## PREFACE

This volume is designed to record and describe the species of native and naturalized flowering plants known by the author to grow naturally in the southeastern United States south of the northern boundaries of North Carolina and Tennessee and east of the Mississippi River. The species are grouped in genera, families, and orders, and are so arranged and described that they may be identified by means of the analytical keys and synopses given under each group, mainly by a study of the morphology of the flowers and the fruits.

The arrangement of the natural plant families is essentially that of Engler and Prantl, *Die Natürlichen Pflanzenfamilien*, although in a few cases modifications of the sequence there adopted seemed to be desirable. The descriptive matter has been made very short, except in special cases. In order to facilitate the tracing and determination of genera and species, a drawing showing a flower and its gross morphology and a fruit, of the first species under each genus is given. The illustrations are not made to a scale, but the sizes of some of the parts are usually given in the descriptive matter. The drawings were made by Miss Mary E. Eaton, with the exception of those of the grasses, which were made by Mrs. Agnes Chase,<sup>1</sup> and those of *Carex* which were made by Mr. H. Creutzberg, through the interest of Mr. K. K. Mackenzie.

In the matter of the interpretation of species and genera what has seemed to the author a balanced course has been followed—traditional “lumping” and modern “splitting” have not influenced the treatments of the various groups. Complex genera have been divided into more natural groups, both for convenience of study and also in order to make the genera, as far as possible, correspond in rank to the great majority of groups of species now recognized as genera by most present-day botanists. Species have been interpreted in the broader sense; minor variations of species, “varieties” or “subspecies” have not been considered to any great extent. “Subvarieties”, “forms”, “subforms” have not been considered at all.

The names adopted for species and genera in this volume are those which to the best of the author's knowledge, were first applied to each, accompanied or supported by an adequate description, and in the case of genera by specific references, from the time (1753) when binomial designation was first used.

<sup>1</sup> The drawings for the grasses were made with the understanding that they were to be reduced to 1 inch square, allowance being made for such reduction. Coarseness of the illustrations, if any, is due to the fact that the drawings were not reduced in engraving.

nation of species was definitely introduced into biological nomenclature, unless preoccupied for another species or genus.<sup>2</sup>

During the preparation of this manual, numerous botanists, naturalists, and collectors helped continuously by the contribution of specimens and of information relating to the vegetation and its distribution, in short, doing much to help to make this volume complete.

Botanists as indicated below kindly prepared the text for several plant-families printed in this volume: POACEAE, by Dr. A. S. Hitchcock; POLEMONIACEAE, by Dr. E. T. Wherry; RHINANTHACEAE, by Dr. F. W. Pennell; PINGUICULACEAE, by Dr. J. H. Barnhart; LORANTHACEAE, by Dr. William Trelease. The text for certain genera was prepared by the following botanists: *Iris*, *Vincetoxicum*, *Odontostephana*, *Scutellaria*, *Laciniaria*, *Zinnia*, *Melanthera*, *Pterophyton*, *Cosmos*, *Emilia*, by Mr. E. J. Alexander; *Philadelphus*, by Mr. C. D. Beadle; *Crataegus*, by Mr. Ivar Tidestrom; *Tilia*, by Mr. B. F. Bush; *Physalis*, *Acanthoxanthium*, *Xanthium*, by the late Dr. P. A. Rydberg; *Carex*, *Solidago*, by Mr. K. K. Mackenzie; *Rudbeckia*, by Mr. C. L. Boynton and Mr. C. D. Beadle; *Helianthus*, by Mr. E. E. Watson; *Coreopsis*, by Mr. F. E. Boynton; *Bidens*, by Dr. Karl M. Wiegand. The following genera were revised: *Viola*, *Aster*, by Mr. E. J. Alexander. Assistance is preparing the text of *Philotria* and of *Trillium* was furnished by Dr. Harold St. John and Mr. Donald C. Peattie, respectively.

Help in many ways was given by my associates on the botanical staff of the Garden. Among those who participated in intensive field-work of the past two decades were Mr. Charles A. Mosier, the late Captain Paul A. Matthaus, and Mr. John B. DeWinkeler. Both the galley and the page proof have been read by Dr. Edgar T. Wherry, who also supplied the provincial distribution of the species, checked many of the geographic ranges, and furnished data as to habitats and soils. The galley proof was read in whole or in part by Mr. Kenneth K. Mackenzie, Dr. N. L. Britton, Dr. Roland M. Harper, Mr. Edward J. Alexander, and Miss Bertha Pickering, while each contributor of generic or family treatments, as indicated in the text, read the proofs of these.

The author is indebted to Dr. John H. Barnhart for advice and information on many botanical and bibliographic questions that arose throughout the years of preparation of the manuscript and the reading

<sup>2</sup> The manuscript of the grasses (POACEAE) was completed several years ago and was held in proof along with other parts of this work. It was therefore impracticable to bring the nomenclature into accord with the rules of nomenclature which Dr. Hitchcock is now following. This statement also applies to the treatment of the figworts (RHINANTHACEAE) by Dr. Pennell, and to the treatments of several other families and genera by others, for which credit is given.

of the proof and to Mr. E. J. Alexander for cooperation in studies on many genera and species.

The completion of the manuscript was made possible, in part, by the cooperation of the Board of Managers of The New York Botanical Garden. The publication was made possible, in part, by the interest of the late Mr. Charles Deering.

The numerous specimens, which the investigations connected with this work have brought to the author during a period of thirty-five years, along with much botanical information, have been incorporated in the herbarium, the museums, and the records of the Garden.

## INTRODUCTION

This manual supplants, in part, the Flora of the Southeastern United States published by the author in 1903 (second edition 1913). That volume recorded and described the flowering plants and pteridophyta<sup>3</sup> known at that time to grow naturally in the southern United States east of the one hundredth meridian of longitude. The complexity and magnitude of the flora in this area, resulting from its proximity to the tropics, the intrusion of the northern highlands, and the extension of the Great Plains and the deserts from the west, made it seem desirable to divide the "Flora" into two parts. The result is the present volume and a proposed volume to include the area west of the Mississippi River south of the same degree of latitude and east of the western boundary of Texas. Thus smaller volumes will result, and plants may be traced by the analytical keys with greater ease, since fewer genera and species are usually involved.

The geographic area concerned represents one of the cradles of botany on the American mainland, for on the coasts of the Gulf States early Spanish expeditioners were necessarily, not by choice, brought into close contact with the native vegetation. They left us printed records of the uses made of various plants by the aborigines and by themselves for foods, drinks, medicines, clothing, utensils, and fumitories. Their interest was not wholly utilitarian, for some plants so impressed them, the cacti for example, that they took them back to Europe and grew them there.

About a century after the discovery of America by Columbus, living specimens of plants from the Atlantic coast began to find their way into European botanic gardens. Explorations by plant collectors were soon extended into the highlands and into the Florida peninsula. Later, collectors were sent over from Europe and Americans were commissioned by European patrons of botany to explore for plants. American residents about this time began to publish the results of their studies. Today the works on the flora are numerous.

The first American botanical garden in the northeast developed near Philadelphia, Pennsylvania, in the middle part of the eighteenth century, as a result of the plant-collecting activities of John Bartram. Here many of the plants of the southeast were cultivated. In the second half of that century the first botanical garden in the southeast grew about the home of Thomas Walter on the Santee River north of Charleston, South Carolina. Walter's association with this native flora crystallized into the first manual of the plants of a more or less definite geographic area, under the title *Flora Caroliniana*, in 1788. Interest in the native plants and in botany increased and reached a culmination about the middle of the last century,

<sup>3</sup> The pteridophyta are omitted from the present work.

in the publication of Chapman's Flora of the Southern United States, in 1860. Then, botanical activity waned in the South. Toward the end of the last century, however, a revival took place in the southeastern states, mainly through the activities of permanent and transient residents, of plant collectors, and of botanists and naturalists who moved into the region to fill professional positions.

In pioneer days with the horse and few trails, the sail-boat and undeveloped water-ways, botanical exploration was restricted to limited areas and progressed slowly, consequently the botanical harvests were often scant. Since the advent of the automobile, the motor-boat, and the construction of a vast network of highways, canals, and improved waterways, largely through virgin country, a vast territory, until recently inaccessible, has been made to yield numerous botanical and horticultural treasures. As a consequence, many additional species and not a few genera of all groups of plants have been recorded for the area under consideration only since the end of the last century.

The area extends over about twelve degrees of latitude. The southern limit lies within less than a hundred miles of the Tropic of Cancer. The northern limit is not very far north, but two mountain ranges, with a multitude of peaks rising to between five and six thousand feet and several to more than six thousand, furnish a cool climate representing a high latitude through altitude. Intermediate altitudes (Piedmont and Appalachian Plateau) supply still other elements for greater variety in the vegetation. As compared with northeastern America there are one-third more species in about one-fifth the area. Three main factors contribute to this condition—*latitude, geology, physiography*.

The ancestors of our present plant-covering were subjected to both major and minor earth disturbances, elevations and depressions and rearrangements of the land-mass. Submergences also destroyed vast areas of coastwise vegetation several times. When the areas emerged from the sea for the last time and the higher lands became more stable, the coastwise areas were populated from both the plant refuges in the highlands and those of continental and insular regions lying to the south. Whether these early floras were more extensive in kinds and density of population than those of today we shall never know. The records of several different floras are preserved in the sedimentary rocks, but they are naturally very incomplete. Large areas of eroded materials of the very old geological formations, often segregated into areas of different kinds of soil, such as sand, clay, marl, loam, in the Coastal Plain and the Piedmont, very definitely contribute to the complexity of the flora. Then, in relatively recent geologic time, came the advance of successive great ice-sheets from the north as far south as New Jersey and Pennsylvania, with accompanying cold, which killed the vegetation before their immediate front, while they

advanced, or drove the more distant plants southward. When the ice receded to the north some plants at the south doubtless succumbed as the temperature rose to a point beyond their endurance more rapidly than they could migrate; while others accommodated themselves to the new conditions, and traveled back to their former, more northern latitudes.

Thus our present plant population shows the results of invasions from the north. On the other hand, peninsular Florida, and in a lesser degree the more northern Gulf Coast, received many elements from the West Indies near at hand, and from northern South America, carried over a narrow ocean area by birds, winds, and currents. The physiographic structure of the area involved furnishes a sliding scale, either from the boreal to the tropical or *vice versa*, so that any plant which gains a foothold in the area might find conditions suitable for its growth and maintenance. The above remarks apply mainly to the eastern part of the area; here we find a very dense plant population, specifically and generically considered. In the western part there are less differences in elevation, and much simpler geologic history; here there is sparser plant-population both in density and variety.

There are many locally peculiar minor plant areas. For example, capes, peninsulas, coastal sand-dunes, river-deltas, river-valleys or watersheds, swamps, marshes, plateaus, mountain-valleys, mountain ranges, and mountain peaks, each harboring peculiar or endemic plants.

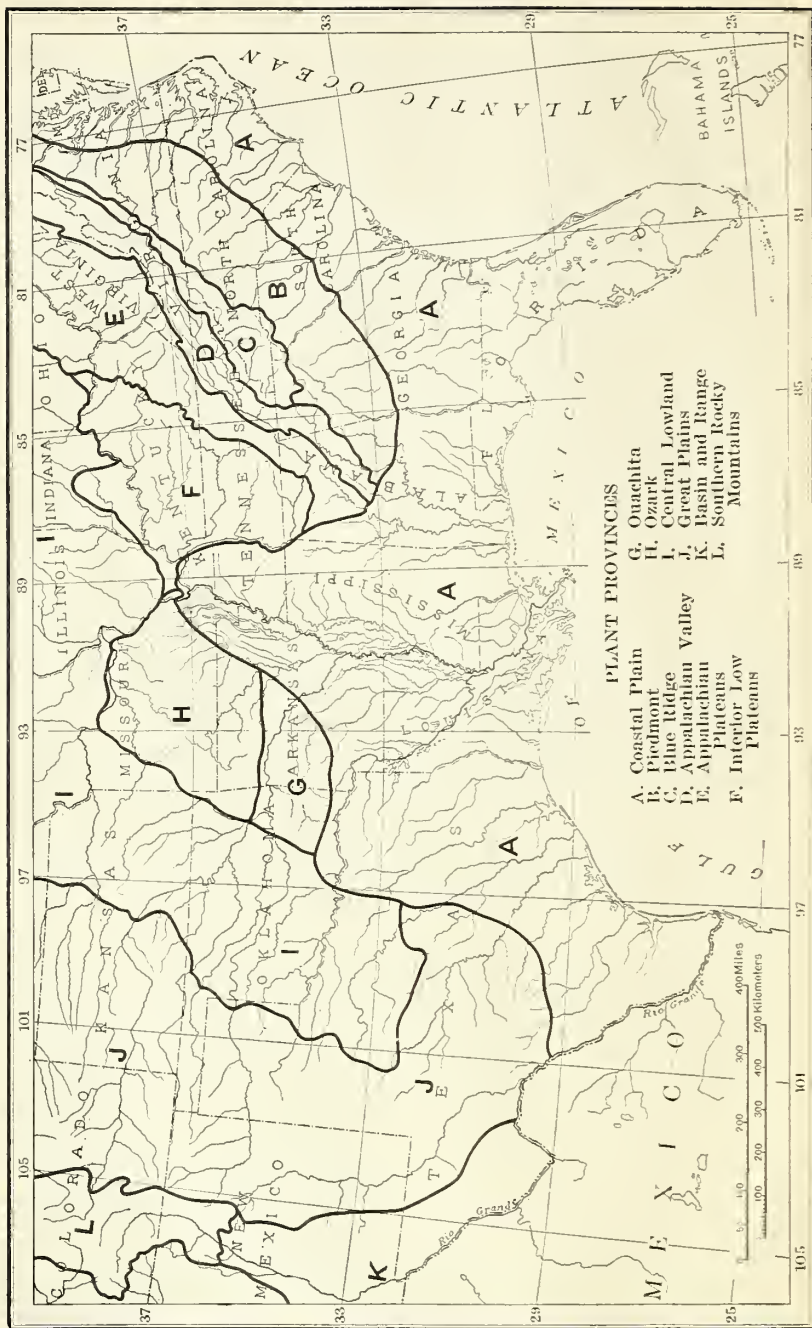

The accompanying map shows the territory included in the Southeastern States and the Southcentral States. The Mississippi River divides the area into approximate halves. Both areas are shown for convenience in tracing the geographic distribution of the plants, and to show the relation of the floras of the two areas. These are closely related at the boundary line, for they both naturally merge in the ancient delta of the Mississippi River or the present Coastal Plain part of the Mississippi watershed.

Following the description of each species, and separated by a dash from it (or from synonyms or common names which may be introduced at this point), the habitat, the province, and the geographic range are stated.

*Habitat.*—Not only are the physical features briefly characterized, but in cases where it seems noteworthy, something is stated as to the chemical nature of the soil, that is whether it is acid, neutral, or alkaline, whether siliceous or calcareous. When the habitat is given as pinelands, the soil may be inferred to be acid, except in southern Florida, where the pine-woods cover limestone rocks and have more or less alkaline soil. Otherwise, where no statement is made as to soil reaction, either no data are available or else the plant appears to be indifferent to this factor.

*Provinces.*—Each species is here assigned to one or more physiographic provinces. These are used instead of life-zones because the latter do not

really express very well the distributional relations of plants in our region. Thus, in the east Gulf Coastal Plain, where the Lower Austral life-zone should supposedly be represented, there occur many Transition and even Canadian plants which have pushed southward, west of the Appalachian mountains, in some past geological period and have persisted there. Again, in the Blue Ridge, where on ascending a high mountain the theoretical sequence should be Upper Austral—Transition—Canadian—Hudsonian, one finds instead a mixture of Upper Austral and Transition plants on the lower slopes, Canadian plants further up, but then instead of anything more boreal, a mixture of plants characterizing the Upper Austral of the Atlantic Coastal Plain mingled with many Transition shrubs and Canadian trees at the summit. It has accordingly seemed best to refer the plants only to the physiographic provinces in which they have been observed to grow, and to leave the untangling of the complexities of life-zone relations to other writers.

The physiographic province names used have been taken, with minor modifications, from "Physiographic Divisions of the United States."<sup>4</sup> The boundaries of those lying within our limits are indicated on the accompanying sketch map (figure 1), and certain points concerning their positions are here discussed.

<i>Physiographic province</i>	<i>Discussion</i>
Coastal Plain	Separated in some cases into "Atlantic" and "Gulf" Coastal Plain, the division between these extending from Macon, Ga., to Gainesville, Fla.
Piedmont	Alabama to New York; between the Coastal Plain and the Blue Ridge and Appalachian provinces.
Appalachian Valley } Appalachian Plateau }	Often collectively referred to as "Appalachian provinces."
New England	Includes E Canada; often divided into "Upland" and "Coast," the division between these lying roughly 30 miles inland.
Interior Low Plateaus	Northern Alabama to Southern Illinois, Indiana, and Ohio.
Central Lowland	The portion immediately surrounding Lakes Michigan, Huron, and Erie is often separately referred to as the "Great Lakes Lowland."
Great Plains	Texas to North Dakota.
Ozark Plateaus	Northern Arkansas to central Missouri.
Ouachita	Central Arkansas to eastern Oklahoma.
Basin-and-range	Western Texas to California and southern Oregon.

<sup>4</sup> Nevin M. Fenneman, Ann. Assoc. Am. Geogr., 1917, reprinted 1921.

In addition, the following special groupings of provinces are often found convenient:

"Coastal Plain and adj. provinces." Plants thus annotated appear to reach their maximum development on the Coastal Plain, but also occur northward and westward in the Piedmont, Appalachian Valley, Appalachian Plateau, and other provinces which border the Coastal Plain.

"Various provinces, in Coastal Plain only N." These plants are not known to grow in the Coastal Plain within our limits, although they may be abundant in or even typical of that province further northward, as in Va., Md., or N. J.

"Blue Ridge and more N Provinces." In this manner are designated plants which reach their greatest development in regions north (and northwest) of our limits, or in some cases in the Rocky Mountains.

As the states of Florida, Mississippi, and Louisiana lie essentially within the Coastal Plain, plants limited to them have not required special mention of province. Moreover, plants occurring "in salt-marshes along the coast" or "on sand-dunes," are so obviously limited to the Coastal Plain that statement of it has been omitted. It is of course realized that the Coastal Plain is not an ecological unit, being divisible into a considerable number of areas with different soils and other features; however, in a work of the scope of the present volume it is impracticable to go into details in this respect, which must be left for the writers of local floras.

While every effort has been made to have these province-assignments accurate, the data in the literature are often inadequate to decide the exact range of given species, and errors which users of this work may discover will be thankfully received.

*Range.*—Instead of following the usual plan of beginning range statements at the northeast, we begin at the southeasternmost state within our limits at which the plant is known to occur. When the starting-point lies toward the eastern coast, the final state named is that lying furthest northeast, as "Ga. to La., Minn., and Me." When, however, the start is made far inland, the last state given is the southernmost in which the plant approaches the coast, as "Tenn. to Mo., Mich., N. Y., and Va." The primary reason for this method is that this manual covers southern plants, and users are naturally most interested in the places where the plant occurs in the south, hence it is convenient to have the southern limits come first. There is, however, also a scientific significance to the plan, in that the last great plant migration on this continent, resulting from the climatic change connected with the retreat of the ice-sheets of the final stage of the Glacial Period, consisted in a movement of plants from south to north, of which the range as stated may give a rough picture.

J. K. S.

# KEY TO THE ORDERS

## Subkingdom **SPERMATOPHYTA**—Seed-Plants

- Plants producing flowers and seeds. A seed contains an embryo consisting of a short stem (radicle, caulicle, hypocotyl), one, two, or several rudimentary leaves (cotyledons), and a terminal bud (plumule).  
 Carpel or pistil represented by a scale on the face of which the ovules are borne.  
 and on which the naked seeds mature. Class 1. GYMNOSPERMAE.  
 Carpel or pistil with a closed cavity within which the ovules are borne and the seeds mature. Class 2. ANGIOSPERMAE.

### 1. Gymnospermae

Plants growing by single terminal bud or sometimes with adventitious buds, when with pinnate leaves, circinate in bud.

- |  |           |
|--|-----------|
| Palm-like or fern-like plants. Leaves in a crown: blades pinnate. Flowers in cones of approximate scales or on less modified leaves. Staminate cone with scales bearing several pollen-sacs. Ovulate cone with two or more ovules on each scale. Seed drupe-like or nut-like.  | PAGE<br>1 |
| Order CYCADALES.   |           |
| Shrubs or trees. Leaves scale-like, narrow, or needle-like, and often borne in bundles. Flowers mainly monoecious, the cones of spirally imbricate bracts or in <i>Taxaceae</i> the ovulate flowers often solitary. Seed borne in a cone of dry or fleshy scales, or partly or wholly naked.—A group developed later and more highly organized than the CYCADALES. | 2         |
| Order PINALES.   |           |

### 2. Angiospermae

Embryo with a single cotyledon, the early leaves alternate; blades, except in *Smilacaceae*, parallel-veined: stem with a mass of cellular tissue through which woody fibers are scattered: flower with the parts in threes or sixes.

- Subclass 1. MONOCOTYLEDONES.  
 Embryo usually with a pair of opposite cotyledones, the early leaves opposite; blade net-veined: stem with central pith, enclosed in layers of wood which is surrounded by bark: flower with the parts in fours or fives.  
 Subclass 2. DICOTYLEDONES.

#### 1. MONOCOTYLEDONES

- Perianth rudimentary or degenerate, the members often bristles or mere scales, not corolla-like, or wanting.
- Flowers not in the axils of dry or chaffy bracts (scales or glumes).  
 Perianth of bristles or chaffy scales. Order PANDANALES. 13  
 Perianth fleshy or herbaceous, or wanting.  
 Fruit baccate: endosperm present. Order ARALES. 243  
 Fruit drupaceous: endosperm wanting. Order NAIADALES. 14  
 Flowers in the axils or dry or chaffy, usually imbricated, bracts (scales or glumes). Order POALES. 29
- Perianth of 2 distinct series, the inner series usually corolloid.  
 Gynoecium of distinct carpels. Order ALISMALES. 220  
 Gynoecium of united carpels.  
 Endosperm mealy. Order XYRIDALES. 250  
 Endosperm fleshy, horny or cartilaginous.  
 Ovary, and fruit, superior.  
 Herbs, or rarely shrubs or trees, with simple leaves: ovules 2—many in each cavity of the ovary, or solitary only in the case of a few herbs.  
 Inflorescence not a fleshy spadix. Order LILIALES. 273  
 Inflorescence a fleshy spadix subtended by a spathe.  
 Order ARALES. 243
- Trees or shrubs, with pinnately or palmately compound or lobed leaf-blades: ovules solitary in each cavity of the ovary.  
 Order ARECALES. 236
- Ovary, and fruit, wholly inferior or half-inferior.  
 Endosperm present and usually copious.  
 Flowers regular: androecium not reduced.  
 Order AMARYLLIDALES. 314  
 Flowers very irregular: androecium much reduced and modified.  
 Order SCITAMINALES. 358
- Endosperm wanting.  
 Flowers regular, monoecious or dioecious: aquatic plants.  
 Order HYDROCHARITALES. 26  
 Flowers irregular, perfect: terrestrial or epiphytic plants.  
 Order ORCHIDALES. 362

Corolla wanting, except in the pistillate flowers of <i>Juglans</i> (Juglandaceae).	
Calyx wanting, at least in the staminate flowers, except sometimes in <i>Casuarina</i> (Casuarinaceae).	
Herbs.	
Flowers mainly perfect.	
Seeds solitary in each carpel or in each cavity of the ovary: endosperm present.	
Flowers spicate; styles wanting; stigmas sessile.	Order PIPERALES. 399
Flowers axillary; styles present.	
Callitrichaceae in Order EUPHORBIALES.	804
Seeds numerous in each cavity of the ovary: endosperm wanting.	
Podostemaceae in Order ROSALES.	584
Flowers monoecious or dioecious.	Order EUPHORBIALES. 774
Trees or shrubs: flowers monoecious or dioecious, or polygamous.	
Leaves represented by appressed whorled scales; stems or branches loosely jointed.	Order CASUARINALES. 402
Leaves not appressed scales; stems or branches not loose jointed.	
Fruit 1-seeded; seeds without tufts of hairs.	
Ovules 1 or 2 in each cavity of the ovary: flowers not in heads.	
Gynoecium 1-carpellary: stigma 1: ovule laterally attached and amphitropous.	Order LEITNERIALES. 407
Gynoecium 2-carpellary: stigmas 2: ovule erect and amphitropous or pendulous and anatropous.	
Pistillate flowers without a calyx: ovule erect and orthotropous.	Order MYRICALES. 408
Pistillate flowers with a calyx: ovule pendulous and anatropous.	
Leaf-blades simple.	
Fruit a nut or an achene.	
Corylaceae in Order FAGALES.	415
Fruit a drupe.	Oleaceae in Order OLEALES. 1037
Leaf-blades compound: fruit a samara.	
Oleaceae in Order OLEALES.	1037
Ovules many: flowers aggregated into dense heads.	
Altingiaceae in Order ROSALES.	601
Fruit many-seeded: seeds each with a tuft of hairs.	
Order SALICALES.	410
Calyx present at least in the staminate or in the perfect flowers.	
Leaves represented by appressed whorled scales: branches loosely jointed.	Order CASUARINALES. 402
Leaves not appressed scales: branches not loosely jointed.	
Flowers, at least the staminate, in aments, or ament-like spikes.	
Leaf-blades simple: ovule pendulous and anatropous.	
Pistillate flowers separate at maturity: fruit a nut or an achene.	Order FAGALES. 415
Pistillate flowers forming aggregate fruits: fruit drupe-like.	
Artocarpaceae in Order URTICALES.	437
Leaf-blades pinnately compound: ovule erect and orthotropous.	
Order JUGLANDALES.	403
Flowers, at least the staminate, not in aments.	
Ovary superior.	
Gynoecium of 1 or several and distinct carpels: stigma and style solitary.	
Carpel solitary.	
Style lateral and oblique.	
Petiveriaceae in Order CHENOPODIALES.	485
Style, axile, erect.	
Ovary neither enclosed nor seated in a hypanthium or a calyx-tube.	
Flowers not solitary in axils; land plants.	
Filaments free and distinct.	
Urticaceae in Order URTICALES.	431
Filaments adnate to the sepals or to the calyx-tube.	Order PROTEALES. 918
Flowers solitary in axils: aquatic plants.	
Ceratophyllaceae in Order RANALES.	509
Ovary enclosed in or seated in a hypanthium or a calyx-tube.	
Stamens borne under the gynoecium.	
Allioniaceae in Order CHENOPODIALES.	487
Stamens borne on the hypanthium or adnate to the calyx-tube.	Order THYMELAEALS. 919
Carpels several.	
Stamens inserted below the ovary.	
Families in Order RANALES.	583

	PAGE
Stamens inserted on the edge of a cup-shaped hypanthium. Rosaceae in Order ROSALES.	604
Gynoecium of 2 or several united carpels: stigmas or styles 2 or several.	
Ovary, by abortion, 1-celled and 1-ovuled.	
Leaves with sheathing stipules (ocreae). Order POLYGONALES.	443
Leaves estipulate, or stipules present if they are not sheathing.	
Trees or shrubs.	
Anthers opening by slits: ovary not seated in a hypanthium. Ulmaceae in Order URTICALES.	440
Anthers opening by hinged valves: ovary seated in an accrescent hypanthium. Lauraceae in Order THYMELEALES.	926
Herbs or vines.	
Leaves with stipules.	
Stipules herbaceous: inflorescence spicate or racemose: leaf-blades palmately veined. Cannabinaceae in Order URTICALES.	436
Stipules scarious or hyaline: inflorescence cymose: leaf-blades pinnately veined. Families in Order CHENOPODIALES.	461
Leaves without stipules.	
Stigmas entire. Order CHENOPODIALES.	461
Stigmas 2-cleft. Euphorbiaceae in Order EUPHORBIALES.	775
Ovary several-celled, or with several placentae, several-ovuled.	
Stamens hypogynous, inserted under the gynoecium in the perfect flowers, not on a disk in the pistillate flowers.	
Herbs.	
Flowers perfect.	
Ovary several-celled.	
Fruit baccate or nut-like, or a circumscissile capsule, the carpels terminal on the receptacle. Families in Order CHENOPODIALES.	461
Fruit of several carpels, lateral on the receptacle, each carpel circumscissile. Penthoraceae in Order ROSALES.	589
Ovary 1-2-celled.	
Stamens not tetradynamous, 4-8: ovary 1-celled. Order CHENOPODIALES.	461
Stamens tetradynamous: ovary 2-celled. Brassicaceae in Order PAPAVERALES.	551
Flowers monoecious or dioecious.	
Ovules with the raphe towards the axis of the gynoecium. Euphorbiaceae in Order EUPHORBIALES.	775
Ovules with the raphe away from the axis of the gynoecium. Buxaceae in Order SAPINDALES.	806
Trees or shrubs.	
Gynoecium 5-carpellary, the carpels nearly distinct. Buettneriaceae in Order MALVALES.	861
Gynoecium 2-4-carpellary, the carpels united.	
Ovary 4-celled: fleshy maritime shrubs. Batidaceae in Order CHENOPODIALES.	486
Ovary 2-celled: plants not fleshy. Oleaceae in Order OLEALES.	1037
Stamens perigynous or epigynous, inserted on the margin of a hypanthium or a disk.	
Fruit a samara. Families in Order SAPINDALES.	805
Fruit not a samara.	
Fruit drupe-like or berry-like: shrubs or trees. Order RHAMNALES.	830
Fruit a capsule: herbs. Order ARISTOLOCHIALES.	1279
Ovary inferior.	
Flowers not in involucrate heads.	
Fruit 3-winged, splitting into 3 nutlets. Gouania in Order RHAMNALES.	834
Fruit neither 3-winged nor splitting into carpels.	
Fruit a berry or a drupe, or nut-like.	

	PAGE
Calyx deciduous as a lid: stamens numerous.	
Calypttranthes in Order MYRTALES.	937
Calyx of valvate or imbricated sepals: stamens few.	
Stamens as many as the perianth-members and alternate with them, or fewer.	
Herbs, with succulent stems and leaves, or woody below: flowers perfect.	
Tetragoniaceae in	
Order CHENOPODIALES.	490
Trees or shrubs: flowers dioecious.	
Nyssaceae in Order AMMIALES.	956
Stamens as many as the perianth-members and opposite them, or twice as many.	
Styles present.	
Ovules mostly on basal placentae, sometimes pendulous: cotyledons not convolute: tree- or root-parasites.	
Order SANTALALES.	1247
Ovules not on basal placentae: cotyledons convolute: not parasitic plants.	
Families in Order MYRTALES.	925
Styles wanting: stigmas sessile.	
Gunneraceae in Order MYRTALES.	953
Fruit a capsule.	
Sepals as many as the ovary-cavities or one half as many.	
Calyx regular and the sepals half as many as the cavities in the ovary, or irregular.	
Order ARISTOLOCHIALES.	1279
Calyx regular and the sepals as many as the cavities in the ovary.	
Order MYRTALES.	925
Sepals (4-5) at least twice as many as the ovary-cavities (2).	
Saxifragaceae in Order ROSALES.	590
Flowers, at least the staminate, in involucrate heads.	
Ambrosiaceae in Order CARDUALES.	1297
Corolla present.	
Petals distinct, at least at the base.	
Carpels solitary, or several and distinct, or united only at the base.	
Stamens at the base of the receptacle, i.e., hypogynous.	
Flowers in monoecious heads.	
Platanaceae in Order ROSALES.	604
Flowers not in monoecious heads.	
Plants with relatively firm stems and leaves, not succulent.	
Order RANALES.	508
Plants with succulent stems and leaves.	
Sedaceae in Order ROSALES.	585
Stamens on the margin of a hypanthium (the hypanthium very small in some Saxifragaceae).	
Plants without secreting glands in the bark.	
Order ROSALES.	583
Plants with secreting glands in the bark.	
Surianaceae in Order GERANIALES.	761
Carpels several and united.	
Ovary superior.	
Stamens inserted at the base of the ovary or receptacle.	
Stamens numerous.	
Sepals imbricated.	
Calyx deciduous.	
Order PAPAVERALES.	546
Calyx persistent.	
Stigmas pinnatifid: insectivorous plants.	
Dionaeaceae in Order SARRACENIALES.	580
Stigmas not pinnatifid: plants not insectivorous (except in Sarraceniales).	
Styles or stigmas distinct or united, but not discoid.	
Leaves glandular or pellucid-punctate.	
Placentae axile.	
Rutaceae in Order GERANIALES.	756
Placentae parietal.	
Canellaceae in Order HYPERICALES.	864
Leaves not glandular.	
Placentae parietal: gynoeceum with a 1-celled ovary.	
Anther-sacs opening lengthwise.	
Capparidaceae in Order PAPAVERALES.	575

	PAGE
Anther-sacs opening at the top.	
Bixaceae in Order HYPERICALES.	864
Placentae axile or central: gynoeceium with a 2-several-celled ovary, (or with distinct carpels.)	
Theaceae in Order HYPERICALES.	875
Styles or stigmas united into a disk.	
Herbs: bog or aquatic plants.	
Petals and sepals numerous: leaves with flat blades: aquatic plants.	
Nymphaeaceae in Order RANALES.	540
Petals and sepals few: leaves with pitcher-like organs: bog plants.	
Sarraceniaceae in Order SARRACENIALES.	580
Shrubs or trees: plants not aquatic.	
Clusiaceae in Order HYPERICALES.	865
Sepals valvate.	
Stamens with distinct filaments.	
Ovary 1-celled: placentae parietal.	
Capparidaceae in Order PAPAVERALES.	575
Ovary 2-several-celled: placentae axile or central.	
Families in Order MALVALES.	840
Stamens with united filaments.	840
Stamens few, not over twice as many as the petals.	
Stamens as many as the petals and opposite them.	
Anther-sacs opening by hinged valves.	
Podophyllaceae in Order RANALES.	543
Anther-sacs opening by slits.	
Flowers monoecious.	
Euphorbiaceae in Order EUPHORBIALES.	775
Flowers perfect.	
Ovules, or seeds, several or many: embryo coiled.	
Portulacaceae in Order CHENOPODIALES.	493
Ovules, or seeds, solitary; embryo straight.	
Armeriaceae in Order PRIMULALES.	1020
Stamens as many as the petals and alternate with them, or more, sometimes twice as many.	
Stamens 6: petals 4: sepals 2 or 4.	
Families in Order PAPAVERALES.	546
Stamens, petals and sepals of the same number, or stamens more, usually twice as many as the sepals or petals.	
Ovary 1-celled.	
Ovules, or seeds, on basal or central placentae.	
Herbs.	
Families in Order CHENOPODIALES.	461
Trees or shrubs.	
Stamens with free and distinct filaments.	
Tamaricaceae in Order HYPERICALES.	866
Stamens with partially united filaments, and usually adnate to the corolla.	
Styracaceae in Order EBENALES.	1036
Ovules, or seeds, on parietal placentae.	
Stigmas 2-cleft.	
Anther with an inconspicuous connective.	
Stigmas not brush-like.	
Droseraceae in Order SARRACENIALES.	578
Stigmas brush-like.	
Turneraceae in Order HYPERICALES.	877
Anther with the conspicuous connective produced beyond the sacs.	
Papayaceae in Order PASSIFLORALES.	894
Stigmas entire.	
Stamens with united filaments and no staminodia.	
Families in Order MALVALES.	840
Stamens with distinct filaments.	
Staminodia present.	
Parnassiaceae in Order ROSALES.	589
Staminodia wanting.	
Families in Order HYPERICALES.	864
Ovary several-celled.	
Stamens adnate to the gynoeceium.	
Asclepiadaceae in Order ASCLEPIADALES.	1064
Stamens not adnate to the gynoeceium.	
Stamens with wholly or partly united filaments.	
Anthers opening lengthwise.	
Families in Order GERANIALES.	743
Anthers opening by pores.	
Polygalaceae in Order POLYGALALES.	765
Stamens with distinct filaments.	

	PAGE
Anthers opening by pores.	
Families in Order ERICALES.	986
Anthers opening by slits.	
Stigmas or styles distinct and cleft, or foliaceous, or united by pairs.	
Order EUPHORBIALES.	774
Stigmas or styles all distinct or all united, neither cleft nor foliaceous.	
Stamens 2. Oleaceae in Order OLEALES.	1037
Stamens more than 2.	
Leaves with compound blades.	
Families in Order GERANIALES.	743
Leaves with simple blades.	
Ovule solitary in each carpel.	
Styles distinct: ovule pendulous. Families in Order GERANIALES.	743
Styles united: ovule erect or ascending.	
Limnanthaceae in	
Order SAPINDALES.	753
Ovules 2 or more in each carpel.	
Flowers irregular: stamens united at the top or converging.	
Placentae axile.	
Balsaminaceae in	
Order GERANIALES.	753
Placentae parietal.	
Violaceae in Order	
HYPERICALES.	884
Flowers regular: stamens neither united nor converging at the top.	
Carpels not circumscissile at maturity.	
Placentae parietal.	
Cistaceae	
in Order	
HYPERICALES.	878
Placentae axile or central.	
Styles distinct,	
Elatinaceae	
in Order	
HYPERICALES.	864
Styles united.	
Ovary sessile: filaments filiform.	
Tiliaceae in	
Order	
MALVALES.	840
Ovary stipitate: filaments fusiform.	
Koeberliniaceae	
in Order	
GERANIALES.	743
Carpels circumscissile at maturity.	
Penthoraceae in	
Order ROSALES.	589
Stamens inserted on the margin of a disk or hypanthium (perigynous or hypogynous).	
Stamens fewer than the sepals or the petals.	
Hippocrateaceae in Order SAPINDALES.	820
Stamens as many as the sepals or the petals, or more.	
Stamens as many as the petals and opposite them.	
Styles and upper part of the ovaries distinct: ovules and seeds many. Saxifragaceae in Order ROSALES.	590
Styles united.	
Ovules and seeds numerous.	
Moringaceae in Order PAPAVERALES.	578
Ovules and seeds solitary or 2.	
Order RHAMNALES.	830

Stamens as many as the petals and alternate with them, or more or many.	
Styles distinct and separate.	
Upper part of the ovaries distinct, at least at ma- turity.	
Saxifragaceae and Iteaceae in Order ROSALES.	590
Upper part of the ovaries united, Order SAPINDALES.	804
Styles united.	
Hypanthium flat or obsolete: disk fleshy.	
Plants without secreting glands in the bark.	
Order SAPINDALES.	804
Plants with secreting glands in the bark.	
Families in Order GERANIALES.	743
Hypanthium cup-shaped or campanulate: disk obso- lete or inconspicuous.	
Order MYRTALES.	925
Ovary inferior.	
Stamens numerous.	
Styles and stigmas united into a disk: water-plants with en- dogenous stems.	
Nymphaeaceae in Order RANALES.	540
Styles distinct, or united, but not forming a disk with radi- ating stigmas: land-plants with exogenous stems.	
Styles distinct.	
Stamens distinct: stigmas simple: shrubs or trees.	
Families in Order ROSALES.	583
Stamens with united filaments: styles branched: herbs.	
Order BEGONIALES.	917
Styles united.	
Shrubs or trees, not succulents, sometimes woody vines.	
Hypanthium not produced beyond the ovary.	
Hydrangeaceae in Order ROSALES.	596
Hypanthium produced beyond the ovary.	
Families in Order MYRTALES.	925
Herbs, or shrub-like or tree-like succulents.	
Order OPUNTIALES.	896
Stamens not more than twice as many as the petals.	
Styles wanting: stigmas sessile.	
Gunneraceae in Order MYRTALES.	953
Styles present.	
Styles distinct.	
Ovules several in each cavity of the ovary: fruit a cap- sule or a fleshy many-seeded berry.	
Fruit, if dehiscent, valvate.	
Families in Order ROSALES.	508
Fruit circumscissile.	
Portulacaceae in Order CHENOPODIALES.	493
Ovules solitary in each cavity of the ovary: fruit a drupe or 2-5 more or less united achenes.	
Order AMMIALES.	955
Styles united, or single.	
Plants without tendrils.	
Ovary enclosed in or surpassed by the hypanthium or adnate to it.	
Anther-sacs opening by pores.	
Vacciniaceae in Order ERICALES.	1006
Anther-sacs opening by slits.	
Ovules solitary in each cavity of the ovary.	
Order AMMIALES.	955
Ovules several in each cavity.	
Ovary with parietal placentae.	
Loasaceae in Order OPUNTIALES.	897
Ovary with central or basal placentae.	
Families in Order MYRTALES.	925
Ovary exceeding the hypanthium, the top free.	
Hydrangeaceae in Order ROSALES.	596
Plants with tendrils.	
Herbs: fruit a pepo: leaf-blades palmately veined.	
Cucurbitaceae in Order CAMPANULALES.	1283
Shrubby vines: fruit drupaceous, separating into nutlets: leaf-blades pinnately veined.	
Frangulaceae in Order RHAMNALES.	830
Petals more or less united.	
Ovary superior.	
Stamens free from the corolla.	
Gynoecium of a single carpel.	
Families in Order ROSALES.	508
Gynoecium of several united carpels.	
Filaments united.	
Stamens diadelphous.	
Fumariaceae in Order PAPAVERALES.	549
Stamens monadelphous.	

	PAGE
Anther-sacs opening by slits.	
Oxalidaceae in Order GERANIALES.	745
Anther-sacs opening by pores.	
Calyx and corolla very irregular.	Order POLYGALALES. 765
Calyx and corolla regular.	Families in Order ERICALES. 986
Filaments distinct.	
Styles wanting or very short: stigma sessile.	Aquifoliaceae in Order SAPINDALES. 813
Styles elongated.	
Ovary several-celled.	Families in Order ERICALES. 981
Ovary 1-celled.	Armeriaceae in Order PRIMULALES. 1020
Stamens partially adnate to the corolla.	
Stamens as many as the lobes of the corolla and opposite them, or twice as many or more.	
Ovary 1-celled.	
Placentae central or basal.	Order PRIMULALES. 1020
Placentae parietal.	Fouquieriaceae in Order HYPERICALES. 864
Ovary several-celled.	
Upper portion of the ovaries distinct.	
Upper portion of the ovaries united.	Sedaceae in Order ROSALES. 585
Stamens as many as the lobes of the corolla and alternate with them, or fewer.	Order EBENALES. 1030
Corolla not scarious, veiny: fruit various, but not a pyxis.	
Gynoecium of 3-6 carpels.	
Shrubs or trees: ovules and seeds few.	Aquifoliaceae in Order SAPINDALES. 813
Herbs, or creeping or tufted shrubby plants: ovules and seeds numerous or few in some members of the Polemoniaceae.	
Stamens adnate up to the sinuses of the corolla: creeping evergreen under-shrubs.	
Stamens adnate to the lower part of the corolla-tube: herbs, undershrubs, or vines.	Diapensiaceae in Order ERICALES. 1018
Gynoecium of 2 carpels.	Families in Order POLEMONIALES. 1078
Carpels distinct, except sometimes at the apex.	
Style terminal.	Order ASCLEPIADALES. 1057
Style basal.	Dichondraceae in Order POLEMONIALES. 1079
Carpels united.	
Ovary 1-celled, with central placentae.	Order GENTIANALES. 1044
Ovary 2-celled, or falsely 4-celled, or if 1-celled with parietal placentae.	
Stamens 2 and opposite each other, or 3.	Order OLEALES. 1037
Stamens usually 4 or 5, if 2 by reduction not opposite each other.	
Leaves with stipules or stipular lines at their bases.	Spigeliaceae in Order GENTIANALES. 1044
Leaves with no traces of stipules.	Families in Order POLEMONIALES. 1078
Corolla scarious, veinless: fruit a pyxis.	Order PLANTAGINALES. 1244
Ovary inferior.	
Stamens with the filaments free from the corolla.	
Stamens 10: anther-sacs opening by terminal pores or chinks.	
Stamens 5 or fewer: anther-sacs opening by longitudinal slits.	Vacciniaceae in Order ERICALES. 1006
Stamens adnate to the corolla.	Order CAMPANULALES. 1283
Ovary with 2-many fertile cavities and 2-many ovules: calyx unmodified, at least not a pappus.	
Plants tendril-bearing.	Cucurbitaceae in Order CAMPANULALES. 1283
Plants not tendril-bearing.	
Ovules mostly on basal placentae: plants parasitic.	Order SANTALALES. 1247
Ovules variously borne, but not on a basal placenta: plants not parasitic.	Order RUBIALES. 1251
Ovary with one fertile cavity.	
Ovules numerous on a basal placenta.	Primulaceae in Order PRIMULALES. 1020
Ovule solitary, the placentae not basal.	
Flowers not in heads, often in head-like spikes or racemes.	Order VALERIANALES. 1276
Flowers in involucrate heads.	Order CARDUALES. 1297

# DESCRIPTIVE FLORA

## SUBKINGDOM **SPERMATOPHYTA** SEED-PLANTS

Plants producing flowers and seeds. A seed contains an embryo consisting of a short stem (radicle, caulicle, or hypocotyl), one, two, or several rudimentary leaves (cotyledons), and a terminal bud (plumule).

## CLASS 1. **GYMNOSPERMAE** CONE-PLANTS

Carpel or pistil represented by a scale on the face of which the ovules are borne, and on which the naked seeds mature.

### ORDER **CYCADALES** — CYCADAL ORDER

Palm-like or fern-like plants. Leaves in a crown: blades pinnate. Flowers in cones of approximate scales or on less modified leaves. Staminate cone with scales bearing several pollen-sacs. Ovulate cone with two or more ovules on each scale. Seed drupe-like or nut-like.

### FAMILY 1. **CYCADACEAE** — SAGO-PALM FAMILY

Diocious plants with subterranean or aerial stems. Leaves clustered: leaflets with 1 or several ribs or veins. Staminate cone deciduous. Ovulate leaf or cone persistent. Seeds exposed on the margins of the ovulate leaf or enclosed in a cone.—The most primitive living seed-plants, even showing some characters of the ferns in their structure. There are about 9 genera and nearly 100 species in tropical and subtropical regions.

1. **ZAMIA** L. Fern-like plants with erect, simple, or sometimes branched, subterranean, stout, fleshy, farinaceous, stems. Leaves erect or spreading: leaflets jointed to the rachis, with parallel veins. Cones stalked, the staminate one more slender than the ovulate one: scales peltate, spiral. Mature ovulate cone erect.—Represented by four species in Florida, but more abundantly in the West Indies and continental tropical America, where other genera occur as well.—COONTIES. CONTIS. COMPTIES. COMFORTROOTS. FLORIDA-ARROWROOTS. WILD-SAGOS.—The zamias were known to the early Seminoles as *Conti Hateka* which means white-root or white bread-plant.

Blades of the leaflets of a narrow type, 8-20-veined, entire or obscurely toothed at the apex.

Leaflets close together on the rachis, mostly less than 11 cm. long.

Leaflets rather distant on the rachis, mostly over 12 cm. long.

Blades of the leaflets narrowly linear-attenuate, 10-14-veined, 6 mm. wide or less.

Blades of the leaflets broadly linear, 14-20-veined, 10 mm. wide or more.

Blades of the leaflets of a broad type, 20-30-veined, evidently callous-toothed at the apex.

1. *Z. integrifolia*.

2. *Z. angustifolia*.

3. *Z. silvicola*.

4. *Z. umbrosa*.

1. *Z. integrifolia* Ait. Leaves 4-9 dm. long; leaflets 8-11 cm. long, the blades linear, 3-7 mm. wide, 8-16-veined, often revolute and very stiff: staminate cone narrowly cylindric, 8-13 cm. long: mature ovulate cone cylindric-ellipsoid, 12-16.5 cm. long: nut-like part of seed ellipsoid, 17-19 mm. long, nearly terete. [*Z. floridana* DC.].—Dry sandy pinelands or rarely coastal dunes, pen. and N Fla., and occasionally lower Keys.—The starchy underground stem of this cycad was the main native source of flour for the Fla. aborigines and for the Seminoles. The phenomenal growth on the Everglade Keys now furnishes "Florida arrowroot" to the white-man. The stems are frequently branched.

2. *Z. angustifolia* Jacq. Leaves 1-2 m. long; leaflets 12-20 cm. long, the blades narrowly linear-attenuate, 3-6 mm. wide, 10-14-veined, flat or nearly so, minutely toothed at the apex: inflorescence not seen in Fla. (Bahamian specimens are described as having oblong-cylindric staminate cones 5-7 cm. long and mature ovulate cones 8-9 cm. long.)—Humus, wet hammock islands, between Royal Palm Hammock and Cape Sable, Fla.—(*W. I.*)—The stems are large but simple.

3. *Z. silvicola* Small. Leaves 1 m. long or less; leaflets 12-17 cm. long, the blades linear, often broadly so, 1-1.5 cm. wide, 14-20-veined, flat, obscurely toothed at the apex: staminate cone cylindric or slightly tapering upward, 8-16 cm. long: mature ovulate cone ellipsoid-cylindric, mostly 9-14 cm. long: nut-like part of seed broadly obovoid, 18-20 mm. long, decidedly flattened, minutely pointed at both ends.—Humus, rich sandy soil, aboriginal village sites, and shell mounds, pen. Fla.—Our most robust zamia, often abundant on the upper western coast, and locally in hammocks to the S. Plants on the shell mounds often have branching stems.

4. *Z. umbrosa* Small. Leaves mostly less than 0.5 m. long; leaflets 7-11 cm. long, the blades linear-oblancoelate, linear-elliptic, or broadly linear, 8-16 mm. wide, 20-30-veined, flat, callous-toothed at the apex, firm: staminate cone narrowly cylindric, 7-11 cm. long: mature ovulate cone cylindric, 6.5-11 cm. long or rarely longer: nut-like part of seed obovoid, 15-17 mm. long, evidently 3-sided. [*Z. pumila* (Fl. SE. U. S.)].—Hammocks, sand-dunes, and shell mounds, NE Fla.—Primarily a hammock plant and especially abundant on the kitchen-middens and aboriginal village sites of the upper eastern coast. The stems are frequently simple.

#### ORDER PINALES — PINAL ORDER

Shrubs or trees. Leaves scale-like, narrow, or needle-like, and often borne in bundles. Flowers mainly monoecious, the cones of spirally imbricate bracts, or in Taxaceae the ovulate flowers often solitary. Seed borne in a cone of dry or fleshy scales, or partly or wholly naked.—A group developed later and more highly organized than the CYCADALES.

Ovulate flowers several, with carpellary scales, these sometimes bracted: cone with either dry or fleshy scales.

Carpellary scales with bracts, not peltate: ovules inverted: buds scaly: wing accompanying the seed a portion of the carpellary scale.

Fam. 1. PINACEAE.

- Carpellary scales without bracts, mostly peltate, or fleshy; ovules erect; buds naked; wing of the seed, when present, a portion of the testa. Fam. 2. JUNIPERACEAE.  
 Ovulate flowers solitary or 2, without carpellary scales: cone drupaceous or baccate. Fam. 3. TAXACEAE.

### FAMILY 1. PINACEAE — PINE FAMILY

Mostly evergreen resin-yielding shrubs or trees, typically conic, with flaky or brittle bark, the buds scaly. Leaves narrow and solitary or needle-like and usually several together, each group with a sheath at the base. Ovulate ament with bracted scales. Ovules inverted. Cone of dry scales. Seeds usually 2 on each scale, often samara-like.—A family of the first economic importance: its members furnish lumber, resinous products, tanning materials, volatile oils. The species fall into a dozen genera of wide geographic distribution.

- Leaves several together, the bundle surrounded by a sheath at the base; cones maturing the second year. Tribe I. PINEAE.  
 Leaves solitary, without a sheath: cones maturing the first year. Tribe II. ABIETINEAE.

#### I. PINEAE

- Cone-scales with dorsal, spine-armed appendages; leaves in 2's or 3's. 1. PINUS.  
 Cone-scales with terminal unarmed appendages; leaves in 5's. 2. STROBUS.

#### II. ABIETINEAE

- Cone drooping; bracts shorter than the cone-scales. Leaves 4-sided or nearly terete, spreading; anther-sacs opening lengthwise. 3. PICEA.  
 Leaves flat, apparently 2-ranked; anther-sacs opening transversely. 4. TSUGA.  
 Cone erect; bracts longer than the cone-scales. 5. ABIES.

1. **PINUS** [Tourn.] L. Trees or rarely shrubs. Leaves needle-like, mostly in 2's or 3's and each with 2 fibro-vascular bundles. Staminate aments elongate, at the ends of branches of the preceding year. Ovulate ament globular or slightly elongate. Cone spreading; scales at length woody and spreading, each with a dorsal, usually spine-armed appendage. Seed samara-like.—About 75 species, mostly in the north temperate zone.—Spr.—PINES.—Most of our pines, especially the long-leaved ones, are important timber trees.

- Branchlets terminated by plumes of relatively long, curved or recurved leaves: resin-ducts of the leaf contiguous to the fibro-vascular bundle. I. AUSTRALES.  
 Branchlets terminated by brushes of relatively short, stiff, straight leaves: resin-ducts of the leaf remote from the fibro-vascular bundle.

#### I. AUSTRALES

- Cone elongate, of a conic type and over twice as long as thick when closed, slightly umbonate, the scale-appendages flat or slightly elevated, with recurved or hooked prickles. Cone-scales thin-edged, the appendages flattish, the prickles hooked. 1. *P. australis*.  
 Cone-scales thick-edged, the appendages turgid, the prickles slightly recurved. 2. *P. caribaea*.  
 Cone short, of an ovoid type and less than twice as long as thick when closed, prominently umbonate, the scale-appendages elevated, often pyramidal, with nearly straight or decurved prickles. 3. *P. palustris*.

#### II. RIGIDAE

- Scales of the ovulate ament stout, each with a short tip which scarcely equals the body in length.  
 Cone over 8 cm. long.  
 Cone broadly conic when closed and prominently umbonate; scales thick-edged, the appendages projecting little, if at all, beyond the short spine. 4. *P. Taeda*.

- Cone narrowly conic when closed, and slightly um-  
bonate; scales thin-edged, the appendage projecting  
far beyond the long spine.  
Cone less than 8 cm. long.  
Cone ovoid or globular-ovoid when closed: leaves 15–25  
cm. long, about 2 mm. wide.  
Cone narrowly conic when closed: leaves 4–12 cm. long,  
about 1 mm. wide.  
Cone-scales readily opening, each with a slender or  
minute spine towards the front of the appen-  
dage, the spine sometimes deciduous or ob-  
solete.  
Cone-scales with minute, deciduous or obsolete  
spines: scales of the staminate aments erose-  
toothed at the apex: bark of the trunk rela-  
tively close and smooth.  
Cone-scales with slender persistent spines: scales  
of the staminate aments entire: bark of the  
trunk broken into angular plates.  
Cone-scales tardily opening or permanently closed,  
each with a stout spine at the middle or towards  
the back of the appendage.  
Scales of the ovulate ament slender, each with a subulate tip  
several times the length of the body.  
Cone conic when closed, ovoid when open: twigs glaucous.  
Cone ovoid when closed, globose-ovoid or depressed when  
open: twigs yellow.  
Scales of the pistillate ament recurved: appendages of  
the cone-scales relatively thin; spines slender, more  
or less recurved.  
Scales of the pistillate ament ascending: appendages  
of the cone-scales very thick; spines stout, more or  
less incurved.
1. *P. australis* Michx. f. Tree becoming 40 m. tall, irregularly branched above,  
the bark in large plates: leaves typically in 3's, 20–40 cm. long, bright-green,  
borne in terminal plumes, on twigs about  
1 cm. in diameter: staminate ament 5.5–8  
cm. long: cone 16–25 cm. long, ascending  
when young, narrowly conic when closed,  
broadly conic when open, each scale-appen-  
dage with a recurved spine: seed 12–13 mm.  
long, the wing 4.5–5 cm. long. [*P. palustris*  
(Fl. SE. U. S.)]—(LONG-LEAF PINE. LONG-  
STRAW PINE. YELLOW-PINE. GEORGIA-PINE.  
SOUTHERN-PINE. PITCH-PINE.)—Sandy soil,  
usually dry and acid, Coastal Plain and  
rarely adj. provinces, Fla. to Tex., N Ala.,  
and S Va.—The giant of our pines, as well  
as the one with the longest leaves and the  
largest cones. A timber tree of the first im-  
portance, and the principal source of rosin and turpentine in the U. S.
  2. *P. caribaea* Morelet. Tree usually smaller than *P. australis*: leaves in 2's  
or 3's, 18–30 cm. long (rarely shorter), bright-green, on twigs about 5 mm. in  
diameter: staminate ament 2.5–4 cm. long: half mature ovulate ament ascending:  
cone 8–15 cm. long, recurving when young, cylindric-conic when closed, cylindric  
or ovoid-cylindric when open: each scale-appendage turgid: seed 4–7 mm. long,  
the wing 2–2.5 cm. long, or smaller.—(SLASH-PINE. CARIBBEAN-PINE. ROCK-  
PINE.)—Dry sandy or rocky soil, often calcareous, pen. Fla. and the lower Keys,  
extending near the coast to Miss. and Ga.—(W. I.)—The only pine growing  
naturally on the Florida Keys.
  3. *P. palustris* Mill. Tree becoming 30 m. tall: leaves in 2's or 3's, deep-green:  
staminate ament 3.5–5 cm. long: half mature ovulate ament recurved: cone 8–12  
cm. long, narrowly ovoid when closed, broadly ovoid when open, each scale-  
appendage very prominent: seed 6–8 mm. long, the wing 2–3 cm. long. [*P.*

5. *P. heterophylla*.6. *P. serotina*.7. *P. glabra*.8. *P. echinata*.9. *P. clausa*.10. *P. virginiana*.11. *P. rigida*.12. *P. pungens*.

*Elliottii* Engelm.]—(SLASH-PINE. SWAMP-PINE.)—Shallow ponds, swamps, and low grounds, often acid, Coastal Plain, C Fla. to E La. and S. C.—Inhabiting the lower or wet situations within the range of *P. australis*, and thriving under the influence of either salt or fresh water. The cones are about as long as those of the next preceding species, but broader.

4. *P. Taeda* L. Tree becoming 45 m. tall, the dark bark deeply furrowed, very rough, exfoliating in coarse plates: leaves in 3's, glaucous, 15–28 cm. long: cone 10–13 cm. long, broadly conic when closed, ovoid or conic-cylindric when open, the scale-appendages thick, projecting little, if at all, beyond the small spine: seed 6–7 mm. long, the wing about 2 cm. long.—(LOBLOLLY-PINE. SHORT-LEAF PINE. OLDFIELD-PINE.)—Sandy or clay soil, frequently acid, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ark., Tenn., and S N. J.—After the manner of a weed completely foresting abandoned cultivated lands.

5. *P. heterophylla* (Ell.) Sudw. Tree becoming 35 m. tall, the pale bark shallowly furrowed: leaves in 2's or 3's, glaucous, 12–25 cm. long, often stouter than in *P. Taeda*: cone 9–14 cm. long, conic when closed, ellipsoid or ovoid-cylindric when open, the scale-appendages thin, projecting beyond the slender spine: seed 5–7 mm. long, the wing 2–2.5 cm. long.—(POND-PINE. SLASH-PINE.)—Sandy swamps, near the coast, Ga. and S. C.—It produces the palest bark and the softest wood of our pines and has the most restricted range.

6. *P. serotina* Michx. Tree becoming 25 m. tall, with many short irregular branches near the base, the bark flaky: leaves in 3's, glaucous, 15–28 cm. long, crowded; sheath about 12 mm. long: staminate ament 1.5–2 cm. long: cone 4–6 cm. long, ovoid or globular-ovoid when closed, very broad when open, each scale with a thick appendage and a minute spine: seed 3–4 mm. long, the wing 2 cm. long.—(BLACK-PINE. POND-PINE. MARSH-PINE.)—Sandy swamps and shallow ponds, frequently acid, Coastal Plain, Fla. and Ala. to S N. J.—The cones are much shorter and thicker than in its relatives.

7. *P. glabra* Walt. Tree becoming 40 m. tall, with a relatively smooth grayish bark: leaves in 2's, glaucous, 4–8 cm. long, very slender; sheath 5–8 mm. long: staminate ament about 1 cm. long: cone 3.5–5 cm. long, conic when closed, ovoid when open, each appendage with a minute or almost obsolete spine: seed about 4 mm. long, the wing usually 1.5 cm. long.—(SPRUCE-PINE. CEDAR-PINE. WHITE-PINE. WALTER'S-PINE.)—Hammocks, bluffs and bottoms, Coastal Plain, N Fla. to E La. and S. C.—Readily distinguished by the smooth bark, the very slender leaves, and the small nearly unarmed cones.

8. *P. echinata* Mill. Tree up to 40 m. tall, the bark splitting into angular plates: leaves in 2's or occasionally in 3's, deep-green, 8–12 cm. long, slender; sheath 10–15 mm. long: cone 3.5–6.5 cm. long, conic when closed, ovoid when open, each appendage with a slender spine: seed 4–5 mm. long, the wing 1.5–2 cm. long. [*P. mitis* Michx.]—(SHORT-LEAF PINE. YELLOW-PINE. FOX-TAIL-PINE.)—Dry sterile and frequently acid soils, various provinces, N Fla. to Tex., SE Kans., Ind., and S N. Y.—This wide-ranging species may be distinguished from its associates by its slender leaves.

9. *P. clausa* (Engelm.) Vasey. Tree becoming 24 m. tall, the bark relatively smooth: leaves in 2's, deep-green, 4–8 cm. long, very slender; sheath 5–7 mm. long: cone 4.5–6 cm. long, conic when closed, ovoid when open, each scale-appendage with a stout spine near the middle: seed 4 mm. long, the wing about 1.5 cm. long.—(SAND-PINE. SPRUCE-PINE.)—Acid sand-ridges and dunes near the coast, and scrublands, Fla. and adj. Ala.—May be recognized by the numerous slender leaves and the persistent cones which are often slow to open.

10. *P. virginiana* Mill. Tree becoming 36 m. tall, the bark rough and the branches sinuous, the twigs glaucous: leaves in 2's, deep-green, 4–7 cm. long, rather stout; sheath 5–8 mm. long: cone 5–7 cm. long, narrowly conic when

closed, ovoid when open, each scale-appendage with a curved spine: seed 4-5 mm. long, the wing fully 1.5 cm. long. [*P. inops* Ait.]—(SCRUB-PINE. JERSEY-PINE. POVERTY-PINE.)—Dry sterile soils, various provinces, C Ga. to E Miss., S Ind. and S N. Y.—Characterized by its short stubby leaves and medium-sized cones.

11. *P. rigida* Mill. Tree becoming 25 m. tall, with stiff branches, the bark very rough, the twigs yellow: leaves in 3's, bright-green, 6-12 cm. long, rather stout; sheath 10-15 mm. long: cone 4-7 cm. long, ovoid when closed, globose-ovoid or depressed when open, the scale-appendages relatively thin, each with a recurved spine: seed 4-4.5 mm. long, the wing about 1.5 cm. long.—(PITCH-PINE.)—Sterile and usually acid soils, various provinces, N Ga. to Ont. and N. B.

12. *P. pungens* Lamb. Tree becoming 18 m. tall, the bark rather smooth, but flaky: leaves in 2's, bright-green, 5-10 cm. long, stout, rigid: cone 8-12 cm. long, very persistent, ovoid when closed, globose-ovoid or depressed when open, the scale-appendages very thick, each with a stout incurved spine: seed 6-7 mm. long, the wing fully 2 cm. long.—(TABLE-MOUNTAIN PINE. TABLE-ROCK PINE. MOUNTAIN-PINE.)—Rocky acid soil and cliffs, Piedmont to Appalachian provinces, N Ga. to Pa. and N. J.—Has stout leaves and very stout cones with prominently armed scales. Cones often persist on the branches for many years.

2. **STROBUS** Opiz. Trees. Leaves needle-like, 5 together, mostly with 1 fibro-vascular bundle each. Staminate aments with involucre bracts at the base. Ovulate ament narrow, stalked. Cone drooping: scales leathery, with neither dorsal appendage nor spine.—A genus represented in eastern North America by the following and in the Pacific States by several other species.

1. *S. Strobis* (L.) Small. Tree becoming 50 m. tall, with a relatively smooth bark and approximately whorled branches: leaves 5 together, 5-10 cm. long, glaucous, very slender; sheath deciduous or fugacious: cone narrow, slightly tapering when open, 10-20 cm. long, often curved; scales loosely spreading: seed 6-7 mm. long, the wing about 2.5 cm. long. [*Pinus Strobis* L.]—(WHITE-PINE.)—Sandy or rocky soil, various provinces, N Ga. to Man. and Newf.—Spr.—The most widely distributed species of the white pines. Its five-fascicled slender leaves and long unarmed cones readily distinguish it from other pines. Once the most important of American timber trees, but greatly depleted by reckless lumbering.

3. **PICEA** Link. Trees. Leaves solitary, ascending or erect, narrow, angled or terete, leaving sterigmata when falling. Pollen-sacs opening lengthwise. Ovulate ament with inconspicuous bracts. Cone drooping.—Spr.—A genus of 14 species of the more northern latitudes, represented in our area only in the higher mountains.—SPRUCE.—Some species are timber trees, and are, also, an important source of paper pulp.

Twigs stout, copiously pubescent: leaves over 1 mm. broad, blunt or mucronate.

Twigs slender, glabrate or merely pubescent between the decurrent sterigmata: leaves barely 1 mm. broad, acute.

1. *P. rubens*.

2. *P. australis*.

1. *P. rubens* Sargent. Tree often becoming 30 m. tall, the bark rough: twigs stout, stiff, pubescent as are usually the sterigmata: leaves curved, 8-12 mm. long, deep-green: cone ellipsoid or ovoid, 2.5-4 cm. long. [*P. mariana* (Fl. SE. U. S.)]—(RED-SPRUCE. HE-BALSAM. TAMARACK. YEW-PINE.)—Moist or rocky and usually acid soil, Blue Ridge and more northern provinces, N. C. to Sask. and Newf.—Often crowns mountain tops with a pure growth. The black spruce—*P. mariana* (Mill.) Britton—recorded as growing in the N. C. Mts., has glaucous leaves and small persistent cones.

2. *P. australis* Small. Tree becoming 40 m. tall, the bark relatively smooth: twigs slender, glabrous or merely pubescent in lines between the decurrent glabrous sterigmata: leaves slender, 8-14 mm. long, straight or nearly so, bright-green: cone ellipsoid, oval or ovoid, mostly less than 2.5 cm. long. [*P. alba* (Chapm. Fl.)]—(SOUTHERN-SPRUCE. HE-BALSAM.)—Dry acid slopes, summits, and cliffs, Blue Ridge, N. C. and Va.—Less common than the preceding. Sometimes in forests unmingled with other trees.

4. *TSUGA* Carr. Trees. Leaves distichously spreading: blades linear, glaucous beneath, not jointed to sterigmata. Pollen-sacs opening transversely. Ovulate ament with inconspicuous bracts. Cone drooping. There are 7 species native of North America and Asia.—HEMLOCKS.—Spr.—Some species are timber trees.

Twigs tomentose with long hairs: cones narrowly ovoid when closed, 1.8-2.3 cm. long: scales nearly erect.

1. *T. canadensis*.

Twigs tomentose with short hairs, or glabrate: cones cylindric-ellipsoid when closed, 3 cm. long: scales spreading at right angles.

2. *T. caroliniana*.

1. *T. canadensis* (L.) Carr. Tree becoming 30 m. tall, with a scaly-exfoliating bark: leaves loosely spreading, 6-14 mm. long, obtuse at the apex: staminate ament 2 mm. in diameter: cone ellipsoid when open, 18-23 mm. long; scales erect, suborbicular or subcuneate: seed-wing mainly less than 1 cm. long.—(CANADA-HEMLOCK. NORTHERN-HEMLOCK. SPRUCE-PINE.)—Rocky banks, woods, and ravines, various provinces, Ga. and Ala. to Minn. and N. S.—Like *Picea rubens*, this tree is fond of moist places and on slopes often forms extensive forests. It is a graceful tree, with pliable branches, soft foliage, and smooth cones.

2. *T. caroliniana* Engelm. Tree becoming 25 m. tall, the bark relatively smooth: leaves rigidly spreading, mostly notched at the apex: staminate ament about 3 mm. in diameter: cone ovoid when open, 25-30 mm. long; scales spreading or nearly so: seed-wing ellipsoid, over 1 cm. long.—(CRAG-HEMLOCK. CAROLINA-HEMLOCK.)—Ravines and rocky slopes, frequently acid, Blue Ridge, Ga. to S Va.—A striking tree, but not graceful. The rigid branches are bristly with the spreading leaves and even the cones are bristly on account of the widely divergent scales.

5. **ABIES** [Tourn.] Hill. Trees. Leaves distichously spreading on twigs and branchlets: blades linear, not jointed to sterigmata. Pollen-sacs opening transversely or nearly so. Ovulate ament with conspicuous bracts. Cone erect, cylindric.—A genus characteristic of high latitudes and mountains, with only 2 species in the eastern United States, 8 species in western North America and about a dozen in the Old World.—**FIRS**.—Some of the western species are valuable timber trees. Canada balsam is an exudation in the blisters on the trunk of *A. balsamea*.

1. **A. Fraseri** (Pursh) Lindl. Tree becoming 25 mm. tall, the bark with balsam-yielding blisters: leaves 1-2 cm. long; blades shining above, glaucous beneath: staminate ament 5-8 mm. long: cone 4-5 cm. long; scales flabellate: bracts exserted, apiculate: seed 4-5 mm. long, the wing about as wide as long.—(**SILVER-FIR**. **BALSAM-FIR**. **SHE-BALSAM**. **LASH-HORN**. **BLISTER-PINE**.)—Acid swamps, slopes, and summits, Blue Ridge to Appalachian Plateau, N. C. and Tenn. to W. Va.—Spr.—A related northern species, *A. balsamea*, with included cone-bracts, may occur in NW N. C.

## FAMILY 2. JUNIPERACEAE — JUNIPER FAMILY

Mostly evergreen often slightly resiniferous shrubs or trees, with fibrous, shreddy bark, the buds naked. Leaves mainly appressed or sometimes subulate and spreading. Ovulate ament with bractless scales. Ovules erect. Cone of dry, often thick, peltate scales, or baccate or drupaceous. Seed wingless, or winged, the wing a portion of the testa.—About 12 genera, widely distributed. The woods and the products are of great economic importance.

Plants monoecious: cones dry, merely imbricated.

Leaves long and narrow, not scale-like, spreading: scales of the ovulate cones spirally placed, imbricate. Tribe I. **TAXODIEAE**.

Leaves scale-like, typically appressed and imbricate (sometimes spreading on twigs): scales of the ovulate cones decussately opposite or ternate. Tribe II. **CUPRESSEAE**.

Plants mostly dioecious: cone berry-like or drupe-like: scales fleshy, coalescent. Tribe III. **JUNIPEREAE**.

### I. TAXODIEAE

Trees producing erect "knees" from the root-system: leaves deciduous.

#### 1. **TAXODIUM**.

### II. CUPRESSEAE

Cones elongate: scales not peltate, the tip apically thickened, often apiculate or hooked below the apex.

Cones drooping: scales not hooked near the apex: seeds wingless: branchlets in horizontally disposed fronds.

#### 2. **THUJA**.

Cones erect: scales hooked below the apex: seeds winged: branchlets in vertically disposed fronds.

#### 3. **BIOTA**.

Cones nearly globular: scales peltate, the conspicuously thickened tops ending in short tips.

#### 4. **CHAMAECYPARIS**.

### III. JUNIPEREAE

Leaves subulate and spreading on the mature branches: aments axillary, the pistillate with smaller scales at the top.

#### 5. **JUNIPERUS**.

Leaves scale-like and appressed on the mature branches: aments terminal, the pistillate with larger scales at the top.

#### 6. **SABINA**.

1. **TAXODIUM** L. C. Rich. Deciduous-leaved trees, the roots producing erect conic "knees." Leaves often almost 2-ranked: blades narrow. Staminate

aments in paniced spikes or racemes. Ovulate aments with peltate scales. Cone spreading, globular or obovoid, the scales woody, stalked. Seed wingless.—Comprises three species of the southern Atlantic and Gulf seaboard.—Spr.—The wood has exceptionally durable qualities.—CYPRESSES.—Inhabitants of low grounds.

Leaves 2-ranked, widely spreading: branchlets usually horizontal: bark thin, comparatively smooth.

Leaves appressed to the erect branchlets: bark thick, strongly furrowed.

1. *T. distichum*.

2. *T. ascendens*.

1. *T. distichum* (L.) L. C. Rich. Tree becoming 50 m. tall, the base of trunk conic, narrowly ridged, the bark thin, relatively smooth: leaves 1–1.5 cm. long, often curved: cone globular, about 2.5 cm. in diameter: seed 8–10 mm. long.—(BALD-CYPRESS. RIVER-CYPRESS.)—Swamps, or rarely rocky slopes, often over calcareous subsoil, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., Ind. and N. J.; also rare along the Hudson River, N. Y., where perhaps introduced.—The characteristic cypress of river swamps. Often a very large tree with the trunk gradually tapering near the base. It is usually copiously branched.

2. *T. ascendens* Brongn. Tree typically smaller than *T. distichum*, but with very similar inflorescence and fruit, the knees less abundant, the trunk with a conoidal broadly ridged base: leaves incurved; blades 0.5–1 cm. long. [*T. imbricarium* (Nutt.) Harper.]—(POND-CYPRESS.) Pineland ponds, creeks, and small rivers, usually over a clay subsoil, rarely in dry barrens, Coastal Plain, Fla. to La. and Va.—The cypress of ponds and marshy places. It is less branched than the preceding. The bark is rougher than that of *T. distichum*, and as a consequence the trees are sometimes copiously infested with air-plants.

2. **THUJA** L. Evergreen trees. Leaves scale-like, 4-ranked, often with a gland on the back. Staminate aments solitary. Ovulate ament with imbricate scales. Cone drooping, ellipsoid or ovoid, the scales leathery, lax. Seeds winged on both sides.—About 15 species, native of North America and Asia. Only two species in America, one in the eastern part and one in the western.—**ARBORVITAE.**

1. *T. occidentalis* L. Tree up to 18 m. tall, the branchlets in horizontally disposed fronds. Leaves appressed, those of the branches 5–7 mm. long: staminate ament globose: ovulate ament with erect scale-tips: cone 9–13 mm. long; scales obtuse, each apiculate below the apex.—(WHITE-CEDAR. AMERICAN-ARBORVITAE.)—Swamps or rocky banks, usually calcareous, Blue Ridge and more northern provinces, N. C. and Tenn. to Man. and N. B.—Spr.—One of the cool climate plants surviving in our range only in the mountains. It is used in horticulture. The wood has few uses in the industries.

3. **BIOTA** Endl. Evergreen trees. Branchlets placed in a vertical plane, with both sides alike. Leaves scale-like, 4-ranked, with a gland on the back. Staminate aments solitary. Ovulate aments with fleshy imbricate scales. Cone erect, slightly elongate, the scales leathery, each with a stout hook below the apex. Seeds thick, wingless.—Only one species, native of eastern Asia, and widely cult.—**ARBORVITAE.**

1. **B. orientalis** (L.) Endl. Tree 9 m. tall or less, the branches in vertically disposed fronds: leaves appressed, those of the branches 2-4 mm long: staminate ament ellipsoid: ovulate ament with recurved scale-tips: cone erect, mostly 15-25 mm. long; scales hooked below the apex. [*Thuja orientalis* L.]—(**CHINESE-ARBORVITAE.** **ASIATIC-ARBORVITAE.**)—Sandy soil, coast of Fla. Nat. of Asia.—All year.—Not extensively naturalized, but persistent about abandoned gardens and occasionally spontaneous.

4. **CHAMAECYPARIS** Spach. Trees. Leaves scale-like and imbricate, each with a gland on the back, or sometimes subulate on twigs. Staminate aments terminal. Ovulate aments with peltate scales. Cone spreading, globular: scales woody, appendaged. Seeds winged. About 7 species, two in western North America and several in eastern Asia.—**CYPRESSES.**

1. **C. thyoides** (L.) B. S. P. Strong-scented tree becoming 27 m. tall: leaves 1-2 mm. long, appressed, the lateral ones keeled, the vertical merely convex: staminate ament 2-3 mm. long: ovulate ament glaucous, the scales with hyaline appendages: cone globular, 5-7 mm. in diameter: seed narrowly winged. [*C. sphaeroidea* Spach.]—(**WHITE-CEDAR.**)—Acid swamps, Coastal Plain and rarely adj. provinces, N Fla. to Miss. and Me.—Spr.—A tree somewhat resembling the arborvitae in habit, but with quite different cones. It varies much in its mode of branching. The natural growth is being rapidly depleted by cutting the trees for telephone poles. The wood has many uses in the industries.

5. **JUNIPERUS** [Tourn.] L. Shrubs or trees. Leaves in 3's, subulate, neither imbricate nor appressed, glandless. Staminate aments axillary. Ovulate ament with ovules alternate with the scales. Cone baccate. Seeds wingless.—Spr.—Consists of ten or fifteen species, mostly in the more northern parts of the northern hemisphere.—**JUNIPERS.**

- A depressed shrub, with creeping branches: leaves abruptly bent at the base, deeply channeled, rather abruptly pointed. 1. *J. sibirica.*  
A tree; leaves straight or nearly so, shallowly channeled, gradually acuminate. 2. *J. communis.*

1. *J. sibirica* Burgsd. Depressed shrub, the radiating branches rarely rising over 5 dm., often matted: leaves stout, mostly 5–8 mm. long, abruptly curved at the base, erect or erect-ascending, abruptly pointed: cone globular, 8–10 mm. in diameter.—(MOUNTAIN-JUNIPER.)—Dry gravelly soil, Blue Ridge and more northern provinces, N. C. to Rocky Mts., Alas., and Lab.—(*Eurasia*.)—Our two species of juniper may be distinguished by habit alone. The present one is always depressed with the branches on the ground and only ascending at the tips.

2. *J. communis* L. Erect tree becoming 8 m. tall: leaves slender, 10–20 mm. long, spreading, gradually narrowed at the apex: cone globular, 6–8 mm. in diameter.—Dry sandy hills, Blue Ridge and more northern provinces, Ga. to N. M. and Can.—(*Eurasia*.)—Rare in our range.

6. *SABINA* Haller. Shrubs or trees. Leaves scale-like, except sometimes on twigs, appressed, often imbricate, each with a gland in the back. Staminate aments terminal on branchlets. Ovulate ament with ovules opposite the scales. Cone baccate. Seeds wingless.—Spr.—About 25 species, most abundant northward, but ranging southward to the West Indies and Mexico.—CEDARS. SAVINS.

Staminate ament 3–4 mm. long: cone 5–6 mm. long.  
Staminate ament 4–5 mm. long: cone 3–4 mm. long.

1. *S. virginiana*.  
2. *S. silicicola*.

1. *S. virginiana* (L.) Antoine. Tree becoming 30 m. tall: scale-like leaves opposite, 4-ranked, 1–4 mm. long, acute: staminate ament 3–4 mm. long: cone sub-globose, 5–6 mm. long, glabrous: seed 3–4 mm. long, smooth. [*Juniperus virginiana* L.]—(RED-CEDAR.)—Dry hills or rarely swamps, nearly throughout N. A., east of the Great Plains.—The foliage is strong scented. The durable heart-wood is used in cabinet work and especially for lead-pencils. The cones are much eaten by birds and the seeds thus widely distributed. This species reaches its maximum development in our region, forming pure forest stands, in the so-called Cedar glades, in the Interior Low Plateau province.

2. *S. silicicola* Small. Tree similar to *S. virginiana* in habit, but with shorter and rather thicker leaves, the relatively blunt apex closely appressed: staminate ament 4–5 mm. long: cone ovoid or ellipsoid-ovoid, 3–4 mm. long. [*S. barbadensis* (Fl. SE. U. S.)]—(SOUTHERN RED-CEDAR.)—Sand and clay soil, Coastal Plain, Fla. to Tex. and S. C.—(*W. I.*)—With the same qualities and a source of the same products as the preceding. The natural supply has been exhausted through the manufacture of pencil wood.

### FAMILY 3. TAXACEAE — YEW FAMILY

Evergreen shrubs or trees, mostly destitute of resin, the buds scaly. Leaves distichously spreading: blades narrow, entire. Staminate ament

mostly few-flowered, with scaly involucres. Ovulate ament most 1-flowered, the carpellary scale wanting. Cone baccate or drupaceous, wholly or partially enclosed by a pulpy cup-like aril.—About 12 genera, widely distributed. Many kinds are used in ornamental horticulture.

Ovulate flowers usually 2 together: ovule borne in a cup: seed enclosed in the accrescent cup: endosperm channeled: pollen-sacs 4. 1. TUMION.

Ovulate flowers usually solitary: ovule borne in a cup: seed surrounded by the accrescent cup: endosperm even: pollen-sacs more than 4. 2. TAXUS.

1. **TUMION** Raf. Trees. Leaves rigid. Staminate ament with 4 pollen-sacs under each scale. Ovulate ament usually with 2 ovules. Seed baccate, the pericarp fleshy. [*Torreya* Arn.].—Besides the following, there are three other species, one in California and two in eastern Asia.

1. **T. taxifolium** (Arn.) Greene. Tree becoming 18 m. tall, with a disagreeable odor when bruised: leaf-blades linear, 1.5–3 cm. long, firm-tipped: staminate ament 5–8 mm. long: seed globose-ellipsoid or somewhat obovoid, 3–4 cm. long, glaucous. [*Torreya taxifolia* Arn.].—(STINKING-CE-DAR. TORREYA.)—Bluffs and woods along the Apalachicola River, and tributary streams, Fla. and adj. Ga.—Spr.—Limited in distribution, but often plentiful where it grows. The wood is durable, and many of the better specimens have been destroyed for making fence-posts. The seeds are a favorite food of wild rodents. The heartwood is pale-yellow.

2. **TAXUS** [Tourn.] L. Diffuse shrubs, or trees. Leaves leathery. Staminate ament with mostly 6–8 pollen-sacs under each scale. Ovulate ament with 1 ovule each. Seed nut-like, surrounded by the pulpy aril, except the apex.—About 6 species, of wide geographic distribution. A shrubby one occurs in NE N. A. and may extend into NW N. C., and an arboreal kind ranges west of the continental divide. The European species was formerly much used in ecclesiastical ceremonies, and much superstition was associated with the tree.—YEWS.

1. **T. floridana** Nutt. Tree becoming 6 m. tall, pleasant-scented when bruised: leaf-blades narrowly linear, 1–2 cm. long, sharply apiculate: aril light-red, 6–10 mm. long, the seed ovoid, 5–7 mm. long.—(YEW. FLORIDA-YEW.)—Bluffs and woods along the Apalachicola River, and tributary streams, Fla.—Spr.—Less common than *TORREYA*. On account of its smaller size, limited distribution and comparative scarcity, it has not been used economically. The heartwood is light-brown.

CLASS 2. **ANGIOSPERMAE** SEED-POD PLANTS

Carpel or pistil with a closed cavity within which the ovules are borne and the seeds mature.

SUBCLASS 1. **MONOCOTYLEDONES** MONOCOTYLS

Stem consisting of a ground-mass of soft tissue in which bundles of wood-cells are irregularly placed. Early leaves alternate. This subclass embraces one-fourth of the living seed-plants.

ORDER **PANDANALES** — PANDANAL ORDER

Perennial, aquatic or marsh herbs, with elongate rootstocks. Leaves with narrow blades. Flowers in narrow racemes or globular spikes. Perianth of scales or bristles. Androecium of 2-7 stamens. Gynoecium 1- or 2-carpellary. Fruit nut-like.

Racemes cylindric; perianth of bristles.  
Spikes (heads) globular; perianth of scales.

Fam. 1. **TYPHACEAE**.  
Fam. 2. **SPARGANIACEAE**.

FAMILY 1. **TYPHACEAE** — CAT-TAIL FAMILY

Plants erect. Raceme spike-like, solitary and terminal, subtended by deciduous bracts, the staminate portion uppermost. Perianth of bristles. Pistil stipitate: stigma narrow, spatulate, elliptic, or rhomboidal.—A family of uncertain relationship. Consists of the following genus.

1. **TYPHA** [Tourn.] L. Erect herbs with sheathed stems. Leaves erect, with linear blades. Raceme cylindric, the pistillate portion brown.—About 12 species of tropical and temperate regions. Represented in our range by 2 species, widely distributed.—Sum.—fall.—CAT-TAILS. REED-MACES. COOPER'S REEDS. CAT-O'-NINE-TAILS.—The rootstocks were an aboriginal food.

Raceme with staminate and pistillate portions usually separate: pollen of simple grains: pedicels of the mature pistillate raceme short, rigid, 1 mm. long or less. 1. *T. angustifolia*.  
Raceme with staminate and pistillate portions usually contiguous: pollen grains in 4's: pedicels of the pistillate raceme bristle-like, 2-3 mm. long. 2. *T. latifolia*.

1. *T. angustifolia* L. Stem slender, 1.5-3 m. tall: leaf-blades 5-15 mm. wide: raceme light-brown, the pistillate portion 0.5-2 cm. thick, separated from the staminate: stigma narrow: nutlet terete. [*T. domingensis* Pers.]—Marshes, river-shores, and ditches, nearly throughout N. A., but best developed near the coast.—(*W. I., Mex., C. A., S. A., Eurasia.*)—The leaves are used for making mats and the hairs of the fruits to stuff pillows and mattresses.

2. *T. latifolia* L. Stem about 1-2.5 m. tall: leaf-blades 10-25 mm. wide: raceme dark-brown or black, the pistillate portion 2.5-3.5 cm. thick, contiguous to the staminate: stigma spatulate or rhomboidal: nutlet furrowed.—Shores of lakes, ponds, and rivers, and marshes, nearly throughout U. S. and Can.—(*Eurasia.*)—Used for the same purposes as the preceding.

## FAMILY 2. SPARGANIACEAE—BUR-REED FAMILY

Plants erect, or rarely floating. Spikes globular, borne in racemes or panicles, or spicate, their bracts persistent. Perianth of scales. Pistil sessile: stigma subulate, lanceolate, elliptic, or linear. Fruit an achene. Related to the Typhaceae, but with less modified flower-parts. Comprises the following genus.

1. **SPARGANIUM** [Tourn.] L. Plants growing in low grounds, marshes, or deep water. Stem not sheathed. Leaves erect and triangular-keeled at the base or floating and flat.—About 24 species in temperate and boreal regions.—A dozen species additional to those described below occur elsewhere in North America.—Sum.—BUR-REEDS.

Achene fusiform, the body stalked: fruit-producing flowers pedicelled.

Achene obovoid or obpyramidal, sessile: fruit-producing flowers sessile.

1. *S. americanum*.

2. *S. eurycarpum*.

1. *S. americanum* Nutt. Plant 2-8 dm. tall, simple or branched: staminate heads mostly less than 1 cm. thick: fruit-head 1-2 cm. thick: achene-body 6-7 mm. long, narrowed at the apex, stipitate. [*S. simplex* (Chapm. Fl.)]—River-shores, borders of lakes, and ponds, various provinces, Fla. to Okla., Minn., and Newf. Plants with branched inflorescence have been referred to *S. androcladum*.

2. *S. eurycarpum* Engelm. Plant 8-20 dm. tall: staminate head about 1 cm. thick: fruit-head 2.5 cm. thick: achene-body 7-8 mm. long, rounded or depressed at the apex, sessile.—Marshes, stream-banks, and pools, various provinces, Fla. to Calif., B. C., and Newf.—This is a very vigorous plant. It frequently fills whole ponds and streams, the dense growth of leaves resembling species of iris or of sweet-flag (*Acorus*).

## —ORDER NAIADALES — NAIADAL ORDER

Perennial aquatic or marsh herbs. Leaves various, sometimes mere phyllodia. Flowers usually symmetric. Perianth wanting or imperfect. Androecium usually of 1-4 stamens. Gynoecium simple or several-carpellary.

Gynoecium of distinct carpels.

Gynoecium of one carpel, or of united carpels.

Staminate and pistillate flowers borne alternately on a one-sided spadix, laterally attached.

Staminate and pistillate flowers borne in the leaf-axils.

Staminate flower consisting of 2 anthers terminating an elongate pedicel: perianth wanting: stigmas filiform: caulescent plants with entire leaf-blades.

Staminate flower sessile or nearly so, consisting of an anther surrounded by the perianth: stigmas subulate: caulescent plants with spiny toothed leaf-blades.

Fam. 1. ZANNICHELLIACEAE.

Fam. 2. ZOSTERACEAE.

Fam. 3. CYNODOCEACEAE.

Fam. 4. NAIADACEAE.

## FAMILY 1. ZANNICHELLIACEAE — PONDWEED FAMILY

Aquatic caulescent herbs. Leaves alternate, filiform or with broad entire blades. Flowers perfect or monoecious, in spikes or clusters from a spathe. Androecium of 1 or mostly 2-4 distinct stamens. Gynoecium of several distinct carpels. Fruit a cluster or spike of drupelets.—Five genera and about 80 species, most abundant in temperate regions.

Flowers monoecious, axillary: leaves opposite.  
Flowers perfect, borne in stalked clusters or spikes: leaves alternate.

Tribe I. ZANNICHELLIEAE.

Tribe II. RUPPIEAE.

## I. ZANNICHELLIEAE

Submerged herbs, the very slender leaves with membranous stipules.

## 1. ZANNICHELLIA.

## II. RUPPIEAE

Stamens 2 or sometimes solitary, the connective without appendages: drupelet manifestly stipitate.

## 2. RUPPIA.

Stamens 4, the connective with dilated appendages: drupelet sessile.

## 3. POTAMOGETON.

1. **ZANNICHELLIA** [Mich.] L. Delicate herbs of fresh or brackish water. Leaves with narrow blades and inconspicuous bases. Flowers monoecious: staminate with 1 stamen: pistillate with 2-6 carpels together. Drupelets clustered, curved, crested.—Two or three species, widely distributed.

1. *Z. palustris* L. Stem 2-7 dm. long: leaves 2-7 cm. long, acute: drupelets 2-4, or sometimes 6, together, the body 2-4 mm. long, short stipitate.—(HORNED-PONDWEED.)—Ponds, ditches, and pools, throughout U. S. and S. Can.—(W. I., Mex., C. A., O. W.)—Spr.-sum.—Often in dense mats just beneath the surface of the water.

2. **RUPPIA** L. Delicate herbs of salt or brackish water. Leaves with slender blades and conspicuous bases. Flowers perfect. Stamens 2. Carpels 4. Drupelets clustered, oblique, crestless.—Three or four species, very widely distributed.

1. *R. maritima* L. Stem 3-10 dm. long: leaves 2.5-10 cm. long, capillary at the apex: drupelets few, the body ovoid, gibbous at the base, long-stipitate.—(DITCH-GRASS. TASSEL-PONDWEED. SEA-GRASS.)—Shallow water, throughout N. A., except the extreme N.—(W. I., Mex., C. A., S. A., O. W.)—Sum.-fall.—Commonly in extensive dense masses just beneath the surface of the water. In the extreme southern Coastal Plain the plant may be found in the winter.

3. **POTAMOGETON** [Tourn.] L. Herbs growing mostly in fresh water. Leaves various, the submerged and floating mainly different. Flowers perfect, spicate. Stamens 4, with appendaged anthers. Carpels 4. Drupelets 4 together, spicate, sessile.—About 70 species, widely distributed in temperate

regions.—PONDWEEDS. FISHWEEDS.—Both the submerged and the floating kinds often occur in such dense masses that navigation by small boats is seriously impeded. Plants are sometimes collected *en masse* and used as fertilizer. Our plants usually flower in sum.

Stipules axillary, free from the leaf.

Plant with both submerged and floating leaves.

Submerged leaves without blades.

Floating leaves with ovate or oval blades subcordate or rounded at the base: flowering spikes 3-6 cm. long, 5-6 mm. thick.

Floating leaves with narrowly elliptic blades acute at both ends: flowering spikes 1-2 cm. long, 2.5-4 mm. thick.

Submerged leaves with normal blades.

Blades of submerged leaves of 2 forms.

Blade of the floating leaves cordate at the base: drupelet-beak erect.

Blade of the floating leaves rounded at the base: drupelet-beak oblique.

Blades of submerged leaves all alike.

Submerged leaves with linear or nearly linear blades.

Leaf-blades with coarse cellular reticulation in the middle.

Leaf-blades with inconspicuous cellular reticulation.

Submerged leaves with lanceolate or oblanceolate blades.

Leaf-blades distinctly petioled.

Leaf-blades sessile or nearly so.

Plant with submerged leaves only.

Leaf-blades broad.

Blade short-petioled or nearly sessile.

Blade clasping the stem.

Leaf-blades linear or filiform.

Blade 1-nerved.

Blade 3-nerved.

Drupelet crested: plants without propagating buds or glands.

Drupelet crestless: plants with both propagating buds and glands.

Stipules adnate to the blades or to the petioles of the submerged leaves.

Plant with both submerged and floating leaves: drupelet crested.

Plant with submerged leaves only: drupelet crestless.

1. *P. natans*.

2. *P. floridanus*.

3. *P. pulcher*.

4. *P. amplifolius*.

5. *P. epiphydrus*.

6. *P. heterophyllus*.

7. *P. fluitans*.

8. *P. angustifolius*.

9. *P. lucens*.

10. *P. perfoliatus*.

11. *P. Curtissii*.

12. *P. foliosus*.

13. *P. pusillus*.

14. *P. diversifolius*.

15. *P. pectinatus*.

1. *P. natans* L. Leaves of 2 kinds, the submerged phyllodia, the floating ones with ovate or oval blades 4-9 cm. long, rounded or subcordate at the base: anther notched at the apex: drupelet obovoid, 4-4.5 mm. long, scarcely keeled.—Still water and slow streams, various provinces, Tenn. to Calif., B. C., and N. S.—(*Eurasia*.)

2. *P. floridanus* Small. Smaller than *P. natans*: floating leaves with narrowly elliptic blades 4-7 cm. long, acute at both ends: anther apiculate at the apex: drupelet smaller than in *P. natans*.—Blackwater River, W Fla.

3. *P. pulcher* Tuckerm. Leaves of 3 kinds, the lower submerged ones leathery, the blades spatulate to ovate, the upper submerged ones narrower, flimsy, the floating leaves with leathery ovate or orbicular-ovate, cordate blades: drupelet

turgid, 4-4.5 mm. long, 3-keeled.—(HEARTLEAF-PONDWEED.)—Ponds, various provinces, Fla. to Ark., B. C., and Me.

4. *P. amplifolius* Tuckerm. Leaves of 3 kinds, the lower submerged ones with lanceolate blades acute at each end, the upper submerged ones mostly smaller than the lower ones; blades elliptic to oval, the floating leaves with thick ovate or oval blades rounded at the base: drupelet turgid, 4-5 mm. long, the middle keel prominent.—Streams and ponds, various provinces, Fla. to Ark., Calif., B. C., and N. S.

5. *P. epihydrus* Raf. Leaves of 2 kinds, the submerged with linear 5-nerved blades, the floating ones with elliptic or obovate blades 3-8 cm. long: drupelet globose-obovoid, 2.5-3 mm. long, the middle keel sharp. [*P. pennsylvanicus* Willd., *P. Nuttallii* Cham. & Schlecht.]—Ponds and streams, various provinces, S. C. to B. C. and Newf.

6. *P. heterophyllus* Schreb. Leaves of 2 kinds, the submerged narrowed upward, inconspicuously reticulate, the floating ones with oval or elliptic blades 1.5-4 cm. long, abruptly pointed: drupelet 1.5-3 mm. long, indistinctly 3-keeled.—Still or flowing water, throughout U. S. and S Can.—(*W. I., Mex., Eurasia.*)

7. *P. fluitans* Roth. Leaves of 2 kinds, the submerged long-petioled, with elongate blades, the floating ones with elliptic, sometimes narrowly so, long-petioled blades 4-15 cm. long, usually acute: drupelet 3.5-4 mm. long, the middle keel prominent. [*P. americanus* Cham. & Schlecht., *P. lonchites* Tuckerm.]—Streams and ponds, various provinces, Fla. to Calif., B. C., and N. B.—(*W. I., Mex., O. W.*)

8. *P. angustifolius* Berch. & Presl. Leaves of 2 kinds, the submerged with blades 5-15 cm. long, the floating ones with elliptic, nearly sessile blades 3-10 cm. long: drupelet 2.5-3.5 mm. long, 3-keeled, abruptly pointed. [*P. Zizii* Roth.]—Lakes and streams, various provinces, Fla. to Tex., Calif., and Me.—(*Mex., C. A., O. W.*)

9. *P. lucens* L. Leaves of 1 kind, all submerged; blades elliptic or lanceolate, or oval above, 5-20 cm. long, acute or acuminate and often serrulate at the apex, nearly sessile: drupelet 3 mm. long, blunt-tipped.—(CORNSTALK-PONDWEED.)—Ponds, various provinces, Fla. to Tex., Calif., and N. S.—(*W. I., Mex., O. W.*)

10. *P. perfoliatus* L. Leaves submerged; blades suborbicular to ovate or lanceolate, 2-4 cm. long, usually obtuse and serrulate at the apex, cordate-perfoliate: drupelet 2.5-3 mm. long, obscurely 3-keeled.—Slow rivers and ponds, various provinces, Fla. to Tex., Minn., and Newf.—(*Eu.*)

11. *P. Curtissii* Morong. Leaves submerged; blades linear-filiform, 1-4 cm. long, 1-ribbed, hair-tipped: drupelet not seen.—Tidal creeks, Blackwater River region, W Fla.

12. *P. foliosus* Raf. Leaves very many, submerged; blades linear or filiform, 1.5-5 cm. long, 3-ribbed, acute: drupelet 1.5-2 mm. long, the middle keel crest-like. [*P. pauciflorus* Pursh.]—Streams and ponds, various provinces, Fla. to Calif., B. C., and N. B.—(*W. I., Mex.*)

13. *P. pusillus* L. Leaves numerous, submerged; blades linear or linear-filiform, 2-8 cm. long, 3-ribbed, acute: drupelet 1.5-2 mm. long, the middle keel not crest-like, or obsolete.—Slow streams and ponds, various provinces, Ala. to Calif., B. C., N. S., and N. C.—(*Mex., Eurasia.*)

14. *P. diversifolius* Raf. Leaves of 2 kinds, the submerged linear-setaceous, the floating ones elliptic, oval, or elliptic-lanceolate, 1-2.5 cm. long: drupelet about 1 mm. long, the middle keel crest-like. [*P. hybridus* Michx.]—Ponds and still water, various provinces, Fla. to Tex., Calif., and Me.—(*W. I., Mex.*)

15. *P. pectinatus* L. Leaves of 1 kind, all submerged, setaceous or filiform, 2-15 cm. long: drupelet 1.5 mm. long, crestless.—Still water or streams, various provinces, Fla. to Tex., Calif., B. C. and Que.—(*W. I., O. W.*)

## FAMILY 2. ZOSTERACEAE — EEL-GRASS FAMILY

Marine herbs. Leaves alternate: blades narrow, the base inflated. Flowers monoecious, alternating on a flat spadix; staminate a sessile anther; pistillate an ovary with a style and two capillary stigmas. Fruit utricular.—Consists of 2 genera and about 8 species of wide distribution in coastal regions.

1. *ZOSTERA* L. Plants submerged or floating. Leaf-blades elongate. Spathe thin-edged.—About 8 species in both the Old World and the New.

1. *Z. marina* L. Leaf-blades linear, 3.5-5 mm. wide: spadix 2.5-6.5 cm. long: seed about 20-ribbed.—(GRASS-WRACK. EEL-GRASS.)—Streams, bays, and ditches along the coast, Fla. to Newf.; also on Pacif. coast.—(*O. W.*)—It occurs only in salt water.—*Z. minor* has been reported in our region, but imperfect material of the next following species has been mistaken for it.

## FAMILY 3. CYMODOCEACEAE — MANATEE-GRASS FAMILY

Submerged herbs with jointed rootstocks. Leaves clustered at the nodes or on short branches each with a sheath and a narrow blade. Flowers monoecious or dioecious. Perianth wanting. Androecium a pair of anthers terminating a long stalk. Gynoecium of 2 united carpels, terminating in a style and 2 elongate stigmas, or of 1 carpel. Fruit an oblique nutlet.—Comprises 2 genera and 10 species, widely distributed.

Anthers equally attached to the stalk: stigmas 2: leaf-blade terete or nearly so.

Anthers unequally attached to the stalk: stigma 1: leaf-blade flat.

1. CYMODOCEA.

2. HALODULE.

1. *CYMODOCEA* Koenig. Rootstock elongate. Leaves terete or half-terete above the sheaths. Flowers hidden in the leaf-sheaths, or the staminate long-exserted.—Seven or eight species, in tropical regions.

1. *C. manatorum* Aschers. Plant growing on sandy bottoms, the short stems arising from the nodes of the rootstock: leaf-blades narrowly linear, 5-25 cm. long: nutlet 6-7 mm. long, short-stipitate, prominently beaked.—(MANATEE-GRASS.)—Coastal creeks and bays, Fla. to La.—(*W. I.*)—All year. Seldom seen unless dredged up or blown ashore during storms.

2. **HALODULE** Endl. Rootstock elongate. Leaves flat above the sheaths. Flowers borne in the leaf-sheaths or the staminate long-exserted.—Two species, one in the Old World and one in the New.

1. **H. Wrightii** Aschers. Plant growing on sandy bottoms, the short stems arising from the nodes of the rootstock: leaf-blades narrowly linear, 3-40 cm. long: nutlets sessile.—Bays and creeks along the coast, southern Fla., particularly on the Reef.—(W. I.)—All year.—Grows alone or in company with *Cymodocea*. Both these plants are commonly associated with the turtle-grass, *Thalassia*, on sandy bottoms.

#### FAMILY 4. NAIADACEAE — NAIAD FAMILY

Mostly fresh-water herbs. Leaves mainly opposite: blades mostly toothed, the bases dilated. Flowers dioecious, axillary: staminate, a double perianth and a single stamen: pistillate, a gynoecium consisting of an ovary, a style, and 2 or 3 stigmas. Fruit drupaceous.—Consists of the following genus:

1. **NAIAS** L. Submerged plants with usually much-branched stems. Leaves numerous, the margins prominently or inconspicuously toothed.—About 10 species, collectively almost cosmopolitan.—NAIADS.

Flowers monoecious: internodes and lower surfaces of the leaves unarmed.

Anther 1-celled: seeds shining.

Anther 4-celled: seeds reticulated.

Leaf-margins with minute subulate teeth.

Leaf-margins with prominent triangular teeth.

Flowers dioecious: internodes and lower surfaces of the leaves spiny.

Leaves about 0.5 mm. wide, with 15-24 marginal teeth: internodes filiform.

Leaves about 2 mm. wide, with 6-10 marginal teeth: internodes stout.

1. *N. flexilis*.

2. *N. guadalupensis*.

3. *N. conferta*.

4. *N. gracilis*.

5. *N. marina*.

1. ***N. flexilis*** (Willd.) Rostk. & Schmidt. Stem slender: leaves more numerous, rather closer together and smaller than in the next following; blade mainly acuminate: drupelet 3-4 mm. long.—Streams and ponds, various provinces, S. C. to Tex., B. C., and Lab.—(W. I. ? Mex. ? O. W.)—Sum.—This and some of the following species are sometimes collected for fertilizer. Dried *en masse* it is occasionally used as a packing material.

2. ***N. guadalupensis*** (Spreng.) Morong. Stem capillary or filiform: leaves 10-26 mm. long; blade acute: drupelet about 2 mm. long.—Ponds and lakes, various provinces, Fla. to Tex., Ore., and Pa.—(W. I., Mex., C. A.)—Sum.—fall.

3. *N. conferta* A. Br. Similar to *N. flexilis* in habit, but the leaves more slender; blade with prominently sharp-toothed margins.—Tidal creeks, W Fla.—(*W. I.*)—Sum.

4. *N. gracilis* (Morong) Small. Stem filiform, the internodes slightly armed near the top: leaf-blades slender, acuminate: drupelet mainly less than 4 mm. long.—Creeks and ponds, Fla.—All year.

5. *N. marina* L. Stem stout, the internodes strongly armed throughout: leaf-blades linear, acute: drupelet mainly over 4 mm. long. [*N. major* All.]—Lakes, rivers, marshes, and salt springs, various provinces, Fla. to Calif., Minn., and N. Y.—(*W. I.*, *Mex.*, *O. W.*)—Sum.

#### ORDER ALISMALES — ALISMAL ORDER

Marsh or aquatic herbs. Leaves alternate, mere phyllodia, or with dilated blades. Flowers regular. Perianth of sepals and usually also of petals. Androecium of 3-6 stamens or more. Gynoecium of 3-many carpels.

Petals nearly similar to the sepals: carpels coherent.

Fam. 1. SCHEUCHZERIACEAE.

Petals very different from the sepals: carpels not coherent.

Fam. 2. ALISMACEAE.

#### FAMILY 1. SCHEUCHZERIACEAE — ARROW-GRASS FAMILY

Perennial herbs. Leaves narrow or slender above the dilated bases. Flowers perfect, in spikes or racemes. Perianth herbaceous. Gynoecium 3-6-carpellary. Style wanting or obsolete. Fruit 3-6 turgid carpels.—Four genera and about 10 species of wide geographic distribution.

1. **TRIGLOCHIN** L. Acaulescent herbs, the perianth inconspicuous.—Nine species, in subarctic and temperate regions. Two species, additional to the following, occupy similar habitats in North America north of our range.

1. *T. striata* R. & P. Plants glabrous: leaves 2-3 dm. long, attenuate: raceme 2-15 cm. long: sepals ovate or oval, less than 1 mm. long, greenish or light-yellow: fruit 1.5-2 mm. in diameter, each carpel 3-ribbed. [*T. triandra* Michx.]—(ARROW-GRASS.)—Salt-marshes, river-shores, and edges of lakes, mostly near the coast, Fla. to La. and Md.; also Calif.—(*Mex.*, *S. A.*)—Sum.—fall, or all year S.—Reaches its best development in the coastwide marshes. It is rare in the Florida lake region.

#### FAMILY 2. ALISMACEAE — WATER-PLANTAIN FAMILY

Annual or perennial herbs. Leaves basal, the blades flat, often with basal lobes, or mere phyllodia. Flowers perfect, monoecious, or dioecious, whorled. Sepals herbaceous. Petals tender, white or pink. Gynoecium of few to many carpels. Style manifest. Fruit a head of flattened or turgid achenes.—About 14 genera and 75 species, widely distributed in fresh-water swamps and marshes.

Carpels borne in one series: achenes verticillate.  
Carpels borne in several spiral series: achenes capitate.

I. ALISMEAE.  
II. SAGITTARIEAE.

## I. ALISMEAE

Flowering stem much branched, the pedicels very slender and wiry.

## 1. ALISMA.

## II. SAGITTARIEAE

Flowers all perfect.

Style not apical: fruit-head not echinate: achene turgid, beakless or only obscurely beaked.

Style apical: fruit-head echinate: achene flat, prominently beaked.

Flowers polygamous or dioecious, or monoecious—the lower flowers of the inflorescence perfect or pistillate, the upper ones staminate.

Lower flowers of the inflorescence perfect.

Lower flowers of the inflorescence pistillate.

## 2. HELANTHIUM.

## 3. ECHINODORUS.

## 4. LOPHOTOCARPUS.

## 5. SAGITTARIA.

1. **ALISMA** L. Leaves without basal lobes. Flowers perfect, in compound panicles. Stamens mostly 6. Achenes in 1 whorl.—About 10 species, mostly in temperate and tropical regions.

1. **A. subcordatum** Raf. Leaves erect; blade entire, 3–15 cm. long, long-petioled: scape 1–10 dm. tall, the branches, or pedicels, whorled in 3's to 10's: sepals obtuse: petals 1–2 mm. long: fruit-heads depressed, 3.5–4.5 mm. wide: achene 1.5–2 mm. long. [*A. Plantago* (Chapm. Fl.)]—(WATER-PLANTAIN.)—Swamps, ditches, and shallow water, various provinces, Fla. to Tex., Minn., and Mass.—Spr.—fall.

2. **HELANTHIUM** Engelm. Leaves without basal lobes, the blades narrow. Flowers perfect, borne in racemes. Stamens 6 or 9. Achenes borne in an inconspicuous naked head.—Two species, one in Cuba and the following.

1. **H. parvulum** (Engelm.) Britton. Leaves lax; blade linear or linear-elliptic, 1–3 cm. long: scape 3–11 cm. tall, with a terminal whorl of 2–8 flowers: petals 1.5–2 mm. long: fruit-head 3–4 mm. thick: achene barely 1 mm. long. [*Echinodorus parvulus* Engelm.]—Muddy places or shallow water, various provinces, Fla. to Tex., Minn., and Mass.—(*W. I., Mex.*)—Spr.—fall.

3. **ECHINODORUS** L. C. Rich. Leaves with rounded basal lobes. Flowers perfect, in racemes or panicles. Stamens 12–30. Achenes borne in a bristly naked head.—About 15 species, all but the following mostly tropical American.—Spr.—sum.—BUR-HEADS. MUD-BABIES. CREEPING WATER-PLANTAINS.

Flowers, and fruit-heads, borne on pliable curved pedicels: style shorter than the ovary: achene-beak about  $\frac{1}{4}$  as long as the body.

1. *E. radicans*.

Flowers, and fruit-heads, borne on stiff spreading pedicels: style longer than the ovary: achene-beak fully  $\frac{1}{2}$  as long as the body.

2. *E. cordifolius*.

1. *E. radicans* (Nutt.) Engelm. Stem creeping near the base: leaf-blades ovate or elliptic, 5–20 cm. long: scape often creeping, the flower-whorls remote: petals about 6 mm. long: fruit-head 7–8 mm. thick: achene 2 mm. long, short-beaked.—Pond-margins and ditches, various provinces, Fla. to Tex., Calif., Kans., and D. C. (*Mex.*)

2. *E. cordifolius* (L.) Griseb. Stem erect or ascending: leaf-blades lanceolate to broadly ovate, 4–20 cm. long: scape 1–5 dm. tall, the flower-whorls less remote than in *E. radicans*: petals 4–6 mm. long: fruit-head 4–6 mm. thick: achenes 2.5–3 mm. long, long-beaked. [*E. rostratus* Engelm.]—Swamps, ditches, and ponds, various provinces, Fla. to Tex., Kans., and Ill.—(*W. I., Mex., C. A.*)

4. **LOPHOTOCARPUS** T. Durand. Leaves often with basal lobes, but variable. Flowers monoecious, the upper ones staminate. Stamens 9–15. Achenes in a head embraced by the calyx.—About 7 species, besides the following and several that range westward to California, others occur in tropical America.—Sum.—fall.

1. *L. calycinus* (Engelm.) J. G. Smith. Leaves with petioles 1.5–4 dm. long: scape with 2–6 flower-whorls: achene over 2 mm. long, broad, beaked.—Wet grounds, swamps, and ponds, various provinces, Ala. to N. M., S. Dak., and Del.

5. **SAGITTARIA** L. Leaves often with basal lobes, sometimes lobeless, or mere phyllodia. Flowers monoecious or dioecious, the upper ones usually staminate. Corolla white. Stamens mainly numerous. Achenes numerous or rarely few, in dense heads.—Comprises about 40 species of wide geographic distribution. Several species produce edible starchy tubers which were extensively used by the aborigines.—Mainly sum.—fall, or all year S.—**ARROW-HEADS. SWAMP-POTATOES.**

Sepals of the pistillate flowers ultimately lax or reflexed, not accrescent.

Fruit-bearing pedicels reflexed or recurved.

Fruit-bearing pedicels ascending.

Leaf-blades without basal lobes.

Leaf-blades with basal lobes.

Sepals of the pistillate flowers accrescent and ultimately appressed to the fruit-heads.

I. SUBULATAE.

II. ANGUSTIFOLIAE.

III. LATIFOLIAE.

IV. MONTEVIDENSES.

#### SUBULATAE

Filaments glabrous.

Inflorescence simple, except in robust plants of *S. torata*: phyllodia obtuse or abruptly pointed.

Mud-inhabiting plant with short leaves: filaments about as long as the anthers: achene long-beaked.

Aquatic plants with elongate leaves: achene short-beaked.

1. *S. subulata*.

Leaves with small floating blades: inflorescence simple: crests of the achene with mere shallow undulations.

Leaves elongate ligulate pbyllodia: inflorescence sometimes branched: crests of the achene with deep undulations.

Inflorescence branched: pbyllodia slenderly attenuate. Filaments pubescent.

2. *S. stagnorum*.

3. *S. lorata*.

4. *S. filiformis*.

5. *S. platyphylla*.

## II. ANGUSTIFOLIAE

Pedicels of the pistillate flowers as long as those of the staminate ones, or nearly so.

Filament dilated, relatively short.

Leaf-blade terete or 3-sided, often imperfectly developed.

Anther longer than the filament: achene with several facial wings.

Anther shorter than the filament: achene with 3 low facial ridges.

Leaf-blade flat.

Achene oval or broadly elliptic.

Achene cuneate:

Beak large, horizontal at the top of the achene-body.

Beak minute, borne much below the top of the achene-body.

Inflorescence simple: lower bracts ovate, united to the middle: achene with lateral ribs or wings.

Inflorescence widely branched: lower bracts lanceolate, united at the base: achene without lateral ribs or wings.

Filament not dilated, slender.

Bracts and sepals granular-papillose.

Bracts and sepals ribbed.

Achene more or less falcate, gradually beaked, the dorsal wing thick and even.

Achene not falcate, abruptly beaked, the dorsal wing usually thin and crested.

Pedicels of the pistillate flowers very short or nearly wanting.

Fruit-head not ecbinate: achene broadly winged and short-beaked: anther broadly elliptic, about as long as the filament.

Fruit-head echinate: achene narrowly winged and long-beaked: anther suborbicular, shorter than the filament.

6. *S. teres*.

7. *S. isoetiformis*.

8. *S. cycloptera*.

9. *S. Mohrii*.

10. *S. graminea*.

11. *S. Chapmanii*.

12. *S. falcata*.

13. *S. lancifolia*.

14. *S. angustifolia*.

15. *S. macrocarpa*.

16. *S. rigida*.

## III. LATIFOLIAE

Achene minutely or inconspicuously beaked.

Achene prominently long-beaked:

Beak horizontal or nearly so.

Inflorescence-rachis, pedicels, bracts, and sepals pubescent.

Achene less than 4 mm. long: beak horizontal or declined, narrow, much smaller than the body from which it is differentiated: bracts tomentulose.

Achene over 4 mm. long: beak horizontal-ascending, broad, larger than the body, with which it is continuous: bracts granular-pubescent.

Inflorescence-rachis, pedicels, bracts, and sepals glabrous.

Beak erect.

Filament pubescent.

Pistillate pedicel very short: sepals and bracts glabrous.

Pistillate pedicel elongate: sepals and bracts pubescent.

Filament glabrous.

Basal lobes of the leaf-blade acute or acuminate.

Basal lobes of the leaf-blade rounded.

10. *S. graminea*.

17. *S. pubescens*.

18. *S. ornithorhyncha*.

19. *S. latifolia*.

16. *S. rigida*.

20. *S. viscosa*.

21. *S. longirostra*.

22. *S. australis*.

## IV. MONTEVIDENSES

Robust plant: leaf-blades 1-5 dm. long and wide: scape up to 1 m. tall.

23. *S. montevidensis*.

1. *S. subulata* (L.) Buch. Leaves erect; blade linear or linear-lanceolate, 2-3 cm. long, or wanting, the phyllodia slender: scape 5-15 cm. tall, with 1 or 2 flower-whorls: achenes relatively few, about 1.5 mm. long, the beak ascending. [*S. natans pusilla* Chapm.]—Tidal flats and mud, Coastal Plain and New England Coast, Fla. to Ala. and Conn.

2. *S. stagnorum* Small. Leaves few; blades elliptic to ovate-elliptic 1.5-5 cm. long, the phyllodia linear, wider than the petioles: scape with 1-few flower-whorls: flowers floating: achenes few, about 2 mm. long, the beak mostly erect. [*S. natans* Michx. not Pall.]—Shallow ponds, Coastal Plain, Fla. to Ala. and S. C.

3. *S. lorata* (Chapm.) Small. Leaves represented by elongate-linear, often rather broad phyllodia which sometimes are up to 250 cm. long, 3-5-ribbed, at least in age: scape about as long as the leaves: flower-whorls usually 4-8: flowers floating: achenes numerous, 2-2.5 mm. long, the beak horizontal.—Streams and springs, Fla. and adj. Coastal Plain of Ala. and Ga.; perhaps N along the coast. The plant of the northern states, sometimes referred here, may represent a different species.—An apparently extremely large form of *S. lorata* in the Wakulla River, Fla., has been named *S. kurziana* Glück.

4. *S. filiformis* J. G. Smith. Leaf-blades wanting: scape 6-12 dm. long, with several flower-whorls; only 1 or 2 flowers of the lower whorls pistillate, their pedicels elongate: fruit-head 6-7 mm. thick: achene 1.5 mm. long, about 6-crested, the beak curved up.—Ponds, Coastal Plain, Fla. and Ala.; apparently also in the Carolinas.

5. *S. platyphylla* (Engelm.) J. G. Smith. Leaf-blades lanceolate, elliptic, or ovate, 5-15 cm. long: scape 2-5 dm. tall, with 3-8 flower whorls, the flowers of 2 or 3 lower whorls pistillate, their pedicels very short: fruit-heads fully 10 mm. thick: achenes 2 mm. long, winged, the beak horizontal.—Ponds and swamps, various provinces, Ala. to Tex., Kans., and Mo.

6. *S. teres* S. Wats. Leaf-blades narrow and imperfect, or wanting: scape 1.5-4.5 dm. tall, with 1 or rarely 2 or 3 flower-whorls, 1 or 2 flowers of the lower whorl pistillate: fruit-head 8-12 mm. thick: achene 2 mm. long, unevenly crested, the beak nearly erect.—Shallow water, Coastal Plain and New England Coast, S. C. to Mass.

7. *S. isoetiformis* J. G. Smith. Leaf-blades wanting or imperfect: scape 7-12 dm. tall, usually with 1 flower whorl: fruit-head about 6 mm. thick: achene 1 mm. long, dorsally crested, the beak oblique.—Low grounds and sandy lake-margins, Coastal Plain, Fla. and S. Ga.

8. *S. cycloptera* (J. G. Smith) C. Mohr. Leaf-blades linear or linear-lanceolate, 4-15 cm. long, or wanting: scape 2-8 dm. long, mainly with 3-15 flower-whorls: fruit-head barely 10 mm. thick: achene 1.5 mm. long, the minute beak ascending.—Swamps, Coastal Plain, Fla. to La. and S. C.

9. *S. Mohrii* J. G. Smith. Leaf-blades linear to lanceolate, 5-15 cm. long, sometimes imperfect: scape 4-9 dm. long, with 6-8 flower-whorls: fruit-head 6-8 mm. thick: achene 2.5-3.5 mm. long, the large beak horizontal.—Ponds, Coastal Plain, Fla. to Miss. and Ga.

10. *S. graminea* Michx. Leaf-blades linear, lanceolate, or elliptic, 5-15 cm. long, or wanting: scape 1-6 dm. tall, with few or many flower-whorls: fruit-head less than 10 mm. thick: achene 1.5 mm. long, winged, the minute beak horizontal.—Mud and ponds, various provinces, Fla. to Tex., Sask., and Newf.

11. *S. Chapmanii* (J. G. Smith) C. Mohr. Leaf-blades linear or lanceolate, 15–20 cm. long, or wanting: scape 3–5 dm. long, with often many flower-whorls and paniculate: fruit-head 5 mm. thick: achene 1 mm. long, wingless, the minute beak lateral.—Ponds and marshes, Coastal Plain, Fla., Ala., and Ga.

12. *S. falcata* Pursh. Leaf-blades narrowly elliptic, sometimes slightly broadest above the middle, or nearly linear, 10–35 cm. long, mainly 3–5 nerved: pedicels of the pistillate flowers relatively short, their bracts of an ovate type: achene about 2 mm. long.—Low grounds and marshes, Coastal Plain, Fla. to Tex. and Del.—(*Mex.*)

13. *S. lancifolia* L. Leaf-blades elliptic or nearly so to narrowly elliptic-lanceolate, 30–60 cm. long, mainly 5–9-nerved: pedicels of pistillate flowers relatively long, their bracts of a lanceolate type: achene 2.5–3 mm. long.—Swamps, pools, and low river-banks, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)—Very variable in size, but at its best it is the giant of our arrow-heads. On the Florida prairies and marshes the leaves and flower-stalks often grow higher than one's head. Used medicinally by the Seminoles in cases of shock following alligator bite.

14. *S. angustifolia* Lindl. Leaf-blades linear or nearly so, sometimes very narrow, 9–40 cm. long: scape as long as the leaves or longer, usually simple, with several flower-whorls, their bracts of a lanceolate type: fruit-head 1–1.5 cm. thick: achene 2–2.5 mm. long, abruptly narrowed into the minute beak, the dorsal wing usually crested.—Low grounds and swamps, Coastal Plain, Ga. to La.—(*W. I., Mex., C. A., S. A.*)

15. *S. macrocarpa* J. G. Smith. Leaf-blades linear or linear-lanceolate, 5–7 cm. long: scape 2–4.5 dm. tall, with 3–5 flower-whorls, the flowers of the lowest whorl or the 2 lower whorls pistillate: fruit-head 10–12 mm. thick: achene 3 mm. long, winged, the beak ascending.—Pond-margins and streams, Coastal Plain, S. C. and N. C.

16. *S. rigida* Pursh. Leaf-blades linear to broadly ovate, individually with basal lobes, 5–20 cm. long: scape weak, 1–8 dm. long, with 5–9 flower-whorls: fruit-head 8–15 mm. thick, sessile or nearly so: achene 3–4 mm. long, winged, the beak ascending.—(*STIFF-ARROWHEAD.*)—Swamps and running water, various provinces, Tenn. to Nebr., Minn., Que., and N. J.

17. *S. pubescens* Muhl. Leaf-blades 8–25 cm. long, with the terminal lobe more rounded than in no. 20, puberulent or hirsute: scape 3–6 dm. tall: pedicels of pistillate flowers about as long as the obtuse bracts or slightly longer: sepals not accrescent: fruit-head 8–15 mm. thick: achene 2–3 mm. long, the beak horizontal or somewhat declined.—Meadows, spring-runs, and marshes, Coastal Plain and rarely adj. provinces, Fla. to Ala., Tenn., Pa., and N. J.

18. *S. ornithorhyncha* Small. Leaf-blades 9–17 cm. long, hastate, the terminal lobe slightly acuminate, the basal lobes as long as the terminal one or nearly so: scape 7–9 dm. tall: pedicels of the pistillate flowers much longer than the acute or acutish bracts: sepals ovate, obtuse: fruit-heads globular, 1.5–2 cm. in diameter: achene resembling a bird, 4–6 mm. long, the beak as long as the achene-body or longer, winged, horizontal-ascending.—Swamps, Coastal Plain, N. C.

19. *S. latifolia* Willd. Leaf-blades broad, 15–40 cm. long, glabrous, the basal lobes narrower and rather shorter than the terminal one: scape 3–6 dm. tall: pedicels of pistillate flowers much longer than the acute bracts: fruit-head 15–30 mm. thick: achene about 3 mm. long, the beak ascending or recurved. [*S. variabilis* Engelm.]—(*ARROWLEAF. DUCK-POTATO. WAPATO.*)—Swamps, shallow water, and river-banks, various provinces, Fla. to Calif., B. C., and N. B.—(*Mex., C. A.*)

20. *S. viscosa* C. Mohr. Leaf-blades 20-35 cm. long, the middle lobe broadly ovate, the basal lobes shorter, acute or acuminate: scape 5-8 dm. tall, with few flower-whorls: bracts obtuse: fruit-heads not seen.—Muddy places and marshes, Coastal Plain, N Fla. and S Ala.

21. *S. longirostra* (Micheli) J. G. Smith. Leaf-blades 10-25 cm. long, the terminal lobe broadly ovate, the basal lobes as long but narrower: scape 4-8 cm. tall, with few flower-whorls: bracts acuminate: fruit-heads 12-18 mm. thick, short-pedicelled: achene 4 mm. long, with facial wings, the dorsal wing partially crenate, the beak erect.—Pond-margins and streams, Coastal Plain and rarely adj. provinces, Fla. to Ark., Pa., and N. J.

22. *S. australis* (J. G. Smith) Small. Leaf-blades 8-10 cm. long, the terminal lobe very broad, the basal lobes shorter, obtuse: scape 4-5 dm. tall, with 4-6 flower-whorls: fruit-heads fully 10 mm. thick: achene 3-3.5 mm. long, with facial wings, the dorsal wing undulate, the beak curved over the crest.—Low grounds, Appalachian Plateau, N Ala.

23. *S. montevidensis* C. & S. Leaf-blades 1-5 dm. long, the basal lobes narrower and shorter than the ovate terminal one: scape very stout, about as tall as the leaves, the pedicels relatively short: fruit-heads 15-30 mm. thick: achene 2-3 mm. long, the slender beak oblique.—(GIANT-ARROWLEAF.)—Low grounds and swamps, Coastal Plain, Fla. to Ala. and N. C.; also Calif. Nat. of S. A.

#### ORDER HYDROCHARITALES — HYDROCHARITAL ORDER

Perennial aquatic herbs, with rootstocks. Leaves usually with blades. Flowers monoecious or dioecious, or rarely perfect, from spathes. Perianth double, or the corolla wanting. Androecium of 1-12 stamens. Gynoecium 3-15-carpellary. Ovary inferior. Fruits capsular or baccate.

Gynoecium 3-carpellary, or rarely 2-, 4- or 5-carpellary: ovary 1-celled, with 3, or rarely with 2, 4 or 5 parietal placentae: stigmas usually 3. Fam. 1. ELODEACEAE.

Gynoecium 6-9 carpellary: ovary 6-9-celled: stigmas 6-9. Fam. 2. HYDROCHARITACEAE.

#### FAMILY 1. ELODEACEAE — TAPE-GRASS FAMILY

Plants with leafy stems, or leaves basal, often greatly elongate. Gynoecium 2-5-carpellary, the ovary 1-celled.—Comprises 6 genera and about 24 species, widely distributed in warm regions.

Staminate flower with 1-3 stamens: plant with horizontal rootstocks.

Leaves opposite on short horizontal stems; blade broad, more or less petioled: stigmas filiform: pollen filiform: marine plant. 1. HALOPHILA.

Leaves spiral, but in a basal cluster; blade linear, without a petiole: stigmas short and broad: pollen spheroidal: fresh water plant. 2. VALLISNERIA.

Staminate flower with 9 stamens: fresh water plant with floating stems and whorled leaves. 3. PHILOTRIA.

1. *HALOPHILA* Thouars. Marine submerged herbs, with short branches arising from the rootstock. Leaves opposite or whorled, the lower ones often scale-like. Flowers dioecious or monoecious, the staminate pedicelled, the pistillate sessile in the spathe, flask-shaped. Fruit short, included in the spathe.—About 6 species, mostly circumtropical.—SEA-GRASSES—The plants creep on the sea-bottom, in shallow water, or at considerable depths when

the water is clear. Their habit is somewhat suggestive of marine algae of the genus *Caulerpa*; often found washed ashore after storms.

Leaves 1 or 2 at the tip of the branches; blades evidently serrulate, on filiform petioles; capsule short-beaked.

Leaves 3-7 at the tips of the branches; blades ciliate or ciliolate and obscurely serrulate, sessile or with stout short petiole-like bases; capsule long-beaked.

1. *H. Baillonis*.

2. *H. Engelmannii*.

1. **H. Baillonis** Aschers. Plant with a thread-like rootstock, the branches short, usually very short or obsolete: leaves opposite, blades oblong, linear-oblong, or spatulate, mostly 1-2.5 mm. long, thin, often minutely pubescent, especially when young, with the lateral veins indistinct or obscure, slender-petioled: capsule ellipsoid or ovoid-ellipsoid, 3-3.5 mm. long.—Sandy or marly bottoms on Reef about the Florida Keys.

2. **H. Engelmannii** Aschers. Plant with a cord-like rootstock; the branches stoutish, mostly 2-6 cm. long: leaves mostly whorled at the tips of the stem and branches; blades linear, elliptic, or oblanceolate, 1-3 cm. long, thick, glabrous, sharply serrulate, evidently 3-veined, sessile or with short petiole-like bases: capsule ovoid or globose-ovoid, 2.5-3 mm. long.—Bays and creeks, coast of Fla. and open waters of the Fla. Reef.

2. **VALLISNERIA** [Mich.] L. Fresh-water herbs. Leaves basal with greatly elongate ribbon-like blades. Flowers dioecious, the staminate numerous, crowded on a spadix; they break away from their short stalks and float on the surface of the water where they shed their pollen about the pistillate flowers which have been raised to the surface by the rapid growth of the pedicels. Pistillate flowers few, each solitary at the end of an elongate spiral scape. Fruit subtended by the spathe.—Two species, both represented in our range, the first one also in the Old World.—EEL-GRASSES. TAPE-GRASSES. WATER-CELERIES.—Plants with their long leaves and pistillate flowers usually partly floating.

Stigmas cleft for less than half their length: sepals of the pistillate flowers 2-3 mm. long.

Stigmas cleft nearly to the base: sepals of the pistillate flowers 5-6 mm. long.

1. *V. spiralis*.

2. *V. americana*.

1. **V. spiralis** L. Leaf-blades thin, 3-8 mm. wide, usually denticulate, especially near the apex: peduncles of the pistillate flowers 3-6 dm. long, spirally twisted at maturity: spathe close-fitting, 1-1.5 cm. long: hypanthium 1-2 cm. long in anthesis: petals minute: capsule slender.—Still and flowing water, various provinces, N. C. to Ind., S. Dak., and N. S.—(O. W.)—Sum.-fall.—A wide-spread species, occurring in both the Old World and the New, but barely entering our range from the North.

2. **V. americana** Michx. Leaf-blades thickish, 6-20 mm. wide, often denticulate: peduncles of the pistillate flowers 5-10 dm. long or more, curved at maturity, but

scarcely spiral; spathe loose, 2-2.5 cm. long: hypanthium 2.5-3 cm. long in anthesis: petals less than  $\frac{1}{2}$  as long as the sepals: capsule stout, 7-11 cm. long.—Creeks, rivers, and lakes, Coastal Plain, Fla. to La.—All year.—A plant much larger in all its parts than the preceding. Often very luxuriant in growth. Like the preceding species it is a favorite food of ducks, and perhaps of other water birds.

3. **PHILOTRIA** Raf.<sup>1</sup> Fresh-water herbs. Leaves cauline, opposite or whorled. Flowers perfect and with 3 stamens or dioecious or polygamous; the staminate with 9 stamens detach themselves, arise and float on the surface of the water and shed their pollen about the pistillate or perfect flowers or reach the surface by the elongation of their thread-like hypanthia like the pistillate flowers which are raised to the surface on long stalks; the pistillate similar and slender-pedicelled. Fruit enclosed by the spathe. [*Elodea Michx.*]—About 10 species, natives of America; one naturalized in Europe.—Spr.-sum.—**WATERWEEDS.**—The plants of some species are collected locally and applied to cultivated land as fertilizers.

Staminate spathes not cleft nearly to the base, 1-flowered: petals less than 5 mm. long or wanting: upper leaves in whorls of 3.

Leaf-blades 1-5 mm. broad: staminate flowers with the 3 central stamens on a stalk exceeding the other 6: pistillate flowers frequent, long-exserted.

Leaf-blades less than 1 mm. broad: staminate flowers with 9 equal stamens: pistillate flowers unknown.

Staminate spathes cleft nearly to the base, several-flowered: petals about 1 cm. long; upper leaves in whorls of 4.

1. *P. canadensis*.

2. *P. linearis*.

3. *P. densa*.

1. **P. canadensis** (Michx.) Britton. Stem slender, dichotomously branched: lower leaves opposite, with small ovate blades; upper leaves of pistillate plants with elliptic to lanceolate-ovate blades, firm, dark-green, imbricate above; those of staminate plants narrower, even lanceolate-linear, thinner, scarcely imbricate: staminate spathe slender at the base, with an inflated ellipsoid bidentate apex; staminate flower exserted on a thread-like hypanthium: sepals elliptic, 3.5-5 mm. long; petals white, linear: anthers 3 mm. long: pistillate spathe nearly cylindric, bidentate: pistillate flower long exserted; sepals 2.2 mm. long; petals white clawed, spatulate; staminodia 3, acicular: stigmas 3, ligulate, pink, 2-cleft. [*P. Nuttallii* (Fl. SE. U. S.)]—Ponds, springs, and streams, various provinces, N. C. and Ala. to Calif., Wash., and Que.—A related species, *P. angustifolia*, has been reported from Florida in error.

2. **P. linearis** Rydb. Stem slender: upper leaves with linear, flaccid, pale-green blades, 5-12 mm. long, not imbricate: staminate spathe as in *P. canadensis*; staminate flower exserted on a thread-like hypanthium: sepals oval, 2.5-4 mm. long: petals white, linear, exceeding the sepals or abortive; anthers 2 mm. long.—Swamps, Interior Low Plateaus, along Cumberland River, near Nashville, Tenn.

3. **P. densa** (Planch.) Small. Stem stout, 2-3 mm. in diameter: leaves very numerous, densely crowded; blades lanceolate to linear-lanceolate, 1.5-2 cm. long, 2-5 mm. broad, acuminate, serrulate: spathe of the staminate flowers

<sup>1</sup> Prepared with the assistance of Harold St. John.

narrowly conic, about 1 cm. long: sepals green, oval to ovate, 3-4 mm. long: petals white, 9-11 mm. long: pistillate flowers not seen.—Lakes, Pineillas pen., Fla.—Perhaps introduced through cultivated plants.—(*S. A.*)

## FAMILY 2. HYDROCHARITACEAE — FROG'S-BIT FAMILY

Plants with leaves in clusters on the rootstocks. Gynoecium 6-9-carpellary, the ovary 6-9-celled.—Comprises 8 genera and about 20 species of temperate and tropical regions.

Flowers dioecious: stamens distinct: anther nearly sessile: leaf not differentiated into blade and petiole.

Flowers monoecious: stamens with united filaments: leaf differentiated into blade and petiole.

1. *THALASSIA*.

2. *LIMNOBIUM*.

1. *THALASSIA* Banks. Marine herbs. Leaves mere strap-like blades. Flowers dioecious. Fruit rugose or nearly echinate.—Two species, circum-tropical.

1. *T. testudinum* Koenig & Sims. Leaves 2-5 together; blade linear, 5-30 cm. long: fruit echinate-pubescent, erect.—(TURTLE-GRASS. SEA-WEED.)—Bays and coasts, pen. Fla. and Florida Reef.—(*W. I., S. A.*)—All year.—Occurs mainly in vast submarine fields, often forming a dense turf. The leaves are washed ashore in vast quantities and are gathered as "sea weed" for fertilizer. Only during quiet weather, and consequent clear water, can one get an adequate view of these submarine fields which are favorite rendezvous for various kinds of fish, turtles, and other marine animals.

2. *LIMNOBIUM* L. C. Rich. Fresh-water herbs. Leaves with dilated blades terminating petioles. Flowers monoecious. Fruit smooth. Three or four species, American.

1. *L. Spongia* (Bosc.) L. C. Rich. Leaves several together; blade ovate to suborbicular or reniform, 2-5 cm. broad: fruit glabrous, nodding.—(FROG'S-BIT.)—Shallow water and mud, various provinces, Fla. to Tex., Mo., Ont., and N. J.—Sum.—fall.—The plants are very variable in size, and the leaves vary in shape and have short or long petioles. In marshes as the water dries up, the frog's-bit grows rapidly and often covers acres of these low lands with a bright green carpet.

## ORDER POALES — POAL ORDER

Mostly perennial caulescent or acaulescent plants, known as grasses and sedges. Stems sometimes conspicuously jointed. Leaves alternate, mostly sheathing at the base: blades usually narrow and elongate, entire or nearly so. Flowers variously disposed in a simple or compound inflorescence, perfect or rarely monoecious or dioecious, incomplete, inconspicuous, borne in the axils of chaffy bracts or scales (glumes). Fruit a caryopsis (grain) or an achene, or rarely a nut, or baccate.

Leaves 2-ranked, their sheath-margins usually not united: stem mostly hollow: fruit a grain (caryopsis). Fam. 1. POACEAE.  
 Leaves 3-ranked, their sheath-margins united: stem solid: fruit an achene. Fam. 2. CYPERACEAE.

### FAMILY 1. POACEAE — GRASS FAMILY<sup>1</sup>

Herbs or rarely woody plants, with often hollow stems (*culms*) closed at the nodes, and 2-ranked parallel-veined leaves, these consisting of 2 parts, a lower (the *sheath*), enveloping the culm, its margins overlapping or sometimes grown together, an upper (the *blade*), usually flat, while between the two on the inside, a membranaceous hyaline or hairy appendage (the *ligule*). Flowers perfect (rarely unisexual), small, with no distinct perianth, arranged in spikelets consisting of a shortened axis (*rachilla*) and 2 to many 2-ranked bracts, the lowest 2 being empty (the *glumes*, rarely 1 or both of these obsolete), the 1 or more succeeding ones (*lemmas*) bearing in their axils a single flower, and, between the flower and the rachilla, a second 2-nerved bract (the *palea*). Stamens 1 to 6, usually 3, with very delicate filaments and 2-celled anthers. Pistil 1, with a 1-celled 1-ovuled ovary, 2 (rarely 1 or 3) styles, and usually plumose stigmas. Fruit a caryopsis (grain) with starchy endosperm and a small embryo at the base on the side opposite the hilum.—The perianth is usually represented by 2 (rarely 3) small hyaline scales (the *lodicules*) at the base of the flower inside the lemma and palea. The lemma, palea, and inclosed flower constitute the *floret*. The spikelets are almost always aggregated in an inflorescence at the ends of the main stems or branches. The grain or caryopsis (the single seed and the adherent pericarp) may be free, as in wheat, or permanently inclosed in the lemma and palea as in the oat. Rarely the seed is free from the pericarp, as in species of *Sporobolus* and *Eleusine*. The stems of bamboos are woody as are also those of a few genera, such as *Olyra* and *Lasiacis*, belonging to other tribes. The culms are solid in our species of the tribes Tripsaceae and Andropogoneae. The margins of the sheaths are grown together in species of *Bromus*, *Festuca*, *Melica*, *Panicularia*, and others. The parts of the spikelet may be modified in various ways. The first, and more rarely also the second, glume may be wanting. The lemmas may contain no flower, or even no palea, or may be reduced or rudimentary. The palea is rarely wanting in perfect florets as in species of *Agrostis*.—Comprises about 500 genera and 7,000 species very widely distributed in latitude, altitude, and habitat. The so-called cereals are of great economic importance.

Spikelets with 1 perfect terminal floret (disregarding those of the staminate and neuter spikelets) and a sterile or staminate floret below, usually represented by a sterile lemma only, one glume sometimes, both glumes rarely, wanting: articulation below the spikelets either in the pedicel, in the rachis, or at the base of a cluster of spikelets, the spikelets falling entire, singly, in groups, or together with joints of the rachis: spikelets, or at least the fruits, more or less dorsally compressed (except in some genera of Nazieae). (SUBFAMILY PANICATAE.)  
 Glumes indurate: fertile lemma and palea hyaline or membranaceous, the sterile lemma (when present) like the fertile one in texture.

Spikelets unisexual, the pistillate below, the staminate above, on the same inflorescence, or in separate inflorescences. Tribe I. TRIPSACEAE.

Spikelets perfect, staminate or neuter ones sometimes also present.

Spikelets in pairs: one sessile and perfect, the other pedicelled and usually staminate or neutral (the pedicellate one sometimes obsolete, or rarely both pedicellate): lemmas hyaline.

Tribe II. ANDROPOGONEAE.

<sup>1</sup> Contributed by Albert Spear Hitchcock.

- Spikelets in groups of 2-5, the groups falling entire from the continuous axis: lemmas membranous.
- Glumes membranaceous: fertile lemma and palea indurate, at least firmer than the glumes: sterile lemma like the glumes in texture.
- Spikelets 1- to many-flowered, the reduced florets, if any, above the perfect florets (except in Phalarideae: sterile lemmas below as well as above in *Campulosus* and *Uniola*): articulation usually above the glumes: spikelets usually more or less laterally compressed. (SUBFAMILY POATAE.) *Festucoidae*
- Plants woody, the stem perennial: spikelets several-flowered.
- Plants herbaceous, the stem annual.
- Spikelets with 2 staminate, neuter or rudimentary lemmas unlike and below the fertile lemma: no sterile or rudimentary florets above.
- Spikelets without sterile lemmas below the perfect floret (or these rarely present and like the fertile ones.)
- Spikelets unisexual, articulate below the glumes, 1-flowered, terete or nearly so.
- Spikelets perfect (rarely unisexual but then not as above), usually articulate above the glume.
- Spikelets articulate below the glumes, 1-flowered, very flat, the lemma and palea about equal, both keeled; glumes small or wanting.
- Spikelets articulate above the glumes (rarely below, but the glumes, at least one, then well developed).
- Spikelets sessile on a usually continuous rachis (short-pedicellate in *Leptochloa*: the rachis disarticulating in *Hordeum*): articulation above the glumes except in *Spartina*.
- Spikelets on opposite sides of the rachis: spike terminal, single.
- Spikelets on one side of the rachis: spikes usually more than 1, digitate or racemose.
- Spikelets pedicellate in open or contracted, sometimes spike-like, panicles.
- Spikelets 1-flowered.
- Spikelets 2- to many-flowered.
- Glumes as long as the lowest floret, usually as long as the spikelet: lemmas awned from the back (awnless in *Koeleria* and *Sphenopholis*).
- Glumes shorter than the first floret: lemmas awnless or awned from the tip or from a bifid apex.
- Tribe III. NAZIEAE.
- Tribe IV. PANICEAE.
- Tribe XIII. BAMBUSEAE.
- Tribe VII. PHALARIDEAE.
- Tribe VI. ZIZANIEAE.
- Tribe V. ORYZEAE.
- Tribe XII. HORDEAE.
- Tribe X. CHLORIDEAE.
- Tribe VIII. AGROSTIDEAE.
- Tribe IX. AVENEAE.
- Tribe XI. FESTUCEAE.

## Tribe I. TRIPSACEAE

- Fruiting spikelets not enclosed in a hard bead-like involucre.
- Staminate and pistillate spikelets in the same inflorescence, the former comprising the upper part of the spike and the latter the lower.
- Staminate and pistillate spikelets in separate inflorescences, the former in racemes borne in terminal panicles, the latter in spikes subtended by and enclosed by large bracts.
- Pistillate spikes separate, the rachis articulate: fruits enclosed.
- Pistillate spikes united into a thick receptacle-like axis (cob): fruits exposed.
- Fruiting spikelets enclosed in a hard bead-like involucre formed from the indurate sheath of the subtending bract.
1. TRIPSACUM.
2. EUCHLAENA.
3. ZEA.
4. COIX.

## Tribe II. ANDROPOGONEAE

Spikelets all perfect, surrounded by copious soft hairs.

Rachis continuous, the spikelets falling: spikelets of the pair unequally pedicellate.

Racemes in a narrow spike-like panicle: spikelets awnless.

Racemes in an open, usually flabellate, panicle: spikelets awned.

Rachis breaking up into joints at maturity with the spikelets attached: one spikelet sessile, the other pedicellate.

Spikelets awnless.

Spikelets awned.

Spikelets unlike, the sessile perfect, the pedicellate sterile.

Pedicel thickened, appressed to the thickened rachis-joint (at least parallel to it) or adnate to it: spikelets awnless, appressed to the joint.

Rachis-joint and pedicel adnate, forming a short flat joint, this sunken in the open side of the globose first glume of the sessile spikelet: sterile spikelet conspicuous.

Rachis-joint and pedicel distinct, the sessile spikelet appressed to them, its first glume lanceolate.

Racemes subcylindric: rachis-joints and pedicels glabrous, much thicker at the summit, the spikelets sunken in the hollow below: sterile spikelet rudimentary.

Racemes flat: rachis-joints and pedicels woolly, not much thicker at the summit: sterile spikelet staminate or neuter.

Pedicel not thickened (if slightly so the spikelets awned), neither appressed nor adnate to the rachis-joint, this usually slender: spikelets usually awned.

Fertile spikelet with a hairy-pointed callus, formed of the attached supporting rachis-joint or pedicel: awns strong.

Racemes reduced to a single joint, long-peduncled, in a simple open panicle.

Racemes of several to many joints, single.

Fertile spikelet without a callus, the rachis disarticulating immediately below the spikelet: awns slender, sometimes wanting.

Racemes of several to many joints, solitary, digitate, or aggregate.

Racemes reduced to 1 or few joints: these mostly peduncled in a subsimple or compound panicle.

Pedicellate spikelets staminate.

Pedicellate spikelets wanting, the pedicel only present.

## Tribe III. NAZIEAE

Annuals with flat leaf-blades and spikes of bur-like spikelets.

## Tribe IV. PANICEAE

Spikelets monoecious: leaf-blades petioled.

Spikelets all perfect.

Spikelets of 2 kinds, aerial and subterranean.

Spikelets all of one kind.

Spikelets sunken in the cavities of the flattened corky rachis.

Spikelets not sunken in the rachis.

Spikelets subtended or surrounded by 1 to many bristles, these distinct or more or less connate, forming an involucre.

Bristles persistent, the spikelets deciduous.

Bristles falling with the spikelets at maturity.

Bristles not united at base, slender, often plumose.

Bristles united into a bur-like involucre, the bristles retrorsely barbed.

5. IMPERATA.

6. MISCANTHUS.

7. SACCHARUM.

8. ERIANTHUS.

10. RYTILIX.

9. MANISURIS.

11. ELYONURUS.

15. RHAPHIS.

16. HETEROPOGON.

12. ANDROPOGON.

13. HOLCUS.

14. SORGHASTRUM.

17. NAZIA.

38. OLYRA.

37. AMPHICARPON.

36. STENOTAPHRUM.

33. CHAETOCLOA.

34. PENNISETUM.

35. CENCHRUS.

Spikelets not subtended by bristles.

Glumes or sterile lemma awned. (Awn short, concealed in the silky hairs of the spikelet in *Tricholaena*; awn reduced to a point in *Echinochloa colonum*.)

Inflorescence paniculate; spikelets silky.

Inflorescence of unilateral simple or somewhat compound racemes along a common axis; spikelets smooth or hispid, not silky.

Leaf-blades lanceolate, broad and thin; glumes 2-lobed, awned from between the lobes.

Leaf-blades long and narrow; glumes awned from the tip.

Glumes and sterile lemma awnless.

Fruit cartilaginous-indurate, flexible, usually dark-colored, the lemma with more or less prominent white hyaline margins, these not inrolled.

Spikelets in racemes, covered with long silky hairs, the racemes panicle.

Spikelets glabrous or variously pubescent, but not long-silky.

Spikelets in slender racemes more or less digitate.

Spikelets in panicles.

Fertile lemma boat-shaped; panicles narrow.

Fertile lemma convex; panicles diffuse.

Fruit chartaceous-indurate, rigid.

Spikelets placed with the back of the fruit turned away from the rachis of the racemes, usually single (not in pairs).

First glume and the rachilla-joint forming a swollen ring-like callus below the spikelet.

First glume present or wanting, not forming a ring-like callus below the spikelet.

First glume present; racemes racemose along the main axis.

First glume wanting; racemes digitate or subdigitate.

Spikelets placed with the back of the fruit turned toward the rachis of the spike-like racemes, or pedicellate in panicles.

Fruit long-acuminate; both glumes wanting.

Fruit not long-acuminate; at least one glume present.

First glume typically wanting; spikelets plano-convex, sub-sessile in spike-like racemes.

First glume present; spikelets usually in panicles.

Second glume inflated-saccate, this and the sterile lemma much exceeding the stipitate fruit.

Second glume not inflated-saccate.

Stems woody; plants bamboo-like; fruit with a tuft of down at the apex.

Stems herbaceous; no tuft of down at the apex of the fruit.

#### Tribe V. ORYZEAE

Glumes minute; lemma often awned.

Glumes wanting; lemma awnless.

32. TRICHOLAENA.

30. OPLISMENUS.

31. ECHINOCHLOA.

19. VALOTA.

20. SYNTHESISMA.

18. ANTHAENANTIA.

21. LEPTOLOMA.

22. ERIOCHLOA.

23. BRACHIARIA.

24. AXONOPUS.

25. REIMAROCHLOA.

26. PASPALUM.

29. SACCIOLEPIS.

28. LASIACIS.

27. PANICUM.

39. ORYZA.

40. HOMALOCENCHRUS.

## Tribe VI. ZIZANIEAE

Stem slender, low: staminate and pistillate spikelets borne in separate inflorescences.

Inflorescence a few-flowered spike: plants not stoloniferous.

Inflorescence a panicle: plants stoloniferous.

Stem robust, tall: staminate and pistillate spikelets borne in the same panicle.

Spikelets in pairs, the larger one sessile and pistillate, the smaller staminate and pedicellate.

Spikelets not paired.

Plant annual: pistillate spikelets on the ascending upper branches, the staminate on the spreading lower branches of the panicle.

Plant perennial: pistillate spikelets at the ends, the staminate below on the same branches of the panicle.

41. HYDROCHLOA.  
42. LUZIOLOA.

45. PHARUS.

44. ZIZANIA.

43. ZIZANIOPSIS.

## Tribe VII. PHALARIDEAE

Sterile florets reduced to small awnless scale-like lemmas: spikelets much compressed laterally.

Sterile florets consisting of awned hairy empty lemmas exceeding the fertile floret: spikelets terete.

46. PHALARIS.

47. ANTHOXANTHUM.

## Tribe VIII. AGROSTIDEAE

Rachilla articulate below the glumes, these falling with the spikelet.

Glumes long-awned.

Glumes awnless.

Rachilla not prolonged behind the palea: panicle dense and spike-like: glumes united toward the base, ciliate on the keel.

Rachilla prolonged behind the palea: panicle narrow or open, not dense: glumes not united, not ciliate on the keel.

Panicle narrow: lemma with a slender bent twisted awn from the bifid apex.

Panicle open and drooping: lemma with a minute straight awn just below the entire apex.

Rachilla articulate above the glumes.

Fruit indurate, terete, awned, the nerves obscure: callus well-developed, oblique, bearded.

Awn trifid, the lateral divisions sometimes short, rarely obsolete (when obsolete no line of demarcation between awn and lemma as in the next).

Awn simple, a line of demarcation between the awn and the lemma.

Fruit thin, or firm, but scarcely indurate, if firm the nerves prominent or evident: callus not well-developed.

Glumes longer than the lemma.

Glumes compressed-carinate, abruptly mucronate, stiffly ciliate on the keels: panicle dense, cylindric or ellipsoid.

Glumes not compressed-carinate, not ciliate.

Florets bearing a tuft of hairs at the base from the short callus, the hairs at least half as long as the lemma.

Florets without hairs at the base or the hairs very short.

Glumes not longer than the lemma, usually shorter (the awn-tips longer in *Muhlenbergia racemosa*).

Lemma awned from the tip or mucronate, 3-5-nerved.

Rachilla prolonged behind the palea: floret stipitate.

Rachilla not prolonged: floret not stipitate.

Lemmas awnless or awned from the back.

Callus bearded: lemma and palea chartaceous, awnless.

Panicles spike-like: rachilla prolonged.

Panicles open: rachilla not prolonged.

Callus not bearded.

55. POLYPOGON.

53. ALOPECURUS.

56. LIMNODEA.

57. CINNA.

48. ARISTIDA.

49. STIPA.

52. PHLEUM.

59. CALAMAGROSTIS.

58. AGROSTIS.

51. BRACHYELYTRUM.

50. MUHLENBERGIA.

60. AMMOPHILA.

61. CALAMOVILFA.

54. SPOROBOLUS.

## Tribe IX. AVENEAE

Spikelets falling entire: first glume much smaller than the second.

Florets alike, perfect.

Florets unlike, the lower perfect, awnless, the upper staminate and bearing a hooked awn.

Spikelets not falling entire, the glume persistent.

Florets 2, the lower staminate, awned; the upper perfect, awnless.

Florets 2 or more, all alike except the reduced upper ones.

Awn arising from between the teeth of a bifid apex, flattened, twisted.

Awn dorsal, not flattened: lemma often bifid at apex.

Spikelets large, the glumes over 1.5 cm. long.

Spikelets less than 1 cm. long.

Lemmas keeled: awn arising from above the middle.

Lemmas bidentate: perennial.

Lemmas entire: annual.

Lemmas convex: awn from below the middle.

Rachilla prolonged behind the upper floret: lemmas truncate and erose-dentate.

Rachilla not prolonged: lemmas tapering into 2 slender teeth.

66. SPHENOPHOLIS.

62. NOTHOLCUS.

69. ARRHENATHERUM.

70. DANTHONIA.

68. AVENA.

65. TRisetum.

67. KOELERIA.

63. AIRA.

64. ASPRIS.

## Tribe X. CHLORIDEAE

Spikelets with more than 1 perfect floret.

Spikes numerous, slender, racemose on an elongate axis.

Spikes few, digitate or nearly so.

Rachis of spike extending beyond the spikelets.

Rachis not prolonged.

Spikelets with only 1 perfect floret, often with additional imperfect florets above.

Spikelets without additional modified florets, the rachilla sometimes prolonged.

Rachilla articulate below the glumes, the spikelets falling entire.

Rachilla articulate above the glumes.

Spikes digitate: rachilla prolonged.

Spikes racemose along the main axis: rachilla not prolonged.

Spikelets with one or more modified florets above the perfect one.

Spikelets with 2 sterile florets below the perfect one: second glume bearing a squarrose spine on the back: spike single, recurved.

Spikelets with no sterile florets below the perfect one: second glume without a squarrose spine: spikes usually several.

Spikes digitate or nearly so.

Spikes racemose along the main axis.

Spikelets distant, appressed: spikes slender, elongate.

Spikelets contiguous or crowded, not appressed: spikes usually short, relatively stout.

79. LEPTOCHLOA.

78. DACTYLOCTENIUM.

77. ELEUSINE.

72. SPARTINA.

71. CAPRIOLA.

73. CAMPULOSUS.

74. CHLORIS.

75. GYMNOPOGON.

76. BOUTELOUA.

## Tribe XI. FESTUCEAE

Tall stout reeds with large plume-like panicles: lemmas or rachilla with long silky hairs as long as the lemmas.

Lemmas hairy: rachilla naked.

Lemmas naked: rachilla hairy.

Low or rather tall stems, rarely over 1.5 m. tall.

Plant dioecious, perennial: lemmas glabrous: grasses of salt or alkaline soil.

Plant low and creeping: spikelets obscure, scarcely differentiated from the short crowded rigid leaves.

Plant erect from creeping rootstocks: spikelets in a narrow simple exerted panicle.

Plant not dioecious (except in a few species of *Poa* with villous lemmas and in an annual species of *Eragrostis*).

81. ARUNDO.

82. PHRAGMITES.

80. MONANTHOCHELOE.

89. DISTICHLIS.

- Lemmas 3-nerved, the nerves prominent, often hairy.  
 Lemmas pubescent on the nerves or callus: mid-  
 nerve usually exserted as an awn or mucro.  
 Palea long-ciliate on the upper half.  
 Palea sometimes villous, but not long-ciliate  
 on the upper half.
- Lemmas not pubescent on the nerves or callus  
 (the internerves sometimes sparsely pubes-  
 cent), awnless.
- Lemmas chartaceous: grain large and  
 beaked, at maturity forcing the lemma and  
 palea open.
- Lemmas membranaceous, if firm the grain  
 neither large nor beaked.
- Lemmas 5- to many-nerved, the nerves sometimes  
 obscure.
- Spikelets with 1 to 4 empty lemmas below the  
 fertile florets: nerves obscure: lemmas  
 firm.
- Spikelets with no empty lemmas below the fer-  
 tile florets: nerves usually prominent:  
 lemmas membranaceous (firm in a few  
 species of *Bromus* and *Festuca*).
- Lemmas keeled on the back.
- Spikelets strongly compressed, crowded in  
 1-sided clusters at the ends of the stiff  
 naked panicle-branches.
- Spikelets not strongly compressed, not  
 crowded in 1-sided clusters.
- Lemmas awned from a minutely bifid  
 apex (awnless or nearly so in *B.*  
*unioloides*): spikelets large.
- Lemmas awnless: spikelets small.
- Lemmas rounded on the back (slightly keeled  
 toward the summit in *Festuca* and  
*Bromus*).
- Glumes papery: lemmas firm, strongly  
 nerved, scarious-margined: upper  
 florets sterile, often reduced to a  
 club-shaped rudiment enfolded by  
 the broad upper lemmas: spikelets  
 tawny or purplish.
- Glumes not papery: upper florets not un-  
 like the others.
- Nerves of the lemma prominent, paral-  
 lel, not converging at the sum-  
 mit or but slightly so: lemmas  
 awnless, mostly obtuse.
- Nerves of the lemma converging at the  
 summit: lemmas awned or  
 pointed.
- Florets minute: spikelets many-  
 flowered, in small rigid pani-  
 cles.
- Florets 4 mm. or more long: spike-  
 lets few to several flowered,  
 not in rigid panicles.
- Lemmas entire, awned from the  
 tip or pointed.
- Lemmas awned or awn-tipped  
 from a minutely bifid apex.
84. *TRIPLASIS*.
83. *TRIODIA*.
87. *DIARINA*.
85. *ERAGROSTIS*.
88. *UNIOLA*.
90. *DACTYLIS*.
95. *BROMUS*.
91. *POA*.
86. *MELICA*.
92. *PANICULARIA*.
94. *SCLEROPOA*.
93. *FESTUCA*.
95. *BROMUS*.
- Tribe XII. HORDEAE
- Spikelets solitary at each node of the rachis.
- Spikelets placed edgewise to the rachis: glume 1 except  
 in the terminal spikelet.
- Spikelets placed flatwise to the rachis.
- Spikelets more than 1 at each node of the rachis.
- Spikelets 3 at each node of the rachis, 1-flowered, the  
 lateral pair pedicelled, usually reduced to awns.
- Spikelets 2 at each node of the rachis, 2- to 6-flowered,  
 all alike.
- Glumes usually equalling the florets: spikelets ap-  
 pressed or ascending.
- Glumes wanting or reduced to 2 short bristles:  
 spikelets horizontally spreading at maturity:  
 spikes very loose.
96. *LOLIUM*.
97. *AGROPYRON*.
98. *HORDEUM*.
99. *ELYMUS*.
100. *HYSTRIX*.

## Tribe XIII. BAMBUSEAE

Gregarious woody grasses with usually branching stems. 101. ARUNDINARIA.

1. **TRIPSACUM** L. Robust perennials, with monoecious terminal and axillary inflorescences, of 1, 2, or 3 spikes, the pistillate below, breaking up into bony seed-like joints, the staminate above on the same rachis, deciduous as a whole. Staminate spikelets 2-flowered, in pairs on a continuous rachis, one sessile, the other sessile or pedicellate. Pistillate spikelets single at each joint of the thick, hard, articulate lower part of the same rachis, sunken in hollows in the joints, consisting of one perfect floret and a sterile lemma; first glume coriaceous, nearly enfolding the spikelet, fitting into and closing the hollow of the rachis: second glume similar to the first but smaller, enfolding the remainder of the spikelet: sterile and fertile lemmas and palea hyaline.—About 7 species in temperate and tropical America.—GAMA-GRASSES.

Leaf-blades 1-2 cm. wide, flat: plant 1-2 m. tall.

Leaf-blades 1-3 mm. wide, more or less involute: plant less than 1 m. tall.

1. *T. dactyloides*.

2. *T. floridanum*.

1. ***T. dactyloides*** L. Plant commonly 2-4 m. tall: leaf-blades more or less auricled at the base: rachis of the pistillate spike 5-6 mm. in diameter: terminal spikes usually 2-3 together, the contiguous sides flattened, those from the axils usually single, cylindric, the long purple stigmas showy during anthesis.—Moist soil, riverbanks, pond-margins, and hammocks, various provinces, Fla. to E Tex., Nebr., and R. I.—(*W. I., Mex., S. A.*)—Sum.-fall, or all year S.—Used for forage when abundant.

2. ***T. floridanum*** Porter. Smaller than *T. dactyloides* in all ways, commonly less than 1 m. tall: leaf-blades not auricled at the base: rachis of the pistillate spike 3-4 mm. in diameter.—Low rocky pinelands, Everglade Keys, and adj. Everglades, pen. Fla. and Florida Keys.—All year.

2. **EUCHLAENA** Schrad. Tall monoecious annuals or perennials, with broad leaf-blades and long sheaths. Staminate spikelets 2-flowered, in pairs, unequally pedicellate, on a simple rachis: racemes several, in a terminal corymbiform panicle. Pistillate spikelets single on opposite sides and sunken in cavities in the hardened joints of an obliquely articulate rachis, the indurate first glume covering the cavity, the spikes 2-several together, enclosed in the leaf-sheaths.—Three species, natives of Mex.

1. ***E. mexicana*** Schrad. Stem up to 5 m. tall: leaf-blades elongate-lanceolate, 1 m. long or less, up to 8 cm. wide: staminate racemes mostly 10-15 cm. long, the spikelets about 8 mm. long: pistillate enclosed in trapezoid joints: spikelets about 7 mm. long.—(TEOSINTE).—Waste places and cultivated grounds, Fla. Nat. of Mex.

—Sum.—fall.—Plants rarely flower, and mature fruits only in S Fla. Grown for forage and for soil improvement.

3. **ZEAL** L. A tall annual grass, with broad, conspicuously distichous blades, monoecious inflorescences, staminate flowers in spike-like racemes, these numerous, forming large spreading panicles (tassels) terminating the stems. Pistillate inflorescence in the axils of the leaves, the spikelets in 8 to 16 or even as many as 30 rows on a thickened, almost woody axis (cob), the whole enclosed in numerous large foliaceous bracts (husks), the long styles (silk) protruding from the tops as a silky mass of threads. Spikelets unisexual; staminate spikelets 2-flowered, in pairs, on one side of a continuous rachis, one nearly sessile, the other pedicellate: glumes membranaceous, acute: lemma and palea hyaline: pistillate spikelets sessile, in pairs, consisting of one fertile floret and one sterile floret, the latter sometimes developed as a second fertile floret: glumes broad, rounded or emarginate at apex: style very long and slender, stigmatic along both sides well toward the base.—Consists of the following species, known only in cultivation or as an escape, and in many varieties.

1. **Z. Mays** L. Stem up to 4 m. tall, stout, leafy: leaf-blades linear-lanceolate, elongate, fully 10 cm. wide, or less: staminate panicle erect, 20–30 cm. long, with spreading or drooping branches: pistillate panicle ultimately protruding from the leaf-sheaths, the grains white or variously colored.—(CORN. INDIAN-CORN. MAIZE.)—Roadsides, fields, and waste-places, locally throughout our range. Nat. of trop. Am.—Sum.—fall.—Extensively cultivated in many varieties in America from prehistoric times. Corn is one of the important economic plants of the world.

4. **COIX** L. Diffuse monoecious annuals, with narrow elongate leaf-blades. Inflorescence compound, each branch bearing a bead-like involucre enclosing 1 pistillate and 2 sterile spikelets, and a short staminate raceme on a slender peduncle protruding from an orifice at the summit of the involucre. Grain enclosed in the hard bead-like involucre.—Four species, natives of Asia; the following now widely distributed in the tropics.

1. **C. Lachryma-Jobi** L. Stem 0.5–1.5 m. tall, much-branched: leaf-blades elongate, linear-lanceolate, 4 cm. wide or less: spikelets and spikes terminating fascicles of branches from the leaf-axils: involucres globular or ovoid, mostly about 1 cm. long, white or bluish, shining.—(TEAR-GRASS. JOB'S-TEARS. CHRIST'S-TEARS.)—Widely cult. and locally escaped, cult. grounds and roadsides, Coastal Plain, Fla. to Tex. Nat. of E Ind.—(H. I., Mex., C. A., S. A.)—Spr.—fall.—Employed medicinally, while the hard mature involucres are used as beads.

5. **IMPERATA** Cyr. Slender erect perennials with terminal narrow woolly panicles. Spikelets all alike, awnless, in pairs, unequally pedicellate on a slender continuous rachis, surrounded by long silky hairs: glumes about equal, membranaceous: sterile lemma, fertile lemma, and palea thin and hyaline.—Five species, in nearly all tropical and subtropical regions.

1. **I. brasiliensis** Trin. Stem 0.5–1 m. tall, from scaly rootstocks: leaf-blades mostly basal, 3–8 mm. wide, the stem-blades short, the uppermost leaf reduced to a nearly bladeless sheath: panicle pale, usually not over 10 cm. long.—(BRAZILIAN BLADY-GRASS. SILVER-PLUME.)—Pinelands, prairies, sand-dunes and Everglades, S pen. Fla.—(W. I., Mex., C. A., S. A.)—All year.—Conspicuous on account of the erect narrow silvery plume-like inflorescence. The plants are often tufted.

6. **MISCANTHUS** Anderss. Robust perennials with usually flat leaf-blades and terminal panicles of aggregate slender racemes. Spikelets all perfect, in pairs, unequally pedicellate along a continuous rachis: glumes membranous: lemma hyaline, 2-toothed, with a slender, somewhat geniculate and flexuous awn.—Six species, natives of Asia.

1. **M. sinensis** Anderss. Stems 1–2 m. tall: leaf-blades 80 cm. long or less, 1–1.5 cm. wide: panicle 20–40 cm. long, flabellate: spikelets 4.5–5 mm. long, yellowish-brown, shining, encircled at the base with white or purplish hairs equalling or exceeding the spikelet, the awns 8–10 mm. long, twisted at the base.—(EULALIA.)—Waste-places and roadsides, various provinces, Fla. to Miss. and Mass. Escaped from cult. Nat. of E Asia.—Spr.—fall.—Frequently cultivated for ornament. Sometimes with variegated leaves.

7. **SACCHARUM** L. Tall perennials with many-jointed stems, flat leaf-blades, and usually large loose silky terminal panicles. Spikelets in pairs, one sessile, the other pedicellate, both perfect, awnless, in slender racemes, the rachis disarticulating. Glumes acute, membranous, or indurate at base: lemmas hyaline, the fertile sometimes wanting.—Twelve species, most abundant in the tropical regions of the Old World.

1. **S. officinarum** L. Stem tall and leafy, sometimes several meters high, usually decumbent and rooting at the base: leaf-blades often over 1 m. long, 6 cm. wide or less: panicle plume-like, mostly 60 cm. long or more, loose.—(SUGAR-CANE.)—Old fields

and cult. grounds, Coastal Plain, Gulf States. Often persisting after cult. Nat. of trop. Asia.—Spr.—fall.—Cultivated in many varieties as sugar-cane, the main source of sugar. Sometimes used for forage. Matures its fruit in Fla.

8. **ERIANTHUS** Michx. Reed-like perennials, with flat leaf-blades and terminal oblong usually dense silky panicles. Spikelets all alike, in pairs along a slender axis, 1 sessile, the other pedicellate, the rachis disarticulating below the spikelets, the rachis-joint and pedicel falling attached to the sessile-spikelet: glumes coriaceous, equal, usually copiously clothed, at least at the base, with long silky spreading hairs: sterile and fertile lemmas hyaline, the latter bearing a slender awn: palea small, hyaline.—About 20 species, natives of nearly all tropical and temperate regions.—**WOOLLY BEARD-GRASSES. PLUME-GRASSES.**—Some species are cultivated for ornament, but the plants are too coarse for forage.

Spikelets with a tuft of hairs at base.

Awn flat, spirally coiled at base, the upper portion more or less bent and flexuous or loosely spiral.

Basal hairs about as long as the brownish spikelets: panicle not conspicuously hairy, the main axis and branches visible: stems usually glabrous below panicle.

Basal hairs copious, about twice as long as the yellowish spikelets: panicle conspicuously woolly, the hairs hiding the main axis and branches: stems villous below panicle.

Awn terete, or at base flattened, not coiled, the upper portion usually straight, sometimes flexuous.

Basal hairs rather sparse, shorter than the spikelet.

Basal hairs copious, longer than the spikelet.

Spikelets naked, or nearly so, at base.

1. *E. contortus*.

2. *E. divaricatus*.

3. *E. brevibarbis*.

4. *E. saccharoides*.

5. *E. strictus*.

1. *E. contortus* Ell. Stem 1-2 m. tall, glabrous or sometimes sparsely appressed-pilose below the panicle, the nodes glabrous or pubescent with erect deciduous hairs: panicle 15-30 cm. long, narrow, the branches ascending but not closely appressed: spikelets 6-8 mm. long, brownish, glabrous on the back, the rachis-joints and pedicels villous, the awn about 2 cm. long. [*E. Smallii* Nash]—Moist pinelands, thickets, and dry slopes, Coastal Plain, Fla. to E Tex., Okla., and Md.

2. *E. divaricatus* (L.) A. Hitchc. Stem 1.5-3 m. tall, appressed-villous below the panicle, the nodes usually appressed-hirsute: panicle 20-30 cm. long, tawny or purplish: spikelets 5-6 mm. long, pale, sparsely villous, shorter than the copious basal hairs, the awns 1-1.5 cm. long. [*E. alopecuroides*

Ell.]—Damp woods, thickets, rocky hills, and borders of fields, Coastal Plain and occasionally more northern provinces, Fla. to E Tex. and S N. J.

3. *E. brevibarbis* Michx. Stem 1-2 m. tall, glabrous, the nodes glabrous or appressed-hirsute: panicle 20-30 cm. long, brown or purplish, the branches ascending, not conspicuously woolly: spikelets 6-7 mm. long, brown.—Moist soil, low thickets and about ponds, Coastal Plain, Fla. to La. and Del.

4. *E. saccharoides* Michx. Stem 1-3 m. tall, appressed-villous below the panicle, the nodes hispid with appressed-deciduous hairs: panicle oblong or ovoid, tawny or purplish, 10-40 cm. long, rather compact (*E. compactus*) or somewhat open: spikelets 5-7 mm. long, sparsely long-villous on the upper part. [*E. laxus* Nash *E. compactus* Nash *E. Tracyi* Nash]—Moist soil,

swamps, wet hammocks, and marshes, Coastal Plain, Fla. to E Tex. and N. J.—(W. I.)

5. *E. strictus* Baldw. Stem 1-2 m. tall, glabrous, the nodes hirsute with stiff erect deciduous hairs: panicle 20-40 cm. long, strict, the branches closely appressed: spikelets about 8 mm. long, scabrous, the awn straight, about 1.5 cm. long.—Moist soil, marshes, low thickets and beds of streams, Coastal Plain and rarely adj. provinces, Fla. to Tex., S Mo., Tenn., and S. C.

9. **MANISURIS** L. Slender rather tall perennials or annuals with usually numerous smooth cylindric or flattened spikes or racemes, single on the stem and branches. Spikelets awnless in pairs at the nodes of a thickened articulate rachis, one sessile and fertile, the other pedicellate and sterile, the pedicel thickened and appressed to the rachis, the sessile spikelet fitting closely against the rachis, forming a cylindric or subcylindric raceme: glumes obtuse, the first coriaceous, fitting over the hollow containing the spikelet, the second less coriaceous than the first; sterile and fertile lemmas and palea hyaline: pedicellate spikelet reduced, often rudimentary. [*Röttboellia* L. f.]—About 20 species, natives of the warm temperate and tropical regions of both hemispheres. Of little economic importance.

Plant perennial.

Leaf-sheath not compressed-keeled: first glume more or less pitted.

Leaf-sheath compressed-keeled: first glume tessellated or wrinkled, rarely smooth.

First glume tessellated, the depressions rectangular.

First glume wrinkled, tubercled, or smooth.

Glume bearing prominent transverse wrinkles.

Glume bearing a few low tubercles or smooth.

Plant annual.

1. *M. campestris*

2. *M. tessellata*.

3. *M. rugosa*.

4. *M. tuberculosa*.

5. *M. exaltata*.

1. *M. campestris* (Nutt.) A. Hitchc. Stem 0.3-1 tall, erect, rather slender, producing short rootstocks: leaf-blades 1-2 mm. wide: raceme 5-15 cm. long, slightly curved: first glume 4-5 mm. long, pitted along the obscure nerves. [*R. campestris* Nutt *R. cylindrica* Chapm. *M. cylindrica* Kuntze]—Pinelands and prairies, Coastal Plain, Fla. to E Tex., S Mo., and S. C.

2. *M. tessellata* (Steud.) Scribn. Stem 0.8-1.2 m. tall, rather stout: raceme 5-12 cm. long: spikelets about 4 mm. long. [*R. corrugata* Chapm.]—Moist pinelands, Coastal Plain, Fla. to La. and Ala.

3. *M. rugosa* (Nutt.) Kuntze. Stem 0.7-1.2 m. tall: raceme 5-8 cm. long: first glume with prominent transverse ridges. [*M. Chapmani* Nash *R. rugosa* Nutt.]—Wet pinelands, Coastal Plain, Fla. to E Tex. and S N. J.

4. *M. tuberculosa* Nash. Similar to *M. rugosa*; but the first glume with a few short ridges or low tubercles, these sometimes obscure or wanting, the glume then smooth and shining.—Lake shores and about ponds, pen. Fla.

5. *M. exaltata* (L. f.) Kuntze. Stem stout, 1 m. tall or more, branching: leaf-sheaths hispid; leaf-blades elongate, 1-2.5 cm. wide: racemes numerous, more or less included at base, dwindling at the summit and bearing abortive spikelets only: first glume of sessile spikelet smooth.—Moist soil, S Fla. Nat. of S Asia. (W. I.)

10. **RYTILIX** Raf. Much branched erect annuals with flat leaf-blades, the numerous racemes single and more or less enclosed in the sheathing bract, these somewhat clustered in the axils of the leaves. Spikelets awnless, in pairs, the rachis-joint and pedicel grown together, the two clasped between the edges of the globose alveolate first glume of the sessile spikelet: pedicellate spikelet conspicuous, staminate. [*Hackelochloa* Kuntze]—Consists of the following species only:

1. **R. granularis** (L.) Skeels. Stem as much as 1 m. tall: leaf-sheaths papillose-hispid: raceme 1-2 cm. long. [*Manisuris granularis* Sw. *Hackelochloa granularis* Kuntze]—Pinelands, prairies, and waste grounds, various provinces, Fla. and Ga. to Ariz. Nat. of E I.—(W. I., Mex., C. A., S. A., O. W.)—A weed in many countries.

11. **ELYONURUS** Humb. & Bonpl. Erect moderately tall perennials with solitary spike-like racemes. Spikelets awnless, in pairs along a somewhat tardily disarticulating rachis, the joints and pedicels thickened and parallel, the sessile spikelets appressed to the concave side, the pedicellate spikelet staminate, similar to the sessile one, the pairs falling with a joint of the rachis: first glume firm, somewhat coriaceous, with a line of balsam glands on the marginal nerves, the apex acute or acuminate, bifid: second glume similar to the first: sterile and fertile lemmas hyaline: palea obsolete.—About 15 species, circumtropical.—Important grazing grasses in tropical America.

1. **E. tripsacoides** Humb. & Bonpl. Stem 0.6-1.2 m. tall: leaf-blades flat or involute, 2-4 mm. wide, slightly pilose on the upper surface below: raceme 7-12 cm. long: sessile spikelet 6-8 mm. long.—Hammocks, pinelands, prairies, and open grassy slopes, Coastal Plain, Fla. to Tex. and Ga.—(Mex., C. A., S. A.)

12. **ANDROPOGON** [Roen] L. Mostly slender perennials (in our range), with solid sometimes tufted stems, the spikelets arranged in racemes, these single, in pairs, or in 3's or 4's, the common peduncle usually enclosed by a spathe-like sheath, these sheaths often numerous, forming a compound inflorescence, usually narrow, but sometimes in dense subcorymbose masses. Spikelets in pairs at each node of an articulate rachis, one sessile and perfect, the other pedicellate and staminate, neuter or reduced to the pedicel, the rachis and pedicels of sterile spikelet often villous, sometimes conspicuously so: glumes of fertile spikelet coriaceous, narrow, the first rounded, flat, or concave on the back, several-nerved, the median nerve weak or wanting: sterile lemma hyaline: fertile lemma hyaline, narrow, entire or bifid, usually bearing a bent and twisted

awn: palea hyaline, small or wanting: pedicellate spikelet sometimes staminate and about as large as the sessile spikelet, sometimes reduced or wanting, only the pedicel present. [*Schizachyrium* Nees]—About 150 species widely distributed in temperate and tropical regions.—BROOM-GRASSES. BEARD-GRASSES. SAGE-GRASSES. SAND-GRASSES. BUNCH-GRASSES.—Some species are important forage grasses.

Racemes single, from bract-like sheaths.—(*Schizachyrium*.) I. SCOPARI.  
 Racemes more than one from the spathe or several in a panicle on a naked peduncle.—(*Andropogon*.) II. FURCATI.

## I. SCOPARI

Leaf-blade flat or folded, not terete.

First glume of sessile spikelet glabrous.

Internodes of rachis glabrous or ciliate at base and near apex only.

Sessile spikelet 4 mm. long: leaf-blades scarcely 1 mm. wide.

1. *A. tener*.

Sessile spikelet about 6 mm. long: leaf-blades mostly 2–4 mm. wide.

2. *A. semiberbis*.

Internodes of rachis and sterile pedicel villous from base to apex.

Rootstock present.

Sessile spikelet about 1 cm. long.

Glume of pedicellate spikelet 1-awned.

3. *A. maritimus*.

Glume of pedicellate spikelet 3-awned.

4. *A. littoralis*.

Sessile spikelet 6 mm. long.

5. *A. stolonifer*.

Rootstock wanting.

6. *A. scoparius*.

First glume of sessile spikelet villous.

7. *A. hirtiflorus*.

Leaf-blade slender, terete, the upper surface a mere groove.

8. *A. gracilis*.

## II. FURCATI

Pedicellate spikelet staminate, similar to the sessile spikelet.

9. *A. provincialis*.

Pedicellate spikelet reduced to 1 or 2 glumes.

Racemes in pairs, the spathes aggregate in a flabellate inflorescence.

10. *A. glomeratus*.

Racemes 2–4, the spathes not aggregate (somewhat aggregate in *A. capillipes*).

Peduncle of the 2 (sometimes 3 or 4) racemes less than 1 cm. long, (2 cm. in *A. Tracyi*) enclosed in the spathe.

Silky hairs of the spike dense, concealing the rachis and sterile pedicels.

Peduncles in each spathe about 5 mm. long.

11. *A. longiberbis*.

Peduncles in each spathe about 2 cm. long.

11a. *A. Tracyi*.

Silky hairs of the spike comparatively sparse, not concealing the rachis and sterile pedicels.

Plant green, more or less pilose on the leaf-sheaths or blades.

12. *A. virginicus*.

Plant glabrous, often glaucous.

Ligule truncate, concealed within the folded blade.

13. *A. capillipes*.

Ligule acutish, protruding from the folded blade.

14. *A. perangustatus*.

Peduncle of the 2–4 racemes more than 1 cm. long, often long-exserted from the spathe.

Racemes in pairs, usually not over 15 mm. long: branches bearing the spathes numerous and slender.

15. *A. brachystachys*.

Racemes more than 15 mm. long.

Sheaths, especially the upper, long and inflated, more or less aggregate: rachis very slender and flexuous, the internodes 2–3 mm. long.

16. *A. Elliottii*.

Sheaths not conspicuously inflated (or occasionally so in *A. campyloracheus*).

Rachis conspicuously slender and flexuous, the internodes 7–10 mm. long.

17. *A. campyloracheus*.

Rachis not conspicuously slender: racemes densely silky.

Racemes in 4's: plant stout, the sheaths usually woolly.

18. *A. Mohrii*.

Racemes in pairs.

First glume of sessile spikelet 2-nerved between the keels: hairs

on rachis and sterile pedicels not concealing spikelets.

First glume of sessile spikelet nerveless between the keels.

Awn twisted into a column at base. (see *A. Tracyi*)

Stamen 1: spikelets 4-5 mm. long, with brownish hairs about as long, not concealing the spikelets: awn rather short.

Stamens 3: spikelets 5-7 mm. long, with silvery white hairs as long or longer, concealing the spikelets: awn 15-20 mm. long.

Awn not twisted into a column at base: plant stout, much-branched: spikelets 3 mm. long.

19. *A. Cabanisii*.

20. *A. arctatus*.

21. *A. ternarius*.

22. *A. floridanus*.

1. *A. tener* (Nees) Kunth. Stem slender, 0.6-1 m. tall, sometimes reclining or decumbent: leaf-blades scarcely 1 mm. wide: racemes long-exserted, slender, glabrous, 2-6 cm. long: first glume of sessile spikelet about 3 mm. long, the awn 7-10 mm. long. [*S. tenerum* Nees]—Dry pine-lands, woods, and prairies, Coastal Plain, Fla. to La. and Tex.—(*W. I., Mex., C. A., S. A.*)

2. *A. semiberbis* (Nees) Kunth. Stem glabrous, erect, 0.6-1.2 m. tall: leaf-blades glabrous, 2-4 mm. wide: racemes erect, 5-8 cm. long, the rachis straight, the joints short-hispid at base with erect hairs: sessile spikelet about 6 mm. long, acuminate, the awn 10-15 mm. long: sterile pedicel ciliate on one margin from below the middle. [*S. semiberbe* Nees]—Pinelands, pen. Fla.—(*W. I., S. A.*)

3. *A. maritimus* Chapm. Stem decumbent at base, often glaucous, 0.4-0.6 m. long: leaf-sheaths compressed and keeled: racemes 3-5 cm. long, the rachis slender and becoming flexuous, the hairs about 5 mm. long: sessile spikelet 8-10 mm. long, glabrous, the awn about 1 cm. long: sterile spikelet staminate, nearly as large as the fertile. [*S. maritimum* Nash]—Coastal sands, W Fla. and Miss.

4. *A. littoralis* Nash. Resembling *A. maritimus*: sterile spikelet a single glume about 5 mm. long, the 3 nerves extending into cusps or awns, the central distinct, the lateral usually minute, sometimes wanting. [*S. littorale* Bickn. *S. triaristatum* Nash]—Sand-dunes and beaches, Coastal Plain, Fla. to Tex., N. Y., and N. J.

5. *A. stolonifer* (Nash) A. Hitchc. Stem 0.6-1 m. tall, often glaucous: leaf-sheaths glabrous: racemes 3-4 cm. long, the rachis slender and flexuous, the hairs about 3 mm. long: sterile spikelet about 3 mm. long. [*S. stoloniferum* Nash]—Pinelands, prairies, hammocks, and scrublands, Coastal Plain, Fla., and Ga.—Differs from *A. scoparius* in having rootstocks. Forms rarely have villous leaf-sheaths.

6. *A. scoparius* Michx. Stem 0.5-1.5 m. tall, sometimes glaucous: leaf-sheaths glabrous or sometimes villous: racemes 3-6 cm. long, the rachis slender and flexuous: sessile spikelet 6-7 mm. long, scabrous, the awn 8-15 mm. long. [*S. scoparium* Nash *S. villosissimum* Nash *S. acuminatum* Nash]—(LITTLE BLUE-STEM. BROOM-SEDGE.)—Pinelands, prairies, open woods, hillsides, and dry fields, various provinces, Fla. to Ariz., Alb., and N. B.

7. *A. hirtiflorus* (Nees) Kunth. Stem 0.6–1.2 m. tall, often glaucous: leaf-blades 2–4 mm. wide, smooth: racemes 6–10 cm. long, the base included in the somewhat inflated upper sheath, the rachis straight, the joints tapering below: sessile spikelet about 6 mm. long, the awn geniculate and twisted, about 1 cm. long: pedicellate spikelet reduced to a glume 2–4 mm. long, the pedicel thick, villous. [*A. oligostachyus* Chapm. *A. feensis* Fourn. *S. oligostachyum* Nash]—Pinelands, various provinces, Fla., Ga., and Ariz. (*W. I., Mex., S. A.*)

8. *A. gracilis* Spreng. Stem slender, tufted, glabrous, 0.2–0.6 m. tall: racemes 2–4 cm. long, silvery white, long-exserted, the rachis slender, very villous: sessile spikelet about 5 mm. long, the awn geniculate and twisted, 1–2 cm. long: pedicellate spikelet reduced to an awned or awnless glume, the pedicel very villous. [*S. gracile* Nash]—Rocky pinelands, S Fla.—(*W. I.*)

9. *A. provincialis* Lam. Glabrous or more or less villous and often glaucous: stem 1–2 m. tall: racemes 2–4, rarely more, on each peduncle, long-exserted, 5–10 cm. long, the peduncles terminal and axillary: rachis straight, the joints pilose at base and along one or both margins: sessile spikelet 7–10 mm. long, the first glume slightly sulcate, scabrous, the awn geniculate and tightly twisted below, 1–2 cm. long: sterile pedicel sparingly short-villous, the hairs whitish. [*A. furcatus* Muhl. *A. tennesseensis* Scribn.]—(*BLUE-STEM.*)—Dry soil, open woods, pinelands, and old fields, various provinces, Fla. to Tex., Ariz., and Me.

10. *A. glomeratus* (Walt.) B. S. P. Glabrous and often glaucous the leaf-sheaths sometimes villous: stem 0.5–1.5 m. tall: racemes 1–3 cm. long, as long as or a little longer than the somewhat inflated spathe and protruding from its side, the common peduncle within the spathe, and the stem just below the spathe villous, the rachis slender and flexuous, long-villous: sessile spikelet 3–4 mm. long, the awn straight, 1–1.5 cm. long: sterile spikelet reduced to a subulate glume or wanting, the pedicel slender, long-villous. [*A. macrourus* Michx. *A. corymbosus* Nash *A. tenuispathus* Nash]—Low moist grounds, swamps, marshes, and wet pinelands, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and Mass.—(*W. I., Mex., C. A.*)

11. *A. longiberbis* Hack. Stem slender, 0.5–1 m. tall: racemes in pairs, 2–3 cm. long, the spathe 3–5 cm. long, enclosing the base of the racemes: sessile spikelets about 3 mm. long, the awn slender and straight, 10–15 mm. long. —Dry pinelands, pen. Fla.—*A. Tracyi* Nash, differs from *A. longiberbis* in the longer peduncles (about 2 cm.) of the racemes in each spathe: leaf-sheaths glabrous.—Pinewoods, Fla. to La.

12. *A. virginicus* L. Stem virgate, 0.5–1 m. tall: lower sheaths compressed, equitant: ligule strongly ciliate: spathes scattered along the upper half or two-thirds of the plant: racemes 2–4 from each spathe, 2–3 cm. long, the bases enclosed in the spathe, this usually a little longer than the racemes: rachis very slender, flexuous: sessile spikelet about 3 mm. long, the awn 1–2 cm. long. [*A. tetrastachys* Ell. *A. vaginatus* Ell. *A. macrourus viridis* Chapm.]—(*BROOM-SEDGE.*)—Dry grounds, pinelands, open woods, old fields, and beach sands, various provinces, Fla. to Tex., Mo., and Mass.; also in S Calif.—(*W. I., Mex.*)

13. *A. capillipes* Nash. Differs from *A. virginicus* in being glabrous and glaucous, especially the strongly compressed innovations, in having more flexuous peduncles and often a more compact inflorescence: ligule entire or minutely ciliate. [*A. glaucopsis* Nash]—Moist pinelands, Coastal Plain, Fla. to Miss. and N. C.

14. *A. perangustatus* Nash. Plant green or slightly glaucous: stem slender, 0.3–0.6 m. tall: sheaths not equitant: leaf-blades very narrow, the blades of the innovations tightly folded, almost filiform, the ligule 1–1.5 mm. long, firm,

glabrous. [*A. virginicus stenophyllus* Hack.]—Wet pinelands, Fla.—The leaf-blades of the innovations are often solid, the upper surface being obliterated.

15. *A. brachystachys* Chapm. Stem 1–1.5 m. tall: spathes in a long inflorescence, not usually inflated, the peduncles of the spathes slender, often flexuous: racemes in pairs, usually about 1 cm. long, the common peduncle sometimes exerted from the spathe: sessile spikelet about 3 mm. long, the awn less than 1 cm. long, sometimes wanting.—Moist pinelands, Fla.

16. *A. Elliottii* Chapm. Stem 0.3–0.8 m. tall: leaf-sheaths more or less villous, the upper inflated and aggregate: racemes in pairs, 3–4 cm. long, some of the pedicels exerted from the appressed spathe and from the sheaths, others more or less included in the inflated upper sheaths: sessile spikelet 4–5 mm. long, the awn 10–15 mm. long, geniculate and twisted.—Pinelands, prairies, rocky hills, open dry grounds, and old fields, Coastal Plain and occasionally adj. provinces, Fla. to E Tex., S Mo., and Pa.—(*Mex.*)—The inflated ferruginous sheaths are conspicuous in winter.—*A. gracilior* (Hack.) Nash is a slender form with sometimes scarcely inflated upper sheaths. [*A. subtenuis* Nash]—Fla. to Miss.

17. *A. campyloracheus* Nash. Stem 0.4–0.8 m. tall: racemes mostly in pairs, sometimes in 3's or 4's, 5–10 cm. long, the terminal peduncle long-exserted: rachis slender and very flexuous, the internodes much longer than the sessile spikelet, this 3–4 mm. long, the awn as much as 2 cm. long.—Dry pinelands, Coastal Plain, Fla. to La.

18. *A. Mohrii* Hack. Stem stout, 0.8–1.2 m. tall: leaves villous, especially at summit of sheath: racemes in 4's, 2–4 cm. long, protruding from the side of inflated spathes and about as long as these: rachis scarcely flexuous: sessile spikelet 4–5 mm. long, longer than the internodes of the rachis, the awn 1.5–2 cm. long.—Wet pinelands and beach sands, Coastal Plain, Ga. to La. and N. C.

19. *A. Cabanisii* Hack. Stem stout, 0.6–1 m. tall: racemes 4–7 cm. long, tawny, rather stout, scattered along the upper part of the plant: sessile spikelet 6–7 mm. long, the first glume firm, broadly lanceolate, the awn about 1 cm. long.—Dry pinelands, pen. Fla.

20. *A. arctatus* Chapm. Stem 1–1.5 m. tall: racemes 3–5 cm. long, tawny: sessile spikelet 4–5 mm. long, the awn 1–1.5 cm. long.—Low pinelands, Fla.

21. *A. ternarius* Michx. Stem 0.8–1.2 m. tall: racemes 3–5 cm. long, silvery white, rather stout. [*A. argyraeus* Schult. *A. mississippiensis* Scribn. & Ball *A. Scribnerianus* Nash]—Dry sandy soil, often in pinelands or open woods, Coastal Plain and rarely Blue Ridge, Fla. to E Tex., Okla., and Del.

22. *A. floridanus* Scribn. Stem 1–1.5 m. tall: racemes 2–4 cm. long, slender, the spathes long-exserted on capillary peduncles, numerous in a large loose inflorescence. [*A. Bakeri* Scribn. & Ball]—Low pinelands, pen. Fla.

*Arthraxon ciliaris cryptatheris* Hack. A weak-stemmed, laxly branching annual, with ascending flowering branches, bearing thin cordate-lanceolate blades, the inflorescence of several slender racemes in a cluster, occurs in lawns and old fields, various provinces from Fla. to Ark. and Penn. Nat. of Asia.

13. **HOLCUS** L. Tall or moderately tall annuals or perennials, with flat leaf-blades and terminal panicles. Spikelets in pairs, the pedicellate spikelet well-developed, usually staminate: racemes reduced to 1–5 joints, these disarticulating tardily, the racemes in a large open or contracted panicle.—About 10 species widely distributed in tropical and warm temperate regions.

Plants perennial with stout creeping rootstocks.  
Plants annual.

1. *H. halepensis*.  
2. *H. Sorghum*.

1. *H. halepensis* L. Stem 0.5–1.5 m. tall, arising from a stout creeping root-stock: panicle oblong or pyramidal, 15–50 cm. long, the branches sometimes finally drooping: sessile spikelet 4.5–5.5 mm. long, plump, more or less pubescent, the awn, if present, 1–1.5 cm. long, deciduous. [*Sorghum halepense* Pers. *Andropogon halepensis* Brot.]—(JOHNSON-GRASS. EVER-GREEN-MILLET. EGYPTIAN-MILLET.)—Fields and waste-places, various provinces, Fla. to Tex., Calif., Kans., and Mass. Nat. of Afr.—(*W. I., Mex., C. A., S. A.*)—Sometimes a troublesome weed. This and the following species sometimes produce hydrocyanic acid in sufficient abundance to poison grazing animals.

2. *H. Sorghum* L. Annual with stouter stems and broader leaf-blades. The cultivated sorghum or sorgo sometimes persists in fields and waste-places, locally throughout our range. Nat. of E. I.—(*W. I., Mex., C. A., S. A.*)—This grass has been cultivated from prehistoric times in many varieties for food and forage—SORGO, KAFIR, MILO, SHALLU, KAOLIANG, DURRA, BROOM-CORN, EGYPTIAN-CORN, CHICKEN-CORN, JERUSALEM-CORN, FETERITA—and for its sweet juice which is made into sirup.

14. **SORGHASTRUM** Nash. Erect rather tall perennials, with narrow flat leaf-blades and narrow terminal panicles. Spikelets in pairs, one nearly terete, sessile and fertile, the other wanting, only the hairy pedicel present: glumes coriaceous, brown or yellowish, hirsute: sterile and fertile lemmas hyaline, the latter bearing a well-developed bent and twisted awn: racemes reduced to 1 to few joints.—About 12 species, natives of tropical and temperate regions.—INDIAN-GRASSES. INDIAN-REEDS.

Awn usually 15 mm. or less long, once bent: spikelets yellowish: panicle rather dense.

Awn 20 to 30 mm. long, twice bent, twisted below the second bend. Spikelets chestnut-brown, the ultimate branchlets villous only at the very tip: panicle loose, not unilateral.

1. *S. nutans*.

2. *S. Elliottii*.

3. *S. secundum*.

Spikelets yellowish-brown, the upper portion of the ultimate branchlets with long ascending hairs: panicles rather dense, distinctly unilateral.

1. *S. nutans* (L.) Nash. Stem 1–2.5 m. tall: panicle oblong, yellowish or bronze, 20–50 cm. long, rather compact, the branchlets not flexuous: spikelets 6–8 mm. long, the awn geniculate and twisted. [*Sorghum avenaceum* Chapm. *S. nutans* A. Gray]—(WOOD-GRASS.)—Dry soil, various provinces, Fla. to Tex., Ariz., N. D., and Me.—(*Mex.*)

2. *S. Elliottii* (Mohr) Nash. Stem 1–1.5 m. tall: panicle 15–30 cm. long, loose, the pedicels flexuous or drooping: spikelets 6–7 mm. long. [*S. Linnaeanum* Nash]—Dry soil, woods, slopes, and bluffs, Coastal Plain and rarely adj. provinces, Fla. to E. Tex., Tenn., and Md.

3. *S. secundum* (Ell.) Nash. Stem 1-2 m. tall: panicle 20-40 cm. long: spikelets 6-8 mm. long. [*Sorghum secundum* Chapm.]—Pinelands, Coastal Plain, Fla. to Tex., and S. C.

15. **RHAPHIS** Lour. Our species annual, with open panicles, the three spikelets (reduced racemes) borne at the ends of long slender naked branches. Spikelets in 3's, one sessile and perfect, the other two pedicellate and sterile, or sometimes a pair below, one fertile and one sterile: fertile spikelets terete, the glumes coriaceous: sterile and fertile lemmas hyaline, the latter long-awned.—Twenty species, widely distributed in tropical regions.

1. *R. pauciflora* (Chapm.) Nash. Stem 0.5-1 m. tall: panicle very open, the branches 2-5 cm. long: spikelets about 8 mm. long, the peduncle disjoining obliquely leaving a long sharp densely pubescent callus below: awn stout, 10-14 cm. long, geniculate, twisted below. [*Sorghum pauciflorum* Chapm.]—Pinelands and old fields, pen. Fla.—(Cuba.)

16. **HETEROPOGON** Pers. Annuals or perennials, often robust with flat leaf-blades and solitary terminal racemes: rachis slender, the lower part, bearing the pairs of staminate spikelets, continuous, the remainder disarticulating obliquely at the base of each joint, the joint forming a sharp-barbed callus below the fertile spikelet, the pedicellate spikelet readily falling, its pedicel remaining, obscured in the hairs of the callus. Spikelets in pairs, one sessile, the other pedicellate, both of the lower few to several pairs staminate or neuter, the remainder of the sessile spikelets perfect, terete, long-awned, the pedicellate spikelets, like the lower, staminate, flat, conspicuous: glumes of the fertile spikelet equal, coriaceous, the first brown-hirsute, infolding the second: lemmas hyaline, the fertile one bearing a strong bent and twisted brown awn: palea wanting: glumes of the staminate spikelet membranaceous, the first green, faintly many-nerved, unsymmetrical, one submarginal keel rather broadly winged, the other wingless, the margins inflexed, the second glume narrower, symmetrical.—Six species, most abundant in the Old World. Our species is annual.

1. *H. melanocarpus* (Ell.) Benth. Stem 1-2 m. tall, branched: raceme 3-6 cm. long: sessile spikelet 5-6 mm. long, the awn 10-15 cm. long: pedicellate spikelet 1.5-2 cm. long, acuminate, the first glume with a row of oil glands. [*H. acuminatus* Trin.]—Fields and open grounds, Coastal Plain, Fla., Ala., and Ga.; also in Ariz.—(Mex., C. A., S. A.)

17. **NAZIA** Adans. Low annuals with flat leaf-blades and terminal spikes, the bur-like clusters of spikelets rather closely arranged along a slender axis.

Spikelets in groups of 2-5, the groups falling entire, the spikelets sessile on a short zigzag axis, the upper 1-3 reduced and sterile, the lower perfect, 1-flowered: first glume small and thin, or wanting: second glume of the two lower spikelets 3-nerved, and with a row of prickles on each side of each nerve: lemma and palea thin.—Three species, natives of the tropics, and more widely naturalized.

1. *N. racemosa* (L.) Kuntze. Stem usually branching at the base and decumbent, 30 cm. long or less: leaf-blades ciliate, mostly less than 5 cm. long: spike 8 cm. long or less: spikelets 4-4.5 mm. long, the acuminate apex projecting beyond the spines, the cluster pedicelled. — (PRICKLE-GRASS.) — Waste places, especially ballast, coast region of N. C., and at more northern seaports; also in Tex. and Ariz. Nat. of Eu.

18. *ANTHAENANTIA* Beauv. Erect perennials, with short creeping rootstocks, narrow, firm flat leaf-blades, the uppermost much reduced, and narrow panicles, the slender branches ascending or appressed. Spikelets obovoid, villous: first glume wanting: second glume and sterile lemma subequal, broad, 5-nerved, the sterile lemma with a small palea and sometimes a staminate flower: fertile lemma cartilaginous, boat-shaped, 3-nerved, subacute, chestnut-brown, as long as the glume, the pale margins very narrow.—Two species, natives of the S United States.

Leaf-blades erect, or spreading at the apex, linear, folded at base: panicle usually purple.

Leaf-blades ascending or spreading (on the average shorter and broader than in *A. rufa*), tapering to the apex, rounded at base: panicle usually pale.

1. *A. rufa*.

2. *A. villosa*.

1. *A. rufa* (Ell.) Schult. Stem slender, erect; 0.6-1.2 m. tall: lower sheaths crowded, keeled, often purplish; leaf-blades mostly 20-50 cm. long, 2-4 mm. wide: panicle 8-15 cm. long, 1.5-3 cm. wide, brownish at maturity, the slender erect branches spikelet-bearing throughout; spikelets 3-4 mm. long, the copious pubescence in stripes down the middle of the internerves.—Moist pinelands, Coastal Plain, Fla. to Tex. and N. C.

2. *A. villosa* (Michx.) Beauv. Differs from *A. rufa* in the short lower sheaths, shorter, wider leaf-blades and paler, more open panicle.—Dry pinelands, Coastal Plain, Fla. to E Tex. and N. C.

19. *VALOTA* Adans. Perennials from knotty pubescent crowns, the slender racemes erect or nearly so, aggregated along the upper part of the main

axis, forming a white or tawny silky panicle. Spikelets lanceolate, in pairs, short-pedicelled in 2 rows along one side of a narrow rachis: first glume minute, glabrous: second glume and sterile lemma about as long as the fruit, 3-5-nerved, copiously silky: fertile lemma cartilaginous, lanceolate, acuminate, brown, the flat white hyaline margins broad.—About 12 species, in temperate and tropical America.

1. *V. insularis* (L.) Chase. Stem 1-1.5 m. tall, rather stout: leaf-blades as much as 30 cm. long and 1.5 cm. wide: panicle 15-30 cm. long, more or less nodding. [*Trichachne insularis* Nees *Panicum leucophaeum* H. B. K.] —(SILKY-GRASS.)—Moist soil and waste-places, Coastal Plain, Fla. and S Tex.—(W. I., Mex., C. A., S. A.)

20. **SYNTHERISMA** Walt. Erect or prostrate annuals or perennials, the slender racemes digitate or aggregate on a short axis. Spikelets in 2's or 3's, subsessile or short-pedicelled, alternate in 2 rows on one side of a 3-angled rachis, lanceolate or elliptic: first glume minute or wanting: second glume equalling the sterile lemma or shorter: fertile lemma cartilaginous, the hyaline margins pale. [*Digitaria* Haller]—About 60 species, in tropical and temperate regions. —FINGER-GRASSES. CRAB-GRASSES.—Some species are pernicious weeds.

Rachis of raceme winged, or flat-margined: creeping annuals.  
Rachis of raceme wingless, triangular: plants not creeping, annual or perennial.

I. SANGUINALIA.

II. FILIFORMIA.

#### I. SANGUINALIA

Rachis bearing scattered long, fine hairs (these rarely wanting): spikelets narrow, acuminate, nearly glabrous.

1. *S. digitatum*.

Rachis not bearing hairs.

Leaf-sheaths glabrous: fertile lemma brown.

Spikelets 2 mm. long.

Spikelets 1.7 mm. long.

2. *S. Ischaemum*.

3. *S. floridanum*.

Leaf-sheaths hispid or villous: fertile lemma pale.

Spikelets 1.5 mm. long: pedicels terete, glabrous.

4. *S. serotinum*.

Spikelets 2.5-3.5 mm. long: pedicels angled, scabrous.

Second glume much smaller than the spikelets; first glume present.

5. *S. sanguinale*.

Second glume equalling the spikelets; first glume obsolete.

6. *S. Simpsoni*.

#### II. FILIFORMIA

Fertile lemma pale or gray: plant perennial.

7. *S. pauciflorum*.

Fertile lemma dark-brown: plant erect or at least not rooting at decumbent base, annual or sometimes apparently perennial.

Second glume and sterile lemma glabrous.

8. *S. gracillimum*.

Second glume and sterile lemma glandular-pubescent.

Spikelets about 1.5 mm. long.

Leaf-blades folded or involute, flexuous.

9. *S. panicum*.

Leaf-blades flat.

10. *S. filiforme*.

Spikelets 2-3 mm. long.

11. *S. villosum*.

1. *S. digitatum* (Sw.) A. Hitchc. Plant decumbent and spreading, with the aspect of *S. sanguinale*: stem as much as 60 cm. long or rarely 100 cm.: leaf-sheaths papillose-hirsute: racemes slender, mostly 5-10, aggregate, spreading, 5-10 cm. long: spikelets about 2 mm. long: first glume minute; second

glume half as long as the spikelet, both sparingly appressed-pubescent: fruit slightly shorter than the sterile lemma, pale. [*S. setosum* Nash]—Waste-places, Coastal Plain, C and S Fla. and Ala.—(*W. I., Mex., C. A., S. A.*)

2. *S. Ischaemum* (Schreb.) Nash. Plant decumbent and spreading or at first erect: stem usually less than 50 cm. tall: leaf-sheaths smooth: racemes 2-6, rarely more, mostly 4-7 cm. long: spikelets about 2 mm. long, usually purplish: first glume wanting: second glume and sterile lemma equal, glandular-pubescent, as long as the dark fruit. [*S. humifusum* Rydb. *Panicum glabrum* Gaud.]—Waste-places, various provinces, S. C. to Ark., S. D., and Me.; occasional westward. Nat. of Eu.—(*W. I.*)

3. *S. floridanum* A. Hitchc. Differs from *S. Ischaemum* in the smaller spikelets (1.7 mm. long, 0.6 mm. wide) and the less pubescent second glume and sterile lemma, the hairs not being glandular.—Sandy pinelands, Hernando Co., Fla.

4. *S. serotinum* Walt. Plant creeping, sometimes forming extensive mats: flowering stem usually not more than 30 cm. tall: leaves crowded on the creeping stems, the sheaths villous, the blade 1-2 cm. long, 3-5 mm. wide: racemes usually 3-5, slender, often arcuate, usually 3-6 cm. long: spikelets pale, crowded: first glume wanting: second glume about one-third as long as the sterile lemma, both pubescent. [*Panicum serotinum* Michx.]—Pasture and waste-places, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

5. *S. sanguinale* (L.) Dulac. Plant decumbent and spreading, often purplish: stem rooting at the lower nodes, as much as 1 m. long: leaf-sheaths papillose-pilose: racemes several to many, 3-15 cm. long, digitate at the summit of the stems and usually one or more whorls a short distance below: spikelets usually about 3 mm. long: first glume minute, triangular, glabrous: second glume about half as long as the sterile lemma, both appressed-pilose, the hairs becoming spreading, or the sterile lemma glabrous. [*Panicum sanguinale* L. *S. fimbriatum* Nash *S. marginatum* Nash *S. barbatum* Nash]—(CRAB-GRASS.)—Fields, pastures, and waste-places, throughout E U. S.—(*W. I., Mex., C. A., S. A., O. W.*)

6. *S. Simpsoni* (Vasey) Nash. Stem creeping and rooting at the lower nodes, as much as 1-1.5 m. long: leaf-sheaths papillose-pilose, those of the innovations compressed and keeled: racemes 4-8, ascending, pale, 8-12 cm. long: spikelets about 3 mm. long: second glume and sterile lemma finely nerved, as long as the fertile lemma.—Sandy fields, Fla.—(*Cuba.*)

7. *S. pauciflorum* A. Hitchc. Plant perennial: stem erect or somewhat decumbent at base, 0.5-1 m. tall, very slender: leaf-sheaths and blades grayish-villous: racemes 2-3, ascending or erect, 5-11 cm. long, the filiform rachis naked for 1-5 cm. at base: spikelets rather distant, elliptic, about 3.2 mm. long, glabrous: first glume minute, with a hyaline erose margin: second glume and sterile lemma finely nerved, as long as the grayish fertile lemma.—Pinelands, S Fla.

8. *S. gracillimum* (Scribn.) Nash. Stem 0.5-1 m. tall: leaf-sheaths appressed-pilose: blades long and narrow, 1-2 mm. wide, often involute: racemes 2-several, slender, ascending or erect, 10-30 cm. long: spikelets about 2 mm. long,

often in 3's, the longer pedicels as much as 5 mm. long: first glume wanting: second glume half to three-fourths as long as the sterile lemma. [*S. Bakeri* Nash]—Dry pinelands, Fla.

9. *S. panicum* (Sw.) Nash. Stems commonly in dense tufts, 0.3–1 m. tall: leaf-sheaths appressed-pubescent or glabrous: blades about 1 mm. wide, slender, often folded or involute, the older ones usually flexuous: racemes mostly 1–3, erect, 5–20 cm., commonly 10–15 cm. long.—Moist soil, pinelands or open grounds, S Fla.—(*W. I.*)

10. *S. filiforme* (L.) Nash. Stems usually in small tufts, rarely as much as 0.6 m. tall: leaf-sheaths pilose: blades usually less than 10 cm. long: racemes 1–5, erect or ascending, usually not over 10 cm. long: spikelets rather crowded: first glume wanting: second glume somewhat shorter than the sterile lemma, both densely pubescent with crisp glandular-tipped whitish hairs: fertile lemma somewhat acuminate. [*Panicum filiforme* L.]—Sandy fields and open grounds, Coastal Plain and adj. provinces, Fla. to Tex., Kans., and Mass. Nat. of Eu.—(*W. I., Mex.*)

11. *S. villosum* Walt. Differs from *S. filiforme* in being taller (as much as 1–1.5 m.) and apparently perennial, the leaf-blades longer, the racemes more numerous (5–7) and longer (as much as 25 cm.), and in the larger spikelets (2–3 mm.).—*S. leucocoma* Nash is a form with few racemes and silky spikelets.—Sandy fields and woods, Coastal Plain, Fla. to E Tex., Okla., Ill., and S Va.—(*W. I., Mex.*)

21. **LEPTOLOMA** Chase. Branching perennials with brittle culms, felty pubescent at base, flat blades and open or diffuse panicles, these breaking away at maturity, becoming tumble-weeds. Spikelets lanceolate, on slender pedicels: first glume minute or obsolete: second glume 3-nerved, nearly as long as the 5–7-nerved sterile lemma, a stripe of appressed silky hairs down the internerves and margins of each: fertile lemma cartilaginous, elliptic, acute, brown, the delicate hyaline margins enclosing the palea.—Four species, Australian, except the following.

1. *L. cognatum* (Schult.) Chase. Stem decumbent at base, 20–50 cm. long: leaf-blades mostly less than 10 cm. long: panicle 10–20 cm. long, becoming nearly as wide: spikelets about 3 mm. long, borne singly at the ends of capillary branchlets. [*Panicum cognatum* Schult. *P. autumnale* Bosc.]—(*WITCH-GRASS.*)—Sandy open grounds, various provinces, Fla. to Tex., Ariz., Kans., and Vt.—(*Mex.*)

22. **ERIOCHLOA** H. B. K. Annuals or perennials with terminal panicles consisting of several to many spreading or appressed racemes, usually rather closely arranged along the main axis. Spikelets more or less pubescent, solitary or sometimes in pairs, short-pedicelled or subsessile in 2 rows on one side of a narrow, usually hairy rachis, the pedicels often clothed with long stiff hairs, the back of the fertile lemma turned from the rachis: lower rachilla-joint thickened, forming a more or less ring-like callus below the second glume, the first glume reduced to a minute sheath adnate to it: second glume and

sterile lemma about equal, acute or acuminate, the lemma usually enclosing a hyaline palea or sometimes a staminate flower: fertile lemma indurate, minutely papillose-rugose, mucronate or awned, the margins slightly inrolled.—Fifteen species, in the warmer regions, but mostly American.

1. *E. Michauxii* (Roem. & Schult.) A. Hitchc. Plant perennial: stem erect, single, puberulent about the nodes, 70–150 cm. tall: leaf-blades usually 20–40 cm. long, (very narrow, and with few racemes and empty sterile lemma in *E. Michauxii Simpsoni*): racemes ascending or spreading: spikelets about 5 mm. long. [*E. mollis* Michx. *E. longifolia* Vasey *E. mollis longifolia* Chapm.]—Wet soil, Coastal Plain, Fla. and S Ga.

23. **BRACHIARIA** (Trin.) Griseb. Annuals or perennials, with terminal inflorescence of several racemes along a common axis: spikelets dorsally compressed, solitary, rarely in pairs, sessile, in two rows on one side of a 3-angled, sometimes narrowly winged rachis, the first glume turned toward the axis; first glume short or nearly as long as the spikelets: second glume and sterile lemma about equal, 5- to 7-nerved, the lemma enclosing a hyaline palea and sometimes a staminate flower: fertile lemma indurate, usually papillose-rugose, the margins inrolled, the apex rarely mucronate or bearing a short awn.—Fifteen species, in the warmer regions of both hemispheres.

Anastomosing veins of spikelet prominent.  
Anastomosing veins of spikelet obscure or wanting.

1. *B. extensa*.
2. *B. plantaginea*.

1. *B. extensa* Chase. Plant annual, nearly glabrous throughout: stem branching, decumbent and rooting at base, 40–60 cm. long: leaf-blades flat, mostly not over 10 cm. long, 8–12 mm. wide: spikes 2–5, spreading, 3–7 cm. long, distant on the axis: spikelets about 4 mm. long, the second glume and sterile lemma pointed beyond the turgid fruit. [*B. platyphylla* Nash]—Moist fields, Coastal Plain, Fla., La., and Tex.—(*W. I., S. A.*)

2. *B. plantaginea* (Link) A. Hitchc. Differs from *B. extensa* in having the anastomosing veins of the spikelet obscure or wanting and the second glume and sterile lemma not pointed beyond the fruit.—Open moist ground, various provinces, Ga. to Pa. and N. J.—(*Mex., S. A.*)

24. **AXONOPUS** Beauv. Our species stoloniferous or tufted glabrous perennials, with usually flat abruptly rounded or somewhat pointed leaf-blades, and 2–4 slender spike-like digitate racemes. Spikelets depressed biconvex, not turgid, oblong, usually obtuse, solitary, sessile and alternate in 2 rows on one side of a 3-angled rachis, the back of the fertile lemma turned from the axis: first glume wanting: second glume and sterile lemma equal, the former without

a palea: fertile lemma indurate, oblong-elliptic, obtuse, the margins of the lemma slightly inrolled.—About 30 species, mostly natives of tropical America.

Spikelets 2-2.5 mm. long, obscurely silky pubescent: midnerve suppressed.

Spikelets more than 4 mm. long, glabrous: midnerve evident.

1. *A. compressus*.
2. *A. furcatus*.

1. *A. compressus* (Sw.) Beauv. Tufted, often producing long leafy stolons with short broad obtuse leaf-blades: flowering stem 20-40 cm. tall: leaf-sheaths compressed: racemes mostly 2 or 3, spreading, 3-10 cm. long, long-exserted on slender peduncles, terminal and axillary: spikelets 2-2.5 mm. long. [*Anastrophus compressus* Schlecht. *A. platycaulis* Nash *Paspalum platycaule* Poir.]—(CARPET-GRASS.)—Moist open ground, Coastal Plain, Fla. to E Tex., Ark., and N. C.—(W. I., Mex., C. A., S. A.)

2. *A. furcatus* (Flügge) A. Hitchc. Plant usually larger than *A. compressus*, the stems few in a tuft, extensively stoloniferous: racemes 2, 5-15 cm. long: second glume and sterile lemma conspicuously pointed beyond the fruit: foliage rarely pubescent. [*Anastrophus paspaloides* Nash *Paspalum furcatum* Flügge]—Moist pinelands and open grounds, Coastal Plain, Fla. to Tex. and Va.

25. **REIMAROCHLOA** A. Hitchc. Spreading or stoloniferous perennials with flat leaf-blades and slender subdigitate racemes, stiffly spreading or reflexed at maturity. Spikelets strongly dorsally compressed, lanceolate, acuminate, rather distant, subsessile and alternate in two rows along one side of a narrow, flattened rachis, the back of the fertile lemma turned toward it: both glumes wanting, or the second sometimes present in the terminal spikelet: sterile lemma about equalling the fruit, the sterile palea obsolete: fertile lemma scarcely indurate, faintly nerved, acuminate, the margins inrolled at the base only, the palea free nearly half its length.—Four species, natives of tropical America.

1. *R. oligostachya* (Munro) A. Hitchc. Plant glabrous: stem compressed, 40-80 cm. long: racemes 1-4, 5-7 cm. long: spikelets about 5 mm. long. [*Reimaria oligostachya* Munro]—In water or wet soil, Fla.—(Cuba.)

26. **PASPALUM** L. Mostly perennials, with 1 to many spike-like racemes, these single or paired at the summit of the stem or racemosely arranged along the main axis. Spikelets plano-convex, usually obtuse, subsessile, solitary or in pairs, in two rows on one side of a narrow or dilated rachis, the back of the fertile lemma toward it: first glume usually wanting: second glume and sterile lemma commonly about equal: fertile lemma usually obtuse, chartaceous-

indurate, the margins inrolled.—Over 300 species, widely distributed in the warmer parts of both hemispheres.

Rachis with broad green membranous wings. (Subgenus CERESIA.)  
Rachis not winged or very narrowly so.

## I. DISSECTA.

Racemes in pairs at the summit of the stem, rarely a third one below, divaricate at maturity: spikelets solitary.

Spikelets narrowly ovate, 3–4.5 mm. long.

## II. DISTICHA.

Spikelets nearly circular, 1.5 mm. long.

## III. CONJUGATA.

Racemes 1-many, racemose on the axis, not in pairs at the summit.

Fruit pale.

Spikelets not over 2 mm. long (except in no. 6): slender leafless flowering branches borne in the upper sheaths (except in nos. 7–10).

## IV. SETACEA.

Spikelets over 2 mm. long: branches, if any, leafy.

First glume usually present on one of each pair of spikelets, sometimes on both: plants producing scaly rhizomes.

## V. BIFIDA.

First glume wanting.

Spikelets glabrous: leaf-blades flat or folded, 5–12 mm. wide.

## VI. LAEVIA.

Spikelets with a silky fringe around the margin, in pairs

## VII. DILATATA.

Fruit dark brown at maturity

## VIII. PLICATULA.

## I. DISSECTA

Racemes not more than 6, usually 3 or 4: spikelets broadly ovate: rachis not extending beyond the uppermost spikelet.

1. *P. dissectum*.

Racemes numerous: spikelets about half as broad as long: rachis extending as a point beyond the spikelet.

2. *P. repens*.

## II. DISTICHA

Sterile lemma wrinkled in the internerves: spikelets glabrous, flattened.

3. *P. vaginatum*.

Sterile lemma not wrinkled: second glume pubescent.

4. *P. distichum*.

## III. CONJUGATA

Plant stoloniferous; widely creeping.

5. *P. conjugatum*.

## IV. SETACEA

First glume present in at least one of each pair of spikelets: spikelets obovate, appressed-pubescent, 2–2.5 mm. or more long.

6. *P. Langei*.

First glume wanting: spikelets not over 2 mm. long.

Racemes 3–9, scarcely longer than the corresponding internode of the axis: leaf-sheath with an erect pointed auricle on each side at the summit: axillary racemes rarely present.

Spikelets about 1.3 mm. long, obovate, blunt, crowded, glandular-pubescent.

7. *P. Blodgettii*.

Spikelets 1.5–2 mm. long, elliptic.

Racemes 2–3 cm. long, relatively thick.

Racemes 5–10 cm. long, slender.

8. *P. caespitosum*.

9. *P. laxum*.

Racemes 1 or 2, rarely 3, 2 or 3 times longer than the axis internodes: leaf-sheaths not auricled (rarely so in *P. ciliatifolium*): stems slender.

Spikelets not over 1.8 mm. long (if as much as 1.8 mm., leaf-blades either pubescent on the surface or clustered at the base).

10. *P. longepedunculatum*.

Spikelets 1.6–1.8 mm. long, oval: leaf-blades conspicuously villous, usually 3–10 mm. wide.

11. *P. debile*.

Spikelets about 1.5 mm. long, orbicular: leaf-blades short-pilose, usually not over 4 mm. wide.

12. *P. setaceum*.

Spikelets 2 mm. long (or less in *P. ciliatifolium*). Leaf-blades linear, rarely over 4 mm. wide, firm, glabrous.

13. *P. rigidifolium*.

Leaf-blades lanceolate to linear, if the latter pubescent on both surfaces.

Leaf-blades glabrous or with occasional cilia, 8-16 mm. wide.

Leaf-blades firm, tapering from the subcordate base to summit: plants rather stout.

Leaf-blades thin, tapering toward base and summit: sheaths glabrous or margin ciliate: spikelets 1.8-2 mm. long.

Leaf-blades pubescent on one or both surfaces.

Leaf-blades on both surfaces sparsely pilose with long hairs, rather thin.

Leaf-blades densely pubescent on both surfaces.

14. *P. propinquum*.

15. *P. ciliatifolium*.

16. *P. pubescens*.

17. *P. supinum*.

#### V. BIFIDA

Racemes solitary or rarely 2: spikelets subsessile, crowded.

Racemes 2-5: spikelets long-pedicellate, loose.

18. *P. monostachyum*.

19. *P. bifidum*.

#### VI. LAEVIA

Plant erect or ascending, not stoloniferous nor with leafy branches: spikelets blunt, mostly solitary.

Spikelets more or less flattened.

Spikelets  $\frac{1}{3}$ - $\frac{1}{2}$  as thick as broad: glume and sterile lemma firm.

Spikelets rarely over 2.8 mm. long, longer than broad, more than  $\frac{1}{3}$  as thick: panicle much exceeding the blades.

Leaf-sheaths glabrous or ciliate only.

Leaf-sheaths and blades pilose.

Spikelets 3-3.2 mm. long, circular, not more than  $\frac{1}{3}$  as thick: leaf-blades equalling the base of the panicle or overtopping it.

Spikelets flattened, not more than  $\frac{1}{4}$  as thick as broad, closely imbricate, often in pairs: glume and sterile lemma thin, the cells visible: short scaly rootstocks present.

Plant glabrous or nearly so: spikelets 2.2-2.8 mm. long.

Plant villous: spikelets 2.7-3.4 mm. long.

Spikelets turgidly plano-convex: glume and sterile lemma firm.

Leaves clustered toward the base of the stem; rarely over 15 cm. long, the upper half of the stem appearing naked: stems less than 1 m. tall, usually 75 cm. or less, mostly ascending.

Leaves scattered along the stem; some of the blades, at least, 20 cm. long, commonly much longer: stems usually 1-2 m. tall, erect.

Glume and sterile lemma not inflated and wrinkled, commonly rusty-tinged: racemes usually long and widely spreading at maturity: leaf-blades flat, 1.2-2.3 cm. wide, the base wider than the sheath.

Glume and sterile lemma slightly inflated and wrinkled, not rusty-tinged: racemes erect or ascending: leaf-blades firm, commonly folded, the base not wider than the sheath, rarely as wide.

Plant decumbent at base, rooting at the nodes, or stoloniferous (occasional plants in dry situations erect from the base), producing leafy branches: rachis about 2 mm. wide: spikelets in pairs, acute or subacute. (See also no. 26.)

Spikelets depressed plano-convex, not over 1.5 mm. wide: leaf-sheaths keeled: blades rarely over 5 mm. wide, usually folded at base: racemes ascending or erect.

Spikelets turgidly plano-convex, 2 mm. or more wide: leaf-sheaths not keeled: blades more than 7 mm. wide (usually 10 mm. or more), flat.

20. *P. laeve*.

21. *P. longipilum*.

22. *P. circulare*.

23. *P. praecox*.

24. *P. lentiferum*.

25. *P. difforme*.

26. *P. giganteum*.

27. *P. floridanum*.

28. *P. lividum*.

29. *P. pubiflorum*.

#### VII. DILATATA

Panicle virgate, the usually numerous racemes suberect: spikelets scarcely over 2 mm. long.

30. *P. Urvillei*.

Panicle lax, the few to several racemes more or less spreading: spikelets about 3.5 mm. long.

31. *P. dilatatum*.

#### VIII. PLICATULA

Spikelets about 2 mm. long, nearly as broad, glabrous: rachis 1.5–2 mm. wide: plant annual.

32. *P. Boscianum*.

Spikelets 3 mm. long: rachis 1 mm. or less wide: plant perennial

33. *P. plicatulum*.

1. *P. dissectum* L. Glabrous creeping subaquatic perennial: stem 20–60 cm. long: leaf-blades 3–6 cm. long, 4–5 mm. wide: racemes usually erect, 2–3 cm. long, the rachis 2–3 mm. wide: spikelets 2 mm. long, obovate, pale, glabrous. [*P. membranaceum* Walt. *P. Walterianum* Schult.]—Muddy banks, ditches, wet sandy places, and in shallow water, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., and Del.—(*W. I.*)

2. *P. repens* Berg. Aquatic perennial with submerged stems as much as 200 cm. long, and numerous floating branches with inflated sheaths: leaf-blades 10–20 cm. long, 12–15 mm. wide: racemes ascending, spreading or recurved, rather lax, 3–5 cm. long, the rachis about 1.5 mm. wide: spikelets 1.4–2 mm. long, elliptic. [*P. mucronatum* Muhl. *P. fluitans* Kunth]—Ponds, marshes, and streams, Coastal Plain, Fla. to Tex., Ill., and S. C.—(*W. I., Mex.*)

3. *P. vaginatum* Swartz. Stem producing creeping rootstocks and also stolons 100 cm. or more long, the flowering shoots 8–60 cm. tall: leaf-sheaths inflated; blades 3–8 mm. wide: racemes usually 2, at first erect, finally spreading or reflexed: spikelets 3–4.5 mm. long, acute, pale. [*P. reismarioides* Chapm.]—(*SALT JOINT-GRASS.*)—Seacoasts and brackish marshes, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)

4. *P. distichum* L. Resembling *P. vaginatum*: leaf-sheaths usually less inflated and papery: spikelets less flattened, first glume often present on some of the spikelets.—(*JOINT-GRASS.*)—Ditches, fresh or brackish marshes and prairies, Coastal Plain and Basin and Range, Fla. to Tex., Calif., Okla., and N. J.—(*W. I., Mex., C. A., S. A.*)

5. *P. conjugatum* Berg. Perennial, extensively creeping: stems compressed: flowering-branches as much as 100 cm. tall: leaf-blades flat, thin, about 1 cm. wide: racemes widely divaricate, usually arcuate, slender, 10–12 cm. long: spikelets 1.5 mm. long, flat on both sides, pale-yellow, silky-pubescent around the margin.—Moist ground, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

6. *P. Langei* (Fourn.) Nash. Stem 70–110 cm. tall: leaf-sheaths glabrous or sometimes hirsute, ciliate; blades flat, as much as 1.5 cm. wide: racemes 2 or 3, 7–9 cm. long: spikelets obovate, 2.5–2.8 mm. long. [*Dimorphostachys ciliifera* Nash]—Moist woods and thickets, Fla. to Tex.—(*W. I.*)

7. *P. Blodgettii* Chapm. Stem erect, as much as 100 cm. tall: leaf-sheaths glabrous or the lower appressed villous; blades 2–15 mm. wide, glabrous, often ciliate: racemes 3–15, spreading or ascending. [*P. gracillimum* Nash]—Pine-lands and hammocks, Everglade Keys, and adj. Everglades, Fla. and Florida Keys.—(*W. I.*)

8. *P. caespitosum* Flügge. Stem 30–60 cm. tall: leaf-sheaths glabrous; blades 3–7 mm. wide, glabrous, flat, usually subinvolute in drying, narrowed at both ends: racemes 2–6: spikelets sparsely appressed-pubescent.—Pinelands, Everglades, and hammocks, S pen. Fla. and the Keys.—(*W. I.*)

9. *P. laxum* Lam. Stem 60–100 cm. tall: leaf-sheaths glabrous, a few long white hairs at the mouth: blades folded or involute: racemes few to several, mostly arcuate-divaricate: spikelets crowded, 1.8–2 mm. long, pubescent or rarely glabrous. [*P. elatum* (Fl. SE. U. S.)]—Rocky hammocks, Key West, Fla.—(*W. I.*)

10. *P. longepedunculatum* Le Conte. Stem spreading, 25–80 cm. tall: leaf-sheaths glabrous, ciliate: blades 4–10 mm. wide, the margin ciliate: racemes 1 or 2, 2–8 cm. long, slender, usually curved: spikelets 1.5 mm. long. [*P. kentuckyense* Nash]—Pinelands, fields, and woods, Coastal Plain and rarely adj. provinces, Fla. to Miss. and Ky.

11. *P. debile* Michx. Stem 40–100 cm. tall: leaf-sheaths villous; blades 3–10 mm. wide: racemes usually single, 7–11 cm. long: spikelets glandular-pubescent. [*P. villosissimum* Nash]—Pinelands and fields, Coastal Plain, Fla. to Tex. and N. Y.

12. *P. setaceum* Michx. Stem 20–70 cm. tall: leaf-sheaths villous; blades linear, 2.5–5 mm. wide: racemes usually single: spikelets glabrous or sparsely glandular-pubescent.—Meadows, fields, pinelands, and woods, various provinces, Fla. to Tex. and N. Y.

13. *P. rigidifolium* Nash. Stem erect, 30–80 cm. tall: lower leaf-sheaths villous; blades erect or ascending: racemes usually single, 6–13 cm. tall: spikelets about 2 mm. long, glabrous or pubescent.—Pinelands, Coastal Plain, Fla. to Tex.—(*W. I.*)

14. *P. propinquum* Nash. Stem 50–100 cm. tall: leaf-sheaths glabrous; blades glabrous or sparingly ciliate, 7–20 mm. wide: racemes 1–3, 6–12 cm. long: spikelets glabrous, about 2 mm. long.—Hammocks, moist banks, and thickets, sandy soil, Coastal Plain, Fla. to Tex.

15. *P. ciliatifolium* Michx. Stem 40–80 cm. tall: leaf-blades 6–15 mm. wide: racemes 1 or 2, 5–11 cm. long: spikelets glabrous or pubescent. [*P. blepharophyllum* Nash *P. Chapmanii* Nash *P. Eggertii* Nash *P. epile* Nash *P. latifolium* Le Conte]—Fields, pinelands, hammocks, open woods, and swamps, Coastal Plain and adj. provinces, Fla. to Tex. and N. J.—(*W. I.*)

16. *P. pubescens* Muhl. Stem 40–80 cm. tall, usually pilose below the racemes: leaf-blades linear: racemes usually single, 6–12 cm. long: spikelets about 2 mm. long, glabrous. [*P. Muhlenbergii* Nash]—Fields, acid swamps, and marshes, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Vt.

17. *P. supinum* Bosc. Stem 20–60 cm. tall: leaf-blades 10–20 mm. wide: racemes usually 2 or 3, 4–10 cm. long: spikelets about 2 mm. long, glandular-pubescent, or sometimes glabrous. [*P. dasyphyllum* Ell.]—Sandy soil, pinelands, fields, banks, and swamps, Coastal Plain, Fla. to La., Tenn., and N. C.

18. *P. monostachyum* Vasey. Glabrous: stem strict, 60–120 cm. tall: leaf-blades elongate, terete: racemes mostly 10–30 cm. long: spikelets 3 mm. long. [*P. solitarium* Nash]—Wet soil, prairies and marshes, Coastal Plain, S Fla. and Tex.

19. *P. bifidum* (Bertol.) Nash. Stem erect, 70–130 cm. tall; leaf-sheaths mostly papillose-hirsute; blades 5–10 mm. wide, glabrous beneath, hirsute above toward the base: racemes 2–5, 7–15 cm. long, erect; the rachis very slender, flexuous: spikelets turgid, 3.5–4 mm. long. [*P. racemulosum* Nutt.]—Dry pine-lands, sandy woods, shaded banks, and thickets, Coastal Plain, Fla. to Tex. and S. C.

20. *P. laeve* Michx. Stem erect or ascending, glabrous, 40–100 cm. tall: leaf-blades glabrous, or sparsely pilose on the upper surface: racemes 2–5, usually 3 or 4, 3–10 cm. long, spreading or ascending: spikelets 2.5–3 mm. long. [*P. angustifolium* Le Conte *P. australe* Nash]—Fields, woods, swamps, and meadows, various provinces, Fla. to Tex. and N. J.

21. *P. longipilum* Nash. Resembling *P. laeve*: leaf-blades pilose on both surfaces or nearly glabrous beneath: racemes 2–6, rather lax and spreading. [*P. plenipilum* Nash *P. praelongum* Nash]—Moist sandy soil, pinelands, woods, and marshes, Coastal Plain, Fla. to Tex., Tenn., and N. Y.

22. *P. circulare* Nash. Stem 30–60 cm. tall: leaf-sheaths sparsely pilose or the upper glabrous; blades 5–10 mm. wide, usually more or less pilose: racemes 2–4, 5–10 cm. long, mostly suberect or the lower spreading.—Fields, marshes, meadows, prairies, and sandy woods, Coastal Plain and occasionally adj. provinces, N. C. to Tex., Kans., and Conn.

23. *P. praecox* Walt. Stem 50–100 cm. tall, producing short scaly rootstocks: leaf-sheaths glabrous or the lower pilose; blades 3–7 mm. wide, glabrous, or somewhat pilose on upper surface toward the base: racemes 2–8 (usually 4–6), 2–7 cm. long, ascending.—Wet pinelands, marshes, and ponds, Coastal Plain, Fla. to Tex. and N. C.

24. *P. lentiferum* Lam. Resembling *P. praecox*, but commonly more robust, the leaf-sheaths and blades often conspicuously pilose: racemes 2–9, usually 4 or 5, 3–10 cm. long. [*P. Curtisianum* Steud. *P. glaberrimum* Nash *P. tardum* Nash *P. Kearneyi* Nash *P. amplum* Nash]—Moist pinelands, wet woods, and marshes, Coastal Plain, Fla. to Tex. and N. C.

25. *P. difforme* LeConte. Stem 35–75 cm. tall: leaf-sheaths pilose on keel and margin or glabrous; blades usually pilose on the upper surface at least at base: racemes 2 or 3, 3.5–8 cm. long: spikelets mostly in pairs, 3.5–4 mm. long, oval.—Low grounds and rich woods, Coastal Plain, Fla. to La., and Ga.

26. *P. giganteum* Baldw. Stem mostly solitary, 150–200 cm. tall, with short scaly rootstocks: leaf-sheaths glabrous or pilose: racemes usually 3 or 4, 10–20 cm. long: spikelets 3–3.8 mm. long, oval or obovate, glabrous. [*P. longiciliatum* Nash.]—Moist sandy soil or clay, pinelands, marshes, and ditches, Coastal Plain, Fla. to Miss.

27. *P. floridanum* Michx. Stem 100–150 cm. tall, with short scaly rootstocks (more robust and taller: foliage glabrous or nearly so: racemes averaging longer, in *P. floridanum glabratum*. [*P. altissimum* Le Conte], Fla. to Tex., Kan., Md., and N. J.): leaf-sheaths commonly villous; blades 4–10 mm. wide, usually villous at least above: racemes mostly 2–4, 4–12 cm. long: spikelets 3.6–4 mm. long, oval, glabrous.—Low sandy soil, pinelands, prairies, swamps, and fields, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., and Va.

28. *P. lividum* Trin. Stem 60–100 cm. tall: leaf-sheaths usually glabrous; blades 3–6 mm. wide, sometimes pubescent on the upper surface: racemes

usually 4-7, often flexuous, 1.5-5 cm. long.—Wet ground, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

29. *P. pubiflorum* Rupr. Stem 40-100 cm. tall, rather stout: leaf-sheaths glabrous or the lower hirsute; blades 10-15 mm. wide, glabrous: racemes usually 3-5, 5-10 cm. long: spikelets about 3 mm. long, softly pubescent (stems often taller: spikelets glabrous in *P. pubiflorum glabrum*. [*P. laevigumis* Scribn.], Woods, various provinces, Kans., Ind., and N. C.), broadly obovate. [*P. Hallii* Vasey & Scribn. *P. geminum* Nash]—Moist soil, Coastal Plain, La. to Tex.—(*Mex.*)

30. *P. Urvillei* Steud. Stems in large clumps, 100-150 cm. tall: lower leaf-sheaths densely papillose-hirsute, purplish; blades 8-12 mm. wide: racemes 10-20, 8-12 cm. long. [*P. Vaseyanum* Scribn.]—(VASEY-GRASS.)—Fields, low grounds, prairies, and roadsides, Coastal Plain, Fla. to Tex. and S. C.—(*C. A., S. A.*)

31. *P. dilatatum* Poir. Stem 50-170 cm. tall: leaf-sheaths glabrous; blades 3-12 mm. wide: racemes 3-8, 5-10 cm. long.—(DALLIS-GRASS.)—Moist soil, stream-banks, marshes, and waste-places, various provinces, Fla. to Tex., Tenn., and N. J.—(*W. I., C. A., S. A.*)

32. *P. Boscianum* Flüggé. Annual, glabrous as a whole, stems ascending from a decumbent rooting base, 50-120 cm. long: leaf-sheaths purplish, the lowermost hirsute; blades 3-10 mm. wide: racemes 2-9 cm. long: spikelets mostly in pairs 2-2.3 mm. long, obovate. [*P. purpurascens* Ell.]—Moist soil, swamps, cult. grounds, and hillsides, Coastal Plain, Fla. to Miss. and Pa.—(*W. I.*)—*P. scrobiculatum* (Fl. SE. U. S.) is a depauperate plant with solitary spikelets.

33. *P. plicatulum* Michx. Stem 50-100 cm. tall: leaf-sheaths keeled, glabrous or rarely hirsute, the lower crowded: blades mostly folded at base, rather firm, 3-10 mm. wide: racemes usually 3-10 (2-19), 2-10 cm. long, usually arcuate-spreading: spikelets drying brown, the sterile lemma wrinkled just inside the margin.—Moist soil, pinelands, woods, and prairies, Coastal Plain, Fla. to Tex. and Ga.—(*W. I., Mex., C. A., S. A.*)

27. **PANICUM** L. Annuals or perennials various in habit. Spikelets in open or compact panicles, rarely in racemes: glumes 2, usually very unequal, the first often minute, the second typically equalling the sterile lemma, the latter enclosing a thin palea and sometimes a staminate flower: fertile lemma chartaceous-indurate, typically obtuse, the nerves obsolete, the margins inrolled over a palea of the same texture.—Five hundred species, in the warmer parts of both hemispheres.—Sum.-fall, or all year S.—PANIC-GRASSES. WITCH-GRASSES.

Axis of branchlets extending beyond the base of the uppermost spikelet as a point or bristle 1-6 mm. long: perennials: fruit transversely rugose.

I. DISTANTIFLORA.

Axis of branchlets not extending into a bristle. (In *Panicum geminatum* and *P. paludivagum* the somewhat flattened axis pointed but not bristle-form.)

Basal leaves similar to stem-leaves, not forming a winter rosette: spikelets all fertile.

Fruit transversely rugose.

Plant annual: leaf-sheaths rather wide, flat: spikelets more or less reticulate-veined.

III. FASCICULATA.

Plant perennial: spikelets glabrous.

Inflorescence consisting of several spike-like racemes along a main axis.

II. GEMINATA.

Inflorescence an open panicle.

VI. MAXIMA.

Fruit not transversely rugose.

First glume truncate or triangular-tipped, not more than one fourth the length of the nar-

- row, acute or acuminate, glabrous spikelet: plants annual.
- First glume not truncate (except in *P. repens*). Plant annual.
- Spikelets glabrous, pointed: leaf-sheaths papillose-hispid; leaves hirsute.
- Spikelets warty: leaves glabrous.
- Plant perennial.
- Spikelets short-pedicel along one side of the main branches of the panicle forming narrow or spike-like racemes, sometimes somewhat aggregate toward the ends of branches (see also VIII. *Tenera*).
- First glume nearly equalling the sterile lemma.
- First glume much shorter than the sterile lemma.
- Panicle long (15-30 cm.), very narrow, the branches erect or nearly so; fruit rather thin and soft, the palea scarcely enclosed.
- Panicle usually open (at least not long and narrow), the main branches spreading; fruit indurate, the palea enclosed: plants commonly producing axillary panicles.
- Sterile palea not enlarged at maturity.
- Sterile palea enlarged at maturity, forcing open the spikelet.
- Spikelets in open or sometimes in contracted or congested panicles, but the main branches not in narrow or spike-like racemes: stems simple.
- Panicle narrow and few-flowered: stems erect and wiry: leaf-blades drying involute.
- Panicle open or contracted, several to many-flowered: stems stout or rigid.
- Basal leaves usually distinctly different from those of the stem, forming a winter rosette: stems at first simple, the spikelets of the primary panicle not perfecting seed, later usually becoming much-branched, the small secondary panicles with cleistogamous, fruitful spikelets: panicles open, the branchlets usually flexuous: perennials.
- Leaf-blades elongate, not more than 5 mm. wide, 20 times as long as wide: autumnal phase branching from the base only.
- Leaf-blades not elongate (or if so more than 5 mm. wide and autumnal phase not branching from the base).
- Plant branching from the base, finally forming rosettes or cushions, the foliage soft and lax: leaf-blades prominently ciliate (except in *P. laxiflorum*).
- Plant branching from the stem-nodes or rarely remaining simple.
- Leaf-blades long, stiff: autumnal phase bushy-branched above.
- Spikelets turgid, attenuate at base, mostly pustulose-pubescent: leaf-blades conspicuously striate, tapering from base to apex.
- Spikelets scarcely turgid, not attenuate at base: leaf-blades tapering to both ends.
- Leaf-blades not long and stiff (somewhat so in *P. oligosanthos*, *P. malacon*, *P. Commonsianum*, and *P. equilaterale*): autumnal phase usually not bushy-branched.
- Spikelets turgid, blunt, strongly nerved (not strongly turgid in *P. oligosanthos*): leaf-blades rarely as much as 1.5 cm. wide (sometimes 2 cm. in *P. Ravenelii*).
- Leaf-sheaths glabrous or minutely puberulent: spikelets 1.5-2.5 mm. long, asymmetrically pyriform, strongly nerved: stems wiry.
- IV. DICHOTOMIFLORA.
- V. CAPILLARIA.
- XI. VERRUCOSA.
- XXIX. GYMNOCARPA.
- XXVIII. HEMITOMA.
- IX. AGROSTOIDEA.
- X. LAXA.
- VIII. TENERA.
- VII. VIRGATA.
- XII. DEPAUPERATA.
- XIII. LAXIFLORA.
- XIV. ANGUSTIFOLIA.
- XV. BICKNELLIANA.
- XXIII. LANCEARIA.

Leaf-sheaths, or some of them, papillose-hispid; spikelets 3-4 mm. long.

Spikelets not rigid, blunt, nor strongly nerved (see, however, *P. roanokeense* and *P. caeruleascens*).

Ligule of conspicuous hairs, usually 3-5 mm. long; spikelets pubescent.

Leaf-sheaths glabrous or only the lowermost somewhat pubescent.

Leaf-sheaths strongly pubescent.

Ligule obsolete or nearly so (manifest in *P. tegetorum* and *P. curtifolium*).

Spikelets spheric at maturity; leaf-blades glabrous, firm, cordate, with a fine white margin; plants sparingly branching; panicle-branches with viscid spots.

Spikelets usually obovate or elliptic.

Leaf-blades of the mid-stem elongate, less than 1.5 cm. wide; stems usually tall; spikelets pointed, abruptly so in the velvety *P. scoparium*.

Leaf-blades of the mid-stem not elongate, somewhat so in *P. equilateralis*.

Blades cordate, 1-3 cm. wide (5-12 mm. in *P. Ashei*); spikelets pubescent.

Spikelets 2.5-3 mm. long; leaf-sheaths glabrous or minutely puberulent.

Spikelets 3-5 mm. long (sometimes but 2.7 mm. long in the hispid-sheathed *P. clandestinum*).

Blades not cordate, somewhat in *P. annulum*, less than 1 cm. wide.

Sheaths crisp- or appressed-pubescent; blades firm; spikelets pubescent.

Sheaths glabrous, sparsely pilose in *P. curtifolium* and the lower ones velvety in *P. matamorasense* and often in *P. annulum*.

Vernal stems delicate (sometimes scarcely so in *P. albomarginatum* and *P. tenue*); spikelets 1.5 mm. long or less (1.6-1.7 mm. in *P. tenue*).

Vernal stems slender but not delicate, rarely less than 40 cm. high; spikelets 2-2.9 mm. long (1.5 mm. in *P. microcarpon* and *P. caeruleascens*).

Lower internodes short, upper elongate, producing a nearly naked stem, leafy at base; spikelets narrowly ovate, 2.7-2.9 mm. long.

Lower internodes not short; vernal stems about evenly leafy throughout; spikelets elliptic or obovate, not more than 2.5 mm. long.

XXIV. OLIGOSANTHIA.

XVIII. SPRETA.

XIX. LANUGINOSA.

XXI. SPHAEROCARPA.

XXV. SCOPARIA.

XXVI. COMMUTATA.

XXVII. LATIFOLIA.

XX. COLUMBIANA.

XXII. ENSIFOLIA.

XVI. NUDICATULA.

XVII. DICHOTOMA.

# I. DISTANTIFLORA

Plant slender, erect, with narrow erect or appressed racemes.

1. *P. Chapmani*.

## II. GEMINATA

Nodes bearded: leaf-sheath villous.

Nodes glabrous: plants glabrous throughout.

Spikelets 3 mm. long: glumes and sterile lemma papery.

Spikelets not over 2.4 mm. long: glumes and sterile lemma not papery.

2. *P. barbinode*.

3. *P. paludivagum*.

4. *P. geminatum*.

## III. FASCICULATA

Spikelets 2-4 mm. long.

Spikelets strongly reticulate-veined, 2-3 mm. long: glabrous.

Spikelets scarcely reticulate-veined or only near apex.

Spikelets not over 2 mm. long, glabrous.

Spikelets over 3 mm. long, pubescent.

Spikelets 5-6 mm. long.

5. *P. fasciculatum*.

6. *P. reptans*.

7. *P. adpersum*.

8. *P. texanum*.

## IV. DICHOTOMIFLORA

Leaf-sheaths papillose-hispid.

Leaf-sheaths glabrous.

9. *P. bartowense*.

10. *P. dichotomiflorum*.

## V. CAPILLARIA

Panicles drooping: spikelets 4.5-5 mm. long.

Panicles erect: spikelets less than 3.5 mm. long.

Panicles more than half the length of the entire plant.

Panicles narrow, usually less than half as broad as long.

Panicles as broad as long.

Panicles not more than one-third the entire height of the plant.

Stem stout: leaf-blades about 1 cm. wide: spikelets turgid.

Stem slender: leaf-blades not over 6 mm. wide: spikelets not turgid.

11. *P. miliaceum*.

12. *P. flexile*.

13. *P. capillare*.

14. *P. Gattingeri*.

15. *P. philadelphicum*.

## VI. MAXIMA

Plant large, rather coarse, with ample panicles.

16. *P. maximum*.

## VII. VIRGATA

Spikelets not over 2.5 mm. long, first glume less than half the length of the spikelet.

Panicles loosely flowered: first glume truncate, about one-fifth the length of the spikelet.

Panicle rather densely flowered: first glume triangular, about one-third the length of the spikelet.

Spikelets 3-7 mm. long (sometimes less than 3 mm. in *P. virgatum cubense*): first glume more than half the length of the spikelet.

Panicles elongate, strongly contracted: seacoast plants.

Stem rarely 1 m. high, solitary from the nodes of the horizontal rootstock.

Stem 1-2 m. high, in dense tufts.

Panicles diffuse or only slightly contracted: plants sometimes of salt marshes but not littoral.

17. *P. repens*.

18. *P. Gouini*.

19. *P. amarum*.

20. *P. amarulum*.

21. *P. virgatum*.

## VIII. TENERA

Plant slender, stiffly erect, with narrow strict panicles.

22. *P. tenerum*.

## IX. AGROSTOIDEA

Rootstock present: stem but little compressed: spikelets set obliquely on their appressed pedicels.

Panicles open: spikelets 3.4-3.8 mm. long (shorter in exceptional specimens).

Panicles more or less contracted: spikelets not over 2.8 mm. long.

Rootstock wanting: stem strongly compressed: leaf-sheaths keeled: spikelets not obliquely disposed.

Ligules ciliate: basal leaves half as long as the stem or more: panicle rather open, much exceeding the upper leaves.

23. *P. anceps*.

24. *P. rhizomatum*.

- Spikelets not over 2.7 mm., usually 2.5 mm. long, the first glume less than half that length: ligules 2-3 mm. long.  
 Spikelets 3-3.5 mm. long: first glume two-thirds to three-fourths that length: ligule less than 1 mm. long.  
 Ligules erose or lacerate, not ciliate: basal leaves in short tufts, the upper usually nearly equalling the terminal rather dense panicle.  
 Fruit stipitate: spikelets 2.5-2.8 mm. long, conspicuously secund.  
 Fruit not stipitate: spikelets not conspicuously secund.  
 Spikelets 1.8-2 mm., in occasional specimens 2.2 mm. long: panicle-branches ascending or spreading.  
 Spikelets about 2.5 mm. long: panicle-branches erect or nearly so.

25. *P. longifolium*.26. *P. Combsii*.27. *P. stipitatum*.28. *P. agrostoides*.29. *P. condensum*.

## X. LAXA

Plant erect or partly decumbent, with lax panicles and small gaping spikelets.

30. *P. hians*.

## XI. VERRUCOSA

Plant weak, often with reclining stems, the mature panicle diffuse, with filiform branches and scattered spikelets.

31. *P. verrucosum*.

## XII. DEPAUPERATA

Spikelets about 3.5 mm. long, beaked.  
 Spikelets 3 mm. long or less.

32. *P. depauperatum*.  
 33. *P. linearifolium*.

## XIII. LAXIFLORA

Leaf-sheaths retrorsely pilose: spikelets papillose-pilose.  
 Leaf-blades glabrous or nearly so on the surface and margin: spikelets 2.2 mm. long.  
 Leaf-blades ciliate and more or less pilose on the surface: spikelets 2 mm. long.  
 Leaf-sheaths not retrorsely pilose: spikelets pubescent or glabrous.  
 Spikelets pubescent, about 2 mm. long.  
 Spikelets glabrous.  
 Leaf-blades glabrous on the surface.  
 Leaf-blades pilose on the surface.

34. *P. laxiflorum*.35. *P. xalapense*.36. *P. ciliatum*.37. *P. polycaulon*.38. *P. strigosum*.

## XIV. ANGUSTIFOLIA

Nodes bearded: plant grayish-villous: autumnal leaf-blades flat.  
 Spikelets 2 mm. long.  
 Spikelets 2.5-2.8 mm. long.  
 Nodes not bearded: plant villous only at base, or nearly glabrous: autumnal leaf-blades involute or flat.  
 Autumnal leaf-blades flat: lower panicle-branches spreading or deflexed.  
 Autumnal leaf-blades involute: lower panicle-branches more or less ascending.  
 Spikelets 3.3-3.5 mm. long, pointed.  
 Spikelets less than 3 mm. long, not pointed, or obscurely so.  
 Plant glabrous or nearly so: autumnal stems erect.  
 Spikelets subsecund along the suberect panicle-branches.  
 Spikelets not subsecund: panicle loose and open.  
 Plant pubescent, at least on the lower half.  
 Spikelets about 2.4 mm., rarely only 2.1 mm. long: vernal leaf-blades 7-12 cm. long: autumnal blades not falcate.  
 Spikelets not over 2 mm. long: vernal leaf-blades 4-6 cm. long: autumnal blades much crowded, falcate.

39. *P. chrysopsidifolium*.  
 40. *P. consanguineum*.

41. *P. angustifolium*.42. *P. fusiforme*.43. *P. neuranthum*.44. *P. ovinum*.45. *P. arenicoloides*.46. *P. aciculare*.

## XV. BICKNELLIANA

Plant with tufted stems and open panicles with few spikelets.

47. *P. Bicknellii*.

## XVI. NUDICAULIA

Plant with erect or partly decumbent stems, the panicles with spreading branches.

48. *P. nudicaule*.

## XVII. DICHOTOMA

Nodes, at least the lower, bearded.

Spikelets 1.5-1.6 mm. long, glabrous (occasional individuals with pubescent spikelets).

49. *P. microcarpon*.

Spikelets 2 mm. or more long.

60. *P. barbulatum*.

Spikelets glabrous, 2 mm. long: autumnal form top-heavy-reclining.

50. *P. annulum*.

Spikelets pubescent.

Leaf-blades all velvety: autumnal form sparingly branched.

Leaf-blades glabrous, or only the lower pubescent or velvety: autumnal form freely branching.

Spikelets 2 mm. long: autumnal form profusely branching.

51. *P. nitidum*.

Spikelets 2.2 mm. or more long: autumnal form less profusely branching.

Lower leaf-sheaths and all nodes pubescent.

52. *P. mattamuskeetense*.

Leaf-sheaths and upper nodes glabrous.

53. *P. Clutei*.

Nodes not bearded (lower nodes pubescent in *P. barbulatum*).

Spikelets pubescent.

Stems erect, never becoming vine-like.

53. *P. Clutei*.

Stems soon prostrate, vine-like: branches divaricate.

Plants bright-green; stems lax: spikelets not over 2.1 mm. long.

54. *P. lucidum*.

Plants grayish-green; stems stiff: spikelets 2.5 mm. long.

55. *P. sphagnicola*.

Spikelets glabrous.

Stem soon prostrate.

Plant bright-green; stems lax: spikelets not over 2.1 mm. long.

54. *P. lucidum*.

Plant grayish-green; stems stiff: spikelets 2.5 mm. long.

55. *P. sphagnicola*.

Stem erect, or the autumnal form topheavy, never prostrate.

Spikelets not over 1.6 mm. long: panicles narrow: plants glaucous bluish-green.

56. *P. caerulescens*.

Spikelets 2 mm. or more long: panicles open.

Leaf-blades erect, firm: spikelets turgid, strongly nerved: plants grayish olive-green.

57. *P. roanokense*.

Leaf-blades spreading: spikelets not turgid.

Spikelets 2.2 mm. or more long, pointed: sheaths bearing pale glandular spots.

58. *P. yadkinense*.

Spikelets not over 2 mm. long, not pointed.

Autumnal form erect, branched like a little tree: primary leaf-blades rarely over 5 mm. wide: second glume shorter than fruit and sterile lemma.

59. *P. dichotomum*.

Autumnal form topheavy-reclining: primary leaf-blades 6-10 mm. wide: second glume equaling fruit and sterile lemma.

60. *P. barbulatum*.

## XVIII. SPRETA

Panicle narrow, one-fourth to one-third as wide as long.

Panicle open, two-thirds as wide as long, or more.

Spikelets 1.5 mm. long.

Spikelets 1.3 mm. long or less.

Stem and leaf-sheaths glabrous.

61. *P. spretum*.

62. *P. Lindheimeri*.

63. *P. longiligulatum*.

Stem and leaf-sheaths appressed-pubescent.

Spikelets 1.2-1.3 mm. long.

Spikelets not over 1 mm. long.

64. *P. leucothrix*.

65. *P. Wrightianum*.

#### XIX. LANUGINOSA

Spikelets not over 2 mm. long.

Plant grayish, velvety-pubescent.

Spikelets 1.4-1.5 mm. long; autumnal leaf-blades involute-pointed (see also *P. albemarlense*).

Spikelets 1.8-2 mm. long; autumnal leaf-blades flat.

Plant dark-green or olive-green when dry; spikelets 1.9-2 mm. long.

Plant light-green or yellow-green when dry.

Plant pubescent, often villous, but not velvety.

Vernal leaf-blades glabrous or nearly so on the upper surface, firm in texture.

Vernal leaf-blades pubescent on upper surface, sometimes pilose near base and margins only.

Spikelets 1.3-1.5 mm. long; vernal leaf-blades long-pilose on upper surface.

Autumnal form widely decumbent-spreading, forming a mat; vernal stems soon geniculate-spreading; plants olivaceous.

Autumnal form erect or leaning, never forming a mat; plants yellowish-green.

Spikelets 1.6-2 mm. long; vernal leaf-blades pilose or pubescent.

Spikelets 2.2 mm. or more long; plants conspicuously pilose.

Spikelets 2.2-2.4 mm. long.

Pubescence on stems and leaf-sheaths horizontally spreading; autumnal form freely branching.

Pubescence on stems and leaf-blades appressed or ascending; autumnal form rather sparingly branching.

Spikelets 2.7-2.9 mm. long.

66. *P. auburne*.

67. *P. Thurocuii*.

68. *P. lanuginosum*.

69. *P. tennesseense*.

70. *P. albemarlense*.

71. *P. meridionale*.

72. *P. Huachucae*.

73. *P. villosissimum*.

74. *P. pseudopubescentis*.

75. *P. ovale*.

#### XX. COLUMBIANA

Spikelets 2-3.2 mm. long, mostly elliptic.

Winter leaf-blades 5-10 cm. long; spikelets 2 mm. long; plants blue-green.

Winter leaf-blades 1-3 cm. long.

Spikelets 3.2 mm. long; first glume conspicuously distant.

Spikelets not over 2.5 mm. long; first glume not distant.

Spikelets about 2.4 mm. (2.2-2.4 mm.) long; panicle open; branches stiffly spreading.

Spikelets 2-2.1 mm. long; panicle rather dense; branches ascending.

Spikelets not over 1.9 mm. long, obovate, turgid.

Spikelets about 1.9 mm. long.

Spikelets about 1.5 mm. long.

76. *P. wilmingtontense*.

77. *P. malacon*.

78. *P. Commonsianum*.

79. *P. Addisonii*.

80. *P. tsugetorum*.

80a. *P. columbianum*.

#### XXI. SPHAEROCARPA

Stem spreading; leaf-blades obscurely nerved; panicle nearly as broad as long.

Stem erect or ascending; leaf-blades rather strongly nerved; panicle never more than two-thirds as broad as long, usually less.

Spikelets 1.5-1.6 mm. long; leaf-blades lanceolate, the upper not reduced.

Spikelets 1-1.2 mm. long; leaf-blades tapering from base to apex, the upper much smaller than the lower.

81. *P. sphaerocarpon*.

82. *P. polyanthes*.

83. *P. erectifolium*.

#### XXII. ENSIFOLIA

Ligule about 1 mm. long; sheaths or some of them sparsely spreading-pilose.

Ligules obsolete or nearly so; pubescence if present not spreading.

Leaf-blades prominently white-margined, firm; spikelets densely puberulent.

84. *P. curtifolium*.

Leaf-blades puberulent beneath, often above: sheaths and sometimes lower internodes ascending pubescent.

Leaf-blades glabrous: sheaths glabrous or minutely ciliate only.

Uppermost leaf-blades much reduced: stems branching from lower nodes only, the branches repeatedly branching.

Uppermost leaf-blades about as long as the others: stems bearing short branches from the upper and middle nodes.

Leaf-blades not white-margined or very obscurely so (or if white margin is evident spikelets only 1.1 mm. long): spikelets glabrous or puberulent.

Stem branching only at base: plants soft, light green.

Stem branching at the nodes: plant firm or at least not soft.

Spikelets glabrous.

Spikelets 1.1-1.2 mm. long: leaf-blades rarely as much as 5 cm. long.

Spikelets 1.2-1.5 mm. long.

Leaf-blades elongate, at least some of them 8-10 cm. long.

Leaf-blades not over 3 cm. long.

Spikelets puberulent.

Spikelets 1.1 mm. long: winter leaf-blades bluish-green, not glossy.

Spikelets 1.3-1.5 mm. long.

Leaf-blades involute, falcate, with long stiff hairs on margin near base: plants stiff and wiry.

Leaf-blades not involute, or at tip only, not falcate: plants bright-green: winter leaf-blades conspicuous, glossy green.

85. *P. tenue*.

86. *P. albomarginatum*.

87. *P. trifolium*.

88. *P. vernale*.

89. *P. chamaelonche*.

90. *P. glabrifolium*.

91. *P. ensifolium*.

92. *P. concinnius*.

93. *P. breve*.

94. *P. flavovirens*.

#### XXIII. LANCEARIA

Spikelets 1.5-1.6 mm. long.

Spikelets 2 mm. or more long.

Leaf-blades, or some of them, at least 8 mm. wide, glabrous on the upper surface: fruit papillose-roughened.

Leaf-blades not over 6 mm. wide (or if wider, puberulent on the upper surface): fruit smooth and shining.

Spikelets 2.4-2.6 mm. long: leaf-blades narrowed toward the base.

Spikelets not over 2.1 mm. long.

Leaf-blades firm, glabrous above: stem stiffly ascending.

Leaf-blades lax, softly puberulent on both surfaces: stem decumbent.

95. *P. portoricense*.

96. *P. Webberianum*.

97. *P. patentifolium*.

98. *P. lancearium*.

99. *P. patulum*.

#### XXIV. OLIGOSANTHIA

Nodes bearded: blades velvety-pubescent beneath.

Plants lax, soft-velvety throughout: spikelets not over 3 mm. long.

Plants stiff, pubescence harsh: spikelets about 4 mm. long.

Nodes not bearded: leaf-blades not velvety.

Spikelets narrowly obovate, subacute: plants olivaceous, appressed-pubescent.

Spikelets broadly obovate, turgid, blunt: plants green, pubescence, if any, not appressed.

100. *P. malacophyllum*.

101. *P. Ravenelii*.

102. *P. oligosanthos*.

103. *P. Scribnerianum*.

#### XXV. SCOPARIA

Pubescence soft-villous or velvety: spikelets abruptly pointed.

Pubescence when present not velvety.

Spikelets elliptic: fruit about 2.5 mm. long.

Spikelets ovate, that is, broadest below the middle: fruit 2 mm. long or less.

104. *P. scoparium*.

105. *P. aculeatum*.

Leaf-sheaths or some of them hispid, rarely glabrous: autumnal phase with crowded branchlets.

Leaf-sheaths glabrous: autumnal phase sparingly branching.

106. *P. scabriusculum*.

107. *P. cryptanthum*.

#### XXVI. COMMUTATA

Plant glaucous, glabrous: basal leaf-blades conspicuously ciliate: vernal stems usually solitary.

Plant not glaucous.

Leaf-blades linear: first glume about half as long as the spikelet.

Leaf-blades lanceolate.

Stems crisp-puberulent: leaf-blades usually rigid, symmetrical, rarely over 10 mm. wide: spikelets about 2.5 mm. long.

Stems glabrous or softly puberulent: leaf-blades firm or lax: spikelets 2.7–3.2 mm. long.

Stems erect, or autumnal form leaning: leaf-blades symmetric, broadly cordate.

Stems decumbent: leaf-blades usually unsymmetric and falcate, narrowed to the scarcely cordate base.

108. *P. mutabile*.

109. *P. equilaterale*.

110. *P. Ashei*.

111. *P. commutatum*.

112. *P. Joorii*.

#### XXVII. LATIFOLIA

Leaf-sheaths, at least the lower and those of the branches, strongly papillose-hispid.

Leaf-sheaths glabrous or softly villous.

Nodes glabrous: spikelets 3.4–3.7 mm. long.

Nodes bearded: spikelets 4–4.5 mm. long.

113. *P. clandestinum*.

114. *P. latifolium*.

115. *P. Boscii*.

#### XXVIII. HEMITOMA

Plant vigorous, extensively rooting, with erect narrow, often elongate, panicles and acute spikelets.

116. *P. hemitomon*.

#### XXIX. GYMNOCARPA

Plant stout, extensively creeping, with spreading panicles and long narrowly pointed spikelets.

117. *P. gymnocarpon*.

1. *P. Chapmani* Vasey. Stem ascending or spreading, 40–100 cm. tall: leaf-blades erect, 2–5 mm. wide: panicle elongate, as much as 30 cm. long, the branches remote, appressed.—Rocky pinelands, shell-mounds and cleared hammock land, S pen. Fla. and the Keys.—(*Bah.*)

2. *P. barbinode* Trin. Stem erect from a long decumbent rooting stoloniferous base, 200–600 cm. long: leaf-sheaths villous, or glabrous toward the summit, densely pubescent on the collar: blades 10–15 mm. wide, glabrous: panicle 12–20 cm. long, the rather distant subracemose densely flowered branches ascending or spreading: spikelets 3 mm. long. [*P. molle* (Fl. SE. U. S.)—Hammocks, fields, and waste-places, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A., O. W.*)

3. *P. paludivagum* H. & C. Stem elongate, as much as 200 cm. long, the base creeping, rooting at the nodes: panicle 25–35 cm. long; racemes 12–15, erect, the lower distant, 3 cm. long.—In fresh water, Coastal Plain, Fla. and Tex.—(*Mex., C. A., S. A.*)

4. *P. geminatum* Forsk. Stem 25–80 cm. tall, spreading from a somewhat decumbent base: panicle 12–30 cm. long, the racemes 12–18, erect, the lower 2.5–3 cm. long. [*P. paspaloides* (Fl. SE. U. S.)—(*WATER-GRASS.*)—Moist ground, ponds and prairies, Coastal Plain, S Fla. and Tex.—(*W. I., Mex., C. A., S. A., O. W.*)—Plant cespitose.

5. *P. fasciculatum* Swartz. Stem erect or spreading from a decumbent base, 30–100 cm. tall: leaf-sheaths glabrous or papillose-hispid: blades 6–20 mm. wide, glabrous: panicle 5–15 cm. long, the branches racemose along the main axis, solitary or clustered, 5–10 cm. long, spreading, the spikelets short-pedicelled (panicles smaller and more compact, the branches appressed: leaf-blades narrower, pubescent: spikelets 2.5–3 mm. long, in *P. fasciculatum reticulatum*. Tex. to Ariz.; introd. into S. C.—(*Mex., C. A., S. A.*)): spikelets mostly brownish, usually 2–2.5 mm. long, glabrous. [*P. fuscum* Swartz]—Hammocks, fields, and waste-places, S Fla. and S Tex.—(*W. I., Mex., C. A., S. A.*)

6. *P. reptans* L. Stem prostrate or decumbent at base, rooting at the lower nodes, the ascending portion 10–30 cm. tall: leaves glabrous, the blades ciliate at base: panicle 2–6 cm. long, the 3–12 spike-like branches ascending or spreading: first glume truncate, about one-sixth the length of the spikelet. [*P. prostratum* Lam.]—Fields and moist open ground, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

7. *P. adpersum* Trin. Stem ascending or spreading from a decumbent base, 30–100 cm. tall: leaf-blades 6–20 cm. wide: panicle 6–15 cm. long, the few ascending spike-like racemes 3–10 cm. long: spikelets pale, 3.5–4 mm. long, abruptly acuminate, more or less hispid.—Moist open ground, Fla.—(*W. I.*)—A robust form is *P. keyense* Mez.

8. *P. texanum* Buckl. Stem stout, 50–150 cm. tall, branching at base and lower nodes, pubescent below nodes and panicle: leaf-sheaths and blades softly pubescent: panicle 8–20 cm. long, 1–3 cm. wide, the axis densely pubescent: spikelets fusiform, pointed, pilose. Prairies and open ground, Coastal Plain, Tex. and Okla., introd. in Ariz., and eastward to Fla. and N. C.—(*Mex.*)

9. *P. bartowense* Scribn. & Merr. Stem erect, as much as 200 cm. tall: leaf-blades 15–40 cm. long, 5–13 mm. wide: glabrous or nearly so: panicle large, loosely spreading, 15–60 cm. long: spikelets short-pedicelled, appressed, about 2.5 mm. long.—(WITCH-CRASS.)—Low grounds, marshes, and prairies, Fla.—(*W. I.*)

10. *P. dichotomiflorum* Michx. Stem much-branched, ascending from a geniculate base, usually 50–100 cm. tall, sometimes as much as 2 m., the plant usually glabrous throughout: leaf-blades 3–20 mm. wide: panicles terminal and axillary, 10–40 cm. long: spikelets short-pedicelled along the main branches, usually 2.5 mm. long. [*P. proliferum* (Fl. SE. U. S.)]—Low grounds, fields, roadsides, and waste-places, various provinces, Fla. to Tex., Calif., Nebr., and Me.—(*W. I.*)

11. *P. miliaceum* L. Stem as much as 100 cm. tall, rather stout: leaf-blades mostly pilose, as much as 30 cm. long and 2 cm. wide: panicle 10–30 cm. long, usually rather compact, the numerous branches narrowly ascending, spikelet-bearing toward the summit.—Roadsides, waste-places, and cult. grounds, occasional throughout the U. S., rare S—Cult. as PROSO. HOG-MILLET. BROOM-CORN MILLET. Nat. of Eu.—(*Mex.*)

12. *P. flexile* (Gatt.) Scribn. Stem erect, 20–70 cm. tall, slender, branching at base: leaf-blades erect, glabrous to sparsely hispid, 2–6 mm. wide: spikelets 3–3.5 mm. long, acuminate.—Sandy damp soil, various provinces, Fla. to Tex., S. D., and Ont.

