than the outer ones. Flowers whitish, the pistillate marginal, with filiform corollas. Perfect flowers few: corollas with a cylindraceous or narrowly funnelform throat and a narrow tube. Pappus wanting.—About 12 species, natives of warm and temperate regions.

1. **F. nivea** Small. Plant 2–15 cm. tall, whitish: leaf-blades oblong to oblong-lanceolate, 5–12 mm. long: bracts of the involucre barely 2 mm. long or less: staminate corollas less than 1.5 mm. long. [*Filago nivea*

Small.]—(POVERTY-WEED. RABBIT-TOBACCO.)—Dry plains or stony soil, Coastal Plain and adj. provinces, Ga. to Tex. Naturalized E.—Spr.—sum.

**53. INULA L.** Perennial, often large, pale-pubescent herbs. Leaves alternate: blades broad, toothed, often clasping. Heads in open panicles or corymbs, terminating long peduncles, usually showy. Involucre hemispheric, very many-flowered: bracts, at least the outer ones broad, somewhat foliaceous. Ray-flowers numerous: corollas with a long tube and a narrow elongate yellow ligule. Disk-flowers numerous: corolla with narrowly funnelform throat above a narrow tube with a dilated base: lobes lanceolate. Anthers longer than the filaments. Achene columnar, ribbed. Pappus of several or many capillary scabrous bristles.—About 90 species, Eurasian and African.

**1. I. Helenium L.** Stem, 2 m. tall or less, softly pubescent: leaf-blades pale beneath, those of the basal leaves lanceolate to elliptic-lanceolate, 1-3 dm. long, petioled, those of the cauline leaves elliptic, oval, or ovate, sessile and clasping, mostly 9-20 cm. long, all toothed: involucre hemispheric, 1.5-1.7 cm. high; bracts various, the outer ovate or oval, the inner narrowly linear, about 2 cm. long: ligules yellow, narrowly linear, 2-3 cm. long: achene 4-5 mm. long, finely ribbed.—(ELECAMPANE.)—Roadsides, fence-rows, and fields, various provinces N of Coastal Plain, N. C. to Mo., Ont., and N. S. Nat. of Eu.—Sum.

**54. VICOA Cass.** Annual or perennial herbs with much-branched stems. Leaves alternate: blades narrow, shallowly toothed, at least the upper ones auricled at the base and clasping. Heads several or numerous, often radiate, rather slender-peduncled. Involucre hemispheric-campanulate, many-flowered: bracts very narrow, numerous. Ray-flowers few: corolla with a very slender tube and a short rather broad ligule. Disk-flowers numerous: corolla with a slender tube and an elongate cylindric throat: lobes triangular-lanceolate. Anthers longer than the filaments. Achene cylindric, not ribbed. Pappus of few capillary bristles.—About 8 species, Asiatic and African.

**1. V. auriculata Cass.** Annual, 1 m. tall or less, widely branched, finely pubescent and partly viscid: leaf-blades lanceolate to elliptic-lanceolate, 3-11 cm. long or much reduced on the branchlets, acute, sometimes toothed: heads erect: involucre 4-4.5 mm. high; bracts linear-lanceolate to narrowly linear, the inner ones about 5 mm. long, acuminate, sparingly glandular-pubescent, ciliate: ligules yellow, rather ob-cuneate, about 3 mm. long: achene about 0.8 mm. long, pubescent: pappus-

bristles several times longer than the achene.—Waste-places and roadsides, W Fla. Nat. of E. I.—Sum.

**55. CUPULARIA** Godr. & Gren. Perennial, much-branched, partly woody plants. Leaves alternate: blades rather narrow, toothed, clasping, more or less auricled at the base. Heads numerous, panicled, short-peduncled. Involucre campanulate, many-flowered: bracts narrow, not foliaceous. Ray-flowers few: corolla with slender tube and a short rather broad ligule. Disk-flowers rather numerous: corolla with a slender tube and a narrowly funnel-form throat; lobes triangular-lanceolate. Anthers longer than the filaments. Achene of a cylindric-ellipsoid type, not ribbed. Pappus of several capillary scabrous bristles.—About 3 species, Eurasian and African.

1. *C. viscosa* (Ait.) Godr. & Gren. Stem 1 m. tall or less, glandular-pubescent; leaf-blades elliptic to lanceolate or linear-lanceolate, 2–12 cm. long, serrate, sessile: involucre 8–9 mm. high, glandular; bracts ovate to linear or linear-spatulate, the inner 6–7 mm. long, short-acuminate: ligules yellow, elliptic, 5–7 mm. long: achene narrowly ellipsoid or slightly broadened upward, about 2 mm. long, finely pubescent.—Roadsides and waste-places, W Fla. Nat. of Eu.—Sum.—fall.

**56. SMALLANTHUS** Mackenzie. Perennial herbs. Leaves opposite: blades very broad, palmately veined. Heads conspicuously radiate. Involucre large, the outer series of bracts foliaceous, the inner narrower. Ray-flowers conspicuous, the corollas with pubescent tubes and long yellow ligules. Disk-flowers with short abortive ovaries, the corollas with cylindraceous throats and short, ciliate lobes. Stigma slender, not thickened under the appendage. Achene somewhat laterally compressed, oblique, finely striate.—One species.

1. *S. Uvedalia* (L.) Mackenzie. Stem 1–3 m. tall: leaves 1–5 dm. long; blades 3–5-lobed or angled: outer bracts of the involucre ovate to elliptic, 9–14 mm. long: ray-flowers with yellow ligules 15–20 mm. long: achene 5–6 mm. long. [*Polymniastrium Uvedalia* (L.) Small]—(BEAR-FOOT.)—Rich soil, edges of woods, thickets, and stream-banks, various provinces, Fla. to Tex., Mo. and N. Y.—Sum.—fall.

**57. POLYMNIA** L. Perennial, widely branched herbs. Leaves opposite or mainly so: blades broad, pinnately veined. Heads inconspicuously radiate. Involucre small, double, the outer series of bracts loose, the inner ones variously shaped. Ray-flowers inconspicuous, the corollas with pubescent

tubes and white, greenish, or pale-yellow, wide ligules. Disk-flowers with long abortive ovaries, the corollas with broadly funnelform throats and relatively long, ciliate lobes. Stigma stout, thickened under the tip. Anther-body broader than the appendage. Achene slightly obcompressed, not oblique, 3- or 5-ribbed, with a rounded tip. Pappus wanting.—About 10 species, American.—Sum.-fall.—LEAF-CUPS.

Foliage manifestly or copiously pubescent: achene 3-ribbed or angled.

Ray-flowers evident; ligules 5-10 mm. long.

1. *P. radiata*.

Ray-flowers inconspicuous; ligules 1-2 mm. long.

2. *P. canadensis*.

Foliage glabrous or the stem with merely puberulent nodes: achene 5-ribbed.

3. *P. laevigata*.

1. ***P. radiata*** (A. Gray) Small. Stem 5-15 dm. tall: leaves 1.5-3 dm. long; blades elliptic to oval or elliptic-ovate: intermediate bracts of the involucre rather long-acuminate: ligules of the ray white, conspicuous cuneate to oval-cuneate: achene about 5 mm. long, sharp-angled.—Rich woods, often over calcareous rocks, various provinces N of Coastal Plain, Ga. to Mo., Wis., and N. Y.

2. ***P. canadensis*** L. Stem 5-15 dm. tall: leaves 1-2 dm. long; blades elliptic, oval, or ovate: intermediate bracts of the involucre short-acuminate: ligules of the ray greenish or whitish, inconspicuous, or obsolete: achene about 3 mm. long, obtuse-angled.—Stream-banks, ravines, hillsides, and thickets, various provinces, rarely Coastal Plain, La. to Mo., Ont., and Vt.

3. ***P. laevigata*** Beadle. Stem 5-12 dm. tall: leaves 1-2.5 dm. long; blades oval to ovate or deltoid: intermediate bracts of the involucre acute: ligules of the ray, white, broad: achene barely 3 mm long.—Mt. slopes, often in somewhat acid soil over siliceous rocks, Appalachian Plateau, Ga. and Tenn.

**58. ACANTHOSPERMUM** Schrank. Annual, coarse herbs. Leaves opposite: blades broad, toothed. Heads inconspicuously radiate. Involucre double: bracts of the inner series becoming bur-like, each one surrounding an achene. Ligules of the ray-corollas concave or hooded, yellowish, inconspicuous with short pubescent tubes. Disk flowers with long abortive ovaries, the corollas with campanulate throats, short tubes, and lobes. Achene slightly flattened, fusiform or obovoid, smooth. Pappus wanting.—About 3 species, tropical American.—Spr.-fall.

Involucral bracts uniformly prickly: petioles not broadly winged.

1. *A. australe*.

Involucral bracts with 2 large spines in addition to the prickles: petioles broadly winged or leaf-blades cuneately sessile.

Leaf-blades wing-petioled, incised: involucral bracts 3-4 mm. long.

2. *A. humile*.

Leaf-blades sessile by a cuneate base: involucral bracts 4-5 mm. long.

3. *A. hispidum*.

1. ***A. australe*** (L.) Kuntze. Stem branched at the base, the branches prostrate or creeping: leaf-blades ovate, oval, or rhombic, 1-2.5 cm. long: disk-

corollas about 2 mm. long: mature involucre starfish-like.—Pinelands, waste-grounds, and roadsides, Coastal Plain and Piedmont, Fla. to La., and Va. Nat. of trop. Am.

2. *A. humile* (Sw.) DC. Stem or branches erect or ascending: leaf-blades deltoid-ovate to pandurate, 1–3 cm. long: disk-corollas about 1 mm. long: mature involucre spinescent.—Sandy roadsides and pinelands, Fla. to Ala., and at Atlantic seaports. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*).

3. *A. hispidum* DC. Stem erect, 1 m. tall or less, widely branched: leaf-blades ovate, elliptic, or oval, 3–5 cm. long, obtuse, shallowly toothed, copiously pubescent, more or less cuneate at the base, sessile: involucre campanulate: bracts (outer) elliptic to ovate, long-ciliate: mature inner bracts of the involucre similar to those of *A. humile*.—Roadsides, pinelands, and oak-woods, Coastal Plain, Fla. to Ala., and Ga. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*).

59. **SILPHIUM** L. Perennial, erect, usually large herbs. Leaves alternate or opposite: blades entire, toothed, or pinnately or pedately parted, sometimes connate-perfoliate. Heads erect. Involucre campanulate or hemispheric, many-flowered: bracts distinct, relatively broad. Ligules of the ray-corollas yellow or rarely white, conspicuous, the tube short. Disk-flowers with long abortive ovaries, the corollas with short tubes, tubular throats, and short lobes. Achene conspicuously flattened, winged. Pappus of two awns beside the apical teeth of the wings, which usually form a U- or V-shaped sinus, or wanting. —More than 30 species, North American.—**ROSIN-WEEDS. ROSIN-PLANTS.**

Leaf-blades or their petiole-like bases connate-perfoliate: stem square, sharply angled.

#### I. PERFOLIATA.

Leaf-blades not connate-perfoliate: stem terete or obtusely quadrangular.

Plants with scape-like flower-stems, the leaves basal or near the base of the stem: leaf-blades pinnately or pedately parted or lobed, or very coarsely toothed.

Heads borne in a raceme at the top of the stem, very large, the involucre 3–4 cm. wide.

#### II. LACINIATA.

Heads borne in terminal effuse or diffuse panicles, or individually solitary, relatively small, the involucre 1–3 cm. wide.

#### III. COMPOSITA.

Plants with leafy flower-stems: leaf-blades toothed or entire.

Bracts of the involucre ciliate, otherwise glabrous or nearly so.

#### IV. DENTATA.

Bracts of the involucre with pubescent surfaces as well as ciliate margins.

#### V. INTEGRIFOLIA.

#### I. PERFOLIATA

Tall often much-branched plant, with a square stem and finely rough-pubescent toothed leaf-blades.

1. *S. perfoliatum*.

#### II. LACINIATA

Ray-flowers with yellow ligules: wings of the achene prolonged into short lacerate teeth.

2. *S. laciniatum*.

#### III. COMPOSITA

Heads relatively small, the involucre less than 2 cm. broad.

Blades of the basal leaves coarsely toothed or sometimes also shallowly lobed.

3. *S. reniforme*.

Blades of the basal leaves deeply lobed or parted:

Blades mostly pedately lobed: involucre about 1 cm. wide.

Blades pinnately lobed or pinnate: involucre 1-1.5 cm. wide.

Heads small; involucre about 1 mm. broad.

Leaf-blades very scabrous: bracts of the involucre with spreading or recurved tips.

Leaf-blades smooth or nearly so: bracts of the involucre with erect or appressed tips.

Heads rather large: involucre about 2 cm. broad.

Basal leaves with petioles as long as the blades or longer: apical tips of the achene-wings obtuse.

Basal leaves with petioles scarcely half as long as the blades: apical tips of the achene-wings acute.

Heads large, the involucre over 2 cm. broad: ligules of the ray-flowers 1.5-3 cm. long.

Leaf-blades merely toothed.

Outer bracts of the involucre broader than long: leaf-blades narrowed at the base.

Outer bracts of the involucre longer than broad: leaf-blades cordate.

Leaf-blades pinnatifid, except a form with narrow undulate-toothed or undulate leaf-blades.

#### IV. DENTATA

Leaves, at least on the lower part of the stem, whorled in threes.

Leaves alternate or opposite, often both on the same plant.

Blades of the basal and lower cauline leaves narrowed at the base; those of the upper cauline leaves short-petioled or sessile.

Stem smooth and glabrous or essentially so, except sometimes near the top.

Leaf-blades smooth except the margins, or slightly scabrous.

Leaves regularly disposed along the stem; blades smooth.

Leaves mainly crowded at the base of the stem; blades scabrous near the edges.

Leaf-blades very rough-pubescent.

Leaf-blades entire.

Leaf-blades coarsely toothed.

Stem rough-pubescent.

Leaves mainly cauline, often numerous on the stem, opposite or alternate or both.

Achene with a U-shaped sinus at the top, the wings produced into two teeth above the apex.

Leaves several or numerous, usually scattered along the stem, often rather close together; blades short-petioled or sessile.

Leaves few, usually remote on the stem; blades of the upper ones, and petiole-like bases of the lower ones more or less clasping.

Achene truncate at the apex, the very narrow wings not produced into teeth at the apex.

Leaves mainly basal or approximate at the base of the stem, the stem with few remote opposite or alternate leaves, often scape-like: achenes with large apical teeth.

Blades of the basal leaves very coarsely toothed: achenes 7-8 mm. long.

Blades of the basal leaves shallowly toothed: achenes 9-10 mm. long.

Blades of the basal and lower cauline leaves cordate or truncate at the base; those of the upper cauline leaves manifestly petioled.

19. *S. nodum*.

20. *S. incisum*.

21. *S. gracile*.

22. *S. brachiatum*.

## V. INTEGRIFOLIA

Stem pubescent with short, stiff hairs, often very rough.

Upper leaves sessile, cordate or clasping.

Achenes with very short apical teeth, the sinus broadly U-shaped.

Achenes with long apical teeth, the sinus narrowly U-shaped.

Upper leaves narrowed or rounded at the base, short petioled.

Stem at least above, and involucre bracts shaggy-hispid or hispid.

Involucre bracts appressed towards the base: leaf-blades relatively narrow.

Involucre bracts loose and spreading: leaf-blades relatively broad.

23. *S. asperriumum*.

24. *S. integrifolium*.

25. *S. scaberrimum*.

26. *S. Gatesii*.

27. *S. Mohrii*.

1. *S. perfoliatum* L. Stem 8–26 dm. tall, often branched above, smooth and glabrous: leaf-blades lanceolate to ovate, 2–6 dm. long, dentate-serrate, the lower ones narrowed into broad petiole-like bases: heads showy: involucre 1–2 cm. high, broader than high; bracts ovate-lanceolate to ovate or oval, subreniform, or the inner broadly spatulate or cuneate: ray-flowers mostly 15–25; ligules bright-yellow, 2.5–3 cm. long: achene obovate, narrowly winged, 11–14 mm. long, emarginate by slight projections of the wings at the apex.—(CUP-PLANT.)—Prairies and moist soil, various provinces, Ga. to La., Ont., and Neb. Also naturalized E.—Sum.

2. *S. laciniatum* L. Stem 10–35 dm. tall, coarsely hispid: blades of the basal leaves ovate to elliptic in outline, 10–40 cm. long, the segments lanceolate to linear, entire or pinnatifid, the dilated bases of the petioles often pinnatifid: heads showy: involucre 2.5–3 cm. high; bracts broadly lanceolate or ovate-lanceolate, or with ovate or orbicular-ovate bases and involute curved tips, 2.5–4 cm. long, the outer more or less shaggy-pubescent: ray-flowers numerous; ligules yellow, 3–5.5 cm. long: achene oval-obovate to suborbicular, 12–15 mm. long, the wings erose, forming a shallow apical sinus.—(COMPASS-PLANT. ROSIN-WEED.)—Prairies, various provinces, Ala. to Tex., S. Dak., and Ohio.—Sum.

3. *S. reniforme* Raf. Stem 8–20 dm. tall, glabrous or nearly so: blades of the basal leaves ovate to reniform, 10–35 cm. long, obtuse, coarsely dentate, deeply cordate at the base; petioles longer than the blades on the lower part of the stem: involucre campanulate, 6–8 mm. high; bracts ovate or broadly elliptic to elliptic, ciliate, otherwise glabrous, the obtuse tips spreading or recurved: ray-flowers several; ligules yellow, 1–1.5 cm. long: achene suborbicular or orbicular-obovate, 7–8 mm. long; wing-tips forming a shallow apical sinus.—Dry or stony soil, Blue Ridge, N. C. and Appalachian shale slopes, Va.—Sum.

4. *S. compositum* Michx. Stem 9–20 dm. tall, glabrous, glaucous: blades of the basal leaves 10–30 cm. long, not conspicuously veined, mostly somewhat pedately parted, the segments broad; petioles longer than the midribs: heads often numerous: involucre campanulate, 7–8 mm. high; bracts ovate to broadly elliptic or oval, obtuse, ciliate, otherwise glabrous, the tips erect: ray-flowers several; ligules bright-yellow, 14–20 mm. long: achene cuneate or cuneate-obovate, 7–9 mm. long, the wing-tips broad, erose, forming a U-shaped apical sinus.—Dry woods and pinelands, Coastal Plain and adj. provinces, Ga. to Ala., Tenn., and N. C.—Sum.—fall.

5. *S. lapsuum* Small. Stem 9–22 dm. tall, glabrous, green or glaucescent: blades of the basal leaves pinnatifid or pinnately parted, the segments coarsely toothed or pinnatifid, usually very scabrous on both sides, the lower ones often long-stalked: heads few to several: involucre hemispheric, 8–10 mm. high; bracts orbicular-ovate to obovate or orbicular-obovate, obtuse, ciliate, often veiny, the tips spreading or recurved: ray-flowers mostly 6–8; ligules 8–10 mm. long: achene obovate, 8–9 mm. long, the wing-tips coarsely toothed forming a U-shaped sinus.—Sandhills and oak-woods, Coastal Plain and Piedmont, near the Fall Line, Ga., and S. C.—Sum.

6. *S. orae* Small. Stem 6–21 dm. tall, glabrous, glaucescent: blades of the basal leaves 8–16 cm. long, more or less pinnately parted, ciliate, with scattered hairs, but not rough, the lower segments sometimes long-stalked: heads rather numerous: involucre campanulate, 8–9 mm. high; bracts ovate to obovate, obtuse, ciliate, the tips erect or appressed: ray-flowers mostly 6–9; ligules yellow, 11–16 mm. long: achene obovate to orbicular-obovate, 6–7 mm. long, the wing-tips toothed, forming a small U-shaped sinus at the top.—Sandy woods, Coastal Plain, S. C. to N. C.—Sum.

7. *S. ovatifolium* (T. & G.) Small. Stem 5–20 dm. tall, glabrous or nearly so, glaucescent: blades of the basal leaves ovate to elliptic-ovate, 10–30 cm. long pinnately lobed or pinnately parted, the lobes coarsely toothed, rounded or acute; petioles longer than the midribs on the lower part of the stem: involucre campanulate, or hemispheric-campanulate, about 1 cm. high; bracts ovate to elliptic, oval, or elliptic-obovate, ciliate, rounded at the apex, the tips erect or nearly so: ray-flowers several; ligules yellow, 1–1.5 cm. long: achene sub-orbicular, about 10 mm. broad; the wing-tips irregularly toothed forming a usually V-shaped sinus.—Sandy woods, Coastal Plain, Fla. to Ga.—Spr.-sum.

8. *S. venosum* Small. Stem 8–12 dm. tall, glabrous or nearly so, glaucous: blades of the basal leaves ovate to elliptic, 9–30 cm. long, conspicuously red-veined, deeply pinnatifid or pinnately parted, the segments linear to linear-elliptic, coarsely and irregularly toothed or incised; petioles about  $\frac{1}{2}$  as long as the blades, dilated at the base: heads few, showy, corymbose: involucre campanulate, about 1 cm. high; bracts ovate or broadly elliptic to orbicular-oval, or spatulate, rounded at the apex, ciliate: ray-flowers several; ligules yellow, 1–1.5 cm. long: achene suborbicular or rhombic-orbicular about 10 mm. long, the wing-tips forming a narrow U-shaped sinus, nearly entire.—Pinelands, Coastal Plain, Ga.—Spr.-sum.

9. *S. rumicifolium* Small. Stem 4–8 dm. tall: blades of the basal leaves elliptic to elliptic-ovate or obovate, 9–15 cm. long, rounded at the apex, repand-undulate, smooth, red-veined above, rather cuneate at the base; petioles shorter than the blades, dilated and sheathing at the base: involucre hemispheric, fully 2 cm. broad; bracts various, the outer suborbicular, broader than long, the inner broadly elliptic to cuneate or spatulate, rounded at apex: ray-flowers several; ligules yellow, 1.5–2 cm. long: achene cuneate to elliptic-obovate, 9–10 mm. long, narrowly winged, nearly truncate or slightly notched at the top.—Dry, sterile soil, in the Appalachian Valley near Knoxville, Tenn.—Sum.-fall.

10. *S. terebinthinaceum* Jacq. Stem 9–30 dm. tall: blades of the basal leaves ovate to elliptic, 9–60 cm. long, coarsely dentate, with more or less prolonged teeth, usually cordate at the base: heads showy, relatively few: involucre broadly campanulate, 2–3 cm. broad; bracts various, the outer ovate, oval, or obovate, the inner elliptic, much broader than the outer, all obtuse and longer than broad: ray-flowers 15–25; ligules yellow, 2–3 cm. long: achene obovate-cuneate, 9–11 mm. long, narrowly thick-winged, truncate or notched at the top.—Dry hills and prairies, various provinces, Ga. to La., Ia., and Mich.—Sum.-fall.

11. *S. pinnatifidum* Ell. Stem 5–30 dm. tall, pubescent: blades of the basal leaves pinnatifid or pinnately parted, the segments entire or incised, or rarely some of them merely undulate; petioles shorter than the blades: heads showy: involucre hemispheric, 2–3 cm. broad; bracts various, the outer suborbicular, the inner elliptic to elliptic-lanceolate, about twice as long as the outer, all obtuse: ray-flowers 12–20; ligules yellow, 1.5–2 cm. long: achene cuneate to obovate-cuneate or cuneate, 9–10 mm. long, with a small notch at the top.—Open grounds, Appalachian provinces and Interior Low Plateaus, Ga. to Ala., and Ohio.—Sum.—An apparent extreme form with narrow (lanceolate) undulate-toothed or undulate leaf-blades is *S. chickamaugense* Canby (*S. lanceolatum* Canby, not Nutt.).

12. *S. trifoliatum* L. Stem 9–22 dm. tall, glabrous, glaucous: leaves in whorls of 3, or rarely opposite or alternate above; blades lanceolate to ovate-lanceolate or linear-lanceolate, 8–20 cm. long, remotely serrate or nearly entire, acute or slightly acuminate, scabrous on both sides: heads several or numerous, rather showy: involucre campanulate, 10–12 mm. high; bracts ovate to ovate-lanceolate and elliptic, the tips often lax or somewhat spreading, ciliate, the outer acutish, the inner obtuse: ray-flowers few; ligules yellow, 2–2.5 cm. long: achene obovate or elliptic-obovate, 8–10 mm. long, narrowly winged, the wing-tips often toothed.—Hillsides, in sterile soil, various provinces, rarely Coastal Plain, Ala. to Ohio, Pa., and Md.—A form with scabrous-pubescent stems occurs in S. C.

13. *S. glabrum* Eggert. Stem 9–15 dm. tall, smooth, often glaucescent: leaves opposite or the upper ones sometimes alternate; blades ovate-lanceolate, 8–20 cm. long, acute or short-acuminate, remotely dentate, smooth and glabrous except along the margins: heads few to several: involucre campanulate, 9–12 mm. high; bracts elliptic-lanceolate to ovate or elliptic, obtuse, ciliate, spreading at the tip or slightly recurved: ray-flowers several; ligules yellow, 2–2.5 cm. long: achene obovate, 7–9 mm. long, rather narrowly winged, the wing-tips short with acute or lacerate teeth.—Dry soil, various provinces, rarely Coastal Plain, Ga. to Miss., Tenn., and N. C.—Sum.—fall.

14. *S. confertifolium* Small. Stem 1–6 dm. tall, glaucous, smooth and glabrous: leaves mainly on the lower part of the stem, and there approximated or crowded at the base; blades firm, elliptic to ovate-lanceolate, 6–12 cm. long, acute or cuspidate, ciliate, nearly entire or shallowly toothed, slightly scabrous except near the center: involucre campanulate, 7–10 mm. high; bracts broadly ovate, elliptic or elliptic-obovate to somewhat cuneate, obtuse, merely ciliate, with spreading or recurving tips at maturity: ray-flowers several; ligules yellow, 1.5–2 cm. long: achene orbicular-cuneate to orbicular-obovate, 6–8 mm. long, margined, the wings-tips ascending.—Dry soil, Choctaw Co., on the Coastal Plain of Ala.; also Ga.(?)—Sum.

15. *S. Elliottii* Small. Stem 8–13 dm. tall, glabrous, often red or reddish: leaves alternate, or few sometimes opposite; blades lanceolate to broadly elliptic-lanceolate elliptic ovate or rarely oval, 6–12 cm. long, entire, or occasionally with few indistinct teeth, conspicuously ciliate; petioles of the lower leaves more conspicuously ciliate than the blades: heads showy, often in terminal clusters: involucre 10–12 mm. high; bracts ovate or ovate-elliptic to sub-orbicular and obovate, merely ciliate, obtuse, or the outer sometimes acutish: ray-flowers several; ligules 1.5–2 cm. long, yellow: achene obovate or cuneate-obovate, 7–10 mm. long, narrowly winged, the wing-tips short, broad, rather widely separated.—Dry soil, woods and river-banks, Coastal Plain and adj. provinces, Ga. to Ala., and N. C.—Sum.

16. *S. dentatum* Ell. Stem 6–15 dm. tall, glabrous, or sparingly pubescent near the top: leaves opposite or the upper rarely alteruate, or in whorls of 3;

blades elliptic to lanceolate or ovate-lanceolate, 5–15 cm. long, acute, commonly coarsely dentate or dentate-serrate; heads corymbose: involucre about 1 cm. high; bracts ovate-lanceolate to suborbicular, oblong or oblong-cuneate, merely ciliate, the outer ones acute, the inner obtuse: ray-flowers several; ligules yellow, 2–3 cm. long: achene obovate to oval, 6–8 mm. long, narrowly winged, the wing-tips rounded, or the sinus nearly obsolete.—Sandy soil, Coastal Plain, Fla. to Ala., and S. C.—Sum.—fall.

17. **S. Asteriscus** L. Stem 6–15 dm. tall, scabro-pubescent: leaves mostly alternate, approximate or scattered; blades elliptic to elliptic-lanceolate, ovate-lanceolate, 4–15 cm. long, more or less distinctly serrate, those of the lower leaves petioled: heads showy, solitary or few: involucre campanulate, about 1 cm. high: bracts ovate, elliptic-lanceolate to oval and elliptic, obtuse, or the outer ones acutish, merely ciliate: ray-flowers 11–15; ligules 1.5–2 cm. long: achene oval or obovate-oval, 8–9 mm. long, the wing-tips rather broad forming a rather broad sinus.—Dry soil, various provinces, Fla. to Miss., Ohio, and Va.—Sum.—fall.

18. **S. Simpsonii** Greene. Stem 9–12 dm. tall, less densely pubescent above than below: leaves opposite, the pairs rather remote; blades various, those of the basal leaves spatulate to spatulate-elliptic, 10–15 cm. long, on short-margined petioles, those of the upper part of the stem elliptic to lanceolate or ovate, 3–10 cm. long, sessile and clasping by broad bases, all coarsely crenate-serrate or slightly repand: heads few or solitary: involucres 1–1.5 cm. high: ovate-orbicular or sub-orbicular or ovate to orbicular-obovate, merely ciliate: ray-flowers 12–16; ligules yellow, 2.5–3 cm. long; achene broadly obovate or orbicular-obovate, 10–13 mm. long, broadly winged, the wing-tips erect, blunt, forming a deep U-shaped sinus.—Sandy pinelands, S. pen. Fla.—Sum.

19. **S. nodum** Small. Stem mostly less than 1 m. tall, hispid: leaves opposite, the pairs distant; blades elliptic, oval, or broadly ovate, 5–8 cm. long, shallowly and remotely dentate-serrate, obtuse or sometimes abruptly pointed, of the lower ones with short petiole-like bases: heads solitary or few together: involucre broadly campanulate, about 1 cm. high; bracts ovate or orbicular-ovate to obovate, obtuse, ciliate: ray-flowers few, ligules 1.5–2 cm. long: achene obovate or oval, 7–8 mm. long, narrowly winged, contracted into more or less of a neck at the top and truncate, the wing-tips obsolete or obscure.—Sandy soil, about Charleston, S. C.—Sum.

20. **S. incisum** Greene. Stem about 6 dm. tall, perhaps up to 1 m., hirsute: leaves opposite and alternate; blades of the basal ones ovate to ovate-lanceolate, 9–21 cm. long, coarsely dentate-serrate, abruptly narrowed or truncate at the base, on long hirsute petioles, those of the remote cauline leaves lanceolate or elliptic-lanceolate, somewhat acuminate, coarsely few-toothed, short-petioled or sessile: heads usually few: involucre broadly campanulate, about 1 cm. high; bracts elliptic-ovate to broadly ovate, ciliate, sparingly pubescent, obtuse or merely acutish, with more or less recurved tips: ray-flowers few; ligules yellow: achene obovate, 7–8 mm. long, narrowly winged, the wing-tips broad, forming a rather broad U-shaped sinus.—Appalachian provinces, Ga.—Sum.

21. **S. gracile** A. Gray. Stem 3–9 dm. tall, hirsute: leaves opposite; blades of the basal leaves elliptic-lanceolate to ovate-lanceolate, 5–30 cm. long, acute at both ends or slightly acuminate or rarely obtuse, remotely dentate-serrate, those of the remote cauline leaves elliptic to lanceolate: heads solitary or few, showy: involucre 1–1.5 cm. high; bracts ovate or orbicular-ovate to elliptic-ovate, oval, or obovate, ciliate, obtuse, or the often inconspicuously pubescent outer ones acutish, ciliate: achene suborbicular or orbicular-oval, 9–10 mm. long, or rarely larger, very broadly winged, the wing-tips broad, forming a rather shal-

low sinus.—Rocky soil, woods or prairies, Coastal Plain and adj. provinces, Ala. to Tex.—Sum.

22. *S. brachiatum* Gattinger. Stem 8–20 dm. tall, glabrous: blades of the basal leaves triangular-hastate, 8–15 cm. long, repand, the lower cauline ones triangular-hastate, truncate subcordate, or cordate at the base, repand-toothed or coarsely dentate-serrate, acute, with petioles sometimes half as long as the blades, conspicuously ciliate, blades of the upper leaves ovate-lanceolate to lanceolate, entire or nearly so: heads several or numerous, usually on long, slender, glaucous peduncles: involucre campanulate, about 1 cm. high; bracts ovate, orbicular-ovate to elliptic, or ovate-elliptic obtuse, ciliate, the tips often somewhat spreading: ray-flowers several; ligules yellow, 1–1.5 cm. long: achene suborbicular, 7–8 mm. long, narrowly winged, emarginate at the apex, the wing-tips very short and broad.—Hillsides, Appalachian Plateau, Tenn.—Sum.

23. *S. asperrium* Hook. Stem 6–15 dm. tall, scabro-pubescent: leaves opposite or sometimes alternate, especially above; blades ovate, ovate-lanceolate, elliptic-lanceolate, or lanceolate, 4–14 cm. long, acute or somewhat acuminate, entire or shallowly toothed, rounded at the base, sessile and more or less clasping: heads few or several, showy: involucre hemispheric 1.5–2 cm. high; bracts pubescent, the outer ovate or lanceolate, the inner broadly ovate, acute or obtuse, ciliate, the tips often lax or recurved: ray-flowers several or numerous; ligules 2.5–3.5 cm. long, yellow: achene obovate or oval-obovate, 9–14 mm. long or rarely smaller, the wing-tips forming a broadly U-shaped sinus.—Woods, prairies, and old fields, various provinces, Ala. to N. M., Okla., and Mo.—Sum.—fall.

24. *S. integrifolium* Michx. Stem 8–15 dm. tall, scabro-pubescent: leaves opposite or mainly so; blades ovate to broadly lanceolate, often nearly uniform in size, 7–12 cm. long, scabrous on both sides, acute, often shallowly toothed, especially on the lower part of the stem, mostly entire above: heads in rather open corymbs: involucre 1–1.5 cm. high; bracts more or less pubescent, the outer triangular-ovate to lanceolate, acute, the inner broader, obtuse, all often with recurved tips: ray-flowers 15–23; ligules bright-yellow, 2–3 cm. long: achene narrowly obovate, about 1 cm. long, broadly winged only near the top, the wing-tips broad, long, forming a narrowly U-shaped sinus.—Plains and prairies, various provinces, Miss. to Tex., Wis., and Ill.—Sum.—fall.

25. *S. scaberrimum* Ell. Stem 9–15 dm. tall, pubescent, sometimes sparingly so: leaves opposite or alternate: blades elliptic-lanceolate, ovate-lanceolate or narrowly ovate, or those of the basal leaves lanceolate, 8–20 cm. long, or rather shorter high up on the stem, acute or somewhat acuminate, sharply serrate, scabrous on both sides; heads usually few, showy: involucre campanulate, about 1 cm. high; bracts ovate-lanceolate to ovate or elliptic, not conspicuously pubescent, but ciliate, obtuse or the outer ones acutish, the inner with recurved tips: ray-flowers several; ligules about 1.5 cm. long, yellow: achene suborbicular, 5–7 mm. broad, broadly winged, the wing-tips forming a deep apical notch.—Open woods, fields, and pinelands, Coastal Plain and adj. provinces, Ga. to Miss., Tenn., and S Va.—Sum.

26. *S. Gatesii* C. Mohr. Stem 6–15 dm. tall, hispid: leaves alternate, often rather numerous; blades broadly linear to elliptic-lanceolate or lanceolate, 5–14 cm. long, acute, entire or remotely shallowly toothed, scabrous-pubescent, the lower ones petioled: heads showy; involucre campanulate, about 1 cm. high; bracts ovate-lanceolate to ovate, hispid, the outer acute and short-acuminate, coarsely hairy, the inner obtuse: ray-flowers several; ligules yellow, 12–20 mm. long: achene suborbicular or broader than high, the wing-tips forming a broad sinus.—Dry soil, various provinces N of Coastal Plain, Ala., and Tenn., to Mo.—Spr.—sum.

27. *S. Mohrii* Small. Stem 6–12 dm. tall, shaggy-hispid: leaves alternate; blades ovate-lanceolate to narrowly ovate, 5–28 cm. long, acuminate, remotely serrate with prominent teeth except near the base, or merely undulate: heads showy, but relatively few: involucre campanulate or hemispheric, 1–1.5 cm. high; bracts lanceolate to ovate-lanceolate, acute or slightly acuminate, densely hispid and conspicuously long-ciliate: ray-flowers several; ligules yellow, 10–14 mm. long: achene obovate, about 7–9 mm. long, the wing-tips acutish or blunt, widely separated.—Dry soil, Interior Low Plateaus and Appalachian Provinces, Ga. to Ala., and Tenn.—Sum.—fall.

60. *CHRYSOGONUM* L. Perennial, depressed, stoloniferous herbs. Leaves opposite: blades toothed. Heads erect. Involucre hemispheric: bracts distinct, the outer foliaceous. Ligules of the ray yellow. Disk-flowers with short abortive ovaries and corollas with a very short tube and funnelform throat. Filaments less than half as long as the anthers. Style glabrous. Achene wingless. Pappus a half cup-shaped crown.—Two or three species.

Leaf-blades truncate or abruptly cuneate at the base, deltoid-ovate: plant eventually caulescent.  
Leaf-blades gradually tapering at the base, elliptic: plant acaulescent.

1. *C. virginianum*.

2. *C. australe*.

1. *C. virginianum* L. Stem hirsute, prostrate, sometimes 6 dm. long: leaf-blades light-green, deltoid-ovate, 2.5 cm. long, long-petioled, short-pubescent on both surfaces: involucre hirsute: outer bracts 7–10 mm. long: ligules of the ray mostly 9–11 mm. long: achene 4–4.5 mm. long.—Dry woods and hillsides, Coastal Plain to Blue Ridge, Fla. to La., Tenn., and Pa.—Spr.

2. *C. australe* Alexander. Stem a mere caudex, giving off hirsute stolons which form new plants at their tips: leaf-blades dark-green, elliptic, 3–7 cm. long, tapering at the base to a long petiole, hirsute on both surfaces: involucre hirsute; outer bracts 8–9 mm. long: ligules of the ray 10–15 mm. long: mature achene not seen.—Dry woods, various provinces Fla. to Ala. and N. C.—Spr.

61. *BERLANDIERA* DC. Perennial, erect herbs, with large roots. Leaves alternate: blades toothed or pinnatifid. Heads more or less nodding. Involucre somewhat depressed: bracts broad, often veiny. Ligules of the ray-corollas yellow. Disk-flowers with long abortive ovaries and corollas with a very short tube and a funnelform throat. Filaments nearly as long as the anthers. Style pubescent. Achene wingless, 1 ribbed within. Pappus obsolete or of 2 caducous-awns.—About 8 species, North American.—Sum.—fall, or all year S.—GREEN-EYES.

Leaf-blades merely toothed or slightly pinnatifid near the base, often gray-woolly or tomentose.

Plants with stem leafy to near the inflorescence.

Plants with scapes.

Leaf-blades pinnatifid throughout: stem hispidulous.

1. *B. pumila*.

2. *B. humilis*.

3. *B. subacaulis*.

1. *B. pumila* (Michx.) Nutt. Stem 2–9 dm. tall, gray-woolly: leaf-blades elliptic, ovate, or oval, 4–10 cm. long, obtuse, crenate, truncate or subcordate

at the base or rarely narrowed, pubescent with gray wool beneath, the upper ones sessile or nearly so: involucre flattish, 2–2.5 cm. broad; bracts elliptic, oval, or obovate, obtuse, ciliate: ligules of the ray yellow, 1–1.5 cm. long: disk-corolla 3–3.5 mm. long: achene 6 mm. long, ciliate. [*B. tomentosa* Nutt.]—Sandy soil, Coastal Plain, Fla. to Ala., and N. C.

2. *B. humilis* Small. Plant 1–2 dm. tall, tomentose: leaf-blades elliptic to ovate, 3–8 cm. long, rounded at the apex, unevenly crenate, pale beneath, more or less lyrate-pinnatifid near the base, or some of them merely cordate: scape simple or corymbosely branched, the heads thus solitary or several together: involucre 1.5–2 cm. broad; bracts elliptic or lanceolate to ovate or orbicular, closely soft-pubescent: ligules of the ray 1.5–2 cm. long: achene obovate, 5–6 mm. long, woolly.—Pinelands and sandy woods, Fla.

3. *B. subacaulis* Nutt. Plant 1–5 dm. tall, hispidulous: leaf-blades deeply sinuate-pinnatifid or lyrate-pinnatifid, elliptic to oblanceolate, 4–12 cm. long, the lobes obtuse, entire or toothed: involucre about 2 cm. broad; bracts elliptic or elliptic-spatulate to obovate and cuneate, obtuse, ciliate: ligules of the ray 1–1.5 cm. long: disk-corollas 3–3.5 mm. long: achene elliptic or nearly so, 5–6 mm. long, ciliate.—Dry pinelands, Fla.

62. **PARTHENIUM** L. Coarse herbs, or shrubs, usually pale-pubescent. Leaves alternate: blades toothed, pinnatifid, or dissected. Heads inconspicuously radiate. Involucre depressed to globular: bracts appressed, broad. Ray-flowers usually 5: ligules inconspicuous, white or whitish. Lobes of the disk-corollas ovate, ciliate. Anthers longer than the filaments. Achene flattened. Pappus of 2 or 3 scales or awns.—About 12 species, American.

Leaf-blades 1–2-pinnatifid: heads not firm at maturity.  
Leaf-blades merely toothed: heads very firm at maturity.

1. *P. Hysterophorus*.  
2. *P. integrifolium*.

1. *P. Hysterophorus* L. Plant annual, 3–7 dm. tall: leaf-blades elliptic to ovate in outline: involucre saucer-like, 4–5 mm. long: achene 1–1.5 mm. long.—(RAG-WEED.) — Pinelands, waste-places, cult. grounds, and roadsides, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Pa.

2. *P. integrifolium* L. Plants perennial, 4–12 dm. tall: blades of the basal leaves elliptic to lanceolate: involucre campanulate, becoming globular, 4–6 mm. broad: disk-corollas, 2.5–3 mm. long: achene 3.5–4 mm. long.—Dry soil, woods and hillsides, various provinces, Ga. to Tex., Minn., and Md.—Spr.-sum.—*P. hispidum* Raf., with rough-pubescent foliage and coarsely toothed or incised leaf-blades, known to range from Tex. to Kans. and Mo. is to be expected from W. Tenn.

**63. ZINNIA** L.<sup>1</sup> Annual or perennial, erect herbs, or shrubby plants. Leaves opposite: blades entire or sparingly toothed, 3-ribbed. Heads showy, on usually clavate peduncles. Involucre hemispheric to somewhat cylindric: bracts broad except the inner elongate ones. Ray-flowers few: ligules red, purple, yellow, or variegated, conspicuous. Lobes of the disk-corollas lanceolate to linear, ciliate. Anthers shorter than the filaments, the appendages deltoid or lanceolate. Achene of the ray 3-angled. Pappus of 1-few awns, or wanting.—About 15 species, natives of western America.

Involucre cylindric-campanulate: chaff of the receptacle with erose or lacerate tips.

1. *Z. pauciflora*.

Involucre hemispheric: chaff of the receptacle with long-fringed, appendage-like tips.

2. *Z. elegans*.

1. ***Z. pauciflora*** L. Stem 1-6 dm. tall: leaf-blades linear-elliptic to ovate, 2-5 cm. long: outer bracts of the involucre ovate, the inner bracts linear-elliptic to slightly broadened upward, 11-13 mm. long: ligules of the ray 10-15 mm. long: lobes of the disk-corollas linear. [*Z. multiflora* L.]—Dry soil, Fla. to Ariz. and N. C. Nat. of trop. Am., but possibly native in the SW U. S.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

2. ***Z. elegans*** Jacq. Stem 1-6 dm. tall: leaf-blades elliptic to ovate, 2-10 cm. long: outer bracts of the involucre broadly obovate, the inner bracts elliptic, slightly broadened upward, 9-12 mm. long: ligules of the ray, 10-20 cm. long: lobes of the disk-corollas linear.—Waste-places, roadsides and cult. grounds, Fla. Native of Mex. and S. A., and widely cult. (*W. I., Mex., S. A.*)—Sum.-fall. The common zinnia of gardens is a cultivated form of *Z. elegans*, sometimes hybridized with *Z. pauciflora* and other species, as is shown by the varying shape of the involucre as well as the color of the ray-flowers.

**64. HELIOPSIS** L. Perennial or rarely annual, *Helianthus*-like herbs. Leaves opposite: blades serrate, petioled. Heads showy. Involucre flattish: bracts in 2 or 3 series, the outer more or less spreading. Ray-flowers several: ligules yellow, conspicuous. Disk-corollas longer than the ovaries. Stigmas long. Achene of the ray with a pappus of 2-4 teeth or a crown, or the pappus obsolete.—About 6 species, American.—Spr.-fall.—OX-EYES.

Foliage, especially the leaf-blades, very scabrous.

1. *H. scabra*.

Foliage, especially the leaf-blades, smooth or very slightly scabrous.

Heads usually over 1 cm. high: achene glabrous.

2. *H. helianthoides*.

Heads usually less than 1 cm. high: achene pubescent above.

3. *H. minor*.

1. ***H. scabra*** Dunal. Stem 8-14 dm. tall: leaf-blades thick, deltoid or broadly lanceolate, 5-15 cm. long, serrate, cuneate to truncate at the base:

<sup>1</sup> Revised by Edward Johnston Alexander.

heads showy, with broadly conic disks: bracts of the involucre linear-elliptic to elliptic, acutish or obtuse: ray-flowers several; ligules of the ray 2-2.5 cm. long, bright-yellow: bractlets slightly dilated and barely erose at the tip: achene pubescent on the margins, at least when young, each with a pappus of 1-3 short awns, or a laciniate crown.—Fields, roadsides, and woods, various provinces, Tenn. to Ark., B. C., Ont., Me., and N. J.

2. *H. helianthoides* (L.) B. S. P. Stem 3-15 dm. tall: leaf-blades thinnish, ovate to lanceolate, 8-20 cm. long, sharply serrate, cuneate to truncate at the base: heads showy, with a rounded disk usually over 1 cm. high: bracts of the involucre elliptic-lanceolate to elliptic, ciliate, acute or acutish, the outer with spreading or reflexed tips: ray-flowers several; ligules of the ray bright-yellow, 2-3 cm. long: bractlets dilated and erose at the apex: achene glabrous, truncate or obscurely 2-4-toothed at the apex. [*H. laevis* Pers.]—Banks, thickets, and open woods, various provinces, Fla. to Miss., Ont., and N. Y.

3. *H. minor* (Hook.) C. Mohr. Stem 2-7 dm. tall: leaf-blades thinnish, lanceolate, elliptic or elliptic-lanceolate, 3-10 cm. long, sharply serrate, cuneate, rounded, or truncate at the base: heads with disks usually less than 1 cm. high: bracts of the involucre ovate or lanceolate to elliptic, rather obtuse, the outer, at least, with spreading or reflexed tips: ray-flowers few; ligules bright-yellow, 1-2 cm. long: achene 2.5-3 mm. long: pappus short. [*H. gracilis* Nutt.]—Pinelands, woods, and hillsides, Coastal Plain and adj. provinces, Fla. to Ark. and Ga.

65. **TETRAGONOTHECA** L. Perennial, erect, stout herbs. Leaves opposite: blades broad, repand, saliently toothed or pinnatifid, sessile or connate-perfoliate. Heads large, resembling those of *Silphium*. Involucre with thin partially united foliaceous outer bracts, and narrower and shorter inner ones. Ray-flowers several: ligules narrow, yellow. Disk-flowers numerous: corollas with a short tube and a longer throat: lobes deltoid or triangular. Anthers mostly longer than the filaments, the appendages ovate. Stigmas slender. Achene very thick, broadened upward, striate or angled. Pappus wanting.—About 5 species, American.

1. *T. helianthoides* L. Stem 3-10 dm. tall, pubescent: blades of the upper leaves elliptic to oval, 8-15 cm. long, remotely toothed: outer involucre 4-6 cm. broad; inner bracts slenderly acuminate: ligules 3-4 cm. long: achene 5-6 mm. long.—(PINELAND-GINSENG).—Dry soil, pinelands and woods, Coastal Plain and adj. provinces, Fla. to Miss. and Va.—Spr.-fall.

66. **VERBESINA** L. Annual diffuse herbs. Leaves opposite, blades narrow, entire or sparingly toothed. Heads small, inconspicuously radiate.

Involucre hemispheric or campanulate: bracts broad, those of the outer series scarcely larger than those of the inner. Ray-flowers several: ligules white, inconspicuous. Disk-flowers numerous: corollas with a short tube and a longer funnelform throat: lobes deltoid. Anthers ellipsoid, longer than the filaments, the appendages ovate. Stigmas broad. Achene stout, 3-4-angled, or somewhat flattened in the disk. Pappus wanting or minute.—About 4 species, tropical.

1. *V. alba* L. Stem and branches 2-9 dm. long, finely pubescent: leaf-blades elliptic, or lanceolate, or narrower, 3-10 cm. long, sessile: involucre broadly campanulate, the larger bracts about 4.5 mm. long: achene about 2.5 mm. long. [*Eclipta alba* (L.) Hassk.]—Waste-places, stream-banks, and low grounds, various provinces, Fla. to Tex., N. M., Neb., and Mass. Introd. NE.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall or all year S.

67. **MELANTHERA** Rohr.<sup>1</sup> Perennial, erect herbs. Leaves opposite: blades entire, toothed, or hastate-lobed. Heads discoid, appearing gray on account of the dark anthers. Involucre hemispheric or depressed: bracts often broad, in 2 or 3 series. Throat of the white corolla much longer than the tube. Filaments generally as long as the black-tipped anthers or nearly so. Stigmas often flattened, mostly subulate. Achene compressed-quadrangular, somewhat obpyramidal, truncate.—About 12 species, tropical American.

Leaf-blades ovate to deltoid in outline.

Involucral bracts and chaff acute, obtusish, or merely short-acuminate.

Leaf-blades less than 5 cm. long: chaff short-acuminate.

Middle lobe of the leaf-blade very narrow and long with a roundish few toothed tip.

Middle lobe of the leaf-blade, if present, broad and short with an expanded many toothed tip.

Leaf-blades over 5 cm. long: chaff acute or bluntly tipped.

Involucral bracts and chaff long-acuminate.

Leaf-blades elliptic to linear in outline.

Involucral bracts fully as long as the disk, linear-lanceolate.

Involucral bracts shorter than the disk, rhombic-ovate.

1. *M. parvifolia*.

2. *M. radiata*.

3. *M. deltoidica*.

4. *M. hastata*.

5. *M. ligulata*.

6. *M. angustifolia*.

1. *M. parvifolia* Small. Stems often several together, 3-8 dm. tall, very rough-hispidulous, slender, sparingly branched: leaf-blades prominently hastate, 2-5 cm. long, or longer, the lateral lobes prominent, coarsely toothed or entire, the middle lobe elongate, contracted between the lateral lobes and the dilated apex, usually coarsely few-toothed above, the petioles rather short: heads few, usually very long-peduncled: larger bracts of the involucre 5-7 mm. long.—Pinelands and coastal sand-dunes, S pen. Fla. and the Keys.—All year.

2. *M. radiata* Small. Stems radially spreading from a woody root, 1-4 dm. long: leaf-blades ovate, 1-4 cm. long, entire and coarsely serrate, or hastately lobed and irregularly toothed, the middle lobe often obovate: larger bracts of the involucre ovate,

<sup>1</sup> Contributed by Edward Johnston Alexander.

5.5–6.5 mm. long, obtuse: corolla mostly about 6 mm. long.—Pinelands, Everglade Keys, Fla. and Florida Keys.—All year.

3. *M. deltoidea* Michx. Stem 8–24 dm. tall, somewhat rough-pubescent, often stout, considerably branched: leaf-blades ovate to deltoid or ovate-hastate or deltoid-hastate, 5–15 cm. long, obtuse or acute, crenate, or serrate, the petioles rather long: heads several or numerous, mostly rather short-peduncled: larger bracts of the involucre 3.5–5 cm. long: pappus of 2–3 bristles with a shorter fringe-like crown at their base.—Hammocks and coastal sand-dunes, S pen. Fla. and the Keys.—(*W. I.*)—All year.

4. *M. hastata* Michx. Stem 8–18 dm. tall, scabrous or hispidulous: leaf-blades 8–15 cm. long, ovate to deltoid in outline, often hastate or hastately lobed, crenate to serrate: larger bracts of the involucre 8–10 mm. long, acuminate as is also the receptacle chaff: corollas 3–4 mm. long. [*M. nivea* (Fl. SE. U. S.) *M. lobata* Small.]—Along lake and stream shores and in damp soil, Coastal Plain, Fla. to La. and S. C.—Sum.

5. *M. ligulata* Small. Stem erect, 4–7 dm. tall, finely pubescent: leaf-blades elongate-linear, mainly 8–16 cm. long, irregularly toothed, sometimes saliently so at the base: larger bracts of the involucre linear-lanceolate, 9–13 mm. long, acuminate: corolla 5–6 mm. long.—Pinelands, S pen. Fla.—Spr.

6. *M. angustifolia* A. Rich. Stem 2–8 dm. tall, strigillose: leaf-blades linear to linear-ob lanceolate, 4–8 cm. long: larger bracts of the involucre rhombic-ovate, acute, 4–5 mm. long: corolla about 4 mm. long. [*M. lanceolata* (Fl. SE. U. S.)]—Everglades and low pinelands, pen. Fla.—(*W. I.*)—Spr.—fall.

68. **SPILANTHES** Jacq. Annual or perennial (ours), diffuse or creeping herbs, or partly woody plants. Leaves opposite: blades relatively broad, often toothed. Heads radiate, often inconspicuous, long-peduncled; the disk protruding high above the involucre by the elongation of the receptacle. Involucre campanulate or flat: bracts broad, narrowed to the apex. Ligules of the ray-corollas white or yellow. Disk-flowers inflated by the bractlets: corollas yellow, the throat often somewhat inflated: lobes deltoid. Filaments very short. Achene of the disk flattened, margined. Pappus one or several awns.—About 30 species, of warm and tropical regions.

1. *S. Americana* (Mut.) Hieron. Stem 2–8 dm. long, often creeping: leaf-blades ovate to lanceolate, 2–6 cm. long, toothed: bracts of the involucre lanceolate to elliptic or ovate-lanceolate, 4–5 mm. long: ligules of the ray about 5 mm. long: disk ovoid: achene 1.5 mm. long. [*S. repens* (Walt.) Michx.]—Low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. C.—Spr.—fall or all year S.

69. **ECHINACEA** Moench. Perennial, caulescent herbs. Leaves normally alternate: blades simple, entire or toothed. Heads radiate, solitary or few, conspicuous. Involucres many-flowered, rather flat: bracts in 2–4 series, narrow. Receptacle depressed, hemispheric, chaffy. Ray-flowers several, neutral, often with imperfect styles: ligules spreading or drooping, purple or rose, rarely yellow or white. Disk-flowers perfect, fruit-producing: chaff awned, surpassing the flowers, persistent. Achene acutely 4-angled, stout.

Pappus a crown, more or less produced into triangular teeth at the angles. [*Brauneria* Neck.]—Six species, North American.—CONE-FLOWERS.

Awn of the chaff about as long as the body: root horizontal or horizontally inclined, fibrous. I. PURPUREAE.

Awn of the chaff shorter than the body: root vertical, fusiform. II. ANGUSTIFOLIAE.

## I. PURPUREAE

Rather coarse herb, with leaf-blades ovate lanceolate.

## II. ANGUSTIFOLIAE

Plant glabrous or glabrate.

Plant hirsute or hispid.

Ray-flowers with drooping ligules 4-8 cm. long.

Ray-flowers with spreading ligules 1.5-2.5 cm. long.

1. *E. purpurea*.

2. *E. laevigata*.

3. *E. pallida*.

4. *E. tennesseensis*.

1. *E. purpurea* (L.) Moench. Stem scabrous-pubescent, 6-12 dm. tall: leaf-blades ovate to lanceolate, 5-12 cm. long, serrate or dentate-serrate: bracts of the involucre linear to linear-lanceolate, hispidulous: ligules of the ray 2.5-5 cm. long, or rarely shorter, purple or somewhat crimson or whitish. [*B. purpurea* Britton.] Rich soil, woods, and fields, various provinces, Ala. to La., Mo., S Va., and N. C.—Sum.—fall.

2. *E. laevigata* (Boynton & Beadle) Small. Stem glabrous, about 10 dm. tall: blades of the basal and lower cauline leaves 1.5-3.5 cm. wide: bracts of the involucre lanceolate to elliptic-lanceolate, merely ciliate: ligules of the ray 3-6 cm. long, rose-color. [*B. laevigata* Boynton & Beadle.]—Woods and fields, Piedmont of S. C.—Sum.—fall.

3. *E. pallida* Nutt. Stem hispid, 5-10 dm. tall: leaf-blades broadly linear to narrowly elliptic, 5-20 cm. long: bracts of the involucre lanceolate, hispid: ligules of the ray 4-8 cm. long, pale or deep rose-color. [*B. pallida* Britton.]—Dry soil, prairies, barrens, and hillsides, various provinces, Ala. to Tex., Minn., and Mass.—Spr.—sum.

4. *E. tennesseensis* (Beadle) Small. Stem shaggy-hispid, 2-3 dm. tall: leaf-blades linear, 5-18 cm. long: bracts of the involucre lanceolate, bristly: ligules of the ray 1.5-2.5 cm. long, purplish. [*B. tennesseensis* Beadle.]—Gravelly hillsides, Interior and Ozark Plateaus, Tenn. and Ark.—Spr.—sum.

70. **VIGUIERA** H.B.K. Annual herbs. Leaves alternate: blades narrow, entire. Heads conspicuously radiate, the disk elongating in age. Involucre campanulate or hemispheric: bracts lax, narrow, unequal. Receptacle conic, becoming columnar. Ray-flowers several: ligules yellow. Disk-corollas with a very short tube and a broadly campanulate throat: lobes lanceolate, longer than the throat. Anthers slightly longer than the filaments. Achene turgid. Pappus obsolete or wanting.—About 150 species, natives of the Western Hemisphere.

1. *V. Porteri* (A. Gray) Blake. Annual, 2-12 dm. tall, hispid: leaf-blades narrowly linear to narrowly linear-lanceolate, 3-15

cm. long: heads showy: outer bracts of the involucre linear or linear-lanceolate, 6-10 mm. long, acuminate: ligules 1-2 cm. long: achene 2.5-3 mm. long. [*Gymnolomia Porteri* A. Gray.]—Granite outcrops, Stone Mt. and vicinity in the Piedmont of Ga.—Sum.—fall.

**71. RUDBECKIA** L.<sup>1</sup> Perennial or sometimes annual or biennial, often pubescent herbs. Leaves alternate: blades entire, toothed, or pinnatifid. Heads erect. Involucre hemispheric or depressed, many-flowered: bracts spreading or reflexed, often unequal. Receptacle conic or convex. Ray-flowers several: ligules yellow, rarely discolored or crimson, spreading or drooping. Disk-flowers crowded: corollas with a short tube and a longer throat: lobes deltoid or ovate. Anthers longer than the filaments. Achene 4-angled, flat-topped. Pappus merely a low crown or obsolete.—About 40 species, North American.—CONE-FLOWERS.

Stigmas with short obtuse tips: pappus present except in *R. mollis*.

Chaff of the receptacle acute, mucronate or obtuse.

Chaff canescent or pubescent at the apex.

Leaf-blades, at least those of the lower leaves, deeply lobed or divided.

Leaf-blades entire or merely toothed.

Disk globose-ovoid, ovoid-conic, or hemispheric: plant pubescent: corolla-lobes reflexed after anthesis.

Disk cylindric or conic-cylindric at maturity: plant glabrous: corolla-lobes erect after anthesis.

Chaff ciliate or fimbriate, denticulate or entire at the apex.

Chaff ciliate or fimbriate.

Chaff with entire, hyaline, or erose-denticulate tips.

Leaf-blades various, but not elongate-linear.

Leaf-blades elongate-linear.

Chaff of the receptacle aristate or subulate.

Stigmas with slender subulate tips: pappus wanting.

Plant annual or biennial.

Plant perennial.

#### I. LACINIATAE

Plant glabrous or glabrate.

Plant cinereous-pubescent.

Disk greenish-yellow.

Disk brown-purple, anise-scented.

#### II. HELIOPSIDES

Cauline leaves with petioled blades.

Heads small, the disk about 1 cm. in diameter.

Heads large, the disk 1.5-2.5 cm. in diameter.

Stem glabrous or glabrate.

Stem hispid or scabrous.

Cauline leaves with closely sessile or partly clasping blades.

#### III. LAEVIGATAE

Leaves glaucous; blades oval, broadly ovate, or elliptic.

Leaves lustrous; blades narrower.

Leaf-blades ovate-spatulate to lanceolate-elliptic.

Leaf-blades elongate-lanceolate to linear-lanceolate, attenuate at both ends.

#### IV. FULGIDAE

Blades of the basal and lower cauline leaves cordate or truncate.

Chaff of the disk 1.5-2.5 mm. wide, densely ciliate at the tip.

Chaff of the disk narrower, sparsely ciliate at the tip.

<sup>1</sup> Contributed by Charles Lawrence Boynton and Chauncey Delos Beadle.

9. *R. nitida*.

10. *R. glabra*.

11. *R. umbrosa*.

12. *R. Chapmanii*.

Blades of the basal and lower cauline leaves not cordate or truncate.

Involucral bracts ciliate, glabrous above: leaves larger, with long-acuminate blades.

Stem glabrate or glabrous.  
Stem strigose.

Involucral bracts ciliate, pubescent above: leaves small or medium, with acute or short-acuminate blades.

Upper leaves with cuneiform or elliptic-lanceolate blades.

Well-developed disks 1–1.5 cm. in diameter: ligules of the ray relatively short.

Well-developed disks smaller: ligules relatively large.

Upper leaves with conspicuously dilated blade.

13. *R. palustris*.

14. *R. acuminata*.

15. *R. fulgida*.

16. *R. foliosa*.

17. *R. spathulata*.

#### V. SPECIOSAE

Ligules of the ray large and showy, much exceeding the diameter of the disk.

Leaf-blades laciniate or very coarsely dentate.

Prevailing leaves with blades of an ovate type.

Prevailing leaves with blades of a narrower type.

Leaf-blades remotely and shallowly dentate or entire.

Plant glabrous or nearly so.

Plant densely hirsute.

Ligules short, often less than the diameter of the disk.

#### VI. GRAMINIFOLIAE

Plant pubescent: ligules of the ray crimson.

Plant glabrous: ligules yellow.

23. *R. graminifolia*.

24. *R. Mohrii*.

#### VII. TRILOBAE

Blades of the lower cauline leaves, or some of them palmately 3-lobed.

Disk 5–13 mm. wide: ray-flowers with ligules 1.5–2.5 cm. long.

Disk 15–20 mm. wide: ray-flowers with ligules 2–3.5 cm. long.

Blades of the lower cauline leaves, or some of them pinnately 5–7 lobed.

Bracts of the involucre, or most of them, as long as the ligules of the ray: Alleghenian species.

Bracts of the involucre, or most of them, not half as long as the ligules: Floridian species.

25. *R. triloba*.

26. *R. rupestris*.

27. *R. Beadlei*.

28. *R. pinnatiloba*.

#### VIII. BICOLORES

Plant hispid: ligules of the ray brown-purple at the base.

29. *R. bicolor*.

#### IX. HIRTAE

Well-developed disks 1 cm. in diameter or more: ligules of the ray large and showy.

Blades of the upper cauline leaves not of an ovate type.

Petioles of the basal leaves not exceeding 1 dm. in length.

Leaf-blades broader than linear.

Main axis or stem not divergently branched.

Upper cauline leaves elliptic-lanceolate or lanceolate, or narrower.

Upper cauline leaves elliptic, subcordate-clasping.

Main axis or stem divergently branched, usually from near the base.

Leaf-blades linear or linear-lanceolate, elongate.

Petioles of the basal leaves, or some of them, conspicuously elongate.

Blades of the upper cauline leaves, or some of them, of an ovate type.

Blades of the basal leaves 5–6 cm. wide: involucral bracts often foliaceous.

Blades of the basal leaves narrower: involucral bracts not foliaceous.

Well-developed disks smaller: ligules of the ray short.

30. *R. hirta*.

31. *R. amplexens*.

32. *R. divergens*.

33. *R. sericea*.

34. *R. longipes*.

35. *R. Brittonii*.

36. *R. monticola*.

37. *R. floridana*.

1. *R. laciniata* L. Stem 6–20 dm. tall, glabrous or nearly so: blades of the upper leaves less deeply lobed than those of the lower, or merely cleft: bracts of the involucre elliptic to lanceolate: ligules of the ray 2–4 cm. long: disk becoming cylindric or long-conic.—Rich woods, thickets, and meadows, various provinces, N. Fla. to La., Man., and Que.—Sum.—fall.—Cult. in several forms.—A full double form is common in cultivation under the name *Golden-glow*.

2. *R. heterophylla* T. & G. Stem 4–16 dm. tall, cinereous-pubescent: blades of the upper leaves coarsely toothed, or lobed: bracts of the involucre elliptic to elliptic-lanceolate: ligules of the ray 1–2.5 cm. long: disk subglobose.—Swamps, woods, and damp places, N. Fla.—Sum.

3. *R. subtomentosa* Pursh. Stem 6–15 dm. tall, cinereous-pubescent: blades of the upper leaves mostly undivided: bracts of the involucre linear or nearly so: ligules of the ray 2–3 cm. long: disk hemispheric to ovoid-conic.—Dry soil and low grounds, various provinces, Tenn. to Miss., Tex., Kans., Ia., and Ill.—Sum.—fall.

4. *R. Heliopsisidis* T. & G. Stem 3–7 dm. tall, glabrate or softly pubescent: leaf-blades elliptic-ovate to ovate-lanceolate, 3–10 cm. long, serrate: bracts of the involucre elliptic to linear-lanceolate: ligules of the ray 1.5–2.5 cm. long: disk subglobose, about 1 cm. in diameter: pappus nearly obsolete.—Woods and low grounds, Piedmont to Appalachian Plateau, Ga. and Ala.—Sum.—fall.

5. *R. alismaefolia* T. & G. Stem 5–9 dm. tall, hispidulous or scabrous above: leaf-blades oval or elliptic, 5–12 cm. long, repand-denticulate to nearly entire: bracts of the involucre linear to elliptic: ligules of the ray 3–4 cm. long: disk subglobose, 1.5–2 cm. in diameter: pappus prominent.—Pine-woods and prairies, Coastal Plain and adj. provinces, La. to Tex. and Ark.—Sum.—fall.

6. *R. grandiflora* C. G. Gmel. Stem scabrous or hispid throughout: leaf-blades ovate-elliptic to lanceolate, 6–15 cm. long, usually shallowly toothed: bracts of the involucre linear: ligules of the ray 3–4 cm. long: disk ovoid or ovoid-globose, 1.5–2.5 cm. in diameter: pappus prominent.—Dry prairies, Coastal Plain and adj. provinces, La. to Tex. and Mo.—Sum.

7. *R. mollis* Ell. Stem 3–10 dm. tall, gray-hirsute: leaf-blades elliptic-spatulate to elliptic, 1.5–6 cm. long, crenate or nearly entire: bracts of the involucre linear to linear-lanceolate: ligules of the ray 2–3.5 cm. long: disk hemispheric, 1.5–2 cm. in diameter: pappus wanting.—Pinelands and dry soil, Coastal Plain, Fla., also E Ga.—Spr.—sum.—Little known.

8. *R. maxima* Nutt. Stem 9–30 dm. tall, glaucous: leaf-blades elliptic, oval, or ovate, or sometimes pandurate, 6–30 cm. long, dentate or repand-dentate: bracts of the involucre linear to linear-lanceolate: ligules of the ray 1.5–4 cm. long: disk ellipsoid to conic-cylindric, 3–4.5 cm. long: pappus conspicuous.—Moist soil, various provinces, La. to Tex., Okla., and Mo.—Spr.—sum.

9. *R. nitida* Nutt. Stem 6–12 dm. tall, glabrous: leaf-blades ovate-spatulate to lanceolate-elliptic, 8–15 cm. long, nearly entire to repand-dentate: bracts of the involucre linear to linear-lanceolate: disk cylindric to conic-cylindric, 3–4.5

cm. long.—Low pinelands and pond-margins, Coastal Plain, Fla. to Tex. and Ga.—Spr.—fall.

10. *R. glabra* DC. Stem 6–12 dm. tall, glabrous: leaf-blades elongate-lanceolate to linear-lanceolate, 9–30 cm. long, repand-dentate or undulate, veiny: bracts of the involucre linear: ligules of the ray 3–5 cm. long: disk cylindric or conic-cylindric, 2–4 cm. long.—Low grounds, Coastal Plain, Fla. to Tex. and Ga.—Spr.—fall.

11. *R. umbrosa* Boynton & Beadle. Stem 4–10 dm. tall, pubescent: blades of the lower leaves ovate, coarsely serrate: bracts of the involucre elliptic to linear-elliptic, 10–15 mm. long: ligules of the ray 1.5–2 cm. long.—Moist soil, Appalachian provinces and Interior Low Plateaus, Ga. to Ky.—Sum.

12. *R. Chapmanii* Boynton & Beadle. Stem 4–10 dm. tall, glabrous or glabrate: blades of the lower leaves ovate-lanceolate, dentate or coarsely crenate-dentate: bracts of the involucre linear or linear-elliptic, 6–12 mm. long: ligules of the ray 1.5–2.5 cm. long.—Mt. slopes, Blue Ridge, Ga. and Ala.—Sum.

13. *R. palustris* Eggert. Stem 5–7 dm. tall, glabrous or glabrate, at least below: blades of the lower leaves ovate-lanceolate, remotely serrate or dentate, or nearly entire: bracts of the involucre linear to linear-oblong, mostly obtuse: ligules of the ray 1–2 m. long.—Low grounds, wet banks, and cedar-glades, Interior and Ozark Plateaus, Tenn. to Mo. and Ky.—Sum.—fall.

14. *R. acuminata* Boynton & Beadle. Stem 5–8 dm. tall, strigose: blades of the lower leaves lanceolate, remotely serrate with low teeth or entire: bracts of the involucre lanceolate, acute: ligules of the ray 1–2.5 cm. long.—Woods, Interior Low Plateau, Tenn.—Sum.

15. *R. fulgida* Ait. Stem 3–7 dm. tall, hirsute or somewhat hispid: blades of the lower leaves lanceolate, elliptic-lanceolate, or cuneiform, remotely toothed or entire: bracts of the involucre linear to linear-lanceolate: ligules of the ray 9–15 mm. long: disk 1–1.5 cm. wide.—Woods, thickets, meadows, low grounds, and swamps, various provinces, rarely Coastal Plain, Ala. to Miss., Tenn., W. Va., Pa., and N. C.—Fall.

16. *R. foliosa* Boynton & Beadle. Stem 3–7 dm. tall, pubescent or somewhat hispid: leaf-blades lanceolate, elliptic-lanceolate, elliptic or cuneiform, sparingly serrate or entire: bracts of the involucre linear to elliptic-linear: ligules of the ray 1–1.5 cm. long: disk mostly less than 1 cm. wide.—Woods and thickets, mostly in marly places, Coastal Plain and Piedmont, Fla. to N. C.—Sum.—fall.

17. *R. spathulata* Michx. Stem 3–7 dm. tall, minutely pubescent: blades of the lower leaves lanceolate, elliptic, or oblanceolate, entire, or minutely and remotely toothed: bracts of the involucre linear, mostly acute: ligules of the ray 1–2 cm. long: disk about 1 cm. wide.—Woods, and along streams, various provinces, rarely Coastal Plain, Ga. to Ala., Tenn., and N. C.—Sum.—fall.

18. *R. Sullivantii* Boynton & Beadle. Stem 5–10 dm. tall, hispid or glabrate: blades of the lower leaves oval, ovate, or ovate-lanceolate, irregularly coarse-toothed: bracts of the involucre linear-elliptic, obtuse: ligules of the ray 2–4 cm. long: disk 12–18 mm. wide.—Low grounds, various provinces N of Coastal Plain, Ala. to Mich.—Sum.—fall.

19. *R. speciosa* Wenderoth. Stem 5–10 dm. tall, hirsute or somewhat hispid: blades of the lower leaves elongate-lanceolate, often falcate, irregularly coarse-

toothed: bracts of the involucre linear to linear-lanceolate: ligules of the ray 2–3.5 cm. long: disk 13–20 mm. wide.—Woods and low grounds, various provinces N of Coastal Plain, Ga. to Ala., Mo., and Pa.—Sum.–fall.

20. *R. truncata* Small. Stem 3–8 dm. tall, glabrous or nearly so: blades of the lower leaves narrowly lanceolate to elliptic or elliptic-linear, remotely and shallowly dentate or entire: bracts of the involucre linear to linear-lanceolate: ligules of the ray 1.5–2 cm. long: disk 10–15 mm. wide.—Woods and low grounds, Blue Ridge to Appalachian Plateau, Ga. to Ala. and Tenn.—Fall.

21. *R. missouriensis* Engelm. Stem 4–6 dm. tall, hirsute: blades of the lower leaves linear-lanceolate to linear, entire: bracts of the involucre linear to linear-elliptic: ligules of the ray 1.5–2.5 cm. long: disk 10–15 mm. wide.—Dry hills and rocky soil, La. to Mo.—Sum.–fall.

22. *R. tenax* Boynton & Beadle. Stem 4–8 dm. tall, sparingly pubescent, often hirsute: blades of the lower leaves ovate-lanceolate to lanceolate, remotely shallow-dentate or entire: bracts of the involucre elliptic to lanceolate: ligules of the ray 6–12 mm. long: disk 10–18 mm. wide.—Woods and fields, Interior Low Plateau, Ala. and Tenn.—Sum.–fall.

23. *R. graminifolia* (T. & G.) Boynton & Beadle. Stem 6–8.5 dm. tall, pubescent: blades of the lower leaves elongate-linear, grass-like, entire, the midrib alone prominent: bracts of the involucre mostly lanceolate: ligules of the ray 8–12 mm. long: disk hemispheric to elliptic-ovoid. [*Echinacea? atrorubens graminifolia* T. & G.]—Pineland ponds, Coastal Plain, N Fla. and Ga.—Spr.–sum.

24. *R. Mohrii* A. Gray. Stem 4–12 dm. tall, glabrous: blades of the lower leaves linear or elongate-linear, several-ribbed: bracts of the involucre linear to linear-lanceolate: ligules of the ray 15–30 mm. long: disk ovoid-conic to conic-cylindric. [*R. bupleuroides* Shuttlew.]—Pineland ponds and moist pine-lands, Coastal Plain, N Fla. and Ga.—Sum.

25. *R. triloba* L. Stem 6–15 dm. tall, hispid or hirsute: blades of the upper leaves ovate-lanceolate to lanceolate: bracts of the involucre linear to linear-lanceolate: ligules of the ray 15–25 mm. long: disk subglobose to conic-globose, 5–13 mm. broad.—Moist soil, rocky woods, old fields, and thickets, various provinces, Ga. to Tex., Kans., Mich., and N. J.—Sum.–fall.

26. *R. rupestris* Chickering. Stem 7–15 dm. tall, sparingly pubescent: blades of the upper leaves ovate: bracts of the involucre lanceolate to elliptic-lanceolate: ligules of the ray 20–35 mm. long: disk hemispheric to ovoid-conic, 15–20 mm. broad. [*R. triloba rupestris* A. Gray.]—Rocky slopes, Roan Mt. and adj. peaks, in the Blue Ridge of N. C. and Tenn.—Sum.–fall.

27. *R. Beadlei* Small. Stem 6–15 dm. tall, hirsute: blades of the upper leaves lanceolate: bracts of the involucre linear to linear-lanceolate: ligules of the ray 11–20 mm. long: disk 5–10 mm. wide.—Rocky slopes, above 1,000 m., in the Blue Ridge of N. C.—Sum.

28. *R. pinnatiloba* (T. & G.) Beadle. Stem 6–12 dm. tall, softly hirsute: blades of the upper leaves ovate-lanceolate: bracts of the involucre linear to linear-lanceolate: ligules of the ray 10–15 mm. long: disk 6–9 mm. broad. [*R. triloba pinnatiloba* T. & G.]—Calcareous soil, W Fla.—Sum.–fall.

29. *R. bicolor* Nutt. Stem 3-9 dm. tall, hispid: blades of the upper leaves elliptic to lanceolate, sometimes narrowly so: bracts of the involucre elliptic-lanceolate to linear: ligules of the ray 15-25 mm. long, brown-purple at the base.—(NIGGER-TEATS. THIMBLE-FLOWER.)—Woods, dry hills, and sandy soil, various provinces, Ala. to Tex., Ark., and Tenn.—Spr.—sum.

30. *R. hirta* L. Stem 3-7 dm. tall, hirsute or hispid: blades of the upper leaves elliptic, oblong, or lanceolate, or nearly linear: bracts of the involucre linear-lanceolate or linear-elliptic: ligules of the ray 20-35 mm. long: disk 10-18 mm. wide.—(YELLOW-DAISY. BLACK-EYED SUSAN.)—Fields, roadsides, and woods, various provinces, Fla. to Okla., S. Dak., and Que. Native mainly W.—Sum.

31. *R. amplexens* T. V. Moore. Stem 3-6 dm. tall, hispidulous: blades of the upper leaves elliptic: bracts of the involucres linear-elliptic to linear-lanceolate: ligules of the ray 10-20 mm. long.—Dry soil, Piedmont, Ga., and S. C.—Sum.

32. *R. divergens* T. V. Moore. Stem 3-10 dm. tall, hirsute or hispid: blades of the upper leaves elliptic to lanceolate or almost linear: bracts of the involucre linear or linear-lanceolate: ligules of the ray 15-30 mm. long: disk 12-18 mm. wide.—Pinelands and fields, Coastal Plain, Fla. to S. C.—Spr.—sum.—This and related species are used by the Seminoles as a cold infusion in cases of fever and headache.

33. *R. sericea* T. V. Moore. Stem 5-12 dm. tall, hispid: blades of the upper leaves linear-lanceolate to linear, shallowly toothed: bracts of the involucre linear to elliptic-linear or lanceolate: ligules of the ray 20-40 mm. long: disk 12-20 mm. long.—Dry woods and fields, various provinces N of Coastal Plain, Ga. to Ala., Mo., and S. Dak.—Sum.

34. *R. longipes* T. V. Moore. Stem 3-10 dm. tall, hispid: blades of the upper leaves lanceolate to elliptic-lanceolate, entire or toothed bracts of the involucres linear-lanceolate to elliptic-lanceolate: ligules of the ray 20-35 mm. long: disk about 15 mm. wide.—Woods and fields, various provinces, rarely Coastal Plain, Ala. to Miss., Ia., and N. Y.—Sum.—fall.

35. *R. Brittonii* Small. Stem 5-8 dm. tall, hispid or hirsute-hispid: blades of the upper leaves mostly ovate to elliptic-ovate, rather coarsely toothed or shallowly crenate: bracts of the involucre elliptic to lanceolate: ligules of the ray 25-35 mm. long.—Wooded hill-sides, various provinces N of Coastal Plain, Ala. to Tenn.—Sum.

36. *R. monticola* Small. Stem 3-10 dm. tall, hirsute or hispid: blades of the upper leaves ovate or ovate-lanceolate, mostly serrate: bracts of the involucre linear to linear-lanceolate, 10-14 mm. long; ligules of the ray 20-35 mm. long.—Woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., and Pa.—Sum.—fall.

37. *R. floridana* T. V. Moore. Stem 3-6 dm. tall, hispid: blades of the upper leaves elliptic, lanceolate, or narrowly pandurate (very narrow in *R. floridana angustifolia*): bracts of the involucre elliptic to linear-elliptic, 6-10 mm. long: ligules of the ray 10-20 mm. long, yellow, fading greenish.—Sandy soil, Coastal Plain, Fla. to Tex. and Ark.—Spr.—fall.

72. **DRACOPIS** Cass. Annual, glaucous herbs. Leaves alternate: blades entire or slightly toothed, clasping. Heads erect. Involucre of few

somewhat foliaceous bracts which are ultimately reflexed. Ray-flowers few: ligules yellow, drooping, often discolored. Disk-flowers crowded: corollas relatively long with a short tube and a longer throat, ultimately deciduous, leaving the erect cone-like disk. Anthers usually about as long as the filaments. Stigmas slender. Achene terete, striate and transverse-wrinkled. Pappus wanting.—One species.

1. *D. amplexicaulis* (Vahl.) Cass. Stem 3–7 dm. tall: stem-leaves 4–10 cm. long, the blades of the upper ones ovate to ovate-lanceolate, sometimes shallowly toothed: bracts of the involucre 6–10 mm. long: ligules of the ray-flowers broad, 10–25 mm. long: disk-corollas 3.5–4 mm. long: achene 2 mm. long.—Moist, rich soil, Coastal Plain, Ga. to Tex. Introduced eastward.—Spr.—sum.

73. *RATIBIDA* Raf. Annual, biennial, or perennial, pubescent herbs. Leaves alternate: blades pinnately parted or divided, or lyrate. Heads erect, usually showy. Involucre flat: bracts mostly spreading or reflexed, narrow. Ray-flowers several: ligules broad or narrow, often discolored. Disk-flowers crowded on the elongate receptacle: corollas stout, with a very short tube and a longer relatively wide throat; lobes ovate or deltoid. Anthers longer than the filaments. Stigmas stout or slender. Achene flattened, margined or winged, deciduous with bractlets. Pappus of 2 awns or wanting.—About 6 species, North American.

Stigmas with lanceolate-subulate tips: ligules of the ray elongate, linear to linear-spatulate.

1. *R. pinnata*.

Stigmas with short obtuse tips: ligules of the ray relatively short, elliptic to oval.

2. *R. columnaris*.

1. *R. pinnata* (Vent.) Barnhart. Stem strigillose and scabrous, 6–15 dm. tall, often with elongate branches: leaves 5–20 cm. long; blades pinnately 3–7-foliate or -parted, the segments linear to lanceolate, entire or toothed: heads showy: disk subglobose to oval, 1–2 cm. long: ray-flowers few; ligules bright yellow, 3–5 cm. long, early drooping: achene 2–2.5 mm. long.—Dry, often calcareous soil, various provinces, Fla. to Tex., Ia., and N. Y.—Sum.—fall.

2. *R. columnaris* (Sims) D. Don. Stem 3–7 dm. tall, scabrous-strigose, often branched at the base and sometimes above: leaves 5–12 cm. long; blades pinnately parted, the segments mostly linear, lanceolate, or oblanceolate, often pinnatifid or 2–3-cleft: heads showy: disk cylindric or columnar, 2.5–4 cm. long: ray-flowers few; ligules yellow (or brown-purple at the base in *R. columnaris pulcherrima*), 2–4 cm. long, drooping: achene 2–2.5 mm. long.—(NIGGER-HEAD)—Dry soil, prairies, plains, and hills, Tenn. to Tex., Ariz., Sask., and Minn.—Sum.—fall.—Often cult.

74. **WEDELIA** Jacq. Perennial, caulescent, diffusely branching and creeping herbs. Leaves opposite: blades typically or predominantly of a cuneate type, coarsely few-toothed or -lobed. Heads erect, peduncled, radiate. Involucre broad, somewhat foliaceous: bracts in 2 or 3 unequal series, the outer mostly longer than the inner. Ray-flowers few: corollas with broad yellow, 3-lobed ligules. Disk-corollas with a cylindric-funnelform throat longer than the tube; lobes deltoid. Anthers sagittate at the base, with deltoid appendages. Stigmas stout-tipped. Achene of the ray 3-angled, turgid, tuberculate. Pappus a fimbriate crown, deciduous.—About 40 species, of warm and tropical regions.

1. **W. trilobata** (L.) A. Hitchc. Stem and branches creeping, fleshy: leaf-blades cuneate or elliptic and cuneate at the base, 3–10 cm. long, coarsely few-toothed, or 3–5-lobed, more or less auricled at the base, or abruptly narrowed into a short petiole-like base: outer bracts of the involucre elliptic to ovate, lax: ligules of the ray mostly broadly elliptic, 8–12 mm. long: anthers about 2 mm. long: achene of the ray obovoid, 4–4.5 mm. long, coarsely tuberculate.—Shores of Bay Biscayne, Fla.—(W. I.)—All year.

75. **STEMMODONTIA** Cass. Perennial, caulescent, *Helianthus*-like herbs or partly woody plants. Leaves opposite: blades of a lanceolate or an ovate type, entire or shallowly toothed. Heads erect, peduncled, radiate. Involucre rather broad, somewhat foliaceous: bracts in 3 or 4 unequal series, the outer mostly longer than the inner. Ray-flowers few: corolla with broad yellow, often 2-lobed ligules. Disk-corollas with a nearly cylindric throat much longer than the tube; lobes ovate-lanceolate. Anthers sagittate at the base, with ovate appendages. Stigmas capillary-tipped. Achene of the ray flattened, thick-margined, pubescent. Pappus a fimbriate crown, persistent.—About 6 species, tropical American.

1. **S. calycina** (L. C. Rich.) O. E. Schulz. Stem and branches erect, mostly 2 m. tall or less, partly woody: leaf-blades lanceolate to ovate-lanceolate, 4–15 cm. long, serrate or erenate-serrate, rough-pubescent, gradually narrowed or rounded at the base: outer bracts of the involucre mostly elliptic to lanceolate, lax: ligules of the ray narrowly elliptic: anthers about 3 mm. long: achene of the ray elliptic-cuneate, about 4 mm. long, appressed-pubescent.—Waste-places, Coastal Plain, Ala. Nat. of W. I.—Sum.—fall.

76. **PASCALIA** Ortega. Perennial, caulescent herbs. Leaves opposite: blades entire, toothed, or somewhat lobed. Heads erect, radiate. In-

volucre hemispheric: outer bracts herbaceous, the inner membranous. Ray-flowers pistillate: ligules yellow, spreading. Disk-flowers perfect: corollas with a very short tube, a long throat and deltoid lobes. Anthers much longer than the filaments. Achene various, those of the ray 3-angled, those of the disk 4-angled. Pappus of scales, which are often accompanied by awns.—One species.

1. *P. glauca* Ortega. Stem mostly 1 m. tall or less, glaucous: leaf-blades 3-ribbed, 1 dm. long or shorter on the upper part of the stem, those of the lower cauline leaves ovate-lanceolate or narrowly ovate, shallowly toothed, those of the upper cauline often linear-lanceolate or narrowly lanceolate, repand or entire: involucre 1.5–2 cm. wide; bracts lanceolate to linear, the larger ones 8–15 mm. long: ligules of the ray-flowers bright-yellow, 1–1.5 cm. long: achene 5–6 mm. long.—Waste-places and roadsides, coast of N Fla. Nat. of Chile.—Spr.-fall.

77. **BORRICHIA** Adans. Fleshly, maritime, erect herbs or shrubs. Leaves opposite: blades thick, entire, or toothed. Heads erect, on stiff peduncles. Involucre hemispheric or flattish: bracts fleshy or leathery. Ray-flowers yellow, few. Disk-corollas with a cylindric-funnelform throat and a very short tube: lobes eciliate. Free portions of the filaments much longer than the corolla-tube. Pappus crown-like.—About 5 species, American.—SEA OX-EYES.

Outer bracts of the involucre spreading or reflexed at maturity: bractlets of the receptacle spine-tipped.

1. *B. frutescens*.

Outer bracts of the involucre appressed at maturity: bractlets of the receptacle obtuse or barely mucronate.

2. *B. arborescens*.

1. *B. frutescens* (L.) DC. Plant 2–7 dm. tall: leaf-blades linear-spatulate to obovate, 2–6 cm. long: outer bracts of the involucre acute, the inner ones subulate-tipped.—Shores, sand-dunes, prairies, and salt-marshes, Coastal Plain, Fla. to Tex. and S Va.—(*W. I., Mex.*)—Sum.-fall, or all year S.

2. *B. arborescens* (L.) DC. Plant 2–12 dm. tall: leaf-blades oblanceolate or spatulate-oblanceolate, 3–6 cm. long: outer bracts of the involucre acute, the inner ones rounded at the apex.—Shores, sand-dunes, and low waste hammocks, pen. Fla. and Fla. Keys.—(*W. I., Mex., C. A., S. A.*)—All year.—This species is much more variable than the preceding one. The plants become very robust and succulent in strictly saline localities. The foliage various from glabrous and glossy green to densely pale silky-canescens. The glabrous form has been described as *B. glabrata* Small and may be specifically distinct from the pubescent and larger form.

**78. TITHONIA** Desf. Annual, *Helianthus*-like herbs. Leaves alternate: blades entire or three lobed. Heads large, erect, on peduncles swollen just below the involucre. Involucre hemispheric or broadly campanulate: bracts in two series, the other short and appressed, the inner long, appressed at the base and somewhat foliaceous above. Ray flowers several, neutral: ligules yellow, showy. Disk flowers perfect: corollas yellow, with a short villous tube dilated into a long throat: lobes lanceolate. Stigmas slender, hirsute. Achene broadened upward, flattened, four-angled, wingless, embraced by the bractlets. Pappus of 2 awns or scales, caducous or persistent, accompanied by several shorter, always persistent, scales.—Four or five species, native of Mexico, Central America and the West Indies.

**1. T. diversifolia** (Hemsl.) Gray. Plant up to 4.5 m. tall, with a branching, woody stem, slightly pubescent or glabrate: leaf-blades ovate in outline, 3–5 lobed, or entire on the upper stem, serrate, pubescent beneath, pubescent, scabrous, or glabrate above, tapering abruptly to a cuneate-winged petiole: involucre bracts of two kinds, the outer short, ovate, striate and appressed, usually acute, the inner long, ligule-like, striate, somewhat foliaceous above, usually obtuse or rounded, appressed at the base, 18–25 mm. long: ligules 4–6 cm. long, bidentate at the apex: achene pubescent, about 6 mm. long.—Pine-lands, roadsides, and about gardens, pen. Fla. Nat. of Mex. and cult.—All year.