13. *P. capillare* L. Stem erect or ascending, simple or sparingly branched, 20–80 cm. tall: leaf-blades 5–15 mm. wide, hispid: panicle large, diffuse, at maturity breaking away as a tumble-weed: spikelets 2–2.5 mm. long.—(WITCH-

GRASS.)—Woods, fields, marshes, prairies, and waste-places, various provinces, Fla. to Tex., Mont., and Me.—*Panicum Bergii* Arech., differing from *P. capillare* in being perennial, in having involute leaf-blades, the axils of the panicle strongly pilose, and the lower branches in verticils, has been found on ballast at Mobile, Ala., and Galveston, Tex.

14. *P. Gattingeri* Nash. Stem soon decumbent-spreading, rooting at the lower nodes, as much as 100 cm. long: leaf-blades 6–10 mm. wide, more or less hispid: panicles numerous, terminal and axillary, the former 10–15 cm. long, the latter smaller.—Open ground, dry hills, woods, cult. grounds, and waste-places, various provinces, N. C. and Tenn. to Minn. and N. Y.

15. *P. philadelphicum* Bernh. Stem mostly erect, 15–20 cm. tall, usually zigzag at the slender base: leaf-blades 2–6 mm. wide, sparingly hirsute: panicle ovoid, few-flowered, the spikelets usually in twos at the ends of the branchlets.—Dry open ground, hillsides, barrens, and roadsides, various provinces, Ga. to Okla., Wis., and Me.

16. *P. maximum* Jacq. Stem erect, 100–250 cm. tall, from a creeping rootstock: leaf-sheaths papillose-hirsute to glabrous: ligules 4–6 mm. long: blades elongate, 1–3.5 cm. wide: panicle 20–50 cm. long, about one-third as wide, the branches ascending, the lower in whorls, pilose in the axils: spikelets about 3 mm. long.—(GUINEA-GRASS.)—Cult. grounds, roadsides, and ditches, Coastal Plain, Fla. Nat. of Afr.—(*W. I., Mex., C. A., S. A., O. W.*)

17. *P. repens* L. Stem rigid, 30–80 cm. tall, from an extensively creeping rootstock: leaf-blades 2–5 mm. wide: panicle 7–12 cm. long, the branches ascending: spikelets pale, about 2.5 mm. long.—Sea beaches, sand-dunes, and sandy soil, Coastal Plain, Ala. to La. Nat. of O. W.—(*W. I., C. A., S. A.*)

18. *P. Gouini* Fourn. Resembling *P. repens*, usually lower: panicle smaller, narrower, more densely flowered, commonly purple: spikelets 2–2.4 mm. long. [*P. halophilum* Nash]—Sea beaches, Ala. and Miss.—(*Mex.*)

19. *P. amarum* Ell. Plant glaucous and glabrous throughout: stem solitary from a stout extensively creeping rootstock, 30–100 cm. tall: panicle not over 3 cm. wide, few-flowered, the branches appressed: spikelets 5–6.5 mm. long, acuminate, strongly nerved. [*P. amaroides* Scribn. & Merr.]—Beaches and dunes, Coastal Plain and New England Coast, Ga. to Miss. and Conn.

20. *P. amarulum* H. & C. Resembling *P. amarum*, but grows in large bunches, 100–200 cm. tall: panicles 5–10 cm. wide, nodding: spikelets 4.5–5.5 mm. long. [*P. amarum* (Fl. SE. U. S.)]—(BEACH-GRASS.)—Beaches and dunes, Coastal Plain, Fla. to La. and Va.—(*W. I.*)

21. *P. virgatum* L. Plant erect, with stout scaly rootstocks, glabrous throughout, or upper surface of leaf-blades pilose, 100–200 cm. tall (more slender, the panicle narrower: spikelets 2.8–3.2 mm. long, first glume about half the length of the spikelet, acute only, in *P. virgatum cubense*. [*P. virgatum brevirostratum* Nash]—Sandy moist woods, Coastal Plain, Fla. to Miss. and Conn. (*W. I.*)): panicles 15–50 cm. long, open or diffuse: spikelets 3.5–5 mm. long, acuminate.—Prairies, pinelands, marshes, hammocks, and salt marshes, various provinces, Fla. to Ariz., Wyo., and Me.—(*Mex., C. A., S. A.*)

22. *P. tenerum* Beyr. Plant slender in small tufts from a knotted crown, 40–90 cm. tall: leaf-blades erect, firm, 2–4 mm. wide: panicle 3–8 cm. long, about 5 mm. wide: spikelets about 2.5 mm. long. [*P. stenodes* (Fl. SE. U. S.)]—Wet pinelands, ponds, and prairies, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)

23. *P. anceps* Michx. Stem erect, rather stout, 50–100 cm. tall: leaf-sheaths glabrous to papillose-pilose: blades 20–50 cm. long, 4–12 mm. wide, pilose above toward the base: panicle 15–40 cm. long, the remote branches somewhat spreading: spikelets somewhat curved, set obliquely on the pedicels. [*P. rostratum* Muhl.]—Moist sandy soil, stream-banks, meadows, and pinelands, various provinces, Fla. to Tex., Kans., and N. J.
24. *P. rhizomatum* H. & C. Resembling *P. anceps*, the stem more slender: rootstocks more numerous: leaves shorter, somewhat crowded at the base, the sheaths villous.—Moist sandy woods, pinelands and swamps, Coastal Plain, Fla. to Tex. and Va.
25. *P. longifolium* Torr. Plant in dense tufts, 35–80 cm. tall, usually surrounded by basal leaves: leaf-sheaths usually glabrous, sometimes villous toward the summit: blades 2–5 mm. wide: panicle 10–25 cm. long: spikelets about 2.5 mm. long: first glume not over half the length of the spikelet. [*P. pseudanceps* Nash]—Moist acid sandy soil and low pinelands, Coastal Plain and New England Coast, Fla. to Tex. and R. I.
26. *P. Combsii* Scribn. & Ball. Resembling *P. longifolium*, but usually glabrous, the leaf-blades shorter: lateral panicles seldom developed: spikelets 3–3.5 mm. long, the first glume two-thirds to three fourths as long as the spikelet.—Wet woods, low pinelands, and cypress-ponds, Coastal Plain, Fla. to La. and Ga.
27. *P. stipitatum* Nash. Resembling *P. agrostoides*, often purple-tinged throughout, the stem strongly compressed: panicles usually several to a stem, 10–20 cm. long, rather narrow.—Moist soil, and stream-banks, various provinces, S. C. to Tex., Mo., and Conn.
28. *P. agrostoides* Spreng. Plant 50–100 cm. tall, with a dense clump of stems from a short caudex, with numerous shoots of short leaves at the base: stems compressed: panicle 10–30 cm. long, the stiff branches ascending or spreading: spikelets about 2 mm. long.—Wet meadows, ponds, swamps and marshes, various provinces, Fla. to Tex., Kans., and Me.
29. *P. condensum* Nash. Resembles *P. agrostoides*, usually rather taller: panicle 10–25 cm. long, rarely over 5 cm. wide, rather compact: spikelets 2.2–2.5 mm. long, turgid, the tips slightly spreading.—Wet places, marshes, swamps and ditches, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Pa. —(W. I.)
30. *P. hians* Ell. Stem slender, erect or geniculate and rooting at the lower nodes, 20–60 cm. long: leaf-blades 1–5 mm. wide: panicle 5–20 cm. long, usually loose and open, the primary branches few, slender, distant, spreading to drooping, the spikelets towards the ends: spikelets about 2.3 mm. long, rather strongly nerved, glabrous. [*Steinchisma hians* Nash]—Damp soil, low woods, stream-banks, pools, and ditches, Coastal Plain and adj. provinces, Fla. to N. M. and N. C.
31. *P. verrucosum* Muhl. Plant bright-green, lax, soon decumbent, widely spreading, and divaricate-branched, as much as 150 cm. long: leaf-blades thin, lax, 4–10 mm. wide: panicle 5–30 cm. long, diffuse, the mostly solitary branches bearing a few short-pedicelled spikelets mostly in 2's toward the ends.—Wet shady places, acid swamps, ditches, and woods, Coastal Plain and New England Coast, Fla. to Tex. and Mass., and Great Lake Lowlands, N Ind.
32. *P. depauperatum* Muhl. Stem 20–40 cm. tall, erect and rather stiff: leaf-sheaths glabrous or pilose: blades linear, 6–15 cm. long, 2–5 mm. wide, often involute in drying: panicle 4–8 cm. long, the rather strict remote branches ascending: spikelets glabrous or sparsely pubescent. Autumnal phase similar,

but with reduced secondary panicles more or less concealed among the basal leaves.—Open sterile woods, fields, and rocky slopes, various provinces, Ga. to Tex., Minn., and Me.

33. *P. linearifolium* Scribn. Stem 20–45 cm. tall, not stiff: leaf-sheaths papillose-pilose: blades 10–35 cm. long, 2–4 mm. wide: panicle 5–10 cm. long. Autumnal phase with small panicles among the basal leaves.—Dry woods, hill-sides, fields and thickets, various provinces, Ga. to Tex., Minn. and Me.

34. *P. laxiflorum* Lam. Stem slender, 20–60 cm. tall, erect, or geniculate at base: leaf-blades 10–18 cm. long, 7–12 mm. wide: panicle 8–12 cm. long, lax, few-flowered, the branches flexuous, spreading, the lower often deflexed. Autumnal phase much-branched at base, forming a soft spreading mat, with small secondary panicles intermixed. [*P. pyriforme* Nash] Rich woods, Coastal Plain, Fla., Ga., and Ala.

35. *P. xalapense* H. B. K. Resembling *P. laxiflorum*; differing in the pilose and ciliate leaf-blades and somewhat smaller (2 mm.) spikelets (with ovoid more compact panicles and somewhat smaller spikelets, about 1.7 mm. long, in *P. xalapense strictirameum*. S. C. to La.) [*P. laxiflorum* (Fl. SE. U. S.)] Open woods, pinelands, hammocks, and rocky fields, various provinces, Fla. to Tex., Mo., and Md. (*W. I., Mex.*)

36. *P. ciliatum* Ell. Stem 5–30 cm. tall, erect or spreading: leaf-blades 3–6 cm. long, 3–8 mm. wide, conspicuously ciliate: panicle 3–4 cm. long, the axis pilose. Autumnal phase a soft flat mat. Low pinelands, Coastal Plain, Fla. to La. and N. C.

37. *P. polycaulon* Nash. Resembling *P. ciliatum*: panicle larger, the axis sparsely pilose: spikelets about 1.5 mm. long, rarely as much as 2 mm. long. Low pinelands, and prairies, Coastal Plain, Fla. to Miss. (*W. I.*)

38. *P. strigosum* Muhl. Resembling *P. ciliatum*: panicle-axis and branches pilose: spikelets 1.3–1.5 mm. long. Sandy woods and pinelands, Coastal Plain, Fla. to La., Tenn., and Va. (*W. I., Mex.*)

39. *P. chrysopsidifolium* Nash. Stems ascending or spreading, 30–45 cm. tall: leaf-blades 5–10 cm. long, 3–5 mm. wide, conspicuously pointed, villous on both surfaces: panicles 4–6 cm. long, the flexuous branches ascending or spreading: spikelets villous. Autumnal phase forming mats, the blades 1–3 cm. long, 1.5 mm. wide, papery.—Sandy pinelands and woods, Coastal Plain, Fla. to La.—(*W. I.*)

40. *P. consanguineum* Kunth. Stem ascending or spreading, 20–55 cm. tall, densely felty-villous below: leaf-blades erect, 7–11 cm. long, 5–8 mm. wide: panicles 4–8 cm. long, the lower branches narrowly ascending. Autumnal phase spreading or decumbent, the numerous branches somewhat flabellately fasciated, the blades 3–4 cm. long, 2–3 mm. wide.—Sandy pinelands and meadows, Coastal Plain, Fla. to Tex. and Va.

41. *P. angustifolium* Ell. Stem erect, 30–55 cm. tall, the lowermost internodes gray crisp-villous, the upper glabrous: panicle 4–12 cm. long: spikelets 2.5–2.8 mm. long, papillose-villous. Autumnal phase stiffly ascending or somewhat topeavy-reclining, not mat-like: blades very numerous.—Sandy woods and pinelands, Coastal Plain and adj. provinces, Fla. to Tex. and Pa.

42. *P. fusiforme* A. Hitchc. Vernal phase similar to that of *P. angustifolium*: stem 30–70 cm. tall: lower leaf-blades softly pubescent beneath:

panicle long-exserted. Autumnal phase erect or reclining, forming dense bushy clusters 30-60 cm. tall.—Sandy pinelands and prairies, Coastal Plain, Fla. to Miss. and Ga.—(W. I.)

43. *P. neuranthum* Griseb. Stem stiff, 30-60 cm.: leaf-blades erect or ascending, 3-5 mm. wide: panicles 5-9 cm. long: spikelets 2 mm. long, finely papillose-pubescent. Autumnal phase slender.—Prairies, open woods and pinelands, Coastal Plain, Fla. to Miss.—(W. I.)

44. *P. ovinum* Scribn. & Smith. Stem erect, 30-50 cm. tall: leaf-blades erect or ascending, the lowermost as much as 1 cm. wide: panicle 5-9 cm. long, three-fourths as wide: spikelets slightly over 2 mm. long, minutely papillose-pubescent. Autumnal leaf-blades not much reduced.—Dry or moist grounds, woods and pinelands, Coastal Plain, Miss. to Tex. and Ark.—(Mex.)

45. *P. arenicoloides* Ashe. Stem mostly erect, 30-50 cm. tall: leaf-blades 3-4 mm. wide: panicle 4-6 cm. long: spikelets papillose-pubescent. Autumnal phase bushy-branched, erect or topheavy.—Sandy pinelands, sand-dunes, and woods, Coastal Plain, Fla. to Tex. and N. C.—(W. I., C. A.)

46. *P. aciculare* Desv. Stem ascending, 20-50 cm. tall: leaf-blades stiff, spreading or ascending, narrowed to an involute point, 2-5 mm. wide: panicle open, 3-7 cm. long, the flexuous branches spreading. Autumnal phase bushy-branched, 10-30 cm. long, spreading and forming dense cushions, the blades 1-3 cm. long. [*P. arenicola* Ashe]—Sandy woods and pinelands, Coastal Plain, Fla. to Tex., Okla., and N. J.—(W. I.)

47. *P. Bicknellii* Nash. Stem erect, 30-50 cm. tall, glabrous, or puberulent toward base: nodes sparsely bearded or glabrous: leaf-sheaths glabrous or nearly so: blades stiffly ascending, 8-15 cm. long, 3-8 mm. wide, the uppermost usually longest: panicle ovoid, 5-8 cm. long, the branches ascending: spikelets 2.3-2.8 mm. long, sparsely pubescent, rarely glabrous. Autumnal phase erect, branching from middle nodes, forming a loose bushy crown of stiffly ascending blades. [*P. nemopanthum* Ashe]—Dry sterile or acid woods and hillsides, various provinces N of Coastal Plain, Ga. to Mo. and Conn.

48. *P. nudicaule* Vasey. Stem erect from a spreading base, 40-60 cm. tall, glabrous: panicle long-exserted, 4-7 cm. long.—Swamps, Coastal Plain, W Fla. and S Ala.

49. *P. microcarpon* Muhl. Stem erect, or geniculate at base, usually 60-100 cm. tall: leaf-sheaths glabrous or the lowermost pubescent: blades 8-15 mm. wide: panicle 8-12 cm. long, the branches ascending. Autumnal phase repeatedly branching from all the nodes, reclining from the weight of the dense mass: leaf-blades and panicles reduced. [*P. barbulatorum* (Fl. SE. U. S.)]—Wet woods, marshy places, swamps, hillsides, and thickets, various provinces, Fla. to Tex., Mo., and Mass.

50. *P. annulum* Ashe. Stem usually purplish, 35-60 cm. tall: leaf-sheaths velvety or the upper nearly glabrous: blades 7-13 mm. wide: panicle 6-8 cm. long: spikelets 2 mm. long. Autumnal phase erect, bearing a few erect branches at the upper nodes.—Dry woods, Piedmont and rarely inner margin of Coastal Plain, Ga. to Miss. and N. J.

51. *P. nitidum* Lam. Stem erect, 30-60 cm. tall, sometimes taller: leaf-sheaths glabrous, or the lower pubescent, mottled or glandular: blades 5-10 mm. wide, glabrous: panicle 5-8 cm. long, the axis and the ascending branches viscid-spotted. Autumnal phase erect or reclining from the weight of the

foliage, the branchlets forming large clusters from the nodes: reduced blades numerous, 1-3 cm. long, 1-3 mm. wide, flat or soon involute.—Low moist ground, pinelands, prairies, and hammocks, Coastal Plain, Fla. to Tex. and Va.—(*W. I.*)

52. *P. mattamuskeetense* Ashe. Stem erect, usually purplish, 40-100 cm. tall: leaf-blades 8-12 cm. long, 8-12 mm. wide, glabrous or velvety: panicle 8-10 cm. long, the flexuous branches spreading: spikelets about 2.5 mm. long. Autumnal phase erect or decumbent, branching rather sparingly from the middle nodes.—Low moist grounds, Coastal Plain, N. C. to N. Y.

53. *P. Clutei* Nash. Resembling *P. mattamuskeetense*, but more nearly glabrous, only the lowermost nodes, leaf-sheaths and blades velvety: spikelets slightly smaller.—Moist acid soils, Coastal Plain and New England Coast, N. C. to Mass.

54. *P. lucidum* Ashe. Plant glabrous, at first erect and resembling those of *P. dichotomum*, the weak stem soon decumbent: spikelets 2 mm. long, glabrous or rarely pubescent. Autumnal phase repeatedly branching, forming large clumps or mats of slender, weak vine-like stems, the branches elongate and divergent, not fascicled.—Wet woods, prairies, and sphagnum bogs, Coastal Plain and New England Coast, Fla. to Tex. and Mass., and Great Lake Lowland, N Ind.—(*W. I.*)

55. *P. sphagnicola* Nash. Plant glabrous: stem slender, erect or reclining, 50-100 cm. tall: spikelets 2.5 mm. long, glabrous or puberulent toward the apex. Autumnal phase decumbent or finally prostrate-spreading, divaricately branched from all the nodes.—Edges of cypress swamps and in sphagnum bogs, Coastal Plain, Fla. and Ga.

56. *P. caerulescens* Hack. Plant glabrous: stem slender, 50-75 cm. tall: leaf-blades 5-8 cm. long, 4-7 mm. wide, usually purplish-beneath: panicle 3-7 cm. long: spikelets turgid, strongly nerved.—Marshes, prairies, and swampy woods, Coastal Plain, Fla. to Miss. and N. J.—(*W. I.*)

57. *P. roanokense* Ashe. Resembles *P. caerulescens*: stem 50-100 cm. tall: panicle more spreading: spikelets turgid, strongly nerved, purple-tinged at base. [*P. curtivaginum* Ashe]—Open swampy woods, Coastal Plain, Fla. to Tex. and Va.—(*W. I.*)

58. *P. yadkinense* Ashe. Plant glabrous, in a small tuft: stems erect and as much as 100 cm. tall: leaf-blades 8-11 mm. wide: panicle 10-12 cm. long: spikelets about 2.5 mm. long, the second glume and sterile lemma pointed beyond the fruit. Autumnal phase erect or leaning, loosely branched from the middle nodes.—Moist woods and swamps, Coastal Plain and rarely adj. provinces, Ga. to La., Ill., and Pa.—(*Mex.*)

59. *P. dichotomum* L. Plant glabrous: stem erect from a knotted crown, 30-50 cm. tall: leaf-blades spreading, 5-11 cm. long, 4-6 mm. wide: panicle 4-9 cm. long: spikelets 2 mm. long, glabrous, rarely pubescent.—Dry sterile woods, various provinces, Fla. to Tex., Mich., and N. B.

60. *P. barbulatum* Michx. Resembling *P. dichotomum*: differs in having pubescent lower nodes and in the diffusely branched autumnal phase, forming large reclining bunches, the slender branches recurved, the numerous flat leaf-blades horizontally spreading.—Sterile woods, pinelands, and fields, various provinces, Ga. to Tex., Mich., and Mass.

61. *P. spretum* Schult. Plant glabrous: stem erect, 30–90 cm. tall: panicle 8–12 cm. long, the branches ascending or appressed: spikelets about 1.5 mm. long, pubescent or rarely glabrous. Autumnal phase reclining, the branches in short fascicles at the nodes, the blades much reduced. [*P. octonodum* J. G. Smith *P. paucipilum* Nash *P. nitidum* (Fl. SE. U. S.)]—Wet acid soil and low pinelands, Coastal Plain and New England Coast, Fla. to Tex. and Me., and Great Lake Lowland, N Ind.

62. *P. Lindheimeri* Nash. Stem stiffly ascending or spreading, 30–100 cm. tall: nodes swollen: leaf-sheaths glabrous or the lower pubescent: blades 5–10 cm. long, 6–8 mm. wide, usually glabrous. Autumnal phase usually stiffly spreading or radiate-prostrate, the internodes elongate, with tufts of short appressed branches at the nodes, the blades reduced, involute-pointed, often conspicuously ciliate at base.—Dry woods, open grounds, and prairies, various provinces, Fla. to N. M., Calif., Minn., and Me.

63. *P. longiligulatum* Nash. Stem relatively stout, 30–70 cm. tall: nodes swollen: leaf-blades rather firm and thick, 4–8 cm. long, 4–8 mm. wide, glabrous above, puberulent beneath: panicle 3–8 cm. long: spikelets 1.1–1.2 mm. long, pubescent. Autumnal phase reclining, the branchlets crowded on spreading branches, the blades reduced and subinvolute.—Low pinelands, swamps, and ponds, Coastal Plain, Fla. to La. and N. C.

64. *P. leucothrix* Nash. Stem erect or ascending, 25–45 cm. tall, appressed papillose-pilose: leaf-blades rather firm, 3–7 cm. long, 3–7 mm. wide, glabrous above, puberulent beneath: panicle 3–8 cm. long. Autumnal phase with appressed fascicled branches: the blades not much reduced. [*P. parvispiculum* Nash]—Low pinelands and cypress swamps, often in acid peat, Coastal Plain, Fla. to La. and N. J.—(*W. I.*)

65. *P. Wrightianum* Scribn. Stem weak and slender, ascending from a decumbent base, 15–40 cm. tall, minutely pubescent: leaf-blades 2–4 cm. long, 3–5 mm. wide, glabrous or puberulent beneath, minutely pilose above: panicle 3–6 cm. long. Autumnal phase decumbent spreading, somewhat bushy-branched.—Moist soil, swamps, ponds, and cypress-heads, Coastal Plain and New England Coast, Fla. to Tex. and Mass.—(*W. I.*)

66. *P. auburne* Ashe. Stem 20–50 cm. tall, geniculate, widely spreading, densely papillose, silky-villous below, velvety with copious silky hairs intermixed above: leaf-sheaths villous: blades 3–7 cm. long, 3–5 mm. wide: panicle 3–5 cm. long. Autumnal phase diffusely branched, prostrate spreading, forming large mats, the branches curved upward at the ends.—Sandy woods, Coastal Plain, Fla. to La., Ark., and N. Y.—Plants tufted.

67. *P. Thurowii* Scribn. & Smith. Stem erect, 35–70 cm. tall, the nodes bearded: leaf-blades rather stiff, 7–12 cm. long, 6–10 mm. wide, velvety beneath: panicle 7–11 cm. long. Autumnal phase erect, bearing at the middle nodes a few appressed fascicled branches.—Prairies and dry open woods, Coastal Plain, Ala. to Tex.

68. *P. lanuginosum* Ell. Stem 40–70 cm. tall, spreading, the nodes villous, usually with a glabrous ring below: panicle 6–12 cm. long, the axis pubescent, the lower branches often drooping. Autumnal phase widely spreading or decumbent, freely branching. [*P. ciliosum* Nash]—Moist sandy woods, thickets and pinelands, mostly near the coast, Coastal Plain, Fla. to Tex. and N. J.

69. *P. tennesseense* Ashe. Plant somewhat bluish-green: stem erect or stiffly spreading, 25–60 cm. tall: leaf-sheaths spreading-pubescent: blades with a

thin white cartilaginous margin, ascending or erect, 5–8 mm. long, the lower surface appressed-pubescent: panicle 4–7 cm. long: spikelets about 1.6 mm. long. Autumnal phase widely spreading, with numerous fascicled branches, often forming prostrate mats.—Open moist ground, woods, and barrens, various provinces, Ga. to Ariz., Minn., and Me.—(*Mex.*)

70. *P. albemarlense* Ashe. Plant grayish-villous: stem 25–45 cm. tall: leaf-blades puberulent as well as long-villous on the upper surface: panicle 3–5 cm. long, the axis puberulent: spikelets 1.4 mm. long. Autumnal phase freely branching.—Low sandy woods and dunes, Coastal Plain and New England Coast N. C. to Minn. and Mass. and Great Lake Lowland, N. Ind.

71. *P. meridionale* Ashe. Stem very slender, 15–40 cm. tall: panicle 1.5–4 cm. long, the axis appressed-pubescent: spikelets about 1.3 mm. long. Autumnal phase erect or nearly so, not bushy. [*P. filiculme* Ashe]—Sandy soil, sterile woods, and bogs, various provinces, Ga. to Wis. and R. I.

72. *P. Huachucae* Ashe. Stem stiffly upright, light-olivaceous, copiously pillose-pubescent, 20–60 cm. tall, the nodes bearded: (taller and more slender, brighter-green and less densely pubescent: leaf-blades lax, thin, spreading, the upper surface sparsely short-pillose, or with copious long hairs near the base, the lower surface pubescent and with a satiny luster in *P. Huachucae silvicola*. [*P. lanuginosum* (Fl. SE. U. S.)]—Fla. to Tex., Nebr., and Me.): leaf-sheaths pubescent: blades firm, stiffly erect or ascending, the upper surface copiously short-pillose, the lower densely pubescent: panicle 4–6 cm. long, the axis pillose: spikelets about 1.7 mm. long. Autumnal phase stiffly erect or ascending, the branches fascicled. [*P. unciphyllum* (Fl. SE. U. S.)]—Prairies and open grounds, various provinces, N. C. to Calif., S. D., and Me.

73. *P. villosissimum* Nash. Stem 25–45 cm. tall, erect or ascending: panicle 4–8 cm. long, the branches rather stiffly ascending or spreading: spikelets about 2.2 mm. long. Autumnal phase finally prostrate, forming a mat, the leaf-blades not much reduced. [*P. atlanticum* Nash *P. xanthospermum* Scribn. & Mohr]—Dry sandy or sterile soil, woods, and pinelands, various provinces, Fla. to Tex., Minn., and Mass.—(*C. A.*)

74. *P. pseudopubescens* Nash. Resembling *P. villosissimum*: leaf-blades glabrous on upper surface along center or all over: spikelets about 2.3 mm. long. Autumnal phase stiffly spreading.—Sandy woods and pinelands, Coastal Plain and adj. provinces, Fla. to Miss., Ill., and Conn.—(*Mex.*)

75. *P. ovale* Ell. Stem 20–50 cm. tall, relatively stout, the lower portion and the leaf-sheaths long-pillose with ascending or appressed hairs: blades nearly glabrous on upper surface: panicle 5–9 cm. long. Autumnal phase spreading-decumbent, the stiff stems rather loosely branching, the winter blades very firm, conspicuously ciliate. [*P. ciliiferum* Nash]—Dry sandy woods and pinelands, Coastal Plain, Fla. to Tex. and N. C.—Plant densely tufted.

76. *P. wilmingtontense* Ashe. Stem 20–40 cm. tall, pillose with soft ascending hairs, the nodes pillose: leaf-sheaths villous like the stems: blades rather stiff, ascending, 4–9 cm. long, glabrous on the upper surface, softly pubescent to nearly glabrous beneath: panicle 5–8 cm. long. Autumnal phase spreading, the branches crowded, the reduced blades involute-pointed.—Sandy woods, Coastal Plain, Ala. to N. C.

77. *P. malacon* Nash. Stem erect or stiffly spreading, 30–50 cm. tall, pubescent with ascending hairs like the leaf-sheaths: blades stiffly ascending, 4–12 cm. long, 3–5 mm. wide, sharply acuminate, puberulent or glabrous above,

often villous on the margin: panicle 4–7 cm. long, the few branches stiffly ascending, the spikelets on long stiff pedicels. Autumnal phase decumbent-spreading, the branches appressed. [*P. strictifolium* Nash]—Dry pinelands and scrublands, Fla.

78. *P. Commonsianum* Ashe. Plant olivaceous: stem 20–50 cm. tall, stiffly ascending or spreading, appressed-strigose or appressed-pilose: leaf-blades firm, stiffly ascending, glabrous above, strigose or glabrous beneath: panicle 4–8 cm. long. Autumnal phase spreading or prostrate, forming mats.—Sandy woods and pinelands, Coastal Plain and New England Coast, Fla. to Conn.

79. *P. Addisonii* Nash. Resembling *P. Commonsianum*: usually less than 40 cm. tall: leaf-sheaths sparsely ascending-pilose: blades glabrous above, pubescent or glabrous beneath: panicle 2–6 cm. long. Autumnal phase spreading, freely branching, the branches appressed.—Sandy barrens, often acid, Coastal Plain and New England Coast, S. C. to Ind. and Mass.

80. *P. tsugetorum* Nash. Plants rather pale bluish-green: stem 30–50 cm. high, ascending, sometimes geniculate at base, densely appressed-pubescent: ligules 1–1.5 mm. long: leaf-blades 4–7 cm. long, 4–7 mm. wide, glabrous above, appressed-puberulent beneath: spikelets about 1.8 mm. long. Autumnal phase decumbent-spreading, branched, the branches appressed.—Acid sandy woods, various provinces, Va. to Tenn., Ill., and Me.

80a. *P. columbianum* Scribn. Differs from *P. tsugetorum* in being smaller, more slender, with the stiffer culms densely crisp-puberulent, and smaller spikelets (about 1.5 mm. long).—Sandy woods, various provinces, N. C. to Me.

81. *P. sphaerocarpon* Ell. Plant light-green: stem 20–55 cm. tall, radiate-spreading (ascending: ligules 0.3–1 mm. long in *P. sphaerocarpon inflatum*.—Tex. to N. C.): leaf-sheaths glabrous, ciliate: ligules obsolete: blades thick and firm, rough above, smooth beneath: panicle long-exserted, 5–10 cm. long: spikelets 1.6–1.8 mm. long, puberulent. Autumnal phase prostrate-spreading, the branches mostly simple.—Sandy soil, acid woods, thickets, and prairies, various provinces, Fla. to Tex., Kans., and Vt.—(*Mex., C. A., S. A.*)

82. *P. polyanthes* Schult. Plant glabrous or nearly so: stem erect, 30–90 cm. tall: leaf-blades 12–23 cm. long, 15–25 mm. wide: panicle 8–25 cm. long. Autumnal phase erect, sparsely branched.—Damp ground, woods, thickets, stream-banks, and prairies, various provinces, Ga. to Tex., Okla., and N. J.

83. *P. erectifolium* Nash. Stem erect, 30–70 cm. tall: panicle 6–12 cm. long. Autumnal phase erect, little-branched.—Moist pinelands, prairies and cypress-ponds, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

84. *P. curtifolium* Nash. Stem weak, slender, 10–30 cm. tall, angled, the nodes sparsely bearded: leaf-blades spreading or reflexed, 1.5–3 cm. long, 2–5 mm. wide, thin and soft: panicle 2–3 cm. long: spikelets 1.4 mm. long, glabrous or minutely pubescent. Autumnal phase weakly spreading, the ultimate branches in small fascicles. [*P. Earlei* Nash]—Boggy soil, Coastal Plain and adj. provinces, Fla. to Ala., Tenn., and S. C.

85. *P. tenue* Muhl. Stem 20–55 cm. tall, glabrous or the lower part sparsely appressed-pubescent: leaf-sheaths sparsely appressed-pilose or the upper glabrous: panicle 3–5 cm. long: spikelets 1.6 mm. long, puberulent. Autumnal phase erect or leaning, branching from the middle nodes.—Moist sandy woods, Coastal Plain, Fla. to N. C.

86. *P. albomarginatum* Nash. Stem 15–40 cm. tall: leaf-blades thick and firm, with a thick cartilaginous margin: panicle 3–6 cm. long: spikelets about 1.5

mm. long, puberulent. Autumnal phase spreading, repeatedly branching from the base.—Low sandy soil, pinelands, and prairies, Coastal Plain, Fla. to La. and Va.—(*W. I., C. A.*)

87. *P. trifolium* Nash. Resembling *P. albomarginatum*: stem more slender, leaves less conspicuously crowded at the base, blades less thick and firm. Autumnal phase sparingly branching from the middle and upper nodes.—Low woods, pinelands, and prairies, Coastal Plain, Fla. to La., Tenn., and N. J.

88. *P. vernale* H. & C. Stem 15–30 cm. tall, very slender, glabrous: leaves clustered at the base, the blades thin, soft, 2–7 cm. long, 3–5 mm. wide: panicles 1.5–3 cm. long: spikelets 1.5 mm. long, pubescent. Autumnal phase forming soft mats.—Moist places, Coastal Plain, Fla. to Miss.

89. *P. chamaelonche* Trin. Stem 10–20 cm. tall, glabrous. Autumnal phase freely branching from the base and lower nodes. [*P. Baldwinii* Nutt.]—Open sandy soil, pinelands, old fields, and hammocks, Coastal Plain, Fla. to Miss. and N. C.—(*W. I.*)

90. *P. glabrifolium* Nash. Resembling *P. chamaelonche*: stem as much as 50 cm. tall. Autumnal phase freely branching from the middle and upper nodes.—Low sandy pinelands, pen. Fla.

91. *P. ensifolium* Baldw. Stem 20–40 cm. tall, slender, glabrous: panicle 1.5–4 cm. long: spikelets glabrous or puberulent. Autumnal phase spreading or reclining, sparingly branching. [*P. Cuthbertii* Ashe *P. glabrissimum* Ashe]—Wet places, woods, and pinelands, often in acid soil, Coastal Plain, Ga. to Miss. and N. J.

92. *P. concinnus* H. & C. Stem very slender, 12–50 cm. tall, glabrous, puberulent at the nodes: panicle 3–6 cm. long. Autumnal phase radiate-spreading, sparingly branched. [*P. gracilicaule* Nash]—Moist, sandy soil, Piedmont and Appalachian Valley, Ga. and Ala.

93. *P. breve* H. & C. Stem erect, 5–15 cm. tall: panicle 1.5–4 cm. long: spikelets about 1.3 mm. long. Autumnal phase spreading, freely branching from the upper and middle nodes.—Low sandy or rocky pinelands, pen. Fla.

94. *P. flavovirens* Nash. Stem slender, ascending or spreading, 15–30 cm. tall, the lower leaves somewhat crowded: blades 2–5 cm. long, 3–4 mm. wide: spikelets about 1.4 mm. long. Autumnal phase spreading, branching from the lower and middle nodes.—Moist shady soil, Coastal Plain, Fla. to Miss. and N. C.

95. *P. portoricense* Desv. Stem 15–30 cm. tall: leaf-blades 2–5 cm. long, 3–6 mm. wide, firm, glabrous to puberulent: panicle 2–4 cm. long: spikelets puberulent. Autumnal phase ascending from a decumbent base, repeatedly branching.—Sandy pinelands, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)

96. *P. Webberianum* Nash. Stem 20–50 cm. tall, rather stout: leaf-blades 3–9 cm. long, 4–12 mm. wide: panicle 4–10 cm. long: spikelets 2.3–2.5 mm. long, glabrous or puberulent. Autumnal phase spreading or decumbent, flabellately branched.—Low pinelands, prairies, and fields, Coastal Plain, Fla. to N. C.

97. *P. patentifolium* Nash. Stem 25–55 cm. tall: leaf-blades stiffly spreading, 2.5–8 cm. long: panicle 3–7 cm. long: spikelets puberulent or nearly glabrous. Autumnal phase decumbent or spreading, branched from the middle and upper nodes.—Dry sand, prairies, pinelands, and hammocks, Coastal Plain, Fla. to Miss. and Ga.

98. *P. lancearium* Trin. Stem 20–50 cm. tall: leaf-blades 2–6 cm. long, 3–7 mm. wide, puberulent or nearly glabrous beneath, strongly ciliate towards base: panicle 3–6 cm. long: spikelets puberulent or glabrous. Autumnal phase geniculate-spreading, branching from the middle nodes. [*P. Nashianum* Scribn.]—Low sandy woods, prairies, and pinelands, Coastal Plain and rarely Blue Ridge, Fla. to Miss. and Va.—(W. I., C. A.)

99. *P. patulum* (Scribn. & Merr.) A. Hitchc. Resembling *P. lancearium*, but more lax. Autumnal phase more freely branching, often forming large mats. —Low moist woods, pinelands and hammocks, Coastal Plain, Fla. to La. and Va.

100. *P. malacophyllum* Nash. Stem slender, 25–70 cm. long, geniculate, ascending or spreading: ligules 1–1.5 mm. long: leaf-blades 6–12 mm. wide: panicle 3–7 cm. long: spikelets papillose-pilose. Autumnal phase spreading, freely branching from the upper and middle nodes.—Sandy woods, various provinces N of Coastal Plain, Tex. to Okla. and Tenn.

101. *P. Ravenelii* Scribn. & Merr. Stem erect, 30–70 cm. tall: ligules 3–4 mm. long: leaf-blades 1–2 cm. wide, glabrous on upper surface: panicle 7–12 cm. long: spikelets sparsely papillose-pubescent. Autumnal phase spreading, the branches numerous at the summit.—Sandy woods, pinelands, and marshes, various provinces, Fla. to Tex., Mo., and Del.

102. *P. oligosanthos* Schult. Stem erect, 35–80 cm. tall: ligules 1–2 mm. long: leaf-blades stiffly spreading or ascending, 5–8 mm. wide, glabrous on upper surface: panicle 6–12 cm. long: spikelets 3.5–4 mm. long, sparsely hirsute. Autumnal phase topheavy-prostrate, the short branches aggregate at the summit.—Sandy moist woods, dunes, and bottoms, Coastal Plain, Fla. to Tex., Okla., and N. J., and Great Lake Lowland, N Ind.

103. *P. Scribnerianum* Nash. Stem erect, rather stiff, 20–50 cm. tall: ligules about 1 mm. long: leaf-blades 6–12 mm. wide, glabrous on the upper surface: panicle 4–8 cm. long: spikelets sparsely pubescent to nearly glabrous. Autumnal phase much-branched at summit, the blades not greatly reduced.—Dry prairies, sandy soil, woods, prairies, barrens, and fields, various provinces, Tenn. to Ariz., Wash., Ont., Me., and Md.

104. *P. scoparium* Lam. Stem 80–130 cm. tall, stout, erect or ascending, usually geniculate at base, the nodes villous with reflexed hairs, a glabrous viscid ring below: leaf-sheaths glabrous and viscid on the back toward the summit: leaf-blades 10–18 mm. wide, long-acuminate: panicle 8–15 cm. long: spikelets turgid, about 2.5 mm. long, papillose-pubescent. Autumnal phase leaning or spreading, freely branching, the ultimate branches in fascicles at the nodes. [*P. pubescens* Lam.]—Wet soil, prairies, swamps, woods, and thickets, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and Mass.—(W. I.)

105. *P. aculeatum* H. & C. Stems in large clumps, 70–100 cm. tall, harshly pubescent below: leaf-sheaths papillose-hispid with stiff, sharp hairs: blades firm, 12–20 cm. long, 9–13 mm. wide, involute-pointed: panicle 8–12 cm. long: spikelets 3 mm. long, minutely pubescent. Autumnal phase branching from the middle nodes.—Swampy woods, Coastal Plain, N. C. to Long Id., N. Y.

106. *P. scabriusculum* Ell. Stem 1–1.5 m. tall, scabrous at least below the nodes, sometimes puberulent: leaf-blades 15–25 cm. long, 9–12 mm. wide, glabrous or scabrous, often pubescent beneath: panicle 10–20 cm. long: spikelets 2.3–2.6 mm. long, glabrous or obscurely puberulent, the second glume and sterile lemma much larger than the fruit. Autumnal phase erect, branching from the middle and upper nodes, finally bearing fascicled branchlets and forming dense oblong masses along the upper part of the primary stem.—

Moist ground, wet acid woods, and pinelands, Coastal Plain, Fla. to Tex. and N. J.

107. *P. cryptanthum* Ashe. Stem erect, 80–100 cm. tall, glabrous except the usually bearded nodes: leaf-blades 7–9 mm. wide, glabrous: panicle 6–10 cm. long: spikelets 2.2–2.4 mm. long, glabrous or sparsely pilose, the second glume and sterile lemma pointed beyond the fruit. Autumnal phase erect, sparingly branched at the middle and upper nodes.—Low swampy ground, Coastal Plain, Fla. to Tex. and N. J.

108. *P. mutabile* Scribn. & Smith. Stem erect, 30–70 cm. tall: leaf-blades horizontally spreading, 6–15 cm. long, 8–20 mm. wide: panicle 7–15 cm. long: spikelets about 3 mm. long. Autumnal phase erect or reclining, sparingly branched from the middle and upper nodes.—Sandy pinelands, dunes, and hammocks, Coastal Plain and rarely Blue Ridge, Fla. to Miss. and Va.

109. *P. equilaterale* Scribn. Stem stiffly erect, 25–70 cm. tall: leaf-blades firm, widely spreading, 6–17 cm. long, 6–14 mm. wide, very scabrous, often ciliate at base: panicle 5–10 cm. long: spikelets 3.2 mm. long. Autumnal phase erect or leaning, branching from the upper and middle nodes. [*P. epilifolium* Nash]—Pinelands, hammocks, and dunes, Coastal Plain, Fla. to S. C.

110. *P. Ashei* Pearson. Stem usually purplish, erect, 25–50 cm. tall: leaf-sheaths puberulent: blades 4–8 cm. long, 5–10 mm. wide: panicle 5–8 cm. long. Autumnal phase divergently branching from the middle and upper nodes.—Dry sterile woods, rocky places, and sand hills, various provinces, Fla. to Miss., Mich., and Mass.

111. *P. commutatum* Schult. Stem 40–75 cm. tall: leaf-sheaths glabrous or puberulent between the nerves: blades 5–12 cm. long, 12–25 mm. wide, glabrous, or puberulent beneath: panicle 6–12 cm. long: spikelets 2.6–3.2 mm. long. Autumnal phase erect or leaning, branching from the middle nodes, the blades not much reduced. [*P. ovale* (Fl. SE. U. S.)]—Woods, copses, stream-banks, and hammocks, various provinces, Fla. to Tex., Ill., and Mass.

112. *P. Joorii* Vasey. Stem 20–55 cm. tall, spreading or ascending from a decumbent base, at least the lower part purple: panicle 5–9 cm. long: spikelets 3 mm. long. Autumnal phase widely spreading, bearing more or less divaricate branches from all the nodes, the ultimate branchlets in dense fascicles. [*P. manatense* Nash]—Low woods, hammocks, and cypress-swamps, Coastal Plain, Fla. to Tex. and Va.—(*W. I., Mex.*)

113. *P. clandestinum* L. Stems in dense clumps, 70–150 cm. tall: leaf-blades 10–20 cm. long, 1.2–3 cm. wide, cordate-clasping: panicle 8–15 cm. long: spikelets 2.7–3 mm. long, sparsely pubescent. Autumnal phase erect or leaning, sparingly branched, the swollen bristly sheaths overlapping on the shortened branchlets inclosing wholly or partially the secondary panicles.—Moist ground, woods and thickets, various provinces, Fla. to Tex., Kans., and Me.

114. *P. latifolium* L. Stem erect, 45–100 cm. tall: leaf-blades 8–18 cm. long, 1.5–4 cm. wide, cordate-clasping, usually ciliate at base, otherwise glabrous: panicle 7–15 cm. long: spikelets sparsely pubescent. Autumnal phase branching from the middle nodes, the branches crowded and spreading. [*P. macrocarpon* Le Conte]—Rocky or sandy woods, various provinces N of Coastal Plain, N. C. to Kan., Minn., and Me.

115. *P. Boscii* Poir. Stem 40–70 cm. tall, erect or ascending, glabrous or minutely puberulent: leaf-sheaths glabrous or nearly so (downy-villous, the blades velvety beneath in *P. Boscii molle* = *P. pubifolium* Nash—Fla. to La., Ark., and Conn.): blades 7–12 cm. long, 1.5–3 cm. wide: spikelets papillose-

pubescent. Autumnal phase more freely branched than in *P. latifolium*, sometimes top-heavy-reclining. [*P. Porterianum* Nash]—Woods, bottoms, and hillsides, various provinces, Fla. to Tex., Okla., and Mass.

**116. *P. hemitomon* Schult.** Plant aquatic or semiaquatic, with extensively creeping rootstocks, often producing numerous sterile shoots with densely hirsute sheaths and strigose blades: stem 50–150 cm. tall, glabrous: leaf-blades ascending or spreading, 10–25 cm. long, 7–15 mm. wide, scabrous on upper surface, glabrous beneath: panicle 15–30 cm. long, the branches solitary or 2 or 3 in a fascicle, 2–10 cm. long: spikelets about 2.5 mm. long, lanceolate, acute, glabrous. [*P. digitarioides* Carpenter]—(MAIDEN-CANE.)—Stream-banks, ditches, ponds, and lakes, often in the water, Coastal Plain, Fla. to Tex. and N. J.

**117. *P. gymnocarpon* Ell.** Plant perennial, with a succulent decumbent or creeping base as much as 2 m. long: stem erect or ascending, 60–100 cm. tall, the nodes often dark-colored: leaf-blades linear-lanceolate, 20–35 cm. long, 15–25 mm. wide, flat, cordate: panicle 20–40 cm. long, with several solitary or fascicled racemes along the main axis, these 8–12 cm. long: spikelets short-pedicelled, appressed, 6–7 mm. long, glabrous, the glumes acuminate. [*Phanopyrum gymnocarpon* Nash]—Ditches, ponds, and muddy banks, Coastal Plain, Fla. to Tex. and Ga.

**28. LASIACIS A. Hitchc.** Large branching perennials, with woody culms often straggling several feet high into shrubs or trees, the leaf-blades firm, flat, usually lanceolate and narrowed into a petiole, the spikelets in an open panicle. Spikelets subglobose, glabrous, placed obliquely on their pedicels; first glume somewhat inflated-ventricose, usually not over one-third the length of the spikelet, several nerved; second glume and sterile lemma about equal, broad, abruptly apiculate, papery-chartaceous, shining, many-nerved, the lemma enclosing a membranaceous palea and sometimes a staminate flower; fertile lemma white, bony-indurate, obovoid, obtuse, this and the palea bearing at the apex in a slight crateriform depression a tuft of woolly hairs, the palea concave below, gibbous above, the apex often free at maturity.—Twenty species, natives of tropical America.

**1. *L. divaricata* (L.) A. Hitchc.** Plant glabrous throughout except the margin of the sheaths: stem branching, shrubby or elongate, straggling over bushes or up into trees, or vine-like, 2–4 m., the main stem strong, as much as 6 mm. in diameter, the main branches often fascicled, the vigorous sterile secondary shoots often strongly divaricate or zigzag: leaf-blades narrowly lanceolate, 5–12 cm. long, 5–15 mm. wide, on vigorous shoots much larger: panicle ovate, 5–20 cm. long: spikelets about 4 mm. long, commonly black at maturity. [*Panicum divaricatum* L. *P. latifolium* (Fl. SE. U. S.)]—(SMALL-CANE. WILD-BAMBOO.)—Hammocks, S Fla.—(*W. I., Mex., C. A., S. A.*)

**29. SACCIOLEPIS Nash.** Perennials of wet soil; stems usually branching, with elongate spike-like panicles. Spikelets oblong-conic; first glume minute: second glume broad, inflated-saccate, strongly many-nerved; sterile lemma

narrower, flat, fewer-nerved, its palea nearly as long, often subtending a staminate flower: fertile lemma much smaller, stipitate, elliptic, chartaceous-in-durate, the margins inrolled, the palea not enclosed at the summit.—Twelve species, except the following confined to the tropics of both hemispheres.

1. *S. striata* (L.) Nash. Plant glabrous, often decumbent and rooting at base: stem finally branched, as much as 1-2 m. long: leaf-sheaths more or less papillose-hirsute: blades lanceolate, 4-20 cm. long, long-acuminate: panicle rather loose, 6-30 cm. long: spikelets about 4 mm. long. [*Panicum gibbum* Ell. *S. gibba* Nash]—Marshes, ditches, prairies, and ponds, Coastal Plain, Fla. to E Tex., Okla., and N. J.—(W. I.)

30. *OPLISMENUS* Beauv. Freely branching, creeping perennials, with slender erect flowering shoots, flat, thin, lanceolate or ovate leaf-blades, and several 1-sided thickish spikes rather distant on a main axis. Spikelets terete or somewhat laterally compressed, subsessile, solitary or in pairs in 2 rows, crowded or somewhat distant on one side of a narrow scabrous or hairy rachis: glumes about equal, emarginate or 2-lobed, awned from between the lobes; sterile lemma exceeding the glumes and fruit, notched or entire, mucronate or short-awned, inclosing a hyaline palea: fertile lemma elliptic, acute, convex or boat-shaped, the firm margins clasping the palea, not inrolled.—Ten species, except the following, confined to the tropics of both hemispheres.

1. *O. setarius* (Lam.) Roem. & Schult. Flowering stem 20-30 cm. tall: leaf-blades 1-3 cm. long, lanceolate, conspicuously undulate-margined: racemes 3-5, distant, 1-3 cm. long, the rachis usually 2-5 mm. long, sometimes 1 cm. long: the spikelets appearing to be in clusters on the rather strict axis.—(WOOD-GRASSES.)—Moist woods, swamps, hammocks, and shady banks, Coastal Plain, Fla. to Tex. and N. C.—(W. I., Mex., C. A., S. A.)

31. *ECHINOCHLOA* Beauv. Our species coarse, often succulent, annuals, with compressed leaf-sheaths, no ligule, linear flat blades and rather compact panicles composed of short densely flowered racemes along a main axis. Spikelets plano-convex, often stiffly hispid, subsessile, solitary or in irregular clusters on one side of the panicle-branches; first glume not over half the length of the spikelet; second glume and sterile lemma equal, pointed, mucronate, or the glume short-awned and the lemma long-awned, sometimes conspicuously so, inclosing a membranaceous palea and sometimes a staminate flower; fertile lemma acuminate-pointed, the margins inrolled below, flat above, the apex of

the palea not inclosed.—Ten species, natives of the tropical and temperate regions of both hemispheres.

Spikelets mostly in pairs, evenly imbricate in 3 or 4 rows on one side of the rachis, abruptly pointed.

Spikelets irregularly crowded in the spike-like scarcely 1-sided branches.

Leaf-sheaths smooth.

Sterile floret neuter.

Sterile floret staminate.

Leaf-sheaths, at least the lower ones, hispid or scabrous: panicle a nodding dense mass of long-awned spikelets.

1. *E. colona*.

2. *E. Crus-galli*.

3. *E. paludigena*.

4. *E. Walteri*.

1. *E. colona* (L.) Link. Stem compressed, branching at the more or less decumbent base, as much as 80 cm. tall: leaf-blades about 5 mm. wide, sometimes barred with purplish-brown: racemes usually 5–10, ascending, distant nearly their own length on the strict axis: spikelets about 3 mm. long. [*Panicum colonum* L.] — (JUNGLE-RICE.) — Fields, waste-places, ditches, and moist open grounds, various provinces, Fla. to S Calif., Mo., and N. J.—(*W. I., Mex., C. A., S. A.*)

2. *E. Crus-galli* (L.) Beauv. Stem usually spreading and much branched at base, as much as 100 cm. tall, rather stout and succulent: leaf-blades 15–60 cm. long, 1–2 cm. wide: panicle pale or often purple: awns mostly not over 1 cm. long, rarely 3 cm. [*Panicum Crus-galli* L.] — (BARNYARD-GRASS.)—Waste-places, fields, and moist ground, throughout the U. S. and S Can.—(*Eu., W. I., Mex., C. A., S. A.*)—An exotic form, *E. Crus-galli edulis*, has panicle rather compact, 10–20 cm. long, the thick branches often slightly incurved: spikelets, excluding awn, about 3 mm. long, the awn usually not over 2 mm. long.—(JAPANESE BARNYARD-MILLET. BILLION-DOLLAR-GRASS.)—Waste-places, various provinces, Ala. to Tex. and Conn.—(*E. I.*)—Occasionally cult. for forage.

3. *E. paludigena* Wiegand. Stems mostly solitary, erect, 1 to 1.5 m. tall: panicles narrow, 20–30 cm. long: racemes ascending, mostly simple: sterile floret staminate.—Ditches, marshes, and wet places, often in shallow water, pen. Fla.

4. *E. Walteri* (Pursh) Heller. Stem 1–2 m. tall: ligule none: awns 2–4 cm. long.—Wet banks, marshes, and ponds, various provinces, Fla. to Tex., Wis., and Mass.—(*W. I., Mex.*)—Exceptional specimens have glabrous or scabrous sheaths, *E. longiaristata* Nash.

32. *TRICHOLAENA* Schrad. Perennials with rather open panicles of silky spikelets. Spikelets on short capillary pedicels; first glume minute, villous; second glume and sterile lemma equal, raised on a stipe above the first glume, short-awned from a notched apex, thickly beset, except towards the apex, with long silky hairs, the palea of the sterile lemma well developed; fertile lemma shorter than the spikelet, cartilaginous, boat-shaped, obtuse, the margins thin, not inrolled.—Fifteen species, natives of Africa.

1. *T. rosea* Nees. A short-lived perennial: stem slender, about 1 m. tall, the base often decumbent; leaf-sheaths sparsely papillose-hirsute: blades flat, 2-5 mm. wide: panicles rosy purple, 10-15 cm. long, the branches slender, ascending: spikelets about 5 mm. long, the capillary pedicels flexuous or recurved.—(NATAL-GRASS.)—Prairies, pinelands, old fields, and roadsides, Fla. Nat. of Afr.—(*W. I., Mex., C. A., S. A.*)—Formerly cult. for hay, now very abundant in sandy fields, groves, and pinelands, and on roadsides. Seeds readily and spreads rapidly.

33. *CHAETOCLOA* Scribn. Annuals or perennials, with narrow bristly terminal panicles, these dense and spike-like or somewhat loose and open. Spikelets subtended by 1 to several bristles (sterile branchlets), deciduous, falling free from the bristles; first glume broad, usually less than half the length of the spikelet, 3- to 5-nerved; second glume and sterile lemma equal, or the former shorter, several-nerved; fertile lemma coriaceous-indurate, smooth or rugose. [*Setaria* Beauv., not Achar.]—Sixty-five species, most abundant in the tropical and warm-temperate parts of both hemispheres.—FOXTAIL-GRASSES. BRISTLY FOXTAIL-GRASSES. PIGEON-GRASSES.

Plant annual.

Bristles retrorsely scabrous.

Bristles antrorsely scabrous.

Bristles 5-12 at the base of each spikelet: panicle cylindrical, yellow.

Bristles 1-3 at the base of each spikelet.

Second glume distinctly shorter than the spikelet.

Leaf-blades pilose.

Leaf-blades scabrous but not pilose.

Second glume about as long as the spikelet (a little shorter sometimes in *C. italica*).

Fertile lemma smooth and shining: plant robust, the panicle usually 2-5 cm. in diameter.

Fertile lemma more or less roughened or wrinkled.

Fruit disarticulating above the sterile lemma: panicle usually large and robust, often lobed (smaller forms often purple).

Fruit not disarticulating, the spikelets falling entire.

Plant perennial.

Bristles 8-12 at the base of each spikelet.

Bristles 1-3 at the base of each spikelet.

1. *C. verticillata*.

2. *C. lutescens*.

3. *C. hispida*.

4. *C. corrugata*.

5. *C. magna*.

6. *C. italica*.

7. *C. viridis*.

8. *C. geniculata*.

9. *C. macrosperma*.

1. *C. verticillata* (L.) Scribn. Stem 0.3-0.6 m. tall: leaf-blades flat, 7-13 cm. long, 6-12 mm. wide, scabrous on both surfaces: panicle 5-10 cm. long, compact or somewhat loose and lobed toward base: spikelets 2-2.5 mm. long, the bristles flexuous, 3-6 mm. long. [*S. verticillata* Beauv.]—Cult. grounds and waste-places, E U. S. and SE Can. Nat. of Eu.—Rare in the S States.—(*W. I., Mex., C. A.*)

2. *C. lutescens* (Weigel) Stuntz. Stem as much as 1 m. tall, often branched and decumbent at base: leaf-blades linear-lanceolate, often glaucous, twisted in a half spiral: panicle 10 cm. long, seldom more than 1 cm. thick, not narrowed above: bristles 3-8 mm. long, yellow: spikelets about 3 mm. long: first glume one-half, the second two-thirds as long as the striate undulate-rugose fertile lemma. [*C. glauca* (Fl. SE. U. S.)]—(YELLOW-FOXTAIL. PIGEON-GRASS.)—Fields, waste-places, roadsides, and woods, various provinces, U. S. and S Can. Nat. of Eu.—(*W. I., Mex.*)

3. *C. hispida* Scribn. & Merr. Stem as much as 1 m. tall, decumbent at base: leaf-sheaths sparsely appressed-pilose: blades 4–6 mm. wide: panicle 10–15 cm. long, the axis villous: spikelets about 2 mm. long.—Shell mounds, Marco Island, S Fla.—(*Cuba*.)

4. *C. corrugata* (Ell.) Scribn. Stem as much as 1 m. tall, usually spreading and decumbent at base: leaf-blades 3–6 mm. wide: panicles 5–15 cm. long, 5–10 mm. in diameter, exclusive of the bristles, the rachis villous: spikelets about 2 mm. long, the bristles 5–15 mm. long: fertile lemma undulate-rugose. [*S. corrugata* Schult.]—Fields and sandy soil, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

5. *C. magna* (Griseb.) Scribn. Stem stout, erect, as much as 4 m. tall: leaf-sheaths keeled, glabrous or scabrous: blades as much as 3 cm. wide, scabrous: panicles as much as 40 cm. long, interrupted below, the secondary panicles smaller, sometimes not over 5 cm. long: spikelets about 2 mm. long, the bristles 8–11 mm. long, ascending, tawny. [*S. magna* Griseb.]—Marshes, swamps, and ditches, Coastal Plain, Fla. to Tex. and N. J.—(*W. I., C. A.*)

6. *C. italica* (L.) Scribn. Stem as much as 1–2 m. tall: leaf-blades as much as 3 cm. wide: panicle as much as 20 cm. long. Cult. for forage. Escaped in fields and waste places, such specimens usually much reduced, the panicles often purple. [*S. italica* Beauv.]—(COMMON-MILLET. HUNGARIAN-GRASS.)—Cult. grounds, roadsides, waste-places, and woods, various provinces, Fla. to Tex., Calif., Minn., and Que. Nat. of Eurasia.

7. *C. viridis* (L.) Scribn. Stem usually less than 0.6 m. tall: leaf-blades not twisted (as in *C. lutescens*): panicle green, tapering at summit, as much as 10 cm. long: spikelets 2 mm. long, the bristles 7–12 mm. long: second glume and sterile lemma equal, covering the striate faintly wrinkled fertile lemma. [*S. viridis* Beauv.]—(GREEN-POXTAIL.)—Fields and waste-places throughout U. S. and S Can. Nat. of Eu.—(*W. I., Mex., C. A.*)—*Chaetochloa ambigua*, found on ballast at Mobile, Ala., differs from *C. viridis* in the scabrous, not villous axis of the panicle; the spikelets resemble those of *C. verticillata*.

8. *C. geniculata* (Lam.) Millsp. & Chase. Stem compressed, as much as 1 m. tall, usually tufted and decumbent at base, from short knotty rootstocks: leaf-sheaths glabrous: blades attenuate at apex, often with long hairs on upper surface near base: panicle cylindric, dense, not tapering at either end, 2–10 cm. long, 7–8 mm. in diameter, exclusive of bristles, the rachis pubescent: spikelets 2–3 mm. long, the bristles horizontally spreading, as much as 10 mm. long or sometimes scarcely longer than the spikelets, yellow or purplish: first glume one-third as long as the spikelet: second glume half to two-thirds as long as the spikelet: fertile lemma finely transversely rugose. [*C. imberbis* Scribn. *C. versicolor* Bickn. *C. occidentalis* Nash *C. purpurascens* Scribn. & Merr. *S. imberbis* Roem. & Schult. *S. laevigata* Chapm. *S. perennis* Hall]—Pinelands, prairies, hillsides, swamps, and roadsides, various provinces, Fla. to S Calif. and Conn.—(*W. I., Mex., C. A., S. A.*)

9. *C. macrosperma* Scribn. & Merr. Stem stout, 0.6–1.2 m. tall: leaf-sheaths glabrous, compressed, the margins ciliate: blades 10–30 cm. long, 10–20 mm. wide: panicles as much as 30 cm. long and 5 cm. wide, tapering toward the apex: bristles 1.5–3 cm. long: fertile lemma finely transversely undulate-wrinkled.—Hammocks, shell-mounds, and swamps, Fla.—(*W. I.*)

*C. barbata* (Lam.) H. & C., a weak-stemmed annual, with plaited blades, 1–3 cm. wide, tapering at each end, and narrow panicles of numerous pale racemes, has been collected at Miami, Fla. Introd. from trop. Asia.—(*W. I., S. A.*)

*C. rariflora* (Mikan) H. & C., a perennial with flat blades mostly more than 5 mm. wide, pale narrow rather loosely branched panicles, tapering to a slender

summit, [*C. caudata* Scribn.], has been collected on ballast at Mobile, Ala. Nat. of S. A.—(*W. I., Mex., S. A.*)

**34. PENNISETUM** L. C. Rich. Annuals or perennials, often branched, with dense spike-like terminal panicles. Spikelets solitary or in groups of 2 or 3 surrounded by an involucre of slender bristles, these not united except at the very base, often plumose, falling attached to the spikelets; glumes shorter than the sterile and fertile lemmas; fertile lemma chartaceous, smooth, the margin thin, enclosing the palea.—Fifty species, natives of the tropical regions.

Bristles, at maturity, not exceeding the spikelets, the large caryopsis bursting through the lemma and palea. 1. *P. glaucum*.

Bristles much exceeding the spikelets, the caryopsis remaining within the lemma and palea. 2. *P. setosum*.

1. *P. glaucum* (L.) R. Br. Stout annual, 1–3 m. tall, or even more: leaf-blades as much as 40 cm. long and 4 cm. wide: panicle glaucous, dense, spike-like, cylindric, 10–30 cm. long, 1–1.5 cm. in diameter. [*Penicillaria spicata* Willd.]—(PEARL-MILLET.)—Cult. grounds and roadsides, various provinces, Gulf States to Md. Nat. of Afr.—Cult. for forage.

2. *P. setosum* (Swartz) L. C. Rich. Stem 1–1.5 m. tall: leaf-blades 5–10 mm. wide: panicle 10–15 cm. long, tapering above, usually purple: outer bristles about as long as spikelets, scabrous, inner bristles longer, densely silky-plumose on lower part, one longer than the others: spikelets about 3 mm. long.—Sandy soil, S. Fla.—(*W. I., Mex., C. A., S. A.*)

**35. CENCHRUS** L. Low branching annuals or perennials, with flat blades and terminal spikes of readily deciduous burs. Spikelets solitary or few together, surrounded and enclosed by a spiny bur composed of several coalescing bristles (sterile branchlets), the bur subglobular, the peduncle short and thick, articulate at base, falling with the spikelets enclosed, the spines in ours retrorsely barbed.—Twenty-five species, in warm regions generally, most abundant in America.—SAND-BURS. BUR-GRASSES. SAND-SPURS. COCK-SPURS.

Involucral lobes united below: stem compressed, branched, the branches usually decumbent and spreading. I. TRIBULOIDES.

Involucral lobes united at the base only: stem terete. II. MYOSUROIDES.

#### I. TRIBULOIDES

Involucre with a ring of slender bristles at base.

Burs excluding bristles not over 4 mm. wide, numerous, crowded in a long spike; lobes of the involucre interlocking.

Burs excluding bristles 5–7 mm. wide, not densely crowded; lobes of the involucre erect.

Involucre with flattened spreading spines, no ring of slender bristles at base.

Burs tapering at base, ovate: stems rather slender and wiry, ascending or erect, 30–60 cm. tall: plants perennial.

1. *C. viridis*.

2. *C. echinatus*.

Burs pubescent: spines relatively few, usually 2-4 mm. long.

Burs glabrous: spines numerous, 4-6 mm. long.

Burs globose, rounded at base, the spines numerous: stems spreading: plants annual.

Burs 7-8 mm. wide, finely pubescent.

Burs 10-15 mm. wide, densely woolly: inflorescence usually included at base in the inflated sheaths.

3. *C. incertus*.

4. *C. gracillimus*.

5. *C. pauciflorus*.

6. *C. tribuloides*.

## II. MYOSUROIDES

A stout glaucous woody perennial.

7. *C. myosuroides*.

1. *C. viridis* Spreng. Stem erect or spreading, 30-50 cm. tall: leaf-blades lax, 6-12 mm. wide: spike about 10 cm. long.—Hammocks, fields, and waste-places, S Fla.—(*W. I., Mex., C. A., S. A.*)

2. *C. echinatus* L. Stem 30-50 cm. long: blades flat and thin, 5-10 mm. wide: spike usually 5-7 cm. long.—(HEDGEHOG-GRASS.)—Pinelands, hammocks, coastal sand-dunes, fields, and waste-places, Coastal Plain and adj. provinces, Fla. to N. Mex. and S. C.—(*W. I., Mex., C. A., S. A.*)

3. *C. incertus* M. A. Curtis. Leaf-blades commonly folded, 2-5 mm. wide: spike 3-6 cm. long: burs rather crowded: spines broad at base.—Sandy soil, pinelands, woods, and dunes, Coastal Plain, Fla. to Tex. and N. C.

4. *C. gracillimus* Nash. In dense clumps: leaf-blades folded, stiffly flexuous, usually 2-3 mm. wide: spike often long-exserted, 3-5 cm. long: burs usually few, the spines slender.—Sandy soil, pinelands and coastal dunes, Fla. and Ala.—(*W. I.*)

5. *C. pauciflorus* Benth. Stem 20-60 cm. long: leaf-blades 2-7 mm. wide: spike 3-8 cm. long: burs usually 6-12, sometimes more, the spines 3-4 mm. long. [*C. tribuloides* (Fl. SE. U. S.)]—Sandy soil, roadsides, cult. grounds, pinelands and coastal dunes, various provinces, Fla. to Calif. and Me.—(*W. I., Mex., C. A., S. A.*)

6. *C. tribuloides* L. Resembles *C. pauciflorus*: plant more robust, the trailing stems as much as 1 m. long. [*C. macrocephalus* Scribn.]—Sandy beaches, Coastal Plain, Fla. to La. and Long Id., N. Y.—(*W. I., Mex., C. A., S. A.*)

7. *C. myosuroides* H. B. K. Stem erect, often decumbent at base, branching, 1-1.5 m. tall: spike 5-20 cm. long: burs narrow, numerous, contiguous: spikelets about 5 mm. long. [*Cenchropsis myosuroides* Nash]—Sandy soil, cult. grounds, and beaches, Coastal Plain, Fla. to La. and Tex.—(*W. I., Mex., C. A., S. A.*)

*C. catharticus* Del., a spreading annual with stems up to 1 m. long, its burs 4-6 mm. long, 2-flowered, the lobes united at the base only, the flat erect inner lobes densely ciliate, has been collected on ballast at Mobile, Ala.

36. **STENOTAPHRUM** Trin. Creeping stoloniferous perennials, with short flowering stems, rather broad and short obtuse leaf-blades, and terminal and axillary racemes. Spikelets imbedded in one side of an enlarged and flattened articulate rachis: first glume small: second glume and sterile lemma

about equal, the latter with a palea or staminate flower: fertile lemma chartaceous.—Five species, except the following, on the islands of the Pacific Ocean.

1. *S. secundatum* (Walt.) Kuntze. Stem compressed, the flowering shoots 10–30 cm. tall: leaf-blades usually less than 15 cm. long, 4–10 mm. wide: racemes 5–10 cm. long. [*S. americanum* Schrank]—(ST. AUGUSTINE-GRASS. RUNNING CRAB-GRASS.)—Moist loamy or sandy soil, mostly on or near beaches, Coastal Plain, Fla. to Tex. and S. C.—(*W. I., Mex., C. A., S. A., O. W.*)—Commonly cult. for lawns in Gulf States, particularly in Fla.

37. **AMPHICARPON** Kunth. Erect annuals or perennials, with stiff flat blades and narrow terminal panicles. Spikelets of two kinds on the same plant, one in a terminal panicle, perfect but not fruitful, the other cleistogamous on slender leafless subterranean branches from the base of the stem, sometimes also from the lower nodes: first glume of the aerial spikelets variable in size, sometimes obsolete: second glume and sterile lemma about equal; lemma and palea indurate, the margins of the lemma thin and flat: fruiting spikelets much larger, first glume wanting: second glume and sterile lemma strongly nerved, subrigid, exceeded at maturity by the turgid elliptic acuminate fruit with strongly indurate lemma and palea, the margins of the lemma thin and flat: stamens with small anthers on short filaments.—Two species, confined to the eastern United States.

Blades conspicuously hirsute.  
Blades glabrous or nearly so.

1. *A. Amphicarpon*.  
2. *A. floridanum*.

1. *A. Amphicarpon* (Pursh.) Nash. Annual: stem erect, 30–80 cm. tall, the leaves crowded toward the base: leaf-blades erect, 10–15 cm. long, 5–15 mm. wide, sharp-pointed: panicle narrow, 3–20 cm. long: spikelets elliptic, 4–5 mm. long: subterranean spikelets 7–8 mm. long, plump. [*A. Purshii* Kunth]—Sandy pinelands, Coastal Plain, Ga. to N. J. (Ga., according to Chapman.)

2. *A. floridanum* Chapm. Perennial: stem usually decumbent at base, 30–100 cm. tall, the leaves scattered along the stem; blades firm, white-margined when dry, mostly less than 10 cm. long, 5–10 mm. wide: panicles long-exserted, narrow, few-flowered: spikelets narrowly lanceolate, 6–7 mm. long: subterranean spikelets 6–9 mm.—Low pine-lands, Coastal Plain, Fla. to S. C.

38. **OLYRA** L. Tall monoecious perennials, with broad flat leaf-blades which are contracted into a petiole-like base, and terminal or axillary panicles.

Staminate spikelets arranged along the panicle-branches below the summit: lemma usually awned; palea as long as the lemma. Pistillate spikelets terminating the main branches of the panicle, much larger than the staminate: first glume wanting, second glume and lemma awned, membranous, the fertile lemma chartaceous-bony-indurate in fruit.—Twenty species, mostly natives of tropical America.

1. *O. latifolia* L. A tall woody-stemmed branching perennial, with oblong to broadly lanceolate leaf-blades as much as 5 cm. wide, and oblong somewhat open panicles, 10–15 cm. long, the branches stiffly ascending or spreading, bearing one large pistillate spikelet at the summit and several spikelets along the side.—Region of Tampa Bay, Fla.—(*W. I., Mex., C. A., S. A.*)—The occurrence of this species, at least at the present time, in Florida is doubtful.

39. *ORYZA* L. Swamp annuals or perennials, often tall, with flat leaf-blades and spikelets in open panicles. Spikelets 1-flowered, laterally compressed-flattened; glumes 2, much shorter than the lemma, narrow: lemma rigid, keeled, 3-nerved, sometimes awned: palea similar to the lemma, narrower, keeled but with no midnerve on the back, 2-nerved close to the margins.—Seven species, mostly of the Old World tropics.

1. *O. sativa* L. Stem erect, 50–100 cm. tall: panicles 10–30 cm. long, the branches erect below drooping above: spikelets 8–10 mm. long, oblong, hispid, awned or awnless.—(*RICE.*)—Wet places, cult. and sometimes escaped, though scarcely permanently established, on the Coastal Plain, Fla. to Tex. and Va. Nat. of trop. Asia.—(*W. I., Mex., C. A., S. A.*)

40. *HOMALOCENCHRUS* Meig. Perennials, usually with creeping root-stocks, flat scabrous leaf-blades and usually open panicles, the spikelets nearly sessile along one side of the branchlets. Spikelets 1-flowered, strongly compressed laterally: glumes wanting: lemma chartaceous, broad, oblong, boat-shaped, usually 5-nerved, the lateral pair of nerves close to the margins, these and the keel often hispid-ciliate, the intermediate nerves sometimes faint: palea as long as the lemma, much narrower, usually 3-nerved, the keel usually hispid-ciliate, the lateral nerves close to the margins, closely held by the margins of the lemma: stamens 6 or fewer. [*Leersia* Sw.]—Ten species, of tropical and temperate regions.—CUT-GRASSES.

Spikelets broadly oval, 3–4 mm. wide.  
Spikelets elliptic, not over 1.5 mm. wide.  
Panicle narrow, the branches ascending.

1. *H. lenticularis*.
2. *H. herandrus*.

Panicle open, the branches slender, spreading.

Spikelets glabrous, about 2 mm. long: stems tufted, erect: rootstocks wanting.

Spikelets hispidulous: stems decumbent at base: rootstocks present.

Lower branches of panicle single at the node.

Lower branches of panicle more than one at the node.

3. *H. monandrus*.

4. *H. virginicus*.

5. *H. oryzoides*.

1. *H. lenticularis* (Michx.) Kuntze. Stem about 100 cm. tall, with rather stout rootstocks: leaf-sheaths somewhat retrorsely scabrous: blades very scabrous, 5–20 mm. wide: panicle 10–20 cm. long, the few branches spreading, spikelet-bearing towards the ends. [*L. lenticularis* Michx.]—Marshes, swamps, and wet woods, various provinces, Fla. to Tex., Minn., and S. C.

2. *H. hexandrus* (L.) Kuntze. Stem slender, 50–150 cm. long, often long-decumbent and rooting at the base, with slender scaly rootstocks: leaf-blades mostly erect, usually not over 5 mm. wide: panicle mostly less than 10 cm. long, often purplish: spikelets about 5 mm. long, 1.5 mm. wide. [*L. hexandra* Swartz]—Marshes, lakes, and ponds, often in rather deep water, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A., O. W.*)

3. *H. monandrus* (Sw.) Kuntze. Stem tufted, slender, erect, 50–100 cm. tall: leaf-blades erect, slender, 2–5 mm. wide, narrowed towards the base: panicle 5–15 cm. long, the capillary branches solitary, naked below: spikelets 1 mm. wide. [*L. monandra* Sw.]—Rocky woods and fields, Coastal Plain, Fla. to E Tex.—(*W. I., S. A.*)

4. *H. virginicus* (Willd.) Britton. Stem 50–100 cm. long, erect from an often straggling or decumbent base with densely imbricate-scaly rootstocks: leaf-blades thin, rather short, mostly 5–10 mm. wide: panicle 5–20 cm. long: spikelets 3–4 mm. long, 1–1.5 mm. wide. [*L. virginica* Willd.]—(WHITE-GRASS.)—Moist woods, meadows, stream-banks and low pinelands, various provinces, Fla. to Tex., Minn., and Mass.

5. *H. oryzoides* (L.) Poll. Stem 100–150 cm. tall, with slender, loosely scaly rootstocks: leaf-sheaths retrorsely scabrous: blades very rough, 5–10 mm. wide: panicle 10–20 cm. long: spikelets about 5 mm. long, 1.5 mm. wide. [*L. oryzoides* Sw.]—Marshes and wet places, often in zones around ponds, various provinces, Fla. to Tex., S Calif., Wash., and Newf.—(*Eurasia.*)

41. *HYDROCHLOA* Beauv. A slender branching monoecious aquatic, probably perennial, the leaves floating: staminate flowers in a small few-flowered terminal raceme: pistillate flowers in few-flowered racemes in the axils of the leaves. Spikelets 1-flowered: staminate spikelets with a thin 7-nerved lemma, 2-nerved palea, and 6 stamens, the glumes wanting: pistillate spikelets with a thin 3-nerved second glume and 5-nerved lemma, the first glume and palea wanting, the stigmas long and slender.—Represented only by the following species.

1. *H. caroliniensis* Beauv. Leaf-blades 1–5 cm. long, 1–5 mm. wide: staminate spikelets 4–5 mm. long: pistillate spikelets about 2–5 mm. long. [*H. fluitans* (Fl. SE.

U. S.)—In water, lakes, ponds, and river-shores, Coastal Plain, Fla. to La. and Md.

**42. LUZIOLA** Juss. Creeping low or delicate monoecious perennials, with narrow flat blades and terminal and axillary panicles. Spikelets 1-flowered, the staminate and pistillate flowers in separate panicles: first glume and palea wanting: second glume and lemma about equal, thin, several- to many-nerved, lanceolate or oblong: stamens several: stigmas long, plumose. Grain free, globose, smooth.—Six species, mostly in tropical America.

Pistillate spikelets ovoid, about 2 mm. long: staminate and pistillate inflorescences on the same shoot.

Pistillate spikelets oblong-lanceolate, 4 mm. long: staminate and pistillate inflorescence on different shoots.

1. *L. peruviana*.

2. *L. bahiensis*.

1. *L. peruviana* J. G. Gmel. Stem tufted, decumbent or stoloniferous: blades not so narrow at base as in *L. bahiensis*: panicles 3-6 cm. long, the staminate branches ascending, the pistillate spreading and flexuous.—Ditches and wet places, Coastal Plain, Fla. to La.—(*W. I., Mex., C. A., S. A.*)

2. *L. bahiensis* (Steud.) A. Hitchc. Tufted, sending out long slender stolons: leaf-blades acuminate, gradually narrowed to the base, narrower than the sheath, 5-20 cm. long, 2-4 mm. wide: panicle shorter than the leaves, the lower branches finally spreading or deflexed. [*L. alabamensis* Chapm.]—In water or mud, lagoons and stream-banks, Coastal Plain, Ala. and Miss.

**43. ZIZANIOPSIS** Doell. & Aschers. Robust monoecious marsh perennials, with stout creeping rootstocks, flat leaf-blades and large open panicles. Spikelets 1-flowered, the 2 kinds on the same branches of the panicle, the staminate below: first glume wanting: second glume 7-nerved, awn-pointed in the pistillate spikelets: lemma 3-nerved: palea wanting: stamens 6: styles rather long, united: caryopsis obovate, free, coriaceous, smooth and shining, beaked with the persistent style.—Three species, the following, and two in South America.

1. *Z. miliacea* (Michx.) Doell. & Aschers. Stem as much as 4 m. tall, the rootstocks covered with large overlapping scales: leaf-blades as much as 1 m. long and 3 cm. wide, the midrib thick and pithy, the margins very scabrous: panicle as much as 60 cm. long: spikelets 5-8 mm. long. [*Zizania miliacea* Michx.]—(*WATER-MILLET.*)—Marshes, swamps, and moist hammocks, Coastal Plain, Fla. to Tex., Okla. and Va.

**44. ZIZANIA** [Gronov.] L. Tall monoecious aquatic annuals; ours with flat blades, and large terminal panicles, the staminate spikelets pendulous on the

lower spreading branches, early deciduous, the pistillate erect on the appressed upper branches, tardily deciduous. Spikelets 1-flowered; first glume of staminate spikelet wanting, the second 5-nerved, membranaceous, linear-acuminate or awn-pointed; lemma about as long as the glume, 3-nerved; palea wanting; stamens 6: pistillate spikelet terete, angled at maturity; glumes wanting: lemma chartaceous, 3-nerved, tapering into a long slender awn; palea 2-nerved, closely clasped by the lemma. Grain cylindric, as much as 2 cm. long.—Three species, one in Asia, two in North America.

1. *Z. aquatica* L. Stem succulent, stout, as much as 3 m. tall: leaf-blades as much as 1 m. long and 4 cm. wide: panicle 20–30 cm. long.—(INDIAN RICE. WILD-RICE.)—Marshes, fresh or brackish water, various provinces, Fla. to Tex., N. D., and Vt.

45. *PHARUS* L. Monoecious perennials, with ample panicles and large oblique long-petiolate feather-veined leaf-blades with numerous veinlets, the petioles twisted, reversing the leaf. Spikelets in pairs on the stiff fragile branches of the panicle; pistillate, subsessile; the staminate much smaller, pedicellate. Glumes in the staminate spikelets membranous, somewhat broadened, the first a little shorter, the second longer than the lemma, enclosing a flower but no palea: in the pistillate spikelets the glumes membranous, many-nerved, subequal, the lemma longer than the glumes, narrow, at length subindurate, clothed at least toward the beaked apex, with uncinate hairs, nearly closed by the involute margins, enfolding a 2-toothed membranous palea.—Five species, natives of tropical America.

1. *P. parvifolius* Nash. Stem creeping and rooting at base, 50–100 cm. long: leaf-blades oblanceolate-elliptic, acuminate, narrowed into a petiole 1–3 cm. long, the middle ones 12–15 cm. long, about 4 cm. wide: spikelets 8–10 mm. long: fruit pubescent all over, about twice as long as the glumes.—Rocky hammocks, N pen. Fla.—(W. I., Mex., C. A.)—*P. latifolius*, a tropical American species, formerly credited to the flora of Florida, does not occur in our range.

46. *PHALARIS* L. Erect annuals or perennials, with flat blades. Spikelets laterally compressed, with one terminal perfect floret and 2 lateral sterile lemmas, articulate above the glumes, arranged in usually dense spike-like panicles; glumes equal, boat-shaped, often winged on the keel; sterile lemmas reduced to 2 small scales (rarely only one): fertile lemma coriaceous, shorter than the glumes, enclosing the faintly 2-nerved palea.—Twenty species, natives of temperate Europe and America.—CANARY-GRASSES.

Plant perennial, with stout creeping rootstocks: panicles contracted but somewhat lobed or interrupted.

1. *P. arundinacea*.

Plant annual: panicles ovoid to linear, dense.

Glumes broadly winged: panicle ovoid.

2. *P. canariensis*.

Glumes wingless or nearly so: panicles oblong to linear.

3. *P. caroliniana*.

1. *P. arundinacea* L. Stem erect, usually 100–150 cm. tall: panicle in anthesis rather open, 10–20 cm. long, pale: spikelets lanceolate, about 5 mm. long.—(REED CANARY-GRASS.)—Wet soil, swamps, and stream-banks, various provinces, N. C. and Ky. to Kan., Ariz., B. C., and N. S.

2. *P. canariensis* L. Stem usually less than 50 cm. tall: panicles 2–3 cm. long: spikelets broadly obovate, 5–6 mm. long: glumes white with green veins, the keel entire: fertile lemma brown. (CANARY-GRASS.)—Waste-places, various provinces, Fla. to Ariz., Wash., and N. S. Nat of Eu.—Rare within our limits. (*W. I., Mex.*)

3. *P. caroliniana* Walt. Stem 30–100 cm. tall: panicle ellipsoid to linear, 1–6 cm. long: spikelets 5–6 mm. long, rather abruptly narrowed to an acute apex, the keel scabrous and narrowly winged above from below the middle, the lateral nerves about midway between keel and margin: fertile lemma ovate, acute, densely villous, about 4 mm. long. [*P. intermedia* Bosc.]—Moist soil, coastal sands, borders of woods, prairies, and roadsides, Coastal Plain and southwestern provinces, Fla. to Tex., S Calif., Mo., and Md.—(*Mex.*)

47. **ANTHOXANTHUM** L. Sweet-smelling annuals or perennials, with flat blades and spike-like panicles. Spikelets with 1 terminal perfect floret and 2 lateral sterile lemmas, articulate above the glumes; glumes unequal, acute or mucronate; sterile lemmas shorter than the glumes, empty, awned from the back; fertile lemma shorter than the sterile ones, awnless; palea 1-nerved, rounded on the back, enclosed in the lemma.—Four species, of Europe and Asia.

1. *A. odoratum* L. Perennial, the plant very fragrant in drying: stems tufted, 30–60 cm. tall: panicle 3–8 cm. long, tapering above: spikelets brownish green, 8–10 mm. long, the sterile lemmas and fruit golden-brown.—(SWEET-VERNAL GRASS.)—Meadows, pastures, woods, roadsides, and waste-places, nearly throughout N. A., less common southward. Nat. of Eu.—(*W. I.*)  
—*A. aristatum* Boiss., a native of Europe, differing in being annual, has been found in Fla. and Miss.; it also occurs in the NE States.

*Torresia odorata* (L.) A. Hitchc., representing an allied genus in which the lower florets are staminate, is recorded by Chapman from Statesville, N. C. Stems 30–60 cm. long: spikelets bronze-brown, 3-flowered, the terminal floret perfect, the 2 lateral staminate. [*Savastana odorata* Scribn. *Hierochloa borealis* Roem. & Schult.]—(VANILLA-GRASS. HOLY-GRASS.)—Moist grounds, N. J. to Colo., B. C., and Newf.

48. **ARISTIDA** L. Mostly low or moderately tall annuals or perennials, with narrow often convolute leaf-blades and narrow or sometimes open panicles. Spikelets 1-flowered, the rachilla articulate obliquely above the glumes; glumes narrow, acute, acuminate or awn-tipped; lemma indurate, narrow, terete, convolute, with a pointed usually minutely bearded callus at base, terminating above in a usually trifid awn.—One hundred and fifty species, of the warmer parts of the world.—NEEDLE-GRASSES. POVERTY-GRASSES. WIRE-GRASSES.

Lemma articulate with the column of the awns: awns nearly equal.

Lemma not articulate.

Lateral awns minute (less than 1 mm.) or wanting.

Lateral awns usually well developed (reduced in *A. dichotoma*).

Central awn coiled at base; plants annual.

Central awn not spirally coiled (sometimes all the awns loosely contorted in the lower part).

Plants annual.

Plants perennial.

Panicle open, the branches spreading, naked at base.

Panicle narrow, the branches ascending or appressed.

#### I. TUBERCULOSAE.

#### II. TERNIPIDES.

#### III. DICHOTOMAE.

#### IV. OLIGANTHAE.

#### V. DIVARICATAE.

#### VI. STRICTAE.

#### I. TUBERCULOSAE

Tufted annual with involute leaf-blades: panicles with the numerous long bristle-like awns spreading in all directions.

1. *A. tuberculosa*.

#### II. TERNIPIDES

Tufted erect perennial with wiry stems, long leaf-blades and open panicles nearly half the length of the plant.

2. *A. ternipes*.

#### III. DICHOTOMAE

Glumes about equal, mostly 5-7 mm. long; straight portion of the central awn about 5 mm. long; lateral awns short, scarcely 2 mm. long, erect.

3. *A. dichotoma*.

Glumes unequal, the second longer, 10-15 mm. long; straight portion of the central awn about 10 mm. long.

4. *A. Curtissii*.

#### IV. OLIGANTHAE

Central awn horizontally spreading or reflexed, much longer than the lateral.

Central awn 15-30 mm. long, with a semi-circular or S-shaped bend at base.

Central awn about 10 mm. long, merely spreading or reflexed.

Central awn ascending (or spreading in *A. intermedia*), about as long as the others.

Glumes 20-30 mm. long; awns 4-7 cm. long.

Glumes not over 10 mm. long; awns not over 2.5 cm. long.

5. *A. ramosissima*.

6. *A. longespica*.

7. *A. oligantha*.

8. *A. intermedia*.

#### V. DIVARICATAE

Erect stiff perennial with long leaves and large open few-flowered panicles with spreading branches.

9. *A. patula*.

#### VI. STRICTAE

Neck of fruit 1.5-3 cm. long, slender, twisted: panicle congested.

Neck of fruit sometimes twisted but not long and slender.

Sheaths more or less lanose.

Sheaths not lanose.

First glume  $\frac{1}{2}$  to  $\frac{2}{3}$  as long as second.

First glume nearly as long as the second or longer.

Leaf-blades closely involute, densely villous on upper surface near base.

Leaf-blades flat or loosely involute, not densely villous at base.

Central awn horizontally spreading or reflexed by a semicircular bend.

10. *A. spiciformis*.

11. *A. lanosa*.

12. *A. gyrans*.

13. *A. stricta*.

- Lateral awns erect.  
 Glumes 6 mm. long.  
 Glumes 12 mm. long.  
 Lateral awns spreading or reflexed.  
 Glumes 6-7 mm. long; spikelets mostly in pairs.  
 Glumes 10 mm. long; spikelets solitary.  
 Central awn with no semicircular bend; all awns spirally contorted at base.  
 First glume longer than the second; fruit sparsely pubescent on the short (0.5 mm. long) callus.  
 First glume slightly shorter than the second; fruit strongly pubescent on the slender (1 mm. long) callus.  
 Panicle slender, the branches short, rather distant, few-flowered.  
 Panicle rather stout, the branches as much as 10 cm. long, rather densely many-flowered.
14. *A. virgata*.  
 15. *A. palustris*.  
 16. *A. simpliciflora*.  
 17. *A. Mohrii*.  
 18. *A. purpurascens*.  
 19. *A. tenuispica*.  
 20. *A. condensata*.

1. *A. tuberculosa* Nutt. Stem 20-50 cm. tall: panicle 10-20 cm. long: glumes equal, 2 cm. long, awned: lemma 15 mm. long, the neck about 1 cm. long, the awns 3-5 cm. long.—Sandy soil, pinelands, sand-dunes, and gravelly fields, near the coast, Coastal Plain, New England Coast, and Great Lake Lowland, Ga. to Miss., Minn., and Mass.—(*Mex.*)

2. *A. ternipes* Cav. Stem 60-100 cm. tall: panicle 15-30 cm. long, the short branches ascending: glumes about equal, 8 mm. long: lemma about as long as the glumes, gradually tapering into an awn, 15-20 mm. long. [*Streptachne floridana* Chapm. *Ortachne floridana* Nash]—Hammocks, Key West, Fla.; also in N. M. and Ariz.—(*W. I., Mex., C. A., S. A.*)

3. *A. dichotoma* Michx. Stem slender, much branched at base, 20-60 cm. tall: panicle narrow, 5-7 cm. long, the branches short, appressed, bearing 1 or 2 spikelets: lemma about as long as second glume.—Dry open grounds, roadsides, barrens, woods, and fields, various provinces, Fla. to Tex., Kans., and Me.

4. *A. Curtissii* (A. Gray) Nash. Resembles *A. dichotoma*: second glume 10-12 mm. long, the first shorter: lemma shorter than the second glume, the lateral awns just about reaching its summit: straight portion of central awn about 10 mm. long.—Sterile open grounds, various provinces, Fla. to Okla., Wyo., and Md.

5. *A. ramosissima* Engelm. Stem spreading, 30-60 cm. tall: panicle usually reduced to a raceme 5-10 cm. long: spikelets ascending on short pedicels: glumes unequal, the second longer, about 2 cm. long: lateral awns short or minute.—Sterile open grounds and sandy places, various provinces, La. to Okla., Ia., Ind., and Tenn.

6. *A. longespica* Poir. Stem slender, 15-50 cm. tall: panicle narrow and strict, the branches short and appressed, bearing 1 or 2 spikelets, the lower branches distant: glumes nearly equal, about 6 mm. long, about as long as the lemma: central awn 8-15 mm. long, the lateral 2-6 mm. long. [*A. gracilis* Ell.]—Sterile open ground, roadsides, fields, and dry banks, various provinces, Fla. to Tex., Mo., and N. H.

7. *A. oligantha* Michx. Stem 30-60 cm. tall: panicle few-flowered, nearly simple, the pedicels or branchlets short: glumes somewhat unequal, awned: lemma 3-nerved, 2 cm. long, narrowed into a short beak, the three awns diver-

gent, finally horizontally spreading or reflexed, somewhat spirally curved at base.—Dry sterile soil, various provinces, Fla. to Tex., S. D., and Mass.; also Ore. and Calif.

8. *A. intermedia* Scribn. & Ball. Resembles *A. longespica*: stem slender, 30–80 cm. tall: panicle 20–40 cm. long: glumes 7–9 mm. long: awns all spreading, the central 18–22 mm. long, the lateral 14–17 mm. long.—Dry soil, especially sandy bottom lands, Coastal Plain and Central Lowland, Miss. to Tex., Nebr., and Ind.

9. *A. patula* Chapm. Stem erect, 100–150 cm. tall: leaf-blades smooth, flat, as much as 60 cm. long, 2–3 mm. wide: panicle as much as 60 cm. long, the branches naked below: central awn 2–3 cm. long.—Pinelands and coastal dunes, pen. Fla.

10. *A. spiciformis* Ell. Stem stiffly erect, 40–100 cm. tall: panicle dense and spike-like, 10–20 cm. long: glumes unequal, the first about half as long as the second, the second about 1 cm. long, both long-awned: lemma about 5 mm. long: awns curved at base, spreading, 2–3 cm. long.—Moist pinelands and scrublands, Coastal Plain, Fla. to Tex. and S. C.—(*W. I.*)

11. *A. lanosa* Muhl. Stem erect, rather stout, 80–140 cm. tall: leaves mostly near the base of the plant: blades flat, 2–7 mm. wide: panicle narrow, 40–60 cm. long, the branches distant, ascending, 8–12 cm. long, villous at the axils: glumes unequal, acuminate or short-awned, the first longer than the second, about 15 mm. long: lemma about 1 cm. long, the central awn recurved-spreading, 1.5–2.4 cm. long, the lateral shorter, erect or ascending. [*A. lanata* Poir.] —Dry sandy soil, woods, thickets, and roadsides, Coastal Plain and rarely adj. provinces, Fla. to Tex., Okla., and N. J.

12. *A. gyrans* Chapm. Stem slender, erect, 30–60 cm. tall: leaf-blades 1 mm. wide or less: panicle slender, 10–25 cm. long, the short branches distant, appressed, bearing 1 or 2 spikelets: lemma fusiform, the body 4–5 mm. long, the slender bearded callus 1.5 mm. long, the pale neck about 1 mm. long: awns about 1 cm. long, about equally spreading.—Pinelands, Coastal Plain, Fla. and Ga.

13. *A. stricta* Michx. Stems tufted, erect, wiry, 50–100 cm. tall: leaf-blades slender, firm: panicle strict, 10–30 cm. long, the short branches appressed: glumes somewhat unequal, the second longer, about 1 cm. long: lemma about 7–9 mm. long, minutely hispidulous toward the tip: awns 10–15 mm. long.—(*WIRE-GRASS.*)—Sandy pinelands and scrublands, Coastal Plain, Fla. to Miss. and N. C.

14. *A. virgata* Trin. Stem slender, 50–80 cm. tall: leaf-blades flat, 1–2 mm. wide, becoming involute toward the tip: panicle slender, the spikelets appressed, distant: glumes about 7 mm. long; lemma flattish: central awn 15–20 mm. long, horizontally spreading, the lateral awns more slender, erect,  $\frac{2}{3}$  as long as the central. [*A. Chapmaniana* Nash]—Dry pinelands and scrublands, Coastal Plain, Fla. to Miss. and N. J.

15. *A. palustris* (Chapm.) Vasey. Stem erect, stout, 100–150 cm. tall: leaf-blades 2–3 mm. wide: panicle strict, 20–40 cm. long, the branches appressed, the lower 2–4 cm. long: glumes about 1 cm. long: lemma about 8 mm. long, smooth: central awn spreading, 2–3 cm. long, the lateral erect or ascending.—Low pinelands and shallow ponds, Coastal Plain, Fla. to E. Tex. and N. C.

16. *A. simpliciflora* Chapm. Stem slender, erect, 30–60 cm. tall: leaf-blades flat, 1 mm. wide: panicle slender, 10–20 cm. long, few-flowered, the spikelets mostly in pairs, unequally pedicelled: glumes 6–7 mm. long, awn-tipped: lemma a little shorter than the glumes: central awn reflexed by a semicircular bend, 1.5 cm. long, the lateral horizontally spreading, a little shorter than the central.—Moist pine woods, W. Fla. and Miss.

17. *A. Mohrii* Nash. Resembles *A. virgata*: inflorescence reduced to a raceme, the spikelets short-pedicelled and distant along the main axis: glumes 10–11 mm. long, glabrous: lemma terete; lateral awns about as long as the central, spreading or reflexed.—Dry sandy pine ridges and woods, Coastal Plain, Ala.

18. *A. purpurascens* Poir. Stems erect, mostly in small tufts, rather slender, 30–100 cm. tall: leaf-blades flat, or becoming loosely involute, 1–2 mm. wide: panicle strict, 15–30 cm. long, rather dense, or interrupted: first glume about 1 cm. long: lemma about 7 mm. long, smooth: awns 15–25 mm. long, the central spreading, the lateral often somewhat shorter, erect or spreading.—Sandy woods, thickets, prairies, fields and coastal sands, various provinces, Fla. to Tex., Wis., and Mass.—(*W. I.*)

19. *A. tenuispica* A. Hitchc. Stem slender, 60–100 cm. tall: leaf-blades flat, 1–2 mm. wide, with scattered long hairs on the upper surface: panicle slender, the branches appressed, somewhat distant, few-flowered: glumes equal, about 8 mm. long: lemma 7 mm. long: awns equal, 12–15 mm. long, spreading or reflexed, somewhat contorted at base.—Low pine woods, pen. Fla.

20. *A. condensata* Chapm. Stem erect, rather stout, 50–100 cm. tall: leaf-blades 2–3 mm. wide: panicle compound, 15–30 cm. long, the branches ascending, many-flowered, as much as 10 cm. long: glumes about 8 mm. long: lemma a little shorter than the glumes, smooth: awns spreading, often somewhat curved at base, 10–15 mm. long.—Dry sandy woods, pinelands, sandhills and coastal sands, Coastal Plain, Fla., Ala. and Ga.

49. *STIPA* L. Perennials, usually tufted and erect, with narrow leaf-blades. Spikelets 1-flowered, articulate above the glumes, the articulation oblique, leaving a bearded sharp-pointed callus at the base of the floret; glumes membranaceous, often papery, acute, acuminate, or even aristate, long and narrow; lemma narrow, terete, firm or indurate, strongly convolute, terminating in a usually bent and twisted prominent persistent awn; palea enclosed in the convolute lemma.—One hundred species, of temperate regions generally.—SPEAR-GRASSES. PORCUPINE-GRASSES. FEATHER-GRASSES. DEVILS' DARNING-NEEDLES.

Glumes purple below: first glume 5-nerved.  
Glumes pale: first glume 3-nerved.

1. *S. avenaceoides*.  
2. *S. avenacea*.

1. *S. avenaceoides* Nash. Stem 70–140 cm. tall, naked above: leaf-blades 1 mm. wide, flat or involute: panicle 10–25 cm. long, the few branches capillary, ascending, bearing 1 or 2 spikelets: glumes 15–20 mm. long, acuminate: lemma about 1.5 cm. long, the long callus brown-bearded; awn 7–10 cm. long.—Dry pine-lands, Fla.

2. *S. avenacea* L. Stem 50–100 cm. tall: leaf-blades 1 mm. wide, flat or involute: panicle 10–20 cm. long, the capillary nodding branches bearing 1 or 2 spikelets: glumes about 1 cm. long, abruptly acute or acuminate: lemma brown, scabrous above, 8–10 mm. long, the callus brown-felty, the neck very short, ciliate: awn 4–7 cm. long.—

(BLACK OAT-GRASS.)—Rocky or sandy woods, thickets and old fields, various provinces, Fla. to Tex., Mich. and Mass.

**50. MUHLENBERGIA** Schreb. Low or moderately tall perennials, the stems simple to much branched, the inflorescence a narrow or open panicle. Spikelets 1-flowered: glumes usually shorter than the lemma, obtuse to acuminate or awned, the first sometimes small, rarely obsolete; lemma membranaceous, 3- to 5-nerved, with a very short usually minutely pilose callus, the acute apex sometimes extending into a straight or flexuous awn, or mucronate only.—Eighty species, mostly in Mexico and the SW United States.—HAIR-GRASSES.

Plant producing creeping scaly rootstocks: glumes at least half as long as the floret.

I. TENUIFLORAE.

Plant without creeping scaly rootstocks, but base sometimes decumbent and rooting.

Panicle more or less contracted, not diffuse: stems branched: leaf-blades flat.

II. SCHREBERIANAE.

Panicle diffuse, the branches capillary: stems simple: leaf-blades involute.

III. EXPANSAE.

I. TENUIFLORAE

Stem erect, ultimately somewhat branched above: leaf-blades divaricate: glumes broad and thin, shorter than the body of the lemma: panicles slender, loosely flowered.

Spikelets 1.5-2 mm. long: lemmas awnless or short-awned.

Spikelets 3-4 mm. long: lemmas long-awned.

Stem much-branched, soon spreading: leaf-blades ascending or erect: glumes narrow, acuminate, about as long as the body of the lemma.

Stem glabrous below the nodes.

Stem minutely pubescent below the nodes.

Lemma long-awned.

Lemma mucronate or short-awned.

1. *M. sobolifera*.

2. *M. tenuiflora*.

3. *M. mexicana*.

4. *M. umbrosa*.

5. *M. foliosa*.

II. SCHREBERIANAE

Plant with weak stem and branches: leaf-blades flat, mostly 2-3 mm. wide.

III. EXPANSAE

Awn shorter than the lemma, sometimes wanting: glumes half to  $\frac{2}{3}$  as long as the lemma.

Awn longer than the lemma; glumes, excluding awns, less than half as long as the lemma.

6. *M. Schreberi*.

7. *M. expansa*.

8. *M. capillaris*.

1. *M. sobolifera* (Muhl.) Trin. Stem glabrous, slender, 30-80 cm. tall: leaf-blades as much as 15 cm. long, 3-7 mm. wide: panicle 5-15 cm. long: glumes about half as long as the acuminate or short-awned lemma.—Rocky woods, various provinces, Tenn. to Tex., Wis., N. H., and Va.

2. *M. tenuiflora* (Willd.) B. S. P. Stem 60-100 cm. tall: leaf-blades 6-18 cm. long, mostly 8 mm. wide or more: panicle 10-25 cm. long: glumes abruptly acuminate, half to  $\frac{2}{3}$  as long as the floret: awn of lemma 5-10 mm. long. [*M. Willdenovii* Trin.]—Rocky woods and dry hillsides, various provinces, Tenn. to Ark., Wis., and Vt.

3. *M. mexicana* (L.) Trin. Stem 50-100 cm. long, sprawling: panicle 5-15 cm. long, the branches appressed (spreading at anthesis), spike-like: spikelets 2.5-3 mm. long.—Moist places, rich woods, and prairies, various provinces, N. C. to Tex., N. D., and N. B.

3a. *Muhlenbergia racemosa* (Michx.) B. S. P. [*M. glomerata* Trin.] has been reported from Statesville, N. C. (Chapm. Fl.). Its panicle is dense and the glumes aristate, exceeding the awnless lemma.

4. *M. umbrosa* Scribn. Stem 30–100 cm. tall: panicle 5–15 cm. long, narrow, the branches appressed or ascending: glumes 2.5–3 mm. long, awn-pointed: awn of lemma 5–15 mm. long. [*M. sylvatica* Torr.]—Moist woods, various provinces, N. C. to Tex., Minn., and N. B.

5. *M. foliosa* Trin. Stem erect, 30–100 cm. tall: panicle slender, exserted, 5–15 cm. long: spikelets 3–4 mm. long.—Swamps, various provinces, N. C. to Ariz., Mont., and Me.

6. *M. Schreberi* Gmel. Stem decumbent or prostrate, slender and wiry, diffusely branched: leaf-blades mostly 1–3 mm. wide: panicle 5–20 cm. long, slender, rather lax: glumes minute, the first often wanting: lemma about 2 mm. long, the awn 1–4 mm. long. [*M. diffusa* Willd.]—(NIMBLE-WILL.)—Low ground, moist woods, thickets, and cult. grounds, various provinces, Fla. to Tex., Nebr., and N. H.—(*Mex.*)

7. *M. expansa* (DC.) Trin. Stems tufted, erect, 60–100 cm. tall: leaf-blades flat, 2–3 mm. wide, becoming involute: panicle 20–40 cm. long, about half as wide, oblong, the branches ascending: lemma 4–5 mm. long, the glumes acuminate, half to  $\frac{2}{3}$  as long, the awn usually minute. [*M. trichopodes* Chapm. *M. caespitosa* Chapm. *M. Reverchoni* (Fl. SE. U.S.).]—Pinelands, Coastal Plain, Fla. to La. and N. C.

8. *M. capillaris* (Lam.) Trin. Resembles *M. expansa*, but stems not so tall: panicles more diffuse, broader, the capillary branches somewhat flexuous and implicate: glumes shorter (long-awned in *M. capillaris filipes*): awn of lemma 5–15 mm. long.—(HAIR-GRASS.)—Dry pinelands, prairies, meadows, and stream-banks Coastal Plain and adj. provinces, Fla. to Tex., Okla., and Mass.—(*W. I.*)—Grows in large tufts.

51. **BRACHYELYTRUM** Beauv. Erect slender perennials, with short knotty rootstocks, flat blades and narrow rather few-flowered panicles. Spikelets 1-flowered: rachilla prolonged behind the palea as a slender naked bristle; glumes very short, unequal, the first often obsolete, the second sometimes awned; lemma firm, narrow, 5-nerved, with an oblique callus, the apex terminating in a long straight awn.—One species.

1. *B. erectum* (Schreb.) Beauv. Stem 50–100 cm. tall: leaf-sheaths sparsely retrorse-hispid: blades 10–20 cm. long, 1–2 cm. wide: panicle 10–20 cm. long: spikelets 1 cm. long: awn 1–2 cm. long. [*Muhlenbergia erecta* Schreb. *Dilepyrum erectum* Farwell]—Rocky woods, various provinces, Ga. to Okla., Minn., and Newf.

52. **PHLEUM** L. Annuals or perennials, with erect stems, flat leaf-blades and a dense cylindric spike-like panicle. Spikelets 1-flowered, laterally compressed: glumes equal, membranaceous, keeled, abruptly mucronate or awned; lemma shorter than the glumes, hyaline, broadly truncate, 3- to 5-nerved; palea narrow, nearly as long as the lemma.—Ten species, in the temperate regions of both hemispheres.

1. **P. pratense** L. Stem erect, 40–100 cm. tall, the base swollen: panicle 5–10 cm. long: glumes about 3 mm. long, the awn 1–2 mm. long.—(TIMOTHY).—Meadows, cult. grounds, and waste-places, cult. and escaped, nearly throughout N. A. Nat. of Eu.—(W. I., S. A.)

53. **ALOPECURUS** L. Low or moderately tall perennials or rarely annuals, with flat blades and soft dense spike-like panicles. Spikelets 1-flowered, articulate below the glumes, falling entire, strongly compressed laterally: glumes equal, awnless, usually united at base, ciliate on the keel; lemma 5-nerved, obtuse, connate at base, bearing a delicate awn from below the middle, this included or exerted 2 or 3 times the length of the spikelet; palea wanting.—Twenty-five species, in the temperate regions of the Northern Hemisphere.—FOXTAIL-GRASSES.

1. **A. ramosus** Poir. Annual; stems tufted, much branched at the base, 20–50 cm. tall: panicle 2–5 cm. long, slender, pale; glumes about 2 mm. long, long-ciliate on the keel; lemma about as long as the glumes, the awn bent, the exerted portion as long again as the glumes: anthers about 0.5 mm. long. [*A. geniculatus* (Chapm. Fl.) (Fl. SE. U. S.)].—Moist places, meadows, and cult. grounds, various provinces, Fla. to Tex., Calif., Alberta, and N. J.

1a. **A. myosuroides** Huds. has broader panicles than *A. ramosus*: glumes 4–5 mm. long. [*A. agrestis* L.].—(MEADOW FOXTAIL).—Waste-places, Atlantic and Gulf coasts.—Nat. of *Eurasia*.

54. **SPOROBOLUS** R. Br. Annuals or perennials, with small spikelets in open or contracted panicles. Spikelets 1-flowered: glumes awnless, usually unequal, the second often as long as the spikelet: lemma membranaceous, awnless: palea usually prominent and as long as the lemma or longer: seed free from the pericarp.—Ninety-five species, most abundant in the warmer parts of America.—DROPSEDS. RUSH-GRASSES.

Plant annual.

Plant perennial.

Creeping rootstock present.

Creeping rootstock wanting: plant tufted.

Glumes nearly equal, much shorter than the lemma.

Glumes unequal, the second as long as the floret or a little shorter.

Second glume shorter than the floret: panicles narrow, the branches appressed.

Second glume as long as the floret.

Spikelets 1.5-2 mm. long, pale.

Panicles narrow or pyramidal.

Panicles open above, included below.

Spikelets 3 mm. long or more, purplish or bronze.

# I. VAGINAEFLORI.

## II. VIRGINICI.

### III. INDICI.

#### IV. ASPERI.

##### V. ARGUTI.

##### VI. CRYPTANDRI.

##### VII. GRACILES.

## I. VAGINAEFLORI

Lemma pubescent.

Lemma glabrous.

## II. VIRGINICI

Panicle narrow or spike-like: leaf-blades involute-pointed.

Second glume shorter than the floret: rootstock short and simple.

Second glume as long as the floret or longer: rootstock long and branching.

Panicle open: leaf-blades conduplicate, rather lax.

## III. INDICI

Tufted perennials with tall virgate stems, rather long leaves, and slender elongate panicles.

## IV. ASPERI

Lemma sparsely pilose.

Lemma glabrous.

## V. ARGUTI

Panicle-branches, especially the lower, whorled.

Panicle-branches not whorled.

## VI. CRYPTANDRI

Tufted perennial; sheaths conspicuously pilose at the throat.

## VII. GRACILES

Panicle-branches in whorls.

Panicle-branches not in whorls.

Leaf-blades narrowly involute.

Leaf-blades flat.

Pedicels appressed to the branches: leaf-blades about 1 mm. wide.

Pedicels spreading: leaf-blades 2-4 mm. wide.

1. *S. vaginaeflorus*.

2. *S. neglectus*.

3. *S. macrus*.

4. *S. virginicus*.

5. *S. Torreyanus*.

6. *S. Berteroanus*.

7. *S. clandestinus*.

8. *S. asper*.

9. *S. argutus*.

10. *S. domingensis*.

11. *S. cryptandrus*.

12. *S. gracilis*.

13. *S. teretifolius*.

14. *S. Curtissii*.

15. *S. floridanus*.

1. *S. vaginaeflorus* (Torr.) Wood. Stem slender, erect, spreading or prostrate, 20-60 cm. tall: leaf-blades 1-2 mm. wide, those of the stem usually less than 5 cm. long: panicle 2-4 cm. long, partially enclosed in the inflated sheaths, or the terminal exserted: spikelets about 4 mm. long: glumes acuminate, about equal: lemma about as long as the glumes, minutely appressed-pubescent: palea acuminate, longer than the lemma. [*S. vaginaeflorus minor* Scribn.]—Sterile open ground, pastures, fields, barrens, and waste-places, various provinces, Ga. to Tex., Ariz., Minn., and Me.

2. *S. neglectus* Nash. Differs from *S. vaginaeflorus* chiefly in the smaller spikelets and glabrous lemma: glumes broader proportionately, about 2 mm. long: lemma more turgid, acutish, glabrous, about 2 mm. long; palea about as long as the lemma.—Dry open ground and sandy fields, various provinces, Tenn. to Tex., N. D., and Que.

3. *S. macrus* (Trin.) A. Hitchc. Stem 40–70 cm. tall: rootstocks numerous: leaf-blades 2–3 mm. wide, flat at base: panicle narrow, partially included in the uppermost sheath, the branches appressed, 2–3 cm. long: spikelets glabrous, about 4 mm. long: glumes somewhat unequal, slightly shorter than the nearly equal lemma and palea.—Wet pinelands, Coastal Plain, Miss. and La.
4. *S. virginicus* (L.) Kunth. Stem 15–50 cm. tall: leaf-sheaths overlapping: blades firm, flat or becoming involute, conspicuously distichous on the sterile shoots: panicle exserted, dense and spike-like, 3–10 cm. long: spikelets about 3 mm. long; glumes somewhat unequal, the second as long as the lemma or longer.—Sandy beaches, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)—A robust form, *S. littoralis* (Lam.) Kunth, with culms as much as 100 cm. tall, and panicles as much as 15 cm. long, is found in S. Fla.
5. *S. Torreyanus* (Roem. & Schult.) Nash. Stem erect, from a short rootstock: leaf-blades flat, rather lax: panicle narrow, open, the branches ascending. [*S. compressus* (Torr.) Kunth]—Acid bogs in pinelands, Coastal Plain, Ga. to N. J.
6. *S. Berteroanus* (Trin.) H. & C. Stem erect, virgate, 40–100 cm. tall: leaves mostly basal, the blades flat below, as much as 5 mm. wide, tapering to a long involute point: panicle 10–40 cm. long, dense, the branches appressed, usually interrupted below: spikelets about 2 mm. long: glumes broad, obtuse, the second about half as long as the lemma, the first a little shorter. [*S. angustus* Buckl.]—(BULL-GRASS. SMUT-GRASS, the inflorescence often affected by a black fungus.)—Waste-places, hammocks, pinelands, prairies, and cult. grounds, Coastal Plain and rarely Blue Ridge, Fla. to Tex., and Va.—(*W. I., Mex., C. A., S. A.*)—*S. indicus* (L.) R. Br. has been collected on ballast at Mobile. Differs from *S. Berteroanus* in having slender, secund, loosely ascending panicle-branches and slender lax leaf-blades: glumes nearly equal, about 3 mm. long.—(*W. I., Mex., C. A., S. A.*)
7. *S. clandestinus* (Spreng.) A. Hitchc. Stem erect, 60–120 cm. tall: leaf-blades attenuate in slender involute points: panicle 5–15 cm. long, usually more or less enclosed in the sheaths: glumes 3–5 mm. long: lemma 6–7 mm. long, acuminate, exceeded by the acuminate or subulate-pointed palea. [*S. canovirens* Nash]—Sandy soil, prairies, sand-hills, woods, and uplands, various provinces, Fla. to Tex., Kans., and Conn.
8. *S. asper* (Michx.) Kunth. Stem erect, rather stout, 50–150 cm. tall: leaf-blades usually glabrous except near the base: panicle 10–20 cm. long, often more or less enclosed in the sheaths: first glume about half as long as the spikelet, the second a little shorter than the spikelet: lemma slightly exceeding the palea, all obtusish. [*S. longifolius* Wood *S. compositus* Merr.]—Dry soil, often on prairies, various provinces, Miss. to Tex., N. D., and Me.—*Sporobolus Drummondii* (Trin.) Vasey, differing from *S. asper* in being less robust, the panicles less dense and more attenuate, the branches slender and ascending: spikelets somewhat smaller, is not considered specifically distinct from *S. asper*. It occurs in Miss. and Tex.
9. *S. argutus* (Nees) Kunth. Stems tufted, usually geniculate at base, sometimes prostrate, 20–40 cm. long: leaf-blades mostly less than 10 cm. long, flat: panicle pyramidal, 2–10 cm. long.—Open, especially alkaline, soil, various provinces, W. La. to Ariz. and Kans.; also hammocks, and cult. grounds, S. Fla.—(*W. I., Mex., C. A., S. A.*)
10. *S. domingensis* (Trin.) Kunth. Stem erect, 30–50 cm. tall: leaves mostly basal, the blades flat, 2–4 mm. wide, involute-pointed: panicle contracted, oblong-pyramidal or spike-like, 5–15 cm. long.—Rocky or sandy soil and dunes, on or near the coast, S. Fla.—(*W. I., Mex.*)

11. *S. cryptandrus* (Torr.) A. Gray. Stems erect, tufted, 30–100 cm. tall: leaf-blades flat, tapering to a fine point: panicles terminal and axillary, included at base in upper sheath, sometimes entirely included, the well-developed terminal panicles open, as much as 25 cm. long: spikelets crowded along the upper part of the main branches, 2–25 mm. long.—Sandy open ground, various provinces, N. C. to Tex., Ariz., Wash., and Me.

12. *S. gracilis* (Trin.) Merr. Plant tufted, with numerous long basal leaves: stem erect, slender, 30–60 cm. tall: leaf-blades mostly less than 1 mm. wide: panicle narrowly pyramidal, 10–18 cm. long, 2–3 cm. wide, purple. [*S. juncea* Kunth *S. ejuncidus* Nash]—Pinelands and sandy woods, Coastal Plain, Fla. to Tex. and N. C.

13. *S. teretifolius* Harper. Plant tufted, with numerous long basal leaves: stem 50–60 cm. tall: leaf-blades firm, glabrous, filiform, channeled, flexuous, villous above the ligule: panicle oblong-pyramidal, 20 cm. long, about 8 cm. wide.—Moist pinelands, Coastal Plain, Ga.

14. *S. Curtissii* (Vasey) Small. Stem slender, erect, 30–60 cm. tall: leaf-blades 0.5–1.5 mm. wide: panicle 15–20 cm. long, the branches rather stiffly ascending.—Moist pinelands, Coastal Plain, Fla. to N. C.

15. *S. floridanus* Chapm. Stem rather stout, 50–100 cm. tall: panicle 15–40 cm. long, mostly 5–10 cm. wide.—Moist pinelands, Coastal Plain, Fla. and Ga.

55. **POLYPOGON** Desf. Annuals or perennials, usually decumbent, with flat blades and dense soft-bristly spike-like panicles. Spikelets 1-flowered, the pedicel disarticulating a short distance below the glumes, leaving a short-pointed callus attached; glumes equal, entire or 2-lobed, awned from the tip or from between the lobes, the awn slender, straight; lemma much shorter than the glumes, hyaline, usually bearing a slender straight awn shorter than the awns of the glumes.—Ten species, most abundant in the Eastern Hemisphere.  
—BEARD-GRASSES.

Plant annual: awns 6–10 mm. long.

Glumes slightly lobed, the lobes not ciliate.

Glumes prominently lobed, the lobes ciliate-fringed.

Plant perennial: awns 1–3 mm. long.

1. *P. monspeliensis*.

2. *P. maritimus*.

3. *P. lutosus*.

1. *P. monspeliensis* (L.) Desf. Stem usually 20–30 cm. tall, sometimes taller: leaf-sheaths glabrous: panicle pale, dense and silky, usually 2–10 cm. long: spikelets about 2 mm. long, the awns as much as 10 mm. long.—Moist waste-places, various provinces, N. C. to Tex. and Me.; also on Pacific Coast. Nat. of Eu.—(*Mex.*, *S. A.*)

2. *P. maritimus* Willd. Stem 20–30 cm. tall: leaf-blades usually less than 5 cm. long, 2 to 4 mm. wide: panicle cylindric, scarcely lobed, 5 cm. long, or less, 1 cm. thick: glumes 3 mm. long, villous, the awn as much as 7 mm. long.—Roadsides and fields, Tybee Island, Ga. Nat. of Eu.

3. *P. lutosus* (Poir.) A. Hitchc. Stem 10–50 cm. tall: leaf-sheaths scabrous: panicle as much as 10 cm. long, somewhat lobed: spikelet 2–3 mm. long. [*P. littoralis* J. E. Smith]—Wet places, fields, and roadsides, various provinces, La. to Calif. and Wash. Nat. of Eu.—(*Mex.*, *S. A.*)

**56. LIMNODEA** L. H. Dewey. A slender annual, with flat blades and narrow loose panicles. Spikelets 1-flowered, articulate with the pedicel below the glumes, the rachilla prolonged behind the palea as a short slender bristle; glumes equal, firm; lemma membranaceous, smooth, nerveless, 2-toothed at apex, bearing from between the teeth a slender bent awn, twisted at base; palea a little shorter than the lemma.—One species.

1. *L. arkansana* (Nutt.) L. H. Dewey. Stem tufted, 20–40 cm. tall; leaf-blades more or less pubescent on both surfaces: panicle 5–15 cm. long: spikelets 3.5–4 mm. long, the glumes hispidulous or hirsute: awn 8–10 mm. long. [*Thurberia arkansana* Benth.]—Dry soil, prairies, river-banks, and sand-dunes, Coastal Plain, Fla. to Tex. and Okla.

**57. CINNA** L. Tall perennials, with flat blades and large drooping panicles. Spikelets 1-flowered, articulate below the glumes, falling entire, the rachilla produced behind the palea as a minute bristle; glumes subequal, 1–3-nerved; lemma similar to the glumes, nearly as long, 3-nerved, bearing a minute short straight awn just below the tip: palea apparently 1-nerved.—Three species, natives of North America.—REED-GRASSES.

Spikelets 5 mm. long: panicle rather compact, the branches ascending.

Spikelets 4 mm. long: panicle loose, the branches flexuous, drooping.

1. *C. arundinacea*.

2. *C. latifolia*.

1. *C. arundinacea* L. Stem 60–150 cm. tall; leaf-blades as much as 1.5 cm. wide, scabrous: panicle 15–30 cm. long, somewhat glaucous: glumes somewhat unequal, acute, the second 3-nerved; lemma usually just a little shorter than the first glume; palea 1-nerved.—Moist woods, swamps, hillsides, and meadows, various provinces, Ga. to Tex., S. D., and Me.

2. *C. latifolia* (Trev.) Griseb. Stem 60–120 cm. tall: leaf-blades 10–14 mm. wide: panicle 15–30 cm. long, bright-green, “awn of lemma sometimes as much as 1 mm. long; palea 2 nerved, the nerves close together.” [*C. arundinacea pendula* A. Gray]—Moist woods, stream-banks, and swamps, Blue Ridge and more northern provinces, N. C. to Colo., Alas., Ont., and Newf.—(Eu.)

**58. AGROSTIS** L. Slender, tall or low, perennials (one of our species annual), with glabrous stems, flat or sometimes involute, scabrous blades and open or contracted panicles of small spikelets. Spikelets 1-flowered, the rachilla not prolonged; glumes equal or nearly so, acute or acuminate, carinate, usually scabrous on the keel and sometimes on the back; lemma obtuse, usually shorter than the glumes and thinner in texture, awnless or dorsally

awned, sometimes minutely hairy at base; palea usually shorter than the lemma, small and nerveless or obsolete or rarely well-developed and 2-nerved.—One hundred species, natives of temperate and cool regions.—BENT-GRASSES

Palea evident, 2-nerved.

Branches of panicle unequal, some short and floriferous from base: ligule 2-5 mm. long. 1. *A. alba*.

Branches of panicle all naked at base: ligule about 1 mm. long. 2. *A. tenuis*.

Palea wanting, or minute and nerveless.

Lemma bearing a delicate awn about 5 mm. long: annual. 3. *A. Elliottiana*.

Lemma awnless or short-awned: perennial.

Lemma with a bent, exserted awn: stems tufted.

Spikelets 2 mm. long.

4. *A. canina*.

Spikelets 2.5-3 mm. long.

5. *A. borealis*.

Lemma awnless: panicle-branches capillary.

Panicle very diffuse, with very scabrous primary branches, these branching above the middle, the spikelets clustered toward the ends of the smaller branchlets.

6. *A. hiemalis*.

Panicle open but not conspicuously diffuse, the branches forking at or below the middle.

7. *A. perennans*.

1. *A. alba* L. Stem erect, 20-100 cm. tall, producing short rootstocks and sometimes stolons: ligule 2-5 mm. long: panicle 5-30 cm. long, the lower branches in whorls, some floriferous from base, some naked at base: glumes acute, 2-3 mm. long: lemma  $\frac{2}{3}$ - $\frac{3}{4}$  as long as glumes: palea  $\frac{1}{2}$ - $\frac{2}{3}$  as long as the lemma. —(RED-TOP.)—Fields, meadows, and waste-places, nearly throughout cult. N. A. Nat. of Eurasia.

2. *A. tenuis* Sibth. Stem slender, usually 20-40 cm. tall: ligule short and truncate: panicle 5-10 cm. long, open, the branches few and spreading, naked at base. [*A. vulgaris* With.] —(RHODE-ISLAND BENT.)—Meadows, various provinces, Tenn. to Me. Nat. of Eu.

3. *A. Elliottiana* Schult. Stem very slender, 10-40 cm. tall: panicle diffuse, the slender branches spreading, scabrous, floriferous toward the ends: glumes 1.5 mm. long: lemma 1 mm. long. [*A. arachnoides* Ell.]—Open dry places, woods, and prairies, various provinces, Ga. and N. C. to Tex., Kans., and Ind.

4. *A. canina* L. Stem 30-50 cm. tall: panicle open, 5-10 cm. long, the branches spreading.—Meadows and waste-places, various provinces, Tenn. to Me. Nat. of Eurasia.

5. *A. borealis* Hartm. Stem 20-40 cm. tall: leaves mostly basal: panicle 5-15 cm. long, open, usually purple, the branches spreading, naked below, nearly smooth. [*A. rubra* (Fl. SE. U. S.)]—Rocky places, Blue Ridge and more northern provinces, N. C. to Alas. and Lab.

6. *A. hiemalis* (Walt.) B. S. P. Stem erect, slender, tufted, 20-40 cm. tall, sometimes as much as 80 cm.: leaves mostly basal, the blades short and very narrow or almost setaceous: panicle often more than half the height of the plant: glumes 1.5-2 mm. long. [*A. scabra* Willd.]—(HAIR-GRASS.)—Open grounds, nearly throughout N. A.—The mature panicle breaks away as a tumble-weed.

7. *A. perennans* (Walt.) Tuckerm. Stem erect or decumbent at base, 30-100 cm. tall, in the shade often weak and lax (more slender and taller, with

spikelets crowded toward the ends of the branches in *A. perennans elata*. [*A. altissima* (Fl. SE. U. S.) not *Cornucopiae altissima* Walt.]—Acid marshes, Coastal Plain, Ala. to Miss. and N. J.): leaves scattered along the stem: panicles 10–30 cm. long, ellipsoid, the delicate branches ascending or spreading, branching at or below the middle. [*A. novae-angliae* Tuckerm. *A. Scribneriana* Nash]—Open woods, old fields, meadows, and moist soil, various provinces, Fla. to Tex., Minn., and Me.—(*W. I., Mex., C. A., S. A.*)

**59. CALAMAGROSTIS** Adans. Moderately tall or robust erect perennials, with small spikelets in open or narrow sometimes spike-like panicles. Spikelets 1-flowered, the rachilla prolonged behind the palea as a short hairy bristle; glumes about equal, acute or acuminate; lemma shorter than the glumes, usually more delicate, with a tuft of hairs at base, these usually copious, awned from the back, usually below the middle, the awn (in our species) delicate and straight: palea shorter than the lemma.—One hundred species, natives of temperate and cool regions.—**REED BENT-GRASSES.**

Panicle rather open, usually nodding: spikelets 3–4 mm. long.  
Panicle contracted, strict: spikelets 6–7 mm. long.

1. *C. canadensis*.  
2. *C. cinnoides*.

1. *C. canadensis* (Michx.) Beauv. Stem 60–120 cm. tall: panicle 10–20 cm. long: callus-hairs copious, about as long as the lemma: awn delicate, straight, attached just below the middle and extending to or slightly beyond its tip.—(**BLUE-JOINT GRASS.**)—Marshes, swamps, stream-banks, and wet places, Blue Ridge, N. C., and various provinces, N. J. to Calif., B. C., Ont., N. S., and Newf.

2. *C. cinnoides* (Muhl.) Barton. Stem 1–1.5 m. tall: panicle 10–15 cm. long, tapering at summit: callus-hairs about half as long as the lemma: awn attached about  $\frac{1}{4}$  below the tip; rachilla about 1 mm. long, glabrous below, long-villous above. [*C. Nuttalliana* Steud.]—Wet places, acid swamps, marshes, and damp wooded slopes, various provinces, Ala. to Me.

**60. AMMOPHILA** Host. A coarse erect perennial with stout creeping rootstocks, long tough involute blades, and a pale dense spike-like panicle. Spikelets 1-flowered, the rachilla produced beyond the palea as a short bristle, hairy above; glumes about equal, chartaceous; lemma similar to the glumes, about as long, slightly emarginate, mucronate between the teeth, the callus bearing short hairs; palea nearly as long as the lemma.—Two species, of the Northern Hemisphere.

1. *A. breviligulata* Fernald. Stem 50–100 cm. tall: leaf-blades nearly equalling the panicle, the upper surface turned downward: panicle 10–40 cm. long: spikelets flattened, about 1 cm. long. [*A. arenaria* (Fl. SE. U. S.)]—(**BEACH-GRASS.** **SEA-SAND REED.** **SEA-MAT WEED.**)—Sandy beaches and dunes, Coastal Plain and New England Coast, N. C. to Newf.; also Great Lake Lowland, Ind. to Wis. and Mich.

**61. CALAMOVILFA** Scribn. Rigid usually tall perennials with narrow or open panicles, some species with creeping root-stocks. Spikelets 1-flowered, the rachilla not prolonged behind the palea; glumes unequal, acute, chartaceous, awnless; lemma a little longer than the second glume, chartaceous, awnless, smooth or pubescent, the callus bearded; palea about as long as the lemma.—Four species, natives of the United States and Canada.—SAND-GRASSES. REED-GRASSES.

Panicle long and narrow, the branches appressed.  
Panicle open, the branches spreading.

1. *C. Curtissii*.
2. *C. brevipilis*.

1. *C. Curtissii* (Vasey) Scribn. Stem 80–120 cm. tall: leaf-blades 2–3 mm. wide: panicle 15–30 cm. long, narrow, somewhat loose, the branches ascending or appressed. [*Calamagrostis Curtissii* Vasey]—Sandy pinelands, E pen. Fla.

2. *C. brevipilis* (Torr.) Scribn. Stem 60–120 cm. tall, tufted: panicle purplish, 10–20 cm. long, pyramidal, rather open, the branches glabrous, naked below.—Acid sandy swamps, Coastal Plain, N. C. to N. J.

**62. NOTHOLCUS** Nash. Perennials with flat blades and contracted panicles. Spikelets 2-flowered, the pedicel articulate below the glumes, the rachilla curved and somewhat elongate below the first floret, not prolonged above the second floret; glumes about equal, longer than the 2 florets; first floret perfect, the lemma awnless; second floret staminate, the lemma bearing on the back a short hooked awn.—Eight species, natives of Europe and Africa.

1. *N. lanatus* (L.) Nash. Stem 30–60 cm. tall: leaf-sheaths and blades pale, velvety-pubescent, the latter 5–10 mm. wide: panicle pale-purplish, 5–10 cm. long: spikelets 4 mm. long: glumes hairy. [*Holcus lanatus* L.]—(VELVET-GRASS.)—Moist meadows, fields, woods, and waste-places, various provinces, S. C. to La., Ill., and N. S.; also on the Pacific Coast. Nat. of Eu.

**63. AIRA** L. Low or rather tall perennials with shining pale or purplish spikelets in open panicles: spikelets 2-flowered, articulate above the glumes, the hairy rachilla prolonged behind the upper floret as a stripe, this sometimes bearing a reduced floret; glumes about equal, acute or acutish, membranaceous; lemmas thin, truncate and 2–4-toothed at the summit, bearing a slender awn from or below the middle, the awn straight, bent, or twisted, sometimes absent from the lower floret. [*Deschampsia* Beauv.]—Thirty-five species, in cool and temperate regions generally.—HAIR-GRASSES.

Awn twisted below at maturity, bent, exserted: leaf-blades filiform, lax.

Awn not twisted, straight, not much exserted: leaf-blades 1.5-3 mm. wide, flat or folded, firm.

1. *A. flexuosa*.

2. *A. caespitosa*.

1. *A. flexuosa* L. Stems tufted slender, 30-80 cm. tall: leaves chiefly basal, the blades 5-20 cm. long, the sheaths scabrous: panicle 5-12 cm. long, open; spikelets 4-5 mm. long, purplish: glume acute: awn 5-7 mm. long, attached near the base, geniculate, twisted. [*D. flexuosa* Trin.]—Dry woods or rocky banks, meadows, and dry fields, Blue Ridge, N. C. to Tenn., and various provinces, Va. to Wis. and Newf.—(*Eu.*)

2. *A. caespitosa* L. Stems tufted, 60-120 cm. tall: panicle 10-20 cm. long: spikelets about 4 mm. long, pale: awn only a little longer than the lemma, straight, articulate at the base, deciduous. [*D. caespitosa* Beauv.]—Moist places, meadows, and swamps, Blue Ridge and more northern provinces, N. C. (?) to Alas., Ont., and Newf.—(*Eu.*)—The former definite inclusion of this species in our range may have been an error.

= *Aira*

64. *ASPRIS* Adans. Annuals with pale shining spikelets in narrow or open panicles. Spikelets 2-flowered, articulate above the glumes, the rachilla not prolonged: glumes about equal, acute, membranaceous, or subscarios: lemmas firm, rounded on the back, tapering into 2 slender teeth, bearing on the back below the middle a slender geniculate twisted usually exserted awn, this rarely wanting in the lower floret or reduced, the callus with a very short tuft of hairs.—Nine species, natives of Europe.—HAIR-GRASSES. WIND-GRASSES.

Lower floret awned, the awn as long as that of the upper floret.  
Lower floret awnless or nearly so.

1. *A. caryophyllea*.

2. *A. capillaris*.

1. *A. caryophyllea* (L.) Nash. Stem delicate, less than 20 cm. tall: panicle open, about  $\frac{1}{3}$  the height of the plant, the capillary branches spreading: spikelets clustered toward the ends of the branches, 3 mm. long: teeth of lemma setaceous.—(SILVERY HAIR-GRASS.)—Waste-places, fields, woods, and roadsides, various provinces, Fla. to La., Ohio, and Mass.; also on the Pacific Coast. Nat. of Eu.

2. *A. capillaris* (Host.) A. Hitchc. Similar to *A. caryophyllea*: spikelets scattered at the ends of the branches, 2.5 mm. long: lemma of lower floret with short teeth, of the upper floret with setaceous teeth.—Waste-places, various provinces, Fla. to La., Calif., N. J., and Md. Nat. of Eu.

65. *TRISETUM* Pers. Tufted perennials with flat blades and open or usually contracted or spike-like panicles. Spikelets 2-flowered, sometimes 3- to 5-flowered, the rachilla prolonged behind the upper floret, usually villous; glumes somewhat unequal, acute, awnless, the second usually longer than the

first floret; lemmas usually short-bearded at the base, 2 cleft at the apex, the teeth often awned, and with a bent and exserted awn from the back below the cleft apex.—Sixty-five species, in the Arctic and temperate regions of both hemispheres.—FALSE-OATS. WILD OAT-GRASSES. SWAMP OAT-GRASSES.

Panicle dense, spike-like, sometimes interrupted below.

1. *T. spicatum*.

Panicle narrow but loose.

Awn twisted below: both florets long-awned; rachilla articulate above the glumes.

2. *T. flavescens*.

Awn not twisted: lower floret awnless or with a short straight awn: pedicel articulate below the glumes.

3. *T. pennsylvanicum*.

1. *T. spicatum* (L.) Richt. Stem 15–50 cm. tall: leaves more or less puberulent: panicle 3–10 cm. long: spikelets 5–6 mm. long, the rachilla articulate above the glumes: awn 4–5 mm. long, exserted, divergent. [*T. molle* Kunth *T. subspicatum* Beauv.]—Mtn. summits and slopes, Blue Ridge and more northern provinces, N. C. to Alas., Ont., and Lab.—(*W. I., Mex., C. A., S. A.*)

2. *T. flavescens* (L.) Roem. & Schult. Stem 40–100 cm. tall: leaf-sheaths pubescent: blades 2–6 mm. wide: panicle 5–15 cm. long: spikelets 3–4-flowered: lemmas 5–6 mm. long.—Occasional in waste-places; reported from Miss. Nat. of Eu.

3. *T. pennsylvanicum* (L.) B. S. P. Stem 30–100 cm. tall: leaf-sheaths glabrous or the lower pubescent: panicle 10–20 cm. long: awn 4–5 mm. long. [*Sphenopholis palustris* Scribn. *T. palustre* Torr. *T. ludovicianum* Vasey]—Marshes, swamps, and springy places, various provinces, Fla. to La., and Mass.

66. **SPHENOPHOLIS** Scribn. Erect perennials with usually flat blades and narrow panicles of shining spikelets. Spikelets 2- or 3-flowered, the rachilla articulate below the glumes and between the florets, produced beyond the upper floret as a slender bristle; glumes unlike in shape, the first narrow, acute, 1-nerved, the second broadly obovate, 3- to 5-nerved, somewhat coriaceous; lemmas firm, scarcely nerved, awnless or rarely short-awned, the first a little shorter or a little longer than the second glume. [*Eatonia* Endl. Not Raf.]—Four species, natives of the United States, Mexico, and the West Indies.

Leaf-blades about 1 mm. wide, elongate, flat or involute.

1. *S. filiformis*.

Leaf-blades flat, more than 1 mm. wide, not much elongate.

Panicle narrow, densely flowered: glumes equal in length, about 2 mm. long, the second much broadened above, 1 mm. wide as folded.

2. *S. obtusata*.

Panicle lax, the branches more or less spreading: glumes unequal, the second longer, widened above, 0.5–0.75 mm. wide as folded.

3. *S. pallens*.

Lemmas smooth: panicle-branches approximate. Lemmas, especially the second, scabrous: panicle-branches rather distant.

4. *S. nitida*.

1. *S. filiformis* (Chapm.) Scribn. Stem densely tufted, 30–60 cm. tall: panicle 5–15 cm. long, slender, often nodding: spikelets about 4 mm. long. [*E. filiformis* Vasey]—Dry soil, Coastal Plain, Fla. to Tex., Tenn., and N. C.

2. *S. obtusata* (Michx.) Scribn. Stem 30–100 cm. tall: leaf-sheaths glabrous or pubescent: panicle 6–18 cm. long, often glomerate: spikelets 2.5–3 mm. long. [*E. obtusata* A. Gray *E. pubescens* Scribn. & Merr., the pubescent form.]—Dry soil, various provinces, Fla. to Tex. and Me.—(*W. I., Mex.*)

3. *S. pallens* (Spreng.) Scribn. Stem 30–100 cm. tall: leaf-sheaths glabrous or pubescent: panicle 8–20 cm. long, nodding: spikelets 3–4 mm. long: lemmas lanceolate, acute, glabrous, sometimes awned below the apex. [*E. pennsylvanica* A. Gray *E. longiflora* Beal]—Damp or rocky woods, various provinces, Fla. to Ariz., Wis., and Me.—*S. aristata* (Scribn. & Merr.) Heller [*Eatonia aristata* Scribn. & Merr. *Trisetum aristatum* Nash] resembles *S. pallens*: lemmas scabrous as in *S. nitida*, the second awned. S. C. Probably a hybrid.

4. *S. nitida* (Spreng.) Scribn. Resembles *S. pallens*: stem more slender and usually not so tall: leaves pubescent or glabrous: panicle looser, the branches more widely spreading in flower: first glume proportionately wider. [*E. nitida* Nash *E. Dudleyi* Vasey *E. glabra* Nash, the glabrous form.]—Dry woods, various provinces, Fla. to Tex., N. D., and Mass.

67. **KOELERIA** Pers. Slender low or rather tall annuals or perennials with narrow blades and spike-like panicles. Spikelets 2- to 4-flowered, the rachilla prolonged beyond the perfect florets as a slender bristle or bearing a reduced or sterile floret: glumes about equal in length, unequal in shape, the lower narrow and sometimes shorter, 1-nerved, the upper somewhat broader above the middle, wider than the lower, 3- to 5-nerved; lemmas somewhat scarious and shining, the lowermost a little longer than the glume, obscurely 5-nerved, acute or short-awned.—Twenty species, in the temperate regions of both hemispheres.—JUNE-GRASSES.

1. *K. phleoides* (Vill.) Pers. Annual with short oblong panicles and short-awned lemmas.—Pensacola, Fla. and Ala. Nat. of Eu.

68. **AVENA** [Tourn.] L. Low or moderately tall annuals or perennials with narrow or open usually rather few-flowered panicles of large spikelets. Spikelets 2- to several-flowered, the rachilla bearded, articulate above the glumes and between the florets; glumes about equal, membranaceous or papery, several-nerved, longer than the lower floret, usually exceed-

ing the upper floret: lemmas indurate except toward the summit, 5- to 9-nerved, bidentate, bearing a dorsal bent and twisted awn (this straight or reduced in *A. sativa*).—Fifty-five species, in temperate regions, most abundant in the Old World.—OATS.

1. *A. sativa* L. Annual: stem 50–100 cm. tall: leaf-blades flat, 5–10 mm. wide: panicle nodding, 15–40 cm. long, the branches spreading or ascending: spikelets usually 2-flowered: glumes 2–2.5 cm. long: lemmas glabrous, the awn usually straight, often wanting.—(OAT.)—Escaped from cult., fields, roadsides, woods, and waste-places, nearly throughout N. A. Nat. of Eurasia.—(*W. I., Mex.*)

69. *ARRHENATHERUM* Beauv. Rather tall perennials, with flat leaf-blades and rather dense panicles. Spikelets 2-flowered, the lower floret staminate, the upper perfect, the rachilla produced beyond the florets as a slender bristle; glumes rather broad and papery, the first 1-nerved, the second a little longer than the first, about as long as the spikelet, 3-nerved; lemmas 5-nerved, hairy on the callus, the lower bearing near the base a twisted, geniculate, exserted awn, the upper bearing a short straight slender awn just below the tip.—Six species, in the temperate parts of Eurasia.

1. *A. elatius* (L.) Mert. & Koch. Stem 100–150 cm. tall (with tubers or corms in a short chain at the base of the stem in *A. elatius tuberosum*. Ala. to Va. Nat. of Eu.): leaf-blades 5–10 mm. wide: panicle pale and shiny, sometimes purplish, 15–30 cm. long, narrow, the short branches verticillate: spikelets 7–8 mm. long. [*A. avenaceum* Beauv.]—(TALL OAT-GRASS.)—Meadows, fields, roadsides, and waste-places, escaped from cult., various provinces, Ga. to La. and N. C. Nat. of Eu.

70. *DANTHONIA* Lam. Tufted low or moderately tall perennials, with few-flowered open or contracted panicles of rather large spikelets, and, besides, solitary or few cleistogamous spikelets of 1 or 2 florets at the base of the lower leaf-sheaths. Spikelets several-flowered, the rachilla readily disarticulating above the glumes and between the florets; glumes about equal, broad and papery, acuminate, mostly exceeding the uppermost floret; lemmas rounded on the back, obscurely several-nerved, the apex bifid, the lobes acute, often aristate, a stout awn arising from between the lobes, the awn flat, twisted, geniculate, exserted.—One hundred species, in the temperate parts of both hemispheres, most abundant in southern Africa.—WILD OAT-GRASSES.

Leaf-sheaths villous: lemmas densely long-villous all over.

Leaf-sheaths glabrous or sparsely pilose: lemmas villous on the margins, glabrous or sparsely pilose on the back.

Glumes about 1.5 cm. long: lemmas glabrous on the back.

Glumes 7–10 mm. long: lemmas sparsely pilose on the back.

Stem terete: teeth of lemma triangular, acute, or acuminate, not aristate.

Stem compressed: teeth of lemma aristate.

1. *D. sericea*.

2. *D. epilis*.

3. *D. spicata*.

4. *D. compressa*.

1. *D. sericea* Nutt. Stem 50–100 cm. tall: panicle 6–10 cm. long, rather loose, the branches ascending or spreading: teeth of lemma 2–3 mm. long, the dorsal awn 12–15 mm. long.—Sandy soil, dry acid woods, and pinelands, various provinces, W Fla. to La., Tenn., and Mass.

2. *D. epilys* Scribn. Resembles *D. sericea*, usually not so tall: panicles smaller: lemma glabrous except at the base and on the margins below the middle.—Acid bogs and wet sandy soil, Coastal Plain, Ga. to N. J., rare. Probably only a variety of *D. sericea*.

3. *D. spicata* (L.) Beauv. Stem 20–70 cm. tall: leaves usually in a basal tuft, the blades short and curly: panicle few-flowered, the few short branches erect.—Dry and sterile soil, woods, pastures, clearings, and sand-hills, various provinces, Fla. to Tex., N. M., Wash., and Me.

4. *D. compressa* Austin. Stem 40–90 cm. tall: leaf-blades elongate, 2–3 mm. wide: teeth of lemma 2 mm. long or more.—Dry woods, various provinces, N. C. to Tenn. and Me.

71. *CAPRIOLA* Adans. Perennial, usually low grasses with extensively creeping stolons and rootstocks, short blades and several slender spikes digitate at the summit of the upright flowering stems. Spikelets 1-flowered, awnless, sessile in 2 rows along one side of a slender continuous rachis, the rachilla prolonged behind the palea, sometimes bearing a minute bract; glumes narrow, acuminate, 1-nerved, about equal, shorter than the floret; lemma strongly compressed, pubescent on the keel, firm in texture, 3-nerved, the lateral nerves close to the margins.—Six species, of the warmer regions, the following widely distributed.

1. *C. Dactylon* (L.) Kuntze. Stem flattened, wiry, 10–30 cm. tall: spikes usually 4–5, slender, 2–5 cm. long: spikelets imbricate, 2 mm. long. [*Cynodon Dactylon* Pers.]—(BERMUDA-GRASS. SCUTCH-GRASS.)—Fields and waste-places, various provinces, Fla. to Tex., Calif., Ore., and Mass. Nat. of Eu. (*W. I., Mex., C. A., S. A.*)—A more robust form is found along the seacoast of Fla.

72. *SPARTINA* Schreb. Stout erect, often tall perennials with usually extensively creeping firm, scaly rootstocks, long tough blades, and 2 to many appressed or sometimes spreading spikes racemose on the main axis. Spikelets 1-flowered, the rachilla articulate below the glumes, not produced beyond the floret, much flattened laterally, sessile and usually closely imbricate in 2 rows on one side of a continuous rachis: glumes keeled, 1-nerved, acute or short-awned, the first shorter, the second often exceeding the lemma; lemma firm, keeled, the lateral nerves obscure, narrowed to a rather obtuse point; palea

2-nerved, keeled and flattened, the keel between or at one side of the nerves.—Fourteen species, most of them North American.—MARSH-GRASSES. CORD-GRASSES.

Leaf-blades more than 5 mm., usually more than 8 mm. wide, flat (more or less rolled in drying): plants robust, often tall and reed-like.

First glume as long as the floret, slender-acuminate, the second with an awn about 7 mm. long: spikes somewhat distant. 1. *S. Michauxiana*.

First glume shorter than the floret, acute, the second acute or mucronate, but not slender-awned: spikes approximate. 2. *S. cynosuroides*.

Spikes numerous, ascending, forming a thick panicle. 3. *S. alterniflora*.

Spikes few to several, remote, erect or nearly so.

Leaf-blades less than 5 mm. broad, involute or soon becoming so: plants rather slender.

Spikes appressed, forming a dense cylindrical inflorescence. 4. *S. spartinae*.

Spikes spreading or appressed, but not closely approximate and dense.

Creeping rootstocks wanting: plant in a dense hard clump with tall stems (1-2 m.) and long slender involute leaf-blades as much as 2 m. long. 5. *S. Bakeri*.

Creeping rootstocks present: plant more slender and with shorter blades. 6. *S. patens*.

1. *S. Michauxiana* A. Hitchc. Stem 1-2 m. tall: leaf-blades 60-120 cm. long, as much as 15 mm. wide, tapering to a very slender point: spikes 5-20, appressed or ascending, mostly 4-8 cm. long: glumes serrulate-hispid on the keel, the first acuminate, equalling the floret, the second longer than the floret, tapering into an awn 7 mm. long: lemma 7-9 mm. long. [*S. cynosuroides* (Fl. SE. U. S.)]—(SLOUGH-GRASS.)—Marshes, river-banks, swamps, and wet prairies, various provinces, N. C. to N. M., Wash., N. S., and N. J.

2. *S. cynosuroides* (L.) Roth. Stem 1-3 m. tall, as much as 2 cm. thick at base: leaf-blades 1-2.5 cm. wide: spikes 20-50, dark colored, crowded, usually ascending: glumes acuminate, the first about half as long as the lemma, the second longer than the lemma. [*S. polystachya* Willd.]—(SALT REED-GRASS.)—Salt and brackish marshes, Coastal Plain and New England Coast, Fla. to La. and Me.

3. *S. alterniflora* Loisel. Stem rather lush, 1-2 m. tall, leafy: leaf-blades 1-1.5 cm. wide: spikes appressed, 5-15 cm. long: spikelets 10-14 mm. long, remote along the rachis, barely overlapping: glumes and lemma sparingly pilose, the first glume  $\frac{2}{3}$  as long as the second, the lemma 8-10 mm. long (spikelets imbricate, the lemma glabrous in *S. alterniflora glabra* [*S. stricta* (Fl. SE. U. S.)] *S. glabra* Muhl.)—Salt-marshes, Coastal Plain and New England Coast, Fla. to Tex. and Me.

4. *S. spartinae* (Trin.) Merr. Stem 0.3-1 m. tall, in dense hard clumps, the rootstocks wanting: panicles 10-20 cm. long, strict: spikes numerous, mostly 2-3 cm. long: spikelets about 7 mm. long. [*S. junciformis* Engelm. & Gray]—Sandy marshes, cypress-ponds, and alluvial flats, Coastal Plain, Fla. to Tex.—(*Mex.*)

5. *S. Bakeri* Merr. Stems in dense tufts: spikes few, 3-6 cm. long, appressed: first glume about 3 mm. long: second glume about 1 cm. long, acuminate: lemma about 6 mm. long, glabrous except the scabrous keel.—Fresh water marshes, prairies, and borders of lakes, Coastal Plain, Fla. and Ga.

6. *S. patens* (Ait.) Muhl. Stem 0.3–0.9 m. tall, rarely taller: spikes mostly 4–6, ascending, 2–5 cm. long: spikelets 7–10 mm. long. [*S. juncea* Willd.]—(SALT-GRASS. SALT MARSH-GRASS.)—Salt marshes, along the coast, Fla. to Tex. and Newf.—(W. I.)

73. **CAMPULOSUS** Desv. Erect slender, rather tall perennials with solitary curved spikes. Spikelets several-flowered but with only one perfect floret, sessile and closely imbricate on one side of a continuous rachis, the rachilla disarticulating above the glumes; first glume small, hyaline, 1-nerved, the second as long as the lemma, firm, 3- to 4-nerved, bearing on the back a strong divergent awn: lemmas rather papery, 3-nerved, villous on the lateral nerves and callus, bearing a short straight awn on the back just below the apex, the first and second lemmas empty, the third enclosing a perfect flower, the upper 1 to 3 empty and successively smaller. [*Ctenium* Panz.]—Twelve species, of the warmer regions; mostly American.—TOOTHACHE-GRASSES.

Plant forming dense tussocks: second glume with a row of prominent glands on each side of the mid-nerve: awn stout, at maturity horizontal or nearly so: ligule about 1 mm. long.

Plants with slender scaly rootstocks: second glume glandless or with obscure glands: awn rather slender, not horizontally spreading: ligule 2–3 mm. long.

1. *C. aromaticus*

2. *C. floridanus*.

1. *C. aromaticus* (Walt.) Trin. Stem 1–1.5 m. tall: old leaf-sheaths persistent and fibrillose at the base of the stem; leaf-blades flat or involute, stiff: spike 5–15 cm. long: spikelets 5–7 mm. long. [*Ctenium americanum* Spreng.]—Damp pine-lands and swamps, Coastal Plain and rarely adj. provinces, Fla. to La. and Va.—Root-stock pungent.

2. *C. floridanus* A. Hitchc. Differs from the preceding in having a creeping root-stock: stem erect, 0.6–1 m. tall: leaf-blades firm, mostly becoming involute, attenuate at the apex, glabrous, 10–15 cm. long, 1–3 mm. wide: spike 8–15 cm. long, often twisted; second glume glandless or the glands obscure. [*C. chapadensis* (Fl. SE. U. S.)]—Pinelands, Fla.

74. **CHLORIS** Swartz. Tufted perennials or annuals with flat blades and 2- to several often showy and feathery spikes aggregated at the summit of the stems. Spikelets with 1 perfect floret, sessile in 2 rows along one side of a continuous rachis, the rachilla produced beyond the perfect floret and bearing 1 to several reduced florets consisting of empty lemmas, these often truncate and, if more than one, the smaller ones enclosed in the lower, forming a usually club-shaped rudiment; glumes somewhat unequal, the first shorter, narrow, acute: lemma keeled, usually broad, 1- to 5-nerved, often villous on the callus, and on the keel or marginal nerves, awned from between the short teeth of a bifid apex, the awn slender, sometimes obsolete: sterile lemmas awned or awnless. [*Eustachys* Desv.]—Sixty species, in the warmer regions of both hemispheres.—BRANCHING-FOXTAILS. FINGER-GRASSES.

Lemma awnless or with an inconspicuous awn, dark-brown; leaf-sheaths much compressed; blades abruptly rounded at the tip.—EUSTACHYS. I. PETRAEAE.  
Lemma distinctly awned, pale.—CHLORIS. II. VIRGATAE.

## I. PETRAEAE

Spikes numerous (10-25): second glume truncate, not notched. Spikes rarely more than 6.

Spikelets 2 mm. long: second glume mucronate from a notched apex.

Spikelets 3 mm. long.

Spikes 1 or 2, rarely 3.

Spikes 4 to 6, rarely more.

1. *C. glauca*.

2. *C. petraea*.

3. *C. floridana*.

4. *C. neglecta*.

## II. VIRGATAE

Rudiment narrow: awns about 8 mm. long.

Rudiment truncate, broadened above: awns 3-5 mm. long.

Plants strongly stoloniferous: lemmas pilose on nerves.

Plants without stolons: lemmas strongly ciliate-villous.

5. *C. Prieuri*.

6. *C. Gayana*.

7. *C. polydactyla*.

1. *C. glauca* (Chapm.) Vasey. Stem stout, 50-150 cm. tall, one or more nodes with opposite, spreading leaf-sheaths: leaf-blades as much as 1.5 cm. wide: spikes 5-15 cm. long: spikelets about 2 mm. long. [*E. glauca* Chapm.]—Brackish marshes, prairies, and cypress swamps, Fla. to N. C.

2. *C. petraea* Swartz. Stem 30-100 cm. tall: leaf-sheaths often paired: leaf-blades 4-10 mm. wide: spikes mostly 4-6, sub-erect, 4-10 cm. long. [*E. petraea* Desv.]—Dry soil, hammocks, pinelands, and prairies, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)

3. *C. floridana* (Chapm.) Vasey. Stem 40-100 cm. tall: leaf-sheaths not paired: leaf-blades 4-8 mm. wide: spikes erect, 5-10 cm. long. [*E. floridana* Chapm.]—Dry sandy soil, woods, and old fields, Coastal Plain, N. Fla. and Ga.

4. *C. neglecta* Nash. Similar to *C. floridana*, usually taller and stouter: leaf-sheaths commonly paired: spikes more numerous, usually longer. [*E. neglecta* Nash]—Open sandy woods and swamps, Fla.

5. *C. Prieuri* Kunth. Perennial with stems 30-60 cm. tall: leaf-blades 2-3 mm. wide: spikes 2-8, erect, 5-8 cm. long: fertile lemma 2.5 mm. long, ciliate near summit: rudiment narrow, bearing 3 or 4 awns.—Waste grounds, Mobile, Ala., and Wilmington, N. C. Nat. of Africa.

6. *C. Gayana* Kunth. Plant producing stout stolons a meter or more long: stem tufted, 100-150 cm. tall: leaf-blades 3-5 mm. wide: spikes mostly 12-15, straight, ascending or erect, 6-8 cm. long, inconspicuously pilose.—(RHODES GRASS.)—Fields and roadsides, various provinces, Fla. to Miss., Tex., and S Calif. Nat. of Afr.

7. *C. polydactyla* (L.) Swartz. Perennial: stem 50-100 cm. tall: leaf-blades as much as 1 cm. wide: spikes several to many, flexuous, tawny, mostly 8-12 cm. long. [*C. barbata* Nash]—Open sandy soil, S Fla.—(*W. I., S. A.*)

75. **GYMNOPOGON** Beauv. Rigid perennials with short flat stiff blades, numerous stiff slender divergent spikes loosely scattered along the upper part of the stem, often deflexed at maturity. Spikes 1 or rarely 2-4-flowered, nearly sessile, appressed and usually remote in 2 rows, along 1 side of a slender con-

tinuous rachis, the rachilla prolonged behind the 1 or more fertile florets bearing a rudiment of a floret, this sometimes bearing 1 or 2 slender awns; glumes narrow, acuminate, 1-nerved, usually longer than the floret; lemmas narrow, 3-nerved, the lateral nerves near the margin, the apex minutely bifid, bearing between the teeth a slender awn, or rarely awnless.—Ten species, mostly American.—BEARD-GRASSES.

Awn longer than the lemma: spikes floriferous from base.

1. *G. ambiguus*.

Awn shorter than the lemma or none.

Spikes spreading or reflexed, naked for 1 to several cm. at base: leaf-blades spreading: spikelets 2-flowered.

2. *G. brevifolius*.

Spikes ascending, approximate, floriferous from base: leaf-blades ascending: spikelets 3-flowered (2-4-flowered), the florets zigzag.

3. *G. Chapmanianus*.

1. *G. ambiguus* (Michx.) B. S. P. Stem 30-60 cm. tall: leaf-blades 5-10 mm. wide: spike 10-20 cm. long: glumes 4-6 mm. long: awn 4-6 mm. long. [*G. racemosus* Beauv.]—Dry soil, woods, pinelands, and hillsides, Coastal Plain and adj. provinces, Fla. to Tex., Kans., and N. J.

2. *G. brevifolius* Trin. Resembles *G. ambiguus*: stem more slender: leaf-blades narrower and shorter: spikes floriferous usually only on the upper half or third.—Dry grounds, Coastal Plain, Fla. to La. and N. J.

3. *G. Chapmanianus* A. Hitchc. Stem 30-40 cm. tall, stout: leaf-blades 5-6 cm. long, about 5 mm. wide: branches of panicle relatively stout.—Sandy pinelands, Fla.

76. **BOUTELOUA** Lag. Low or rather tall perennials or annuals, with 2 to many spikes, or sometimes solitary, racemose on a common axis, the spikelets few to many in each spike, pectinate or more loosely arranged and appressed, the rachis of the spike usually produced beyond the insertion of the spikelets. Spikelets 1-flowered, with the rudiments of 1 or more florets above, sessile in 2 rows along one side of the rachis: glumes unequal, 1-nerved, acuminate or short-awned, the first shorter and narrower: lemma as long as the second glume or a little longer, 3-nerved, the nerves extending into short or often rather long awns, the internerves usually extending into teeth; palea sometimes 2-awned; rudiment various, usually 3-awned, a second rudimentary floret sometimes present. [*Triathera* Desv. *Atheropogon* Muhl. *Polyodon* H. B. K.]—Thirty-eight species, mostly North American.—MESQUITE-GRASSES. GRAMA-GRASSES.

Spikes falling from the axis entire: spikelets not pectinately arranged.—*ATHEROPOGON*.

1. *B. curtipendula*.

Spikes persistent, the florets falling, more than twice as long as wide: spikelets pectinately arranged.—*BOUTELOUA*.

2. *B. hirsuta*.

1. *B. curtipendula* (Michx.) Torr. Stem erect, 50-80 cm. tall: inflorescence 15-25 cm. long, mostly 1-sided: spikes 1-2 cm. long, the peduncles recurved:

spikelets 5-8: first glume 4-5 mm., the second 7 mm. long: rudiment 3-awned, the awns 3-6 mm. long, the lateral ones sometimes obsolete. [*A. curtipendulus* Fourn.]—Hills, plains, barrens, prairies, and rocky slopes, various provinces, S. C. to Calif., Mont., and Conn.—(*Mex.*, *C. A.*, *S. A.*)

2. **B. hirsuta** Lag. Stem erect, 20-50 cm. tall: leaf-blades about 3 mm. wide, sparsely papillose-pilose: spikes 1-4, usually 2, 2.5-3.5 cm. long, the rachis projecting 5-8 mm.; spikelets about 6 mm. long: second glume tuberculate-pilose.—(**BLACK-GRAMA.**)—Rocky hills, various provinces, Tex. to Calif., Mont., and Ill.; also in pinelands, pen. Fla.—(*Mex.*)

77. **ELEUSINE** Gaertn. Annuals, with 2 to several rather stout spikes digitate at the summit of the culms, sometimes with 1 or 2 a short distance below, rarely with a single terminal spike. Spikelets few- to several-flowered, compressed, sessile and closely imbricate in 2 rows along one side of a rather broad rachis, the latter not prolonged beyond the spikelets; glumes unequal, rather broad, acute, 1-nerved, shorter than the first lemma; lemmas acute, with 3 strong green nerves close together forming a keel, the uppermost somewhat reduced.—Six species, natives of the warmer parts of the Eastern Hemisphere.

1. **E. indica** (L.) Gaertn. Glabrous stem decumbent or prostrate, flattened, usually 10-40 cm. long: spikes 2.5-8 cm. long: spikelets 3-5-flowered, about 5 mm. long: seed roughened by fine ridges, loosely enclosed in the pericarp.—(**WIRE-GRASS. YARD-GRASS. DOG-GRASS. CRAB-GRASS. CROW-FOOT.**)—Roadsides, cult. grounds, yards and waste-places, various provinces, Fla. to Tex., Calif., Kans., and Mass. Nat. of E. I.—(*W. I.*, *Mex.*, *C. A.*, *S. A.*)

1a. **Eleusine tristachya** Lam. Glabrous, tufted, the stems geniculate, mostly not more than 25 cm. long: spikes 2 or 3, thick, 1.5-3 cm. long, often 1 cm. wide: spikelets 5-9-flowered, 6-8 mm. long.—Ballast at Mobile, Ala., also in N. J. and Ore.—(*S. A.*, *Africa.*)

78. **DACTYLOCTENIUM** Willd. Annuals or perennials with flat blades and 2 to several short thick spikes digitate at the summit of the culms. Spikelets 3- to 5-flowered, compressed, sessile, closely imbricate in 2 rows along one side of the rather narrow flat rachis, the end projecting in a point beyond the spikelets; glumes somewhat unequal, broad, 1-nerved, the first persistent upon the rachis, the second mucronate or short-awned below the tip, deciduous;

lemmas firm, broad, keeled, acuminate or short-awned, 3-nerved, the lateral nerves indistinct, the upper floret reduced; palea about as long as the lemma; seed subglobose, ridged or wrinkled, enclosed in a thin, early disappearing pericarp.—Three species, natives of Eurasia.

1. *D. aegyptium* (L.) Richt. Glabrous annual: stem spreading or prostrate, often rooting at the nodes: spikes 1.5–5 cm. long: glumes scabrous on the keel, the second with a short awn: lemmas cuspidate. [*D. aegyptiacum* Willd. *Eleusine aegyptiaca* Pers.] — (EGYPTIAN - GRASS. CROWFOOT-GRASS.)—Waste-places, roadsides, and cult. grounds, various provinces, Fla. to Ariz., Ill., and Me. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

79 *LEPTOCHLOA* Beauv. Annuals or perennials with flat blades and numerous racemes, racemose along a common axis forming a panicle. Spikelets 2- to several-flowered, sessile or short-pedicelled, approximate or somewhat distant along one side of a slender rachis; glumes unequal or nearly equal, usually shorter than the first lemma, awnless or mucronate, 1-nerved: lemma obtuse or acute, sometimes 2-toothed and mucronate or short-awned from between the teeth, 3-nerved, the nerves sometimes pubescent. [*Diplachne* Beauv.]—Twenty species, in the warmer parts of both hemispheres.—FEATHER-GRASSES. SALT-GRASSES.

Plant perennial.

Lemmas broad, notched at apex, the lateral nerves glabrous.

Lemmas acute or awned, the lateral nerves pubescent.

Lemmas awnless or only lowest with short awns: plants smooth, glaucous.

Lemmas awned, the awn as long as or longer than the body: leaf-sheaths and blades sparsely pilose, not glaucous.

Plant annual.

Sheaths papillose-pilose: spikelets minute.

Sheaths smooth or scabrous, not pilose.

Lemmas awned.

Lemmas awnless or mucronate only.

1. *L. dubia*.

2. *L. virgata*.

3. *L. domingensis*.

4. *L. filiformis*.

5. *L. fascicularis*.

6. *L. floribunda*.

1. *L. dubia* (H. B. K.) Nees. Stem erect, 30–100 cm. tall: leaf-blades as much as 5 mm. wide: racemes several, ascending, 5–15 cm. long, scattered: spikelets 5–10 mm. long, 5–8-flowered, rarely only 2-flowered: lemmas broad, obtuse or emarginate, sometimes mucronate between the lobes. [*D. dubia* Benth.]—(SPRANGLE.)—Plains, hills, and rocky woods, various provinces, Fla.; Tex. to Ariz.—(*Mex., S. A.*)

2. *L. virgata* (L.) Beauv. Stem wiry, erect, slender, 50–100 cm. tall: leaf-blades flat, 5–10 mm. wide: racemes 10–15 cm. long, ascending, lax: spikelets 3.5–4 mm. long: lemmas 2–2.5 mm. long.—Sandy soil, cult. grounds, and roadsides, Coastal Plain, S. Fla. and S. Tex.—(*W. I., Mex., C. A., S. A.*)

3. *L. domingensis* (Jacq.) Trin. Resembles *L. virgata*: commonly stouter: racemes shorter, usually more numerous, more closely flowered. [*D. domingensis* Chapm.]—Sandy soil, S Fla.—(*W. I., Mex., C. A., S. A.*)

4. *L. filiformis* (Lam.) Beauv. Stem 40–80 cm. tall, sometimes depauperate: racemes 20–40, ascending or spreading, very slender, lax, 5–10 cm. long: spikelets about 3 mm. long, 3–4-flowered: lemmas awnless. [*L. mucronata* Kunth. *L. attenuata* Nash]—Fields, sandy bottoms and rocky hills, various provinces, Fla. to Tex., Calif., Ill., and Mass.—(*W. I., Mex., C. A., S. A.*)

5. *L. fascicularis* (Lam.) A. Gray. Plant smooth: stem erect, spreading or prostrate, 20–100 cm. long: leaf-blades 3–5 mm. wide, usually involute: panicles as much as 25 cm. long, the base included in the upper sheath, the racemes 8–12 cm. long, at first ascending, finally spreading: spikelets 6–12-flowered: lemmas 4–5 mm. long, the nerves pubescent below, the awn sometimes as long as the lemma. [*D. fascicularis* Beauv. *D. acuminata* Nash *D. procumbens* Nash]—Brackish soil along the coast, and moist places in the interior, various provinces, Fla. to Tex., Calif., S. D., and N. H.

6. *L. floribunda* Doell. Stem 60–100 cm. tall: leaf-blades lax, elongate, 5–10 mm. wide, scaberulous: panicles oblong, rather compact, 10–20 cm. long, the numerous racemes ascending, 4–6 cm. long: spikelets 4–5 mm. long, 5–7-flowered: lemmas 3 mm. long. [*D. Halei* Nash]—Marshes, Coastal Plain and adj. provinces, S Miss. to Tex., and S Ind., probably introduced.—(*S. A.*)

6a. *Leptochloa uninervia* (Presl) Hitchc. & Chase. Annual, densely tufted: stems ascending to suberect, 50–100 cm. tall: leaf-blades narrow, subinvolute: panicle purplish-leadcolor, 15–30 cm. long, the numerous spikes stiffly ascending: spikelets 5–7 cm. long, 6–9-flowered, the lemmas obtuse, minutely mucronate.—Introduced in Miss. It is an annual with numerous spikes and obtuse awnless lemmas. La. to Cal. (*Mex., C. A., S. A.*)

80. **MONANTHOCHLOË** Engelm. A creeping wiry dioecious perennial, with clustered short subulate leaves, the spikelets at the ends of the short branches only a little exceeding the leaves. Spikelets 3- to 5-flowered, the rachilla disarticulating tardily in pistillate spikelets; glumes wanting: lemmas rounded on the back, convolute, narrowed above, several-nerved, those of the pistillate spikelet like the leaves: palea narrow, in the pistillate spikelets convolute around the pistil, the rudimentary uppermost floret enclosed between the keels of the floret next below.—Two species, both American.

1. *M. littoralis* Engelm. Branches 10–20 cm. tall: leaf-blades squarrose, rigid, 3–8 mm. long.—(KEY-GRASS.)—Rocky or muddy saline shores, S Fla., S Tex., and S Calif.—(*W. I., Mex., S. A.*)

81. **ARUNDO** L. Tall perennial reeds with broad linear blades and large plume-like terminal panicles. Spikelets several-flowered, the rachilla glabrous, articulate above the glumes and between the florets; glumes somewhat unequal, membranaceous, 3-nerved, narrow, tapering into a slender point,

about as long as the spikelet: lemmas thin, 3-nerved, densely long-pilose, gradually narrowed at the summit, the nerves ending in slender teeth, the middle one longer, extending into a straight awn, the florets successively smaller, the summits of all about equal.—Six species, natives of the warmer parts of the Old World.

1. *A. Donax* L. Stem as much as 6 m. tall, branching, the rootstocks thick, rough and knotty: leaf-blades as much as 7 cm. wide, those on the branches much smaller: panicle 30–60 cm. long: spikelets about 12 mm. long. — (GIANT-REED.) — Low grounds and wet places, various provinces, Fla. to Tex., Calif., and Va. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

82. **PHRAGMITES** Adans. Perennial reeds with broad linear flat blades and large terminal panicles. Spikelets several-flowered, the rachilla clothed with long silky hairs, disarticulating above the glumes and at base of each joint between the florets, the lowest floret staminate or neuter: glumes 3-nerved or the upper 5-nerved, lanceolate, acute, the upper shorter than the florets, the lower about half as long as the upper: lemmas narrow, long-acuminate, glabrous, 3-nerved, the florets successively smaller, the summits of all about equal: palea much shorter than the lemma.—Three species, the following cosmopolitan.

1. *P. Phragmites* (L.) Karst. Stem as much as 4 m. tall, from long creeping rootstocks, these sometimes appearing above the ground as leafy stolons as much as 10 m. long: leaf-blades as much as 5 cm. wide: panicle 15–40 cm. long: spikelets 12–14 mm. long. [*P. communis* Trin.]—(COMMON-REED.)—Marshes, swamps, and wet places, various provinces, nearly throughout U. S. and S Can.—(*W. I., Mex., C. A., S. A., O. W.*)—*Neyraudia arundinacea* (L.) Heuw. has escaped in a few places in S Fla. It is a large reed resembling *Phragmites*; sheaths woolly at the throat: panicle 30 to 50 cm. long: spikelets 4–8-flowered, 6–8 mm. long; lemmas long-villous on the margin, with 2 short setaceous tips with an awn between. Nat. of Madagascar and S. Asia. Cult. for ornament.

83. **TRIODIA** R. Br. Erect tufted perennials, rarely stoloniferous, the leaf-blades usually flat, the inflorescence an open or contracted panicle. Spikelets several-flowered, the rachilla disarticulating above the glumes and between the florets: glumes membranaceous, often thin, subequal, the first sometimes narrower, 1-nerved or the second rarely 3- to 5-nerved, acute or acuminate: lemmas broad, rounded on the back, the apex from minutely emarginate or toothed to deeply and obtusely lobed, 3-nerved, the midnerve excurrent between the lobes as a minute point, the lateral nerves near the margin often

excurrent as minute points, all the nerves pubescent below, the lateral ones sometimes conspicuously so throughout: palea broad, the nerves near the margin, sometimes villous. [*Erioneuron* Nash *Rhombolytrum* Link]—Thirty species, natives of temperate regions.—SAND-GRASSES.

Pedicels more than 1 mm. long, often longer than the spikelet.

Lateral nerves of the lemma excurrent.

Panicle open with the branches spreading or ascending, naked below.

Panicle narrow, contracted or spike-like, the branches appressed.

Lateral nerves of the lemma disappearing at the margin, not excurrent: lemma about 2 mm. long.

Pedicels less than 1 mm. long.

Panicle open.

Panicle dense, elongate.

1. *T. flava*.

2. *T. Drummondii*.

3. *T. eragrostoides*.

4. *T. Elliottii*.

5. *T. stricta*.

1. ***T. flava*** (L.) A. Hitchc. Stem 100–200 cm. tall, very smooth, viscid along the upper part and in the panicles: panicle 20–45 cm. long, the branches spreading or drooping (smaller, the branches stiffly ascending in *T. flava* Chapmani. Fla. to Mex., Mo., and S. C.): spikelets purple, rarely pale, 7–8 mm. long, 5–8-flowered: lemmas 3–4 mm. long, minutely emarginate, the nerves pubescent below, excurrent. [*Triodia cuprea* Jacq. *Tridens seslerioides* Nash]—(TALL RED-TOP.)—Dry fields, open woods, roadsides, and waste-places, various provinces, Fla. to Tex., Nebr. and N. H.

2. ***T. Drummondii*** Scribn. & Kearn. Stem 100–150 cm. tall: panicle 15–20 cm. long, the branches appressed naked below: spikelets rather loosely few-flowered: glumes about 5 mm. long: lemmas about 5 mm. long, minutely cleft, pilose on the lower half of the nerves, all the nerves excurrent as mucros.—Pinelands and open grounds, Coastal Plain, Fla. to La. and S. C.

3. ***T. eragrostoides*** Vasey & Scribn. Stems tufted, slender, 60–100 cm. tall: panicle as much as 40 cm. long, the branches distant, spreading or drooping, as much as 15 cm. long: spikelets oblong: lemmas emarginate, the nerves minutely pilose below, the midnerve excurrent. [*Tridens eragrostoides* Nash]—Dry grounds, Coastal Plain, S. Fla. and Tex.—(W. I., Mex.)

4. ***T. Elliottii*** Bush. Stem 60–120 cm. tall: panicle 10–20 cm. long, the branches ascending: spikelets along the main branches of the panicle: lemmas 4–5 mm. long, prominently villous on the lower half of the nerves, emarginate, obtuse, all the nerves slightly excurrent. [*Tridens Langloisii* Nash *T. ambiguus* Schult. *Triodia ambigua* Vasey]—Low pinelands, Coastal Plain, Fla. to Tex. and S. C.

5. ***T. stricta*** (Nutt.) Benth. Stem strict, rather stout, 1–1.5 m. tall: leaf-blades elongate, flat or loosely involute, 3–8 mm. wide: panicle dense, more or less interrupted below, narrowed above, 10–20 cm. long: spikelets 4–6-flowered, about 5 mm. long.—Low moist ground and low woods, various provinces, Ala. to Tex., Kan., and Mo.

84. **TRIPLASIS** Beauv. Slender tufted annuals or perennials, with short blades, short open few-flowered purple panicles, narrow cleistogamous panicles in the swollen leaf-sheaths, those in the lower leaves reduced to single 1-flowered

spikelets. Spikelets few-flowered, the florets remote, the rachilla slender, disarticulating above the glumes and between the florets; glumes subequal, 1-nerved, acute; lemmas narrow, 3-nerved, 2-lobed, the nerves parallel, villous, the lateral pair near the margin, the midnerve excurrent as an awn as long as the lobes or longer: palea shorter than the lemma, the keels densely long-ciliate on the upper half.—Three species, natives of the United States.—SAND-GRASSES.

Lobes of lemma subulate-pointed: awn longer than the body: perennial.

1. *T. americana*.

Lobes of lemma not subulate-pointed: annuals.

Awn about 3 mm. long: lobes of lemma narrow.

2. *T. intermedia*.

Awn scarcely exceeding the rounded, broad, lobes of lemma.

3. *T. purpurea*.

1. *T. americana* Beauv. Stem spreading, 30–70 cm. tall: panicle 2–5 cm. long, the branches bearing usually only 1–3 spikelets about 1 cm. long: glumes about 5 mm. long, narrow, acuminate; lemmas cleft to the middle or below, about 5 mm. long, the flat awn densely pubescent below, scabrous above.—Sandy soil, pinelands and sandy ridges, Coastal Plain, Fla. to Miss. and N. C.

2. *T. intermedia* Nash. Stem decumbent-spreading, 30–60 cm. long: panicle as in *T. americana*: lemmas about 4 mm. long, the lobes about 1 mm. long, acute but not subulate, the awn exceeding the lobes.—Sandy soil, Fla. to Tex. and S. C.

3. *T. purpurea* (Walt.) Chapm. Stem spreading or ascending, 30–80 cm. long: panicle 3–7 cm. long, the few stiff branches finally divergent: spikelets 5–8 mm. long: lemmas about 3 mm. long, cleft at the summit, the obtuse lobes less than 1 mm. long. [*T. sparsiflora* Chapm.]—(SAND-GRASS.)—Sandy soil, Coastal Plain and New England Coast, Fla. to Tex. and N. H., and Great Lake Lowland, Minn. to Mich.

85. **ERAGROSTIS** Beauv. Annuals or perennials of various habit, the inflorescence an open or contracted panicle. Spikelets few-many-flowered, the florets usually closely imbricate, the rachilla disarticulating above the glumes and between the florets, or continuous, the lemmas deciduous, the paleas persistent; glumes somewhat unequal, shorter than the first lemma, acute or acuminate, 1-nerved, or the second rarely 3-nerved: lemmas acute or acuminate, keeled or rounded on the back, 3-nerved, the nerves usually prominent; keels of the palea sometimes ciliate.—One hundred species, in temperate and tropical regions generally.—LOVE-GRASSES. SKUNK-GRASSES. MEADOW-GRASSES.

Plant perennial.

Spikelets 2.5–4 mm. wide.

Panicle narrow: florets sharp-pointed.

Panicle wide, open: florets acute or acuminate but not sharp-pointed.

Spikelets 1.5 mm. wide.

Plant annual.

Stem low, stoloniferous and creeping.

Stem erect, or decumbent at base, but not stoloniferous.

Palea conspicuously ciliate: panicle narrow.

Palea not conspicuously ciliate.

Spikelets nearly sessile, mostly more than 20-flowered, somewhat clustered along the main axis or along the short spreading branches.

I. SECUNDIFLORAE.

II. REFRACTAE.

III. BAHIENSES.

IV. HYPNOIDES.

V. CILIARES.

VI. SIMPLICES.

Spikelets pedicelled, few-many-flowered, not clustered.

Panicle contracted, the numerous branches appressed: spikelets minute, tawny or stramineous.

Panicle open, the branches spreading.

VII. GLOMERATAE.  
VIII. PILOSÆ.

#### I. SECUNDIFLORÆ

Plant more or less tufted, the stem with a very short branching base, the spikelets in contracted or open panicles.

1. *E. secundiflora*.

#### II. REFRACTÆ

Panicle conspicuously purple, many-flowered, closely flowered toward the usually included base.

2. *E. spectabilis*.

Panicle plumbeous, tawny or brownish (sometimes purplish in *E. hirsuta*), rather loosely few-flowered in proportion to size.

Branches, branchlets, and pedicels capillary, stiff, fragile, not flexuous: spikelets usually more than 10-flowered, distinctly flattened.

3. *E. refracta*.

Lateral spikelets short-pedicelled, appressed: axils of panicle-branches bearded.

4. *E. Elliottii*.

Lateral spikelets on slender spreading pedicels: axils usually not bearded.

Branches, branchlets, and pedicels flexuous: spikelets flat or turgid, less than 10-flowered.

5. *E. trichocolea*.

Leaf-blades strongly papillose-villous.

Leaf-blades not villous.

Stems mostly less than 50 cm. tall: sheaths glabrous, except on margins: blades folded or involute, short.

6. *E. lugens*.

Stems mostly more than 50 cm. tall: sheaths hirsute: blades flat, elongate.

7. *E. hirsuta*.

#### III. BAHIENSES

Plant with a stout tufted base, narrow erect leaves, and numerous spikelets in a narrow panicle.

8. *E. bahiensis*.

#### IV. HYPNOIDES

Plant extensively branching and creeping, forming a carpet, the spikelets borne in numerous open or compact small panicles.

9. *E. hypnoides*.

#### V. CILIARES

Lemmas 1 mm. long: hairs on palea 0.5 mm. long.

10. *E. ciliaris*.

Lemmas 0.7 mm. long: hairs on palea 0.2-0.3 mm. long.

11. *E. amabilis*.

#### VI. SIMPLICES

Plant low, in dense tufts, very leafy at the base, the short panicle-branches spreading or reflexed, the spikelets relatively large.

12. *E. simplex*.

#### VII. GLOMERATAE

Plant tall, more or less branched at the base, with flat leaf-blades and plume-like panicles with numerous minute spikelets.

13. *E. glomerata*.

#### VIII. PILOSÆ

Spikelets mostly not over 5-flowered.

Plant erect, branched from the base: panicle diffuse, pale or green: pedicels mostly over 5 mm. long.

14. *E. capillaris*.

Plant decumbent or spreading, branched above the base: panicle oblong, the branchlets rather crowded, usually purple: pedicels usually less than 5 mm. long.

15. *E. Frankii*.

Spikelets mostly more than 5-flowered.

Spikelets ovate to oblong, many-flowered, more than 3 mm. wide, the florets closely imbricate.

16. *E. uniolooides*.

Florets nearly horizontal, not glandular.

17. *E. cilianensis*.

Florets ascending: lemmas glandular on the keel.

Spikelets oblong or linear, not over 2 mm. wide, the florets relatively distant.

Spikelets 1 mm. wide: branches of panicle more or less flexuous.

18. *E. pilosa*.

Spikelets 1.5 mm. wide or more: axils of panicle-branches usually not pilose.

Spikelets appressed along the spreading branchlets, 1.5 mm. wide.

Spikelets not appressed; pedicels spreading or ascending.

Margins of leaf-blades and sometimes other portions of the plant beset with glandular depressions.

Margins of leaf-blades not glandular.

Lemmas 1.5 mm. long; stems 10 to 20 cm. tall, spreading or decumbent at base.

Lemmas about 2 mm. long; stems 30 to 50 cm. long, erect.

19. *E. pectinacea*.

20. *E. Eragrostis*.

21. *E. tepsanthos*.

22. *E. limbata*.

1. *E. secundiflora* Presl. Stem as much as 80 cm. tall; panicle purplish, 5–15 cm. long, the short branches ascending or appressed: spikelets oblong, many-flowered: lemmas 3–5 mm. long, pointed. [*E. oxylepis* Torr.]—Sandy soil, mostly on plains, various provinces, Ala. to S Calif. and Kan.—(*Mex.*)

2. *E. spectabilis* (Pursh.) Steud. Plants in dense stiff clumps: stem erect or ascending, 30–80 cm. tall: leaf-sheaths glabrous or pilose, densely pilose at the throat: panicle usually more than half the entire height of stem, the branches pilose in the axils, the whole finally breaking away as a tumble-weed: spikelets 5–15 flowered.—Open sandy places, old fields, and roadsides, various provinces, Fla. to Tex., Ariz., Minn., and Me.—(*Mex.*)

3. *E. refracta* (Muhl.) Scribn. Stem erect, 30–90 cm. tall: leaf-sheaths glabrous, sparingly villous at the throat: blades 2–4 mm. wide: panicle 20–50 cm. long, the branches remote: spikelets 6–25-flowered, 6–12 mm. long: lemmas acuminate. [*E. campestris refracta* Chapm. *E. campestris* Trin.]—Sandy ground, low pinelands, river-banks, and swamps, Coastal Plain, Fla. to Tex. and Del.

4. *E. Elliottii* S. Wats. Resembles *E. refracta*: spikelets linear, as much as 2 cm. long, the pedicel 5–15 mm. long.—Sandy pinelands, and prairies, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex.*)—*E. acuta* A. Hitchc. differs in the spikelets which are 8–12 mm. long, and the acuminate lemmas 3 mm. long.—S. pen. Fla.

5. *E. trichocolea* Hack. & Arech. Stem erect or geniculate at base, 20–40 cm. tall: leaves villous, or the sheath glabrate, the blades 2–3 mm. wide: panicle comprising one-third to one-half the length of the plant, nearly as broad as long, the branches stiffly spreading, pilose in the axils: spikelets 3–5 mm. long, 3–6-flowered: lemmas about 2 mm. long. [*E. floridana* A. Hitchc. *E. lugens* (Fl. SE. U. S.)]—Pinelands, pen. Fla.—(*S. A.*)

6. *E. lugens* Nees. Stem erect, 30–70 cm. tall: leaf-sheaths glabrous or sparsely pilose, prominently pilose at the throat: blades flat or loosely involute: panicle one-third to half the entire height of the plant, the branches rather stiffly spreading or ascending: spikelets oblong, 3–6 mm. long, 3–7-flowered, the pedicels as long as the spikelet or longer, flexuous: glumes acute, about 1.5 mm. long: lemmas 2 mm. long.—Dry grounds, La. to Calif. Nat. in Coastal Plain of Ga. and Ala.—(*Mex., C. A., S. A.*)

7. *E. hirsuta* (Michx.) Nees. Stem erect, 60–120 cm. tall: panicle diffuse, as much as 80 cm. long, the branches finally widely spreading, as much as 25 cm. long, sparingly pilose in the axils: lemmas about 2 mm. long.—Dry fields and open woods, Coastal Plain, Fla. to Tex., Mo., and S Va.

8. *E. bahiensis* Steud. Stem ascending, 30–50 cm. tall: panicle 7–12 cm. long, the branches as much as 5 cm. long, appressed: spikelets linear, 1 cm. long, many-flowered: lemmas about 2 mm. long, acute.—On ballast, Pensacola, Fla., and Mobile, Ala., and in La. Nat. of S. A.

9. *E. hypnoides* (Lam.) B. S. P. Stem much-branched, prostrate-spreading, rooting at the nodes, the flower-bearing branches erect or ascending, 5–12 cm. tall: leaf-blades 1–4 cm. long: panicle nearly simple, rather compact, usually not over 5 cm. long: spikelets pale, linear, 10–35-flowered, 5–15 mm. long: lemmas acuminate, keeled.—Moist sandy places, river-banks, ponds, lakes, and wet sandy slopes, various provinces, Fla. to Tex., N. D., and Vt.; Wash. to Calif.—(*W. I., Mex., C. A., S. A.*)

10. *E. ciliaris* (L.) Link. Stem erect or spreading, as much as 50 cm. tall: panicle as much as 15 cm. long, compact and spikelike or sometimes rather open: spikelets 5–15-flowered, 3–4 mm. long.—Sandy roadsides and waste-places, Coastal Plain, Fla. to Tex. and N. J.—(*W. I., Mex., C. A., S. A.*)

11. *E. amabilis* (L.) Wight & Arn. Stem erect or spreading, as much as 40 cm. tall: panicle as much as 10 cm. long: spikelets 4–8-flowered, 1–2 mm. long. [*E. plumosa* Link]—Waste-places, cult. grounds, and roadsides, Fla., Tex. and Ga.—(*W. I., Mex., C. A., S. A.*)

12. *E. simplex* Scribn. Stem erect or spreading, as much as 50 cm. tall: panicle narrow, with a few distant branches, the lower finally reflexed: spikelets linear: lemmas 1.5 mm. long.—Waste-places, roadsides, and fields, Coastal Plain, Fla. and Ga.

13. *E. glomerata* (Walt.) L. H. Dewey. Stem erect, 25–80 cm. tall: panicle pale, as much as 50 cm. long, the slender crowded branches as much as 10 cm. long: spikelets 5–10-flowered: lemmas about 1 mm. long, hyaline, the caryopsis visible through them. [*E. conferta* Trin.]—Damp places, sloughs, and ponds, Coastal Plain, Fla. to Tex. and S. C.—(*W. I., Mex., C. A., S. A.*)

14. *E. capillaris* (L.) Nees. Stem slender, erect, 15–60 cm. tall or more: panicle more than half the entire height of the plant, oblong-ovoid, the capillary branches spreading: spikelets 2–3 mm. long, on long divergent pedicels: lemmas about 1.5 mm. long.—(LACE-GRASS.)—Dry sandy soil, fields, woods, river-banks, and prairies, various provinces, Ga. to Tex., Ia., and Me.

15. *E. Frankii* (Fisch. Mey. & Lall.) Steud. Stem 15–40 cm. tall: leaf-sheaths glabrous: panicle less than half the entire height of plant, the short branches spreading: spikelets 2–3 mm. long on mostly appressed pedicels: lemmas scarcely over 1 mm. long.—Low ground, woods, river-banks, fields, and barrens, various provinces, Fla. to Miss., Minn., and N. H.

16. *E. utriusque* (Retz.) Nees. Stem 30–50 cm. tall: panicle oblong, 5–15 cm. long: spikelets 5–10 mm. long, 3–4 mm. wide: florets 2 mm. long, falling entire from the continuous rachilla.—Roadsides, Coastal Plain, N. Fla. and Ga. Nat. of Asia.

17. *E. cilianensis* (All.) Link. Stem erect or spreading, 20–80 cm. tall: panicle greenish or plumbeous, 5–15 cm. long, rather densely flowered: spikelets 5–15 mm. long, 10–40-flowered: lemmas about 2.5 mm. long, the lateral nerves prominent. [*E. major* Host. *E. megastachya* Link]—Waste places, fields, and roadsides, U. S. and SE Can. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

18. *E. pilosa* (L.) Beauv. Stem erect or spreading, 20–60 cm. tall: panicle oblong-elliptic, 5–20 cm. long, the lower branches usually verticillate, pilose in the axils: spikelets linear, mostly 4–6 mm. long, 5–10-flowered: first glume 0.5

mm. long, the second 1 mm. long; lemmas about 1.3 mm. long, 0.3 mm. wide; caryopsis 0.5–0.7 mm. long.—Waste-places and roadsides, various provinces, Fla. to Tex. and Me. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

19. *E. pectinacea* (Michx.) Nees. Resembles *E. pilosa*: axils of panicle-branches glabrous or the lower sparingly pilose: spikelets 1.5 mm. wide: first glume 1 mm. long, the second 1.5 mm. long; lemma 1.7 mm. long, 0.5 mm. wide, the lateral nerves more prominent; caryopsis 1 mm. long, light brown, faintly alveolate. [*E. Purshii* Schrad.]—Fields, waste-places, and moist open grounds, various provinces, Fla. to Tex., Calif., Wash., and Me.—(*Mex.*)

20. *E. Eragrostis* (L.) Beauv. Resembles *E. cilianensis*: stem mostly decumbent at base, 10–30 cm. tall: panicle mostly less than 10 cm. long, rather compactly flowered, the branches and pedicels divergent: spikelets about 2 mm. wide. [*E. minor* Host.]—Waste-places, infrequent in widely separated localities throughout U. S. Nat. of Eu.—(*W. I.*)

21. *E. tephrosanthos* Schult. Stem spreading or decumbent at base, usually lax, as much as 30 cm. long: panicle mostly less than 10 cm. long, the branches ascending or spreading, the lower mostly less than 4 cm. long.—Waste-places, Coastal Plain, Fla. to Tex.—(*W. I., C. A., S. A.*)

22. *E. limbata* Fourn. Stem mostly erect, 30–50 cm. tall: panicle erect, open, 10–30 cm. long, the branches, branchlets, and pedicels ascending, flexuous, glabrous in the axils, the pedicels mostly 2–3 times as long as the spikelets.—Open moist ground, Sanibel Island, Fla.; various provinces, W Tex. to S Calif. (*Mex., C. A., S. A.*)

86. **MELICA** L. Rather tall perennials, with closed sheaths, flat blades, narrow or sometimes open, usually simple panicles. Spikelets 2- to several-flowered, the rachilla disarticulating above the glumes and between the florets, prolonged beyond the perfect florets and bearing at the apex 2 or 3 gradually smaller empty lemmas, convolute together or the upper enclosed in the lower: glumes somewhat unequal, thin, often papery, scarious-margined, obtuse or acute, sometimes nearly as long as the lower floret, 3- to 5-nerved, the nerves usually prominent: lemmas convex, several-nerved, membranaceous or rather firm, scarious-margined, sometimes conspicuously so, awnless in ours.—Sixty species, in the cooler parts of both hemispheres.—**MELIC-GRASSES.**  
**HONEY-GRASSES.**

1. *M. mutica* Walt. Stem as much as 1 m. tall: leaf-sheaths scabrous: blades 2–10 mm. wide: panicle 10–25 cm. long, few-flowered: spikelets 7–10 mm. long, nodding.—Dry woods, river-banks, and pond-borders, various provinces, rarely Coastal Plain, Fla. to Tex., Ia. and Md.

87. **DIARINA** Raf. Slender perennials with rootstocks, broadly linear, flat blades, long-tapering below, and narrow, few-flowered panicles. Spikelets few-flowered, the rachilla disarticulating above the glumes and between the

florets; glumes unequal, acute, shorter than the lemmas, the first 1-nerved, the second 3- to 5-nerved; lemmas chartaceous, pointed, 3-nerved, the nerves converging in the point, the upper floret reduced; palea chartaceous, obtuse, at maturity the lemma and palea widely spread by the large turgid beaked caryopsis with hard shining pericarp.—Two species, the following, and one in Asia.

1. *D. festucoides* Raf. Stem erect, 60–100 cm. tall: leaves nearly as long as the stem, 1–2 cm. wide: panicle nearly simple, 10–25 cm. long: spikelets 10–15 mm. long, the pedicels short. [*Diarrhena americana* Beauv. *Korycarpus diandrus* Kuntze]—Rich woods, Interior Low Plateaus and Central Lowland, Tenn. to Tex., S. D., and Ohio.

88. **UNIOLA L.** Rather tall erect perennials with flat or sometimes involute blades and narrow or open panicles of compressed sometimes very broad flat spikelets. Spikelets 3- to many-flowered, the lower 1 to 4 lemmas empty, the rachilla disarticulating above the glumes and between the florets; glumes compressed-keeled, rigid, usually narrow, nerved, acute or acuminate, or rarely mucronate; lemmas compressed, sometimes conspicuously flattened, chartaceous, many-nerved, the nerves sometimes obscure, usually acute or acuminate, the empty ones at the base usually successively smaller, the uppermost reduced; palea rigid, sometimes bowed-out on the winged keels.—Nine species, North American.—SPIKE-GRASSES. SPANGLE-GRASSES.

Panicle drooping.

Leaf-blades broad, flat.

Leaf-blades narrow, involute.

Panicle erect, contracted or somewhat open.

- I. LATIFOLIAE.
- II. PANICULATAE.
- III. LAXAE.

#### I. LATIFOLIAE

Slender wood-grass with flat blades and very flat many-flowered green spikelets.

- 1. *U. latifolia*.

#### II. PANICULATAE

Stout dune-grass with a heavy rather dense panicle and many-flowered stramineous spikelets.

- 2. *U. paniculata*.

#### III. LAXAE

Spikelets not over 7 mm. wide; leaf-blades and panicles elongate.

Collar and usually sheaths densely pubescent.

Collar and sheaths glabrous.

Spikelets 1 cm. or more wide; leaf-blades not elongate.

Panicle not over 10 cm. long: spikelets crowded.

Panicle usually 10–20 cm. long: spikelets not crowded.

- 3. *U. longifolia*.
- 4. *U. laxa*.
- 5. *U. ornithoryncha*.
- 6. *U. nitida*.

1. *U. latifolia* Michx. Stem 60–150 cm. tall, leaf-blades commonly 15 mm. wide: panicle 10–25 cm. long, drooping, the slender branches bearing a few broad flat spikelets as much as 3 cm. long: lemmas 9–12 mm. long.—Shaded slopes and stream-banks, various provinces, Fla. to Tex., Kans., and Mass.

2. *U. paniculata* L. Stems in dense clumps, stout, 100–150 cm. tall: leaf-blades involute in drying, firm: panicle 20–30 cm. long: spikelets 1–2 cm. long, 8–15-flowered: lemmas 8–10 mm. long.—(SEA-OAT. BEACH-GRASS.)—Beach sands and dunes, Coastal Plain, Fla. to Tex. and Va.—(*W. I., Mex., C. A., S. A.*)

3. *U. longifolia* Scribn. Stems in clumps, 80–120 cm. tall: leaf-blades flat, 6–12 mm. wide: panicle 20–40 cm. long, the branches mostly distant, short and appressed, or the lower ascending: spikelets 3–4-flowered, 6 mm. long: lemmas 5 mm. long.—Dry sandy soil, woods, pinelands, and hammocks, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and Va.

4. *U. laxa* (L.) B. S. P. Stem 60–120 cm. tall: leaf-blades 3–7 mm. wide: panicle 15–40 cm. long, the slender branches erect: spikelets 3–6-flowered, 5–7 mm. long. [*U. gracilis* Michx.]—Sandy soil, woods, swamps, low meadows and hammocks, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Okla., and Long Id., N. Y. Plants in clumps.

5. *U. ornithoryncha* Steud. Stem 100–150 cm. tall, slender, from short slender rootstocks: leaf-blades 4–7 mm. wide, rarely over 15 cm. long: panicle 4–8 cm. long: spikelets 8–10 mm. long.—Low woods, Coastal Plain, Ala. to La.

6. *U. nitida* Baldw. Stem 50–150 cm. tall, from a slender rootstock: panicle 10–15 cm. long, the branches spreading or ascending: spikelets 1–1.5 cm. long.—Low woods and stream-banks, Coastal Plain, Fla. and S. C.

89. **DISTICHLIS** Raf. Low dioecious perennials with extensively creeping scaly rootstocks, erect, rather rigid stems, and short dense rather few-flowered panicles: spikelets several- to many-flowered, the rachilla of the pistillate spikelets disarticulating above the glumes and between the florets; glumes unequal, broad, acute, keeled, mostly 3-nerved, the lateral nerves sometimes faint: lemmas closely imbricate, firm, the pistillate coriaceous, the margins bowed out near base, acute or acutish, 3-nerved, with several intermediate nerves or striations: palea as long as the lemma or shorter, the pistillate coriaceous.—Six species, mostly American.—SALT-GRASSES. SPIKE-GRASSES. ALKALI-GRASSES.

1. *D. spicata* (L.) Greene. Stem erect, 15–60 cm. tall: leaf-sheaths overlapping, the blades usually conspicuously distichous, rigidly ascending: panicle 2–6 cm. long: spikelets 8–18 mm. long. [*D. maritima* Raf.]—(MARSH SPIKE-GRASS.)—Salt-marshes along the coast, and alkaline soil in the interior, nearly throughout U. S.—(*W. I., Mex., C. A., S. A.*)—*Briza minor* L. has been introd. in Fla., Ala., and S. C. It is

an annual, with erect pyramidal panicles, triangular several-flowered spikelets, 3 mm. long, on curved pedicels; also Va., Ark., Cal., Ore.—Nat. of Eu.

**90. DACTYLIS L.** An erect perennial with flat blades. Spikelets few-flowered, compressed, finally disarticulating above the glumes and between the florets, nearly sessile in dense 1-sided fascicles, these borne at the ends of the few panicle-branches: glumes unequal, carinate, acute, hispid-ciliate on the keel; lemmas compressed-keeled, mucronate, 5-nerved, ciliate on the keel.—Two species, native of Eurasia.

**1. D. glomerata L.** Stems in large often coarse tufts, 60–120 cm. tall: leaf-sheaths scabrous: panicle 8–15 cm. long, the few stiff branches widely spreading in anthesis, erect in fruit.—(ORCHARD-GRASS.)—Waste-places, fields, and orchards, ranging from the Piedmont of Ala. northward throughout the cooler parts of the U. S. Nat. of Eu.

**91. POA L.** Annuals or usually perennials, low or rather tall, with spikelets in open or contracted panicles, the narrow linear blades ending in a navicular point. Spikelets 2- several-flowered, the rachilla disarticulating above the glumes and between the florets, the uppermost floret reduced or rudimentary; glumes acute, keeled, somewhat unequal, the first 1-nerved, the second usually 3-nerved: lemmas somewhat keeled, acute or acutish, awnless, membranaceous, often somewhat scarious at the tip, 5-nerved, the nerves somewhat pubescent.—Two hundred species, in cool and temperate regions generally.—BLUE-GRASSES. SPEAR-GRASSES.

Plant annual, low, usually less than 25 cm. tall.

Plant perennial, taller.

Creeping rootstock present.

Creeping rootstock wanting.

#### I. ANNUAE.

#### II. PRATENSES.

#### III. TRIVIALES.

#### I. ANNUAE

Florets with cottony hairs at base: lemmas distinctly 3-nerved, the intermediate nerves obscure.

Florets not cottony at base: lemmas 5-nerved, the intermediate nerves distinct.

#### II. PRATENSES

Stem distinctly flattened, wiry: plant blue green.

Stem terete or nearly so.

Plant dioecious: panicle silvery.

Plant with perfect spikelets: panicle not silvery.

Leaves about as long as the stem; panicle few-flowered, the slender branches spikelet-bearing near the ends.

Leaves shorter than the stems: panicles pyramidal, the spikelets rather crowded.

#### III. TRIVIALES

Leaf-sheaths scabrous: panicle pale.

Leaf-sheaths smooth.

Lemmas not cottony at the base, pubescent below between the nerves.

Lemmas cottony at the base.

Panicle-branches spikelet-bearing from about the middle.

Panicle-branches bearing a few spikelets near the ends.

Marginal nerves glabrous.

Marginal nerves pubescent.

1. *P. Chapmaniana*.

2. *P. annua*.

3. *P. compressa*.

4. *P. arachnifera*.

5. *P. cuspidata*.

6. *P. pratensis*.

7. *P. trivialis*.

8. *P. autumnalis*.

9. *P. sylvestris*.

10. *P. alsodes*.

11. *P. Wolffii*.

1. *P. Chapmaniana* Scribn. Plants yellowish-green: stem mostly erect: nerves of lemma pubescent. [*P. cristata* (Chapm. Fl.)]—Dry open grounds, prairies and roadsides, Coastal Plain and adj. provinces, Fla. to Tex., Ia., and Ind.

2. *P. annua* L. Plants bright glossy-green: stem usually spreading: panicle pyramidal, 3–8 cm. long: spikelets 3–6-flowered, about 4 mm. long: nerves of lemma pubescent below.—(SIX WEEK'S GRASS. LOW SPEAR-GRASS.)—Open grounds, throughout N. A. Nat. of Eu.—(*W. I., Mex., C. A., S. A.*)

3. *P. compressa* L. Stem wiry, 20–60 cm. tall, geniculate at base: panicle narrow, 2–8 cm. long: spikelets crowded, 4–6 mm. long, 3–6-flowered; lemmas obscurely nerved, sparingly cottony at base, the nerves pubescent below.—(CANADA BLUE-GRASS.)—Dry sterile soils, from Ga. and Okla. northward, nearly throughout N. A. Nat. of Eu.—(*W. I.*)

4. *P. arachnifera* Torr. Stem 30–80 cm. tall: panicle 5–15 cm. long: spikelets several-flowered: lemmas 4–5 mm. long, the pistillate woolly on the nerves and copiously cottony at base.—[*P. glabrescens* Nash, the staminate form.]—Dry grounds, pinelands, prairies, and cult. grounds, Coastal Plain, Tex. and Okla. Naturalized from Fla. to Miss. and S. C.

5. *P. cuspidata* Nutt. Stem 30–50 cm. tall: panicle 7–12 cm. long: spikelets 3–4-flowered: lemmas cottony at base, the nerves sparingly pubescent below, sometimes the lemma villous all over. [*P. brachyphylla* Schult. *P. brevifolia* Muhl.]—Rocky woods and stream-banks, various provinces N of Coastal Plain, Ga. to Ky. and N. J.

6. *P. pratensis* L. Stem up to 100 cm. tall: panicle pyramidal, 5–20 cm. long: spikelets 4–5 mm. long, 3–5-flowered: lemmas 3 mm. long, cottony at base, the nerves pubescent.—(KENTUCKY BLUE-GRASS. JUNE-GRASS.)—Open grounds and woods, nearly throughout N. A. (*Eurasia.*)—(*W. I.*)

7. *P. trivialis* L. Stem erect from a decumbent base, up to 100 cm. long, scabrous below the panicle: panicle 6–15 cm. long: spikelets 2–3-flowered, 3 mm. long: lemma strongly nerved, cottony at base, pubescent on keel only.—(ROUGH-STALKED MEADOW GRASS.)—Moist meadows, various provinces N of Coastal Plain, La. to S. D., Va., and Que. Nat. of Eu.

8. *P. autumnalis* Muhl. Stem 30–100 cm. tall: leaf-blades 2–3 mm. wide: panicle 8–20 cm. long: spikelets 4–6-flowered, about 6 mm. long. [*P. flexuosa* Muhl.]—Woods and swamps, various provinces, Fla. to Tex., Ill., and N. J.

9. *P. sylvestris* A. Gray. Stem 30–100 cm. tall: panicle 10–20 cm. long, rather narrow, the lower branches whorled, often reflexed: spikelets 2–4-flowered, 2.5–4 mm. long: lemmas 2.5 mm. long, pubescent on the keel: glumes widely spreading at maturity.—Rich woods and stream-banks, various provinces, N Fla. to Tex., Wis., and N. Y.

10. *P. alsodes* A. Gray. Stem 20–60 cm. tall: leaf-blades 2–5 mm. wide: panicle 10–20 cm. long, the branches in 3's or 4's: spikelets 2–3-flowered, about 5 mm. long: lemmas faintly nerved, villous on the keel below.—Wooded slopes, Blue Ridge and more northern provinces, N. C. and Tenn. to Minn. and Que.

11. *P. Wolfii* Scribn. Stem slender, 50–100 cm. tall: leaves mostly basal, the blades 1–2 mm. wide: panicle 8–15 cm. long: spikelets 2–4-flowered, 5–6 mm. long: lemmas strongly nerved, the keel and marginal nerves pubescent.—Woods, various provinces, Tenn. (?), Ill. to Minn.—Specimens from Tenn. seem to be lacking.

92. **PANICULARIA** Heister. Usually tall aquatic or marsh perennials, with flat blades, closed or partly closed sheaths, and open or contracted panicles. Spikelets few- to many-flowered, subterete or slightly compressed, the rachilla disarticulating above the glumes and between the florets; glumes unequal, short, obtuse or acute, usually scarious, mostly 1-nerved; lemmas broad, convex on the back, firm, usually obtuse, awnless, scarious at apex, 5- to 9-nerved, the nerves parallel, usually prominent. [*Glyceria* R. Br.].—Thirty-five species, in the temperate regions of both hemispheres.—MANNA-GRASSES. MEADOW-GRASSES. FOWL MEADOW-GRASSES.

Spikelets narrow, mostly linear, usually more than 1 cm. long.  
Spikelets ovoid or oblong, usually not over 0.5 cm. long.

I. ACUTIFLORAE.  
II. OBTUSAE.

#### I. ACUTIFLORAE

Lemmas obtuse, about as long as the palea.  
Lemmas acute, much exceeded by the palea.

1. *P. septentrionalis*.  
2. *P. acutiflora*.

#### II. OBTUSAE

Panicle contracted, narrow.

Lemmas about 3 mm. long: panicle oblong, dense, usually not over 10 cm. long.

Lemmas about 2 mm. long: panicle linear, 15–30 cm. long, loose.

Panicle open, lax.

Glumes short, rounded, the first about 1 mm. long or less: lemmas about 2 mm. long.

Glumes oblong, the first 1.5–2 mm. long: lemmas about 3 mm. long.

Spikelets elliptic, pointed, pale: plant weak or lax, usually creeping and rooting at the base: panicles usually not over 15 cm. long, few-flowered.

Spikelets oblong, purple: plant upright, stout: panicle many-flowered.

3. *P. obtusa*.  
4. *P. melicaria*.  
5. *P. striata*.  
6. *P. pallida*.  
7. *P. grandis*.

1. *P. septentrionalis* (A. Hitchc.) Bicknell. Stem 1–1.5 m. tall: panicle 5–6 cm. long, the short branches ascending or spreading: spikelets 1.5–2 cm. long: lemmas 4–4.5 mm. long, faintly 7-nerved, scabrous on and between the nerves. [*P. frutans* (Fl. SE. U. S.)]—(SWEET-GRASS. FLOTE-GRASS.)—Shallow water, various provinces, S. C. to Tex., Minn., and Mass.

2. *P. acutiflora* (Torr.) Kuntze. Stem weak, slender, as much as 100 cm. long: panicle nearly simple, 15–35 cm. long, the branches mostly appressed: spikelets 5–12-flowered, 2–4 cm. long: lemmas 6–8 mm. long, scabrous. [*G. acutiflora* Torr.]—Shallow water, various provinces, Tenn. to Ohio, Ind., and N. H.

3. *P. obtusa* (Muhl.) Kuntze. Stem stout, erect, 30–120 cm. tall: panicle 6–18 cm. long: spikelets 3–7-flowered, 5–6 mm. long. [*G. obtusa* Trin.]—Bogs and marshes, often in acid soil, Coastal Plain and adj. provinces, N. C. to N. B.

4. *P. melicaria* (Michx.) A. Hitchc. Stem erect from a creeping rootstock, 60–100 cm. tall: panicle nodding at the summit: spikelets appressed, 3–4-flowered, about 4 mm. long. [*P. elongata* Kuntze *G. elongata* Trin. *G. Torreyi* A. Hitchc.]—Wet woods, Blue Ridge and more northern provinces, N. C. and Tenn. to Minn. and Que.

5. *P. striata* (Lam.) A. Hitchc. Forming dense tussocks: stem erect, 30–100 cm. tall: leaf-blades elongate: panicle nodding, 10–20 cm. long, the branches drooping, naked below: spikelets 3–7-flowered, 3–4 mm. long: lemmas prominently 7-nerved. [*Poa striata* Lam. *G. nervata* Trin. *P. nervata* Kuntze *G. striata* A. Hitchc.]—Moist ground, various provinces, Fla. to Tex., Wash., Ont., and Newf.—(*Mex.*)

6. *P. pallida* (Torr.) Kuntze. Stem often reclining, up to 100 cm. long: spikelets loosely 4–9-flowered, 6–7 mm. long: lemmas 7-nerved, scabrous. [*G. pallida* Trin.]—Shallow water, various provinces, Tenn. to Mo. and N. S.—Plants resemble those of some species of *Poa*.

7. *P. grandis* (S. Wats.) Nash. Stem 100–150 cm. tall: leaf-blades 5–15 mm. wide: panicle 20–40 cm. long, loose and open: spikelets 4–7-flowered, 5–6 mm. long: lemmas 7-nerved. [*P. americana* MacM. *G. grandis* S. Wats.]—Wet places, various provinces, Tenn. to Alas., Ont., and N. B.

93. **FESTUCA** L. Low or rather tall annuals or perennials of various habit, the spikelets in narrow or open panicles. Spikelets few- to several-flowered, the rachilla disarticulating above the glumes and between the florets: glumes narrow, acute, unequal, the first sometimes very small: lemmas rounded on the back, membranaceous or somewhat indurate, 5-nerved, the nerves often obscure, acute or rarely obtuse, awned from the tip or rarely from a minutely bifid apex.—One hundred species, in temperate and cool regions.—FESCUE-GRASSES. FESCUES.

Plant annual: stamen usually 1.

Plant perennial: stamens 3.

Leaf-blades very narrow, involute.

Leaf-blades flat.

I. OCTOFLORAE.

II. RUBRAE.

III. OBTUSAE.

#### I. OCTOFLORAE

Awn less than twice as long as the lemma: spikelets closely 5–13-flowered, glabrous or scabrous.

1. *F. octoflora*.

Awn more than twice as long as the lemma: spikelets loosely 4–6-flowered.

Lemmas scabrous above: first glume less than half as long as the second.

2. *F. Myuros*.

Lemmas pubescent: first glume  $\frac{1}{2}$ – $\frac{3}{4}$  as long as the second.

3. *F. sciurea*.

#### II. RUBRAE

Plant decumbent at base: stems solitary or clustered, the leaves often numerous: panicle with erect or appressed branches.

4. *F. rubra*.

#### III. OBTUSAE

Spikelets oblong to linear, about 1 cm. long: panicles narrow, the branches appressed at maturity.

5. *F. elatior*.

Spikelets ovate or oval, mostly less than 5 mm. long: panicles open, the branches spreading, naked below.

Spikelets at the end of long slender branches of a very open panicle.

6. *F. obtusa*.

Spikelets somewhat aggregate along the upper half of the short branches of the less open nodding panicle.

7. *F. Shortii*.

1. *F. octoflora* Walt. Stem erect, 5–40 cm. tall: panicle narrow, erect, 3–12 cm. long, often reduced to a raceme: spikelets 5–12 mm. long: lemmas 4–5 mm. long, the awn 1–7 mm. long. [*F. tenella* Willd. *F. parviflora* Ell.]—Dry sterile soil, various provinces, Fla. to Tex., Calif., B. C., and Que.—(*Mex.*)

2. *F. Myuros* L. Stem erect or decumbent at base, 20–60 cm. tall: panicle 7–20 cm. long, narrow: spikelets 8–11 mm. long: glumes very unequal, the first 1–1.5 mm. long.—Dry fields and waste-places, various provinces, Ga. to La. and Mass. Nat. of Eu.—(*W. I., Mex.*)

3. *F. sciurea* Nutt. Similar to *F. Myuros*: spikelets 4–5 mm. long: first glume 2 mm. long.—Sandy grounds, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and Va.

4. *F. rubra* L. Stem solitary, sometimes a few stems together, 30–80 cm. tall: leaves glabrous: panicles 5–20 cm. long, usually contracted, the branches erect: spikelets 4–6-flowered, 7–8 mm. long: lemmas 5–7 mm. long, the awn usually about half as long.—Brackish meadows along the coast, N. C. to Lab.; on the Pacific Coast; also cult. and escaped, various provinces, Ga. to Tenn. and Md.—(*Eurasia.*)

4a. *F. ovina* L. and some of its allies are occasionally introduced with grass seed, but they do not appear to persist. They resemble *F. rubra* but are erect and closely tufted.—*F. ovina* L. (SHEEP'S FESCUE) has capillary short firm blades, the awn of the lemma 1 mm. or more long.—*F. capillata* Lam. has slender flexuous capillary blades, the lemmas awnless or nearly so.—*F. duriuscula* L. (HARD FESCUE) has firm blades about 1 mm. wide.

5. *F. elatior* L. Stem 50–120 cm. tall: leaf-blades 4–8 mm. wide: panicle 10–20 cm. long, the branches spreading in flower, appressed in fruit, spikelet-bearing nearly to base: spikelets 9–11 mm. long: lemmas acute, awnless, rarely short-awned.—Meadows and waste-places, from Ala. to La. northward nearly throughout U. S. and S Can. Cult. as meadow grass. Nat. of Eu.

6. *F. obtusa* Spreng. Stem solitary or few, 40–120 cm. tall: panicle diffuse, drooping, 10–20 cm. long, the branches loosely spikelet-bearing near the ends: spikelets 3–5-flowered, 5–7 mm. long. [*F. nutans* Spreng.]—Moist woods, various provinces, Fla. to Tex., N. D., and N. S.

7. *F. Shortii* Kunth. Resembles *F. obtusa*: panicle more compact, the few shorter branches spikelet-bearing from about the middle, the spikelets crowded.—Wet prairies, various provinces, Fla. to Tex., Ia. and Pa.

94. *SCLEROPOA* Griseb. Low annual. Spikelets spiral-flowered, linear, somewhat compressed, the rachilla disarticulating above the glumes and between the florets: glumes unequal, short, acutish, strongly nerved, the first 1-nerved, the second 3-nerved: lemmas convex, nearly terete, glabrous, obscurely

5-nerved, obtuse, awnless, slightly scarious at the tip. Resembling *Festuca*.—One species, native of Eu.

1. *S. rigida* (L.) Griseb. Stems erect or spreading, 10–20 cm. tall, glabrous or minutely puberulent: leaf-blades flat, 1–2 mm. wide: panicles narrow, condensed, 5–10 cm. long, the branches short, floriferous to base, these and the thick pedicels somewhat divaricately spreading in anthesis: spikelets 4–10-flowered, 5–8 mm. long: glumes about 2 mm. long, lemmas about 2.5 mm. long. [*Diplachne rigida* Munro]—(PRICKLY FESCUE).—Waste-places, introduced with ballast, Apalachicola, Fla. and Mobile, Ala.; also S Miss.

95. **BROMUS** L. Low or rather tall annuals or perennials, with closed sheaths, flat blades and open or contracted panicles of large spikelets. Spikelets several- to many-flowered, the rachilla disarticulating above the glumes and between the florets; glumes unequal, acute, the first 1- to 3-nerved, the second usually 3- to 5-nerved; lemmas convex on the back or keeled, 5- to 9-nerved, 2-toothed at the apex, awnless or usually awned from between the teeth; palea usually shorter than the lemma.—One hundred species, in temperate regions generally.—BROME-GRASSES. CHEATS. CHESSES.

Spikelets strongly flattened, the lemmas distinctly compressed-keeled: lemmas acuminate, mucronate, the awn usually not more than 2 mm. long: plant annual.

Spikelets usually not flattened: lemmas not compressed-keeled. Plant perennial.

Plant annual.

Glumes rather broad: lemmas broadly elliptic.

Glumes narrow: lemmas narrow and gradually acuminate.

#### I. UNIOLOIDES.

#### II. CILIATI.

#### III. RACEMOSI.

#### IV. STERILES.

#### I. UNIOLOIDES

Plant rather stout, with tufted, usually decumbent stems, and pubescent leaf-sheaths.

1. *B. unioloides*.

#### II. CILIATI

Lemmas awnless or nearly so: panicle-branches suberect.

Lemmas long-awned: panicle-branches drooping.

Lemmas glabrous.

Lemmas pubescent or scabrous.

2. *B. inermis*.

3. *B. ciliatus*.

3. *B. laevigulum*.

4. *B. purgans*.

#### III. RACEMOSI

Leaf-sheaths glabrous.

Leaf-sheaths pubescent.

5. *B. secalinus*.

6. *B. commutatus*.

#### IV. STERILES

Awns about 1.5 mm. long: lemmas pubescent.

Awns 2–3 cm. long: lemmas scabrous-puberulent.

7. *B. tectorum*.

8. *B. sterilis*.

1. *B. unioloides* H. B. K. Stem rather stout, 30–100 cm. tall: panicle 15–50 cm. long, usually narrow, the branches appressed, sometimes wider with spreading branches: spikelets 2–3.5 cm. long, 7–11-flowered: first glume, 5-nerved, 7–10 mm. long, the second 7-nerved, 10–13 mm. long: lemmas subcoriaceous,

glabrous or scabrous, 13-16 mm. long.—Waste-places, roadsides, and prairies, various provinces, Fla. to Tex., Calif., and Tenn.—(*Mex., C. A., S. A.*)—Cult. as RESCUE GRASS.

2. *B. inermis* Leyss. Perennial with a creeping rootstock: spikelets linear, purplish, the lemmas awnless or nearly so, glabrous.—(BROME-GRASS.)—Cult., and rarely found in waste-places within our range. Nat. of Eu.—*B. erectus* Huds. has been found in Ala. It differs from *B. inermis* in having no rootstocks; also N. Y. to Wash. and Me.

3. *B. laeviglumis* (Scribn.) A. Hitchc. Stem up to 100 cm. tall: leaf-sheaths glabrous or pilose: panicle open, 15-20 cm. long: spikelets, 1.5-2 cm. long: lemmas about 1 cm. long, the awn about half as long. [*B. ciliatus laeviglumis* Scribn.]—Moist woods, Blue Ridge and more northern provinces, N. C. to N. D. and Me.

4. *B. purgans* L. Stem 70-140 cm. tall: leaf-sheaths sparsely retrorsely pilose: blades as much as 1.5 cm. wide: panicle 15-25 cm. long, the branches bearing a few spikelets near the ends: spikelets 2-2.5 cm. long, 7-10-flowered: lemmas 10-12 mm. long, densely pubescent all over, the awn 4-6 mm. long.—Dry woods, various provinces, Fla. to Tex., Mont., and Vt.

4a. *Bromus ciliatus* L. has been found in Tenn. It differs from *B. purgans* in the lemmas pubescent at margin, glabrous on back; also W. Va., to Cal. and northward.

5. *B. secalinus* L. Stem 40-100 cm. tall: panicle open, 5-15 cm. long, the branches drooping: spikelet 5-15-flowered, glabrous: lemmas 8-11 mm. long, plump at maturity, the margins inrolled, the awn mostly less than 5 mm. long.—(CHESS. CHEAT.)—Fields and waste-places, nearly throughout U. S. and S Can. Nat. of Eu.

6. *B. commutatus* Schrad. Similar to *B. secalinus*, but the leaf-sheaths pubescent: lemmas slightly longer, at maturity less plump, the margins not inrolled. [*B. racemosus commutatus* Hook.]—Waste-places, from S. C., Tenn., and Tex. northward, nearly throughout U. S. and S Can. Nat. of Eu.

6a. *Bromus japonicus* Thunb. has been found in N. C. and Ky. It differs from *B. commutatus* in the slender flexuous branches of the panicle and the divergent awn; also Vt. to Calif. and Wash.—(*Eurasia.*)

7. *B. tectorum* L. Stem 30-60 cm. tall: leaves softly pubescent: panicle rather dense, drooping, 6-15 cm. long: spikelets 13-20 mm. long, nodding.—Waste-places, various provinces, Miss. and Tenn. to Wash. and Me.; Pacific Coast. Nat. of Eu.

8. *B. sterilis* L. Leaves minutely puberulent: panicle 10-20 cm. long, broad, lax, drooping, the slender branchlets usually bearing one spikelet: spikelets 2.5-3.5 cm. long, drooping.—Waste-places, various provinces, N. C. to Ala., Ill., and Mass. Nat. of Eu.—(*W. I.*)

96. **LOLIUM** L. Annuals or perennials, with flat blades and simple terminal flat spikes. Spikelets several-flowered, solitary, sessile, placed edgewise to the continuous rachis, one edge fitting to the alternate concavities, the rachilla disarticulating above the glumes and between the florets; first glume wanting (except on the terminal spikelet), the second outward, strongly 3-5-nerved:

lemmas rounded on the back, 5- to 7-nerved.—Eight species, natives of Eurasia.—**RYE-GRASSES. DARNELS.**

Glume equalling the uppermost floret: plant annual.

Glume shorter than the spikelet: plants perennial.

Lemmas awned.

Lemmas awnless or nearly so.

1. *L. temulentum*.

2. *L. multiflorum*.

3. *L. perenne*.

1. ***L. temulentum*** L. Stem 60–120 cm. tall: spike 10–30 cm. long: spikelets 5–7-flowered: lemma awned or awnless, plump.—(**POISON-DARNEL**).—Waste-places, various provinces, Ga. to Tex., Kan., and N. B. Nat. of Eu.

2. ***L. multiflorum*** Lam. Stem 30–60 cm. tall: spike 20–30 cm. long: spikelets 10–20-flowered: lemmas 7–8 mm. long, at least the upper awned. [*L. italicum* A. Br.]—(**ITALIAN RYE-GRASS**).—Meadows and waste-places, nearly throughout U. S.; infrequent southward. Nat. of Eu.

3. ***L. perenne*** L. Resembles *L. multiflorum*: spike more slender: spikelets 8–10-flowered: lemmas 5–6 mm. long.—(**ENGLISH RYE-GRASS. PERENNIAL RYE-GRASS**).—Meadows and waste-places, cult. as a meadow grass, northern states; infrequent southward, but locally naturalized. Nat. of Eu.

97. **AGROPYRON** Gaertn. Our species perennials, with erect culms, erect spikes, and creeping rootstocks. Spikelets several-flowered, solitary, sessile, placed flatwise at each joint of a continuous rachis; glumes equal, firm, several-nerved, usually shorter than the first lemma, acute or awned: lemmas convex on the back, rather firm, 5–7-nerved, usually acute or awned from the apex: palea shorter than the lemma.—Sixty species, natives of temperate regions generally.—**WHEAT-GRASSES. QUITCH-GRASSES. QUICK-GRASSES.**

1. ***A. repens*** (L.) Beauv. Plant green or glaucous: spikelets about 5-flowered, 1–1.5 cm. long: glumes 8–10 mm. long, strongly nerved: lemmas about 1 cm. long, usually with an awn about 5 mm. long.—(**QUACK GRASS**).—Fields and waste-places, from N. C. northward almost throughout the N U. S. Nat. of Eu.—(*Mex.*)

98. **HORDEUM** [Tourn.] L. Low or rather tall annuals or perennials with flat blades and dense terminal cylindrical or bristly-bushy spikes. Spikelets 1-flowered, 3 together at each node of the articulate rachis, the middle one sessile, the others short-pedicelled, the rachilla disarticulating above the glumes and, in the central spikelet, prolonged behind the palea as a bristle, this sometimes bearing a rudimentary floret: lateral spikelets reduced, imperfect; glumes narrow, often subulate and awned, rigid, standing in front of the spikelet; lemmas rounded on the back, 5-nerved, usually obscurely so, tapering into a usually long awn.—Twenty species, natives of the temperate region of both hemispheres.—**BARLEY-GRASSES. DWARF-BARLEYS.**

Glumes not ciliate.

Glumes of fertile spikelet dilated above the base: plant annual. 1. *H. pusillum*.

Glumes not dilated, all awn-like: plant perennial. 2. *H. nodosum*.

Glumes, or some of them, ciliate: plant annual. 3. *H. murinum*.

1. *H. pusillum* Nutt. Stem 10–40 cm. tall: spike narrow, erect, 2–7 cm. long: first glume of each lateral spikelet and both glumes of central spikelet dilated above the base.—Open grounds, various provinces, Fla. to Calif., Wash., Ohio, to Me., and D. C.—(*Mex.*)

2. *H. nodosum* L. Plant larger than *H. pusillum*, the stems tufted, commonly 30–60 cm. tall: spike 8–10 mm. wide, bristly.—(MEADOW-BARLEY).—Open ground, Calif. to Alas. and Mont. Introduced in Coastal Plain, in Miss., and in Piedmont northward.

3. *H. murinum* L. Stem bushy-branched, spreading: spikes 5–7 cm. long, often partly inclosed in the uppermost inflated sheath: glumes of the central spikelet narrowly spindle-form, 3-nerved, long-ciliate on both margins, the nerves scabrous: awns 2–3 cm. long.—Fields, waste-places, and open ground, various provinces, Ala. to Mass.; also W U. S. Nat. of Eu.

99. **ELYMUS** L. Erect usually rather tall perennials, with flat blades and terminal spikes. Spikelets 2- to 6-flowered, sessile in pairs (rarely in 3's), on a continuous rachis, the rachilla disarticulating above the glumes and between the florets; glumes equal, usually rigid, sometimes indurate below, narrow, sometimes subulate, 1- to several-nerved, acute to aristate, somewhat asymmetric and placed in front of the spikelet: lemmas rounded on the back or nearly terete, obscurely 5-nerved, acute or usually awned from the tip.—Twenty-five species, in the temperate regions of the Northern Hemisphere.—WILD-RYES. LYME-GRASSES. BUFFALO-RYES.

Glumes narrowly lanceolate, more or less indurate at base.

Glumes very narrow with about 2 strong nerves.

Leaf-blades pubescent.

Leaf-blades glabrous.

1. *E. virginicus*.

2. *E. striatus*.

3. *E. riparius*.

1. *E. virginicus* L. Stem 60–100 cm. tall: spike erect, often included at base in the upper leaf-sheath: spikelets glabrous, erect: glumes rigid, broadened and bowed out above the terete yellowish indurate base, narrowed into an awn 1–2 cm. long: lemmas awned, the awn mostly 1–2 cm. long.—(TERRELL-GRASS).—Moist woods, various provinces, Fla. to Tex., Mont., and Newf.—Various subspecies have been described: *E. virginicus hirsutiglumis*, with villous hirsute lemmas and glumes, within the range of the species; *E. virginicus australis* with narrow glumes which, like the lemmas, are villous-hirsute and with long awns, Ga. to Tex. and Mass.; *E. virginicus glabriflorus*, with glabrous spikelets, Fla. to Tex., Nebr., and Md.

2. *E. striatus* Willd. Stem slender, 50–100 cm. tall: leaf-blades 6–10 mm. wide, villous

on the upper surface: sheaths villous: spike pale, 5-10 cm. long, nodding, long-exserted: spikelets 1-2-flowered, somewhat spreading: glumes 1.5-3 cm. long, villous: lemmas about 6 mm. long, hirsute, the awns 2-3 cm. long (glumes and lemmas glabrous in *E. striatus arkansansus*, various provinces, Tenn. to Tex. and Wyo.)—(BLUE-JOINT.)—Rocky woods, various provinces, N. C. to Tex., Wyo., and Vt.

3. *E. riparius* Wiegand. Stem rather slender, 90-150 cm. tall; leaf-sheaths glabrous: blades thin, flat, scabrous, 5-15 mm. wide; spike somewhat nodding, 7-20 cm. long: glumes narrow, somewhat indurate but not bowed-out at base: lemmas minutely hispidulous, the awn straight, mostly 2-3 cm. long—River banks and low ground, various provinces, N. Fla. to Ky., Ind., and Que.

100. *HYSTRIX* Moench. Erect perennials with flat leaf-blades and loosely flowered bristly spikes. Spikelets 2- to 4-flowered, sessile, 1 to 3 at each node of a continuous flattened rachis, horizontally spreading at maturity: glumes reduced to short awns, the first usually obsolete, both often wanting in the upper spikelets: lemmas convex, rigid, tapering into long awns, 5-nerved, the nerves obscure except toward the tip: palea about as long as the body of the lemma.—Four species, of temperate regions, but widely scattered.

1. *H. Hystrix* (L.) Millsp. Stem 60-120 cm. tall: leaf-sheaths glabrous or scabrous; blades mostly 7-15 mm. wide: spike 8-15 cm. long, the internodes of the rachis 5-10 mm. long: spikelets 1-1.5 cm. long: lemmas glabrous, the awns 1-4 cm. long, straight or rarely curved. [*Asprella Hystrix* Willd.]—(BOTTLEBRUSH-GRASS. BOTTLEBRUSH.)—Moist woods, various provinces, rarely Coastal Plain, N. C. to Okla., Minn., and N. B.—The inflorescence resembles a commercial bottle-brush.

101. *ARUNDINARIA* Michx. Gregarious shrubs or tall reeds, with woody perennial branching stems, flat leaf-blades with petioles articulate with the sheaths, and loose racemes or panicles. Spikelets few- to many-flowered, large, compressed, the rachilla disarticulating above the glumes and between the florets: glumes unequal, shorter than the lemmas, the first sometimes wanting: lemmas acute or acuminate, mucronate, faintly many-nerved: palea about as long as the lemma, prominently 2-keeled.—Twenty-five species, all except the following, in the tropics of both hemispheres.—CANES.

Inflorescence borne on short leafless radical shoots of the year.  
Inflorescence borne on leafy branches of the old canes.

1. *A. tecta*.
2. *A. macrosperma*.

1. *A. tecta* (Walt.) Muhl. Stem 1-4 m. tall: leaf-blades 8-20 cm. long: panicle of few aggregate spikelets on slender shoots with rather loose sheaths, the blades obsolete or nearly so: spikelets 2.5-4 cm. long, 5-10-flowered.—(SMALL-CANE. REED. SWITCH-CANE.)—Sour swamps and bogs, Coastal Plain and occasionally Appalachian provinces, Fla. to La. and Md.—Stems in col-

onies that sometimes flower several seasons in succession. Leaves usually rough, drooping.

2. *A. gigantea* (Walt.) Chapm. Stem as much as 10 m. tall and 7 cm. thick at base: leaf-blades 20–50 cm. long: panicle of few simple unequal racemes: spikelets 3–5 cm. long, 5–15-flowered. [*A. macrosperma* Michx.]—(LARGE-CANE. GIANT-CANE.)—Alluvial situations, Coastal Plain, Fla. to Tex., Okla., Ky., and Va.—Stems arborescent, forming “cane-brakes.” Plants flower at irregular and indefinite periods. They resemble bamboo. Stock browse on the young leaves and seeds. Young shoots are used as a pot herb. Stems of the large cane are used for fishing-poles, mats, baskets, and a variety of other purposes. Leaves usually smooth, ascending.

## FAMILY 2. CYPERACEAE — SEDGE FAMILY

Grass-like or rush-like caulescent or scapose herbs, when perennial usually with scaly or tuber-bearing rootstocks. Stems or scapes (culms) mostly solid, angular, terete, or flattened. Leaves 3-ranked, with closed sheaths and narrow blades, sometimes mere scales. Flowers perfect, or monoecious or dioecious, borne in spikelets, usually solitary in the axils of each scale (bract, glume), the spikelets solitary or variously clustered, the scales 2-ranked or spirally imbricate, sometimes partly changed into leaves. Perianth hypogynous, consisting of bristles or scales, or wanting. Androecium of 1–3 stamens, or rarely of more. Gynoecium of 2 or 3 united carpels. Ovary 1-celled. Styles united. Stigmas 2 or 3. Ovules solitary, anatropous. Fruit a lenticular or 3-angled achene.—About 75 genera and 3,200 species, of wide geographic distribution, but of little economic importance.

Spikelets with perfect flowers, or some flowers with abortive androecium or gynoecium. Scales of the spikelet enclosing 1 or 2 bractlets. Tribe I. HEMICARPHEAE.

Scales of the spikelet not enclosing bractlets.

Spikelets many-flowered, sometimes few-flowered, with the lowest scale, or rarely several of the lower scales, flowerless.

Spikelets 1- or 2-flowered, or rarely several-flowered, with 2—several of the lower scales empty.

Spikelets with monoecious or dioecious flowers.

Pistillate flower subtended by a flat scale: achene exposed.

Pistillate flower, and achene, enclosed in a utricle (perigynium).

### I. HEMICARPHEAE

Flower enclosed in 2 bractlets, one of them anterior, the other posterior.

Flower subtended by a single minute posterior bractlet.

### II. SCIRPEAE

Scales of the spikelets conduplicate, often keeled, 2-ranked, the spikelets mostly flattened.

Flowers with barbed perianth-bristles.

Flowers without perianth-bristles.

Achene smooth: style-base not swollen.

Spikelets with 2—many perfect flowers: achene enclosed in a single scale.

Spikelets with 1 perfect flower: achene enclosed in a pair of scales.

Achene warty: style-base swollen.

### II. SCIRPEAE.

### III. RYNCHOSPOREAE.

### IV. SCLERIEAE.

### V. CARICEAE.

### 1. LIPOCARPHA.

### 2. HEMICARPHA.

### 3. DULICHIMUM.

### 4. CYPERUS.

### 5. KYLLINGA.

### 6. ABILDGAARDIA.

Scales of the spikelets merely concave, spirally imbricate.

Base of the style manifestly swollen, persistent as a tubercle on the achene, or deciduous in *Websteria*.

Perianth-(bristles) wanting.

Achene not surmounted by a tubercle: dilated style-base truncate.

7. *FIMBRISTYLIS*.

Achene surmounted by a tubercle: dilated style-base not truncate.

8. *STENOPHYLLUS*.

Perianth-(bristles) present.

Scapose herbs: spikelet solitary, several-many-flowered: achene tubercled: anthers ellipsoid to linear, not conspicuously elongate.

9. *ELEOCHARIS*.

Caulescent herbs: spikelets umbellate, 1-flowered: achene not tubercled: anthers linear-filiform, greatly elongate.

10. *WEBSTERIA*.

Base of the style not at all, or only slightly, thickened, deciduous.

Perianth of short or elongate bristles, or obsolete or wanting.

Perianth-bristles numerous, greatly elongate, silky.

11. *ERIOPHORUM*.

Perianth-bristles 1-8, short, stiff, or wanting.

12. *SCIRPUS*.

Perianth of 3 sessile or stipitate scales, usually alternating with as many barbed bristles.

13. *FUIRENA*.

### III. RYNCHOSPOREAE

Stigmas 2: achene lenticular.

Spikelets in a dense head subtended by a leafy involucre.

14. *DICHROMENA*.

Spikelets not in dense involucre heads.

Spikelets several-flowered: perianth none.

15. *PSILOCARYA*.

Spikelets 1-2-flowered, or rarely few-flowered: perianth present, the bristles sometimes deciduous or obsolete.

16. *RYNCHOSPORA*.

Stigmas 3: achene 3-angled.

Perianth wanting: spikelets short and stout: achene dark. Inflorescence paniculate: spikelets straight: achene of an ovoid type.

17. *MARISCUS*.

Inflorescence capitate: spikelets curved: achene ellipsoid, similar at both ends.

18. *REMIREA*.

Perianth present: spikelets slender: achene white.

19. *SCHOENUS*.

### IV. SCLERIEAE

Spikes few-flowered: perianth-bristles wanting: achene bony or crustaceous, with a disk at the base.

20. *SCLERIA*.

### V. CARICEAE

Plant with more than one leaf, each leaf with a sheath, a ligule, and a midrib.

21. *CAREX*.

Plant with one leaf, the leaf without sheath, ligule, or midrib.

22. *CYMOPHYLLUS*.

1. **LIPOCARPHA** R. Br. Annual low tufted herbs. Leaf-blades very narrow. Spikelets many-flowered, few in a terminal involucre head. Scales firm, spirally imbricate, each subtending a pair of bractlets which enclose a flower, or several of the lower ones empty. Flowers perfect. Perianth wanting. Stamens 1 or 2. Style deciduous, not enlarged at the base. Stigmas 2 or 3. Achene flattened or 3-angled.—About 15 species, widely distributed.

1. **L. maculata** (Michx.) Torr. Plant glabrous: leaf-blades narrowly linear, 1-2 mm. wide, involute: scape flattened, taller than the leaves: involucre bracts 2-4, narrowed above the dilated leaves: spikelets ovoid or ellipsoid, 4-7 mm. long; scales rhombic-cuneate, scarcely 2 mm. long, white-margined, or with reddish-brown spots: exterior bractlet hyaline, few-veined: achene pale, ellipsoid-obovoid, nearly 1 mm. long.—Moist and springy places, Coastal Plain, Fla. to Ala. and Va. Adv. N.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall.

2. **HEMICARPHA** Nees & Arn. Annual low or dwarf caulescent herbs. Leaf-blades very narrow or slender. Spikelets many-flowered, solitary or few together in an involucre head, one involucre bract much exceeding the spikelets. Scales firm, spirally imbricate, each subtending a minute posterior bractlet and a flower. Flowers perfect. Perianth wanting. Stamens 1 or 2. Style deciduous, not swollen at the base. Stigmas 2. Achene flattened or nearly terete.—About 5 species, natives of warm regions. Besides the following, 2 other species occur in the western U. S.—Sum.-fall.

1. **H. micrantha** (Vahl) Pax. Plant 2-10 cm. tall, or rarely more, often tufted or in mats: stem very slender, glabrous: leaf-blades setaceous, smooth: spikelets solitary or 2 or 3 together, ovoid, 2-4 mm. long, not bristly: scales cuneate or cuneate-ovate, about 1 mm. long, abruptly pointed: bractlets fully 0.5 mm. long, delicately veined: achene subcylindric or ellipsoid-ovoid, about 0.7 mm. long, mucronulate, light-brown.—Moist soil and pond-margins, various provinces, Fla. to Tex., Wash., Ont., and N. H.—(W. I., Mex., C. A., S. A.)

3. **DULICHIMUM** L. C. Rich. Perennial tall caulescent herbs, the stems hollow, copiously leafy. Leaf-blades short, very short or wanting on the lower sheaths. Spikelets several-flowered, 2-ranked on axillary peduncles, flat. Scales 2-ranked, conduplicate, decurrent as a wing on the lower joint. Flowers perfect. Perianth of 6-9 retrorsely barbed elongate bristles. Stamens 3. Style not swollen. Stigmas 2. Achene flattened, narrow, beaked with the persistent style-base—One species.

1. **D. arundinaceum** (L.) Britton. Plants gregarious, the stem up to 1 m. tall: leaf-blades spreading or ascending, flat, linear, 2-8 cm. long: spikelets narrowly linear, spreading, 1-2.5 cm. long: scales appressed, lanceolate, fully twice as long as the rachis-joints: achene linear-ellipsoid, 3-3.5 mm. long, slightly stipitate, each with a setaceous beak.—(SHEATHED-GALINGALE.)—Swamps, springy places, and pond-margins, various provinces, Fla. to Tex., Wash., Ont., and N. S.—Sum.-fall.

4. **CYPERUS** [Tourn.] L. Annual or perennial scapose herbs. Leaves basal, with elongate narrow blades or rarely mere sheaths. Scapes simple (in our species) with a terminal involucre of one or several bracts which subtend the simple or compound inflorescence. Inflorescence-branches, when present, sheathed at the base, usually very unequal. Spikelets few—many-flowered, flat or nearly terete, borne in clusters, heads, spikes, or panicles: scales 2-ranked, deciduous, or persistent and falling away with the rachis which dis-

articulates above the lower pair of scales or with each joint of the rachis when it breaks up into 1-fruited sections, the internodes of the rachis often winged. Flowers perfect. Perianth wanting. Stamens 1-3. Style deciduous. Stigmas 2 or 3. Achene lenticular or 3-angled.—About 600 species, widely distributed in warm regions.—Sum.-fall, or all year S.—GALINGALES. SWEET-RUSHES.—The tuberous-thickened rootstocks of some species are used as food.

Stigmas 2: achene of a lenticular type.

Achene laterally flattened. (Subgenus **I. Pycreus**.)

Achene much shorter than the subtending scale.

Achene about as long as the subtending scale.

Achene dorsally flattened. (Subgenus **II. Juncellus**.)

Stigmas 3: achene of a triquetrous type.

Spikelets persistent on the spike-rachis. (Subgenus **III. Eucyperus**.)

Wings of the spikelet-rachis, if any, very narrow.

Plant annual.

Scales of the spikelets awn-tipped.

Scales of the spikelets obtuse, acute, or merely acuminate.

Achene much shorter than the subtending scale.

Achene as long as the subtending scale or longer.

Plant perennial.

Scales of the spikelets appressed, contiguous, the rachis-internodes very short.

Stamens 3: leaves viscid.

Stamen 1: leaves not viscid.

Scales of the spikelets not appressed, distant, the rachis-internodes  $\frac{1}{2}$  as long as the scales or more.

Wings of the spikelet-rachis prominent, often very broad, persistent or deciduous.

Rachis-wings persistent: plant perennial.

Scapes not nodose, 3-angled.

Leaves reduced to sheathing scales at the base of the scape.

Inflorescence subtended by an involucre of 2 short erect or ascending bracts: spikelets narrow, dull.

Inflorescence subtended by an involucre of numerous elongate spreading and drooping bracts: spikelets broad, shining.

Leaves with elongate-linear blades.

Scapes nodose, nearly terete.

Rachis-wings deciduous as interior scales: plant annual.

Spikelets deciduous above the lower pair of scales, or breaking up into 1-fruited sections.

Spikelets deciduous above the lower pair of scales.

(Subgenus **IV. Mariscella**.)

Achene thrice as long as thick or more.

Spikelets decidedly flattened.

Spikelets only slightly flattened or nearly terete or angled, very narrow.

Achene less than thrice as long as thick.

Spikelets breaking up into 1-fruited sections. (Subgenus **V. Torulinum**.)

#### I. FLAVESCENTES

Achene orbicular-obovoid or suborbicular, the superficial cells oblong.

Achene ellipsoid, obovoid, or linear, the superficial cells quadrate.

Scales of the spikelets obtuse, acute, or mucronulate.

Achene obovoid, usually broadly so.

Stamens 2: stigmas much exserted beyond the scale.

Stamens 3: stigmas included, or only slightly exserted.

Achene linear, ellipsoid, oval, or narrowly obovoid.

Scales of the spikelets obtuse.

XVIII. SPECIOSI.

1. *C. flavescons*.

2. *C. diandrus*.

3. *C. rivularis*.

4. *C. densus*.

Scales of the spikelets mucronulate.

Achene nearly 1.5 mm. long: scales about 3 mm. long.

Achene about 1 mm. long: scales 2 mm. long or less.

Spikelets in stiff clusters, spreading.

Spikelets 1.5-2 mm. wide: achene much over  $\frac{1}{2}$  as long as the scale.

Spikelets 1 mm. wide or less: achene slightly over  $\frac{1}{2}$  as long as the scale.

Spikelets in soft plume-like, often dense, clusters, erect or ascending.

Scales of the spikelets prominently short-pointed beyond the scarious margin.

## II. SABULOSI

Achene less than 1.5 mm. long, about equalling the subtending scale.

## III. LAEVIGATI

Spikelets few, in a cluster, appearing lateral on the scape: one involucrel bract elongate and erect: anther slender-tipped, 1 mm. long.

Spikelets numerous, in a terminal erect head: several involucrel bracts elongate and spreading: anther blunt, less than 1 mm. long.

## IV. CUSPIDATI

Scale-body acute or rounded at the base of the awn: achene cuneate-obovoid.

Scale-body notched at the base of the awn: achene obovoid.

## V. COMPRESSI

Spikelets in stiff clusters: achene less than  $\frac{1}{2}$  as long as the scale.

## VI. IRIAE

Spikelets in plume-like clusters: achene as long as the subtending scale.

## VII. ELEGANTES

Spikelets crowded; scales with ciliate-serrulate keels.

## VIII. VIRENTES

Young spikelets long and narrow; scales persistent.

Young spikelets short and broad; scales deciduous.

Achene linear or narrowly ellipsoid, over 1 mm. long.

Achene narrowly ellipsoid: spikelet-scales about 2.5 mm. long.

Achene linear: spikelet-scales about 2 mm. long.

Achene oval or broadly ellipsoid, less than 1 mm. long.

## IX. DISTANTES

Spikelets in irregular spikes, very slender.

## X. HASPAN

Spikelets linear to linear-lanceolate, about 1 mm. wide: involucrel bracts 2, erect or ascending.

## XI. ALTERNIFOLIIS

Spikelets ovate to elliptic, 2-2.5 mm. wide: involucrel bracts numerous, spreading and drooping.

## XII. ESCULENTI

Scales of the spikelets with lax or spreading prominently mucronate tips.

Scales of the spikelets with erect, obtuse, acute, or obscurely mucronulate tips.

Achene  $\frac{1}{4}$  as long as the scale or less: scales blunt, hooded at the apex.

Achene nearly  $\frac{1}{2}$  as long as the scale or more: scales acute, blunt, or mucronulate, not hooded at the apex.

Spikelets of wholly or partly reddish-brown or purple-brown scales.

Spikelets of stramineous or yellowish-brown scales.

5. *C. filicinus*.

6. *C. microdontus*.

7. *C. paniculatus*.

8. *C. odoratus*.

9. *C. pumilus*.

15. *C. compressus*.

16. *C. Iria*.

17. *C. elegans*.

18. *C. ochraceus*.

19. *C. virens*.

20. *C. pseudovegetus*.

21. *C. surinamensis*.

22. *C. distans*.

23. *C. Haspan*.

24. *C. alternifolius*.

25. *C. dentatus*.

26. *C. Le Contei*.

27. *C. rotundus*.

Spikelet-scales less than 3 mm. long.  
Spikelet-scales 3 mm. long or more.

28. *C. esculentus*.  
29. *C. lutescens*.

## XIII. ARTICULATI

Tall gregarious perennial, the leaves mostly represented by basal sheaths: spikes umbel-like.

30. *C. articulatus*.

## XIV. ERYTHORRHIZI

Spikelets many-flowered, mostly over 5 mm. long: spikes mainly ellipsoid.  
Spikelets few-flowered, mostly less than 5 mm. long: spikes mainly cylindric.

31. *C. erythrorrhizos*.

32. *C. Halei*.

## XV. STRIGOSI

Spike-rachis very short, the spike thus globose.  
Spike-rachis elongate, the spike thus longer than wide.  
Achene over  $\frac{1}{2}$  as long as the subtending scale.  
Achene less than  $\frac{1}{2}$  as long as the subtending scale.  
Scales of the spikelets appressed: anthers less than 0.5 mm. long.  
Scales of the spikelets lax: anthers over 0.5 mm. long.

33. *C. Martindalei*.

34. *C. litoreus*. ✓

35. *C. strigosus*.

36. *C. stenolepis*.

## XVI. PRAELONGATI

Spikelets loosely spicate or paniculate, or capitate.  
Spikelets in several or many spikes or panicles.  
Achene 1.5-2 mm. long, less than  $\frac{1}{2}$  as long as the scale: rachis-wings very narrow.  
Achene 2.5-3 mm. long, fully  $\frac{1}{2}$  as long as the scale: rachis-wings broad.  
Spikelets capitate, the head solitary.  
Spikelets crowded, sometimes densely so, in globose, cylindric, or obovoid spikes.  
Spikelets reflexed or deflexed, the spikes broadest at the top or above the middle.  
Scape rough-pubescent, at least above.  
Inflorescence-rays rough: lower spikelets deflexed.  
Inflorescence-rays smooth: lower spikelets reflexed-spreading.  
Scape smooth and glabrous.  
Spikelets spreading in all directions, only the basal ones reflexed.  
Spikes ovoid or ellipsoid to cylindric, or narrowed near the base.  
Spikes large, 2 cm. thick or more.  
Spikes small, less than 1.5 cm. thick.  
Spikes narrowly obovoid or cylindric-obovoid, the basal spikelets only reflexed.  
Spikes ellipsoid to cylindric.  
Spikelets 4.5 mm. long or less.  
Spikelets 1-2-flowered: rachis-wings broad.  
Spikes ellipsoid, sometimes narrowly so, simple: spikelets 3-4 mm. long, green.  
Spikes cylindric, the larger ones, at least, compound: spikelets 2.5-3 mm. long, stramineous.  
Spikelets 3-4-flowered: rachis-wings very narrow.  
Spikelets 5 mm. long or more.  
Spikes stramineous: scales 1.5-2 mm. long, lax.  
Spikes green: scales 2.5-3 mm. long, closely appressed.  
Spikes globose.

37. *C. praelongatus*. ✓

38. *C. refractus*.

39. *C. floridanus*.

40. *C. retrofractus*.

41. *C. dipsaciformis*.

42. *C. hystericinus*. ✓

43. *C. lancastriensis*.

44. *C. retrorsus*.

45. *C. Torreyi*.

46. *C. Dceringianus*. ✓

47. *C. Pollardi*.

48. *C. Winkleri*.

49. *C. Plankii*.

50. *C. ovularis*.

## XVII. TETRAGONI

Spikelets few-flowered, bearing 1-4 achenes; scales appressed.  
Spikes dense, the spikelets usually crowded together.  
Spikes umbellate, oval, ellipsoid, globose, or depressed: spikelets subulate.  
Spikes simple, or sometimes with a small cluster at the base.  
Spikes ellipsoid or oval.

51. *C. Nashii*.

- Spikes globose or depressed, or globose-ovoid.  
 Spikes panicately branched, compound.  
 Spikes capitate, cylindric: spikelets ellipsoid or ellipsoid-ovoid.  
 Spikes lax or stiff, the spikelets loosely spreading.  
 Spikelets slender, linear-subulate to subulate, 4-8 times as long as wide.  
 Spikelets contiguous on the rachis; scales over 3 mm. long.  
 Spikelets separated on the rachis; scales less than 3 mm. long.  
 Spikelets stout, linear-elliptic to elliptic, 2-3 times as long as wide.  
 Spikelets several to many-flowered, bearing 8-12 achenes: scales not appressed.  
 Spikelets green or yellowish-green.  
 Spikelets less than 2 mm. wide: achene ellipsoid, about 0.5 mm. wide.  
 Spikelets 2-3 mm. wide: achene obovoid, about 1 mm. wide.  
 Spikelets chestnut-colored, pale or dark.  
 Rachis-wings obsolete or very narrow.  
 Inflorescence branched: spikelet-rachis slender.  
 Inflorescence a single sessile head: spikelet-rachis stout.  
 Rachis-wings broad, partly enveloping the achene.

52. *C. globulosus*.  
 53. *C. ligularis*.  
 54. *C. cayennensis*.

55. *C. hermaphroditus*.  
 56. *C. dissitiflorus*.  
 57. *C. tetragonus*.

58. *C. multiflorus*.  
 59. *C. filiculmis*.

60. *C. Blodgettii*.  
 61. *C. fuliginosus*.  
 62. *C. brunneus*.

## XVIII. SPECIOSI

- Scales of the spikelets distant, the successive scales on either side remote from the bases of those above them: achene linear-ellipsoid.  
 Scales of the spikelets manifestly imbricate: achene broader.  
 Achene ellipsoid, narrowly obovoid, or ellipsoid-obovoid, inequilateral.  
 Spikes yellowish or grayish-brown; scales firm: achene obovoid, sometimes narrowly so.  
 Spikes dull-brown; scales thin: achene ellipsoid or ellipsoid-obovoid.  
 Achene broadly obovoid or obpyramidal, equilateral.

63. *C. Engelmannii*.

64. *C. ferax*.

65. *C. speciosus*.  
 66. *C. longispicatus*.

1. *C. flavescens* L. Plant annual, tufted, up to 4 dm. tall, yellowish-green: spikelets clustered, linear, 8-18 mm. long, straw-colored: scales ovate, about 2 mm. long, obtuse or obtusish, appressed: achene orbicular-obovoid, or suborbicular, 1 mm. long, about  $\frac{1}{2}$  as long as the scale, black.—Low and marshy places, various provinces, Fla. to Tex., Mich., and N. Y.—(*W. I., Mex., C. A., O. W.*)

2. *C. diandrus* Torr. Plant annual, tufted, up to 4 dm. tall, deep-green: spikelets clustered, elliptic-ovate or linear-elliptic, 8-18 mm. long, dull: scales thin, ovate, about 3 mm. long, brown-margined and more or less brown-spotted, obtuse, loosely appressed: stigmas conspicuously exserted from the scales: achene obovoid, often broadly so, fully 1 mm. long, about  $\frac{1}{2}$  as long as the scale, brown or gray.—(*CYPRESS-GRASS.*)—Low grounds, swamps, and marshes, various provinces, Ala. to Nebr., Ont., and N. B.

3. *C. rivularis* Kunth. Similar to *C. diandrus* in habit: spikelets clustered, ovate, elliptic, or broadly linear, 8-20 mm. long, somewhat shining: scales firm, ovate or rhombic-ovate, about 3 mm. long, with broad brown margins or brown, or rarely pale, obtuse, appressed: stigmas slightly exserted: achene broadly obovoid, fully 1 mm. long, about  $\frac{1}{2}$  as long as the scale, brown.—Wet soil or low ground, chiefly along streams or ponds, various provinces, N. C. to Ark., Nebr., Ont., and Me.

4. *C. densus* Link. Plant annual, sparingly tufted, up to 7 dm. tall, bright-green: spikelets clustered, sometimes densely so, linear to lanceolate, 5-9 mm. long, straw-colored or yellowish-green: scales thinnish, ovate, about 2 mm. long, obtuse, appressed, sometimes loosely so: achene oval or ellipsoid-obovate, about 1 mm. long,  $\frac{1}{2}$  as long as the scale, brown.—Ditches and moist ground, or sometimes epiphytic, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)
5. *C. filicinus* Vahl. Plant annual, tufted, up to 3 dm. tall, yellowish-green: spikelets rather loosely clustered, linear to linear-lanceolate, 9-30 mm. long, mainly yellowish-brown: scales firm, ovate or somewhat rhombic, about 3 mm. long, mucronulate, loosely appressed: achene obovate or narrowly obovate, nearly 1.5 mm. long, obtuse or truncate at the apex, light-brown,  $\frac{1}{2}$  as long as the scale or nearly so.—The plant of the Southern States has narrower spikelets and narrower achenes. [*C. Nuttallii* Eddy]—Salty and brackish marshes, and low grounds, Coastal Plain and New England Coast, Fla. to Miss. and Me.—(*W. I.*)
6. *C. microdontus* Torr. Plant annual, tufted, up to 7 dm. tall, yellowish-green: spikelets clustered, linear, often narrowly so, 6-18 mm. long, yellowish-brown: scales thin, ovate, about 1.5 mm. long or rarely nearly 2 mm. long, obtuse, notched, or abruptly pointed, rather loosely appressed: achene ellipsoid, about 1 mm. long, mucronulate, grayish, fully  $\frac{1}{2}$  as long as the scale.—Moist to wet ground, Coastal Plain and adj. provinces, Fla. to Tex. and N. J.
7. *C. paniculatus* Rottb. Plant annual, tufted, up to 6 dm. tall, bright-green: spikelets clustered, narrowly linear to narrowly linear-lanceolate, 6-18 mm. long, pale chestnut-brown: scales rather firm, elliptic to ovate, 1.5-2 mm. long, or rarely longer, mucronulate: achene ellipsoid-obovate, about 1 mm. long, mucronulate, about  $\frac{1}{2}$  as long as the scale, grayish. [*C. Gatesii* Torr.]—Low grounds and springy places, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Va.—(*W. I., Mex., C. A., S. A.*)
8. *C. odoratus* L. Plant annual, tufted, up to 9 dm. tall, pale-green: spikelets crowded, linear-lanceolate to narrowly linear, 6-20 mm. long, gray-brown or straw-colored: scales ovate, 1.5-2 mm. long, mucronulate, appressed: achene ellipsoid or nearly so, often contracted at the base, about 1 mm. long, rounded at the apex, over  $\frac{1}{2}$  as long as the scale, grayish. [*C. polystachys* Rottb.]—Ditches and low grounds, Coastal Plain, Fla. to Tex.—(*W. I., Mex., S. A., O. W.*)
9. *C. pumilus* L. Plant annual, densely tufted, up to 3 dm. tall, pale-green: spikelets crowded, sometimes loosely so, linear, 4-9 mm. long, silvery-gray: scales ovate, 1.5 mm. long, prominently short-pointed, appressed: achene obovate, about 0.5 mm. long, truncate and mucronulate at the apex, less than  $\frac{1}{2}$  as long as the scale.—Sandy, often wet soil, Coastal Plain, Fla. and Ala.—(*W. I., O. W.*)
10. *C. sabulosus* Mart. & Schrad. Plant annual, sometimes tufted, up to 10 dm. tall, often yellowish-green: spikelets densely clustered, linear, 8-20 mm. long, yellowish-brown: scales oval or suborbicular, about 1.5 mm. long, truncate at the apex, appressed: achene obovate, nearly 1.5 mm. long, mucronate, black, as long as the scale or nearly so. [*C. flavicomus* Vahl]—Moist to wet sandy soil, Coastal Plain, Fla. to Tex. and Va.
11. *C. laevigatus* L. Plant perennial, tufted or gregarious, up to 4 dm. tall, light-green: bracts of the involucre very unequal, one only conspicuous and elongate, erect or nearly so: spikelets crowded, usually in a single head, oblong-ovate to elliptic or linear, 6-15 mm. long, chestnut, or merely variegated with chestnut: scales deltoid-ovate, nearly 2 mm. long, obtuse or acutish, appressed:

achene oval to oval-ovoid or somewhat obovate, less than 1.5 mm. long, or rarely larger, fully  $\frac{1}{2}$  as long as the scale.—Sandy, often moist, soil, Coastal Plain, S. C. and N. C. Introduced in Calif.—(*W. I., Mex., C. A., S. A., O. W.*)

12. *C. Careyi* Britton. Plant annual, tufted, up to 1 dm. tall, pale-green: bracts of the involucre elongate, mostly 1–2.5 mm. wide: spikelets crowded in a head, ovate-elliptic to elliptic, 3–4 mm. long, silvery or whitish: scales ovate, 2–2.5 mm. long, abruptly pointed, appressed: achene ellipsoid or obovoid-ellipsoid.—Sandy soil, M Fla.

13. *C. inflexus* Muhl. Plant annual, tufted, up to 1.5 dm. tall, bright-green, fragrant: spikelets densely crowded, linear-elliptic or elliptic, 3–9 mm. long, light-brown: scales less than 2 mm. long, rather lax, the subulate awn much shorter than the striate body: achene cuneate-obovoid, about 1 mm. long, abruptly short-beaked, brown, less than  $\frac{1}{2}$  as long as the scale.—Damp to wet sandy soil, rocks, and shores, various provinces, Fla. to Tex., Calif., B. C., Sask., and N. B.—(*Mex.*)

14. *C. cuspidatus* H. B. K. Plant annual, tufted, up to 1.5 dm. tall, bright-green, licorice-scented: spikelets loosely capitate, linear, 5–12 mm. long, often curved, light-chestnut: scales about 2 mm. long, lax, the subulate awn nearly or quite as long as the body: achene obovoid, about 0.5 mm. long, dark-brown, minutely beaked, less than  $\frac{1}{2}$  as long as the scale. [*C. squarrosus* (Fl. SE. U. S.)]—Sandy fields and pinelands, Coastal Plain, Fla. to Tex. and Ga. Introduced in Calif.—(*W. I., Mex., C. A., S. A.*)

15. *C. compressus* L. Plant annual, tufted, up to 3.5 dm. tall, with the scapes sometimes reclining, light-green: spikelets loosely capitate, but stiff, narrowly lanceolate or narrowly elliptic to linear, 7–25 mm. long, mainly greenish, often shining: scales ovate to ovate-lanceolate, 3–3.5 mm. long, somewhat acuminate, appressed: achene obovoid, fully 1 mm. long, rounded at the apex, dull-brown, less than  $\frac{1}{2}$  as long as the scale.—Sandy roadsides, pinelands, and fields, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Pa.—(*W. I., Mex., C. A., S. A., O. W.*)

16. *C. Iria* L. Plant annual, up to 6 dm. tall, sometimes tufted, bright-green: spikelets in plume-like clusters, elliptic, mostly 5–10 mm. long, about 2 mm. wide, yellowish or brownish: scales thin, obovate or nearly orbicular, 1–1.5 mm. long, mucronulate: achene elliptic-obovoid, 1–1.5 mm. long, abruptly pointed, as long as the scale or longer.—Swamps and cult. grounds, especially about rice-fields, Coastal Plain and adj. provinces, Fla. to Tex. and N. C.; also S N. Y.—Nat. of Asia.

17. *C. elegans* L. Plant perennial, tufted, up to 7 dm. tall, pale-green: spikelets densely crowded, linear-elliptic, 6–12 mm. long, light tan-colored or pale-green: scales rhombic-ovate, 2.5–3 mm. long, scabrous on the back, acute, loosely appressed: achene obpyramidal (or obovoid), fully 1.5 mm. long, gray, short-beaked, about  $\frac{1}{2}$  as long as the scale.—Sandy soil or marl, Key West and Big Pine Key, Fla.; also in Tex. and N. M.—(*W. I., Mex., C. A.*)

18. *C. ochraceus* Vahl. Plant perennial, up to 12 dm. tall, bright- or yellowish-green, the scapes smooth: spikelets densely clustered, linear-elliptic to linear-lanceolate, 5–12 mm. long, 2–3 mm. wide, yellowish: scales ovate, 2–2.5 mm. long, obtuse: achene fully 1 mm. long, the body ovoid, contracted at both ends, over  $\frac{1}{2}$  as long as the scale.—Moist slopes, swamps, and ponds, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A.*)

19. *C. virens* Michx. Plant perennial, up to 15 dm. tall, often tufted, pale-green: spikelets crowded in rather large clusters, ovate to elliptic-ovate, rela-

tively narrower in age, 6–14 mm. long, 3–4 mm. wide, pale-green: scales elliptic-lanceolate, about 2.5 mm. long, obtuse or acutish, nearly straight: achene narrowly ellipsoid, about 1.5 mm. long, short-stipitate and short-beaked, straight, fully  $\frac{1}{2}$  as long as the scale.—Damp soil, low grounds, and swamps, Coastal Plain, Fla. to Tex. and N. C.; also in Calif.—(*W. I., Mex., C. A.*)—Specimens occur with nodose leaves and smooth.

20. *C. pseudovegetus* Steud. Plant perennial, up to 13 dm. tall, sometimes tufted, pale-green: spikelets crowded in rather small clusters, ovate to orbicular, relatively narrower in age, 4–6 mm. long, 4–5 mm. wide, light-green: scales lanceolate, about 2 mm. long, acute or acutish, strongly curved: achene linear, fully 1 mm. long, slender-stipitate and slender-beaked, often curved, over  $\frac{1}{2}$  as long as the scale.—Wet places, swamps, low woods, and ditches, Coastal Plain and adj. provinces, Fla. to Tex., Kans., and N. J.—(*W. I.*)

21. *C. surinamensis* Rottb. Plant perennial, up to 12 dm. tall, solitary or tufted, pale-green, the scape rough above: spikelets clustered in rather small dense heads, ovate, narrower and elongate in age, 5–12 mm. long, 2–2.5 mm. wide, yellow or yellowish: scales ovate, about 1.5 mm. long, acute or acutish, straight: achene ellipsoid, less than 1 mm. long, short-stipitate and short-beaked, straight, about  $\frac{1}{2}$  as long as the scale.—Moist grounds, swamps, roadsides, and ditches, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A.*)

22. *C. distans* L. Plant perennial, up to 15 dm. tall, commonly gregarious, light-green: spikelets in lax irregular spikes, linear-filiform, very slender, 9–25 mm. long, less than 1 mm. wide, chestnut-colored: scales elliptic, about 2 mm. long, obtuse or truncate at the apex, loosely imbricate at maturity: achene ellipsoid or ellipsoid-obovoid, about 1.5 mm. long, acute, somewhat shorter than the scale.—Banks, wet woods, and swamps, Coastal Plain and adjacent Piedmont, Ga. to N. C.—(*W. I., Mex., C. A., S. A., O. W.*)

23. *C. Haspan* L. Plant perennial, up to 11 dm. tall, tufted or gregarious, the scape smooth: spikelets few together in usually numerous lax spikes, on stiff stalks, linear to linear-lanceolate, 6–12 mm. long, about 1 mm. wide, mostly reddish-brown: scales elliptic, elliptic-lanceolate, or ovate, about 1.5 mm. long, often mucronulate, loosely appressed: achene pale, the body oval, suborbicular, or broadly obovate, about 0.5 mm. long, mucronulate, about  $\frac{1}{2}$  as long as the scale.—Wet pinelands, swamps, and ponds, Coastal Plain and adj. provinces, Fla. to Tex. and Va.—(*W. I., Mex., C. A., S. A., O. W.*)

24. *C. alternifolius* L. Plant perennial, up to 20 dm. tall, often tufted, bright-green, the leaves represented by basal sheaths: spikelets rather numerous in head-like spikes which terminate slender curved or drooping stalks, ovate to elliptic, or rarely narrower, 4–9 mm. long, 2–2.5 mm. wide, pale: scales ovate or ovate-lanceolate, about 2 mm. long, acute or acutish, ascending or spreading: achene brown, the body obovoid or oval, over 0.5 mm. long, mucronulate, about  $\frac{1}{2}$  as long as the scale.—(UMBRELLA-SEDGE. UMBRELLA-PLANT.)—Swamps, pen. Fla. Nat. of Africa.—(*W. I.*)—Frequently cultivated as an ornamental plant.

25. *C. dentatus* Torr. Plant perennial, 2–5 dm. tall, somewhat tufted, bright-green: spikelets in rather lax clusters, linear to linear-lanceolate, 9–12 mm. long, 2–2.5 mm. wide or wider, reddish-brown: scales ovate to ovate-lanceolate, about 2.5 mm. long, mucronate, the tip not appressed: achene obovoid or globose-obovoid, less than 1 mm. long, mucronate, short-stipitate, about  $\frac{1}{2}$  as long as the scale.—Sandy, often acid swamps and river shores, various provinces, S. C. to Ind., N. Y., and Me. Introd. in Ala.

26. *C. LeContei* Torr. Plant perennial, up to 4 dm. tall, solitary or gregarious, yellowish-green: spikelets in lax clusters, lanceolate to linear, 10–30

mm. long, 3-4 mm. wide, yellow: scales ovate, 3 mm. long or less, blunt, hooded at the apex, the tips appressed: achene ovoid or oval, 1 mm. long or less, mucronulate, nearly sessile, less than  $\frac{1}{2}$  as long as the scale. [*C. dentatus multiradiatus* Torr.]—Pinelands, sand-dunes, low grounds, and pond-margins, Coastal Plain, Fla. to La.