**79. HELIANTHUS** L.<sup>1</sup> Annual or perennial, coarse, erect or diffuse herbs. Leaves various, the first ones opposite, sooner or later the succeeding ones becoming alternate, or in a few species very rarely all alternate: blades simple, 3-veined, but sometimes obscurely so. Flowers in involucre, radiate heads, the rays usually conspicuous, the ligules always yellow, sterile and in one series; flowers of the disk perfect, with tubular corollas and the corolla 5-lobed, the tube short, the lobes yellow, red-purple, or brownish. Achene obovate, slightly compressed, surmounted by a pappus of two scale-like awns on the long diameter, the bases of the awns expanded and often lacerate, sometimes with accessory and intermediate scales, the whole pappus readily caducous; each flower subtended by a conduplicate, chaffy bractlet on the receptacle. Bracts of the involucre in 3 or 4 series, green.—About 100 species, American.—Sum.—fall, unless otherwise stated.—SUNFLOWERS.

Disk-corollas with red, purple, or brown lobes.  
Disk-corollas with yellow lobes.

I. RUBRI.  
II. FLAVI.

#### I. RUBRI

Ray-flowers with ligules more than 5 mm. long.

Leaves more or less pubescent, but not densely white-hairy.

Blades of the cauline leaves of a long-linear type, 2–8 mm. wide.

Heads many: leaves alternate.

Head solitary: leaves opposite.

1. *H. angustifolius*.
2. *H. heterophyllus*.

<sup>1</sup> Contributed by Elba Emanuel Watson.

Blades of the cauline leaves of a lanceolate to ovate type.

Leaves opposite.

Bracts of the involucre linear, mucronate: leaves chiefly basal.

Bracts of the involucre lanceolate, not mucronate: leaves cauline.

Leaves alternate.

Disk more than 3 cm. in diameter.

Disk less than 3 cm. in diameter.

Chaff toward center of disk, conspicuously white-bearded.

Chaff not thus bearded.

Leaf-blades decurrent on the petiole nearly or quite to its base:

Blade conspicuously bristly ciliate toward the base: annual.

Blade not thus ciliate (often undulate): perennial.

Leaf-blades obviously petioled.

Stem, especially the branches, conspicuously white-villous.

Stem more or less pubescent, but not as above.

Plant erect: stems more or less mottled.

Plant prostrate: stems not conspicuously mottled.

Leaves densely white-pubescent, especially beneath.

Ray-flowers wanting or minute, the ligules less than 3 mm. long.

## II. FLAVI

Leaves verticillate.

Leaves not verticillate.

Leaf-blades of a linear type, some or all more than 10 times as long as broad.

Leaves cauline; blades usually less than 5 mm. wide, revolute and pubescent.

Leaves mostly basal; blades usually more than 7 mm. wide.

Head solitary: disk about 1.5 cm. wide.

Heads several: disk about 1 cm. wide.

Leaf-blades of a linear, lanceolate or ovate type, less than 10 times as long as broad.

Leaf-blades linear to lanceolate, never broadly so.

Leaf-blades densely white-pubescent both sides.

Leaf-blades more or less pubescent but not as above.

Branches of the inflorescence and leaves below it opposite.

Leaves strumose-hispid: bracts hispidulous, longer than the disk and recurved.

Leaves and bracts almost or quite glabrous, latter about equal to disk and erect, or leaf-blades strumose-setose above.

Branches of the inflorescence and leaves below it alternate.

Mature cauline leaf-blades deeply and irregularly serrate.

Cauline leaf-blades entire or serrate, but not as above.

Bracts longer than the disk, very loose.

Leaves evenly tomentulose; blades copiously resin-dotted and much lighter beneath.

Leaves not tomentulose; blades not copiously resin-dotted beneath.

Leaf-blades firm, conduplicate, densely scabrous-hispidulous: ligules of the ray deep-yellow.

Leaf-blades thinnish, flat, remotely pubescent: ligules of the ray light-yellow.

Bracts about as long as the disk, not conspicuously loose.

Leaf-blades with revolute margins, usually undulate, fine-tomentose beneath.

3. *H. atrorubens*.

4. *H. rigidus*.

5. *H. annuus*.

6. *H. petiolaris*.

7. *H. agrestis*.

8. *H. floridanus*.

9. *H. vestitus*.

10. *H. cucumerifolius*.

11. *H. debilis*.

12. *H. argophyllus*.

13. *H. radula*.

14. *H. verticillatus*.

15. *H. simulans*.

16. *H. carnosus*.

17. *H. longifolius*.

18. *H. Schuecinizii*.

19. *H. stenophyllus*.

20. *H. Eggertii*.

21. *H. grosse-serratus*.

22. *H. tomentosus*.

23. *H. Maximiliani*.

24. *H. giganteus*.

5. *H. floridanus*.

- Leaf-blades not revolute-margined,  
not undulate, not tomentulose  
beneath.
- Leaf-blades serrate, the lower sur-  
face glabrous except on the  
nerves.
- Leaf-blades entire, at most, ob-  
scurely denticulate, long-hispid  
beneath.
- Leaf-blades of a broadly lanceolate to ovate type.
- Heads small: disk less than 8 mm. wide.
- Leaves, stems, and bracts entirely glabrous.
- Some or all of these parts more or less pubescent.
- Leaf-blades firm, copiously resin-dotted beneath:  
stem dark and conspicuously glaucous.
- Leaf-blades thin, remotely if at all resin-dotted  
beneath: stem light, at most faintly  
glaucous.
- Bracts of the involucre linear, abruptly  
curled: peduncles short.
- Bracts of the involucre loose but not re-  
flexed: peduncles long and very slender.
- Heads larger: disk more than 8 mm. wide.
- Leaf-blades broadly decurrent on the petiole, lateral  
nerves confluent only a little below the middle  
of the blade, the petiole from the confluence  
often as long as the blade.
- Basal leaves numerous, approximate and per-  
sistent; cauline leaves few and greatly re-  
duced.
- Basal leaves often fugacious; cauline leaves  
more evenly disposed on the stem and not  
greatly reduced.
- Leaf-blades sessile or petiolate; if decurrent, the  
petiole (from the confluence of the lateral  
nerves) much less than half the length of the  
leaf.
- Bracts of the involucre about as long as the disk.
- Leaves opposite; blades sessile and often  
clasping: branches conspicuously erect.
- Leaves opposite or alternate; blades not  
clasping: branches spreading.
- Base of leaf-blade obtuse, cordate or  
roundish; petiole distinct or blade  
only briefly decurrent.
- Leaves opposite and divaricate.
- Leaves alternate (rarely opposite),  
not divaricate.
- Base of leaf-blade more pointed, decur-  
rent, but petiole partly distinct.
- Leaves mostly or all alternate, light  
green, evenly, short-hispid above,  
short-hirsute beneath, not glaucous  
beneath.
- Leaves mostly opposite, dark green  
above, glabrous beneath, except on  
the nerves, and glaucous.
- Bracts of the involucre longer than the disk.
- Leaves opposite (sometimes alternate above  
in *H. decapetalus* and *H. reindutus*);
- Blade decurrent to the base of the petiole.
- Blade not decurrent to the base of the  
petiole, distinctly petiolate.
- Leaf-blades thin, ovate, very sparingly  
pubescent: branches of the in-  
florescence and rarely the uppermost  
leaves alternate.
- Leaf-blades firm, broadly lanceolate,  
densely rough-pubescent: branches  
of the inflorescence opposite.
- Leaves alternate (lower cauline rarely oppo-  
site in *H. doronicoides*);
- Blades densely tomentose beneath.
- Leaf-blades sessile, broadly decurrent  
to the base of the petiole.
- Leaf-blades apparently short-petio-  
late, less broadly decurrent and not  
quite to the base of the petiole.

26. *H. alienus*.
27. *H. laevigatus*.
28. *H. glaucus*.
29. *H. decapetalus*.
30. *H. microcephalus*.
31. *H. occidentalis*.
32. *H. Dowellianus*.
33. *H. mollis*.
34. *H. divaricatus*.
35. *H. saxicola*.
36. *H. tuberosus*.
37. *H. strumosus*.
38. *H. reindutus*.
29. *H. decapetalus*.
39. *H. hirsutus*.
40. *H. doronicoides*.
22. *H. tomentosus*.

Blades more or less pubescent, but not densely tomentose or tomentulose.

Leaf-blades conspicuously resin-dotted beneath, finely tomentulose.

Leaf-blades thin, lower surface little if any lighter than the upper.

Leaf-blades firm, lower surface lighter than the upper.

Leaf-blades not conspicuously resin-dotted beneath.

Leaf-blades tapering at the base, decurrent almost to the base of the petiole: bracts loose.

Leaf-blades roundish, or at least broad toward the base, not decurrent to the base of the petiole: bracts erect.

41. *H. resinosus*.

22. *H. tomentosus*.

42. *H. validus*.

43. *H. lactiflorus*.

1. *H. angustifolius* L. Perennial: stem 1–2 m. high, slender, simple to the inflorescence, hispid: leaves alternate: blades varying in width from 2–4 mm. in sunny, exposed places to about 1 cm. in moist, shady habitats, usually 8–15 cm. long, revolute except when very wide: ray-flowers with bright yellow ligules: lobes of the disk-corollas red-purple.—Moist ground, wet pine-lands, woods, and prairies, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. Y.—A showy plant, often in large masses.

2. *H. heterophyllus* Nutt. Perennial: stem slender, simple, about 1 m. high, rarely with long, ascending branches, usually rough: leaves of two kinds, the basal with broadly ovate to elongate, narrowly oblanceolate blades, the cauline narrowly linear, all very coarse in texture and scabrous-hispid, the hairs often very long: heads solitary on the stem and branches, large, disk often 2 cm. wide, corollas of the disk very dark.—Wet clay soil, low pine-lands, edges of swamps, and marshes, Coastal Plain, Fla. to La. and N. C.—There are no crown buds nor rhizomes; the longer of the fibrous roots produce a bud about 2 cm. from the tip, which grows at once, the daughter plants often blooming the same season.

3. *H. atropurpureus* L. Perennial: stem about 1.5 m. high, slender, very coarsely hispid, simple to the inflorescence: basal leaves large, approximate, opposite: blades mainly ovate, oval, or elliptic; the cauline leaves alternate, broadly ovate, obtuse, the blades abruptly contracted below to a long, winged petiole, often as long as the blade, rough, coarse, hispid: heads few, rarely more than 6–7: bracts of the involucre oblong, glabrous: ray-flowers with short, deep yellow ligules: disk-flowers with very dark-red corollas.—Open woods, creek-banks, and shaded mountain sides, various provinces, Fla. to La., Mo., and Va.—Vegetative propagation is from axillary buds at the base of the stem.

4. *H. rigidus* (Cass.) Desv. Perennial: stem 0.7–1.75 m. high, rough, simple or branched, mostly purple: leaves opposite: blades lanceolate, rarely ovate, obtuse, mostly entire, thick, firm, rough both sides, dark-green: heads large, very compact, solitary on the stem and branches: bracts of the involucre ovate, appressed, obtuse, glabrous, ciliate: disk-corollas with red-purple lobes: the papus usually with many small intermediate scales. [*H. scaberrimus* Ell. *H. subrhomboides* Rydb.]—Dry sandy soil, usually on prairies, various provinces, Ga. to Tex.—The root stocks have swollen tips which bear abundant rootlets.

5. *H. annuus* L. Annual, similar to the preceding, but taller, more branched, and less pubescent: disk-corollas shorter than in the preceding, and the lobes brownish-red rather than magenta-colored or in cultivated forms the lobes of the disk-corollas frequently yellow.—Dry plains, various provinces, Tex. to Sask. and Minn.; also cult. grounds, waste-places, and fields throughout the E U. S.

6. *H. petiolaris* Nutt. Annual: stem simple or, in vigorous plants, much branched, rough: leaves alternate; blades lanceolate to ovate, mostly entire, distinctly petiolate, very variable in size, 4–15 cm. long, in normal plants about 7 cm. long, densely appressed-scarious on both sides, blue-green: inflorescence terminal and axillary, profuse, the heads very showy: bracts of the involucre broadly lanceolate, about as long as the disk, erect, densely hispidulous, often without cilia: ray-flowers with oval ligules, about 2 cm. long: disk 1–2.5 cm. wide: lobes of disk corollas red-purple.—Plains, hills, river-bottoms, and rocky banks, various provinces, Tex. to Ariz., Ore., Sask., and Minn.; also waste-places and cult. grounds in the E U. S.

7. *H. agrestis* Pollard. Annual: stem 1–2 m. high, light-green, glabrous, sulcate, in vigorous plants much branched: leaves alternate; blades broadly elliptic-lanceolate, very light-green, hispid on both sides, the midrib beneath and the margin toward the base with long, rather remote bristly cilia: heads few but very showy: bracts of the involucre lanceolate, glabrous, erect: ray-flowers with bright-yellow ligules: disk-corollas deep-violet. [*H. Curtissii* Fernald.]—Pinelands, scrub, and prairies, often along ditches, pen. Fla.

8. *H. floridanus* Gray. Perennial: stem 1–2 high, hispid, simple: leaves alternate toward the top of the stem (opposite in small individuals); blades lanceolate, sessile or subsessile, scarious above, mostly fine-tomentose beneath, revolute, often unevenly so and apparently undulate, mostly 6–8 cm. long: inflorescence one to four or five heads in a loose panicle: bracts of the involucre about as long as the disk: disk-corollas mostly with red-brown lobes, rarely yellow. [*H. undulatus* Chapm.]—Woods, thickets, and edges of fields, Coastal Plain, Fla. to La.

9. *H. vestitus* E. E. Watson. Annual: stem 6–7.0 dm. high, lax, densely white-villous, profusely branched: leaves alternate, crowded; blades deltoid-lanceolate, mostly about 6 cm. long, deeply irregularly serrate, or lobed, hispid-hirsute beneath, especially on the veins appressed-hispid above, distinctly petioled, the petioles long, slender, very hirsute: heads terminal on the stem and branches: bracts of the involucre linear-lanceolate, attenuate, longer than the disk, densely hispidulous, very loose; ray-flowers with oval ligules 1.5 cm. long; disk 1 cm. wide; lobes of the disk-corollas purple: achene villous.—Sandy places, Hog Island, Fla.

10. *H. cucumerifolius* T. & G. Annual: stem erect, 1–2 m. tall somewhat rough above, with ascending branches mostly above the middle: leaves alternate; blades deltoid-ovate, 5–8 cm. long, acute, irregularly serrate, strumose-setose above, scarious-hispid beneath, cordate; petioles about as long as the blades: heads 1–3 terminating the stem and the branches: bracts of the involucre narrowly lanceolate, longer than the disk, scarious, scarcely ciliate: disk about 2 cm. wide, its corollas with red-purple lobes.—Sandy places near the coast, La. and Tex.; naturalized in Fla. through cult.—Sum.—fall.—Cult. forms have yellow disks.

11. *H. debilis* Nutt. Annual: stem more or less branched at the base, the branches decumbent or horizontal, up to 1 m. long, subglabrous to hispid: leaves alternate; blades deltoid-ovate, acute, 5–8 cm. long, irregularly serrate, scarious-setose and deep-green on both sides, broadly cuneate to cordate; petioles sca-

brous, about one-third as long as the blades: heads terminating the stem and the branches: peduncles hispid: bracts of the involucre narrowly lanceolate, longer than the disk, scabrous, scarcely ciliate: ray-flowers with light-yellow ligules about 1.5 cm. long: disk about 1.5 cm. wide, its corollas with red-purple lobes.—Coastal sand-dunes and rarely introduced into sandy places inland, Coastal Plain, Fla. to Tex. and Ga.—All year.

12. *H. argophyllus* T. & G. Annual: stem 1–2 m. high, branched, densely white-tomentose, especially on younger parts: leaves alternate: blades ovate, mostly entire, 1–2 dm. long, the petiole a little shorter, densely pubescent: heads large, very showy: bracts of the involucre ovate-acuminate, white-tomentose: disk 2–3 cm. in diameter; lobes of the disk-corollas magenta-red.—Sandy places, wood and chaparral, various provinces, Tex., often cultivated and readily escaping and persistent through the southeast.—Similar to *H. annuus*, but shorter and less branched. The leaf-buds are densely long, white-pubescent.

13. *H. radula* (Pursh) T. & G. Perennial: stem erect from an ascending base, about 0.5–1 m. high, hirsute below, simple to the inflorescence: leaves opposite, the basal ones crowded into a rosette, with obovate or suborbicular blades 5–21 cm. in diameter; cauline leaves much reduced, rough-hispid: flower-stem rising from beneath the basal rosette: peduncles 1-flowered, heads large: ray-ligules minute, 1–2 mm. long: disk 2–3 cm. in diameter, like the whole head, often including the glabrous involucre bracts, suffused with purple.—Sandy pinelands, flat-woods, and oak-ridges, Coastal Plain, Fla. to Ala. and Ga.—There are no rootstocks, and vegetative propagation is by crown-buds.

14. *H. verticillatus* Small. Perennial: stem slender, less than 2 m. high, glabrous: leaves verticillate in 4's, blades lanceolate, narrowly sessile, about 9 cm. long, scabrous above, finely short-pubescent and paler beneath: inflorescence a cyme: bracts of the involucre lanceolate, sub-glabrous, a little longer than the disk: disk-corollas yellow.—Wet sandy soil, Interior Low Plateaus, Tenn.

15. *H. simulans* E. E. Watson. Perennial: stem erect, simple to the inflorescence, scabrous-strigose: leaves alternate, crowded; blades linear, mostly about 14 cm. long, revolute, rough-scabrous above, tomentulose beneath: heads showy: bracts of the involucre linear-lanceolate, longer than the disk, thinly pubescent, scarcely ciliate: the ray-flowers with ligules deeply 2–3-dentate at the apex, 2–3 cm. long: corollas of the disk yellow.—Wet muck, low woods, and pinelands, Coastal Plain, Fla. to La.—Differs from *H. angustifolius*, with which it is often confused, by its yellow disk.

16. *H. carnosus* Small. Perennial: stem 0.8–1 m. high, slender, glabrous, arising from a mass of basal leaves surmounting a bulbous base: basal leaves with blades varying from ovate-spatulate to narrowly linear-oblancoate, 4–17 cm. long; cauline leaves alternate; blades glabrous, succulent: inflorescence a single terminal head on the main stem: bracts of the involucre oblong-lanceolate 4–5 mm. wide, a little longer than the disk and glabrous: ray-flowers with ligules about 2 cm. long and 2–3-dentate at the apex: disk 1.5 cm. wide; corollas yellow.—Wet sandy soil, mostly about ponds, N Fla.—The main stem arises from one side of the bulbous base and the basal clump of leaves from the other side; rootstocks none, propagation is from crown buds.

17. *H. longifolius* Pursh. Perennial, similar to the preceding species: stem simple to the much branched inflorescence, often purplish: leaves opposite or the upper alternate; blades narrowly linear-oblancoate, the longest being 25 cm. long, chiefly basal and sheathing the stem: inflorescence an open panicle: heads smaller than in *H. carnosus*; bracts of the involucre narrowly lanceolate,

about as long as the disk, glabrous, scarcely ciliate: disk rarely more than 1 cm. wide, its corollas yellow: ray-flowers with ligules about 1.5 cm. long.—Wet sandy or rocky glades and sandhill bogs, Coastal Plain and adj. provinces, Ga. and Ala.

18. **H. Schweinitzii** T. & G. Perennial: stem erect, branched, 1–2 m. high, strigose or glabrescent in age, purple: leaves alternate above; blades lanceolate, acuminate, revolute, narrowly sessile, scabrous above, densely white-pubescent beneath: heads few, on short, slender peduncles, small: bract of the involucre lanceolate, a little shorter than the disk, pubescent: disk about 6 mm. wide, the corollas yellow.—Dry, often sandy and rocky woods, various provinces, Ga. to Ala. and N. C.

19. **H. stenophyllus** (T. & G.) E. E. Watson. Perennial, with stout branched rootstocks 1–3 dm. long: stem 0.5–1 m. high, slender, simple, scabrous-hispid, light-green; leaves opposite; blades narrowly lanceolate, attenuate, acute, 10–15 cm. long, pointed at the base, thick, densely strumose-hispid above, scabrous-hispid beneath, the petioles more or less winged by the decurrence of the blade: inflorescence cymose, bracts of the involucre linear-lanceolate, longer than the disk, loose, recurved, densely hispidulous; ray-flowers with ligules deep-yellow, 2.5 cm. long, disk 1–2 cm. wide, its corollas yellow, the lobes pubescent.—La. to Tex., and Okla. Perhaps not east of the Mississippi River.

20. **H. Eggertii** Small. Perennial: stem erect, slender, purplish, glabrous, glaucous, 1–2 m. high: leaves opposite, or the uppermost alternate in vigorous plants; blades lanceolate, acute, thinnish, glaucous on both sides, conspicuously so beneath, strumose-setose above, glabrous beneath, obscurely serrulate broadly decurrent to the base of the petiole, about 12 cm. long: inflorescence a few heads on short peduncles from the axils of the alternate upper leaves; involucre cylindrical; bracts broadly lanceolate, acuminate, not very loose, a little longer than the disk, glabrous: ray-flowers with ligules about 1.5 cm. long: disk about 1.2 cm. wide, its corollas yellow.—Dry, often rocky hills, Interior Low Plateau, Tenn.

21. **H. grosse-serratus** Martens. Perennial, with abundant, often branched rootstocks and woody roots: stem 1–3.5 m. high, simple to the inflorescence, glabrous, glaucous; leaves alternate; blades broadly linear-lanceolate, grossly and saliently serrate, often very large, 15–25 cm. long, thinly strumose-setulose above, with fine, soft, short, straight hairs beneath, abruptly contracted to a stout petiole which is 4–8 cm. long, the upper leaves smaller and less deeply serrate: inflorescence a many headed-panicle: heads large and showy: involucre campanulate; bracts linear-lanceolate, attenuate, longer than the disk, loose but not reflexed, very dark green, subglabrous; ray-flowers with bright yellow ligules, 2.5–4 cm. long: disk 1–2 cm. wide, its corollas yellow.—Rich soil, fields, pastures, meadows, and waste-places, various provinces, Tenn. to Tex., N. M., Wyo., Sask., Me., and Va.

22. **H. tomentosus** Michx. Perennial, with rootstocks 3–4 cm. long and numerous crown-buds: stems 1–2 m. high, usually 3–5 together, very variable in pubescence, always more or less hispid, rarely subglabrous or tomentose: leaves alternate toward the inflorescence; blades usually broadly lanceolate, often very narrowly so, and rarely ovate, decurrent to the base of the petiole, dark-green and hispid above, subglabrous to densely tomentose beneath, usually sparingly tomentose, always resin-dotted: inflorescence a small panicle, the peduncles slender; heads showy: bracts of the involucre linear-lanceolate, loose, reflexed, hispidulous, resin-dotted, longer than the disk: ray-flowers with ligules about 2 cm. long, bright-yellow, pubescent and resin-dotted on lower surface: disk 1–2.5 cm. wide, its corollas yellow, pubescent, resin-dotted.—Woods and hillsides, Piedmont and adj. Blue Ridge, Ga. to Ala., and Va.

23. *H. Maximiliani* Schrad. Perennial: stem 1-2 m. high, very scabrous, often several from one root: leaves alternate; blades lanceolate, conduplicate, densely scabrous-hispidulous on both sides, both stem and leaves light gray-green: inflorescence normally racemose, with 2 or 3 heads on very short peduncles in the axils of the upper leaves, occasionally the peduncles are 1-1.5 dm. long, and bear 1-3 heads: heads showy: bracts of the involucre narrowly linear-lanceolate, densely scabrous-hispidulous, attenuate, longer than the disk, loose, but not reflexed: ray-flowers with many, but short ligules, distinctly cupped: disk large, often 2 cm. wide, its corollas yellow.—Rather dry and rocky soil, plains and prairies, various provinces, Tex. to Man., and Minn.; also adv. in the E U. S.—The Texan specimens are often coarsely hispid-scabrous.

24. *H. giganteus* L. Perennial with numerous short rootstocks and crown-buds: stem stout, simple to the inflorescence, usually rough-hispid, 1.5-3.5 m. tall: leaves alternate; blades lanceolate, pointed at both ends, but very narrowly sessile, rather thin, serrate, sharply scabrous above, the lower surface paler, with remote, long, ascending hairs: inflorescence a many-flowered panicle: heads showy: bracts of the involucre linear or linear-lanceolate, much longer than the disk, dark green, glabrous, but conspicuously ciliate: ray-flowers with ligules about 1.5 cm. long, oval, light-yellow: disk relatively large, about 1.5 cm. wide, its corollas yellow.—Swamps and wet thickets, various provinces, N. C. to Colo., Sask., Ont., and Me.

25. *H. montanus* E. E. Watson. Perennial: stem 1-2 m. high, glabrous, purple, striate, more or less glaucous, branching above: leaves alternate, blades lanceolate, about 12 cm. long, serrate, slightly revolute, upper surface strumose-scabrous, lower surface paler and glabrous except on the hispid nerves, the petiole narrowly winged almost to its base: inflorescence of 2 or 3 heads on slender branches from the upper axils: involucre bracts lanceolate, nearly or quite glabrous, erect but loose, about as long as the disk: disk about 1 cm. wide, its florets yellow, the rays about 2 cm. long, the achene slender and glabrous, chaff 3-cuspidate.—Stony or sandy soil, various provinces, Fla. and Ga.

26. *H. alienus* E. E. Watson. Perennial, with coarse woody roots: stem 1-1.5 m. high, stout, scabrous toward the apex, purplish, sulcate: leaves alternate; blades lanceolate, obscurely denticulate, very narrowly sessile, 11-15 cm. long, thickish, densely scabrous above, sparingly but long-hispid beneath, the veins prominent: inflorescence few-flowered: heads showy: bracts of the involucre linear-lanceolate, about as long as the disk, densely hispidulous, spreading-ciliate: ray-flowers with ligules about 1.7 cm. long: disk about 1.3 cm. wide, its corollas yellow, the chaff entire.—Woods, Blue Ridge, N. C. to Va.

27. *H. laevigatus* T. & G. Perennial, with rootstocks rarely more than 3 cm. long: stem slender, erect, glabrous, 1-2 m. high: leaves mostly opposite, or alternate above in vigorous plants; blades narrowly, or often very broadly, lanceolate, pointed at both ends, glabrous on both sides: inflorescence a few-flowered panicle: heads small: bracts of the involucre lanceolate, glabrous, a little longer than the disk; disk rarely exceeding 8 mm. in diameter: ray-flowers with ligules 1-2 cm. long: disk-corollas yellow.—Woods, Blue Ridge and adj. provinces, N. C. to Ky. and Va.

28. *H. glaucus* Small. Perennial, with rootstocks 2-5 cm. long: stem purple, branched, glabrous, glaucous, up to nearly 2 m. high; leaves alternate above, though often all opposite: blades ovate to lanceolate, firm, scabrous above, tomentulose and very resin-dotted beneath, the veins conspicuously brown: heads many, small: bracts of the involucre lanceolate, about as long as the disk: disk about 7 mm. wide, the corollas yellow.—Dry woods, various provinces, Fla. to Miss., Ark. (?), and N. J.

29. *H. decapetalus* L. Perennial, with long rootstocks: stem slender, light-green, glabrous, simple to the inflorescence: leaves opposite to the inflorescence (branches of the latter mostly alternate); blades ovate, serrate, broadly decurrent on the usually long petiole, very thin, dark-green, remotely setose above, sparingly pubescent beneath: heads very showy: bracts of the involucre linear or linear-lanceolate, longer than the disk, very loose, often curling about, subglabrous: ray-flowers with ligules often 2.5 cm. long: disk 0.7 to 1.5 cm. wide; corollas yellow.—Rich woods, river-banks, and roadsides, various provinces, Ga. to Tenn., Mich., and Que.

30. *H. microcephalus* T. & G. Perennial, with rootstocks about 1 dm. long, the crown buds numerous: stem very slender, light-green, glabrous, simple: leaves opposite, or sometimes the upper alternate: blades very thin and delicate, light-green, broadly oblong-lanceolate, thinly pubescent beneath, remotely short-hispid above: heads few, very small: disk rarely exceeding 5 mm. in diameter: bracts of the involucre lanceolate, subglabrous, a little longer than the disk.—Woods, thickets, and fence-rows, various provinces, Ga. to Ky. and Pa.

31. *H. occidentalis* Riddell. Perennial, with rootstocks 2–3 dm. long, the terminal bud producing a daughter plant during the season, and numerous fine-fibrous roots: stem arising from a basal rosette which is not always persistent, simple to the inflorescence, scabrous; leaves opposite, crowded toward the base of the stem; blades oval in outline, either very narrowly or very broadly so, exceedingly variable in size, obtuse, entire or serrulate, rough above, hispid beneath, the base gradually contracted into a long, margined petiole which is as long as or often longer than the blade: inflorescence a panicle, or often only a single head in small plants; heads showy: bracts of the involucre narrowly lanceolate, acute, not longer than the disk, sparingly pubescent, ciliate: ray-flowers with ligules about 1.8 cm. long: disk about 1 cm. wide, its corollas yellow.—Dry or moist clay or sandy soil, woods, plains, and prairies, various provinces, Fla. to Tex., Minn., Ohio, and N. C.—The plants are large and vigorous in black, rich soil, smaller, but no less abundant in dry, sandy soil.

32. *H. Dowellianus* M. A. Curtis. Perennial, with rootstocks 1–3 dm. long and fibrous roots: stem 1–2.5 m. high, usually simple, rarely branched, appressed-pubescent or subglabrous: leaves more numerous and more approximate towards the base of stem, opposite below, alternate above; blades ovate, acute, rather densely short-hispid beneath, dark-green, concolor, contracted at the base to a long, margined petiole, the latter about as long as the blade: bracts of the involucre lanceolate, acuminate, a little longer than the disk, finely appressed-pubescent, the cilia short and very fine: ray-flowers with light yellow ligules about 2 cm. long: disk about 1 cm. wide, its corollas yellow: achene pubescent at the apex and on the angles.—Open woods, rocky banks, and sandy bottoms, various provinces, Ga. to Ill., and D. C.

33. *H. mollis* Lam. Perennial, with stout rootstocks about 15 cm. long, the terminal bud very large, and numerous crown-buds, the roots fine-fibrous: stems 0.5–1 m. high, more or less tufted, scabrous-hirsute, usually simple, if branched, the branches closely ascending, even parallel to the main stem, the pubescence of two kinds, long, scabrous, spreading hairs, and short, closely appressed hairs: leaves opposite, or in very vigorous plants the upper sometimes alternate: blades ovate, sessile, often clasping, 7–9 cm. long, densely pubescent on both sides: inflorescence a single terminal head, or else racemose in the upper axils, in the latter case, the peduncles short: heads very showy: bracts of the involucre broadly linear-lanceolate, about as long as the disk, densely pubescent: ray-flowers numerous, with ligules 2–3 cm. long: disk 2–3 cm. wide, its corollas yellow.—Prairies, barrens, woods, and fields, various provinces, Ga. to Tex., Kans., Ia., and Mass.—Frequently cultivated.

34. *H. divaricatus* L. Perennial, with numerous rootstocks 1-7 dm. long and few roots: stem simple to the inflorescence, or very vigorous plants often branched, subglabrous, usually purple if exposed to the sun, enlarged and woody at the base: leaves opposite; blades lanceolate, usually broadly so, rarely very narrow or very broad, round at the base, sessile, rough above, sparingly pubescent beneath, with remote, long, ascending hairs, divaricate: inflorescence a single, terminal head or else a cyme: heads not very showy; bracts of the involucre lanceolate, a little longer than the disk, subglabrous, erect with very loose tips: ray-flowers with narrow ligules about 2.0 cm. long: disk about 1 cm. in width, its corolla yellow.—Dry woods and old fields, various provinces, Fla. to La., Man., Ont., and Me.

35. *H. saxicola* Small. Perennial: stem slender, 0.8-1.5 m. high, glabrous, glaucous, reddish, simple; leaf arrangement unstable, alternate or opposite; blades ovate, acuminate, serrulate, rounded at the base to a short distinct petiole 2-3 cm. long, dark-green and rough above, paler and glabrous beneath, the main veins sometimes slightly short-hispid: inflorescence solitary or few-flowered: heads showy; bracts of the involucre broadly lanceolate, a little longer than the disk, glabrous or subglabrous, somewhat reflexed: ray-flowers with ligules 2-2.5 cm. long: disk about 1.5 cm. wide, its corollas yellow.—Rocky and sandy soil, Blue Ridge, Ga. to N. C.

36. *H. tuberosus* L. Tall, perennial, with tuber-bearing rootstocks: stem simple or branched, robust, hispid, rough, often 2-3 cm. thick at the base, light-green: leaves alternate above the middle of the stem, in plants often all opposite: blades ovate, thinnish, short-hispid above, short-hirsute beneath, soft to the touch, abruptly contracted below to a margined petiole, 10-20.0 cm. long: inflorescence paniculate: heads very showy: bracts of the involucre lanceolate or linear-lanceolate, sparingly pubescent, often glabrous, erect, the tips recurring slightly, very dark green: ray-flowers with ligules 2.5-4 cm. long: disk relatively small, rarely more than 1 cm. wide, the disk-corollas yellow.—(ARTICHOKE. JERUSALEM-ARTICHOKE.)—Moist or dry rich soil, various provinces, Fla. to Tex., Sask., Ont., and N. S.—The plant is commonly cultivated for its edible tubers, which accounts for its wide distribution, as it is native only in the western part of its range.

37. *H. strumosus* L. Perennial, with an often very long branched rootstock, the roots coarse: stem tall, erect, glabrous or subglabrous, sometimes a little pubescent toward the apex, mostly simple, sometimes, when very vigorous, a little branched: leaves mostly opposite: blades broadly lanceolate, rarely ovate, acuminate at the apex, serrate or serrulate, rounded at the base, the petiole partly distinct, 10-15 cm. long, strumose-setose above, the strumae becoming conspicuously white in dry specimens, much paler beneath, and (in the southern states) pubescent beneath only on the main veins: inflorescence cymose, the main branches opposite, usually all opposite: ray-flowers with ligules 2-3 cm. long: disk 1-2 cm. wide, its corollas yellow: bracts of the involucre broadly lanceolate; bracts usually glabrous, never more than very sparingly pubescent, ciliate, loose but erect.—Dry woods, hillsides, and fields, various provinces, Ga. to Ark., Minn., and Me.

38. *H. reindutus* (Steele) E. E. Watson. Perennial with rootstocks 7-8 cm. long, the crown buds numerous: stem reddish, especially above, glabrous, rarely a little rough, 1-2 m. high: leaves opposite or sometimes alternate above: blades lanceolate, serrulate, narrowly sessile, firm, glabrous or remotely setose above, very remotely scabrous beneath, the scabra usually large and blunt, the margins usually appressed hispid-ciliate below: inflorescence a profusely branched, open panicle, the branches very slender: heads showy: bracts of the involucre lanceolate, longer than the disk, loose, often reflexed, scarcely ciliate:

disk 1-1.5 cm. wide, its florets yellow.—Woods and shale-barrens, Blue Ridge and Appalachians, N. C. and Va.—Similar to *H. laevigatus*, but differs by its profuse inflorescence, and its pubescent leaves.

39. *H. hirsutus* Raf. Perennial, with stout abundant profusely branched rootstocks 1-3 dm. long: stem stout, 0.5-1.7 m. high, hispid, often branched, the pubescence spreading or retrorse: leaves opposite; blades ovate to ovate-lanceolate, thick, rounded or obtuse at the base, on short, stout petioles 1-2 cm. long, densely scabrous above, hispid-hirsute, often densely beneath: inflorescence cymose, its branches rarely more than 10-15 cm. long: bracts of the involucre lanceolate attenuate, very loose, longer than the disk, recurved, densely hispidulous: ray-flowers with oval ligules 2 cm. long: disk 1-2 cm. wide, its corollas yellow.—Open, often rocky woods, river-banks, prairies, and old fields, various provinces, Ga. to Tex., Kans., Wise., and Pa.

40. *H. doronicoides* Lam. Perennial, with short stout rootstocks with woody roots: stem stout, 1-2 m. high, usually densely, softly pubescent: leaves opposite below the middle of stem, alternate above, or all opposite in weak plants; blades broadly oval-lanceolate, serrate, obtuse, narrowly sessile, densely tomentose both sides, but more so beneath: inflorescence a lax, open panicle, the peduncle 1-4-flowered: bracts of the involucre linear-lanceolate, loose, reflexed, longer than the disk, densely pubescent: ray-flowers with oval ligules, 2-3 cm. long, light-yellow: disk about 1.7 cm. wide, its corollas yellow, the lobes puberulent.—River bottoms, prairies, and woods, various provinces, Ala. to Ark. (?), Mo., and Ohio.

41. *H. resinosus* Small. Perennial: stem 1-2 m. high, slender retrorsely hispid: leaves opposite below but alternate above, or in small plants all opposite; blades ovate or oblong-ovate, narrowly sessile, hispid with rather long hairs above, tomentulose, but not densely so, and copiously resin-dotted beneath. thin in texture: heads few on long peduncles, either cymose or paniculate: bracts of the involucre linear-lanceolate, longer than the disk, reflexed, pubescent, resin-dotted: ray-flowers with ligules 2-2.5 cm. long: disk 1-1.6 cm. wide, its corollas yellow, both rays and disk florets copiously resin-dotted.—Woods, N. Fla.—Very similar to *H. tomentosus* but more delicate.

42. *H. validus* E. E. Watson. Perennial: stem slender, 1-2 m. high, branched toward the apex, rough with very fine scabra: leaves alternate; blades broadly lanceolate-elliptic, obscurely serrulate, acute at both ends, 10-12 cm. long, scabrous-setose above, sparingly hispid and resin-dotted beneath: inflorescence of 3-4 rather large heads which are solitary on leafy peduncles on the stem and branches: bracts of the involucre linear-lanceolate, sparingly short-pubescent or puberulent, scarcely ciliate, longer than the disk, loose but erect: ray-flowers with ligules 1.5 cm. long: disk 1.5-2 cm. wide, its corollas yellow.—Blue Ridge, N. C.

43. *H. laetiflorus* Pers. Perennial, with numerous profusely branched rootstocks: stem erect, rough but shining, 1-2 m. high, simple to the inflorescence: leaves opposite, or alternate on the upper part of stem in vigorous plants: blades broadly lanceolate, narrowly decurrent to the base of the petiole, usually thick, firm, shining, very rough, very variable in size: heads on very long, stout, ascending, not very leafy branches, very handsome: bracts of the involucre linear-lanceolate, subglabrous, usually with 2-3 dark brown lines: ray-flowers with ligules 2-3 cm. long, deep-yellow: disk 1.5-2.5 cm. wide, its corollas yellow.—Creek-bottoms, woods, and banks, various provinces, Ga. to Mo., and Ill.

80. **PHOEBANTHUS** Blake. Perennial, *Helianthus*-like herbs, the stems arising from horizontal tubers. Leaves alternate or opposite: blades typically

narrow. Heads erect or nearly so, radiate. Involucre hemispheric or depressed: bracts narrow or broad, ultimately lax. Ray-flowers several: corolla with a very short tube and a long yellow ligule. Disk-corollas with a cylindric-funnelform throat abruptly narrowed into the short tube. Filaments slightly shorter than the anthers. Stigmas linear-lanceolate. Pappus sometimes of several scales between chaffy awns or teeth.—Two species, as follows:

Leaf-blades linear or linear-lanceolate: involucre bracts appressed: ray-flowers 16–20.

1. *H. grandiflora*.

Leaf-blades linear-filiform: involucre bracts spreading: ray-flowers 10–15.

2. *H. tenuifolia*.

1. *P. grandiflora* (T. & G.) Blake. Stem 6–13 dm. tall, simple or sparingly branched above: leaves mostly alternate; blades linear to linear-lanceolate, 2–6 cm. long, acute, entire, somewhat revolute: heads showy: involucre bracts linear-subulate to lanceolate or cuneate, or oblong with lanceolate or ovate tips, hispidulous, the tips rather lax: ray-flowers 16–20; ligules yellow, 3–4.5 cm. long: disk 1.5–2 cm. broad: achene 5–6 mm. long, narrowly margined or wing-margined, strongly ribbed, pubescent about the upper edge, each side surmounted by a tooth, and one or both sometimes prolonged into an awn. [*Helianthella grandiflora* T. & G.]—Pinelands, oak-woods, and stream-banks, pen. Fla.—Spr.–fall.

2. *P. tenuifolia* (T. & G.) Blake. Stem 3–11 dm. tall, simple or sparingly branched above: leaves alternate or opposite or whorled on the lower part of the stem: blades linear-filiform, 3–8 cm. long, acute, entire, revolute, very scabrous: heads showy: involucre bracts linear-subulate to linear-lanceolate, attenuate, spreading: disk 1–2 cm. wide: achene unequally 4-angled, 3–4 mm. long, often minutely pubescent, the margins prolonged into triangular scales. [*Helianthella tenuifolia* T. & G.]—Sandhills and pinelands, N Fla.—Spr.–Fall.

81. **XIMENESIA** Cav. Annual, caulescent herbs. Leaves alternate or sometimes opposite: blades toothed or somewhat lacinate. Heads peduncled, often showy. Involucre flat, or flattish. Bracts rather narrow and elongate. Ray-flowers numerous: corollas with a slender tube and yellow ligules. Disk-corollas with a narrowly funnelform throat and a short tube: lobes triangular or lanceolate-triangular. Filaments nearly as long as the anthers. Pappus of short awns.—About 4 species, American.

1. *X. encelioides* Cav. Plant 3–7 dm. tall, pale-pubescent: leaf-blades deltoid or lanceolate, 5–10 cm. long, serrate or incised, the broader petiole-bases appendaged at the base: larger bracts of the involucre linear to linear-lanceolate, 15–20 mm. long: ligules cuneate, 1–2 cm. long: achene 6–7 mm. long, broadly winged.—(SKUNK-DAISY.)—Hammocks and waste-places, Key West, Fla., and several points in Ala. Nat. from Tex. to Ariz., and Colo.

**82. PHAETHUSA** Gaertn. Perennial herbs or shrubby plants. Leaves alternate or opposite: blades entire or toothed, more or less decurrent. Heads numerous and clustered. Involucre narrow or broad: bracts not slender-tipped. Ray-flowers 4 or 5, pistillate and fertile, with an often short or obsolete corollatube, the ligules white or yellow, or wanting. Disk-corollas with a campanulate throat, contracted into a shorter tube: lobes lanceolate to triangular-lanceolate. Filaments slightly shorter than the anthers. Pappus of 1-3 awns.—About 35 species, American.—CROWNBEARDS.—The stem is ridged or winged.

Leaves alternate: ray-flowers with white ligules.

Leaf-blades undulate, sinuate, or serrate.

Leaf-blades pinnatifid or pinnately lobed.

Leaves opposite: ray-flowers with yellow ligules.

1. *P. virginica*.

2. *P. laciniata*.

3. *P. occidentalis*.

1. ***P. virginica*** (L.) Small. Stem 6-18 dm. tall, tomentulose or puberulent: leaf-blades membranous, lanceolate to oval or ovate, 5-21 cm. long: larger bracts of the involucre about 7 mm. long: disk-corollas about 5 mm. long: achene winged, 5 mm. long. [*Verbesina virginica* L.]—(FROST-WEED. TICKWEED. INDIAN-TOBACCO.)—Dry soil, various provinces, Fla. to Tex., Mo., and Pa.

2. ***P. laciniata*** (Poir.) Small. Stem 7-16 dm. tall, tomentulose: leaf-blades ovate to elliptic-ovate in outline, 5-22 cm. long, the segments sometimes repand: larger bracts of the involucre about 6 mm. long: disk-corollas about 5 mm. long: achene obovate, 5-6 mm. long: achene with wings as broad as the body, 5-7 mm. long. [*Verbesina laciniata* (Poir.) Nutt.] — Pineland and sandy hammocks, Coastal Plain, Fla. to S. C.

3. ***P. occidentalis*** (L.) Small. Stem 9-20 dm. tall, smooth and glabrous: leaf-blades ovate to elliptic-lanceolate, 5-20 cm. long: larger bracts of the involucre about 6 mm. long, broadly linear: ligules 10-15 mm. long: achene with very long pappus bristles and wingless or nearly so, 5-6 mm. long. [*Verbesina occidentalis* (L.) Walt.]—Rich soil, various provinces, Fla. to Miss., Ill., and Pa.

**83. PTEROPHYTON** Cass.<sup>1</sup> Perennial caulescent herbs. Leaves alternate or opposite: blades entire or toothed, decurrent or sessile. Heads solitary or few together, long-peduncled. Involucre broad: bracts shorter than the disk. Ray-flowers when present 5-10 pistillate or neutral, but always sterile, the ligules yellow or whitish. Disk corollas with a campanulate throat, contracted into a shorter tube: lobes triangular-lanceolate to lanceolate. Filaments shorter than the anthers. Pappus of 1-3 very short, slender awns or wanting.—About 15 species, American.

Stem winged: leaves decurrent.