27. *C. rotundus* L. Plant perennial by tuberous rootstocks, 2-6 dm. tall, gregarious, deep-green: spikelets in lax clusters, linear, often narrowly so, 8-30 mm. long, 2-3 mm. wide, mainly purple-brown: scales ovate to elliptic-ovate, acute or blunt, the tips appressed: achene obovoid, 1-1.5 mm. long, mucronate, about  $\frac{1}{2}$  as long as the scale.—(NUT-GRASS. COCO-GRASS.)—Sandy fields, lawns, and roadsides, Coastal Plain, Fla. to Tex. and Va. Nat. of the trop.—(*W. I., Mex., C. A., S. A., O. W.*)—Often becomes a troublesome weed through spreading by tuberiferous rootstocks, which are edible.

28. *C. esculentus* L. Plant perennial by tuber-bearing rootstocks, up to 1 m. tall, tufted or gregarious, bright-green: spikelets in lax spikes or panicles, lanceolate to linear-lanceolate or linear, 9-15 mm. long, or rarely longer, 2-3 mm. wide, stramineous or yellowish-brown: scales ovate to elliptic-ovate, 2-3 mm. long acutish, the tip rather long: achene obovoid or ellipsoid, nearly 1.5-2 mm. long, mucronate, somewhat shorter than the scale. [*C. phymatoides* Muhl.]—(CHUFA. EARTH-ALMOND. YELLOW NUT-GRASS.)—Low grounds, moist fields, river-banks, roadsides, and ditches, various provinces, Fla. to Tex., Minn., and N. B.; also W N. A.—(*W. I., Mex., C. A., O. W.*)—Sometimes a troublesome weed. Cultivated for hogs, on account of the tuberiferous rootstocks which are edible.

29. *C. lutescens* Torr. & Hook. Plant perennial by elongate, often tuber-bearing, rootstocks, gregarious, mostly 3-9 dm. tall, bright-green: spikelets in lax spikes or panicles, narrowly linear, often curved, 20-40 mm. long or sometimes shorter, 1.5-2.5 mm. wide, stramineous: scales ovate, 3-3.5 mm. long, rounded at the apex or abruptly pointed, the tips becoming lax: achene ellipsoid-obovoid, nearly 2 mm. long, mucronate, about  $\frac{1}{2}$  as long as the scale.—Dry sandy soil and swamps, Coastal Plain, Fla. to Tex.—(*Mex., C. A., S. A.*)

30. *C. articulatus* L. Plant perennial, up to 20 dm. tall, gregarious, the nearly terete scape smooth, the leaves mostly represented by basal sheaths: bracts of the involucre very short: spikelets in lax umbel-like spikes, narrowly linear, 20-50 mm. long, or sometimes shorter, mostly 1-2 mm. wide, stramineous: scales mainly ovate, 3-4 mm. long, acutish or blunt, appressed or becoming lax: achene ellipsoid to cuneate-ellipsoid, 1.5 mm. long or nearly so, mucronate, about  $\frac{1}{2}$  as long as the scale.—Calcareous swamps, ponds, lakes, and creeks, Coastal Plain, Fla. to Tex. and S. C.—(*W. I., Mex., C. A., S. A., O. W.*)

31. *C. erythrorhizos* Muhl. Plant annual, 1-5 dm. tall, solitary or gregarious, the scape rough-angled above: bracts of the involucre elongate: spikelets in dense spikes or panicles, linear, 6-25 mm. long, 1-1.5 mm. wide, chestnut-brown: scales ovate, or sometimes elliptic-lanceolate, about 1.5 mm. long, obtuse or abruptly pointed, the tips scarcely lax: achene obovoid, nearly 1 mm. long, slightly mucronate, fully  $\frac{1}{2}$  as long as the scale.—Swamps, river-banks, and wet soil, various provinces, Fla. to Tex., Calif., Minn., Ont., and Mass.

32. *C. Halei* Torr. Plant annual, up to 1 m. tall, tufted or gregarious, bright-green: spikelets crowded in cylindric spikes, linear, 3-5 mm. long, about 1 mm. wide, brown: scales broadly elliptic or obovate, 1-1.5 mm. long, mucronulate, the tips becoming somewhat lax: achene obovoid, about 1 mm. long, as long as the scale or nearly so.—River banks and swamps, Coastal Plain, Fla. to La., and perhaps in the Miss. Valley.

33. *C. Martindalei* Britton. Plant perennial, 2-7 dm. tall, tufted, bright-green: spikelets crowded in capitate spikes, linear or nearly so, 6-10 mm. long, 2-3 mm. wide, yellowish-green: scales thick, broadly elliptic or elliptic-ovate, 2.5-3 mm. long, notched, mucronulate, or eroded at the apex, loosely imbricate: achene ellipsoid, 2-2.5 mm. long, abruptly pointed, somewhat shorter than the scale.—Pinelands, sand-hills, and dry woods, Coastal Plain, Fla. to La. and S. C.

34. *C. litoreus* (Clarke) Britton. Plant perennial, up to 5 dm. tall, sparingly tufted, light-green: spikelets in dense capitate spikes, narrowly linear, 9-12 mm. long, greenish: scales thin, ovate to elliptic-ovate, 2.5-3 mm. long or smaller, mucronate, loosely imbricate: achene linear-ellipsoid, about 1.5 mm. long, minutely pointed, fully  $\frac{1}{2}$  as long as the scale.—Hammocks, Long Key, Fla.

35. *C. strigosus* L. Plant perennial, 1-9 dm. tall, gregarious or somewhat tufted, bright-green: spikelets in rather dense spikes or panicles, linear, 7-19 mm. long, about 1.5 mm. wide, stramineous: scales elliptic-lanceolate, 4-5 mm. long, mucronate, usually appressed: achene linear-ellipsoid, about 2 mm. long, abruptly pointed at the apex, constricted at the base, about  $\frac{1}{3}$  as long as the scale or more.—Meadows, swamps, fields, and waste-places, various provinces, Fla. to Tex., Minn., Ont., and Me.—Often very persistent on account of the tuberiferous rootstocks. Several forms differing in size and habit have been given names.

36. *C. stenolepis* Torr. Plant perennial, up to 12 dm. tall, often gregarious, bright-green: spikelets in rather dense spikes or panicles, linear, 9-20 mm. long, mostly 1.5-2.5 mm. wide, stramineous: scales linear to linear-lanceolate, 4-5 mm. long, somewhat lax at maturity: achene narrowly ellipsoid or linear-ellipsoid, about 2 mm. long, abruptly pointed at the apex, constricted at the base, less than  $\frac{1}{2}$  as long as the scale.—Swamps and low grounds, Coastal Plain, Fla. to Tex. and N. C.

37. *C. praelongatus* Steud. Plant perennial, up to 1 m. tall, sometimes tufted, bright-green: spikelets in rather lax spikes or panicles, linear-subulate or nearly subulate, 8-14 mm. long, 1 mm. wide or less, green or somewhat stramineous: scales lanceolate, 4-5 mm. long, mucronate, closely imbricate: achene ellipsoid or nearly so, 1.5-2 mm. long, abruptly pointed, less than  $\frac{1}{2}$  as long as the scale.—Low grounds, Coastal Plain and adj. provinces, Miss. to Tex. and Tenn.—(*Mex.*)

38. *C. refractus* Engelm. Plant perennial, 2-9 dm. tall, solitary or gregarious, bright-green: spikelets in lax spikes or panicles, very narrowly linear or subulate, 9-30 mm. long, fully 1 mm. wide or less, yellowish-green; scales oblong-lanceolate to linear, 6-7 mm. long, obtuse, closely appressed: achene linear, 2.5-3 mm. long, abruptly pointed at the apex, constricted at the base, fully  $\frac{1}{2}$  as long as the scale.—Dry woods, fields, river-banks, and swamps, Coastal Plain and rarely more N provinces, Fla. to Tex., Mo., and N. J.

39. *C. floridanus* Britton. Plant perennial, 1-7 dm. tall, tufted, bright-green: bracts of the involucre smooth, involute: spikelets in capitate sessile spikes, linear-subulate, 6-10 mm. long, 1 mm. wide or less, chestnut-brown: scales broadly elliptic to ovate-elliptic, about 2 mm. long, blunt, closely imbricate: achene ellipsoid or nearly so, about 1.5 mm. long, abruptly pointed, nearly as long as the scale.—Sandy soil, Everglade Keys, pen. Fla. and Florida Keys.—(*W. I.*)

40. *C. retrofractus* (L.) Torr. Plant perennial, up to 1 m. tall, solitary or gregarious, grayish-green: bracts of the involucre smooth or nearly so, often as long as the inflorescence, pubescent: spikelets crowded in turbinate or obovate turbinate spikes, subulate, 5-7 mm. long, less than 1 mm. wide, green-

ish or drab: scales mostly 4 or 5, various, the lower ones short and broad, the upper long and narrow, closely appressed: achene linear, 2.5–3 mm. long, abruptly pointed at the apex, constricted at the base, over  $\frac{1}{2}$  as long as the scale.—Sandy and rocky soil, and dry woods, Coastal Plain and occasionally more N provinces, Fla. to Tex., Mo., and N. J.

41. *C. dipsaciformis* Fernald. Plant perennial, 2–8 dm. tall, the scape rough, at least above: bracts of the involucre shorter than the inflorescence, or longer, often sparingly pubescent: spikelets rather crowded in obovate or cylindric-obovate spikes, subulate, 5–11 mm. long, yellowish or brownish: scales mostly 4–6, various, the lower ones short and broad, the upper long and narrow: achene linear, about 3 mm. long, abruptly pointed at the apex, slightly constricted at the base, fully  $\frac{1}{2}$  as long as the scale.—Dry, often acid, sandy soil, and woods, Coastal Plain and adj. provinces, Ga. to Ky. and N. J.

42. *C. hystricinus* Fernald. Plant perennial, 3–8 dm. tall, the scape smooth: bracts of the involucre smooth: spikes oval or obovoid, 1.5–3 cm. long: spikelets subulate, 4–10 mm. long, becoming golden-brown, the lower ones reflexed: scales few, subulate or linear-subulate, 3–5 mm. long, or shorter at the base of the spikelet, acute: achene linear, 2–2.5 mm. long, abruptly pointed at the apex, somewhat constricted at the base, much shorter than the scales.—Dry sandy soil and pinelands, Coastal Plain, Ga. to Tex., Ark., and N. J.

43. *C. lancastriensis* Porter. Plant perennial, up to 8 dm. tall, tufted or gregarious, bright-green: spikes oval or nearly so, 1–2.5 cm. long, not very dense: spikelets linear-subulate, 8–10 mm. long, 2–4-flowered, pale-green: scales few, oblong to oblong-lanceolate, 4–5 mm. long, acute or acutish, appressed: achene linear-ellipsoid, 2–2.5 mm. long or rarely larger, abruptly pointed, about  $\frac{1}{2}$  as long as the scale or more.—Fields and river-banks, various provinces, Ga. to Ark., Pa., and N. J.

44. *C. retrorsus* Chapm. Plant perennial, 2–7 dm. tall, the scapes smooth: spikes narrowly obovoid or cylindric-obovoid, 1–1.5 mm. long, dense, sometimes compound: spikelets subulate, 2–3 mm. long, the lower one becoming reflexed: scales few, oblong, 2–3 mm. long, closely appressed: achene broadly ellipsoid, less than 2 mm. long, abruptly pointed, somewhat shorter than the scale.—Sandy soil, pinelands, and cult. grounds, Coastal Plain, Fla. to Miss. and Ga.

45. *C. Torreyi* Britton. Plant perennial, 1–5 dm. tall, often sparingly tufted: spikes ellipsoid, often narrowly so, 1.5 cm. long or less, dense: spikelets linear-subulate, 3–4 mm. long, 1 mm. wide or less, 1–2-flowered, green: scales few, ovate, 2.5–3 mm. long, often notched and mucronulate at the apex, appressed: achene ellipsoid, fully 1.5 mm. long, abruptly pointed at the apex, constricted at the base, fully  $\frac{1}{2}$  as long as the scale. [*C. cylindricus* (Ell.) Britton.]—Sandy, often acid, soil, low grounds, and pond margins, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and S. N. Y.—(W. I.)

46. *C. Deeringianus* Britton & Small. Plant perennial, 4–12 dm. tall, yellowish-green: spikes cylindric, 1–3 cm. long, very dense, the main ones usually compound: spikelets subulate, 3–4 mm. long, fully 0.5 mm. wide, 1–2-flowered, yellowish: scales usually 3, ovate, 2–2.5 mm. long, mucronulate, appressed: achene narrowly ellipsoid, less than 1.5 mm. long, abruptly pointed at the apex, somewhat constricted at the base, about  $\frac{2}{3}$  as long as the scale. [*C. cylindrostachys* (Fl. SE. U. S.)]—Pinelands, prairies, swamps, hammocks, and marshes, Coastal Plain, Fla. to Miss. and Ga.

47. *C. Pollardi* Britton. Plant perennial, up to 13 dm. tall, bright-green: spikes cylindric to ellipsoid, 1–2 cm. long, dense: spikelets linear, 3–4.5 mm. long, 1–1.5 mm. wide, green: scales few, elliptic to ovate-elliptic, 2–2.5 mm.

long, often abruptly pointed, rather lax: achene linear-ellipsoid, about 1.5 mm. long, abruptly pointed, over  $\frac{1}{2}$  as long as the scale.—Pinelands, hammocks, swamps, and salt-marshes, Fla.—(*W. I.*)

48. *C. Winkleri* Britton & Small. Plant perennial, tall, often tufted, light-green: spikes ellipsoid, 1–1.5 cm. long, dense: spikelets linear-subulate, 5–6 mm. long, mostly 5–6-flowered, stramineous: scales mostly 6 or 7, ovate, 1.5–2 mm. long, mucronulate: achene narrowly ellipsoid, slightly over 1 mm. long, abruptly pointed, about  $\frac{2}{3}$  as long as the scale.—Humbuggus prairie, Dade Co., Fla.

49. *C. Plankii* Britton. Plant perennial, stouter than *C. Torreyi*, bright-green: spikes cylindric or ellipsoid-cylindric, 1.5–2 cm. long, very dense: spikelets subulate, 5–7 mm. long, mostly 4- or 5-flowered, sometimes fewer-flowered, green: scales few, ovate, 2.5–3 mm. long, abruptly pointed: achene ellipsoid or linear-ellipsoid, about 1.5 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale—Low grounds, Coastal Plain and adj. provinces, Miss. to Tex. and Okla.

50. *C. ovularis* (Michx.) Torr. Plant perennial, 1–8 dm. tall, often tufted, the scape smooth: spikelets compactly crowded in globular capitate spikes, linear or elliptic, 3–7 mm. long, greenish: scales ovate to ovate-lanceolate or lanceolate, the upper ones 3–5 mm. long (7–11 mm. long and spikes larger in *C. ovularis robustus*), appressed: achene linear-ellipsoid or ellipsoid-obovoid, 2–2.5 mm. long, or rarely smaller, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale.—Dry fields, woods, and hillsides, various provinces, Fla. to Tex., Kans., Ill., and N. Y.

51. *C. Nashii* Britton. Plant perennial, up to 11 dm. tall, bright-green: spikes ellipsoid to oval, 1 cm. long or less, dense, often compound: spikelets subulate, 2–3 mm. long, less than 1 mm. wide, green or yellowish-green: scales few, elliptic-ovate, 2.5–3 mm. long, often notched at the broad apex, appressed: achene ellipsoid-linear or ellipsoid, about 2 mm. long, somewhat shorter than the scale.—Pinelands and sandy soil, pen. Fla.

52. *C. globulosus* Aubl. Plant perennial, 1–6 dm. tall, often gregarious or tufted, bright-green: spikelets in rather compact capitate spikes, linear-subulate, 4–8 mm. long, fully 1 mm. wide, scarcely flattened, green: scales few, ovate-lanceolate, mostly 3–4 mm. long, acute, appressed: achene ellipsoid-obovoid or ellipsoid, about 1.5 mm. long, abruptly pointed at the apex, constricted at the base, fully  $\frac{1}{2}$  as long as the scale. [*C. echinatus* (Ell.) Wood.]—Pinelands, woods, and sandy soil, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—(*W. I.*)—The related *C. Grayi* Torr. of northern regions has been recorded from the Southern States, but apparently erroneously.

53. *C. ligularis* L. Plant perennial, up to 13 dm. tall, sometimes clustered, glaucous: spikes cylindric or ellipsoid, mostly 1–2.5 cm. long, dense, sometimes crowded: spikelets elliptic or ovate-elliptic, 3–6 mm. long, 1.5–2 mm. wide, gray to green: scales ovate to oval, 2–2.5 mm. long, obtuse or mucronulate: achene ellipsoid or obovoid, 1.5 mm. long or nearly so, acute, fully  $\frac{1}{2}$  as long as the scale.—Swamps, hammocks, and sandy places, Fla. and coast of Ala.—(*W. I., Mex., C. A., S. A., O. W.*)

54. *C. cayennensis* (L.) Britton. Plant perennial, up to 7 dm. tall, often tufted, bright-green: spikes cylindric, mostly 1–2.5 cm. long, dense, sessile or nearly so and clustered in the involucre: spikelets ellipsoid or ellipsoid-obovoid, 3–5 mm. long, yellowish or light-chestnut: scales ovate to elliptic, 2–3.5 mm. long, mucronate, appressed: achene obovoid, about 2 mm. long, mucronulate, fully  $\frac{1}{2}$  as long as the scale.—Fields, ditches, swamps, and waste-places, Mississippi River delta, La. and Coastal Plain, Tex.—(*W. I., Mex., C. A., S. A.*)—A plant collected at St. Augustine in 1876 by A. P. Garber has the spikes capitate as in this species; but the spikelets are very slender and the achene is linear-ellipsoid.

55. *C. hermaphroditus* (Jacq.) Britton. Plant perennial, up to 8 dm. tall, often sparingly tufted, bright-green: spikes stiff, ellipsoid to cylindric: spikelets linear-subulate, 5–9 mm. long, less than 1 mm. wide, green or yellowish: scales mainly elliptic, fully 3–4 mm. long, rounded or acutish, appressed: achene ellipsoid, 1.5–2 mm. long, mucronulate, fully  $\frac{1}{2}$  as long as the scale.—Wet stream-banks and swamps, Coastal Plain, Ala.—(*W. I., Mex., C. A., S. A.*)

56. *C. dissitiflorus* Torr. Plant perennial, up to 9 dm. tall, sometimes sparingly tufted, bright-green: spikelets linear-subulate, 5–8 mm. long, 1–1.5 mm. wide, chestnut-colored: scales ovate to elliptic, 2.5–3 mm. long, rounded or abruptly pointed at the apex, closely imbricate: achene ellipsoid or slightly broadened upward, 1.5 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale.—Sandy soil and waste-places, Coastal Plain, Fla. to Tex.

57. *C. tetragonus* Ell. Plant perennial, 2–11 dm. tall, often solitary: spikes cylindric, 1–4 cm. long, not dense: spikelets linear-elliptic to elliptic, 3–6 mm. long, 1.5–2 mm. wide, chestnut-colored: scales oblong to ovate, 2.5–3.5 mm. long, blunt or mucronate, loosely appressed: achene ellipsoid, sometimes broadly so, 2 mm. long or nearly so, often slightly curved, much shorter than the scale.—Dry sandy soil, swamps, and hammocks, Coastal Plain, Fla. to Tex. and N. C.

58. *C. multiflorus* (Britton) Small. Plant perennial, 2–7 dm. tall, tufted or gregarious, bright-green: spikelets crowded in short often depressed capitate spikes, linear, mostly 10–25 mm. long, fully 1.5 mm. wide, flat, green: scales numerous, ovate to elliptic-ovate, the lower ones 2–2.5 mm. long, the upper 3–4 mm. long, obscurely mucronulate, lax, the tip, at least, somewhat spreading: achene ellipsoid, somewhat inequilateral, fully 1.5–2 mm. long, abruptly pointed at the apex, constricted at the base, the lower ones nearly as long as the scale, the upper fully  $\frac{1}{2}$  as long.—Sandy soil, Coastal Plain, Fla. to Tex.—(*W. I.*)

59. *C. filiculmis* Vahl. Plant perennial, 1–6 dm. tall, the scapes sometimes reclining: spikes capitate, all sessile in the involucre or some slender-stalked: spikelets linear, 9–21 mm. long, 2–3 mm. wide, 8–16-flowered, (4–8-flowered and spikelets 3–8 mm. long in *C. filiculmis macilentus*), yellowish-green or pale-green: scales ovate or elliptic, 3–3.5 mm. long, often mucronulate, loosely appressed: achene obovoid, about 2 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale.—Dry sterile, gravelly soil, and fields, various provinces, Fla. to Tex., Minn., Ont., and N. H.—(*Mex.*)

60. *C. Blodgettii* Torr. Plant perennial, 1–3 dm. tall, tufted, bright-green: spikes capitate, all sessile in the involucre, or several slender-stalked: spikelets elliptic to linear-elliptic, 6–8 mm. long, 1.5–2 mm. wide, chestnut-colored: scales oval or ovate, mostly 2–2.5 mm. long, obtuse or slightly mucronulate, rather loosely appressed: achene ellipsoid or slightly obovoid, 1–1.5 mm. long, abruptly pointed, much over  $\frac{1}{2}$  as long as the scale.—Rocky soil in hammocks, Upper Matecumbe Key and Key West, Fla.

61. *C. fuliginous* Chapm. Plant perennial, 1–4 dm. tall, tufted, the leaf-sheaths blackish: spikes capitate, sessile in the involucre, 1–1.5 cm. in diameter: spikelets linear or linear-elliptic, 4–11 cm. long, 1.5–2 mm. wide, dark-brown: scales oval or ovate, about 2 mm. long, rounded or mucronulate, appressed: achene ellipsoid-obovoid or broadly ellipsoid, 1–1.5 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale.—Rocky soil in hammocks, Key West, Fla.—(*W. I.*)

62. *C. brunneus* Sw. Plant perennial, 1.5–12 dm. tall, solitary or clustered, the scapes stout: spikes in a sessile terminal head or on unequal stalks, rather lax: spikelets linear or linear-lanceolate, 9–17 mm. long, 2–3 mm. wide, chestnut-

colored: scales oval, ovate, or elliptic, 3-4 mm. long, mucronate, rather loosely appressed: achene obovoid, ellipsoid-obovoid, or ellipsoid, about 1.5 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale. [*C. Ottonis* Boeckl.]—Wet and dry sand, sea-beaches, and hammocks, Fla.—(*W. I., Mex., C. A., S. A.*)

63. *C. Engelmannii* Steud. Plant annual, 1-7.5 dm. tall, often tufted, bright-green: spikes lax, mostly clustered at the ends of short stalks: spikelets narrowly linear to linear-subulate, 9-25 mm. long, less than 1 mm. wide, often curved, greenish-brown: scales elliptic to ovate-elliptic, 2-2.5 mm. long, blunt or mucronulate, loosely appressed: achene linear-ellipsoid, about 2 mm. long, often slightly curved, acute, somewhat shorter than the scale.—Low grounds and swamps, various provinces N of Coastal Plain, W Tenn. (?) to W Ark., Wis., Ont., Mass., and N N. Y.; adv. in Ala.

64. *C. ferax* L. C. Rich. Plant annual, up to 9 dm. tall, tufted or gregarious, bright-green: spikes rather crowded at the ends of slender stalks: spikelets narrowly linear, 8-20 mm. long or rarely longer, 1-1.5 mm. wide, yellowish or grayish-brown: scales ovate to ovate-elliptic, 2-3.5 mm. long, obtuse or acutish, appressed: achene obovoid, sometimes narrowly so, about 1.5 mm. long, abruptly pointed, about  $\frac{1}{2}$  as long as the scale.—Swamps, banks, sand-dunes, and low grounds, various provinces, Fla. to Tex., Minn., Ont., and Mass.; also on the Pacific Coast.—(*W. I., Mex., C. A., S. A., O. W.*)

65. *C. speciosus* Vahl. Plant annual, 1-4.5 dm. tall, usually tufted, bright-green: spikes mostly clustered at the ends of the slender stalks: spikelets narrowly linear, 8-18 mm. long or rarely longer, 1 mm. wide or less, straight or nearly so, brownish or yellowish-brown: scales ovate or elliptic-ovate, 2-2.5 mm. long, mostly obtuse, rather loosely appressed: achene ellipsoid or ellipsoid-obovoid, 1.5-2 mm. long, abruptly pointed, fully  $\frac{1}{2}$  as long as the scale.—Low grounds, swamps, ditches, and banks, various provinces, Fla. to Tex., S. Dak., and Mass.; also on the Pacif. slope.—(*W. I., Mex.*)

66. *C. longispicatus* Norton. Plant perennial, up to 20 dm. tall, gregarious, bright-green: spikes mostly clustered at the ends of the slender stalks, spikelets narrowly linear, 20-40 mm. long, or rarely shorter, 1.5-2 mm. wide, yellowish-brown: scales thick, ovate, 2.5-3 mm. long, mostly mucronulate, appressed: achene broadly obovoid or obpyramidal, less than 1.5 mm. long, abruptly pointed, about  $\frac{1}{2}$  as long as the scale.—Low grounds, swamps, and pond-margins, various provinces, Fla. to Tex. and Calif.—(*Mex.*)

5. *KYLLINGA* Rottb. Annual or perennial scapose, often tufted, herbs. Leaf-blades very narrow. Spikelets several or many in an involucre head, the involucre of 3 or more elongate bracts. Scales mostly 3- or 4-ranked, the 2 lower empty, the middle one fructiferous, the upper empty or staminate. Perianth wanting. Stamens 1-3. Style not enlarged, deciduous. Stigmas mostly 2. Achene lenticular.—About 45 species, natives of warm regions.—Sum.—fall, or all year S.

Larger scales of the spikelets with ciliate or scabrous keels, sharp- or firm-pointed.

Achene body of an ellipsoid type: plants annual.

Achene-body of an obovate type: plants perennial.

Larger scales of the spikelets with smooth keels, blunt or merely acutish.

1. *K. pumila*.

2. *K. brevifolia*.

3. *K. odorata*.

1. *K. pumila* Michx. Annual, densely tufted, the scapes 0.5-4 dm. long, erect or reclining: leaf-blades mostly less than 2 mm. wide: bracts of the involucre

spreading or reflexed: spikes ellipsoid or ovoid-ellipsoid, 6-7 mm. long, solitary or accompanied by 1 or 2 smaller ones: spikelets 2.5-3 mm. long, the scales minutely pointed the 2 larger ones very unequal: achene-body ellipsoid, fully 1 mm. long, mucronulate.—Moist stream-banks and wet soil, various provinces, Fla. to Tex., Mo., Ohio, and Md.—(*W. I., Mex., C. A., S. A.*)

2. *K. brevifolia* L. Perennial, tufted or gregarious, the scapes up to 3 dm. tall: leaf-blades 1-2.5 mm. wide: bracts of the involucre 3, one erect, the others spreading: spikes solitary, globose or ovoid, 5-10 mm. long, greenish, commonly inclined: spikelets 2.5-3 mm. long, the scales firm-pointed, the two larger ones somewhat unequal: achene-body obovoid or globose-obovoid, nearly 1 mm. long, mucronulate. [*K. monocephala* L.]—Low grounds and moist sandy places, Coastal Plains, Fla. to Tex. and Ga.—(*W. I., Mex., C. A., S. A.*)

3. *K. odorata* Vahl. Annual or biennial, tufted, the scapes 1-3 dm. tall: bracts of the involucre 4 or 5, becoming reflexed: spikes 2 or 3 together or solitary, ovoid to cylindric, 8-15 mm. long, the terminal one the largest, erect, pale or whitish: spikelets 3-3.5 mm. long, the scales blunt or merely acutish, the two larger ones slightly unequal: achene-body obovoid, fully 1 mm. long, mucronulate.—Moist to wet soil, roadsides, and ditches, Coastal Plain, Fla. to Miss. and Ga.—(*W. I., Mex., C. A., S. A.*)

6. *ABILDGAARDIA* Vahl. Perennial, or sometimes perhaps annual scapose tufted herbs. Leaf-blades very narrow. Spikelets usually solitary, several-many-flowered, each subtended by a small bract. Scales firm, imbricate mostly in 2 rows, deciduous. Perianth wanting. Stamens 1-3; filaments narrowly linear. Ovary stipitate; style swollen at the base, deciduous. Stigmas 3. Achene 3-angled, stipitate, the body warty.—About 15 species, widely distributed in warm regions.

1. *A. monostachya* (L.) Vahl. Plant 1-4 dm. tall, glabrous: leaves shorter than the scapes; blades involute: involucre inconspicuous: spikelet ovoid or ellipsoid-ovoid, 1-1.5 cm. long, or longer: scales pale, 5-6 mm. long, acute or mucronulate: anthers nearly 2 mm. long: achene pale, 2.5-3 mm. long, the body globose or broadly obovoid, abruptly pointed, the stipe stout.—Hammocks, pinelands, and adj. Everglades, Everglade Keys, pen. Fla. and on the Florida Keys.—(*W. I., S. A., O. W.*)—All year.

7. *FIMBRISTYLIS* Vahl. Annual or perennial scapose herbs. Leaf-blades flat or involute. Spikelets in umbel-like or capitate clusters, often rather large, terete, several-many-flowered. Scales firm, deciduous. Perianth wanting. Stamens 1-3: filaments slender. Ovary sessile or nearly so: style

usually dilated or swollen at the base, mostly ciliate, deciduous. Stigmas 2 or 3. Achene lenticular or 3-angled, reticulate, cancellate, or ribbed lengthwise, not tubercled.—About 130 species, of wide geographic distribution.—Sum.—fall.

Stigmas 2: achene lenticular.  
Stigmas 3: achene 3-angled.

I. CASTANEAE.  
II. AUTUMNALES.

#### I. CASTANEAE

Spikelets peduncled and in umbels, or sessile and solitary.

Achene not ribbed, smooth or cancellate in rows: leaf-blades mostly involute: plants perennial.

Spikelets solitary, or with 1, 2, or 3 additional peduncled ones: involucre minute or small, inconspicuous, mostly shorter than the inflorescence.

Spikelets several or many: involucre conspicuous, usually with some of the bracts longer than the inflorescence.

Styles swollen at the base.

Scales of the spikelets, at least the lower ones, puberulent or minutely pubescent.

Achene broadly obovoid, truncate or broadly rounded at the top: leaf-blades strongly involute.

Achene narrowly obovoid or ellipsoid-obovoid, somewhat narrowed at the top: leaf-blades flat, or somewhat involute in age.

Scales of the spikelets glabrous.

Styles not swollen at the base.

Achene ribbed lengthwise and reticulate: leaf-blades mostly flat, except in age.

Achene with smooth or nearly smooth ribs: perennial.

Achene with copiously tubercled ribs: plants annual.

Spikelets several, sessile and borne in a terminal head.

Scales of the spikelets acuminate: achene obovoid.

Scales of the spikelets subulate-tipped: achene ellipsoid-cylindric.

1. *F. schoenoides*.

2. *F. puberula*.

3. *F. Harperi*.

4. *F. castanea*.

5. *F. anomala*.

6. *F. diphylla*.

7. *F. Baldwiniana*.

8. *F. VahlII*.

9. *F. perpusilla*.

#### II. AUTUMNALES

Spikelets ovoid or oval to lanceolate.

Umbel simple or sparingly branched: spikelets stout, ovoid or oval, obtuse.

Umbel much-branched: spikelets narrow, linear-oblong to lanceolate, acute.

Spikelets subglobose: umbel decomposed.

10. *F. geminata*.

11. *F. autumnalis*.

12. *F. miliacea*.

1. *F. schoenoides* Vahl. Perennial, up to 4 dm. tall, glabrous: leaf-blades attenuate from the slightly dilated bases, involute: bracts of the involucre inconspicuous: spikelets solitary, or with 1, 2, or 3 additional peduncled ones, ovoid or conic-ovoid, 5–12 mm. long, pale-brown: scales 3–3.5 mm. long, blunt or acutish: achene broadly obovoid, less than 1.5 mm. long, whitish.—Low grounds and wet pinelands, W Fla. and S Ga. Introduced.—(*O. W.*)

2. *F. puberula* (Michx.) Vahl. Perennial, 1–7 dm. tall, finely pubescent, at least in parts: leaf-blades involute, thus often very slender, ciliate, and usually more or less pubescent: involucre small: spikelets ovoid, 5–10 mm. long, brown: scales 3–4 mm. long, usually mucronulate, minutely pubescent: achene broadly obovoid, about 1 mm. long, cancellate, brownish. [*F. castanea puberula* (Michx.) Britton *F. spadiccea* (Fl. SE. U. S.)]—Low grounds, swamps, and wet pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Mo., Ill., and N. Y.

3. *F. Harperi* Britton. Perennial, 2–6 dm. tall, light-green: leaf-blades flat or

somewhat involute in age, ciliate, often puberulent: involucre rather small: spikelets ellipsoid-ovoid, becoming cylindric, 8–14 mm. long, chestnut-colored: scales 3.5–4 mm. long, mucronate, puberulent: achene narrowly obovoid or ellipsoid-obovoid, about 1.5 mm. long, pale.—Sand-dunes, beaches, and swamps, Coastal Plain, Fla. to Miss. and Ga.

4. *F. castanea* (Michx.) Vahl. Perennial, up to 1 m. tall, deep-green: leaf-blades involute, commonly glabrous: involucre small: spikelets ellipsoid or ovoid-ellipsoid, 6–10 mm. long, brown: scales 3.5–4.5 mm. long, obtuse or acutish, glabrous: achene obovoid or ellipsoid, about 1.5 mm. long, brown.—Salt meadows, marshes, and low pinelands, various provinces, except Appalachian, Fla. to Tex., Nebr., Mich., and N. Y.—(*W. I.*)

5. *F. anomala* Boeckl. Perennial, up to 9 dm. tall, bright-green: leaf-blades more or less involute, slender, often pubescent: involucre inconspicuous: spikelets ellipsoid-ovoid, often narrow, 9–13 mm. long, pale-brown: scales 3.5–4 mm. long, obtuse or mucronulate, glabrous: achene obovoid, less than 1.5 mm. long, brown. [*F. Drummondii* (Torr. & Hook.) Boeckl.]—Low grounds, Coastal Plain, Miss. to Tex.

6. *F. diphylla* (Retz.) Vahl. Perennial, 1–6 dm. tall, pubescent: leaf-blades very narrow, involute, at least in age: involucre with one or more of the bracts usually elongate: spikelets ellipsoid to ovoid-ellipsoid, 5–11 mm. long, pale: scales about 2.5 mm. long, mucronate, glabrous: achene broadly obovoid, about 1 mm. long, pale, longitudinally ribbed, the ribs smooth or nearly so and irregularly tubercled. [*F. laxa* Vahl.]—River-banks, low grounds, fields, swamps, and waste-places, Coastal Plain, Fla. to Tex. and Ga. Nat. of trop.—(*W. I., Mex., C. A., S. A., O. W.*)

7. *F. Baldwiniana* (Schult.) Torr. Annual, 1–4 dm. tall, glabrous or sparingly pubescent: leaf-blades very narrow, flat or nearly so: involucre of 3–5 usually short bracts: spikelets ovoid or ovoid-ellipsoid, 6–13 mm. long, pale, often greenish-brown: scales 2.5–3 mm. long, mucronulate, glabrous: achene broadly obovoid, fully 1 mm. long, pale, longitudinally ribbed, the ribs tubercled.—Low wet to dryish grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Pa.—(*W. I.*)—Formerly included in the next preceding species.

8. *F. VahlII* (Lam.) Link. Annual, 1–1.5 dm. tall: leaf-blades setaceous or filiform, scabrous: scapes flattened, very slender: involucre of several setaceous elongate bracts: spikelets ellipsoid-cylindric, 4–8 mm. long, obtuse, greenish-brown; scales 1.5–2 mm. long, acuminate, the tip erect: achene obovoid, about 0.5 mm. long, yellowish-white.—River-banks and low grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. C.—(*Mex.*)

9. *F. perpusilla* Harper. Annual, 3 cm. tall: leaf-blades filiform, smooth or nearly so: scapes setaceous, in small prostrate radiating tufts: involucre of several slender-setaceous bracts exceeding the inflorescence: spikelets globose, 1–2 mm. in diameter, green or yellowish, on peduncles up to 4 mm. long: scales 1–1.5 mm. long, subulate-tipped, the tip loosely spreading: achene ellipsoid-cylindric, about 0.5 mm. long, pale.—Pineland ponds, near Leslie, on the Coastal Plain of Ga.—Fall.—Collected only once.

10. *F. geminata* (Nees) Kunth. Annual, 0.5–2 dm. tall: umbels usually with short branches: spikelets ovoid or oval, 2–5 mm. long, obtuse, reddish-brown: scales lanceolate, mucronate: achene obovoid, fully 0.5 mm. long, distinctly reticulate. [*F. Frankii* Steud.]—Sandy fields, bottoms, and shores, various provinces, Ga. to La., Ont., and Que.

11. *F. autumnalis* (L.) R. and S. Annual, 1–4 dm. tall: umbels usually with long branches: spikelets linear-ellipsoid to lanceolate, 6–10 mm. long, acute,

brown or greenish-brown: scales ovate-lanceolate or lanceolate, mucronate: achene obovoid, scarcely 0.5 mm. long, smooth or indistinctly reticulate.—Moist soil, sandy banks, pond-margins, and meadows, various provinces, Fla. to Tex., Kans., Mich., and Mass.—(*W. I., Mex., (?)*, *S. A.*)—Plant erect.

12. *F. miliacea* Vahl. Annual (always ?), 2–6 dm. tall, glabrous: leaf-blades ensiform, long-attenuate: scapes weak, often loosely tufted: spikelets usually numerous, subglobose, 2–3 mm. long, obtuse, pale-brown: scales ovate, fully 1 mm. long, obtuse: achene obovoid, fully 0.5 mm. long, minutely roughened.—Bogs and ditches, N Fla. Nat. of the trop.—(*W. I., Mex., C. A., S. A., O. W.*)—Plant prostrate.

8. **STENOPHYLLUS** Raf. Annual tufted scapose herbs. Leaf-blades setaceous, linear, or filiform. Spikelets in umbel-like clusters, capitate, or solitary, relatively small, terete or nearly so, few-many-flowered. Scales firm, short, deciduous. Perianth wanting. Stamens 2 or 3: filaments very slender. Ovary sessile or short-stipitate: style swollen at the base, glabrous, the base persistent. Stigmas 2 or 3. Achene lenticular or 3-angled, smooth or papillose, surmounted with a tubercle.—About 90 species, abundant in warm regions.—Spr.-fall.

Spikelets in open or compact umbel-like clusters, or rarely solitary.

Leaf-blades serrulate or minutely ciliate, usually scabrous.

Umbel-like cluster of spikelets simple: achene transversely wrinkled.

1. *S. capillaris*

Umbel-like cluster of spikelets compound: achene papillose.

Achene about 1 mm. long: umbel-like cluster of spikelets open.

2. *S. ciliatifolius*.

Achene about 0.5 mm. long: umbel-like cluster of spikelets compact.

3. *S. Carteri*.

Leaf-blades smooth and glabrous or nearly so.

4. *S. coarctatus*.

Spikelets in a terminal involucre head.

Bracts of the involucre entire at the base.

Achene fully 0.5 mm. long, about  $\frac{1}{3}$  as long as the scale: scales short-tipped.

5. *S. barbatus*.

Achene about 1 mm. long, about  $\frac{1}{2}$  as long as the scale: scales slender-tipped.

6. *S. stenophyllus*.

Bracts of the involucre fimbriate at the base.

7. *S. Warei*.

1. *S. capillaris* (L.) Britton. Plant 0.5–2.5 dm. tall: leaf-blades minutely ciliate: scapes smooth, except sometimes near the top: spikelets narrowly ellipsoid, 5–8 mm. long, in a single cluster or solitary: scales oblong to ovate, about 2 mm. long, obtuse or emarginate, often ciliate: achene obovoid or turbinate, about 1 mm. long, yellow-brown, slightly stipitate.—(*HAIR-SEDGE*.)—Dry to wet sandy and rocky soil, and fields, various provinces, Fla. to Tex., Calif., Ore., Ont., and Me.—(*W. I., Mex., C. A., S. A.*)

2. *S. ciliatifolius* (Ell.) C. Mohr. Plant 1–3 dm. tall: leaf-blades serrulate-ciliate: scapes often scabrous near the top: spikelets linear-ellipsoid, 2–4 mm. long, in a compound cluster: scales broadly ovate or deltoid, about 1.5 mm. long, obtuse or abruptly pointed, often ciliate toward the apex: achene broadly obovoid or turbinate, about 1 mm. long, bluish, barely stipitate.—Pinelands, dry sandy soil, and sand-hills, Coastal Plain, Fla. to La. and N. C.

3. *S. Carteri* Britton. Plant 1-2 dm. tall; leaf-blades setaceous, ciliate: scapes smooth: spikelets mainly ovoid, 2-4 mm. long, in a compound cluster: scales ovate, slightly over 1 mm. long, minutely pointed or obtuse: achene broadly obovoid or turbinate, about 0.5 mm. long, not stipitate.—Pinelands, Everglades Keys, Fla.

4. *S. coarctatus* (Ell.) Britton. Plant 1-3 dm. tall: leaf-blades glabrous or nearly so: scapes smooth: spikelets linear-ellipsoid, or ellipsoid, 2-6 mm. long, in a contracted simple cluster: scales broadly ovate, about 1.5 mm. long, obtuse or minutely pointed: achene turbinate, about 1 mm. long, pale, slightly stipitate.—Pinelands and sandy soil, Coastal Plain, Fla. to Ala. and S. C.

5. *S. barbatus* (Rottb.) Britton. Plant 0.5-2 dm. tall: leaf-blades minutely ciliate: scapes smooth or nearly so: spikelets linear to linear-lanceolate, 4-8 mm. long, acute, capitate: scales 1-2 mm. long, each with a minute slightly spreading tip: achene broadly obovoid, fully 0.5 mm. long, pale, minutely stipitate. [*Isolepis barbata* (Rottb.) R. Br. *S. floridanus* Britton.]—(WATER-GRASS).—Pinelands, roadsides, fields, and gardens, Coastal Plain, Fla. to Ala. and S. C. Nat. of O. W. trop.

6. *S. stenophyllus* (Ell.) Britton. Plant 1-2 dm. tall: leaf-blades bristly-ciliate: scapes scabrous, at least above: spikelets ellipsoid to linear, 5-7 mm. long, capitate, the head sessile in an involucre of setaceous-tipped bracts: scales lax, ovate to lanceolate, mostly 2-3 mm. long, slender-tipped, finely pubescent: achene obovoid, about 1 mm. long, bluish-white, rounded under the tubercle, contracted at the base.—Pinelands, roadsides, and dry sandy soil, Coastal Plain, Fla. to La. and N. C.

7. *S. Warei* (Torr.) Britton. Plant 1-4 dm. tall: leaf-blades smooth or slightly scabrous: scapes smooth and glabrous: spikelets ovoid to ellipsoid-ovoid, 5-7 mm. long, capitate, the head sessile in an involucre of bracts with broad fimbriate bases and setaceous tips: scales ovate, mostly 3-4 mm. long, abruptly short-tipped, finely pubescent: achene turbinate or broadly obovoid, less than 1 mm. long, white, truncate or notched under the tubercle, somewhat constricted at the base.—Dry sandy soil, pinelands, sandhills, and roadsides, Coastal Plain, Fla. and Ga.

9. **ELEOCHARIS** R. Br. Annual or perennial scapose tufted herbs. Leaves reduced to more or less elongate sheaths which are truncate or sometimes produced into tooth-like or more elongate blades. Scapes simple, except when proliferous. Spikelet solitary, terete, angled, or flattened, erect, the subtending bract inconspicuous. Scales spirally imbricate. Perianth of 1-12, usually 6, retrorsely barbed bristles, or wanting. Stamens 2 or 3. Ovary mostly sessile: style swollen at the base. Stigmas 2 or 3. Achene lenticular or 3-angled, smooth or variously roughened, capped by a tubercle formed by the persistent base of the style.—About 150 species, widely distributed in cool and warm regions.—Spr., fall, or all year S.—SPIKE-RUSHES.

Spikelets scarcely if at all thicker than the scape; scales mostly leathery.

Spikelets manifestly thicker than the scape; scales mostly membranous.

Stigmas 2: achene lenticulate or biconvex.

Stigmas 3: achenes 3-angled or turgid.

I. CELLULOSAE.

II. OBTUSAE.

III. TENUES.

#### I. CELLULOSAE

Scape nodose-septate: bristles poorly developed, shorter than the achene or rarely equalling it.

Scape not nodose-septate: bristles well-developed longer than the achene.

1. *E. equisetoides*.

Scape terete 2 at least above: bristles smooth: tubercle of the achene deltoid.

Scape angled or flattened: bristles toothed: tubercle of the achene narrow lanceolate or subulate.

Scape stout, mostly over 2 mm. in diameter: tubercle of the achene lanceolate.

Scape slender, mostly less than 2 mm. in diameter: tubercle of the achene subulate.

Achene 2-2.5 mm. long, mostly lenticular: bristles about equalling the top of the tubercle.

Achene about 1 mm. long, mostly 3-angled: bristles about equalling the base of the tubercle.

2. *E. cellulosa*.

3. *E. quadrangulata*.

4. *E. Robbinsii*.

5. *E. elongata*.

## II. OBTUSAE

Upper sheath scarious, hyaline: plant perennial by slender rootstocks.

Achene about 0.5 mm. long.

Scales pale-green or rarely white: perianth-bristles longer than the achene.

Scales brown: perianth-bristles shorter than the achene.

Achene about 1 mm. long: perianth-bristles longer than the achene: scales brown.

Upper sheath truncate, oblique, or toothed, not scarious.

Plant annual, with fibrous roots.

Scape capillary: spikelets with 1-4 achenes.

Scape slender: spikelets with several to many achenes.

Achene black.

Achene about 0.5 mm. long: perianth-bristles usually 2-4, pale: scape mostly 2-9 cm. tall.

Achene about 1 mm. long: perianth-bristles mostly 5-8, brown: scape mostly 5-25 cm. tall.

Achene pale-brown to white.

Scape filiform or bristle-like: achene white.

Scales of the spikelets pale, with brown midrib: achene whitish: upper leaf-sheath short, obtuse.

Scales of the spikelets dark, with whitish midrib and margins on either side of the dark-brown body: achene brown: upper leaf-sheath elongate, acute.

Scape slender: achenes pale-brown.

Perianth-bristles longer than the achene: spikelets ovoid.

Perianth-bristles not longer than the achene, often short or wanting: spikelets cylindric.

Plant perennial, with horizontal rootstocks.

Scape nodose-septate: achene about 1 mm. long: tubercle deltoid.

Scape continuous: achene 1.5 mm. long or nearly so: tubercle conic.

6. *E. flaccida*.

7. *E. praticola*.

8. *E. olivacea*.

9. *E. capillacea*.

10. *E. atropurpurea*.

11. *E. caribaea*.

12. *E. uncialis*.

13. *E. bicolor*.

14. *E. obtusa*.

15. *E. Engelmannii*.

16. *E. nodulosa*.

17. *E. calva*.

## III. TENUES

Achene cancellate.

Achene longitudinally ribbed.

Achene not longitudinally ribbed.

Scape filiform: spikelets with 1-4 achenes.

Scape slender: spikelets with several-many achenes.

Spikelets linear-ellipsoid, often proliferous.

Spikelets ovoid to conic-ovoid, not proliferous.

Tubercle conic, smaller than the achene.

Tubercle miter-like, as large as the achene or larger.

Achene smooth, papillose, or irregularly ridged-reticulate.

Scape capillary or filiform.

Spikelets terete or nearly so, 6-20-flowered.

Achene smooth, ellipsoid-obovoid or pyriform.

Scape capillary: achene-body 0.5 mm. long.

Scape filiform: achene-body over 0.5 mm. long.

Upper leaf-sheath bladeless: perianth-bristles about as long as the achene: achenes more than 0.5 mm. long, up to 1 mm.

Spikelet-scales lax, not concealing the achenes: perianth-bristles about as long as the achene: achene ellipsoid-obovoid, nearly 1 mm. long, pale-brown, the tubercle minute, depressed-conic.

18. *E. acicularis*.

19. *E. retroflexa*.

20. *E. vivipara*.

21. *E. simplex*.

22. *E. tuberculosa*.

23. *E. microcarpa*.

24. *E. Torreyana*.

Spikelet-scales closely concealing the achenes: perianth-bristles very short or obsolete: achene pyriform, about 0.7 mm. long, whitish, the tubercle a disk-like crown with a minute tip.

Upper leaf-sheath with an acicular blade: perianth-bristles about one-half as long as the achene: achenes about 0.5 mm. long.

Achene ridged-reticulate, broadly obovoid.

Spikelets flattened, 2-6-flowered, often proliferous.

Achene obovoid: tubercle deltoid or depressed.

Achene ellipsoid or nearly so: tubercle abruptly subulate-tipped.

Scape slender or stout.

Tubercle plainly distinguishable from the achene.

Achene smooth.

Tubercle depressed, covering the top of the black achene.

Tubercle low-conic, acute, contracted at the base.

Achene papillose or irregularly ridged-reticulate.

Achene with the 3 angles ribbed.

Achene obtusely 3-angled.

Scape slender to nearly filiform, not flattened: scales obtuse.

Bristles 2-4, shorter than the achene: achene strongly papillose.

Bristles 6, the longer as long as the achene: achene faintly reticulate.

Scape flattened: scales acute.

Tubercle conic-subulate or pyramidal, scarcely distinguishable from the achene.

25. *E. Brittonii*.

26. *E. carolina*.

27. *E. Curtisii*.

28. *E. prolifera*.

29. *E. Baldwinii*.

30. *E. melanocarpa*.

31. *E. albida*.

32. *E. tricostrata*.

33. *E. capitata*.

34. *E. arnicola*.

35. *E. acuminata*.

36. *E. rostellata*.

1. *E. equisetoides* (Ell.) Torr. Perennial, up to 1 m. tall, the scapes nodose, terete: leaf-sheaths often blade-bearing: spikelet cylindric, 2.5-4 cm. long, many-flowered: scales mostly obtuse, 5-6.5 mm. long, narrowly margined: perianth-bristles as long as the achene or shorter, or wanting: achene obovoid, 2 mm. long, or sometimes slightly smaller or larger, light-brown, the tubercle dark,  $\frac{1}{4}$ - $\frac{1}{3}$  as long as the achene.—(KNOTTED SPIKERUSH).—Shallow water, various provinces, Fla. to Tex., Mich., and Mass.—(*W. I., Mex., C. A., S. A.*)

2. *E. cellulosa* Torr. Perennial, up to 8 dm. tall, the scapes not nodose, terete above: leaf-sheaths bladeless, sometimes short-tipped: spikelet cylindric, 1.5-3 cm. long, many-flowered: scales rounded, 4-5 mm. long, hyaline-margined: perianth-bristles smooth, longer than the achene: achene obovoid, about 2 mm. long, dark-brown, rather coarsely pitted, the tubercle pale, very stout,  $\frac{1}{2}$ - $\frac{1}{3}$  as long as the achene.—Fresh marshes and lagoons near the coast, Fla. to Tex.—(*W. I.*)

3. *E. quadrangulata* (Michx.) R. and S. Perennial, up to 1.2 m. tall, the scapes 4-angled, not nodose: leaf-sheaths sometimes blade-bearing: spikelet cylindric, 2-5 cm. long, many-flowered: scales many, 5-6 mm. long, firm, broad and rounded: perianth-bristles as long as the achene or longer: achene obovoid, 2-2.5 mm. long, brown, the tubercle lanceolate, about half as long as the achene, constricted at the base. [*E. mutata* (Fl. SE. U. S.)]—Ponds, streams, and swamps, various provinces, Fla. to Tex., Mo., Mich., Ont., and Conn.—(*W. I., Mex., C. A., S. A.*)

4. *E. Robbinsii* Oakes. Perennial, 2-7 dm. tall, the scapes 3-angled, producing tufts of very slender scapes or leaves: leaf-sheaths not blade-bearing:

spikelet subulate, 1-2 cm. long, few-flowered: scales few, mostly 6-7 mm. long, thin, narrow, obtuse: perianth-bristles much longer than the achene, often twice as long: achene obovoid, sometimes narrowly so, 2-2.5 mm. long, light-brown, the tubercle subulate, about one half as long as the achene, with a raised ring around the base.—Shallow water, often acid, various provinces, Fla. to Ind., Mich., and N. B.

5. *E. elongata* Chapm. Perennial, up to 1 m. tall, the scapes terete, often producing tufts of very slender scapes: leaf-sheaths usually bladeless: spikelet cylindric, 1-2 cm. long, rather few-flowered: scales relatively few, 5-6 mm. long, thinnish, obtuse: perianth-bristles longer than the achene: achene obovoid, about 1 mm. long, brown, the tubercle barely one half as long as the achene, subulate above the ring-like base.—Still water, Coastal Plain, Fla. to La. and Tex. (?).

6. *E. flaccida* (Reichenb.) Urban. Perennial, 0.5-3 dm. tall, the scapes 3-angled: upper leaf-sheath with a hyaline limb: spikelet oval or ovoid, 2-4 mm. long, several-flowered: scales pale-green or rarely white, 2 mm. long, or less, mostly obtuse: perianth-bristles longer than the achene: achene broadly obovoid, 1 mm. long or less, dark-brown, the tubercle depressed-conic. [*E. ochreata* Nees.]—(PALE SPIKERUSH.)—Wet soil, Coastal Plain, Fla. to Miss. and N. J.—(*W. I., Mex., C. A., S. A.*)

7. *E. praticola* Britton. Annual, 2-6 cm. tall, the scapes flattened: upper leaf-sheaths hyaline, lax: spikelets ovoid or ellipsoid-ovoid, 2-3 mm. long, few-flowered: scales brown, less than 2 mm. long, obtuse or acutish, lax in age: perianth-bristles shorter than the achene: achene broadly obovoid, 0.5 mm. long or more, dark-brown, the tubercle minute, depressed.—Low and wet grounds, Everglades and vicinity, Fla.—(*W. I.*)

8. *E. olivacea* Torr. Perennial, 0.5-1.5 dm. tall, the scapes flattened: upper leaf-sheath with a hyaline limb: spikelet ovoid, 3-5 mm. long, several-many-flowered: scales reddish-brown, 2-2.5 mm. long, scarious-margined, lax in age: perianth-bristles longer than the achene: achene obovoid, about 1 mm. long, green to blackish, the tubercle with a saucer-shaped base and a minute tip.—Wet, often acid, soil, shores of ponds, various provinces, S. C. to Mich., Ont., and Me.

9. *E. capillacea* Kunth. Annual, diminutive, 2-5 cm. tall, the scapes capillary: leaf-sheaths with scarious blade-like tips: spikelet linear-cylindric, 2-4.5 mm. long, few-flowered: scales deep-brown or reddish, narrow, mostly 2-3 mm. long, appressed: perianth-bristles about as long as the achenes: achene narrowly obovoid, 0.5 mm. long or more, pale, the tubercle slender-conic above the ring-like base.—Pineland ponds and wet sand, Coastal Plain, Fla. to N. C.—(*W. I., Mex., C. A., S. A.*)

10. *E. atropurpurea* (Reitz.) Kunth. Annual, 3-9 cm. tall, the scapes stiff and slender: upper leaf-sheaths with a tooth-like blade: spikelet ovoid, 3-4 mm. long, several-many-flowered: scales thinnish, purple-brown, except the midrib and narrow scarious margins, broad, 1-1.5 mm. long, rather lax in age: perianth-bristles as long as the achene or shorter: achene obovoid, 0.5 mm. long or more, jet-black, the tubercle saucer-shaped with a minute tip.—Moist soil and sink-holes, various provinces, Fla. to Tex., Colo., Ia., and Ga.—(*W. I., Mex., C. A., S. A., O. W.*)

11. *E. caribaea* (Rottb.) Blake. Annual, up to 2.5 dm. tall, the scapes terete: upper leaf-sheath with a tooth-like blade: spikelet ovoid, 3-5 mm. long or smaller, many-flowered: scales thickish, brown, except the midrib and margins, broad, 1.5-2 mm. long, appressed: perianth-bristles about as long as

the achene: achene obovoid, about 1 mm. long, jet-black, the tubercle depressed or saucer-shaped with a minute tip.—Moist soil, swamps, and sink-holes, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and Md.—(*W. I., Mex., C. A., S. A.*)—Formerly referred to *E. capitata*, in error.

12. *E. uncialis* Chapm. Annual, mostly 1–6 cm. tall, the scapes bristle-like, angled: upper leaf-sheath oblique, obtuse: spikelet ovoid, 2–3 mm. long, several-flowered: scales pale, with a brown midrib and scarious margins, 1.5–2 mm. long, lax in age: perianth-bristles about one-half as long as the achene: achene ellipsoid-obovoid, 0.7 mm. long, whitish, smooth, the tubercle depressed-conic, much narrower than the achene.—Damp pinelands, N Fla.

13. *E. bicolor* Chapm. Annual, 1–2 dm. tall, the scapes 4-angled: upper leaf-sheath very thin: spikelet ovoid, 2–3 mm. long, few-flowered: scales thinnish, dark-brown except the pale midrib and margins, 1.5–2.5 mm. long, lax in age: perianth-bristles about  $\frac{1}{2}$  as long as the achene: achene ellipsoid-obovoid, about 0.8–1 mm. long, brown, the tubercle depressed, the base nearly as wide as the achene.—Moist to wet pinelands, Coastal Plain, Fla. and Ga.

14. *E. obtusa* (Willd.) Schultes. Annual, 1–7 dm. tall, the scapes nearly terete: upper leaf-sheaths with a tooth-like blade: spikelet ovoid to ellipsoid-ovoid, 3–13 mm. long, many-flowered: scales thin, dull-brown, 1.5–2 mm. long, usually appressed: perianth-bristles longer than the achene: achene turbinate-obovoid, 1.5 mm. long or less, pale-brown, the tubercle deltoid, the base somewhat narrower than the achene.—Wet soil and mud, various provinces, Fla. to Tex., Ont., and N. S.; also Calif. to B. C.

15. *E. Engelmannii* Steud. Annual, 1–5 dm. tall: upper leaf-sheath oblique or with a tooth-like blade: spikelet cylindric or conic-cylindric, 5–20 mm. long, many-flowered: scales brown, 1.5–2 mm. long, obtuse, appressed: perianth-bristles about as long as the achene, or sometimes rudimentary or wanting: achene turbinate-obovoid or somewhat cuncate, 1.5 mm. long or less, pale-brown, the tubercle very low, the base nearly as wide as the achene.—Wet soil and ditches, various provinces, Ga. to Tex., Calif., Mo., and Mass.

16. *E. nodulosa* (Roth) Schultes. Perennial, up to 1 m. tall, the scapes nodose: upper leaf-sheath truncate or minutely pointed: spikelet conic-cylindric, 1–2 cm. long, many-flowered: scales brownish, 2–3 mm. long, or sometimes longer, obtuse, often constricted below the apex, closely imbricate: perianth-bristles as long as the achene or shorter or longer: achene obovoid, about 1 mm. long, turgid, the tubercle deltoid, fully  $\frac{1}{3}$  as long as the achene.—Swamps, Coastal Plain and Basin-and-Range province, Fla. to Tex. and Ariz.—(*W. I., Mex., C. A., S. A.*)

17. *E. calva* Torr. Perennial, up to 1 m. tall, the scapes often tufted, slender, not nodose: upper leaf-sheath truncate or slightly pointed: spikelet ellipsoid or ellipsoid-lanceolate, 0.5–1.5 cm. long, many-flowered: scales brown or dark-green, 2.5–3.5 mm. long, blunt or often acute: perianth-bristles as long as the achene or shorter: achene obovoid, about 1.5 mm. long, brown, the tubercle cap-like, much constricted at the base. [*E. glaucescens* (Fl. SE. U. S.)]—Swamps and meadows, various provinces, Fla. to Tex., Nebr., Minn., and Ont.—A related species, *E. macrostachya* Britton, with 2 or 3 empty bracts at the base of the spikelet, instead of one as in *E. calva*, has been found at New Orleans, La.

18. *E. acicularis* (L.) R. & S. Perennial with slender rootstocks, 0.5–2 dm. tall, or greatly elongate when submersed, the scapes 4-angled, filiform or setaceous: leaf-sheaths truncate: spikelet flattened, narrowly ovate to linear-ellipsoid, 3–10 mm. long, few-flowered: scales pale-green, except the usually brown

bands on either side of the midrib, 1.5–2 mm. long: perianth-bristles fully as long as the achene or shorter: achene ellipsoid obovoid, 1 mm. long or shorter, the tubercle conic from a narrow base, about  $\frac{1}{4}$  as long as the achene.—Wet soil and muddy shores, various provinces, Ga. to Calif., B. C., and Newf.—(*O. W.*)

19. *E. retroflexa* (Poir.) Urban. Perennial or annual (?), 0.5–2 dm. tall, the scapes 4-angled, filiform: leaf-sheaths often with minute blades: spikelet ellipsoid to ovoid-ellipsoid, 2–3 mm. long, few-flowered: scales pale, 1.5–2 mm. long: perianth-bristles as long as the achene or much shorter: achene obovoid, barely 1 mm. long, the tubercle pyramidal with a broad base, shorter than the achene. [*E. chaetaria* R. & S.]—Sandy soil and low grounds, Coastal Plain, S Ala.—(*W. I., Mex., C. A., S. A.*)

20. *E. vivipara* Kunth. Perennial, 1–3 dm. tall, the scapes flattened: leaf-sheaths usually with a short blunt tip: spikelet linear-ellipsoid, 4–7 mm. long, several-flowered, often sparingly proliferous: scales whitish, 2–3 mm. long, thin: perianth-bristles unequal, fully as long as the achene or shorter: achene obovoid, about 1 mm. long or less, finely marked, pale, the tubercle often deltoid, with a broad base.—Low grounds and marshy shores, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and N. C.

21. *E. simplex* (Ell.) A. Dietr. Annual, 1–4 dm. tall, the scapes sharply 3-angled: leaf-sheaths obliquely truncate: spikelet ovoid or ellipsoid, 4–6 mm. long, several-many-flowered: scales pale, 2–3 mm. long, firm: perianth-bristles much longer than the achene: achene obovoid, about 1.5 mm. long, turgid, coarsely marked, the tubercle a cap-like cone, much constricted at the base, attenuate at the apex. [*E. tortilis* (Link) Schultes.]—Wet soil and marshy woods, Coastal Plain, Fla. to Tex. and N. J.

22. *E. tuberculosa* (Michx.) R. & S. Annual, 1–5 dm. tall, the scapes flattened: upper leaf-sheath obliquely truncate or with a tooth-like blade: spikelet ovoid to conic-ovoid, 6–12 mm. long, many-flowered: scales greenish-brown, except the dark midrib, 2.5–3.5 mm. long, firm: perianth-bristles much longer than the achene: achene obovoid, about 1.5 mm. long, coarsely marked, the tubercle miter-like, as large as the achene or larger.—Moist to wet, often acid, soil, Coastal Plain and adj. provinces, Fla. to Tex., Pa., and Mass.

23. *E. microcarpa* Torr. Annual, 0.5–2 dm. tall, the scapes slender, 4-angled: leaf-sheaths usually minutely pointed: spikelet oblong or nearly so, 2–3 mm. long, few-flowered: scales pale or with brownish patches on either side of the midrib, 1–1.5 mm. long, thin: perianth-bristles shorter than the achene: achene ellipsoid-obovoid, much constricted at the narrow base, 0.5 mm. long or a little longer, grayish-white, smooth or nearly so, the tubercle depressed-conic, minute, base less than  $\frac{1}{2}$  as wide as the achene.—Moist to wet soil, Coastal Plain, Fla. to La. and S. C.—(*W. I.*)

24. *E. Torreyana* Boeckl. Annual, 1–6 dm. tall, the scapes somewhat 4-angled, sometimes proliferous at the spikelet: upper leaf-sheath obliquely truncate: spikelet ellipsoid or ovoid-ellipsoid, 3–6 mm. long, several-many-flowered: scales brownish-red, except the green midrib and paler margins, 1.5–2 mm. long, firm: perianth-bristles about as long as the achene: achene ellipsoid-obovoid, nearly 1 mm. long, pale-brown, smooth, the tubercle minute, depressed-conic.—Wet sandy, and usually acid, soil, Coastal Plain, Fla. to Tex. and N. J.—(*W. I.*)

25. *E. Brittonii* Svenson. Annual, like *E. Torreyana* in habit: spikelet ellipsoid to ovoid-ellipsoid, 2.5–5 mm. long, several-flowered: scales obtuse, closely concealing the achenes which they much exceed in length, scarious-margined: perianth-bristles very short or obsolete: achene pyriform, about 0.7 mm.

long, whitish, smooth, the tubercle a disk-like crown with a minute tip.—Flat-woods and shallow ponds, Coastal Plain, N. Fla. to Tex. and S. C.

26. *E. carolina* Small. Annual, mostly less than 1 dm. tall, the scapes bristle-filiform, striate and slightly angled: upper leaf-sheath usually with an acicular blade: spikelet ovoid, 2–2.5 mm. long, several-flowered: scales pale, with a brown midrib and somewhat scarious margins, 1–1.5 mm. long, slightly lax in age: perianth-bristles about one half as long as the achene: achene ellipsoid-obovoid, about 0.5 mm. long, pale-brown, smooth, the tubercle depressed-conic.—Damp pinelands, Coastal Plain, S. C.

27. *E. Curtisii* Small. Annual, 0.5–1 dm. tall, the scapes filiform, striate and somewhat angled: upper leaf-sheath oblique, discolored at the edge, minutely pointed: spikelet ovoid-ellipsoid, 2–3 mm. long, few-flowered: scales pale, with a brownish midrib and scarious margins, 1.5–2 mm. long, lax in age: perianth-bristles shorter than the achene: achene broadly obovoid, 0.8 mm. long, light-brown, irregularly ridged-reticulate, the tubercle broadly conic.—Damp soil, Coastal Plain, Wilmington, N. C.

28. *E. prolifera* Torr. Annual, 1–6 dm. tall, the scapes often diffuse or floating, flattened: leaf-sheaths nearly truncate or minutely pointed: spikelet conic, 4–8 mm. long, usually proliferous or rooting: scales whitish or brown-spotted, 2–3 mm. long, thin: perianth-bristles shorter than the achene: achene obovoid, less than 1 mm. long, pale, smooth, the tubercle deltoid or depressed-conic, minute.—Ponds and ditches, Coastal Plain, Fla. to La. and N. C.

29. *E. Baldwinii* (Torr.) Chapm. Perennial, 0.5–2 dm. tall, the scapes slender, more or less diffuse, grooved: upper leaf-sheath oblique and often minutely pointed: spikelet ellipsoid, 4–6 mm. long, flattened, few-flowered, often proliferous and rooting: scales brown or brownish, narrow, 3–5 mm. long: perianth-bristles unequal, as long as the achene or shorter: achene ellipsoid or nearly so, about 1 mm. long, brown or greenish-brown, the tubercle conic, with a ring-like base, and a subulate tip.—(ROAD-GRASS.)—Damp pinelands, especially along roads, Coastal Plain, Fla. and Ga.

30. *E. melanocarpa* Torr. Perennial, 1–5 dm. tall, the scapes stout, wiry, flattened: upper leaf-sheath usually with a tooth-like blade: spikelet ellipsoid or cylindric-oblong, 6–12 mm. long, thick, many-flowered: scales brown, except the lighter midrib and scarious margins, broad, 3–4 mm. long: perianth-bristles as long as the achene or longer, or shorter or obsolete: achene obpyramidal or cuneate-turbinate, about 1 mm. long, black, the tubercle depressed, about as broad as the achene and covering its top, minutely pointed in the middle.—(BLACK-SPIKERUSH.)—Wet sandy soil, Coastal Plain and New England Coast, Fla. to Mass.; also Great Lake Lowland, Ind.—(*W. I.*)

31. *E. albida* Torr. Annual (?), 1–2 dm. tall, the scapes nearly terete: upper leaf-sheath usually with a tooth-like blade: spikelet ovoid-globose or ellipsoid, 4–8 mm. long, many-flowered: scales pale-green or nearly white, 2–2.5 mm. long, firm: perianth-bristles about as long as the achene: achene broadly obovoid, about 1 mm. long, the tubercle low-conic, sessile on the achene.—Damp to wet, usually brackish, soil, Coastal Plain, Fla. to Tex. and Md.—(*W. I., Mex.*)

32. *E. tricostrata* Torr. Perennial, 1–6 dm. tall, the scapes flattened: upper leaf-sheath with a tooth-like blade: spikelet ellipsoid to cylindric, 6–18 mm. long, many-flowered: scales brown except the green midrib and the scarious margins, 2–3 mm. long, acute: perianth-bristles wanting: achene obovoid, 1 mm. long or less, brown, prominently 3-angled, obscurely papillose, the tubercle low-conic, with a broad base, acute.—Wet, often acid, soil, Coastal Plain, Fla. to N. Y.

33. *E. capitata* (L.) R. Br. Perennial, up to 7 dm. tall, the scapes 4-angled: upper leaf-sheath with a tooth-like blade: spikelet narrowly ellipsoid, 4-10 mm. long, many-flowered: scales brownish-purple, except the green midrib and the scarious margins, 1.5-2.5 mm. long, thin: perianth-bristles about  $\frac{1}{2}$  as long as the achene or wanting: achene obovoid, about 1 mm. long, yellow to brown, obtusely 3-angled, papillose, often persistent, the tubercle depressed-conic or disk-like. [*E. tenuis* (Willd.) Schultes.]—(POVERTY-GRASS.)—Wet soil, various provinces, Fla. to Tex., Man., Ont., and Newf.

34. *E. arenicola* Torr. Perennial, 1-4.5 dm. tall, the scapes slender-wiry: upper leaf-sheath truncate or with a tooth-like blade: spikelet ellipsoid or ovoid-ellipsoid, 4-12 mm. long, many-flowered: scales often brown at the apex, and with scarious margins, 2-3 mm. long, thin: perianth-bristles unequal, the longer ones often fully as long as the achene: achene obovoid or ellipsoid-obovoid, about 1 mm. long, brownish, faintly reticulate, the tubercle deltoid or depressed.—Sandy shores and swamps, Coastal Plain, Fla. to Tex. and S. C.

35. *E. acuminata* (Muhl.) Nees. Perennial, up to 5 dm. tall, the scapes flat, coarse-wiry: upper leaf-sheath sometimes with a tooth-like blade: spikelet ovoid or ellipsoid, 6-12 mm. long, many-flowered: scales purple-brown, except the greenish midrib and the hyaline margins, mostly 2.5-3 mm. long, broad, thin: perianth-bristles as long as the achene or shorter: achene obovoid, 1-1.5 mm. long, yellowish-brown, somewhat papillose, often persistent on the rachis, the tubercle depressed-conic.—Wet soil, various provinces, Ga. to La., Wash., Man., Ont., and Anticosti.

36. *E. rostellata* Torr. Perennial, up to 15 dm. long, the scapes flattened, stout sterile ones reclining and rooting at the apex; leaf-sheaths without blades, usually oblique: spikelet ellipsoid to fusiform, 6-15 mm. long, several-many-flowered: scales light-brown or green, 3-5 mm. long, rather firm: perianth-bristles longer than the achene: achene obovoid or ellipsoid-obovoid, about 1.5 mm. long, brown, the tubercle conic-subulate or pyramidal,  $\frac{1}{2}$  as long as the achene or less and confluent with its apex.—Brackish marshes and meadows, Coastal Plain and New England Coast, Fla. to Tex. and N. H.; also saline places in the interior, and Calif. to B. C.

10. **WEBSTERIA** S. Hart Wright. Perennial aquatic, caulescent herbs. Stems repeatedly branched. Leaves clustered or whorled at the nodes: blades capillary. Spikelets in often compound umbel-like clusters, 1-flowered, narrow. Scales 2, soft, narrow. Flowers perfect. Perianth of 6-10 short, commonly barbed, pale bristles. Stamens 3. Styles not swollen, deciduous. Stigmas 2. Achene lenticular.—A single species.

1. *W. submersa* (Sauv.) Britton. Plant submersed, glabrous: stems elongate, the internodes 8-25 cm. long, partly sheathed, the branches topped by the clusters of spikelets subulate, 8-12 mm. long: scales acuminate, the lower one mostly 3-veined, the upper 1-veined: perianth-bristles longer than the achene, tortuous: anthers slender-subulate, about 3 mm. long: achene obovoid or oval, 1.5-2 mm. long.—Lakes and ponds, pen. Fla.—(*W. l.*, *S. A.*)

**11. ERIOPHORUM L.** Perennial erect caulescent herbs with rootstocks.

Leaves with narrow blades, or some of them mere bladeless sheaths. Spikelets solitary, clustered, or umbellate, often subtended by an involucre of 1 to several bracts. Scales spirally imbricate, usually all fructiferous, or some of the lower ones empty. Flowers perfect. Perianth of numerous naked capillary greatly elongate bristles. Stamens 1-3. Style not swollen, deciduous. Stigmas 3. Achene 3-angled.—About 15 species, in the northern hemisphere.—Sum.-fall.—COTTONGRASSES. COTTONRUSHES.

Spikelets peduncled; scales prominently 1-ribbed, the rib extending to the apex: achene obovoid, rounded at the apex.

Spikelets glomerate; scales prominently striate ribbed, the ribs not extending to the apex: achene oblong-obovoid, abruptly pointed.

1. *E. viridicarinatum*.

2. *E. virginicum*.

1. *E. viridicarinatum* (Engelm.) Fernald. Stem 3-9 dm. tall: leaf-blades flat below the channeled tip: bracts of the involucre neither spreading nor deflexed: spikelets several or numerous, drooping on slender pubescent peduncles: scales broadly ovate, 3-4 mm. long, acute or acutish: perianth-bristles bright-white: achene obovoid, 2.5-3 mm. long, rounded at the apex, not stipitate.—(HARE-TAIL. TASSEL COTTON-GRASS.)—Bogs and swamps, Blue Ridge and more northern provinces, Ga. to B. C., Mich., and Newf. Formerly included in *E. polystachyon* L.

2. *E. virginicum* L. Stem 4-12 dm. tall: leaf-blades flat below the channeled tip: bracts of the involucre spreading or deflexed: spikelets crowded in a dense terminal cluster: scales ovate, 3-4 mm. long, obtuse: perianth-bristles brown: achene ellipsoid-obovoid, 3.5-4 mm. long, abruptly narrowed at the apex, short-beaked, stipitate.—(TAWNY-COTTONGRASS.)—Acid bogs and swamps, various provinces, Fla. to Nebr., Man., Ont., and Newf.

**12. SCIRPUS L.** Annual or perennial, scapose or caulescent herbs.

Leaves with blades or represented by mere sheaths. Spikelets few- to many-flowered, terete or somewhat flattened, solitary, capitate, or umbellate, usually involucre, the involucre, when simple, appearing like a continuation of the scape. Scales spirally imbricate. Flowers perfect. Perianth of 1-6, or 8, barbed or smooth, sometimes pubescent, bristles, or rarely wanting. Stamens 2 or 3. Style not swollen, wholly deciduous or the base persistent. Stigmas 2 or 3. Achene 3-angled or lenticular, beaked or beakless, not tubercled.—About 150 species, widely distributed in cool and warm regions.—Sum.-fall, or all year S.—BULRUSHES. CLUBRUSHES.

Involucre of a single bract, or wanting.

Spikelets solitary, or rarely 2 in No. 5, terminal.

Spikelets more than 1, usually several or many, often apparently lateral.

Involucre of 2 or more bracts with flat blades.

Spikelets not in dense globose heads.

Spikelets very numerous in one or several dense globular heads.

I. CAESPITOSI.

II. VALIDI.

III. SYLVATICI.

IV. CUBENSES.

## I. CAESPITOSI

Involucre wanting: annuals.

Involucre present, of a single bract.

Perianth-bristles present: scales not keeled: perennial plants.

Scape terete: upper sheath with a subulate blade: perianth-bristles smooth or downwardly barbed.

Achene about 1.5 mm. long: perianth-bristles smooth: spikelet slightly longer than thick: bog or rock plant.

Achene 2-3 mm. long: perianth-bristles barbed: spikelet several times longer than thick: aquatic or semiaquatic.

Scape triangular: upper sheath with a linear blade: perianth-bristles upwardly barbed.

Perianth-bristles wanting: scales keeled: annual plants.

1. *S. nanus*.

2. *S. caespitosus*.

3. *S. subterminalis*.

4. *S. Clintonii*.

5. *S. carinatus*.

## II. VALIDI

Spikelets few, 1-12, appearing lateral.

Scape not sharply 3-angled: plants annual.

Achene strongly transverse-rugose: perianth-bristles wanting.

Achene smooth or very slightly roughened: perianth-bristles 4-6.

Scape sharply 3-angled: plants perennial by rootstocks.

Spikelets acute: scales awned: involucre bract much surpassing the inflorescence.

Spikelets obtuse: scales mucronate: involucre bract only slightly surpassing the inflorescence.

Spikelets several or numerous, in umbels or umbel-like clusters.

Scape sharply 3-angled: leaves with blades about as long as the scape.

Scape terete: leaves reduced to mere sheaths.

Perianth-bristles downwardly barbed: achene gray, or darker, abruptly mucronate.

Perianth-bristles short-plumose below: achene nearly white, narrowed above.

6. *S. Hallii*.

7. *S. debilis*.

8. *S. americanus*.

9. *S. Olneyi*.

10. *S. etuberculatus*.

11. *S. validus*.

12. *S. californicus*.

## III. SYLVATICI

Spikelets few to several, capitate to umbellate, relatively large, in often compound clusters: achene globose-obovoid, dark-brown.

Spikelets very numerous, in compound umbels or umbelled heads, relatively small.

Perianth-bristles downwardly barbed, or wanting: spikelets in umbelled heads.

Perianth-bristles present.

Perianth-bristles equalling or slightly exceeding the achene: leaf-blades 6-16 mm. wide.

Spikelets 3-8 in each head: scales obtuse: perianth-bristles barbed throughout.

Spikelets 8-20 in each head: scales acute: perianth-bristles not barbed below.

Perianth-bristles twice as long as the achene: leaf-blades 4-6 mm. wide.

Perianth-bristles wanting.

Perianth-bristles smooth or slightly pubescent: umbel mostly decompound.

Perianth-bristles shorter than the scales or scarcely exceeding them.

Perianth-bristles about as long as the achene: scales rather acute.

Inflorescence merely terminal: spikelets 1 mm. thick: achene not papillose.

Inflorescence terminal and lateral: spikelets 2-3 mm. thick: achene papillose.

Perianth-bristles much longer than the achene: scales mucronate.

Perianth-bristles much exerted beyond the scales at maturity.

Spikelets sessile, in small heads or clusters.

Spikelets, at least some of them, distinctly peduncled.

13. *S. robustus*.

14. *S. sylvaticus*.

15. *S. atrovirens*.

16. *S. polyphyllus*.

17. *S. georgianus*.

18. *S. divaricatus*.

19. *S. fontinalis*.

20. *S. lineatus*.

21. *S. cyperinus*.

22. *S. Eriophorum*.

## IV. CUBENSES

Perennial herb, resembling species of *Cyperus*: leaves and bracts of the involucre quite similar.

23. *S. cubensis*.

1. *S. nanus* Spreng. Annual, tufted: scapes flattened and grooved, less than 1 dm. tall, the basal sheath bladeless: spikelet ovoid or ovoid-oblong, 2-3 mm. long, 3-8-flowered: scales 1.5-2 mm. long, pale-green: perianth-bristles longer than the achene, barbed: achene oblong or elliptic, varying to ovoid or obovoid, about 1 mm. long, acute.—(DWARFED-BULRUSH.)—Salt to brackish marshes, Coastal Plain and New England Coast, Fla. to Tex. and N. S.; also interior and Pacific Coast provinces.—(*W. I., Mex., O. W.*)

2. *S. caespitosus* L. Perennial, densely tufted: scapes filiform, nearly terete, 1-5 dm. tall, copiously sheathed at the base, the upper sheath bearing a short, subulate blade: spikelet ovoid-oblong or ovoid, about 4 mm. long, few-flowered: scales 3-4 mm. long, yellowish-brown: perianth-bristles longer than the achene, smooth: achene ellipsoid to obovoid, about 1.5 mm. long, short-beaked.—(DEER-HAIR. DEERHAIR-BULRUSH.)—Bogs and moist rocks, Blue Ridge and more northern provinces, N. C. and Tenn. to Ill., Colo., Alas., C Can., and Lab.—(*Greenl., O. W.*)

3. *S. subterminalis* Torr. Perennial, mostly aquatic: scapes up to 1 m. tall, nearly terete, the basal sheaths with elongate submersed (except in terrestrial forms) blades: spikelet oblong, narrowly ovoid, or subcylindric, 5-13 mm. long, few-flowered: scales 4-5 mm. long, green or stramineous: perianth-bristles as long as the achene or shorter, downwardly barbed: achene obovoid, 2-3 mm. long, abruptly short-beaked.—(SWAYING-RUSH.)—Ponds and streams, often acid, various provinces, Miss. to B. C., Ont., and Newf.

4. *S. Clintonii* A. Gray. Perennial, tufted: scapes 3-angled, very slender, sheathed at the base, some of the sheaths bearing slender, often linear blades: spikelet ovoid, 3-4 mm. long, few-flowered: scales 3-3.5 mm. long, pale-brown: perianth-bristles as long as the achene or longer, upwardly barbed: achene oblong or obovoid, 1.5-2 mm. long, obtuse.—Banks, fields, and thickets, Blue Ridge and more northern provinces, N. C. to Mich. and N. Y.

5. *S. carinatus* (H. & A.) A. Gray. Annual, tufted: scapes 3-angled, channeled, 0.5-2 dm. tall, the basal sheath with a slender blade: spikelet ovoid, about 4 mm. long, 6-8-flowered: scales 1.5-2 mm. long, pale, except the midrib and keel, the scarious margins very wide: perianth-bristles wanting: achene oval or slightly obovoid, about 1.5 mm. long, brown, minutely pointed.—Low grounds, fields, and roadsides, Coastal Plain and adj. provinces, Ala. to Tex., Okla., and Tenn.; also in Calif.

6. *S. Hallii* A. Gray. Annual, tufted: scapes up to 4 dm. tall, nearly terete or obtusely 3-angled, the upper basal sheath usually with a slender blade: spikelet ovoid, becoming oblong-cylindric, 6-15 mm. long, many-flowered: scales 2.5-3 mm. long, greenish, abruptly pointed: perianth-bristles wanting: achene obovoid-globose, sometimes depressed, fully 1 mm. long, black, transverse-wrinkled.—Wet soil, various provinces, Fla. to Tex., Colo., and Ill.; also in Mass.—(*Mex.*)

7. *S. debilis* Pursh. Annual, tufted: scapes 1-6 dm. tall, nearly terete or obtusely triangular, yellowish-green, the sheaths bladeless or the upper one with a short blade: spikelets ovoid or oblong-ovoid, 5-10 mm. long, many-

flowered: scales 2.5–3 mm. long, yellowish-brown, except the green midrib and the often tawny margins: perianth-bristles about as long as the achene, downwardly barbed, sometimes very short: achene obovoid, sometimes very broadly so, 1.5–2 mm. long, black, smooth or nearly so, abruptly short-pointed.—Swamps and wet soil, various provinces, N. Ga. to Ark., Nebr., Minn., Ont., and Me.

8. *S. americanus* Pers. Perennial, gregarious: scapes up to 1.5 m. tall, sharply triangular, bright-green, the sheaths (1–3) with elongate-linear blades: spikelets ovoid, mostly 5–12 mm. long, acute, many-flowered: scales 4.5–6 mm. long, brown, erose, minutely subulate-tipped at the notched apex: perianth-bristles as long as the achene or shorter: achene obovoid, about 2.5 mm. long, dark-brown, mucronulate.—(SWORD-GRASS. THREE-SQUARE BULRUSH. CHAIR-MAKER'S RUSH.)—Borders of ponds and streams, various provinces, Fla. to Tex., Calif., B. C., Ont., and Newf.—(*Mex., C. A., S. A., O. W.*)

9. *S. Olneyi* A. Gray. Perennial, gregarious: scapes up to 2 m. tall, sharply 3-angled or somewhat winged, the upper sheath sometimes with a 3-angled blade: spikelets oblong or ovoid-oblong, or ovoid, 5–9 mm. long, obtuse, many-flowered: scales 3–4 mm. long, dark-brown, except the green midrib, slightly erose, minutely mucronate at the emarginate apex: perianth-bristles shorter than the achene or about equalling it: achene obovoid, about 2.5 mm. long, brown, mucronulate.—Salt and fresh marshes, Coastal Plain and New England Coast, Fla. to Ark. and N. H.; also in Mich. and on Pacific Coast.

10. *S. etuberculatus* (Steud.) Kuntze. Perennial, sometimes tufted: scapes up to 2 m. tall, sharply 3-angled above, the upper sheath with a 3-angled and channeled blade nearly or quite as long as the scape: spikelets oblong-cylindric, 9–21 mm. long, acutish: scales 5–7 mm. long, pale-brown, acute at the sometimes hooded apex: perianth-bristles equalling the beak of the achene, with spreading barbs: achene obovoid, 3–4 mm. long, including the subulate beak, brown or blackish. [*S. cylindricus* Britton.]—Ponds and swamps, Coastal Plain and adj. provinces, Fla. to La., Ind., and Md.

11. *S. validus* Vahl. Perennial, gregarious: scapes up to 3 m. tall, light-green, stout (2–3 cm. at the base), the basal sheaths usually bladeless: spikelets ovoid, often becoming oblong-cylindric, 5–16 mm. long, acutish: scales 2.5–3.5 mm. long, minutely pubescent, erose-ciliate, usually mucronulate: perianth-bristles about equalling the achene, downwardly barbed: achene broadly obovoid, about 2 mm. long, gray, reddish, or black, abruptly mucronate. [*S. lacustris* (Fl. SE. U. S.)]—(GREAT-BULRUSH. CATTAIL FLAG. MAT-RUSH. BLACK-RUSH. TULE.)—Ponds, swamps, and streams, throughout temperate N. A.—(*W. I., Mex., C. A.*)

12. *S. californicus* (C. A. Meyer) Britton. Perennial, gregarious: scapes mostly 1–3 m. tall, obtusely 3-angled, often very stout, the basal sheaths bladeless: spikelets ovoid to oblong-ovoid, 6–11 mm. long, acute: scales 2.5–3.5 mm. long, brown or reddish, glabrous or nearly so, stout-mucronate: perianth-bristles as long as the achene or shorter, plumose-barbed: achene broadly obovoid, about 2 mm. long, nearly white, narrowed above and short-tipped.—Swamps, Coastal Plain and Basin-and-Range province, Fla. to Tex. and Calif.—(*Mex., C. A., S. A.*)

13. *S. robustus* Pursh. Perennial, tufted or gregarious: stems up to 1.5 m. tall, 3-angled: leaves dark-green: spikelets ovoid-oblong or ovoid, 1.5–3 cm. long, in sometimes dense clusters: scales mostly 7–9 mm. long, reddish or brown, with long markings, puberulent, the awn several times longer than the notched tip: perianth-bristles shorter than the achene or wanting: achene globose-obovoid, sometimes nearly orbicular in outline, 3–3.5 mm. long, abruptly

short-pointed.—(SEA CLUB-RUSH. SALT-MARSH BULRUSH. SPURT-GRASS.)—Brackish marshes, Coastal Plain and New England Coast, Fla. to Tex. and N. S.

14. *S. sylvaticus* L. Perennial, tufted: stems up to 2 m. tall, rather stout: leaves bright-green: spikelets ovoid or oblong-ovoid, 3–5 mm. long, 2–8 in the clusters: scales 1–1.5 mm. long, brown, except the green center, obtuse: perianth-bristles longer than the achene: achene obovoid or ellipsoid, about 1 mm. long.—Swamps and wet stream-banks, various provinces, Ga. to Mich. and Me.—(*O. W.*)

15. *S. atrovirens* Muhl. Perennial, tufted: stems up to 1.5 m. tall, rather slender: leaves bright-green: spikelets ovoid-oblong to cylindric, 3.5–8 mm. long, or longer, 9–30 in the clusters: scales 1.5–2 mm. long, greenish-brown or reddish, acute: perianth-bristles about as long as the achene: achene ellipsoid-obovoid, about 1 mm. long, rather long-pointed.—(GREEN-BULRUSH.)—Swamps and meadows, various provinces, Ga. to La., Sask., Ont., and N. S.

16. *S. polyphyllus* Vahl. Perennial, often tufted: stems up to 1.5 m. tall, sharply 3-angled: leaves light-green: spikelets ovoid, 2.5–3 mm. long, 3–8 in the clusters: scales 1–1.5 mm. long, bright-brown or reddish, mucronulate: perianth-bristles much-bent, about twice as long as the achene: achene obovoid, fully 1 mm. long, short-tipped.—Swamps, wet woods, and meadows, various provinces, Ga. to Ala., Ark., Minn., and Mass.

17. *S. georgianus* Harper. Perennial, often tufted: stems up to 1.2 m. tall, nearly terete: leaves bright-green: spikelets ovoid, 2–4 mm. long, numerous, or sometimes few, in the clusters: scales 1–1.5 mm. long, green, greenish-brown, or reddish, mucronulate: perianth-bristles wanting or mere rudiments: achene broadly ellipsoid, less than 1 mm. long, short-pointed.—Meadows, swamps, and muddy banks, various provinces, Ga. to Ark. and Que.

18. *S. divaricatus* Ell. Perennial, sometimes tufted: stems up to 1.5 m. tall, obtusely 3-angled: leaves deep-green, soft: spikelets cylindric or oblong, 3–5 mm., becoming 10–12 mm. long, mostly solitary at the tips of the inflorescence-branches: scales 1–1.5 mm. long, brown, greenish-brown, or pale, acute: perianth-bristles bent, longer than the achene: achene obovoid or nearly ellipsoid, about 1 mm. long, pale or nearly white, smooth, short-pointed.—Swamps and muddy banks, Coastal Plain, Fla. to La., Mo., and Va.

19. *S. fontinalis* Harper. Perennial and similar to *S. divaricatus* and *S. lineatus* in habit: spikelets ovoid, 2–4 mm. long, becoming narrower and longer in age, mostly solitary at the tips of the inflorescence-branches: scales 1.5–2 mm. long, greenish or brownish-green, the margins often whitish, acute: perianth-bristles bent, about as long as the achene: achene ellipsoid, sometimes broadly so, about 1 mm. long, yellowish or greenish, minutely papillose, long-tipped.—Pond-margins and springy places, Coastal Plain of Ga.

20. *S. lineatus* Michx. Perennial, tufted: stems up to 1.5 m. tall, 3-angled: leaves remote, pale-green, stiff: spikelets oblong, becoming cylindric, 5–10 mm. long, usually solitary at the tip of the inflorescence-branches: scales 2–2.5 mm. long, reddish-brown or pale-brown, except the green midrib, short-pointed: perianth-bristles much bent, much longer than the achene: achene obovoid or ellipsoid-obovoid, fully 1 mm. long, pale-brown, short-pointed.—Swamps and wet meadows, various provinces, Fla. to Tex., Ore., Ont., and N. H.

21. *S. cyperinus* (L.) Kunth. Perennial, up to 1.5 m. tall, nearly terete: leaves bright-green: spikelets ovoid or ovoid-oblong, 4–6 mm. long or longer in age, in dense heads or clusters: scales 1.5–2 mm. long, obtuse or acute: perianth-bristles elongate, much exceeding the achenes and scales, grayish-brown or rust-colored: achene ellipsoid, oval, or obovoid, barely 1 mm. long, pale or nearly white, short-pointed.—(WOOL-GRASS.)—Swamps and wet meadows, various provinces, N. C. to Ark., Mo., Ont., and Newf.

22. *S. Eriophorum* Michx. Perennial and similar to the next preceding species in habit, sometimes 2 m. tall: leaves pale-green: inflorescence laxer, the branches elongate and often drooping: spikelets ovoid or oblong-ovoid, 3.5–6 mm. long, some of the lateral ones peduncled: scales 1.5–2 mm. long, short-pointed: perianth-bristles pale, long as in *S. cyperinus*: achene ellipsoid to obovoid, less than 1 mm. long, pale, rather long-pointed.—Swamps and low grounds, various provinces, Fla. to Tex., Ark., Ind., and Conn.

23. *S. cubensis* Poepp. & Kunth. Perennial, resembling species of *Cyperus*, sometimes tufted, the scapes up to 1 m. tall, sharply 3-angled: leaves and bracts of the involucre quite similar, smooth above: spikelets densely crowded into 1 or several subglobose heads: scales firm, 3–4 mm. long, each with a short spreading tip: perianth-bristles wanting: achene ellipsoid, varying to narrowly obovoid or narrowly ovoid, 2–3 mm. long, stout-beaked.—Swamps and river-shores, Coastal Plain, Fla. to La. Nat. of the trop.—(*W. I., Mex., C. A., S. A., O. W.*)

13. **FUIRENA** Rottb. Perennial or rarely annual caulescent herbs. Leaves sometimes represented only by sheaths. Spikelets many-flowered, terete, often bur-like, clustered, or rarely solitary. Scales spirally imbricate, awned. Flowers perfect. Perianth of 3 usually stalked scales alternating with downwardly barbed bristles. Stamens 3. Ovary stipitate. Style not swollen at the base, deciduous. Stigmas 3. Achene 3-angled, stipitate or nearly sessile, smooth.—About 30 species, most abundant in the warmer regions.—Spr.—fall.  
—**UMBRELLA-GRASSES.**

Leaves reduced to sheaths without blades, except sometimes near the top of the stem.

Leaves with well-developed sheaths and blades.

I. SCIRPOIDEAE.  
II. SQUARROSAE.

#### I. SCIRPOIDEAE

Leaf-sheaths all bladeless: blades of the perianth-scales ovate.

Leaf-sheaths on the upper part of the stem blade-bearing: blades of the perianth-scales suborbicular.

1. *F. scirpoidea*.

2. *F. longa*.

#### II. SQUARROSAE

Perianth-bristles exceeding the achene and perianth-scales: plants annual.

Perianth-bristles reaching to the middle of the achene or shorter: plants perennial.

Perianth-bristles very short, not exceeding the stipe of the achene, or slightly longer: perianth-scales with suborbicular or somewhat reniform blades.

Perianth-bristles reaching to about the middle of the achene: perianth-scales with deltoid-ovate blades.

3. *F. squarrosa*.

4. *F. breviseta*.

5. *F. hispida*.

1. *F. scirpoidea* Michx. Perennial, the stems tufted or gregarious, 2–6 dm. tall: leaves mere sheaths with oblique margins: bracts of the involucre 2–6 mm. long: spikelets solitary or clustered, 5–12 mm. long: scales pubescent, the body 3–4 mm. long, with a short subulate tip: blades of the perianth-scales ovate, acute, fully 1 mm. long, rounded at the base: perianth-bristles as long as the sepal-stalks or longer: achene-body oval-rhombic or somewhat obovoid, fully 1 mm. long.—Lake shores, swamps, and low pinelands, Coastal Plain, Fla. to La. and Ga.

2. *F. longa* Chapm. Perennial, the stems loosely tufted or gregarious, 8–15 dm. long, usually reclining: leaves various, the lower ones mere sheaths, the upper ones with narrow blades: bracts of the involucre 8–16 mm. long: spikelets clustered, 10–15 mm. long: scales pubescent, the body 3–4 mm. long, with a long subulate tip: blades of the perianth-scales suborbicular, abruptly pointed, less than 1 mm. long, truncate or subcordate at the base: perianth-bristles shorter than the sepal-stalks: achene-body obovoid or oval, barely 1 mm. long.—Low pinelands, Coastal Plain, W Fla. to Miss.

3. *F. squarrosa* Michx. Annual, 1–3 dm. tall, or rarely taller: leaves glabrous or the sheaths of the lower ones finely hirsute: spikelets usually clustered: scales pubescent, the body ovate, the awn slender-subulate, one-half as long as the body or more: perianth-scales 3 mm. long or more; blades elliptic or nearly so, each prolonged into a long slender awn, narrowed at the base: achene-body broadly oval, less than 1 mm. long.—(SALT-MARSH UMBRELLA-GRASS.)—Wet, often brackish, grounds, Coastal Plain, Fla. to Mass.; also Great Lake Lowland, Ind. and Mich.

4. *F. breviseta* Coville. Perennial, up to 1 m. tall: leaves finely pubescent, or the sheaths sometimes hirsute, the blades of the upper leaves often deflexed: spikelets mostly clustered: scales pubescent, the body obovate, the awn nearly or quite as long as the body: perianth-scales about 2 mm. long; blades suborbicular or somewhat reniform, short-tipped, abruptly narrowed at the base: achene-body rhombic-oval, less than 1 mm. long. [*F. squarrosa breviseta* Coville.]—Moist sandy soil and swamps, Coastal Plain, Fla. to Tex. and N. C.

5. *F. hispida* Ell. Perennial, 2–8 dm. tall: leaves, both the sheaths and the blades more or less hirsute: spikelets usually clustered: scales pubescent, the body obovate, the awn subulate, nearly or quite as long as the body: perianth-scales about 2 mm. long; blades deltoid-ovate, abruptly pointed, truncate or cordate at the base: achene-body oval or rhombic, much less than 1 mm. long. [*F. squarrosa hispida* (Ell.) Chapm.]—Swamps and wet pinelands, Coastal Plain and adj. provinces, Fla. to Tex., Okla., Ky., and N. J. (or N. Y. ?)

14. **DICHROMENA** Michx. Perennial caulescent herbs with rootstocks. Leaves mostly near the base of the stem: blades narrow, attenuate. Spikelets few—several-flowered, or rarely many-flowered, crowded in a terminal head which is involucre by a whorl of leaf-like bracts, the bracts often white or colored at the base, thus serving to attract insects. Scales rather closely imbricate, broad, keeled, white or whitish. Perianth wanting. Stamens 3. Ovary sessile: style subulate. Stigmas 2. Achene short, lenticular, often turgid, transversely wrinkled, crowned with the broad truncate or decurrent tubercle. About 20 species, natives of the warm parts of America.—Spr.-fall. —WHITE-TOPS.

Bracts of the involucre 4–6, linear or slenderly attenuate: tubercle truncate on top of the achene.

Leaves filiform above the dilated base: achenes dark; tubercle low, blunt.

1. *D. floridensis*.

Leaves linear above the dilated base: achenes pale; tubercle long, acute.

2. *D. colorata*.

Bracts of the involucre 7–10, lanceolate: tubercle decurrent on the sides of the achene.

3. *D. latifolia*.

1. *D. floridensis* Britton. Plant 1–4 dm. tall, the stem slender, often copiously tufted: bracts of the involucre 4–6, slenderly attenuate beyond the dilated

bases: heads about 1 cm. in diameter: spikelets elliptic, 5-7 mm. long, pale, often greenish-white: scales 3-4 mm. long, obtuse or mucronulate: achene broadly obovoid or broadly oval, fully 1 mm. long, finely wrinkled.—Pinelands, Everglade Keys, Fla.

2. *D. colorata* (L.) A. Hitchc. Plant up to 1 m. tall, the stem 3-angled, usually gregarious: leaf-blades narrowly linear-attenuate: bracts of the involucre 4-6, white or yellowish-white at the base, reflexed when mature: heads 1.5-2 cm. in diameter or rarely smaller: spikelets narrowly elliptic: scales 4-5 mm. long, whitish: achene obovoid or globose-obovoid, fully 1 mm. long, not constricted at the base, the tubercle truncate on the top of the achene.—(STAR-RUSH.)—Wet places, low grounds, and swamps, usually calcareous, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and Va. (or N. J.?)—(W. I., Mex.)

3. *D. latifolia* Baldw. Plant up to 1.2 m. tall, the stem nearly terete: leaf-blades broadly linear-attenuate: bracts of the involucre 7-10, becoming colored, often reddish at the base, strongly reflexed when mature: heads 1.5-2 cm. in diameter or rarely longer: spikelets elliptic: scales 4.5-6 mm. long, whitish: achene globose-obovoid or turgid-globose, fully 1 mm. long, often constricted at the base, the tubercle decurrent on the sides of the achene.—(WHITE-TOP RUSH.) Moist or wet pinelands, shallow ponds, and acid sandy swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Va.

15. *PSILOCARYA* Torr. Annual, or rarely perennial, caulescent herbs. Leaves few: blades very narrow and elongate. Spikelets few to many, in terminal and axillary umbel-like or cyme-like clusters, not flattened, several-many-flowered. Scales closely imbricate, concave, deciduous. Perianth-bristles wanting. Stamens 2 or rarely 1. Ovary sessile: style with a dilated and enlarging base. Stigmas 2. Achene lenticular, short, sometimes depressed, more or less prominently transversely wrinkled, capped by the short or long tubercle.—About 10 species, natives of the warmer parts of America.—Sum.-fall, or all year S.—BALD-RUSHES.

*Tubercle* ovate to triangular-lanceolate or subulate, nearly or quite as long as the achene, slightly decurrent.

Achene finely and shallowly, often obscurely, wrinkled, the tubercle subulate.

1. *P. scirpoides*.

Achene coarsely wrinkled, the tubercle ovate to triangular-lanceolate.

2. *P. corymbifera*.

Tubercle depressed, much shorter than the achene, more or less shouldered at the base.

Achene about 1 mm. long, slightly, often obscurely, shouldered at the base: spikelet-scales 2-3 mm. long.

3. *P. nitens*.

Achene about 1.5 mm. long, prominently shouldered at the base: spikelet-scales 4-5.5 mm. long.

4. *P. Schiedeana*.

1. *P. scirpoides* Torr. Plant 0.5-3 dm. tall, or rarely smaller or larger: spikelets ovoid, usually narrowly so, 5-7 mm. long, obtuse or acute: scales 2.5-3 mm. long, obtuse or acute, appressed, chestnut-brown: achene sub-orbicular in outline, or depressed, barely 1 mm. long, finely and shallowly

wrinkled, slightly margined, somewhat contracted at the base, the tubercle subulate, as long as the achene or longer, slightly decurrent.—(BALD-RUSH.)—Wet soil and margins of ponds, Coastal Plain, N. C., New England Coast, Mass. to R. I., and Great Lake Lowland, Ind. and Mich.

2. *P. corymbifera* (C. Wright) Britton. Plant 1–7 dm. tall: spikelets ellipsoid-ovoid, 6–10 mm. long, acutish: scales 2.5–3.5 mm. long, acute, rather lax, especially at the tip, brownish, often pale: achene suborbicular in outline, or much depressed, 0.5 mm. long or more, rather coarsely wrinkled, marginless, the tubercle ovate or triangular-lanceolate, nearly or quite as long as the achene, slightly decurrent. [*P. corymbiformis* Benth.]—Wet pinelands and ponds, Coastal Plain, Fla. to La. and Ga.—(W. I.)

3. *P. nitens* (Vahl) Wood. Plant 2–7 dm. tall: spikelets ovoid to ellipsoid-ovoid, 5–7 mm. long, usually acute: scales 2–3 mm. long, mostly acute or slightly acuminate, appressed, brown: achene suborbicular in outline or orbicular-obovoid, about 1 mm. long, coarsely wrinkled, often margined, barely contracted at the base, not decurrent, much shorter than the achene.—Swamps, lake-shores, and wet ground, Coastal Plain, Fla. to Tex. and N. Y., and Great Lake Lowland, Ind. and Mich.

4. *P. Schiedeana* (Nees.) Liebm. Plant mostly 2–5 dm. tall: spikelets conic-ovoid, 6–8 mm. long, somewhat acuminate: scales 4–5.5 mm. long, acuminate, rather lax, brownish: achene depressed, about 1.5 mm. long, wrinkled-cancelate, marginless, the tubercle much depressed, with a short tip and very prominent shoulders.—Wet soil, pen. Fla.—(W. I., Mex.)

16. **RYNCHOSPORA** Vahl. Perennial or rarely annual caulescent gregarious or tufted herbs. Leaves with narrowly linear, flat, channeled, involute, filiform, or capillary blades, those of the stem with long sheaths. Spikelets mainly globose, ovoid, ellipsoid, or fusiform, 1–2-flowered or rarely few-flowered, borne in terminal and axillary capitate or open, often corymb-like cymes. Scales imbricate, concave. Perianth of 3–6, or fewer or more, barbed or plumose bristles, or obsolete. Stamens mostly 3. Ovary sessile or stipitate: style partly persistent. Stigmas 2. Achene lenticular, sometimes very turgid, smooth, cancellate, or transversely wrinkled, capped or crowned with a depressed or elongate tubercle. About 200 species, most abundant in warm regions.—Spr.-fall, or all year S.—BEAK-RUSHES.

Style elongate: stigmas much shorter than the style.

Spikelets in 1–4 dense globose heads.

Spikelets in paniced clusters: achene capped with a stout tubercle.

Style short: stigmas as long as the style or longer.

Perianth-bristles wanting or very short.

Perianth-bristles present and usually well-developed.

Bristles plumose: achenes wrinkled.

Bristles more or less distinctly barbed.

I. CAPITATAE.

II. CORNICULATAE.

III. PUSILLAE.

IV. PLUMOSAE.

V. GLOMERATAE.

#### I. CAPITATAE

Plant stiffly erect: leaf-blades involute, thus elongate-acicular: heads short-peduncled or long-peduncled.

1. *R. Tracyi*.

## II. CORNICULATAE

Achene ellipsoid-obovate, much longer than wide.

Perianth-bristles shorter than the achene: mature achene 5-6 mm. long.

Perianth bristles about twice as long as the achene: mature achene less than 5 mm. long.

Achene broadly-obovate, slightly longer than wide.

Inflorescence effuse, the primary glomurels with few spikelets: achene less than 5 mm. long: perianth-bristles usually 4.

Inflorescence fastigiate, the primary glomurels with many (10-50) spikelets: achene 5-6 mm. long: perianth-bristles usually 6.

2. *R. corniculata*.

3. *R. inundata*.

4. *R. Careyana*.

5. *R. macrostachya*.

## III. PUSILLAE

Achene transversely wrinkled.

Achene smooth or reticulate.

Achene reticulate, 0.5-0.7 mm. long: spikelets loosely corymbose.

Achene smooth, 1.5-2 mm. long: spikelets corymbose-capitate.

Stem-leaves with blades 0.7 mm. wide or less: spikelets 3-4 mm. long.

Stem-leaves with blades 1.5-2.5 mm. wide: spikelets 4-6 mm. long.

Achene about 1.5 mm. long, obovoid-ellipsoid or oval, minutely pitted, the tubercle minute, inconspicuous.

Achene about 2 mm. long, suborbicular or oval-orbicular, smooth, the tubercle prominent.

6. *R. intermixta*.

7. *R. divergens*.

8. *R. Chapmanii*.

9. *R. pallida*.

10. *R. Rappiana*.

## IV. PLUMOSAE

Spikelets solitary or 2-4 together, 6-8 mm. long.

Spikelets numerous, clustered, 2.5-4 mm. long.

Perianth-bristles plumose nearly or quite to the top.

Stems slender, 1.5-3.5 dm. tall: spikelets small.

Stems stout, 3-6 dm. tall: spikelets large.

Perianth-bristles plumose below the middle or only near the base.

11. *R. oligantha*.

12. *R. plumosa*.

13. *R. intermedia*.

14. *R. semiplumosa*.

## V. GLOMERATAE

Bristles retrorsely barbed.

Scales pale-green or white: perianth-bristles 9-24.

Achene broadly ellipsoid or ellipsoid-obovoid: perianth-bristles mostly fewer than 15.

Achene turbinate-obovoid: perianth-bristles mostly more than 15.

Scales brown: perianth-bristles 6.

Spikelets few to numerous in rather loose, often panicked clusters.

Spikelets many together in clusters; scales dark-brown.

Achene about 1.5 mm. long, the body broadly ellipsoid above the stipe-like base.

Achene about 2 mm. long, the body subglobose above the stipe-like base.

Spikelets few in distant clusters; scales pale-brown.

Spikelets numerous, in 2-4 dense globose clusters.

Spikelets 5-6 mm. long: achene 2.5 mm. long.

Spikelets 3-3.5 mm. long: achene 1.5 mm. long.

Bristles upwardly barbed.

Achene smooth or cancellate, not transversely wrinkled.

Achene smooth.

Tubercle of the achene ciliate to serrulate.

Leaf-blades flat.

Leaf-blades channeled, involute, filiform or nearly so.

Achene linear-oblong: perianth-bristles much overtopping the tubercle.

Achene obovoid: perianth-bristles, or some of them at least, not longer than the achene and tubercle, or scarcely so.

Achene 1 mm. long or less, light-brown.

Achene 1.5-2 mm. long, dark-brown.

15. *R. alba*.

16. *R. macra*.

17. *R. capitellata*.

18. *R. glomerata*.

19. *R. leptocarpa*.

20. *R. axillaris*.

21. *R. microcephala*.

22. *R. fuscooides*.

23. *R. Curtissii*.

24. *R. filifolia*.

- Achene narrowly obovoid, much less than 1 mm. wide.  
 Achene broadly obovoid, about 1 mm. wide.  
 Tubercle of the achene smooth or merely granular.  
 Perianth-bristles as long as the achene or longer.  
 Leaf-blades 0.5-2 mm. wide.  
 Perianth-bristles about as long as the achene.  
 Spikelet-scales very broad, suborbicular to reniform, mostly less than 3 mm. long.  
 Spikelet-scales narrow, lanceolate to elliptic, mostly over 3 mm. long.  
 Perianth-bristles much longer than the achene.  
 Achene without a stipe-like base, the tubercle conic-subulate.  
 Achene with a stipe-like base, the tubercle lanceolate.  
 Leaf-blades 2-7 mm. wide.  
 Perianth-bristles much shorter than the achene, sometimes very short.  
 Leaf-blades 0.5-3 mm. wide; spikelets 2-5 mm. long.  
 Leaf-blades narrowly linear: spikelets 4-5 mm. long.  
 Leaf-blades bristle-like, filiform: spikelets 2.5-3 mm. long.  
 Leaf-blades 4-10 mm. wide; spikelets 6-8 mm. long.  
 Achene cancellate.  
 Leaf-blades broadly linear, blunt or merely acute: achene 1.5 mm. long.  
 Leaf-blades narrowly linear, attenuate.  
 Achenes 2.5 mm. long, equalling or shorter than the bristles.  
 Achenes 1.5 mm. long, much longer than the bristles.  
 Spikelets ellipsoid or ovoid-ellipsoid, 2.5-3.5 mm. long; tubercle not constricted at the base.  
 Spikelets globose-ovoid, about 2 mm. long; tubercle constricted at the base.  
 Achene transversely wrinkled.  
 Perianth-bristles shorter than the achene.  
 Leaf-blades and stems filiform: spikelets filiform-pedicelled, stalked.  
 Leaf-blades flat or involute, not filiform: spikelets sessile or short-pedicelled, stalked.  
 Leaf-blades involute.  
 Achene flat, 1.5 mm. long, continuous with the tubercle.  
 Achene strongly biconvex, 2 mm. long, constricted under the tubercle.  
 Leaf-blades flat.  
 Achenes biconvex, not constricted under the tubercle.  
 Achenes 1 mm. long; tubercle depressed, wider than high.  
 Achene ellipsoid, decidedly longer than wide, nearly 1 mm. wide, finely wrinkled.  
 Achene orbicular-obovoid, about as long as wide, fully 1 mm. wide, coarsely wrinkled.  
 Cymes many-flowered, more or less nodding: tubercle confluent with the achene-body.  
 Cymes few-flowered, erect: tubercle with a ring-like base, thus sharply differentiated from the achene-body.

 26. *R. Harperi*.  
 27. *R. distans*.  
 28. *R. solitaria*.  
 29. *R. gracilentia*.  
 30. *R. Smallii*.  
 31. *R. Baldwinii*.  
 32. *R. fascicularis*.  
 33. *R. Wrightiana*.  
 34. *R. dodecandra*.  
 35. *R. ciliaris*.  
 36. *R. Grayi*.  
 37. *R. Harveyi*.  
 38. *R. pinetorum*.  
 39. *R. rariflora*.  
 40. *R. Torreyana*.  
 41. *R. Earlei*.  
 42. *R. Edisoniana*.  
 43. *R. perplexa*.  
 44. *R. globularis*.

- Achene 1.5 mm. long: tubercle conic, about as high as wide. 45. *R. cymosa*.  
 Achene compressed, constricted under the tubercle. 46. *R. compressa*.  
 Perianth-bristles as long as the achene or longer.  
 Spikelets ovoid to globular, 2-4 mm. long.  
 Achene not stipitate.  
 Cymes with erect or ascending peduncles and pedicels.  
 Tubercle not setose.  
 Tubercle depressed-conic or disk-like. 47. *R. saxicola*.  
 Tubercle conic or triangular,  $\frac{1}{4}$  to  $\frac{1}{2}$  as long as the achene.  
 Achene 2-3 mm. long. 48. *R. punctata*.  
 Achene 1-1.5 mm. long.  
 Perianth-bristles about as long as the achene, exceeded usually by the tubercle.  
 Spikelets clustered: tubercle bluntish, achene orbicular-obovoid. 49. *R. microcarpa*.  
 Spikelets sharp-pointed, achene ellipsoid. 50. *R. decurrens*.  
 Perianth-bristles usually longer than the achene and tubercle. 51. *R. schoenoides*.  
 Tubercle setose.  
 Spikelets 1-3-flowered.  
 Perianth-bristles not longer than the achene and tubercle. 52. *R. patula*.  
 Perianth-bristles longer than the achene and tubercle.  
 Achene broadly obovoid or orbicular-obovoid. 53. *R. caduca*.  
 Achene narrowly obovoid. 54. *R. mixta*.  
 Spikelets 5-10-flowered. 55. *R. prolifera*.  
 Cymes with divaricate peduncles and pedicels. 56. *R. miliacea*.  
 Achene constricted at the base into a stipe: tubercle setose. 57. *R. stipitata*.  
 Spikelets fusiform to lanceolate, 4-6 mm. long.  
 Leaf-blades filiform: achene obovoid: tubercle smooth. 58. *R. stenophylla*.  
 Leaf-blades not filiform: achene linear-ellipsoid or oblanceolate: tubercle setose. 59. *R. incarpansa*.

1. *R. Tracyi* Britton. Stem up to 1.2 m. tall, nearly terete: leaf-blades channeled, 4-8 mm. wide: spikelets in 1-6 dense heads, 5-6 mm. long, pale: scales acute or slightly acuminate: achene obovoid or cuneate-obovoid, 2.5-3 mm. long, ciliate, much exceeded by the perianth-bristles, the tubercle subulate, fully twice as long as the achene. [*Ceratoschoenus capitatus* Chapm.]—Pineland ponds and swamps, Coastal Plain, Fla. to Miss. and Ga.—(W. I.)

2. *R. corniculata* (Lam.) A. Gray. Stem up to 2 m. tall, 3-angled: leaf-blades 6-20 mm. wide, rough-margined: spikelets borne in diffuse decomposed cymes, fusiform: scales acute or slightly acuminate: achene ellipsoid-obovate, 5-6 mm. long, much exceeding the subulate unequal perianth-bristles, the tubercle subulate, several times longer than the achene.—(HORNED-RUSH.)—

Swamps and wet grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., Del., and Pa.—A form from the interior, Ala. to Tex., Ark., and Ind., with somewhat smaller achenes has been described as *R. corniculata interior*.

3. *R. inundata* (Oakes) Fernald. Stem, leaves, and inflorescence resembling *R. corniculata*, but plants loosely stoloniferous and widely gregarious: spike-

lets slender-fusiform: scales acute or abruptly pointed: achene mostly 4–4.5 mm. long, about  $\frac{1}{2}$  as long as the perianth-bristles, the tubercle about thrice or four times as long as the achene.—(HORNED-RUSH.)—Ponds, lakes, swamps, and marshes, Coastal Plain and New England Coast, Fla. to Mass.

4. *R. Careyana* Fernald. Stem and leaves resembling those of *R. corniculata* and *R. inundata*, the plants like the latter widely stoloniferous; inflorescence effuse, the clusters rather lax: spikelets loosely spreading: scales acute to abruptly pointed: achene mostly about 4 mm. long, about  $\frac{1}{2}$  as long as the perianth-bristles, the tubercle nearly thrice as long as the achene.—(HORNED-RUSH.)—Marshes, ponds, ditches, low pinelands, Fla.

5. *R. macrostachya* Torr. Stem up to 2 m. tall, 3-angled, solitary or somewhat tufted, but not stoloniferous: leaf-blades mostly less than 2 cm. wide: spikelets in one or several dense fastigiate clusters, fusiform: scales acute or acuminate and often slender-tipped: achene broadly obovate, 5–6 mm. long, much shorter than the perianth-bristles, the tubercle thrice or four times as long as the achene. [*R. corniculata macrostachya* Britton.]—(HORNED-RUSH.)—Swamps, marshes, ponds, and wet pinelands, sometimes in salt-marshes, various provinces, Fla. to Tex., SE Kans., Mich., and E Mass.—The fruit characters as given above fail occasionally in specimens from west of the Mississippi River, which have narrower achenes and short perianth-bristles.

6. *R. intermixta* C. Wright. Stem 1–3 dm. tall, filiform or capillary: leaf-blades resembling the stem, but more slender, curved: spikelets elliptic-ovoid, about 2 mm. long, borne in 1–3 separate lax clusters: scales obtuse or abruptly pointed, 1.5–2 mm. long: achene ellipsoid-obovoid or cuneate-obovoid, 1 mm. long or nearly so, transversely wrinkled, whitish, not accompanied by perianth-bristles, the tubercle small, depressed. [*R. pusilla* M. A. Curtis.]—Pineland swamps, Coastal Plain, Fla. to Tex.—(W. I.)

7. *R. divergens* M. A. Curtis. Stem 1.5–4 dm. tall, filiform or wiry: leaf-blades resembling the stem but more slender, curved: spikelets borne in loose or somewhat contracted corymb-like cymes, elliptic to ovoid-elliptic, 3–3.5 mm. long, acute: scales acute or mucronulate, 2–2.5 mm. long: achene broadly obovoid or orbicular-obovoid, much less than 1 mm. long, constricted at the base, not accompanied with perianth-bristles, the tubercle much depressed.—Moist pinelands, Coastal Plain, Fla. to S. C.—(W. I.)

8. *R. Chapmanii* M. A. Curtis. Stem 2–6 dm. tall, filiform: leaf-blades resembling the stem but more slender: spikelets borne in usually a solitary terminal cluster, fusiform, 3–4 mm. long: scales aristate-mucronate, 2–3 mm. long: achene oval, fully 1 mm. long, smooth and shining, not accompanied by perianth-bristles, the tubercle deltoid, sometimes slightly depressed.—Low pinelands, Coastal Plain, Fla. to La. and N. C.

9. *R. pallida* M. A. Curtis. Stem 1–6 dm. tall, stoutish: spikelets numerous, borne in a mostly solitary terminal dense cluster, fusiform, 4–6 mm. long: scales acuminate or abruptly pointed, 2.5–4 mm. long: perianth-bristles very short, rudimentary, or wanting: achene obovoid-ellipsoid or oval, about 1.5 mm. long, smooth, the tubercle inconspicuous, minute, depressed.—Acid pineland bogs, Coastal Plain, N. C. to N. Y.

10. *R. Rappiana* Small. Similar to *R. pallida* in habit, but stouter and with broader leaf-blades: spikelets rather numerous, borne in a single terminal cluster, fusiform, chestnut-colored, 5–6 mm. long; scales abruptly short-pointed, mostly 3–4 mm. long: perianth-bristles very short or wanting: achene sub-orbicular or oval-orbicular, about 2 mm. long, pale, minutely pitted, the tubercle prominent, somewhat depressed.—Low pinelands, E pen. Fla.

11. *R. oligantha* A. Gray. Stem 2–4 dm. tall, capillary: spikelets solitary, or few together in a lax cluster, ellipsoid or ellipsoid-fusiform, 6–8 mm. long: scales acute or abruptly pointed, 4–6.5 mm. long: perianth-bristles longer than the achene, densely plumose below the middle: achene obovoid, about 2 mm. long, transversely wrinkled, the tubercle prominent, with a dilated border and a conic tip.—Wet, often acid, sandy soil and pinelands, Coastal Plain, Fla. to Tex. and N. J.

12. *R. plumosa* Ell. Stem 1–3.5 dm. tall, slender and wiry: leaves few: blades filiform, curving: spikelets borne in 2–4 lax clusters, ellipsoid-ovoid, 2.5–3.5 mm. long: scales short-acuminate or aristulate, 2.5–4 mm. long: perianth-bristles plumose nearly or quite to the top, about as long as the achene or shorter: achene orbicular-obovoid or broadly oval, fully 1.5 mm. long, strongly wrinkled, the tubercle depressed-conic, not constricted under the base.—Pinelands, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

13. *R. intermedia* (Chapm.) Britton. Stem 2–7 dm. tall, stout: leaves numerous: blades 1–2 mm. wide, more or less involute: spikelets borne in 4–6 clusters which form a continuous or an interrupted terminal inflorescence, ovoid or elliptic-ovoid, 3–4 mm. long: scales short-acuminate, 3–5 mm. long: perianth-bristles plumose nearly or quite to the top, longer than the achene: achene obovoid, about 2 mm. long, transversely wrinkled, the tubercle depressed-conic, constricted under the base.—Pinelands, Fla.—Reported from Ala.

14. *R. semiplumosa* A. Gray. Stem 2.5–7 dm. tall, bright-green: leaf-blades 1.5–2.5 mm. wide: spikelets crowded in a terminal head-like cluster, or sometimes with an additional cluster, fusiform, 4–6 mm. long: scales short-acuminate, 2–3 mm. long: perianth-bristles plumose below the middle or only near the base, longer than the achene: achene broadly obovoid or orbicular-obovoid, about 1.5 mm. long, wrinkled, the tubercle conic, often broadly so, above the annular base.—Pinelands, Coastal Plain, Fla. to Tex. and Ga.—(*W. I.*)

15. *R. alba* (L.) Vahl. Stem 1–6 dm. tall, pale-green: leaf-blades mostly less than 2 mm. wide: spikelets borne in mostly 2–4 dense corymb-like clusters, 4–5.5 mm. long, narrowly fusiform: scales acute or mucronate, 3.5–5 mm. long, white or pale-green: perianth-bristles 9–15 or rarely more, much longer than the achene: achene broadly ellipsoid to ellipsoid-obovoid, fully 1.5 mm. long, pale-brown, constricted at the base, the tubercle lanceolate, one-half as long as the achene or more.—(WHITE BEAK-RUSH.)—Acid bogs, various provinces, Ga. to Ky., Minn., N Calif., Alas., C Can., and Newf.—(*W. I.*, *O. W.*)

16. *R. macra* (Clarke) Small. Stem 2–8 dm. tall, bright-green: leaves mostly over 2 mm. wide: spikelets borne in mostly 1 or 2 dense corymb-like clusters, 4.5–5.5 mm. long, fusiform: scales mucronulate, 3–4.5 mm. long, whitish-green: perianth-bristles mostly 15–24, much longer than the achene: achene turbinate-obovoid, about 2 mm. long, brown, constricted at the base, the tubercle conic or conic-subulate, about one-half as long as the achene. [*R. alba macra* Clarke.]—Wet pinelands, Coastal Plain, Fla. to Tex. and Ga.

17. *R. capitellata* (Michx.) Vahl. Stem up to 1.5 m. tall, bright-green: leaf-blades deep-green, mostly 3 mm. wide or less: spikelets borne in few dense corymbose-capitate, mostly erect, distant, clusters, ellipsoid-ovoid, 3–4 mm. long: scales dark-brown, 1.5–3 mm. long, usually mucronulate: perianth-bristles much longer than the achene: achene obovoid, about 1.5 mm. long, constricted at the base, dark-brown, the tubercle subulate or lanceolate-subulate, as long as the achene or nearly so. [*R. glomerata* (Fl. SE. U. S.)]—Low and wet grounds, often acid, various provinces, Fla. to Tex., Mich., and N. B.

18. *R. glomerata* (L.) Vahl. Stem up to 2 m. tall, bright-green: leaf-blades bright-green, flat, mostly 4–7 mm. wide: spikelets borne in several to many

corymbose-cymose dense clusters which are often nodding, fusiform, 5-6 mm. long: scales dark-brown, mucronate, 2.5-5 mm. long: perianth-bristles much longer than the achene: achene broadly obovoid or pyriform, about 2 mm. long, much constricted at the base, the body thus often orbicular in outline, or even wider than high, the tubercle subulate, as long as the achene or nearly so. [*R. glomerata paniculata* (A. Gray) Chapm.]—Swamps, moist slopes, and ravines, Coastal Plain and adj. provinces, Fla. to Tex. and Md.

19. *R. leptocarpa* (Chapm.) Small. Stem up to 1 m. tall, light- or pale-green: leaf-blades thinnish, 1.5-2.5 mm. wide: spikelets borne, usually few together, in 3-6 short-stalked clusters, whose bracts and bractlets project as almost capillary tips, ellipsoid or ellipsoid-fusiform, 3-4 mm. long: scales obtuse or acute, very thin, pale-brown, 1.5-3 mm. long: perianth-bristles much longer than the achene: achene obovoid, about 1.5 mm. long, pale, slightly constricted at the base, smooth, shining, the tubercle lanceolate-subulate, shorter than the achene. [*R. glomerata leptocarpa* Chapm.]—Wet woods and low pinelands, Coastal Plain, Fla. to Miss. and S. C.

20. *R. axillaris* (Lam.) Britton. Stem stout, up to 1 m. tall: leaf-blades 2-3 mm. wide, flat: spikelets borne in several large globular heads (mostly 1.5-2.5 cm. in diameter), fusiform, 5-6 mm. long: scales dark-brown, 3-5 mm. long, aristulate-acuminate: perianth-bristles larger than the achene, usually not exceeding the tubercle: achene globose-obovoid, above the stipe-like base, about 2.5 mm. long, the tubercle subulate, about as long as the achene. [*R. cephalantha* A. Gray.]—Acid bogs and swamps, Coastal Plain and adj. provinces, Fla. to La. and N. S.—(*W. I.*)

21. *R. microcephala* Britton. Stem slender, up to 1.5 m. tall: leaf-blades involute, thus linear-filiform: spikelets borne in several small globose heads (mostly 1-1.5 cm. in diameter), fusiform, 3-3.5 mm. long: scales chestnut-brown, 2-4 mm. long, mucronulate: perianth-bristles usually longer than the achene and tubercle: achene obovoid, about 1.5 mm. long, constricted at the base, the tubercle subulate-lanceolate, shorter than the achene.—Swamps and low grounds, often acid, Coastal Plain and adj. provinces, Fla. to La. and N. J.

22. *R. fuscoides* Clarke. Stem slender, 1-7 dm. tall: leaf-blades flat, mostly 1-2 mm. wide: spikelets borne few together in 1-3 stiff clusters, ovoid or ellipsoid-ovoid, 2-2.5 mm. long, acute at both ends: scales mucronate, 2-4 mm. long: perianth-bristles longer than the achene: achene broadly oval or orbicular-oval, 1.5-2 mm. long, not constricted at the base, the tubercle subulate-conic, as long as the achene or longer.—Low pinelands, Coastal Plain, Fla. to Tex.—(*W. I.*)

23. *R. curtissii* Britton. Stem filiform, 1-2 dm. tall: leaf-blades strongly involute, thus very narrow: spikelets solitary or borne few together in 1-3 lax clusters, ellipsoid often narrowly so, 4-6 mm. long, acute at both ends: scales mucronate, 2.5-5 mm. long or rarely smaller: perianth-bristles longer than the achene: achene narrowly ellipsoid or linear-ellipsoid, about 1.5 mm. long, smooth, the tubercle lanceolate, fully one-half as long as the achene.—Moist pinelands, W. Fla.

24. *R. filifolia* Torr. Stem 2-6 dm. tall: leaf-blades channeled and involute, thus filiform or bristle-like: spikelets borne in usually 2-4 capitate clusters, lanceolate in outline or ovoid-lanceolate, 3-3.5 mm. long: scales acuminate or mucronulate, 2-3 mm. long, brown: perianth-bristles mostly longer than the achene: achene obovoid, about 1 mm. long, shining, light-brown, the tubercle deltoid to triangular-lanceolate, shorter than the achene.—Pineland ponds, Coastal Plain and adj. provinces, Fla. to Tex. and N. J.—(*W. I.*)

25. *R. fusca* (L.) Ait.f. Stem 1-6 dm. tall, deep-green: leaf-blades filiform-setaceous, channeled: spikelets borne few together in 1-4 rather lax clusters,

fusiform, 4.5–6 mm. long: scales mucronate, 3–5 mm. long, chestnut-colored: perianth-bristles unequal, some of them longer than the achene: achene narrowly obovoid, about 1 mm. long, smooth, constricted at the base, the tubercle triangular-subulate or lanceolate, shorter than the achene.—Around ponds, often in acid soil, various provinces, Fla. to Ga., Miss.(?), Mich., Ont., and Newf.—(*O. W.*)

26. *R. Harperi* Small. Stem 3–7 dm. tall, slender: leaf-blades involute, thus filiform or linear-filiform: spikelets borne in usually 2 or 3 loose-capitate clusters, fusiform, 4.5–5.5 mm. long: scales aristulate-mucronate, mostly 3–5 mm. long, brown: perianth-bristles longer than the achene: achene obovoid, about 2 mm. long, constricted into a somewhat stipe-like base, smooth, the tubercle subulate, truncate.—Pineland ponds, Coastal Plain, Ga.—Most closely related to *R. leptorhyncha* C. Wright, of Cuba, which was once recorded from Florida, apparently in error.

27. *R. distans* (Michx.) Vahl. Stem 2–7 dm. tall, slender: leaf-blades very narrow, involute, thus filiform or nearly so: spikelets borne, few together or several, in usually 2 or 3 head-like cymes, ovoid, 2.5–3 mm. long: scales mucronate, dark-brown, 2–3 mm. long: perianth-bristles mostly as long as the achene or longer: achene oval or orbicular-oval, varying to ovoid or obovoid, about 1.5 mm. long, the tubercle conic-subulate, about one-half as long as the achene.—Pinelands, Coastal Plain, Fla. to S. C.—(*W. I.*)

28. *R. solitaria* Harper. Stem slender, 3–8 dm. tall, flattened: leaf-blades about 2 mm. wide, or less, mostly flat: spikelets in 1 or 2 capitate clusters, narrowly fusiform or lanceolate in outline, 5–6.5 mm. long: scales aristulate-tipped, brown, mostly 3–6 mm. long: perianth-bristles about as long as the achene: achene obovoid, about 1.5 mm. long, faintly pitted, the tubercle triangular or deltoid, much shorter than the achene.—Moist pinelands, Coastal Plain, S Ga.

29. *R. gracilentia* A. Gray. Stem 1–5 dm. tall, very slender or filiform: leaf-blades flat, or somewhat involute in drying, mostly less than 2 mm. wide: spikelets borne in 1–4 lax clusters, narrowly ovoid, 3.5–4 mm. long: scales acute or abruptly pointed, mostly 2–3 mm. long, brown: perianth-bristles much longer than the achene: achene oval or subglobose, about 1.5 mm. long or more, smooth, the tubercle subulate, as long as the achene or longer.—Low pinelands and acid swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex. and N. J.—(*W. I.*)

30. *R. Smallii* Britton. Stem up to 1.5 m. tall, bright-green: leaf-blades flat, 5 mm. wide or less: spikelets borne in several rather lax, sometimes corymb-like clusters, fusiform, 3–4 mm. long: scales mucronulate, brown 2–3.5 mm. long: perianth-bristles much longer than the achene: achene obovoid, sometimes narrowly so, about 1.5 mm. long, smooth, the tubercle lanceolate, one-half as long as the achene or more.—Swamps and damp hillsides, Blue Ridge, N. C., and various provinces, Va. to Pa. and N. J.

31. *R. Baldwinii* A. Gray. Stem stout, up to 1.2 m. tall, sharply 3-angled: leaf-blades 2–7 mm. wide, more or less glaucous: spikelets borne in 1–3 loosely capitate clusters, ovoid or ellipsoid-ovoid, 5–6 mm. long: scales aristate-tipped, chestnut-colored, 3–5 mm. long: perianth-bristles longer than the achene: achene oval or globose-oval, fully 2 mm. long, minutely granular, the tubercle triangular-conic, shorter than the achene.—Low pinelands, Coastal Plain, Fla. to Miss. and N. C.

32. *R. fascicularis* (Michx.) Vahl. Stem stout, up to 1.5 m. tall, often obscurely 3-angled: leaf-blades 1.5–4 mm. wide, more or less involute, but not very narrow: spikelets borne in 2–5 rather large head-like cymes, broader or ovate-lanceolate in outline, 4–5 mm. long or rarely smaller: scales aristate-

mucronate, 3-4.5 mm. long, dark brown: perianth-bristles shorter than the achene: achene oval or orbicular-oval, 2 mm. long or less, the tubercle triangular, often deltoid.—Low pinelands, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

33. *R. Wrightiana* Boeckl. Stem very slender or filiform, 2-4 dm. long, spreading or procumbent: leaf-blades involute, thus filiform or setaceous: spikelets borne in usually 2 or 3 cluster-like cymes, fusiform or narrowly ovoid, 2.5-3 mm. long: scales mucronate, 2.5-3 mm. long, brown, often pale: perianth-bristles much shorter than the achene: achene oval or orbicular-obovoid, 1-1.5 mm. long, the tubercle deltoid or depressed. [*R. brachychaeta* Sauv.]—Moist pinelands and grassy swamps, Coastal Plain, Fla. to N. C.—(*W. I.*)

34. *R. dodecandra* Baldw. Stem stout, up to 1.2 m. tall, 3-angled: leaf-blades flat, 4-10 mm. wide: spikelets borne in 4-6 lax corymb-like clusters, ovoid, 6-8 mm. long: scales mucronate, chestnut-colored, 3-8 mm. long: perianth-bristles shorter than the achene: achene orbicular-obovoid or oval, 3-4 mm. long, smooth, the tubercle depressed, with a collar-like base, much shorter than the achene.—Sandy hammocks, sandhills, and scrub, Coastal Plain, Fla. to Miss. and N. C.

35. *R. ciliaris* (Michx.) C. Mohr. Stem stout (?), up to 8 dm. tall, obtusely 3-angled: leaf-blades linear, 5-8 mm. wide, ciliate, glaucous: spikelets usually borne in a solitary capitate cluster, narrowly ovoid, or lanceolate in outline, 5-6 mm. long: scales aristate-tipped, brown, 2.5-4.5 mm. long: perianth-bristles much shorter than the achene: achene oval or orbicular-oval, about 1.5 mm. long, cancellate, the tubercle depressed-conic, much shorter than the achene. [*R. ciliata* Vahl]—Low pinelands, Coastal Plain, Fla. to Miss. and N. C.

36. *R. Grayi* Kunth. Stem relatively slender, 2-7 dm. tall, 3-angled: leaf-blades narrowly linear, mostly 2-4 mm. wide, not ciliate, shining: spikelets borne in 2-4 loose capitate clusters, ovoid, 5-6 mm. long: scales mucronate, 3-5 mm. long, light chestnut-colored: perianth-bristles much longer than the achene: achene obovoid or broadly ellipsoid, about 2.5 mm. long, cancellate, dark-brown, the tubercle depressed-conic, much shorter than the achene.—Dry pinelands, Coastal Plain and adj. provinces, Fla. to Tex. and N. C.

37. *R. Harveyi* W. Boott. Stem up to 1 m. tall, 3-angled, bright-green: leaf-blades flat or nearly so, 1.5-4 mm. wide: spikelets borne in 1-4 capitate cymes or clusters, especially those of the terminal inflorescence in corymb-like cymes, ovoid, 2.5-3.5 mm. long: scales aristate-tipped or mucronate, 2-3 mm. long, chestnut-colored: perianth-bristles much shorter than the achene: achene broadly obovoid or orbicular-obovoid, fully 1.5 mm. long, finely cancellate, brown, the tubercle depressed, with a somewhat collar-like base. [*R. Plankii* Britton]—Low grounds, Coastal Plain and adj. provinces, Ga. to Tex., Okla., and Ark.

38. *R. pinetorum* Britton & Small. Stem up to nearly 1 m. tall, sharply 3-angled and striate, light-green: leaf-blades flat, 1.5-2 mm. wide: spikelets borne in several cluster-like cymes, globose-ovoid, about 2 mm. long, the bracts inconspicuous: scales acute or mucronulate, 2-2.5 mm. long, chestnut-colored: perianth-bristles much shorter than the achene: achene orbicular-obovoid, about 1.5 mm. long, finely cancellate, light-brown, the tubercle depressed, constricted at the base.—Pinelands between Myakka prairie and Punta Gorda, Fla.

39. *R. rariflora* (Michx.) Ell. Stem filiform, 2-5 dm. long, sometimes reclining: leaf-blades involute-filiform or setaceous: spikelets borne in usually 2 or 3 lax open corymb-like cymes, ellipsoid or ovoid, 2.5-3 mm. long: scales acute or obtusish, 2-3 mm. long, brown: perianth-bristles shorter than the achene: achene obovoid or broadly ellipsoid, about 1.5 mm. long, strongly transversely wrinkled, the tubercle depressed-conic.—Pinelands, Coastal Plain and Piedmont, Fla. to Tex. and N. J.—(*W. I.*)

40. *R. Torreyana* A. Gray. Stem 3-9 dm. tall, terete or obscurely 3-angled: leaf-blades involute, those of the upper leaves setaceous: spikelets borne in 1-4 lax, filiform-stalked, corymbose, rather narrow, cymes, ovoid, about 3 mm. long: scales mucronate, brown, mostly 2.5-4 mm. long: perianth-bristles shorter than the achene: achene ellipsoid-obovoid, about 1.5 mm. long, transversely wrinkled, the tubercle broadly conic or depressed, much shorter than the achene.—Wet pinelands and acid swamps, Coastal Plain and New England Coast, Ga. to N. H.

41. *R. Earlei* Britton. Stem 3-8 dm. tall, 3-angled: leaf-blades flat or nearly so, 1.5-3 mm. wide: spikelets borne in 1 or few open corymb-like cymes, ovoid, 3.5-4 mm. long: scales aristulate-mucronate, or some of them acute, 2.5-3.5 mm. long, red: perianth-bristles shorter than the achene: achene broadly obovoid or orbicular-obovoid, about 2 mm. long, transversely wrinkled, reddish-brown, somewhat constricted at the apex, the tubercle much depressed or nearly flat.—Pinelands, Coastal Plain, S Ga. and Ala.

42. *R. Edisoniana* Britton. Stem slender, up to 1.8 m. tall, 3-angled: leaf-blades deep-green, flat or nearly so, 4 mm. wide or less: spikelets borne in a terminal, compound, corymb-like cyme, and also often in few smaller axillary clusters, ovoid, 1.5-2 mm. long: scales mucronulate, 1.5-2 mm. long, chestnut-brown: perianth-bristles shorter than the achene: achene ellipsoid, fully 1 mm. long, cancellate and transversely wrinkled, the tubercle depressed, low-conic or somewhat rounded.—Swamps and ponds, pen. Fla.

43. *R. perplexa* Britton. Stem slender, up to 1.2 m. tall: leaf-blades deep-green, flat, 1-2.5 mm. wide: spikelets borne in a terminal, and also sometimes 1 or few smaller, compound corymb-like cymes, ovoid or orbicular-ovoid, about 2 mm. long: scales mucronulate, brown, 1.5-2.5 mm. long: perianth-bristles shorter than the achene: achene orbicular-obovoid, about 1 mm. long, transversely wrinkled, brown, not constricted at the apex, the tubercle much depressed.—Swamps, hammocks, and low pinelands, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

44. *R. globularis* (Chapm.) Small. Stem very slender, 0.1-1.5 m. tall, bright-green: leaf-blades 1-2 mm. wide, but usually strongly involute: spikelets borne in 1 or few small few-flowered close clusters, subglobose or oval-globose, 1.5-2 mm. long, the subtending bractlets capillary-tipped: scales blunt or obscurely tipped, dark-brown: perianth-bristles less than  $\frac{1}{2}$  as long as the achene: achene orbicular-obovoid, about 1 mm. long or slightly longer, very turgid, transversely wrinkled, brown, the tubercle depressed-conic.—Pinelands, Coastal Plain, Fla. to Tex. and Va.

45. *R. cymosa* Ell. Stem slender, 0.5-1 m. tall, light-green: leaf-blades 2-5 mm. wide, flat or somewhat involute: spikelets borne in few several-many-flowered corymb-like cymes, ovoid or ellipsoid-ovoid, 2.5-3.5 mm. long, the subtending bractlets with long capillary tips: scales slender-mucronate to aristate, reddish-brown or dark-brown: perianth-bristles over  $\frac{1}{2}$  as long as the achene: achene obovoid or ellipsoid-obovoid, about 1.5 mm. long, strongly transversely wrinkled, the tubercle low-conic.—Swamps, meadows, ponds, pinelands, and woods, various provinces, Fla. to Tex., Kans., Ind., and N. J.—(*W. I.*)

46. *R. compressa* Carey. Stem rather stout, up to 1.2 m. tall: leaf-blades 3-5 mm. wide: spikelets borne in 2-5 cluster-like or corymb-like cymes, with projecting bracts and bractlets, ovoid, 2-4 mm. long: scales mucronate, 1.5-2.5 mm. long, brown: perianth-bristles shorter than the achene: achene rhombic-obovoid or orbicular-obovoid, about 2 mm. long, somewhat constricted at both

ends, transversely wrinkled and cancellate, the tubercle low-conic, with a collar-like base.—Low pinelands and ponds, Coastal Plain, Fla. to La., S Mo., and Ga.

47. *R. saxicola* Small. Stem 2–3 dm. tall, somewhat 3-angled: leaf-blades 1–1.5 mm. wide, nearly flat: spikelets borne 2–6 together in 2–6 corymb-like cymes on filiform peduncles, ovoid to ellipsoid, 2.5–3 mm. long: scales mucronulate, dark-brown: perianth-bristles longer than the achene: achene obovoid, about 1.5 mm. long, transversely wrinkled, yellowish or light yellow-brown, the tubercle depressed-conic or disk-like, a sixth or an eighth the length of the achene.—Boggy slopes, Stone Mountain and Little Stone Mountain on the Piedmont of Ga.

48. *R. punctata* Ell. Stem 3–7 dm. tall, slender, 3-angled: leaf-blades 2–5.5 mm. wide, flat or nearly so: spikelets borne, rather few together, in few irregular corymb-like or cluster-like cymes, ovoid, 3–4.5 mm. long: scales mucronate, 2–4 mm. long, light chestnut-colored: perianth-bristles longer than the achene: achene obovoid, 2–3 mm. long, prominently transversely wrinkled, the tubercle triangular, often deltoid, much shorter than the achene.—Pinelands, Coastal Plain, Ga. and S. C.

49. *R. microcarpa* Baldw. Stem up to 1 m. tall, nearly terete: leaf-blades channeled, 1.5–4 mm. wide: spikelets borne usually many together, in 2–3, often somewhat nodding, corymb-like cymes, ovoid, 2–3 mm. long: scales mucronulate, 1.5–2.5 mm. long, very broad, dark-brown: perianth-bristles about as long as the achene or slightly longer: achene broadly obovoid or orbicular-obovoid, about 1 mm. long, strongly transversely wrinkled, the tubercle depressed, obtusish, much shorter than the achene.—Low grounds, moist pinelands, and ponds, Coastal Plain and adj. provinces, Fla. to Tex. and N. C.—(*W. I.*)

50. *R. decurrens* Chapm. Stem 0.5–1.2 m. tall, nearly terete: leaf-blades lax, 2–4 mm. wide, flat: spikelets borne in 4–7 lax, spreading or drooping, corymb-like cymes, ovoid, 2–2.5 mm. long: scales mucronulate, 1.5–2.5 mm. long, brown: perianth-bristles about as long as the achene or longer: achene narrowly obovoid or cuneate-obovoid, about 1 mm. long, transversely wrinkled, the tubercle triangular, acute, somewhat decurrent on the achene-sides.—Swamps and muddy banks, W Fla.

51. *R. schoenoides* (Ell.) Britton. Stem up to 1.2 m. tall, 3-angled: leaf-blades mostly 2–3 mm. wide, flat or slightly involute: spikelets borne many together in 3–5 lax, often somewhat nodding, corymb-like cymes, ovoid, 2.5–3 mm. long: scales mucronulate, mostly 2–3 mm. long, dark-brown: perianth-bristles, unequal, as long as the achene or longer: achene oval or orbicular-oval, fully 1 mm. long, strongly transversely wrinkled, constricted at the base, the tubercle depressed, much shorter than the achene.—Wet grounds and ponds, Coastal Plain and occasionally adj. provinces, Fla. to La. and N. C.

52. *R. patula* A. Gray. Stem rather slender, 0.7–1.2 m. tall: leaf-blades 2–6 mm. wide or more: spikelets borne in 1 or more compound corymb-like cymes, ovoid, 3–3.5 mm. long: scales mucronate, brown, 2–3 mm. long: perianth-bristles as long as the achene or longer: achene broadly obovoid, orbicular-obovoid, 1.5 mm. long or more, transversely wrinkled, the tubercle low-conic or depressed.—Swamps and low pinelands, Coastal Plain and adj. provinces, Fla. to Miss. and N. C.

53. *R. caduca* Ell. Stem 0.9–1.5 m. tall, sharply 3-angled: leaf-blades 4–10 mm. wide: spikelets borne very many together in 3–6 irregular corymb-like cymes, ovoid, sometimes narrowly so, 4–6 mm. long: scales mucronulate, 2–3.5 mm. long, dark-brown: perianth-bristles longer than the achene: achene broadly obovoid or orbicular-obovoid, about 1.5 mm. long, finely transversely wrinkled,

the tubercle low-conic, much shorter than the achene.—Swamps and shaded banks, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and N. C.—(*W. I.*)

54. *R. mixta* Britton. Stem up to 1.5 dm. tall, 3-angled: leaf-blades 3–7 mm. wide: spikelets borne relatively few together in open or lax corymb-like cymes, fusiform, or lanceolate in outline, 3–4 mm. long: scales short-acuminate or somewhat mucronate, 2.5–3.5 mm. long, brown: perianth-bristles longer than the achene: achene narrowly obovoid or ellipsoid, about 1.5 mm. long, finely transversely wrinkled, the tubercle conic, often one-half as long as the achene.—Swamps and low pinelands, Coastal Plain, Fla. to Tex. and Ga.

55. *R. prolifera* Small. Stem 0.5–1 m. tall, slender, weak, 3-angled: leaf-blades 2–6 mm. wide, flat: spikelets borne, usually many together, in several corymb-like cymes, flat, ovoid or ellipsoid-ovoid, 6–8 mm. long: scales obtuse or acutish, mostly 2–3 mm. long, thin, deciduous: perianth-bristles fully as long as the achene: achene broadly obovoid to suborbicular, 1–1.5 mm. long, slightly transversely wrinkled, persistent on the rachis, the tubercle conic, somewhat constricted at the base.—River-banks, moist sandy soil, and pinelands, Coastal Plain, Fla. to Miss. and N. C.

56. *R. miliacea* (Lam.) A. Gray. Stem up to 1.5 m. tall, 3-angled: leaf-blades 3–8 mm. wide, flat: spikelets borne many together in mostly 6–8 lax corymb-like cymes with divergent stalks, ovoid, 2.5–3 mm. long: scales mucronulate, 1.5–3 mm. long, brown: perianth-bristles longer than the achene: achene obovoid, oval, or suborbicular, 1–1.5 mm. long, transversely wrinkled, pale, the tubercle depressed or depressed-conic, much shorter than the achene.—Calcareous low hammocks and pond-margins, Coastal Plain, Fla. to La. and N. C.—(*W. I.*)

57. *R. stipitata* Chapm. Stem up to 1 m. tall, arching above: leaf-blades flat, 4–10 mm. wide: spikelets borne many together in 3–5 more or less nodding corymb-like cymes, narrowly ovoid or broadly fusiform, 7–8 mm. long, brown: scales mucronate, 3.5–7 mm. long, brown: perianth-bristles much longer than the achene: achene orbicular-obovoid, 1.5–2 mm. long, finely transversely wrinkled, with a stipe-like base, the tubercle depressed-conic, about one-half as long as the achene.—Swamps and low pinelands, Coastal Plain, Fla. to N. C.—(*W. I.*)

58. *R. stenophylla* Chapm. Stem 1–4 dm. tall, wiry-filiform: leaf-blades channeled or somewhat involute, very slender: spikelets borne few together in lax erect corymb-like cymes, narrowly fusiform or lanceolate in outline, 4–5 mm. long: scales mucronulate, 3–4.5 mm. long, pale-brown: perianth-bristles longer than the achene: achene obovoid or obovoid-ellipsoid, about 1.5 mm. long, transversely wrinkled, the tubercle conic, about one-half as long as the achene.—Grassy pinelands, Coastal Plain, Fla. to Ala. and S. C.—(*W. I.*)

59. *R. inexpansa* (Michx.) Vahl. Stem up to 1 m. tall, slender, 3-angled: leaf-blades flat, 2 mm. wide or less: spikelets borne many together in 1–4 narrow, ultimately drooping panicle-like cymes, fusiform, 5–6 mm. long: scales acuminate or slightly mucronulate, 2.5–5 mm. long, brown, or reddish-brown: perianth-bristles about twice as long as the achene: achene narrowly ellipsoid or linear-ellipsoid, or slightly broadened upward, about 2 mm. long, transversely wrinkled, the tubercle triangular-lanceolate or triangular-subulate, one-half as long as the achene or more.—Damp roadsides and pinelands, Coastal Plain and adj. provinces, Fla. to La. and Va.

17. **MARISCUS** [Hall.] Zinn. Perennial caulescent, often tall, herbs. Leaves few, not crowded: blades elongate, flat, or revolute in age, sometimes with spinulose-serrulate margins. Spikelets short, in small clusters which are borne in short rigid or long plume-like panicles, with the terminal flower per-

fect and fructiferous. Scales rather loosely imbricate, broad. Perianth wanting. Stamens 2. Ovary sessile: style deciduous. Stigmas 2 or 3. Achene short, usually ovoid, turgid-lenticular or obscurely 3-angled, striate or wrinkled, not tubercled. [*Cladium* P. Br.]—About 40 species, most abundant in warm regions.—Sum.—fall.

Achene with a broad flat base which often has a flaring edge:  
leaf-blades smooth or nearly so.

Achene with a narrowed base: leaf-blades with spinulose-serrulate margins and midrib beneath.

1. *M. mariscoides*.

2. *M. jamaicensis*.

1. *M. mariscoides* (Muhl.) Kuntze. Stem up to 1 m. tall, obscurely 3-angled, with stiff branches: leaf-blades channeled, 3 mm. wide or less, nearly smooth: clusters of spikelets on rigidly erect or ascending branches: larger scales over 4 mm. long: achene ovoid, 3–4 mm. long, including the beak-like tip, longitudinally striate, the flat base often with a flaring edge.—(POND-RUSH. TWIG-RUSH.)—Swamps, marshes and wet sandy shores, various provinces, Fla. to Ala., Minn., and N. S.

2. *M. jamaicensis* (Crantz) Britton. Stem mostly 1–3 m. tall, obtusely 3-angled, with lax branches: leaf-blades flat, 5 mm. wide or more, spinulose-serrulate on the margins and on the midrib beneath: clusters of spikelets on lax, often recurving branches: larger scales less than 3.5 mm. long: achene ovoid, 2–2.5 mm. long, obtuse or abruptly short-pointed, wrinkled, narrowed at the base. [*C. effusum* (Sw.) Torr.]—(SAW-GRASS.)—Swamps and marshes, mostly less than 100 ft. above sea-level, Coastal Plain, Fla. to Tex. and Va.—(W. I., Mex., C. A., S. A.)—In mass and large areas of pure growth the saw-grass excels any other sedge in our range. It is the characteristic plant of the Everglades and of other marshes, and also of swamps ranging from saline to fresh. The numerous very sharp-edged leaves make progress through colonies of it difficult.

18. **REMIREA** Aubl. Perennial gregarious caulescent herbs with elongate horizontal rootstocks. Leaves numerous, crowded, imbricate at the base: blades not elongate, striate. Spikelets several or many in a sessile terminal involucre head. Scales few, closely imbricate, short and relatively wide, blunt. Perianth wanting. Stamens 3. Ovary sessile: style slender, deciduous. Stigmas 3. Achene rather narrow, 3-angled, not tubercled.—A single species, widely distributed in the tropics.

1. *R. maritima* Aubl. Stem 1–3 dm. tall, arising at intervals along the elongate rootstock, simple: leaf-blades recurved-spreading, 2–10 cm. long, attenuate, smooth: head ovoid, 1–2 cm. long: spikelets 3–5 mm. long, slightly curved: scales hooded at the apex: achene narrowly ellipsoid, 2–2.5 mm. long or rarely longer, obtuse.—(BEACH-STARS.)—Sand-dunes along the beach, east-

ern coast of S. pen. Fla. and the Keys.—(*W. I., O. W.*)—Although relatively small, this plant is conspicuous on account of the lines of starry tufts which arise at intervals from the long rootstocks which are buried in the beach sand.

**19. *SCHOENUS* L.** Perennial scapose rush-like tufted herbs with short rootstocks. Leaves few, erect: blades elongate, involute, thus slender. Spikelets black, in a dense sessile terminal head subtended by a long involucrel bract. Scales few, closely imbricate, long and narrow, acute. Perianth of 3-6 scabrous or plumose bristles. Stamens 3. Ovary sessile: style slender, deciduous. Stigmas 3. Achene short and stout, 3-angled, not tubercled.—About 60 species, mostly natives of the Old World.

**1. *S. nigricans* L.** Plant densely tufted, up to 1 m. tall, glabrous: leaf-sheaths dark-brown or almost black at the base; blades rigid: head of spikelets 1-2 cm. long: spikelets linear-lanceolate in outline, 9-12 mm. long, dark-chestnut: scales lanceolate or lanceolate-subulate, or the lower ones broader, acute, scabrous-ciliate on the keel near the apex: achene oval, 1.5 mm. long or rarely longer, white, shining, somewhat constricted at both ends.—Calcareous low pinelands, prairies, and Everglades, pen. Fla. and L. Keys; also Calif. coast.—(*W. I., Mex., O. W.*)—A second species of *Schoenus* may occur within our range. There is a specimen of *S. ferrugineus*, preserved in the Columbia University herbarium, labelled in Dr. Torrey's handwriting as having been collected in Florida and received from Dr. Chapman. *S. ferrugineus* differs from *S. nigricans* in having only 1-3 spikelets in a head and perianth-bristles as long as the achene or longer. *S. nigricans* has 5-15 spikelets in a head and very short or obtuse bristles.

**20. *SCLERIA* Berg.** Annual or mostly perennial, caulescent herbs with horizontal rootstocks. Leaf-blades elongate-linear, usually very narrow. Flowers monoecious. Spikelets in terminal or in both axillary and terminal clusters, the pistillate 1-flowered, the staminate several-flowered: scales imbricate. Perianth none. Stamens 1-3: anthers narrow. Ovary sometimes borne on a disk (hypogynium). Styles deciduous. Stigmas 3. Achene crustaceous, bony, or enamel-like, the body globular or slightly elongate, ours white or nearly so, smooth or variously roughened.—About 200 species, most abundant in warm regions.—Spr.—fall, or all year S.—NUT-RUSHES.

Achene with a circular, angled, or lobed disk (hypogynium) which often bears tubercles.

Achene-body smooth.

Achene-body papillose, wrinkled, or reticulate.

Achene without hypogynium, sometimes narrowed into a stipe-like base.

Spikelets in a single terminal cluster.

Spikelets in several separated clusters along the upper part of the stem.

I. TRIGLOMERATAE.

II. SETACEAE.

III. GRACILES.

IV. VERTICILLATAE.

#### I. TRIGLOMERATAE

Hypogynium papillose-crustaceous.

Hypogynium with 8 or 9 tubercles.

1. *S. triglomerata*.

2. *S. oligantha*.

## II. SETACEAE

Achene-body reticulate.

Hypogynium 3-lobed, the lobes appressed to the achene-body.

Achene 2 mm. long or less, the body glabrous.

Achene 2.5-3 mm. long, the body pubescent.

Hypogynium disk-like, with 3 pairs of tubercles.

Achene-body papillose or somewhat wrinkled.

Hypogynium with 3 entire, notched or 2-lobed tubercles: achene 2.5-3 mm. long.

Plant pubescent: achenes about 3 mm. long.

Hypogynium-tubercles 2-lobed: spikelet-scales pubescent on the back.

Hypogynium-tubercles entire or merely notched: spikelet-scales glabrous or pubescent on the keel.

Plant glabrous: achene about 2.5 mm. long.

Hypogynium with 6 distinct tubercles: achenes 1.5-2 mm. long.

3. *S. reticularis*.

4. *S. setacea*.

5. *S. Curtissii*.

6. *S. Elliottii*.

7. *S. ciliata*.

8. *S. Brittonii*.

9. *S. pauciflora*.

## III. GRACILES

Achene 3 mm. long or less, with a pair of prominent pits on each side of the base.

Achene over 3 mm. long, without pits, or with a single pit on each side of the base.

Achene-body smooth and even, the base, each side, with a shallow excavation and often 2 obscure pits in it.

Achene-body ribbed lengthwise, the base prominent, each side with a deep excavation, but without pits.

10. *S. gracilis*.

11. *S. Baldwinii*.

12. *S. costata*.

## IV. VERTICILLATAE

Achene 2-2.5 mm. long.

Achene about 1.5 mm. long.

Achene-body papillose-ridged: bracts merely serrulate near the apex.

Achene-body smooth: bracts with long spreading hairs.

13. *S. lithosperma*.

14. *S. verticillata*.

15. *S. hirtella*.

✓ 1. *S. triglomerata* Michx. Plant up to 1 m. tall, the stems somewhat scabrous, stout: leaf-blades flat, 3-9 mm. wide, scabrous: clusters of spikelets terminal, and usually 1 or 2 long-stalked ones from the upper leaf-axils: achene about 3.5 mm. long, the body ovoid to globose-ovoid, obtuse, smooth and even, the hypogynium low, obscurely triangular, papillose-crustaceous. —(TALL NUT-RUSH.)—Moist to dry sandy soil, meadows, and thickets, various provinces, Fla. to Tex., Kans., Ia., and Vt.

✓ 2. *S. oligantha* Michx. Plant up to 9 dm. tall, the stems nearly smooth, slender: leaf-blades flat, 3-6 mm. wide, smooth, or scabrous near the apex: clusters of spikelets terminal, and sometimes 1 or 2 long-stalked ones from the upper leaf-axils: achene about 3 mm. long, the body ovoid, sometimes narrowly so, obtuse or acute, smooth and even, the hypogynium low, obtusely triangular, supporting 8 or 9 tubercles just under the achene-body. —Moist soil, often in woods, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and D. C.

3. *S. reticularis* Michx. Plant 2-7 dm. tall, the stems smooth, slender: leaf-blades 2-3 mm. wide, smooth: clusters of spikelets terminal and usually also in 1-3 sessile or nearly sessile in the upper leaf-axils: achene 2 mm. long or less, the body dull-white, globose, glabrous, reticulate, the hypogynium 3-lobed, the lobes appressed to the achene-body. —Moist meadows, damp sand, and pine-lands, Coastal Plain and adj. provinces, Fla. to Mo. and Mass.; also Great Lake Lowland, Ind. —(W. I., Mex.)

4. *S. setacea* Poir. Plant often spreading, up to 7 dm. long, the stems erect, spreading, or diffuse, 8 dm. long or less, usually tufted: clusters of spikelets terminal and axillary, the axillary ones stalked, nodding or sometimes nearly erect: scales mostly 3–5 mm. long: achene 2.5–3 mm. long, the body globose or spheroidal, rugose or reticulate, pubescent, the hypogynium 3-lobed, appressed to the achene-body. [*S. hemitaphra* Steud. *S. Torreyana* Walp. *S. trichopoda* C. Wright.]—Low pinelands and sandy swamps, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Conn.; also Great Lake Lowland, Ind.—(*W. I., Mex., C. A.*)

5. *S. Curtissii* Britton. Plant weak, often reclining, 1.5–4.5 dm. long, the stems relatively slender, glabrous or nearly so: leaf-blades 1–2 mm. wide, smooth: clusters of spikelets scant, the axillary ones, when present, slender-stalked: scales 3–5 mm. long, pubescent on the keel: achene about 2 mm. long, the body globose or slightly depressed, reticulate, glabrous, the hypogynium supporting 3 pairs of tubercles.—Pinelands, near Jacksonville, Fla.

6. *S. Elliottii* Chapm. Plant 2–7 dm. tall, the stems stoutish, usually copiously pubescent: leaf-blades broad, mostly 4–6 mm. wide, usually flat: clusters of spikelets large, terminal and commonly 1 or 2 stout-stalked axillary ones present: scales 5–7 mm. long, usually pale, finely pubescent all over: achene about 3 mm. long, the body subglobose or slightly elongate, wrinkled or coarsely papillose, some of the basal papillae elongate and deflexed, the hypogynium with 3 strongly 2-lobed tubercles.—Pinelands, hammocks, and dry hillsides, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—(*W. I.*)

7. *S. ciliata* Michx. Plant up to 1 m. tall, the stems slender, stout, glabrous or pubescent on the angles: leaf-blades narrow, 1–2.5 mm. wide, becoming revolute: clusters of spikelets small, terminal, and sometimes also axillary, slender-stalked ones present: scales 4–6 mm. long, usually chestnut-colored, glabrous or pubescent on the keel: achene about 3 mm. long, the body subglobose or ovoid, finely and usually sharply papillose, some of the basal papillae elongate and deflexed, the hypogynium with 3 entire or merely notched tubercles.—Woods, pinelands, sandhills, and meadows, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.

8. *S. Brittonii* Core. Plant up to 9 dm. tall, the stems pliable, relatively slender, often reclining, glabrous: leaf-blades 2–3 mm. wide or less, glabrous: clusters of spikelets small, terminal, and sometimes also axillary and short- or slender-stalked: scales mostly 4–5 mm. long, glabrous, often light or dark chestnut-colored: achene about 2.5 mm. long, the body globose or ovoid-globose, papillose, or papillose-wrinkled, the hypogynium with 3 tubercles. [*S. glabra* (Chapm.) Britton, not Boekl.]—Pinelands, sandhills, and ditches, Coastal Plain, Fla. to Miss. and N. C.

9. *S. pauciflora* Muhl. Plant 1–6 dm. tall, the stems slender, pubescent: leaf-blades less than 2 mm. wide, or rarely more, pubescent: clusters of spikelets few together, terminal and often also 1 or 2 short-stalked or long-stalked axillary ones present: scales 2.5–5 mm. long, glabrous, or pubescent about the keel: achene 1.5–2 mm. long, the body globose or ovoid-globose, papillose, some of the lower papillae elongate and reflexed, the hypogynium with 3 pairs of small tubercles.—Woods, pinelands, meadows, and swamps, various provinces, Fla. to Tex., Kans., Ohio, and N. H.—(*W. I.*)

10. *S. gracilis* Ell. Plant 1–4 dm. tall, the stems slender, sometimes filiform, smooth: leaf-blades involute, thus filiform, smooth: spikelets in a single terminal cluster: scales glabrous, the larger ones 4–5 mm. long: achene 2–3 mm. long, the body ovoid or globose-ovoid, ribbed lengthwise, obtuse or minutely pointed, with a pair of pits on each side of the triangular base, the hypogynium

wanting.—Low pinelands, and shallow ponds, Coastal Plain, Fla. to Tex. and S. C.—(*W. I.*)

11. *S. Baldwinii* (Torr.) Steud. Plants up to 1 m. tall, the stems stout, rough, at least above: leaf-blades flat, 2–5 mm. wide, or sometimes narrower, smooth or somewhat scabrous: spikelets in a single terminal cluster: scales glabrous, the longer ones 8–9 mm. long: achene fully 4 mm. long, the body ovoid or oval-ovoid, smooth and even, prominently pointed, the base obscure, often with 2 obscure pits in the shallow transverse excavations, the hypogynium wanting.—Pineland ponds and low grounds, Coastal Plain, Fla. to Tex.

12. *S. costata* (Britton) Small. Similar to *S. Baldwinii* in habit, but with smaller spikelets and clusters: scales glabrous, the larger ones less than 8 mm. long: achene less than 3.5 mm. long, the body globose, ribbed lengthwise, prominently pointed, the base prominent, triangular, each side with a deep transverse excavation without pits, the hypogynium wanting. [*S. Baldwinii costata* Britton.]—Swamps and ponds, Coastal Plain, Fla. to Tex. and Ga.

13. *S. lithosperma* (L.) Sw. Plant 1–6 dm. tall, the stems smooth, slender: leaf-blades 1.5–2.5 mm. wide, with scabrous-ciliate margins and keel: clusters of spikelets 2–4, often separated, the lower with leaf-like bracts, the upper with bristle-like bracts: achene 2–2.5 mm. long, or rarely smaller, the body bright-white, oval, ellipsoid, or obovoid, smooth and even, narrowed into a stout stipe-like base with 3 depressions, the hypogynium wanting.—Low pinelands and hammocks, Everglade Keys, Fla. and Florida Keys.—(*W. I., Mex., O. W.*)

14. *S. verticillata* Muhl. Plant up to 9 dm. tall, the stems slender, often filiform, sometimes diffuse, usually glabrous: leaf-blades very narrowly linear, 0.5–1 mm. wide, glabrous: clusters of spikelets several on the upper part of the stem, separated: scales 1.5–3 mm. long: achene about 1.5 mm. long, the body globose, papillose-ridged with the ridges sometimes connected and thus reticulate, beaked, with a broad stipe-like base.—Moist pinelands, sandy woods, swamps, and wet rocks, various provinces, Fla. to Tex., Minn., Ont., and Mass.—(*W. I., Mex.*)

15. *S. hirtella* Sw. Plant 1–6 dm. tall, the stems slender, smooth or nearly so: leaf-blades 2–4 mm. wide, pubescent: clusters of spikelets several on the upper part of the stem, separated, sessile, often nodding: scales mostly 2–3 mm. long: achene about 1.5 mm. long, the body subglobose, smooth, sometimes slightly pointed, contracted into a triangular base.—Moist pinelands and river-swamps, Coastal Plain, Fla. to La. and S. C.—(*W. I., Mex., C. A., S. A.*)

21. **CAREX** [Rupp.] L.<sup>1</sup> Grass-like sedges, perennial by rootstocks, the plants monoecious or sometimes dioecious. Culm (stem) mostly triangular, often strongly phyllopodic or aphylllopodic. Leaves 3-ranked, the upper (bracts) elongate or short, and subtending the spikes of flowers, or wanting. Flowers solitary in the axils of scales (glumes). Spikes one to many, either wholly pistillate, wholly staminate, androgynous or gynaeceandrous, sessile or peduncled, the base of the peduncle often with a perigynium-like or spathe-like organ (eladio-prophyllum) surrounding it. Perianth none. Staminate flowers of three (or rarely two) stamens, the filament filiform. Pistillate flowers of a single pistil, with a style and two or three stigmas. Style jointed with the apiculate-tipped or rounded achene and withering, and at length deciduous, or continuous with achene persistent and not withering. Achene 3-angled, lenticu-

<sup>1</sup> Contributed by Kenneth Kent Mackenzie.

lar, or plano-convex, completely surrounded by the perigynium or rarely rupturing it in ripening. Racheola occasionally developed.—Comprises 1,000 species, widely distributed, but most abundant in temperate regions.—SEDGES.

Achene lenticular and stigmas two: lateral spikes sessile: terminal spike partly pistillate, or if (rarely) staminate the lateral spikes short, or heads dioecious.

Spikes strictly androgynous (*i.e.*, with the staminate flowers uppermost).

Spikes few (ten or less): perigynium green until over-ripe.

I. MUHLENBERGIANAE.

Spikes numerous: perigynium yellowish or brownish.

Perigynium abruptly contracted into the beak.

Perigynium yellowish: opaque part of leaf-sheath usually transversely rugulose.

II. MULTIFLORAE.

Perigynium brownish: opaque part of leaf-sheath not transversely rugulose.

III. PANICULATAE.

Perigynium tapering into the beak.

IV. STENORHYNCHAE.

Spikes, some or all of them, gynaeandrous (*i.e.*, staminate at base): some often entirely pistillate or some occasionally entirely staminate or staminate at both ends.

Perigynium white-puncticulate.

V. CANESCENTES.

Perigynium not white-puncticulate.

Perigynium at most thin-edged.

VI. DEWEYANAE.

Perigynium appressed.

VII. STELLULATAE.

Perigynium spreading or ascending at maturity.

Perigynium narrowly to broadly wing-margined.

VIII. OVALES.

Achene triangular and styles three, or lenticular and styles two: if lenticular, lower lateral spikes conspicuously peduncled, or terminal spike staminate and lateral spikes elongate.

Achene rounded at apex, strongly constricted at base: lower scales bract-like.

IX. PHYLLOSTACHYAE.

Achene apiculate-tipped, not strongly constricted at base: lower scales not bract-like.

Spike one: perigynium rounded at apex, beakless, glabrous.

X. POLYTRICHOIDEAE.

Spikes one or more, when one not as described above.

Perigynium triangular, or circular in cross-section, closely enveloping the achene, 2-ribbed, stipitate, tapering at the base, pubescent or puberulent, at least at the base of the beak: bracts sheathless or nearly so.

Perigynium obtusely triangular: foliage not pubescent.

XI. MONTANAE.

Perigynium acutely triangular: foliage often pubescent.

XII. TRIQUETRAE.

Perigynium glabrous or minutely hispidulous or pubescent: if pubescent some or all of the other characters differing from those given above.

Lowest bract strongly green-sheathing: beak of perigynium, if present, rarely bidentate, but if so the apex hyaline and the teeth weak.

Spike normally one.

XIII. PICTAE.

Spikes two or more.

Bracts with obsolete or rudimentary blades.

Leaf-blades flat: perigynium puberulent to pubescent.

XIV. DIGITATAE.

Leaf-blades filiform: perigynium glabrous.

XV. ALBAE.

Bracts with well-developed blades.

Pistillate spikes short-oblong to linear, erect, or if drooping the spikes short and perigynium acutely triangular: terminal spike staminate.

- Rootstock long-creeping: scales reddish-purple-tinged.
- Rootstock not long-creeping: scales greenish or reddish-brown-tinged.
- Perigynium triangular, tapering at the base, closely enveloping the achene.
- Perigynium with few-many strong nerves or nerveless.
- Perigynium finely many-striate.
- Perigynium suborbicular in cross-section, rounded at the base.
- Perigynium with few-many strong nerves, rather loosely enveloping the achene.
- Perigynium finely many-striate.
- Pistillate spikes elongate, linear to cylindric, slender-peduncled, the lower drooping.
- Perigynium beakless or short-beaked; terminal spike gynae-candrous.
- Perigynium conspicuously or strongly beaked.
- Culm strongly reddish-purple-tinged at the base, aphyllopodic.
- Culm not strongly reddish-purple-tinged at the base, phyllopodic.
- Lowest bract sheathless to strongly green-sheathing: if green-sheathing, perigynium with strongly bidentate non-hyaline apex and stiff teeth.
- Foliage (at least the lower sheaths) pubescent: perigynium-beak not bidentate.
- Foliage not pubescent (save in some species of the *HIRTAE* having a strongly bidentate perigynium).
- Perigynium rough-papillose.
- Perigynium not rough-papillose.
- Perigynium beakless or very short-beaked: achene triangular.
- Terminal spike if staminate without rough-awned scales.
- Scales dark-tinged.
- Scales not dark-tinged.
- Terminal spike staminate: scales rough-awned.
- Perigynium strongly beaked, the beak usually strongly bidentate; or if not so, the achene lenticular.
- Achene lenticular: stigmas two.
- Scales not long-aristate: achene not constricted in middle.
- Scales long-aristate: achene usually constricted in the middle.
- Achene triangular: stigmas three.
- Style jointed with the achene; perigynium strongly pubescent to glabrous, coriaceous.
- Style continuous with the achene.
- Perigynium coriaceous (impressed, nerved in our species).
- Perigynium membranous, the nerves or ribs not impressed.
- XVI. PANICEAE.

- XXVIII. PENDULINAE.
- XXIX. ACUTAE.
- XXX. CRYPTOCARPAE.

Perigynium lanceolate or lance-subulate, tapering into the beak, many-nerved.

Perigynium-teeth reflexed: perigynium green, early deciduous.

Perigynium-teeth not reflexed: perigynium yellowish-green.

Perigynium broader, abruptly contracted into the beak, usually strongly ribbed.

Perigynium less than 1 cm. long.

Perigynium-body ovoid or globose, not truncately contracted.

Perigynium coarsely ribbed or nerveless.

Perigynium finely and closely ribbed.

Perigynium with an obovoid or obconic body truncately contracted into the prominent beak.

Perigynium 1 cm. long or longer.

XXXIV. FOLLICULATAE.

XXXV. VESICARIAE.

XXXVI. PSEUDO-CYPHEREAE.

XXXVII. SQUARROSAE.

XXXVIII. LUPULINAE.

#### I. MUHLENBERGIANAE

Perigynium conspicuously corky-thickened at base, usually widely radiating or reflexed at maturity.

Beak of perigynium smooth: scales acuminate, deciduous: spikes mostly approximate.

Body of perigynium broadly ovate, unequally biconvex, deep-green, many striate at base ventrally.

Body of perigynium lanceolate or ovate-lanceolate, plano-convex, light-green, nerveless.

Beak of perigynium serrulate: scales obtuse or acutish, persistent: spikes mostly separate.

Stigmas slender, not twisted, elongate, light-brownish-red: perigynium light-green tapering or but little contracted into beak, inconspicuously white-hyaline at the orifice.

Stigmas stouter, twisted, short, deep-brownish-red: perigynium deep-green, contracted into beak, conspicuously white-hyaline at the orifice.

Leaf-blades averaging 2.5 mm. wide: spikes usually with 9-12 perigynia: perigynium 3.25-4.5 mm. long, widely radiating.

Leaf-blades averaging little more than 1 mm. wide: spikes usually with 2-6 perigynia: perigynium 2.5-3 mm. long, more ascending.

Perigynium not or but little corky-thickened at base, spreading or ascending.

Perigynium nerveless dorsally or 2- or 3-nerved: (ascending awn) much exceeded by body sheaths not or but slightly with; head ovoid-orbicular.

Obovate, narrowed at base, middle, with narrow raised

ovate, broadest at the truncate and sharp-edged only to the middle on inner face.

1. *C. retroflexa*.

2. *C. texensis*.

3. *C. rosea*.

4. *C. convoluta*.

5. *C. radiata*.

6. *C. cephalophora*.

7. *C. Leavenworthii*.

Perigynium strongly many-nerved dorsally: body of scale little shorter than to exceeding perigynium: sheaths thickened at mouth.

Perigynium strongly nerved ventrally, narrowly wing-margined to base, the margin and center slightly elevated: head oblong: achene sub-orbicular.

Perigynium nerveless or nearly so ventrally, sharp-edged below the middle, flat or very nearly so.

Head oblong, 1.5-4 cm. long: culms tall, stiff: leaf-blades elongate: achene ovoid-orbicular.

Head suborbicular, 0.7-2 cm. long: culms low, not stiff, spreading: leaf-blades short.

8. *C. Muhlenbergii*.

9. *C. plana*.

10. *C. mesochorea*.

## II. MULTIFLORAE

Beak of perigynium equalling the body: leaves usually exceeding culm: perigynium dull-yellowish.

Beak of perigynium shorter than the body: leaves shorter than culm: perigynium deeper-yellow.

11. *C. vulpinoidea*.

Body of perigynium reniform or broadly orbicular, strongly resinous-dotted: perigynium squarrose, mostly exceeding awn of scale.

12. *C. triangularis*.

Body of perigynium ovate to broadly orbicular, but little resinous-dotted: perigynium more ascending, mostly exceeded by awn of scale.

13. *C. annectens*.

## III. PANICULATAE

Represented by one species in our range.

14. *C. decomposita*.

## IV. STENORHYNCHAE

Perigynium 4-6 mm. long; beak 1-2 times length of body: leaf-sheaths not red-dotted ventrally.

Sheaths cross-rugulose ventrally, easily broken, not thickened at mouth.

15. *C. stipata*.

Leaf-blades 4-8 mm. wide; perigynium 4-5 mm. long, the beak about the length of the body.

Leaf-blades 8-15 mm. wide: perigynium 5-6 mm. long, the beak longer than the body.

16. *C. uberior*.

Sheaths not cross-rugulose ventrally, not easily broken, thickened at mouth.

17. *C. laevi-vaginata*.

Perigynium 6-7 mm. long, with a disk-like base: beak 2-3 times length of body: leaf-sheaths conspicuously red-dotted ventrally.

18. *C. crus-corvi*.

## V. CANESCENTES

Represented by one species in our range.

19. *C. brunnescens*.

## VI. DEWEYANAE

Represented by one species in our range.

20. *C. bromoides*.

## VII. STELLULATAE

Body of perigynium broadest near middle; beak not serrulate on margins.

21. *C. scorsa*.

Body of perigynium broadest near base; beak and often upper part of body serrulate on margins.

Perigynium 2.25-3.25 mm. long: perigynium-beak  $\frac{1}{4}$ - $\frac{3}{4}$  length of body, very shallowly bidentate: scale one-half to two-thirds length of body of perigynium.

Spikes strongly separate: leaf-blades 0.25-1 mm. wide.

22. *C. Howei*.

Spikes aggregated in a dense head: leaf-blades 1-2.5 mm. wide.

23. *C. Mohriana*.

Perigynium 2.75-4.75 mm. long: perigynium-beak sharply bidentate, the ventral false suture conspicuous.

Body of perigynium suborbicular or very broadly ovate, deep-green at maturity (before over-ripe); beak less than half the length of the body.

Scale acutish to short-cuspidate,  $\frac{2}{3}$  to nearly the length of the perigynium, sharply keeled with the prominent mid-vein extending to apex: achene ovate, widest at base.

Scale obtuse, about half the length of the body of perigynium, the midvein not forming a sharp keel, obsolete or nearly so at apex: achene orbicular, widest near middle.

Body of perigynium ovate to lanceolate, straw-colored at maturity or often darker-tinged; beak half the length of the body or more.

Body of perigynium noticeably exceeding the obtusish to acute scale: leaf-blades 3-3.5 mm. wide: culm stout.

Body of perigynium equalled or exceeded by the sharp-pointed scale: leaf-blades 0.75-1.75 mm. wide: culm slender.

24. *C. incomperata*.

25. *C. atlantica*.

26. *C. Ruthii*.

27. *C. angustior*.

#### VIII. OVALES

Perigynium narrowly to broadly lanceolate, at least  $2\frac{1}{2}$  times as long as broad, very thin and scale-like.

Leaf-blades at most 3 mm. wide, those of sterile shoots few, ascending.

Leaf-blades broader, those of sterile shoots numerous, spreading.

Perigynium ovate-lanceolate or broader, at most twice as long as broad.

Body of perigynium obovate (often broadly) broadest at top, very abruptly beaked: leaf-sheaths green-striate ventrally nearly to the mouth.

Scales obtuse to short-acuminate: achene sessile or substipitate: perigynium 1.5-3 mm. broad.

Scales obtuse or acute: spikes silvery-green: culm stiff: perigynium with body rounded at apex, very short-beaked, the beaks not conspicuous at top of spikes.

Scales acute or short-acuminate: spikes not silvery-green: culm slender: perigynium with body truncate-rounded at apex, twice length of beak, the beaks conspicuous at top of spikes.

Scales long-acuminate or aristate: achenes stipitate: perigynia 2.5-4 mm. broad.

Body of perigynium ovate to orbicular, broadest at middle or base: leaf-sheaths conspicuously hyaline ventrally.

Perigynium 3-4 mm. long, strongly nerved ventrally.

Perigynium-body ovate: leaf-blades 2.5-6 mm. wide: spikes short-clavate at base.

Perigynium-body orbicular: leaf-blades 1.5-2.5 mm. wide: spikes mostly long-clavate at base.

Perigynium 4-6 mm. long, nerveless ventrally.

Perigynium plano-convex with suborbicular body 2.5-3.5 mm. wide: scales usually acute.

Perigynium very flat with reniform body 3.5-4.5 mm. wide: scales obtuse.

28. *C. scoparia*.

29. *C. tribuloides*.

30. *C. Longii*.

31. *C. straminea*.

32. *C. alata*.

33. *C. normalis*.

34. *C. festucea*.

35. *C. brevior*.

36. *C. reniformis*.

#### IX. PHYLLOSTACHYAE

Body of perigynium oblong: pistillate flowers usually 3-10.

Body of perigynium globose: pistillate flowers usually 2 or 3.

37. *C. Willdenovii*.

38. *C. Jamesii*.

#### X. POLYTRICHOIDEAE

Represented by one species.

39. *C. leptalea*.

#### XI. MONTANAE

None of the culms short and hidden among the base of the leaves.

- Culm aphyllopodic and but little fibrillose at base: stolons wanting: ligule conspicuous, longer than wide.
- Culm phyllopodic and strongly fibrillose at base: ligule short, much wider than long.
- Body of perigynium globose: staminate spike 10-25 mm. long: plants conspicuously long-stoloniferous.
- Beak of perigynium less than half the length of the body.
- Beak of perigynium as long as, or longer than the body.
- Body of perigynium oblong-ovoid: staminate spike 4-12 mm. long.
- Plants without long slender stolons.
- Plants with very long slender stolons.
- Many of the culms short and hidden among the base of the leaves.
- Achene normally triangular: scales strongly dark-margined: stolons short, ascending: culm copiously fibrillose at the base.
- Achene normally lenticular: scales at most moderately dark-margined: stolons long, horizontal: culm little fibrillose at the base.
40. *C. communis*.
41. *C. pennsylvanica*.
42. *C. lucorum*.
43. *C. varia*.—
44. *C. physorhyncha*.
45. *C. nigro-marginata*.
46. *C. floridana*.

## XII. TRIQUETRAE

- Foliage not pubescent: perigynium short-pubescent, many-ribbed, obovoid: achene very short stipitate: scales strongly several-ribbed.
- Lower foliage soft pubescent: perigynium densely villos above, many-nerved, elliptic-oblancheolate: achene long stipitate: scales slenderly ribbed.
47. *C. validior*.
48. *C. dasycarpa*.

## XIII. PICTAE

- Represented by one species.
49. *C. picta*.

## XIV. DIGITATAE

- Represented by one species in our range.
50. *C. Baltzellii*.

## XV. ALBAE

- Represented by one species in our range.
51. *C. eburnea*.

## XVI. PANICEAE

- Perigynium with very short, often bent beak or beakless: staminate scales strongly purplish-brown-tinged.
- Culm phyllopodic, not strongly purplish-tinged at the base, spreading by deep-seated slender white rootstocks.
- Culm aphyllopodic, strongly purplish-tinged at the base, with interwoven stout rootstocks.
- Perigynium with prominent beak 1.5 mm. long: staminate scales slightly yellowish-brown-tinged.
52. *C. Meadii*.
53. *C. biltmoreana*.
54. *C. Chapmani*.

## XVII. LANIFLORAE

- I. Staminate scales purplish. Bract-sheaths (usually) and base of the culm (always) strongly purplish. Bracts bladeless: pistillate spikes closely flowered above: perigynium sharply triangular.
- Leaf-blades 3-6 mm. wide: pistillate spikes 2-6 flowered on long capillary peduncles.
- Leaf-blades 10-25 mm. wide: pistillate spikes 4-12 flowered on stiff peduncles.
- Bracts long-bladed: pistillate spikes with perigynium widely separate: perigynium obtusely triangular.
- II. Staminate scales never purplish. Bract-sheaths not purplish-tinged, the base of the culm but rarely so.
- Perigynium acutely triangular, short-tapering at base, hispidulous.
- Leaf-blades very smooth (except edges), the larger 12 mm. wide or more, those of the fertile culm much smaller than those of the sterile.
55. *C. austro-caroliniana*.
56. *C. plantaginea*.
57. *C. purpurifera*.
58. *C. platyphylla*.

- Leaf-blades hispidulous on the veins, 10 mm. wide or less, those of the fertile culm moderately smaller than those of the sterile. Sessile inconspicuous staminate spike and approximate upper pistillate spikes subtended by subspathaceous bracts.
- Leaf-blades 1-3 dm. long; perigynium 2.5-3.5 mm. long, the sides 1.5 mm. wide, essentially beakless. 59. *C. abscondita*.
- Leaf-blades 1.5-3.5 dm. long; perigynium 4-4.5 mm. long, the sides 2 mm. wide, the beak 1 mm. long. 60. *C. magnifolia*.
- Staminate spike conspicuous, peduncled; pistillate spikes scattered; bracts not at all spathaceous.
- Lowest scale of pistillate spikes with a pistillate flower: leaf-blades not glaucous, erect, 2.5-5 mm. wide. 61. *C. digitalis*.
- Lowest scale of pistillate spikes empty or with a staminate flower: leaf-blades more or less glaucous, spreading, 4-8 mm. wide. 62. *C. laxiculmis*.
- Perigynium obtusely triangular, long-tapering at base, smooth.
- Sterile shoots reduced to tufts of leaves.
- Pistillate scales very rounded-truncate; beak of perigynium short, abruptly bent; culm strongly narrowly wing-margined; leaves not semi-evergreen. 63. *C. albursina*.
- Pistillate scales acuminate to strongly cuspidate; beak of perigynium conspicuous, straight or oblique; culm less wing-margined; leaves semi-evergreen.
- Perigynium appressed-ascending, membranous, 3-4.25 mm. long; leaf-blades beneath and culm conspicuously white-striolate; culm narrowly wing-margined. 64. *C. heterosperma*.
- Perigynium spreading-ascending, subcoriaceous, 4-5 mm. long; leaf-blades not white-striolate beneath, except at apex; culm not wing-angled. 65. *C. laxiflora*.
- Sterile shoots developing conspicuous culms; leaves not semi-evergreen.
- Perigynium obovoid-elliptic or fusiform, rather sharply angled above and with straight conspicuous beak.
- Perigynium strongly nerved, 3.5-5 mm. long.
- Pistillate spikes short-oblong, few-flowered, the lower on long capillary peduncles; culm and bract-sheaths not retrorsely serrulate; staminate spike usually long-peduncled. 66. *C. styloflexa*.
- Pistillate spikes linear-oblong, 10-20-flowered, on erect peduncles; culm and bract-sheaths (at mouth) retrorsely serrulate; staminate spike and uppermost pistillate spikes closely contiguous. 67. *C. crebriflora*.
- Perigynium nerveless or nearly so, 3-4 mm. long; pistillate spikes linear-oblong, many-flowered, erect; bract-sheaths strongly retrorsely serrulate towards mouth. 68. *C. leptonervia*.
- Perigynium very obtusely triangular-obovoid and with abruptly bent short beak; spikes many-flowered.
- Culm not purplish-tinged at the base; perigynium obovoid, 3-4 mm. long; staminate scales usually greenish-white. 69. *C. blanda*.
- Culms strongly purplish-tinged at the base; perigynium broadly obovoid, 2.5-3 mm. long; staminate scales usually reddish-brown-tinged. 70. *C. gracilescens*.

## XVIII. OLIGOCARPAE

Represented by one species in our area.

71. *C. oligocarpa*.

## XIX. GRANULARES

Rootstock not long-creeping: staminate spike short-peduncled: bracts over-topping the culm, their sheaths conspicuously prolonged upward at mouth.

72. *C. granularis*.

Rootstock long-creeping: staminate spike long-peduncled: bracts rarely over-topping culm, their sheaths not prolonged upward at mouth.

73. *C. Crawei*.

Perigynium nerved, 3-3.5 mm. long, very short-beaked, the orifice nearly entire: pistillate spikes 5-6 mm. wide: leaf-blades 1.5-3 mm. wide.

74. *C. microdonta*.

Perigynium ribbed, 3.5-4.5 mm. long, moderately beaked, the orifice emarginate: pistillate spikes about 7.5 mm. wide: leaf-blades 3-6 mm. wide.

## XX. GRISEAE

Perigynium elliptic, 1.5 mm. wide: leaf-blades 4 mm. wide or less: bract-sheaths rough and peduncles very rough.

75. *C. conoidea*.

Perigynium oblong or broadly obovoid, 2-2.5 mm. wide: leaf-blades 2.5-18 mm. wide: bract-sheaths smooth and peduncles nearly so.

Leaf-blades not glaucous: larger spikes normally less than 12-flowered: lower scales usually equalling perigynia: bract-sheaths tight.

76. *C. amphibola*.

Culm strongly purplish-tinged at base: perigynium little turgid: leaf-blades 2-4 mm. wide, erect: spikes widely scattered, the lower nearly basal.

77. *C. grisea*.

Culm brownish-tinged at the base: perigynium turgid: leaf-blades 4-6 mm. wide, spreading: lower spikes not nearly basal.

Leaf-blades glaucous: larger spikes more than 12-flowered: lower scales shorter than perigynia: bract-sheaths enlarged upward.

78. *C. glaucodea*.

Tip of achene bent: perigynium 3-5 mm. long, somewhat exceeding scale.

79. *C. flaccosperma*.

Tip of achene straight: perigynium 4.5-6 mm. long, two to three times exceeding the scales.

## XXI. GRACILLIMAE

Plant glabrous: lowest bract very short-sheathing: perigynium 3.5 mm. long or less.

80. *C. prasina*.

Sheaths, and often foliage, pubescent: at least lowest bract strongly sheathing.

Terminal spike gynaeandrous: pistillate scales not reddish-brown: lowest bract, at least, strongly sheathing.

Perigynium 1.75-2.5 mm. thick, strongly nerved, with short shallowly bidentate beak: lateral spikes closely flowered except at base: bracts strongly sheathing: leaf-blades 3-6 mm. wide.

81. *C. oxylepis*.

Upper scales acuminate or short-cuspidate: perigynium 3.5-4 mm. long, less than 2 mm. wide, little swollen: spikes linear-cylindric.

82. *C. Davisii*.

Upper scales long-cuspidate: perigynium 4-5 mm. long, more than 2 mm. wide, strongly swollen: spikes linear-oblong or oblong-cylindric.

83. *C. aestivalis*.

Perigynium 1 mm. thick, obscurely nerved, beakless, the orifice entire: lateral spikes alternately flowered: lower bract only strongly sheathing: leaf-blades 1.5-2.5 mm. wide.

84. *C. misera*.

Terminal spikes staminate: pistillate scales reddish-brown-tinged: lowest bract not sheathing.

## XXII. SYLVATICAE

Perigynium firm, strongly several-nerved; scales tinged with reddish-brown; upper sheaths puberulent at mouth.

Perigynium glabrous, strongly ribbed, subcoriaceous, the beak thickish, flattened.

Perigynium pubescent, strongly nerved, submembranous, the beak more slender, conic.

Perigynium membranous, light nerved; scales hyaline with green mid-rib or somewhat reddish-brown-tinged; upper sheaths not pubescent at mouth.

Scales cuspidate or awned, the midvein extending to the tip; perigynium hispidulous, short-stipitate, the beak sharply but unequally bidentate; sterile shoots aphyllopodic.

Scales obtuse, hyaline at apex, the midvein not extending to tip; perigynium normally glabrous, sessile.

Perigynium 6-10 mm. long, light-green or greenish-straw-colored, the beak subulate, very obliquely cleft, very conspicuously white-hyaline tipped, the apex more or less cleft; scales white-hyaline margined, rounded on back.

Perigynium 4.5-7 mm. long, green, the beak less subulate, deeply bidentate, little or not at all obliquely cleft, hyaline between the teeth; scales tawny-tinged, sharply keeled.

85. *C. oblita*.86. *C. venusta*.87. *C. allegheniensis*.88. *C. debilis*.89. *C. flexuosa*.

## XXIII. LONGIROSTRES

Represented by one species in our range.

90. *C. cherokeensis*.

## XXIV. VIRESCENTES

Perigynium densely pubescent; lower spikes distant, peduncled; ligule conspicuously longer than wide.

Leaves exceeding culm; lowest bract setaceous, 0.5 mm. wide; pistillate spikes oblong-cylindric; perigynium obovoid.

Culm exceeding leaves; lowest bract leaflet-like, 0.5-3 mm. wide; pistillate spikes linear-cylindric; perigynium ellipsoid.

Perigynium glabrous at least at maturity; spikes contiguous, sessile or nearly so; ligule shorter than wide or at least not longer.

Perigynium much flattened, rounded at apex, lightly nerved; tip of achene straight or little bent.

Leaf-blades glabrous, stiff; perigynium granular roughened, nerveless ventrally.

Leaf-blades pubescent, not stiff; perigynium not granular roughened, nerved ventrally.

Perigynium turgid, nearly orbicular in cross-section, short-pointed at apex, coarsely nerved or ribbed; tip of achene very abruptly bent.

Perigynium 2 mm. long, brownish-green; scales not pilose, not rough-cuspidate; leaf-blades smooth or nearly so.

Perigynium 2.5-3.5 mm. long, green; scales rough-cuspidate, sparingly pilose above; leaf-blades hairy.

91. *C. Sicanii*.92. *C. virescens*.93. *C. complanata*.94. *C. hirsutella*.95. *C. caroliniana*.96. *C. Bushii*.97. *C. scabrata*.

## XXV. ANOMALAE

Represented by one species.

99. *C. Burbaumii*.

## XXVI. ATRATAE

Terminal spike staminate; lateral spikes slender-stalked, the lower drooping; pistillate scales obtuse or acute, shorter than perigynia.

Terminal spike gynaeandrous; lateral spikes short-stalked or sessile, erect; pistillate scales strongly awned, normally exceeding perigynia.

98. *C. Barrattii*.

## XXVII. SHORTIANAE

Represented by one species.

100. *C. Shortiana*.

## XXVIII. PENDULINAE

Perigynium strongly ribbed, squarrose, often but slightly glaucous: staminate scales tapering into the awn: basal sheaths not filamentose.

Perigynium nerved, ascending, very glaucous: staminate scales abruptly awned.

Pistillate spikes erect: scales purplish-brown-tinged: perigynium conspicuously nerved.

Pistillate spikes nodding: scales reddish-brown-tinged: perigynium obscurely nerved.

101. *C. Joorii*.

102. *C. verrucosa*.

103. *C. glaucescens*.

## XXIX. ACUTAE

Culm stout at base, smooth above: beak of perigynium prominent, twisted when dry: stolons very short, ascending.

Culm more slender, very rough above: beak of perigynium very short or absent, not twisted: stolons, when present, elongate, horizontal.

In large beds: leaf-blades bluish-green or glaucous-green, flat at base: scales dark-purplish-brown.

In dense tussocks: leaf-blades deep-green, channeled at base: scales reddish-brown.

104. *C. torta*.

105. *C. strictior*.

106. *C. stricta*.

## XXX. CRYPTOCARPAE

Perigynium smooth or slightly granular: achenes normally constricted in the middle.

Sheaths rough hispid dorsally: lower pistillate scales tapering into the awn.

Sheaths smooth dorsally: lower pistillate scales abruptly contracted into the awn.

Perigynium strongly papillate: achenes normally not constricted in the middle: lower sheaths slightly hispidulous dorsally: lower pistillate scales abruptly awned.

107. *C. gynandra*.

108. *C. crinita*.

109. *C. Mitchelliana*.

## XXXI. HIRTAE

Perigynium glabrous to sparsely pubescent.

Pistillate spikes oblong to globose, their scales strongly 5-7-ribbed; perigynium 8-11 mm. long, coarsely ribbed.

Pistillate spikes narrowly oblong, their scales 3-nerved; perigynium 4-6 mm. long, impressed nerved.

Perigynium densely pubescent.

110. *C. turgescens*.

111. *C. Walteriana*.

112. *C. lanuginosa*.

## XXXII. PALUDOSAE

Represented by one species in our range.

113. *C. hyalinolepis*.

## XXXIII. COLLINSIAE

Represented by one species.

114. *C. Collinsii*.

## XXXIV. FOLLICULATAE

Perigynium narrowly lanceolate, 2.5 mm. wide at base: pistillate scales acute to short-awned, averaging half length of perigynium: pistillate spikes staminate at apex: bract-sheaths enlarged upward.

Perigynium lanceolate, 3 mm. wide at base: pistillate scales awned, averaging three-fourths length of perigynium: pistillate spikes not normally staminate at apex: bract-sheaths enlarged upward.

115. *C. Smalliana*.

116. *C. folliculata*.

## XXXV. VESICARIAE

Pistillate scales (except rarely lowest) not rough awned.

Perigynium abruptly beaked, strongly inflated: pistillate spikes oblong or cylindric, 20-40-flowered.

Perigynium more gradually beaked, much less strongly inflated: pistillate spikes globose to short oblong, 10-20-flowered.

Pistillate scales rough-awned.

Pistillate spikes cylindric to nearly globose, 14-18 mm. thick: perigynium contracted into beak.

Pistillate spikes narrowly cylindric, 8-12 mm. thick: perigynium abruptly contracted into beak.

117. *C. bullata*.

118. *C. Elliottii*.

119. *C. lurida*.

120. *C. Baileyi*.

## XXXVI. PSEUDO-CYPEREAE

Perigynium obtusely triangular, scarcely inflated, closely enveloping achene below: rootstock not long stoloniferous: ligule much longer than wide.

Perigynium suborbicular in cross-section, more or less inflated: rootstock long stoloniferous: ligule wider than long.

121. *C. comosa*.122. *C. Schweinitzii*.

## XXXVII. SQUARROSAE

Scales exceeding perigynia: terminal spike small, normally staminate.

Scales much shorter than perigynia: terminal spike gynaeceandrous.

Achene linear-oval with flattish sides: style strongly sinuous or abruptly bent below: spikes oval, the perigynia with widely radiating beaks: pistillate scales acuminate or awned.

Achene obovoid with concave sides: style straight below: spikes oblong-cylindric, the perigynia mostly with beaks appressed-ascending: pistillate scales obtusish.

123. *C. Frankii*.124. *C. squarrosa*.125. *C. typhina*.

## XXXVIII. LUPULINAE

Pistillate spikes globose or subglobose: style straight: stolons very short, ascending.

Perigynium rounded at base, membranaceous, shining, smooth: leaf-blades 2.5-8 (averaging 3-5) mm. wide, their sheaths short-prolonged upward at mouth beyond base of blade: pistillate spikes 1-15-flowered.

Perigynium cuneate at base, firm, dull, often hispidulous: leaf-blades 4.5-14 (averaging 7-10) mm. wide, their sheaths not prolonged upward at mouth beyond base of blade: pistillate spikes 6-30-flowered.

126. *C. intumescens*.

Pistillate spikes oblong or cylindric: style abruptly bent: stolons long, slender, horizontal.

Perigynium ascending, the beak less than twice the length of the body.

Culms arising singly from elongate rootstocks: leaf-blades 2-5 mm. wide: pistillate scales acute or acuminate.

Culms caespitose: leaf-blades 4-12 mm. wide: pistillate scales acuminate or aristate.

Perigynium spreading at right angles, the beak two to three times the length of the body.

127. *C. Asa-Grayi*.128. *C. louisianica*.129. *C. lupulina*.130. *C. gigantea*.

I. MUHLENBERGIANAE Tuckerm. Densely caespitose or a few species with the rootstock elongate, tough, and dark-colored. Culm not flattened. Opaque part of sheaths neither transversely rugulose nor red-dotted. Spikes usually 10 or less, androgynous or pistillate, but not gynaeceandrous, rarely at all compound. Bracts from little to strongly developed. Perigynium plano-convex, green or chestnut-tinged or light-brownish in age, from appressed to reflexed, often strongly spongy at base, nerveless or sparingly nerved, narrowly sharp-margined, conspicuously beaked, the beak sharply bidentate. Achene lenticular. Style-base more or less thickened. Stigmas 2.

1. *C. retroflexa* Muhl. Culm slender, stiffish, 2-5 dm. tall: leaf-blades 1-2.5 mm. wide: spikes 4-8, 4-10-flowered, the upper aggregated, the lower 1-3 separated: perigynium 3 mm. long, 1.6 mm. wide, green-brown, the beak more than one-third length of

the body.—Woods and thickets, various provinces, Fla. to Tex., Ill., Mich., and Vt.—Spr.—early sum.

2. *C. texensis* (Torr.) Bailey. Culm very slender, 1.5–4.5 dm. tall: leaf-blades about 1 mm. wide: spikes 4–7, 4–8-flowered, the upper aggregated, the lower separated: perigynium 3 mm. long, 1 mm. wide, green at maturity, the beak about half as long as the body.—Woods and thickets, inner part of Coastal Plain and adj. provinces, N. C. and Ga. to Tex., Mo., and S. Ill.—Spr.

3. *C. rosea* Schk. Culm 2–5 dm. tall, slender: leaf-blades 1–2 mm. wide, light-green: spikes 4–8, 4–12-flowered, the upper aggregated, the lower 3–5 separated: perigynium light-green, 3–3.5 mm. long, 1.5 mm. wide, nerveless, or obscurely nerved, the beak  $\frac{1}{4}$  length of the body.—Woods and thickets, various provinces, Ga. to La., N. D., Que., and N. S.—Spr.—early sum.

4. *C. convoluta* Mackenzie. Culm 3–6 dm. tall, strict: leaf-blades deep-green, the sheaths somewhat septate-nodulose: spikes 4–7, 6–20-flowered, the upper aggregated, the lower strongly separate: perigynium 1.75 mm. wide, nerveless or obscurely nerved, the beak  $\frac{1}{3}$  length of the body.—Woods and thickets, various provinces, Ala. to Kans., Man., Que., and N. S.—Spr.—early sum.

5. *C. radiata* (Wahl.) Dewey. Culm very slender, weak, 2.5–5 dm. tall: leaf-blades light-green, the sheaths not septate-nodulose: spikes usually 4, the two upper contiguous, the two lower strongly separate: perigynium at first erect, at maturity more or less strongly spreading, 1.5 mm. wide, nerveless or obscurely nerved, the beak half length of the body.—Woods and thickets, Blue Ridge and more northern provinces, N. C. and Tenn. to Mich., Que., and Me.—Sum.

6. *C. cephalophora* Muhl. Culm slender, 2–6 dm. tall, rough above: leaf-blades 2–4 mm. wide: head 8–15 mm. long, subglobose, the spikes densely aggregated: perigynium 2.5 mm. long, 1.5 mm. wide, narrowed into a bidentate beak much shorter than the body.—Dry open woodlands, various provinces, Fla. to Tex., Man., Que., and Me.—Spr.—early sum.

7. *C. Leavenworthii* Dewey. Culm very slender, erect or spreading, roughish above, 1.5–5 dm. tall: leaf-blades 1–3 mm. wide: head short-oblong, 8–15 mm. long, the spikes densely aggregated: perigynium 2–2.5 mm. long, 1.25–1.75 mm. wide, nerveless or nearly so, the bidentate beak  $\frac{1}{4}$  length of the body.—Dry open woodlands and fields, various provinces, Ga. to Tex., Ont., and N. J. (introduced.)—Spr.—early sum.

8. *C. Muhlenbergii* Schk. Culm slender but stiff and erect, rough above, 5–9 dm. tall: leaf-blades 2–5 mm. wide, somewhat involute: head oblong, 2–4 mm. long, the spikes 4–10, distinct but aggregated: bracts bristle-form, conspicuous: scales cuspidate or short-awned: perigynium 3.5 mm. long, 2 mm. wide, strongly ribbed on both sides, the beak conspicuous, deeply bidentate.—Sterile sandy fields and dry rocky slopes in non-calcareous regions, various provinces, Fla. to Tex., Minn., and R. I.—Spr.—early sum.

9. *C. plana* Mackenzie. Culm stiff, erect, rough above, 3–7 dm. tall: leaf-blades 2–5 mm. wide, little involute: head oblong, 1.5–4 cm. long, the spikes 4–10 distinct but not aggregated: bracts except lowest not conspicuous: scales cuspidate or short-awned: perigynium 3 mm. long, 2.25 mm. wide, the beak rather short, deeply bidentate. [*C. Muhlenbergii enervis* Boott.]—Dry fields

and open woods in calcareous regions, various provinces, Ala. to Tex., Nebr., Mich., and Maine.—Spr.—early sum.

10. *C. mesochorea* Mackenzie. Culm slender, spreading or reclining, 1.5–10 dm. tall: leaf-blades 2.5–4 mm. wide, usually about half length of culms: head ovoid, 10–17 mm. long, 10 mm. thick, the spikes densely aggregated: perigynium 3.5 mm. long, 2 mm. wide or slightly more, nerved dorsally, contracted into a bidentate beak half the length of the body.—Dry sunny places, often on roadsides, Coastal Plain and adj. provinces, Tenn. to D. C.; becoming sparingly introduced northward.—Spr.—early sum.

II. MULTIFLORAE Kunth. Densely cespitose. Culm sharply triangular. Opaque part of sheaths usually transversely rugulose, red-dotted. Spikes numerous, small, androgynous or pistillate, but not gynaeceandrous, the lower more or less compound. Bracts frequently conspicuous. Perigynium plano-convex, not very thick, yellowish-brown, appressed-ascending or somewhat spreading, not thick-walled, somewhat spongy at base, short-stipitate, sharp-margined, more or less nerved, conspicuously rough-beaked, the beak bidentate. Achene lenticular. Stigmas 2. Style-base more or less enlarged.

11. *C. vulpinoidea* Michx. Culm 3–10 dm. tall, very rough above: leaf-blades 2–5 mm. wide, elongate: sheaths tight, transversely rugulose: head 3–15 cm. long, with very many small spikes, often somewhat compound or interrupted: bracts setaceous, usually conspicuous: scales strongly awned: perigynium 2–3 mm. long, narrowly to broadly ovate, ascending or spreading at maturity.—Swamps and wet meadows, various provinces, Fla. to Tex., Ore., Vanc., and N. B.—Sum.

12. *C. triangularis* Boeckl. Culm 3–8 dm. tall, stiff, roughened above: leaf-blades 2–6 mm. wide: sheaths transversely rugulose: head 3–8 cm. long with very many small spikes, more or less compound at base: bracts short, setaceous, often conspicuous: scales awned: perigynium 3 mm. long, 2.5 mm. wide.—Low prairies and meadows, Coastal Plain and adj. provinces, Miss. to Tex., Okla., and Ark.—Spr.—early sum.

13. *C. annectens* Bicknell. Culm 3–10 dm. tall, stiff, rough above: leaf-blades 2–5 mm. wide: sheaths transversely rugulose, strongly prolonged upward at mouth: head 2–7 cm. long, more or less compound at base and with very many small spikes: bracts short, setaceous, rarely conspicuous: scales strongly awned: perigynium 2.6–3.2 mm. long, 1.7–2.25 mm. wide, nerveless or nearly so ventrally. [*C. setacea ambigua* (Barratt) Fernald.]—Fields, mostly east of the mountains in non-calcareous districts: frequently introduced, various provinces, Fla. to Ark., Ia., and Me.—Sum.

III. PANICULATAE Kunth. Densely or loosely cespitose. Culm not flattened. Opaque part of sheaths strongly red-dotted. Spikes numerous, small, androgynous or pistillate, but not gynaeceandrous, the lower compound or decompound. Bracts usually inconspicuous. Perigynium thick, strongly convex

on the dorsal, and often somewhat convex on the ventral face, brownish or chestnut in age, ascending or spreading, coriaceous, spongy at base, stipitate, narrowly margined, more or less nerved, conspicuously rough beaked, the beak bidentate. Achene lenticular. Style-base more or less thickened. Stigmas 2.

14. *C. decomposita* Muhl. Culm 5–10 dm. tall, stout, roughened above, obtusely triangular or terete below: leaf-blades 2.5–8 mm. wide, longer or shorter than the culm: head 4–15 cm. long, decompound with very numerous small spikes: bracts inconspicuous: scales ovate, acute, nearly the length of the perigynia: perigynium short-obovoid, 2–2.5 mm. long, tapering at base, very abruptly short-beaked, strongly nerved dorsally, faintly nerved ventrally.—Swamps, various provinces, Fla. to La., Mo., Mich., and W N. Y.—Late spr.—sum.

IV. *STENORHYNCHAE* Holm. Densely cespitose or with a more or less elongated rootstock. Culm triangular or somewhat flattened. Opaque part of sheaths usually transversely rugulose or red-dotted. Spikes few to many, androgynous to pistillate, but not gynaeceandrous, the lower from simple to compound. Bracts little developed. Perigynium plano-convex, yellowish or yellowish-brown, appressed-ascending to spreading, not thick-walled, but strongly spongy at base, stipitate, strongly many-nerved, the margins nearly obsolete on the lower half, conspicuously beaked, the beak bidentate. Achene lenticular. Style-base more or less thickened. Stigmas 2.

15. *C. stipata* Muhl. Culm 2–12 dm. tall, stout at base, sharply 3-angled, slightly winged and strongly serrulate above, rather weak: leaf-blades 4–8 mm. wide: head 2.5–10 cm. long, somewhat compound, the spikes numerous, small, yellowish-brown: bracts inconspicuous: scales ovate or lanceolate, acuminate, much shorter than the perigynia: perigynium 4–5 mm. long, lanceolate, strongly nerved.—Swamps and wet meadows, neutral soils, various provinces, Tenn. to Mo., N. M., Calif., S Alas., and Newf.—Spr.—sum.

16. *C. uberior* (C. Mohr) Mackenzie. Culm 4–9 dm. tall, very thick, but weak, sharply triangular, very rough above, much flattened in drying: leaf-blades 8–15 mm. wide: head 4–10 cm. long, compound, the spikes numerous, small, yellowish-brown: bracts inconspicuous: scales lanceolate, cuspidate or awned, much shorter than perigynia: perigynium 5–6 mm. long, lanceolate, strongly nerved. [*Carex stipata uberior* C. Mohr.]—Deep swamps, neutral soils, Coastal Plain, Fla. to Ala. and S N. J.—Spr.—early sum.

17. *C. laevi-vaginata* (Kükenth.) Mackenzie. Culm 4–8 dm. tall, little thickened at base, sharply 3-angled, slightly winged and strongly serrulate above, rather weak: leaf-blades 3–6 mm. wide: head 2.5–6 cm. long, the spikes numer-

ous, small, yellowish-green: bracts inconspicuous: scales ovate or lanceolate, acuminate, much shorter than the perigynia: perigynium 4–5.5 mm. long, lanceolate, strongly nerved.—Wooded swamps, neutral soils, various provinces, Fla. to S Mo., Ill., and Mass.—Spr.—sum.

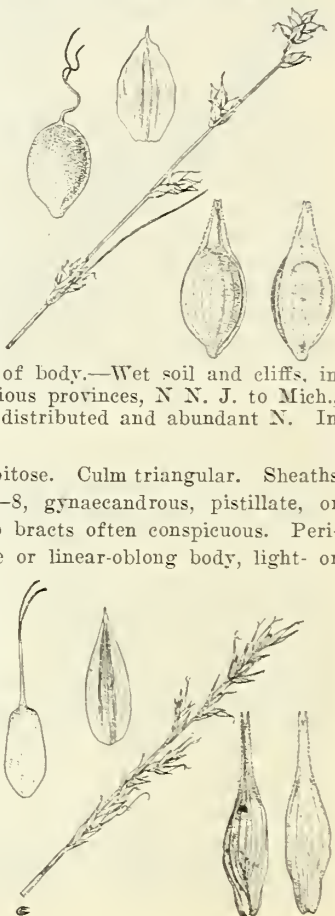

18. *C. crus-corvi* Shuttleworth. Culm 5–12 dm. tall, stout, very rough above: leaf-blades 5–12 mm. wide, the sheaths conspicuously red-dotted: head compound, branching, 1–3 dm. long, 2.5–7.5 cm. wide, the spikes very numerous: perigynium much exceeding scales, elongate-lanceolate, 2.75 mm. wide, 6–7 mm. long, the base hard and disk-like.—Swamps, neutral soils, Gulf Coastal Plain and more northern provinces, Fla. to Tex., Nebr., Minn., and Ind.—Late spr.—sum.

V. *CANESCENTES* Fries. Cespitose, but in some species with slender stolons. Culm triangular. Sheaths not cross-rugulose. Spikes 1–10, with few to many perigynia, the terminal one gynaeceandrous, the lateral pistillate or gynaeceandrous, simple. Bracts inconspicuous. Perigynia plano-convex, white-punctulate, lanceolate, ovate, oval, or obovoid, appressed to spreading, beakless to prominently beaked, more or less nerved on both sides, not winged or margined, but acute-edged above, nearly or entirely filled by lenticular achene. Style-base not enlarged. Stigmas 2.

19. *C. brunnescens* (Pers.) Poir. Culm 2–5 dm. tall, slender, stiff: leaf-blades 1–2.5 mm. wide, dark-green, not glaucous: spikes 4–8, subglobose or short-oblong, 4–10-flowered: scales ovate, shorter than the perigynia: perigynium loosely spreading when mature, 2–3 mm. long, 1–1.5 mm. wide, the minutely bidentate roughish beak  $\frac{1}{4}$  length of body.—Wet soil and cliffs, in acid soils, Blue Ridge, N. C. and Tenn., various provinces, N. N. J. to Mich., B. C., Lab., and Newf.—Sum.—Very widely distributed and abundant N. In our region only in the higher mountains.

VI. *DEWEYANAE* Tuckerm. Densely cespitose. Culm triangular. Sheaths not red-dotted or cross-rugulose. Spikes 3–8, gynaeceandrous, pistillate, or rarely staminate, simple. Lower one or two bracts often conspicuous. Perigynium plano-convex, with a narrowly ovate or linear-oblong body, light- or yellowish-green, 3.5–5.5 mm. long, appressed, strongly spongy at base, only the upper-half sharp-edged, round-tapering at base, nerved on the outer face, nerved or nerveless on the inner face, the beak bidentate to deeply bidentate. Achene lenticular. Stigmas 2.

20. *C. bromoides* Schk. Culm 3–6 dm. tall, slender, very rough above: leaf-blades 2 mm. wide, bright-green: spikes 3–7 narrowly oblong-cylindric, 7–18 mm. long, 3 mm. thick, the staminate flowers basal or terminal, or both: perigynium narrowly lanceolate, exceeding the oblong-lanceolate scale, 4–5.5

mm. long, 1 mm. wide, little margined, little nerved, the rough beak at least half the length of the body.—Swampy woodlands, acid or neutral soils, various provinces, Fla. to La., Mich., and N. S.—Late spr.—sum.

VII. STELLULATAE Kunth. Densely cespitose. Culm triangular. Sheaths not red-dotted or cross-rugulose. Spikes 2–10, or by reduction one, gynaeandrous or pistillate, or in a few species staminate, not compound. Bracts inconspicuous. Perigynium plano-convex, with orbicular, ovate, or broadly oval bodies, green, yellowish-brown or brown, spreading or reflexed at maturity, 2.5–4.5 mm. long, strongly spongy at base, sharp-edged nearly, if not entirely, to the rounded or truncate base, not puncticulate, nerved on the outer surface, nerved or nerveless on the inner, the beak bidentate or obliquely cut. Achene lenticular. Stigmas 2.

21. *C. seorsa* E. C. Howe. Culm 3–7 dm. tall, weak: leaf-blades 2–4 mm. wide, deep-green: spikes 3–7, the upper approximate, the terminal 6–12 mm. long, the lateral 4–7 mm. long, 4–6 mm. wide, with 5–20 at length widely spreading perigynia: scales orbicular-ovate, narrower and shorter than perigynia bodies: perigynium 2.5 mm. long, 1.5 mm. wide, deep-green, strongly nerved on both faces. [*C. rosaeoides* E. C. Howe.]—Acid swampy woodlands, various provinces, Ga. to Ark., Ind., and Mass.—Spr.—early sum.

22. *C. Howei* Mackenzie. Very densely cespitose in large clumps: culm 2–7 dm. tall, usually very weak: leaf-blades 0.25–1 mm. wide, more or less involute, usually exceeding the culm: spikes 2–5, more or less strongly separate, the terminal long-clavate at base, the lateral 4–6 mm. long and as wide, the 5–10 perigynia at length widely spreading: scales broadly ovate, whitish or opaque with green midvein: perigynium ovate, 2.5 mm. long, 1.25 mm. wide. [*Carex interior* (Fl. SE. U. S.) Not Bailey.]—Acid swampy woods (usually coniferous), various provinces, Fla. to La., Vt., and N. S.—Spr.—sum.

23. *C. Mohriana* Mackenzie. Densely cespitose in large clumps: culm 2–7 dm. tall, very slender, usually weak: leaf-blades 1–2.5 mm. wide, canaliculate, usually exceeding the culm: head 0.75–1.5 cm. long, the spikes 2–5, the terminal inconspicuously staminate at base, the lateral suborbicular, 4–6 mm. long, the 4–10 perigynia at length widely spreading: scales broadly ovate, white-hyaline except the green center: perigynium ovate, concave-convex, 2.25–2.5 mm. long, 1.75 mm. wide.—Pinelands, acid soil, Coastal Plain, Fla. and Ala.—Spr.

24. *C. incompta* Bickn. Culm 2.5–6 dm. tall, wiry: leaf-blades flat or canaliculate, 1.5–2.5 mm. wide: spikes 3–4, aggregated or lower slightly separate, the terminal 6–10 mm. long, clavate at base, the lateral 4–6 mm. long, suborbicular, with 6–15 spreading perigynia: scales yellowish-brown tinged, except the green midrib: perigynium 3 mm. long, 2 mm. wide, strongly nerved on both sides, the body serrulate above.—Acid swampy woods, various provinces, N. Fla. to Miss., Mich., and N. S.—Spr.—early sum.

25. *C. atlantica* Bailey. Culm 2–7 dm. tall, stiff, thickish at base: leaf-blades flat or canaliculate, 1.5–4 mm. wide: spikes 3–5, more or less separate or rarely aggregated, the terminal 8–15 mm. long, strongly clavate at base,

the lateral 8-15 mm. long, 6-7 mm. wide, suborbicular, with 8-20 at length widely spreading perigynia: scales light-brownish-tinged except the green center: perigynium 3 mm. long, 2.25 mm. wide, strongly nerved on both sides, the body serrulate above.—Acid swampy woods near the coast, Coastal Plain and New England Coast, Fla. to Tex. and N. S.—Spr.—early sum.

26. *C. Ruthii* Mackenzie. Culm 3-7 dm. tall, 3 mm. thick at base: leaf-blades flat or canaliculate, averaging 3-3.5 mm. wide: spikes 5-6, the lower widely separate, the lateral subglobose, 3-6 mm. long, 5-7 mm. wide, the terminal similar, but longer and clavate at base: scales light reddish-brown-tinged except the broad hyaline margins: perigynium 3.25-3.75 mm. long, 1.5 mm. wide, nerved dorsally, nerveless ventrally, serrulate above.—Wooded slopes, Blue Ridge, Ga. to N. C.—Sum.

27. *C. angustior* Mackenzie. Culm 1.5-6 dm. tall, slender but strict: leaf-blades flat or canaliculate: spikes 3-5, approximate or little separate, the lateral suborbicular, 4-6 mm. long, 5-15-flowered, the terminal similar, but longer and clavate at the base: scales yellowish-green with sharply defined midvein and ill-defined margins: perigynium 2.5-3.5 mm. long, 1.25 mm. wide, impressed-nerved ventrally, the body not serrulate.—Open swampy places, various provinces, mts. of N. C. to Calif., Wash., Mich., and Newf.—Sum.

VIII. *OVALES* Kunth. Densely caespitose or (rarely) with short-prolonged rootstocks. Culm triangular. Opaque part of sheaths not red-dotted or cross-rugulose, but sometimes green-striate. Spikes 2 or 3, up to 20, each with several to many perigynia, the terminal gynaeceandrous, the lateral pistillate or gynaeceandrous, simple, the inflorescence varying from capitate to moniliform. Lower bracts from inconspicuous to very conspicuous. Perigynium varying from scale-like or flat (except where distended by the achene) to thick and plano-convex, the body subulate to reniform, narrowly to broadly wing-margined, appressed or ascending or spreading, little corky thickened at base, prominently beaked, the beak bidentate or obliquely cut, becoming bidentulate, usually serrulate on the margins. Style-base scarcely thickened. Achene lenticular. Stigmas 2.

28. *C. scoparia* Schk. Culm 1.5-10 dm. tall, slender, roughish above: spikes 3-10, mostly ellipsoid-ovoid, narrowed at both ends, or sometimes truncate above, brownish or straw-colored, 6-16 mm. long, 3-9 mm. wide, aggregated or more or less separate: bracts inconspicuous: scales thin, acute or acuminate, shorter than perigynia: perigynium 4-6.5 mm. long, 1.2-2 mm. wide, appressed, tapering into the serrulate bidentate beak.—Moist soil, various provinces, S. C. to Mo., Colo., Ore., B. C., and Newf.—Sum.

29. *C. tribuloides* Wahl. Culm 3-10 dm. tall, rather stout, or sometimes slender, roughish above: leaf-blades 2.5-12 mm. wide, the sheaths loose: spikes 6-20, aggregated or slightly separate, obovoid or turbinate varying to suborbicular, blunt, 6-12 mm. long, 5-8 mm. wide: perigynium thin, little distended over achene, ascending or erect, 3-5 mm. long, 1-1.5 mm. wide, strongly exceeding the acute lanceolate scale.—Wet meadows, various provinces, Fla. to Tex., Minn., and N. B.—Sum.

30. *C. Longii* Mackenzie. Culm 3–8 dm. tall, strictly erect, roughish above: leaf-blades 2–4 mm. wide: spikes 3–10, aggregated or lower somewhat separate, 6–12 mm. long, 4–6 mm. wide, silvery-green or in age silvery-brownish, the lateral rounded or little clavate at base: bracts inconspicuous: perigynium appressed, 3–4.5 mm. long, 2 mm. wide, nerved on both faces, firm, the serrulate beak one-third length of body or less: scale nearly equalling perigynium. —Wet, often acid soil, Coastal Plain and adj. provinces, Fla. to Tex. and Mass. —(*W. I., Mex., C. A., S. A.*)—Late spr.–sum.

31. *C. straminea* Willd. Culm 2.5–9 dm. tall, very slender, roughish above: leaf-blades 2–3 mm. wide: spikes 3–10, aggregated or more or less separate, ovoid, 6–10 mm. long, 4.5–6 mm. wide, rounded at apex, clavate or rounded at base: bracts except lowest inconspicuous: perigynium appressed, green, 3.5 mm. long, 1.5–2 mm. wide, thinnish, many-nerved dorsally, lightly about 7-nerved ventrally, abruptly contracted into a strongly serrulate beak less than half the length of the body, the scale hyaline, greenish-tinged and narrower and shorter than the perigynium. [*C. albolutescens* Schw.]—Acid swampy woods, various provinces, Fla. to Tex., Ind., and N. S.—Late spr.–sum.

32. *C. alata* Torr. Culm 3–12 dm. tall, rather stout, slightly roughish above: leaf-blades 2–4 mm. wide: spikes 5–8, more or less aggregated, 8–16 mm. long, 6–10 mm. wide, suborbicular and rounded at base or short clavate, rounded or short pointed at apex, whitish-green or in age brownish-green: bracts, except the lowest, inconspicuous: perigynium appressed-ascending, 4–5 mm. long, nerved dorsally, faintly nerved ventrally, abruptly contracted into a strongly serrulate beak  $\frac{1}{3}$  the length of the body, the scale somewhat shorter and much narrower than the perigynium.—Moist meadows near the coastal salt marshes or in calcareous districts inland, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and N. H.—Spr.–early sum.

33. *C. normalis* Mackenzie. Culm 3–15 dm. tall, roughened above: spikes 4–10, from aggregated to more or less moniliform, greenish or brownish, 6–9 mm. long, 5–8 mm. wide: bracts except lowest inconspicuous: perigynium ascending, thickish, 1.5–2 mm. wide, few-nerved ventrally, with the serrulate beak less than half the length of the body, longer than the scale. [*C. mirabilis* Dewey.]—Dry woodlands, in neutral or calcareous soils, various provinces, N. C. to Okla., Man., and Que.—Late spr.–sum.

34. *C. festucacea* Schk. Culm slender, 5–10 dm. tall, roughish above: spikes 4–10, moniliform, 6–16 mm. long, 5–6 mm. wide, rounded at apex: bracts, except lowest, inconspicuous: perigynium 3.5 mm. long, 2 mm. wide, green or in age straw-colored, appressed-ascending, the body thick, orbicular, nerved or clavate at the base: bracts inconspicuous: perigynium somewhat spreading or ascending, 2.5–3.5 mm. wide, with the serrulate beak  $\frac{1}{3}$  the length of body, longer and wider than the scale: achene suborbicular, 2.5 mm. long. [*C. festucacea* (Fl. SE. U. S.)]—Dry fields and open places in calcareous or neutral soils, various provinces, Tenn. to Tex., N. M., B. C., and N. B.; rare S.—Sum.

35. *C. brevior* (Dewey) Mackenzie. Culm rather stout, 3–9 dm. tall, slightly roughish above: leaf-blades 2–4 mm. wide: spikes 3–10, approximate or more or less separate, 7–14 mm. long, 4–9 mm. wide, oblong or suborbicular, rounded or clavate at the base: bracts inconspicuous: perigynium somewhat spreading or ascending, 2.5–3.5 mm. wide, with the serrulate beak  $\frac{1}{3}$  the length of body, longer and wider than the scale: achene suborbicular, 2.5 mm. long. [*C. festucacea* (Fl. SE. U. S.)]—Dry fields and open places in calcareous or neutral soils, various provinces, Tenn. to Tex., N. M., B. C., and N. B.; rare S.—Sum.

36. *C. reniformis* (Bailey) Small. Culm 3–9 dm. tall, roughened above: leaf-blades 2–2.5 mm. wide: spikes 3–6, more or less separate, 6–10 mm. long, 5–8 mm. wide, suborbicular, rounded at the base and apex, greenish: bracts inconspicuous: perigynium appressed-ascending, very abruptly beaked, with

the serrulate beak 1.5–2 mm. long, about the length of the scale.—Moist soil, Coastal Plain and occasionally adj. provinces, S. C. to Tex. and Ark.—Spr.

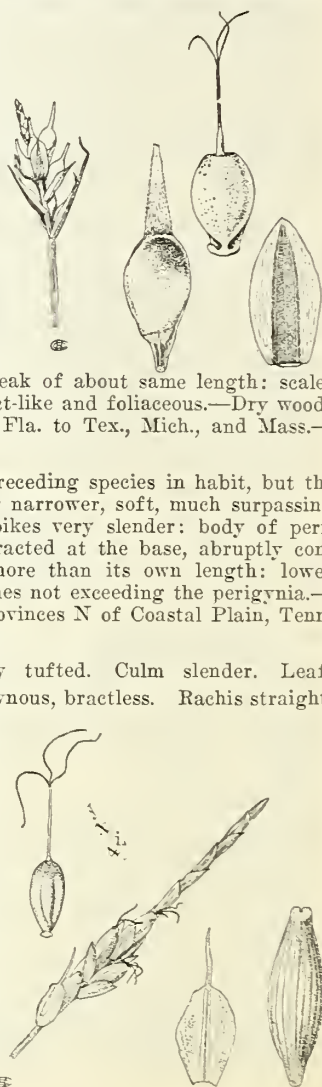

IX. PHYLLOSTACHYAE Tuckerm. Culm densely cespitose, weak, compressed, dilated below the spikes, mostly much exceeded by the leaves. Spikes 2–4, androgynous, the rachis zigzag, dilated; one spike terminal, the others basal on often much elongate peduncles; staminate portion with small tight scales united at base; pistillate portion loosely one-several-flowered, the scales elongate and conspicuous. Perigynium glabrous, 2-keeled, but otherwise nerveless, nearly round in cross-section, more or less beaked, the beak flattened-triangular, the orifice hyaline. Achene closely enveloped, triangular, stipitate, the sides convex, the apex rounded. Stigmas 3, short. Style jointed at the base with achene, soon withering.

37. *C. Willdenovii* Schk. Culm very short up to 2.5 dm. tall, little serrulate: leaf-blades pale-green, 1.5–4 mm. wide, 1–4 dm. long: spikes 1–5 mostly androgynous, the lowest appearing nearly basal: perigynium with a body 2–3 mm. long, less than 2 mm. thick, narrowed into a flattened 2-edged serrulate beak of about same length: scales acuminate or awned, the lowest commonly bract-like and foliaceous.—Dry woods and thickets, in acid soils, various provinces, Fla. to Tex., Mich., and Mass.—Spr.—early sum.

38. *C. Jamesii* Schw. Similar to the next preceding species in habit, but the culm very rough above, the leaf-blades rather narrower, soft, much surpassing the spikes: terminal staminate portion of spikes very slender: body of perigynium subglobose, 2 mm. in diameter, contracted at the base, abruptly contracted into a subulate, serrulate beak of more than its own length: lower scales bract-like, foliaceous, the upper sometimes not exceeding the perigynia.—Rich woods, in calcareous districts, various provinces N of Coastal Plain, Tenn. to Okla., Ia., Mich., N. Y., and N. J.—Spr.

X. POLYTRICHOIDEAE Tuckerm. Densely tufted. Culm slender. Leaf-blades narrow. Spike solitary, linear, androgynous, bractless. Rachis straight, not dilated. Perigynium appressed, membranous, with the upper part empty, oblong-elliptic, many-nerved (not 2-ribbed), compressed triangular, beakless. Achene triangular. Style slender, flexuous, its base not enlarged. Stigmas 3, short.

39. *C. leptalea* Wahl. Culm very slender, smooth, 1.5–6 dm. tall: leaf-blades very narrow: spike narrowly linear, 4–16 mm. long, 2–3 mm. thick: perigynium narrowly oblong, light-green, 2.5–5 mm. long, 1–1.5 mm. thick: lowest scale cuspidate, the upper short acuminate to very obtuse and much shorter than the perigynium. [*C. polytrichoides* Muhl. *C. Harperi* Fernald.]—Acid bogs

and swampy meadows, various provinces, Fla. to Tex., Colo., N Calif., Alas., Lab., and Newf.—Sum.

XI. *MONTANAE* Fries. Culm slender, leafy at the base. Leaf-blades narrow, rough above. Terminal spike linear, normally staminate. Lateral spikes 1–5, small, pistillate, or sometimes androgynous, subglobose to oblong, closely few-many-flowered, approximate and sessile or short-peduncled, or in some species basal and long-peduncled. Lowest bract squamiform or leaflet-like, sheathless or sub-sheathing. Scales often reddish-brown-tinged, acute to cuspidate. Perigynium membranous, ascending, the body pubescent, at least at the base of the beak, obovoid to elliptic, triangular, 2-keeled, strongly stipitate at the base, abruptly contracted into a cylindric or terete, emarginate to deeply bidentate beak, hyaline-tipped. Achene normally triangular, the sides concave, closely enveloped, short-apiculate. Style short, jointed with apex of achene, thickish. Stigmas normally 3, long.

40. *C. communis* Bailey. Loosely cespitose: culm 1.5–5 dm. tall, roughish above: leaf-blades 2–4 mm. wide, shorter than culm: staminate spike 4–18 mm. long: pistillate spikes 2–4, short-oblong, 3–10-flowered, usually separated, sessile or short-stalked: perigynium obovoid, the body 2–2.5 mm. long, and 1.2 mm. thick, pale, the beak  $\frac{1}{4}$  of its length: scales acuminate to obtuse, nearly equalling the perigynia.—Rocky woods, various provinces N of Coastal Plain, Ga. to Ky., Minn., and N. S.—Late spr.—sum.

41. *C. pennsylvanica* Lam. Strongly long-stoloniferous: culm slender but strict, 0.5–4 dm. tall: leaf-blades 1.5–3 mm. wide: pistillate spikes 1–4, short-oblong, 4–20-flowered, contiguous or somewhat separate, sessile or short-peduncled: perigynium with body round-triangular in cross-section, 1.5 mm. thick, tipped with a bidentate beak much shorter than the body: scales acute or cuspidate, equalling or exceeding the perigynia.—Dry, often acid, soil, various provinces, S. C. to Tenn., N. D., and N. B.—Spr.

42. *C. lucorum* Willd. Strongly long stoloniferous: culm slender, 1–3 dm. tall: leaf-blades 1.5–2.5 mm. wide: pistillate spikes 2–3, suborbicular or short-oblong, 4–10-flowered, contiguous, sessile or short-peduncled: perigynium with body obtusely triangular in cross-section, 1.5 mm. thick, tipped with a slender bidentate beak as long or longer than the body: scales acute to long-acuminate, exceeding the perigynia.—Dry woodlands, acid soils, Blue Ridge and more northern provinces, N. C. to Wis. and Me.—Spr.—In our region only in the mountains.

43. *C. varia* Muhl. Cespitose: culm slender, erect, 0.5–5 dm. tall, rough above, usually exceeding leaves: leaf-blades 0.5–2.5 mm. wide: staminate spike 3–14 mm. long, sessile or slightly peduncled, rather conspicuous: pistillate spikes 1–4, the upper approximate, the lower separate, 4–12-flowered: perigynium sparingly short-pubescent, 3–3.5 mm. long, the body ellipsoid-ovoid, 1–1.5 mm. thick, the beak about half length of body, bidentate: scales purplish-tinged, about equalling perigynia.—Dry soils, various provinces, N. C. to Tenn., Man., and N. S.—Spr.

44. *C. physorhyncha* Liebm. Freely stoloniferous, the slender stolons often 8 cm. long, very conspicuous: culm slender, 1.5–3.5 dm. tall, reddened and fibrillose at base, exceeding the leaves: leaf-blades 1.75–2.75 mm. wide: lowest bract not sheathing, from much shorter than to exceeding the inflorescence: staminate spike sessile, 5–8 mm. long, 2 mm. wide: pistillate spikes 3–4, sessile and approximate, or the lowest somewhat remote and short-peduncled: scales ovate, acute to short-cuspidate, more or less purplish-tinged: perigynium 2.5–3 mm. long, more than 1 mm. thick, abruptly strongly stipitate, puberulent, abruptly contracted into a shallowly bidentate beak half its length. [*C. varia australis* Bailey.]—Dry soil, Coastal Plain, Ala. to Tex., Ark., and S. C.—(Mex.)—Spr.—early sum.

45. *C. nigro-marginata* Schw. Cespitose: culm 2–10 cm. tall, rough: leaf-blades 2–4 mm. wide: staminate spike sessile, 5–8 mm. long, usually 2–4 mm. wide: pistillate spikes 2–3, sessile, erect, contiguous or slightly separate, 4–7 mm. long, 3–5 mm. wide: scales about about length of perigynia, ovate, usually conspicuously dark-margined: perigynium 3–4 mm. long, puberulent, the beak 1 mm. long, bidentate.—Dry woods, in acid soils, Coastal Plain and adj. provinces, Ala. to La., SE Mo., and Conn.—Spr.

46. *C. floridana* Schw. Long stoloniferous: culm from very short to 2 dm. tall, roughened: leaf-blades 1–2 mm. wide: staminate spike inconspicuous, sessile, 3–5 mm. long, 0.75 mm. wide: pistillate spikes 2, closely contiguous, sessile, 4–8 mm. long, 2.5–4 mm. wide; scales shorter than the perigynia, little or not at all dark-margined: perigynium 3.25 mm. long, puberulent, the beak 0.75 mm. long, nearly entire.—Dry woods, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and Ga.—Spr.

XII. TRIQUETRAE Carey. Cespitose, leafy towards the base. Leaf-blades narrow, the sheaths not purplish-tinged. Terminal spike linear, staminate. Lateral spikes 2–4, approximate or separate, or sometimes radical, 5–30-flowered in few ranks, the peduncles included or exerted. Bracts sheathing, not purplish-tinged, the lowest with a well-developed blade. Pistillate scales greenish or hyaline, or reddish-brown-tinged. Perigynium membranaceous, ascending, obovoid, short-pubescent or puberulent, triangular, tapering and stipitate at base, abruptly contracted into the minute beak, the orifice obliquely cut, minutely bidentate. Achene triangular, closely enveloped. Style very short, thickish, jointed with the apex of the achene, withering. Stigmas 3, early deciduous.

47. *C. validior* Mackenzie. Rootstock short: culm 2.5–3.5 dm. tall, stiff, roughened above: leaf-blades 1.5–2.5 mm. wide, canaliculate, often stiffly spreading, hispidulous at base: staminate spike 1–3 cm. long: pistillate spikes 1–3, approximate, suborbicular to short-oblong, 5–18 mm. long, closely 3–20-flowered: scales half length of the mature perigynia, ovate, acute to short-cuspidate: perigynium 4.5 mm. long, sharply triangular, the beak 0.5 mm. long, emarginate. [*C. Chapmanii* Sartw. Not Steud.]—Dry ridges, in acid soils, Coastal Plain and adj. provinces, Fla. to Miss. and S. C.—Spr.—early sum.

48. *C. dasycarpa* Muhl. Rootstock short creeping: culm 1.5–4 dm. tall, slender, minutely pubescent: leaf-blades 2–4.5 mm. wide, flat or nearly so, the

lower at least pubescent: staminate spike 1-2 cm. long: pistillate spikes 1-4, approximate or but little separate, oblong, 6-20 mm. long, closely 5-25-flowered: scales less than half length of the mature perigynia, ovate, acute to short-cuspidate: perigynium 4.5-6 mm. long, sharply triangular, strongly soft-villous towards the apex and less so below, the beak 0.5 mm. long, emarginate.—Sandy woods, in acid soils, Coastal Plain, Fla. to Miss. and S. C.—Spr.-early sum.

XIII. *PICTAE* Kükenth. Culm lateral. Leaf-blades flat. Spike one, pistillate or staminate, linear-cylindric, densely many-flowered, long-peduncled, the bract sometimes present or more often the culm with one to several colored bract-like sheaths towards the base. Scales scarcely ciliate, short-cusped. Perigynium appressed, narrowly obovoid, many-nerved, strongly stipitate, flattened-triangular, short-pubescent, obtuse, beakless, thickish, closely enveloping achene. Achene triangular. Style slender, long-exserted, little enlarged at base. Stigmas 3.

49. *C. picta* Steud. Rootstock thick, creeping: culm 1-2.5 dm. tall, usually fibrillose at the base: leaf-blades 2-4.5 mm. wide: staminate spikes 2-5 cm. long: pistillate spike 4-6 cm. long, 3-6 mm. wide, bractless, the scales obovate-oblong, obtuse to cuspidate, concealing the numerous perigynia, purplish-tinged: perigynium ascending, oblong-obovoid, triangular, many-striate, 4-5 mm. long, 1.5 mm. wide, tapering at the base and stipitate, short-tapering to the pointed but beakless apex.—Coastal Plain, near New Orleans, La.; also Interior Low Plateaus, NW Ala. to C Ind.—Spr. and early sum.—Grows in circular colonies. Known only from a few, mostly, widely separated stations. Very local in dry woods and neutral soils.

XIV. *DIGITATAE* Fries. Culm slender, leafy at the base. Leaf-blades narrow, the sheaths usually strongly purplish. Terminal spike linear, staminate. Lateral spikes 1-5, approximate, or separated or sometimes basal, oblong to linear, 5-20-flowered in few rows, the peduncles included or exserted. Bracts sheathing, more or less strongly purplish-tinged, subspathaceous, the blade absent or rudimentary. Pistillate scales strongly purplish or reddish-brown-tinged. Perigynium membranous, appressed, oblong-obovoid, pubescent to glabrate, triangular, long tapering into the stipitate base, abruptly contracted into the minute beak, the orifice entire or nearly so. Achene triangular, closely enveloped. Style-base short, thickened, jointed with the apex of the achene. Stigmas 3, early deciduous.

50. *C. Baltzellii* Chapm. Rootstock thick, creeping: culm 1.5-3 dm. tall, nearly smooth, fibrillose at base: leaf-blades 4-8 mm. wide, much exceeding the culm: staminate spike 1.5-2.5 cm. long, long-peduncled, the pistillate spikes one at the top and several at the base of the culm, long-peduncled, 1.5-3.5 cm. long, 4-6 mm. wide: peri-

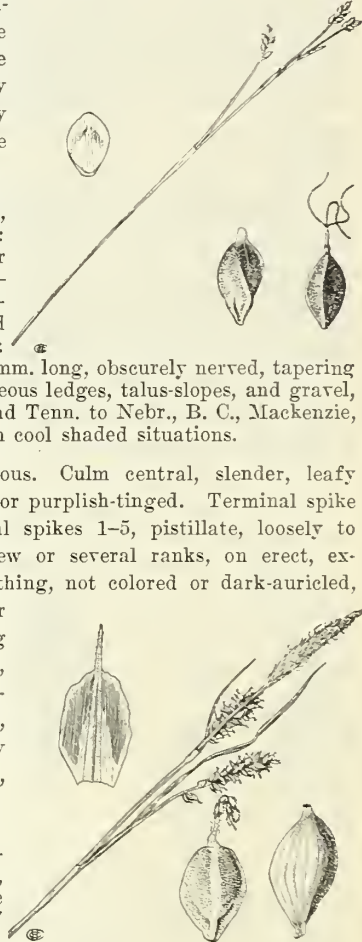

gynium 5-15, ascending, oblong-obovoid, triangular, many-striate, 4-5 mm. long, 1.5 mm. thick, tapering and stipitate at base, abruptly minutely beaked, about equalling the oblong-obovate, abruptly mucronate, brownish-purple-tinged scales.—Sandy ravines, Gadsden Co., Fla. and SW Ga.—Spr.—A very well-marked species which has not been collected for many years.

XV. *ALBAE* Aschers. & Graebn. Slenderly long-stoloniferous. Culm very slender, obtusely triangular, leafy near the base. Leaf-blades of the fertile culm very narrow, involute. Terminal spike linear, staminate. Lateral spikes 2 or 3, (or 4), oblong or linear, loosely 4-8-flowered, all long-peduncled, linear or oblong, often overtopping the staminate one. Bracts sheathing, subspathaceous, bladeless, white-hyaline above. Scales white-hyaline, yellowish-tinged. Perigynium erect, obovoid, triangular, glabrous, nerved, tapering at the base, abruptly minutely beaked, the orifice entire, hyaline. Achene triangular, closely enveloped, the sides concave. Style-base very short, bulbous-thickened, jointed with the achene. Stigmas 3, long.

51. *C. eburnea* Boott. Culm 1-3.5 dm. tall, slender, smooth: leaf-blades 0.5 mm. wide: staminate spike 4-8 mm. long, sessile or nearly so: pistillate spikes 2-4 usually 2, 2-6-flowered, exsert-peduncled, the upper overtopping the staminate spike: scales exceeded by perigynia, whitish, obtuse or acutish: perigynium elliptic-obovoid, membranous, 2 mm. long, obscurely nerved, tapering at base, abruptly very short-beaked.—Calcareous ledges, talus-slopes, and gravel, various provinces N of Coastal Plain, Va. and Tenn. to Nebr., B. C., Mackenzie, and Newf.—Spr.—early sum.—In our area in cool shaded situations.

XVI. *PANICEAE* Tuckerm. Stoloniferous. Culm central, slender, leafy towards the base. Basal sheaths brownish or purplish-tinged. Terminal spike staminate, linear or linear-oblong. Lateral spikes 1-5, pistillate, loosely to rather closely several-many-flowered, in few or several ranks, on erect, exserted or included peduncles. Bracts sheathing, not colored or dark-auricled, the blades developed. Scales purplish or reddish-brown-tinged. Perigynium ascending or spreading, ovoid or obovoid, membranous, obtusely triangular, slightly inflated, glabrous, puncticulate, light- or olive-green, pointed or beaked, the orifice entire or nearly so. Achene triangular. Style-base slender, jointed with achene. Stigmas 3.

52. *C. Meadii* Dewey. Rootstock deep-seated, white, slender: culm phyllopodic, stoutish, 2-5 dm. high, not or but little purplish-tinged at the base: leaf-blades 2.5-7 mm. wide: staminate spike 1.5-4 cm. long, the peduncle long, rough: pistillate spikes 1-3, oblong or linear-oblong, 1-3.5 cm. long, 5-7 mm. wide: scales ovate, obtuse to cuspidate: perigynium obovoid,

3-5 mm. long, 1.75-2.5 mm. wide, strongly nerved, tapering to the base, abruptly minutely beaked.—Open places, meadows and prairies, in calcareous districts, various provinces, Ga. to Tex., Sask., Mich., and W N. J.—Spr.—early sum.

53. *C. biltmoreana* Mackenzie. Rootstock stout, interwoven: culm strongly purplish-tinged at base, 3-7 dm. tall, 3-4 mm. thick at the base, aphyllopodic: leaf-blades 3.5-5 mm. wide: bract-sheaths 5-30 mm. long: staminate spike strongly rough-peduncled: pistillate spikes 1-3, erect, distant, usually strongly peduncled, 1.5-3.5 cm. long, loosely or somewhat closely flowered above: scales ovate, obtuse to cuspidate, usually purplish-brown-tinged: perigynium obovoid, many-nerved, 2.5-3.5 mm. long, abruptly rounded at apex and minutely beaked or beakless, the orifice entire. [*C. tetanica* (Fl. SE. U. S.) not Schk.]—Rocky soil, Blue Ridge, N. C.—Spr.

54. *C. Chapmanii* Steud. Cespitose, the clumps small, sending forth long horizontal stolons: culm 1-3 dm. high, not winged or serrulate: sterile shoots elongate: leaf-blades light-green, 2.5-5 mm. wide: staminate spike short-peduncled, 7-20 mm. long: pistillate spikes 2-4, rather closely 8-18 flowered, the lowermost widely separate, more or less strongly exsert-peduncled: bract-sheaths sparingly retrorsely serrulate at mouth: scales mucronate or cuspidate, usually markedly exceeded by the perigynia: perigynium obovoid-fusiform, obtusely triangular, 4.5 mm. long, subcoriaceous, tapering into the conspicuous, straight or excurved beak. [*C. fusiformis* Chapm.]—Hammocks and woodlands, Fla.—Spr.

XVII. LAXIFLORAE Kunth. Cespitose. Fertile culm mostly lateral, the sterile shoots leafy, conspicuous. Basal sheaths brownish- or purplish-tinged. Terminal spike staminate, linear. Lateral spikes 2-5, pistillate or androgynous, loosely to closely few-many-flowered, in few-several ranks, on erect to drooping, included or exserted, peduncles. Bracts sheathing, the sheaths green or purplish-tinged, the blades leaf-like or sometimes reduced. Scales green with hyaline margins or more or less colored. Perigynium ascending, membranous, triangular, usually nerved, closely enveloping the achene, glabrous or hispidulous, tapering at the base, short-beaked or beakless, the orifice entire. Achene triangular. Style-base slender, jointed with the achene. Stigmas 3.

55. *C. austro-caroliniana* Bailey. Culm 2-4.5 dm. tall, weak, nearly smooth: leaf-blades 3-6 mm. wide, those of the sterile shoots 3-3.5 dm. long: staminate spike long-peduncled, 1-2 cm. long: pistillate spikes about 3, widely separated, capillary-peduncled, 2-6-flowered: scales ovate-orbicular, obtuse to cuspidate: perigynium broadly ovoid, triangular, minutely hispidulous, finely many-nerved, 2.5-3.75 mm. long, tapering at the base and apex, short-beaked.—Mountain gorges, Blue Ridge and adj. provinces, S. C. to Tenn. and N. C.—Spr.—A very rarely collected species, but a handsome plant.

56. *C. plantaginea* Lam. Culm 2.5-6 dm. tall, erect or reclining, smooth: leaf-blades 10-25 mm. wide, those of the sterile shoots 1.5-3.5 dm. long: staminate spike long-peduncled, 1-2 cm. long: pistillate spikes 3-4, widely separated,

4-12-flowered on erect peduncles: scales broadly ovate, acuminate or cuspidate: perigynium ovoid-elliptic, triangular, minutely hispidulous, finely many-nerved, 4-5 mm. long, tapering at base, abruptly beaked, the beak 1 mm. long.—(PLANTAIN-LEAF SEDGE).—Woodlands, in calcareous districts, apparently avoiding strongly magnesian rocks, various provinces, N. C. to Ill., Sask., and N. B.—Spr.

57. *C. purpurifera* Mackenzie. Culm 2-4 dm. high, weak, not flattened in drying, the angles papillose: leaf-blades 3-8 mm. wide: staminate spike long-peduncled, 2-3 cm. long: pistillate spikes 2-3, the lower strongly exsert-peduncled, widely separate, very loosely alternately 7-15-flowered: scales obovate, the midvein excurrent as an awn: perigynium oblong-obovoid, 3.75-4.25 mm. long, many-nerved, tapering into the straight or somewhat excurved short beak.—Open dry rich woodlands, in calcareous soil, Appalachian Valley, Morley, Campbell County, Tenn.—Sum.

58. *C. platyphylla* Carey. Culm 1.5-3 dm. tall, slender, not winged, strongly lateral, cinnamon-brown at base: sterile shoots mostly reduced to tufts of leaves: leaf-blades glaucous, 9-25 mm. wide: staminate spike more or less peduncled, 8-15 mm. long: pistillate spikes 2-4, widely separated, the lower short-peduncled, 4-10-flowered: scales short-awned to acuminate, exceeded by perigynia: perigynium obovoid, 2.5-3.5 mm. long, finely many-nerved.—Dry wooded slopes, often in loose shale, various provinces, N. C. to Ill., Mich., and Que.—Spr.—early sum.

59. *C. abscondita* Mackenzie. Culm 0.5-2 dm. tall, slender, smooth: leaf-blades 4-9 mm. wide: staminate spike 4-9 mm. long: pistillate spikes 2 or 3, approximate and short-peduncled or lowest remote and long-peduncled, all loosely 3-10-flowered: scales ovate, half the length of the perigynia, obtuse to short cuspidate: perigynium oblong-obovoid, 2.5-3.5 mm. long, the sides 1.5 mm. wide, finely many-nerved, tapering at the base and apex, short-beaked. [*C. pythocarpa* Steud. *C. laxiculmis floridana* Bailey.]—Woodlands, in acid soils, Coastal Plain and occasionally adj. provinces, Fla. to La., Ind., N. J., and Mass.—Sum.

60. *C. magnifolia* Mackenzie. Culm smooth, slender, 1-2 dm. high, much shorter than the leaves: leaves glaucous; blades 5-8 mm. wide, 1.5-3.5 dm. long, numerous and very conspicuous: lower bracts foliaceous: staminate spike sessile or nearly so, about 1 cm. long: pistillate spikes usually 3, erect, the lowest long-peduncled, nearly basal, the upper two and the staminate contiguous, loosely 5-14-flowered: scales ovate, obtuse or acutish, about  $\frac{1}{4}$  the length of the perigynia: perigynium broadly fusiform, acutely triangular, 4-4.5 mm. long, the sides 2 mm. wide, finely many-nerved, the nearly straight beak 1 mm. long, with entire orifice. [*C. digitalis glauca* Chapm.]—In shaded moist woodlands, in acid soils, Fla.—Spr.

61. *C. digitalis* Willd. Culm 1-5 dm. tall, slender, smooth: leaf-blades bright-green: staminate spike 1-2 cm. long: pistillate spikes 2-4, widely separated, the upper short- and the lower long-peduncled, loosely 3-12-flowered: second bract usually exceeding the culm: scales ovate-lanceolate, rather shorter than perigynia, acute to short cuspidate: perigynium oblong-ovoid, 2.5-4 mm. long, the sides 1.5 mm. wide, finely many-nerved, tapering at the base and apex, short-pointed.—Woods and thickets, in acid or neutral soils, various provinces, Fla. to Tex., Minn., and Me.—Spr.—early sum.

62. *C. laxiculmis* Schw. Culm 1.5-6 dm. tall, weak, smooth: leaf-blades glaucous-green: staminate spike 8-20 mm. long: pistillate spikes 2-4, widely sepa-

rated, the upper short-peduncled and erect, the lower drooping on filiform peduncles, rather loosely 5-10-flowered: second bract usually shorter than culm: scales ovate, shorter than perigynia, acute to cuspidate: perigynium oblong-obovoid, 3-4 mm. long, the sides 1.75-2.25 mm. wide, finely many-nerved, tapering at base and very short-beaked at apex.—Woods and thickets, in acid or neutral soils, various provinces, rarely Coastal Plain, N. C. to Mo., Wis., and Me.—Spr.

63. *C. albursina* Sheldon. Culm 2-6 dm. tall, strongly flattened in drying, narrowly winged, roughened: leaf-blades 7-30 mm. wide: staminate spike sessile or nearly so, 5-17 mm. long, the scales very obtuse: pistillate spikes 2-4, linear, the upper closely approximate and scarcely exsert-peduncled, the lower distant and slender-peduncled, loosely 3-18-flowered: scales strongly scarious-margined: perigynium ascending, obovoid, 3-4 mm. long, 2 mm. wide, finely many-nerved.—Wooded calcareous bluffs, various provinces N of Coastal Plain, Va. and Tenn. to Mo., Minn., and Que.—Spr.

64. *C. heterosperma* Wahl. Densely cespitose: culm lateral, 1.5-4 dm. tall, flattened in drying, weak: leaf-blades 5-20 mm. wide, soft, the basal rarely more than 3 dm. long, their sides not strongly parallel: staminate spike sessile or short- or occasionally long-peduncled: pistillate spikes 3-4, narrowly linear, 1.5-4.5 cm. long, 2-3 mm. wide, loosely-flowered, erect, the lower distant and long-peduncled: scales ovate, acuminate or short-cuspidate: perigynium narrowly obovoid, 3-4.25 mm. long. [*C. anceps* Muhl.]—Dry woods, in acid or neutral soils, Blue Ridge, N. C. to Tenn., and various provinces, Va. to Mich. and Me.—Spr.—In the mountains in our range.

65. *C. laxiflora* Lam. Loosely cespitose: culm 2-6 dm. tall, slender, lateral and central: leaf-blades 7-14 mm. wide, firm, the longer basal ones more than 3 dm. long with sides strongly parallel: staminate spike usually long-stalked, its scales often reddish-brown-tinged: pistillate spikes usually 2, linear-oblong, 1.5-5 cm. long, 6-20-flowered: scales ovate, short-cuspidate, slightly reddish-brown tinged: perigynium obovoid-fusiform, 4-5 mm. long. [*C. striatula* Michx.]—Dry woodlands, in acid soils, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and Conn.—Spr.—early sum.

66. *C. styloflexa* Buckley. Culm 2-8 dm. tall, slender, smooth, brownish at the base, loosely cespitose: leaf-blades 2.5-3.5 mm. wide: staminate spike mostly long-stalked, its scales usually reddish-brown-tinged: pistillate spikes 1-4, 1-2 cm. long, loosely 4-15-flowered, the lower drooping on elongate filiform peduncles: scales ovate, acute or cuspidate, reddish-brown-tinged: perigynium 4-5 mm. long, 1.5-2 mm. thick, divergent, tapering at both ends.—Dry woodlands, in acid soils, Coastal Plain and occasionally adj. provinces, Fla. to Tex. and Conn.—Spr.—early sum.

67. *C. crebriflora* Wiegand. Loosely cespitose: culm 2-6 dm. tall, stoutish, slightly winged, brownish at base, both lateral and central: leaf-blades green, 3-8 mm. wide: staminate spike 1-2.5 cm. long, sessile or short-peduncled: pistillate spikes 2 or 3, closely 10-20-flowered, the lowermost strongly separate, and long-peduncled: scales oblong-obovate, obtuse to cuspidate, half the length of the perigynia: perigynium elliptic-obovoid, 3.5-4.5 mm. long, subcoriaceous, many-nerved.—Woodlands, in acid soils, Coastal Plain, Fla. to La. and S. C.—Spr.

68. *C. leptonervia* Fernald. Culm 1.5-7 dm. tall, slender, becoming decumbent, the sterile shoots well-developed: leaf-blades 3-10 mm. wide, their sheaths

tight: bract-sheaths strongly retrorsely serrulate at the mouth: staminate spike sessile or nearly so: pistillate spikes 2-4, linear-oblong, 1-3 cm. long, rather loosely 10-20-flowered, the upper contiguous, the lower widely separate: scales obtuse to acuminate, greenish: perigynium 3.5-4.5 mm. long, obovoid-elliptic, nerveless or nearly so, straight-beaked, rather sharply angled above.—Damp woodlands, in acid soils, Blue Ridge and more northern provinces, N. C. to Mich., Newf., and N N. J.—Spr.—A widely distributed northern species reaching our area in the higher mountains only.

69. *C. blanda* Dewey. Culm 1-6 dm. tall, thick but weak, flattened in drying, serrulate, slightly winged above: leaf-blades 3.5-15 mm. wide, soft, the sheaths very loose with much crinkled margins: staminate spike sessile or short-peduncled or rarely even long-peduncled: pistillate spikes 2-5, oblong or linear-oblong, 0.5-3 cm. long, 3.5-5 mm. wide, closely 8-25-flowered, erect, closely contiguous or lower widely separate: scales ovate, the lower at least strongly awned: perigynium obovoid, 3-4 mm. long.—Dry woodlands, in calcareous or neutral soils, various provinces, Fla. to Tex., N. D., and Me.—Spr.—sum.—One of the most widely distributed and abundant species in the E U. S.

70. *C. gracilescens* Steud. Culm 1.5-6 dm. tall, slender, erect, scarcely winged, serrulate above, not flattened in drying: leaf-blades 3-7 mm. wide, their sheaths tight, with margins little crinkled: staminate spike usually long-stalked: pistillate spikes 2-4, linear-cylindric, 7-30 mm. long, 3-4 mm. thick, loosely 7-20-flowered, widely separate, the lower long-peduncled: scales ovate to broadly obovate, the lower at least strongly awned, usually much shorter than the perigynia and reddish-brown-tinged: perigynium 2.5-3.5 mm. long, the beak conspicuous, strongly bent. [*C. laxiflora* (Fl. SE. U. S.) not Lam.]—The more open parts of woodlands, mostly in neutral soils, various provinces, rarely Coastal Plain, Tenn. to Ark., Mich., and E Que.—Spr.—early sum.

XVIII. OLIGOCARPAE Carey. Culm slender, central, leafy. Leaf-blades flat. Basal sheaths brownish or purplish. Terminal spike staminate, linear. Lateral spikes 2-4, pistillate, few-many-flowered in few-several ranks, erect, on more or less strongly exerted peduncles. Bracts sheathing, not colored or dark-auricled, the blades leaf-like. Scales ovate, pointed. Perigynium ascending, oblong-elliptic or obovoid, glabrous, subcoriaceous, finely many-striate, obtusely triangular in cross-section, tapering at base, constricted at apex, closely enveloping the achene, beakless or slightly beaked, the orifice entire. Achene triangular, apiculate, jointed with the slender style. Stigmas 3.

71. *C. oligocarpa* Schk. Culm 1-5 dm. tall, roughened, purplish-tinged at the base: leaf-blades 2-4.5 mm. wide, the sheaths not hispidulous: staminate spike 1-2.5 cm. long, more or less peduncled: pistillate spikes 2-4, erect, widely separated, loosely 2-8-flowered: scales ovate, strongly cuspidate: perigynium ascending, 3.5-4 mm. long, scarcely 2 mm. wide, the body obovoid, obtusely triangular, abruptly contracted into a straight beak 0.75 mm. long.—Slopes and rocky banks

in rich woods in calcareous regions, various provinces, rarely Coastal Plain, Fla. to Tex., Ia., Mich., and Vt.—Spr.—early sum.

XIX. *GRANULARES* Bailey. Culm central, slender, leafy. Leaf-blades flat. Basal sheaths brownish. Terminal spike staminate, linear. Lateral spikes 2–4, pistillate, closely many-flowered, in several ranks, erect on more or less strongly exserted peduncles. Bracts sheathing, not colored or dark-auricled, the blades leaf-like. Scales ovate, pointed, slightly ferruginous. Perigynium ascending, elliptic to ovoid, membranous, glabrous, with many elevated nerves, suborbicular in cross-section, loosely enveloping the achene, rounded at the base, short tapering and minutely beaked, the orifice entire or sub-emarginate. Achene triangular, strongly apiculate, jointed with the slender style. Stigmas 3, short.

72. *C. granularis* Muhl. Culm 2–9 dm. tall, smooth: leaf-blades 3–9 mm. wide: staminate spike 1–2.5 cm. long: pistillate spikes 2–5, distant or upper two contiguous, 0.5–3 cm. long, 5–6 mm. wide, closely 10–50-flowered: scales exceeded by the perigynia, ovate-lanceolate, acuminate or cuspidate: perigynium turgid, broadly ovoid or obovoid, suborbicular in cross-section, 2.5–4 mm. long, 2–2.5 mm. thick, abruptly contracted into the short beak.—Moist meadows, in calcareous regions, various provinces, Ga. to La., Minn., and Vt.—Spr.—early sum.

73. *C. Crawei* Dewey. Culms in small clumps, 1–3 dm. tall, smooth or nearly so: leaf-blades 1.5–3 mm. wide, thick, spreading, channeled: staminate spike 1–3 cm. long: pistillate spikes 2–4, widely separate, 1–3 cm. long, 5–6 mm. wide, closely 10–45-flowered: scales about half the length of the perigynia, ovate, acuminate or cuspidate: perigynium turgid, ascending, ovoid, suborbicular in cross-section, 3–3.5 mm. long, 1.25–2 mm. thick, abruptly contracted into the minute beak: achene straight-tipped.—Moist rocky ledges in calcareous regions, various provinces N of Coastal Plain, Tenn. to Kans., Wyo., Alb., Que., Cape Breton Id., and N N. J.—Spr.—early sum.

74. *C. microdonta* Torr. & Hook. Culms in small clumps, 1.5–6 dm. tall, smooth or nearly so: leaf-blades 3–6 mm. wide, flat, spreading: staminate spike 2–4 cm. long: pistillate spikes usually 3, widely separate, 1–3.5 cm. long, 5–7 mm. thick, closely 10–45-flowered: scales shorter than the perigynia, ovate, acuminate or cuspidate: perigynium turgid, ascending, ovoid, suborbicular in cross-section, 3–4.5 mm. long, ribbed, moderately beaked, the orifice emarginate: achene with bent tip.—Wet prairies, in calcareous regions, Coastal Plain and Central Lowland, Miss. to Tex. and Okla.—Spr.

XX. *GRISEAE* Bailey. Culm slender, leafy. Leaf-blades flat. Basal sheaths brownish or purplish. Terminal spike staminate, linear. Lateral spikes 2–4, pistillate, many-flowered in several ranks, erect, on more or less strongly exserted peduncles. Bracts sheathing, not colored or dark-auricled,

the blades leaf-like. Scales ovate, pointed. Perigynium ascending, oblong, glabrous, membranous or subcoriaceous, finely many-striate, rounded at both ends, suborbicular in cross-section, beakless or nearly so, the orifice entire or emarginate. Achene triangular, apiculate, jointed with the style. Stigmas 3.

75. *C. conoidea* Schk. Culm 1-7 dm. tall, roughened: leaf-blades 2-4 mm. wide: staminate spike 1-2 cm. long, usually long-peduncled: pistillate spikes 1-3, distant, erect, peduncled, oblong, 0.5-2.5 cm. long, 4-5 mm. thick, rather closely 8-25-flowered: scales ovate, acuminate or rough-awned: perigynium oval, 3 mm. long, 1.5 mm. thick, suborbicular in cross-section.—Meadows, mostly in neutral soils, occasionally in other types, Blue Ridge, N. C., and various provinces, Va. to Ia., Wis., and Newf.—Spr.—early sum.

76. *C. amphibola* Steud. Culm 2-6 dm. tall, smooth or slightly roughened above: staminate spike usually peduncled: pistillate spikes 2-4, erect, 1-2.5 cm. long, 2.5-4 mm. thick, loosely 4-12-flowered, widely separated, the lower often nearly basal and on long filiform peduncles: scales ovate, awned: perigynium firm, 3.5-4.5 mm. long, 2 mm. thick, pointed, but beakless.—Dry open woodlands, in neutral soils, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and W N. J.—Spr.—early sum.

77. *C. grisea* Wahl. Culm 2-8 dm. tall, stoutish, slightly roughened above: staminate spike sessile or very short peduncled: pistillate spikes 3-5, 7-25 mm. long, 4-7 mm. thick, closely 4-15-flowered, widely separated, but the lower not nearly basal, the lower at least long-peduncled: scales ovate, cuspidate or awned: perigynium about 5 mm. long, 2 mm. thick, tapering at apex, beakless.—Rich woods and thickets, in calcareous or neutral soils, various provinces, Ga. to Tex., Minn., and Me.—Spr.—early sum.

78. *C. glaucoidea* Tuckerm. Culm 1-6 dm. tall, smooth: leaf-blades 3-10 mm. wide, often rather rigid, the basal usually shorter than the culm: staminate spike 10-25 mm. long, sessile to strongly peduncled: pistillate spikes 3-5, 1-4 cm. long, 5 mm. thick, erect, widely separate, the lower slender-peduncled: scales ovate, acute to awned: perigynium oblong-elliptic, 1.5-1.75 mm. thick, beakless.—Fields and meadows, in clayey places, various provinces, N. C. to Ark., Ill., and Ont.—Spr.—early sum.

79. *C. flaccosperma* Dewey. Strongly resembling *C. glaucoidea*, but rather less glaucous: culm 1.5-6 dm. tall, smooth: leaf-blades 4-18 mm. wide, thin, not rigid, the basal rather shorter than the culm: staminate spike 10-25 mm. long, sessile to strongly peduncled: pistillate spikes 2-5, 1-3.5 cm. long, 4.5-6 mm. thick, erect, widely separated, the lower slender-peduncled: scales ovate, acute to awned, often reddish-brown-tinged: perigynium ovoid-elliptic, 2-2.25 mm. thick, beakless.—Moist clayey places in fields and meadows, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. C.—Spr.—early sum.

XXI. GRACILLIMAE Carey. Culm slender, leafy. Leaf blades flat. Terminal spike gynaeceandrous or sometimes staminate. Lateral spikes 2-4, elon-

gate, linear or cylindric, the lower at least slender-peduncled and drooping. Lower bract at least usually strongly green-sheathing, rarely sheathless, the blades leaf-like. Perigynium oblong or ovoid, membranaceous, little or not at all inflated, 2-keeled and otherwise nerveless, or strongly several-nerved, beakless or short-beaked, the orifice truncate or emarginate. Achene triangular, apiculate, jointed with the style. Stigmas 3, short.

80. *C. prasina* Wahl. Culm 3–8 dm. tall, erect, slender, slightly roughened above: leaf-blades 2.5–5 mm. wide: terminal spike strongly peduncled, sometimes partly pistillate: pistillate spikes 2–4, narrowly cylindric, 2–6 cm. long, about 4 mm. thick, densely many-flowered, attenuate at base, separated, the lower at least nodding on long peduncles: scales ovate, acute to short awned: perigynium light-green, sharply triangular, 3–4 mm. long, 1.5 mm. thick, nerveless or nearly so.—(DROOPING-SEDGE.)—Springy banks of shaded streamlets, neutral soils, various provinces, rarely Coastal Plain, Ga. to Ky., Mich., Que., and Me.—Spr.—early sum.