Stem wingless: leaves merely sessile.

I. HETEROPHYLLA.

II. NUDICAULIA.

#### I. HETEROPHYLLA

Leaf-blades hirsute beneath, very acute: stem leafy to the inflorescence.

1. *P. helianthoides*.

<sup>1</sup> Contributed by Edward Johnston Alexander.

Leaf-blades hispidulous beneath, somewhat blunt: stem sparingly scaly above the middle.

2. *P. heterophyllum*.

## II. NUDICAULIA

Foliage scabrous: leaf-blades elliptic or broadest slightly above the middle: heads rayless.

3. *P. pauciflorum*.

Foliage hirsute or hispid: leaf-blades broadest at or below the middle: heads with rays.

4. *P. aristatum*.

1. *P. helianthoides* (Michx.) Alexander. Stem 5–11 dm. tall, finely pubescent: leaves mostly alternate; blades lanceolate to elliptic, 4–12 cm. long: larger bracts of the involucre about 8 mm. long, linear: ligules 20–30 mm. long: achene with short, slender pappus-bristles, usually narrowly winged, 5 mm. long. [*Verbesina helianthoides* Michx.]—Open woods and thickets, various provinces, Ga. to Tex., Ia., and Ohio.

2. *P. heterophyllum* (Chapm.) Alexander. Stem 5–12 dm. tall, scabro-hispidulous: leaves mostly opposite; blades elliptic, or elliptic-lanceolate, 2–6 cm. long, serrate-dentate: larger bracts of the involucre about 7 mm. long, elliptic-lanceolate: ligules 15–20 mm. long: achene with short pappus-bristles, broadly winged, 5–6 mm. long. [*Verbesina heterophylla* (Chapm.) A. Gray.]—Dry pinelands, Fla.

3. *P. pauciflorum* (Nutt.) Alexander. Stem 3–7 dm. tall, scabrous: leaves scattered; blades elliptic or slightly broadest above the middle, 3–9 cm. long, lucid: involucre about 1 cm. high: ray-flowers wanting: achene with no pappus, narrowly winged, 5–6 mm. long. [*Actinomeris pauciflora* Nutt. *Verbesina Warei* A. Gray.]—Low pinelands, W Fla.

4. *P. aristatum* (Ell.) Alexander. Stem 5–12 dm. tall, hirsute to hispid: leaves remote; blades elliptic to elliptic-ovate or elliptic-lanceolate, 3–10 cm. long, scabrous: involucre 5–6 mm. high: ray-flowers 7–12: achene with short pappus-bristles, very broadly winged, 4–5 mm. long. [*Verbesina nudicaulis* (Nutt.) A. Gray. *V. aristata* (Ell.) Heller.]—Pinelands, Coastal Plain and adj. provinces, Fla. to Ala., and Ga.

84. **RIDAN** Adans. Perennial, rather coarse, tall herbs. Leaves alternate or opposite: blades usually toothed and decurrent. Heads several or numerous. Involucre narrow: bracts few, spreading or recurving, becoming lax. Ray-flowers few: ligules yellow or wanting. Disk-corollas many, with a funnelform throat rather abruptly contracted into the shorter tube: lobes lanceolate. Filaments slightly shorter than the anthers. Pappus of 2 more or less spreading awns, accompanied by 2 or 3 smaller awns, or scales. [*Actinomeris* Nutt.]—Sum.-fall.—Two species, as follows:

Ray-flowers 2–8: disk-corollas yellow.  
Ray-flowers wanting: disk-corollas white.

1. *R. alternifolia*.  
2. *R. paniculata*.

1. *R. alternifolia* (L.) Britton. Plant 6–25 dm. tall: leaf-blades elliptic, 9–30 cm. long: disk-corollas 5 mm. long: achene-body with ciliate wings.

[*Actinomeris alternifolia* (L.) DC.]—Rich woods, moist thickets, and roadsides, various provinces, Fla. to La., Ia., and N. J.

2. *R. paniculata* (Walt.) Small. Plant 6–24 dm. tall: leaf-blades linear to elliptic or narrowly elliptic, 8–31 cm. long: disk-corollas 4 mm. long: achene-body with toothed wings. [*Athanasia paniculata* Walt.]—Alluvial soil, Coastal Plain, Fla. to La. and S. C.—The typical habitat of these species is the alluvial flood-plains of creeks and river. There the plants grow very tall and in dense colonies.

85. **SYNEDRELLA** Gaertn. Annual, pubescent, erect herbs. Leaves opposite: blades usually toothed. Heads inconspicuous. Involucre simple, narrow, several-flowered, with 1 or 2 herbaceous and several chaffy bracts. Ray-flowers few: corolla with a very slender tube and a yellow ligule. Disk-corollas with a cylindraceous throat and a slender tube nearly or quite as long: lobes broad. Filaments much shorter than the linear anthers. Pappus of 2 or 3 awns becoming longer than the corolla in the disk.—Two species, tropical American.

1. *S. nodiflora* (L.) Gaertn. Plant 3–8 dm. tall: leaf-blades ovate to elliptic, 5–10 cm. long, serrate, the petiole-like bases hispid-ciliate: involucre 7–9 mm. high; larger bracts narrow: disk-corollas about 4 mm. long: achene 4–5 mm. long, those of the ray elliptic, with ascending marginal bristles, those of the disk columnar or clavate.—Sandy soil and wet places, Fla. Nat. of trop. Am.—(W. I., Mex., C. A., S. A., O. W.)—All year.

85a. **CALYPTOCARPUS** Less. Annual, pubescent, erect, herbs. Leaves opposite: blades toothed. Heads inconspicuous radiate. Involucre several-flowered: bracts various, with 3 herbaceous and several chaffy. Ray-flowers few: corolla with a tube shorter than the yellow ligule. Disk-corollas with a funnel-form throat and tube: lobes narrow. Anthers somewhat longer than the filaments. Pappus of 2 or 3 awns with a rim at the base.—The following species:

Involucral bracts not ciliate: leaf-blades abruptly tapering at the cuneate or subcordate base, broadest below the middle.  
Involucral bracts long-ciliate: leaf-blades long-tapering to a cuneate base, broadest above the middle.

1. *C. vialis*.

2. *C. blepharolepis*.

1. *C. vialis* Less. Stem 1–4 dm. long, branched at the base, the branches erect or prostrate: leaf-blades ovate, 1–3 cm. long, serrate, the petiole-like bases

shorter than the blade, hispid: involucre 5-7 mm. high; larger bracts broad: disk-corollas about 4 mm. long: achene 4-5 mm. long, those of the ray and disk alike wingless, minutely muricate.—Dry soil and waste-places, S La. to S Tex. (*W. I., Mex., C. A.*)—All year.

2. *C. blepharolepis* B. L. Robinson. Stem branched at the base, branches opposite, spreading: leaf-blades 2-3 cm. long, obovate, entire or nearly so: involucre about 5 mm. high: ligules of the ray corollas very short: achenes of the ray apparently glabrous and smooth, those of the disk muricate.—Tensaw, Ala. — Sum.-fall. — Apparently introduced, but nativity unknown.

86. **COREOPSIS** L.<sup>1</sup> Annual, or perennial herbs. Leaves various. Heads conspicuously radiate. Involucre campanulate to hemispheric: bracts distinct or nearly so, the outer narrow. Ray-flowers several: corollas with yellow, discolored, or pink ligules. Disk-corollas with a funnelform throat and a stout or slender tube. Filaments mostly shorter than the anthers. Achene with entire or pinnate wings, or wingless.—About 5 species, American, African, and Australian.—DYE-FLOWERS. TICKWEEDS.

Stigmas with acute or cuspidate tips.

Leaf-blades or their divisions with entire margins.

Stigma-tips cuspidate: chaff of the receptacle with broad bases and attenuate filiform tips: leaf-blades simple or pinnately lobed.

—Subgenus *EUCOREOPSIS*.

Stigma-tips acutely conic: chaff of the receptacle linear or with slightly dilated tips: leaf-blades palmately lobed.—Subgenus *ANACIS*.

Leaf-blades evenly toothed.—Subgenus *SILPHIDIUM*.

Stigmas with truncate or obtusely conic tips.—Subgenus *CALLIOPSIS*.

Achene wingless.

Achene winged.

Leaves with flat blades or divisions, not rush-like.

Leaves thick, rush-like.

#### I. LANCEOLATAE

Achene with broad outspread wings (entire or fimbriate).

Stem leafy near the base, bearing long, naked, peduncle-like branches.

Ligules uniformly yellow.

Plant glabrous except the ciliate bases of the leaves.

Plant pubescent except near the inflorescence.

Ligules with dark markings near the base.

Stem leafy to near the summit: peduncle short.

Leaf-blades of the main stem broad, simple or with 1-5 small lateral lobes.

Leaf-blades of the main stem pinnately parted into narrow divisions.

Achenes with entire wings: petioles ciliate near the base.

Achenes with fimbriate wings: petioles and entire plant glabrous.

Achene with strongly incurved entire wings, which become callous-thickened at maturity.

#### II. PALMATAE

Leaves with petioled blades.

Leaves with sessile blades.

<sup>1</sup> Contributed by Frank Ellis Boynton.

#### I. LANCEOLATAE.

#### II. PALMATAE.

#### III. LATIFOLIAE.

#### IV. TINCTORIAE.

#### V. ANGUSTIFOLIAE.

#### VI. NUDATAE.

1. *C. lanceolata*.
2. *C. crassifolia*.
3. *C. nuecensis*.

#### 4. *C. pubescens*.

#### 5. *C. grandiflora*.

#### 6. *C. saxicola*.

#### 7. *C. auriculata*.

#### 8. *C. tripteris*.

Disk-flowers with yellow corollas.

Leaf-segments entire, elliptic-lanceolate or lanceolate.  
Leaf-segments 1-2-pinnately parted, very narrowly linear or filiform.

Disk-flowers with purple-brown corollas.

Divisions of the leaf-blades comparatively few, 2-4 mm. broad: internodes longer than the leaves.

Divisions of the leaf-blades very numerous, appearing in dense fascicles, 1-2 mm. broad: internodes mostly shorter than the leaves.

### III. LATIFOLIAE

Plant with ovate or ovate-lanceolate leaf-blades.

### IV. TINCTORIAE

Ligules of the ray yellow with crimson-brown base: flowers of the disk with dark-red corollas.

Outer involucrel bracts much shorter than the inner: achene linear-elliptic, thin, flat.

Outer involucrel bracts mostly about as long as the inner: achene obovate, thick, convex.

Ligules of the ray pink: flowers of the disk with yellow corollas.

### V. ANGUSTIFOLIAE

Achenes with entire scarious margins.

Pappus of minute teeth or wanting.

Ligules of the ray discolored.

Ligules of the ray uniformly yellow.

Pappus of conspicuous awns.

Leaf-blades, or some of them, lobed: internodes mostly shorter than the leaves.

Leaf-blades simple and entire: internodes mostly much longer than the leaves.

Achenes with fimbriate or dissected winged margins.

Blades of the larger leaves of an elliptic, lanceolate, or narrower type.

Lower leaves little longer than the internodes.

Lower leaves much longer than the internodes.

Blades of the basal leaves linear, lanceolate, or linear-elliptic, mostly pointed.

Leaf-blades simple and entire: achene obovate or spatulate, about 4 mm. long, the wing about one-third as wide as the body.

Leaf-blades often lobed: achenes elliptic, about 5 mm. long, the wing as wide as the body.

Blades of the basal leaves elliptic or oblanceolate, obtuse.

Blades of the larger leaves of an ovate or ovate-lanceolate type.

Leaves opposite: petioles and blades (when young) ciliate-margined.

Leaves alternate; margins naked.

### VI. NUDATAE

Plant with long-tapering leaves and pink-purple ligules.

1. *C. lanceolata* L. Plant 2-6 dm. tall: blades of the lower leaves spatulate to linear-oblanceolate, and rarely with 1 or 2 lateral lobes (in *C. lanceolata glabella* the leaves with narrow blades or crowded at the base of the stem): outer involucrel bracts lanceolate: achene orbicular, 2.5-3 mm. long.—Dry soil, pinelands, barrens, woods, and stony fields, various provinces, Fla. to La. and Ont.—Spr.-sum.

2. *C. crassifolia* Ait. Plant 2-4 dm. tall: blades of the lower leaves obovate-spatulate to elliptic, entire, usually pubescent at least beneath: outer involucrel bracts lanceolate: achene elliptic-orbicular, 2.5-3 mm. long.—Dry soil, woods, and old fields, Coastal Plain and adj. provinces, Ga. to La., Ill., and N. C.—Spr.-sum.

9. *C. major*.

10. *C. verticillata*.

11. *C. delphinifolia*.

12. *C. pulchra*.

13. *C. latifolia*.

14. *C. tinctoria*.

15. *C. Drummondii*.

16. *C. rosea*.

17. *C. cardaminefolia*.

18. *C. stenophylla*.

19. *C. Leavenworthii*.

20. *C. Lewtonii*.

21. *C. angustifolia*.

22. *C. longifolia*.

23. *C. falcata*.

24. *C. gladiata*.

25. *C. integrifolia*.

26. *C. helianthoides*.

27. *C. nudata*.

3. *C. nuecensis* Heller. Plant up to 1 m. tall, usually glabrous: blades of the lower leaves ovate to elliptic in outline, usually pinnately lobed, the lobes elliptic: outer involueral bracts lanceolate: ligules cuneate, with several dark markings near the base of each, together appearing as a corona: achene suborbicular, about 5 mm. long, the body with a reniform callosity at either end within, the wings nearly as broad as the body.—Moist soil, Coastal Plain, S Tex., also escaped from cultivation eastward.

4. *C. pubescens* Ell. Plant 6–12 dm. tall, pubescent: leaf-blades ovate to elliptic-lanceolate, the lobes small when present: outer involueral bracts linear-lanceolate: achene orbicular, about 3 mm. long.—Dry woodlands, thickets, and old fields, various provinces, Fla. to Miss., Ill., and Va.—Sum.—fall.

5. *C. grandiflora* Hogg. Plant 3–6 dm. tall, glabrous except the leaf-bases: blades of the lower leaves spatulate or lanceolate, sometimes lobed: outer bracts of the involucre lanceolate, 6–9 mm. long: achene orbicular, 2.5 mm. long.—Dry soil, woods and fields, various provinces, rarely Coastal Plain, Ga. to Tex., N. Mex., and Md.—Spr.—sum.

6. *C. saxicola* Alexander. Plant up to 1 m. tall, glabrous throughout: leaf-blades pinnately dissected into linear-elliptic segments: outer bracts of the involucre ovate-lanceolate to lanceolate 7–10 mm. long: achene suborbicular, 2–3 mm. long, with stalked glands on the inner face, the wings more or less fimbriately dissected.—Dry soil, on and about Stone Mtn. in the Piedmont of Ga., also Tallapoosa Co., in the Piedmont of Ala.—Sum.

7. *C. auriculata* L. Plant 2–5 dm. tall, more or less pubescent: leaf-blades round-oval to elliptic-ovate, sometimes with 1 or 2 small basal lobes: outer involueral bracts linear-elliptic, 7–9 mm. long: achene oval, 2–2.5 mm. long.—Dry soil, woods, thickets, and waste-places, various provinces, Fla. to Miss., Tenn., W. Va., and Va.—Spr.—sum.

8. *C. tripteris* L. Plant 8–30 dm. tall, glabrous or nearly so: leaf-blades deeply 3–5-divided, the divisions elliptic-lanceolate or lanceolate, or those of the upper leaves entire: outer involueral bracts linear, 2–3 mm. long: ligules elliptic, yellow: achene elliptic, 5–6 mm. long.—Woods, river-shores, and old fields, various provinces, Fla. to La., Tenn., and Pa.—Sum.—fall.

9. *C. major* Walt. Plant 5–9 dm. tall, pubescent (or glabrous in *C. major Oemleri*); leaf-blades with elliptic-lanceolate or lanceolate lobes (or lobes very long and narrow in *C. major rigida*): outer involueral bracts linear-elliptic, 5–6 mm. long: achene elliptic, 5–6 mm. long. [*C. senifolia* Michx.]—Dry woods, various provinces, Fla. to Miss., Tenn., W. Va., and Va.—Sum.—fall.

10. *C. verticillata* L. Plant 5–9 dm. tall, glabrous: leaf-blades with the divisions once or twice pinnately parted into linear-filiform lobes: outer involueral bracts linear, 5–6 mm. long: achene elliptic-obovate, 4–5 mm. long.—Dry acid soil, rocky places, woods, and pinelands, various provinces, rarely Coastal Plain, Ala. to Kans., Nebr., Ont., N. J., and N. C.—Sum.—fall.

11. *C. delphinifolia* Lam. Plant 8–15 dm. tall, glabrous: leaf-blades with the middle division parted into 3–5 linear lobes: outer involueral bracts linear, 5–6 mm. long: achene elliptic, 5–6 mm. long.—Dry woods, pinelands, and low grounds, various provinces, Ga. to Ala. and Va.—Sum.

12. *C. pulchra* F. E. Boynton. Plant 4–7 dm. tall, glabrous: leaf-blades with the primary divisions parted into linear lobes: outer involueral bracts linear,

5-6 mm. long: achene narrowly winged, elliptic-obovate, about 4 mm. long.—Rocky woodlands, N Ala.—Sum.

13. *C. latifolia* Michx. Plant 9-15 dm. tall, pubescent or glabrate: leaf-blades ovate to ovate-lanceolate, coarsely toothed: outer involueral bracts narrowly linear, about 5 mm. long: achene wingless, narrowly elliptic, about 7 mm. long.—Wooded slopes, Blue Ridge, N. C. and Tenn.—Sum.

14. *C. tinctoria* L. Plant 6-12 dm. tall, glabrous: blades of the lower leaves twice pinnately parted, the lobes linear-lanceolate or linear: outer involueral bracts triangular-lanceolate, about 2 mm. long: achene linear-elliptic about 2 mm. long.—Moist soil, prairies, and fields, various provinces, La. to Ariz., Sask., and Minn.; also cult. and naturalized eastward.—Sum.-fall.

15. *C. Drummondii* (D. Don) T. & G. Plant 2-4 dm. tall, pubescent or nearly glabrous: blades of the lower leaves ovate, oval, or lanceolate, frequently entire, or like the upper ones with elliptic or linear-lanceolate lobes (or with very narrow lobes in *C. Drummondii Wrightii*): outer involueral bracts linear-lanceolate, 5-9 mm. long: achene obovate, about 2 mm. long.—Dry soil, and sandy prairies, Tex., also escaped from cultivation eastward.—Sum.

16. *C. rosea* Nutt. Plant 2-5 dm. tall, glabrous: leaf-blades linear and entire, or with 2 or 3 linear lobes: outer bracts of the involucre lanceolate, 2-3 mm. long: achene wingless, narrowly elliptic, about 2 mm. long.—Moist, or wet, acid soil, Coastal Plain, and occasionally other provinces, Ga. to Mass. and E Tenn.—Sum.

17. *C. cardaminefolia* (DC.) T. & G. Plant 2-5 dm. tall, glabrous: blades of the lower leaves once or twice pinnately divided into elliptic or linear-lanceolate lobes; blades of the upper leaves few-lobed or entire and linear: outer involueral bracts lanceolate, 3-4 mm. long: achene elliptic, 2.5-3 mm. long.—Low grounds, various provinces, Miss. to Tex., Ariz., and Kans.—Sum.

18. *C. stenophylla* F. E. Boynton. Plant 4-8 dm. tall, glabrous: blades of the lower leaves entire and sometimes 2 mm. wide, or with 1 or 2 narrow lobes, those of the upper leaves narrowly linear to filiform, and sometimes with filiform lobes: outer involueral bracts lanceolate, 1-2 mm. long: achene elliptic, 1.5-2 mm. long, the wing  $\frac{1}{3}$  as wide as the body.—Pinelands, La.—Sum.-fall.

19. *C. Leavenworthii* T. & G. Plant 5-15 dm. tall, glabrous: blades of the lower leaves mostly with 2 or more narrow lobes, usually very narrow, (or broad in *C. Leavenworthii Garberi*), those of the upper leaves mostly entire and narrow: outer involueral bracts subulate-lanceolate, 1-2 mm. long: achene roundish oval, 2.5-3 mm. long, the wing as broad as the body.—Pinelands and moist prairies, pen Fla. and the Keys.—All year.—A hot infusion of this plant is used externally by the Seminoles in cases of heat prostration.

20. *C. Lewtonii* Small. Plant 3-5 dm. tall: blades of the lower leaves linear or narrowly cuneate, entire: outer involueral bracts suborbicular, about 2 mm. long: achene not seen.—Low grounds, pen. Fla.—Sum.

21. *C. angustifolia* Ait. Plant 5-7 dm. tall: blades of the lower leaves spatulate or oblanceolate, entire: outer involueral bracts ovate, 2-3 mm. long: achene oval, 2.5-3 mm. long.—Low pinelands and swampy places, Coastal Plain, Fla. to Tex. and N. C.—Sum.-fall.

22. *C. longifolia* Small. Plant 7-10 dm. tall: blades of the lower leaves linear-elliptic, linear-lanceolate, or linear, entire: outer involueral bracts lanceolate, 2-4 mm. long: achene obovate or spatulate in outline, about 4 mm. long.—Low woods and thickets, Coastal Plain, Fla. and Ga.—Fall.

23. *C. falcata* F. E. Boynton. Plant 8-12 dm. tall: blades of the lower leaves scythe-shaped, entire or with 1 or 2 narrow lobes: outer involueral bracts lanceolate, 5-7 mm. long: achene elliptic, about 5 mm. long.—Swamps and pineland ponds, Coastal Plain, N. C.—Early sum.

24. *C. gladiata* Walt. Plant 6-12 dm. tall: blades of the lower leaves elliptic or oblanceolate, entire: outer involueral bracts broadly triangular, 3-4 mm. long: achene elliptic, about 3.5 mm. long.—Swamps and low pinelands, Coastal Plain, Fla. to Miss. and N. C.—Fall.

25. *C. integrifolia* Poir. Plant 6-9 dm. tall: blades of the lower leaves ovate, entire: outer involueral bracts elliptic, 4-6 mm. long: achene not seen.—Moist soil, Coastal Plain, Fla. and Ga.—Fall.

26. *C. helianthoides* Beadle. Plant 5-12 dm. tall: blades of the lower leaves ovate to ovate-lanceolate, entire: outer involueral bracts lanceolate, 5-9 mm. long: achene spatulate, about 3 mm. long.—Low grounds, bogs, and woods, Coastal Plain, N. Fla. and Ga.—Fall.

27. *C. nudata* Nutt. Plant 6-12 dm. tall: leaves terete: outer involueral bracts lanceolate, 4-6 mm. long: rays pink-purple: achene elliptic, about 3 mm. long.—Wet pinelands and cypress ponds, Coastal Plain, Fla. and Ga.—Spr.—sum.

87. **BIDENS** L.<sup>1</sup> Annual or biennial, or rarely perennial, herbs. Leaves opposite or the upper ones sometimes alternate: blades entire, toothed, or divided. Heads erect or nodding. Involucre double, the outer bracts foliaceous, the inner appressed. Ray-flowers few and with white or yellow ligules, or wanting. Disk-corollas with a short tube and a longer throat: lobes mostly deltoid. Achene flat, terete, or 4-angled. Pappus of 2-4 rigid barbed awns or these much reduced and tooth-like.—About 75 species, of wide geographic distribution.—BUR-MARIGOLDS. BEGGAR-TICKS.

Achene spindle-shaped, gradually tapering above: ligules of the ray white or yellowish white.

Achene flattened, broadest above the middle: ligules of the ray, when present, yellow.

Ray-flowers inconspicuous and caducous or wanting.

Ray-flowers showy or conspicuous.

Leaf-blades undivided: pappus-awns 2-4, retrorsely barbed.

Leaf-blades pinnately divided or individually simple: pappus-awns 2 or none.

I. LEUCANTHAE.

II. VULGATAE.

III. CERNUAE.

IV. AUREAE.

#### I. LEUCANTHAE

Leaves 1-3-pinnately dissected, the divisions incised or lobed: ray-flowers with inconspicuous, mostly entire ligules.

Leaves 1-pinnate or undivided, the segments evenly crenate-serrate: ray-flowers with showy and lobed ligules.

1. *B. bipinnata*.

2. *B. pilosa*.

#### II. VULGATAE

Leaves usually undivided: pappus awns 3 or 4.

Disk-corollas pale, 4-lobed: achene-margins strongly, retrorsely barbed throughout; involucre long.

3. *B. comosa*.

<sup>1</sup> Contributed by Karl McKay Wiegand.

Disk-corollas orange, 5-lobed: barbs of the achene-margins few, directed both ways: involucre short.  
Leaves 3-5-divided: pappus-awns 2.

Awns long, usually retrorsely barbed: achene-body 5-11 mm. long.

Outer involucre bracts 10-16, ciliate, the inner constricted at the tip: disk-corollas pale.

Outer bracts 6-8, nearly glabrous, the inner not constricted: disk-corollas orange.

Awns short, erect-barbed: achene-body 4-5.5 mm. long: leaf-blades long-acuminate.

4. *B. connata*.

5. *B. vulgata*.

6. *B. frondosa*.

7. *B. discoidea*.

### III. CERNUAE

Outer involucre bracts exceeding the disk, foliaceous: ray-flowers with ligules twice the length of disk or less: achene dilated at the summit.

Outer bracts rarely exceeding the disk: ray-flowers with ligules 2-4 times the length of disk: achene not dilated above.

Blades of the upper cauline leaves elliptic-lanceolate to lanceolate, acuminate, mostly sharply serrate.

Blades of the upper cauline leaves spatulate, obovate, oval or elliptic, obtuse, abruptly pointed or acutish, nearly entire, shallowly serrate, or crenate-serrate.

8. *B. cernua*.

9. *B. laevis*.

10. *B. Nashii*.

### IV. AUREAE

Achene 6-8 mm. long, ciliate,

In fruit obovate.

Involucre nearly glabrous: pappus-awns slender or wanting.

Involucre hispid: achene bidentulate.

In fruit narrowly cuneate, 2-2.5 mm. wide, short-awned.

Achene 2-4 mm. long, not ciliate, the awns very short.

11. *B. aristosa*.

12. *B. involucreta*.

13. *B. coronata*.

14. *B. mitis*.

1. *B. bipinnata* L. Stem 3-17 dm. tall, glabrous or nearly so, 4-angled, branched and rather slender: primary leaf-segments thin, deltoid, the ultimate one lanceolate, incised or lobed: outer involucre bracts 7-10, linear, shorter than the acute inner ones: rays few, the ovaries awnless and glabrous, the ligules yellowish-white, about equaling the disk, nearly entire: disk-corolla 5-lobed: stamens included: achenes spindle-shaped, much longer than the involucre, the outer slightly shorter; awns 3-4, yellow, retrorsely barbed.—(SPANISH-NEEDLES.)—Rich soil, and a weed in waste-places, various provinces, Fla. to Ariz., Nebr., and R. I.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

2. *B. pilosa* L. Stem 4-12 dm. tall, branched, 4-10 dm. high, nearly or quite glabrous: leaf-segments ovate or ovate-lanceolate, 2-8 cm. long, evenly crenate-serrate: outer bracts of the involucre about 8, linear-elliptic, usually shorter than the inner: rays white, the ligules 1-2 cm. long, broadly cuneate, 2-3-lobed, the ovaries awnless, few-barbed toward summit: disk-corollas 5-toothed: stamens barely exserted: achene spindle-shaped, very unequal, the inner much longer than the involucre; awns 2-4, short, yellow, retrorsely barbed. [*B. leucantha* L.]—(SHEPHERD'S-NEEDLE.)—Sandy soil, cult. grounds, roadsides, and waste-places, Coastal Plain, Fla. and sporadically in S Ga. and Ala.—(*W. I., Mex., C. A., O. W.*)—All year.

3. *B. comosa* (A. Gray) Wiegand. Stem 3-8 dm. tall, pale throughout, stout, glabrous, the branches short, stout: leaves undivided, 8 cm. long: blades elliptic-lanceolate, regularly serrate, acute, each attenuate into a margined petiole, or the upper sessile: heads large: peduncles short and stout: outer

bracts of the involucre 6-8, often 2-5 times the length of the disk, erect: rays wanting: disk-corollas funnelform, pale-yellow, 4-lobed: stamens included: achene large, flat, 8-10 mm. long, 3 mm. wide, brown or olive, nearly smooth and glabrous, margined to the base, the 3 long awns retrorsely barbed.—Damp soil, rich banks, and sandy shores, various provinces, Ga. to La., Minn., and Me.—Fall.

4. *B. connata* Muhl. Stem 3-14 dm. tall, sparingly branched, glabrous, bright-green: leaf-blades undivided or some of the lower deeply parted, lanceolate to elliptic, acuminate, tapering to the petiole, coarsely and saliently serrate: heads medium; outer bracts of the involucre 4-5, linear-spatulate, rarely exceeding the disk, glabrous: rays rarely present, the ligules one-half longer than the disk, the ovaries awnless, and hairy: disk-corollas campanulate above, 5-lobed, orange: achene 4-6 mm. long, rather narrow and thick, nearly black, covered with yellowish warts; some or all marginal barbs erect; awns 4, slender, with retrorse, nearly erect barbs.—(SWAMP BEGGAR-TICKS.)—Swamps and ditches, various provinces, N. C. to Mo., Minn., and N. H.—Fall.

5. *B. vulgata* Greene. Stem 7-15 dm. tall, much branched, nearly glabrous: leaf-blades commonly 5-divided, the segments lanceolate, straight-veined, acute, serrate with numerous regular sharp or bluntish teeth: heads large, 15-25 mm. wide: outer bracts of the involucre 10-16, unequal, usually longer than the disk, ciliate, the inner with abruptly narrowed tips: rays pale-yellow, the ligules equaling the disk, the ovaries awnless and nearly glabrous: disk-corollas funnelform, pale, 4-5-lobed: stamens included: achene large; body 6-11, 7.5-9 mm. long, 3.5-5 mm. wide, very flat, brown or olive, nearly smooth, the 2 long awns and the upper part of the achene-margins retrorsely barbed.—(STICK-TIGHT.)—Damp soil, waste-places, and roadsides, various provinces, rarely Coastal Plain, N. C. to Mo., Calif., B. C., and Ont.—Fall.

6. *B. frondosa* L. Stem 5-12 dm. tall, slender, bushy-branched, nearly glabrous: leaf-blades pinnately 3-divided or rarely 5-divided, the segments lanceolate, serrate with sharp spreading teeth, acuminate: heads not large: outer bracts of the involucre 6-8, subequal, spatulate, sparsely ciliate, usually exceeding the disk: rays usually present, golden-yellow, the ligules equaling the disk, the ovaries hairy and with 2 short retrorsely barbed awns: disk-corollas orange, 5-lobed: stamens exserted: achene black; body 5-9 mm. long, 2-4.5 mm. wide, cuneate, flattish, sparsely hairy and often tuberculate, the barbs on the margins erect, those on the 2 awns reflexed or rarely erect.—Damp soil, often a weed, various provinces, Fla. to Tex., Nebr., and N. B.—Sum.-fall.

7. *B. discoidea* (T. & G.) Britton. Stem 3-15 dm. tall, slender, diffusely branched, nearly or quite glabrous: leaf-blades 3-divided, the segments lanceolate or ovate-lanceolate, 4-9 cm. long, sharply and coarsely serrate below the entire long-acuminate tip: heads very small and numerous, 8-10 mm. broad: outer bracts of the involucre mostly 4, spatulate-linear, rarely exceeding the disk, glabrous: rays none: disk-corollas orange, 5-lobed: achene small body 4-5.5 mm. long, black, cuneate, thickish, tuberculate or nearly smooth, hairy, the margins and the 2 short awns erect-barbed.—Swamps, wet banks, and low woods, various provinces, Ala. to Tex., Mich., Mass., and N. C.—Late sum.-fall.

8. *B. cernua* L. Stem 2-7 dm. tall, low, pale-green, nearly glabrous; the branches very short, decreasing down the stem: leaf-blades undivided, 6-16 cm. long, lanceolate or linear-lanceolate, more or less connate by the broad bases, acuminate, serrate with coarse distant teeth: heads very large, broader than high, nodding in fruit: outer bracts of the involucre 7-8, unequal, exceeding the disk and spreading: rays usually present, bright-yellow, the ligules

about one-half longer than the disk, the ovaries glabrous except the margin, and awnless: disk-corollas orange, 5-lobed: achene narrowly cuneate, slightly dilated at the summit, 4-angled, the margins retrorsely barbed and tuberculate, the awns 4, slender, retrorsely barbed.—(STICK-TIGHT.)—Swamps and wet meadows, various provinces, rarely Coastal Plain, N. C. to Mo., Ore., and N. S.—(*O. W.*)—Sum.—fall.

9. **B. laevis** (L.) B. S. P. Stem 5–14 dm. tall, glabrous, 5–10 mm. high, the branches all toward the summit of the stem, slender, ascending: leaf-blades undivided, 7–13 cm. long; blades elliptic-lanceolate, serrate with small inconspicuous teeth, acute, contracted toward the sessile base: heads medium, nearly globular, erect or nodding in fruit: outer bracts of the involucre 7–8, rarely longer than the disk: rays very large, the ligules 2–3 cm. long, golden-yellow, the ovaries as in the next preceding species: disk-corollas orange, 5-lobed: achene cuneate, neither dilated nor contracted at the top, not tuberculate, the margins and 2–4 awns retrorsely barbed. [*B. chrysanthemoides* Michx.]—(WILD-GOLDENGLOW.)—Swamps and low woods, Coastal Plain and adj. provinces, Ga. to Ala., Tenn., N. Y., and Pa.—Sum.—fall.

10. **B. Nashii** Small. Similar to the next preceding species but slightly succulent, less branched: leaves ascending; blades broader and thicker, elliptic-lanceolate or oblanceolate, with very broad but scarcely connate bases, finely serrate or entire: achene slightly contracted at the summit.—Swamps, Coastal Plain, Fla. to Tex.—Sum.—fall. The plants of this and of the next preceding species are slightly fleshy.

11. **B. aristosa** (Michx.) Britton. Stem 3–10 dm. high, much-branched: leaf-blades pinnately 5–7-divided, the segments lanceolate, acuminate, serrate, incised or pinnatifid, slightly pubescent beneath: heads numerous, 2–5 cm. broad: outer bracts of the involucre 8–10, linear-spatulate, rarely ciliate, not surpassing the inner: rays 6–10, the ligules golden-yellow, the ovaries ciliate and awnless: achene obovate, flat, strigose and hispid-ciliate; awns 2, slender, as long as the achene-body or shorter, the barbs erect or reflexed (or the papus-awns wanting in *B. aristosa mutica*).—Swamps, various provinces, rarely Coastal Plain, Tex. to Kans., Minn., and Ohio, and adv. eastward.—Sum.—fall.

12. **B. involucrata** (Nutt.) Britton. Stem 3–10 dm. high, much-branched, minutely pubescent: leaf-blades pinnately divided, the segments narrow, linear-lanceolate, incised or pinnatifid, long-acuminate: heads 3–5 cm. broad: outer bracts of the involucre 12–20, linear, acutish, hispid on back and margins, mostly surpassing the inner: rays several, the ligules golden-yellow, the ovaries awnless, ciliate throughout: disk-corollas 5-lobed: stamens exserted: achene very flat, obovate, slightly contracted at the top, strigose-ciliate, bidentulate.—Swamps, various provinces, Tex. to Kans. and Ill., and adv. eastward.—Sum.—fall.

13. **B. coronata** (L.) Britton. Stem 9–20 dm. tall, glabrous, much-branched: leaf-blades pinnately divided, with 4–8 narrowly lanceolate, serrate or incised, acute or acuminate segments: heads 4–6 cm. broad: outer bracts of the involucre linear-spatulate, rarely ciliate, equaling the disk: rays several, the ligules bright-yellow, 12–25 mm. long, the ovaries bidentulate at the summit: disk-corollas deep yellow, 5-lobed: stamens exserted: achene narrowly cuneate, slightly strigose-ciliate above; awns 2, about equaling the breadth of the achene, erect-barbed. [*B. trichosperma* (Michx.) Britton.]—Swamps, various provinces, Fla. to Miss., Ill., and Mass.—Sum.—fall.

14. **B. mitis** (Michx.) Sherff. Stem 3–10 dm. tall, glabrous or nearly so, branched: leaf-blades 7–12 cm. long, 3–5-divided or rarely mostly simple, the

segments lanceolate, acuminate, serrate (narrowly linear and almost or quite entire, and achenes awnless, in *B. mitis leptophylla*), the lateral much smaller: heads 2–5 cm. broad: outer bracts of the involucre linear-spatulate, equaling the disk, glabrous, the inner usually black-punctate: rays-several, the ligules 1–3 cm. long, golden-yellow, the ovaries glabrous and awnless: disk-corollas 5-lobed: stamens exserted: achene very small, 2–4 mm. long, glabrous; awns very short, tooth-like. [*B. coronata* (L.) Britton.]—Wet soil, often in brackish marshes, Coastal Plain, Fla. to Miss. and Va.—Sum.—fall.

**88. COSMOS** Cav.<sup>1</sup> Annual or perennial, usually tall, widely branched herbs. Leaves opposite: blades entire, lobed, or 2–3-pinnately dissected. Heads peduncled, showy. Involucre nearly hemispheric: bracts unequal, the outer sometimes smaller than the inner. Ray-flowers few: corollas with pink, purple, yellow, or orange-yellow ligules. Disk-corollas yellow in our species, with a funnellform throat and a shorter tube. Filaments as long as the anthers or nearly so, sometimes pubescent. Achene beaked. Pappus of 2–4 barbed awns, or a crown.—About 20 species, tropical American.—Spr.—fall or all year S.

Leaf-segments broad, elliptic, lanceolate, or linear.

Ligules pink or rose, mostly less than 2 cm. long.

Ligules orange-yellow, mostly over 2 cm. long.

Leaf-segments filiform or linear-filiform.

1. *C. caudatus*.

2. *C. sulphureus*.

3. *C. bipinnatus*.

1. **C. caudatus** H. B. K. Stem 7–14 dm. tall: leaf-blades 2-pinnately parted, the segments lanceolate or linear: involucre bracts linear or nearly so: ray-flowers 7–12; ligules pink or rose-colored, 1–2 cm. long: achene fusiform, about 2 cm. long, the beak nearly or quite as long as the body.—Waste-places and cult. grounds, Key West, Fla. Nat. of trop. Am. and cult.

2. **C. sulphureus** Cav. Stem 2–21 dm. tall, often pubescent, much-branched: leaf-blades 2-pinnately parted, the segments elliptic or lanceolate: involucre bracts linear: ray-flowers 8–10; ligules orange-yellow, 2–3 cm. long: achene fusiform, 2–2.5 cm. long, the beak as long as the body or nearly so.—Pinelands, edges of hammocks, and waste-places, pen. Fla. Nat. of trop. Am. and cult.

3. **C. bipinnatus** Cav. Stem 3–30 dm. tall, usually glabrous or nearly so: leaf-blades 2-pinnately divided, the segments remote and filiform or linear-filiform: involucre bracts of two kinds, the outer ovate-acuminate, the inner elliptic: ray-flowers 8–10; ligules pink crimson or white, 2–4 cm. long: achene fusiform, 1–1.5 cm. long, the beak shorter than the body.—Pinelands, waste-places, and cult. grounds, Fla. Nat. of trop. Am. and cult.

**89. ENDORIMA** Raf. Perennial or biennial, usually simple-stemmed herbs. Leaves alternate, few: blades narrow, entire. Involucre thick: bracts herbaceous, the outer ones broad, the inner ones longer and narrower. Ray-flowers numerous: corollas with narrow yellow or purple ligules. Disk-corollas

<sup>1</sup> Revised by Edward Johnston Alexander.

with a narrowly funnelform throat and a shorter tube. Filaments nearly as long as the anthers. Pappus of 7-9 elliptic or lanceolate scales. Achene pubescent.—Two species; as follows:

Disk dark-purple: lower cauline leaves 10-12 cm. long.  
Disk yellow: lower cauline leaves 4-6 cm. long.

1. *E. atropurpurea*.
2. *E. uniflora*.

1. *E. atropurpurea* (Harper) Small. Plant 6-8 dm. tall: leaf-blades linear-spatulate; narrower bracts of the involucre 8-9 mm. long: ligules linear-cuneate: corollas of the disk mostly less than 6.5 mm. long: filaments much shorter than the anthers. [*Baldwina atropurpurea* Harper] Moist pinelands, Coastal Plain, S. Ga.—Fall.

2. *E. uniflora* (Nutt.) Barnhart. Plant 3-9 dm. tall: leaf-blades spatulate to linear: narrower bracts of the involucre 10-11 mm. long: ligules spatulate: corollas of the disk mostly over 6.5 mm. long: filaments nearly as long as the anthers. [*Baldwina uniflora* Nutt.]—Low pinelands, Coastal Plain, Fla. to La. and N. C.—Sum.-fall.—*Endorima* and *Actinospermum* are peculiar in having the bractlets of the receptacle partly concreted into honeycomb-like structure which partly surrounds the achenes.

90. *ACTINOSPERMUM* Ell. Annual or biennial, branching herbs. Leaves alternate, often numerous: blades very narrow, entire. Involucre thick: bracts in several series, in the inner narrower and longer than the outer. Ray-flowers numerous: corollas with rather broad yellow ligules. Disk-corollas with a cylindric-campanulate throat and a very short or obsolete tube: lobes lanceolate. Filaments shorter than the anthers. Pappus of 7-12 obovate-orbicular scales. Achene pubescent.—One species.

1. *A. angustifolium* (Pursh) T. & G. Plant 2-5 dm. tall: leaf-blades narrowly linear or slightly broadened upward: heads showy: involucre bracts acuminate: ray-flowers 8-18; ligules cuneate, bright-yellow, less than 2 cm. long: disk-corollas 4-5 mm. long; lobes lanceolate: achene turbinate, about 2 mm. long.—Sandhills, pine-lands, and scrub, Coastal Plain, Fla. to Miss. and Ga.—Spr.-fall or locally all year.

91 *MARSHALLIA* Schreb. Perennial, rigid herbs. Leaves alternate: blades entire. Heads discoid. Involucre campanulate or hemispheric: bracts broad or narrow. Ray-flowers wanting. Disk-corollas white, pink, or purple, with a campanulate or obsolete throat and a long slender tube: lobes linear or nearly so. Filaments somewhat shorter than the anthers. Pappus of 5 or 6 nearly equal scales.—About 10 species, natives of the southeastern United States.—BARBARA'S-BUTTONS.

Bracts of the involucre attenuate or subulate-tipped.  
Bracts of the involucre obtuse or merely acute or apiculate.

I. GRAMINIFOLIAE.  
II. OBOVATAE.

## I. GRAMINIFOLIAE

Basal and lower cauline leaves with spatulate, elliptic to elliptic-ovate, obtuse blades.

Basal and lower cauline leaves with elongate linear-attenuate 3-ribbed blades.

Heads few-flowered: longer involucral bracts less than 6 mm. long: pappus-scales ovate.

Heads many-flowered: longer involucral bracts over 6 mm. long: pappus-scales lanceolate.

## II. OBOVATAE

Corolla-throat long (3-3.5 mm.), half as long as the tube or nearly so.

Outer bracts of the involucre acute: upper cauline leaves broad, markedly acuminate.

Outer branches of the involucre obtuse or abruptly pointed: upper cauline leaves narrow acute or slightly acuminate. Corolla-throat very short (1-1.5 mm.).

Bractlets of the receptacle spatulate or markedly clavate-spatulate, spine-tipped.

Bractlets of the receptacle linear, or sometimes slightly enlarged near the tip, not spine-tipped.

Blades of the upper cauline leaves linear, thick: bracts of the involucre obtuse or abruptly acutish.

Blades of the upper cauline leaves lanceolate or elliptic-lanceolate, thinnish: bracts of the involucre somewhat acuminate.

1. *M. graminifolia*.

2. *M. laciniarioides*.

3. *M. Williamsonii*.

4. *M. trinervia*.

5. *M. grandiflora*.

6. *M. obovata*.

7. *M. ramosa*.

8. *M. Mohrii*.

1. *M. graminifolia* (Walt.) Small. Plant 2-11 dm. tall, the stem simple or with few erect branches: basal and lower cauline leaves 3-12 cm. long, with narrowly spatulate or linear-spatulate mostly obtuse blades: upper cauline leaves much smaller, with linear blades: outer bracts of the involucre linear or linear-lanceolate, 4-6 mm. long, with narrow margins, acuminate: corolla-tube 5-6 mm. long: achene 2.5-3 mm. long: pappus-scales ovate, very short. [*M. angustifolia* Pursh *M. angustifolia cyananthera* Ell.] Moist pinelands and prairies, Coastal Plain, Fla. to La. and N. C.—Sum.

2. *M. laciniarioides* Small. Plant 3-4 dm. tall, the stem usually with few erect branches above: basal and lower cauline leaves 3-17 cm. long, with spatulate to linear, mostly acute or acuminate blades; upper cauline leaves smaller, several or many, with narrowly linear blades: outer bracts of the involucre ovate-lanceolate, 5-6 mm. long, with broad margins, rather abruptly narrowed to a long tip: corolla-tube less than 5 mm. long: achene 1-1.5 mm. long. Sandy soil, Coastal Plain, Ga. to S. C.—Sum.

3. *M. Williamsonii* Small. Plant similar to that of *M. laciniarioides* but larger, and leaves fewer: blades of the basal and lower cauline leaves 8-21 cm. long, with linear-spatulate to linear acuminate blades: upper cauline leaves few, with narrowly linear blades: outer bracts of the involucre lanceolate, 7-8 mm. long, with rather wide margins, acuminate: corolla-tube 6-7 mm. long: achene 2.5-3 mm. long.—Sandy pine woods, Coastal Plain, S. C. and N. C.—Spr.-fall.

4. *M. trinervia* (Walt.) Porter. Plant 3-9 dm. tall, the stem typically simple, rarely with one or few erect branches: basal and lower cauline leaves 5-14 cm. long with spatulate or elliptic obtuse or acute 3-veined blades narrowed into long petiole-like bases; upper cauline leaves with elliptic, elliptic-ovate or lanceolate markedly acuminate blades: outer bracts of the involucre ovate-

lanceolate or lanceolate, acute or acuminate, 7–10 mm. long, strongly ribbed: corolla-tube 7–8 mm. long: achene 3–4 mm. long, the pappus scales subulate-tipped, about half as long as the achene.—Pinelands and damp woods, Coastal Plain and adj. provinces, Ala. to Miss., Tenn., and Va.—Spr.—sum.

5. *M. grandiflora* Beadle & Boynton. Plant 2–10 dm. tall, thirteen typically simple basal and lower cauline leaves 3–19 cm. long, with elliptic, spatulate, or oval obtuse blades; upper cauline leaves with linear-elliptic to lanceolate-acute or slightly acuminate blades: outer bracts of the involucre linear lanceolate to elliptic, obtuse or abruptly pointed, 8–11 mm. long, narrowly margined; corolla-tube 8–11 mm. long: achene 3.5–4 mm. long, the pappus-scales fully half as long as the achene.—Sandy river-banks and open woods, Blue Ridge and Appalachian Plateau, N. C. to W. Va. and Pa.—Spr.—sum.

6. *M. obovata* (Walt.) Beadle & Boynton. Plant 1–7 dm. tall, the stem typically simple: basal and lower cauline leaves 2–12 cm. long, with linear, spatulate, elliptic-ovate or obovate mostly obtuse blades; upper cauline leaves rarely present: outer bracts of the involucre elliptic or linear-elliptic, 6–8 mm. long, obtuse or abruptly pointed, very narrowly margined: corolla-tube 7–8 mm. long: achene 3–3.5 mm. long, the pappus-scales less than half as long as the achene. [*M. obovata platyphylla* (M. A. Curtis) Beadle & Boynton]—Pinelands and dry woods, Coastal Plain and adj. provinces, Fla. to Ala. and N. C.—Spr.—sum.

7. *M. ramosa* Beadle & Boynton. Plant 1.5–6 dm. tall, the stem corymbosely branched above: leaves many; blades of the basal and lower cauline 3–21 cm. long, narrowly spatulate to linear, obtuse or acutish, those of the upper cauline linear or narrowly linear-lanceolate: outer bracts of the involucre linear, lanceolate, or narrowly elliptic, 5–7 mm. long, obtuse or acutish, narrowly margined: corolla-tube about 5 mm. long: achene about 4 mm. long, the pappus-scales about half as long as the achene.—Pinelands and moist rocks, Coastal Plain and Piedmont, Ga.—Spr.—sum.

8. *M. Mohrii* Beadle & Boynton. Plant 2–7 dm. tall, the stem sparingly corymbosely branched above: leaves few, blades of the basal and lower cauline spatulate to narrowly elliptic, those of the upper cauline elliptic-lanceolate to lanceolate: outer bracts of the involucre elliptic to lanceolate, 5–9 mm. long, acute, rather obscurely margined: corolla-tube 6–8 mm. long: achene about 4 mm. long, the pappus scales fully half as long as the achene.—Low grounds and pine-woods, Appalachian Plateau, Ga. and Ala.—Spr.—sum.

92. **GALINSOGA** R. & P. Annual, tender herbs. Leaves opposite: blades toothed. Heads radiate. Involucre campanulate or hemispheric: bracts relatively broad. Ray-flowers 4 or 5: corollas with a pubescent tube and broad white to purple ligule. Disk-corollas with a campanulate throat and a tube of about the same length. Anthers ellipsoid. Achene nearly or quite as long as the corolla. Pappus of the ray of several bristles or wanting, of the disk of lacerate or fimbriate bristles.—About 5 species, of tropical and temperate America.

1. *G. ciliata* (Raf.) Blake. Plant 1–7 dm. tall, often branched, the pubescence coarse and spreading, often glandular: leaf-blades

ovate to ovate-lanceolate, 2-5 cm. long, petioled: involucre 2-2.5 mm. high; outer bracts ovate, obtuse: ligules white, 1-1.5 mm. wide: disk-corollas about 1.5 mm. long: achene less than 2 mm. long: pappus scales minutely fimbriate and aristate. [*G. parviflora* (Fl. SE. U. S.)]—Roadsides, cult. grounds, and waste-places, throughout U. S. and S. Can. Nat. of S. Am.—(*W. I., Mex., C. A.*)—Sum.—fall.—A particularly pestiferous weed of such rapid growth and seeding as to make eradication extremely difficult.

*G. parviflora* Cav. with much smaller ray-flowers, appressed pubescence, and pappus scales fimbriate, but not aristate, often occurs with *G. ciliata* north of our range, and may be looked for in N. C. and Tenn. or further S.

93. **TRIDAX** L. Perennial, caulescent, decumbent herbs. Leaves opposite: blades incised-toothed or pinnately dissected. Heads radiate. Involucre ovoid to campanulate: bracts various, the inner broader than the outer. Ray-flowers few: corollas with a slender glabrous tube and a broad yellow or pale ligule. Disk-corollas with a narrowly funnelform throat and a short tube. Anthers linear. Achene much shorter than the corolla. Pappus of numerous plumose-ciliate scales.—About 12 species, tropical American.

1. **T. procumbens** L. Plant branched at the base, the branches hirsute: leaf-blades ovate to ovate-lanceolate, 2-5 cm. long, incised or incised-lobed: involucre 6-7 mm. high; bracts hispidulous, the outer lanceolate, the inner broad and abruptly pointed: ligules as broad as long: achene of the disk about 2 mm. long.—Pinelands, hammocks, and cult. grounds, S. pen. Fla. and the Keys. Nat. of (*W. I.*)

94. **HYMENOXYS** Cass. Annual, biennial, or perennial, erect, caulescent herbs. Leaves alternate: blades pinnatifid or pinnatisect, the segments usually narrow. Heads radiate, or (in ours) discoid, peduncled. Involucre often campanulate or hemispheric: bracts in 2 series, the outer smaller than the inner, firm and more or less united at the base. Ray-flowers, when present yellow or orange, few or several, pistillate, fruit-producing: ligules 3-lobed. Disk-flowers numerous, perfect, fruit-producing: corollas yellow, with a short tube and a cylindric or funnelform throat of equal length or longer; lobes deltoid. Anthers very minutely appendaged at the base. Stigmas blunt. Achene obpyramidal, 5-angled, pubescent. Pappus of 5 scales.—Seven species, North American.

1. **H. anthemoides** (Juss.) Cass. Stem branched throughout, the branches ascending or diffuse: leaf-segments narrowly linear or linear-filiform: peduncles erect, fluted, enlarged under the head: involucre broadly

campanulate; bracts finely pubescent, the outer ovate, tubercled at the base, the inner elliptic or elliptic-obovate, 4-5 mm. long, longer than the outer: achene 2-2.5 mm. long, densely appressed-pubescent: pappus-scales acuminate, shorter than the achene.—Waste-places, Coastal Plain, Ala. Nat. of S. A.—Sum.

**95. HELENIUM L.** Annual, biennial, or perennial, bitter, caulescent herbs. Leaves alternate: blades entire, toothed, or pinnatifid, often decurrent. Heads solitary, few, or numerous. Involucre flattish: bracts spreading or reflexed. Receptacle conic, ellipsoid, or subglobose. Ray-flowers several, the corollas with cuneate yellow or red-stained ligules. Disk-corollas with broadly ovate lobes. Achene ribbed. Pappus of 5-8 acuminate or awn-tipped scales. —About 25 species, North American.—SNEEZEWEEDS.

Ray-flowers pistillate, or wanting.

Plant annual or rarely biennial.

Leaves with narrowly linear or linear-filiform blades, not decurrent.

Leaves with broader blades, more or less decurrent.

Plant perennial.

Ray-flowers neutral or sterile.

Heads corymbose.

Heads solitary or 2 or 3 on long peduncles.

I. TENUIFOLIA.

II. QUADRIDENTATA.

III. AUTUMNALES.

IV. NUDIFLORA.

V. HELENIA.

#### I. TENUIFOLIA

Leaves numerous; blades entire: pappus-scales awn-tipped.

1. *H. tenuifolium*.

#### II. QUADRIDENTATA

Leaves few; blades of the lower ones pinnately lobed: pappus-scales rounded.

2. *H. quadridentatum*.

#### III. AUTUMNALES

Disk mostly over 1 cm. wide: disk-corollas about 3 mm. long.

3. *H. latifolium*.

Disk mostly less than 1 cm. wide: disk-corollas about 2.5 mm. wide.

4. *H. parviflorum*.

#### IV. NUDIFLORA

Disk yellow.

4. *H. parviflorum*.

Disk purplish or dark-brown.

Upper part of the stem and branches with wings 1 mm. wide or less: upper cauline-leaves much smaller than the lower ones.

5. *H. nudiflorum*.

Upper part of the stem and branches with wings 2 mm. wide or more: upper cauline leaves not conspicuously smaller than the lower ones.

6. *H. polyphyllum*.

#### V. HELENIA

Disk yellow.

Receptacle ovoid or ovoid-conic: disk subglobose to hemispheric: bracts of the involucre early reflexed. Pappus-scales dissected into bristle-like segments: disk about 1.5 cm. wide.

7. *H. fimbriatum*.

Pappus-scales entire or merely erose: disk about 2 cm. wide.

8. *H. Curtisii*.

Receptacle and disk depressed-hemispheric or convex: bracts of the involucre spreading or tardily recurved.

Achene glabrous or merely glandular-granular.

Achene pubescent on the ribs.

9. *H. Helenium*.

10. *H. vernale*.

Disk purplish or brown.

11. *H. brevifolium*.

1. *H. tenuifolium* Nutt. Plant 2-4 dm. tall: leaves numerous; blades 1-5 cm. long: involucre bracts linear-subulate to subulate, 4-7 mm. long: ligules

7-12 mm. long: pappus-scales prolonged into slender awns.—(YELLOW-DICK. BITTER-WEED. SPANISH-DAISY.)—Fields, roadsides, and waste-places, various provinces, Fla. to Tex., Mo., and S Va.; adventive NE to Pa. and Mass.—Sum.—fall.

2. *H. quadridentatum* Labill. Plant 3-10 dm. tall, loosely branched: blades of the lower leaves 8-15 cm. long, pinnatifid: involucre bracts linear to linear-subulate, becoming 4-6 mm. long: ligules 3-5 mm. long: pappus-scales orbicular-oval.—Low grounds, Coastal Plain, Fla. to Tex. and S. C.—Spr.—fall.

3. *H. latifolium* Mill. Plant 2-9 dm. tall: leaf-blades elliptic or slightly broadest above the middle or below it, 3-12 cm. long, rather prominently toothed: involucre bracts linear-lanceolate or narrower, 5-7 mm. long: ligules 10-20 mm. long: disk yellow; corollas about 3 mm. long. [*H. autumnale* L. in part]—Swamps and low grounds, various provinces, Fla. to Tex., Minn., Que., and Conn.—Sum.—fall.

4. *H. parviflorum* Nutt. Plant 2-8 dm. tall, much branched: leaf-blades elliptic to elliptic-lanceolate, 3-12 cm. long, shallowly toothed: involucre bracts linear-subulate or narrower, 6-9 mm. long: ligules 6-10 mm. long: disk yellow; corollas about 2.5 mm. long.—Low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Ark., Tenn., and Ga.—Sum.—fall.

5. *H. nudiflorum* Nutt. Plant 2-10 dm. tall, corymbosely branched above: leaf-blades oblanceolate to elliptic or linear, 2.5-12 cm. long, those of the lower leaves often toothed: involucre bracts narrowly linear to linear-subulate, 5-7 mm. long: ligules 10-15 mm. long.—Low grounds, prairies, and flat-woods, various provinces, Fla. to Tex., Mo., and Md.; adv. NE to Conn.—Spr.—fall.

6. *H. polyphyllum* Small. Plant 3-8 dm. tall: leaf-blades elliptic to linear-lanceolate, 2-10 cm. long, undulate or remotely toothed: involucre bracts narrowly linear to linear-subulate, 5-8 mm. long: ligules 6-12 mm. long: disk purplish: corollas 2 mm. long.—Fields, meadows, and thickets, Appalachian provinces, Ga. and Tenn.—Sum.—fall.

7. *H. fimbriatum* (Michx.) A. Gray. Plant 4-8 dm. tall: leaf-blades linear-spatulate to broadly linear, 4-12 cm. long, entire: involucre bracts linear-subulate, 7-10 mm. long, reflexed: ligules 1.5-2 cm. long: disk corollas 5 mm. long: achene 1 mm. long.—Low pinelands, Coastal Plain, Fla. to Tex.—Sum.—fall.

8. *H. Curtisii* A. Gray. Plant 5-9 dm. tall: leaf-blades oblanceolate to linear, 4-10 cm. long, undulate: involucre bracts lanceolate to lance-subulate, 5-8 mm. long: ligules 1.5-2 cm. long: disk corollas 4.5-5 mm. long: achene 1.5 mm. long.—Low pinelands and marshes, Coastal Plain, N. C.—Spr.—sum.

9. *H. Helenium* (Nutt.) Small. Plant 3-7 dm. tall: leaf-blades linear or nearly so, 5-15 cm. long, undulate or coarsely few-toothed: involucre bracts linear or linear-lanceolate, 5-9 mm. long: ligules 9-17 mm. long: disk corollas 4.5 mm. long: achene 1-1.5 mm. long. [*H. incisum* (T. & G.) Wood]—Marshes, low pinelands, and about ponds, Coastal Plain, Fla. to La. and S. C.—Spr.—fall.

10. *H. vernale* Walt. Plant 3-7 dm. tall: leaf-blades spatulate to linear, 6-15 cm. long, toothed or incised-pinnatifid: involucre bracts lance-subulate, 5-6 mm. long, spreading: ligules 1 cm. long: disk corollas 4-4.5 mm. long:

achene 1.5–2 mm. long. [*H. pinnatifidum* (Schw.) Rydb.]—Low pinelands and swamps, Coastal Plain, Fla. to Miss. and N. C.—Spr.-sum.

11. *H. brevifolium* (Nutt.) A. Gray. Plant 3–8 dm. tall: leaf-blades spatulate to linear, 2–8 cm. long, entire, or undulate: involueral bracts linear-lanceolate to linear, 8–10 mm. long: ligules 1–1.5 cm. long: disk-flowers 4 mm. long: achene 1.5 mm. long.—Wet pinelands, Coastal Plain and adj. provinces, Fla. to Miss. and N. C.—Spr.-sum.

96. **GAILLARDIA** Foug. Annual, biennial, or perennial, often diffuse herbs. Leaves alternate: blades entire, toothed, or pinnatifid. Heads erect, radiate and showy, or sometimes discoid. Involucre broad or flat: bracts ultimately spreading or reflexed. Ray-flowers several, the corollas with prominently lobed yellow, orange, red, or purple ligules, or wanting. Disk-corollas with a short tube, a longer throat, and deltoid, triangular-lanceolate or caudate-acuminate lobes. Achene 5-ribbed. Pappus of 6–12 awned, 1-nerved scales.—About 20 species, all except one North American.—BLANKET-FLOWERS. FIRE-WHEELS. BANDANA-DAISIES.

Fimbrillae of the receptacle obsolete or very small tooth-like projections: lobes of the disk-corollas caudate-acuminate from a broad base. I. LANCEOLATAE.  
Fimbrillae of the receptacle subulate or setiform, longer than the achenes: lobes of the disk-corollas short-acuminate. II. PULCHELLAE.

#### I. LANCEOLATAE

Disk light-yellow.

Disk purplish or purplish-brown.

1. *G. chrysantha*.

2. *G. lanceolata*.

#### II. PULCHELLAE

Plant herbaceous: leaf-blades thin.

Plant partly woody: leaf-blades fleshy.

3. *G. Drummondii*.

4. *G. picta*.

1. *G. chrysantha* Small. Plant annual or biennial, finely pubescent, 3–6 dm. tall, usually with few elongate more or less spreading branches: leaf-blades spatulate or elliptic-spatulate on the lower part of the stem to linear or elliptic-linear above, 2–8 cm. long, undulate or remotely sinuate-toothed: heads long-peduncled: involueral bracts 7–11 mm. long, the outer triangular or lanceolate-triangular, the inner lanceolate: ligules of the ray-flowers yellow, 1–1.5 cm. long, 3-cleft, the middle lobe the narrowest: disk light-yellow, 1.5–2 cm. broad: achene about 2 mm. long.—Pinelands and sandy prairies, Coastal Plain, Ala. to Tex. and Ark.—Spr.-fall.

2. *G. lanceolata* Michx. Plant annual or sometimes biennial, cinereous-pubescent, 3–7 dm. tall, loosely branched, the branches long and spreading: leaf-blades spatulate to elliptic or linear, 1.5–8 cm. long, acute, entire or remotely serrate, sessile, at least above the base of the stem: heads long-peduncled: involueral bracts oblong to lanceolate, 8–12 mm. long, acute or acuminate: ligules of the ray-flowers yellow, 1.5–2 cm. long, 3-cleft: disk purplish or purplish-brown, 1.5–2 cm. broad: receptacle naked or nearly so: achene 1.5–2 mm. long.—Pinelands, dry woods, rocky banks, and prairies, various provinces, Fla. to Tex., Kans., and S. C.—Spr.-sum.

3. *G. Drummondii* (Hook.) DC. Plant annual, 6 dm. tall or less, the branches puberulent and somewhat villous: leaf-blades spatulate to oblanceolate and undulate to pinnatifid on the lower part of the stem, lanceolate to linear-

lanceolate above, entire, undulate, or distantly toothed, sessile: heads slender-peduncled: involucre bracts 12–20 mm. long, or rarely shorter, linear-lanceolate, usually narrowly so, long-attenuate, hirsute and ciliate; ligules of the ray-flowers 15–22 mm. long, usually purple, except the yellow tips: achene 2.5 mm. long or nearly so, strigose.—Dry soil, prairies, open woods, and cult. grounds, Coastal Plain, S Fla. and Tex.—(*Mex.*)—Spr.–fall, or all year S.

4. *G. picta* Sweet. Plant perennial, but flowering the first year, becoming woody below, 3 dm. tall or less, the branches puberulent and densely long-hairy: leaf-blades spatulate and pinnatifid on the lower part of the stem, linear to lanceolate and mostly entire on the upper part and sessile: heads long-peduncled: involucre bracts narrowly lanceolate, mostly 9–15 mm. long, acuminate, copiously pubescent and ciliate: ligules of the ray-flowers 15–24 mm. long, purple or sometimes yellow-tipped: achene about 2 mm. long, strigose.—Coastal sands, Fla. to Tex. and S. C.—Spr.–fall.

97. **HYMENOPAPPUS** L'Her. Biennial or perennial, erect herbs. Leaves alternate: blades pinnatifid or dissected, or rarely entire. Heads discoid, corymbose. Involucre bracts petaloid. Disk-corollas white or pink, becoming purplish-red the second day, pubescent, with a campanulate or urceolate throat and spreading or recurved lobes. Anther-appendages deltoid-ovate. Achene broadened upward, pubescent all over. Pappus of several scales shorter than the achene, or obsolete.—About 7 species, North American.

1. *H. scabiosaeus* L'Her. Stem 3–7 dm. tall, glabrate or thinly tomentose: leaf-segments rather coarse, elliptic to linear, entire or with ovate to elliptic teeth: bracts of the involucre narrowly elliptic to oval, varying to somewhat obovate: achene 3.5–4 mm. long, or sometimes smaller: pappus-scales obovate, about 0.5 mm. long.—Dry sandy soil, various provinces, Fla. to Tex., Kans., and S. C.—Sum.

98. **POLYPTERIS** Nutt. Perennial, tall, branching, rigid herbs. Leaves alternate, or opposite on the lower part of the stem: blades entire, thick. Heads corymbose, scattered, discoid. Involucre turbinate: bracts rather numerous and broad, scarious above the base, mainly in 2 series. Receptacle naked. Ray-flowers wanting. Disk-corollas white or pink, with a campanulate throat and a long slender tube. Anthers longer than the filaments. Achene 4-angled, rather stoutly enlarged upward, pubescent. Pappus of several slender pubescent awn-like scales.—One species.

1. *P. integrifolia* Nutt. Plant 1.5 m. tall or less, corymbose above: leaf-blades lanceolate or linear-lanceolate to linear, 3–7 cm. long obtuse or acutish: involucre corolloid; bracts elliptic or spatulate, 10–14 mm. long, obtuse: corollas 9–14 mm. long; lobes linear-

lanceolate: achene narrowly obpyramidal, 4-5 mm. long.—Dry pinelands, Coastal Plain, Fla. and Ga.—Sum.—fall or all year S.

**99. PALAFOXIA** Lag. Annual or perennial, sometimes partly woody plants. Leaves alternate or opposite: blades narrow, entire. Heads corymbose. Involucre campanulate to ellipsoid: bracts narrow, herbaceous. Disk-corollas with a cylindric throat much longer than the tube. Achene 4-angled, slenderly enlarged upward, pubescent. Pappus of 4-8 short broad scales.—About 6 species, North American.

**1. P. Feayi** A. Gray. Slender shrubby plant 6-35 dm. tall minutely pubescent: leaves evergreen; blades elliptic to elliptic-lanceolate, 2-7 cm. long: involucre 7-8 mm. long; bracts obtuse: corollas white, 7-8 mm. long: achene clavate, 5-6 mm. long.—Pine-lands and scrub, pen. Fla.—All year S.

**100. FLAVERIA** Juss. Annual, glabrous or pubescent, erect but often bushy-branched, somewhat succulent herbs. Leaves opposite: blades entire or toothed, sessile, sometimes connate. Heads individually inconspicuous. Involucre narrow, prismatic: bracts few, 1-8, mostly nearly equal. Ray-flowers mostly solitary and ligule yellow, or wanting. Disk-flowers 1-15. Achene narrow, 8-10-ribbed. Pappus wanting, or rarely of 2-4 scales.—About 10 species, all except 1 American.—Spr.—fall or all year S.

Receptacle naked: involucre of more than 2 bracts: heads 2-20-flowered: disk-corollas with a funnelform throat.

Involucre of 3 bracts or rarely of 4.

Involucre of 5-7 bracts.

Heads 2-8-flowered.

Stem with long internodes below and usually simple at the base: leaves herbaceous: plant annual.

Stem with short internodes below and usually branched at the base: leaves fleshy: plant perennial (?).

Heads 10-15-flowered.

Receptacle setose: involucre of 1, 2, or 3 bracts: head usually 1-flowered: disk-corollas with a campanulate throat.

1. *F. bidentis*.

2. *F. latifolia*.

3. *F. linearis*.

4. *F. floridana*.

5. *F. trinervia*.

**1. F. bidentis** (L.) Kuntze. Stem 10 dm. tall or less, angled, glabrous or sparingly villous on the angles and the nodes: leaf-blades lanceolate-elliptic, linear-lanceolate, or linear-elliptic, 3-8 cm. long, serrate, 3-ribbed, glabrous, slightly connate: inflorescence with scorpioid branches: heads 2-9-flowered: bracts of the involucre 3, with 1 or 2 additional scale-like ones at the base, oval to ovate, concave 3-4 mm. long, obtuse: ligule about 1 mm. long, narrow: disk-flowers 1-8, the corolla 2-3 mm. long: achene 1.5 mm. long. [*F. chilensis* Gmel.]—Waste-places and roadsides, Coastal Plain, Fla. to Ala. and Ga.—(Mex., S. A.)

**2. F. latifolia** (J. R. Johnston) Rydb. Stem 10 dm. tall or less, glabrate: leaf-blades linear-lanceolate to linear, 2.5-10

cm. long, entire or serrulate, connate: corymb open: heads in small clusters: bracts of the involucre 5, narrowly elliptic, 3.5–4.5 mm. long: ligule 2.5–3 mm. long: disk-flowers 2–5, the corolla 2.5 mm. long: achene about 1.5 mm. long.—Low pinelands, wet prairies, and mangrove swamps, pen. Fla. and the Keys.

3. *F. linearis* Lag. Stem 2–9 dm. long, sometimes decumbent, corymbose above, striate, glabrous: leaf-blades narrowly linear, often narrowly so, 3–10 cm. long, narrowed above the connate bases, entire: corymbs irregular: heads numerous: bracts of the involucre mostly 5, 3.5–4 mm. long, elliptic, or lanceolate: ray-flowers usually solitary; ligule elliptic to oval, 2–3.5 mm. long: disk-flowers usually 5–10, the corollas 2.5–3.5 mm. long: achene about 2 mm. long. [*F. pinetorum* Blake.]—Coastal sands, hammocks, marshes, and low pinelands, pen. Fla. and the Keys.—(*W. I., Mex.*)

4. *F. floridana* J. R. Johnston. Stem 10 dm. tall or less, striate, glabrous: leaf-blades linear-lanceolate to linear, 2.5–8 cm. long, entire or rarely denticulate, slightly connate: heads 10–13-flowered, in compact clusters which are often subtended by a whorl of leaves: bracts of the involucre about 4 mm. long: ligule oval, about 2 mm. long: disk-corollas 2.5 mm. long: achene about 1.5 mm. long.—Sandy shores, pen. Fla.

5. *F. trinervia* (Spreng.) C. Mohr. Stem 2–12 dm. tall, widely branched, glabrate: leaf-blades linear-elliptic to lanceolate or broadly linear, 3–10 cm. long, acute or somewhat acuminate, serrate, 3-ribbed, narrowed to the sessile but connate bases: heads usually 1-flowered, in axillary or involucre clusters: bracts 1–3, or sometimes accompanied by a few accessory ones: corolla of the pistillate flowers 1.5 mm. long, the ligule oblique: corolla of the perfect flower 2 mm. long: achene clavate, about 2 mm. long.—Waste-places and cult. grounds, various provinces, Ala. to Ariz.—(*W. I., Mex., C. A., S. A.*)

101. **TAGETES** L. Annual or rarely perennial, strong-scented, erect, caulescent herbs. Leaves mostly opposite: blades pinnately divided. Heads erect. Involucre narrow: bracts partly united. Ray-flowers several, the corollas with elongate tubes and broad colored, often variegated, ligules. Disk-corollas elongate, the slender tube and narrow throat about equal in length. Achene elongate, somewhat 4-angled. Pappus of unequal narrow scales.—About 20 species, of warm and tropical America.—**MARIGOLDS.**

Heads solitary at the ends of the branches: involucre campanulate: ray-flowers 5–8; ligules obovate, 1 cm. long or more. 1. *T. erecta*.

Heads in compact corymbose cymes: involucre fusiform: ray-flowers usually 3; ligules suborbicular, usually 5 mm. long or less. 2. *T. minuta*.

1. *T. erecta* L. Plant mostly 2–15 dm. tall, the branches spreading or ultimately more or less decumbent: leaf-divisions linear-lanceolate, elliptic, mostly 1–2 cm. long, sharply and rather coarsely serrate: peduncles elongate, markedly clavate: involucre 15–18 mm. long; lobes ovate, short-acuminate: ligules obovate, orange or pale-yellow, 1–2 cm. long: disk-corollas 11–16 mm. long; lobes lanceolate: achene nearly linear, 7–9 mm. long, about as long as the longer pappus-scale.—(**AFRICAN MARIGOLD.**)—Roadsides, fields, and waste-places, Fla. Nat. of Mex.—(*W. I., C. A., S. A., O. W.*)—All year.

2. *T. minuta* L. Plant 3–10 dm. tall, the branches erect or nearly so: leaf-divisions linear to linear-lanceolate, finely but sharply serrate: peduncles short, slender: involucre about 1 cm. long; lobes deltoid, obtuse or merely acutish: ligules yellowish, suborbicular.

usually less than 5 mm. long; disk-corollas 3-4 mm. long; lobes ovate: achene 5-6 mm. long, much longer than the longer pappus-scale.—Sandy waste-places, Coastal Plain, N. C. Nat. of Chile.—Sum.—fall.

**102. BOEBERA** Willd. Annual or perennial, glandular-dotted, strong-scented herbs. Leaves alternate or opposite: blades commonly parted or dissected. Heads inconspicuous, usually corymbose. Involucre turbinate or campanulate: bracts broad, thin-margined. Receptacle flat or nearly so. Ray-flowers yellow, few, the corollas with minute ligules. Disk yellow. Achene 3-5-angled. Pappus of 10 or more partly united narrow scales.—About 3 species, North American.

**1. B. papposa** (Vent.) Rydb. Plant annual, pubescent, 1-4 dm. tall: leaves opposite; blades 1-3 cm. long, pinnately 1- or 2-parted: involucre 6-8 mm. high; bracts scarious-margined: ligules of the ray-flowers inconspicuous: achene 3.5-4 mm. long, pubescent.—Waste-places and roadsides, Tenn. to La., Ariz., Minn., and Ohio.—(Mex.)—Adv. E.—Sum.—fall.

**Thymophylla tenuiloba** (DC.) Small, a native of Tex. and adj. Mex., is adventive at Miami, Fla. It has finely cut leaf-blades and yellow heads.

**103. PECTIS** L. Slender or wiry glandular-dotted herbs, the stems usually pubescent in lines. Leaves opposite: blades narrow, usually ciliate near the base. Heads clustered or solitary. Involucre narrow, few-several-flowered: bracts gland-bearing. Ray-flowers few: corollas with yellow ligules. Styles pubescent. Stigmas of the disk-flowers very short.—About 75 species, American.

Heads sessile or nearly so, mostly in clusters.

Leaves with scattered glands; blades oblanceolate to linear-spatulate.

Leaves with 2 rows of glands beneath; blades narrowly linear.

Heads distinctly peduncled, solitary in the branch-forks and at the ends of the branches.

1. *P. prostrata*

2. *P. linearifolia*.

3. *P. leptocephala*.

**1. P. prostrata** Cav. Stem usually branched at the base, the branches procumbent or prostrate, 0.5-2 dm. long: leaf-blades oblanceolate to linear-spatulate, 1-3 cm. long, entire, with 5-9 pairs of bristles: heads sessile or nearly so, more or less clustered: involucre 5-7 mm. long; bracts 5, elliptic to linear-elliptic, concave and keeled: ray-flowers 5: disk-flowers 4-15, with corollas 2-2.5 mm. long: achene 3-4 mm. long or rarely smaller: pappus-scales of the ray 2, narrowly lanceolate, accompanied by 1-3 bristles; of the disk 5, unequal.—Waste-places and cult. grounds, various provinces, Fla. to Ariz.—(W. I., Mex., C. A., S. A.)

**2. P. linearifolia** Urban. Stem 1-4 dm. tall, erect or diffusely branched, puberulent in lines: leaf-blades linear or nearly so, over

1 mm. wide, acute, entire, 3-6 pairs of bristles near the base: heads sessile or nearly so, few in clusters: involucre prismatic, 4-5 mm. high; bracts 4-6, linear or linear-lanceolate: ray-flowers 2-3; ligules 2-2.5 mm. long: disk-flowers 6 or 7, with corollas about 2.5 mm. long: achene 3 mm. long or nearly so: pappus-scales of the ray 2, narrowly lanceolate and aristate-attenuate, of the disk 5. [*P. ciliaris* Fernald, not L.]—Sandy woods and cult. grounds, pen. Fla.—(W. I.).

3. *P. leptoccephala* (Cass.) Urban. Stem more or less diffusely branched, slender, 1-4 dm. long, the branches prostrate, forming mats, finely pubescent in lines: leaf-blades narrowly linear, commonly 1-3 cm. long, mostly less than 1 mm. wide, acute, entire, with 2-4 pairs of bristles below the middle: heads solitary on filiform peduncles, 1-2.5 cm. long: involucre narrow, 4-5 mm. high; bracts 5, linear or nearly so: ray-flowers 5; ligules 2-2.5 mm. long: disk-flowers 4-7, with corollas 2-2.5 mm. long: achene slender, 2.5-3 mm. long: pappus-bristles of the ray 2, with an incised lanceolate base and a slender awn, of the disk 5, or rarely 4. [*P. linifolia* Less. *P. Lessingii* Fernald.]—Pine-lands and sand-dunes, S pen. Fla. and the Keys.—(W. I.).

104. **ACHILLEA** (Vaill.) L. Perennial, usually copiously pale-pubescent, herbs. Leaves alternate: blades coarsely toothed to thrice-pinnatifid. Heads several or numerous, rather small, in corymbs or corymbiform panicles. Involucre hemispheric, campanulate, or obovoid: bracts imbricate in 3 or 4 series, the outer the smaller. Receptacle conic or convex, chaffy, the chaff membranous, broad. Ray-flowers 5-12, pistillate, fruit-producing: corollas with short and broad, white, pink or purple, or rarely yellow ligules. Disk-flowers 15-75, perfect, fruit-producing: corollas yellowish-white or straw-colored, the tube equaling or longer than the throat. Achene ellipsoid or obovoid, callous-margined. Pappus wanting.—About 75 species, in the Northern Hemisphere, mostly in the Old World.—Spr.-fall.—MILFOILS. YARROWS.

Ultimate leaf-segments linear or nearly so: ligules of the ray white.

Ultimate leaf-segments ovate or lanceolate.

Ligules of the ray purplish: leaf-blades conspicuously punctate, the ultimate segments strongly callous-thickened toward the apex.

Ligules of the ray white or rarely pink: leaf-blades not conspicuously punctate, the ultimate segments not callous-thickened toward the apex.

1. *A. occidentalis*.

2. *A. asplenifolia*.

3. *A. Millefolium*.

1. *A. occidentalis* Raf. Stem 3-10 dm. tall, silky-villous, mostly simple: leaves sparingly villous; rachis merely margined; ultimate segments linear or nearly so: bracts of the involucre elliptic, often broadly so, to elliptic-lanceolate, the outer obtuse, the inner acute, all erose-ciliate at the apex: ligules 2 mm. wide: disk-corollas 2-2.5 mm. long: achene narrowly cuculate, nearly 2 mm. long.—Open woods, clearings, roadsides, and waste-places, various provinces, Fla. to Ark., Colo., Minn., and Mass.

2. *A. asplenifolia* Vent. Stem 2.5-6 dm. tall, nearly glabrous or sparingly silky-villous, sometimes branched above: leaves glabrous above, sparingly villous beneath; rachis winged; ultimate segments lanceolate: bracts of the involucre ovate to ellip-

tic, sometimes narrowly so, all obtuse, ciliate at the apex: ligules nearly 2 mm. wide: disk-corollas about 2 mm. long: achene ellipsoid, less than 2 mm. long.—(YAR.)—Roadsides, fields, and woods, various provinces N of Coastal Plain, N. C. to S. Dak. and N. S. Nat. of Eu.

3. **A. Millefolium** L. Stem 2–7 dm. tall, sparingly villous, sometimes branched above: leaves sparingly villous; rachis winged; ultimate segments ovate or ovate-lanceolate: bracts of the involucre ovate to elliptic, all obtuse, ciliate at the apex: ligules about 2 mm. wide: disk-corollas fully 2 mm. long: achene ellipsoid or slightly broadened upward, fully 2 mm. long.—Dry hillsides, woods, pastures, and roadsides, various provinces, Fla. to Miss., Ill., Yukon, and N. S.—(W. I., O. W.)—Often a weed.

105. **ORMENIS** Cass. Annual, diffusely branched herbs. Leaves alternate: blades pinnatifid, the segments rather broad. Heads solitary at the ends of the branches. Involucre saucer-shaped: bracts in 2 or 3 series, rather broad. Receptacle conic, chaffy, the chaff cartilaginous, boat-shaped, surrounding the achenes. Ray-flowers perfect, fruit-producing; corollas with yellow ligules, or white and yellow at the base. Disk-flowers numerous, perfect, fruit-producing, the tube produced into an appendage at the base. Achene ellipsoid or obovoid, prominently 3-ribbed on the inner side. Pappus wanting.—One species.

1. **O. mixta** (L.) Dum. Stem 1–4 dm. tall, usually branched at the base, the branches spreading, villous: leaf-blades cuneate or spatulate to linear in outline, 1–3 cm. long, the rachis broad, the segments triangular to lanceolate on the lower part of the blade, often broadened upward toward the apex: peduncles slightly thickened under the head: bracts of the involucre ovate to elliptic and linear, 3–4 mm. long, villous: ligules cuneate, 5–8 mm. long, yellow at the base: achene obovoid, fully 1 mm. long.—Waste-places and cult. grounds, various provinces, Fla. to B. C. and N. J. Nat. of Medit. Reg.—Spr.–fall.

106. **ANTHEMIS** L. Annual or perennial, branched, leafy herbs. Leaves alternate: blades pinnatifid or bipinnatifid, the segments rather narrow. Heads solitary at the ends of the branches. Involucre saucer-shaped: bracts in about 3 series, usually thin. Receptacle conic to hemispheric, chaffy, the chaff membranous, with a midrib. Ray-flowers pistillate, fruit-producing: corollas with white ligules. Disk-flowers numerous, perfect, fruit-producing: corolla yellow, the tube equalling or longer than the throat, the lobes ovate. Achene subcylindric or somewhat obovoid, with filiform ribs. Pappus wanting or a minute crown.—About 80 species, Eurasian and African.

Receptacle with cuspidate-acuminate chaff: achene equally 10-nerved. 1. *A. arvensis*.  
Receptacle with obtuse chaff: achene 3-nerved on the inner side. 2. *A. nobilis*.

1. **A. arvensis** L. Annual or sometimes biennial, not strong-scented: stem 1–5 dm. tall, finely pubescent: leaf-blades 2–5 cm. long, pinnatifid or bipin-

natisfied, the segments linear-lanceolate to subulate: bracts of the involucre pubescent, the outer lanceolate, acute, the inner elliptic, obtuse: ligules 7-12 mm. long: achene subcylindric, 1.5-2 mm. mm. long: pappus a minute border.—Waste-places, roadsides, and fields, various provinces, Fla. to Ore., B. C., and Que. Nat. of O. W.—Spr.—fall.

2. *A. nobilis* L. Perennial, aromatic: stem 1-3.5 dm. tall, pubescent, sometimes decumbent: leaf-blades 1-4 cm. long, pinnatifid or bipinnatifid, the segments linear to subulate: bracts of the involucre pubescent, the outer ovate-lanceolate, obtuse, the inner elliptic, rounded at the apex: ligules 6-10 mm. long: achene somewhat pyriform, 1-1.5 mm. long: pappus wanting.—Waste-places and about gardens, various provinces, N. C. to Tenn. and R. I. Nat. of Eu.—Sum.—fall.

107. **MARUTA** Cass. Annual, branching, usually very leafy herbs. Leaves alternate: blades pinnatifid, the segments narrow. Heads solitary at the ends of the branches. Involucre saucer-shaped: bracts in 2 series, rather broad. Receptacle conic, chaffy toward the apex, the chaff subulate, rather persistent. Ray-flowers 10-15, neutral: corollas with white ligules. Disk-flowers perfect, fruit-producing: corollas greenish-yellow, the tube longer than the throat, the lobes ovate. Achene nearly cylindric, 10-ribbed, glandular-tubercled. Pappus wanting.—About 12 species, natives of the Old World.

1. *M. Cotula* (L.) DC. Plant strong-scented: leaf-blades thrice pinnately dissected, the segments very slender: disk-flowers near the center of the receptacle with chaff; corollas mostly 2.5 mm. long: achene tuberculate-roughened: pappus wanting. [*Anthemis Cotula* L.]—(MAY-WEED. DOG'S-CAMOMILE. DOG-DAISY. DOG-FENNEL.)—Fields, roadsides, cult. grounds, and waste-places, various provinces, Fla. to Calif., Alas., and Newf. Nat. of O. W.—Sum.—fall.

108. **CHAMOMILLA** [Hall.] Gilib. Annual herbs, resembling *Anthemis* and *Maruta*. Leaves alternate: blades once to thrice pinnatifid, the segments narrow. Heads solitary or corymbose. Involucre saucer-shaped to hemispheric: bracts somewhat imbricate in 2-4 series, scarious-margined. Receptacle conic, hemispheric, or subglobose, naked. Ray-flowers, if present, pistillate, fruit-producing: corollas with white ligules. Disk-flowers numerous, perfect, fruit-producing: corollas yellow, the tube equaling or slightly longer than the throat, the lobes lanceolate to ovate. Achene asymmetric, the back nerveless, the face 3-5-ribbed. Pappus a crown or a mere border.—About 50 species, mostly natives of the Old World.

1. *C. maritima* (L.) Rydb. Stem and branches 1–3 dm. tall, often decumbent: leaf-blades 2–4 cm. long; blades bipinnatifid, the segments spreading, fleshy: involucre 10–12 mm. wide; bracts elliptic, obtuse, brown-margined: ray-flowers 15–20; ligules white, 8–11 mm. long: achene cuneate, 2–2.5 mm. long, rugose on the back and between the corky ribs: pappus-crown toothed.—Ballast and waste-places, Coastal Plain and adj. provinces, Ala. to Pa. and Mass. Nat. of Eu.—Spr.—fall.

109. **MATRICARIA** [Tourn.] L. Annual or perennial, branching herbs, but sometimes partly woody. Leaves alternate: blades lobed, dissected, or pinnately divided. Heads corymbose. Involucre saucer-shaped to hemispheric: bracts somewhat imbricate in 2–4 series, narrow. Receptacle convex, naked. Ray-flowers usually present, several, pistillate, fruit-producing: corollas with narrow or broad ligules, white in our species. Disk-flowers numerous, perfect, fruit-producing: corollas often yellow, the tube and throat slightly differentiated, the lobes deltoid. Achene subcylindric, 5–10-angled or 5–10-ribbed. Pappus in both ray and disk a lobed crown. —About 100 species, widely distributed.

1. *M. Parthenium* L. Stem 2–7 dm. tall, striate: leaf-blades broad, those of the lower ones at least, twice pinnately parted, the divisions incised: involucre 7–10 mm. wide; outer bracts linear-lanceolate, acute; inner bracts linear-elliptic, 2.5–3 mm. long, acute or obtuse: ligules white, 3–8 mm. long: disk cream-colored: achene 1.5 mm. long, 8–10-ribbed: pappus a toothed crown. [*Chrysanthemum Parthenium* (L.) Bernh.]—(FEVERFEW.)—Roadsides, fence-rows, and waste-places, various provinces, Ga. to Ohio and N. B.; also Calif. to Wash. Nat. of Eu.—(W. I., Mex., C. A.)—Sum.—fall.

110. **LEUCANTHEMUM** [Tourn.] Mill. Perennial herbs with root-stocks. Leaves alternate: blades toothed or entire, or sometimes pinnatifid. Heads solitary at the ends of the stem and branches. Involucre saucer-shaped: bracts somewhat imbricate in 2–4 series, narrow. Receptacle flat or convex, naked. Ray-flowers usually present, 10–25, pistillate and fruit-producing: corollas with white ligules. Disk-flowers numerous, perfect, fruit-producing: corollas yellow, the tube usually shorter than the throat, the lobes lanceolate. Filaments adnate to the tube. Achene cylindric or nearly so, 10-ribbed or 10-angled. Pappus wanting or obsolete, or in the ray a mere crown.—About 20 species, natives of the northern hemisphere.

1. **L. Leucanthemum** (L.) Rydb. Plant 2-9 dm. tall, glabrous or nearly so: leaf-blades spatulate to linear, 2-15 cm. long, serrate or pinnatifid: involucre 12-18 mm. wide; outer bracts linear-lanceolate, acute: inner bracts elliptic, 5.5-6.5 mm. long, obtuse: ray-flowers numerous; ligules white or pink, 1-2.5 cm. long: disk yellow: achene cylindric, about 1.5 mm. long: pappus obsolete. [*Chrysanthemum Leucanthemum* L.]—(WHITE-DAISY. OX-EYE DAISY. WHITE-WEED.)—Fields, roadsides, woods, and waste-places, nearly throughout U. S. and Can. Nat. of O. W.—(W. I.)—Sum.-fall.—Widely distributed in the Southern States during the Civil War. In the mountains, when abundant, the plants, especially the ripe heads, are much eaten by sheep.