81. *C. oxylepis* Torr. & Hook. Culm 2.5–8 dm. tall, erect, slender: terminal spike gynaeandrous, 1.5–3.5 cm. long, peduncled: pistillate spikes 2–3, somewhat remote, the lower usually more or less drooping, 1.5–4.5 cm. long, 3–4 mm. wide, closely (except at base) 15–40-flowered: perigynium elliptic-lanceolate, obscurely triangular, scarcely inflated, strongly several-nerved, rounded at apex and abruptly minutely beaked, the orifice emarginate. [*C. gracillima* (Fl. SE. U. S.) not Schw.]—Rich woods, Coastal Plain and occasionally adj. provinces, Fla. to Tex., SE Mo., Tenn., and Va.—Spr.

82. *C. Davisii* Schw. & Torr. Culm 3–9 dm. tall, erect: leaf-blades often pubescent: terminal spike gynaeandrous, 1.5–3.5 cm. long, peduncled: pistillate spikes 2 or 3, somewhat remote, the lower usually more or less drooping, 2–4 cm. long, 3–6 mm. wide, closely 10–40-flowered: perigynium oblong-ovoid, obscurely triangular, somewhat inflated, strongly several-nerved, rounded at apex and abruptly minutely beaked, the orifice bidentate.—Rich alluvial woodlands in calcareous regions, various provinces, rarely Coastal Plain, Tenn. to Tex., Minn., Que., and Vt.—Spr.—early sum.

83. *C. aestivalis* M. A. Curtis. Culm 3–6 dm. tall, erect, slender, roughened above, reddish at the base: leaf-blades 1.5–2.5 mm. wide, sometimes slightly pubescent, the lower sheaths short-pubescent: terminal spike gynaeandrous, the upper half pistillate, rather closely flowered: pistillate spikes usually 3, approximate or somewhat remote, 2–4 cm. long, 2–3 mm. thick, erect, nearly sessile to long-peduncled, loosely flowered: scales half the length of the perigynia, obtusish to cuspidate: perigynium lanceolate-elliptic, rather sharply triangular, smooth, 2.5–3 mm. long, the sides 1 mm. wide, tapering at both ends, not beaked.—Mt. woods, in acid soils, Blue Ridge and more northern provinces, Ga. to N. Y., N. H., and Mass.—Sum.

84. *C. misera* Buckley. Culm 2.5–4.5 dm. tall, minutely pubescent, strongly reddish-purple at base: leaf-blades 1–1.5 mm. wide, sparsely pubescent: ter-

minal spike staminate, 1-2 cm. long, peduncled: pistillate spikes 2 or 3, strongly separate, the lower long-peduncled, 12-35 mm. long, 3 mm. wide, with 10-25 appressed-ascending perigynia: scales oblong-ovate, about half length of perigynia, mostly obtuse, brownish-red-tinged: perigynium oblong-lanceolate, 4-4.5 mm. long, 1.25 mm. wide, obscurely triangular, lightly fawn-nerved, sparsely pubescent above, tapering at base and apex, the orifice entire: achene narrowly oblong-obovoid. [*C. juncea* (Fl. SE. U. S.) not Willd.]—Mt. summits, in acid soils, Blue Ridge, N. C.—Sum.

XXII. SYLVATICAE Boott. Culm aphyllopodie, strongly purplish tinged at the base, tufted, slender, leafy. Leaf-blades flat. Terminal spike normally staminate. Lateral spikes 2-5, elongate, narrowly linear, slender-peduncled, the lower drooping. Bracts green-sheathing, the blades leaf-like. Perigynium appressed or ascending, lanceolate to ovoid, membranous, obsoletely nerved, rather closely enveloping the achene, tapering to a well-developed conic beak, obliquely cut at orifice and strongly hyaline-tipped, at length bidentate. Achene triangular, apiculate, jointed with the slender style. Stigmas 3.

85. *C. oblita* Steud. Culm 2.5-6.5 dm. tall, slender, little roughened above: leaf-blades 2-6 mm. wide: staminate spike slender-peduncled, 1.5-4 cm. long: pistillate spikes 2 or 3, the lower distant, linear, 1-5 cm. long, 3-5 mm. wide, rather loosely flowered, the lower at least nodding, the peduncles long, slender, rough: scales ovate-lanceolate, less than half the length of the perigynia, acute or obtuse: perigynium 5-7 mm. long, 2-2.25 mm. wide, oblong-oblancoate, obscurely triangular, prominently about 10-ribbed, tapering at both ends, minutely beaked, the orifice shallowly bidentate.—Moist sandy acid woods and thickets, Coastal Plain and occasionally adj. provinces, Ala. to La., N. Y., and N. J.—Late spr.—sum.

86. *C. venusta* Dewey. Culm 3-9 dm. tall, slender, little roughened above: leaf-blades 3-8 mm. wide: staminate spike slender-peduncled, 2.5-5 cm. long: pistillate spikes 3 or 4, the lower distant, linear, 3-5 cm. long, 3-5 mm. wide, rather loosely flowered, the lower at least drooping on long, slender, rough peduncles: scales oblong-ovate, less than half length of perigynia, obtuse to acuminate: perigynium 6-7.5 mm. long, 2 mm. wide, oblong-lanceolate, flattened triangular, strongly nerved, tapering at both ends, short beaked, the beak obliquely cut.—Low pine woods, in acid soils, Coastal Plain, Fla. to N. C.—Spr.—early sum.

87. *C. allegheniensis* Mackenzie. Culm 2.5-6 dm. tall, slender, slightly roughened above: sterile shoots aphyllopodie: leaf-blades 2-3 mm. wide, light-green; staminate spike peduncled, 1.5-3 cm. long: pistillate spikes 2-4, narrowly linear, 2.5-5 cm. long, 3-4 mm. wide, drooping or weakly erect on slender peduncles, the lower distant: scales oblong-obovate, sharply keeled, the mid-vein prominent to tip, cuspidate or awned, much shorter than the perigynia: perigynium 5-7 mm. long, strongly nerved, with slender unequally cleft sharply bidentate beak.—Dry woodlands, in acid soils, Blue Ridge and adj. provinces, Ga. to Tenn., Pa., and Md.—Spr.—early sum.

88. *C. debilis* Michx. Culm 2.5–12 dm. tall, slender, slightly rough above: sterile shoots aphyllopodic: leaf-blades 2–4 mm. wide, light-green: staminate spike peduncled, 1.5–5 cm. long: pistillate spikes 2–4, the lower distant, linear, 2.5–6 cm. long, 3–4 mm. wide, the lower at least on long slender rough peduncles: scales ovate,  $\frac{1}{3}$  to  $\frac{1}{2}$  length of perigynia, closely appressed, very membranaceous, obtuse: perigynium subulate-lanceolate, flattened triangular, 1.5 mm. wide, glabrous or rarely puberulent, sessile, the beak 1.5–2 mm. long: achene strongly stipitate.—Dry woods and copses, in acid or neutral soils, Coastal Plain and adj. provinces, Fla. to Tex., Ind., N. J., and Long Id., N. Y.—Spr.

89. *C. flexuosa* Muhl. Culm 2–10 dm. tall, slender, roughened above: sterile shoots phyllopic: leaf-blades 2–4 mm. wide: staminate spike peduncled, 1.5–5 cm. long: pistillate spikes 2–4, the lower distant, linear or elongated linear, 2–8 cm. long, 3–4 mm. wide, the lower at least on long slender rough peduncles: scales ovate or oblong, firm, half the length of the perigynia, usually obtuse, the tips not appressed: perigynium lanceolate or ovoid-lanceolate, triangular, slightly flattened, nearly 2 mm. wide, glabrous, sessile, the beak 1 mm. long: achene stipitate. [*C. tenuis* Rudge.]—Dry woods and copses in acid or neutral soils, Blue Ridge and more northern provinces, N. C. to Wis. and Newf.—Spr.—early sum.—In our area only in the mountains.

XXIII. LONGIROSTRES Kükenth. Culm phyllopic, tufted, leafy towards the base. Leaf-blades flat. Terminal spike staminate. Lateral spikes 2–5, linear-oblong or oblong-cylindric, peduncled, many-flowered in several rows. Bracts green-sheathing, the blades developed. Perigynium appressed to spreading, membranous, globose-triangular, somewhat inflated, prominently beaked, the apex bidentate, the teeth weak, scarious. Achene triangular, apiculate, the apiculation very abruptly bent, jointed with the slender style. Stigmas 3.

90. *C. cherokeeensis* Schw. Rootstock stout: culm 3–6 dm. tall, stout, smooth: leaf-blades thick, 3–7 mm. wide, strongly striate: staminate spike 2.5–6 cm. long, peduncled, usually with 1–2 smaller ones at base: pistillate spikes 3–6, widely separate, the lower at least on long peduncles, oblong-cylindric, 1.5–4.5 cm. long, 6–9 mm. thick, closely 10–50-flowered: scales somewhat shorter than the perigynia, lanceolate, acuminate: perigynium ovoid, obtusely triangular, 5–6 mm. long, 2.5 mm. wide, contracted into a beak  $\frac{1}{4}$  the length of the body, scarious and oblique at apex.—Wet woodlands and swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex., SE Mo., and Ga.—Spr.—The basal leaf-sheaths are often chestnut-colored.

XXIV. VIRESCENTES Kunth. Culms largely aphyllopodic, tufted, leafy towards the base. Leaves with at least the sheaths pubescent. Terminal spike gynaeandrous or staminate. Lateral spikes pistillate, closely many-flowered in several rows. Bracts sheathless or nearly so, at least the lower

leaflike. Scales cuspidate. Perigynium green, round-triangular in cross-section, membranous, from little to rather strongly inflated, several-nerved or ribbed, glabrous or hairy, rounded or pointed at apex, the orifice entire or nearly so. Achene triangular, apiculate, jointed with the short thick style. Stigmas 3.

91. *C. Swanii* (Fernald) Mackenzie. Culm 1.5–6 dm. tall, erect, reddened at base, rough above: leaf-blades 1.5–2.5 mm. wide, the uppermost normally about 3 cm. below the spikes: spikes 2–5, very short-peduncled, erect or nearly so, oblong-cylindric, densely many-flowered, 5–20 mm. long, 3–5 mm. thick: lowest bract twice exceeding spikes: scales slightly shorter than the perigynia, the lower cuspidate: perigynium obovoid, triangular, 2–2.25 mm. long, few-nerved, beakless, the orifice entire. [*C. virescens* (Fl. SE. U. S.) not Muhl.]—Dry woods and thickets, in acid or neutral soils, various provinces, N. C. to Ark., Wis., and N. S.—Sum.

92. *C. virescens* Muhl. Culm 4–10 dm. tall, erect, slender, strongly reddened at base: leaf-blades 2–4 mm. wide, the uppermost usually 2–3 dm. below the spikes: spikes 2–5, the lower at least strongly peduncled, erect or spreading, linear-cylindric, many-flowered, 1–4 cm. long, 2.5–4 mm. thick: lowest bract somewhat exceeding spikes: scales shorter than the perigynia, acuminate or cuspidate: perigynium oblong-elliptic to obovoid, triangular, 2–2.5 mm. long, narrowed at each end, several ribbed, tapering at apex but beakless, the orifice entire. [*C. costellata* Britton.]—Dry wooded slopes, in acid soils, various provinces N of Coastal Plain, Ga. to Ky., Ind., and Me.—Sum.

93. *C. complanata* Torr. Culm 2–6 dm. tall, erect, rather stiff, roughish above, strongly reddened at base: leaf-blades 1.5–3 mm. wide, stiff, spreading, glabrous or very nearly so, the sheaths pubescent: spikes 2–5, sessile or nearly so, approximate, oblong, densely-flowered, the lateral 6–15 mm. long, 5–7 mm. thick: scales cuspidate, mostly shorter than the perigynia, scarious margined: perigynium obovoid, flattened, brownish-green, appressed or ascending, glabrous, 2 mm. long, more or less nerved dorsally, rounded at apex and beakless: anthers reddish. [*C. triceps* Michx.]—Dry pine woodlands, in acid soils, Coastal Plain and rarely adj. provinces, Fla. to Tex. and S N. J.—Spr.—early sum.

94. *C. hirsutella* Mackenzie. Culm 2–9 dm. tall, erect, slender, roughish above, strongly reddened at base: leaf-blades 1.5–4 mm. wide, flaccid, softly pubescent as are the sheaths: spikes 2–5, sessile or nearly so, approximate, oblong or oblong-cylindric, densely-flowered, the lateral 6–18 mm. long, 5–7 mm. thick: scales obtuse to short cuspidate, mostly shorter than the perigynia, scarious margined: perigynium obovoid, flattened, greenish, appressed or ascending, glabrous, 2–2.25 mm. long, strongly several-nerved dorsally, rounded at apex and beakless: anthers yellowish. [*C. hirsuta* Muhl.]—Fields and dry open woods in calcareous or neutral soils, various provinces, Ala. and Miss. to Mo., Mich., and Me.—Spr.—early sum.

95. *C. caroliniana* Schw. Culm 2.5–8 dm. tall, slender, erect, roughish above, strongly reddened at base: leaf-blades 1.5–3 mm. wide, glabrous, the sheaths pubescent: spikes 2–4, sessile or nearly so, oblong, 8–18 mm. long, 4 mm. thick, densely flowered, approximate: scales ovate, mucronate: perigynium pointed at apex, the orifice entire or emarginate: achene bent at summit or tipped with bent style. [*C. Smithii* Porter.]—Meadows in non-calcareous districts, various provinces, N. C. to Tex., Ind., and N. J.—Spr.—early sum.

96. *C. Bushii* Mackenzie. Culm 3–9 dm. tall, slender, erect, reddish at base: leaf-blades 1.5–3 mm. wide, short-pubescent especially below, as are the sheaths: spikes 2–3, sessile or nearly so, oblong or oblong-cylindric, 5–20 mm. long, 5–8 mm. thick, densely many-flowered, approximate: scales triangular-lanceolate, usually strongly exceeding perigynia: perigynium 2.5–3.5 mm. long, 1.5–2 mm. thick, tapering to the blunt or slightly constricted apex, the orifice entire or emarginate: style bent.—Dry open woodlands, barrens, and fields in calcareous districts, Coastal Plain and occasionally adj. provinces, Miss. to Tex., Ind., N. Y., and Mass.—Spr.—sum.

XXV. ANOMALAE Carey. Culm stout, leafy. Leaf-blades broad, flat, glabrous, not septate-nodulose. Terminal spike staminate, linear. Lateral spikes pistillate, linear-cylindric, scattered, closely many-flowered in several rows. Bracts leaf-like, sheathless. Perigynium ascending or in age spreading, obovoid, small, 2.5–4 mm. long, olive-green, nerved, tapering at the base, triangular, slightly inflated, abruptly beaked, the beak conic, shallowly bidentate. Achene triangular, subapiculate, the style short, thickish, jointed with achene. Stigmas 3.

97. *C. scabrata* Schw. Long stoloniferous: culm 2.5–9 dm. tall, very rough above: leaf-blades 5–18 mm. wide, elongate, very rough on upper surface: staminate spike peduncled, 1.5–4 cm. long: pistillate spikes 3–8, densely many-flowered, narrowly oblong, 1.2–6 cm. long, 5–8 mm. thick, the upper erect, the lower distant and long peduncled: scales lanceolate, exceeded by perigynia, acute to cuspidate: perigynium brownish-green, 2.5–4 mm. long, the body obovoid, 1.5–2 mm. wide, strongly nerved, papillose, abruptly long-beaked, the orifice obliquely cut and hyaline.—Springy banks in woods, in the less calcareous districts, but not in strongly acid districts, various provinces N of Coastal Plain, S. C. to Tenn., Mich., and P. E. Id.—Late spr.—sum.

XXVI. ATRATAE Kunth. Culm leafy below. Terminal spike staminate or gynaeandrous, the lateral 1–10, normally pistillate, from sessile, erect, and closely approximate, to long-peduncled, nodding, and distant. Bracts sheathless or nearly so, dark-colored at the base, the blades short. Scales dark-tinged. Perigynium membranaceous, straw-colored, often dark-tinged, elliptic

to broadly obovoid, circular in cross-section to much-flattened, papillose to puncticulate, glabrous, abruptly short-beaked or beakless, the orifice entire or bidentate. Achene triangular, the style slender, straight, often exserted, its base not enlarged. Stigmas 3.

98. *C. Barrattii* Schw. & Torr. Culm 3-9 dm. tall, slender, smooth, aphyllopodic and strongly filamentose at base: leaf-blades 2-4 mm. wide, pale- or glaucous-green: staminate spike 3-5 cm. long, long-peduncled (often with 1-2 smaller ones at base): pistillate spikes 2-4, linear-cylindric, 1-5 cm. long, 4.5-6 mm. thick, closely many-flowered: scales ovate, brownish-purple: perigynium 2.5-3 mm. long, ovoid or oval, faintly few-nerved, obscurely triangular, abruptly minutely beaked. [*C. littoralis* Schw.]

—Very acid swamps and bogs, Coastal Plain and occasionally adj. provinces, N. C. to Pa. and Conn.—Spr.

99. *C. Buxbaumii* Wahl. Culm 2.5-10 dm. tall, slender, rough above, aphyllopodic and strongly filamentose at base: leaf-blades 1.5-4 mm. wide, glaucous-green: spikes 2-7, oblong, 1-4 cm. long, 8-12 mm. thick, approximate or lowest distant, the terminal rarely entirely staminate: scales black or dark-brown with green midvein: perigynium very light-green, elliptic or obovate, triangular biconvex, 2.5-4 mm. long, faintly nerved, nearly beakless, the orifice minutely 2-toothed. [*C. fusca* (Fl. SE. U. S.) not All.]—Open swamps in calcareous districts, various provinces, Ga. to Ark., Colo., Calif., B. C., and Greenl.—(*Eurasia*).—Spring.—early sum.

XXVII. *SHORTIANAE* Bailey. Culm leafy. Leaves glabrous, the blades flat. Spikes 4-5, the terminal gynaeceandrous, the lateral pistillate with a few staminate basal flowers, erect, cylindric, more or less peduncled, closely many-flowered. Bracts sheathless, the lower leaf-like. Pistillate scales 3-nerved, mucronate. Perigynium orbicular-obovate, compressed-triangular, membranous, corrugated, nerveless, margined, short-stipitate, abruptly short-beaked, the orifice nearly entire. Achene triangular, jointed with the short deciduous style. Stigmas 3, short.

100. *C. Shortiana* Dewey. Rootstock short, thick: culm 3-9 dm. tall, rough above: leaf-blades elongate, 4-8 mm. wide: spikes 3-7, gynaeceandrous, linear-cylindric, densely many-flowered, 1-3.5 cm. long, 4-5 mm. thick, erect, the lower distant and long-peduncled: scales about equalling perigynia, sharp-pointed: perigynium orbicular or obovate, flattened, 2-edged, 2.5-3 mm. long, 2 mm.

wide, slightly wrinkled, nerveless but ridged at apex, abruptly minutely beaked, the orifice entire or nearly so.—Moist meadows and thickets in calcareous dis-

tricts, various provinces, rarely Coastal Plain, Tenn. to Okla., Ia., and Pa.—Spr.-early sum.

XXVIII. PENDULINAE Fries. Phyllopodic. Culm leafy below. Spikes two to seven, the upper 1-3 staminate, linear, the lower 2-4 pistillate, linear or oblong-cylindric, closely very many-flowered, the lower at least long-peduncled and often more or less drooping: lowest bract from nearly equalling to exceeding the inflorescence, sub-sheathing. Scales sharp-pointed to long-awned. Perigynium coriaceous to submembranaceous, firm, appressed-hispidulous to granular, nerveless, except for the two marginal nerves, to strongly ribbed, scarcely inflated, minutely or short-beaked, the orifice entire to shallowly bidentate. Achene rather closely enveloped, triangular, apiculate, jointed with the style. Stigmas 3, slender.

101. *C. Joorii* Bailey. Rootstock stout: culm strongly phyllopodic, 4-10 dm. tall, stout, much roughened above: leaf-blades 3-10 mm. long, glaucous-green: staminate spike long-peduncled: pistillate spikes 3-5, cylindric, densely 15-50-flowered, 1.5-6 cm. long, 7-10 mm. thick, little separated, erect, sessile or peduncled: scales abruptly awned, reddish-brown-tinged: perigynium broadly obovoid, 4 mm. long, 3-3.5 mm. thick, abruptly beaked, the beak  $\frac{1}{4}$  the length of body, the orifice entire.—Cypress swamps, in humus-rich and sometimes acid soils, Coastal Plain, Fla. to Tex., Mo., and S. C.—Sum.

102. *C. verrucosa* Muhl. Culm 6-12 dm. tall, not filamentose at base, rather slender above, smooth: leaf-blades somewhat glaucous, 4-10 mm. wide: staminate spike 3-6 cm. long, usually solitary: pistillate spikes 3-6, cylindric, strongly separate, densely many-flowered, 2.5-8 cm. long, 7-10 mm. thick, sessile or short-peduncled: perigynium broadly obovoid, 3-angled, 3-4.5 mm. long, 2.5 mm. thick, very short-beaked, the orifice entire. [*C. macrokolea* Steud.]—Pineland swamps, in acid soils, Coastal Plain, Fla. to La. and S. C.—Early spr.-late sum.

103. *C. glaucescens* Ell. Culm 5-12 dm. tall, strongly filamentose at base, somewhat roughened above: leaf-blades glaucous, 3-5 mm. wide: staminate spike 2.5-6 cm. long, peduncled: pistillate spikes 3-4, cylindric, strongly separate, densely many-flowered, 2.5-5 cm. long, 7-10 mm. thick, slender-peduncled: perigynium ovoid or obovoid, 3-angled, 3-3.5 mm. long, 2-2.25 mm. thick, very short-beaked, the orifice entire.—Pineland swamps, in acid soils, Coastal Plain, Fla. to La. and Va.—Sum.

XXIX. ACUTAE Fries. Culm leafy below, aphyllopodic or phyllopodic. Terminal 1-several spikes staminate (rarely gynaeandrous), linear, the remaining pistillate, linear to cylindric or oblong, closely many-flowered, sessile or peduncled. Bracts sheathless (rarely short-sheathing), leafy or squamiform, biauriculate and often darkened at the base. Perigynium membranaceous to

coriaceous, plano- or bi-convex, or turgid, elliptic to obovate, punctulate, margined, beakless or abruptly minutely beaked, the orifice entire to deeply bidentate. Achene normally lenticular. Style slender, straight, sometimes exserted, its base not enlarged. Stigmas normally 2.

104. *C. torta* Boott. Culm 2.5-9 dm. tall: leaf-blades 3-4 mm. wide, light-green, the lower sheaths not filamentose: staminate spike usually one, peduncled: pistillate spikes 3-6, 2-7.5 cm. long, 2.5-4.5 mm. thick, linear, closely many-flowered, sometimes loosely so at base, erect to drooping, the lower slender-peduncled: scales ovate-oblong, shorter than perigynia, obtuse or acutish: perigynium oblong-ovate, light-green, nerveless, 2.5-3 mm.

long.—Rocky banks of swift-flowing streams, various provinces, though rarely Coastal Plain, N. C. to S Mo., Minn., Que., and N. S.—Spr.-early sum.—Our only species habitually growing among the boulders in or on the very edges of torrents.

105. *C. strictior* Dewey. Growing in beds, long-stoloniferous: culm 3.5-9 dm. tall, slender, purplish-tinged at base: leaf-blades 2.5-3.5 mm. wide, light- or glaucous-green, flat to the base, the margins very rough: lower sheaths filamentose, rounded and hispidulous dorsally: staminate spike strongly peduncled, 2-3 cm. long: pistillate spikes usually 3, sessile to long-peduncled, approximate or lower distant, 1.5-6 cm. long, 4-5 mm. wide, closely many-flowered: lowest bract little shorter than inflorescence: scales purplish-black-tinged: perigynium ovate, plano-convex, 2-edged, punctulate, granular, green, 2.25-2.75 mm. long, 1.5 mm. wide, obscurely nerved dorsally, very minutely beaked. [*C. stricta* (Fl. SE. U. S.) not Lam.]—Swampy meadows, without marked soil preferences, Blue Ridge and more northern provinces, N. C. to Tenn., Ia., Wis., Que., and N. S.—Spr.-early sum.—Does not have the troublesome characteristics of the next following species.

106. *C. stricta* Lam. Growing in large very dense tussocks: culm 3-8 dm. tall, slender to base, brownish or light-purplish-brown at the base: leaf-blades 1.5-3 mm. wide, deep-green, channeled and keeled towards the base, the margins very rough: lower sheaths filamentose, subcarinate and smooth or nearly so dorsally: principal staminate spike 2-4 cm. long: pistillate spikes 2 or 3, sessile or short-peduncled, approximate or the lower distant, 2-6 cm. long, 3-5 mm. wide, closely many-flowered: lower bract usually much shorter than the inflorescence: scales reddish-brown-tinged: perigynium ovate, plano-convex, 2-edged, punctulate, granular, dark-green, 2.25-2.75 mm. long, 1.5 mm. wide, obscurely nerved dorsally, beakless or nearly so.—Swampy meadows or woods, in acid soils, various provinces, N. C. to Mich. and N. H., mostly east of the mtns. Spr.-early sum.—Our most troublesome species. Its large, very dense, and tough tussocks cover great areas in the lowlands to the practical exclusion of other vegetation. The water stands in small pools between the tussocks, and cannot readily be drained off, while the tussocks themselves cannot be broken up except at prohibitive cost, so that lands where it occurs in quantity are practically valueless. The leaves are very rough margined, and are avoided by stock; they are sometimes used to make mats.

XXX. *CRYPTOCARPAE* Tuckerm. Stoloniferous. Culm aphyllopodic or phyllopodic. Terminal one or two spikes staminate, linear, the others pistillate, linear or oblong, closely many- or very many-flowered, the lower or all peduncled, and erect or very often pendulous. Bracts sheathless, the upper at least biauriculate at base. Scales 3-nerved, usually cuspidate or aristate, but in some species obtuse. Perigynium coriaceous or membranaceous, plano- or bi-convex or turgid, elliptic to obovate, punctulate, margined, abruptly minutely beaked or beakless, the orifice entire or nearly so. Achenes lenticular, usually constricted in the middle. Style straight, slender, jointed with achene, at length deciduous. Stigmas 2.

107. *C. gynandra* Schw. Culm 4–10 dm. tall, reddened and filamentose at base, roughened above: leaf-blades 3–12 mm. wide: staminate spikes 1–3, 2–6 cm. long: pistillate spikes 2–5, approximate, peduncled, drooping, 2.5–10 cm. long, 8–12 mm. wide: scales with 3-ribbed center, brownish-tinged, ascending: perigynium oblong-obovoid to oval, ascending, compressed, 3–4 mm. long, 1.5–2 mm. thick, 2-edged but otherwise nerveless or nearly so, scarcely inflated, the walls thin but rather firm, abruptly minutely beaked: achene constricted in middle.—Woodland swamps, in acid or neutral soils, various provinces, N. C. to Tenn., Wis., and Newf.—Sum.

108. *C. crinita* Lam. Culm 4–12 dm. tall, reddened and filamentose at base, roughened above; the basal sheaths prominently keeled: leaf-blades 3–10 mm. wide: staminate spikes 1–2, 2–6 cm. long: pistillate spikes 2–6, approximate, drooping or somewhat erect, peduncled, 2.5–10 cm. long, 8–12 mm. wide: scales with 1–3 ribbed center, brownish-tinged, spreading: perigynium inflated, 2–3.5 mm. long, 1.25–2 mm. thick, nerveless or faintly nerved, the walls thin, abruptly minutely beaked.—(TASSEL-SEDGE.)—Swampy places in woodlands, in acid or neutral soils, various provinces, N. C. to Tex., Minn., and N. S.—Sum.

109. *C. Mitchelliana* M. A. Curtis. Cespitose, sending forth horizontal stolons: culm 5–9 dm. tall, smooth or nearly so, dull purplish-brown at the base, the basal sheaths little or not at all filamentose: leaf-blades 2.5–4.5 mm. wide: staminate spike 2.5–4 cm. long: pistillate spikes usually 3, more or less strongly separate, peduncled, drooping, 2–4.5 cm. long, 6–8 mm. wide: scales reddish-brown-tinged, 3-nerved, the lower retuse, strongly rough-awned, much exceeding the perigynia, the upper shorter-awned: perigynium oblong-ovate, flattened-bi-convex, 2.5–3 mm. long, 1.75 mm. wide, normally slenderly few-nerved, strongly papillate, abruptly beaked: achene normally not constricted in the middle.—Swampy woodlands, in acid soils, Coastal Plain, mostly near the coast, Fla. to Mass.—Spr.—early sum.

XXXI. *HIRTAE* Tuckerm. Culm stout, leafy. Rootstock with long stolons. Leaves septate-nodulose. Spikes 3–10, the upper 1–5 staminate, slender, the others pistillate, many-flowered, erect. Bracts leaf-like, equalling or exceeding the culm, often sheathing. Pistillate scales acute or aristate, ovate or lanceolate. Perigynium mostly ascending, coriaceous or subcoriaceous, ovoid or oblong-ovoid, somewhat inflated, nearly orbicular in cross-section,

many-nerved, often hairy, round-tapering at base, tapering into a bidentate beak. Achene triangular, often stipitate, the faces flat or deeply concave, apiculate, jointed with the straight or slightly flexuous slender style. Stigmas 3.

110. *C. turgescens* Torr. Culm 6-9 dm. tall, slender, smooth: leaf-blades 1.5-5 mm. wide, nearly flat: staminate spike slender-peduncled, 3.5-5 cm. long: pistillate spikes 2 or 3, widely separate, short-oblong, 2-3 cm. long, 1.5-2.5 cm. thick, 10-20-flowered, strongly peduncled: bracts conspicuous: scales half length of perigynia or less, ovate, acute to cuspidate: perigynium ovoid-lanceolate, 3-3.5 mm. thick, coarsely many-nerved, yellowish-green, tapering into the smooth or slightly serrulate bidentate beak, 2-3 mm. long.—Wet pinelands, Coastal Plain, Fla. to La. and N. C.—Spr.-sum.

111. *C. Walteriana* Bailey. Culm 2-8 dm. tall, slender, stout, roughish above, reddened and filamentose at base: staminate spikes 1-2, 1.5-5 cm. long: pistillate spikes 1-2, oblong-cylindric, 2-6 cm. long, 5-8 mm. thick, distant, sessile or very short-peduncled, many-flowered: lowest bract prominent: scales ovate, acute to short awned: perigynium ovoid, 4-6 mm. long, 2-2.5 mm. thick, ascending, coriaceous, glabrous or sparsely short-pubescent, many-nerved, the beak  $\frac{1}{3}$  length of the body, the teeth 0.5 mm. long. [*C. striata* Michx. *C. polymorpha* (Fl. SE. U. S.) not Muhl.]—Open pineland swamps, in acid soils, Coastal Plain and New England Coast, Fla. to Mass.—Spr.-early sum.

112. *C. lanuginosa* Michx. Culm 3-10 dm. tall, stoutish, sharply triangular, rough above, reddened and filamentose at base: staminate spikes 1-2: pistillate spikes 1-3, cylindric, 1-5 cm. long, 5-8 mm. thick, usually distant, sessile or the lower slender-peduncled, 25-75-flowered: bracts conspicuous: scales lanceolate, long-acuminate or awned: perigynium broadly ovoid, 2.5-3.5 mm. long, 1.75-2 mm. wide, ascending or spreading, coriaceous, densely soft-hairy, many-nerved, short-beaked, the teeth 0.5 mm. long. [*Carex hirta* (Fl. SE. U. S.) not L.]—Open swamps and wet meadows in calcareous districts, various provinces, N. C. to Tex., S Calif., B. C., and Que.—Sum.

XXXII. PALUDOSAE Fries. Phyllopodic or aphyllpodic. Rootstock with stout stolons. Culm leafy, the leaves often more or less glaucous. Staminate spikes 1-3, linear. Pistillate spikes 2-6, cylindric or oblong, densely many-flowered, erect, peduncled. Bracts sheathless to strongly sheathing, the lower leaf-like. Scales cuspidate or aristate. Perigynium coriaceous, ovoid, suborbicular in cross-section, many-nerved or ribbed, abruptly beaked, the orifice emarginate to deeply bidentate. Achene triangular, continuous with the persistent style. Stigmas 3.

113. *C. hyalinolepis* Steud. Culm 5-10 dm. tall, stout, phyllopodic, smooth or nearly so, neither conspicuously reddened nor filamentose at base: leaf-blades more or less

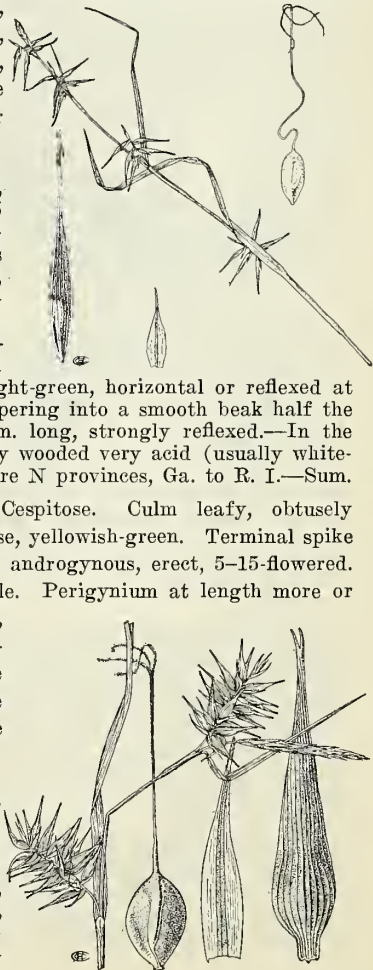

glaucous, the ligule short: staminate spikes 2-4, 1-4 cm. long: pistillate spikes 2-4, cylindric, 1-7.5 cm. long, 10-14 mm. thick, widely separate, short-peduncled, very many-flowered: bracts prominent: scales ovate to lanceolate, acute to awned: perigynium narrowly ovoid, 6 mm. long, 2.5 mm. thick, ascending, coriaceous, glabrous, impressed-nerved, the beak short, the teeth 0.5 mm. long. [*C. riparia* (Fl. SE. U. S.) not Curtis. *C. impressa* (S. H. Wright) Mackenzie]—Open neutral swamps and wet swales, various provinces, Fla. to Tex., Kans., Ont., and S N. J.—Spr.

XXXIII. *COLLINSIAE* Mackenzie. Cespitose. Culm leafy. Leaf-blades flat, septate-nodulose, deep-green. Terminal spike staminate, short, few-flowered. Lateral spikes 3-4, androgynous, erect, the pistillate part loosely 1-8-flowered, the staminate part few-flowered. Bracts strongly sheathing, leaf-like. Scales short, whitish, pointed. Perigynium subulate, widely spreading or reflexed, deep-green, membranaceous, many-nerved, tapering to the long beak, deeply obliquely cut and sharply bidentate, the slender awns abruptly reflexed. Achene linear-obovoid, continuous with the slender flexuous style. Stigmas 3, short.

114. *C. Collinsii* Nutt. Culm 1.5-6 dm. tall, slender, smooth: leaf-blades thin, soft, 2-5 mm. wide: staminate spike short- or long-peduncled, 5-10 mm. long: pistillate spikes 2-4, distant, 1-8-flowered, staminate above, the upper short- and the lower long-peduncled: bracts leaf-like, strongly sheathing: scales lanceolate,  $\frac{1}{3}$  the length of the perigynia, short awned, persistent: perigynium subulate, 8-14 mm. long, 1-2 mm. thick, light-green, horizontal or reflexed at maturity, readily detached, many-nerved, tapering into a smooth beak half the length of body, the teeth slender 1.5-2 mm. long, strongly reflexed.—In the most wet sphagnum in deep shade in densely wooded very acid (usually white-cedar) swamps, Coastal Plain and rarely more N provinces, Ga. to R. I.—Sum.

XXXIV. *FOLLICULATAE* Mackenzie. Cespitose. Culm leafy, obtusely triangular. Leaf-blades flat, septate-nodulose, yellowish-green. Terminal spike staminate. Lateral spikes 3-4, pistillate or androgynous, erect, 5-15-flowered. Bracts long-sheathing. Scales 3-nerved, pale. Perigynium at length more or less spreading, yellowish-green at maturity, many-nerved, subcoriaceous, sparingly inflated, contracted into the long bidentate beak, the teeth scarcely spreading. Achene triangular, obovoid, continuous with the slender flexuous style. Stigmas 3, short.

115. *C. Smalliana* Mackenzie. Culm 4-8 dm. tall, smooth or nearly so, somewhat fibrillose at base: leaf-blades 3.5-12 mm. wide: staminate spike short-peduncled, 2-3 cm. long: pistillate spikes 1-3, widely separate, 1.5-2.5 cm. long, 2-3 cm. wide, 8-20-flowered, the upper short- and the lower long-peduncled: bracts leaf-like: perigynium 10-14 mm. long, deep-green, or at matur-

ity yellowish-green, finely many-nerved, rounded at base, gradually tapering into the beak, the teeth 0.5-1 mm. long. [*C. folliculata australis* Bailey.]—Swamps and wet woods, in acid soils, Coastal Plain, Fla. to Tex. and S. C.—Spr.-early sum.

116. *C. folliculata* L. Culm 3-12 dm. tall, smooth, fibrillose at base: leaf-blades 6-16 mm. wide: staminate spike peduncled, 1-2.5 cm. long: pistillate spikes 2-5, widely separate, 1.5-2.5 cm. long, 1.5-2 cm. wide, 5-20-flowered, the upper short- and the lower long-peduncled: bracts leaf-like: perigynium 10-15 mm. long, yellowish-green, many-nerved, rounded at base, tapering into the rough beak, the teeth 1 mm. long.—Swampy woodlands, in acid soils, various provinces, N. C. and Tenn. to Mich. and Newf.—Late spr.-sum.

XXXV. VESICARIAE Tuckerm. Culm mostly tall and stout, leafy below. Leaves not hairy, septate-nodulose. Spikes 2-10, the upper 1-5 staminate, the others normally pistillate, subglobose to linear-cylindric, generally closely many-flowered, erect, short-peduncled, more or less remote. Bracts leaf-like, much exceeding the inflorescence, normally sheathless. Perigynium ascending, spreading, or even reflexed, membranaceous, smooth, from little to much inflated, suborbicular in cross-section, coarsely many-ribbed or nerveless, contracted into a beak, the beak entire or bidentate. Achene much shorter than the perigynium, triangular or lenticular, continuous with the usually tortuous style. Stigmas 3 or 2.

117. *C. bullata* Schk. Culm 4-10 dm. tall, sharply triangular, rough above, reddish-purple-tinged and filamentose at base: leaf-blades 2-6 mm. wide: staminate spikes 1-3, 2-4 cm. long: pistillate spikes 1-3, widely separate, oblong-cylindric, 2-5 cm. long, 12-15 mm. wide, 20-40-flowered, short-peduncled or sessile: bracts leaf-like: scales ovate,  $\frac{1}{2}$  length of perigynia, acute or obtusish: perigynium broadly ovoid, 5-9 mm. long, 3 mm. thick, firm, yellowish-green, strongly about 10-nerved, abruptly beaked, the beak more or less roughened, the slender teeth 0.5-1 mm. long.—Swampy acid meadows, Coastal Plain and New England Coast, Ga. to Me.—Sum.

118. *C. Elliottii* Schw. & Torr. Culm 2.5-9 dm. tall, slender, somewhat roughened above: leaf-blades 1.5-5 mm. wide, channeled, the basal sheaths purplish: staminate spike slender-peduncled, 2-4 cm. long: pistillate spikes 2-3, the upper approximate, the lower widely separate, suborbicular, 12-18 mm. in diameter, 10-20-flowered: bracts conspicuous: scales less than half length of perigynia, ovate, obtusish or acute: perigynium ovoid, 2.5-3 mm. thick, strongly about 10-nerved, green, tapering into the slightly serrulate or smooth strongly bidentate beak, 1.5-3 mm. long.—Wet pinelands, in acid soils, Coastal Plain, Fla. to Ala. and N. C.—Spr.-early sum.

119. *C. lurida* Wahl. Culm 1.5-10 dm. tall, little roughened above, purplish-red at base: leaf-blades 2-7 mm. wide: staminate spike 1-7 cm. long, short- or long-peduncled: pistillate spikes 1-4, 1-7.5 cm. long, very variable in size, densely many-flowered, varying from sessile (the upper sometimes) to long-peduncled (the lower): perigynium ovoid, 6-9 mm. long, 2.5-3 mm. wide,

spreading-ascending, straw-colored, strongly about 10-nerved, tapering into the long slender smooth or roughish beak, the teeth 0.5–1 mm. long. [*Carex hystrix* (Fl. SE. U. S.) not Muhl.]—Swampy meadows and woods, apparently without any strongly marked soil preferences, various provinces, Fla. to Tex., Minn., and N. S.—(*Mex.*)—Sum.—early fall.

120. *C. Baileyi* Brit. Culm 2–7 dm. tall, slender to base, roughened above, strongly purplish-red at base: leaf-blades 2–4 mm. wide: staminate spike 1.5–3 cm. long, peduncled: pistillate spikes 1–4 cm. long, densely 20–40-flowered, sessile or peduncled: perigynium ovoid, 5–7 mm. long, 2.5 mm. wide, squarrose, straw-colored, strongly about 10-nerved, abruptly contracted into the smooth beak about length of body, the teeth 0.5 mm. long.—Swampy meadows and bogs, Blue Ridge and more northern provinces, Tenn. to Va., Vt., and N. H.—Sum.

XXXVI. PSEUDO-CYPHEREAE Tuckerm. Culm tall, generally stout, acutely angled, leafy below. Leaf-blades flat, septate-nodulose. Spikes 3–9, the upper 1–3 slender, staminate, the others normally pistillate, densely flowered, the upper approximate, the lower remote and strongly peduncled, often nodding. Bracts leaf-like, much exceeding the culm, mostly not sheathing. Pistillate scales aristate. Perigynium spreading or reflexed, membranous or stiff, triangular or circular in cross-section, 3–8 mm. long, closely many-ribbed, greenish-straw-color, smooth, stipitate, contracted into a ridged, slender beak. Achene triangular, continuous with the slender often flexuous style. Stigmas 3, short.

121. *C. comosa* Boott. Cespitose and not stoloniferous, the culm 5–15 dm. tall, stout, light-brownish at base, roughened above: leaf-blades 6–16 mm. wide: staminate spike slender-peduncled, the scales rough-awned: pistillate spikes 1–4, densely many-flowered, 1.5–7.5 cm. long, 12–17 mm. wide, the lower slender-peduncled and at length nodding: scales very rough-awned: perigynium rigid, greenish or brownish-tinged, reflexed when mature, 5–7 mm. long, many-ribbed, the beak smooth, the awns spreading, 1.5–2 mm. long.—(BOTTLE-BRUSH SEDGE.)—Open swamps, in calcareous or neutral soils, various provinces, Fla. to La., Minn., and Que.; also Calif. to Wash. and Ida.—Sum.

122. *C. Schweinitzii* Dewey. Culm solitary from creeping rootstocks, 2.5–7.5 dm. tall, smooth: leaf-blades 5–10 mm. wide, yellow-green: staminate spike solitary, slender peduncled: pistillate spikes 2–5, the upper approximate, narrowly cylindric, 2.5–9 cm. long, 8–14 mm. thick, many-flowered: scales rough-awned: perigynium ovoid, 5–7 mm. long, rather coarsely several-ribbed, smooth beaked.—Swamps and bogs, calcareous districts, various provinces N of Coastal Plain, Tenn. to Mo., N Mich., and Vt.—Sum.—An extremely local species.

XXXVII. SQUARROSAE Carey. Cespitose or stoloniferous. Culm leafy. Leaf-blades flat, septate-nodulose. Terminal spike staminate or gynaeandrous. Lateral spikes 1–5, pistillate or gynaeandrous, ovoid to oblong-cylindric, closely many-flowered. Bracts setaceous or leaf-like, sheathless or sheathing. Perigynium yellowish-green or greenish, obconic and depressed at apex, inflated, several-nerved, membranaceous, very abruptly truncately contracted into a

bidentate beak. Achene triangular, continuous with the flexuous style. Stigmas three, short.

123. *C. Frankii* Kunth. Culm stout, very leafy, 1-8 dm. tall: leaf-blades 3-10 mm. wide: staminate spike peduncled or nearly sessile: pistillate spikes 3-7, cylindric, erect, 1-4 cm. long, 8-12 mm. thick, very densely many-flowered, the lower slender-peduncled: scales linear-subulate, very rough: perigynium squarrose, green, 4-5 mm. long, 2-2.5 mm. thick, obconic, with a depressed summit from which arises the subulate bidentate beak. [*C. stenolepis* Torr.]—Open swamps and wet meadows, in calcareous districts, various provinces, rarely Coastal Plain, Ga. to Tex., Mo., Ill., W N. Y. and S Pa.—Sum.

124. *C. squarrosa* L. Culm 3-9 dm. tall, slender, rough above: leaf-blades elongate, 2-6 mm. wide: spikes 1-3, usually erect, peduncled, exceedingly dense, the pistillate portion 1-3 cm. long, 15-22 mm. thick, the uppermost conspicuously staminate at base: perigynium squarrose or the lower reflexed, obovoid, 4-5 mm. long, 3 mm. thick, yellowish-green, becoming tawny, few-nerved, truncate contracted into the subulate minutely bidentate beak: achene linear-oval, 3 mm. long, flat-sided, tapering into the stout strongly flexuous style.—Swampy woods, in acid soils, various provinces, N. C. to Ark., Nebr., Mich., and Que.—Sum.

125. *C. typhina* Michx. Culm 3-9 dm. tall, rather stoutish, rough above: leaf-blades elongate, 3.5-10 mm. wide: spikes 1-6, usually 3, erect, peduncled, very dense, the pistillate portion 1.2-4.5 cm. long, 8-16 mm. thick, often staminate at both ends: perigynium ascending or the lower spreading or reflexed, obovoid, dull straw-colored, few-nerved, truncate contracted into the slender bidentate beak: achene obovoid, 2.5 mm. long, the sides concave, tipped with the slender style which is straight below. [*C. typhinoides* Schw.]—Rich alluvial woods, in calcareous districts, various provinces, Ga. to La. and Que.—Sum.

XXXVIII. LUPULINAE Tuckerm. Culm stout and leafy. Leaf-blades flat, strongly septate-nodulose. Upper 1-3 spikes staminate, linear. Lateral spikes 1-5, pistillate, or staminate at apex, densely several-many-flowered. Bracts sheathless or lowest more or less sheathing. Perigynium large, 10-20 mm. long, green, ovoid, strongly ribbed or nerved, membranaceous or subcoriaceous, tapering to the deeply bidentate beak. Achene triangular, continuous with the style. Stigmas 3, short.

126. *C. intumescens* Rudge. Cespitose, the culm 3-10 dm. tall, slender, reddish-purple at base: leaf-blades elongate, dull-green: staminate spike usually long-peduncled: pistillate spikes 1-3,

sessile or short-peduncled: perigynium spreading or upper ones erect, 10–17 mm. long, 3.5–8 mm. thick, many-nerved, contracted into the subulate bidentate beak, the teeth nearly erect.—Swampy woods in acid soils, various provinces, Fla. to Tex., Man., and Newf.—Spr.—fall.

127. *C. Asa-Grayi* Bailey. Cespitose, the culm 3–10 dm. tall, rather stout, strongly reddish-purple at base: leaf-blades elongate, light-green: staminate spike usually long-peduncled: pistillate spikes 1–2, sessile or short-peduncled: perigynium spreading, 12–18 mm. long, 6–7 mm. thick, glabrous or hispidulous, many-nerved, contracted into the subulate bidentate beak, the teeth somewhat spreading or erect.—Rich alluvial woods in calcareous districts, various provinces, Ga. to Mo., Mich., and Que.—Sum.

128. *C. louisianica* Bailey. Culm 2–6 dm. tall, slender, smooth or nearly so: staminate spike solitary, long-peduncled: pistillate spikes 1–4, about 2–3.5 cm. long, 1.5–2.5 cm. thick, the lower slender-peduncled: scales ovate or lanceolate, half length of perigynia, sharp-pointed: perigynium ovoid, 10–13 mm. long, 4–6 mm. thick, smooth, strongly-nerved, contracted into the long bidentate beak, the teeth mostly slightly spreading.—Swampy woods, in acid soils, Coastal Plain and rarely adj. provinces, Fla. to Tex., W Mo., Ind. and N. J.—Sum.

129. *C. lupulina* Muhl. Culm 3–12 dm. tall, stout, smooth: staminate spike solitary, nearly sessile to long-peduncled, 2–10 cm. long; pistillate spikes 2–5, 2–8 cm. long, 2–3.5 cm. thick, densely many-flowered: scales lanceolate, much shorter than perigynia; perigynium lanceolate-ovoid, 10–20 mm. long, 4–7 mm. thick, many-nerved, contracted into the subulate bidentate beak, the teeth more or less spreading.—(HOP-SEGE.)—Swamps, various provinces, Fla. to Tex., Ia., Minn., Que., and N. B.—Sum.

130. *C. gigantea* Rudge. Culm 4–10 dm. tall, smooth: leaf-blades 7–16 mm. wide: staminate spikes 1–3, sessile or peduncled: pistillate spikes 2–5, peduncled or the upper sessile, 2–8 cm. long, 2.5–3 cm. thick, densely many-flowered: scales lanceolate,  $\frac{1}{4}$ – $\frac{1}{3}$  length of perigynia, acuminate or awned: perigynium lanceolate, much swollen at base, 12–18 mm. long, 4–6 mm. thick, many-nerved, contracted into the very long subulate beak, the teeth more or less spreading.—Open swamps in acid soils, Coastal Plain and adj. provinces, Fla. to Tex., Mo., Ky., and Del.—Sum.

The following species included in Fl. SE. U. S. have been omitted because no evidence has been found that they occur within our area: *Carex trichocarpa* Muhl., *C. hystriocina* Muhl., *C. vestita* Willd., "*C. filiformis* L." (*C. lasiocarpa* Ehrh.), *C. hirta* L., *C. gracillima* Schw., *C. polymorpha* Muhl., *C. Sartwellii* Dewey, *C. interior* Bailey, *C. hormathodes* Fernald (*C. tenera* authors); and the following have been omitted because found only in territory covered by above mentioned Flora, but not by this: *Carex planostachys* Kunze, *C. filifolia* Nutt., "*C. gravis* Bailey," *C. Brittoniana* Bailey, *C. hyalina* Boott, *C. Bicknellii* Britton.

22. **CYMOPHYLLUS** Mackenzie. Perennial sedge with short rootstocks and culms flattened in drying. Culms with four to six overlapping striate bladeless sheaths and after flowering developing one large blade-bearing leaf without sheath, ligule, or midrib, and with undulate margins appearing minutely serrulate. Spike one, bractless, androgynous, the flowers monoecious,

solitary in the axils of the scales. Perianth none. Staminate flower of three stamens, the filaments filiform. Pistillate flower of a single pistil, with ovary, style, and three or very rarely four stigmas enveloped by a bladder-like perigynium. Achene triangular. Racheola often developed.

1. *C. Fraseri* (Andr.) Mackenzie. Culm smooth, weak, 1.5–4.5 dm. tall: leaf-blade 1.5–6 dm. long, 2.5–5 cm. wide, flat, firm, finely many-ribbed: spikes 1.2–2.5 cm. long, the pistillate portion dense, nearly 1 cm. thick: scales broadly ovate, much shorter than perigynium, obtuse to acute: perigynium elliptic-ovoid, milk-white, 5–6 mm. long, 2.25–2.5 mm. thick, thin, faintly nerved, tipped with a short nearly truncate beak. [*Carex Fraseri* Andre.]—(LILY-LEAF SEDGE.)—Rich woods, Appalachian provinces, S. C. to Tenn., W. Va., and S. Va.—Late spr.–sum.—The phylogenetic position of this plant is very obscure. It has no near relatives.

## ORDER ARECALES — ARECAL ORDER

Shrubs or trees, typically with a single terminal bud, but the stem sometimes branching, the branches erect or diffuse. Leaves aggregated at the end of the stem: blades plaited, pinnate, or flabellate. Flowers perfect, polygamous, or dioecious, on axillary compound spadices. Perianth of 6 fleshy members in 2 series. Androecium of 6, or 9–12 stamens. Gynoecium of 3 distinct or united carpels. Fruit drupaceous or baccate.

## FAMILY 1. ARECACEAE — PALM FAMILY

Stem, and branches, with a crown of leaves. Leaf-blades flabellate or pseudoflabellate and plaited, or pinnate, the segments induplicate or reduplicate, long-petioled. Inflorescence at first included in a large bract (spathe), from which it ultimately protrudes, borne in the crown of leaves or on the stem below it, the usually copious branching of the spadix most evident in fruit. Perianth white, yellowish, or greenish.—About 150 genera and 1,200 species, most abundant in the tropics.

Leaves with pinnate blades, the divisions often separated, sometimes clustered.

I. PINNATAE.

Leaves with simple lobed blades.

Leaf-blades with partial midrib and partly pinnately veined and lobed, thus pinnately flabellate.

II. PINNATIPALMATAE.

Leaf-blades without midrib, palmately veined and lobed, thus flabellate.

III. PALMATAE.

### I. PINNATAE

Carpels 3, united, or sometimes 1 or 2 by abortion: seed short and thick, not grooved on one side: leaf-segment reduplicate.

Leaves with short bases: spadices protruding from the crown of leaves: drupe orange-scarlet or green. Stamens included: drupe 3-angled, with the style, or stigmas, terminal: seed hollow.

Stamens exserted: drupe globular or 2- or 3-lobed, with the style, or stigmas, nearly basal: seed solid.

Leaves with long sheathing bases clothing the upper part of the trunk: spadices borne on the trunk far below the crown of leaves: drupe violet-purple.

Carpels 3, distinct: seed long and narrow, grooved on one side: leaf-segments induplicate.

## II. PINNATIPALMATAE

Plants with subterranean or erect stems: leaf-blades fan-like, but with the midrib running up into the blade.

## III. PALMATAE

Leaves with unarmed sheaths: flowers perfect: petals valvate: style present: drupe glabrous.

Calyx and corolla united into a 6-lobed or truncate perianth, or obsolete.

Drupe with white flesh: endosperm even: spadix elongate in flower and fruit.

Drupe with dark flesh: endosperm ruminate: spadix permanently very short.

Calyx and corolla distinct and manifestly in 2 series.

Anthers elongate: seed elongate.

Anthers didymous: seed depressed.

Leaves with armed sheaths: flowers polygamo-dioecious: petals imbricate: styles wanting: drupe pubescent.

1. *COCOS*.

2. *PSEUDOPHOENIX*.

3. *ROYSTONEA*.

4. *PHOENIX*.

5. *SABAL*.

6. *THRINAX*.

7. *COCCOTHRINAX*.

8. *SERENOA*.

9. *PAUROTIS*.

10. *RHAPIDOPHYLLUM*.

1. *COCOS* L. Unarmed trees, except for some long needle-like structures mostly hidden in the leaf-sheath. Leaves spreading in all directions: blades pinnate. Spadix ultimately drooping, relatively short. Sepals and petals of the staminate flowers valvate, those of the pistillate flowers imbricate, much enlarged and persistent on the fruit. Drupe 3-angled, with a fibrous pericarp and a hard endocarp, the endosperm with a large cavity which contains a fluid.—A single species, the following, now widely distributed in tropical regions.

1. *C. nucifera* L. Stately tree up to 30 m. tall, the trunk often with a conspicuously swollen inclined or decumbent base: leaf-blades 3-7 m. long, the numerous segments 5-10 dm. long: perianth of the staminate flower fully 1 cm. long, that of the pistillate larger: drupe oval or ovoid, 2-3 dm. long, green or brown, sessile: endosperm enclosing a watery juice which later turns milky.—

(COCONUT. COCO-PALM.)—Shores and shore hammocks, pen. Fla. and the Keys. Nat. of the Malayan or Indo-Pacific region.—(*W. I., Mex., C. A., S. A., O. W. trop.*)—The coconut-palm produces flower-stalks at frequent intervals, thus flowers and several generations of fruits are borne on a tree at one time. Approximately nine months are required to mature a coconut. May have been native on the Fla. Keys, but most of the present representatives were planted or are the descendants of planted trees. Now grown commercially in Fla., but only to supply the demand for horticultural purposes.

2. **PSEUDOPHOENIX** H. Wendl. Unarmed trees, the trunk rather smooth and conspicuously banded. Leaves spreading: blades pinnate: petioles concave throughout. Spadix spreading during anthesis, elongate, with stiff-spreading branches. Petals valvate, persistent. Drupe pedicelled, globular or 2- or 3-lobed.—Only the following species known.

1. **P. vinifera** (Mart.) Becc. Tree up to 8 m. tall, the trunk often slightly fusiform: leaf-blades 1–1.5 m. long, the larger segments 4–4.5 dm. long: perianth about 1 cm. wide: petals oblong to oval, yellowish, reflexed in age: drupe globular, or 2- or 3-lobed, 11–14 mm. long, orange-scarlet. [*P. Sargentii* H. Wendl.]—(SARGENT'S-PALM. BUCANEER-

PALM. HOG CABBAGE-PALM. DATELET. DUMMY-DATE.)—Dry hammocks, upper Fla. Keys.—(*W. I.*)—Spr.—Plants slow-growing. Found only on Sand's Key, Elliott's Key, and Long Key, as solitary specimens or few individuals together. The colony of several hundred individuals on Long Key, where this palm was discovered in Fla. nearly a half century ago, has been destroyed by vandals who have removed the trees and sold them as royal-palms.

3. **ROYSTONEA** O. F. Cook. Unarmed trees, the trunk gray, concrete-like, not conspicuously banded. Leaves spreading: blades pinnate: petiole nearly terete above. Spadix drooping, short, with numerous pendulous branches. Petals valvate, deciduous. Drupe sessile, not lobed, short.—About six species, natives of tropical America.

1. **R. regia** (H. B. K.) O. F. Cook. Stately tree up to 40 m. tall, the pale, smooth trunk often fusiform: leaf-blades 2.5–3.5 m. long, the larger segments 7–9 dm. long: perianth of the staminate flowers 6–7 mm. long, that of the pistillate barely  $\frac{1}{2}$  as large: drupe oval or globose-oval, 12–14 mm. long, violet-blue. [*Oreodoxa regia* H. B. K., *R. floridana* O. F. Cook.]—(ROYAL-PALM.)—

Low hammocks, mostly in the Everglades, Cape Sable region and Big Cypress, S pen. Fla.—(*W. I.*)—Spr.—Plants fast-growing. Now confined to limited areas in S Fla., the royal-palm once grew on the St. John's R. near Lake George. Apparently a vanishing type in Fla. The fruits which are borne in great masses were an aboriginal food. Much planted as an ornamental.

4. **PHOENIX** L. Shrubs or trees, the stems rough but unarmed. Leaves in a dense crown, recurved-spreading: petioles short: blades pinnate, the divisions numerous. Spadix erect, or ultimately drooping, arising from the leaf-axils, fastigiately branched. Flowers dioecious, the staminate ones larger than

the pistillate. Calyx cup-like, shallowly 3-lobed, the lobes broad. Petals 3, much longer than the calyx. Stamens mostly 6: anthers narrow. Carpels 3, distinct. Berry terete, with a fleshy pericarp, yellow, orange, brown, or black.—About a dozen species, mostly natives of tropical Asia.

1. *P. dactylifera* L. Stem stout, irregularly roughened by the persistent leaf-blades: leaves numerous, spreading, the lower part of the rachis spiny; divisions stiff, the larger ones about the middle of the rachis, pale green: spadix spreading and drooping, much shorter than the leaves: petals of the staminate flowers ovate, several times longer than the calyx: petals of the pistillate flowers reniform, about twice as long as the calyx: drupe ellipsoid or cylindric, 30–40 mm. long, orange-brown.—(DATE-PALM.)—Hammocks, coastal dunes, and about dwellings, S Fla.—Nat. of N Afr. and Arabia.—Spr.—A food-plant of the first importance, especially in desert countries. Grown as an ornamental.

5. *SABAL* Adans. Unarmed shrubs, with horizontal or contorted rootstocks, or trees. Leaves upright or spreading: blades flabellate, glabrous. Spadix upright in anthesis, or spreading. Stamens equal or nearly so: filaments narrow. Drupe globose, spheroidal, or obovoid, the seed usually depressed.—Spr.—sum.—PALMETTOS. CABBAGE-TREES.—About 18 species, natives of southeastern United States, the West Indies, and continental tropical America.

Leaf-blade flat, the segments not filiferous, the midrib short or only partly developed into the blade, the ligule short and rounded or ovate: spadix erect or ascending, the inflorescence slender and more or less interrupted: anthers ovoid. (Subgenus *EUSABAL*.)

Leaf-blades recurved and with the sides more or less folded along the stout midrib which extends nearly or quite through the blade except in *S. Jamesiana*, the segments filiferous, the ligule lanceolate: spadix spreading or drooping, the inflorescence thick, dense, and continuous: anthers ellipsoid. (Subgenus *INODES*.)

#### I. MINORES.

#### II. PALMETTONES.

##### I. MINORES

Stem (rootstock) subterranean: leaves in a crown arising from the ground: petals ellipsoid.

Stem erect: leaves in a crown terminating a stout trunk: petals suborbicular.

1. *S. minor*.

2. *S. Deeringiana*.

##### II. PALMETTONES

Stem (rootstock) subterranean, short, S-shaped or more or less spiral: drupe subglobose or depressed, mostly over 1.5 cm. in diameter.

Stem erect, up to 20 m. tall or more: drupe subglobose, mostly less than 1 cm. in diameter.

Leaf-blades recurved, often strongly so, with the sides more or less strongly folded along the midrib; the segments stiff, longer than the undivided part of the blade, copiously filiferous.

Leaf-blades straight, flat, the segments limber, shorter than the undivided part of the blade, sparingly filiferous.

3. *S. Etonia*.

4. *S. Palmetto*.

5. *S. Jamesiana*.

1. *S. minor* (Jacq.) Pers. Rootstock straight or merely curved: leaf-blades glaucous or pale-green, the segments sparingly if at all filiferous, the midrib very short: spadix narrowly branched at long intervals, 1-2 m. long, erect or ascending at maturity: petals about 2 mm. long: drupes 6-8 mm. in diameter: seeds 5-6 mm. broad. [*S. Adansonii* Guerns. *S. glabra* Sarg.](—(DWARF-PALMETTO. BLUE-STEM.)—Hammocks, swampy or sometimes rocky, often along streams, Coastal Plain and rarely adj. provinces, Fla. to Tex., Ark., and N. C.—More frequently browsed by cattle than any other palm.

2. *S. Deeringiana* Small. Tree up to 8 m. tall: leaves spreading in all directions, up to 3 m. long: blades suborbicular, deep-green, the segments filiferous, the midrib extending  $\frac{1}{3}$  to  $\frac{1}{2}$  the length of the blade: spadix elongate, up to 5 m. long: petals fully 2 mm. long: drupes 10-13 mm. in diameter: seeds 8-9 mm. broad.—(DELTA-PALMETTO. PALMETTO-WITH-A-STEM.)—Flat alluvial places, along the lower Mississippi River, bayous, and lakes, S La.

3. *S. Etonia* Swingle. Rootstock S-shaped and more or less spiral: leaves erect or ascending, deep-green, copiously filiferous: spadix closely branched, 5-8 dm. long, often prostrate at maturity: petals 3-3.5 mm. long: drupes 15-20 mm. in diameter: seeds 10-13 mm. broad. [*S. Adansonii* ? *megacarpa* Chapm. ?](—(SCRUB-PALMETTO. SCRUB-CABBAGE.)—Dry pinelands and scrub, pen. Fla.—The leaves are usually less than half as large as those of the following species, as well as relatively shorter-petioled. The bud is eaten like cabbage. The stem is sometimes so strongly spiral that the plant is known as CORKSCREW-PALM.

4. *S. Palmetto* (Walt.) Todd. Tree up to 20 m. tall: leaves spreading in all directions, 2-3 m. long; blades often wider than long: spadix 1-2 m. long or less, the ultimate branches slender: calyx-lobes deltoid: petals about 3 mm. long: drupes subglobose, 5-9 mm. in diameter: seed somewhat depressed, less than 8 mm. broad.—(CABBAGE-TREE. CABBAGE-PALMETTO. CABBAGE-PALM.)—Prairies, marshes, pinelands, and hammocks, Coastal Plain, Fla. to islands off the coast of N. C.—(W. I.)—Almost ubiquitous in pen. Fla. where it grows not only in wet and dry places, but in all kinds of soil and in fresh, sulphur, and salt waters. Rare on the upper Florida Keys: abundant on some of the lower keys. The fruits were an aboriginal food. The Seminoles use it almost exclusively in the structures comprising their villages. The trunks are used for piling. The young part of the bud is used as food, while the unfolded leaf-blades are gathered at Easter time and distributed by religious organizations as amulets. Within and near its range much planted as an ornamental. The plant of the Everglade Keys has been described as *Inodes Swartzii* O. F. Cook, but does not appear to be distinct. The exact position in the genus of *S. Adansonii* ? *megacarpa* as cited above, is uncertain. It is not a true *Sabal*, but a cabbage. We have not yet been able to decide whether it is conspecific with *S. Etonia* or merely a juvenile condition of *S. Palmetto*.

5. *S. Jamesiana* Small. Tree up to 5 m. tall, the stout, often inclined trunk usually 1-3 m. tall, usually clothed with the persistent leaf-bases: leaves loosely spreading in all directions, mostly 2-4 m. long; blades longer than wide, mostly 1-1.5 mm. long, flat, the very numerous (70-100) segments much shorter than the undivided part of the blade, sparingly filiferous: spadix about 1 m. long: drupes depressed, about 1 cm. in diameter: seed 7.5-8.5 mm. broad, much depressed.—High hammocks, Everglade Keys, S pen. Fla.

6. **THRINAX** L. Unarmed trees. Leaves with flabellate blades pale or silvery scurfy beneath, and smooth petioles; the leaf-segments rather stiff: spadix relatively long, often decidedly elongate, erect or ascending in anthesis, the branches borne at intervals on a long spadix. Stamens mostly 6: filaments united at the base. Style concave or flat. Drupe ivory-white.—About 12 species of tropical America.—THATCH-PALMS. REEF-THATCHES.

Flowers, and fruits, on slender pedicels: sepals and petals united into an obscurely lobed or truncate cup: filaments subulate.

Flowers, and fruits, on stout disk-like pedicels: sepals and petals partly united, the lobes acute: filaments nearly triangular.

1. *T. parviflora*.

2. *T. microcarpa*.

1. *T. parviflora* Sw. Slender tree up to 9 m. tall: leaves with relatively short stiff petioles; blades mostly 9–13 dm. wide, yellowish-green above; pedicels 3–4 mm. long: drupe 8–12 mm. in diameter, with thick flesh. [*T. floridana* Sarg.] —(FLORIDA THATCH-PALM.)—Hammocks and sandy shores, pen. Fla. and the Keys.—(*W. I.*)—Spr.—First detected in Florida on Cape Romano, but now extinct there. Occasional in the coastal hammocks on the lower eastern coast, where migratory birds have carried seeds northward of its usual range. The trunks of this and of the following species are used where light piling is needed. The leaves are gathered in great quantities, treated and made into artificial house palms for northern latitudes. Plants sometimes referred to the Cuban *T. Wendlandiana* seem to belong here.

2. *T. microcarpa* Sarg. Stout tree up to 10 m. tall: leaves with long pliable petioles; blades 10 dm. wide or more, usually pale-green above; pedicels mere disks: drupe 3–6 mm. in diameter, with thin flesh.—(BRITTLE-THATCH.)—Pine-lands, hammocks, and sandy shores, S pen. Fla. and the Keys.—(*W. I.*)—Spr.—The status of *T. keyensis* Sarg. (KEY-THATCH) is doubtful. The assigned diagnostic characters—the elongate spadices and large (5–6 mm.) fruits—together with a hammock habitat, may, upon further study, prove it to be entitled to specific rank.

7. **COCCOTHRINAX** Sarg. Unarmed shrubs or trees. Leaves with flabellate blades silvery or pale-scurfy beneath, and smooth petioles; the leaf-segments pliable and somewhat drooping. Spadix relatively short, nodding, the branches congested on a short spadix. Stamens mostly 9: filaments distinct or nearly so. Style funnelliform. Drupe black or purple-black—About 10 species, West Indian.

1. *C. argentea* (Lodd.) Sarg. Shrub or small tree up to 8 m. tall: leaf-blades 2–8 dm. broad, with the ligule 1–1.5 cm. broad: spadix 2–4 dm. long: mature pedicels 1–2 mm. long: drupe 7–10 mm. thick. [*Thrinax argentea* Lodd. *C. jucunda* Sarg.]—(SILVER-PALM. BISCAINE-PALM.)—Rocky pine-lands or rarely in hammocks, Everglade Keys and Cape Sable, Fla. and Florida Keys.—(*W. I.*)—Spr., or other seasons following forest fires.—*C. Garberi*

(Chapm.) Sarg. is a stunted form at the northern end of its natural range, near Miami. The most graceful of our smaller palms. On the mainland confined to the Cape Sable region, the Everglade Keys, and to the lower coastal dunes where seeds have been carried by migratory birds.

8. **SERENOA** Hook. Armed shrubs or trees. Leaves upright or spreading: blades flabellate, cordate at the base: petioles armed with short recurved spines along their edges. Stamens unequal, those opposite the petals with the broader filaments. Drupe and seed ellipsoid or oval.—One species.

1. *S. repens* (Bartr.) Small. Shrub with simple or branched stems, or a tree, the trunk 7 m. tall or less, or usually horizontal: leaf-blades suborbicular, green or glaucous, 3-8 dm. broad, cordate at the base; petioles with firm spines: petals 4-4.5 mm. long: drupe 15-25 mm. long. [*S. serrulata* (Michx.) Hook.]—(SAW-PALMETTO.)—Hammocks, pinelands, scrub, sand-dunes, and savannahs, Coastal Plain, Fla. to La. and S. C.—Spr.—This palm occupies a large range of habitats. Along the eastern coast of Florida and in the scrub, the foliage is usually glaucous, but in other localities it is green. Plants vary greatly in size. The stem is normally creeping and copiously rooted along the under side. Sometimes, however, single plants or colonies have oblique to erect stems rooted only at the base. Contrary to the habit of most of our palms, the stems are frequently much-branched. The fruits were an important aboriginal food. They are used in medicine. The stems are a source of tannic-acid extract. The flowers are an important source of honey. The deep-red fibrous sheaths at the bases of the petioles are noticeable only when the bud is pulled apart.

9. **PAUROTIS** O. F. Cook. Armed shrubs or trees. Leaves spreading: blades flabellate: petioles with mostly upcurved spines. Spadix elongate, projecting beyond the leaves, with separated branches. Stamens equal or essentially so, the filaments broad. Stigmas terminal. Drupe globular, glabrous. Seed depressed. [*Acoelorporphe* H. Wendl.]—One species.

1. *P. Wrightii* (Griseb.) Britton. Shrub with many stems, or a tree, the trunks rarely solitary or several, or very many together, up to 12 m. tall or less: leaf-blades half-orbicular or orbicular, 5-10 dm. broad, sometimes truncate at the base, the segments slenderly attenuate; petioles with flat orange spines: petals about 1 mm. long: drupe 8-10 mm. thick. [*Serenoa arborescens* Sarg.]—(SAW-CABBAGE-PALM. CUBAN-PALM.)—Hammocks and low savannahs, Big Cypress and S Everglades, Fla.—(W. I.)—Spr.—Differs from our other palms in the extensive underground stem-system which supports a colony of tall slender often closely placed erect branches. The panicles of maturing red

fruits are very conspicuous, suggesting tongues of flame extending out from the crown of leaves.

10. **RHAPIDOPHYLLUM** H. Wendl. & Drude. Armed shrubs. Leaves upright: blades flabellate, silvery beneath, the lobes without marginal fibers: petioles rough-edged, with sheaths of interwoven spines and fibers. Spadix erect, slightly exserted from the imbricate involucre. Staminate flowers about half as large as the pistillate. Stigmas introrse, slightly curved. Drupe of a globular type, or 2-lobed or 3-lobed, hirsute.—Only the following species known.

1. **R. Hystrix** (Fraser) H. Wendl. Shrub with short erect or spreading stems, the rootstock proliferous: leaf-sheaths persistent, the fibers fine, the rigid needle-like spines erect, mostly 1-4 dm. long: leaf-blades 5-7 dm. in diameter, scurfy beneath: spadix stout, 1-2.5 dm. long, densely flowered: petals ovate or orbicular: anthers 2 mm. long, exserted, longer than the filaments: drupe ovoid or globular, 15-20 mm. in diameter, red, persistent.—(NEEDLE-PALM. BLUE-PALMETTO. VEGETABLE-PORCUPINE.)—Swamps and hammocks, rarely on dry rocks, Coastal Plain and rarely adj. provinces, Fla. to Miss. and S. C.—Spr.—Remarkable both for its armament and short spadix. The spadix remains so short that the fruits are mostly caught and held in the cluster of petioles and needles. Stolons from the caudex help to maintain the species which otherwise would soon be reduced as a result of the scant propagation by seeds. Frequently planted.

#### ORDER ARALES — ARAL ORDER

Perennial, frequently bog or aquatic herbs; in *Lemnaceae*, mere floating thalloid bodies. Leaves mainly basal. Flowers complete or incomplete, borne on a spadix accompanied by a spathe, or in *Lemnaceae* 1 or few in a pouch in the plant-body. Perianth inconspicuous or wanting. Fruit baccate or utricular.

Plants terrestrial or aquatic, with the flowers on a spadix, this sometimes subtended by or partly enclosed in a spathe. Fam. 1. ARACEAE.  
Plants reduced to small floating thalloid structures, with one or few flowers. Fam. 2. LEMNACEAE.

#### FAMILY 1. ARACEAE — ARUM FAMILY

Fleshy mostly acaulescent plants. Leaves with simple or divided blades. Flowers perfect, monoecious, or dioecious. Perianth of 4-6 scale-like members, or wanting. Androecium of 4-10 stamens. Gynoe-

cium of 1 carpel, or of several united carpels. Fruit a berry or a utricle.  
—About 100 genera and 900 species, mostly in tropical regions.

Rooted land-plants: pistillate flowers several or many.

Flowers perfect: perianth of several scale-like parts.

Spadix borne somewhat laterally on the leaf-like  
scape: marsh-plants.

Tribe I. ACOREAE.

Spadix terminating the clavate or cylindric fleshy  
scape: aquatic plants.

Tribe II. ORONTIEAE.

Flowers monoecious or dioecious: perianth wanting.

Leaf-blades entire: axis of the spadix completely  
covered with flowers.

Tribe III. PELTANDREAE.

Leaf-blades 3-many-divided: axis of the spadix  
naked above.

Tribe IV. AREAE.

Floating water-plants: pistillate flower solitary.

Tribe V. PISTIEAE.

#### I. ACOREAE

Marsh plants with ensiform leaves: spathe a mere flat prolonga-  
tion of the scape.

1. ACORUS.

#### II. ORONTIEAE

Spadix naked, merely subtended by a deciduous spathe, narrowly  
conic, yellow.

2. ORONTIUM.

Spadix surrounded by a fleshy persistent spathe, globular, green.

3. SPATHYEMA.

#### III. PELTANDREAE

Scapose herbs with sagittate or hastate leaf-blades: spathe green  
or with a white blade.

4. PELTANDRA.

#### IV. AREAE

Leaf-blades palmately divided: spathe convolute below, with a  
dilated hood above: spadix included.

5. ARISAEMA.

Leaf-blades pedately divided: spathe convolute throughout or  
slightly dilated at the tip: spadix with a long-exserted  
slender tip.

6. MURICAUDA.

#### V. PISTIEAE

Floating plants: leaves imbricated on a short caudex: spadix ad-  
nate to the spathe.

7. PISTIA.

1. **ACORUS** L. Herbs with aromatic rootstocks. Leaves with narrowly  
linear blades. Spadix lateral, elongate, at the base of the linear spathe.  
Flowers perfect. Perianth of 6 rather  
narrow concave members: anthers didy-  
mous-reniform. Ovary not depressed. Spa-  
dix elongate. Fruits crowded.—Two spe-  
cies, one additional to the following in  
Japan.

1. **A. Calamus** L. Rootstock horizontal:  
leaves 5–20 dm. tall, very pliable: scape  
resembling the leaves: spathe erect: spadix  
yellowish, cylindric-conic or elongate-conic,  
3–8 cm. long.—(CALAMUS. SWEET-FLAG.  
FLAG-ROOT.)—Low grounds, meadows, and  
marshes, various provinces, Fla. to Tex.,  
Ida., Ont., and N. S.—(O. W.)—Spr.—  
sum.—Both plants and habit of growth resemble irises.

2. **ORONTIUM** L. Aquatic herbs. Leaves with relatively narrow blades. Spadix terminal, elongate, subtended by the thin spathe, the scape elongate, pliable, soon weak, and prostrate. Flowers perfect. Perianth of 4-6 very broad scale-like members (6 below, 4 above). Anthers didymous. Ovary much-depressed. Fruits not immersed.—One species.

1. **O. aquaticum** L. Rootstock deeply buried. Leaf-blades oblong or elliptic, 1-3 dm. long, long-petioled: spadix golden-yellow, elongate-conic, 2-10 cm. long.—(GOLDEN-CLUB. BOG-TORCHES. WATER-DOCK. NEVER-WET. FIRE-LEAF.)—Swamps, ponds, or streams, various provinces, Fla. to La., Tenn., and Mass.—Spr.—The bluish-green, often iridescent leaves shed water like the back of a duck. The bluish-green leaves and the golden spadices are a combination quite unique in our flora.

3. **SPATHYEMA** Raf. Coarse herbs. Leaves with cordate blades, the petioles, and the scapes, partially underground. Spadix ellipsoid or globular, enclosed in the thick cochleate, colored spathe, the scape rigid. Flowers perfect. Perianth of 4 hooded members. Anthers reniform. Gynoeceium conic. Fruits immersed in the subglobose spadix.—One species.

1. **S. foetida** (L.) Raf. Plants garlic-scented, glabrous: leaf-blades 2-5 dm. long, often 3 dm. broad: sepals erect, mainly subterranean: spathe seated on the ground, preceding the leaves, 8-15 cm. long, beaked, purple-mottled. Sepals and filaments fitting tightly about the style: fruit-head persistent, 9-15 cm. in diameter, the berries green. [*Symplocarpus foetidus* Salisb.]—(MIDAS'-EARS. PARSON-IN-THE-PILORY. SKUNK-CABBAGE. SWAMP-CABBAGE.)—Swamps and low meadows, various provinces, Ga. (or Fla.) to Mo., Minn., and N. S.—Wint.-spr.

4. **PELTANDRA** Raf. Tufted herbs with rootstocks. Leaf-blades of a hastate or sagittate type. Scapes recurved at maturity or permanently erect. Flowers monoecious. Spadix completely covered with flowers. Stamens 6-10. Spathe green or white. Fruits green or red.—Spr.-sum.—Comprises only the two following species.—ARROW-ARUMS.

Spathe convolute throughout, narrow, green: fruits green.  
Spathe dilated and spreading above, mainly white: fruits crimson.

1. *P. virginica*.
2. *P. glauca*.

1. *P. virginica* (L.) Kunth. Leaf-blades sagittate or hastate, with several prominent lateral ribs: spathes 8–20 cm. long, the edges crisped: spadix included,  $\frac{1}{4}$  pistillate,  $\frac{3}{4}$  staminate: scapes recurved at maturity: fruits mostly over 1 cm. thick. [*P. undulata* Raf.]—(VIRGINIA WAKE-ROBIN. POISON-ARUM. GREEN-ARUM.)—Swamps and shallow water, various provinces, Fla. to La., Ont., and N. S.

2. *P. glauca* (Ell.) Feay. Leaf-blades sagittate, without prominent lateral ribs: spathe 4–10 cm. long, the edges flat: spadix exserted above,  $\frac{1}{2}$  pistillate,  $\frac{1}{2}$  staminate: scapes permanently erect or ascending: fruits mostly less than 10 mm. thick. [*P. alba* Raf. *P. sagittifolia* (Michx.) Morong not Raf. *Xanthosoma sagittifolium* Chapm.]—(WHITE-ARUM.)—Non-alluvial swamps, usually in acid soil, Coastal Plain and rarely adj. provinces, Fla. to Ala. and N. C. (or Va.?).

5. *ARISAEMA* Mart. Herbs with corms. Leaf-blades palmate, 3–5-divided. Scape permanently erect. Spadix clavate or cylindric, the fertile portion partly flower-bearing. Spathe cornucopia-like. Fruits red.—Spr.-sum.—About 50 species, mostly natives of Asia.—JACK-IN-THE-PULPITS. INDIAN-TURNIPS.—The corms of the plants of this genus contain an extremely acrid juice, as well as raphides of calcium oxalate. The combination produces a violent burning sensation if an attempt is made to eat them raw.

Leaf-segments 3 (the lateral ones rarely 2-lobed): spathe acute-acuminate: spadix straight.

Spathe short-acuminate or acute; blade dark-colored or striped.

Hood of the spathe uniformly colored within, black, red-brown or rarely green: naked portion of the spadix cylindric: fruits 4–6 mm. in diameter.

Hood of the spathe strongly striped within, light-green and brown, or dark-green: naked portion of the spadix clavate: fruits 8–12 mm. in diameter.

Spathe caudate-acuminate; blade usually green.

Leaf-segments 5 (the lateral ones sometimes partly united): spathe abruptly pointed: spadix curved.

1. *A. pusillum*.

2. *A. triphyllum*.

3. *A. acuminatum*.

4. *A. quinatum*.

1. *A. pusillum* (Peck) Nash. Plants mostly less than 3 dm. tall: leaf-segments 5–12 cm. long: spathe-blades short-acuminate, red-brown to almost black or sometimes pale-green within: fruits 4–6 mm. thick.—Swamps and damp woods, often in acid soil, various provinces, N. Ga. to Ky. and N. Y.—Blooms 2–3 weeks later than the next following species.

2. *A. triphyllum* (L.) Torr. Plants mostly over 4 dm. tall: leaf-segments 8–30 cm. long; blades dull, rather abruptly short-acuminate: spathe-blade short-acuminate, pale-green, often striped

with purple, brown or dark-green within: fruits 8–12 mm. thick.—Swamps, moist hillsides, and thickets, various provinces, Fla. to La., Kans., Minn., and N. S.

3. *A. acuminatum* Small. Plants more slender than *A. triphyllum*: leaf-segments 7–12 cm. long: spathe-blade long-acuminate, deeper-green than the convolute portion: fruits 8–9 mm. thick.—(PARSON-IN-THE-PULPIT.)—Woods, often swampy, N Fla.—Forms with the spathe-blade moderately long-acuminate occur in the Coastal Plain as far up as SE Va., and may represent this species.

4. *A. quinatum* (Nutt.) Schott. Plants about as large as *A. triphyllum*: leaf-segments 5, the lateral pairs sometimes partly or wholly united, glaucous beneath: spathe green: spadix slender: fruits 6–7 mm. thick.—(PRESTER-JOHN.)—Woods and moist rich soil, various provinces, Ga. to La., Tenn., and N. C.

6. **MURICAUDA** Small. Herbs with clustered corms: leaf-blades pedately 5–17 divided. Scapes permanently erect. Spadix whip-like, the fertile portion covered with flowers. Stamens 4. Spathe wholly convolute or slightly dilated at the tip. Fruits red.—One species.

1. *M. Dracontium* (L.) Small. Leaf-segments cuneate to oblanceolate, 1–3 dm. long: spathe green, 3–10 cm. long: fruits 6–8 mm. thick. [*Arisaema Dracontium* Schott]—(GREEN-DRAGON, DRAGON-ROOT.)—Rich woods and bottoms, various provinces, N pen. Fla. to Tex., Minn., Ont., and Me.—Spr.

7. **PISTIA** L. Floating herbs. Leaves clustered on very short branches at the nodes of the rootstock: blades entire, dilated upward. Spadix adnate to the axillary spathe. Flowers monoecious, the pistillate solitary, the staminate above the pistillate. Perianth wanting.—One species.

1. *P. Stratiotes* L. Leaves in rosettes; blades cuneate or obovate-cuneate, 8–23.5 cm. long, or more, strongly ribbed: spathe about 1.5 cm. long, pubescent, the upper part ovate.—(WATER-LETTUCE, WATER-BONNETS.)—Streams, lakes, and ponds, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A., O. W.)—Frequently forming a complete, often extensive gray-green carpet. The hairy ribbed myriad leaf-surfaces produce an iridescent effect. Contrary to the usual uniformity in the size in species of aquatics, the plants of water lettuce are extremely variable. The tissues are very spongy.

A variety of *Colocasia antiquorum*—(DASHEEN, TARO)—is cultivated for its edible tubers in Florida and has escaped to marshes and roadsides in some places. It has peltately attached leaf-blades.

## FAMILY 2. LEMNACEAE — DUCKWEED FAMILY

Floating herbs, consisting chiefly of very small, often minute, fleshy structures, sometimes with 1 or several roots. Propagative pouches 1 or 2 in each body. Flowers monoecious, one or two staminate and one pistillate in a propagative pouch. Staminate flowers consist of 1 stamen. Pistillate flowers consist of 1 carpel. Fruit a utricle.—Four genera and 26 species, widely distributed.—Comprises the smallest of the flowering plants.

Plant-body not disk-like, rootless: propagative pouch solitary. Tribe I. WOLFFIEAE.  
Plant-body disk-like, with a single root or a cluster of roots: propagative pouches 2. Tribe II. LEMNEAE.

### I. WOLFFIEAE

Plant-body very thick or globose.  
Plant-body thin, tongue-like or sabre-form.

1. BRUNERIA.
2. WOLFFIELLA.

### II. LEMNEAE

Plant-body inconspicuously nerved: root solitary, without fibro-vascular bundle.  
Plant-body conspicuously nerved: roots 2-several, each with a fibrovascular bundle.

3. LEMNA.
4. SPIRODELA.

1. **BRUNERIA** Franch. Plant-body much thickened or subglobose. Propagative pouch funnelliform. Spadix of 1 staminate and 1 pistillate flower bursting through the upper surface of the plant-body.—[*Wolffia* Horkel.]—Several species, most abundant in tropical and subtropical regions.—MUD-MARYS.

Plant-body smooth, somewhat flattened above, gibbous beneath, brown-punctate.  
Plant-body ellipsoid or globose, with 2-3 papules on dorsal surface, not punctate.

1. *B. punctata*.
2. *B. columbiana*.

1. ***B. punctata*** (Griseb.) Nieuw. Plant-body boat-like, elliptic to ovoid-ellipsoid, 0.58–0.82 mm. long, flat or nearly so above, gradually rising at the apex: tissue various; lower portion of the plant-body composed of larger cells than the upper. [*W. punctata* Griseb.]—Floating on the surface of stagnant water, Coastal Plain and occasionally other provinces, Fla. to Tex. and Ont.

2. ***B. columbiana*** (Karst.) Nieuw. Plant-body globose to ellipsoid, 0.48–1 mm. long, the upper surface convex, with a row of inconspicuous papillae, only a small portion emerged, this with 1–10 stomata: tissue of uniform large cells. [*W. columbiana* Karst.]—Floating beneath the surface of stagnant water, various provinces, Fla. to La., Minn., Ont., and Mass.

2. **WOLFFIELLA** Hegelmaier.

Plant-body thin, tongue-shaped or sabre-form. Propagative pouch triangular. Inflorescence and fruit unknown.—About 7 species, mostly of tropical distribution.

1. **W. floridana** (J. D. Smith) C. H. Thompson. Plants solitary or usually several generations cohering; body attenuate from the base to the slender apex, 5.5–8.5 mm. long, hollow except near the apex.—(MUD-MIDGET. BOG-MAT.)—Stagnant water, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. J.

3. **LEMNA** L. Plant-body disk-like, inconspicuously nerved. Anthersacs opening transversely. Utricle somewhat flattened, often ribbed.—Sum.—About 8 species, widely distributed in tropical and temperate regions.—DUCK-WEEDS. FROG-BUTTONS.

Plant-bodies long-stipitate, forming large submerged masses.

Plant-bodies sessile, or short-stipitate, floating, more or less detached.

Plant-body symmetrical or nearly so.

Plant-body elliptic-obovate: utricle lenticular.

Plant-body elliptic or oblong: utricle elongate.

Plant-body unsymmetrical.

Plant-body thick, obliquely obovate, papillose on the median line.

Plant-body thin, elliptic, smooth.

Plant-body manifestly 3-nerved: root-sheath with lateral appendages.

Plant-body obscurely 1-nerved: root-sheath without appendages.

1. *L. trisulca*.

2. *L. minor*.

3. *L. minima*.

4. *L. perpusilla*.

5. *L. trinervis*.

6. *L. cyclostasa*.

1. **L. trisulca** L. Root-sheath acute: plant-bodies both submerged and aerial, often falcate, 5–10 mm. long, acute: aerial plants smaller than the submerged and short-stalked, cavernous: submerged plants with twisted stipes.—Ponds and spring-runs, various provinces, Ala. to Calif., Alas., Ont., and N. S.—(O. W.)

2. **L. minor** L. Root-sheath obtuse: plant-bodies elliptic, obovate, or sub-orbicular, 2–4 mm. long, mostly 3-nerved, commonly keeled on the back and papillose on the midrib: seeds 12–15-ribbed.—Ponds and stagnant water, various provinces, Fla. to Calif., B. C., and Ont.—(O. W.)

3. **L. minima** Philippi. Root-sheath obtuse: plant-body oblong or elliptic, 1.5–3.9 mm. long, rounded at the apex, sometimes slightly oblique, nearly nerveless,

convex above: seeds commonly 16-ribbed.—Pools, various provinces, Fla. and Ga. to Calif. and Wyo.

4. *L. perpusilla* Torr. Root-sheath acute: plant-body obovate, usually obliquely so, 2-3.5 mm. long, obtuse, often papillose along the midrib and with a larger apical papilla: utricle tipped with the eccentric style.—Ponds and stagnant streams, various provinces, Fla. to Kans., N. D., and Mass.

5. *L. trinervis* (Austin) Small. Root-sheath with lateral appendages: plant-body oblong or nearly so, a little convex above, flat beneath, abruptly narrowed to the blunt apex, smooth: utricle tipped with the terminal style.—Still water, various provinces, La. to Kans. and N. J.

6. *L. cyclostasa* (Ell.) Chev. Root-sheath without appendages: plant-body oblong or nearly so, 2.3-4.5 mm. long, obtuse, often somewhat falcate, unsymmetrical at the base, obscurely 1-nerved. [*L. valdiviana* Philippi]—Pools, various provinces, Fla. to Tex., Calif., and Mass.—(*Mex., S. A.*)

4. **SPIRODELA** Schleid. Plant-body disk-like, conspicuously several-nerved. Anther-sacs opening lengthwise. Utricle lenticular, with winged margins.—Three species, 2 in America, the other in S Asia and Australia.

1. *S. polyrhiza* (L.) Schleid. Plants mostly sterile and perennial: roots 4-16: plant-body obovate or suborbicular, 2.5-8 mm. long, 5-15-nerved: seeds smooth.—(DUCK-WEED. MINNOW-FOLE.)—Pools, ponds, and along streams, various provinces, Fla. to Tex., Calif., B. C., Ont., and N. S.—(*Mex., C. A., S. A., O. W.*)—Sum.—Floating dense masses of plants give a pale golden-green hue to the surface of pools. They are often purple beneath.

#### ORDER XYRIDALES — XYRIDAL ORDER

Caululent moss-like or acaulescent rush-like terrestrial herbs. Leaves alternate, equitant when basal: blades narrow, sometimes notched at the apex. Flowers axillary or usually borne in a terminal cone-like spike. Calyx regular or one sepal crested. Corolla regular. Gynoecium with a superior ovary. Fruit a capsule. Seeds minute, often caudate.

Caululent moss-like herbs: flowers axillary to leaf-like bracts: sepals alike: styles wholly united. Fam. 1. MAYACACEAE.

Acaulescent rush-like herbs: flowers in terminal dense spikes: sepals of 2 forms, or 1 sepal wanting: styles partially united. Fam. 2. XYRIDACEAE.

#### FAMILY 1. MAYACACEAE — BOG-MOSS FAMILY

Leaves cauline: blades narrow, flaccid, 1-nerved, minutely notched at the apex. Flowers perfect, borne on axillary pedicels. Sepals 3, nar-

rowed upward. Petals 3, broadened upward. Androecium of 3 stamens: anthers ovoid. Gynoecium 3-carpellary. Fruit a capsule.—Only the following genus.

1. **MAYACA** Aubl. Moss-like aquatic herbs, the stems copiously leafy. Peduncles 1-flowered. Calyx herbaceous. Corolla pink, persistent with the sepals. Anther with an oblique tip.—Spr.-fall.—About 7 species, in the warmer parts of America.—BOG-MOSSES. POOL-MOSSES.

Pedicels much longer than the leaves: capsule globular or ovoid.  
Pedicels shorter than the leaves: capsule ellipsoid.

1. *M. Aubletii*.  
2. *M. fluviatilis*.

1. *M. Aubletii* Michx. Stems tufted or matted, 2–20 cm. long: leaves approximate or densely crowded; blades narrowly lanceolate or almost linear, 3–5 mm. long, sharply notched at the apex: pedicels 8–20 mm. long: sepals about 4 mm. long at maturity: capsule 4–4.5 mm. long.—Springy places and margins of pools or streams, Coastal Plain, Fla. to Tex. and Va.

2. *M. fluviatilis* Aubl. Larger than *M. Aubletii*, the stems often 40 cm. long: leaves very numerous, approximate; blades narrowly linear-lanceolate to linear-filiform, 4–12 mm. long, very flaccid: pedicels 2–5 mm. long: sepals 3–4 mm. long: capsule 4–5 mm. long.—Pools, ponds, and sluggish streams, Coastal Plain, Fla. to Miss. and Ga.—(W. I., Mex., C. A., S. A.)

## FAMILY 2. XYRIDACEAE — YELLOW-EYED GRASS FAMILY

Leaves basal: blades thickish. Flowers perfect, in a compact terminal spike. Sepals 3, the two lateral firm, keeled and often appendaged, persistent, the third larger, deciduous. Petals 3, fugacious. Androecium of 3 stamens usually alternating with 3 staminodia: anthers linear. Gynoecium 3-carpellary. Fruit a capsule.—Two genera and about 60 species, most abundant in the tropics.

1. **XYRIS** [Gronov.] L. Rigid herbs of bogs, swamps, prairies, and pine-lands. Leaves not forked at the tip, imbricate at the base of the scape. Flowers aggregated in a spike with closely imbricate scale-like bracts. Corolla yellow or rarely white. Anthers narrow, the sacs opening lengthwise.—About 50 species, mostly in the tropics of both hemispheres.—Spr.-fall, or all year S.—YELLOW-EYED GRASSES. VARE-GOLDIES.—The plants of this genus prefer soils of a high degree of acidity.

Annual or biennial plants: leaves mainly shorter than the sheath of the scape.

Perennial plants: leaves mainly longer than the sheath of the scape.

I. BREVIFOLIAE.

Sterile filaments bearded; leaf-blades flat.

Lateral sepals included, i.e., concealed by the bracts.

Lateral sepals partially exserted.

Sterile filaments glabrous; leaves terete, filiform.

II. COMMUNES.

III. FIMBRIATAE.

IV. BALDWINIANAE.

#### I. BREVIFOLIAE

Keel of the lateral sepals smooth or erose-scabrous.

Keel of the lateral sepals ciliate-fringed.

1. *X. brevifolia*.

2. *X. flabelliformis*.

#### II. COMMUNES

Keel or wing of the lateral sepals ciliate.

Lateral sepals winged, the wing partially ciliate, not bearded.

Sepal-wing narrow, narrower than the sepal-body.

Sepal-wing broad, broader than the sepal-body.

Lateral sepals keeled, the keel mainly ciliate its entire length, bearded at the apex.

Keel or wing of the lateral sepals incised, erose-toothed or lacerate.

Keel or wing cross-toothed or incised.

Lateral sepals crested from below the middle or from the base to the apex.

Lateral sepals crested from above the middle to the apex.

Scape and leaves not scabro-puberulent.

Spike ovoid, oval or glohular, 5-15 mm. long at maturity; bracts in relatively few series.

Bracts loosely imbricate in few series, deciduous.

Bracts closely imbricate in several series, persistent.

Spike oblong to conic-oblong, 16-23 mm. long at maturity; bracts numerous and in many series.

Scape and leaves scabro-puberulent all over.

Keel or wing lacerate.

Lateral sepals crested from about the middle, or below it, to the apex, the crest erect or nearly so.

Spike ovoid, 11-15 mm. long; bracts rounded at the apex.

Spike acute: lateral sepals with the wing narrow or obsolete near the base; leaves and scape smooth.

Spike obtuse: lateral sepals with the wing broad to the base; leaves and scape rough-margined.

Spike oblong or cylindric, 15-30 mm. long; bracts very broad and broadly rounded or nearly truncate at the apex.

Lateral sepals crested from the base to the apex, the crest spreading or partially recurved.

3. *X. ambigua*.

4. *X. stricta*.

5. *X. torta*.

6. *X. neglecta*.

7. *X. caroliniana*.

8. *X. communis*.

9. *X. elata*.

10. *X. scabrifolia*.

11. *X. difformis*.

12. *X. serotina*.

13. *X. platylepis*.

14. *X. iridifolia*.

#### III. FIMBRIATAE

Plant not bulbous at the base, the leaf-bases not greatly dilated.

Leaves numerous; blades mostly 1-2 mm. wide at maturity.

Leaves few; blades mostly 5-10 mm. wide at maturity.

Crest of the lateral sepals of very short erect segments: upper part of the scape smooth.

Crest of the lateral sepals of very long spreading segments: upper part of the scape rough.

Plant markedly bulbous at the base, the leaf-bases greatly dilated and persistent.

Corolla yellow: upper part of the scape, and the spike, green.

Corolla white: upper part of the scape, and the spike, glaucous or glaucescent.

15. *X. Elliottii*.

16. *X. Smalliana*.

17. *X. fimbriata*.

18. *X. flexuosa*.

19. *X. pallescens*.

#### IV. BALDWINIANAE

Plants clustered: leaves very slender.

20. *X. Baldwiniana*.

1. *X. brevifolia* Michx. Leaves narrowly linear, 2–8 cm. long, clustered: scape 8–30 cm. tall, nearly terete: spike subglobose, 4–6 mm. long; bracts eroded: lateral sepals 3.5–4.5 mm. long.—Low pinelands, Coastal Plain, Fla. to N. C.

2. *X. flabelliformis* Chapm. Leaves linear or narrowly linear-lanceolate, 1–2.5 cm. long, spreading in a fan-shaped manner, often curved: scape very slender, 8–30 cm. tall, nearly terete below, slightly flattened above: spike ovoid or ellipsoid, 4–8 mm. long, usually acute; bracts entire: lateral sepals 4–5 mm. long.—Low pinelands, Coastal Plain, Fla. to Miss.

3. *X. ambigua* Beyr. Leaves linear, 1–4 dm. long, tapering from a rather broad base, commonly roughish on the edges: scape 4–10 dm. tall, finely ridged, 2-edged above, the edges often rough: spike ovoid or ellipsoid-ovoid, 1.5–2.5 cm. long, often acute: lateral sepals 5–8.5 mm. long; wing ciliolate.—Swamps or open pinelands, Coastal Plain, Fla. to Tex. and N. C.—An infusion of the herbage of this, and doubtless other, species of *Xyris* is rubbed on the chest by the Seminoles, in cases of colds and pulmonary disorders.

4. *X. stricta* Chapm. Leaves linear or slightly tapering upward, 1–4 dm. long, quite narrow, smooth-edged, often discolored in drying: scapes 4–10 dm. tall, 2-edged and margined above, the margins rough: spikes narrowly ellipsoid or cylindric, 2–3.5 cm. long: lateral sepals 5.5–7 mm. long; wing ciliolate, from the middle to the top.—Shallow pineland ponds, Coastal Plain, Fla. to Miss.

5. *X. torta* J. E. Sm. Leaves narrowly linear, 5–30 cm. long, acute, straight or spirally twisted: scape 2–6 dm. tall, more or less spirally twisted, nearly terete below, 2-edged above, smooth: spike oval or subglobose, 5–10 mm. long: lateral sepals margined, 4–5 mm. long; keel ciliate and bearded at the apex. [*X. flexuosa* Chapm. not Muhl.]—Swamps, damp banks, and wet soil, various provinces, Ga. to Tex., Minn., and Me.

6. *X. neglecta* Small. Leaves few, linear, 3–10 cm. long, acute, straight or slightly curved, rather erect: scape 1–4 dm. tall, spirally twisted, 10-ridged: spike ovoid, 4–9 mm. long; bracts 3–5 mm. long: lateral sepals 3–4 mm. long; wing with erose-serrate crest from near the base to the apex.—Moist pinelands, Coastal Plain, Fla. to Miss. and Ga.

7. *X. caroliniana* Walt. Leaves linear, attenuate, smooth, the longer fully  $\frac{1}{2}$  as long as the scape: scape 1–6 dm. tall, flattened and 2-edged above, the edges smooth: spike oval or ovoid, 6–9 mm. long, obtuse; bracts loosely imbricate in few series and splitting in age: lateral sepals 4–5 mm. long; wing narrower than the sepal-body, incised-toothed or eroded beyond the middle.—Shallow ponds and swamps, Coastal Plain and New England Coast, Fla. to La., and Me.; Great Lake Lowland, Ind.

8. *X. communis* Kunth. Leaves gradually attenuate, shorter than the scape: scape 2–7 dm. tall, 2-edged above: spike oval or globular, 8–15 mm. long: bracts closely imbricate in few series: lateral sepals 3–4 mm. long; wing narrower

than the sepal-body, erose-toothed or incised-toothed above the middle.—Low pinelands and swamps, Coastal Plain and rarely adj. provinces, Fla. to La. and Md.—(*W. I.*)

9. *X. elata* Chapm. Leaves few, 2–6 dm. long: scape 3–12 dm. tall, 2-edged above: spike oblong to conic-oblong, 16–23 mm. long: bracts numerous, closely imbricate in many series: lateral sepals 4–5 mm. long; wing narrow, toothed above the middle.—Low pinelands and swamps, Coastal Plain, Fla. to La. and N. J.

10. *X. scabrifolia* Harper. Leaves few, very narrow, elongate-linear, scabro-puberulent, 3–4 dm. long: scape surpassing the leaves, and puberulent like them: spike 1–1.5 cm. long; bracts rather numerous, closely imbricate: lateral sepals about 5 mm. long; wing narrow, toothed above the middle.—Bogs, Piedmont, W Ga.

11. *X. difformis* Chapm. Leaves few, linear, 1–5 dm. long, smooth: scape 2–5 dm. tall, mostly clustered, twisted, sharply 2-edged above, smooth: spike ovoid, 12–18 mm. long, acute, the bracts rounded: lateral sepals 4.5–6 mm. long: wing narrow or obsolete near the base of the sepal, with a crest of fringe extending  $\frac{1}{2}$ – $\frac{1}{3}$  the length of the sepal from the tip.—Swamps, Coastal Plain, Fla., Ga., and Ala.

12. *X. serotina* Chapm. Similar to *X. difformis* in habit. Leaves and scape rough-margined: spike ovoid, 12–18 mm. long, obtuse; bracts rounded: lateral sepals 4.5–5 mm. long; wing broad to the base of the sepal, with a fringed crest mainly above the middle.—Pineland swamps, Coastal Plain, Fla. and Miss.

13. *X. platylepis* Chapm. Leaves linear, 2–6 dm. long: scape 5–9 dm. tall, 2-ridged above, sometimes slightly roughened on the margins: spike ellipsoid or cylindric, 1.5–3 cm. long; bracts very broad and broadly truncate or nearly so at the apex: lateral sepals 4.5–6 mm. long; wing with a lacerate crest above the middle.—Low sandy places or pinelands, Coastal Plain, Fla. to La. and S. C.

14. *X. iridifolia* Chapm. Leaves few, linear, 5–8 dm. long, relatively broad: scape 6–10 dm. tall, stout, nearly terete or 1-edged below, flattened and 2-edged above, the edges broad: spike ellipsoid or cylindric, 1.5–3.5 cm. long; bracts rounded: lateral sepals 5–6 mm. long; wing narrow, incised-fimbriate its whole length.—Shallow ponds and wet pinelands, Coastal Plain and adj. provinces, Fla. to Tex. and Ga.

15. *X. Elliottii* Chapm. Leaves numerous, narrowly linear, grass-like, 3–10 cm. long or longer, acute, often twisted: scape 2–5 dm. tall, twisted, 2-edged throughout, or only 1-edged below, roughish on the edges: spike oval or ellipsoid: bracts with thin eroded edges: lateral sepals 4–6.5 mm. long; wing incised-lacerate above the middle or nearly entire below the terminal tuft or beard.—Wet grassy pinelands and swamps, Coastal Plain, Fla. to Miss. and S. C.—(*W. I.*)

16. *X. Smalliana* Nash. Leaves few, lustrous, linear, 3.5–7 dm. long, the lower half often purplish, striate: scape 7–10 dm. tall, about twice as tall as the leaves, flattened, unequally 2-edged below the spike, smooth: spike ovoid or at maturity ellipsoid, 1.5–2.5 cm. long: lateral sepals 5–8 mm. long; wing crested with short erect segments from about the middle.—Shallow ponds, Coastal Plain, Fla. to La. and Ga.

17. *X. fimbriata* Ell. Leaves not lustrous, linear, 3–5 dm. long, smooth: scape stiff and straight, erect, 6–12 dm. tall, roughish, and 2-edged above: spike ovoid

to ellipsoid, 1.5–2.5 cm. long; lateral sepals 7–9 mm. long, relatively broad; wing crested with long spreading segments from about the middle to the apex.—Ponds or swampy places in pinelands, Coastal Plain, Fla. to Miss. and N. J.

18. *X. flexuosa* Muhl. Leaves with dark dilated bases, 1–4 dm. long, usually spirally twisted: scape 3–7 dm. tall, somewhat flattened above, spirally twisted: spike cylindric or conic-oblong, 1.5–3 cm. long, often acute: lateral sepals 8–12 mm. long; fringe of the wing firm: corolla yellow. [*X. torta* Kunth *X. arenicola* Small]—Pinelands, Coastal Plain, Fla. to Tex., Ark., and N. J.

19. *X. pallescens* (C. Mohr) Small. Leaves few, accompanied by the persistent purple or brown bases of those of previous years, 2–4 dm. long, spirally twisted: scape 3–6 dm. tall, spirally twisted, 2-edged above: spike ellipsoid or conic-ellipsoid, 1–1.5 cm. long: lateral sepals 6.5–9 mm. long, very delicate, narrow; fringe of the wing delicate: corolla white.—Pinelands, open hammocks, and sandy shores, Coastal Plain, Fla., Ala., and Ga.

20. *X. Baldwiniana* R. & S. Leaves numerous, filiform, terete, 0.5–2 dm. long, becoming twisted: scape slender, 2–4 dm. tall, 1-angled or nearly terete, smooth: spike ovoid or subglobose, 4–6 mm. long, turbinate at the base: lateral sepals 4–6 mm. long, the upper half of the keel-wing serrate: sterile filaments glabrous.—(ST. MARY'S GRASS.)—Damp pinelands or pineland ponds, Coastal Plain, Fla. to Tex. and N. C.

#### ORDER ERIOCAULALES—ERIOCAULAL ORDER

Acaulescent terrestrial herbs with the narrow leaves often crowded on a short caudex or with the caudex elongate and stem-like. Flowers crowded in a dense depressed or elongate head, monoecious or dioecious. Calyx and corolla minute. Gynoecium with a superior ovary. Fruit a fragile capsule. Seeds very minute, nut-like.

#### FAMILY 1. ERIOCAULACEAE — PIPEWORT FAMILY

Perennial and perhaps rarely annual, mostly acaulescent, bog or aquatic herbs. Rootstocks often creeping or horizontal. Leaves clustered: blades narrow. Scapes simple, subtended by sheathing bracts. Flowers monœcious (androgynous), or rarely dioecious, densely crowded in a terminal involucrate head. Perianth in 2 series (the inner rarely obsolete). Staminate flowers with as many stamens as the sepals or twice as many. Pistillate flowers with a 2–3-celled ovary. Fruit a capsule.—Nine genera and over 500 species, in warm and tropical regions, most abundant in South America.

Stamens 2 or 3, as many as the sepals: petals glandless.

Petals of the pistillate flowers obsolete.

Petals of the pistillate flowers resembling the sepals and united at the middle.

Stamens 4–6, twice as many as the sepals: petals each bearing a prominent gland.

1. LACHNOCAULON.

2. SYNGONANTHUS.

3. ERIOCAULON.

1. *LACHNOCAULON* Kunth. Flower head not conspicuously involucrate. Staminate flowers: sepals 3; petals obsolete; stamens 3; filaments united below, coalescent with a rudimentary corolla or pistil, this with 3 lobes at the top; anthers 1-celled. Pistillate flowers: sepals 3; petals obsolete.—Repre-

sented only by the following species.—Heads white, gray, brown, or black.—**HAIRY-PIPEWORT. BOG-BUTTONS.**

Scape glabrous.

Gynoecium 3-carpellary: stigmas 3: bracts of the involucre obtuse.

Head dark-brown or black, scarcely, if at all, pubescent: sepals obscurely pubescent near the apex.

Head white or gray, woolly: sepals copiously ciliate.

Head gray, globular at maturity: sepals about 1 mm. long: anther as long as the filament.

Head white, spheroidal at maturity: sepals about 1.5 mm. long: anther shorter than the filament.

Gynoecium 2-carpellary: stigmas 2: bracts of the involucre acute.

Scape pubescent.

Seeds smooth.

Seeds cancellate.

Bractlets and sepals of the pistillate flowers not ciliate.

Bractlets and sepals of the pistillate flowers ciliate.

Head gray or brown-gray, 4 mm. thick or less: seeds oval or ovoid, 0.5 mm. long.

Head white, 5 mm. thick or more: seeds ellipsoid, 0.8 mm. long.

1. *L. Engleri*.

2. *L. floridanum*.

3. *L. glabrum*.

4. *L. digynum*.

5. *L. Beyrichianum*.

6. *L. eciliatum*.

7. *L. minus*.

8. *L. anceps*.

1. *L. Engleri* Ruhl. Leaf-blades 1-3 cm. long, linear-attenuate, glabrous, firm: scape 5-30 cm. tall, 3-5-ridged, twisted, glabrous: head cylindric at maturity, 3-6 mm. long: receptacle with slender-clavate hairs: bractlets obovate, minutely pubescent near the apex: sepals obovate, obtuse.—Damp, sandy and springy places, Fla.—(W. I.)

2. *L. floridanum* Small. Leaf-blades 2-4.5 cm. long, linear, less attenuate than those of *L. glabrum*, sparingly ciliate, manifestly cellular at the base: scape 3-11 cm. tall, twisted, glabrous: head 3-3.5 mm. long at maturity: bractlets spatulate or obovate-spatulate, ciliate: sepals similar to the bractlets, ciliate.—Low sandy places, pen. Fla.

3. *L. glabrum* Koern. Leaf-blades spreading and ascending, linear-attenuate, 4-5 cm. long, glabrous: scape 15-30 cm. tall, twisted, glabrous: head white, 3-4 mm. thick: bractlets and sepals ciliate.—Pinelands, damp woods, and wet sandy places, Coastal Plain, Fla. and Ala.

4. *L. digynum* Koern. Leaf-blades 8-15 mm. long, linear, glabrous: scape 6-15 cm. tall, glabrous: head globular, about 2 mm. in diameter, gray: bractlets spatulate, each with a nerve-like keel: sepals obtuse, ciliate: ovary 3-celled.—Sandy soil, often in pinelands, Fla.

5. *L. Beyrichianum* Sporleder. Leaf-blades 1.5-5 cm. long, very narrowly linear or linear-filiform, sparingly ciliate or nearly glabrous: scape 3-14 cm. tall, sparingly hairy: head globular, becoming somewhat elongate, about 3 mm. thick: bractlets spatulate, ciliate: sepals obovate to nearly spatulate, ciliate.—Sandy shores and springy places, Coastal Plain, Ga.

6. *L. eciliatum* Small. Leaf-blades 1-4.5 cm. long, linear-attenuate, sparingly ciliate: scapes slender, 3-9 cm. tall, pubescent: heads globular, 3-3.5 mm. thick, gray: bractlets spatulate, not ciliate: sepals spatulate to oblanceolate,

eciliate, those of the pistillate flowers wholly glabrous, those of the staminate minutely pubescent at the apex: seeds ovoid, cancellate.—Sandy shores, NW Fla.

7. *L. minus* (Chapm.) Small. Leaf-blades 1–4 cm. long, linear-attenuate, sparingly ciliate: scape slender, 0.5–3 dm. tall, pubescent: head globular to cylindric, 3–4 mm. thick: bractlets and sepals ciliate with relatively short hairs. [*L. Michauxii minus* Chapm.]—Moist soil, often on pond-margins, Coastal Plain, Fla. to N. C.

8. *L. anceps* (Walt.) Morong. Leaf-blades 2–6 cm. long, narrowly linear-attenuate, sparingly pubescent or glabrate: scape 0.5 dm. tall, very slender, pubescent: head spheroidal, 5 mm. thick or more: bractlets and sepals ciliate with relatively long hairs.—Sandy places and low or moist pinelands, Coastal Plain, Fla. to Tex. and Va.; and Appalachian Plateau, Ala.

2. **SYNGONANTHUS** Ruhl. Flower-head conspicuously involucre. Staminate flowers with 2 or 3 distinct sepals and petals: stamens 2–3: filaments distinct: anthers 2-celled. Pistillate flowers with 2 or 3 distinct sepals and 2 or 3 petals united at the middle.—About 80 species, mostly natives of tropical America.—Heads yellowish-white.

1. *S. flavidulus* (Michx.) Ruhl. Leaf-blades filiform-linear or linear-subulate, 2–7 cm. long, floccose near the base: scapes 1–3 dm. tall, 5-angled, pubescent, very slender: heads 4–6 mm. thick: bracts of the involucre straw-colored, shining. [*Paepalanthus flavidulus* Kunth] —(SHOE-BUTTONS. BANTAM-BUTTONS.)—Low pinelands, margins of sandhill ponds and bogs, Coastal Plain, Fla. to Ala. and N. C. (or Va. ?)—Spr.

3. **ERIOCAULON** [Gronov.] L. Flower-heads not conspicuously involucre. Staminate flowers: sepals 2–3; petals 2–3, each with a gland; stamens usually 4–6; filaments distinct. Pistillate flowers: sepals as in the staminate flowers; petals much reduced and narrow; stamens wanting.—About 200 species, mostly in warm temperate and tropical regions.—Heads white, gray, or lead-colored, except in *E. Ravenelii*, in which they are brown or blackish.—PIPEWORTS. BUTTON-RODS. HAT-PINS.

Sheath at the base of the scape surpassing the leaves, except in the case of submerged plants.

Petals linear to spatulate: scape 4–7 ridged: head less than 10 mm. in diameter.

Petals broader: scape 10–12-ridged: head over 10 mm. in diameter.

Sheath at the base of the scape surpassed by the leaves, or some of them.

Head 10–16 mm. thick: bractlets, sepals, and petals ciliate: bractlets acute.

Head 3–5 mm. thick: bractlets, sepals, and petals glabrous: bractlets obtuse.

1. *E. lineare*.

2. *E. compressum*.

3. *E. decangulare*.

4. *E. Ravenelii*.

1. *E. lineare* Small. Leaf-blades 2-5 cm. long, curved, attenuate, sparingly pubescent or almost glabrous: scape deep green, 1-3 dm. tall, 3-5-ridged: head depressed, 5-6 mm. broad: bracts of the involucre rhombic, acute, pubescent near the tip: sepals mainly spatulate: petals at least obovate of the staminate flowers, linear.—Wet woods, and moist pinelands, Coastal Plain, Fla., Ala., and Ga.—Spr.—*E. septangulare* as admitted into our range, seems to have been, for the most part, based on small specimens of *E. lineare*.

2. *E. compressum* Lam. Leaves ascending-spreading; blades 2-12 cm. long, flaccid, longitudinally striate: scape 2-10 dm. tall, 10-12-ridged: head spheroidal, over 10 mm. thick: petals of the staminate flowers ciliate-fimbriate at the apex or above the middle.—Acid ponds and low pinelands, Coastal Plain, Fla. to Tex. and N. J.—Spr. or all year S.

3. *E. decangulare* L. Leaves erect or ascending: blades 10-50 cm. long: rather firm, finely many-striate, obtuse: scape stout, 3-10 dm. tall, 10-14-ridged: head globular, 10-16 mm. thick: bracts of the involucre acute: bractlets, sepals, and petals ciliate, or pubescent on the back.—Moist pinelands and acid swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex., Pa., and N. J.—Sum. or all year S.

4. *E. Ravenelii* Chapm. Leaves various, the smaller spreading, the larger ascending or erect; blades 2-13 cm. long, pellucid, attenuate-acute: scape very slender, 4-30 cm. tall, 5-6-ridged: head spheroidal, 3-5 mm. thick: bracts of the involucre obtuse: bractlets, sepals, and petals glabrous.—Swamps and low pinelands, Coastal Plain, Fla. to Miss. and S. C.—Sum.-fall, or all year S.

#### ORDER COMMELINALES—COMMELINAL ORDER

Caulscent or acaulescent terrestrial or aquatic and often fleshy, or epiphytic and firm herbs. Leaves various: thread-like to very broad. Inflorescence an axillary or terminal spike, raceme, or panicle, or spadix-like. Flowers mostly perfect. Calyx and corolla regular or very irregular. Gynoecium with the ovary superior or sometimes inferior. Fruit a utricule or a capsule. Seeds grain-like or sometimes comose.

Terrestrial or aquatic plants: foliage not scurfy: stigmas united.

Calyx and corolla free, of very different members: stamens free.

Fam. 1. COMMELINACEAE.

Calyx and corolla of quite similar members and partly united: stamens partly adnate to the perianth.

Fam. 2. PONTEDERIACEAE.

Epiphytes (except in *Ananas*, a spiny-toothed cultivated terrestrial), often with scurfy foliage: stigmas 3.

Fam. 3. BROMELIACEAE.

#### FAMILY 1. COMMELINACEAE — SPIDERWORT FAMILY

Annual or perennial caulescent succulent herbs. Leaves alternate, sheathing at the base. Flowers perfect, the mostly umbel-like or rarely scorpioid cymes involucreate. Calyx of 3 persistent herbaceous or partly petaloid sepals. Corolla of 3 equal or unequal delicate petals. Androecium of 5-6 stamens, sometimes 2 or 3 mere staminodia. Gynoecium

2-3-carpellary. Styles united. Fruit a loculicidally 2-3-valved capsule.  
—About 30 genera and 350 species, most abundant in tropical regions.

Polleniferous stamens 6, or rarely 5.

Petals, or both sepals and petals, distinct

Petals, or sepals and petals, partly coherent or ad-  
nate into a tube.

Polleniferous stamens 3, or rarely 2.

Tribe I. TRADESCANTIEAE.

Tribe II. ZEBRINEAE.

Tribe III. COMMELINEAE.

#### I. TRADESCANTIEAE

Flower-clusters subtended by minute or leaf-like bracts.

Cymes or cymules subtended by small or minute bracts very unlike the leaves.

Inflorescence simple: filaments pubescent.

Inflorescence dichotomously compound: filaments gla-  
brous.

Cymes subtended by an involucre of 1-3 bracts similar to  
the leaves.

Flower-clusters subtended by specialized boat-like involucres.

1. CUTHBERTIA.

2. TRADESCANTELLA.

3. TRADESCANTIA.

4. RHOEO.

#### II. ZEBRINEAE

Succulent herbs with plain green or variegated leaves.

5. ZEBRINA.

#### III. COMMELINEAE

Flower-clusters not subtended by folded bracts.

Flower-clusters subtended by a folded spathe-like involucre.

6. ANEILEMA.

7. COMMELINA.

1. **CUTHBERTIA** Small. Stems upright or sometimes ultimately diffuse, often tufted, from a dense cluster of cord-like naked or fuzzy roots. Leaf-blades narrow, elongate, flat or half-terete. Cyme simple, terminating a long peduncle, with scale-like bracts. Petals pink or purplish, equal. Stamens 6: filaments pubescent.—Represented only by the following species.—ROSELINGS.

Leaves erect; blades half-terete or channeled, slender: capsule subglobose.

Petals entire: corolla 2-2.5 cm. wide.

Petals crenate: corolla 3-4 cm. wide.

Leaves loosely spreading; blades flat: capsule obovoid or globose-  
obovoid.

1. *C. graminea*.

2. *C. ornata*.

3. *C. rosea*.

1. **C. graminea** Small. Plant 0.5-2 dm. tall, densely tufted, the stem slender, nearly straight: leaves erect; blades filiform-subulate: corolla 2-2.5 cm. wide: capsule subglobose, about 4 mm. in diameter: seed about 1.5 mm. wide, prominently ribbed.—Sandy woods, pinelands, and sandhills, Coastal Plain and adj. Piedmont, Fla. to N. C.—Spr.-sum.

2. **C. ornata** Small. Plant 3-6 dm. tall, single or sparingly tufted, the stem stoutish, nearly straight: leaves erect: blades subulate-acicular: corolla 3-4 cm. wide: capsule globular, about 4 mm. in diameter: seed about 1.5 mm. in diameter, rather shallowly ribbed.—Scrub, pen. Fla.—All year.

3. **C. rosea** (Vent.) Small. Plant erect, single or sparingly tufted, often becoming diffuse: leaves lax; blades narrowly linear and somewhat attenuate: corolla 2-2.5 cm. wide: capsule obovoid or globose-obovoid, 3.5-4 mm. in diameter: seed about 1.5 mm. in diameter, rather sharply ribbed. [*Tradescantia rosea* Vent.]—Oak-woods, pinelands, and river-swamps, Coastal Plain and Piedmont, Fla. to N. C. (or Va.?)—Spr.-sum.

2. **TRADESCANTELLA** Small. Herbs with creeping stems. Leaf-blades small but relatively broad. Cyme dichotomous, the cymules with scale-like bracts. Petals nearly equal. Stamens 6: filaments glabrous.—One species.

1. **T. floridana** (S. Wats.) Small. Stem and branches more or less matted: leaf-blades ovate to ovate-lanceolate, 1-2 cm. long, ciliolate: sepals ovate, 2-3 mm. long: petals white: capsule nearly 2 mm. long.—Damp shady places and hammocks, pen. Fla.—Spr.-fall.—Most frequent on kitchenmiddens and sites of aboriginal activity. Often forming a dense ground cover.

3. **TRADESCANTIA** [Rupp.] L. Plants mostly erect. Leaf-blades usually relatively long and narrow. Cyme in an involucre of 1-3 leaf-like bracts. Flowers sometimes fragrant. Petals nearly equal. Capsule sessile.—About 35 species, natives of temperate and tropical America.—Spr.-sum.—SPIDERWORTS. BLUE-JACKETS.—Some species have become favorite garden plants and are greatly admired for their bright-blue or purple flowers which open, however, only in the morning.

Stem and branches erect: flower cluster subtended by an involucre of elongate bracts: leaves elongate.

Leaf-blades greatly elongate and attenuate: flowers in a terminal cluster or also in stalked axillary clusters at the upper remote nodes of the stem.

Leaf-blades lanceolate to linear-lanceolate, acuminate: flowers in sessile or short-stalked clusters at the approximate successive upper nodes of the stem.

Stem and branches decumbent or prostrate, creeping: leaf-blades broad.

#### I. LONGIFOLIAE.

#### II. BREVIFOLIAE.

#### III. FLUMINENSES.

#### I. LONGIFOLIAE

Stem abbreviated, sometimes only about a centimeter long: bracts of the involucre mostly longer than the leaves.

Stem elongate, up to a meter tall: bracts of the involucre shorter than the leaves.

Stem glabrous or sparingly pubescent.

Sepals pubescent with long non-glandular hairs all over.

Sepals with a small tuft of hairs at the tip.

Sheaths of the lower leaves glabrous on the back.

Bracts of the involucre elongate: petals blue.

Bracts of the involucre very short: petals red.

Sheaths of the lower leaves arachnoid.

Stems hirsute, and also sometimes glandular.

Stem, pedicels, and sepals hirsute with non-glandular hairs.

Stem, pedicels, and sepals glandular-pubescent.

1. *T. brevicaulis*.

2. *T. virginiana*.

3. *T. reflexa*.

4. *T. incarnata*.

5. *T. foliosa*.

6. *T. hirsuticaulis*.

7. *T. longifolia*.

#### II. BREVIFOLIAE

Plant very variable in size and habit, but leaves usually distichous, those subtending the very many-flowered clusters mostly saccate at the base.

8. *T. pilosa*.

#### III. FLUMINENSES

Spreading plant with weak creeping stems and branches: leaf-blades ovate, oval, or elliptic.

9. *T. fluminensis*.

1. *T. brevicaulis* Raf. Stem very short, somewhat elongating in age, but less than 1 dm. long, densely villous, simple: leaves elongate, with large sheaths that nearly or quite clothe the stem; blades attenuate, less pubescent than the stem: flowers rather few in a cluster, on conspicuously elongate densely villous pedicels: sepals elliptic-ovate, 10–13 mm. long, villous all over: petals blue or purple, 2–2.5 cm. long: capsule globose-obovoid, about 5 mm. long, sparingly pubescent at the top: seed about 2.5 mm. long.—(BLUE-GRASS.)—Prairies, hillsides, and woods, Interior Plateau provinces, Tenn. to Ark., Mo., and Ill.—Spr.

2. *T. virginiana* L. Stem single or branched at the base, the branches then tufted, 2–5 dm. tall, green, glabrous or finely pubescent, commonly simple: leaves few, elongate; blades attenuate, glabrous or pubescent in plants with pubescent stems: flowers several to many in a cluster: sepals broadly ovate, 12–18 mm. long, more or less villous all over, thin in age: petals blue, violet, rose, or white, 1.5–2 cm. long: capsule ellipsoid-obovoid, 4–5 mm. long, glabrous: seed about 2.5 mm. long.—Woods, meadows, hillsides, stony bluffs, and stream-banks, various provinces, rarely Coastal Plain, N. C. to Ark., Ill., and N. S.—Spr.

3. *T. reflexa* Raf. Stem usually single, up to 1 m. tall, glabrous, glaucous, branched in robust plants: leaves elongate, glabrous, glaucous or nearly so; blades attenuate, occasionally with scattered hairs near the sheath: flowers several or many in a cluster: sepals elliptic to ovate-elliptic, 8–11 mm. long, one, at least, with a tuft of hairs at the apex, permanently thick: petals blue, ovate, usually broadly so, 1.5–2 cm. long: capsule ellipsoid, about 5 mm. long, glabrous, glaucous: seed about 2.5 mm. long.—Woods, sandhills, dunes, barrens, and pinelands, various provinces, N. Fla. to Tex., Minn., and N. C.—Spr.—sum.

4. *T. incarnata* Small. Stem commonly single, up to 1 m. tall, glabrous, simple or with a branch or two above: leaves elongate, with long, arachnoid sheaths or glabrous, except for hairs on or near the edges; blades linear-attenuate, glabrous or with long hairs near the sheath: flowers rather few in a cluster, or numerous in the terminal cluster: sepals elliptic or elliptic-lanceolate, 6–8 mm. long, one of them, at least, sparingly bearded at the apex: petals bright-red, broadly ovate, 1–1.5 cm. long: capsule glabrous.—Sandy woods, N. Miss.—Spr.—sum.

5. *T. foliosa* Small. Stem often single, mostly 3–7 dm. tall, simple above, or sparingly branched, glabrous: leaves erect, the lower ones several or numerous, with ample imbricate arachnoid sheaths; blades elongate, linear-attenuate, those of the lower ones, at least, with scattered hairs above the sheathing bases: flowers rather numerous in the terminal cluster: sepals elliptic-ovate, 7–8 mm. long, 2 of them, at least, pubescent near the apex: petals blue, broadly ovate, 1.5–2 cm. long: capsule globose-obovoid, 4–5 mm. long, glabrous: seed 3 mm. long.—Hammocks, NE Fla., and N part of the pen.—Spr.

6. *T. hirsuticaulis* Small. Stem single, or branched at the base, the branches 2–5 dm. tall, simple or sometimes branched, hirsute with long white or pale hairs: leaves elongate; blades narrowly linear-attenuate, hirsute: flowers usually relatively few in a cluster: sepals narrowly ovate to elliptic-ovate, 9–11 mm. long, or rarely longer, hirsute, green or magenta-margined: petals violet, ovate or orbicular-ovate, 1.6–2.2 cm. long: capsule globose-ellipsoid, 6–7 mm. long, glabrous or inconspicuously glandular-pubescent: seed about 3 mm. long.

—Sandy woods, rocky hills, and fields, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Ga.—Spr.

7. *T. longifolia* Small. Stem single, or branched at the base, the branches tufted, up to 6 dm. tall, sometimes branched above, finely glandular-pubescent and often with additional longer glandless hairs: leaves elongate, the lower ones usually equalling the height of the stem; blades narrowly linear-attenuate, pubescent like the stem: flowers commonly numerous in a cluster: sepals elliptic to elliptic-lanceolate, 9–10 mm. long, glandular-pubescent, often magenta-margined: petals blue to violet, 1.3–2 cm. long, broadly ovate to orbicular-ovate: capsule ellipsoid, 6–7 mm. long, finely glandular-pubescent: seed 3 mm. long. [*T. roseolens* Small]—Scrub, pinelands, and oak-woods, pen. Fla.—All year.

8. *T. pilosa* J. G. C. Lehm. Stem up to 1 m. tall, usually simple, but often with short or elongate flower-stalks from the axils of some of the upper leaves, or rarely branched, frequently zigzag, glabrous or villous, often gregarious: leaves rather approximate and distichous or ultimately distant; blades lanceolate to linear-lanceolate, or rarely elongate: flowers typically numerous, sometimes very numerous: sepals elliptic-ovate to elliptic-lanceolate, mostly 6–8 mm. long, hairy all over: corolla 3–3.5 cm. wide: capsule oval, about 5 mm. long, glandular-pubescent on the top: seed fully 2.5 mm. long. [*T. montana* Shuttlew. *T. comata* Small]—Rich woods, various provinces, N Fla. to La., Mo., Ohio, and Va.—Of wide distribution, and variable in size and habit. The broad-leaved forms are very distinct; those with narrower sometimes elongate leaves resemble forms of *T. reflexa*, but may be distinguished from that species by the pubescent sepals. Throughout so wide a range there is much variation in the color of the corolla which varies from deep-violet through pale-violet shades to white.

9. *T. fluminensis* Vell. Stem and branches widely spreading, up to 1 m. long, glabrous: leaf-blades ovate, oval or elliptic, 3–9 cm. long, acute, or slightly acuminate, the sheaths long-ciliate: flowers few in a cluster: sepals ovate, about 6 mm. long, with a finely pubescent median keel: corolla white, 10–13 mm. wide: capsule subglobose, about 3 mm. long: seed scarcely 1.5 mm. long.—(WANDERING-JEW.)—Sandy woods and waste-places, Coastal Plain, Fla. to N. C. Nat. of S. A. and cult.

4. **RHOEO** Hance. Herbs with erect or ascending stiff leaves, crowded on a stout caudex which is a branch of a fleshy rootstock: blades contracted above the sheathing base. Cyme congested, borne in an involucre of imbricate boat-like bracts. Petals equal, not clawed. Capsule sessile.—One species.

1. *R. discolor* (L'Her.) Hance. Leaves 2–4 dm. tall; blades very thick, broadly linear, acute, often purple, especially so beneath: flower-stalks clustered: spathes 3–4 cm. long: petals white or blue, 5–8 mm. long: capsule 4–5 mm. long.—(BOAT-LILY. OYSTER-PLANT.)—Pinelands and cult. grounds, pen. Fla. Nat. of Mex., and cult.—(W. I.)—All year.—A favorite garden plant in the tropics and frequently grown under glass in extra-tropical regions.

5. **ZEBRINA** Schnizl. Herbs with diffusely branching stems. Leaf-blades relatively broad. Cymes borne in involucre of leaf-like bracts with saccate bases. Corolla-lobes essentially equal. Stamens 6. Capsule slender-pedicelled.—Two species, Mexican.

1. **Z. pendula** Schnizl. Stem and branches very weak, often creeping: leaf-blades ovate to elliptic-ovate, 3–8 cm. long, often purple-striped or mottled: calyx coralloid; lobes lanceolate: corolla rose-purple or white; lobes ovate or suborbicular, 5–8 mm. long: capsule ovoid or ellipsoid-ovoid, 1.5 mm. long: seed about 1 mm. long.—(WANDERING-JEW.)—Hammocks, S pen. Fla. Nat. of Mex. and cult.—(W. I.)—All year.—A favorite house plant of long standing, most frequently used in hanging-baskets.

6. **ANEILEMA** R. Br. Herbs with diffuse, often creeping stems and branches. Leaf-blades long and narrow. Cyme subtended by involucre of leaf-like bracts. Perianth regular. Stamens 3, or rarely 2. Capsule not borne in a spathe.—About 60 species, most abundant in the Old World tropics.

1. **A. nudiflorum** (L.) Kunth. Plant 1–3 dm. tall, the stems often branched: leaf-blades linear to linear-acuminate, 3–11 cm. long, ciliate at the base: cymes long-peduncled: petals blue or purplish, 5–8 mm. long: capsule oval or globular, 4–5 mm. long, minutely beaked.—Roadsides, woods, and orange-groves, Coastal Plain, Fla. to Ga. Nat. of E Indies.—Spr.—fall.

7. **COMMELINA** [Plum.] L. Herbs with erect, spreading, or creeping stems. Leaf-blades relatively short. Cyme borne in a specialized folded involucre. Perianth irregular, sometimes only slightly so. Corolla blue, at least the larger petals. Stamens 3 or rarely 2. Capsule hidden in the spathe.—About 100 species, widely distributed in temperate and tropical regions.—Spr.—sum.—DAY-FLOWERS. DEW-FLOWERS.—Some species are frequently grown in gardens for their bright-green foliage and bright-blue flowers. Some tropical species may be grown in the open in temperate latitudes.

Spathe-like involucre open at the base, the edges not united.

Two posterior petals blue; anterior one much smaller, narrow, white: capsule 2-celled, 4-seeded: spathe short: plants annual, diffuse. I. COMMUNES.

All three petals blue, with broad blades; anterior one slightly smaller than the posterior: capsule 3-celled, 5-seeded: plants perennial: spathe elongate.

Spathe-like involucre with the edges united at the base.

Two posterior petals blue; anterior one much smaller, white: leaf-sheaths ciliate with white hairs: capsule with the carpels 1-seeded, or the posterior one reduced or obsolete.

II. LONGICAULES.

III. ANGUSTIFOLIAE.

All three petals blue; anterior one somewhat smaller than the posterior ones: leaf-sheaths with ferruginous hairs: capsule with the anterior carpels 2-seeded and the posterior carpel 1-seeded.

## I. COMMUNES

Plants annual, diffusely spreading, the stems rooting at the lower nodes: leaf-blades lanceolate: anthers 6.

## II. LONGICAULES

Plants mainly erect or diffuse with decumbent or climbing stems and erect branches: involucre mostly 2.5-5 cm. long, long-acuminate: seeds smooth, over 2.5 mm. long. Spathe about thrice as long as wide: petal-blades reniform, the posterior ones long-clawed.

Spathe about four times as long as wide: petal-blades deltoid, the posterior ones short-clawed.

Plants with creeping stems and branches: involucre mostly less than 2.5 cm. long, acute: seeds reticulate, 2-2.5 mm. long.

## III. ANGUSTIFOLIAE

Leaf-blades ovate to elliptic-lanceolate or ovate-lanceolate: posterior petals 8-12 mm. long: seeds scarcely flattened: plant with procumbent creeping stems and branches.

Leaf-blades linear, lanceolate, or linear-lanceolate: posterior petals 12-25 mm. long: seeds manifestly flattened: plant with erect or merely decumbent stems and branches.

Leaf-blades of a lanceolate type: seeds of an ellipsoid type. Leaf-blades of a linear or linear-lanceolate type: seeds of a spheroidal type.

Involucre 2-3 cm. long, mostly with long white hairs near the base.

Involucre 1-2 cm. long, rarely with long white hairs near the base.

## IV. HIRTELLAE

Relatively coarse herb with usually clustered spathes.

1. *C. communis* L. Stem and branches 3-10 dm. long, somewhat creeping: leaf-blades lanceolate, 4-12 cm. long, acute or acuminate: spathe 2-4 cm. long, mostly about twice as long as wide: sepals 4-5 mm. long: anterior petal white, rhombic-ovate or rhombic-lanceolate; posterior ones with stalked reniform blue blades: anthers 6: capsule 6-7 mm. long: seeds 3.5-4 mm. long.—Waste grounds, about gardens, and moist banks, various provinces, Ala. to Ark., Mo., Mass., and N. C.—Nat. of E Asia.—Equally at home in natural habitats, and as a weed in waste-places.

2. *C. caroliniana* Walt. Stem and branches erect or diffuse, often more than 1 m. long: leaf-blades lanceolate, 8-12 cm. long, acute or acuminate: spathe 2.5-3.5 cm. long, mostly about thrice as long as wide: sepals 3-4 mm. long: anterior petal less than 5 mm. long, reniform: anthers 5, the larger less than 2 mm. long: seeds 3 mm. long or nearly so.—Moist sandy soil and cult. grounds, Coastal Plain, N Fla. to Miss., Mo., and S. C.

3. *C. Gigas* Small. Stem and branches reclining and creeping, climbing into shrubs and trees, often 3-5 m. long: leaf-blades lanceolate, often narrowly so. 12 cm. long or less, acuminate: spathe 4-5 cm. long, about 4 times as long as wide: sepals 4-5 mm. long: anterior petal deltoid, over 6 mm. long: anthers 5, the larger ones 2 mm. long: capsule not seen.—Hammocks, Lake Okeechobee region, Fla.—Our most vigorous and robust species. The herbage is frequently eaten by cattle.

## IV. HIRTELLAE.

1. *C. communis*.

2. *C. caroliniana*.

3. *C. Gigas*.

4. *C. longicaulis*.

5. *C. elegans*.

6. *C. erecta*.

7. *C. crispa*.

8. *C. angustifolia*.

9. *C. virginica*.

4. *C. longicaulis* Jacq. Stem and branches 3-10 dm. long, creeping, the roots fibrous: leaf-blades lanceolate or oblong-lanceolate, 3-8 cm. long, acute: spathe 1-2.5 cm. long, often twice as long as wide: posterior petals long-clawed: anthers 5: seeds 2-2.5 mm. long. [*C. nudiflora* (Fl. SE. U. S.)]—(BABY-DEWFLOWER.)—Moist soil, sandy places, along streams, or cult. grounds, various provinces, Fla. to Tex., Kans., Ind., and Ga.; occasional as a weed N to Pa. Nat. of trop. Am.

5. *C. elegans* H.B.K. Stem and branches 2-9 dm. long, erect or ultimately reclining: leaf-blades thin, ovate to lanceolate, or elliptic-lanceolate, 4-9 cm. long, from long sheaths which are sparingly hairy at the mouth: spathe rather broad, 1.5-2 cm. long, acute: capsule about 4 mm. long.—Moist, often sandy soil, S Fla. and S Tex.—(*W. I.*, *Mex.*, *C. A.*, *S. A.*)

6. *C. erecta* L. Stem and branches 2-9 dm. tall, erect or ascending: leaf-blades thick, lanceolate, 3-12 cm. long, acuminate, sparingly hairy about the mouth of the sheath: spathe 2-3 cm. long, acuminate: anterior petal shorter than the claws of the posterior ones: capsule 4-5 mm. long. [*C. virginica* (Fl. SE. U. S.) not *L. C. saxicola* Small]—Sandy soil, loam, and rocky woods, various provinces, Fla. to Tex., Kans., and N. Y.

7. *C. crispa* Wooton. Stem and branches 2-9 dm. long, often decumbent: leaf-blades linear to narrowly linear-lanceolate, 3-8 cm. long, crisped: spathe 2-3 cm. long, acute or acuminate: capsule 4-5 mm. long.—Sandy or rocky soil, Tenn. to Tex., Ariz., Colo., and Ind.

8. *C. angustifolia* Michx. Stem and branches 2-8 dm. long, erect or decumbent: leaf-blades linear, sometimes narrowly so, flat, attenuate: spathe 1-2 cm. long, acute or acuminate: capsule 4-5 mm. long. [*C. hamipila* C. Wright *C. Swingleana* Nash *C. Nashii* Small]—Pinelands, sand-dunes, and fields, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)—The mucilaginous sap is used by the Seminoles to soothe irritations.

9. *C. virginica* L. Stem 2-12 dm. tall, simple or sparingly branched: leaf-blades lanceolate or elliptic, 10-20 cm. long, often scabrous: spathes usually clustered, triangular or ovate-triangular, 2-2.5 cm. long, acute: petals ovate: capsule 7-8 mm. long. [*C. hirtella* Vahl]—Moist or wet soil, mostly alluvial swamps and river shores, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Pa.

## FAMILY 2. PONTEDERIACEAE — PICKEREL-WEED FAMILY

Bog or aquatic herbs with rootstocks. Leaves alternate: blades dilated, narrow, or mere phyllodia. Flowers 1 or several from a bract-like spathe. Calyx and corolla of rather similar partially united members. Androeceum of 3-6 stamens: filaments unequally adnate to the perianth-tube. Gynoeceum 3-carpellary but sometimes with a 1-celled ovary. Fruit a 1-seeded utricle or a many-seeded capsule.—About 6 genera and 25 species, fresh-water inhabitants in tropical and temperate regions.

Stamens 3: flowers few: perianth salverform.

Stamens equal: anthers narrow, erect: leaf-blades narrow.

Stamens unequal: anthers various, the 2 posterior ones broad, versatile: leaf-blades broad.

Stamens 6: flowers many: perianth 2-lipped.

Ovary 1-celled: ovule, and seed, solitary: fruit indehiscent.

Ovary 3-celled: ovules, and seeds, many: fruit dehiscent.

1. ZOSTERELLA.

2. HETERANTHERA.

3. PONTEDERIA.

4. PIAROPUS.

1. **ZOSTERELLA** Small. Aquatic plants with regularly leafy stems. Leaf-blades linear, sessile. Spadix 1-flowered. Perianth yellow, regular, the lobes narrow, nearly equal. Stamens 3, equal: anthers narrow, erect. Ovary 3-celled: style conspicuously swollen under the stigma. Ovules numerous. Capsule many-seeded.—Two species of temperate and tropical America.

1. **Z. dubia** (Jacq.) Small. Stem and branches elongate: leaf-blades mainly 4–11 cm. long: perianth lobes linear, 8–15 mm. long: capsule 4–6 mm. long. [*Heteranthera graminea* (Michx.) Vahl] —(WATER STAR-GRASS).—Still shallow water, various provinces, Fla. to Tex., Ore., and Ont.—(*W. I., Mex.*)—Spr. sum.—Usually grows with the foliage submersed, but with the flowers extending above the water. On muddy shores the plant sometimes develops a short erect stem.

2. **HETERANTHERA** R. & P. Plants of muddy places, with rootstocks from which arise short branches bearing a cluster of leaves and a peduncle with a bract. Leaf-blades broad, long-petioled. Spadix 1-few-flowered. Perianth white or blue, the calyx-lobes narrower than the corolla-lobes. Stamens 3, unequal, 1 of them with a longer filament and a larger anther than the others: anthers versatile. Ovary 3-celled: styles barely if at all thickened under the stigma. Ovules numerous. Capsule many-seeded.—About 8 species, mostly natives of tropical America.—MUD-PLANTAINS.

Leaf-blades longer than wide, obtuse at both ends: style glabrous. Leaf-blades wider than long, cordate at the base: style pubescent.

1. *H. limosa*.

2. *H. reniformis*.

1. **H. limosa** (Sw.) Willd. Leaf-blades ovate to elliptic-ovate, 1–4 cm. long: spadix 1-flowered: perianth blue; tube 15–20 mm. long: capsule mostly 2 cm. long.—Ditches, shallow water, and mud, various provinces, Fla. to N. M., Colo., and Va.—(*W. I., Mex., C. A., S. A.*)

2. **H. reniformis** R. & P. Leaf-blades reniform or orbicular-reniform, 1.5–6 cm. broad: spadix 2–5-flowered: perianth white; tube 7–10 mm. long: capsule mostly 1 cm. long.—Shallow water and mud, various provinces, Ga. to Tex., and Conn.—(*W. I., Mex., C. A., S. A.*)

3. **PONTEDERIA** L. Aquatic herbs. Leaf-blades narrow or broad, the basal on tapering petioles. Spadix many-flowered. Perianth 2-lipped, blue with a yellow spot on the upper lip, the lobes nearly equal. Anthers versatile. Ovary 1-celled. Fruit with tubercled or incised crests. Seed solitary.—About 8 species, natives of America.—PICKEREL-WEEDS. DOG-TONGUES. WAMPEES.)—Frequently called BLUE-FLAGS.

Spike densely flowered: perianth villous, at least when young: fruits conic or oblong in outline, about twice as long as thick.

1. *P. cordata*.

Spike loosely flowered: perianth glandular and sometimes also hirtellous, at least when young: fruits subglobose in outline, nearly or quite as wide as long.

2. *P. lanceolata*.

1. *P. cordata* L. Basal leaves erect, but not very rigid, the tissues soft; blades broadly ovate to deltoid-ovate and cordate at the base, varying to narrowly deltoid or linear-lanceolate and truncate or narrowed at the base; cauline leaves nearly similar to the basal, but short-petioled: spike stout and densely flowered: perianth over 1.5 cm. long; lower lobe 8–10 mm. long; fruit 6–10 mm. long, mostly over 6 mm., with tubercled crests.—Streams, marshes, bogs, and lakes, various provinces, N Fla. to Okla., Ont., and N. S.—Spr.-fall, or all year S.

2. *P. lanceolata* Nutt. Basal leaves stiffly erect; blades lanceolate to linear-lanceolate and narrowed or rounded at the base, varying to deltoid or ovate and truncate, subcordate, or deeply cordate; cauline leaves nearly similar to the basal, but with rather short petioles: spike slender and loosely flowered: perianth less than 1.5 cm. long; lower lobe 5–6 mm. long; fruit 5–6 mm. long, mostly less than 6 mm., with incised crests.—Ponds, ditches, and stagnant water, Coastal Plain, Fla. to Tex. and Va.—Spr.-fall, or all year S.—In pure growth the spikes of this and of the preceding species make a brilliant show in the landscape.

4. **PIAROPUS** Raf. Aquatic herbs. Leaf-blades dilated, sometimes with inflated petioles. Spadix few-flowered. Perianth somewhat 2-lipped, the lobes unequal. Anthers erect. Ovary 3-celled. Seeds many.—Five species, mostly natives of South America.—**WATER-HYACINTHS.**

Leaf-blades orbicular to reniform: flowers in a spike or spike-like panicle: perianth over 3 cm. wide.

1. *P. crassipes*.

Leaf-blades ovate: flowers in an open panicle: perianth less than 2.5 cm. wide.

2. *P. paniculatus*.

1. *P. crassipes* (Mart.) Britton. Plants 1–12 dm. tall: leaves with inflated petioles and mainly orbicular to reniform blades 3–15 cm. broad: perianth bluish-purple; tube 1.5–2 cm. long; limb 4–7.5 cm. broad, the lobes longer than the tube.—(**WATER-HYACINTH. RIVER-RAFT. WAMPEE.**)—Streams, lakes, ponds, and ditches, Coastal Plain, Ga. and Fla. to Tex.—In part, at least, escaped from cultivation.—(*W. I., Mex., C. A., S. A.*)—Plants of the water-hyacinth vary greatly in size, the leaves ranging from a few centimeters to a meter in height. The extent of growth also varies, a patch may cover several square feet or many acres of water. It is the most showy, especially *en masse*, of our water plants. The myriad brilliant torches scattered in a sea of deep-green foliage is a unique sight. Whether a native or an immigrant from tropical America cannot be certainly determined. However, its growth in the waters of the rather recently opened up wilderness of the interior of peninsular Florida indicates that it was native there.

2. *P. paniculatus* (Spreng.) Small. Plant 3-6 dm. tall: leaves with slender petioles and ovate blades, 7-11 cm. long: panicle 1-1.5 cm. long, many-flowered: peduncles relatively slender: perianth mainly blue or purplish: calyx-lobes oblong, 9-11 mm. long: corolla-lobes obovate, slightly longer than and about twice as wide as the calyx-lobes, the narrower one pale and with 2 yellow blotches below the middle.—Ditches and wet pinelands, pen. Fla. Nat. of Brazil and cult.—(*W. I.*, *C. A.*, *S. A.*)

### FAMILY 3. BROMELIACEAE — PINEAPPLE FAMILY

Epiphytic or rarely terrestrial herbs, commonly with scurfy foliage. Leaves usually crowded at the base of the flowering stem: blades entire or spiny-toothed. Flowers perfect, regular, solitary or spicate. Calyx of 3 sepals. Corolla of 3 narrow petals. Androecium of 3-6 stamens. Gynoecium 3-carpellary, the ovary superior or inferior: styles united. Ovules numerous. Fruit baccate or capsular.—About 45 genera and 900 species, natives of tropical and subtropical America.

Ovary superior: fruit capsular: leaves spineless: plants epiphytic.

Tribe I. TILLANDSIEAE.

Ovary inferior: fruit a syncarp, baccate: leaves spiny: plants terrestrial.

Tribe II. BROMELIEAE.

#### I. TILLANDSIEAE

Corolla cylindric, ovoid, or urceolate, not constricted: stamens with straight filaments and not dilated upward.

Corolla cylindric: petals of a spatulate type, much longer than the sepals: capsule cylindric.

Flowers solitary or 2 together, terminating naked peduncles: style short, columnar.

Stems pendant, elongate, filiform: flowers surpassed by the slender-tipped bracts of the involucre.

1. DENDROPOGON.

Stem not pendent, short: flowers exceeding the short bracts of the involucre.

2. DIAPHORANTHEMA.

Flowers several to many in simple or branched spikes which terminate a sheathed flower-stalk: style elongate, filiform.

3. TILLANDSIA.

Corolla ovoid-urceolate; petals ovate, as long as the sepals or slightly longer: capsule ovoid.

4. CATOPSIS.

Corolla clavate, much constricted above the middle: stamens with spirally twisted filaments which are spoon-like where the anthers are attached.

5. GUZMANNIA.

#### II. BROMELIEAE

Coarse plants with a rosette of elongate leaves from which arises a stout flower-stalk upon the top of which the fruit ripens.

6. ANANAS.

1. *DENDROPOGON* Raf. Pendent festoon-like epiphytic plants, with regularly leafy stems. Leaves remote: blades linear-filiform above the base. Flowers axillary.—Represented only by the following species.

1. *D. usneoides* (L.) Raf. Plant clothed with silver-gray scales. Stems filiform, often greatly elongate: leaves 2.5-8 cm. long: flowers fragrant: sepals 5-7 mm. long, green: petals linear-spatulate, about twice as long as the sepals, yellow or yellowish: capsules 15-30 mm. long: seed-body subulate, 2.5-3 mm. long.—(LONG-MOSS. SPANISH-MOSS. FLORIDA-MOSS. CRAPE-MOSS. WOOL-CRAPE.)—On trees, especially in hammocks and swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex. and Va.; also Tenn. (?)—(*W. I.*, *Mex.*, *C. A.*, *S. A.*)—Our most widely distributed epiphyte and the most

characteristic feature of the Coastal Plain swamps. The plant is used as fodder and in upholstery.

**2. DIAPHORANTHEMA** Beer. Limp, very gregarious epiphytic plants, with peduncle-like flowering branches. Leaves several on the short stem or branches, the blades elongate-subulate, recurved from the imbricate bases. Flowers in a terminal long-peduncled spike. Style columnar, as long as the ovary or shorter.—About 6 species, mainly tropical American.

**1. D. recurvata** (L.) Beer. Plant gray-fuzzy, 5–15 cm. tall, the stems and branches often densely clustered: leaf-blades mostly 5–10 cm. long, 2–4 mm. wide: peduncles wiry: sepals 7–9 mm. long, acute: petals violet, 12–14 mm. long: capsule 2–2.5 cm. long. [*Tillandsia recurvata* L.] (BALL-MOSS. BUNCH-MOSS.)—Hammocks, scrub, cypress-swamps, and pinelands, Coastal Plain, Fla. to Tex.—(W. I., Mex., C. A., S. A.)—Frequently on insulated electric wires and other unnatural habitats.

**3. TILLANDSIA** L. Stiff, epiphytic, solitary or gregarious plants with leafy flower-stems. Leaves several or many, mainly in a basal rosette, flat or dilated and sometimes saccate at the base, those on the flowering stem more or less reduced. Flowers in simple or branched spikes with imbricate bracts. Style filiform, much longer than the ovary.—About 350 species, natives of warm and tropical America.—AIR-PLANTS. WILD-PINES.

Main rachis of the inflorescence covered with the closely imbricate more or less distichous bracts.

Main rachis of the inflorescence exposed, the bracts, at least neither imbricate nor distichous.

Bracts, flowers, and capsules appressed to the rachis: flowers sessile: corolla cream-color or ivory-white.

Bracts, flowers, and capsules lax or spreading: flowers pedicelled: corolla lavender to rose-purple.

#### I. FASCICULATAE.

#### II. UTRICULATAE.

#### III. ALOIFOLIAE.

#### I. FASCICULATAE

Leaves with short slightly-dilated bases which are narrowed into elongate-subulate straight erect tips.

Leaves with long much dilated bases which are narrowed into short or elongate curved or twisted tips.

Leaf-bases flat or nearly so, not forming a bulb-like swelling at the base of the flower-stem.

Basal leaves erect or ascending, except the more or less spreading or curled tips.

Inflorescence not contracted, the lateral branches erect or ascending.

Leaf-blades with a concave upper face: stem-leaves with ascending or spreading slender tips.

Leaf-blades with a V-shaped upper face: stem-leaves with erect or appressed filiform tips.

Inflorescence contracted into an ellipsoid head which is subtended by an involucre.

Leaves and bracts coriaceous: bracts loosely imbricate and separated in fruit.

Leaves and bracts chartaceous: bracts permanently approximate and closely imbricate.

1. *T. tenuifolia*.

2. *T. simulata*.

3. *T. myriophylla*.

4. *T. juncea*.

5. *T. Valenzuelana*.

Leaves stiff, straight or nearly so, in a bristly spreading basal cluster, the short base abruptly narrowed into an elongate dagger-like tip; petals spatulate.

6. *T. hystriocina*.

Leaves not stiff, strongly curved, in a large recurving basal rosette, the long base gradually narrowed into the rather wide tip; petals linear.

7. *T. fasciculata*.

Leaf-bases inflated, forming a bulb-like swelling at the base of the flower stem.

Basal leaves with long pliable whip-like tips; corolla violet; flowering-stem elongate, much exerted from the cluster of basal leaves.

Basal leaves with the tips elongate, tentacle-like, abruptly reflexed and spirally twisted; stem-leaves with abruptly recurved tips; spikes lanceolate, the bracts narrow.

8. *T. Balbisiana*.

Basal leaves with the tips not tentacle-like, ascending; stem-leaves with erect tips; spikes linear-elliptic, the bracts broad.

9. *T. polystachya*.

Basal leaves with short rigid tips; corolla lavender; flower-stem very short, protruding from the cluster of basal leaves only in fruit, if at all.

10. *T. circinata*.

## II. UTRICULATAE

Tall plant with numerous long, flat or nearly flat, widely recurving, basal leaves: flower-stem many-flowered.

11. *T. utriculata*.

## III. ALOIFOLIAE

Low plant with the few short basal leaves, erect or nearly so and spirally twisted: flower-stem few-flowered.

12. *T. aloifolia*.

1. *T. tenuifolia* L. Plant green, dark-red, or purple-red, 1-3 dm. tall, the stems and leaves often in dense clusters: leaves quill-like, often exceeding the stem: spikes few-flowered: petals violet, about 3 cm. long: capsule 2.5-3 cm. long. [*T. Bartramii* Ell. *T. caespitosa* LeConte]—Hammocks and swamps, Coastal Plain, Fla. and Ga.—(*W. I., C. A., S. A.*)

2. *T. simulata* Small. Plant pale-green or gray-green, scurfy and red, 2-4 dm. tall, the stems solitary or few together: basal leaves erect or ascending, with the slender tips often becoming filiform and curled: leaves of the flower-stem with long slender greatly elongate quill-like tips, the upper ones often red: spikes with the bracts red-tinged: petals violet, about 4.5 cm. long: capsule stout, about 3 cm. long. [*T. angustifolia* (Chapm. Fl.) ?.]—Hammocks, often along streams and swamps, pen. Fla.

3. *T. myriophylla* Small. Plant gray and reddish-pink scurfy, 1-3 dm. tall, the stems few or many together: basal leaves erect or ascending with the very slender tips straight or curved: leaves of the flower-stem with elongate almost filiform but stiff quill-like tips, the upper ones often reddish-pink: spikes with the bracts reddish-pink tinged: petals violet, about 4 cm. long: capsule rather slender about 2.5 cm. long.—Hammocks, often in the hilly parts, pen. Fla.

4. *T. juncea* (R. & P.) Poir. Plant gray-green, 1.5-3.5 cm. tall, the stems usually several together: basal leaves mostly ascending, some of the outer ones recurved-spreading; leaves of the flower-stem with elongate-subulate, quill-like strictly erect or appressed tips, the upper ones often red-tinged: spikes congested, the lateral branches short, thus the whole inflorescence contracted into a terminal more or less elongate cluster: bracts red or red-tinged: petals violet, about 3 cm. long: capsule stoutish, 2.5-3 cm. long.—Hammocks, pen. Fla.—(*W. I., C. A., S. A.*)

5. *T. Valenzuelana* A. Rich. Plant light-green or red-tinged, 2-5 dm. tall, the stems solitary or few together: basal leaves with the almost flat tip often curled back; leaves of the flower-stem lax with acuminate tips: spikes with the bracts red-tinged or red: petals violet, about 3.5 cm. long: capsule slender, about 3 cm. long. [*T. Houzeavi* (Chapm. Fl.)]—Hammocks, S Fla.—(*W. I., Mex., C. A., S. A.*)—*T. sublaxa* Baker, seems to be the simple spiked condition of this species.
6. *T. hystricina* Small. Plant bright-green, 2-3.5 dm. tall, the stem usually solitary: basal leaves numerous, stiffly spreading, with abruptly dilated short bases and stiff nearly flat knife-like tips; leaves of the flower-stem with stiff erect awl-like tips: spikes few, the bracts mostly green: petals violet, about 4 cm. long: capsule not seen.—Hammocks, Everglade Keys, S pen. Fla.
7. *T. fasciculata* Sw. Plant gray-green, except the inflorescence, 2-6 dm. tall, the stems solitary or few together: basal leaves numerous, recurved-spreading, gradually attenuate above the widely dilated base; leaves of the flower-stem with broad erect tips: spikes several to many, the bracts yellow, red, or green: petals violet, 4.5-5 cm. long: capsule 3-3.5 cm. long. [*T. bracteata* Chapm.]—Hammocks, cypress-swamps, and rarely pinelands, pen. Fla.—(*W. I., Mex., C. A., S. A.*)—*T. Wilsonii* S. Wats. was based on seedling plants of this species.
8. *T. Balbisiana* Schult. Plant gray-green to the inflorescence, 2-9 dm. tall, the stems solitary or few together: basal leaves few, with tips recurved-twisted; leaves of the flower-stem with lax attenuate tips: spikes narrow, slightly flattened, the lateral ones erect, the bracts red: petals violet, about 3.5 cm. long: capsule 4-4.5 cm. long. [*T. juncea* (Chapm. Fl.)]—Hammocks and cypress-swamps, S Fla.—(*W. I., Mex.*)
9. *T. polystachya* L. Plant dark gray-green or slate-colored up to the inflorescence, 2.5-6 dm. tall, the stems solitary or few together: basal leaves often numerous, with long-attenuate slightly involute tips; leaves of the flower-stem with rigid, erect, stout-subulate tips: spikes usually sparingly branched, flattened, the lateral ones erect or ascending, the bracts red or yellow-tinged: petals violet, about 4 cm. long: capsule about 4 cm. long.—Hammocks and cypress-swamps, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)
10. *T. circinata* Schlecht. Plant gray, 1-2 dm. tall, the stems usually clustered, sometimes 4-9 together: basal leaves few; leaves of the flower-stem with sheathing bases and short stout-subulate tips: spikes simple or sparingly branched, flattened, the lateral ones appressed to the main one: bracts gray or greenish: petals lavender, about 3 cm. long: pods 5-6 cm. long. [*T. bulbosa* (Chapm. Fl.)]—Hammocks and cypress-swamps, S Fla.—(*W. I., Mex.*)
11. *T. utriculata* L. Plant light-green, 3-20 dm. tall, the stems solitary: leaves numerous, with elongate flat or nearly flat blades attenuate from the wide bases; leaves of the flower-stem more or less remote, with sheathing bases, the lower ones with elongate tips the upper with slender tips or merely acute: inflorescence loosely and usually widely branched: spikes with zigzag rachises and separated green bracts: petals cream-colored or ivory-white, about 4 cm. long: capsule 4.5-5.5 cm. long.—Hammocks, cypress-swamps and scrub, SE Ga. and Fla.—(*W. I., Mex., C. A., S. A.*)—Our largest wild-pine. The plants flower once only and die soon afterward.
12. *T. aloifolia* Hook. Plant light-green, 2-9 dm. tall, the stems solitary or 2 or 3 together: basal leaves few, in a cylindric or cornucopia-like cluster, with long horizontally banded bases and broad tips; leaves of the flower-stem often separated, only the lower ones with subulate tips: inflorescence loosely and sparingly branched, the rachis zigzag: racemes mostly 1-flowered, spreading: petals pink, 3-4 cm. long: capsule 4-6 cm. long. [*T. utriculata* (Chapm. Fl.)]—Hammocks and cypress-swamps, S Fla.—(*W. I., C. A., S. A.*)

4. **CATOPSIS** Griseb. Plants resembling *Tillandsia* in habit, also epiphytic, but inflorescence inconspicuously bracted. Flowers small and inconspicuous: corolla white. Style short or wanting. Capsule ovoid.—About 10 species, natives of tropical and subtropical America.—All year.—AIR-PLANTS.

Petals shorter than the sepals: capsule slightly longer than the sepals.

Petals longer than the sepals: capsule fully twice as long as the sepals.

1. *C. Berteroniana*.

2. *C. nutans*.

1. **C. Berteroniana** (Schult.) Mez. Plant yellow: blades of the basal leaves narrowed to the apex: bracts 10–12 mm. long: sepals 11–13 mm. long: capsule 12–13 mm. long, abruptly pointed.—Hammocks, S pen. Fla. and the Keys.—(*W. I.*)

2. **C. nutans** (Sw.) Griseb. Plant green: blades of the basal leaves rather abruptly narrowed into long slender tips: bracts 4–5 mm. long: sepals 5–6 mm. long: capsule 11–13 mm. long, attenuate.—Hammocks, S pen. Fla.—(*W. I.*, *C. A.*)

5. **GUZMANNIA** R. & P. Plants resembling species of *Tillandsia*, but with the blades of the basal leaves less attenuate, the sides above the dilated base nearly parallel up to the abruptly narrowed apex. Flowers in conspicuously bracted spike-like panicles, the bracts becoming membranous. Sepals, and petals, partially united. Anthers coherent around the stigma. Capsule elongate.—Five species, natives of tropical America.

1. **G. monostachya** (L.) Rusby. Plant 3–6 dm. tall: leaves bright-green or variegated, with recurving tips: spike stout: bracts as long as the corolla or longer: calyx firm, 12–15 mm. long: corolla-lobes oblong or ovate, shorter than the tube: capsule becoming 3–3.5 cm. long.—Hammocks, Everglade Keys, Fla.—(*W. I.*, *C. A.*, *S. A.*)—The form with variegated leaves has been introduced into cultivation. The white corollas are in strong contrast to the vermilion bracts which, however, in age become green striate.

6. **ANANAS** Adans. Terrestrial plants, with stout scape-like stems. Leaves mainly basal: blades narrow and elongate, spiny-edged. Flowers in a terminal leafy-bracted spike, the lower part of which, both ovaries and bracts, ripens into an aggregate juicy cone-like fruit.—Five or 6 species, natives of tropical America.

1. *A. Ananas* (L.) Lyons. Leaves 35-50, crowded, 1-2 m. long, the marginal spines hooked: stem erect: corolla white or yellowish, fully twice as long as the calyx: fruit ovoid, oblong, or oblong-conic, 1-4 dm. long, fragrant.—(PINE-APPLE.)—Pinelands and cultivated grounds, S. fla. Nat. of trop. Am. and cult.—(W. I., Mex., C. A., S. A., O. W.)—A tropical fruit of the first order; grown in many varieties. This plant does not reproduce from seeds in our area, but specimens originating from "slips" thrown away in the area where it is cultivated may sometimes be found.

### ORDER LILIALES — LILIAL ORDER

Herbs, commonly fleshy or grass-like, or vines or trees. Leaves with narrow or dilated blades, sometimes scale-like or terete. Flowers perfect, polygamous, or dioecious, complete, mostly regular. Perianth of 3-6 members which are usually distinguishable into calyx and corolla, sometimes partly united. Androeceium of 3-6 stamens. Gynoeceium 3-carpellary or rarely 2-carpellary. Ovary superior or essentially so. Fruit capsular or baccate.

Styles present, distinct or united: stigmas terminal.

Styles distinct: capsule septicidal and rarely also loculicidal.

Styles united, often very short or obsolete during anthesis: capsule primarily loculicidal.

Sepals and petals chaffy, persistent, sometimes only marcescent.

Perianth firm and persistent: flowers in variously disposed clusters: stigmas elongate.

Perianth marcescent: flowers in a terminal raceme-like panicle: stigmas minute.

Sepals and petals not chaffy, deciduous.

Herbs with bulbs, corms or rootstocks.

Plants with bulbs or corms.

Flowers in umbels, at first included in and later subtended by a scarious involucre.

Flowers solitary or racemose, without an involucre.

Plants with elongate rootstocks.

Herbaceous or shrubby plants with stout, often woody caudices, or trees.

Fleshy plants: style filiform: leaf-blades spiny-toothed.

Fibrous plants: style short and stout, or obsolete in anthesis: leaf-blades not spiny-toothed.

Styles wanting: stigmas introrse, sometimes elongated.

Flowers perfect.

Gynoeceium 3-carpellary: fruit a berry.

Gynoeceium 2-carpellary: fruit a capsule.

Flowers dioecious.

Fam. 1. MELANTHIACEAE.

Fam. 2. JUNCACEAE.

Fam. 3. NARTHECIACEAE.

Fam. 4. ALLIACEAE.

Fam. 5. LILIACEAE.

Fam. 6. CONVALLARIACEAE.

Fam. 7. ALOACEAE.

Fam. 8. DRACAENACEAE.

Fam. 9. TRILLIACEAE.

Fam. 10. ROXBURGHACEAE.

Fam. 11. SMILACACEAE.

### FAMILY 1. MELANTHIACEAE—BUNCH-FLOWER FAMILY

Perennial herbs with long or short rootstocks. Leaves alternate, sometimes all basal: blades flat or plicate. Flowers borne in a terminal simple or branched inflorescence, or solitary. Perianth of 3 sepals and 3 petals. Androeceium of 6, or rarely 9-12 stamens. Gynoeceium 3-car-

pellary: styles distinct. Fruit capsular, septicidal and rarely also loculicidal.—About 40 genera and 150 species, of wide geographic distribution.

Anthers oblong or ovoid, 2-celled.

Anther-sacs introrsely dehiscent.

Anther-sacs extrorsely dehiscent.

Anthers cordate or reniform, sometimes becoming peltate, confluent 1-celled.

Sepals and petals glandless

Sepals and petals with glands at or near the base.

Tribe I. TOFIELDIEAE.

Tribe II. HELONIEAE.

Tribe III. VERATREAE.

Tribe IV. MELANTHIEAE.

#### I. TOFIELDIEAE

Bracts short: flowers subtended by 3 connate bractlets: stamens 6; anthers erect.

Flowers in centripetal racemes: seeds unappendaged.

Flowers in centrifugal panicles: seeds appendaged.

Bracts spathe-like: bractlets wanting: stamens 9-12: anthers versatile.

1. TOFIELDIA.

2. TRIANTHA.

3. PLEEA.

#### II. HELONIEAE

Flowers perfect: sepals and petals ovate or oblong.

Capsule not depressed, 6-seeded, 2 seeds to each cavity: flowers long-pedicelled: leaves slender and wiry.

Capsule depressed, many-seeded: flowers short-pedicelled: leaves with flat blades and fleshy.

Flowers dioecious: sepals and petals clavate-spatulate.

4. XEROPHYLLUM.

5. HELONIAS.

6. CHAMAELIRIUM.

#### III. VERATREAE

Inflorescence paniculate: flowers polygamous or monoecious.

Ovary wholly superior: styles slender: petals obtuse.

Ovary inferior at the base: styles very short and stout: petals acuminate.

Inflorescence racemose or spicate: flowers perfect.

Carpels united to near the tips: sepals and petals narrow: filaments longer than the petals: capsule with narrow erect carpels.

Carpels united below the middle: sepals and petals broad: filaments shorter than the petals: capsule with turgid spreading carpels.

7. VERATRUM.

8. STENANTHIUM.

9. SCHOENOCALON.

10. CHROSPERMA.

#### IV. MELANTHIEAE

Sepals and petals with a single gland each.

Flowers polygamous: rootstock fibrous-coated.

Flowers perfect: rootstock membranous-coated.

Flowers in an ovoid or cylindric raceme: perianth glands obovate or suborbicular.

Ovary wholly superior: capsule ovoid or ellipsoid.

Ovary inferior at the base: capsule conic.

Flowers in a widely branching panicle: perianth glands obcordate.

Sepals and petals with 2 glands each.

Petals barely clawed: flowers perfect: seeds angled: plant glabrous.

Petals long-clawed: flowers polygamous: seeds winged: plant pubescent.

11. OCEANOROS.

12. TOXICOSCORDION.

13. TRACYANTHUS.

14. ANTICLEA.

15. ZYGADENUS.

16. MELANTHIUM.

1. **TOFIELDIA** Huds. Herbs with glabrous foliage. Leaves nearly erect. Flowers perfect, racemose. Petals longer and more concave than the sepals.—About 12 species, mostly natives of the north temperate zone.

1. **T. glabra** Nutt. Plant 3-6 dm. tall: basal leaves with elongate linear blades: raceme 2-10 cm. long: pedicels 2-4 mm. long: sepals oblong, 2.5-3.5 mm. long: petals white, acute: capsule 3-3.5 mm. long.—(WHITE-FEATHERLING.)—Low pinelands, Coastal Plain, Ga. to N. C.—Fall.

2. **TRIANTHA** Nutt. Herbs with pubescent foliage. Leaves erect or nearly so. Flowers perfect, paniculate. Petals greenish-white, longer and slightly narrower than the sepals.—Three known species, besides the following, one in Japan.—WOOD-FEATHERLING.

Petals oblong, permanently membranous: capsule 6-7 mm. long.  
Petals cuneate, becoming rigid: capsule 3-4 mm. long.

1. *T. glutinosa*.  
2. *T. racemosa*.

1. *T. glutinosa* (Michx.) Baker. Plant 1.5-5 dm. tall: basal leaves with elongate linear blades: panicle 2-4 cm. long; pedicels 3-10 mm. long: petals 3-4 mm. long, much shorter than the capsule.—Bogs and moist ground, Blue Ridge and more northern provinces, N. C. to Ohio, Ore., Alas., Ont., and Me.—Spr.

2. *T. racemosa* (Walt.) Small. Plant similar to the preceding in foliage and habit: panicles 2-10 cm. long; pedicels 1-4 mm. long: petals 4-5 mm. long, slightly shorter than the capsule. [*Tofieldia pubens* Ait.]—Low pinelands, in acid soil, Coastal Plain, Fla. to La. and N. J.—Spr.-fall.

3. **PLEEA** Michx. Slender rush-like herbs. Leaves few, erect or nearly so, striate. Flowers in a terminal raceme with appressed partially imbricate spathe-like bracts, green. Sepals slightly longer than the petals.—One species.

1. *P. tenuifolia* Michx. Plant 3-8 dm. tall: basal leaves with elongate linear striate attenuate blades: racemes slender, 3-9-flowered; bracts 1.5-2 cm. long, acuminate: sepals and petals 12-14 mm. long, lanceolate, rather firm: capsule 6-9 mm. long.—(RUSH-FEATHERLING.)—Pineland swamps, Coastal Plain, Fla. to N. C.—Fall.

4. **XEROPHYLLUM** Michx. Stout rigid herbs. Leaves very numerous at the base of the stem, spreading. Flowers perfect, in a raceme-like panicle, white, each subtended by 1-3 narrow branchlets. Sepals and petals broad, 5-9-nerved, the latter longer than the former. Ovules 2-4 in each cavity.—Three known species; besides the following 2 occur in western North America.

1. *X. asphodeloides* (L.) Nutt. Plant 6-15 dm. tall: leaf-blades slenderly attenuate, stiff and wiry: panicle stout, many-flowered; pedicels 1.5-2 cm. long; petals ovate, about 4 mm. long, obtuse: capsule ovoid, 4-5 mm. long.—(TURKEY-BEARD. MOUNTAIN-ASPHODEL.)

—Sandy acid pinelands, Coastal Plain, N. C. (or Fla. ?) to N. J.; acid woods, Blue Ridge to Appalachian Plateau, N. C., to Tenn. and Va.—Spr.—sum.

5. **HELONIAS** L. Stout caulescent herbs. Leaves several or numerous and persistent at the base of the stem, those on the stem much reduced. Flowers perfect, in a dense terminal raceme. Sepals and petals narrowly oblong, 3-veined. Ovary spheroidal. Ovules numerous in each carpel. Capsule lobed. —Following is the only known species:

1. **H. bullata** L. Plant 1.5–6 dm. tall: basal leaves 12–40 cm. long; blades oblanceolate to spatulate: raceme becoming 9–20 cm. long: sepals and petals pink, becoming green, 5–7 mm. long, obtuse: anthers blue: capsule broadly obovoid, 8–9 mm. long, notched at the apex.—(SWAMP-PINK).—Acid bogs, Coastal Plain and Piedmont, Va. (?) or Del. to Staten Id., N. Y.; and acid woods, Blue Ridge, N. C.—Spr.—Flowers hyacinth-scented.

6. **CHAMAELIRIUM** Willd. Fleshy caulescent herbs. Leaves relatively few, the cauline much narrower than the basal. Flowers dioecious, in a bracted spike or raceme. Sepals and petals clavate-spatulate, those of the staminate flowers much longer than those of the pistillate, all 1-nerved. Ovules 6–12 in each cavity.—Following are the only known species.—Spr.—sum.—BLAZING-STARS. DEVIL'S-BITS. SQUIRREL-TAILS.

Capsule ellipsoid or ovoid-ellipsoid, 7–10 mm. long.  
Capsule obovoid or ellipsoid-obovoid, 12–14 mm. long

1. *C. luteum*.  
2. *C. obovale*.

1. **C. luteum** (L.) A. Gray. Stem 2–12 dm. tall, simple: basal leaves spreading; blades spatulate to oblong-spatulate, 5–20 cm. long: staminate perianth white; pistillate green: capsule 7–10 mm. long.—[*C. carolinianum* Willd.]—(FAIRY-WAND. UNICORN-ROOT).—Moist thickets, meadows, and pinelands, various provinces, Fla. to Ark., Mich., Ont., and Mass.

2. **C. obovale** Small. Similar to *C. luteum*, but with longer flowers: capsule longer-pedicelled, 12–14 mm. long.—Woods, Appalachian provinces, Ala. to N. C., W. Va., and N. Y.

7. **VERATRUM** [Tourn.] L. Coarse herbs. Leaves mainly cauline: blades broad, plicate. Flowers polygamous or monoecious, paniculate, the panicle-branches pubescent. Sepals and petals glandless, greenish, yellow, brown, or purple, the latter larger than the former. Capsule narrow. Seeds winged. —About 12 species, natives of the north temperate zone.—VAREBELLS. FALSE HELLEBORES.

Upper stem-leaves sessile or merely clasping.

Pedicels more than twice as long as the subtending bracts.

Pedicels shorter than the subtending bracts or barely twice as long.

Upper stem-leaves with sheathing bases.

1. *V. parviflorum*.

2. *V. intermedium*.

3. *V. viride*.

1. *V. parviflorum* Michx. Stem 6–15 dm. tall: leaf-blades mainly elliptic or oval: panicle-branches spreading: sepals greenish or yellowish-green: petals 4.5–5.5 mm. long.—(HELLEBORE.)—Wooded slopes, Blue Ridge to Appalachian Plateau, Ga. to Tenn., W. Va., and Va.—Sum.

2. *V. intermedium* Chapm. Stem 9–15 dm. tall: leaf-blades narrowly elliptic: panicle-branches ascending or curving upward: sepals and petals brown: petals 8–10 mm. long.—Hammocks, M Fla.—Sum.

3. *V. viride* Ait. Stem 6–25 dm. tall: leaf-blades oval, or narrower on the upper part of the stem: panicle-branches ascending: sepals and petals yellowish-green: petals 11–14 mm. long.—(INDIAN-POKE. AMERICAN WHITE-HELLEBORE. VERNAL-VAREBELL.)—Swamps and damp woods, various provinces, Ga. to Minn. and N. B.—Spr.-sum.—An insecticide is made from the powdered dried roots. Large quantities of roots are gathered in the Appalachians.

8. *STENANTHIUM* Kunth. Graceful caulescent herbs. Leaves mainly basal: blades elongate, channeled. Flowers polygamous or monoecious, paniculate, the panicle-branches glabrous. Sepals and petals white, pinkish, or green, glandless. Seeds angled.—Following are the only known species.—Sum.—fall.—FEATHERBELLS. FEATHER-FLEECES.

Perianth white: capsule deflexed, about 8 mm. long.

Perianth green: capsule erect, fully 10 mm. long.

1. *S. gramineum*.

2. *S. robustum*.

1. *S. gramineum* (Ker.) Morong. Stem 8–15 dm. tall, slender: blades of the lower leaves mostly less than 10 mm. wide: petals of the pistillate flowers 5–6 mm. long: capsule about 8 mm. long, deflexed.—Dry acid woods and hill-sides, various provinces, Fla. to Miss., Ky., and Va.

2. *S. robustum* S. Wats. Stem 10–20 dm. tall, stout: blades of the lower leaves over 10 mm. wide: panicle plume-like: petals of the pistillate flowers 7–8 mm. long: capsule fully 10 mm. long, erect.—Acid swamps, various provinces, S. S. to Ark., Ohio, and Pa.

9. *SCHOENOCALON* A. Gray. Slender scapose herbs. Leaves basal: elongate, channeled. Scape simple. Flowers perfect, in slender spikes or

spike-like racemes. Sepals and petals green, linear, elliptic, or lanceolate, shorter than the filaments. Ovules 4-8 in each cavity. Capsule of a conic type.—Five known species in North America.

1. *S. dubium* (Mich.) Small. Scape 3-9 dm. tall, from a fibrous base: leaves green; blades 2-4 mm. wide: spikes 6-8 mm. wide; bracts usually abruptly pointed: sepals and petals about 2 mm. long, the herbaceous tips often incurved: filaments 2-3 mm. long: capsules 7-9 mm. long. [*S. gracile* A. Gray]—(FEATHER-SHANK.)—Pinelands, Coastal Plain, Fla. and Ga.—Spr.-sum.

10. *CHROSPERMA* Raf. Stout caulescent herbs. Leaves many at the base of the stem, few and small above; blades elongate, flat. Flowers perfect, in a thick raceme. Sepals and petals white, glandless. Carpels united below the middle. Capsule with 3 spreading lobes.—One species.

1. *C. muscaetoxicum* (Walt.) Kuntze. Stem 3-14 dm. tall, sparingly leafy: leaf-blades linear: racemes 5-15 cm. long, about  $\frac{1}{2}$  as thick: sepals oval or suborbicular, 3-3.5 mm. long: petals elliptic, 4-5 mm. long: capsule broader than high, the carpels turgid, 4-6 mm. long. [*Amianthium muscaetoxicum* A. Gray]—(CROW-POISON. FLY-POISON. ST. ELMOS-FEATHER.)—Thickets, acid woods, and pinelands, various provinces, Fla. to Ark. and N. Y.—Sum.—A very toxic alkaloid is contained in the foliage and the roots. Cattle are frequently poisoned by eating it.

11. *OCEANOROS* Small. Slender caulescent herbs, the rootstock fibrous-coated. Leaves mainly basal: blades elongate. Flowers polygamous, paniculate, the upper ones not fruit-producing. Sepals and petals cream-colored or deeper yellow, clawless, each with a pale gland. Seeds few.—Following is the only known species:

1. *O. leimanthoides* (A. Gray) Small. Stem 5-24 dm. tall: leaf-blades linear: panicle pyramidal: sepals and petals oval or nearly so, 4-5 mm. long, obtuse: capsule conic, 8-10 mm. long. [*Amianthium leimanthoides* A. Gray *Zygadenus leimanthoides* A. Gray]—Sandy pinelands and acid sand-hill bogs, Coastal Plain, Ga. to S. La. and N. J.; acid woods, Blue Ridge and Appalachian provinces, Ala. to Va.—Sum.

**12. TOXICOSCORDION** Rydb.

Slender caulescent herbs, the rootstocks membranous-coated. Leaves mainly basal: blades elongate. Flowers perfect, relatively few in a raceme or a panicle. Sepals and petals white or yellowish, sometimes clawed, each with a gland above the base. Seeds numerous.—About 7 species, natives of North America.

1. *T. Nuttalli* (A. Gray) Rydb. Stem 3–7 dm. tall: upper leaves with sheathing bases: sepals and petals ovate-oval, 6–8 mm. long, the gland merging into the surrounding tissue.—(MERRY-HEARTS.)—Prairies, various provinces, Tenn. to Tex. and Kans.—Spr.

**13. TRACYANTHUS** Small. Herbs similar to *Toxicoscordion*. Leaves mainly basal: blades elongate. Flowers perfect, numerous in a thick raceme. Sepals and petals white, pink, or purplish-red, each with a gland at the very base. Carpels united to above the middle. Seeds few.—Two known species, the following, and one in Texas.

1. *T. angustifolius* (Michx.) Small. Stem 5–10 dm. tall, sparingly leafy: leaf-blades linear: raceme cylindric, 5–10 cm. long, about  $\frac{1}{2}$  as thick: sepals and petals obovate, 4–5 mm. long: capsule conic, 15–20 mm. high. [*Helonias angustifolia* Michx. *Amianthium angustifolium* A. Gray]—(CROW-POISON. ST. AGNES' FEATHER.)—Moist pinelands, borders of swamps, and sand-hill bogs, Coastal Plain and occasionally adj. provinces, Fla. to Miss. and N. C.—Spr.

**14. ANTICLEA** Kunth. Herbs similar to *Toxicoscordion* in habit. Flowers perfect, racemose or paniculate. Sepals and petals greenish or yellowish, obscurely or broadly clawed, each with a 2-lobed gland near the middle. Seeds numerous.—About 8 species, North American and Asiatic.

1. *A. chlorantha* (Richards.) Rydb. Stem up to 1 m. tall, glabrous: leaves keeled, the upper sheathing at the base, attenuate, but often blunt at the tip: sepals and petals somewhat spatulate, the gland just below the middle, the blade elliptic or nearly so, obtuse: capsule conic-ovoid, 1.5–2 cm. long.—(WHITE-CAMAS.)—Rocky places and cliffs, Blue Ridge N. C. and various provinces N. Y. to S. D., Sask., and N. B.—Sum.

15. **ZYGADENUS** Michx. Glaucous caulescent herbs, with horizontal rootstocks. Leaves mainly basal: blades elongate. Flowers perfect, paniculate. Sepals and petals white, each with 2 glands above the base or claw. Seeds angled.—Following is the only known species.

1. **Z. glaberrimus** Michx. Stem 5–14 dm. tall: leaf-blades linear: panicle-branches ascending: sepals 11–15 mm. long, with an ovate acute or acuminate blade and a stout claw: petals about as long as the sepals, elliptic to lanceolate-elliptic, clawless: capsule about 1 cm. long.—Sandy bogs, Coastal Plain, Fla. to La. and Va.—Sum.

16. **MELANTHIUM** L. Coarse caulescent herbs. Leaves mainly basal: blades linear or slightly dilated. Flowers monoecious or polygamous, paniculate, the panicle-branches pubescent. Sepals and petals white, cream-colored, or greenish, each with 2 glands above the claw. Seeds winged. The genus comprises only the following species.—Sum.—BUNCH-FLOWERS.

Blades of the sepals and petals suborbicular reniform, often acute, undulate, the filaments adnate the whole length of the claws: leaf-blades manifestly broadest above the middle.

Blades of the sepals and petals elliptic, entire, the filaments adnate to the base of the claws: leaf-blades linear or nearly so.

Panicle narrow, elongate, central axis much surpassing the branches: flowers numerous: blades barely twice as long as the claws of the sepals and petals.

Panicle about as broad as long, central axis not surpassing the branches: flowers few: blades fully thrice as long as the claws of the sepals and petals.

1. *M. latifolium*.

2. *M. virginicum*.

3. *M. dispersum*.

1. **M. latifolium** Desv. Stem 5–12 dm. tall: leaf-blades broadened above the middle, acute or acuminate: panicle 2–6 dm. long: perianth whitish: sepals and petals with claws nearly as long as the blades.—Swamp margins, meadows, and woods, Piedmont and rarely adj. provinces, S. C. to Pa. and Conn.

2. **M. virginicum** L. Stem 7–17 dm. tall: leaf-blades linear, attenuate: panicle narrow, 1–5 dm. long: perianth greenish-yellow: sepals and petals with claws about  $\frac{1}{2}$  as long as the blades.—Wet meadows, swamps, and moist pine-lands, various provinces, N Fla. to Tex., Minn., and R. I.—The persistent perianth often turns red or brown. In the figure the filaments are partly pulled away from the perianth-claws.

3. **M. dispersum** Small. Stem 9–20 dm. tall: leaf-blades linear, attenuate: panicle very broad: perianth greenish: sepals and petals with claws about  $\frac{1}{3}$  as long as the blades.—Woods, Coastal Plain, N Fla. to Miss. and N. C.

## FAMILY 2. JUNCACEAE — RUSH FAMILY

Perennial or sometimes annual herbs, usually grass-like in habit. Leaves with flat blades, or terete. Flowers scattered along the inflorescence-branches, or in dense heads. Perianth inconspicuous, whitish, green, yellowish, or brownish. Calyx of 3 chaffy sepals. Corolla of 3 petals nearly or quite similar to the sepals. Androecium of 3 or 6, or rarely 4 or 5 stamens. Gynoecium 3-carpellary. Ovary 1-3-celled. Fruit a loculicidal capsule, or opening irregularly. Seeds sometimes appendaged.—Eight genera and about 300 species, of wide geographic distribution.

Leaf-sheaths open: capsule 1- or 3-celled with axial or parietal placentae: seeds many.

Leaf-sheaths closed: capsule 1-celled with basal placentae: seeds 3.

1. **JUNCUS** [Tourn.] L. Glabrous or merely scabrous herbs. Leaves terete or with flat but thick blades. Bracts subtending the flowers, mostly entire.—About 215 species, most abundant in the Northern Hemisphere.—Spr.-fall, or all year S.—**RUSHES**.

Lower bract of the inflorescence terete, not markedly channeled, erect, appearing like a continuation of the scape, the inflorescence thus appearing lateral.

Lower bract of the inflorescence not appearing like a continuation of the scape, the inflorescence therefore usually appearing terminal.

Leaf-blades with their flat surface facing the stem, or terete or channeled, not provided with node-like septa.

Flowers bracteolate, borne singly on the inflorescence-branches, or sometimes clustered, but never capitate.

Flowers not bracteolate, capitate on the inflorescence-branches.

Leaf-blades either terete and not flattened, or flattened or compressed, with the flat surfaces not facing the stem, hollow and provided with septa.

Leaf-blades terete, the pith perforated with slender tubes: clusters of the inflorescence reduced to a single flower each.

Leaf-blades either terete, hollow, and with node-like septa, or flattened or compressed or both: clusters of the inflorescence few-many-flowered.

Stamens 6, one facing each sepal and each petal.

Stamens 3, one facing each sepal.

## I. EFFUSI.

## II. BUFONII.

## III. MARGINATI.

## IV. ABORTIVI.

## V. ARTICULATI.

## VI. ACUMINATI.

## I. EFFUSI

Flowers bracteolate, borne singly on the branches of the inflorescence.

Stamens 3: sepals and petals about as long as the capsule: petals acute or acuminate: capsule of an obovoid type.

Stamens 6: sepals and petals about  $\frac{1}{2}$  as long as the capsule: petals obtuse: capsule of an ovoid type.

Flowers not bracteolate, borne in heads on the branches of the inflorescence.

1. *J. effusus*.

2. *J. gymnocarpus*.

3. *J. Roemerianus*.

## II. BUFONII

Leaf-blades flat, but sometimes involute in drying so as to appear terete. (See also *J. dichotomus* below.)

Plant annual: inflorescence, exclusive of its bracts, more than one-third the height of the plant: anthers shorter than the filaments.

Plant perennial: inflorescence, exclusive of its bracts, less than one-third the height of the plant (except sometimes in *J. Georgianus*, and the anthers then longer than the filaments).

Inflorescence 1-3-flowered: leaves with fimbriate auricles.

Inflorescence several-many-flowered: leaves with entire auricles.

Plant caulescent: sepals and petals obtuse.

Plant scapose: sepals and petals acute or acuminate.

4. *J. bufonius*.

5. *J. trifidus*.

6. *J. Gerardi*.

Auricles at the summit of the leaf-sheath membranous or scarious, whitish.

Auricles membranous, scarcely scarious, rarely if at all prolonged beyond the point of insertion.

Sepals and petals 2.5-4 mm. long: capsule about as long as the perianth.

Flowers and fruit conspicuously secund: perianth 2.5-3.5 mm. long: anthers longer than the filaments: bracts shorter than the inflorescence: capsules oval.

Flowers scarcely or not at all secund: perianth 3-4 mm. long: anthers shorter than the filaments: bracts exceeding the inflorescence: capsules ovoid-ellipsoid or ellipsoid.

Sepals and petals 4-6 mm. long: capsule shorter than the perianth.

Auricles scarious, markedly prolonged beyond the point of insertion.

Auricles at the summit of the leaf-sheath cartilaginous, yellow to yellow-brown.

Leaf-blades terete, channeled along the upper side.

Lowest bract less than 4 times the length of the inflorescence: capsule ellipsoid or obovoid, with the ordinary dehiscence.

Lowest bract rarely less than 4 times the length of the inflorescence: capsule globose-ovoid, breaking up irregularly in age.

7. *J. secunans*.

8. *J. interior*.

9. *J. georgianus*.

10. *J. tenuis* *maier*

11. *J. Dudleyi*.

12. *J. dichotomus*. *Tenuis*

13. *J. setaceus*.

### III. MARGINATI

Stem floating, creeping or diffusely spreading: capsule of a subulate type.

Stem erect or nearly so: capsule of an obovoid type.

Perianth at least  $\frac{1}{2}$  longer than the capsule: anthers yellow.

Perianth equalling or barely exceeding the capsule: anthers reddish-brown.

Heads of the inflorescence commonly 5-15, usually 5-10-flowered: plants mostly less than 5 dm. tall.

Heads of the inflorescence numerous, except in depauperate plants, usually 2-5-flowered: plants mostly over 5 dm. tall.

14. *J. repens*.

15. *J. filipendulus*.

16. *J. marginatus*.

17. *J. aristulatus*.

### IV. ABORTIVI

Rootstock thick and woody: leaves rigid: panicle compound, the slender branches diffuse: flowers scattered.

18. *J. abortivus*.

### V. ARTICULATI

Leaf-blades divergent from the stem: sepals longer than the petals.

19. *J. Torreyi*.

### VI. ACUMINATI

Capsule truly subulate.

Uppermost leaf-sheath with an almost obsolete blade, this seldom exceeding 1 or 2 cm. in length.

Uppermost leaf-sheath with a normal blade few to several cm. in length.

Stamens as long as the petals, the anthers exerted between them.

Stamens considerably shorter than the petals: anthers included.

Leaf-blades flattened and usually with incomplete septa: capsule markedly beaked, the valves in dehiscence curved outward in the middle, but united above by the beak.

Leaf-blades slightly compressed, the septa complete: capsule beakless, the valves separating throughout in dehiscence.

Capsule ellipsoid to linear-lanceolate in outline, obtuse or acute at the apex, or sometimes mucronate, but not truly subulate.

Capsule one-half to two-thirds as long as the perianth.

20. *J. megacephalus*.

21. *J. scirpoides*.

22. *J. polycephalus*.

23. *J. validus*.

24. *J. brachycarpus*.

Capsule equalling the perianth in length or exceeding it.

Seed 0.7-2.5 mm. long, the body tapering at either end into a white tail of varying length.

Plant rigid throughout; stem 2-4 mm. in diameter; sepals and petals spinescent: capsule dark red, firm, exceeding the perianth by about  $\frac{1}{2}$  their length.

Plant with none of its parts unusually stiff or hard: stem less than 2 mm. in diameter, or the capsule not exerted from the perianth by more than 1 mm.

Seed 0.35-0.55 mm. long, the body with a short, rather abrupt, papilla-like, usually dark-colored apiculation at either end.

Capsule nearly twice the length of the perianth, the two together 3.5-5 mm. long.

Capsule equalling or sometimes about one-third exceeding the perianth, the two together 2-3.5 mm. long.

✓ Perianth 2-2.5 mm. long.

Larger basal leaf-blades with more than 40 septa: capsule green or straw-colored: plants usually over 5 dm. tall.

Larger basal leaf-blades with less than 40 septa: capsule dark-brown above at maturity.

Perianth 2.5-3.5 mm. long, or if less the capsule straw-colored at maturity and the whole plant less than 5 dm. tall.

Sepals and petals 2.5-3.5 mm. long: capsule ovoid-lanceolate in outline, broadly acute and mucronate, about as long as the perianth.

Sepals and petals 2-2.5 mm. long: capsule linear-lanceolate in outline, obtuse and merely apiculate, about one-third exceeding the perianth.

25. *J. trigonocarpus*.

26. *J. canadensis*.

27. *J. diffusissimus*.

28. *J. robustus*.

29. *J. Elliottii*.

30. *J. acuminatus*.

31. *J. debilis*.

1. *J. effusus* L. Scape 5-12 dm. tall, striate near the top: leaf-blades obsolete, or mere acicular rudiments: inflorescence open: flowers perfect: mature perianth 2.5-3 mm. long: sepals and petals lanceolate: capsule obovoid, readily dehiscent, rounded at the apex.—(RICE-RUSH. SOFT-RUSH.)—Swamps and low grounds, various provinces, U. S. and S Can.—(*Mex., O. W.*)—The scapes are sometimes woven into matting for floor-covering.

2. *J. gymnocarpus* Coville. Scape 3-8 dm. tall: leaf-blades obsolete: flowers perfect: sepals ovate-lanceolate, apiculate: petals ovate, obtuse, 1.5-2 mm. long, shorter than the sepals: capsule barely dehiscent.—Acid swamps; known only on Coastal Plain in W Fla. and on Appalachian plateau in E Pa.

3. *J. Roemerianus* Scheele. Scape 5-12 dm. tall: leaf-blades elongate: flowers mostly dioecious: sepals linear-lanceolate, 2.5-3.5 mm. long: petals linear-elliptic, shorter than the sepals: capsule longer than the sepals.—(BLACK-RUSH. BROWN-RUSH.)—Brackish marshes, Coastal Plain, Fla. to Tex. and N. C.—The copious growth of this dark-hued plant gives a brown aspect to tidal-flats and salt-marshes.

4. *J. bufonius* L. Stem mostly less than 2 dm. tall: leaf-blades flat, or involute on small plants: panicle diffuse: sepals elliptic-lanceolate, 4-6 mm. long, acuminate: petals linear-elliptic, obtuse, shorter than the sepals: stamens less than  $\frac{1}{2}$  as long as the perianth: capsule oblong.—Roadsides, damp grounds, and dried pools, various provinces, U. S. and S Can.—(*W. I., Mex., C. A., S. A., O. W.*)

5. *J. trifidus* L. Stem 1-3 dm. tall: leaf-blades rudimentary, except that of the single stem-leaf: lower bracts resembling the stem-leaf: sepals lanceolate, 3-4 mm. long, acute: petals elliptic, shorter than the sepals: capsule obovoid.—Sterile soil, Blue Ridge and more northern provinces. N. C. to N. Can. (*O. W.*)
6. *J. Gerardi* Lois. Stem 2-6 dm. tall: leaf-blades elongate-linear: flowers paniculate: sepals narrowly oblong, 2.5-3 mm. long: petals narrowly lanceolate, slightly shorter than the sepals, the midrib green: capsule ovoid.—(*HOG-RUSH. BLACK-GRASS RUSH.*)—Salt meadows, Coastal Plain and New England Coast, Fla. to Me.; Great Lake Lowland, Ill. to Mich.—(*O. W.*)
7. *J. secundus* Beauv. Scape 1-4 dm. tall: flowers permanently approximate: sepals becoming 3.5 mm. long: petals green, longer than the sepals, about as long as the capsule.—Swamps, muddy banks, and dry sandy soil, Coastal Plain and adj. provinces, N. C. to Me.
8. *J. interior* Wiegand. Scapes 1-5 dm. tall, pale-green: flowers rather irregularly borne on the inflorescence-branches and scattered: sepals becoming 4 mm. long: petals straw-colored, much shorter than the sepals, slightly longer than the capsule.—Dry woods or prairies, various provinces, Miss. and Tenn. to Ariz., Wyo., and Ill.
9. *J. georgianus* Coville. Scapes 1-4 dm. tall: involueral bract shorter than the inflorescence: sepals becoming 5-6 mm. long: petals green, slightly shorter than the sepals, much longer than the oblong capsule.—Flat granite rocks, Piedmont, Ga. to N. C.
10. *J. tenuis* Willd. Scape 2-9 dm. tall: auricles of the leaf-sheaths scarious: sepals lanceolate, 3-4 mm. long, acuminate: petals slightly broader than the sepals, much longer than the ovoid or obovoid capsule: anthers much shorter than the filaments.—(*HEMP-RUSH. WIRE-GRASS RUSH.*)—Low grounds, paths, and roadsides, various provinces, U. S. and S. Can. Introd. in Eu.
11. *J. Dudleyi* Wiegand. Scape 3-10 dm. tall: auricles of the leaf-sheaths cartilaginous: sepals 4-5 mm. long, lanceolate, becoming very firm: petals shorter than the sepals, acuminate, slightly longer than the oval capsule: stamens 6; anthers shorter than the filaments.—Hillsides and damp calcareous soil, various provinces, Tenn. to Tex., N. M., Wash., Sask., Ont., and Pa.—(*Mex.*)
12. *J. dichotomus* Ell. Scape 2-9 dm. tall: leaf-blades merely terete (flat in *J. dichotomus platyphyllus*): inflorescence terminal: sepals narrowly lanceolate, 3-4 mm. long, becoming very rigid: petals somewhat smaller than the sepals, longer than the ellipsoid capsule.—Sandy soil, Coastal Plain and adj. provinces, Fla. to Tex., Ind., and Mass.
13. *J. setaceus* Rostk. Scapes in dense tufts, spreading, 3-11 dm. long: leaf-blades rudimentary: involueral bract appearing like a continuation of the scape: inflorescence apparently lateral: sepals lanceolate, 3.5-5 mm. long, very rigid: petals ovate-lanceolate, much shorter than the sepals, shorter than the globular-ovoid or spheroidal capsule: stamens 6.—Marshes and springy places, various provinces, Fla. to Tex., Mo., and N. J.
14. *J. repens* Michx. Stem stoloniferous, becoming 4-6 dm. long: leaf-blades 3-8 cm. long, filiform-acuminate at the apex: heads 1-8, panicle, 5-10-flowered: sepals subulate-lanceolate, 4-8 mm. long: petals more attenuate than the sepals, 6-10 mm. long, much longer than the columnar capsule: stamens 3. [*Cephaloxys flabellata* Desv.]—Streams, ponds, swamps, and ditches, various provinces, Fla. to Tex., Okla., and Del.—(*W. I.*)
15. *J. filipendulus* Buckl. Stem 1-3 dm. tall: basal leaves about  $\frac{1}{2}$  as tall as the stem; blades 1-2.5 mm. wide: heads commonly 2 or 3, 4-7-flowered: sepals

lanceolate, attenuate, 4–5.5 mm. long: petals similar to the sepals but slightly longer, nearly twice as long as the narrowly obovoid capsule: stamens 3.—Low grounds, interior provinces, Ala. to Tex., and Tenn.

16. *J. marginatus* Rostk. Stem 1.5–5 dm. tall, somewhat bulbous at the base: blades of the basal leaves 1–3 mm. wide: heads relatively large, commonly 5–15 together: sepals ovate to ovate-lanceolate, 2.5–3 mm. long, acute: petals obovate or elliptic-obovate, obtuse, slightly longer than the sepals, slightly longer than the obovoid capsule: stamens 3.—Moist grounds, various provinces, Fla. to Tex., Nebr., Ont., and Me.

17. *J. aristulatus* Michx. Stem 6–12 dm. tall, markedly bulbous-thickened at the base (from thick woody rootstocks in *J. aristulatus biflorus*): blades of the basal leaves mainly 3–5 mm. wide: heads relatively small, 20–100: sepals 2–2.5 mm. long, acute or acuminate: petals slightly longer than the sepals, obtuse or acutish, about as long as the obovoid capsule.—Moist soil or meadows, Coastal Plain, Piedmont, and Great Lake Lowland, Fla. to Tex., Mich., and N. Y.—(*W. I., Mex.*)

18. *J. abortivus* Chapm. Stem 3–6 dm. tall, from a stout rootstock: leaf-blades terete, slightly nodose: panicle-branches filiform: sepals lanceolate, 1.5–2 mm. long, acute: petals slightly longer than the sepals, obtuse, shorter than the conic capsule.—Pond-margins, Coastal Plain, M. Fla. to S. C.

19. *J. Torreyi* Coville. Stem 2–10 dm. tall, from a slender rootstock: leaf-blades terete, 1–2.5 mm. thick: heads 1–6 or rarely 15–20, aggregated, surpassed by the involucre bract: sepals subulate, 4–5 mm. long: petals shorter than the sepals, less attenuate: capsule barely exceeding the perianth, the beak 1–1.5 mm. long.—Low grounds and ditches, various provinces, Fla. to Tex., Sask., and Mass.

20. *J. megacephalus* M. A. Curtis. Stem 3–10 dm. tall: leaf-blades rather stout, those of the stem-leaves relatively short: heads 8–12 mm. thick, 1–40, scattered: lowest involucre bract almost bladeless: sepals subulate, 3–3.5 mm. long: petals shorter than the sepals, less attenuate: capsule subulate, about as long as the sepals.—Wet sandy soil or swamps, usually calcareous, Coastal Plain, Fla. to Va.

21. *J. scirpoides* Lam. Stem 2–9 dm. tall: leaf-blades terete, 2–3 mm. thick, the septa complete: heads globose, not lobed (or lobed, sepals about 2 mm. long, and capsule about 2.5 mm. long in *J. scirpoides compositus*): sepals subulate-lanceolate, about 3 mm. long: petals slightly shorter than the sepals: capsule slender, mostly 4–5 mm. long, thus much exceeding the perianth.—River-banks, moist sandy places, and swamps, Coastal Plain and Great Lake Lowland, Fla. to Tex., Ind., and N. Y.

22. *J. polycephalus* Michx. Stem mainly 8–11 dm. tall: leaf-blades flat, 3–8 mm. broad, the septa incomplete: sepals lanceolate, 3–4 mm. long: petals slightly shorter and more attenuate: beak of the capsule much exerted.—Ponds and ditches, Coastal Plain, Fla. to Tex. and Va.—The spongy leaves are evidently equitant.

23. *J. validus* Coville. Stem 4–10 dm. tall, compressed: leaf-blades merely compressed, 2–4 mm. wide, septa complete: heads scattered: sepals subulate-lanceolate, attenuate, 3.5–5 mm. long: petals much shorter than the sepals: capsule subulate, much exceeding the perianth.—Sandy soil, Coastal Plain and occasionally adj. provinces, Miss. to Tex. and Mo.

24. *J. brachycarpus* Engelm. Stem 2–9 dm. tall, terete: leaf-blades terete, 2 mm. thick or less: heads scattered or rarely solitary: sepals subulate-lanceolate,

3-3.5 mm. long, attenuate: petals about  $\frac{1}{4}$  shorter than the sepals: capsule oblong, slightly shorter than the petals.—Low grounds or sandy places, various provinces, Ga. to Ark., Ont., and Md.

25. *J. trigonocarpus* Steud. Stem 6-12 dm. tall, terete, or nearly so: leaf-blades nearly as thick as the stem: heads usually numerous and 2-4-flowered: sepals lanceolate, 3-3.5 mm. long, acute: petals somewhat longer than the sepals: capsule narrowly pyramidal, nearly twice as long as the sepals.—Sandy bogs, mostly in pinelands, Coastal Plain and Piedmont, Fla. to La. and S. C.

26. *J. canadensis* J. Gay. Stem 3-12 dm. tall: heads many-flowered, rather crowded: sepals lanceolate, 3-3.5 mm. long: petals longer than the sepals, attenuate, nearly as long as the stout capsule: capsule narrowly conic: seeds long-tailed at each end.—Low grounds, various provinces, Ga. to La., Minn., and Newf.

27. *J. diffusissimus* Buckl. Stem 3-6 dm. tall: inflorescence with elongate widely spreading branches, the heads 3-12-flowered, scattered: sepals narrowly linear-lanceolate, 2.5-3.5 mm. long: petals nearly like the sepals, about  $\frac{1}{2}$  as long as the slender capsule: seeds abruptly apiculate.—Low grounds, various provinces, Ga. to Tex., Kans., and Ind.

28. *J. robustus* (Engelm.) Coville. Stem 6-10 dm. tall: inflorescence with 300-500 heads: sepals subulate-lanceolate, 2-3 mm. long: petals nearly equal to the sepals: capsule generally slightly longer than the sepals.—Low grounds, Coastal Plain and Interior Provinces, La. to Tex., Kans., Ill., and Tenn.

29. *J. Elliottii* Chapm. Stem 2-8 dm. tall: inflorescence with 5-50 heads (100-200 heads in *J. Elliottii polyanthemus*): sepals lanceolate, 2-2.5 mm. long: petals slightly shorter than the sepals: capsule exceeding the sepals.—(BOG-RUSH.)—Bogs and ditches, Coastal Plain, Fla. to Tex. and N. C.

30. *J. acuminatus* Michx. Stem 2-8 dm. tall: heads generally 5-12-flowered: sepals lanceolate-subulate, 2.5-3.5 mm. long: petals slightly shorter than the sepals: capsule about equalling the sepals, ovoid: seeds acute at both ends.—(KNOT-LEAVED RUSH.)—Moist soil, ditches, meadows, and stream-banks, various provinces, Ga. to Tex., Minn., and Me.; also in W N. A.—(Mex.)

31. *J. debilis* A. Gray. Stem 2-4 dm. tall: heads generally 2-6-flowered: sepals narrowly lanceolate, 2-2.5 mm. long: petals nearly equalling the sepals: capsule oblong, exceeding the sepals and petals. [*J. acuminatus debilis* Engelm.]—Moist soil and wet sandy places, in acid soil, various provinces, Fla. to Miss., Ark., Mo., and R. I.

2. **JUNCOIDES** Adans. Pubescent herbs. Leaf-blades flat and relatively thin, or sometimes involute. Bracts subtending the flowers usually lacerate or denticulate. Perianth greenish.—About 65 species, widely distributed.—Spr. —WOOD-RUSHES.

Peduncles terminated by 1 or 2 flowers or by a cyme: capsule of an ovoid type.

Filaments deltoid, one-third or one-fourth as long as the anthers: peduncles with 1 or 2 flowers.

Filaments lanceolate, about as long as the anthers: peduncles cymose at the tip.

Peduncles terminated by compact spikes: capsule of an obovoid type.

Sepals and petals 3-4 mm. long: capsule much surpassed by the perianth.

Sepals and petals 2-2.5 mm. long: capsule surpassing the perianth or about equalling it in length.

1. *J. saltuense*.

2. *J. caroliniae*.

3. *J. echinatum*.

4. *J. bulbosum*.

1. *J. saltuense* (Fernald) Small. Plants 1-4 dm. tall: stem-leaves 1.5-4.5 cm. long: peduncles 1-2-flowered: sepals and petals broadly lanceolate, becom-

ing 3-4 mm. long: filaments  $\frac{1}{3}$  or  $\frac{1}{4}$  as long as the anthers: style longer than the stigmas: capsule 3.5-4.5 mm. long.

—Woods, various provinces, Ga. and Tenn. to Ore., Alas., Ont., and Newf. —(*Asia*.)

2. *J. carolinæ* (S. Wats.) Kuntze. Plant 1-3 dm. tall: leaf-blades flat, 3-9 mm. wide, ciliate, and webbed on both surfaces, gland-like at the blunt tip: flowers solitary or 2 together: sepals, and petals, 3.5-4 mm. long, lanceolate: filaments nearly as long as the anthers: style shorter than the stigmas: capsule ovoid, surpassing the perianth. [*J. pilosum* (Fl. SE. U. S.)]—Woods, Blue Ridge, N. C. and Tenn.

3. *J. echinatum* Small. Plant 2.5-5 dm. tall: the stem without bulblets at the base: sepals and petals lanceolate, the tips soft: capsule 2.5-3 mm. long.—Woods and thickets, Piedmont to Appalachian provinces, Ga. to Ala., and N. C.

4. *J. bulbosum* (Wood) Small. Plant 1-4 dm. tall, the stem arising from a cluster of bulblets: sepals and petals ovate-lanceolate, the tips firm: capsule mainly 2.5-3 mm. long.—Woods, thickets, and barrens, various provinces, Ga. to Tex., Kans., and Md.

### FAMILY 3. NARTHECIACEAE — BOG-ASPHODEL FAMILY

Perennial herbs with elongate rootstocks. Leaves alternate. Flowers borne in an erect narrow raceme-like panicle. Perianth of 3 sepals and 3 nearly similar petals. Androecium of 6 stamens. Gynoecium 3-carpellary: styles united. Fruit capsular, loculicidal. One genus.

1. *ABAMA* Adans. Rush-like caulescent herbs. Leaves mainly basal, erect and equitant, the blades very narrowly linear. Sepals and petals obscurely 3-veined, glandless. Five species, in the Northern Hemisphere.—Sum.

Sepals and petals 6-7 mm. long: panicle lax, the flower-stalks very slender, much longer than the bracts.

Sepals and petals 4-5 mm. long: panicle compact, the flower-stalks stoutish, about as long as the bracts or nearly so.

1. *A. montana*.

2. *A. americana*.

1. *A. montana* Small. Stem 2-5 dm. tall, with remote very narrow leaves: panicle lax; flower-stalks longer than the sepals: perianth yellow: anthers lanceolate, fully 1.5 mm. long, scarcely half as long as the filaments: capsule subulate-conic, 8-10 mm. long, long-beaked.—(MOUNTAIN-ASPHODEL.)—Swamps, Blue Ridge, N. C.

2. *A. americana* (Ker) Morong. Stem 3-6 dm. tall, with narrow leaves: panicle close; flower-stalks shorter than the sepals: perianth yellow; anthers ellipsoid, less than 1.5 mm. long, one-third to one-fourth as long as the filaments: capsule narrowly conic, 10-12 mm. long, short-beaked.—(YELLOW-ASPHODEL.)—Sandy bogs, pine barrens, Coastal Plain, S. C. to N. J.

FAMILY 4. **ALLIACEAE** — ONION FAMILY

Perennial herbs with coated bulbs or corms. Leaves basal or mainly so: blades typically narrow. Flowers in a terminal umbel subtended by a scarious involucre at the top of the simple scape or stem. Perianth of 3 sepals and 3 petals, persistent. Androecium of 6 stamens. Gynoecium 3-carpellary. Ovary superior. Styles united. Fruit a loculicidal capsule. —About 20 genera and 360 species, widely distributed.

Ovules or seeds 1 or 2 in each cavity: plant with an onion-like odor.

Ovules 2 in each cavity: scape or stem accompanied by leaves.

Ovule 1 in each cavity: scape not accompanied by leaves.  
Ovules or seeds several in each cavity: plant destitute of an onion-like odor.

1. *ALLIUM*.2. *VALIDALLIUM*.3. *NOTHOSCORDUM*.

1. **ALLIUM** [Tourn.] L. Alliaceous herbs. Leaf-blades narrow, soft, flat, hollow or keeled. Perianth white, pink, or purple in our species. Stamens with nearly equal filaments or alternately appendaged. —About 300 species of wide geographic distribution. —ONIONS. GARLICS.

Bulb with membranous-scaly outer coats.

Umbel horizontal or nodding: plant scape: sepals and petals very broad.

Perianth campanulate, mostly white or pink; sepals acute or abruptly pointed.

Perianth urceolate, mostly deep-purple; sepals obtuse or notched.

Umbel erect: plant caulescent: sepals and petals relatively narrow.

Bulb with fibrous-matted outer coats.

Flowers replaced, at least in part, by bulblets.

Flowers neither replaced by, nor accompanied by bulblets.

Ovary and capsule not crested: sepals and petals obtuse.

Umbel open, the pedicels elongate: petals over 4.5 mm. long.

Umbel compact or head-like, the pedicels short: petals less than 4.5 mm. long.

Ovary and capsule crested: sepals and petals acuminate.

1. *A. cernuum*.2. *A. allegheniense*.3. *A. vineale*.4. *A. canadense*.5. *A. microscordium*.6. *A. arenicola*.7. *A. Cuthbertii*.

1. **A. cernuum** Roth. Scape 2-6 dm. tall, 2-edged: umbel nodding; pedicels becoming 2-3 cm. long: sepals acute: petals oval or broadly ovate, rounded or abruptly pointed at the apex, 4.5-6 mm. long: capsule 4-5 mm. long. —(WILD-ONION. LADY'S-LEEK.) —Rocky hillsides and prairies, various provinces N of Coastal Plain, S. C. to Tex., Sask., and N. Y. —Sum.

2. **A. allegheniense** Small. Scape 3-5 dm. tall, becoming 2-edged: umbel nodding: pedicels 1.5-2.6 cm. long: sepals obtuse or notched at the apex: petals ovate, notched at the apex, 5-6.5 mm. long: capsule nearly as in *A. cernuum*. —(MOUNTAIN-RAMP.) —Cliffs and rocky soil, Blue Ridge to Appalachian Plateau, Ga. to Tenn. and Va. —Sum.

3. **A. vineale** L. Stem 3-9 dm. tall: leaves terete: umbel erect, the flowers wholly or partially replaced with bulblets: perianth green, pink, or purple: sepals narrowly ovate to elliptic-ovate, 4-5 mm. long: petals slightly longer than the sepals: filaments opposite the petals with 2 lateral appendages. —

(FIELD-GARLIC. CROW-GARLIC. RAMP.)—Fields, meadows, and thickets, various provinces, Ga. to Ark., Mo., and N. H. Nat. of Eu.

4. *A. canadense* L. Stem 2-6 dm. tall: umbel erect, with most of the flowers replaced with bulblets: perianth pink or white: sepals elliptic to elliptic-lanceolate, 5-7 mm. long: petals lanceolate to elliptic-lanceolate, slightly longer than the sepals, acute or acutish at the apex: filaments alternately longer and shorter. [*A. mutabile* Michx. *A. continuum* Small]—(MEADOW-LEEK. WILD-ONION. ROSE-LEEK.)—Thickets, meadows, and fields, various provinces, Fla. to Tex., Ont., and N. B.—Spr.—fall.

5. *A. microscordium* Small. Scape 2-5 dm. tall: umbel erect, simple: pedicels over 10 mm., mostly 15-25 mm. long: perianth pink: sepals elliptic to elliptic-ovate or elliptic-lanceolate, 4.5-7 mm. long, obtuse: petals mostly narrower than the sepals. [*A. mutabile* Chapm. Not Michx.]—Sandy soil or hillsides, various provinces, W Fla. to Tex. and Nebr.—Spr.

6. *A. arenicola* Small. Scape 1-3 dm. tall: umbel erect: pedicels mostly less than 10 mm. long: perianth deep-pink, not tubular: sepals ovate or elliptic-ovate, or rarely narrower, 3-4.5 mm. long, delicate, obtuse: petals narrower than the sepals.—Sandy woods, Coastal Plain, N Fla. to Tex. and Okla.—Spr.

7. *A. Cuthbertii* Small. Scape 1.5-3.5 dm. tall: umbel erect: pedicels 2-2.5 cm. long: perianth white: sepals narrowly lanceolate to linear-lanceolate, 6-9 mm. long, long-acuminate: petals similar to the sepals: stamens alternately larger and smaller: anthers about 1.5 mm. long: capsule crested.—(STRIPED-GARLIC.)—Sandy woods, Coastal Plain, Fla. to Ala. and N. C.—Spr.

2. **VALIDALLIUM** Small. Alliaceous herbs. Leaf-blades dilated. Perianth white or pale. Stamens unequal, the filaments alternately subulate and lanceolate.—Represented only by the following species:

1. *V. tricoccum* (Ait.) Small. Leaves vernal; blades oblong to oblong-elliptic, 1-3 dm. long: scape 1-4 dm. tall: umbel erect: perianth white: sepals elliptic, 5-7 mm. long, obtuse: petals oval, longer than the sepals, somewhat shorter than the filaments: capsule about 6 mm. broad. (WILD-LEES. RAMP. RAMP-SCALLIONS.)—Rich woods and hillsides, various provinces, rarely Coastal Plain, Ga. to Minn. and N. B.—Sum.—The bulbs, being pleasantly flavored, are much sought after by the natives of the mountains.

3. **NOTHOSCORDUM** Kunth. Scapose herbs, resembling *Allium*, but not odorous. Leaf-blades narrow, elongate, straight. Perianth white, greenish, or yellow. Sepals and petals distinct. Filaments distinct, essentially equal. Ovary glabrous.—About 12 species, mostly in tropical America.—Spr.—FALSE-GARLICS. GRACE-GARLICS.

Leaf-blades narrow, mostly 1-3.5 mm. wide: ovary scarcely longer than thick: capsule subglobose.  
Leaf-blades broad, mostly 8-12 mm. wide: ovary much longer than thick: capsule obovoid.

1. *N. bivalve*.

2. *N. fragrans*.

1. *N. bivalve* (L.) Britton. Plant 1-4 dm. tall, the scape slender: leaf-blades mostly less than 4 mm. wide, few-veined: umbel usually few-flowered: sepals and petals elliptic to linear-elliptic, 8-11 mm. long: capsule subglobose, about 5 mm. long, not stipitate, the valves sub-orbicular.—Sandy soil, open woods, rocky places, fields, and prairies, various provinces, Fla. to Tex., Nebr., and Va.—(*Mex.*)

2. *N. fragrans* (Vent.) Kunth. Plant 3-8 dm. tall, the scape stout: leaf-blades mostly over 7 mm. wide, many-veined: umbel usually many-flowered: sepals and petals elliptic or ovate-elliptic above a narrowed base, 9-12 mm. long: capsule obovoid, 8-10 mm. long, with a stout stipe-like base, the valves elliptic.—Sandy roadsides, woods, and cult. grounds, Fla. to La. and S. C. Nat. of Africa.—(*W. I., Mex.*)

#### FAMILY 5. LILIACEAE — LILY FAMILY

Perennial mainly caulescent herbs. Leaves alternate to whorled, sometimes all basal: blades entire or essentially so. Flowers solitary or variously clustered. Calyx of 3 sepals. Corolla of 3 petals, together with the sepals sometimes partially united into a tube. Androecium of 6 stamens, the anthers distinct. Gynoecium of 3 united carpels. Fruit a loculicidal capsule.—About 100 genera and 1,000 species of wide geographic distribution.

Sepals and petals distinct.

Anthers not introrse: bulbs scaly or solid (corms).

Tribe I. LILIEAE.

Anthers introrse: bulbs coated.

Tribe II. SCILLEAE.

Sepals and petals partly united.

Perianth globose-urceolate, blue: anthers very short.

Tribe III. MUSCARIEAE.

Perianth funnellform, brownish-red or yellow: anthers elongate.

Tribe IV. HEMEROCALLIDEAE.

##### I. LILIEAE

Anthers versatile: leaves several or many, cauline: seeds flat.

1. LILIUM.

Anthers erect: leaves 2, basal: seeds globose.

2. ERYTHRIONUM.

##### II. SCILLEAE

Sepals and petals elongate: anthers of a linear type: capsule not three-lobed at the apex.

Filaments not flattened: perianth blue or purple.

3. QUAMASIA.

Filaments flattened: perianth greenish-white.

4. ORNITHOGALUM.

Sepals and petals short: anthers of an elliptic type: capsule prominently three-lobed at the apex.

5. OXYTRIA.

##### III. MUSCARIEAE

Small succulent herb with narrow leaf-blades and small racemose flowers.

6. MUSCARI.

##### IV. HEMEROCALLIDEAE

Large coarse herb with greatly elongate narrow leaf-blades and large flowers.

7. HEMEROCALLIS.

1. *LILIUM* L. Tall caulescent herbs with scaly bulbs. Leaf-blades flat, relatively short. Perianth showy, red, orange, or yellow, more or less mottled with brown or black, the sepals, and petals, distinct. Filaments slightly adnate

to the sepals and petals: anthers versatile.—About 45 species, natives of the north temperate zone.—Sum.—LILIES.

Flower or flowers erect: sepals and petals narrowed into claws. I. ERECTA.  
Flower or flowers horizontal or nodding: sepals and petals without claws. II. NUTANTES.

## I. ERECTA

Leaves erect or nearly so, all alternate: sepals and petals long-acuminate.  
Leaves spreading, some alternate: sepals and petals merely acute, or obtuse.

## II. NUTANTES

Leaf-blades finely roughened on the margins and nerves beneath: sepals and petals not recurved.

Sepals and petals erect, abruptly pointed: flowers horizontal.

Sepals and petals spreading at the middle, acuminate: flowers nodding.

Leaf-blades smooth: sepals and petals recurved.

Foliage green: leaf-blades broadest at or below the middle.

Foliage glaucous: leaf-blades broadest above the middle.

1. *L. Catesbaei*.2. *L. philadelphicum*.3. *L. Grayi*.4. *L. canadense*.5. *L. superbum*.6. *L. carolinianum*.

1. *L. Catesbaei* Walt. Bulb-seales slender: stem 3-8 dm. tall: leaves alternate; blades linear or narrowly linear-lanceolate, 3-12 cm. long: perianth bright-red: sepals 8-12 mm. long, with linear-lanceolate blades: petals with lanceolate blades: capsule 1.5-2 cm. long.  
—(LEOPARD-LILY. PINE-LILY.)—Pine-lands and acid swamps, Coastal Plain, Fla. to La. and N. C.

2. *L. philadelphicum* L. Stem 3-9 dm. tall: leaves mainly whorled; blades narrowly elliptic to linear, 3-10 cm. long: sepals 5-6 cm. long, with oblong, elliptic, or oval blades: perianth red: petals broader than the sepals, sometimes ovate: capsule 2-4 cm. long.—(WOOD-LILY. ORANGE-CUP LILY.)—Thickets and open woods, often in acid soil, Blue Ridge, N. C., and various provinces, Va. to Ont. and Me.

3. *L. Grayi* S. Wats. Stems 5-10 dm. tall: leaves mainly whorled; blades lanceolate to elliptic or elliptic-lanceolate, 4-12 cm. long, roughened on the edges and the nerves beneath; sepals and petals mostly red, 3.5-4.5 cm. long, acute or abruptly pointed: capsule 3-4 cm. long.—(ROAN-LILY. ORANGE-BELL LILY.)—Acid meadows, Blue Ridge to Appalachian Plateau, N. C. and Tenn. to Va.—Because of its supposed rarity this species is sought by specialists in lily-culture. Mountaineers collect it in the fall, distinguishing it from the two following species by the white bulbs.

4. *L. canadense* L. Stem 6-15 dm. tall: leaves mainly whorled; blades lanceolate to elliptic or elliptic-lanceolate, 5-15 cm. long, acute or acuminate, roughened on the margins and the veins beneath: flowers usually few: sepals and petals red or yellow, often variegated, usually spotted, 4.5-7.5 cm. long, the upper portion spreading: capsule 3-5 cm. long.—(WILD YELLOW-LILY. YELLOW-BELL LILY.)—Wet thickets and meadows, various provinces, rarely Coastal Plain, Ga. and W Fla. to Mo., Minn., and N. S.

5. *L. superbum* L. Stem 8-25 dm. tall: leaves mainly whorled; blades elliptic, elliptic-lanceolate, or nearly linear, 5-15 cm. long, acuminate, smooth: flowers usually many: sepals and petals orange, red, or orange-yellow, usually purple-spotted, 6-10 cm. long, recurved from below the middle: capsule 3-5 cm. long.—(LILY-ROYAL.)—Moist slopes, acid meadows, and swamps, various provinces, Ga. to Ark., Minn., and N. B.

6. *L. carolinianum* Michx. Stem 6–12 dm. tall: leaves scattered or partly whorled: blades obovate, elliptic-obovate or oblanceolate, 3–12 cm. long, abruptly pointed or acuminate: flower usually solitary: sepals and petals orange-red, purple-spotted, 8–10 cm. long, strongly recurved from the middle, the midrib winged beneath: capsule 3–4.5 cm. long.—(TURK'S-CAP LILY.)—Woods, often in acid soil, Coastal Plain, Fla. to La. and N in the Appalachian provinces to S Va.—The large fragrant flowers of this species make it a very desirable subject for gardens, where however it is rarely seen.

2. **ERYTHRONIUM** L. Low herbs with deeply buried corms and subterranean stems. Leaves generally 2; blades dilated. Perianth white or colored, the sepals and petals distinct. Filaments nearly free: anthers erect.—About 12 species, all, except one, North American.—Spr.—DOG-TOOTH VIOLETS. ADDER'S-TONGUES. LILLETTE. LILIANS. TROUT-LILIES.

Perianth white, pink, or purplish within: styles united to above the middle, topped by 3 spreading stigmas.

Perianth yellow within: styles wholly united: stigmas terminal.

1. *E. albidum*.

2. *E. americanum*.

1. *E. albidum* Nutt. Leaf-blades elliptic, 5–15 cm. long, often mottled: scape 1–3 dm. tall: sepals and petals white or pink, (or suffused with rose-purple or red in *E. albidum coloratum*), curved: stigmas spreading or recurved: capsule 1–2 cm. long.—(BLONDE-LILIAN.)—Moist soil, rich woods, or hillsides, various provinces, rarely Coastal Plain, Ga. to La., Minn., Ont., and Md.

2. *E. americanum* Ker. Leaf-blades elliptic, 10–15 cm. long, commonly mottled: scape 1–3 dm. tall: sepals and petals green or greenish without, yellow within or rarely partly red, 3–3.5 cm. long, recurved: stigmas erect: capsule 1–1.5 cm. long, resting on the ground.—(AMBERBELL.)—Moist banks and swamps, various provinces, Fla. to Ark., Ont., and N. B.—Rare southward.

3. **QUAMASIA** Raf. Scapose succulent herbs with coated edible bulbs. Leaf-blades narrow, elongate. Raceme with narrow bracts. Sepals and petals blue or purple, distinct. Filaments filiform. Anthers versatile. Style longer than the ovary. Ovules numerous in each carpel.—Four species, North American.

1. *Q. hyacinthina* (Raf.) Britton. Bulbs 2–3 cm. long: leaf-blades narrowly linear: scape 3–6 dm. tall: raceme 8–20 cm. long in anthesis: perianth blue, or rarely white: sepals and petals 14–20 mm. long: capsule 9–10 mm. wide. [*Camassia Fraseri* Torr.]—(WILD-HYACINTH. INDIGO-SQUILL. MEADOW-HYACINTH.)—Thickets and meadows, various provinces, rarely Coastal Plain, Ga. to Tex., Minn.,

and Pa.—Spr.—Plants often become very abundant in abandoned fields and in fence-rows where the mass-effect of the delicate sky-blue flowers is exceedingly attractive.

4. **ORNITHOGALUM** [Tourn.] L. Scapose succulent herbs with coated bulbs. Leaf-blades narrow, elongate. Corymb or raceme bracted. Sepals and petals white or greenish without, nearly equal. Filaments flattened. Anthers versatile. Style shorter than the ovary. Ovules several or numerous in each carpel.—About 75 species, natives of Europe, Asia, and Africa.

1. **O. umbellatum** L. Scape 1-3.5 dm. tall: leaf-blades usually paler-green near the midrib, 2-5 cm. wide: flowers erect: sepals and petals oblong to oblong-lanceolate, 10-20 mm. long: filaments subulate to subulate-lanceolate: anthers oblong.—(STAR-OF-BETHLEHEM. NAP-AT-NOON. SUMMER-SNOWFLAKE.)—Woods, fields, and roadsides, various provinces, N. C. to Miss., Ohio, and N. H.—Nat. of Eu.—Spr.—Locally becoming a bad weed.

5. **OXYTRIA** Raf. Scapose rather wiry herbs, with bulb-like corms. Leaf-blades elongate and very narrow. Raceme or panicle with short bracts. Sepals, and petals, white or yellow, distinct. [*Schoenolirion* Torr.]—Four species, natives of North America.

Perianth bright-yellow: bracts obtuse.

Perianth white or greenish-white: bracts acute or acuminate.

Raceme mostly simple: bracts acute: seeds 2 mm. long.

Raceme mostly paniced: bracts acuminate: seeds 4 mm. long.

1. *O. crocea*.

2. *O. texana*.

3. *O. albiflora*.

1. **O. crocea** (Michx.) Raf. Leaf-blades 2-4 mm. wide: scape 3-4.5 dm. tall: raceme simple: sepals and petals bright-yellow, 4-5 mm. long, much longer than the subulate filaments: capsule 4-5 mm. wide. [*S. croceum* A. Gray]—(SUNNYBELL.)—Sandy soil and swamps, Coastal Plain and Piedmont, Fla. to La. and Ga.

2. **O. texana** (Scheele) Pollard. Leaf-blades 3-8 mm. wide: scape 3-4 dm. tall: raceme simple: sepals and petals greenish-white, 4.5-5.5 mm. long, much longer than the subulate filaments: capsule 3-4 mm. wide.—Wet places, Coastal Plain and adj. provinces, Ala. to La., Tex. and W Tenn.

3. **O. albiflora** (Raf.) Pollard. Leaf-blades 2-6 mm. wide: scape 4-6.5 dm. tall: raceme branched: sepals and petals white, 5-6 mm. long: capsule 5-6

mm. wide. [*S. Elliottii* Feay.](WHITE-SUNNYBELL.)—Low pinelands and wet prairies, Coastal Plain and rarely adj. provinces, Fla., Ala., and Ga.

6. **MUSCARI** [Tourn.] Mill. Scapose succulent herbs with coated bulbs. Leaf-blades elongate, channeled. Racemes dense, inconspicuously bracted. Perianth globular to urceolate, commonly deep-blue. Filaments adnate to the perianth-tube up to near the anthers. Anthers nearly as wide as long. Ovules 2 in each carpel. Capsules 3-angled or 3-winged.—About 40 species, most abundant in the Mediterranean region.—GRAPE-HYACINTHS. BLUE-BOTTLES.

Perianth cylindric-urceolate: anthers borne alternately high and low on the perianth.

Perianth globular-urceolate: anthers borne evenly on the perianth.

1. *M. botryoides*.

2. *M. racemosum*.

1. ***M. botryoides*** (L.) Mill. Plants 8–25 cm. tall: leaves erect; blades mostly 6–8 mm. wide: perianth mostly 2.5–4 mm. long; lobes as long as wide, about equal: style shorter than the ovary.—Rather common, about gardens and in meadows, E U. S. Nat. of Eu.

2. ***M. racemosum*** (L.) Mill. Plants 11–28 cm. tall: leaves recurved; blades mostly 2–4 mm. wide: perianth 4.5–5.5 mm. long; lobes broader than long, unequal: style about as long as the ovary. Woods, meadows, and about gardens, various provinces, N. C. to Miss., Md., and N. Y. Nat. of Eu. and cult.—Spr.

7. **HEMEROCALLIS** L. Acaulescent herbs, with thickened coated bulbs. Leaf-blades elongate-linear. Perianth yellow or orange, funnellform, the lobes broad, longer than the tube. Filaments adnate to the perianth-tube. Style elongate. Capsule somewhat elongate.—About 6 species, natives of Eurasia.—DAY-LILIES.

1. ***H. fulva*** L. Plant 1–2 m. tall: leaf-blades mostly 1.5–2 cm. wide: perianth mainly tawny-orange; tube about 3 cm. long: corolla-lobes 8–10 cm. long, red near the center, orange near the tips, the margins involute, crisped: capsule obovoid, 4–6 cm. long.—(TAWNY DAY-LILY.)—Meadows, roadsides, and thickets, various provinces, N. C. to Tex., Ont., and N. B. Nat. of Eu. and cult.—Sum.—A vigorous colonizer, and often a weed, crowding out native vegetation in meadows, and on banks and edges of woods.

#### FAMILY 6. CONVALLARIACEAE — LILY-OF-THE-VALLEY FAMILY

Perennial herbs, with rootstocks. Leaves alternate, sometimes all basal, sometimes scale-like. Flowers in a terminal cluster, raceme, or

panicle, or axillary. Calyx of 2 or 3 sepals. Corolla of 2 or 3 petals, together with the sepals sometimes partially united. Androecium of 4 or 6 stamens. Gynoecium of 2 or 3 united carpels. Fruit a berry or rarely a tardily dehiscent capsule.—About 25 genera and 220 species, widely distributed.

Sepals, and petals, distinct or essentially so.

Fruit baccate.

Flowers axillary: leaves scale-like: branchlets proliferous.

Tribe I. ASPARAGEAE.

Flowers terminal: leaves, or most of them, not scale-like: plants not proliferously branched.

Tribe II. STREPTOPEAE.

Fruit a capsule.

Tribe III. UVULARIEAE.

Sepals, and petals, partly united into a tube.

Flowers axillary: anthers sagittate.

Tribe IV. POLYGONATEAE.

Flowers in a terminal raceme or panicle.

Perianth campanulate: fruit a berry.

Tribe V. CONVALLARIEAE.

Perianth tubular, the lobes recurved: fruit a capsule.

Tribe VI. SANSEVIERIEAE.

#### I. ASPARAGEAE

Plant with a short scaly rootstock and very much-branched stem: flowers, and berries, small.

1. ASPARAGUS.

#### II. STREPTOPEAE

Flowers in umbels or umbel-like cymes: leaves apparently basal.

Flowers in a terminal umbel: ovules 2 in each ovary-cavity.

2. XENIATRUM.

Flowers in a simple or compound umbel-like cyme: ovules 12 or more in each ovary-cavity.

3. CLINTONIA.

Flowers in racemes or panicles, or solitary: leaves cauline.

Flowers in a terminal raceme or panicle.

Sepals and petals 3 each: stamens 6: gynoecium 3-carpellary.

4. VAGNERA.

Sepals and petals 2 each: stamens 4: gynoecium 2-carpellary.

5. UNIFOLIUM.

Flowers in extra-axillary clusters or solitary.

Peduncles scattered along the branches: filaments dilated: anthers acute.

Anthers 2-horned: stigmas 3.

6. STREPTOPUS.

Anthers subulate-tipped: stigmas united.

7. TORTIPES.

Peduncles at the ends of the branches: filaments slender: anthers obtuse.

8. DISFORUM.

#### III. UVULARIEAE

Sepals and petals with 2 ridges on either side of a deep nectary: capsule obovoid or turbinate, 3-lobed.

9. UVULARIA.

Sepals and petals without ridges or nectary: capsule elliptic or oval, 3-winged.

10. OAKESIELLA.

#### IV. POLYGONATEAE

Caulescent herbs with thick scarred rootstocks: flowers solitary or few in clusters, nodding.

11. POLYGONATUM.

#### V. CONVALLARIEAE

Scapose herbs with slender rootstocks: flowers in a terminal raceme on a scape arising between the erect leaves, nodding.

12. CONVALLARIA.

#### VI. SANSEVIERIEAE

Coarse plants with elongate rootstocks: leaves erect or nearly so, fleshy-fibrous: flowers erect or ascending.

13. CORDYLINA.

1. ASPARAGUS [Tourn.] L. Caulescent herbs, the branches plume-like on account of the minute branchlets clustered in the axils of the scales. Leaves

scale-like. Flowers mainly solitary in the axils, nodding. Perianth white or yellowish. Berry nodding.—About 100 species, natives of the Old World.

1. *A. officinalis* L. Stem at first scaly and succulent, becoming slender and firmer, 4–20 dm. tall: sepals and petals 4–7 mm. long, linear or nearly so, the latter broader than the former: berries red, 6–8 mm. in diameter.—(ASPARAGUS.)—Thickets, fence-rows, roadsides, and about gardens, various provinces, Fla. to La., Tenn., and N. B. Nat. of Eu.—Spr.—sum.—The occurrence of this esculent outside of vegetable gardens is due mostly to the agency of birds which are fond of eating the fruits.

2. *XENIATRUM* Salisb. Short-stemmed herbs, the scape unbranched. Leaves mainly 2 or 3. Flowers erect, in a terminal umbel. Filaments slightly dilated below. Ovules 2 in each ovary-cavity. Berries erect or spreading.—One species.

1. *X. umbellulatum* (Michx.) Small. Leaf-blades elliptic or elliptic-spatulate, 1–3 dm. long, ciliate: scape as long as the leaves or longer, pubescent: umbel 5–15-flowered: sepals and petals white, speckled with green and purple dots, elliptic or oval, 5–8 mm. long: berry globular, 5–7 mm. in diameter, black. [*Clintonia umbellulata* Torr.]—(GLOBE-AMORETTE. SPECKLED WOOD-LILY.)—Woods and hillsides, Blue Ridge and Appalachian provinces, Ga. to N. Y.—Spr.

3. *CLINTONIA* Raf. Short-stemmed herbs, the scape unbranched. Leaves 2 or 3. Flowers in simple or compound umbel-like cymes, the cymes sometimes reduced to 1 or 2 flowers. Filaments nearly filiform. Ovules 12 or more in each ovary-cavity. Berries spreading.—About 4 species, natives of North America and Asia.

1. *C. borealis* (Ait.) Raf. Leaf-blades elliptic or oval, 1–3 dm. long: scape surpassing the leaves: flowers 2–7: sepals and petals 1.5–2 cm. long, greenish-yellow: berry oval or subglobose, 8–9 mm. in diameter, bright-blue.—(BALSAMBELL. BLUE-BEAD LILY. YELLOW WOOD-LILY.)—Deep woods and swamps, often in acid soil, Blue Ridge and more northern provinces, N. C. to Minn., and Newf.—Spr.

4. **VAGNERA** Adans. Herbs with simple stems arising from short rootstocks. Leaves several. Flowers in a terminal raceme or panicle. Sepals and petals of a linear, lanceolate, or elliptic type. Filaments dilated or inflated. Stigma obscurely 3-lobed or nearly entire. Ovules 2 in each ovary-cavity. Berry spreading.—About 25 species, natives of North America and Asia.—Sum.—WILD-SPIKENARDS. SOLOMON'S-FEATHERS. SOLOMON'S-PLUMES.

Sepals and petals broadly linear: filaments inflated, about as long as the perianth.

Sepals and petals narrowly linear: filaments flat, twice as long as the perianth.

1. *V. racemosa*.

2. *V. australis*.

1. *V. racemosa* (L.) Morong. Stem 3–9 dm. tall: leaf-blades elliptic-lanceolate or elliptic, 5–20 cm. long, sessile: panicle 3–10 cm. long, many-flowered: sepals and petals white, 1.5–2 mm. long: berry globular, 4–6 mm. long, red, or spotted with purple. [*Smilacina racemosa* Desf.]—Woods and thickets, various provinces, Ga. to Tex., Calif., B. C., Ont., and N. S.—The berries are edible.

2. *V. australis* Rydb. Similar to *V. racemosa* in habit, but more slender: leaf-blades relatively narrower, markedly acuminate, prominently 3-ribbed, the other nerves less prominent: panicles loosely flowered, the branches glabrous: sepals and petals smaller.—Woods and hillsides, Piedmont and rarely adj. provinces, Ga. and Ala.—Perianth white as in the preceding species.

5. **UNIFOLIUM** Adans. Herbs with simple stems arising from slender rootstocks. Leaves few. Flowers in a terminal raceme. Filaments filiform or subulate. Stigmas 2. Ovules 2 in each ovary-cavity. Berry spreading.—Two species, the following and one in western North America and the Old World.

1. *U. canadense* (Desv.) Greene. Stem 5–15 cm. tall: leaves 2 or 3; blades ovate to lanceolate, 2–8 cm. long, truncate or subcordate at the base: sepals and petals 2.5–3.5 mm. long, white: berries globular, about 4 mm. in diameter, red-speckled. [*Smilacina bifolia* (Chapm. Fl.)]—(TWO-LEAVED SOLOMON'S SEAL. ELF-FEATHER. HEART-LEAF SOLOMON'S-PLUME.)—Moist woods, thickets, and springy places, Blue Ridge, N. C., and various provinces, Va. to S. D., Man., and Lab.—Spr.

6. **STREPTOPUS** Michx. Herbs with forking stems arising from short or elongate rootstocks. Perianth rose, purple, or purplish: sepals and petals with recurved tips, not transversely veiny. Anthers sagittate, 2-horned at the

apex. Stigmas 3. Ovules several in each ovary-cavity. Berry drooping.—Two or 3 species, widely distributed in the north temperate zone.

1. *S. roseus* Michx. Stems 3–9 dm. tall: leaf-blades oblong to oblong-ovate or ovate, 5–12 cm. long, sessile: sepals linear-lanceolate or nearly so, 8–12 mm. long, acuminate: berries red, globular or oval-globose, 10–12 mm. long.—(ROSY-TWISTED-STALK. ROSE-BELLS. ROSE-MANDARIN.)—Woods, Blue Ridge and more northern provinces, Ga. to Mich., Ore., Alas., Ont., and Lab.—Spr.—sum.

7. **TORTIPES** Small. Herbs similar to *Streptopus* in habit. Leaves flimsy: blades not transversely veiny. Flowers solitary or 2 together, nodding, extra-axillary, terminal, the stalk sharply bent or spirally twisted near the middle. Perianth greenish or whitish: sepals and petals with recurved tips, the petals keeled. Anthers sagittate, entire at the apex. Stigmas united. Ovules many in each ovary-cavity. Berry drooping.—Two or 3 species in the north temperate zone.

1. *T. amplexifolius* (L.) Small. Stem 3–12 dm. tall: leaf-blades elliptic to elliptic-lanceolate or ovate-lanceolate, 5–12 cm. long, clasping: sepals narrowly lanceolate, 9–12 mm. long: berry red, oval, 10–15 mm. long. [*Streptopus amplexifolius* DC.]—(PAGODA-BELLS. TWISTED-STALK. WHITE-MANDARIN.)—Woods, Blue Ridge and more northern provinces, N. C. to Ohio, N. M., Alas., Ont., and Lab. Spr.—sum.

8. **DISPORUM** Salisb. Herbs with branching stems. Leaves firm in age, transversely veiny. Flowers nodding, on straight peduncles near the tips of the branches. Perianth whitish, greenish, or yellowish, sometimes spotted: sepals and petals not recurved at the tip, transversely veiny. Anthers narrowly elliptic. Stigmas 3. Ovules 2 in each ovary-cavity. Berry drooping, mostly red. [*Prosartes* Don.]—About 15 species, natives of North America and Asia.—Spr.—sum.—FAIRY-BELLS.

Sepals and petals yellowish, black-dotted: filaments 12–15 mm. long.

Sepals and petals greenish, not dotted: filaments 5–7 mm. long.

1. *D. maculatum*.

2. *D. lanuginosum*.

1. *D. maculatum* (Buckl.) Britton. Stem 2–6 dm. tall: leaf-blades ovate-lanceolate to elliptic-ovate, 3–6 cm. long: pedicels 5–12 mm. long: sepals and

petals 15–20 mm. long, markedly clawed, the blades lanceolate: filaments over twice as long as the anthers. [*P. maculata* Michx.] — (NODDING-MANDARIN.) — Woods, Blue Ridge to Appalachian Plateau, Ga. to Ala., Tenn., Ky., and N. C.

2. *D. lanuginosum* (Michx.) Nichols. Stem 3–9 dm. tall: leaf-blades oblong, lanceolate-elliptic or ovate-lanceolate, 5–12 cm. long, mostly rounded at the base: pedicels 20–30 mm. long: sepals and petals 14–19 mm. long, scarcely clawed, linear-lanceolate: filaments less than twice as long as the anthers: ovary glabrous: berry 10–14 mm. long, few-seeded, smooth. [*P. lanuginosa* Don.] — (YELLOW-MANDARIN.) — Woods, various provinces N of Coastal Plain, Ga. to Ark., Minn., and N. B.

9. *UVULARIA* L. Herbs with terete forking stems. Leaf-blades perfoliate, membranous, smooth-margined. Perianth mainly yellow. Sepals and petals acuminate. Anthers longer than the filaments. Ovary nearly globular or elongate. Seeds about  $\frac{1}{2}$  covered with the thin aril.—Represented by the following species, and possibly another in Ark.—BELLWORTS. STRAW-FLOWERS.

Sepals and petals smooth within, mostly over 3 cm. long: anthers

12–16 mm. long: leaves pubescent beneath.

Sepals and petals papillose within, mostly less than 2.5 cm. long:

anthers 5–8 mm. long: leaves glaucous.

1. *U. grandiflora*.

2. *U. perfoliata*.

1. *U. grandiflora* J. E. Smith. Relatively larger than *U. perfoliata*: leaf-blades elliptic to elliptic-lanceolate: pedicels 10–40 mm. long: anther-connectives blunt.—Rich woods and thickets, various provinces, N of Coastal Plain, Ga. to Okla., Minn., Que., and N. H.

2. *U. perfoliata* L. Stem 1–8 dm. tall: leaf-blades elliptic or oval, or slightly broadened upward, 3–6 cm. long: pedicels 5–25 mm. long: anther-connectives acute: capsule about 1 cm. long.—(STRAW-BELL.) Rich woods and thickets, various provinces, Fla. to Ark.(?), N. D., and Que.—Spr.

10. *OAKESIELLA* Small. Herbs with angled forking stems. Leaf-blades sessile, leathery, scabrous-margined. Perianth yellow or greenish-yellow. Sepals and petals blunt. Anthers longer than the filaments. Ovary oblong. Seeds with a swollen spongy raphe.—Four species, the following and one in New Jersey.—BELLWORTS. HAY-BELLS. MERRY-BELLS. COW-BELLS.

Flower-stalk bractless: sepals and petals not attenuate: capsule beakless.

Ovary and capsule not stipitate: plant puberulent.

1. *O. puberula*.

Ovary and capsule stipitate; plant glabrous. Flower-stalk bearing an adnate bract: sepals and petals attenuate: capsule beaked.

2. *O. sessilifolia*.

3. *O. floridana*.

1. *O. puberula* (Michx.) Small. Stem 1-5 dm. tall: leaf-blades elliptic, elliptic or oval, 3-8 cm. long, thick: sepals and petals 2-2.5 cm. long, nearly linear: capsule elliptic or oval-ovate, 2-2.5 cm. long. [*Uvularia puberula* Michx.]—Woods, Piedmont to Appalachian provinces, Ga. and Ala. to W. Va. and Va.

2. *O. sessilifolia* (L.) Small. Stem 1-4 dm. tall: leaf-blades elliptic, 3-8 cm. long, thin: sepals and petals 1.5-2 cm. long, nearly linear: capsule oval, 1.5-2.3 cm. long. [*Uvularia sessilifolia* L.]—Thickets moist woods, and banks, various provinces, Ga. to Ark., Minn., and N. B.—Spr.

3. *O. floridana* (Chapm.) Small. Stem 1-4 dm. tall: leaf-blades mainly elliptic, 3-8 cm. long, thinnish: sepals and petals narrowly linear and attenuate, 2-3 cm. long: capsule rhombic-oval, 2.5-3 cm. long, including the beak. [*Uvularia floridana* Chapm.]—Woods, Coastal Plain, N. Fla., Ala., and Ga.

11. **POLYGONATUM** [Tourn.] Mill. Herbs with jointed rootstocks and simple stems. Leaves spreading: blades sessile. Flowers 1 or few terminating axillary peduncles, drooping. Perianth white or greenish: lobes erect or nearly so. Filaments adnate to the middle of the perianth-tube or above it. Berry globular, blue or nearly black. Seeds flattened. [*Salomonina* Heist.]—About 20 species, natives of the north temperate zone.—Spr.—SOLOMON'S SEALS.

Filaments rough, adnate to the perianth-tube for about  $\frac{3}{4}$  its length.

1. *P. biflorum*.

Filaments smooth, adnate to the perianth-tube for about  $\frac{1}{2}$  its length.

2. *P. commutatum*.

1. *P. biflorum* (Walt.) Ell. Stem 2-9 dm. tall: leaf-blades oval, elliptic, or elliptic-lanceolate, 4-10 cm. long, pubescent beneath: pedicels commonly 2-flowered: perianth 8-12 mm. long: berry 6-8 mm. in diameter.—Moist woods and banks, various provinces, Fla. to Tex., Kans., Ont., and N. B.

2. *P. commutatum* (R. & S.) Dietr. Stem 3-25 dm. tall: leaf-blades elliptic, elliptic-lanceolate, oval, or oval-ovate, 5-15 cm. long, glabrous: pedicels usually more than 2-flowered: perianth 10-20 mm. long: berry 8-12 mm. in diameter.—(KING-SOLOMON'S SEAL.)—Rich soil, especially near streams, various provinces, Ga. to La., Utah, Man., Ont., and N. H.

**12. CONVALLARIA L.** Herbs with slender rootstocks and simple scapes. Leaves erect; blades sheathing at the base. Flowers nodding in a 1-sided raceme. Perianth white: lobes recurved. Filaments adnate to the lower part of the perianth-tube. Berry globular. Seed rounded.—One species.

1. *C. majalis* L. Leaves 2 or 3 together; blades elliptic, 1–3 dm. long: scape 1.5–4 dm. tall: perianth 5–7 mm. long: berry 1 cm. in diameter or less, red: seeds 3–4 mm. in diameter.—(*LILY-OF-THE-VALLEY*.)—Woods, often in acid soil, Blue Ridge and Appalachian provinces, S. C. to Tenn., W. Va., and Va.—Spr.—The native plant of the southern Appalachian mountains appears to be almost identical with the European one, which is much cultivated and sometimes escapes. The native American plant usually has a shorter inflorescence, and has larger bracts and an oblate seed. Like the European plant it also prefers a rather acid soil. The flowers are very fragrant.

**13. CORDYLINE Adans.** Succulent herbs with stout rootstocks. Leaves erect, flat or nearly terete. Flowers in narrow panicles, erect or ascending. Perianth white or greenish: lobes narrow, about as long as the cylindric tube. Capsule membranous. Seeds baccate. [*Sansevieria* Thunb.]—About 25 species, natives of Asia and Africa.

1. *C. guineensis* (L.) Britton. Leaves 4–10 dm. tall, usually mottled: panicle many-flowered: perianth-lobes linear or linear-spatulate, 14–18 mm. long, curled back. [*S. guineensis* Willd.]—(*AFRICAN BOWSTRING-HEMP*.)—Pinelands, hammocks, and cult. grounds, S Fla. and the Keys. Nat. of Africa, and cult.—(*W. I.*)—Vigorously growing rootstocks often establish this plant about gardens. However, it is frequently met with in localities remote from gardens. The leaves and the feathery panicles arise from the ground often separately. The leaves furnish a strong fiber.

#### FAMILY 7. ALOACEAE — ALOE FAMILY

Coarse succulent or partly woody plants with horizontal rootstocks and short caudices terminating in erect flowering stems. Leaves alternate, crowded on the caudex, erect or spreading, the blades usually closely sessile, entire or spring-toothed. Flowers in a terminal raceme or panicle. Calyx of 3 elongate sepals which together with the 3 nearly similar petals are united into a campanulate or tubular perianth, the lobes erect or slightly spreading. Androeceum of 6 stamens with slender elongate free filaments. Gynoeceum superior, of 3 united carpels. Style slender, elongate. Fruit

a loculicidal capsule or sometimes baccate.—Four or five genera and 180 species, natives of the Old World.

1. **ALOE** L. Succulent, or partly shrubby or arborescent plants, with simple or branched caudices. Leaves succulent, often crowded, sometimes distichous: blades entire or spiny-toothed. Flower-stalk terminating in a dense raceme, the flowers mostly nodding. Perianth mostly red or yellow. Sepals and petals partially united. Filaments free: anthers much shorter than the filaments. Ovules numerous in each ovary-cavity. Capsule somewhat elongate.—About 75 species, mostly natives of Africa.—**ALOES**.

1. **A. vera** L. Leaves clustered at the base of the flowering stem and ultimately raised with the caudex, sessile; blades lanceolate, sometimes narrowly so, 2-5 dm. long, glaucous, curved, the marginal spines mostly 1-1.5 cm. apart: flowering stem with broad scales: raceme strict: flowers nodding, imbricately crowded: perianth 27-33 mm. long: calyx-lobes and corolla-lobes broadly linear to linear-lanceolate, obtuse, longer than the tube.—(**BITTER-ALOE**. **BARBADOES-ALOE**. **BAMBOO**.)—Sandy fields and rocky soil, Florida Keys and S Tex. Nat. of Medit. region.—(*W. I.*)—Colonies of this succulent are very persistent on account of the plant's great vitality. Its abundance on one of the Florida Keys has led to the naming of the island Bamboo Key. Used in medicine.

#### FAMILY 8. DRACAENACEAE — YUCCA FAMILY

Shrubby plants or trees, with woody, generally copiously leafy, caudices. Leaves alternate: blades narrow, firm or rigid, sometimes flififerous on the margins. Flowers in racemes or panicles, terminating scape-like stems. Calyx of 3 generally white or greenish sepals. Corolla of 3 petals nearly similar to the sepals. Androecium of 6 stamens. Gynoecium superior, of 3 united carpels. Style stout, sometimes obsolete during anthesis. Fruit a primarily loculicidal capsule, sometimes indehiscent or baccate.—Four genera and about 50 species, most abundant in Mex. and Cent. Am.

Antthers sagittate: ovary elongate: capsule not 3-winged: seeds flattened, many in each cavity of the capsule.  
Antthers cordate: ovary globular: capsule 3-winged: seeds thick, solitary or few in each cavity.

1. **YUCCA**.

2. **NOLINA**.

1. **YUCCA** [Rupp.] L. Caudex commonly leafy throughout. Flowers perfect, relatively large, in panicles or racemes. Sepals and petals several-veined, deciduous. Ovules numerous. Capsule dehiscent, or baccate. Seeds black.—About 18 species, natives of North America.—**BEAR-GRASSES**. **ADAM'S-NEEDLES**. **YUCCAS**.

Fruit an erect, dry, dehiscent capsule.

Leaf-blades short-attenuate, abruptly pointed, or rounded at the apex; marginal fibers curly: capsule evenly narrowed to the apex.

Leaf-blades of a linear type, somewhat narrowed toward both ends, attenuate to the slender apical spine, flat.

Leaf-blades spatulate, abruptly narrowed or rounded and concave at the base of the stout apical spine.

Leaves long-attenuate; marginal fibers straight: capsules truncately narrowed at the apex, the carpels uneven or angulate.

Fruit a drooping (erect in *Y. recurvifolia*), pulpy, indehiscent, berry-like capsule.

Seed thin, margined: endosperm even.

Leaves rigid, stiffly erect or spreading: capsule 6-ribbed: seeds shining.

Leaves pliable, recurving: capsule 6-winged: seeds dull.

Seed turgid, marginless: endosperm ruminated.

1. *Y. filamentosa*.

2. *Y. concavo*.

3. *Y. flaccida*.

4. *Y. gloriosa*.

5. *Y. recurvifolia*.

6. *Y. aloifolia*.

1. *Y. filamentosa* L. Caudex short: leaves firm, 3-6 dm. long, erect and spreading; blades gradually narrowed toward both ends, the terminal spine rather long and slender, the marginal fibers rather short: flowering stalk 1.5-4 m. tall: panicle-branches glabrous: sepals lanceolate to narrowly ovate: petals broadly ovate, 4-5 cm. long: capsule ellipsoid, 5-6 cm. long: seeds decidedly elongate, sometimes angulate.—(BEAR-GRASS. ADAM'S-NEEDLE. CURLY-HAIR. YUCCA.)—Bluffs, sandhills, old-fields, and other habitats protected from fire, Coastal Plain and adj. provinces, Fla. to Miss., Tenn., and N. C.; escaping further N.

2. *Y. concava* Haw. Caudex short or slightly elongate: leaves very firm, mostly 4-11 dm. long, erect or ascending; blades spatulate, somewhat plicate, concave, the terminal spine short and stout, the marginal fibers long: flowering stalk 2-5 m. tall: panicle-branches glabrous, at least at maturity: perianth similar to that of *Y. filamentosa*, but the sepals and petals usually broader: capsule ellipsoid or somewhat cylindric, 4-5 cm. long: seeds nearly circular.—(SPOON-LEAF YUCCA.)—Sand-dunes and sandy open woods, Coastal Plain, Ga. to Del.

3. *Y. flaccida* Haw. Similar to *Y. filamentosa*, but less rigid: leaves pliable, with straight fibers, the outer ones recurved: panicle-branches pubescent: capsule 6-7 cm. long: seeds dull, 8-10 mm. long.—(WEAK-LEAF YUCCA.)—Dry or stony soil, Blue Ridge and Appalachian provinces, Ala. to N. C.

4. *Y. gloriosa* L. Caudex becoming 5 m. tall, sometimes branched: leaves very numerous, firm, 3-5 dm. long, spreading: panicle long-stalked: sepals and petals 4-5 cm. long: capsule nodding, leathery, 5-6 cm. long, indehiscent: seeds lustrous, 6-7 mm. long.—(SPANISH BAYONET. MOUND-LILY YUCCA.)—Dunes, Coastal Plain, Fla. to N. C.; reported from Miss.

5. *Y. recurvifolia* Salisb. Caudex commonly 1-2 m. tall, branched: leaves numerous, eventually smooth-margined, recurved: panicle but slightly raised above the leaves: capsule erect, 5-7 cm. long, indehiscent, the 6 ribs winged: seeds dull, 7-8 mm. long.—(CURVE-LEAF YUCCA.)—Dunes, Coastal Plain, Ga. to La.

6. *Y. aloifolia* L. Caudex often 1-2.5 m. tall, commonly branched: leaves very numerous, spreading above, deflexed and deciduous below, scabrous-margined: panicle ample and showy, 3-7 dm. long: sepals and petals 4-6 cm. long: capsule 7-9 cm. long.—(SPANISH-DAGGER.)—Sand-dunes and shell-mounds, Coastal Plain, Fla. to La. and N. C.—(W. I.)—Cultivated and escaping in provinces beyond its natural range. The fiber from the leaves of this, and of other species of *yucca*, have been used by pioneers to make ropes, and for string for hanging up cured meats.

2. *NOLINA* Michx. Caudex short, the greatly elongate entire or serrulate leaves spreading on the ground. Flowers polygamo-dioecious, in a virgate or branching panicle. Sepals and petals 1-veined, entire, marcescent. Ovules 2 in each cavity. Capsule broader than long or as broad as long. Seeds pale.—About 12 species, natives of North America.—Spr.

Ovary rounded at the apex: capsule not notched, at least at the base.

Capsule symmetrical, 8-10 mm. wide: seeds loosely invested by the capsule.

Capsule unsymmetrical, 3-4 mm. wide: seeds closely invested by the capsule.

Ovary depressed at the apex: capsule conspicuously notched at both ends.

1. *N. georgiana*.

2. *N. atopocarpa*.

3. *N. Brittoniana*.

1. *N. georgiana* Michx. Plant 5-15 dm. tall: blades of the basal leaves 3-5 mm. wide: sepals and petals mostly oblong, about 3 mm. long: anthers mostly oblong: capsule sharply 3-lobed.—Pine-lands and sandhills, Coastal Plain, Fla. to S. C.

2. *N. atopocarpa* Bartlett. Plant 8-15 dm. tall: blades of the basal leaves 2-4 mm. wide: sepals and petals mostly oval, about 3 mm. long: anthers mostly globular: capsule obtusely 3-lobed.—Pine-lands, E pen. Fla.

3. *N. Brittoniana* Nash. Plant 10-20 dm. tall: leaf-blades 6-13 mm. wide: panicle with erect or strongly ascending branches: sepals and petals conspicuously glandular at the apex: capsule 9-12 mm. wide, the walls opaque.—Dry pinelands, pen. Fla.

#### FAMILY 9. TRILLIACEAE —WAKE-ROBIN FAMILY

Perennial herbs with rootstocks. Leaves in a whorl on the stem, or basal and wanting on the mature plant: blades broad. Bracts leaf-like in a whorl at the top of the scape or peduncle. Flowers perfect, solitary or in a terminal cluster. Calyx of 3 sepals. Corolla of 3 petals more or less different from the sepals. Androecium of 6 stamens. Gynoecium of 3 united carpels. Stigmas 3. Ovules several in each ovary-cavity. Fruit baccate.—Four genera and 34 species, natives of the north temperate zone.

Flowers several in an umbel-like cluster: sepals and petals nearly alike: flowering stem with a whorl of leaves and a whorl of bracts.

1. MEDEOLA.

Flowers solitary: sepals and petals very different: flowering stem (scape) with only a whorl of leaf-like bracts.

2. TRILLIUM.

1. **MEDEOLA** [Gronov.] L. Caulescent herbs, with long brittle rootstocks. Leaves and bracts with thinnish blades. Pedicels slender, more or less declined. Anthers shorter than the filaments. Stigmas crimson.—One species.

1. **M. virginiana** L. Stem 2-9 dm. tall: leaves 4-10; blades elliptic, spatulate, or obovate, 5-15 cm. long: bracts smaller than the leaves: sepals and petals greenish, 9-11 cm. long: berry spheroidal, 8-15 mm. thick, dark-purple.—(INDIAN CUCUMBER-ROOT. CUSHAT-LILY.)—Moist woods, various provinces, Fla to La., Minn., and N. S.—Spr.—The white tuber-like root-stock tastes like cucumbers or raw potatoes.

2. **TRILLIUM** L.<sup>1</sup> Scapose herbs with firm corm-like rootstocks. Leaves and bracts with thick blades. Pedicel stout, or solitary flower sessile. Corolla white or of various colors. Anthers usually longer than the filaments. About 25 species, of North America and eastern Asia.—Spr.—WAKE-ROBINS. BIRTH-ROOTS.

Flower sessile.

Petals with claw-like bases which are sometimes different in coloring from the blades.

Petals not narrowed into claw-like blades, normally of one color throughout.

Flower pedicelled (sessile in a form of *T. pusillum*).

Stigmas sessile, distinct: style wanting.

Stigmas terminating a short style.

#### I. RECURVATA

Bracts narrowed into petiole-like bases: petals with ovate, elliptic, oval or obovate blades.

Bracts not narrowed at the base: petals with linear or linear-elliptic blades.

Scape smooth and glabrous.

Bracts with lanceolate or elliptic blades: anthers curved: filaments nearly as long as the anthers.

Bracts with ovate blades: anthers straight: filaments much shorter than the anthers.

Scape rough-pubescent near the top (sometimes glabrous at maturity).

#### II. SESSILES

Petals broadly spatulate, one of them prominently apiculate: anthers less than 1 cm. long.

Petals linear, lanceolate, elliptic, or oblanceolate: anthers more than 1 cm. long.

Scape rough-pubescent near the top: bracts pubescent on the veins beneath.

Scape erect: bracts raised above the ground: petals 2-3 cm. long: anther-sacs 15-18 mm. long, the connective not much prolonged.

Scape decumbent: bracts lying flat on the ground: petals 4-7 cm. long: anther-sacs 8-10 mm. long, the connective much prolonged.

Scape and bracts smooth and glabrous.

Bracts typically 8 cm. long or less: sepals 2-3.5 cm. long.

Bracts typically 10 cm. long or more: sepals 4.5-5.5 cm. long.

4. *T. viride*.

5. *T. discolor*.

6. *T. stamineum*.

7. *T. decumbens*.

8. *T. sessile*.

<sup>1</sup> Prepared in part from the studies of Donald Culross Peattie.

Bracts much longer than wide, often twice as long :  
filaments less than 2 mm. long.

Bracts nearly or quite as wide as long : filaments  
more than 2 mm. long.

9. *T. Underwoodii*.

10. *T. Hugeri*.

### III. ERECTA

Bracts not narrowed into petiole-like bases : ovary 6-angled.  
Stigmas decidedly curved : petals slightly longer than the  
sepals.

Petals not recurved, spreading or erect-spreading.

Stamens shorter than the stigmas, or barely exceed-  
ing them : filaments stout, much shorter than the  
anthers : flowers often rather ill-scented.

Stamens decidedly longer than the stigmas : fila-  
ments slender, as long as the anthers or nearly  
so : flowers often sweet-scented.

Filaments 8-12 mm. long, as long as the an-  
thers ; connective purple : bracts long-acumi-  
nate.

Filaments 4-6 mm. long, shorter than the an-  
thers ; connective yellow : bracts short-acumi-  
nate.

Petals recurved.

Flower short-pedicelled : pedicel 0.5-2.5 cm. long :  
filaments two-thirds as long as the anther or  
longer : anther 2.5-4.5 mm. long.

Flower long-pedicelled : pedicel 3-12 cm. long : fila-  
ment  $\frac{1}{2}$  as long as the anther or less : anther  
6-15 mm. long.

Stigmas straight or nearly so : petals much longer than  
the sepals.

Bracts narrowed into petiole-like bases : ovary 3-lobed.

11. *T. erectum*.

12. *T. Vaseyi*.

13. *T. simile*.

15. *T. declinatum*.

16. *T. grandiflorum*.

17. *T. undulatum*.

### IV. PUSILLA

Flower on an erect pedicel or rarely sessile : stamens straight :  
filaments about half as long as the anthers.

Flower on a nodding pedicel : stamens curved : filaments fully  
as long as the anthers.

18. *T. pusillum*.

19. *T. Catesbaei*.

1. *T. recurvatum* Beck. Scape 1-4 dm. tall, glabrous : bracts 5-9 cm. long ;  
blades ovate-lanceolate, oval or suborbicular, often mottled, longer than the  
petiole-like bases : sepals lanceolate, 2-3 cm. long, acute : petals purple, the  
blades ovate, obovate or elliptic, about  
twice longer than the claws : anthers  
9-12 mm. long.—Woods, Gulf Coastal  
Plain and Interior provinces, Miss. to  
Ark., Minn., and Ohio.