**111. CHRYSANTHEMUM** L. Annual herbs, suggesting coarse-leaved *Maruta* or *Cotula*. Leaves alternate: blades toothed to pinnatifid. Heads solitary at the ends of the branches. Involucre hemispheric or nearly so: bracts thin, imbricate in about 3 series, broad. Receptacle convex, naked. Ray-flowers 10-20, pistillate, fruit-producing: corollas with yellow ligules. Disk-flowers numerous, perfect, fruit-producing: corollas yellow, the tube and throat about equal in length, the lobes ovate. Achenes various, those of the ray short and obpyramidal, with 2 or 3 wing-angles, those of the disk prismatic or cylindric, 8-10-ribbed. Pappus wanting.—About 15 species, natives of the Old World.

Leaf-blades dissected, bipinnatifid: achenes of the ray 3-angled, the median angle with the broader wing-margin. 1. *C. coronarium*.

Leaf-blades toothed or merely pinnately lobed: achenes of the ray with 2 lateral wings. 2. *C. segetum*.

1. **C. coronarium** L. Stem 3-6 dm. tall, glabrous: blades of the cauline leaves obovate outline 3-6 cm. long, mostly bipinnatifid, sessile and auricled, the ultimate segments linear-lanceolate: heads on peduncles mostly over 5 cm. long: involucre 1 cm. high or less; bracts ovate to elliptic, with broad light-brown margins: ray-flowers 15-20, the ligules 1-1.5 cm. long: disk-corollas about 5 mm. long: achenes of the ray 3-angled, the middle angle winged, those of the disk 4-angled, the inner angle produced into a spur.—Waste-places and roadsides, various provinces, Ala. to Ont. Nat. of Medit. Reg.—(W. I.)—Spr.-fall.

2. **C. segetum** L. Stem 2-5 dm. tall, glabrous: blades of the cauline leaves spatulate to elliptic or lanceolate, pinnately lobed, toothed, or entire, the segments oblanceolate to cuneate: heads on peduncles mostly less than 5 cm. long: involucre about 1 cm. high; bracts elliptic, often broadly so, with broad brown margins: ray-flowers 12-15, the ligules 1-2 cm. long: disk-corollas about 5 mm. long: achenes of the ray with two lateral wings, those of the disk cylindric, 10-ribbed.—(CORN-MARIGOLD. CORN-CHRYSANTHEMUM.)—Waste-places, fields, and cult. grounds, various provinces, Fla. to Ala., N. Y., and N. B.; also Calif. and Ore. Nat. of O. W.—Sum.-fall.

**112. TANACETUM** [Tourn.] L. Perennial rather coarse erect herbs with rootstocks or rarely annuals. Leaves alternate: blades once to thrice

pinnatifid. Heads corymbose. Involucre hemispheric to saucer-shaped: bracts in 2 or 3 series, usually narrow, often partly similar. Receptacle convex, naked. Ray-flowers 5-20, pistillate, fruit-producing: corollas with erect or spreading, inconspicuous, yellow ligules. Disk-flowers numerous, perfect, fruit-producing: corollas with the tube and throat only slightly differentiated. Achenes subcylindric, those of the ray mostly 3-angled, those of the disk 5-angled. Pappus a crown-like border.—About 30 species, widely distributed in the Northern Hemisphere.

1. **T. vulgare** L. Plants perennial, 3-10 dm. tall, acrid-aromatic: leaf-blades 5-20 cm. long, with the ultimate segments sharply toothed: involucre 6-8 mm. wide, the inner bracts 4-5 mm. long: ray-flowers scarcely exceeding the disk and so inconspicuous as to make the heads appear discoid; corollas yellow: achene about 2 mm. long.—(TANSY.)—Fields, roadsides, and about gardens, various provinces, Ga. to Miss., Calif., Wash., and N. S. Nat. of O. W.—Sum.

113. **ARTEMISIA** L. Annual or perennial, often copiously branched herbs, or shrubs. Leaves alternate: blades dissected, lobed, or toothed, or entire. Heads relatively small, mostly in panicles, usually nodding before maturity, apparently discoid, the marginal flowers without ligules or wanting. Involucre campanulate to hemispheric: bracts in 2-4 series, the inner longer and thinner than the outer. Receptacle convex or conic, naked or hairy. Flowers yellowish or greenish. Marginal flowers (functionally ray-flowers) pistillate, fruit-producing: corollas various, sometimes oblique, or wanting. Disk-flowers few, perfect, often fruit-producing: corollas campanulate, funnel-form, or trumpet-shaped. Achene ellipsoid, terete. Pappus wanting.—About 250 species, in the Northern Hemisphere and South America.—WORMWOODS.

Disk-flowers not producing fruits: stigmas united or very short and erect: receptacle naked.

Disk-flowers fruit-producing, their stigmas elongate and recurved.

Receptacle hairy.

Receptacle naked.

Annual or biennial herbs.

Perennial plants.

Leaf-blades with broad lobes.

Leaf-blades bipinnatifid, the segments very narrow or filiform.

I. DRACUNCULOIDES.

II. FRIGIDAE.

III. ANNUE.

IV. VULGARES.

V. PONTICAE.

#### I. DRACUNCULOIDES

Plant biennial: heads mostly erect.

Plant perennial: heads mostly nodding.

1. *A. caudata*.

2. *A. campestris*.

#### II. FRIGIDAE

Woody perennial: leaf-blades with linear to ovate obtuse teeth.

3. *A. Absinthium*.

#### III. ANNUE

Heads in dense axillary spikes, not nodding.

Heads in lax racemes or panicles, nodding.

4. *A. biennis*.

5. *A. annua*.

## IV. VULGARES

Perennial with broad-lobed leaf-blades: heads in simple or compound spikes.

6. *A. vulgaris*.

## V. PONTICAE

Perennial with narrow lobed leaf-blades: heads in simple or compound racemes.

7. *A. Abrotanum*.

1. *A. caudata* Michx. Stem, glabrous, at least at maturity, 5–18 dm. tall, often with ascending branches at the base: leaves numerous; blades once to thrice pinnately divided, the segments linear-filiform to nearly filiform: heads very numerous in elongate panicles: involucre with the disk-flowers perfect but not producing fruit, 3–4 mm. high; bracts ovate to oval or broadly elliptic: ray-flowers 6–8: corollas 1.5 mm. long: achene about 1 mm. long.—Sandy soil, various provinces, Fla. to Tex., Wyo., and N. B.—Sum.—fall.

2. *A. campestris* L. Stem, glabrous, 3–6 dm. tall, usually branched, striate: leaves clustered at the base of the stem; blades mostly once or twice pinnately divided, the segments linear-filiform: heads numerous, in open panicles: involucre with the disk-flowers perfect, but not producing fruits, 2–2.5 mm. high; bracts ovate to oval: ray-flowers 6–10: corollas 1 mm. long: achene fully 0.5 mm. long.—Sandy woods and dry banks, various provinces, S. C. to Conn. Nat. of Eu.—Sum.—fall.

3. *A. Absinthium* L. Stem, more or less woody, 4–12 dm. tall, finely cinereous-pubescent, much-branched: leaf-blades once, twice, or thrice pinnately divided, the segments linear, lanceolate, or ovate: heads numerous in leafy panicles, nodding: involucre 3–3.5 mm. high, with the central flowers fruit-producing; bracts lanceolate to ovate: ray-flowers about 10: corollas 1.5 mm. long: achene fully 1 mm. long.—(WORMWOOD.)—Fields, roadsides, and banks, various provinces, N. C. to Utah, B. C., Ont., and Newf. Nat. of Eu.—Sum.—fall.

4. *A. biennis* Willd. Plant glabrous, inodorous, insipid, 2–11 dm. tall, the stem nearly simple or sparingly branched: leaves numerous; blades once or twice pinnately divided, the segments lanceolate or linear, incised-pinnatifid or pinnatifid: panicle-branches ending in spikes: heads not drooping, crowded in axillary clusters: involucre 2–3 mm. high, with the central flowers perfect and fruit-producing; bracts elliptic to elliptic-lanceolate: ray-flowers 10–15; disk-flowers 10–15; corollas yellow, about 1 mm. long: achene about 1 mm. long.—Gravelly banks and rocky soil, various provinces N of Coastal Plain, Tenn. to Mo., B. C., N. S., and Pa.; naturalized eastward.—(O. W.)—Sum.—fall.

5. *A. annua* L. Plant, glabrous, very aromatic, 4–10 dm. tall, the stem much-branched: leaf-blades once, twice, or thrice pinnately divided, the segments elliptic or incised, or pinnatifid: panicle-branches ending in loose racemes: heads subglobose, scattered, nodding: involucre about 1.5 mm. high, with the central flowers perfect and fruit-producing; bracts mostly elliptic, the outer narrower than the inner: ray-flowers 5 or 6; corollas greenish-yellow, less than 1 mm. long: disk-flowers 5 or 6; corollas yellow, 1 mm. long: achene 1 mm. long.—Fields, roadsides, and waste-places, various provinces, Tenn. to Ark., Ont., N. B., and Va.; also Calif. Nat. of O. W.—Sum.

6. *A. vulgaris* L. Herbaceous, lanate-tomentose, 3-12 dm. tall, the stems paniculately branched: leaf-blades various, white-woolly beneath, twice pinnatifid or pinnately parted, the segments lanceolate or linear: heads first nodding, soon erect, in a leafy panicle: involucre 4-5 mm. high, with the central flowers fruit-producing; bracts ovate to elliptic or elliptic-lanceolate: ray-flowers 6-12; corollas 2 mm. long: disk-flowers 5-15; corollas 2.5 mm. long: achene 1.5 mm. long or more.—(MUGWORT. WHITE-SAGE.)—Roadsides, stream-banks, cult. grounds, and waste-places, various provinces, Ga. to Ala., B. C., Ont., and Newf. Nat. of Eu.—(W. I.)—Sum.—fall.

7. *A. Abrotanum* L. Shrub 1 m. tall or less, puberulent or glabrous, the stem much-branched, the branches erect or ascending: leaf-blades twice pinnately divided, the segments linear-filiform, revolute: heads numerous, nodding, in leafy panicles: involucre about 3 mm. high; bracts linear-lanceolate to elliptic, arachnoid-canescens: ray-flowers about 10; corollas 1.5 mm. long: disk-flowers 15-20; corollas nearly 2 mm. long: achene about 1 mm. long.—(SOUTHERNWOOD.)—Waste-places and roadsides, various provinces, N. C. to Colo. and N. B. Nat. of Eu.—Sum.—fall.

114. *SOLIVA* R. & P. Annual, caulescent, diminutive herbs. Leaves alternate: blades pinnately twice divided, the ultimate segments deeply lobed. Heads sessile on the stem or on the branches, green, discoid, the flowers mostly pistillate and apetalous, the few perfect ones with 2-6-lobed corollas. Involucre hemispheric: bracts broad in 2 series. Anthers broad, mostly rounded at the base. Achene much flattened, winged, the wings, often broadly pandurate, smooth, usually prolonged into a short spine on either side of the larger terminal spine. Pappus none.—About 3 species, South American.

1. *S. sessilis* R. & P. Plant depressed, the stem and branches, at least, villous: leaves 2-5 cm. long, the lobes acute or acuminate, ciliate: involucre sessile in the somewhat dilated leaf-bases; bracts ovate, about 4 mm. long, acute or sharp acuminate: achene-body about 2 mm. long, the broad wings ciliolate, the terminal spine about as long as the achene-body.—Lawns and banks, N Fla. to La. Nat. of S. Am.—Spr.—fall.

115. *GYMNOSTYLES* A. Juss. Annual, caulescent, diminutive, often matted stoloniferous herbs. Leaves alternate: blades once or twice pinnately divided, the ultimate segments entire or toothed. Heads sessile at the base of the plant, green, discoid, the flowers as in *Soliva*. Involucre hemispheric, becoming flattish: bracts narrow, in 1 or 2 series. Anthers narrow, somewhat sagittate at the base. Achene somewhat flattened, with callous corrugated margins and a terminal spine. Pappus none.—About 3 species, South American.

Leaf-blades 2-pinnate: achene-callous corrugated up to the base of the rounded top: heads much depressed, 8-10 mm. wide. 1. *G. anthemifolia*.

Leaf-blades 1-pinnate: achene-callous corrugated up to the truncate or notched top: heads subglobose, 3-6 mm. wide. 2. *G. nasturtiifolia*.

1. *G. anthemifolia* A. Juss. Plant somewhat depressed, light-green, the branches often creeping: leaves erect or nearly so, 4–14 cm. long, the lobes acute or acuminate, long-hairy: bracts of the involucre elliptic-lanceolate, 4.5–5.5 mm. long, usually somewhat acuminate: achene-body ellipsoid-cuneate, about 2 mm. long, the margins bluntly corrugated.—In dense tufts, bayou-banks, roadsides, ditch-banks, paths, fields, yards and waste grounds, Coastal Plain, N. Fla. to Tex. Nat. of S. Am.—Spr.

2. *G. nasturtiifolia* A. Juss. Plant much depressed, dark-green, the branches creeping: leaves prostrate or spreading, 1.5 cm. long or less, the lobes obtuse or acutish, short-hairy: bracts of the involucre lanceolate to linear-spatulate, 2.5–3 mm. long, acute or acuminate: achene-body cuneate, 1.5–2 mm. long, the margin sharply corrugated. [*Soliva nasturtiifolia* (A. Juss.) D. C.]—In patches or carpets, low, moist, or damp, partly shaded places, Coastal Plain, Fla. to La. and N. C. Nat. of S. Am.—Early spr.

116. *ARNICA* L. Perennial simple-stemmed or sparingly branched herbs. Leaves typically opposite: blades entire or toothed. Heads solitary or several. Involucre mostly turbinate or campanulate, or broader in age: bracts nearly equal, narrow. Ray-flowers with yellow ligules. Corollas of the disk-flowers tubular, the lobes very short. Achene ribbed. Pappus a single series of slender bristles.—About 45 species, in the Northern Hemisphere.

1. *A. acaulis* (Walt.) B. S. P. Plant 2–10 dm. tall, hirsute: leaves mainly basal and spreading on the ground; blades elliptic to oval or ovate, 5–12 cm. long, shallowly toothed or nearly entire: bracts of the involucre 9.5–11 mm. long, acute: ligules 1.5–2.5 cm. long: achene 4 mm. long. [*A. nudicaulis* Nutt.]—(LEOPARD'S-BANE.)—Pinelands and low open woods, in acid soil, Coastal Plain and adj. provinces, Fla. to Pa.—Sum.—Rather rare.

117. *EMILIA* Cass.<sup>1</sup> Annual or perennial, tender herbs. Leaves alternate, but often mostly basal: blades entire toothed, or lyrate-pinnatifid. Heads solitary or in lax corymbs. Involucre swollen at the base: bracts in one series and without accessory ones at the base. Ray-flowers wanting. Disk-corollas golden, purple, or red, with a cylindric throat and a slender tube, the lobes lanceolate. Filaments slender. Achene 5-ribbed.—About 5 species, natives of the Old World Tropics.

Corollas scarlet or orange: heads stout: involucre campanulate, usually over 1 cm. long.

Corollas lilac or pale-purplish: heads slender: involucre cylindric-campanulate, usually less than 1 cm. long.

1. *E. coccinea*.

2. *E. sonchifolia*.

<sup>1</sup> Revised by Edward Johnston Alexander.

1. *E. coccinea* (Sims) Sweet. Plant moderately slender, mostly 1–8 dm. tall: leaf-blades rather succulent, those of the lower leaves spatulate, those of the upper leaves lanceolate to linear, auricled at the base, all sinuate-dentate: heads long-peduncled: involueral bracts linear, 10–12 mm. long: corollas 9–11 mm. long: achene 4 mm. long. [*E. sonchifolia* (Fl. SE. U. S.)]—Cult. grounds, waste-places, fields, and roadsides, pen. Fla. and Florida Keys. Nat. of O. W. trop.—(W. I., Mex., C. A., S. A.)—All year.

2. *E. sonchifolia* (L.) DC. Plant very slender, 1–5 dm. tall: leaf-blades spatulate in outline below, above lanceolate to elliptic, all auricled at the base, the lower narrowed to a wing-like petiole between the blade and the auricled base, all sinuate-dentate, or somewhat pinnatifid: heads long-peduncled: involueral bracts linear, 8–10 mm. long: corollas 7–8 mm. long: achene 3 mm. long.—Cult. grounds, waste-places, fields, and roadsides, pen. Fla. and Florida Keys. Nat. of O. W. trop.—(W. I., Mex., C. A., S. A.)

118. *GYNURA* Cass. Annual or perennial, rather coarse herbs or subshrubs. Leaves alternate; blades entire, toothed, pinnatifid or pinnately parted. Heads solitary to many. Involucre campanulate or cylindric, with several subtending bractlets: bracts flat. Heads discoid. Corollas yellow or orange to red, with a long, narrow funnel-form throat, and triangular or ovate lobes. Anthers entire or minutely sagittate at the base. Style-branches slender with long, subulate, pubescent appendages. Achene terete, 5–10-ribbed. Pappus copious, white.—About 20 species, natives of Asia, Africa, East Indies, and Australia.

1. *G. aurantiaca* (Blume) DC. Plant up to 1 m. tall, the stem densely velvety with long purple hairs, often widely branched: leaf-blades simple, with flaring teeth; the lower petioles expanding into an auriculate base; upper leaves sessile by an auriculate base: bracts subtending the involucre narrowly linear to filiform; involucre 10–15 mm. high: corollas yellow-orange: achene pubescent.—(VELVET-PLANT.)—Pinelands, roadsides and waste-places, S pen. Fla. Nat. of E. I. (W. I.)—Spr.

119. *MESADENIA* Raf. Perennial, somewhat leafy herbs. Leaves alternate: blades undulate, toothed, or somewhat lobed. Heads in corymb-like clusters but centrifugal. Involucre cylindric to cylindric-ovoid: bracts sometimes winged or keeled. Flowers white or pinkish; disk-corollas with linear or linear-lanceolate lobes longer than the campanulate throat. Filaments filiform. Achene ribbed, glabrous. [*Cacalia* L. in part]—About 30 species, North American.—Sum. or Spr.—fall S.—INDIAN-PLANTAINS.

Bracts of the involucre wingless.

Leaf-blades pedately or digitately veined, those of the lower leaves wider than long.

I. RENIFORMES.

Leaf-blades parallel-veined or subpinnately veined: stem terete.  
Bracts of the involucre winged along the midrib.

II. LANCEOLATAE.  
III. TUBEROSAE.

#### I. RENIFORMES

Leaves green on both sides or glaucous beneath; blades pedately veined.

Leaves green: stem furrowed.

Leaves glaucous beneath: stem terete.

Leaves glaucous on both sides: blades digitately veined.

1. *M. reniformis*.
2. *M. atriplicifolia*.
3. *M. maxima*.

#### II. LANCEOLATAE

Leaf-blades ovate, commonly broadly so.

Leaf-blades linear to lanceolate.

4. *M. Elliottii*.
5. *M. lanceolata*.

#### III. TUBEROSAE

Stem terete, merely striate: blades of the upper stem-leaves hastate.

Stem channeled or angled: blades of the upper stem-leaves not hastate.

Lower leaves with 7-9-veined entire or crenate blades.

Leaf-blades entire or nearly so.

Leaf-blades crenate.

Lower leaves with 3-5-veined sinuate-dentate blades.

6. *M. diversifolia*.

7. *M. tuberosa*.
8. *M. floridana*.
9. *M. sulcata*.

1. *M. reniformis* (Muhl.) Raf. Stem 9-30 dm. tall: blades of the cauline leaves reniform, 10-60 cm. wide: involueral bracts 8-11 mm. long: achene about 5 mm. long. [*C. reniformis* Muhl.]—(GREAT INDIAN-PLANTAIN.)—Rich banks, woods, and thickets, various provinces, rarely Coastal Plain, Ga. to Ala., Tenn., Minn., and N. J.

2. *M. atriplicifolia* (L.) Raf. Stem 9-20 dm. tall: blades of the cauline leaves ovate to triangular, or narrower above, angulate-lobed or sharply and coarsely toothed: involueral bracts 8-11 mm. long: achene 4-4.5 mm. long. [*C. atriplicifolia* L.]—(PALE INDIAN-PLANTAIN.)—Woods, various provinces, Fla. to Kans., Minn., and N. J.

3. *M. maxima* Harper. Stem about 15 dm. tall: blades of the cauline leaves broadly ovate or narrower above, coarsely sinuate-toothed involueral bracts 9-11 mm. long: achene not seen.—Dry pinelands, Sumter Co., near inner edge of Coastal Plain of Ga.

4. *M. Elliottii* Harper. Stem 8-12 dm. tall: blades of the cauline leaves ovate to oval, entire or repand-undulate: involueral bracts 8-10 mm. long: achene 6-6.5 mm. long. [*Cacalia ovata* (Chapm. Fl.) *M. ovata* (Fl. SE. U. S.)]—Swamps, low pinelands, and damp woods, Coastal Plain, Fla. to La. and Ga.—Late sum.

5. *M. lanceolata* (Nutt.) Raf. Stem 8-15 dm. tall: blades of the cauline leaves linear, narrowly lanceolate, or linear-elliptic, entire or repand-denticulate: glaucous (or merely yellowish-green in *M. lanceolata virescens*): involueral bracts 8-10 mm. long: achene about 5 mm. long. [*C. lanceolata* Nutt.]—Everglades and wet pinelands, Coastal Plain, Fla. to La. and N. C.

6. *M. diversifolia* (T. & G.) Greene. Similar to *M. atriplicifolia* in habit, but not glaucous: stem angled, bracts keeled: corolla-lobes but little longer than the throat. [*C. diversifolia* T. & G. *M. difformis* Small.]—Swamps, Coastal Plain, W Fla. and SW Ga.

7. *M. tuberosa* (Nutt.) Britton. Stem 6–12 dm. tall: blades of the cauline leaves ovate, oval, elliptic-lanceolate, or narrowly elliptic, 5–20 cm. long: bracts of the involucre 8–10 mm. long: achene 4.5–5 mm. long. [*C. tuberosa* Nutt.]—Prairies, various provinces, Ala. to La., Minn., and Ont.

8. *M. floridana* (A. Gray) Greene. Stem 7–12 dm. tall: leaf-blades ovate, oval, or elliptic, crenate: involucre bracts 10–12 mm. long: corolla-lobes slightly longer than the throat: achene about 5 mm. long.—Dry pinelands, E Fla.—Spr.—sum.

9. *M. sulcata* (Fernald) Small. Stem 9–15 dm. tall: leaf-blades ovate to elliptic-ovate, narrowly elliptic, or elliptic-lanceolate: involucre bracts 8–10 mm. long: corolla-lobes twice as long as the throat: achene 5.5–6 mm. long.—Bogs or wet woods, Coastal Plain, N Fla. to Ala. and Ga.—Sum.—fall.

120. **SYNOSMA** Raf. Perennial, copiously leafy herbs. Leaves alternate: blades triangular to hastate, toothed. Heads corymbose. Involucre nearly cylindric: bracts narrow. Flowers white or pinkish: disk-corollas with lanceolate lobes shorter than the funnelform throat. Filaments enlarged below the anthers. Achene ribbed, glabrous.—One species.

1. *S. suaveolens* (L.) Britton. Plant 6–15 dm. tall: leaves numerous; blades hastate, 8–20 cm. long, serrate or dentate-serrate: larger bracts of the involucre 10–11 mm. long: corollas 11–12 mm. long: achene slender, 7–9 mm. long. [*Cacalia suaveolens* L.]—Rich woods, thickets, and shaded banks, various provinces, Fla. to Tenn., Minn., and Mass.—Sum.—fall.

121. **ERECHTITES** Raf. Annual herbs. Leaves alternate: blades toothed or pinnatifid. Heads corymbose or paniculate. Involucre narrow and somewhat swollen at the base: bracts narrow, flat. Disk-corollas with triangular-lanceolate or deltoid lobes shorter than the narrow throat. Filaments longer than the anthers. Achene ribbed. Pappus of many white bristles.—About 12 species, American and Australian.

1. *E. hieracifolia* (L.) Raf. Plant 2–20 dm. tall, watery: leaf-blades spatulate-elliptic to lanceolate, 5–20 cm. long, coarsely toothed, incised, or pinnatifid: involucre 12–15 mm. long; bracts narrowly linear: corollas 8–9 mm. long, white: achene about 1.5 mm. long.—(FIREWEED. PILEWORT.)—Fields, woods, roadsides, and waste-places, various provinces, Fla. to La., Sask., and Newf.—Sum. or all year S.—A rather tender, but also somewhat coarse herb varying greatly in habit and with almost endless leaf-forms.

**122. SENECIO** [Tourn.] L. Annual or perennial herbs. Leaves alternate: blades entire, toothed, pinnatifid, or pinnately parted. Heads solitary or many. Involucre campanulate to cylindric: bracts flat. Ligules of the ray yellow, when present, in our species. Disk-corollas yellow with a funnel-form throat and triangular or ovate lobes. Filaments often enlarged below the anthers. Achene 5-10-ribbed, pubescent or papillose.—About 1,500 species, widely distributed.—Spr.—SQUAW-WEEDS. RAGWORTS. RAGWEEDS. GROUNDSELS.

Plant annual or perhaps biennial: pubescence, if present, arachnoid.

Ray-flowers present: achene pubescent on the angles.

Ray-flowers wanting: achene pubescent all over.

Plant perennial: foliage, if pubescent, woolly or floccose.

Heads large, the involucre over 1 cm. high: ray-flowers none.

Heads small, the involucre less than 1 cm. high: ray-flowers normally present.

Blades of the basal leaves toothed or partly and slightly lyrate-pinnatifid.

Blades of the basal leaves pinnately parted and twice or thrice pinnatifid or dissected.

#### I. LOBATI

Plant with pinnately parted leaf-blades: involucre 4-5 mm. high; bracts light-green.

#### II. VULGARES

Plant with pinnatifid leaf-blades: involucre 6-8 mm. high; bracts, as well as the small bracts at their bases, dark-green or black.

#### III. NUDICAULES

Stem usually bearing 3-5 pedunculate somewhat racemose heads: heads very many-flowered.

#### IV. AURIE

Blades of the basal leaves cordate or truncate at the base.

Blades of the basal leaves predominantly lanceolate or elliptic-lanceolate, sharply serrate.

Blades of the basal leaves predominately orbicular or ovate, crenate.

Involucre over 5 mm. high.

Involucre less than 5 mm. high.

Blades of the basal leaves gradually narrowed or cuneate at the base.

Blades of the basal leaves scarcely longer than broad.

Blades of the basal leaves manifestly or markedly longer than broad.

Blades of the basal leaves wholly, or predominately, narrowly or broadly spatulate: achene glabrous.

Blades of the basal leaves wholly, or predominately elliptic, oval, or lanceolate: achene pubescent.

Foliage more or less copiously arachnoid; often densely so, the base of the stem and petioles of the basal leaves usually copiously silky-tomentose.

Involucre 4-6 mm. high: blades of the basal leaves elliptic or oval, varying to broadest above or below the middle, or oblanceolate to lanceolate.

Blades of the basal leaves elliptic to oval, varying to ovate or obovate: involucre 5-6 mm. long.

Blades of the basal leaves narrowly lanceolate to oblanceolate: involucre 4-5 mm. long.

Involucre 6-7 mm. high: blades of the basal leaves triangular-ovate to broadly lanceolate, triangular-lanceolate, or ovate.

Foliage nearly glabrous, the base of the stem, petioles, and inflorescence inconspicuously arachnoid.

#### V. MILLEFOLIA

Primary leaf-divisions 1-2-pinnatifid.

Primary leaf-divisions dissected, the ultimate divisions mainly linear.

I. LOBATI.

II. VULGARES.

III. NUDICAULES.

IV. AUREI.

V. MILLEFOLIA.

1. *S. glabellus*.

2. *S. vulgaris*.

3. *S. Rugelia*.

4. *S. Robbinsii*.

5. *S. aureus*.

6. *S. gracilis*.

7. *S. rotundus*.

8. *S. obovatus*.

9. *S. pauperculus*.

10. *S. Smallii*.

11. *S. tomentosus*.

12. *S. alabamensis*.

13. *S. Memmingeri*.

14. *S. Millefolium*.

1. *S. glabellus* Poir. Plant annual, glabrous, the stem, 1-9 dm. tall: leaf-blades 3-20 cm. long, the lateral lobes cuneate to suborbicular, coarsely toothed, the terminal lobe rather large: involucre 4-6 mm. long; bracts narrowly linear to linear-lanceolate: ligules 4-8 mm. long; achene 1.5-2 mm. long, pubescent on the ribs. [*S. lobatus* Pers.]—Wet soil and river bottoms, various provinces, Fla. to Tex., Mo., Ill., and N. C.—(Mex.)—Spr.-fall.—The form with few-lobed broad terminal leaf-segments has been described as *S. mississippianus*.—Sometimes called BUTTER-WEED.

2. *S. vulgaris* L. Plant annual, sparingly pubescent, the stem 5 dm. tall or less, hollow, corymbosely branched: leaf-blades mostly 1 dm. long or less; the lobes and rachis toothed, the terminal lobe relatively small: involucre 6-8 mm. long; bracts narrow, acuminate: ligules wanting: achene about 2.5 mm. long, minutely pubescent all over.—(COMMON-GROUNDSEL.)—Cult. grounds and waste-places, various provinces, rarely Coastal Plain, N. C. to Tex., S. Dak., Ont., and Newf.; also Pacific Coast. Nat. of Eu.—Spr.-fall.—*Senecio viscosus* L., coarser than *S. vulgaris* and strong-scented, with wholly green involucral bracts and inconspicuous ray-flowers, has been reported from N. C. It is a native of Eu.

3. *S. Rugelia* A. Gray. Plant 2-5 dm. tall: leaf-blades ovate to elliptic-oval, 8-15 cm. long, denticulate or dentate: bracts of the involucre linear-lanceolate, 12-13 mm. long: disk-corollas 7-8 mm. long: achene about 6 mm. long.—High mt. slopes, Blue Ridge, N. C. and Tenn.—Sum.

4. *S. Robbinsii* Oakes. Plant 3-10 dm. tall: blades of the basal leaves 3-8 cm. long, acute: involucre 6-8 mm. long; bracts narrowly linear: ligules 4-5 mm. long: achene pubescent.—Mt. meadows, Roan Mt. in the Blue Ridge of N. C. and Tenn., and more N provinces, N. Y. to Que. and N. B.—Sum.

5. *S. aureus* L. Plant 3-7 dm. tall: blades of the basal leaves 2-12 cm. long, rounded at the apex: involucre 6-7 mm. long; bracts linear, fully 1 mm. wide: ligules narrow, 5.5-7.5 mm. long: achene glabrous.—Low grounds, swamps, and wet woods, various provinces, Fla. to Tex., Ont., and Newf.—Spr.-sum.

6. *S. gracilis* Pursh. Plant similar to that of *S. aureus* in habit, but smaller and more slender: involucre 3.5-4.5 mm. long; bracts narrowly linear, scarcely 1 mm. wide: ligules broad, 3.5-5 mm. long.—Wet grounds, various provinces, Ga. to Pa.—Spr.

7. *S. rotundus* (Britton) Small. Plant 3-6 dm. tall: blades of the basal leaves suborbicular to orbicular-ovate, coarsely crenate-serrate: involucre 4-5 mm. long; bracts linear-subulate to linear-lanceolate: ligules 8-10 mm. long.—Low grounds or wet rocks, various provinces, La. to Tex., Mo., and Ohio.—Spr.

8. *S. obovatus* Muhl. Plant 1-5 dm. tall: blades of the basal leaves spatulate to obovate, coarsely toothed or some of them lyrate-pinnatifid: involucre 4-5 mm. long: bracts narrowly linear or subulate-linear: ligules 5-7 mm. long.—Thickets and dry hillsides, various provinces, W Fla. to Tex., Vt., and Me.—Spr.-sum.

9. *S. pauperculus* Michx. Plant 2-6 dm. tall: blades of the basal leaves elliptic to oval, varying ovate or obovate, serrate, incised-serrate or partly

pinnatifid: heads typically few, not crowded: involucre 5-6 mm. long; bracts glabrous or nearly so: ligules of the ray mostly 7-9 mm. long: achene 2.5-3 mm. long.—Stony woods, dry pastures, hillsides, and meadows, various provinces, Ga. to Tex., B. C., Ont., and Newf.—Spr.—sum.—*Senecio Earlei* Small seems to be a more robust and broader leaved form of this species in the southern part of its range.

10. *S. Smallii* Britton. Plant 3-6 dm. tall: blades of the basal leaves narrowly lanceolate to oblanceolate, serrate, incised-serrate, or incised or pinnatifid near the base: heads typically numerous and often crowded: involucre 4-5 mm. long; bracts glabrous or nearly so: ligules of the ray mostly 4-5 mm. long: achenes 1.5-2 mm. long.—Sandy fields, ditches, pinewoods, and dry woods, various provinces, Fla. to Miss., Tenn., and Pa.—Spr.

11. *S. tomentosus* Michx. Plant 2-7 dm. tall, the foliage typically and persistently floccose-tomentose: blades of the basal leaves triangular-ovate to broadly lanceolate, triangular-lanceolate, or ovate, crenate or crenate-serrate, abruptly narrowed or truncate at the base: heads few, at least relatively so, ultimately not crowded: involucre 6-7 mm. long; bracts densely white-pubescent when young: ligules of the ray 5-8 mm. long: achene 2-2.5 mm. long.—Sandy fields, banks, roadsides, and prairies, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and N. J.—Spr.

12. *S. alabamensis* Britton. Plant similar to *S. tomentosus* in habit, but nearly glabrous up to the inflorescence where the peduncles are arachnoid: blades of the basal leaves ovate, triangular-ovate, or ovate-lanceolate, crenate, dentate, or nearly entire, often inequilateral at the abruptly narrowed or truncate base: heads rather few, not crowded, except when young: involucre 6-7 mm. long: bracts slightly arachnoid or nearly glabrous: ligules 5-8 mm. long: achene about 2.5 mm. long.—Moist pine woods, Coastal Plain, Ala.—Spr.

13. *S. Memmingeri* Britton. Plant 3-6 dm. tall: blades of the basal leaves bipinnatifid: involucre 5-6 mm. long; bracts linear: ligules 5-6 mm. long.—Cliffs and dry soil, Blue Ridge to Appalachian Plateau, Ala. to N. C.—Spr.—sum.

14. *S. Millefolium* T. & G. Plant 3-7 dm. tall: blades of the basal leaves bipinnately dissected into narrowly linear segments: involucre 5-6 mm. long; bracts linear and usually lanceolate at the tip: ligules 2-4 mm. long: disk-corollas 4 mm. long.—Cliffs, Blue Ridge, S. C. and N. C.—Sum.

123. **ARCTIUM** L. Biennial, coarse herbs. Leaves alternate: blades often ample, mainly entire or repand. Heads solitary in the axils or clustered, not conspicuous. Involucre with many narrow bracts, each hooked at the tip. Filaments glabrous. Pappus of short, rigid or scale-like bristles.—About 6 species, Eurasian.

1. *A. minus* Schk. Plant 4-16 dm. tall, often widely branched: leaf-blades ovate, those of the lower cauline leaves 2-4.5 dm. long, all undulate or shallowly toothed: inner bracts of the involucre mostly 7-8 mm. long: corollas purple, pink, or white: achene cuneate to elliptic-obovate, 5-6 mm. long or rarely smaller. — (BURDOCK. BEGGAR'S-BUTTONS. CLOTHUR.) — Waste-places, cult. grounds, and roadsides throughout U. S. and S Can. Nat. of Eu.—Sum.—fall.

**124. CIRSIIUM** [Tourn.] Hill. Annual, biennial or perennial, large or coarse herbs. Leaves alternate: blades toothed, lobed, or pinnatifid, usually spiny. Heads erect, often showy. Involucre with the outer bracts, at least, spine-tipped or spiny margined. Flowers violet, purple, lilac, or yellowish, or rarely white. Filaments mostly pubescent. Pappus of elongate capillary, plumose bristles in several series.—More than 200 species, widely distributed in the Northern Hemisphere.—Sum.—fall or all year S.—**THISTLES. BULL-THISTLES.**

Heads not involucre, but sometimes approximate to 1 or few bract-like leaves.

Bracts of the involucre not spine-tipped.

Heads solitary or few, large, the involucre over 2 cm. in diameter.

Heads numerous, small, the involucre less than 2 cm. in diameter.

Bracts of the involucre, at least the outer spine-tipped.

Spines of the involucre bracts appressed or erect.

Spines of the involucre bracts spreading.

Inner bracts of the involucre narrow, with soft flattened tips.

Inner bracts of the involucre, as well as outer spine-tipped.

Heads involucre, surrounded by a whorl of spinescent bracts.

#### I. MUTICA

Rather tall plant with woolly involucre bracts and deeply pinnatifid leaf-blades.

#### II. ARVENSIA

Very spiny erect or diffuse plant with clusters of numerous small, lilac-colored, heads of flowers.

#### III. REPANDA

Body of the involucre 2 cm. thick or less.

Leaf-margins densely spiny: glutinous line of the involucre bracts narrow.

Leaf-margins not densely spiny: glutinous line of the involucre bracts broad.

Body of the involucre 3 cm. thick or more.

#### IV. ALTISSIMA

Involucre less than 1.5 cm. thick.

Leaf-blades densely lanate-tomentose beneath.

Leaf-blades merely spiny toothed: spines of the involucre bracts slender, over 2 mm. long.

Leaf-blades pinnatifid or sinuate-pinnatifid: spines of the involucre bracts stout, less than 2 mm. long.

Leaf-blades thinly lanate-tomentose beneath.

Leaf-blades with weak, rather few, marginal spines: spines of the involucre bracts over 2 mm. long.

Leaf-blades with long and stout, very numerous marginal spines: spines of the involucre bracts less than 2 mm. long.

Involucre over 1.5 cm. thick.

Leaf-blades, except those near the heads, merely toothed.

Leaf-blades 1-2-pinnatifid.

#### V. LANCEOLATA

Very spiny plant with decurrent leaves: heads of flowers brilliant-violet.

#### VI. HORRIDULA

Involucre bracts all serrulate-ciliate.

Basal leaves with narrow spine-margined blades: anthers twice as long as the filaments.

Basal leaves with broad pinnatifid blades: anthers about as long as the filaments.

Involucre bracts puberulent or pubescent, but not ciliate.

I. MUTICA.

II. ARVENSIA.

III. REPANDA.

IV. ALTISSIMA.

V. LANCEOLATA.

VI. HORRIDULA.

14. *C. Smallii*.

15. *C. horridulum*.

1. *C. muticum* Michx. Stem 8-25 dm. tall, angled, lanuginous or glabrate: leaf-blades elliptic to elliptic-ovate, 1-2-pinnatifid, mainly 17-40 cm. long,

rather weakly spine-armed: outer bracts of the involucre obtuse or cuspidate, the inner ones narrowly linear, short-acuminate, 27-29 mm. long: corollas lilac, mostly 28-30 mm. long.—(SWAMP-THISTLE.)—Swamps, meadows, fields, and roadsides, various provinces, Fla. to Tex., Sask., and Newf.—Sum.—fall.

2. *C. arvensis* (L.) Scop. Stems 2-10 dm. tall, glabrous or nearly so: leaf-blades spatulate, elliptic, or lanceolate in outline, pinnatifid, 4-16 cm. long, rigidly spine-armed, pubescent beneath or sometimes nearly glabrous: outer bracts of the involucre acute, the inner ones narrowly linear, short-acuminate, 9-12 mm. long: corollas lilac to rosy-purple or white, mostly 12-15 mm. long.—(CANADA-THISTLE.)—Fields, pastures, waste-places, and roadsides, various provinces, N. C. to Kans., B. C., and Newf.—Sum.—Nat. of Eu.—Plants are imperfectly dioecious.

3. *C. repandum* Michx. Stem 1.5-5 dm. tall, webby-lanate: leaf-blades spatulate to narrowly elliptic or broadly linear, pinnately many-lobed and copiously spiny: outer bracts of the involucre long-acuminate, the inner ones with curled tips: corollas rosy-purple.—Pinelands and sand-hills, Coastal Plain, Fla. to N. C.—Sum.

4. *C. LeContei* T. & G. Stem 6-11 dm. tall, floccose-woolly: leaf-blades oblanceolate to lanceolate, pinnatifid and relatively sparingly spiny: outer bracts of the involucre short-acuminate, the inner ones with erect tips: corollas rosy-purple.—Low pinelands, Coastal Plain, Fla. to La. and N. C.—Sum.—fall.

5. *C. odoratum* (Muhl.) Petrak. Stem 3-10 dm. tall, tomentulose: leaf-blades oblanceolate, 1 or 2-pinnatifid: outer bracts of the involucre lanceolate, slender-tipped, the inner bracts 25-35 mm. long: corollas rosy-purple, 40-50 mm. long.—(PASTURE-THISTLE.)—Pastures, fields, and low grounds, various provinces N of Coastal Plain, N. C. to Pa. and Me.—Sum.—fall.

6. *C. virginianum* (L.) Michx. Stem 5-11 dm. tall, arachnoid: leaf-blades linear to linear-elliptic, or spatulate at the base of the stem, spiny-toothed: outer bracts of the involucre with slender tips nearly as long as the body, the inner bracts 12-14 mm. long: corollas lilac to rosy-purple, 16-19 mm. long.—Woods and thickets, Fla. to Miss., Ky., and Va.—Spr.—sum.

7. *C. revolutum* Small. Stem 5-20 dm. tall, floccose: leaves rigid; blades thick, revolute, rigidly spine-armed, densely white-woolly or tomentose beneath: outer bracts of the involucre short-tipped, the inner bracts 12-20 mm. long, narrowly linear: corollas lilac to rosy-purple, 20-25 mm. long.—Low pinelands, Coastal Plain, Fla. to N. C.—Sum.—fall.

8. *C. flaccidum* Small. Stem 7-16 dm. tall, floccose: leaves pliable; blades thin, flat, weakly spine-armed, thinly gray tomentose-woolly beneath: outer bracts of the involucre with slender tips nearly as long as the body, the inner bracts long-tipped, 12-16 mm. long: corollas lilac to rosy-purple, 19-21 mm. long.—Woods and banks, Coastal Plain and adj. provinces, Ga. to Tex. and Mo.—Late spr.—sum.

9. *C. Nuttallii* (DC.) A. Gray. Stem 9–40 dm. tall, early glabrate: blades of the basal and the lower cauline leaves elliptic to elliptic-spatulate, 2-pinnatifid: outer bracts of the involucre short-tipped, the inner bracts abruptly short-tipped, 15–20 mm. long: corollas lilac to rosy-purple, 20–25 mm. long.—Dry soil, Coastal Plain, Fla. to Miss. and S. C.—Spr.—fall or all year S.

10. *C. altissimum* (L.) Spreng. Stem 9–30 dm. tall, downy: blades of the basal or lower cauline leaves elliptic, or broadest above or below the middle, densely white-tomentose beneath: outer bracts of the involucre with tips about  $\frac{1}{2}$  as long as the body, the inner bracts 28–30 mm. long: corollas purple to lilac, 37–40 mm. long.—(ROADSIDE-THISTLE.)—Thickets and fields, various provinces, Fla. to Tex., Minn., and Mass.—Sum.—fall.

11. *C. discolor* (Muhl.) Spreng. Similar to *C. altissimum* in habit, but seldom over 20 dm. tall: leaf-blades mainly elliptic-lanceolate to ovate-lanceolate, densely white-tomentose beneath: outer bracts of the involucre with tips about as long as the body, the inner bracts 25–28 mm. long: corollas, lilac to purple, 28–30 mm. long.—(FIELD-THISTLE.)—Thickets and roadsides, various provinces, rarely Coastal Plain, Ga. to Miss., Mo., Ont., and N. B.—Sum.—fall.

12. *C. lanceolatum* (L.) Hill. Stem 8–15 dm. tall, pubescent: leaves crowded; blades lanceolate, 1 or 2 pinnatifid, grayish-woolly beneath: outer bracts of the involucre gradually narrowed into slender tips, the inner bracts very narrowly linear and attenuate: corollas, brilliant violet, 32–35 mm. long.—(COMMON-THISTLE. BULL-THISTLE.)—Fields, pastures, and roadsides, various provinces, Ga. to Nebr., Calif., Ore., Minn., and Newf.; mostly a weed. Nat. of Eu.—Sum.—fall.

13. *C. vittatum* Small. Stem 2–7 dm. tall, thinly pubescent: leaf-margins undulate or sinuate, with mostly ascending spines: inner bracts of the involucre 30–35 mm. long: corollas yellow or cream, about 30 mm. long: anthers much longer than the filaments.—Everglades and low pinelands, Everglade Keys, Fla.—Spr.—sum.

14. *C. Smallii* Britton. Stem 4–9 dm. tall, thinly pubescent: leaf-segments with the terminal spines directed forward: inner bracts of the involucre 25–30 mm. long: corollas yellow or cream, 30–40 mm. long: anthers about as long as the filaments. [*C. pinetorum* Small not Greenm.]—Pinelands and sand-dunes, Coastal Plain, Fla. to S. C.—(W. I.)—Wint.—late spr.