2. *T. lanceolatum* Boykin. Scape 1-4  
dm. tall, glabrous : bracts 7-9 cm. long ;  
blades lanceolate to elliptic, sessile,  
green : sepals linear or linear-lanceolate,  
green : petals greenish, the blades linear  
or linear-oblong, about  $\frac{1}{2}$  as long as  
the claws : anthers 6-8 mm. long.—Moist  
woodlands and river bluffs, Coastal Plain  
and adj. provinces, W Fla. to La., Tenn.,  
and Ga.

3. *T. ludovicianum* Harbison. Scape 0.8-2 dm. tall, glabrous : bracts 5-8  
cm. long ; blades ovate to broadly ovate, mottled : sepals lanceolate to broadly  
lanceolate, purplish at the base : petals purple or greenish above the purple  
base, the blades linear or linear-lanceolate : anthers 8-12 mm. long.—Rich  
woods, Coastal Plain, Fla. to La.

4. *T. viride* Beck. Scape 1-2 dm. tall, pubescent near the top, but often becoming glabrous at maturity: bracts 5-11 cm. long; blades oblong to ovate, or rarely suborbicular, deep-green, often mottled: sepals linear to linear-lanceolate, 2-4 cm. long; petals green or purplish green, the blades linear or linear-elliptic, longer than the claws: anthers 15-20 mm. long.—(WOOD-TRILLIUM.)—Woods, various provinces, Ala. to Miss., Kans., and SW Va.
5. *T. discolor* Wray. Scape 1-3 dm. tall, glabrous: bracts 4-13 cm. long; blades oval or oval-ovate, mottled: sepals oblong to oblong-lanceolate: petals broadly spatulate, greenish: anthers 9-13 mm. long.—Woods, various provinces, Ga. to N. C.
6. *T. stamineum* Harbison. Scape 1-3 dm. tall, pubescent near the top: bracts 5-8 cm. long; blades ovate-lanceolate to broadly ovate, mottled, somewhat pubescent on the veins beneath: sepals broadly lanceolate to elliptic: petals lanceolate, dark purple: anthers 15-18 mm. long.—Rocky woods, various provinces, rarely Coastal Plain, Ga. to Miss.
7. *T. decumbens* Harbison. Scape 0.4-1 dm. tall, pubescent near the top: bracts 4-8 cm. long; blades broadly ovate to suborbicular, mottled, pubescent on the veins beneath: sepals lanceolate: petals linear or linear-lanceolate, purple: anthers 9-11 mm. long.—Rocky woods, Appalachian provinces, Ala.
8. *T. sessile* L. Scape 1-2 dm. tall: bracts 4-8 cm. long; blades oval to suborbicular, often mottled: sepals lanceolate: petals narrowly elliptic, maroon: anthers 10-12 mm. long.—(TOAD-SHADE.)—Rich woods, various provinces, Ga. to Miss., Minn., and N. Y.—Instead of maroon-colored petals, some plants have greenish-yellow ones. This form possibly represents what Muhlenberg named *T. luteum*. The flowers have a penetrating scent resembling that of the sweetshrub (*Calycanthus*).
9. *T. Underwoodii* Small. Scape 1-3 dm. tall: bracts 10-18 cm. long; blades lanceolate to ovate-lanceolate or broadly ovate, lustrous and with 3 shades of green above: sepals lanceolate, 4.5-5.5 cm. long: petals lanceolate, elliptic or oblanceolate, maroon: anthers 10-15 mm. long. [*T. rectistamineum* (Gates) St. John]—Woods and pastures, Coastal Plain and adj. provinces, Fla. to Ala., Ark., and N. C.
10. *T. Hugeri* Small. Scape 1-2.5 dm. tall: bracts 10-14 cm. long; blades suborbicular to broadly ovate, green, mottled: sepals oblong to oblong-lanceolate, 4-5.5 cm. long: petals elliptic-lanceolate to spatulate, dark-maroon or brown: anthers 10-20 mm. long.—(WHIPPOORWILL-FLOWER.)—Rich woods, various provinces, Fla. to Miss., Tenn., and N. C.—The typical maroon or brown of the petals sometimes gives way to yellow or green. Several forms in these paler colors—petals broad or petals narrow—have been proposed. *T. luteum* (Fl. SE. U. S.) is such a color form. Flowers scented as in *T. sessile*.
11. *T. erectum* L. Scape 3-6 dm. tall: bracts 8-18 cm. long; blades rhombic, often broader than long: pedicel 3-10 cm. long, erect to horizontal: sepals oblong or lanceolate, 2-3.5 cm. long: petals lanceolate or ovate-lanceolate, maroon or brown-purple varying to yellow, white or white blotched with purple: anthers 5-9 mm. long: berry purplish-red. [*T. album* (Fl. SE. U. S.), *T. Rugelii* Britt. & Rendle]—(BROWN-BETH. STINKING-WILLIE.)—Rich woods, various provinces, N of Coastal Plain, Ga. to Ala., Man., Ont., and N. S.—Perhaps the most variable of our trilliums. Foliage and floral variations have furnished the basis for the segregation of several forms.

12. *T. Vaseyi* Harbison. Scape 3-6 dm. tall: bracts 10-20 cm. long; blades oval to broadly rhombic, slightly acuminate: pedicel 4-8 cm. long, declined or nearly horizontal: sepals lanceolate, 4-6 cm. long, acuminate: petals crimson or purple brown, ovate to orbicular-ovate: anthers 8-12 mm. long; connectives purple.—(SWEET-BETH. SWEET-TRILLIUM.)—Woods or slopes, Blue Ridge and Appalachian provinces, Ga. to Tenn. and N. C.—Lack of color in the petals or scant color results in white- or yellow-flowered forms.

13. *T. simile* Gleason. Similar to *T. Vaseyi*, but bracts usually larger, 10-18 cm. long and broad, broadly obrhombic, very short-acuminate: pedicel 3-7 cm. long, erect, but flower horizontal: sepals lanceolate to ovate-lanceolate, 2.5-3.5 cm. long: petals creamy or white, 3-6 cm. long, broadly ovate or rhombic-ovate, obtuse or acutish: anthers 10-12 mm. long, wholly yellow.—Woods, Piedmont and adj. Blue Ridge, Ga. and N. C.—The plants are rare and local. The flowers are deliciously fragrant.

14. *T. cernuum* L. Scape 2-6 dm. tall: bracts 6-12 cm. long; blades sometimes decidedly wider than long: petals white, elliptic-lanceolate to ovate, 1.5-2.5 cm. long: anthers 2.5-6.5 mm. long: seed about 2 mm. long.—Rich woods, various provinces, in Coastal Plain only N, Ga. to Ala., Mo., Man., and Newf.

15. *T. declinatum* (A. Gray) Gleason. Scape 2-4.5 dm. tall: bracts 8-17 cm. long; blades broadly rhombic, often decidedly contracted at the base: petals white, elliptic-lanceolate to ovate, 2-5 cm. long: anthers 6-15 mm. long: seed about 3 mm. long.—Alluvial bottom lands, Interior Low Plateau and more N provinces, Tenn. to Mo., Minn., and C N. Y. In some colonies the petals are pink, purplish, or maroon.

16. *T. grandiflorum* (Michx.) Salisb. Scape 2-5 dm. tall: bracts 6-14 cm. long; blades oval or rhombic-oval, acuminate: pedicel 5-8 cm. long, erect or nearly so: sepals lanceolate, 2.5-5 cm. long, acute: petals oblanceolate or obovate-lanceolate, white or pink, or later rose, or rarely green or white with green stripes, crisped: berry erect, 2-2.5 cm. thick.—(WHITE WAKE-ROBIN.)—Rich woods, various provinces, rarely Coastal Plain, N. C. to Ark., Minn., Que., and Vt.—The corolla of the typical plant unfolds white and later turns pink. In some forms it is pink from the beginning or more rarely green or white with green stripes. Occasionally the petals are spirally overlapped. Colonies sometimes have bracts with petiole-like bases.

17. *T. undulatum* Willd. Scape 2-5 dm. tall: bracts 6-20 cm. long; blades ovate, longer than the petiole-like bases: pedicel erect, 2-6 cm. long: sepals lanceolate to oblong-lanceolate, 1.5-2.5 cm. long: petals white striped with pink, oblong to oval, varying to obovate: berry ellipsoid to ovoid-ellipsoid, erect, bright-red. [*T. erythrocarpum* Michx.].—(STRIPED WAKE-ROBIN. PAINTED-LADY. PAINTED-TRILLIUM.)—Damp woods and bogs, often in acid soil, Blue Ridge and more northern provinces, Ga. to Mo., Wis., and N. S.—The preference of this typically northern type of *Trillium* for acid soil distinguishes it from most of the other species of the genus.

18. *T. pusillum* Michx. Scape 1-2 dm. tall: bracts 3-4 cm. long; blades oblong to lanceolate, sessile: sepals lanceolate to oblong-lanceolate, about 1.5 cm. long, obtuse: petals white or pink, linear-oblong to lanceolate: anthers 5-6 mm. long.—Woods, Coastal Plain, S. C. to Va., and Ozark Plateau, Ark.

19. *T. Catesbaei* Ell. Scape 2-5 dm. tall, mottled above: bracts 5-15 cm. long; blades elliptic or oval: pedicel spreading or deflexed, 2-5 cm. long: sepals linear or linear-lanceolate, or sometimes spatulate-oblong, 2-4 cm. long, curled or reflexed: petals pink or sometimes rose, oblong to oblong-lanceolate,

obtuse or abruptly pointed, recurved: berry 1-1.5 cm. thick. [*T. stylosum* Nutt.]—(ROSY WAKE-ROBIN. BASHFUL WAKE-ROBIN.)—Woods, Piedmont and adj. provinces, Ga. to Ala. and N. C.

**FAMILY 10. ROXBURGHIACEAE — ROXBURGHIA FAMILY**

Perennial herbs or shrubs. Leaves alternate: blades with palmately parallel veins. Flowers perfect, in axillary racemes. Calyx of 2 sepals. Corolla of 2 petals. Androecium of 4 stamens. Gynoecium of 2 united carpels. Ovary 1-celled. Stigma sessile. Fruit capsular.—Three genera and 8 species, mostly natives of Asia.

**1. CROOMIA** Torr. Caulescent herbs with horizontal rootstocks. Leaves approximate near the top of the stem. Flowers nodding. Sepals and petals partially united. Capsule 2-valved.—Two species, the following and one in Japan.

**1. C. pauciflora** (Nutt.) Torr. Stems 1-4 dm. tall, simple: leaf-blades elliptic or elliptic-ovate, 5-15 cm. long, cordate at the base, petioled: sepals and petals greenish tinged with purple, especially at the base, 3-5 mm. long: filaments purple; anthers yellow: capsule ovoid, 3-6 mm. long.—(CROOMIA.)—Rich woods, mostly on river-bluffs, Coastal Plain and adj. provinces, N Fla. to Ala. and Ga.—Spr.

**FAMILY 11. SMILACACEAE — SMILAX FAMILY**

Perennial armed or unarmed vines or low herbs. Leaves alternate: blades ribbed, netted-veined, commonly persistent: petiole usually bearing a pair of appendages. Flowers dioecious, in axillary peduncled umbels. Perianth regular, usually green, that of the staminate flowers larger than that of the pistillate. Calyx of 3 sepals. Corolla of 3 petals. Androecium of 6 stamens. Anthers erect. Gynoecium 3-carpellary. Stigmas 3, sessile, sometimes elongate. Fruit a berry with 3 bands of strengthening tissue in the pulp connecting the base and apex.—Four genera and 250 species in tropical and temperate regions.

Stem annual, herbaceous, unarmed: ovules 2 in each carpel. 1. NEMEXIA.  
Stem perennial, woody, usually prickly: ovule solitary in each carpel. 2. SMILAX.

**1. NEMEXIA** Raf. Stems erect or climbing, herbaceous, unarmed, annual. Leaf-blades membranous, broad, often ribbed. Flowers often carrion-scented. Perianth pale-green, or yellowish-green, the petals usually narrower than the sepals. Berries black or glaucous.—About 10 species, natives of North America.—Spr.—CARRION FLOWERS. DEAD-MAN'S BRYONYS.—The more common species are well known for their carrion-scented flowers.

Anthers shorter than the filaments: leaf-blades ovate, often cordate, not hastate-lobed.  
Anthers about as long as the filaments: leaf-blades lanceolate or ovate-lanceolate, more or less hastate-lobed.

I. HERBACEAE.  
II. TAMNIFOLIAE.

## I. HERBACEAE

Mature leaf-blades green and shining beneath, decidedly acuminate: sepals and petals of the staminate flowers 4.5-5.5 mm. long; berry black.

Mature leaf-blades pale beneath, abruptly pointed or short-acuminate: sepals and petals of the staminate flowers 4 mm. long or less, except in no. 5; berry glaucous.

Leaf-blades merely glaucous beneath: scales on the stem below the leaves appressed.

Mature stem with alternate separated leaves: leaf-blades acuminate: sepals and petals of the staminate flowers 3-3.5 mm. long: seeds 3-5 to a berry, 3.5-4 mm. long.

Mature stem with leaves clustered near the top: leaf-blades abruptly pointed: sepals and petals of the staminate flowers 2.5-3.5 mm. long: seeds 2 to a berry, 4.5-5 mm. long.

Leaf-blades pubescent or puberulent beneath: scales on the stem below the leaves more or less spreading.

Stem elongate, climbing, with numerous tendrils: peduncles axillary to leaves.

Stem short, not climbing, the tendrils usually wanting: peduncles, at least in part, from the axils of scale-like bracts below the leaves.

Leaf-blades acuminate: sepals and petals of the staminate flowers 4-5 mm. long: berry with 3-5 seeds.

Leaf-blades acute to mucronate: sepals and petals of the flowers 2.5-3.5 mm. long: berry with 2 or 3 seeds.

## II. TAMNIFOLIAE

Sepals and petals of the staminate flowers 4 mm. long: pedicels elongate, about 2 cm. long.

Sepals and petals of the staminate flowers about 3.5 mm. long: pedicels short, less than 1 cm. long.

1. *N. pulverulenta*.

2. *N. herbacea*.

3. *N. biltmoreana*.

4. *N. lasioneuron*.

5. *N. cecirrhata*.

6. *N. Hugeri*.

7. *N. leptanthera*.

8. *N. tamnifolia*.

1. *N. pulverulenta* (Michx.) Small. Stem stout: leaf-blades ovate to elliptic-ovate, 8-15 cm. long, short-acuminate, usually 9-nerved, cordate at the base: sepals of the staminate flowers ovate, elliptic, or obovate, 4.5-5.5 mm. long; those of the pistillate flowers 3-3.5 mm. long: berry black, 8-10 mm. in diameter, with 3-5 seeds.—Rich woods, various provinces, rarely Coastal Plain, N. C. to Tenn., Mo., and S. N. Y.

2. *N. herbacea* (L.) Small. Stem elongate: leaf-blades ovate, triangular-lanceolate or lanceolate, 4-8 cm. long, short-acuminate, 7-9-nerved, rounded or truncate at the base: sepals of the staminate flowers elliptic or nearly so, 3.5-4 mm. long; those of the pistillate 3-3.5 mm. long: berry 6-8 mm. in diameter.

—Moist woodlands, stream-banks, thickets, and barrens, various provinces, Ala. to Nebr. and N. B.

3. *N. biltmoreana* Small. Stem 2.5-6 dm. tall: leaf-blades ovate, 6-12 cm. long: sepals of the staminate flowers elliptic, sometimes narrowly so, 2.5-3.5 mm. long: anthers ellipsoid: berry glaucous, 7-9 mm. long.—Hillsides and woods, Blue Ridge, and adj. provinces, S. C. and N. C.

4. *N. lasioneuron* (Hook.) Rydb. Stem 1-3 m. long or more: leaf-blades ovate or elliptic-ovate, or those subtending peduncles lanceolate, 3-5 cm. long, 3-7-ribbed, truncate or cordate at the base, often slightly twisted at the tip:

sepals of the staminate flowers elliptic, about 4 mm. long; those of the pistillate flowers ovate-elliptic, 2-2.5 mm. long: anthers linear-ellipsoid: berry 6-9 mm. in diameter. [*N. diversifolia* Small]—Moist soil, thickets, woods, and stream-banks, Blue Ridge and more northern provinces, Ga. to Ala., Colo., Wyo., and Ont.

5. *N. ecirrhata* (Engelm.) Small. Stem mostly 3-6 dm. tall, occasionally with tendrils: leaf-blades ovate to lanceolate-ovate, 8-12 cm. long, acuminate, paler beneath: sepals of the staminate flowers elliptic, 4-5 mm. long: anthers ellipsoid: berry purple-black, 9-11 mm. in diameter, with 3-5 seeds.—Woods, Blue Ridge and more northern provinces, Ala. to Mo., Ont., and N. C.

6. *N. Hugerii* Small. Stem 2-5 dm. tall: leaf-blades oblong-oval, 9-14 cm. long, obtuse or abruptly pointed at the apex: sepals of the staminate flowers elliptic, 2.5-3.5 mm. long: anthers ellipsoid: berry glaucous, 8-10 mm. in diameter.—Woods, various provinces, N. Fla. to Ala. and N. C.

7. *N. leptanthera* (Pennell) Small. Stem elongate: leaf-blades triangular-ovate, 6-11 cm. long, 5-7-nerved, cordate at the base: sepals of the staminate flowers elliptic to linear-elliptic, about 4 mm. long: anthers narrowly linear, 1.5-2 mm. long. [*Smilax leptanthera* Pennell]—Woods, Piedmont, Ga.

8. *N. tamnifolia* (Michx.) Small. Stem elongate: leaf-blades hastate-ovate to hastate-lanceolate, 5-12 cm. long, 5-7-nerved, truncate or cordate at the base, the basal lobes rounded: sepals of the staminate flowers broadly elliptic, about 3 mm. long: anthers narrowly ellipsoid: berry 4-6 mm. in diameter.—Moist sandy soil near streams and acid marshy grounds, Coastal Plain and rarely adj. provinces, S. C. to Miss., Tenn., and N. Y.

1. **SMILAX** L. Stems usually greatly elongate, with very hard wood, and usually armed with prickles. Leaf-blades leathery, prominently ribbed. Flowers often fragrant. Perianth green. Berry red, blue, or black. Vigorous shoots often bear very large leaves.—About 220 species, most abundant in tropical America and Asia.—Spr.-sum.—GREENBRIERS. HORSEBRIERS.—The plants of some species are very vigorous and produce an almost impenetrable tangle of woody, often armed, stems. The large roots of some of our native species furnished a red flour to the aborigines, which was called *Conti Chatee*, meaning red flour-root. The roots of some exotic species are used in medicine under the name sarsaparilla.

Leaf-blades entire or lobed at the base, sometimes merely erose or with fine prickly edges: berry globular. (In *S. pumila* ovoid and red or orange.)

Leaf-blades glabrous, sometimes merely hispidulous or prickly on the veins beneath: berry globular.

Peduncles much longer than the petioles.

Leaf-blades glaucous beneath: berry glaucous.

Leaf-blades green: berry not glaucous.

Peduncles about as long as the petioles or shorter.

Stigmas 2 or 3: berry 2- or 3-seeded, maturing the first season: leaf-blades thin- or firm-coriaceous.

Berry black.

Leaf-blades not reticulate.

Leaf-blades reticulate.

Berry red.

Stigma solitary: berry 1-seeded, maturing the second season: leaf-blades thick-coriaceous.

Leaf-blades woolly beneath: berry ovoid, red or orange.

Leaf-blades sinuate, the teeth firm or shiny, or the thick edges sometimes entire: berry black, ovoid.

I. GLAUCAE.

II. HISPIDAE.

III. ROTUNDIFOLIAE.

IV. AURICULATAE.

V. LANCEOLATAE.

VI. LAURIFOLIAE.

VII. PUMILAE.

VIII. HAVANENSES.

#### I. GLAUCAE

Vine with terete or nearly terete branches, often armed with scattered prickles: foliage glaucous.

1. *S. glauca*.

## II. HISPIDAE

Leaf-blades thin-coriaceous, with the veins pale beneath.  
 Leaf-blades firm-coriaceous, the veins not pale.

2. *S. hispida*.  
 3. *S. Bona-Nox*.

## III. ROTUNDIFOLIAE

Leaf-blades not lobed, smooth-margined and smooth on the veins beneath.

4. *S. rotundifolia*.

## IV. AURICULATAE

Leaf-blades usually lobed, prominently veined.

5. *S. auriculata*.

## V. LANCEOLATAE

Leaf-blades deep-green and shining above, paler beneath: peduncle terete: berry dull-red.

6. *S. lanceolata*.

Leaf-blade equally green on both sides: peduncle flattened: berry bright coral-red.

7. *S. Walteri*.

## VI. LAURIFOLIAE

Very vigorous vine, with terete or 1-angled branches: berry green or whitish the first year, black the second year.

8. *S. laurifolia*.

## VII. PUMILAE

Soft-woody trailing or low-climbing unarmed vine, the leaves and fruits persistent, the stem pubescent like the leaves: berry 1-seeded.

9. *S. pumila*.

## VIII. HAVANENSES

Rigid prickly-armed vine, with angled stems: leaf-blades with the thickened margins sinuate and spiny toothed or entire: berry jet-black.

10. *S. havanensis*.

1. *S. glauca* Walt. Stem and branches diffuse or widely climbing, terete or nearly so, often with few scattered prickles: leaf-blades ovate, usually broadly so, ranging to elliptic-ovate or orbicular-ovate, or, on vigorous shoots, orbicular-reniform to pandurate-lanceolate, mostly 4-9 cm. long, glaucous beneath, smooth-edged: peduncle longer than the petiole, very slender: sepals and petals of the staminate flowers 3.5-4 mm. long: berry globular, 6-8 mm. in diameter, glaucous: seed 4-5 mm. long, brown. —(WILD-SARSAPARILLA. SAW-BRIER.)—Sandy woods, thickets, margins of swamps, and old fields, various provinces, Fla. to Tex., Kans., and Mass.—Spr.—The leaves are deciduous.

2. *S. hispida* Muhl. Stem and branches diffuse and high-climbing, somewhat angled, the lower part of the stem often densely beset with dark or rarely pale, acicular prickles which are accompanied by scattered subulate prickles: leaf-blades ovate, usually elliptic-ovate or orbicular-ovate (hastate or pandurate in *S. hispida australis*), 5-15 cm. long, or very broad and larger on vigorous shoots, thin-coriaceous, erose, often more or less prickly on the pale veins beneath, abruptly narrowed to cordate at the base: sepals and petals of the staminate flowers linear or linear-elliptic, 4-5 mm. long: berry globular, 6-8 mm. in diameter, black: seed 4-5.5 mm. in diameter, dark-brown. —(HAGBRIER. HELPFETTER. BRISTLY-GREENBRIER.)—Rich woods and thickets, often along streams, various provinces, rarely Coastal Plain, Ga. to Tex., Minn., Ont., N. Y., and Conn.—Spr.—The dominant rounding of the leaf-bases, with usually no tendency to lobing, serve to distinguish this from the following species.

3. *S. Bona-Nox* L. Stem and branches extensively climbing, often high-climbing, sometimes with scattered rigid subulate prickles, more or less 4-

angled: leaf-blades dominantly ovate or broadly lanceolate, at least in outline, more or less triangular, often deltoid or hastate, 3-14 cm. long, more or less reticulate, erose or spiny-margined, glabrous, sometimes prickly on the veins beneath, mostly truncate to cordate at the base: sepals and petals of the staminate flowers linear or nearly so, 4-5 mm. long: berry globular, 6-8 mm. in diameter, or rarely smaller, black: seed 5-5.5 mm. in diameter, brown. [*S. Pseudo-China* L. *S. tamnoides* (Chapm. Fl.)] — BAMBOO. CHINABRIER. BULLBRIER. TRAMP'S-TROUBLE. STRETCH-BERRY.)—Woods, thickets, hammocks, and fence-rows, various provinces, Fla. to Tex., Nebr., and Md.—(*Mex.*)—Spr.—The dilation of the leaf-bases resulting in a deltoid or hastate blade is a mark to distinguish this from the next preceding species.

4. *S. rotundifolia* L. Stem and branches diffuse and often high-climbing, often armed with remote firm prickles, more or less four-angled: leaf-blades ovate varying to orbicular-ovate, or suborbicular (or narrowly ovate to lanceolate and with erose edges in *S. rotundifolia crenulata*), thin-coriaceous, glabrous, abruptly narrowed to subcordate at the base, or cordate in the very broad leaves of vigorous shoots: sepals and petals of the staminate flowers 5-6 mm. long: berry globular, 6-8 mm. in diameter, reddish-brown.—(GREENBRIER. CATBRIER. HORSEBRIER.)—Woods, thickets, fence-rows, and stream-banks, various provinces, Fla. to Tex., Minn., Ont., and N. S.—Spr.

5. *S. auriculata* Walt. Stem and branches diffuse or high-climbing, sometimes armed with very small prickles, more or less 4-angled, the branchlets zigzag: leaf-blades ovate, oval, or elliptic, at least in outline, more or less hastate, pandurate or rhombic, or broader on shoots, 2-12 cm. long, notched, mucronate, or abruptly pointed at the apex, reticulate, thick-margined, glabrous: sepals and petals of the pistillate flowers linear-elliptic or linear-oblancoate, 4-5 mm. long: berry globular, 6-13 mm. in diameter, or rarely smaller, black, but sometimes glaucous until maturity: seed about 5 mm. in diameter, brown. [*S. Beyrichii* Kunth *S. lata* Small]—(WILD-BAMBOO.)—Hammocks, pinelands, sandhills, and scrub, Coastal Plain, Fla. to Miss. and N. C.—(*W. I.*)—Spr.-sum. or all year S.—Plants growing in the pinelands show rather abbreviated growth and spread diffusely on the ground or cover brush. In hammocks the plants are larger, often vigorous and high-climbing, and when in flower fill the air with fragrance. The leaves are evergreen.

6. *S. lanceolata* L. Stem and branches high-climbing, unarmed, often glaucous, terete or nearly so: leaf-blades elliptic-lanceolate to ovate, 4-10 cm. long, firm-coriaceous, glabrous, smooth-edged, shining above, acute to truncate at the base: sepals and petals of the staminate flowers linear-spatulate, 4-5 mm. long, yellowish-green: stamens nearly as long as the petals: berry globular, 5-8 mm. in diameter, dull-red: seed about 5 mm. in diameter, brown. [*S. Smallii* Morong. *S. cinnamomifolia* Small]—(JACKSONBRIER.)—Rich woods, hammocks, roadsides, and other places protected from fire, Coastal Plain and adj. provinces, N Fla. to Tex., Ark., and Va.—Spr.-sum.—In the Coastal Plain the plants, although vigorous, produce leaves with blades of a rather narrow type (elliptic-lanceolate), while in or near the adjacent provinces the leaf-blades are broader, often ovate. The leaves are evergreen. Much used for winter decorations, large quantities being shipped from the Gulf States.

7. *S. Walteri* Pursh. Stem and branches diffusely climbing, sometimes with scattered prickles near the base, obscurely 4-angled: leaf-blades ovate, ovate-lanceolate, or broadly lanceolate, 5-14 cm. long, thin-coriaceous, often erose, 5-veined, glabrous, abruptly narrowed to subcordate at the base: sepals and petals of the staminate flowers linear or nearly so, 6-7 mm. long, brownish: stamens 5-6 mm. long: berry globular, 6-8 mm. in diameter, bright coral-red: seed 5-6 mm. in diameter, dark-brown.—(SARSAPARILLA. CORAL-GREENBRIER.)

—Pineland ponds, swamps, and stream-banks, in acid soil, Coastal Plain and adj. provinces, Fla. to La. and N. J.—Spr.—The leaves are deciduous.

8. *S. laurifolia* L. Stem and branches extensively climbing or high-climbing, sometimes armed with very rigid prickles, often 1-angled: leaf-blades lanceolate, elliptic, oval, or ovate, or rarely linear, 5-15 cm. long, thick-coriaceous, acute or rounded, or subcordate at the base on vigorous shoots, mostly 3-veined: sepals and petals of the pistillate flowers linear-lanceolate or elliptic-linear, 4-5 mm. long, or rarely longer: berry globular or ovoid-globose, 5-8 mm. in diameter, black: seed 4-5 mm. in diameter, black.—(BAMBOO-VINE. BLASPHEME-VINE.)—Non alluvial, often acid swamps, wet woods, and hammocks, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and N. J.—(W. I.)—Spr.-sum.—In size and vigor this outclasses our other kinds of smilax. The long-persistent ultimately hard woody stems and branches form impenetrable entanglements. The character of the fruit in requiring two seasons to ripen is an anomaly among our species. The leaves are evergreen.

9. *S. pumila* Walt. Stem and branches trailing or low-climbing, woolly, unarmed: leaf-blades quite uniform, ovate to elliptic-ovate or ovate-lanceolate, 5-10 cm. long, woolly beneath, cordate at the base: peduncles about as long as the petioles or shorter, and like them woolly: sepals and petals of the staminate flowers linear or linear-ob lanceolate, about 3 mm. long or rarely longer: berry ovoid, 5-8 mm. long, red, acute: seed about 3 mm. long, red.—(SARSA-PARILLA-VINE.)—Pinelands, oak woods, sandhills, hammocks, and river-bluffs, Coastal Plain, Fla. to Tex. and S. C.—Fall.—After the manner of our common witch-hazel this smilax blooms in the fall and ripens its fruit in the spring. The berries, however, may persist on the stems for a year longer.

10. *S. havanensis* Jacq. Stem and branches more or less armed with short stout, dark-tipped slightly recurved prickles: leaf-blades mostly oval or elliptic, varying to ovate or obovate, 4-8 cm. long or smaller on branchlets, sinuate and spiny, or sometimes entire, often spiny on the midrib beneath: sepals and petals elliptic to ovate, about 1.5 mm. long: stamens about 1 mm. long: berry ovoid, 5-8 mm. long, 1-3-seeded: seed nearly 4 mm. in diameter, brown.—Pinelands and hammocks, Everglade Keys, Fla. and Florida Keys.—(W. I.)—Spr. or often at other seasons.—Habitat seems to have a very marked effect on this plant. Specimens in the pinelands are stunted rigid and with armed stems and leaves. In hammocks the plant is vigorous and climbs to the top of the tallest trees. Then the spines of the stem nearly or quite disappear and the leaf-blades are broader and less spiny or entirely smooth. The leaves are evergreen.

*Smilax megacarpa* Morong (*S. Morongii* Small) was based on a herbarium sheet containing fragmentary specimens of *Smilax laurifolia* and *S. Walteri*.

#### ORDER AMARYLLIDALES — AMARYLLIDAL ORDER

Perennial herbs or vines. Leaves with narrow or dilated blades. Flowers perfect or dioecious, complete. Perianth of 3 sepals and 3 petals, these distinct or partly united. Androeceum of 3 or 6 stamens. Gynoeceum mostly 3-carpellary, the ovary wholly or partly inferior.

Leaves not equitant: stamens 6.  
 Upright herbs: flowers perfect.  
 Twining vines: flowers dioecious.  
 Leaves equitant: stamens 3 or 6.  
 Perianth not woolly.  
 Perianth woolly.

Fam. 1. LEUCOJACEAE.  
 Fam. 2. TAMACEAE.  
 Fam. 3. INIACEAE.  
 Fam. 4. HAEMODORACEAE.

FAMILY 1. **LEUCOJACEAE** — **AMARYLLIS FAMILY**

Herbs, commonly succulent, with rootstocks, bulbs, or corms. Leaves alternate, wholly or mainly basal. Flowers perfect, the perianth sometimes with a crown. Calyx of 3 sepals. Corolla of 3 petals, together with the sepals partially united into a tube. Androecium of 6 stamens, the filaments sometimes united into a crown. Gynoecium of 3 united carpels. Ovary inferior or half-inferior. Styles united. Ovules numerous.—About 70 genera and 800 species, most abundant in tropic and warm temperate regions.

Plant perennial by corms or elongate rootstocks.

Ovary and capsule half-inferior.

Ovary and capsule wholly inferior.

Inflorescence umbel-like: capsule circumscissile:  
leaves grass-like.

Inflorescence spicate, racemose, or paniculate:  
capsule 3-valved: leaves succulent.

Plant perennial by bulbs.

Filaments distinct.

Filaments connected with a cup-like or funnelform  
membrane (crown).

Tribe I. **ALETREAE**.

Tribe II. **HYPOXIDEAE**.

Tribe III. **AGAVEAE**.

Tribe IV. **CRINEAE**.

Tribe V. **HYMENOCALLEAE**.

**I. ALETREAE**

Flowers in a raceme or a spike: perianth granular; lobes relatively short, converging, erect or somewhat spreading: stamens included.

1. **ALETRIS**.

**II. HYPOXIDEAE**

Acaulescent herbs with narrow leaf-blades and very slender scapes.

2. **HYPOXIS**.

**III. AGAVEAE**

Plant with bulbs, dying down annually: leaf-blades neither spiny-toothed nor spine-tipped.

3. **MANFREDIA**.

Plant with caudices, long-persistent: leaf-blades spiny-toothed and spine-tipped.

4. **AGAVE**.

**IV. CRINEAE**

Scapes 1-flowered: stigmas 3.

5. **ATAMOSCO**.

Scapes 2-several-flowered: stigmas united.

6. **CRINUM**.

**V. HYMENOCALLEAE**

Succulent herbs with strap-like leaves: scape terminated by one flower or by a cluster of flowers.

7. **HYMENOCALLIS**.

1. **ALETRIS** L. Caulescent herbs with thick rootstocks and scape-like stems. Basal leaves spreading. Flowers in an interrupted spike or raceme. Perianth white to yellow, campanulate, cylindric, or obovoid, granular or mealy: lobes much shorter than the tube. Filaments adnate to the middle of the perianth or above it.—About 8 species, natives of eastern North America and Asia.—Spr.—fall, or all year S.—**COLIC-ROOTS**. **STAR-GRASSES**.

Perianth cylindric or campanulate: filaments adnate to near the base of the perianth-lobes.

Perianth campanulate, 5-7 mm. long: lobes erect or converging.

1. *A. aurea*.

Perianth cylindric or constricted above the middle, 7-10 mm. long: lobes spreading.

Perianth yellow: capsule gradually narrowed into a beak  
 $\frac{1}{2}$  as long as the body.

2. *A. lutea*.

Perianth white: capsule abruptly narrowed into a beak as  
long as the body.

Perianth copiously granular: capsule-body ovoid.

3. *A. farinosa*.

Perianth slightly granular: capsule-body conic.

4. *A. bracteata*.

Perianth obovoid: filaments adnate to a little above the middle  
of the perianth.

5. *A. obovata*.

1. *A. aurea* Walt. Stem 3-8 dm. tall: blades of the basal leaves oblong to elliptic, 3-8 cm. long: perianth yellow; lobes broader than long, blunt-tipped: style short: capsule ovoid, 5 mm. long, short-beaked.—Moist pinelands, Coastal Plain, Fla. to Tex. and Md.—This and the other yellow-flowered species are conspicuous features in the landscape where the plants are close-set and the golden spikes abundant.

2. *A. lutea* Small. Stem 3-11 dm. tall: blades of the basal leaves linear to linear-lanceolate, or sometimes broadest above the middle, 4-12 cm. long: perianth yellow, 8-10 mm. long; lobes mostly ovate: capsule conic-ovoid, long-beaked.—Low pinelands, Coastal Plain, Fla. to La. and Ga.

3. *A. farinosa* L. Stem 3-12 cm. tall: blades of the basal leaves narrowly oblong or elliptic, or elongate and broadly linear, 5-30 cm. long: perianth white or cream-colored, 7-10 mm. long; lobes ovate: style elongate: capsule ovoid, abruptly beaked.—(MILLER'S-MAID. ALOE.)—Sandy soil, dry woods, prairies, and pinelands, various provinces, Fla. to La., Minn., Ont., and Me.

4. *A. bracteata* Northrop. Stem 3-6 dm. tall: blades of the basal leaves nearly linear to linear-lanceolate, 6-12 cm. long: perianth white, 6-8 mm. long; lobes lanceolate to triangular, spreading: capsule conic, gradually beaked.—Pinelands, Everglade Keys and adj. Everglades Fla. and the lower Florida Keys.—(W. I.)

5. *A. obovata* Nash. Stem 5-8 dm. tall: blades of the basal leaves narrowly elliptic to obovate-lanceolate, 6-8 cm. long: perianth white, obovoid, 5-6 mm. long; lobes broadly ovate, converging: style very short: capsule ovoid, short-beaked.—Pinelands, Coastal Plain, E Fla. and S Ga.

2. **HYPOXIS** L. Acaulescent herbs with corm-like rootstocks. Leaves with elongate-linear or nearly filiform blades. Scapes slender, sometimes tufted. Flowers solitary or clustered. Perianth mainly yellow, or rarely white. Filaments adnate to the base of the perianth.—About 50 species of wide geographic distribution.—STAR-GRASSES.

Leaf-blades linear, often very narrow and somewhat channeled: seeds muricate or pebbled. I. LINEARES.

Leaf-blades setaceous or filiform-setaceous as a result of the strongly involute margins: seeds with hieroglyphic-like carvings. II. SETACEAE.

#### I. LINEARES

Seed black: leaf-blades linear, flat or nearly so, at least when green.

Leaf-bases (corm-scales) not breaking down into fibrous bristles.

Capsule globose to ellipsoid, 2-6 mm. long: leaf-blades pubescent.

Capsule clavate to ellipsoid-clavate, 6-11 mm. long or rarely smaller: leaf-blades glabrous.

Leaf-bases (corm-scales) breaking down into fibrous bristles.

Seed brown: leaf-blades narrowly linear, often involute.

Seed iridescent: scape very short or up to 8 cm. long, usually less than 4 cm. long.

Seed not iridescent: scape 4-18 cm. long, usually over 5 cm. long.

1. *H. hirsuta*.

2. *H. leptocarpa*.

3. *H. rigida*.

4. *H. sessilis*.

Seed nearly or quite beakless, papillose-muricate: corm-scales membranous, often dark and thick.  
Seed beaked, crudely pebbled: corm-scales becoming fibrillose.

5. *H. micrantha*.

6. *H. Wrightii*.

## II. SETACEAE

Plants with elongate corms: perianth bright-yellow.

7. *H. juncea*.

1. *H. hirsuta* (L.) Coville. Corm with membranous pale or brown-tinged sheaths: leaf-blades 8 mm. wide or less, 1-6 dm. long, pubescent, stiff: scape slender, stiffish, 4-35 cm. long, 2-7 flowered: bracts small, subulate or linear-subulate: sepals lanceolate, elliptic, or elliptic-lanceolate, pubescent without: petals elliptic or narrowly ovate, 6.5-15 mm. long: anthers about 3 mm. long: capsule obovoid to globose, 3-4.5 mm. long, pubescent: seed 0.8-1.3 mm. long. [*H. erecta* L. *H. grandis* Pollard.]—Dry, often acid soil, open woods, hillsides, and pastures, various provinces, Fla. to Tex., Man., and N. H.—Spr.-fall.

2. *H. leptocarpa* Engelm. & Gray. Similar to *H. hirsuta* in habit, but corm usually with dark scales: leaf-blades 15 mm. wide or less, up to 80 mm. long, nearly or quite glabrous, usually flat, very thin, flaccid: scape shorter than the leaves, loosely pubescent especially above: scape filiform, lax, 1-3-flowered: bracts slender, often elongate: sepals linear to narrowly linear-lanceolate, sparingly pubescent: petals linear-lanceolate to elliptic or elliptic-lanceolate, 6.5-8 mm. long: anthers about 1.5 mm. long: capsule clavate to ellipsoid-clavate, 6-11 mm. long, glabrous or sparingly pubescent: seed mostly larger than in *H. hirsuta*. [*H. decumbens* (Chapm. Fl.) *H. Curtissii* Rose]—Damp sandy soil, wet hammocks, swamps, and bottom lands, Coastal Plain and rarely more northern provinces, Fla. to Tex. and N. C.—Spr.-sum.

3. *H. rigida* Chapm. Corm somewhat elongate, covered with bristly fimbriate scales: leaf-blades linear, rather stiff, 1-4 mm. wide, 0.7-4 dm. long, pubescent: scape very slender, 0.3-3 dm. long, minutely pubescent or nearly glabrous, 1-3-flowered: bracts minute: sepals lanceolate to elliptic, 7-12 mm. long, densely pubescent without: petals slightly broader than the sepals: anthers 2-3 mm. long: capsule narrowly obovoid, 9 mm. long or less, pubescent: seed about 1 mm. in diameter, with short rounded papillae.—Low pinelands, Coastal Plain, Fla. to Tex. and N. C.—Spr.-fall.

4. *H. sessilis* L. Corm slightly elongate, covered with membranous scales: leaf-blades narrowly linear, 1-4 cm. wide, 7-30 cm. long, rather firm, sparingly pubescent: scape very short or up to 8 cm. long, filiform, pubescent, usually 1-flowered: bract minute: sepals lanceolate or elliptic-lanceolate, 5-11 mm. long, obtuse or acutish: petals slightly broader than the sepals: anthers nearly or quite 2 mm. long: capsule pyriform, 3-4 mm. long, densely pubescent: seed oval, 1-4 mm. in diameter, the flat pebbled surface covered with an iridescent film.—Pinelands, Coastal Plain, Fla. to Tex. and N. C.—Spr.-fall.—Specimens from S. C. sometimes have one whorl of the perianth missing, and the three parts are reported to be often pale or white.

5. *H. micrantha* Pollard. Corm somewhat elongate, covered with dark scales which rarely break down into fibrous bristles: leaf-blades narrowly linear, 1-6

mm. wide, 8–40 cm. long, pubescent: scape very slender, 5–18 cm. long, pubescent: bracts minute: sepals lanceolate to elliptic, 6.5–15 mm. long, acute: petals slightly broader than the sepals: anthers 2–2.5 mm. long: capsule subglobose, or somewhat elongate, 3.4–9 mm. long, pubescent: seed subglobose, about 1 mm. in diameter, the numerous murications short-subulate.—Pinelands, Coastal Plain, Fla. to Tex. and N. C.—(*W. I.*)

6. *H. Wrightii* (Baker) Brackett. Corm short, covered with brown fibrillose scales: leaf-blades narrowly linear, 0.4–3 mm. wide, 4–26 cm. long, channeled or involute, sparingly pubescent: scape filiform, 4–12 cm. long, 1–2-flowered: bracts minute: sepals lanceolate to narrowly elliptic, 7–8 mm. long, acutish: petals broader than the sepals: anthers 2–3 mm. long: capsule subglobose to ellipsoid, 4–6 mm. in diameter, densely pubescent: seed subglobose, 0.8–1.1 mm. in diameter, the pebbling crudely carved.—Pinelands, Fla., Keys.—(*W. I.*)—Although in flower throughout the year, this plant blooms most vigorously after the land is fire-swept. Its flowers are the first to appear after a fire.

7. *H. juncea* J. E. Smith. Corm elongate, covered with membranous brown scales: leaf-blades involute, thus filiform or setaceous, usually 3-ribbed, with few long hairs especially on the back: scape filiform, usually finely pubescent, 0.5–2 dm. long, 1- or 2-flowered: bracts subulate, minute: sepals lanceolate to elliptic-lanceolate, pubescent: petals elliptic to elliptic-lanceolate, 9–15 mm. long: anthers 2.5–3 mm. long: capsule clavate or ellipsoid, 4–6 mm. long: seed nearly 1 mm. long.—Pinelands, Coastal Plain, Fla. to N. C.—(*W. I.*)—All year.

3. **MANFREDA** Salisb. Succulent herbs, arising annually from bulbs borne on rootstocks, the leaves mostly basal. Flowers in spikes or racemes. or in spike-like panicles. Perianth mainly green.—About 25 species, all American.—Sum.—**FALSE-ALOES**.—There may be species additional to the following in our range. Herbarium material is scant and very unsatisfactory for study. A proper interpretation of the species will not be possible until after further exploration and the assembling of living plants from all parts of the range for study.

Capsule longer than broad: leaves green.

Capsule broader than long: leaves purple-blotched.

1. *M. virginica*.

2. *M. tigrina*.

1. *M. virginica* (L.) Salisb. Stem 8–18 dm. tall: basal leaves 1–3 dm. long; blades lanceolate, oblong or oblong-spatulate, 3–5 cm. wide, green: perianth greenish or brownish-yellow; lobes linear-oblong, 10–12 mm. long: anthers about 12 mm. long: capsule subglobose: seeds 4–6 mm. broad.—(**RATTLESNAKE-MASTER**).—Sandy soil, rocky woods, and dry pinelands, various provinces, Fla. to Tex., Mo., Ky., and N. C. (or Md.?).—The green flowers are poorly adapted for attracting day-flying insects, but their fragrance which increases towards evening attracts nocturnal insects to aid in cross-pollination.

2. *M. tigrina* (Engelm.) Small. Stem 10–25 dm. tall: basal leaves 3–5 dm. long; blades lanceolate or oblong-lanceolate, 5–7 cm. wide, purple-spotted: perianth larger than that of *M. virginica*: capsule spheroidal: seeds 8–10 mm. broad.—(**RATTLESNAKE-MASTER**).—Sandy and rocky soil, various provinces, Ga. to Mo., Ky., and N. C.

4. **AGAVE L.** Usually monocarpic succulent or fibrous herbs rarely with a woody trunk (caudex), the usually large or very large crowded leaves persisting for several years: blade ending in a spine, and usually with horny marginal teeth sometimes connected by a similar border or fraying away in threads as in *Yucca*. Flowers perfect. Perianth of 3 sepals and 3 nearly similar petals, which are partly united, mainly green. Stamens 6: filaments elongate: anthers versatile. Ovary inferior, 3-celled, with many ovules: stigma slightly 3-lobed. Capsule loculicidal. Seeds many, thin, flat.—About 150 species, most abundant in tropical America.—**MAGUEYS.** **CENTURY-PLANTS.**—Plants flower only once, then die, but sometimes produce offsets at the base.

Leaf-margins minutely prickly or toothed, the prickles or teeth not raised on fleshy bases.

Leaf-blades narrow (5–10 cm.) and long: caudex short or up to 2 m. tall.

Caudex becoming leafless: leaf-blades deeply concave, the margins with recurved or hooked regularly placed prickles.

Caudex permanently leafy: leaf-blades nearly flat, the margins with few and minute irregular prickles.

Leaf-blades broad (20–25 cm.) and long: caudex very short, the plants thus acaulescent.

Leaf-margins prominently armed with gray teeth each of which is raised on a fleshy prominence.

1. *A. decipiens*.

2. *A. sisalana*.

3. *A. neglecta*.

4. *A. americana*.

1. ***A. decipiens* Baker.** Trunk 1–2 m. high: leaves 5–10 x 100–250 cm.; blades narrowly lanceolate, deeply concave, outcurving, green, each with an abrupt conical brown end-spine 3–4 x 10–15 mm., the somewhat repand margins with recurved or hooked slender prickles about 2 mm. long, and borne 10 mm. apart: panicle 2–3 m. long on a scape of equal length, ellipsoid, with slender branches: flowers greenish-yellow, fetid, 60 mm. long: filaments inserted about the middle of the tube: capsule ellipsoid, 3.5–5 cm. long, but flowers often followed by abundant bulbils.—(**FALSE-SISAL.**)—Coastal hammocks and kitchenmiddens, pen. Fla. and the Keys.—Our two native century-plants show no relationship to the species of *Agave* in the West Indies. They are related to a Mexican group, and it has been suggested that they represent prehistoric introductions from Mexico. If this be so, their Mexican ancestors have been lost, or the Florida plants have greatly changed.

2. ***A. sisalana* Perrine.** Nearly trunkless: leaves 10 x 150 cm.; blades sword-shaped, nearly flat, straight, slightly glaucous, becoming green and glossy, with an abrupt conic glossy brown end-spine 4–5 x 20–25 mm., the margins typically with few and minute prickles: panicle 2 m. long on a scape of equal length, ellipsoid, with slender branches: flowers yellowish-green, fetid, 45–60 mm. long: filaments inserted about the upper third of the tube: capsule rarely produced, but the flowers followed by numerous bulbils.—(**SISAL. SISAL-HEMP.**)—Hammocks, pinelands, and cult. grounds, pen. Fla. and the Keys, escaped from plants originally introduced from Yucatan. First planted in our range on Indian Key where the descendants of the original planting still grow. One of the more important fiber-plants. The product is used mainly for making twine.

3. *A. neglecta* Small. Acaulescent: leaves spreading, 20-25 x 100-150 cm.; blades broadly lanceolate, concave, pale and glaucous, each with a slender brown scarcely decurrent end-spine, about 3 x 25 mm., the straight margins with numerous close minute prickles: panicle 3 m. long, ovoid, on a scape three or four times as long: filaments inserted about the upper third of the tube: capsule brown, obovoid, accompanied by bulbils.—(WILD CENTURY-PLANT).—Pinelands, hammocks, and kitchenmiddens, pen. Fla.—Like *A. decipiens* this century plant thrives on kitchenmiddens and aboriginal village sites. The Bartrams found "forests" of it in the Mosquito River region in the eighteenth century. William Bartram figured it in his "Travels," under the name of "*Agave vivipara*." It is extensively planted for ornament, in Florida.

4. *A. americana* L. Acaulescent: leaves 15 x 100-200 cm.; blades oblanceolate, somewhat concave, the outer recurved above the middle, glaucous, each with an abrupt stoutly conical somewhat curved brown or gray end-spine 4 x 20 mm., the margins with heavy straight gray teeth 5-10 mm. long deltoid, on the tops of large fleshy prominences: panicle 1-1.5 m. long, ovoid, on a scape of two or three times its length: flowers yellow, 70 mm. long: filaments inserted towards the throat of the tube: capsule brown, ellipsoid, not accompanied by bulbils.—(CENTURY-PLANT).—Hammocks, pinelands, and cult. grounds, pen. Fla. and the Keys, and along the Rio Grande, Tex. Nat. of Mex., and escaping from cult.—A variety with variegated leaves is commonly cultivated.

5. **ATAMOSCO** Adans. Herbs with coated bulbils. Leaves basal: blades narrowly linear. Scape 1-flowered. Perianth white, pink, purple, or yellow. Filaments adnate up to the throat of the perianth-tube: anthers versatile. [*Zephyranthes* Herb.]—About 50 species, natives of America.—**ATAMASCO-LILIES.** **STAGGER-GRASSES.** **AMARYLLIS.** **ZEPHYR-LILIES.** **FAIRY-LILIES.** **RAIN-LILIES.**—An infusion made from the bulbils is used by the Seminoles to cure toothache.

Perianth funnellform, the tube 1.5-2.5 cm. long: stigmas 3, narrow.

Leaf-blades concave, with sharp margins: sepals and petals abruptly pointed.

Spathe a fourth to a third as long as the perianth: perianth broadly funnellform, the sepals and petals with spreading tips.

Spathe a third to a half as long as the perianth: perianth narrowly funnellform, the sepals and petals with erect or ascending tips.

Leaf-blades nearly half-terete, with rounded margins: sepals and petals acuminate.

Perianth rotate, the tube very short or wanting: stigmas 3-lobed.

1. *A. Atamasco*.

2. *A. Simpsonii*.

3. *A. Treatiae*.

4. *A. candida*.

1. *A. Atamasco* (L.) Greene. Leaves 2-4 dm. long; blades concave, sharp-edged, mostly acute or acuminate: scape 2-3.5 cm. tall, nearly terete: involucral bract mostly shorter than the perianth-tube: perianth mainly white or pinkish within: sepals and petals elliptic, 6-10 cm. long, more or less spreading: capsule oval or globose-oval, slightly 3-lobed.—(**EASTER-LILY**)—Low ground, usually in rich woods, Coastal Plain and adj. provinces, Fla. to Miss. and Va.—Spr.—Colonies of this plant are so densely populated that year after year great quantities of the flowers are gathered about Easter time and sold especially in southern cities.

2. *A. Simpsonii* (Chapm.) Greene. Leaves 3-5 dm. long; blades concave,

obtuse: scape 2-2.5 dm. tall, flattened, the edges sharp near the base: involucrel bract nearly or quite equalling the perianth-tube: perianth mainly white and purple-tinged about the edges: sepals and petals oblanceolate, 4-7 cm. long, ascending or spreading merely at the tips: capsule depressed-globose, usually prominently 3-lobed.—Low pinelands, pen. Fla.—Wint.-Spr.—The perianth resembles that of *Cooperia* of Texas.

3. *A. Treatiae* (S. Wats.) Greene. Leaves 1-4 dm. long; blades nearly half-terete, blunt-edged, mostly obtuse: scape 1-3.5 dm. tall, terete or nearly so: involucrel bract nearly or quite as long as the perianth-tube: perianth mainly white, often turning pink within; sepals and petals narrowly elliptic, narrowly oblanceolate or linear-elliptic, 6-8 cm. long, recurved-spreading above the middle: capsule depressed-globose, more or less prominently 3-lobed.—(EASTER-LILY)—Low pinelands and swamps, Fla.—Spr.

4. *A. candida* (Lindl.) Small. Leaves 1-4.5 dm. long; blades channeled, mostly acute: scape 2-3 dm. tall, slightly flattened: involucrel bract equalling the perianth-tube: perianth white within, or sometimes pinkish: sepals and petals elliptic or elliptic-oblanceolate, 2-3.5 cm. long, spreading: capsule subglobose, often somewhat depressed, more or less 3-lobed.—Waste-places, roadsides and old fields, Coastal Plain, Fla. to Tex. Nat. of the La Plata region, S. A.—Sum.-fall.

6. *CRINUM* L. Herbs with succulent coated bulbs, the neck short. Leaves basal: blades narrow, usually linear or nearly so, often elongate. Scape 2-many flowered. Perianth salverform or funnellform, white, pink, or red: lobes narrow. Filaments adnate up to the mouth of the perianth-tube. Capsule lobed.—Fully 60 species, mostly tropical.

Perianth salverform: sepals and petals shorter than the tube. 1. *C. americanum*.  
Perianth funnellform: sepals and petals longer than the tube. 2. *C. longifolium*.

1. *C. americanum* L. Bulb 7-11 cm. thick: leaf-blades 6-12 dm. long, irregularly denticulate: scape 3-8 dm. tall: flowers fragrant: perianth white or pink-tinged: sepals and petals 5-12 cm. long, spreading, acuminate: capsule subglobose or depressed, 4-6 cm. thick, irregularly lobed.—(SWAMP-LILY. STRING-LILY) —Swamps, marshes, and river-shores, Coastal Plain, Fla. to Tex.—Spr.-fall.

2. *C. longifolium* (L.) Thunb. Bulb and leaves like those of *C. americanum*: scape up to 1 m. tall: flowers fragrant, perianth white, or pink within and reddish without; sepals and petals elliptic to elliptic-oblanceolate, ascending or spreading at the tip, acute.—Roadsides and ditches, S. La. Nat. of S. Africa.

*Hippeastrum puniceum* (Lam.) Urban, a bulbous plant with narrow leaves appearing after the flowers which are borne few in an umbel, the perianth crimson-scarlet with a whitish midstripe on each lobe, the tube funnellform, the lobes broad (the blades ovate), a native of tropical America, occurs in the Gulf States. It is known as RED SPIDER-LILY.

7. *HYMENOCALLIS* L. Herbs with coated bulbs. Leaves basal, spreading: blades linear or nearly so. Scape terminated by a single flower or by a cluster, the flowers erect. Perianth showy, mostly white, pink, or purplish: tube elongate: lobes narrow. Filaments adnate to the perianth-

tube above which they are connected by a crown.—About 40 species, all American.—SPIDER-LILIES.—Following is a tentative interpretation of the species.

Sepals and petals white: scape terminated by 2-16 flowers.

Scape terminated by several to many (8-16) flowers:  
crown small (2.5-3.5 cm. wide).

Scape terminated by few (2-8) flowers: crown large  
(4-6.5 cm. wide).

Sepals or sepals and petals green: scape terminated by 1-few  
flowers.

Sepals and petals green: scape terminated by 2-few  
flowers.

Sepals green: petals white: scape terminated by 1 flower.

I. MULTIFLORAE.

II. PAUCIFLORAE.

III. VIRIDIFLORAE.

IV. UNIFLORAE.

#### I. MULTIFLORAE

Crown (flat) hexagonal.

Crown with the angles of the hexagon formed by the median teeth.

Crown with the angles of the hexagon formed by the filament-bases.

Crown (flat) circular, the rounded lobes minutely notched.

#### II. PAUCIFLORAE

Filaments arising from a sinus, sometimes very shallow, between the lobes or angles of the crown.

Flowers several, mostly 4-6, in a cluster.

Flowers 2 or 3 together.

Edge of the crown between the filaments erose.

Edge of the crown between the filaments with 2, 3 or 6 teeth.

Edge of crown between the filaments with 3, sometimes 5, teeth, the middle tooth the largest, often lobe-like.

Edge of crown between the filaments with a 2-toothed lobe, sometimes with a minute tooth between the pair of large teeth.

Filaments arising from a truncate or sinuate lobe of the crown, the intervening edge a toothed sinus.

Sinus of the crown between the filaments with small irregular teeth on each side: filaments arising from a truncate lobe.

Sinus of the crown between the filaments with lacinate teeth on each side: filaments arising from a 2-pronged lobe.

#### III. VIRIDIFLORA

Stout plants: scape terminated by usually 2, more or less spreading flowers.

#### IV. UNIFLORA

Slender plants: scape terminated by a single erect flower.

1. *H. keyensis*.

2. *H. Collieri*.

3. *H. Kimballiae*.

4. *H. occidentalis*.

5. *H. crassifolia*.

6. *H. tridentata*.

7. *H. bidentata*.

8. *H. coronaria*.

9. *H. laciniata*.

10. *H. viridiflora*.

11. *H. Palmeri*.

1. *H. keyensis* Small. Bulb-body globose-ovoid: leaves arching, 8 dm. long or less, shallowly channeled, green: scape scarcely as long as the larger leaves, much flattened and sharp-edged, glaucous: flowers 10-16 together: hypanthium-tube 12-17 cm. long, or sometimes shorter in the later flowers, bluntly 3-angled: sepals elongate-linear, nearly as long as the hypanthium, strongly involute, the edges often almost meeting: petals slightly wider than the sepals: crown 2.5-3.5 cm. wide: filaments 5-6 cm. long: anthers orange, 2-2.5 cm. long: capsule ovoid, 4-5 cm. long. [*H. caribaea* (Chapm. Fl.).]—Mangrove swamps, sandy shores, and rarely hammocks, eastern coast of pen. Fla. and the Keys.—Spr.-sum.

2. *H. Collieri* Small. Bulb-body depressed: leaves arching, barely 1 m. long or less, nearly flat, acute, glaucescent: scape 1 m. tall or less, directly flat-

tened and sharp-edged throughout, glaucous: flowers 8–13 together: hypanthium-tube 11–19 cm. long, decidedly 3-angled, green below, white above: sepals narrowly linear, usually shorter than the hypanthium, involute: petals somewhat wider than the sepals: crown 2.5–3.5 cm. wide: filaments 4–5 cm. long: anthers orange, about 1.5 cm. long: capsule subglobose, often slightly depressed, stout-beaked, 2–3 cm. in diameter.—Sandy shores and banks of estuaries, lower western coastal region, pen. Fla.—Sum.

3. *H. Kimballiae* Small. Bulb-body ovoid: leaves erect or ascending, often slightly widened upward, 1 m. long, or less, acute, deep-green: scape about as tall as the larger leaves, much-flattened and sharp-edged throughout, glaucescent: flowers 9–15 together: hypanthium-tube 12–16 cm. long, green below, white near the perianth, obscurely 3-angled: sepals very narrowly linear, 9–10.5 cm. long, involute: petals slightly wider than the sepals: crown 2.5–3 cm. wide, with a minute tooth between the filaments: anther about 2 cm. long: capsule broadly ovoid, 2.5–3.5 cm. long.—Swamps about the estuary of the Apalachicola River, Fla.—Sum.—The fragrance of the flowers resembles that of a tea-rose.

4. *H. occidentalis* (Le Conte) Kunth. Leaves numerous; blades linear, about 6 dm. long or less, shallowly channeled, glaucous: scape about as tall as the longer leaves, 2-edged, glaucous: flowers usually 6 in a cluster, very fragrant: crown with the intervals between the filaments 4–6-toothed.—Meadows, hillsides, and stream-banks, various provinces, rarely Coastal Plain, Ga. to Mo. and Ind.—Spr.—sum.—The bulbs are said not to produce runners.

5. *H. crassifolia* Herb. Leaves few; blades linear, 5 dm. long or less, nearly flat, bright-green: scape 4–6 dm. tall, somewhat flattened, glaucescent: flowers usually 3 in a cluster, fragrant: crown orbicular-hexagonal in outline, the edges with a series of blunt or acute erose teeth between the filaments.—Marshes and river-banks, Coastal Plain, N E Fla. to N. C.—Spr.

6. *H. tridentata* Small. Leaves mostly 4 to 6; blades narrowly linear, 4–5 dm. long, somewhat channeled, keeled beneath, deep-green: scape about 3 dm. tall, 2-edged, glaucescent: flowers 2 together, fragrant: crown 5.5–6.5 cm. wide, the edge between the filaments with 3–6 teeth, usually 3 teeth, the middle tooth the largest.—Swamps and marshes, E coast region, Fla.—Spr.—Conspicuous on account of the very large toothed crown.

7. *H. bidentata* Small. Leaves few, usually 3 or 4; blades narrowly linear, rather flat, deep-green: scape 3–4 dm. tall, decidedly flattened, with sharp edges, green: flowers usually 3 in a cluster: crown 4–4.5 cm. wide, the edge between the filaments with a prominent 2-toothed lobe, and sometimes with a minute tooth between the larger ones.—Wooded hillsides, Appalachian provinces, Ala.—Spr.—sum.—Remarkable for the small prominently lobed crown and relatively broad sepals and petals.

8. *H. coronaria* (Le Conte) Kunth. Leaves as many as 8 together; blades linear, up to 6 dm. long, shallowly channeled: scape 4–6 dm. tall, 2-edged, green: flowers often 4 together, fragrant: crown 5–6 cm. wide, with truncate lobes at the bases of the filaments, the intervening sinuses with sharp irregular teeth: capsule often 2- or 3-lobed, depressed, 2.5–3.5 cm. in diameter.—Stream-banks, rock islands and shoals, Coastal Plain and adj. Piedmont, Fla. to Ala. and S. C.—Spr.—Bulbs said not to produce stolons. Plants occur mostly above the fall line. Several localities have been destroyed by dams.

9. *H. laciniata* Small. Leaves few; blades narrowly linear, 5 dm. long or less, nearly flat, deep-green: scape 2–4 dm. tall, much flattened, 2-edged, glaucous: flowers usually 3 together, very fragrant: crown 4–5 cm. wide, with 2-pronged lobes from which the filaments arise, and lacinate-toothed sinuses between them.—Swamps, N Fla.—Spr.

10. *H. rotatum* LeConte. Leaves usually 2 or 3; blades linear, nearly flat, glaucous: scape 2.5–3.5 dm. tall, flattened, sharp-edged, very glaucous: flowers usually 2 together, fragrant: crown 4–5 cm. wide, truncate at the bases of the filaments, with 2 or 3 teeth between the lateral teeth on the truncate parts: capsule subglobose, slightly lobed, 2.5–3 cm. wide.—Flat woods, N Fla.—Spr.

11. *H. Palmeri* S. Wats. Leaves 4 dm. long or less; blades narrowly linear, 5–10 mm. wide, channeled, angled on the back: scape 1–4 dm. tall, flattened, glaucescent, the edges rounded: flower erect, faintly fragrant: hypanthium-tube 6–8 cm. long, yellowish-green, nearly terete: sepals narrowly linear, 6–8 cm. long, involute-channeled: petals similar to the sepals, but slightly wider: crown about 5 cm. wide, the limb white, flaring from a short greenish base, the edge between the filament with a short and broad tooth in the middle and 2 longer and narrow teeth on each side: filaments white, about 2.5 cm. long. [*H. humilis* S. Wats.]—(ALLIGATOR-LILY.)—Prairies and Everglades, pen. Fla.—Spr.

## FAMILY 2. TAMACEAE — YAM FAMILY

Perennial vines with rootstocks. Leaf-blades ribbed and netted-veined. Flowers monoecious or dioecious, or rarely perfect. Calyx of 3 sepals. Corolla of 3 petals resembling the sepals. Androeceum of 3–6 stamens, imperfect in pistillate flowers. Gynoeceum of 3 united carpels, imperfect in staminate flowers. Ovary inferior. Styles 3. Ovules 1 or 2 in each cavity of the ovary. Fruit a 3-winged, 3-valved capsule, or baccate.—About 10 genera and 175 species, mostly American.

1. **DIOSCOREA** [Plum.] L. Upper leaves alternate: blades mainly cordate. Sepals and petals mainly green or whitish.—About 160 species, most abundant in tropical regions.—Early sum.—WILD YAM-ROOTS. YAM-VINES.

Staminate panicles solitary in the leaf-axils.

Lower leaves whorled in 4's–7's.

Leaf-blades green beneath: staminate sepals 1.5 mm. long or less.

Leaf-blades glaucous beneath: staminate sepals over 1.5 mm. long.

Lower leaves typically alternate.

Pistillate racemes many-flowered, many-fruited at maturity: stem internodes glabrous.

Pistillate racemes few-flowered, 1–4-fruited at maturity: stem internodes pubescent.

Staminate panicles clustered in the leaf-axils or sometimes individually solitary, and terminating the stem.

1. *D. quaternata*.

2. *D. glauca*.

3. *D. villosa*.

4. *D. hirticaulis*.

5. *D. floridana*.

1. *D. quaternata* (Walt.) Gmel. Rootstock slender, mostly 1 cm. thick or less, sometimes forked, often with few short lateral branches: lower petioles densely pubescent at the base and the apex: leaf-blades ovate to ovate-lanceolate, mostly 8–11 cm. long, repand, green and glabrous: staminate sepals elliptic or oval: pistillate racemes few-flowered: fruit obovate, 1.5–3 cm. long.—Woods and banks, Coastal Plain and adj. provinces, Fla. to La., Mo., and S Va.

2. *D. glauca* Muhl. Root-stock stout, over 1 cm. thick, often forked and with many short stout lateral branches; lower petioles densely pubescent at the apex: leaf-blades ovate to orbicular-ovate, or rarely ovate-lanceolate, usually larger than in *D. quaternata*, sometimes undulate, glaucous and usually finely

pubescent beneath: staminate sepals oval: pistillate racemes few-flowered: fruits few, suborbicular to broadly obovate or obreniform, 2-3.5 cm. long.—Thickets and rich woods, various provinces, rarely Coastal Plain, S. C. to Ark., Mo., and Pa.

3. *D. villosa* L. Rootstock slender, elongate, rarely forked, with few more slender lateral branches: stem glabrous: leaf-blades broadly ovate or orbicular-ovate, more or less pubescent beneath or sometimes glabrous: pistillate racemes many-flowered: fruit numerous, suborbicular, varying to orbicular-obovate or obreniform, 2 cm. long or less.—Moist thickets and woods, various provinces, Va. to Tex., Minn., and Mass.

4. *D. hirticaulis* Bartlett. Rootstock very slender and usually simple, bearing more slender short lateral branches: stem pubescent: leaf-blades broadly ovate, densely pale-pubescent beneath: pistillate racemes few-flowered: fruit few, broadly obovate or deltoid-obovate, about 2 cm. long.—Branch swamps, Coastal Plain, Ga. and S. C.

5. *D. floridana* Bartlett. Rootstock not seen: stem glabrous: leaf-blades broadly ovate to ovate-hastate, decidedly acuminate, green, but paler beneath than above, glabrous: staminate panicles clustered, often greatly elongate: pistillate racemes few-flowered: fruit few, broadly obovate to suborbicular, about 2 cm. long.—Moist thickets, Coastal Plain, Fla. to S. C.

### FAMILY 3. IXIACEAE — IRIS FAMILY

Perennial, mostly caulescent herbs with short or long rootstocks. Leaves equitant, mostly elongate. Flowers perfect, mostly regular, arising from spathe-like bracts. Calyx of 3 sepals. Corolla similar to the calyx or of 3 very different members. Androecium of 3 stamens, the filaments partially adnate to the perianth. Gynoecium of 3 united carpels. Ovary inferior. Styles entire or divided, sometimes petal-like. Ovules few or numerous. Fruit a loculicidal 3-valved capsule.—About 60 genera and 1,000 species of wide geographic distribution.

Style-branches or stigmas alternate with the stamens:

stamens not lying against the style-branches.

Tribe I. SISYRINCHIEAE.

Style-branches or stigmas opposite the stamens: stamens lying against the style-branches.

Tribe II. IRIDEAE.

#### I. SISYRINCHIEAE

Filaments distinct or united into a very short tube: sepals and petals obtuse or merely acute: capsule erect, more or less elongate.

Style-body very short-columnar, surrounded by the filament-tube: style-branches slender-subulate: stigmas capitate or minutely notched.

Style-body elongate, clavate or trumpet-shaped, not surrounded by the filament-tube: style-branches linear, and stigmas reniform or columnar, and stigmas 2-lobed.

Flower zygomorphic, the style declined, the stamens ascending: perianth nodding: stigmas reniform, spreading.

Flower actinomorphic, the style and stamens erect: perianth erect: stigmas erect.

Filaments united into a long tube and around the style: sepals and petals mucronate or aristate at the apex: capsule subglobose.

1. NEMASTYLIS.

2. SALPINGOSTYLIS.

3. BELAMCANDA.

4. SISYRINCHIUM.

#### II. IRIDEAE

Style-branches petaloid and appendaged at the tip: filaments distinct.

Flower terminating a short leafy branch from the rootstock: hypanthium tube elongate, nearly or quite as long as the sepals: seeds arillate.

Flower or flower-clusters on tall stems, subtended by foliaceous bracts: hypanthium tube very short: seeds not arillate.

Style-branches not petaloid and unappendaged: filaments united.

5. NEUBECKIA.

6. IRIS.

7. HERBERTIA.

1. **NEMASTYLIS** Nutt. Herbs with bulbs and usually branched flower-stems. Leaf-blades narrow, plicate. Flowers erect, actinomorphic. Perianth violet or blue, except the white "eye," or sometimes white, the petals slightly smaller than the sepals. Filaments partly united. Anthers coiling from the tip. Style with 6 slender-subulate radiating branches, longer than the column. Stigmas 6, minutely notched or tufted-capitate. Capsule erect.—A few species, American.—CELESTIALS, CELESTIAL-LILIES.

Perianth blue: sepals oval: petals rhombic-oval.

1. *N. acuta*.

Perianth violet: sepals elliptic or narrowly elliptic-obovate: petals elliptic.

2. *N. floridana*.

1. ***N. acuta*** (Bart.) Herb. Plant 1.5–4 dm. tall, with a bulb usually 1.5–2 cm. in diameter: leaf-blades narrowly attenuate, sharply plicate: scape slender, usually sparingly and strictly branched: the branches slender: perianth 4–6 cm. wide: sepals oval: petals rhombic-oval: style-branches longer than the body: capsule obovoid or cylindric-obovoid, 1.5–2 cm. long. [*N. geminiflora* Nutt.]—Rich prairies and heavy clay soil on wooded hillsides, Coastal Plain and adj. provinces, La. to Tex., Kan., and Tenn.—Spr.—The flowers of this, like those of most of our iridaceous plants, open in the early forenoon, the perianth lasting for a few hours.

2. ***N. floridana*** Small. Plant 4–15 dm. tall, with a bulb usually about 2 cm. in diameter: leaf-blades very narrow and slenderly attenuate, sharply plicate: scape very slender, loosely branched, the branches very slender, often almost filiform: perianth 3–5 cm. wide: sepals elliptic or narrowly elliptic-obovate: petals elliptic: style-branches much longer than the body: capsule obovoid, 1–1.5 cm. long.—Swamps, marshes, and flat-woods, NE coastal region of Fla.—Fall.—The flowers of this autumn flowering plant—our other iridaceous plants being spring-flowering—open about four o'clock in the afternoon and close about six o'clock.

2. **SALPINGOSTYLIS** Small. Herbs with bulbs and usually branching flower-stems. Leaf-blades very narrow, plicate. Flowers 1 or 2 in the terminal erect, spathe. Flowers nodding, slightly zygomorphic: perianth violet except the white "eye," or rarely white, the petals slightly smaller than the sepals. Filaments distinct or nearly so. Anthers not coiled. Style trumpet-shaped. Stigmas 3, reniform, spreading, double-toothed, terminating the short flat, erect style-branches. Capsule erect.—One species.

1. ***S. coelestina*** (Bartr.) Small. Plant 2–5 dm. tall, with a bulb 1–1.5 cm. in

diameter: leaf-blades very narrowly linear-attenuate, bluntly plicate: scape very slender, simple or rarely branched: perianth 4.5–6 cm. wide: sepals obovate: petals broadly cuneate or cuneate-obovate: stamens and style nearly or quite 1 cm. long: capsule ellipsoid or ellipsoid-obovoid, 1.5–2 cm. long. [*Ixia coelestina* Bartr. *Nemastylis coelestina* Nutt. in part]—Flatwoods N pen. Fla. and S Ga. (?)—Spr.—The flowers are locally called violets.

**3. BELAMCANDA** Adans. Caulescent herbs with horizontal rootstocks. Leaf-blades folded. Flowers in corymbose cymes. Sepals and petals pink, orange, or reddish, mottled with crimson-purple spots, nearly equal, distinct or nearly so, persistent and coiled on the capsule.—One species.

**1. B. chinensis** (L.) DC. Stem 3–13 dm. tall: leaf-blades with the faces united above the middle: sepals and petals elliptic, 2.5–3.5 cm. long: capsule 2–2.5 cm. long: seeds black, shining. [*Gemmingia chinensis* Kuntze]—(BLACK-BERRY-LILY. PARDELLE.)—Dry hills, roadsides, and fence-rows, various provinces, Ga. to Tex., Mo., and N. Y. Nat. of China, and cult.—(W. I.)—Sum.—An early escape from gardens.

**4. SISYRINCHIUM** L. Perennial scapose usually tufted grass-like herbs, with distinct or obsolete rootstocks and fibrous roots. Leaves basal: blades linear: scapes 2-edged or 2-winged, when branched each node furnished with a bract resembling a leaf-blade: flowers in terminal clusters arising from spathes of mostly 2 bracts each. Perianth blue, white or yellow: lobes spreading. Stamens 3: filaments united to the top or nearly so: anthers clustered. Ovary 3-celled: style-branches filiform, alternate with the anthers, or styles mostly wholly united: ovules few to many in each cavity of the ovary. Capsule subglobose or depressed or longer than thick, globular or angled, readily opening near the apex.—Numerous species, all American.—BLUE-EYED GRASSES. FEVER-GRASSES. IRISSETTES.—An interpretation of this genus by the late Eugene Pintard Bicknell, in which are numerous critical species not here included may be found in the Flora of the Southeastern States. This partial revision prepared by Edward Johnston Alexander.

Scape terminated by a sessile or a pair of sessile spathes.  
Scape terminated by one or more peduncled spathes.

I. SESSILES.  
II. PEDUNCULATAE.

#### I. SESSILES

Old leaf-bases not persistent, or if so, merely soft, loose shreds.

Spathe solitary or normally so.

Leaf-blades and scapes mostly 1.5–2.5 mm. wide, distinctly winged: capsule 4–6 mm. long.

Leaf-blades and scapes mostly less than 1.5 mm. wide, margined or narrowly winged: capsule 2–4 mm. long.

Spathes 2 together or rarely 3 or sometimes solitary in no. 5.

Scape distinctly winged: leaf-blades 1.5–3 mm. wide: spathe and scape smooth and glabrous or nearly so.

1. *S. angustifolium*.

2. *S. mucronatum*.

3. *S. albidum*.

Scape margined or narrowly winged: leaf-blades 1-2 mm. wide: spathe and scape pubescent with stiff, spicule-like hairs.  
Old leaf-bases persistent, forming dense tufts of straight bristle-like fibers.

## II. PEDUNCULATAE

Perianth not yellow.

Plant (tuft) erect.

Tufts of plants densely fibrous at the base.

Scape flattened and distinctly winged.

Leaves and spathe-bracts rugose-veined: capsule thick-walled: plant drying dark.

Leaves and spathe-bracts not rugose: capsule thin-walled: plant not drying dark.

Scape margined or narrowly winged.

Plant drying dark.

Flowering scapes serrulate-edged.

Flowering scapes smooth-edged.

Plant not drying dark.

Peduncles somewhat fascicled, shorter than the subtending bract.

Peduncles not fascicled, as long as or longer than the subtending bract.

Tufts of plants without fibers or not densely fibrous at the base.

Scape broadly winged.

Scape margined or narrowly winged.

Plant (tuft) with depressed radially spreading leaves and scapes.

Perianth blue, violet, or purple: capsule subglobose.

Perianth old-rose: capsule oblong to narrowly obovoid.

Perianth yellow.

4. *S. scabrellum*.

5. *S. capillare*.

6. *S. xerophyllum*.

7. *S. fibrosum*.

8. *S. incrustatum*.

9. *S. fuscatum*.

10. *S. rufipes*.

11. *S. floridanum*.

12. *S. graminoides*.

13. *S. atlanticum*.

14. *S. rosulatum*.

15. *S. minus*.

16. *S. brounei*.

1. *S. angustifolium* Mill. Plant glaucous, 1-5 dm. tall: leaf-blades 1-3 mm. wide: spathe green or merely purple-tinged, the outer bract with the edges united 3-6 mm. above the base: capsule dull-brown or purple-tinged.—Woods, fields and meadows, various provinces, Ala. to La., Colo., Sask., Ont., Newf., and N. C.—Spr.

2. *S. mucronatum* Michx. Plant green or glaucescent, mostly 1-4 dm. tall: leaf-blades very slender or up to 1.5 mm. wide: spathe red-purple or rarely green, the outer bract with the edges united a little above the base: capsule stramineous or greenish-yellow.—Meadows, hillsides, and grassy places, various provinces, Fla. to Mich., Ont., and Mass.—Spr.

3. *S. albidum* Raf. Plant more or less tufted, 1.5-4.5 dm. tall, green or glaucous: leaf-blades mostly 1.5 mm. wide (1.5-3.5 mm.): scapes 1.5-3 mm. wide, often very flat, broadly thin-winged: spathes 2 together, the primary bract 2.5-7 cm. long, much surpassing the others, the edges distinct to the base: perianth 8-12 mm. long, clear white or violet-blue: capsule pale, broadly subglobose, 2-3 mm. long, thick-walled.—Dry or moist soil, often in meadows, various provinces, Ala. to La., Mo., Mich., and N. C.—Spr.

4. *S. scabrellum* Bicknell. Plant closely tufted, 2.5-4 dm. tall, slightly fibrillose at the base, dull pale-green or glaucescent: leaf-blades 1-2 mm. wide: scapes slender, longer than the leaves, 1-2 mm. wide, flattened: spathes 2, or rarely 3, together, mostly green, the primary bract 3.5-11.5 cm. long, the outer bract attenuate, 1.2-3.8 cm. long, surpassing the inner bracts: perianth pale-blue, 8-12 mm. long.—Hillsides or woods, various provinces, Ga. to N. C.—Spr.

5. *S. capillare* Bicknell. Plant extremely slender and delicate, 2-4.5 dm. tall, in thin tufts, closely fibrillose at the base, glaucescent, drying a dull olive-

green: leaves almost filiform, 0.5 mm. wide or less: scapes higher than the leaves which they resemble: spathes sessile, mostly in pairs, sometimes solitary, green, bracts nearly equal, 10–13 mm. long, narrowly acute or aculeate: perianth light violet-blue, 6–8 mm. long: capsule pale, subglobose, 2–3 mm. high.—Flat sandy woods, Coastal Plain, Fla. to N. C.—Spr.

6. *S. xerophyllum* Greene. Plant erect, stout, 2–6.5 dm. tall, pale-green and often glaucescent: leaves strictly erect, usually much more than  $\frac{1}{2}$  as tall as the scape; blades linear, thick, 3.5–6 mm. wide, or rarely narrower: scape thick, about as wide as the leaf-blades, the wings hyaline-margined: spathes 2–2.5 cm. long: perianth large, about 2 cm. wide: capsule subglobose, 5–8 mm. long.—High pinelands and scrub, pen. Fla.—All year.—The plants dry brown or blackish. The largest and stoutest of our blue-eyed-grasses, and most restricted in range.

7. *S. fibrosum* Bicknell. Plant loosely tufted, 2–3 dm. tall, fibrous-coated at the base, pale and glaucescent, often yellowish-green: leaf-blades 2–5 mm. wide; scapes longer than the leaves, 2–3 mm. wide, broadly winged, the edges mostly serrulate or even ciliate: spathes 15–20 mm. long, the bracts nearly equal: perianth pale violet-blue, 8–10 mm. long: capsule pale and thin-walled, broadly ovoid, 3–4 mm. high. [*S. carolinianum* Bicknell, not Klatt.]—Woods and fields, various provinces, Fla. to Miss. and N. C.—Spr.

8. *S. incrustatum* Bicknell. Plant 2.5–5 dm. tall, coarsely fibrous at the base, dull-green and glaucescent, drying dark: leaf-blades 1.5–3.5 mm. wide, striate, harshly rugulose-scabrous to densely incrustate-roughened with pale papillae, the edges ciliate-serrulate: scapes 1.5–3 mm. wide, roughened like the leaves: spathes 1.5–2.5 cm. long, the nearly equal bracts acute to slenderly attenuate: perianth about 8 mm. long: capsule subglobose, dark, 3–4 mm. long.—Moist sandy soil and open grassy woods, Piedmont and Coastal Plain, S. C. to N. C.—Sum.

9. *S. fuscatum* Bicknell. Plant 15–50 cm. high, more or less fibrous at base, dull-green and glaucescent, drying dark: leaf-blades 0.5–2.5 mm. wide: scapes longer than the leaves, 0.75–2 mm. wide, smooth-edged: spathes narrow, the subequal bracts firmly herbaceous, striate, cuspidate-acuminate: perianth about 10 mm. long: capsule 2.5–4 mm. high, broadly subglobose, drying dark.—Sandy soil, Coastal Plain, Fla. to Miss. and Ga.—Spr.

10. *S. rufipes* Bicknell. Plant 1.5–3 dm. tall, with rufous or brown fibers at the base, rather bright-green and glaucescent: leaf-blades 1–2.5 mm. wide: scapes about as tall as the leaves, about 1 mm. wide, narrowly margined, bracteal leaf subtending a cluster of 2 or 3 short-peduncled spathes and sometimes also a short branch: spathes about 12 mm. long, the bracts somewhat divergent: perianth blue, about 8 mm. long: anthers relatively large: capsule about 3 mm. high.—Sand hills, Coastal Plain, Ga. to N. C.—Early Spr.

11. *S. floridanum* Bicknell. Plant tufted, 2.5–5 dm. tall, densely fibrillose at the base, dull-green and glaucescent: leaf-blades 2–3 mm. wide: scapes narrowly firm margined, 2–3 mm. wide: bracteal leaf shorter than the peduncles: spathes green or slightly purplish, 15–20 mm. long, the bracts nearly equal: perianth pale-blue, about 10 mm. long: capsule pale, subglobose, 3–4 mm. high.—Sand, pen. Fla.—Late Wint.—early Spr.

12. *S. graminoides* Bicknell. Plant erect, bright-green, 1.5–6 dm. tall, stoutish: leaves erect, usually about  $\frac{1}{2}$  as tall as the scape or less; blades narrowly linear, thinnish, 1.5–6 mm. wide: scape thin, about as wide as the leaf-blades: spathe 1.5–2 cm. long: perianth usually about 1.5 cm. wide: capsule subglobose, 4–6 mm. long, thin-walled. [*S. anceps* (Chapm. Fl.)]—Meadows, wet woods, and grassy places, various provinces, Fla. to Tex., Minn., and Newf.—Spr.—sum.

13. *S. atlanticum* Bicknell. Plant green, often glaucous, 1–7 cm. tall: leaves slender, often wiry, narrowly-margined: spathes green or purplish, 1–2 cm.

long: perianth 8–14 mm. wide: capsule oval to subglobose, 3–5 mm. long.—Fields, moist banks, open woods, pinelands, and edges of salt-marshes, various provinces, Fla. to Miss., Mich., Ont., and Me.—Spr.—sum.—A relatively slender plant of wide geographic range, but variable in the width of the leaves and scapes.

14. *S. rosulatum* Bicknell. Plant rosulate, the branches up to 2 dm. long, often zigzag: leaves 2–8 cm. long, light-green; blades 1.5–2.5 mm. wide: peduncles 2–10 cm. long, slender, but often more broadly winged than the scape: spathe about 2 cm. long: perianth small, about 1 cm. wide: capsule subglobose, pale, but purple-tinged, 2.5–3.5 mm. long.—Sandy, often grassy dunes and meadows, outer part of Coastal Plain, Ala. to S. C.—Spr.—The plants dry green. Unique in its depressed habit.

15. *S. minus* Engelm. & Gray. Plant rosulate, in loose tufts, the branches up to 2 dm. long, usually zigzag: leaves 2–7 cm. long, deep-green; blades thin, 1–4 mm. wide: scape branched and leafy from near the base, margined or narrowly winged: peduncle 4–6 cm. long: the larger spathe-bract 1.3–3.5 cm. long: perianth old-rose, barely 1 cm. wide: capsule nodding, light-brown, corrugated, oblong to narrowly obovoid, 3–5 mm. long.—Dry, usually clay soil and prairies, Coastal Plain, La. to cent. Tex.—Spr.

16. *S. Brownei* Small. Plant slightly glaucous, 10–15 cm. tall: leaf-blades 2–3 mm. wide: spathe green, the outer bract with the edges united 1–3 mm. above the base: perianth yellow, 5–7 mm. long, the divisions with a brown nerve without and brown spots at the base within: capsule subglobose, 2–3 mm. long, green with brown stripes.—Low, swampy ground, Coastal Plain, S E La.—Spr.

5. **NEUBECKIA** Alef. Tufted grassy acaulescent herbs of dry woods or rocky ledges, with wiry, more or less knotted rootstocks, the roots fibrous. Leaves imbricate on the flowering branch. Hypanthium-tube elongate, often filiform. Perianth mainly blue or violet, and more or less variegated. Sepals with beaded or papillose crests. Capsules long-stalked, thin-walled. Seeds arillate.—About 12 species, widely distributed in temperate regions.—Albino flowers occur in the several species.—Spr.—DWARF-IRISES.

Sepal with a papillose crest: petals long-clawed: seed with a crest-like aril.

1. *N. verna*.

Sepal with a beaded crest: petals short-clawed: seed with a caudate aril.

2. *N. cristata*.

1. *N. verna* (L.) Alef. Leaf-blades narrowly linear, much elongating in age, glaucous, at least on one side, mostly 4–8 mm. wide: flower violet-scented: perianth mainly violet-blue or rarely white: hypanthium-tube scarcely enlarged under the perianth: sepals cuneate or cuneate-spatulate, about 4 cm. long, with a papillose yellow crest extending from the base of the claw well up into the blade and flecked with white along the edges: capsule oval or ellipsoid varying to ovoid or obovoid, 1.5–2 cm. long, slender-beaked, sometimes doubling in size after the seeds mature. [*Iris verna* L.]—(VIOLET-IRIS.)—Open acid woods and dry pinelands, various provinces, Ga. to Miss., Ky., and Pa.—The name violet-iris is quite appropriate. Sandy fields and woods where it abounds look as if dotted with large violets, and, moreover, its delicate fragrance decidedly resembles that of the European sweet-violet.

2. *N. cristata* (Ait.) Alef. Leaf-blades narrowly lanceolate to linear-lanceolate, somewhat elongating in age, often glaucescent, mostly 9–20 mm. wide, usually curved, sometimes falcate: flower faintly scented: perianth mainly pale or deep-lavender or sometimes white: hypanthium-tube funnel-form under the perianth: sepals cuneate-spatulate to narrowly obovate, 3.5–4 cm. long, with a white or whitish blotch in the beaded crest bordered with violet: capsule ellipsoid or oval, varying to ovoid or obovoid, mostly 1–1.5 cm. long, or sometimes larger, minutely beaked. [*Iris cristata* Ait.]—(CRESTED DWARF-IRIS.)—Rich woods, banks, and cliffs, various provinces, Ga. to Ark. and Md.

6. *IRIS* L.<sup>1</sup> Gregarious reedy acaulescent herbs of swamps and marshes, with fleshy, usually stout rootstocks, the roots fleshy. Leaves basal, elongate, ensiform, mostly erect. Flower-stalk erect or rarely procumbent, with one or more leaf-like bracts. Flowers solitary or several together, each subtended by an involucre of bractlets, which is subtended by a foliaceous bract. Hypanthium-tube short. Perianth violet, blue, red, yellow, or white, often variegated. Sepals without crests or with narrow papillose or hairy crests in the upper part of the claw and the lower part of the more or less variegated blade. Petals shorter than the sepals. Style-branches arching, with a pair of apical inequilateral appendages. Stigma entire or 2-lobed. Capsule thick-walled. Seeds corky.—Fully 100 species, natives of the north temperate zone.—Albino flowers occur in the various species.—FLAGS. BLUE-FLAGS. IRISES. WILD-GLADIOLES.—Some of the species are used by the Seminoles as a remedy for shock following alligator-bite.—Following is an incomplete and necessarily tentative interpretation of the irises of the Gulf States, particularly of the lower Mississippi Delta. A complete interpretation must await further field work and study. Our usual criterion for assigning the status of species is an isolated colony or colonies, the plants persisting through propagation by rootstocks and by an annual accretion of seedlings without showing variation in the characters of the perianth.

Petals present and well developed, nearly as long as the sepals.

Perianth shades of copper-red, orange-red, salmon or rarely yellow, or even red, usually with an orange cast, but sometimes mauve or lilac; crest not noticeably present except as a midrib of the claw.

#### I. FULVAE.

Perianth usually varying from brown-red through red and pink to purple, violet, and lilac to white, sometimes even with an orange cast; crest always present and extending into the sepal-blade.

Hypanthium surrounding the ovary six-angled: main bract of the terminal involucre with an elongate tip, equalling or exceeding the flower: stigma two-lobed.

Capsule six-ridged or six-lobed; flower-stalks erect and straight or nearly so.

Crest of the sepal apparently not present, it and the claw being of the same color as the sepal-blade, the crest therefore indistinguishable.

#### II. ECRISTATAE.

Crest of the sepal very apparent as a prominent rib, which is usually some shade of yellow, orange or cream, though sometimes purple or reddish.

Crest simple, a single ridge in the sepal-blade.

<sup>1</sup> Study of the gulf region irises done with the cooperation of Edward Johnston Alexander. The following interpretation is by Mr. Alexander.

- Crest extending but a short distance into the sepal-blade, split downward from the apex by a dark median line.
- Crest extending well into the sepal-blade, with an acute or acuminate apex which becomes a dark vein.
- Crest compound, the median ridge accompanied by one or several additional ones on either side of it.
- Crest with one or more laterals on either side of median, but sharply demarked from it, and not radially spreading.
- Crest with several radially spreading laterals.
- Crest-zone not surrounded by a zone of white or paler color, but giving way to sepal-blade color either by merging streaks and dots or by a sharp outline.
- Crest median acute or acuminate, not apically cleft.
- Crest median split downward from the apex by a dark median line.
- Crest-zone surrounded by a white or paler colored zone, separating it from the sepal-blade color, and itself either merging in streaks or sharply demarked from the blade color.
- Capsule sharply six-angled; flower-stalks zigzag; erect or reclining.
- Hypanthium surrounding the ovary three-angled; main bract of the terminal involucre much shorter than the flower: stigma not lobed.
- Hypanthium and capsule bluntly three-angled; rootstocks stout and fleshy: capsule usually indehiscent, often decaying to release the seeds.
- Hypanthium and capsule sharply three-angled; rootstock slender and wiry: capsule dehiscent by three apical valves.
- Petals present, but almost rudimentary and half-hidden by the sepal-claws which far exceed them.
- Perianth violet, violet-blue, or white in albinos, sepal-crest not outlined by black streaks.
- Perianth yellow, or cream color in albinos; sepal-crest outlined by black streaks.

## I. FULVAE

Plant relatively slender, erect: sepals broad with short claws: petals scarcely clawed.

## II. ECRISTATAE

Slender plants with purple or red-purple flowers: sepals and petals rather long and slender: the sepals not crested.

## III. BICRISTATAE

Petals drooping immediately upon opening: color of sepal-blade extending down into the upper part of the claw.

Anther-tips exserted: crest clear-colored except for median cleft.

Perianth red, orange-red, or copper-red.

Perianth mauve, violet, or purple.

Anther-tips included: crest muddied throughout with dark blotches.

Petals erect or spreading, not drooping until late in the day, if at all: color of sepal-blade and claw markedly distinct.

Perianth roseate.

Perianth violet, lavender, or purple.

Perianth lavender or pale-violet.

1. *I. fulva*.

2. *I. ecristata*.

3. *I. subfulva*.

4. *I. regifulva*.

5. *I. rubea*.

6. *I. rosiflora*.

Perianth lavender: sepal-blade nearly as broad as long.

Perianth pale-violet: sepal-blade much longer than broad.

Crest yellowish-green, deeply cleft, extending barely into the base of blade.

Crest yellow, only notched, extending well into the blade.

Perianth deep-violet, red-violet, or purple.

Perianth red-violet.

Perianth deep-violet.

Sepal-blade nearly as wide as long.

Sepal-blade much longer than wide.

7. *I. chlorolopha*.

8. *I. aelcantha*.

9. *I. iophaea*.

10. *I. ludoviciana*.

11. *I. ianthina*.

12. *I. violivenosa*.

#### IV. UNICRISTATAE

Sepal-crest truly solitary, not even rudimentary laterals present.

Perianth fulvous, orange-red, or orange.

Crest crimson or carmine.

Crest yellow.

Perianth buff or salmon-colored, the veins not prominent.

Perianth orange-red or orange: the veins very prominent.

Perianth red or orange-red: crest clear yellow.

Perianth pinkish-orange or smoky-orange: crest greenish.

Perianth otherwisely colored.

Perianth verging towards pink and reddish shades.

Petals drooping: perianth various shades of mauve or pink.

Petals erect: perianth various shades other than mauve.

Sepal-blade three times as long as claw.

Perianth evenly colored, the flower not fragrant: crest extending nearly half the length of the blade.

Perianth heavily flushed orange on lower portions of sepal-blades, petals, and style-branches: flower rose-scented: crest extending only  $\frac{1}{3}$  the length of the blade.

Sepal-blade not over twice as long as claw.

Perianth intense magenta-purple.

Perianth not magenta-purple.

Perianth vinaceous.

Perianth not vinaceous.

Sepal-blade very prominently veined with brown: crest yellow-green.

Sepal-blade not markedly veined: crest dark-yellow.

Perianth violet or lavender.

Sepal-blade sharply differentiated from claw.

Perianth lavender or white.

Perianth dark violet-blue.

Sepal-blade tapering gradually into claw.

Sepal-crest not truly solitary, rudimentary laterals present.

Perianth violet-purple or rose: sepal-blade fully 3 times as long as the claw.

Perianth wine-red: sepal-blade not over twice as long as claw.

13. *I. pyrrholopha*.

14. *I. salmonicolor*.

15. *I. fulvaurea*.

16. *I. fumifulva*.

17. *I. fumiflora*.

18. *I. moricolor*.

19. *I. fuscaurea*.

20. *I. purpurissata*.

21. *I. viridivinea*.

22. *I. fuscivenosa*.

23. *I. crocinubia*.

24. *I. miraculosa*.

25. *I. atrocyanea*.

26. *I. tyriana*.

27. *I. violipurpurea*.

28. *I. vinicolor*.

#### V. LANCICRISTATAE

Crest present as a raised ridge.

Crest-laterals only one well-developed on either side.

Perianth some shade of rose, red, or brown-red.

Perianth not markedly veined.

Crest-laterals standing out very sharply from blade-color: perianth orange-rose.

Crest-laterals indistinctly outlined: perianth brownish-rose.

Perianth markedly veined.

Perianth rosaceous, flushed with pale orange near base of blades.

29. *I. rosilutea*.

30. *I. fuscirosea*.

- Perianth veined red-brown over old-rose: crest laterals not extending into claw.
- Perianth flush-veined, flushed pale salmon on lower edges of petals and sepals: crest laterals extending into claw.
- Perianth rose-lilac, flushed with lavender near base of blade.
- Perianth red-purple, purple, violet, or lilac.
- Perianth red-purple or lilac.
- Perianth lilac.
- Sepal-blade nearly as broad as long, the base pale: crest-laterals very narrow; perianth pale-lilac.
- Sepal-blade much longer than broad, the base not pale: crest-laterals broad; perianth deep-lilac.
- Perianth red-purple or red-violet.
- Crest extending scarcely at all into sepal-blade; laterals, if present, very narrow and indistinct.
- Crest extending well into sepal-blade; laterals usually present and distinct.
- Perianth violet or violet-blue.
- Crest yellow: anthers not bifurcate: flower not fragrant.
- Perianth markedly dark-veined.
- Crest-laterals deep-yellow, the zone at the junction of claw and blade dark: outside of sepals greenish-yellow.
- Crest-laterals white or cream, the claw nearly white, as also the zone at the junction: outside of sepals nearly white.
- Perianth not markedly veined.
- Crest greenish: anthers bifurcate: flower very fragrant.
- Crest-laterals 2 or more well-developed on either side.
- Perianth red-lilac or rose-lilac.
- Perianth violet, blue-violet, or lavender.
- Perianth violet or blue-violet.
- Crest-laterals the same color as the crest: sepal-blade about twice as long as claw.
- Perianth light-violet: sepals spreading.
- Perianth deep-violet: sepals recurved.
- Crest-laterals paler than crest: sepal-blade about 3 times as long as claw.
- Crest lemon: sepal-blade entire.
- Crest orange-yellow: sepal-blade erose-margined.
- Perianth lavender.
- Crest present as a groove, but colored light-yellow.
31. *I. rubicunda*.
32. *I. cerasioides*.
33. *I. rosipurpurea*.
34. *I. regalis*.
35. *I. lilacinaurea*.
36. *I. fourchiana*.
37. *I. oenantha*.
38. *I. iocyanca*.
39. *I. ioleuca*.
40. *I. cyanantha*.
41. *I. bifurcata*.
42. *I. rubrolilacina*.
43. *I. viridis*.
44. *I. citriviola*.
45. *I. iodantha*.
46. *I. gentilliana*.
47. *I. lancipetala*.
48. *I. pseudocristata*.
- VI. TRICRISTATAE
- Crest-zone not sharply demarked from the sepal-color, but merging gradually into it.
- Crest-zone sharply demarked from the sepal-color.
- Crest-laterals well developed, their color extending upward from the claw.
- Crest-laterals separated from the median and from each other by veins or bands of another color.
- Perianth dull-rose, the crest-laterals very narrow and not prominent.
- Perianth red-purple or maroon, the crest-laterals broad and prominent.
- Crest-laterals merging into the median and all together forming a triangular color-blotch at base of sepal-blade.
- Perianth verging towards rose and red shades.
- Perianth rose or roseate.
- Perianth intensely colored: crest evenly colored.
49. *I. rhodantha*.
50. *I. parvirosea*.
51. *I. Marplei*.

Crest clear yellow: sepal-blade abruptly tapering to claw.

Sepals brilliant carmine-rose, tawny-flushed: petals pale salmon-pink.

Sepals and petals dull-rose.

Crest olive-yellow: sepal-blade gradually tapering to claw.

Perianth pale-colored: crest yellow at center, pale elsewhere.

Perianth purple or red-purple.

Crest orange-yellow; crest-zone a shortly radial, unspotted area.

Crest lemon; crest-zone lanceolate, spotted and streaked.

Perianth verging towards violet or violet-blue. Crest-laterals only short streaks or spot-like, their color not extending upward from the claw.

Perianth deep-violet.

Perianth maroon, magenta, or vinaceous.

Sepal-claw pale, dark-veined only above.

Sepal-claw dark, dark-veined all over, except median rib.

#### VII. CORONICRISTATAE

Crest-radials extending but little into the sepal-blade.

Perianth heavily streaked and spotted with creamy-lavender.

Perianth, if streaked and spotted, so marked by yellow, orange, or brownish.

Radial-zone gradually merging into sepal-color with no distinct outline.

Perianth brown-violet or brown-red: style-branches with yellow wings.

Perianth red-violet or purple: style branches not yellow-winged.

Radial-zone clearly demarked from sepal-color, not merging into it.

Crest median merely notched at apex: laterals forming a straight-sided triangular blotch.

Crest median deeply cleft at apex: laterals not forming a straight-sided triangle.

Crest-laterals forming an elliptic blotch, not streaking into the blade-color.

Crest-laterals radiating into the blade-color.

Crest-radials streaked and blotched well into the sepal-blade.

Only the mid-portion of crest yellow, the lateral portions all flushed and overstreaked with brown.

Entire radial zone of crest yellow, the lateral portion sometimes brown or violet-spotted on margins.

Radial streakings confined to lower-central half of sepal blade.

Radial zone light-yellow, the radial outline clearly demarked from the sepal-color.

Radial zone deep-yellow, the radial outline streaked into, and itself streaked with the sepal-color.

Radial streakings extending all over blade.

#### VIII. RADICRISTATAE

Capsule six-ribbed: species Floridian.

Perianth white, except the yellow crest.

Perianth colored.

Style-appendages shallowly obtusely toothed, capsule 6-ribbed.

Style-appendages deeply and sharply toothed, capsule bluntly 6-sided.

Capsule six-lobed: species not Floridian.

Sepal-blade longer than the claw.

Perianth ivory-white: sepal-crest with lateral veinings of lemon or greenish yellow.

Perianth colored, or if white, with no greenish veinings.

Crest-zone nearly white, crest-median yellow: perianth pale with lilac veins.

52. *I. callirhodea*.

53. *I. rhodochrysea*.

54. *I. DeWinkeleri*.

55. *I. pallidirosea*.

56. *I. Thomasii*.

57. *I. amnicola*.

58. *I. cyanochrysea*.

59. *I. iochroma*.

60. *I. atroenantha*.

61. *I. fuscisanguinea*.

62. *I. albilinea*.

63. *I. auralata*.

64. *I. phoenicis*.

65. *I. violilutea*.

66. *I. oolopha*.

67. *I. chrysolopha*.

68. *I. chrysaecola*.

69. *I. chrysophoenicea*.

70. *I. callilopha*.

71. *I. schizolopha*.

72. *I. Albispiritus*.

73. *I. savannarum*.

74. *I. Kimballiae*.

75. *I. elephantina*.

76. *I. venulosa*.

Crest-zone yellow as well as crest-median, then outlined white: perianth not markedly veiny.

Crest-zone color extending upwards from the claw.

Crest-zone sharply demarked, not overflushed with darker color, and unspotted.

Crest yellow or orange, separated from the sepal color by a zone of white.

White zone completely surrounding the sepal-crest, and streaked and flecked into the sepal blade color.

White zone only at base of crest and streaked very slightly into the sepal-blade: the crest median extending into the blade with only a dark outline and not paler zone.

Crest lemon or yellow, with a pale-yellow or pale-lemon zone, but no white zone.

Crest extending  $\frac{1}{3}$  or less the length of the sepal-blade, the median ridge not markedly raised.

Perianth red-violet: sepal-crest orange-yellow with pale-yellow crest-zone.

Perianth violet, or violet blue: sepal-crest lemon with pale-lemon crest-zone.

Crest extending fully  $\frac{1}{2}$  way down the sepal-blade, the median ridge very markedly raised.

Crest-zone not at all demarked, overflushed with darker color, and heavily spotted.

Crest-zone color only on sepal-blade, not extending upwards from claw.

Sepal-blade and claw of equal length.

77. *I. giganteaerulea*.

78. *I. paludicola*.

79. *I. Wherryana*.

80. *I. citricristata*.

81. *I. alticristata*.

82. *I. aurilinea*.

83. *I. fluviatilis*.

84. *I. parvicacrulea*.

#### IX. HEXAGONAE

Stem flower-bearing on the upper part, erect: sepal-blade oval.

Style-appendages half-ovate: claw of the sepal yellow-green without: foliage yellow-green.

Crest of the sepal surrounded by a zone of radial white streaks extending into the lower third of the blade: perianth rich-violet.

Crest of the sepal accompanied near the base of the blade with a narrow zone of yellow streaks, these not surrounded by white, but spotted with violet near the base of the blade: perianth violet-blue.

Style-appendages lanceolate: claw of the sepal deep-green without: foliage deep-green.

Stem flower-bearing from near the base, decumbent or prostrate: sepal-blade ovate.

Petals with long, slender claws: plants with long, large leaves, which usually lie on the ground at flower time.

Petals with short, broad claws: plants with relatively short, narrow leaves, which are erect or nearly so at flowering time.

Sepal-blade ovate; crest-median extending beyond the white zone.

Sepal-blade orbicular-ovate; crest-median exceeded by the white zone.

85. *I. hexagona*.

86. *I. alabamensis*.

87. *I. rivularis*.

88. *I. foliosa*.

89. *I. brevipes*.

90. *I. mississippiensis*.

#### X. PRISMATICAE

Very slender gregarious plants with grass-like leaves, the brightly variegated sepals with slender claws: rootstock wiry, with brown scales.

91. *I. prismatica*.

## XI. VERSICOLORES

Seeds in two rows in each carpel: sepal-blade orbicular-ovate, crestless, with very short zone of yellow-green extending but little if at all into the blade: perianth violet to purple.

Sepals and petals with broad claws much shorter than the blades: petals much shorter than the sepals: style-appendages undulate-angulate.

Sepals and petals with narrow claws nearly or quite as long as the blades: petals slightly shorter than the sepals: style-appendages incised.

Seeds in one row in each carpel: sepal-blade obovate, oval, or elliptic or nearly so, usually slightly crested, the crest papillose, with a zone of yellow or orange-yellow extending far into the claw from one-third to nearly one-half its length: perianth light-violet to lavender or whitish (very rarely violet).

92. *I. versicolor*.

93. *I. Shrevei*.

94. *I. virginica*.

## XII. TRIPETALAE

Relatively slender plants with stout cord-like rootstocks: sepal-blade suborbicular or oval, with yellow blotch at the base: petals entire or slightly 3-lobed, much shorter than the sepal-claw.

95. *I. tripetala*.

## XIII. PSEUDACORI

Plants with bright-yellow flowers, or cream colored in albinos: leaves overtopping the inflorescence.

96. *I. Pseudacorus*.

1. *I. fulva* Ker. Flower-stalk erect, mostly 0.5–1.5 m. tall, slightly zigzag: flowers slightly fragrant: hypanthium covering the ovary sharply 6-angled:

sepals red, either pale, often copper-colored, or dark, or rarely yellow, 5–8 cm. long, spreading-arching, the claw red, the blade oval or oval-obovate, crestless or nearly so: petals arching or drooping, colored like the sepals, about two-thirds as long as the sepals, narrowly obovate to elliptic-obovate or cuneate-obovate, not clawed: capsule ellipsoid to oval, 4.5–8 cm. long, 6-angled. [*I. cuprea* Pursh]—Swamps, marshes, bayou-banks, and ditches, Coastal Plain and rarely more northern provinces, Ga. to E Tex., Mo., and Ky.—Spr.—The shades of color through which this species ranges seem endless. They are various shades of orange, salmon, copper, salmon-pink, salmon-red, crimson, and scarlet, many of them curiously streaked. A yellow-flowered form furnishes the only true yellow among our native eastern irises.

2. *I. ecristata* Alexander. Flower-stalk erect, strict: flowers scarcely fragrant: sepals 8–9 cm. long, arching: the claw greenish-yellow veined with yellow-green, the blades spatulate, about twice as long as the claw, wine-red to wine-purple, irregularly veined with brownish-purple, crestless, but the mid-rib of the claw extending into the blade as a dark red-purple band: petals somewhat shorter than the sepals, wine-red to wine-purple, except the yellow base of the claw: capsule not seen.—Swamps, ditches, and bayous, S La.—Spr.

3. *I. subfulva* Small. Flower-stalk erect, rigid: sepals recurved, 7–8 cm. long, the claw yellow, its wings pencilled and flushed brown-red, the blade intense orange-red, sometimes paler or darker, rather veiny, the central zone darker, the crest yellow, split nearly to the base of the sepal-blade by the dark median vein: petals orange-red, somewhat veiny: style-branches dark orange-red, paler on the sides and wings, the wing-margins yellowish; appendages flushed yellow: anther-tips exerted: capsule not seen.—Swamps, marshes, and ditches, S La.—Spr.

4. *I. regifulva* Alexander. Flower-stalk erect, slender, strict: sepals recurved-spreading, about 7 cm. long, the claw dull orange-yellow at base, its wings apricot, heavily flushed and veined red-purple, the blade royal-purple, scarcely veined, with a median band slightly darker, the crest beginning as a greenish-yellow midrib in the claw and extending into the basal part of the blade where it becomes dull-yellow and is finally split apically by the dark blade-median which replaces it: petals magenta-purple, somewhat shorter than the sepals: style-branches light rose-purple, wing-margined, light-yellow; appendages dark red-purple above, magenta-purple beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

5. *I. rubea* Alexander. Flower-stalks erect, stiff: sepals reflexed, about 7 cm. long, the claw yellow, its wings veined and streaked with orange-brown, the median rib yellow-green, the blade a dark ruby color veined darker, with a triple median vein of black-crimson and slightly flushed orange on and near lower margin; crest merely the yellow tip of the claw-midrib, but nearly obscured by reason of many splotches and streaks of brown which cover it: petals drooping, brownish-ruby, the lower half flushed and streaked brown-orange: style-branches brownish-ruby, their wings pink-margined: appendages brownish-ruby above, orange-flushed beneath: anther-tips included: capsule oval, about 8 cm. long, 6-angled.—Swamps and marshes, S La.—Spr.

6. *I. rosiflora* Small. Flower-stalk strict, rigid: flowers slightly fragrant: sepals 7-8 cm. long, spreading, the claw suffused with cream-color or pale yellow-green and brownish-veined, the blade obovate to suborbicular, much longer than the claw, often nearly twice as long, old-rose-lilac and deeper-veined, the crest pale-yellow, apically cleft and replaced by a brown-orange band: petals spatulate, much shorter than the sepals, the claw suffused with pale-yellow, especially near the base, and brownish-veined, the blade usually paler than the sepal-blade: style-branches lilac-rose, the appendages the same color, lacerate-toothed: anther-tips included: capsule not seen.—Marshes, bayous, and ditches, S La.—Spr.

7. *I. chlorolopha* Small. Flower-stalk strict: flowers not fragrant: sepals 7-8 cm. long, recurved-spreading, the claw suffused with yellow-green, the blade of a lavender ground-color, faintly veined darker lavender and with a light reddish-violet central band, the crest olive-yellow, deeply cleft apically by a brownish vein: petals spatulate, considerably shorter than the sepals, the claw suffused with light-green, the blade paler than the sepal-blade, becoming pinkish toward the base: style-branches salmon, the wings flushed pale reddish-violet, the body irregularly and faintly so flushed; appendages pale lavender-violet, flush-streaked reddish-lavender, deeply lacerate-toothed: anther-tips included: capsule not seen.—Swamps and bayou-banks. S La.—Spr.—In the sunlight, the flower of this species has a decidedly silvery cast.

8. *I. acleantha* Small. Flower-stalk erect, stiff: sepals reflexed, about 8 cm. long, the claw lemon-yellow, veined yellow-green, the blade a dull, smoky, shade of pale red-violet, irregularly flushed drab, the crest greenish-lemon, apically split by a dull brown-purple vein, a few irregular lemon markings running up from the claw into the base of the blade: petals smoky, light gray-violet, grayish-flushed above, lower half irregularly flushed drab, the lower claw pale olive-drab: style-branches greenish-yellow, the wings yellow, the sides dull, smoky violet-flushed; appendages light, smoky red-violet, flushed drab above, coarsely lacerate-toothed, below smoky-lavender flushed yellowish: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

9. *I. iophaea* Alexander. Flower-stalk erect, rigid: sepals spreading, about 8 cm. long, the claw creamy, veined greenish, the veins and the wing-veins pencilled and flushed with lavender, the blade smoky lavender-violet, with a

median band of smoky red-violet, the central vein of which notches the tip of the solitary yellow crest, cream streaks are extended into the basal portion of the blade from the claw, this portion is also drab-flushed, the entire blade is veined somewhat more dark than the ground-color: petals light smoky lavender-violet, slightly veiny, flushed orange-drab in the claw: style-branches greenish at the base, becoming a somewhat roseate shade of smoky lavender-lilac above, the wings and lower portion apricot-flushed; appendages coarsely but deeply and regularly lacerate-toothed: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

10. *I. ludoviciana* Small. Flower-stalk erect, rigid and strict: sepals recurved or recurved-spreading, 7–8 cm. long, the claw yellow, veined brown-red, the blade dull red-violet, rather veiny, the crest light-yellow, deeply apically cleft by a dark brown-purple vein, the 1 or 2 laterals very narrow, not radial: petals dull red-purple, flushed red-violet towards center, the claw-channel flushed orange, its wings yellow-margined: style-branches rosy-purple, faintly orange-flushed especially towards the base, the wings margined yellow; appendages smoky rose-purple, flushed orange: anther-tips slightly exserted: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.

11. *I. ianthina* Alexander. Flower-stalk erect, rigid: sepals reflexed-spreading, 7–8 cm. long, the claw cream, veined red-violet, the midrib light-olive, streaked pale red-violet, the blade nearly orbicular, dark-violet, faintly veined, but some veins of red-purple are distinguishable in the lower and central portions; the crest split completely into the claw by a violet-black streak, a few pale-olive streakings showing on its sides: petals violet, flushed reddish near the base: style-branches dark purple-violet: appendages violet, lacerate-toothed: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

12. *I. violivenosa* Small. Flower-stalk erect, stiff: sepals spreading, about 8 cm. long, the claw greenish-white with green veins, its wings sparsely violet-veined, the blade dark-violet, almost black in a median band which terminates and splits the yellow-green crest; creamy streaks, over-veined with violet are flushed into the base of the blade: petals nearly as long as sepals, the blade reddish-violet, flush-veined red-purple near the margin, and bluish-purple towards the channel, the claw nearly white, flushed lavender and veined purplish-red, the channel greenish-yellow: style-branches greenish, flushed purplish on the upper part of the keel; appendages finely lacerate, pale rosy-purplish, flushed pale blue-violet: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

13. *I. pyrrhophpha* Alexander. Flower-stalk erect, strict and rigid: sepals recurved, about 7 cm. long, the claw yellow, veined darker, its wings dark-pencilled and flushed, as also part of the body, the blade orange-red, pinkish, or salmon, usually dark-veined, the crest solitary, crimson or carmine, the color continuing as a median band on to the apex of the blade: petals colored like the sepal-blade, but paler, the channel and claw portion yellowish or salmon flushed: style-branches orange or fulvous, the keel darker, the body and wings flushed yellow; appendages pinkish or reddish, flushed orange or salmon: anther-tips slightly exserted: capsule not seen.—Swamps, marshes, ditches, and bayou banks, S La.—Spr.

14. *I. salmonicolor* Small. Flower-stalk strict: flowers fragrant: sepals spreading, the claw lemon-yellow, the color flushing up into base of blade, the blade opening dark-buff with yellow-brown veins, fading to pale-pinkish with orange veins, the crest greenish-yellow, becoming brown-lilac at the tip: petals pale pinkish-buff veined light-orange, the channel of the claw flushed pink: style-branches yellow, fringed along margins: tips of the anthers exserted: capsule not seen.—Marshes, S La.—Spr.

15. *I. fulvaurea* Small. Flower-stalk erect, straight, rather slender: sepals spreading, the claw apricot-yellow veined dark-crimson, the blade crimson-scarlet, veined darker and flushed apricot near the base, the crest single, bright-yellow to red-orange: petals apricot, flushed and veined with crimson, the claw apricot: style-branches salmon-pink: anther-tips exserted: capsule not seen.—Bayous, marshes, and ditches, S La.—Spr.

16. *I. fumifulva* Small. Flower-stalk erect, stiff: sepals recurved-spreading, 6-7 cm. long, the claw yellow with green midrib, its side- and wing-veins pencilled with brown, the yellow color of claw flushed into the basal portions of the blade; blade smoky salmon-pink, veined with brown-red, the crest light-yellow, surrounded by a zone of crimson-brown, and finally becoming a crimson brown median band: petals light-salmon, over-flushed pink, especially around central portion, the whole veined rose-brown, a median band of orange-yellow running the length of the petal, but widening as it descends until it covers the entire claw: style-branches green at base, the sides further up pale greenish-orange, the wings pink-flushed especially above, the entire keel dull rosy-purple: appendages dull smoky salmon-pink, flushed dull orange: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.—Probably of hybrid origin, but now widespread.

17. *I. fumiflora* Alexander. Flower-stalk erect, slender, rigid: sepals recurved-spreading or spreading, 7-8 cm. long, within, the claw light greenish-yellow, faintly pencilled on its wings with lavender, the blade mauve or orchid, often with a pink cast, not very prominently veiny, the crest solitary, yellow; without, dull mauve, overlain greenish-yellow on crest region and claw: petals mauve-pink, the lower third smoky, pale buff or salmon: style-branches pale salmon or ecru; appendages smoky salmon-pink, shallow-toothed, flushed pale-orange below: anther-tips exserted: capsule not seen.—Swamps, marshes, bayou-banks, and ditches, S La.—Spr.

18. *I. moricolor* Small. Flower-stalk rigid: sepals 7-8 cm. long, recurved-spreading; the claw rather short and broad, dark-yellow, flecked and veined with red-violet, the blade oval, much longer than the claw, crimson-maroon veined darker, the crest a single rather prominent ridge of intense yellow, extending into the blade for nearly half of its length: petals broadly spatulate, slightly shorter than the sepals, the claw brownish-apricot, the blade crimson maroon, with a median darker line: style-branches dull purplish old-rose with greenish-yellow margins, the under side yellow-green flushed with old-rose, the appendages obliquely ovate, about 1 cm. long, purplish old-rose, shallow-toothed: capsule ovoid or ellipsoid-ovoid, 6-8 cm. long, 6-ridged-angled.—Bayous and marshes, S La.—Spr.—This is one of the darkest colored and richest of the "reds" yet seen.

19. *I. fuscaurea* Small. Flower-stalk erect: flowers rose-scented: sepals 7-8.5 cm. long, spreading, firm, the claw flushed with apricot and veined and pencilled orange-brown, with the midrib pale yellow-green, the blade brown-lilac, the lower portion apricot-flushed, especially towards the margin, dark brown-lilac about and beyond the very narrow bright-yellow crest: petals cuneate-spatulate, much shorter than the sepals, the claw with brown-lilac lines and orange margins, the blade flushed with apricot at the base, brown-lilac beyond: style-branches rosy-brown-lilac, the wings yellow; appendages slightly darker-colored, flushed apricot beneath: anther-tips included: capsule not seen.—Ponds and swamps. S La.—Spr.

20. *I. purpurissata* Small. Flower-stalk erect, rigid: sepals recurved-spreading, within, the claw greenish-white, veined magenta, especially on the wings, the blade ecclesiastic-purple or brilliant magenta-purple, the crest lemon, beyond the yellow green in claw, solitary, but surrounded by a zone of purple veins;

without, dull-plum, overlain light, silvery-green on crest and claw, the claw also speckled purple: petals somewhat paler than the sepals, the claw-wings cream near the base: style-branches and appendages about the same magenta as the petals, the wings paling to the margin, the body white at the base on both sides: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

21. *I. viridivinea* Small. Flower-stalk slender, erect: sepals spreading or recurving, the claw greenish-yellow veined brown, and flushed and splotched red-brown, deep-cream flushings at its upper end extend into the base of the blade heavily veined brown-purple, the blade red-violet or vinaceous, flecked with violet and with purplish-brown veins, the crest greenish-yellow or yellow-green, blackish tipped, eventually becoming a red-violet streak with a red-violet eye zone around the blackish tip: petals red-violet, flushed bluish-lilac in the median part: style-branches light brown-lilac, becoming cream on the margins: capsule not seen.—Marshes, ditches, and bayous, S La.—Spr.—This may prove, upon further study, to contain more than one species.

22. *I. fuscivenosa* Small. Flower-stalk erect and stiff, slender: sepals reflexed, about 8 cm. long, the claw orange-cream, veined yellow-green, the veins and those of the wings pencilled with rose-brown, the blade dull rose heavily and prominently veined rose-brown, flushed down the center band and all over lower third with brown-orange, the crest lemon-green, solitary, the brown veins coming so close together around it as to make a dark central zone: petals light old-rose, veined in channel with rose-orange, lower half rose-orange veined and flushed rose: style-branches dull old-rose, flushed dull pinkish-orange on the sides, the keel dark old-rose, the appendages old-rose, slightly flushed orange-rose: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

23. *I. crocinubia* Alexander. Flower-stalk erect, stiff and slender: sepals recurved, about 6 cm. long, the claw dull orange-green-veined at the base, veins above clouded over with orange and vein-pencilled rose-brown, the blade smoky lavender-old-rose on outer third, but entire lower two-thirds so heavily clouded over and flushed with dull orange as to almost completely obscure its color, some of these cloudings extend nearly to the apex, the crest solitary, orange-yellow, completely outlined with red-violet: petals smoky gray-pink, clouded and flushed on the lower third with brown-orange: style-branches dull purplish-rose on the keel, the body flushed brown-orange, the wings dull pale-orange; appendages purplish old-rose, irregularly toothed: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

24. *I. miraculosa* Small. Flower-stalk rigid, strict: flowers slightly fragrant: sepals 10–12.5 cm. long, recurved-spreading, the claw suffused and lined with green, the blade elliptic, oval, or oval-obovate, lavender or white, the prominent crest bright-yellow: petals spatulate or cuneate-spatulate, somewhat shorter than the sepals, white or lavender beyond the greenish-tinged base: style-branches greenish-white, the wings white, faintly flushed pale-lavender; appendages lavender, shallowly lacerate-toothed: anther-tips included: capsule oval, ellipsoid, or obovoid, 6.5–9 cm. long, 6-lobed.—Swamps and ditches, S La.—Spr.

25. *I. atrocyanea* Small. Flower-stalk rigid, strict: flowers fragrant: sepals 7.5–9.5 cm. long, spreading or recurved-spreading, the claw suffused with yellowish-green and with often whitish margins, the blade orbicular-oval or orbicular-ovate, dark violet-blue, the narrow crest yellow: petals broadly spatulate, somewhat shorter than the sepals, the cuneate claw shorter than the blade, greenish at the base, tinged with red-violet above, the blade deep violet-blue and often with dark lines at the base: style-branches red-purple; appendages irregularly lacerate-toothed: capsule ellipsoid or nearly so, 8–10 cm. long, 6-lobed.—Swamps, ditches, and bayou-banks, S La.—Spr.

26. *I. tyriana* Small. Flower-stalk erect, strict and rigid: sepals recurved-spreading, within, the claw pale orange-cream veined brown, the blade rich violet-purple, flushed around the crest zone pale, dull reddish purple, the crest greenish-yellow, solitary, with the brown veinings of the claw extending up and radiating into the crest zone; without dull slaty-violet, crest and claw overlain pale creamy-green: petals a slightly more bluish cast of purple than the sepal, flushed orange-cream on the claw wings and near base, outside a mid-band of greenish-white: style-branches light red-violet, pale yellow-green at base, the keel purplish-pink, the wings pale-salmon, flushed reddish near apex; appendages dull red-violet, flushed pinkish-purple near base, sharply lacerate toothed: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

27. *I. violipurpurea* Small. Flower-stalk rigid, strict: flowers slightly fragrant: sepals 7–11 cm. long, spreading or recurved-spreading, the claw suffused with green, and veined brown-violet, its wings orange-cream, pencilled red-violet, the blade about twice as long as the claw, elliptic or ovate-elliptic, violet-purple, the crest yellow, its rudimentary laterals barely reaching the base of the blade: petals spatulate, much shorter than the sepals, the claw yellowish only at the base, the blade violet-purple and dark-lined at the base: style-branches red-purple, the wings greenish; appendages red-purple, shallowly lacerate-toothed: anther-tips included: capsule oval or ovoid-oval, 7–9 cm. long, bluntly 6-lobed.—Marshes, swamps, and bayous, S La.—Spr.

28. *I. vinicolor* Small. Flower-stalk erect, strict: flowers slightly fragrant: sepals 7.5–8.5 cm. long, recurved-spreading or drooping, the claw yellow-green at the base, above dull orange-flushed, veined and pencilled brown-violet; the blade vinaceous-purple, especially dark about the narrow yellow crest: petals broadly spatulate, much shorter than the sepals, the claw greenish-yellow and somewhat lined, the blade vinaceous-purple and somewhat suffused with yellow-green at the base: style-branches dull reddish-purple, the wings pale-orange: appendages red-purple, finely erose-toothed: anther-tips included: capsule ellipsoid or obovoid-ellipsoid, 5–7.5 cm. long, sharply 6-angled.—Swamps and bayou banks, S La.—Spr.

29. *I. rosilutea* Alexander. Flower-stalk erect, stiff, but rather short: sepals reflexed, about 7 cm. long, the claw yellow, its wings pencilled and flushed with orange-pink, the blade opening orange-rose, but soon fading to a light but dull rosy-pink, the crest bright-yellow with a single bright-yellow lateral on either side, the median finally becoming a brown vein: petals opening orange-rose, but central and lower blade portions light rosy-purple, the whole fading to the same color to which the sepals fade: style-branches pinkish-orange on the sides, the wings flushed old-rose and margined yellow, the keel purplish rose, which color is flushed on the upper portion of the body, orange-rose beneath, flushed purplish-rose above; appendages deeply toothed, especially near the tips; anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

30. *I. fuscirosea* Small. Flower-stalk erect, strict, rigid: sepals slightly recurved, 7–8 cm. long, the claw pale-olive, veined darker, the claw-wings pencilled and streaked with brown-rose, the blade dark, brownish old-rose veinstreaked darker, the crest orange-yellow, one lateral of same color on each side, but half obscured by brown-rose blotchings and suffusions: petals dull old-rose wrinkle-streaked darker, the claw-channel olive, as also is the claw-base: style-branches greenish old-rose, the wing margins pale olive-yellow; appendages dull, pale old-rose, lacerate toothed: anther-tips about equalling the stigmas: capsule not seen.—Swamps, marshes, and ditches, S La.—Spr.

31. *I. rubicunda* Small. Flower-stalk erect, stiff: sepals about 8 cm. long, the claw greenish-yellow within, brown-violet veined and with brown-violet spots

near the upper end, the blade with a ground-color of a brilliant magenta-cerise, prominently veined with brown, the crest-median orange-yellow with one short lateral on either side and two minor laterals more or less brown-spotted, the entire crest-zone surrounded by an outlining zone of brown-violet, giving a dark eye effect; without, the blade dull old-rose, the crest area pale-yellow: petals about 6 cm. long, the blade a lilac-old-rose on both sides, but within with brown-orange veinings and a central band of crimson-orange which spreads with apricot flushings over the entire claw, a central band of pale yellow-green without: style-branches purplish old-rose at the base, fading rapidly above to apricot, the wing-margins of the body pale-yellow, the keel dull-orange; the appendages apricot at the base, becoming flushed towards the edges with purplish old-rose: capsule not seen.—Ditches and marshes, S La.—Spr.

32. *I. cerasioides* Alexander. Flower-stalk erect and stiff, but overtopped by the leaves: sepals spreading, about 8 cm. long, the claw orange-cream, heavily veined and flushed with dark, purplish-rose, the midrib greenish-yellow, unmarked, the blade flushed light-salmon on the sides near the base, above, dull purplish-rose, the whole streak-veined brownish-rose, the crest bright-yellow, with one or two laterals of the same color, whose color does not extend into the claw proper: petals old-rose at central portion, the outer portions and all but the channel below flushed and streaked light-salmon, the channel brown-orange: style-branches old-rose; appendages deeply but sparsely lacerate-toothed: anther-tips exerted: capsule obovate, about 6 cm. long, 6-angled.—Swamps and marshes, S La.—Spr.

33. *I. rosipurpurea* Alexander. Flower-stalk erect, rigid: sepals recurved-spreading, within, the claw apparently cream, but obscured by a profusion of red-violet streaks and pencillings except on the median ridge, the blade dull rose-lilac, very much veined darker, especially on the lower portion, which is in addition well streaked and flushed with lavender, the crest dark-lemon, the laterals on either side almost obliterated by the dark brown-purple veins which at this point come very close together; without, light reddish-violet, the crest and claw overlain pale-olive, the claw brown-purple streaked: petals light, purplish-rose within, outside, lavender, with a bluish midflush: style-branches light lavender-rose, the wings white below, the white gradually narrowing to a margin above; appendages light, purplish-magenta, irregularly somewhat shallow-toothed: anther-tips equalling the stigmas: capsule not seen.—Swamps and marshes, S La.—Spr.

34. *I. regalis* Small. Flower-stalk erect, flowers strongly musk-scented: sepals 9–11 cm. long, spreading, firm, the claw suffused with green, the blade rosy-lilac light with numerous darker veins, the crest yellow, with one or two laterals of intense lemon, sometimes a third rudimentary lateral at the very base of the blade: petals broadly spatulate, slightly shorter than the sepals, the claw suffused with green and dark-lined, the blade elliptic or oval, varying to obovate or ovate, undulate, rosy-lilac on both sides of the greenish-brown median line: style-branches mostly greenish, heavily flushed rosy-lilac, deeply lacerate-toothed, heavily flushed orange-yellow on the lower side: anther-tips included: capsule obovoid, the six ridges very distinct on the lower two-thirds, very faint towards the apex.—Swamps and pools, S La.—Spr.

35. *I. lilacinaurea* Alexander. Flower-stalk rigid and erect: sepals spreading, the claw yellow except the orange median ridge and the lavender wings, the blade dark rich lilac, with the veinings not prominent, much longer than broad, the crest a broad lanceolate triangle of brilliant orange outlined in red-violet, the two laterals which help form the triangle contiguous with the crest median: petals lilac, paler and reddish flushed in the claw portion: style-branches red-violet, the appendages red-lilac: capsule not seen.—Marshes and bayous, S La.—Spr.

36. *I. fourchiana* Small. Flower-stalk erect, rigid and strict: sepals 7-8 cm. long, the claw pale yellow-green, veined and pencilled red-violet, the blade dull red-violet, veined darker, the crest yellow, scarcely extending into the base of the sepal-blade, 1-3 laterals, usually narrow and indistinct surrounded by pale yellowish flushings accompany the crest forming a pale but very veiny blotch at the base of the sepal-blade: petals light red-violet, often same color as the sepal-blade, flushed near lower center and in claw with apricot: style-branches light orange-purple, the wings yellowish; appendages light red-violet, deeply lacerate toothed: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.—This may include more than one species. It is one of the most widely distributed and variable of the La. species.

37. *I. oenantha* Small. Flower-stalk erect, stout, strict: sepals 9-10.5 cm. long, rather laxly drooping, the claw orange-yellow, with the median ribs green, the lateral veins red-brown, and the wings veined red-brown, a zone of brownish flushes and veins at the junction of the claw and blade, the blade nearly three times the length of the claw, wine-purple with a darker median band and a darker zone surrounding the crest; the crest bright-yellow, rather broad, with one or two yellow laterals on either side: petals light red-violet, nearly as long as the sepals, the basal channel orange-flushed, as also are the margins of the lower third and the claw: style-branches red-violet, becoming very pale towards base, the appendages the same color: capsule 8-9 cm. long narrowly ellipsoid, sharply 6-ridged.—Marshes, bayous, and ditches, S La.—Spr.

38. *I. iocyanea* Small. Flower-stalk erect, strict, rigid: sepals spreading, about 9 cm. long, the claw yellow, veined greenish, the blade blue-violet, the more prominent veins brown, the crest dark-lemon, with one or two paler laterals, the median and laterals outlined by a black-violet zone, which eventually becomes a median band: petals blue-violet, with darker median, the claw portion yellow, veined red-purple in channel and flush-veined red-purple on wings: style-branches violet, their wing-margins greenish; appendages violet, finely and deeply lacerate-toothed: anther-tips included: capsule not seen.—Swamps, marshes, and bayou-banks, S La.—Spr.—There is a closely similar form with the sepal-claw greenish-white with reddish-violet veinings, and the petals pale-violet, flushed cream in the claw; this may prove upon further study to be a species.

39. *I. ioleuca* Alexander. Flower-stalk erect, stiff: sepals recurved-spreading, 9-10 cm. long, the claw white, veined pale-green, its wings faintly flushed pale-green, their veins and those of the main body faintly pencilled with brown-purple, the blade blue-violet, rather veiny, the crest pale-yellow with a single white lateral on either side and a pale flushed zone in the base of the blade, outside of sepal white, irregularly flushed faintly with pale-violet: petals light-violet, the claw white, its upper channel and wing-margins flushed light-violet: style-branches greenish-lavender, the wings greenish but lavender flushed, the keel violet with a lavender ridge; appendages light-violet, flushed bluish, coarsely lacerate-toothed: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.

40. *I. cyanantha* Alexander. Flower-stalk erect, strict: flowers slightly fragrant: sepals 8-9 cm. long, the claw pale greenish-yellow, veined yellow-green, the blade with a deep-blue ground-color, fading violet-blue, unstreaked, the crest bright yellow, with one narrow lateral of yellow and a rudimentary lateral of cream: petals spatulate, somewhat shorter than the sepals, the claw red-purple, the blade of the same ground-color as the sepal-blade, but often becoming whitish-streaked: capsule not seen.—Swamps, moist woods, and bayous S La.—Spr.—This is one of the closest approaches to true blue yet found in Louisiana irises.

41. *I. bifurcata* Small. Flower-stalk erect, stiff, strict: flowers slightly rose-scented: sepals 9–10.5 cm. long, recurved, the claw suffused and lined with green, deeper in the middle, the blade oval-ovate, of a violet-blue ground-color, very prominently dark-veined, with a narrow lemon lateral near the base of the lemon-yellow crest: petals cuneate, somewhat shorter than the sepals, the claw greenish and lined with brownish-green, the blade violet-blue, usually dark-lined down the middle: style-branches violet, flushed red-violet: appendages deep-violet, lacerate toothed: anther-tips included: capsule not seen.—Swamps and meadows, S La.—Spr.

42. *I. rubrolilacina* Alexander. Flower-stalk erect, rigid and strict, branched: sepals recurved-spreading, the blade dull rose-magenta, prominently veined darker, the crest orange-yellow, long-acuminate, together with 2 or 3 laterals on either side forming a lancehead which extends from well down into the claw to one third the length of the sepal-blade: petals slightly paler than the sepal-blades: style-branches heavily streaked and flushed pale-orange, the keel pale-orange: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

43. *I. viridis* Alexander. Flower-stalk erect, strict: flowers slightly musk-scented: sepals 7.5–8.5 cm. long, wide-spreading, the claw suffused with pale yellowish-green, veined yellow-green, the blade violet, the crest and its 2 or 3 contiguous laterals forming a lancehead of bright greenish-yellow: petals spatulate, somewhat shorter than the sepals, the claw suffused with green and green-lined, the blade much longer than the claw, of a violet ground-color, darker toward the tip: style-branches greenish, the body becoming flushed pale-violet above; appendages pale-violet, lacerate-erose-toothed, lavender on the under side: anther-tips exerted: capsule ellipsoid or nearly so, 5–6.5 cm. long, slightly 6-lobed.—Marshes and bayou-banks, S La.—A species with very free-flowering plants, the sepals not always spreading out full, but the brilliant violet-color gives a pleasing effect.

44. *I. citriviola* Small. Flower-stalk erect, rigid and strict: sepals recurved-spreading, within, the claw greenish-white veined yellow-green, its wings lightly pencilled red-violet, the blade royal-purple, the crest brilliant lemon, with one or two laterals of same color, all outlined deep-violet, the claw-veins becoming brown at top of claw; without the blade light silvery-violet, overlain silvery, the crest and claw yellow-green: petals same color as sepal-blades, within, flushed lavender in the claw portion, without, the claw flushing pale silvery-green: style-branches dull light-violet, fading paler and more greenish at base, the wings white; appendages light-violet, flushed lavender beneath, erose-toothed: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.

45. *I. iodantha* Alexander. Flower-stalk erect, stout, rigid: sepals recurved, within, the claw greenish-yellow, yellow-green veined, the veins becoming black-purple at base of blade, claw-wings creamy, margined dark-lavender, the veins brown-flecked, the blade rich, brilliant-violet, the crest dark-lemon, with 2 short laterals, the first lemon, the second pale-lemon, barely extend into the base of the blade and all outlined with black-purple; without, the crest-region overlain creamy greenish-white, the claw light yellow-green, streaked purplish: petals same color as sepal-blade, except lower part of blade flushed red-violet, the claw cream-flushed, and red-lilac streaked; without, claw and lower part of blade silvery greenish-white: style-branches dull red-violet, becoming paler towards base, wings white below, white-margined above; appendages violet, flushed withish near base beneath, lacerate-toothed: anther-tips very slightly exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

46. *I. gentilliana* Alexander. Flower-stalk erect, stout and rigid: sepals recurved, within, the claw pale whitish-green, veined yellow-green, the blade

erose-crenulate, rich-violet, slightly veiny, the crest orange-yellow, laterals 2, the first orange-yellow, the second cream-orange, spotted purple, the veins between and around crest and laterals brown-purple, no crest color descending into the claw; without, light silvery-violet overlain greenish-cream around crest, the crest and claw light-green: petals erose-margined, 3 cm. or more broad, same color as sepal-blades except the channel red-lilac, the claw portion cream, flushed reddish lilac; outside, with a median of pale silvery-green: style-branches dull light red-lilac, the claw portion cream, flushed reddish-lilac; outside with a median of pale silvery-green: style-branches dull light red-violet, becoming greenish at base, the wings silvery-white, only white-margined above; appendages light-violet, irregularly lacerate-toothed, flushed cream at base beneath: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

47. *I. lancipetala* Alexander. Flower-stalk erect, slender, but rigid: sepals spreading, within, the claw pale-lemon, veined pale-olive, the blade lavender, very veiny, the veins bistre, the crest dark-yellow, very narrow, brown-tipped, the tip continuing as a median vein-like band, laterals 2, yellow, rather faint, the tips slightly streaky; without, lavender, central zone overlain silvery-yellow, crest and claw yellow-green: petals lavender, becoming grayish below and pale lilac-brown veined: style-branches smoky, with faint lavender flush, the keel gray-green, the wings pale silver-pink; appendages lavender, frilly, irregularly erose toothed: anther-tips barely included: capsule not seen.—Swamps and marshes, S La.—Spr.

48. *I. pseudocristata* Small. Flower-stalk rigid, usually rather slender, strict: sepals 8-9 cm. long recurved, the claw sulphur-yellow, the midrib yellow-green, the blade oval or nearly so, of a light lavender-violet ground-color, the crest represented by a groove, but marked by a narrow lancehead of lemon-yellow: petals conspicuous, slightly shorter than the sepals, elliptic spatulate, undulate-cripsed, the claw suffused with yellow-green at the base, the blade much longer than the claw, colored like the sepal-blade: style-branches lavender-violet; appendages light lavender-violet, lacerate toothed: anther-tips included: capsule not seen.—Marshes and edges of bayous, S La.—Spr.—Although the sepals appear to have a crest, color alone indicates it, for there is a groove in the base of the sepal blade instead of a ridge.

49. *I. rhodantha* Alexander. Flower-stalk erect, strict: sepals sharply recurved, the claw lemon-yellow with the wings streak-veined rose-brown, the blade deep orange-rose veined orange-brown, the crest intense lemon-yellow with a zone of orange and yellow around it at the base of the sepal-blade, which is so streaked with rose-brown as to make the crest-zone merge with blade-color: petals light-rose, the claw flushed apricot: style-branches old-rose: appendages about 5 mm. long, merely undulate-margined: anther-tips slightly exerted: capsule not seen.—Marshes and ditches, S La.—Spr.

50. *I. parvirosea* Small. Flower-stalk erect and slender, rigid: sepals spreading, about 7 cm. long, the claw light-yellow, the greenish veins of body and wings pencilled with brownish-rose, the blade dull-rose, the crest bright-yellow with about 3 laterals-of the same color, these laterals very narrow and separated from each other and from the main crest by orange-brown veins, which veins after passing the crest zone become brown-rose and radiate a short distance into the blade: petals light, dull-rose, flushed along the channel-sides and below with rosy orange, the base of the claw yellow: style-branches dull, greenish-rose, somewhat flushed rosy-orange, the wings pale creamy-yellow; appendages irregularly toothed: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

51. *I. Marplei* Alexander. Flower-stalk erect, stout, rigid: sepals spreading, the claw lemon-yellow, veined pale yellow-green, its wings veined violet-brown

and dotted with red-violet, the blade plum-color or nearly maroon with a darker central band, the crest deep-yellow with a median brown line on the lower portion, notched at the tip, with 2-4 very broad prominent yellow laterals on either side, each, however, separated by bands of brown-red, the tips of all laterals and the crest together outline a broad radial triangle: petals and style-branches plum-color: capsule not seen.—Swamps, S La.—Spr.—The crest of this species is the most unusual of the Louisiana group, causing a very striking perianth.

52. *I. callirhodea* Alexander. Flower-stalk erect, stiff: sepals spreading or recurved-spreading, about 8 cm. long, the claw greenish-yellow, its veins yellow-green, pencilled with rose-brown, the blade dark rose, flushed lilac near the margins and prominently veined orange-brown, the crest brilliant-yellow, three distinct laterals on either side forming a large triangle which is outlined with red-brown, a large area around the crest heavily flushed dull-vermilion, becoming yellow at extreme base: petals salmon-pink, salmon-flushed and prominently veined rose-brown, the claw-wings pale orange-yellow veined rose-brown: style-branches with the body mainly smoky-lilac flushed rose, becoming almost magenta above, the keel-ridge greenish, the wings margined green; appendages smoky brown-orange flushed rosy-lilac and veined brown: anther-tips included: capsule not seen.—Swamps, marshes, and partly dried bayous, S La.—Spr.

53. *I. rhodochrysea* Small. Flower-stalk erect, stiff: sepals spreading, the claw light orange-yellow, its wings veined red-brown, the blade an intense old-rose lilac, veined prominently with violet-brown, the veins at the base forming a brown outline to the crest, the crest a deep brilliant yellow, with a broad triangle of unmarked and intense color, separated from the margins by a zone of rose fleckings mingled with cream, this zone extending all around the base of the blade: petals old-rose, veined lilac, the claw flushed apricot: style-branches pale old-rose, the wings flesh-color, notched their entire length, the appendages about 13 mm. long, old-rose, widely flaring: capsule not seen.—Ditches and marshes, S La.—Spr.

54. *I. DeWinkeleri* Small. Flower-stalk erect, strict and rigid: sepals recurved-spreading, within, the claw pale-olive, overflushed with pinkish and rose-brown streaks and dots, the veins pencil-streaked with rose-brown, and extending into the blade as radial veins, the blade nearly light rose-pink, but this color is clear only on the outer third, the inner part heavily flushed pale pinkish-brown and prominently veined with pink-brown, the crest olive-yellow, 2 laterals of same color at the base of the blade, the median brown-tipped; without, light orange-pink overlain pale sulphur, except on margin, crest and claw pale yellow-green: petals pale gray-pink, banded down center a rosy orange-brown, claw-wings pale-yellow flushed; without, slightly paler, the center band pale silvery-yellow: style-branches dull orange-rose, the wings pale-green at base, flushed near center with orange-pink, then becoming light old-rose above; appendages light old-rose, irregularly and shallowly frill-toothed: anther-tips included: capsule not seen.—Marshes, swamps, and ditches, S La.—Spr.

55. *I. pallidirosea* Alexander. Flower-stalk erect, strict and rigid: sepals spreading 7-8 cm. long, the claw pale, creamy-yellow, veined darker yellow, the blade extremely pale-pinkish, flushed rather irregularly with buff and with a median band of buff, the crest orange-yellow, brown-orange tipped, 2 or 3 laterals of light yellow forming a broad triangular crest zone; petals the same color as the sepal blade with the channel light brown-orange, the claw wings pale-yellow: style-branches pale-yellow faintly flushed pinkish on the sides; appendages flushed pinkish, irregularly toothed: anther-tips slightly exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

56. *I. Thomasii* Small. Flower-stalk erect, rigid: sepals recurved-spreading, 7-8 cm. long, the claw deep-yellow, veined yellow-green, the blade red-violet with a darker median band, the crest orange-yellow, a series of short radials around its base which do not however extend into the blade-color but form a sharply outlined narrowly triangular zone: petals red-violet, the channel light orange-brown, the claw wings cream-orange, veined red-violet near channel: style-branches dull red-violet, their wings margined yellowish; appendages dull red-violet edged and flushed slate; shallowly lanceolate-toothed: anther-tips included: capsule oval with a tapering, beak-like apex, 6-10 cm. long, bluntly 6-angled.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.—A form of this with very veiny perianth, a rather smoky-green sepal-claw, widely dilated petals with orange and brown veined claw may represent another species.

57. *I. amnicola* Alexander. Flower-stalk erect, rigid, strict: sepals recurved-spreading, within, the claw sulphur, its upper two-thirds flecked and spotted dull red-violet, the veins green, the blade deep vinaceous-purple, the crest dark-lemon, narrowly lance-shaped, its color streaked, flecked and spotted into the lower part of the blade, and itself spotted and flecked dull red-violet; without, dull, dark violet, overlain greenish-sulphur on crest zone and claw: petals within, deep vinaceous purple, red violet in the lower portion, the claw pale orange-yellow, margined orange-cream; without, slightly more dull-colored, a broad median band of sulphur in the lower half: style-branches dull, light red-violet, the margin creamy; appendages the same color, sparsely and shallowly sharp-toothed, flushed orange at base beneath: anther-tips exerted: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.

58. *I. cyanochrysea* Small. Flower-stalk erect, rigid: sepals recurved-spreading, within, the claw greenish cream veined yellow-green, its wings streaked red-violet on the inner side, the blade blue-violet, the crest deep-yellow, two laterals on each side forming an oval blotch of color, outlined with dark-violet and flecked outside of this border with red-violet and white, the median ridge tipped orange-brown, no blade color extending downward into the claw; without, pale-violet, overlain white on crest zone, crest median and claw yellow-green: petals blue-violet, the base of the blade and the channel red-violet, margined by a pinkish zone heavily flushed reddish-violet, becoming white towards base, without, with a greenish-white flush down the lower portion of the channel: style-branches dull red-violet, the wings white below, gradually becoming lilac towards the top, lower third of the keel green; appendages light-violet, erose-toothed, flushed whitish beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

59. *I. iochroma* Small. Flower-stalk erect, strict: sepals recurved-spreading, within, the claw greenish-cream, veined yellow-green, the blade pansy-purple, veined dark violet-brown, the crest lemon, with two lemon laterals on either side about 3 mm. long, their color stopping abruptly at the claw; without, a dull shade of light-violet, overlain with white, the crest median and the claw pale yellow-green: petals pansy-purple, flushed red-violet below, the claw-wings whitish; without, paler colored, the median band nearly white, the claw greenish-yellow its wings whitish: style-branches dull red-violet, greenish white near base, the wings very broad, white below, faintly flushed red-violet above, lower half of the keel white; appendages violet, deeply toothed, flushed lavender beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

60. *I. atroenantha* Small. Flower-stalk erect, strict and rigid: sepals spreading-recurved, within, the claw greenish-yellow, veined brown-purple near top, veined green below, its wings yellow, flushed and veined lilac-brown, the blade dull wine-purple, fading paler near base, the crest yellow, with 2 or 3 laterals on either side about 6 mm. long, crest-veins brown-purple; without, the blade

slightly paler than within, but overlain with sulphur, the crest and claw yellow-green: petals dull wine-purple within, the margins pale creamy-orange towards base, without, a central band of silvery greenish-yellow: style-branches smoky red-violet, the lower third of the keel green, the wings cream-margined; appendages sparsely toothed, flushed pale-orange at base beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

61. *I. fuscisanguinea* Alexander. Flower-stalk erect, rigid and strict: sepals spreading, within, the claw so heavily flushed with purple-brown as to obscure its color, but the midrib greenish-yellow, the wings pale orange-margined, the blade a rich purplish-red, becoming brown around crest, the crest dark rich lemon, with one or two short laterals sometimes irregularly and imperfectly formed, but always surrounded by a dense mass of brown-purple veinings; without, dull red-purple, overlain sulphur on crest-zone and claw, the claw purple-brown spotted: petals pink, faintly flushed lilac-blue, the channel region flushed red-purple near middle, below, brown-purple flushed, the wings pale-orange near base; without, silvery old-rose, median band pale, silvery-orange: style-branches light orange-rose, the wings old-rose near tip, cream margined, becoming all cream below; appendages smoky heather-red, finely shallow-toothed, flushed orange at base beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

62. *I. albilinea* Alexander. Flower-stalk erect, strict: sepals recurved-spreading, within, the claw greenish-cream veined yellow-green, the blade light violet-purple, fading somewhat paler, all except the apical portion heavily streaked and splotted with creamy lavender, the crest deep-lemon, one lemon lateral on either side at base of blade, the median apically cleft by a black-purple stripe; without, dull red-violet, overlain with rich yellowish-cream, the crest and claw pale yellow-green: petals the same color as sepals and similarly marked, the claw creamy white, the upper claw-channel brownish-lilac; without, the claw greenish cream: style-branches light smoky lilac, becoming very pale yellow-green below, the lower two-thirds of the keel greenish-white, the wings whitish, flushed near the appendages with red-violet: appendages widely divergent, light red-violet, lacerate-toothed, flushed lavender beneath: anther-tips included: capsule not seen.—Swamps and marshes, S La.—Spr.

63. *I. auralata* Small. Flower-stalk erect, stout: sepals 9–10 cm. long, the claw pale orange-yellow, green-veined, the blade fully twice the length of the claw, without dull brown-violet, suffused towards base with yellowish-green, within, dull, smoky red-violet with a darker central zone, flushed heavily with dull orange on lower portion, the crest an indistinctly outlined radial zone of light-yellow, spotted at the edges with red-brown, only the median extending into the lower part of the blade proper; petals broadly spatulate, about 7 cm. long, without dull gray-lilac with a pale-green median, within the upper half dull red-lilac with a darker median, the lower half reddish-apricot veined red-violet and becoming yellow towards base: style-branches red-violet, sharply keeled, the wings bright-yellow; appendages broad, blunt, finely and unevenly toothed, bright-yellow at the base on the side next the wings, otherwise dull red-violet streaked with apricot: capsule not seen.—Swamps and bayous, S La.—Spr.

64. *I. phoenicis* Small. Flower-stalk erect, strict and rigid: sepals recurved-spreading, 8–9 cm. long, the claw pale creamy-yellow, veined pale-green, the veins pencilled brown-purple, the wings heavily flushed brown-lilac in addition to these pencillings, the blade rather rotund, purple, faintly veined darker and flushed reddish at the base, the crest dark-yellow, 2–4 lemon-colored radials coming from the claw into the base of the blades: petals blue-purple, the claw portion red-purple: style-branches dark-purple the wings pale-margined; appendages light-violet: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou banks, S La.—Spr.

65. *I. violilutea* Alexander. Flower-stalk erect and strict: sepals 7.5–9.5 cm. long, recurved-spreading, the claw whitish-green, veined yellow-green, the blade of a dull-violet ground-color, the crest yellow or orange-yellow, with 1 well developed lateral and 2 or 3 more rudimentary ones forming a radial-based triangular blotch: petals spatulate, much shorter than the sepals, the claw suffused with green and lined with red-violet at the base, the blade dull-violet and darker-veined, except the red-violet midvein and flush at the base: style-branches greenish, faintly flushed dull-lavender on upper portion; appendages pale reddish-lavender, flushed greenish above and beneath, shallowly but finely lacerate-toothed: anther-tips included: capsule long-ellipsoid, 6.5–8 cm. long, shallowly 6-lobed.—Marshes and swamps, S La.

66. *I. oolopha* Alexander. Flower-stalk erect, strict: sepals recurved, about 8 cm. long, the claw yellow, veined yellow, the blade light smoky lilac or pale-violet, veined darker, the crest deep-yellow, a radial zone, ellipsoidal in outline, formed by the laterals, the median ridge cleft by a nearly black vein, a darkened blotch around the crest-apex: petals light bluish-lilac or pale lavender-violet, the claw-portion streak-pencilled pale greenish brown and flushed yellow, the base yellow: style-branches red-lilac or light violet; appendages deeply toothed: anther-tips included: capsule not seen.—Swamps, marshes and ditches, S La.—Spr.

67. *I. chrysolopha* Small. Flower-stalk erect, slender, stiff: sepals spreading, 8.5 cm. long, the claw yellow-veined, pale yellow-green, the blade smoky salmon-pink, over-flushed dull-orange and prominently veined dark rose-brown, the crest bright-yellow, the median split nearly to the base by a black-red vein, the first lateral on each side split by a similar vein, the radial laterals all bright-yellow, spotted brownish near their apices: petals light-salmon, flushed salmon-pink and veined brown-orange, the three medial veins black-crimson, the claw orange-yellow, pencilled brown-orange: style-branches dull-salmon, flushed pinkish-orange; appendages shallowly lacerate-toothed: anther-tips slightly exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

68. *I. chrysaecola* Small. Flower-stalk stout, rigid, strict: sepals 8–10 cm. long, recurved-spreading or recurved, the claw suffused with yellowish-green and faintly veined, the blade oval-ovate or oval, much longer than the claw, the bright-violet ground-color suffused below the middle with flecks and lines of yellow or greenish-yellow, veined brown, and with a yellow crest: petals broadly spatulate, somewhat shorter than the sepals, with the lower parts of the claw yellowish-green, the blade often somewhat paler than the sepal-blade: style-branches red-purple, the wings yellowish: appendages dull-violet, sharply lacerate-toothed: anther-tips included: capsule ellipsoid-ovoid, 7–10 cm. long, bluntly 6-lobed.—Swamps, bayous, and ditches, S La.—Spr.

69. *I. chrysophoenicia* Small. Flower-stalk strict, rigid, stout: flowers slightly fragrant: sepals 7.5–9 cm. long, recurved-spreading, the claw suffused with greenish-yellow and pale-veined, the blade oval, much longer than the claw, dark violet-purple (plum-color), the crest-median orange-yellow surrounded by a greenish-yellow crest-zone, which forms a radial blotch in the base: petals broadly spatulate, slightly shorter than the sepals, the claw mainly greenish-yellow, flushed red-brown at the base of the blade, often slightly paler than the sepal-blade and with a median brownish line: style-branches dull red-purple, the keel and wings greenish; appendages dull red-violet, finely and irregularly toothed: anther-tips included: capsule ovoid or ellipsoid-ovoid, 6–9 cm. long, rather prominently 6-lobed.—Bayous and swamps, S La.—Spr.

70. *I. callilopha* Alexander. Flower-stalk erect, stiff: sepals recurved, 9–10 cm. long, the claw yellow, veined greenish-yellow, the blade magenta-lilac or pontifical-purple, prominently darker-veined, with a dark brown-violet median band which splits the crest-median apically, the crest-median orange-

yellow, the entire crest zone a blotch of yellow, veined, flecked, and streaked with brown-violet and itself well streaked into the lower third of the blade: petals the same color as sepal-blades, faintly bluish-tinged near center, the lower blade sides flushed yellow, the nearly wingless claw yellow with orange veins, the blade-channel pale orange-green: style-branches orange-purplish the wing-margins greenish-yellow; appendages slaty-rose-lilac, flushed dull brown-orange: anthers included: capsule not seen.—Swamps, marshes, and ditches, S La.—Spr.—A variety with less prominent veinings and less streaked sepal-crest, the petals without the greenish channel, and with a very broad-winged claw of yellow, veined brown, may represent another species.

**71. *I. schizolopha*** Alexander. Flower-stalk erect, stout, strict and rigid: sepals spreading or recurved-spreading, within, the claw creamy-yellow, veined olive-yellow above, olive-green below, the blade ground-color varying from light-violet to light purplish-rose, but a great radial blotch of creamy yellow extends up from the claw and streaks in flecks, blotches, and streaks out nearly to the blade margins, nearly obscuring the ground color, and veined and spotted brown-violet, the crest yellow, split to the base of the blade by a black-violet or brown-red band, which forks just beyond the crest zone into two parts, both of which continue separately to the margin; without, all yellow, except the blade margin: petals marked like sepals: style-branches smoky-colored, faintly flushed with purplish or pinkish, the wings pale greenish-yellow; appendages light-violet or light old-rose, lacerate-toothed: anther-tips included: capsule not seen.—Ditches and bayou-banks, S La.—Spr.

**72. *I. Albispiritus*** Small. Flower-stalk erect, rigid: flowers slightly fragrant: sepals 8.5–14 cm. long, more or less recurved, the claw suffused with yellow-green, the blade elliptic to ovate-elliptic, white, the crest greenish-yellow accompanied by a paler blotch, toothed and undulate: petals spatulate, considerably shorter than the sepals, the broad claw suffused and lined with green, the blade longer than the claw, white: style-branches greenish-white; appendages white, deeply lacerate-toothed: capsule ellipsoid, 6–10.5 cm. long, 6-ribbed.—Low pinelands and savannahs, pen. Fla.—Early Spr.—This species is most common in the lower half of the Florida peninsula.

**73. *I. savannarum*** Small. Flower-stalk strict, rigid, erect: sepals 8–4 cm. long, recurved-spreading, the claw suffused with green, the blade elliptic to oval, of a violet-blue or violet ground-color, whitish or white-flecked at the base, the narrow crest extending well up into the blade: petals spatulate or nearly linear, often much shorter than the sepals, the claw suffused with green or lavender, the blade longer than the claw, bluish or violet: style-branches with a greenish ground-color, but heavily flushed and streaked red-violet, the wings pale; appendages sharply and irregularly toothed, light-violet: capsule ellipsoid or nearly so, 8–11 cm. long, 6-ribbed.—Prairies, savannahs, and hammocks, pen. Fla.—Early Spr.—Larger areas are exclusively occupied by this prairie iris than by any of our other species. Colonies, in extent as far as the eye can see, often occupy the low prairies where the soils are usually strongly acid. The plant is decidedly influenced by the water-table: following a dry season during the resting period, few flowers are produced, following a wet season, especially if the plants stand in water for a period, myriad flowers appear. This species occurs in deep-violet, lavender and pure white forms as well as the typical blue-violet.

**74. *I. Kimballiae*** Small. Flower-stalk erect, rigid: sepals 8.5–10 cm. long, recurved-spreading, the claw suffused with green, the blade ovate or elliptic-ovate, violet except the greenish-yellow blotch, with white-flecked margins beyond which the yellow crest extends: petals spatulate, somewhat shorter than the sepals, the claw whitish or greenish and more or less suffused with red-violet: the blade longer than the claw, mainly blue: style-branches light pink-

ish-violet, becoming paler near the base, the wings whitish; appendages violet, deeply lacerate-toothed near the apex: capsule ellipsoid or oval, 5-9 cm. long, bluntly 6-sided.—Swamps, often calcareous, coastal regions of the Apalachicola delta, N Fla.—Spr.

75. *I. elephantina* Small. Flower-stalk erect, rigid: sepals 9-10 cm. long, recurved, within, the claw greenish, the blade longer than the claw, oval or nearly so, ochroleucous, especially near the center, white near the edges, the crest lemon, extending half way up the blade, accompanied by lateral veins of yellowish-green which radiate out into the blade: without, greenish near the base and ochroleucous beyond, the claw pale-green: petals spatulate, shorter than the sepals, the claw narrowly cuneate, yellowish-green, the margins and wings white; appendages rather sharply toothed, white: anther-tips included: capsule not seen.—Lake margins, marshes, bayous, and ditches, S La.—Spr.

76. *I. venulosa* Alexander. Flower-stalk erect, strict and rigid: sepals recurved, within, the claw cream, veined yellow-green below, its wings scarcely veined, flushed lavender near blade, the blade orchid-color, prominently veined darker, and heavily streaked and spotted with white on the lower two-thirds, the crest bright-yellow, brown-purple tipped, all the veins of the blade with a basal tip of brown-purple at the crest zone; without, all overlain rich cream, the claw light yellow-green towards the base: petals lavender-pink, the lower margins cream-flushed, the claw-channel brownish; without, the claw channel silvery-yellow: style-branches pale old-rose, the wings pale orange-cream, the keel dull orange-cream; appendages orchid, sharply-toothed, flushed greenish-cream at base beneath: anther-tips exerted: capsule not seen.—Swamps and marshes, S La.—Spr.

77. *I. giganteaerulea* Small. Flower-stalk erect, strict, stout: flowers strongly musk-scented: sepals 9.5-11.5 cm. long, recurved-spreading, the claw suffused with green, except the often white or greenish-margins, the blade oval to oval-orbicular, of a blue or violet-blue ground-color, with white veinings often extending nearly or quite to the margins arising from the whitish zone about the yellow crest: petals broadly spatulate, somewhat shorter than the sepals, the claw cuneate, white or greenish-white at the base, with violet-tinged margins and violet-lines, the blade blue-violet and violet-veined: style-branches dull light-violet, becoming greenish towards base, the wings pale or greenish margined; appendages light blue-violet, deeply sharp-toothed: anthers included: capsule ellipsoid or ovoid-ellipsoid, 6.5-10 cm. long, with 6 rounded ridges.—Marshes, meadows, ditches, and pools, S La.—In abundance, within its range, this species resembles *I. savannarum* of Florida. There are numerous color forms; dark violet, violet-blue, blue-violet, lavender, lilac, and white as well as variously streaked forms—the crest also varies from greenish white to deep orange.

78. *I. paludicola* Alexander. Flower-stalk erect, rigid and strict: sepals recurved or recurved-spreading, rarely horizontally spreading, 8-10 cm. long, the claw greenish-white, veined yellow-green, the blade various shades of violet, usually light blue-violet, veined darker mostly around and near the crest zone, the crest bright-yellow, the median ridge extending beyond the zone and outlined with black-violet, 2-4 laterals of dull lemon radiate upwards from the claw, one or two of them usually terminating in white blotches, the first one, or rarely the second also with a bright yellow blotch at the exact junction point of the blade and sepal: petals colored like the sepal blade with a red-violet channel, which color is suffused over the entire claw-portion, base of claw creamy white: style-branches dark red-violet, the wing-margins creamy brown-orange; appendages light-violet, lacerate-toothed: anther-tips included: capsule not seen.—Marshes, swamps, bayou-banks, and ditches, S La.—Spr.

79. *I. Wherryana* Small. Flower-stalk erect, stiff, strict: sepals 9–10 cm. long, the claw suffused with green, the blade ovate, light-violet, the crest orange-yellow, surrounded by a radial zone of pale-yellow paling to whitish-yellow and lavender where it merges with the blade-color, all prominently veined red-violet: petals spatulate, much shorter than the sepals, the short claw greenish at the base, suffused with light red-violet above, the blade pale-violet and darker lined: style-branches light-violet, the wings margined with lavender-pink; appendages flushed greenish beneath, sharply toothed: anther-tips included: capsule not seen.—Swamps, marshes, and ditches, S La.—Spr.

80. *I. citricristata* Small. Flower-stalk erect, stiff, strict: sepals 8–10 cm. long, recurved, the claw suffused with yellow-green, but pale on the edges, and lined in the middle, the blade oval-obovate, slightly longer than the claw, of a violet-blue ground-color, the crest lemon, surrounded by a pale-lemon zone, with some whitish or lavender flecks where it merges with the blade-color: petals cuneate-spatulate, much shorter than the sepals, the claw often yellow-green at the very base, whitish above and with red-violet lines, the blade violet-blue, except the suffusion of red-purple extending up from the claw: style-branches violet, the wings pale-margined; appendages violet, deeply and sharply lacerate-toothed: anther-tips included: capsule not seen.—Marshes and bayou-borders, S La.—Spr.—This species and *I. giganteaerulea* are the two most abundant and widespread of the Louisiana group, often forming great fields of nearly solid growth. There are albinos of both species.

81. *I. alticristata* Small. Flower-stalk erect, strict and rigid: sepals recurved, within, the claw cream, veined greenish-yellow, the midrib rich-yellow above middle, cream below, the wings heavily flecked violet on upper half, the blade dark-violet, the crest a very prominent, high ridge, rich-yellow, extending halfway down the blade, the laterals terminating in blotches and flecks of light-yellow, each outlined with black-violet, the median terminating in a ridge of deep-violet, the crest-zone flecked all over with white; outside, the margin violet, otherwise overlain greenish-cream, the claw pale yellow-green, cream-margined: petals dark-violet, with a band of deep violet down channel, the wings whitish-margined towards the claw, the claw-channel deep red-violet; without, a radial marking of silvery-cream on lower half with a central band of slate-green, the claw pale yellow-green: style-branches dark, smoky purple, the wings, keel, and body becoming white on lower portion; appendages dull slaty-violet, sparsely deep-toothed at apex, very shallowly toothed otherwise, flushed creamy at base beneath: anther-tips equalling the stigmas: capsule not seen.—Swamps and marshes, S La.—Spr.

82. *I. aurilinea* Alexander. Flower-stalk erect, rigid and strict: sepals recurved-spreading, within, the claw apparently yellow, but so heavily streaked, flushed, and spotted with brown-rose, that the yellow is only visible at base, the midrib yellow, the blade brown-rose around and towards the margin, the inner portion so heavily flushed brownish-orange as to blot out ground-color, the crest is dark-yellow, the median brown tipped, lateral flushings of light yellow and great masses of brown spots are all over the crest zone and upper claw; without, dull brownish red-purple overlain sulphur on crest zone and claw: petals light, smoky old-rose, the lower channel orange-brown streaked, the blade covered with pale-orange flushings: style-branches with a yellowish ground color, heavily flush-streaked dull, brownish-rose with a heavy underflushing of bright-yellow on upper half, and an underflushing of pale-green on lower half; appendages scarcely shallow-toothed, flushed orange beneath: anther-tips included: capsule not seen.—Swamps, marshes, ditches, and bayou-banks, S La.—Spr.

83. *I. fluviatilis* Small. Flower-stalk erect, strict and rigid: sepals recurved, within, the claw pale whitish-green, veined yellow-green, the blade

nearly rotund, frilly, violet, radially veined darker all around crest, the crest median orange-yellow, three laterals at base of blade only making a broad yellow blotch, which color does not extend down into the claw, all around this yellow blotch is a zone of lavender fleckings all over-dotted red-violet; without, dull light-violet, overlain greenish-lavender on crest zone, the claw light-green: petals slightly lighter than sepals, flushed white in the claw, and vein-flushed light red-violet over the white: style-branches dull, smoky red-violet, the keel light green on the lower third, the body light-green towards base, the wings white becoming flushed red-violet above except on margin; appendages red-violet, lacerate-toothed: anther-tips barely included: capsule not seen.—Ditches, bayou-banks, swamps, and marshes, S La.—Spr.

**84. *I. parvicaerulea* Alexander.** Flower-stalk erect, slender, rigid: hypanthium covering the ovary 6-angled: sepals spreading, the blade and claw of about equal length, within, the claw greenish-cream, yellow-green veined, its wings cream, veined lilac-brown, the blade light blue-violet, the crest dull-lemon, tipped purplish-brown, the crest-zone veined purplish-brown; without, pale bluish-violet flushed whitish, the crest and claw yellow-green: petals pale violet-blue, lavender flushed towards blade base and veined red-violet: style-branches light blue-violet above, becoming light red-violet below, the wings white below; appendages light violet-blue, sharply toothed: anther-tips barely included: capsule not seen.—Swamps and marshes, S La.—Spr.

**85. *I. hexagona* Walt.** Flower-stalk rigid, erect, 8-12 dm. tall: flowers slightly fragrant: hypanthium covering the ovary sharply 6-angled: sepals 8-11 cm. long, spreading or recurved spreading, the claw suffused with green, the blade oval or obovate, violet, often of a deep-violet ground-color, except for the white crest-zone at the base and the prominent yellow crest: petals spatulate, slightly shorter than the sepals, the claw suffused with green at the base, the blade lined in the middle at the base and with whitish edges, deep-violet above: style-branches green below, becoming gradually flushed lavender and then light-violet towards the apex, the wings and keel greenish; appendages violet deeply lacerate-toothed towards the apex: capsule ovoid or oval-ovoid, 3-6 cm. long, each lobe with 2 lateral sharp ridges, the body hence 6-angled.—Swamps, ditches, and stream-beds, Coastal Plain, N Fla. to S. C.—Late spring-early sum.—A form is known in Florida with the sepal-crest yellow-green. The firmness of the yellowish-green foliage extends to the flowers. A pure white albino is known.

**86. *I. alabamensis* Small.** Flower-stalk rigid, erect, slightly zigzag: sepals spreading or recurved-spreading, about 9 cm. long, the claw pale yellow-green, veined olive, the veins of the wings pencilled with dull red-violet, the midrib olive, the blade violet, with a deeper zone around the crest, the crest deep-yellow, a narrow lateral zone of yellow around it becoming pale-lemon towards the blade-margin, all giving way to the blade color in a series of dots and short streaks of violet: petals violet-blue, flush-streaked red-violet, the lower portion of blade red-violet at center, becoming red-lilac, the veins also red-lilac on down into the claw, claw-wings pinkish-lavender, flushed violet, becoming pale-green towards base: style-branches dull red-violet, the keel slightly paler, the wings white; appendages light violet, large-toothed: capsule not seen.—Swamps, ditches, and marshes, W central Ala.—Spr.

**87. *I. rivularis* Small.** Flowers-stalks 2.5-6 dm. tall, rigid, sometimes slightly zigzag: flowers slightly fragrant: sepals 6.5-8 cm. long, arching, spreading, or recurved-spreading, the claw suffused with green, the blade oval, violet-blue, except the greenish blotch at the base, the green crest, and the accompanying white flecks: petals spatulate, much shorter than the sepals, the claw greenish at the base, the blade longer than the claw, violet-blue: capsule oval, varying to somewhat ovoid or obovoid, 3.5-7 cm. long.—Streams and swamps, Coastal Plain, N E Fla. and S E Ga.—Spr.

88. *I. foliosa* Mackenzie & Bush. Flower-stalk prostrate, 3-5 dm. long, zigzag, the internodes rather unequal, some of them very short: flowers two together in the terminal involucre and usually single in the several greatly elongate lateral involucres, short-pedicelled: hypanthium covering the ovary prominently 6-angled: sepals 8-10 cm. long, spreading, the claw suffused with yellowish-green, the blade ovate, mainly of a clear-violet or deep-blue ground-color, with white flecks at the base on either side of a yellowish blotch and the yellow crest: petals spatulate, slightly shorter than the sepals, the claw suffused and lined with green, the blade longer than the claw, slightly paler than the sepal-blade and more or less whitish or green-tinged at the base: capsule ovoid or ellipsoid-ovoid, 3-5 cm. long, each lobe with 2 lateral sharp ridges, hence 6-angled.—Open woods and prairies, Coastal Plain and adj. provinces, Ark. to Kans., Ohio, and Ky.—Spr.—The leaves are prostrate and the flower-stalk usually lies on the ground among them or on them. The deep-green, flaccid leaves and the zigzag flower-stalk are in striking contrast to those parts of the next-following species with which it has sometimes been confused.

89. *I. brevipes* Small. Flower-stalk suberect, 1-1.5 dm. long, very zigzag, often flowering from the very base, the internodes short, flowers two together in the terminal involucre and usually one in the two to four lateral involucres: hypanthium covering the ovary sharply 6-angled: sepals spreading, 7-8 cm. long, the claw greenish-cream, its midrib yellow-green, its wings flushed rosy-lavender and veined smoky lilac, the blade ovate, with a truncate base, violet or violet-blue, scarcely veined but darker around crest, the crest yellow, the white lateral markings not exceeding the median: petals light-violet to light violet-blue, becoming paler towards the base, scarcely clawed: style-branches red-violet; appendages violet or blue-violet, shallowly toothed, nearly lanceolate: capsule ovoid, 2-3 cm. long, each lobe with 2 lateral sharp ridges, the capsule hence 6-angled.—Swamps, marshes, ditches, and stream banks, S La.—Spr.—This iris is the lowest growing and most nearly blue-flowered species among the gulf states irises yet discovered.

90. *I. mississippiensis* Alexander. Flower-stalk nearly erect, 1-2 dm. long, very zigzag, flowering from near the base, but usually with a basal leaf-like bract below the inflorescence, the internodes short, flowers 2 together in the terminal involucre and usually 1 in the two to four lateral involucres: hypanthium covering the ovary sharply 6-angled: sepals recurved or recurved-spreading, 6-7 cm. long, the claw white, the veins brownish-olive, the blade lavender to lavender-violet (white in albinos), suborbicular to orbicular-ovate, its base tapering, the crest yellow, often with a small lateral blotch of yellow, but all surrounded by a radial zone of white interveined with pale violet, extending well out nearly to the middle of the blade: petals lavender or lavender-violet, the basal third and half the channel white, scarcely clawed; capsule not seen.—Swamps, marshes, ditches, and stream banks, S cent. La.—Late spr.—This iris is a very free flowering species, but the flowers are half concealed by the taller leaves. Its range is uncertain and it may possibly extend as far east as Ala. A pure white form is known.

91. *I. prismatica* Pursh. Flower-stalk erect, 3-6 dm. tall: flowers borne, usually in pairs in the terminal involucre: hypanthium covering the ovary sharply 3-angled: sepals mainly of a blue ground-color, 3.5-5 cm. long, recurved-spreading, the claw more or less suffused with yellowish-green and lined with magenta near the base, the blade obovate or oval-obovate, with a white back-ground in the middle and yellow-tinged at the base, and veined and flecked with blue which merges about the edges: petals somewhat shorter than the sepals, the claw inrolled, the blade blue: capsule erect, narrowly prismatic-cylindric, 3-5 cm. long, 3-angled, shortly 3-valved at the apex. [*I. virginica* Pursh, not L.]—Marshes, swamps, and ditches, often in acid soils, Coastal Plain and occasionally Piedmont and Blue Ridge, Ga. to N. S.—Spr.—sum.—As

indicated by its rootstocks and its capsule this iris falls in a group of its own within our range.

92. *I. versicolor* L. Flower-stalk erect, 3-6 dm. tall, often slightly zigzag: flowers scarcely fragrant: hypanthium covering the ovary obtusely 3-angled: sepals 4-6 cm. long, recurved-spreading, the claw suffused with yellowish-green, the blade obovate to suborbicular, of a violet or purple ground-color, except the yellowish-green blotch at the base and surrounding whitish zone: petals very much shorter than the sepals, with a short yellowish-green claw and a violet or purple blade: capsule prismatic-cylindric, or ellipsoid in small specimens, mostly 3.5-5.5 cm. long, somewhat 3-sided.—Marshes, swamps, meadows, and stream-banks, various provinces, Ga. to Miss., Man., Ont., and Newf.—Spr.—sum.—Apparently the most widespread of our species, the more northern plant usually referred here, however, may represent a distinct species.

93. *I. Shrevei* Small. Flower-stalk erect, up to 1 m. tall, rigid: flowers fragrant: hypanthium covering the ovary bluntly 3-angled: sepals 5-7 cm. long, recurved-spreading, the claw suffused with greenish-yellow, the blade oval or orbicular-oval, of a violet or purple ground-color, except the yellow-green blotch at the base: petals spatulate, somewhat shorter than the sepals, with a long claw suffused with green and an oval or elliptic, violet or purple blade often with a yellowish-green midrib in the base: capsule prismatic-cylindric, 7-11 cm. long, 3-sided.—Meadows, marshes, and swamps, usually in non-acid soils, Coastal Plain and adj. provinces, Ala. (and perhaps further east in the Gulf States) to La., Okla., and Ill.—Spr.—This iris seems to replace *I. versicolor* in the Mississippi Valley. Its perianth indicates relationship to *I. virginica*, while its fruit resembles that of *I. versicolor*, although relatively much longer. A form with rose-lilac flowers has been found in Autauga Co., Ala.

94. *I. virginica* L. Flower-stalk 3-6 dm. tall, rigid, often somewhat zigzag: flowers slightly fragrant: hypanthium covering the ovary bluntly 3-angled: sepals 6-7.5 cm. long, recurved-spreading, the claw suffused with yellowish-green or bronze, the blade obovate to elliptic or oval, mainly of a light-violet to lavender or whitish ground-color, with a yellow or orange-yellow blotch at the base: petals spatulate, somewhat shorter than the sepals, with a yellowish-green or bronze claw and an obovate blade with the ground-color of the sepal-blade: capsule ellipsoid to ovoid-ellipsoid, 4-7 cm. long, somewhat 3-angled. [*I. carolina* Radius. *I. caroliniana* S. Wats. *I. georgiana* Britton]—Swamps, marshes, meadows, and river-shores, Coastal Plain and adj. provinces, N. Fla. to Tex., and Del.—Spr.—This species has recently been considered to represent the Linnaean *I. virginica*, but specimens growing at Gloucester, Va., where the original specimens of *I. virginica* may have been collected, seem to represent *I. versicolor*. This species replaces *I. versicolor*, in the southeastern Coastal Plain, and is the most widely distributed iris there. The capsule resembles that of the Old World *I. Pseudacorus* when it does dehisce, in its recurring valves with shiny inner coat. There is greater variation in color in *I. carolina* than in any of our species. The perianth shows shades varying from dark-violet to pale-pinkish, and a pure white albino has been found in Florida.

95. *I. tripetala* Walt. Flower-stalk 2-4 dm. tall, rigid, slender, often slightly zigzag: flowers usually solitary in the terminal involucre and an additional one sometimes in the axil of the narrow bract, fragrant: hypanthium surrounding the ovary bluntly 3-angled: sepals 6-9 cm. long, recurved-spreading or drooping, the claw margined with violet and pale in the middle, the blade suborbicular or oval, with a violet ground-color, or white, except the yellow blotch at the base: petals involute, much shorter than the claw of the sepal, acute or acuminate, violet above the greenish base: capsule ellipsoid, 2.5-3.5 cm. long, somewhat 3-angled.—Low pinelands, bays, and acid swamps, Coastal Plain, N. Fla. to N. C.—Late spr.—Like *I. prismatica*, this species is in a group by itself in our range. It, too, is slender throughout, and the cord-like rootstocks are peculiar. The plants from the gulf coast have larger flowers and

longer style-appendages than those from the Atlantic coastal region. A pure white albino has been found.

96. **I. Pseudacorus** L. Flower-stalk 6–10 dm. tall, but sometimes rather weak, and slightly decumbent: flowers slightly fragrant: hypanthium covering the ovary bluntly 3-angled: sepals 5–7.5 cm. long, arching, orbicular-ovate in outline, the claw with a yellow ground-color streaked and flecked with brown, the blade suborbicular, broadly oval, or broadly ovate, with the yellow ground-color faintly lined and flecked with brown at the base or the brown sometimes exaggerated into a blotch: petals somewhat pandurate, 1.5–2.5 cm. long, yellow: capsule cylindric-prismatic, or somewhat ellipsoid, 5–8.5 cm. long, bluntly 3-angled, the 3 valves spreading or recurved-spreading at maturity.—Stream-banks, woods, and waste-places, Ga. to S Can. Nat. of the Old World.—Spr.—The yellow flowers of this immigrant are a welcome addition to our iris flora. The color varies from clear canary yellow to deep cream-color, but always with the irregular brown-black outline to the crest region.

7. **HERBERTIA** Sweet. Scapose herbs with deep-seated bulbs. Leaves with sheathing bases and plicate narrow blades. Scape erect, more or less sheathed by the leaf-bases. Hypanthium-tube very short or wanting. Flower erect. Sepals 3, spreading, crestless. Petals very much smaller than the sepals, spreading. Anthers narrow, lying against the style-branches, curling in at anthesis. Style-branches spreading, each with 2 subulate branches which are toothed at the apex. Capsule erect, thin-walled.

1. **H. caerulea** Herb. Bulb ovoid, brown-coated: leaves 1–3 dm. tall; blades narrowly linear: scape slender, usually simple, 1–3 dm. tall: spathe usually 1- or 2-flowered: flowers long-stalked: sepals cuneate-ovate, 3–4 cm. long, acute, pale-violet or wisteria-color, with a violet band outlining the white base which is violet spotted: petals 1–1.5 cm. long, short-acuminate, the upper part light-violet, the lower more or less channeled, black-violet, and white spotted near the base: capsule erect, cylindric or somewhat clavate, 2–3 cm. long.—Prairies and marshes, Coastal Plain, S La. to Tex.—Spr.

Two species of *Gladiolus* have been found growing as escapes in southern Louisiana west of the Mississippi River. They may be expected east of the river. The genus differs from other members of the iris family in the one-sided inflorescence and the curved and oblique perianth. *G. segetum* Ker-Gawl, native of the Mediterranean region has a rose-magenta perianth; the sepals and petals are clawed, the three upper blades each have a median whitish zone, the three lower blades each with a whitish median line bordered by crimson. *G. hortulanus* Bailey, native of southern Africa, has a scarlet to vermilion perianth; the sepals have a red-brown median line and minute brownish specks near the base, the petals have a median brown line and patches of minute specks and are often minutely pointed, the three lower blades of the perianth are yellow on the basal two-thirds and only scarlet-bordered.

FAMILY 4. **HAEMODORACEAE** — BLOODWORT FAMILY

Perennial caulescent herbs. Leaves alternate, often mainly basal: blades narrow. Flowers perfect, in terminal clusters. Calyx of 3 sepals. Corolla of 3 petals, persistent. Androecium of 3 stamens opposite the petals. Gynoecium of 3 united carpels. Ovary inferior, 3-celled, or rarely 1-celled. Styles united. Fruit a loculicidally 3-valved capsule.—Nine genera and 35 species, most abundant in Africa and Australia.

Ovary wholly inferior: stamens 3: style deciduous.  
Ovary half-inferior: stamens 6: style persistent.

1. **GYROTHECA**.
2. **LOPHIOLA**.

1. **GYROTHECA** Salisb. Herbs with colored rootstocks. Leaves equitant. Flowers in a terminal cymose corymb. Perianth pubescent without, yellow within. Capsule crowned by the persistent perianth. [*Lachnanthes* Ell.]—One species.

1. **G. tinctoria** (Walt.) Salisb. Rootstock elongate. Stem 3–12 dm. tall, pubescent above: leaves shorter than the stem, the cauline gradually reduced: sepals and petals nearly linear, the latter 10–12 mm. long: capsule 5–6 mm. in diameter.—(RED-ROOT. PAINT-ROOT. DYE-ROOT.)—Bogs and wet pinelands, often acid, Coastal Plain and New England Coast, Fla. to La. and Mass.—(W. I.)—Spr.-fall.—Resembles *Lophiola aurea*, but coarser and more weedy, and the pubescence of the perianth is tawny.

2. **LOPHIOLA** Ker. Herbs with rootstocks and leafy stems. Basal leaves equitant, upright. Flowers in a dichotomous cyme. Perianth yellow within: lobes much longer than the tube. Filaments adnate to the base of the perianth.—The following is, apparently, the only representative of the genus, although a somewhat divergent form occurs further northward.

1. **L. aurea** Ker. Stem 5–8 dm. tall, woolly above: leaf-blades linear, shorter than the stem: perianth yellow, pubescent without; lobes linear-lanceolate, 4–5 mm. long: capsule-body about 2 mm. long, long-beaked.—(GOLD-CREST.)—Moist pinelands and acid bogs, Coastal Plain, Fla. to Miss. and N. C.; also N. J.—Spr.-sum.—The golden perianths showing through glistening white wool, form a striking inflorescence.

ORDER 11. **SCITAMINALES**

Large, commonly perennial, herbs with rootstocks or tubers. Leaves alternate, sometimes all basal: blades relatively large, sometimes very large: petioles sheathing at the base. Flowers very irregular. Perianth white or

bright-colored. Androecium very irregular. Gynoecium compound. Ovary inferior. Fruit a capsule, a utricle, or a berry. Endosperm present.

Polleniferous stamens 5 or 6 in each flower.

Fam. 1. MUSACEAE.

Polleniferous stamens 1 in each flower.

Ovary 3-celled, all 3 carpels fructiferous: ovules numerous in each cavity of the ovary: fruit capsular: embryo straight.

Fam. 2. CANNACEAE.

Sepals distinct: anthers 1-celled.

Fam. 3. ALPINIACEAE.

Sepals partially united: anthers 2-celled.

Ovary 1-celled, or 3-celled, but 2 of the carpels abortive: ovules solitary in each cavity of the ovary: fruit utricular: embryo hooked.

Fam. 4. MARANTACEAE.

### FAMILY 1. MUSACEAE — BANANA FAMILY

Caulescent, usually large herbs, or trees. Leaves spiral or distichous: blades usually very large. Flowers perfect or somewhat monoecious. Inflorescence conspicuously bracted. Calyx of 3 distinct sepals, or united into a spathe-like organ. Corolla of 3 distinct petals, or of partially united petals, sometimes partially adnate to the calyx. Androecium of 5 or 6 polleniferous stamens. Gynoecium of 3 united carpels. Fruit baccate or capsular.—Six genera and 70 species of warm regions.

1. *MUSA* L. Tree-like herbs, the stems sheathed with the thick leaf-bases. Leaves with large prominently feather-veined blades. Inflorescence drooping, with large bracts. Perianth white or pink. Petals shorter than the sepals, 2 of them partly adnate to the calyx-tube, the other free, and often snort, with a bent tip. Berry elongate.—About 20 species, of the warmer parts of the Old World. There are numerous cultivated varieties.—BANANA.—The fruits of several species are foods and fiber is also obtained from some species.

Leaf-blades long-petioled: free petals over  $\frac{1}{2}$  as long as the calyx.

1. *M. sapientum*.

Leaf-blades sessile or nearly so: free petals less than  $\frac{1}{2}$  as long as the calyx.

2. *M. Cavendishii*.

1. *M. sapientum* L. Plant 6–10 m. tall: leaf-blades broadly elliptic, 1.5–2.5 m. long, rounded or cordate at the base: panicle drooping, 1.5–2 m. long: bracts purplish: calyx about 4 cm. long, the apical appendages minute or obsolete: berry long-elliptic, 8–15 cm. long, bright-yellow, the pulp sweet.—(COMMON-BANANA.)—Hammocks, S pen. Fla. and S La. Nat. of E. I., and cult.—All year.

2. *M. Cavendishii* Lamb. Plant mostly 1–2.5 m. tall: leaf-blades broadly elliptic mostly about 1 m. long: calyx 3–3.5 cm. long, the appendages minute: tip of the free petal nearly erect: berry mostly 10–15 cm. long, yellowish, the pulp sweet.—(DWARF-BANANA.)—Hammocks and swampy grounds, S pen. Fla. and the Keys. Nat. of China, and cult.—All year.

### FAMILY 2. CANNACEAE — CANNA FAMILY

Caulescent herbs. Flowers perfect. Calyx of 3 erect sepals. Corolla of 3 partially united petals. Androecium more or less adnate to the

corolla: one filament anther-bearing, the others petaloid. Ovary 3-celled, the placentae parietal. Style petaloid, the stigma marginal. One genus.

1. **CANNA** L. Large or tall herbs, with relatively large leaves. Flowers mostly showy, borne in terminal thyrsoid panicles. Perianth variously colored.—About 40 species, mostly American.—INDIAN-SHOTS.—Some species and many hybrids are widely cultivated.

Perianth yellow: sepals 2.5–3 cm. long: perianth-tube much longer than the sepals: lip much dilated.

Perianth red: sepals 1–1.5 cm. long: perianth-tube shorter than the sepals: lip linear-spatulate.

1. *C. flaccida*.

2. *C. indica*.

1. **C. flaccida** Salisb. Leaf-blades 2.5–5.5 dm. long: flowers very showy: perianth mainly yellow: sepals 2.5–3 cm. long: corolla-lobes 5–6.5 cm. long, about as long as the tube: staminodia dilated, wavy-margined: capsule 4–6 cm. long.—(GOLDEN-CANNA. BANDANA OF THE EVERGLADES.)—Swamps and marshes. Coastal Plain, Fla. to S. C.—Spr.—fall.

2. **C. indica** L. Leaf-blades 2–4 dm. long: flowers not showy: perianth mainly red: sepals much longer than the perianth-tube: corolla-lobes 3–3.5 cm. long, much longer than the tube: staminodia linear or narrowly spatulate, flat: capsule 2.5–3.5 cm. long.—Low grounds, Coastal Plain, Fla. to Tex. Nat. of E. I., and cult.—Sum.—fall.

### FAMILY 3. ALPINIACEAE — GINGER FAMILY

Caulесcent, sometimes large, herbs mostly with horizontal rootstocks. Flowers mostly perfect, borne in spike-like, sometimes cone-like, thyrsoid, or open panicles. Calyx of 3 partially united sepals, sometimes spathe-like. Corolla of 3 petals partially united into a tube. Fruit capsular.—About 25 genera and 200 species, mostly of tropical distribution.

1. **LANGUAS** Koen. Herbs with horizontal rootstocks and erect stems. Leaves erect. Panicle thyrsoid, terminating a leafy stem, with often imbricate bracts. Calyx 3-lobed. Petals 3, the upper one larger than the others. Lip large and showy. Staminodia minute or wanting. Capsule sometimes baccate.—About 40 species of the warm regions of the Old World.

1. **L. speciosa** (Wendl.) Small. Plant 1–4 m. tall, the stem sheathed: leaf-blades elliptic to elliptic-lanceolate, 1.5–4 dm. long: flower-stalks drooping from sheaths: calyx 18–23 mm. long: corolla white, tinged with magenta: lip 5–6 cm. long, crisped, yellow, variegated with brown and red.—(SHELL-FLOWER.)—

Hammocks, S pen. Fla. Nat. of E. I. and cult.—(W. I.)—All year.—A very vigorous garden plant. Aggressive when established. It resembles its relative the true ginger plant in habit.

**Hedychium coronatum** Koenig, GINGER-LILY or BUTTERFLY-LILY, native of the East Indies, is a tall evergreen herb with large lanceolate or elliptic-lanceolate leaf-blades, clavate inflorescence, and large white flowers, the lateral staminodia petal-like, thus differing from *Languas*, has become naturalized in marshes in eastern Ga. and along the Mississippi River below New Orleans, La.

#### FAMILY 4. MARANTACEAE — ARROWROOT FAMILY

Scapose or caulescent herbs. Flowers perfect or sometimes polygamous. Calyx of 3 distinct or partially united sepals. Corolla of 3 distinct or partially united petals. Androecium partially adnate to the corolla: one filament anther-bearing, the others petaloid. Ovary 1-3-celled. Style thick, the stigma 2-lipped. Fruit utricular, smooth.—About 12 genera and 160 species, mostly tropical.

Petals partially united: lateral staminodia 2.

Petals distinct or nearly so: lateral staminodium 1.

1. MARANTA.

2. THALIA.

1. **MARANTA** L. Relatively slender caulescent herbs, not white-powdery. Flowers solitary or few in panicles. Calyx of narrow sepals. Corolla-tube cylindric. Perianth and androecium mainly white.—About 15 species, all of tropical America.

1. **M. arundinacea** L. Stem 1-2 m. tall, from scaly rootstocks: leaf-blades lanceolate to ovate-lanceolate, 8-25 cm. long: sepals 10-12 mm. long: corolla white, about 2 cm. long: staminodia surpassing the corolla: fruit about 1 cm. long.—(ARROWROOT.)—Hammocks and moist soil, S pen. Fla. Nat. of E. I., and cult.—(*W.I.*)—All year.—The tuberous rootstocks are the source of true arrowroot starch, although this term is often applied also to zamia starch.

2. **THALIA** L. Relatively stout scapose herbs, white-powdery, at least above. Flowers rather numerous, in panicles. Calyx minute. Corolla-tube wanting or obsolete. Perianth and androecium mainly purple, blue, or violet.—About 7 species, all American.—Spr.—fall.

Flowers closely crowded on the rachis: clusters of bracts and bractlets ovoid: utricle subglobose.

Flowers separated on the rachis: clusters of bracts and bractlets narrowly conic: utricle oval.

1. *T. dealbata*.

2. *T. geniculata*.

1. **T. dealbata** Roscoe. Plant 1-2 m. tall: leaf-blades ovate, ovate-elliptic, or elliptic-lanceolate, 2-5 dm. long, acute or acuminate at the apex, rounded or cordate at the base: panicle narrowly and stiffly branched, the zigzag internodes short (2-3 mm.), stout: spikes erect or ascending: bracts broad at the apex, the longer ones 1-1.5 cm. long: perianth purple: petals 7-8 mm. long: larger staminodium about 1.5 cm. long: utricle subglobose, 10-13 mm. in diameter. [*T. barbata* Small.]—(POWDERY-THALIA.)—Ponds and swamps, Coastal Plain, Fla. to Tex., Mo., and S. C.

2. *T. geniculata* L. Plant 2-3.5 m. tall: leaf-blades lanceolate to broadly lanceolate, 2.5-8 dm. long, acuminate at the apex, rounded or truncate at the base: panicle widely and loosely branched, the internodes long (7-11 mm.), slender: spikes nodding or spreading: bracts narrowed at the apex, the larger ones 2-2.5 cm. long: perianth purple: petals 8-9 mm. long: larger staminodium about 2 cm. long: utricle oval, 6-7 mm. in diameter. [*T. divaricata* Chapm.]—(LILIES.)—Pools, ponds, marshes, swamps, and river-shores, Fla.—(*W. I.*)—Our largest-leaved native herb. In colonies usually conspicuous, but not attractive. The tall scapes, irregularly branched, stand at various angles and the large leaf-blades are usually weather-worn.

## ORDER 12. ORCHIDALES — ORCHIDAL ORDER

Terrestrial, aquatic or epiphytic herbs. Leaves usually fleshy, sometimes scale-like. Flowers mostly perfect and complete, very irregular, except in BURMANNIACEAE. Calyx of 3 sepals. Corolla of 3 petals. Gynoeceium compound. Ovary inferior. Seeds numerous. Endosperm wanting.

Flowers regular: stamens and pistil distinct.

Fam. 1. BURMANNIACEAE.

Flowers irregular: stamens and pistil united into a column.

Fam. 2. ORCHIDACEAE.

### FAMILY 1. BURMANNIACEAE — BURMANNIA FAMILY

Slight or relatively small herbs. Leaves mainly basal, those on the stem scale-like. Flowers regular. Sepals and petals partially united. Androeceium of 3 to 6 stamens: filaments adnate to the perianth-tube. Gynoeceium 3-carpellary. Fruit capsular, sometimes angled or winged.—Ten genera and about 60 species, mostly in the tropics.

Hypanthium 3-angled or 3-winged: ovary 3-celled: capsule 3-valved from the apex or irregularly rupturing. 1. BURMANNIA.

Hypanthium terete: ovary 1-celled: capsule 3-valved from the base. 2. APTERIA.

1. *BURMANNIA* L. Annual herbs. Flowers spreading or erect, short-pedicelled, white or blue. Filaments unappendaged; connective prolonged beyond anther-sacs.—Twenty species, in the tropics of the Old World and the New.—Spr.—fall, or all year S.

Flowers 1-few, usually 2, in a terminal raceme: hypanthium broadly 3-winged.

Flowers several in a terminal cluster: hypanthium 3-angled.

1. *B. biflora*.

2. *B. capitata*.

1. *B. biflora* L. Stem 5-15 cm. tall: leaf-scales 1-3 mm. long: flowers solitary at the top of the stem or 2-few together: corolla-lobes narrow: capsule 4-5 mm. long.—Low pinelands, often in acid peat, Coastal Plain, Fla. to La. and Va.

2. *B. capitata* (Walt.) Mart. Stem 5-20 cm. tall: leaf-scales 1-5 mm. long: flowers several or many in a terminal cluster: corolla-lobes obsolete: capsule 2-3 mm. long.—Low pinelands, Coastal Plain, Fla. to La. and N. C.—(*W. I.*, *S. A.*)

2. **APTERIA** Nutt. Perennial herbs. Flowers nodding, long-pedicelled, white or purple. Filaments with wing-like appendages: connective not prolonged beyond the anther-sacs.—Three species, the following and two in tropical America.

1. **A. aphylla** (Nutt.) Barnhart. Stem 5–20 cm. long, mostly simple: leaf-scales 1–2 mm. long: flowers 10–15 mm. long: capsule 5–8 mm. long. [*A. setacea* Nutt.] —(NODDING-NIXIE.)—Moist shaded places and acid, swampy woods, Coastal Plain, Fla. to La. and Ga.

## FAMILY 2. ORCHIDACEAE — ORCHID FAMILY

Perennial herbs, commonly succulent, with tuberous or fibrous roots, corms, bulbs or elongate rootstocks. Stems or scapes usually simple, at least below the inflorescence. Leaves basal or cauline, often reduced to scales, mostly sheathing at the base. Flowers perfect, irregular, solitary or disposed in a simple or compound inflorescence. Perianth inconspicuous or showy, usually of 2 series. Sepals 3, (or 2) nearly alike. Petals 3, of 2 kinds, the 2 lateral ("petals") similar, and the middle one ("lip") usually very different from the other petals, sometimes prolonged below into a spur, often inferior by the torsion of the pedicel or ovary. Androecium irregular, of one or more stamens, adnate to the style, forming an asymmetrical column. Anther 1, or rarely 2 anthers, often 2-celled, containing 2–8 waxy or powdery pollinia; these pollen-masses usually stalked, united by elastic threads and often attached at the base to a viscid gland. Gynoecium of 3 united carpels. Ovary inferior, 1-celled, often twisted. Style commonly terminating in a beak at the base of the anther, or between its sacs. Stigma a viscid surface facing the lip beneath the beak or between the anther-sacs. Fruit a 3-valved capsule. Seeds numerous, very small.—About 450 genera and over 5,000 species of wide geographic distribution, but most abundant in the tropics, where many species are epiphytes.

Polleniferous anthers 2, borne laterally on the column: lip a large inflated sac or pouch, without an apical blade—DIANDRAE.

Tribe I. CYPRIPEDIEAE.

Polleniferous anther solitary: lip simple or complex, if saccate bearing an apical blade, or if merely saccate and bladeless, then forming the upper member of the perianth—MONANDRAE.

Anther attached by a broad base, not only persistent, but inarticulate and immobile: pollinia narrowed into tails which emerge from the base of the erect cavities of the anther: lip developed into a spur or a sac at the base.

Tribe II. ORCHIDEAE.

Anther terminating the column or posterior, often affixed by a slender filament, often deciduous or coming away with the pollinia, or rarely firmly attached as in *Triphora*: lip rarely produced into a spur or sac.

Pollinia readily disintegrating, granular, mealy, or sectile, when in masses neither hard nor waxy.

Tribe III. NEOTTIEAE.

Pollinia waxy, aggregated in masses in which the pollen grains cohere.

Flower-stem terminating a corm, a cluster of rootstocks, or arising from a pseudobulb or a short rootstock.

Flower-stem lateral on a leafy stem or pseudobulb or from an abbreviated leafless stem.

Leafy plants: main stem composed of annual members of which each one terminates the year's growth.

Leaves pliable, not coriaceous, convolute.

Leaves rigid, coriaceous, conduplicate.

Leafless plants with green roots: main stem growing on year after year, not produced into distinct annual members, thus of unlimited growth.

Tribe IV. EPIDENDREAE.

Tribe V. BLETIEAE.

Tribe VI. ONCIDIEAE.

Tribe VII. POLYRRHIZEAE.

#### I. CYPRIPEDIEAE

Caulescant plants: foliaceous leaves several: lip with a rounded opening: sterile stamen glabrous: stigma broadest at the base.

Scapose plants: foliaceous leaves 2, basal: lip with a fissure down the front: sterile stamen glandular-pubescent: stigma broadest at the apex.

1. CYPRIPEDIUM.

2. FISSIPES.

#### II. ORCHIDAE

Stigma flat, without appendages.

Glands of the stigma enclosed in a pouch.

Glands of the stigma naked, or merely surrounded by the appendages of the anther.

Glands covered by a thin membrane, which is deciduous with them.

Glands without a membrane.

Valves of the anther not enclosing the glands below.

Lip entire or shallowly lobed.

Lip incised or fringed.

Valves of the anther enclosing the glands below by infolding of the margins.

Stigma with well-developed appendages.

Base of the anther with long slender appendages.

Lip with three narrow lobes: stigma erect.

Lip entire or nearly so: stigma drooping.

Base of the anther without appendages.

3. GALEORCHIS.

4. COELOGLOSSUM.

5. LYSIAS.

6. BLEPHARIGLOTTIS.

7. PERULARIA.

8. HABENARIA.

9. HABENELLA.

10. GYMADENIOPSIS.

#### III. NEOTTIEAE

Stem climbing: elongate vines.

Stem not climbing: terrestrial or epiphytic herbs.

Anther terminating the column.

Leaves, or bracts, alternate, sometimes represented by mere scales, or if more than 2, whorled (*Isotria*).

Anther loosely attached, thus mobile.

Pollinia mealy, the grains not connected by elastic threads.

Plant caulescent: bracts, and leaves, alternate.

Lip recurved, the edges of the dilated upper part laciniate-pectinate, the face with a tufted crest: anther hollowed on the back.

Lip straight, the lobes erose, the face near the apex crested with two short lateral toothed ridges and a long median one: anther flat on the back.

Plant scapose: bracts whorled at the top of the scape.

Pollinia attached by elastic threads.

Flowers several: lip with the middle lobe dilated upward, erect.

Flower solitary: lip with the middle lobe rounded, pendent.

Anther immobile, rigidly erect.

Leaf-like bracts opposite.

11. VANILLA.

12. POGONIA.

13. CLEISTES.

14. ISOTRIA.

15. LIMODORUM.

16. ARETHUSA.

17. TRIPHORA.

18. OPHRYS.

Anther posterior, borne on the back of the column.

Inflorescence simple, the rachis not branched.

Lip posterior, forming the upper member of the perianth.

Lip borne at the base of the column or below it.

Lateral sepals united at the base and adherent to the base of the lip.

Lateral sepals distinct and free from the lip.

Lip borne above the base of the column.

Lip anterior, forming the lower member of the perianth.

Flower-stem arising from a fleshy root or a cluster of fleshy roots: rootstock wanting or not obvious.

Column-foot short or obsolete: lateral sepals borne obliquely on the hypanthium, scarcely, if at all, decurrent.

Anther acute, not lobed: lip with basal callosities.

Stigma 2-cleft: lip free from the column.

Stigma entire: lip adnate to the column.

Anther notched at the apex, thus 2-lobed: lip without callosities.

Column-foot elongate: lateral sepals decurrent on the hypanthium.

Lateral sepals forming a chin-like spur at the base of the hypanthium.

Lateral sepals forming a slender spur at the base of the hypanthium.

Flower-stem arising from elongate horizontal rootstocks.

Foliaceous leaves alternate on the flower-stem: lip spurless, or with only a short sac which is surrounded by the lateral sepals.

Foliaceous leaves clustered at the base of the flower-stem: lip with an extended spur or sac between the lateral sepals.

Inflorescence compound, the rachis branched.

19. *PRESCOTTIA*.

20. *CRANICHIS*.

21. *PONTHIEVA*.

22. *IBIDIUM*.

23. *CYCLOPOGON*.

24. *MESADENUS*.

25. *STENORRHYNCHUS*.

26. *PELEXIA*.

27. *PERAMIUM*.

28. *PHYSURUS*.

29. *TROPIDIA*.

#### IV. EPIDENDREAE

Foliage leaves, when developed, succulent-membranous, represented in *Tipularia* and in *Aplectrum*, at flowering time, by withered fragments or few persistent fibers, or in *Corallorrhiza* and *Hexalectris* all leaves represented by clasping scales: terrestrial herbs.

Roots or rootstocks not coralloid or sometimes with coralloid appendages, especially in young plants of *Tipularia* and *Aplectrum*: some leaves foliaceous.

Foliage leaves always present at flowering time.

Column short: lip 3-lobed at the apex.

Column elongate: lip dilated at the apex.

Foliage leaves absent at flowering time, or sometimes represented by mere withered remains.

Lip prolonged posteriorly into an elongate slender spur.

Lip not prolonged into a slender spur.

Roots or rootstocks coralloid.

Pollinia 8: lip with a crest of about 5 longitudinal ridges.

Pollinia 4: lip with a callus on each side of the midrib near the base.

Foliage leaves coriaceous or firm-fleshy, always present on the flower-stems.

Column without a foot, or with a very short one: lateral sepals various, but not triangular.

Pollinia 2-4: evergreen epiphytes.

Petals scarcely half as long as the sepals.

Petals nearly or quite as long as the sepals.

30. *MALAXIS*.

31. *LIPARIS*.

32. *TIPULARIA*.

33. *APLECTRUM*.

34. *HEXALECTRIS*.

35. *CORALLORRHIZA*.

36. *PLEUROTHALLIS*.

- Lip partly adnate to the column.  
 Column wholly adnate to the lip: plants without true pseudobulbs at the base of the leafy flowering stems.
- Lip and column with short stout adnate bases: flowers axillary to spathe-like or scale-like bracts borne along a rachis terminating the leafy stems and branches.
- Lip and column with elongate, often slender, adnate bases: flowers in an open or congested panicle or raceme which terminates the leafy stem.
- Column partly adnate to the lip: plants with pseudobulbs at the base of the naked or scaly flowering stems.
- Lip 3-lobed, shallowly or deeply so, longitudinally crested or appendaged: sepals and petals relatively short, not attenuate.
- Column adnate at the base: lip deeply 3-lobed, with a dilated middle lobe and long narrow lateral lobes: pseudobulbs terete: flowering stem not subtended by a foliaceous spathe.
- Column adnate to about the middle: lip obscurely 3-lobed, with a minute middle lobe and broad and short lateral lobes: pseudobulbs flattened: flowering stem subtended by a foliaceous spathe.
- Lip entire, clamshell-like, neither crested nor appendaged: sepals and petals elongate, attenuate.
- Lip free from the column.
- Pollinia 8: terrestrial herb.
- Column with a distinct foot: lateral sepals triangular, forming a chin.
37. SPATHIGER.
38. AMPHIGLOTTIS.
39. ENCYCLIA.
40. EPICLADIUM.
41. ANACHEILUM.
42. HORMIDIUM.
43. BASIPHYLLAEA.
44. POLYSTACHYA.
- ### V. BLETIEAE
- Lip encompassing the column or growing to it, without a sac: pollinia 4 or 8, with caudiculae, but without stipes.
- Lip articulated to the foot of the column, or forming with it a spur: pollinia 2 or 4, without caudiculae but with short stipes.
- Lip contracted into a claw: foot of the column slender: plants epiphytic.
- Lip sessile, the base truncate or cuneate: foot of the column dilated or abruptly narrowed at the base: plants terrestrial.
- Lip crestless, deeply 3-lobed, the lateral lobes widely spreading: foot of the column concave and grooved, not dilated, the margins thick.
- Lip with a crest of nipple-like papillae, shallowly 3-lobed: foot of the column flat, thin and dilated, the margins thin.
45. BLETIA.
46. CYRTOPODIUM.
47. TRIORCHOS.
48. PLATYPUS.
- ### VI. ONCIDEAE
- Pseudobulbs 1-leaved.
- Pseudobulbs at least 3-leaved.
- Column simple, neither 2-winged nor 2-auricled near or at the summit.
- Sepals and petals not caudate-tipped.
- Sepals and petals caudate.
- Column 2-winged or 2-auricled at or near the summit.
49. MACRADENIA.
50. IONOPSIS.
51. BRASSIA.
52. ONCIDIUM.
- ### VII. POLYRRHIZEAE
- Pollinia stalked: lip saccate or short-spurred, the apex entire.
- Flowers in a lax raceme: lip sessile at the base of the column, with a globular spur: roots fine.
- Flowers in a stiff spike: lip partially adnate to the column, usually saccate at the base: roots coarse.
- Pollinia sessile: lip long-spurred, the apex or the middle lobe again lobed.
53. HARRISELLA.
54. CAMPYLOCENTRUM.
55. POLYRRHIZA.

1. **CYPRIPEDIUM** L. Caulescent herbs with fibrous roots. Leaves several: blades plaited. Sepals 2. Lip a horizontally suspended sac, yellow or white. Stamens appressed, the free tips directed forward.—About 20 species, natives of north temperate regions.—Our plants prefer calcareous soils.—Spr.—**LADIES'-SLIPPERS. MOCCASIN-FLOWERS.**

Sterile stamen with the stalk wholly adnate to the column, the blade rounded at the base: column-wings short and broad: lip longer than the sepals and petals.

Sterile stamen with the stalk partially adnate to the column, the blade not rounded at the base: column-wings long and narrow: lip shorter than the sepals and petals.

1. *C. reginae*.

Sterile stamen with a triangular-ovate blade, less than 1 cm. long, obtuse: lip golden-yellow: flowers fragrant.

2. *C. parviflorum*.

Sterile stamen with an oblong-ovate or ovate-lanceolate blade over 1 cm. long, acute: lip yellow: flowers not fragrant.

3. *C. pubescens*.

1. *C. reginae* Walt. Stem 3–6 dm. tall: leaf-blades oval or elliptic, 8–20 cm. long: sepals white, oblong to oval: petals white, lanceolate, barely as long as the sepals: lip about 4 cm. long, with rose and white stripes: capsule-body 3–4 cm. long. [*C. spectabile* Salisb.]—(**SILVER-SLIPPER. QUEEN'S-SLIPPER.**)—Swamps and low woods, Blue Ridge, Ga. to Va., and various provinces, Md. to Mo., Minn., Ont., and Newf.

2. *C. parviflorum* Salisb. Stem 3–5 dm. tall: leaf-blades elliptic to oval, 6–12 cm. long: sepals lanceolate to oblong-lanceolate, 2.5–3.5 cm. long: petals longer and narrower than the sepals: lip 1.5–2.5 cm. long: capsule-body 2–3.5 cm. long.—(**GOLDEN-SLIPPER.**)—Woods and shaded hillsides, various provinces, Ga. to Miss., Mo., Wash., B. C., Sask., Ont., and Newf.

3. *C. pubescens* Willd. Stem 3–7 dm. tall: leaf-blades oblong or elliptic, 9–15 cm. long: sepals ovate-lanceolate or oblong-ovate: petals linear or attenuate, longer than the sepals: lip 3.5–5 cm. long: capsule-body 3.5–4 cm. long. [*C. hirsutum* (Fl. SE. U. S.)]—(**GOLDEN-SLIPPER.**)—Rich woods, banks, and thickets, various provinces, rarely Coastal Plain, Ga. to N. M., B. C., Ont., and N. S.

2. **FISSIPES** Small. Acaulescent herbs, with fibrous roots. Leaves mostly 2: blades plaited. Lip a drooping sac. Stamens spreading, the free tips at right angles to the column.—One species.

1. *F. acaulis* (Ait.) Small. Leaves 1–3 dm. long; blades oblong-elliptic or oval: scape 1–5 dm. tall: sepals 2, elliptic to lanceolate, 3–4 cm. long: petals narrower and longer than the sepals: lip pink or rarely white, obovoid, 4–6 cm. long: capsule 3.5–4 cm. long. [*Cypripedium acaule* Ait.]—(**MOCCASIN-FLOWER. PURPLE SLIPPER. PINK LADY-SLIPPER.**)

**VENUS'-SLIPPER.**—Acid sandy woods and bogs, various provinces, Ala. to Tenn., Man., Ont., and Newf.—Spr.

3. **GALEORCHIS** Rydb. Acaulescent fleshy herbs, with tuberous roots. Flowers in a spike. Perianth ringent. Sepals and petals converging. Lip broad, spurred. Stigma hollow, the glands enclosed in a pouch.—One species.

1. *G. spectabilis* (L.) Rydb. Leaves usually 2; blades oblong-elliptic, elliptic or oval, 6–17 cm. long: scape 1–3 dm. tall, the spike 3–12-flowered: sepals and petals violet-purple, lip white, 10–13 mm. long, slightly shorter than the spur: capsule 2–2.5 cm. long. [*Orchis spectabilis* L.]—(SHOWY-ORCHIS. KIRTLE-PINK. PURPLE-HOODED ORCHIS.)—Rich woods, various provinces, rarely Coastal Plain, Ga. to Ark., Nebr., Minn., Ont., and N. S.—Spr.

4. **COELOGLOSSUM** Hartman. Caulescent herbs, with biennial 2-branched tubers, the stem leafy. Flowers relatively small, in a terminal spike. Perianth green or greenish. Sepals and petals converging, the petals much narrower than the sepals. Lip narrow, 2–3-lobed at the apex, the spur much shorter than the lip. Anthers with narrow valves, the glands surrounded by a thin membrane.—Three species of north temperate regions.

1. *C. bracteatum* (Willd.) Parl. Stem 2–6 dm. tall: leaf-blades oblong-ovate to oblong-elliptic or oblong-lanceolate, 10–15 cm. long: bracts surpassing the flowers: sepals ovate to ovate-lanceolate, 5–6 mm. long: petals nearly linear or linear-filiform: lip narrow, 6–8 mm. long: capsule 8–10 mm. long. [*Platanthera bracteata* Torr.]—(SATYR-ORCHID.)—Meadows and woods, Blue Ridge and more northern provinces, N. C. to Nebr., Wash., Alas., Ont., and N. B.—(O. W.)—Spr.

5. **LYSIAS** Salisb. Caulescent herbs, the stem scape-like, scaly. Flowers in a spike or raceme. Perianth white or greenish. Sepals spreading, relatively broad, the lateral ones longer and narrower than the median one. Petals much smaller than the sepals. Lip narrow, entire, the spur longer than the lip. Anthers with diverging sacs whose beak-like bases project forward—About 6 species of the north temperate zone.

1. *L. orbiculata* (Pursh) Rydb. Stem 3–9 dm. tall: basal leaves 2, flat on the ground; blades orbicular to oval, 1–3 dm. long: sepals greenish-white, the median one suborbicular or reniform, 5–6 mm. long, the lateral ones ovate, 8–10

mm. long: petals reflexed, 7-8 mm. long: lip nearly linear, 12-15 mm. long, obtuse, the spur 2.5-4 cm. long: capsule about 1.5 cm. long. [*Platanthera orbiculata* Lindl.]—(MOON-SET. ROUND-LEAF ORCHID.)—Woods, Blue Ridge and more northern provinces, Ga. to Minn., Wash., Alas., Ont., and Newf.—Sum.

6. **BLEPHARIGLOTTIS** Raf. Caulescent herbs, the stem leafy. Flowers in a terminal spike. Perianth white, yellow, orange, purple, or violet-purple. Sepals spreading or reflexed. Petals toothed or lacerate. Lip fringed, or 3-lobed, the lobes toothed or lacinate. Spur often longer than the lip. Anthers with widely separated sacs, their narrow beak-like bases supported on the arms of the stigma, projecting forward and upward. Glands naked.—About 10 species, all North American.—Sum.—FRINGE-ORCHIDS.

Petals fringed at the apex: lip not 3-lobed.

Lip mostly less than 8 mm. long: petals slightly shorter than the lip.

Lip mostly over 10 mm. long: petals about  $\frac{1}{2}$  as long as the lip.

Perianth white.

Lip with long fringe: spur about as long as the ovary.

Lip with short fringe: spur about twice as long as the ovary.

Perianth yellow or orange.

Petals spatulate: lip fringed all around.

Petals cuneate: lip with 2 basal tufts and a terminal fringe.

Petals entire, crenulate or merely erose: lip 3-lobed.

Petals entire, linear: lip with narrow lobes.

Petals crenulate or erose, dilated upward: lip with dilated lobes.

Perianth white: petals with flabellate-dilated blades.

Perianth lilac or violet-purple (albinos occur): petals not flabellate-dilated.

Lobes of the lip fimbriate or fringed: petal-blade toothed on the sides.

Lip 14-20 mm. long: lateral sepals 9-11 mm. long: petals 9-12 mm. long.

Lip 7-10 mm. long: lateral sepals 5-6 mm. long: petals 5-7 mm. long.

Lobes of the lip incised or erose: petal-blade toothed at the tip or entire.

1. *B. cristata*.

2. *B. Blephariglottis*.

3. *B. conspicua*.

4. *B. ciliaris*.

5. *B. Chapmanii*.

6. *B. lacera*.

7. *B. leucophaca*.

8. *B. grandiflora*.

9. *B. psychodes*.

10. *B. peramoena*.

1. **B. cristata** (Michx.) Raf. Stem 2-6 dm. tall: leaf-blades linear-lanceolate to linear, 5-20 cm. long: perianth orange: lateral sepals orbicular-ovate or broadly ovate, 3-3.5 mm. long: petals cuneate, about 3.5 mm. long, fringed above the middle: lip suborbicular in outline, 5-9 mm. long, deeply fringed: spur 4-6 mm. long. [*Platanthera cristata* Lindl.]—(GOLDEN FRINGE-ORCHID.)—Acid bogs and low pinelands, Coastal Plain and rarely adj. provinces, Fla. to La., Ark., Tenn., and Mass.

2. **B. Blephariglottis** (Willd.) Rydb. Stem 3-9 dm. tall: leaf-blades oblong-lanceolate to linear-oblong, 10-25 cm. long: perianth white: lateral sepals suborbicular to orbicular-obovate, 5-7 mm. long: petals linear or linear-cuneate, 5-6 mm. long, fringed at the apex: lip ovate in outline, 8-11 mm. long, rather copiously fringed: spur 10-25 mm. long.

[*Platanthera blephariglottis* Hook.]—(WHITE FRINGE-ORCHID. PLUME-OF-

NAVARRE.)—Acid sandy bogs and swamps, various provinces, Fla. to La., Minn., and Newf. Hybrids with the orange-colored species are known.

3. *B. conspicua* (Nash) Small. Stem 4–8 dm. tall: leaf-blades linear-lanceolate to broadly linear, 8–40 cm. long: perianth white: lateral sepals suborbicular, 6–9 mm. long: petals linear or oblanceolate, 5–8 mm. long, erose or toothed at the apex: lip oblong or oblong-lanceolate, 12–16 mm. long, short-fringed: spur 40–50 mm. long.—(SNOWY-ORCHID.)—Bogs, Coastal Plain or rarely adj. provinces, Fla. to La., Ky., and N. C.—The lip is sometimes nearly entire.

4. *B. ciliaris* (L.) Rydb. Stem 3–8 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth orange: lateral sepals orbicular-ovate to orbicular-ovate, 6–8 mm. long: petals linear, oblong-linear or spatulate, 5–7 mm. long, sharply toothed at the apex: lip ovate in outline, copiously fringed: spur 15–25 mm. long. [*Platanthera ciliaris* Lindl.]—(YELLOW-FRIDGE-ORCHID. ORANGE PLUME.)—Acid bogs, meadows, and open woods, various provinces, Fla. to Tex., Mich., and Vt.

5. *B. Chapmanii* Small. Stem 6–10 dm. tall: leaf-blades linear-lanceolate to broadly linear, 9–20 cm. long: perianth deep orange: lateral sepals suborbicular to orbicular-ovate, 3.5–4.5 mm. long: petals flabellate or cuneate, 3.5–4 mm. long, pectinate-fringed: lip about 10 mm. long, the linear body with a terminal fringe and 2 basal lateral fringes: spur 16–20 mm. long.—Pinelands, Fla. Perhaps a hybrid between *B. ciliaris* and *B. cristata*.

6. *B. lacera* (Michx.) Rydb. Stem 3–9 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth greenish-white: lateral sepals ovate to orbicular-ovate, 5–6 mm. long: petals linear, 5.5–6 mm. long, entire: lip 12–15 mm. long, each narrow lobe terminating in a fringe of several processes: spur 14–16 mm. long. [*Platanthera lacera* A. Gray]—[GREEN-FRIDGE-ORCHID. RAGGED-ORCHID. RUSSET-ORCHID.]—Meadows, swamps, and moist open woods, various provinces, Ga. to Ark., Man., and Newf.

7. *B. leucophaea* (Nutt) Rydb. Stem 3–8 dm. tall: leaf-blades oblong to oblong-lanceolate, 8–20 cm. long: perianth white: lateral sepals broadly ovate or oval, 6–10 mm. long: petals obovate to broadly spatulate 6–9 mm. long, erose: lip 12–16 mm. long, the cuneate lobes long-fringed: spur 25–40 mm. long.—(PRAIRIE-ORCHID.)—Meadows and moist soil, various provinces, La. to Minn. and N. S., rare E of the Appalachians.—The flowers are fragrant.

8. *B. grandiflora* (Bigel.) Rydb. Stem 3–15 dm. tall: leaf-blades oblong-ovate or oblong to lanceolate, 8–30 cm. long: perianth lilac-purple: lateral sepals ovate, 9–11 mm. long: petals with narrow claws: lip with a spur 20–30 mm. long. [*Platanthera fimbriata* Lindl.]—(PLUME-ROYAL. PURPLE-FRIDGE-ORCHID.)—Meadows and rich woods, Blue Ridge, N. C. and Tenn. to Md., and various provinces, W. Va. to Ont., Newf., and N. J.

9. *B. psycodes* (L.) Rydb. Stem 3–10 dm. tall: leaf-blades oval, elliptic or oblong-lanceolate, 5–25 cm. long: perianth lilac: lateral sepals ovate, 5–7 mm. long: petals with broad claws: lip with a spur 13–16 mm. long. [*Platanthera psycodes* A. Gray]—(FAIRY-FRIDGE.)—Meadows, swamps and open woods, Blue Ridge, N. C. and Tenn. to Md., and various provinces, N. J. and Pa. to Ia., Minn., and Newf.

10. *B. peramoena* (A. Gray) Rydb. Stem 3–9 dm. tall: leaf-blades oblong to lanceolate, 8–20 cm. long: perianth rose-purple: lateral sepals broadly ovate to suborbicular, 7–10 mm. long: petals as long as the sepals or nearly

so, spatulate, or the body orbicular-obovate, entire, or erose: lip 14–18 mm. long, the lobes cuneate or flabellate, incised or erose: spur 19–26 mm. long. [*Platanthera peramoena* A. Gray]—(PRIDE-OF-THE-PEAK. PINK-FRIDGE-ORCHID.)—Meadows and stream-banks, Blue Ridge and Appalachian provinces, Ala. to N. C., and various provinces, Tenn. to Ark., Ohio, and N. J.

**7. PERULARIA** Lindl. Caulescent herbs, with thick fibrous roots, the stem leafy. Flowers relatively small, in a terminal spike. Perianth yellowish or greenish. Sepals and petals spreading, all relatively broad. Lip lanceolate to suborbicular, undulate or with a lobe on each side near the base, and a median tubercle, the spur longer than the lip. Anthers with horizontal valves opening upward, dilated at the base, thus forming a cavity enclosing the orbicular gland. About 4 species of the north temperate zone.—Sum.—GYPSY-SPIKES.

Lip decidedly longer than wide: bracts mostly longer than the flowers.

Lip about as wide as long: bracts mostly shorter than the flowers.

Lip undulate, suborbicular, oval or ovate-orbicular: petals much longer than wide.

Lip with 2 lobes at the base of the blade, hastate: petals as wide as long or wider.

1. *P. flava*.

2. *P. scutellata*.

3. *P. bidentata*.

1. *P. flava* (L.) Farwell. Stem 3–6 dm. tall: leaf-blades elliptic, oblong or lanceolate, 0.7–3 dm. long: bracts mostly longer than the flowers: lateral sepals oval to obovate, 3–4 mm. long: petals slightly smaller than the sepals, erose or crenulate: lip hastate, the middle lobe oblong to lanceolate, 4–5.5 mm. long: spur shorter than the ovary. [*Platanthera flava* A. Gray]—Wet woods, various provinces, rarely E of Blue Ridge, La. to Minn., Ont., and N. S.

2. *P. scutellata* (Nutt.) Small. Stem 3–6 dm. tall: leaf-blades oblong-lanceolate or linear-lanceolate, 0.7–2.5 dm. long: bracts shorter than the flowers: lateral sepals ovate to obovate, 2.5–3 mm. long: lip suborbicular or broadly oval in outline, 2.5–4 mm. long: spur about  $\frac{1}{2}$  as long as the ovary.—Swamps and shallow water, Coastal Plain and adj. provinces, Fla. to Ark., Ind., and Pa. —Often confused with *P. flava* which has a more N and W range.

3. *P. bidentata* (Ell.) Small. Similar to the next preceding species in habit: flowers decidedly larger: petals as wide as long or wider: lip ovate in outline, 4–6 mm. long, the tubercle horn-like: spur about as long as the ovary.—Low woods, Coastal Plain, Fla. to Ala. and N. C.

**8. HABENARIA** Willd. Caulescent herbs. Flowers in a terminal spike-like raceme. Perianth white, green, or yellow. Sepals distinct or nearly so, the lateral ones spreading, slightly inequilateral. Petals unequally 2-parted. Lip 3-parted, spurred. Anther-sacs elevated, each with an appendage at the base. Stigma with narrow appendages, the glands naked.—About 50 species, most abundant in the tropics.—LONG-SPUR ORCHIDS.

Spur about as long as the hypanthium or the ovary.

Spur clavate: stem slender, scape-like, with few remote scale-like leaves: raceme interrupted.

Spur filiform, sometimes slightly-thickened at the tip: stem stout, leafy: raceme continuous.

Spur much longer than the hypanthium or the ovary.

Spur twice to thrice as long as the hypanthium or the ovary: narrow lobe of the petal less than twice as long as the broad lobe.

Spur four to six times as long as the hypanthium or the ovary: narrow lobe of the petal over twice as long as the broad lobe.

1. *H. distans*.

2. *H. repens*.

3. *H. quinqueseta*.

4. *H. Habenaria*.

1. *H. distans* Griseb. Stem scape-like, 2-3 dm. tall, with the larger leaves near the base, and remote sheathing scales above: leaf-blades elliptic, varying to ovate or obovate, 4-15 cm. long: raceme few-flowered: lateral sepals oval to ovate, 5-6 mm. long: narrow lobe of the petal slightly longer than the broader one: lip 6-9 mm. long.—Low pinelands, pen. Fla.—(*W. I.*)—Spr.-sum.

2. *H. repens* Nutt. Stem 2-6 dm. tall: leaf-blades elliptic-lanceolate or lanceolate to linear-lanceolate, 5-30 cm. long: raceme few- to many-flowered: lateral sepals ovate, about 5 mm. long, obtuse: narrow lobe of the petal longer than the obtuse elliptic broader one: lip 8-9 mm. long, the lateral lobes much longer than the middle one. [*H. Nuttallii* Small]

—Ditches, swamps, ponds, streams, and lake-shores, Coastal Plain, Fla. to La. and N. C.—(*W. I., C. A., S. A.*)—Spr.-fall, or all year S.—Erroneously reported from Va. To be found in both terrestrial and aquatic habitats. Often found growing in detached floating clusters of decaying vegetation, water-hyacinths, and water-lettuce.

3. *H. quinqueseta* (Michx.) Sw. Stem 2-5 dm. tall, evenly leafy: leaf-blades oval, elliptic, or ovate, 3-10 cm. long: bracts lanceolate to ovate lanceolate: lateral sepals elliptic to ovate, 7-10 mm. long: narrow lobe of the petals longer than the narrowly elliptic or linear-elliptic broader one: middle lobe of the lip linear-spatulate to almost linear: capsule short-stalked. [*H. Michauxii* Nutt. *H. Simpsonii* Small]—Pinelands, Coastal Plain, Fla. to Tex. and S. C.—Sum.-fall.

4. *H. Habenaria* (L.) Small. Stem 3-6 dm. tall, the leaves mainly on the lower part of the stem: leaf-blades elliptic to lanceolate, 5-15 cm. long: lateral sepals elliptic to ovate-elliptic, 12-14 mm. long: narrow lobe of the petals longer than the linear or linear-elliptic broader one: middle lobe of the lip linear: capsule long-stalked. [*H. macroceratitis* Willd.]—Hammocks, pen. Fla.—(*W. I.*)—Sum.—It seems strange that this tropical orchid should not occur in tropical Fla., but it appears to be restricted to hammocks north of the middle of the peninsula. The flowers, with much longer spurs than any of our other species, are very fragrant.

9. **HABENELLA** Small. Caulescent herbs. Flowers in a terminal spike. Perianth yellowish, becoming green. Sepals distinct, the lateral ones spreading, very inequilateral. Petals much smaller than the sepals, sinuately lobed at the apex and with a small basal lobe. Lip entire above, with 2 small basal

lobes. Anther-sacs with filiform appendages at the base. Stigma with two short appendages, the glands naked.—

One species.

1. *H. odontopetala* (Reichenb. f.) Small. Stem 3–6 dm. tall: leaf-blade oblong to oblong-lanceolate, 6–10 cm. long, acute: lateral sepals very broad, 5.5–6.5 mm. long: petals about 4 mm. long, sinuately 3-lobed at the apex: lip 6–10 mm. long, broadly linear, obtuse: spur 12–18 mm. long: capsule spreading, the body 9–13 mm. long, longer than the stipe. [*Platanthera Garberi* (Porter) Chapm. *Habenella Garberi* (Porter) Small]—Hammocks, pen. Fla.—(W. I., Mex., C. A.)—All year.

10. **GYMNADENIOPSIS** Rydb. Caulescent herbs. Flowers in a terminal spike. Perianth white, pink, greenish, or orange-yellow. Sepals distinct, the lateral ones slightly inequilateral. Petals mostly smaller than the sepals, undulate, sinuate-lobed or erose. Lip entire, 3-lobed at the apex, or crenulate or erose. Anthers with parallel approximate sacs, and naked contiguous glands. Stigmas with 2 or 3 appendages at the beak.—A genus of eastern North America represented by the following species.—Sum.—REIN-ORCHIDS.

Lip posterior, erect.  
Lip anterior, pendent.

I. NIVEAE.  
II. INTEGRÆ.

I. NIVEAE  
Stem topped by a short stout spike, the hypanthium and perianth white.

II. INTEGRÆ

Lip erose-crenulate: perianth yellow or orange: spur filiform.  
Lip 3-lobed at the apex: perianth whitish or greenish: spur clavate.

1. *G. nivea*.  
2. *G. integra*.  
3. *G. clavellata*.

1. *G. nivea* (Nutt.) Rydb. Stem 2–5 dm. tall: leaves reduced on the upper part of the stem, the lower ones with linear or linear-oblong blades 5–20 cm. long: perianth white or pinkish: lateral sepals ovate or oblong-ovate, 4–6 mm. long: petals 3–4.5 mm. long, curved, the tip oblique: lip linear or linear-lanceolate, 5–7 mm. long, entire, erect: spur about 1 cm. long, curving upward: capsule 9–11 mm. long. [*Gymnadenia nivea* Engelm. and Gray]—(BOG-TORCHES. FROG-SPEAR. WHITE REIN-ORCHID.)—Low pinelands, acid meadows, and moist hillsides, Coastal Plain, Fla. to Tex., Ark., and N. J.—(W. I.)

2. *G. integra* (Nutt.) Rydb. Stem 3–6 dm. tall: leaves much reduced on the upper part of the stem, the lower ones with broadly linear or linear-lanceolate blades 5–20 cm. long: perianth yellow or orange-yellow: lateral sepals ovate to obovate, 3–4 mm. long: petals 3–3.5 mm. long, oblong or nearly so: lip

oblong to ovate-oblong or oval, 4-4.5 mm. long, erose or crenulate, pendent: spur 4-5 mm. long, extending downward: capsule fully 10 mm. long. [*Gymnadenia flava* Lindl.]—(FROG-ARROW. ORANGE REIN-ORCHID.)—Moist pinelands and acid bogs, Coastal Plain and rarely adj. provinces, Fla. to Tex., Tenn., and N. J.

3. *G. clavellata* (Michx.) Rydb. Stem 1-5 dm. tall, rather naked above: leaves scale-like except 1 or 2 near the middle of the stem or below it; blades oblong or oblong-lanceolate, 5-12 cm. long: perianth whitish or greenish: lateral sepals ovate to oval, 2-3.5 mm. long: petals 3-4 mm. long, sinuately 3-lobed: lip slightly dilated upward, 3-5 mm. long: capsule 7-8 mm. long. [*Gymnadenia tridentata* (Willd.) Hook.]—(FROG-SPIKE. GREEN REIN-ORCHID.)—Moist grounds and swamps, various provinces, Fla. to La., Minn., and Newf.

11. **VANILLA** Sw. Vines with rope-like stems and aerial roots. Leaves remote, often much reduced. Flowers in axillary clusters. Perianth mainly pale, but showy. Lateral sepals narrow, slightly broadened upward. Petals slightly shorter than the sepals. Lip cornucopia-like, involute and adnate to the long column, the free dilated tip fringed or crisped. Capsule elongate.—About 20 species, mostly of tropical regions.—Spr.—VANILLA-ORCHIDS.

Leaves with blades, not recurved: capsule elongate.

Lip fringed, 40-50 mm. long: sepals and petals less than 60 mm. long.

Lip crisped, 70-80 mm. long: sepals and petals over 70 mm. long.

Leaves obsolete, or scale-like, and recurved at the tip: capsule short.

Lip abruptly pointed at the apex: leaves mere narrow scales near the tips of the branches.

Lip notched at the apex: leaves obsolete.

1. *V. Vanilla*.

2. *V. phaeantha*.

3. *V. Eggersii*.

4. *V. articulata*.

1. **V. Vanilla** (L.) Britton. Leaf-blades oblong to elliptic, 10-18 cm. long: lateral sepals broadly linear to linear-spatulate, 50-56 mm. long: petals linear or nearly so: lip 45-50 mm. long, the edge fringed. [*V. planifolia* Andr.]—(VANILLA-VINE.)—Hammocks, S pen. Fla. Nat. of Mex.—The cured capsule is the "vanilla-bean" of commerce. Usually merely a waif.

2. **V. phaeantha** Reichenb. Leaf-blades narrowly oblong to oblong-lanceolate, 9-15 cm. long: lateral sepals nearly linear, slightly narrowed to the base and the apex, 65-80 mm. long: petals rather narrower than the lateral sepals: lip 70-80 mm. long, the edge crenulate.—(LEAFY-VANILLA.)—Low hammocks, S pen. Fla.—(W. I.)

3. **V. Eggersii** Rolfe. Leaves remote, scale-like, linear to lanceolate, 5-7 cm. long: lateral sepals spatulate, 33-36 mm. long: petals narrowly spatulate: lip 30-36 mm. long, the edge crisped: capsule 5-7 cm. long, slender-clavate.—(LEAFLESS-VANILLA.)—Hammocks, Everglade Keys and Cape Sable region, Fla.—(W. I.)—In hammocks which are permanently dry or usually dry.

4. **V. articulata** Northrop. Stem and branches very stout: leaves obsolete: lateral sepals narrowly oblong, 28-33 mm. long: petals oblong-spatulate: lip 28-32 mm. long, the edge undulate-crisped: capsule 7-9 cm. long, stout-clavate.—(WORM-VINE.)—Hammock islands, S Everglades and swamps, Cape Sable region, Fla.—(W. I.)—In hammocks subject to overflow part of the year.

**12. POGONIA** Juss. Caulescent herbs, with cord-like roots. Leaves usually solitary or 2 on the stem. Flowers solitary or 2 together. Perianth mainly pink, rose, or lilac. Sepals nearly equal, slightly longer than the petals. Petals broader than the sepals. Lip fringed at the dilated apex, with a papillose crest on the face. Capsule erect.—One species.

1. *P. ophioglossoides* (L.) Ker. Stem 2–5 dm. tall: blades of the cauline leaves and bracts green, oblong-lanceolate to elliptic, 3–8 cm. long: lateral sepals linear-elliptic or narrowly oblong, 15–20 mm. long, acute: petals elliptic or oblong-cuneate, 14–16 mm. long, obtuse: lip longer than the petals, blunt at the rounded apex.—(ETTERCAP. CRESTED-ETTERCAP. ROSE CRESTED-ORCHID.)—Acid bogs, flat woods, and damp prairies, various provinces, Fla. to Tex., Minn., and Newf.—Spr.

**13. CLEISTES** L. C. Rich. Caulescent rather succulent herbs, with cord-like roots. Leaves 1 or 2 on the stem, but usually solitary. Flowers mostly 1 or 2, somewhat nodding, the bract or bracts foliaceous. Perianth mainly brown and pink. Sepals various, the lateral ones much narrower than the median. Petals nearly like the lateral sepals. Lip erose on the edges, the apical lobe with a median and 2 lateral ridges. Capsule erect.—One species.

1. *C. divaricata* (L.) Ames. Stem 2–6 dm. tall: blades of the cauline leaves glaucous, narrowly oblong to oblong-lanceolate, 5–15 cm. long: lateral sepals linear or nearly so, 26–50 mm. long, attenuate, brownish: petals narrowly elliptic to elliptic-oblancheolate, 20–35 mm. long, acuminate, pinkish: lip as long as the petals, acuminate above the middle, erose. [*Pogonia divaricata* R. Br.]—(LADY'S-ETTERCAP. ROSE-ORCHID.)—Acid meadows, prairies, swamps, wooded hillsides, and mountain tops, various provinces, Fla. to Miss., Ky., and N. J.—Spr.—sum.—After the seas which deposited the Coastal Plain strata retreated, this plant spread to the seacoast, but still maintained a foothold in the mountains. In the level lowlands of the coast regions it occurs in such abundance as to form seas of pale rose. There are several forms in the Coastal regions showing much variation in the size of the perianth and of its parts.

**14. ISOTRIA** Raf. Scapose herbs, with elongated roots. Leaves reduced to scales at the base of the scape. Scape topped by a whorl of 5 or 6 spreading leaf-like bracts. Flowers solitary or 2 together. Perianth purple or greenish. Sepals nearly equal, much longer than the petals. Petals broader than the sepals. Lip 3-lobed at the apex, sessile, crested along the middle. Capsule erect.—Two species, the following and one in the northeastern States.

1. *I. verticillata* (Willd.) Raf. Scapes 2-4.5 dm. tall: blades of the whorled bracts mainly elliptic to oval or obovate, 2.5-8 cm. long: flower long-stalked: lateral sepals purple, narrowly linear, 30-50 mm. long: petals linear, 15-20 mm. long: lip-body green, 10-15 mm. long, terminating in 2 lateral lobes striped with madder-purple and a white, median broad lobe: capsule 2-3 mm. long. [*Pogonia verticillata* Nutt.]—(GREEN ADDERLING. FIVE-LEAF ORCHID.)—Woods, often in acid soil, various provinces, Fla. to La., (Tex.?), Wis., and Me.—Spr.—A related species, *I. affinis* (Aust.) Rydb., with yellowish sessile or nearly sessile flowers, occurs in S Va. and may be expected in N. C.

15. *LIMODORUM* L. Scapose herbs with corms. Leaves few, consisting of several sheathing scales, and one with an elongate blade. Flowers in a terminal raceme-like spike. Perianth mainly purple, pink-purple, or white. Lateral sepals inequilateral, shorter than the median one. Petals nearly equilateral, somewhat narrowed at the base. Lip erect, with 2 minute lateral lobes and a large dilated middle lobe bearded with clavate hairs. Capsule erect. [*Calopogon* R. Br.]—Represented by the following species.—GRASS-PINKS. ROSE-WINGS.

Dilated portion of the middle lobe of the lip separated from the lateral lobes by a linear stalk-like base.

Lip 15-19 mm. long: column-wing narrowed at the base.

Middle lobe of the lip cuneate-flabellate: mature leaf-blades over 10 mm. wide.

Middle lobe of the lip obreniform: mature leaf-blades less than 8 mm. wide.

Lip 9-10 mm. long: column-wings truncate at the base.

Dilated portion of the middle lobe of the lip narrowed down to the lateral lobes.

Middle lobe of the lip cuneate, the lateral lobes half-orbicular.

Lateral sepals broadly ovate: lip rounded or truncate at the apex; crest extending to the margins.

Lateral sepals elliptic-ovate: lip deeply 2-lobed at the apex; crest central.

Middle lobe of the lip rounded at the base, the lateral lobes much wider than long.

1. *L. tuberosum*.

2. *L. Simpsonii*.

3. *L. pallidum*.

4. *L. multiflorum*.

5. *L. pinetorum*.

6. *L. parviflorum*.

1. *L. tuberosum* L. Leaf-blade broadly linear to narrowly elliptic, 1-4 dm. long: scape 2-9 dm. tall: perianth pink-purple: lateral sepals half-orbicular, 15-17 mm. long, acute: petals 16-18 mm. long, the blade elliptic to lanceolate: middle lobe of the lip mostly less than 10 mm. wide, flabellate, nearly truncate: column-wings rhombic. [*Calopogon pulchellus* (Salisb.) R. Br.]—Acid bogs and meadows, and rarely gravelly slopes, various provinces, Fla. to Tex., Minn., and Newf.—Spr.—sum.—The flower-color varies from deep-purple to white.

2. *L. Simpsonii* (Chapm.) Small. Leaf-blade narrowly linear, 3-5 dm. long: scape 5-9 dm. tall: perianth rose-purple or rarely white: lateral sepals half-orbicular, 17-18 mm. long, cuspidate: petals 20-22 mm. long, the blade elliptic-ovate: middle lobe of the lip 8-10 mm.

wide, obreniform, emarginate, mostly over 11 mm. wide: column-wings broadly obovate.—Swamps and prairies, often in calcareous soil, mostly in the Everglades, pen. Fla.—(*W. I.*)—Spr. or all year.

3. *L. pallidum* (Chapm.) C. Mohr. Leaf-blade narrowly linear, 10–30 cm. long: scape 2–5 dm. tall: perianth pale-pink or white tinged with purple: lateral sepals broadly elliptic to obovate, 11–13 mm. long, acute: petals 13–14 mm. long, the blades linear to linear-lanceolate: middle lobe of the lip 5–6 mm. wide, cuneate-flabellate, emarginate: column-wings broadly deltoid.—Wet pinelands, Coastal Plain, Fla. to La. and N. C.—Spr.

4. *L. multiflorum* (Lindl.) C. Mohr. Leaf-blade linear, 8–15 cm. long: scape 1–2.5 dm. tall: perianth rose-purple: lateral sepals ovate, 10–12 mm. long, acute: petals 12–13 mm. long, the blades ovate or obovate: middle lobe of the lip broadly cuneate, 8–9 mm. wide, truncate or rounded: column-wings rhombic.—Damp pinelands, Coastal Plain, Fla. to Miss.—Spr.

5. *L. pinetorum* Small. Leaf-blade narrowly linear, 0.5–1.5 dm. long: scape 1–2.5 dm. tall: perianth deep-pink: lateral sepals elliptic-ovate, 10.5–11.5 mm. long, acutish: petals 11–12 mm. long, the blade elliptic: middle lobe of the lip cuneate, 6–8 mm. wide, deeply 2-lobed at the apex and mucronate: column-wings half-orbicular.—Dry pinelands, Everglade Keys, Fla.—Spr.

6. *L. parviflorum* (Lindl.) Nash. Leaf-blade narrowly linear, 1–3 dm. long: scape 1.5–4 dm. tall: perianth rose-pink: lateral sepals ovate or elliptic, 11–14 mm. long, abruptly contracted at the apex: petals 13–15 mm. long, the blade elliptic-lanceolate: middle lobe of the lip orbicular-reniform, 9–10 mm. wide, broadly rounded at the apex: column-wings nearly half orbicular. [*L. graminifolium* (Ell.) Small]—Low pinelands, and acid meadows, Coastal Plain, Fla. to La. and N. C.—Spr.

16. *ARETHUSA* L. Scapose herbs, with corms. Leaves elongate sheathing scales, the upper one producing a narrow blade. Flower usually solitary at the top of the scape. Perianth mainly rose-pink. Lateral sepals slightly curved. Petals quite similar to the lateral sepals, but shorter. Lip dilated, recurved, crested. Capsule erect.—Two species, the following and one in Japan.

1. *A. bulbosa* L. Basal leaf with a linear blade 10–15 cm. long: scape 1–3 dm. tall: lateral sepals broadly linear to narrowly oblong, 35–43 mm. long, acute: lip 25–30 mm. long, with 2 shallow lateral lobes and a larger middle lobe, toothed or fringed at the apex: capsule 20–25 mm. long.—(ROSE-LIP. SWAMP ROSE-ORCHID.)—Acid bogs, Blue Ridge, S. C. to Va., and various provinces, Md. to Minn. and Newf.—Spr.—Plant “leafless” during anthesis, but as the flowers wither an elongate blade protrudes from the basal sheaths. Albino forms occur.

17. *TRIPHORA* Nutt. Caulescent herbs, with fleshy tubers. Leaves several, with relatively broad scale-like blades. Flowers nodding, several, axillary to leaf-like bracts. Perianth white or magenta-pink. Sepals nearly equal, about as long as the petals. Petals about as broad as the sepals, but narrower at the base. Lip dilated above the claw, prominently 3-lobed, crestless or with 3 low crests, the middle lobe much larger than the lateral ones. Capsule droop-

ing.—NODDING-CAPS.—About 10 species, natives of tropical and temperate America.—Sum.—fall.

Column 10–12 mm. long: petals spatulate: capsule as long as the stalk or slightly shorter.

Column 6–7 mm. long: petals linear or nearly so: capsule much shorter than the stalk.

1. *T. trianthophora*.

2. *T. cubensis*.

1. *T. trianthophora* (Sw.) Rydb. Stem 5–30 cm. tall: leaf-blades suborbicular to ovate-orbicular or ovate, 5–20 mm. long, partly clasping, but spreading: flowers nodding, white flushed with pink: lateral sepals linear-spatulate, 12–15 mm. long: petals spatulate: lip 12–15 mm. long, the middle lobe 5 mm. wide or more: capsule 10–14 mm. long. [*Pogonia pendula* (Nutt.) Lindl.]—(NODDING-ETTERCAP. THREE-BIRDS.)—Rich woods, various provinces, rarely Coastal Plain, Fla. to Kans., Wis., and Me.

2. *T. cubensis* (Reichenb.) Ames. Stem 10–30 cm. tall: leaf-blades broadly ovate, mostly 10–20 mm. long, clasping the stem and mostly appressed: flowers nodding, magenta: lateral sepals broadly linear, about 8 mm. long: petals linear. lip 8–9 mm. long, the middle lobe 3 mm. wide or less: capsule 12–15 mm. long.—Pinelands, S pen. Fla.—(W. I.)—Both species are irregular in their flowering seasons; several years may elapse between them.

18. **OPHRYS** L. Scapose herbs. Leaves reduced to scales at the base of the scape. Flowers in a raceme subtended by 2 opposite leaf-like bracts. Perianth greenish or brownish purple. Sepals and petals distinct, nearly equal, spreading or reflexed. Lip more or less drooping, 2-lobed at the apex, the lobes sometimes elongate. Stigma-beak rounded. Capsule slender-stipitate. [*Listera* R. Br.]—About 12 species, natives of north temperate and arctic regions.—TWAYBLADES. DOUBLE-LEAF ORCHIDS.

Lip wedge-shaped, about twice as long as the petals, notched at the apex: column 1.5 mm. long.

Lip linear, 6–10 times longer than the petals, 2-parted: column 0.5 mm. long.

1. *O. Smallii*.

2. *O. australis*.

1. *O. Smallii* (Wiegand) House. Plant 1–3 dm. tall: blades of the bracts reniform or ovate-reniform, 1–3 cm. long: sepals and petals 3.5–4 mm. long, acute or acutish: lip 6–8 mm. long, the lobes rounded. [*Listera convallarioides* (Chapm. Fl.). *L. reniformis* Small]—(GYPSY-WITCH.)—Thickets and wooded hillsides, in acid humus, Blue Ridge and Appalachian Valley, N. C. to Tenn. and Pa.—Spr.—sum.

2. *O. australis* (Lindl.) House. Plant 1–3 dm. tall: blades of the bracts ovate to triangular-ovate, 1.5–2.5 cm. long: sepals and petals 1.5–2 mm. long: lip 6–12 mm. long, the lobes acute. [*Listera australis* Lindl.]—Wet acid thickets

and low woods, Coastal Plain, New England Upland and Great Lake Lowland, Fla. to La., Ont., and Vt.—Spr.

**19. PRESCOTTIA** Lindl. Caulescent herbs, with stout roots. Leaves various, the basal ones with broad blades, the cauline ones reduced to sheathing scales. Flowers minute, in a terminal spike. Perianth white, pink, or greenish. Lateral sepals broad, nearly equilateral. Petals much smaller than the sepals. Lip very broad, the blade auricled at the base. Capsule ascending.—About 30 species of tropical America.

**1. *P. oligantha*** (Sw.) Lindl. Plant 2–4 dm. tall, the stem with narrow scales: blades of the lower leaves ovate or elliptic to oval, 2–6 cm. long: lateral sepals ovate, about 1.5 mm. long: petals ovate to oblong-ovate, about 1 mm. long: lip 1.2–1.5 mm. long, the blade suborbicular, with minute auricles at the base: capsule-body 4–5 mm. long.—Hammocks. Everglade Keys, Fla.—(W. I.)—Wint.

**20. CRANICHIS** Sw. Caulescent succulent herbs, with coarse roots. Leaves various, the lower cauline with mostly long-petioled dilated blades, the upper ones reduced to partially sheathing scales. Flowers in a terminal spike. Perianth white or whitish. Lateral sepals broad, slightly inequilateral. Petals narrow, much smaller than the sepals. Lip longer than the petals, concave. Capsule scarcely stipitate.—About 20 species of tropical America.

**1. *C. muscosa*** Sw. Plant 1–3 dm. tall, the stem scaly: leaf-blades oblong-elliptic, oval or ovate, 2.5–7 cm. long: lateral sepals ovate, 3–3.5 mm. long: petals narrowly elliptic to cuneate-spatulate, 2.5–3 mm. long: lip oblong or nearly so, about 3 mm. long, sessile: capsule oval or ellipsoid, 1 cm. long or less.—Hammocks, Everglade Keys, Fla.—(W. I.)—Wint.—spr.

**21. PONTIEVA** R. Br. Caulescent herbs with scape-like stems from clustered roots. Leaves various, the lower cauline with dilated blades, the upper mere scales. Flowers in a lax raceme. Perianth greenish. Lateral sepals broad, slightly inequilateral. Petals drooping, the blade very inequilateral, slender-clawed. Lip relatively small, concave, beaked, short-clawed. Capsule spreading.—About 20 species, natives of the tropical and warm parts of America.—SHADOW-WITCHES.

Petal-blades about as wide as long: lip 4 mm. long or more. 1. *P. racemosa*.  
 Petal-blades decidedly longer than wide: lip 3.5 mm. long or less. 2. *P. Brittonae*.

**1. *P. racemosa*** (Walt.) C. Mohr. Plant 2–5 dm. tall, the stem scape-like, with remote sheathing scales: leaves mainly near the base of the stem; blades ellip-

tic or ovate-oval, 4-13 cm. long, or longer: raceme stout, glandular-pubescent, 6-21 cm. long: bracts linear-lanceolate, 5-14 mm. long: median sepal oblong or elliptic-lanceolate, 6-7 mm. long, obtuse; lateral sepals ovate, 5-5.5 mm. long, acutish: petals 5-5.5 mm. long, the blades about as wide as long: lip white with green stripes, 4-4.5 mm. long: anther broadly linear. [*P. glandulosa* (Sims) R. Br.]—Rich woods, Coastal Plain and occasionally adj. provinces, Fla. to Ala. and Va.—Fall-spr.

2. *P. Brittonae* Ames. Plant similar to that of *P. racemosa*, but smaller and with a more slender raceme: leaf-blades elliptic, ovate, or obovate, 3-11 cm. long, acute: raceme 4-16 cm. long: bracts linear-lanceolate, 4-8 cm. long:

median sepal elliptic-lanceolate or oblong, 4-4.5 mm. long, obtuse; lateral sepals ovate, 4-4.5 mm. long, acute: petals 4-4.5 mm. long, the blades decidedly longer than wide: lip 3-3.5 mm. long: anther narrowly ellipsoid.—Pinelands and rarely hammocks, Everglade Keys, Fla.—(W. I.)—Wint.

22. *IBIDIUM* Salisb. Caulescent herbs. Leaves various, the basal and lower cauline with usually narrow blades or sometimes with short broad blades, the upper cauline leaves mere sheathing scales. Flowers in a terminal spiral spike. Perianth white, rarely pinkish, yellowish, or greenish. Median sepal and petals coherent: lateral sepals erect. Lip erect, or with a spreading tip, bearing 2 basal callosities, the lower portion folded around the very short column. Stigma with a 2-forked beak. Capsule ascending. [*Spiranthes* L. C. Rich. *Gyrostachys* Pers.]—About 80 species, natives of temperate and tropical America.—LADIES'-TRESSES. PEARL-TWISTS. SPIRAL-ORCHIDS.—A decoction from the roots of some of the species is used by the Seminoles as a blood purifier.

Flowers merely alternate, apparently secund as a result of the twisting of the rachis. Stem with sheathing scales: basal leaves with relatively short and broad blades, fugaceous.

Spike decidedly spirally twisted: perianth small (2-5 mm. long).

Lip white throughout: perianth about 3 mm. long.

Lip medially colored: perianth 4-5 mm. long.

Lip medially yellow: flowers opening in spring.

Lip medially green: flowers opening in summer.

Spike merely secund, unilateral or slightly spirally twisted: perianth large (7-11 mm. long).

Stem more or less leafy below: basal leaves with elongate more or less persistent blades.

Blades of the basal leaves elongate-linear or filiform, semiterete and channeled.

Blades of the basal leaves narrowly linear, flat.

Lip pubescent without.

Lip of an elliptic type, usually broadest across the callosities, lacinate at the tip.

Lip of an ovate type, usually broadest in front of the callosities, not lacinate at the tip.

Lip glabrous without.

Flowers 2-several ranked, borne in an elongate, often dense spike, the rachis not conspicuously twisted.

Lip white, pubescent, the callosities prominently exerted and more or less hooked.

Perianth over 8 mm. long, not conspicuously ringent, the parts not slender-tipped.

Perianth less than 4 mm. long, conspicuously ringent, the parts with conspicuously slender tips.

Lip yellow, glabrous, the callosities imbedded in the base of the blade.

1. *I. Beckii*.

2. *I. floridanum*.

3. *I. gracile*.

4. *I. longilabre*.

5. *I. tortile*.

6. *I. laciniatum*.

7. *I. vernale*.

8. *I. praecox*.

9. *I. cernuum*.

10. *I. ovale*.

11. *I. plantagineum*.

1. **I. Beckii** (Lindl.) House. Stem 1-3 dm. tall, from a single root (the preceding season's root sometimes persisting): blades of the basal leaves ovate to elliptic, 1-3 cm. long: spike very slender, relatively few-flowered: perianth white: lateral sepals lanceolate, about 3 mm. long: petals spatulate to elliptic-spatulate: lip ovate to orbicular-ovate, 2.5-3 mm. long. [*Spiranthes simplex* A. Gray]—Dry acid soil, often in open woods, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Mass.—Sum.

2. **I. floridanum** Wherry. Stem 1.5-4 dm. tall, from a cluster of fleshy roots: blades of the basal leaves elliptic or essentially so, 1-4 cm. long: spike slender, 3-10 cm. long: perianth whitish or cream-colored, with a bright yellow stripe down the middle of the lip: lateral sepals lanceolate, 4-5 mm. long: petals linear: lip elliptic-oblong, about as long as the sepals.—Moist, strongly acid pinelands and boggy meadows, Coastal Plain, Fla. to E Tex. and S. C.—Spr.

3. **I. gracile** (Bigel.) House. Stem 2-8 dm. tall, from a cluster of short roots: blades of the basal leaves elliptic or ovate-lanceolate, 1.5-5 cm. long: spike slender, 5-12 cm. long: perianth white, with a bright green stripe down the middle of the lip: lateral sepals lanceolate, 4-4.5 mm. long: petals linear: lip elliptic-oblong, slightly longer than the sepals.—Dry, moderately acid grassy fields and open woods, various provinces, Ga. to Tex., Man., and N. S.—Sum.

4. **I. longilabre** (Lindl.) House. Stem 2-5 dm. tall, from usually 3 fleshy roots: blades of the basal leaves lanceolate to elliptic-lanceolate, 2-5 cm. long: spike stout: perianth mainly white: lateral sepals lanceolate or linear-lanceolate from a dilated base: petals broadly linear or nearly so: lip ovate to elliptic-ovate, 7-9 mm. long, much crisped above the base, recurved near the apex. [*Spiranthes brevifolia* Chapm.]—Moist grassy pinelands, Coastal Plain, Fla. to La.—Fall.

5. **I. tortile** (Sw.) House. Stem 2-4.5 dm. tall, from a cluster of long roots: blades of the basal and lower cauline leaves elongate-linear or filiform-linear, very thick, mostly 8-30 cm. long: spike relatively slender: perianth mainly white: lateral sepals broadly lanceolate, 4.5-5.5 mm. long: petals narrowly elliptic: lip ovate, 4-6 mm. long.—Marshes and moist pinelands, Coastal Plain, Fla. to La.—(W. I.)—Spr.-fall.

6. **I. laciniatum** (Small) House. Stem 2-6 dm. tall, from a cluster of coarse elongate roots, more or less pubescent: blades of the basal and lower cauline leaves narrowly linear and often long-tapering, up to 40 cm. long: spike slender, elongate: perianth white or nearly so, 7-9 mm. long: lateral sepals linear-lanceolate, mostly 6-9 mm. long: petals linear: lip elliptic-ovate, finely lacinate near the apex.—Wet sandy soil, marshes, ponds, and lake shores, often in acid soil, Coastal Plain, Fla. to Tex. and S. C.—Spr.-sum.

7. **I. vernale** (Engelm. & Gray) House. Stem 1.5-6.5 dm. tall, from elongate-fusiform roots, copiously pubescent above: blades of the basal and lower cauline leaves linear, tapering to both ends, or sometimes phyllode-like and without a dilated blade, 7-15 cm. long: spike elongate: perianth yellowish: lateral sepals lanceolate, 6-10 mm. long: petals linear or elliptic-linear: lip ovate, sometimes rhombic-ovate. [*I. xyridifolium* Small]—Sandy or gravelly soil, meadows, fields, and open woods, various provinces, Fla. to N. M., Kans., and Mass.—(W. I.)—Spr.-fall. Hybridizes with *I. gracile*, yielding  $\times$  *I. intermedium*.

8. **I. praecox** (Walt.) House. Stem 2-8 dm. tall, from clustered elongate roots, sparingly pubescent above: blades of the basal and lower cauline leaves linear, often narrowly so, 8-25 cm. long: spike elongate, slender, not very dense: perianth

mainly white with the parts sometimes veined with green, 4–5 mm. long: lateral sepals lanceolate to linear-lanceolate, 5–6 mm. long (rarely longer): petals linear: lip elliptic.—Wet grassy places, Coastal Plain, Fla. to Tex. and N. J.—Spr.—sum.

9. *I. cernuum* (L.) House. Stem 1–4 dm. tall or up to 1 m., from coarse cord-like roots: blades of the basal and lower cauline leaves linear, sometimes broadly so, varying to linear-oblanccolate or linear-lanceolate, up to 25 or 40 cm. long, sometimes with elongate petiole-like bases: spike dense, 3–15 cm. long, stout: flowers more or less fragrant: perianth white or creamy, 7–11 mm. long: petals lanceolate: lip ovate-elliptic, somewhat rhombic, or dilated at the base, more or less erose or crisped near the apex. [*I. trilobum* Small]—Bogs, swamps, wet woods, river-banks, usually in acid soil, various provinces, Fla. to Tex., N. M., S. D., and Newf.—Sum.—fall, or all year S.—A form with cream-colored spikes, growing in non-acid soil and often drier places, has been described as *I. ochroleucum* (Rydb.) House, while a vigorous variant, growing mostly in rich swamps of moderate acidity, in the southern Coastal Plain, has been described as *I. odoratum* (Nutt.) House.

10. *I. ovale* (Lindl.) House. Stem 2–4 dm. tall, from a cluster of elongate roots: blades of the basal and lower cauline leaves broadly linear to linear-elliptic, 4–16 cm. long: spike slender, tapering, closely flowered but not very dense: perianth white, 4–5 mm. long: lateral sepals broadly lanceolate: petals broadly linear or linear-lanceolate: lip ovate to elliptic-ovate, narrowed at the apex. [*Spiranthes cernua parviflora* Chapm.]—Moist woods, swamps, and hill-sides, various provinces, Ga. to La. (Tex.?), Mo., and Ohio.—Fall.

11. *I. plantagineum* (Raf.) House. Stem 1–4 dm. tall, from a cluster of thick roots: blades of the basal and lower cauline leaves broadly linear to linear-elliptic, or broadest slightly above the middle or below it: spike stout, not tapering, rather loosely flowered: perianth, except the lip, white or nearly so, 5–7 mm. long: lateral sepals narrowly lanceolate: petals linear: lip quadrate-elliptic, yellow, broad at the apex.—Moist woods and grassy banks, various provinces, rarely Coastal Plain, N. C. to Minn. and N. S.—Spr.—sum.

23. **CYCLOPOGON** Presl. Caulescent herbs. Leaves various, the basal and lower cauline with wide blades, the upper cauline mere sheathing scales. Flowers in a terminal spike. Perianth whitish. Median sepal and petals coherent; lateral sepals erect. Lip with a large body completely involute about the long column and a short nearly erect tip, the basal callosities commonly minute or obscure. Stigma-beak not forked.—About 30 species in tropical America.

Column and androecium nearly equalling the lip: apical lobe of the lip rhombic, much narrower than the body of the lip.

Column and androecium about half as long as the lip: apical lobe of the lip reniform or flabellate, nearly or quite as wide as the body of the lip.

1. *C. cranichoides*.

2. *C. elata*.

1. *C. cranichoides* (Giseb.) Schltr. Plant 1–3 dm. tall: blades of the basal leaves ovate to oval, often oblique, 2–3.5 cm. long, usually acute: flowers spreading: lateral sepals linear-lanceolate, about 5 mm. long, obtuse: petals spatulate: lip about 5 mm. long, the body obovate or broadly cuneate when spread out, much wider than the small rhombic terminal lobe: column longer than the anther: capsule obovoid-ellipsoid, 7–9 mm. long. [*Spiranthes Storeri* Chapm. *Beadlea Storeri* Small]—Hammocks, pen. Fla. and the Keys.—(W. I.)—Wint.—spr.

2. *B. elatum* (Sw.) Schltr. Plant similar to that of the preceeding species, but usually larger, up to 6 dm. tall: blades of the basal leaves elliptic or oval, varying to broadest above the middle or below it, 15 cm. long or less, acute or short-acuminate, often with a long petiole-like base: lateral sepals lanceolate, about 6 mm. long: petals linear-elliptic, about 5 mm. long: lip about 6 mm. long, the body ovate, when spread out, about as wide as the reniform or flabellate terminal lobe or narrower: column shorter than the anther: capsule ellipsoid, 10–12 mm. long.—Hammocks, Brooksville hammock region, Fla.—(*W. I.*, *S. A.*)—Spr.

24. *MESADENUS* Schlechter. Caulescent herbs with stout tuberous roots. Leaves various, the basal with broad short blades, those of the stem mere sheathing scales. Spike erect, slender, sometimes elongate, with short bracts. Flowers arcuate, the perianth ringent, horizontal or somewhat nodding, greenish-purple. Median sepal and petals coherent, recurved. Lateral sepals free, somewhat recurved. Lip similar to the lateral sepals but slightly wider and shorter, recurved near the tip, sessile, without callosities at the base. Column long, but less than half as long as the lip. Anther didymous, extending beyond the truncate or emarginate stigma. Capsule sessile.—Five species in tropical America.

1. *M. lucayanus* (Britton) Schlechter. Stem 2–7 dm. tall, glabrous, from a cluster of roots: blades of the basal leaves narrowly or broadly elliptic to ovate, 2.5–11 cm. long, acute, narrowed into petiole-like bases: petals narrowly linear-lanceolate, 4.5–5 mm. long, acute, curved: lip lanceolate, faintly veined: column about 2 mm. long: anther as wide as long: capsule oval or obovoid, 4–6 mm. long, ribbed.—Hammocks, Florida Keys.—(*W. I.*)—Wint.-spr.

25. *STENORRHYNCHUS* L. C. Rich. Caulescent highly colored succulent herbs. Leaves various, the basal with more or less elongate blades, early decaying, upper cauline leaves sheathing scales. Flowers in a conspicuous spike. Perianth reddish, yellowish, or white. Lateral sepals narrow, decurrent together with the base of the lip as a spur adnate to the hypanthium. Petals shorter than the lateral sepals. Lip entire, scarcely as long as the lateral sepals, the blade lanceolate, the claw ciliate and with thickened margins, destitute of callosities. Stigma-beak subulate.—About 25 species, natives of tropical and subtropical America.

1. *S. orchioides* L. C. Rich. Stem 3–7 dm. tall, stout: spike conspicuous: lateral sepals linear-lanceolate, 20–27 mm. long: petals lanceolate, 15–20 mm. long, slightly curved: lip slightly shorter than the lateral sepals, with a lanceolate body and a stout claw with lateral ridges and cilia: capsule body 1–1.5 cm.

long. [*Spiranthes jaliscana* S. Wats.]—Hammocks, pen. Fla.—(*W. I., Mex., C. A., S. A.*)

**26. PELEXIA** Poit. Caulescent herbs, with scape-like stems. Leaves various, the lower cauline with dilated long-petioled blades, the upper cauline mere sheathing scales. Flowers in a spike. Perianth greenish. Lateral sepals united at the base and produced into a spur. Petals adnate to the narrow elongated median sepal. Lip elongated, the upper part of the narrow blade crisped: callosities wanting.—About 20 species, of tropical and subtropical America.

1. *P. setacea* Lindl. Plant 3–6 dm. tall: blades of the lower cauline leaves oblong to elliptic, 4–10 cm. long: lateral sepals linear-filiform, 15–17 mm. long, exclusive of spur: lip 30–37 mm. long, the body narrowly elliptic or linear-elliptic with a slender tip: capsule 14–17 mm. long.—Hammocks, Everglade Keys, Fla.—(*W. I., S. A.*)—Wint.-spr.

**27. PERAMIUM** Salisb. Caulescent herbs, with scape-like stems. Leaves narrow, those near the base of the stem with dilated blotched blades, those higher up mere sheathing scales. Flowers in a spike. Perianth white or pink. Lateral sepals of an ovate type. Petals very inequilateral. Lip sessile, sac-like, *i. e.* with a small blade and a large saccate base. Capsules erect. [*Good-ya* R. Br.].—About 25 species, widely distributed in temperate and tropical regions.—Sum.—RATTLESNAKE-PLANTAINS. LATTICE-LEAVES.

Spike 1-sided: petals 3–3.5 mm. long: lip-sac with a broad border.  
Spike cylindric: petals 4.5 5.5 mm. long: lip-sac with a narrow border.

1. *P. ophioides*.

2. *P. pubescens*.

1. *P. ophioides* (Fernald) Rydb. Plant 1–2.5 dm. tall: blades of the lower cauline leaves ovate to lanceolate-ovate, 1–2 cm. long: lateral sepals about 4 mm. long: petals shorter than the sepals, erose, acute: lip 4 mm. long, the edge even, the tip triangular.—Moist cool woods, Blue Ridge and more northern provinces, N. C. to N. M., B. C., Alas., Ont., and Newf.—*Peramium repens* (L.) Salisb., in which the above species was formerly included, is an Old World plant.

2. *P. pubescens* (Willd.) MacM. Plant 1.5–5 dm. tall: blades of the lower cauline leaves oblong, elliptic or ovate, 2–5 cm. long: lateral sepals about 5 mm. long: petals about as long as the sepals, not erose, obtuse: lip 4 mm. long, the edge undulate, the tip reniform or nearly so.—Woods, usually in dry soil, various provinces, Ala. to Minn., Newf., and N. C.

**28. PHYSURUS** L. C. Rich. Caulescent herbs, the stems leafy. Leaves with wide blades. Flowers in a spike or spike-like raceme. Perianth whitish or greenish. Lateral sepals relatively broad, decurrent together with the base of the lip as a spur partially adnate to the hypanthium. Petals mostly smaller than the sepals. Lip 3-lobed, the terminal lobe quite as large as the body of the lateral lobes, with a reflexed tip, the broad claw-like base forming part of the spur; callosities wanting. Capsule spreading.—About 65 species, natives of tropical and subtropical regions.

Lateral sepals broadly linear: lateral lobes of the terminal lip-lobe ovate, directed forward; leaf-blades acuminate.

1. *P. Sagraeanus*.

Lateral sepals ovate: lateral lobes of the terminal lip-lobe semi-orbicular, directed outward: leaf-blades acute.

2. *P. querceticola*.

1. *P. Sagraeanus* A. Rich. Plant 2–4 dm. tall, the stem simple: leaf blades lanceolate to ovate-lanceolate, the upper ones 4–8 cm. long: median sepal lanceolate, 4 mm. long: petals slightly inequilateral: lip, with spur, about 6 mm. long, the middle lobe broadly cuneate at the base when spread out: capsule 6.5–7 mm. long, rather faintly ribbed.—Hammocks, S pen. Fla.—(*W. I.*)—Fall-spr.

2. *P. querceticola* Lindl. Plant 0.5–1.5 dm. tall, the stem simple: leaf-blades ovate, often broadly so, the upper ones 1.5–5 cm. long: median sepal ovate to ovate-lanceolate, about 3 mm. long: petals very inequilateral: lip, with spur, about 5 mm. long, the middle lobe subcordate at the base when spread out: capsule 5.5–6 mm. long, prominently ribbed.—Low woods and hammocks, Coastal Plain, N pen. Fla. to La. and Tex.—Sum.

**29. TROPIDIA** Lindl. Caulescent somewhat woody herbs with fibrous roots. Leaves with plicate blades terminating long sheathing bases. Panicle stalked. Perianth greenish-white. Lateral sepals nearly equilateral. Petals somewhat smaller than the sepals, slightly curved. Lip shorter than the petals, with a saccate base and a slightly curved blade. Capsule spreading.—About 5 species, widely distributed in the tropics.

1. *T. polystachya* (Sw.) O. Ames. Stem 3–5 dm. tall, branched: leaf-blades elliptic to elliptic-lanceolate, 5–20 cm. long, persistent: lateral sepals elliptic or nearly so, 6–7 mm. long: petals 5–6 mm. long: lip 4–4.5 mm. long, constricted about the middle: capsule-body 9–14 mm. long. [*Corymbis polystachya* Benth.]—Hammocks, Everglade Keys, Fla.—(*W. I.*)—Spr.—sum.

**30. MALAXIS** Soland. Scapose herbs, with corms. Leaves mainly elongate sheaths, the upper 1 or 2 bearing a dilated blade at the top. Flowers in a terminal raceme. Perianth white or greenish. Lateral sepals slightly inequilateral. Petals linear-filiform or filiform, shorter than the sepals. Lip broad, cordate at the base, sometimes lobed at the apex. Capsule short. [*Achroanthos* Raf.].—About 140 species of wide geographic distribution.—Sum.—fall.—ADDER-SMOUTHS.

Lip with basal auricles: lateral sepals obtuse.

Lip with 2 lateral lobes projecting far beyond the minute middle one: lateral sepals much shorter than the lip. 1. *M. unifolia*.

Lip with 2 broadly rounded lateral lobes shorter than the middle one but broader: lateral sepals nearly as long as the lip.

Lip without basal auricles: lateral sepals acuminate.

2. *M. spicata*.

3. *M. brachypoda*.

1. *M. unifolia* Michx. Leaf usually solitary; blade elliptic, ovate or oval, 2–6 cm. long: scape 1–3 dm. tall: raceme stout: lateral sepals ovate or elliptic-ovate, 1–1.5 mm. long, obtuse: lip green, about 2.5 mm. long, the 2 lateral lobes much larger than the middle one: capsule 5–6 mm. long. [*Microstylis ophioglossoides* Nutt.].—Acid woods, various provinces, Ga. to La., Man., and Newf. —(*W.I., Mex.*)

2. *M. spicata* Sw. Leaves normally 2; blades ovate to elliptic-ovate, 3–10 cm. long: scape 1–3 dm. tall: raceme stoutish: lateral sepals elliptic or nearly so, about 3 mm. long, obtuse: lip brownish-green, about 3.5 mm. long, prominently auricled at the base, with a broad blunt tip: capsule 6–7 mm. long. [*Microstylis floridana* Chapm. *Malaxis floridana* Small].—Low or wet hammocks, and stream-banks, often in calcareous soil, Coastal Plain, Fla. to Va. —(*W. I.*)

3. *M. brachypoda* (A. Gray) Fernald. Leaf solitary; blade elliptic to oval, 3–7 cm. long: scape 1–2 dm. tall: raceme slender: lateral sepals lanceolate, about 2.5 mm. long, acuminate: lip 2–2.5 mm. long, greenish-white, not auricled at the base, with a reniform base and an acuminate tip: capsule 4–5 mm. long. —Woods and swamps, various provinces, Tenn. to Tex., Minn., Que., and Pa. —(*Eurasia.*)

**31. LIPARIS** L. C. Rich. Scapose green herbs, with corms. Leaves 2 or more at the base of the scape, with wide blades, accompanied by several scales. Flowers in a terminal raceme. Perianth greenish. Lateral sepals narrow, nearly equilateral. Petals linear, elongate-linear or filiform, longer than the sepals. Lip free, dilated, undulate or erose, sometimes with tubercles at the base. Capsule erect. [*Leptorchis* Thouars.].—About 100 species, widely distributed in temperate and tropical regions.—TWAYBLADES.

Lip rounded at the apex and abruptly pointed: petals narrowly linear to linear-filiform.

Lip with an undulate blade 2.5–3.5 mm. wide: petals narrowly linear.

Lip with an erose blade 12–13 mm. wide: petals linear-filiform.

Lip cuneately dilated at the apex and notched: petals broadly linear.

1. *L. Loeselii*.

2. *L. liliifolia*.

3. *L. elata*.

1. *L. Loeselii* (L.) L. C. Rich. Leaf-blades elliptic to elliptic-lanceolate, 5–17 cm. long: scape 0.5–2 dm. tall: lateral sepals lanceolate, about 4 mm. long: petals 6–7 mm. long: lip yellowish-green, about 4 mm. long, the blade suborbicular, abruptly pointed: capsule ellipsoid, 10–14 mm. long.—Wet rocky soil, swamps, moist thickets, and cliffs, various provinces, rarely Coastal Plain, Ala. to Mo., Sask., Ont., and N. S.—Spr.

2. *L. liliifolia* (L.) L. C. Rich. Leaf-blades ovate to oval or elliptic-ovate, 5–15 cm. long: scape 1–3 dm. tall: lateral sepals linear-lanceolate or nearly linear, about 11 mm. long: petals 11–13 mm. long: lip russet or brown-purple, 11–13 mm. long, the blade obovate-cuneate to suborbicular, erose, abruptly pointed: capsule clavate-ellipsoid, 12–18 mm. long.—(RUSSET-WITCH.)—Rocky woods and thickets, various provinces, Ga. to Ala., Mo., Minn., and Me.—Spr.—sum.

3. *L. elata* Lindl. Leaf-blades few, broad, elliptic, elliptic-ovate, 6–18 cm. long: scape 15–43 cm. tall: lateral sepals ovate-oval, about 5 mm. long: petals broadly linear, about 5.5 mm. long: lip dark-green or brownish, about 4 mm. long, the blade broadly cuneate, notched at the apex: capsule clavate-ellipsoid or clavate-oval, 16–21 mm. long.—Hammocks, S pen. Fla.—(W. I., C. A., S. A.)—All year.

32. **TIPULARIA** Nutt. Caulescent herbs, with grouped corms. Leaf solitary, terminating the corm, decaying before the lateral scaly stem arises. Flowers numerous, in a terminal raceme. Perianth brownish. Lateral sepals nearly equilateral. Petals shorter and narrower than the sepals. Lip free, with 2 broad basal lobes and a narrow terminal lobe, long-spurred. Capsule nodding.—Two species, the following and one in the Himalayas.

1. *T. unifolia* (Muhl.) B. S. P. Leaf solitary, autumnal; blade ovate or ovate-lanceolate, 4–9 cm. long, purple beneath: flower-stalk 3–6 dm. tall: raceme loosely flowered: lateral sepals broadly linear or elliptic-linear, 6–8 mm. long: petals broadly linear: lip about 7 mm. long, the lateral lobes broad, toothed, the terminal lobe linear: spur slender: capsule 10–12 mm. long. [*T. discolor* Nutt.]—(ELFIN-SPUR. CRANEFLY-ORCHID.)—Woods, shaded banks, and hammocks, in acid soil, Coastal Plain and occasionally other provinces, Fla. to Tex., Ind., N. Y., and N. J.—Sum.—The leaves last through the winter.

33. **APLECTRUM** Nutt. Caulescent herbs with a chain of corms. Leaf solitary, terminating the corm, decaying before the lateral scaly stem arises.

Flowers few in a terminal raceme. Perianth brownish-yellow, striped with purple. Lateral sepals narrow, slightly curved. Petals slightly longer than the sepals. Lip dilated, 3-lobed, 3-ridged above the claw, spurless. Capsule drooping.—One species.

1. *A. hyemale* (Muhl.) Torr. Leaf autumnal, or slightly earlier; blade elliptic, 4–20 cm. long: flower-stalk vernal, 2–6 dm. tall: lateral sepals linear-spatulate, 10–13 mm. long: petals spatulate: lip 11–12 mm. long, the blade with 2 oblong-ovate lateral lobes and a suborbicular crenulate middle lobe: capsule 2–2.5 cm. long.—(ADAM-AND-EVE. PUTTY-ROOT.)—Woods, various provinces, rarely Coastal Plain, Ga. to Ark., Calif., Sask., Ont., and Vt.—Spr.

34. *HEXALECTRIS* Raf. Caulescent herbs, with coral-like rootstocks. Leaves scale-like. Flowers in a terminal raceme. Perianth brownish-yellow striped with light purple. Lateral sepals inequilateral, shorter than the median one. Petals curved, longer than the lateral sepals. Lip 3-lobed, with a crest of several ridges, spurless. Capsule drooping.—Two species, the following and one in Mexico.

1. *H. spicata* (Walt.) Barnhart. Stem 1–5 dm. tall, scaly: raceme loosely-flowered: lateral sepals half-ovate, 16–20 mm. long: petals elliptic-spatulate: lip 16–18 mm. long, with a narrow base, wide lateral lobes and a crisped middle lobe: capsule 2–2.5 cm. long. [*H. aphylla* (Nutt.) Raf.]—(BRUNETTA.)—Rich woods, Coastal Plain and occasionally other provinces, Fla. to Tex., Ariz., Mo., Ind., and Md.—(*Mex.*)—Sum.—The plant is devoid of roots and of chlorophyll. The stem and leaves are brown.

35. *CORALLORRHIZA* R. Br. Caulescent succulent purplish, brownish or reddish herbs, with coral-like rootstocks. Leaves reduced to scales. Flowers in a terminal raceme. Perianth white or yellow. Lateral sepals slightly inequilateral, often curved. Petals rather smaller than the sepals, somewhat narrowed at the base. Lip dilated, the blade undulate or lobed. Capsule nodding.—About 15 species, widely distributed in the north temperate zone.—CORAL-ROOTS. CORAL-ORCHIDS.

Lip 3-lobed, the lateral lobes spreading or directed forward.

Lip deeply 3-lobed: spur prominent.

Lip shallowly 3-lobed: spur obsolete.

Lip not lobed, often erose or crisped.

Lip 4–8 mm. long, the blade obovate to suborbicular.

Lip long-clawed or clawless, the blade notched: column broadly winged.

• Lip short-clawed or clawless, the blade short-tipped: column narrowly winged.

Lip 3–3.5 mm. long, the blade elliptic, obtuse.

1. *C. maculata*.

2. *C. Corallorrhiza*.

3. *C. Wisteriana*.

4. *C. odontorrhiza*.

5. *C. micrantha*.

1. *C. maculata* Raf. Stem 2-5 dm. tall: raceme 5-20 cm. long: lateral sepals linear to linear-oblong, 6-9 mm. long: petals elliptic to elliptic-spatulate: lip white with purple spots, 6-8 mm. long, the blade with 2 prominent lateral lobes and a suborbicular middle lobe: capsule 12-20 mm. long. [*C. multiflora* Nutt.]—Woods, various provinces, rarely Coastal Plain, Fla. to Tex., Calif., B. C., Ont., and Newf.—Sum.

2. *C. Corallorrhiza* (L.) Karst. Stem 1-3 dm. tall: raceme 2-10 cm. long: lateral sepals linear to linear-spatulate, 3-4 mm. long: petals mostly spatulate: lip white, 3-4 mm. long, the blade with 2 shallow lateral lobes below the middle and an ovate middle lobe: capsule 8-10 mm. long. [*C. innata* R. Br.]—Woods, Blue Ridge, Ga. to Md., and various provinces, Pa. to Wash., Alas., Ont., and Newf.—(*Eurasia*).—Spr.

3. *C. Wisteriana* Conrad. Stem 2-3.5 dm. tall: raceme 3-10 cm. long: lateral sepals linear to linear-lanceolate, 6-8 mm. long: petals elliptic-spatulate: lip white with purple spots, 8-10 mm. long, the blade broadly oval to broadly obovate, notched at the apex: capsule 9-11 mm. long.—Rich woods, various provinces, Fla. to Tex., Mo., Ind., and Pa. (or Mass.?).—Wint.—sum.

4. *C. odontorrhiza* (Willd.) Nutt. Stem 1-3 dm. tall: raceme 4-10 cm. long: lateral sepals linear or nearly so, 3-4 mm. long: lip white with purple streaks, 4-4.5 mm. long, the blade suborbicular, with erose-crested margins and an abrupt-acute tip: capsule 6-7 mm. long.—Woods, various provinces, Fla. to Tex., Mich., and Me.—Spr.—sum.

5. *C. micrantha* Chapm. Stem 8-15 cm. tall: raceme 2-4 cm. long: lateral sepals broadly linear to linear-elliptic, 2-3 mm. long: lip whitish, 3-3.5 mm. long, the blade elliptic, with erose sides and a rounded apex: capsule 6-7 mm. long.—Woods, Coastal Plain, N Fla. and Ga.—Sum.—fall.

36. **PLEUROTHALLIS** R. Br. Epiphytic herbs. Leaves usually solitary: blades thick. Flowers in elongate spike-like racemes, or in clusters. Perianth usually pale, often white or green. Sepals converging or nearly erect, distinct, or the lateral ones partly united. Petals mostly shorter than the sepals. Lip usually pandurate, smaller than the petals. Column short. Capsule erect or nodding.—About 400 species of tropical America.

1. *P. gelida* Lindl. Plant 1-3 dm. tall: leaf-blades elliptic to elliptic-lanceolate, 8-16 cm. long: flower-stalks 1-3, arising from the axil of a bract, 1-2 cm. long: perianth yellowish: lateral sepals nearly linear, 5-5.5 mm. long: petals broadened upward, 3.5-4 mm. long: lip about 2 mm. long: capsule short-stalked, the body ellipsoid, 9-11 mm. long.—Hammocks, SW pen. Fla.—(*W. I.*)

37. **SPATHIGER** Small. Epiphytic herbs with stiff, creeping stems and branches. Leaves mostly ascending or spreading, with rather narrow blades, and sheathing bases. Flowers in the axils of clasping bracts. Perianth small and inconspicuous. Lateral sepals broad, often wider than the median one. Petals rather broad, scarcely dilated upward. Lip concave; blade ovate, sub-orbicular, or reniform. Column short, wholly adnate to the lip. Capsule erect. —About 10 species, of tropical America.

Spike with the bracts separated: lip rounded at the apex: capsule ovoid, long-beaked, subtended by the bract. 1. *S. rigidus*.

Spike with the bracts imbricate: lip acute or acuminate: capsule globose-ovoid, short-beaked, invested by the bract. 2. *S. strobiliferus*.

1. *S. rigidus* (Jacq.) Small. Plant with creeping stem and branches 1–5 dm. long: leaf-blades elliptic, sometimes narrowly so, 4–8 cm. long: perianth greenish: lateral sepals ovate or elliptic-ovate, 5–7 mm. long: petals broadly linear to elliptic spatulate: lip green; blade 2–3 mm. long, triangular-reniform to suborbicular, bearing callosities near the base: capsule 15–18 mm. long. [*Epidendrum rigidum* Jacq.]—Hammocks, S pen. Fla.—(*W. I., C. A., S. A.*)—Spr.

2. *S. strobiliferus* (Reichenb. f.) Small. Plant with creeping stem and branches 0.5–3 dm. long: leaf-blades elliptic to broadly linear or elliptic-lanceolate, 1–2.5 cm. long: perianth mainly or wholly white: lateral sepals obliquely ovate to obliquely-lanceolate, 3–4.5 mm. long: petals linear or somewhat constricted near the base: lip white or whitish; blade 2–3 mm. long, ovate-cordate, unappendaged: capsule 5–7 mm. long. [*Epidendrum strobiliferum* Reichenb. f.]—Hammocks, S pen. Fla.—(*W. I., C. A., S. A.*)—Spr.

38. **AMPHIGLOTTIS** Salisb. Epiphytic herbs with erect or ascending, often tufted, stems. Leaves ascending or spreading, with broad or narrow blades, and sheathing bases, the lower portion of the stem often merely scaly and sometimes thickened after the manner of an elongate pseudobulb. Flowers in a terminal open or contracted raceme or panicle, usually long-pedicelled. Perianth rather large, often showy. Lateral sepals obtuse, acute, or attenuate, often elongate. Petals spatulate or slender and attenuate. Lip relatively large, entire or fimbriate, the middle lobe wanting, minute or elongate. Column elongate, wholly adnate to the lip-base. Capsule drooping.—About 80 species of tropical America.

Lip with 2 spreading lateral lobes and a broad middle lobe.

Blade of the lip about as broad as long, the middle lobe about as large as the lateral ones.

Sepals not ribbed, the lateral ones spatulate: lip with 2 appendages at the base: column slender.

Sepals ribbed, the lateral ones falcate-obovate: lip unappendaged: column stout.

Blade of the lip much broader than long, the middle lobe much smaller than the lateral ones.

Lip with 2 lateral lobes directed forward and a slender elongate middle lobe.

1. *A. conopsea*.

2. *A. anceps*.

3. *A. difformis*.

4. *A. nocturna*.

1. *A. conopsea* (Ait.) Small. Plant 0.5–2 dm. tall: leaf-blades oblong to elliptic-lanceolate, 3–8 cm. long: flower-stalk slender: flowers fragrant: perianth green and often purple-tinged: lateral sepals spatulate, 8–10 mm. long: petals linear-spatulate, 8–10 mm. long: lip green; blade 5–6 mm. long, with 2 broad lateral lobes and a slightly narrower middle lobe: capsule-body 15–20 mm. long. [*Epidendrum conopseum* Ait.]—(GREEN-FLY ORCHID.)—Hammocks and river swamps, mostly on live-oaks and magnolias, or rarely on rocks, Coastal Plain, Fla. to La. and N. C.—Sum.

2. *A. anceps* (Jacq.) Britton. Plant 1.5 dm. tall: leaf-blades mainly elliptic to elliptic-lanceolate, 5–18 cm. long: flower-stalk stoutish: perianth greenish or purple-green: lateral sepals slightly oblique and obliquely truncate at the apex, 6–7 mm. long: petals spatulate, often broadly so, 5.5–6.5 mm. long: lip mostly green; blade 5–6 mm. long, with 2 broad rounded lateral lobes and a middle notched lobe: capsule-body 13–15 mm. long. [*Epidendrum anceps* Jacq.]—Hammocks, S pen. Fla.—(W. I.)—All year.

3. *A. difformis* (Jacq.) Britton. Plant 1–3.5 dm. tall: leaf-blades elliptic or nearly so, 4–8 cm. long: perianth green: lateral sepals more or less oblique, sometimes broadly scimitar-shaped, 12–15 mm. long: lip green; blade 7–8 mm. long, reniform to orbicular-reniform, with broad rounded lateral lobes and a short notched middle lobe: capsule-body 13–16 mm. long. [*Epidendrum difforme* Jacq. *E. umbellatum* Sw.]—Hammocks, S pen. Fla.—(W. I., Mex., C. A., S. A.)—Sum.—fall.

4. *A. nocturna* (L.) Britton. Plant 3–11 dm. tall: leaf-blades elliptic to broadly linear, 8–16 cm. long: perianth showy: lateral sepals linear-attenuate, 40–60 mm. long, green: petals narrower than the sepals: lip white; blade with 2 ovate or elliptic-ovate lateral lobes directed forward and a linear-setaceous middle lobe 35–50 mm. long: capsule-body 3–5 cm. long. [*Epidendrum nocturnum* L.]—Hammocks, S pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)—Sum.—fall.—The flowers are fragrant, especially at night.

39. **ENCYCLIA** Hook. Epiphytic herbs with terete pseudobulbs which bear several erect or arching elongate leaves and a scaly elongate branched flowering stem at the apex. Flowers nodding, subtended by small bracts. Perianth often conspicuous. Lateral sepals rather broad, usually about as wide as the median one. Petals usually of a spatulate type. Lip 3-lobed, the middle lobe much broader than the lateral ones. Column slightly adnate to the lip. Capsule drooping, ribbed.—About 75 species, of tropical and subtropical America.

1. *E. tampensis* (Lindl.) Small. Plant 1.5–6 dm. tall: leaf-blades linear to narrowly linear-lanceolate, 8–20 cm. long: flower-stem typically branched: lateral sepals 17–20 mm. long, slightly broadened upward, green, tinged with brown: petals spatulate, deeper brown-shaded than the sepals: lip white, with 3 purple or magenta spots;

blade 15–17 mm. long, the lateral lobes oblong-lanceolate, the middle lobe orbicular or reniform-orbicular: capsule-body 25–30 mm. long. [*Epidendrum tampense* Lindl.]—Hammocks, pen. Fla. and the Keys.—Spr.-sum.

**40. EPICLADIUM** Small. Epiphytic herbs with short flattened pseudobulbs which bear several short erect leaves and a relatively short mostly simple flowering stem which is subtended by a long foliaceous spathe. Flowers erect or ascending, subtended by minute bracts. Perianth small, but showy. Lateral sepals rather short, about as wide as the median one. Petals nearly resembling the lateral sepals or more dilated upward. Lip shorter than the sepals and petals, the blade usually rhombic. Column partly adnate to the lip. Capsule nodding, winged.—One species.

1. **E. Boothianum** (Lindl.) Small. Plant 1–2 dm. tall, with flattened suborbicular pseudobulbs: leaf-blades spatulate, 6–12 cm. long: flower-stem simple: lateral sepals 11–13 mm. long, elliptic or slightly broadened upward: petals broadly spatulate, brown-spotted like the sepals: lip yellow or mainly so; blade rhombic, 4–6 mm. long, the broad lateral lobes spreading; capsule-body 25–30 mm. long. [*Epidendrum Boothianum* Lindl.]—Hammocks, S pen. Fla. and the Keys.—(W. I.)—Fall.

**41. ANACHEILUM** Hoffmg. Epiphytic herbs with elongate flattened pseudobulbs which bear several elongate erect leaves and a simple flowering stem at the apex. Flowers nodding, subtended by often lanceolate bracts. Perianth usually showy. Lateral sepals narrow and elongate, usually attenuate, resembling the median one. Petals usually slightly shorter than the sepals. Lip much shorter than the sepals and petals; blade very broad, concave and clamshell-like, entire. Column partly adnate to the lip. Capsule drooping, wing-angled.—One species.

1. **A. cochleatum** (L.) Hoffmg. Plant 2–5 dm. tall: leaf-blades linear or nearly so, 1.5–4 dm. long: flower-stem simple: lateral sepals 25–30 mm. long, linear-lanceolate and attenuate: lip brown or purplish; blade orbicular-reniform, 16–20 mm. long, entire, abruptly pointed: capsule-body 20–30 mm. long. [*Epidendrum cochleatum* L.]—(CLAMSHELL-ORCHID.)—Hammocks, pen. Fla. and the Keys.—(W. I.)—Fall-spr. or all year.—In the Florida plant the column bears three anthers instead of two as found in the West Indian plant. It has been named *A. cochleatum triandrum*.

**42. HORMIDIUM** Lindl. Epiphytic herbs with creeping stems. Leaves spreading, the blades relatively narrow. Flowers in terminal clusters which are subtended by an involucre of leaf-like bracts. Perianth inconspicuous.

Lateral sepals mostly narrow and shorter than the median one. Petals much smaller than the sepals. Lip relatively small, with 2 large lateral lobes and a very small middle lobe. Capsule nodding.—Seven species, in tropical America.

1. *H. pygmaeum* (Hook.) Benth. & Hook. Stems scaly with old leaf-bases: leaf-blades elliptic or nearly so, 2.5–7.5 cm. long: perianth, except the lip, green: sepals acuminate, the lateral ones 5–5.5 mm. long: petals linear, 4–4.5 mm. long: lip 4.5–5 mm. wide, white, tipped and tinged with rose, the lateral lobes ovate or oval: capsule-body 12–15 mm. long, winged. [*H. tripterum* (Brongn.) Cong.]—Hammocks, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)

43. **BASIPHYLLAEA** Schlechter. Caulescent herbs, with clustered fleshy tubers. Leaves various, the basal ones with firm narrow plicate blades, the cauline mere sheathing scales. Flowers erect, several, axillary to scale-like bracts. Perianth mainly rose-purple. Sepals nearly equal, longer than the petals. Petals decidedly narrower than the sepals. Lip short, sessile, slightly 3-lobed at the apex, with 5 longitudinal crests. Capsule erect. [*Carteria* Small, not Franzé]—Two species in Florida and the West Indies.

1. *B. corallicola* (Small) Ames. Stem 2–3.5 dm. tall: basal leaves 2–7 cm. long; blades nearly linear, narrowed at both ends: flowers erect: lateral sepals linear-lanceolate to broadly linear, 6.5–7.5 mm. long: lip oval to orbicular-oval, 6–7 mm. long, the middle lobe much larger than the lateral ones: capsule not seen mature. [*C. corallicola* Small]—Rocky pinelands, Everglade Keys, Fla.—(*W. I.*)—Wint.—Although the plants are apparently perennial, they bloom only at intervals of several years.

44. **POLYSTACHYA** Hook. Epiphytic herbs. Leaves several, approximate at the base of the flower-stalk. Flowers in a terminal panicle. Perianth mainly yellow. Lateral sepals broad, adnate to the long column-foot. Petals narrow. Lip dilated, 3-lobed, jointed to the column-foot, folded up against the edges of the lateral sepals. Capsule nodding.—About 170 species, mostly of tropical regions.

1. *P. minuta* (Aubl.) Britton. Stem 1–6 dm. tall: blades of the lower cauline leaves elliptic to broadly linear, 1–3 dm. long: lateral sepals triangular, 5–6 mm. long, acute: petals spatulate or linear-cuneate, 3–3.5 mm. long, obtuse: lip 5–6 mm. long, the lateral lobes directed forward and nearly equalling the broad middle lobe: capsule 9–11 mm. long. [*P. luteola* Hook.]—

Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex. C. A., S. A.*)—All year.

45. **BLETIA** R. & P. Caulescent herbs with corms. Leaves several from the top of the corm, mostly persisting until after the lateral flower-stem arises. Flowers in a terminal raceme with minute bracts. Perianth mainly pink or purplish. Lateral sepals slightly inequilateral. Petals quite similar to the lateral sepals. Lip wide, crested, 3-lobed, the middle lobe crisped. Capsule mostly erect.—About 45 species, mostly of tropical America.

1. **B. purpurea** (Lam.) DC. Leaf-blades broadly linear to linear-elliptic, 1.5–3.5 dm. long, attenuate: flower-stalk 3–11 dm. tall: lateral sepals elliptic-ovate to broadly elliptic, 11–16 mm. long, abruptly acuminate: petals oval or ovate-oval, barely as long as the sepals and like them rose-purple: lip 11–15 mm. long, with a broad base, ear-like lateral lobes and a crisped and crested middle lobe: capsule 3–4 cm. long. [*B. verecunda* R. Br.]—Pinelands, pen. Fla. and the Keys.—(*W. I., C. A.*)—All year. An epiphytic form growing on the bases of cypress trunks, stumps, and “knees” in the Big Cypress Swamp, has apparently cleistogamous flowers with the lip nearly similar to the two lateral petals.

46. **CYRTOPODIUM** R. Br. Epiphytic herbs. Leaves borne on a short club-like pseudobulb, from the base of which arises the lateral flower-stalk. Flowers in a terminal panicle. Perianth mainly brown or yellowish. Lateral sepals relatively broad. Petals longer than the sepals. Lip wider than long, the lateral lobes larger than the middle one, the claw jointed to the slender column-foot. Capsule drooping.—Three species, natives of tropical America.

1. **C. punctatum** (L.) Lindl. Pseudobulbs 1.5–4 dm. long: leaf-blades broadly linear-attenuate, 3–7 dm. long: flower-stalks 8–15 dm. long: perianth yellowish-green, brown-spotted: lateral sepals oval or obovate, 14–16 mm. long: petals elliptic, 18–21 mm. long: lip butterfly-like, 21–24 mm. wide, the middle lobe reniform, with a beaded margin, the lateral lobes larger than the middle one: capsule-body 6–10 cm. long.—(*COWHORN-ORCHID. BUTTERFLY-ORCHID.*)—Hammocks, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—Spr.—In massiveness second only to *Oncidium undulatum*. Plants with as many as 200 pseudobulbs have been found. Specimens are occasional on sand-dunes and kitchen-middens half way up the eastern coast of Fla.

47. **TRIORCHOS** Small & Nash. Caulescent herbs with corms. Leaves several, arising from the corm before the lateral flower-stalk. Flowers in a terminal raceme with elongate bracts. Perianth mainly brown. Lateral sepals curved, slightly adnate to the column-foot. Petals nearly equilateral, shorter

than the lateral sepals. Lip fully as wide as long, crestless, 3-lobed, the lateral lobes spreading. Capsule erect.—Only the following species:

1. *T. ecristatus* (Fernald) Small. Leaf-blades linear to narrowly linear-elliptic, 2–5 dm. long: flower-stalk virgate, 4–21 dm. tall: lateral sepals elliptic to elliptic-lanceolate, 8–9 mm. long: petals usually elliptic-lanceolate, 7–8 mm. long: lip 7–8 mm. long, the middle lobe much longer than the lateral lobes: capsule oval, about 2 cm. long. [*Cyrtopodium Woodfordii* (Chapm. Fl.) *C. ecristatum* Fernald]—Pinelands and scrub, pen. Fla.—(*W. I.*)—Sum.

48. **PLATYPUS** Small & Nash. Caulescent herbs with corms. Leaves several from the top of the corm, persisting until the lateral flower-stalk arises. Flowers in a terminal raceme with small bracts. Perianth mainly brown and purple. Lateral sepals slightly dilated upward, broader than the median one, decurrent to the base of the forked column-foot. Petals shorter than the lateral sepals, less decurrent. Lip concave at the base, papillose-crested, shallowly 3-lobed, the middle lobe drooping. Capsule mostly drooping.—One species.

1. *P. altus* (L.) Small. Leaf-blades narrowly linear-elliptic to almost linear, 2–8 dm. long: flower-stem 5–19 dm. tall: lateral sepals elliptic or nearly so, 14–16 mm. long: petals broader than the lateral sepals: lip 16–18 mm. long, the middle lobe 8–10 mm. wide, papillose-crested: capsule-ellipsoid, 3–4 cm. long. [*P. papilliferus* Small & Nash]—Moist sand and rich soil, borders of the Everglades and Big Cypress Swamps, Fla.—(*W. I., C. A., S. A.*)—Fall-wint.

49. **MACRADENIA** R. Br. Epiphytic caulescent herbs, with pseudobulbs. Leaves terminating the pseudobulb from the base of which arises the often drooping flower-stalk. Flowers in lax racemes, small and rather inconspicuous. Perianth mainly yellowish or salmon-colored. Median sepal boat-shaped. Lateral sepals slightly inequilateral. Petals nearly like the lateral sepals, slightly smaller. Lip sessile, with 2 broad basal lobes and 1 narrow middle lobe.—Five species, of tropical America.

1. *M. lutescens* R. Br. Pseudobulb 2–4 cm. long: leaf-blades broadly linear to elliptic-linear 8–16 cm. long: flower-stalk mostly shorter than the leaves, drooping: perianth yellowish: lateral sepals elliptic-lanceolate, 8–9.5 mm. long: lip 8–10 mm. long, the lateral lobes forming a reniform body terminated with

the linear-lanceolate middle lobe: capsule-body ellipsoid, 2-2.5 cm. long.—Hammocks, Everglade Keys, Fla.—(*W. I., S. A.*)—Wint.—Most abundant in Royal Palm Hammock; it also occurs in neighboring hammocks.

**50. IONOPSIS** H. B. K. Epiphytic caulescent herbs. Leaves approximate at the base of the terminal flower-stalk. Flowers in a terminal panicle. Perianth mainly white, pink, or lavender. Lateral sepals united at the base and produced into a short spur. Petals larger than the lateral sepals. Lip relatively large, with 2 small lateral lobes and a dilated notched middle lobe with 2 tubercles at its base. Capsule drooping.—Nine species, of tropical America.

**1. I. utricularioides** Lindl. Plant 1.5-6 dm. tall: blades of the lower cauline leaves linear or nearly so, 5-16 cm. long, very thick: panicle many-flowered: lateral sepals lanceolate, 5-6 mm. long: petals elliptic, 6-7 mm. long: lip 11-13 mm. long, the middle lobe nearly as wide: capsule 2-3 cm. long, beaked.—Hammocks, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)—Spr.—Restricted mostly to low hammocks in the Big Cypress Swamp. The perianth is typically lilac; but white forms sometimes occur.

**51. BRASSIA** Lindl. Epiphytic caulescent herbs with flat pseudobulbs which arise from several imbricate scales. Leaves terminating the pseudobulbs from the base of which arise ascending or assurgent flower-stalks. Flowers in lax raceme-like spikes. Perianth large and showy, the yellow parts more or less mottled. Lateral sepals greatly elongate, caudate-acuminate, nearly equilateral, spreading, longer than the median one. Petals nearly similar to the sepals or much shorter and relatively wider. Lip much shorter than the sepals, with a rather broad body and a narrow tip. Columns very short. Capsule drooping: stipitate, the body 3-sided, 3-ribbed, beaked.—About 30 species, natives of tropical America.

**1. B. caudata** (L.) Lindl. Plant usually tufted, the pseudobulbs elliptic to lanceolate, mostly 6-14 cm. long: leaves 2 together; blades broadly linear to linear-spatulate, 2-4 dm. long: spike lax, the flowers remote, the parts light-yellow spotted with brown: lateral sepals 6-14 cm. long, caudate-attenuate from a lanceolate base: petals lanceolate, acuminate: lip 2.5-3 cm. long, acuminate at the tip, sessile: capsule 5.5-8 cm. long, the body narrowly ellipsoid or prismatic-ellipsoid, with a slender stipe-like base and a shorter and stouter beak.—(*SPIDER-ORCHID.*)—Hammocks, Everglade Keys, Fla.—(*W. I., Mex., C. A., S. A.*)—Spr.—Rare in a few hammocks on the Biscayne pineland and Long Key pineland; often growing with *Anacheilium*, which it resembles in habit.

**52. ONCIDIUM** Sw. Epiphytic or sometimes terrestrial herbs, with pseudobulbs. Leaves with broad or narrow and elongate blades, terminating

the pseudobulb, from the base of which arises the flower-stalk. Flowers in a raceme or panicle. Perianth mostly showy, the parts often mottled. Lateral sepals slightly inequilateral, reflexed or spreading. Petals often quite similar to the sepals. Lip crested, clawless or short-clawed, 3-lobed, the middle lobe larger than the lateral ones. Capsule nodding.—Fully 400 species, natives of tropical and subtropical America.—Spr.

Leaf-blades flat or nearly so, the faces not united: lateral sepals separate.

Leaf-blades equitant, the faces united: lateral sepals coherent.

I. UNDULATA.  
II. VARIEGATA.

I. UNDULATA

Leaf-blades short and wide, thick-coriaceous and stiff: sepals and petals obtuse or notched: pseudobulbs very small or obsolete.

Median sepal cuneate: lateral lobes of the lip knob-like.

Median sepal with a reniform, orbicular, or ovate blade: lateral lobes of the lip broad and flat.

Leaf-blades greatly elongate, thin-coriaceous and pliable: sepals and petals acute or acuminate: pseudobulb large.

1. *O. undulata*.
2. *O. carthaginense*.
3. *O. floridanum*.

II. VARIEGATA

Tufted plant with curved keeled leaves and a slender flower-stalk.

4. *O. variegatum*.

1. *O. undulata* (Sw.) Salisb. Pseudobulb 1–2 cm. long: leaf-blades elliptic-lanceolate, 25–60 cm. long: flower-stalk 110–220 cm. long: perianth mainly orange mottled with red-brown: lateral sepals 16–19 mm. long, the blades oval to obovate, crisped: petals rather shorter than the sepals, the blades obovate to cuneate: lip 18–20 mm. wide: capsule-body 5–8 cm. long, ellipsoid or nearly so. [*O. guttatum* Reichenb. f.]—Hammocks, S pen. Fla.—(*W. I., Mex., C. A., S. A.*)

2. *O. carthaginense* Sw. Pseudobulb very small: leaf-blades narrowly elliptic, 9–30 cm. long, or the outer ones mere scales: flower-stalk 50–150 cm. long: perianth mainly pink, mottled with magenta: lateral sepals 9–11 mm. long, the blades spatulate, crisped: petals about as long as the sepals, the blades ovate: lip fully 11–12 mm. long, the middle lobe mostly 7–9 mm. wide: capsule-body 4–7 cm. long.—(SPREAD-EAGLE ORCHID.)—Hammocks, Cape Sable region, Fla.—(*W. I., Mex., C. A., S. A.*)

3. *O. floridanum* Ames. Pseudobulbs ovoid, 8–12 cm. long: leaf-blades linear, 25–110 cm. long: flower-stalk 85–210 cm. long: perianth mainly yellow mottled with brown: lateral sepals 15–16 mm. long, the blades elliptic-lanceolate: petals shorter than the sepals, the blades ovate-lanceolate or ovate: lip 13–15 mm. long, the middle lobe 11–13 mm. wide: capsule-body 2–3 cm. long, ellipsoid. [*O. sphacelatum* Fl. SE. U. S.]—Hammocks and rarely pinelands, Everglade Keys and Cape Sable region, Fla.—(*W. I., Mex., C. A., S. A.*)—Typically an epiphytic hammock plant. Rarely a terrestrial in pinelands on areas where at no remote date hammocks existed. The hammock plants have relatively larger leaves, but the flowers from the two habitats are identical in structure.

4. *O. variegatum* (Sw.) Willd. Pseudobulb minute or slender: leaf-blades curved, 3–7 cm. long, 2-keeled above: flower-stalk 9–35 cm. long: perianth mainly white and greenish marked with purple and brown: lateral sepals about 6 mm. long, the blades spatulate: petals about 8 mm. long, the blades orbicular or orbicular-obovate: lip 10–12 mm. long, the middle lobe 15–21 mm. wide: capsule-body ellipsoid, 1.5–2 cm. long.—Hammocks, S pen. Fla.—(*W. I.*)

53. **HARRISELLA** Fawcett & Rendle. Epiphytic herbs consisting chiefly of roots. Leaves minute scales or obsolete. Flowers borne in lax slender stalked racemes. Perianth minute and inconspicuous. Lateral sepals nearly equilateral. Petals narrower and rather longer than the lateral sepals. Lip sessile at the base of the column, with a globular spur. Capsule stipitate.—Four species, natives of tropical America.

1. **H. porrecta** (Reichenb. f.) Fawcett & Rendle. Roots matted, about 1 mm. thick: flower-stalk very slender, the bracts remote and inconspicuous: perianth yellowish-green: lateral sepals ovate, about 2.5 mm. long: blade of the lip suborbicular when flattened out: capsule-body oval, 4.5–6 mm. long. [*Harriella Amesiana* Cong.]—Hammocks and cypress-heads, S pen. Fla.—(W. I., Mex., C. A.)—Spr.—Often on the trunk of conifers, *Sabina* and *Taxodium*, as well as on various angiospermous trees.

54. **CAMPYLOCENTRUM** Benth. Epiphytic herbs consisting chiefly of roots. Leaves with thick blades or mere minute scales. Flowers borne in a stiff spike. Perianth minute or inconspicuous. Lateral sepals nearly equilateral. Petals similar to the lateral sepals, but smaller, usually narrow. Lip partially adnate to the column-foot, usually saccate at the base. Capsule sessile.—About 20 species, natives of tropical America.

1. **C. pachyrrhizum** (Reichenb. f.) Rolfe. Roots several mm. thick: flower-stalk relatively stout, the bracts approximate and conspicuous: perianth yellow-green: lateral sepals lanceolate, about 4.5 mm. long: blade of the lip elliptic to elliptic-lanceolate when flattened out: capsule ellipsoid, 7.5–9 mm. long.—Hammocks, SW pen. Fla.—(W. I., S. A.)—Spr.—Usually on angiospermous trees.

55. **POLYRRHIZA** Pfitz. Epiphytic herbs with clusters of roots. Leaves scale-like or obsolete. Flowers solitary or few terminating the short scape. Perianth showy, often white. Lateral sepals curved. Petals nearly like the sepals or broader. Lip sessile, 3-lobed, the middle lobe again 3-lobed, the lateral lobes angular: spur elongate. Capsule linear-cylindric.—Four species, wholly West Indian, except the following.

1. **P. Lindenii** (Lindl.) Cong. Stem 4–12 cm. long, scaly: perianth conspicuous: lateral sepals linear or linear-lanceolate, 2.5–5 cm. long: lip 3–5 cm. long, the middle lobe with 2 linear-lanceolate spreading segments 5–10 cm. long; spur 10–15 cm. long: capsule spreading; body narrowly linear, 5–8 cm. long, ribbed. [*Dendrophylax Lindenii* Benth.]—(WHITE BUTTERFLY-ORCHID. PALM-POLLY.)—On tree-trunks, S pen. Fla.—(W. I.)—Spr.—Restricted mostly

to the Big Cypress Swamp. Most abundant in the royal-palm hammocks where it occurs on various rough-barked trees, as well as on the trunks of the royal-palms. The elongate flattened worm-like roots are supplied with chlorophyll and function as leaves.

A species of the genus *Lepanthes* has recently been found growing on trees in the Big Cypress Swamp. This genus is related to *Pleurothallis*, but differs in the perianth in which the claws of the petals and lip are adnate to the base of the column. The plants are small, 3-5 cm. tall, caespitose, the stems pubescent, each with cornucopia-like, ciliate sheaths and one leaf: leaf-blade elliptic to oval, 1.5-2 cm. long, with a callous margin and a minute callous tip.

## SUBCLASS 2. **DICOTYLEDONES** — DICOTYLES

Stems exogenous, consisting of pith, wood, and bark (endogenous in rare cases): pith of parenchymatous cells: wood in one or several layers surrounding the pith, traversed by medullary rays: bark covering the wood. Leaves various: blades mostly pinnately or palmately veined, their bases, or the bases of the petioles articulated. Perianth and essential parts of the flower rarely in threes or sixes. Embryo with two cotyledons. The first leaves (cotyledons) are opposite.

### SERIES 1. **CHORIPETALAE**

Petals separate and distinct from each other, or wanting. The series embraces most of the families formerly included in the APETALAE and the POLYPETALAE.

#### ORDER **PIPERALES** — PIPERAL ORDER

Herbs of wet or moist places, or hammocks, usually with rootstocks, or shrubs or trees. Leaves with simple blades. Flowers perfect or unisexual. Perianth wanting. Androecium of several stamens. Gynoecium of 1, or of several distinct or united carpels. Fruit baccate, drupaceous, capsular, or nut-like.

Carpels distinct or nearly so, 3-4: ovules 2-8 in each cavity. Fam. 1. SAURURACEAE. Carpels united to form a single pistil: ovule 1 in each cavity. Fam. 2. PIPERACEAE.

#### FAMILY 1. **SAURURACEAE** — LIZARD'S-TAIL FAMILY

Perennial herbs with rootstocks. Leaves alternate, sometimes basal. Flowers spicate or racemose. Androecium of 3-8 stamens. Gynoecium of 3 or 4 distinct or nearly distinct carpels. Stigmas simple. Fruit capsular.—Three genera and 4 species, natives of North America and Asia.

1. **SAURURUS** L. Aquatic or marsh herbs. Leaf-blades thick-membranous, cordate. Raceme with a drooping tip, the bractlets adnate to the pedicels or ovaries. Pistils 3 or 4. Mature carpels veiny, opening introrsely.—Two species, the following and one in Asia.

1. *S. cernuus* L. Stems 3–12 dm. tall: leaf-blades ovate to ovate-lanceolate, cordate at the base, 8–15 cm. long, acuminate, petioled: racemes 1–2 dm. long: filaments clavate, about 4 mm. long: fruit depressed, the carpels about 2 mm. high.—(LIZARD'S-TAIL.)—Swamps, wet woods, streams, and ditches, various provinces, Fla. to Tex., Minn., Ont., and R. I.—Spr.—Sum.—The inflorescence is white or creamy-white. The flowers are fragrant. The rootstocks are very aromatic.

## FAMILY 2. PIPERACEAE — PEPPER FAMILY

Herbs, shrubs, or trees. Leaf-blades mostly fleshy or leathery. Spikes, or rarely racemes, simple or compound, the bractlets cup-like or peltate. Androecium of 2–6 or rarely 8–10 stamens. Gynoecium of 3 or rarely more united carpels, the ovary 1-celled. Fruit drupaceous.—About 6 genera and over 1000 species, mostly in the tropics.

Flowers and scales (bracts) separated on the rachis: berries distant, beakless.

1. MICROPIPER.

Flowers and scales (bracts) contiguous on the rachis: berries crowded into a solid mass on the rachis, beaked.

2. RYNCHOPHORUM.

1. **MICROPIPER** Miq. Herbaceous succulents with annual erect stems from horizontal stoloniferous rootstocks. Leaves mostly opposite, deciduous: blades soft-fleshy and rather thin, pubescent. Spikes loosely-flowered. Rachis not honeycombed. Flowers and fruits sessile on the rachis. Ovary rounded at the apex, topped by the tufted stigma. Bracts peltate, scale-like. Stamens 2. Berry beakless, not immersed in the rachis, very viscid.—About 60 species, mostly in tropical regions.—WILD-PEPPERS. PEPEROMIAS.—The inflorescence is green.

Blades of the upper leaves oval, varying to ovate, or obovate: bractlets crenulate.

1. *M. leptostachyon*.

Blades of the upper leaves elliptic, varying to elliptic-ovate or elliptic-obovate: bractlets even-edged.

2. *M. humile*.

1. **M. leptostachyon** (Nutt.) Small. Terrestrial, the stems mostly 1–2 dm. tall: blades of the lower cauline leaves obdeltoid to broadly cuneate, 3–6 cm. long, rounded, truncate, or emarginate, shining above: spikes about 1 mm. thick, mostly 2–8 cm. long: bracts fully 0.5 mm. long: berry obovoid. [*Piper leptostachyon* Nutt. *Peperomia leptostachya* Chapm. *P. cumulicola* Small]—Kitchenmiddens and aboriginal village sites, eastern coast and fern grottoes along the Withlacoochee River, Fla.—Wint.—Abundant only on the well drained shell-mounds, and thrives only on a light humus.

2. **M. humile** (Vahl) Small. Terrestrial, the stems mostly 2–7 dm. tall: blades of the lower cauline leaves elliptic, varying to broader above the middle or below it, or individually obovate, 1–5 cm. long, rounded,

obtuse, or acutish, dull above: spikes about 2 mm. thick, mostly 5–12 cm. long: bracts less than 1 mm. long: berry oval or ovoid. [*Peperomia humilis* Vahl]—Hammocks, pen. Fla.—(W. I.)—Wint.—Thrives equally well in the marl of the Cape Sable region which is flooded about half of each year and on the sand-dunes of the eastern coast which are dry except for the rain that falls there.

**2. RHYNCHOPHORUM** (Miq.) Small. Coriaceous perennials with diffusely creeping stems, sometimes vine-like. Leaves alternate, persistent: blades firm-succulent and thick, glabrous. Spikes closely and densely-flowered. Rachis honeycombed. Flowers and fruits partly imbedded in deep pits of the rachis. Bracts peltate. Stamens 2. Ovary narrowed at the apex, terminated by a long beak which has a minute stigma near its base. Berry beaked, partly immersed in the rachis, not viscid or only slightly so.—About 60 species, widely distributed in the tropics.—PEPEROMIAS.—The inflorescence is green.

Leaf-blades obovate, varying to oval, ovate, or suborbicular, or cuneate-obovate: spikes stout, stiffly erect, mostly simple: berry with a body of a cylindric type.

I. OBTUSIFOLIA.

Leaf-blades narrowly cuneate to spatulate: spikes slender, nodding, mostly branched: berry with a body of an ovoid or an oval type.

II. SPATHULIFOLIA.

I. OBTUSIFOLIA

Leaf-blades typically cuneate-obovate, averaging about 1 dm. long or more.

Leaf-blades typically oval to suborbicular, varying to broadest above the middle or below it, less than 1 dm. long.

1. *R. obtusifolium*.

2. *R. floridanum*.

II. SPATHULIFOLIA

Terrestrial humus-herbs with cuneate to spatulate leaf-blades and branching nodding pale spikes.

3. *R. spathulifolium*.

**1. *R. obtusifolium* (L.) Small.** Epiphytic, the stems very stout, the branches often elongate and vine-like: leaf-blades spatulate-obovate or broadly cuneate, tapering to the long petiole-like base, 9–15 cm. long; inflorescence rather long-stalked, with a single erect stout spike 7–12 cm. long, or with 2 spikes, the rachis 4 mm. thick or less: berry cylindric-ellipsoid, about 1 mm. long, the beak shorter than the body, hooked. [*Peperomia obtusifolia* A. Dietr.]—Low hammocks, on tree-trunks or rotten logs, Cape Sable and Cape Romano Regions, Fla.—(W. I.)—All year.—The largest and most robust of our species. Plants somewhat aromatic in drying. Occurs only in the marl regions, and grows luxuriantly only in low situations that are flooded part of each year.

**2. *R. floridanum* Small.** Epiphytic, the stems stout, the branches often matted, elongate, sometimes vine-like: leaf-blades ovate to suborbicular, broadest above the middle or below it, 4–9 cm. long, abruptly or rather gradually narrowed to the petiole-like base: inflorescence with a short stout stalk, with usually a single stiffly erect stout spike less than 1 dm. long, the rachis 5 mm. thick or less: berry cylindric-ovoid or cylindric, about 1 mm. long, the beak slightly shorter than the body, hooked. [*Peperomia magnoliaefolia*

(Chapm. Fl.) *P. floridana* Small]—High limestone hammocks, on tree-trunks and rotten logs, S pen. Fla., and the Keys.—All year.—Like the preceding somewhat aromatic in drying. Occurs only in the oolitic limestone region, and grows luxuriantly only in the dry hammocks.

3. *R. spathulifolium* Small. Terrestrial, but growing in humus, the stems rather stout, the branches elongate, often 1-2 m. long, creeping and asurgent: leaf-blades narrowly cuneate to spatulate, 6-11 cm. long, bright-green: inflorescence with a slender, often elongate stalk: spikes slender, 1-2 dm. long, 2-5 together, nodding, the rachis less than 2-5 mm. thick: berry turgid, the body ovoid or oval, nearly 1 mm. long, the beak strongly curved or hooked. [*Peperomia spathulifolia* Small]—Hammocks, in humus or limestone, Everglade Keys, Fla.—(W. I.)—All year.—Our rarest species and the plants most aromatic in drying.

#### ORDER CASUARINALES — CASUARINAL ORDER

Shrubs or trees, with loosely jointed branches, resembling stems of *Equisetum*. Leaves scale-like, whorled at the nodes and decurrent on the internodes. Flowers monoecious, the staminate in slender terminal spikes with imbricate bracts, often with a posterior and anterior perianth-member, and 1 stamen. Pistillate flowers in dense cones or spikes, the perianth wanting. Ovary 1-celled. Style-branches slender. Fruit an aggregate of winged achenes.

#### FAMILY 1. CASUARINACEAE — BEEFWOOD FAMILY

Stems with more or less whorled branches. Staminate spikes long-stalked. Pistillate spikes short-stalked. Gynoeceum 2-carpellary.—The following is the only genus; the 25 species are most abundant in Australasia.

1. *CASUARINA* Adans. Stem clothed with a smooth or smoothish bark, except when very old. Stamens with long filaments and short anthers. Stigmas elongate. Fruiting spike compact.

1. *C. equisetifolia* Forst. Tree often 10 m. tall, with many slender branches: leaves (scales) 1-3 mm. long, 6-8 in each whorl: staminate spikes 1-4 cm. long: pistillate spikes globular, becoming 1-2 cm. in diameter in fruit: seed-wing nearly thrice as long as the body. (BEEFWOOD. AUSTRALIAN-PINE. HORSETAIL-TREE.)—Sandy shores, pinelands, everglades and hammocks, S pen. Fla., particularly S of Miami, and the Keys. Nat. of Oceanica.—(W. I., Mex., C. A., S. A.)—Established in quite out of the way places through the agencies of wind and water. The wind blowing through the numerous slender branchlets produces a rushing sound as in the case of the pine. The tree grows rapidly, but produces a very hard wood.

## ORDER JUGLANDALES — JUGLANDAL ORDER

Trees. Leaves alternate: blades pinnate. Flowers monoecious, the staminate in lateral aments on the twigs of the preceding year, with a 2-6 lobed calyx bearing several rows of stamens, or the calyx obsolete. Pistillate flowers terminal, consisting of an involucre 2-4-carpellary gynoeceium: calyx partially adnate to the gynoeceium. Fruit drupe-like, the nut enclosed in an indehiscent or a dehiscent involucre. Seed oily.—Seven genera and about 40 species, mostly in the north temperate zone.

## FAMILY 1. JUGLANDACEAE — WALNUT FAMILY

Aromatic trees, with hard wood. Leaves with unequally pinnate blades. Staminate aments solitary or clustered. Involucre of the fruits dry or juicy.—The wood of many of the species is used in cabinet-work, construction, and implements.

Staminate aments stout, simple, sessile or short-stalked: husk indehiscent: nut sculptured. 1. WALLIA.  
Staminate aments slender, branched, long-stalked: husk dehiscent: nut not sculptured. 2. HICORIA.

1. **WALLIA** Alef. Bark furrowed. Pith in plates. Leaflets conduplicate in vernation. Staminate aments simple. Anther-connective conspicuous.—About 8 species, natives of North America, West Indies, and the Andes of South America.—Spr.—WALNUTS.—The genus *Juglans* to which the American walnut and the butternut are usually referred is typified by *J. regia* L. which is generically distinct.

Anther-connective a rounded tip; fruit elongate, viscid-pubescent: nut 4-angled.  
Anther-connective crown-like: fruit not elongate, glabrous: nut not angled.

1. *W. cinerea*.
2. *W. nigra*.

1. **W. cinerea** (L.) Alef. Tree becoming 30 m. tall, the heartwood pale: leaflets 11-17, the blades lanceolate to elliptic-lanceolate or elliptic, 6-8 cm. long (rarely larger): staminate aments 6-15 cm. long: fruit 8-12 cm. long, usually acute: nut 2-celled below the middle, the ridges thin and brittle. [*Juglans cinerea* L.]—(BUTTERNUT. WHITE-WALNUT. OIL-NUT.)—Rich woods, various provinces, N of the Coastal Plain, Ga. to Ark., N. Dak., and N. B.—A valuable tree for nuts and wood.

2. **W. nigra** (L.) Alef. Tree becoming 50 m. tall, the heart-wood dark-brown: leaflets 15-23, the blades 8-10 cm. long, rounded or subcordate at the base: staminate aments 5-10 cm. long: fruit 5-8 cm. in diameter: nut 4-celled below the middle, sculptured, the ridges thick, firm. [*Juglans nigra* L.]—(BLACK-WALNUT.)—Rich soil, mostly in woods, various provinces, N Fla. to Tex., Minn., Ont., and Mass.—A very valuable tree, both for nuts and wood.

**2. HICORIA** Raf. Bark close or scaly. Pith solid. Leaflets involute in veneration. Staminate aments branched. Anther-connective inconspicuous. [*Carya* Nutt.]—About 18 species, natives of eastern North America and Mexico.—Many of the hickories furnish a very hard and tough valuable wood. The fruits furnished a valuable food supply for the aborigines and are extensively used by the white-man. The bark is used medicinally, and it furnishes the flavoring substance, “mapleine,” and a yellow dye.—Spr.—**HICKORIES.**

Cotyledons entire or merely notched at the apex: nut terete or slightly flattened, 2-celled below, the shell smooth and even. (Subgenus I. **PECAN.**) I. **PECANES.**

Cotyledons deeply 2-lobed: nut markedly flattened, 4-celled below, the shell uneven or slightly corrugated. (Subgenus II. **EUHICORIA.**)

Bud-scales valvate: blades of the lateral leaflets narrow and falcate, except in *H. cordiformis latifolia* where they may be broadly ovate.

II. **AQUATICAE.**

Bud-scales imbricate: blades of the lateral leaflets broad, not falcate.

Husk of the fruit (involucre) splitting freely and promptly to the base, the valves mostly woody or corky.

III. **OVATAE.**

Husk of the fruit (involucre) splitting rather tardily to about the middle, the valves firm-leathery.

IV. **GLABRAE.**

#### I. **PECANES**

Leaflets 5-9; blades of the lateral ones not falcate: nut with an exceedingly thick shell: staminate aments usually in 3's on a slender peduncle.

1. *H. myristicaeformis.*

Leaflets usually more than 9; blades of the lateral ones falcate: nut with a thin shell: staminate aments fascicled.

Lateral leaflets with manifestly stalked blades: nut terete: seed sweet.

2. *H. Pecan.*

Lateral leaflets with sessile or nearly sessile blades: nut somewhat flattened: seed bitter.

3. *H. texana.*

#### II. **AQUATICAE**

Leaflets mostly more than 9; blades glabrous: nuts corrugated: bark of trunk flaky.

4. *H. aquatica.*

Leaflets mostly fewer than 9; blades pubescent beneath: nuts smooth: bark of trunk close.

5. *H. cordiformis.*

#### III. **OVATAE**

Bark of the trunk rough, but close or with thin flaky plates.

Leaves permanently more or less pubescent; leaflets 7-9: fruit over 3 cm. in diameter.

6. *H. alba.*

Leaves glabrous; leaflets 5-7: fruit less than 3 cm. in diameter.

7. *H. microcarpa.*

Bark of the trunk shaggy, separating in long flat plates. Leaflets 7-9, or individually 5: twigs pale-orange: fruit 7-9 cm. in diameter.

8. *H. laciniosa.*

Leaflets 3-5, or individually 7: twigs red-brown: fruit 4-6 cm. in diameter.

Anthers pubescent: blades of the lower pair of leaflets ovate to elliptic-lanceolate, acute or short-acuminate.

9. *H. ovata.*

Anthers glabrous: blades of the lower pair of leaflets narrowly lanceolate to linear-lanceolate, long-acuminate.

10. *H. carolinenseptentrionalis.*

#### IV. **GLABRAE**

Fruit large, 3-4 cm. in diameter.

Leaf-rachis and leaflets glabrous: blades of the leaflets shining above: inner bud-scales densely pubescent.

11. *H. austrina.*

Leaf-rachis or leaflets, or both, pubescent: blades of the leaflets dull above: inner bud-scales puberulent.

12. *H. pallida.*

Fruit small, 2-2.5 cm. in diameter.

Young leaflets rusty-pubescent: winter-buds with copiously pubescent scales.

Young leaflets not rusty pubescent: winter-buds with puberulent scales.

13. *H. floridana*.

14. *H. glabra*.

1. *H. myristicaeformis* (Michx. f.) Britton. Tree becoming 35 m. tall, the bark scaly: leaflets 5-9; blades of the lateral ones elliptic or oval, varying to ovate, ovate-lanceolate, or narrowly obovate, thinnish, finely and sharply serrate, pale or silvery beneath, with a metallic luster: fruits ellipsoid to ellipsoid-obovoid or obovoid, 2.5-3.5 cm. long, narrowly winged: nut ellipsoid, acute at both ends.—(NUTMEG-HICKORY. BITTER-WATERNUT.)—Woods, hillsides, and low grounds, Coastal Plain, Ala. to Tex., Ark., and S. C.—(*Mex.*)

2. *H. Pecan* (Marsh) Britton. Tree becoming 50 m. tall, the bark somewhat roughened: leaflets 11-17; blades of the lateral ones lanceolate, elliptic-lanceolate, or ovate-lanceolate, shallowly and rather coarsely toothed, falcate: fruits usually clustered, ellipsoid, 3.5-6 cm. long, prominently winged: nut ellipsoid or ovoid-ellipsoid, acute, at least at the apex.—(PECAN.)—Woods and river-bottoms, various provinces, Ala. to Tex., Kans., Ia., and Ind. Also cult. in Fla., Ga., and S. C., for the production of nuts on a large commercial scale.—(*Mex.*)

3. *H. texana* Le Conte. Tree becoming 30 m. tall, the bark rough: leaflets 7-13; blades of the lateral ones lanceolate, elliptic-lanceolate, or ovate, shallowly toothed, falcate: fruits often clustered, ellipsoid or obovoid-ellipsoid, 3-5 cm. long, slightly winged: nut ellipsoid or nearly so, usually acute at both ends.—(BITTER-PECAN.)—Woods, low grounds and river-swamps, Coastal Plain, Miss. to Tex. and Ark.—(*Mex.*)

4. *H. aquatica* (Michx. f.) Britton. Tree becoming 30 m. tall, the bark flaky: leaflets 9-15; blades of the lateral ones lanceolate, linear-lanceolate, or elliptic-lanceolate, falcate, shallowly toothed: fruits often clustered, subglobose, ellipsoid, or obovoid, 2.5-3 cm. long, narrowly winged to the base, the thin husk tardily dehiscent: nut obovoid, corrugated, thin-shelled, the seed very bitter.—(WATER-HICKORY. SWAMP-HICKORY. BITTER-PECAN. WATER-BITTERNUT.)—River-swamps, river-bottoms, and moist or wet woods, Coastal Plain, Fla. to Tex., Mo., Ill., and Va.

5. *H. cordiformis* (Wang.) Britton. Tree becoming 30 m. tall, the bark close, with shallow furrows and flat ridges: leaflets 7-11, or individually 5; blades of the lateral ones lanceolate, elliptic-lanceolate, elliptic, or ovate, (sometimes broadly ovate in *H. cordiformis latifolia*), finely serrate, slightly or decidedly falcate: fruits sometimes clustered, subglobose, or obovoid, 2.5-3 cm. long narrowly winged especially above the middle, the thin husk tardily dehiscent: nut uneven, thin-walled, the seed bitter. [*Carya amara* Nutt. *Hicoria minima* (Marsh.) Britton]—(SWAMP-HICKORY. BITTER-NUT. WHITE-HICKORY. PIGNUT.)—River-banks, rocky hillsides, swamps, and low woods, various provinces, Fla. to Tex., Minn., and Que.

6. *H. alba* (L.) Britton. Tree becoming 30 m. tall, the bark with flat ridges but close: leaflets 7-9; blades of the lateral ones elliptic, varying to elliptic-

lanceolate, or ovate, or sometimes broadened upward, rather coarsely serrate: fruits globose or globose-obovoid, 4-6 cm. long, often prominently lobed above, the very thick husk readily dehiscent: nut globular or globose-oval, brownish, somewhat angled, very thick-shelled: seed sweet. [*Carya tomentosa* (Lam.) Nutt.]—(MOCKERNUT. WHITE-HEART HICKORY. BULLNUT. BLACK-HICKORY. WHITE-HICKORY. RED-HICKORY.)—Rocky woods and rich dry soil, various provinces, Fla. to Tex., Ont., and Mass.

7. *H. microcarpa* (Nutt.) Britton. Tree becoming 25 m. tall, the bark separating in thin plates: leaflets 5-7; blades of the lateral ones ovate, oval, elliptic, or ovate-lanceolate, varying to broadest above the middle, serrate: fruits subglobose or depressed, 2-2.5 cm. long, slightly winged, the husk thin, freely dehiscent to the base: nut about as wide as long, abruptly pointed at the apex or sometimes depressed, whitish, barely angled, thin-shelled: seed sweet.—(SMALL-PIGNUT. LITTLE SHAG-BARK.)—Rich, sometimes rocky, woods, various provinces, rarely Coastal Plain, Ga. to Mo., Mich., and Mass.

8. *H. laciniosa* (Michx.) Sarg. Tree becoming 40 m. tall, the bark separating in narrow plates: leaflets 7-9, or individually 5; blades of the lateral ones elliptic, lanceolate, elliptic-lanceolate, elliptic-ovate, or ovate, or rarely broadened upward, rather finely serrate: fruit broadly ellipsoid to subglobose, 6-9 cm. long, slightly lobed above, the thick husk readily dehiscent: nut broadly ellipsoid, slightly obovoid or wider than long, white or yellowish, ridged, thick-shelled: seed sweet.—(KING-NUT. BIG SHAG-BARK. BIG SHELL-BARK. THICK SHELL-BARK.)—Rich soil, especially in river bottoms, various provinces, Tenn. to Okla., Ia., and N. Y.

9. *H. ovata* (Mill.) Britton. Tree becoming 40 m. tall, the bark separating in large plates: leaflets 3-5, or rarely 7; blades of the lateral ones oval or elliptic, varying to ovate or obovate, or broadly elliptic-lanceolate, rather coarsely serrate: fruits oval to subglobose, 3-5 cm. thick, somewhat lobed, the husk thick, freely splitting to the base: nut often wider than long, white or whitish, slightly angled, thin-shelled: seed sweet. [*Carya alba* Nutt. *H. carolinae-septentrionalis australis* Ashe]—(SHAG-BARK HICKORY. SHAG-BARK. SCALY-BARK HICKORY. WHITE-HICKORY.)—Rich soil and woods, various provinces, Fla. to Tex., Minn., and Que.—A related tree, *Carya leiodermis* Sarg., native of E Tex., Ark., and La., is said to grow in Miss. It may be distinguished from *H. ovata* by the slightly ridged bark, the dominant 7 leaflets, and the thick-shelled nut.—The fruits of *H. ovata* are distinguished for the thinness of the shell and the good flavor of the kernel. They are extensively collected for the market.

10. *H. carolinae-septentrionalis* Ashe. Tree becoming 40 m. tall, the bark separating in large and very long plates: leaflets 3-5; blades of the lateral ones lanceolate, linear-lanceolate, narrowly elliptic-lanceolate, or narrowly elliptic, or individually ovate-lanceolate, rather finely serrate with somewhat cartilaginous hairy-tufted teeth: fruits subglobose, 2.5-3.5 cm. long, slightly lobed, the husk thick, readily dehiscent: nuts about as wide as long, whitish, angled, thin-shelled: seed sweet.—(SHAG-BARK. BOTTOM-HICKORY.)—Sandy or rocky woods and rich bottom-lands, various provinces, Ga. to Ala., Ky., and Del.

11. *H. austrina* Small. Tree becoming 18 m. tall or less, the bark rough, but close: leaflets 5-7; blades of the lateral ones ovate, elliptic, elliptic-lanceolate or ovate-lanceolate, serrate, often coarsely so, glabrous at least at maturity: fruit subglobose, 3-4 cm. long, rounded at the base, rather prominently ridged, the thick husk tardily dehiscent: nut pale-brown, subglobose,

slightly roughened, thick-shelled: seed sweet. [*Carya megacarpa* Sarg. in part.]—Hammocks, upper pen. and N Fla.

12. *H. pallida* Ashe. Tree becoming 35 m. tall, the bark very rough: leaflets 7-9; blades of the lateral ones lanceolate, elliptic-lanceolate, elliptic, or ovate, finely serrate: fruit subglobose, oval, or obovoid-pyriform, 3-4.5 cm. long, often slightly ridged, the thickish husk dehiscent; nut whitish, subglobose or slightly elongate, smooth or nearly so, thick-shelled: seed sweet.—(PALE-HICKORY.)—Dry woods, Coastal Plain, and adj. provinces, Fla. to Tenn., and Va.

13. *H. floridana* (Sarg.) Small. Shrub or tree becoming 25 m. tall, the bark close, slightly ridged: leaflets 3-5 or rarely 7; blades of the lateral ones lanceolate, elliptic-lanceolate, or elliptic, scarcely falcate, rather remotely cartilaginous toothed: fruit obovoid or subglobose, 2-2.5 cm. long, wingless, sometimes slightly ridged, the thin husk tardily and irregularly dehiscent: nut uneven, rather thick-shelled. [*Carya floridana* Sarg.]—(SCRUB-HICKORY.)—Sandy ridges and scrub, pen. Fla.—Considerable instability in the morphologic characters has been attributed to the species of *Hicoria*, perhaps, however, chiefly as a result of our rather incomplete knowledge of the genus and limited field-study. However, *H. floridana*, which occupies one of our very late and unstable physiographic areas, shows great variation in the shape and size of the fruits. These, on adjacent trees range from subglobose to narrowly pyriform, often with a stipe-like base in addition. The fruits are quite uniform on a given tree.

14. *H. glabra* (Mill.) Britton. Tree becoming 40 m. tall, or rarely larger, the bark ridged, but close: leaflets 5-7, or 3; blades of the lateral ones lanceolate, ovate-lanceolate, elliptic, or sometimes broadened upward, serrate, glabrous or nearly so (or more or less hirsute in *H. glabra hirsuta*): fruit obovoid or pyriform, 1.5-3 cm. long, often with a prominent stipe-like base, even or nearly so, the thinnish husk tardily dehiscent: nut brownish, obovoid to subglobose, thick-shelled, even or slightly angled: seed sweet. [*Carya porcina* Nutt.]—(PIG-NUT. BLACK HICKORY. BROOM-HICKORY. BROWN-HICKORY. SWITCH-BUD HICKORY.)—Dry woods and open hillsides, often in acid soil, various provinces, Fla. to La., Minn., and Me.

#### ORDER LEITNERIALES — LEITNERIAL ORDER

Shrubs or trees, with exceedingly light wood. Leaves alternate. Flowers dioecious, in aments appearing before the leaves, the staminate flowers borne on the base of each bract: perianth wanting: androecium of 3-12 stamens: pistillate flowers each with a minute perianth: gynoecium a single carpel, the stigma introse. Ovule solitary. Fruit a collection of drupes each subtended by a bract.

#### FAMILY 1. LEITNERIACEAE — CORKWOOD FAMILY

Bark smooth, brown. Leaf-blades entire. Stipules wanting. Aments from the axils of last year's leaves. Staminate aments many-flowered: filaments short: anthers 2-celled. Pistillate aments few-many-flowered: ovary sessile: stigma elongate. Drupes elongate.—Represented by the following genus and species only:

1. **LEITNERIA** Chapm. Leaves scattered: blades shining above, petioled. Staminate aments conspicuously bracted: filaments distinct. Pis-

tillate aments inconspicuously bracted: ovary shorter than the stigma. Drupe glabrous, the flesh leathery.

1. *L. floridana* Chapm. Shrub, or tree becoming 7 m. tall, with wood lighter than cork: leaf-blades narrowly elliptic, or elliptic-lanceolate, or rarely oval, 10–20 cm. long, pubescent beneath: staminate aments 3–4 cm. long, the bracts acuminate: pistillate aments with acute bracts: drupe elliptic, 15–17 mm. long.—(CORKWOOD.)—Swamps, brackish, fresh, or alluvial, Coastal Plain, N Fla. to Tex., Mo., and Ga.—Spr.—The wood is lighter than cork, and is occasionally used for floats and stoppers.

### ORDER MYRICALES — MYRICAL ORDER

Shrubs or small trees, usually aromatic. Leaves alternate: blades simple, sometimes toothed or pinnatifid. Flowers dioecious or monoecious; the staminate in long aments, each flower consisting of an androeium of 2–8 stamens; the pistillate in short aments, each flower consisting of a gynoeium of 2 united carpels on a bract subtended by 2 bractlets and surrounded by 2–8 scales. Stigmas 2. Ovules solitary. Fruit a nut, the epicarp often waxy.

### FAMILY 1. MYRICACEAE — BAYBERRY FAMILY

Shrubs or trees. Leaves resinous-dotted. Aments scaly-bracted. Perianth wanting. Ovary 1-celled. Nut short and thick. Three genera and about 35 species of wide geographic distribution.

Leaves without stipules; blades entire or toothed: fruit not in a bristly involucre.

Bractlets of the pistillate flowers persistent: fruits winged by the clasping bractlets; fruiting spikes bracted.

1. MYRICA.

Bractlets of the pistillate flowers deciduous: fruits wingless, very waxy: fruiting spikes cluster-like, bractless.

2. CEROHAMNUS.

Leaves stipulate; blades pinnatifid: fruit in a bristly involucre.

3. COMPTONIA.

1. *MYRICA* L. Dioecious shrubs. Leaf-blades entire or toothed above the middle. Aments appearing before the leaves. Staminate aments with closely imbricate bracts: flowers with 4 stamens, without bractlets. Pistillate aments not bristly: flowers with a gynoeium subtended by 2 lateral bractlets which later develop into wings. Fruit nut-like, flattened, 2-winged, crowded in spikes with the persistent bracts.—Represented by the following species only:

1. *M. Gale* L. Shrub 1.5 m. tall or less, with dark twigs: leaf-blades thick, spatulate to oblanceolate or oblong-cuneate, mostly 1.5–5 cm. long, serrate near the apex, often minutely pubescent: mature

pistillate aments cylindric, dense, becoming 1-1.5 cm. long: nut 2-2.5 mm. long, the wings somewhat prolonged at the top.—(SWEET-GALE. BOG-MYRTLE.) In swamps and on borders of ponds, often in acid soil, Blue Ridge and more northern provinces, N. C. to Minn., Ore., Alas., Ont., and Newf.—Spr.

**2. CEROTHAMNUS** Tidestrom. Dioecious shrubs or trees. Leaves evergreen in our range: blades entire or merely toothed. Aments appearing after the leaves. Staminate aments with loosely imbricate bracts: flowers with 2-16 stamens which are often subtended by bractlets. Pistillate aments not bristly: flowers with a gynoeceium subtended by 2-4, or more, bractlets which are not accrescent. Fruit globular, drupe-like, in cluster-like spikes without bracts, the epicarp very waxy. [*Morella* (Fl. SE U. S.)]—About 9 species, mostly North American.—The bark is astringent and wax is obtained from the exudations of the fruits.—Wint.—spr.—BAYBERRIES. WAX-MYRTLES. WAX-BERRIES. TALLOW-SHRUBS. CANDLE-BERRIES.

Low shrub, less than 1 m. tall, with horizontal subterranean stems (rootstocks), the erect branches often forming large patches.

Tall shrubs or small trees, without rootstocks.

Leaf-blades toothed or individually entire: stamens about 4: twigs pubescent.

Drupe 2-3 mm. in diameter: leaf-blades of a narrow type, long-attenuate to the base.

Drupe 4-5 mm. in diameter: leaf-blades of a broad type, usually not long-attenuate to the base.

Leaf-blades entire: stamens about 10: twigs glabrous.

1. *C. pumilus*.

2. *C. ceriferus*.

3. *C. carolinensis*.

4. *C. inodorus*.

1. ***C. pumilus*** (Michx.) Small. Shrub 2-6 dm. tall, gregarious from horizontal rootstocks: leaf-blades obovate to linear-spatulate, cuneate at the base, 1.5-3 cm. long or rarely larger, commonly 5-8 mm. long: nut 3.5-4 mm. in diameter.—(DWARF WAX-MYRTLE. DWARF-CANDLE-BERRY.)—Sandy acid pinelands, Coastal Plain, Fla. to La. and N. C.

2. ***C. ceriferus*** (L.) Small. Shrub, or tree becoming 12 m. tall: leaves much reduced toward the tips of the branches and often yellowish; blades oblanceolate to elliptic-oblanceolate, 3-10 cm. long, toothed or individually entire: staminate aments 1-1.5 cm. long: nut 2-3 mm. in diameter.—(WAXBERRY. WAX-MYRTLE. SPICE-BUSH. CANDLEBERRY.)—Hammocks, and swamps, protected from fire, often in acid soil, Coastal Plain, Fla. to Tex., Ark., and S N. J.

3. ***C. carolinensis*** (Mill.) Tidestrom. Shrub 1-3 m. tall: leaves not conspicuously reduced toward the tips of the branches; blades elliptic, oblanceolate or obovate, 2-10 cm. long, shallowly toothed toward the apex: staminate aments 1-1.5 cm. long: nut 4-5 mm. in diameter.—(BAYBERRY. NORTHERN. BAYBERRY. SWAMP-CANDLEBERRY.)—Low or wet acid pinelands, edges of hammocks, dunes, and stream-banks, various provinces, Fla. to Ala., La., (?), Ind., and N. S.

4. ***C. inodorus*** (Bart.) Small. Shrub, or tree 6 m. tall: leaf-blades elliptic-obovate or sometimes spatulate, 4-8 cm. long, entire: staminate aments 1-1.5 cm. long: nut 5-7 mm. in diameter.—(ODORLESS WAX-MYRTLE.)—Edges of

pineland swamps and Titi bays, Coastal Plain, N. Fla. to Miss.—Remarkable for the lack of fragrance in the foliage. The leaves are smooth, while in the preceding species they are scurfy.

3. **COMPTONIA** Banks. Monoecious shrubs. Leaves deciduous; blades pinnatifid. Pistillate aments bristly. Fruit not drupe-like, surrounded by a bur-like involucre.—One species:

1. **C. peregrina** (L.) Coulter. Shrub 3–10 dm. tall: leaf-blades linear-elliptic to linear-lanceolate, 4–11 cm. long, the segments obtuse: staminate aments 1–3 cm. long, the bracts 3–4 mm. long: pistillate aments bur-like: nut ovoid, 5 mm. long, shining.—(SWEET-FERN. FERN-BUSH. SWEET-BUSH.)—Dry sterile soil, various provinces, N Ga. and Tenn. to Man. and N. S.—Spr.—The pleasant fragrance of the foliage may often be discerned distant from the plant. A characteristic plant of poor soil, often making very dense colonies, almost excluding other growth.

#### ORDER SALICALES — SALICAL ORDER

Shrubs or trees. Leaves alternate: blades simple, entire or toothed. Flowers dioecious in aments, the staminate consisting of an androeceum of 2 or more stamens, the pistillate consisting of a gynoeceum of 2 or 4 united carpels. Ovules numerous. Fruit capsular.

#### FAMILY 1. SALICACEAE — WILLOW FAMILY

Shrubs or trees with soft wood. Leaf-blades very narrow to very wide. Aments erect or drooping, the bracts mostly ciliate or toothed. Capsule narrowed to the apex. Seed usually with a tuft of hairs.—Two genera, the following, and more than 250 species, widely distributed in temperate and arctic regions.

Bracts incised: disk cup-like: stamens usually 10 or more, rarely 6–8: stigmas elongate and expanded: winter buds with several scales. 1. **POPULUS**.

Bracts entire: disk merely 1 or more axillary glands: stamens less than 10: stigmas short, not expanded: winter buds with 1 scale each. 2. **SALIX**.

1. **POPULUS** [Tourn.] L. Trees, the buds with several scales. Leaf-blades palmately veined, relatively long-petioled. Stamens more than 10, or rarely 6 or 8: anthers purple or red. Ovary sessile. Stigmas dilated.—About 30 species, natives of the Northern Hemisphere.—The wood is used in construction and for making paper pulp.—Spr.—POPLARS. COTTONWOODS.

Stigmas with slender lobes: terminal buds small, short, not glutinous, or only slightly so.

Capsule slender, of a conic type: bracts of the aments lobed, the lobes narrow: leaf-blades glabrous or nearly so at maturity.

Capsule stout, of an ovoid type: bracts of the aments crenate: leaf-blades persistently white-tomentose.

Stigmas with broad lobes: terminal buds large, long, very glutinous.

I. **GRANDIDENTATAE**.

II. **ALBAE**.

Petioles laterally flattened.  
Petioles terete or channelled.

III. DELTOIDES.  
IV. HETEROPHYLLAE.

## I. GRANDIDENTATAE

Leaf-blades finely crenate-serrate: bud-scales glabrous or merely ciliate.

Leaf-blades coarsely sinuate-dentate: bud-scales tomentulose.

1. *P. tremuloides*.
2. *P. grandidentata*.

## II. ALBAE

Leaf-blades very broad, several-lobed and few toothed, the pubescence on the lower surface often felt-like.

3. *P. alba*.

## III. DELTOIDES

Stamens 6-8: tree-trunk fastigiately branched.  
Stamens 5 or more: tree-trunk widely branched.

4. *P. italica*.
5. *P. balsamifera*.

## IV. HETEROPHYLLAE

Anthers ellipsoid: pistillate aments loosely flowered: capsule slender-pedicelled: young leaves white-tomentose.

Anthers globose-oval: pistillate aments densely flowered: capsule stout-pedicelled: young leaves not white-tomentose.

6. *P. heterophylla*.
7. *P. candicans*.

1. *P. tremuloides* Michx. Tree becoming 15 m. tall (rarely taller), the bark smooth or smoothish, greenish-white: leaf-blades ovate to orbicular-ovate, or orbicular-reniform, 3-8 cm. long, abruptly pointed, nearly or quite regularly crenate-serrate, becoming glabrous: ament-bracts with 3 or 4 coarse lobes: capsule 5-8 mm. long.—(AMERICAN ASPEN. QUIVER-LEAF. QUAKING-ASPEN. TREMBLING-POPLAR.)—Woods and thickets, various provinces, Tenn. to Calif., Alas., Ont., N. S., and Newf.

2. *P. grandidentata* Michx. Tree becoming 25 m. tall, the bark fissured, gray: leaf-blades ovate to orbicular-ovate, 6-10 cm. long, acute, unevenly sinuate-dentate, becoming glabrous: ament-bracts with 5 or 6 fine lobes: capsule 4-7 mm. long.—(GREAT-ASPEN. LARGE-TOOTHED ASPEN.)—Woods, stream-borders, usually in burns and clearings, and various provinces, N. C. to Minn., and N. S.

3. *P. alba* L. Tree becoming 35 m. tall, the bark pale, except when old and rough: leaf-blades ovate or orbicular in outline, or somewhat rhombic, 5-10 cm. long, sinuate or somewhat lobed, white-tomentose beneath: ament-bracts crenate: capsule ovoid, 2.5-3 mm. long.—(WHITE-POPLAR. SILVER-LEAVED POPLAR. SILVER-POPLAR. DUTCH-BEECH.)—Cult. grounds, roadsides, and fields, locally through our range, and in other parts of the U. S. and S. Can. Nat. of Eurasia.

4. *P. italica* Moench. Tree with fastigiately branched trunk, becoming 25 m. tall: leaf-blades deltoid, subrhomboidal, or somewhat reinform, mostly 5-8 cm. long, crenate or crenate-serrate: staminate aments 2-5 cm. long: stamens few: capsule ovoid, 6-8 mm. long. [*P. dilatata* Ait.]—(LOMBARDY-POPLAR. WATER-POPLAR.)—Roadsides, fields, meadows, and pastures, locally in our range. Nat. of Eu.

5. *P. balsamifera* L. Tree with widely branched trunk, becoming 40 m. tall, the twigs dark: leaf-blades deltoid to ovate-deltoid, 8-15 cm. long, or longer, acute or short-acuminate, serrate or crenate-serrate, nearly or quite to the petiole, usually with two prominent basal-glands: staminate aments 8-12 cm.

long: stamens numerous: capsule ovoid, 8-10 mm. long. [*P. deltoides* Marsh.]—(NECKLACE-POPLAR. CAROLINA-POPLAR. RIVER-POPLAR. COTTONWOOD.)—Moist soil, mostly along streams, various provinces, Fla. to La., Man., and Que.

6. *P. heterophylla* L. Tree becoming 30 m. tall, the bark flaky: leaf-blades broadly ovate, 8-15 cm. long, or longer, obtuse or acutish, crenate or serrate-crenate: pistillate aments short, the flowers long-pedicelled: capsule ovoid, 9-12 mm. long.—(SWAMP-COTTONWOOD. BLACK-COTTONWOOD. DOWNY-POPLAR.)—Swamps and river-banks, various provinces, except Appalachians, N. Fla. to La., Ark., Ind., and Conn.

7. *P. candicans* Ait. Tree becoming 30 m. tall, the bark ridged: leaf-blades broadly ovate or orbicular-ovate, 6-16 cm. long, acuminate, crenate: pistillate aments elongate, the flowers short-pedicelled: capsule ovoid, 8-11 mm. long.—(BALM-OF-GILEAD.)—Roadsides, fields, and cult. grounds, various provinces, N. C. to N. Dak., Alas., Ont., and Newf. Nat. of Eurasia, and perhaps also of N. N. A.

2. **SALIX** [Tourn.] L. Shrubs or trees, the buds with a single scale. Leaf-blades pinnately veined, relatively short-petioled. Stamens 2, or rarely 1-7: anthers yellow or reddish. Ovary stipitate: stigmas not dilated.—About 200 species widely distributed in north temperate and arctic regions; few in the south temperate zone.—The wood is used to make fine grades of charcoal, the bark yields tannic acid and the branchlets are used in making baskets. Some species are used in ornamental horticulture.—Wint.-Spr.—WILLOWS. OSIERS. WITHYS.

Aments borne on lateral leafy branchlets, their scales of one color, usually yellowish, deciduous: filaments distinct, pubescent below.

Stamens 3-7.

Stamens 2.

Leaf-blades closely serrate, long-acuminate.

Leaf-blades entire or remotely denticulate or dentate.

Aments borne laterally, or terminal, their bracts discolored, colored at the tips, persistent: filaments distinct and glabrous, except in *S. purpurea*.

Filaments glabrous, distinct.

Capsule glabrous.

Capsule pubescent.

Leaf-blades serrate.

Leaf-blades undulate, crenate, or undulate-crenate.

Filaments pubescent, united.

I. NIGRAE.

II. ALBAE.

III. LONGIFOLIAE.

IV. CORDATAE.

V. SERICEAE.

VI. DISCOLORES.

VII. PURPUREAE.

#### I. NIGRAE

Leaf-blades green on both sides, sometimes paler beneath.

Capsule conic or ovoid-conic, the lower part more or less swollen, the base not broadly rounded: pedicels less than one-half as long as the capsules.

Capsule ovoid, the lower part conspicuously turgid, the base broadly rounded: pedicels one-half as long as the capsules or more.

Leaf-blades glaucous or silvery-white pubescent beneath.

Capsule conic, the valves veiny: fruiting aments short.

Capsule ovoid, the valves not veiny: fruiting aments elongate.

1. *S. nigra*.

2. *S. marginata*.

3. *S. amphibia*.

4. *S. longipes*.

#### II. ALBAE

Capsule distinctly pedicelled, conic-subulate or conic.

Capsule sessile or nearly so, ovoid or conic-ovoid.

Capsule 4-5 mm. long: pistillate aments 4 cm. long or more.

Capsule 2-3 mm. long: pistillate aments 3 cm. long or less.

5. *S. fragilis*.

6. *S. alba*.

7. *S. babylonica*.

#### III. LONGIFOLIAE

Leaf-blades of a narrowly linear type: capsule with a broad base abruptly narrowed into the beak.

*S. S. interior*.

## IV. CORDATAE

Capsule mostly less than 7 mm. long: twigs greenish, more or less grayish-pubescent.

Capsule mostly over 7 mm. long: twigs purple.

9. *S. cordata*.  
10. *S. Chapmanii*.

## V. SERICEAE

Leaf-blades glabrous in maturity: capsule 5–8 mm. long.

Leaf-blades persistently sericeous: capsule 3–4 mm. long.

11. *S. petiolaris*.  
12. *S. sericea*.

## VI. DISCOLORES

Leaf-blades glabrous, at least at maturity slender-petioled.

Leaf-blades persistently pubescent, at least beneath, distinctly petioled, or very short-petioled.

Mature pistillate aments 2–4 cm. long: capsule 7–9 mm. long.

Mature pistillate aments 1–1.5 cm. long: capsule 5–6 mm. long.

13. *S. discolor*.  
14. *S. humilis*.  
15. *S. tristis*.

## VII. PURPUREAE

Filaments pubescent, united.

16. *S. purpurea*.

1. *S. nigra* Marsh. Shrub or small tree, the twigs brown: leaf-blades narrowly lanceolate to linear-lanceolate, 6–12 cm. long, acute at both ends, or acuminate from the roundish base, green on both sides, and glabrous at least in maturity, closely serrate: bracts of the staminate aments obtuse: capsules 3–5 mm. long, somewhat swollen below, but not broadly rounded at the base.—(BLACK-WILLOW. SWAMP-WILLOW.)—Low grounds, swamps, and river-banks, various provinces, Fla. to Tex., N. D., and N. B.

2. *S. marginata* Wimm. Shrub or small tree, the twigs reddish: leaf-blades ovate, elliptic, or lanceolate, 2–5 cm. long, obtuse, acute, or slightly acuminate, green on both sides, but often slightly paler beneath, finely serrate, ultimately glabrous or nearly so: bracts of the staminate aments acute or acutish: capsule 4–6 mm. long, turgid below and with a broadly rounded base.—(GULF-WILLOW.)—River-banks and swamps, Coastal Plain, Fla. to La.—Specimens commonly referred to this and the preceding species, with fragile branchlets, have been described as *S. Harbisonii* C. Schneider.

3. *S. amphibia* Small. Shrub or small tree, the twigs purple or purplish: leaf-blades linear-lanceolate, lanceolate, or elliptic, 3–13 cm. long, acute or acuminate, glabrous or pubescent when young, glaucous beneath, finely serrate: bracts of the staminate aments usually acute or acutish: capsule conic, 6–8 mm. long, long-beaked.—Borders of lakes, swamps, and hammocks, pen. Fla.

4. *S. longipes* Anders. Shrub or small tree, the twigs gray or gray-brown: leaf-blades lanceolate, ovate-lanceolate or narrowly elliptic, or rarely somewhat broadened upward, 7–15 cm. long, acute or acuminate, finely serrate, glaucous and veiny, and often finely pubescent beneath, stout-petioled: stipules large, persistent: capsule ovoid, 4–6 mm. long, short-beaked. [*S. floridana* Chapm.]—Rocky and gravelly shores and stream-beds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Md.

5. *S. fragilis* L. Tree becoming 25 m. tall, the twigs brown: leaf-blades green, or pale beneath, lanceolate to elliptic-lanceolate, 8–15 cm. long, glabrous: capsule conic-subulate or conic, 4.5–5 mm. long.—(CRACK-WILLOW. BRITTLE-

WILLOW. SNAP-WILLOW.)—Roadsides, fields, and meadows, locally nat. in the E U. S. Nat. of Eu.

6. *S. alba* L. Tree becoming 30 m. tall, the twigs greenish (yellow or reddish and with glabrous leaves in *S. alba vitellina*; olive green or bluish in *S. alba coerulea*): leaf-blades pale, or white beneath, lanceolate or elliptic, 5–12 cm. long, permanently sericeous in the typical tree: capsule ovoid, 3–5 mm. long.—(WHITE WILLOW.)—Stream-banks, meadows, and roadsides, locally nat. in temp. N. A. Nat. of Eu.

7. *S. babylonica* L. Tree becoming 20 m. tall, the twigs greenish: leaf-blades narrowly lanceolate to linear-lanceolate, 5–12 cm. long, sericeous at first, becoming glabrous, pale beneath, finely serrate: capsule ovoid-conic, 2–3 mm. long or rarely smaller.—(WEeping-WILLOW. DROOPING-WILLOW.) Stream-banks, roadsides, and about dwellings, locally nat. in E N. A. Nat. of Eu.

8. *S. interior* Rowlee. Shrub or small tree, the twigs red or reddish: leaf-blades linear, varying to broadest below the middle or above it, remotely dentate, glabrous or nearly so, or sericeous when young: capsule ovoid-conic, the base broadly ovoid, rather abruptly narrowed into a long beak, 5–8 mm. long, glabrous, at least in maturity. [*S. longifolia* Muhl.]—(SANDBAR-WILLOW. RIVER-BANK WILLOW.)—Alluvial soil, river-banks, and islands, various provinces, Tenn. to La., Man., Que., and Del.

9. *S. cordata* Muhl. Shrub sometimes 5 m. tall, the twigs greenish, more or less grayish-pubescent: leaf-blades elliptic-lanceolate or narrowly elliptic (linear-lanceolate in *S. cordata angustata*), 5–11 cm. long or larger on shoots, acuminate, serrate, somewhat sericeous when young, green, pale or somewhat glaucous beneath: capsule ovoid-conic, 5–7 mm. long, slender-beaked, abruptly narrowed or somewhat rounded at the base, short-pedicelled. [*S. missouriensis* Bebb.]—(HEART-LEAVED WILLOW.)—Wet soil and damp banks, Ala. to Okla., Calif., B. C., Ont., and N. B.

10. *S. Chapmanii* Small. Shrub or small tree, the twigs purple, sometimes sparingly pubescent: leaf-blades elliptic or elliptic-lanceolate or ovate-lanceolate, 5–8 cm. long or larger, on twigs, acute serrate, very glaucous beneath: capsule conic, 7–9 mm. long, stout-beaked, truncate at the turgid base.—River-banks and wet woods, Coastal Plain, N Fla. and S Ga.

11. *S. petiolaris* J. E. Smith. Shrub often 4 m. tall, the twigs purplish: leaf-blades lanceolate, narrowly elliptic, or linear-elliptic, 4–7 cm. long, acuminate at both ends, finely serrate, sparingly sericeous when young: capsule slender-conic, or ovoid-ellipsoid below the beak, 5–8 mm. long, or rarely smaller, pubescent.—(ROSEMARY-WILLOW.)—Swamps and low grounds, various provinces, Tenn. to Mass. and N. B.

12. *S. sericea* Marsh. Shrub sometimes becoming 4 m. tall, the twigs purple or purplish, finely pubescent: leaf-blades lanceolate, often narrowly so, narrowly elliptic, or broadly linear, 5–10 cm. long, acute or acuminate, finely serrate, copiously sericeous especially when young: capsule short-conic, ovoid-conic, or ovoid-oblong, 3–4 mm. long, pubescent.—(SILKY-WILLOW.)—Wet hillsides, swamps, and stream-banks, various provinces, N. C. to Mich. and N. B.

13. *S. discolor* Muhl. Shrub or small tree, the twigs purple or grayish and slightly pubescent when young: leaf-blades elliptic, elliptic-lanceolate, or ovate-lanceolate, or obovate, 5–10 cm. long, or larger on shoots, glabrous, at

least in maturity, glaucous beneath, irregularly crenate-serrate: capsule slender-conic, 5–10 mm. long, slender-beaked, pubescent.—(GLAUCOUS-WILLOW. BOG-WILLOW. SILVER-WILLOW. WILD PUSSY-WILLOW.)—Swamps, meadows, and moist hillsides, various provinces, N. C. to Mo., Man., and N. S.

14. *S. humilis* Marsh. Shrub 3 m. tall or less, the twigs purplish or grayish, closely pubescent: leaf-blades elliptic, or oblanceolate, 5–10 cm. long or longer, becoming glabrous or nearly so above, glaucous, veiny, and more or less pubescent beneath, entire or nearly so, undulate-revolute, distinctly petioled: staminate aments over 1 cm. long: capsule 7–9 mm. long, the narrowly ovoid base rather slender-beaked, thinly fine-pubescent.—(PRAIRIE-WILLOW.)—Dry banks, rocky slopes, and moist thickets, various provinces, N. C. to Tex., Kans., Minn., and Newf.

15. *S. tristis* Ait. Shrub usually less than 1 m. tall, the twigs brownish or grayish, closely pubescent: leaf-blades oblanceolate to linear-elliptic, or broadly linear, 2–5 cm. long, persistently hoary-pubescent, but more densely so beneath than above, undulate-revolute, very short-petioled: staminate aments less than 1 cm. long: capsule 5–6 mm. long, the broadly ovoid base rather stout-beaked, copiously fine-pubescent.—(DWARF GRAY-WILLOW. SAGE-WILLOW. DWARF PUSSY-WILLOW.)—Dry open woods, thickets, and hillsides, various provinces, Fla. to Nebr., Minn., and Me.—Usually in acid soil.

16. *S. purpurea* L. Shrub or small tree, the twigs brownish: leaf-blades oblong, broadly linear, oblanceolate, or spatulate, 4–7 cm. long, serrulate near the apex, pale beneath, short-petioled: staminate aments 2–3 cm. long: capsule ovoid-conic or ovoid, 3–4 mm. long or rarely 5 mm. long, tomentose.—(PURPLE-WILLOW. PURPLE-OSIER. BITTER-WILLOW. BASKET-WILLOW.)—Low ground, swamps, and roadsides, E U. S. Nat. of Eu.

#### ORDER FAGALES — FAGAL ORDER

Shrubs or trees. Leaves alternate: blades simple. Flowers monocious or rarely dioecious, at least the staminate borne in aments, the pistillate sometimes with an involucre which becomes a bur or cup in fruit. Calyx usually present. Corolla wanting. Fruit a nut or rarely a samara.

Staminate and pistillate flowers in aments: fruit not with a bur or a cup.

Staminate flowers solitary in the axil of each bract, without a calyx: pistillate flowers with a calyx. Fam. 1. CORYLACEAE.

Staminate flowers 2–3 together in the axil of each bract, each with a calyx: pistillate flowers without a calyx. Fam. 2. BETULACEAE.

Staminate flowers in aments: pistillate often solitary, the involucre becoming a bur or cup. Fam. 3. FAGACEAE.

#### FAMILY 1. CORYLACEAE — HAZEL-NUT FAMILY

Shrubs or trees, the wood close-grained. Leaves deciduous: blades mostly doubly toothed. Staminate aments drooping, with each bract subtending one flower, the calyx wanting. Pistillate aments not drooping, each bract bearing 2 or 3 pistils, the involucre of a bract and 2 scales. Fruit consisting of one or more accrescent bracts each subtending or inclosing 1, 2 or 3 nuts.—Four genera and 20 species, most abundant in the Northern Hemisphere.

Staminate flowers without bractlets: pistillate flowers numerous, in elongate aments: nut small, subtended by or inclosed in a bract: stamens many.

Fruiting bracts flat, 3-lobed, the terminal lobe toothed.

Fruiting bracts bladder-like.

1. CARPINUS.

2. OSTRYA.

Staminate flowers with bractlets; pistillate flowers few, in heads:  
nut large, in a leaf-like involucre: stamens few.

3. **CORYLUS**.

1. **CARPINUS** [Tourn.] L. Trees or shrubs, the bark smooth. Staminate aments usually solitary, with separated spreading bracts. Pistillate aments with 3-lobed bracts at maturity.—About 12 species, only the following American:

1. **C. caroliniana** Walt. Shrub, or small tree becoming 13 m. tall, the trunk fluted, smooth, gray: leaf-blades elliptic, varying mainly to ovate or ovate-lanceolate, 3-14 cm. long, glabrous above: staminate aments 2-5 cm. long: mature bracts of the pistillate aments hastate, 2-3 cm. long: nut 5-6 mm. long.—(HORNBEAM. BLUE-BEECH. WATER-BEECH. IRONWOOD.)—Moist woods, swampy places, and along streams, various provinces, Fla. to Tex., Minn., and N. S.—Spr.—The wood is used for tool-handles and other small articles.

2. **OSTRYA** [Mich.] Scop. Shrubs or trees, the bark scaly. Staminate aments usually clustered, with close imbricate bracts. Pistillate aments with lobeless bracts. Six species, 3 American, 3 in the Old World.

1. **O. virginiana** (Mill.) Willd. Shrub, or tree becoming 18 m. tall, the bark rough, finely furrowed, brown: leaf-blades mainly elliptic, or oval, 3-13 cm. long, slightly pubescent or glabrate above: staminate aments 3-8 cm. long: mature bracts of the pistillate aments oblong to ovate, 1.5-2 cm. long: not 6-7 mm. long.—(HOP-HORN-BEAM. DEER-WOOD. IRONWOOD. LEVER-WOOD. BLACK-HAZEL.)—Rich, often dry or rocky, woods, hammocks, and bluffs, various provinces, Fla. to Tex., Man., and N. S.—Spr.—The wood is used mostly for mallets and tool-handles.

3. **CORYLUS** [Tourn.] L. Shrubs or trees, the bark smoothish. Staminate aments with acuminate bracts. Pistillate aments with foliaceous bractlets at maturity, these are dilated, or sometimes formed into a beaked involucre.—Seven species, 3 American, 4 in the Old World.—Spr.—HAZEL-NUTS. FILBERTS.

Mature bractlets distinct, leaf-like, incised.  
Mature bractlets united, prolonged into a narrow beak.

1. *C. americana*.  
2. *C. cornuta*.

1. **C. americana** Walt. Shrub 1-4 m. tall: leaf-blades thickish, oval or sub-orbicular, varying to ovate or obovate, 5-15 cm. long: staminate aments 6-10

cm. long, the bracts broadly oval or nearly so, acuminate: each bractlet of the pistillate aments becoming foliaceous and lobed. —(AMERICAN-HAZELNUT.)—Low thickets or hillsides, often in rather rich soil, various provinces, Ga. to Kans., Sask., and Me.

2. *C. cornuta* Marsh. Shrub 1-2 m. tall: leaf-blades thinnish, oblong or oval, varying to obovate, 4-12 cm. long, coarsely serrate and sharply serrulate: staminate aments 2-5 cm. long, the bracts rhomboid-obovate, apiculate: each bractlet of the pistillate aments developing a beaked tubular involucre. [*C. rostrata* Ait.]—(BEAKED-HAZELNUT.)—Stony, often acid

soil along streams, and in open woods, Piedmont and more northern provinces, Ga. to Kans., Sask., Que., and N. S.

## FAMILY 2. BETULACEAE — BIRCH FAMILY

Shrubs or trees, the wood close-grained. Leaves deciduous: blades with 2-several series of teeth. Staminate aments drooping, with each bract subtending 2 or 3 flowers, the calyx present. Pistillate aments seldom drooping, the bracts thickened and woody, each one bearing 2 or 3 pistils, the calyx wanting. Fruit a cone-like aggregate of the accrescent bracts, each of which subtends a nut.—Two genera and about 45 species, most abundant in the Northern Hemisphere.

Stamens 2: bracts of the mature pistillate aments membranous, 3-lobed, deciduous with the nuts. 1. *BETULA*.  
Stamens 4 (3-6): bracts of the mature pistillate aments thickened and woody, persistent. 2. *ALNUS*.

1. *BETULA* [Tourn.] L. Shrubs or trees, the bark often aromatic. Staminate flowers with 2 stamens, the anther-sacs separated. Bracts of the pistillate aments 3-lobed, thin and appressed or ascending at maturity.—About 35 species, natives of the north temperate and arctic zones.—The wood is valuable for cabinet work and for small articles used in various manufactures. The bark, which is impervious to water, is used for canoes, boxes, and shoes. It peels naturally in horizontal strips.—Spr.—BIRCHES.

Fruiting ament peduncled: samara wider than long. I. *NIGRAE*.  
Fruiting ament sessile at the end of a short branch: samara longer than wide. II. *LENTAE*.

I. *NIGRAE*  
Fruiting aments ellipsoid, erect; scales tomentose: leaf-blades broadly cuneate at the base. 1. *B. nigra*.  
Fruiting aments narrowly cylindric, nodding; scales not tomentose: leaf-blades cordate at the base. 2. *B. cordifolia*.

II. *LENTAE*  
Leaf-blades shining above: mature pistillate bracts with two short broad diverging lateral lobes: samara with triangular-obovate or cuneate wings: bark brown. 3. *B. lenta*.  
Leaf-blades dull above: mature pistillate bracts with two ascending lateral lobes: samara with orbicular-obovate wings: bark yellowish or silvery. 4. *B. allegheniensis*.

1. *B. nigra* L. Tree becoming 30 m. tall, the younger bark silvery or yellow: leaf-blades rhombic-ovate, 3-6 cm. long, broadly cuneate at the base, more or less tomentose beneath except in age: staminate aments with suborbicular bracts: mature pistillate aments 3-4 cm. long, less than 1 cm. thick, the bracts 6-7 mm. long, tomentulose: wing of the fruit reniform, ciliate.—(RIVER-BIRCH. RED-BIRCH. WATER-BIRCH.)—Swamps and stream-banks, various provinces, except Blue Ridge, N Fla. to Tex., Minn., and Mass.

2. *B. cordifolia* Regel. Tree 10 m. tall or less, the young bark white or whitish: leaf-blades ovate to triangular-ovate, 4-8 cm. long, acute or short-acuminate, doubly serrate, cordate at the base, with scattered hairs beneath on the veins: staminate aments with broadly ovate bracts: mature pistillate aments 2.5-5 cm. long, slender-peduncled, the bracts 5.5-6.5 mm. long, glabrous or obscurely pubescent: wing of the fruit subreniform, ciliate.—Cool woods, Blue Ridge, N. C., and various provinces, N N. Y. to Minn. and Newf.

3. *B. lenta* L. Tree becoming 25 m. tall, the bark blackish: leaf-blades ovate, elliptic-ovate, or elliptic-lanceolate, 4-12 cm. long, rounded or cordate at the base, silky on the nerves beneath: staminate aments with ovate bracts: mature pistillate aments 1.5-3 cm. long, over 1 cm. thick, the bracts 5-6 mm. long and quite or nearly as wide, usually glabrous: wing of the fruit triangular-obovate or cuneate, not ciliate.—(SWEET-BIRCH. CHERRY-BIRCH. BLACK-BIRCH. SPICE-BIRCH. MAHOGANY-BIRCH.)—Woods and hillsides, various provinces, in Coastal Plain only N, Ga. to Ala., Minn., and Newf.—The bark contains an essential oil similar to that of wintergreen, and is distilled with steam in order to secure it on a commercial scale.

4. *B. allegheniensis* Britton. Tree becoming 30 m. tall, the bark yellowish or silvery: leaf-blades ovate to elliptic-ovate, 5-10 cm. long, rounded or cordate at the base, pubescent on the nerves beneath: staminate aments with ovate or oval-ovate bracts: mature pistillate aments 1.5-2.5 cm. long, very stout, the bracts 7-9 mm. long, quite or fully as wide, ciliate: wing of the fruit orbicular-obovate. [*B. lutea* (Fl. SE. U. S.)]—(SOUTHERN YELLOW-BIRCH. GRAY-BIRCH.)—Rich, often rocky woods, Blue Ridge and more northern provinces, Ga. to Mau. and Newf.

2. **ALNUS** [Tourn.] L. Shrubs or trees, the bark astringent. Staminate flowers with 3-6 stamens, the anther-sacs connected. Bracts of the pistillate aments not lobed, woody and spreading at maturity.—About 15 species, natives of the Northern Hemisphere and the Andes. The bark yields tannic acid.—ALDERS.

Aments flowering before or after the leaves develop: nut wingless, merely margined.

Aments flowering as the leaves develop: nut winged.

1. *A. rugosa*.

2. *A. Alnobetula*.

1. *A. rugosa* (Du Roi) Spreng. Shrub or tree, becoming 13 m. tall: leaf-blades thickish, obovate or oval, 4-10 cm. long: mature pistillate aments

oblong or oval, 1.5–2 cm. long, the bracts 3-lobed: nut 1.5–2.5 mm. long, sharp-margined.—(SMOOTH-ALDER. GREEN-ALDER. TAG-ALDER. RED-ALDER. SPECKLED-ALDER. HAZEL-ALDER.)—Low woods, thickets, swamps, and stream-banks, various provinces, except Blue Ridge and Adirondacks, Fla. to Tex., Minn., and Me.—Spr.

2. *A. Alnobetula* (Ehrh.) K. Koch. Shrub becoming 3 m. tall: leaf-blades oval or ovate, 3–9 dm. long: mature pistillate aments 1–2 cm. long, the bracts undulately lobed: nut 2–3 mm. long, winged.—(MOUNTAIN-ALDER. GREEN-ALDER. RUSSET-ALDER.)—Stony often acid soil, Blue Ridge and more northern provinces, N. C. and Tenn. to Man., N. Y., and Lab.—Spr.—(Eurasia.)

### FAMILY 3. FAGACEAE — OAK FAMILY

Shrubs or trees, the wood coarse-grained. Leaves sometimes persistent: blades simple, entire, toothed, or lobed. Staminate aments elongate or globular, the calyx of 4–7 partially united sepals. Pistillate flowers solitary or several together, each subtended by a bristly involucre, the sepals thick. Fruit a bur-like, cup-like, or saucer-like involucre enclosing or subtending 1 or more nuts.—About 6 genera and 400 species of wide geographical distribution.

Staminate aments globose, drooping on slender bracted peduncles: nut 3-angled or 3-winged.

Staminate aments elongate, slender.

Staminate aments erect or ascending: nuts 1–3, included in a very spiny involucre.

Staminate aments drooping: nut seated in an involucre of imbricate scales.

1. FAGUS.

2. CASTANEA.

3. QUERCUS.

1. **FAGUS** [Tourn.] L. Shrubs or trees, with close-grained wood. Leaf-blades toothed. Staminate aments globular, pendulous: calyx 4–7-lobed: stamens 8–16. Pistillate flowers 2–4 together: calyx 4–5-lobed. Staminodia wanting. Ovary 3-celled: stigmas 3, filiform. Mature involucre with fleshy spines, enclosing the nuts. Nuts 2–4, 3-angled or 3-winged. About 4 species of the Northern Hemisphere. The tree more common in the southern Coastal Plain, with the leaf-blades rounded or cordate at the base, has been described as *F. grandifolia caroliniana* (Loud.) Fernald & Rehder.

1. *F. grandifolia* Ehrh. Tree becoming 40 m. tall, the bark smooth, pale: leaf-blades ovate or elliptic-ovate, 5–14 cm. long: staminate aments 1–1.5 cm. in diameter, long-peduncled: ripe involucre ovoid, 1.5–2 cm. long, short-peduncled: nut ovoid, narrowly winged, edible.

[*F. americana* Sweet]—(BEECH. RIDGE-BEECH. RED-BEECH. WHITE-BEECH. BEECH-NUT TREE.)—Rich or low woods and stream-banks, various provinces, N Fla. to Tex., Minn., Ont., and N. S.—Spr.—The wood is used for furniture and various small articles. The nuts are edible.

**2. CASTANEA** [Tourn.] Hill. Shrubs or trees, with porous wood. Leaf-blades toothed, the teeth slender-tipped. Staminate aments elongate, spreading: calyx 6-lobed: stamens 10–20, the filaments greatly elongate. Pistillate flowers several: calyx 6-lobed. Stamnodia present. Ovary imperfectly 6-celled. Stigmas 6, slender. Mature involucre with rigid often branching spines, including the nuts. Nuts 2 or 3, or sometimes solitary.—Spr.—CHESTNUTS. CHINQUAPINS. About 11 species, natives of the Northern Hemisphere. The wood is used in construction and for interior finish. The seeds are edible.

Leaf-blades glabrous, green on both sides: nuts usually 2 or 3 in an involucre, or rarely more, flattened, at least on one side. I. DENTATAE.

Leaf-blades permanently pubescent beneath, except in *C. floridana*, the pubescence tawny or pale: nuts solitary, not flattened. II. PUMILAE.

#### I. DENTATAE

Large tree with long coarsely sharp-toothed, decidedly acuminate leaf-blades.

1. *C. dentata*.

#### II. PUMILAE

Shrub without rootstocks, or more or less arborescent, or a tree: ripe involucre with a single nut or rarely with 2.

—Leaf-blades densely and permanently pubescent beneath.

Shrub or shrub-like tree: leaves small; blades mostly 7–15 cm. long, with relatively small acute teeth.

Spines of the ripe involucre comparatively slender and long, glabrate or sparingly pubescent: leaf-blades velvety-pubescent beneath.

2. *C. pumila*.

Spines of the ripe involucre comparatively stout and short, rather canescent well to the tips: leaf-blades felt-like beneath.

3. *C. Ashei*.

Large tree: leaves large; blades mostly 15–25 cm. long, with coarse, salient, bristle-tipped teeth.

4. *C. ozarkensis*.

—Leaf-blades glabrous or nearly so beneath at maturity.

Tree with large leaves; blades 11–20 cm. long, somewhat glaucous beneath at maturity.

5. *C. alabamensis*.

Shrub or small tree with small leaves; blades 7–11 cm. long, somewhat lustrous beneath at maturity.

6. *C. floridana*.

Shrub with elongate rootstocks, the branches erect, gregarious, often forming large colonies.

7. *C. alnifolia*.

1. *C. dentata* (Marsh.) Borkh. Tree becoming 30 m. tall, the bark furrowed: leaf-blades narrowly elliptic or elliptic-lanceolate, 10–30 cm. long, acuminate at the apex, glabrous: neck of the hypanthium longer than the body: ripe involucre 5–10 cm. in diameter: nuts mostly 2, 3 or 5 together, 2–2.5 cm. long.—(CHESTNUT. PRICKLY-BUR.)—Rocky woods and hillsides, various provinces, Ga. to Ala., Ont., and Me.—Late spr.—early sum.—The species seems to be on a fair way to become extinct through the ravages of the chestnut-blight since about 1905.—*C. neglecta* Dode, described as a hybrid between *C. dentata* and *C. pumila* is reported from N. C.

2. *C. pumila* (L.) Mill. Shrub or small tree up to 9 m. tall, the bark smooth: leaf-

blades obovate, oval, or elliptic, 7-14 cm. long, acute or slightly acuminate, the lateral veins rather few and distant: ripe involucre with long slender spines: nut 1-1.5 cm. long.—Dry sandy soil, woods and thickets, various provinces, Fla. to Tex., Ind., and N. J.—Spr.

3. *C. Ashei* Sudw. Shrub or tree up to 10 m. tall, the bark smooth: leaf-blades elliptic or oval varying to obovate, cuneate, or oblanceolate, usually smaller and narrower than in *C. pumila*, mostly rounded or acute, or sometimes acuminate, the lateral veins rather numerous and closely placed: ripe involucre with short stubby spines.—Dry sandy soil, woods, hammocks, Coastal Plain, Fla. to Tex. and Va.—Spr.—The form with acuminate leaf-blades has been described as *C. Margaretta* Ashe.

4. *C. ozarkensis* Ashe. Tree up to 20 m. tall, sometimes with several stems from a common base, the trunk sometimes 1 m. in diameter, the bark furrowed: leaf-blades elliptic-obovate to broadly lanceolate-elliptic, 15-25 cm. long, more or less acuminate, with coarse salient bristle-tipped teeth, permanently finely brown- or pale-pubescent beneath: ripe involucre 2.5-3.5 cm. in diameter, the spines finely and densely pubescent. [*C. arkansana* Ashe]—(CHINQUAPIN.)—Woods, rocky slopes, and stream-banks, Ozark-Quachita Plateau and adj. Coastal Plain, Miss. to La., Okla., and S Mo.—Spr.

5. *C. alabamensis* Ashe. Tree up to 10 m. tall, with a somewhat furrowed bark: leaf-blades elliptic varying to elliptic-lanceolate, elliptic-ob lanceolate, or elliptic-obovate, 11-20 cm. long, rather coarsely dentate with bristle-tipped teeth, somewhat glaucous beneath, often with scattered hairs on the veins beneath: ripe involucre 2.5-3.5 cm. in diameter, the spines coarsely and sparsely pubescent.—(CHINQUAPIN.)—Hillsides and creek-banks, Ala.—Spr.

6. *C. floridana* (Sarg.) Ashe. Arborescent shrub with several or numerous stems from a common base, up to 18 m. tall, the stems rarely over 2-3 dm. in diameter: leaf-blades elliptic, varying to broadest above the middle or below it, 6-13 cm. long, minutely pubescent beneath when young, glabrous and somewhat shining at maturity, shallowly, but usually rather sharply toothed, the teeth bristle-tipped: ripe involucre 2-2.5 cm. in diameter. [*C. alnifolia floridana* Sarg.]—(CHINQUAPIN.)—Woods and stream-banks, Coastal Plain, Fla. to E Tex. and S Ark.—Spr.

7. *C. alnifolia* Nutt. Shrub with underground stems (rootstocks) and erect branches 2-5 dm. tall: leaf-blades cuneate to lanceolate with a cuneate base, 5-15 cm. long, obtuse or apiculate at the apex, with tawny or dirty-white tomentum beneath, the lateral ribs in 12-14 pairs: ripe involucre 1.5-2 cm. in diameter: nut solitary, 1.5-2 cm. long. [*C. nana* Muhl.]—(CHINQUAPIN. DOWNY-CHINQUAPIN.)—Pinelands and sandhills, Coastal Plain, Fla. to La. and N. C.—Spr.

3. **QUERCUS** [Tourn.] L. Shrubs or trees, with coarse-grained wood. Leaf-blades entire, toothed, or lobed. Staminate aments drooping: calyx 4-7-lobed: stamens 6-12, the filaments relatively short. Pistillate flowers solitary or several: ovary usually 3-celled: stigmas 3, dilated. Mature involucre (cup) saucer-like or deeper, subtending the nut, or rarely enclosing it.—About 240 species, natives of the Northern Hemisphere.—The wood is extensively used in construction work, cabinet-work, and for tools and utensils. The fruits furnished an important food supply for the Indian. The white-oaks and live-oaks are the more valuable kinds.—Spr., or wint. S.—OAKS.

Fruit maturing the first year: nut-shell glabrous within: seeds with the abortive ovules at the base: leaf-blades with blunt, or merely acute or mucronate teeth or lobes.

Leaves deciduous: blades toothed or lobed:—White-oaks.

I. ALBAE.

Leaves evergreen; blades entire, except sometimes on shoots and in *Q. minima*:—Live-oaks.

II. VIRGINIANAE.

Fruit maturing the second year: nut-shell pubescent within: seed with the abortive ovules at or near the apex: leaf-blades with bristle-tipped lobes or teeth.

Leaf-blades entire (or undulately lobed on young shoots) or in Nos. 22 and 23 with a more or less lobed terminal dilation: acorn-nut of a globose type, small:—Laurel-oaks.

III. LAURIFOLIAE.

Leaf-blades prominently lobed, except sometimes in *Q. marilandica* and *Q. arkansana*: acorn-nut of an ovoid type:—Red-oaks.

IV. RUBRAE.

#### I. ALBAE

Leaf-blades lyrate or sinuate-pinnatifid.

Leaf-blades glabrous beneath: acorn-cup with tubercled scales.

Leaf-blades pubescent beneath or sometimes glabrous in *Q. lyrata*: acorn-cup with flat or slightly thickened scales.

Upper scales of the cup not awn-tipped.

Acorns sessile or nearly so: nut not depressed, much protruding from the close-scaly cup.

Leaf-blades obovate in outline, gray or yellowish beneath, the 3–5 ample lobes often broad and dilated.

Leaf-blades with truncate or emarginate upper lobes: acorn-cup mostly over 15 mm. wide: nut more than half protruding from the cup.

Leaf-blades with rounded upper lobes: acorn-cup mostly less than 15 mm. wide: nut less than half protruding from the cup.

Leaf-blades cuneate in outline, brown or yellowish beneath, the 3–7 lobes low and rounded.

Acorns peduncled: nut depressed, nearly or quite included in the loose-scaly cup.

Upper scales of the cup awn-tipped, thus forming a fringe around the nut.

Leaf-blades undulate, sinuate-lobed, or coarsely toothed.

Leaf-blades coarsely toothed.

Acorns manifestly peduncled, the peduncle shorter or longer than the petiole.

Peduncles much longer than the petioles: upper scales of the cup mostly awn-tipped, sometimes forming a fringe.

Peduncles about as long as the petioles or shorter: upper scales of the cup not awn-tipped, consequently no fringe around the nut.

Bark of trunk white or whitish, flaky: leaf-blades glabrous or white-pubescent beneath, with acute or mucronate teeth.

Acorn over 2.5 cm. long: cup 2.5 cm. wide or more, the scales free to the base.

Acorn less than 2 cm. long: cup 1.5 cm. wide or less, the scales free at the tip.

Bark of the trunk dark-gray, furrowed: leaf-blades gray-pubescent beneath, with rounded or obtuse teeth.

Acorns sessile: leaf-blades typically of an obovate type, with few teeth: shrub or small tree.

Leaf-blades sinuate-lobed, merely undulate, or entire.

Leaf-blades glabrous, at least when fully grown, green beneath: acorn-cup hemispheric, sometimes slightly constricted at the base.

Leaf-blades persistently pubescent and white beneath: acorn-cup very shallow, saucer-shaped or almost disk-like.

#### II. VIRGINIANAE

Stem (rootstocks) underground, the branches erect, low: plants with narrow and broad leaf-blades, the broad ones prominently sinuate or pinnately lobed.

1. *Q. alba*.

2. *Q. stellata*.

3. *Q. Margaretta*.

4. *Q. Boyntonii*.

5. *Q. lyrata*.

6. *Q. macrocarpa*.

7. *Q. bicolor*.

8. *Q. Prinus*.

9. *Q. Muhlenbergii*.

10. *Q. montana*.

11. *Q. prinoides*.

12. *Q. austrina*.

13. *Q. Durandii*.

14. *Q. minima*.

Stem erect, developing into tall shrubs or trees: plants with nearly or quite uniform leaf-blades.

Leaf-blades prominently rugose-reticulate: cup of the acorn turbinate.

Leaf-blades not rugose-reticulate: cup of the acorn hemispheric or saucer-shaped.

Cup of the acorn hemispheric or funnellform: leaves not succulent: nut  $\frac{1}{3}$ - $\frac{1}{2}$  included at the base.

Leaf-blades various, entire, not lobed, except sometimes on vigorous shoots, not of a cuneate type.

Leaf-blades of a cuneate type, more or less prominently 3-lobed at the apex, or those on shoots sinuate.

Cup of acorn hemispheric, about as deep as wide: nut ovoid or oval-ovoid, less than twice as long as thick.

Cup of acorn deeper than wide, somewhat funnel-form: nut ellipsoid, twice as long as thick.

Cup of acorn saucer-shaped, nut very slightly included at the base.

15. *Q. geminata*.

16. *Q. virginiana*.

17. *Q. Chapmanii*.

18. *Q. Rolfsii*.

19. *Q. succulenta*.

20. *Q. pumila*.

21. *Q. myrtifolia*.

22. *Q. microcarya*.

23. *Q. nigra*.

24. *Q. laurifolia*.

25. *Q. Phellos*.

26. *Q. obtusa*.

27. *Q. cinerea*.

28. *Q. imbricaria*.

### III. LAURIFOLIAE

Stems underground, the branches erect, usually low.

Stems erect, developing into tall shrubs or trees.

Leaf-blades glabrous beneath.

Leaf-blades obovate, the margins more or less revolute.

Leaf-blades linear, elliptic, or broadest above the middle, the margins flat.

Leaf-blades broadened upward and 3-lobed near the apex.

Acorn-cup hemispheric: nut less than 1 cm. long.

Acorn-cup saucer-shaped: nut 1 cm. long or more.

Leaf-blades linear or elliptic, or somewhat cuncate, not 3-lobed at the apex.

Acorn-cup hemispheric: leaves evergreen, flat in bud.

Acorn-cup saucer-shaped: leaves deciduous.

Leaf-blades narrow, linear to linear-elliptic, varying to lanceolate or oblanceolate, revolute in the bud.

Leaf-blades broad, elliptic to cuneate, flat in the bud.

Leaf-blades pubescent beneath.

Leaf-blades gray-tomentose beneath: acorn-cup very shallow, saucer-shaped.

Leaf-blades brown-tomentose beneath: acorn-cup deep, usually hemispheric.

### IV. RUBRAE

Leaf-blades green and glabrous, or merely with tufts of hair in the vein-axils beneath.

Acorn-cup saucer-shaped, flat or slightly rounded at the base.

Cup with gray scales, small, mostly less than 1.5 cm. wide.

Leaf-lobes mostly toothed: acorn-cup flat at the base.

Leaf-lobes mostly entire: acorn-cup slightly rounded at the base.

Cup with brown scales, large, mostly over 2 cm. wide.

Larger lobes of the leaf about equalling the body of the blade: buds red-brown.

Larger lobes of the leaf much longer than the body of the blade: buds stramineous.

Acorn-cup turbinate or hemispheric, more or less constricted at the base.

Cup with small closely appressed scales: buds glabrous.

Leaf-lobes more or less dilated and lobed at the apex: buds stramineous.

Leaf-lobes narrowed at the apex and coarsely toothed: buds red-brown.

29. *Q. palustris*.

30. *Q. georgiana*.

31. *Q. maxima*.

32. *Q. Shumardii*.

33. *Q. Schneekii*.

34. *Q. borealis*.

- Cup with coarse loosely appressed scales: buds pubescent.
- Leaf-blades broad-based, long-petioled; lobes nearly or quite regular, not falcate. 35. *Q. coccinea*.
- Leaf-blades narrow-based, short-petioled; lobes irregular, falcate. 36. *Q. laevis*.
- Leaf-blades persistently pubescent beneath.
- Leaf-blades broadly cuneate in outline, more or less flabellately dilated.
- Acorn-cup hemispheric-turbinate, mostly over 1.5 cm. wide, the tips of several rows of the inner scales pubescent, forming a kind of fringe. 37. *Q. marilandica*.
- Acorn-cup saucer-shaped, mostly less than 1.5 cm. wide, the tips of the inner row of scales merely puberulent, not forming a fringe. 38. *Q. arkansana*.
- Leaf-blades pinnatifid, or sometimes 3-lobed in *Q. rubra*, the form known as *Q. triloba*.
- Acorn-cup of large, coarse, somewhat lax scales. 39. *Q. velutina*.
- Acorn-cup of small closely appressed scales.
- Larger leaf-lobes lanceolate, often falcate.
- Leaf-blades rounded or obtuse at the base, the 3-5 lobes ascending. 40. *Q. rubra*.
- Leaf-blades broadly cuneate or truncate at the base, the 5-13 lobes spreading. 41. *Q. Pagoda*.
- Larger leaf-lobes triangular or deltoid. 42. *Q. ilicifolia*.

1. *Q. alba* L. Tree becoming 45 m. tall, the bark light-gray, sometimes tinged with red or brown, or nearly white, with thin appressed scales: leaf-blades obovate or oval in outline, 10-20 glaucous and finally glabrous beneath, pin-cm. long, bright-green and smooth above, natifid into 3-9, usually 7, ascending narrow usually entire lobes: acorns short-stalked; cup saucer-shaped or shallow-hemispheric, with the scales woody-tuberculate, 15-20 mm. wide; nut ellipsoid-ovoid, 15-25 mm. long.—(WHITE-OAK. STAVE-OAK.)—Woods and hillsides, various provinces, N Fla. to Tex., Minn., Ont., and Me.—Hybridizes with *Q. Prinus* = x *Q. Beadlei*; with *Q. stellata* = x *Q. Fernowi*.

2. *Q. stellata* Wang. Tree becoming 30 m. tall, the bark reddish and usually brown-tinged, with broad ridges and deep fissures: leaf-blades broadly obovate in outline, 10-20 cm. long, dark-green and rough above, finely tomentose beneath with gray or yellowish hairs, pinnatifid into usually broad diverging often undulate notched lobes: acorns often clustered; cup hemispheric and contracted at the base, 15-20 mm. wide; nut ovoid, 15-20 mm. long. [*Q. minor* (Marsh.) Sarg.]—(POST-OAK. IRON-OAK.)—Dry sandy, usually sterile and acid, soil, various provinces, N Fla. to Tex., Nebr., and Mass.—Hybridizes with *Q. montana* = x *Q. bernardiensis*.

3. *Q. Margaretta* Ashe. Shrub, or tree sometimes 10 m. tall, the bark brown or reddish, ridged and fissured: leaf-blades oval or obovate in outline, 6-9 cm. long, more or less pubescent about the veins beneath, sinuate or shallowly 3-5 lobed: acorn sessile or short-stalked; cup turbinate-hemispheric, 11-14 mm. wide; nut ellipsoid to ovoid-ellipsoid, 12-14 mm. long.—(SMALL POST-OAK.)—Sandhills and dry pinelands, Coastal Plain, Fla. to Ala. and Va.—Hybridizes with *Q. geminata* = x *Q. Harbisonii*.

4. *Q. Boyntonii* Beadle. Shrub 1-5 m. tall, the bark gray, often tinged with brown or black, broken into broad irregular appressed scales: leaf-blades cuneate in outline, often narrowly so, 5-9 cm. long, with 3-7 small

obtuse lobes above the middle or near the apex, tomentose beneath; acorn sessile or nearly so; cup turbinate, 9–12 mm. wide; nut oval or ovoid, 12–15 mm. long.—Rocky soil, forming thickets, on ridges, Appalachian Valley, Ga. and Ala.

5. *Q. lyrata* Walt. Tree becoming 35 m. tall, the bark gray, often red-tinged, broken into thick plates: leaf-blades obovate or spatulate in outline, 9–17 cm. long, white-tomentose beneath or glabrate and green, lyrate-pinnatifid, with 7–9 lobes: acorn short-stalked; cup hemispheric or depressed-globose, 20–40 mm. wide; nut ovoid and slightly exserted or spheroidal and nearly or wholly included in the cup.—(OVERCUP-OAK. SWAMP WHITE-OAK. WATER WHITE-OAK. SWAMP POST-OAK.)—Swamps, usually along rivers, Coastal Plain and adj. provinces, Fla. to Tex., Mo., (Ia.?) Ind., and N. J.—Hybridizes with *Q. virginiana* = x *Q. Comptonae*.

6. *Q. macrocarpa* Michx. Tree becoming 55 m. tall, the bark brown and often red-tinged, broken into irregular plates: leaf-blades obovate to spatulate in outline, 10–30 cm. long, finely tomentose beneath the pinnate lobes, spreading, the terminal lobe largest and usually coarsely crenate: acorns long-stalked; cup deep-hemispheric or globular, 20–40 mm. wide, the upper scales with filiform tips; nut subglobose or broadly ellipsoid, 30–50 mm. long.—(OVERCUP-OAK. MOSSY-CUP OAK. BUR-OAK.)—Rich woods, Piedmont and more northern provinces, Ga. to Tex., Man., and N. S.—Supposed to hybridize with *Q. Prinus* = x *Q. Byarsi*.

7. *Q. bicolor* Willd. Tree sometimes becoming 36 m. tall, the bark gray-brown and often red-tinged, broken in broad ridges by more or less irregular fissures: leaf-blades obovate to elliptic-obovate, 5–20 cm. long, coarsely toothed, usually cuneate at the base, densely white-tomentose beneath: acorns long-stalked; cup saucer-shaped or depressed-hemispheric, 20–25 mm. wide, with some of the bracts prolonged; nut ellipsoid or ellipsoid-ovoid, 20–25 mm. long or slightly longer. [*Q. platanoides* (Lam.) Sudw.]—(SWAMP WHITE-OAK.)—Swamps, meadows, and stream-banks, various provinces in Coastal Plain only N, Ga. to Ark., Minn., and Me.

8. *Q. Prinus* L. Tree becoming 35 m. tall, the bark silvery white or gray, and often red-tinged, broken into thin appressed scales: leaf-blades obovate, varying to elliptic, 8–16 cm. long, coarsely crenate-serrate, finely tomentose beneath: acorn sessile; cup deeply saucer-shaped or shallow-hemispheric, 25–35 mm. wide; nut ellipsoid or ellipsoid-ovoid, 30–35 mm. long. [*Q. Michauxii* Nutt.]—(COW-OAK. BASKET-OAK. SWAMP WHITE-OAK. SWAMP CHESTNUT-OAK.)—Swamps, bottoms, and calcareous hammocks, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Mo., and N. J.—Hybridizes with *Q. alba* = x *Q. Beadlei*; there is a supposed hybrid with *Q. macrocarpa* = x *Q. Byarsi*.

9. *Q. Muhlenbergii* Engelm. Tree becoming 50 m. tall, the bark silvery white and often tinged with brown, broken into loose scales: leaf-blades lanceolate to elliptic-lanceolate, 5–20 cm. long, coarsely serrate, with usually somewhat flaring teeth, minutely pubescent beneath or glabrate: acorns sessile, or nearly so; cup hemispheric, 12–17 mm. wide; nut ovoid, 15–20 mm. long. [*Q. acuminata* (Michx.) Houba]—(CHINQUAPIN-OAK. YELLOW-OAK.)—Calcareous bottoms and hillsides, various provinces, W Fla. to Tex., Minn., Ont., and Vt.

10. *Q. montana* Willd. Tree becoming 30 m. tall, the bark reddish-brown or almost black, broken into broad rounded ridges and deep furrows: leaf-blades elliptic to oval, varying to broadest slightly above or below the

middle, 15–20 cm. long, coarsely crenate-serrate, gray-tomentulose beneath: acorns short-peduncled; cup hemispheric, 12–35 mm. wide; nut ovoid or ellipsoid-ovoid, 25–35 mm. long. [*Q. Prinus* Du Roi not L.]—(CHESTNUT-OAK. TANBARK-OAK.)—Rocky hillsides and dry woods, various provinces, Ga. to Miss., Ont., and Me.—Hybridizes with *Q. stellata* = *x Q. bernardiensis*.

11. *Q. prinoides* Willd. Shrub or tree becoming 6 m. tall, the bark brown, with flat ridges and shallow furrows: leaf-blades obovate or oblanceolate, or rarely nearly elliptic, 5–15 cm. long, coarsely toothed, cuneate or rarely rounded at the base, finely gray-tomentulose beneath: acorns sessile or nearly so; cup hemispheric, 13–18 mm. wide; nut ellipsoid-ovoid, 15–25 mm. long.—(SCRUB CHESTNUT-OAK. DWARF CHINQUAPIN-OAK.)—Dry sandy or rocky, often acid, soil, various provinces, N. C. to Tex., Minn., and Me.

12. *Q. austrina* Small. Tree becoming 25 m. tall, the bark gray or brownish-gray, more or less scaly and broken into wide ridges; leaf-blades cuneate to elliptic-cuneate, 5–15 cm. long, with 3–5 blunt lobes, ascending, white-tomentulose beneath but soon glabrous, bright-green above: acorns sessile or short-stalked; cup hemispheric, 12–16 mm. wide; nut ovoid, 15–20 mm. long. [*Q. sinuata* Walt.?]  
to Miss. and S. C.

13. *Q. Durandii* Buckl. Tree becoming 16 m. tall, light-gray or nearly white, broken into thin loosely appressed scales: leaf-blades narrowly elliptic, varying to broadest above or below the middle, 4–10 cm. long, entire or slightly 5-lobed near the apex, pale- or whitish-tomentulose beneath, pale-green above: acorns nearly sessile; cup very shallow, 10–14 mm. wide, thin-sealy; nut ovoid or somewhat depressed, about 10 mm. long.—(BASTARD WHITE-OAK. PIN-OAK. WHITE-OAK.)—Hills and stream-banks, mostly calcareous, Coastal Plain, Ga. to Tex. and Ark.

14. *Q. minima* (Sarg.) Small. Shrub, with underground stems, the branches less than 1 m. tall, the bark brown, either pale or dark: leaf-blades obovate or sometimes elliptic or oblanceolate in outline, 3–10 cm. long, glabrous or finely pubescent beneath, repand-toothed or those of the upper leaves sometimes entire: acorns solitary or several on a peduncle; cup hemispheric, about 15 mm. wide; nut ovoid or ellipsoid, 15–18 mm. long. [*Q. virens dentata* Chapm. *Q. virginiana minima* Sarg. *Q. virginiana dentata* Sarg.]—(SCRUB-OAK. DWARF LIVE-OAK.)—Flat pinelands, Coastal Plain, Fla. to S. Ala. and Ga.

15. *Q. geminata* Small. Shrub, or tree 10 m. tall with trunk usually curved: leaf-blades narrowly elliptic, elliptic, or elliptic-oblanceolate, 3–6 cm. long, entire, revolute, very stiff, rugose-reticulate, finely tomentulose beneath: acorns usually 2 at the end of a stalk; cup turbinate, about 10 mm. wide; nut ovoid or narrowly oval, 10–17 mm. long. [*Q. virens maritima* Chapm.]—(TWIN LIVE-OAK. SCRUB LIVE-OAK.)—Sandy hammocks, scrub, and sand-ridges, Coastal Plain, Fla. to Miss. and N. C.—Hybridizes with *Q. Margareta* = *x Q. Harbisonii*.

16. *Q. virginiana* Mill. Tree with erect trunk and wide-spreading branches, becoming 30 m. tall, the bark brown or gray, broken into irregular ridges by shallow furrows: leaf-blades oval or elliptic, varying to obovate or oblanceolate, 3–12 cm. long, entire, except sometimes on shoots, slightly revolute, smooth above, pale beneath: acorns solitary, or spicate on peduncles; cup hemispheric, 15–20 mm. wide; nut ovoid or ellipsoid-ovoid, 20–25 mm. long, more than twice as long as the cup. [*Q. virens* Ait.]—(LIVE-OAK.)—Woods and hammocks, Coastal Plain, Fla. to Tex. and Va.—(*W. I., Mex.*)—Hy-

bridizes with *Q. lyrata* = x *Q. Comptonae*.—*Q. Andromeda* Ridd. differs in its smooth leaf-blades which are veinless on both sides.—The rough bark furnishes a favorite anchorage for "air-plants" and many species of them may be found on it in the more southern latitudes. The spread of the branches is, often, much greater than the height of the tree.

17. *Q. Chapmanii* Sarg. Shrub, or tree becoming 15 m. tall, the bark brown, sometimes rather pale, broken into irregular plates: leaf-blades obovate or elliptic, or somewhat cuneate, 5–10 cm. long, sinuately 3-lobed near the apex, or merely undulate, sparingly pubescent beneath, lustrous above: acorn sessile or nearly so; cup depressed-hemispheric, 15–20 mm. wide; nut ovoid or oval ovoid, 1.5–2.5 cm. long. [*Q. stellata parvifolia* Chapm.]—(CHAPMAN'S-OAK. SCRUB-OAK.)—Sandy hammocks and scrub, Coastal Plain, Fla. to S. C.—A scrub-oak growing on the sand ridges about Fort Bassenger, Florida, resembles *Q. Chapmanii*, but it has thick-edged acorn-cups. It may represent another species.

18. *Q. Rolfii* Small. Shrub, or small tree 7 m. tall, with hard rigid branches, the bark brown, scaly: leaf-blades cuneate, 2.5–6 cm. long, mostly 3-lobed at the apex, or sometimes 5-lobed, bright-green, glabrous and finely reticulate above, pale and thinly stellate-pubescent beneath: acorns usually in pairs at the ends of short peduncles: cup hemispheric above a stout base, about 1.5 cm. broad; nut ellipsoid, or slightly broadest below the middle, 2–2.5 cm. long, about  $\frac{1}{2}$  included in the cup.—(ROLFS'-OAK. SCRUB-OAK.)—Hammocks, and scrub, lower E coast, Fla.

19. *Q. succulenta* Small. Shrub, mostly about 1 m. tall, with soft, partly fleshy, spreading branches, the bark brownish, slightly scaly: leaf-blades linear to cuneate, fleshy-coriaceous, 2–4.5 cm. long, entire or with 3–5 slightly spinescent lobe-like teeth, smooth and glabrous above, tomentulose beneath: acorns peduncled; cup saucer-shaped, 3–4 mm. high, 5–6 mm. broad; nut ellipsoid-conic, 1–1.5 cm. long, only the very base included in the cup.—Pinelands, S pen. Fla.

20. *Q. pumila* Walt. Shrub with underground stems, the branches 3–6 dm. tall, or sometimes taller: leaf-blades deciduous, narrowly elliptic, varying to lanceolate or oblanceolate, 5–12 cm. long, more or less finely tomentose beneath, entire, sometimes slightly crisped: acorns sessile or nearly so; cup saucer-shaped, sometimes deeply so, 12–15 mm. wide; nut ovoid, 10–15 mm. long.—(RUNNING-OAK.)—Pinelands, Coastal Plain, Fla. to Miss. and N. C.

21. *Q. myrtifolia* Willd. Shrub, or tree becoming 6 m. tall, the bark brown, smooth or somewhat furrowed: leaf-blades obovate or oval, 2–5 cm. long, entire, evergreen, shiny above, dull beneath: acorn sessile or nearly so; cup hemispheric, sometimes deeply so, 10–13 mm. wide; nut ovoid or ellipsoid-ovoid, 10–14 mm. long. [*Q. Phellos arenaria* Chapm.]—(SCRUB-OAK.)—Sandy hammocks, scrub, and sand-ridges, Coastal Plain, Fla. to La. and S. C.—Supposed to hybridize with *Q. cinerea* = x *Q. oviedoensis*.—An apparent form of this species from the lake region of Florida, with larger and broader-based leaf-blades, has been described as *Q. inopina* Ashe.

22. *Q. microcarya* Small. Shrub, or tree becoming 5 m. tall, the bark brown, often slightly fissured and scaly: leaves deciduous; blades broadly spatulate in outline, 5–10 cm. long, undulate or shallowly lobed, tufted in the vein-axils beneath: acorns sessile; cup deep saucer-shaped, 6–7 mm. wide; nut globose-ovoid, 8–9 mm. long, nearly  $\frac{1}{2}$  in the cup.—Granite rocks along streams or gullies, Little Stone Mt. on the Piedmont, Ga.

23. *Q. nigra* L. Tree becoming 30 m. tall, the bark gray or blackish, or tinged with red, broken into appressed scales: leaves deciduous northward, partly evergreen southward; blades oblanceolate to spatulate or rhombic in outline, 5–15 cm. long, entire and sometimes with a dilated terminal lobe, or 3-lobed at the apex, glabrous beneath or sometimes sparingly tomentose: acorn sessile or short-peduncled; cup saucer-shaped, 12–15 mm. wide; nut subglobose, 10–13 mm. long. [*Q. aquatica* Walt.]—(WATER-OAK. PIN-OAK. SPOTTED-OAK. DUCK-OAK. POSSUM-OAK.)—Sandy soil, swamps, and river-swamps, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., Ill., and S N. J.—Hybridizes with *Q. cinerea* = *x Q. caduca*; with *Q. laevis* = *x Q. Walteriana*.

24. *Q. laurifolia* Michx. Tree becoming 30 m. tall, the bark dark-brown or nearly black, with flat ridges and deep furrows: leaves evergreen or partly deciduous northward; blades flat in bud, elliptic, varying to oval or obovate, 4–13 cm. long, entire, deep-green, glabrous: acorn short-stalked or nearly sessile; cup hemispheric, 10–15 mm. wide; nut ovoid or globose-ovoid, 10–15 mm. long. [*Q. Phellos laurifolia* Chapm.]—(LAUREL-OAK. WATER-OAK. WILLOW-OAK. LIVE-OAK.)—Sandy hammocks and river-bluffs, Coastal Plain and rarely Piedmont, Fla. to La. and Va.—Supposed to hybridize with *Q. laevis* = *x Q. Mellichampi*; with *Q. cinerea* = *x Q. sublaurifolia* (? *Q. atlantica* Ashe).

25. *Q. Phellos* L. Tree becoming 25 m. tall, the bark brown or reddish-brown, ultimately with irregular scaly plates and shallow fissures: leaves all deciduous, turning yellow in fall; blades revolute and almost filiform in bud, linear or linear-elliptic to lanceolate or oblanceolate, 4–10 cm. long, shining and glabrous at maturity, entire: acorns sessile or nearly so; cup saucer-shaped, 10–15 mm. wide; nut subglobose, often depressed or globose-ovoid, about 1 cm. long.—(WILLOW-OAK.)—Swamps, stream-banks, and sandy bottoms, Coastal Plain and rarely adj. provinces, Fla. to Tex., Mo., and N. Y.—Hybridizes with *Q. marilandica* = *x Q. Rudkinii*; with *Q. velutina* = *x Q. dubia*; with *Q. rubra* = *x Q. subfalcata*.

26. *Q. obtusa* (Willd.) Pursh. Tree becoming 25 m. tall, the bark brown, ultimately shallowly fissured and ridged: leaves somewhat persistent, but not wholly evergreen; blades elliptic-cuneate, to cuneate, or elliptic-obovate, 6–12 cm. long, rounded at the apex, dark-green: acorn sessile; cup saucer-shaped, very flat, 9–12 mm. wide; nut subglobose or ovoid-globose, 7–9 mm. long. [*Q. hybrida* (Michx.) Small]—River banks and bottoms, mostly calcareous, Coastal Plain, Fla. to Miss. and Ga.

27. *Q. cinerea* Michx. Small tree, the bark gray, dark-brown, or blackish, broken into squarish plates: leaves deciduous; blades elliptic, varying to lanceolate or oblanceolate, 5–12 cm. long, mainly entire, pale-green, gray-tomentose beneath: acorn nearly sessile; cup saucer-shaped, 10–15 mm. wide; nut ellipsoid or subglobose, about 15 mm. long.—(TURKEY-OAK. UPLAND WILLOW-OAK. BLUE-JACK. HIGH-GROUND WILLOW-OAK. SAND-JACK. CINNAMON-OAK.)—Sand-ridges, dry woods, and pinelands, Coastal Plain, Fla. to Tex., Okla., and N. C.—Hybridizes with *Q. laevis* = *x Q. Ashei*; with *Q. laurifolia* = *x Q. sublaurifolia* (? *Q. atlantica* Ashe.); with *Q. marilandica* = *x Q. carolinensis*; with *Q. nigra* = *x Q. caduca*; with ? *Q. velutina* = *x Q. podophylla* (*Q. petiolaris* Ashe.); with *Q. rubra* = *x Q. subintegra*; with *Q. myrtifolia* = *x Q. oviedoensis*.

28. *Q. imbricaria* Michx. Tree becoming 30 m. tall, the bark brown and often red-tinged, broken into broad scaly ridges: leaves deciduous; blades elliptic, varying to lanceolate or oblanceolate, 6–20 cm. long, mainly entire, softly brown-

tomentose beneath: acorns short-stalked; cup nearly hemispheric, 15–20 mm. wide; nut ovoid or subglobose, 10–15 mm. long.—(SHINGLE-OAK.)—Dry rich woods, various provinces, N of Coastal Plain, Ga. to Ark., Nebr., and Pa.; also SE N. Y. and E Mass.—Hybridizes with *Q. marilandica* =  $\times$  *Q. tridentata*.

29. *Q. palustris* Du Roi. Tree becoming 6 m. tall, the lower branches reflexed, the bark grayish-brown or light-brown, rather smooth except for small scales: leaf-blades broadly oval, varying to ovate or obovate in outline, 6–15 cm. long, merely pubescent in the vein-axils beneath, deeply pinnatifid, the lobes oblong, lanceolate, or triangular: acorns short-stalked; cup saucer-shaped, 10–14 mm. wide; nut globose-ovoid, 10–15 mm. long.—(SWAMP SPANISH-OAK. PIN-OAK. WATER SPANISH-OAK.)—Woods and swamps, various provinces, rare in Appalachians, Tenn. to Okla., Kans., Mich., Pa., and Mass.

30. *Q. georgiana* M. A. Curtis. Shrub, or tree becoming 8 m. tall, the bark brown, scaly: leaf-blades obovate or elliptic in outline, 5–12 cm. long, glabrous, or the vein-axils pubescent beneath, pinnatifid, the lobes triangular or ovate: acorns sessile or short-stalked; cup saucer-shaped, 12–16 mm. wide; nut ovoid or subglobose, 10–14 mm. long.—(GEORGIA-OAK. STONE MOUNTAIN-OAK.)—Granite and sandstone ridges, Piedmont, Ga. and Ala.—Hybridizes with *Q. marilandica* =  $\times$  *Q. Smallii*.

31. *Q. maxima* (Marsh.) Ashe. Tree becoming 50 m. tall, the lower branches spreading, the bark brown ultimately with rounded ridges with small scaly plates: leaf-blades oval, varying from ovate to obovate in outline, 10–20 cm. long, with tufts of hairs in the vein-axils beneath, pinnately 5–7-lobed, dark-red in fall, the lobes ascending, the sinuses rounded: acorns short-stalked; cup saucer-shaped, 25–35 mm. wide; nut ovoid, 25–30 mm. long. [*Q. rubra* Du Roi] —(RED-OAK.)—Woods and bluffs, various provinces, N Fla. to Okla., and Minn., and N. S.

32. *Q. Shumardii* Buckl. Tree becoming 65 m. tall, the bark reddish-brown, irregularly ridged and somewhat scaly: leaf-blades oval, varying to obovate in outline, 6–20 cm. long, with tufts of hairs in the vein-axils beneath, pinnately 5–7-lobed, the lobes ascending, elliptic or triangular, the sinuses rounded: acorn short-stalked or nearly sessile; cup saucer-shaped, 20–30 mm. wide, the scales thick or tuberculate; nut ovoid to ellipsoid-ovoid, 12–25 mm. long.—(LEOPARD-OAK. SPANISH-OAK.)—Woods, bottoms, and river-bluffs, often calcareous, Coastal Plain and adj. provinces, N Fla. to Tex. and Ia.

33. *Q. Schneckii* Britton. Tree nearly similar to *Q. Shumardii* in habit and foliage: acorn sessile or slightly stalked, especially by the constricted base of the cup; cup turbinate or hemispheric, 20–30 mm. wide, the scales thin or thinnish, appressed; nut ovoid, 20–30 mm. long.—Woods, stream-banks, and hillsides, Coastal Plain and adj. provinces, Ala. to Tex., Okla., and Ohio.

34. *Q. borealis* Michx. f. Tree becoming 25 m. tall, the bark brown, often red-tinged, with thick scaly plates: leaf-blades mainly oval to elliptic in outline, mostly 15–20 cm. long, glabrous, pinnately 7–13-lobed, the lobes as long as the body or longer: acorns short-stalked; cup turbinate, 14–18 mm. wide; nut ovoid, commonly 18–23 mm. long.—(GRAY-OAK.)—Woods and hillsides, Blue Ridge and more northern provinces, N. C. to Ont., Que., and N. S. Has been reported from Ark.

35. *Q. coccinea* Wang. Tree becoming 50 m. tall, the bark brown, with irregular fissures and scaly ridges: leaf-blades oval, varying to elliptic or obovate in outline, 10–20 cm. long, glabrous, except the tufted vein-axils

beneath, or with these sometimes nearly or quite hairless, bright-red in fall, pinnately 5-7-lobed, the lobes usually toothed: acorn sessile or short-stalked; cup broadly or shallowly turbinate, 15-20 mm. wide, more or less constricted at the base; nut ovoid or ellipsoid-ovoid, mostly 10-20 mm. long.—(SCARLET-OAK. SPANISH-OAK. RED-OAK.)—Dry woods and hillsides, various provinces, Ga. to Nebr., Ont., and Me.

36. *Q. laevis* Walt. Tree becoming 20 m. tall, the bark gray or bluish-gray, prominently ridged and broken into thick scales or blocks: leaf-blades elliptic to ovate in outline, 9-20 cm. long, glabrous, except the tufted vein-axils beneath, coriaceous, veiny, green both sides, deeply pinnate-lobed, red in fall, the lobes elliptic, ovate, or usually lanceolate, often curved: acorn short-stalked; cup broadly turbinate, sometimes rather flat, 25-30 mm. wide with incurved scales; nut ovoid, 20-25 mm. long. [*Q. Catesbaei* Michx.]—(SAND BLACK-JACK. TURKEY-OAK. FORKED-LEAF. SCRUB-OAK.)—Dry pine-lands and acid sand-ridges, Coastal Plain and rarely Piedmont, Fla. to La. and Va.—Hybridizes with *Q. cinerea* = x *Q. Ashei*; with *Q. rubra* = x *Q. bluff-tonensis*; with *Q. laurifolia* = x *Q. Mellichampi*; with *Q. nigra* = x *Q. Walteriana*.

37. *Q. marilandica* Muench. Tree becoming 20 m. tall, the bark dark-brown or nearly black, broken into irregular plates or blocks, very rough: leaf-blades broadly or narrowly obovate in outline, 8-17 cm. long, 3-5-lobed or with a single dilated terminal lobe, brownish-pubescent beneath: acorns sessile or short-stalked; cup turbinate or hemispheric-turbinate, 16-20 mm. wide; nut subglobose or ovoid, 10-20 mm. long. [*Q. nigra* L.]—(BLACK-JACK. BARREN-OAK. IRON-OAK. SCRUB-OAK.)—Dry clayey or rocky soil, various provinces, except Blue Ridge, N Fla. to Tex., Minn., and S N. Y.—Hybridizes with *Q. cinerea* = x *Q. carolinensis*; with *Q. georgiana* = x *Q. Smallii*; with *Q. imbricaria* = x *Q. tridentata*; with *Q. velutina* = x *Q. Bushii*; with *Q. Phellos* = x *Q. Rudkinii*.

38. *Q. arkansana* Sarg. Tree sometimes with crooked trunk becoming 15 m. tall, the bark gray, brown, or nearly black, with long narrow scaly ridges: leaf-blades broadly rhombic-cuneate or rhombic-obovate, 6-15 cm. long, broadly 3-lobed near the apex, deep-green above, slightly paler beneath, glabrous at maturity, except the tufted vein-axils beneath, rather slender-petioled: acorns sessile or nearly so; cup saucer-shaped, 12-14 mm. wide; nut ovoid, 10-15 mm. long. [*Q. caput-rivuli* Ashe]—Sandy river banks, bluffs and hammocks, Coastal Plain, W Fla. to Ark.

39. *Q. velutina* Lam. Tree becoming 50 m. tall, the bark dark-brown or nearly black, the broad ridges with plate-like scales: leaf-blades oval or obovate in outline, 10-30 cm. long, usually rusty-pubescent beneath, pinnately lobed, the lobes coarsely bristle-toothed: acorn sessile or nearly so; cup turbinate or hemispheric-turbinate, 20-25 mm. long. [*Q. tinctoria* Bartr. *Q. coccinea tinctoria* A. Gray]—(BLACK-OAK. YELLOW-BARKED OAK. QUERCITRON.)—Dry, usually sandy or rocky soil, various provinces, N Fla. to E Tex., Minn., Ont., and Me.—Hybridizes with *Q. Phellos* = x *Q. dubia*; with *Q. cinerea* = x *Q. podophylla* (*Q. petiolaris* Ashe); with *Q. marilandica* = x *Q. Bushii*.

40. *Q. rubra* L. Tree becoming 40 m. tall, the bark blackish with broad scaly ridges: leaf-blades ovate or oval in outline, finely tomentose with yellowish-gray hairs beneath, pinnatifid above a rounded base into 3-5 flaring or scythe-shaped lobes, (cuneate and 3-lobed at the apex in *Q. rubra triloba*), turning brown in fall: acorn short-stalked; cup flat-turbinate or saucer-shaped above the turbinate base, 15-18 mm. wide; nut subglobose, 10-15 mm. long. [*Q. falcata* Michx. *Q. triloba* Michx. *Q. digitata* (Marsh.) Sudw.]—(RED-OAK. SPANISH-OAK.)—Dry woods, often in acid soil, Coastal Plain and occasionally

adj. provinces, C Fla. to Tex., Mo., Ind., and N. J.—Hybridizes with *Q. laevis* = *x Q. blufftonensis*; with *Q. Phellos* = *x Q. subfalcata*; with *Q. cinerea* = *x Q. subintegra*.

41. *Q. Pagoda* Raf. Tree becoming 32 m. tall, the bark blackish or gray-brown, roughened with plate-like scales: leaf-blades oval to elliptic in outline, 15–30 cm. long, persistently white-tomentose, pinnatifid above a cuneate or truncate base into 5–13 lanceolate or narrowly triangular lobes: acorn sessile or nearly so; cup shallow-turbinate, or saucer-shaped above the turbinate base, 12–14 mm. wide; nut subglobose, about 10 mm. long. [*Q. pagodaefolia* (Ell.) Ashe]—(SPANISH-OAK. SWAMP SPANISH-OAK.)—Woods, river bottoms, and river-banks, Coastal Plain and rarely Piedmont, Fla. to Ark., Mo., and Va.

42. *Q. ilicifolia* Wang. Shrub rather intricately branched, or tree becoming 7 m. tall, the bark brown, smooth except for small scales: leaf-blades obovate or oval in outline, 6–12 cm. long, with white or pale-gray tomentum beneath, pinnatifid into 3–5 triangular or deltoid lobes: acorns short-stalked or nearly sessile; cup saucer-shaped, flat at the base or sometimes constricted, 14–18 mm. wide; nut ovoid-globose or depressed, 10–15 mm. long. [*Q. nana* (Marsh.) Sarg.]—(BEAR-OAK. BLACK SCRUB-OAK.)—Acid sandy or rocky soil, especially in pine-barrens and on bare rocky mountain tops, various provinces, S. C. to Ky., Ohio, and Me.

### ORDER URTICALES — URTICAL ORDER

Shrubs or trees, or herbs. Leaves alternate, or in the case of herbs often opposite: blades simple, entire, toothed, or divided. Flowers various, not in aments. Calyx present. Corolla wanting. Androeceum often of as many stamens as there are sepals. Gynoeceum of a single carpel or of 2 united carpels. Fruit an achene, a samara, a drupe, a syncarp, or a syconium.

Fruit an achene, the achenes sometimes in the accrescent sepals and forming a syncarp.

Flowers not on a receptacle: fruit not a syncarp:  
sepals neither thick and juicy nor enveloping  
achene.

Style or stigma 1: the latter sometimes tufted:  
ovule erect: filaments inflexed in the bud.

Styles or stigmas 2: ovule pendulous: filaments  
erect in the bud.

Flowers on the outside or inside of a receptacle:  
fruit a syncarp or syconium: sepals accrescent, en-  
veloping the achene.

Fruit a samara or a drupe, sometimes nut-like.

Fam. 1. URTICACEAE.

Fam. 2. CANNABINACEAE.

Fam. 3. ARTOCARPACEAE.

Fam. 4. ULMACEAE.

### FAMILY 1. URTICACEAE — NETTLE FAMILY

Herbs or shrubby plants, often with stinging hairs. Leaf-blades entire, toothed, or rarely lobed. Flowers dioecious, monoecious, or polygamous, cymose. Calyx of 2–5 distinct or partially united sepals. Androeceum of 2–5 stamens. Gynoeceum a single carpel. Fruit an achene.—About 40 genera and 550 species of wide geographic distribution.—Our species have greenish or greenish-white, inconspicuous flowers.

Sepals of the pistillate flowers distinct or slightly united: achene not invested by the calyx.

Flowers not involucrate.

Pistillate flowers with a calyx of 4 or 5 sepals.

Pistillate flowers with a calyx of 3 sepals.

Flowers or flower-clusters involucrate.

Tribe I. UREREAE.

Tribe II. PILEAE.

Tribe III. PARIETARIEAE.

Sepals of the pistillate flowers united: calyx-tube investing the achene.

Tribe IV. BOEHMERIEAE.

#### I. UREREAE

Stigma subulate, not tufted: ovary and achene oblique.  
Stigma tufted: ovary and achene equilateral.

1. URTICASTRUM.
2. URTICA.

#### II. PILEAE

Sepals of the pistillate flowers nearly equal, all slightly broadened or hooded at the apex.

Sepals of the pistillate flowers very unequal, the larger one helmet-like.

3. ADICEA.
4. PILEA.

#### III. PARIETARIEAE

Diffuse flimsy herbs with soft watery stems and leaves.

5. PARIETARIA.

#### IV. BOEHMERIEAE

Flowers monoecious, in glomerules on branches: leaves opposite.  
Flowers dioecious, in axillary or lateral compound clusters: leaves alternate.

6. BOEHMERIA.
7. RAMIUM.

1. **URTICASTRUM** Fabr. Perennial herbs with stinging hairs. Leaves alternate: blades toothed. Pistillate flowers with a calyx of 5 sepals and an oblique ovary.—About 25 species mostly of tropical regions.

1. **U. divaricatum** (L.) Kuntze. Stem 2–12 dm. tall: leaf-blades ovate, ovate-orbicular, or elliptic, 5–20 cm. long, long-petioled: panicles spreading, the lower staminate, the upper pistillate: sepals oblong, or broader in the pistillate flowers: achene oblique, about 3 mm. in diameter, exserted.—(WOOD-NETTLE. CANADA-NETTLE. NETTLE-PATCH.)—Rich woods and bottoms, various provinces, Fla. to Kans., Minn., and N. S.—Sum.

2. **URTICA** [Tourn.] L. Annual or perennial often coarse herbs with stinging hairs. Leaves opposite: blades toothed or incised-lobed. Pistillate flowers with a calyx of 4 distinct sepals and an equilateral ovary.—About 30 species of wide geographic distribution.—NETTLES.

Annual: flower-clusters simple.

Leaf-blades incised-toothed, the upper ones but little reduced.

Perennial: flower-clusters compound.

Stems sparingly bristly: petioles more than half the breadth of the leaf-blades.

Stems densely bristly: petioles less than half the breadth of the leaf-blades.

1. *U. urens*.
2. *U. chamaedryoides*.
3. *U. gracilis*.
4. *U. dioica*.

1. **U. urens** L. Stem and branches 1–4 dm. tall: leaf-blades oval, elliptic, or ovate, 1–4 cm. long, rounded or broadly cuneate at the base, incised, the teeth

acute; petioles  $\frac{1}{2}$  as long as the blades, or more; achene about 2 mm. long.—(DWARF-NETTLE. SMALL-NETTLE.) — Waste-places, various provinces, Fla. to Calif., N. Y., and Newf.—Nat. of Eu.—(W. I.)—Spr.-fall.

2. *U. chamaedryoides* Pursh. Stem and branches 1-10 dm. tall: leaf-blades ovate-reniform, ovate, or deltoid, 1-4 cm. long, cordate or truncate at the base, crenate-dentate, the teeth obtuse; petioles  $\frac{1}{2}$  as long as the blades or less: achene fully 1 mm. long.—Thickets, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Ky.—Spr.-sum.

3. *U. gracilis* Ait. Stem 6-28 dm. tall: leaf-blades lanceolate, occasionally broadly so, 6-15 cm. long, acuminate, serrate: sepals hispidulous: achene fully 1 mm. long.—(TALL WILD-NETTLE.) —Fence-rows and river-banks, various provinces, N. C. to La., B. C., Ont., and N. S.—Sum.-fall.

4. *U. dioica* L. Stem 6-13 dm. tall: leaf-blades ovate to ovate-lanceolate, 3-12 cm. long, prominently incised-serrate, cordate, sometimes deeply so: sepals soft-hispidulous: achene fully 1 mm. long.—(STINGING-NETTLE.) —Waste-places and roadsides, various provinces, S. C. to Mo., Minn., and N. S.—Nat. of Eu.—Sum.-fall.

3. *ADICEA* Raf. Annual or perennial erect succulent herbs. Leaves mainly opposite: blades toothed, 3-ribbed. Flowers dioecious. Sepals of the pistillate flowers 3, nearly equal, slightly broader and more or less hooded at the apex, not enclosing the achene, each accompanied by a staminodium. Stigma tufted.—One species in the United States, perhaps others in tropical America.

1. *A. pumila* (L.) Raf. Stem 1-7 dm. tall, translucent, watery: leaf-blades ovate to elliptic, 3-10 cm. long, coarsely crenate-serrate, long-petioled: sepals lanceolate: achene ovoid, about 2 mm. long.—(CLEAR-WEED. RICHWEED. CHURLE-HEMP. NO-STING. COOLWEED.)—Moist banks and cool shaded places, various provinces, Fla. to La., Minn., and N. H.—Sum.-fall.

4. *PILEA* Lindl. Depressed, often creeping, succulent herbs. Leaves mainly alternate: blades entire, 1-ribbed. Flowers monoecious. Sepals of the pistillate flowers 3, very unequal, 2 of them flat, the third one much larger, helmet-like, often enclosing the achene. Stigma tufted.—About 200 species, mostly tropical.

Flower-clusters sessile in the leaf-axils or nearly so, very short: plants mostly monoecious.

Leaf-blades suborbicular to oval-orbicular or reniform-orbicular, less than twice as long as wide, long-petioled.

Leaf-blades elliptic, oblanceolate, or obovate, over twice as long as wide, short-petioled.

1. *P. herniarioides*.

2. *P. microphylla*.

Flower-clusters stalked and elongate, becoming as long as the leaves or nearly so: plants mostly dioecious.

3. *P. serpyllifolia*.

1. *P. herniarioides* (Sw.) Lindl. Stem and branches filiform, prostrate or decumbent, 3-10 cm. long: leaf-blades 2-4 mm. long, obtuse at the apex, very thin at least when dry, transversely wrinkled: smaller sepals mostly oblong: achene oblong-ovoid, 0.3-0.4 mm. long.—Hammocks, S pen. Fla. and Florida Keys.—(W. I.)

2. *P. microphylla* (L.) Liebm. Stem and branches spreading or creeping, 2-15 cm. long: leaves, and flower-clusters not crowded; blades 2-6 mm. long, acute or acutish: smaller sepals mostly ovate, greenish or pink: achene 0.5-0.6 mm. long.—Pinelands and hammocks, pen. Fla. and the Keys.—(W. I., Mex., C. A., S. A.)

3. *P. serpyllifolia* (Poir.) Wedd. Stem and branches erect, becoming diffuse, 3 dm. long or less, thick and succulent: leaves, and flower-clusters, crowded; blades obovate to elliptic-obovate or cuneate, 3-8 mm. long or more, thick and firm even when dry: smaller sepals ovate, greenish: achene about 0.5 mm. long.—(ARTILLERY-PLANT.)—Pinelands and waste-places, pen. Fla. and coastal La.—Nat. of Mex.—(W. I., Mex., C. A., S. A.)

5. **PARIETARIA** [Tourn.] L. Annual or perennial flimsy succulent herbs. Leaves alternate: blades entire. Flowers polygamous, in clustered involucre axillary cymes, the involucre of 2-6 more or less united bracts. Stigma tufted.—About 7 species, widely distributed.—PELLITORIES.

Plant annual, with fibrous roots: stem and branches finely or minutely pubescent.

Leaf-blades manifestly longer than wide, mostly 1-6 cm.

long: achene over 1 mm. long.

Leaf-blades of an ovate or elliptic type, relatively long-petioled.

Leaf-blades of a lanceolate type, relatively short-petioled.

Leaf-blades mostly as wide as long or wider, mostly 0.5 cm. wide: achene less than 1 mm. wide.

Plant perennial, with long woody roots, and with somewhat creeping stems: stem and branches coarsely pubescent.

1. *P. floridana*.

2. *P. pennsylvanica*.

3. *P. nummularia*.

4. *P. officinalis*.

1. *P. floridana* Nutt. Stems 1-5 dm. long, usually puberulent, often much branched: leaf-blades ovate to subrhombic, 0.5-5 cm. long: sepals acute: achene ovoid, 1 mm. long.—Hammocks and damp shaded places, Coastal Plain, Fla. to Tex. and N. C.—(W. I.)

2. *P. pennsylvanica* Muhl. Stems 1-4 dm. sepals and 4 stamens. Pistillate spikes leaf-blades lanceolate to elliptic or sometimes broader, 1-6 cm. long, acute or acuminate at the base: sepals acute: achene oval, fully 1 mm. long.—(HAMMERWORT. PELLITORY.)—Dry, often rocky banks, or woods, various provinces, Fla. to Tex., Minn., Ont., and Me.

3. *P. nummularia* Small. Stem usually branched at base, the branches becoming assurgent or prostrate, mostly 1-3 dm. long:

leaf-blades reniform, to rhombic-orbicular or orbicular-ovate, obtuse, relatively long-petioled: sepals abruptly pointed: achene ellipsoid, less than 1 mm. long.—Wet sandy soil, often in hammocks, E and pen. Fla.—The numerous very small leaves gives this plant the aspect of a small-leaved *Pilea*. Specimens of this species and those of *P. floridana* have erroneously been referred to the New Zealand *P. debilis*.

4. *P. officinalis* L. Stem usually branched at the base, hirsute: leaf-blades ovate, sometimes narrowly so, 1.5–3 cm. long, more or less acuminate at the apex, petioled: sepals with acute tips: achene ovoid, fully 1 mm. long.—Sandy pinelands, old fields, and roadsides, pen. Fla. Nat. of Eu.

6. **BOEHMERIA** Jacq. Perennial herbs. Leaves opposite: blades toothed, often 3-ribbed. Flowers monoecious, in clusters on branches, the pistillate with 4 united sepals surrounding the ovary. Stigma elongate. Achene included in the horseshoe-like accrescent calyx.—About 50 species mostly in tropical regions.—The plants produce a fiber valuable for weaving into cloth.—Sum.—fall.—FALSE-NETTLES.

Leaf-blades leathery, finely serrate; petioles much shorter than the blades.

1. *B. Drummondiana*.

Leaf-blades relatively thin, coarsely serrate; petioles as long as the blades or little shorter.

Main pair of lateral nerves arising at the base of the leaf-blade.

Main pair of lateral nerves arising some distance above the base of the leaf-blade.

2. *B. cylindrica*.

3. *B. decurrens*.

1. *B. Drummondiana* Wedd. Stems 2–12 dm. tall, typically rough-pubescent: leaf-blades firm, ovate to elliptic-ovate, or the lower ones orbicular to reniform, 2–5 cm. long, or rarely larger, short-petioled: flower-clusters mostly contiguous: inflorescence-branches short: achene mostly about 1.5 mm. wide. [*B. scabra* (Porter) Small] — (BOG-HEMP.) — Swamps, low grounds and hammocks, various provinces, Fla. to Tex., Kans., Mich., and Conn.

2. *B. cylindrica* (L.) Willd. Stems 2–13 dm. tall, typically smooth and glabrous: leaf-blades pliable, ovate to lanceolate, 3–12 cm. long, long-petioled: flower-clusters mostly separate: inflorescence-branches elongate: achene mostly about 1 mm. wide. — (BUTTON-HEMP.) — Woods and moist shaded places, various provinces, Fla. to Tex., Minn., Que., and Me.—Although closely resembling some of our stinging-nettles in habit, this plant is devoid of stinging-hairs.

3. *B. decurrens* Small. Stem 7–12 dm. tall, typically smooth and glabrous: leaf-blades lanceolate to ovate-lanceolate, 10–18 cm. long, sparsely pubescent beneath; petioles relatively slender: flower-clusters mainly contiguous: achenes fully 1.5 mm. wide.—Sandy, usually low or moist places, N Fla.

7. **RAMIUM** Rumph. Perennial shrubby plants. Leaves alternate: blades toothed. Flowers dioecious, in axillary or lateral compound clusters with slender branches, the pistillate with 4 united sepals enclosing the ovary.

Stigma elongate. Achene included in the little changed calyx.—Few species, mostly Asiatic.

1. **R. niveum** (L.) Small. Stem and branches more or less woody, 1–3 m. tall: leaf-blades broadly ovate, 8–30 cm. long, dentate, the upper surface rough, the lower densely white-pubescent: achene about 1 mm. long. [*Boehmeria nivea* (L.) Gaud.] —(RAMIE.)—Waste places, cult. grounds and roadsides, Coastal Plain, Fla. to Tex. and S. C. Nat. of Asia.

## FAMILY 2. CANNABINACEAE — HEMP FAMILY

Annual or perennial, often coarsely pubescent herbs. Leaves opposite or sometimes alternate: blades toothed, lobed, or divided. Flowers dioecious, the pistillate in bracted spikes, with an entire perianth, and a gynoeceium of 2 united carpels, the ovary 1-celled. Fruit an achene.—Two genera and about 4 species of the Northern Hemisphere.

Stem twining: leaf-blades usually 3-lobed: fruit a drooping cone.  
Stems erect: leaf-blades 3-7-parted: fruit spicate on stiff branches.

1. **HUMULUS**.  
2. **CANNABIS**.

1. **HUMULUS** L. Perennial vines. Leaves opposite: blades serrate or lobed. Pistillate flowers 2 together in drooping spikes which become cone-like at maturity.—Two or 3 species widely distributed in the north temperate zone.—HOPS.

1. **H. Lupulus** L. Stem and branches pubescent with recurved hairs: leaf-blades orbicular or ovate in outline, 3–15 cm. in diameter, 3–6-lobed and serrate, or merely serrate: mature pistillate spikes 3–8 cm. long, ovoid or cylindric: achene subglobose, 2–3 mm. in diameter.—(HOP.)—Grown for the bitter hops—the fruits—which are used in brewing.—Thickets, fence-rows, and waste-places, various provinces, Fla. to Ariz., Wis., and N. S. Nat. of Eurasia.—Sum.

2. **CANNABIS** [Tourn.] L. Annual coarse herbs. Leaves opposite or alternate: blades digitately divided. Pistillate flowers solitary, bracted, spicate at maturity.—Represented by the following species only.—HEMPS.

1. **C. sativa** L. Stem 1–4 m. tall, rough-pubescent, the inner bark tough: leaf-blades 4–15 cm. long, the divisions 5–11, linear or linear-lanceolate, serrate, acuminate: mature pistillate spikes leafy-bracted: achene oval, 4–5 mm. long. (HEMP. HANGMAN'S-HEMP.)—Waste-places and fence-rows, various provinces, Ga. to Tenn., Kans., Minn., and N. B. Nat. of Asia.—Sum.—Hemp is cultivated both for

its fiber which is made into cloth and cordage, and as a source of a narcotic drug—hashish.

### FAMILY 3. ARTOCARPACEAE — MULBERRY FAMILY

Shrubs or trees, the sap milky. Leaves mostly alternate: blades equilateral, entire, toothed, or lobed. Flowers monoecious or dioecious, in ament-like spikes or enclosed in a receptacle, the staminate with 3 or 4 stamens, the pistillate with a calyx of 3-5 sepals which greatly enlarge and subtend or envelop the achene: gynoeceium of 1 or 2 united carpels; styles or stigmas 1 or 2. Fruit a syncarp or syconium.—About 55 genera and 1000 species, natives of tropical and temperate regions.—Our species have flowers with a green or greenish calyx.

Staminate and pistillate flowers on the outside of a receptacle: style or stigma terminal.

Stigmas 2, short: pistillate spike cylindric.

Tribe I. MOREAE.

Stigma solitary, elongate: pistillate spike globose.

Tribe II. PAPYRIEAE.

Staminate and pistillate flowers on the inside of a receptacle: style lateral.

Tribe III. FICEAE.

#### I. MOREAE

Widely branched shrubs and trees, the pistillate spikes becoming succulent, white, pink, purple, or nearly black.

1. MORUS.

#### II. PAPYRIEAE

Staminate spikes cylindric: achene protruding: leaf-blades toothed or lobed.

2. PAPYRIUS.

Staminate spikes globose: achene deeply imbedded: leaf-blades entire.

3. TOXYLON.

#### III. FICEAE

Shrubs and trees with milky sap, often producing copious aerial roots.

4. FICUS.

1. **MORUS** [Tourn.] L. Shrubs or trees, with scaly bark. Leaves deciduous: blades commonly serrate, sometimes lobed. Staminate flowers in cylindric spikes, with 4 sepals and 4 stamens. Pistillate spikes cylindric: sepals 4, the lateral ones larger than the others: stigmas 2, short. Fruit cylindric, the achenes included in the calyx.—About 10 species, natives of the northern hemisphere.—The inner bark furnishes a fiber that has been used from prehistoric times.—MULBERRIES.

Leaf-blades glabrous beneath or sparingly pubescent on the nerves.

Syncarp white or pinkish.

Syncarp black at maturity.

Leaf-blades softly pubescent beneath.

1. *M. alba*.

2. *M. nigra*.

3. *M. rubra*.

1. **M. alba** L. Tree 5-12 m. tall, with sparingly pubescent twigs: leaf-blades ovate to oval or oval-ovate, 6-20 cm. long, becoming glabrous beneath: staminate spikes 1-2 cm. long: fruit subglobose to oval-oblong, 1-2 cm. long, white or pinkish. — (WHITE-MULBERRY.) — Roadsides, fields and thickets, various provinces, Ga. to Tex., Minn., and Me. Nat. of Eu.—Spr.—sum.

2. **M. nigra** L. Shrub, or tree sometimes becoming 8 m. tall, with pubescent twigs: leaf-blades ovate, 4-15 cm. long, abruptly short-pointed, becoming glabrous, but usually rough above: staminate spikes 1-2 cm. long: fruits oval-oblong, 1-2 cm. long, black. — (BLACK-MULBERRY.) — Fencerows, roadsides and waste grounds, various provinces, Fla. to Tex. and N. Y. Nat. of Eurasia.—Spr.

3. *M. rubra* L. Tree becoming 20 m. tall, with early glabrous twigs: leaf-blades ovate to oval or oval-ovate, 6–20 cm. long, softly pubescent beneath: staminate spikes 4–8 cm. long: fruit cylindric, 3–6 cm. long, deep-red or purplish.—(RED-MULBERRY.)—Rich woods and bottoms, various provinces, Fla. to Tex., S. D., Ont., and Vt.—Spr.—Perhaps two species are involved in *M. rubra* as now interpreted. The plants of Florida, especially those from the southern part of the State, have thicker, more copiously veiny, and more densely pubescent leaf-blades than in the more northern plants. The fruit, too, is drier, more compact, and more spicy in flavor than that of the northern plant. In Florida the mulberry is largely confined to the sites of aboriginal activity. Trees extend well to the Cape Sable region. They are always deciduous, while the host of associates are evergreen. The fibrous inner bark was used by the aborigines for clothing and for making other objects.

2. *PAPYRIUS* Lam. Trees with smooth bark. Leaves deciduous: blades serrate, often lobed. Staminate flowers in cylindric spikes, with 4 sepals and 4 stamens. Pistillate spikes globose: calyx 4-lobed: stigma 1, elongate. Fruit globular, each achene protruding from the persistent calyx.—Four species, Asiatic.

1. *P. papyrifera* (L.) Kuntze. Tree resembling the red-mulberry in habit, sometimes 15 m. tall, with hirsute-tomentose twigs: leaf-blades ovate, 8–16 cm. long, scabrous pubescent: fruits globular, 2–3 cm. in diameter, the protruding achenes reddish or orange. [*Broussonetia papyrifera* (L.) Vent.]—(PAPER-MULBERRY.)—Roadsides and about dwellings, various provinces, Fla. to Mo. and N. Y. Nat. of Asia.—Spr.—The inner bark furnishes both paper and cloth.

3. *TOXYLON* Raf. Shrubs or trees, with furrowed bark. Leaves deciduous: blades entire. Staminate flowers in globose raceme-like spikes, with 4 sepals and 4 stamens. Pistillate spikes globose: sepals 4, the lateral ones broader than the others: stigma 1, elongate. Fruit globose, the achenes deeply imbedded.—Represented by the following species only:

1. *T. pomiferum* Raf. Shrub, or tree becoming 20 m. tall: leaf-blades ovate, ovate-lanceolate, or oblong-lanceolate, 4–30 cm. long, acuminate, dark-green and lustrous above: calyx-lobes ovate: stamens long-exserted: fruit globose, 5–15 cm. in diameter, golden-yellow. [*Maclura aurantiaca* Nutt.]—(OSAGE-ORANGE. MOCK-ORANGE. BOW-WOOD.)—Woods, fields and thickets, Coastal Plain and adj. provinces, Ga. to Tex. and Mo.; also nat. in Atlantic States.—Readily forming thickets which the dense growth and thorns make almost impenetrable.—The strong flexible orange-colored or brown wood was formerly used by some Indian tribes for making bows. It is now used for objects where strength and durability are needed. The bark of the roots yields a yellow dye.—Late spr.—sum.

4. **FIGUS** [Tourn.] L. Shrubs, trees, or vines, with smoothish bark. Leaves mainly persistent: blades entire, toothed, or lobed. Flowers in hollow receptacles, the staminate with a calyx of 2-6 sepals, or these obsolete, and 1-2 or rarely 3 stamens. Pistillate flowers numerous: style rather long: stigma clavate, peltate, or 2-lobed. Fruit depressed-globular or elongate, the achenes included.—About 600 species, natives of tropical and warm regions.—FIGS.

Leaf-blades entire, smooth and glabrous: fruit glabrous, 1-2.5 cm. long. I. AUREAE.  
 Leaf-blades lobed, very scabrous-pubescent: fruit pubescent, 4-8 cm. long. II. CARICAE.

## I. AUREAE

Fruit globose, spheroidal or obovoid: lateral veins of the leaf-blades few and separated.

Fruits sessile: leaf-blades usually narrow-based.

Fruits peduncled: leaf-blades usually broad-based.

Fruit oblong: lateral veins of the leaf-blades very numerous and close together.

1. *F. aurea*.
2. *F. brevifolia*.
3. *F. elastica*.

## II. CARICAE

Shrub with many stems or a small tree, with coarsely pubescent foliage.

4. *F. Carica*.

1. ***F. aurea*** Nutt. Shrub, often starting as a vine, or tree becoming 20 m. tall, with glabrous twigs: leaf-blades elliptic, or oval, 3-10 cm. long, acute or short-acuminate at the base: fruits spheroidal or obovoid, about 2 cm. in diameter.—(GOLDEN-FIG. STRANGLER-FIG.)—Hammocks, S pen. Fla. and Florida Keys.—(W. I.)—Seedling plants are epiphytic. They emit aerial roots which coalesce and finally “strangle” the host. The roots and branches finally form a terrestrial forest tree which may in turn “strangle” itself.

2. ***F. brevifolia*** Nutt. Shrub, or tree sometimes 15 m. tall, with glabrous twigs: leaf-blades ovate-oval or rarely obovate, 3-10 cm. long, mainly rounded or cordate at the base: fruit subglobose, 2-2.5 cm. in diameter. [*F. populnea* Willd.]—(WILD-FIG. WILD-BANYAN.)—Hammocks and rarely in pinelands, Everglade Keys, pen. Fla. and Florida Keys.—(W. I.)—The seedlings of this fig are also epiphytic. The aerial roots may coalesce to form a stout trunk, usually without strangling the host. If the roots fail to coalesce they may spread out forming a structure like the banyan.

3. ***F. elastica*** Roxb. Tree with glabrous twigs: leaf-blades elliptic, often broadly so, 9-30 cm. long, abruptly blunt- or acute-tipped, glabrous, shining, short-petioled: fruit oblong, 1-1.5 cm. long, greenish-yellow, smooth, sessile.—(RUBBER-PLANT. INDIA-RUBBER PLANT.)—Pinelands and roadsides, S pen. Fla. Nat. of trop. Asia.

4. ***F. Carica*** L. Shrub, or tree 2-5 m. tall, with pubescent twigs: leaf-blades palmately 5-7-lobed; petioles pubescent: fruit obovoid, 4-8 cm. long.—(COMMON-FIG.)—Fields, roadsides, and cult. grounds, Coastal Plain and adj. provinces, Fla. to Tex., Tenn., and Va. Nat. of Asia.

FAMILY 4. **ULMACEAE**—ELM FAMILY

Shrubs or trees, the sap watery. Leaves alternate: blades inequilateral, commonly toothed. Flowers perfect, polygamous or monoecious, variously disposed. Calyx of 4 or 5, or rarely 3–9 partially united sepals. Androecium of usually as many stamens as there are sepals. Gynoecium of 2 united carpels. Fruit a samara or a drupe, or nut-like.—About 13 genera and 140 species, widely distributed.—Ours have greenish flowers.

Fruit dry, a samara, or nut-like: anthers introrse: embryo straight.

Tribe I. ULMEAE.

Fruit a drupe: anthers extrorse: embryo with conduplicate cotyledons.

Tribe II. CELTIDEAE.

## I. ULMEAE

Flowers perfect: fruit a samara.

1. *ULMUS*.

Flowers polygamo-monoecious: fruit nut-like, tubercled.

2. *PLANERA*.

## II. CELTIDEAE

Flowers solitary or merely clustered: drupe solitary.

3. *CELTIS*.

Flowers in dichotomous cymes: drupes in cymes.

Stigmas entire: staminate flowers with valvate calyx-lobes.

4. *TREMA*.

Stigmas 2-cleft: staminate flowers with imbricate calyx-lobes.

5. *MOMISIA*.

1. **ULMUS** [Tourn.] L. Shrubs or trees, with furrowed bark and sometimes winged branches. Leaves deciduous: blades toothed. Calyx campanulate. Ovary sessile or nearly so, smooth, but sometimes pubescent. Samara orbicular to oblong. About 16 species, natives of the Northern Hemisphere.—The inner bark of some species is used for making ropes and coarse cloth. Some species are extensively used for shade trees.—ELMS.

Flowers and fruits autumnal: flower-clusters in the leaf-axils.

I. SEROTINAE.

Flowers and fruits vernal: flower-clusters on naked branches.

II. AMERICANAE.

## I. SEROTINAE

Leaf-blades obtuse: samaras ciliolate.

1. *U. crassifolia*.

Leaf-blades acute or short-acuminate: samaras ciliate.

2. *U. serotina*.

## II. AMERICANAE

Flower-clusters long: pedicels longer than the calyx: samara deeply notched.

Samara over twice as long as wide: branches corky winged.

3. *U. alata*.

Samara less than twice as long as wide: branches wingless.

Samara ovate, the tips erect or nearly so: leaf-twigs mainly glabrous.

4. *U. floridana*.

Samara oval or obovate, the tips converging: leaf-twigs mainly pubescent.

5. *U. americana*.

Flower-clusters dense: pedicel shorter than the calyx: samara not notched.

6. *U. fulva*.

1. **U. crassifolia** Nutt. Tree becoming 30 m. tall, the branches often corky-winged, the twigs pubescent: leaf-blades elliptic, varying to broadly elliptic or ovate, 1.5–4 cm. long, obtuse, finely serrate, rough above; petioles 1–2 mm. long: calyx about 1.5 mm. long: samara oval, 8–10 mm. long, ciliolate.—(CEDAR-ELM.)—Woods and river-bottoms, Coastal Plain and adj. provinces, Miss. to Tex. and Ark.—(Mex.)—Late sum.–fall.

2. **U. serotina** Sarg. Tree becoming 16 m. tall, the branches often corky-winged, the twigs glabrous, at least at maturity: leaf-blades elliptic to oval, or broadest above the middle, 5–8 cm. long, short-acuminate, coarsely serrate, smooth above; petioles 4–5 mm. long: calyx 2.5–3 mm. long: samara oblong-elliptic, 10–12 mm. long, ciliate.—

(SEPTEMBER-ELM.)—Rich ravines and bluffs, Appalachian and Interior Low plateau provinces, Ga. to Ala. and Tenn.—Fall.

3. *U. alata* Michx. Tree becoming 20 m. tall, the branches often corky-winged: leaf-blades narrowly elliptic or broadly elliptic, or rarely broader, 2–10 cm. long, typically smooth above; petioles 1.5–3 mm. long: calyx deeply lobed: samara elliptic, 6–8 mm. long, long-stipitate, the wings pubescent and long-ciliate.—(WINGED-ELM. WAHOO. RED-ELM. WATER-ELM. CORK-ELM.)—River banks, swamps and woods, Coastal Plain and adj. provinces, Fla. to Tex., Kans., Ind., and Va.—Spr.

4. *U. floridana* Chapm. Tree becoming 20 m. tall, the branches not corky-winged, the twigs glabrous: leaf-blades mainly elliptic, oval, or ovate, 3–12 cm. long, mostly smooth above; petioles 6–10 mm. long: calyx shallowly lobed: samara ovate, 11–13 mm. long, short-stipitate, the wings merely long-ciliate.—(FLORIDA-ELM.)—Swamps and low hammocks, Coastal Plain, Fla. to N. C.—Spr.

5. *U. americana* L. Tree becoming 40 m. tall, the branches not corky-winged, the twigs typically pubescent: leaf-blades oval to ovate, 5–10 cm. long, sometimes rough-pubescent above; petioles 4–7.5 mm. long: flower-clusters lax: calyx shallowly lobed: samara oval or obovate, 10–12 mm. long, the wings merely long-ciliate.—(WHITE-ELM. AMERICAN-ELM. COMMON-ELM. ROCK-ELM.)—Moist woods, river-banks, and low grounds, often calcareous, various provinces, N Fla. to Tex., Sask., Ont., and Newf.—Early spr.

6. *U. fulva* Michx. Tree becoming 25 m. tall, the twigs densely pubescent, the inner bark mucilaginous: leaf-blades ovate-oval or obovate, 8–19 cm. long, rough-pubescent on both sides: flower-clusters dense: samara suborbicular, 14–17 mm. in diameter, finely pubescent, ciliate.—(SLIPPERY-ELM. RED-ELM. SWEET-ELM. ROCK-ELM. INDIAN-ELM.)—Rich, often rocky woods and banks, various provinces, W Fla. to Tex., N. D., and Que.—Early spr.—The fragrant mucilaginous inner bark is used in medicine.

2. **PLANERA** J. F. Gmel. Trees, with scaly bark. Leaves deciduous: blades toothed. Calyx campanulate. Ovary short-stipitate, tubercular. Nut-like fruit irregularly warty. One species.

1. *P. aquatica* (Walt.) J. F. Gmel. Tree becoming 12 m. tall: leaf-blades ovate or elliptic-ovate, 3–8 cm. long, serrate or crenulate-serrate, short-petioled: calyx lobes ovate, obtuse: fruit ovoid, about 1 cm. long, short-stalked, the processes soft.—(WATER-ELM. HORNBAM.)—Swamps and river-banks subject to considerable fluctuation of water, Coastal Plain, N Fla. to Tex., S Ill., and N. C.—Spr.—The favorite habitat in the southeastern coastal regions is deep swamps which are covered with water during several months of each year. However, its greatest development is in the higher lands of western Louisiana and southern Arkansas.

3. **CELTIS** [Tourn.] L. Unarmed shrubs or trees, the bark often warty. Leaves deciduous: blades entire or toothed, very inequilateral. Calyx rotate, the lobes much longer than the tube. Stigmas 2, entire. Drupe subglobose.—

About 60 species of tropical and temperate regions. The wood is used in the manufacture of furniture.—Spr.—HACKBERRIES. NETTLE-TREES. SUGAR-BERRIES.

Leaf-blades of an ovate type.

Mature drupe 7-10 mm. in diameter.

Mature drupe 5-7 mm. in diameter.

Leaf-blades of a lanceolate type.

Leaf-blades entire or nearly so.

Leaf-blades sharply serrate.

1. *C. occidentalis*.

2. *C. georgiana*.

3. *C. mississippiensis*.

4. *C. Smallii*.

1. *C. occidentalis* L. Tree becoming 40 m. tall, the twigs glabrous (or pubescent, and leaf-blades rough above in *C. crassifolia* which now appears not to be specifically distinct): leaf-blades ovate or rarely elliptic-ovate, 5-15 cm. long, smooth or nearly so above: drupe oval, globose or subglobose, 7-10 mm. in diameter, orange, purple or nearly black.—(BEAVER-WOOD. BASTARD-ELM. ONE-BERRY.)—Woods and river-banks, various provinces, rarely Coastal Plain, S. C. to Ala., Okla., Man., and Que.

2. *C. georgiana* Small. Shrub, or tree becoming 8 m. tall, the twigs pubescent: leaf-blades deep-green, ovate, 2-5 cm. long, rough and sometimes sparingly pubescent above, entire or sharply serrate: drupe globose or nearly so, 5-7 mm. in diameter, red-purple or tan-colored.—(GEORGIA-HACKBERRY.)—Rocky places and stream-banks, Coastal Plain and adj. provinces, Fla. to Ala., Mo., and N. J.

3. *C. mississippiensis* Bosc. Tree becoming 30 m. tall, the twigs sometimes pubescent: leaf-blades lanceolate varying to ovate-lanceolate or elliptic-lanceolate (relatively broader, often ovate, in *C. Berlandieri*), 6-12 cm. long, long-acuminate, entire or nearly so: drupe globose or ovoid-globose, 5-7 mm. in diameter, dark-purple or orange-red.—Rich woods, river-bottoms, and hammocks, Coastal Plain and adj. provinces, Fla. to Tex., Mo., Ind., and D. C.—(*W. I., Mex.*)

4. *C. Smallii* Beadle. Tree usually smaller than *C. mississippiensis*: leaf-blades thin, lanceolate or elliptic-lanceolate, 5-10 cm. long, acuminate, with the tips sometimes elongate, sharply and irregularly serrate: drupe subglobose, 5-7 mm. in diameter.—Sandy or rocky woods and river-banks, Coastal Plain and adj. provinces, Fla. to Ala., Mo., Ky., and N. C.

4. **TREMA** Lour. Unarmed shrubs or trees, the bark smoothish: leaves persistent: blades toothed, more or less inequilateral. Calyx rotate, the lobes much longer than the tube. Stigmas 2, entire. Drupe ovoid or globose.—About 30 species of tropical regions.—In Florida the fruits are a favorite bird-food.—NETTLE-TREES.

Leaf-blades cordate at the base: anthers over 1 mm. long: drupe yellow or orange.

1. *T. floridana*.

Leaf-blades obtuse or rounded at the base: anthers less than

1 mm. long: drupe pink.

2. *T. Lamarckiana*.

1. *T. floridana* Britton. Shrub, or tree 6 m. tall, with copiously pubescent foliage: leaf-blades ovate, elliptic-ovate or lanceolate, 4-10 cm. long, softly

pubescent beneath: calyx greenish: drupe subglobose, 2.5–3.5 mm. in diameter, yellow or orange.—(FLORIDA-TREMA.)—Hammocks, particularly where burned or cleared, S pen. Fla. and the Keys.—Often a roadside weed.

2. *T. Lamarckiana* (R. & S.) Blume. Small tree or shrub, with finely hirsute or velvety twigs: leaf-blades elliptic, lanceolate, or narrowly ovate, mostly 1–3 cm. long, finely serrate, scabrous above, veiny-reticulate beneath, obtuse or rounded at the base: calyx whitish or pinkish: drupe ovoid or globose-ovoid, 2–2.5 mm. in diameter, pink.—(WEST-INDIAN TREMA.)—Hammocks and prairies, S pen. Fla. and the Keys.—(W. I.)

5. *MOMISIA* F. G. Dietr. Spine-armed shrubs or trees, the bark relatively smooth. Leaves deciduous: blades toothed, slightly inequilateral. Calyx rotate, the lobes much longer than the tube. Stigmas 2, each 2-cleft. Drupe oblong, ovoid, or globose.—Spr.—CHAPARRAL-SHRUBS.

Leaf-blades nearly smooth: drupe 8–12 mm. in diameter: stone with warty faces.  
1. *M. Iguanaea*.  
Leaf-blades very scabrous: drupe 5–8 mm. in diameter: stone with reticulate faces.  
2. *M. pallida*.

1. *M. Iguanaea* (L.) Rose & Standley. Stem and branches spreading or climbing, 1–3 m. long, the branches with recurved spines, glabrous: leaf-blades ovate, oval or elliptic-ovate, 4–12 cm. long, often coarsely toothed, nearly smooth: drupe globose-ovoid. [*M. aculeata* (Sw.) Kl.]—Hammocks, kitchenmiddens W coast of Fla. and Coastal Plain Tex.—(W. I., Mex., C. A., S. A.)

2. *M. pallida* (Torr.) Planch. Stem and branches spreading, 2–4 mm. long, the branches puberulent, with straight spines: leaf-blades ovate to elliptic, 2–3.5 cm. long, often coarsely toothed, rough: drupe subglobose.—Hammocks, kitchenmiddens, SW coast of Fla. and Coastal Plain Tex.—(Mex.)

## ORDER POLYGONALES — POLYGONAL ORDER

Herbs, shrubs, trees, or vines. Leaves alternate, or sometimes opposite or whorled: blades mostly entire: stipules present, usually as a sheath, rarely obsolete. Flowers perfect, monoecious, dioecious, or polygamous, variously disposed. Hypanthium long or short. Calyx of 2–6 sepals, which sometimes develop keels or wings. Corolla wanting. Androeium of 2–9 stamens. Gynoeceium of 2 or 3 united carpels, the ovary superior. Fruit an achene.

## FAMILY 1. POLYGONACEAE — BUCKWHEAT FAMILY

Plants various in habit. Leaves with manifest, usually sheathing, stipules (ocreae) and inflorescence not involucrate, or the stipules sometimes obsolete and the inflorescence involucrate.—About 40 genera and 800 species, widely distributed.—Some plants furnish food, others are used in ornamental gardening. Many species are weeds.

Flowers, or flower-clusters subtended by involucre: stamens 9; no sheaths (ocreae) at the nodes of the stem and the branches. Tribe I. ERIOGONEAE.

Flowers, or flower-clusters, not involucrate, but subtended by sheathing bracts (ocreolae) at the nodes of the inflorescence: stamens 4-8; sheaths (ocreae) surrounding the stem and the branches above each node, except in *Brunnichia*.

Hypanthium slightly developed, except often as a stipe-like more or less elongate base.

Stigmas tufted or fimbriate-pinnatifid.

Tribe II. RUMICEAE.

Stigmas not tufted.

Stamens distinct: herbs or vines without tendrils.

Tribe III. POLYGONEAE.

Stamens with the filaments united into a tube at the base: vines with tendrils.

Tribe IV. ANTIGONONES.

Hypanthium well-developed, enclosing the achene.

Tribe V. COCCOLOBEAE.

## I. ERIOGONEAE

Annual or perennial plants with alternate or whorled leaves and bracts: involucre lobed, sessile or peduncled, each with few or many exserted flowers: achene often swollen at the base.

1. ERIOGONUM.

## II. RUMICEAE

Sepals of pistillate flower distinct, neither indurated nor with spreading horn-like spines.

Inner sepals not developing wings: achene partly exposed, granular.

Inner sepals developing wings: achene included, smooth.

Sepals of the pistillate flower partly united into an indurated urceolate perianth, the tips of the three outer developing into spreading horn-like spines.

2. ACETOSELLA.

3. RUMEX.

4. EMEX.

## III. POLYGONEAE

Internodes of the stem and the branches partly adnate.

Inner sepals not fimbriate, often conspicuously accrescent.

Inner sepals accrescent, wing-like: achene included.

Anthers alike or nearly so: outer sepals reflexed.

Anthers various, those of the filaments with dilated bases very small and imperfect: outer sepals appressed.

5. POLYGONELLA.

Inner sepals not accrescent: achene partly exposed.

6. DENTOCERAS.

Inner sepals fimbriate, somewhat accrescent.

7. DELOPTYRUM.

8. THYSANELLA.

Internodes of the stem and the branches not adnate.

Leaf-blades jointed at the base: ocreae 2-lobed, becoming lacerate: filaments, at least the inner, dilated.

9. POLYGONUM.

Leaf-blades not jointed at the base: ocreae various, not 2-lobed: filaments slender.

Ocreae cylindric, truncate, sometimes fringed.

Sepals 4: calyx curved: stamens 4 or 5.

10. TOVARA.

Sepals 5, or if fewer, the stamens more than 5: calyx not curved.

11. PERSICARIA.

Ocreae oblique, more or less open on the side facing the leaf.

Sepals neither keeled on the back nor winged: erect or reclining herbs.

Racemes collected into terminal corymbs: embryo dividing the endosperm by an S-shaped curve: plants smooth.

12. FAGOPYRUM.

Racemes not in terminal corymbs: embryo slender, at one side of the endosperm: plants prickly-armed.

13. TRACALON.

Sepals, at least the outer ones, keeled or winged: vines with twining stems and branches or large herbs with numerous hollow stems arising from extensively branching rootstocks.

Stigmas capitate, styles short, erect, or none: stems slender, twining.

14. *BILDERDYKIA*.

Stigmas dilated, toothed: styles divaricate: stems stout, erect.

15. *PLEUROPTERUS*.

#### IV. ANTIGONONES

Vine with broad leaves, and racemes of pink or red flowers, terminating in tendrils.

16. *CORCULUM*.

#### V. COCCOLOREAE

Vine with tendrils: hypanthium developing into a samara-like fruit with a wing extending the length of the elongate pedicel-like base: stigmas 2-cleft.

17. *BRUNNICHIA*.

Shrubs or trees: hypanthium developing into a drupe-like fruit: stigmas not 2-cleft.

18. *COCCOLOBIS*.

1. **ERIOGONUM** Michx. Herbs, partially woody plants, or shrubs. Leaves mainly alternate, without ocreae, the stipules scale-like. Flowering-stems or branches with alternate or whorled bracts. Flowers involucre. Hypanthium jointed to a pedicel which is subtended by a minute bractlet. Sepals 6, often unequal. Stamens 9. Gynoecium 3-carpellary: stigmas capitate.—About 250 species, North American, mostly in the western United States—WILD-BUCKWHEATS. UMBRELLA-PLANTS.

Flowering stem with whorled leaves, the blades relatively wide: inflorescence with leaf-like bracts: sepals broad, flat or crisped: filaments pubescent below.

1. *E. tomentosum*.

Flowering stem with alternate leaves, the blades relatively narrow: inflorescence with minute bracts: sepals narrow, involute: filaments glabrous.

2. *E. floridanum*.

1. ***E. tomentosum*** Michx. Basal leaves evergreen, 5–18 cm. long; blades oblong to spatulate: flowering-stem 4–12 dm. tall, the leaves in whorls of 3–5; blades ovate to obovate or oblanceolate: involucre about 4 mm. long: sepals white, the inner ones becoming ovate to suborbicular, 6–8 mm. long, broadly cuneate to truncate at the base, tomentulose without: achenes about 5 mm. long.—(DOG-TONGUE. WILD-BUCKWHEAT.)—Dry pinelands and sandhills, Coastal Plain, Fla. to Ala. and S. C.—Sum.—fall or all year S.

2. ***E. floridanum*** Small. Basal leaves somewhat persistent, 8–20 cm. long; blades long; blades broadly or narrowly linear: flowering stem 6–10 dm. tall, the leaves alternate; blades linear to linear-lanceolate: involucre 6–7 mm. long: involute sepals slender-subulate, becoming 5–6 mm. long, long-silky: achenes about 6 mm. long, pubescent, the beak nearly as long as the body. [*E. longifolium* (Chapm. Fl.)]—Dry sandy pinelands and scrub, C Fla.—Spr.—fall.

2. **ACETOSELLA** Raf. Perennial herbs. Leaves alternate, with very thin ocreae. Flowers dioecious, in panicles, the hypanthium base conspicuously jointed to the curved pedicel. Sepals 6, essentially unchanged in fruit, without

callosities. Stamens 6. Stigmas peltate, tufted. Achene exserted, granular, the angles not margined. One species in many forms.

1. **A. Acetosella** (L.) Small. Plant glabrous, 1-6 dm. tall: blades of the lower leaves 2.5-15 cm. long, hastate, the auricles entire or toothed: sepals green, or reddish, those of the pistillate flowers becoming 1 mm. long: achene ovoid, 3-angled, 1.5 mm. long. [*Rumex Acetosella* L.]—(SHEEP-SORREL. FIELD-SORREL. COW-SORREL. HORSE-SORREL. SOUR-GRASS. SOUR-DOCK.)—Sterile soil, roadsides, fields, meadows, pastures, and waste-places, throughout U. S. and Can., except the extreme N and S. Nat. of Eu.—(Almost cosmop.)—Spr.-fall.

3. **RUMEX** L. Annual or perennial fleshy herbs. Leaves alternate, with brittle ocreae. Flowers in panicles, perfect, polygamous, or dioecious, the hypanthium-base conspicuously jointed to the pedicel. Sepals green, 6, unequal or the 3 inner developing wings, one or all of which usually bear a callosity or tubercle. Stamens 6. Stigmas peltate, tufted. Achene exserted or included, smooth or granular, usually more or less margined.—About 140 species, of wide geographic distribution.—The foliage of some species is eaten as “greens.”—DOCKS.

Flowers dioecious: lower leaves with hastate blades: plants acid.  
Flowers perfect or andro-polygamous: leaf-blades not hastate:  
plants not acid.

Mature inner sepals (wings) entire, undulate or toothed, not spinulose-margined.

Sepal-wings broad, ovate, deltoid, or somewhat reniform or hastate.

Sepal-wings narrow, elliptic to pandurate, or elliptic-ovate.

Mature inner sepals (wings) spinulose-margined.

I. HASTATULI.

II. CRISPI.

III. SANGUINEI.

IV. OBTUSIFOLII.

#### I. HASTATULI

Perennial dioecious plant with horizontal rootstocks: panicle naked.

#### II. CRISPI

Pedicel-like hypanthium-base short, usually about as long as the sepal-wings or shorter, spreading or recurved.

Only one sepal-wing bearing a tubercle.

All three sepal-wings bearing tubercles.

Leaf-blades flat, the edges not crisped.

Leaf-blades crisped.

Sepal-wings deltoid, ovate-deltoid or hastate.

Sepal-wings round-ovate.

Pedicel-like hypanthium-base elongate, much longer than the sepal-wings, deflexed.

Leaf-blades broad, short, broadly rounded or cordate at the base: sepal-wings denticulate.

Leaf-blades narrow, elongate, acutely narrowed at the base: sepal-wings undulate.

Sepal-wings reniform.

Sepal-wings ovate, hastate, or reniform-hastate.

1. *R. hastatulus*.

2. *R. altissimus*.

3. *R. Berlandieri*.

4. *R. crispus*.

5. *R. fascicularis*.

6. *R. floridanus*.

7. *R. verticillatus*.

#### III. SANGUINEI

Only one sepal developing a tubercle: whorls of the inflorescence not leafy-bracted.

8. *R. sanguineus*.

All three sepals developing tubercles: whorls of the inflorescence, at least the lower ones, leafy-bracted.

Mature sepal-wings about 3 mm. long: achene less than 2 mm. long.

Mature sepal-wings 5-6 mm. long: achene 2.5-3 mm. long.

9. *R. conglomeratus*.  
10. *R. cuneifolius*.

#### IV. OBTUSIFOLIUS

Blades of the lower leaves cordate or truncate at the base: tall perennial plants.

Stipe-like base of the hypanthium much shorter than the sepal-wings: two sepal-wings with callosities.

Stipe-like base of the hypanthium mostly longer than the sepal-wings: one sepal-wing with a callosity.

Blades of the lower leaves gradually or abruptly narrowed at the base: low annual plants.

11. *R. pulcher*.  
12. *R. obtusifolius*.  
13. *R. persicarioides*.

1. *R. hastatulus* Baldw. Plant 1.5-13 dm. tall: basal and lower stem-leaves 5-15 cm. long; blades with 2 spreading auricles at the base or sometimes merely undulate: sepal-wings reniform to ovate-reniform, 3.5-4 mm. wide: achene nearly 1.5 mm. long.—Sandy soil, roadsides, fields, and woods, Coastal Plain and adj. provinces, Fla. to Tex., Kans., Ill., and Mass.—Spr.

2. *R. altissimus* Wood. Plant 6-20 dm. tall, the panicle-branches ascending: lower stem-leaves 1-3 dm. long; blades lanceolate to elliptic-lanceolate, scarcely crisped: sepal-wings triangular-ovate, 4-5 mm. long, longer than wide, slightly cordate: achene about 3 mm. long.—(PALE-DOCK. PEACH-LEAVED DOCK.)—River-banks, ditches, and low woods, various provinces, rarely Coastal Plain, Ga. to Tex., Nebr., and Mass.—Spr.-sum.

3. *R. Berlandieri* Meisn. Plant 5-7 dm. tall, the panicle-branches loosely flowered: lower stem-leaves 8-17 cm. long; blades elliptic: often narrowly so, flat or nearly so: whorls of the inflorescence often separated: sepal-wings deltoid, about 4 mm. long, leathery; achene fully 2.5 mm. long. [*R. Langloisii* Small]—Low grounds, prairies, and ditches, Coastal Plain, La. and Tex.—(Mex.)—Spr.-fall.

4. *R. crispus* L. Plant 3-11 dm. tall, the panicle-branches rather closely flowered: lower stem-leaves 15-30 cm. long; blades elliptic to elliptic-lanceolate, much crisped: flower-clusters contiguous: sepal-wings orbicular-ovate, 4-5 mm. long, undulate: achene 2.5-3 mm. long.—(CURLED-DOCK. YELLOW-DOCK. NARROW-DOCK.)—Fields and waste-places, throughout the U. S. and S Can. Nat. of Eu.—(W. I., Mex.)—Sum.

5. *R. fascicularis* Small. Plant 5-15 dm. tall, the panicle-branches rather lax: lower stem-leaves 1-2 dm. long; blades ovate to broadly elliptic, rounded or cordate at the base: sepal-wings deltoid-reniform or reniform, 5-5.5 mm. wide: achene about 3 mm. long.—Ponds and lake-shores, pen. Fla.—Spr.-sum.

6. *R. floridanus* Meisn. Plant 4-11 dm. tall, the panicle-branches often fastigiate: lower stem-leaves 1-4 dm. long; blades broadly linear to linear-lanceolate: flower-clusters rather dense: sepal-wings reniform, 5-6.5 mm. wide: stipe-like base of the hypanthium mostly less than 1 cm. long: achene 3-3.5 mm. long.—Wet grounds, ditches, and river-swamps, Coastal Plain, Fla. to La.—Spr.-fall.

7. *R. verticillatus* L. Plant 9–15 dm. tall, the panicle-branches lax: lower stem-leaves 1.5–4.5 dm. long; blades linear-elliptic to linear-lanceolate: flower-clusters rather loose: sepal-wings ovate, hastate, reniform-hastate, 4.5–5.5 mm. wide: pedicel-like base of the hypanthium mostly over 1 cm. long, gradually tapering: achene about 2.5–3 mm. long.—(SWAMP-DOCK.)—Swamps and ditches, various provinces, Fla. to Tex., Ia., and Que.—Spr.–sum.

8. *R. sanguineus* L. Plant 3–11 dm. tall, the stems erect, the panicle-branches rather loosely-flowered and loosely-fruited: lower stem-leaves 9–16 cm. long; blades elliptic to elliptic-lanceolate, somewhat crisped: flower-clusters not very dense: sepal-wings oblong, 2.5–3 mm. long, somewhat unequal, entire, the callosity globular: achene fully 1.5 mm. long.—(BLOODY-DOCK. RED-VEINED DOCK. BLOODWORT.)—Waste-places, various provinces, Ala. to La., N. Y., and Va. Nat. of Eu.—Spr.–sum.

9. *R. conglomeratus* Murray. Plant 3–12 dm. tall, the stems erect, the panicle-branches rather densely flowered: lower stem-leaves 8–17 cm. long; blades ovate, lanceolate, or elliptic, somewhat crisped: flower-clusters dense: sepal-wings oblong to pandurate, 2.5–3 mm. long, entire or nearly so, the callosities oblong: achene about 2 mm. long.—(CLUSTERED-DOCK.)—Waste places, Coastal Plain, S. C. to Va.; also Calif. Nat. of Eu.—(*W. I., Mex.*)—Spr.–sum.

10. *R. cuneifolius* Campd. Plant 4 dm. tall or less, the stems assurgent, the panicles dense: lower stem-leaves mostly 1 dm. long or less; blades cuneate to elliptic-obovate, finely crisped, usually rounded or retuse at the apex: flower-clusters dense, contiguous: sepal-wings oblong-ovate, 5–6 mm. long, undulate, coarsely-reticulate: achene fully 2.5 mm. long.—Waste-places, W. Fla. Nat. of S. A.—Spr.–fall.

11. *R. pulcher* L. Plant 3–9 dm. tall, the panicle-branches spreading: lower stem-leaves 0.8–1.7 dm. long; blades elliptic or elliptic-pandurate, truncate or shallowly cordate, crisped: flower-clusters separated, leafy-bracted: sepal-wings ovate-deltoid, about 4 mm. long, with 5–10 teeth: achene fully 2 mm. long.—(FIDDLE-DOCK.)—Low woods, roadsides, and waste grounds, various provinces, Fla. to Tex., Calif., Ark., and Va. Nat. of Eu.—(*W. I., Mex.*)—Spr.–fall.

12. *R. obtusifolius* L. Plant 6–12 dm. tall, the panicle-branches nearly erect: lower stem-leaves 3–5.5 dm. long; blades elliptic to broadly lanceolate, deeply cordate, somewhat crisped: flower-clusters mostly contiguous, not leafy-bracted: sepal-wings ovate-hastate, 3.5–5 mm. long, with 3–5 teeth: achene 2–2.5 mm. long.—(BITTER-DOCK. BROAD-DOCK. BUTTER-DOCK.)—Wet woods, cultivated grounds, roadsides, ditches, fields, and waste-places, throughout the U. S. and S Can. Nat. of Eu.—(*W. I., Mex.*)—Sum.–fall.

13. *R. persicarioides* L. Plant 1–6 dm. tall, the panicle densely-flowered and densely-fruited: leaves 2.5–30 cm. long; blades lanceolate, narrowly elliptic, crisped, the lower ones abruptly narrowed at the base: flower-clusters densely many-flowered: stipe-like base of the hypanthium not involute: sepal-wings 2–2.5 mm. long, each with an oblong or ovate-oblong body and 3–6 slender teeth: achene about 1.5 mm. long.—(GOLDEN-DOCK.)—Shores or sandy banks, various provinces, coast of N. C. to N. B., also in saline places inland—Mo. to Ont., and coast of Calif. to B. C.—(*Mex.*)—Spr.–fall.—Admitted on the basis of old records.

4. **EMEX** Neck. Annual somewhat succulent herbs. Leaves alternate, with oblique ocreae. Flowers in axillary, often dense clusters or in panicles, monoecious; the staminate ones long-pedicelled, with 5 or 6 nearly equal sepals; the

pistillate sessile, the short hypanthium and the 6 partly united sepals in two series forming an urceolate perianth, the outer sepals developing spreading spine-like tips. Stamens 6. Stigmas 3, fimbriate-pinnatifid. Achene included, 3-angled.—Two species, natives of the Old World.

1. *E. spinosa* Campd. Stem more or less diffusely branched, glabrous: leaf-blades ovate, narrowly or broadly so, 2–8 cm. long, or smaller, acute or rounded at the apex and minutely pointed, undulate, truncate to cordate at the more or less auricled base, long-petioled: sepals of the staminate flowers elliptic, about 2 cm. long, those of the pistillate firm, the inner with erect firm tips, the outer with spreading subulate rigid tips: achene ovoid, 2.5–3 mm. long.—Waste grounds, W. Fla.—Nat. of the Mediterranean region.—Spr.—fall.

5. **POLYGONELLA** Michx. Perennial or biennial branched woody plants. Leaves numerous, rather persistent. Flowers white or pink, in spreading panicles, the pedicels exserted at anthesis. Inner sepals accrescent, not spreading, developing into wing-like structures wholly covering the achene, with lateral wrinkles. Achene stout, sometimes very broad.—Represented by the following species.—JOINTWEEDS.

Leaf-blades decidedly dilated, spatulate, obovate, or cuneate.  
Leaf-blades not dilated, clavate to almost filiform.

I. POLYGAMAE.  
II. AMERICANAE.

#### I. POLYGAMAE

Inner sepals becoming 2–2.5 mm. long: achene 1.5–2 mm. long.  
Inner sepals becoming 4–5 mm. long: achene 3.5–4 mm. long.

1. *P. polygama*.
2. *P. macrophylla*.

#### II. AMERICANAE

Inner sepals becoming about 2 mm. long: stipe-like base of the hypanthium barely 1 mm. long.

Lateral racemes of the panicles mostly less than 1 cm. long: sepals 1.5 mm. long in anthesis.

Lateral racemes of the panicles mostly over 1 cm. long: sepals 1 mm. long in anthesis.

Inner sepals becoming about 2 mm. long: stipe-like base of the hypanthium fully 1.5 mm. long.

3. *P. brachystachya*.
4. *P. Croomii*.
5. *P. americana*.

1. *P. polygama* (Vent.) A. Gray. Plant slender, 3–6 dm. tall, usually copiously branched: lower leaves 1–3 cm. long; blades spatulate to cuneate, 3-ribbed: stipe-like base of the hypanthium about 1 mm. long: inner sepals becoming ovate: achene barely 1 mm. wide. [*P. parvifolia* Michx.]—(OCTOBER-FLOWER.)—Sandy soil, pinelands, and scrub, Coastal Plain, Fla. to N. C., and perhaps to Miss.—Sum.—fall.

2. *P. macrophylla* Small. Plant stout, 8–11 dm. tall, sparingly branched: lower leaves 4–6.5 cm. long; blades spatulate-obovate, or cuneate-obovate, 5–9-ribbed: stipe-like base of the hypanthium about 3 mm. long: inner sepals becoming oval or suborbicular: filaments fully 2.5 mm. long, alternately slender subulate and narrowly lanceolate: achene fully 1.5 mm. wide.—Sandhills, near the coast, M and W Fla.—Fall.

3. **P. brachystachya** Meisn. Plant slender, 2-6 dm. tall, copiously branched: leaves 5-13 mm. long, bright-green, rather persistent: racemes short and relatively stout: ocreolae closely imbricate, very oblique: inner sepals becoming orbicular-ovate to subreniform, over 2 mm. long: achene broadly rhombic-ovoid, 1.5 mm. long.—Pinelands, S pen. Fla.—Sum.-fall.

4. **P. Croomii** Chapm. Plant very slender, 2-5 dm. tall, copiously branched: leaves 9-21 mm. long, glaucous, fugaceous: racemes relatively long and very slender: ocreolae scarcely imbricate, slightly oblique: inner sepals ovate to oval: achene narrowly rhombic-ovoid, about 1.5 mm. long.—Sandhills, Coastal Plain, N Fla. to S. C.—Sum.-fall.

5. **P. americana** (F. & M.) Small. Plant stout, 5-12 dm. tall, somewhat branched: leaves numerous, 1-3 cm. long, persistent: racemes stout: inner sepals becoming orbicular to oval-orbicular: achene rhombic-ovoid, about 3 mm. long. [*Gonopyrum americanum* F. & M. *P. Meisneriana* Shuttlw.]—Sandy soil, sandhills, and hillsides, Coastal Plain and adj. provinces, S. C. to Tex. and Mo.—Sum.-fall.

6. **DENTOCERAS** Small. Depressed, copiously branched shrub. Leaves exceedingly numerous, crowded on the branchlets, narrow, persistent. Flowers white, in short strobiliform racemes, rather long-stalked, the pedicels long-exserted from the ocreolae at anthesis, accompanied by a second bractlet within the ocreolae which forms a circular hollow from which the pedicel protrudes. Sepals accrescent for almost their entire length, the outer folded up over and partly covering the inner. Achene very broad, included.—One species.

1. **D. myriophylla** Small. Branches radially prostrate, 2-25 dm. long, copiously branched, the branchlets often short: leaf-blades clavate, somewhat fleshy, 3-12 mm. long: racemes short-stalked, often in small panicles: flowers crowded: outer sepals ovate, appressed: inner sepals ultimately much longer than outer, oval, orbicular-ovate, or slightly obovate, 2.5-3 mm. long: achene broadly ovoid, about 3 mm. long.—(WOODY WIRE-WEED.)—Scrub on sandhills, S part of Lake Legion, Fla.—All year.—Conspicuous on account of the numerous branches with myriad leaves, disposed in large green mats on the white sand.

7. **DELOPYRUM** Small. Annual loosely branched firm-herbaceous plants. Leaves few, remote, early deciduous. Flowers white or pink-tinged, in erect lax racemes, short-stalked, the pedicel slightly if at all exserted from the ocreolae in anthesis. Inner sepals accrescent only at the base, thence spreading and exposing the achene, merely elongating, smooth, not wrinkled. Achene slender, sometimes subulate. [*Polygonella* Michx. in part.]—Represented by the following species only.—JOINTWEEDS. WIREWEEDS.—The leaves are early deciduous.

Inner sepals becoming longer than the outer: achene acuminate, the tip much exserted from the calyx: stipe-like base of the hypanthium very short.

Inner sepals (pistillate) linear, linear-spatulate, or linear-oblong at maturity: ocreae ciliate.

Achene ellipsoid-ovoid; hypanthium-base obconic; upper ocreae leaf-bearing; fruiting calyx persistent.

Achene subulate; hypanthium-base clavate; upper ocreae leafless; fruiting calyx deciduous.

Inner sepals (pistillate) elliptic or elliptic-obovate at maturity; ocreae eciliate.

Inflorescence rachis with separated ocreolae; stem-leaves with filiform blades.

Inflorescence rachis with contiguous ocreolae; stem-leaves with elliptic, spatulate or linear-spatulate blades.

Inner and outer sepals about equal in length at maturity; achene acute, the tip barely exerted from the calyx; stipe-like base of the hypanthium filiform or filiform-clavate.

1. *D. ciliatum*.

2. *D. basiramia*.

3. *D. filiforme*.

4. *D. gracile*.

5. *D. articulatum*.

1. *D. ciliatum* (Meisn.) Small. Stem 6–17 dm. tall; stem-leaves with stiff filiform or linear-filiform blades 2–4 cm. long; ocreolae acuminate; hypanthium-base turbinate, less than 1 mm. long; sepals (staminate) oblong or nearly so; inner sepals (pistillate) becoming 1.5 mm. long, much longer than the outer; achene about 2 mm. long, slightly exceeding the calyx.—Pinelands, pen. Fla.—Sum.—fall.

2. *D. basiramia* Small. Stems and branches few or many (10–70) from the top of a woody tap-root, slender wiry-filiform in the inflorescence; stem-leaves slenderly linear, mostly 1–2.5 cm. long, acute, revolute; hypanthium-base clavate, nearly 1 mm. long at maturity; sepals of the pistillate flowers spatulate to linear, the inner about 2 mm. long, much exceeding the outer; achene subulate, fully 2.5 mm. long, thrice as long as thick, much exceeding the loosely investing calyx.—Inland sand-dunes and scrub, S end of the lake region, Fla.—All year.

3. *D. filiforme* Small. Stem 9–16 dm. tall; stem-leaves with pliable filiform blades 4–9 cm. long; flowers smaller than in *D. gracile*; hypanthium-base turbinate, very short; sepals (staminate) oval, varying to ovate or obovate; inner sepals (pistillate) oblong or oblong-obovate, slightly longer than the outer, becoming 1.5 mm. long; achene 2–2.5 mm. long, the tip much exceeding the calyx.—Sandhills and pinelands, Coastal Plain, E pen. Fla. to Ga.—Sum.—fall.

4. *D. gracile* (Nutt.) Small. Stem 3–17 dm. tall; stem-leaves with oblong, spatulate, or linear-spatulate blades 1–2.5 cm. long; hypanthium-base turbinate, very short; sepals (staminate) obovate; inner sepals (pistillate) becoming 2 mm. long, decidedly longer than the outer; achene about 2.5 mm. long, slightly exceeding the calyx.—Dry pinelands and sandhills, Coastal Plain, Fla. to La. and S. C.—Sum.—fall.

5. *D. articulatum* (L.) Small. Stem 1–4.5 dm. tall; stem-leaves with narrowly linear or linear-subulate blades 1–2.5 cm. long; stipe-like base of the hypanthium slender, about 1.5 mm. long; inner sepals (pistillate) becoming 2 mm. long, obovate or orbicular-obovate; achene rhombic-ovoid, about 2 mm. long.—(JOINTWEED.)—Acid sandy and open woods, Coastal Plain and New England Coast, Ga. (or Fla.) to Me.; also Great Lake Lowland, Ill. to N. Y.—Sum.—fall.

8. *THYSANELLA* A. Gray. Woody annual herbs. Leaves alternate, jointed near the top of the fringed firm ocreae. Flowers polygamo-monoecious, those of the upper racemes mostly fruit-producing. Sepals white or pink, not

acrescent into wings, the 2 outer ones auriculate-cordate at the base, the 3 inner at least pectinate-fimbriate. Stamens 8: filaments slender-filiform. Achene 3-angled, included in the calyx, short-stipitate.—Following are the only known species.

Outer sepals becoming 2-2.5 mm. long: achene less than 2 mm. long, broadly ovoid.

1. *T. fimbriata*.

Outer sepals becoming 3.5-4 mm. long: achene over 2 mm. long, narrowly ovoid.

2. *T. robusta*.

1. *T. fimbriata* (Ell.) A. Gray. Stem slender, 1.5-6 dm. tall, simple at the base: leaf-blades narrowly linear, 1-3 cm. long, mostly less than 1.5 mm. wide, few-striate: ocreae sparingly fringed: racemes 1-2.5 cm. long: outer sepals (pistillate) incised or incised-fimbriate, slightly exceeding the achene: filaments about 2 mm. long: achene barely 1 mm. wide, short-beaked.—Sandhills, Coastal Plain, NE Fla. to Ala. and Ga.—Sum.—fall.

2. *T. robusta* Small. Stem much stouter than those of *T. fimbriata*, mainly 6-9 dm. tall, usually branched at the base: leaf-blades linear, 2-6 cm. long, mostly over 2.5 mm. wide, many-striate: ocreae copiously fringed, the bristles sometimes deciduous: racemes mainly 4-7 cm. long: outer-sepals (pistillate) undulate or erose, much exceeding the achene: filaments about 4 mm. long: achene fully 1 mm. wide, long-beaked.—Pinelands and scrub, pen. Fla.—All year.

9. **POLYGONUM** [Tourn.] L. Annual or perennial, erect or prostrate herbs. Leaves alternate, jointed near the top of the ultimately lacerate ocreae. Flowers in axillary clusters which are sometimes aggregated near the ends of the branches. Sepals green to pink or white, or green with pale edges or yellow, the outer ones sometimes corrugated or veiny in age. Stamens 3-8, often 5-6. Stigmas 3. Achene 3-angled.—Sum.—fall, or all year southward.—About 100 species of wide geographic distribution.—KNOTWEEDS. DOORWEEDS. KNOTGRASSES.

Flower-clusters separated, scattered more or less throughout the plant: stem and branches not sharply angled: leaf-blades without impressions beside the midrib, not plicate.

I. AVICULARIA.

Flower-clusters approximate on the upper part of the branches, thus forming long raceme-like panicles: stem sharply angled: leaf-blades with impressions on either side of the midrib, thus plicate.

II. TENUIA.

#### I. AVICULARIA

Calyx green, or sepals with white, pink, or purplish margins. Plants copiously leafy throughout, the upper leaves only slightly reduced in size.

Achene prominently exserted from the calyx: sepals rather petaloid.

Achene included in the calyx or the mere tip exposed: sepals not petaloid.

Achene with striate faces.

Mature perianth 3-4 mm. long: achene 3-4 mm. long.

Mature perianth 1.5-2 mm. long: achene 1.5-2 mm. long.

Achene with granular or nearly smooth faces.

1. *P. glaucum*.

2. *P. aviculare*.

3. *P. neglectum*.

4. *P. buxiforme*.

Plants with the upper leaves scattered and reduced in size.  
 Calyx, at least the inner sepals, yellow or yellow-green.  
 Leaf-blades broad: achene dull.  
 Leaf-blades narrow: achene shining.

5. *P. camporum*.

6. *P. erectum*.

7. *P. ramosissimum*.

## II. TENUA

Annual with erect wiry stems and very slender panicles, the clusters often reduced to a single flower each.

8. *P. tenue*.

1. *P. glaucum* Nutt. Plant glaucous, sometimes nearly white, the branches mainly prostrate or assurgent, 2-7 dm. long: leaf-blades fleshy, generally longer than the internodes, the larger ones 4-8 mm. wide: ocreae silvery and very conspicuous: perianth becoming 3-4 mm. long; sepals with white or pink margins, lax at maturity: achene chestnut-brown, 3.5-4 mm. long, lustrous. [*P. maritimum* (Fl. SE. U. S.)]—Coastal sands, Fla. to Ala. and Me.—(Eu.)

2. *P. aviculare* L. Plant bright-green, the branches ultimately procumbent or prostrate, 1-6 dm. long: leaf-blades thin or thinnish, commonly 4-8 mm. wide: ocreae very thin: perianth becoming 3-4 mm. long; sepals with white, pink, or purplish borders: achene 3-4 mm. long, dull, granular-striate.—(BIRD-KNOTGRASS.)—Fields, roads, and waste places, various provinces, Fla. to La., Calif., and C Can.—(Eurasia.)

3. *P. neglectum* Besser. Plant bright-green or bluish-green, the branches ultimately prostrate or procumbent, 1-6 dm. long: leaf-blades thin, narrowly elliptic, elliptic-lanceolate, or linear, commonly 2-3 mm. wide, acute or acuminate: ocreae very thin: perianth becoming 1.5-2 mm. long; sepals with pale-pink or purplish-red borders: achene 1.5-2 mm. long, dull, granular-striate.—Common, about dwellings, and on roadsides and in waste places, various provinces, Fla. to Tex., Calif., and S Can.—(Eurasia.)

4. *P. buxiforme* Small. Plant bright-green or pale-green, the branches stout, diffuse or prostrate, 2-8 dm. long: leaf-blades thick, mainly 4-10 mm. wide: ocreae conspicuous: perianth becoming 2-3 mm. long; sepals with pale or carmine borders: achene 2-2.5 mm. long, often granular.—Roadsides, fields, and waste places, various provinces, N. C. to Tex., N. M., B. C., Ont., and N. B.

5. *P. camporum* Meisn. Plant pale-green, 3-12 dm. tall: leaf-blades narrowly oblong or elliptic to linear, varying to oblanceolate or lanceolate, 1-3 mm. long: perianth becoming about 2 mm. long; sepals veiny in age: achene broadly ovoid, 2 mm. long or nearly so, thinning, acute.—Low grounds, Coastal Plain, La. and Tex. Nat. in Ala.—(Mex.)

6. *P. erectum* L. Plant yellowish-green, the lower branches spreading or decumbent, 1-12 dm. long: leaf-blades much larger than in any of the preceding species, mainly 2-6 cm. long, elliptic, oval, or somewhat broadened upward: ocreae rather sordid: perianth becoming 3.5 mm. long; sepals often veiny in age: achene 3 mm. long, striate, dull.—Yards, waste places, and moist banks, various provinces, Ga. to Ark., Man., Ont., and Me.

7. *P. ramosissimum* Michx. Plant yellow-green, 2.5-13 dm. tall, usually sparingly branched above: leaf-blades mainly 2-5 cm. long: ocreae conspicuous: perianth becoming 2.5-3 mm. long; sepals usually veiny at maturity: achene

3–3.5 mm. long, smooth and shining.—Dry, often saline soil, various provinces, Tenn. to N. M., Wash., Sask., and Minn.

8. *P. tenue* Michx. Plant 1–4 dm. tall, the branches wiry: leaf-blades linear to linear-lanceolate, 0.5–3 cm. long, each with 2 lateral impressions on either side of the midrib: flowers short-pedicelled; perianth becoming 2.5–3 mm. long: achene ovoid, 2.5–3 mm. long.—Dry sandy or rocky soil, various provinces, Ga. to Tex., Nebr., Minn., and Ont.

10. *TOVARA* Adans. Perennial erect herbs. Leaves alternate, not jointed at the fringed ocreae. Flowers in lax remote clusters borne on virgate branches. Sepals more or less colored, 4, unequal, the 2 lateral ones overlapping the others. Stamens 4, and alternating with the sepals, or 5, the fifth one opposite the lower sepal: filaments slender. Stigmas 2. Achene lenticular.—Two species, the following and one Japanese.

1. *T. virginiana* (L.) Adans. Stem strigose, at least below the nodes, 3–14 dm. tall, virgately branched or simple: leaf-blades ovate or elliptic to ovate-lanceolate, 3–16 cm. long: pedicels flattened: perianth becoming 3.5–4 mm. long; sepals longitudinally ribbed: styles bent at an angle to the achene: achene 3.5–4 mm. long, ovoid or ovoid-oblong, invested in the nodding calyx.—(JUMP-SEED.)—Rich woods and thickets, various provinces, Fla. to Tex., Minn., Ont., and N. S.—Sum.—fall.—The common name refers to the surprising distance the ripe achenes fly when pressed under the thumb nail. In the case of this genus and of the following generic segregates from the composite genus *Polygonum*, the species recorded in Chapman's "Flora" will be found under the same specific names, unless otherwise mentioned.

11. *PERSICARIA* [Tourn.] Adans. Annual or perennial, erect or spreading herbs. Leaves alternate, not jointed at the cylindric naked or fringed ocreae: blades narrowed at the base or rarely cordate. Flowers borne in spike-like panicles. Sepals white or colored, mostly 5, neither winged nor keeled. Stamens 4–8: filaments slender. Stigmas 2 or sometimes 3. Achene lenticular or 3-angled, included or the tip merely exposed.—About 125 species, widely distributed.—Spr.—fall, or all year southward.—SMARTWEEDS. GANDER-GRASSES.

Panicle, or pair of panicles, terminal only: mature perianth much longer than the achene.

Panicles axillary as well as terminal, often numerous: mature perianth reaching to about the tip of the achene or merely covering it.

Ocreae with erect edges: leaf-blades of a narrow type: stigmas minute: cotyledons accumbent.

Ocreae with spreading collar-like edges: leaf-blades of a broad type: stigmas large: cotyledons incumbent.

#### I. AMPHIBIAE.

#### II. LAPATHIFOLIAE.

#### III. ORIENTALES.

#### I. AMPHIBIAE

Coarse perennial with diffuse and widely creeping stems and branches.

1. *P. Muhlenbergii*.

## II. LAPATHIFOLIAE

Ocreae not fringed with bristles, rarely inconspicuously ciliate when young.

Panicle strictly erect, stout.

Achene turgid-lenticular: plant perennial.

Achene flat, the faces concave or merely umbonate: plant annual.

Flowers on different plants with much variation in the style lengths, the styles in the long-styled forms, conspicuously exserted: achene ovate, the faces more or less umbonate.

Plant annual, sometimes with creeping woody branches: achene shining.

Plant perennial: achene dull.

Flowers with slight variation in the style-lengths, the styles not conspicuously exserted: achene nearly orbicular, the faces flat or concave.

Panicle nodding, rather slender.

Ocreae fringed with bristles.

Stem, branches, and peduncles hispid and more or less glandular.

Stem, branches, and peduncles not hispid.

Sepals not pustulate-punctate.

Panicle short, stout, compact.

Panicle slender and elongate, lax or interrupted.

Leaf-blades narrowed at the base, manifestly petioled: stem and ocreae glabrous or appressed pubescent.

Ocreolae ciliate.

Ocreae strigillose, with marginal cilia: leaf-blades glabrous or sparingly strigillose.

Calyx greenish-white: achene nearly as wide as long, the tip protruding beyond the calyx.

Calyx white, pink, or purplish-pink: achene manifestly longer than wide, the tip covered over.

Ocreae loosely strigose, with long, coarse marginal cilia: leaf-blades copiously loosely strigose.

Ocreolae eciliate.

Leaf-blades cordate or subcordate at the base, sessile or nearly so: stem, at least below the nodes, and ocreae hirsute.

Sepals pustulate-punctate.

Achene granular, dull: panicle nodding.

Achene smooth, shining: panicle erect.

2. *P. portoricensis*.

3. *P. longistyla*.

3a. *P. mississippiensis*.

4. *P. pennsylvanica*.

5. *P. lapathifolia*.

6. *P. Careyi*.

7. *P. Persicaria*.

8. *P. opelousana*.

9. *P. hydropiperoides*.

10. *P. setacea*.

11. *P. patudicola*.

12. *P. hirsuta*.

13. *P. Hydropiper*.

14. *P. punctata*.

## III. ORIENTALES

Tall rather coarse annual with usually numerous dense cylindric nodding panicles of rose-colored flowers.

15. *P. orientalis*.

1. *P. Muhlenbergii* (Meisn.) Small. Perennial, generally strigose, creeping: leaf-blades lanceolate to elliptic-lanceolate, 5-20 cm. long, rounded or cordate at the base: ocreae strigose: panicles compact, 3-10 cm. long: perianth becoming 4-5 mm. long; sepals rose-colored, not punctate: achene lenticular, 2.5-3 mm. long. [*P. emersa* (Michx.) Small]—(RED-CARELESS.)—Muddy shores, swamps, and ditches, various provinces, Fla. to Tex., Calif., B. C., Ont., and Que.—(*Mex.*)

2. *P. portoricensis* (Bertero) Small. Perennial, generally glabrous: leaf-blades lanceolate, usually narrowly so, 3-25 cm. long, acuminate: ocreae very thin: panicles lax, but often copiously-flowered: ocreolae eciliate: perianth becoming 3.5-4 mm. long; sepals white or whitish, punctate: achene

turgid-lenticular, 2.5 mm. long, or less. [*Polygonum densiflorum* Meisn.]—Swamps, ponds, lake-borders, and ditches, Coastal Plain, Fla. to Tex., Mo., and N. J.—(W. I., Mex., S. A.)

3. *P. longistyla* Small.<sup>1</sup> Annual, sometimes with creeping woody branches, more or less glandular-pubescent above: leaf-blades lanceolate, 3–12 cm. long, somewhat attenuate: peduncles glandular-pubescent: panicles often plume-like on account of the exserted stamens and style: ocreolae ciliate: perianth bright-pink: sepals not punctate: achene ovate or orbicular-ovate, 2.5–3 mm. long, rather sharply pointed.—Low grounds, wet woods, and waste-places, Miss. to Tex., Okla., and Mo.

3a. *P. mississippiensis* (Stanford) Small. Plant perennial, quite woody below, glabrous up to the inflorescence: leaf-blades lanceolate, 5–10 cm. long, strigillose on both sides, long-attenuate: peduncles more or less strigose: panicles often slightly plume-like: perianth pink: sepals not punctate: achene narrowly ovoid, 2–2.5 mm. long, decidedly pointed. [*Polygonum mississippiense* Stanford]—Low grounds, fields, and ditches, Miss. to Tex.

4. *P. pennsylvanica* (L.) Small. Annual, the upper branches finely glandular-pubescent: leaf-blades lanceolate, 4–22 cm. long: ocreae eciliate: panicles stout, erect: ocreolae eciliate or nearly so: perianth becoming 3.5–4 mm. long: sepals pink or light-purple, not punctate: stamens and style short: achene flat-lenticular, 3–3.5 mm. long, shining, short-beaked.—(PINKWEED.)—Waste-places, roadsides, and cult. grounds, various provinces, Fla. to Tex., Minn., and N. S.—(Mex.)

5. *P. lapathifolia* (L.) S. F. Gray. Annual, glabrous or nearly so: leaf-blades lanceolate, sometimes narrowly so, 5–20 cm. long: ocreae eciliate: panicles slender, nodding: ocreolae eciliate, acuminate: perianth becoming 2.5–3 mm. long: sepals whitish to rose-colored: achene flat-lenticular, 2–2.5 mm. long. [*Polygonum incarnatum* Ell.]—(PALE-PERSICARIA.)—River banks, and wet grounds, various provinces, Fla. to Tex., Calif., and Can.—(W. I., Mex., C. A., O. W.)

6. *P. Carey* (Olney) Greene. Annual, hispid and more or less glandular: leaf-blades elliptic-lanceolate to linear-lanceolate or almost linear on the upper part of the plant, 5–16 cm. long: ocreae bristle-fringed: panicles slender, loosely-flowered, nodding: ocreolae ciliate, rounded: perianth becoming 2.5–3 mm. long: sepals purplish: achene turgid-lenticular, 2–2.5 mm. long, smooth and shining.—Swamps, marshes, and clearings, various provinces, Fla. (perhaps introd.), N. J. to Ont. and Me.

7. *P. Persicaria* (L.) Small. Annual, glabrous or partly pubescent: leaf-blades lanceolate to linear-lanceolate, 2–18 cm. long, often with a central blotch: ocreae fringed: panicles stout: ocreolae ciliate: perianth becoming 3 mm. long or nearly so: sepals pink, purple, green, or reddish, not punctate: achene turgid-lenticular or 3-angled, 2–2.5 mm. long, shining.—(LADY'S-THUMB. HEARTWEED.)—Cult. grounds, waste-places, and roadsides, various provinces, Fla. to Tex., Calif., and S. Can. Nat. of Eu.

8. *P. opelousana* (Ridd.) Small. Perennial, more or less strigillose: leaf-blades linear to linear-lanceolate, 3–11 cm. long: ocreae long-fringed: panicles slender, erect: ocreolae long-fringed: perianth becoming 2–2.5 mm. long: sepals greenish-white, not punctate: achene 3-angled, 2 mm. long or nearly so, shin-

<sup>1</sup> The related species, *P. mexicana* Small and *P. segetum* (H. B. K.) Small, seem not to be definitely known from our range; the former is to be expected in S. Tex., the latter in S. Fla.

ing, tip usually protruding from the calyx.—Swamps, ditches and wet grounds, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Mass.—(*W. I., Mex.*)

9. *P. hydropiperoides* (Michx.) Small. Perennial, strigillose in parts: leaf-blades lanceolate, varying to elliptic-lanceolate or linear-lanceolate, 4–13 cm. long: ocreae long-fringed, sparingly strigose: panicles slender, erect: ocreolae fringed: perianth becoming 3–3.5 mm. long; sepals pink, purplish or white, not punctate: achene 3-angled, 2–2.5 mm. long, shining, the tip covered by the calyx.—(*MILD WATER-PEPPER.*)—Swamps, wet soil, and low woods, various provinces, Fla. to Tex., Wash., Ont., and N. B.—(*Mex.*)

10. *P. setacea* (Baldw.) Small. Perennial, more or less strigose: leaf-blades elliptic-lanceolate to narrowly lanceolate, 4–18 cm. long, narrowed at the base: ocreae long-fringed, coarsely-strigose: panicles slender, erect: ocreolae long-fringed: perianth becoming 2.5–3 mm. long; sepals white or pink, not punctate: achene 3-angled, 2–2.5 mm. long, shining.—Swamps, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Mass.

11. *P. paludicola* Small. Perennial, glabrous or nearly so: leaf-blades oval, elliptic, or elliptic-lanceolate, 1.5–8 cm. long: ocreae bristle-fringed, glabrous or sparingly pubescent: panicles slender, erect: ocreolae glabrous and eciliate: perianth becoming 2.5–3 mm. long; sepals greenish, not punctate: achene 3-angled, broadly obovoid, about 2.5 mm. long, shining, the apex protruding from the calyx.—Everglades, Fla.

12. *P. hirsuta* (Walt.) Small. Perennial, hirsute, up to the inflorescence (glabrous or glabrate, the internodes merely strigillose in *P. hirsuta glabrescens*): leaf-blades lanceolate, 3–10 cm. long, cordate or subcordate at the base: ocreae hirsute and fringed: panicles slender, erect: ocreolae usually sparingly fringed, the cilia usually deciduous: perianth becoming 2.5–3 mm. long; sepals white or pinkish, not punctate: achene 2–2.5 mm. long, shining.—Swamps and wet soil, Coastal Plain, Fla. and Ga.—(*W. I.*)

13. *P. Hydropiper* (L.) Opiz. Annual, glabrous or nearly so: leaf-blades narrowly ovate to elliptic-lanceolate or lanceolate, 1.5–9 cm. long: ocreae short-fringed: panicles stoutish, nodding: ocreolae short-fringed: perianth becoming 3–3.5 mm. long; sepals greenish, pustulate-punctate: achene turgid-lenticular or 3-angled, dull, 2.5–3 mm. long.—(*WATER-PEPPER. COMMON-SMARTWEED.*)—Moist soil and wet banks, various provinces, Fla. to Tex. and S Can. Nat. of Eu.

14. *P. punctata* (Ell.) Small. Perennial, usually nearly glabrous: leaf-blades lanceolate to elliptic-lanceolate, 2–11 cm. long: ocreae long-fringed: panicles slender, mostly continuous during anthesis (very slender and with remote ocreolae and achenes 2 mm. long in *P. punctata leptostachya*): ocreolae more or less fringed: perianth becoming 3–4.5 mm. long; sepals whitish or green, pustulate-punctate: achene mostly 3-angled, about 2.5 mm. long, shining. [*Polygonum acre* H.B.K.]—(*WATER-SMARTWEED. DOTTED-SMARTWEED.*)—Low grounds and swamps, various provinces, Fla. to Tex., Calif. and S Can.—(*W. I., Mex., C. A., S. A.*)

15. *P. orientalis* (L.) Spach. Annual, tall, more or less hirsute: leaf-blades ovate to broadly elliptic, 6–25 cm. long: ocreae spreading and ciliate at the top: panicles stout, nodding: ocreolae pubescent and ciliate: perianth becoming 4–4.5 mm. long; sepals dark rose-colored, not punctate: achene lenticular, orbicular, 3–3.5 mm. long.—(*PRINCE'S-FEATHER. PRINCE'S-PLUME.*)—Roadsides, waste grounds, and about dwellings, various provinces, E U. S. Nat. of Asia.

**12. FAGOPYRUM** [Tourn.] Gaertn. Annual erect smooth herbs, the stems terete. Leaves alternate, not jointed at the oblique ocreae: blades hastate or cordate at the base. Flowers borne in branching raceme-like panicles. Sepals white, 5, almost unchanged at maturity. Stamens 5-8: filaments filiform. Stigmas 3. Achene 3-angled, exserted.—About 6 species, Eurasian.

1. *F. Fagopyrum* (L.) Karst. Stem 1-9 dm. tall, slightly pubescent about the nodes: leaf-blades hastate, 2.5-8 cm. long: panicles persistently flowering: perianth becoming 2.5-3.5 mm. long: achene 5-6 mm. long.—(BUCKWHEAT).—Fields, roadsides and waste-places, U. S. and S Can. Nat. of Eu.—(W. I.)—Sum.

**13. TRACAULON** Raf. Annual or perennial, prickly-armed, with the prickles reflexed, reclining-climbing herbs. Leaves alternate, not jointed at the oblique ocreae. Flowers borne in spike-like or capitate panicles. Sepals often slightly colored, 5 or 4, neither keeled nor winged. Stamens 5-8: filaments slender. Stigmas 2 or 3. Achene lenticular or 3-angled, included.—About 18 species North American and Asiatic.—TEARTHUMBS. RAKESTRAWS.

Leaf-blades sagittate: achenes 3-angled.  
Leaf-blades hastate: achenes lenticular.

1. *T. sagittatum*.  
2. *T. arifolium*.

1. *T. sagittatum* (L.) Small. Leaf-blades lanceolate-sagittate to elliptic-sagittate, 1-12 cm. long, the basal lobes acute: ocreolae 3-5 mm. long: perianth becoming 4 mm. long: stamens 8: achene 3-3.5 mm. long.—(ARROW-VINE).—Wet places and meadows, various provinces, Fla. to Tex., Sask., Ont., and Newf.—Sum.-fall.

2. *T. arifolium* (L.) Raf. Leaf-blades hastate, 2-18 cm. long, the basal lobes spreading, acuminate: ocreolae 2-3 mm. long: perianth becoming 4-5 mm. long: stamens 6: achene 4 mm. long.—(SCRATCH-GRASS).—Wet thickets and meadows, various provinces, Ga. to Minn. and N. B.—Sum.-fall.—The calyx in both species ranges from white to greenish or red-tinged.

**14. BILDERDYKIA** Dum. Annual or perennial, unarmed twining vines. Leaves alternate, not jointed at the oblique ocreae. Flowers borne in branching raceme-like panicles or in axillary clusters. Sepals white or yellowish, 5, the outer ones keeled or winged at maturity. Stamens 8: filaments slender. Stigmas 3. Achene 3-angled, included. [*Tiniaria* Webb & Moq.]—About 8 species, North American and Asiatic.—Sum.-fall.—NIMBLE-WILLS.

Outer sepals unchanged or merely keeled at maturity.

Achene granular, dull: inflorescence of axillary and terminal clusters and simple racemes. 1. *B. Convolvulus*.

Achene smooth, shining: inflorescence of axillary and terminal panicle racemes. 2. *B. cilinodis*.

Outer sepals developing conspicuous wings.

Sepal-wings not incised.

Mature perianth 6-8 mm. long, wings flat.

Mature perianth 10-15 mm. long, wings crisped.

Sepal-wings incised.

3. *B. dumetorum*.

4. *B. scandens*.

5. *B. cristata*.

1. *B. Convolvulus* (L.) Dum. Stem and branches trailing or twining, green or purple-tinged: leaf-blades ovate to ovate-sagittate, or those of the upper ones sagittate, 1.5-6 cm. long: ocreae rough-edged: perianth becoming about 4 mm. long; sepals mealy-granular, the outer becoming longer than the inner: achene 3-3.5 mm. long.—(BLACK-BINDWEED. CLIMBING-BUCKWHEAT.)—Cult. grounds, waste-places, and fields, various provinces, Fla. to Tex., Calif., and S Can. Nat of Eu.—(*W. I., Mex.*)

2. *B. cilinodis* (Michx.) Greene. Stem prostrate or twining, purple: leaf-blades ovate, 2-8 cm. long, cordate and sometimes hastate at the base: ocreae with reflexed hairs at the base: perianth becoming about 4 mm. long; sepals smooth or nearly so, the outer shorter than the inner: achene about 3 mm. long.—Rocky places and thickets, Blue Ridge and more northern provinces, N. C. to Athabasca and N. S.

3. *B. dumetorum* (L.) Dum. Stem twining, purple-tinged: leaf-blades ovate to ovate-hastate, 2-7 cm. long: ocreae glabrous: perianth becoming 6-8 mm. long: achene about 3 mm. long.—(FALSE-BUCKWHEAT.)—Thickets, various provinces, locally in the E U. S. Nat. of Eu.

4. *B. scandens* (L.) Greene. Stem and branches twining, purplish: leaf-blades ovate to elliptic-ovate, 4-12 cm. long: ocreae with rough ridges: perianth becoming 10-15 mm. long: achene 4-4.5 mm. long.—(HEDGE-BUCKWHEAT. FALSE-BUCKWHEAT.)—Thickets and fence-rows, various provinces, Fla. to Tex. and S Can.

5. *B. cristata* (Engelm. & Gray) Greene. Stem and branches twining, green or purplish: leaf-blades ovate to triangular, 1-6 cm. long: perianth becoming 6.5-7.5 mm. long: achene 3 mm. long.—Thickets, fence-rows, and river banks, various provinces, Fla. to Tex., Okla., and Mass.

15. *PLEUROPTERUS* Turcz. Perennial, often large many-stemmed herbs with extensively spreading rootstocks. Leaves alternate: blades broad, commonly large, mostly truncate or cordate at the base and abruptly pointed at the apex. Flowers numerous, borne in short axillary clustered or branching panicles. Sepals mostly 5, the 3 outer ones developed into firm wings at maturity. Stamens 6-8: filaments united at the base. Stigmas 3, short-fimbriate. Achene 3-angled, included.—About 4 species, Asiatic.

1. *P. Zuccarinii* Small. Large nearly glabrous herb with hollow stems 1-3 m. tall:

leaf-blades broadly ovate, varying to elliptic-ovate, deltoid-ovate, or hastate-ovate, 5–15 cm. long, finely reticulate, usually truncate at the base: panicles 2–11 cm. long, the branches finely pubescent: stipe-like base of the hypanthium longer than the pedicel: calyx white or red: sepals oval and 1.5 mm. long at anthesis: achene ellipsoid, narrowed to both ends, about 2.5 mm. long, black, shining.—(JAPANESE-KNOTWEED. ITADORI).—Waste-places, woods, and fence-rows, various provinces, locally escaped from cult. in the E U. S. from N. C. N. Nat. of Japan.—Sum.—fall.—A very persistent as well as a vigorous plant. It rapidly forms large colonies by the widely branched rootstocks.

**16. CORCULUM** Stuntz. Perennial vines with partly woody stems. Leaves alternate: blades ovate to hastate. Flowers borne in spreading or diffuse panicles whose branches terminate in tendrils. Sepals 5 or 6, the 3 outer ones conspicuously accrescent, ultimately enveloping the fruit as 3 broad wings. Stamens 7–9; filaments united at the base, alternating with small staminodia. Stigmas 3, capitate. Achenes 3-angled, included in the sepal-wings.—About 4 species, natives of Mex. and C. A.

**1. C. leptopus** (H. & A.) Stuntz. Leaf-blades ovate in outline, more or less hastate, the larger ones 10–15 cm. long, acuminate, somewhat crisped and undulate, cordate at the base: sepals rose-colored or purplish, the outer ones ovate, cordate at the base, becoming 15–18 mm. long: achene 8–9 mm. long, the body terete, the beak 3-angled.—(MOUNTAIN-ROSE. ROSA-DE-MONTANA. CORAL-VINE. PINK-VINE. TALLAHASSEE-VINE.)—Hammocks, roadsides, and waste-places, pen. Fla. to Ga. Nat. of trop. Am.—(W. I., Mex., C. A., S. A.)—All year.—Widely grown as an ornamental vine.

**17. BRUNNICHIA** Banks. Woody tendril-bearing vines. Leaves alternate, the ocreae obsolete. Flowers borne in branching panicles. Sepals 5, surrounding the hypanthium which enlarges and develops a wing which is decurrent on its pedicel-like base. Stamens usually 8. Stigmas 3, each 2-cleft. Achene 3-angled, included in the dry hypanthium.—Two known species, the following and one in Africa.

**1. B. cirrhosa** Banks. Stems high-climbing, much-branched, sometimes 2 cm. thick: leaves deciduous; blades ovate to ovate-lanceolate, 3–15 cm. long: perianth becoming 3–3.5 cm. long, the sepals oblong, about 5 mm. long: hypanthium, both tube and pedicel-like base, greatly elongated, the wing 2.5–3.5 mm. wide: achene 7–10 mm. long.—(EARDROP. BUCKWHEAT-VINE. BUCK-VINE.)—Mostly on river-banks, Coastal Plain and occasionally adj. provinces, Fla. to Tex., Mo., Ill., and S. C.—Spr.—sum.

**18. COCCOLOBIS** P. Br. Evergreen shrubs or trees. Leaves alternate, the ocreae cylindric or funnelliform. Flowers borne in spikes or racemes. Sepals

5, surmounting the accrescent hypanthium. Stamens 8. Stigmas 3, entire. Achene 3-angled, included in the juicy hypanthium.—About 130 species, of tropical America.—The hard close-grained wood is used in cabinet-work.—The flowers are green or greenish-yellow.

Leaf-blades longer than wide, narrowed at the base: fruit about 1 cm. thick.

Leaf-blades wider than long, cordate at the base: fruit 1.5–2 cm. thick.

1. *C. laurifolia*.

2. *C. uvifera*.

1. *C. laurifolia* Jacq. Shrub or tree: leaf-blades ovate to obovate, 5–10 cm. long, narrowed or rounded at the base: panicles less than 1 dm. long in anthesis, the lower flower-clusters usually with 3 or 4 pedicels: sepals 2.5–3.5 mm. long: hypanthium-margin even between the filaments or with tooth-like staminodia: fruit black, in lax clusters. [*C. floridana* Meisn.] —(PIGEON-PLUM.)—Hammocks on or near the coast, E pen. Fla. and the Keys.—(*S. A.*)—The fruits are a favorite bird-food.

2. *C. uvifera* (L.) Jacq. Shrub or small tree: leaf-blades suborbicular, 4–20 cm. wide, cordate at the base: panicles over 1 dm. long in anthesis, dense: sepals 2–3 mm. long: fruit reddish, borne in dense grape-like clusters. —(SEA-GRAPE. GRAPE-TREE. PLATTER-LEAF.)—Coastal hammocks and dunes, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)—The fruits are used to make jelly.

## ORDER CHENOPODIALES — CHENOPODIAL ORDER

Herbs, often partially woody, or shrubs or trees. Leaves alternate or opposite, occasionally scale-like. Flowers mostly perfect, sometimes monoecious or dioecious. Calyx usually present, the sepals mainly separate. Corolla wanting, or present and of minute or large petals. Androecium of 1–several stamens. Gynoecium of a single carpel or of several united carpels, the ovary mostly superior. Fruit various.

Fruit a utricle, achene, or berry, sometimes an anthocarp, not valvate, or merely circumscissile.

Fruit various, not an anthocarp.

Fruit utricular.

Bracts not scarious: stipules wanting.

Erect or diffuse plants.

Stamens inserted at the base of the ovary or in the margin of a short hypanthium.

Stamens inserted on the margin of a hypanthium which ultimately exceeds the sepals in length.

Climbing vines.

Bracts or stipules scarious.

Stipules wanting: sepals scarious.

Stipules present: sepals herbaceous or scarious-margined.

Fruit baccate or an achene, or aggregate.

Hypanthium wanting: stamens borne below the ovary: stigmas not penicellate.

Hypanthium present: stamens borne on the edge of the hypanthium: stigma penicellate.

Fam. 1. CHENOPODIACEAE.

Fam. 2. SCLERANTHACEAE.

Fam. 3. BASELLACEAE.

Fam. 4. AMARANTHACEAE.

Fam. 5. CORRIGIOLACEAE.

Fam. 6. PHYTOLACCACEAE.

- Fruit an achene: flowers perfect, not in cones.  
 Fruit aggregate: flowers dioecious, in axillary cones.  
 Fruit an anthocarp, the achene surrounded by the calyx-tube.  
 Herbs: seed with a hooked embryo.  
 Shrubs or trees: seed with a straight embryo.  
 Fruit a capsule dehiscent by apical or longitudinal valves (a pyxis in *Portulaca*).  
 Ovary several-celled: corolla wanting.  
 Ovary 1-celled: corolla mostly present.  
 Sepals 2: leaves mostly alternate.  
 Sepals 4 or 5: leaves mostly opposite.  
 Sepals distinct: ovary sessile: petals not clawed.  
 Sepals united: ovary stipitate: petals clawed.
- Fam. 7. PETIVERIACEAE.  
 Fam. 8. BATIDACEAE.  
 Fam. 9. ALLIONIACEAE.  
 Fam. 10. PISONIACEAE.  
 Fam. 11. TETRAGONIACEAE.  
 Fam. 12. PORTULACACEAE.  
 Fam. 13. ALSINACEAE.  
 Fam. 14. CARYOPHYLLACEAE.

### FAMILY 1. CHENOPODIACEAE—GOOSEFOOT FAMILY

Herbs or woody plants. Leaves alternate or opposite: blades simple. Flowers perfect, polygamous, monoecious, or dioecious, mostly in congested spikes. Calyx of 1, 2, 3, 4, or 5 persistent sepals. Corolla wanting. Androecium of as many stamens as there are sepals. Gynoecium of 2 or more united carpels. Ovary 1-celled. Fruit a utricle, sometimes achene-like.—About 75 genera and 550 species of wide geographic distribution, many of them becoming weeds.

Plant not succulent: the stems not conspicuously jointed: leaves alternate, not scale-like.

Embryo annular, conduplicate, or semi-annular: endosperm surrounded by the embryo.

Fruit opening at maturity, or at germination, by a lid: flowers perfect.

Fruit indehiscent.

Flowers mostly perfect, ebracteolate.

Flowers usually unisexual, the pistillate bi-bracteolate.

Embryo spirally coiled: endosperm wanting or present and divided by the embryo.

Leaves and bracts succulent: calyx wingless.

Leaves, and bracts spinescent: calyx horizontally winged at maturity.

Plant succulent, the stems conspicuously jointed: leaves scale-like, opposite.

#### I. BETEAE.

Herbs with fleshy roots, crisped leaf-blades, and the fruit enclosed in the hardened base of the perianth.

#### II. CHENOPODIEAE.

Calyx horizontally winged in fruit.

Calyx not winged.

Calyx becoming saccate and reticulate, slightly lobed.

Calyx neither saccate nor veiny, deeply lobed.

Embryo annular, encircling the endosperm.

Embryo horseshoe-shaped, not encircling the endosperm.

Pericarp not gland-dotted: inflorescence a dichotomous cyme.

Pericarp gland-dotted: inflorescence spicate or paniculate.

#### III. SPINACIEAE.

Stigmas 4 or 5: bracts united to the apex: foliage glabrous.

Stigmas 2 or 3: bracts distinct, at least at the apex: foliage with inflated hairs, at least when young.

#### IV. DONDIEAE.

Plants with nearly terete leaves, the mature calyx wingless.

#### V. SALSOLEAE.

Plants with spinescent leaves, the mature calyx winged.

#### VI. SALICORNIEAE.

Green or red succulents, with the flowers sunken in excavations of the internodes.

Tribe I. BETEAE.

Tribe II. CHENOPODIEAE.

Tribe III. SPINACIEAE.

Tribe IV. DONDIEAE.

Tribe V. SALSOLEAE.

Tribe VI. SALICORNIEAE.

1. BETA.

2. CYCLOLOMA.

3. ROUBIEVA.

4. CHENOPODIUM.

5. BOTRYDIUM.

6. AMBRINA.

7. SPINACIA.

8. ATRIPLEX.

9. DONDIA.

10. SALSOLA.

11. SALICORNIA.

1. **BETA** L. Fleshy edible herbs. Leaves alternate: blades soft, more or less crisped. Flowers perfect, clustered and coherent by their bases. Calyx herbaceous, hardened and closed in fruit. Stigmas introrse. Utricle enclosed, achene-like.—About 14 species, Eurasian.

1. **B. vulgaris** L. Annual or biennial, with a conic or pyriform root, commonly purplish: stem 3-7 dm. tall: leaf-blades ovate to elliptic-ovate, 0.5-1.5 dm. long: sepals oblong, becoming linear, 2.5-3 mm. long, keeled: fruit 4-5 mm. long.—(BEET.)—Cult. grounds, various provinces, U. S. Nat. of Eu. and cult.—(*Mex.*)—Sum.—fall.—The plant has been used as a table vegetable from prehistoric times. The root of one variety is an important source of sugar.—The flowers are greenish or reddish.

2. **CYCLOLOMA** Moq. Coarse erect or spreading scurfy-pubescent herbs. Leaves alternate: blades irregularly toothed. Flowers mostly perfect, or sometimes pistillate. Calyx with triangular-ovate lobes, developing a horizontal wing below the lobes. Utricle depressed-globose, nearly enclosed.—One species.

1. **C. atriplicifolium** (Spreng.) Coulter. Annual, 1.5-8 dm. tall: leaf-blades lanceolate to elliptic, 2-8 cm. long, sinuate-dentate: sepals pubescent, red or purple in age: utricles 2-3 mm. wide, the surrounding wing 4-5 mm. in diameter: seed about 1.5 mm. wide.—(WINGED-PIGWEEED.)—Sandhills, sandy fields, and banks, various provinces, Miss. to Tex., Ariz., Man., and Mass.—Sum.

3. **ROUBIEVA** Moq. Strong-scented prostrate or procumbent pubescent herbs. Leaves alternate: blades sinuate-dentate or pinnatifid. Flowers perfect, or by abortion, pistillate, solitary or clustered in the axils. Calyx with rounded lobes, saccate and reticulate in age. Utricle compressed-globose, enclosed.—One species.

1. **R. multifida** (L.) Moq. Perennial, the branches 1.5-7 dm. long: leaf-blades elliptic in outline or narrower, 1-4.5 cm. long, deeply pinnatifid or merely coarsely lobed near the base of the stem; sepals 3-5: utricles glandular-dotted, in the obovoid-calyx; seed about 1 mm. in diameter.—Waste-places and cult. grounds, Coastal Plain and occasionally adj. provinces, Fla. to Ala. and N. Y. Nat. of S. A.—Sum.—fall.—The flowers are greenish.

4. **CHENOPODIUM** [Tourn.] L. Odorless or heavy-scented non-glandular herbs, ours annuals. Leaves alternate: blades entire to coarsely toothed, often mealy-coated. Sepals hooded. Anther-sacs commonly separate. Ovary often depressed.—About 50 species of wide geographic distribution.—The seeds of some species are used by primitive people as a source of flour.—GOOSEFOOTS. PIGWEEDS.—The flowers are greenish or sometimes tinged with red.

Leaf-blades smooth and shining above.

I. URBICA.

Leaf-blades dull above.

Seed free from the pericarp, or if adherent, blades of the lower leaves entire.

Plants not strong-scented: seed and pericarp free.

II. BOSCIANA.

Plants strong-scented: seed and pericarp adherent.

III. VULVARIAE.

Seed adherent to the pericarp: blades of the lower leaves sinuate-dentate.

IV. ALBA.

#### I. URBICA

Plant irregularly branched: leaf-blades irregularly toothed.

1. *C. murale*.

#### II. BOSCIANA

Erect plant with the blades of the upper leaves narrow and entire.

2. *C. Boscianum*.

#### III. VULVARIAE

Diffuse plant with squarish-rhombic leaf-blades.

3. *C. Vulvaria*.

#### IV. ALBA

Blades of the lower leaves about as wide as long.

4. *C. amaranticolor*.

Blades of the lower leaves decidedly longer than wide.

Leaf-blades, except the lower ones, entire, lanceolate or oblong-lanceolate.

5. *C. lanceolatum*.

Leaf-blades, toothed or lobed, broader than lanceolate.

Seeds over 1 mm. wide: plant not strong-scented.

Plants bright-green: inflorescence loose and open.

6. *C. paganum*.

Plants copiously farinose: inflorescence dense.

7. *C. album*.

Seeds 1 mm. wide or less: plant strong-scented.

8. *C. Berlandieri*.

1. *C. murale* L. Plant deep-green, somewhat mealy, 1-6 dm. tall: leaf-blades ovate to rhombic-ovate, 2-8 cm. long, coarsely, sharply, and irregularly toothed: panicles terminal and lateral, the small flower-clusters naked, numerous and close: seed barely 1.5 mm. wide, dull, acute-margined.—(NETTLE-LEAVED GOOSEFOOT.)—Waste-places and roadsides, various provinces, Fla. to Tex. and S Can. Nat. of Eu.—(*W. I., Mex., C. A.*)—Sum.

2. *C. Boscianum* Moq. Plant light-green, often minutely mealy when young, 3-9 dm. tall: leaf-blades ovate, elliptic-ovate, or lanceolate, 1-6 cm. long, thin, the lower ones often sinuate: panicle-branches very slender, spreading, the flower-clusters scattered, relatively small: seed 1.5 mm. wide, shining, obtuse-margined.—Woods, thickets, and waste-places, various provinces, rarely Coastal Plain, Ga. to Tex., Minn., and Me.—Sum.

3. *C. Vulvaria* L. Plant white mealy, much-branched, the branches procumbent: leaf-blades thickish, ovate, deltoid, or suborbicular, 0.5-2.5 cm. long, acute or acutish, entire, relatively long-petioled: flower-clusters simple or branched: seed about 1 mm. wide, dull, obtuse-margined.—(STINKING-GOOSE-

root.)—Waste-grounds, various provinces, Fla. to Tex., Wis., Ont., and Que. Nat. of Eu.—The odor, very penetrating, may be carried long distances by the wind.

4. *C. amaranticolor* Coste & Reyn. Plant 1-3 m. tall, the stout branches ascending or erect from a spreading base, sharp-angled, bright-green striped with red, sparsely and finely farinose: leaf-blades broadly rhombic, 6-14 cm. long, obtuse, usually shallowly 3-lobed and finely and irregularly sinuate-dentate, finely farinose beneath when young: bracts rhombic-ovate to oblong or elliptic, usually toothed, bright red, at least when young: inflorescence rather diffuse, the flowers in small glomerules which are borne in dense spikes: sepals slightly keeled, copiously farinose and usually reddish.—Fields and waste-places, Coastal Plain, N Fla. and Ga. Nat. of Eu.—(*W. I.*)—Spr.-fall.