15. *C. horridulum* Michx. Stem 3–40 dm. tall, woolly: leaf-segments with spreading spines: inner bracts of the involucre 40–45 mm. long: corollas 40–43 mm. long, yellow, (or purple in *C. horridulum Elliottii*): anthers mostly shorter than the filaments. [*Carduus spinosissimus* Walt.]—(YELLOW-THISTLE.)—Low grounds, swamps, and pastures, Coastal Plain and adj. provinces, Fla. to Tex. and Me.—Spr.—sum.—Often a weed.

125. **ONOPORDUM** [Vaill.] L. Annual or biennial, caulescent, coarse herbs, the stems and branches winged. Leaves alternate: blades sinuate or pinnatifid, prickly-armed, decurrent. Heads erect, many-flowered. Involucre ovoid, globular, or depressed: bracts numerous, narrow, spine-tipped. Receptacle honeycombed. Flowers numerous, all alike, perfect, tubular. Corollas elongate, with a slender tube and a shorter campanulate throat: lobes linear or

nearly so. Anthers sagittate at the base, with subulate appendages. Achene stout, broadened upward. Pappus of many capillary-attenuate scabrous or barbellate bristles which are united at the base and deciduous all together.—About 12 species, natives of the Old World.

1. *O. Acanthium* L. Stem 2 m. tall or less, lanate, the wings spiny margined: leaf-blades oblanceolate, elliptic, lanceolate, or ovate, mostly 1–3 dm. long, lanate, copiously spine-armed: involucre 3–4 cm. in diameter; bracts numerous, linear-subulate, firm, the inner 2–3 cm. long, the outer shorter and reflexed: corollas purple or purplish: achene narrowly obovoid, 4–5 mm. long, transversely wrinkled and ribbed.—(COTTON-THISTLE. SCOTCH-THISTLE.)—Roadsides, waste-places, and fields, various provinces, Ala. to Ont. and N. S. Nat. of Eurasia.—Sum.

126. *MARIANA* [Vaill.] Hill. Annual or biennial, tall, thistle-like herbs, the stem not winged. Leaves alternate: blades sinuate-lobed or pinnatifid, prickly-armed, not decurrent. Heads erect, many-flowered, not radiate. Involucre depressed-globose: bracts conspicuous, spiny-ciliate, with broad bases and firm spreading or reflexed spine-armed tips. Receptacle flattish, densely bristly. Flowers all alike, perfect, tubular. Corollas elongate, with a very slender tube and a short campanulate throat: lobes linear. Anthers slightly sagittate at the base, with lanceolate appendages. Achene stout. Pappus of numerous capillary-attenuate barbellate bristles which are united at the base and deciduous all together from the ring-like top of the achene.—One species.

1. *M. Mariana* (L.) Hill. Stem 1.5 m. tall or less, sparingly branched: leaf-blades pinnately lobed and spinescent on and near the margins, those of the basal leaves with stout petiole-like bases, those of the cauline auriculate-clasping, mostly 1–4 dm. long: involucre mostly 4–6 cm. in diameter; bracts with sub-orbicular, ovate, or elliptic bodies and equally as long or longer tips: corollas purple or purplish, mostly 2.5–3 cm. long: achene more or less oblique, ellipsoid-obovoid, 5.5–6.5 mm. long, glabrous, with a blunt protuberance within the ring-like top.—(MILK-THISTLE.)—Roadsides and waste-places, locally in various provinces, Ala. to Ont.; also on Pacific Coast. Nat. of Eu.—Spr.—sum.

127. *CENTAUREA* L. Annual (ours), or perennial herbs. Leaves alternate: blades entire, toothed, or pinnatifid. Heads relatively small. Involucre with irregularly toothed or fimbriate outer bracts, the intermediate ones, at least, often armed with spines. Anthers sagittate at the base, with appendages at least  $\frac{1}{2}$  as long as the sacs. Achenes flattened or 4-angled. Pappus

of scales or bristles in several series, or obsolete.—About 350 species, mostly natives of the Old World.—Sum.—STAR-THISTLES.

Corollas yellow: stem and branches winged.

Stem woolly: spines of the involucre yellowish.

Stem: spines of the involucre purplish.

Corollas purple: stem and branches wingless.

1. *C. solstitialis*.

2. *C. melitensis*.

3. *C. Calcitrapa*.

1. *C. solstitialis* L. Stem 3–6 dm. tall, woolly: blades of the stem-leaves elliptic-lanceolate or linear, entire or merely toothed: involucre ovoid or subglobose, about 1.5 cm. long; bracts various, the intermediate ones with long, slender, yellow spines: corollas yellow.—(BARNABY'S-THISTLE).—Waste-places, fields, and roadsides, various provinces, Fla. to Calif., Ia., Ont., and Mass. Nat. of Eu.

2. *C. melitensis* L. Stem 1 m. tall or less, arachnoid, usually sparingly branched: leaf-blades various, those of the basal leaves spatulate, toothed or pinnatifid, those of the stem-leaves oblanceolate, elliptic or linear, narrowly decurrent on the stem: heads sessile or short-peduncled: involucre ovoid, the outer and middle bracts with slender apical prickles: corollas yellow.—Various provinces, Ga. to Ala., N. Mex., Calif., Mo., and Mass. Nat. of Eu.

3. *C. Calcitrapa* L. Stem 3–4 dm. tall: blades of the stem-leaves 1–2-pinnatifid: corollas purple.—Waste-places, various provinces, Ala. to N. C. and Mass.; also on Pacific Coast. Nat. of Eu.

*Centaurea Cyanus* L. An annual, native of Europe, with white-floccose foliage, narrow entire leaves, white, pink, blue, or purple heads, and spineless involucral bracts, has escaped from cultivation in the eastern United States. It is known as CORN-FLOWER, BLUEBOTTLE, BACHELOR'S-BUTTON, or RAGGED-ROBIN.

128. **CNICUS** L. Annual, caulescent, widely branched herbs. Leaves alternate: blades sinuate-pinnatifid and spiny-margined or merely spiny-pinnatifid, veiny. Heads erect, many-flowered, sessile. Involucre ovoid, leafy-involucrate: bracts narrow, rigid, some of them pectinate-spiny near the tip, appressed. Receptacle with capillary bristles. Flowers various, the marginal ones sterile, the central fruit-producing. Corollas elongate, with a slender tube and a shorter cylindric-campanulate throat: lobes narrow, unequal. Anthers minutely tailed at the base, with lanceolate appendages. Achene stout, oblique, many striate-ribbed, with a scalloped crown. Pappus double, the outer row of long slender-subulate bristles, the inner of short-subulate bristles.—One species.

1. *C. benedictus* L. Stem usually less than 1 m. tall, finely hirsute or villous: leaf-blades mostly 5–15 cm. long, coarsely reticulate, the upper ones somewhat clasping: involucre 1.5–2 cm. in diameter; larger bracts

lanceolate, with pectinate spinescent tips: corollas mainly yellow: achene nearly cylindric, 7-9 mm. long, with many prominent ribs, thus fluted; teeth of the crown deltoid: longer pappus-bristles exceeding the achene.—(BLESSED-THISTLE.)—Waste-places, roadsides, and fields, various provinces, Ga. to Ala. and N. S. Nat. of Eu.—Spr.-sum.

**129. CHAPTALIA** Vent. Perennial, scapose, small herbs, woolly throughout. Leaves alternate, all basal: blades undulate to lyrate-pinnatifid. Heads nodding, at least when young, solitary. Involucre mostly narrow: bracts herbaceous, ultimately reflexed. Flowers white, sometimes purple-stained without. Marginal corollas ligulate. Anthers long-tailed at the base: appendages lanceolate. Achene mostly beaked or narrowed at the apex.—About 25 species, natives of warm-temperate and tropical America.—SUN-BONNETS.

Involucre becoming 1-1.5 cm. long: achene narrowed into a short neck; only the pistillate perfect. 1. *C. tomentosa*.  
Involucre becoming 2 cm. long: achene with a beak fully as long as the body; all perfect. 2. *C. dentata*.

1. **C. tomentosa** Vent. Leaves in rosettes; blades elliptic to oblanceolate, 4-10 cm. long, apiculate, entire or remotely denticulate, green and glabrous above, densely white tomentose beneath: scapes 1-3 dm. tall, sometimes tufted, simple: involucre bracts subulate to linear, the inner becoming 10-15 mm. long: ligules of the ray-flowers purple without, white or ivory within, 7-10 mm. long: achene of the pistillate flowers perfect, glabrous, 3 mm. long, each constricted into a short neck. [*Thysanthera semiflosculare* (Walt.) Kuntze.]—Moist pinelands, Coastal Plain, Fla. to Tex. and N. C.

2. **C. dentata** (L.) Cass. Leaves spreading; blades spatulate to oblanceolate, 3-11 cm. long or more, undulate or denticulate, evergreen, floccose above or glabrous in age, lanate-tomentulose beneath: scape slender, 1-3 dm. tall, floccose: involucre lanate, the inner bracts becoming 18-21 mm. long, narrowly linear: inner corollas 7-8 mm. long: achene slender, the body 3.5-4.5 mm. long, the beak as long or longer than the body. [*Thysanthera dentata* (L.) Kuntze.]—Pinelands, Everglade Keys, Fla.—(W. I.)—Spr.

### FAMILY 3. CICHORIACEAE — CHICORY FAMILY

Annual, biennial, or perennial herbs, or partially woody plants. Leaves alternate: blades entire, toothed, or parted. Flowers perfect, all alike, borne in heads. Corolla ligulate, the 1-sided limb mostly 5-lobed at the apex. Stigmas unappendaged. Achene smooth, papillose, muriculate, or spiny.—About 70 genera and 1,500 species, of wide geographic distribution.

Pappus wanting or obsolete.  
Pappus present.

1. SERINEA.

Pappus of plumose bristles.

Receptacle not chaffy: plant caulescent.  
Receptacle chaffy: plant scapose.

2. TRAGOPOGON.

3. HYPOCHAERIS.

Ad. Kuntze

Pappus not plumose.

Pappus consisting, at least in part, of scales which sometimes are united into a crown.

Involucre single: pappus of both scales and bristles: corolla yellow.

Pappus of 5 broad scales and 5-10 bristles: plant annual.

Pappus of 10-15 minute narrow scales and 10-15 bristles or more: plant perennial.

Involucre double: pappus crown-like, of numerous scales in 2 or more series: corolla blue.

Pappus consisting of capillary bristles, not plumose.

Achene not flattened, cylindric or prismatic.

Achene not beaked.

Corolla rose or purplish.

Achene tapering to the apex: plant with rush-like stems and narrow leaf-blades.

Achene tapering to the base: plant with cane-like stems and broad leaf-blades.

Corolla yellow, cream-colored, or white.

Ligules cream-colored.

Ligules yellow.

Pappus tawny, or white in *H. argyraeum*: leaf-blades not pinnatifid.

Pappus white: leaf-blades pinnatifid.

Achene beaked at the apex, the beak long and slender or short and stout.

Achenes, at least the marginal ones slender beaked.

Achene smooth, merely nerved or ribbed.

Bracts of the outer involucre appressed: pappus white: achene attached by a narrowed base.

Bracts of the outer involucre lax: pappus sordid: achene attached by a disk-like base.

Achene tuberculate and spinulose.

Achenes with short stout beaks.

Achene flattened.

Achene narrowed at the apex or beaked.

Achene thin, prolonged into a slender, often filiform beak.

Achene thickish, narrowed at the apex, but not beaked.

Achene truncate at the apex.

4. KRIGIA.

5. CYNTHIA.

6. CICHORIUM.

7. LYGODESMIA.

8. NABALUS.

8. NABALUS.

9. HIERACIUM.

10. CREPIS.

10. CREPIS.

11. SITILIAS.

12. LEONTODON.

13. BRACHYRHAMPHUS.

14. LACTUCA.

15. MULGEDIUM.

16. SONCHUS.

1. **SERINEA** Raf. Annual, pale, tender, caulescent herbs. Leaves often numerous: blades narrow, entire, repand, or lyrate-pinnatifid. Heads long-peduncled, small (1-1.5 cm. broad). Involucre campanulate: bracts rather broad, ribbed, erect at maturity. Corollas yellow. Achene obovoid, 8-10-ribbed. Pappus wanting or obsolete.—Three species, North American.

1. **S. oppositifolia** (Raf.) Kuntze. Stem 5-30 cm. tall, slender, sometimes sparingly glandular-pubescent: leaf-blades spatulate to linear, 2-12 cm. long, very irregular, those of the lower leaves often toothed or pinnatifid and with petiole-like bases, those of the upper entire and sessile: bracts of the involucre ovate to lanceolate, becoming 4-5 mm. long: achene 1.5 mm. long, prominently ribbed.—Moist soil, fields, and waste-places, various provinces, Fla. to Tex., Kans., and S. C.—Spr.

**2. TRAGOPOGON** [Tourn.] L. Biennial or perennial erect caulescent, rather coarse herbs. Leaf-blades narrow, long-attenuate, often sheathing at the base. Heads erect. Involucres relatively narrow: bracts elongate, often surpassing the disk. Achene terete or 5-angled, the inner at least slender-beaked.—About 35 species, natives of the Old World.

Bracts of the involucre surpassing the ligules: corollas purple.  
Bracts of the involucre as long as the ligules or shorter: corollas yellow.

1. *T. porrifolius*.

2. *T. pratensis*.

1. **T. porrifolius** L. Stem 4–15 dm. tall: leaf-blades clasping or sheathing at the base: peduncles gradually enlarged upward: bracts of the involucre linear-lanceolate, 30–60 mm. long: achene slender-fusiform, 3.5–4 cm. long, the beak longer than the body.—(SALSIFY. OYSTER-PLANT.)—Fence-rows and roadsides, various provinces, Ga. to Calif. and Ont. Nat. of Eu.—Sum.

2. **T. pratensis** L. Similar to *T. porrifolius* in habit: peduncle abruptly thickened under the head: bracts of the involucre lanceolate, 25–35 mm. long: achene stout-fusiform, 1.5–2 cm. long, the beak shorter than the body.—(GOAT'S-BEARD.)—Fields and waste-places, various provinces, Ga. to Ont. Nat. of Eu.

**3. HYPOCHAERIS** L. Perennial or rarely annual, scapose herbs, the scapes often minutely scaly. Leaf-blades entire, toothed, or pinnatifid. Heads showy, erect, long-peduncled. Involucres cylindric to campanulate: bracts in several unequal series, the outer ones very small, the inner ones with dorsal crests near the apex. Corollas yellow. Stigmas slender, filiform or short. Achenes, the inner ones, at least, slender-beaked. Pappus single, the bristles plumose.—About 50 species, Eurasian and South American.—CAT'S-EARS.

Achenes uniform, all beaked: corollas much exceeding the involucre.  
Achenes of 2 kinds, the outer beakless, the inner beaked: corollas slightly exceeding the involucre.

1. *H. radicata*.

2. *H. glabra*.

1. **H. radicata** L. Plant perennial, 2–6 dm. tall: leaves mostly 4–17 cm. long, hirsute; blades spatulate in outline, coarsely toothed or pinnatifid: heads 2.5–4 cm. wide: corollas with very narrow ligules: achenes fusiform, the bodies 3–3.5 mm. long, spinulose, those of the inner ones at least shorter than the filiform beaks.—Waste-places, fields, and wet pastures, various provinces, S. C. to Tex., Ont., and N. J.; Colo., and Pacif. St.—Nat. of Eu.—Spr.—sum.

2. **H. glabra** L. Plant annual, 2–5 dm. tall: leaves mostly 6–14 cm. long, glabrous or nearly so; blades spatulate to linear-spatulate in outline, pinnatifid or pinnately toothed: heads smaller than in *H. radicata*: corollas with narrow but relatively short ligules: achenes various, the inner fusiform

with bodies 3–4 mm. long and slender beaks, the outer about 3 mm. long, beakless.—Roadsides, lawns, and grassy places, various provinces, N Fla. to Ohio and Me. Nat. of Eu.—Spr.–fall.

**4. KRIGIA** Schreb. Annual herbs. Leaves mainly basal: blades narrow, toothed or pinnatifid. Heads slender-peduncled. Involucre narrow: bracts narrow, reflexed at maturity. Corollas light-yellow. Achene oblong or broadened upward. Pappus of 5 scales about  $\frac{1}{2}$  as long as the achene and also of 5 or 10 barbellate bristles.—One species.

**1. K. virginica** (L.) Willd. Plant 0.3–4 dm. tall: leaf-blades spatulate to nearly linear, 2–12 cm. long: involucre mostly less than 7 mm. long: corollas 6–7 mm. long: achenes fully 1.5 mm. long, finely ribbed. [*Adopogon carolinianus* (Walt.) Britton.] —(DWARF-DANDELION.)—Open sandy places, and woods, various provinces, Fla. to Tex., Ont., and Me.—Spr.

**5. CYNTHIA** D. Don. Perennial herbs. Leaves mainly basal: blades narrow or broad, entire, repand, or pinnatifid. Heads long-peduncled. Involucre stout: bracts narrow, reflexed at maturity. Corollas bright-yellow. Achene not broadened upward. Pappus of 10–15 minute scales and as many or more numerous barbellate bristles.—Four species, North American.

Plant caulescent, the roots not tuber-bearing: pappus-scales not attenuate: heads 2–many.

Pappus-scales very short: stem erect, sparingly leafy: leaves with dilated blades.

Pappus-scales about  $\frac{1}{4}$  the length of the achene: stem decumbent or reclining, very leafy: leaves with narrow blades.

Plant acaulescent, the roots tuber-bearing: pappus-scales attenuate: heads solitary.

1. *C. virginica*.
2. *C. montana*.
3. *C. Dandelion*.

**1. C. virginica** (L.) D. Don. Stem 1–7 dm. tall: leaf-blades spatulate, elliptic, or oval, not elongate, entire or repand or slightly lyrate-pinnatifid: involucre mostly over 8 mm. long: corollas 10–12 mm. long: achene 2 mm. long, coarsely ribbed.—Moist banks and meadows, various provinces, rarely Coastal Plain, Ga. to Kans., Man., and Mass.—Spr.–fall.

**2. C. montana** (Michx.) Standley. Stem 1–4 dm. tall, branched, diffuse at maturity: leaf-blades linear to linear-spatulate, elongate, entire or irregularly pinnatifid: peduncles usually solitary: achene slightly broadest above the middle, 2.5–3 mm. long,  $\frac{1}{2}$  as long as the pappus-bristles: pappus-scales about  $\frac{1}{4}$  as long as the achene.—Cliffs and rocky slopes, in rather acid soil, Blue Ridge, Ga. to Tenn. and N. C.—Sum.–fall.

**3. C. Dandelion** (L.) DC. Scape 0.5–5 dm. tall, simple: leaf-blades spatulate to linear-oblong or linear, 5–15 cm. long, entire, repand, or irregularly

pinnatifid: head solitary: achene slightly broadest above the middle, nearly 2.5 mm. long, about  $\frac{1}{3}$  as long as the pappus-bristles: pappus-scales  $\frac{1}{4}$ – $\frac{1}{2}$  as long as the achene.—Moist or dry soil, often in woods, various provinces, Fla. to Tex., Kans., and N. J.—Spr.—sum.

6. **CICHORIUM** [Tourn.] L. Perennial rigid herbs. Leaf-blades toothed or pinnatifid, or crisped. Heads sessile or nearly so. Involucre firm or rigid: outer bracts spreading, the inner erect. Achene 5-ribbed or 5-angled. Pappus of 2 or 3 rows of scales.—About 8 species, in the Old World.—CHICORIES. SUCCORIES.

1. **C. Intybus** L. Tap-root elongate, tough. Stem 3–15 dm. tall, rigidly wide-branched: blades of the stem-leaves oblong to lanceolate, pinnatifid, toothed, or entire: involucre 10–12 mm. long; bracts lanceolate to linear, the outer glandular-ciliate: corollas sky-blue or white: ligules 10–20 mm. long: achene 2–2.5 mm. long.—(COMMON-CHICORY. BLUE-SAILORS.)—Fields, fence-rows, and roadsides, various provinces, Fla. to Tex., Calif., Wash., Ont., and N. S. Nat. of Eu.—(W. I.)—Sum.—fall.

7. **LYGODESMIA** D. Don. Annual or perennial caulescent herbs or partly woody plants, the stems rush-like. Leaf-blades narrow, entire or remotely pinnate-toothed, or scale-like. Heads erect. Involucre cylindric. Achene not flattened.—About 6 species, North American.

1. **L. aphylla** (Nutt.) DC. Stem erect or ascending, 3–8 dm. tall, solitary or tufted by the branching base, rush-like, naked or nearly so, sometimes forking above: leaves wanting or represented by narrow scales, or a few elongate linear blades at base of stem: involucre cylindric, about 2 cm. long; bracts various, the outer small, 1–3 mm. long, the inner linear or nearly so: ligules rose-colored or rarely white, 1.5–2 cm. long, toothed at the apex: achene narrow, 10–13 mm. long, nearly as long as the white pappus.—(FLOWERING-STRAWS. ROSE-RUSH.)—Dry pinelands and scrub, Coastal Plain, Fla. and Ga.—Spr.—fall.

8. **NABALUS** Cass. Perennial caulescent herbs. Leaf-blades toothed, lobed, pinnatifid, or divided. Heads nodding. Involucre cylindric or nearly so: main bracts nearly equal in length. Achene ellipsoid to columnar.—About 25 species, American and Asiatic.—Sum.—fall.—RATTLESNAKE-ROOTS. WHITE-LETTUCES. LION'S-FOOT. GALL-OF-THE-EARTH.

Heads 8–18-flowered, in thyrsoïd or virgate racemiform panicles.

Achene minutely, sometimes obscurely striate and also sometimes 3- or 4-ribbed: involucre glabrous or nearly so.

I. ALBI.

Achene 5-15-nerved and sometimes angled by 4 or 5 of the stronger nerves: involucre copiously pubescent. Heads 20-35-flowered, in corymb-like panicles.

II. RACEMOSI.  
III. CREPIDINEI.

## I. ALBI

Heads 5-7-flowered: involucre slender, less than 3 mm. thick; bracts light-green: pappus stramineous.

Heads 8-16-flowered: involucre stout, over 3 mm. thick, deep-green, glaucous, or purple.

Pappus deep cinnamon-colored.

Pappus stramineous or light-brown.

Leaf-blades merely toothed or somewhat incised.

Larger bracts of the outer involucre lanceolate: lower leaf-blades elliptic to oval, not cordate.

Larger bracts of the outer involucre ovate: lower leaf-blades hastate, cordate.

Leaf-blades, at least some of them, pinnatifid, lobed, or divided.

Inflorescence paniculate.

Panicle broadened upward: bracts of the involucre, at least the longer ones, glabrous.

Larger bracts of the outer involucre lanceolate: pappus exceeding the inner involucral bracts.

Larger bracts of the outer involucre ovate to triangular-ovate: pappus and inner involucral bracts about equal.

Panicle cylindric: bracts of the involucre sparingly hairy.

Inflorescence racemiform.

1. *N. altissimus*.

2. *N. albus*.

3. *N. integrifolius*.

4. *N. roanensis*.

5. *N. serpentarius*.

6. *N. trifolius*.

7. *N. cylindricus*.

8. *N. virgatus*.

## II. RACEMOSI

Leaf-blades entire or rather finely toothed: branches of the inflorescence very short and close together.

9. *N. asper*.

## III. CREPIDINEI

Leaf-blades finely or coarsely toothed or incised: branches of the inflorescence elongate and distant.

10. *N. crepidineus*.

1. *N. altissimus* (L.) Hook. Stem 9-21 dm. tall, glabrous, glaucous: leaf-blades denticulate, or lobed or divided and with denticulate or lobed divisions: involucre less than 3 m. thick, the outer bracts of the involucre deltoid to ovate, 1-2 mm. long, the inner ones 9-10 mm. long, light-green, glabrous: ligules greenish or yellowish.—Woods and low thickets, various provinces, rarely Coastal Plain, Ga. to Miss., Tenn., Man., and Newf.

2. *N. albus* (L.) Hook. Stem 3-16 dm. tall, glabrous, glaucous: leaf-blades, or the divisions, coarsely toothed: outer bracts of the involucre ovate, 2-3 mm. long, the inner ones 10-12 mm. long, dark-green, glabrous: ligules dull-white or cream-colored.—Rich banks, woods, and thickets, various provinces, rarely Coastal Plain, Ga. to Tenn., Sask., and Me.

3. *N. integrifolius* Cass. Stem 4-18 dm. tall, glabrous, at least in age: leaf-blades oblong, varying to broadest above or below the middle, finely or coarsely dentate, those of the lower leaves cuneate to subcordate at the base: outer bracts of the involucre lanceolate, hirsute on the back: pappus dirty-brown.—Woods, various provinces N of Coastal Plain, Ga. to N. Y.

4. *N. roanensis* Chickering. Stem 3-5 dm. tall, pubescent: leaf-blades ovate to hastate, denticulate, the basal lobes directed backwards or sideways:

inner bracts of the involucre 8-9 mm. long, sparingly hirsute on the back with long hairs: pappus dingy straw-colored.—Mt. peaks, Blue Ridge, N. C. and Tenn.

5. *N. serpentarius* (Pursh) Hook. Stem 3-12 dm. tall, glabrous: larger leaf-blades pinnately lobed: inner bracts of the involucre 9-11 mm. long, often ciliate at the tip: pappus straw-colored.—(LION'S-FOOT.)—Fields, woods, and thickets, various provinces, Fla. to Miss., Ont., and Mass.

6. *N. trifolius* Cass. Stem 8-26 dm. tall, glabrous: larger leaf-blades pedately lobed: inner bracts of the involucre 9-11 mm. long, wholly glabrous: pappus light-brown.—(GALL-OF-THE-EARTH.)—Woods and thickets, various provinces, rarely Coastal Plain, N. C., and Tenn.

7. *N. cylindricus* Small. Stem 3-9 dm. tall, glabrous: larger leaf-blades pinnately 3-5-lobed: inner bracts of the involucre 9-10 mm. long, with scattered hairs on the back: pappus pale-brown.—Mt. slopes, Blue Ridge to Appalachian Plateau, N. C. to Tenn. and Ky.

8. *N. virgatus* (Michx.) DC. Stem 6-12 dm. tall, glabrous: leaf-blades spatulate to lanceolate in outline, pinnatifid, the lobes sometimes toothed: outer bracts of the involucre ciliate, the inner ones 9-10 mm. long, glabrous: ligules white or pink: pappus straw-colored.—Pinelands, Coastal Plain, Fla. to Miss. and N. J.

9. *N. asper* (Michx.) T. & G. Stem 9-20 dm. tall, pubescent: leaf-blades obovate, oblong or lanceolate, undulate to coarsely toothed: bracts of the involucre hirsute, the inner ligules cream-colored: pappus sordid-brown or pale straw-colored.—Dry soil, various provinces, La. to Tenn., S. Dak., and Ohio.

10. *N. crepidineus* (Michx.) DC. Stem 9-21 dm. tall, finely pubescent at least when young: leaf-blades ovate to ovate-hastate, finely or coarsely toothed: bracts of the involucre strigose-hirsute, the inner 9-10 mm. long: ligules cream-colored: pappus dirty-brown.—Rich soil and thickets, various provinces N of Coastal Plain, Tenn. to Kans., Minn., and N. Y.

9. **HIERACIUM** L. Perennial caulescent or scapose herbs. Leaf-blades entire or toothed. Heads erect, paniculate or corymbose. Involucres usually narrow: main bracts unequal in length, often in 2 or 3 series, with a calyculum. Corolla yellow, rarely white or orange. Achenes fusiform or columnar, ribbed. Pappus of 1 or 2 series of sordid or brownish fragile bristles, or rarely white.—About 300 species, natives of the north temperate zone and South America.—HAWKWEEDS.

Flowering stem leafy.  
Flowering stem leafless.

I. PANICULATA.  
II. VENOSA.

#### I. PANICULATA

Achene columnar.

Inflorescence more or less elongate, not flat-topped.

Panicle lax: heads few- (10-20) flowered.

Panicle stiff: heads many- (40-50) flowered.

Inflorescence corymbiform.

Heads many- (20-40) flowered: peduncles densely pubescent.

Heads few- (10-15) flowered: peduncles glaucous.

Achene fusiform.

Inflorescence elongate, paniculate.

Inflorescence corymbiform.

Pappus brown.

Pappus white.

1. *H. paniculatum*.  
2. *H. scabrum*.

3. *H. marianum*.  
4. *H. Scribneri*.

5. *H. Gronovii*.

6. *H. megacephalon*.  
7. *H. argyraeum*.

## II. VENOSA

Inflorescence-branches glabrous or sparingly pubescent: bracts of the involucre glabrous or with scattered fine short glandular hairs.

Inflorescence-branches tomentulose and hispid: bracts of the involucre tomentulose and also with long black glandular hairs.

8. *H. venosum*.

9. *H. Greenii*.

1. *H. paniculatum* L. Plant pale-green or glaucescent, 3–12 dm. tall, the stem sometimes villous at the base: blades of the cauline leaves elliptic-spatulate to elliptic or elliptic-lanceolate, mostly 3–13 cm. long, sinuate-toothed, glabrous, acute or acuminate, sessile: peduncles very slender, nearly filiform, usually glabrous: inner bracts of the involucre 5–6 mm. long, glabrous or obscurely pubescent: achene about 2.5 mm. long.—Banks, woods, and thickets, various provinces, Ga. to Ala., Mich., and N. S.—Sum.

2. *H. scabrum* Michx. Plant bright-green, 3–14 dm. tall, the stem pubescent throughout: blades of the cauline leaves spatulate to elliptic, oval, or ovate, 3–16 cm. long, entire or repand-denticulate, pubescent, obtuse or acutish, the upper ones sessile: peduncles rather stout, copiously glandular-pubescent: inner bracts of the involucre 7–9 mm. long, glandular-pubescent: achene 2–2.5 mm. long.—Clearings, dry woods, pastures, and roadsides, various provinces, Ga. to Miss., Kans., Minn., and N. S.—Sum.—fall.

3. *H. marianum* Willd. Plant bright-green, 3–8 dm. tall, the stem glabrous or softly hirsute near the base: basal leaves often persistent; blades spatulate to obovate, mostly 10–15 cm. long, with more or less shaggy-pubescent petiole-like bases: cauline leaves few; blades obovate, oblanceolate, or elliptic, entire or repand-denticulate, obtuse or abruptly pointed, sessile: peduncles usually finely white-tomentulose and also glandular-pubescent: inner bracts of the involucre 7–9 mm. long, sparingly glandular-pubescent: achene 2.5–3 mm. long, or rarely longer.—Woods, clearings, and banks, various provinces, Fla. to Miss., Ohio, and N. H.—Spr.

4. *H. Scribneri* Small. Plant glaucous, 3–8 dm. tall, the stem glabrous or hirsutulous at the more or less purple-tinged base: basal leaves often persistent; blades spatulate to elliptic, 5–15 cm. long, with shaggy-pubescent petiole-like bases: cauline leaves few; blades oblanceolate, elliptic, lanceolate, or linear-lanceolate, undulate or repand-denticulate, acuminate or acute, sessile: peduncles glabrous or sparingly glandular-pubescent: inner bracts of the involucre 7–9 mm. long, glabrous or sparingly glandular pubescent: achene 2–2.5 mm. long or rarely larger.—Rocky slopes, wooded hillsides, and bluffs, Blue Ridge to Interior Low Plateaus, Ga. to Ala. and Ind.—Sum.

5. *H. Gronovii* L. Plant 2–12 dm. tall, very variable in habit, bright-green, the stem pubescent on the lower part or near the base: basal leaves sometimes persistent; blades obovate to spatulate, 3–16 cm. long, sparingly shaggy-pubescent at the edges or sometimes only sparingly pubescent: cauline leaves few to many; blades spatulate, obovate, elliptic, or ovate, mostly sessile or clasping: peduncles glandular-pubescent: inner bracts of the involucre 6–7 mm.

long, glandular-pubescent: achene 3–3.5 mm. long.—Dry woods, barren hill-sides, and pinelands, various provinces, Fla. to Tex., Ont., and Mass.—Sum.—fall.—The plant with broad based sessile leaf-blades extending nearly to the base of the stem, from Florida, has been described as *H. floridanum*.

6. *H. megacephalon* Nash. Plant 2–7 dm. tall, the stem hirsute, sometimes sparingly so, throughout: basal leaves persistent; blades spatulate to obovate, 4–17 cm. long, more or less shaggy-pubescent: cauline leaves few; blades spatulate, obovate, elliptic, or lanceolate: peduncles finely pubescent and glandular: inner bracts of the involucre 9–11 mm. long, glandular-pubescent: achene 4.5–5.5 mm. long.—Pinelands, pen. Fla. and Coastal Plain of Ga.—All year.

7. *H. argyraeum* Small. Plant 1.5–5 dm. tall, the stem more or less hirsute and glandular above: basal leaves persistent; blades spatulate, obovate, or elliptic, 2–13 cm. long, more or less shaggy-pubescent: cauline leaves few; blades spatulate, obovate, elliptic, or lanceolate: peduncles closely glandular pubescent and finely tomentulose: inner bracts of the involucre 8–10 mm. long, glandular-pubescent, sometimes copiously so: achene 4–4.5 mm. long.—Hammocks and open pinelands, Fla.—All year.

8. *H. venosum* L. Plant 2–6.5 dm. tall, the stem (scape) usually glabrous and purple-tinged: basal leaves persistent; blades obovate to spatulate, 3–15 cm. long, undulate or repand-denticulate usually pale-green and purple-veined, sometimes purple beneath, glabrous or pubescent near the base: peduncles glabrous or sparingly glandular-pubescent: inner bracts of the involucre 6–7 mm. long: achene 2.5–3 mm. long.—(RATTLESNAKE-WEED. POOR-ROBIN'S PLANTAIN.)—Dry woods, shaded banks, and plains, often in acid soil, various provinces, Ga. to Nebr., Mass., and Me.—Sum.

9. *H. Greenii* Porter & Britton. Plant 3–9 dm. tall, the stem (scape) glabrous or finely pubescent, often only in lines: basal leaves persistent; blades spatulate to elliptic-spatulate, 5–20 cm. long, undulate, somewhat shaggy-pubescent, especially near the margins and at the base, bright green: peduncles finely white tomentulose and glandular-pubescent: inner bracts of the involucre 8–11 mm. long: achenes 3–3.5 mm. long.—Dry woods and open slopes, Blue Ridge and more N provinces, Ga. to Ala., Ohio, and Pa.—Spr.

10. *CREPIS* L. Annual or biennial herbs, resembling *Hieracium*, with glabrous or sparingly pubescent foliage. Leaves alternate: blades mostly repand or pinnatifid. Heads few-many-flowered, paniculate or corymbose. Involucres narrow: bracts usually in a single row or in several rows. Corollas yellow. Achene narrow. Pappus of white soft hairs.—About 200 species, natives of the Northern Hemisphere.

Involucre 6–8 mm. high: achenes fusiform, beakless.

Leaf-blades runcinate-pinnatifid: involucre 6–8 mm. high: achene 2.5–3 mm. long.

Leaf-blades lyrate-pinnatifid: involucre 3.5–4.5 mm. high: achene 1.5–2 mm. long.

Involucre 9–12 mm. high: achene slender-fusiform, beaked, the marginal ones filiform-beaked.

1. *C. tectorum*.

2. *C. japonica*.

3. *C. foetida*.

1. *C. tectorum* L. Plant usually branched at the base. 2–4 dm. tall, sparingly pubescent: leaf-blades elliptic, lanceolate, or linear-lanceolate in outline,

runcinate-pinnatifid, usually sagittate-auriculate at the base: involucre 6-8 mm. high; bracts hirsute-hispid, acute: achene fusiform, 2.5-3 mm. long, ribbed.—(HAWKS-BEARD.)—Roadsides and fields, various provinces, N. C. to Nebr. and Ont. Nat. of Eu.—Fall.

2. *C. japonica* (L.) Benth. Plant 1-6 dm. tall: stem simple below or branched at the base, finely pubescent near the base, glabrous or nearly so above and in the very slenderly branched inflorescence: leaves mainly or wholly basal; blades lyrate-pinnatifid, mostly 5-15 cm. long, petioled: involucre 3.5-4.5 mm. high; bracts acuminate, glabrous: achene fusiform, 1.5-2 mm. long, ribbed.—Roadsides, waste-places, and meadows, S. La. Nat. of Japan.—(W. I.)—All year.

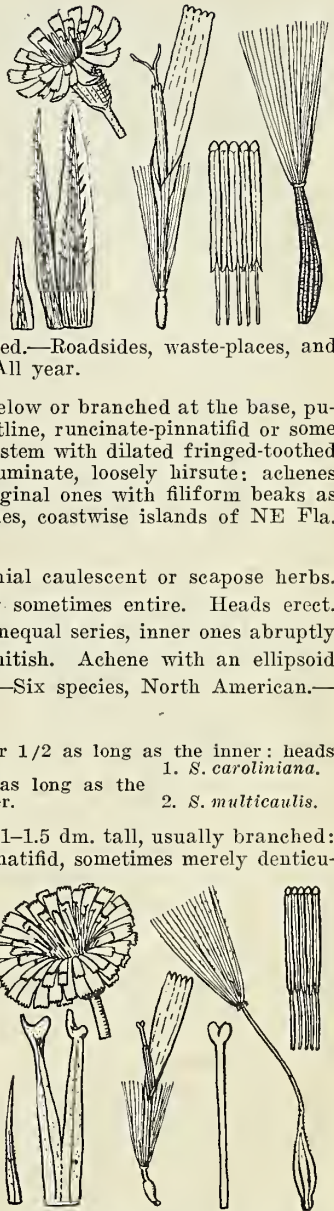

3. *C. foetida* L. Plant 3-5 dm. tall, simple below or branched at the base, pubescent: leaf-blades mostly oblanceolate in outline, runcinate-pinnatifid or some of them coarsely sinuate-toothed, those of the stem with dilated fringed-toothed bases: involucre 9-12 mm. high; bracts acuminate, loosely hirsute: achenes various, and inner ones short-beaked, the marginal ones with filiform beaks as long as the body.—Roadsides, fields, and dunes, coastwise islands of NE Fla. and Ga.—Nat. of Eu.—Spr.-fall.

11. **SITILIAS** Raf. Biennial or perennial caulescent or scapose herbs. Leaf-blades irregularly toothed, pinnatifid, or sometimes entire. Heads erect. Involucre ovoid to campanulate: bracts in 2 unequal series, inner ones abruptly keeled near the apex. Corollas yellow or whitish. Achene with an ellipsoid body. Pappus double, the outer very short.—Six species, North American.—Spr.-fall.—FALSE-DANDELIONS.

Bracts of the outer involucre fully  $\frac{1}{3}$  to over  $\frac{1}{2}$  as long as the inner: heads fully 2.5 cm. long at maturity. 1. *S. caroliniana*.  
Bracts of the outer involucre less than  $\frac{1}{3}$  as long as the inner: heads 2 cm. long at maturity or shorter. 2. *S. multicaulis*.

1. *S. caroliniana* (Walt.) Raf. Stems erect, 1-1.5 dm. tall, usually branched: leaves various; blades more or less deeply pinnatifid, sometimes merely denticulate or nearly entire, these conspicuously elongate: involucre 12-26 mm. long; inner bracts narrowly linear; outer bracts narrower, fully  $\frac{1}{3}$  to over  $\frac{1}{2}$  as long as the inner: ligules yellow: achene-body about 5 mm. long, ribbed, somewhat rufous. [*Pyrrophappus carolinianus* (Walt.) DC.]—Dry soil, roadsides, waste-places and pinelands, various provinces, Fla. to Tex., Kans., and Del.—Spr.-fall.—A variety with pale cream-colored ligules, tipped with rose, and streaked rose on the under side, occurs in N. Fla. A similar or the same one occurs in Ala. This may prove, upon further investigation to be a distinct species.

2. *S. multicaulis* (DC.) Greene. Stems solitary or tufted, ascending or spreading, 1-4 dm. long, more or less branched: leaves mainly basal, 5-15 cm. long;

blades pinnate or irregularly pinnatifid, the segments entire or toothed; upper leaves narrower, deeply pinnatifid or merely toothed; involucre 1–1.5 cm. long; inner bracts narrowly linear, acute; outer bracts linear-subulate,  $\frac{1}{4}$  to nearly  $\frac{1}{3}$  as long as the inner bracts: ligules bright-yellow, 1.5–2 cm. long: achene-body 3.5–4 mm. long, reddish, transversely wrinkled.—Dry soil, hillsides, prairies, woods, and ditch-banks, various provinces, N Fla. to Tex. and Ariz.—(Mex.)—Spr. and sum.

**12. LEONTODON** L. Perennial low caulescent herbs. Leaf-blades sinuate-toothed or runcinate-pinnatifid, or rarely entire. Heads solitary. Involucre thick, scaly. Achene not much flattened. Pappus persistent. [*Taraxacum* Ludwig.]—About 30 species, in the Northern Hemisphere and South America.—Spr.-fall.—**DANDELIONS. BLOW-BALLS.**

Inner involucre bracts unappendaged. achene brown or olive-green.

Inner involucre bracts appendaged at the tip: achene red or red-brown.

1. *L. Taraxacum*.

2. *L. erythrospermum*.

1. **L. Taraxacum** L. Leaf-blades sinuate or coarsely pinnatifid, often lyrate, the lobes broad: heads 3–5 cm. wide, the ligules orange-yellow: involucre bracts green, the outer ones long, reflexed: achene-body bluntly spinulose near the top: pappus white. [*Taraxacum Taraxacum* (L.) Karst.]—Fields, open grounds, waste-places, and woods, throughout U. S. and S. Can.

2. **L. erythrospermum** (Andrz.) Eichw. Leaf-blades pinnatifid or pinnately divided, runcinate, the lobes narrow: heads 2–3 cm. wide, the ligules light-yellow: involucre bracts glaucous, the outer ones short, ascending or spreading: achene-body sharply spinulose near the apex: pappus dirty-white.—Fields, lawns, and waste-places, various provinces N of Coastal Plain, N. C. to Tenn., Alb., and Me. Nat. of Eu.

**13. BRACHYRHAMPHUS** DC. Annual, coarse herbs with branching stems. Leaves mainly basal or on the lower part of the stem. Leaf-blades sagittate-clasping, mostly pinnatifid or lyrate-pinnatifid. Heads erect. Involucre ovoid-conic. Achene subterete, ribbed, the ribs muriculate.—The following and perhaps a few other species, tropical.

1. **B. intybaceus** (Jacq.) DC. Stem 3–15 dm. tall, glabrous: leaf-blades bright-green, those of the lower leaves 1–3 dm. long, the edges or lobes spiny-toothed: heads solitary at the nodes, on slender scaly stalks: bracts of the involucre conspicuously scarious-margined, the outer ovate, the inner linear-lanceolate: corollas yellow or ochroleucous: achene somewhat fusiform, about 4 mm.

long: pappus bright-white.—(WILD-LETTUCE.)—Roadsides, cult. grounds, and waste-places, S Fla. Nat. of Trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.

**14. LACTUCA L.** Annual, biennial, or perennial herbs, the stems stout. Leaf-blades mostly relatively broad, entire, toothed, or pinnatifid, sometimes spiny-margined. Heads erect. Involucres cylindric to ovoid. Achene flattened, slender-beaked.—About 75 species, in the Northern Hemisphere.—Sum.-fall.—LETTUCES. WOOD-LETTUCES. WILD-LETTUCES.

Leaf-blades spiny-toothed and often spiny along the midrib beneath: corollas yellow.

Involucres 6-12-flowered.

Leaf-blades sinuately spiny-denticulate.

Leaf-blades deeply pinnatifid.

Involucres 12-20-flowered.

Involucres over 1.5 cm. high: beak fully as long as the body of the achene.

Involucres less than 1.5 cm. high: beak shorter than the body of the achene.

Leaf-blades without spines on the margins or midribs.

Leaf-blades entire or merely toothed.

Leaf-blades, at least some of them, pinnatifid.

Leaves glabrous.

Leaves hirsute, at least their midribs.

Lower leaf-blades all pinnatifid: beak of achene fully as long as the body.

Lower leaf-blades usually both entire and pinnatifid: beak of achene much shorter than the body.

1. *L. virosa*.

2. *L. Scariola*.

3. *L. ludoviciana*.

4. *L. sagittifolia*.

4. *L. sagittifolia*.

5. *L. canadensis*.

6. *L. hirsuta*.

7. *L. graminifolia*.

1. ***L. virosa* L.** Stem hirsute below, 6-20 dm. tall: leaf-blades oblanceolate to oblong, merely denticulate, glaucous: inner bracts of the involucre 12-15 mm. long, narrowly linear: outer corollas 11-12 mm. long: achene-body gradually narrowed at the apex.—Fields, waste-places, and roadsides, various provinces, Ga. to Tenn., Kans., and N. Y. Nat. of Eu.

2. ***L. Scariola* L.** Stem nearly or quite glabrous, 4-15 cm. tall: leaf-blades oblong to lanceolate in outline, pinnatifid, bright-green: inner bracts of the involucre 8-10 mm. long, linear-oblong: outer corollas 8-9 mm. long: achene-body abruptly narrowed at the apex.—(PRICKLY-LETTUCE.)—Waste-places, fields, and roadsides, various provinces, Ga. to Miss., Mo., and Vt. Nat. of Eu.