5. *C. lanceolatum* Muhl. Plant 0.5-1.5 m. tall, the slender branches ascending, obtuse-angled, green and striate, glabrous or nearly so: leaf-blades lanceolate, elliptic-lanceolate or elliptic, or rarely broader, 2-5 cm. long, obtuse or acutish and mucronulate, entire or the lower ones with few broad teeth, sparsely and finely farinose beneath: bracts little if at all reduced, narrowly elliptic to lanceolate; inflorescence more or less diffuse, the flowers in small glomerules which are borne in usually slender interrupted spikes: sepals obtuse-keeled, sparsely farinose, green with white margins: seed 1-1.2 mm. wide, shining, obtuse-margined.—Waste-places and cult. grounds, various provinces, Fla. to Okla., Wash., and Ont.—(*Eurasia.*)—Sum.-fall.

6. *C. paganum* Reichenb. Plant 0.4-1.5 m. tall, the branches stout or slender, ascending, obtuse-angled, bright-green, striate, glabrous or nearly so: leaf-blades rhombic-ovate, rhombic, or ovate-elliptic, 4-8 cm. long, obtuse, coarsely and irregularly sinuate, sometimes shallowly 3-lobed or entire, bright-green nad glabrous or sparsely and minutely farinose beneath: bracts ovate to lanceolate, often cuspidate, usually entire: inflorescence usually broad and lax, the flowers in large glomerules which are borne in slender interrupted spikes: sepals sharp-keeled, sparsely farinose: seed 1.3-2 mm. wide, shining, obtuse-margined.—Fields and waste-places, various provinces, Fla. to Tex., Calif., and Ont. Nat. of Eu.

7. *C. album* L. Plant 0.3-2 m. tall, the branches slender or stout, ascending, obtuse-angled, pale-green, striate, mostly glabrous: leaf-blades rhombic-ovate, or rarely ovate or lanceolate, 2.5-8 cm. long, obtuse and apiculate, often shallowly 3-lobed, irregularly sinuate or rarely nearly entire, finely and commonly densely farinose beneath: bracts ovate to lanceolate, usually entire: inflorescence usually narrow and compact, the flowers in large glomerules which are borne in dense stout spikes: sepals sharply carinate, farinose: seed 1.3-1.5 mm. wide, shining, obtuse-margined.—(*LAMB'S-QUARTER'S. PIGWEED.*)—Waste-places and cult. grounds, various provinces, Fla. to Tex., Calif., B. C., Ont., and N. S. Nat. of Eu.—(*Mex.*)—Sum.-fall.—Plants cooked before they have flowered make excellent "greens."

8. *C. Berlandieri* Moq. Plant 0.4-1.5 m. tall, the slender or stout branches ascending, obtuse-angled, striate, glabrate: leaf-blades rhombic-ovate, oval, or elliptic, 1.2-3 cm. long or larger, acute or obtuse and mucronulate, sinuate or entire, often densely farinose when young: bracts much reduced, ovate to linear-lanceolate, often entire: inflorescence-branches slender: sepals sharply-keeled, densely farinose: seed 1 mm. wide or less, shining, obtuse-margined.—Dry soil, Coastal Plain and occasionally other provinces, Fla. to Tex. and N. C.; also adv. N E.—(*Mex.*)—Sum.-fall.

5. **BOTRYDIUM** Spach. Low sweet-scented glandular-pubescent herbs, ours annual. Leaves alternate: blades pinnatifid or toothed. Flowers sessile

or pedicelled, in loosely dichotomous cymes. Sepals keeled. Ovary usually depressed. Seed adherent to the pericarp, horizontal. —About 6 species of wide geographic distribution.—The flowers are yellowish-green.

1. **B. Botrys** (L.) Small. Stem 1-6 dm. tall, the branches erect or spreading: leaf-blades elliptic to ovate, 1-5 cm. long, the lobes entire or toothed: panicle-branches cymose: utricle partially enclosed: seed less than 1 mm. wide. [*Chenopodium Botrys* L.]—(JERUSALEM-OAK. TURNPIKE-GERANIUM. FEATHER-GERANIUM.)—Road-sides and waste-places, various provinces, rarely Coastal Plain, Ga. to Tex., Calif., and S Can. Nat. of Eu. (Mex., E. A.)—Sum.-fall.—The foliage is aromatic.

6. **AMERINA** Spach. Erect or diffuse annual or perennial aromatic herbs, with yellow glands, and sometimes pubescent. Leaves alternate: blades coarsely toothed or pinnatifid. Flowers sessile, spicate. Sepals rounded, not keeled. Seeds horizontal or vertical.—Three or four species, natives of America.—The flowers are white or yellowish-green.

1. **A. ambrosioides** (L.) Spach. Stem 5-8 dm. tall, the branches sometimes decumbent: leaf-blades elliptic to elliptic-lanceolate or ovate-lanceolate, those of the stem-leaves 3-15 cm. long, undulate to repand-dentate: panicle-branches spike-like: utricle wholly enclosed: seed 0.7-0.8 mm. wide. [*Chenopodium ambrosioides* L.]—(MEXICAN-TEA. WORMSEED. STINKWEED.)—Waste-places, cult. grounds, and shores, various provinces, Fla. to Tex., Calif., Ont., and Me. Nat. of trop. Am.—(W. I., Mex., C. A., S. A., O. W.)—Sum.-fall.—The foliage and oil give off a disagreeable odor.

7. **SPINACIA** L. Fleshy edible herbs. Leaves alternate: blades often hastate. Flowers dioecious or rarely perfect, in compact glomerules. Calyx herbaceous, that of the staminate flower 4-5-lobed; pistillate borne in 2 united bracts, which in the fruit, surround the utricle and develop spine-tips, or unappendaged. Utricle enclosed, achene-like.—About 4 species, natives of the Orient.

1. **S. oleracea** L. Annual or biennial: stem 3-10 dm. tall: leaf-blades ovate to deltoid in outline, more or less hastate, 0.5-2 dm. long: fruit 4-5 mm. long, the spreading spines as long as the fruit-body or longer.—(SPINACH. SPINAGE.)—Cult. grounds and fields generally. Nat. of the O. W. and cult.

—Spr.-fall.—The foliage has been used as a table vegetable from prehistoric times.

**7. ATRIPLEX** [Tourn.] L. Scaly herbs or shrubs. Leaves alternate or sometimes opposite; blades often angulate or toothed. Flowers monoeious or dioecious, the staminate bractless, the pistillate bracted. Calyx herbaceous. Utricle wholly or partially surrounded by the crested, tubercled, or winged accrescent bracts.—About 135 species of wide geographic distribution.—The flowers are greenish or red-tinged. The foliage of some species is boiled and eaten.—ORACHES. SALT-BUSHES.

Fruiting bracts united only at the base.

Leaves, at least the lower ones, opposite; blades usually hastate or subhastate, some of the lower ones sometimes toothed: foliage bright green and glabrous.

Leaves alternate; blades usually toothed: foliage furfuraceous.

Fruiting bracts united above the base, usually up to the middle.

#### I. HASTATAE.

#### II. ROSEAE.

#### III. ARENARIAE.

#### I. HASTATAE

Bracts rhombic-oval, cuneate or rounded at the base.

Bracts orbicular-deltoid or ovate-deltoid, truncate or broadly rounded at the base.

#### II. ROSEAE

Stem freely branching: flowers staminate and pistillate, mixed in axillary clusters.

#### III. ARENARIAE

Leaf-blades toothed.

Staminate glomerules in elongate, usually branched spikes.

Staminate glomerules axillary or in short simple spikes.

Leaf-blades entire.

1. *A. patula*.

2. *A. hastata*.

3. *A. rosea*.

4. *A. Lampa*.

5. *A. pentandra*.

6. *A. arenaria*.

1. *A. patula* L. Stem and branches 2-9 dm. long, green: blades of the lower leaves hastate and sinuate, or usually entire, the lobes ascending, those of the upper leaves rhombic-lanceolate, lanceolate, elliptic or narrowly elliptic-lanceolate, 2.5-8 cm. long: fruiting bracts rhombic-oval, often subhastate, 2-6 mm. long, rounded or broadly cuneate at the base, usually denticulate: seed yellowish or black, 1.5-2.5 mm. wide.—(ORACH.)—Coastal salt-marshes, Fla. to N. B., and Calif. to B. C.; also in calcareous bogs in Ill. and other inland regions.—(*Eurasia*.)—Spr.-fall.

2. *A. hastata* L. Stem and branches 3-9 dm. long, green or straw-yellow; blades of the lower leaves triangular-hastate to orbicular-deltoid, entire, sinuate or repand, truncate or subcordate at the base, the lobes spreading or reflexed, those of the upper leaves oblong-hastate, lanceolate-hastate, oblong or lanceolate, 2-6 cm. long: fruiting bracts orbicular-deltoid or ovate-deltoid, 3-7 mm. long, truncate or rounded at the base, denticulate or rarely entire: seed nearly black, 1.5-2.5 mm. wide.—Saline and calcareous marshes, and waste-places, N. C. to Newf., and Tex. to Calif., Ore. and Ind.—(*Eurasia*.)—Spr.-fall.

3. *A. rosea* L. Stem 2-10 dm. tall, much-branched, yellowish or whitish: leaves numerous, alternate; blades ovate, rhombic-ovate, or oval, 2-8 cm. long, sinuate, broadly cuneate or rounded at the base: flowers in axillary glomerules and also usually in terminal interrupted spikes: fruiting bracts rhombic to cuneate-orbicular, 4-5 mm. long or rarely longer, toothed at least near the base: seed

dark-brown, 1.5–2 mm. wide.—Alkaline soil, and waste-places, various provinces, Fla. to N. Y.; also W. U. S.—(*Mex., O. W.*)—Spr.—fall.

4. **A. Lampa** (Moq.) Gillies. Annual, pale-scurfy: stems mostly 1 m. tall or less, sometimes prostrate, often widely branched, the branches slender: leaf-blades hastate, or those of the upper leaves elliptic-lanceolate to linear, mostly 2–8 cm. long, the terminal lobe often toothed: spikes or panicles elongate, glomerate-interrupted: fruiting bracts reniform or ovate-rhombic, 5–6 mm. broad, shallowly toothed, the faces veiny: seed brown.—Waste-places and cult. grounds, Coastal Plain, N. Fla. and Ala. Nat. of S. A.—Sum.—fall.

5. **A. pentandra** (Jacq.) Standley. Annual or perennial, green, 3–6 dm. tall: leaf-blades elliptic to elliptic-ovate, or oblong-lanceolate, 1.5–3 cm. long, repand or sinuate, or entire above: fruiting bracts flabellate, 2–3 mm. wide, sharply toothed, the faces with 2–4 tubercles: seed brown. [*Obione cristata* H. & B.]—Coastal sand-dunes and shores, S. Fla.—(*W. I., S. A.*)—All year.

6. **A. arenaria** Nutt. Annual, pale or silvery, 1–5 dm. tall: leaf-blades oblong to oval, obovate or narrowly elliptic, 1–4 cm. long: fruiting bracts 3–5 mm. wide, flabellate, 3–5-toothed, the faces tuberculate or spiny: seed reddish-brown. [*Obione arenaria* Moq.]—(BEACH-ORACH.)—Sea beaches, Fla. to Tex., and N. S.—(*W. I.*)—Sum.—fall.

8. **SALICORNIA** Tourn. L. Fleshy herbs or shrubs. Leaves opposite, mere scales. Flowers perfect or polygamous, in cavities at the rachis-nodes. Calyx fleshy. Utricle included in the spongy perianth.—About 10 species, widely distributed in saline regions.—The popular name “glasswort” originated from the crunching sound the plants make under foot.—GLASSWORTS. SAMPHIRES.

Plant perennial: central flower extending but little higher than the lateral ones.

1. *S. perennis*.

Plant annual: central flower extending much higher than the lateral ones.

Scales mucronate: spike 4–6 mm. thick.

2. *S. Bigelovii*.

Scales obtuse or merely acutish: spike 2–3 mm. thick.

3. *S. europaea*.

1. **S. perennis** Mill. Perennial, the decumbent or trailing stems and branches 1–7 dm. long, often in mats: internodes of the inflorescence 3–4 mm. thick and about as long: seed about 1.2 mm. long, pubescent with slender curved hairs. [*S. ambigua* Michx.]—(WOODY GLASSWORT.)—Sea-beaches and coastal salt-marshes, Fla. to Miss. and N. H.—(*W. I., O. W.*)—Sum.—fall, or all year S.

2. **S. Bigelovii** Torr. Annual, stout, 1–6 dm. tall, green: internodes of the inflorescence about as long as thick; seed nearly black, 1.5–2 mm. long, with short curved hairs. [*S. mucronata* Bigel. not Lag.]—Salt marshes, along the coast, Fla. to Tex., and N. S.; also Calif.—(*W. I., Mex.*)—Sum.

3. **S. europaea** L. Annual, relatively slender, 1–6 dm. tall, often red or reddish: internodes of the inflorescence 2–4 times longer than thick: seed brown, 1.5–2 mm. long, with short curved hairs. [*S. herbacea* L.]—Salt marshes, along the coast, Ga. to Anticosti and occasionally in saline soil in various interior provinces;

also Pacif. coast.—(*W. I., O. W.*)—Sum.—fall.—This unusual plant often forms extensive beds, and crunches under foot, like thin glass. Often brilliant red in fall.

9. **DONDIA** Adans. Fleshy leafy herbs. Leaves alternate: blades thick or terete, entire. Flowers perfect or polygamous. Sepals hooded, keeled at maturity. Filaments very short.—About 50 species, widely distributed.—SEA-BLITE.

1. **D. linearis** (Ell.) Millsp. Plants glabrous, 1-9 dm. tall, diffusely branched: leaf-blades nearly terete, linear, 1-5 cm. long, acute: sepals equally cucullate-carinate: seed about 1.5 mm. wide, smooth and shining. [*Suaeda linearis* Moq.]—(SEA-BLITE.)—Sandy shores and salt-marshes, Coastal Plain, Fla. to Tex., and Me.—(*W. I.*)—Spr.—fall.—**Dondia maritima** (L.) Druce, which differs from *D. linearis* in the seed being 2 mm. broad, the calyx-lobes rounded or obscurely carinate on the back, and the plant glaucous, is naturalized in the NE U. S. from Europe, reported, but apparently unconfirmed from our area.

10. **SALSOLA** L. Coarse herbs or woody plants. Leaves mostly alternate: blades narrow, firm, entire. Flowers perfect. Sepals flat, developing horizontal wings. Filaments elongate.—About 50 species widely distributed, especially in saline regions.

1. **S. Kali** L. Annual, 2-6 dm. tall: leaf-blades subulate-lanceolate, 6-20 mm. long, the midrib prolonged into a spine: calyx leathery, the wings 4-8 mm. in diameter, erose or lacerate: seed shining, 2-3 mm. thick.—(SALTWORT.)—Sea beaches, Fla. to Miss. and Newf.—(*Eurasia*)—Sum.—fall.—**Salsola Pestifer** A. Nelson, which differs from *S. Kali* in the almost filiform leaves 3-6 cm. long, and a fruiting calyx 3-6 mm. broad, is occasional in the E U. S. It has become thoroughly naturalized in the W U. S. and has proved to be a most pernicious and troublesome weed as it is not confined to saline soil for its habitat.—Commonly known as RUSSIAN-THISTLE, a name sometimes also applied to the other species.—Nat. of Eurasia.—The flowers of both species are green, but the mature calyx becomes more or less tinged with pink.

## FAMILY 2. BASELLACEAE — MADEIRA-VINE FAMILY

Somewhat succulent vines, with tuber-bearing rootstocks. Leaves alternate: blades relatively broad, entire. Flowers perfect in spike-like racemes. Calyx of 2 sepals, sometimes winged in fruit. Corolla of 5 often somewhat colored petals. Androecium of 5 stamens borne opposite the petals. Gynoecium 3-carpellary. Ovary superior, 1-celled. Fruit utricular.—Five genera and about 15 species, mostly natives of the tropics.

1. **BOUSSINGAULTIA** H.B.K. Vines. Leaf-blades of an ovate type, rather fleshy. Racemes axillary and terminal. Sepals 2, nearly flat, not winged. Petals 5, longer than the sepals. Stigmas cleft.—Ten species, natives of tropical America.—**MADEIRA-VINE.**

1. **B. leptostachya** Moq. Glabrous vine with slender stems and branches: leaf-blades ovate to elliptic, 2–7 cm. long, acute or slightly acuminate, thickish, gradually or abruptly narrowed at the base, short-petioled: racemes slender, elongate: bractlets acuminate: sepals ovate to elliptic, 1–1.5 mm. long: petals elliptic to oval.—Roadsides, pinelands, and hammocks, S Fla.—(*W. I., Mex., C. A., S. A.*)—Widely cultivated for its bright-green foliage and very fragrant flowers.

### FAMILY 3. SCLERANTHACEAE — KNAWEI FAMILY

Annual or biennial herbs. Leaves opposite, without stipules: blades narrow. Flowers perfect, in clustered cymes. Calyx of 4 or 5 persistent sepals which are commonly shorter than the hypanthium. Corolla wanting. Androeium of 5 or 10 stamens borne on the margin of the hypanthium. Gynoeium 2-carpellary. Ovary 1-celled. Fruit a utricle.—About 3 genera and few species, widely distributed in the Old World.

1. **SCLERANTHUS** L. Herbs, usually branched at the base. Leaves stiff. Sepals slightly hyaline-margined, like the hypanthium indurated in age. Utricle included.

1. **S. annuus** L. Plant diffuse, the branches 0.5–3 dm. long, pubescent and viscid on one side: leaf-blades linear-filiform, 0.5–1.5 cm. long: flowers greenish: sepals lanceolate to ovate-lanceolate, 1–1.5 mm. long: utricle 1.5 mm. long.—(**KNAWEI. GERMAN-KNOT-GRASS.**)—Roadsides, waste-places, and old fields, E U. S., and S Can. Nat. of Eu.—Spr.—sum.—An extremely persistent weed, as it seeds rather rapidly and flowers when very young; and not easily eradicated, as trampling upon it merely strengthens its growth and a fragment may start a new plant; also it often does not winterkill, but becomes perennial, thereby obtaining an earlier blooming and fruiting season.

### FAMILY 4. AMARANTHACEAE — AMARANTH FAMILY

Herbs, shrubs, or trees. Leaves alternate or opposite, estipulate: blades entire or nearly so. Flowers perfect, polygamous, or dioecious, in spikes or panicles with scarious or colored bracts. Calyx of 2–5 mostly distinct sepals. Corolla wanting. Androeium of 5, or fewer, distinct or monadelphous stamens. Gynoeium of 2 or more united carpels. Ovary

1-celled. Fruit a utricle or pyxidium, or rarely baccate.—About 40 genera and 475 species, widely distributed.

Anthers 4-celled.

Leaves alternate.

Fruit several-seeded.

Fruit 1-seeded.

Leaves opposite.

Anthers 2-celled.

Sepals distinct or nearly so, unchanged at maturity.

Sepals partly united, the tube indurate at maturity and variously appendaged.

Tribe I. CELOSIEAE.

Tribe II. AMARANTHEAE.

Tribe III. CENTROSTACHYDEAE.

Tribe IV. GOMPHRENEAE.

Tribe V. FROELICHIEAE.

#### I. CELOSIEAE

Woody plant with spreading or vine-like branches.

1. CELOSIA.

#### II. AMARANTHEAE

Perianth present in the pistillate flowers.

Perianth wanting in the pistillate flowers.

2. AMARANTHUS.

3. ACNIDA.

#### III. CENTROSTACHYDEAE

Firm-herbaceous or partly woody plants with elongate spikes, the flowers and fruits deflexed.

4. CENTROSTACHYS.

#### IV. GOMPHRENEAE

Stigma capitate.

Stigma with slender lobes.

Stamen-tube with broad lobed, toothed, or lacinate segments, without pseudostaminodia.

Stamen-tube with entire segments, and often with pseudostaminodia.

Flowers not compressed, borne in panicle spikes.

Flowers strongly compressed, borne in dense head-like spikes.

5. ACHYRANTHES.

6. GOMPHRENA.

7. IRESINE.

8. PHILOXERUS.

#### V. FROELICHIEAE

Herbs with virgate flowering stems.

9. FROELICHIA.

1. **CELOSIA** L. Herbs or shrubs. Leaves alternate: blades mainly entire. Flowers perfect, spicate: sepals 5, scarious. Filaments partially united. Styles united. Ovules 2-8. Utricle circumscissile.—About 40 species, natives of tropical and subtropical regions.—Forms with fasciated inflorescence are favorite garden plants.—Cock's-combs.—The flowers are white or greenish white.

1. **C. nitida** Vahl. Perennial, glabrous, 1 m. long or more: leaf-blades ovate, deltoid-ovate, or ovate-lanceolate, 1.5-7 cm. long: spikes 1-3 cm. long: sepals oblong, 3.5-4 mm. long: utricle included: seed about 1 mm. long. [*C. paniculata* (Chapm. Fl.)—Coastal sand-dunes and hammocks near the seashore S Fla.; also S Tex.—(*W. I. Mex.*, *C. A.*, *S. A.*)—All year.

2. **AMARANTHUS** [Tourn.] L. Herbs. Leaves alternate: blades entire. Flowers polygamous, monoecious, or dioecious, densely spicate or clustered, each subtended by mostly 3 bracts. Sepals 2-5. Filaments distinct. Stigmas 2 or 3, distinct. Ovule solitary. Utricle circumscissile, irregularly opening or inde-

hiscent.—About 60 species widely distributed in temperate and tropical regions.  
—Mostly weeds, but some species are cultivated for their colored inflorescences.  
—The flowers are green or red.—AMARANTHS. PIGWEEDS. TUMBLEWEEDS.

Sepals of the pistillate flowers spatulate, clawed: flowers all axillary.

## I. CRASSIPES.

Sepals of the pistillate flowers not spatulate: staminate flowers in terminal spikes or all flowers in axillary clusters in *A. blitoides* and *A. graecizans*.

## II. PANICULATI.

## I. CRASSIPES

Bracts and pedicels much thickened and indurate: utricle indehiscent.

Bracts and pedicels not thickened nor indurate: utricle circumscissile.

1. *A. crassipes*.2. *A. polygonoides*.

## II. PANICULATI

Utricle dehiscent.

Inflorescence of terminal or axillary simple or compound spikes, and with clusters of flowers often present in the leaf-axils.

Utricle regularly dehiscent: leaf axils without spines.

Sepals shorter than the utricle, or, if longer, acute or acuminate.

Bracts obtuse or merely acutish, about equalling the sepals or somewhat longer, usually red or purple.

3. *A. cruentus*.4. *A. hybridus*.

Bracts acute or acuminate, usually twice as long as the sepals, usually green or pink.

5. *A. retroflexus*.

Sepals mostly longer than the utricle, obtuse or truncate.

6. *A. spinosus*.

Utricle irregularly and imperfectly dehiscent: leaf axils with rigid spines.

Inflorescence wholly of axillary clusters.

Sepals 4 or 5: stem and branches prostrate.

7. *A. blitoides*.

Sepals 3: stem erect.

8. *A. graecizans*.

Utricle indehiscent.

Utricle rugose.

Flowers borne in axillary clusters: leaf-blades crisped.

9. *A. crispus*.

Flowers borne in terminal and axillary spikes: leaf-blades flat.

Leaf-blades narrow, linear to elliptic-linear:

10. *A. muricatus*.

sepals 5.

Leaf-blades broad, ovate to rhombic-ovate:

11. *A. gracilis*.

sepals 3.

Utricle smooth.

Leaf-blades membranous: flowers partly in terminal spikes: seeds about 1 mm. in diameter.

12. *A. deflexus*.

Leaf-blades thick and fleshy: flowers all in axillary clusters: seeds 2–2.5 mm. in diameter.

13. *A. pumilus*.

1. *A. crassipes* Schlecht. Stem and branches 1–6 dm. long, stout: leaf-blades spatulate to ovate, 1–2.5 cm. long: staminate calyx 1.9–2.2 mm. long: pistillate calyx 1.7–2 mm. long; sepals spatulate, abruptly pointed: ovary tuberculate. [*Scleropus crassipes* Moq.]—Hammocks and waste-places, Coastal Plain, pen. Fla. to Ala.—(W. I., S. A.)—All year.

2. *A. polygonoides* L. Stem and branches 1–5 dm. long: leaf-blades rhombic, ovate or oval, 1–2 cm. long: staminate calyx 0.9–1 mm. long: pistillate calyx 2.2–2.4 mm. long; sepals narrowly cuneate. [*Amblogyna polygonoides* Raf.]—Hammocks and open sandy places, Coastal Plain, Fla. and Tex.—(W. I., Mex., C. A., S. A.)

3. *A. cruentus* L. Stem 5–20 dm. tall, smooth: leaf-blades elliptic, ovate-lanceolate,

or rhombic-ovate, 3.5–30 cm. long: staminate calyx 1–1.5 mm. long: pistillate calyx about 1.5 mm. long; sepals elliptic, often narrowly so: utricle exceeding the sepals.—(BLOOD-RED PRINCE'S-FEATHER. PILEWORT.)—Waste-places and gardens, various provinces, U. S. generally, except the extreme west. Nat. of Asia.—(*W. I., Mex., C. A., S. A.*)—Sum.–fall.

4. *A. hybridus* L. Stem 5–25 dm. tall, not spiny: leaf-blades lanceolate or ovate to ovate-lanceolate or elliptic, 3–15 cm. long: staminate calyx 1.7–1.9 mm. long: pistillate calyx 1.7–2 mm. long; sepals narrowly oblong to oblong-lanceolate: utricle equalling the sepals or shorter. [*A. chlorostachys* Willd.]—(PIG-WEED. AMARANTH.)—Waste-places and cult. grounds, nearly throughout the U. S. and S Can.—(*W. I., Mex., C. A., S. A., O. W.*)—Sum.–fall.

5. *A. retroflexus* L. Stem 3–30 dm. tall: leaf-blades ovate to ovate-lanceolate or lanceolate above, 5–15 cm. long: staminate calyx 3.4–3.6 mm. long: pistillate calyx 3.5–4 mm. long; sepals linear-oblong to linear-cuneate: utricle shorter than the sepals.—(GREEN-AMARANTH.)—Cult. grounds and waste-places, nearly throughout the U. S. and S Can.—(*Mex., O. W.*)—Spr.–fall.

6. *A. spinosus* L. Stem 2–12 dm. tall, spiny: leaf-blades ovate, rhombic-ovate, or lanceolate, 1.5–8 cm. long: staminate calyx 2–2.7 mm. long: pistillate calyx 2–2.5 mm. long; sepals broadened upward, abruptly pointed: utricle about equalling the sepals.—(THORNY-AMARANTH.)—Roadsides, waste-places, and fields, Fla. to Tex., Minn., Ont., and Me. Nat. of India.—(*W. I., Mex., C. A., S. A., O. W.*)—Sum.–fall.

7. *A. blitoides* S. Wats. Stem 1.5–6 dm. long, prostrate: leaf-blades obovate, to spatulate, oval, or elliptic, 0.8–4 cm. long: staminate calyx about 2 mm. long: pistillate calyx 2.5–3 mm. long; sepals elliptic, acuminate.—(SPREADING-PIG-WEED.)—Waste-places, fields, and roadsides, nearly throughout the U. S. and S Can. Nat., perhaps, of Eu.—Sum.–fall.

8. *A. graecizans* L. Stem 1–6 dm. tall, erect: leaf-blades spatulate, obovate, or elliptic, 1–3 cm. long: staminate calyx 1.4–1.6 mm. long: pistillate calyx 1.8–2.2 mm. long; sepals lanceolate, long-acuminate. [*A. albus* L.]—(TUMBLE-WEED.)—Roadsides, fields, and waste-places, throughout the U. S. and S Can.—(*Mex., S. A., O. W.*)—Sum.–fall.

9. *A. crispus* (Lesp. & Thév.) A. Br. Stem much branched, the branches forming large mats: leaf-blades rhombic-ovate to elliptic, 0.6–2.5 cm. long: staminate calyx about 1.5 mm. long: pistillate calyx about 1.5 mm. long; sepals 5, elliptic to oblanceolate, rounded and abruptly pointed. [*Euxolus deflexus* (Chapm. Fl.)]—Waste-places and cult. grounds, Coastal Plain and occasionally other provinces, La., N. C., and N. Y. Nat. of Eu.—(*S. A.*)—Sum.–fall.

10. *A. muricatus* (Moq.) Gillies. Stem 3–7 dm. tall: leaf-blades linear to elliptic-linear, 2–8 cm. long: staminate calyx fully 1.5 mm. long: pistillate calyx 1.5–1.7 mm. long; sepals 5, elliptic, abruptly pointed.—Waste-places, Coastal Plain, Ala. Nat. of S. A.—(*O. W.*)—All year.

11. *A. gracilis* Desf. Stems 2–9 dm. tall, erect: leaf-blades ovate or rhombic, 2–8 cm. long: staminate calyx 1.3–1.5 mm. long: pistillate calyx 1.4–1.6 mm. long; sepals 3, broadened upward, and mucronate. [*Euxolus lividus* Chapm. not Moq.]—Hammocks and cult. grounds, Fla. to Ala., and N. C. Nat. of Afr.—(*W. I., Mex., C. A., S. A.*)—Spr.–fall.

12. *A. deflexus* L. Stem 1.5–6 dm. long, sometimes decumbent: leaf-blades broadly ovate, rhombic-ovate, oval, or lanceolate, 2–7.5 cm. long: staminate

calyx 1–1.5 mm. long: pistillate calyx 1.5–2 mm. long; sepals often 3. [*Euxolus deflexus* Raf.]—Waste-places, Coastal Plain and New England Coast, Fla. to Ala., and Mass.; also in Calif. Nativity not known.—(*Mex., S. A., O. W.*)

13. *A. pumilus* Raf. Stem 0.5–3 dm. tall, fleshy: leaf-blades suborbicular, obovate, rhombic, or ovate, 1–2 cm. long: staminate calyx 1.7–2.2 mm. long: pistillate calyx 3–4 mm. long; sepals 5, elliptic to linear-cuneate, abruptly pointed. [*Euxolus pumilus* Raf.]—(DWARF-AMARANTH.)—Sea beaches, N. C. to R. I.—Spr.—fall.

3. *ACNIDA* L. Herbs, mostly annuals and large. Leaves alternate: blades entire. Flowers dioecious, the spike sometimes interrupted, the staminate with 5 sepals and 5 distinct filaments, the pistillate flowers without a perianth.—About 6 species, native of eastern North America and the West Indies.—The flowers are green or greenish.

Utricle fleshy, 3–5-angled.

Utricle membranous, not angled.

I. CANNABINAE.

II. TAMARICINAE.

#### I. CANNABINAE

Seed much flattened.

Inflorescence leafy: bracts much shorter than the utricle: seed about 2 mm. in diameter.

Inflorescence nearly or quite leafless: bracts equalling the utricle or longer: seed about 1 mm. in diameter.

Seed turgid, lenticular.

Leaf-blades narrow: pistillate flowers few in a cluster: utricle less than 1.5 mm. long.

Leaf-blades broad: pistillate flowers many in a cluster: utricle 1.5 mm. long or more.

Sepals mucronate: pistillate inflorescence of few, usually distant, large (8–18 mm.) glomerules.

Sepals obtuse: pistillate inflorescence of many crowded small (4–10 mm.) glomerules.

1. *A. cannabina*.

2. *A. cuspidata*.

3. *A. floridana*.

4. *A. concatenata*.

5. *A. alabamensis*.

#### II. TAMARICINAE

Utricle indehiscent or irregularly dehiscent.

Utricle circumscissile.

6. *A. subnuda*.

7. *A. tamariscina*.

1. *A. cannabina* L. Stem 0.5–4 m. tall, branched above: leaf-blades ovate to lanceolate, or linear above, 5–15 cm. long: staminate calyx about 3 mm. long: sepals lanceolate to elliptic-lanceolate: pistillate calyx 1–1.5 mm. long; sepals ovate to ovate-lanceolate: utricle 2.5–3.5 mm. long. [*A. rusocarpa* Michx.]—(WATER-HEMP. WATER-LEAF.)—Tidal marshes, and river-shores, Coastal Plain and adj. provinces, Fla. to N. H.—Sum.—fall.

2. *A. cuspidata* Bertero. Stem stout, 1.5–7 m. tall, widely branched: leaf-blades lanceolate to elliptic-lanceolate, 10–30 cm. long: staminate calyx about 2 mm. long; sepals elliptic to elliptic-ovate, mostly obtuse: pistillate calyx 1.7–2 mm. long; sepals lanceolate: utricle 1–1.5 mm. long or sometimes longer. —(CARELESS.)—Low hammocks, marshes, and swamps, cult. grounds, usually remote from saline situations, Coastal Plain, Fla. to La.—(*W. I., Mex.*)—All year.—Our largest herb, the stem often becoming a foot in diameter near the base. The Florida plant has been known as *A. australis*.

3. *A. floridana* S. Wats. Stem slender, 4–15 dm. tall, simple, or branched at the base: leaf-blades linear, elliptic-linear, or narrowly elliptic, 0.8–11 cm. long: staminate calyx 1.5–2.5 mm. long; sepals ovate to elliptic-ovate: pistillate calyx 1–1.5 mm. long: sepals lanceolate, acuminate: utricle about 1 mm. long.—Swamps and marshes, Fla.—All year.

4. *A. concatenata* Moq. Stem stout, 0.5–2 m. tall, usually much-branched: leaf-blades elliptic to lanceolate, 2.5–8 cm. long: staminate calyx about 2 mm. long; sepals lanceolate to elliptic-lanceolate: pistillate calyx 1–1.5 mm. long; sepals subulate-lanceolate: utricle about 1 mm. long.—Sandy banks and dunes, Coastal Plain, Miss. to La.—Sum.—fall.

5. *A. alabamensis* Standley. Stem stout, 1.5–2 m. tall, branched above: leaf-blades narrowly ovate to elliptic-ovate or elliptic-lanceolate, 4–9 m. long: staminate calyx about 2 mm. long; sepals elliptic to elliptic-lanceolate: pistillate calyx 1–1.5 mm. long; sepals lanceolate: utricle about 1.5 mm. long.—Brackish marshes along the coast, Ala. to La.—Sum.—fall.

6. *A. subnuda* (S. Wats.) Standley. Stem slender, 0.1–0.4 m. long, prostrate and ascending, much-branched in the pistillate plants: leaf-blades broadly ovate, spatulate, elliptic, or lanceolate, 0.7–7 cm. long: staminate calyx about 2.5 mm. long; sepals elliptic: pistillate calyx 1–2 mm. long; sepals lanceolate to ovate-lanceolate: utricle about 1.5 mm. long.—Muddy or sandy stream banks, Interior Lowland provinces, Tenn. to Mo., S. D., and Ont.—Sum.—fall.

7. *A. tamariscina* (Nutt.) Wood. Stem stout, 0.5–2 m. tall, more or less branched: leaf-blades ovate-lanceolate to lanceolate or elliptic, 2–11 cm. long: staminate calyx 2.5–3 mm. long; sepals elliptic-lanceolate to ovate-lanceolate: pistillate calyx 1–2 mm. long; sepals lanceolate to lanceolate-subulate: utricle 1.5 mm. long.—Swamps, fields, and stream-banks, various provinces, Tenn. to Tex., N. M., S. D., and Ky.; adv. E.—Sum.—fall.

4. **CENTROSTACHYS** Wall. Herbs or woody plants. Leaves opposite: blades entire. Flowers perfect, in slender elongate spikes, commonly deflexed. Sepals 4 or 5, becoming firm. Stamens 5 or rarely fewer. Styles united.—About 12 species, natives of tropical and warm regions.

Leaf-blades abruptly pointed: sepals less than 5 mm. long: utricles less than 2.5 mm. long.

1. *C. indica*.

Leaf-blades acuminate: sepals over 5 mm. long: utricles over 2.5 mm. long.

2. *C. aspera*.

1. *C. indica* (L.) Standley. Plants 4–12 dm. tall, finely pubescent: leaf-blades broadly rhombic-ovate to obovate or cuneate, 1–3 cm. long, truncate or retuse at the apex, and abruptly tipped: bracts 2.5–3 mm. long, long-acuminate: sepals lanceolate, 3–4 mm. long: utricle with a sharp rim at the top, about 2 mm. long. [*Achyranthes obtusifolia* Lam.]—Cultivated grounds and waste places, Coastal Plain, Fla. to Ala. Nat. of Asia.—(W. I., Mex., C. A., S. A.)

2. *C. aspera* (L.) Standley. Plants 6–14 dm. tall, copiously pubescent: leaf-blades elliptic or nearly so, 7–16 cm. long, acuminate: bracts 4–4.5 mm. long, abruptly long-aristate: sepals linear-lanceolate, 6–7 mm. long: utricle about 3 mm. long. [*Achyranthes aspera* L.]—Hammocks, S Fla. Nat. of trop. Am.—(W. I., Mex., C. A.)

5. **ACHYRANTHES** L. Herbs (ours perennial). Leaves opposite: blades entire or nearly so. Flowers perfect, in head-like spikes. Sepals 5, unequal; white or greenish. Filaments united at the base. Staminodia mostly shorter than the anthers. Styles united. [*Alternanthera* Forsk.]—About 45 species, most numerous in the tropics.—CHAFF-FLOWERS.

Spikes sessile, axillary.  
Spikes terminating elongate peduncles.

I. REPENTES.  
II. RAMOSISSIMAE.

#### I. REPENTES

Stamen-tube very short, the staminodia shorter than the filaments, entire or merely toothed.

Sepals rigidly spine-tipped.

Sepals 6 mm. long or more: staminodia toothed: leaf-blades usually as broad as long.

Sepals 5 mm. long or less: staminodia entire: leaf-blades longer than broad.

Sepals merely acute, not rigid-tipped.

Stamen-tube elongate: staminodia equalling the filaments or much longer, lacinate.

#### II. RAMOSISSIMAE

Flowers sessile in the bractlets: leaf-blades narrow, linear or narrowly elliptic to oblanceolate, not acuminate.

Flowers stalked, the stalk articulate, 5-grooved: leaf-blades broad, ovate or elliptic, varying to broadest above the middle or below it, more or less acuminate.

1. *A. leiantha*.
2. *A. repens*.
3. *A. polygonoides*.
4. *A. maritima*.
5. *A. philoxeroides*.
6. *A. ramosissima*.

1. *A. leiantha* (Seub.) Standley. Branches prostrate, mostly less than 1 m. long, short-villous: leaf-blades suborbicular, or broadly oval, varying to ovate or obovate, 1.3–5 cm. long, abruptly short-pointed, glabrous except the midrib and veins, stout-petioled: sepals lanceolate to elliptic-lanceolate, the larger ones becoming 4.5–5 mm. long, or rarely longer, prominently subulate-tipped, the inner smaller, minutely-tipped with dorsal crests of glochidiate hairs: filaments subulate, alternating with lanceolate staminodia: utricle less than 2 mm. in diameter.—Waste grounds and roadsides, Coastal Plain, Fla. to Ala. Nat. of S. A.—(*W. I., Mex., C. A.*)

2. *A. repens* L. Stem and branches prostrate and often creeping, 1–5 dm. long, copiously pubescent with white hairs: leaf-blades broadly spatulate, oval, or ovate, 8–20 cm. long, usually abruptly pointed: sepals lanceolate to ovate-lanceolate, abruptly pointed: utricle ovoid-globose. [*Alternanthera Achyrantha* R. Br. *Alternanthera repens* (L.) Kuntze]—Waste-places, cult. grounds, and sidewalks, Coastal Plain and southwestern provinces, Fla. to Tex., Calif., and S. C. Nat. of Asia.—(*W. I., Mex., C. A.*)—All year.

3. *A. polygonoides* (L.) Lam. Plant similar to that of *A. repens*, but less pubescent or glabrate: leaf-blades narrowly spatulate to elliptic, 5–20 mm. long, obtuse or acute: sepals elliptic, acute, the larger ones becoming about 5 mm. long: utricle globular or globular-obovoid. [*Alternanthera paronychioides* St. Hil. *Telanthera polygonoides* Moq.]—Cult. grounds and roadsides, Fla. to La., and N. C. Nat. of Trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.

4. *A. maritima* (Mart.) Standley. Stem and branches procumbent or prostrate and creeping, 3–21 dm. long, glabrous, except at the leaf-axils: leaf-blades

cuneate, obovate or elliptic, 1.5–6 cm. long, rounded at the apex or acutish: sepals ovate to ovate-lanceolate, the outer ones becoming 4–5 mm. long, the acuminate apex rigid: utricle obovoid. [*Alternanthera maritima* St. Hil. *Telanthera maritima* Moq.]—Sand-dunes and hammocks, coastal and interior, pen. Fla and the Keys.—(W. I., S. A.)—All year.

5. *A. philoxeroides* (Mart.) Standley. Stem and branches decumbent or prostrate, stout, often fistulose, 3–15 cm. long, glabrous, except at the leaf-axils, and sometimes near the tips: leaf-blades 3–11 cm. long, acute or obtuse: sepals lanceolate, elliptic, or ovate-elliptic, becoming 6 mm. long. [*Alternanthera philoxeroides* Griseb.]—Low waste-places, ponds, ditches, bayous, and slow streams, Coastal Plain, Fla. to La. and N. C. Nat. of S. A.—All year.—In southern Louisiana this plant is as much of a pest as water hyacinth, often filling up ditches and bayous with a floating mass of growth, usually choking out other plants.

6. *A. ramosissima* (Mart.) Standley. Stem usually much-branched, the branches diffusely spreading, reclining, or even vine-like, 5–400 cm. long, more or less strigose, sometimes geniculate: leaf-blades elliptic or oval, varying to broadest above the middle or below it, acuminate, mostly 2–9 cm. long: sepals lanceolate to elliptic-lanceolate, becoming 4–5 mm. long. [*Telanthera floridana* Chapm. *T. brasiliana* (Chapm. Fl.). *Alternanthera brasiliana* Uline & Bray *Alternanthera floridana* Small *Alternanthera Moquinii* Small not Webb.]—Hammocks, S Fla.—(W. I., S. A.)—All year.

6. **GOMPHRENA** L. Herbs (ours mostly perennials). Leaves opposite: blades entire. Flowers perfect, usually in terminal head-like spikes. Sepals 5, mostly acute. Filaments united in a tube. Stamens present. Stigmas terminating a short style.—About 90 species, widely distributed, but most abundant in South America.

1. *G. dispersa* Standley. Stem and branches diffuse or decumbent, somewhat appressed-pubescent: leaf-blades spatulate, elliptic-spatulate, or elliptic, 2–5 cm. long: bractlets becoming 5–6 mm. long, white or purplish-red: sepals linear-elliptic or somewhat lanceolate, lanate: filament-tube about 3 mm. long: seed 1.5 mm. long. [*G. decumbens* Moq.]—(GLOBE-AMARANTH. BACHELOR'S-BUTTON.)—Waste places and roadsides, Coastal Plain, Fla. to Tex. Nat. of trop. Am.—(W. I., Mex., C. A.)—A favorite plant in old fashioned gardens.—The flowers are white, yellow, purple, or red.

7. **IRESENE** R. Br. Herbs with erect or diffuse stems. Leaves opposite: blades broad. Flowers dioecious, pauculate. Sepals 5, equal, obtuse, acute, or acuminate. Filaments united at the base. Stamens wanting. Stigmas sessile.—About 20 species, natives of temperate and tropical regions.—The flowers are white, pink or greenish.

Plant annual, but sometimes persistent for more than a year from a stout taproot: sepals of the pistillate flowers 3-veined, obtuse. 1. *I. Celosia*.  
Plant perennial from elongate rootstocks: sepals of the pistillate flowers faintly 1-veined, acute. 2. *I. rhizomatosa*.

1. **I. Celosia** L. Annual, but sometimes persistent from a stout taproot, mostly 1-3 m. tall, erect or clambering: leaf-blades ovate, rhombic, or lanceolate, 3-14 cm. long, obtuse, acute, or short-acuminate, sometimes soft-pubescent: panicles much-branched, the pistillate ones with fluffy wool at the base of the flowers: sepals elliptic, 1-1.5 mm. long, obtuse: utricle shorter than the calyx. [*I. celosioides* L. *I. paniculata* (L.) Kuntze]—Hammocks, marshes and old fields, Coastal Plain, Fla. to La. and N. C.—(*W. I., Mex., C. A., S. A.*)—Sum.-fall or all year S.

2. **I. rhizomatosa** Standley. Perennial from slender horizontal rootstocks, mostly 0.5-1.5 m. tall, erect or reclining: leaf-blades ovate, varying to deltoid or elliptic, 6-15 cm. long, glabrous, or with few short soft hairs, especially beneath: sepals ovate-elliptic or elliptic, 1-1.3 mm. long, acute or acuminate: utricle equalling the calyx or longer. —River-banks, bottoms, meadows, and woods, various provinces, N of Coastal Plain, Ala. to Tex., Kans., and Md.—Sum.-fall.

8. **PHILOXERUS** R. Br. Herbs with prostrate or creeping branches. Leaves opposite: blades narrow. Flowers perfect, in dense head-like spikes. Sepals 5, very unequal, the outer ones, at least, obtuse. Filaments united at the base. Staminodia wanting.—About 10 species, widely distributed in warm coastal regions.

1. **P. vermicularis** (L.) R. Br. Plant somewhat succulent, the branches 2-18 dm. long: leaf-blades half-terete, linear to clavate, 1-3.5 cm. long: spikes 1-2.5 cm. long, silvery-white: sepals 3.5-4 mm. long, the outer oblong, the inner lanceolate. [*Iresine vermicularis* (L.) Moq. *Lithophila vermicularis* Uline]—Coastal sand-dunes, damp shores, and waste places, Coastal Plain, Fla. to Tex.—(*W. I., Mex., C. A., S. A., O. W.*)—All year.

9. **FROELICHIA** Moench. Herbs (ours annual or biennial). Leaves opposite: blades entire. Flowers perfect, in dense spikes on long peduncles. Calyx crested or tubercled at maturity. Filaments united into a long tube.—About 12 species, American.

1. **F. floridana** (Nutt.) Moq. Plants rather slender: stem 4-18 dm. tall, sometimes branched at the base, puberulent: leaves few, conspicuously remote; blades linear or slightly broadest above or below the middle, 3-12 cm. long, acute, appressed pubescent beneath or occasionally slightly woolly: spikes 1-6 cm. long: calyx-tube with prominently toothed crests and 1 or 2 tubercle-like or spiny ridges on one or each face at

maturity.—(COTTONWEED.)—Pinelands, sandhills, and sandy old fields, Coastal Plain, Fla. to Miss. and Ga.; adv. in Del.—All year S.

## FAMILY 5. CORRIGIOLACEAE—WHITLOW-WORT FAMILY

Herbs, but often firm or woody at the base. Leaves opposite, stipulate: blades entire. Flowers perfect, cymose. Calyx of 4 or 5 sepals, which are sometimes awned or cuspidate at the apex. Corolla wanting. Androecium of 4 or 5 stamens borne on the margin of the minute or long hypanthium. Gynoecium mostly 2-carpellary. Ovary 1-celled. Fruit a utricle or an achene. Seed solitary.—About 20 genera and 100 species of wide geographic distribution.

Hypanthium very small: stamens borne on its edge under the ovary.

Tribe I. PARONYCHIEAE.

Hypanthium well-developed, nearly or quite as long as the calyx: stamens borne high up on its edge.

Tribe II. SIPHONYCHIEAE.

### I. PARONYCHIEAE

Sepals with slender awns on the back of the hood.

Sepals with a cusp or mucro on the back of the hood.

Style elongate, slender.

Calyx turgid at the base: sepals narrow, elongate: anther-sacs narrow.

Calyx not turgid at the base: sepals broad: anther-sacs broad.

Style wanting or very short.

Sepals mucronate.

Sepals umbonate at the apex.

#### 1. PARONYCHIA.

#### 2. GASTRONYCHIA.

#### 3. ANYCHIASTRUM.

#### 4. ANYCHIA.

#### 5. NYACHIA.

### II. SIPHONYCHIEAE

Flowers subtended by herbaceous bracts at maturity.

Sepals short and broad, with a mucro: flower urceolate.

Sepals long and narrow, without a mucro: flower subulate or narrowly campanulate.

Flowers subtended by indurated bracts at maturity.

#### 6. SIPHONYCHIA.

#### 7. ODONTONYCHIA.

#### 8. GIBBESIA.

1. **PARONYCHIA** [Tourn.] Adans. Annual or perennial herbs, with short tufted or matted branches and longer, often erect flower-stems. Leaves with narrow, often bristle-like blades. Cymes compact or congested. Sepals narrow, hooded at the apex, and terminating in a cusp or awn, sometimes alternating with small bristles or tooth-like lobes. Utricle included.—About 50 species, natives of warm regions.—Sum.—fall.—WHITLOW-WORTS. NAILWORTS.

Cymes nearly naked: calyx glabrous: bracts bristle-like.

#### 1. *P. dichotoma*.

Cymes densely silvery bracted: calyx pubescent: bracts linear.

#### 2. *P. argyrocoma*.

1. ***P. dichotoma*** (L.) Nutt. Plants in tufts: leaf-blades bristle-like, 1–3.5 cm. long, often obscurely pubescent: flowering stems 1–4 dm. tall, glabrous or nearly so: sepals becoming 3.5 mm. long, the awn short, green, glabrous.—(NAILWORT.)—Rocks and rocky banks, various provinces N of Coastal Plain, N. C. to Ark., Tex., W. Va. and Md.

2. ***P. argyrocoma*** (Michx.) Nutt. Plants in mats: leaf-blades linear or nearly so, flat, 1–3 cm. long, silky: flowering stems 0.5–3 dm. tall, closely pubescent: sepals becoming about 5 mm. long, the awns slender, white, pubescent.—(SILVER-CHICKWEED. SILVER-HEAD. SILVER-WORT.)—Stony mt. tops, cliffs, and rocky slopes, often in acid soil, Blue Ridge and adj. provinces, Ga. to Tenn. and Va.—Carpets of this plant on the rocky

peaks of the southern Alleghenies are striking as a result of the silvery stipules, hence the name SILVERLING.

**2. GASTRONYCHIA** Small. Annual herbs with radially branched stems, at maturity usually in cushion-like tufts. Leaves with rather broad blades. Cymes effuse, the cymules borne in small leafy clusters. Calyx swollen near the base. Sepals narrow, with slender tips with a minute hood at the apex and a slender spine-like cusp. Anthers narrow. Styles elongate, united, sometimes separating in age and partly deciduous. Utricle included in the swollen bottom of the calyx.—One species.

**1. G. herniarioides** (Michx.) Small. Plant in a depressed mat, finely somewhat rough-pubescent, the branches 0.5–2 dm. long: leaf-blades elliptic to oval, or those of the basal leaves spatulate, 3–10 cm. long, with a minute pale apical cusp: sepals lanceolate, about 1.5 mm. long, rarely larger, closely pubescent, the swollen basal part and the tip about equal in length: utricles about half as long as the calyx. [*Paronychia herniarioides* Nutt. *Anychiastrum herniarioides* Small.]—Sandhills and scrub, Coastal Plain, Fla. to N. C.—Spr.–fall.

**3. ANYCHIASTRUM** Small. Annual or rarely perennial herbs with radially spreading, usually prostrate branches. Leaves with narrow blades. Cymes effusely branched, the cymules usually lax. Calyx not swollen near the base. Sepals broad, with a wide hood at the apex and a short stubby mucro. Anthers broad. Styles elongate, united, separating and partly deciduous in age. Utricle reaching the top of the calyx or exserted.—Three species in the SE U. S.—Sum.–fall.

Annual or biennial plants, the stems pubescent.

Calyx pubescent: leaf-blades ciliate.

Calyx glabrous: leaf-blades not ciliate.

Perennial plants, the stems glabrous.

1. *A. Baldwinii*.

2. *A. montana*.

3. *A. riparia*.

**1. A. Baldwinii** (T. & G.) Small. Stem and branches minutely pubescent, the main ones 1–4 dm. long, usually with many short-lateral branchlets: leaf-blades narrowly elliptic to linear-elliptic, 8–20 mm. long, minutely pubescent, sometimes obscurely so: sepals oval to ovate, about 1 mm. long, pubescent: utricles equalling the calyx or slightly longer. [*Paronychia Baldwinii* Chapm.]—Dry sandy soil, often on sand-dunes, Coastal Plain, Fla. to La. and N. C.

**2. A. montanum** Small. Stems and branches diffuse and often effusely branched, minutely pubescent, rather uniformly dichotomous throughout: leaf-blades spatulate to elliptic-spatulate, 4–11 mm. long, glabrous or nearly so: sepals ovate to elliptic-ovate, about 1 mm. long, glabrous: utricles included.—Dry woods, Blue Ridge and adj. provinces, Ga. to Pa.

3. *A. riparium* (Chapm.) Small. Stem and branches prostrate, glabrous, 2–12 dm. long, with slender elongate lateral branchlets: leaf-blades elliptic to linear-elliptic, 5–12 mm. long, glabrous: sepals ovate or oval-ovate, about 1 mm. long: utricle about as long as the calyx. [*Paronychia riparia* Chapm.]—Dry sandy soil, river-banks and sandhills, Coastal Plain, N Fla. to Ala. and N. C.

4. **ANYCHIA** Michx. Annual herbs with forking stems. Leaves herbaceous, with narrow or rather broad flat blades. Stipules lacerate. Cymes terminating the branches, the cymules open or clustered. Sepals with narrow margins, hooded and mucronate. Anthers usually borne about half way up on the inner face of the sepal. Styles short, united.—Represented by the following two species.—Sum.—fall.—FORKED-CHICKWEEDS.

Leaves glabrous: sepals flat at maturity: utricle much exceeding the calyx.

Leaves pubescent: sepals ridged at maturity: utricle about as long as the calyx.

1. *A. canadensis*.

2. *A. polygonoides*.

1. *A. canadensis* (L.) B. S. P. Stem 0.5–4 dm. tall, the branches very slender, often almost capillary, long-jointed, glabrous: leaf-blades thin, elliptic to oval, 0.5–2 cm. long, deep-green, typically obtuse, petioled: cymes open: bracts broad, obtuse: sepals obtuse, with wide scarious margins. [*A. dichotoma capillacea* (Nutt.) Torr.]—Dry woods and shaded hillsides, various provinces, Ga. to Ark., Minn., Ont., and Mass.

2. *A. polygonoides* Raf. Stem 0.5–3 dm. tall, the branches slender, short-jointed, pubescent: leaf-blades thick, oblanceolate to linear-elliptic, 0.5–1.5 cm. long, pale-green, typically acute, sessile or nearly so: cymes compact: bracts narrow, slender-tipped: sepals acute, with very narrow or obscure margins. [*A. dichotoma* (Fl. SE. U. S.)]—Rocky woods, hillsides and dry open slopes, various provinces, Fla. to Tex., Minn., and Me.

5. **NYACHIA** Small. Annual copiously branched partly fleshy herbs. Leaves chartaceous, with broad, but revolute blades. Stipules pectinate fimbriate. Cymes much branched, the cymules borne all along the branches. Sepals with broad wing-margins, hooded and with a thick umbo. Anthers relatively large, borne in the sepal-hood. Styles very short, distinct.—One species.

1. *N. pulvinata* Small. Stem branched at the base, the branches radially spreading and repeatedly dichotomous, 5–20 cm. long, wiry: leaf-blades ovate to triangular-ovate, 1.5–3 mm. long, strongly revolute, sessile: calyx about 0.5 mm. long, its sepal hoods blunt, pale, minutely pitted: utricle oval or ellipsoid, about 0.4 mm. long.—Sand-dunes, S end of lake region, Fla.—Spr.—sum.

6. **SIPHONYCHIA** T. & G. Annual or biennial herbs with radially prostrate stems and branches. Leaves with narrow, somewhat fleshy, often curved blades. Cymes several- to many-flowered, usually densely glomerulate in age. Sepals broad, narrowly or widely hooded at the apex and minutely or obscurely cuspidate, pale or pale-margined, longer or shorter than the hypanthium. Utricle included.—Following are the only known species.—Spr.—fall.

Sepals narrowed at the tip, with an evident but minute cusp, longer than the hypanthium. 1. *S. diffusa*.

Sepals broadened at the tip, with an obscure cusp, shorter than the hypanthium.

Cymes many-flowered: cymes with minute bracts.

2. *S. americana*.

Cymes few-flowered: cymes with foliaceous bracts.

3. *S. pauciflora*.

1. *S. diffusa* Chapm. Stem and branches 1–6 dm. long, minutely pale-pubescent: blades of the cauline leaves oblanceolate, linear-oblanceolate, or linear-spatulate to almost linear, 0.5–2.5 cm. long, nirsutulous: cymes ultimately dense, glomerulate: flowers over 1.5 mm. long: sepals ovate to lanceolate, as long as the hypanthium or slightly longer, with a narrow hood at the erect apex and a minute cusp.—Dry pinelands, oak-woods, sandhills, and scrub, Coastal Plain, Fla. to La. and Ga.

2. *S. americana* (Nutt) T. & G. Stem and branches 2–8 dm. long, minutely retrorse-pubescent when young, obscurely pubescent or glabrous in age: blades of the cauline leaves linear-oblanceolate to spatulate, 0.5–2 cm. long, minutely pubescent and with the usually pale margins ciliate: flowers scarcely 1.5 mm. long: sepals obovate, as long as the hypanthium or shorter, with a broad dilated hood at the inflexed apex and an obscure cusp.—Sandhills, dry pinelands, and old fields, Coastal Plain, Fla. to S. C.

3. *S. pauciflora* Small. Stem and branches 1–6 dm. long, obscurely pubescent or glabrous in age: leaves similar to those of *S. americana*, but usually larger and less pubescent: flowers about 1.5 mm. long: sepals obovate-cuneate, rather shorter than the hypanthium, with a broad dilated hood at the inflexed apex and an obscure cusp.—Sandhills, dry woods, and pinelands, Coastal Plain, Fla. and Ga.

7. **ODONTONYCHIA** Small. Annual or perennial herbs, with erect or diffuse stems and branches. Leaves somewhat fleshy, the blades narrow, entire. Cymes corymbose, compact or open, the cymules congested. Sepals concave, sometimes with a mere indication of a blunt or acute mucro. Utricle included.—Only the following species known.—Spr.—fall.

Stem and branches glabrous: hypanthium glaucous.

1. *O. erecta*.

Stem and branches pubescent: hypanthium pubescent.

Sepals lanceolate when flattened: hypanthium bristly pubescent.

2. *O. interior*.

Sepals ovate when flattened: hypanthium minutely pubescent.

3. *O. corymbosa*.

1. *O. erecta* (Chapm.) Small. Plant glaucous, the branches erect, 1–4 dm. tall: leaf-blades mainly spatulate, linear-oblanceolate or linear, 0.5–3 cm. long,

the silvery stipules very conspicuous against the stem and leaves: flowers becoming nearly or quite 3 mm. long: sepals lanceolate, much longer than the hypanthium: utricle about 1 mm. long. [*Siphonochia erecta* Chapm.]—Coastal sand-dunes, N Fla. and Ala.

2. *O. interior* Small. Plant closely brown-pubescent and often somewhat viscid, the branches spreading, 1-4 dm. long: leaf-blades spatulate to linear, 0.5-2.5 cm. long, relatively coarse-pubescent: cymes open, diffuse: flowers becoming 2.5 mm. long: sepals lanceolate, acute, much longer than the hypanthium: utricle less than 1 mm. long.—Scrub. N Fla.

3. *O. corymbosa* Small. Plant minutely grayish, pubescent, the branches erect, 1-3 dm. tall: leaf-blades oblanceolate to elliptic or linear, 0.5-1.5 cm. long, minutely pubescent: cymes aggregated in a compact terminal corymb: flowers scarcely 2.5 mm. long: sepals ovate, obtuse, slightly longer than the hypanthium: utricle about 1 mm. in diameter.—Coastal sand-dunes, N Fla. to Miss.

8. *GIBBESIA* Small. Annual or biennial herbs with erect stems. Leaves with narrow blades. Cymes several to many-flowered, dichotomous, the cymules often compact, but not glomerulate. Sepals narrow, pale, minutely hooded and cuspidate at the apex, longer than the hypanthium. Utricle included.—One species.

1. *G. Rugelii* (Chapm.) Small. Stem 1-5 dm. tall, rather closely, pale-pubescent, ultimately effusely branched: leaf-blades narrowly oblanceolate, linear-oblanceolate, or nearly linear, 1-3 cm. long, slightly more coarsely pubescent than the stem: sepals lanceolate-subulate, about 2 mm. long, the cusp acute. [*Paronychia Rugelii* Shuttlw.]—Sandhills, pinelands, and old fields, Coastal Plain, N Fla. to Ala. and Ga.—Sum.—fall.

## FAMILY 6. PHYTOLACCACEAE — POKEWEED FAMILY

Herbs, shrubs, or trees. Leaves alternate: blades entire, sometimes fleshy. Flowers perfect or dioecious, in racemes or panicles. Calyx of 4 or 5 sepals. Corolla wanting. Androecium of 4-8 stamens, or more, borne below the ovary. Gynoecium 1-many-carpellary. Fruit baccate.—About 22 genera and 110 species, mostly natives of the tropics.

Hypanthium wanting: ovary superior.

Gynoecium 1-carpellary: style single: fruit laterally flattened.

Gynoecium 2-many-carpellary: styles 2-many: fruit vertically flattened.

Hypanthium present: ovary inferior.

Tribe I. RIVINEAE.

Tribe II. PHYTOLACCACE.

Tribe III. AGDESTIDEAE.

## I. RIVINEAE

Stamens 4: style elongate: stigma capitate.  
Stamens 8-16: style wanting: stigma penicillate.

1. RIVINA.
2. TRICHOSTIGMA.

## II. PHYTOLACCACEAE

Large perennial herbs, with the raceme-like panicles ultimately opposite the leaves.

3. PHYTOLACCA.

## III. AGDESTIDEAE

Vines with much-branched stems, broad leaf-blades, and many-flowered panicles.

4. AGDESTIS.

1. **RIVINA** [Plum.] L. Relatively small often partially woody plants. Flowers racemose. Sepals narrow, partly enclosing the simple fruit or reflexed at maturity. Stamens 4: anthers ovoid. Style eccentric, stout: stigma capitate. Berry red, purple orange or yellow.—Four or 5 species of tropical and warm-temperate regions.

1. *R. humilis* L. Plants 3-7 dm. tall, or with elongate vine-like stems: leaf-blades ovate, lanceolate, or elliptic, 3-15 cm. long, undulate: sepals cuneate to linear-oblong, 2-2.5 mm. long: berry 2-3.5 mm. long.—(ROUGE-PLANT. BABY-PEPPER.)—Hammocks, sand-dunes, and thickets, Coastal Plain, Fla. to Tex. and Ark.—(*W. I., Mex., C. A., S. A.*)—All year S.—Sometimes known as blood-berry.

2. **TRICHOSTIGMA** A. Rich. Shrubs with trailing, diffuse, reclining, or climbing stems and branches. Leaf-blades broad, entire. Flowers borne in raceme-like panicles, each flower-stalk with a minute persistent bract near the middle. Sepals 4, broad, persistent, the inner ones often much shorter than the outer. Stamens 8-16: anthers sagittate, extrorse. Style wanting. Stigma tufted. Berry dark-colored.—About 4 species of tropical America.

1. *T. octandrum* (L.) H. Walt. Shrub with diffuse, reclining, or climbing branches often 10 m. long: leaf-blades ovate, elliptic, or oval, mostly 4-9 cm. long, usually short-acuminate, rather long-petioled: panicles narrow, the flower-stalks 4-6 mm. long: sepals oval or obovate, 4-6 mm. long, early reflexed: anthers 2-2.5 mm. long: berry globular or oval, 4-5 mm. long, purplish-black.—Hammocks, coastal region, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)

3. **PHYTOLACCA** [Tourn.] L. Relatively large or stout plants. Flowers paniculate, the panicles often raceme-like. Sepals broad, spreading under the compound fruit. Stamens 5-25: anthers short, often ovoid or globose. Styles 5-12.—About 24 species mostly tropical.—The fruits are a favorite bird-

food. The young shoots are sometimes used as a substitute for asparagus or cooked as greens. The roots contain a deadly poison.—POKES. INKBERRIES. SOKES. PIGEON-BERRIES.

Panicles nodding in fruit: berry shorter than its stalk.  
Panicles permanently erect: berry longer than its stalk.

1. *P. americana*.  
2. *P. rigida*.

1. *P. americana* L. Plants 1–3 m. tall, the branches green, magenta, or purple: leaf-blades mainly ovate-lanceolate to ovate, 9–30 cm. long: calyx 5–6 mm. wide: berry 7–10 mm. wide, its length less than the length of its stalks: seed about 3 mm. long. [*P. decandra* L.]—Waste places, cultivated grounds, and rich soil generally, various provinces, Fla. to Tex., Minn., and Me.—Spr.–fall.—The flowers of this and the following species are white often sordid or flushed with purple. The berries are often used to make a red ink.

2. *P. rigida* Small. Plants 1–3 m. tall, or sometimes arborescent and becoming 6 or 7 m. tall, the branches greenish-purple: leaf-blades lanceolate to oblong-lanceolate, 7–34 cm. long: berry 10–12 mm. wide.—Hammocks and cult. grounds, Coastal Plain, Fla. to Tex.—All year.

4. **AGDESTIS** Moc. & Sessé. Vines with turnip-like roots and copiously branched stems. Leaf-blades very broad. Flowers perfect, borne in panicles. Sepals 4, or rarely 5, spreading, persistent. Stamens numerous: filaments slender: anthers narrow. Ovary inferior: style short: stigmas narrow, introrse. Achene 4–5-winged.—The flowers are white or greenish-white.

1. *A. clematidea* Moc. & Sessé. Vine with much branched stems: leaf-blades ovate to reniform, 3–9 cm. long, obtuse at the apex, broadly cordate or truncate at the base, long-petioled: panicles many-flowered, mostly 1–1.5 dm. long: sepals mainly oblong or oval, 4–6 mm. long: achene turbinate, the wings 11–13 mm. broad from tip to tip.—Hammocks and waste-places, S pen. Fla. and Tex.—Nat. of Mex. and cult.—All year.—Extensively grown in S Fla. as an ornamental vine.

## FAMILY 7. PETIVERIACEAE — PETIVERIA FAMILY

Woody plants, usually strong-scented. Leaves alternate: blades firm, entire. Flowers perfect, in virgate spikes. Hypanthium present. Calyx of 4 nearly equal sepals. Corolla wanting. Androeceum of 4–8 stamens, borne like the calyx on the long hypanthium. Gynoeceum a single carpel borne in the hypanthium. Fruit an achene with reflexed spines at the top.—Consists of the following genus and species.

1. **PETIVERIA** [Plum.] L. Shrubs with extensively creeping or horizontal rootstocks. Leaves with narrow stipules. Anthers sagittate, forked at the apex. Style wanting. Stigma lateral, penicellate. Achene appressed to the spike-rachis.

1. *P. alliacea* L. Stems 3–12 dm. tall, often with virgate branches: leaf-blades obovate, elliptic-obovate, or elliptic, 4–12 cm. long: spikes 1–3 dm. long, interrupted: sepals linear to linear-lanceolate, 3–4 mm. long, about as long as the hypanthium: achene linear-cuneate, 6–10 mm. long, the spines one-half as long as the body or less.—(GUINEA-HEN WEED.)—Hammocks, pen. Fla. and the Keys; also S. Tex.—(*W. I., Mex., C. A., S. A.*)—When crushed, this plant emits a disagreeable skunk-like odor. The flowers are white or greenish, often ivory-white.

#### FAMILY 8. BATIDACEAE — SALTWORT FAMILY

Maritime partially succulent shrubs. Leaves opposite, fleshy, half-terete, linear or clavate, entire. Flowers small, dioecious, in axillary cone-like spikes. Staminate cones with persistent imbricate scales each subtending a flower: calyx cup-shaped, 2-lobed: stamens 4–5, inserted at the base of the calyx: filaments thick, alternating with staminodia. Pistillate cones peduncled, 4–12-flowered, the scales deciduous: the flowers each consisting of merely a 4-celled ovary with a sessile stigma. Ovule 1 in each cavity. Fruit a fleshy cone.—Represented by the following genus and species.

1. **BATIS** P. Br. Plants with smooth and glabrous foliage. Leaves without stipules.

1. *B. maritima* L. A glabrous pale-green strong-scented shrub, with spreading or prostrate, often creeping, stems 0.5–1.5 m. long: leaves curved, 1–2.5 cm. long: cones 5–10 mm. long, ovoid; pistillate on peduncles 2–5 mm. long: bracts reniform or suborbicular, often apiculate: fruit oblong or obovoid, 1–2 cm. long, short-stalked, drooping.—(SALTWORT. BEACHWORT.)—Low sandy or rocky places, usually in salt marshes and low muddy shores, Coastal Plain, Fla. to Tex. and N. C.—(*W. I., Mex., C. A., S. A.*)—The stems and branches often recurve and root at the tip.—In its typical habitat the saltwort occupies the ground exclusively. The peculiar pale-green of the foliage is striking. It crunches under foot after the manner of samphire.

## FAMILY 9. ALLIONIACEAE — FOUR-O'CLOCK FAMILY

Herbs with dichotomous stems or shrubs or trees. Leaves opposite: blades entire or nearly so. Flowers mostly perfect, 1 or more in an involucre. Calyx of several united sepals, usually corolloid, deciduous above the ovary. Corolla wanting. Androecium of 1-many stamens, borne below the ovary. Gynoecium a single pistil. Fruit an anthocarp.—About 25 genera and 350 species, most abundant in America.—The plants are easily grown, and some with showy flowers are widely cultivated.

Flower, or flower-head, subtended by an involucre: fruit not clavate or obpyramidal.

Bracts of the involucre distinct: stamens 10-18: fruit subterranean.

Bracts of the involucre united: stamens 3-6: fruit not subterranean.

Calyx long-salverform: fruit obtusely- or obscurely-angled: involucre unchanged in fruit.

Calyx campanulate or short-funnel form: fruit grooved: involucre accrescent.

Flower not subtended by an involucre: fruit obpyramidal or clavate or obovoid.

1. OKENIA.

2. MIRABILIS.

3. ALLIONIA.

4. BOERHAAVIA.

1. **OKENIA** Schlecht. & Cham. Annual prostrate herbs. Leaves opposite: blades inequilateral. Flowers solitary in the 3-bracted involucres. Calyx short-funnelform, the lobes emarginate. Stamens 14-18: filaments united at the base. Fruit somewhat elongate, bent, 1-striate and transversely wrinkled, subterranean.—One species.

1. **O. hypogaea** Schlecht. & Cham. Stem and branches creeping, densely viscid-pubescent, 2-11 dm. long: leaf-blades fleshy, ovate to elliptic-ovate, 2.5-4 cm. long, obtuse at the apex, truncate or cordate at the base, stout-petioled: calyx of the conspicuous infertile flowers deep-violet or rose-purple, 3-4 cm. wide on young plants, 6-8 cm. on old ones, that of the cleistogamous flowers inconspicuous: fruits ellipsoid or oval, 1-2 cm. long.—Coastal dunes and hammocks, S Fla.—(*Mex.*)—All year.

2. **MIRABILIS** L. Perennial herbs. Leaves opposite. Flowers typically 1 in an involucre. Calyx salverform, the limb large. Stamens 3-6; filaments united at the base. Fruit of an ovoid type, constricted near the base.—About 25 species natives of America.

1. **M. Jalapa** L. Plants glabrous, except the young parts: leaf-blades ovate, sometimes broadly so, 3-12 cm. long: involucres 7-8 mm. long; lobes acute: calyx deep-red to purple, yellow, pink, or white and variously variegated: fruit broadly ovoid.—(**FOUR-O'CLOCK. MARVEL-OF-PERU.**)—Waste places, cult. grounds, and roadsides, S Fla. Nat. of trop. Am.—(*W. I., Mex., C. A., S. A.*)—All year.—A favorite old-fashioned garden plant, sometimes escaped.

3. **ALLIONIA** Loebl. Perennial herbs. Leaves opposite: blades equilateral or nearly so. Flowers 1-5 in each involucre. Calyx campanulate or short-funnelform. Stamens 2-5, unequal. Fruit obovoid, slightly 5-angled or 5-grooved. [*Oxybaphus* L'Her.].—About 40 species, with one exception American.—Spr.-sum.—UMBRELLA-WORTS.

Leaf-blades narrow, gradually narrowed at the base  
Leaf-blades, except in the uppermost leaves, broad, cordate at the base.

1. *A. albida*.

2. *A. nyctaginea*.

1. *A. albida* Walt. Stem up to 2 m. tall: leaf-blades lanceolate, narrowly elliptic, or linear-lanceolate, 3-15 cm. long, sessile or nearly so: involucre becoming 1.5-2 cm. wide: calyx white or pale-pink: fruit 4.5-5 mm. long, the angles, and the faces, coarsely tuberculate. [*Oxybaphus albidus* Choisy].—Dry soil on hill-sides or meadows, various provinces, rarely Coastal Plain, S. C. to Tex., Kans., and Tenn.

2. *A. nyctaginea* Michx. Stem up to 1 m. tall: leaf-blades broadly ovate, or triangular-ovate, or broadly lanceolate, 2-11 cm. long, petioled: involucre becoming 2 cm. wide: calyx red or pink: fruit about 5 mm. long, the angles rugulose, the faces rugulose or finely tuberculate. [*Oxybaphus nyctagineus* Sweet].—(WILD FOUR-O'CLOCK. UMBRELLA-WORT.)—Dry soil, various provinces, rarely Coastal Plain, Ala. to Tex., Mont., and Wis.—(Mex.)

4. **BOERHAAVIA** [Vaill.] L. Annual or perennial usually diffuse herbs. Leaves opposite: blades often undulate. Flowers subtended by minute bracts. Calyx-tube not prolonged beyond the ovary, the limb campanulate to rotate. Fruit clavate to obovoid, 5-10 ribbed.—About 50 species, natives of the Old World and the New.—SPIDERLINGS.

Fruits glandular, rounded at the apex: plants perennial.  
Fruits glabrous, flat at the apex: plants annual.

1. *B. coccinea*.

2. *B. erecta*.

1. *B. coccinea* Mill. Stem branched at the base, the branches diffusely spreading, 6-12 dm. long: leaf-blades ovate to elliptic-ovate, 2-8 cm. long, both surfaces of almost the same color: calyx pink or purplish; tube glandular-pubescent; limb campanulate, 1.5 mm. high, glabrous or sparingly pubescent: fruit obpyramidal, 3 mm. long, the ribs glandular, the top rounded.—[*B. hirsuta* Willd., *B. paniculata* Rich., *B. decumbens* Vahl, *B. viscosa* Lag. & Rodr. Small Fl.].—Roadsides, waste places, and hammocks, pen. Fla.; adv. in N. C.; also Tex. to Calif.—(W. I., Mex., C. A., S. A., O. W.)

2. *B. erecta* L. Stem simple below, erect or branched at the base, the branches decumbent or spreading, 3-12 dm. long: leaf-blades ovate to deltoid-ovate, 2-8 cm. long,

minutely black-dotted on the lower whitish surface: calyx white or purple; tube glabrous; limb campanulate, 1-1.5 mm. long, sparingly pubescent: fruit obpyramidal, 3.5-4 mm. long, 5-angled, the grooves transversely wrinkled, the top flat.—Waste places, fields, roadsides, and hammocks, Coastal Plain and occasionally adjoining provinces, Fla. to Tex., Ariz., Ark., and S. C.—(*W. I., Mex., C. A., S. A.*)

## FAMILY 10. PISONIACEAE — PISONIA FAMILY

Shrubs, trees, or vines. Leaves opposite or alternate: blades simple. Flowers perfect, dioecious or rarely monoecious, cymose. Calyx of 5 united sepals, campanulate, tubular, or funnelform. Corolla wanting. Androecium of 5-30 stamens. Gynoecium 1-carpellary. Ovary 1-celled: style terminal. Fruit an anthocarp.—Three genera and about 40 species, mostly tropical.

Fruit angular, with rows of glands: calyx broad.  
Fruit terete, glandless: calyx narrow.

1. *PISONIA*.
2. *TORRUBIA*.

1. *PISONIA* [Plum.] L. Armed woody vines, or shrubs or trees. Leaves opposite: blades entire. Flowers in compound cymes. Calyx broadly funnelform or rotate, with a thin undulate recurved edge. Fruit dry, with rows of glands.—About 25 species in tropical and subtropical regions.

Stem mostly climbing, armed: leaf-blades abruptly pointed or short-acuminate: fruits glandular from the base to the apex.

Stem erect, unarmed: leaf-blades blunt or retuse: fruits glandular above the middle.

1. *P. aculeata*.

2. *P. rotundata*.

1. *P. aculeata* L. Woody vine with branching thorns, the ultimate divisions curved or hooked, very sharp, or rarely erect and somewhat tree-like: leaf-blades elliptic, oval, or ovate, 2.5-7 cm. long: pedicels slender: calyx-lobes mostly longer than wide: fruit slender, 3-3.5 mm. thick.—(COCK-SPUR. DEVIL'S-CLAWS. PULL-AND-HOLD-BACK. OLD-HOOK.)—Hammocks, S pen. Fla. and the Keys.—(*W. I.*)—The calyx is usually purple.

2. *P. rotundata* Griseb. Shrub or small tree, the bark pale: leaf-blades thick, broadly elliptic or oval, varying to obovate, 2.5-8 cm. long, short-petioled: cymes densely flowered: fruit green or whitish, broadly funnelform, about 3 mm. long, tomentulose along the edge: fruit broadly or narrowly obovoid, 5-6 mm. long.—(*PISONIA*.)—Hammocks and pinelands, Florida Keys.—(*W. I.*)

2. *TORRUBIA* Vell. Unarmed shrubs or trees. Leaves opposite: blades entire. Flowers in cymes. Calyx narrowly funnelform to tubular, with an erect nearly or quite even edge, purplish, pink, green, or white. Fruit juicy, without glands.—About 20 species, natives of tropical and subtropical America.—BEEF-TREES.

Leaf-blades glabrous: inflorescence-branches glabrous in age.  
Fruit obovoid or ellipsoid-obovoid, 8-10 mm. long, the hard part ellipsoid: leaf-blades oblanceolate, obovate, cuneate, elliptic or oval.

Leaf-blades oblanceolate to cuneate or narrowly obovate: fruit obovoid.

Leaf-blades obovate, elliptic, or oval: fruit ellipsoid or ellipsoid-obovoid.

Fruit subglobose, 6-7 mm. long, the hard part oval: leaf-blades orbicular-cuneate to suborbicular.

Leaf-blades copiously pubescent: inflorescence-branches persistently pubescent.

1. *T. longifolia*.

2. *T. Bracei*.

3. *T. globosa*.

4. *T. floridana*.

1. ***T. longifolia*** (Heimerl) Britton. Shrub or small tree, with pale smooth bark and brittle branches; leaf-blades oblanceolate, to cuneate or narrowly obovate, 2.5-5 cm. long, thinnish, obtuse or rounded at the apex, slender-petioled: calyx green or purplish: fruit obovoid, about 8 mm. long, red, juicy, rounded or slightly depressed at the apex, the hard part 7-7.5 mm. long. [*Pisonia obtusata* (Chapm. Fl.)]—(BLOLLY.)—Hammocks, S pen. Fla. and the Keys.—(*W. I.*)

2. ***T. Bracei*** Britton. Shrub or small tree, with rather pale bark: leaf-blades obovate, elliptic, or oval, 3.5-6 cm. long, thick, rounded or retuse at the apex, rather slender-petioled: calyx purplish: fruit ellipsoid or ellipsoid-obovoid, 9-11 mm. long, red, very juicy, nearly truncate at the apex, the hard part 8-9 mm. long.—(BLOLLY.)—Hammocks and adj. pinelands, lower eastern coast, pen. Fla. and the Keys.—(*W. I.*)

3. ***T. globosa*** Small. Small tree, with gray, often dark-gray bark: leaf-blades orbicular-cuneate to suborbicular, mostly 1-2 cm. long, thinnish, rounded or emarginate at the apex, slender-petioled: calyx greenish-purple: fruit subglobose, 6-7 mm. long, dark-red, juicy, depressed at the apex, the hard part 5-6 mm. long.—Hammocks, lower eastern coast, pen. Fla. and the Keys.

4. ***T. floridana*** Britton. Low shrub with gnarled branches: leaf-blades spatulate, cuneate, or obovate, 2-3.5 cm. long: fruit slightly broadened upward, 6-7 mm. long.—Rocky places, Rock Key, Fla.—Collected nearly a century ago about twelve miles west of Key West; not found since.

#### FAMILY 11. TETRAGONIACEAE — CARPET-WEED FAMILY

Herbs, firm or succulent, or partially woody plants. Leaves alternate or opposite, sometimes apparently whorled. Flowers perfect, polygamous, or unisexual, regular or nearly so. Calyx of 4 or 5 sepals. Corolla wanting (in our species). Androecium of 4 or 5 hypogynous or perigynous stamens, or sometimes fewer, or more numerous. Gynoecium of 2-several united carpels. Ovary superior or partly inferior. Fruit a capsule or pyxis, or baccate or nut-like.—Twenty-two genera and 500 species, mostly natives of the tropics.

Hypanthium minute: ovary essentially superior.  
Hypanthium quite evident, cylindric, turbinate, or campanulate: ovary more or less inferior.

Tribe I. MOLLUGINEAE.

Ovary partly inferior.  
Capsule circumscissile.

Tribe II. SESUVIEAE.

Capsule loculicidal.

Tribe III. AIZOEAEE.

Ovary inferior.

Tribe IV. TETRAGONIEAE.

#### I. MOLLUGINEAE

Radially prostrate wiry-stemmed herb.

1. MOLLUGO.

## II. SESUVIEAE

Leaves with stipules: ovary 1- or 2-celled.

Sepals unappendaged: stamens 1-3.

Sepals appendaged: stamens 5-10.

Leaves without stipules: ovary 3-5-celled.

2. *CYPSELEA*.

3. *TRIANTHEMA*.

4. *SESUVIUM*.

## III. AIZOEAE

Diffuse or prostrate plants with numerous leaves and small axillary flowers.

5. *GALENIA*.

## IV. TETRAGONIEAE

Diffuse somewhat fleshy plants with large leaves and small flowers in their axils.

6. *TETRAGONIA*.

1. **MOLLUGO** L. Annual slender herbs. Leaves alternate, sometimes apparently whorled: blades narrow. Sepals 5, hyaline-margined, glabrous. Stamens 3-5. Styles 5, short.—About 12 species, mostly tropical.

1. *M. verticillata* L. Branches slender, prostrate, 4-30 cm. long: stem-leaves 1-3 cm. long; blades spatulate to linear-spatulate, obtuse or acute at the apex: flowers 2-5 at each node, slender-pedicelled: sepals elliptic, 2.5-3 cm. long, green, or white within: stamens usually 3, occasionally 4; filaments 2.5-3 mm. long: capsule ellipsoid or nearly so, usually slightly exceeding the calyx, 20-30 seeded.—(INDIAN-CHICKWEED. CARPET-WEED.)—River-banks, waste-places, cult. grounds and roadsides, various provinces, Fla. to Tex., N. D., Ont., and N. B.—(W. I., Mex., C. A., S. A.)—Spr.-fall.

2. **CYPSELEA** Turp. Annual or probably perennial succulent herbs. Leaves opposite: blades relatively broad. Sepals 4 or 5, herbaceous, not horned. Stamens mostly 1-3. Styles usually 2, very short.—Only the following species known.

1. *C. humifusa* Turp. Plants forming mats 2-10 cm. wide, glabrous: leaf-blades elliptic to oval, 1.5-6 cm. long or rarely larger, obtuse, entire: flowers axillary, short-pedicelled: sepals ovate or oval, 1.5-2 mm. long or rarely longer, greenish, obtuse or acutish: filaments often nearly as long as the sepals: capsule subglobose, 1.5-2 mm. in diameter.—Pinelands and sandy soil, Fla. and Calif. Nat. of W. I.—Spr.-fall.

3. **TRIANTHEMA** L. Annual or perennial herbs or woody plants. Leaves opposite: blades broad. Sepals 5, petaloid, each horned at the tip. Stamens 5-10. Stigma lateral on the style. Ovules few.—About 12 species, mostly natives of the Old World tropics.

1. *T. Portulacastrum* L. Plants diffusely branched at the base, the branches often 5-10 dm. long: leaf-blades suborbicular to obovate, 0.5-2 cm. long: sep-

als ovate-lanceolate to oblong, becoming 4-5 mm. long, purple within: capsule 3.5-5 mm. long. [*T. monogyna* L.]—Hammocks and sandy shores, S pen. Fla. and the Keys; also Tex. to Ariz.—(*W. I., Mex., C. A., S. A., O. W.*)—All year.

4. **SESUVIUM** L. Annual or perennial succulent herbs, or partially woody plants. Leaves opposite: blades narrow. Sepals 5, petaloid, each horned at the apex. Stamens 1-many, sometimes grouped.—About 4 species natives of saline regions.—Spr.-fall.—SEA-PURSLANES.

Stamens numerous: sepals over 5 mm. long at maturity.

Upper leaves with spatulate or rarely elliptic blades: sepals becoming ovate: plants green.

Upper leaves with linear blades: sepals becoming hastate: plants glaucous.

Stamens 5: sepals less than 5 mm. long at maturity.

1. *S. Portulacastrum*.

2. *S. crithmoides*.

3. *S. maritimum*.

1. **S. Portulacastrum** L. Plants usually sparingly branched, the branches often 1-2 m. long: leaf-blades spatulate to oblanceolate or rarely elliptic, 1.5-4 cm. long: flowers short pedicelled: sepals ovate to ovate-lanceolate, 8-10 mm. long, the outer with a broad green body and narrow margins, the inner with a green rib and wide margins, all pink within: capsule 9-10 mm. long.—Coastal sand-dunes and shores, Coastal Plain, Fla. to N. C.—(*W. I., Mex., C. A.*)

2. **S. crithmoides** Welw. Similar to *S. Portulacastrum* in habit: leaf-blades narrowly linear, 2-6 cm. long: flowers sessile: sepals 9-11 mm. long: capsule 9-11 mm. long.—Waste places among wharves, Brunswick, Ga. Nat. of Angola.

3. **S. maritimum** (Walt.) B. S. P. Plants copiously branched, 0.5-4 dm. long: leaf-blades spatulate to obovate, 1-2.5 cm. long: flowers sessile: sepals 3-4 mm. long: capsule about 5 mm. long. [*S. pentandrum* Ell.]—Sandy shores and waste grounds, Coastal Plain, Fla. to Tex. and N. Y.—(*W. I.*)

4. **GALENIA** L. Herbs or shrubs, with spreading or prostrate branches. Leaves opposite or alternate, often very variable in size. Flowers perfect, inconspicuous, axillary. Sepals 4 or 5. Stamens 8 or 10, in pairs at the sinuses of the perianth. Capsule 3-5 angled, leathery.—About 17 species, natives of Africa.

1. **G. secunda** Sond. Stem branched at the base, the branches radially spreading, several dm. long, much-branched: leaves numerous; blades rhombic, cuneate-obovate or spatulate-obovate, mainly 1-2 cm. long: calyx about 3 mm. long; lobes oblong or lanceolate-oblong, ciliate near the tip and pubescent without: filaments shorter than the calyx-lobes.—Waste places, W Fla. Nat. of S Africa.—Spr.-fall.

5. **TETRAGONIA** L. Annual or perennial fleshy herbs or partially woody plants. Leaves opposite or alternate: blades broad. Sepals mostly 4, fleshy. Stamens 1-many, often somewhat grouped. Styles short. Ovules solitary in each cavity.

1. **T. expansa** Murr. Stem or branches spreading or procumbent, 3-14 dm. long: leaf-blades ovate to deltoid, 2-6 cm. long, entire, truncate to cuneate at the base: sepals yellowish green, ovate to half-orbicular, about 2 mm. long: nut-like fruit 8-12 mm. long, 4-6-horned. — (NEW-ZEALAND SPINACH.)—Waste places and fields, Fla. and Calif. Nat. of Asia and Australia.—Spr.—fall.

## FAMILY 12. PORTULACACEAE — PURSLANE FAMILY

Herbs, mostly fleshy or succulent, or partially woody. Leaves alternate or opposite: blades entire. Flowers perfect, regular. Calyx of 2 sepals. Corolla of 4 or 5, or rarely more, fugacious petals. Androecium of as many stamens as there are petals, or fewer or more. Gynoecium of 3 or more united carpels. Ovary superior or inferior, 1-celled. Fruit a capsule or pyxis.—About 40 species, mostly American.

Ovary and capsule superior: capsule 3-valved.

Sepals deciduous: stamens more numerous than the sepals, or petals: capsules many-seeded. 1. **TALINUM**.

Sepals persistent: stamens as many as the sepals, or petals: capsules few-seeded. 2. **CLAYTONIA**.

Ovary and capsule wholly or partly inferior: capsule circumscissile. 3. **PORTULACA**.

1. **TALINUM** Adans. Perennial succulent and sometimes partially woody herbs, or shrubs, the stem and branches often terminating in wiry peduncles. Leaves terete or flat. Flowers erect. Sepals 2, deciduous. Petals 5 or more. Stamens few or many. Style elongate. Ovules many on a stalked placenta.—About 35 species, mostly American.

Plant herbaceous: leaves crowded on a caudex; blades terete or nearly so.

Plant partly woody: leaves not crowded on a caudex; blades broad but succulent.

### I. TERETIFOLIA

Stamens 20 or fewer: style scarcely, if at all exerted beyond the stamens: corolla less than 2 cm. wide.

Stamens 40 or more: style much exceeding the stamens: corolla over 2 cm. wide.

### II. LATIFOLIA

Plant simple below the inflorescence or nearly so, leafy to about the middle, the upper part a naked elongate dichotomously compound inflorescence: peduncles terete.

Plant much-branched, leafy throughout, the branches and branchlets terminating in corymbiform cymes: peduncles 3-angled.

### I. TERETIFOLIA.

### II. LATIFOLIA.

1. *T. teretifolium*.

2. *T. Mengesii*.

3. *T. paniculatum*.

4. *T. triangulare*.

1. **T. teretifolium** Pursh. Plant 1-3 dm. tall, the stems often tufted, sometimes branched, copiously leafy: leaves 2-6 cm. long: peduncles slender-wiry:

bracts appendaged at the base: flowers short-pedicelled: petals rose-purple, 5-6.5 mm. long: stamens mostly 12-20: capsule subglobose, 4-5 mm. in diameter.—(ROCK-PORTULACA.)—Rocks, rocky soil, and sand, various provinces, rarely Coastal Plain, Ga., Fla. (?) to Ala., Tenn. and Pa.—Spr.-fall. —The delicate flowers open only for a few hours during the middle of the day.

2. *T. Mengesii* W. Wolf. Plants similar to those of *T. teretifolium* in habit, but often larger: leaves 3-7 cm. long: petals rose-purple, 10-15 mm. long: stamens 40-100, usually 50-80: capsule 3-4 mm. in diameter.—Cliffs and rocky blanks, Appalachian Plateau and adj. provinces, Ala. and Ga. to Tenn.—Sum.

3. *T. paniculatum* (Jacq.) Gaertn. Plant slightly-woody, 3-15 dm. tall, (with procumbent branches in *T. paniculatum sarmentosum*): leaf-blades spatulate, obovate, or elliptic, 3-11 cm. long: flowers numerous in an elongate thyrsoid panicle: sepals 3-4 mm. long: corollas mostly carmine, sometimes yellowish, 0.8-1 cm. wide: capsule 3-4 dm. in diameter.—Sandy soil and cult. grounds, Fla. to Tex. and Ariz. Nat. of the W. I.—(Mex., C. A., S. A.)—All year.

4. *T. triangulare* (Jacq.) Willd. Plant quite woody, 6-15 dm. tall: leaf-blades spatulate to narrowly elliptic, 2-9 cm. long: flowers few in corymbiform cymes: sepals 5-6 mm. long: corolla purple, pink, or yellow, 1.5-2 cm. wide: capsule 5-8 mm. in diameter.—Hammoeks, pinelands, and waste places, S pen. Fla. and the Keys. Nat. of the W. I.—(Mex., C. A., S. A.)—All year.

2. **CLAYTONIA** L. Perennial or annual fleshy herbs, the weak stems often arising from tuber-like corms. Leaves flat. Flowers spreading or nodding. Sepals 2, persistent. Petals 5. Style elongate. Ovules few.—About 10 species, natives of N. A.—SPRING-BEAUTIES. ROSE-ELFS.

Leaf-blades relatively short and broad: petals abruptly narrowed into claws.

Leaf-blades long and narrow: petals more gradually narrowed.

Capsule 4-4.5 mm. thick: leaf-blades of a broadly linear type.

Capsule 2-3 mm. thick: leaf-blades of a narrowly linear type.

1. *C. caroliniana*.

2. *C. media*.

3. *C. virginica*.

1. *C. caroliniana* Michx. Plants 5-20 cm. tall: leaf-blades ovate to narrowly elliptic, 2-7 cm. long: sepals 6-9 mm. long: petals 10-12 mm. long: seed about 2.5 mm. wide.—(WIDE-LEAF SPRING-BEAUTY.)—Woods, Blue Ridge and more northern provinces, N. C. and Tenn. to Sask. and N. S.; reported from La.—Spr.-sum.

2. *C. media* (DC.) Small. Plants 10-30 cm. tall: leaf-blades broadly linear or tapering to both ends, 7-12 cm. long: sepals becoming 7-9 mm. long: petals 8-11 mm. long: seed about 1.5 mm. wide.—Woods, various provinces N of Coastal Plain, D. C. to Tenn., Kans., and N. S.—Spr.

3. *C. virginica* L. Plants 5-25 cm. tall: leaf-blades narrowly linear, sometimes very narrow, 6-14 cm. long: sepals becoming 4-7

mm. long: petals 9–13 mm. long: seed about 2.5 mm. wide.—Woods, Coastal Plain and adjoining provinces, Ga. to Miss., Tex., Ohio, and Va.—Spr.

**3. PORTULACA** [Tourn.] L. Annual or perennial succulent herbs. Leaves flat or terete. Flowers erect. Sepals 2, deciduous. Petals 4–6. Style short; stigmas 3–8, slender. Ovules many on a basal placenta.—About 20 species, mostly natives of America.—PORTULACAS.

Leaf-blades terete or nearly so: leaf-axils more or less hairy.  
Leaf-blades flat: leaf-axils not hairy.

I. PILOSÆ.  
II. OLERACEÆ.

#### I. PILOSÆ

Corolla 4–5 cm. wide: seeds silvery.

Corolla less than 1.5 cm. wide: seeds black or brown.

Corolla pink, or purplish, mostly over 1 cm. wide: seeds black.

Petals obovate: seeds 0.4–0.5 mm. in diameter.

Petals elliptic to elliptic-ovate: seeds 0.7–0.9 mm. in diameter.

Corolla yellow or white, less than 1 cm. wide: seeds brown.

1. *P. grandiflora*.
2. *P. pilosa*.
3. *P. Smallii*.
4. *P. phaeosperma*.

#### II. OLERACEÆ

Upper leaves with lanceolate or elliptic-lanceolate blades: capsule with a crown like rim around the base of the cap: seeds gray.

Upper leaves with cuneate or obovate blades: capsule with a mere line about the base of the cap: seeds black.

5. *P. coronata*.
6. *P. oleracea*.

**1. *P. grandiflora*** Hook. Plant annual, with ascending or diffuse branches, hair-tufted in the leaf-axils: leaves 0.8–2.5 cm. long; blades terete: flowers solitary or 2 or 3 together in an involucre of 0–8 bracts and long hairs: sepals ovate or triangular-ovate, 7–10 mm. long: corolla white, pink, red, salmon, yellow, or orange; petals obovate, 1.5–2.5 cm. long: stamens 40 or more: capsule 4–5 mm. high: seeds somewhat silvery.—(SUN-PLANT.)—Roadsides, fence-rows, cult. grounds, and waste-places, E & W N. A. Nat. of S. A.—Sum.-fall.

**2. *P. pilosa*** L. Plants annual or sometimes persistent for more than a year, erect or diffuse, with conspicuously hair-tufted leaf-axils: leaves mostly 1–2 cm. long; blades nearly terete: flowers terminal, in an involucre 6–10 bracts and white or brownish hairs: sepals ovate or triangular-ovate, 2–3 mm. long: petals pink or purplish: stamens 15–32: capsule subglobose, 3–4 mm. broad.—Sandy woods, roadsides, and cult. grounds, Coastal Plain and adj. provinces, Fla. to Tex., and Ga.—(W. I., Mex., C. A., S. A.)—Spr.-fall.

**3. *P. Smallii*** P. Wilson. Plants with spreading or prostrate branches, with slightly hair-tufted leaf-axils: leaves 1–1.5 cm. long; blades nearly terete: flowers terminal, in an involucre of 10 or more bracts and pale-brown hairs: sepals orbicular-deltoid, about 3 mm. long: petals pink: stamens 8–12: capsule subglobose, 3–3.5 mm. broad.—Sandy soil on granite outcrops, Piedmont, Ga. to N. C.—Spr.-fall.

**4. *P. phaeosperma*** Urban. Plants with more or less diffusely branched stems from tuberous roots and rather inconspicuously tufted leaf-axils: leaves 0.5–2 cm. long; blades nearly terete; flowers terminal, in an involucre of 5–8 bracts

and whitish or brownish hairs; sepals suborbicular to ovate-orbicular, 3-4 mm. long; petals yellow; stamens 12-16; capsule subglobose, 3-3.5 mm. broad. [*P. halimoides* A. Gray, not L.]—Sand-dunes, scrub, and shell-mounds, S pen. Fla. and the Keys.—(*W. I., Mex., S. A.*)—All year.

5. *P. coronata* Small. Plant nearly simple and erect or diffusely branched, the branches usually deep-pink or magenta: leaf-blades mostly 1-1.5 cm. long, the lower ones oblanceolate, the upper elliptic or elliptic-lanceolate, obtuse or acutish: sepals triangular, about 2 mm. long: corolla about 5 mm. wide; petals yellow, ovate to elliptic-ovate, acute: capsule hemispheric to turbinate-hemispheric, about 5 mm. high.—Granite rocks, Little Stone Mt. in the Piedmont of Ga.—Fall.

6. *P. oleracea* L. Plant prostrate, more or less radially branched, the branches green or dark-spotted: leaf-blades cuneate to obovate, 1-3 cm. long, rounded at the apex: sepals 2.8-4.5 mm. long: corolla mostly 8-20 mm. wide; petals yellow or orange, 3-8 mm. long, notched: capsule circumscissile about the middle, 5-9 mm. high.—(*PURSLANE. PUSSLEY. DUCKWEED.*)—Hammocks, pinelands, cult. grounds, and waste-places, U. S. and S Can.—(*W. I., Mex., C. A., S. A., O. W.*)—Spr.-fall or all year S.

### FAMILY 13. ALSINACEAE — CHICKWEED FAMILY

Herbs, sometimes woody at the base. Leaves opposite: blades entire. Flowers mostly perfect. Calyx of 4 or 5 persistent, distinct sepals. Corolla of 4 or 5 clawless petals, or wanting. Androecium of twice as many stamens as sepals, or fewer. Gynoecium of 2-5 united carpels. Ovary superior. Fruit a capsule subtended by the calyx.—Thirty-two genera and 500 species, most abundant in temperate regions.

Styles distinct.

Stipules wanting.

Stipules present.

Styles partly united.

Tribe I. SAGINEAE.

Tribe II. TISSEAE.

Tribe III. DRYMERIEAE.

#### I. SAGINEAE

Styles alternate with the sepals.

Styles opposite the sepals or alternate in *Alsine aquatica*.

Capsule short, ovoid or ellipsoid, the valves as many as the styles.

Petals 2-lobed or wanting.

Petals entire or slightly notched.

Valves of the capsule entire.

Valves of the capsule 2-lobed.

Capsule long, cylindric, opening by twice as many tooth-like valves as there are styles.

Petals toothed.

Petals deeply lobed.

1. SAGINA.

2. ALSINE.

3. SABULINA.

4. ARENARIA.

5. HOLOSTEUM.

6. CERASTIUM.

#### II. TISSEAE

Leaves opposite: styles 3; capsule 3-valved.

Leaves whorled: styles 5; capsule 5-valved.

7. TISSA.

8. SPERGULA.

#### III. DRYMERIEAE

Petals deeply 2-lobed.

Petals entire or merely toothed.

Sepals keeled.

Sepals not keeled.

9. DRYMERIA.

10. POLYCARPON.

11. STIPULICIDA.

1. *SAGINA* L. Annual or perennial diminutive herbs. Leaf-blades subulate to filiform. Flowers axillary. Sepals 4 or 5, persistent. Petals white, 4 or 5, about as long as the sepals, or wanting. Stamens 5, or sometimes 3-10.

Stigmas short. Capsule longer than the sepals.—About 10 species natives of the Northern Hemisphere.

1. *S. decumbens* (Ell.) T. & G. Plants 2–10 cm. tall, very slender: leaf-blades linear-subulate, 2–8 mm. long: pedicels erect, very slender: sepals ovate or oval, about 1.5 mm. long: petals scarcely as long as the sepals, (or wanting or rudimentary in *S. decumbens Smithii*): capsule oblong-ovoid, about twice as long as the calyx: seed orange-brown, resinous-dotted.—(PEARLWORT.)—Sandy soil, *Smithii*): capsule oblong-ovoid: seed orange-brown, resinous-dotted.—(PEARLWORT.)—Sandy soil, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Mass.—Spr.-sum.

2. **ALSINE** [Tourn.] L. Annual or perennial weak herbs. Leaf-blades succulent. Flowers cymose or axillary. Sepals 5 or 4, ribless. Petals 5 or 4, 2-cleft or 2-parted, rarely wanting. Stamens 10 or fewer. Stigmas 3–5, slender. Capsule barely exceeding the sepals, with twice as many valves as stigmas. [*Stellaria* L.]—About 75 species, most abundant in temperate and cold regions.—CHICKWEEDS. STARWORTS. STITCHWORTS.—Flowers white or pink.

Styles 5.

Styles 3, or rarely 4.

I. AQUATICAE.

II. MEDIAE.

#### I. AQUATICAE

Perennial herb with broad leaf-blades, the upper ones sessile and cordate: pedicel and calyx glandular.

1. *A. aquatica*.

#### II. MEDIAE

Corolla present.

Leaf-blades manifestly petioled.

Sepals mostly over 3 mm. long: petals shorter

Sepals mostly less than 3 mm. long: petals longer.

Leaf-blades, at least those of the upper leaves, sessile.

Seeds smooth.

Seeds rough.

Sepals obtuse: petals longer than the sepals.

Sepals acute or acuminate: petals about as long as the sepals.

Corolla wanting.

2. *A. media*.

3. *A. Baldwinii*.

4. *A. longifolia*.

5. *A. pubera*.

6. *A. tennesseensis*.

7. *A. fontinalis*.

1. *A. aquatica* (L.) Britton. Stems 2–6 dm. long, usually villous and glandular above: leaf-blades ovate to elliptic-ovate, or sometimes ovate-lanceolate, 3–6 cm. long: sepals ovate, 4–5 mm. long: petals  $1\frac{1}{2}$ –2 times as long as the sepals: capsule 5–6 mm. long. [*Stellaria aquatica* Scop.]—(WATER-CHICKWEED.)—Moist woods and waste-places, various provinces, La. to N. C., N. Y., and Ont.; also to B. C. Nat. of Eu.—Spr.-sum.

2. *A. media* L. Stems 1–3 dm. long, often growing in mats: leaf-blades ovate, 0.5–2 cm. long: sepals oblong-lanceolate, 3–4 mm. long, soft-tipped: petals shorter than the sepals: capsule 4–5 mm. long, longer than the calyx. [*Stellaria media* (L.) Vill.]—(COMMON-CHICKWEED.)—Cult. grounds, woods, and fields, throughout U. S. and Can., except the extreme N and S. Nat. of Eu.—All year.

3. *A. Baldwinii* Small. Stems 1-6 dm. long, often pubescent: leaf-blades ovate, sometimes very broadly so, 0.5-2 cm. long: sepals ovate, 2-3 mm. long: petals about twice as long as the sepals: capsule 3.5-4 mm. long. [*Stellaria prostrata* Bald. not *Alsine prostrata* Forsk.]—Moist soil, Coastal Plain and adj. provinces, Fla. to Tex. and Ga.—(Mex.)—Spr.

4. *A. longifolia* (Muhl.) Britton. Stems 1.5-4.5 dm. long, glabrous or nearly so: leaf-blades narrowly linear-lanceolate, 1.5-7 cm. long: sepals lanceolate, about 3 mm. long, acute, firm-tipped: petals as long as the sepals or somewhat longer: capsule 5-6 mm. long, longer than the calyx. [*Stellaria longifolia* Muhl.]—(STITCHWORT.)—Wet places and swamps, various provinces, La. to Colo., Alas., Md., and Newf.—Spr.

5. *A. pubera* (Michx.) Britton. Stems 1-3 dm. tall, finely pubescent: leaf-blades ovate, or elliptic, 14 cm. long, or those on the sterile branches 5-10 cm. long: sepals ovate to broadly oblong-lanceolate, 5-7 mm. long: petals longer than the sepals: capsule 3-4 mm. long, shorter than the calyx. [*Stellaria pubera* Michx.]—(GREAT-CHICKWEED. STAR-CHICKWEED.)—Rich mould on hill-sides, various provinces, rarely Coastal Plain, N Fla. to Ala., Ind., and N. J.—Spr.

6. *A. tennesseensis* (C. Mohr) Small. Similar to *A. pubera* in habit: leaf-blades oval to suborbicular on the lower part of the stem, to elliptic or elliptic-lanceolate above, 3-5 cm. long, or longer on the sterile shoots: sepals narrowly lanceolate, 9-11 mm. long: capsule 4-5 mm. long.—Woods, Interior Low Plateau, Ala., Tenn., and Ky.—Spr.

7. *A. fontinalis* (Short & Peter) Britton. Stems 1-3 dm. long, glabrous: leaf-blades linear-spatulate, 0.5-2 cm. long, obtusish: sepals lanceolate to oblong-lanceolate, 2.5-3 mm. long: petals wanting: capsule surpassing the sepals. [*Stellaria fontinalis* Robinson]—River banks, Interior Low Plateau, Tenn. and Ky.—Spr.

3. **SABULINA** Reichenb. Annual or perennial herbs. Leaf-blades subulate or sometimes flat, but narrow. Flowers in cymes. Sepals 5, often fleshy. Petals 5, entire or emarginate. Stamens usually 10. Stigmas typically 3, slender. Capsule with as many valves as stigmas. [*Alsinopsis* (Fl. SE. U. S.)]—SANDWORTS. WITCHLINGS.—The flowers are white or pinkish.

Leaves herbaceous or fleshy.  
Leaves leathery, rigid, subulate or bristle-like.

I. BREVIFOLIAE.  
II. STRICTAE.

#### I. BREVIFOLIAE

Sepals not ribbed, scarcely nerved.

Mature sepals 4-5 mm. long.

Leaf-blades linear or linear-oblong.

Leaf-blades filiform to subulate.

Mature sepals 2-3 mm. long.

Basal and lower stem-leaves mostly less than 1 cm. long:

upper stem-leaves and bracts minute or subulate.

Basal and lower stem-leaves mostly over 1 cm. long:

upper stem-leaves and bracts linear.

Sepals strongly 3-5-ribbed.

1. *S. uniflora*.
2. *S. groenlandica*.
3. *S. brevifolia*.
4. *S. glabra*.
5. *S. patula*.

#### II. STRICTAE

Leaves clustered in the axils.

Leaves densely imbricated.

6. *S. stricta*.
7. *S. caroliniana*.

1. *S. uniflora* (Walt.) Small. Stems 1-3 dm. tall: leaf-blades linear, 1-4 cm. long, acute: pedicels 2-3 cm. long: sepals lanceolate, 4-5 mm. long, acute:

petals linear-cuneate, 6–8 mm. long: seed 0.5 mm. long, minutely roughened. [*Stellaria uniflora* Walt.].—Meadows or springy places, Coastal Plain and adj. provinces, Fla. to Ala. and N. C.—Spr.

2. *S. groenlandica* (Retz.) Small. Stems 0.3–2 dm. tall: leaf-blades filiform to subulate, 3–15 mm. long: sepals elliptic to elliptic-lanceolate, 3.5–4 mm. long, obtuse: petals obovate to cuneate, 6–8 mm. long: capsule 5–6 mm. long. [*Alsine groenlandica* (Retz.) A. Gray].—(MOUNTAIN-SANDWORT).—Rocky soil, Blue Ridge and more northern provinces, N. C. and Tenn., to N. Y., Conn., Lab., and Greenl.—Spr.—sum.

3. *S. brevifolia* (Nutt.) Small. Stems 0.2–1.2 dm. tall: leaf-blades linear-spatulate to subulate, 2–6 mm. long: sepals ovate-lanceolate to elliptic-lanceolate, 2–3 mm. long, truncate or emarginate: petals spatulate or obovate: spatulate, 4–5 mm. long: capsule about 4 mm. long. [*Alsine brevifolia* Chapm.].—Flat granite rocks, and Altamaha grit, inner Coastal Plain and Piedmont, Ga. and Ala. to N. C.—Spr.

4. *S. glabra* (Michx.) Small. Stems 0.5–3 dm. tall: leaf-blades narrowly linear to nearly filiform, 1–2.5 cm. long: sepals elliptic to elliptic-ovate, 2.5–3 mm. long, obtuse: petals spatulate, 4–6 mm. long: capsule about 3 mm. long. [*Alsine glabra* A. Gray].—Cliffs, Blue Ridge and Appalachian Plateau, N. C. and Tenn.—Sum.

5. *S. patula* (Michx.) Small. Stems 0.4–3 dm. tall: leaf-blades linear or filiform, 1–4 cm. long: sepals lanceolate, 3–5 mm. long, acute or acuminate, prominently 3–5-ribbed: petals spatulate, 8–11 mm. long: capsule about as long as the sepals. [*Alsine patula* A. Gray].—Rocky woods, limestone outcrops, and prairies, various provinces N of Coastal Plain, Ala. to Tex., Minn., and Ky.—Spr.—sum.

6. *S. stricta* (Michx.) Small. Stems 1–3 dm. tall: leaf-blades linear-subulate, 5–10 mm. long: sepals ovate, about 2.5 mm. long: petals about thrice as long as the sepals: capsule nearly twice as long as the sepals. [*Alsine Michauxii* Fenzl].—(ROCK-SANDWORT).—Rocky hillsides and cliffs, often calcareous, various provinces N of Coastal Plain, S. C. to Minn., and N. H.—Sum.

7. *S. caroliniana* (Walt.) Small. Stems 0.5–3 dm. tall: leaf-blades linear-subulate, 5–10 mm. long: sepals ovate, about 2.5 mm. long: petals about thrice as long as the sepals: capsule nearly twice as long as the sepals. [*Alsine squarrosa* Fenzl].—(LONGROOT).—Sand-hills and pinelands, often in acid soil, Coastal Plain, W Fla. to N. Y.—Spr.—sum.

4. **ARENARIA** L. Annual or perennial herbs. Leaf-blades flat, broad or sometimes narrow. Flowers axillary or cymose. Sepals 5, firm, often ribbed. Petals 5, entire or notched, or wanting. Stamens typically 10. Stigmas 3, or rarely 2–5. Capsules with twice as many valves as stigmas.—SANDWORTS. SANDYWINKS.

Plant annual: leaf-blades several-ribbed: outer sepals lanceolate, hispidulous.

Plant perennial: leaf-blades not ribbed: outer sepals ovate, glabrous or nearly so.

1. *A. serpyllifolia*.

2. *A. lanuginosa*.

1. *A. serpyllifolia* L. Plant 1-4 dm. tall, erect, sometimes in much-branched tufts: leaf-blades ovate, elliptic, or oval, 2-8 mm. long, ciliolate, hispidulous: outer sepals lanceolate, 2-2.5 mm. long, becoming strongly ribbed: petals white, shorter than the sepals: capsule with a turgid base and a constricted tip, about 2.5 mm. long.—(THYME-LEAVED SANDWORT.)—Dry soil, woods, fields, roadsides and waste-places, widely distributed in the U. S. and S. Can. Nat. of Eurasia.—Spr.—A related species, *A. leptoclados* Guss. with smaller and narrower leaves and bracts on more slender branches, and narrower capsules is to be expected in N. C.; it has been found in S. Va.

2. *A. lanuginosa* (Michx.) Rohrb. Plant with diffusely prostrate branches, mostly 1-6 dm. long: leaf-blades spatulate to elliptic, 1-2.5 cm. long, eciliate, often obscurely fine-pubescent: outer sepals ovate, 2.5-3.5 mm. long, not ribbed: petals white, much shorter than the sepals: capsule ovoid, about 3.5 mm. long.—Woods, shaded banks, swamps, and hammocks, Coastal Plain and adj. provinces, Fla. to Tex. and N. C.—(W. I.)—Spr.—fall.

5. *HOLOSTEUM* [Dill.] L. Annual tender herbs. Leaf-blades flat. Flowers in umbel-like cymes. Sepals 5, persistent. Petals 5, emarginate or toothed. Stamens 5, or 3. Stigmas slender. Capsule narrow, partly enclosed in the calyx.—Three species, natives of Europe and temperate Asia.

1. *H. umbellatum* L. Plants 8-40 cm. tall: leaf-blades elliptic or oblanceolate below, to elliptic or lanceolate above, 1-3 cm. long: sepals lanceolate, 4-5 mm. long: petals 5.5-6.5 mm. long, toothed: capsule 5-6 mm. long.—(JAGGED-CHICKWEED.)—Cult. grounds, roadsides, and waste-places, Coastal Plain, Ga. to Pa. and N. J. Nat. of Eu.—Spr.—This chickweed is one of the very early spring plants. The pale-green or glaucous foliage is usually strongly contrasted with that of the usually darker-green plants of the fields and roadsides where this plant thrives. The flowers are white or pinkish.

6. *CERASTIUM* L. Annual or perennial herbs. Leaf-blades herbaceous. Flowers cymose. Sepals 5, or 4, ribless. Petals 5, or 4, notched or 2-cleft, or rarely wanting. Stamens 10 or fewer. Stigmas 5 or 4, stout. Capsule much exceeding the calyx.—About 50 species, natives mostly of temperate regions.—Spr.—early sum.—MOUSE-EAR CHICKWEEDS. *CERASTIUMS*.—The various species of *Cerastium* exhibit great contrasts in flowers. The white or pinkish, or rarely greenish, corollas of some species form conspicuous patches when the plants are in flower, while in other species the petals are so small that they are scarcely visible.

Corolla shorter than the calyx or slightly longer, the petals inconspicuous.

## I. VULGATA.

Corolla twice as long as the calyx or nearly so, the petals conspicuous.

## II. ARVENSIA.

## I. VULGATA

Bracts scarious or scarious-margined.

Plants annual: capsule nearly straight, less than 8 mm. long.

Plant perennial: capsule curved upward, over 8 mm. long.

Bracts herbaceous.

Capsule about twice as long as the calyx or less.

Capsule fully twice as long as the calyx.

Pedicle 3 times as long as the fruiting calyx or less, straight or nearly so: cymes more or less glomerate.

Pedicle about 5 times as long as the fruiting calyx, bent: cymes open.

1. *C. semidecandrum*.

2. *C. vulgatum*.

3. *C. viscosum*.

4. *C. brachypodum*.

5. *C. longipedunculatum*.

## II. ARVENSIA

Capsule less than twice as long as the calyx: blades of the cauline leaves linear to linear-lanceolate.

Capsule over twice the length of the calyx: blades of the cauline leaves narrowly lanceolate to elliptic.

6. *C. arvense*.

7. *C. velutinum*.

1. *C. vulgatum* L. Plants 8-50 cm. tall, pubescent and somewhat clammy: blades of the upper leaves elliptic, narrowly elliptic, or ovate, 5-35 mm. long: sepals lanceolate, 5-6 mm. long, obtuse: petals narrowly obovate: capsule 9-11 mm. long.—(MOUSE-EAR.)—Roadsides, pastures, and fields, U. S. generally and S. Can. Nat. of Eu.—Sum.

2. *C. semidecandrum* L. Plants 5-15 cm. tall, viscid-villous; blades of the upper leaves obovate or elliptic, 5-10 mm. long: sepals lanceolate, 3-3.5 mm. long, acuminate: petals elliptic, about as long as the sepals: capsule 5-7 mm. long.—Dry pastures, fields, and waste-places, Coastal Plain and adj. provinces, N. C. to Mass. Nat. of Eu.—Sum.

3. *C. viscosum* L. Plants 8-40 cm. tall, viscid-villous: blades of the upper leaves oval or obovate, 8-25 mm. long: sepals oblong-lanceolate, 4-5 mm. long, acute: petals elliptic-oblong, shorter than the sepals or slightly longer: capsule 7-9 mm. long.—Hillsides, meadows, and moist soil, various provinces, Fla. to Tex., Ont., and N. B.; also Pacif. States.—Spr.

4. *C. brachypodum* (Engelm.) Robinson. Plants 5-15 cm. tall, viscid-pubescent: blades of the upper leaves oblanceolate, elliptic or linear-elliptic, 8-30 mm. long: cymes somewhat open (or congested and with very slender capsules in *C. brachypodum compactus*): sepals lanceolate, 3-4 mm. long, acute or acuminate: petals spatulate or elliptic-spatulate, fully as long as the sepals or shorter: capsule 5-8 mm. long.—Dry soil, various provinces, Ga. to Tex., Ariz., S. D., and Ill.—(Mex.)—Spr.—sum.

5. *C. longipedunculatum* Muhl. Plants 8-50 cm. tall, clammy-villous: blades of the upper leaves elliptic, linear-elliptic, or lanceolate, 9-60 mm. long: sepals elliptic or elliptic-lanceolate, 4-5 mm. long, acute: petals elliptic or linear-elliptic, somewhat longer than the sepals, or wanting: capsule 9-13 mm. long. [*C. nutans* Raf.]—Rich soil, moist thickets, and woods, various provinces, Fla. to Tex., Calif., B. C., and N. S.—(Mex.)—Spr.

6. *C. arvense* L. Plants 9–40 cm. tall, soft-pubescent: blades of the upper leaves linear-lanceolate to linear, 25–30 mm. long: sepals elliptic-lanceolate, 4–5 mm. long, acutish: petals cuneate, scarcely twice as long as the sepals: capsule 8–10 mm. long, less than twice the length of the mature calyx.—(STARRY-CERASTIUM.)—Hillsides, dry stony places, and cliffs, various provinces, in Coastal Plain only N, Ga. to Ind., Alas., Ont., and Lab.—Spr.

7. *C. velutinum* Raf. Plants 15–40 cm. tall, copiously soft-pubescent, or becoming glabrous in age: blades of the upper leaves mostly narrowly lanceolate to elliptic, 2.5–4 cm. long, flat: sepals elliptic to ovate-elliptic, 4.5–5.5 mm. long, obtuse: petals broadly cuneate, about twice as long as the sepals: capsule 12–14 mm. long, fully twice as long as the mature calyx.—Rocks or in stony soil, various provinces, N of Coastal Plain, Tenn. to Ark. (?), Minn., N. Y., and Md.—Spr.—sum.

7. *TISSA* Adans. Annual, biennial, or perennial, diffuse herbs. Leaf-blades narrow. Flowers in raceme-like cymes. Sepals 5, persistent. Petals 5. or fewer, entire, or wanting. Stamens 2–10. Stigmas slender.—About 20 species, widely distributed, but most abundant in saline regions.

1. *T. marina* (L.) Britton. Plants 10–20 cm. tall: leaf-blades linear, 10–30 mm. long: sepals ovate to elliptic-ovate, 4–6 mm. long: petals about as long as the sepals: capsule somewhat longer than the sepals. [*Spergularia salina* Presl]—(SAND-SPURRY. PINK MARSH-SPURRY.)—Beach sands and gravel, and saline places, Coastal Plain, Fla. to Tex., and N. B.; also around salt springs in C U. S., and on the Pacific Coast.—Spr.—fall. —The petals are pale-pink or whitish.—Another species, *T. rubra* (L.) J. & C. Presl, native of Europe, with broad and short stipules and purplish-red or pink-red corollas, has been found in Va. and La. and should be looked for in our range.

8. *SPERGULA* L. Annual herbs. Leaves numerous: blades thick, narrow. Flowers cymose. Sepals 5, persistent. Petals 5, larger than the sepals. Stamens 10 or rarely 5. Stigmas very short. Capsule longer than the calyx.—Three species, natives of the Old World.

1. *S. arvensis* L. Plants diffuse, 8–45 cm. tall: leaf-blades linear-filiform, 10–35 mm. long: sepals elliptic to elliptic-ovate, 3.5–5 mm. long: petals about as long as the sepals: capsule globular or globose-ovoid, 6–7 mm. long.—(SPURRY. CORN SPURRY.)—Fields, cult. grounds, and waste-places, N. A. generally, except extreme N. Nat. of Eu.—Sum.—The other Old World species resemble *S. arvensis* in habit. They are to be expected in waste-places and cultivated grounds. In addition to minor foliage characters, they differ from *S. arvensis* in their winged seeds. The seeds of the latter species are margined. The petals of all the species are white or pinkish.

9. **DRYMARIA** Willd. Annual or perennial diffuse herbs. Leaves opposite, with small, often deciduous, stipules: blades broad. Flowers cymose, inconspicuous. Sepals 5, herbaceous or scarious-margined. Petals 5 or fewer, usually shorter than the sepals, deeply 2-lobed. Stamens 5 or fewer. Capsule shorter than the calyx, 3-valved.—About 30 species most abundant in tropical regions.—The petals are mostly white.

1. **D. cordata** (L.) Willd. Annual, the branches diffuse or prostrate, mostly 1-4 dm. long: leaf-blades orbicular-ovate to reniform, mostly 5-20 mm. long, usually abruptly pointed, slender-petioled: cymes slender-peduncled: sepals narrowly elliptic or nearly so, becoming 4-4.5 mm. long, acute or slightly acuminate: petals 2-2.5 mm. long, the lobes spatulate or nearly linear: capsule oval or oval-ovoid, 3-3.5 mm. long.—Roadsides, gardens, fields, and banks, pen. Fla.—Nat. of trop. Am.—All year.—(W. I., Mex., C. A., S. A.)

10. **POLYCARPON** L. Annual herbs. Leaves opposite or in 4's: blades flat. Flowers cymose. Sepals 5, keeled. Petals 5, shorter than the sepals. Stamens 3-5. Stigmas short. Capsule often shorter than the calyx.—Six or eight species, widely distributed.

1. **P. tetraphyllum** L. f. Plants 2-12 cm. tall: leaf-blades spatulate to oval, 5-15 mm. long: sepals 1.5-2 mm. long at maturity, the keel arose above: petals inconspicuous, emarginate: capsule shorter than the sepals.—Waste-places and woods, Coastal Plain and Piedmont, Ala. to S. C.; also Calif. Widely distributed.—Spr.-fall.—Nearly all the species of *Polycarpon* are natives of the Old World. They have been widely scattered through the agency of ballast and cultivation. The flowers of this species have partly united and wholly united styles. The petals are white.

11. **STIPULICIDA** Michx. Perennial glabrous herbs. Leaf-blades dilated at the base of the plant, scale-like above. Flowers in terminal capitate clusters. Sepals 5, notched or emarginate. Petals 5, often toothed near the base. Stamens 3-5. Style short. Capsule longer than the sepals.—Only the following species known.—Spr.-fall.

Stem or branches wire-like: flowers 3-6 in a cluster: petals spatulate. 1. *S. setacea*.  
Stems or branches filiform: flowers solitary or 2-3 in a cluster: petals constricted at the middle. 2. *S. filiformis*.

1. **S. setacea** Michx. Plants 5-22 cm. tall: leaf-blades spatulate to obovate or suborbicular, 8-15 mm. long or longer: sepals elliptic to cuneate, 1.5-2 mm.

long, narrowly hyaline-margined: capsule over 1 mm. long.—Pinelands and sandhills, Coastal Plain, Fla. to Miss. and N. C.

2. *S. filiformis* Nash. Plants 6–20 cm. tall: leaf-blades suborbicular, about 4 mm. long: sepals obovate, 1.5–3 mm. long, broadly hyaline-margined: capsule scarcely 1 mm. long.—Pinelands, and scrub, Coastal Plain, Fla. to Miss.—The plants start with a dense rosette of small leaves. They grow best in the apparently sterile white sand. Plants vary from those with a single stem to those with a hundred or more stems thus formed into dense dome-like clusters.

#### FAMILY 14. CARYOPHYLLACEAE — PINK FAMILY

Herbs with stems usually swollen at the nodes. Leaves opposite: blades often with connate bases. Flowers perfect, polygamous, or rarely dioecious. Calyx of 4 or 5 partially united sepals. Corolla of 4 or 5 distinct petals, the claws in the calyx-tube, the blades often appendaged at the base. Androecium of usually 8 or 10 distinct stamens. Gynoecium of 2–5 united carpels. Ovary often stalked. Fruit a capsule opening by apical valves.—Twenty genera and 600 species, widely distributed.

Calyx-tube with 5 ribs, nerved or nerveless: styles 2.  
Calyx-tube with 10 or more ribs: styles 3 or more.

Tribe I. DIANTHEAE.  
Tribe II. LYCHNIDEAE.

##### I. DIANTHEAE

Petals unappendaged.

Calyx terete or nearly so, subtended by bractlets.

Calyx angled, or wing-angled in fruit, not bracteolate.

Petals appendaged at the blade-base: calyx without bractlets.

1. DIANTHUS.
2. VACCARIA.
3. SAPONARIA.

##### II. LYCHNIDEAE

Styles 3, or rarely 4.

Styles 5.

Calyx-lobes relatively small, short: petal-blades appendaged.

Calyx-lobes foliaceous, elongate: petal-blades unappendaged.

4. SILENE.
5. LYCHNIS.
6. AGROSTEMMA.

1. *DIANTHUS* L. Perennial or rarely annual herbs. Leaf-blades usually narrow. Flowers perfect, sessile. Calyx narrow: tube equally striate. Petals 5: blades narrow. Ovary elongate. Capsule narrow, sessile.—About 200 species, natives of the Old World, except one extending into Arctic America.—PINK. CARNATION.—Many species are represented among the pinks of the gardens.

1. *D. Armeria* L. Stem 2–8 dm. tall, minutely pubescent: blades of the cauline leaves linear, 3–8 cm. long: calyx pubescent, 19–22 mm. long; lobes lanceolate, acuminate: petal-blades elliptic to cuneate, 5–6.5 mm. long, mainly pink, toothed: capsule 13–15 mm. long.—(DEPTFORD-PINK.) —Roadsides, fields, and woods, various provinces, Ga. to Ia., Mich., and Me. Nat. of Eu.—Sum.

2. **VACCARIA** Medic. Annual herbs. Leaf-blades relatively wide. Flowers pedicelled. Calyx inflated: tube angled or winged. Petals 5: blades broad. Capsule slightly longer than thick.—Three species, natives of Eu. and Asia.

1. **V. Vaccaria** (L.) Britton. Stems 2-9 dm. tall, glaucous: blades of the upper cauline leaves lanceolate to ovate-lanceolate, 3-11 cm. long: calyx 10-15 mm. long, ovoid at maturity; lobes acute: petal-blades obovate, rose-colored: capsule 5-10 mm. long.—(COW-HERB. DAIRY-PINK.)—Fields and waste-places, various provinces, Fla. to Tex., B. C., Ont., and Me. Nat. of Eu.—Sum.—This species is said to have come originally from continental Europe. The plants are showy when in flower. They were for a long time an esteemed garden annual. It is said to be a favorite food of cattle.

3. **SAPONARIA** L. Annual or perennial herbs. Leaf-blades often broad. Flowers pedicelled. Calyx narrow: tube terete. Petals 5: blades narrow. Ovary elongate. Capsule-body cylindric or oblong, short-stipitate.—About 35 species, natives of the Old World.

1. **S. officinalis** L. Stems 3-9 dm. long, often decumbent: leaf-blades elliptic to lanceolate, 3-11 cm. long: calyx 20-25 mm. long; lobes triangular to lanceolate: petal-blades cuneate, 15-18 mm. long, entire, pink or white: capsule-body 12-20 mm. long.—(SOAPWORT. BOUNCING-BET. HEDGE-PINK.)—Waste-places, roadsides, fence-rows, and river-banks, generally in eastern N. A. Nat. of Eu.—Sum.—fall.—A rapid-spreading and persistent weed. Double-flowered forms occur. The juices contain saponin.

4. **SILENE** L. Annual or perennial herbs. Leaf-blades various, commonly narrow. Flowers mostly pedicelled. Calyx narrow or becoming inflated: tube 10-many-nerved. Petals 5: blades often toothed at the apex or lobed. Ovary somewhat elongate. Capsule-body much longer than thick.—About 250 species of wide geographic distribution.—CAMPIONS. CATCHFLYS.

Calyx clavate, cylindric, or campanulate, definitely 10-ribbed.  
Calyx ovoid or globular. obscurely 15-20-ribbed.

I. **STELLATAE**.  
II. **LATIFOLIAE**.

#### I. **STELLATAE**

Plants perennial.  
Calyx inflated.

Leaves in whorls of 4's: petals laciniately cleft; appendages wanting.

Leaves opposite: petals 2-cleft; appendages present.

Calyx merely filled by the capsule.

Corolla white or pink.

Blades of the petals erose.

Petal-claws much exceeding the calyx: calyx rather sparsely glandular-pubescent: style much longer than the ovary.

1. *S. stellata*.
2. *S. alba*.

3. *S. caroliniana*.

- Petal-claws about equalling the calyx: calyx densely pubescent with glandless hairs: style about as long as the ovary.  
 Blades of the petals fringed or dichotomously cleft.  
 Stems with short rigid hairs: calyx about 1 cm. long.  
 Stems with villous pubescence: calyx about 2.5 cm. long.  
 Corolla scarlet or crimson.  
 Petals 2-lobed.  
 Stems finely pubescent: upper stem-leaves with blades several times longer than broad.  
 Stems villous: upper stem-leaves with blades usually less than twice as long as broad.  
 Petals entire or nearly so, sometimes merely erose.  
 Plants annual or biennial.  
 Inflorescence simple.  
 Inflorescence branched.  
 Flowers in dichotomous racemes.  
 Flowers in dichotomous cymes.  
 Foliage pubescent: stem viscid.  
 Foliage glabrous, normally glutinous about the nodes of the stem.

4. *S. Wherryi*.
5. *S. ovata*.
6. *S. Baldwinii*.
7. *S. virginica*.
8. *S. rotundifolia*.
9. *S. regia*.
10. *S. anglica*.
11. *S. dichotoma*.
12. *S. noctiflora*.
13. *S. antirrhina*.

## II. LATIFOLIAE

Perennial herb usually branched at the base, the flowers more or less nodding.

14. *S. latifolia*.

1. *S. stellata* (L.) Ait. f. Stem 3–12 dm. tall, usually minutely pubescent: leaf-blades ovate to lanceolate, 4–12 cm. long: calyx becoming 10–16 mm. long; lobes about  $\frac{1}{2}$  as long as the tube: petals white, 1.5–2 cm. long; blades lacinate: capsule-body subglobose to ovoid-globose, 6–8 mm. long, short-stipitate.—(STARRY-CAMPION. WIDOW'S-FRILL.)—Rich or dry woods, various provinces, Ga. to Tex., Minn., and Mass.—Sum.

2. *S. alba* Muhl. Stem 3–8 dm. tall, sometimes minutely pubescent: leaf-blades lanceolate to linear-lanceolate or slightly broadest above the middle, 4–15 mm. long: calyx becoming 14–16 mm. long: lobes about  $\frac{1}{2}$  as long as the tube: petals white, 2–2.5 cm. long; blades cleft: capsule-body oblong to ovoid, 9–11 mm. long.—(SNOWY-CAMPION.)—River shores and islands, various provinces, N of Coastal Plain, Tenn. to Nebr., Minn., and Md.—Spr.—sum.

3. *S. caroliniana* Walt. Stem 1–2.5 dm. long, closely pubescent: leaf-blades spatulate to linear-spatulate on the lower part of the stem, lanceolate above, 3–12 cm. long: calyx clavate, becoming 2–2.5 cm. long; lobes broadly ovate: petals pink or white, the blades about 1.5 cm. long, notched, raised above the calyx-lobes on the long claws: capsule 9–11 mm. long. [*S. pennsylvanica* Muhl.]—(WILD-PINK. ROCK-CATCHFLY.)—Shaded banks and rocky woods, various provinces, Ga. to Ky. and Me.—Spr.

4. *S. Wherryi* Small. Plant similar to *S. caroliniana* in habit and foliage: calyx densely pubescent with whitish glandless hairs: petals white to rose-pink, the blades less notched than in those of the next preceding species, little, if at all raised above the calyx-lobes.—Rocky slopes and stream banks, Interior Low Plateaus and adj. provinces, Ala. to Mo. and S Ohio.—Spr.

5. *S. ovata* Pursh. Stem 5–12 dm. tall, minutely pubescent: leaf-blades ovate to ovate-lanceolate or elliptic-lanceolate, 4–15 cm. long: calyx becoming 8–10

mm. long; lobes deltoid to broadly triangular: petals white; blades 1-1.5 cm. long: capsule-body narrowly ovoid, 8-9 mm. long.—Woods, Blue Ridge and adj. provinces, Ga. to Ala. and N. C.; also Ozark Plateau, Ark.—Sum.

6. *S. Baldwinii* Nutt. Stem 1-4 dm. tall, villous: leaf-blades spatulate to elliptic or lanceolate, 3-9 cm. long: calyx becoming 2.5 cm. long; lobes lanceolate: petals white or pink; blades 2-2.5 cm. long, flabellate: capsule-body oval, 7-9 mm. long.—Woods, Coastal Plain and Piedmont, Fla. to Ga.—Spr.

7. *S. virginica* L. Stem 2-5 dm. tall, very clammy-pubescent: leaf-blades spatulate to elliptic or lanceolate, 5-20 cm. long: calyx becoming 2-2.5 cm. long; lobes ovate to deltoid-ovate: petals crimson; blades linear to narrowly elliptic, 2-2.5 cm. long: capsule-body narrowly obovoid, 10-15 mm. long.—(FIRE-PINK.)—Open woods and gravelly or sandy hillsides, various provinces, N of Coastal Plain, Ga. to Ark., Minn., Ont., N. Y., and N. J.—Spr.—fall.

8. *S. rotundifolia* Nutt. Stem 2-7 dm. tall, clammy-villous: leaf-blades spatulate to oval or ovate, 5-20 cm. long: calyx becoming 2.5-3 cm. long; lobes ovate-lanceolate: petals bright scarlet; blades elliptic, 1-1.5 cm. long: capsule-body 17-22 mm. long.—Rocky banks, Appalachian Plateau and occasionally adj. provinces, Ga. to Ala. and Ohio.—Sum.

9. *S. regia* Sims. Stems 6-15 dm. tall, viscid-pubescent: leaf-blades lanceolate to ovate, or narrower at the base of the stem, 4-8 cm. long: calyx becoming 2-2.5 cm. long; lobes ovate: petals scarlet; blades 1.5-2 cm. long: capsule-body 15-20 mm. long.—Dry or rocky woods, various provinces, N of Coastal Plain, Ga. to Okla., Mo., and Ohio.—Sum.

10. *S. anglica* L. Stems 2-4 dm. tall, villous: leaf-blades spatulate to linear, 1.5-3 cm. long: calyx-tube slightly ribbed, less than 1 mm. long: petal-blades white (or crimson with a pink or white border in *S. anglica quinquevulnera*), 5-6 mm. long: capsule 8-9.5 mm. long.—Waste-places, various provinces, S. C. to Ont. and Me.; also Pacific slope. Nat. of Eu.—Spr.—sum.

11. *S. dichotoma* Ehrh. Stems 3-7 dm. tall, finely pubescent: leaf-blades oblanceolate to lanceolate, 5-8 cm. long: calyx-tube wing-ribbed, ultimately over 1 cm. long: petal-blades white or pink, 6-8 mm. long: capsule 10-11 mm. long.—Fields and waste-places, locally in the U. S. Nat. of Eurasia.—Sum.

12. *S. noctiflora* L. Stem 2-8 dm. tall, closely pubescent: leaf-blades spatulate to elliptic or lanceolate, 2-8 cm. long: calyx-tube prominently ribbed, ultimately 12-15 mm. long: petal-blades 9-11 mm. long, white or nearly so: capsule 6-8 mm. long.—(NIGHT-FLOWERING CATCHFLY.)—Roadsides, fields, and waste-places, various provinces, Fla. to Mo., Man., and N. B. Nat. of Eu.—Sum.

13. *S. antirrhina* L. Stem 2-8 dm. tall, with glutinous patches near the nodes: leaf-blades linear to linear-elliptic, or the lower ones elliptic, 2-8 cm. long: calyx-tube 5.5-7.5 mm. long, ultimately ovoid or oval (globose in *S. antirrhina linaria*): petals white or pink; blades cuneate to linear, 6-8 mm. long: capsule 6-8 mm. long, not stipitate.—(SLEEPY-CATCHFLY. GARTER-PINK.)—Waste-places, cult. grounds, and roadsides, various provinces, Fla. to Tex., B. C., Ont., and Me.—(Mex.)—Sum.

14. *S. latifolia* (Mill.) Britton & Rendle. Stem 2-5 dm. tall, glaucous and usually glabrous: leaf-blades various, spatulate on the lower part of the stem, lanceolate to ovate-lanceolate above: calyx becoming much inflated, finely reticulate between the inconspicuous ribs: petal-blades white or pink, about 1 cm. long, 2-lobed: capsule ovoid, 5-7 mm. long.—(BLADDER-CAMPION. COWBELLS. RATTLE-BAGS.)—Fields, roadsides, meadows, woods, and waste-places, various provinces, Tenn. to Mo., Ia., Ont., and N. B.; also Pacific Coast. Nat. of Eu.—Sum.

5. **LYCHNIS** [Tourn.] L. Annual or perennial herbs similar to *Silene* in habit. Flowers pedicelled and mostly erect. Calyx becoming more or less inflated, 10-nerved. Petals 5: blades entire, cleft, or lacinate, generally appendaged. Ovary more or less elongate. Capsule as long as thick or longer.—About 35 species, natives of the temperate and Arctic zones.—**CAMPIONS.**

1. **L. alba** Mill. Plants 1 m. tall or less, the stem usually branched throughout, fine-pubescent: leaf-blades spatulate to elliptic, oval, or lanceolate, 3-8 cm. long: calyx becoming 14-21 mm. long; lobes triangular to ovate,  $\frac{3}{4}$ -1 as long as the tube: petals white or rarely pink; blades reniform to broadly cuneate: capsule conic-ovoid, the opening narrow.—(**WHITE-CAMPION.**)—Road-sides and fields, N. C. to Ont. and N. S. Nat. of Eu.—Sum.

6. **AGROSTEMMA** L. Annual coarse herbs. Leaf-blades very narrow. Flowers long-peduncled. Calyx becoming swollen: tube 10-ribbed. Petals 5: blades broad, unappendaged. Ovary about as thick as long. Capsule slightly elongate.—Two species, natives of Eurasia.

1. **A. Githago** L. Stems 2-9 dm. tall, appressed-pubescent: leaf-blades linear, 4-12 cm. long: calyx becoming 5-6 cm. long; lobes linear, acuminate, longer than the copiously pubescent tube: petals 30-35 mm. long; blades cuneate to obovate, purple or magenta: capsule 18-22 mm. long.—(**CORN-COCKLE. CORN-ROSE. CORN-CAMPION.**)—Grain-fields and fence-rows, nearly throughout cult. N. A. Nat. of Eu.—Sum.

## ORDER RANALES — RANAL ORDER

Herbs, shrubs, or trees. Leaves mostly without stipules, with entire or dissected blades, in aquatics often various on the same plant. Flowers perfect, monoecious, or dioecious. Calyx and corolla of distinct sepals and petals. The corolla is sometimes wanting. Androeceum of usually more hypogynous stamens than there are sepals. Gynoeceum of 1 or several distinct or united carpels. Ovary superior. Fruit various.

Stamens usually numerous, the anther-sacs opening by slits.

Land plants, except in CERATOPHYLLACEAE and some RANUNCULACEAE: leaf-blades not peltate.

Flowers perfect or monoecious, if dioecious, on neither vines nor herbs with simple leaves.

Plant with minute axillary monoecious flowers: anthers horned.

Plant with perfect or rarely dioecious flowers: anthers not horned.

Carpels 1 or more, distinct, at least at maturity.

Fam. 1. CERATOPHYLLACEAE.

Sepals 3-15; petals about as many: plants if shrubby not with pulpy fruit; endosperm even.

Sepals 3 (or 4): petals 6; fruit pulpy; endosperm channeled.

Carpels more or less coherent or united into cone-like structures, or immersed in the pulpy receptacle.

Sepals valvate.

Sepals imbricated.

Flowers dioecious: vines with simple leaves.

Water plants: emerged or floating leaves with peltate blades.

Carpels several and distinct.

Carpels not in a fleshy receptacle: sepals and petals 3 or 4 each; stamens 3-18.

Carpels immersed in a fleshy receptacle: sepals and petals numerous: stamens indefinite.

Carpels united into a compound pistil.

Stamens few and definite, the anther-sacs opening by hinged valves, except in *Podophyllum*.

Herbs: leaves with simple or ternate blades.

Shrubs: leaves with pinnately or digitately compound, sometimes 1-foliate blades.

Fam. 2. RANUNCULACEAE.

Fam. 3. ANNONACEAE.

Fam. 3. ANNONACEAE.

Fam. 4. MAGNOLIACEAE.

Fam. 5. MENISPERMACEAE.

Fam. 6. CABOMBACEAE.

Fam. 7. NELUMBONACEAE.

Fam. 8. NYMPHAEACEAE.

Fam. 9. PODOPHYLLACEAE.

Fam. 10. BERBERIDACEAE.

## FAMILY 1. CERATOPHYLLACEAE — HORNWORT FAMILY

Annual aquatic herbs. Leaves whorled: blades cleft or finely dissected. Flowers monoecious. Calyx of 6-12 narrow toothed or cleft sepals. Corolla wanting. Androecium of 10-24 stamens with short filaments. Gynoecium 1-carpellary: stigma subulate. Fruit an achene, sometimes spine-armed.—Represented by the following genus only.

1. *CERATOPHYLLUM* L. Submerged plants with sessile leaf-blades, the divisions mostly thrice forked. Flowers sessile in the leaf-axils.—Following are the only known species.—Sum. or all year southward.—CEDAR-MOSSES. COON-TAILS. FISH-BLANKETS. HORNWEEDS. HORNWORTS.

Achene armed on the edges with spines, long beaked.

Leaves 6-9 in a whorl; segments spiny-toothed; achenes with a spine on either side of the base.

Leaves 9-12 in a whorl; segments bristly-toothed: achenes fringed with spines.

Achene unarmed, short-beaked.

1. *C. demersum*.

2. *C. echinatum*.

3. *C. submersum*.

1. *C. demersum* L. Stem 3-12 dm. long: leaves rather rigid; blades 1-2 times forking: sepals elliptic to ovate-elliptic, erose; stamens slightly exserted: style and stigma exserted: achene-body ovoid, ovoid-ellipsoid, or ellipsoid, 5-6 mm. long.—Shallow water and slow-flowing streams, various provinces, Fla. to La., Calif., and S Can.—(*W. I., Mex., O. W.*)

2. *C. echinatum* A. Gray. Stem 2-5 dm. long: leaves flaccid; blades 3-4 times forked: achene-body broadly ellipsoid, about 6 mm. long, margined.—Slow streams and ponds, various provinces, Fla. to Calif. and S Can.

3. *C. submersum* L. Stem 3-4 dm. long: leaves flaccid; blades 3-4 times forking, the segments bristly toothed: achene-body ellipsoid, 4 mm. long, spineless, sparingly warty.—Ponds, S pen. Fla.—(*O. W.*)

## FAMILY 2. RANUNCULACEAE — CROWFOOT FAMILY

Herbs or woody vines. Leaves alternate (opposite in Clematideae): blades simple or compound. Calyx of 3-5 imbricate (valvate in Clematideae) sepals. Corolla of about as many petals as there are sepals, occasionally wanting. Androeium of several of many hypogynous stamens. Gynoeium of 1 to many usually distinct carpels. Fruit an achene, a follicle or baccate.—About 35 genera and 1,100 species, widely distributed.

Fruit a follicle or a berry.

Carpel with a pair of ovules: fruit 1-seeded or 2-seeded.

Shrub: flowers paniculate: corolla present: fruit follicles.

Tribe I. XANTHORRHIZAE.

Herb: flowers solitary: corolla wanting: fruit berries.

Tribe II. HYDRASTAE.

Carpel with more than 2 ovules: fruit several-seeded.

Tribe III. HELLEBOREAE.

Fruit an achene: carpel with a single ovule.

Sepals imbricate: leaves, below the inflorescence, alternate, sometimes all basal.

Tribe IV. ANEMONEAE.

Sepals valvate, the edges sometimes turned in: leaves opposite.

Tribe V. CLEMATIDEAE.

## I. XANTHORRHIZAE

Shrub with pinnate leaf-blades.

1. XANTHORRHIZA.

## II. HYDRASTAE

Herb with simple lobed leaf-blades.

2. HYDRASTIS.

## III. HELLEBOREAE

Flowers regular.

Leaf-blades palmate or pedately veined or lobed.

Petals wanting.

3. CALTHA.

Petals present.

4. HELLEBORUS.

Leaf-blades ternately compound.

Petals without spurs, or wanting.

Fruit dry follicles.

Low herbs: flowers solitary or few.

5. COPTIS.

Carpels, and follicles, stalked: petals present.

Carpels, and follicles, not stalked: petals wanting.

6. ISOPYRUM.

Tall herbs: flowers many in elongate racemes.

7. CIMICIFUGA.

Fruit berry-like.

8. ACTAEA.

Petals prolonged backward into hollow spurs.

9. AQUILEGIA.

Flowers irregular.

Upper sepal prolonged into a spur: upper pair of petals sessile or nearly so, long-spurred.

10. DELPHINIUM.

Upper sepal hooded: upper pair of petals long-clawed, wholly concealed in the sepal-hood.

11. ACONITUM.

## IV. ANEMONEAE

Flowers, or their pedicels or peduncles subtended by involucre: petals wanting: sepals petal-like.

Involucre close to the calyx; bracts entire.

12. HEPATICA.

Involucre remote from the calyx: bracts toothed to dissected.

Style subulate: leaf-segments sessile.

13. ANEMONE.

Style wanting: leaf-segments stalked.

14. SYNDESMON.

Flowers not subtended by involucre: sepals rarely petal-like.

Leaf-blades simple, entire, toothed, lobed, or dissected.

Sepals spurred: receptacle greatly elongate.

15. MYOSURUS.

Sepals spurless: receptacle not greatly elongate.

Petals wanting.

16. TRAUTVETTERIA.

Petals present.

Petal-blades with a nectariferous gland or pit at the base.

Achene transversely wrinkled: petals white.

17. BATRACHIUM.

Achene not transversely wrinkled: petals yellow, at least without.

18. RANUNCULUS.

Petal-blades without gland or pit at the base.

19. ADONIS.

Leaf-blades ternately decomposed: petals wanting.

20. THALICTRUM.

## V. CLEMATIDEAE

Petals wanting.

Stamens spreading: sepals spreading.

Sepals with scarcely any border: flowers dioecious or polygamo-dioecious.

21. CLEMATIS.

Sepals with a wide border: flowers perfect.  
Stamens erect: sepals more or less converging.  
Petals present (in our species), smaller than the sepals.

22. VITICELLA.  
23. VIORNA.  
24. ATRAGENE.

1. **XANTHORRHIZA** L'Her. Weak shrubs. Leaf-blades 1-2-pinnate. Flowers paniculate. Sepals 5, brownish-purple, deciduous. Petals 5, gland-like. Stamens 5 or 10: filaments stout. Carpels few, sessile, 2-ovuled, in fruit forming a whorl of follicles.—One species.

1. **X. simplicissima** Marsh. Plant 2-6 dm. tall, diffuse: leaves approximate: leaflets mostly 5, the blades ovate to elliptic, 2.5-7.5 cm. long, incised-toothed or divided: sepals ovate to ovate-lanceolate, brownish-purple: follicles elliptic, 3-4 mm. long. [*X. apifolia* L'Her.] — (YELLOW-ROOT. SHRUB YELLOW-ROOT. BROOK-FEATHER.)—Woods, rocky banks, and ledges, various provinces, M Fla. to Tenn. and SW N. Y.—Spr.—The roots are brilliant yellow.

2. **HYDRASTIS** Ellis. Perennial herbs. Leaf-blades palmately lobed. Flowers solitary. Sepals 3, fugacious. Petals wanting. Filaments slender, white. Carpels several, 2-ovuled, in fruit forming a head of berries.—Two species, the following and one in Japan.

1. **H. canadensis** L. Plant pubescent, mostly 2-4 dm. tall: blade of the cauline leaf becoming 8-24 cm. wide: bract leaf-like, flower white: sepals ovate: fruit-head 14-16 mm. thick; berry 5-6 mm. long, crimson.—(GOLDEN-SEAL. ORANGE-ROOT. EYE-ROOT. INDIAN-DYE.)—Rich woods and shaded banks, various provinces N of Coastal Plain, Ga. to Kans., Minn., and Vt.—Spr.—The rootstock is used in medicine.

3. **CALTHA** [Rupp.] L. Perennial herbs. Leaf-blades entire or toothed. Flowers few or solitary. Sepals few, yellow, pink, or white, deciduous. Petals wanting. Filaments slender. Carpels few or many, several-ovuled, in fruit forming a whorl of leathery green follicles.—About 15 species, widely distributed.

1. **C. palustris** L. Plant glabrous, 2-6 dm. tall: blades of the cauline leaves similar to those of the basal but smaller, reniform to orbicular-reniform, 4-9 cm. wide: sepals yellow, oblong to oval-orbicular, 1.5-2 cm. long: follicles 10-12 mm. long.—(MARSH-MARIGOLD. COWSLIP. BULL'S-EYES. KINGCUP.)—Swamps and low meadows, often calcareous, various provinces, S only in Blue careous, various provinces, S. C. to Sask., Ont., and Newf.—(*Eurasia*.)—Spr.

4. **HELLEBORUS** L. Perennial herbs. Leaf-blades palmately lobed or divided. Flowers few or solitary. Sepals 5, white, greenish, or yellowish, mainly persistent. Petals small. Filaments filiform or nearly so. Carpels generally few, several-ovuled, in fruit forming a whorl of follicles.—About 15 species, Eurasian.

1. **H. viridis** L. Plant 3–6 dm. tall: blades of the basal leaves 1–3 dm. wide: segments 7–11, sharply serrate; sepals elliptic, about 25 mm. long: petals tubular, about 4 mm. long: follicles about 15 mm. long.—(CHRISTMAS-FLOWER. CHRISTMAS-ROSE. GREEN-HELLEBORE.)—Waste-places, cult. grounds, and fields, various provinces, N. C. to N. Y. Nat. of Eu.—Wint.—spr.

5. **COPTIS** Salisb. Perennial scapose herbs. Leaf-blades 3-foliate. Flowers solitary. Sepals 5–7, deciduous. Petals 5–7, cucullate. Stamens numerous: filaments slender. Carpels few, stipitate, several-ovuled, in fruit forming a cluster of apically beaked follicles.—About nine species, natives of the cooler parts of the north temperate zone.

1. **C. trifolia** (L.) Salisb. Plant 7–15 cm. tall: leaves persistent; divisions 3, obovate-cuneate to suborbicular, 1.5–3 cm. long, crenate or slightly lobed: flower white: sepals elliptic, 6–8 mm. long: petals about  $\frac{1}{2}$  as long as the sepals: follicles 3–7, the bodies 4–6 mm. long.—(GOLD-THREAD. CANKER-ROOT.)—Woods and bogs, various provinces, rarely Coastal Plain, S only in Blue Ridge and Appalachian provinces, N. C. to B. C., Alas., C Can. and Newf.—(Eurasia.)—Delights to form mats on decaying logs.—Spr.

6. **ISOPYRUM** L. Perennial caulescent herbs. Leaf-blades ternately decompose. Flowers few or solitary. Sepals 5–9, petal-like. Petals 5, gland-like or wanting. Stamens numerous: filaments clavate. Carpels mostly few, sessile (in ours), several-ovuled, in fruit forming ahead of follicles.—About 15 species, natives of the north temperate zone.

1. **I. biternatum** (Raf.) T. & G. Plant 1–3.5 dm. tall: leaflets 1–2.5 cm. long, lobed or divided; flower white: sepals elliptic or somewhat obovate, 9–12 mm. long: follicles 4–6 mm. long, slender-beaked.—(FALSE RUE-ANEMONE.)—Woods and bluffs, various provinces, west of Appalachians, W Fla. to Tex., Minn., and S Ont.—Spr.

7. **CIMICIFUGA** L. Perennial herbs. Leaf-blades decom- pound. Flowers numerous, in long racemes, white. Sepals 2-5, deciduous. Petals 1-8, clawed, notched at the apex. Stamens numerous: filaments filiform. Carpels few or solitary, many-ovuled, becoming dry follicles.—About 10 species, natives of North America and Eurasia.—BUGBANES.—Some species are used in medicine.

Carpels 1 or 2, sessile: seeds wholly or partially in 2 rows.

Filaments about 4 mm. long: follicles 8-10 mm. long: seeds chaffy.

Filaments about 8 mm. long: follicles 5-7 mm. long: seeds smooth.

Carpels 3 or 8, stalked: seeds in 1 row.

1. *C. rubifolia*.

2. *C. racemosa*.

3. *C. americana*.

1. **C. rubifolia** Kearney. Plant 6-14 dm. tall: terminal leaflets 5-7-lobed, 10-30 cm. wide: follicles glabrous, the beak spreading.—Wooded bluffs along Tennessee River, Appalachian Valley E Tenn.—Fall.

2. **C. racemosa** (L.) Nutt. Plant 10-25 dm. tall: terminal leaflets 3-lobed, 4-16 cm. wide: follicles puberulent and often pubescent, the beak recurved.—(BLACK-COHOSH. BLACK-SNAKE-ROOT. COHOSH-BUGBANE. FAIRY-CANDLES. RATTLE-TOP. STAR-LANCE.)— Woods, various provinces, rarely Coastal Plain, Ga. to Mo., Wisc., S Ont., and W Me.—Early sum.

3. **C. americana** Michx. Plant 10-20 dm. tall: terminal leaflets 6-15 cm. wide: follicles glabrous, the bodies 10-12 mm. long. [*C. cordifolia* Pursh.].—(SUMMER-COHOSH. Blue Ridge and Appalachian provinces, Ga. to

Tenn. and N. Y.—Late sum.

8. **ACTAEA** L. Perennial herbs. Leaf-blades ternately compound. Flowers rather many, in short racemes, white. Sepals 3-5, deciduous. Petals 4-10, clawed, not notched. Stamens numerous: filaments filiform. Carpel solitary, many-ovuled, becoming a baccate follicle.—About 6 species, natives of the north temperate zone.—Spr.—BANE-berries.

Pedicels slender, less than 1 mm. thick: fruits red.

Pedicels stout, over 1 mm. thick: fruits white.

1. *A. rubra*.

2. *A. alba*.

1. **A. rubra** (Ait.) Willd. Plant 3-8 dm. tall: terminal leaflets mostly as wide as long and deeply 3-lobed, truncate to cidedly elongate: seed about 3 mm. long. [*A. spicata rubra* Ait.]—(CORALBERRY. POISONBERRY. SNAKEBERRY. RED-BANE-BERRY.)—Woods, various provinces, rarely Coastal Plain, N. C. to Tenn., Colo., Alb., Ont., and N. S.

2. **A. alba** (L.) Mill. Plant 4-11 dm. tall: terminal leaflets mostly longer than wide and scarcely lobed, cuneate or rounded at the base: follicles white, about as thick as long, on spreading stout red pedicels: seed about 4 mm. long.—(DOLL'S-EYES. NECKLACE-WEED. WHITE-BANE-BERRY. WHITEBERRY.)— Rocky woods, various provinces, N Fla. to La., B. C., Ont., Ga., and Que.

**9. AQUILEGIA** [Tourn.] L. Perennial herbs. Leaf-blades ternately compound, the segments broad. Flowers inverted on nodding pedicels, of many different colors, but ours scarlet and yellow. Sepals 5, equal, petal-like. Petals 5, cornucopia-like. Stamens numerous, the inner ones staminodia. Carpels 5, sessile, many-ovuled, in fruit forming a capsule-like erect head of follicles.—About 50 species, widely distributed in the north temperate zone.—Spr.—COLUMBINES.—Several species are widely cultivated.

Sepals ovate, sometimes broadly so, mostly less than 14 mm. long: spurs 2-2.5 cm. long: follicles with spreading tips.

Sepals lanceolate or elliptic-lanceolate, mostly more than 15 mm. long: follicles with erect tips.

Sepals elliptic-lanceolate: follicle-body fully 2 cm. long.

Sepals lanceolate: follicle-body about 1.5 cm. long.

1. *A. canadensis*.

2. *A. coccinea*.

3. *A. australis*.

1. ***A. canadensis*** L. Plant 2-6 dm. tall: leaflets or their divisions cuneate: sepals ovate, scarlet without, 10-14 mm. long: spurs scarlet without, 2.5-3 cm. long, swollen at the tip: follicle-body mostly 1.5-2 cm. long.—(RED-BELLS. ROCK-BELLS. ROCK-HONEYSUCKLE.)—Woods and rocky banks, often in calcareous soil, various provinces, Ga. to Tex., Ont., and N. S.

2. ***A. coccinea*** Small. Plant usually larger than in *A. canadensis*: leaflets or their divisions wider and often rounded at the base: sepals elliptic-lanceolate, 16-21 mm. long: spurs very stout: follicle-body 2-2.5 cm. long.—Hillsides, woods, and cliffs, various provinces, N of Coastal Plain, Ala. to Tex., Nebr., and S Ont.

3. ***A. australis*** Small. Plant 3-9 dm. tall, paler-green or more glaucous than in the two preceding species: sepals lanceolate, 16-18 mm. long: spurs slender: follicle-body 1.5-2 cm. long.—Cliffs and bluffs, in calcareous soil, Gulf Coastal Plain, Fla. to Tex. (†).

**10. DELPHINIUM** [Tourn.] L. Annual or perennial erect herbs. Leaf-blades palmately lobed or dissected, the segments narrow. Flowers spreading, blue to purple, or nearly white. Sepals 5, the posterior one spurred. Petals 2 or 4, the 2 posterior ones spurred. Filaments dilated below. Carpels few or solitary, sessile, many-ovuled, becoming dry follicles.—About 125 species, natives of the north temperate zone.—LARKSPUR.—Several species are favorite garden flowers. Albinos occur in some species.

Plant annual: carpel 1: petals 2, united.

Follicle pubescent.

Follicle glabrous.

Plant perennial: carpels 3: petals 4, distinct.

Follicles erect: raceme elongated.

Leaf-segments narrow, the ultimate divisions linear or narrowly oblong.

Seeds strongly wing-margined, slightly rugose-squamellate.

Seeds not wing-margined, strongly squamellate.

Leaf-segments relatively broad, the ultimate divisions lanceolate.

Follicles widely spreading: raceme short.

1. *D. Ajacis*.

2. *D. Consolida*.

3. *D. carolinianum*.

4. *D. vilmorinum*.

5. *D. exaltatum*.

6. *D. tricornis*.

1. *D. Ajacis* L. Plant 1 m. tall or less, branched: leaf-blades with short and diverging segments: sepals blue, with suborbicular to reniform or broadly ovate blades: posterior petals 10–12 mm. long, excluding the spur: follicle-body 13–20 mm. long, pubescent, stout-tipped. — (ROCKET-LARKSPUR.)—Fields and waste places, various provinces, S. C. to Kans., Mont., and N. S. Nat. of Eu.—Sum.

2. *D. Consolida* L. Plant 3–9 dm. tall: leaf-blades with narrowly linear cleft or toothed segments: sepals with elliptic blades: follicle-body 7–10 mm. long, slender-tipped. — (FIELD-LARKSPUR. KNIGHT'S-SPUR. LARK-HEEL.)—Waste places, various provinces, E U. S. Nat. of Eu.—Sum.

3. *D. carolinianum* Walt. Plant 3–6 dm. tall, minutely pubescent above; segments of the upper leaves very narrow: spur mostly slender, longer than the other sepals: follicle-body 14–18 mm. long. — [*D. azureum* Michx.]—Sand-hills, open woods, and rocky soil, various provinces, Fla. to Tex., Mo., and Va.—Spr.—sum.

4. *D. vimineum* D. Don. Plant 5–7 dm. tall, closely pubescent above: segments of the upper leaves narrow: spur mostly stout, shorter than the other sepals: follicle-body 13–16 mm. long. — Dry soil, Coastal Plain, and adjoining provinces, Ala. to Tex.—Spr.

5. *D. exaltatum* Ait. Plant 5–20 dm. tall, minutely pubescent above: leaf-divisions cuneate to lanceolate, thin: flowers 16–22 mm. long: follicle-body 8–10 mm. long: seeds wingless. — (TALL-LARKSPUR.)—Woods and rocky soil, various provinces, chiefly W of Blue Ridge, Ala. to Nebr., Minn., and Pa.—Sum.—Has been mistaken for *D. urceolatum* Jacq.

6. *D. tricornis* Michx. Plant 3–9 dm. tall, minutely pubescent above: leaf-divisions linear or nearly so, thick: flowers 25–35 mm. long: follicle-body 12–17 mm. long, or rarely shorter: seeds winged. — (DWARF-LARKSPUR. ROCK-LARKSPUR. STAGGERWEED.)—Woods, thickets, and rocky slopes, often in calcareous soil, various provinces, N of Coastal Plain, Ga. to Ark., Minn., and Pa.—Spr.

11. *ACONITUM* L. Perennial reclining or procumbent herbs. Leaf-blades palmately lobed or divided. Flowers somewhat nodding. Sepals 5, the posterior one hooded or helmet-like. Petals 2–5, the 2 posterior ones concealed in the helmet. Filaments dilated below. Carpels 3–5, many-ovuled, becoming follicles. — About 70 species, mostly in the higher parts of the north temperate zone. — MONKSHOODS. WOLFSBANES. ACONITES.

Flowers blue or purplish: hood helmet-shaped.  
Flowers white or yellowish: hood elongate-conic.

1. *A. uncinatum*.  
2. *A. reclinatum*.

1. *A. uncinatum* L. Stem ascending or reclining, 6–12 dm. tall: leaf-blades thick, the larger ones 8–10 cm. wide, the divisions mostly few-toothed: follicle 14–16 mm. long. — (CLAMBERING-MONKSHOOD. WILD-MONKSHOOD.)—Woods, vari-

ous provinces, N of Coastal Plain, Ga. to Ala., Wis., and Pa.—Sum.—fall.

**2. *A. reclinatum*** A. Gray. Stem trailing, 5–25 dm. tall, leaf-blades thin, the larger ones 15–20 cm. wide, the divisions mostly many-toothed: follicle 8–11 mm. long.—(AMERICAN-WOLFSBANE. TRAILING-WOLFSBANE.)—Woods, Blue Ridge and Appalachian provinces, Ga. to Va.—Sum.—The wolfsbanes or monkshoods have long been known for the powerful narcotic poison contained in the roots. The first-cited popular name was derived from the use of the plant in poisoning wolves; the second name from the shape of the upper sepal.

**12. HEPATICA** [Rupp.] Hill. Perennial scapose tufted herbs. Leaf-blades 3-lobed, persistent. Flowers solitary on each scape, subtended by a calyx-like involucre. Sepals several, petal-like. Petals wanting. Achene-cluster seated in the involucre.—About 4 species, natives of the north temperate zone.—Wint.-spr.—LIVER-LEAF. HEPATICAS.

Lobes of the leaf-blades and bracts of the involucre obtuse.  
Lobes of the leaf-blades and bracts of the involucre acute.

1. *H. Hepatica*.  
2. *H. acuta*.

**1. *H. Hepatica*** (L.) Karst. Leaf-blades becoming 6–8 cm. wide, the middle lobe typically reniform: bracts of the involucre ovate to elliptic, obtuse: sepals blue, purple or white, or sometimes quite pink, 7–12 mm. long: achene-body ovoid-ellipsoid or ellipsoid, about 3 mm. long.—[*Anemone Hepatica* L.]—(BLUE-ANEMONE. SQUIRREL-CUPS.)—Rocky woods and banks, various provinces, N Fla. to Mo., Man., and N. S.

**2. *H. acuta*** (Pursh) Britton. Leaf-blades becoming 10–12 cm. wide, the middle lobe typically ovate: sepals white to bluish-purple: achene-body about 4 mm. long.—[*Anemone acutiloba* Lawson]—(SHARPL-LOBE-LIVERLEAF.)—Rich woods, often in calcareous soil, Blue Ridge and more N provinces, Ga. to Mo., Minn., and Que.

**13. ANEMONE** [Tourn.] L. Perennial scapose herbs with rootstocks. Leaf-blades lobed, divided, or dissected, not persistent. Flowers subtended by a foliaceous involucre. Sepals 4–20, petal-like. Petals wanting. Filaments filiform. Achene-cluster long-peduncled.—About 85 species, widely distributed in temperate and arctic regions.—ANEMONES. WIND-FLOWERS.

Achene densely long-woolly: fruit-head cottony at maturity.

Rootstock tuberos: scape simple, 1-flowered.

Rootstock elongate: scape mostly branched, several-flowered.

Achene finely or obscurely pubescent: fruit-head not cottony.

I. DECAPETALAE.

II. VIRGINIANAE.

III. QUINQUEFOLIAE.

#### I. DECAPETALAE

Involucre mostly above the middle of the scape: tips of the achenes not projecting beyond the wool.

1. *A. decapetala*.

Involucre mostly below the middle of the scape: tips of the achenes projecting beyond the wool.

II. VIRGINIANAE

Sepals greenish: head of fruit mostly over 1 cm. thick: achene with a spreading style.

Sepals clear white: head of fruit mostly less than 1 cm. thick: achene with an appressed or ascending style.

III. QUINQUEFOLIAE

Divisions of the involucre bracts lobed or incised, membranous.

Divisions of the involucre bracts merely toothed, leathery at maturity.

2. *A. caroliniana*.

3. *A. virginiana*.

4. *A. riparia*.

5. *A. quinquefolia*.

6. *A. lancifolia*.

1. *A. decapetala* Ard. Plant 1-3 dm. tall: leaf-segments ovate to obovate or cuneate, 1-2 cm. long: bracts of the involucre very different from the leaves: sepals pink or greenish-white: head of fruit cylindric, 2-3.5 cm. long: achene buried in wool.—Rich prairies, ravines, and hillsides, various provinces, Ala. to Tex. and Ark.—(*Mex.*)—Spr.

2. *A. caroliniana* Walt. Plant 1-2.5 dm. tall: leaf-segments narrower than those of *A. decapetala* and commonly quite similar to those of the bracts: sepals 6-20, purple or white: head of fruit ellipsoid, 1.5-2 cm. long: achene with a projecting tip.—Dry rich or stony soil, various provinces, Fla. to Tex., S. D., Wis., and N. C.

3. *A. virginiana* L. Plant 5-10 dm. tall: leaf-blades 3-parted, the divisions sharply lobed, incised and toothed: bracts of the involucre similar to the leaves: sepals greenish, mostly 8-13 mm. long, concave: head of fruit ellipsoid.—(*THIMBLEWEED.*)—Meadows, thickets, and woods, various provinces, Ga. to Ark., Alb., and N. S.—Sum.

4. *A. riparia* Fernald. Plant 3-9 dm. tall: leaf-blades 3-parted, the divisions rather less sharply incised and toothed than in *A. virginiana*: bracts of the involucre similar to the leaves: sepals mostly 20-30 mm. long, flat: head of fruit cylindric.—(*MOUNTAIN-THIMBLEWEED. WIND-WAIF.*)—Banks, often calcareous stony soil, Blue Ridge and more northern provinces, N. C. to Tenn., Alb., and Que.—Sum.

5. *A. quinquefolia* L. Plant 1-2.5 dm. tall: leaf-divisions mainly lobed or parted: bracts of the involucre similar to the leaves: sepals white, usually purplish on the under side, mainly 1-1.5 cm. long: head of fruit globular, 1 cm. in diameter or less: achene slightly less than 4 mm. long, about 1.5 mm. wide.—(*NIGHTCAPS. SNOWBOYS. WOOD-ANEMONE.*)—Moist woods and thickets, various provinces, in Coastal Plain only N, Ga. to Ala., Ont., and N. S.—Spr.—Has been confused with *A. nemorosa* L. of Europe.

6. *A. lancifolia* Pursh. Plant 1-4 dm. tall: leaf-divisions merely toothed: sepals mainly 2-2.5 cm. long: achene slightly over 4 mm. long.—(*MOUNTAIN-ANEMONE.*) Woods, often in acid soil, Blue Ridge, extending into adjoining provinces, Ga. to Pa.—(*Eu.*)—Spr.—Has been confused with *A. trifolia* L.

14. *SYNDESMON* Hoffmg. Perennial scapose herbs with tuberous roots. Leaf-blades 2-3-ternate. Flowers in an umbellate cluster, the involucre foli-

aceous. Sepals 5-10, petal-like. Petals wanting. Filaments clavate. Achene-cluster peduncled.—One species.

1. *S. thalictroides* (L.) Hoffmg. Plant 1-2.5 dm. tall: leaflets 1-2.5 cm. long, mostly 3-lobed: sepals 5-10, white or pinkish, 9-15 mm. long: achene 4-6 mm. long, or sometimes longer, ribbed. [*Anemella thalictroides* Spach]—(RUE-ANEMONE. WILDRUE. WIND-FLOWER.)—Moist woods and thickets, various provinces, N Fla. to Ark., Kans., Ont., and N. H.—Spr.-sum.—Plants occur with red leaves and pink flowers. The tuberous roots resemble miniature dahlia tubers.

15. *MYOSURUS* L. Annual diminutive acaulescent herbs. Leaf-blades narrow, entire. Flower solitary. Sepals 5, or 6 or 7, separated at the base. Petals 5, or 6 or 7, the claws, each with a pit at the summit, or wanting. Stamens 5-25: filaments filiform. Carpels many, on a greatly elongating receptacle. Achenes firm, imbricate.—About 5 species, widely distributed.

1. *M. minimus* L. Plant 2.5-15 cm. tall: leaves 5-10 cm. long; blades narrowly linear: flowers yellow: sepal-blades elliptic-spatulate: spike of achenes often 2-3 cm. long.—(MOUSE-TAIL.)—Moist alluvial or calcareous soil, various provinces, Fla. to N. M., Sask., Ont., and Va.; also on the Pacific coast.—(Eu.)—Spr.-sum.

16. *TRAUTVETTERIA* F. & M. Perennial large caulescent herbs. Leaf-blades broad, palmately lobed. Flowers corymbose-paniculate. Sepals 3-5, concave. Petals wanting. Stamens many: filaments clavate. Carpels numerous, on a short receptacle. Achenes inflated.—One or two species, North American and Asiatic.

1. *T. carolinensis* (Walt.) Vail. Plant 4-15 dm. tall: leaf-blades deeply lobed, those of the lower leaves mainly 1-3 dm. wide, the lobes sharply toothed or incised: flowers white: sepals 4-5 mm. long: achene 4.5-5 mm. long. [*T. palmata* Fish. & Mey.]—(FALSE-BUGBANE. TASSEL-RUE.)—Woods and shaded stream-banks, various provinces, Coastal Plain only on river-bluffs toward the Gulf, W Fla. to Mo. and W. Pa.—Spr.-sum.

—Plants in which the ribs of the achene are branched, thus making a vein through the usual plane faces of the achene, have been described as *T. nervata*.

**17. BATRACHIUM** S. F. Gray. Perennial aquatic or ditch herbs. Leaf-blades dissected or palmately lobed, the segments often narrow. Flowers on peduncles opposite the leaves. Sepals 5. Petals usually 5, mainly white, each claw with a pit. Stamens several-many. Achenes oblique, compressed, transverse-wrinkled, often nearly or quite beakless.—Spr.—fall.—(WATER-CROWFOOTS. FROGWEEDES.)—About 20 species, of wide geographic distribution.

Leaf-segments 10-15 mm. long, firm: blades scarcely collapsing when withdrawn from the water.

Leaf-segments 15-30 mm. long, flaccid: blades collapsing when withdrawn from the water.

1. *B. trichophyllum*.

2. *B. flaccidum*.

**1. B. trichophyllum** (Chaix) Bosch. Leaves firm, 3-5 cm. long, the segments mostly 10-15 mm. long; stipules short and broad, pubescent: petals 5-8 mm. long: head of achenes 4-5 mm. in diameter. [*Ranunculus aquatilis trichophyllum* A. Gray]—WHITE WATER-CROWFOOT.—Ponds, springs, and spring-runs, various provinces, N. C. to Calif. and S Can.—(*Mex., O. W.*)

**2. B. flaccidum** (Pers.) Rupr. Similar to the preceding species: leaves with longer and more slender petioles, and very long slender segments.—Streams, various provinces, N. C. to Calif., Wash., S Can., and Mass.—(*Mex., O. W.*)

**18. RANUNCULUS** [Tourn.] L. Annual or perennial herbs. Leaf-blades entire, lobed, or divided. Flowers solitary or variously disposed. Sepals mostly 5, deciduous. Petals as many as the sepals or more, or rarely fewer, each with a pit or scale at the base. Carpels several or numerous. Achenes generally flattened, smooth, papillose, or echinate.—About 275 species, most abundant in temperate and cold regions.—BUTTERCUPS. CROWFOOTS. GOLD-CUPS.

Aquatic plants: submerged leaves with dissected blades; floating leaves with lobed blades.

I. MULTIFIDI.

Terrestrial or mud-inhabiting plants: leaves with entire, toothed, lobed, or divided blades.

Leaf-blades linear to oval, entire, crenate or denticulate.

II. FLAMMULAE.

Leaf-blades, at least some of them, lobed or divided.

Achene turgid, marginless.

III. ABORTIVI.

Achene more or less flattened, margined or variously roughened.

Achene smooth.

Achene-beak distinctly hooked.

IV. RECURVATI.

Achene-beak straight or nearly so.

V. REPENTES.

Achene variously roughened.

VI. MURICATI.

#### I. MULTIFIDI

Lower leaves with finely dissected, often thrice 3-cleft blades.

1. *R. delphinifolius*.

#### II. FLAMMULAE

Annuals: achene beakless.

Head of fruit cylindric to ellipsoid.

Head of fruit globose to ovoid.

2. *R. tener*.

Achene papillose.

3. *R. Lindheimeri*.

Achene smooth.

Petals mostly less than 3 mm. long.

Petals mostly over 3 mm. long.

Petals less than 6 mm. long, mostly 5:

Petals over 6 mm. long, mostly more than 5:

4. *R. pusillus*.

5. *R. oblongifolius*.

6. *R. mississippiensis*.

7. *R. obtusiusculus*.

Perennial: stems creeping: achene with a subulate beak.

## III. ABORTIVI

Basal leaves with all or some of the blades crenate: stem not hollow.

Style very short.

Basal leaves with cordate blades: foliage glabrous or nearly so.

Basal leaves with truncate or cuneately narrowed blades: foliage pubescent.

Style subulate, hooked nearly  $\frac{1}{2}$  as long as the achene-body.

Basal leaves with all blades lobed or divided: stem hollow.

8. *R. abortivus*.

9. *R. micranthus*.

10. *R. allegheniensis*.

11. *R. sceleratus*.

## IV. RECURVATI

Leaf-blades with broadly cuneate lobes.

12. *R. recurvatus*.

## V. REPENTES

Achene with a beak less than  $\frac{1}{2}$  as long as the body.

Petals about as long as the sepals: head of fruit ellipsoid or cylindric.

Petals much longer than the sepals: head of fruit subglobose.

Stem spreading and creeping, stoloniferous.

Stem erect, not stoloniferous.

Sepals spreading: leaf-blades digitately divided.

Sepals reflexed: leaf-blades pinnately divided.

Achene with a beak over  $\frac{1}{2}$  as long as the body; beaks sometimes partially deciduous.

Carpels or achenes few.

Carpels or achenes numerous.

Plant stoloniferous: foliage glabrous or nearly so.

Plant not stoloniferous: foliage copiously pubescent, except sometimes in age.

Stem with silky or appressed pubescence.

Stem with spreading pubescence.

13. *R. pennsylvanicus*.

14. *R. repens*.

15. *R. acris*.

16. *R. bulbosus*.

17. *R. palmatus*.

18. *R. septentrionalis*.

19. *R. fascicularis*.

20. *R. hispidus*.

## VI. MURICATI

Achene more or less papillose; beak minute.

Corollas 2-3 cm. broad: achene sparingly papillose near the edges.

Corollas 2-5 mm. broad: achene papillose all over.

Achene muricate or spiny; beak about  $\frac{1}{2}$  as long as the body.

21. *R. parvulus*.

22. *R. parviflorus*.

23. *R. muricatus*.

1. *R. delphinifolius* Torr. Stem mostly glabrous, 1-6 dm. long: blades of the emerged leaves smaller than those of the submersed: petals 5-8, 8-16 mm. long: head of fruit ellipsoid to nearly globose: achene-body about 2 mm. long, wide-margined below, the beak fully  $\frac{1}{2}$  as long as the body.—(WATER-BUTTERCUP.)—Ponds, various provinces, rarely Coastal Plain, N. C. to Kans., Mich., Ont., and Mass.—Sum.

2. *R. tener* C. Mohr. Stem glabrous, 0.5-6 dm. tall: blades of the lower leaves ovate to ovate-lanceolate, 1-3.5 cm. long, those of the upper ones much narrower: petals 1-3, or rarely 5, 1-2.5 mm. long: head of fruit cylindric to ellipsoid, 1.5-2.5 mm. thick: achene-body obovoid, nearly 1 mm. long, scarcely beaked. [*R. trachyspermus* Engelm. not Ell.]—Swamps and low woods, Coastal Plain, and adj. provinces, Ala. to Tex.—Spr.

3. *R. Lindheimeri* Engelm. Stem mostly glabrous, 1-4 dm. tall: blades of the lower leaves ovate to elliptic, 1-3 cm. long, those of the upper leaves narrower: petals mostly 1-3, 1-2 mm. long: head of fruit ovoid to globose, 2-3 mm. thick:

achene-body obovoid, about 1 mm. long, minutely beaked.—Ponds and low grounds, various provinces, Ala. to Calif. and Ark.—Sum.

4. *R. pusillus* Poir. Stem glabrous, 1–4 dm. tall: blades of the basal leaves ovate to oblong, 1–4 cm. long, those of the upper leaves mostly linear: petals mostly 1–3, 1–3 mm. long: head of fruit ovoid, 3–4 mm. thick: achene-body ellipsoid or ellipsoid-obovoid, about 1.5 mm. long, somewhat flattened.—(LESSER SPEARWORT.)—Marshes, various provinces, Fla. to Tex., Mo., and N. Y.—Spr.—sum.

5. *R. oblongifolius* Ell. Stem mostly pubescent below, 1–5 dm. tall: blades of the lower leaves ovate to elliptic, 1–4 cm. long, undulate to denticulate, those of the upper leaves narrow, commonly remotely toothed: petals mostly 5, 3.5–5.5 mm. long: head of fruit 3–4 mm. thick: achene-body obovoid, about 1 mm. long, turgid, margined within at the base.—(MANY-FLOWERED SPEARWORT.)—Swamps, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—Spr.—sum.

6. *R. mississippiensis* Small. Stem sometimes pubescent below, 2–3 dm. tall: blades of the lower leaves ovate, 2–6 cm. long, crenate or undulate-crenate, those of the upper leaves narrow, more sharply and remotely toothed: petals more than 5, 7–8 mm. long: head of fruit 3–5 mm. in diameter: achene-body sub-orbicular, about 1.5 mm. long.—Alluvial soil, Coastal Plain, Miss. to Ark.—Spr.

7. *R. obtusiusculus* Raf. Stem stout, glabrous, 3–12 dm. long: leaf-blades linear to lanceolate, 8–15 cm. long, denticulate or entire: petals 5–7, 5–8 mm. long: head of fruit globose or nearly so, 4.5–6 mm. thick, or longer: achene-body orbicular-obovoid, about 2 mm. long, the subulate deciduous beak horizontal. [*R. ambigens* S. Wats.]—(WATER-PLANTAIN SPEARWORT.)—Swamps and marshes, various provinces, Coastal Plain only N, Ga. to Mo., Minn., Ont., and Me.—Sum.

8. *R. abortivus* L. Stem 1.5–6 dm. tall, glabrous or nearly so: blades of the lower leaves reniform to suborbicular, 2–4 cm. wide, mostly crenate: petals pale-yellow, 2–3 mm. long: head of fruit ellipsoid to cylindric: achene-body fully 1.5 mm. long, very minutely beaked.—(KIDNEY-LEAF BUTTERCUP.)—Moist ground and thickets, various provinces, Fla. to Ark., Colo., Man., and Lab.—Spr.

9. *R. micranthus* Nutt. Stem typically more slender than in *R. abortivus*, pubescent: blades of the lower leaves cuneate to ovate, 1–3 cm. long, mostly crenate-lobed or parted: petals light-yellow, 2–3 mm. long: head of fruit ellipsoid to ovoid-ellipsoid: achene-body barely 1.5 mm. long, minutely short-beaked.—Woods and rocky hillsides, various provinces N of Coastal Plain, Ga. to Ark., Colo., Sask., and Me.—Spr.

10. *R. allegheniensis* Britton. Stem 2–6 dm. tall, glabrous: blades of the lower leaves reniform to orbicular-reniform, 1.5–4 cm. long, commonly crenate-lobed: petals 1.5–2.5 mm. long: head of fruit mainly ovoid: achene-body fully 1.5 mm. long, with a slender curved beak.—Woods, Blue Ridge and more northern provinces, N. C. to Ala. and Mass.—Spr.

11. *R. sceleratus* L. Stem stout, 1.5–6 dm. tall, glabrous or nearly so: leaf-blades thick, the divisions cuneate, lobed: sepals ovate to suborbicular: petals bright-yellow, 3–5 mm. long: head of fruit cylindric to ellipsoid, the receptacle glabrous or sparingly pubescent: achene-body fully 1 mm. long, minutely beaked, thick-margined, the faces uneven.—(CELERY-LEAVED BUTTERCUP. DITCH-CROWFOOT. CURSED-CROWFOOT.)—Wet places and swamps, sometimes in saline soil, various provinces, throughout the U. S. and S Can.; also in Alas.—Nat. of Eu., whence apparently introduced into part of America.—Spr.—sum.

12. *R. recurvatus* Poir. Stem slender, 1.5–7 dm. tall, hirsute: leaf-blades thinnish, the divisions rhombic to ovate, toothed and sometimes also lobed: sepals mainly lanceolate: petals pale-yellow, 3–5 mm. long: head of fruit globular, the receptacle hispid: achene-body fully 2 mm. long, long-beaked, thin-margined, the faces granular.—(BLISTERWORT. HOOKED-BUTTERCUP.)—Rich woods and swamps, various provinces, Fla. to Miss., Kans., Man., and N. S.—Spr.

13. *R. pennsylvanicus* L. f. Stem erect, 3–7 dm. tall, hispid: leaf-blades thinnish, the divisions relatively narrow, irregularly sharp-toothed: petals pale-yellow, 2–4.5 mm. long: head of fruit cylindric to ellipsoid: achene-body about 2 mm. long, prominently beaked.—(BRISTLY-BUTTERCUP.)—Low grounds and river-banks, various provinces, Ga. to Ark., B. C., and N. S.—Sum.

14. *R. repens* L. Stem creeping, 1–8 dm. long, hirsute or glabrate: leaf-blades thickish, the divisions broad, coarsely toothed or lobed: petals bright-yellow, 10–13 mm. long: head of fruit globose: achene-body 3 mm. long, minutely beaked, narrow-margined.—(BUTTERROSE. CREEPING-BUTTERCUP. GOLD-WEED. HORSE-GOLD. MAT-BUTTERCUP. MEG-MANY-FEET.)—Fields, roadsides, and low grounds, various provinces, N of Coastal Plain, N. C. to Mo., B. C., Ont., and Newf. Nat. of Eu.—(W. I.)—Spr.-sum.

15. *R. acris* L. Stem 2–11 dm. tall, loosely pubescent: leaf-blades pedately mostly 5-divided, the divisions broad, sharp-toothed, the middle division not stalked: petals bright-yellow, about 1 cm. long: head of fruit globose: achene-body about 3 mm. long, obscurely margined, minutely fine-beaked.—(MEADOW-BUTTERCUP. TALL-BUTTERCUP.)—Woods, fields, and roadsides, various provinces, N. C. to Mo., B. C. and Newf. Nat. of Eu.—Spr.-sum.

16. *R. bulbosus* L. Stem 1.5–5 dm. tall, rather appressed-pubescent: leaf-blades thick, the divisions pinnate, broad, blunt-toothed: petals bright-yellow, 7–11 mm. long: head of fruit globose: achene-body about 3 mm. long, prominently margined, minutely stout-beaked.—(MEADOW-GOLD. TURNIP-BUTTERCUP.)—Roadsides, fields, and meadows, various provinces, N. C. to La., N. Y., and Me. Nat. of Eu.—Spr.-sum.

17. *R. palmatus* Ell. Stem 1–6.5 dm. long, sparingly appressed-pubescent or glabrate: leaf-blades thin, the divisions shallowly few-toothed and sometimes lobed: petals pale-yellow, 6–10 mm. long: head of fruit globose: achenes few in a head, the body about 3 mm. long, the broad beak nearly as long. [*R. septentrionalis nitidus* Chapm.]—Swamps and low woods, Coastal Plain and adj. provinces, Fla. to Tenn. and S. C.—Spr.

18. *R. septentrionalis* Poir. Stem 3–12 dm. long, glabrous or pubescent: leaf-blades thickish, the divisions incised-toothed and often lobed: petals bright-yellow, 10–14 mm. long: head of fruit globose to oval: achene-body 4–5 mm. long, wide-margined, the slender beak shorter than the body.—(SWAMP-BUTTERCUP.)—Low grounds and swamps, various provinces, Ga. to Tex., Man., and N. B.—Spr.-sum.

19. *R. fascicularis* Muhl. Stem 1–3 dm. tall, densely silky: leaf-blades thick, those of the lower leaves with typically cuneate-flabellate lobed or parted divisions: petals 8–14 mm. long: head of fruit globose: achene-body 2.5–3 mm. long, slightly margined, the beak as long, slender. [*R. apricus* Greene]—(EARLY-CROWFOOT. EARLY WOOD-BUTTERCUP.)—Woods and thickets, various provinces N of Coastal Plain, Ga. to Tex., Kans., Ont., and Mass.—Spr.—The roots of this species are tuber-like and clustered; the roots of the next preceding and next following species are more or less clustered, but they are long and slender.

20. *R. hispidus* Michx. Stem 2-6 dm. tall, hirsute or villous-hirsute: leaf-blades pubescent, those of the lower leaves generally 3-parted, the divisions suborbicular to cuneate, incised, lobed, or sometimes parted: petals 9-16 mm. long: head of fruit globose to oval: achene-body 2.5-3 mm. long, slightly margined, the beak about  $\frac{1}{2}$  as long as the body. [*R. septentrionalis marilandicus* Champ.].—(BRISTLY-BUTTERCUP).—Woods and thickets, various provinces, in Coastal Plain only N, Ga. to Ark., N. D., and Ont.—Spr.

21. *R. parvulus* L. Stem erect, 1.5-4 dm. tall, strigillose or somewhat hirsute: leaf-blades pubescent, those of the lower leaves mostly parted, the divisions incised or lobed: petals 7-11 mm. long: head of fruit ellipsoid or oval: achene-body 2-2.5 mm. long, minutely beaked, the faces papillose.—Waste-places, especially on ballast, Coastal Plain and New England Coast, Ga. to N. B. Nat. of Eu.—Sum.

22. *R. parviflorus* L. Stem diffuse, 1-3 dm. long, villous: leaf-blades finely pubescent, those of the lower leaves mostly lobed and toothed: petals 1-2 mm. long: head of fruit globose: achene-body about 2 mm. long, papillose all over, minutely beaked.—Waste-places and fields, Coastal Plain and adj. provinces, Fla. to Tex., Ark., and Md. Nat. of Eu.—(W. I.)—Spr.-sum.

23. *R. muricatus* L. Stem 2-6 dm. tall, glabrous or nearly so: leaf-blades often with scattered hairs, those of the lower ones mostly 3-lobed and scarcely toothed or incised: petals 5-8 mm. long: head of fruit globose: achene-body 4-5 mm. long, prominently beaked, the faces spiny.—Waste-places, various provinces, Fla. to Tex., Calif., and Va. Nat. of Eu.—Widely distributed.—Spr.-sum.

19. **ADONIS** L. Annual or perennial herbs. Leaf-blades pinnately dissected. Flower solitary, terminal. Sepals often 5, broad. Petals 5-16, larger than the sepals. Filaments filiform. Carpels numerous. Achenes crowded at the rachis.—About 6 species, Eurasian.

1. *A. annua* L. Stem 2-6 dm. tall: leaf-blades 2-5 cm. long: sepals 6-9 mm. long: petals orange or red, 8-12 mm. long: head of achenes cylindric, 1-2 cm. long: achene 3-5 mm. long.—(PHEASANT'S-EYE. BIRD'S-EYE. ADONIS'-FLOWER).—Waste-places and fields, various provinces, E U. S. to Tex. Nat. of Eu.—Spr.-sum.—This is a showy plant, but it has the habit of weeds in springing up in newly formed land. For example, on newly made levees along the Mississippi River it comes up in great quantities. The petals usually have a dark spot at the base.

20. **THALICTRUM** [Tourn.] L. Perennial herbs. Leaf-blades ternately decomound. Flowers perfect, polygamous, or dioecious, often numerous, white or greenish. Sepals 4-5. Petals wanting. Stamens numerous, conspicuous. Carpels commonly few. Achenes ribbed or nerved, sometimes stipitate.—About 85 species, mostly in the north temperate zone.—MEADOW-RUES.—Several species have found their way into ornamental gardening, being admired for their myriad miniature tassels of stamens or the mist-like effect when planted *en masse*.

Flowers perfect: filaments petal-like: carpels long-stipitate.  
 Flowers dioecious or polygamous: filaments not petal-like: carpels short-stipitate or sessile.

I. CLAVATA.

II. DIOICA.

## I. CLAVATA

Achene curved along the upper edge, the body longer than the stipe.

Achene straight along the upper side, the body shorter than the stipe.

1. *T. clavatum*. ✓2. *T. mirabile*.

## II. DIOICA

Filaments subulate or filiform.

Flowers dioecious: leaflets not waxy-granular beneath.

Achenes distinctly stipitate.

Achene-body oval: anther 3-4 mm. long: sepals of the staminate flowers 2.5-3.5 mm. long.

Achene-body ellipsoid: anther 5-6 mm. long: sepals of the staminate flowers 4.5-5.5 mm. long.

3. *T. coriaceum*. ✓4. *T. caulophylloides*.

Achenes not stipitate.

Stem procumbent: stamens less than 18.

Stem erect: stamens more than 18.

Flowers polygamous: leaflets waxy-granular beneath.

Filaments spatulate, often broader than the anthers.

Leaflets entire or nearly so: flowers nearly dioecious: achene-body 3-4 mm. long.

5. *T. debile*.6. *T. dioicum*.7. *T. revolutum*. ✓

Leaflets strongly lobed: flowers polygamous: achene-body 4-5 mm. long.

8. *T. macrostylum*.

Achene sessile or nearly so: leaflets green beneath.

9. *T. polygamum*.

Achene stipitate: leaflets glaucous beneath.

10. *T. perelegans*.

1. *T. clavatum* DC. Plant 1.5-6 dm. tall: blades of the leaflets thin, 1.5-3 cm. long, prominently lobed: achene scimitar-shaped, about 7 mm. long, the stipe shorter than the flat body.—(MOUNTAIN MEADOW-RUE. LADY-RUE.)—About brooks, Blue Ridge, and adj. provinces, Ga. to Ala., W. Va., and Va.—Spr.—sum.

2. *T. mirabile* Small. Plant 1-3 dm. tall: blades of the leaflets very thin, 2-3 cm. long, shallowly lobed: achene clavate, about 7 mm. long, the stipe longer than the turgid body.—Sandstone bluffs, Little Mt. in the Appalachian Plateau, Ala.—Spr.

3. *T. coriaceum* (Britton) Small. Plant 9-16 dm. tall: blades of the leaflets thickish, the terminal ones 2.5-4 cm. wide: carpel stipitate: achene-body 3-4 mm. long.—(MAD-OF-THE-MIST.)—Woods, Blue Ridge and Appalachian provinces, N. C. to Tenn., Ky., and Va.—Spr.—sum.

4. *T. caulophylloides* Small. Plant 6-18 dm. tall: blades of the leaflets thickish, the terminal ones 4-9 cm. wide: carpels stipitate: achene-body 4-6 mm. long.—Open woods, Blue Ridge and Appalachian provinces, extending into Piedmont along river valleys, Tenn. to Ky. and Md.—Spr.—sum.

5. *T. debile* Buckl. Plant 1-4.5 dm. tall: blades of the leaflets 6-15 mm. wide, mostly rounded or subcordate at the base: style slender, fully twice as long as the ovary: achene-body slender-ribbed, with a long and very slender beak.—Rich woods, Coastal Plain and adj. provinces, Ga. to Ark.—Spr.

6. *T. dioicum* L. Plant 3-6 dm. tall: cauline-leaves with long petioles: blades of the leaflets thin, the terminal ones 1.5-3 cm. wide, lobed: carpel sessile: achene-body 3-4 mm. long, abruptly beaked, blunt-ribbed.—(EARLY MEADOW-RUE. SPRING MEADOW-RUE.)—Rocky hillsides and woods, various provinces, in Coastal Plain only N. Ga. to Mo., Sask., and Lab.—Spr.

7. *T. revolutum* DC. Plant 9–20 dm. tall, the stem usually glabrous: blades of the leaflets thickish, glaucous beneath and becoming veiny, slightly revolute, the terminal one 3-lobed at the apex: achene-body ellipsoid, sharply ribbed, sessile or short-stipitate. [*T. purpurascens* (Fl. SE. U. S.)—SKUNK MEADOW-RUE.]—Woods and swamps, various provinces, Fla. to Ariz., Sask., and N. S.—Sum.

8. *T. macrostylum* (Shuttlw.) Small & Heller. Plant 5–15 dm. tall: blades of the leaflets thick, predominantly entire, glaucous beneath, the terminal one 5–15 mm. wide, but usually less than 10 mm.: achene-body ellipsoid, sharply beaked.—Meadows, marshes, and lime-sinks, Coastal Plain, and adj. provinces, W Fla. to Ala. and Va.—Spr. *mic*

9. *T. polygamum* Muhl. Plant 9–30 dm. tall: cauline leaves sessile; blades of the leaflets thinnish, prominently lobed, green beneath, the terminal one mainly 1.5–4 cm. wide: filaments filiform-clavate: achene-body narrowly ellipsoid, gradually beaked, sharp-ridged.—(FEATHER-COLUMBINE. FENN-RUE. SUMMER MEADOW-RUE. TALL MEADOW-RUE.)—Swamps and low meadows, various provinces, Fla. to Ohio and Lab.—Sum.

10. *T. perelegans* Greene. Similar to *T. polygamum* in habit, the foliage bright-green and glaucous: cauline leaves rather large; blades of the leaflets thinnish, decidedly glaucous and finely pubescent beneath, narrowly obovate to reniform, with three broad apical mucronate lobes, mostly 1–2.5 cm. wide: filaments slender-clavate: achene-body broadly ellipsoid, narrowed at both ends, glabrous, decidedly stipitate, often slenderly so.—Woods, Blue Ridge and adj. provinces, E Tenn.—Sum.—fall.

21. **CLEMATIS** L. Perennial herbaceous vines. Leaf-blades 3–several-foliolate. Flowers dioecious or polygamo-dioecious, in broad paniculate cymes. Sepals relatively small, but petaloid, without a border, thin, spreading, white or pale. Petals wanting. Stamens spreading: anthers short, blunt. Carpels several. Achenes with silky or plumose styles.—About 25 species, of very wide distribution.—VIRGIN'S-BOWERS. OLD-MAN'S BEARDS.

Blades of the leaflets toothed and often also lobed, membranous.

Leaves with once ternately compound blades.

Leaves with twice ternately compound blades.

Calyx about 2 cm. wide: stamens 6–9 mm. long.

Calyx about 1 cm. wide: stamens 4–6 mm. long.

Blades of the leaflets entire, somewhat coriaceous.

1. *C. virginiana*.

2. *C. Catesbyana*.

3. *C. micrantha*.

4. *C. paniculata*

1. *C. virginiana* L. Plant sparingly pubescent or glabrate: leaves mainly 3-foliolate: sepals whitish, thin, 9–12 mm. long: achene-body 4–5 mm. long, very inequilateral.—(GANDER-VINE.)—Thickets and along streams, various provinces, Ga. to La., Man., and N. S.—Sum.

2. *C. Catesbyana* Pursh. Plant minutely pubescent or glabrate: leaves twice ternately compound: sepals linear to cuneate, 9–11 mm. long: achene-body about 4 mm. long, scarcely inequilateral.—(SATIN-CURLS.)—Sandy woods, Coastal Plain, Fla. to La. and S. C.—Spr.—sum.

3. *C. micrantha* Small. Plant closely fine-pubescent: leaves twice ternately compound: sepals broadly linear and obovate, 5–6.5 mm. long: achene-body narrowly ellipsoid, 3–3.5 mm. long.—Fence-rows, bushes, and trees, Brooksville Hammock region, W. pen. Fla.—Sum.

4. *C. paniculata* Thunb. Plant glabrous or nearly so: leaves 1-ternate: leaflets ovate, elliptic-ovate, or orbicular-ovate, entire: sepals white or nearly so, thickish, 8-15 mm. long: achene-body 5-6 mm. long, slightly inequilateral.—Road-sides, thickets and woods, various provinces, Fla. to Tenn. and N. Y. Nat. of Japan and cult.—Sum.—fall.

22. *VITICELLA* Dill. Perennial vines. Leaf-blades several-foliolate. Flowers perfect, solitary or few together. Sepals spreading, petal-like, each with a wide border on either side of the veins. Petals wanting. Stamens spreading; anthers long and narrow. Carpels several. Achenes with pubescent, but rarely plumose styles.—About 6 species, Eurasian.

1. *V. Viticella* (L.) Small. Plant minutely pubescent: leaflets 2-5 cm. long, the blades thin, inequilateral: flowers showy: sepals cuneate to cuneate-spatulate, 2-4 cm. long, purple or blue: achene-body ovoid to elliptic-ovoid, 8-10 mm. long.—(ITALIAN-CLEMATIS.)—Stream-banks, Interior Low Plateaus, Tenn. Nat. of Eu. and cult.—Sum.

23. *VIORNA* Reichenb. Perennial herbs or vines. Leaf-blades entire or lobed, or pinnate. Flowers solitary or few together. Sepals 4 or 5, thick, valvate, petal-like. Petals wanting. Stamens erect: anthers long and narrow. Achenes with long plumose, silky, or naked style-tails. [*Clematis* L. in part.]—About 20 species, North American and European.—LEATHER-FLOWERS. VASE-VINES.—Some of the species have been brought into cultivation.—The flowers are purple or blue-violet, unless otherwise mentioned.

Vines with elongate stems and branches.

Upright perennial herbs, the stems simple or with short branches.

I. *VIORNAE*.

II. *OVATAE*.

#### I. *VIORNAE*

Flower-stalk bractless.

Sepals with petal-like dilations above, the bodies long-tipped.

Sepals with mere cottony margins above, the bodies short-tipped.

Flower-stalk bracted.

Achene with silky style-tips.

Achene with plumose style-tips.

Foliage glandular.

Foliage glabrous, glaucous, or simply pubescent.

Leaflets prominently and conspicuously reticulate.

Leaflets nearly as prominently reticulate above as beneath.

Leaflets thin, the larger ones 12 cm. long, the bracts nearly as large.

Leaflets thick, the larger ones less than 6 cm. long, the bracts much smaller.

Leaflets much more prominently reticulate beneath.

Leaflets not reticulate, sometimes with a few prominent nerves.

Elongate vines.

Achene ovate or elliptic: leaflets not glaucous beneath.

Leaflets simple and usually entire.

Leaflets, at least the lower ones, ternate or 3-lobed.

1. *V. crispa*.

2. *V. obliqua*.

3. *V. Pitcheri*.

4. *V. Gattereri*.

5. *V. subreticulata*.

6. *V. reticulata*.

7. *V. Beadlei*.

8. *V. flaccida*.

9. *V. Viorna*.

Achenes suborbicular: leaflets glaucous beneath.  
Shrubby or stocky vine.

10. *V. glaucophylla*.  
11. *V. Addisonii*.

II. OVATAE

Leaf-blades reticulate, rounded or cordate at the base: achenes with yellow plumes.  
Leaf-blades not reticulate, mostly cuneately narrowed at the base: achenes with white plumes.

12. *V. ochroleuca*.  
14. *V. Baldwinii*.

1. *V. crispa* (L.) Small. Stem often pubescent about the nodes: leaflets ovate to lanceolate (linear-lanceolate in *V. crispa Walteri*), 2.5–7 cm. long, thin, acute or acuminate: flower-stalks naked: sepals with showy marginal dilations above: achene-body ovate, 7–8 mm. wide. [*C. crispa* L.]—(BLUE-JASMINE. CURL-FLOWER. MARSH-CLEMATIS. CURLY-CLEMATIS.)—Swamps and wet woods, often in acid soil, Coastal Plain, Fla. to Tex. and Va.—Spr.—sum.

2. *V. obliqua* Small. Stem glabrous, or sometimes pubescent about the nodes: leaflets ovate to ovate-lanceolate, 3–8 cm. long, glabrous: sepals with mere cottony margins above: achene-body about 7 mm. wide.—Woods and swamps, Coastal Plain, Fla. to Tex. and Ga.—Spr.—sum.

3. *V. Pitcheri* (T. & G.) Britton. Stem pubescent, especially about the nodes: leaflets ovate, 3–7 cm. long, thick, reticulate, obtuse or acute: flower-stalk with ovate mostly entire bracts: sepals with mere margins above: anthers long-tipped: achene-body orbicular, 6–7 mm. wide. [*V. Simsii* (Fl. SE. U. S.)]—Low grounds, various provinces, Tenn. to Tex., Ia., and S Ind.—Spr.—sum.

4. *V. Gattingeri* Small. Stem glandular-pubescent: leaflets lanceolate to ovate-lanceolate, 1.5–7 cm. long, thin, not reticulate: flower-stalk with entire bracts: sepal-body 10–14 mm. long: achene-body ovoid, 5–6 mm. wide.—River banks, Interior Low Plateau, Tenn.—Sum.

5. *V. subreticulata* Harbison. Stem often finely pubescent: leaflets ovate, 6–12 cm. long, thin, prominently fine-reticulate, acute, predominantly lobeless: flower-stalk with large petioled bracts far above the middle: sepal-body globose-ovoid, 22–26 mm. long: achene-body orbicular-rhombic, 5.6–6.5 mm. wide.—Rocky or sandy banks, various provinces, Ala. to E Tex. and Ark.—Spr.—The leaflets are much less coarsely veined than in the related *V. reticulata*. The calyx is thinly pubescent and bright-purple.

6. *V. reticulata* (Walt.) Small. Stem pubescent at least about the nodes: leaflets elliptic, oval, ovate, or elliptic-lanceolate, 2–6 cm. long, thick and very prominently coarse-reticulate, on both sides, mostly rounded or mucronate at the apex, typically lobeless or lobed on one side: flower-stalk with petioled bracts about the middle or below it: sepal-body 17–21 mm. long, narrowly ovoid or conic-ovoid, closely covered with gray or brown hairs: achene-body rhombic, 5–6 mm. wide. [*C. reticulata* Walt.]—Sandy thickets, Coastal Plain, Fla. to Tex. and S. C.—Spr.—sum.

7. *V. Beadlei* Small. Stem pubescent, at least at the nodes: leaflets lanceolate to ovate and commonly lobed, 4–8 cm. long, thinnish, finely reticulate in age, acute or acuminate: flower-stalk with sessile or short-petioled bracts: sepal-body 16–22 mm. long: achene-body ovate, 4.5–5.5 mm. wide.—Thickets, Appalachian provinces, Ga. and Tenn.—Spr.—sum.

8. *V. flaccida* Small. Stem finely pubescent: leaflets thin, elliptic-ovate or ovate-lanceolate, 2-10 cm. long, closely silky beneath, mostly entire: flower-stalk with stout-stalked bracts below the middle: sepal-body 18-20 mm. long: achene-body ovate, 5.5-6.5 mm. wide.—Thickets, Interior Low Plateau, Tenn. and Ky.—Spr.

9. *V. Viorna* (L.) Small. Stem pubescent about the nodes: leaflets ovate to lanceolate or suborbicular in outline, 2.5-9 cm. long, entire or lobed, green and sometimes sparingly pubescent beneath: flower-stalk with short-stalked bracts near the middle: sepal-body 19-22 mm. long: achene-body ovate to elliptic, 4.5-5.5 mm. wide. [*C. Viorna* L.]—(VASE-VINE).—Woods and thickets, various provinces N of Coastal Plain, Ga. to Ala., Ohio, and Pa.—Spr.-sum.—The achene-plumes are usually tawny, but sometimes white ones may be found.

10. *V. glaucophylla* Small. Stem glabrous or nearly so: leaflets ovate to suborbicular, 3-10 cm. long, entire or lobed, glabrous, but glaucous beneath: flower-stalk with short-stalked bracts about the middle: sepal-body 20-25 mm. long: achene-body suborbicular or rhombic-orbicular, 6-8 mm. wide.—River valleys, various provinces, Fla. to Ala., Ky., and N. C.—Spr.-sum.

11. *V. Addisonii* (Britton) Small. Stem glabrous: leaf-blades ovate to suborbicular, 5-10 cm. long, entire or those of the lower ones lobed, glaucous beneath: flower-stalk with sessile bracts: sepal-body 18-20 mm. long, or rarely longer: achene-body suborbicular, about 6 mm. wide.—River banks, Blue Ridge and adj. provinces, N. C. to Tenn. and Va.—Spr.

12. *V. ochroleuca* (Ait.) Small. Plant 3-6 dm. tall: leaf-blades ovate, sometimes narrowly so, 3-12 cm. long, entire or the lower ones sometimes lobed: pedicels hirsute: sepal-body 19-22 mm. long: achene-body about 5 mm. wide. [*C. ochroleuca* Ait.]—(CURLY-HEADS).—Sandy soil, various provinces, Ga. to N. Y.—The calyx is yellowish-white.—*V. ovata* (Pursh) Small, included in *Fl. SE U. S.* is believed to be identical with this species.

13. *V. Baldwinii* (T. & G.) Small. Plant 2-6 dm. tall: leaf-blades elliptic to lanceolate or linear, sometimes pinnately parted, 1.5-10 cm. long: sepals purple or paler, 2.5-4 cm. long, each with a thin crisped margin and a slender apex: achene-body 4.5-5.5 mm. wide, with style-tips 6-10 cm. long. [*C. Baldwinii* T. & G.]—(PINE-HYACINTH).—Pinelands and marshes, pen. Fla.—Spr.-fall or all year S.—An infusion taken cold is considered a valuable remedy by the Seminoles in cases of sunstroke.

24. **ATRAGENE** L. Perennial vines. Leaf-blades several-foliate. Flowers solitary on axillary branches. Sepals mostly 4, thin, petal-like, large, veiny. Petals small, spatulate. Stamens numerous, erect, the outer more or less petal-like; anthers oval. Carpels several. Achenes with long plumose styles.—About 5 species, natives of the north temperate zone.

1. *A. americana* Sims. Stem brown, trailing or diffuse: leaflets ovate to ovate-lanceolate, 2.5-9 cm. long, mostly toothed or somewhat lobed: sepals purplish-blue, 3-5 cm. long: petals 8-13 mm. long: achene-body 3-4 mm. wide, with style-tips 3-4 cm. long. [*Clematis verticillaris* DC.]—(BELL-RUE. MOUNTAIN-CLEMATIS. PURPLE VIRGIN-BOWER. ROCK-CLEMATIS).—Rocky woods, Blue Ridge and more northern provinces, N. C. to Man. and Que.—Spr.

## FAMILY 3. ANNONACEAE — CUSTARD-APPLE FAMILY

Shrubs or trees with uniform or dimorphous stems. Leaves alternate, estipulate: blades entire, pinnately veined and often prominently reticulate. Flowers perfect, monoecious, or dioecious, solitary in the leaf-axils, paired, or in threes. Calyx of 3 (rarely 4) sepals. Corolla much larger than the calyx, of 6, (9, or 12) petals. Androecium of many stamens: anthers blunt. Gynoecium of few or many carpels or sometimes of one carpel. Fruit berry-like, clustered (solitary by abortion), or aggregate. Seeds arillate, with ruminant endosperm.—About 48 genera and 550 species, most abundant in the tropics.

Carpels few and distinct or solitary, borne on a flat or globular receptacle: petals thin-edged, imbricate in the bud, herbaceous or coriaceous: anther-sacs separate.

## TRIBE I. ASIMINEAE.

Carpels numerous, confluent with each other and with the elongate receptacle: petals thick-edged, valvate in the bud, felt-like: anther-sacs contiguous.

## TRIBE II. ANNONEAE.

## I. ASIMINEAE

Receptacle hemispheric or globular: petals relatively broad, those of the 2 series dissimilar.

Petals impressed veiny within; inner merely concave at base; leaf-blades membranous.

Petals not impressed veiny; inner corrugated within at base; leaf-blades coriaceous.

Receptacle flat: petals narrow, of a linear type: those of the 2 or 3 series not very dissimilar.

## 1. ASIMINA.

## 2. PITYOTHAMNUS.

## 3. DEERINGOTHAMNUS.

## II. ANNONEAE

Tree or shrub of low situations: berry reticulate, scaly or muricate.

## 4. ANNONA.

1. **ASIMINA** Adans. Shrubs or trees with heavy-scented foliage. Leaves promptly deciduous: blades membranous, pinnately veined, not reticulate. Flowers inconspicuous, solitary in the axils of last year's leaves. Corolla lurid-green to dark-purple: petals much larger than the sepals, stiff, erect and recurved at the tip. Ovules few—several. Berries pulpy, solitary or 2-4 together, edible.—Following are the only known species.—Spr.—PAWPAWS. CUSTARD-APPLES.—The flowers are nearly or quite full-grown when they open.

Corolla over 3 cm. wide: sepals 12-14 mm. long: seeds decidedly flattened, 2-3 cm. long.

1. *A. triloba*.

Corolla less than 1.5 cm. wide: sepals 5-7 mm. long: seeds turgid, 1-1.5 cm. long.

2. *A. parviflora*.

1. ***A. triloba*** (L.) Dunal. Shrub, or small tree up to 12 m. tall: leaves narrowly obovate to cuneate-obovate, 10-30 cm. long, acuminate: pedicels 10 mm. long or more, densely hirsute: sepals ovate: outer petals orbicular or reniform, 2-2.5 cm. long, glabrous or sparingly pubescent: berries ellipsoid to somewhat cylindric, 7-16 cm. long.—(FALSE-BANANA. PAWPAW-APPLE.)—River banks and rich woods, various provinces, Fla. to Tex., Nebr., Mich., and Ont.—Efforts are now being made to grow the fruit on a commercial scale.

2. ***A. parviflora*** (Michx.) Dunal. Shrub 4 m. tall or less: leaf-blades obovate, elliptic-obovate, or cuneate-obovate, 6-17 cm. long, acuminate or abruptly pointed: pedicels very short, 5 mm. long or less, tomentulose: sepals

broadly ovate: outer petals ovate or nearly so, 7–10 mm. long, densely pubescent: berries oval or ellipsoid, often irregular, 2–6 cm. long.—(SMALL-FRUITED PAWPAW. DWARF-PAWPAW.)—Pinelands, oak-woods, and hammocks, Coastal Plain and adj. provinces, N pen. Fla. to Miss. and N. C.

**2. PITYOTHAMNUS** Small. Shrubs with odorous, somewhat aromatic, foliage and uniform stems. Leaves tardily deciduous or somewhat persistent: blades leathery or chartaceous, reticulate-veined. Flowers conspicuous, solitary or in pairs, before or after the leaves. Corolla white or yellowish, or partly or wholly red-purple: petals very much larger than the sepals, more or less drooping. Ovules few. Berries solitary or 2–7 together, more or less inequilateral, often uneven from the unequal development of the seeds, edible.—Comprising only the following species.—Spr.—PAWPAWS. DOG-APPLES.—The flowers often increase much in size and assume deeper colors after they open.

Flowers arising from axils of the deciduous leaves of the preceding season, appearing before the leaves of the season or with them as they develop. I. RETICULATAE.  
Flowers terminal on short-scaly stalks or leafy branchlets axillary to the leaves of the season, thus appearing after the leaves. II. OBOVATI.

#### I. RETICULATAE

Young leaves copiously pubescent beneath, but not lanate-tomentose: mature outer petals obovate: inner petals strongly auriculate near the base.

Young leaves densely lanate-tomentose: mature outer petals oval, often broadly so, or oval-obovate: inner petals not strongly auriculate.

1. *P. reticulatus*.

2. *P. incanus*.

#### II. OBOVATI

Flowers borne on a short axillary stalk which bears a scale-like bract at the base or near it: outer petals 6 cm. long or less.

Outer petals flat, mostly over 5 cm. long: inner petals corrugated at the base: anthers over 2 mm. long.

Outer petals revolute, mostly less than 5 cm. long: inner petals corrugated all over: anthers less than 2 mm. long.

Inner petals narrowed at the apex, decidedly longer than wide: perianth trimerous.

Inner petals rounded at the apex, as wide as long or nearly so: perianth tetramerous.

Flowers borne on a short leafy branchlet: outer petals 6 cm. long or more.

3. *P. angustifolius*.

4. *P. pygmaeus*.

5. *P. tetramerus*.

6. *P. obovatus*.

**1. *P. reticulatus*** (Chapm.) Small. Shrub 1 m. tall or less, the stems with grayish or brown bark, the shoots tawny tomentulose: leaf-blades elliptic-cuneate to cuneate, or individually narrowly elliptic, 2.5–9 cm. long, mostly rounded at the apex, abruptly narrowed at the base, very short-petioled: sepals oval to ovate, about 1 cm. long, tawny-tomentulose: outer petals obovate, 3–4 cm. long, finely pubescent without: inner petals 2–2.5 cm. long: berry elliptic, 2.5–9 cm. long, rounded at base: seeds 1–1.5 cm. long. [*Asimina reticulata* Chapm. *A. cuneata* Shuttlw.]—Pinelands and scrub, pen. Fla.—A tea made from the flowers of this and the other species is used by the Seminoles as a remedy for kidney disorders.

**2. *P. incanus*** (Bartr.) Small. Shrub 1.5 m. tall or less, the stems with a dark-gray bark, the shoots densely tawny tomentulose: leaf-blades elliptic-obovate or obovate, or individually elliptic or some-

what cuneate, mostly rounded at the apex, gradually narrowed at the base, short-petioled: sepals ovate, 6–8 mm. long, tawny-tomentulose: outer petals obovate or oval, 4–6 cm. long, rather coarsely pubescent without; inner petals about 2 cm. long: berry mostly oval, varying to ovoid or obovoid, 4–7 cm. long: seeds 1–1.5 cm. long. [*Asimina grandiflora* (Michx.) A. Gray *A. speciosa* Nash]—(FLAG-PAWPAW.)—Pinelands, Coastal Plain, NE Fla. to S Ga.

3. **P. angustifolius** (A. Gray) Small. Shrub 1.5 m. tall or less, the erect or ascending, often virgate stems with brown or red bark, or gray when very old, the twigs minutely tawny-pubescent: leaf-blades narrowly linear, often elongate-linear, to oblanceolate or narrowly spatulate, 6–10 cm. long, acute or obtuse, glabrous and shining, gradually narrowed to the base, short-petioled: sepals ovate, 1–1.5 cm. long, glabrous or nearly so: outer petals elliptic, varying to broadest above or below the middle, 4–6 cm. long: inner petals somewhat pandurate, 4–5 cm. long: berry ellipsoid or cylindric-ellipsoid, 4–8 cm. long: seeds 1–2 cm. long. [*Asimina angustifolia* A. Gray]—Pinelands, woods, and hammocks, Coastal Plain, N pen. Fla. to SE Ala. and S Ga.

4. **P. pygmaeus** (Bartr.) Small. Shrub with arching ascending or decumbent stems 2–6 dm. long, usually several together from the top of the root, the bark red or reddish, the twigs tawny-pubescent: leaf-blades spatulate, oblanceolate, or elliptic-oblanceolate, or individually obovate or cuneate, 8–15 cm. long, acute or obtuse, glabrous or nearly so when full grown and sharply reticulate: sepals 3, broadly ovate to reniform, 6–7 mm. long, minutely pubescent when young: petals 6, the outer narrowly obovate, but more or less revolute and crisped above the middle, 2–4 cm. long or rarely longer, white tinted with purple to dark-maroon; inner petals narrowly obovate to lanceolate, 1.5–2.5 cm. long, sometimes acuminate, dark-purple: berry inequilaterally ellipsoid or ellipsoid-obovoid, 4–7 cm. long: seeds mostly less than 1.5 cm. long. [*Asimina pygmaea* (Bartr.) A. Gray *A. secundiflora* Shuttlw.]—Pinelands, E Fla. and N Fla.

5. **P. tetramerus** Small. Shrub 1–3 m. tall, with irregularly placed, often virgate branches, the bark gray and glabrous, the twigs finely red-pubescent: leaf-blades spatulate to elliptic-spatulate, 3–13 cm. long, obtuse, glabrous and obscurely reticulate at maturity: sepals 4, rhombic-ovate, 7–10 mm. long: petals 8, the outer lanceolate to elliptic-lanceolate, somewhat revolute above the middle, 1.5–2.5 cm. long, white above, reddish-purple below; inner petals rhombic or rhombic-ovate, 9–11 mm. long, reddish-purple, obtuse, constricted at the base: berry ellipsoid or cylindric-ellipsoid, mostly 5–9 cm. long: seeds mostly over 1.5 cm. long.—Scrub, near estuary of the St. Lucie River, Fla.

6. **P. obovatus** (Willd.) Small. Shrub 3 m. tall or less, with erect branching stems, sometimes tree-like, the bark dark-gray or gray-brown, the twigs red- or brown-tomentulose: leaf-blades obovate, elliptic-obovate, or cuneate-obovate, 4–10 cm. long, rounded or notched at the apex, with the veins and veinlets red-tomentulose beneath, abruptly narrowed at the base, short-petioled: sepals ovate, oval, or elliptic, 10–16 mm. long, thinly pubescent when young: outer petals obovate or oval, 6–11 cm. long; inner petals elliptic to obovate, often somewhat pandurate, 3–6 cm. long: berry oval, obovate, or oval-ellipsoid, mostly 6–12 cm. long: seeds 1.5–2 cm. long. [*Asimina obovata* (Willd.) Nash]—(FLAG-PAWPAW.)—Pinelands and scrub, pen. Fla.

3. **DEERINGOTHAMNUS** Small. Shrubs with aromatic foliage and dimorphous stems, *i.e.*, foliaceous and floriferous. Leaves persistent on the slender stems which are longer than the flower stems: blades firm-membranous. Flowers very fragrant, on stout stems clustered on the top of a long tap-root,

solitary or two or three together in the axils of broad foliaceous bracts. Sepals 2 to 4, broad. Corolla white or ochroleucous: petals 6-12, narrow, coriaceous, often curled backward. Ovules 6-8. Berry solitary or 2 or 3 together.—Following are the only known species.—Spr.

Corolla white or pinkish; petals of a linear type, the longer ones more than four times the length of the sepals: pedicels over 1 cm. long. 1. *D. pulchellus*.  
Corolla yellow; petals of a lanceolate type, the longer ones less than four times the length of the sepals: pedicels less than 1 cm. long. 2. *D. Rugelii*.

1. *D. pulchellus* Small. Root fusiform, 3-6 dm. long: stems 3 dm. tall or less, those bearing flowers stouter than the leafy ones, all early glabrous: leaves bright-green; blades cuneate to spatulate, 3-11 cm. long, obtuse or rounded at the apex, sharply reticulate above, glabrous at maturity or with persistent scattered fuscous hairs on the midrib beneath: bracts of the flowering stems foliaceous, ovate, oval, or elliptic, sessile or nearly so: pedicels curved, 1-2.5 cm. long: sepals coriaceous, triangular to lanceolate, 4-8 mm. long, acute, glabrous or obscurely pubescent: petals linear, varying to broadest above the middle or below it, 11-22 mm. long, the outer finely pubescent: stamens 2.5-3 mm. long; apical gland of the connective knob-like: berry obovoid, or cylindric-ellipsoid, often somewhat constricted between the seeds, 2-4.5 cm. long: seeds very turgid, subglobose or flattened on one side.—Low pinelands, SW pen. Fla.

2. *D. Rugelii* (Robinson) Small. Plant similar in habit to that of *D. pulchellus*, but more erect: but more copiously red-tomentose, at least when young: stems 2-6 dm. tall: leaves deep-green; blades spatulate, cuneate, or obovate: bracts of the flowering stem foliaceous, elliptic or nearly so, 2.5-4 cm. long, rounded at the apex, reticulate, abruptly contracted to a short petiole: pedicels spreading or recurved spreading, less than 1 cm. long: sepals broadly ovate to deltoid, obtuse, copiously pubescent at least when young: petals lanceolate, or sometimes elliptic-lanceolate, 12 mm. long, very fleshy, obtuse, minutely pubescent: stamens 2.5-3 mm. long or less: berry obovoid to cylindric-obovoid, often curved and constricted between the seeds, 2-6 cm. long: seeds subglobose to oval, very turgid. [*Asimina Rugelii* Robinson]—Flatwoods, NE pen. Fla.

4. **ANNONA** L. Trees with pungent-aromatic foliage. Leaves persistent: blades thick-membranous or coriaceous, pinnately veined or reticulate. Flowers perfect, solitary or clustered. Sepals usually broad. Corolla white or yellow, conic to globose-conic: petals 6, very broad, the outer converging to the apex, completely enclosing the smaller inner ones. Ovule solitary in each carpel. Fruit an aggregate of the receptacle and the fleshy mature carpels.—About 60 species, mostly in tropical America.—PAWPAWS. CUSTARD-APPLES.

Petals very broad, often wider than long: fruit not tuberculate. 1. *A. glabra*.  
Petals narrow: fruit strongly tuberculate. 2. *A. squamosa*.

1. *A. glabra* L. Tree 14 m. tall or less with stout buttressed trunks: leaf-blades elliptic, oval, or elliptic-ovate, 9-18 cm. long, acute or short-acuminate,

short-petioled: flowers drooping, short-pediceled: sepals reniform, appressed: petals white, except the red or crimson blotch within, clamshell-like, the outer 3-3.5 cm. long or smaller: stamens 3.5-4 mm. long: berry ovoid, inequilateral, 5-12 cm. long, yellow blotched with brown, coarsely reticulate: seeds 9-20 mm. long. [*A. laurifolia* Dunal.] — (POND-APPLE. CUSTARD-APPLE. ALLIGATOR-APPLE.) — Swamps, ponds, and low hammocks, S pen. Fla. and the Keys. — (*W. I.*) — Spr. — The form with small flowers and small fruits has sometimes been considered a distinct species, under the name *A. palustris*.

2. *A. squamosa* L. Tree with glabrous or nearly glabrous twigs: leaf-blades mainly elliptic, varying to elliptic-lanceolate, mostly 10-15 cm. long, rather slender petioled: sepals broadly deltoid, about 2 mm. long, acute: outer petals narrowly elliptic to linear-lanceolate, 24-28 mm. long: berries ovoid to globose-ovoid, 6-10 cm. long, tuberculate, yellowish-green. — (SUGAR-APPLE. SWEET-SOP.) — Hammocks, Florida Keys. Nat. of trop. Am. — (*W. I.*) — Grown extensively in the tropics for its edible fruits.

#### FAMILY 4. MAGNOLIACEAE — MAGNOLIA FAMILY

Shrubs, trees, or vines. Leaves, alternate, sometimes apparently whorled: blades entire, toothed, or lobed. Flowers perfect or monoecious. Calyx of 3 petaloid sepals or rarely more. Corolla of 5 imbricate petals as large as the sepals or larger, or more. Androecium of many stamens or rarely few. Gynoecium of several or many distinct carpels. Fruit a cone or a whorl of accrescent carpels which become baccate or follicular, or rarely samaroid. — About 10 genera and 75 species, widely distributed.

Leaves not lobed, sometimes merely auricled at the base: mature carpels dehiscent or berry-like.

Carpels in a whorl: petals many.

Carpels imbricated in several series: petals about 5.

Twining shrubs with monoecious flowers: stamens 5, united into a disk: fruit a spike of berries.

Erect shrubs or trees with perfect flowers: stamens numerous, distinct: fruit a head of imbricated follicles.

Corolla greenish or yellow: styles or stigmas filiform, deciduous: follicle rounded.

Corolla white: styles or stigmas stout, persistent: follicle tipped by the style or stigma.

Leaves 4-lobed: mature carpels samara-like, indehiscent.

1. *ILLICIAM*.

2. *SCHIZANDRA*.

3. *TULIPASTRUM*.

4. *MAGNOLIA*.

5. *LIRIODENDRON*.

1. *ILLICIAM* L. Aromatic shrubs or trees. Leaves evergreen: blades entire, exstipulate. Flowers perfect, more or less nodding. Sepals 3-6. Petals many, in 3-several series, the inner the narrower. Stamens numerous: filaments nearly linear: anther-sacs contiguous. Carpels in 1 series. Seed solitary. — Seven species, the following and 5 in Asia. — Spr. — ANISE-TREES. STAR-ANISES.

Corolla 2 cm. broad: petals 6-12: leaf-blades obtuse.

Corolla 2.5-3 cm. broad: petals 20-30: leaf-blades acuminate.

1. *I. parviflorum*.

2. *I. floridanum*.

1. *I. parviflorum* Michx. Shrub 1-2 m. tall: leaf-blades elliptic, 6-10 cm. long, sepals less than 10 mm. long: petals ovate or suborbicular, about as long

as the sepals, yellow: fruit about 2 cm. wide.—(STAR-ANISE.)—Low woods and swamps, Coastal Plain, Fla. to Ga.

2. **I. floridanum** Ellis. Shrub 2-3 m. tall: leaf-blades elliptic, 6-15 cm. long, rosin-scented: sepals over 10 mm. long: petals linear or nearly so, 15-20 mm. long, dark-red: fruit 25-30 mm. wide—(PURPLE-ANISE. STINK-BUSH.)—Swamps and low hammocks, Coastal Plain, N Fla. to La. and N Ala.—The flowers have the odor of decaying fish.

2. **SCHIZANDRA** Michx. Vines. Leaves deciduous: blades sometimes toothed. Flowers monoecious, drooping. Sepals 5 or 6. Petals 5 or 6, each thickened at the base. Stamens 5: filaments dilated, united into a disk: anther-sacs separated. Carpels in several series. Seeds 2.—Six species, the following and 5 others Asiatic.

1. **S. coccinea** Michx. Woody vine: leaf-blades thickish, oval, elliptic or ovate, 5-15 cm. long, slender-petioled: sepals oval to ovate, 3-6 mm. long: petals obovate-cuneate, mostly crimson: spike of fruit 4-7 cm. long, the berries about 1 cm. long.—(WILD-SARSAPARILLA. BAY STAR-VINE.)—Rich woods, Coastal Plain, Fla. to La. and S. C.—Spr.—sum.

3. **TULIPASTRUM** Spach. Trees. Leaves deciduous: blades entire. Flowers perfect, greenish, yellowish, or yellow, erect. Fruit a torulose cone.—The following are the only known species.—Spr.—CUCUMBER-TREES.

Leaf-blades more or less acuminate: corolla greenish.  
Leaf-blades obtuse or abruptly pointed: corolla canary-yellow.

1. *T. acuminatum*.  
2. *T. cordatum*.

1. **T. acuminatum** (L.) Small. Tree becoming 30 m. tall: leaf-blades elliptic to ovate, or rarely obovate, 1.5-3 dm. long, more or less acuminate, usually membranous: sepals mostly lanceolate or elliptic: petals cuneate to oblanceolate, 5-7 cm. long, greenish or yellowish-green, (or yellowish in *T. acuminatum flavum*): fruit-cone 5-8 cm. long, usually with many foli-  
cles. [*Magnolia acuminata* L.]—(CUCUMBER-TREE. MOUNTAIN-MAGNOLIA. BLACK-LINN. YELLOW-LINN.)—Rich woods, various provinces, S Ga. to Ark. and Ont.

2. **T. cordatum** (Michx.) Small. Shrub or small tree: leaf-blades oval or orbicular-oval, to broadly ovate or obovate, 1-1.5 dm. long, coriaceous: sepals ovate: petals obovate, 4-5 cm. long, light-yellow: fruit-cone 2-5 cm. long, with few foli-  
cles. [*Magnolia cordata* Michx.]—Rich woods, Piedmont and Blue Ridge, Ga. to N. C.; Ala.

4. **MAGNOLIA** L. Shrubs or trees. Leaves deciduous or persistent, sometimes very large, scattered or in umbrella-like clusters; blades entire, sometimes auricled at the base. Flowers perfect, erect, white. Sepals and petals about equal in size, more or less coriaceous. Fruit an echinate cone of usually colored carpels.—About 25 species, North American and Asiatic—BAYS.—The trees are ornamental both in flower and in fruit. The fruits are very conspicuous when the scarlet seeds dangle from the follicles on invisible threads.

Leaves persistent; blades coriaceous, gradually or abruptly narrowed at the base: flower-buds silky; petals short and broad. I. GRANDIFLORAE.

Leaves deciduous; blades membranous, cordate, auriculate, or acute at the base: flower-buds tomentose or glabrous: petals elongate: pale-barked trees.

Leaf-blades green, often pale beneath: buds glabrous: fruit-cone somewhat elongate, often ellipsoid: leaves of the flowering branches umbrella-clustered.

Leaf-blades glaucous beneath: buds tomentose: fruit-cone subglobular, oval or ovoid: leaves of the flowering branches not umbrella-clustered.

## II. UMBRELLAE.

## III. MACROPHYLLAE.

## I. GRANDIFLORAE

Leaf-blades thick-coriaceous: corolla 1-1.5 dm. long: fruit-cone 8-12 cm. long, the carpels numerous.

Leaf-blades thin-coriaceous: corolla 3-5 cm. long: fruit-cone 3-5 cm. long, the carpels few.

## II. UMBRELLAE

Leaf-blades acute at the base.

Leaf-blades auricled at the base.

Leaf-blades elongate-obovate, to obovate-spatulate, gradually pointed at the apex: stamens 9-12 mm. long.

Leaf-blades rhombic-obovate, abruptly acute: stamens 4-6 mm. long.

## III. MACROPHYLLAE

Leaves very large, cordate or subcordate at the base, very glaucous beneath: fruit-cone subglobose or cylindric-ovoid.

Corolla mostly 2-3 dm. wide: fruit-cone subglobose: seed 11-14 mm. long.

Corolla mostly 3-4 dm. wide: fruit-cone cylindric-ovoid: seed 9-10 mm. long.

1. **M. grandiflora** L. Tree, when large with a trunk-diameter of over 2 m. and dark bark: leaf-blades elliptic, oval, broadly oblanceolate, or rarely ovate, 10-30 cm. long, brown- or rusty-tomentose beneath: flowers very conspicuous, lemon-scented: petals creamy-white; blades sub-orbicular to orbicular-obovate, 5-10 cm. wide: fruit-cone oval; carpels pubescent: seeds 1.5-2 cm. long. [*M. foetida* (L.) Sarg.]—(LAUREL. BULL-BAY. LOBLOLLY-MAGNOLIA. SOUTHERN-MAGNOLIA.)—Hammocks, bluffs, sand-dunes, and sandy bottoms, Coastal Plain, C Fla. to Tex., Ark., and N. C.—Spr.-sum.—Cult. for ornament as far N as Washington, D. C.

2. **M. virginiana** L. Shrub or tree, at most with a trunk-diameter of 1 m., and pale bark: leaf-blades elliptic or oval, or rarely oblanceolate, 5-15 cm. long, glaucous and more or less silky beneath: flowers rather inconspicuous, but very fragrant: petals white; blades elliptic, oval or obovate, mostly 2-3 cm. wide: fruit-cone oval or ovoid; carpels glabrous: seeds 8-10 mm. long. [*M. glauca* L.]—

(SWEET-BAY. SWAMP-BAY. WHITE-BAY. BEAVER-TREE.)—Swamps and low woods, Coastal Plain and rarely adj. provinces, Fla. to E Tex., Tenn. and Mass.—Spr.—fall.—Of all our trees, this is one of the most consistent occupants of mediacid soils. It is deciduous N.

3. *M. tripetala* L. Tree with a maximum trunk-diameter of 4 dm., the twigs glabrous: leaf-blades elliptic-oblongate to obovate-oblongate, 2-7 dm. long, acute, sometimes abruptly pointed, pubescent beneath at least when young: flowers scented, but not pleasantly so: petals elliptic-oblongate, 11-16 cm. long: fruit-cone ellipsoid, 8-12 cm. long, pink. [*M. Umbrella* L.]—(UMBRELLA-TREE. UMBRELLA-MAGNOLIA. ELK-WOOD.)—Rich woods and ravines, various provinces N of Coastal Plain, Ga. to Ark., Mo., and Pa.—This and the four following species are called cucumber-trees.

4. *M. Fraseri* Walt. Tree with a maximum trunk-diameter of 5 dm., the twigs glaucous: leaf-blades elongate-obovate to obovate-spatulate, 2-4 dm. long, the basal auricles mostly directed backward: flowers pleasantly scented: petals elliptic to narrowly ovate, 6-14 cm. long: fruit-cone ellipsoid-conic, 7-12 cm. long, deep-pink.—(EAR-LEAF UMBRELLA-TREE. MOUNTAIN-OREAD. INDIAN-PHYSIC.)—Woods, Blue Ridge and adj. provinces, Ga. to Ala., Ky., and Va.

5. *M. pyramidata* Pursh. Tree with a maximum trunk-diameter of about 2 dm., the twigs green: leaf-blades rhombic-obovate, 1-2 dm. long, the basal auricles diverging: flowers somewhat fragrant: petals lanceolate, 5-8 cm. long: fruit-cone ellipsoid, 6-8 mm. long, pink.—(WOOD-OREAD.)—Woods and stream-banks, Coastal Plain, W Fla. to Miss. and Ga.

6. *M. macrophylla* Michx. Tree with a maximum trunk-diameter of about 5 dm., the twigs pubescent: leaf-blades obovate to elliptic-lanceolate, 3-9 dm. long, the basal lobes broad: flowers fragrant: petals rather irregular in shape, but broad, the outer 19-23 cm. long: fruit-cone subglobose or broadly oval, 6-11 mm. in diameter, deep-pink.—(GREAT-LEAF MAGNOLIA. ROYAL-OREAD. SILVER-LEAF. BIG-BLOOM.)—Rich woods, various provinces, W Fla. to La., Ark., Ky., and N. C.—The trunk is sometimes branched near the base

7. *M. Ashei* Weatherby. Tree similar to *M. macrophylla*, but smaller and sometimes shrubby: leaf-blades with the pubescence of the midrib beneath sub-appressed: petals more or less irregular in shape, mostly elliptic to oval, varying to broadest above the middle or below it, the outer 12-15 cm. long: fruit-cone cylindric-ovoid, 5-11 cm. long.—Sandy woods near streams, Coastal Plain, W Fla. (and S Ga.?) ; also Tex.

5. *LIRIODENDRON* L. Trees. Leaves deciduous: blades lobed. Flowers perfect, greenish-yellow. Sepals 3, reflexed. Petals 6, broader than the sepals, erect. Fruit a cone of appressed samara-like carpels.—Two species, the following and one in China.

1. *L. Tulipifera* L. Tree becoming 60 m. tall, the bark with flat ridges: leaf-blades 6-20 cm. wide, 4-lobed, truncate or notched at the apex: flowers campanulate: sepals elliptic to elliptic-obovate, 4-5 cm. long: petals elliptic, oval, or suborbicular, greenish-yellow and often tinged with orange: fruit conic, 5-7 cm. long, erect, the carpels 3-4 cm. long, indehiscent.—(TULIP-TREE. WHITE-WOOD. YELLOW-POPLAR.)—Rich or damp woods, various provinces, N pen. Fla. to Ark., Mich., Ont., and Mass.—Sum.—An important timber-tree.

## FAMILY 5. MENISPERMACEAE — MOONSEED FAMILY

Perennial herbaceous vines. Leaves alternate: blades entire or lobed, sometimes peltate. Flowers polygamous or dioecious, in racemose or paniculate cymes. Calyx of 6 sepals, or fewer or more. Corolla of 4-6, or more, petals smaller than the sepals, or wanting. Androecium of 6-12 stamens, or more. Gynoecium of 3-6 distinct carpels, or more. Fruit a berry-like drupe.—About 55 genera and 150 species, mostly natives of the tropics.

Corolla none: stigma radiate.

Corolla present: stigma entire or 3-lobed.

Pistillate flowers with 4-8 petals: gynoecium of 3-5 carpels, the stigmas not lobed: androecium of 6-24 stamens, the anthers terminating long filaments: drupe glabrous.

Stamens 6: stigma subulate: drupe red.

Stamens 12-24: stigma dilated: drupe black.

Pistillate flowers with 1 petal: gynoecium a single carpel, the stigma 3-lobed: androecium of 2 or 4 stamens, the anthers sessile on a central peltate column: drupe pubescent.

## 1. CALYCOCARPUM.

## 2. EPIBATERIUM.

## 3. MENISPERMUM.

## 4. CISSAMPELOS.

1. **CALYCOCARPUM** Nutt. Vines with relatively large prominently lobed leaf-blades. Sepals 6. Filaments nearly linear. Stigma radiate. Seed cup-like.—One species.

1. **C. Lyonii** (Pursh) Nutt. Stems twining: leaf-blades 6-20 cm. in diameter, palmately 3-7-lobed: flowers green: sepals elliptic or elliptic-obovate, 4.5-5 mm. long, or smaller: drupes subglobose or oval, about 25 mm. long, black, the stone toothed along the edge.—(CUP-SEED. LYONIA-VINE.)—Rich woods and river-banks, various provinces, Fla. to La., Kans., Ill., and Ky.—Spr.—The stem and branches, mostly herbaceous, are often greatly elongate. The unripe green plum-like and ripe black fruits hang on long stalks from the branches.

2. **EPIBATERIUM** Forst. Vines with relatively small entire or lobed leaf-blades. Sepals 6. Petals 6, involute at the base. Stamens club-like. Gynoecium sessile. Stigmas subulate. Seed cochleate. [*Cebatha* Forsk. *Cocculus* DC.]—About 11 species, mostly tropical.

1. **E. carolinum** (L.) Britton. Leaf-blades broadly ovate to deltoid, 4-12 cm. long: flowers white: outer sepals elliptic: drupes red, 7-8 mm. long. [*Cocculus carolinus* DC.]—(CORAL-BEADS. CAROLINA-MOONSEED. RED-MOONSEED. SNAILSEED.)—Woods, fields and thickets, various provinces, Fla. to Tex., Kans., and Va.—Sum.—This is a much less woody vine than the next following. The leaf-blades vary much, some are entire, others prominently lobed. The dense clusters of bright-red fruits borne close along the branches are very conspicuous.

3. **MENISPERMUM** [Tourn.] L. Vines, with rather large entire or shallow-lobed leaf-blades. Sepals 4-8. Petals 4-8, with involute sides. Filaments clavate. Gynoecium stipitate. Stigmas flabellate. Seed cochleate.—Two species, the following and one Asiatic.

1. **M. canadense** L. Stems finely pubescent: leaf-blades 5-20 cm. wide, peltate near the base: flowers greenish-white: sepals elliptic or oval, 1.5-2 mm. long: petals with somewhat flabellate blades: drupes bluish-black, about 1 cm. in diameter.—(MOONSEED.)—Woods, thickets, and fence-rows, various provinces, Ga. to Okla., Man., and Que.—Sum.—The stout woody stems and branches of this vine sprawl over rock or climb over shrubs. The clusters of dark-blue or blue-black fruits often resemble bunches of grapes.

4. **CISSAMPELOS** L. Vines with broad entire leaf-blades which are sometimes notched at the apex. Sepals 4 in the staminate flowers, one in the pistillate flowers. Petals 4 and united into a cup in the staminate flowers, one in the pistillate flowers. Stamens 2 or 4, the anthers sessile on a central peltate column. Gynoecium of a single inequilateral carpel with a short style and 3 acute stigmas. Drupe subglobose.—Several dozen species, widely distributed, especially in the tropics.

1. **C. Pareira** L. High-climbing vine: leaf-blades bright-green suborbicular varying to ovate-orbicular or orbicular-reuiform, 4-10 cm. broad, entire, truncate or cordate and more or less peltate at the base, long-petioled: staminate flowers in much-branched cymes, the calyx nearly 2 mm. wide; sepals suborbicular: pistillate flowers in bracted clusters along a long rachis, the sepals and petals cuneate or obovate: drupe subglobose, 7-10 mm. in diameter, red, pubescent.—Hammocks, Everglade Keys, peu. Fla.—(W. I., Mex., C. A., S. A.)—Sum.

#### FAMILY 6. CABOMBACEAE — WATER-SHIELD FAMILY

Aquatic caulescent plants, often coated with transparent jelly. Leaves alternate or opposite: blades of the submerged ones palmately dissected, those of the floating leaves entire and peltate. Flowers perfect. Calyx and corolla of 3 or 4 sepals or petals each, the latter not larger than the former. Androecium of 3-18 stamens.—Two genera and about 5 species, widely distributed in fresh lakes and streams.

Leaf-blades dissected except the inconspicuous floating ones: petals auricled: carpels 2-4.  
Leaf-blades all entire: petals entire: carpels 4-18.

1. CABOMBA.
2. BRASENIA.

1. **CABOMBA** Aubl. Slender tender herbs. Blades of the submerged leaves dissected. Sepals and petals about equal. Stamens mostly shorter than the carpels: filaments subulate. Stigma terminal. Seed rough.—Four species, natives of the warmer parts of America.

1. **C. caroliniana** A. Gray. Stems green (or purple or deep-pink as are also the petals in *C. caroliniana pulcherrima* SW Fla. and S Ga.): blades of the floating leaves linear-elliptic, peltate, 1.5–2 cm. long: sepals and petals obovate, white or pink-purple, sometimes yellow at the base, 8–12 mm. long: mature carpels flask-shaped, 5–7 mm. long, the beak shorter than the body.—(FANWORT. WATER-SHIELD. WEN-DOCK.)—Ponds and slow-flowing streams, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and N. C.—Spr.—sum.

2. **BRASENIA** Schreb. Stout herbs. Leaves peltate: blades entire. Petals narrower than the sepals. Stamens mostly longer than the carpels: filaments filiform.—One species.—The leaves evergreen in the southern part of our range, and the flowers are long-staked and floating.

1. **B. Schreberi** Gmel. Stems, and other submerged parts, mucilage-coated: leaf-blades oval or elliptic, 5–12 cm. long: sepals and petals linear or linear-lanceolate, 1–1.5 cm. long, dull-purple: mature carpels 5–8 mm. long, the beak angled. [*B. purpurea* (Michx.) Casp. *B. peltata* Pursh]—(PURPLE-BONNET. PURPLE WEN-DOCK. WATER-SHIELD. WATER-TARGET.)—Ponds and still-water, various provinces, Fla. to Tex., Man., and N. S.—(*W. I.*, *O. W.*)—Sum.

## FAMILY 7. NELUMBONACEAE — LOTUS FAMILY

Aquatic acaulescent plants with rootstocks. Leaves alternate, blades suborbicular, centrally peltate, the principal veins radiating from the center and forking towards the margins. Flower solitary on the erect scape. Calyx of several sepals. Corolla of many petals, larger than the sepals. Androeium of numerous stamens: anthers narrow, over-topped by the prolonged connective. Gynoeium of several carpels separately immersed in an obconic enlargement of the receptacle. Stigma umbilicate. Fruit several nuts immersed in the accrescent turbinate or hemispheric receptacle. Represented by the following genus:

1. **NELUMBO** Adans. Leaves and flowers erect on the tuberous rootstock. Leaf-blades large, elevated above the water on stout petioles, depressed

or cup-like at the center. Flowers erect. Sepals and petals passing gradually into each other. Stamens numerous, deciduous. Fruits acorn-like, imbedded in the top of the receptacle.—Three species, the following and two in the Old World—The flowers and leaves are elevated above the water, the latter are not evergreen.

1. *N. lutea* (Willd.) Pers. Leaf-blades elevated on the petioles, or floating, orbicular, 3-6 dm. in diameter, the edges turned upward: peduncles 1-2 m. tall: corolla pale-yellow, 1-2.5 dm. wide: appendages of the anthers 4-7 mm. long: fruiting receptacle 7-10 cm. wide: nuts 10-12 mm. in diameter.—(DUCK-ACORN. LOTUS. WATER-CHINQUAPIN. WATER-NUT. YONKAPIN. ALLIGATOR-BUTTONS. CAN-DOCK.)—Ponds, lakes, and slow streams, Coastal Plain and isolated localities in other provinces, Fla. to Tex., Nebr., Minn., Ont., and Mass.—Sum.—The fruits were used as food by the aborigines.

#### FAMILY 8. NYMPHAEACEAE — WATER-LILY FAMILY

Aquatic plants with stout horizontal rootstocks. Leaves with erect or floating blades. Flower terminating a long scape. Calyx of 4-6 sepals. Corolla of many petals passing into the stamens. Androecium of numerous stamens. Gynoecium of 6-36 united carpels, the stigmas radiate on a disk. Fruit baccate.—Five genera and about 45 species, widely distributed in fresh water.—In addition to emersed and floating leaves there are sometimes submersed ones.

Petals small, filament-like: stamens hypogynous: ovary superior. 1. NYMPHAEA.  
Petals about as large as the sepals: stamens epigynous: ovary inferior. 2. CASTALIA.

1. **NYMPHAEA** [Tourn.] L. Plants with erect or floating leaf-blades and yellow flowers. Leaf-blades not peltate, with a deep sinus at the base. Sepals 5 or 6, concave, converging. Petals numerous, thick, scale-like, borne with the stamens, under the ovary. Berry smooth, maturing above water.—About 12 species, natives of the north temperate zone.—SPATTER-DOCKS. SPATTER-DOCKS. BONNETS. COW-LILIES. YELLOW POND-LILIES.

Leaf-blades more than twice as long as wide, the sinus less than one-fourth the length of the blade. I. SAGITTIFOLIAE.

Leaf-blades less than twice as long as wide, the sinus one-fourth to one-half the length of the blade.

Leaf-blades glabrous beneath.

II. ADVENAE.

Leaf-blades pubescent beneath.

III. ORBICULATAE.

##### I. SAGITTIFOLIAE

Leaf-blades over thrice as long as wide, the sinus open: stigma-rays linear.

1. *N. sagittifolia*.

Leaf-blades less than thrice as long as wide, the sinus closed: stigma-rays elliptic.

2. *N. ulvacea*.

##### II. ADVENAE

Leaf-blades of an orbicular or ovate-orbicular type.

3. *N. fluviatilis*.

Leaf-blades markedly longer than wide.

Sepals and leaf-blades very thin: submersed leaves present. 4. *N. chartacea*.

Sepals and leaf-blades thick : submersed leaves wanting.

Leaf-blades ovate or oval : inner sepals suborbicular : fruits subglobose : disk green or yellowish-green.

Leaf-blades elliptic-ovate : inner sepals cuneate-obovate : fruits narrowly ovoid ; disk chrome-yellow to red.

6. *N. macrophylla*.

5. *N. advena*.

III. ORBICULATAE

Leaf-blade with a closed sinus : stamens in 9 or 10 rows : flowers about 5 mm. in diameter : seeds about 4 mm. long.

7. *N. orbiculata*.

Leaf-blade with an open sinus : stamens in 6 or 7 rows : flowers about 7 mm. in diameter : seeds about 6 mm. long.

8. *N. bombycina*.

1. *N. sagittifolia* Walt. Blades of the floating leaves narrowly elliptic-lanceolate to elliptic, 14–28 cm. long, the sinus V-shaped ; petioles stoutish : flowers spheroidal, 2.6–2.9 cm. in diameter : sepals 6, the 3 outer elliptic or nearly so, 2–2.6 cm. long, the 3 inner suborbicular : filaments fully as long as the anthers or nearly so : fruit ovoid, 3–3.4 cm. long, ribbed above, the disk with linear stigma-rays : seed 4–5 mm. long. [*Nuphar sagittaeifolia* Pursh]—(ARROW-LOTUS.)—Sluggish streams and tidal bayous, Coastal Plain, S. C. and N. C.

2. *N. ulvacea* Miller & Standley. Blades of the floating leaves lanceolate to ovate-lanceolate, 11.5–16.5 cm. long, the sinus closed ; petioles slender : flowers spheroidal, 2–2.3 cm. in diameter : sepals 6, the 3 outer broadly elliptic, 2.4–2.8 cm. long, the 3 inner broadly obovate, clawed : filaments shorter than the anthers : fruit subglobose or ovoid-globose, 1.5–2.1 cm. long, ribbed to the base, the disk with elliptic stigma-rays : seed 3–4 mm. long.—Slow streams, W Fla.

3. *N. fluviatilis* Harper. Blades of the floating leaves suborbicular or ovate-orbicular, 18–25 cm. long, thin, the sinus open : flowers spheroidal, about 2.5 cm. in diameter : sepals 6, very thin, the 3 outer nearly elliptic, 16–18 mm. long, the 3 inner obovate, slightly longer than the outer, clawed : petals about as long as the stamens, mostly truncate : fruit (immature) ovoid ; disk orbicular, the rays linear.—Streams and bayous, Coastal Plain, and adj. provinces, W Fla. to Ala. and N. C.

4. *N. chartacea* Miller & Standley. Blades of the floating leaves ovate to elliptic-ovate, 14–23 cm. long, thin, the sinus closed or very narrow : flowers spheroidal, 3–3.5 cm. in diameter : sepals 6, thin, the 3 outer elliptic, 12–20 mm. long, the 3 inner obovate, nearly or quite as long as the outer, and thinner : petals about as long as the stamens, rounded or truncate at the apex : fruit not seen.—Ponds and bayous, near the Gulf, Fla. to Miss.

5. *N. advena* Ait. Leaf-blades erect, normally borne above the surface of the water, ovate to oval, 15–33 cm. long, glabrous, obtuse, the sinus usually forming a right angle ; petioles nearly terete : flowers spheroidal, 3–4 cm. in diameter : sepals usually 6, the 3 outer ovate, about 35 mm. long, the 3 inner suborbicular, about as long as the outer : petals clear-yellow like the inner sepals, about 20, elliptic-cuneate, about 8 mm. long, truncate or retuse at the apex : filaments cuneate-linear, somewhat shorter than the anther, usually dull-green except the yellow tip : fruit subglobose, about 5 cm. in diameter ; disk light-green or yellowish-green. [*Nuphar advena* R. Br.]—(MULEFOOT-LILY.)—Ponds and streams, various provinces, Ga. to Tex., Nebr., Wis., and N. Y.

6. *N. macrophylla* Small. Leaf-blades erect or floating, elliptic-ovate, 28–40 cm. long, glabrous, the sinus V-shaped: flowers spheroidal, 3.2–3.8 cm. in diameter: sepals 6, the 3 outer obovate, about 32 mm. long, the 3 inner broadly cuneate-obovate; petals light lemon-yellow, broadly cuneate, about 10 mm. long: filaments about  $\frac{1}{2}$  as long as the anthers, lemon-yellow: fruit narrowly ovoid, about 3.5 cm. long; disk chrome-yellow to red.—Streams and sloughs, N E Fla. and the peninsula.

7. *N. orbiculata* Small. Leaf-blades floating, suborbicular, 3–5 dm. long, glabrous above, silky beneath, the sinus closed by the overlapping lobes: flowers spheroidal, about 5.5 cm. in diameter: outer sepals elliptic, about 45 mm. long, the inner suborbicular, short-clawed: petals linear to elliptic-obovate: filaments slightly shorter than the anthers: fruit subglobose, about 4.5 cm. long, the stigmatic disk with erect edges: seed 4 mm. long.—Lakes and ponds, Coastal Plain, M Fla. and adj. Ga.

8. *N. bombycina* Miller & Standley. Leaf-blades floating, broadly ovate to orbicular-ovate, 2–3 dm. long, glabrous above, densely silky beneath, the sinus open: flowers spheroidal, 6–8 cm. in diameter: outer sepals elliptic, 2.5–4.5 cm. long, the inner obovate: petals broad, often truncate, 6–10 mm. long: filaments about  $\frac{1}{2}$  as long as the anthers: fruit ovoid to nearly cylindric, 5–6 cm. long, the stigmatic disk with somewhat spreading edges: seed 6 mm. long.—Ponds, Coastal Plain, N Fla. to Ga.

2. **CASTALIA** Salisb. Plants with floating leaf-blades and white, pink, blue, or yellow flowers. Leaf-blades subpeltate, cleft at the base. Sepals mostly 4, spreading. Petals few to many, spreading, the outer ones as large as the sepals, borne with the stamens on the hypanthium, which encloses the ovary. Berry covered with the persistent petal- and stamen-bases, maturing under water.—About 40 species, of wide geographic distribution.—**WATER-LILIES. WATER-NYMPHS. POND-LILIES.**—The inner petals resemble stamens.

Corolla white, pinkish, blue or violet: rootstock not stoloniferous.

Corolla white or pinkish: outer stamens not appendaged at the apex: styles subulate.

Corolla blue or violet: outer stamens with the connective produced into an apical appendage: styles mere blunt protuberances.

Corolla yellow: rootstock stoloniferous at the tip.

I. ODORATAE.

II. ELEGANTES.  
III. FLAVAE.

#### I. ODORATAE

Styles stout-subulate, 5 mm. long or less, when converging not meeting at the tip: style-disk basin-shaped: corolla mostly 10 cm. wide or less: leaf-blades flat.

Calyx 9–11 cm. wide: petaloid stamens 3–3.5 cm. long: anthers of the inner stamens 6–7 mm. long: style-disk 17–20 mm. wide.

Calyx mostly 6–8 cm. wide: petaloid stamens 2–2.5 mm. long: anthers of the inner stamens 10–11 mm. long: style-disk 10–13 mm. wide.

Styles slender-subulate, 10 mm. long or more, when converging meeting at the tip: style-disk funnelliform: corolla mostly over 15 cm. wide: leaf-blades with the edges turned up.

1. *C. odorata*.

2. *C. minor*.

3. *C. lekophylla*.

#### II. ELEGANTES

Plants with slender petioles and flower-stalks, the leaf-blades floating, the flowers elevated above the water.

4. *C. elegans*.

#### III. FLAVAE

Plant with warty rootstocks and somewhat peltate leaf-blades.

5. *C. flava*.

1. *C. odorata* (Ait.) Woodv. & Wood. Rootstock stout, mostly 2.5–3 cm. thick: leaf-blades suborbicular, 15–20 cm. wide, green tinged with red or

purple-red and obscurely veined beneath: sepals elliptic or elliptic-ovate, 5-6 mm. long: petals usually more than 25, elliptic or slightly broadened upward, thickish: stamens mostly more than 70, the petaloid ones 3-3.5 cm. long: styles mostly 18-20: berry depressed-globose, mostly 2.5-3 cm. in diameter: seed about 3 mm. long. [*Nymphaea odorata* Ait.]—(ALLIGATOR-BONNET. STAR-LOTUS.)—Ponds, lakes, slow streams, and ditches, various provinces, Fla. to La., Man., and N. S.

2. *C. minor* (Sims) DC. Rootstock slender, mostly about 1.5 cm. thick: leaf-blades oval-orbicular, 5-11 cm. wide, dark red-purple and scarcely veined beneath: sepals narrowly elliptic, mostly about 4 cm. long: petals usually less than 20, narrowly elliptic or elliptic-cuneate, very thin and delicate: stamens usually less than 60, the petaloid ones 2.5-3 cm. long: styles mostly 10-15: berry subglobose or somewhat depressed, mostly less than 2.5 cm. in diameter: seed about 2 mm. long.—Lakes, ponds, and ditches, often in acid water, Coastal Plain, Fla. to La. and N. J.

3. *C. lekophylla* Small. Rootstock very stout, 4-6 cm. thick: leaf-blades suborbicular, 20-60 cm. wide, with the edges turned upwards somewhat as in Victoria, deep-green beneath or tinged with purple or red, coarsely reticulate beneath with very stout veins: sepals elliptic-ovate or broadly elliptic, 8-10 cm. long: petals 25-30, narrowly elliptic to linear-elliptic, thick: stamens mostly 80-100, the petaloid ones about 5 cm. long: styles 20-25: berry depressed globose, 3.5-4.5 cm. in diameter. [*C. reniformis* (Fl. SE. U. S.)]—(APPLE-LOTUS.)—Lakes and ponds, Coastal Plain, Fla. to Tex. and Del.—(W. I., Mex.)—The West Indian specimens seem to be like those from Florida. Those from Mexico may represent a different species.

4. *C. elegans* (Hook.) Greene. Rootstock stout: leaf-blades ovate to oval-orbicular, mostly 8-20 cm. wide, undulate-sinuate or near entire, usually dark red-purple and somewhat veiny beneath: flowers usually standing 1-2.5 dm. above the water: sepals mostly lanceolate, 4-5 cm. long: petals 6-10, lanceolate or sometimes ovate-lanceolate, blue or pale-violet: stamens numerous: styles mere blunt protuberances; 15-25: berry depressed-globose, 1.5-3 cm. in diameter: seeds 1-1.5 mm. in diameter.—(BLUE WATER-LILY.)—Ponds, pools, and ditches, Big Cypress swamp, Fla., also Coastal Plain, S Tex.—(Mex.)

5. *C. flava* (Leitner) Greene. Rootstock warty with the persistent petiole-bases: leaf-blades oval to suborbicular, 6-20 cm. wide, glabrous, bright-green above, purple or crimson beneath: flowers 6-10 cm. wide: sepals lanceolate to narrowly elliptic-lanceolate: petals usually about 25, bright yellow, more elliptic than the sepals: stamens 50-60, the petaloid ones mostly 2-2.5 cm. long: anthers of the inner ones 4-6 mm. long: styles 7-9: berry ovoid, 2-2.5 cm. long: seed, 4-5 mm. in diameter. [*Nymphaea flava* Leitner]—(YELLOW WATER-LILY. SUN-LOTUS.)—Lakes, ponds, and slow streams, pen. Fla.

## FAMILY 9. PODOPHYLLACEAE — MAY-APPLE FAMILY

Perennial herbs. Leaves alternate, sometimes all basal and scale-like: blades simple or ternately compound. Flowers perfect, of 4 or 6 sepals. Corolla of 6 or 9 petals resembling the sepals except in *Caulophyllum*. Androecium of 6-18 stamens, the anthers opening by valves, except in *Podophyllum*.—About 10 genera and 30 species, widely distributed.

Anthers opening lengthwise.

Anthers opening by valves hinged at the top.

Leaf-blades simple: seeds enclosed.

Flower solitary: stamens 8: fruit a capsule.

Flowers several, cymose: stamens 6: fruit baccate.

Leaf-blades ternately compound: seed naked, drupe-like.

1. *PODOPHYLLUM*.

2. *JEFFERSONIA*.

3. *DIPHYLLEIA*.

4. *CAULOPHYLLUM*.

1. **PODOPHYLLUM** L. Glabrous herbs, with elongate rootstocks. Leaves solitary, or 2 at the top of the flowering stem: blades peltate, many-lobed. Flower solitary, nodding. Sepals 6, fugaceous. Petals 6-9. Stamens 12-18. Berry fleshy, nodding.—About 4 species, the following and 3 in Asia.

1. *P. peltatum* L. Plants 2-4 dm. tall: leaf-blades suborbicular, 1-3 dm. in diameter, 7-9-lobed: pedicel 2-4 cm. long: petals white, 6-9, obovate, 2.5-4 cm. long, wax-like: berry yellow, somewhat oblique, 4-5 cm. long.—(MAY-APPLE. MANDRAKE. GROUND-LEMON. UMBRELLA-LEAF.)—Rich soil, especially in woods, various provinces, Fla. to Tex., Minn., and Que.—Spr.—The rootstock is used in medicine. The fruit is edible.

2. **JEFFERSONIA** Bart. Small herbs, with short rootstocks. Leaves basal: blades 2-parted. Flower solitary, erect at the end of the scape. Sepals 4, deciduous. Petals 8. Stamens 8: anthers longer than the filaments. Stigma 2-lobed. Capsule opening by a lid.—About 2 species, the following and 1 in Asia.

1. *J. diphylla* (L.) Pers. Plants 1-3.5 dm. tall: leaf-blades 5-10 cm. long, the segments entire or coarsely crenate: petals white, 1.5-2 cm. long, mostly elliptic-lanceolate or oblanceolate: capsule erect, obovoid or obconic, 1.5-2 cm. long: seed 4-7 mm. long.—(TWIN-LEAF. RHEUMATISM-ROOT.)—Rich woods, often in calcareous soil, various provinces N of Coastal Plain, Ala. to Wis., Ont., N. Y., and Md.—Spr.

3. **DIPHYLLEIA** Michx. Large herbs, with stout rootstocks. Leaves mostly 1 or 2 on the flowering stem: blades laterally peltate, deeply lobed. Flowers cymose. Sepals 6, deciduous. Petals 6. Stamens 6: anthers longer than the filaments. Stigma umbilicate. Berry oblique, erect.—Two species, the following and 1 in Japan.

1. *D. cymosa* Michx. Plants 6-12 dm. tall: leaf-blades suborbicular, 3-6 dm. in diameter, 2-cleft and many-lobed: petals 6, white, 8-10 mm. long: berry subglobose, 10-12 mm. in diameter: seed about 5 mm. long.—(PIXIE-PARASOL. UMBRELLA-LEAF.)—Along brooks, Blue Ridge, Ga. to Va.—Spr.

4. **CAULOPHYLLUM** Michx. Large herbs, with thick rootstocks. Leaf high up on the flowering stem, ternately compound. Flowers in a raceme-like cyme. Sepals 6, accompanied by 3 or 4 bractlets. Petals 6, gland-like, dilated. Stamens 6: anthers shorter than the filaments. Fruit erect.—Two species, the following and one in Asia.

1. **C. thalictroides** (L.) Michx. Plants 3–9 dm. tall: leaflets 2–3-lobed at the apex, 4–10 cm. long: panicle 4–10 cm. long: sepals greenish or purplish, 3–6 mm. long: petals about 2 mm. long: seed about 1 cm. in diameter.—(BLUE-COHOSH. BLUE-GIN-SENG. GREEN-VIVIAN. PAPPOOSE-ROOT.)—Rich woods, various provinces N of Coastal Plain, S. C. to Nebr., Minn., and N. B.—Spr.—The exserted seed is likely to be mistaken for a drupe. The plant is medicinal.

#### FAMILY 10. BERBERIDACEAE — BARBERRY FAMILY

Shrubs or small trees, sometimes spiny. Leaves alternate: blades compound, sometimes 1-foliolate. Flowers perfect. Calyx of 6–9 sepals usually accompanied by bractlets. Corolla of 6–9 petals usually smaller than the inner sepals. Androecium of 6 irritable stamens, the anthers opening by valves. Gynoecium of a single carpel. Stigma orbicular. Fruit a berry.—Two genera and about 100 species, widely distributed.

1. **BERBERIS** L. Shrubs with lax branches. Leaves of the main branches transformed into spines, those of the branchlets with 1-foliolate deciduous blades. Flowers racemose. Sepals 6–9, the inner the larger, resembling the petals. Petals 6–9, with basal glands. Berry red.—About 80 species, American and Eurasian.

1. **B. canadensis** Pursh. A shrub 3–20 dm. tall: leaflets mostly 3–6 cm. long, the blades mainly spatulate, sometimes elliptic-spatulate or rarely oval, spiny-serrate: racemes 2–6 cm. long: calyx 8–11 mm. wide, the inner sepals 3–4 mm. long: petals yellow, mainly 2.5–3.5 mm. long: berry scarlet, 5–7 mm. long.—(BARBERRY. ALLEGHENY-BARBERRY. CLIFF-BARBERRY.)—Rocky woods and cliffs, various provinces N of Coastal Plain, Ga. to W. Va., also Mo.; not in Can.—Spr.—The berries are edible.—*B. Thunbergii* DC. A native of Japan, a much-branched spiny shrub up to 15 dm. tall, with obovate or spatulate entire leaf-blades, numerous yellow flowers, and bright red, ellipsoid or subglobose persistent berries, is naturalized in the mountains of N. C.

## ORDER PAPAVERALES — PAPAVERAL ORDER

Herbs, shrubs, trees, or vines. Leaves with entire, toothed, dissected, or compound blades. Flowers perfect. Calyx of distinct or nearly distinct sepals. Corolla of distinct or nearly distinct petals, or wanting. Androecium of few or many hypogynous stamens. Gynoecium of 2-several united carpels. Ovary superior. Fruit capsular or baccate.

Sepals 2, or very rarely 3 or 4: endosperm present.

Flower regular: stamens 8 or numerous: juice usually milky or colored.

Flower irregular: stamens 6: juice usually watery.

Sepals 4-8: endosperm wanting.

Capsule 2-celled: stamens 6, tetradynamous.

Capsule 1-celled: stamens when 6 not tetradynamous.

Gynoecium 2-carpellary: leaves with simple or palmately compound blades.

Gynoecium 3-carpellary: leaves with pinnately compound blades.

Fam. 1. PAPAVERACEAE.

Fam. 2. FUMARIACEAE.

Fam. 3. BRASSICACEAE.

Fam. 4. CAPPARIDACEAE.

Fam. 5. MORINGACEAE.

## FAMILY 1. PAPAVERACEAE — POPPY FAMILY

Herbs or rarely woody plants, the sap colored. Leaves alternate or opposite: blades entire, toothed, or divided. Flowers perfect, regular. Calyx of 2 or rarely 3 caducous sepals. Corolla of 4, 8, or 12, or rarely more, deciduous petals. Androecium usually of many distinct stamens. Gynoecium 2-several-carpellary. Fruit a capsule or a silique.—About 23 genera and 115 species, most abundant in the north temperate zone.

Acaulescent herbs: petals 8-12, not crumpled in the bud: stigmas over the valves of the capsule.

Caululent herbs: petals 4-6, mostly crumpled: stigmas over the placenta.

Capsule splitting to the base.

Capsule pubescent.

Capsule glabrous.

Capsule dehiscent at the top or only to the middle.

Stigma crown-like or disk-like: capsule opening by tooth-like lids under the edge of the stigma: leaf-blades unarmed.

Stigmas 4-6-lobed: capsule 4-6-valved: leaf-blades spiny-toothed.

1. SANGUINARIA.

2. STYLOPHORUM.

3. CHELIDONIUM.

4. PAPAVER.

5. ARGEMONE.

1. **SANGUINARIA** [Dill.] L. Perennial herbs with red rootstocks. Leaves basal: blades palmately lobed. Flowers solitary. Sepals 2, glabrous. Petals 8-12, narrow, white. Gynoecium 2-carpellary, glabrous.—One species.

1. **S. canadensis** L. Plant 8-30 cm. tall, glabrous: leaf-blades orbicular to reniform in outline, 6-25 cm. wide, 5-9-lobed: scapes finally over-topped by the leaves: petals elliptic or rarely broader, 2-3 cm. long: capsule fusiform, 3-5 cm. long.—(BLOOD-ROOT. RED-PUCCOON.)—Rich woods, various provinces, N. Fla. to Ark., Man., and N. S.—Spr.—The rootstock furnished a dye for the aborigines.—Two or three or even a half-dozen species additional to the one here recognized have been described. However, the characters of the rootstocks, the

leaf, and the flower used to distinguish them do not seem to be constant indices to the groups.

**2. STYLOPHORUM** Nutt. Perennial herbs, with orange-yellow roots. Leaves cauline: blades pinnately lobed or dissected. Flowers usually few or several. Sepals 2, pubescent. Petals 4, broad, yellow or red. Gynoecium 3-4-carpellary, pubescent. Stigma crown-like. Capsule stout. Seed thick-crested.—About 4 species, the following and 3 in Asia.

**1. S. diphyllum** (Michx.) Nutt. Plant 2-5 dm. tall, pubescent: leaf-blades 2-pinnatifid, the segments broadened upward; petals deep-yellow, obovate, 1-1.5 cm. long: capsule ovoid or oval, about 2.5 cm. long.—(CELANDINE-POPPY. MOCK-POPPY. WOOD-POPPY. YELLOW-POPPY.)—Woods, often in calcareous soil, various provinces, N of Blue Ridge, Tenn. to Mo., Wis., and W Pa.—Spr.

**3. CHELIDONIUM** [Tourn.] L. Biennial or perennial herbs. Leaves cauline: blades pinnately dissected. Flowers numerous. Sepals 2. Petals 4, broad, but longer than wide, yellow. Gynoecium slender, 2-carpellary. Stigmas 2. Capsule elongate.—One species.

**1. C. majus** L. Plants 2-7 dm. tall: leaf-blades 1-3 dm. long, the segments with lobes or teeth: petals suborbicular, 8-13 mm. long: capsule slender, 3-5 cm. long.—(CELANDINE. ROCK-POPPY. SWALLOW-WORT.)—Roadsides and fence rows, Appalachian provinces in S, various provinces in N, Ga. to Tenn., Ont., and Me.—Nat. of Eu.—Spr.—Celandine, like hoarhound, catnep, and similar herbs, was brought to this country by early settlers from Europe. Being a popular remedy for various external and internal body-disorders it early became naturalized about dwellings over a large area. It has active medicinal properties.

**1. PAPAVER** [Tourn.] L. Annual or perennial herbs. Leaves sometimes mainly basal: blades mostly pinnately lobed. Flowers few or solitary, the buds drooping. Sepals 2, or rarely 3. Petals 4, or rarely 6, broad. Gynoecium several-carpellary, the ovary with 4-20 septiform placentae. Stigma crown-like or disk-like. Capsule long, short, or depressed.—About 45 species, all, except 4 or 5, natives of the Old World.—POPPIES.

Plant glaucous: leaf-blades lobed, clasping at the base: capsule subglobose or depressed. **1. P. somniferum.**

Plant pubescent, mostly hirsute: leaf-blades pinnately divided, narrowed at the base: capsule elongate, or longer than thick. **2. P. dubium.**

**P. somniferum** L. Plant 3-10 dm. tall: leaf-blades 6-20 dm. long, the lobes toothed: sepals glabrous: petals white to purple, 2.5-5 cm. long: fila-

ments clavate: capsule subglobose or depressed, 2-3 cm. long.—(OPIUM-POPPY. GARDEN-POPPY.)—Fields and waste-places, various provinces, Fla. to La., Tenn., and S. Can. Nat. of Eu.—Sum.—The capsule produces opium and its derivatives.

2. *P. dubium* L. Plant 2-7 dm. tall: leaf-divisions entire, or sparingly toothed or incised: sepals hirsute: petals scarlet, 2.5-3.5 cm. long: filaments filiform: capsule 1.5-2 cm. long.—(SMOOTH-FRUITED POPPY. BLIND-EYE HEADACHE-POPPY. LONG-POD POPPY.)—Fields, roadsides, and waste-places, various provinces N of Coastal Plain, N. C. to Tenn. and R. I. Nat. of Eu.—Spr.-sum.

4. *ARGEMONE* L. Annual or biennial herbs. Leaves cauline: blades incised-pinnatifid. Flowers few, the buds erect. Sepals 2 or 3, hooded or horned. Petals 4 or 6, broad. Gynoecium 4-6-carpellary, the ovary with 4-6 nerviform placentae. Stigma 4-6-lobed. Capsule stout.—About 10 species, American.—PRICKLY-POPPIES. THORN-APPLES.

Inflorescence and capsule spine-armed.

Corolla yellow: leaf-blades blotched.

Corolla white: leaf-blades not blotched or sometimes slightly so.

Inflorescence and capsule spineless.

1. *A. mexicana*.

2. *A. alba*.

3. *A. leiocarpa*.

1. *A. mexicana* L. Plant glaucous, 3-9 dm. tall, more or less spiny: leaves 10-25 cm. long; blades runcinate-pinnatifid, blotched, spiny-toothed and commonly spiny along the midrib, sessile and clasping: flowers sessile or nearly so: sepals acuminate and bristle-tipped: corolla yellow, 3-7 cm. broad: capsule ellipsoid, 2.5-3 cm. long, spine-armed.—(MEXICAN-POPPY. THORN-APPLE. YELLOW-THISTLE.)—Roadsides, waste-places and fields, various provinces, Fla. to Tex., Tenn., Pa., and Mass.—Sum.-fall or all year S.

2. *A. alba* Lestib. Plant pale or somewhat glaucous, spine-armed: stems stout, 3-5 dm. tall, often diffuse: leaves 3-15 cm. long: blades pinnately lobed or pinnatifid, sometimes whitish along the veins, the midrib slightly prickly: flowers pedicelled: sepals 1.5-2 cm. long, the terminal spine 1-1.5 mm. long, distinctly flattened: corolla white, 7-10 cm. broad: capsule oval or ellipsoid, 2.5-4 cm. long.—(CAROLINA-POPPY.)—Roadsides, waste-places, and cult. grounds, various provinces, Fla. to Tex., Mo., and S. C.—Spr.-sum. or all year S.

3. *A. leiocarpa* Greene. Plant resembling those of *A. mexicana*, but more glaucous, devoid of spines, except on the margins of the leaf-blades, which are rather more copiously spinescent: calyx unarmed: petals yellow, 3-4 cm. long: capsule smooth and glabrous, 3-4 cm. long.—Hammocks and cult. grounds, S. pen. Fla. and the Keys.—All year.

## FAMILY 2. FUMARIACEAE — FUMITORY FAMILY

Herbs, sometimes vines, the sap colorless. Leaves alternate: blades dissected. Flowers perfect, irregular. Calyx of 2 scale-like sepals. Corolla of 4 petals, sometimes persistent, the outer with spreading tips and one or both of them saecate or spurred at the base, the inner 2 smaller, thickened at the tip and enclosing the stigma. Androeceium of 6 diadelphous stamens, the middle anther of each group 2-celled, the lateral ones 1-celled. Gynoeceium 2-carpellary. Fruit a silique, a capsule, or a nutlet.—Five genera and 170 species, natives of the north temperate zone and Africa.

Both of the two outer petals spurred at the base.

Petals permanently united and enclosing the capsule: seed crestless: vines.

Petals lightly united, deciduous: seed mostly crested: acaulescent herbs.

One of the 2 outer petals spurred at the base.

Ovules several or many: fruit an elongate capsule: seed with crests or arils.

Ovule solitary: fruit a globose nutlet: seed crestless.

1. *ADLUMIA*.

2. *BICUCULLA*.

3. *CAPNOIDES*.

4. *FUMARIA*.

1. **ADLUMIA** Raf. Biennial or perennial tender vines. Leaf-blades with broad segments. Flowers mostly in panicle-like cymes, white or pink. Sepals 2, toothed. Stamens 6, monadelphous below, the 3 filaments of each group united to near the anthers. Capsule included.—One species.

1. *A. fungosa* (Ait.) Greene. Leaf-blades decompose, the ultimate divisions entire or lobed, 3–10 mm. long: corolla 15–18 mm. long: petals pink or whitish, the inner with suborbicular blades about 1.5 mm. broad: capsule slender, 1.5–2 cm. long. [*A. cirrhosa* Raf.]—(ALLEGHENY-VINE. CLIMBING-FUMITORY. FAIRY-CREEPER. MOUNTAIN-FRIDGE. CLIFF-HARLEQUIN.)—Rich woods and stream banks, various provinces N of Coastal Plain, N. C. to Tenn., Wis., and N. B.—Sum.—fall.

2. **BICUCULLA** Adans. Perennial herbs, with granular or tuberous rootstocks. Leaf-blades with narrow segments. Flowers in racemes or panicles, mostly white to deep-pink. Sepals 2, entire. Stamens 6, somewhat diadelphous at the base. Capsule not included. [*Dicentra* Bork.]—About 16 species, North American and Asiatic.—Stagger-weeds.

Inflorescence a simple raceme: corolla not deep-pink, deciduous.

Inflorescence a thyrsoid panicle: corolla deep-pink, marcescent.

I. *CUCULLARIAE*.

II. *EXIMIAE*.

I. *CUCULLARIAE*

Rootstocks bearing yellow tubers: outer petals with rounded sacs: inner-petals conspicuously crested.

Rootstocks without tubers: outer petals with spreading spurs: inner petals minutely crested.

1. *B. canadensis*.

2. *B. Cucullaria*.

II. *EXIMIAE*

Leaves and stem arising from stout fleshy rootstocks.

3. *B. eximia*.

1. **B. canadensis** (Goldie) Millsp. Plant 2–3 dm. tall: leaf-blades dissected into linear or nearly linear segments, pinkish-gray on the under side: corolla greenish-white or purplish-tinged, the spurs much shorter than the upper portion of the petals: capsule-body 11–15 mm. long, abruptly narrowed at both ends. [*D. canadensis* DC.] — (SQUIRREL-CORN. TURKEY-CORN.)—Rich woods, various provinces N of Coastal Plain, N. C. to Mo., Minn., and N. S.—Spr.

2. **B. Cucullaria** (L.) Millsp. Plant 1–3 dm. tall: leaf-blades similar to those of *B. canadensis* but greenish-gray on the under side: corolla white or pale-pink, the spurs about as long as the other portion of the petals: capsule-body 10–13 mm. long, gradually narrowed at both ends. [*D. Cucullaria* DC.] — (BUTTERFLY-BANNER. PEARL-HARLEQUIN. EAR-DROPS. KITTEN-BREECHES. DUTCHMAN'S-BREECHES. LITTLE-STAGGERWEED. SOLDIER'S-CAP. WHITE-HEARTS.)—Rich woods, Blue Ridge and Appalachian provinces in the S, various provinces in the N, Ga. to Nebr., Minn., and Ont.—Spr.—After flowering the foliage soon yellows, and the plants usually vanish by mid-summer.

3. **B. eximia** (Ker) Millsp. Plants 3–6 dm. tall: leaf-blades with the ultimate segments oblong or ovate: corolla deep-pink, the outer petals with rounded spurs at the base: capsule-body 16–21 mm. long, long-beaked. [*D. eximia* DC.] — (BLEEDING-HEART. FRINGED BLEEDING-HEART. STAGGERWEED. TURKEY-CORN. RED-HARLEQUIN.)—Rocky woods and cliffs, often in rather acid soil, Blue Ridge and Appalachian provinces, Ga. to W. N. Y.—Spr.—fall.—This species is much used in rock gardens, its long flowering season making it especially desirable.

3. **CAPNOIDES** Adans. Annual or biennial caulescent herbs. Leaf-blades with toothed segments. Flowers racemose, yellow, pink or white. Sepals 2, usually toothed. Stamens 6, diadelphous. Ovary elongate, several-ovuled: style persistent. Capsule often torulose. [*Corydalis* Vent.]—About 110 species, natives of the north temperate zone and Africa.—Spr.—SCRAMBLED-EGGS. WILD-FUMEROOTS. ROKE-LADIES.—The roots of most species emit a pungent nitrous odor.

Corolla pink or purple, except the yellow tip: plant erect.  
Corolla yellow: plant diffuse.

I. SEMPERVIRENTES.  
II. AUREA.

#### I. SEMPERVIRENTES

Plant pale-green: flower with a short rounded spur: capsule erect.

#### II. AUREA

Corolla less than 12 mm. long.

Capsule ascending: seed with blunt margins.

Capsule drooping or spreading: seed with acute winged margins.

Corolla over 12 mm. long.

Hood or sac of the outer petals with a wing-like crest.

Hood or sac of the outer petals merely keeled.

1. *C. sempervirens*.

2. *C. micranthum*.

3. *C. flavulum*.

4. *C. Halei*.

5. *C. aureum*.

1. **C. sempervirens** (L.) Borek. Plant 3–12 dm. tall, the branches ascending: leaf-segments obovate to cuneate: corolla 14–16 mm. long, the spur

rounded, the inner petals about 15 mm. long, the blade about  $\frac{1}{3}$  as long as the claw: capsule 3–4 cm. long.—(PINK-CORYDALIS. PALE-CORYDALIS. ROCK-FUMEROOT. ROKE-HARLEQUIN.)—Rocky places and open woods, often in rather acid soils, various provinces N of Coastal Plain, Ga. to Minn., B. C., Alas., Ont., and N. S.

2. *C. micranthum* (Engelm.) Britton. Plant 1–3 dm. tall, the branches spreading: leaf-blades finely divided: corolla pale-yellow, 9–10 mm. long, the smaller outer petals with a minute crest: capsule 1–2 cm. long, prominently torulose. [*C. micrantha* A. Gray] — (SLENDER-FUMEROOT.) — Woods, various provinces, Fla. to Mo., Minn., and Va.

3. *C. flavulum* (Raf.) Kuntze. Plant 1–5 dm. tall, the branches spreading, leaf-segments narrow, acute: corolla yellow, 10–11.5 mm. long, the smaller outer petals prominently crested: capsule 1.5–2.5 cm. long, somewhat torulose. [*C. flavula* DC.]—(YELLOW-FUMEROOT. YELLOW-HARLEQUIN.)—Rich soil, especially in rocky woods, various provinces, La. to Kans., Minn., Ont., N. Y., and Va.

4. *C. Halei* Small. Plant 1–3 dm. tall, the branches spreading or ascending: leaf-blades with rather broad segments: corolla yellow, 14–16 mm. long, the spur somewhat inflated at the tip, the smaller outer petals with a narrow crest: capsule 2–2.5 cm. long.—Dry soil, Coastal Plain, Fla. to La.

5. *C. aureum* (Willd.) Kuntze. Plant 1.5–3 dm. tall, the branches sometimes decumbent: leaf-segments mostly elliptic: corolla golden-yellow, 12–14 mm. long, the spur somewhat conic, slightly curved, the smaller outer petals with a toothed crest: capsule 1–2 cm. long, slender. — (GOLDEN-FUMEROOT.) — Woods and banks, often in calcareous soil, various provinces, N of Coastal Plain, Tenn. to Tex., Ariz., Alas., Ont., N. S., and W. Va.

4. **FUMARIA** [Tourn.] L. Annual herbs. Leaf-blades with small segments. Flowers racemose, white or pink. Sepals 2, scale-like. Stamens 6, diadelphous. Ovary scarcely longer than thick, 1-ovuled: style deciduous. Nutlet globular.—About 40 species, natives of the Old World.

1. *F. officinalis* L. Stem and branches 2–10 dm. long: leaf-segments linear or nearly so: racemes 2–10 cm. long: pedicels 2–4 mm. long: corolla purplish or flesh-colored, and crimson at the tip, 6–8 mm. long: nutlet 2–2.5 mm. in diameter, emarginate at the apex.—(EARTH-SMOKE. FUMITORY. FUMEROOT. FUME-WEED. FUME-WORT.)—Fields and roadsides, various provinces, Fla. to Tex., Tenn., N. Y., and N. S. Nat. of Eu.

### FAMILY 3. BRASSICACEAE — MUSTARD FAMILY

Herbs or partially woody plants, the sap watery. Leaves alternate: blades entire, toothed, or dissected. Flowers perfect, in spikes or racemes.

Calyx of 4 mostly erect or appressed sepals. Corolla of 4 usually clawed petals, or wanting. Androecium of 6 stamens with 1 pair shorter than the others, or rarely of 2 or 4 stamens. Gynoecium of 2 united carpels. Stigma depressed or 2-lobed. Fruit capsular, elongate (silique) or short (silicle), flat, terete, or angled.—About 200 genera and 1,800 species, of wide geographic distribution; many are cultivated, some are weeds.

Pod longitudinally dehiscent or indehiscent, not transversely jointed.

Pod not stipitate.

Pod flattened or compressed contrary to the narrow partition.

Tribe I. LEPIDIEAE.

Pod neither compressed nor flattened contrary to the partition.

Pod terete or prismatic.

Length of pod less than twice its width.

Seeds flat: plants pubescent with mostly branched hairs.

Pods globular, the valves nerveless: cotyledons accumbent.

Tribe II. PHYSARIEAE.

Pods pyriform, the valves 1-nerved: cotyledons incumbent.

Tribe III. CAMELINEAE.

Seeds turgid: plants pubescent with simple hairs or glabrous.

Tribe IV. COCHLEARIEAE.

Length of pod over twice its width.

Pod merely tipped with the short style.

Pod terete or nearly so.

Seeds in 2 rows in each cavity.

Tribe IV. COCHLEARIEAE.

Seeds in 1 row in each cavity.

Tribe V. EYSIMEAE.

Pod 4-sided or 4-angled.

Tribe VI. BARBAREAE.

Pod markedly beaked.

Tribe VII. BRASSICEAE.

Pod flattened or compressed parallel to the broad partition.

Tribe VIII. ARABIDAEAE.

Pod stipitate.

Tribe IX. WAREAE.

Pod transversely 2-jointed, the joints indehiscent.

Tribe X. CAKILEAE.

#### I. LEPIDIEAE

Pods didymous, separating from the partition as 2 plump nutlets.

1. CARARA.

Pods flat, regularly dehiscent, many-seeded.

Pods cuneate, wingless, 1-several-seeded.

2. BURSA.

Pods orbicular to elliptic or obovate, wing-margined at least at the apex.

Seeds solitary in each cavity of the pod.

3. LEPIDIUM.

Seeds several in each cavity of the pod.

3a. THLASPI.

#### II. PHYSARIEAE

Stellate-pubescent herbs with mostly yellow flowers and inflated pods.

4. LESQUERELLA.

#### III. CAMELINEAE

Erect herbs with yellowish flowers and obovoid or pyriform turgid pods.

5. CAMELINA.

#### IV. COCHLEARIEAE

Pod less than twice as long as wide.

Corolla yellow.

6. RADICULA.

Corolla white.

Plant with a long pungent tap-root: stamens with short filaments and ellipsoid anthers appendaged at the tip: style very short.

7. ARMORACIA.

Plant with elongate rootstocks: stamens with slender filaments and sagittate unappendaged anthers: style slender.

8. NEOBECKIA.

Pod over twice as long as wide.

Corolla yellow: leaf-blades toothed or pinnatifid.

6. RADICULA.

Corolla white: leaf-blades pinnately divided.

9. SISYMBRIUM.

#### V. EYSIMEAE

Leaf-blades pinnatifid or coarsely toothed.

Anthers ovoid: pod slender and tapering to the apex, appressed to the rachis.

Outer sepals not horned: corolla yellow or white.

10. ERYSIMUM.

Outer sepals horned: corolla violet or purple.

11. IODANTHUS.

Anthers ellipsoid-sagittate: pod very slender but not tapering to the apex, widely spreading.

12. NORTA.

Leaf-blades entire or slightly toothed.

Leaf-blades cordate-clasping: corolla yellowish.  
Leaf-blades not clasping: corolla purple or white.

## VI. BARBAREAE

Corolla white.

Corolla yellow.

Seed flat: leaf-blades pinnatifid.

Seed plump: leaf-blades entire or toothed.

## VII. BRASSICEAE

Pod dehiscent.

Pod-beak conic, terete, the pod-body relatively long.

Pod terete: seeds in one row in each cavity.

Pod flattened: seeds in two rows in each cavity.

Pod-beak flat, 2-edged, the pod-body relatively short.

Pod-valves 3-nerved; beak long.

Pod-valves 1-nerved; beak short.

Pod indehiscent: spongy between the seeds.

## VIII. ARABIDEAE

Pod suborbicular or ovoid.

Pod elliptic to narrowly linear.

Valves of the pod nerveless.

Seeds wingless.

Seeds in 2 rows in each cavity.

Seeds in 1 row in each cavity.

Scapose, with 2-4 leaf-like bracts subtending the peduncle: cotyledons unequal.

Caulescent, with alternate leaves: cotyledons equal.

Seeds winged.

Valves of the pod nerved.

Leaf-blades entire or merely toothed.

Pod oval, elliptic to broadly linear.

Pod narrowly linear to linear-filiform.

Leaf-blades finely dissected.

## IX. WAREAE

Slender herbs with entire leaf-blades and elongate pods.

## X. CAKILEAE

Fleshy seaside, dune, or hammock plants with toothed or pinnatifid leaf-blades.

13. CONRINGIA.

14. HESPERIS.

15. ARABIDOPSIS.

16. CAMPE.

17. CHEIRINIA.

18. BRASSICA.

19. DIPLOTAXIS.

20. SINAPIS.

22. RAPHANUS.

21. ERUCA.

23. KONIGA.

24. DRABA.

25. DENTARIA.

26. CARDAMINE.

27. LEAVENWORTHIA.

24. DRABA.

28. ARABIS.

29. SOPHIA.

30. WAREA.

31. CAKILE.

1. **CARARA** Medic. Annual or biennial herbs. Leaf-blades entire to pinnatifid. Racemes lateral. Sepals 4, spreading. Corolla greenish or whitish. Petals 4, broad or narrow, without distinct claws, or abortive. Stamens often 2 or 4: anthers didymous. Ovule and seed 1 in each carpel. Pod with crested, rugose, or tuberculate valves. [*Senebiera* Poir.]—About 6 species, widely distributed in warm regions.—WART CRESSES. SWINE CRESSES.

Ovary smooth: capsule reticulate, notched.

Ovary tuberculate: capsule tuberculate-wrinkled, not notched.

1. *C. didyma*.

2. *C. Coronopus*.

1. **C. didyma** (L.) Britton. Branches ascending or spreading: lower leaves 3-10 cm. long; blades 1-2-pinnatifid: sepals 0.6-0.8 mm. long: petals shorter than the sepals or slightly longer: pod didymous, 2-2.5 mm. wide, notched above and below. [*Senebiera pinnatifida* DC.]—Waste places, various provinces, Fla. to Tex., Calif., Mo., and Newf.—Nat. of Eu.—Spr.—sum.

2. **C. Coronopus** (L.) Medic. Similar to *C. didyma* in habit: lower leaves 4-12 cm. long; blades pinnately parted: sepals 1-1.5 mm. long: petals much longer than the sepals: pod not didymous, 3.5-4 mm. wide, apiculate.—Waste places, various provinces, Fla. to Tex. and N. B.; also on Pacif. coast. Nat. of Eu.—Spr.—fall.

**2. BURSA** Weber. Annual erect herbs. Leaves sometimes mainly basal: blades entire to pinnatifid. Raceme terminal. Sepals 4, spreading. Petals 4, much longer than the sepals. Anthers broad. Ovules and seeds many in each carpel. Pod cuneate. [*Capsella* Vent.]—Four species, in the Northern Hemisphere. Some appear to be unstable and develop mutants.

**1. B. Bursa-pastoris** (L.) Britton. Stem 3–9 dm. tall: basal leaves 3–15 cm. long; blades mainly pinnately lobed or pinnatifid; blades of the stem-leaves auricled at the base; pedicels 10–15 mm. long: sepals 1.5–1.7 mm. long: petals white, spatulate, 2–2.3 mm. long: pod 5–8 mm. long.—(SHEPHERD'S-PURSE. SHOVEL-WEED. HEN-PEPPER.)—Common, in fields and waste places, almost throughout N. A. Nat. of Eu.—Spr.—fall.—Plants grown from seeds collected at Tuscaloosa, Ala., have been described as *B. tuscaloosae* Shull. They differ from plants of *B. Bursa-pastoris* in the backwardly curved and rather blunt leaf-lobes.—Known only from the original station.

**3. LEPIDIUM** [Tourn.] L. Annual, biennial, or perennial herbs. Leaf-blades entire to pinnatifid. Racemes terminal. Sepals 4, spreading. Petals 4, longer than the sepals or wanting. Stamens usually fewer than 6. Ovule, and seed, 1 in each carpel. Pod suborbicular to oblong.—About 65 species of wide distribution.—Spr.—sum.—PEPPER-GRASSES. PEPPER-CRESSSES. CHURL'S-CRESSSES.

Blades of the cauline leaves sagittate-clasping: pod winged.  
Blades of the cauline leaves tapering at the base: pod wingless, margined.

Cotyledons accumbent.

Cotyledons incumbent.

Pod wingless and marginless: plant strong-scented.

Pod winged or margined at the apex: plant not strong-scented.

1. *L. campestre*.

2. *L. virginicum*.

3. *L. rudérale*.

4. *L. densiflorum*.

**1. L. campestre** (L.) R. Br. Plant 1–4 dm. tall, softly fine-pubescent: blades of the lower leaves spatulate to oblanceolate, those of the upper leaves sagittate, clasping, shallowly toothed: pedicels downy: sepals elliptic to elliptic-ovate, about 1.5 mm. long: petals white, spatulate, 2–2.5 mm. long: pod ovoid, 4.5–5.5 mm. long, winged above the base, minutely pubescent.—(COW-CRESS. FIELD-CRESS.)—Waste places, fields, and roadsides, various provinces, rarely Coastal Plain, N. C. to Kans., Ont., and N. B.; also on Pacif. coast.

**2. L. virginicum** L. Annual or biennial, more or less puberulent: stem 2–9 dm. tall, simple or widely branched: basal leaves seldom persistent: blades spatulate or oblanceolate, pinnatifid, the segments toothed or incised, the terminal one much longer than

the others: stem-leaves narrow, erect or ascending; blades sharply toothed or incised: pedicels finally spreading, 3-4 mm. long: sepals elliptic, about 1 mm. long, obtuse: petals white, spatulate, slightly longer than the sepals: pod suborbicular, 3-4 mm. broad, margined above, notched at the apex.—(FIELD-CRESS. POOR-MAN'S PEPPER. YELLOW-SEED.)—Waste places, fields, and roadsides, various provinces, S Fla. to Tex., Minn., and Que.—(*W. I., Mex., O. W.*)—Spr.—fall.

**3. *L. ruderale* L.** Annual, unpleasantly scented: stem mostly 1-3 dm. tall, commonly branched at the base, glabrous or nearly so: leaves rather numerous, the basal with pinnatifid blades, rather early withering: cauline leaves more persistent; blades narrower, mostly 1-3 cm. long, entire or few-toothed: racemes ultimately open: flowers numerous: pedicels very slender, glabrous or minutely pubescent, 2-3 mm. long: petals wanting or minute: pod oval, 2.5-3 mm. long, smooth and glabrous, wingless and marginless.—Roadsides and waste-places, about seaports, Tex. to Fla. and N. S. Nat. of Eu.—Sum.

**4. *L. densiflorum* Schrad.** Annual, finely pubescent or puberulent, odorless: stem 2-7 dm. tall, more or less branched: basal leaves and sometimes the lower stem-leaves with pinnatifid blades, glabrous or sparingly pubescent, not hispidulous: upper stem-leaves narrow, incised or toothed, erect or ascending: pedicels becoming 2-3 mm. long, spreading or curving out, making the fruiting raceme much thicker than the top: petals rudimentary or wanting: pod suborbicular, about 2.5 mm. broad, glabrous, notched at the narrowly wing-margined apex.—Dry soil and waste-places, various provinces, Tex. to B. C., Me., and N. C.—Spr.—fall.

**3a. *THLASPI* [Tourn.] L.** Annual or perennial erect or depressed caulescent herbs. Leaf-blades entire or toothed, those of the upper leaves auriculate-clasping. Racemes inconspicuously bracted or bractless, elongating. Sepals rather broad. Petals white or purplish, longer than the sepals, equal or nearly so. Filaments stout: anthers short. Pods orbicular, obovate or cuneate, winged, notched at the apex.

**1. *T. arvense* L.** Annual, 1-5 dm. tall, glabrous: blades of the lower cauline leaves of a spatulate type, those of the upper cauline leaves sagittate, 1.5-5 cm. long, toothed: sepals oblong or oblong-ovate, 2-2.5 mm. long: petals white, cuneate to spatulate, 2.5-3 mm. long: pods suborbicular to orbicular-obovate, 1-1.5 cm. broad, broadly winged.—(FIELD-PENNYCRESS. FRENCHWEED.)—Waste-places, roadsides, and fields, various provinces, N. C. to Ark., Kans., Man., and Que. Nat. of Eurasia.—Spr.—sum.

**4. *LESQUERELLA* S. Wats.** Annual, biennial, or perennial herbs. Leaf-blades entire, undulate, or pinnatifid. Raceme simple or sometimes branched. Sepals 4, usually pubescent like the leaves. Petals 4, of a spatulate type, often broadly so, yellow (or rarely white or purplish). Stamens 6: filaments slender throughout or enlarged or winged near the base: anthers oblong or sagittate. Style slender. Ovules few. Pod globular oblong or ovoid, rarely flattened. Seed sometimes margined.—About 35 species, American.—Spr.—BLADDER-PODS.

Filaments winged at the base: pods flat, ovoid: leaf-blades auriculate-clasping.

Filaments slightly enlarged at the base: pods globular: leaf-blades neither auriculate nor clasping.

1. *L. Lescurii*.

2. *L. globosa*.

1. *L. Lescurii* (A. Gray) S. Wats. Branches loosely stellate-pubescent, 1-3 dm. long: cauline leaves 1-4 cm. long; blades elliptic-oval to elliptic-ovate, repand-dentate: sepals becoming 3-3.5 mm. long: petals spatulate, 4-6 mm. long: ovary long-pubescent, flat: pod ovoid, 5-6.5 mm. long, coarsely pubescent.—Glades and fields, Interior Low Plateaus, near Nashville, Tenn.

2. *L. globosa* (Desv.) S. Wats. Branches finely and closely hoary with stellate hairs, 2-4 dm. long: cauline leaves 1-2 cm. long; blades oblanceolate to elliptic or linear, entire or rarely undulate-repand, sessile or nearly so: sepals ovate to elliptic, becoming 3-3.5 mm. long: petals spatulate, 5-6 mm. long: ovary short-pubescent, turgid: pod globular, about 2 mm. long, sparingly fine-pubescent.—River bluffs and rocky banks, Interior Low Plateaus, Tenn. to Ky.

5. **CAMELINA** Crantz. Annual herbs. Leaf-blades entire or toothed, or pinnatifid at the base of the stem, sometimes clasping. Raceme elongate. Sepals 4, rather broad. Petals 4, narrow, yellowish or greenish. Stamens 6: anthers ovoid. Style columnar. Ovules few or many. Pod turgid, margined. Seed marginless.—About 5 species, Eurasian.—Spr.—FALSE-FLAXES.

Stem manifestly pubescent: pod rounded at the apex, 4-5 mm. wide.

Stem glabrous or nearly so: pod truncate or notched at the apex, 6-8 mm. wide.

1. *C. microcarpa*.

2. *C. sativa*.

1. *C. microcarpa* Andr. Plants pubescent, at least below, 5-8 dm. tall: blades of the upper cauline leaves lanceolate, 1.5-7 cm. long, sagittate-auriculate at the base: pod narrowly obovoid, 4-5 mm. wide: seed fully 1 mm. long.—Fields and waste-places, various provinces, N. C. to Ariz., B. C. and Ont. Nat. of Eu.—All the species of *Camelina* are much alike in habit. Species additional to those described here, are to be expected in cultivated N. A.

2. *C. sativa* (L.) Crantz. Plants glabrous or nearly so, 3-9 dm. tall: leaves nearly similar to those of *C. microcarpa*: pod broadly obovoid, 6-7 mm. wide: seed fully 2 mm. long.—(DUTCH-FLAX. OIL-SEED.)—Waste-places, cult. grounds, banks, and roadsides, various provinces, N. C. and Tenn. to S Can. Nat. of Eu.

6. **RADICULA** [Dill.] Hill. Annual, biennial, or perennial herbs. Leaf-blades toothed, lobed, or dissected. Raceme often branched. Sepals 4, broad or narrow. Petals 4, yellow, often scarcely longer than the sepals. Stamens

1-6: anthers ovoid to globose. Style very short. Pod short or elongate. Seed turgid. [*Nasturtium* R. Br.]—About 50 species, widely distributed.—WATER-CRESSSES. MARSH-CRESSSES.

Annual or biennial plants with fibrous roots.

Pod short, ellipsoid to subglobose.

Pod elongate, linear-filiform.

Perennial plants with creeping or horizontal rootstocks.

I. PALUSTRES.

II. HETEROPHYLLAE.

III. SYLVESTRES.

I. PALUSTRES

Pedicle short, much less than half the length of the pod.

Leaf-blades bipinnatifid: style 1-2 mm. long: pod narrowly elliptic, curved.

Leaf-blades 1-pinnatifid: style almost wanting: pod broadly elliptic, straight.

Pedicle rather long, half the length of the pod or more.

Pod ellipsoid: stem glabrous.

Pod oval, ovoid, or subglobose: stem hirsute.

1. *R. Walteri*.

2. *R. sessiliflora*.

3. *R. palustris*.

4. *R. hispida*.

II. HETEROPHYLLAE

Plant diffuse, the leaves usually with a large terminal lobe: flowers with inconspicuous white corollas.

5. *R. heterophylla*.

III. SYLVESTRES

Plant with rather large yellow corollas and very narrow slender pedicelled pods.

6. *R. sylvestris*.

1. *R. Walteri* (Ell.) Small. Stem often diffusely branched, 1-4 dm. tall: cauline leaves 2-10 cm. long; blades bipinnatifid, the segments irregular: petals slightly longer than the sepals: pod long-beaked. [*N. tanacetifolium* (Chapm. Fl.)]—Low grounds, fields, and ditches, Coastal Plain and rarely adj. provinces, Fla. to Tex., Okla., and S. C.—(*Mex.*)—Spr.

2. *R. sessiliflora* (Nutt.) A. Hitchc. Stem branched above, 2-6 dm. tall: cauline leaves 3-15 cm. long; blades lobed or pinnatifid: petals about twice as long as the sepals: pod short-beaked.—Damp places or wet banks, various provinces, Fla. to Tex., Nebr., Ia., and D. C.—Spr.-sum.

3. *R. palustris* (L.) Moench. Stem glabrous or minutely pubescent, 2-10 dm. tall: leaf-blades oblanceolate to elliptic or linear-elliptic, pinnatifid, or toothed or repand above, 2-20 cm. long: ovary elliptic: pod 5-8 mm. long.—(MARSH-CRESS. YELLOW WATER-CRESS.)—Low grounds and meadows, various provinces, Fla. to Tex., Ariz., Alas., Ont., and N. B. Apparently nat. of Eu.—Spr.-sum.

4. *R. hispida* (Desv.) Heller. Stem hirsute or hispid, 3-12 dm. tall: leaf-blades oblanceolate, elliptic, pinnatifid or rarely only toothed, 2-18 cm. long: ovary globular: pod 2-3 mm. long.—Sandy soil, especially along streams, various provinces, N. C. to Tex., Calif., and S. Can.—Sum.

5. *R. heterophylla* (Blume) Small. Stem diffusely branched, the branches sometimes divaricate, glabrous or nearly so: cauline leaves 3-11 cm. long; blades obovate, oval, ovate, or ovate-lanceolate in outline, toothed, unequally lobed or pinnatifid: flowers inconspicuous: sepals 2-2.5 mm. long: petals about as long as the sepals or wanting: pod linear-filiform, 1.5-2.5 cm. long, stiffly ascending or spreading, straight.—Low grounds and ditches, Coastal Plain, S. Miss. and S. La. Nat. of Asia.—Wint.-spr.

6. *R. sylvestris* (L.) Druce. Stem ascending or decumbent, 2–7 dm. long: leaf-blades often ovate or elliptic, 4–15 cm. long, pinnately divided, the segments distant, entire or toothed: sepals becoming 2–2.5 mm. long: filaments scarcely longer than the anthers: pod slender, 8–15 mm. long, short-beaked.—(YELLOW-CRESS.)—Wet ground along streams and waste-places, various provinces, rarely Coastal Plain, Ala. to La., Ill., Ont., Newf., and Va. Nat. of Eu.—Spr.—sum.

7. **ARMORACIA** Gaertn. Perennial erect herbs with long, pungent roots. Leaf-blades coarsely toothed or sometimes pinnatifid. Raceme stiff, with slender pedicels. Sepals rather broad. Petals white, much exceeding the sepals. Stamens 4 or 6: anthers ovoid. Ovary obovoid: style short-columnar: stigma capitate. Pod short and stout.—About 4 species, Eurasian.

1. *A. Armoracia* (L.) Britton. Stem erect: leaf-blades various, those of the basal leaves elliptic to elliptic-lanceolate, mostly 15–40 cm. long, irregularly crenate, unequally cordate or truncate at the base; those of the cauline leaves smaller and more coarsely toothed or incised: petals white, obovate, 6–8 mm. long: pod 5–7 mm. long, straight. [*Roripa Armoracia* (L.) A. Hitchc.]—

(HORSERADISH.)—Roadsides, thickets, low grounds, various provinces N of Coastal Plain, N. C. to Tenn. and S Can. Nat. of Eu.—Spr.

8. **NEOBECKIA** Greene. Perennial aquatic herbs. Leaves various, the immersed ones with finely dissected blades, the emerged ones with smaller, entire, toothed, or pinnatifid blades. Raceme often paniculate. Sepals 4, erect. Petals 4, of a spatulate type, white. Stamens 6: filaments slender, but slightly enlarged below: anthers sagittate. Ovary not stipitate: style slender. Ovules numerous. Pod 1-celled, short, turgid.—One species.

1. *N. aquatica* (Eaton) Britton. Stem partly immersed, weak: immersed leaves sometimes numerous; blades 1–3-pinnately dissected, the segments filiform or capillary: emerged leaves distant; blades elliptic to linear, entire, toothed, or pinnatifid: pedicels spreading: sepals elliptic to ovate, 3.5–4 mm. long: petals broadly spatulate, 6–7 mm. long: pod ellipsoid, 5–6 mm. long. [*Nasturtium lacustre* A. Gray *Roripa americana* (A. Gray) Britton]—(LAKE-CRESS.)—Lakes and slow streams, various provinces, Fla to La., Minn., and Que.—Sum.

9. **SISYMBRIUM** [Tourn.] L. Perennial diffuse aquatic herbs with creeping stems. Leaf-blades pinnately divided. Raceme lax. Sepals broad. Petals 4, white, much exceeding the sepals. Stamens mostly 6: anthers ovoid.

Ovary narrow: style very stout: stigma discoid. Pod elongate, linear.—One species.

1. *S. Nasturtium-aquaticum* L. Stems diffuse or floating, 1–6 dm. long: leaf-blades unequally pinnate, 2–15 cm. long, the segments irregular: petals white, 3–4 mm. long: pods linear, 10–25 mm. long, curved. [*Nasturtium officinale* R. Br. *Roripa Nasturtium* (L.) Rusby]—(WATER-CRESS. STURSHUM.)—Springs and slow streams, various provinces, Ga. to Tex., Calif., and S Can. Nat. of Eu.—Spr.—fall.—Frequently used as a garnish and a condiment.

10. *ERYSIMUM* [Tourn.] L. Annual or perennial herbs. Leaf-blades entire, lobed or pinnatifid. Raceme elongating, strict. Sepals 4, rather narrow, nearly equal. Petals 4, slightly larger than the sepals, yellow, spatulate. Stamens 6: anthers ovoid. Ovary narrow: style very short or obsolete: stigma 2-lobed. Pod elongate.—About 3 species, natives of the Old World.

1. *E. officinale* L. Stem 3–12 dm. tall, the branches spreading: leaf-blades 2–20 cm. long, runcinate-pinnatifid, the segments irregular, entire, toothed, or lobed: sepals 1.5–2 mm. long: petals yellow, spatulate: pod slender, 10–16 mm. long, slender-beaked. [*Sisymbrium officinale* (L.) Scop.]—(HEDGE-MUSTARD.)—Waste-places and roadsides, nearly throughout cult. N. A. Nat. of Eu.—Spr.

11. *IODANTHUS* T. & G. Perennial herbs. Leaf-blades toothed to lyrate-pinnatifid. Racemes or panicles elongate. Sepals 4, the lateral ones more or less appendaged near the apex. Petals 4, white or violet, spatulate. Stamens 6: anthers elliptic to ovoid. Style short. Pod elongate.—One species.

1. *I. pinnatifidus* (Michx.) Steud. Stem 3–10 dm. tall: blades of the lower leaves often pinnatifid, the terminal segment larger, incised or with flaring teeth, blades of the upper leaves dentate or incised; petioles broad, clasping: sepals elliptic, 3–4 mm. long: petals over twice as long as the sepals: pod 3–4 cm. long. [*I. hesperioides* T. & G.]—(PURPLE-ROCKET.)—River banks, various provinces, La. to Tex., Minn., Tenn., and W Pa.—Spr.

12. *NORTA* Adans. Biennial, tall, sometimes diffusely branched, herbs. Leaf-blades toothed or pinnatifid. Raceme lax, becoming very lax in age,

the pedicels short and stout. Sepals rather narrow, spreading. Petals yellow, exceeding the sepals. Stamens 6: anthers elliptic-sagittate. Style short: stigma 2-lobed. Pod slender, much-elongate, spreading.—About 10 species, natives of the Old World.

1. *N. altissima* (L.) Britton. Stem 1.5 m. tall or less, the branches spreading, often divaricate: leaf-blades mostly 1–2 dm. long, deeply 1–2-pinnatifid, the segments narrow, entire or toothed: sepals 4–5 mm. long: petals spatulate: pod elongate-linear, 6–10 cm. long, stout-beaked. [*Sisymbrium altissimum* L.] — (TUMBLE-MUSTARD.) — Fields and waste-places, nearly throughout cult. N. A. Nat. of Eu.—Sum.

13. *CONRINGIA* [Heist.] Adans. Annual glabrous herbs. Leaf-blades entire, sessile, cordate. Racemes elongating, becoming lax, the pedicels rather long. Sepals narrow, erect. Petals yellowish, much longer than the sepals, the blades rather narrow. Stamens 6: anthers narrow. Ovary elongate: style very short: stigma slightly 2-lobed. Pod narrow, much elongate, angled, erect or ascending.—About 7 species, Eurasian.

1. *C. orientalis* (L.) Dumort. Stem up to 1 m. tall, simple or sparingly branched: leaf-blades spatulate or obovate at the base of stem, elliptic-obovate, elliptic, elliptic-ovate or ovate above, pale-green 3–16 cm. long, obtuse at the apex, cordate-sagittate at the base: sepals lanceolate, 5–6 mm. long: petals spatulate, pale-yellow, 8–11 mm. long: pod narrowly linear, 6–12.5 cm. long, rather slender-beaked.—Waste-places and fields, various provinces, Fla. to Mo., Ore., Alb., and N. B. Nat. of Eu.—Spr.—sum.

14. *HESPERIS* [Tourn.] L. Biennial or perennial herbs. Leaf-blades entire, toothed, or rarely pinnatifid. Raceme or panicle elongate. Sepals 4, broad. Petals 4, white or purple, with broad blades. Stamens 6: anthers oblong. Style very short or obsolete. Pod elongate.—About 25 species, Eurasian.

1. *H. matronalis* L. Stems 3–12 dm. tall, roughish-pubescent: leaves 2–15 cm. long; blades of the upper ones elliptic or ovate-lanceolate, denticulate or rarely pinnatifid: sepals becoming 6–8 mm. long: petals 19–22 mm. long, the broadly obovate blades about as long as the claws: pod 5–10 cm. long.—(ROCKET. DAME'S-VIOLET. DAME'S-ROCKET. SWEET-ROCKET.)—Fields and on roadsides, various provinces, Ga. to Utah, Minn., Ont., and Mass.—Nat. of Eu.—Spr.—sum.

15. **ARABIDOPSIS** Schur. Annual or perennial herbs. Leaf-blades entire, toothed, or pinnatifid. Raceme elongate. Sepals 4, narrow. Petals 4, spatulate, white. Stamens 6: anthers ovoid. Style short. Pod elongate.—About 12 species, North American and Eurasian.

1. **A. Thaliana** (L.) Britton. Plant 0.3–5 dm. tall, mainly branched throughout, pubescent near the base: blades of the basal leaves elliptic, or oblanceolate, 1.5–4.5 cm. long, entire or shallowly toothed: sepals 1–1.5 mm. long: petals about twice as long as the sepals: pod linear-filiform, 10–15 mm. long. [*Sisymbrium Thaliana* Gay. *Stenophragma Thaliana* (L.) Celak.](—MOUSE-EAR CRESS. WALL-CRESS.)—Waste-places and fields, various provinces, Ga. to Ark., Utah, Minn., Ont., and Mass.—Nat. of Eu.—Spr.

16. **CAMPE** Dulac. Biennial or perennial herbs. Leaf-blades lyrate-pinnatifid. Raceme or panicle often dense. Sepals 4, unequal. Petals 4, yellow, spatulate. Stamens 6: anthers elliptic to ovoid. Style columnar: stigma not dilated. Pod elongate. [*Barbarea* R. Br.]—About 7 species, natives of temperate regions.—SCURVY-GRASSES. WINTER-CRESSES. ROCKETS. CORN-MUSTARDS.

Pod slender-pedicelled, obtusely 4-angled: leaf-segments 3–9.

Pod spreading or ascending: corolla bright-yellow.

Pod erect and appressed: corolla pale-yellow.

Pod stout-pedicelled, acutely 4-angled: leaf-segments 9–17.

1. *C. Barbarea*.
2. *C. stricta*.
3. *C. verna*.

1. **C. Barbarea** (L.) W. F. Wight. Plant 2–9 dm. tall: leaves 5–15 cm. long, or shorter above; blades of the lower ones pinnatifid, those of the upper ones toothed or incised: sepals mostly 3–3.5 mm. long: petals 5–5.5 mm. long: pod 2–2.5 cm. long, slender-beaked. [*B. vulgaris* R. Br.]—(BITTER-CRESS. YELLOW-ROCKET.)—Road-sides and fields, and cult. grounds, various provinces, on Coastal Plain only N, Ga. to N. Y. and Ont., and locally in the interior and on Pacif. coast. Native northward and in Eu.—Spr.—sum.

2. **C. stricta** (Andrz.) W. F. Wight. Plant similar to that of *C. Barbarea* in habit and foliage: sepals mostly 4–4.5 mm. long: petals 5.5–6.5 mm. long: pod 2–2.5 cm. long, short-beaked. [*B. stricta* Andrz.]—Road-sides and fields, and cult. grounds, various provinces, Fla. to Nebr., Alas., Ont., and Que. Nat. northward and in Eu.—Spr.

3. **C. verna** (Mill.) Heller. Plant 1–6 dm. tall: leaves 2–15 cm. long; blades pinnatifid, the segments toothed: sepals 3–3.5 mm. long: petals about twice as long as the sepals: pod 3.5–8 cm. long. [*B. verna* Asch.]—(EARLY WINTER-

CRESS. LAND-CRESS.)—Roadsides and in waste-places, various provinces, Fla. to Calif., Wash., and Mass. Nat. of Eu., and cult.—Spr.

17. **CHEIRINIA** Link. Annual or biennial herbs. Leaf-blades entire, toothed, or lobed. Sepals 4, nearly equal. Petals 4, yellow, with broad blades. Stamens 6: anthers elliptic to sagittate. Style very short: stigma depressed. Pod elongate.—About 90 species, natives of the north temperate zone.—TREACLE-MUSTARDS. BLISTER-CRESSES.

Petals less than 5 mm. long: anthers over 2 mm. long: pod less than 15 times as long as wide: seed about 1 mm. long. 1. *C. cheiranthoides*.

Petals over 15 mm. long: anthers about 1 mm. long: pod over 30 times as long as wide: seed about 2 mm. long.

2. *C. aspera*.

1. *C. cheiranthoides* (L.) Link. Stem 1–7 dm. tall, strigillose: leaf-blades elliptic to lanceolate or linear, 2–10 cm. long, entire, or obscurely toothed: sepals 2–2.5 mm. long: petals with obovate blades about as long as the claws: filaments 3–4 mm. long: pod ascending, 1.5–2 cm. long, the style-beak about 1 mm. long. [*Erysimum cheiranthoides* L.] — (WORMSEED-MUSTARD. WILD-WALLFLOWER.)—Sandy soil, especially along streams, various provinces N of Coastal Plain, N. C. to Tenn., Wash., Alas., and Newf.—Sum.

2. *C. aspera* (Nutt.) Rydb. Stem 6–10 dm. tall, scabrous and canescent with forked hairs: leaf-blades lanceolate to linear or elliptic, 3–15 cm. long, entire or repand, or the lower ones sometimes pinnatifid: sepals 10–12 mm. long: petals with cuneate-obovate blades much shorter than the claws: longer filaments 12–14 mm. long: pod stout, spreading, 8–11 cm. long, the style-beak about 4 mm. long.—Dry soil, various provinces, Tenn. to N. M. and S. Can.—Spr.

17. **BRASSICA** [Tourn.] L. Annual, biennial, or perennial herbs. Leaf-blades lobed or pinnatifid, or those of the upper leaves entire. Sepals 4, rather narrow. Petals 4, yellow, cream-colored, or white, the blades broad. Stamens 6: anthers sagittate. Style columnar: stigma depressed or 2-lobed. Pod elongate, sometimes angled, the beak conic.—About 80 species, Eurasian and African—MUSTARDS.—Many of the species are important food plants. Here belongs cabbage in its many varieties, mustards, turnips, and charlocks.

Blades of the upper leaves merely sessile: petal-blades abruptly narrowed into slender claws, yellow.

Pod erect or appressed, short-beaked, less than 2 cm. long: pedicel appressed.

1. *B. nigra*.

Pod spreading, long-beaked, over 2 cm. long: pedicel spreading.

Leaf-blades lyrate: pod stout, mostly over 3 mm. wide.

2. *B. juncea*.

Leaf-blades much incised and crisped: pod slender, mostly less than 3 mm. wide.

3. *B. japonica*.

Blades of the upper leaves clasping: petal-blades gradually narrowed into broad claws, cream-colored.

4. *B. campestris*.

1. *B. nigra* (L.) Koch. Stem 1–2 m. tall, sometimes sparingly pubescent, widely branched: leaves 5–20 cm. long; blades of the lower ones lyrate-

pinnatifid, the terminal segment the largest: sepals becoming 4.5–5 mm. long: petals 7–9 mm. long: pod 10–16 mm. long. [*Sinapis nigra* L.]—(BLACK-MUSTARD. CHARLOCK.)—Waste-places and fields, nearly throughout cult. N. A. Nat. of Eu.—Spr.—sum.

2. *B. juncea* (L.) Cosson. Stem 3–17 dm. tall, glaucous, sparingly branched: leaves 5–17 cm. long; blades of the lower ones elliptic to oval, coarsely toothed or lyrate-pinnatifid: sepals becoming 4–6 mm. long: petals 9–12 mm. long: pod 30–50 mm. long.—(INDIAN-MUSTARD.)—Waste-places and roadsides, nearly throughout cult. N. A. Nat. of Asia.—Spr.—sum.

3. *B. japonica* Siebold. Similar to *B. juncea* in habit: leaves 6–21 cm. long: blades incised, lobed and crisped: sepals becoming 4–5 mm. long: petals 7–9 mm. long: pod 30–40 mm. long.—(CURLED-MUSTARD. POTHEB-MUSTARD.)—Fields and waste-places, various provinces, Fla. to Me. Nat. of Asia.—Spr.—fall.

4. *B. campestris* L. Stem 3–6 dm. tall, glabrous and glaucous: leaves 9–30 cm. long, or shorter above; blades lyrate-pinnatifid: sepals becoming 4–5 mm. long: petals 8–12 mm. long: pod 30–70 mm. long.—(RUTA-BAGA. TURNIP.)—Fields and roadsides, nearly throughout cult. N. A. Nat. of Eu.—Spr.

19. **DIPLLOTAXIS** DC. Annual, biennial, or perennial caulescent herbs. Leaf-blades coarsely toothed or pinnatifid, sometimes lyrate. Sepals 4, rather narrow. Petals 4, yellow, the blades broad. Stamens 6: anthers oblong to linear. Style short-columnar: stigma depressed, slightly 2-lobed. Pod elongate, flattened, short-beaked.—About 20 species, natives of the Old World.—SAND-ROCKETS.—Spr.—fall.

Plant perennial: ovary, and pod, short-stipitate: flowers large; petals 1 cm. long or more.

1. *D. tenuifolia*.

Plant annual: ovary, and pod, not stipitate: flowers small; petals less than 1 cm. long.

2. *D. muralis*.

1. *D. tenuifolia* (L.) DC. Perennial, 3–12 dm. tall, the branches glabrous or nearly so: leaves mainly cauline; blades conspicuously pinnatifid, the lobes usually narrow: sepals 5–7 mm. long: petals 10–12 mm. long: pod linear, short-stipitate: seed over 1 mm. long.—(FLIX-WEED. SAND-ROCKET.)—Waste-places and ballast, about sea-ports, La. to N. S. Nat. of Eu.

2. *D. muralis* (L.) DC. Annual or biennial, mostly 2–4 dm. tall, the branches sometimes decumbent, sparingly pubescent: leaves mostly near the base of the plant; blades elliptic to spatulate, coarsely pinnately toothed to somewhat pinnatifid: sepals 3.5–4 mm. long: petals 7–8 mm. long: pod narrowly linear, not stipitate: seed less than 1 mm. long.—(CROSS-WEED. WALL-ROCKET.)

—Waste-places and ballast, usually about sea-ports, various provinces, La. to Ont., and N. S. Nat. of Eu.

20. **SINAPIS** L. Annual or biennial herbs. Leaf-blades lobed or pinnatifid. Sepals 4, herbaceous. Petals 4, mostly yellow, the blades broad. Stamens 6: anthers narrowly oblong. Style columnar: stigma depressed. Pod elongate, the beak sword-like.—About 5 species, European.—CHARLOCKS.

Blades of the upper leaves toothed: pod with a somewhat 4-angled beak about  $\frac{1}{2}$  the length of the pod-body.

Blades of the upper leaves pinnatifid: pod with a flat beak about as long as the pod-body.

1. *S. arvensis*.

2. *S. alba*.

1. *S. arvensis* L. Stem 3–6 dm. tall, hispid: leaves 4–17 cm. long; blades of the lower ones coarsely toothed or lyrate-pinnatifid: sepals becoming 5–6 mm. long: petals 5.8–8.5 mm. long, the suborbicular or obovate blades abruptly contracted into the slender claws: pod 21–24 mm. long.—(WILD-MUSTARD. CRUNCH-WEED.)—Fields and waste-places, nearly throughout cult. N. A. Nat. of Eu.—Spr.-fall.

2. *S. alba* L. Stem pubescent with rigid spreading hairs, 3–7 dm. tall, branched: blades of the basal leaves obovate, pinnatifid, on long petioles, those of the upper leaves narrow, elliptic to lanceolate, pinnatifid, those near the top of the stem sessile: sepals 4–5 mm. long: petals yellow, much longer than the sepals: pods hispid, the body 8–15 mm. long, constricted below the seeds, the beak flat, as long as the body or longer.—(WHITE-MUSTARD.)—Fields, roadsides, and waste-places, U. S. and S Can. Nat. of Eurasia.—Sum.

21. **ERUCA** L. Herbs resembling *Brassica* and *Sinapis*. Leaf-blades pinnatifid or some of them merely toothed, not clasping. Raceme narrow: pedicels ascending. Sepals narrow, erect. Petals with spreading dilated veiny blades. Anthers sagittate. Ovary short. Style short, but longer than the ovary. Pod short, turgid, the beak flat, shorter than the body.—About 10 species, Eurasian.

1. *E. Eruca* (L.) Britton. Plant 2–7 dm. tall, the stem usually branched, sparingly pubescent: leaf-blades various, those of the lower leaves shallowly toothed or pinnatifid, those of the upper leaves usually pinnatifid, the segments toothed: pedicels stout, 2–4 mm. long: sepals linear-lanceolate, 13–15 mm. long, glabrous: petals dirty-yellow, spatulate, 1.5–2 cm. long, veiny: pod erect, slender-fusiform, 2–3 cm. long, the beak much shorter than the body. [*E. sativa* Mill.] — (GARDEN-ROCKET.) — Fields, nearly throughout cult. N. A. Nat. of Eu.—Spr.-sum.

22. **RAPHANUS** [Tourn.] L. Annual or mostly biennial herbs. Leaf-blades lyrate-pinnatifid, or those of the upper ones merely toothed. Sepals 4,

narrow. Petals 4, yellow, pink, or white, the blades cuneate or obovate. Stamens 6: anthers narrow. Style columnar: stigma depressed or globular. Pod elongate, beaked. —About 6 species, Eurasian.

1. *R. sativus* L. Plant 3–11 dm. tall, usually with scattered hairs: leaves finely pubescent; blades spatulate to obovate in outline, pinnatifid or pinnately parted, the terminal lobe very large and irregularly toothed: flowers rather short-pedicelled: sepals elliptic to linear, 6–7 mm. long, bearded at the apex: petals pink or white, spatulate, 11–14 mm. long: pod turgid, the body mostly 2.5–3.5 cm. long, beaked. —(RADISH.) —Fields and roadsides, more or less persistent after cultivation, various provinces, U. S. and S Can. Nat. of Eu.—Spr.

23. *KONIGA* Adans. Annual or perennial, often diffuse herbs, or shrubby plants. Leaf-blades entire. Sepals 4, herbaceous. Petals 4, white, with broad blades. Stamens 6: anthers ovoid. Style slender: stigma depressed. Pod ovate to subglobose. Seed solitary. —About 4 species, natives of the Mediterranean region.

1. *K. maritima* (L.) R. Br. Stem usually diffuse, minutely pubescent: leaves 1–5 cm. long; blades of the cauline ones oblanceolate to linear or linear-lanceolate: flowers fragrant: sepals becoming 1.5–2 mm. long: petals 3–4 mm. long, the suborbicular blades longer than the claws: pod 2–3 mm. long, short-beaked. [*Alyssum maritimum* L.] —(SWEET-ALYSSUM.) —Waste places, and cult. grounds, various provinces, Fla. to Tex., Calif., and S Can. Nat. of Eu. and cult.—Spr.—fall.

24. *DRABA* [Dill.] L. Annual or perennial, often small herbs. Leaf-blades entire or toothed. Sepals 4, rather broad. Petals 4, white or yellow, or rarely pink or purple, or wanting. Stamens 6: anthers ovoid. Style columnar or very short: stigma depressed. Pod oval to linear, sometimes twisted. Seeds several. —About 175 species, natives, mainly, of north temperate and arctic regions. —Spr.—WHITLOW-GRASSES. WHITLOW-WORTS.

Annuals or often winter-annuals: pod not spirally twisted: petals about twice as long as the sepals.

Petals 2-cleft.

Petals entire, erose or emarginate.

Leaf-blades entire.

Pod glabrous.

Pod pubescent.

Leaf-blades toothed.

Pod 5–15 mm. long: sepals 2 mm. long.

Pod 2–3 mm. long: sepals 1–1.5 mm. long.

Perennial: pod spirally twisted: petals thrice as long as the sepals.

1. *D. verna*.

2. *D. caroliniana*.

3. *D. aprica*.

4. *D. cuneifolia*.

5. *D. brachycarpa*.

6. *D. ramosissima*.

1. *D. verna* L. Plant 2–16 cm. tall, acaulescent: leaf-blades spatulate to narrowly elliptic, 5–15 mm. long, entire, or toothed near the apex, sparingly pubescent: scape glabrous: sepals becoming 1.5–2 mm. long: petals cuneate, nearly twice as long as the sepals: pod elliptic or rarely oval, 4–9 mm. long.—(WHITE-BLOW. WHITLOW-GRASS.)—Dry banks and fields, various provinces, Ga. to Ark., Minn., and Mass. Nat. of Eu.—Wint.-spr.

2. *D. caroliniana* Walt. Plant 4–10 cm. tall, often short-stemmed: leaf-blades obovate, spatulate, elliptic, or suborbicular, 5–15 mm. long, entire or shallowly few-toothed, closely pubescent: scape pubescent, at least below: sepals becoming 2–2.5 mm. long, glabrous: petals 3–4 mm. long, with cuneate or oval blades: ovary glabrous: pod linear, 7–18 mm. long.—Rocks, fields, and sandy soil, various provinces, Ga. to Ark., Minn., and Mass.—Spr.

3. *D. aprica* Beadle. Plant 1–2.5 dm. tall, finely appressed-pubescent: leaves distant; blades obovate or oval to elliptic or linear-lanceolate, 19–26 mm. long, coarsely few-toothed: peduncles very short or wanting: terminal raceme elongate, the lateral racemes wholly or partially congested: sepals elliptic, becoming 0.8–1 mm. long: petals spatulate, 2.5–3 mm. long: ovary pubescent: pod linear-elliptic 4–6 mm. long.—Dry soil, Kennesaw Mt. in the higher Piedmont, Ga.—Spr.

4. *D. cuneifolia* Nutt. Plant 6–10 mm. tall, usually short-stemmed, stellate-pubescent: leaves approximate; blades cuneate, obovate or sometimes spatulate, 8–30 mm. long, coarsely few-toothed: peduncles elongate: racemes not congested: sepals becoming 3–5 mm. long, broad: petals spatulate, 3–5 mm. long: ovary pubescent: pod linear-elliptic, 8–15 mm. long.—Fields and cliffs, various provinces, Fla. to Tex., Calif., Ill., and Ky.—Spr.

5. *D. brachycarpa* Nutt. Plant 4–20 cm. tall, strigillose, caulescent: leaves 5–15 mm. long; blades ovate to elliptic or elliptic-lanceolate, or rarely obovate at the base of the plant, entire or nearly so: raceme elongate: sepals becoming 1–1.5 mm. long, glabrous: petals 1.5–2.5 mm. long, with oval rounded blades, or wanting: ovary glabrous: pod elliptic, 2–3 mm. long.—Dry soil, various provinces rarely Coastal Plain, N Fla. to Tex., Mo., and Va.—Spr.

6. *D. ramosissima* Desv. Plant 10–40 cm. tall, caulescent, stellate-pubescent all over: leaves 10–45 mm. long: blades spatulate at the base of the stem; elliptic to elliptic-lanceolate above, with remote spreading teeth; racemes corymbosely disposed: sepals becoming 2.5–3 mm. long: petals 6–8 mm. long, spatulate: ovary pubescent: pod narrowly elliptic, 5–12 mm. long, long-beaked.—Cliffs and rocky banks, often calcareous, Blue Ridge and Appalachian provinces, N. C. to Tenn., W. Va. and Va.

25. **DENTARIA** [Tourn.] L. Perennial scapose herbs with horizontal rootstocks. Leaves basal: blades palmately cleft or divided. Scapes simple, each bearing 2 or 3 bracts with blades similar to the basal leaves. Sepals 4, much shorter than the petals. Petals 4, white or purple, relatively large. Stamens 6; anthers elliptic to lanceolate. Style slender. Pod elongate.—About 15 species, natives of the Northern Hemisphere.—Spr.—CRINKLE-ROOTS. TOOTHWORTS. PEPPERWORTS.

Blades of leaves and bracts similar.

Leaf-segments linear.

Leaf-segments 1-2-parted.

Leaf-segments entire, toothed or merely incised.

Leaf-segments not linear.

Rootstock tuberous, moniliform, not scaly: leaf-segments laciniate.

Rootstock elongate, continuous, scaly: leaf-segments toothed or incised.

Leaf-segments incised, with narrow, very acute, often flaring teeth.

Leaf-segments not incised, with broad, blunt or merely mucronate teeth.

Blades of leaves and bracts very dissimilar.

1. *D. multifida*.

2. *D. furcata*.

3. *D. laciniata*.

4. *D. incisa*.

5. *D. diphylla*.

6. *D. heterophylla*.

1. *D. multifida* Muhl. Rootstock continuous: scape 2-3 dm. tall: bracts 2; segments with linear, entire or sparingly toothed blades: sepals broad, 5-6 mm. long: petals 12-14 mm. long: pod 3-3.5 cm. long.—Rich woods, Appalachian provinces, Ga. to Ala. and Ohio.

2. *D. furcata* Small. Rootstock moniliform: scape 2-3 dm. tall: bracts 3; segments with linear, entire, toothed, or incised blades: sepals narrow, 5-6 mm. long: petals 12-17 mm. long: pod 2.5-3 cm. long.—Rich woods, Appalachian provinces, Ala. to Ohio.

3. *D. laciniata* Muhl. Rootstock jointed: scape 1-3.5 dm. tall: bracts 3; segments with linear-lanceolate or elliptic coarsely serrate or incised blades: sepals narrow, 5-6 mm. long: petals oblong-spatulate, 12-15 mm. long: pod 3-5 cm. long, slender-beaked.—(PEPPER-ROOT.)—Moist banks and rich woods, various provinces, M Fla. to La., Minn., and Que.

4. *D. incisa* Small. Rootstock continuous: scape 2-3 dm. tall: bracts 3; segments with ovate or lanceolate conspicuously incised blades, the teeth narrow, more or less flaring: sepals narrow, 5.5-7 mm. long: petals broadly spatulate, 10-13 mm. long: pod not seen.—Moist rich woods, Lookout Mt., Tenn.

5. *D. diphylla* Michx. Rootstock continuous: scape 1-3 dm. tall: bracts 2; segments with ovate or lanceolate cuneate serrate blades: sepals narrow, 5-7 mm. long: petals broad, 12-14 mm. long: pod 2.5-4 mm. long.—(CRINKLE-ROOT.)—Woods, various provinces, S. C. to Ky., Minn., and N. S.

6. *D. heterophylla* Nutt. Rootstock continuous: scape 2-3 dm. tall: bracts usually 2; segments with ovate or obovate coarsely crenate or lobed blades: sepals 5-7 mm. long: petals narrow, 14-17 mm. long: pod 2.5-3.5 cm. long.—Rich woods, various provinces N of Coastal Plain, Ga. to Tenn., Pa., and N. J.

26. **CARDAMINE** [Tourn.] L. Annual or perennial herbs with erect or creeping stems. Leaves alternate: blades entire to pinnately dissected. Sepals 4, much shorter than the petals. Petals 4, white, pink, or purple. Style very short. Pod elongate.—About 125 species, natives of temperate regions.—BITTER-CRESSSES. BOG-CRESSSES.

Plants perennial: leaf-blades entire or pinnatifid, with 3 segments or with 3-7 segments in *C. curvisiliqua*.

Plant with an erect, simple stem from a tuberous-thickened base: leaf-blades entire or merely undulate.

I. BULBOSAE.

Plant with elongate rootstocks or rootstocks and creeping stems: leaf-blades simple, with 3 segments or 3-7 segments.

Stem weak, diffuse or prostrate and more or less creeping, with flowering branches or stolons from the upper leaf-axils.

Stem stiffly erect, not creeping, typically simple, not stoloniferous.

Plants annual or biennial: leaf-blades with several to many segments.

#### I. BULBOSAE

Plant with long-petioled basal leaves and sessile cauline leaves.

#### II. ROTUNDIFOLIAE

Cauline leaves simple: pod slender-beaked.

Cauline leaves pinnatifid: pod stout-beaked.

#### III. CLEMATITES

Leaf-blades or leaflets shallowly 3- or 5-lobed: style columnar. Leaf-blades or leaflets coarsely crenate or crenate-lobed: style subulate.

Flowers large; petals 7-9 mm. long, long-clawed.

Flowers small; petals 4-5 mm. long, almost clawless.

#### IV. PARVIFLORAE

Pod short, mostly 1-1.5 cm. long.

Lower leaves with few broad slender-stalked segments.

Lower leaves with several narrow segments which are more or less narrowed at the base.

Pod elongate, mostly 2-3 cm. long.

Stamens 6: flowering stems leafy, often conspicuously so.

Lower leaves with several to many narrow segments.

Lower leaves with few broad segments.

Stamens 4: flowering stems leafless or sparingly leafy, but scape-like.

#### II. ROTUNDIFOLIAE.

#### III. CLEMATITES.

#### IV. PARVIFLORAE.

1. *C. bulbosa*.

2. *C. rotundifolia*.

3. *C. curvisiliqua*.

4. *C. Clematidis*.

5. *C. flagellifera*.

6. *C. Hugerii*.

7. *C. debilis*.

8. *C. parviflora*.

9. *C. arenicola*.

10. *C. pennsylvanica*.

11. *C. hirsuta*.

1. *C. bulbosa* (Schreb.) B. S. P. Plant 1-5 dm. tall, with tuber-like bases: cauline-leaves 3-8 cm. long; blades oval, elliptic, ovate, or lanceolate: sepals becoming 3-3.5 mm. long: petals broadly cuneate, 7-12 mm. long: pod mostly 2-2.5 cm. long. [*C. rhomboidea* DC.]—(SPRING-CRESS.)—Swamps and low woods, various provinces, N. Fla. to Tex., Minn., and N. S. —Spr.

2. *C. rotundifolia* Michx. Plant 1-4 dm. long, cauline leaves 1-4.5 cm. long; blades ovate, oval, or suborbicular, entire, undulate, or angled, sometimes lobed: sepals becoming about 3 mm. long: petals 8-10 mm. long, the claws broad: pod mostly 1.5-2 cm. long, straight.—(MOUNTAIN-WATERCRESS.)—Springy places, Blue Ridge and Appalachian provinces, N. C. to Ky., Ohio, and N. J. —Spr.—sum.

3. *C. curvisiliqua* Shuttlw. Plant 3-8 dm. long, cauline leaves 3-9 cm. long; blades mostly pinnately parted, with 3-7 suborbicular, oval, or obovate undulate segments: sepals becoming 2-2.5 mm. long: petals 4-5 mm. long, spatulate, the claws slender: pod 1.5-2 cm. long, curved.—(COASTAL WATERCRESS.)—Springs and streams, Fla.—Spr.—fall.

4. *C. Clematidis* Shuttlw. Plant stiffly erect, 1-3 dm. tall, from a slender horizontal rootstock: cauline leaves 3-8 cm. long; blades or the 3 divisions

irregularly 3-5-lobed: sepals becoming 3.5-4 mm. long: petals 6-7 mm. long, pandurate, the claws very broad: pod 2.5-4 cm. long.—Wet mt. peaks, Blue Ridge and Appalachian provinces, Ala. to Tenn. and Va.—Spr.-sum.—Usually growing at about 6,000 feet alt. in the Blue Ridge.

5. *C. flagellifera* O. E. Schulz. Plant erect, 1-3 dm. tall, from a stoutish horizontal rootstock: cauline leaves 7-16 cm. long; blades pinnately parted, with 3-5 ovate, orbicular, or reniform coarsely crenate or crenate-lobed divisions, the teeth or lobes mucronate: sepals becoming 4-4.5 mm. long: petals 7-9 mm. long, spatulate, pandurate: filaments much flattened: pod not seen.—Mt. slopes, Blue Ridge, N. C.—Spr.—Usually at 3,000-4,000 feet alt.

6. *C. Hugerii* Small. Plant similar to *C. flagellifera* in habit, but usually more slender and with the lobes or teeth of the leaf-divisions less prominently mucronate: sepals becoming 2-2.5 mm. long: petals 4-5 mm. long, pandurate: filaments scarcely flattened: pod not seen.—Mt. woods, Blue Ridge, Ga. and S. C.—Spr.—Usually at 1,500-2,000 feet alt.

7. *C. debilis* D. Don. Plant with ascending or spreading stems 1-4 dm. long: cauline leaves 1-7 cm. long; blades pinnately divided, the few lateral segments wide, broadened upward, often lobed: sepals becoming about 1 mm. long: petals nearly twice as long as the sepals: pod 1-1.5 cm. long.—Ham-mocks and cult. places, Fla.—(*Asia*.)—Spr.-sum. or all year S.

8. *C. parviflora* L. Plant with slender stems 0.5-3 dm. tall: cauline leaves 1.5-6 cm. long; blades pinnately divided, the several lateral segments narrow, but broadened upward: sepals becoming 1-1.5 mm. long: petals slightly longer than the sepals: pod 1-1.5 cm. long.—Dry banks, roadsides and waste places, Coastal Plain, Fla. to Me. Nat. of Eurasia.—Spr.

9. *C. arenicola* Britton. Plant 1-3 dm. tall: cauline leaves 1-4 cm. long; blades pinnately divided, the lateral segments linear or linear-elliptic, mainly entire: sepals becoming about 1 mm. long: petals about twice as long as the sepals, mostly cuneate: pod linear, 2-2.5 cm. long.—Spring-runs, moist sandy soil, prairies, rock ledges, and woods, various provinces, Fla. to Tex., Mo., and Conn.—Spr.—Appears to be the American counterpart of *C. parviflora*.

10. *C. pennsylvanica* Muhl. Plant 2-10 dm. tall, glabrous or nearly so: cauline leaves 4-8 cm. long; blades pinnately divided, the lateral segments very broad or narrow, undulate, toothed, or lobed: sepals becoming about 2 mm. long: petals somewhat longer than the sepals, mostly spatulate: pod linear-filiform, 2-2.5 cm. long.—Wet places and meadows, various provinces, Fla. to Ark., Minn., and Newf.—Spr.

11. *C. hirsuta* L. Plant 0.5-2.5 dm. tall, pubescent: cauline leaves few or wanting: sepals becoming 1.5-2 mm. long: petals about twice as long as the sepals: pod narrowly linear, 2-2.5 cm. long.—Moist places and waste grounds, various provinces, Ga. to Mich. and Wash.—(*Eurasia*.)—Spr.

27. **LEAVENWORTHIA** Torr. Annual or biennial herbs with tufted scapes or scape-like stems. Leaf-blades lyrate-pinnatifid. Sepals 4, erect. Petals 4, white, yellowish, or purple, cuneate. Stamens 6: anthers ellipsoid to ovoid. Style columnar. Pod elongate, sometimes constricted between the seeds.—Four species.—Spr.

Pod broadly linear or elliptic, not torulose.

Pod with a very short stout or slender beak, 4-8-seeded, linear.

Pod with a short slender beak: leaves with a few relatively large blunt-lobed segments.

1. *L. aurea*.

Pod with a very short stout beak: leaves with many small sharp-toothed or angulate segments.

Pod with a long slender beak, 1-3-seeded, elliptic or linear-elliptic.

Pod narrowly linear, torulose.

2. *L. uniflora*.

3. *L. stylosa*.

4. *L. torulosa*.

1. *L. aurea* Torr. Leaf-blades with few blunt-lobed segments: pedicels becoming 3-11 cm. long: sepals 3-3.5 mm. long: petals 5-7 mm. long, white or purplish, except the yellow base: pod linear, 2-2.5 cm. long: seed with a straight radicle. —Rocks, often calcareous, various provinces N of Coastal Plain, Ala. to Tex., Ark., and Tenn.

2. *L. uniflora* (Michx.) Britton. Leaf-blades with many unequal toothed or angular segments: pedicels becoming 7-15 cm. long: sepals 3.5-4 mm. long: petals 5-7 mm. long, white with a yellow claw or purplish: pod linear-elliptic, 2.5-4 mm. long: seed with an oblique radicle. [*L. Michauxii* Torr.]—Dry soil or wet rocks, often calcareous, various provinces N of Coastal Plain, Ala. to Ark., Mo., and Ind.

3. *L. stylosa* A. Gray. Leaf-blades with 3-7 entire or angled segments: pedicels becoming 3-15 cm. long: petals yellow: pod elliptic, 12 mm. long.—Cedar glades, on limestone rocks, Interior Low Plateaus, Tenn.

4. *L. torulosa* A. Gray. Leaf-blades with entire angled or lobed segments: pedicels becoming 9-20 cm. long: petals purplish with a yellow base: pod narrowly linear, 2-5.5 cm. long.—Moist Cedar glades, Interior Low Plateaus, N Ala., Tenn., and Ky.

28. **ARABIS** L. Annual or perennial herbs. Leaf-blades entire, toothed, or pinnatifid. Sepals 4, erect, broad or narrow. Petals 4, white, pink, purple, or yellowish, as long as the sepals or much longer. Stamens 6: anthers ovoid to ellipsoid or sagittate. Style very short or obsolete. Pod elongate.—About 120 species, natives of the Northern Hemisphere.—Spr.-sum.—**ROCK-CRESSSES.** **SPIKED-CRESSSES.**

Seed winged, sometimes only so at the apex.

Pods erect, ascending, or spreading, straight.

Pods recurved, nodding, or drooping, curved.

Seed wingless.

I. VIRGINICAE.

II. LAEVIGATAE.

III. LYRATAE.

#### I. VIRGINICAE

Low plants, ultimately much-branched at the base and diffuse: lower leaves with deeply pinnatifid blades.

Taller plants, simple or sparingly branched at the base, erect or nearly so: lower leaves with merely toothed blades.

Stem and leaves conspicuously pubescent: pod spreading: sepals becoming 5-6 mm. long: petals broadly spatulate.

Stem and leaves inconspicuously pubescent: pod erect: sepals becoming 2.5-4 mm. long: petals narrowly spatulate.

Petals fully twice as long as the sepals: anthers sagittate: pod 4.5 cm. long or more: style 1 mm. long.

Petals less than twice as long as the sepals: anthers ovoid: pod 4 cm. long or less: style obsolete.

1. *A. virginica*.

2. *A. patens*.

3. *A. georgiana*.

4. *A. ovata*.

#### II. LAEVIGATAE

Outer sepals narrow, linear to elliptic-linear: plant glabrous, mostly glaucous: pod 1-2 mm. wide.

Seed suborbicular, broadly winged all around: petals 6-8 mm. long.

5. *A. Burkii*.

Seed oblong, winged at the apex, margined on the sides: petals 4-4.5 mm. long.  
Outer sepals broad, ovate to elliptic-ovate: plant pubescent, at least below: pod 2.5-3.5 mm. wide.

6. *A. laevigata*.

7. *A. canadensis*.

### III. LYRATAE

Blades of the basal leaves toothed: stem and leaves finely grayish-pubescent: petals slightly longer than the sepals: anthers ovoid: pod finely pubescent.

8. *A. dentata*.

Blades of the basal leaves lyrate-pinnatifid: stem and leaves glabrous or nearly so: petals twice as long as the sepals: anthers sagittate: pod glabrous.

9. *A. lyrata*.

1. *A. virginica* (L.) Trelease. Stem branched at the base, the branches ascending or decumbent, 1-4 dm. tall, sparingly short-hirsute or nearly glabrous: cauline leaves 2-7 cm. long, glabrous or nearly so; blades deeply pinnatifid, the segments often uniform, linear, spatulate, or elliptic, entire or 1- or 2-toothed: sepals elliptic or ovate-elliptic, becoming 1.5 mm. long: petals white, spatulate, 2.5-3 mm. long: anthers ovoid, apiculate: pod ascending, linear, 2-3 cm. long, less than 2 mm. wide, straight: seed suborbicular, about 1 mm. in diameter, narrowly winged. [*A. ludoviciana* C. A. Meyer]—Sandy or stony soil, woods, prairies, waste places, and cult. grounds, various provinces, Fla. to Tex., Kans., and Pa.—Spr.

2. *A. patens* Sulliv. Stem simple or branched at the base, 3-7 dm. tall, the branches ascending, closely hirsute: cauline leaves 2-7 cm. long, hirsute; blades ovate, oblong, or lanceolate, coarsely serrate, sessile and clasping: sepals oblong to ovate-elliptic, becoming 5-6 mm. long: petals white, broadly spatulate, 6-10 mm. long: anthers sagittate, apiculate: pod spreading or ascending, very narrowly linear, 2.5-4 cm. long, about 1 mm. wide, straight or slightly curved: seed elliptic, nearly 1.5 mm. long, narrowly winged.—Rocky river-banks, various provinces N of Coastal Plain, Ala. to Mo., Minn., and Pa.—Spr.

3. *A. georgiana* Harper. Stem 9 dm. tall or less, short-hirsute below, with few erect mostly basal branches: cauline leaves 3-9 cm. long; bright green, sparsely pubescent on the lower surface and margin: blades elliptic-lanceolate to lanceolate or linear-lanceolate, acute or acutish, entire, or remotely and saliently denticulate, sessile and half-clasping: raceme rather lax: sepals elliptic to elliptic-ovate, becoming 3.5-4 mm. long: petals white, oblanceolate, 6-10 mm. long: anthers sagittate, apiculate: style 1 mm. long: pod erect, linear-filiform, 4.5-7 cm. long, about 1 mm. wide: seeds narrowly elliptic, about 1.5 mm. long, narrowly winged.—Shaded river banks, Appalachian Valley, Ga. and Ala.—Spr.

4. *A. ovata* Michx. Stem 1 m. tall or less, simple or with few erect or ascending branches, short-hirsute or nearly glabrous: cauline leaves erect or ascending, 1-6 cm. long, often pubescent; blades ovate, elliptic, or lanceolate, entire or dentate, sessile, slightly auricled and clasping: sepals elliptic, becoming 2-2.5 mm. long: petals greenish or greenish-white, spatulate, 3-4 mm. long: anthers ovoid, acute: pod erect or nearly so, 2.5-4 cm. long, about 1 mm. wide, straight: seeds broadly oblong, nearly 1.5 mm. long, rather broadly winged. [*A. hirsuta* (Fl. SE. U. S.)]—Stony or sandy soil, various provinces N of Coastal Plain, Ga. to Calif., B. C. and Newf.—Spr.—fall.

5. *A. Burkii* (Porter) Small. Stem nearly 1 m. tall or less, glabrous and sometimes glaucous, simple or with few erect branches: cauline leaves elliptic or elliptic-oblongate to lanceolate, or linear-lanceolate, 1.5–6 cm. long, acute or acutish, entire or saliently toothed, sessile and sometimes slightly auricled at the base: raceme compact, at least when young: sepals linear-spatulate to linear-elliptic, becoming 4.5–5.5 mm. long, obtuse: petals white or yellow-tinged, linear-spatulate, 6–8 mm. long: anthers sagittate, acute: pod drooping, narrowly linear, 7–9 mm. long, curved, 2 mm. wide or less: seed suborbicular, 1–1.5 mm. in diameter, broadly winged all around. [*A. laevigata* *Burkii* Porter]—Dry hillsides or bluffs, various provinces N of Coastal Plain, N. C. to Mo. and Vt.—Spr.

6. *A. laevigata* (Muhl.) Poir. Stem 1 m. tall or less, glaucous, glabrous, with erect or ascending branches: cauline leaves oblanceolate to lanceolate or linear-lanceolate, entire, denticulate, or saliently few-toothed, sessile auriculate, and clasping: raceme strict: sepals linear to linear-elliptic, becoming 3.5–4 mm. long, obtuse: petals white, spatulate, 4–5 mm. long: anthers rounded at the apex: pod drooping, very narrowly linear, 6–11 cm. long, curved, less than 2 mm. wide: seed elliptic, about 2 mm. long, wing-margined on the sides, decidedly winged at the apex.—Woods and rocky soil, various provinces, rarely Coastal Plain, Ga. to Ark., N. D., Ont., and Que.—Spr.

7. *A. canadensis* L. Stem 1 m. tall or less, usually sparingly pubescent, at least below, simple or with few ascending branches: cauline leaves 3–12 cm. long, often sparingly pubescent; blades oblanceolate, elliptic, or lanceolate, thin, entire, sinuate or dentate-serrate, narrowed at the base, sessile: sepals broadly elliptic, becoming about 3.5 mm. long, pubescent: petals greenish-white, oblanceolate, 5–6 mm. long: anthers oblong, obtuse or minutely pointed: pod drooping, narrowly linear, 5–7.5 cm. long, 3–4 mm. wide, curved: seed orbicular-reniform, about 3 mm. in diameter, broadly winged.—(SICKLE-POD).—Rocky woods, various provinces, rarely Coastal Plain, Ga. to Tex., Minn., and Ont.—Spr.—sum.

8. *A. dentata* T. & G. Stem 2–6 dm. tall, finely roughish-pubescent, usually branched at the base and often with ascending branches above: cauline leaves 1.5–6 cm. long, pubescent; blades oblanceolate to elliptic-ovate, or elliptic-lanceolate, irregularly dentate, sessile, auricled and clasping: sepals elliptic, becoming 1.5–2 mm. long, often sparingly pubescent: petals whitish, spatulate, 2.5–3 mm. long: anthers ovoid, obtuse or acutish: pod spreading, narrowly linear, 2–3 cm. long, about 1 mm. wide, straight: seed elliptic, fully 1 mm. long, wingless.—Rich woods and river-banks, various provinces N of Coastal Plain, Tenn. to Kans., Minn., and N. Y.—Spr.

9. *A. lyrata* L. Stem usually branched at the base, the branches erect or ascending, 1–4 dm. tall, glabrous or finely hirsute near the base: cauline leaves 1–3 cm. long, glabrous, spatulate to linear, entire or the lower ones individually irregularly toothed: sepals elliptic, becoming 2.5 mm. long, obtuse: petals white, spatulate, 7–9 mm. long: anthers elliptic or ovate-elliptic, abruptly pointed: pod ascending, narrowly linear, 2–3 cm. long, about 1 mm. wide, nearly straight: seed elliptic, less than 1.5 mm. long, wingless.—(DWARF ROCK-CRESS).—Cliffs, wet rocks, and sandy soil, various provinces, N. C. to Mo., Man., and Ont.—Spr.

29. **SOPHIA** Adans. Annual or perennial herbs or shrubby plants, densely fine-pubescent. Leaf-blades 2-pinnatifid or dissected. Sepals 4, early deciduous. Petals 4, yellow or yellowish, slightly longer than the sepals or shorter. Anthers globular to ovoid. Style very short. Pod elongate.—About 20 species of wide geographic distribution.—FLIXWEEDS. TANST-MUSTARDS.

Pod narrowly linear, 1.5-2.5 cm. long, 1 mm. wide, curved upward.

Pod elliptic or linear-elliptic, 5-14 mm. long, 1-2 mm. wide, straight or nearly so.

Foliage densely canescent: pedicels horizontal: pod ascending.

Foliage glabrate or sparingly canescent.

Pedicel and pod horizontal.

Pedicel ascending: pod nearly erect.

1. *S. Sophia*.

2. *S. pinnata*.

3. *S. millefolia*.

4. *S. intermedia*.

1. *S. Sophia* (L.) Britton. Stem 3-7.5 dm. tall, hoary-canescenscent: leaf-blades 2-3-pinnatifid, the segments linear to elliptic-linear: sepals linear to lanceolate, about 1.5 mm. long: petals mainly shorter than the sepals: ovary linear: pod with seeds in 1 row.—(HERB-SOPHIA. FLIXWEED.)

—Waste places, various provinces, about 8 seaports, and from N. Y. to Nebr., Ont., and N. B. Nat. of Eu.

2. *S. pinnata* (Walt.) Britton. Stem 3.5-7 dm. tall, hoary-canescenscent: leaf-blades 2-3-pinnatifid, the segments linear to elliptic-linear: sepals linear to lanceolate, about 1.5 mm. long: petals mainly shorter than the sepals: ovary linear: pod with seeds in 1 row. [*Sisymbrium canescens* Nutt.]—Cult. grounds and waste places, various provinces, Fla. to Tex., Tenn., and Va.

3. *S. millefolia* Rydb. Stem rather taller and less leafy than in *S. pinnata*, and nearly glabrous: leaf-blades 2.5-10 cm. long, less finely dissected than in *S. pinnata*: sepals about 1.5 mm. long: petals about as long as the sepals: ovary narrowly oblong: pod clavate, 7-9 mm. long, the seeds in 2 rows.—Dry soil, Coastal Plain and adj. provinces, Ky. to Tex.

4. *S. intermedia* Rydb. Stem 2-7 dm. tall, nearly glabrous, or thinly stellate-pubescent and glandular: leaf-blades pinnately-parted or 2-pinnatifid, the segments linear to elliptic: sepals about 1.5 mm. long: petals about as long as the sepals: ovary elliptic: pods linear or elliptic or nearly so, 8-15 mm. long, the seeds in 1 row.—Dry soil, various provinces W of Blue Ridge, Tenn. to Tex., Calif., B. C. and Minn.

30. **WAREA** Nutt. Slender glabrous herbs. Leaf-blades entire. Sepals 4, narrow. Petals 4, white, rose, or purple, each abruptly narrowed into a slender claw. Stamens 6: anthers elliptic to elliptic sagittate. Style wanting. Pod very narrow, thick, long-stipitate.—Following are the only known species.

Leaf-blades cuneately narrowed at the base: claw of the petal pectinate fimbriate.

Stipe of the pod longer than the pedicel: petal-blade obovate or cuneate.

Stipe of the pod shorter than the pedicel: petal-blade sub-orbicular.

Leaf-blades rounded or auricled at the base.

Leaf-blades not auricled at the base: petal-claw granular-toothed.

Leaf-blades auricled at the base: petal-claw erose-toothed.

1. *W. cuneifolia*.

2. *W. Carteri*.

3. *W. sessilifolia*.

4. *W. amplexifolia*.

1. *W. cuneifolia* (Muhl.) Nutt. Plant 3-12 dm. tall: leaf-blades cuneate to oblanceolate or linear-cuneate, 1-2.5 cm. long: sepals about 5 mm. long: petals pinkish-purple or bluish, 5.5-6.5 mm. long, the claw minutely toothed: pedicels becoming 4-6 mm. long: pod-body 3-4 cm. long.—Sandhills, Coastal Plain, Fla. to Ala. and S. C.—Spr.-sum.

2. *W. Carteri* Small. Plant 4–15 dm. tall: leaf-blades linear or sometimes cuneate on the lower part of the stem, 1.5–3.5 cm. long: sepals 4.5–5.5 mm. long: petals white or nearly so, 5–6 mm. long, the claw prominently densely glandular-pubescent: pedicels becoming 9–12 mm. long: pod-body 5–6 cm. long.—Pinelands, scrub, and sandhills, S pen. Fla.—All year.

3. *W. sessilifolia* Nash. Plant 3–6 dm. tall: leaf-blades ovate to ovate-lanceolate, 1–2 cm. long, sessile: sepals 6.5–7.5 mm. long: petals pink, 5–6 mm. long, the blade suborbicular, the claw minutely granular-toothed: pedicels becoming 10–11 mm. long: ovary  $\frac{1}{3}$ – $\frac{1}{4}$  as long as the stipe: pod-body 3–4 cm. long.—Sandhills, dunes, and pinelands, M Fla.—Spr.–sum.

4. *W. amplexifolia* (Nutt.) Small. Plant 3–7 dm. tall: leaf-blades lanceolate to elliptic-lanceolate or ovate, 1–3 cm. long, clasping: sepals 6–6.5 mm. long: petals white, fading purple, 8–9 mm. long, the blade orbicular-reniform, the claw erose-toothed: pedicels becoming 10–12 mm. long: ovary  $\frac{1}{2}$  as long as the stipe: pod 3–4 cm. long.—Dry pinelands and sandhills, E Fla.—Spr.–sum.

31. **CAKILE** [Tourn.] Ludwig. Chiefly maritime fleshy herbs. Leaf-blades entire to pinnatifid. Sepals 4, succulent. Petals 4, white, pink, or purple. Stamens 5: anthers ovoid. Style very short: stigma depressed. Pod of two dissimilar portions.—About 10 species, natives of North America and Europe.—Spr.–fall, or all year southward.—SEA-ROCKETS.

Lower joint of the pod 2-seeded.

Lower joint of the pod 1-seeded.

Upper joint of the pod slender, about as thick as the lower.

Upper joint of the pod swollen, much thicker than the lower.

Pod without lateral projections at the node, the upper joint not constricted.

Pod with a 4-ridged upper joint.

Pod with a 6–10-ridged upper joint.

Facial ridges of the upper joint 8, sharp.

Facial ridges of the upper joint 6 or 10, rounded.

Upper joint 6-ridged.

Upper joint 10-ridged.

Pod with 2 lateral projections at the node, the upper joint much constricted.

1. *C. fusiformis*.

2. *C. americana*.

3. *C. edentula*.

4. *C. Harperi*.

5. *C. Chapmani*.

6. *C. lanceolata*.

7. *C. Cakile*.

1. *C. fusiformis* Greene. Plant diffuse, rather stout: leaves 5–15 cm. long; blades lacinate-pinnatifid, the segments linear: sepals becoming 4.5–5 mm. long: petals 7–8 mm. long: pod 1.5–2.5 cm. long; the upper joint subulate to lanceolate-subulate.—Sandy shores and sand-dunes, pen. Fla. and the Keys to Miss.

2. *C. americana* Nutt. Plant erect or spreading: leaves 2.5–7 cm. long; blades oblanceolate to spatulate, toothed near the apex, or sometimes slightly incised: sepals becoming 3–4 mm. long: petals 6–7 mm. long: pod 1.5–2 cm. long, the upper joint fusiform.—Beaches, S. C. ? to Conn.; also Great Lake Region.

3. *C. edentula* (Bigel.) Hook. Plant erect or decumbent: leaves 2–16 cm. long; blades oblanceolate to elliptic-lanceolate or rarely ovate, coarsely toothed or lobed: sepals becoming 3–3.5 mm. long: petals 4.5–6.5 mm. long: pod 1.5–2 cm. long, the upper ovoid or ellipsoid-ovoid.—Beach sands, Fla. to Lab.

4. *C. Harperi* Small. Similar to *C. edentula* in habit: leaves 3–11 cm. long; blades spatulate to oblanceolate, crenate or incised-crenate: sepals becoming 3–3.5 mm. long: petals 4–5 mm. long: pod 2–2.5 cm. long, the upper joint ellipsoid-conic.—Sandy beaches, Coastal Plain, Fla. to La. and S. C.

5. *C. Chapmanii* Millsp. Plant spreading or prostrate: leaves 2–10 cm. long; blades oblanceolate to elliptic, undulate to coarsely toothed: sepals becoming 3.5–4 mm. long: petals 6–7 mm. long: pod 1.5–2 cm. long, the upper joint fusiform-lanceolate.—(BEACH-SAP.)—Drifting sand, Coastal Plain, Fla. to Miss.

6. *C. lanceolata* (Willd.) O. E. Schulz. Plant spreading or procumbent: leaves 3–9 cm. long; blades oblanceolate to broadly linear or lanceolate, 3–8 cm. long, entire, or dentate, or the lower pinnatifid: sepals becoming 3.5–4 mm. long: petals 4–7 mm. long: pod 1.7–2 cm. long, the upper joint conic or ovoid-conic.—Coastal sand-dunes and shores, S pen. Fla. and the Keys.—(*W. I., Mex., C. A., S. A.*)

7. *C. Cakile* (L.) Karst. Plant spreading: leaves 4–11 cm. long; blades pinnatifid, the segments linear: sepals becoming 4–11 mm. long: petals 6–8 mm. long: pod about 2 cm. long, the upper joint mitre-like.—About seaports, Fla. to Ala., and N. J. Nat. of Eu.

#### FAMILY 4. CAPPARIDACEAE—CAPER FAMILY

Herbs, shrubs, trees, or vines. Leaves alternate or rarely opposite. Flowers perfect, in racemes or cymes, or solitary. Calyx of 4 or 5 sepals. Corolla of 4 or 5, often unequal, petals. Androecium of 4–6 stamens or more. Gynoecium of 2 united carpels. Fruit capsular, baccate. Seeds conduplicate.—About 35 genera and 450 species, widely distributed.

Herbs or herbaceous plants: fruit a 2-valved capsule.

Receptacle neither elevated nor elongate, with or without an appendage.

Appendage present: filaments distinct.

Petals very unequal, barely clawed: capsule with deciduous valves.

Petals nearly equal, long-clawed: capsule opening near the apex.

Appendage wanting: filaments united below.

Receptacle elevated or elongate.

Shrubs or trees: fruit baccate, or a pulpy capsule, sometimes opening irregularly.

1. ALDENELLA.

2. POLANISIA.

3. CLEOME.

4. NEOCLEOME.

5. CAPPARIS.

1. *ALDENELLA* Greene. Herbs. Leaf-blades 3-foliolate, except some of the upper ones, the leaflets very narrow. Sepals 4, reflexed. Petals 4, unequal, the posterior pair before a solid gland, barely clawed. Stamens 9–12: anthers linear, curved. Ovary short. Style slender. Capsule narrowly linear. One species.

1. *A. tenuifolia* (T. & G.) Greene. Stem 2–8 dm. tall: leaflets 1–4 cm. long; blades narrowly linear or filiform-linear: sepals 2–2.5 mm. long: petals white, the larger ones 6–8 mm. long; blades oval or ovate, entire: capsule 4–6 cm. long. [*Polanisia tenuifolia* T. & G.]—Scrub, dry pinelands, and sand hills, Coastal Plain, Fla. to Miss.

and Ga.—Spr.—fall.—There is much variation in the size of the flower, and in the sepals. One pair of sepals may be ovate and the other lanceolate. Sometimes all are ovate or ovate-lanceolate.

**2. POLANISIA** Raf. Herbs. Leaf-blades simple or 3-foliolate. Sepals 4, spreading. Petals 4, white or pink, somewhat unequal, long-clawed, the posterior pair before a short gland. Stamens 12–32: anthers oval to ovoid. Ovary sessile or nearly so: style slender. Capsule linear or linear-oblong.—About 30 species, natives of temperate and tropical regions.

**1. P. graveolens** Raf. Plant 1–8 dm. tall: leaflets 1.5–3.5 cm. long; blades elliptic or obovate: lower bracts 3-foliolate: sepals elliptic to lanceolate, about 3 mm. long: petals 4–5 mm. long: blades obovate-cuneate: capsule linear-elliptic, 3–5 cm. long.—(CLAMMY-WEED. SPIDER-ROSE. WORM-WEED.)—Fields, roadsides, and river-shores, various provinces, Tenn. to Kans., Man., Que., and Md.—Sum. **P. trachysperma** T. & G. with flowers about twice the size of those of *P. graveolens* and elongate stamens, has been collected near Dadeville, Ala.

**3. CLEOME** L. Herbs. Leaf-blades 3–7 foliolate. Sepals 4, spreading. Petals 4, white or pink, nearly equal, long-clawed. Gland wanting. Stamens 6, borne on the gynophore; anthers elliptic. Ovary long-stipitate: style almost wanting. Capsule linear. [*Gynandropsis* DC.]—About 12 species, natives of tropical regions.—Sum.—fall or all year S.—SPIDER FLOWERS.

Bracts 3-foliolate: sepals glandular: petals 1–1.5 cm. long: stipe of the capsule shorter than the gynophore. **1. C. gynandra.**  
 Bracts simple: sepals glabrous: petals 2.5–3.5 cm. long: stipe of the capsule many times longer than the gynophore. **2. C. speciosa.**

**1. C. gynandra** L. Stem glandular-pubescent and with scattered long hairs: leaflets 3–5; blades obovate, oval, elliptic, or ovate, the larger ones 2–8 cm. long, mostly acute or short-acuminate, finely toothed, often obscurely so: pedicel glandular: corolla 2–3 cm. in diameter, bright-pink: capsule-body 5–7 cm. long, the stipe 1 cm. long or less: seed 1.5 mm. in diameter, sharply tuberculate. [*Pedicellaria pentaphylla* Schrank.]—(SPIDER-WISP.)—Cult. grounds, waste-places, and roadsides, Coastal Plain, Fla. to La. and Ga. Nat. of the Old World.—(W. I., Mex., C. A., S. A.)

**2. C. speciosa** H. B. K. Stem glabrous or sparingly pubescent: leaflets 5–7; blades oblanceolate to narrowly elliptic, the longer ones 7–15 cm. long, often long-acuminate, entire or minutely toothed: pedicels glabrous: corolla 5–7 cm. in diameter, pink: capsule-body 6–10 cm. long, the stipe half as long as the body or more: seed nearly or quite 3 mm. in diameter, sparingly tuberculate.—Waste-places and cult. grounds, Fla. Nat. of Cont. Trop. Am.

4. **NEOCLEOME** Small. Herbs or somewhat woody plants. Leaf-blades 3-7 foliolate. Sepals 4, spreading. Petals 4, bright-pink, nearly equal, slender-clawed. Receptacle produced into a long gland. Stamens 6, or rarely 4, borne below the gynophore: anthers elliptic. Ovary long-stipitate: style wanting or nearly so. Capsule narrow, the valves linear.—About 70 species, natives, mainly, of tropical regions.—SPIDER-FLOWERS.

Bracts more or less foliaceous: sepals subulate: corolla 4-5 cm. wide: capsule-body as long as the stipe or shorter.

1. *N. spinosa*.

Bracts minute or obsolete: sepals elliptic to lanceolate-elliptic: corolla about 2 cm. wide: capsule-body many times longer than the very short stipe.

2. *N. serrata*.

1. *N. spinosa* (L.) Small. Stem glandular: leaflets 5-7; blades pubescent, the terminal one elliptic to elliptic-lanceolate, 3-10 cm. long, entire: flowers numerous, the buds clavate: sepals 5-7 mm. long: petals 2.5-3 cm. long: capsule-body 5-8 cm. long, the stipe filiform: seed about 2 mm. in diameter, tuberculate. [*Cleome spinosa* Jacq. *C. pungens* Willd.]—Waste places, cult. grounds, and roadsides, various provinces, Fla. to Tex., Mo., and N. Y. Nat. of trop. Am.—(O. W.)—Apr.-fall, or all year S.

2. *N. serrata* (Jacq.) Small. Stem glabrous: leaflets 3; blades glabrous, the terminal one ovate-lanceolate, 4-14 cm. long, shallowly toothed: flowers few, sepals 2-3 mm. long: petals 1 cm. long or less: capsule-body 4-7 cm. long, the stipe very short: seed about 1.5 mm. in diameter, smooth. [*Cleome serrata* Jacq.]—Collected many years ago in Ga. Nat. of trop. Am.—Sum.-fall.

5. **CAPPARIS** [Tourn.] L. Shrubs, trees, or vines. Leaf-blades simple, entire. Sepals 4 or 5, often spreading or reflexed. Petals 4 or 5, sessile, white. Receptacle unappendaged. Stamens numerous: anthers elliptic to linear. Ovary long-stipitate: style wanting. Capsule sometimes baccate, often torulose.—About 150 species, natives of tropical and subtropical regions.—Spr.

Leaves glabrous; blades reticulate: capsule glabrous.  
Leaves scaly; blades not reticulate: capsule scaly.

1. *C. flexuosa*.

2. *C. cynophallophora*.

1. *C. flexuosa* L. Shrub or small tree: leaf-blades elliptic to elliptic cuneate, mainly 5-8 cm. long: sepals suborbicular: corolla 5.5-7.5 cm. wide: fruit-body mostly 10-20 cm. long. [*C. cynophallophora* L. 1759.]—(BAY-LEAVED CAPER-TREE.)—Coastal hammocks, S pen. Fla. and the Keys.—(W. I., C. A., S. A.)

2. *C. cynophallophora* L. Shrub or small tree: leaf-blades elliptic or oval, mainly 4-10 cm. long: sepals lanceolate to ovate-lanceolate: corolla about 3 cm. wide: fruit-body mostly 20-30 cm. long. [*C. jamaicensis* Jacq.]—(JAMAICA CAPER-TREE.)—Hammocks, usually coastal, S pen. Fla. and Keys. (W. I.)—The relatively high and even temperature of the coastwise kitchenmiddens of Florida enables these tropical caper-trees to grow far up the peninsula.

FAMILY 5. **MORINGACEAE**—HORSERADISH-TREE FAMILY

Trees. Leaves alternate: blades 2-3-pinnate. Flowers perfect, slightly irregular, panicled. Calyx of 5 unequal sepals borne on the edge of the cup-shaped hypanthium. Corolla of 5 petals resembling the sepals, the lower petal reflexed, the upper one erect-spreading. Androecium of 5 stamens, borne on the hypanthium, and 5 staminodia. Gynoecium 3-carpellary. Ovary stipitate, with 3 parietal placentae. Fruit an elongate capsule. Seeds 3-winged or wingless.—One genus.

1. **MORINGA** Juss. Trees, with spreading branches. Panicles axillary, long-peduncled. Pods drooping.—Three known species.

1. **M. Moringa** (L.) Millsp. Tree becoming 11 m. tall: leaves 3-6 cm. long; leaflets cuneate to oval or elliptic, mostly 1-2 cm. long; panicles many-flowered: sepals linear or elliptic-linear, 9-10 mm. long: petals usually white or pinkish, mainly elliptic: capsule 2.5-3.5 dm. long: seed 3-winged, the body fully 1 cm. long.—(HORSERADISH-TREE.)—Pinelands, hammocks, roadsides, and fields, S pen. Fla. and Florida Keys.—Nat. of S Asia, and cult.—(W. I.)—All year.—The roots have the odor of horseradish. The seeds produce a fixed oil.

ORDER **SARRACENIALES**—SARRACENIAL ORDER

Insectivorous, usually scapose herbs, with viscid-fluid secreting tissues. Leaves alternate, various, filiform, or with dilated, sometimes sensitive blades, or hollow. Flowers usually perfect and regular. Calyx of distinct sepals. Corolla of distinct petals. Androecium of few or many stamens. Gynoecium of 2-5 united carpels. Ovary 1-celled, with 3-5 parietal or basal placentae, or 3-5-celled. Fruit capsular. Endosperm fleshy.

Ovary 1-celled, with a basal placenta or parietal placentae, not surmounted by a peltate disk: leaves with filiform or dilated blades.

Styles distinct: stigmas 2-lobed: placentae parietal:  
stamens 4-8, usually 5.

Fam. 1. DROSERACEAE.

Styles united: stigmas pinnatifid: placentae basal:  
stamens 10-20.

Fam. 2. DIONAEACEAE.

Ovary 3-5-celled with central placentae, surmounted by a peltate disk: leaves with hollow blades.

Fam. 3. SARRACENIACEAE.

FAMILY 1. **DROSERACEAE**—SUNDEW FAMILY

Annual, biennial, or perennial, glandular-pubescent herbs. Leaves circinate in the bud, merely filiform or with broad blades. Flowers spicate or racemose. Calyx of 4-8 persistent sepals. Corolla of 4-8 petals, or rarely of 1-3 petals. Androecium of 4-8, usually 5, distinct stamens. Capsule loculicidally 3-5-valved.—About 5 genera and 90 species, widely distributed.

1. **DROSERA** L. Annual or perennial scapose herbs. Leaves clustered. Scape nodding at the apex.—About 85 species, most abundant in Australia.—Corolla white or pink.—SUNDEWS.

Leaves spreading, with petioles and blades: corolla white or pink.

## I. ROTUNDIFOLIAE.

Leaves erect, elongate, bladeless phyllodia: corolla rose-purple, or rarely white.

## II. FILIFORMES.

## I. ROTUNDIFOLIAE

Scape glandular-pubescent.

Scape glabrous.

Corolla pink.

Corolla white.

Leaf-blades spatulate: seed ellipsoid.

Leaf-blades suborbicular or wider than long: seed spindle-shaped.

1. *D. brevifolia*.

2. *D. capillaris*.

3. *D. intermedia*.

4. *D. rotundifolia*.

## II. FILIFORMES

Leaves filiform, copiously glandular.

5. *D. Tracyi*.

1. ***D. brevifolia*** Pursh. Plant 10–15 cm. tall: leaves mainly 1–1.5 cm. long; blades cuneate, with short pubescent petioles: sepals becoming 3–3.5 mm. long: corolla white, 11–15 mm. wide: capsule scarcely as long as the sepals: seed ovoid, about 0.3 mm. long.—(DWARF-SUNDEW.)—Damp pinelands, low sandy woods, and acid swamps, Coastal Plain, Fla. to Tex. and Va.—Spr.—Whole plant sometimes red.

2. ***D. capillaris*** Poir. Plant 5–40 cm. tall: leaves 3–8 cm. long; blades broadly spatulate, with long, ultimately glabrous, petioles: sepals becoming about 3 mm. long: corolla pink, 7–9 mm. wide: capsule about equaling the sepals: seed oval, scarcely 0.5 mm. long.—(PINK-SUNDEW.)—Damp, acid, sandy places, Coastal Plain, Fla. to Tex. and S. C.—(W. I.)—Spr.—fall.

3. ***D. intermedia*** Hayne. Plant 5–20 dm. tall: leaves 2–6 cm. long: blades linear-spatulate, with long glabrous petioles: sepals becoming 5–5.5 mm. long: corolla white, 10–12 mm. wide: capsule scarcely as long as the sepals: seed oblong-cylindric, about 0.8 mm. long. [*D. longifolia* Michx. not L.]—(NARROWLEAF SUNDEW.)—Bogs and moist, acid, sandy soil, various provinces, Fla. to La., Man., and Newf.—(W. I., O. W.)—Sum.—fall.

4. ***D. rotundifolia*** L. Plant 5–30 cm. tall: leaf-blades suborbicular or reniform: scape glabrous: sepals becoming 5–6 mm. long: corolla 5–6 mm. wide: capsule slightly exceeding the sepals: seed fusiform, 1.5 mm. long.—(DEW-PLANT. ROUNDEAF SUNDEW.)—Moist, acid, sandy soil, bogs, and sandy swamps, various provinces, Fla. to Calif., Alas., Ont., and Lab.—(O. W.)—Sum.—fall.

5. ***D. Tracyi*** Macfarlane. Plant mostly 3–6 cm. tall: leaves coarse-filiform, mostly over 1 mm. wide: lower pedicels longer than the calyx or becoming so in age: sepals becoming 5–6 mm. long: petals 15–17 mm. long: anthers about 2.5 mm. long: capsule broadly obovoid, about 4 mm. long. [*D. filiformis* Fl. SE. U. S. in part.]—(DEW-THREADS.)—Low pinelands, Coastal Plain, N. Fla. to La. and S. C.—Spr.

FAMILY 2. **DIONAEACEAE**—VENUS'-FLYTRAP FAMILY

Perennial glabrous herbs. Leaves conduplicate and inflexed in the bud, the blade folding lengthwise. Flowers corymbose. Calyx of 5 persistent sepals. Corolla of 5 petals. Androecium of 10–20 stamens united at the base. Gynoecium of 5 united carpels. Fruit an irregularly opening capsule. Seed shining.—One genus and one species.

1. **DIONAEA** Ellis. Erect herbs. Leaves basal, arching-decumbent. Petioles winged. Petals white, marcescent. Capsule erect.

1. **D. muscipula** Ellis. Leaves 4–15 cm. long: petioles spatulate or obovate, naked: blades suborbicular to reniform, long-ciliate: scapes 1–4 dm. tall: sepals 7–9 mm. long: petals cuneate, 11–13 mm. long, truncate and erose at the apex: capsule ovoid, 3–4 mm. long.—(FLYTRAP. VENUS'-FLYTRAP.)—Sandy bogs, savannas, and low pinelands, usually in acid soil, Coastal Plain, E. S. C. and N. C.—Spr.—The outstanding features of the flytrap are the three irritable cilia on the face of each leaf-lobe which transmit the stimulus that causes the paired lobes to snap shut on an insect, and the eyelash-like cilia of the lobes which close together like the fingers when one's hands are folded, thus making sure the victim is securely held.

FAMILY 3. **SARRACENIACEAE**—PITCHER-PLANT FAMILY

Perennial bog herbs, living to some extent on decaying insects and leaves which have fallen into the tubular or pitcher-like leaves. Flowers perfect, nodding. Calyx of 5 persistent sepals, accompanied by 3 bracts. Corolla of 5 deciduous petals. Androecium of numerous stamens. Gynoecium of 5 united carpels. Fruit a 5-valved capsule.—Three genera and 10 species, all American.

1. **SARRACENIA** [Tourn.] L. Acaulescent herbs with horizontal rootstocks. Leaves basal, erect or decumbent, hollow, with a ventral ridge or wing and a terminal expansion or hood, green, yellow, or purple, or variegated; phyllodia, not pitcher-like or trumpet-like, sometimes present. Flowers on erect hollow scapes. Stigmas hooked, under the angles of the umbrella-like expansion of the style.—About 8 species, natives of eastern North America.—EVE'S-CUPS. FROG-BONNETS. BOG-BUGLES. PITCHER-PLANTS. TRUMPETS.—Spr.—sum.—Natural hybrids observed and described are cited under the species following. There are many artificial hybrids. The morphology of the leaf is such that insects are entrapped and digested, thus furnishing material which the plant uses for nourishment. Some species have phyllodia in winter.

Leaves (pitchers) decumbent, relatively short.

Leaves (trumpets) erect, elongate:

Orifice open, at least not closely covered by the hood:

petals yellow, cream-colored or red.

Orifice closely covered by the arched cucullate hood:

petals clear-yellow.

I. PURPUREAE.

II. FLAVAE.

III. MINORES.

## I. PURPUREAE

Pitchers ventricose; hood erect, reniform, opening outward, the orifice terminal.  
Pitchers tubular-clavate; hood globose-cucullate, opening inward, the orifice lateral.

1. *S. purpurea*.2. *S. psittacina*.

## II. FLAVAE

Hood flat, green, more or less veined with purple: flower small, the petals less than 4 cm. long.

Hood with more or less reflexed sides, yellow, yellow-green, green and white, or dark-red, often red-veined; flower large, the petals over 4 cm. long.

Hood mottled green and white and purple-veined: petals dark-red.

Hood yellow or yellow-green, or dark-red in a variety of *S. flava*, veinless or red-veined.

Petals yellow or cream-colored, or dark-red in a variety of *S. flava*.

Hood reniform or orbicular-reniform: petals yellow or rarely red in isolated colonies.

Hood ovate sometimes broadly so: petals cream-colored.

Petals dark-red.

3. *S. rubra*.4. *S. Drummondii*.5. *S. flava*.6. *S. Sledgei*.7. *S. Jonesii*.

## III. MINORES

Plant growing in clumps and colonies, conspicuous on account of the variegated tops and backs of the leaves.

8. *S. minor*.

1. *S. purpurea* L. Leaves 1-2 dm. long, evergreen, decumbent, in a basal rosette, often variegated with purple: pitcher ventricose, with a half-obovate or half-oblongate wing, the orifice not contracted: hood erect, reniform, often notched at the apex: scape erect, 2-4 dm. tall: flower 5-6 cm. broad: sepals ovate, about 3 cm. long, obtuse: petals fiddle-shaped, 4-5 cm. long, obtuse, purple: style-disk 3-4 cm. broad, the lobes notched: capsule about 1.5 cm. broad. — (PITCHER-PLANT. INDIAN PITCHER. FLYTRAP. SIDESADDLE-PLANT. ADAM'S-PITCHER. HUNTSMAN'S-CUP. FORE-FATHER'S-CUP. DEVIL'S-BOOTS.) — Sphagnum or rarely marly bogs, various provinces, N Fla. to La., Man., and Newf.—Spr. — Hybridizes with *S. flava* =  $\times S.$  *Catesbaei*; also with *S. Drummondii*. The representative of this species in our region differs from that further north in having much shorter and broader pitchers, and may be found on further study to be a distinct species, in which case it should bear the name *S. venosa* Rafinesque.

2. *S. psittacina* Michx. Leaves 0.5-1.5 dm. long, evergreen, in a basal rosette, variegated, especially above, with white spots and purple veins: pitcher tubular-clavate, with a broad half-obovate wing: hood strongly incurved, inflated, globose-cucullate: scape erect, 2-4 dm. tall: flowers 3-5 cm. broad: sepals ovate, 2-2.5 cm. long, obtuse: petals 3-4 dm. long, rounded or retuse at the apex, purple: style-disk about 3.5 cm. broad, the lobes 2-cleft: capsule 9-14 mm. in diameter.—(PARROT PITCHER-PLANT.)—Lowlands, Coastal Plain, N Fla. to La. and Ga.—Spr.—Hybridizes with *S. minor*.

3. *S. rubra* Walt. Leaves 1-4 dm. long: trumpets nearly tubular or narrowly trumpet-shaped, narrowly winged, hardly expanded at the throat, slightly paler above, and, like the ovate acute or acuminate finally erect hood, faintly reticulate with purple: scape erect, most taller than the leaves: flower 3-5 cm. broad: sepals ovate, 2-2.5 cm. long, obtuse: petals 3-4 cm. long, reddish-

purple, with obovate blades: style-disk 3-3.5 cm. broad, the lobes notched at the apex: capsule about 1.5 cm. in diameter.—(SWEET PITCHER-PLANT.)—Bogs and low pinelands, Coastal Plain and adj. Piedmont, W Fla. to SE N. C.—Spr.—Flowers very fragrant.

4. *S. Drummondii* Croom. Leaves erect, elongate: trumpets narrowly trumpet-shaped, 4-12 dm. long, slightly winged (or sometimes all wing and no tube), the upper part gradually expanding, white, reticulate with purple, like the erect ovate or suborbicular hood, whose margins are undulate above and recurved below, the edges of the pitcher revolute: scape erect, scarcely longer than the leaves: flowers 7-9 cm. broad: sepals ovate, 5-6 cm. long, obtuse: petals fiddle-shaped, 5-7 cm. long, purple: style-disk 5-6 cm. broad, the lobes 2-cleft: capsule 2.5-3.5 cm. in diameter.—(PURPLE-TRUMPET. FIDDLER'S-TRUMPET.)—Sandy bogs, Coastal Plain, NW Fla. to Miss., and W Ga.—Spr.—Hybridizes with *S. flava* (or perhaps *S. rubra*) =  $\times$  *S. Mandaiana*; also with *S. purpurea*.—Bartram planned to call this species *S. lacunosa*, but accompanied his proposal with a description of *S. minor*, so his name is invalid. Rafinesque named it *S. leucophylla* in 1817, 31 years before the publication of Croom's name, but his name has not been adopted because he based it on a mere description by Robin, without seeing actual specimens.

5. *S. flava* L. Leaves (summer) erect, elongate: trumpet-shaped, narrowly-winged, 5-13 dm. tall, gradually expanding above, the edges revolute, the upper part, as well as the very broad apiculate hood which is 8-12 cm. broad, often bright-yellow, more or less reticulate with reddish or purple veins; winter leaves consisting of wing without tube or hood: scape about as tall as the leaves: flower 10-12 cm. broad: sepals widest at the middle, 4-5 cm. long, rounded at the broad apex: petals bright-yellow, 7-10 cm. long: blades narrowly obovate, abruptly narrowed to the elliptic claw, scarcely widened at the base: style-disk 7-9 cm. broad, the lobes 2-cleft at the apex: capsule about 2 cm. in diameter.—(TRUMPETS. GOLDEN-TRUMPETS. WATCHES. TRUMPET-LEAF. HUNTSMAN'S-HORN. FLY-CATCHERS.)—Wet pinelands, Coastal Plain, Piedmont, and S end of Appalachians, N Fla. to Ala. and Va.—Spr.—Hybridizes with *S. minor*.—The mountain plant may be a distinct species.

6. *S. Sledgei* Macfarlane. Leaves (summer) erect, rather slender: pitchers narrowly trumpet-shaped, 2-8 dm. long, slightly expanding above: hood ovate, with relatively straight inconspicuous red veins, these much less branched than in *S. flava*: scape about as tall as the leaves: sepals widest near the base, tapering to the narrow but blunt apex, 4-5 cm. long, resembling the petals in texture: petals greenish-yellow, 5-6 cm. long, fiddle-shaped: blades rhombic-ovate, the abruptly widened basal portion nearly 2 cm. long, rhombic-obovate: capsule similar to that of *S. flava*.—(YELLOW TRUMPETS.)—Wet pinelands, Coastal Plain, Ala. to E Tex.—Spr.

7. *S. Jonesii* Wherry. Leaves (summer) erect, distinctly expanded upward, but rather slender, narrowly trumpet-shaped, 3-7.5 dm. tall, green, but often with rather inconspicuous red veinings. Hood ovate to suborbicular, curving high over the orifice, finely inconspicuously veined: scape about as tall as the leaves, at least in anthesis: sepals widest near the base, obtuse, 2-3 cm. long: petals dark-red, 4-5 cm. long, fiddle-shaped; blades orbicular-obovate: capsule about 1.5 cm. in diameter.—Bogs, wet meadows, and swamps, various provinces, W. Fla. to Miss. and N. C.—Spr.

8. *S. minor* Walt. Leaves erect, 2-10 dm. long, trumpet-shaped, gradually expanding from the base, variegated at and near the top with green and purple veins and white or yellowish scar-like blotches: hood ovate, arch-

ing, incurved over the orifice of the pitcher: scape erect, shorter than the leaves or slightly longer: flower 4-6 cm. broad: sepals ovate, 2.5-3 cm. long, obtuse: petals narrowly fiddle-shaped, 4-5 cm. long, rounded at the apex, clear-yellow: style-disk 2.5-3 cm. broad, the lobes notched: capsule about 1.5 cm. broad. [*S. variolaris* Michx.]—(HOODED PITCHER-PLANT.)—Low pinelands and hogs, Coastal Plain, Okeechobee region, Fla. to SE N. C.—Spr.—Hybridizes with *S. flava*, *S. psittacina*, *S. rubra*, and *S. purpurea*.

### ORDER ROSALES—ROSAL ORDER

Herbs, shrubs, or trees, or rarely aquatic plants or vines. Leaves with simple or compound blades. Flowers mostly perfect. Calyx and corolla present and sometimes irregular, or the latter occasionally, or both rarely, wanting. Androecium of few or many stamens. Gynoecium of 1-several distinct or united carpels. Fruit various.

Aquatic alga-like fleshy herbs, with spathe-like involucre: perianth usually wanting. Fam. 1. PODOSTEMACEAE.

Terrestrial or swamp plants, without spathe-like involucre: perianth present.

Endosperm present, usually copious and fleshy: stipules mostly wanting.

Herbs.

Carpels as many as the sepals: stamens as many as the sepals or twice as many.

Plants succulent: carpels distinct or united at the base, opening lengthwise.

Plants not succulent: carpels united to the middle, circumscissile.

Carpels fewer than the sepals.

Staminodia present: carpels 3 or 4, wholly united into a 1-celled gynoecium.

Staminodia wanting: carpels mostly 2, distinct or partially united.

Shrubs or trees.

Leaves opposite.

Leaves alternate.

Fruit a 2-celled capsule.

Capsule thin-walled, almost free from the hypanthium.

Stamens 5: hypanthium flattish, not accrescent: leaves without stipules.

Stamens numerous: hypanthium hemispheric, inflated in age: leaves with stipules. *Opulaster* in

Capsule woody or thick-walled, manifestly adnate to the hypanthium.

Calyx, or calyx and corolla, present: ovule solitary in each carpel, suspended.

Calyx and corolla wanting: ovules several or numerous in each carpel, horizontal.

Fruit a 1-celled berry.

Endosperm wanting or scant (copious in *Opulaster* in ROSACEAE): stipules mostly present.

Flowers monoecious, in dense capitate clusters.

Flowers perfect, or if monoecious or dioecious, not in capitate clusters.

Flowers regular.

Carpels several or numerous, or if solitary becoming an achene.

Carpels distinct, rarely adnate to the hypanthium: fruit achenes or follicles.

Sepals and petals 5: leaves mostly alternate.

Fam. 2. SEDACEAE.

Fam. 3. PENTHORACEAE.

Fam. 4. PARNASSIACEAE.

Fam. 5. SAXIFRAGACEAE.

Fam. 6. HYDRANGEACEAE.

Fam. 7. ITEACEAE.

Fam. 12. ROSACEAE.

Fam. 8. HAMAMELIDACEAE.

Fam. 9. ALTINGIACEAE.

Fam. 10. GROSSULARIACEAE.

Fam. 11. PLATANACEAE.

Fam. 12. ROSACEAE.

- Sepals and petals numerous:  
leaves opposite.  
Carpels united, enclosed by the hypanthium and adnate to it: fruit a pome.  
Carpel solitary, not becoming an achene.  
Ovary with 2 ovules: leaf-blades simple: fruit a drupe.  
Ovary with several ovules: leaf-blades 2-3-pinnate: fruit a legume.  
Petals valvate in the bud.  
Petals imbricated in the bud,  
*Gleditsia* and *Gymnocladus* in  
Fam. 13. CALYCANTHACEAE.  
Fam. 14. MALACEAE.  
Fam. 15. AMYGDALACEAE.  
Fam. 16. MIMOSACEAE.  
Fam. 17. CASSIACEAE.  
Flowers irregular (nearly or quite regular in *Gleditsia* and *Gymnocladus* in CASSIACEAE).  
Fruit indehiscent, armed with barbed spines: leaf-blades simple: stipules wanting.  
Fruit a legume or loment: leaf-blades compound: stipules usually present.  
Upper petal enclosed by the lateral ones in the bud.  
Upper petal enclosing the lateral ones in the bud.  
Fam. 18. KRAMERIACEAE.  
Fam. 17. CASSIACEAE.  
Fam. 19. FABACEAE.

### FAMILY 1. PODOSTEMACEAE—RIVER-WEED FAMILY

Aquatic herbs, adhering to rocks, the vegetative organs resembling the thallus of an alga or a hepatic. Leaves alternate: blades lobed or decompose. Flowers perfect, arising from a spathe. Perianth wanting, or of 3-5 scale-like or membranous sepals. Androecium of 1-many stamens. Gynoecium of 2 or 3 united carpels. Fruit capsular.—About 21 genera and 175 species, mostly natives of the tropics.

1. **PODOSTEMON** Michx. Caulescent alga-like herbs. Leaf-blades divided or dissected. Flowers green. Perianth obsolete. Stamens 2. Ovary 2-celled. Capsule unequally 2-valved, one valve persistent.—About 12 species of wide geographical distribution.—Sum.—fall.—RIVER-WEED.

Flower solitary: leaf-segments flattened.

Flowers 2 or 3 together: leaf-segments almost capillary.

1. *P. Ceratophyllum*.

2. *P. abrotanoides*.

1. ***P. Ceratophyllum*** Michx. Plant olive-green, glabrous. Stems 0.5-2 dm. long, attached to stones in running water by disk-like expansions: leaves rigid; blades divided into many narrow segments, the base sheathing the stem: flowers solitary, slender-pedicelled: united filaments much longer than the ovary: capsule oval, 2.5 mm. long.—(THREAD-FOOT. JASPER-GREEN.)—Attached to rocks in streams, various provinces N of Coastal Plain, Ga. to Ala., Ont., and N. B.

2. ***P. abrotanoides*** Nutt. Similar to the preceding species in habit, but larger, the stems sometimes becoming 6-8 dm. long: leaves often numerous: blades much divided into almost capillary segments: flowers 2 or 3 together, sessile or short-pedicelled: capsule ellipsoid, 10-ribbed. — Streams, Coastal Plain, extending into adj. provinces, W Fla. to Miss., Tenn., and C Ga.

## FAMILY 2. SEDACEAE—ORPINE FAMILY

Herbs, usually succulent, or partially woody plants. Leaves alternate, opposite, or whorled: blades thick, flat to terete. Flowers perfect or dioecious, cymose. Calyx of usually 4-6 persistent sepals. Corolla of as many petals as sepals, or wanting. Androecium of as many stamens as sepals or twice as many. Gynoecium of as many distinct or partially united carpels as there are sepals. Fruit follicular.—About 30 genera and 600 species of wide geographic distribution.

Sepals distinct or united only at the base: calyx not inflated.

Petals distinct.

Carpels distinct: petals not hooded at the apex.

Stamens as many as the sepals.

Stamens twice as many as the sepals.

Carpels united to the middle: petals hooded.

Petals with the claws united into a tube.

Sepals united into a tube: calyx inflated.

Tribe I. TILLAEAE.

Tribe II. SEDEAE.

Tribe III. DIAMORPHEAE.

Tribe IV. KALANCHOEAE.

Tribe V. BRYOPHYLLEAE.

## I. TILLAEAE

Very small annual herbs with opposite leaves.

## 1. TILLAEASTRUM.

## II. SEDEAE

Follicles erect: plant perennial by stout, woody-fleshy, mostly underground caudices.

Flowers dioecious or polygamous: follicle-beaks stout, short, spreading.

Flowers perfect: follicle-beaks slender, erect.

Follicles widely spreading: plant annual or perennial by fleshy stolons.

## 2. RHODIOLA.

## 3. ANACAMPSEROS.

## 4. SEDUM.

## III. DIAMORPHEAE

Diminutive annuals or biennials with wiry stems: corolla pink or purple.

## 5. DIAMORPHA.

## IV. KALANCHOEAE

Rather coarse succulent perennials, growing in tufts, with broad-toothed leaves: corolla yellow; lobes spreading.

## 6. KALANCHOE.

## V. BRYOPHYLLEAE

Coarse succulent herbs, growing in colonies by branching rootstocks.

## 7. BRYOPHYLLUM.

1. **TILLAEASTRUM** Britton. Annual small aquatic or mud-inhabiting herbs. Leaves opposite. Flowers solitary in the axils. Sepals mostly 4. Petals mostly 4. Stamens free. Carpels usually 4, distinct. Ovules, or seeds, few-several. About 20 species, widely distributed.

1. **T. aquaticum** (L.) Britton. Plant 1-8 cm. tall: leaves 4-6 mm. long; blades linear-elliptic: sepals about 0.5 mm. long: petals about twice as long as the sepals, whitish. [*Tillaea aquatica* L. *T. simplex* Nutt.].—(RIVER-LEEK.)—Muddy banks, various provinces, La. to Tex., N. S., Mass., and Md., also in W N: A.—Spr.-fall.

2. **RHODIOLA** L. Perennial herbs with woody rootstocks. Leaves alternate: blades flat, sometimes toothed. Flowers dioecious or polygamous, borne

in a dense terminal cyme. Sepals 4 or 5, decidedly longer than wide. Petals 4 or 5, yellowish, purplish, or greenish. Follicles erect.—About 8 species, natives of the north temperate zone.—ROSEROOTS.

1. *R. roanensis* Britton. Plant 1–4 dm. tall, tufted: leaf-blades elliptic to cuneate or linear-cuneate, 1–3.5 cm. long, entire or nearly so: sepals lanceolate-acuminate, about 2 mm. long: petals elliptic or slightly broadened upward, 3–4 mm. long, purplish: follicles 8–10 mm. long. [*Sedum Rhodiola* (Chapm. Fl.) *Sedum roanense* Britton]—(PURPLE-ORPINE. ROSEROOT.)—Cliffs, in rather acid soil, top of Roan Mt., Blue Ridge, N. C. and Tenn.—Spr.—sum.

3. *ANACAMPSEROS* Mill. Perennial tufted herbs. Leaves alternate: blades flat, relatively broad, often toothed. Flowers perfect, in terminal corymbose cymes. Sepals 4 or 5, mostly ovate to lanceolate. Petals 4 or 5, pink or purple, much longer than the sepals. Follicles 4 or 5, erect. Few species of the Old World, except the following.

1. *A. telephioides* (Michx.) Haw. Plant 1–4 dm. tall, glabrous: leaf-blades flat, obovate or ovate, coarsely toothed: sepals triangular-lanceolate, about 2 mm. long: petals pale-pink, elliptic to elliptic-lanceolate, 4.5–6 mm. long: follicles 4–5 mm. long. [*Sedum telephioides* L.]—(CLIFF-ORPINE. WILD-LIVE-FOR-FOREVER.)—Cliffs and rocks, various provinces, N. of Coastal Plain, Ga. to Ill., W N. Y., and D. C.—Sum.

4. *SEDUM* L. Annual or perennial, fleshy, often stoloniferous herbs. Leaves alternate, opposite, or whorled: blades flat, but thick, turgid or terete, entire. Flowers perfect, in cymes which are often branched and sometimes very one-sided. Sepals 4 or 5, deltoid to linear. Petals 4 or 5, white or variously colored, longer than the sepals. Follicles 4 or 5, spreading, beaked, the beaks sometimes short.—About 200 species, most abundant in the temperate and cold regions of the Northern Hemisphere.—STONECROPS. SEDUMS.

Sepals deltoid: carpels and follicles short-beaked.  
Sepals ovate to linear: carpels and follicles long- or slender-beaked.

Corolla white to pink.

Plant perennial, producing leafy stolons; petals white: leaf-blades thick, but flat or somewhat turgid.

Leaves of the rosettes of the stolons with orbiculate-obovate blades; leaves of the flowering stem with obovate to elliptic blades.

Leaves of the rosettes of the stolons with spatulate or narrowly cuneate blades; leaves of the flowering stems with spatulate to cuneate blades.

1. *S. pusillum*.

2. *S. ternatum*.

3. *S. Nevii*.

Plant annual, without stolons: petals pink or pinkish: leaf-blades terete or subterete, linear-filiform or very narrowly linear.

Leaves linear-filiform: petals broadly lanceolate: follicles 6–7 mm. long.

Leaf-blades subterete, narrowly linear: petals narrowly lanceolate: follicles 4–4.5 mm. long.

Corolla yellow.

4. *S. pulchellum*.

5. *S. vigilmontis*.

6. *S. acre*.

1. *S. pusillum* Michx. Plant 5–12 cm. tall, pale-green, the stem glabrous, simple or branched throughout: leaves 2–9 mm. long; blades spatulate to obovate or elliptic, turgid, obtuse: cymes often copiously flowered, but not densely so: pedicels clavate: sepals deltoid, 1 mm. long or nearly so: acute: petals white or pink, ovate, 2.5–3 mm. long, obtuse: follicles 3.5–4 mm. long, very short-beaked. [*Tetrorum pusillum* (Michx.) Rose]—(PUCK'S-ORPINE.)—Rocks, chiefly granite, Piedmont and Blue Ridge, M Ga. to N. C.—Spr.

2. *S. ternatum* Michx. Plant light-green, with matted branches: leaves various, those of the sterile shoots whorled near the tip, alternate below, with the blades obovate to suborbicular, mostly 1–2 cm. long; the upper ones of the flowering branches smaller, scattered, with obovate to elliptic blades; sepals about 5 mm. long: petals broadly lanceolate, 6–7 mm. long: follicles 5.5–8 mm. long.—(MOUNTAIN-STONE CROP. SHEPHERD'S CRESS. THREE-LEAF STONECROP.)—Rocks and damp shaded banks, various provinces, rarely Coastal Plain, Ga. to Mo., Mich., and Mass.—Spr.—Extensively grazed by sheep in the mountains in winter.

3. *S. Nevii* A. Gray. Plant light-green, with often densely matted branches: leaves various, those of the sterile shoots alternate, but often crowded, with the blades narrowly cuneate to spatulate, mostly 0.5–2 cm. long; the upper leaves of the flowering branches scattered, with cuneate, spatulate, or linear-spatulate blades: sepals 3–3.5 mm. long: petals narrowly lanceolate, 5–6 mm. long: follicles 4–4.5 mm. long.—(CLIFF-STONECROP.)—Rocky woods, Blue Ridge, Appalachian provinces, and rarely Interior Low and Ozark Plateaus, Ga. to Mo. and Va.—Spr.

4. *S. pulchellum* Michx. Plant 5–30 cm. tall, bright-green, the stem branched, ascending or decumbent: leaves often crowded, terete, linear-filiform, 9–25 mm. long: flowers crowded on the cyme-branches: sepals narrowly ovate, 2.5–3 mm. long: petals broadly lanceolate, 5–6 mm. long: anthers about 1 mm. long: follicles 6–7 mm. long, relatively long-beaked.—(ROCK-CRESS. ROCK-ORPINE. WIDOW'S CROSS.)—Calcareous rocks, various provinces, N of Coastal Plain, Ga. to Tex., Kans., and W Va.—Spr.—sum.

5. *S. vigilmontis* Small. Plant 6–15 cm. tall, bright-green, the stems erect or ascending: leaves numerous, subterete, narrowly linear, 0.5–2 cm. long: flowers rather close on the cyme-branches, but not crowded: sepals narrowly lanceolate, 1.5–2 mm. long: petals narrowly lanceolate, 3.5–4 mm. long: anthers about 0.6 mm. long: follicles 4–4.5 mm. long, relatively short-beaked.—Rocks, lower slopes, Lookout Mt., Ga.—Spr.

6. *S. acre* L. Plant in a depressed mat, the stems very leafy, creeping, yellowish-green: leaf-blades very thick, ovate, 2–5 mm. long, imbricate: sepals ovate, 2–2.5 mm. long: petals lanceolate, 5–6.5 mm. long: follicles broad, 4–5 mm. long or rarely shorter, short-beaked.—(MOSSY-STONECROP. GOLD-MOSS.

WALL-PEPPER.)—Rocks, walls, and stony roadsides, various provinces N of Coastal Plain, N. C. to Colo., Ont., and N. S. Nat. of Eu.—Sum.—Another yellow-flowered stonecrop—*Sedum mexicanum* Britton—is often cultivated and occasionally escapes from gardens.

5. **DIAMORPHA** Nutt. Annual or biennial slender herbs. Leaves alternate: blades nearly terete. Flowers borne in corymbose cymes. Sepals 4 or 5, about as wide as long. Petals 4 or 5, pink or purple, not contracted below the middle. Stamens free. Carpels 4 or 5, united to below the middle, wide-spreading in age.—Following are the only known species.—Spr.—ELF-ORPINES.

Petals elliptic, about twice as long as wide: carpel long-tipped.  
Petals ovate, slightly longer than wide: carpel short-tipped.

1. *D. cymosa*.  
2. *D. Smallii*.

1. ***D. cymosa*** (Nutt.) Britton. Plant reddish, 2–10 cm. tall: leaves 2–5 mm. long; blades obtuse: sepals deltoid, about 1 mm. long: petals elliptic, 3–3.5 mm. long: carpels lanceolate. [*D. pusilla* Nutt.]—Rocks, chiefly granite, Piedmont to Appalachian provinces, Ga. to Ala., Tenn., and N. C.—Flat granite exposures are the favorite habitats of this plant. When in flower, the unusual abundance of the plants forms large pink areas.

2. ***D. Smallii*** Britton. Plant similar to that of *D. cymosa* but more slender: sepals about 0.5 mm. long: petals ovate, 2–2.5 mm. long: carpels ovoid.—Rocks, Falls of the Yadkin River, at the juncture of the Piedmont and Coastal Plain, N. C.—*Sedum pusillum* often occurs intimately associated with these plants, especially when the growth is abundant. The plants of the two genera are sharply differentiated by their respective colors.

6. **KALANCHOE** Adans. Perennial tufted succulent herbs, or plants sometimes woody at the base. Leaves opposite: blades simple, usually toothed. Flowers perfect, borne in corymbose cymes. Calyx 4-lobed, the tube very short. Corolla much exserted, salverform, the tube usually exceeding the calyx, the 4 lobes spreading. Stamens with united filaments. Follicles 4, erect. Capsule somewhat swollen.—About 20 species, African and Asiatic.

1. ***K. crenata*** Haw. Plant often tufted, mostly 3–7 dm. tall: leaf-blades obovate, oval, ovate, or elliptic, 5–12 cm. long, crenate, those of the lower ones narrowed at the bases: cymes corymbose: flowers pedicelled: calyx-lobes lanceolate, 4–5 mm. long, acuminate, minutely glandular-ciliate: corolla yellow: lobes obovate, oval or ovate, 6–8 mm. long, longer than the tube, caudate-tipped: capsule conic or conic-ovoid, 6–8 mm. long.—Hammocks, waste-places, and roadsides, S pen. Fla. and the Keys. Nat. of Africa.—(W. I., Mex., C. A., S. A.)—All year.

**7. BRYOPHYLLUM** Salisb. Perennial coarse gregarious herbs. Leaves opposite: blades simple or pinnately compound. Flowers perfect, borne in simple or compound cymes. Calyx 4-lobed. Corolla exserted, 4-lobed. Follicles 4.—Four known species, of Asia and Africa.

1. **B. pinnatum** (Lam.) S. Kurz. Plant 4–15 dm. tall, glaucous: leaves 1–3 dm. long; blades of the leaflets elliptic, crenate: panicles 1–4 dm. long: calyx becoming 3–3.5 cm. long: corolla lobes narrowly ovate.—(LIFE-PLANT. LIVE-LEAF. SHADOW-WITCH.)—Hammocks and waste places, S Fla. Nat. of trop. Asia.—(*W. I., Mex., C. A., S. A.*)—All year.—Frequently grown in tropical gardens. Well known for its tenacity of life. The corolla is greenish with dark-red streaks.

### FAMILY 3. PENTHORACEAE—DITCH-STONECROP FAMILY

Caulescent plants. Leaves alternate: blades toothed. Flowers perfect, borne in terminal cymes. Calyx of 5 or 6 sepals. Corolla of 5 or 6, inconspicuous veinless petals, or wanting. Androeceium of twice as many stamens as sepals. Gynoeceium of 5 or 6 carpels united to the abruptly contracted middle. Fruit depressed, the follicle bodies circumscissile near the base of the free portion.—One genus and one species.

1. **PENTHORUM** [Gronov.] L. Perennial herbs with rootstocks. Flowers greenish-white or yellowish, borne along one side of the cyme-branches. Styles incurved during anthesis, recurved at maturity. Follicles stout, ascending.

1. **P. sedoides** L. Plant 1–6 dm. tall, bright-green, the stem above, and branches angled: leaf-blades narrowly elliptic to elliptic-lanceolate or lanceolate, 3–15 cm. long, finely serrate: cyme-branches spreading: flowers contiguous: sepals ovate, about 1.5 mm. long, acute: capsule depressed, 4–5 mm. broad, each lobe tipped with the recurved style. — (DITCH-STONECROP.) — Meadows, swamps, and low grounds, various provinces, Fla. to Tex., Minn., and N. B.—Sum.

### FAMILY 4. PARNASSIACEAE—GRASS-OF-PARNASSUS FAMILY

Acaulescent herbs, with glabrous foliage. Leaves basal: blades leathery, entire: petioles usually elongate, erect, dilated at the base. Scapes simple, each bearing a bract. Flowers perfect, white or pale-yellow, solitary. Calyx persistent: sepals 5, imbricate. Corolla of 5 variously shaped imbricate, entire or fimbriate, white, often conspicuously nerved, deciduous petals. Androeceium of 5 hypogynous or perigynous stamens alternating with entire or tufted staminodia. Gynoeceium of 3 or 4 united carpels.

Ovary 1-celled, superior or half-inferior, with 3 or 4 parietal placentae. Styles very short. Stigmas 3 or 4, over the placentae. Fruit a 1-celled loculicidal capsule, 3-4-valved at the apex. Seeds numerous, winged, the testa loose.—Represented by the following genus:

1. **PARNASSIA** L. Perennial herbs with basal or nearly basal leaves. Flower terminating the scape.—About 15 species, natives of the north temperate and arctic regions.—Sum.—fall.—GRASSES-OF-PARNASSUS. BOG-STARS.

Petals clawless: leaf-blades ovate, elliptic, or orbicular.

Anthers acute: petals slightly 5-7-veined.

Anthers obtuse: petals strongly many-veined.

Petals clawed: leaf-blades reniform or orbicular-reniform.

1. *P. grandifolia*.

2. *P. caroliniana*.

3. *P. asarifolia*.

1. *P. grandifolia* DC. Plant 3-6 dm. tall: leaf-blades oval or ovate, usually subcordate, 3-10 cm. long: sepals oval to elliptic, 4-5 mm. long: petals elliptic to oval, 15-20 mm. long: anthers 4-5 mm. long: capsule about 1.5 cm. long.—(UNDINE)  
—Wet soil, various provinces, Fla. to Tex., Mo., and Va.

2. *P. caroliniana* Michx. Plant 2-4 dm. tall: leaf-blades ovate, 2-5 cm. long, cordate: sepals linear-elliptic, 5-6 mm. long: petals broadly oval, 15-17 mm. long: anthers 2-3 mm. long: capsule oval or ovoid-oval, 1-1.5 cm. long.—Swamps and flat woods, Coastal Plain, Fla. to N. C.—Fall.

3. *P. asarifolia* Vent. Plant 2-4 dm. tall: leaf-blades 4-10 cm. wide: sepals ovate or elliptic, 4-5 mm. long: petals 15-21 mm. long: blades ovate to suborbicular: capsule ovoid, 6-11 mm. long.—(BROOK-PARNASSIA).—Wet woods and stony brooks, often in acid soil, Blue Ridge to Appalachian provinces and rarely Coastal Plain, Ga. to Ala., W. Va. and Va.

## FAMILY 5. SAXIFRAGACEAE—SAXIFRAGE FAMILY

Herbs. Leaves alternate or sometimes opposite: blades simple or compound. Flowers perfect or polygamo-dioecious. Calyx of 5, or rarely of 4 or more, persistent sepals. Corolla of 5, or rarely of 4 or more, petals, or wanting. Androecium of as many stamens as there are sepals, or twice as many. Gynoecium of fewer carpels than there are sepals. Fruit a capsule, or follicles.—About 90 genera and 650 species of wide geographic distribution.

Leaves with simple blades: flowers perfect.

Leaves with 3-ternate blades: flowers polygamous.

Tribe I. SAXIFRAGACEAE.

Tribe II. ASTILBEAE.

### I. SAXIFRAGACEAE

Placentae parietal, sometimes nearly basal: ovary 1-celled.

Flowers solitary and axillary to leaf-like bracts, or 2-4 in corymbs each with a leaf-like bract.

Sepals, and petals, 5: stamens 10: gynoecium 3-carpellary: annuals.

Sepals, and petals, 4: stamens 4-8: gynoecium 2-carpellary: perennials.

Flowers in elongate racemes or panicles.

Gynoecium of 2, or 3, equal carpels.

Petals pinnately cleft or pinnatifid.

Petals entire or toothed.

Gynoecium of 2 very unequal carpels.

1. *LEPUROPETALON*.

2. *CHRYSO SPLENIUM*.

3. *MITELLA*.

4. *HEUCHERA*.

5. *TIARELLA*.

Placentae axile: ovary 2-celled or rarely 3-celled.

Stamens 5: ovary almost all adnate to the hypanthium.

Stamens 10: ovary basally adnate to the hypanthium.

Corolla regular, the petals essentially similar.

Corolla irregular, the petals of 2 kinds.

6. THEROPHON.

7. MICRANTHES.

8. HYDATICA.

## II. ASTILBEAE

Large herbs with much-branched plume-like panicles.

9. ASTILBE.

1. **LEPUROPETALON** Ell. Annual diminutive terrestrial herbs. Leaf-blades entire. Petals white. Stamens 10. Styles 3.—One species.

1. **L. spatulatum** (Muhl.) Ell. Plant glabrous, in patches 1–15 cm. wide: leaf-blades spatulate, 2–6 mm. long: sepals ovate, about 1 mm. long: petals broad: follicles short-beaked.—Moist clay soil, Coastal Plain extending into adj. provinces, Ga. to Tex. and S. C.—(*Mex.*)—This plant is so small that it may have been overlooked outside of the range given above. The whole plant is inconspicuous, the pale flowers serving but little more to attract the attention than the foliage. The calyx and corolla are curiously irregular in the size of the parts.

2. **CHRYSPLENUM** [Tourn.] L. Perennial (ours) semiaquatic herbs. Leaf-blades crenate or lobed. Petals wanting. Stamens mostly 4–8. Styles 2. Capsule flattened, 2-lobed, very short.—About 15 species, natives of the north temperate zone and S. America.

1. **C. americanum** Schwein. Plants decumbent, 2–20 cm. long: leaf-blades sub-orbicular to orbicular-reniform, 4–20 mm. broad: sepals 4, yellowish or purplish within: capsule about 3 mm. long.—(*GOLDEN-SAXIFRAGE. WATER-CARPET.*)—Brooks and wet shaded places, various provinces, in Coastal Plain only N, Ga. to Sask. and N. S.—Spr.

3. **MITELLA** L. Perennial herbs with lateral flowering branches. Leaf-blades lobed and toothed. Flowers in racemes. Sepals equal. Petals pectinately pinnatifid. Stamens 10: filaments very short. Styles very short. Capsule abruptly narrowed near the apex.—Four species, North American and Asiatic.

1. **M. diphylla** L. Plant 2–4 dm. tall: leaf-blades ovate to orbicular-ovate in outline, 3–5 lobed, 3–8 cm. long, acute, cordate: petals white: sepals ovate, 1–1.5 mm. long, acute: petals 2.5–3 mm. long, white: capsule 2-beaked at the apex, about 3 mm. long.—(*FAIRY-CUP. MITREWORT. BISHOP'S-CAP.*)—Rich woods, various provinces, N. C. to Mo., Minn., and Que.—Spr.

4. **HEUCHERA** L. Perennial herbs with lateral flowering branches. Leaf-blades toothed and usually lobed. Flowers in paniced cymes. Sepals often unequal. Petals entire, erose or toothed. Stamens 5: filaments elongate. Styles slender. Capsule gradually narrowed into the slender elongate beak.—About 70 species, North American.—**ALUMROOTS. ROCK-GERANTUMS. CRAG-JANGLES.**—The hypanthium and calyx are green, pink, or red, and sometimes veined; the petals are usually whitish or yellowish.

Flowers essentially regular, the upper sepals sometimes larger than the lower.

Petals much exceeding the calyx, with long very slender claws and long blades. Leaves, at least the larger ones, with low rounded lobes: panicle-branches filiform or capillary.

Leaves, at least the larger ones, with prominent angled lobes: panicle-branches slender.

Petals shorter than the calyx or slightly longer, with short stout claws and short blades.

Flowers decidedly irregular: calyx oblique or 2-lipped.

#### I. MICRANTHAE

Sepals acute or acutish, ovate, much shorter than the hypanthium during anthesis: petioles villous.

Sepals obtuse, broadly ovate, as long as the hypanthium during anthesis or nearly so: petioles puberulent.

#### II. VILLOSAE

Terminal leaf-lobe elongate: petals, and filaments, thrice as long as the sepals or more.

Terminal leaf-lobe short and wide: petals, and filaments, twice as long as the sepals or less.

#### III. AMERICANAE

Petals as long as the calyx or shorter.

Hypanthium fully 1 mm. long during anthesis, this together with the calyx becoming 4-5 mm. long.

Hypanthium barely 1 mm. long during anthesis, this together with the calyx becoming 3 mm. long.

Petals longer than the calyx, or individually shorter.

Petal-blades narrow, entire: flowering branches leafless.

Petal-blades broad, toothed: flowering branches leafy.

#### IV. HISPIDAE

Flowering branches leafy: free portion of the hypanthium not gibbous.

Sepals of the upper lip about as long as the free portion of the hypanthium, the lateral ones not spreading.

Sepals of the upper lip shorter than the free portion of the hypanthium, the lateral ones spreading.

Flowering branches not leafy: free portion of the hypanthium gibbous below.

Anthers long-exserted: flowers short.

Anthers included or slightly exserted: flowers long.

Lower petals with spatulate blades, longer than the sepals.

Lower petals with orbicular or rhombic-orbicular blades, about as long as the sepals.

1. *H. parviflora* Bartl. Leaf-blades reniform, often broadly so, 5-14 cm. wide, more or less pubescent, often reddish beneath, the teeth broad, mucronate: flowering branch 1.5-6 dm. tall, villous-hirsute; inflorescence branches glandular-hirsute; petals 2-2.5 mm. long, with linear or spatulate blades. [*H. Egelii* Shuttlw.]—Cliffs and rocky places, Blue Ridge, Appalachian provinces, and Interior Low Plateaus, Ga. to Ala., Ill., and Va.—Sum.-fall.—Corolla usually white.

2. *H. puberula* Mackenzie & Bush. Similar to *H. parviflora* in habit and closely related to it: leaf-blades usually smaller and with shorter hairs: flowering branch 0.5-3 dm. tall, puberulent: inflorescence branches

1. *H. parviflora*.

2. *H. puberula*.

3. *H. villosa*.

4. *H. macrorhiza*.

5. *H. americana*.

6. *H. calycosa*.

7. *H. lancipetala*.

8. *H. Curtisii*.

9. *H. pubescens*.

10. *H. aceroides*.

11. *H. hirsuticaulis*.

12. *H. scabra*.

13. *H. longiflora*.

finely glandular-pubescent: petals 3.5–4 mm. long, with linear-spatulate or spatulate blades.—Bluffs, Ozark and Interior Low Plateaus, Tenn. to Mo. and Ky.—Sum.—fall.—Corolla white.

3. *H. villosa* Michx. Leaf-blades 5–12 cm. wide, acutely 7–9 lobed; middle lobe relatively long and narrow; petioles villous or glabrate: flowering branch 2–4 dm. tall: calyx and hypanthium long-hairy: petals 2–2.5 mm. long: panicle at maturity, as well as during anthesis, rather lax and open.—(HAIRY-ALUMROOT. ROCK-SANICLE.)—Cliffs and rocks, Blue Ridge, Interior Low Plateau provinces, Ga. to Ky. and Va.—Sum.—fall.—Corolla pinkish.

4. *H. macrorhiza* Small. Leaf-blades 8–22 cm. wide, shallowly 5–9-lobed; middle lobe very broadly triangular or depressed; petioles densely villous-hirsute: flowering branch 2–8 dm. tall: calyx and hypanthium short-hairy: petals 2.5–3 mm. long: panicle at maturity, as well as during anthesis, rather compact.—(GIANT-ALUMROOT.)—Bluffs and river-banks, Appalachian and Interior Low Plateau provinces, Ala. to Ark. and Ky.—Sum.—fall.—Corolla white.

5. *H. americana* L. Leaf-blades orbicular-ovate or suborbicular, 5–11 cm. wide, the lobes broad and with broad teeth: flowering branch 3–9 dm. tall: sepals much longer than the free portion of the hypanthium: petals about 1.5 mm. long, spatulate, the blades elliptic, finely toothed.—The campestrian plants are commonly copiously hirsute.—(COMMON-ALUMROOT. ROCK-GERANIUM.)—Rocky woods, various provinces, Ga. to La., Minn., Ont., and Conn.—Sum.—Corolla yellowish or pinkish.

6. *H. calycosa* Small. Resembling *H. americana*, but more slender: leaf-blades ovate or orbicular-ovate, 5–10 cm. wide, shallowly lobed, ciliate and pubescent near the margins: flowering branch 2–9 dm. tall: hypanthium turbinate, barely 1 mm. long during anthesis: sepals broadly ovate, rounded at the apex: petals oblong or spatulate-oblong, much surpassed by the sepals, acute or apiculate, entire.—Woods, Appalachian provinces, Ga. and Ala.—Spr.—Corolla pinkish.

7. *H. lancipetala* Rydb. Leaf-blades suborbicular or orbicular-reniform, 4–8 cm. wide, with shallow lobes and broad sharply mucronate teeth, glabrous except the margins and the veins beneath: flowering branch short-hirsute: sepals about as long as the free-portion of the hypanthium: petals white or pink, about 3 mm. long, much exceeding the sepals, the blades oblanceolate to linear-elliptic, acute, entire.—Woods, Interior Low Plateaus, Tenn. and Ky.—Spr.—sum.

8. *H. Curtisii* T. & G. Leaf-blades suborbicular, varying to ovate or reniform, sometimes hispidulous above, and ciliate, the lobes broad and with few coarse broad teeth: flowering branch glabrous below, puberulent above, leafy: petals purple or pinkish, exceeding the sepals, the blades usually rhombic, finely toothed, (individually shorter than the sepals, and flowering branches very leafy in *H. Curtisii crenata*): free portion of the mature hypanthium short.—Rich woods, various provinces N of Coastal Plain, N. C. and Tenn. to N. Y.—Spr.—sum.

9. *H. pubescens* Pursh. Leaf-blades orbicular-ovate, glabrate in age, the lobes often ovate, with usually sharply mucronate teeth: flowering branch densely glandular-puberulent at least above: sepals together with the hypanthium 6–8 mm. long, the lower ones ovate: petals purplish, the larger ones 2.5–3 mm. long, the blades obovate, coarsely toothed: free portion of the mature hypanthium long: stamens exserted.—(MARBLED-ALUMROOT.)—Rocky woods, various provinces N of Coastal Plain, N. C., and Tenn. to Mo. and Pa.—Spr.—sum.

10. *H. aceroides* Rydb. Leaf-blades ovate, about 7-lobed, shining above, puberulent beneath: flowering branch glabrous or glandular-puberulent above, usually leafy: sepals together with the hypanthium 8-10 mm. long, the lower ones oblong: petals pink, the larger ones 3.5-4 mm. long, the blades cuneate, toothed: free portion of the mature hypanthium much longer than in *H. pubescens*.—Hillsides, Blue Ridge, N. C.—Spr.

11. *H. hirsuticaulis* (Wheelock) Rydb. Leaf-blades reniform or suborbicular with broad lobes, hirsute on both sides, except sometimes in age: flowering branch hirsute: hypanthium together with the sepals 5-6 mm. long at maturity: petals spatulate, about 2 mm. long, the upper ones shorter than the sepals: capsule-body short.—Shaded banks, various provinces, La. to Mo. and Mich.—Spr.—Corolla pinkish or yellowish.

12. *H. scabra* Rydb. Leaf-blades ovate, 7-9-lobed, scabrous-puberulent above, hirsute beneath: flowering branch glandular-puberulent, usually leafless: hypanthium green, together with the sepals 9-10 mm. long; lower sepals narrowly oblong: petals pinkish or purplish, the larger ones 4-5 mm. long, the blades spatulate.—Woods, Blue Ridge, N. C.—Sum.

13. *H. longiflora* Rydb. Leaf-blades orbicular-reniform to ovate, glabrous, except the margins and veins beneath, the lobes shallow and rounded: flowering branch glabrous or glandular-pubescent above: hypanthium often reddish: lower sepals elliptic, together with the hypanthium 6-8 mm. long: petals yellowish, or purple-tipped, the larger ones 4-4.5 mm. long, the blades orbicular or rhombic-orbicular.—Hillsides, Appalachian and Interior Low Plateau provinces, Ala. to Ky.—Spr.

*Heuchera hispida* Pursh with a narrow, lax panicle, nearly regular flowers, and exserted anthers was originally described from plants from the mountains of Virginia. It is not definitely known from our range.

5. **TIARELLA** L. Perennial herbs usually with leafy runners. Leaves mostly at the base of the plant, except on the runners. Petals white, with narrow blades. Stamens 10, the filaments elongated. Styles unequal. Follicles unequal, with erect beaks.—About 6 species, North American and Asiatic.—Spr.—FALSE-MITREWORTS. COOLWORTS. FOAM-FLOWERS.

Terminal leaf-lobe ovate, larger than the others: petals long-clawed.

Terminal leaf-lobe triangular, not larger than the others: petals short-clawed.

1. *T. cordifolia*.

2. *T. macrophylla*.

1. *T. cordifolia* L. Leaf-blades mostly 3-7 cm. wide; petioles mostly hirsute: flowering branch scaly: sepals typically oblong: petals about 4 mm. long, the claw over  $\frac{1}{2}$  as long as the acuminate blade: capsule slender-beaked.—Rich woods, various provinces, rarely Coastal Plain, Ga. to Ark., Minn., and N. S.

2. *T. macrophylla* Small. Leaf-blades mostly 12-20 cm. wide; petioles mostly glabrous: flowering branch leafy: sepals typically ovate or oval: petals 2.5-3 mm. long, the claw less than  $\frac{1}{2}$  as long as the acute blade: capsule short-beaked.—Woods, Blue Ridge, N. C.—It is impossible to tell whether this species is starting on its career or if its restricted range is the remnant of a former wider distribution.

6. **THEROPHON** Raf. Perennial herbs without runners. Leaves mainly cauline. Petals white, with broad blades. Stamens 5, the filaments short. Styles equal. Follicles with spreading beaks. [*Boykinia* Nutt.]—About 10 species; North American.

1. *T. aconitifolium* (Nutt.) Millsp. Plants 2–10 dm. tall; leaf-blades 4–18 cm. wide, 5–9-lobed and incised-serrate; sepals triangular-ovate to broadly lanceolate, about 1 mm. long; petals 3–3.5 mm. long; blades oval to orbicular-ovate; capsule 3–4 mm. long. [*B. aconitifolia* Nutt.]—(BROOK-SAXIFRAGE.)—Along streams, Blue Ridge and Appalachian provinces, Ga. to Tenn., W. Va., and Va.—Spr.—sum.

7. **MICRANTHES** Haw. Acaulescent herbs with short caudices. Leaf-blades ovate to flabellate, or rarely cordate at the base. Petals white, nearly equal. Carpels slightly united below. [*Saxifraga* L. in part.]—About 65 species, most abundant in the cooler parts of the Northern Hemisphere.—SAXIFRAGES. DWARF-SAXIFRAGES.

Filaments subulate or filiform-subulate.

Petals wholly white, destitute of yellow spots.

Petals bimaculate, each with 2 yellow spots below the middle.

Petals lanceolate to elliptic-lanceolate; follicles 4–5 mm. long.

Petals elliptic; follicles 2.5–3 mm. long.

Filaments clavate.

Leaf-blades not elongate; petals bimaculate.

Leaf-blades elongate; petals wholly white.

1. *M. virginiensis*.

2. *M. tennesseensis*.

3. *M. Careyana*.

4. *M. caroliniana*.

5. *M. micranthidifolia*.

1. *M. virginiensis* (Michx.) Small. Leaves 2–20 cm. long; blades ovate, oval or elliptic; cymules becoming lax, the axis often elongate; petals elliptic, 4–5.5 mm. long. [*S. virginiensis* Michx.]—(ST. PETER'S-CABBAGE.)—Dry hillsides and rocks, various provinces, Ga. to Ala., Minn., and N. B.—Spr.

2. *M. tennesseensis* Small. Leaves 4–13 cm. long; blades ovate, sometimes suborbicular or elliptic-ovate or occasionally orbicular-reniform; cymules open; petals lanceolate to elliptic-lanceolate, 4–4.5 mm. long.—(GOLDEN-EYE SAXIFRAGE.)—Limestone bluffs, Appalachian Valley, Tenn.—Spr.

3. *M. Careyana* (A. Gray) Small. Leaves 2–11 cm. long; blades ovate to orbicular-ovate or somewhat reniform; cymules lax; petals elliptic, 2.5–3 mm. long; follicles 2.5–3 mm. long. [*S. Careyana* A. Gray.]—Cliffs, Blue Ridge, N. C. and Tenn.—Spr.

4. *M. caroliniana* (A. Gray) Small. Leaves 5–19 cm. long; blades oval to orbicular or ovate; panicle wide; petals 3–3.5 mm. long, ovate to elliptic-ovate; follicles 4–6 mm. long. [*S. caroliniana* A. Gray.]—Banks and limestone cliffs, Blue Ridge and Appalachian provinces, N. C. to Va.—Sum.

5. *M. micranthidifolia* (Haw.) Small. Leaves 10–32 cm. long; blades elliptic to oblanceolate: panicles narrow: petals 2.5–3.5 mm. long, elliptic to elliptic-ovate: follicles 7–8 mm. long. [*S. erosa* Pursh.]—(LETTUCE-SAXIFRAGE. MOUNTAIN-LETTUCE).—Brooks, logs, and wet rocks, Blue Ridge and Appalachian provinces, Ga. to Tenn. and Pa.—Spr.-sum.

8. *HYDATICA* Neck. Acaulescent herbs with short or slightly elongate caudices. Leaf-blades broadened upward. Petals mainly white, unequal, the 3 upper ones abruptly narrowed into the claws, the 2 lower ones gradually narrowed. Carpels nearly distinct. [*Spatularia* Haw.]—About 12 species, natives of the cooler parts of the Northern Hemisphere.

1. *H. petiolaris* (Raf.) Small. Plant 2–9 dm. tall or rarely smaller: leaf-blades 3–30 cm. long, oblanceolate to elliptic-spatulate, coarsely dentate-serrate: sepals strongly deflexed at maturity: petals 3.5–5.5 mm. long, the 3 upper with lanceolate blades; the 2 lower ones with yellow or brown spots: follicles 4.5–5 mm. long. [*Saxifraga leucanthemifolia* Michx. *Spatularia Michauxii* (Britton) Small.]—(MOUNTAIN-SAXIFRAGE).—Cliffs and banks, Blue Ridge, Ga. to Tenn. and Va.—Sum.

9. *ASTILBE* Hamilt. Perennial caulescent herbs. Leaflets numerous, the terminal one 3-lobed. Flowers very numerous, in spikes, racemes or panicles. Petals 5, or rarely 4, long and narrow, white, or wanting. Follicles erect.—About 7 species, North American and Asiatic.—FALSE GOAT'S-BEARDS. FEATHER-TREES.

Leaflets sharply toothed or lobed: fruit 4–5 mm. high.

Leaflets crenately toothed or lobed: fruit 3 mm. high.

1. *A. biternata*.

2. *A. crenatilobata*.

1. *A. biternata* (Vent.) Britton. Plants 1–2 m. tall: leaflet-blades sharply serrate or incised: panicle 1–3 dm. long; petals linear-spatulate, 2.5–4 mm. long, or obsolete in perfect flowers: fruit conic, the follicles 4–5 mm. long. [*A. dodecandra* Don.]—Woods, Blue Ridge, extending into adj. provinces, Ga. to Tenn. and Va.—Spr.—Resembles *Aruncus* in habit, but more graceful.

2. *A. crenatiloba* (Britton) Small. Plants rather smaller than those of *A. biternata*: leaflet-blades crenate, the teeth mucronate-tipped: fruit ovoid, the follicles 3 mm. long.—Woods, Roan Mt. region, Blue Ridge, N. C. and Tenn.—Sum.—Interesting, not only in being two of our very large herbs, but also, as in the case of *Tiarella*, a pair of species, the one widely distributed; the other very local.

## FAMILY 6. HYDRANGEACEAE—HYDRANGEA FAMILY

Shrubs or trees, or vines. Leaves mostly opposite: blades often toothed. Flowers borne in raceme-like, corymb-like, or paniced cymes.

Calyx of usually 4–10 sepals, surmounting the often ribbed hypanthium. Corolla of mostly 4–10 petals. Androecium of 8–many stamens. Gynoecium of 2–5, or rarely of 10, united carpels. Ovary wholly or partially inferior. Fruit capsular.—About 16 genera and 80 species, natives of temperate and tropical regions.

Sepals, and petals, 5 or fewer: styles and stigmas mostly distinct: stigmas when united elongate.

Stamens 8–10: corolla relatively small; petals valvate.

1. HYDRANGEA.

Stamens 12–20, or more: corolla large; petals convolute.

2. PHILADELPHUS.

Sepals, and petals, 7 or more: styles united: stigma depressed.

3. DECUMARIA.

1. **HYDRANGEA** [Gronov.] L. Shrubs. Leaf-blades toothed or lobed. Sepals 4 or 5, minute, or petal-like in the marginal flowers. Petals valvate, small, white or greenish. Stamens 8–10. Styles wanting. Capsule opening between the stigmas.—About 35 species, American and Asiatic.—Spr.-sum.—HYDRANGEAS. SEVENBARKS.—Several species are grown as ornamental shrubs. They are hardy northward of their natural range.

Leaf-blades merely toothed: inflorescence corymbose; sterile flowers around the edge.

I. RADIATEAE.

Leaf-blades deeply lobed: inflorescence paniculate, sterile flowers throughout the panicle.

II. QUERCIFOLIAE.

#### I. RADIATEAE

Leaf-blades glabrous or inconspicuously pubescent beneath: hypanthium mostly wider than high.

1. *H. arborescens*.

Leaf-blades conspicuously and copiously pubescent beneath: hypanthium mostly higher than wide.

Leaf-blades membranous, light-gray beneath.

2. *H. cinerea*.

Leaf-blades leathery, bright-white beneath.

3. *H. radiata*.

#### II. QUERCIFOLIAE

Spreading or sprawling shrub, with large panicles.

4. *H. quercifolia*.

1. ***H. arborescens*** L. Shrub with sparingly pubescent branches and twigs: leaf-blades thin, ovate, oval or elliptic: petals 1–1.5 mm. long: capsule-body 2–2.5 mm. long, broader than high.—(MOUNTAIN HYDRANGEA. SMOOTH-HYDRANGEA. SEVEN-BARK.)—Woods and stream-banks, various provinces, Fla. to La., and N. Y.

2. ***H. cinerea*** Small. Shrub with copiously or densely pubescent twigs: hypanthium about 2 mm. wide at maturity: petals 1.5–2 mm. long: capsule-body usually higher than broad.—(ASHY-HYDRANGEA.)—Woods, Blue Ridge and Appalachian provinces, Ga. to Ala., Tenn., and N. C.

3. ***H. radiata*** Walt. Shrub with finely pubescent twigs: hypanthium about 2.5 mm. wide at maturity: ray-flowers few: petals 1–1.5 mm. long: capsule often smaller than that of *H. cinerea*.—(SNOWY-HYDRANGEA. SILVER-LEAF.)—Rocky slopes, Blue Ridge and Piedmont, S. C. and N. C.

4. ***H. quercifolia*** Bartr. Shrub with densely reddish-tomentose twigs which are usually also arachnoid: hypanthium 3–3.5 mm. wide at maturity: ray-flowers numerous, becoming purple: petals 1.5–2 mm. long: capsule-body about 3 mm. high.—(GRAY-BEARD. OLD-MAN'S BEARD. SEVEN-BARK. OAK-LEAF HYDRANGEA.)—River-banks, bluffs and woods, Coastal Plain, extending into adj. provinces, N Fla. to Miss., Tenn., and Ga.

2. **PHILADELPHUS**: L. Shrubs. Leaves deciduous: blades entire or toothed. Sepals 4 or 5, prominent. Petals convolute, relatively large, white or pinkish. Stamens numerous, or very rarely 15. Styles present. Capsule loculicidal.—About 50 species, North American and Eurasian.—**SYRINGAS**. **MOCK-ORANGES**.—Some species are much grown for their abundance of white flowers.

Stigmas and upper part of styles distinct.

Flowers few together, not more than 5: bark of last year's shoots brown, exfoliating. I. **GRANDIFLORI**.

Flowers racemose, numerous: bark of last year's shoots gray or ochre-colored, not exfoliating.

II. **CORONARI**.

Stigmas and styles united.

III. **HIRSUTI**.

#### I. **GRANDIFLORI**

Pedice and hypanthium glabrous.

Base of the mature hypanthium attenuate to the pedicel, the point of union obscure.

Leaf-blades ovate or oval, entire or with minute distant teeth: sepals acute.

Leaf-blades ovate-lanceolate to elliptic, sharply and remotely toothed: sepals acuminate.

Base of the mature hypanthium abruptly contracted, it and the pedicel sharply differentiated.

Pedice and hypanthium, and outer surface of the sepals pubescent.

1. *P. inodorus*.

2. *P. grandiflorus*.

3. *P. gloriosus*.

4. *P. floridus*.

#### II. **CORONARI**

Leaf-blades pubescent on the lower surface: hypanthium and calyx pubescent.

Leaf-blades glabrous or nearly so: hypanthium and calyx glabrous without.

5. *P. latifolius*.

6. *P. intectus*.

#### III. **HIRSUTI**

Shrub with erect or spreading branches: twigs brownish, more or less pubescent.

7. *P. hirsutus*.

1. **P. inodorus** L. Shrub 2-3 m. high, the bark of the shoots brown, exfoliating: leaf-blades ovate, broadly ovate or oval, acute at the apex, rounded or slightly narrowed at the base, 3-10 cm. long, glabrate or with short appressed hairs either scattered or more copious especially on the lower surface, (thickly covered with stiff appressed hairs on the lower surface, and frequently on the sepals, in *P. inodorus strigosus*), prominently 3-veined, entire or with minute distant teeth: sepals acute: corolla 3-4 cm. wide.—Banks of streams and moist woods, various provinces, Ala. to Miss., Tenn., and N. C.

2. **P. grandiflorus** Willd. Shrub 2-3 m. tall, the bark of the shoots brown, exfoliating: leaf-blades ovate-lanceolate or elliptic, acuminate, sharply dentate, either rounded or narrowed at the base, 4-12 cm. long, glabrate or with short appressed pubescence. 3-veined: sepals acuminate: corolla 4-5 cm. wide: capsule attenuate to the pedicel.—Banks of streams and moist rocky slopes, Blue Ridge and Piedmont extending into Coastal Plain along river bluffs, Fla. to Tenn. and Va.—*P. laxus* Schrad., similar to the last, but with much narrower leaf-blades more densely appressed pubescent on the lower surface, and smaller and usually solitary flowers, is unknown to the writer in a wild state, although apparently of eastern American origin.

<sup>1</sup> Contributed by Chauncey Delos Beadle.

3. *P. gloriosus* Beadle. Shrub 2-3' m. high, the bark of the previous season's growth dark brown, exfoliating: leaf-blades ovate or elliptic, acute at the apex, either rounded or narrowed at the base, 4-10 cm. long, glabrate or with short appressed hairs, remotely dentate, 3-veined: hypanthium and sepals glabrous: corolla 3-4 cm. broad: stigmas distinct: capsule abruptly contracted at the base.—Rocky banks of the Coosa River in the Appalachian Valley, Ga.

4. *P. floridus* Beadle. Shrub 2-3 m. high, the bark of last year's shoots dark brown, exfoliating: leaf-blades oval or elliptic, acute, remotely toothed, either rounded or narrowed at the base, 4-10 cm. long, sparsely pubescent on the lower surface, glabrate above, prominently 3-veined: pedicels, hypanthium, and exterior surface of the acuminate sepals appressed pubescent: corolla 3-4 cm. broad: stigmas not united.—Rocky slopes and banks of streams, Floyd Co. in the Appalachian Valley, Ga.

5. *P. latifolius* Schrad. Shrub 2-3 m. high, the bark of the shoots gray or yellowish, not exfoliating: leaf-blades broadly ovate or elliptic, acute at the apex, rounded or contracted at the base, 3-10 cm. long, mostly dentate, softly and densely pubescent on the lower surface, glabrate or glabrous above, 3-4-nerved: flowers racemose, the lower pair axillary: pedicels, hypanthium, and exterior of the sepals pubescent: corolla 3-4 cm. wide: stigmas not united.—Rocky banks of streams, Interior Low Plateaus, Tenn.—*P. pubescens* Loisel., resembling the last but with brown bark and more numerous flowers, the lower two or three pairs of which are axillary, is unknown in a wild state.

6. *P. intectus* Beadle. Shrub 2-3 m. tall, the bark of the shoots gray or ochre-color, not exfoliating: leaf-blades ovate, oval or elliptic, acute or acuminate at the apex, either rounded or narrowed at the base, 3-12 cm. long, glabrous or glabrate on both surfaces, prominently 3-nerved either entire or prominently 3-nerved: flowers solitary or in twos and threes; pedicels, hypanthium, and exterior of the sepals glabrous: corolla 3-4 cm. wide: stigmas distinct.—Bluffs of the Cumberland River, Interior Low Plateaus, Tenn.

7. *P. hirsutus* Nutt. Shrub 1-2.5 m. tall, the bark of the previous season's growth brown, exfoliating: leaf-blades ovate or ovate-acuminate, either rounded or narrowed at the base, gray-pubescent on the lower surface, appressed-pubescent or eventually glabrate or glabrous above, 3-8 cm. long, dentate, prominently 3-nerved: flowers solitary or in twos and threes; pedicels, hypanthium, and sepals pubescent: corolla 2-3 cm. wide: stigmas united.—Rocky slopes and banks of streams, various provinces N of Coastal Plain, Ga. to Ala., Tenn., and N. C.

3. **DECUMARIA** L. Woody vines. Leaves opposite, deciduous: blades entire or sparingly toothed. Flowers numerous in corymbose panicles, small. Sepals 7-10, minute. Petals narrow, valvate. Stamens 20-30. Styles united. Capsule opening between the ribs.—One species.

1. *D. barbara* L. Stem with aerial rootlets: leaf-blades tender, ovate, oval or suborbicular or rarely obovate, 5-10 cm. long, toothed: hypanthium with a prominent border: flowers fragrant: petals white, elliptic to linear-elliptic, 3-4 mm. long: capsule-body 4-5 mm. long, with a capitate beak.—(WOOD-VAMP. COWITCH-VINE. CLIMBING-HYDRANGEA.)—River-banks and low woods, Coastal Plain and adj. provinces, Fla. to La., Tenn., and Va.—Spr.

FAMILY 7. **ITEACEAE**—VIRGINIA-WILLOW FAMILY

Shrubs or trees. Leaves alternate: blades toothed. Flowers perfect, borne in racemes or panicles. Calyx of 5 sepals. Corolla of 5 narrow petals. Androecium of 5 stamens. Gynoecium of 2 united carpels. Fruit an elongate, 2-grooved, septicidal capsule. Seeds flattened. One genus.

1. **ITEA** [Gronov.] L. Shrubs with estipulate leaves. Racemes narrow. Hypanthium flattish, not accrescent.—About 5 species, the following and the others in Asia.

1. **I. virginica** L. Shrub 1-3 m. tall, twigs and racemes pubescent: leaf-blades elliptic to oval or obovate, 5-14 cm. long, bristly serrate: sepals lanceolate, 1-1.5 mm. long: petals linear to linear-lanceolate, 4 mm. long, white: filaments pubescent: capsule 6-8 mm. long.—(VIRGINIA-WILLOW. SWEET-SPIRES. TASSEL-WHITE.) — Swamps and stream-banks, Coastal Plain and adj. provinces, Fla. to La., Mo., and N. J.—Spr.—This shrub often grows intermixed with other shrubs which produce an abundance of racemes of white or pale-pink flowers.

FAMILY 8. **HAMAMELIDACEAE**—WITCH-HAZEL FAMILY

Shrubs or trees. Leaves alternate: blades mostly toothed. Flowers perfect, monoecious, or polygamous, variously clustered or spicate. Calyx of 4 or 5 sepals. Corolla of 4 or 5 narrow petals, or wanting. Androecium of 4-many stamens. Gynoecium 2- or 3-carpellary. Ovary 2- or 3-celled: styles distinct. Fruit a leathery or woody capsule, often elastically dehiscent.—About 13 genera and 40 species, widely distributed.

Petals 4, ribbon-shaped: stamens 4: filaments short.  
 Petals wanting: stamens about 24: filaments elongate.

1. **HAMAMELIS**.  
 2. **FOTHERGILLA**.

1. **HAMAMELIS** L. Shrubs or trees with perfect or polygamous flowers, which are borne 3 together on short lateral peduncles. Sepals spreading or reflexed. Petals linear or nearly so. Stamens 4; filaments short-subulate. Capsule abruptly beaked.—About 5 species, North American and Asiatic.

1. **H. virginiana** L. Small tree or shrub: leaf-blades suborbicular, oval-elliptic or obovate, 4-15 cm. long, coarsely crenate: petals yellow, 1-2 cm. long: capsule ovoid to subglobose, 12-15 mm. long, elastically dehiscent. — (SNAPPY-HAZEL. WINTER-BLOOM. WITCH-HAZEL.)—Low woods and moist hillsides, various provinces, N Fla. to Tex., Ont., and N. S.—Fall.—The bark is used medicinally. A small-leaved form occurs on the coast of S. C.

**2. FOTHERGILLA** Murr. Shrubs with monoecious flowers, which are borne in dense terminal ament-like yellow spikes. Sepals erect. Stamens numerous, long-clavate. Capsule gradually beaked. Three species.—Spr.—WITCH-ALDERS. BUTTON-HAZELS. BUTTON-ALDERS.

Flowers appearing with the leaves: leaf-blades glabrate above: filaments mostly over 11 mm. long: capsules 11–13 mm. long. 1. *F. major*.  
Flowers appearing before the leaves: leaf-blades stellate-pubescent above: filaments and capsules less than 11 mm. long.  
Leaf-blades cuneate or rounded at the base, much longer than broad, toothed only near the apex. 2. *F. Gardeni*.  
Leaf-blades cordate at the base, about as broad as long, toothed from below the middle to the apex. 3. *F. parvifolia*.

1. **F. major** Lodd. Shrub mostly 1 m. tall or more: leaf-blades suborbicular to ovate, obovate to oval, 6–12 cm. long, coarsely repand-toothed or nearly entire: capsule 10–13 mm. long.—Rich moist woods, Blue Ridge and Appalachian provinces, Ala. to S. C. and N. C.

2. **F. Gardeni** Murr. Isolated shrub usually less than 1 m. tall, branched: leaf-blades elliptic to elliptic-ovate or ovate-orbicular below, repand or coarsely toothed near the apex: capsule 8–10 mm. long. [*F. alnifolia* L.f.]—(DWARF-WITCH-ALDER.)—Sandy swamps, Coastal Plain, Ga. to Ala. and Va.

3. **F. parvifolia** Kearney. Gregarious shrub 3–6 dm. tall, with underground stems: leaf-blades suborbicular to oval, or broadly ovate, 2–6 cm. long, coarsely toothed mostly from below the middle to the apex: capsule 6–8 mm. long.—Pinelands, Coastal Plain, Fla. to N. C.

## FAMILY 9. ALTINGIACEAE—SWEET-GUM FAMILY

Shrubs or trees. Leaves alternate: blades toothed or palmately lobed. Flowers usually monoecious, borne in heads. Calyx and corolla wanting. Androecium of numerous stamens interspersed in scales. Gynoecium of 2 partially united carpels. Stigmas introrse. Fruit a head of many con- creted capsules.—Five genera and about 10 species.

1. **LIQUIDAMBAR** L. Trees with balsamic sap and corky-winged branches. Leaf-blades palmately lobed. Staminate flowers in racemes or panicle green heads. Pistillate flowers in solitary heads. Fruiting head pendulous. Fertile seeds small, numerous, winged at one end.—One species.

1. **L. styraciflua** L. Tree becoming 45 m. tall: leaf-blades 5-lobed, the lobes triangular or lanceolate: fruiting heads 3–4 cm. in diameter, persistent: fertile seeds about 1 cm. long.—(SWEET-GUM. RED-GUM. BILSTED. STAR-LEAVED GUM. ALLIGATOR-TREE.)—Moderately rich soil, Coastal Plain and adj. provinces, C. Fla. to Tex., Mo., and Conn.—(Mex.)—The foliage is brilliant in fall. The wood is used for cabinet-work, interior

finish of houses, for boxes and utensils. The leaf-blades are sometimes 7-lobed.

# FAMILY 10. GROSSULARIACEAE—GOOSEBERRY FAMILY

Shrubs, often spiny. Leaves alternate: blades usually palmately lobed or cleft. Flowers borne in racemes, which are sometimes reduced to few flowers, or to a single flower. Calyx of 5 sepals borne on the hypanthium. Corolla of 5 relatively small petals. Androecium of 5 stamens. Gynoecium of 2 partially united carpels: ovary with 2 parietal placentae: styles more or less united. Fruit a many-seeded berry.—Three genera and about 130 species, widely distributed.

Flower-stalk jointed beneath the ovary: berry disarticulating from the pedicel.

1. *RIBES*.

Flower-stalk not jointed beneath the ovary: berry not disarticulating from the pedicel.

2. *GROSSULARIA*.

1. *RIBES* L. Shrubs with erect stems and branches, without nodal spines. Leaf-blades palmately veined and lobed. Flowers solitary or few together, borne on stalks which are jointed beneath the ovary. Berry disarticulating from the stalk.—About 65 species, natives of the north temperate zone, Mexico, and South America.—CURRANTS.

1. *R. glandulosum* Grauer. Decumbent diffuse shrub: leaf-blades with angular lobes: racemes with remote flowers and minute ovate bracts: hypanthium short, less than 3 mm. long: sepals rhombic-obovate, 2.5–3 mm. long: petals greenish or reddish, cuneate, about 1 mm. long: berry red, 5–8 mm. in diameter. [*R. prostratum* L'Her.] — (FETID - CURRANT. SKUNK - CURRANT. MOUNTAIN-CURRANT.)—Deep woods, Blue Ridge and more N provinces, N. C. to Colo., Sask., Mich., and Lab.

*R. resinsum* Pursh, described in the first edition of Flora of the South-eastern United States, from specimens supposed to have been collected in the mountains of North Carolina by Fraser, seems to be *Ribes orientale* Desf. of Asia.

2. *GROSSULARIA* Mill. Shrubs with irregular arching or recurved stems and branches, and with nodal spines. Leaf-blades palmately veined. Flowers in drooping racemes or panicles, borne on stalks which are jointed near the base. Petals white or greenish-white. Berry not disarticulating from the stalk.—About 60 species, natives of the north temperate zone.—Spr.—The fruits are sometimes used for preserves.—GOOSEBERRIES.

Sepals longer than the free part of the hypanthium: stamens exserted.

Berry smooth and glabrous: petals not tubular.

I. ROTUNDIFOLIAE.

Berry echinate, the spines gland-tipped: petals tubular.

II. ECHINELLAE.

Sepals shorter than the free part of the hypanthium: stamens included.

III. CYNOSBATI.

## I. ROTUNDIFOLIAE

Filaments pubescent: hypanthium glandular.

Filaments glabrous: hypanthium glandless.

1. *G. curvata*.

Free part of the hypanthium and calyx 5-6 mm. long:  
petals flabellate-cuneate, 1.5-2 mm. long.  
Free part of the hypanthium and calyx 9-10 mm. long:  
petals cuneate-spatulate, 2-2.5 mm. long.

2. *G. rotundifolia*.

3. *G. missouriensis*.

## II. ECHINELLAE

A diffuse shrub with glabrous or nearly glabrous twigs: free part of the hypanthium shorter than the sepals: stamens long-exserted.

4. *G. Echinella*.

## III. CYNOSBATI

A rigid shrub with closely pubescent twigs: free part of hypanthium longer than the sepals: stamens not long-exserted.

5. *G. Cynosbati*.

1. *G. curvata* (Small) Coville & Britton. Diffusely branched shrub, 5-8 dm. tall, armed with slender red spines, the branches purplish, shining, recurved or drooping: leaf-blade 1-2 cm. broad, 3-lobed, the lobes few-toothed: hypanthium glandular: sepals linear or linear-spatulate, 6-10 mm. long, white, reflexed and recurved: petals prominently toothed near the apex, 1.5-2 mm. long: stamens conspicuous, erect: filaments villous: berry globular, 6-8 mm. in diameter. [*Ribes curvatum* Small.] — (GRANITE-GOOSEBERRY.) — Rocky woods and slopes, Piedmont, Ala. and Ga.

2. *G. rotundifolia* (Michx.) Coville & Britton. Straggling shrub, armed with slender reddish spines, the branches reddish or brownish: leaf-blades 2-5 cm. in diameter, glabrate or finely pubescent, especially on the veins beneath, 3-5-lobed, the lobes toothed: hypanthium glabrous: sepals linear or linear-spatulate, 4-5 mm. long, obtuse: petals flabellate-cuneate, 1.5-2 mm. long, undulate, at length crisped: filaments glabrous: anthers less than 1 mm. long: berry globular, 8-10 mm. in diameter, reddish-purple. [*Ribes rotundifolium* Michx.]. — (MOUNTAIN-GOOSEBERRY.) — Rocky woods, Piedmont and Blue Ridge, rarely extending into Coastal Plain, N. C. to N. Y. and Mass.

3. *G. missouriensis* (Nutt.) Coville & Britton. Spreading shrub, armed with stout reddish spines, the branches gray or buff: leaf-blades 2-6 cm. in diameter, more or less pubescent, especially when young, prominently 3-5-lobed; hypanthium glabrous: sepals narrowly elliptic or elliptic-spatulate or narrower, 7-8 mm. long: petals cuneate-spatulate, 2-2.5 mm. long: filaments glabrous: anthers over 1 mm. long: berry globular, 9-15 mm. in diameter, purple or brown. [*R. gracile* Pursh not Michx.]. — (MISSOURI-GOOSEBERRY.) — Thickets and river-banks, Interior Low Plateaus and Central Lowlands, Tenn. to Kans., S. D., and Mass.

4. *G. Echinella* Coville. Diffuse shrub with pale-gray branches armed with stoutish purple-brown spines: leaf-blades 1-2.5 cm. in diameter, 3-lobed, with the lobes incised and toothed, sparingly pubescent, slender-petioled: lower part of the hypanthium closely covered with gland-tipped hairs; free part campanulate, 3-5.4 cm. long, pubescent: sepals linear or nearly so, about 5 mm. long, recurved: petals erect, about 3 mm. long, convolutely-folded and thus tubular, with the truncate top rolled back: filaments glabrous; anthers less than 2 mm. long: style glabrous: berry globular or oval, green, echinate, 1-1.5 cm. in diameter, closely beset with gland-tipped spines. — (FLORIDA-GOOSEBERRY.) — Rich woods, along Lake Miccosukee, Fla. — The leaves unfold in the fall.

5. *G. Cynosbati* L. Straggling shrub, with spine-armed and often prickly stems, the twigs closely pubescent: leaf-blades 3-5 cm. in diameter, pubescent

when young, mostly glabrate in age, 3-5-lobed, the lobes rounded or the terminal one acute, all crenate; hypanthium glabrous but more or less spiny: sepals elliptic, obtuse: petals 1-1.5 mm. long, broadly cuneate or somewhat truncate, reniform: filaments subulate, as long as the anthers or about  $\frac{1}{2}$  as long: berry globular, about 1-1.5 cm. in diameter, armed with stout prickles. [*Ribes Cynosbati* L. *R. gracile* Michx.]—(DOGBERRY. PASTURE-GOOSEBERRY. PRICKLY-GOOSEBERRY.)—Rocky woods and hillsides, various provinces, N of Coastal Plain, Ala. to Mo., Man., N. B., and N. C.

#### FAMILY 11. PLATANACEAE—PLANE-TREE FAMILY

Trees, with exfoliating bark. Leaves alternate: blades membranous-leathery, palmately lobed. Flowers monoecious, minute, borne on globose receptacles, in dense pedunculate pendent solitary, spicate, or racemose heads. Perianth obsolete. Staminate heads red: filaments nearly obsolete: anthers elongate, each surmounted by a dilated connective. Pistillate heads green: carpels 2-9, 1-celled, mingled with staminodia which are pilose at the apex, surrounded by long-jointed persistent hairs: style terminal, stigmatose to below the middle on the ventral suture. Fruit an elongate achene, surrounded by rigid hairs, with a thin leathery pericarp, crowded in dense globose heads.—Comprises the following genus:

1. **PLATANUS** [Tourn.] L. Trees, with smooth bark and stout irregular branches from which are suspended the usually numerous long-peduncled fruit-heads.—About 8 species in the north temperate zone.—PLANE-TREES.

1. **P. occidentalis** L. Tree with a maximum trunk diameter of over 4 m., becoming 50 m. tall: leaves numerous; blades angularly 3-5-lobed, permanently woolly on the veins beneath, mostly truncate at least at the base, the lobes acute: flowers green or purplish: fruiting heads solitary, subglobose, 2-4 cm. in diameter, drooping.—(SYCAMORE. BUTTONWOOD. BUTTONBALL.)—Low grounds, usually near streams, various provinces, N Fla. to Tex., Nebr., and Me.—Spr.—Frequently grown as a shade tree.—Sections of the trunk are used for butcher's blocks. The wood is used for furniture, interior finish, and boxes.

#### FAMILY 12. ROSACEAE—ROSE FAMILY

Herbs, shrubs, trees, or rarely vines. Leaves mostly alternate: blades simple or compound, often stipulate. Flowers perfect or rarely dioecious. Calyx of 5, or rarely 4-9, sepals borne on the edge of the hypanthium, sometimes accompanied by as many bractlets. Corolla of as many distinct petals as there are sepals, or wanting. Androecium of 1 or more series of stamens. Gynoecium of 1-many carpels. Ovary 1-celled or imperfectly 2-celled. Fruit mostly follicles or drupelets, or achenes which are borne in the hypanthium or on the accrescent receptacle.—About 75 genera and 1300 species, of wide geographic distribution.

Fruit consisting of 1-5 dehiscent follicles.

Carpels as many as the sepals and alternate with them, or fewer: stipules none or deciduous.

Carpels 1-5, if more than one, more or less united below: seeds shining, thick, pyriform, the coat bony: endosperm present.

Tribe I. NEILLIEAE.

Carpels usually 5, distinct: seeds dull, narrow, linear to linear-lanceolate, the coat thin: endosperm wanting.

Tribe II. SPIRAEAE.

Carpels opposite to the sepals: stipules present, persistent.

Tribe III. SORBARIEAE.

Fruit consisting of indehiscent achenes or drupelets.

Carpels not enclosed in a fleshy hypanthium.

Fruits consisting of dry achenes.

Ovules 2, one above the other: achenes more or less flattened, usually 1-seeded, borne in a single whorl.

Tribe IV. ULMARIEAE.

Ovules, and seeds, solitary: achenes usually turgid, if many borne in a spiral.

Seeds inserted at the distal end of the ovary, that is, at the point where the style arises, pendulous, or in genera with basal styles, ascending: radicle superior.

Style articulated to the ovary: hypanthium campanulate to almost flat, neither contracted at the throat nor closely investing the achenes.

Tribe V. POTENTILLEAE.

Style not articulated to the ovary; hypanthium more or less urceolate, contracted at the mouth.

Style nearly basal: inflorescence cymose: hypanthium loosely investing the achenes.

Tribe VI. ALCHEMILLEAE.

Style terminal: inflorescence spicate, racemose, or paniculate: hypanthium closely investing the achenes.

Tribe VII. SANGUISORBEAE.

Seeds inserted at the proximal end of the ovary, that is, perfectly basal: radicle inferior.

Style wholly deciduous.

Tribe VIII. COLUMBIEAE.

Style partly or wholly persistent.

Tribe IX. DRYADEAE.

Fruits of more or less fleshy drupelets: ovules collateral.

Carpels at least as many as the sepals, usually numerous: corolla present at least in the stamiferous flowers, the petals white to purple.

Tribe X. RUBEAE.

Carpels fewer than the sepals: corolla wanting or if present the petals yellow.

Tribe XI. KERRIEAE.

Carpels enclosed in the hypanthium which becomes fleshy in fruit.

Tribe XII. ROSEAE.

#### I. NEILLIEAE

Shrubs with alternate leaves, with toothed and usually lobed blades.

1. OPULASTER.

#### II. SPIRAEAE

Stamens borne on the edge of the hypanthium: flowers perfect: shrubs or undershrubs: leaf-blades simple.

2. SPIRAEAE.

Stamens borne on the inside of the hypanthium: flowers dioecious: tall herbs: leaf-blades twice or thrice compound.

3. ARUNCUS.

#### III. SORBARIEAE

Perennial herbs with rootstocks: leaves with 3-foliolate blades.

4. PORTERANTHUS.

#### IV. ULMARIEAE

Perennial herbs with rootstocks: leaf-blades pinnatifid and incised.

5. FILIPENDULA.

#### V. POTENTILLEAE

Style terminal or nearly so, or lateral.

6. POTENTILLA.

Style terminal or nearly so.

Style lateral.

Herbs, achenes glabrous, borne on the surface of an enlarged receptacle.

- Corolla yellow: receptacle not pulpy.  
 Corolla white or pinkish: receptacle pulpy.  
 Shrubs: achenes pubescent, borne on an inconspicuous receptacle.  
 Low shrub: leaf-blade 3-foliolate: style filiform: corolla white.  
 Tall shrub: leaf-blades pinnate: style clavate: corolla yellow.

Style nearly basal.

7. DUCHESNEA.  
 8. FRAGARIA.  
 9. SIBBALDIOPSIS.  
 10. DASIPHORA.  
 11. DRYMOCALLIS.

#### VI. ALCHEMILLEAE

Small annual herbs: leaf-blades digitately 3-parted and again toothed or lobed.

12. APHANES.

#### VII. SANGUISORBEAE

Hypanthium not prickly: petals wanting: inflorescence compact.

Stamens 2-4, not declined: pistil 1.

Stamens, in staminate flowers, numerous, declined: pistils 2.

Hypanthium with hooked spines: petals present: inflorescence open.

13. SANGUISORBA.  
 14. POTERIUM.  
 15. AGRIMONIA.

#### VIII. COLURIEAE

Perennial herbs with rootstocks: leaves basal: blades lobed or compound: hypanthium mostly obconic: corolla yellow: achenes in the hypanthium.

16. WALDSTEINIA.

#### IX. DRYADEAE

Style conspicuously bent and geniculate above, the upper portion usually hairy, readily deciduous.

Head of achenes sessile: sepals accompanied by bractlets.

Head of achenes stalked: sepals not accompanied by bractlets.

Style neither conspicuously bent nor distinctly geniculate, the upper portion glabrous, persistent.

17. GEUM.  
 18. STYLIPUS.  
 19. SIEVERSIA.

#### X. RUBEAE

Spreading stoloniferous herb, with reniform leaf-blades: flowers of 2 kinds, the essentially staminate flowers petaliferous, the fructiferous flowers apetalous, and with few stamens: drupelets nearly dry.

Erect or diffuse shrubs, with lobed or compound leaf-blades: flowers all petaliferous: drupelets juicy and pulpy.

Styles clavate: stigmas slightly 2-lobed: receptacle flat: leaf-blades digitately veined and lobed: plants unarmed.

Styles filiform, glabrous: stigmas capitate: receptacle convex, hemispheric, or nipple-shaped: leaf-blades mostly compound: plants usually prickly.

20. DALIBARDA.  
 21. RUBACER.  
 22. RUBUS.

#### XI. KERRIEAE

Corolla wanting: calyx corolloid: sepals toothed.

Corolla present: calyx herbaceous: sepals entire.

23. NEVIUSIA.  
 24. KERRIA.

#### XII. ROSEAE

Shrubs with usually bristly or prickly stems: leaf-blades 3-foliolate or pinnate.

25. ROSA.

1. **OPULASTER** Medic. Shrubs. Leaf-blades palmately lobed. Flowers corymbose. Corolla white. Stamens numerous, without staminodia. Carpels 1-5, short-stipitate: styles filiform. Stigmas depressed-capitate. Follicles inflated. [*Physocarpus* Maxim.]—NINEBARKS.—About 12 species, North American and Asiatic.

Follicles glabrous at maturity, ovoid, usually 5 together.

Seed with a long lateral caruncle: follicles usually twice as long as the sepals: leaf-blades of the sterile shoots usually longer than wide.

Seed with a short almost terminal caruncle: follicles not more than half longer than the sepals: leaf-blades of the sterile shoots scarcely longer than wide.

Follicles stellate-pubescent, ellipsoid, usually 3 or 4 together.

Leaf-blades of the sterile shoots ovate in outline, acuminate, sparingly pubescent.

Leaf-blades of the sterile shoots orbicular-ovate in outline, acute, densely stellate-pubescent.

1. *O. opulifolius*.  
 2. *O. australis*.  
 3. *O. alabamensis*.  
 4. *O. stellatus*.

1. *O. opulifolius* (L.) Kuntze. Shrub 1–3 m. tall: leaf-blades 3–8 cm. long, acutely lobed: sepals ovate, 2.5–3.5 mm. long: follicles 8–10 mm. long, acute. [*P. opulifolius* Maxim.]—Rocky soil and river banks, various provinces, Tenn. to Mich., Que., and Va.—Spr.—sum.

2. *O. australis* Rydb. Shrub with glabrous angled branches: leaf-blades broadly ovate, 4–8 cm. long, acute, deeply 3-lobed and doubly toothed, rounded or truncate at the base: follicles usually 5, glabrous, 3–6 mm. long, acute.—Wooded slopes, Blue Ridge, S. C. to Va.—Sum.

3. *O. alabamensis* Rydb. Shrub, with stellate branches: leaf-blades broadly ovate, 2–5 cm. long, obtuse or acute at the apex, often indistinctly 3-lobed, doubly crenate, stellate-pubescent, at least beneath, acute or rounded at the base: inflorescence densely stellate: follicles 3–5, permanently stellate, about 8 mm. long.—Thickets and river-bottoms, Coastal Plain and Piedmont, Ala., Ga., and S. C.—Sum.

4. *O. stellatus* Rydb. Low shrub, with decidedly pubescent foliage: leaf-blades 1–4 cm. long: sepals narrowly ovate, 2–2.5 mm. long: follicles mostly 4, about 5 mm. long.—Stream-banks, Coastal Plain, Fla. and Ga.—Spr.—sum.

2. **SPIRAEA** [Tourn.] L. Shrubs. Leaf-blades toothed or lobed. Flowers corymbose or paniculate. Corolla white, pink, or rose. Stamens numerous, accompanied by lobe-like staminodia. Carpels usually 5, mostly stipitate: styles clavate: stigmas minute and oblique. Follicles not inflated.—About 70 species, natives of the north temperate zone.—SPIREAS.—Several species are extensively grown for ornament.

Inflorescence elongate, paniculate, ovoid or conic.  
Inflorescence flat-topped, corymbose.

I. SALICIFOLIAE.  
II. CORYMBOSAE.

#### I. SALICIFOLIAE

Sepals merely spreading: disk obsolete.

Inflorescence glabrous: leaf-blades broadly oblanceolate to obovate.

Inflorescence pubescent: leaf-blades narrowly oblanceolate. Sepals early reflexed: disk prominent.

Follicles glabrous: leaf-blades lanceolate to elliptic-lanceolate.

Follicles pubescent: leaf-blades elliptic or oval, varying to ovate or elliptic-ovate.

1. *S. latifolia*.
2. *S. alba*.
3. *S. subcanescens*.
4. *S. tomentosa*.

#### II. CORYMBOSAE

Hypanthium turbinate, tapering to the base: leaf-blades glaucous beneath.

Hypanthium campanulate, abruptly contracted at the base: leaf-blades scarcely glaucous beneath.

5. *S. virginiana*.
6. *S. corymbosa*.

1. *S. latifolia* (Ait.) Borkh.<sup>1</sup> Shrub with glabrous twigs: leaf-blades broadly oblanceolate to obovate, 2–8 cm. long, sharply serrate, glabrous or nearly so:

<sup>1</sup> Formerly included in *Spiraea salicifolia*, a native of Siberia and eastern Russia.

hypanthium hemispheric, less than 1 mm. high, glabrous: petals white, or pinkish in the bud, about 1.5 mm. long: follicles oblanceolate, 3-4 mm. long.—(MEADOW-SWEET. MEADOW-QUEEN. PINK MEADOW-SPIREA.) — Moist slopes, meadows and rocky banks, various provinces, in Coastal Plain only N, N. C. to Sask. and Newf.—Sum.

2. *S. alba* Du Roi. Shrub with puberulent twigs: leaf-blades narrowly oblanceolate, 3-6 cm. long, sharply serrate, more or less puberulent on the veins: hypanthium puberulent, about 1 mm. high: petals white, about 2 mm. long: follicles oblanceolate, about 3.5 mm. long.—(MEADOW-SWEET. MEADOW-SPIREA.)—Wet thickets and meadows, various provinces N of Coastal Plain, N. C. to Mo., Ont., and N. Y.—Sum.

3. *S. subcanescens* Rydb. Shrub somewhat resembling *S. tomentosa* in habit, but with the stem and branches less densely pubescent: leaf-blades thinish, but firm, lanceolate to elliptic-lanceolate, acute at both ends, sharply and finely serrate, slightly pubescent above, tomentulose beneath: sepals ciliate: petals pink, suborbicular, about 2 mm. wide: follicles glabrous, about 2 mm. long.—Woods, near Anderson, on Piedmont of S. C.—Sum.—This may be a hybrid between *S. tomentosa* and *S. alba*.

4. *S. tomentosa* L. Shrub 3-15 dm. tall: leaf-blades thick, tomentose beneath: flowers stout-pedicelled: sepals ciliate: petals rose-colored or rarely white, 1-15 mm. wide: carpels and follicles pubescent, the latter 2-2.5 mm. long.—(HARDHACK. STEEPLE-BUSH.)—Swamps and meadows, various provinces, in Coastal Plain only N, Ga. to Kans., Man., and N. S.—Sum.

5. *S. virginiana* Britton. Straggling shrub: leaf-blades 2-6 cm. long: longer stamens about twice as long as the sepals: staminodia ovate: petals white, about 2 mm. in diameter.—(MOUNTAIN MEADOW-SWEET.)—Rocky banks, Blue Ridge and Appalachian Plateau, Tenn. to W. Va.—Spr.-sum.

6. *S. corymbosa* Raf. Erect shrub: leaf-blades 2-10 cm. long: longer stamens about thrice as long as the sepals: staminodia depressed: petals white, about 1.5 mm. in diameter.—(DWARF-SPIREA.)—Rocky banks and acid soil, Blue Ridge, extending into adj. provinces, Ga. to W. Va. and N. J.—Spr.-sum.

3. **ARUNCUS** Adans. Perennial herbs. Leaf-blades twice or thrice pinnately compound. Flowers dioecious, very many, borne in panicle narrow racemes. Sepals deltoid to triangular. Petals broad, white. Stamens numerous, conspicuous: filaments elongate. Carpels mostly 3: styles short or elongate. Follicles erect or deflexed.—About 5 species, natives of North America and Eurasia.—Spr.-sum.—GOAT'S-BEARDS. BRIDE'S-FEATHERS.

Style short, much shorter than the carpel-body during anthesis: follicle-bodies narrowly ellipsoid, about 3 mm. long.

Style long, about as long as the carpel-body during anthesis: follicle-bodies turgid, oval or ovoid, about 2 mm. long.

Mature carpel-bodies ovoid, sometimes apparently ellipsoid when dry, the beaks mostly spreading: leaflets decidedly pubescent beneath.

Mature carpel-bodies oval, sometimes apparently ovoid when dry, the beaks mostly erect: leaflets glabrous or nearly so.

1. *A. Aruncus*.

2. *A. pubescens*.

3. *A. allegheniensis*.

1. *A. Aruncus* (L.) Karst. Plant 2 m. tall or less, glabrous or nearly so up to the inflorescence at maturity: leaflets ovate, 2-7 cm. long, acuminate, doubly serrate, glabrous, smooth and shiny, or with scattered hairs especially when young: sepals of the pistillate flowers lanceolate or triangular-lanceolate, acuminate: petals of the staminate flowers scarcely 1.5 mm. long, narrowed at the base: follicles narrowly elliptic, about 3 mm. long, less than 1 mm. thick, slightly beaked.—Thickets and waste places, locally nat. in various provinces in E U. S., from N. C. northward. Nat. of Eu.

2. *A. pubescens* Rydb. Plant 3 m. tall or less, decidedly pubescent: leaflets ovate, 3-10 cm. long, short-acuminate, singly or doubly serrate, pubescent beneath: sepals of the pistillate flowers triangular lanceolate, acute: petals of the staminate flowers slightly over 1 mm. long, scarcely narrowed at the base: follicles ovoid, sometimes appearing ellipsoid when dry, the body about 2 mm. long, with the slender beak mostly spreading.—Woods, various provinces N of Coastal Plain, Okla. to Ia. and Va.

3. *A. allegheniensis* Rydb. Plant 2.5 m. tall or less, glabrous or nearly so at maturity below the inflorescence: leaflets ovate to elliptic, 3-10 cm. long, short-acuminate, doubly serrate, glabrous or with scattered hairs beneath: sepals of the pistillate flowers deltoid or ovate-deltoid, acute or acutish: petals of the staminate flowers about 1 mm. long, not narrowed at the base: follicles oval, sometimes appearing ovoid when dry, the body about 2 mm. long, with the slender beak mostly erect. [*Spiraea Aruncus* (Chapm. Fla.).] Rich woods, various provinces, in Coastal Plain only N, Ga. to Ala., Ky., and Pa.

4. **PORTERANTHUS** Britton. Perennial herbs. Leaf-blades 3-parted or 3-foliolate. Flowers perfect, few, borne in open lax panicles. Sepals shorter than the hypanthium. Petals narrow, white or pink. Stamens numerous, in one row: filaments very short. Carpels mostly 5: styles subulate. Follicles erect. [*Gillenia* Moench.]—Two species.—Spr.-sum.—INDIAN PHYSICS.

Sepals glandular-serrate, caudate-acuminate: stipules subulate or lanceolate, entire or nearly so: dorsal suture of the follicle not prominent. 1. *P. trifoliatus*.  
Sepals merely ciliolate, acute or slightly acuminate: stipules foliaceous, coarsely lacinate: dorsal suture of the follicle keel-like. 2. *P. stipulatus*.

1. *P. trifoliatus* (L.) Britton. Plant 3-14 dm. tall: leaflets 3-9 cm. long; blades oval or elliptic to obovate, or those of upper leaves sometimes lanceolate, sharply serrate or incised-serrate: petals white, mostly 15-20 mm. long; blades nearly linear or slightly broadened upward: follicles 5.5-7 mm. long, stout-beaked, not stipitate, closely fine-pubescent. [*G. trifoliata* Moench.]—(BOWMAN'S-ROOT. FALSE IPECAC.—Woods, thickets, and river-banks, various provinces, in Coastal Plain only N, Ga. to Mo., Mich., Ont., and N. Y.

2. *P. stipulatus* (Muhl.) Britton. Plant 1.5-12 dm. tall: leaflets 5-8 cm. long; blades oblanceolate to elliptic or lanceolate, acuminate, those of the lower leaves incised or lacinate, those of the upper coarsely doubly-toothed: petals white or pinkish, 11-

15 mm. long; blades oblanceolate or elliptic-oblanceolate: follicles 6.5–9.5 mm. long, slender-beaked, stipitate, glabrous or with few hairs. [*G. stipulata* Muhl.]—(AMERICAN IPECAC.)—Woods and thickets, often in calcareous soil, various provinces, chiefly W of Blue Ridge, extending into Piedmont and Atlantic Coastal Plain only in river valleys, Ga. to La., Kans., and N. Y.

5. **FILIPENDULA** [Tourn.] Hill. Perennial caulescent herbs. Leaf-blades pinnate. Flowers numerous, borne in corymbose cymes. Sepals entire. Petals broad, white, pink, or purple. Carpels 5–15: style short: stigma capitate. Achene capsule-like.—About 10 species, natives of the north temperate zone.—MEADOW-SWEETS.

1. **F. rubra** (Hill) B. L. Robinson. Plant 5–24 dm. tall: lower leaves 3–9 dm. tall; blades of the leaflets palmately 3–5-lobed: sepals almost half-orbicular: petals 2–3 mm. long, pink or purple; the blades sub-orbicular: fruits 6–7 mm. long, clavate. [*Spiraea lobata* Chapm. Fl.]—(PRAIRIE-MEADOW-SWEET. QUEEN-OF-THE-PRAIRIE.)—Swamps and low grounds, Blue Ridge and more N provinces, Ga. to Ia., Pa., and Vt.—Spr.—sum.

6. **POTENTILLA** L. Herbs or partially woody plants. Leaf-blades pinnately or digitately foliolate. Flowers in corymbose cymes or solitary. Petals white, yellow, red, or purple, notched. Receptacle hemispheric or conic. Carpels and achenes ovoid.—About 325 species, natives of the north temperate zone.—CINQUEFOILS. FIVE-FINGERS. MEADOW-STARS.—Our species all have yellow flowers.

Flowers solitary, on long axillary pedicels: plant perennial.

Flowers cymose: cymes many-flowered, leafy bracted: plant annual.

I. TORMENTILLAE.

II. SUPINAE.

#### I. TORMENTILLAE

Stem, branches, petioles, and pedicels with appressed pubescence.

Leaflets sparingly silk or strigose: blades oblanceolate, elliptic-oblanceolate or rarely obovate, toothed except at the base.

Leaflets densely silky beneath; blades of those of the basal ones cuneate-obovate, toothed only at the apex or above the middle.

Stem, branches, petioles, and pedicels with spreading hairs.

Blades of the leaflets obovate or oblanceolate, appressed-pubescent.

Blades of the leaflets cuneate, pubescent with long lax hairs.

1. *P. simplex*.

2. *P. pumila*.

3. *P. canadensis*.

4. *P. caroliniana*.

#### II. SUPINAE

Achene corky-gibbous on the upper suture: corolla less than 8 mm. wide: lower leaves with 9–11 leaflets.

Achene not gibbous: corolla over 9 mm. wide: lower leaves with 3–5 leaflets.

5. *P. paradoxa*.

6. *P. monspeliensis*.

1. **P. simplex** Michx. Stem erect or early decumbent, 4–10 dm. long, appressed-pubescent: leaflets 2–6 cm. long; mostly 5; blades oblanceolate, elliptic-

oblanceolate, or rarely obovate, coarsely toothed except near the base: sepals lanceolate, 4–5 mm. long, about equalling the linear-lanceolate bractlets: petals 5–6 mm. long.—Grassy slopes and open woods, various provinces N of Coastal Plain, Ala. to Mo., Minn., and N. S.—Spr.—This, and related species, are sometimes called wild-strawberry.

2. *P. pumila* Poir. Stem erect in anthesis, producing runner-like branches, densely silky-strigillose: leaflets 5; blades 2–2.5 cm. long, cuneate-obovate, coarsely toothed at the apex or above the middle: sepals narrowly lanceolate, 3–5 mm. long, about equalling the brackets: petals 4–7 mm. long. [ *P. canadensis pumila* T. & G. ]—Sandy banks and dry woods, various provinces, Ga. to Ohio, Ont., and Me.—Spr.

3. *P. canadensis* L. Stem branched at the base, the branches decumbent or prostrate, 4–6 dm. long, with spreading hairs: leaflets 3 or 5; blades obovate-oblanceolate, or oval, 2–5 cm. long, coarsely toothed: corolla 12–15 mm. wide, the petals about  $\frac{1}{3}$  longer than the sepals.—(FIVE-FINGER.)—Dry soil, banks, and thickets, various provinces, La. to Tex., Wis., N. B., and N. C.—Spr.—sum.

4. *P. caroliniana* Poir. Stem often branched at the base, the branches prostrate, usually rooting at the nodes, 3–10 dm. long, with spreading pubescence: leaflets mostly 5; blades cuneate, 1.5–4 cm. long, coarsely toothed above: corolla 8–10 mm. wide, the petals about  $\frac{1}{3}$  longer than the sepals.—Dry woods, various provinces, Ga. to Mo. and Va.—Sum.

5. *P. paradoxa* Nutt. Stem becoming much-branched, the branches mostly ascending or spreading, 2–5 dm. tall, hirsute above, sometimes glabrate below: leaflets pinnate, 9–11 on the lower leaves, 1–2 cm. long; blades obovate-cuneate, crenate or cleft, the teeth rounded: cymes leafy: hypanthium becoming 7–9 mm. in diameter, hirsute: sepals elliptic ovate, 3–4 mm. long: petals obovate-cuneate, equalling the sepals or exceeding them: stamens 15–20: achene corky, thickened on the inner side.—Low grounds, Appalachian and more N provinces, Tenn. to N. M., Wash., Ont. and N. Y.—(Mex., O. W.)—Sum.

6. *P. monspeliensis* L. Stem simple and erect, or with ascending branches, 1 m. tall or less, hirsute (finely pubescent and with oblong narrowly serrate leaflets in *P. norvegica*): leaflets 3, digitate, or in luxuriant plants 5, digitate or pinnate, 3–10 cm. long; blades obovate, broadly serrate: cymes dense: hypanthium becoming 7–8 mm. wide, hirsute: sepals elliptic lanceolate, 7–8 mm. long: petals obovate to cuneate, nearly equalling the sepals: stamens mostly 20; achene usually rugulose. [*P. norvegica* L.]—(ROUGH-CINQUEFOIL.)—Waste-places, cult. grounds, and fields, various provinces, N. C. to Tex., Calif., Alas., Ont., and Lab.—(Mex., O. W.)—Sum.

7. *DUCHESNEA* J. E. Smith. Caulescent creeping herbs. Leaf-blades pinnately 3-foliolate. Peduncles 1-flowered. Bractlets larger than the sepals,

toothed. Petals surpassed by the bractlets. —Two species, natives of Asia.—MOCK-STRAWBERRIES.—The receptacle is red and spongy, but not juicy, at maturity.

1. *D. indica* (Andr.) Focke. Stem or branches elongate: leaflets ovate to obovate: sepals 6–8 mm. long: petals obovate, yellow: fruit ovoid or subglobose, 8–10 mm. in diameter, red, insipid: achenes red. [*Fragaria indica* Andr.]—(YELLOW-STRAWBERRY. INDIAN-STRAWBERRY. SNAKE-BERRY.)—Fields and roadsides, various provinces, N Fla. to Ark., Mo., and N. Y. Nat. of Asia.—Spr.—sum.

8. **FRAGARIA** [Tourn.] L. Acaulescent erect and often stoloniferous herbs. Leaf-blades pinnately 3-foliolate. Scapes several-flowered. Bractlets smaller than the sepals, entire. Petals white, surpassing the bractlets.—About 35 species, natives of the north temperate zone to the mts. of South America.—Spr.—STRAWBERRIES.—Some species and many hybrids are extensively grown for their fruits. The receptacle, conic or globose at maturity, is red or scarlet.

Blades of the leaflets petiolulate: achenes in pits.

Pedicels with appressed hairs.

Blades of the leaflets sessile or nearly so.

Blades of the leaflets petiolulate.

Pedicels with spreading hairs.

Blades of the leaflets sessile or nearly sessile: achenes superficial.

1. *F. virginiana*.

2. *F. australis*.

3. *F. Grayana*.

4. *F. americana*.

1. *F. virginiana* Duchesne. Rootstock stout: blades of the leaflets thick, elliptic to obovate, 3–10 cm. long, coarsely toothed, obtuse: scape stout, 1.5–3 dm. tall, villous: pedicels strigose: bractlets, and sepals, lanceolate: petals obovate: fruit subglobose, 1–1.5 cm. in diameter: achenes in deep pits.—Fields, roadsides, and cult. grounds, various provinces, Fla. to Okla., Minn., and Que.

2. *F. australis* Rydb. Rootstock short, rather slender: blades of the leaflets elliptic-ob lanceolate or obovate, 1–4 cm. long, coarsely few-toothed: scape less than 1 dm. tall, silky: bractlets linear-lanceolate: sepals broadly lanceolate: petals oval: fruit not seen. Woods and river-banks, various provinces, N. C. and Tenn. to W. Va. and Va.

3. *F. Grayana* Vilmorin. Rootstock stout, short: blades of the leaflets firm, obovate, 3–10 cm. long, coarsely toothed, acute or obtuse: scape stout, 1–1.5 dm. tall, hirsute with spreading or reflexed hairs: pedicels hirsute: bractlets linear-lanceolate: sepals lanceolate: petals suborbicular: fruit subglobose, about 1.5 cm. in diameter: achenes in pits.—Cult. grounds, fields, and gardens, Coastal Plain, extending into adj. provinces, Ala. to La., Mo., and Md.

4. *F. americana* (Porter) Britton. Rootstock slender: blades of the leaflets thin, rhombic-obovate, mostly acute, 3–8 cm. long: scape 1.5 dm. tall or less, villous: pedicels somewhat appressed-pubescent: sepals, and bractlets, ovate to lanceolate, 5–6 mm. long: fruit conic-ovoid, 5–7.5 mm. long, red. [*F. vesca* Chapm. not L.]—(WOOD-STRAWBERRY.)—Cliffs, hillsides, and roadsides, various provinces, N of Coastal Plain, N. C. to N. M., Man., and Newf.

9. **SIBBALDIOPSIS** Rydb. Shrubs with creeping stems. Leaf-blades pinnately 3-foliolate, 3-toothed at the apex. Petals white, rounded. Stamens in 3 rows. Carpel-body mostly obovoid: style filiform, lateral. Achene pubescent.—One species.

1. *S. tridentata* (Soland.) Rydb. Plant matted, 0.5–3 dm. tall, somewhat pubescent: leaflets 1–3 cm. long; blades cuneate or obovate-cuneate: cymes open: sepals triangular-ovate to ovate: petals white, 5.5–7 mm. long: achene nearly 2 mm. long. [*Potentilla tridentata* Ait.]—(MOUNTAIN-CINQUEFOIL. WINELEAF-CINQUEFOIL.)—Rocky acid soil, Blue Ridge and more N provinces, Ga. to Man., Newf., and Greenl.—Spr.-sum.—Deposits itself on the most wind-swept summits, either on “balds” or in rock crevices.

10. **DASIPHORA** Raf. Shrubs with unarmed branches. Leaf-blades pinnately several foliolate, the leaflets broad or narrow, entire. Petals yellow, suborbicular, clawless. Stamens about 25, in 5 groups on a pentagonal disk. Carpel-body angular. Achenes pubescent.—About 5 species, natives of the north temperate and arctic regions.

1. *D. fruticosa* (L.) Rydb. Shrub 1.5 m. tall or less with silky twigs: leaflets 3–7, usually 5; blades leathery, elliptic, linear-elliptic, or linear, 1–2 cm. long, or less, silky on both sides: bractlets linear-elliptic: sepals broadly obovate, acuminate: petals about twice as long as the sepals: achene about 1.5 mm. long, long-hairy.—(GOLDEN-HARDHACK. SHRUBBY-CINQUEFOIL.)—Swamps or moist rocky soil, Tenn. to N. M., Calif., Alas., Que., and N. J.—(Eurasia.)—Sum.

11. **DRYMOCALLIS** Fourr. Herbs with erect stems. Leaf-blades pinnately several-foliolate, the leaflets toothed. Petals yellow or white, rounded. Stamens in 5 clusters. Carpel-body ovoid: style fusiform, basal. Achene glabrous.—About 30 species, natives of the north temperate and subarctic regions.

1. *D. agrimonioides* (Pursh) Rydb. Stem 3–10 dm. tall, glandular, villous: leaflets 1–6 cm. long; blades sharply incised-serrate: cymes dense: sepals ovate: petals white: achene about 3 mm. long. [*Potentilla arguta* Pursh.]—Dry banks, rocky hills, and meadows, various provinces, N of Coastal Plain, Tenn. to Colo., Mack., N. B., and D. C.—Sum.

12. **APHANES** L. Annual small caulescent herbs. Leaf-blades digitately lobed or dissected. Flowers minute or inconspicuous, greenish, in small axillary clusters. Hypanthium ellipsoid-urceolate, contracted at mouth, unarmed. Petals wanting. Stamens 1-4. Styles basal. —About 20 species, natives of the north temperate zone.

1. **A. australis** Rydb. Plant pubescent, the stems or branches 2-10 cm. long: leaves 4-8 mm. long; blades 3-parted, the segments cuneate, with obtuse lobes: flower-clusters sessile: sepals ovate, 0.5 mm. long, or less: achenes about 1 mm. long. [*Alchemilla arvensis* (Chapm. Fl.)]—(PARSLEY-PIERT.) —Fields and pastures, various provinces, Ga. to Tenn. and D. C.—Spr.

13. **SANGUISORBA** [Rupp.] L. Perennial or rarely annual, caulescent herbs. Leaf-blades unequally pinnate. Flowers white, or greenish white, in dense heads or spikes. Hypanthium angled, unarmed. Sepals petal-like, deciduous. Petals wanting. Filaments mostly clavate. —Two species, North American.

1. **S. canadensis** L. Plant 3-4 dm. tall: leaflets 7-15; blades elliptic, ovate-elliptic, or elliptic-lanceolate, 1.5-8 cm. long, serrate: spikes 3-15 cm. long: sepals oval or oval-ovate, varying to oblong or cuneate, about 2 mm. long, mucronate: achene about 3 mm. long. [*Poterium canadense* B. & H.] —(BURNET.)—Swamps, low meadows, and wet thickets, various provinces, in Coastal Plain only northward, Ga. to Mich. and Lab.—Sum.—fall.

14. **POTERIUM** L. Caulescent herbs resembling *Sanguisorba* in habit. Leaflets with toothed blades. Flowers monoecious or polygamous, greenish, in dense short peduncled spikes. Hypanthium 4-angled. Sepals 4, green. Petals wanting. Stamens, in the staminate flowers, numerous: filaments elongate. Pistils 2: stigmas tufted. Achenes included. —About 4 species, native of the Old World.

1. **P. Sanguisorba** L. Plant 3-8 dm. tall, glabrous or nearly so: leaflets mostly 9-13; blades suborbicular or reniform, varying to ovate or obovate, serrate or crenate: spikes globose to ovoid: sepals ovate, 3-3.5 mm. long: achene about 3 mm. long. —(GARDEN-BURNET.) —Roadsides and cult. grounds, various provinces, Md. to Ark., Ont., and Me. Nat. of Eu.—Sum.

15. **AGRIMONIA** [Tourn] L. Perennial, often glandular, caulescent herbs. Leaf-blades unequally and interruptedly pinnate, with small leaflets interposed between the larger ones. Flowers small, in virgate interrupted racemes. Hypanthium fluted, armed with hooked bristles. Sepals green, persistent. Petals yellow. Stamens 5-15. Filaments subulate. Style terminal.—About 15 species, widely distributed.—**AGRIMONIES. HARVEST-LICE.**

Mature hypanthium with 2-4 series of bristles, these erect, ascending, or merely spreading; sepals acute.

Leaflets large (mostly over 2 cm. long); blades serrate or crenate, the teeth directed forward.

Raceme and lower surface of the leaflets decidedly pubescent.

Roots not tuberous-thickened: leaflets glandular-granulose beneath.

Leaflets 11-27; blades narrowly lanceolate or elliptic, many-toothed: mature hypanthium 2.5-3 mm. long, the outer bristles spreading or reflexed.

Leaflets 5-9: blades broadly lanceolate to elliptic or oblanceolate, few-toothed: mature hypanthium 5 mm. long, with erect or connivent bristles.

Roots tuberous-thickened: leaflets not glandular-granuliferous or very slightly so, velvety beneath.

Mature hypanthium campanulate or turbinate, longer than broad, with an inconspicuous or evident rim: stems with the long hairs erect or ascending.

Leaflets mostly 7-13; blades, lanceolate to narrowly elliptic; mature hypanthium with an evident rim, the outer bristles spreading.

Leaflets mostly 5-7; blades obovate or oval, or rarely elliptic; mature hypanthium with an obsolete rim, the bristles erect or ascending.

Mature hypanthium broadly obconic, as broad as long or nearly so, shorter than the sepals, with a prominent rim: stem with the long hairs spreading.

Leaflets 3 to 7; blades acute: mature hypanthium usually broader than long: leaves scattered on the stem.

Leaflets 3 or 5, the lower pair much reduced; blades rounded at the apex: mature hypanthium about as broad as long: leaves approximate on the lower part of the stem.

Raceme and leaves glabrous or nearly so, but granular, granuliferous: roots tuberous-thickened.

Leaflets small (1-2 cm. long); blades with few, coarse salient or somewhat recurved teeth.

Mature hypanthium with several series of bristles, the outer reflexed: sepals acuminate, with the tips incurved at maturity.

1. *A. parviflora*.

2. *A. striata*.

3. *A. Bicknellii*.

4. *A. pubescens*.

5. *A. platycarpa*.

6. *A. microcarpa*.

7. *A. rostellata*.

8. *A. incisa*.

9. *A. gryposepala*.

1. *A. parviflora* Ait. Stem 3-20 dm. tall, finely pubescent and densely hirsute: primary leaflets 11-27; blades 3-12 cm. long or rarely smaller, strongly veined, sharply serrate: sepals ovate: petals elliptic, about 2 mm. long, pale yellow: mature hypanthium short-turbinate, 2.5-3 mm. long, the bristles in 2 series with an obscure rim. [*A. Eupatoria* Michx. not L.]—Meadows, stream-banks and rich woods, various provinces, Fla. to Miss., and N. Y.—(*W. I., Mex.*)—Spr.-sum.

2. *A. striata* Michx. Stem 3-21 dm. tall, hirsute and glandular-papillose: primary leaflets 5-9; blades 3-10 cm. long, serrate with mucronate teeth: sepals triangular-ovate: petals obovate, 3-4 mm. long, deep-yellow: mature hypanthium long-turbinate, about 5 mm. long, the bristles in 3 or 4

series, the rim thick. [*A. Eupatoria* (Chapm. Fl.)]—Woods, fence-rows, and thickets, various provinces, Ga. to N. M., B. C., and N. S.—Sum.

3. *A. Bicknellii* (Kearney) Rydb. Stem 3–15 dm. tall, densely villous-canescens and also with scattered long hairs: primary leaflets 7–13; blades 3–8 cm. long, with coarse ovate teeth: sepals ovate, about 1 mm. long: petals elliptic, about 2 mm. long, pale-yellow: mature hypanthium turbinate, about 3 mm. long, the bristles in 3 or 4 series.—Woods and stream-banks, various provinces, Ga. to Tenn. and Mass.—Sum.

4. *A. pubescens* Wallr. Stem 3–15 dm. tall, loosely tomentose and also somewhat villous-hirsute: primary leaflets 5–7 (rarely 9); blades 3–8 cm. long or rarely smaller, with triangular-ovate teeth: sepals ovate, about 1.5 mm. long: petals obovate, about 1.5 mm. long, deep-yellow: mature hypanthium turbinate to campanulate, 2.5–3 mm. long, the bristles in 3 series. [*A. Eupatoria mollis* (Chapm. Fl.) *A. mollis* Britton.]—Dry woods and thickets, various provinces, Ga. to Ark., Kans., Ont., and N. Y.—Sum.

5. *A. platycarpa* Wallr. Stem 3–8 dm. tall, finely pubescent and also sparingly hirsute: primary leaflets 3–5 (rarely 7); blades oval to elliptic, 2–6 cm. long, with ovate teeth: sepals ovate, about 1.5 mm. long: petals obovate, 1.5–2 mm. long, light-yellow: mature hypanthium broadly obconic, about 2 mm. long and 3 mm. wide, the bristles in 2 or 3 series, the rim prominent.—Woods, various provinces, Ga. to Ala. and Pa.—Sum.

6. *A. microcarpa* Wallr. Stem 1–7 dm. tall, finely pubescent and also hirsute: primary leaflets 3–5; blades obovate to cuneate, 1–5 cm. long, crenate or dentate: sepals ovate, about 1.5 mm. long: petals elliptic, 2–2.5 mm. long, deep-yellow: mature hypanthium broadly obconic, 2–2.5 mm. long and about as wide, the bristles in 2 or 3 series, the rim evident. [*A. pumila* Muhl.]—Woods and shaded banks, various provinces, Fla. to E. Tex. and Pa.—Sum.

7. *A. rostellata* Wallr. Stem 2–10 dm. tall, sparingly hirsute or nearly glabrous: primary leaflets 3–9; blades obovate or oval, 3–10 cm. long, serrate with broadly ovate teeth: sepals ovate-lanceolate, about 1.5 mm. long: petals elliptic, 2–3 mm. long, pale-yellow: mature hypanthium hemispheric, about 2 mm. long, the bristles in about 3 series, the rim obsolete.—Wooded hillsides, stream-banks, and fence rows, various provinces, Ga. to Kans. and Conn.—Sum.—fall.

8. *A. incisa* T. & G. Stem 3–10 dm. tall, canescent and somewhat villous: primary leaflets 7–11; blades obovate to elliptic-obovate, 1–2 cm. long, prominently veined: sepals ovate, about 1.5 mm. long: petals elliptic, 2–3 mm. long, deep-yellow: mature hypanthium campanulate, about 2.5 mm. long, the bristles in 3 or 4 series.—Pinelands, Coastal Plain, Fla. to Miss. and N. C.—Sum.

9. *A. gryposepala* Wallr. Stem 3–18 dm. tall, pubescent with spreading hairs: primary leaflets 7–11; blades oval to obovate, oblanceolate or elliptic, 4–12 cm. long, coarsely serrate with ovate teeth: sepals acuminate, about 2 mm. long: petals obovate, 2.5–3 mm. long, bright-yellow: mature hypanthium broadly turbinate, 5–6 mm. long, the outer bristles much shorter than the inner. [*A. hirsuta* Bickn.]—Borders of woods and thickets, various provinces, N. C. to Nebr., N. D., and N. S.; also Calif.—(Mex.)—Sum.

16. **WALDSTEINIA** Willd. Acaulescent herbs. Leaf-blades lobed or divided. Flowers in corymbose cymes. Petals yellow, rounded. Receptacle minute. Carpels and achenes obovoid. Five species, natives of the north temperate zone.—Spr.—BARREN-STRAWBERRIES. STRAWBERRY-FOOL.

Leaf-blades 3-foliolate: style arising abruptly from the ovary.

Petals twice as long as the sepals or longer: sepals mostly longer than the hypanthium.

Petals as long as the sepals or shorter: sepals mostly shorter than the hypanthium.

Leaf-blades 3-lobed: style arising gradually from the ovary.

1. *W. fragarioides*.  
2. *W. Doniana*.  
3. *W. lobata*.

1. *W. fragarioides* (Michx.) Tratt. Plant 0.5-3 dm. tall: leaf-blades 3-foliolate; leaflets 2-4 cm. long, the blades cuneate to obovate, crenate-lobed or incised: petals 8-10 mm. long, twice as long as the sepals: style glabrous.—Damp woods and shaded banks, various provinces N of Coastal Plain, Ga. to Ind., Minn., and N. B.

2. *W. Doniana* Tratt. Plant 1-3 dm. tall: leaflets irregularly crenate or somewhat lobed: petals 2-4 mm. long: style glabrous. [*W. parviflora* Small.]—Rich woods and banks, various provinces N of Coastal Plain, Ga. to Tenn. and Pa.

3. *W. lobata* (Baldw.) T. & G. Plant 1-2 dm. tall: leaf-lobes mucronulate-crenate: sepals longer than the hypanthium: petals narrowly elliptic, as long as the sepals or shorter: style pubescent at the base.—River banks, Coastal Plain and Piedmont, Ga. to N. C.

17. *GEUM* L. Herbs. Leaf-blades mostly 3-foliolate or pinnately divided. Flowers solitary or in open cymes. Petals rounded or retuse. Receptacle sessile. Carpels numerous: style jointed, elongate. Head of carpels, or achenes, sessile.—About 40 species, most abundant in the north temperate zone.—Spr.—sum.—AVENS.

Style bent near the apex: petals not veiny, 2-4 mm. long: bractlets obtuse.

Corolla yellow or cream-yellow.

Corolla white.

Receptacle bristly: stem glabrous or softly pilose.

Receptacle glabrous: stem hirsute.

Style bent near the middle: petals veiny, 6-7 mm. long: bractlets acute.

1. *G. hirsutum*.

2. *G. canadense*.

3. *G. virginianum*.

4. *G. geniculatum*.

1. *G. hirsutum* Muhl. Stem 3-15 dm. tall, hirsute below: blades of the lower leaves usually pinnately divided: sepals about twice as long as the bractlets: achene-body about 3 mm. long. [*G. flavum* (Porter) Bicknell.]—Thickets and open woods, various provinces N of Coastal Plain, N. C. to Tenn., Ohio, and Conn.

2. *G. canadense* Jacq. Stem 3-9 dm. tall: blades of the lower leaves 3-divided or pinnate: sepals about thrice as long as the bractlets: hypanthium glabrous or finely canescent: heads of achene 8-11 mm. long: achene-body 2.5-3 mm. long. [*G. album* Gmel.]—(REDROOT.)—Thickets and open woods, various provinces, Ga. to Tex., S. D., and N. S.—(Mex.)

3. *G. virginianum* L. Similar to *G. canadense* in habit, but stouter, and petals rather smaller: hypanthium hirsute: heads of achenes 12-16 mm. long: achene-body 2.5-3 mm. long.—Damp thickets and low grounds, various provinces, N. C. to Mo., Minn., and N. B.

4. *G. geniculatum* Michx. Stem 5-9 dm. tall: blades of the lower leaves toothed or 3-divided: bractlets linear, about  $\frac{1}{2}$  as long as the sepals: white, with darker veins: achene-body 3.5-4.5 mm. long.—Wooded slopes, Blue Ridge, N. C. and Tenn.

18. **STYLIPUS** Raf. Perennial herbs resembling *Geum* in habit, but calyx not accompanied by a series of bractlets. Style elongated and tapering, bent near the apex. Head of carpels, or achenes, stipitate.—About 3 species, North American.

1. *S. vernus* Raf. Stem and branches often decumbent: blades of the lower leaves both lobed and pinnate: sepals about 2 mm. long: petals yellow, shorter than the sepals: head of achenes 7-9 mm. in diameter: achene-body 3 mm. long. [*Geum vernum* T. & G.]—Thickets and open woods, various provinces N of Coastal Plain, Tex. to Ont. and N. J. This is one of the "western" plants that have migrated eastward through the channels of agriculture.

19. **SIEVERSIA** R. Br. Perennial caulescent herbs. Leaf-blades various, those of the basal leaves with odd-pinnate blades, those of the cauline smaller and usually simple. Flowers few or solitary. Petals yellow or purplish, mostly notched. Carpels numerous: style elongate, not jointed, pubescent or plumose. About 15 species, of Alpine and arctic regions.

1. *S. radiata* (Michx.) Greene. Plant 1-6 dm. tall, hirsute: basal leaves with lyrate-pinnate blades, the terminal division sub-orbicular or reniform, 4-15 cm. wide: sepals acuminate: petals deep-yellow, 12-18 mm. long, deeply obovate: achene-body 3-4 mm. long. [*Geum radiatum* Michx.]—Summits, Blue Ridge, N. C. and Tenn.—Sum.

20. **DALIBARDA** L. Perennial unarmed creeping herbs. Leaf-blades broad, toothed. Flowers of 2 kinds, some petaliferous, but usually sterile on long erect peduncles, others apetalous and fruit-producing on short curved peduncles (not further considered here). Sepals 5 or 6, the 3 larger ones, at least, toothed at the apex. Petals mostly 5, white, deciduous. Carpels 5-10. Fruit a cluster of nearly dry drupelets.—One species.

1. *D. repens* L. Stem and branches soft-pubescent: leaf-blades ovate to orbicular, 2-5 cm. wide, crenate, pubescent on both sides, cordate, slender-petioled: sepals 6-7 mm. long, pubescent: petals elliptic, oval,

or ovate, 7-8 mm. long: drupelets ellipsoid to ovoid, 3-4 mm. long.—(DEW-DROPS. STAR-VIOLET.)—Woods, often in acid soil, Blue Ridge and more N provinces, rarely extending into Coastal Plain northward, N. C. to Minn. and N. B.—Spr.—sum.

**21. RUBACER** Rydb. Perennial partly shrubby diffuse plants. Leaf-blades palmately lobed. Flowers corymbose or racemose. Carpels borne on a flat receptacle. Fruit depressed-hemispheric or nearly flat.—About 3 species, North American.

**1. R. odoratum** (L.) Rydb. Stem 1-2 m. tall, clammy-pubescent: leaf-blades 5-30 cm. wide, 3-5 lobed: sepals elongate, each with an ovate or elliptic-ovate body and a slender appendage: petals rose-purple or rarely white, 1.5-2 cm. broad: fruits red, 15-20 mm. broad, insipid. [*Rubus odoratus* L.]—(FLOWERING-RASPBERRY. RASPBERRY-ROSE. THIMBLE-BERRY.)—Rocky banks and woods, various provinces N of Coastal Plain, Ga. to Mich. and N. S.—Sum.

**22. RUBUS** [Tourn.] L. Perennial erect or trailing shrubs. Leaf-blades simple or 3-7-foliolate. Flowers solitary or variously disposed. Petals white to purple. Carpels borne on a convex or conic receptacle. Fruit hemispheric or elongate, composed of drupelets.—About 200 species, most abundant in the north temperate regions.—Spr.—RASPBERRIES. BLACKBERRIES. BRAMBLES.—Spr. or early sum.—The stems are biennial in our species. The shoots of the season, called turions, arise from the scaly subterranean buds.—The following treatment is based on that of Per Axel Rydberg in North American Flora.

Drupelets united into a thimble-like aggregate fruit which falls away from the dry receptacle.—RASPBERRIES. I. IDAEI.

Drupelets united and on the fleshy receptacle or falling off together with the receptacle, or falling away separately. —BLACKBERRIES.

Shoots of the season (turions) erect: stems erect, arching, or recurved.

Blades of the leaflets white-tomentose beneath.

Blades of the leaflets not white-tomentose beneath.

Shoots of the season (turions) and stems prostrate, only floral branches erect.

Inflorescence not prickly: leaves deciduous, except in *R. hispidus* in which the leaflets are obovate.

Stem prickly and prickles confined to the angles of the stem.

Stem with usually numerous bristles which are not confined to the angles.

Inflorescence with flattened prickles: leaves persistent: blades of the leaflets oblanceolate or elliptic.

II. DISCOLORES.  
III. ARGUTI.

IV. PROCUMBENTES.

V. HISPIDI.

VI. TRIVIALES.

I. IDAEI

Corolla white; petals erect or ascending.

Inflorescence corymbiform: fruits black: leaves, when with more than 3 leaflets, pedately compound.

Inflorescence racemose: fruits red: leaves, when with more than 3 leaflets, pinnately compound.

Corolla rose or purple; petals incumbent, appressed to the stamens: stem densely hispid, but not glandular.

1. *R. occidentalis*.
2. *R. carolinianus*.
3. *R. phoenicolasius*.

II. DISCOLORES

Blades of the lateral leaflets cuneate to obovate: blade of the terminal leaflet entire near the base.

4. *R. cuneifolius*.

Blades of the lateral leaflet broadly ovate: blade of the terminal leaflet toothed to the base.

### III. ARGUTI

Inflorescence densely clothed with long-stalked glands.

Inflorescence glandless, or the sessile glands, if present, hidden in the other pubescence.

Blades of the leaflets markedly pubescent beneath.

Inflorescence elongate-ramose: young branches more or less distinctly angled: prickles stout: blades of the leaflets coarsely pubescent beneath.

Inflorescence short-corymbiform: young branches terete: prickles at least on the branches curved and flattened: leaflets very finely pubescent beneath.

Blades of the leaflets glabrous, or merely pubescent on the veins beneath.

Prickles strongly hooked and flattened, at least on the floral branches.

Prickles, if present, straight and terete.

Stems stout, 1-5 m. tall, angled, usually unarmed.

Stems slender, 1 m. tall or less, terete or nearly so, sparingly retrorse-prickly: erect forms of

5. *R. Linkianus*.

6. *R. nigrobaccus*.

7. *R. argutus*.

8. *R. floridus*.

9. *R. betulifolius*.

10. *R. canadensis*.

14. *R. Enslenii*.

### IV. PROCUMBENTES

Blades of the leaflets markedly pubescent beneath.

Prickles strongly flattened and curved.

Prickles terete or nearly so, rather weak.

Blades of the leaflets light-green and firm, shining above, regularly toothed.

Blades of the leaflets dark-green and very thin, irregularly toothed.

Blades of the leaflets glabrous or sparingly pubescent on the veins beneath.

Leaflets of the flowering branches thin, the blades crenate-serrate with ovate teeth: stem with weak prickles.

Leaflets of the flowering branches firm, the blades serrate with lanceolate teeth: stem with firm prickles.

11. *R. rhodophyllus*.

12. *R. invisus*.

13. *R. Baileyanus*.

14. *R. Enslenii*.

15. *R. flagellaris*.

### V. HISPIDI

Plant with slender, prostrate, often elongate stems: blades of the leaflets thin, but firm, shining above.

16. *R. hispidus*.

### VI. TRIVIALES

Blades of the leaflets of turions ovate, elliptic or lanceolate, simply serrate with triangular teeth.

Inflorescence usually several-flowered: stems decidedly prickly, but not at all bristly.

Inflorescence usually 1-flowered: stems usually bristly as well as prickly.

Blades of the leaflets of turions oval or obovate, doubly toothed with ovate teeth.

Leaflets comparatively thin, turions obtuse or acute.

Leaflets firm and thick, turions short-acuminate.

17. *R. lucidus*.

18. *R. trivialis*.

19. *R. continentalis*.

20. *R. rubrisetus*.

1. *R. occidentalis* L. Stems arching, 3 m. long or less, often rooting at the tip, glaucous, the prickles somewhat flattened, recurved: leaves of the turions 3-foliate or individually pedately 5-foliate, deciduous; leaflet-blades ovate, 5-8 cm. long, double serrate, sometimes lobed, abruptly acuminate, dark-green above, white-tomentose beneath, rounded or cordate at the base: leaves 3-foliate; leaflet-blades similar to those of the stem but smaller: corymbs terminal, few-flowered: peduncles and pedicels prickly, tomentose: petals shorter than the ovate-lanceolate sepals: fruit hemispheric, dark bluish-purple, with a bloom: drupelets many, tomentose.—(BLACK-RASPBERRY. BLACK-CAP. THIMBLEBERRY.)—Woods and thickets, various provinces, in Coastal Plain only northward, Ga. to Colo., Minn., and N. B.

2. *R. carolinianus* Rydb. Stems erect or ascending, 3 m. long or less, densely bristly and hispid, with most of the bristles gland-tipped: leaves of the turions 3-7-foliolate, mostly 5-foliolate, deciduous; leaflet-blades ovate or ovate-lanceolate, 5-8 cm. long, long-acuminate at the apex, doubly-serrate, glabrate above, densely white-tomentose beneath, rounded or acute at the base: leaves of the floral branches mostly 3-foliolate: leaflet-blades more incised than those of the stem-leaves: racemose flower-clusters terminal and in the upper leaf-axils: peduncle and pedicels densely glandular-bristly: petals about  $\frac{1}{2}$  as long as the ovate sepals: fruit hemispheric, red: drupelets numerous, pubescent. [*R. strigosus* (Fl. SE. U. S.)]—(RED-RASPBERRY. WILD RED-RASPBERRY.)—Thickets and open woods, Blue Ridge, N. C. and Tenn.

3. *R. phoenicolasius* Maxim. Stems 2-2.5 m. long, covered like the branches and petioles, with reddish or purplish gland-tipped bristly hairs and scattered prickles: leaflets 3; blades broadly ovate or oval to suborbicular, 3-9 cm. long, acute or short-acuminate, crenate and usually shallowly lobed, green above, densely white-tomentulose beneath: hypanthium densely glandular-bristly: petals about  $\frac{1}{3}$  as long as the linear-lanceolate sepals: fruit ovoid, cherry-red, about 1 cm. broad.—(WINEBERRY.)—Thickets, fence-rows, and roadsides, various provinces, nearly throughout E U. S.—Nat. of Japan.—Spr.

4. *R. cuneifolius* Pursh. Stems erect, 0.5-1.5 m. high, more or less tomentose, the prickles straight or somewhat recurved: leaves of the turions pedately 3-5-foliolate; leaflet-blades obovate or cuneate-obovate, thick, dark-green and sparingly pilose or glabrate above, white-tomentose beneath, finely serrate except towards the acute or cuneate base: floral branches 1-3 dm. long: leaves 1-3-foliolate; leaflet-blades 2-4 cm. long, more cuneate or cuneate-oblongate: corymbs 2-7-flowered, tomentose and prickly: sepals white-tomentose on both sides: petals obovate to elliptic, 8-12 mm. long: fruit black, rather dry, but well-flavored, short-ellipsoid, 10-12 mm. long.—(LATE-BLACKBERRY. BRIER-BERRY. SAND-BLACKBERRY.)—Sandy woods, thickets, and fields, Coastal Plain and adj. provinces, Fla. to La. and Conn.—Two species of this relationship have been proposed by Bailey: *R. inferior* from pen. Fla. has fruiting stems ultimately lying on the ground, with small, short-acute leaflets, and flowers on long erect pedicels; *R. probabilis*, ranging from Fla. to Md., has erect or diffuse fruiting stems with relatively large taper-pointed leaflets and flowers in open corymb-like clusters.

5. *R. Linkianus* Ser. Stem erect, 1-2 m. tall, finely soft-pubescent, the prickles flat, more or less recurved: leaves of the floral branches 3-foliolate or individually 1-foliolate; leaflet-blades ovate, oval, or obovate, green and glabrous above, white-tomentulose beneath, rounded or subcordate at the base: flowers in panicle cymes: sepals densely white tomentose on both sides: petals obovate, 7-10 mm. long: fruit black.—Woods, roadsides, and waste-places, locally escaped from cult., Fla. to Md. Nativity unknown.—The flowers are frequently double.

6. *R. nigrobaccus* Bailey. Stems erect, 3 m. tall or less, usually arching, furrowed and angled, villous when young, the prickles stout, flat, usually somewhat curved: leaves of the turions pedately 5-foliolate; petioles and petiolules villous, glandular-hispid, and with recurved prickles: leaflet-blades ovate, 4-20 cm. long, more or less pilose above, paler and densely soft-pubescent beneath, abruptly acuminate, doubly serrate: floral branches short: leaves 3-foliolate; leaflet-blades smaller and less acuminate than the others: corymbs raceme-like, somewhat leafy-bracted: peduncles and pedicels villous and glandular-hispid: petals oval or elliptic, 10-15 mm. long: fruit black, thimble-shaped, sometimes short, mostly 1-1.5 cm. long. [*R. villosus* (Chapm. Fl.)]—Open woods and thickets, various provinces, N. C. to Ark., Ill., and N. S.

7. *R. argutus* Link. Stems erect or arching, 2 m. long or less, glabrous, angled and furrowed, the prickles stout, spreading, flattened: leaves of the turions pedately 5-foliolate, deciduous; leaflet-blades ovate, 3–10 cm. long, short-acuminate, doubly serrate, dark-green above, softly and rather densely pubescent beneath, sometimes almost velutinous, rounded or subcordate at the base: floral branches 1–2 dm. long, densely villous and rarely slightly glandular; leaves 3-foliolate or some of the upper ones 1-foliolate; leaflet-blades ovate or oval: racemes few-flowered, short and represented by single flowers in the upper leaf-axils: peduncles and pedicels copiously pubescent and with curved prickles: petals orbicular to oval, about 1 cm. long, much exceeding the sepals: fruit slightly elongate, 10–12 mm. long, black.—(Highbush-Blackberry.)—Thickets and woods, various provinces, N. C. to La., Kans., and N. S.—A related plant from Buncombe Co., N. C., with 5-foliolate leaves on the turions, and firm leaflets with less coarsely toothed blades, has been described as *R. crux* Ashe. Another from Tallahassee, Fla., with erect or ascending inflorescence-branches, instead of spreading, has been described as *R. tallahasseeanus* Bailey. *R. ostryifolius* Rydb. may be a hybrid between *R. argutus* × *Ensleni*.

8. *R. floridus* Tratt. Stems erect, 2–5 m. high, or the branches decumbent, more or less angled, the prickles stout, flat, strongly curved: leaves of the turions 3–5-foliolate: petioles and petiolules pilose and sparingly prickly: leaflet-blades elliptic-lanceolate or ovate-lanceolate, 5–10 cm. long, sparingly pubescent above, pale and more densely puberulent beneath, but in age nearly glabrous except the veins, sharply double-serrate: floral branches short: leaves 3-foliolate or the upper unifoliolate; leaflet-blades smaller, more glabrate, elliptic to rhombic-oval: corymbs rather few-flowered, more or less leafy; peduncles and pedicels densely pubescent, sometimes with few scattered glands, but not armed: petals elliptic-obovate, 12–15 mm. long: fruit thimble-shaped, about 1 cm. long, black.—Pinelands and fields, Coastal Plain and adj. provinces, Fla. to Tex., Mo., and Va.—*R. frondosa* Bigel. with nearly terete straight prickles and broadly cordate leaflets, appears not to range south of Va.

9. *R. betulifolius* Small. Stems glabrous, angled, the prickles recurved and strongly flattened, erect or recurved-spreading: leaves of the turions 5-foliolate; leaflet-blades elliptic-lanceolate, evenly serrate, thin, glabrous on both sides: petioles, petiolules, and midveins with very flat recurved prickles, glabrous or nearly so: flowering branches 1–2 dm. long, with recurved prickles: leaves 3-foliolate; leaflet-blades oval or elliptic, thin, glabrous, evenly serrate, shining above: corymbs somewhat leafy-bracted below, sparingly pubescent and armed with recurved prickles: petals elliptic-obovate, 12–15 mm. long: fruit rounded or slightly elongate, black.—Swamps and wet sandy woods, Coastal Plain and adj. provinces, Fla. to Miss., Ill., and Va.—A related plant from Uceta, Fla., with the blades of the leaflets of the turions very broad, that of the terminal one cordate or subcordate, has been described as *R. ucetanus* Bailey.

10. *R. canadensis* L. Stems erect or arching, 4 m. long or less, glabrous, with rounded angles and furrows, unarmed or with few straight weak prickles: leaves of the turions pedately 5-foliolate, deciduous; leaflet-blades ovate to obovate, mostly 6–15 cm. long, abruptly long-acuminate, thin, sharply serrate, glabrous or with few scattered hairs above, glabrous or pubescent on the veins beneath, rounded or subcordate at the base: floral branches with usually 3-foliolate leaves; leaflet-blades oval or nearly so, mostly 5–10 cm. long; raceme several-flowered, terminal, often leafy below: peduncles and pedicels pilose or villous: petals oval, 10–15 mm. long: fruit roundish, 1–1.5 cm. long, black. [*R. Millspaughii* Britton.]—(Spineless-Blackberry.)—Woods and cliffs, Blue Ridge and more N provinces, N. C. to Mich. and Newf.—*R. Randii* (Bailey) Rydb., with terete herbaceous stems, is not definitely known from our range.

11. *R. rhodophyllus* Rydb. Stems decumbent, terete, pubescent or in age glabrate, the prickles recurved, flattened only at the base; leaves of the turions not seen: flowering branches 1 dm. long or less, villous: leaves 3-foliolate; leaflet-blades broadly obovate or ovate, finely and simply serrate with broad triangular teeth, closely villous-tomentose beneath, sparingly hairy or glabrate above: corymb few-flowered: sepals ovate, mucronate, villous or tomentose without, tomentulose within: petals obovate, 10–12 mm. long.—Dry woods and fields, Coastal Plain, E Fla. to S Miss.

12. *R. invisus* (Bailey) Britton. Stems decumbent or ascending, 1–2 m. long or less, glabrous, terete, the prickles weak and straight: leaves of the turions pedately 5-foliolate; blades of the leaflets ovate to orbicular-ovate, 4–10 cm. long, abruptly short-acuminate, thin, glabrous or sparingly pubescent on both sides, coarsely and rather evenly serrate, rounded or subcordate at the base, or those of the narrower lateral leaflets acute at the base: floral branches 1.5–2.5 dm. long; leaves 3-foliolate or individually 1-foliolate; leaflet-blades ovate or oval: flowers solitary in the upper axils or 1, 2, or 3 together at the ends of the branches: peduncles and pedicels villous and more or less glandular-hispid: petals elliptic, 1–1.5 cm. long: fruits hemispheric, 1.5–2 cm. in diameter, black.—Open woods, fields, and clearings, various provinces N of Coastal Plain, N. C. to Ont. and Conn.

13. *R. Baileyanus* Britton. Stems decumbent, trailing, 1–2 m. long, glabrous, sparingly armed with small, recurved prickles: leaves of the turions 3-foliolate, or rarely 5-foliolate, deciduous: leaflet-blades softly pubescent, membranous, mostly ovate, doubly serrate with broad teeth: leaves of the erect flowering branches 3-foliolate with oval or ovate, doubly toothed, and somewhat lobed blades, or 1-foliolate and with an orbicular-ovate or cordate often 3-lobed blade: flowers solitary in the axils of the upper leaves, one, or sometimes 2 or 3, at the ends of the branches, the peduncles villous pilose: petals elliptic, 10–14 mm. long: fruit hemispheric, black, 10–15 mm. in diameter, the drupelets glabrous.—Hillsides and thickets, various provinces N of Coastal Plain, N. C. to Okla., Ont., and Mass.—*R. roribaccus* Rydb. appears to be a hybrid between *R. Baileyanus* × *flagellaris*.

14. *R. Enslenii* Tratt. Stems glabrous, ultimately prostrate or ascending, 1.5 m. long or less, sparingly retrorse-prickly: leaves of the turions 3-foliolate: leaflet-blades glabrous or sparingly pubescent on the veins, and ciliate, membranous, lanceolate or rhombic-lanceolate, doubly serrate, green: leaves of the flowering branches 3-foliolate, with blades similar to those of the other leaves but smaller and relatively broader or 1-foliolate: flowers mostly solitary at the ends of the branches: pedicels glabrous or nearly so: petals elliptic-obovate, 12–18 mm. long: fruit hemispheric, black.—Sandy soil, Coastal Plain extending into adj. provinces, Fla. to Tex., Mo., and Mass.—A related plant, from the mountains of N. C. with the turions, petioles, and pedicels bearing stalked glands and two kinds of prickles on the turions, has been described as *R. Boyntonii* Ashe. *R. immanis* Ashe, from Watauga Co., N. C., a plant of this relationship, is described as being 2–4 m. tall and growing in dense clumps, the stems glabrous, the leaflets rough-pubescent beneath, the racemes 4–8-flowered.

15. *R. flagellaris* Willd. Stem prostrate, often greatly elongate, glabrous, with scattered, rather weak, recurved prickles: leaves of the turions 3–5-foliolate; leaflet-blades pubescent on both sides, often only on the veins beneath, firm-membranous, broadly ovate or rhombic-ovate, coarsely doubly serrate: leaves of the flowering branches 3-foliolate with blades usually obovate to oblanceolate: flowers solitary in the upper axils or rarely 2–4 together; pedicels sparingly villous: petals elliptic-obovate, 10–15 mm. long: fruit hemispheric

to conic, black. [*R. canadensis* (Chapm. Fl.) *R. procumbens* (Fl. SE. U. S.) *R. subuniiflorus* Rydb.]—Dry often stony hillsides and old fields, various provinces, Ala. to Mo., Minn., and Me.; reported also from Fla.

16. *R. hispidus* L. Stems prostrate and trailing, 2 m. long or less slender, glabrous, retrorsely bristly: leaves of the turions 3-foliolate or rarely pedately 5-foliolate, persistent; leaflet-blades broadly ovate to rhombic-obovate, thickish, mostly acute or abruptly short-acuminate, glabrous, dark-green and shining above, coarsely doubly serrate with mucronate teeth: floral branches erect, their leaves 3-foliolate or individually 1-foliolate: leaflet-blades obovate, usually rounded at the apex: flowers few together at the ends of the branches and sometimes 1 or 2 in the upper leaf-axils: peduncles and pedicels tomentulose-puberulent and bristly or unarmed: petals obovate, about 8 mm. long: fruit globular or irregular, 1 cm. in diameter or less, dark-red or purple, the drupelets few.—(SWAMP-DEWBERRY.)—Low woods and wet meadows, often in acid soil, various provinces, Ga. to Mich. and N. S.

17. *R. lucidus* Rydb. Stems trailing, 1-2 m. long, terete, rather slender, the prickles recurved, flattened: leaves of the turions mostly 5-foliolate, persistent, somewhat leathery in age; leaflet-blades lanceolate, acute, glabrous on both sides, regularly serrate, dark-green and shining above, paler beneath: floral branches 1-2 dm., rarely 3 dm. long, erect, sparingly pubescent or glabrate: leaves 3-foliolate; leaflet-blades oblanceolate: flowers in terminal 2-6-flowered corymbs: peduncles and pedicels sparingly pubescent and decidedly prickly: petals obovate, 12-15 cm. long: fruit elongate, rather dry. [*R. persistens* Rydb.]—Open woods, Coastal Plain, Fla. to Miss. and S. C.

18. *R. trivialis* Michx. Stems prostrate and trailing, 5-20 dm. long, slender, terete, more or less hispid and with small, slightly flattened prickles: leaves of the turions 3-5-foliolate, persistent; leaflet-blades glabrous, subcoriaceous, ovate or oblanceolate, sharply serrate, dark-green and shining above, paler and duller beneath: leaves of the erect flowering branches 3-foliolate; leaflet-blades smaller, more elliptic or oval, rounded, obtuse, or acute at the apex: flowers terminal, mostly solitary: peduncles 2-5 cm. long, more or less tomentulose and prickly: petals white, obovate, 10-15 mm. long: fruit usually ellipsoid, black, 10-15 mm. long.—(SOUTHERN-DEWBERRY.)—Thickets, open woods, and fields, Coastal Plain, Fla. to Tex., Okla., and Va.—An infusion made from the herbage is used by the Seminoles in cases of stomach trouble.—A segregate of this species, *R. mississippianus* Bailey, from the coastal region of Mississippi, has narrower leaflets on the turions, the blades being mostly elliptic to elliptic-lanceolate and acuminate.

19. *R. continentalis* (Focke) Bailey. Stems biennial or perennial, 2 m. long or less, procumbent or trailing, bristly and armed with small, flat, recurved prickles: leaves of the turions or trailing stems 5-foliolate; blades thin, elliptic or elliptic-obovate, glabrous, doubly serrate with rather blunt teeth, acute or obtuse at both ends: leaves of the prickly-armed flowering branches 5-foliolate below, 3-foliolate above; blades relatively broader than those of the stem-leaves; flowers solitary or 2-4 at the ends of the branches: pedicels slightly glandular-hispid and armed with weak, flat, recurved prickles: petals white, oval, about 1 cm. long: fruit usually somewhat elongate, 1-2 cm. long. [*R. carpinifolius* Rydb. not Weihe & Nees.]—River-banks, bottom lands, and marshes, Coastal Plain and adj. provinces, Fla. to Tex., Okla., and Ill.—A related plant from the shores of Lake Okeechobee, Fla., with the flowers long-stalked on cane-like, foliose shoots, and leaves with very broad cordate or subcordate, individually undivided leaflets, has been described as *R. okeechobeus* Bailey. Two plants differing from *R. trivialis* and *R. okeechobeus*, in being devoid of bristles, but with flat-based prickles, have been described by

Bailey: *R. ictus*, ranging from Fla. to Miss., has small flowers on weakly armed pedicels and narrow leaflets on the young shoots; *R. mirus*, from Fla. has very large flowers on stout-armed pedicels and broad leaflets on the new shoots.

20. *R. rubrisetus* Rydb. Stems biennial, 2-4 m. long procumbent or trailing, glandular-hispid with red or purplish bristles and armed with weak prickles, also reddish: leaves of the turions or trailing stems 5-foliolate; blades thick and evergreen, oval, obovate or lance-ovate, glabrous except the veins beneath; acute at the base, short acuminate at the apex, irregularly serrate: leaves of the flowering-branches 3-5-foliolate; leaflets more obtuse than those of the turions; flowers 3-7 in small terminal corymbs, somewhat leafy-bracted below: peduncles and pedicels glandular-bristly and sometimes with small prickles, both prickles and bristles red; sepals tomentulose on both sides, ovate, short-acuminate with subulate tips: petals white, oval, 1 cm. long: fruit 1.5-2 cm. long, ellipsoid, very sweet and juicy, the drupelets numerous.—River banks, ditches, marshes and lowlands, Coastal Plain, La. to Mo.

23. *NEVIUSIA* A. Gray. Shrubs. Leaf-blades simple, toothed. Flowers many, borne in open cymes. Calyx corolloid. Sepals 5, whitish, toothed, much larger than the flattish hypanthium. Petals wanting. Stamens numerous; filaments white, conspicuous. Carpels 2-4, the bodies pubescent: style elongate: stigma minute, introrse. Achene drupe-like.—One species.

1. *N. alabamensis* A. Gray. Stems and branches 6-15 dm. tall: leaf-blades ovate to ovate-lanceolate, or somewhat rhombic, 2-7 cm. long, doubly serrate: sepals elliptic to ovate, 8-12 mm. long, incised-serrate above the middle: achenes ovoid, 4-5 mm. long.—(SNOW-WREATH.)—Shale and limestone cliffs, Appalachian Valley and Plateau, Ala.—Spr.

24. *KERRIA* DC. Shrubs. Leaf-blades simple, toothed, often somewhat incised. Flowers solitary or several together. Hypanthium hemispheric. Calyx herbaceous: sepals 5, broad, not toothed. Petals 5, yellow. Stamens numerous. Carpels 4-6, the bodies glabrous: style filiform: stigma minute. Achene drupe-like, 5 together or often solitary, very turgid.—One species.

1. *K. japonica* DC. Stem and branches arching and spreading: leaf-blades lanceolate to ovate, 2.5-6 cm. long, acuminate, doubly serrate or somewhat incised, pubescent: sepals elliptic to ovate or obovate, becoming 9-11 cm. long, erose at the apex: petals yellow, ovate to orbicular-ovate or suborbicular, 20-28 mm. long: achene obliquely ovoid, 4.5-5.5 mm. long.—(GLOBE-FLOWER. JAPANESE-ROSE.)—Road-sides and fence-rows, eastern S. C.—Nat. of Japan.—Spr.—The Japanese-rose is the double-flowered form.

25. *ROSA* [Tourn.] L. Prickly shrubs, sometimes vine-like. Leaf-blades unequally pinnate. Flowers solitary or in corymbs, often showy. Hypanthium urceolate. Sepals more or less foliaceous. Petals 5, broad. Stamens many. Achenes long, enclosed in the pulpy hypanthium. Many species, perhaps more than 100, widely distributed in the Northern Hemisphere.—Spr.-sum.—ROSES.—The following treatment is based on that of Per Axel Rydberg in North American Flora.

Styles much exserted, united, about equalling the stamens: stipules adnate: sepals reflexed.

Styles not exserted or only slightly so; stigmas aggregated into a head which closes the mouth of the hypanthium.

Stipules almost free from the petiole: naturalized climbing or trailing plants.

Leaflets 3-5: branches glabrous: stipules small, entire.

Leaflets 5-9: branches pubescent: stipules pectinate.

Stipules adnate to the petiole: erect, or rarely climbing plants.

Achenes borne both in the inner walls and in the bottom of the hypanthium which is glabrous or glandular-hispid only at the base: prickles rarely infrastipular.

Achenes borne in the bottom of the glandular-hispid hypanthium: infrastipular prickles borne on the stem, the shoots usually bristly.

#### I. SYNSTYLAE

Stipules pectinate.

Stipules entire or denticulate.

Leaves of the flowering branches with 5-7 leaflets: petals white.

Leaves of the flowering branches with 3, or rarely 5, leaflets: petals pink.

Blades of the leaflets glabrous or slightly pubescent on the veins beneath, dark-green and shining above.

Blades of the leaflets velutinous beneath, rather dull above.

#### II. LAEVI GATAE

Leaflet-blades narrowed at the apex: hypanthium and fruit bristly.

#### III. BRAC TEATAE

Leaflet-blades rounded at the apex: hypanthium and fruit puberulent.

#### IV. CANINAE

Leaflets glandular-pruinose beneath: blades manifestly doubly serrate with gland-tipped teeth.

Stem with straight or nearly straight prickles.

Stem with strongly curved prickles.

Blades of the leaflets suborbicular to broadly oval, mostly rounded at the apex: mature hypanthium obovoid or broadly ellipsoid, abruptly contracted at the apex: sepals tardily deciduous or somewhat persistent: styles pubescent.

Blades of the leaflets ovate, acute or short-acuminate: mature hypanthium narrowly ellipsoid, tapering at both ends: sepals rather early deciduous: styles glabrous or nearly so.

Leaflets not glandular beneath: blades singly serrate or somewhat doubly serrate.

#### V. CAROLINAE

Infrastipular prickles decidedly curved.

Blades of the leaflets finely serrulate, elliptic or oblanceolate: prickles short and stout.

Leaflets mostly 7: flowers usually corymbose on erect branches: mature hypanthium about 12 mm. thick.

Leaflets mostly 5: flowers usually solitary or two together on spreading branches: mature hypanthium 8-9 mm. thick.

Blades of the leaflets coarsely serrate, oval or obovate.

Infrastipular prickles straight or nearly so.

Blades of the leaflets membranous.

Blades of the leaflets crenate, rounded at the apex: flowers corymbose: stems unarmed or essentially so.

Blades of the leaflets serrate, acute or acuminate.

Blades of the leaflets shining above: flowers usually corymbose: prickles stout and flattened at the base.

Blades of the leaflets not shining: flowers usually solitary, or rarely a few together: prickles slender and terete.

Blades of the leaflets manifestly pubescent beneath.

Blades of the leaflets glabrous, or pubescent only on the veins beneath.

Leaflets with glandless teeth.

Leaflets with glandular teeth: rachis usually glandular.

Blades of the leaflets subcoriaceous.