3. ***L. ludoviciana* (Nutt.) DC.** Stem 4-15 dm. tall, glabrous: leaves horizontal: blades 5-20 cm. long, sinuate-lobed or pinnatifid: involucres 16-20 mm. long, the inner bracts linear-lanceolate: ligules yellow: achene-body 4-4.5 mm. long.—Dry soil, often on wooded banks, various provinces, Tenn. to Tex., N. Dak., Minn., and Ark.

4. ***L. sagittifolia* Ell.** Stem 9-30 dm. tall, glabrous: blades of the stem-leaves 8-30 cm. long, irregularly dentate: involucres 10-20 mm. long, the inner bracts narrowly linear or nearly so: ligules yellow or reddish: achene-body 2.5-3 mm. long, longer than the beak.—Rich soil, open woods, and shaded banks, various provinces, Ga. to Nebr., and Pa.

5. ***L. canadensis* L.** Stem 9-30 dm. tall, glabrous or nearly so: blades of the stem-leaves 10-30 cm. long, sinuate-pinnatifid: involucres 10-12 mm. long,

the inner ones linear-lanceolate: ligules yellow: achene-body 3-4 mm. long, about as long as the beak.—(WILD-LETTUCE. HORSE-WEED.)—Rich soil, fence-rows, thickets, and open woods, various provinces, Ga. to La., Colo., B. C., Ont., and N. S.—(*W. I.*)

6. *L. hirsuta* Muhl. Stem 6-12 dm. tall, sometimes hirsute: blades of the stem-leaves 9-20 cm. long, sinuate-pinnatifid, not elongate: involucre 12-15 mm. long, the inner bracts linear: ligules purplish yellow to white: achene-body about 4 mm. long, much shorter than the beak.—Dry soil, various provinces, Ala. to Tex., Ont., and Que.

7. *L. graminifolia* Michx. Stem 6-15 dm. tall, glabrous: blades of the stem-leaves 10-40 cm. long, entire or with few spreading or deflexed lobes, conspicuously elongate: involucre 12-15 mm. long, the inner ones linear-lanceolate: ligules purple-blue, or rarely white or yellowish: achene-body 4-4.5 mm. long.—Fields and woods, Coastal Plain and adj. provinces, Fla. to Tex. and S. C.

15. **MULGEDIUM** Cass. Herbs resembling *Lactuca* in habit. Achene thick, beakless. About 25 species, Eurasian and North American.—Sum.—fall.—LETTUCES. BLUE-LETTUCES.

Pappus bright-white: blades of the stem-leaves neither auriculate nor clasping.

Leaf-blades toothed: achene-body not narrowed into a neck. 1. *M. villosum*.

Leaf-blades pinnatifid: achene-body narrowed into a slender neck.

2. *M. floridanum*.

Pappus brown: blades of the stem-leaves auriculate and clasping.

3. *M. spicatum*.

1. *M. villosum* (Jacq.) Small. Stem 9-20 dm. tall: blades of the stem-leaves irregularly dentate, 8-20 cm. long: inner bracts of the involucre linear-lanceolate: ligules blue: achene 4.5-5.5 mm. long.—Borders of woods, open woods, and thickets, various provinces, Fla. to La., Nebr., and N. Y.

2. *M. floridanum* (L.) DC. Stem 10-30 dm. tall: blades of the stem-leaves lyrate-pinnatifid, 2-45 cm. long: inner bracts of the involucre linear: ligules blue: achene 6-7 mm. long.—Rich soil, thickets, and banks, various provinces, Fla. to Tex., Nebr., and N. Y.—(*W. I.*)

3. *M. spicatum* (Lam.) Small. Stem 9-35 dm. tall: blades of the stem-leaves lobed or pinnatifid (merely denticulate in *M. spicatum integrifolium*): ligules white, yellowish, or bluish: achene 4-5 mm. long.—Low grounds, thickets, and open woods, various provinces, rarely Coastal Plain, N. C. to Colo., Man., and Newf.

16. **SONCHUS** [Tourn.] L. Annual or perennial, tall caulescent herbs. Leaf-blades entire, toothed, or pinnatifid, sometimes spiny margined. Heads erect. Involucres ovoid or subglobose. Achene flattened. Pappus deciduous.—About 45 species, natives of the Old World.—Spr.—fall.—SOW-THISTLES.

Leaf-auricles rounded: achenes smooth and 3-ribbed.

Leaf-auricles acute: achenes transverse-wrinkled and striate.

1. *S. asper*.

2. *S. oleraceus*.

1. *S. asper* (L.) All. Stem 2–15 dm. tall: leaf-blades with rigid-tipped teeth: achene 2–2.5 mm. long, margined, ribbed and smooth.—Waste-places, fields, and roadsides, throughout U. S. and S Can. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

2. *S. oleraceus* L. Stem 1–18 dm. tall: leaf-blades more divided than in *S. asper*, with soft-tipped teeth: achene 2.5–3 mm. long, scarcely margined, striate and transverse-wrinkled.—Cult. grounds, waste-places, and fields, various provinces, U. S. and S Can. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

*Scolymus maculatus* L., an annual, spine-armed herb, with pinnately lobed leaves, each lobe terminating in a long spine, the stem with broad spine-margined wings, the involucre not spiny, bracts thin, herbaceous, flowers yellow; achene inclosed by the chaff, has been found on ballast on the seacoast of N. C. Nat. of Eu.

## APPENDIX

This appendix contains descriptions of additional plants found within the region covered by this work during the several years the book has been in press, and corrections.

Page 300, after *O. puberula*, insert:

1a. *O. nitida* (Britton) Mackenzie. Plant similar to *O. puberula* in habit, but usually smaller; leaf-blades narrowly elliptic to elliptic-lanceolate, 2-4 cm. long, thinnish, green and shining on both sides; sepals and petals 1.5-2 cm. long: capsule oval-elliptic to oval-orbicular, 1.5-1.8 cm. long.—Low pinelands, Coastal Plain, N. C. to N. J.—Differs from *O. puberula* in the smooth or nearly smooth stem-angles, the uniformly green and shining leaf-blades, the smaller flowers and the smaller and relatively broader capsules.

Page 375, at bottom of page add:

Petals very much shorter than the sepals: sepals with elongate involute tips: flower (and capsule) long-stalked: lip over twice as long as wide.

Petals as long as the sepals or slightly shorter: sepals without involute tips: flower (and capsule) short-stalked: lip less than twice as long as wide.

1. *I. verticillata*

2. *I. affinis*

Page 376, after *Isotria verticillata* add:

2. *I. affinis* (Austin) Rydb. Plant similar to *I. verticillata* in habit: scapes 1-2.5 dm. tall: blades of the whorled bracts oval to elliptic, 2.5-5 cm. long: flowers short-stalked: lateral sepals greenish-yellow, narrowly spatulate, 1-2 cm. long, without long tips: petals broadly spatulate or obovate, as long as the sepals or somewhat shorter: lip white with green crest, obovate-cuneate, 11-13 mm. long, less than twice as long as wide when spread out, with scattered hairs at the end of the median ridges, the apical lobe flabellate; capsule 2-3 cm. long, stout-stalked. [*Pogonia affinis* Aust.]—Woods, various provinces, N. C. to Pa., Vt., and Me.—Spr.—Discovered in N. C. in the summer of 1933.

Page 389, after *Pleurothallis gelida*, insert:

36a. **LEPANTHES** Sw. Epiphytic dwarf caulescent herbs. Stems clustered, slender, simple, covered with tubular or funnellform sheaths, the uppermost one of which bears a leaf-blade. Leaves solitary on a stem: blade broad, margined, coriaceous, sessile, minutely 3-toothed at the apex. Racemes axillary, solitary or sometimes clustered, slender-peduncled. Flowers few or several, minute, usually approximate, 2-ranked. Sepals spreading or erect, broad, nearly equal, the lateral more or less united. Petals minute, with the short claw adnate to the base of the column, the limb usually wider than long. Lip often slightly longer than the petals, adnate at the base or above the base to the column, entire or lobed, with the two lobes erect, parallel to the column, with the edges thickened and embracing the column. Column short. Anther terminal. Pollinia pyriform. Capsule, oval, ovoid, ellipsoid, or obovoid.—About 50 species, in continental and insular tropical America.—Differs from *Pleurothallis* in having the claws of the petals and the lip adnate to the column.—The description and drawing made partly from Jamaican specimens.

1. **L. Harrisii** Fawcett and Rendle. Stems 3–4.5 cm. tall, simple, several usually together. Leaf-sheaths contiguous, funnellform, oblique, brown-hirtellous on the ridges and on the mouth: leaf-blade elliptic or oval, 1–2 cm. long, acute or acutish, shining. Raceme overtopping the leaf, compact: bracts glabrous, acute: perianth minute, dark crimson-purple: sepals about 2 mm. long, the median one narrowly oval, the 2 lateral  $\frac{1}{2}$  united, lanceolate, 1-veined: petals elliptic, 0.5–0.7 mm. long, rounded at the apex: lip orbicular-ovate, entire, little over 1 mm. long, 3-veined: column about 0.5 mm. long: capsule ellipsoid or oval, 3–4 mm. long, 6-ribbed.—On trees, Big Cypress Swamp, Fla.—(*W. I.*)—Wint.

Page 396, after *Macradenia lutescens*, insert:

49a. **MAXILLARIA** R. & P. Epiphytic herbs with more or less clustered flowering branches, the pseudobulbs sometimes poorly developed, each bearing one leaf. Leaves coriaceous, 2-ranked, erect. Scapes (peduncles) arising at the bases of the pseudobulbs or in the axils of the leaves, solitary, with sheathing bracts, 1-flowered. Flowers large or medium. Sepals narrow, nearly equal, distinct, the lateral adnate to the column-foot, forming a more or less prominent chin. Petals narrower than the sepals, usually somewhat broadened upward. Lip concave, erect at the apex of the column-foot, the claw very short, or wanting, the lateral lobes shallow, erect, the terminal lobe ovate or elliptic-ovate, spreading. Column with a short foot, often slightly incurved, semiterete, not winged. Anther terminal. Pollinia 4, unappendaged. Capsule ovoid, ellipsoid, or obovoid, erect, ribbed, beakless.—About 240 species, in continental and insular tropical America.—Differs from *Macradenia* in having 4 pollinia, instead of 2, the solitary axillary flower at the base of the plant, and the slightly lobed lip.

1. **M. sessilis** (Sw.) Fawcett and Rendle. Stem very short, the branches usually clustered or approximate: pseudobulbs inconspicuous, elongate, flattened, each with a leaf at the apex. Leaves basal (except the one on the apex of the pseudobulb) erect, 2-ranked, the outer ones scale-like; inner one 1–3 dm. long, with blades conduplicate and sheathing at the thickened base, linear, oblique at the apex: flowers few, clustered in two's or three's, from the axils of each leaf, the peduncle very short: pedicels about as long as the peduncle, with one sheathing bract: perianth mainly pale-yellow: sepals coriaceous, lanceolate, about 1.5 cm. long; petals linear-spatulate, about as long as the sepals, slightly curved: lip elliptic-lanceolate, 1–1.5 cm. long, with a strong midrib, acute: capsule ellipsoid, 2–3 cm. long, with 6 ribs and furrows.—On trees, Big Cypress Swamp, Fla.—(*W. I., Mex., C. A., S. A.*)—Spr.—sum.

Page 430, after *Quercus coccinea*, insert:

35a. *Q. Nuttallii* E. J. Palmer. Tree becoming 22 m. tall, with a narrow pyramidal crown, the bark gray or slate-colored and smooth or dark brownish-gray and slightly fissured on old trunks: leaf-blades obovate or elliptic in outline, 8-16 cm. long, glabrous, except tufted vein-axils beneath, pinnately 5-7-lobed, the lobes as long as the body or shorter, all bristle-tipped, the terminal one acuminate: acorns sessile or very short-stalked; cup hemispheric above the stout stipe or deep-turbinate, 2-2.5 cm. wide; nut ovoid or cylindric-ovoid, 20-28 mm. long,  $\frac{1}{3}$  to  $\frac{1}{2}$  included in the cup.—Alluvial lowlands, mostly Coastal Plain, Miss. to E. Tex., to Ark. and Mo. (?)

Page 608, after *Spiraea alba*, insert:

2a. *S. prunifolia* S. & Z. Shrub, with slender arching branches and finely pubescent twigs: leaf-blades elliptic or oval, varying to ovate, 1-2.5 cm. long, obtuse or acute, more or less pubescent and sometimes veiny, serrulate, very short-petioled: hypanthium broadly turbinate, less than 1 mm. high: petals white, about 3 mm. long: follicles oblong, 3-3.5 mm. long. (BRIDAL-WREATH)—Roadsides and about abandoned gardens, various provinces, N. C. to Mass. Nat. of Asia.—Spr.—Differs from *S. alba* in the elliptic, oval or ovate leaf-blades, and the inflorescence which has sessile clusters scattered along the old wood of the slender branchlets.

Page 608, after *Spiraea corymbosa*, add:

6a. *S. japonica* L. f. Shrub 1-2 m. tall with finely pubescent twigs: leaf-blades oblong, elliptic, or oblong-lanceolate, 3-12 cm. long, acuminate, coarsely serrate, finely pubescent at least when young, cuneate at the base: corymbs many-flowered, round-topped: hypanthium broadly campanulate: petals pink or rose-colored, suborbicular, 1.5-2 mm. long, or rarely longer: follicles erect, about 3 mm. long, glabrous.—Woods, hillsides, and roadsides, various provinces, Ga. to Pa., and Conn. Nat. of e Asia.—Sum.—Differs from *S. corymbosa* in the acuminate leaf-blades and the pink or rose-colored corolla.

Page 816, in place of the description of *Ilex Amelanchier* as it now stands, insert:

14. *I. Amelanchier* M. A. Curtis. Shrub or small tree with more or less persistent pubescent foliage: leaf-blades elliptic to elliptic-lanceolate, 4-8 cm. long, acute or short-acuminate, inconspicuously serrate, finely reticulate above, thinly pubescent beneath, acute or rounded at the base: calyx 2-2.5 mm. broad: corolla 6-7 mm. broad: drupe globose, 7-10 mm. in diameter, red.—Swamps and shaded stream-banks, Coastal Plain, Ga. and S. C.—Spr.—This more complete description is to replace that on page 816, where the word petioles is omitted before "6-10 mm." long and to give measurements of the flowers which have only recently been collected.

Pages 1166 and 1167, under *Conradina* in place of *C. montana* Small, read *C. verticillata* Jennison, in both key and description.

# LIST OF GENERA AND SPECIES PUBLISHED IN THIS MANUAL\*

- Sagittaria ornithorhyncha* Small. Type, Fayetteville, N. C., Biltmore Herbarium, No. 5236 b, in herb. N. Y. B. G.
- Philotria densa* (Planch.) Small. *Egeria densa* Planch.
- Cyperus Winkeleri* Britton & Small. Type, Humbuggus Prairie, Dade Co., Fla., Small & Mosier, No. 5625, in herb. N. Y. B. G.
- Cyperus Deeringianus* Britton & Small. Type, Arch Creek Prairie, Dade Co., Fla., Small, Mosier, and Small, No. 6789, in herb. N. Y. B. G.
- Cyperus multiflorus* (Chapm.) Small. *Cyperus echinatus multiflorus* Chapm.
- Eleocharis carolina* Small. Type, South Carolina, M. A. Curtis, in herb. C. U.
- Eleocharis Curtisii* Small. Type, Wilmington, N. C., M. A. Curtis, in herb. C. U.
- Rynchospora Rappiana* Small. Type, between DeLand and New Smyrna, Fla., Rapp, Oct. 10, 1926, in herb. N. Y. B. G.
- Rynchospora leptocarpa* (Chapm.) Small. *Rynchospora glomerata leptocarpa* Chapm.
- Rynchospora Harperi* Small. Type, 3 m. sw. of Hawkinsville, Ga., Harper, No. 1377, in herb. N. Y. B. G.
- Rynchospora pinetorum* Britton & Small. Type, w. of Punta Gorda, Fla., Small, No. 10,912, in herb. N. Y. B. G.
- Rynchospora Edisoniana* Britton. Type, Everglades, w. of Miami, Fla., Small, No. 8835, in herb. N. Y. B. G.
- Rynchospora saxicola* Small. Type, Little Stone Mountain, Ga., Harper, No. 2308, in herb. N. Y. B. G.
- Scleria Brittonii* Core. *Scleria pauciflora glabra* Chapm.
- Carex purpurifera* Mackenzie. Type, Morley, Tenn., John Bright, May 18, 1923, in herb. N. Y. B. G.
- Commelina Gigas* Small. Type, e. shore of Lake Okeechobee, Fla., Small, No. 8247, in herb. N. Y. B. G.
- Tillandsia simulata* Small. Type, along Manatee River, Fla., Garber, June, 1878, in herb. C. U.
- Tillandsia myriophylla* Small. Type, s. of Brooksville, Fla., Small & Alexander, May 13, 1931, in herb. N. Y. B. G.
- Xeniatrum umbellulatum* (Michx.) Small. *Dracaena umbellulatum* Michx.
- Tortipes* Small (tortus, twisting, and pes, foot, referring to the twisted flower-stalk.)
- Tortipes amplexifolius* (L.) Small. *Uvularia amplexifolia* L.
- Atamosco candida* (Lindl.) Small. *Amaryllis candida* Lindl.
- Hymenocallis keyensis* Small. *Hymenocallis caribaea* Chapm., not Herb.
- Hymenocallis Collieri* Small. Type, Marco Island, Fla., Small, May, 1920, in herb. N. Y. B. G.
- Hymenocallis Kimballiae* Small. Type, Apalachicola, Fla., Kimball, May, 1921, in herb. N. Y. B. G.
- Hymenocallis tridentata* Small. Type, Vero, Fla., Small, Dec., 1920, in herb. N. Y. B. G.
- Hymenocallis bidentata* Small. Type, St. Bernard, Ala., Bede Knapke, Oct., 1920, in herb. N. Y. B. G.
- Hymenocallis laciniata* Small. Type, near Carbur, Fla., Small, May 6, 1925, in herb. N. Y. B. G.

\* In this list C. U. = Columbia University and N. Y. B. G. = New York Botanical Garden.

- Habenella odontopetala* (Reichenb. f.) Small. *Habenaria odontopetala* Reichenb. f.  
*Spathiger stroboliferus* (Reichenb. f.) Small. *Epidendrum stroboliferum* Reichenb. f.  
*Amphiglottis conopsea* (Ait.) Small. *Epidendrum conopseum* Ait.  
*Micropiper leptostachyon* (Nutt.) Small. *Piper leptostachyon* Nutt.  
*Micropiper humile* (Vahl) Small. *Piperomia humilis* Vahl.  
*Rhynchophorum* Small. *Peperomia*, subgenus *Rhynchophorum* Miq.  
*Rhynchophorum obtusifolium* (L.) Small. *Piper obtusifolium* L.  
*Rhynchophorum floridanum* Small. *Piperomia floridana* Small.  
*Rhynchophorum spathulifolium* Small. *Piperomia spathulifolium* Small.  
*Hicoria austrina* Small. Type, Shell-midden, 5 m. s. of Daytona, Fla., Small, Britton, & DeWinkeler, No. 9191, in herb. N. Y. B. G.  
*Salix Chapmanii* Small. Type, Middle Fla., Chapman, in herb. C. U.  
*Parietaria nummularia* Small. Type, Sanford, Fla., Rapp, Apr. 11, 1929, in herb. N. Y. B. G.  
*Ramium niveum* (L.) Small. *Urtica nivea* L.  
*Acetosella Acetosella* (L.) Small. *Rumex Acetosella* L.  
*Delopyrum filiforme* Small. Type, near Douglas, Fla., Harper, No. 2010, in herb. N. Y. B. G.  
*Delopyrum articulatum* (L.) Small. *Polygonum articulatum* L.  
*Persicaria mississippiensis* (Sanford) Small. *Polygonum mississippiense* Sanford.  
*Persicaria paludicola* Small. Type, Everglades, Camp Jackson to Camp Longview, Fla., Small, Carter, and Small, No. 3494, in herb. N. Y. B. G.  
*Gastronychia* Small. (*Gaster*, *belly*, and *anychia*, referring to the swollen base of the flower.)  
*Gastronychia herniarioides* (Michx.) Small. *Anychia herniarioides* Michx.  
*Odontonychia interior* Small. Type, along the Suwanee River, e. of Old Town, Fla., Small, Small, & DeWinkeler, No. 11465, in herb. N. Y. B. G.  
*Torrubia globosa* Small. Type, Miami Beach, Fla., Small, Small, & DeWinkeler, No. 11539, in herb. N. Y. B. G.  
*Claytonia media* (DC.) Small. *Claytonia virginica media* DC.  
*Sabularia uniflora* (Walt.) Small. *Stellaria uniflora* Walt.  
*Sabularia groenlandica* (Retz.) Small. *Stellaria groenlandica* Retz.  
*Sabularia brevifolia* (Nutt.) Small. *Arenaria brevifolia* Nutt.  
*Sabularia glabra* (Michx.) Small. *Arenaria glabra* Michx.  
*Sabularia caroliniana* (Walt.) Small. *Arenaria caroliniana* Walt.  
*Clematis micrantha* Small. Type, Devil's Punch Bowl, w. of Brooksville, Fla., Small, No. 11337; for fr. Choocochatte hammock, s. of Brooksville, Fla., Small, No. 10602, in herb. N. Y. B. G.  
*Viorna subreticulata* Harbison. Type, Garden City, Ala., Biltmore herb., No. 15011, in herb. N. Y. B. G.  
*Viorna Beadlei* Small. Type, Currahee Mt., Ga., Small, Sept. 1-3, 1894, in herb. N. Y. B. G.  
*Pityothamnus* Small. (*πίτυς*, *pine*, and *θάμνος*, *shrub*, referring to the habitat of these plants.)  
*Pityothamnus reticulatus* (Chapm.) Small. *Asimina reticulata* Chapm.  
*Pityothamnus incanus* (Bartr.) Small. *Anona incana* Bartr.  
*Pityothamnus angustifolius* (A. Gray) Small. *Asimina angustifolia* A. Gray.  
*Pityothamnus pygmaeus* (Bartr.) Small. *Anona pygmaea* Bartr.  
*Pityothamnus tetramerus* Small. *Asimina tetramera* Small.  
*Pityothamnus obovatus* (Willd.) Small. *Anona obovata* Willd.  
*Neocleome* Small. (*νέος*, *new*, and *Cleome*.)  
*Neocleome spinosa* (L.) Small. *Cleome spinosa* L.  
*Neocleome serrata* (Jacq.) Small. *Cleome serrata* Jacq.  
*Sedum vigilimontis* Small. Type, Lookout Mountain, near Rising Fawn, Ga., Curtiss, No. 6798, in herb. N. Y. B. G.

- Vachellia peninsularis* Small. Type, Long (Pine) Key, Everglades, Fla., for fls., Small & Wilson, No. 1778; for fr., Small & Carter, No. 2975, in herb. N. Y. B. G.
- Vachellia densiflora* Alexander. Type, along Bayou La Fourche near Cut-off, La., for fls., Small & Alexander, Apr. 16, 1931; for fr., Small, Aug., 1931, both in herb. in N. Y. B. G.
- Vachellia insularis* Small. Type, Big Pine Key, Fla., for fls., Small & Mosier, No. 6018; for fr., Small, Carter, & Small, No. 3549, in herb. N. Y. B. G.
- Adipera corymbosa* (Lam.) Small. *Cassia corymbosa* Lam.
- Chamaesenna didymobotrya* (Forsk.) Small. *Cassia didymobotrya* Forsk.
- Crotalaria Linaria* Small. Type, Big Pine Key, Fla., Small & Mosier, No. 6034, in herb. N. Y. B. G.
- Galactia prostrata* Small. Type, for fls., Redlands district, Dade Co., Fla., Small, No. 8633; for fr., near Silver Palm, Dade Co., Fla., Small, Mosier & Small, No. 6453, in herb. N. Y. B. G.
- Stylosanthes calcicola* Small. Type, Rose-Costello hammock, Dade Co., Fla., Small, Mosier, & Small, No. 6539, in herb. N. Y. B. G.
- Asemeia leiodes* (Blake) Small. *Polygala grandiflora leiodes* Blake.
- Asemeia grandiflora* (Walt.) Small. *Polygala grandiflora* Walt.
- Asemeia cumulicola* Small. *Polygala cumulicola* Small.
- Asemeia miamensis* Small. *Polygala miamensis* Small.
- Polygala aboriginum* Small. Type, dunes s. of Coronado, Fla., Small, Mosier, and Matthaus, May 24, 1926, in herb. N. Y. B. G.
- Pilostaxis arenicola* Small. *Polygala arenicola* Small.
- Pilostaxis lutea* (L.) Small. *Polygala lutea* L.
- Pilostaxis Rugelii* (Shuttl.) Small. *Polygala Rugelii* Shuttl.
- Pilostaxis ramosa* (Ell.) Small. *Polygala ramosa* Ell.
- Pilostaxis cymosa* (Walt.) Small. *Polygala cymosa* Walt.
- Pilostaxis Baldwinii* (Nutt.) Small. *Polygala Baldwinii* Nutt.
- Pilostaxis Carteri* Small. *Polygala Carteri*, Small.
- Chamaesyce cumulicola* Small. Type, Caxambas Island, Fla., Small, No. 10490, in herb. N. Y. B. G.
- Chamaesyce Moseri* Small. Type, near Brogdon hammock, Dade Co., Fla., Small & Mosier, No. 6347, in herb. N. Y. B. G.
- Chamaesyce Mathewsii* Small. Type, dunes opposite Miami, Fla., Small, No. 4556.
- Galarrhoeus floridanus* (Chapm.) Small. *Euphorbia floridana* Chapm.
- Galarrhoeus inundatus* (Torr.) Small. *Euphorbia inundata* Torr.
- Galarrhoeus telephioides* (Chapm.) Small. *Euphorbia telephoides* Chapm.
- Galarrhoeus Darlingtonii* (A. Gray) Small. *Euphorbia Darlingtonii* A. Gray.
- Galarrhoeus austrinus* Small. *Tithymalus austrinus* Small.
- Galarrhoeus trichotomus* (H.B.K.) Small. *Euphorbia trichotoma* H.B.K.
- Saccharodendron nigrum* (Michx. f.) Small. *Acer nigrum* Michx. f.
- Argentacer* Small. (argentum, silver, and acer, i.e., silver-maple.)
- Argentacer saccharinum* (L.) Small. *Acer saccharinum* L.
- Rufacer* Small. (rufus, red, and acer, i.e., red-maple.)
- Rufacer rubrum* (L.) Small. *Acer rubrum* L.
- Rufacer carolinianum* (Walt.) Small. *Acer carolinianum* Walt.
- Cardiospermum keyense* Small. Type, Key Largo, Fla., Small, Mosier, & DeWinkeler, No. 10952, in herb. N. Y. B. G.
- Ascyrum Edisonianum* Small. Type, twenty-one m. e. of Arcadia, Fla., Hand, No. 118, in herb. N. Y. B. G.
- Lechea prismatica* Small. Type, scrub, e. of Sebring, Fla., Small, No. 9787, in herb. N. Y. B. G.
- Lechea exserta* Small. Type, w. of Halendale, Fla., Small, DeWinkeler, & Small, No. 11089, in herb. N. Y. B. G.
- Lechea myriophylla* Small. Type, scrub, e. of Sebring, Fla., Small & DeWinkeler, Dec. 13, 1920, in herb. N. Y. B. G.

- Viola rugosa* Small. Type, Telogia, Fla., Small, Apr., 1927, in herb. N. Y. B. G.
- Opuntia atrocapsensis* Small. Type, dunes, Cape Sable (E. Cape), Small, Nov. 25, 1916, in herb. N. Y. B. G.
- Opuntia polycarpa* Small. Type, Caxambas Island, Fla., Small, May 11, 1922, in herb. N. Y. B. G.
- Opuntia nitens* Small. Type, hammock, 5 m. s. of Daytona, Fla., Small, Small, & DeWinkeler, Aug. 23, 1922, in herb. N. Y. B. G.
- Opuntia cumulicola* Small. Type, beach, opp. Lemon City, Fla., Small, Small, & Carter, No. 970, in herb. N. Y. B. G.
- Opuntia tenuiflora* Small. Type, Lignum Vitae Key, Fla. Small, Mar. 30, 1916, in herb. N. Y. B. G.
- Opuntia turbinata* Small. Type, St. George Island, Fla., Small, Aug. 22, 1922, in herb. N. Y. B. G.
- Opuntia magnifica* Small. Type, s. end of Amelia Island, Fla., Small, Small, and DeWinkeler, Aug. 21, 1922, in herb. N. Y. B. G.
- Brasilopuntia brasiliensis* (Willd.) Small. *Cactus brasiliensis* Willd.
- Eugenia anthera* Small. Type, for fls., near Roseland, Fla., Charles A. Mosier, Aug., 1928; for fr., near Roseland, Fla., Small, Dec. 27, 1927, in herb. N. Y. B. G.
- Mosiera* Small. (In honor of Charles A. Mosier.)
- Mosiera longipes* (Berg) Small. *Eugenia longipes* Berg.
- Mosiera bahamensis* (Kiearsk.) Small. *Eugenia bahamensis* Kiearsk.
- Isnardia media* Small, Alexander. Type, between Homestead and Cross Key, Fla., Small & Carter, No. 2626, in herb. N. Y. B. G.
- Ludwigia spathulifolia* Small. Type, Everglades, NW. of Perrine, Fla., Small & Carter, No. 2990, in herb. N. Y. B. G.
- Jussiaea neglecta* Small. Type, along Escambia River, near Pensacola, Fla., Small, Aug., 1930, in herb. N. Y. B. G.
- Proserpinaca amblygona* (Fernald) Small. *Proserpinaca palustris amblygona* Fernald.
- Eryngium cuneifolium* Small. Type, about Lake Nancesowee, Fla., Small & Mosier, Dec., 1927, in herb. N. Y. B. G.
- Sium floridanum* Small. Type, Swamps of the Chipola River, Fla., Chapman, in herb. C. U.
- Zizia latifolia* Small. Type, near Bristol, Fla., Curtiss, Aug. 28, in herb. N. Y. B. G.
- Decachaena tomentosa* Small. *Gaylussacia tomentosa* Small.
- Decachaena nana* (A. Gray) Small. *Gaylussacia frondosa nana* A. Gray.
- Decachaena baccata* (Wang.) Small. *Andromeda baccata* Wang.
- Decachaena ursina* (M. A. Curtis) Small. *Vaccinium ursinum* M. A. Curtis.
- Lasiococcus* Small. (λάσιος, hairy, and κοκκος, berry, referring to the hairy fruit.)
- Lasiococcus dumosus* (Andr.) Small. *Vaccinium dumosum* Andr.
- Lasiococcus Mosieri* Small. *Gaylussacia Mosieri* Small.
- Lasiococcus orocola* Small. Type, near Flat Rock, N. C., Biltmore Herbarium, No. 470b, in herb. N. Y. B. G.
- Buxella* Small. (Diminutive of Buxus.)
- Buxella brachycera* (Michx.) Small. *Vaccinium brachycerum* Michx.
- Polycodium macilentum* Small. Type, Vaughns Mill, Ala., Earle, No. 1632, in herb. N. Y. B. G.
- Polycodium leptosepalum* Small. Type, French Camp, Miss., Ida M. Clute, No. 59, in herb. N. Y. B. G.
- Cyanococcus Myrsinites* (Lam.) Small. *Vaccinium Myrsinites* Lam.
- Cyanococcus fuscatus* (Ait.) Small. *Vaccinium fuscatum* Ait.
- Cyanococcus tenellus* (Ait.) Small. *Vaccinium tenellum* Ait.
- Cyanococcus Elliottii* (Chapm.) Small. *Vaccinium Elliottii* Chapm.
- Cyanococcus amoenus* (Ait.) Small. *Vaccinium amoenum* Ait.
- Cyanococcus virgatus* (Ait.) Small. *Vaccinium virgatum* Ait.

- Cyanococcus atrococcus* (A. Gray) Small. *Vaccinium corymbosum atrococcum* A. Gray.
- Cyanococcus simulatus* Small. *Vaccinium simulatum* Small.
- Cyanococcus Cuthbertii* Small. Type, Augusta, Ga., Cuthbert, No. 259, in herb. N. Y. B. G.
- Cyanococcus holophyllus* Small. Type, for fls., Sandhills, e. of Sebring, Fla., Small, DeWinkeler, & Mosier, No. 11347; for fr., Lake Jackson, Fla., Small, Mosier, & DeWinkeler, No. 10861, in herb. N. Y. B. G.
- Cyanococcus Margarettae* (Ashe) Small. *Vaccinium Margarettae* Ashe.
- Cyanococcus pallidus* (Ait.) Small. *Vaccinium pallidum* Ait.
- Cyanococcus liparus* Small. Type, Bull Pasture Mtn., Va., Rydberg, No. 9007.
- Cyanococcus tallapusae* Coville. Type, for fls., near Tallapoosa, Ga., George E. Murrill, Nat. Herb. No. 1,582,192; for fr. one m. east of Tallapoosa, Ga., G. A. Schulze, No. 691.
- Cyanococcus subcordatus* Small. Type, Knoxville, Tenn., Ruth, No. 445, in herb. N. Y. B. G.
- Cyanococcus hirsutus* (Buckl.) Small. *Vaccinium hirsutum* Buckl.
- Herpothamnus* Small. (ἑρπηγς, *spreads*, and θάμνος, *shrub*, referring to the trailing stems.)
- Herpothamnus crassifolius* (Andr.) Small. *Vaccinium crassifolium* Andr.
- Bumelia lacuum* Small. Type, for fls., dunes, n. of Kuhlman, Fla., Small, & DeWinkeler, No. 9965; for fr., between Avon Park and Sebring, Fla., Small, Small and DeWinkeler, No. 10666 in herb. N. Y. B. G.
- Amarolea* Small. (Amarus, *bitter*, and olea, *olive*, referring to the bitter olive-like fruit.)
- Amarolea megacarpa* Small. Type, for fls. and fr., near Lake Annie, Fla., Small & Matthaus, No. 11612, in herb. N. Y. B. G.
- Lapitheia capitata* (Raf.) Small. *Pleienta capitata* Raf.
- Acerates delticola* Small. Type New Orleans, La., Ingalls in 1834, in herb. C. U.
- Biventraria* Small. (Bis, *two*, and venter, *belly*, referring to the inflated hoods of the flower.)
- Biventraria variegata* (L.) Small. *Asclepias variegata* L.
- Oxypteryx Curtissii* (A. Gray) Small. *Asclepias Curtissii* A. Gray.
- Asclepiodella* Small. (Diminutive of *Asclepias*.)
- Asclepiodella Feayi* (Chapm.) Small. *Asclepiodora Feayi* Chapm.
- Cyclodon* Small. (Κύκλος, *circle*, and ὀδοῦς, *tooth*, referring to the toothed crown of the flower.)
- Cyclodon alabamense* (Vail) Small. *Vincetoxicum alabamense* Vail.
- Odontostephana* Alexander. (ὀδοῦς, *tooth*, and στέφανος, *crown*, referring to the toothed crown of the flower.)
- Odontostephana decipiens* Alexander. *Vincetoxieum carolinense* Authors, not *Cynanchum carolinense* Jacq.
- Odontostephana carolinensis* (Jacq.) Alexander. *Cynanchum carolinense* Jacq.
- Odontostephana obliqua* (Jacq.) Alexander. *Cynanchum obliquum* Jacq.
- Odontostephana Shortii* (A. Gray) Alexander. *Gonolobus obliquus Shortii* A. Gray.
- Odontostephana Baldwiniana* (Sweet) Alexander. *Gonolobus Baldwinianum* Sweet.
- Odontostephana flavidula* (Chapm.) Alexander. *Gonolobus flavidulus* Chapm.
- Odontostephana floridana* (Vail) Alexander. *Vincetoxicum floridanum* Vail.
- Edisonia* Small. (In honor of Thomas Alva Edison.)
- Edisonia pubiflora* (Decne.) Small. *Chthamalia pubiflora* Decne.
- Evolvulus macilentus* Small. Type, Big Pine Key, Ga. Small, No. 3798, in herb. N. Y. B. G.
- Strophocaulos* Small. (στροφή, *twist*, and καυλός, *stem*, referring to the twining stems.)
- Strophocaulos arvensis* (L.) Small. *Convolvulus arvensis* L.

- Decemium appendiculatum* (Michx.) Small. *Hydrophyllum appendiculatum* Michx.
- Solanum perplexum* Small. Type, near Thomasville, Ga., Small, May 28–June 6, 1895, in herb. C. U.
- Myriopus* Small. (μυρίος, many, and πούς, foot, referring to the many-flowered cymes.)
- Myriopus volubilis* (L.) Small. *Tournefortia volubilis* L.
- Myriopus poliochrous* (Spreng.) Small. *Tournefortia poliochrous* Spreng.
- Styloclon carolinensis* (Walt.) Small. *Verbena carolinensis* Walt.
- Glandularia maritima* Small. *Verbena maritima* Small.
- Glandularia Lambertii* (Sims) Small. *Verbena Lambertii* Sims.
- Glandularia canadensis* (L.) Small. *Verbena canadensis* L.
- Glandularia Drummondii* (Lindl.) Small. *Verbena Drummondii* Lindl.
- Glandularia tampensis* (Nash) Small. *Verbena tampensis* Nash.
- Glandularia tenuisecta* (Briq.) Small. *Verbena tenuisecta* Briq.
- Glandularia peruviana* (L.) Small. *Erinus peruvianus* L.
- Scutellaria Cuthbertii* Alexander. Type, Augusta, Ga., Cuthbert, May 26, 1900, in herb. N. Y. B. G.
- Scutellaria alabamensis* Alexander. Type, Attalla, Ala., Eggert, June 30, 1897, in herb. N. Y. B. G.
- Dracocephalum leptophyllum* Small. *Physostegia leptophyllum* Small.
- Dracocephalum veroniciformis* Small. *Physostegia veroniciformis* Small.
- Koelia pauciflora* Small. Type, Albany, Ga., Small, July 9–12, 1895, in herb. C. U.
- Tragiola* Small & Pennell (Anagram of *Gratiola*.)
- Tragiola pilosa* (Michx.) Small & Pennell. *Gratiola pilosa* Michx.
- Tragiola pilosa epilis* (Pennell) Small & Pennell. *Gratiola pilosa epilis* Pennell.
- Penstemon Brittonorum* Pennell. Type, White Rock Mountain, Va., Britton, Britton, & Vail, June 22, 1892, in herb. N. Y. B. G.
- Penstemon brevisepalus* Pennell. Type, Crossville, Tenn., F. W. Pennell, No. 11311, May 30–31, 1923, in herb. Acad. Nat. Sci. Phila.
- Buchnera breviflora* Pennell. Type, Robinson Island, Fla., S. M. Tracy, No. 7605, May 22, 1901, in herb. N. Y. B. G.
- Calpidisca Standleyae* Barnhart. Type, near Ft. Myers, Fla., J. P. Standley, No. 406, in herb. N. Y. B. G.
- Rotantha* Small. (Rota, wheel, and anthus, flower, referring to the rotate corolla.)
- Rotantha floridana* (S. Wats.) Small. *Campanula floridana* S. Wats.
- Rotantha Robinsiae* Small. *Campanula Robinsiae* Small.
- Kuhnia Mosieri* Small. Type, Ross-Costello hammock, Dade Co., Fla., Small, Mosier, & Small, No. 6544, in herb. N. Y. B. G.
- Laciniaria Shortii* Alexander. Type, Ohio, Short, 1842, in herb. C. U.
- Laciniaria Tracyi* Alexander. Type, Gateswood, Ala., Tracy, No. 855S, in herb. N. Y. B. G.
- Laciniaria Ruthii* Alexander. Type, Hiawassee Valley, e. Tenn., Ruth, No. 34, in herb. C. U.
- Chrysopsis subulata* Small. Type, between Avon Park and Sebring, Fla., Small, No. 11495.
- Chrysopsis arenicola* Alexander. Type, Hartsville, S. C., Coker, Oct. 9, 1909, in herb. N. Y. B. G.
- Chrysopsis lanuginosa* Small. Type, Lynn Haven, Fla., A. H. Van Cleve, Dec. 3, 1920, in herb. N. Y. B. G.
- Chrysopsis floridana* Small. Type, Bradenton, Fla., Tracy, No. 7344.
- Pityopsis flexuosa* (Nash) Small. *Chrysopsis flexuosa* Nash.
- Pityopsis Tracyi* Small. *Chrysopsis Tracyi* Small.
- Pityopsis microcephala* Small. *Chrysopsis microcephala* Small.
- Pityopsis Ruthii* Small. *Chrysopsis Ruthii* Small.
- Pityopsis aspera* Small. *Chrysopsis aspera* Small.
- Pityopsis oligantha* (Chapm.) Small. *Chrysopsis oligantha* Chapm.

- Solidago Milleriana* Mackenzie. *Solidago petiolaris* Authors, not Ait.  
*Solidago Harperi* Mackenzie. Type, near Grier's Cave, Randolph Co., Ga., Harper, No. 1778, in herb. N. Y. B. G.  
*Solidago notabilis* Mackenzie. *Solidago amplexicaulis* T. & G., not Martens.  
*Solidago tarda* Mackenzie. Type, Winterville, Ga., J. H. Miller, Oct. 20, 1926, in herb. N. Y. B. G.  
*Solidago Edisoniana* Mackenzie. Type, hammocks, near Ft. Mead, Fla.  
*Solidago mirabilis* Small. Type, Turnbull hammock, near Titusville, Fla., Small.  
*Oligoneuron Jacksonianum* (Kuntze) Small. *Solidago corymbosa* Ell.  
*Aster georgianus* Alexander. Type, Augusta, Ga., Cuthbert, No. 275, in herb. N. Y. B. G.  
*Aster fontinalis* Alexander. Type, prairie, s. of Deep Lake, Fla., Small & Buswell, Dec. 7, 1925, in herb. N. Y. B. G.  
*Aster Walteri* Alexander. *Aster squarrosus* Walter, not All.  
*Aster Smallii* Alexander. Type, between Hendersonville and Salola Mountain, N. C., Small & Huger, October 2-3, 1901, in herb. N. Y. B. G.  
*Aster pinifolius* Alexander. Type, Coconut Grove, Fla., Small, No. 7958, in herb. N. Y. B. G.  
*Aster gracilipes* (Wiegand) Alexander. *Aster dumosus gracilipes* Wiegand.  
*Aster brachypholis* Small. Type, Aspalaga Bluff, Liberty Co., Fla., Small, DeWinkler, & Mosier, No. 11027, in herb. N. Y. B. G.  
*Aster pedionomus* Alexander. Type, Cheatham Co., Tenn., Eggert, Aug. 19, 1897, in herb. N. Y. B. G.  
*Aster Gattingeri* Alexander. Type, Tullahoma, Tenn., Gattinger, Aug. 19, in herb. C. U.  
*Aster hemisphaericus* Alexander. Type, Will's Point, Tex., Reverchon, No. 4363, in herb. N. Y. B. G.  
*Aster verutifolius* Alexander. Type, Ocean Springs, Miss., Earle, Sept. 11, 1899, in herb. N. Y. B. G.  
*Pluchea tenuifolia* Small. Type, 5½ miles n. of Bowling Green on road to Ft. Mead, Fla., Hand, No. 360, in herb. N. Y. B. G.  
*Smallanthus* Mackenzie. (In honor of John Kunkel Small.) Type, *Polymnia Uvedalia* L.  
*Smallanthus Uvedalia* (L.) Mackenzie. *Polymnia Uvedalia* L.  
*Silphium lapsuum* Small. Type, Augusta, Ga., Cuthbert, July 17, 1898, in herb. N. Y. B. G.  
*Silphium orae* Small. Type, Wilmington, N. C., Curtis, in herb. C. U.  
*Silphium confertiflorum* Small. Type, Cocoa, Ala., Schuchert, Oct. 13, 1896, in herb. N. Y. B. G.  
*Silphium nodum* Small. Type, Charleston Neck, Charleston, S. C., Gibbes & Branch in 1855, in herb. N. Y. B. G.  
*Chrysogonum australe* Alexander. Type, Marianna, Fla., Harper, May 16, 1925, in herb. N. Y. B. G.  
*Echinacea tennesseensis* (Beadle) Small. *Brauneria tennesseensis* Beadle.  
*Pterophyton helianthoides* (Michx.) Alexander. *Verbesina helianthoides* Michx.  
*Pterophyton heterophyllum* (Chapm.) Alexander. *Actinomeris heterophylla* Chapm.  
*Pterophyton pauciflorum* (Nutt.) Alexander. *Actinomeris pauciflora* Nutt.  
*Pterophyton aristatum* (Ell.) Alexander. *Verbesina aristata* Ell.  
*Ridan paniculatum* (Walt.) Small. *Anthanasia paniculata* Walt.
